E. Standard rate and data lists four salesmen in Houston offices of KGUL-TV: none are listed in its purported main studios in Galveston.

F. In the background of all this, it must be borne in mind that KGUL-TV's transmitter is so located that relatively few Galvestonians can receive its signal without the same elaborate types of antennas which are necessary to receive the signal in Houston. By invading the Houston market with its signal, Galveston has been placed in a sort of fringe area by KGUL-TV, and the people of Galveston have in effect been deprived of a local station. They must make a heavy investment in antennas to receive a usable signal. They are but little better off in this respect than if they had no local station and were wholly dependent upon Houston stations.

G. KGUL-TV carries very little local Galveston advertising and virtually no local Galveston programming. This is entirely due to the emphasis which KGUL-TV places on Houston. Because it is geared to compete in a great metropolitan market of more than a million population, it must operate on a scale which makes its advertising rates out of reach of all but a handful of Galveston, and that when it is mentioned on I. D. slides it is in such small type it cannot be read and frequently is so located that it does not even show on most TV screens.

H. For the period April 22-28, 1964, KNUZ monitored the programs of KGUL-TV. Based upon these monitoring reports which will be submitted to the Commission upon its request, a total of only four Galveston merchants used the facilities of KGUL-TV. With these few exceptions, all other advertisers were either national or Houston advertisers.

5. In view of the foregoing facts, it is the position of KNUZ that the Commission's failure to recognize the impotency of section 3.685 (a) of its rules in limiting television stations to one principal community greatly outweighs the benefits which might under some circumstances be achieved by the proposed change of the Commission's rule on network territorial exclusivity. Insofar as the Houston situation is concerned and based upon KNUZ's past experience, it is evident that the proposed change in the network territorial exclusivity rule will merely improve KNUZ's legal position in any effort which it may make to
invoke the antitrust laws against the network companies and KGUL-TV. From a practical standpoint, however, it can be anticipated that the networks will merely repeat to KNUZ what they have said in the past, viz: "We just can't force advertisers to take you." It is therefore clear that the network companies will either make no contract at all for Houston, or, if they do, they will make no effort to sell a UHF outlet, such as KNUZ, but instead will rely on their nonexclusive Galveston contract to cover that market. Again, it is emphasized that these expectations are not based upon inferences, presumptions, or speculations; but upon KNUZ's past experiences. Accordingly, it is respectfully requested that the Commission in adopting its proposed rule on territorial network exclusively, at the same time issue a notice of proposed rule-making modifying section 3.685(a) of its rules to require a substantial increase in the minimum signal strength now provided for, in order to eradicate completely the impotency of that rule in limiting television stations to one principal community.

Respectfully submitted.

KNUZ TELEVISION CO.,
By MARCUS COHN. COHN & MARKS.
Attorneys.

MAY 3, 1954.

Senator Potter. Mr. Merryman.
Mr. Merryman is with the Southern Connecticut and Long Island Television Co., Associates of Bridgeport, Conn.

STATEMENT OF PHILIP MERRYMAN, SOUTHERN CONNECTICUT & LONG ISLAND TELEVISION CO. ASSOCIATES, BRIDGEPORT, CONN.

Mr. Merryman. I would like to begin by extending my thanks to you and the committee for the privilege of appearing here and presenting my thoughts on this most intricate and complicated problem.

Senator Potter. We are very pleased to have you here. We are anxious to have the best views of every person who can throw some light on this complicated subject.

Mr. Merryman. Thank you, Senator. I am not sure that my own are the best views. I assure you they represent my own best thinking.

Senator Potter. That is important.

Mr. Merryman. I would like to divert for just a second to apologize to the gentlemen at the press table. I came down here with the press statement. I had 25 copies of it and I had intended to testify from notes. I still do. But I decided to write a press statement; and after I got through with it I decided it was such a good, succinct statement of my position that I ought to put it in the committee's record. So it will be available to them. I will have additional copies made.

Senator Potter. That is the press statement?

Mr. Merryman. That is labeled press statement.

Senator Potter. Do you plan to read the statement?

Mr. Merryman. No. I am going to testify from notes.

Senator Potter. Well, without objection, your statement will be made a part of the record at this point.

(Press release statement of Philip Merryman is as follows:)

The present intolerable monopolistic conditions in the television broadcasting industry stem directly from the FCC's regulations and the rigid allocations system adopted by that body in 1952. This allocations system could be characterized as an engineer's dream which ignores the broad social and economic facts of our democracy. Had the two networks which monopolize national television broadcasting devised their own plan of allocating designed to consolidate and perpetuate their monopolies, they could not have conceived an allocations system better suited to their purposes.
I have frequently stated in public that television broadcasting has a greater
destiny and a greater obligation to the preservation of our democracy than does
a mere purveyor of goods and services. It has a social obligation that far out-
weighs its economic significance.

In the worldwide ideological struggle for men's minds, television broadcasting
could and should be the public communications medium most effective in uniting
our democracy against the aggressive attacks of the cynical prophets of commu-
nism. It also has an obligation to take the leadership in solving such national
social problems as juvenile delinquency.

This can best be done by insuring for each community throughout our land
the opportunity for its own television station or stations. These objectives of
our democracy can best be achieved at the local community level, and unless
something is done to remove the artificial restraints on local television broad-
casting now embodied in the regulations of the FCC they cannot be realized.

Looking toward the elimination of the present inequities and a long-term
solution to the general problem, I made these recommendations to this committee
last May 20:

The recommendations are divided into two categories; those looking toward
immediate relief for television broadcasters, and those looking toward a long-
term solution of the entire television industry's problem. The recommendations
made for immediate relief were as follows:

1. That the Commission rescind its rule against the use of directional antennas
   for allocation purposes in the VHF-TV frequencies. Should this rule be relaxed,
   WICC could operate on channel 6 and thus could provide an immediate tele-
   vision service to Fairfield County. I am sure that similar grants could be made
   in many other important cities in the United States. WICC-TV is preparing
to file with the FCC for channel 6.

2. Recommend to the Small Business Administration that they relax their rule
   against extending relief to companies engaged in public communications to the
   extent of taking first mortgages on buildings of UHF television stations when it
   can be shown that reasonable mortgages are not otherwise obtainable.

3. I recommended support of Senator Johnson's bill proposing to eliminate
   the 10 percent excise tax on all-channel television receivers. Thus, the retail
   price of VHF only and VHF-UHF television receivers could be equalized at
   the retail level.

4. I recommended support of the Commission's proposed rule to eliminate
   exclusive area affiliations between television stations and networks.

5. In view of the controversy over whether the 70 channels in the UHF tele-
   vision frequency spectrum could support a national competitive television broad-
   casting system, I recommended that the FCC present to the subcommittee when
   it reconvenes an allocation plan for television stations using only UHF fre-
   quencies.

Looking toward a long-term solution of the television station allocations prob-
lem, I recommended that:

1. That color television broadcasting be restricted to UHF stations only. The
   public at the present time has approximately $6 billion invested in VHF tele-
   vision receivers. It would obviously be impractical to discontinue VHF broad-
   casting on an immediate cutoff basis. However, to receive color television a
   completely new television set must be purchased. If color television broadcast-
   ing is authorized for UHF only, we will not at some future date find the public
   with $12 billion invested in a television broadcasting system which is insuffi-
   cient for our country's needs. In other words, let's prevent the situation which
   arose early in 1952 when the FCC found it could not institute a UHF only allo-
   cation because, at that time, the public had some $5 billion invested in VHF
   only television receivers.

2. In order to prevent undue economic injury to the existing VHF broadcasters,
   I suggest that they be authorized to operate a companion UHF television station
   and thus implement a gradual transition to UHF broadcasting only.

I would now like to make two further recommendations:

1. That a 3-year depreciation write-off for tax purposes of undepreciated in-
   vestment in VHF technical equipment be granted each VHF television station
   that elects to operate a companion UHF television broadcast station.

2. That the present mandatory separation for VHF television stations on adjacent
   channels be eliminated.

This plan is painless to the public and fair to existing VHF stations. It will
be adopted solve the present difficulties in television broadcasting as a public
service. Within 2 years, the present 10 percent conversion nationally could in
my opinion be increased to 50 percent, and within 3 years to 80 percent. Within 5 years, the transfer to UHF should be virtually complete.

Mr. Merryman. I do intend to refer back to a statement I filed on
my previous appearance of May 20, at which time I made these recom-
mandations which are essentially the same today except that I have
added two new ones which implement the previous position.

Now, I have been quite pleased at listening to the testimony here
today from my fellow broadcasters in UHF. I was particularly
pleased with Mr. Kohn's statement to the committee. It seemed to
me that it was a very statesmanlike presentation.

Senator Potter. He made an excellent presentation.

Mr. Merryman. And that he touched on many of the things I
wanted to talk about. He has already talked about them; so I will
just skip over them very briefly.

Now, Mr. Chairman, it seems to me that the basic trouble here is
that we have an allocation system which does not present to the broad-
casting equal opportunity. I feel that the basic solution to be found
is some way of equalizing those inequities.

I don't mean by that, as the previous witness heretofore stated, that
we and the other UHF broadcasters here are like the Communists; we
want everything equal and everything divided up between us with-
out the result of individual effort. I think that I am a promoter of the
philosophy of free, private enterprise. I believe in competition. I
don't believe in artificial supports or subsidies of any kind to affect
your competitive ability.

But I also don't believe that artificial restraints on competition
should be imposed so that those of us who are trying to serve the pub-
lic in the best way we know find ourselves against apparently insur-
mountable handicaps. It seems to me that the basic conflict here—the
basic reason for the conflict is a misconception of the philosophy on the
part of the Federal Communications Commission itself.

If you will examine Chairman Hyde's testimony, he told you that
priority No. 1 of the Commission in coming out with the allocations
of 1952 was to provide at least one television service to all parts of the
United States; and then he set up his priority No. 2 to provide—I
say he: I should say the Commission—to provide each community with
at least one television station.

I was pleased to hear Mr. Kohn say this morning that conclusions
should be on the allocation of the communities which are really the
basic safeguards of our nation; that they should not be based on the
needs of networks or the needs of the larger cities to the exclusion of
the smaller cities' rights to have this facility. And I submit at this
time, Mr. Chairman, that those priorities should have been reversed;
and had they been reversed, we would not be in as difficult a situation
as we are at the present time.

The very fact that priority No. 1 talks about service to all of the
people of the United States sets out the condition whereby you justify
the monopolistic coverage that was given to the VHF stations, and
that directly led to the monopolistic situation we have today. And
this present intolerable monopolistic condition in the television indus-
try stems directly from the ICC allocations system adopted by that
body in 1952.

Now, this allocation system, in my opinion, should be characterized
as an engineer's dream which generally ignores the broad social and
economic facts of our democracy. And I think that further, in my opinion, had the two networks which monopolize the national television broadcasting devised their own plan of allocating stations, designed to consolidate and perpetuate their monopolies, they could not have conceived an allocation system better suited to their purposes.

I have frequently stated in public that television broadcasting has a greater destiny and a greater obligation to the preservation of our democracy than does a mere purveyor of goods and services. It has a social obligation that far outweighs its economic significance.

In the worldwide ideological struggle for men's minds, television broadcasting should and could be the public communications medium most effective in uniting our democracy against the aggressive attacks of the cynical prophets of communism.

It also has an obligation to take the leadership in solving such national social problems as juvenile delinquency. This can best be done by insuring for each community throughout our land the opportunity for its own television station or stations.

These objectives of our democracy can best be achieved at the local community level, and unless something is done to remove the artificial restraints on local television broadcasting now embodied in the regulations of the FCC they cannot be realized.

Now, an allocation system is not solely an engineering problem. It is also a social and economic problem. And, moreover, it is about as complex a problem in distribution as one can find. But we find, with those complex problems before the Commission, the attempt to solve at the source all of the economic and social problems in the distribution of stations, that we have what must now be apparent to the members of this committee, a miserable failure.

We have an allocation system that sets up 7 stations in New York City, and none, for example—and I use my own city as an example—in the 36th largest market in the United States. We find that we have stations assigned to post offices.

And, all in all, Mr. Chairman, it is not a good economic solution, nor one which apparently will meet the social problems. And I think this is a problem that concerns not only the people in the UHF industry.

What is important to you and your committee is not the difficulties that we in Bridgeport have in competing in this television field, or the difficulties that Mr. Kohn will have in Allentown, or the difficulties Mr. Green has in Houston, or Mr. Chisman in Norfolk. What is important, it seems to me, is that we have here a system for the distribution of the public's property in spectrum space which is not equitable to all people of the United States; and we all should look together for a solution of that problem. And I think it is a problem for the VHF broadcasters also and the networks who are largely affiliated with the large VHF stations. I think it is a problem to them because competition is the essence of our economic system and our democracy: and without competition—which we certainly don't have under this system—if we continue the monopolistic conditions that exist at the present time, I think that both the networks and the larger stations must face the possibility that there will be Government regulation of their activities and possibly even regulation of the program presentations.
Now, in that connection, I would like to comment and to cite what happens when money becomes the all-powerful thing:

Last May 31, during the interim in this committee’s meetings, the President of the United States made an address of international significance at 9:30 in the evening. Now, certainly, I don’t need to recite here the great problems that are facing our administration, and our Republic, in the present situation in international affairs. I don’t need to recite the necessity for constantly impressing upon the minds of our people that these problems exist both internally and externally, and that they must be thinking about those problems and uniting to meet them.

Yet we find, at 9:30 on Monday night, May 31, when the President went before the television cameras to give the people of the United States his thoughts on the international and national problems at that time, we find that only channels 5 and 7 of the New York stations were carrying that program.

Channel 5 is the Dumont Television Network—key station in New York; and channel 7 is the key station of the ABC network.

Of the other 2 networks, NBC carried a recording of the program, a filmed recording of it, at 11:15 at night, and a large share of the population had gone to bed; and CBS carried the program at 11:30 at night.

Now, let’s take a look at what the programs were that were so important on these two monopolistic networks that could not carry the message of the President to States when he was trying to get a message across to our American people.

On CBS we find Red Buttons. And here is a description of the program contained in this program digest:

Red Buttons appears as a country bumpkin, raspberry buttons, in a half-hour musical comedy. The show has original music, as well as parodies on popular tunes.

That was what CBS thought was more important than the President of the United States.

Here is what NBC thought was more important:

“Once Upon a Time”—this is Montgomery Presents—

Once Upon a Time: A bridal couple stand in their receiving line. As the guests pass by the bride and groom look into the faces that recall the days of their courtship, and the people they might have married, if—

Now, obviously, if they continue that type of programming, it is not meeting their public service obligations and if they don’t meet the public service obligations then, of course, Federal regulation of some type will be required.

Senator Potter. The other two carried it live?

Mr. Merryman. The other two carried it live. As we did in our channel 43 in Bridgeport.

Now, Mr. Chairman, getting back to this allocation system, in 1945, at a time when there were only seven television stations in the United States operating, and they were all operating at terrific losses, I testified before the Federal Communications Commission. At that time people were saying—people in the industry—that it took a city of a basic population of 500,000 to support a television station.

I didn’t believe it; so I took the stand and—and I was then the director of facilities, development and research for the National Broadcasting Co.—I took the stand and testified that, in my opinion,
400 cities would have their own television stations within 10 years. And I said that television stations could be supported in towns having populations as little as 25,000.

This is a pamphlet entitled "Television Dollars and Sense."

Senator Potter. Would you like to have it made a part of the record?

Mr. MERRIAM. I would.

Senator Potter. It is made a part of the record at this point.

(The pamphlet "Television Dollars and Sense" is as follows:)

TELEVISION DOLLARS AND SENSE

By Philip Merryman, Director, Facilities Developments and Research, National Broadcasting Co.

Reprinted: Radio Age, July 1945

At the beginning, I want to make it clear that I have no "prevision" on television. I have looked at the facts—learned by experience while developing sound broadcasting—and I have examined most of the evidence available, good and bad, concerning the problems we expect to meet in television. From these explorations I have drawn the conclusions that follow.

It is not my purpose to argue with anyone regarding the technical standards for television. That is a mental blind alley that yields little comfort to the careless thinker. For instance, I prefer to let the public decide whether six megacycle black-and-white television is satisfactory. Mr. and Mrs. Public will make the ultimate decision anyway. The pent-up demand for postwar television is apparently so great that it will reach floodtide as soon as new sets appear on the market. If we are to deprive the public of these sets we need very convincing reasons. King Canute could not stop the tide. It is just as foolish to believe that television can be withheld from an eager public.

One fact is certain—a television picture cannot be evaluated in the same terms as an oil painting. Television pictures were not intended to grace the walls of world's art galleries. They were created for the specific job of bringing into homes the public meeting places, the living, vital, instantaneous reproductions of the pictures and sounds associated with interesting human or natural events wherever they may occur. Any attempt to evaluate television picture on any other basis leads to fundamental errors of interpretation.

Flawless image is objective

Of course, the television industry will not be content until it achieves a picture as flawless as nature itself but this ultimate goal cannot be reached through laboratory research alone. Like the automobile its final perfection will be attained only after millions of people have contributed to its improvement. The names of the engineers who have devoted major efforts to the development of television can be counted by hundreds—perhaps by thousands—but the names of the program, advertising and businessmen who have devoted creative thought to the development of a television service can be counted on the fingers of two hands. Television's real progress as a public service will begin when thousands of such men think constructively on television's problems.

Yet all the constructive thinking in the world will not carry television forward unless labor offers a full measure of cooperation. This failure to evaluate the future possibilities of television in terms of its present status is particularly evident among organizations that have the greatest stake in the ultimate place of video art in the entertainment field.

Orderly progress in television is dependent on far more than the initiative of broadcasters. They cannot do the job alone. They must have the sympathetic support of all factions concerned. With little financial return from their pioneering activities at this time, any additional burdens the television companies are forced to bear because of the extreme demands of labor groups might easily retard the extension of the service to the public.

A little commonsense will show that it is not a "something for nothing" attitude on the part of broadcasters. Television is willing to pay a fair price for contributed services during the present developing stage but if supporting costs are lifted
so high that resources are threatened, the industry will face a critical situation that could easily be its Waterloo.

Television producing companies take the stand that labor should be content to grow with the industry in the same way that broadcasters expect to develop it and the advertisers to use it. There must be fair play and generous treatment by all concerned if television is to become a national medium of entertainment with consequent opportunities for mass employment.

400 cities with television

Last October in testimony before the Federal Communications Commission I stated that I believed television stations could be supported in towns having populations as low as 25,000. I submitted cost and operations statements to support my contention. I can now expand that statement to say that it is my belief that within 10 years more than 400 cities in the United States will have television stations, all operating at a profit.

Unfortunately, sound broadcasters have been led to believe that the installation and operation of television facilities entail a very considerable outlay from the start. This is not so. Television programing can be started in a small way and expanded as receiving sets and commercial sponsors increase. How this can be done is suggested in the illustration on page 5. The objects shown in heavy outline are those that would form the nucleus of a studio. The lighter figures are those that would be added as the scope of the station's programs is extended. It will be seen that one operator, handling cameras and lights by remote control, would be sufficient for simple productions. By restricting their movements to the areas outlined, the actors would always be within the focus of the camera. The latter, once adjusted, would then operate unattended throughout the performance, eliminating need for an operator at each camera.

A studio arrangement such as the one shown here, supplemented by one or two 16-millimeter motion picture projectors, would comprise all essential equipment for a start. As program time is increased and additional studio space secured, the transition from these limited facilities to those that will be required eventually could be carried out in gradual and logical steps.

Now what about the other advertising media—newspapers, magazines, earcards, billboards, direct mail and so on? I predict that all of these media, including sound broadcasting, will be more prosperous than ever, even after television becomes commonplace. It has been the history of advertising that no new form ever completely displaces the older ones. On the contrary, history reveals that the resulting increased volume of advertising increases the distribution of goods and services so that the overall national wealth is increased.

Between 1927 and 1943, for example, newspaper circulation increased from 63 million to 82 million and magazine circulation mounted from 36 million to 63 million. This was the period during which broadcasting was growing most rapidly. There is no fundamental reason why this experience should not be repeated with television even though television should prove to be the most powerful advertising medium devised by man.

I believe that there must be a new program format developed for television just as sound broadcasting had to devise its own program technique. This is not intended to imply that audiences around New York do not like the programs they see now. They do, most emphatically, but we can and will improve the service.

Cannot copy older mediums

Television programs cannot simply ape the older forms of entertainment if they are to fulfill their promise. Although the scope of program material available to television broadcasters will be fully as great as that now available to sound broadcasters, the technique of presentation must be different since the television broadcaster will be presenting pictures themselves—not just sounds which create mental pictures. The technique of the stage will not be suitable since television will use the world for its stage and the usual fifty-by-a-hundred-foot space behind the footlights will be only a small fraction of its area of activities. Nor can it be the technique of the movies, because television will broadcast events as they happen. Furthermore there can be no takes and retakes which, after the final cutting, may lie in cans for months before they are released. No, television's technique must be different from any entertainment technique yet developed and the genius who perfects it is probably still unaware of the part he is to play in its development.

Recently, the British Broadcasting Corp. announced that its postwar television service expansion plans are based on the use of its 405-line standards.
This decision did not exclude the possibility of rapid development of a higher definition television system. It simply recognized that if the British public is to have immediate postwar television service it would have to start with six-megacycle black and white pictures. That should be the program in the United States. No one questions that television techniques will improve as time goes on, but that improvement will be made for 6-megacycle television as well as for 18- and 20-megacycle television. We don't know how long it will take to develop 20-megacycle television. We do know that we can plan postwar television on the six-megacycle basis and every rule of common sense tells us that we should go ahead on that basis.

In 1927, when broadcasters went to the White House to broadcast a speech by the then President Calvin Coolidge, a truck was needed to transport the equipment. Today one man with one suitcase can carry the necessary equipment for a Presidential address into the Presidential Mansion. In 1927, we had cumbersome, unattractive and expensive radio receiver sets. In 1941, we could purchase better sets for $19.95. With all the ingenuity, originality, and progressive thinking the collective brains of the broadcasting industry can bring to bear on television's problems as soon as television becomes an established service, it is inevitable that we shall see progress just as rapid and as revolutionary as we have witnessed in sound broadcasting.

Television seems destined to bring regularly to all America the best in American culture. Later we may exchange programs with the rest of the world. The social and economic effects of thus broadcasting information and entertainment will be considerable. Socially, because television will enlarge mental horizons of people in all walks of life; economically, because it will increase the demand for goods and services so that national employment will be enlarged and national income increased. I look forward eagerly to the rapid release of materials to the communications industry so that we can get on with the job.

Mr. MERRYMAN. However, I did not visualize at that time in 1948, there would be a freeze on the development of the television industry which would last for 4 years; and I never visualized that after a 4-year freeze, while we were studying the problems of providing a competitive national television system, that we would come out of that with a more monopolistic system than that which we went into the freeze.

Senator PORTER. Could you visualize the coverage of one station when you prepared this?

Mr. MERRYMAN. I was thinking in those days, as we all were, in the 25-mile maximum coverage area for a television station.

Now, it seems to me that some of the thinking that has gone into our allocation system is based on a misconception of costs of installation and operating a television station. I said in 1945 that I thought television stations could be supported in cities of 25,000 population, and I still do. That is, provided there is set up a fair opportunity for stations in such cities to compete. Without it, of course, it will not be possible.

It seems to me, also, that in this allocation system there has been a little too much preoccupation with the welfare of the networks. In the history of sound production, networks were extremely important in the early part of the broadcasting history. It was almost impossible for a sound broadcasting station to exist without network relations. That is not true today.

And, in fact, independent stations not affiliated with networks today usually have larger audiences than the network stations themselves.

In television today, it is important for stations to have network service. We have network service on our own stations. The programs of the American Broadcasting Co. and an occasional program from Du Mont. Without such programs we would not be able to exist.

We have been refused program service by both NBC and CBS.
But this preoccupation with the ability of the networks to set up their system seems to be a matter of secondary importance to that of seeing that each community throughout our land has its own television service. When we built our television station in Bridgeport, we knew we’d have competition from 7 stations in New York, and 1 in New Haven. But we felt, and still feel, that our community is entitled to own its own television service. We established that station 15 months ago. We are still operating it; and we expect to continue operating it no matter how much money we use because we are going to give our city a television program service.

We are suffering losses. We are down now where we have two employees on our television payroll. And we are paying the out-of-pocket expenses of the television station from the profits of the radio station, which, incidentally, is having far more competition than does the television station. That is, insofar as the programs coming in from the outside is concerned. That is not what we are afraid of. We will compete with any of their services insofar as furnishing the programs for our community is concerned. What we are concerned with is that our sound station is available to 100 percent of the cities in the area, with television service available to 10 percent; and the situation is not improving too rapidly.

Now, politics has been mentioned here. I would like to touch on it briefly. The area I have talked about in the State of Connecticut happens to be a congressional district. There is no way that the candidates of that congressional city can communicate by television with their fellow Americans.

One of the gentlemen who preceded me mentioned that CBS had increased the rate to $6,000 in New York. CBS has increased it to $6,200—that is, for the class AA time. Obviously, no candidate for public office can afford to pay for the service in order to reach Fairfield County, which this station is serving. They can’t reach them from the VHF stations in New Haven because all the antennas are turned around and pointed to the seven stations in New York, and they don’t look at the New Haven stations.

That is $6,200 an hour charged by the New York station. If we had sold just 3 one-half hour programs a month at those rates, that would support the operation of our television station in Bridgeport; and 36 half-hour programs sold per year at that rate, would support our operation for another year. And from IDS and the 20-second spots, we could make a very handsome profit, probably more than we will ever make on the station in Bridgeport.

But the big thing is that UHF appears to carry a stigma in the public mind. There is the necessity for them to buy a converter; in many other cases, a large percentage of the cases, there is necessity for putting up an antenna on the outside. So it is something different. It is UHF instead of VHF; and it must be a little bit inferior to VHF; so the public finds it hard to believe that we are going to give them a better program service than the alien services arising from the outside of our community.

And then there is a continued effort on the VHF station operators to employ superior VHF stations, and that news gets around all over the area, and tends to substantiate this inherent belief on the part of the public that there is something inferior about UHF.
We have presented a program service in Bridgeport. We don't take a back seat to anyone as to the type of service we have rendered during the 1953-54 season—the educational year. We presented over this station five separate college courses for credit in cooperation with an independent university in Bridgeport called the University of Bridgeport. Two of these programs dealt with English literature; one of them with economics; one with music appreciation; and one with sociology.

Now, we were giving the public educational television, and we were giving it to them at no cost, because the private university has no subsidy of any kind, and neither does our television station. We have exhausted the approach to local programs in our efforts to arouse the public need for these services that we are trying to give them. And we always run up against this factor of the cost of getting our channel 43 over the existing receivers.

Now, we should not have to be in that situation, because Fairfield County, as I said, is the 36th in population. It is the 37th most populous area in the United States. It is the 37th in number of families. It is the second in per capita income and family income in the United States. And we rate 28th in retail sales in the United States.

This market was originally assigned channel No. 1 under the allocations prior to 1947. Then when channel 1 was deleted and turned over to the mobile service, it was taken away from Bridgeport, and no VHF was reassigned. So if we were going to serve our area with the television service, we had no choice but to operate a UHF station. And we have been doing that for a 15 months' period.

There is another commercial UHF assigned to the Bridgeport area. There was a CP granted to it; but the owners, after watching our experience, let the CP lapse, and that channel is now unassigned.

Now, there has been a great deal said here about the effect of this competition; and I would like to pinpoint it just a little bit. In a statement I left with your committee on the 20th of May, I included, as appendix F, a letter from J. von Volkenburg, then president of CBS television.

Now, Bridgeport is located 50 airline miles from New York City. And we had an order for the Jack Carson show in May or June of 1953, after we went on the air, before this unfavorable climate toward the economic accidents of UHF had been set up—we had an order for that program. And it was filed in the Chicago office of CBS, and transmitted to the authorities. The sponsor of the program that was advertising the program wanted our channel 43 in Bridgeport. CBS refused to take it because they said we had no network affiliation with them. I have, of course, tried to get an affiliation, quite unsuccessfully.

So, I wrote a letter to Frank Stanton, who is the president of the CBS station—not just the television network—and he had Mr. J. von Volkenburg reply. I would like to draw your attention to Item No. 3 of his letter, in which he says:

Field Strength Measurements indicate that WCBS-TV delivers a median field of approximately 60 db u. (1 MV/M.) in Bridgeport. We believe this is an adequate signal.

Now, this is one of the most populated industrial cities, 50 miles from New York City. Chairman Hyde stated that in his presentation that the reason for the increase in the power and the antenna height of this station was to insure better coverage of these areas.
Yet, here we are in Bridgeport, where sets are backed up against factories in some places, and we are getting a grade A signal from this station in New York 50 miles away.

Now, you notice, Mr. von Volkenburg uses engineering terms, with which he is not familiar. So this represents the opinion of CBS engineering department.

And then in Item No. 4, Mr. von Volkenburg says:

Supporting the adequacy of the WCBS-TV signal in your area, the Nielsen Coverage Service shows WCBS-TV with an evening circulation of 95 percent of the television homes in Fairfield County. In fact, it shows that 82 percent of these homes watch WCBS-TV on 6 or 7 nights a week.

Now, you have heard the testimony here previously of Mr. Kohn that 40 miles as being the edge of the A area. That is not the edge area designed to support areas which have large segments of industry, such as we have in Bridgeport. That is the area which controls largely suburban or rural types of residence.

They have another designation for covering the industrial sections of the city, which they call the employment contour, which is considerably closer to the station than is the limit of the A area. And here we are 50 miles from New York. I think that will give you a pretty good picture of what the coverage of these stations is.

Now, in that connection, I would like to submit another exhibit here. I will give it to you in just a minute.

I did not pick this station because it happened to be WSAZ-TV in Huntington, W. Va. I picked it because it is illustrative of a problem that exists here that has been talked about at some length today. But I would like you to look at it and I would like to put it in the record. Senator Potter. Without objection, it will be a part of the official files of the committee.

Mr. Merryman. Now, if you will read the caption at the top above the map, you will see that it is labeled:

“Three Prime Trading Areas in WSAZ-TV’s Big Coverage Core.”

And then when you read underneath, it says:

While WSAZ-TV’s 100,000 watts on channel 3 actually covers 5 States and 14 counties, the heart-shaped area circumscribed in the map below represents the station’s primary coverage. Within this primary area are 3 flourishing urban trading areas totaling over 700,000 people. In approximate population, these 3 areas break down this way: The Huntington-Tri-State area 275,000; Charleston-Great Kanawha area, 335,000, and the Portsmouth area, 120,000. Also within the primary but not spotlighted on the map is another important trading center—Parkersburg—which WSAZ-TV offers in this relation as merely one of its bonuses in audience coverage.

Now, I have not measured out the mileage on that map; but certainly they claim that they cover three important trading areas; and they give another one away free.

I believe, in the previous session of your committee, there was a UHF station over here from Parkersburg, which was trying to tell you the problems it had there; and of course, with this station which carries the programs of all four networks, the gentleman from Parkersburg had quite a time convincing the National Advisory Committee.

Now, the Portsmouth area at the present time supports two radio stations. It is assigned one UHF station on channel 30. That UHF is going to have little chance of success. I don’t believe anybody has applied for it.
And in Charleston, which is the largest city among those mentioned, there are five radio stations. That city has assigned 1 VHF and 1 UHF; and 1 UHF, educational, station.

From the network coverage they are getting from Huntington, they will be in a lot of trouble. I don’t know whether they have applied to appear here. But it is one thought that is apparent, as an observation.

Now, I thought it was quite significant that in the first session of your committee, the appearances here were largely on behalf of UHF stations. I did not think there was much interest or concern with this problem; and, certainly, when the association meeting for which you adjourned the hearing convened, in Chicago, it was demonstrated there was no great concern with the people controlling the industry; because they didn’t have one single subject of UHF on the Chicago meeting.

They did not discuss it in their open meeting, nor in their engineering meeting, which was a subsidiary part of it.

There were something like 25 technical papers presented. There was not one presented dealing with the problems of UHF television broadcasting. But there were 13 papers dealing with the subject of color television.

I’d like to put that in the record. It is entitled: “Technical Paper Summaries.”

Senator Potter. It is now made a part of the official files of the committee.

Mr. Merryman. I think that a lot of your appearances that will follow after I get through, will be from the VHF stations; and they seem to be of the opinion that we in the UHF are particularly attacking them.

As I tried to say before, it is not a matter of attacking anybody, trying to take something away from someone. What we are talking about here and attacking here is a national problem with social and economic significance to the future of our country.

Now, Sponsor magazine secured from the pioneer TV stations information regarding their activities and their history, and they published it all in short form, which you have before you. And I would like to submit that for the record. I think it might be useful to the committee in studying the presentation of these VHF broadcasters.

Senator Potter. Without objection, it will be made a part of the official files of the committee.

Mr. Merryman. I think one pertinent thing to call your attention to is that Mr. von Volkenburg, I think, called attention to the manner in which VHF operators delayed going into the business. It was obvious that those 60 that went in in 1949 and 1950 and 1951 were waiting to see how the competitive situation shaped up before they put their money on the line.

So these averages here, I don’t think reflect the true situation. But there is an item in the summary which says that when they started out the starting time of the hourly rate was $250; and in 1952 it was $728; and in 1954 it was $920. This is a very good history of the television industry which comes from Sponsor magazine.

Senator Potter. This will be made a part of the official files of the committee.
Mr. Merryman. There is one more aspect of this situation I would like to touch on; and then I'd like to get on to a brief discussion of the recommendations.

It appears there is developing now a situation which we had not visualized, where the monopolistic situation existing in the television broadcasting industry is beginning to have its effect on the AM broadcasting industry. I have my statement—the original statement, showing the efforts that we have made to get national business; and the frustration we have had. That letter was not written for the purpose of introducing into the testimony. It was a part of the regular business, and I presented it because it was informative.

I have some additional letters I'd like to put in.

This one is dated May 24, addressed to our sales manager, subject: Cashmere Bouquet (Colgate-Palmolive-Peet).

Dear Manning: Subject account used spot radio during 1953, however, all spot radio was canceled at the end of last year and money which would normally have gone into spot radio for the year of 1954 was allocated to the network TV show the Big Payoff. The additional cost of adding stations to the Big Payoff network was the reason why spot radio was canceled. Unfortunately, they do not contemplate going back into spot radio in the near future.

On May 25, subject: Veto (Colgate-Palmolive-Peet):

Dear Manning: Effective January 1 all Veto spot radio was canceled in order to help pay for the Mr. and Mrs. North network radio program and the Strike It Rich daytime TV network program.

Aside from Halo which you are currently carrying there is practically no Colgate business on the loose from the national spot standpoint. Their expanded TV network coverage has required all the money they can get to pay for the additional facilities and unfortunately spot radio has taken a beating. I certainly do not agree with this philosophy but with their recent cost of TV they had to steal the money from somewhere. Kindest regards.

This one is May 25: Subject: BAB-O.

Dear Manning: Early last year BAB-O used radio.

Dancer, Fitzgerald Sample took the account from Benton & Bowles March 1 of 1953 and they let in many cases existing radio schedules run to conclusion. After these radio schedules expired any further activity in the broadcast field was confined to TV. The account is very shortly going off the air and they do not plan to do anything during the summer months either on TV or on radio. Their plans however do call for the reinstatement of TV only beginning about September 1 or mid-September. In short; all future money will be confined to TV instead of radio.

This one is dated May 25. Subject: Lipton Ice Tea.

Dear Manning: Lipton Ice Tea will use nothing but TV for the eastern area this coming campaign. They are buying TV spots on WNH-C-TV in New Haven plus 2 or 3 stations in New York City including the CBS and NBC stations. The only markets where radio will be used this year will be in non-TV markets.

Now, there is an indication of the trend of the radio stations taking their money out of radio and putting it into this monopolistic television setup. So that it appears that we may well have the radio-broadcasting industry from the national standpoint threatened by the continued existence of this monopoly, as well as the UHF stations.

Now, when I appeared before the committee on last May 20, I made a series of recommendations. I divided these recommendations into two categories: Those looking toward immediate relief for television broadcasters, and those looking toward a long-term solution of the entire television industry's problem.
The recommendations made for immediate relief were as follows:

1. That the Commission rescind its rule against the use of directional antennas for allocation purposes in the VHF-TV frequencies. Should this rule be relaxed, WICC would operate on channel 6 and thus could provide an immediate television service to Fairfield County.

I am sure that similar grants could be made in many other important cities in the United States. WICC-TV is preparing to file with the FCC for channel 6.

2. Recommend to the Small Business Administration that they relax their rule against extending relief to companies engaged in public communications to the extent of taking first mortgages on buildings of UHF television stations when it can be shown that reasonable mortgages are not otherwise obtainable.

And there are some exhibits in the back of my testimony.

Senator Potter. That is part of the record.

Mr. MERRYMAN. My third recommendation was the support of Senator Johnson's bill proposing to eliminate the 10 percent excise tax on all-channel television receivers. Thus, the retail price of VHF-only and VHF-UHF television receivers could be equalized at the retail level.

No. 4. I recommended support of the Commission's proposed rule to eliminate exclusive area affiliations between television stations and networks.

No. 5. In view of the controversy over whether the 70 channels in the UHF television frequency spectrum could support a national competitive television broadcasting system, I recommended that the FCC present to the subcommittee when it reconvenes, an allocation plan for television stations using only UHF frequencies.

I would like to add a sixth short-term recommendation, and that is that the present mileage of adjacent channels be eliminated. I think the testimony from the receiver manufacturers show that that mileage separation on adjacent channels is not necessary.

Senator Potter. What do you mean by that?

Mr. MERRYMAN. I mean you cannot only operate on channel 4 and channel 2 on New York; but you can put No. 3 in some other city, like Bridgeport, where it was needed more.

Senator Potter. Without any interference?

Mr. MERRYMAN. Without any interference to the existing receivers.

Looking toward a long-term solution of the television station allocation problems, I recommended that:

1. That color television broadcasting be restricted to UHF stations only.

The public at the present time has approximately $6 million invested in VHF television receivers. It would obviously be impractical to discontinue VHF broadcasting on an immediate cutoff basis. However, to receive color television a completely new television set must be purchased. If color television broadcasting is authorized for UHF only, we will not at some future date find the public with $12 million invested in a television broadcasting system which is insufficient for our country's needs. In other words, let's prevent the situation which arose early in 1952 when the FCC found it could not institute a UHF-only allocation because, at that time, the public had some $3 million invested in VHF only television receivers.
2. In order to present undue economic injury to the existing VHF broadcasters, I suggested that they be authorized to operate a companion UHF television station and thus implement a gradual transition to UHF broadcasting only.

I would like to make one more long-range recommendation, and that is that a three year depreciation writeoff for tax purposes of undepreciated investment in VHF technical equipment be granted each VHF television station that elects to operate a companion UHF television broadcast station.

Now, this plan—and I have used my best judgment in preparing it—it seems to me is painless to the public and it is fair to the existing VHF stations. It will, if adopted, solve the present difficulties in television broadcasting as a public service. And I predict that within 2 years the present 10 percent conversion nationally could, in my opinion, be increased to 50 percent and within 3 years to 80 percent. Within 5 years the transfer to UHF should be virtually complete.

Now, that may sound like an optimistic prediction; but the collateral benefits of coming out with this type of a program for the development of the television industry in the United States would extend not only to color television receivers that the public will have to be buying for either UHF or VHF, but it would extend also to the existing receivers the public has.

UHF would take on a new stature, a new dignity, a new feeling on the part of the public of substantiality. Someone said previously the manufacturers would intensify their research or problems of UHF equipment. So, in a short time, without having to impose governmental regulation on the programs we would find these problems melting away by setting up a really competitive free enterprise system in television broadcasting.

Senator Potter. I wish to thank you for your statement, Mr. Merryman.

We had planned on hearing Mr. Brown as the next witness. Is Mr. Brown here?

I understand that you prefer to testify tomorrow?

Mr. Gordon Brown. That will be much preferable. I will need information that I don’t have now.

Senator Potter. That will be fine.

We will adjourn until tomorrow at 9:30 a.m.

(Whereupon, at 5:10 p.m., the hearing was recessed to 9:30 a.m., Wednesday, June 16, 1954.)
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

WEDNESDAY, JUNE 16, 1954

UNITED STATES SENATE,
SUBCOMMITTEE NO. 2 ON COMMUNICATIONS OF THE COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D. C.

The subcommittee met at 9:42 a.m., pursuant to call, in room G-16 of the Capitol, Senator Charles E. Potter, chairman of the subcommittee, presiding.

Present: Senators Bricker (chairman), Potter, Schoeppel, Bow-ring, and Hunt.

Also present: Bertram O. Wissman, chief clerk; and Nick Zapple, counsel for the subcommittee.

Senator Potter. The subcommittee will come to order.

Before we hear from any witnesses, I have several communications which I would like to make a part of the record at this point.

(The communications referred to are as follows:)

JUNE 10, 1954.

Senator CHARLES POTTER,
Senate Office Building, Washington 25, D. C.

MY DEAR SENATOR: I note with considerable interest, the proposal to shift all television to the UHF channels over a period of years which was made at the hearings of your committee recently. I understand that the committee asked if this were feasible, in view of the fact the total number of channels would be reduced to 70.

If you delve into the record of the 1949 hearings, you will find that former FCC Chairman Coy and I proposed such a shift at that time—I might add, in order to avoid the present TV mess, which was clearly foreseeable.

The pressure for "color TV now" by a majority of the Commission plus the pressure from the big producers of TV receivers who wanted to exploit every market as rapidly as possible, quickly squelched this proposal.

For your further information, I developed an allocation plan, using UHF channels exclusively, which is part of the FCC record. I think you will find that this plan will provide more than adequate coverage on an all-UHF basis.

While such a shift will cause great pain in the circle of the entrenched network operators, it will resolve the difficulties mentioned by Dr. DuMont in providing for four network programs. Further, it will reduce the cost of television receivers to all consumers because production can be concentrated on UHF receivers only.

It will further reduce receiver and antenna installation costs in areas where mixed VHF-UHF reception is now necessary. These costs exceed $50 per receiver. It amounts to nothing more than an unwarranted tax on millions of people, a fact I pointed out in 1949.

While the subject of color television has as yet received little attention in the present hearing, I would like to suggest that if such a change is made it would be possible to change the UHF standards by increasing the width of the channels opening the door to the use of the low-cost CBS color system.

Prior to the adoption of the present standards, I opposed the adoption of this system, again on the ground of cost to the consumer. Several so-called backward
countries have provided for wider TV channels in order to permit the use of simpler, cheaper color receivers.

Because of the arbitrary decision by the FCC to use the same narrow 6-megacycle channel on both VHF and UHF, all opportunity to use anything but a complex color system was eliminated. Every color TV receiver-owner will be forced to pay for this complexity unless this situation is also changed.

I feel I am now in a position to tell both the FCC and the big television receiver producers, "I told you so," with respect to a mixed VHF-UHF system. I derive no pleasure from this. I have found no reason to change my views with respect to color television. While the House committee under Representative Wolverine was pushing for the adoption of the NTSC color standards, I wrote to him that this was a system "for the classes not the masses."

If a drastic change is to be made, the whole subject should be reexamined completely and carefully, including the use of a broader channel width, plus an appropriate set of standards which will permit the production of simpler, cheaper color television receivers.

Let me assure you that the technical means to do this are available to the industry. What is needed is the courage to accomplish it on the part of the FCC and the Congress.

Very truly yours,

COMMUNICATION MEASUREMENTS LABORATORY, INC.
DANA A. GRIFFIN, President.

JUNE 2, 1954.

Senator GUY GILLETTE,
Senate Office Building:

As a UHF operator strongly urge you to take a personal interest in hearing before Senate committee headed by Senator Potter. Relief needed. Tax on UHF sets should be lifted. That would help. Pressure should be exerted on networks to take on more UHF stations. FCC should require stations having more than 1 network to drop all but 1 of networks where it appears that other stations are in area having no network connections.

ED BREEN,
KOTC, Fort Dodge, Iowa.

JUNE 12, 1954.

Hon. CHARLES E. POTTER,
United States Senate, Washington, D.C.

Dear Sir: Somewhat of a furor has been created by the UHF television operators who have been presenting their problems to the Potter Subcommittee of the Senate Interstate and Foreign Commerce Committee.

They have their problems, but in considering them we must not lose sight of the fact that these UHF stations generally were intended to provide local or limited coverage. It is not yet generally accepted that they, even with the high power it is hoped they ultimately can attain, can provide the broader coverage which VHF stations now can give.

There is another side to this power question. This phase has been overlooked altogether in the subcommittee hearings, and yet it directly affects millions of people in zone 1. It can mean innumerably better service to millions of people and has the potential of literally saving billions (correct) of dollars for outside antennas and other installations in rural districts and areas of high noise level.

WBEN has a definite interest in this because of the peculiar freeze in which it found itself after the big TV freeze was lifted in 1952. But pretty nearly everyone interested in TV in zone 1 has a stake in a proper solution of this problem which will eliminate the power restrictions affecting more than 60 million people living in zone 1.

Respectfully yours,

A. H. KIRCHHOFER, Vice President.
RESTRICTED TELEVISION SERVICE IN ZONE 1 AND WHAT IT MEANS TO VIEWERS IN DOLLARS AND PICTURE QUALITY

The FCC has made notable progress in granting VHF and UHF construction permits and licenses. This is an effective step in the public interest. It is promoting a nationwide, competitive television system.

The Congress should not allow the problems of the UHF operators, whose field was conceived to be local, to override the broader service possibilities of VHF, particularly to people in remote and rural areas. No amount of UHF stations, especially with the economic problems the limited number in existence already are facing, in the foreseeable future can give the public this broader service VHF now can provide.

To complete the service possibilities VHF stations can and should give for the benefit of the public, the arbitrary and unrealistic power limits imposed upon stations with tall towers in zone 1 should be removed. These limits adversely affect millions of people in an area in which roughly 40 percent of the national population. The condition is most pronounced within the limits of the grade B contours and fringe areas.

WBEN of Buffalo has filed an application for amendment of the power limitations in all of zone 1. (Petitions of WBEN, Inc., for amendment of section 3.914 (B) of the rules and regulations.) This has been pending since August 24, 1953. We understand that its engineering conclusions generally are concurred in by the FCC staff and the Bureau of Standards, both of which have studied the proposals.

The studies supplied to the Commission in connection with this application show that for all VHF assignments in zone 1 the potential service area would be increased one-third without proportionate interference to other stations if the arbitrary height limitation which applies only in zone 1 were removed.

Full power is permitted in all other sections of the country where tower heights up to 2,000 feet are permitted.

Expressed in terms that apply to the viewer, this means that a vast area and millions of people could receive improved television service if this arbitrary restriction upon television power in the most populous portion of the country were removed.

With full power not only is the service area of the VHF station increased, but more importantly the picture quality provided throughout the entire service area is improved. In many localities this improvement would permit the viewing public to avoid the cost of installing outdoor antennas. The resulting saving throughout a large portion of zone 1 easily could amount to some billions (correct) of dollars. These are not theories; they are engineering facts.

Millions of radio listeners do not have consistent or diversified grade A radio service at night time; this is particularly true at present. Signal strength in TV is vastly more important than in radio. Hence, any restriction upon TV signal strength in populous areas with a high noise level or in remote rural areas will condemn the public in those areas to inferior TV service when the opportunity exists to improve it—often at less cost to the viewer.

To reduce the power of TV stations is like cutting the power of a regional radio station from 5,000 watts to bring it down to the output of a purely local station with 250 watts. Neither procedure makes sense from a public-interest standpoint.

The hue and cry about UHF problems, which are no less real than the problems of many more radio stations as a result of television competition, must not be allowed to obscure the fact that the FCC has within its hands the power to bring better television service to large areas throughout zone 1 which now suffer degraded television service. The benefits removal of the power restrictions could bring to people living in New York City, for example, without harming UHF operation or cochannel stations, are almost incalculable.

To deny this service is a grave responsibility, because it is not public service within the broad meaning of the Communications Act. This aims to improve service to the public—not to restrict it.

A. H. Kirchhoffer,
Vice President, WBEN, Inc.

1950 total population: 64,871,150
Or roughly 43 percent of 1950 total United States population, 150,697,361.

1 Estimates cover portion of State included in zone 1.

Senator Potter. We have several witnesses today, the first of whom is Congressman John Moss from the great State of California.

I assume, Congressman, you would like to make your statement first so that you can get back to your other duties.

We are happy to have you over on this side, and I wish to say that I served over on the House side for several years and I never realized how well they functioned over there until I came over here.

STATEMENT OF HON. JOHN E. MOSS, JR., A REPRESENTATIVE IN CONGRESS FROM THE THIRD DISTRICT OF THE STATE OF CALIFORNIA

Mr. Moss. Of course, Senator, it is a pleasure to be here before your committee.

I will make no comment on the functioning of the two Houses.

I have a statement which I have prepared for the committee and I will try to be brief and summarize some important points.

Senator Potter. Go right ahead.

Mr. Moss. I represent 1 of the 2 largest areas in the United States not presently served by adequate TV facilities, a total broadcast area of about 750,000 population. The city of Sacramento, the population center of that area, has one station operating a UHF station, and the rest of the service is provided from San Francisco VHF stations.

During the past 4 or 5 years there has been approximately 53 percent of the families in the immediate Sacramento area, not in the total broadcast area but in the immediate Sacramento area, buy their television sets in anticipation of improved telecasting for that section of the country. These people have had to make rather substantial investments.

I was one of the early pioneers in the area in buying a television set for my own home. Not only did I have to buy the set, but I in-
vested about the same amount of money in a 50-foot antenna and a booster and other equipment in order to bring in very weak signals.

Before the original freeze on telecasting or on the licensing of stations, applications had been filed with the Commission for the two VHF channels which were allocated to that area. There are 4 applicants competing for those 2 channels. At the present time the preliminary findings have been filed with the Commission by the examiner allocating those two channels.

The area has invested at least $35 million in receiving sets. About 87,000 of those sets have been converted to UHF. It means that the majority of the sets in the area are still dependent upon San Francisco for stations. Those having converted are denied any great variety of programs, and this limits drastically the use of television as an advertising medium.

If there is any delay in the orderly processing of the applications and the granting of the licenses for the additional 2 channels, that is going to hold off the market an estimated $30 million additional purchases of sets, because the most conservative estimates I could find have indicated within a year after putting those 2 VHF channels on the air, approximately $30 million worth of sets could be sold in that area, and undoubtedly would be sold.

Senator Potter. Do I understand you do have a UHF station in Sacramento?

Mr. Moss. One UHF station. That has been on the air for about 9 months.

Senator Potter. Does that station have network affiliation?

Mr. Moss. That station, I believe, is securing programs from all of the networks at the present time. I don't think it is a basic affiliate of any of the networks.

Now, the interest in the licensing of these stations is not only one that touches upon the viewer, but the four applicants for those stations have invested approximately $400,000, or an average of about a hundred thousand dollars each, in the processing of their applications.

If there is a delay brought about because of some freeze while some policies might be determined by the Commission, undoubtedly those men would again have to go back over the groundwork they have already laid and their investment would be increased substantially.

They have also has to pledge definite capitalization for the stations if the permits are granted. That amounts to about $2 1/2 million of capital that is definitely tied up, irrevocably committed to the construction and operation of the stations, if the licenses are granted, and delay there would be very costly and very burdensome.

When the two channels are finally granted, the successful applicants will have to immediately invest about $1,250,000 in the construction of the necessary minimum facilities to get on the air and start telecasting.

But of the utmost concern, I think, is the fact that in this large area of the Nation, where you have a rich market for all of the services and the equipment that goes along with the establishment of television stations, the people are or would be denied a choice of programs. They would be denied those who have invested their money and opportunity to really get the benefits they had anticipated when they made their investments; and at a time when we are talking of stabil-
izing our economy in creating demands for consumer goods, it is a very substantial market for those goods and I would urge that no action be taken by this committee which would delay the processes now going on in the Federal Communications Commission for the licensing of stations in areas such as these.

Senator Potter. In other words, you are opposed to any freeze?

Mr. Moss. Very definitely.

Senator Potter. I assume, Congressman, your interest is to provide adequate television service for the area you represent, isn't that true?

Mr. Moss. That is correct.

Senator Potter. And, whether it be by UHF or VHF, the main consideration is that adequate service be provided?

Mr. Moss. Without unnecessary delay.

Senator Potter. Are there any questions?

Senator SchoeppeL Congressman, you recognize there is a limited channel in VHF, don't you?

Mr. Moss. Yes, sir.

Senator SchoeppeL And it is going to be somebody's responsibility either to expand that or give to the country, not only in these market areas but a lot of other areas, the opportunity to have adequate television service?

Mr. Moss. Yes, sir.

Senator SchoeppeL And, obviously, somebody has to wrestle with that problem?

Mr. Moss. I recognize that, Senator, but I believe for a period of almost 4 years a freeze was put on while a careful study was made.

Senator SchoeppeL Yes.

Mr. Moss. And at the termination of that freeze the ground rules were laid out and the people in my area have made substantial investments on the basis of those ground rules, after it was determined, after the freeze, there is no danger in that area of the country at least of having overallocation of channels either in UHF or VHF.

Senator SchoeppeL The reason I mentioned that is: Here we are sitting over on this side as you gentlemen over on your side there, and we have had a lot of testimony here showing this congested channel, showing what they contend to be a preferential treatment, which could develop into a restricted service that would be given through the medium of television to advertisers and everything else, and they point their finger to us and say, "What about it? You fellows over in Congress here have brought measures in. What are you going to do about it?"

We turn around and we point our finger to the FCC, and we say, "What are you going to do about it?"

They say, "We want some guidance from you up there. We guessed once, and it looks like we guessed wrong."

Somebody has to wrestle with that.

If we do have a situation that is going to get worse, it is going to be an ever-recurring problem for somebody to untangle.

What is the best thing to do, I don't know. I am going to look this record over and I am going to study it as conscientiously as I can, because there has to be something done about it some place.

I much prefer to have the industry itself do it.

Mr. Moss. Of course, that would always be the ideal.
Senator Schoeppel. Yes.

Mr. Moss. But I do believe this: In areas where we can pretty conclusively show that we are not congested, that any freeze should not apply to those areas.

There may well be areas of the country where there is overcongestion because of the earlier allocation of channels on both VHF and UHF, but I don't think that is true in my part of the country and I think the people I represent are entitled to service equally as that provided elsewhere in the Nation, and any policy that fails to recognize that is not doing justice to those people.

Senator Schoeppel. You are up here in the interest of your constituency and you are up here registering what you feel is your best candid judgment under the circumstances at the present time?

Mr. Moss. That is right.

I understand there is an area in Florida probably just as large as this area not receiving adequate service, and there are probably others across the country that could be clearly defined as large areas of inadequate service, and I don't think freeze policies should be applied to those areas.

Senator Schoeppel. I know, for some reason or another, a lot of folks think a committee of Congress can say, "Freeze it," and it is going to be frozen. I don't like that kind of an approach, but it has gotten abroad that there is something contemplated on freeze. I began getting some telegrams, telephone calls, and I wondered who started it all. I don't know.

Mr. Moss. You have had the same experience I have had, sir. I have had quite a number of telephone calls and telegrams and a considerable volume of mail from my area.

Senator Schoeppel. What we are seeking to do here—I can say for myself—is to try to get the best, clearest, concise record possible to base some kind of a judgment factor on findings recommendations on the legislation that is before us, and I wish that we could have down the line a perfect answer. I don't suppose we will get it, but, personally, I do appreciate your frank views about it, and it all goes into the general, overall record. It will be helpful to us if we get the time to study it like we ought to.

Mr. Moss. Thank you very much.

Senator Potter. I might mention at this time, if it is agreeable to the other members of the committee, I hope we can meet in executive session in about the middle of next week to wrestle with some of these suggestions that have been made.

It is a problem. The Commission has told us and people interested in the field, people who are in the television industry have stated, that it is necessary, in order to have a nationwide competitive television system, that you are going to have to utilize the UHF band.

Now, we have had a great deal of testimony from UHF operators that at the present time they can't be competitive.

So, that is the problem we have to deal with.

Take your own area, where you have a UHF station—if the people who have sets were able to tune in on that station, you wouldn't have the trouble with the advertisers, you see, and it is sort of a vicious circle and the solution to it is not easy, and I assume the solution we make will be highly controversial.
Mr. Moss. Senator, I recognize the difficulties of the problem you have before you. I might point out, however, that my UHF operator enjoys a very profitable monopoly.

Senator Potter. Yes.

Mr. Moss. With about 87,000 sets, and the only one in the area, he has a very fine operation, and the advantage he has because of the money spent by the people in the area in converting to UHF will be a continuing advantage regardless of the licensing of VHF stations.

Senator Potter. I wish to thank you for giving us the benefit of your views, and I am sure that your constituents appreciate the fact that you have taken the time out of a busy schedule that I know that you have to come over here and present your views, and I can assure you that your views will receive the highest consideration by this committee.

Mr. Moss. Thank you, sir.

Senator Potter. And, without objection, the statement you have submitted will be made a part of the record at this point.

(The prepared statement submitted by Mr. Moss is as follows:)

STATEMENT OF HON. JOHN E. MOSS, JR.

Mr. Chairman, I represent six counties in the Sacramento Valley of California with a population of almost one-half million persons. The city of Sacramento, in my district, is the center of the second most populous metropolitan center in the nation which has been allocated VHF television channels but does not yet have complete television service.

The television broadcast area surrounding Sacramento is served at present by a single ultra high frequency station in Sacramento and is in the B broadcast area of another UHF station in Stockton, some 40 miles away. There is no very high frequency television reception available to the people in San Francisco, 100 miles away. If a householder has erected a huge rooftop antenna, and if weather conditions permit, a choice of programs from VHF stations in San Francisco is possible.

In spite of these handicaps, some 53 percent of the 220,000 families in the Sacramento broadcast area have purchased television sets, confident that they would have a variety of entertainment. The people in the area have invested some $35 million in television receiving equipment and are not now getting a choice of programs.

The hope of complete television service was held out to the people in the Sacramento area more than 6 years ago when four potential broadcasters applied for permits to operate two VHF television stations. In September 1948, as you know, all television applications were frozen. Since the freeze order was lifted in July 1952, the 4 applicants have made good progress toward providing the complete television service desired by the people in the Sacramento area.

In addition to the fact that some 750,000 people in the Sacramento broadcast area do not now have complete television service, it is well to consider the effect the situation has on the economy of the area. Many families have put off buying television sets until a local VHF station goes on the air. One estimate indicates there will be about $30 million worth of sets sold in the Sacramento area within a year after the first VHF station begins broadcasting. This huge potential investment is important, not only to television dealers and repairmen in my area, but also to the national economy. It will provide an outlet for television sets and parts manufactured in plants throughout the United States.

The advertising service available through two more competitive television stations also is worth considering. The present UHF station in Sacramento has, in effect, a monopoly in television advertising, but it is a monopoly which the station will maintain after competing local VHF stations are on the air. The many already converted UHF television sets in the Sacramento area will remain a prime market for the present UHF station. Competitive television broadcasting in the area will, in fact, increase the interest in the programs and increase the number of UHF converted receiving sets. Granting of the two VHF channels allocated to Sacramento will, therefore, increase the economic stability of the present station.
The public investment already made in television receiving sets, the desire of the people in the area for complete television service, and the economic effect on the area are important considerations. Another factor worth considering is the investment which the 4 applicants for 2 VHF channels already have made in processing their claims and the final capital investment the 2 successful applicants will make.

The four applicants had firmly committed some $2,500,000 in potential capital to be invested in VHF television broadcasting facilities. The two successful applicants will make an actual capital investment of about $1,250,000. This is important to the economic livelihood of the area I represent; it is also important to consider that each of the four VHF permit applicants in Sacramento has spent up to $100,000 processing applications so far. If there were a freeze at this time, they would be required to repeat the entire expensive process.

The applicants sought permits in good faith and followed all of the extensive rules and regulations. Now, a rule change is suggested just when the people in my area are hopeful they will have a choice of television programs in the very near future. To block the pending issuance of VHF television broadcasting permits in Sacramento would be unfair to the investors who have spent their time and money seeking permits; it would delay maximum economic development of an important part of the Nation and it would prevent some 750,000 persons in the Sacramento broadcast area from receiving the complete television service they have been anticipating for more than 6 years.

Senator Potter. Out of order, because of pressing business, we will next hear from the Honorable J. Howard McGrath.

Mr. McGrath. Thank you, Senator.

Senator Potter. General, we are pleased to have you present your views to the committee. I know that you have a busy schedule and we are looking forward to hearing your statement. You know, of course, the scope of our investigation here and I hope you will keep within that scope.

STATEMENT OF J. HOWARD McGRATH, EXECUTIVE VICE PRESIDENT AND GENERAL COUNSEL OF EDWARD LAMB ENTERPRISES, INC.

Mr. McGrath. I have tried to keep within the scope, Senator. Of course, the whole basis of profitable hearings is the experience of people who are in the business and, while our experiences are mentioned here, we hope we are mentioning them in a way that is broad enough to be helpful to the committee and to others as well.

I appreciate the courtesy of the subcommittee in hearing me out of order.

I also appreciate the courtesy of those who are to follow me to understand that I do have an engagement which, if it were not so important, I would not have asked to be heard at this time.

Senator Potter. That is perfectly all right.

Mr. McGrath. My name is J. Howard McGrath, and I appear here as executive vice president and general counsel of the Edward Lamb Enterprises, Inc., which directly or indirectly owns or controls several companies that are applicants for UHF stations; the grantees of a construction permit for another, and the purchasers, subject to Commission approval, of a third. In addition, the Edward Lamb Enterprises also own or control several other broadcast facilities, including a highly successful VHF station at Erie, Pa., as well as various concerns in other fields.

I am delighted to attend this hearing which is designed to solve some of the problems which have arisen by reason of the decision
of the Federal Communications Commission to establish a truly national competitive system of television broadcasting by the addition of the ultra high frequency channels.

I appreciate, especially, the courtesies of those members of the Senate committee who have made themselves available to the broadcasting industry in order that some of the woes of the so-called UHF broadcasters might be understood and possibly corrected.

First, let me say that we can all agree on the worthiness of the UHF signal. My company believes that it is entirely adequate to furnish a desirable nationwide television service.

My company and I are completely in accord with the decision to add the UHF channels, since it was apparent from the very beginning that the 12 VHF channels could not possibly be allocated in such a fashion as to make possible a truly competitive system. Large areas of the Nation could not be served. It was thought that with the UHF channels added, especially in rural areas or areas far removed from the VHF signals, all elements of the industry, including the networks, could back up and would back up the new UHF operators.

Events have not justified this assumption and the networks generally have avoided the U's like one would avoid the plague.

Possibly the ideas incorporated in Senator Bricker's proposal to permit regulations of the networks by the Federal Communications Commission might well be fully considered by this committee. After all, it doesn't seem right that this administrative agency be given the duty of regulating the airways, and then not permit it to control the practices of a very large segment of the broadcast industry.

Anyone familiar with present practices in the telecasting industry will admit that the grant of a network affiliation is of transcendent importance to the survival of a television station. When the Federal Communications Commission adopts regulations governing the conduct of networks, it is natural that steps should be taken to assure competition among various stations throughout the Nation.

We do not believe in stifling VHF in order to make UHF succeed. We think that if the networks are compelled to open up their programming to all stations within an area, just as the movie producers have been compelled to do, the forces of free competition will permit UHF stations to operate on the same basis as that afforded certain favored outlets.

Under the present setup, VHF has a virtual monopoly in telecasting. The situation is so bad that UHF channels have gone begging in major cities such as Columbus, Cincinnati, Minneapolis, and Kansas City.

UHF just can't get going where the networks continue to ignore them. UHF sets and converters will not sell where there is no substantial or alternative programming. It is truly the FM fight over again, whether the broadcasters recognize it or not. After all, the networks could write books about the reasons for the failure of FM.

The members of this committee should see the lineup before the Federal Communications Commission on Tuesdays just before closing, when competing VHF applicants get together their dropouts and mergers. The next day, after these negotiations, settlements or deals are consummated, the Federal Communications Commission oblig-
ingly hands out a VHF channel without hearings or opportunity for protest. These channels are worth, in cities like St. Louis, Buffalo, Milwaukee, and other markets, millions of dollars.

Senator Schoeppel. Might I ask right at that point, Mr. Chairman, I don't know how you feel about it, Mr. McGrath, but does that look right?

Mr. McGrath. It does not, Senator. It is not right.

Senator Schoeppel. Some of us on this committee are getting a tremendous lot of criticism on that score.

Mr. McGrath. I don't doubt it.

Senator Schoeppel. And it is disturbing.

I don't know whether that is good administrative practice or not. I don't want to be critical. It is a factual situation that somebody has to deal with, and maybe this is the way to bring it out.

You are here with broad experience, not only executive experience as a former governor of your State, but a United States Senator and then former Attorney General of this great Nation of ours, and that is the reason I was very much interested in your viewpoint, sir.

Mr. McGrath. I have one suggestion that will follow as I continue my statement.

Senator Schoeppel. I see.

Mr. McGrath. Unless it be thought otherwise, let me say here and now that I do not consider the Commission wholly to be blamed for this practice. As was so eloquently pointed out by Commissioner Hennock, the Congress, too, because of its frequent insistence on quickie grants, must share the responsibility for the resultant evils.

We realize, from the vast number of weddings among the competitors for the VHF stations which have been sanctioned by the membership of this Federal Communication Commission that the antitrust laws of the land have not been too carefully observed: but the abuse and violation of the antitrust laws does not vitiate or minimize the importance of these desirable laws, by any means.

With respect to this malicious merger practice, I have a recommendation which I believe merits the careful consideration of this committee. I recommend that the Antitrust Division of the Department of Justice be required by statute to investigate thoroughly any merger between applicants for television stations and to furnish the Commission with an opinion as to whether any antitrust laws are being violated. The statute would permit no action by the Commission until the opinion was received and then, of course, only if no violations were committed.

Such a statute would not only insure that the antitrust laws were enforced, but would tend, in my opinion, to discourage mergers since it would remove the possibility of an immediate aftermerger grant.

However, despite the seriousness of the so-called dropout situation and the problems caused by the networks and lack of proper transmitting and receiving equipment, about which there has been so much testimony before this committee, there are, in my opinion, other strong reasons for the poor economic health of the UHF industry.

Certain members of the Commission have been heard to say that the plight of the UHF is a result of a lack of good practical business sense on the part of the broadcasters. This, incidentally, comes from members who have never owned any broadcast facilities and who, on
the whole, have led lives largely sheltered from the interplay of competitive forces.

I can certainly testify that lack of good business sense has not contributed in any measure to the difficulties encountered in UHF by the Lamb companies. Mr. Lamb has been, as the entire business world knows, an outstanding success in the broadcasting field as well as in other keenly competitive fields requiring the utmost in business acumen.

What, then, is the cause of the stagnation and decline in growth of the UHF industry?

Speaking from our experience, the cause has been the Commission itself, its slow, strangling, and sometimes arbitrary and capricious procedures.

Let me illustrate.

One of our companies, the Mid-West TV Co., received a license in May of 1953 for a UHF station at Massillon, Ohio. We purchased more than $200,000 worth of equipment. After being given the license and being told to proceed expeditiously, we signed contracts and began construction of a modern building on the most desirable site in the Akron-Canton-Massillon region. We engaged a staff. We signed contracts to bring Bishop Fulton J. Sheen, football games, and many other worthwhile programs to that area.

But then strange things began to happen. Suddenly Mr. Lamb's most routine applications were held up. This was done by the Commission, so it said, to study Lamb's qualifications to own and operate broadcast facilities—this, mind you, from the same Commission, except for certain personnel changes, which had six times previously found Mr. Lamb qualified in all respects. Indeed, it had only recently approved the sale by Lamb of his VHF station at Columbus, Ohio, to the late Senator Taft's fine family, for whom, incidentally, Mr. Lamb is at this very moment the television consultant. There were, and the Commission admitted this, no objections from anyone outside the Commission to the granting of the Lamb licenses. Despite the fact that Mr. Lamb and his operations have won almost every award for public service available to broadcasting operators, and despite the fact that he came forth with numerous testimonials from high church, Government, and other officials, the Commission had persisted in its stand and has continued to delay action on these applications and our property and investment stands idle in the Canton area.

As a result of these delaying actions by the Commission, the investment of our company in Massillon, Ohio, is being rendered worthless and Mr. Lamb, at one time, even found himself in the unenviable position of not being able to turn back to the Government a license for a Portsmouth, Ohio, station which good business and engineering judgment dictated should not be built.

Mr. Lamb sought to sell his VHF transmitter in Erie, Pa., to the educational TV broadcasters of the city of Pittsburgh for $50,000. The Commission sat on this request and even failed to acknowledge receipt of the petition. The sum was, of course, a loss to Mr. Lamb. Then he sought to purchase WTVQ, a UHF station at Pittsburgh, Pa. Again the Commission delayed and refused to act so that this UHF service could not be brought to the eighth largest market in the United States.
Recently Mr. Lamb’s company was the highest bidder for UHF Station WSUN-TV at St. Petersburg, Fla. This is a municipally owned UHF station. Our bid was more than $1 1/2 million above that of the next highest bidder. Because of the Commission’s delay in acting to clear this prominent American, the city of St. Petersburg has been unable to go forward with the transaction.

Senator Schoeppel. How long ago has that been?
Mr. McGrath. This was about May, Senator.
Senator Schoeppel. This year?
Mr. McGrath. Yes.
Senator Potter. That is still being held in abeyance?
Mr. McGrath. The city had to withdraw it from the market, and whether they will ever offer it again I do not know, and whether we would be willing to bid a million and a half above everybody else is something I do not know.

Thus, it is that a man who has been an outstanding success as a broadcaster, and who is financially able and willing to take the risks involved, and one who believes, incidentally, in VHF, has been deprived of an opportunity to help in the development of UHF in these critical days.

Some of the Commission’s methods and procedures which we consider to be manifestly unfair and illegal are now the subject of pending court action by Mr. Lamb and several of his companies. Although we have complete faith in ultimate vindication in the courts, it is unfortunately true that “justice delayed is justice denied.” Complete vindication, therefore, however welcome, can never fully repair the damage that has been done.

As we see it, the delay and harassment which we have experienced constitutes a threat not just to the Lamb companies but to the entire broadcasting industry. Let us then trust that this committee will examine the Communications Act and the functioning of the present Commission to the end that remedial action may be taken and all concerned may look forward to fair and expeditious administration and the establishment of a truly competitive nationwide television system.

Senator Potter. Do you have any questions?
Senator Schoeppel. No; I do not.
Senator Potter. Thank you.
Mr. McGrath. Thank you, Senator, very much.
Senator Potter. Thank you very kindly, General McGrath.
Mr. Kipnes. Mr. Kipnes is with the Beachview Broadcasting Corp., of Norfolk, Va.

STATEMENT OF IRVIN M. KIPNES, SECRETARY, BEACHVIEW BROADCASTING CORP., NORFOLK, VA.

Mr. Kipnes. My name is Irvin M. Kipnes, and I am from Norfolk, Va.

This committee has heard testimony from UHF broadcasters who are apparently beset by a number of problems and, to the end of obtaining a cure, have come to Congress seeking drastic action. We are applicants before the FCC for VHF channel 10 at Norfolk, Va.
We have no quarrel with our friends in Norfolk and elsewhere who are licensees of UHF television stations. We are sympathetic to their problems and recognize that there are soft spots facing those who would develop UHF as a truly nationwide television service.

Many UHF broadcasters, it is acknowledged, have lost large sums of money in the operation of their stations, but a balancing of the equities would require that any measures taken to alleviate their burdens be positive and constructive rather than punitive to those of us who have planned and developed with infinite patience, a pioneering spirit, and at vast expense, VHF television service for our respective communities.

Senator Potter. Could I ask you a question at this point?

Mr. Kipnes. Yes, sir.

Senator Potter. Is this the channel that has been allocated to the Crossroads outside of Norfolk that somebody mentioned here yesterday?

Mr. Zapple. Princess Anne.

Senator Potter. Is it Princess Anne?

Mr. Kipnes. No; it is not, sir.

Senator Potter. This is one for Norfolk?

Mr. Kipnes. This is one of the original allocations, that is, the original allocations issued by the Commission in February of 1953.

Senator Potter. All right.

Mr. Kipnes. If there is any illness existing in UHF, or any phase of television—and there apparently is—we sincerely wish to have it remedied.

We hope, if the Commission favors us with a grant, to become an integral part of the television industry, and it is our sincere wish that the television industry as a whole be healthy and robust; but I respectfully point out to the committee that it would be contrary to the interests of the people of the Norfolk area and the country as a whole, and it would, moreover, be inequitable to those of us who in good faith have sought to acquire a television license, if Congress were to urge the Commission again to freeze television grants.

A brief résumé of our background is pertinent to my reference of a balancing of the equities:

Beachview Broadcasting Corp. was organized in June 1948, for the purpose of filing an application for a television station in Norfolk, Va., the 26th market in the United States. Our local attorney was stricken with a heart attack while preparing our corporate charter and, being sympathetic to his illness, we awaited his return to his office to prepare the legal instruments necessary for the filing of our application. The application was finally filed on August 8, 1948. Some 3 weeks later, the FCC imposed its freeze with the announcement that it would last approximately 6 months. The only VHF station in Norfolk filed its application 1 week prior to our application, and received one of the last grants issued by the Commission.

We have continued our organization during the intervening years. Our stockholders, some of whom will occupy staff positions, visited and studied television station operations in the East, attended a television school, and consulted frequently with our Washington legal counsel and engineers.

When the Commission issued its revised allocation plan, the Norfolk market was assigned 2 VHF channels, one of which being then in operation, and 3 UHF channels.
After numerous and lengthy conferences with our legal and engineering counsel, and after studies which we personally conducted in the market, we decided to reapply for the last remaining VHF channel. Accordingly, at great expense, we amended our application in February 1953. In the summer of 1953, after a 6-month lull, a rash of applicants filed for both VHF and UHF stations in the Norfolk market, apparently being spurred on by the glowing stories in Fortune, the Wall Street Journal, and other widely circulated publications concerning the vast riches to be plucked from the fertile field of television. The UHF applicants were quickly granted, there being no contests involved, but a total of six applicants remained to contest for the last remaining VHF channel.

As the date of the hearing for the VHF channel approached, and it became more apparent that considerably more was required for success in television than a mere application, 4 of the parties withdrew, leaving 2 groups, of which we were 1. In accordance with FCC requirements, detailed amendments were filed by both applicants in November of 1953; precise and intricate program schedules were exchanged in December 1953; and voluminous hearing exhibits were supplied the Commission in February 1954. Prolonged prehearing conferences were held by counsel for the applicants and the FCC in January and February of 1954 and the actual hearings began on March 7 and continued thereafter until they concluded on March 29. Both parties upon request of the examiner subsequently filed detailed findings, and later responses thereto.

The total investment of Beachview Broadcasting Corp. in television to date exceeds $200,000 in time and money. This includes options on highly valuable studio and transmitter property, since 1948, legal and engineering fees, television consultants, travel, office expense, salaries, architects' fees, et cetera. The corporation has yet to realize one cent in income.

This is our investment in television. Our stockholders are men who have for years worked for the betterment of our community and who recognize in television a vehicle for public service unparalleled in potential. We were willing, in the face of all the gloomy talk of 1948, to invest and risk large sums of capital in the development of a great new and unexplored medium and industry. Indeed, at the very time we were preparing our original application, large corporations were returning VHF construction permits for television stations, and withdrawing applications rather than incur the loss which we were willing to assume.

Beachview Broadcasting Corp. and others who applied for television facilities prior to the freeze were pioneers in a medium where only one fact was certain—money would be lost with no assurance of a return on investment. Yet, despite this, we could only dream of the day when this intriguing art, combining sight and sound, would be the most powerful instrument yet devised for public service, enlightenment, and mass entertainment.

To cure the ills of some of the UHF broadcasters by a proposal prejudicial and punitive to VHF applicants such as a freeze would be to pile irreparable damage and abuse upon those who have in sincere good faith invested many hundreds of thousands of dollars in television applications. We do not feel that this committee should cut the throat of the VHF broadcasters to give UHF a blood transfusion.
From an analysis of the testimony and plaints of the UHF broadcasters before this committee, grave doubts exist that the majority of them, or some of them, have come before you with clean hands in pleading for what they acknowledge to be drastic action.

When the Commission issued its original allocation plan, VHF and UHF channels were available to all applicants in open competition. The Commission did not guarantee that any of the channels assigned would be profitable. In point of fact, no such guaranty can be made. Each license is obligated to operate in the public interest, and whether at a profit or loss is subject to the usual American system of competition and free enterprise which is inherent in all business, television being no exception.

The broadcasters—and others—who went in to UHF did so with their eyes wide open. In markets which were intermixed with VHF and UHF, the choice was simple, clear-cut: Apply for VHF and become involved in a prolonged, complicated, and expensive proceeding or apply for a UHF facility and receive a quick grant. Those who chose the latter course did so in the belief that, while the VHF applicants were tied up in hearings, they could secure a competitive advantage by promoting conversions and developing a loyal listening audience. Some have been successful; others have not, for various reasons. For these broadcasters now to come before you with the request that they be made whole at the expense of others is inequitable in the extreme—and they come with unclean hands.

In the Norfolk market there were in excess of 150,000 VHF sets outstanding at the time the 3 UHF stations went on the air. One of these stations is now affiliated with NBC and another with ABC and Du Mont. Of these two, one appears to be doing exceedingly well. Both of these operations, however, are distinguished by their modest, but good, programing and conservative business practices.

It would appear, however, that some of the UHF broadcasters have spent vast amounts of money on lavish studios, earmarking an infinitesimal amount for programs and promotion.

One of the broadcasters who appeared before you several weeks ago extolled the virtues to me of his very costly studios. I cannot help but wonder whether this same individual would have expended such a large sum of money on studios in opening a radio station.

Last summer I visited the station of still another UHF broadcaster who appeared before this committee crying for drastic action and was surprised to see their lack of promotion of UHF in the market; but, more so, I was astounded that this same station—the only station in the city which received fringe-area coverage from a VHF station 40 miles away—did not own a single camera after 6 months of operation with which to program a talent show featuring local children, or a newscast or a sportscast.

How on earth, I ask this committee, or any broadcaster present here today, can UHF succeed under these conditions?

This plainly indicates downright incompetence. Yet, this same individual has now come before you seeking relief, and yet does not have the desire or the intention of helping himself.

Other UHF broadcasters apparently used poor judgment in evaluating their markets; on the other hand, there are some who moved in to a market totally unknown to the people of the area, and operated
intelligently and made a success of operations. One of these individuals, still successful, has come before you for relief, and his only complaint is that he fears the future.

What possible sympathy can this committee feel for one seeking a built-in guaranty of success?

Aside from the inherent unfairness and the inequities of some of the proposals of the UHF broadcasters, a freeze on future VHF grants and the shift of all television to the upper band is not the answer to the problems which beset UHF. If intermixture of VHF and UHF was wrong, the broadcasters should have, at the time the Commission issued the broadcast plan, protested to the Commission and, failing there, should have sought the assistance of Congress.

A freeze now on VHF applications will not correct the abuses of present day arm's-length dealings with networks; nor will a freeze allay any questions held by some national advertising agencies concerning the value of certain UHF stations as an advertising medium. A freeze would only mitigate against those who have sincerely invested in and have earnestly worked for VHF grants.

The proposal to move all television to the ultra-high band indicates an alarming unconcern for the televiewer for whom television is really intended. It would be incompatible to the interests of the farmer, the laborer, the office worker—millions who own VHF sets, many purchased on long-term time payments. The UHF Association would make obsolete these sets because its members do not provide sufficient program incentive for the public to purchase a converter or an all-channel set.

Because of their dilemma, they would willingly create a public economic turmoil, having everlasting ill effect on the entire television industry. In effect they are saying to this committee: "Make John Q. Public receive our program so we can make money, or penalize him by making his set obsolete."

This is simply a "dog in the manger" approach to the problem—punitive and ill conceived.

When the FCC adopted its radio and television standards, it, in effect, established a sort of lock-and-key system which would forever protect the investment of the consuming public in sets. The UHF Association would now suggest breaking the lock, throwing away the key, and telling the public to relegate its 25 million sets to the ashcan—the very public whose interests they propose to serve.

The total investment in VHF sets and stations throughout the country would make the proposals of those who now seek easy street by Senate dictum impossible to reckon with. It would create chaos.

In the interest of solving this perplexity, we recommend that greater consideration be given by Congress to the proposal which would lift the tax from all-channel sets. We suggest also that you request the FCC to look closely into all phases of the ills which beset the UHF broadcaster, the network situation, the advertising agencies, and the set manufacturers.

Senator Schoeppel. To what extent would you suggest looking into that?

Now, you are in this business. From what angle would you look into it?
Mr. Kipnes. Well, the committee has heard testimony—Senator McGrath appeared before you a few months ago—concerning the possibility of regulation of the networks, which certainly originate the bulk of the programs now being aired on television.

Senator Schoeppel. Do you think that ought to be looked into?

Mr. Kipnes. I think so, sir. I think Congress, on the other hand, should give great consideration to relieving the excise tax on sets, all-channel sets.

Senator Schoeppel. Many people have testified before this committee that would be helpful because of the price differential.

Mr. Kipnes. Yes, sir.

Senator Schoeppel. And that a lot of these UHF sets or combination set are piling up in the warehouses.

Mr. Kipnes. That is true; and I think if there were given consideration by Congress to the possibility of eliminating that tax, it would be a great incentive, and I think a great deal of consideration, merit lies in the possibility of regulating the networks; but I think—

Senator Schoeppel. Now, in regulating the networks, do you mean that we should put them on some kind of a comparable basis as a public utility?

Mr. Kipnes. Well, sir, I don't know if you can get into the realm of regulating them precisely as you would a public utility, insofar as utilities are generally conceded to earn a 6-percent return. If you get into that phase of regulation of the networks, you are going to be getting into the field of judging and setting rates in a competitive medium, in a medium that is competitive with newspaper advertising, magazine advertising, and all phases of advertising.

Senator Schoeppel. You understand I am just asking these questions in an effort to kind of explore this situation.

Have you looked into this bill that Senator John Bricker introduced?

Have you given some thought to that?

Do you have an opinion to express on that?

Mr. Kipnes. No; I have not, sir. I have not seen the bill. I have read a number of articles concerning it.

Senator Schoeppel. Mr. Chairman, might I at this juncture say I must be excused? We have an executive session of the Agricultural Committee that I happen to be a member of and I am just compelled to leave and I assure you I will read your statement.

Mr. Kipnes. Thank you, Senator.

Senator Schoeppel. And the other statements that will be made here in this morning session.

Senator Potter. We hate to have you leave, but I know you have pressing business with another committee, and we look forward to your return.

Senator Schoeppel. Thank you.

Senator Potter. All right, you may continue.

Mr. Kipnes. Thank you.

These protesting broadcasters, on the other hand, should give greater consideration to community-service programs, and prudent business techniques. The problems to a great extent are with the operator and not with the facility.

In conclusion, let me say again that we recognize the problems that presently confront the UHF broadcaster. What is more, we, as a potential television broadcaster, urge this committee to use its best
efforts to correct the same. We submit, however, that this should not be
done at the expense of the VHF broadcaster, or the VHF applicant who
in good faith and considerable expense has patiently pursued his ap-
application for a construction permit. This committee's action should
be corrective, not punitive.
It is said that misery loves company. We sympathize with the
UHF broadcasters, but we have no desire to join them at the weeping
wall.
Senator Potter. Do you agree with the Commission's position
that it will be necessary to utilize the UHF band if we are going to
have a nationwide competitive television system?
Mr. Kipnes. I certainly do, Senator.
Senator Potter. I have noticed in your statement that you state a
lot of the difficulty is in the management of the UHF facilities.
Now, assuming that the management is good, what is the biggest
problem, do you think, that the UHF operator has?
Is it lack of good programing?
Is it lack of receivers to get the signal?
Mr. Kipnes. Mr. Chairman, you state "assuming that the manage-
ment is good"—assuming the management is good, we would also
have to assume the programs were good, and if the programs were
good, I think their main problem would be to get receivers and con-
verters into the hands of the public, and I think if worthwhile pro-
grams were presented, programs of interest to the community, the
public would buy the converters or the sets.
I think the example which I cited in my statement is a good one,
wherein a station had been in operation for 6 months and did not
own a single camera, and yet these people came to Congress, came
before this very committee, asking for drastic action. They had no
competition, Mr. Chairman, ladies and gentlemen, from any other
existing facilities in town. They did receive fringe-area service from
a market 40 miles away, but that is not a competitive situation in an
advertising medium.
Senator Potter. We have had a lot of testimony before this com-
mittee that a UHF station would lose its network affiliation when
another VHF comes on the air. Now, do you think that a station can
operate with a V station if it doesn't have adequate network affiliation?
Mr. Kipnes. Mr. Chairman, I would like to say this: Years ago it
was said that radio could not compete or could not be successful unless
it had a network affiliation. Today among the most successful sta-
tions in the country are the independent stations.
I might say in our market all the networks are presently affiliated
with existing stations, VHF and UHF.
Senator Potter. What will happen when you receive your grant or
when that channel 10 is taken?
Mr. Kipnes. Well, sir, we have proposed to the Commission to
cooperate as an independent television station, because a network
affiliation will not be available to us; and I believe with the programs,
the available film programs, and there are excellent programs avail-
able to all television stations on film, and with imaginative program-
ing, we will be able to successfully compete with existing network
affiliated stations.
Senator Potter. You are not going to try to get a network affiliation?
Mr. Kipnes. Sir, we can’t because the existing stations—or I hope we will have our grant very shortly—
Senator Potter. Most of the contracts are 2-year contracts?
Mr. Kipnes. Two-year contracts; yes, sir.
So, therefore, we will assume it will be at least 2 years before a network will be available to us.
Senator Potter. I notice one of the U’s has an affiliation with NBC.
Mr. Kipnes. Yes, sir.
Senator Potter. When their time runs out, are you going to try to get that NBC affiliation?
Mr. Kipnes. Mr. Chairman, that is a hypothetical question.
I would like to say this: If we can operate successfully as an independent station—and I think we can—I think we have a good competitive situation. I know we have an excellent staff of top program people available to us, or who will be with us, and I think we can operate successfully and perhaps do a much better job, community job, as an independent station and conceivably make more money than we could as a network affiliate.
Senator Potter. Now, the Norfolk area is allocated three V’s, is it not?
Mr. Kipnes. Two V’s, sir.
Senator Potter. Two V’s?
Mr. Kipnes. Yes, sir.
Senator Potter. And how many U’s?
Mr. Kipnes. Three U’s.
Senator Potter. You have one V on the air?
Mr. Kipnes. One.
Senator Potter. And how many U’s?
Mr. Kipnes. Two U’s.
Senator Potter. So, one V is on the air, and you have applied for the other U?
Mr. Kipnes No; we have applied for the other V.
One U went off the air about 3 months ago, and I think that is another example, Senator, of a group that went into television simply because they thought fast riches were available to them. They went in with a minimum amount of capital. They programed from signoff to signoff a minimum of 6 hours a day with third- and fourth-run films and the people of Norfolk had already seen those films. They were some 20 years old and I think they saw them the second or third time around when the VHF station went on the air; but they simply wouldn’t take them the fourth time around.
Senator Potter. But you have two U’s on the air now?
Mr. Kipnes. Two U’s on the air at the present time; yes.
Senator Potter. Could the Norfolk area handle three U’s and two V’s?
Mr. Kipnes. I don’t know, sir. I think again that is a question of economics. I don’t know if the Norfolk market can support five UHF stations. I know it is certainly not now supporting all of the existing radio stations that are presently located there, but I don’t think that is within the jurisdiction of the problem of this committee or the problem of this Commission. I don’t think the Commission can guarantee a radio or television station to be a success.
Senator Potter. I think our main concern is that the people of the
country receive adequate television service and that it is on a com-
petitive basis.

Mr. Kipnes. That is correct.

Senator Potter. Do you have any questions, Senator Hunt?

Senator Hunt. What percent of television sets in the Norfolk area
have been converted or can receive both UHF and VHF?

Mr. Kipnes. Senator, I haven't been able to get any reliable figures.
The UHF station has one set of figures and the VHF station has an-
other set of figures. I think there are approximately two-hundred-
odd-thousand VHF sets in the market, and I think, giving the UHF
station the benefit of its figures, there are approximately a hundred
thousand UHF sets outstanding at the present time.

Senator Hunt. Two to one?

Mr. Kipnes. Yes, sir.

Senator Hunt. What would be your reaction to a suggestion if the
industry should all cooperate in helping to solve this problem, which
is going to be very difficult to solve, I am afraid, by legislation, and
limit the manufacture of new sets to those capable of receiving
V and U?

Mr. Kipnes. To limit the manufacture?

Senator Hunt. Yes.

Senator Potter. The all-channel tuner.

Senator Hunt. Yes, so they would receive both. Now, in a period
of time, of course, sets will become obsolete and eventually, if such
an arrangement could be made, then every home would be in a posi-
tion to receive ultra high and very high; and it seems to me that might
eventually eliminate this trouble. There would be a lot of casualties
in the meantime, but eventually, I think, it would eliminate the
trouble.

Mr. Kipnes. Senator, I hesitate to say I think Congress, by legisla-
tion, should limit the manufacture of sets to only those that will re-
ceive VHF and UHF. I think the question of free enterprise will
take care of that problem.

Senator Hunt. I didn't say Congress do that; I said the industry
getting together.

Mr. Kipnes. Oh, the industry.

Senator Hunt. Yes.

Mr. Kipnes. Yes; I heartily concur in that.

Senator Hunt. If they are interested in saving these ultra high
frequency stations.

Mr. Kipnes. Yes; I think that would be very helpful if the in-
dustry were together to agree to limit the manufacture of all sets to
those that would receive both VHF and UHF.

I would like to say this: I don't think that we have quite the analogy
between radio and FM here and VHF and UHF. I think the analogy
is closer to a regional station as opposed to perhaps a local station.

In radio we have seen that both can succeed and the local station
can compete effectively with the regional station.

Senator Hunt. Are any of the communities down around Norfolk
yet getting into this community television system service?
Mr. Kipnes. None that I know of, Senator. There may be some in the more isolated areas of North Carolina, but I haven't heard of any.

Senator Hunt. That is the next great forward step in television.

Mr. Kipnes. I think so.

Senator Hunt. And if this action I suggested with reference to manufacturing only one type of sets could be put into force and effect before this does take in all of these small communities in the United States, it would seem to me it would be a very advanced step and clear up the headache right now.

Mr. Kipnes. I think so, Senator. I think the community antenna system is growing rather rapidly.

Senator Hunt. It is going to spread over this country in the next year just like a rainfall over the whole United States.

Mr. Kipnes. I think that is something else that this committee should give consideration to, the committee and the FCC, and that is the question of whether or not community antenna services should be regulated by the Commission.

Senator Hunt. They will come into direct competition with already established television stations.

Mr. Kipnes. Certainly, and we are obligated and licensed by the Commission to operate in the public interest and, yet, there is no control of the community antenna services.

Senator Hunt. Yet, they will bring television to areas not now having television service?

Mr. Kipnes. Yes; they will.

Senator Potter. I believe the Commission has refused to acknowledge whether they have or have not jurisdictional authority in this field.

Mr. Kipnes. I don't know if the Commission has yet acted on that, Mr. Chairman. I think that is something this committee can look into and perhaps recommend to the Commission. I think they might listen to you.

Senator Potter. What do you think of the suggestion that has been made several times in order to accelerate the manufacturers to build sets that will receive UHF that color television be probably brought into only the UHF band?

Mr. Kipnes. I am opposed to that, Senator, for the reason I think it places an unfair burden upon the VHF station operator. I think that is a situation that primarily can be remedied essentially by free competition amongst the licensees.

As an example, if the UHF station in Norfolk that is now affiliated with NBC were to start programing color, I think they would have a definite competitive advantage over the licensee of channel 10.

I am a great believer in the fact that a great many of these problems rest with the operator rather than with the facility.

Senator Potter. Do you agree that actually what we are dealing with is public property, that we are dealing with the facility of the spectrum, which is public property, and our interest, and it should be the Commission's interest, is to see that that public property is used to the best advantage of the public, and that, while we realize these channels are worth considerable money to the person who receives the channel, speaking now of the VHF, it is public property that you are dealing with and, while there is an economic problem
which is important to the individual, the individual is not the controlling factor; the controlling factor is the best service to the public.

We are confronted with some very serious problems here if the trend continues as it is now, say, with just two networks, for example, and we may end up with a lot more Government regulation.

I think people must recognize the fact you are going to have competition or you are going to have Government regulation.

It is not an easy problem for the committee or the Commission to cope with, but I think that everyone should recognize the fact that, while we all oppose Government regulation, we are caught in that position.

With this concentration of power in the hands of a few groups—the term "monopoly" has been used; I don't know whether it is monopoly or not, and as that concentration builds up, the impetus for more Government regulation is going to go right along with it, and our concern is how fast the public can be served by its own facility, by its own air spectrum.

Mr. KIPNES. I agree very much with what you say, Mr. Chairman. I have a great feeling of the sense of responsibility of a licensee or a prospective licensee, and that we are dealing with the public spectrum and that the airways belong to the people and that we have to serve the people with our facilities.

I don't know, however, that the Commission has rightfully served the public by granting perhaps some of the UHF stations to individuals who are uncapitalized and are not in the position to do the job of serving the public and developing their UHF facilities.

The UHF facility which is now off the air in the Norfolk market certainly cannot be said to have attempted to serve the public by running fourth-rate films all day long.

The UHF station to which I referred in my testimony certainly could not be said to serve the public interest in operating a television station without a camera for 6 months, and those were the critical 6 months, Senator, when they should have been developing their local audience with talent programs, local features, news, sports.

Those are the things which develop a responsible public-minded television operation or radio operation.

I agree that there are serious problems.

When the Commission was considering the television problem, I gave a lot of consideration to whether or not they should eliminate all VHF and put everything into UHF. In my own mind, like everyone else in the industry, I speculated as to what would be best in developing a truly nationwide system.

The Commission issued this allocation plan. I think it is a good one. I don't want to discuss the merits of it.

Senator PORTER. Do you think that a UHF station can be competitive in, and take your own area, in a mixed market?

Mr. KIPNES. I do. Verily if a 200-watt station can compete with a 5,000- or 50,000-watt station in Washington and Baltimore—

Senator HUNT. Do you think that they could compete without a network program?

Mr. KIPNES. I don't know, Senator. That is something that none of us can tell. Those who might think about the ultimate in television might wonder whether networks are the answer in television pro-
Recently a well-known movie producer suggested that he thought independent operations, utilizing films produced in Hollywood of top stars would be the ultimate success for television. I don't know.

As I said earlier, many people believe that a network affiliation is absolutely essential to success in radio. There are many broadcasters here today who will tell you that if they are affiliated in the networks a good independent will give them a run for their money, competitively in their markets.

Senator Hunt. Would you view a local television show or one of the network shows?

Mr. Kipnes. It depends on the program, if the programs were of sufficient interest. Right here in Washington the Du Mont station competes rather effectively with the NBC, CBS, and ABC stations. I know that from my experience of having formerly been in the advertising agency business in Washington, and the Du Mont station in Washington I believe programs perhaps 80 percent of its time locally.

Senator Hunt. Do you think that UHF could be successful in Norfolk, Va., with only one-half the receiver sets that the VHF has?

Mr. Kipnes. I don't know the answer to that, Senator. I understand that the NBC affiliate—and I have not seen the figures—that it is doing rather well in Norfolk with 100,000 sets outstanding.

Senator Hunt. Thank you.

Senator Potter. Do you have any further questions?

Senator Hunt. No, Mr. Chairman.

Senator Potter. Mrs. Bowring.

Senator Bowring. No questions.

Senator Potter. Thank you for your statement, Mr. Kipnes.

Mr. Kipnes. Thank you, sir.

Senator Potter. We will now hear from Mr. A. Earl Cullum, Jr., consulting radio engineer.

STATEMENT OF A. EARL CULLUM, JR., CONSULTING RADIO ENGINEER

Mr. Cullum. I am a consulting radio engineer with offices located in Dallas, Tex. I have requested permission to appear before this committee because certain proposals have been made to it which I, as an engineer, feel are incompatible with the public interest. My qualifications are attached as appendix 1.

Before continuing I might inject at this point the television allocation hearing which was held over several years and which is being discussed here at great length went into many involved factors in trying to decide what channels should be allocated and how they should be allocated.

One of the factors that influenced the Commission, and I think properly so, is the public interest viewpoint, how much service you can render by a station. Particularly I would like to mention, and I can supply copies for the record if you should need them now or later, that there were two exhibits put into the television allocation hearings that probably did more to get the Commission to accept high power and high towers for VHF than any other two exhibits. I prepared the exhibits. If anybody wants to blame anybody for what happened, they can blame me as much as anybody else.

I rested my case at that time and I do at this time strictly on the point of providing public service. I think there is too much thought
given many times to the interests of Congress, the interests of the Commission or the interests of the broadcasters. We have to think about public service rendered.

I have prepared in previous cases and I intend to discuss most of these subjects now and I intend to direct most of my remarks to the public-service viewpoint.

The act of Congress, which created the Federal Communications Commission, stated that the Commission was created for the purpose—

* * * of regulating interstate and foreign commerce in communication by wire and radio so as to make available, so far as possible, to all the people of the United States a rapid, efficient, nationwide and worldwide wire and radio communication service * * *.

It is to the problem of making a television service available to all of the people of the United States that I wish to direct my remarks. It is recognized that engineering factors are not the only consideration in developing a truly nationwide service. The engineering considerations, however, are the basic considerations upon which any such service must be built. I, therefore, want to furnish this committee with the engineering background for my remarks.

Senator Potter. You stated a truly nationwide service. You said nothing about a competitive service.

Mr. Cullum. This has to come out. If we have more than one station we have to have competition. In certain parts of the country you cannot have two stations. If you have service you have to have one service. In most of the areas you can have two. You can have three, four, or five. There is a question as to whether you can have as many services as are provided for. That is an economic problem and not an engineering problem.

Senator Potter. Your presentation deals with nationwide coverage and the competitive, the economic factor, is not a matter of consideration?

Mr. Cullum. It has to be tied together, but not primarily a portion of my statement.

In the first place, it should be understood that, if an adequate signal is available, there need be no difference between the quality of television picture provided by either a UHF or VHF television station. There are differences in the ability of VHF and UHF to establish any given signal intensity and also there are differences in the signal intensity required to give adequate service.

In transmitting a television signal by VHF or UHF, electromagnetic energy is radiated from the transmitting antenna, attenuated through space, reflected or diffracted by the intervening terrain, intercepted by the receiving antenna and converted to signal at the receiver. Basically, the system is this—energy is radiated, there is a loss over the propagation path, some of the energy is intercepted and converted to usable signal.

In comparison with VHF the path losses are substantially greater at UHF, the amount of energy intercepted is generally substantially less at UHF unless extremely elaborate and expensive receiving antennas are used so that lesser signals are available at UHF. Furthermore, a greater strength of signal is required to produce a satisfactory picture at UHF. The signal required depends upon the electrical noise present in the receiver which appears as “snow” on the screen. Present UHF sets are relative snowstorms in this regard.
It is seen that all of the factors favor the VHF services, and in fact tend to favor the low band VHF services. In addition the same factors favor the lower UHF channels as compared with the higher UHF channels. This is a fact that is not generally recognized or admitted, but one which makes it extremely doubtful that all of the 70 UHF channels will be capable of providing satisfactory service. They are not now and will not be able to provide comparable service for many years to come, if ever.

Senator Potter. In other words, the higher up the band they go the more power it takes to get the quality?

Mr. Cullum. The same quality of picture. It takes more for channel 13 than for channel 2. The reason is that it causes more for channel 83 than for channel 14. It is a graded type of problem.

In an attempt to equalize the service of the several classes of stations the Federal Communications Commission has provided that low band VHF stations be restricted to a radiated power of 100 kilowatts while high band VHF stations are permitted 316 kilowatts and all UHF stations are permitted 1,000 kilowatts. Equipment is available to permit stations to achieve full power on all VHF channels, but the present stage of equipment development now limits the maximum power possible at UHF to approximately 250 kilowatts.

In order to show the effects of several of the factors discussed above, I have prepared a series of bar graphs which depict the service area of television stations in the various bands. These are shown in Figure 1 attached.

Senator Potter. Both your qualifications and the graph which you referred to will be made a part of the record at this point.

(Qualifications of Mr. Cullum and graph of relative service area of television facilities are as follows:

APPENDIX 1

QUALIFICATIONS OF A. EARL CULLUM, JR.

1. He is a consulting engineer with offices located in Dallas, Tex.
2. He graduated from the Massachusetts Institute of Technology in 1931 with a Bachelor of Science degree in communication engineering.
3. Since 1936 he has maintained an office as a consulting engineer.
4. During World War II, he was employed by the Office of Scientific Research and Development. Under that employment—
   (a) He was Associate Director of Radio Research Laboratory at Harvard University, Cambridge, Mass.
   (b) He was expert consultant to the Secretary of War on electronic matters.
   (c) He was expert consultant to the United States Strategic and Tactical Air Forces on electronic matters.
5. Since World War II, he has been employed as expert consultant to the Joint Research and Development Board. Under that employment—
   (a) During the last of 1945, he was the first executive secretary of electronics committee of the Joint Research and Development Board.
   (b) From 1946 through 1948, he was consultant to the electronics committee of Research and Development Board.
   (c) From 1946 through 1947, he was chairman of the countermeasures panel of the Electronics Committee.
   (d) During 1948, he was a member of the countermeasurements panel of the electronics committee.
6. He is a fellow of the Institute of Radio Engineers.
7. He has been awarded the Presidential Certificate of Merit.
8. He appears regularly before the Federal Communications Commission as an expert witness on allocation matters.
RELATIVE SERVICE AREA OF TELEVISION FACILITIES

1. With consideration given to present receiver sensitivities
   Channel 2, 100 kW, 1000 ft
   Channel 13, 316 kW, 1000 ft
   Channel 14, 1000 kW, 1000 ft
   Channel 83, 1000 kW, 1000 ft

2. With consideration given to present maximum UHF power
   Channel 14, 250 kW, 1000 ft
   Channel 83, 250 kW, 1000 ft

3. With consideration given to increased UHF propagation losses
   Channel 14, 250 kW, 1000 ft
   Channel 83, 250 kW, 1000 ft

4. With consideration given to more typical UHF antenna height
   Channel 14, 250 kW, 500 ft
   Channel 83, 250 kW, 500 ft

FIGURE 1
Mr. Cullum. They are summarized in the following table in which consideration has been given to present-day receiver sensitivities:

<table>
<thead>
<tr>
<th>Channel</th>
<th>Power (kilowatts)</th>
<th>Height (feet)</th>
<th>Comments</th>
<th>Relative service area (percent)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>100</td>
<td>1,000</td>
<td>VHF</td>
<td>100</td>
</tr>
<tr>
<td>14</td>
<td>316</td>
<td>1,000</td>
<td>VHF</td>
<td>65</td>
</tr>
<tr>
<td>83</td>
<td>1,000</td>
<td>1,000</td>
<td>UHF</td>
<td>26</td>
</tr>
</tbody>
</table>

Senator Potter. In other words, we cannot get the 1,000 kilowatts on channels 14 or 83 and so we have to have 250 kilowatts?

Mr. Cullum. Yes, sir.

Senator Potter. Would that reach 100 percent, 60 or 70 miles?

Mr. Cullum. Yes, sir, about 70 miles.

Senator Potter. And channel 83 would be what?

Mr. Cullum. Fifteen percent of the area in square miles. That doesn’t mean 15 percent of the radius. Forty percent of the radius would be 16 percent.

If consideration is given to the present power possible at UHF, the above table may be extended as follows:

<table>
<thead>
<tr>
<th>Channel</th>
<th>Power (kilowatts)</th>
<th>Height (feet)</th>
<th>Comments</th>
<th>Relative service area (percent)</th>
</tr>
</thead>
<tbody>
<tr>
<td>14</td>
<td>250</td>
<td>1,000</td>
<td>UHF</td>
<td>31</td>
</tr>
<tr>
<td>83</td>
<td>250</td>
<td>1,000</td>
<td>UHF</td>
<td>15</td>
</tr>
</tbody>
</table>

If consideration is also given to additional propagation losses at UHF, the table may be extended as follows:

<table>
<thead>
<tr>
<th>Channel</th>
<th>Power (kilowatts)</th>
<th>Height (feet)</th>
<th>Comments</th>
<th>Relative service area (percent)</th>
</tr>
</thead>
<tbody>
<tr>
<td>14</td>
<td>250</td>
<td>1,000</td>
<td>UHF</td>
<td>8</td>
</tr>
</tbody>
</table>

If further consideration is given to the fact that few UHF stations use heights of 1,000 feet, and 500 feet is used, the table may be extended further:

<table>
<thead>
<tr>
<th>Channel</th>
<th>Power (kilowatts)</th>
<th>Height (feet)</th>
<th>Comments</th>
<th>Relative service area (percent)</th>
</tr>
</thead>
<tbody>
<tr>
<td>14</td>
<td>250</td>
<td>500</td>
<td>UHF</td>
<td>9</td>
</tr>
<tr>
<td>83</td>
<td>250</td>
<td>500</td>
<td>UHF</td>
<td>4</td>
</tr>
</tbody>
</table>

This latter table is more typical of the present UHF stations.

This, as I mentioned, is summarized and the figure 1 in the bar graph takes the same data which I have discussed and puts it in a relative form. It shows the VHF and the UHF, just because of their technical limitations, that nobody can do anything about it, whether it is Congress or the Commission, you just have that problem. It
is a law of nature. There are a few UHF stations that do have higher heights and do attempt to do a more extended area, but this is the general type of UHF station we now have using 500 feet or higher and powers from 50 to 250 kilowatts.

A comparison of the above figures clearly shows that the service area now possible with UHF stations is vastly inferior to the Service area possible with VHF stations. When consideration is given to the UHF service possible with maximum power, with optimum receiver sensitivities and with optimum terrain the service area possible with UHF stations is still inferior to the service area possible from a VHF station. These are engineering facts and are at the heart of the problem of the UHF telecasters. These engineering facts make ridiculous the proposal advanced by the UHF Television Association that all telecasting be confined to the ultra-high frequencies.

The only means of providing television service to vast rural areas is by use of VHF unless there is virtually complete subsidy of a vast number of stations in rural communities. In addition, in rugged terrain, such as the area about Pittsburgh, Pa., VHF service is essential to provide adequate service to the metropolitan area.

Adding to the problem of the UHF telecasters is the fact that not all people within their service area will have sets adjusted to receive UHF signal. When it is considered that there are in excess of 20 million receivers which are incapable of receiving UHF today, and that it would cost perhaps $50 each to convert, it can be seen that the public is being asked to undergo a potential outlay of $1 billion for the privilege of receiving UHF television. The UHF Television Association effectively proposes to tax the public by this amount so that some uneconomic operations may have a better chance of survival.

Senator Hunt. Mr. Chairman, may I ask the witness a question?

Senator Potter. Yes.

Senator Hunt. What additional cost do you think would be necessary for a manufacturer to incur in a set if he manufactures it properly to receive a very high outlet like this.

Mr. Cullum. It has been estimated from $15 to $50, depending on how he does it. To do it well, to get the sets to perform properly, it may cost more than $50. One is the quick and dirty way which allows you to put a number on your set, but it still does not work very well. Right now it is technically impossible to build a good UHF receiver, and since they don’t know how to build it they don’t know how good it will be or how much it will cost.

We know how to build a good radar receiver, but they cost not $50 but hundreds and thousands of dollars, so there is an economic problem as to whether you want a set with numbers on the front of it or whether you want a set that works.

There is another part of the problem here and that is that those are all right for metropolitan areas. There is no doubt about a UHF station providing service to a metropolitan area, but in the rural areas you will force the farmers to buy UHF receivers and cannot put a service there. The vast part of this country is still made up of a lot of square miles.

Senator Potter. We had a set manufacturer, Mr. Tazian, who testified that he has an all-channel tuner that he can produce for about $7. Are you familiar with that?
Mr. CULLUM. No, I am not. I know he is a good manufacturer and I think he would be the first to say that he cannot build for $7 a receiver that has as low a noise figure for UHF as VHF. He can build a receiver that will work well in metropolitan areas, but my point is that we have got rural areas to develop and he would probably build it out in the metropolitan area where a mediocre UHF set will give good results, but I am quite sure he would not propose that particular unit for areas of 70 miles from UHF stations. It just would not provide the service.

The problem of reduced coverage with UHF stations would be alleviated if UHF stations could be built and could operate with less expense than a VHF station. The truth of the matter is, however, that only the cost of UHF transmitting plant equipment is less expensive at the present time, and this is only because full power transmitters are not available. For stations capable of providing the same type of program service there would be no difference in the cost of studio buildings and equipment between a UHF and a VHF station.

When all factors are considered the initial cost of a UHF station is approximately the same as the initial cost of a VHF station. Generally speaking, then, the investment per viewer with a UHF station is greater than the investment per viewer with a VHF station.

Experience indicates that the investment per viewer is not the major criterion which will determine the success or failure of a television station. A more important factor is the cost of operation. If we assume that either a UHF station or a VHF station at the same location would provide the same type and quality of program service then the cost of operating the station will not differ one from the other.

Since a UHF station will generally serve appreciably fewer persons and since it costs the same amount to operate, the operating cost per viewer must be higher than for a VHF station. Where there is demand for this type of service, or additional service, and where the unit cost is not excessive, so that the advertiser, and ultimately the public, is willing to pay the price then, in those locations, UHF stations will be successful.

Any attempt to force all telecasting stations to use UHF can only result in an increased cost for the use of the medium or in a serious reduction in its use. In either case it is the public that will suffer.

It is generally conceded that the 12 VHF channels by themselves cannot provide a truly nationwide television service to all of the people of the United States.

It is not generally realized that 70 UHF stations cannot provide a truly nationwide television service to all of the people of the United States. In other words, with the limited service area of which I have just spoken, if you put in all of them and redistribute, start it over, you still can not provide by UHF alone a nationwide television service as we now see it. There have got to be some changes and I do not believe we will have them.

Senator Potter. You have to use both bands.

Mr. CULLUM. And even with both bands, no. Take this channel 2 station here and it is going to take, if channel 83 is operating, even with its 1,000 kilowatts and 1,000 feet which it now cannot do technically, but we anticipate can be done in some years, it will take 4 of this type of station to cover what 1 VHF will cover. The country
was not built realizing that television was going to be put in that form.

One of the consulting engineers here in Washington said if we want a truly nationwide service we should build the stations and then build the towns around the stations. That is just how impractical some of the proposals of the UHF broadcasters are.

It was also recognized that, in order to survive, individual VHF stations would have to have relatively extensive service. In order to achieve this it was necessary that stations on the same channel be separated by a considerable distance so that they would not mutually destroy an excessive amount of each other's service area. Also stations on adjacent channels require a lesser separation for the same reason.

It is because of these necessary separations between stations and the fact that cities do not conveniently occur with exactly the required minimum separation that the VHF stations are unable to cover the entire country. It is for this reason also that certain cities cannot have assigned to them more than a limited number of VHF stations. It was to provide additional television outlets in certain cities and to provide local television outlets in some areas where it was impracticable to assign VHF channels that it was necessary to expand the television broadcasting industry into the UHF.

After the conclusion of hearings which lasted from 1948 to 1951, during which there was a freeze on new construction, an allocation plan was adopted, which is basically the present plan, and applications for construction permits to build new television broadcast stations were accepted by the Federal Communications Commission. Since in each city there were only a limited number of television allocations available and there was great demand for many of the allocations, it was realized that it would be necessary to hold hearings to determine which among several applicants for any one facility should be granted the construction permit.

The freeze was lifted over the entire country at one time, so that it was also realized that the Commission would be faced with the requirement of holding a great number of hearing for communities all over the United States.

It was obviously a physical impossibility to decide all of the hearings at one time. In an attempt to make an equitable procedure, the Federal Communications Commission established a set of priorities to determine the order of hearings.

Now, more than 2 years after the lifting of the freeze, the process of holding hearings to determine which among competing applicants should be granted a construction permit is still going on. In fact, in certain major cities hearings have not yet begun.

Obviously the competition was most severe for the more desirable channels. This resulted in a situation where there were multiple applicants for VHF channels in cities and in many cases there were only single or even no applicants for UHF channels in the same cities. It is just as obvious that most, if not all, applicants for VHF channels looked at the UHF channels available and wondered whether or not it would be wise to drop the application for the VHF facility and apply for a UHF facility, in the hope of getting a long head start on the VHF competition. In every case where a client of mine asked me to consider and give my opinion on the advisability of making such a change in order to be able to get on the air earlier with a UHF
facility I advised very strongly against it where there was or would be adequate VHF service.

Generally, other competent counsel was also sought and in every case that I know of the recommendation made was the same as mine. My advice was based on a studied opinion that, in a competitive market, it was essential that the greatest possible service be rendered by a television station and that it was very doubtful that a station without extended service would be able to compete economically with superior services. Experience now indicates my recommendations were correct.

Under our system of broadcasting, I believe that ultimately the cost of operation of a television station and the return on the investment must come from the public in the form of acceptance of advertised products. The advertising cost, which includes the cost of the television facility, is beneficial if it creates a sufficient increase in the market so that other savings exceed the advertising cost. This requires a wide-base relatively low-cost advertising medium with good public acceptance.

Wherever the unit costs are too high, or the coverage is inadequate, television is not an economical medium whether it is VHF or UHF. That this is true is witnessed by the number of VHF stations that have suspended operations, or have decided against commencing operations. It is also borne out in the profit-and-loss statements of stations in large metropolitan areas, such as New York and Los Angeles. There, there are so many competing services that some stations do not have a sufficiently wide audience appeal. Some 50 percent of the stations in those 2 cities are actually losing money.

On the basis of the engineering facts, wide-area coverage by single stations is possible only with VHF. In certain areas where the terrain is relatively smooth, UHF stations can serve the principal city approximately as well as VHF stations. Beyond a rather limited radius, however, UHF service has difficulty in competing with VHF, which can provide service to much greater radii. The populations residing at distances of 50 to 100 miles from metropolitan areas having television services can look only to two main sources for television service. Either they must depend upon the service from VHF outlets in the metropolitan areas, the only wide-range service available, or they may develop local outlets. It was for this latter purpose in part that it was necessary to add allocations for UHF channels. Where there is demand, economic justification, and suitable terrain, local UHF outlets will provide a satisfactory service.

In the rural areas, however, without sufficiently large population centers the only hope of receiving television service comes from an augmented VHF service. Furthermore, in metropolitan areas having rugged terrain large segments of the population can only receive satisfactory television service through the use of VHF.

At the present time there is a certain limit to the number of stations throughout the country. This is not a matter of regulation—in fact, most allocations are not used—but a matter of economic fact. There are factors which over a period of years will tend to increase the number of services possible. Technological improvements are possible which will permit increased service by UHF stations.

These factors include higher power transmitters, more sensitive receivers, better antenna systems. Whether or not the potential im-
provements are realized depends upon the demand for the improve-
ment and the willingness of the public to pay the added cost for sets
and service. In any event, however, we cannot now foresee that UHF
television stations will be able to serve by any means as wide an area
as a VHF station at the same location.

As the industry grows experience and study will result in reduc-
tion in the cost of providing a television program service for both
VHF and UHF. Technological factors are also at work here, which
over the years will have their effect.

The use of magnetic tape instead of film offers one possible means.
New-type studio equipment designed with emphasis on ease of opera-
tion and maintenance and more reliable equipment all offer the hope
of reduced operating costs. The major contribution, however, will
probably be made by the ingenuity of station management and pro-
gram personnel in devising simple yet effective program sources.

A combination of the above factors should lead to a television serv-
ice which will gradually increase the total number of stations over
the foreseeable future.

Certain proposals have been made to this committee by members
of the UHF Television Association. These proposals call for a va-
riety of actions from a new freeze on the granting of new television
stations to the forced elimination of the VHF television service and
the use of UHF alone.

The UHF Television Association claims to be a group of pioneers.
The truth of the matter is that many UHF telecasters who are in
direct competition with VHF stations are not pioneers but instead
gamblers. The real pioneers of the television industry are the pre-
freeze VHF stations which started television when no one knew if it
would be economically feasible and also those VIIF and UHF tele-
casters who now are attempting to provide service to rural com-

c
imnies of limited size.

The UHF telecasters who are now in competition with VHF, or
are faced with competition with VHF, have not pioneered, but instead
have merely gambled that the expansion of VHF television would
encounter serious delays. Their arguments for the elimination of
VHF television are purportedly based on a desire to develop a na-
tionwide service. In view of the limited service area of UHF stations,
this can only be achieved by a great expansion in the number of sta-
tions in many small rural communities. In this connection it is
interesting to note the affiliation of the directors of the UHF Televi-
sion Association.

Mr. Poller, of WCAN-TV, Milwaukee, is now in competition with
1 VIIF station of long standing and faced with competition from 2
additional VHF stations. Is his interest in the rural viewer or in
his own competitive situation?

Mr. Tenenbaum of WTVI, Belleville, Ill., claiming to be a St.
Louis station, now is in competition with 1 prefreeze VHF and 1
UHF station and is faced with competition from 2 additional VHF
stations.

Is his interest in the rural viewer or in his own competitive
situation?

Mr. Garrison of KACY, Festus, Mo., also claiming to be a St.
Louis station, is now in competition with 1 prefreeze VHF station

48550—54—40
and 1 UHF station, and is now faced with competition from 2 additional VHF stations.

Is his interest in the rural viewer or in his own competitive situation?

Mr. Berk of WAKR, Akron, Ohio, only 30 miles from Cleveland, Ohio, where there are 3 prefreeze VHF stations is faced with competition from them.

Is his interest in the rural viewer or in his own competitive situation?

Mr. Loewi of WITV, Fort Lauderdale, Fla., only 25 miles from Miami, and only 15 miles from the "farm" where you place the towers for the Miami stations, claiming to be a Fort Lauderdale-Miami station, is now in competition with 1 prefreeze VHF station and 1 UHF station, and facing competition from 2 additional VHF stations. Is his interest in the rural viewer or in his own competitive situation?

Mr. McKinnon of WGVL, Greenville, S. C., now in competition with one VHF station, is faced with competition from a VHF station in nearby Spartanburg.

Is his interest in the rural viewer or in his own competitive situation?

Very frankly, as I have looked at some of the testimony and exhibits and heard some of the testimony, it is unclear to me as to whether some of these UHF petitioners want another VHF facility themselves or want to abolish UHF. Apparently they have anticipated that they are going to be in trouble. But they have anticipated they will be in tougher trouble. If they think they have trouble, they are just getting rid of the trouble. They want to get this thing scrambled up some way to their own advantage and not let in any of these communities and Milwaukee, for instance, which was one of the last on the Commission's priority system, and it will be some time yet before we get all the VHF stations and the same thing occurs in Miami, Pittsburgh, and Boston. All of those places will have considerably more service in the cities and considerably less in the rural area surrounding the cities than they now have. This is a particularly untimely thing because they have not given the VHF fellow time to provide the service that the Commission anticipates will be provided in all these areas.

Senator Potter. Do you think that some of the men who went into the UHF and received grants for UHF channels relied upon the Commission's report, assuming that they would be competitive and be equalized?

Mr. Cullum. I do not think that I have said that. I do not think the Commission did.

Senator Potter. I am wondering when they allowed the UHF, whether they assumed that they will secure the 1,000 kilowatt transmitters and the VHF transmitters were limited to 100 kilowatts on the lower band and 316 on the other end. I am wondering if they felt that would put them in a competitive position and unfortunately they were not able to get the power necessary.

I would like to ask this question, which goes back to the earlier part of your presentation: What action will be necessary to put them in a competitive position from an engineering standpoint? We have the recommendation, the present Commission's ruling where they can
have the power of 1,000 kilowatts and towers of 1,000 feet. Is that adequate to put them in a competitive position from an engineering standpoint?

Mr. Cullum. In Milwaukee I had a client who employed me to study that very problem. In Milwaukee we determined what transmitting equipment was available and going to be available. We made engineering studies of service available and also looked at the VHF situation, and it became obvious to us and it was my recommendation that my client not apply for UHF in Milwaukee. I said 3 or 4 years ago that he would be in economic difficulty if he did.

I also had a client in St. Louis and exactly the same studies were made and we came out with essentially the same recommendations.

I had a client in Pittsburgh who asked the same question and we made the same studies and made the same recommendations.

I had a client in Boston who asked the same question and we made the same studies and made the same recommendation.

I had a client in Miami who asked the same question and we made the same studies and made the same recommendations.

So I don't know how these other people operate, but I do not think they found it in the Commission's report. They may have read between the lines or some Wall Street Journal report and came to the conclusion that they could compete with the VHF broadcasters, but somebody made a big mistake. I don't know whether they employed counsel or maybe they did not. Maybe they did not make the studies, but it is beyond me as to why the Congress or the Commission should get upset because somebody did not make some studies and find out these facts in advance and not make the mistakes.

Senator Potter. Is it your testimony that UHF cannot compete in the metropolitan market?

Mr. Cullum. It can compete in the metropolitan area, but it cannot compete in the rural area. It will have difficulty in competing in certain metropolitan areas where you have rough terrain like around Pittsburgh, Pa.

In Miami, Fla., it ought to be able to compete quite well for the metropolitan area if you are willing to say I will not worry about a radius of 75 miles or more.

Senator Potter. I understood that you advised your clients in these metropolitan areas not to apply for a UHF grant.

Mr. Cullum. That is right.

Senator Potter. The previous question I asked was whether from an engineering standpoint, what would be needed from an engineering standpoint for UHF to be competitive with VHF and would more power be the answer?

Mr. Cullum. If you could have extreme powers and extreme heights, yes. But we are talking of more than 1,000 kilowatts and more than 1,000 feet. In other words, the economics get to be very difficult to cope with. There are areas though—and I do not want to leave the impression that I am against UHF—there are areas where a man cannot have a VHF service. Reading, Pa., is one.

I have a client who started operating there with the largest operation in the country; he knew his problems and still knows his problems. He is not here asking for help. He is home working on his problems. He has got 250 kilowatts of power and about 1,700 feet, trying to cover
the communities in his area, plus the maximum rural service. He feels he must do that or he cannot make a success of it.

I have a client in Youngstown, Pa., who is going to 250 kilowatts of power.

Senator Porter. Perhaps I misunderstood your statement. You stated you advised against your client applying for UHF in some of these metropolitan areas and I had assumed that UHF filled a gap in the rural areas. Is that correct?

Mr. Cullum. Yes, sir, if you cannot get the VFH service. Going back to Milwaukee, we anticipated that there would be three VHF facilities in Milwaukee and we did not see how our client would have much of a station if he had the fourth station and that were a UHF station. That was the way it all boiled down. We felt that three VHF stations would provide service to the city and to the extensive rural area around there.

The fourth one, if it were UHF, would provide service to the city but not to the rural area.

The same thing applied to St. Louis and to other cities.

When you go to Reading, Pa., there is no way to put VHF facility in there and there may be a way but I don’t know it. We told the client of the studies we made and saw no way to do it, and if he wanted to render television service in there he would have to put in a UHF station. He did put in a UHF facility and he is having his troubles because of these other problems of getting the UHF receivers on which he is working. It is a case of working at it and not crying about it.

The UHF Television Association has recommended certain “remedial action.” I would like to consider these item by item.

(A) A hiatus is requested for a minimum of 90 to 180 days. This is obviously a stall and a hope that a new freeze will be instigated lasting indefinitely and eliminating competition to certain UHF telecasters. Such a new freeze would be a gross injustice to the people of many of our major cities such as Boston, Pittsburgh, St. Louis, Milwaukee, and others where there is today either inadequate television service or where an adequate number of services is only available if the public invests additional dollars in their television sets. It is also an injustice to the applicants in cities such as the above who are now involved in hearings to determine which of them will receive permission to build additional VHF stations. These applicants would be penalized for taking a long and accurate look in the potentialities of UHF television in competition with an adequate number of VHF services. This request of the UHF Television Association is obviously for the benefit of a limited few and is not for the benefit of the public.

(B) A transfer from VHF to UHF is requested. Such a proposal would not provide additional service but would provide less service. It is my firm belief that such a transfer can only result in major areas of the country not receiving adequate television service. Furthermore, in those portions of the country where adequate service would be available the public would be taxed more than $1 billion for no better service and in many cases poorer service than they are now receiving. This request of the UHF Television Association is obviously for the benefit of a limited few and is not for the benefit of the public.
(C) As a "first step" the elimination of intermixture of channels has been requested. In view of the fact that intermixture does not exist, any change to avoid intermixture would result in making many VHF only receivers obsolete, or would require greater additional outlay by the public. The result would not be improved service and in many cases would result in inferior service. In fact, although it might be possible to eliminate intermixture within cities, there would always be intermixture in the areas between cities. This request of the UHF Television Association is obviously for the benefit of a limited few and is not for the benefit of the public.

(D) Mandatory regulation of networks and other program sources is requested. I cannot help but believe that in the long run the network problem is one of economics. If a network of UHF stations could produce the same viewing audience for the same cost, its existence would depend upon its ability to perform a service. In general a group of UHF stations cannot reach the same audience for the same cost. Any regulation of networks which requires that they affiliate with inefficient UHF stations can only result in additional costs which ultimately must be borne by the public. This request of the UHF Television Association is obviously for the benefit of a limited few and is not for the benefit of the public.

The CHAIRMAN. I don't quite care for the fact that you placed Youngstown in Pennsylvania.

Mr. CULLUM. I am sorry, Youngstown, Ohio.

The CHAIRMAN. I might say for the record that that bill was not filed at the request of the UHF stations or any other segment of the industry. It was filed as a matter of principle.

Mr. CULLUM. Yes, sir.

(E) Regulations and tax preference to encourage all channel receiver production are urged. This is not an engineering matter so I have no expert opinion on this proposal.

(F) Modification of present income-tax laws is requested. This is not an engineering matter so I have no expert opinion on this proposal.

(G) A Federal contract for development and research in UHF transmission and receiving tubes is requested. This research would constitute merely another tax on the American public. It will be made by private enterprise if there is demand. If there is not demand, it would be an unnecessary expense.

(H) A request is made for financial assistance. This is not an engineering matter so I have no expert opinion on this proposal.

The present rules governing television broadcast stations have been in effect for over 2 years. There is no doubt some readjustment should be made to provide additional television service. Any readjustment should be tested, not by the desires of a limited group of telecasters, but by a careful appraisal of the public service which would result.

In general it is my belief that the present allocation plan has provided a reasonable starting point. I do object to the allocation philosophy of the Federal Communications Commission which has a tendency to be fixed and inflexible and to make administrative convenience paramount to the public interest. A flexible policy, based primarily on consideration of public interest, has been followed in the field of standard broadcasting and as a result a truly nationwide service is approximated.
If the Federal Communications Commission would retreat from its position of arbitrary requirements and instead would give weight to the same type of consideration as has been in standard broadcasting, additional service could be and would be provided. No new "freeze" or "hiatus" would be required.

Senator Potter. Mr. Cullum, there has been testimony here that the problem has been complicated by the jacking up of the power and the extending of the antennas and some of these VHF stations blanketing out areas in which UHF stations operate.

What are your views on that?

Mr. Cullum. Well, that is the only way that we are providing the rural service. The UHF people will not provide that rural service. They have no proposal to provide the rural service.

If you take any large metropolitan area, and that is the only place where you can afford to use the tall towers and the high power, you can afford to do it there because of your large metropolitan area to support it and as a by-product of your service you provide an extensive rural area for the higher power and the higher tower.

You can go out and if a man goes out some 30, 40, 50, 60 miles away from the metropolitan area and if he can come in with a UHF facility and provide a better program service and the public prefers it over the large station, then he is going to be a success.

Senator Potter. We had testimony here I believe yesterday showing the State of New Jersey where it was practically blanketed by the high power stations from New York, Philadelphia and Baltimore.

Mr. Cullum. Right.

Senator Potter. Do you think that is a healthy condition?

Mr. Cullum. No, and that is one of the very things that I did not spell out here, dealing with the flexibility. In New York we have seven VHF stations. There is no need for that many. There should be flexibility whereby things could be moved out to New Jersey or Connecticut, not 7 but 1, 2 or possibly 3. To do so the Commission procedure now requires that a New York fellow losing money go through a process if he wants to put it in New Jersey of surrendering his license. He has to take his facility in which he has invested a lot of dollars, turn in his license and he is out of business. He can propose that the facility be taken from New York to Podunk and then there is argument as to whether that is the place for it to be placed. After the facility has been closed down he has no preference at all. It was all right at the beginning. It has served its purpose to be frozen in that nature, and rigid in that form for the last couple of years.

You have problems in California too. You have got seven stations in Los Angeles and it creates the same kind of problem. Any place where you have 7 stations in 1 community you create a problem all the way around that community. That is the reason New Jersey is in trouble.

Senator Potter. I believe we had a man here from Atlantic City during the first phase of our hearings and he had a UHF station, I believe, and he was blanketed out by Philadelphia.

Now, what about the argument that has been used that you locate a station for example in Atlantic City—and I don't know about the Philadelphia stations, whether they are too much interested in the local problem of the community of Atlantic City—and I would assume
they are interested in the local problems of Philadelphia—what about
the argument that is used that the local station going out of business,
the UHF station in the smaller community is blanketed out by the
VHF stations and that the community loses by the lack of having a
local station?

Mr. Cullum. That is always a problem, but around Philadelphia
there are probably 100 other cities that do not have local expression.
Philadelphia is possibly 1 of 100 that had that problem. It gets around
to what does the public want. The public wants network service.
They are not too interested in the Atlantic City service. They ap-
parently want network service. They are getting some degree of net-
work service from Philadelphia. They can get better network service
if we have even bigger VHF stations in Philadelphia.

Senator Potter. If for example at Atlantic City you could keep a
network, then you feel that it would have been successful?

Mr. Cullum. I think it would have been marginal even then.
Senator Potter. Senator Bricker, do you have any questions?
The Chairman. No.
Senator Potter. Senator Bowring, do you have any questions?
Senator Bowring. No questions.
Senator Potter. Thank you, Mr. Cullum.
Mr. Cullum. Thank you, Mr. Chairman.
Senator Potter. We will now hear from Mr. Franklin C. Salisbury.

STATEMENT OF FRANKLIN C. SALISBURY, WASHINGTON, D. C.

Mr. Salisbury. Senator Potter, members of the committee, I first
want to thank you very much for this opportunity to appear before
you.

Senator Potter. We are happy to have you here.

Mr. Salisbury. At the request of certain of the officers and directors
of television broadcasting station KSTM-TV, operating on UHF
channel 36 in St. Louis, Mo., I have been asked to draw on their ex-
perience and my own to assist this Senate subcommittee in their efforts
to prepare legislation which will provide the United States with a system
of television broadcasting making available the widest opportunities
for both broadcasters and viewers.

Television station KSTM-TV is, I believe, the only television sta-
tion which is presently operating with UHF equipment and simulta-
eneously participating in a hearing before the Federal Communications
Commission for authority to telecast using VHF equipment. We are thus
in the unique position of having an opportunity to serve the people in the St. Louis area and to evaluate from actual experience
which system of television broadcasting will best serve the community. If this committee shares with us the respect which we have for actual
experience, then we believe our advice will be of assistance.

My own experience in the field of radio has been both actual and
theoretical. In 1939 and 1940, I was administrative assistant to Com-
missioner Thad H. Brown, Republican member of the Federal Com-
munications Commission from Ohio. For a period thereafter I was
on the legal staff of the Commission. After approximately 6 years
with various legal staffs of the United States Army, I returned to the
field of radio in the practice of law. I am a member of the Communi-
cations bar.
From the more practical side, I am an officer, director and stockholder in AM radio station KSTL in St. Louis, Mo., and similarly in radio station WBIS, Bristol, Conn. In television, I am counsel for KSTM-TV of which I am also stockholder.

Our experience—that of my associates in KSTM-TV and myself—convinces us that it is impractical to try to operate a television station in the best public interest with two different incompatible types of transmission in the same area competing for the same listeners. If Congress is interested in avoiding monopoly in the television broadcast field it should instruct the Communications Commission to eliminate the intermixture of UHF and VHF frequencies in the same telecast market area.

We earnestly recommend to this subcommittee that section 307-B of the Communications Act of 1934 be amended by the addition of the following language or similar wording:

In considering applications for television construction permits, licenses, modifications and renewals thereof, the Commission shall eliminate as promptly as possible intermixture of UHF and VHF channels in the same market area. In order to permit an orderly shift from intermixed telecasting, existing VHF stations in areas where it is administratively determined that the best service can be obtained by all UHF service, shall be reassigned UHF channels. One VHF outlet in each such area may be continued, but for a period of no longer than five years. Where the area is determined to be more suitable for all UHF service, the UHF stations shall be reassigned VHF channels. One UHF outlet in each such area may be continued, but for a period of no longer than five years. Where an insufficient number of channels are available to reassign existing stations, competitive hearings shall be held to determine which existing station shall be preferred for the available channels as the public interest, convenience, and necessity may demand.

Senator Potter. What recommendation did you have for people who have invested in certain types of receivers? You may take a UHF area, for instance, and the people have invested in VHF receivers, or the other way around.

Mr. Salisbury. I have set forth in this particular proposed amendment that one VHF station would be kept for 5 years, which means that in the St. Louis area they have only 1 VHF station now and they will not be adversely affected now. In 5 years I believe that the new sets coming out will be so good that almost everybody will have replaced their sets anyway. I see the problem and I do not want to see a person who has a set now adversely affected so that he cannot use that set.

The attention of this committee is respectfully directed to the facts of television broadcasting as illustrated by the situation in St. Louis, Mo., which is presently an intermixed market. Seven channels are presently assigned to St. Louis: VHF channels 4, 5, 9, and 11, with channel 9 reserved for noncommercial educational use, and UHF channels 30, 36, and 42. The Pulitzer Publishing Co. operates pre-freeze station KSD-TV on channel 5 in St. Louis.

The Chairman. What is the population of St. Louis?

Mr. Salisbury. I would say about 1,200,000. I am from Detroit and Cleveland myself.

Signal Hill Telecasting Corp. operates UHF station WTVI on channel 54, in Belleville, Ill., within the St. Louis metropolitan area. Broadcast House, Inc., operates UHF station KSTM-TV on channel 36. The Ozark Television Corp. of St. Louis until recently operated station KACY on channel 14. KACY was the first victim of the
present allocation system in the St. Louis area. Construction permits have also been issued for UHF stations KFUO-TV on channel 30 and for UHF station WIL-TV on channel 42 in St. Louis.

With respect to VHF channel 4, the Federal Communications Commission on April 21, 1954, granted the application of KWK, Inc., for a construction permit to operate a VHF telecasting station in St. Louis, Mo. The status therefore of present and potential telecast service for St. Louis, can be summed up by the statement that there is 1 VHF station with approximately 600,000 sets in the area capable of receiving its signal and 2 UHF stations on the air with approximately 200,000 of the same sets equipped to listen to UHF signals. Of these presently broadcasting stations, KSD-TV brings to the people of St. Louis NBC and some CBS programs. WTVI brings Du Mont and some CBS programs, while KSTM-TV brings ABC network programs.

I should have continued on to state that channel 4 is about to go on the air, which means that one of the existing UHF stations will lose its network. As soon as court of appeals denied the stay in that particular VHF channel controversy we were notified by ABC that we would lose our network. They have a 6-month cancellation period.

Senator Potter. Is that a common clause put in all the contracts, a 6-month cancellation?

Mr. Salisbury. I understand it is.

Senator Potter. In other words, a 2-year contract doesn't mean much if a new VHF station comes in? They can cancel it in 6 months?

Mr. Salisbury. I think that is true. There may be a difference between an affiliate like ourselves and a basic station.

It was originally conceived by the Federal Communications Commission that the widest system of telecasting would result from the use of both VHF and UHF assignments, side by side, in any particular community; that UHF stations and VHF stations could compete for listeners in the same community on a favorable basis. We do not criticize the Commission for reaching this decision at the time, since it was at best an "educated" guess.

It is very obvious, however, from the facts which have been developed subsequently and which are eloquently spread on this record, that it is impossible to have a telecasting system which is based on two incompatible engineering systems of telecasting operating in the same community. One or the other will be driven out. The result is an inevitable diminution of the amount of service which the public can receive in any given area. The result is an inevitable monopoly which will irreparably damage this most important means of mass communication so newly available.

Cripple television, if you will, but at least be forewarned.

It is beyond credulity to believe that the FCC, if presented with the intermixture problem for the first time today, would have any hesitation in prohibiting this incompatible anomaly. However, the Federal Communications Commission has an understandable reluctance to change its mind; a natural, human reaction.

We therefore address ourselves to Congress, which has never committed itself one way or the other on the merits of "intermixture" and suggest that Congress has the responsibility to instruct the Commission by an appropriate amendment of the Communications Act.
My client, KSTM-TV, petitioned the Commission on October 15, 1958, that the table of television assignments contained in section 3.606 of the rules be amended to eliminate intermixture. It had the services of George P. Adair, consulting engineer in Washington, D. C., who studied the allocations available for St. Louis, and determined that UHF channels 64, 70, 76, and 82 are available for St. Louis in full compliance with the standards of good engineering practice.

I might add that is in addition to the other UHF channels that are presently allocated.

Obviously, therefore, there is no lack of channels available to St. Louis in the UHF band. On the other hand, there is an extremely limited number of channels available for commercial use in the VHF band in St. Louis. There are only 3 VHF commercial channels which is not even enough to provide service from the 4 national networks. There are at least 7, and perhaps 9 or 10 available channels, if UHF is made the service for the St. Louis area.

In addition, in evaluating these availabilities, there is really no substantial difference between a good service on UHF and a good service on VHF. From our actual experience it matters not what type of transmitting equipment—UHF or VHF—that one has in the transmitter house, for one can serve the public equally well with either. This observation is not prompted by theory but by actual operation.

There is nothing wrong with the quality of the UHF signals presently available to the people of St. Louis.

The CHAIRMAN. Couldn’t this have been anticipated by the Commission? Was there any testimony with respect to the problems at the time the order was issued?

Mr. SALISBURY. I understand at that hearing there was a considerable division of opinion and that experts testified on both sides of that problem with almost equal weight. I understand that Du Mont very expertly asked the Commission to avoid intermixture, but the Commission had no actual experience so they went for intermixture. We cannot criticize them now.

The CHAIRMAN. I know, of course, that hindsight is better than foresight, but it seems to me that an engineering problem of that kind could have been anticipated.

Mr. SALISBURY. Actually, it is an economic problem as I will show in a moment.

The CHAIRMAN. Is that because of the receivers?

Mr. SALISBURY. Because of the receivers; yes, sir.

There immediately occurs to mind the question of why VHF transmitting equipment and UHF television equipment, if it is more or less the same, cannot both be used by telecasting stations in the same area. The answer requires the mind to shift from a compulsive interest in the engineering characteristics of the transmitting equipment to a view of the economics of telecasting.

Such a shift of emphasis is difficult for persons whose experience and responsibility has not been directed to the total picture involved in the presentation of a telecasting program to an audience. The Federal Communications Commission is unable to think in terms of economics but only in theoretical engineering possibilities, and is thus like a horse with blinders on.

The economics of the UHF-VHF controversy are as simple as they are disastrous. Put yourself in the position of an advertiser who
has a choice between a telecasting station with good signal which can reach 600,000 sets and a station with a comparatively good signal which can reach 600,000 sets and a station with a comparatively good signal which can reach only 200,000. There is no doubt but that your support would be given to the station which could reach the most persons. Since it costs as much to reach 200,000 as it does 600,000 persons, the operator with the limited coverage still must charge almost as much for his services as that of the more complete service.

Hence, it has proved impossible to have bargain-basement type of operations in television. The results have been and are inevitably that the medium which does not reach the mass of sets must go out of business. The proof of this is that almost every week a UHF station will go out of business until there are no more trying to compete in this unequal struggle.

If, therefore, it is the wish of Congress that there be a limited number of television stations with consequent monopoly in the most influential means of communication the world has ever known, Congress need do nothing but leave the Communications Commission free to pursue its present ill-conceived allocation system. The Communications Commission has eloquently revealed that it has no intention of giving up its fantasy that intermixture is a practical method of providing television service. This is revealed by its Memorandum Opinion and Order, adopted December 18, 1953, in response to the petition of Broadcast House, Inc., to eliminate intermixture in the St. Louis area. The Commission stated:

9. By its request that VHF channels 4 and 11 be replaced by UHF channels in St. Louis, petitioner is seeking, insofar as possible, to eliminate the intermixture of VHF and UHF assignments in St. Louis. The Commission explained in the sixth report issued in our recent television proceedings in Docket 8736 et al. why we considered an assignment plan based on intermixture of VHF and UHF channels both necessary and desirable.

The Commission recognized that while UHF broadcasters in areas where VHF stations existed would be faced with economic problems, the public interest required that in formulating an assignment plan which was to be the basis of the overall development of television for many years to come, a long-range view must be taken. The Commission stated its view in the sixth report—and we are still of this view—that UHF stations will eventually compete on a favorable basis with VHF stations.

If our nationwide assignment plan is to prove effective, UHF stations must constitute an integral part of a single, nationwide television service. If intermixture were avoided as suggested by petitioner, it would be necessary to limit the number of assignments in certain cities even though a need for such additional frequencies in the communities existed.

A more extensive television service can be made available where some VHF assignments are made in as many communities as possible than where only VHF assignments are made in some communities and only UHF in others. The Commission, moreover, made clear in the sixth report that it believes that wherever possible VHF assignments should be employed in large cities to take advantage of the wide-area coverage afforded by such channels.

Deleting channels 4 and 11 from St. Louis, therefore, would constitute a waste of the valuable spectrum. We do not believe that the Commission's principles of television assignment should be departed from merely because of some temporary adverse effect on private interests.

The error in the Commission's thinking is obvious to anyone familiar with actual operating conditions. If VHF and UHF could be received on the same sets, the Commission's policy would be well founded. Obviously in such a case a greater service could be provided by assigning as many UHF's and as many VHF's in the same com-
munity as possible. But since it is a fact that the UHF signal cannot be received at all, unless the set is converted, the VHF operation which can always be received without conversion, will drive out of business the UHF. Thus the need for additional frequencies will continue.

Even though a large number of incompatible frequencies are assigned to the community, as suggested by the Commission, the need for “additional” frequencies will not be met.

I might interject here that it is amusing that here in Washington we have two UHF channels assigned. Of all the places in the world where it is important and desirable to have as many television stations to take advantage of the great sources of programing, for example the Senate, we have two of them going begging. One of them has been applied for but I understand they would not ask for it if it was the last thing on earth and I also understand the other one, anybody in the room can have. You talk about adding additional frequencies. It is a desirable statement of policy but those additional frequencies must be realistic.

The Commission’s policy of permitting internixture of UHF and VHF in the same area is based on a study of the engineering factors involved. As such it is theoretically accurate. Unfortunately, engineering is only one of the elements of the problem and not even the most important.

I suppose automobile companies could manufacture small cars half the size of our ordinary vehicles with no trouble from an engineering point of view, but you will agree that this could not be done so as to sell the cars at half the price. The economic cost does not coincide with the engineering principles involved.

Should the Interstate Commerce Commission decide that in order to improve the railroad service, the gauge of the tracks should be cut in half in order to provide twice as much service on the same roadbed? Theoretically, I suppose you could get twice as many trains to operate on the same roadbed, if the tracks were half as far apart. You could probably keep the existing trains running on the normal size portion of this proposed system. However, I am equally sure that there would be no increase in service by this opportunity to open a new half-size railroad service, since the rolling stock is limited to the standard gauge.

The differences of opinion which exist in the present controversy rest not in the objective to be reached but in the method of carrying on toward the objective, namely, to provide the widest possible television service to any particular area, the sum of which will provide the most complete television service for the whole nation. We have personally discussed this problem with many members of the Commission’s staff and find that a majority of the Commission’s own personnel believe that internixture is impracticable.

However, there is a universal negativism which implies that although a mistake has been made nothing can be done about it. To the contrary, we are optimistic that this committee which has the responsibility and has no psychological barrier to consider the problem can by a short and simple amendment to the Communications Act resolve this part of the total problem.

We will repeat to this committee the arguments which we advanced to the Commission, but we hope that here, where there is no pride of authorship in the mistaken program, a new policy may be written
into the law. We confine our remarks to the St. Louis area. That is the one with which we are most intimately acquainted. We have no reason to believe that the pattern is not duplicated in other communities similarly situated.

The proposed elimination of the VHF allocations in St. Louis and the addition of a number of UHF channels would permit all of the present serious applicants to obtain television facilities to serve St. Louis. These stations can compete with one another without economic advantage. If the present allocation of three commercial VHF stations is continued in St. Louis, the two presently allocated UHF stations will never go on the air, the UHF station KACY which has been driven off the air will not return, and the existing operating UHF stations will not survive.

Those are the two that are allocated that have not gone on the air. In recognition of this fact, the two operating UHF stations have applied to the Commission to shift from UHF to VHF service. The very announcement of the possibility of channel 4 being occupied by the present construction permit holder in the near future was sufficient for UHF station KSTM-TV to lose its affiliation agreement with the ABC national network. I brought that up earlier. We have not actually lost it, but we have been notified that they reserve the right to change over as soon as the new VHF station gets on the air.

In addition, advertisers are withdrawing the support in anticipation of the arrival of the new VHF station. These same advertisers would support any television station which was not competitively handicapped by an incompatible transmitting system. The addition of every VHF station in an intermixed market is enough to kill three UHF stations. Intermixture means monopoly. Monopoly is bad government in a democracy.

The CHAIRMAN. Is there any difficulty in transferring from the established UHF transmitting stations to a VHF transmission?

Mr. SALISBURY. Do you mean from an engineering point of view, legal or financial?

The CHAIRMAN. Engineering.

Mr. SALISBURY. No difficulty. It is not the least expensive thing you have to do. You just have to change some of your equipment. We propose to do that.

The CHAIRMAN. But the same basic facilities could be used?

Mr. SALISBURY. Yes; you have to make changes in your transmitter and some changes on your tower, but we do not consider it insuperable. It will be the least of our problems.

The CHAIRMAN. It will not be anything like the original cost?

Mr. SALISBURY. Oh, no.

Since the publication of its sixth report which gave birth to the two-headed body, called intermixture, a great deal of additional experience and factual data has become available. In fact, at the time of the determination of its policies in connection with the assignment of UHF and VHF frequencies no actual experience was then available to the Commission. We do not contend that the Commission did not, with the information available at the time, formulate otherwise adequate principles of allocation and provide a temporary solution for the requirement of immediate assignments.

The Commission thus in the pioneering period provided the people of the United States with a tremendous increase in available television
service. However, benefiting from the now available experience, the Congress can further its expressed purpose of fostering a competitive nationwide television system by instructing the Commission to revise its table of assignments to conform to the newly available facts. It can stay the granting of additional VHF construction permits to St. Louis. Because of the large number of VHF receivers, there will be little incentive for the average television viewer to convert his receiver to view UHF channels when there may be several VHF channels available to him.

If the Commission grants construction permits to additional VHF stations in St. Louis, or other areas in the United States similarly situated, it will give these stations such a competitive financial advantage that it will deprive the people of St. Louis and the other areas of the widest potential choice of television programing. This pitfall can be avoided as the industry is still in its infancy. The problem is quite similar to that in the early days of the railroad industry when tracks of several gages were available, a problem which was solved on our continent by the adoption of a uniform track width. This problem still plagues the continent of Europe and militates against the best railroad service to their public.

We are in effect suggesting that in the community of St. Louis, and all other communities similarly situated, the Commission provided a standard "track" upon which all television stations can operate without competitive or other disadvantage.

We must keep also in mind the need of the present 600,000 television viewers in St. Louis that their present receiving sets be not made obsolete before they would wear out in the natural course of events. With that in mind, we believe that the presently operating station—which happens to be KSD-TV—be permitted to continue to operate for a period of 5 years by which time in the normal course of events the telesets in the community will have been replaced by their owners. Obviously, the replacement sets will be capable of obtaining UHF signals and most likely will be equipped for color also.

At the end of the 5-year period, KSD can then shift over to a UHF channel which can be reserved for it. This same plan can be carried out in any community where it is determined that the best allocation would be to permit all VHF operation. In that case, existing UHF stations can be transferred to VHF frequencies, if available, keeping one station on the air to service UHF viewers.

To sum up, it is believed that Congress can provide at this early stage in the industry for a broad competitive television system covering the entire Nation by amending the Communications Act to require the gradual elimination of the use of incompatible television channels in the same community. Both UHF and VHF can be widely used except when their incompatibility destroys their effectiveness.

Elsewhere economic problems will not reflect the engineering differences between UHF and VHF and all stations will stand or fall in proportion to their acceptance by the public service. The proper competitive system is where each television station competes for its audience on the basis of its service to the public and not on the basis of an unnecessary engineering advantage. The amendment suggested will accomplish the public purpose.

Senator Potter. Do you have any questions, Senator Bricker?

The CHAIRMAN. No further questions.
Senator Potter. Senator Bowring.
Senator Bowring. No questions.
Senator Potter. Thank you very much, Mr. Salisbury.
Mr. Salisbury. Thank you, sir.
Senator Potter. The committee will stand in recess until 2 o'clock this afternoon.
(Whereupon, at 12:17 p. m., the subcommittee recessed until 2 p. m., of the same day.)

AFTERNOON SESSION

(The hearing reconvened at 2 p. m., Senator Potter presiding.)

Senator Potter. The subcommittee will come to order.

The first witness this afternoon is Mr. Wilmotte. Is Mr. Wilmotte here?
Mr. Wilmotte. Yes.

Senator Potter. Mr. Wilmotte, will you identify yourself for the record, and speak as loudly as is comfortable, so the people in the back of the room can hear.

Mr. Wilmotte. If they don't hear me, maybe they will say so.

Senator Potter. Yes.
If you don't hear at this time or with any other witness, just sound off, if you will, and I will appreciate it.

STATEMENT OF RAYMOND M. WILMOTTE, CONSULTING ENGINEER, WASHINGTON, D. C.

Mr. Wilmotte. My name is Raymond M. Wilmotte, residing at 1517 30th Street NW., Washington, D. C. I am a consulting engineer with offices in the Warner Building in Washington, D. C. I am a member of the Radio Propagation Advisory Committee of the Federal Communications Commission.

My testimony will be directed first to the basic reason for the UHF problem; second, to the engineering aspects of the UHF problem, and, third, to the problem of the governmental control of engineering.

1. The basic reason for existence of a UHF problem:
There are a great many reasons that can be listed for the present unhappy state of the UHF television band, but most of them are merely manifestations of the one basic fact that under the rules and standards of the Federal Communications Commission, the service from a UHF station is more costly and not as good as the service from a VHF station. The facts are simple and generally recognized. Very roughly we can compare the relationship between the lower ends of the VHF band and of the UHF band from the following list:

<table>
<thead>
<tr>
<th>Ratio of power required at UHF over VHF</th>
<th>Decibels</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum signal intensity including antenna pickup to overcome set noise</td>
<td>12-19</td>
</tr>
<tr>
<td>Loss of power due to curvature of earth (at about 40 miles)</td>
<td>3-6</td>
</tr>
<tr>
<td>Loss of power due to trees</td>
<td>3-6</td>
</tr>
<tr>
<td>Loss of power due to shadows from obstructions caused by buildings or hills in rolling country</td>
<td>5-15</td>
</tr>
<tr>
<td>Total</td>
<td>23-46</td>
</tr>
</tbody>
</table>

While there may be differences of opinion as to the exact values properly applicable to the factors listed above, I believe that a rea-
sonable figure for the power ratio required at the lower ends of the UHF and VHF band for equal service areas lies between 23 db. and 46 db.

Senator Potter. What do you mean by db.?
Mr. Wilmotte. I am explaining it.
Senator Potter. Oh, I see.
Mr. Wilmotte. That is between 200 and 40,000 to 1. In other words, a UHF station to give about the same service, over a big area, 40 to 50 miles, would require about 200 times or 40,000 times the VHF, depending on the conditions.

Those figures are very rough, but if we are seeking really good service, such as this country can well afford to provide, it is apparent that we are not discussing ratios of power of 5 or 10 times, but of hundreds and thousands of times.

The reason I said "good service"—if you decide you are going to leave out some gaps, the ratio would be less. If you decide you are trying to eliminate as many gaps as possible, then the ratio becomes high.

So, to some extent, this ratio depends on the United States consideration of what is the standard of good service.

In terms of square miles of coverage, the difference is far less important, for a small change in power has relatively little effect on the area served as calculated by FCC standards.

It is not surprising, therefore, that except in very special circumstances, the UHF stations would not attract the best programs in competition with VHF stations. What is surprising is that anyone should be surprised that they do not.

The early start of VHF, ahead of UHF, is an additional handicap, one that had been expected and may warrant at this time other than engineering techniques, to counteract its effects. But unless the discrepancy in service between VHF and UHF is overcome at an engineering level, UHF will not generally be able to attract the good programs in competition with VHF.

2. Methods of serving an area:
There are broadly two ways of providing service to an area:
1. Transmit the program from a single station.
2. Transmit the program from several stations.

The first system is the simplest in concept, the simplest to administer, and the only one permitted by the FCC. The second is more complex, and is subject to many variations; the success of the system is more dependent on the ability of the engineer than on the rules of the FCC.

There are three ways of transmitting programs from several stations. They are:
1. Booster operation: 2. satellite operation; and polycasting.

It is the last one I wish to talk to principally.

In the first two types, specific effort is made to have the signals from the several stations fill in the gaps that the main station fails to serve properly. In polycasting, the service from the several stations is deliberately made to overlap. It is believed that considerable gain is obtainable by this technique, for it fills in both the obvious and big gaps as well as the little ones.

The reason for the gain possible by this system—that is, polycasting—is due to the fact that the signal at one point on the roof
of a house may give a good quality picture and at another point, only a few feet away, the quality of the picture may be so bad as not to be worth looking at.

If signals for a program come from several stations, however, it will be automatic and natural to install the antenna on the house so that it will pick out the strongest of the signals. If there are quite a few stations with the same program trying to serve an area, there will be very few points in that area where every one of the signals is weak, so that the strength of the signal actually used is much greater than if the signal were coming from one station only.

Statistical calculations have been made and presented to the FCC in 1949 at the hearings that were held during the freeze, and have been made part of this record, I understand. A summary of these calculations were also published in the proceedings of the Institute of Radio Engineers, in July 1951.

The results of these calculations are surprising. While they were made some time ago, I have no reason to modify them appreciably now. I believe the order of their magnitude is correct.

The calculations were based on an arbitrary theoretical arrange- ment of four small stations at the corners of a square, all serving the area within the square and a substantial area beyond it. It was found that the effect of ghosts would deteriorate the service too much, if only one channel were used. The arrangement was, therefore, to have the stations on a diagonal on one frequency and those on the other on another frequency, requiring two channels.

On this basis, and allowing for the loss of service due to ghosts, it was calculated that:

(a) Four stations each radiating a maximum of 2 kilowatts of power at a height of 300 feet above mean terrain, for a total of 8 kilowatts, would serve the same area as a single station of about 1,000 kilowatts radiated power at the same height. This would be true both for a relatively small area such as a city and its environs or for a large rural area, although the spacing between the stations would be different in the two cases.

Quite a few channels of this nature were given in the calculations. One of them I will refer to here, as referred to in (b):

Twelve similar stations suitably located, or a total of 24 kilowatts radiated, would serve the same area as a single station having a power of 200 million kilowatts.

In addition, this system produces less interference to other stations because the power is small, and the fading at the edge of the service area is less than with a single station.

It seems, therefore, that it is possible at UHF to serve a large area, larger than at VHF, and to serve such an area well and economically.

Polycasting can also be designed with a main fairly powerful sta- tion combined with one or more low-powered stations. It can be designed to serve a circular area or an oblong area. It can to a great extent be designed to fit the social and economic shape of the area to be served.

Senator Potter. Maybe you will explain a little later on, but I still don't know what polycasting is.

Mr. Wilmotte. Polycasting consists of using several small stations instead of one large one to serve one area.
Mr. Wilmotte. Requiring two channels?

Senator Potter. All on the same channel?

Mr. Wilmotte. Requiring two channels.

Senator Potter. Requiring two channels?

Mr. Wilmotte. Requiring two channels. I will go into that a little later on—requiring two channels to achieve what seems to be an economic and good service.

Senator Potter. Is that being done any place in the country today?

Mr. Wilmotte. It is not. It is not permitted to be done.

Senator Potter. It is not permitted by the Commission?

Mr. Wilmotte. That is correct.

Polycasting appears able to serve large, sparsely populated areas well. The several stations in such a case would be located in small centers of population so selected that the rural area between them would be well served; and, very important, the cost will be quite low.

Two kilowatts' radiation in power requires practically no sizable installation. You can plug it into the wall and have a gain antenna, and you can achieve that for relatively few thousands of dollars. You would still have, of course, at the main station your studios and the expensive equipment that goes with a studio operation.

In the presentation that I made to the Commission in 1940, I made an approximate arrangement of stations in two parts of the country, one in the Middle West, around Kansas City, and another one in the East, around New York and Philadelphia, and it is possible, according to my calculations, to give a large number of services all over the country, and each one of them—that is the point—each one of them would give the operator of the stations a very large population to serve, with the result that he ought to be able to receive adequate income to provide good programs—and by large population, I mean even in rural areas in Kansas, without big cities in the populations of a hundred, two hundred, and three hundred thousand, would be covered with relatively little cost.

Senator Potter. How far apart should these stations be?

Mr. Wilmotte. It will depend on the circumstances. The arrangements that I laid out—some were 10 miles apart; some were 5 miles apart; some were 40 miles apart.

Senator Potter. What was the Commission's reason for not permitting polycasting?

Mr. Wilmotte. The Commission, actually in its decision, at the freeze, said polycasting—I should quote it exactly, but it is in the report—should be experimented with and tried out before they could do anything with it; but, as it was, the engineers of the Commission seemed to be interested in it, but had a problem of how to allocate two channels throughout the country, which is much more difficult to handle than when you have just one channel to one person.

I think one of the main problems—and I will take that up later—is the problem of the extent to which the Commission must decide what is good engineering and what is bad engineering, to what extent they have to decide whether a system is possible or isn't possible, whether Washington is a good place to make that decision, or whether industry should make that decision by the normal method that industry uses in appropriating and applying new techniques.

Senator Potter. The two channels should be side by side, like—

Mr. Wilmotte. Not necessarily; preferably not, but again that could be arranged.
In the layout I presented to the Commission, there was one channel in between them, so that there would be little difficulty in separating them. I have the figures—I think I can give them to you later, if you would like them, but they are in the record, as to the number of programs that could be made when using the UHF band, say, from 600 to 750 megacycles, something of that order.

I am not saying that this system is the best for all locations under all circumstances, and that no better system will ever be devised; but I do say that polycasting shows sufficient promise that television broadcast operators should be permitted to make use of the system, if they so desire.

I will go further and state that any system which makes proper engineering use of several stations will give much superior service to that provided by a single station—that is, on the basis that the systems produce no more than a certain degree of interference to other service areas.

In my opinion, polycasting is likely to prove superior to the other two multistation systems—possibly not in every case, but in the majority of cases.

3. Government control of engineering: I would like to say first I think that is possibly the key problem that is facing the industry.

A key point in the above statement is the limitation that "proper engineering" must be used. That leads to my next point, the problem of governmental control of engineering. In this lies, I believe, one of the major causes of recurrent troubles. Flexibility is necessary for the evolution of engineering, for improvement of service. Flexible systems are also more difficult for the Government to administer.

What is the solution? Should we let engineering free to find better ways of providing better service, or should we restrict it, tell it exactly what to do, right down to what tubes to use, what size meters, even what clocks to use sometimes, and thereby make the administration detailed but simple?

In the past there has been but one answer to that question—make the administration simple and restrict the engineering.

The result is that any change in engineering techniques takes years and is very costly. There must be some rules and some restrictions, for the FCC in giving a license should see to it that with the license goes a responsibility of providing service to the public in the designated area and of producing not more than a specified interference in other areas. But surely it is in the public interest first to keep such rules to a minimum, and, second, to insure that such rules do not conflict or contradict in any respect laws of nature.

There is from time to time a very strong temptation to recognize only those physical facts that fit with desired policy or make the administration simpler. Whenever the full and all physical facts have not been recognized, the service to the public has eventually suffered.

We have examples of that in the regular broadcast end. In my opinion, if the FCC had not restricted engineering unduly, there would have been tried already many and varied types of multiple-station operation, boosters, satellites, and polycasting.

It may be said that the FCC permits and even encourages experiments on new systems. While that is true on the surface, the practical facts do not fully support this view. The actual situation is per-
haps best described by a conversation I had a few years ago with one of the top administrative engineers in this industry.

I was endeavoring to interest him in spending some funds in a study of what could be achieved with multiple-station operation. He asked me how much I thought it would cost and how long it would take. I said about $100,000 and 18 months. He replied something to the effect: "To which you should not forget to add $300,000 for presenting it to the Commission, and an additional 2 to 3 years for obtaining a decision."

The FCC cannot help this situation under its present operation. With its limited experimental facilities, its tremendous burden of detailed administrative controls, and its decision that it must say "Yes" or "No" to practically every engineering design, big and small, any change in rule is inevitably cumbersome and costly in dollars and time. Unfortunately, the economic process does not wait, and only the economically large can be expected to carry the burden successfully.

I believe that many of these problems could be solved and many would not even occur if the FCC released its excess burden in engineering controls. The FCC could and should change its point of view and free the operators as far as practicable to serve their areas in any manner they wish.

The FCC controls should be directed not to the equipment or system design that he uses, but to the public service that he performs. The FCC should then check that:

(a) Within the area assigned to him the operator provides an adequate service in accordance with the service standards established by the FCC and proved by accepted calculations or measurements.

(b) Without his assigned area, he does not cause more than a specified degree of interference, also proved by accepted calculations.

It is possible to establish such standards, such techniques of calculations and measurements. Such a procedure would free the operator and would reduce the engineering responsibility of the FCC to establishing the standards, the method of calculations and measurements, and to conform as accurately as possible with the requirements of service and the laws of physics, and to seeing that each operator carries out his license agreement to give service.

The more the FCC lays down in detail everything that the engineer must do in the design of the station, the more is the FCC responsible to the country for any problem that comes up, of poor service, poor economic conditions.

I don't see any reason why the Government should get into that problem at all. There is no reason. What the Government should do—they have a license; they have frequencies; they grant a license to use a frequency. The man who gets that and has the privilege of having that is responsible to the country to give good service, and the Commission should limit itself and its activity to see that he does so, not how he does so.

Right now the Commission doesn't see that he gives a good service. The Commission sees to it that he does it the way the Commission tells him to.

4. Conclusion: Basically, when the FCC grants a license it gives the operator something basic, a frequency channel. With it, he is told to
serve an area. But the license today gives also location, kilowatts, tower heights, et cetera. These last are not the property of the Government to give away, but the channel is.

It is very simple for the Government to make the UHF band attractive. It owns only one thing and that is the frequency. With a UHF license instead of 1 channel, it can give 2. With two channels the FCC will require and will obtain a better service within the area and reduced interference outside of it.

Effectively less than twice the spectrum area will be used up, for the stations on the same frequency can be put closer together, so that they can have more stations on a single frequency. Moreover, there are plenty of channels available in the UHF band for this type of operation, and I think my presentation to the Commission effectively proves that.

I, therefore, request the committee to consider the following:

(a) Providing freedom for the engineer, by limiting, as far as possible, the engineering controls of the FCC directly to service and interference, with a minimum of control on equipment and system design.

(b) Specifically permit an operator to operate more than one transmitter in his area.

(c) Grant two channels wherever possible and particularly in sparsely populated areas to operators of UHF stations.

The Government should have more trust in the American engineer. To bind and restrict him delays progress and leads to such problems as this committee is endeavoring to solve today. Tell him what it is desired that he should provide and in due course he will probably come up with something which, if not exactly what is asked, is very close to it or may even be better.

The concept of engineering by Government control is certainly not our ideal; it is probably the ideal concept in those other parts of the world with which we are not very much in sympathy.

I believe that the UHF problem will be solved in the long run only by permitting the UHF operator to compete in service with VHF. Other solutions may be temporarily needed, but they can only be temporary palliatives; and, above all, the solution of the problem must bring benefit to the public and not be obtained by some limiting legislation which prevents the public obtaining full use of our engineering abilities.

Senator Potter. I still don't understand polycasting.

Mr. Wilmotte. Sir, may I put it this way: You understand the present system. You have one station, and you transmit as much power as you are permitted to transmit from that station, at as high a level as possible.

Instead of that, you can take a number of small stations. You have one station associated with your studio, and you have a number of small stations at a distance from it. You pick up at these small stations the program from your main studio, from this central station. From each of these stations, you then reradiate that program from all directions and, instead of having a station in the center of this area, supposing it were this table you had to serve, you would then put, say, 4 stations—1 around halfway on the diagonal from the center, another 1 halfway on the diagonal from another center, and another 1—and you would have 4 stations at the corner of a square, or some
area which is desired, which is suitable, some location which is suitable for the area to be served.

It is flexible, in that the locations would have to be adjusted to the area, to the centers of population and so forth.

When you do that, this is what happens: Supposing you were taking a point near the center of these four stations; you had a house there, and you wanted to receive a program. You would automatically set your antenna in the direction of the station which had the strongest signal. From that, from pure theoretical calculations, you would say the chances of the signal from all the stations are about equal; but, as a matter of fact, if you do that, you will find not that they are equal, but at this one point the signals from all the stations are very different because the signal from one station varies from point to point.

A few feet away you get quite a different strength of signal. Now, if at every point you pick out the strongest signal, you can see that there will be very few locations where all four signals will be weak. It will be a strange coincidence. It will happen, but it will happen only relatively few times instead of relatively frequently.

So, when you are looking for a good location for 90 percent of the locations you want to serve, 90 percent of the locations you get a tremendous gain, not because of the fact you have more power, but you get a tremendous gain because of a selection of what signal to put out.

Senator Potter. Why would you need two channels?

Mr. Wilmotte. The need for two channels is for this reason; since you have several signals coming in at one point, you have a greater danger of ghosts.

You know what ghosts are, sir. You have an interference in ghosts.

Senator Potter. I have been living with them too much.

Mr. Wilmotte. I would appreciate that if I had attended the hearings as much as you have. This is my first appearance at these hearings.

You have a greater danger of ghosts, because you have ghosts coming from several directions—or signals coming from several directions.

Senator Potter. No pixies?

Mr. Wilmotte. I will have to be very careful of my wording from now on.

You have signals coming from various directions. So, you have an increased chance of ghosts. If you calculate statistically what are the chances of ghosts and reject the locations where the ghosts are too bad, then you find you deteriorate the signal when you have four stations all on the same frequency.

Senator Potter. Then two of your stations would be on one frequency and two on the other?

Mr. Wilmotte. So, if you have two channels that loss is changed into a very important gain. In fact, the gain, in one case that I calculated—well, several cases that I calculated—can be as much as a 100 to 1 in power. In other words, if you have these four 2-kilowatt stations, the effect here, if you pick out the strongest signal, would be the same as if you were receiving 200 kilowatts from one of the locations.
It is a gain which costs nothing, with no more kilowatts on the air, but effectively the receiver gets the same thing as though he had 200 kilowatts instead of 2 kilowatts to receive.

I think the statistics are reasonably correct. I believe they have been checked. I have been told they have been checked, and there may be questions as to the assumptions made, but I think the order is right.

Most of these things—

Senator Potter. These small stations pick up the signal from the control station?

Mr. Wilmotte. That is right, or some method of transmitting the program by radio relay, or some method like that.

Senator Potter. How does that differ from booster stations?

Mr. Wilmotte. Well, booster stations endeavor to serve the areas which are not served by the main station. You have a strong main station, and then you have a little town somewhere 30 miles away, which is under a hill, or there is a hollow somewhere, there is a river in the way, or there are lots of trees in the way, and the people are not getting the service there.

So, you set up a little station there to serve that little town, and as much as possible you try not to send a signal into the main service area. You fill in a hole in the service.

Now, when you do that, in my opinion, according to my mathematics, you have lost a great deal, because you have lost this chance of picking out the big, strong signal; you are just feeding in a little service here and there.

You can do that. You can fill that up everywhere. You may have a little town you want to fill in, but you are not going to put a little station merely because a farmhouse doesn't receive a signal satisfactorily.

That booster wouldn't solve that. Polycasting would tend to solve that. I don't say it will solve it in every case, but I think it will tend to solve it, and is designed to try to solve it.

In some ways that is why it is probably particularly important for large rural areas, where it is not economical to set up a lot of little stations with the booster type.

It is important to serve these areas, if we really want to serve the United States, and I don't know of any other way—probably some other ways will be developed, but today I don't know any other way of doing that except the system proposed by Westinghouse of stratosphere, having an airplane send the signals down.

If we are going to stick down to earth, as far as I know, polycasting is about the only way of doing it.

Senator Potter. This has been very interesting.

Senator Bowring. Mr. Chairman.

Senator Potter. Yes.

Senator Bowring. I would like to ask you to look at the map and the white areas, which I am particularly interested in. I have been sitting here for several sessions of this committee wondering what we are going to do out there.

For your information, Mr. Wilmotte, I am from Nebraska, and from the northwest part of Nebraska. I have looked at yellow spots, red spots, and blue spots, and unfortunately, I don't find any spots
in my area, and I am wondering how we are ever going to get television out there.

I wonder if someone has an answer to that. Now, we have a station at Denver, Colo., and a station at Omaha. Where I am located, I am about 350 miles from either one of those. If one is put in at Rapid City, S. Dak., it will be about 200 miles from that.

Now, will polycasting serve my need there? What have you to suggest that would take care of that area? I didn't hear all of your testimony. Unfortunately, I was delayed in coming in and then interrupted after I came in.

I am beginning to wonder if there is an answer to our problem. Unfortunately, we can't take that part of the United States and lay it outside of New York City. It would look like we might get some programs if we could.

Mr. WILMOTTE. This is a sort of horrible thing to give to you, but may I give it to you just the same?

Senator BOWRING. Yes.

Mr. WILMOTTE. This is a layout that I worked out for the area. It is in the record, as a matter of fact, I believe, isn't it?

Mr. ZAPPLE. Yes.

Mr. WILMOTTE. It is in the record, but here it is.

All these circles, all these lines, represent an area served by polycasting layout.

Senator BOWRING. Is this economically feasible?

Mr. WILMOTTE. Well, this is the approximate population served by one polycasting system, the rural service, and in Illinois the population would be a hundred thousand; Iowa, 200,000; Kansas, 105,000; Missouri, 150,000, and Nebraska, 66,000.

If it is economical for an operator, taking Nebraska, to serve 66,000 person, then polycasting is economical. Polycasting is a lot cheaper to set up than some of the stations that are built to serve towns even today of less than a hundred thousand. So, I presume it could be economical.

It is not my business to run a broadcast station. It is my business to know something about the engineering of it. However, it does seem to me to be economical on the basis of these figures, and I will be glad to leave this with you.

Senator BOWRING. Thank you.

Mr. WILMOTTE. If you wish to have it.

Senator BOWRING. Yes.

Mr. WILMOTTE. These are the number of channels—table 3.

I am referring, by the way, to the paper in the Institute of Radio Engineers, July 1951. Table 3 gives the number of channels required in these various areas, and table 4 gives the estimated population covered by each polycasting system.

Senator BOWRING. Thank you.

Mr. WILMOTTE. Here is the area around New York. That was the two typical areas—one sparsely populated, and one overly populated.

Senator POTTER. There has been no pilot study made of this?

Mr. WILMOTTE. No, there has not been.

I gave you the reason, I believe, in my story.

Senator POTTER. Yes.
Mr. Wilmotte. That it is an expensive process—not to do so much with a pilot study, once you have done it, but getting anything done with it.

Senator Potter. It has been an interesting discussion.

The next witness will be Mr. Tenenbaum, of Station WTVI, St. Louis.

Mr. Wilmotte. Thank you very much.

Senator Potter. Thank you.

STATEMENT OF HARRY TENENBAUM, SECRETARY, TELEVISION STATION WTVI, BELLEVILLE, ILL.

Senator Potter. It is good to see you again.

Mr. Tenenbaum. Thank you.

Senator Potter. You may proceed, Mr. Tenenbaum.

Mr. Tenenbaum. My name is Harry Tenenbaum, and I am secretary of Television Station WTVI, Belleville, Ill., serving the greater St. Louis area, the ninth market in the United States.

I think testimony was given yesterday that one VHF station, Senator Potter, served either 7 or 11 States, and I have no apologies to make to Mr. Conn for serving an area 6 miles from our tower. I am treasurer of Ultra High Frequency TV Association, and member of the Ultra High Frequency Coordinating Committee.

My area, St. Louis, is the largest UHF market excluding Pittsburgh.

A few weeks ago an operator of a North Carolina UHF station, who numbers among his stockholders several wealthy associates, came to me and asked what difficulties we were having in operating a UHF station in the St. Louis market. We had quite a lengthy conversation. At the conclusion this very fine southern gentleman turned to me and said, “Mr. Tenenbaum, I know how we’re gonna cure our U troubles; we’re going to buy us a V.”

One could well believe that this is the solution of UHF if judged by several articles which have appeared since our last hearing to the effect that these hearings are only being held because a few UHF operators, who never should have been in television, are losing a lot of money and are coming to Washington asking for help.

Too much of our money and sweat has gone into our almost superhuman efforts in developing the upper spectrum for us to willingly accept the designation “sucker.” We prefer to be known as pioneers who were courageous enough to accept in good faith the proposition as laid out to us by the FCC, one of the most important bodies in government. After deliberations lasting for 3½ years, they offered us an opportunity to participate in the development of television, and we put into practice what they gave us as their honest conclusion.

We are not here with our hand out. Very simply, we give to you a record of what we have done, and ask the question: Is ultra high frequency necessary for a highly competitive nonmonopolistic systems?

If not, we ask only that you tell us so.

If it is necessary, we ask that we be given the opportunity to exist under conditions that are fair and equitable.
At the outset I want this committee to know that WTVI has no intention of going out of business. If it takes 50 times the effort that our competitors operating in the VHF band require to make our station an outstanding one, we are willing to make this effort. However, what we fear is that the development of the spectrum as a whole can die and, although no fault of our own, we can be destroyed with it.

Several weeks ago the committee heard testimony of many operators who stated that they were suffering large losses, and also that if UHF would become in television what FM was in radio the public would have lost in a very short time considerably more than one-half billion dollars.

Is this the issue that brings this important body of the Senate into session?

If the problem before you could be solved by the economic death of a hundred or so UHF operators and the acceptance by the public of its present loss, it would in no way justify our taking the time which you Senators have so graciously given us.

You have had much testimony in your two hearings, and will probably have considerably more, to the effect that the UHF operators are before you only in self-interest; that we would seek to damage many for the benefit of a few; that we got into television expecting immediate rich financial rewards; that we desire to bring the whole industry down to our level with irreparable harm to the public and to our Nation. The substantiated testimony that I will give you is in direct refutation of these points.

I would like to assure this committee of one thing: I am not appearing before you today as a representative of a fraction, splinter, or special-interest group. Unless my cause and the cause of my community is part and parcel of a much broader national issue, it is not worthy of your interest or concern.

Mr. Chairman, I think the real reason we are here today is brought about by a fact, the unfortunate fact, that guided by the sixth report, approved by the FCC, we have been going down the road of television and now find that the plan which was conceived in theory and administered under political practicality has, in actual practice, proven to be a failure, a failure that will, if left uncorrected, destroy 85 percent of the television spectrum, and in so doing destroy forever any possibility of a truly competitive national television system.

We have come to a sign at the crossroads which tells us that we should stop, look and listen, a sign which clearly tells us that we have been on the wrong road and to continue would assure the failure of our mission to establish on a sound basis a national television system worthy of the American people.

The final allocation plan was conceived in theory and adopted by the Commission with an honest hope that such a plan would give to the people a truly national, competitive, nonmonopolistic television service.

Now, after experiencing actual operations under the plan, it becomes apparent that the hope and theory are not working out in practice.

It is my contention and firm conviction that certain practices that brought about a change in the processing structure and provided a climate for midnight mergers have accelerated the effect of the bad features of the sixth report. At any rate, to all intents and purposes, we know now without fear of contravention that intermixture in a
market like St. Louis is not working out as originally contemplated by the sixth report.

If UHF has proven to be a failure, despite the loss which has been incurred up to this time, the Commission should have the courage to say, "We have made a mistake; we can get a truly competitive system without UHF."

On the other hand, if a truly competitive system requires the use of the UHF spectrum, then I hold that a new plan, benefiting by actual operating experience, should be conceived. This, too, would require great courage, a courage which would recognize that a mistake had been made, a courage that would not let the public down even under pressures of the highest order.

Intermixture was a basic mistake. I do not hold with those who say VHF does not have a purpose and, therefore, move everything to UHF, but I do say that intermixture of the two has failed and that steps should be taken immediately to correct this.

I think Dr. Du Mont should be complimented upon the report given this committee at the last session. My impression of the Du Mont report is that it provided a crystal-clear picture of how necessary it is that we have a healthy climate for the UHF band. I think it is a report that should be read and reread.

Although I heartily agree with the factual portion of the Du Mont Network presentation, I cannot agree as to the effectiveness of any of its remedial conclusions.

We are traveling too fast in the wrong direction to be able to straighten ourselves out without first coming to a full stop.

At the last hearing we asked that an immediate freeze or chill be put into effect.

Every day, with new grants coming into intermixed markets, makes the task more difficult and I will show in detail the effect of this in ours, one of the major markets.

Station WTVI, channel 54, Belleville, Ill., serving the greater St. Louis area, the ninth major market in the United States, received its construction permit in November 1952, and went on the air August 10, 1953, as the first UHF station in this market competing with channel 5, the one VHF station that for 6 years had been the only television service in the market. At the time we went on the air only a few sets were equipped to receive a UHF signal as against 550,000 able to receive a VHF signal.

UHF station KSTM, channel 36, came on the air in the fall of 1953, and UHF station KACY, channel 14, came on the air in December of the same year.

The three UHF stations, together with the FCC approval of construction permits for channels 30 and 42, gave promise that St. Louis would become the capital of UHF. By January 1954, the three St. Louis area UHF stations were operating on the maximum power available, providing truly competitive television service to an area inhabited by over 2 million people.

In that connection, permit me to say that the present available power is adequate to do a thorough coverage job in the St. Louis area. We were not restricted because of a lack of transmitter power. Channels 4 and 11, both VHF, were in contest as provided for in the Federal Communication Act of 1934, and had not a change in the rules under which grants were made been put into effect by the FCC these
competing channels would not have come into this market for at least 2 years after the UHF stations went on the air.

The change of procedure to which I refer is the moving up in the hearings of those cities which already were receiving television service, and the shutting of the Commissioners’ eyes to the circumstances under which mergers were made by payoffs in order to secure a quick grant.

WTVI has a base affiliation with the Du Mont network. We also have a per program agreement with the CBS network. We now carry approximately 50 percent Du Mont and 50 percent CBS network shows.

Channel 36 has an ABC affiliation with the same CBS per program agreement.

Channel 14 was dependent on film and local live talent.

We brought to the St. Louis public for the first time programs they had never seen. We carried major sports events and programs of public interest, such as the McCarthy hearings which are now carried exclusively on our station, having been dropped by the two major networks.

Senator Potter, I don’t know whether carrying the McCarthy hearings is in the interest of the public or not.

Mr. Tenenbaum. Well, it is amazing, Senator. Strangely enough, we get calls from women that have formed parties that want to see the hearings; and, while you might think it was because it might be sensational, I think you hear so many remarks that they at last get a chance to see their Government in action.

Senator Potter. I hope they don’t think that is typical.

Mr. Tenenbaum. Well, I say maybe that is good, too. If they saw them at the best, then maybe they would just pass it over.

Baseball interest is high. For the first time in over 50 years St. Louis is a one-major-league baseball city, the American League’s franchise having been sold to Baltimore, and we carry on our station the 77 Cardinal away-from-home games which, in effect, means that when the Cardinals are away a UHF station becomes the home team.

I would like to point out, Senator, Madam Senator: the sponsors of this program, Anheuser-Busch, spend about a quarter of a million dollars to put that on a UHF station over a period of 5 months. We have local acceptance.

Senator Potter. I imagine by carrying the baseball games, you received a lot of conversions as well.

Mr. Tenenbaum. That is one of the principal reasons we wanted it. It has given us a tremendous stimulus.

With this stimulus, and aided by the fact that there were 2 other UHF stations operating, which meant that of the 4 stations on the air 3 were those with a UHF signal.

I would like to emphasize that for a minute, if I may: that the 3 out of 4 in St. Louis were UHF, and we were off to a big start.

From a standing start, we have converted approximately 250,000 sets as against the 600,000 which can now receive a VHF signal.

Citizens of St. Louis have spent in excess of $25 million in order to receive UHF stations.

I would also like to point out, going back a little bit to the McCarthy hearings, Senator, whether or not our signal is satisfactory and whether or not a UHF station is accepted, whether people in the
community can learn to like a UHF station. The V there ran the McCarthy hearings at the same time we were running them, carrying the Du Mont network. We were showing the same show at the same time and, although they had 632,000 sets, which they claim to have, and we have 250,000 sets that can only receive our station, in a national rating they received a rating of 12 and we received a rating of 6. In other words, if our signal would have not been good, everybody could have just turned onto the other station; but it showed that people turned to look at our station. The signal was satisfactory. WTVI stockholders have put cash to the extent of $828,000 into the station and over in equipment notes approximately $250,000, which represents an investment of over $1 million, and will have to put in additional capital in order to render further UHF service to a quarter of a million homes who have converted. Losses since inception are slightly under $400,000. Somewhat less than half of these losses were incurred before the station went on the air, and the balance has been lost in operations.

Senator Potter. How long have you been in operation?

Mr. Tenenbaum. We have been in operation since August 1953, but we had our permit in November and began to form our operation, began to spend money for promotions and get ready to do a first-class job in St. Louis.

Approximately $85,000 was expended by the station in the promotion of UHF in this area. In this connection I would like to offer for the record, as exhibit A, a sample of the promotional activity initiated by my station.

It might give you an idea what conversions cost and so forth.

Senator Potter. This is it?

Mr. Tenenbaum. That is it, sir.

In December, despite the fact that we were heavily in the red, we junked our 1-kilowatt transmitter and installed a 12-kilowatt transmitter, the highest power transmitter obtainable, at a cost of $200,000.

After 9 months of operations our station, WTVI, reached the break-even point during the month of May 1954.

At this point I would like to comment on statements I have seen many times by those who are interested only in VHF operations, making comparison of the early operations of VHF to UHF and the losses incurred at that time. Such a comparison is odious, unfair and dishonest. True, in the early days of television, those who were bold enough to pioneer suffered losses in some ways comparable to those we are now incurring in the UHF band. There are basic differences though. In those days they were operating for the most part without competition on severely restricted schedules. As has been previously stated before this committee, the early VHF television pioneer was working from the bottom up. Each day he could see an improvement and today's losses could be overlooked because of the eventual assurance of a prosperous tomorrow. You could actually see a day-by-day improvement. Such is not the case with UHF.

In the beginning a large percentage of our revenue came from national advertisers. It is a strange paradox that as our audience became bigger and bigger our national business diminished.

Much has been said on this subject by those who have testified before, and I have no desire to be repetitious.
By hard work and at a cost of many hundreds of thousands of dollars, in a very short span of time we have converted 250,000 families, and are well on our way to making UHF a success in the second largest city in the United States that is an intermixed market.

For this accomplishment, we have been rewarded by almost complete drying up of our national advertising revenue and potential loss of network programing sources to our unfairly favored competitors.

It is bitter experience to see the national advertising agency time buyer ignore a UHF market in St. Louis of 250,000 sets and buy at an even higher rate a VHF market one-half the size of the St. Louis major market.

May I point out that the Commission's rules were firmly fixed for early-day VHF television, and when it became apparent that the early rules wouldn't work there was a freeze which, among other things, gave the early VHF operator complete protection against competition for a period of 3 1/2 years. The present protection of the UHF operator in an intermixed market is limited to any 24-hour period, for that is the length of time in which a "collusive" agreement can further load the scales against the UHF operator's ability to survive.

When we first read of the announcement of these hearings, it was like coming to an oasis in a desert. Our hearts leaped at the thought that you Senators were aroused and were aware of the fact that all was not well.

We also recognized that the announcement of these hearings created an instant danger for us in the way of quickie mergers.

You, Senator Potter, I am sure will remember that I made a special trip to Washington to see you and some of the Commissioners. I told you at that time that I had heard rumors of a quick merger on channel 4 in our city, and I asked you to request that the Commission hold up any quickie grant until such time as these hearings were concluded.

In the St. Louis area, public interest did not require a quick grant. We were giving the public fine programs and major league baseball to boot. Our services were good enough so that the St. Louis Post-Dispatch, operator of V channel 5, were public-minded enough to sponsor the McCarthy hearings on our station, a UHF, in that their network had discontinued the telecasting of these hearings.

I think of necessity this committee must take cognizance of important evidence that has not as yet been entered into the record, namely, because of fear that this committee would recognize the chaotic state of the television industry and do something about it, applicants in two major cities have entered into quickie midnight mergers in an attempt to grab their construction permits prior to any remedial action brought about by the suggestions of this committee. These two major cities perhaps held the brightest promise for UHF in the United States. One was Milwaukee and the other St. Louis.

My reason for emphasizing that is that I am a firm believer that if you will make UHF strong all of these competitive situations and all the economics, if they think we are going to be strong and we are going to live, will solve a great many of our problems; but if they think we are dead, and with color coming in and with personnel of
that caliber at a premium, if they think UHF is going to die, regardless of any promises they make anybody, it will die with us.

We opposed the St. Louis merger. I do not desire to try the case before this committee, but in truthfulness I must say that in connection with the grant of channel 4 in St. Louis the competing applicants introduced something new in the realm of payoffs—stock options worth over $2 million given to the applicants who withdrew. As I pointed out before, there is a good chance this alleged merger would not have taken place without the impetus of the announcement of these committee hearings.

The net result of the St. Louis get-together is to turn VHF television over to the morning and evening newspapers.

I contend that this is part of the present national pattern in which all television is gravitating to the control of the few.

In that connection, if I may point out this: that the St. Louis Post-Dispatch newspaper, evening newspaper, which several years ago bought out the Star-Times, which was also an evening newspaper, control the television station and control the best radio station—one of the best, I might say.

Now, with this new merger, this brings the morning newspaper as a major stockholder in a radio station, KWK, and as a participant under this stock option deal in another radio station, one of the largest there is, Station KXOK.

Now, the owner of this station, the Roberts family, has merged in with this new television radio and has sold or, rather, is contemplating selling the interest to his son.

Senator Potter. That seems to be a national pattern, the ownership being pretty much centralized with the newspaper ownership, radio ownership and TV.

Mr. Tenenbaum. Right.

I think it represents—well, for one, I will tell you there is no finer family than the people that control those stations in this country today; yet, we don't have the assurance they are going to be here many years from now, and control can gravitate.

I think it is a danger.

Many remedies have been suggested to this committee. In contrast you will find those I advocate few in number and concise in application.

1. There must be an immediate freeze: This committee has heard overwhelming evidence that there is something drastically wrong with the television industry in the United States. Common sense dictates that there must be an immediate cessation in the granting of licenses until this is corrected. If it were possible to freeze television grants in this country for 3½ years when there were only 108 stations, certainly it can now be done when most of the Nation is receiving at least some kind of television service.

2. Study: A considerable portion of the industry testimony before this committee has been to the effect that the basic cause of all of our troubles is the intermixing of VHF and UHF stations in the same viewing area. The aforementioned freeze will make it possible for the best minds in this country to devote the time necessary for a complete study of the present allocation system and its results. They will have as an advantage the use of the operating experience since the issuance of the sixth report as a laboratory.
The future of television is in your hands and I am confident that the end result of an immediate freeze and study will be to find a solution that will result in the proper use of all of the peoples television channels in a manner that will assure the greatest good for the greatest number now and in the years to come.

Thank you for the privilege of appearing before you, sir.

Senator Potter. Thank you.

Do you favor the multiple ownership bill, which will allow some of the V operators to—

Mr. Tenenbaum. Yes, sir; I am for it, and I will tell you why.

Senator Potter. You are for it?

Mr. Tenenbaum. I am for it, where they will come into a mixed market or come into a market, whether it is two or three or four stations, because it follows along with the fact that if the manufacturers of equipment know that it will make UHF stronger, it will give it a stability, then it will. I think, hasten the day to where a sensitive receiver will come onto the market, and I am for it.

I think that where you have competition you do not have monopoly.

Senator Potter. Senator Bowring.

Senator Bowring. No questions.

Senator Potter. Thank you for your statement.

Mr. Tenenbaum. I have had a request to tell of specific instances of cancellation of programs by agencies.

Would you like to hear about that?

Senator Potter. Yes.

Mr. Tenenbaum. I imagine one is this: We have been carrying a program that comes to us sponsored over the CBS station, the Jackie Gleason Show, and before even the second V comes on the market the first V, the one that is there now, the only one, went to the sponsors of this program and, while the show comes over live at 5 o'clock on a Saturday night, they are taking it off our station and putting it on a film and running it at 4 to 5 the following Saturday and removing the Cisco Kid and a few kids programs for this station.

That is one instance of it.

More important, I think, is this: We have to anticipate if this V grant is allowed—we are contesting this grant and protesting to the FCC this grant, and they are busy at home—while we are having these hearings, Senator, they are busy constructing their station.

They had, we feel, part of it constructed illegally before they got their grant, but they are trying to get a deadline of July the 1st in order to be on the air, because once they are on the air, then they feel maybe they can't be removed, regardless, although they are proceeding at their own risk.

In anticipation of losing our programs—and, as I said, we intend to stay in business until they bury us—

Senator Potter. Do you think they will pick up CBS?

Mr. Tenenbaum. I do not know who they will get. There are a lot of rumors. We know they will get some affiliation.

If they are given the same agreement with CBS that we have, which is a per program agreement, then CBS is faced with the fact
that sponsors will come to them and say, "Here, we can get time on a
V; we want to get off," and then we will lose our programs.

We hope it isn't true, but, nevertheless, it is a great possibility.

To try to find a way to stay in business, compete, because we have
got a good start there in St. Louis—in Chicago there was a package
of films which recently came on the market. There are a lot of films
that are available, but mostly old runs, reruns; but there was a
package of 30 films that came into the market, films, I believe, that
were made from the year 1950, with name stars that would be attrac-
tive. Those films were offered to the V station at approximately
$1,500 a film, which anyone in the room will tell you that any U
operator that will buy them has lots of courage.

Senator Potter. I have heard a lot of good talks about these good
films. I must watch my television at the wrong time. I either see
films that are made in 1920 or foreign-made films.

Mr. Tenenbaum. Well, in St. Louis you will see them. We will
have more of them as we lose our network.

These films were of the highest caliber available, and even though
we are a U, and even though the price—and there is a great difference
in price sometimes for these old films that you are referring to when
they are run on a V and run on a U. If you have a third conversion,
you may get them at a third of the price.

They offered them to us for $45,000, which is $1,500 a film, and we
accepted them; and by the time we went back to get them they had
offered them and had sold them to the new channel that is coming on.

So, it is a business that you never get a break in, and as a U operator
it is a pretty tough deal; but we can live in St. Louis, all of us, all U's,
and if a major network would buy one of those U's, I would tell you it
would be the greatest boom to St. Louis, because we would get con-
versions.

We don't want to destroy competition. If they came in as a U, or
any more deserving person got the channel—if it was a U channel, we
would still live and we would develop U in St. Louis to the extreme
that it can be developed, and we would ask for no quarter.

It is only the fact when you bring a V in quick you completely
smother us, and all I have to do is put you in the same position, or
most people. If you don't have to convert to get the major programs,
then we have got to get you converted by putting the mayor of St.
Louis on, which we have got coming on our station; we have got to buy
these fine films; we have got to do something.

By bringing a V in quick, you smother us before we have a chance
to live.

We are going to stay in business today, even though maybe we are
going to be smothered; but we are going to give it a good college try.

Senator Potter. Thank you.

The advertisements which you have attached to your statement will
be made a part of the official files of the committee.

Mr. Tenenbaum. Thank you, Mr. Chairman.

Senator Potter. Mr. Kersta.
Mr. Kersta. I am Noran E. Kersta, vice president, general manager, and part owner of the Tri-County Broadcasting Co., operators of UHF station WFTL-TV, channel 23, and WFTL, an independent radio station operating on 1400 kilocycles with 250 watts. The stations are located in Fort Lauderdale, Fla.

Description of the market: Fort Lauderdale is situated between Miami and Palm Beach and is also in the approximate geographic and population center of the Gold Coast strip of Florida which extends from Miami to Palm Beach. The market is approximately 75 miles long and 5 to 7 miles wide. In this area there are between 900,000 and 1 million permanent residents.

Senator Potter, I would like to interject here that our rural area to the west consists of alligators and our rural area to the east consists of sailfish.

Senator Potter. You don't think they are apt to convert?

Mr. Kersta. No, but all the people living in that region.

Recent statistics indicate that Fort Lauderdale is the fastest growing city in the United States.

Lack of experience not the reason: Statements have been made that the lack of experience of UHF operators has been a major factor in their failure to compete against entrenched VHF stations.

During the course of these hearings I have heard a number of pioneer AM and TV broadcasters who are now UHF broadcasters tell of the plight in which they find themselves in trying to exist in an established VHF market. They are experienced broadcasters. They have been successful broadcasters. They have served their areas and the industry faithfully and well over many years.

I disagree with generalized statements that the lack of know-how is the factor causing the predicament in which UHF broadcasters find themselves.

Past experience: I have been associated in many phases of the broadcasting industry for 22 years. With the exception of wartime service, I have devoted my formal training and business activities to this industry. Practically the entire span of this experience has been specifically in television.

I was associated with the National Broadcasting Co. for 17 years. There I served in many capacities, including director of television for the National Broadcasting Co.

I was a director of the original Television Broadcasters Association which eventually merged with the NARTB.

Upon leaving NBC, I was vice president in charge of television and radio for a New York advertising agency that billed approximately $20 million a year. Television and radio accounted for about one-half of this. I was also a member of the plans board of this agency.

Prior to my association with WFTL-TV in Fort Lauderdale, I conducted a television consulting service under the name of the Noran E. Kersta Co. This company served 20 clients in television, both in the United States and Canada. The service included all factors pertaining to station operation. It did not include consulting engineering or legal work.
Why we went into UHF: I list here some of the reasons why we proceeded with a UHF station. The market was studied thoroughly and the decision rested on certain facts and information which we were led to believe were valid:

1. First of all, there were no VHF channels assigned to Fort Lauderdale.

2. The principals of my company were inspired to bring to the people of our area the finest in television service and to offer a choice of programs. There had been but one service in the area for years.

3. Statements indicated that the FCC was aware that UHF required opportunity to compete successfully with the then-operating VHF stations and that official steps and procedures would be followed to carry this out. However, we all know the story of pressures to expedite the granting of VHF stations that distorted the original philosophy, along with the advent of dismissals and mergers of one kind or another.

4. Equipment manufacturers predicted rosy futures with higher-powered UHF transmitters. In our own case we chose to purchase RCA equipment. In negotiating with RCA sales representatives, the dates of possible delivery of higher-powered transmitting amplifiers was delayed time after time. Also, in the quest of getting specifics as to the equipment and its power capabilities, answers become fuzzy. RCA kept talking of a 10-kilowatt amplifier. However, General Electric competition apparently forced RCA to redesign and rerate, and the talk gradually drifted to an amplifier of 12 1/2 kilowatts.

As the matter now stands, our last conversation resulted in the statement that if we put our order in immediately for a higher powered amplifier, we would be in line for delivery sometime in the fall.

In endeavoring to find out whether a still higher powered amplifier would be available, the information has indeed been very sketchy.

From statements made to this committee, from our own experience and based on FCC studies on power requirements to match VHF coverage, we know that an amplifier in the order of 12 1/2 kilowatts is not the answer for us. For example, our VHF competition claims coverage over 15 counties. Hence, in this area of competition, our efforts have been thwarted.

5. At the time we started, we were well aware that the networks were competing for time segments on the then-operating stations. Network programs either were not carried at all, or were being carried in the low-audience periods. We felt that the networks and advertisers would welcome an opportunity to obtain time in periods where the maximum number of people could enjoy these programs. Time proved that other factors entered the field, and this expectation did not materialize.

Later on I will discuss some of these factors.

Difference between early VHF and UHF operations: We have heard that there is nothing unique about the inability of UHF operators to operate successfully because in the early days VHF operators also lost money. This is a gross generalization and skirts the facts.

Early VHF stations did not have the competition from other stations in their markets with 18 hours of programs a day and $50,000 to $100,000 program features.

What early VHF station had to compete with 10 hours a day of national feature programing supplied by 4 networks?
The state of the art today is such that the complement of broadcast equipment required to produce the type of service which the public expects far exceeds the capital expenditures ever dreamed of by the early VHF operators.

An interesting thing, Senator: I heard one of the stations in New York for their application for VHF when they started was $10,000.

Most of the early VHF stations broadcast but a few hours in the evening until revenues justified extension of the broadcast day.

Network cable connections and the increasing availability of film packages and national advertising made programming and profitable operations easier. Also, the entire labor situation was different during the inception years of VHF television compared with what UHF operators are faced with today.

Senator, I might say in some large UHF operations they have more unions than some of the early VHF operators had employees.

In addition, the FCC regulations invoking the freeze provided these stations a 4-year period within which to run free of any threat of competition in any majority of markets.

The situation facing UHF operators today bears no resemblance to the financial requirements, competition, or beneficial Government regulations that existed for the early VHF operators.

Description of station and its operation: Our UHF installation has been recognized by many as being one of the most efficient and well-equipped UHF stations in operation. Our first year of broadcasting has just ended. We have given our audience the best possible service through film, live production, and such network fare as we have been able to acquire. The acceptance which our station received from our audience has been most gratifying.

Senator Potter. What about network?

Mr. Kersta. We come to that, Senator.

We were the recipient of a recent TV Guide gold-medal award for programming in our district, which includes Miami and Palm Beach. We have received other awards and numerous letters which evidence our success in serving many area and national projects. Our efforts in educational TV have been singled out as outstanding in the country as to time segments provided, production assistance to our school system and general cooperation and promotion.

Quality of signal: I concur in the statements made at these hearings in regard to the good quality of UHF reception in the home. I have observed the progress of TV quality from its experimental laboratory stages through to its present standards. It is my observation, and I have had concurrence by experts in the field, that we have as fine a picture as the art has commercially delivered to date.

The UHF signal in our area is impervious to electrical noise, whether manmade or natural. We have not observed airplane interference nor interference from other stations. By comparison, the VHF signal in the area has been affected by many types of electrical disturbances.

I might say there, Senator, our area consists of single-story homes, where the antennas are close to the roads, and so on, and it seems to me, from my experience and observations, automobile ignitions are more serious where you have a whole series of one-story homes and where antennas are relatively low; and also—and I am not an expert at this, but I think—there are certain effects that occur on the power-
lines, a sort of corroding effect, due to the atmosphere, temperature, humidity, or something. Again, I don't want to pose as an expert, but there is something going on down there.

The air route, Amber Seven, passes directly over our market and VHF reception has been subjected to much airplane interference in that the Miami International Airport is one of the busiest airports in the world.

I think it is the second busiest, next to Chicago.

I submit here a series of photos taken in our area showing the interference which VHF channel 4, Miami, receives from Cuban stations. This interference occurs quite frequently, depending on atmospheric conditions.

It can be noted from the photos in exhibit A the type and seriousness of VHF cochannel and adjacent channel interference from this source. The exhibit shows such interference received in our area on VHF channels 2, 3, 4, 5, 6, 7, 9 and 11.

Of particular interest is the difficulty caused on Channel 4, the VHF station presently operating in our area. There are times when channel 4 is completely blanked out and the station is forced to make audio announcements in an effort to explain what causes the interference, at the same time asking the people not to call in to the station because it is beyond the station's control to rectify.

We come into our share of the blame because people think we are causing the trouble with our station, which, of course, is not the case.

I would like to refer you to these photographs, Senator. They are in sequence, from two through the numbers I mention, and if you turn to the second page there, in the top photo you will see the interference on channel 4. That was the picture, and, incidentally, that is as good as it was that night, of the Pabst fights, I think from St. Louis; and this was the Cuban interference—other pictures were taken on the same evening—and you can see the quality there was as good as the quality you could photograph from a local station. So, it takes practically the entire span of the VHF allocations or possibilities.

Cochannel and adjacent channel VHF interference does not only invade our area from Cuba to the south, but also from the north as presented in exhibit B. The exhibit contains a list of distant station reception as recorded on May 26, 1954.

Senator Potter. You get interference from Baltimore down there?

Mr. Kersta. Yes, sir, and also, I must point out that this was received on the back end of a highly sensitive antenna, faced away from the north, or toward the south, toward the Miami station, and this reception—and this was just taken quickly on a Polaroid camera by an amateur who knew nothing about the settings; but if you want to scan down some of these distant receptions—this is just a staff report here—there was WCBS-TV, channel 2, New York—and, of course, they identify the commercials and the shows; it was perfectly readable, and then we have "Mother's Movies" from WSAZ-TV, channel 3, Huntington, W. Va., and there were commercials which mentioned Myers Storage Co. of Huntington and Borden's Coffee Spot, and so on; and WLW-D, channel 2, Dayton, Ohio, with Valspar, and a Mr. District Attorney promotional announcements; and WCIA, channel 3, Champaign, Ill.

Senator Potter. You even pick up Detroit?
Mr. Kersta. We have Detroit, and Louisville, Ky., and Baltimore—and again on the supposedly dead end of a highly sensitive, six-element Yagi antenna, faced in the opposite direction.

I do not know whether this is a condition that is unique to this one subtropical area of the United States. I have submitted the Cuban interference photos for analysis to the National Broadcasting Co. I was informed that an increase in power of the local VHF station should overcome this "other station interference." However, the stations that are interfering with channel 4 are either building more power or can be expected to increase power, in which case the relation between the 2 signals would be the same, and it is my opinion that such interference will ever be present in southern Florida. Of course, Cuban TV does not come under the regulatory powers of our FCC.

Conversions: I have heard from various witnesses at these hearings the techniques used to promote conversions to UHF. To avoid laboring this testimony, please accept the fact that the methods you heard of, along with others, were used by WFTL-TV to achieve as rapid a saturation of UHF conversions as possible. The success of these efforts are borne out by a recent report which stated that our county showed up as among the top four counties with the highest UHF saturation among other counties in the country with VHF competition.

Channel allocations in the area: Mr. Loewi, operator of the other UHF station in Fort Lauderdale, told you of the number of VHF and UHF allocations in the Gold Coast strip. There are 5 commercial VHF channels and 5 commercial UHF channels. One VHF and three UHF stations are now operating.

Our market strip is one distribution area; it is homogeneous in its economic characteristics and contiguous in regard to its population units. The strip lies in three counties—Dade County, containing Miami; Broward County, containing Fort Lauderdale; and Palm Beach County, containing West Palm Beach.

The presently operating VHF station in our area, assigned to Miami, obtained approval recently to move its transmitter some 15 miles north of Miami into our backyard in Broward County. By the same token, the other UHF station in Fort Lauderdale was permitted to move south of Fort Lauderdale toward Dade County. As the two transmitters stand, the UHF Fort Lauderdale station is actually closer to Miami than the VHF channel assigned to Miami; yet, this station must make its station identification as Fort Lauderdale, and the station which is closest to Fort Lauderdale must make its station announcement as identified with Miami.

I point this out to show the results of channel assignments made on the basis of specific cities in population area, rather than on the basis of markets.

The net result of such a ridiculous situation is that the UHF station which is forced to identify itself with Fort Lauderdale must attempt to sell network and national spot advertisers against a market size listed as No. 214; and the VHF station which moved closer to Fort Lauderdale can identify itself with a market listed as No. 39, as contained in the listing of markets published by the J. Walter Thompson Co.

Furthermore, in reality all the 10 commercial allocations in the gold cost strip can serve with an A signal a market that could have a national ranking in the order of lower than 20. Hence, by FCC
requirement, stations are forced to identify themselves unrealistically and many times at great commercial penalty to themselves.

This ludicrous predicament came about because the allocation of television channels was made against a city population list without regard to basic marketing principles, and population areas as they exist. The only solution of this is a reappraisal of the population areas of America on one hand and the coverage potential of TV stations on the other. Anything other than this is merely the application of purely academic theory and submission to pressures to get television channels in terms of numbers in a given state, city or other civic unit with no regard to economics, or the efficient use of one of our greatest national resources, our rate radio spectrum.

Such spraying of TV channels is just as wasteful as uselessly dissipating the people's resources in terms of water power, forests, and the like, or the damming up of some of our great waterways to prohibit shipping. The radio spectrum is in the forefront of all of our national resources and its utilization in terms of efficiency and freedom from monopoly deserves maximum consideration in this country today.

In fairness to NBC and CBS: During these hearings there have been many references to NBC and CBS networks as monopolizing the television industry. Out of fairness to all, I believe that more should be said on this matter.

As mentioned previously, I was associated with NBC for many years and I am acquainted with and have done business with many of the officials of the other networks over the years. I am certain that these networks are guided by men of integrity and that there are no devious schemes within a given network or conspiracies between the networks to generate a national monopoly in this industry.

I know from many years of service with a network that it is a highly competitive business and each network cannot afford to let go of any competitive advantage which, in this case, seems to be the letting go of any fraction of time on a VHF station in any market. This competition can be likened to two roosters fighting with their heads bobbing up and down looking for an advantageous peck. Under fair competitive conditions this is healthy and is the American way.

Neither network can be expected to give in on a voluntary basis regardless of how sincere these networks may be in wanting to foster a truly nationwide competitive television system in the United States. This is brought about because of paucity in the number of VHF channels that can be allocated in the country. The fault lies in what has been referred to as the big mistake made in the allocation plan and in the appraisal of the technical and economic inequities that lie at the present time between a UHF station and a VHF station. Through the present allocation plan and its implementation, monopolies have been nourished and day by day the situation is being abetted.

Frankly, I don't see how any voluntary plan on the part of the networks can break this mounting monopolistic atmosphere. I believe that the Government regulatory powers have inadvertently created this situation. I am always in favor of the least amount of Government control, but it appears that only through more governmental control and a reappraisal of the entire allocation plan can the situation be alleviated. Here, rules have defeated the purpose.
Normally, Government regulates to protect the weak, but, in the case at hand, it is benefiting the strong.

Experience with networks: Prior to our actual operation and for some period thereafter, we endeavored to obtain a network affiliation. At that time the local VHF station was carrying programs from all 4 networks, as it still does, and there was 1 cable connection to Miami.

Our negotiations with CBS resulted in our being informed that CBS intended to remain with the VHF station in our area. Recently it was announced that this station had a basic CBS affiliation.

Du Mont informed us in that Mr. Loewi, president of the corporation operating the other UHF station in our area, was an official of the Du Mont Co., that it would be futile for us to consider getting an affiliation with Du Mont.

In regard to ABC, we were unable to arrive at any conclusion with the network until after the second UHF station had a definite starting date, at which time this station, as well as ourselves, were informed by ABC that whichever of us would bid the most over a minimum of $5,000 a month to pay for cable connection would get the ABC affiliation. We were given a deadline to present these bids. We were also informed by ABC that it intended to continue its agreement with the only VHF station in our area and the VHF station would have first call on any and all ABC service.

Further, whichever of our stations that gave the highest bid would not be guaranteed any traffic whatsoever. We chose not to enter this bidding under these terms. If the cable connection did cost $5,000 per month, it is difficult to understand why they should be sold back to stations on a highest-bid basis. I mention this to indicate the strong position in which this network found itself, whereby it had complete bargaining position with the stations in this case.

In reference to NBC, we did obtain a secondary interim affiliation. For this, naturally, we are thankful. A stipulation in this agreement calls for a 90-day cancellation. The agreement stated that we were liable for $1,083 a month against possible network compensation after foregoing 24 free hours to the network per month. It was further stipulated that our competition, the local VHF station, would have first call and first choice over all NBC programs in our area, and again there was no guarantee of traffic.

This has put us in a position where our competition has the power of life or death over us in regard to carrying national features.

Attached is a letter from NBC, exhibit C, dated May 12, 1954, which illustrates how we must stand in line for our competition to decide whether it would choose to carry a program before we could be considered.

I would like to refer to some matters in those letters. However, before going into that, Mr. Chairman, I wonder if I might have these photographs to which reference was made, which are exhibits A and B, made a part of the record.

Senator Potter. They will be inserted in the record at this point and made a part of the official records of the committee.

Mr. Kersta. Now, here is a letter to which I would like to make reference, an excerpt from it:

As of this writing WTVJ, Miami, has given us an evasive and noncommittal answer on the Lux Video Theatre order. Right now, I would guess the chances of getting live clearance from them is pretty slim. We are waiting for some sort of a definite and concrete answer from them.
I understand the client very strongly wants to clear WTVJ and will not stand while other soap companies are getting clearances in Miami. Our boys have told Lever about the remarkable conversion record in the market, with which the client was impressed.

So far as the second cable going into Miami in September, I don't think it will mean too much of a change to WTVJ and CBS. It does not necessarily mean that the station has to clear for all CBS programming. I don't think there is any way CBS can force them into that. As a matter of fact, it has been their claim that they will continue to take what they consider to be the best programs from all networks. For example, their excuse for not clearing certain high-rated NBC shows was that the cable was not available.

I mentioned that to show what our future looks like.

Also attached herewith is exhibit D, indicating that a national advertiser had ordered our station for the World Series but the National Broadcasting Co. refused to allow it because the VHF station was going to clear time for the series.

Senator Potter. It will be made a part of the official records of committee.

Mr. Kersta. In exhibit E, I am submitting a TWX message from NBC stating that we had been ordered for the Kate Smith Hour and then canceled because the VHF station had decided to carry it. As a matter of fact, we were carrying this program, and it was taken away from us.

Senator Potter. It will be made a part of the official records of the committee.

Mr. Kersta. Exhibit F shows a copy of a TWX wire from the Maxon Advertising Agency in New York, which again indicates that a national advertiser agreed to take the VHF station along with our station for the Rose Bowl game and NBC and the VHF station refused to allow the broadcast on our station.

Senator Potter. It will be made a part of the official records of the committee.

Mr. Kersta. The only time we were allowed to carry an NBC program at the same time as the VHF station was during the NCAA football schedule last fall. This was the result of an NCAA stipulation that the network had to permit such broadcasts. However, we were not compensated for carrying this service.

I use these few examples to indicate how such secondary and interim affiliations operate in practice.

Any statement presented on the amount of network traffic being placed on UHF stations by networks should be analyzed with the following points in mind:

1. The type of programs in reference to their audience ratings.
2. The number of UHF stations on which this traffic is placed.
3. The amount of network compensation paid per station to UHF stations in comparison to VHF stations.
4. To what extent VHF stations have first call on network traffic over UHF stations.

Future of our secondary interim affiliation: During discussions with NBC we were informed that if the Biscayne Television Corp., which is a merger application between two newspapers, the Miami Herald and the Miami Daily News which, in turn, own the NBC radio station outlet and the ABC radio station outlet in Miami under the presidency of Niles Trammell, a consultant to NBC, received its grant on channel 7 in Miami, we would lose our NBC affiliation. Also, that if
Biscayne were unsuccessful in obtaining a grant and if we could deliver the coverage, there may be a chance of our retaining NBC.

We were willing to take our chances under this arrangement in that we believe that it is not in the public interest for the 2 newspapers of Miami and the 2 radio stations to join together and be granted another voice in the area, notwithstanding the stipulation in Biscayne's application that should it be granted a TV license, 1 of the radio stations would be sold. Some of the reasoning offered for this was that NBC recognized certain prior rights and loyalties to its AM affiliate. However, it is a matter of record that such loyalties do not pertain except where they further the convenience and control of valuable properties.

As an example, in this very same Gold Coast strip in Palm Beach the CBS radio affiliate and the NBC radio affiliate received VHF construction permits, incidentally as a result of mergers and withdrawals. However, the CBS affiliate received the NBC-TV affiliation instead of the NBC radio affiliate.

Here there is another force at work in that one of the principal stockholders of the new group which merged with the CBS-AM outlet is a member of the immediate family of an official of RCA, parent company of NBC. This situation takes on greater emphasis when it is considered that Biscayne television in Miami is still in hearing status and the Palm Beach VHF stations are not yet on the air.

As a bit of information, I would like to include here that when we started our operation last spring we were told by NBC and A. T. & T. that we would not have a connection with the cable which ran through our city to Miami until the spring of this year. However, through our own efforts, we got our connection within less than 30 days.

Film availability and pricing: In addition to our difficulty in acquiring additional network service, we have difficulty in acquiring film packages because the operating VHF station usually has first call on these properties and of course the vendors of such films price the packages in terms of a VHF market.

VHF competition: Mr. Loewi, of WITV, presented as an exhibit an advertisement placed by the VHF station in our area which stated that that station carries all the best programs and conversions are not necessary.

Further, on the occasion of a national broadcast, the VHF station was unable to carry a given program in its entirety due to cable allocation. The station announced on the air that another south Florida station had taken the cable, making it impossible to present the remainder of the program.

Since we were the only other station in south Florida at the time, we were the recipient of complaints from viewers and the ill will of a large portion of the television audience. Whereas, the facts of the case were that we had no control over the network cable allocation. This is another example of a VHF station pressing a monopolistic position.

What has happened to UHF in our area? As of approximately the second week in January, the big national pall descended on UHF. Since then our network traffic has been reduced 25 percent of what it was and our national spot business has also declined 25 percent in the past month. The trend indicates a more serious picture in the
immediate future. These declines, I assure you, are not due to lack of increased effort on our part.

Conclusions: 1. I do not see how intermixture of UHF and VHF channels can operate successfully in our market, nor do I see the necessity for it.

2. To put television broadcasting on a practical basis, the allocations plan must be reappraised in terms of market and population areas, rather than a city population list.

3. It is my belief that it is not in the public interest, convenience, or necessity that 1 station in an area should be permitted to edit and control 4 national services, and to have complete competitive control as to what other stations in an area might take from national sources.

4. If the elimination of UHF and VHF intermixture is impractical in an area, UHF should be favored with regulations in regard to satellite stations. Thus, by a combination of UHF main and satellite stations a UHF signal could be achieved with present available transmitter powers which would be equivalent to radiating 1,000 kilowatts at 1,000 feet as authorized by present FCC regulations. This conclusion rectifies the dilemma presented above in regard to presently available 12½-kilowatt UHF amplifiers being inadequate to match maximum allowable VHF coverage.

Senator Potter. Let me see if I understand what you mean by a satellite station.

Mr. Kersta. You could build a 1,000-foot tower and using a 12½-kilowatt transmitter, the highest tower and the highest available amplifier and it would still be very inadequate when compared to the VHF coverage.

In our area it would cost in the order of $250,000 for such a tower, and after you built it, you could not match it anyway. So by having favorable regulations, whereby we could operate a satellite station to achieve in another way what is due us in the Federal Communications regulations would give us a chance to have the same coverage.

Senator Potter. What about this polycasting?

Mr. Kersta. It is a branch of polycasting. It has merit. Polycasting is a development of a satellite operation.

By this statement I have no intention to harm or disparage, whether it be individuals, stations, networks, or the FCC. My objective is to be factual and analytical to bring about a national competitive system of broadcasting of which the American public, networks, manufacturers, stations, and our Government can be truly proud.

Whatever the outcome of these deliberations, as one who has devoted his entire life to this industry, I will continue to play the rules of the game to the fullest of my energies to bring about the finest in television for most people.

Thank you for this opportunity afforded me to present my views and experiences.

Senator Potter. That was a very good statement. I appreciate it. Do you have any questions, Senator Bowring?

Senator Bowring. No questions.

Senator Potter. Thank you again, Mr. Kersta.

Mr. Kersta. Thank you, Mr. Chairman.

Senator Potter. We will now hear from Mr. Gordon Brown, of Rochester, N. Y.
Mr. Brown. I find that very much of what I was going to say here today has been said. I find also that the outline which I have prepared is practically obsolete now. However, I will pull this down to a rather short time.

My name is Gordon Brown. I operate radio station WSAY in Rochester, N. Y. My experience started in 1914 when I was an amateur in wireless telegraphy. In 1920 I experimented with radio telephony, and I have had an amateur radio operator's license, and I started in commercial radio in 1922.

I am owner-licensee of a radio station, and back in 1927 it was WNBQ, a 15-watt AM station. I am a holder of a radio-television first-class operator's license, and I am presently the operator of radio station WSAY, which was on the air since 1936.

I think I am an old-timer in television. Back in 1927 there is a picture of a television receiver which I made and on which I received a picture one inch square with 24 lines. Radio broadcasting and television has been my full life's work. It would appear that what the boys are going through here with UHF is going to follow the pattern that we followed in FM. We had FM coming along, and then we found that the frequencies which were allocated to it were not the proper frequencies and FM went through a complete change of frequency. They went to another spectrum.

In 1927, when I had my radio station, it was assigned on 209 meters, and in November of 1927 the Commission said, "Well, we are going to take you off 209 meters, and we will put you on 1,500 kilocycles." We thought that change was an awful thing, but if it had not happened, I do not think there would have been much radio service in the United States.

I think the same thing is going to be true here with UHF. I think that the time has come, as it did in 1927, and as it did with FM, that you have got to provide a new system, and I think the principles of Commissioner Hennock, Mr. Dumont, and particularly, Mr. McGrath are very laudable.

We have heard here about the good network programs. You have also heard about how afraid everybody is of Madison Avenue. We have the Lux Theatre, which is not a network program. Let us say it is a program of Madison Avenue or a program with a sponsor who bought that program and put it on the network.

By virtue of the network position, which is quite monopolistic, we find that the economic destiny of radio stations is in the palm of their hands. They definitely hold even more so economic destiny of all television stations in their grasp.

Much will be heard in this hearing which could and could not be done for UHF stations, but there is no question of a doubt that you have got to control the networks the same as you control the radio stations, if you are going to have a nonmonopolistic system.

Senator Potter. And you would support Senator Bricker's bill?

Mr. Brown. Very much so, only it doesn't go half far enough. There have been a number of UHF and VHF stations taken off the air, and there is no use talking about that. Everybody knows that.
It might be interesting for this committee to incorporate into this statement the verbatim statements and the reasons for their discontinuance of the television stations. Those reasons were given to the Federal Communications Commission, and are now in the Federal Communications Commission files.

In analyzing these reasons, it will be definitely found that the one basic reason for their discontinuance was the fact that the networks could not feed them the expensive high-quality programs which the advertising sponsors paid for. The Federal Communications Commission needs legislation to control the networks. Congress should give them this power to license the networks the same as they license a radio station.

I have been talking about the licensing of networks for some time. After a considerable amount of research along the lines of legislative history and the Communications Act, I have spent many weeks working with the House in drawing up a bill which might be effective in licensing of the networks. The bill is attached hereto as H. R. 73. This has been drawn up after spending 2 weeks with the legislative counsel of the House, and it is not easy and it takes a lot of forethought to draw up a bill which will not have a lot of leaks in it when it comes to controlling the networks. They are very adept at finding holes in legislation.

So I am very much in favor of regulating the networks, and, as I say, Senator Bricker’s bill is fine, but it does not go half far enough.

I am going to cut this a lot shorter than I anticipated. I have had a problem in radio. I have operated a radio station for years. I have had the networks try to tell me how to run it, and I decided that I was not going to let them tell me how to run it, and the result was that I lost the network affiliation, and as a result of that, in radio, I have lost out of pocket in the last 5 or 6 years about $185,000 in radio. I lost $18,000 last year, and I did not even take a salary, so that did not include my salary.

It appears that the networks have a terrific control over the programming and where it shall go, whose programming shall hit the air, and as a result of that, I think they need some regulation.

You have heard about the monopoly of the networks and they have been talked about for a long time. Here are just a few little articles which show how the networks have been operating, how they have been choking their demands down the affiliates’ throats, and these articles I will turn over to you. I will just read the headlines.

One is an article entitled “Editorial Control by Networks Charged by Ellis,” That is dated January 15, 1951.

Here is another article entitled “As Pegler Sees It—Discusses Air Privileges Granted Giant Networks.” That is from the New York Journal-American dated Wednesday, October 17, 1951.

Here is another one headed “Radio-Television—Too Much Monopoly Creeping into TV,” written by John Crosby.

Here is another one taken from Broadcasting, the August 20, 1951, issue, page 31, which states: “ABC Scored—Sale of Announcements Assailed by NARTSR.”

Now the average radio station sometimes took in network programming with the understanding that they did not get much return from these programs, but they did sell spots around them to national advertisers, so that used to be a source of revenue to the radio stations,
and it was the business of the station representatives to sell those spots for a station. We find now that the networks are taking over spot business also, so it doesn't give the affiliate much of anything left and he has either got to take the networks or else, and that is the situation there.

Now as a result of that situation, we have got another article from the May 31, 1952, issue of the Billboard, which states "Station Reps Threaten NBC with FCC Complaint." There have been a lot of complaints about network operation to the Federal Communications Commission, but it appears that nothing has ever been done with them, and it appears also that not only do we need a law to license the networks, but we must put in that law something to make it compulsory for the Federal Communications Commission to carry out that law.

We have another article here from Broadcasting-Telecasting, the January 1, 1951 issue, which states "NBC Affiliates Up in Arms—Form Anti-Rate-Cut Bloc."

The result to the networks is that they are going to up the rate of many stations. They control the rate of their affiliates, and in so controlling the rates of the affiliates, they control my rates, because I must compete with my competitors, and the affiliate rates are the rates of my competitors, so that we find that not only do the networks control their programing, but also control the rates at which the radio station shall be sold. They not only control the rates for their affiliates, but through that indirect method they control the rates of my station.

Another article states "Webs-Affiliates Split Widens." That is from the Wednesday, May 2, 1951, issue of Variety.

We find continually that the affiliate just cannot seem to take it any longer. They have taken cuts. They are told they will not get anything for this program and that program, and so the affiliates try to get together and gang up and they complain to the Federal Communications Commission, and that is about as far as it goes.

The cuts go through and that is the end of that. Since the legislation, your last hearing here, the networks have decided that they are going to cut radio again. I don't know how much more they can cut it before they will be in the same predicament—in fact, it is in the same predicament now—that UHF is, only the radio boys have not been down here to tell you about it.

I think it is time now that you not only look at this from the picture of UHF, but you look at it from the picture of stations in the country who are losing money.

I have here some figures from the Federal Communications Commission which are as up to date as I could get on the radio station situation.

Senator Potter. Is this with radio, Mr. Brown, or television?
Mr. Brown. This is radio.
Senator Potter. I think it would be very interesting. However, this is primarily a hearing on UHF.

Mr. Brown. I will turn these into the record in which I want to get the television issue included also. I want to show you that not only have you got a problem with television, but radio also.

Whether you get it today or in a week from now, you will get it.
Senator Potter. One headache at a time.
Mr. Brown. I think both headaches can be cured with the same pill, which is going to be hard for the networks to swallow.

We get into another article which is from the Wednesday, June 4, 1952, issue of Variety, and the headline is entitled “Affiliates’ ‘Kill Cut’ Gang-Up.”

Then there is another article from the Billboard, the November 1952, issue, the headline of which is entitled “Station Reps Claim Nets Try Encroachment.”

The next article is from the Wednesday, December 5, 1951, issue of Variety, and the heading of the article is entitled “Barring of Press at Boca Session Angers Affiliates.”

The next article is from the August 9, 1952, issue of the Billboard, and the headline is as follows: “Web Rate Cuts May Cue FCC Move To Split Radio and TV.”

Well, they might have talked about cueing, but nothing has been done about it.

Here we have from the Wednesday, November 12, 1952, issue of Variety the “Estimate Weekly Network TV Program Costs.”

This list is back, as I said, in November of 1952. It gives the cost of all the various TV shows, and I believe they are about 50 percent higher now than this list shows. So you can get some ideas of the costs of the networks for these programs, which of course they charge to the sponsors.

There are three of those estimated weekly network TV program cost sheets.

Then the last heading I have here is from the Wednesday, June 4, 1952, issue of Variety, and the headline is “NBC-TV ‘All Star Re-Vue May Fold; Won’t Go Out on a $5 Million Limb.”

Might these newspaper articles be made a part of the record, Mr. Chairman?

Senator Porter. They will be made a part of the record.

(Newspaper articles referred to are as follows:)

[January 15, 1951]

EDITORIAL CONTROL BY NETWORKS CHARGED BY ELLIS

James H. Ellis, president of Kudner Agency, charged Friday that TV networks are approaching control of the editorial content of the air through growing domination over time, talent, and production.

In an address before the Detroit Adcraft Club, Mr. Ellis put much blame upon networks’ competition for top shows “at any price.”

He said TV networks’ bidding for talent has brought television to a point where it “is getting too rich for the average advertiser’s purse, no matter how good it is.”

Mr. Ellis scored what he called a snowballing trend in which networks put together package shows and sell them to sponsors at skyrocketing prices. He said at least 70 percent of CBS commercial shows and 50 percent of NBC’s are network-controlled, whereas a considerable majority of all shows on the air a year ago were handled by independent agencies.

Mr. Ellis’s agency itself pioneered in development of many top TV shows. Its 1950 billings amounted to $1.5 million for radio and $4 million for television.

The Kudner executive stressed that television produces spectacular results when all factors are right, and conceded that networks are entitled to some control over talent and production. But the trend now, he asserted, is in the direction of “complete and monopolistic” control by networks.

“Three years ago” he said, “the top TV show on the air cost about $10,000 a week for an hour program—$2,000 being for time and $8,000 for entertainment.”
“Now, and in only 3 years’ time,” he continued, “the cost of a top show for 1 hour a week has mounted to $100,000. Time has gone up to $30,000 and entertainment to $60,000 or more.

“This means that to put on a good show on a yearly basis an advertiser must think in terms of a $4 million annual budget—and this of course, is for TV alone without taking other advertising media into consideration.”

He said internetwork competition has reached a point of outright “audience stealing, with networks bidding fabulous prices which few sponsors can justifiably pay.” With individual stars getting as much as $40,000 for a single performance a lot of harm has been done.”

Mr. Ellis feared present trends mean “we soon can arrive at the time when the networks provide all the entertainment.” This, he said would be contrary to the challenge of free competition, and the inherent dangers in it are obvious.”

NO “STRAIGHTJACKET”

He called upon the people responsible for the destiny of television to “stop, look, and listen.”

“They already have a monopoly of the air waves, which is unavoidable,” he said. “Television may prove to be the most powerful selling medium we have ever seen, but monopolizing TV entertainment is hard to justify as serving in anyone’s best interests. We don’t want to be put into a straightjacket when it comes to entertainment.”

Asserting that “the customer has some rights,” he said that “at least we can call a halt and give the independent sources a chance to find if there isn’t some way to keep talent costs from going out of the reach of everyone—and thereby hurting TV owners, and the industry as a whole.”

As Pegler Sees It—Discusses Air Privileges Granted Giant Networks

(By Westbrook Pegler)

[October 17, 1951]

The air above these States which are united in the grand Republic of the United States, is the property of us people. The abuse of this public domain is a violation of our rights and an impudent affront to our human dignity of our rights and our citizenship.

This air does not belong to the National Broadcasting Co., Mutual, Columbia, nor American. It is yours and mine. These, and other, companies have obtained privileges of great value from the Federal Communications Commission which acted in our name in a technical legal sense.

They have not paid us for the use of our airplanes for their own profit. But, because they have created important machinery and towers, and because they have taken on large financial obligations, they presume to claim a vested right in our property.

They think they have a right to sell it to unscrupulous advertisers of products and promoters of propositions, including attacks on the religious and political faith of millions of us citizens. When they are taxed with their misuse of our property and abuse of our rights, they resort to evasive action and lies.

In one case, when a law-abiding taxpaying citizen had been maligned in a nasty way by Drew Pearson with a false statement over the “facilities” of the Blue Network, Robert Kintner, an officer of the company, refused to entertain a complaint.

He seemed to think that the Blue Network had a vested right to use our property to broadcast false, abusive statements about any individual or mass of individuals.

Ed Noble, the proprietor of this company at that time, is a New Dealer who received valuable concessions from the Federal Communications Commission, a very partisan political body. He also tried to discourage Pearson’s victim from pressing his demand for a retraction.

He said that if Pearson were forced to retract he would couch his amend in language which would leave the victim in worse position than before.
Nevertheless, the victim obtained proof that Pearson's statement was a lie. But still, and on notice that this proof was now in hand did Pearson make an unconditional and satisfactory retraction and apology.

But the Blue Network never expressed regret nor any other interest in a flagrant abuse of the air above the land which was entrusted to its stewardship.

Some radio companies pretend that they keep no record of false and gratuitous abusive remarks against respectable citizens which are broadcast after midnight. If that were true, the licenses would be subject to automatic revocation.

One "commentator" prepared himself for greater authority on public affairs by broadcasting from a drinking resort bearing the name of a person who once had been put out of business for running a disorderly place.

The Radio Corporation of America has even risen to a sort of police authority, and goes so far as to undertake to prevent, in the most appropriate way, the use of the air to the discredit of the country. The public is afforded assurance that the licensees shall conduct themselves in such a way as to reflect credit upon the country.

Some radio companies pretend that they keep no record of false and gratuitous abusive remarks against respectable citizens which broadcast after midnight.

The rights of the listener to quick and accurate news are undermined by the character, the motives, and the conduct of the broadcasters.

Adolf Hitler captured Austria "by radio." He infiltrated the Germanic Austrians against those whom he depicted as enemies in their midst. The Austrian military and political forces were reduced to impotence when he made his move.

Similar tricks are employed here by exploiters of the radio channels which are the property of our people. We who own the radio air may yet find ourselves undone by propagandists preying on our credulity, our warm American sympathies and our lack of background knowledge of the character of the broadcasters and the motives of those who pay them.

Broadcasters, uninhibited by decency, truth, and morals, make the most successful operators on our air and get the most money.

They are more effective for advertising purposes because scurrility is dramatic and compels attention which the people will not yield to conscientious, truthful discussion. These powerful individuals are seldom at loss for capitalists with wares to sell who are indifferent to the consequences.

These advertising broadcasts are arranged by advertising agencies, some of whom have become great, undercover powers in the management of our thoughts by slanted radio broadcasts.

Rich corporations, busy with other management problems, job out their advertising to such advertising agencies and, in some cases, obviously pay no attention to the political and moral character of the people who arrange their sales propaganda.

One of our industrial giants, a very sensitive man where his own vanity is concerned, boasted that he had spent $1,200,000 of our money, borrowed from the RFC to maintain a program of abuse composed entirely of lies against a patriotic citizen.

On examination he was unable to reconcile his complacence in this matter with his own notorious touchiness.

Drew Pearson's motive for trying to drive James Forrestal out of public life is one of the great taboos of the time. He certainly acted in collusion and his lies about Forrestal, accusing him of cheating on his income tax and running away in a cowardly flight as armed brigands robbed his wife, were so vile that a reaction set in against him.

Forrestal was a part owner of the air which Pearson used to defame him, and millions of other citizens who also own this air could not protect the victim. But in the finest legal sense they had a right to throw this scoundrel off their air for misusing their property.

In this case Pearson finally went over the line. He lost two sponsors and he has complained that his earnings have declined. But still he does not blame himself. His mentality is such that he may not realize how horrible his lies were. He thinks he owns the air.

As a final thought, though Pearson lost "sponsors," he was not denied the use of our air for nefarious, hidden purposes. He still has free use of it.

And the broadcasting company which uses our air to circulate Pearson's frequent mendacities, boasts that it does not censor any of its broadcasters. They may use our air to shout to the multitudes any lie that serves their questionable purposes.

48530—54—43
One financial aspect of radio, which it seemed to me stunted its growth was its control by the advertiser. It was always my contention, in this column and in an article in Life magazine that the broadcaster should run his own shop, that the advertiser should support, but not control, the editorial content of radio.

In a recent speech by J. H. S. Ellis, president of the Kudner Agency before the Detroit Adcraft Club, it was indicated that broadcasters are running their own shops in television and the results, according to Mr. Ellis, are not entirely happy. In the old days an agency came in with a radio program which it owned and bargained for the best time it could get on the network of its choice. It could drop the program or change networks at will; the network provided little except kilowatts and good frequencies.

Speaking of television, Mr. Ellis says: "Today 50 percent of the commercial shows on NBC are network controlled and the figure for CBS is 80 percent. All of which looks as if the major networks are headed for a monopoly of editorial content." (A year ago most of the shows were owned either by package outfits or advertising agencies.) What is the matter with editorial monopoly by broadcasters which, after all, also is exercised by magazines and newspapers? Mr. Ellis has some interesting criticisms.

Television is full of fierce shortages—a shortage of stations—47 stations on the coaxial cable, 29 cities with only 1 station, 9 with only 1 station, 9 with only 2—and a shortage of prime time. 8 to 11 p.m. at night. This puts the networks in a strong bargaining position for their own shows. With the present shortage of time, they—the networks—give at least a broad hint that if you want to get on their networks, you better buy one of their shows.

Furthermore, the network, Mr. Ellis says, is not above trying to swipe the ad agencies' talent and sign it to exclusive contracts. The agency can offer an actor money. Only the network can give him an audience, can put him on the air. The result, he continues, has been to make monopolies of an unhealthy sort which are behaving like all the monopolies of the past—underpricing the competition and then charging all the traffic can bear.

Mr. Ellis' figures in support of this are fairly startling. The Kudner Agency has the Milton Berle show and always has had. Three years ago, the Berle show's cost—time charges, Berle, production, everything—cost $10,000 a week. Now time charge alone are $36,000 an hour; the show costs around $100,000.

The Texaco show—a variety show—once paid a singer $1,500 for an appearance. In the Bob Hope show, a network package, the same singer got $4,500. Why should the networks try to price themselves out of the market? Well, it's Mr. Ellis' theory that they are more interested in knocking the spots off the competing networks than in developing a balanced program schedule. He accuses them of building a variety show with name and high-priced stars and slotting it opposite a popular show of another network with the twin aims of (a) getting a quick high rating (b) diminishing the opposition rating.

Everyone is suffering from this suicidal competition—the advertiser, the network and—above all—you and me.

It was always my contention that a decent balance of programing—so many variety shows, so many dramatic ones, so many quiz, cultural, sports programs, etc.—would be achieved only if the broadcaster ran the show.
using war against the network sale of announcements, which NARTSR considers unfair encroachment on what should be station business.

"The accepted area of network operation upon which the entire industry's economy is based is in the field of network programs," Murray Grabhorn, managing director of NARTSR, stated. "Revenue from announcements belongs to the stations. It is as simple as that."

Mr. Grabhorn, until recently an ABC vice president, charges this network with offering announcements "integrated within the body of four separate network programs" to stations for sale to local advertisers. "The advertiser is charged what might be considered a premium rate but the station does not get it," Mr. Grabhorn said. "Most of it goes to the network. ** * * It is a wonderful take for the network, but the station gets the short end."

**ABC Answers**

ABC viewed the matter in another light. A network spokesman explained that these announcements within programs are offered to network clients under the ABC pyramid plan. Stations not included in the sponsor's network are given the chance to sell the program spots locally on the standard ABC cooperative program basis, charging 3 percent of their 1-hour nighttime rate for each announcement, which the stations retain, plus a program charge, which the network receives, as it does on all co-op shows.

[May 31, 1952]

**Station Reps Threaten NBC With FCC Complaint—Hit Plan To Sign Rep Stations For National Spot Sales Department**

NEW YORK, May 24.—Immediate filing of a complaint with the Federal Communications Commission was threatened this week by the station representatives' organization, should the National Broadcasting Co. seek to recruit independent affiliated stations for representation by its national spot-sales department.—The Billboard, May 24.

Tom Planagan, head of the National Association of Radio and Television Station Representatives, said that the reps will not take any competitive moves by NBC in this direction lying down. He threatened that should such a drive materialize, NARTSR quickly will proceed to ask the FCC to come to a decision on the matter.

The FCC received a complaint on this subject from the station rep group some 4 years ago, with the Columbia Broadcasting System's spot sales division the main target at that time. Two weeks of hearings were held before the entire FCC, but no definitive conclusion ever was issued. Since that time, the issue has lain dormant, mainly because the web's spot sales division confined their activities mainly to o&o outlets. NBC, as reported in the Billboard last week, now intends to hypo its division, and is planning to line up pacts with additional outlets. The web's legal department has opined that such a procedure is perfectly within FCC and antitrust regulations.

**To Move Swiftly**

Planagan said that "if any network goes after spot representation with independent affiliated stations, you may be sure the move will be promptly and aggressively opposed before the FCC by NARTSR. Nothing could be more damaging to the independence of an affiliated station now owned by a network than to have such a station dependent for spot as well as network business upon the same giant organization."

He added that it is not likely that any such network move would meet with much success, because the trend has been for stations to seek greater independence from the webs, as shown by the actions of the All Affiliates Committee and the NBC Affiliates Committee. Independent affiliated outlets, he said, are determined to get better deals from the webs than they have been getting, and "they are hardly likely to fall into any association which would increase network domination over their livelihood, earnings, and independence."
NBC AFFILIATES UP IN ARMS—FORM ANTI-RATE-CUT BLOC

(By J. Frank Beatty)

Some two-score NBC affiliates blew their tops once again last week as they scanned a confidential document from NBC which explained in detail why the network felt it had to cut evening radio rates in TV cities.

Aroused and organized after a fortnight of indecision and informal talks, affiliates started to prepare, through a provisional committee, for the January 10 New York meeting called by NBC to study rate surgery the network had tried to impose in December—Broadcasting Telecasting, December 25, 18, 1950.

On top of that, angered affiliates laid groundwork for their own private session January 9 at the Waldorf-Astoria, New York. This dinner meeting will serve as an organization and briefing session in advance of the main gathering the following day.

Judging by advance indications, at least 50 affiliate station executives will attend the private dinner meeting and the joint meeting to be held the following day.

Members of the provisional station committee indicated last week, after hearing from NBC stations in TV areas, that stations will stand up and fight against any network effort to slash rates.

PREPARE FOR FIGHT

Meantime, groups of affiliate executives are reviewing selected portions of the NBC bulletin. They will bring their findings together this week and go to New York prepared for a knockout battle to prevent the network from slicing radio rates and perhaps setting in motion a nationwide rate debacle.

As members of the provisional committee heard from affiliates last week they reached the conclusion that NBC will have little support outside its owned stations. They reported many stations felt NBC's confidential bulletin was full of holes.

One member told Broadcasting-Telecasting that no affiliate contacted by the committee was willing to go along with the NBC rate cut. An affiliate listed as in favor of the cut originally is said to have made a flat denial that he had endorsed the idea.

Affiliates, in many cases, are said to insist they can't possibly take a rate cut at this time with present operating costs and the chance that costs will go even higher. They complain that income from network time is low compared to revenue from local and national spot. Some station operators have muttered dire threats about what they would do if NBC decided to resist the affiliates and insist on slashing rates.

The provisional committee comprises Clair McCollough, Steinman Stations, chairman of the NBC Stations Planning and Advisory Committee; Tom A. Brooks, Hearst Radio, WBAL Baltimore; Lee B. Wailes, Fort Industry Co., WSPD Toledo; P. A. Sugg, WKY Oklahoma City; William Fay, WHAM Rochester, and Nathan Lord, WAVE Louisville.

In general, NBC's affiliates argued that the network had pulled a fast one on them. As late as October, during the NBC affiliates' convention at White Sulphur Springs, network officials are said to have assured stations not rate cut was in sight and nothing of the sort could happen this year.

Affiliates argued there's no excuse for rate cuts at this time. Sure, maybe the AM network operation will feel the pinch as advertisers jockey for lower rates, they contend, but that's nothing new in a business operation. What the network should do, they insist, is order officials to develop new clients and new business.

Feeling persists that the network should have raised rates two or three times in the last decade to keep pace with increased circulation and increased listening. Stations, they remind, have had two or three rate hikes in this decade. Other media, too, have done the same thing.

NEED MORE SELLING

"What's the hurry?" one affiliate executive asked. "They say they can't sell enough time. What NBC needs is more selling. Actually, this is the third or fourth rate cut by NBC in the last few years, including the rate scales on Operation Tandem, Sunday afternoon time, and similar efforts."
"Nobody else is cutting rates. This thing is doing incalculable harm to the entire industry. Radio is still the cheapest medium in the world."

William B. Way, vice president and general manager of KVOO Tulsa, was among the affiliates who harshly criticized NBC.

"The attempt at AM network rate reduction is another means of forcing this medium to pay for television," he said. "This is evident when consideration is given to the fact that TV schedules are sold out yet station owners continue to suffer losses or admit that they are barely breaking even.

"It seems the obvious thing is to raise TV rates. If this then forces some TV advertisers off that medium they may return to more profitable AM. If increased rates do not force any advertiser off TV the then increased cost must prove profitable to the users.

"Either way each media will have to stand on its own feet."

---

[May 2, 1951]

**WEBS-AFFILIATES' SPLIT WIDENS—CHIPS ARE DOWN IN RATE CRISIS**

(By George Rosen)

One of the major battles in recent broadcasting history is on—AM's civil war, which lines up the networks against their own affiliates.

The Affiliates Committee representing 700 stations identified with the 4 major networks lost their initial major skirmish with the webs last week. Not only is the CBS rate slash a fait accompli, but NBC, ABC, and Mutual are falling in line.

Of perhaps even more dire consequences to the industry as a whole, however, is the revolution fomenting withing AM's ranks. The networks versus stations' jockeying for position is just beginning. It's apparent that from here on in, there will be no love lost between affiliate managers and network operators.

Behind the veiled statement issued following last week's 2-day meeting of the affiliates with the four network brass, is seen a drawing of battlelines—two concepts matched one against the other. Considered particularly significant is one section in the statement of principle in which the affiliates set forth:

"Any network reduction in rates should be recognized only as one network's opinion of the appropriate price of a network package, and should not be regarded in any respect as an indication of the overall value of radio. Particularly, it should not be regarded as any indication at all of the market-by-market value of radio, and affiliated stations should make their own evaluations of the value of their local service quite independent of network action. Further, stations should have no hesitancy whatsoever in increasing rates wherever in their considered opinion such rate increases are warranted."

Thus the affiliates are drawing up their own blueprint for attack, including a concerted campaign to recondition advertiser thinking that "market-by-market values" rather than cross-the-board network radio is the thing that counts today.

That the chips are down is evidenced from the committee's feeling that "a study should be made of the contractual relations between networks and their affiliate stations to determine, in what respect, if any, those relationships no longer realistically conform to present-day conditions."

The affiliates committee on the basis of some off-the-record observations, feel that the webs have succeeded in pulling a fast one on them. From here on in, they're not going to be caught flatfooted or tied to any contractual strait jacket in fighting off further vital network decisions. They deplore the fact that the webs have already moved into their national "spot biz" domain, and are particularly resentful of the recent ABC maneuver on binding their affiliates to the Procter & Gamble "spot biz" deal.

Unofficially, one key spokesman asserted that they'll be ready next time, in view of the committee's conclusion that "we find nothing * * * which indicates that the move taken by CBS * * * will prevent a further depreciation of radio values." Just how the affiliates committee intends to combat such an eventuality wasn't tipped, however.

**ANTI-TRUST ANGLE**

Because of possible antitrust repercussions, the network prexies, accompanied by other web high command, met individually with members of the affiliates committee representing their networks. CBS prez, Frank Stanton, made it emphatic
that “the die is cast.” NBC prexy, Joseph H. McConnell, is scheduled to announce the NBC rate cut pattern this week following a meeting with his affiliates. Ditto ABC and Mutual. All are expected to follow pretty much the same 10 percent—plus elimination of cream time bonus—formula as evolved by CBS, although one NBC affiliate member expressed the belief that the mobilization may be a factor in “trimming NBC’s sails” somewhat.

The network-affiliate schism apparently isn’t one-sided. Some of the web hierarchy appeared to resent the tactics used by the affiliates committee in promulgating its statement of principles, and not taking the trouble to send copies to the networks.

[June 4, 1952]

AFFILIATES’ ‘KILL CUT’ GANGL—FIREWORKS DUE AT JULY MEET

(By Bert Miller)

A “revolt of the affiliates” in a last-ditch attempt to stave off a slashing of nighttime radio rates is shaping up. A group of CBS radio affiliates has called a meeting of Columbia outlets to take place at the Hotel Ambassador, New York, July 1–2, when action is expected to be taken to “kill the cut.”

On the first day the affiliates will meet alone, with the probability they will “cook up some medicine” for the CBS radio brass to swallow when they appear before the session the following day. Columbia prexy Frank Stanton, Board Chairman William Paley, CBS radio prexy Adrian Murphy and station vice Kenyon Akerberg are expected to meet the chain’s affiliates on July 2.

Idea for the “July 1 and 2 fireworks” presumably arose from the All-Radio Affiliates Committee meeting May 20–21. At that time some segments of the radio industry, particularly station operators, expressed regret that the ARAC did not take a stronger stand against the impending network nighttime rate axing. The reason behind the ARAC’s caution was the committee’s fear that it could be open to charges of “monopolistic conspiracy” if it combined to prevent a rate cut.

However, it’s believed that it is legal for the affiliates of one network to get together to press their case to their own web. It apparently was felt that CBS affiliates should be the first to convene, since that skein seems to be leading the movement for a “rape of the rates,” and was the first to institute the 10 percent slicing in 1951.

Stations linked to other networks may follow suit. Whether affiliates conclude the other chains are called will probably depend on developments at the Columbia pow-wow and industry reactions. However, there is a strong possibility that NBC and ABC outlets will also take the same warpath.

KEYMEN SIGN UP

Among the signers of the call to the July parley are four members of ARAC: Kenyon Brown, KWFT, Wichita Falls, Tex.; John Patt, WGAR, Cleveland, and WJR, Detroit; Victor A. Shollis, WHAS, Louisville; and George Storer, of Storer Broadcasting Corp. Other signers include WMT, Waterloo, Iowa; KIRO, Seattle; ETRH, Houston; WKZO, Kalamazoo, and WKRC, Cincinnati.

Affiliates committee has been moving slowly because of the complex legal questions involved. Combining to resist a price cut might be construed as “illegal combination” under the antitrust acts. However, a leading attorney with heavy experience in both the radio and antitrust fields told Variety that, in his opinion, a resolution recommending that affiliates refuse to accept a network rate cut could be issued. If the resolution were not binding on the affiliates, and accepting or refusing a cut were purely a voluntary matter, it would be within the law, the legal eagle said.

After the recent ARAC meeting, committee issued a statement that “affiliates of each network expressed grave concern over the current competitive network sales and rate situation, which is at such variance with the great resurgence of radio in terms of audience and business at the local and national spot levels.” Significantly, statement spoke of affiliates of “each network”—pointing up the approach of not combining outlets of several chains.

A spokesman for the committee told Variety last week that most affiliates did not follow the network rate slashing last year. He added, “If the webs are able to impose an even greater cut in nighttime rates, affiliates will no longer be
Morency named AIAC Chairman, Swezey, Brown Vice Chairman; To Discuss Alleged CBS Rate Cuts

New York, May 24.—The All Industry Affiliates' Committee met here Tuesday and Wednesday, 21, 22, to establish a constitution and bylaws, and elect a chairman and vice chairman for this year. The group also listened to research presentations from C. E. Hooper and A. C. Nielsen and Ken Baker of Standard Audience Measurement.

Paul W. (Fritz) Morency was unanimously drafter to continue as chairman at least until next National Association of Radio and Television Broadcasters convention. Elected vice chairman were Bob Swezey and Ken Brown. Present at the session was attorney Edgar Barton of White & Case, to guide the affiliates group in the matter of areas in which they may effectively and legally operate.

A subcommittee was formed and instructed as to procedure for setting up a constitution and bylaws for the group. Bob Swezey also heads this subcommittee.

Rumor Discussed

Discussed informally and unofficially by the group were the recent, recurring rumors concerning special rate reductions alleged to have been offered to certain advertisers by the Columbia Broadcasting System. The all-industry group, however, is in no position to, nor will it take any definite action on, the CBS situation.

It was learned, however, that several CBS affiliates are mulling organizing a meeting of CBS affiliates to discuss CBS's alleged recent offers to certain advertisers.

At press time, considerable confusion existed as to whether CBS had or had not made any rate reduction pitches to advertisers. CBS, itself, continued to deny that such offers had been made.

Station Reps Claim Nets Try Encroachment

New York, November 8.—The Station Representatives Association this week charged the networks with two new attempts to "encroach" on spot business. The webs involved are the American Broadcasting Co. and Columbia Broadcasting System.

Tom Flanagan, managing director of the SRA, claimed that ABC's attempt to make a "spot carrier" out of Live Like a Millionaire on its TV network had failed. The contract offered to affiliates proposed that stations pay for the program until 1 network announcement was sold, that the web get the income from the second announcement and that stations could sell 4 more announcements. Since the program has gone on ABC-TV as a sustainer, he pointed out, the web must have failed to win station acceptance for its scheme.

Flanagan also maintained that the CBS radio web is trying to reduce station income by selling local cut-ins on network shows. He claimed these cut-ins logically national spot advertising and should be billed separately as national spot advertising at the regular full-minute, national spot announcement rate. When the networks sell the cut-ins, they pay the affiliates the network rate...
which is about half the spot rate received by stations when their representatives do the peddling.

BARRING OF PRESS AT BOCA SESSIONS ANGERS AFFILIATES

BOCA RATON, Fla., December 4, 1951.—Status of the trade press in relation to NBC and its affiliates almost became a cause celebre at the network's annual convention here. There was considerable rumblings from some station operators, who felt that the attitude of the network echelon in barring the press from all meetings, would only serve to hamper the press and frustrate the reporters seeking to factually record convention progress.

Particularly in view of the fact that this year's convention had such a vital bearing in formulating policy and resolving the economics attending network radio, it was felt that this was no time to allow conjecture or double-guessing to creep in.

Originally it was planned to permit the press to sit in on this year's session—excepting those involving network-affiliate bargaining and jockeying for position. But despite the pleas of the press department, which was backed by "exec veep" Charles R. Denny, they were overruled, and for the fifth successive year the meeting doors were shut to the press.

It was pointed out that, in view of the dual affiliations of TV stations, actually many in attendance had a stake in CBS as well, and since these were permitted to sit in—under circumstances that could tip the rival web as to what's afoot at NBC—there was no reason to bar the press.

In his opening convention remarks, NBC "prexy" Joseph H. McConnell also took a swipe at affiliates who talk to the trade press on matters affecting network-station relations. His criticism was directed at stations who have oppose the new NBC basic economy study, and have expressed their views to the press without consulting NBC about it.

WEB RATE CUTS MAY CURE FCC MOVE TO SPLIT RADIO AND TV—OFFICIALS FEAR ADVERSE EFFECT ON PUBSERVICE—MOOD GROWING FOR OPEN COMPETITION BETWEEN TWO MEDIA

WASHINGTON, August 2.—The long, hard battle put up by the affiliated radio stations of the Columbia Broadcasting System and the National Broadcasting Co. against persistent efforts of the 2 major webs to cut radio rates has attracted the attention of at least 2 key members of the Federal Communications Commission to the degree that the FCC may eventually attempt to move against ownership by single corporations of joint radio and television operations.

FCC Commissioners have been watching the rate crisis with considerable interest. Chairman Paul Walker, indeed, made a comment re the inadvisability of downgrading radio in his talk before the National Association of Radio and Television Broadcasters in Chicago last April, and at least two members of the Commission are becoming increasingly outspoken in their opinion that:

1. If radio rates are slashed any further, radio programming, public service efforts, and other functions in the public interest will suffer, and

2. The single greatest reason for the willingness of NBC and CBS to bend toward advertiser pressure for lower rates is that the webs are dependent to a great degree for business for both television and radio, from the same group of major advertisers.

Thus, the reasoning is, if the radio networks and television networks were owned by different firms, the people running the radio networks only would put up a much stronger fight against advertiser pressure for lower rates, and would take far more aggressive steps to program radio so that it could withstand TV competition more effectively.

Trade observers, within and outside the FCC, indicate that the networks are aware of this thinking on the FCC's part. They point to the sudden decision on the part of NBC to reintegrate radio and TV operations under single departmental heads, and the rumored move in the same direction on the part of CBS—see separate story. They claim that this reversal of operational procedure back to integration is dictated, at least in part, by the web's realization the FCC may move against single ownership of both media. The recent talk about the possibility that the webs may establish a single rate for radio and television
combined is also attributed in part to the web’s realization that the FCC is eyeing their “downgrade radio” efforts.

These trade observers reason that if the webs are able to achieve total reintegration of operations, and set up a sales structure wherein radio and TV are sold in combination for a single rate, they—the webs—will have a strong case against any future FCC effort to force the webs to divest themselves of ownership of either radio or TV.

“What do you mean, two operations?” the webs will be able to say to the FCC. “Our radio and television operations are obviously a single integrated business.”

There is no doubt that the NBC reintegration move is dictated in part by a desire to achieve a more efficient operation, as well as to effect personnel and operating economies, but some key observers insist that the concern over the FCC move against single ownership is at least in part responsible for the reintegration. Effort comes not too long after NBC split radio and TV operations down the middle, on the basis of a costly study by Booz, Allen & Hamilton, management consultants.

There is no doubt either, that if radio rates are slashed considerably, not only the networks themselves, but their affiliates in many cases—and eventually and inevitably all broadcasters—will find themselves unable to program public service and otherwise as effective as they have in the past.

[June 4, 1952]

NBC-TV “ALL-STAR” REVUE MAY FOLD; WON'T GO OUT ON A $5 MILLION LIMB

Fate of the NBC-TV Saturday night “All-Star” Revue will be resolved within the next few days, when the network will decide once and for all whether to call it quits permanently on the star-rotating program.

Although NBC’s video program execs had an impressive talent roster tentatively lined up for the 1952-53 ride, including such newcomers as Maurice Chevalier, Harold Lloyd, Ritz Brothers, and Tallulah Bankhead, sponsorship trouble cropped up last week.

Rather than risk going out on a limb on such a costly undertaking, NBC has decided, unless the matter is resolved this week with a guaranty of $5 million a year in billings, to forget the whole thing and open up Saturday 8 to 9 for half-hour single-sponsor programs.

Initial snag arose when Snow Crop served notice it was canceling out. On top of that, further client trouble developed with Kellogg, which has been balking at the firm 52-week commitment insisted upon by NBC. If Kellogg refuses to come back on NBC’s terms—and the network wants an answer this week—that would leave only Pet Milk to underwrite the costly hour showcase. NBC isn’t willing to gamble on the possibility of two additional clients coming in at a later date, in view of the talent-production coin entailed.

NBC is sorely pressed for desirable half-hour segments in which to install new programs, such as the Fred Allen “Two for the Money” stanza and other recent acquisitions. Web execs say the Saturday periods would help solve matters.

Mr. Brown. We get to the point of what can be done. Two things can be done, I think. One is to pass a bill which will regulate the networks the same as radio stations are regulated now. It doesn’t have to go any further than that, because you find that the regulation of radio stations is pretty effective and has been very good.

But we have a problem here. In Chicago I talked to Ampex, and Ampex is a firm owned by Bing Crosby, which has done a considerable amount of development in the spectrum of taking a television picture and putting it on magnetic tape instead of a motion picture film. That system is going to be very cheap to produce a copy of a given program and it will be very quick. There is no development. You merely record it on the tape, and you can show the picture just as fast as you can run the tape through.
With that service, we will find that it might be possible for a sponsor who spends $100,000 or $150,000 for a show to say to UHF stations, "How about negotiating with us in rebroadcasting this program?"

Rebroadcasting in radio has been a very interesting thing. We find that there is a terrific demand for rebroadcasting, but we find that the Communications Act is so set up that the Federal Communications Commission has been reluctant to allow rebroadcasting to actually grow. They claim that the law states that we must get permission of the originating station to rebroadcast a sponsor’s program, and even though the originating station doesn’t have any money invested in the program, and the sponsor may want to rebroadcast it on our station, we still have to go back to the originating station and get permission. The result is that he refuses. It restrains commerce between myself and the sponsor who would like to present his show a second time in the area to attract more listeners to his original investment in the show.

Surveys on rebroadcasting clearly point out that rebroadcasting in the same area is not only in the public interest, but is an absolute necessity if sponsors are to continue to produce high quality radio programs costing from $5,000 to $25,000 per week.

1. WSAY has for some years been keenly interested in the results of rebroadcasting wherever it was done, especially the public interest aspect of it, and has made special investigations into the need for rebroadcasting with the assistance of radio and TV’s two greatest survey organizations, Hooper and Pulse, Inc.

2. WSAY wishes to call attention to a few of the facts contained in a rebroadcasting survey made in the latter months of 1949, a time when radio listening was the highest it ever attained, just prior to the inroads of television. On page 2 of the first section of this survey entitled “Rebroadcasting,” it was found that all commercial radio programs of all four major network programs, on an average, were heard by only 2.74 percent of the radio listeners in the United States, when these programs were broadcast only once over the air by the sponsors, through the coast-to-coast networks.

Now, mind you, that was prior to the inroads of television, and this was all the programs broadcast over the networks.

It being a fact the 97.26 percent of the radio listening audience of this country which did not hear these programs during their first broadcast, would be potential new listeners for the average sponsor’s program that was rebroadcast for the second time and to rebroadcast these programs would definitely be in the public interest.

In fact, a rebroadcast of Jack Benny’s program brought 31 percent more listeners on the rebroadcast program than on the original broadcast, and a rebroadcast of Charlie McCarthy’s program brought 25 percent more listeners on the rebroadcast program than on the original broadcast.

3. Interesting recent facts on TV program duplication are brought out in the survey figures below, which surveys were made by Pulse, for New York TV stations in November 1952.

4. New York City Pulse survey station WOR-TV.
Program: Duplication of same motion picture for 5 consecutive days, Monday through Friday. Time: 7:30 to 9 p.m. Dates: November 10, 11, 5, 6, 7, 1952.

<table>
<thead>
<tr>
<th>Day</th>
<th>Average rating</th>
<th>Showing</th>
<th>Percent of original broadcast audience</th>
</tr>
</thead>
<tbody>
<tr>

<td>4th</td>
<td>59</td>
</tr>
<tr>
<td>Friday</td>
<td>5.0</td>
<td>5th</td>
<td>71</td>
</tr>
</tbody>
</table>

Above we find a rating for the original broadcast of 7 and the combined ratings of the 4 rebroadcasts of the same program of 19.

Four rebroadcasts of the same program made it possible for 271 percent more people to view the program than saw the original broadcast of the program.

Thus it is quite plain that everybody cannot be at their television set at the time some particular program goes on, so that a rebroadcast of a television show is definitely in the interest of the public and it is definitely in the interest of the sponsor who pays the high talent rate for that show.

The fifth broadcast of the same show in the same area brought over 71 percent as many listeners as the original broadcast.

5. New York City Pulse survey, Station WPIX program: Duplication of same motion picture for 5 days of a week, Wednesday, Thursday, Friday, Monday, and Tuesday. Time: 7:30 to 9 p.m. Dates: November 5, 6, 7, 10, 11, 1952.

<table>
<thead>

</tbody>
</table>

So it is quite clear that not only is rebroadcasting in an area once in the public interest, but this shows quite clearly that it can go five times and still be in the public interest.

Above we find a rating for the original broadcast of 5.2 and the combined ratings of the 4 rebroadcasts of the same program of 17.2.

Four rebroadcasts of the same program made it possible for 331 percent more people to view the program than saw the original broadcast of the program.

The third broadcast of the same show in the same area brought over 96 percent as many listeners as the original broadcast.

6. The WOR-TV survey clearly points out the importance of rebroadcasts or reruns of programs in the same area, particularly in light of the fact that after the same program had been run over the
same station at the same time each evening for four consecutive evenings, the fifth rerun of the program brought 71 percent as many viewers as the original showing of the program. It would also no doubt be a fact that more viewers would have seen the program had the rerun of the program been at a different time on another station.

7. The WPIX survey further substantiates the statements made regarding WOR-TV reruns of programs. In this survey it will be noted that the third run of the program attracted 96 percent as many viewers on Friday as the original broadcast of the program brought on Wednesday and that the fourth run of the program on Monday attracted 85 percent as many viewers as the original broadcast.

8. The above surveys of WOR-TV and WPIX rebroadcasts point out that even a fifth run of the same program brings substantial viewers and indicates beyond a doubt that rebroadcasting in the same area is not only in the public interest, but that it is a definite necessity if many are to have an opportunity to hear or see the high quality programs which are broadcast by sponsors and which cost millions of dollars to produce each week.

9. Further recent investigation of rebroadcasting in Los Angeles and San Diego, Calif., is shown in the four following tabulations of the rebroadcast results of the Jack Benny and Bergen-McCarthy programs when rebroadcast in these areas by radio station KNX in Los Angeles and radio station KCPQ in San Diego.

(The pulse surveys referred to are as follows:)

10. Los Angeles, Calif.

Pulse Survey on Rebroadcasting

Jack Benny Program—Station KNX

Program: Jack Benny rebroadcast on the same day, in the same area, on the same station.

Times:
Original broadcast—4 to 4:30 p.m.
Rebroadcast—9:30 to 10 p.m.
Dates: Sundays, November 9 and December 7, 1952.

In the case of the Jack Benny program in Los Angeles, the rebroadcast program was actually heard by 77.6 of the listeners that heard the original broadcast.

The original broadcast attracted 33.1 percent of the homes listening to radio while the rebroadcast attracted 33.9 percent of the homes listening to radio.

This clearly points out that the rebroadcast was actually 102 percent as effective as the original broadcast.
It is interesting to note from the average ratings below at the time of the rebroadcast that the rebroadcast program attracted many more listeners than the first-run programs on any other station. In fact the rebroadcast program was 376 percent as effective as the average for the first-run programs on all of the other Los Angeles stations.

**Analysis**

In the case of the Bergen-McCarty program in Los Angeles, the rebroadcast program was actually heard by 74.4 of the listeners that heard the original broadcast.

The original broadcast attracted 32.5 percent of the homes listening to radio while the rebroadcast attracted 26.3 percent of the homes listening to radio.

This clearly points out that the rebroadcast was actually 80.9 percent as effective as the original broadcast.

It is interesting to note from the average ratings below at the time of the rebroadcast that the rebroadcast program attracted many more listeners than the first-run programs on any other station. In fact, the rebroadcast program was 257 percent as effective as the average for the first-run programs on all of the other Los Angeles stations.

ANALYSIS

In the case of the Jack Benny program, the rebroadcast program was actually heard by 6 percent more listeners than heard the original program.

It has often been said that rebroadcasts are more successful on the west coast because of the change in time; however this is not true because there were 44 percent more homes using their radios during the original broadcast at 4 p.m. than there were using their radios during the time of the rebroadcast at 9:30 p.m.

The original broadcast attracted 31 percent of the homes listening to radio while the rebroadcast attracted 42 percent of the homes listening to radio.

This clearly points out that the rebroadcast was actually over 35 percent more effective than the original broadcast.

It is interesting to note from the average ratings below at the time of the rebroadcast that the rebroadcast program attracted many more listeners than the first-run programs on any other station. In fact the rebroadcast program was 482 percent as effective as the average for the first-run programs on all of the other San Diego stations.

- Rebroadcast: 22.8%

Analysis

In the case of the Bergen-McCarthy program, the rebroadcast program was actually heard by 22 percent more listeners than heard the original program.

It has often been said that rebroadcasts are more successful on the west coast because of the time change; however, this is not true, as shown here, because there were 32 percent more homes using their radios during the original broadcast at 5 p.m. than there were using their radios during the time of the rebroadcast at 9 p.m.

The original broadcast attracted 26 percent of the people listening to radio while the rebroadcast attracted 41 percent of the people listening to radio.

This clearly points out that the rebroadcast was actually 58 percent more effective than the original broadcast.

It is interesting to note from the average ratings below at the time of the rebroadcast that the rebroadcast programs attracted many more listeners than the first-run programs on any other station. In fact the rebroadcast program was 470 percent as effective as the average for the first-run programs on all of the other San Diego stations.

Mr. Brown. 14. The above surveys not only substantiate the fact that rebroadcasting in the same area is in the public interest, but that it is a definite convenience to the listeners, as well as an absolute necessity, if the listeners and viewers of this country are to get full benefit and use of their public-domain radio and TV channels.

15. To further point out the necessity for a fuller use of the high quality radio programing by rebroadcasting, much of which programing is now being wasted, there is attached hereto as exhibit No. 2, a copy of a letter which substantiates this fact, dated December 30, 1952, from one of the country's most eminent authorities on the listeners’ and viewers’ acceptance of radio and TV programing, Mr. Sydney
Roslow, director of research of The Pulse, Inc. This association is recognized by all in the industry as one of the foremost authorities on radio and TV audience survey research. In Mr. Roslow's letter he states:

We have always found that the second broadcast—
referring to a rebroadcast—
draws a substantial following.

This authority also states:

My own feeling is that since availability to the radio is one factor in audience size, the rebroadcast of significant programs is almost certain to obtain a good audience. This would make it possible for these unavailable listeners to hear such programs.

16. Exhibit No. 3 attached hereto, gives the best available estimates, from a responsible source of the radio and TV program costs for the past year, 1952. This exhibit is furnished for the purpose of conveying to the Commission how many millions of dollars of radio and TV programing are going to waste each week, because these programs are only heard by a very small percentage of the listeners or viewers and are not made available to them by rebroadcasting at other times when they would be able to hear or see them.

17. Exhibit No. 3 is a reprint from the trade periodical Variety, estimating the amount of money spent each week throughout 1952 to 1953 by radio sponsors and advertisers, just for the production of their broadcasts, such as, production expenses, actors, musicians, writers, royalties, free-lance directors, transportation, prizes, and so forth. These figures do not include the costs for commercial announcers, agency directors, agency commission or time charges.

18. Sponsors or advertisers spent $868,400 per week on their radio programs and $2,484,455 per week on their TV programs alone, not including the program costs of commercial announcers, or agency directors. These sponsors have been, and are now being deprived of their property rights, as well as the full use of their own programs, by the misinterpretation of section 325 (a) of the act and the continued refusal by WARC to allow WSAV to rebroadcast such sponsors' programs.

19. The letter on the first page of exhibit No. 3 by Mr. George Rosen, the radio and TV editor of Variety, who is no doubt one of the best informed individuals on radio and TV, program statistics and showmanship, which letter describes the evolution of radio programing, is one of the greatest examples of clear thinking and careful factual analysis of the situation. Mr. Rosen's observations bear serious consideration and study if radio is to continue to best serve the public interest, convenience, and necessity.

20. Attention is called to Mr. Rosen's statement regarding the continued snowballing of TV talent-production fees and the decline of the high-budgeted network radio show. That there is no diminishing in the number of sponsored network radio programs, has a significance all its own, for it reveals the successful attempts to repattern the AM-program structures, with their modified price tags, to meet the TV competition and evaluate programing to match the bankruptcy of the advertiser who still finds network radio a vital and kicking medium in moving the product off the shelf.

21. Exhibit No. 4 entitled, "Pricing TV Off the Market," and exhibit No. 5 entitled, "Now Even Berle Is Singing the Cancellation
Blues," are concrete examples of how the public suffers from the inability of TV and radio to cope with the ever-increasing costs of programing.

22. Radio and TV cannot continue to produce these costly programs for the sponsorship of advertisers when these programs reach such a small percentage of public, as when they are broadcast only once to the listeners and viewers.

23. Attached hereto as exhibit No. 6 is a photocopy of an article appearing in the Billboard trade paper, entitled, "Pic Reruns Shape Up as Major Factor." This article points to the fact that surveys show that the third run of a motion picture on WCBS-TV was seen by about three times as many people as saw the first and second runs of the same picture in the same area. It also points out the fact that reruns of popular programs in the same area attract a greater audience than first runs of less popular programs.

24. Exhibit No. 7 entitled, "Repeats, Discounts in Summer Plans," clearly points out that to continue high-quality programing, rebroadcasts in the same area are an absolute necessity, if the program cost is to be warranted. These exhibits 4, 5, 6, and 7 also point out the public necessity for making these costly programs available to listeners when they can be at their sets to listen and view these high-quality sponsors' programs.

25. It is clear that the networks realize the above facts and they are fostering, and wherever possible using section 325 (a) as an instrument whereby they are restraining the affiliated and independent radio and TV stations from negotiating with sponsors to rebroadcast the sponsors' programs unless the negotiations and revenue come through the network on the network's optioned station time. It definitely is not the congressional intent of 325 (a) to allow such monopolistic practices, which sections 309 (a), 314, 506, and 326 of the Communications Act of 1934 were designed to prohibit.

26. High quality radio programing is without a doubt very costly to produce. Neither networks nor station licensees can afford to broadcast such expensive entertainment. Such programing must be, and is, paid for by sponsors or advertisers. This policy is what has made the American system of broadcasting the most outstanding in the world, as compared with the radio programing of other countries, which is much inferior to ours and for which radio set owners and the public pay taxes to produce this inferior type of radio entertainment.

27. Sponsors and advertisers who pay for and originate our excellent programing must sell their products in order to continue to produce expensive entertainment. In order to sell products the radio programs must be heard by a large number of potential purchasers. In order to reach a greater number of purchasers the sponsors' programs must be rebroadcast. Conclusive proof by the above surveys on rebroadcasting show that rebroadcasting will make it possible for several hundred percent more of our population to avail themselves of this excellent radio entertainment. Statistics show that sponsors are cutting their budgets on radio shows. If sponsors or advertisers can negotiate with individual radio stations for the rebroadcast of their programs without restraint, this fuller use of their programs will without a doubt discourage the trend of cutting their talent and production budget on their radio programs.
28. The better availability, better radio station programing, and the continued or better quality of radio programs broadcast, which rebroadcasting programs in the same area will afford the public, is definitely in their interest, convenience and necessity.

29. After a careful study of the tremendous success of rebroadcasting in the few places where it has been done it is startling to believe that so few people—on an average less than 3 percent—heard the major expensive radio programs when they were broadcast only once in an area, even in the winter months of 1949 prior to the competition of television, and how many more people—several hundred percent more than actually heard the original program—could and would have taken advantage of these high-quality programs, had the rebroadcasting of the programs been made available to them.

30. Another factor in this problem is the fact that one network always arranges to put high quality sponsors' programs in their schedule at times when other competing networks are broadcasting equally popular sponsored programs, thereby making it impossible for one listener or viewer to hear or see all 4 sponsors' high quality and popular programs on the 4 major networks at the same time. Such programing is definitely not in the public interest but in this case the public is secondary. This situation is not the fault of the affiliated station because even though he is a licensee of the Federal Communications Commission, he has no control whatsoever over the majority of the programing on his station, which is scheduled by the networks. Exhibit No. 8, a photocopy of an article appearing in the April 1 copy of Variety, entitled "Du Mont in Repeat Formula," clearly backs up the above statements. It is also significant to note that unless the right to rebroadcast sponsors' programs who desire their programs rebroadcast, is made universal and a determination of the sponsors themselves, section 325 (a) could well shut out negotiations between affiliated or independent stations and sponsors, while at the same time opening the door for further monopoly by the networks of national advertising by giving the networks an exclusive right to negotiate with sponsors for the rebroadcast of their programs, at the exclusion of affiliated and independent stations to do the same.

31. It is fantastic to believe, but it is a plain fact, that for the last 25 years the radio public of the United States has been deprived of actually billions of listeners and viewers high quality program hours of the most expensive entertainment broadcast, because the radio networks and certain affiliated stations such as WARC in Rochester, N. Y., have seen fit to purposely misinterpret section 325 (a) of the Communications Act of 1934, in such a way as to deprive radio advertisers of the property right in their own radio programs for which they spend millions of dollars each week. This restraint of rebroadcasting is just contrary to the intention of Congress, which specifically intended section 325 (a) of the act to protect the property right in the radio programs of those who paid the large sums to prepare and produce them, namely the sponsor.

32. Many, including the affiliated and independent radio stations, the advertisers or sponsors, as well as the public, have suffered damages and restraint beyond any conceivable form of compensation, just because a few in the radio industry set out to misuse the law so that they could monopolize, control the entire economic structure of the industry, and restrain the "preservation of competition in commerce,"
(sec. 314 of the Communications Act of 1934), as it relates to radio and television broadcasting.

THE PUBLIC INTEREST ASPECT OF REBROADCASTING IN THE ROCHESTER AREA AND HOW IT RELATES TO THE FCC'S ORDER OF OCTOBER 30, 1952, INTERPRETING REBROADCASTING

33. The following facts are pointed out to show the great public interest in rebroadcasting and how this relates to the Commission's determination set forth in statements contained in paragraph 13 of its order relative to the intent of the rebroadcast rule 325 (a) adopted October 29, 1952.

A. Quoted from paragraph 13 of the FCC's October 30, 1952, order:

Whether requesting stations serve the same or different area as the station whose program they wish to rebroadcast.

34. From the above language, it is clear that the Commission wishes to determine that the public interest, convenience and necessity would be served if the rebroadcasts were in the same area. To substantiate the fact that such rebroadcasts are in the public interest, and in fact a dire necessity, it is urged that the more recent facts pointed out above, as well as the facts contained in the Analysis of Rebroadcasting made by Gordon P. Brown, attached hereto as exhibit No. 1, be given careful consideration. In light of the fact that the survey entitled "Rebroadcasting" was made in the latter half of 1949, prior to the inroads of radio audiences by television, it is apparent that rebroadcasting would even be a greater public interest now that the radio listening audiences are distributed not only among the radio stations, but among the new television stations as well.

35. For a more recent and local picture, it is pointed out that the latest Rochester Pulse Surveys (based on the 1950 United States census which indicates that there are 3.3 people per household, including quasi-householders in the Rochester area) show that the sponsors' programs broadcast over WARC and which were fed WARC by the ABC network, including all such sponsored programs which are reported in the Pulse survey for the months of October and November of 1952, that an average of only 2 percent of the Rochester listeners were able to hear these programs when they were broadcast only once over WARC and that 98 percent of the Rochester listeners did not, or were not able to hear these programs the first and only time they were broadcast to Rochester listeners over WARC. It certainly would be in the public interest to present by rebroadcast over WSAV, the higher quality group of these programs to the 98 percent of Rochester listeners who did not, or could not hear them the first and only time they were broadcast in the Rochester area. WSAV would make it a point to only rebroadcast those sponsors' programs which WSAV knew as a licensee, were of the greatest public interest, and which would provide a "well-rounded program service".

36. B. Quoted from paragraph 13 of the FCC's October 30, 1952 order:

whether the request is for permission to carry a simultaneous rebroadcast or to rebroadcast a program at some subsequent date.

37. Such a situation is well taken care of by the economics of such a rebroadcast. It is evident that in most cases such rebroadcasts
would be made at a later time. A sponsor would not pay for a rebroadcast which did not reach a fairly large group of listeners, thereby the question of public interest in the above situation would be controlled by the listeners themselves.

38. It is further pointed out that WSAY as a licensee would at all times exercise its duty and right to determine the public interest, convenience and necessity aspects of its programming. WSAY would have a greater opportunity to determine these factors of public interest, and much more so than WARC, or any other licensee who may be affiliated with a network. First, because WSAY does not have network option controls on its time. Second, because WSAY would know in most instances, except in simulcasting, what the program content was, prior to its rebroadcasting, as compared to the network affiliate, such as WARC, who has no knowledge whatsoever of the program content of the large number of programs fed to it by the network and broadcast over its facilities, until after the program has been heard by the listeners.

39. It is important to consider that WARC's night coverage based on FCC statistics is only 165 square miles, and that the Rochester metropolitan area consists of 673 square miles, therefore the signal of WARC, when it is broadcasting the sponsor's original program, is covering less than 18 percent of the Rochester metropolitan area.

40. WSAY's night coverage based on FCC statistics at present is 300 square miles, considerable more than that of WARC. It is clear that the rebroadcasts of sponsors' programs over WSAY, in addition to being presented to the 98 percent of the people in the Rochester area who did not hear the original broadcast, will be made available for the first time to the people within the 135 square miles of the Rochester metropolitan area which actually is not covered by WARC.

41. C. Quoting from paragraph 13 of the FCC's October 30, 1952, order on rebroadcasting:

Whether the program concerned has public-service aspects that make its wide disseminating to the public clearly desirable.

42. A study of the surveys on rebroadcasting presented herein, in themselves are clear evidence of the public's acceptance and listening response to rebroadcasting. This would particularly be the case in Rochester, N. Y., where less than 2 percent of the Rochester listeners were able to hear the more expensive and high quality sponsors' programs when they were broadcast only once in the area over WARC, and particularly in light of the fact that WARC's evening coverage of the Rochester metropolitan area is less than 18 percent of this area. WARC's small coverage is such that many radio listeners in the area do not even have adequate coverage on the first broadcast of the higher quality programs. Proper and much more adequate coverage could be made available by the rebroadcasting over WSAY, of these programs to the over 98 percent of the radio listeners in the Rochester area who are unable to hear these programs when they are broadcast only once over WARC.

43. If a program is not worth broadcasting so that "its wide disseminating to the public is clearly desirable," it is not worth placing on the air in the first place. Such a program in its original broadcast would not be in the public interest.
44. As pointed out, rebroadcasting of a program allows and affords better programming and control of the station's programming by a licensee than the original broadcast of the program by, say, a network affiliate, such as WARC, in which case WARC is not aware of the fact whether the program is clearly desirable or whether it falls in the category of programs now being investigated by the House Interstate and Foreign Commerce Committee.

45. WARC has no idea of the sponsored program's public-interest value or content, fed to it by the network, until after the program has reached the ears of the listeners which in most cases is too late. Such a condition is not only true on WARC but on many other stations, as pointed out by the hundreds of letters received by the House Program Investigation Committee which is scrutinizing radio programs of licensees bordering on the obscene, or in poor taste.

46. WSAY, as a licensee, will, and will be better able to, perform in the public interest through the medium of rebroadcasting. It is pointed out here that the provisions against censorship of radio programming set up by Congress in section 326 of the act, and the requirements of 309(a) of the act, makes the licensee the sole judge of what should or should not be broadcast or rebroadcast over his own station and it also makes the licensee solely responsible to the Commission that such broadcast or rebroadcast, as well as the station policies, practices and overall operation, are in the public interest, convenience and necessity.

47. Testimony by the FCC Chairman, Mr. Walker, and the FCC General Counsel, Mr. Benedict Cottone, before the committee of the House investigating radio and television programs on House Resolution 278, pages 472 to 488, clearly substantiate the facts contained in paragraph 45 and 46 above.

48. It surely is not a privilege of WARC under the FCC's interpretation of section 325(a) to determine whether the rebroadcasting of any individual sponsor's program, or of any or all sponsor's programs by WSAY, is or is not, in the public interest.

REBROADCASTING

The tremendous advantages to national sponsors of rebroadcasting their costly radio programs for a second time in a given area have in the past, been given very little consideration.

The networks wish to discourage this type of advertising on the part of sponsors, because on the east coast the rebroadcasts of the programs of sponsors using the network would have, in the majority of cases, to be placed on the network affiliated stations in nonnetwork optioned time, thus the rebroadcast business would not fall in the networks category, but would fall in the category of direct business placed by the station representatives on the network affiliated stations on non-network optioned time, or independent stations.

The networks have attempted to scare sponsors and their agencies from considering rebroadcasting by telling them that rebroadcasting would involve a serious union problem. This statement is absolutely false, and does not present any problem whatsoever to those who would rebroadcast their programs.

A careful study of the Rebroadcast Program Analysis of the Pacific Coast Hooper Ratings (copy attached) will point out the unusual
results and success of rebroadcasting, as well as the great advantages to those national sponsors who rebroadcast their programs.

John Blair of Chicago, the representative of the Don Lee stations, was the first station representative to recognize the value of rebroadcasting when he placed a simultaneous rebroadcast of the Walter Winchell show on the entire group of Don Lee stations, which rebroadcasting well compensated Mr. Blair, his stations, and, most of all, the sponsor.

Analysis of the Pacific Rebroadcast Hooper Ratings will convince any sponsor or agency of the terrific value of rebroadcasting.

It is as fantastic to assume that when a network program is broadcast once in a metropolitan area that all people owning radio sets in that area hear that program at that particular time, as it would be to think that a major movie by being shown once or for a week in one theater that that picture has no value when it was shown as second, third, fourth, fifth, and so on, runs in the same community. A quick glance at any Hooper tells the broadcasting industry better.

A 1949 Hooper radio listening survey for the entire United States on all of the commercial radio programs of all of the four major networks including the NBC, CBS, ABC, and Mutual, definitely shows on an average only 2.74 percent of the radio listeners in the United States hear the network programs when they broadcast only once over the air by the networks. This means that 97.26 percent of the listening audience of this country would be potential new listeners for the average radio program that was rebroadcast for the second time. Even taking the highest rated network show in the country, which is well above the average, only 10 percent of the potential radio listeners hear the broadcast, while 90 percent of the radio listeners do not hear the program and they would be potential listeners for the rebroadcast of the program.

In another survey, made during December 1949, of programs which were broadcast over the same station the second time, on the same day, the following ratings prove conclusively that programs rebroadcast the second time receive even greater ratings than the ratings for the first broadcast, as tabulated below.

<table>
<thead>
<tr>
<th>Program</th>
<th>Ratings</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Original broadcast</td>
</tr>
<tr>
<td>Charlie McCarthy</td>
<td>15.5</td>
</tr>
<tr>
<td>Jack Benny</td>
<td>15.7</td>
</tr>
</tbody>
</table>

Charlie McCarthy and Jack Benny were rebroadcast on the full CBS west coast network.

The above surveys were taken in 1949 at a time when radio listening was at its peak. Now with the inroads of television on radio listening, rebroadcasting would have even greater advantages to national sponsors.

The above factual data behooves every national radio sponsor, his advertising agency, every network affiliated station, independent station, and most of all the station representatives to pursue the tremendous advantages of this yet untapped reservoir of mutual gains.

A simple campaign by the radio station representatives, as well as
the network affiliated and independent stations, to acquaint national agencies and sponsors with the facts regarding rebroadcasting, could not help but create millions of dollars of additional revenue for the radio industry, without in any way effecting the present revenue of the networks, or the network affiliated stations which stations could greatly supplement their present income through the medium of rebroadcasting.

REBROADCAST PROGRAM ANALYSIS OF THE PACIFIC COAST HOOPER RATINGS

Rebroadcast of Jack Benny program:
1. Jack Benny’s original broadcast on CBS at 4 p.m. brought a rating of 15.7. Five and one-half hours later, at 9:30 p.m., on the same station, a rebroadcast of the program brought a rating of 20.7, an increase in rating of 5, or over 31 percent more than the original program.

Rebroadcast of Charlie McCarthy’s program:
2. Charlie McCarthy’s original broadcast on CBS at 5 p.m. brought a rating of 15.5. Three and one-half hours later, at 8:30 p.m., on the same station, a rebroadcast of the program brought a rating of 19.4, an increase in the rating of 3.9, or over 25 percent more than the original program.

Even more amazing is the fact that this high rebroadcast rating was obtained in spite of the fact that the Charlie McCarthy rebroadcast program was flanked at the exact same time (8:30 p.m.) by a rebroadcast of Walter Winchell on the ABC network, as well as the unusual situation of being flanked at the exact same time (8:30 p.m.) by a simultaneous rebroadcast of Walter Winchell and Louella Parsons on the Don Lee network, a network other than the originating network.

Here we find the clear-cut situation of where not only one network originating the program allows the rebroadcast of this same program on another competing network, but the rebroadcast is in direct competition with the rebroadcast on the originating network, since the rebroadcast was a simultaneous rebroadcast.

In spite of this terrific competition, flanking the rebroadcast of Charlie McCarthy on CBS at 8:30 p.m., which was the rebroadcast of Walter Winchell on the ABC network, as well as a simultaneous rebroadcast of Walter Winchell on the Don Lee Mutual network, even with this stiff competition the rebroadcast of Charlie McCarthy on CBS produced 25 percent more listeners than the original program when it was first broadcast on CBS at 5 p.m., which original broadcast was flanked by shows of very poor rating, such as a religious program on ABC, called This Thing Called Life, and a weak sustainer on DLBS “Mr. Feathers.”

Rebroadcast of Walter Winchell program:
3. Walter Winchell’s original broadcast on ABC at 6 p.m. brought a rating of 17. Two and one-half hours later, at 8:30 p.m., a rebroadcast on ABC (the same network) brought a rating of 4.7, a very good rating considering it was competing with a rebroadcast of Charlie McCarthy on CBS at the exact same time, as well as competing with

---

1 Authority for all the above figures is the December, substantiated by the November, and October 1949, west coast ratings as shown in the Hooper pocket piece rating book.
itself (it's own identical program) at this exact same time which was being rebroadcast on another network (the Don Lee network), and this same Walter Winchell rebroadcast program on Don Lee brought the high rating of 7 in direct competition to itself (a simultaneous rebroadcast) on the ABC network at the exact same time (8:30 p.m.), as well as the rebroadcast of the Charlie McCarthy program on the CBS network.

It is important to notice that the rebroadcast of Walter Winchell at 8:30 p.m. on the same network (ABC network) brought a rating of 4.7 while a rebroadcast at the same time and under identical conditions (a simultaneous rebroadcast), brought a rating of 7 on the Don Lee network, which did not originate the program. A study of this tends to prove that the rating of a rebroadcast program would be higher on a station or network which did not originate the first broadcast of the program.

It is quite apparent that had the rebroadcast of Walter Winchell been placed opposite programs of the same insignificance as those flanking the original broadcast and not opposite the competition of itself duplicated on another network, as well as Charlie McCarthy on the CBS network, that the first rebroadcast as well as even the second rebroadcast might have surpassed the original broadcast in rating.

Rebroadcast of Louella Parsons program:
4. Louella Parsons original broadcast on ABC at 6:15 p.m. brought a rating of 11.7. Two and one-half hours later, at 8:45 p.m., on the Don Lee network, a rebroadcast of Louella Parsons brought the rating of 5.1, an exceptional rating for a rebroadcast of that program, considering that it was flanked at the exact same time by the rebroadcast of the Charlie McCarthy program on CBS.

OVERALL ANALYSIS

A careful study of the December Hooper ratings for the Pacific coast conclusively proves the value of rebroadcasting to the sponsors of these programs and a study of the October and November Hooper ratings conclusively substantiates all the facts enumerated above.

This analysis appears to be definite evidence that a more general use of rebroadcasting would be the incentive for sponsors to continue to produce high-quality programs, and last but not least, rebroadcasting can and will be the medium for the placing of millions of dollars more of business in the Aural radio industry, without in any way injuring or affecting any phase of the existing business or industry.

It appears that this rebroadcasting on the west coast is the first extensive rebroadcasting done in the United States. It is also noted that there is considerable more unsponsored network time available on the stations on the west coast. Naturally, the networks are not anxious to foster rebroadcasting in the East because most of this rebroadcasting would have to be done on time not optioned and controlled by the networks, therefore, the revenue of rebroadcasting programs in the East would not be network revenue but it would be spot revenue direct to the stations.

It must be remembered that these rebroadcast Hooper ratings are for the latter part of 1949, a time when television had not reached a factor to be considered. Naturally, rebroadcasting of radio programs
now would be much more valuable due to the television competition at the times of the original radio broadcasts.

The Commission says under a ruling—which I was some 3½ years getting out of the Commission—that we must still get permission from the originating station.

So we went to the originating station as defined by the Commission, and we asked them for permission to rebroadcast a sponsor’s program. Here is what we asked for, and it is entitled at the top “Request of Station WSAV To Rebroadcast the Signal of Radio Station ——.”

It reads as follows:

WSAY, herewith, pursuant to the FCC interpretation of section 325 (a), of the Communications Act of 1934, requests permission of Station —— to rebroadcast the signal of that station, when the facilities of the station are hired or purchased, either directly by a sponsor, or sponsors, or their agencies, or indirectly through the facilities of a network, and when this signal of —— is broadcasting the program or programs of a sponsor or sponsors, which desire, or may desire, their programs rebroadcast by radio station WSAV; it being expressly understood that Station —— does not have any property right in the sponsor’s programs, and thereby does not in this permission intend to convey any such property right to station WSAV.

It is further understood that WSAV is not requesting, nor is Station —— herewith granting, any permission to rebroadcast the signal of ——, when it is broadcasting sustaining programs, the talent or transcription cost of which is paid for by the station, or a network furnishing the program material, and where on such programs, no major portion of the talent or transcription cost is defrayed or paid for, by any other person, corporation, or organization, which desires or may desire WSAV to rebroadcast their programs.

All we are asking the station to do is to give us permission to rebroadcast that program which belongs to the sponsor. The Commission has refused and we, as a result of the refusal of the station to allow us to rebroadcast this program have gone to the Commission and have cited their interpretation of section 325 (a), and we have asked that the Commission be told that they are not acting in the public interest in withholding these programs of the sponsor from our area for a second run, particularly when the sponsor is willing to pay my station to put his program on for the second time. We find that the Commission came back just a few days ago with an answer, and after this report which is—and this is only part of it—it consisted of, well, over 125 pages explaining the reasons from the public-interest standpoint for rebroadcasting and so forth, the Commission said, and here is what they said in effect—well, we are not going to do anything about it, because you did not ask for specific programs.

In other words, the Commission wants me to go back to the radio station and ask him for every program on his station that I want to rebroadcast and go back to the Commission and ask again.

Well, now, that is absurd, first, because if I am allowed to rebroadcast one sponsor’s program, for anybody to say that I should not broadcast another sponsor’s program is definitely censoring radio. In other words, if the station that I request from says “you can rebroadcast that sponsor’s program, but you cannot rebroadcast this sponsor’s program,” that station is dictating to me what shall be broadcast over my station.

So you consider this on a per-program basis, and it definitely puts the thing into the realm of censorship.

Senator Potter. Mr. Brown, I have to remind you that I have to leave in a few minutes, and we do have another witness.

Mr. Brown. How much time have I got?
Senator Potter. You have had 45 minutes, more than any other person today. It is a very interesting subject, but I would like to get as much testimony today as we can on the problem that we are considering on the matter of UHF, and I would be happy to have anything you care to submit.

Mr. Brown. I do have something. I want to say this one thing that I think the Commission should recognize that rebroadcasting is in the public interest, that it should do something about it, so that the UHF station might go back and negotiate with-sponsors and put these important programs on their television stations the same as I today can put them on radio stations.

Senator Potter. I think that deserves consideration.

Mr. Brown. I think that covers that situation.

There is one other statement. We are opposed to the Federal Communications Commission idea of booster stations.

Statements taken from the FCC sixth report and order relative to a proposal of Gordon P. Brown, of radio station WSAV in Rochester, N. Y.:

222. The Federal Broadcasting System, Inc., proposed that the Commission provide for the assignment of “satellite” or “booster” stations by means of the use of directional antennas. The purpose of the proposal would be to allow parties not financially interested in the dominant station to erect and operate a lower power television rebroadcast station at a high point above communities situated in valleys otherwise out of the range of the dominant station.

223. The assignment plan contemplates the use of stations so removed from each other as to serve the greatest number of areas and persons and to keep the areas of interference between stations to a minimum. The indiscriminate use of “booster” or “satellite” stations in cities other than shown in the assignment table would defeat the aims of the plan. The Commission is of the opinion, however, that there may exist special cases where the carefully controlled utilization of such stations may be beneficial to the plan. However, in view of the absence of adequate data in this record, the Federal Broadcasting System proposal must be denied.

Now this proposal might help this area such as Senator Bowring brought up. In other words, you have a dominant station which is broadcasting a signal, and that signal would be picked up and rebroadcast by a booster station and feed that particular area. There is one particular area south of Rochester, N. Y., which is in a valley, and doesn’t get service and never will get service from any of the existing television allocations, because of the fact that they are not able to reach that area, and this particular rebroadcasting service might be beneficial.

If booster stations are allowed, the dominant station should not own them, but somebody in the particular community who is familiar with the community should own the booster station.

I think that covers most of it.

Senator Potter. I wish to thank you for your testimony.

Mr. Brown. There is one other article I would like to get in, which is the number of television stations which should be owned by the network. It is a presentation to the Commission, and I think the networks are enough of a monopoly now without giving them the television stations to give them a greater monopoly.

Senator Potter. Thank you, Mr. Brown. We will make these other documents of yours part of the record.

(The statement submitted by Mr. Brown is as follows:)

...
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS 689

BEFORE THE FEDERAL COMMUNICATIONS COMMISSION

Washington 25, D. C.

In re Limit of TV stations which can be owned by a single entity

Submitted by Gordon P. Brown, president, the Federal Broadcasting System, Inc., licensee radio station WSAY, Rochester, N. Y.

COMMENTS

The Federal Broadcasting System herewith comments on the FCC's proposal to extend the number of TV stations a single entity may own, the effect of multiple ownership as it relates to the monopolistic control of both national advertisers, advertising budgets, as well as the serious control of public opinion and information channels by a few.

1. The entire purpose and philosophy behind the Congress and Senate in the discussion and debate on the Radio Act of 1927 and later the Communications Act of 1934, which acts formulated the original Radio Commission later to be called the Federal Communications Commission, was the control of the public's radio channels and the prevention of monopoly or control by a few, of these powerful mediums of public information. In fact the act itself directs the Commission to protect radio from such monopolistic control was evidenced by the legislative history of the act of 1934 as quoted below.

"Mr. Broussard. I desire to ask the Senator from Washington a question which has been suggested to me by the remarks made by the Senator from Nevada (Mr. Pittman) and the questions asked by the Senator from Massachusetts (Mr. Walsh):

"I received this morning a telegram from Shreveport, La., signed by Mr. W. K. Henderson, who is a very wealthy man there, and who has a broadcasting station which he uses mostly to entertain his friends and to accommodate the public. I do not think he is making anything out of it. His telegram reads:

"SHREVEPORT, LA., January 31, 1927.

"Hon. Edwin S. Broussard,
United States Senate:

"Our Shreveport Times this morning carried headlines of 35 stations to be chained together. Just as I wired you the other day, chain stations will monopolize and independent stations, such as we have at Shreveport, are practically done for. Hope you will give bill considerable study and stand for interest of others beyond Radio Corporation of America who control chain stations. Between American Telephone & Telegraph Co. and Radio Corporation of America and other interests the independents are through.

"W. K. Henderson,
"Owner, Radio Station KWKH.

"I should like to have the Senator from Washington cover the suggestion contained in telegram, and if the bill does actually make this impossible, to make that known to the Senate.

"Mr. Dill. I am very glad the Senator from Louisiana has asked the question. It gives me an opportunity to explain not only that but some things regarding what the Senator from Nevada said.

"In the first place, under this bill chain broadcasting today, concerning which the writer of the telegram is concerned, is absolutely without regulation. We have no law today to handle the situation, and the various radio organizations, including the Radio Corporation of America and the American Telephone & Telegraph Co., are going ahead and building up the chain stations as they desire, without let or hindrance and without any restrictions, because the Secretary of Commerce has no power to interfere with them. Unless this proposed legislation shall be enacted they will continue to do so, and they will be able by chain-broadcasting methods practically to obliterate the independent small stations, as the man who wrote the telegram suggests.
“While the Commission would have the power under the general terms of the bill, the bill specifically sets out as one of the special powers of the Commission the right to make specific regulations for governing chain broadcasting. As to creating a monopoly of radio in this country, let me say that this bill absolutely precludes, and most specifically it can protect them, by giving the Commission full power to refuse a license to anyone who it believes will not serve the public interest, convenience, or necessity. It specifically provides that any corporation guilty of monopoly shall not only not receive a license but that its license may be revoked and if after a corporation has received its license for a period of 3 years it is then discovered and found to be guilty of monopoly, its license will be revoked.

“In addition to that—
“Mr. Heelin, Mr. President——
“Mr. Dell, Just a moment. In addition to that, the bill contains a provision that no license may be transferred from one owner to another without the written consent of the Commission, and the Commission, of course, having the power to protect against a monopoly, must give such protection.

“I wish to state further that the only way by which monopolies in the radio business can secure control of radio here, even for a limited period of time, will be by the Commission becoming servile to them. Power must be lodged somewhere, and I myself am unwilling to assume in advance that the Commission proposed to be created will be servile to the desires and demands of great corporations of this country.”

2. The net effect of multiple ownership by a few powerful interests has been for these interests to finally own the largest and most powerful outlets in the largest and most densely populated cities and communities. Such effect has come about by the systematic purchase and sale of various radio and TV stations until these groups control the most important outlets in the country. In this, these monopolistic groups have been heretofore assisted by the Commission in that the Commission has sanctioned the purchase of one outlet even if it would exceed the limit of stations to be owned, allowing the monopolistic groups to later dispose of a less powerful outlet to bring the number of stations down to the maximum allowed. In so doing the Commission has already allowed over periods of time, the operation by one owner, of more stations than the maximum allowable under the rules.

3. The Commission apparently feels that allowing the large powerful groups to own two additional UHF TV outlets will boost the cause of UHF, which cause needs boosting. This is a very laudable purpose but not at the expense of monopoly. It is suggested that the Commission insist that at least 2 of the 5 now owned by these powerful groups be UHF TV stations and that the Commission order the disposal of 2 VHF stations by these groups with the right to purchase 2 UHF outlets, and the maximum of TV stations to be owned by any one nonnetwork entity shall not exceed a total of 5. Such a policy may give the end result desired by the Commission in attempting to assist the almost lost cause of the UHF TV broadcaster, many of which have already gone out of business.

4. The multiple ownership of radio and TV stations by the network chains has made it impossible for other stations in these ownership areas to not only compete for the national advertising dollars but also for the local advertising dollars as well as public and program prestige, both of which are directly proportional to a station’s ability to broadcast the expensive and high quality programs paid for by the national advertisers. These network chains who virtually control all program production, the advertisers’ budgets, as well as the operation and financial position of their affiliated stations, should not be allowed to own more than 1 radio station and 1 TV station. It is urged that the Commission rule that any interstate network shall dispose of all its owned and controlled stations except 1 in each category.
The national radio network chains with only their owned and operated stations control the public opinion and information channels of the country. Such a condition in light of the dictates of Congress in the issue of monopoly as evidenced by the legislative history of the act bears careful consideration and bold action. It is a well-known fact that the networks not only control the operation and programming of their owned and operated stations, but the operation and programming of other multiple-ownership groups, as well as hundreds of their affiliated stations. Such control is exercised by the chains' power of granting or refusing network affiliation contracts to such stations, thereby directly controlling the financial destiny of these stations in granting or denying these stations the right to broadcast the high quality programs of the national advertisers which these network chains control.

5. As of the writing of these comments, over 40 postthaw TV stations have surrendered their licenses and all of these communities and people have been deprived of the TV service from these stations, basically because the network chain monopolies have refused to feed these outlets the programs of the national sponsors.

Therefore, in light of considerable personal experience with these monopolistic groups, I beg that your Commission give serious consideration to the above.

Respectfully,

GORDON P. BROWN, President.

1 Although a detailed check has not been made, it may be assumed that few, if any, of these 83 "on air" AM deletions were affiliated with major networks.

2 Approximately 200 of these 244 deleted FM stations were operated jointly with AM stations. It is estimated that in the majority of such instances, the AM station was affiliated with a major network. In the case of deleted FM-only stations, none were affiliated with major networks.

3 All TV deletions were VHF.

MR. GORDON P. BROWN,
WSAY, Rochester, N. Y.

DEAR MR. BROWN: In answer to your inquiry of December 16, we have observed in our surveys on the west coast a definite and strong following in rebroadcast radio programs. I refer to the west coast, because this is the only area where we have surveyed the audiences to such programs. For example, the Jack Benny program which is originally broadcast at 4 p. m. is rebroadcast later in the evening. We have always found that the second broadcast draws a substantial following.

My own feeling is that since availability to the radio is one factor in audience size, the rebroadcast of significant programs is almost certain to obtain a good audience. This would make it possible for these unavailable listeners to hear such programs.

Cordially yours,

SYDNEY ROSLOW, Director.

EXHIBIT No. 3

VARIETY,
New York 36, N. Y.

This year's Radio-TV talent cost charts as compiled exclusively by Variety have a significance far beyond the detailing of program price structures. In themselves, they reflect the changing trends in the AM-TV upheaval; the continuing snowballing of TV talent-production fees and the decline of the high-budgeted network radio show. That there is no diminution in the number of sponsored network radio programs has a significance all its own, for it reveals the successful attempts to repattern the AM program structures, with their modified price tags, to meet the TV competition and evolve programming to match the bankrolls of the advertiser who still finds network radio a vital and kicking medium in moving the product off the shelf.

A further perusal of the TV talent cost chart indicates that talent and production fees (particularly where unions are involved) are reaching new high levels, with programs in the $26,000-$25,000 bracket the norm today for a modest-budgeted display. How high they'll go in 1953 is anybody's guess.

The annual talent cost charts are but one of the many "exclusives" in Variety, an added fillip to the week-to-week comprehensive coverage in Variety's Radio-TV section of an industry where the patterns and the thinking are in a constant state of flux. To keep pace with the trends, Variety today, as always, is "must" reading.

GEORGE ROSEN,
Radio-TV Editor.

BEFORE THE FEDERAL COMMUNICATIONS COMMISSION

Washington 25, D. C.

Docket No. 9808

In the matter of amendment of sections 3,191, 3,291, 3,591, 3,655, and 3,790 of the Commission's rules and regulations

REPORT AND ORDER

By the Commission: Commissioners Hyde and Jones not participating.

This proceeding was instituted on October 5, 1950, by the adoption of a Notice of Proposed Rule Making, released October 6, 1950, which proposed the amend-

1 Sec. 3,655 was formerly sec. 3,691. The number was changed by the Sixth Report and Order in Docket No. 8736 et al.
ment of sections 3.191, 3.291, 3.591, 3.655, and 3.790 of the Commission's Rules and Regulations to clarify these rules with respect to the meaning of the term "originating station" in section 325 (a) of the Communications Act of 1934, to resolve any possible conflict between section 325 (a) of the Communications Act of 1934 and the Commission's rules against exclusivity, and to clarify the Commission's rules with respect to the necessity for securing the consent of foreign broadcast stations under section 325 (a).

Section 325 (a) provides in pertinent part:

"** * * nor shall any broadcasting station rebroadcast the program or any part thereof of another broadcasting station without the express authority of the originating station."

This proceeding arose out of a controversy between television stations WJIM-TV, Lansing, Mich., and WWJ-TV, Detroit, Mich., the facts of which were set forth in the Notice of Proposed Rule Making, and need not be repeated here. Comments on the proposed amendment and clarification of the rules have been received from Hon. Harry R. Sheppard, Member of Congress; television station WWJ-TV; the National Broadcasting Co., Inc.; the then National Association of Broadcasters (now the National Association of Radio and Television Broadcasters); and Gordon P. Brown, general manager of radio station WSAV, Rochester, N. Y. Gordon Brown, Hon. Harry R. Sheppard and American Broadcasting Co., Inc., also filed answers to the filed comments. Each of these expressions of views has been carefully considered, as well as the petition for declaratory ruling filed by WJIM-TV.

To decide the questions before us most expeditiously, we will say first that if we do not believe section 325 (a) requires the consent of the originating station before the rebroadcast of the program of a foreign broadcast station. All who commented on this phase of the proceeding expressed the view that the extension of such protection would be desirable if on a mutual basis. A careful inspection of the relevant legislative history fails to provide any indication that Congress, in adopting section 325 (a), intended to afford protection to foreign radio stations or gave any consideration to this question. In the absence of a treaty or other international agreement providing that consent shall be secured before the rebroadcast of the program of a foreign station, and in the absence of any indication that it was the intent of Congress to protect non-United States stations, we believe that section 325 (a) must be interpreted as requiring consent only when the program of a broadcast station subject to the provisions of the Communications Act of 1934 is to be rebroadcast.

With the question thus limited, the problem remains with respect to the intent of section 325 (a) when one station wishes to pick up and rebroadcast the signal of another station which has in turn received the program from a third station and broadcast it as part of a network presentation. Section 325 (a) refers to "the originating station." The comments which have been filed in this proceeding construe that term in several different ways. One view is that the originating station, whose consent must be secured, means only the station whose signal is picked up and rebroadcast. Another interpretation is that section 325 (a) requires the consent only of the network station through the facilities of which the program is produced and first disseminated. A third view is that while consent must be had from the station whose signal is picked up consent must also be secured from the network station supplying the program, in the case of a network broadcast. And, finally, it has been urged that section 325 (a) was intended to require the consent of the person, sponsor, station, or other party who bore the principal expense for preparing and producing the program. The theory of this latter view is that a program produced predominantly at the expense of a sponsor or advertising agency is not the property of the station whose facilities are used to transmit the program.

These views, as somewhat broadly restated above, present all of the possible interpretations of the statute. However, the suggestion that section 325 (a) be so interpreted as to require the consent only of the party who contributes the major share of the expense of producing the program, however appealing it might be as a matter of policy, requires, we believe not an interpretation of section 325 (a), but a revision of it. The statute refers only, and specifically, to broadcast stations. Its revision, if desirable as a matter of policy, must be left to Congress.

2 Congressman Sheppard also filed an "Introduction of New Evidence," for which a petition for rate acceptance was filed, and which has been considered.
We think section 325 (a) should be interpreted as providing that no program may be rebroadcast without the consent of the station whose radio signals are received, and transmitted either simultaneously or at a later time. We base this opinion primarily upon the fact that the legislative history of the section, insofar as it is helpful here, indicates that Congress, while obviously not facing the problems which the subsequent rapid development of network broadcasting has created, intended the words "originating station" to be applicable solely to the station whose signal was received and rebroadcast. Section 325 (a) of the Communications Act of 1934 is identical with section 28 of the Radio Act of 1927 (44 Stat. 1172), where the prohibition against rebroadcasting first appeared as law. Prior to the adoption of section 28, the Fourth National Radio Conference which met in Washington in 1925, adopted the resolves of its committees on operating regulations and legislation that rebroadcasting of programs should be prohibited "except with the permission of the originating station." (See hearings on S. 1 and S. 1754 before the Senate Committee on Interstate Commerce, 69th Cong., 1st sess., pp. 71 and 85.) S. 1754, a predecessor bill to the Radio Act of 1927, which was introduced by Senator Dill, 69th Congress, 1st session, contained a section 13, which provided:

"No station licensed under this act shall have the right to rebroadcast any radio energy or radio communications or signals transmitted by another station except by permission of the station from which the radio energy, communications, or signals were originally broadcast or transmitted."

The Solicitor of the Department of Commerce testifying on S. 1754, stated that the section adopted a new principle and was "directed to the practice that has commenced to grow up by which one station simply picks out of the air the program of another station and rebroadcasts it. That is entirely a question of policy. It is one that in no way affects [sic] the Department. It is, in other words, a recognition of the right of the originating station to control its programs after it has been thrown into the air." (Hearings on S. 1754, supra, p. 120.)

On the floor of the Senate, Senator Dill stated with respect to section 28 of H. R. 9971, the bill which was enacted as the Radio Act of 1927:

"Mr. President, I may say to the Senator that the bill does not in any way define the terms 'broadcasting' and 'rebroadcasting' because they are terms which have grown up in the use of radio which are generally understood.

"As to section 28, providing that no person, firm, or corporation shall rebroadcast the material broadcast by a station without that station's consent, it is, I think, a very necessary provision. Otherwise, we would have a broadcasting station spending a large amount of money to prepare and present a program as a program from that station, and then under the modern methods of rebroadcasting, it could be picked up and broadcast from other stations, and particularly over the wired wireless, and money charged for listening to it. The provision referred to does not prevent rebroadcasting, but it does require those who would rebroadcast to get permission from the original broadcaster. I do not think the construction placed upon the section by the gentlemen who sent the telegram is justified. Of course, he cannot rebroadcast it, but rebroadcasting is not publishing. It has a generally understood meaning, namely, the reproduction by radio of the broadcasting waves." (68 Congressional Record 2880.) [Emphasis supplied.]

It thus appears from the foregoing that Congress intended section 28 to require the consent of the station whose signal is received and retransmitted. It appears that the purpose of the provision was to protect the rights of those having property rights in programs. At the time Congress acted upon the matter the beneficiary of his protection was normally the station whose broadcast signal was involved. But today the station whose signal is rebroadcast frequently does not own the property rights in the program. Indeed, none of the stations in a network may own the property rights in the program. Since section 325 would have the effect of permitting such a station to reject and rebroadcast programs from originating stations without permission."

See In the Matter of A. E. Newton (2 F. C. C. 281), which is in accord with this interpretation.

The Committee on Operating Regulations reported in part as follows:

The term 'rebroadcasting' was considered as referring to the interception by a broadcasting station of the program transmitted by another station and rebroadcasting the program transmitted from the originating station. It was pointed out that the program feature will ultimately become the most expensive part of a broadcasting station, and that it would be unjust for any station to intercept and rebroadcast programs from originating stations without permission."

STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS 695

48550—54—45
(a) does not purport to alter or define the property rights in program material. In some cases the consent given under the section may be of little value as authority for the rebroadcast of a program because of the station's lack of right to give consent to a third party for the use of someone else's property. To the extent that section 325 (a) may no longer accurately reflect present conditions or effectively carry out the original intent of Congress, the amendment of the section, or its repeal insofar as it pertains to rebroadcasts, is a matter requiring legislative action.

The Commission's notice of proposed rulemaking in this proceeding also raised the question of whether section 325 (a) endows network affiliates with power to prevent the rebroadcast of any network program in a substantially different area from that served by the affiliate. In this connection, the notice of proposed rulemaking suggested that the Commission's rules relating to rebroadcasting might be amended to alleviate any possible conflict between any such grant of power and the policy enunciated in sections 3.102, 3.232, and 3.632 of the Commission's rules and regulations directed against arrangements for territorial exclusivity, by requiring stations to file a written statement explaining the reasons for a refusal of permission to rebroadcast a program. Where such refusal did not arise reasonably related to protecting property interests, the station might be considered in relation to the qualifications of the station.

None of the comments received was directed to this particular proposal for written statements. However, it has been suggested that the Commission's chain-broadcasting regulations could not operate to require a station to permit the rebroadcast of its signal even by a station serving a substantially different area since the station has an independent property right in its broadcast signal which it is entitled to protect.

We have stated our belief that section 325 (a) requires the consent of the station whose signal is rebroadcast, even in those cases where property rights in the program material may rest elsewhere. We do not know what the intention of Congress would be today with respect to requiring consent where only such rights as may exist in a station's signal are concerned. But, even if there be claimed property right in a broadcast signal, or if Congress would today wish to afford protection to the signal alone, it does not follow that section 325 sanctions arbitrary refusals of consent for rebroadcasts on the part of network affiliates or other stations who may have the power or authority to give such consent. In our opinion, a station's operation must be in the public interest in respect of its exercise of the power conferred by section 325 (a) as in other respects, and such powers cannot and were not intended to be used for the monopolistic purposes which the chain-broadcasting rules were intended to prevent. A refusal either by a network affiliate, or a nonnetwork station, to permit a rebroadcast where based upon no reasons at all, or upon unreasonable grounds, may well constitute conduct going to the qualifications of a licensee to operate in the public interest. So that we may be better able to inquire into such instances, we have determined to adopt the rule requiring an explanatory statement for each refusal of consent to rebroadcast.

Since the Commission's rules as presently constituted are consistent with the interpretation of section 325 (a) herein set forth, no other amendment of the rules is being adopted.

Accordingly, pursuant to the authority contained in sections 4 (i), 303 (i), 304 (r) and 325 of the Communications Act of 1934, as amended, sections 3.191, 3.291, 3.591, 3.655 and 3.790 of the Commission's rules and regulations are amended, effective July 1, 1952, by adding thereto as subsections 3.191 (f), 3.291 (e), 3.591 (d), 3.655 (d), and 3.790 (d), respectively, the following:

"Any station which refuses authority for the rebroadcast of a program broadcast by it, or any part thereof, shall file with the Commission within 10 days of such refusal a statement containing the following information: The station requesting authority for the rebroadcast; the date of the request; the program or programs, or parts thereof, for which authority to rebroadcast was requested; the date of refusal; the reason, or reasons, for denial of the request. A copy of the statement filed with the Commission shall also be sent to the station whose request has been denied."

FEDERAL COMMUNICATIONS COMMISSION,
T. J. SLONIE, Secretary.

Adopted May 14, 1952.
Released May 15, 1952.
In the matter of amendment of sections 3.191, 3.291, 3.591, 3.655, and 3.790 of the Commission's rules and regulations

MEMORANDUM OPINION AND ORDER

By the Commission: (Commissioner Hyde concurring in part and issuing a statement)

1. On May 14, 1952, the Commission adopted a report and order in the above-entitled proceeding (17 F. R. 4711) in which it set forth its interpretation of section 325 (a) of the Communications Act of 1934, as amended, with respect to certain matters, and also adopted a new amendment to its rules and regulations.

2. Section 325 (a) provides in pertinent part: "* * * nor shall any broadcasting station rebroadcast the program or any part thereof of another broadcasting station without the express authority of the originating station."

3. As stated in the notice of proposed rulemaking issued herein on October 5, 1950, this proceeding arose out of a controversy between two television stations concerning the meaning of the term "originating station" in section 325 (a), which raised questions of general interest which the Commission believed should be the subject of rulemaking. According, it was proposed to amend sections 3.191, 3.291, 3.591, 3.655, and 3.790 of the Commission's rules and regulations to clarify these rules with respect to the meaning of the term "originating station" in section 325 (a) of the Communications Act; to resolve any possible conflict between section 325 (a) and the Commission's rules against exclusivity, and to clarify the Commission's rules with respect to the necessity for securing the consent of foreign broadcast stations under section 325 (a).

4. In its report and order of May 14, 1952, the Commission, after considering the comments filed in response to the notice of October 5, 1950, set forth its interpretation of section 325 (a) in respect of the following matters:

(1) In the absence of an applicable treaty, the statute does not require the consent of the originating station before the rebroadcast of the program of a foreign broadcast station.

(2) The "originating station" is the station whose signal is received and transmitted, either simultaneously or at a later time.

(3) The statute does not confer upon the originating station an arbitrary right to refuse consent for a rebroadcast, without regard to the nature of the interests sought to be protected by a refusal and its effect upon the public interest. In addition to these interpretations of section 325 (a), an amendment of the rules was adopted providing for a report to the Commission in each instance of a refusal to grant permission for a rebroadcast.

5. Upon petitions seeking such relief, the Commission has twice postponed the effective date of the amendment to the rules for successive periods to, and including, October 31, 1952.

6. Petitions have also been received from Columbia Broadcasting System, Inc., National Broadcasting Co., Inc., National Association of Radio & Television Broadcasters, and on behalf of stations KLOK, WKLO, KXRO, KLO, KING, KPQ, KPHO, WHEN, and WOW, seeking reconsideration of the report and order of May 14, 1952, and the amendments to the rules adopted on that date. These petitions have been opposed by Hon. Harry R. Sheppard, and by Gordon P. Brown of radio station WSAV, Rochester, New York.1

7. The petitions for reconsideration do not seek reconsideration of the Commission's determinations with respect to the need for consent from a foreign station.

The petition filed on October 9, 1952, on behalf of radio stations KLOK, WKLO, KXRO, KLO KING, KPQ, KPQ, WHEN, and WOW has been considered only as it was directed to the amendments to the rules. It was not timely filed with respect to the interpretive aspects of the report and order (Communications Act of 1934, sec. 405). Gordon Brown's petition in opposition, filed on October 23, 1952, was also filed too late for consideration as an opposition thereto since it was filed more than 10 days subsequent to the filing of his petition (see, 1.730 of the rules and regulations). Gordon Brown's request, made in the same petition, that the Commission investigate an alleged conspiracy to restrain rebroadcasting, based on an alleged unity of action in opposing the Commission's report and order herein, will be denied, since it is unsupported by facts sufficient to warrant an investigation.
station or the meaning of the term "originating station." They do challenge
the reporting requirement and the interpretation of the report and order with
respect to the absolute right of a station to refuse consent for a rebroadcast.

8. The Commission finds, upon reconsideration, that the amendments to its
rules have not produced evidence that such instances of a refusal of consent for a rebroad-
cast are unnecessary. No facts have been presented to the Commission by
those opposing the requirement concerning the probable extent of any possible
burden which the reporting requirement might involve. Indeed, the report-
ing rule as finally adopted on May 14, 1952, was in almost the identical language
as that proposed in the notice of proposed rule making which has been adopted
on October 5, 1950. Yet none of the instant petitioners or any other persons
who filed comments addressed to the proposed rule raised any question con-
cerning the burdens which are now alleged.9

9. Nevertheless, we find that many situations may be resented in the day-
to-day operation of stations which raise difficult but bona fide questions as to
the applicability of our rule. Thus, a station may frequently have difficulty
in deciding whether particular types of inquiries are requests for rebroadcasting
privileges, or whether responses to such inquiries setting forth conditions for
granting rebroadcast consent constitute "refusals." A station may thus act
at its peril in failing to file a report which under a different interpretation of
the circumstances involved might be deemed by the Commission to have been
required under the rule. Moreover, an undeterminable number of requests to
rebroadcast may involve situations which would not be thought to warrant a
complaint or where a refusal would not be improper. We now recognize that
these factors make it undesirable to deal with the problem by the rule adopted.
Instead, the same purposes may be achieved by leaving it to the Commission to
request explanatory statements from licensees in situations in which complaint
is made by another licensee of an alleged refusal to permit a rebroadcast. The
procedure in connection with such complaints would thus be similar to that
followed in the case of other complaints. The amendments to the Commission's
rules and regulations adopted on May 14, 1952, will therefore be deleted.

10. The petitions for reconsideration also argue, in substance, that section
325(a) gives an absolute right of refusal, and that the Commission is legislat-
ing, contrary to the intent of the statute, when it declares that the right to
refuse consent for a rebroadcast is not absolute. It is said that a refusal to
grant consent cannot be made a revolant consideration in determining whether
a station has operated in the public interest. The oppositions to the petitions
for reconsideration support the Commission's previous interpretation of the
statue. They also argue that the use of section 325(a) to prevent a station
from carrying a program by means of a rebroadcast when the sponsor
desires to have that station carry the program, involves a restraint of trade,
and that rebroadcasts are valuable both to sponsors, independent stations, and
the public.

11. In the Report and Order of May 14, 1952 we set forth our interpretation
of the meaning and purpose of section 325(a). We have carefully considered
the comments received since the adoption of that report and order. They do
not persuade us, however, that section 325(a) of the Communications Act was
intended as a lone exception to the general principle that every broadcasting
station is licensed to serve the public interest and that every station is account-

8 Sec. 4 (a) of the Administrative Procedure Act requires "either the terms or
substance of the proposed rule or a description of the subjects and issues involved,"
The Commission's notice of proposed rulemaking, although directed chiefly to the problem of
carrying a station which is desired, states that the rule 325(a) is being adopted because
an originating station which refuses to rebroadcast a program file with the
Commission and with the station requesting such permission a written statement describing
the grounds and reasons for the refusal: * * * In view of the importance of the subject
matter it is desired that interested persons be afforded an opportunity to present their
views in the matter before the Commission issues final amendments to the above sections
of the Commission's rules. To accomplish that purpose the instant rulemaking proceeding
are being instituted." The comments received by the Commission in the petitions for re-
consideration which were directed to the reporting requirement should have been filed in
response to the notice of proposed rulemaking. The Commission rules should have been
addressed to the petitioners when the rules were proposed as
after it was adopted. Conceding that the final rule may have had a wider application than
the proposed rule, its substance was exactly the same. It destroys the whole purpose of the
Administrative Procedure Act requirement of notice to ignore a proposal because it is a
"suggestion" when that very purpose is to provide an opportunity to comment on proposed
rules, which, by statutory requirement, can only be suggestions. There is no magic
terminology in proposing a rule and making it effective. It was abundantly clear here.
This problem is mentioned here because a great deal of effort and misunder-
standing might have been avoided if the opportunity to comment on the proposed rule had
been properly availed of by those who now comment adversely upon it.
able for such of its actions as affect that interest and the wider and more efficient use of the channels of interstate communications. We cannot, therefore, accept an interpretation of section 325 (a) which reads into that section the creation of an absolute right unqualified in any respect by the duties and responsibilities of stations under other sections of the act.

12. However, lest there be any misunderstanding, we wish to make clear that we have not said, and we are not saying, that legitimate property rights, recognized by law, may be freely appreciated by others through the mere device of demanding rebroadcast privileges. Moreover, we have not implied, nor are we implying, that many if not most, cases in which request to rebroadcast a station's program is denied may not be justified under the circumstances there presented. It is clear, however, that a licensee may abuse its right to refuse rebroadcast privileges, just as it may abuse other rights. The principle involved is not novel. Thus, a broadcast station has a right to decide who shall use its facilities and for what type of program, but not the right to act arbitrarily in this respect without due regard to the public-interest in a well-rounded program service. See, In the Matter of Editorializing by Broadcast Licensees, 1 (pt. 2) Pike & Fischer, R. R. p. 91:201.) So too, even the holder of a copyright or patent cannot use it unreasonably to the detriment of the public. (See, e.g., 13. We do not attempt here to define the scope and attributes of property interests in broadcast material which may legitimately be entitled to protection, Interstate Circuit v. United States, 306 U. S. 208, at 230.) or the effect of the antitrust laws in this field. Nor do we seek to specify here the situations where such refusal is justified or where it is unjustified. Such determinations will obviously depend upon the facts of particular cases and upon an evaluation of such factors as whether licensees of stations, through express or implied agreements or understandings, act in concert with each other or with other interests in refusing rebroadcast requests, whether requesting stations serve the same or a different area as the station whose program they wish to rebroadcast, whether the request is for permission to carry a simultaneous rebroadcast or to rebroadcast a program at some subsequent date, whether the requesting station has indicated a willingness to pay a reasonable share of the legitimate costs of the originating station, whether or not other persons having interests in the program have requested or agreed to the rebroadcast, and whether the program concerned has public service aspects that make its wide dissemination to the public clearly desirable.

14. Upon reconsideration, we believe, as above stated, that the reporting provisions which we adopted in our May 14, 1952, report are unnecessary and may be deleted. We believe that the interpretation of section 325(a) of the Communications Act herein announced is correct and should be affirmed.

15. Accordingly, IT IS ORDERED that the amendments to section 3.191, 3.291, 3.591, 3.655 and 3.790 of the Commission's rules and regulations adopted on May 14, 1952, are hereby deleted and rescinded and the report in this matter adopted on May 14, 1952, is, in all other respects, AFFIRMED, and

16. IT IS FURTHER ORDERED, That the petition filed on October 23, 1952, by Gordon Brown requesting an investigation of an alleged conspiracy is DENIED.

FEDERAL COMMUNICATIONS COMMISSION.

T. J. SLOWIE, Secretary.

Adopted: October 29, 1952.
Released: October 30, 1952.

NOTE

A large portion of the factual data presented herein was prepared for the Federal Communications Commission in a complaint filed with this Commission by Radio Station WSA Y against Radio Station WBBF in Rochester, N. Y. (formerly Radio Station WABC), which station still persists in preventing WSA Y from rebroadcasting sponsors' programs to the thousands of Rochester listeners who were unable to hear the first broadcast of these sponsors' programs when it was broadcast only once in the area by WBBF, although these sponsors may desire to have their programs rebroadcast by WSA Y.

WBBF persists in using section 325 (a) of the Communications Act to restrain rebroadcasting just contrary to the congressional intent of the act itself.

I favor the reconsideration and deletion of the rule previously announced and concur in the opinion insofar as it accomplishes that purpose.
In a recent decision by the FCC on May 21, 1954, the FCC states "the questions raised by petitioner with respect to rebroadcasting matters, and incorporated in the instant petitions by reference, presented only general allegations rather than specific facts concerning particular instances of refusal by a station to permit rebroadcasts of specific programs." Such a decision by the FCC makes it imperative that Congress immediately restate its intent, to control monopoly and trade restraint, as well as section 325 (a) of the act, by enacting a resolution similar to H. R. 10 which would so plainly word section 325 (a) so that the FCC could carry out the intent of this section of the act.

Source: Authority Hooper Pocket Piece.
Senator Potter. We will now hear from Mr. Harold E. Fellows, president and chairman of the board, National Association of Radio and Television Broadcasters.

STATEMENT OF HAROLD E. FELLOWS, PRESIDENT AND CHAIRMAN OF THE BOARD, NATIONAL ASSOCIATION OF RADIO AND TELEVISION BROADCASTERS

Mr. Fellows. The proper response, Mr. Chairman, is that I am happy to be here.

My name is Harold E. Fellows. I am president and chairman of the board of the National Association of Radio and Television Broadcasters, which is located at 1771 N Street NW., Washington, D. C. I have been the chief executive officer of this association for the past 3 years.

The NARTB is, as its name indicates, a business association comprising in its acting and voting membership radio and television stations, radio and television networks, and various nonvoting associate members who supply equipment, programs, and other services to the industry. Our association was organized 31 years ago and, until the advent of television, dealt exclusively with radio broadcasting matters. Three years ago the board of directors established television memberships, and since that time the association has been known as the NARTB (National Association of Radio and Television Broadcasters).

Its television activities, however, preceded by many years the formalization of television membership. In the beginning the major activities centered around engineering and technical phases. Today the association offers the industry comprehensive services relating to both radio and television. Under its auspices, conferences, panels, and study groups have been convened to give special attention to the current needs of television broadcasters, both UHF and VHF.

The active association membership presently is made up of 1,133 AM radio stations, 330 FM radio stations, 260 television stations, 2 nationwide radio networks, and 4 nationwide television networks.

The association has, in effect, three separate boards of directors. There is the radio board, which consists of directors representing radio members, the television board, representing television members, and the overall joint board, consisting of the members of both the radio and the television boards.

The objective of the association, as stated in its bylaws, is to “foster and promote development of the arts of aural and visual broadcast in all of its forms; to protect its members in every lawful and proper manner from injustices and unjust exactions; to do all things necessary and proper to encourage and promote customs and practices which will strengthen and maintain the broadcasting industry to the end that it may best serve the public.”
I am here by direction of the television board of the association to offer to your committee a brief, factual report of the historical developments of the broadcasting industry in this country. Our television board feels that the hearing record would be incomplete without such a background presentation from our association. This testimony is offered in the spirit of the purpose for which the association was founded and is intended to contribute not alone to the welfare of the television industry but, more importantly, to the requirements of the American people for television service.

The NARTB is dealing constantly with the various complex problems of broadcasting in the interest of the association's membership. Most of the facts that I will give you have been compiled from source material by the research and engineering departments of the association. Many of the statistics which I shall cite are derived from prepared tables attached as appendixes to my presentation. In the interest of brevity, Mr. Chairman, I will not read these, but I commend them to the attention of the committee members, and respectfully request that they be copied into the record as a part of my testimony.

Senator Potter. Without objection they will be made a part of the record.

(The statistics are as follows:)

1 Prefreeze stations reporting, excluding owned and operated.

2 Not available.

Source: FCC records.
Mr. Fellows. At the present time nearly two-thirds of the families of this Nation own and use television sets. Extension of television service to more and more families and increased diversification in programs, are, I am sure, the mutual objectives of the industry, this committee, the FCC, and the public itself.

Here is the statement that was made on October 26, 1928:

The recent advances in radio television threaten to create serious problems.

That prophetic understatement was contained in the second annual report of the old Federal Radio Commission nearly 26 years ago.

The problems under consideration by this committee can be related to historic difficulties that have attended the phenomenal development of broadcasting in this country. The bewildering complications attendant to the development of television are not too dissimilar from situations which existed in radio—and a few references to the development of aural broadcast as a service to the American people are pertinent.

At the end of World War II in 1945—some 23 years after commercial radio was launched in this country—there were only 956 AM stations on the air. In passing, it is interesting to note that radio once had a type of freeze of its own, although it was not known exactly by that name.

During World War II, the FCC suspended the licensing of new radio stations as an emergency measure. With the ending of the Government’s war restrictions, licensing of radio stations was resumed, and during the ensuing 9 years, the number of radio outlets nearly tripled. Today there are 2,686 AM radio stations. This is shown in tables I and III.

In television, the freeze ended in the spring of 1952 with 108 stations on the air. As of June 1—a brief 2 years later—there were 377 television stations on the air. This is shown in table III. Let us compare,

1 Excluding network owned and operated stations in 1948 and 1949, all stations in other years.
2 Not available.
3 This is average loss per station because FCC did not determine median that year.
4 Not computed by FCC because of small number of stations involved.

Source: FCC data.
for a moment, the growth rate of television with that in radio. In a period of slightly more than 30 years radio has advanced to a place where it serves over 98 percent of the families in the country. In less than 9 years, television has developed with sufficient rapidity to serve 63 percent of the families of the Nation. I believe it is fair to state that television’s growth would not have been so rapid and remarkable had not most of the early telecasters who risked capital in this new visual enterprise been thoroughly experienced in the broadcast medium through long association with radio. Nor does this observation detract from the contribution that has been and is being made by manufacturers and others who invested in television as their first venture in the broadcast field.

Federal Communications Commission data show that in 1948, the year the freeze was initiated, when there were 4 television networks and 60 television stations on the air, all networks and all stations reported a loss for the year. These total losses were almost $15 million. The Commission data segregates the network owned and operated station statistics from the rest of the industry. Ten of the fifty stations on the air in 1948 were network owned and operated. The remaining 40 television stations on the air were spending more than 3 times as much to operate as they were taking in—the average operating ratio of expenses to revenue being 314.5 percent. The average annual loss for these 40 stations during 1948, as evidenced by Federal Communications Commission data, was $212,500. This is shown in tables V and VI.

During 1949 a total of 84 stations—not owned or operated by the networks—were in operation. These 84 stations reported that their average ratio of expenses to income was 188 percent—the average television station was still paying out in operating expenses nearly twice the amount being taken in. Although approximately half of the 93 stations were still losing money in 1950, the overall average operating ratio of all stations in this report was 98.4 percent—an average profit before taxes of 1.6 percent.

It is safe to say that these pioneers in television broadcasting—as do pioneers in most risk investments—took considerable losses in the early days of their ventures, finally overcoming these losses, many of them, through increased circulation, a better product, and a better control of operating costs.

If I understand properly, the major situation facing this committee in its current deliberations deals particularly with the question of circulation. The caliber of programing, of course, is vitally important—not only programing locally originated, but that obtained through the two other major sources of supply—networks and films.

With respect to films as a source of television programing, may I suggest that the committee thoroughly examine the present status and the potentialities for future developments in this area. They are, believe me, of great importance in all television broadcasting.

Nevertheless, I repeat, circulation would seem to be the key to the problem—and this is not without comparison to the development in radiobroadcasting. Radiobroadcasting revenues obtained through network affiliations have dropped sharply in the last 2 or 3 years. Despite this fact, for the past 15 years radio total industry revenue from time sales has increased every year as shown in table II, with the replacement dollar coming from the development of more local busi-
ness and so-called national spot business in which national advertisers buy locally on a selective system-by-station basis.

The intriguing development here is the relation of radio stations’ growth to its audience growth. In the broadcasting business, many experts have been predicting for some years that radio had reached its maximum potential and that it was inevitable that many of the two thousand six hundred-odd station would go out of business. This has not happened. As a matter of fact, in the year just past, the Federal Communications Commission granted licenses for about 100 new AM stations. Last year more radio receivers were sold than had been sold in 1952. Although it appears that this year’s set sales will represent a decline over last year—not surprising, since similar declines are noted in other retail lines—there will still be sold more radio receivers than television receivers. It is apparent that the continuing and encouraging sale of radio receivers and the continuing and increasing revenues enjoyed by the radio business indicate the trend one electronics mass medium took after years of trial and error.

It is recognized that this historic growth of radio broadcasting cannot be compared in all respects to the future we can anticipate for television since television is a much more expensive medium to build and to operate. As a matter of fact, it requires about the same investment to put a small radio station on the air today as it does to buy a single television camera chain—just one unit of equipment. Although we are dealing in costs that are not comparable, we are also dealing with revenues that are not comparable. Some television stations take in as much in a month as many small radio stations do in a full year’s operation. On the other hand, the annual operating expenses of a television station are many times those of a radio station.

Radio has reached the saturation point because of a demand on the part of the public. Such a demand certainly exists in television and if there is one objective which should be constantly before us, it is to satisfy this demand. As the members of this committee know, it has been historically true that competition begets business. In the light of this age-old philosophy, it follows that American telecasters want and welcome expansion to a full maturity—expansion accomplished as rapidly as possible in an orderly and logical fashion.

Now the National Association of Radio and Television Broadcasters is supported by all kinds of television broadcasters and thus can devote its efforts with single purpose to all kinds of television. The association recognizes, however, that in the final analysis there is only one kind of television; that which is seen. The public’s interest becomes of moment at the point of reception, not at the point of transmission. I believe this to be a factor for all of us to keep in mind as we review briefly the historic development of the television industry in the United States.

Let us consider an average commercial television station in the United States. It was probably started by a radio broadcaster who applied for and received a license to operate a commercial television station. It became what is called a VHF station because at the time it went on the air the only portion of the spectrum allocated for regular commercial broadcasting, and for which equipment could be purchased, was the very high frequency band. This average station initially invested approximately $540,000 to get on the air and it lost
money heavily for several years. As I have previously stated, this station lost $212,500 in 1948, as shown in table VI.

In that year, the FCC imposed a freeze on new authorizations because it decided that there were not available a sufficient number of VHF channels to assure a nationwide, diversified service, and it wanted to make a new study of propagation characteristics. Nevertheless, in 1949, this average station lost $159,000. Finally, in 1950, if it was among the fortunate, it just about broke even.

Then, by the end of 1951, 15 million families in the United States had invested billions of dollars in television receiving sets. They had done other interesting things. They had bought receiving antennas, soaring high over their housetops. They were sufficiently interested in this new medium to go out and reach for it if it could not reach them.

And, at about this time, when most of the original television broadcasters were beginning to earn a profit, the FCC announced that the freeze was over and there were available for application some 1,800 assignments: two-thirds of them in UHF and one-third of them in VHF, with certain reservations for noncommercial, educational stations.

Today there are television receivers in the homes of 63 percent of the families of America. It has reached this impressive stature after 8 years of operation. Radio, after more than 30 years, reaches listeners in 98 percent of the homes. But the story does not end there. Radio reaches most of its listeners with a choice of program sources, and the American people have come to expect a comparable opportunity of selection as between programs in television as well.

It is at this point that we face the real long-range issue of this hearing which is: what can be done by the industry, the people, and the Government to make possible a truly nationwide competitive television service, and this within the framework of our free-enterprise concept of broadcasting?

The National Association of Radio and Television Broadcasters has no simple answers to suggest to this distinguished committee of the Senate. Our own long and careful study of all of the factors involved has convinced us that there is no tailor-made panacea to cure all of the present and anticipated ills.

On the other hand, we do believe there are certain important considerations which should be kept in focus as the problems are studied. These considerations are vital because they are the product of experience, of technical development, and of managerial skill in the operation of television. Let me set forth for you, if I may, several of these major considerations:

1. The first objective is to extend a satisfactory television picture across the length and breadth of the country so that as many of the people as possible can be served by television. The second objective—and we are into this stage in many parts of the Nation—is to extend a multiple choice of television programs to as many of the Nation's citizens as is economically and technically feasible.

2. From the evidence we have at hand, both from the Government's expert body—the FCC—and the experience of the industry, it will require both the VHF and UHF bands of the spectrum in order to provide desirable flexibility in matching television service with the varying locations and situations of the people.
3. As we know them today, the economic facts of life pertaining to television impose certain limitations on the ability of relatively small cities, and thinly populated areas to sustain a television operation with the same degree of local service to which we have become accustomed in radio.

4. It is axiomatic that where both UHF and VHF television signals are utilized for transmission of programs to common areas, some means short of direct Government intervention must be found to encourage the manufacture and sale of all-channel television receivers to those listeners. In addition, ways and means must be found to make it more attractive and feasible for present VHF-only television owners residing in UHF-VHF-served areas to convert to all-channel receiving sets.

5. The earlier disparities separating and distinguishing VHF and UHF transmitting equipment are being equalized through technical development.

6. Repeating the pattern traceable in the case of radio, there are already hopeful signs in television pointing to the development and practical utilization of additional television program sources to meet the critical requirements of television stations which cannot obtain, or do not choose to have, national network affiliation. Notable in this category are rapidly expanding competitive film library services, and the projected use of video tape.

It was announced 2 weeks ago that I would make this appearance before your committee. I have had many telephone calls and letters from both UHF and VHF television broadcasters. Some of them urging the appearance; some of them suggesting that I should not appear, but the board of directors of the association determined that no good purpose would be served by an attitude on the part of the association that this was a contest between its members and between those television broadcasters operating in all frequencies who are not members of the association.

Earlier in my statement, I used the term "pioneer" in referring to those who put the first television stations on the air in this country. The truth of the matter is that this industry even now is still in its pioneering stages of development—as witness the present difficult problems confronting many UHF licensees and some VHF licensees as well. We are also in a somewhat animated state of suspension with the promise of new technical developments in the future such as the rapid advance of color television which is now being made.

One thing should be kept clearly in mind as we face these trying problems. In no sense are they an indictment of the development of television in this country. We must not lose sight of the fact that when television broadcast service was made available to the American people, the very high frequency band was the only technically proven space in the spectrum then available for television transmission. At that time, as indicated in the experimental designation applied to the ultra high frequency band, the practical use of this space in the spectrum was largely conjectural.

There should be no recriminations nor post mortem regrets about the tremendous clamor on the part of the people for prompt and effective television service when it became technically feasible. In fairness it seems unrealistic to derogate the actions of the Federal Communications Commission in proceeding as it did with its allocations
first in the very high frequency band, and then, as facts became known and service potentials available and evident, to add the ultra high frequency band with its promise of truly diversified program choices to the public.

Our responsibilities to the people now indicate that we should combine our voluntary contributions of know-how and planning to resolve the two really outstanding problems before us, namely, securing more adequate and attractive program service for all television stations to garner larger listening audiences, and seeking to reach the optimum of all-channel television receivers in the hands of the public.

This association will be pleased to join with all interested parties representative of the people, the industry, and the Government in conferences looking toward united voluntary action to the end that something of real value can be done to extend competitive television service, and to meet the genuine plight of television broadcasters who face near-impossible odds in their struggle to survive this transitional period.

I wish to thank the members of this committee for your courtesy in affording me this opportunity to appear and present this statement. If the association can be of any further assistance to you in your deliberations we will be pleased to respond in every way possible.

Senator Potter. Thank you. It is a good statement. Do you have any questions, Senator Bowring?

Senator Bowring. No questions.

Senator Potter. The committee will be in recess until 9:30 tomorrow morning.

(Whereupon, at 4:52 p.m., the committee took a recess until tomorrow, Thursday, June 17, 1954, at 9:30 a.m.)
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

THURSDAY, JUNE 17, 1954

UNITED STATES SENATE,
SUBCOMMITTEE NO. 2 ON COMMUNICATIONS OF THE
COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D. C.

The subcommittee met at 9:40 a. m., pursuant to recess, in room G–16 of the Capitol, Senator Charles E. Potter (chairman of the subcommittee) presiding.

Present: Senators Potter, Schoeppel, Bowring, and Hunt.

Also present: Bertram O. Wissman, chief clerk, and Nick Zapple, counsel for the subcommittee.

Senator Potter. The subcommittee will come to order.

The first witness today, I am happy to announce, is Dr. Hunter from one of our leading institutions of Michigan. Dr. Hunter of Michigan State.

I wish to welcome you to our committee and we are looking forward to your statement. I know of the great work you have done at Michigan State and your efforts to promote an educational television facility there. I have discussed the matter with your great president, Dr. Hanna, and I wish to compliment you for your great interest in this field.

STATEMENT OF DR. ARMAND L. HUNTER, PROFESSOR AND DIRECTOR OF TELEVISION DEVELOPMENT, MICHIGAN STATE COLLEGE

Dr. Hunter. Thank you very much, Senator.

My name is Armand L. Hunter. I am professor and director of television development at Michigan State College. Michigan State College is the Nation's oldest agricultural college, the model for the entire land-grant college system, the largest separate land-grant college in the country, and the ninth largest institution of higher education in the United States. It has an enrollment of over 14,000 students on campus annually, and a total faculty, including teaching, research and extension, above 2,000. The college consists of nine separate schools: Agriculture, Education, Home Economics, Engineering, Veterinary Medicine, Science and Arts, Business and Public Service, Graduate studies and the Basic College. Through the Agricultural Cooperative Extension Services and the Continuing Education Service, an additional 300,000 Michigan residents are given assistance and training each year by the college, both on the campus and throughout the State of Michigan.
Senator Potter. You also have a very good football team.
Dr. Hunter. Yes, sir, and a fairly good football team, that is
correct, sir.

Michigan State College is proud of its heritage, and of its successful
fulfillment of its constitutional obligation to teach such branches of
learning as are related to agriculture and the mechanic arts in order
"to promote the liberal and practical education of the industrial
classes in the several pursuits and professions of life."

All this is pertinent to the matter at issue because it explains why
Michigan State College has operated an educational radio station for
30 years, and why it has established and put into operation an educa-
tional television station. These media of communication and educa-
tion are, in the opinion of the college, necessary and essential to the
effective realization of its traditional mission to serve all of the people
throughout the State of Michigan.

In order to make clear that the college considers television as an
extremely important and significant medium for the extension of its
educational services, research and activities, I would like to state the
nature, conditions, and status of the college television station. The
sixth report and order of the Federal Communications Commission
allocated UHF channel 60 to East Lansing. The college applied for
and received a construction permit for this channel, and went on the
air January 15, 1954, under a special temporary authority with a
visual e. r. p. of 243 kilowatt and an aural e. r. p. of 125 kilowatt. The
total capital investment of the college in the station was over $500,000;
and its annual operating budget is in excess of $350,000. The phy-
sical plant consists of a 1,000-foot tower topped with a 34 foot, 25
gain, General Electric antenna, a 12 kilowatt General Electric trans-
mitter, and a studio and station installation which consists of: Three
separate production studios with separate control rooms, a master
control room, film and projection facilities, kinescope recorder, a com-
plete mobile unit for the origination of remotes and special events,
a microwave relay unit for transmission from the point of origin
of the remote, and a studio transmitter link from the studios on
campus to the transmitter tower and building in Okemos.

Also included are the necessary administrative offices, scenery and
set construction facilities, laboratories and maintenance workshops,
and such functional operational space as is required by the film de-
partment, news and special events, music and continuity, and dressing
rooms. The total station staff consists of over 40 full-time people
working directly in connection with the station's broadcasting activi-
ties, and six producer coordinators and instructors working with the
television courses of study and the development of programs from
the teaching, research, and service departments and divisions of the
college.

The college also offers courses of training and instruction in radio
and television, leading to the bachelor of arts and master of arts de-
grees. Over 125 students are registered each quarter in these courses;
and the station's studios and facilities are used as laboratories for the
student training. In turn, the students are given practical experience
and an opportunity to work in the regular broadcast programs of the
college station.

The program service originating on that opening January 15 date
was set at 6 hours a day, 7 days a week, for an average of 42 hours, of
which 80 percent was local live programming and only 20 percent film of kinescope recording. This average has been held consistently throughout these first 6 months of operation. This is more local live programming per day and week than that produced by any local television station with the possible exception of the network owned and operated stations in such metropolitan centers as New York, Chicago, and Hollywood.

This was made possible by a period of 2½ years of closed circuit operation in which programs were developed, the staff trained, and experience obtained in the conditions and requirements of a daily broadcast service. Also, during this “dry run,” over 700 programs were produced and recorded on kinescope for evaluation, research, and distribution to local commercial stations which were on the air in the State of Michigan.

The structure of the program service which is now being broadcast by the college consists of the following:

1. Informational and demonstration service programs in the areas of agriculture, home economics and engineering;

2. Systematic and adult education programs and courses of study in the areas of literature, the fine arts, political science and economics, business and public service, the natural sciences, and driver education and traffic safety;

3. Cultural and vocational programs in the areas of music, the fine arts, drama, and the dance;

4. Entertainment programs in the areas of baseball, hockey, boxing, wrestling, basketball, and other intercollegiate sports and student activities.

I think you understand, too, that we would like to have the football games on too, but that isn’t possible.

Senator Potter. A lot of people would like to see it, too.

Dr. Hunter. 5. Special events such as the coverage of the hearings of the subcommittee of the House Committee on Un-American Activities held in Lansing under the chairmanship of Congressman Clardy, the college commencement exercises, the College Band recital, and the International Student Festival.

In addition, the station has produced programs for the State legislature, the office of the Governor, the conservation department, the chamber of commerce, the Lansing and East Lansing public schools, the Girl Scouts, the State office of public instruction, the Michigan Health Council, the community hospital drive, and the Michigan State Police.

These programs were either broadcast as a series, or recorded on kinescope for distribution to other stations, or both. The station also has produced, and recorded on kinescope for distribution, special religious, educational and public service programs for outside organizations and agencies.

During this same period, the college station has given approval for the pickup and rebroadcast of its current programs upon special request by UHF stations in Lansing and Ann Arbor, and VHF stations in Lansing and Kalamazoo. At the present time, the Ann Arbor UHF station is carrying the Better Farming series being broadcast Monday through Friday, and other special programs and events upon request.
Now, what has been the result of this program service, and what returns have we realized upon our educational and public-service investment?

First some statistics:

1. The college station went on the air in an already established VHF community, preceded by some 4 months by a local commercial UHF station.

2. The college station also attempts to service a region covering an area of 30 counties, with a population of over 21/2 million. This area is already serviced by 6 VHF stations, and has 3 additional VHF stations in prospect—1 already on the air in Bay City, 1 a recent grant in Flint, and 1 a proposed "drop in" at Parma-Onondaga.

3. UHF stations on the air in Flint and Battle Creek have recently gone off. The UHF stations remaining in Lansing, Ann Arbor, Saginaw, and Battle Creek are having difficulties. There is a very real possibility that these stations will not be able to sustain continued operation under the present conditions.

4. Surveys of UHF conversion and the percentage of available audience indicate that there is approximately 75 percent to 80 percent television set saturation in the families living within the coverage radius of the college station. Of this 75 to 80 percent set saturation, only 25 to 30 percent of the sets have been converted to receive UHF. This is true only in the metropolitan centers with UHF stations. The percentage of converted receivers in the rural areas is probably less than 5 percent. Translated into set and population figures, the best estimate obtainable through regular surveys and our own research indicates that at the most 25,000 receivers have been converted in the coverage area with a total possible audience availability of 50,000 to 60,000.

All of the above refers to live-production production and recording. The film and kinescope program service is obtained from such sources as the Educational Television and Radio Center established by a grant from the fund for adult education by the Ford Foundation, and includes such programs as the award-winning series on Shakespeare by Professor Baxter of the University of Southern California, and the Great Ideas series by Prof. Mortimer Adler, and other programs in the fields of political science, the physical sciences, and international relations, which represents the best of the educational TV programs now produced by colleges and universities over the United States.

Other educational film resources are: Encyclopedia Britannica Films and Coronet Instructional Films; and general film resources have been arranged through Sterling Television, the March of Time, Inter-state Television, Lakeside Television, and the usual Government and international agencies such as the Army, Air Force, United States Department of Agriculture, and British, Dutch, Switzerland, and so forth, Information Services.

All the above is cited in an effort to demonstrate and prove that the college and the station have met every requirement usually given as being necessary for a successful UHF operation. We have met the conditions of tower height and coverage, the highest power UHF transmitter available, and the most effective, unique, and finest program structure possible for us to produce.

5. Reports on reception vary from excellent to poor.
6. Audience response to the programs and to the service we are attempting to provide has been unanimously favorable and enthusiastic.
7. The most persistent criticism we receive is the inability of the viewer to receive the college station, or the inferiority of its picture in comparison with the available VHF services.

Second, steps which have been taken to overcome the above difficulties, and to build audience awareness and interest:
1. An active promotion and advertising campaign to acquaint the audience with the special program features and services of the college station;
2. Cosponsorship with the local UHF commercial station of a seminar and conference on proper UHF installation for the servicemen, dealers, and distributors in the local area;
3. Active production and promotion of programs for special interest groups such as the schools, vocational-agricultural clubs, and various national, professional, and public service organizations;
4. A survey of the coverage and signal characteristics of the station, resulting in a change of 0.6° in the radiation pattern of the antenna by means of an electrical tilt, thus reducing the zero angle, horizontal, ERP from 243 kilowatts to 184 kilowatts visual, in an effort to increase and improve the local signal level.

These efforts and actions have not resulted in any appreciable improvement or change in the reception of the station's signal, or any marked or significant increase in the rate of set conversion. Obviously, there are a number of factors and variables at work. We are meeting the performance requirements of UHF transmission set by the Commission in excess of the minimum for both class A and class B service.

We are covering a radius of over 60 miles as is proved by the fact that the Ann Arbor UHF station, 46 airline miles away, and the Kalamazoo VHF station, approximately 60 airline miles away, can both receive and retransmit our signal without appreciable loss in quality or acceptability.

In addition, we have audience response of the station's reception from as far as 80 to 100 miles away which indicates fair to good reception. However, this range and extent of acceptable signal and service is not particularly comforting when, as a matter of record, the signal pickup and rebroadcast by the VHF station 60 miles away was as good or better when picked up locally on VHF receivers at 60 miles distance, than the UHF receivers from the college station 5 miles away; the signal from the VHF rebroadcast not appearing to lose any detail or contrast in its transmission.

This is all evidence of coverage which indicates the full meeting of all transmission requirements; but, it is countered by equal evidence of difficult and inferior reception.

Apparently, the lack of UHF acceptance is due in large part to the need for a good receiving antenna, properly placed and installed, and the care required to tune it in, the obvious superiority of the VHF receiving circuits over the UHF, and the fact that all of the “big time” and network programs are readily available over the VHF stations.

I do not believe it is a problem of transmission, or of poor management, or of limited local program resources, or of funds or know-how,
or of time and experience. If I may paraphrase and "convert" Shakes-
peare, "the fault is not in ourselves that we are underlings."

The analogy that UHF is going through a period comparable to the 
early days of VHF is not only inaccurate but irrelevant. Early VHF 
had no other television service in competition. It was strictly a ques-
tion of design, transmission and receiver performance, and set 
availability. Present-day UHF has the competition of an excellent 
television service available in the VHF stations. This is a technical 
and program competition which VHF never faced.

Also, VHF can be received with built-in and indoor antennas. 
UHF, for the most part, requires an outside antenna and an extremely 
careful and exact placement and installation. VHF receivers are 
demonstrably superior and less expensive. And, the "big shows" are 
available on VHF only in almost every market where intermitture 
is involved. Obviously, the problem cannot be solved on the basis of 
historical analogy.

The problem facing Michigan State College and its educational 
UHF television station is no different from that facing most of the 
UHF stations, educational or commercial. What is true for the 
majority of the educational reservations and for a large number of 
the commercial UHF stations is true for us. We are in the immediate 
danger of being the only UHF island in a sea of VHF service. Under 
these conditions, highest of towers, the highest of powers, and the 
finest of local and live program service are not sufficient in themselves 
to motivate or develop a general acceptance of UHF and its services 
by the general public. We cannot afford to be "medievalist" in this 
situation, and speculate and theorize in a vacuum. We must "consult 
nature" and go into the marketplace of the general public in order to 
 wrestle with the facts and realities of life, audience preference and 
human behavior.

Anything that costs more, looks worse, and involves additional 
effort is not going to meet with wide public acceptance. Anything 
which requires a special technique and knowledge for installation and 
performance will meet with resistance and disinterest on the part of 
those engaged in service and sales. It is only human nature that the 
"reflection of inferiority" will be cast upon the particular medium 
and the station, rather than upon the quality of the receiver and the 
quality of the service installation.

We have no final answer to the problem at issue before this com-
mittee. However, we do suggest that somehow the differences must 
be eliminated and the conditions made equivalent and truly competi-
tive if UHF is to survive. Somehow, and some way, all television 
stations must be put on an equal and equivalent footing in terms of 
transmission, reception, and access to the audience, if UHF is to have 
any truly competitive opportunity to survive, and if a truly national 
television service is to exist.

We do not ask for subsidy, for privilege, for advantage, or for 
sympathy. We ask only that we have a fair and equitable opportunity 
to reach the public with our educational service through the medium 
of television. The college has been given the responsibility of extend-
ing its educational services to the people of the State of Michigan 
who are its resource as well as its beneficiary. However, the tool, the 
method of distribution, the medium of its fulfillment through televi-
sion, is not equal to the task under the present conditions.
We believe in the medium. We have made the investment. We have met every requirement. We have spared no effort. We only hope and trust that the channel for our educational television service can be made equal to the challenge. This is the responsibility of the Commission. It will be our responsibility then to see that it is properly and effectively used to fulfill the full potentiality of this new medium of communication, and to realize to the fullest degree the values of a democratic system of education, which is the heritage of our Nation, and the hope of civilization.

Senator Potter. Dr. Hunter, I would like to state it gives me a great deal of pride being from Michigan and to realize the tremendous effort and the work that has gone in to promote this UHF station at Michigan State College.

I think from your statement here that you have spared no effort to make this a success. I know if it can be a success any place it can be there. I would like to ask this one question; do you feel that you could be competitive and could get your listening audience if the average receiver could pick up your station?

Dr. Hunter. That would be accessibility to the audience, and that is all that any of us would ask, and that is the opportunity to have equally accessibility to the audience regardless of what methods or means would be possible to achieve it.

Senator Potter. Do you agree that if UHF doesn’t survive in the commercial field that it will not be able to survive in the educational field?

Dr. Hunter. I would say that would be the case, yes, because it would leave the educational UHF station alone and I am quite certain that under those conditions they could not sustain an educational service through UHF only.

Senator Potter. Senator Schoeppel, do you have any questions?

Senator Schoeppel. I do not believe I have any question on this matter. I do appreciate getting your excellent statement before us.

Senator Potter. Senator Hunt, do you have any questions?

Senator Hunt. Dr. Hunter, what percent of the receivers in this area are capable of receiving both UHF and VHF?

Dr. Hunter. In our immediate community area I would say about 30 percent of the receivers are converted to UHF, which would give us in Lansing and East Lansing alone 16,000 or 17,000 receivers that can receive both UHF and VHF.

The total set saturation in the Lansing area would be between 75 percent and 80 percent of the families available, which would mean there would be around 40,000 receivers in the Lansing and East Lansing area and the immediate community, and of that approximately 15,000 to 17,000 have been converted.

Senator Hunt. How long have you been with television?

Dr. Hunter. Approximately 6 months. We started January 15, 1954, this year.

Senator Hunt. What percent of your television audience do you think you are holding?

Dr. Hunter. Holding?

Senator Hunt. Say you started out with 100 percent; what percent do you have now?

Dr. Hunter. I would say that we have increased the conversion rate in our community through the process of going on the air. The
conversion has increased from the point when the local UHF commercial station went on the air, which has been due in some respect I suspect to the Michigan State College station going on the air, and the program service which we have been able to provide.

In that respect we have been helping each other in terms of attempting to develop the rate of conversion.

Senator Hunt. You have no type of advertising of any nature, do you?

Dr. Hunter. No, sir.

Senator Hunt. Would you consider commercial advertising, if you had a sponsor, say the Farm Bureau, or any other organization of that kind which is very desirous of receiving your services?

Dr. Hunter. It could not be and would not be paid advertising. In other words, there are different methods of advertising. If a program is offered that presents information or has a certain content or material within it which is in a form indirect advertising, it would be a form of advertising, but not a paid advertisement.

Senator Hunt. You are precluded from receiving financial assistance from anybody except in the form of gifts.

Dr. Hunter. We are not on our particular channel, but the educational channels are. Our particular channel is not a reserved educational channel, but we operate it as an educational system.

Senator Hunt. Under existing conditions, what do you foresee for your own station, the future?

Dr. Hunter. Under existing conditions I could not expect and would not expect the college to be able to maintain the level of its service or to put the investment into it that would have to be done unless it could provide a much more substantial service through reaching a greater number of people than is possible under the present conditions.

Senator Hunt. And your present expenditure on this particular item in your budget is how much?

Dr. Hunter. Our present expenditure, the total capital investment in all equipment and facilities is around $500,000. Our total annual operating budget for a full-time service would be in the neighborhood of $350,000. This includes faculty and staff and the actual operating cost, supplies and services, equipment, replacement, maintenance, and the rest of it.

Senator Hunt. I understand from your statement that that would be a complete loss to you unless in some way we are able to help on this situation?

Dr. Hunter. That is correct, sir.

Senator Potter. Do you have any other questions?

Senator Hunt. No, sir.

Senator Potter. Dr. Hunter, thank you again for your statement.

Dr. Hunter. Thank you, Senator.

Senator Potter. We will now hear from Mr. George Storer of the Storer Broadcasting Co., from Miami, Fla.

It is good to have you here, and we are looking forward to your statement.
STATEMENT OF GEORGE B. STORER, STORER BROADCASTING CO., MIAMI, FLA.

Mr. Storer. My name is George B. Storer. I am president and founder of Storer Broadcasting Co. My home and the headquarters offices of our company are located in Miami, Fla. Our company and its subsidiaries own and operate, under license of the Federal Communications Commission, five VHF television stations located at Detroit, Mich.; Toledo, Ohio; Atlanta, Ga.; Birmingham, Ala.; and San Antonio, Tex. We also own and operate, under license of the Commission, 7 radio stations located in these same 5 cities, and 2 others at Miami, Fla., and Wheeling, W. Va.

Broadcasting is our business. More than 95 percent of our revenues is derived from the operation of radio and television stations. Our company is owned by some 1,500 stockholders, largely resident in the areas which we serve, many of whom are employees. Each of our principal officers and executives is a substantial stockholder and actual control of the company held by the management group.

Among the larger multiple owners of radio and television broadcasting stations, I believe our company is the only multiple owner which is wholly independent and unrelated by ownership to major interests in the network, manufacturing, newspaper publishing, or motion-picture fields.

I have here a brief history of the growth and development of our company and a statement of the policies which we have established and follow in the operation of our broadcast stations.

Senator Potter. It will be made a part of the record at this point.

(Description of Storer Broadcasting Co. is as follows:)

DESCRIPTION OF STORER BROADCASTING CO.

Storer Broadcasting Co., an Ohio corporation, was organized by Mr. George B. Storer and Mr. J. Harold Ryan, in 1927. In November 1933, the company issued to the public 200,000 shares of its common stock, representing approximately 18 percent of its common stock. Mr. Storer and Mr. Ryan hold voting control of the stock, and substantial stock is also held by the executives and management personnel of the company, including each of the station managers. There are a total of about 1,500 common stockholders, many of whom live in the communities in which the company's stations are located, due to the fact that the publicly held stock was issued primarily through brokers located in these cities in order to encourage local ownership.

The company is primarily engaged in the ownership and operation of radio and television stations, and in 1953 over 95 percent of its gross revenues was derived from the operation of these stations. As distinguished from most other so-called multiple owners of radio and television stations, the company is not connected by ownership with any major network, radio or television manufacturer, magazine, newspaper, or motion-picture concern.

The company entered the radio business in its infancy, in 1928, by the acquisition of a 100-watt standard broadcast station in Toledo, Ohio. In 1931 it acquired its second station in Wheeling, W. Va., then a 5,000-watt station. Step by step it improved the facilities of these stations, and acquired stations in other markets, which were also improved. In 1947, the company built 6 FM broadcast stations, and in 1948-49 it built 3 TV broadcast stations. In 1951 and
1953 it acquired by purchase two additional television stations. At the present
time, the company's AM and TV stations are as follows:

The FCC's multiple-ownership rules preclude the company from owning and
operating TV stations in Wheeling and Miami.

In common with other independent, or non-network-owned, radio stations,
Storer Broadcasting Co.'s broadcast revenues are derived from (1) sale of local
advertising by its local sales staffs, (2) sale of national spot advertising by so-
called national reps, and (3) sale of network advertising by the national
networks. During 1953, national spot and local advertising represented the bulk of
the revenues of the Storer stations, as follows:

<table>

While local stations, of course, cannot afford the tremendous expenditures for
programs and talent made by the major national networks, the radio and TV
programs produced and broadcast by the local independent stations fill a need
for locally tailored programming that the national networks cannot supply. For
example, WAGA-TV, the company's TV station in Atlanta, Ga., during the month
of May 1954 produced and broadcast the following local public-service programs
with live talent (as well as numerous other local commercial programs):

Religious Viewpoint, a daily religious series broadcast in cooperation with the
Atlanta Christian Council for 15 minutes per day, Monday through Friday. To-
tal, 21 programs, 5¼ hours.

School of the Air, a daily educational series broadcast in cooperation with the
University of Georgia, Atlanta division, for 15 minutes per day, Monday through
Friday. Total, 21 programs, 5¼ hours.

This is Your Town, a weekly 30-minute panel show, with a different panel of
local civic leaders for each week, discussing the problems and projects for better-
ment of the community. Total, 5 programs, 2½ hours.

Career Opportunities, a weekly 30-minute panel show, broadcast in cooperation
with the Atlanta city schools, featuring panels of high-school students and busi-
nessmen discussing a different business or industry each week. Total 5 pro-
grams, 2½ hours.

TV Bible Class, a weekly 30-minute program broadcast in cooperation with
the Atlanta Christian Council concerned with the study of the Bible, with a
different Bible class appearing each week from a local church. Total, 5 pro-
grams, 2½ hours.

Capitol Reports, a biweekly discussion program broadcast in cooperation with
the Governor of the State of Georgia, on which the governor appears in person
and answers questions sent in by listeners. Total 2 programs, 1 hour.

The Law Says, a weekly 30-minute discussion program, in cooperation with the
Atlanta Bar Association and Atlanta Lawyers Club, featuring a panel of lawyers
who answer legal questions sent in by listeners. Total 3 programs, 1½ hours.
During this same month WAGA-TV broadcast 307 local public-service announcements, including 56 for Campfire Girls' day camp, 41 for the cerebral palsy drive, 20 for the Civil Defense Ground Observers Corps, 19 for the Salvation Army, 14 for the Atlanta Tuberculosis Association, and many others. Likewise, many public-service films and public-service programs of the CBS and DuMont networks were broadcast.

Throughout the years the company's policies have been designed to insure that each of its radio and television stations was operated in the interest of the public in the service area of the particular station. To this end the company's main policies have been:

1. To integrate its stations into the lives of the communities they serve by cooperating with and supporting the activities of all worthwhile local governmental, civic, educational, religious, and charitable organizations;

2. To insist that local station managers operate with substantial local autonomy, so that the operation of each station is attuned to the needs and desires of its community;

3. To take every practicable step to improve the technical facilities of its stations so that each station may be capable of rendering the best possible service to the community.

Effectuating these policies, the company has "ploughed back" into its stations over its 26 years of broadcasting in excess of 75 percent of its earnings.

Mr. STORER. This opportunity to express the views of our company concerning the ultra-high-frequency television service and upon multiple ownership limitations is most sincerely appreciated. We are hopeful that our statement may be of some help to this subcommittee in achieving a proper perspective of both matters.

During the first 3 days of these hearings, the UHF broadcasting group has primarily directed an attack upon the television allocation table established by the FCC in its sixth report and order of April 12, 1952. The core of the complaint is intermixture of VHF and UHF television facilities in the same markets.

Our company strongly supports the plan of allocation adopted by the Commission, and in fact commends it for having accomplished a superlative job in the face of most difficult and complex circumstances. This is not to say that the allocation plan may not now, in light of present experience, be improved upon, but the all-important fact is only by a plan of allocation involving intermixture could the best possible television service be made available uniformly to the greatest number of people in this country in the shortest possible period of time. More particularly true then, but equally true now, VHF television was and is a superior facility to UHF and nothing that can be said here will alter this scientific reality. In terms of the public interest, therefore, our company believes that the Commission neither had then, nor has now, any alternative other than to proceed with a television allocation plan based upon intermixture.

As a point of departure, we think it should be recognized by this subcommittee that any suggestion advanced here to replace the existing VHF television with UHF, either on a nationwide basis or by the elimination of an existing VHF service in any individual market, will necessarily result in the substitution of an inferior service for a superior service.

The VHF service is superior in point of propagation, a factor of particular importance in terms of service to rural areas, and superior also in fidelity of reception in the home. It is cheaper in terms of cost per thousand to the advertiser, and it should not be forgotten that it is the advertising dollar which supports the television medium and upon which the future of both UHF and VHF are largely dependent.
I feel that the public is entitled to the best television service available, one that will reach the farmer and the rancher remote from the city as well as the city dwellers. The long-range coverage of VHF stations, operating with the maximum powers and antenna heights, now an accomplished fact, is the only feasible method of reaching the large nonurban population.

Many VHF television stations are now operating with maximum power and antenna height which will provide good service to rural viewers living as far as 90 or 100 miles from the station. VHF licensees have made tremendous investments to provide this service. A VHF transmitting plant with 100-kilowatt power and a 1,000-foot tower costs upward of $750,000.

Dozens of applicants for VHF stations have competed in lengthy hearings, involving legal, engineering and other expenses totaling as much as $200,000 per applicant, in the hope of bringing additional VHF service to the public. Many of these applicants have entered into settlement agreements and joined their interests in a single application in order to speed the day when more VHF television service will be available to the public. I know of no legal procedure for unraveling these contractual commitments, which were entered into in good faith and in reliance on the continuation of the VHF service.

Moreover, I deem it a public trust to protect the tremendous investment—probably exceeding $6 billion—that the public has made in 30 million television receivers. It has been proposed by the UHF group, supported by Madam Commissioner Hennock, that on a certain day these 30 million VHF set purchasers be denied a VHF service, based upon the theory that by that date their VHF sets will be obsolete, worn out, or otherwise of no value.

Senator Potter. Mr. Storer, I have a telephone call if you will bear with me for just a moment. I will be right back. You may continue.

Mr. Storer. To set the record straight, I think you should consider how all these 30 million television receivers are constructed. In my household we have sets dating back to 1946. They are in use in different parts of my home. As we have purchased newer and larger-screen sets, we have used the old ones in bedrooms, porches, and elsewhere. Some of these sets are 8 years old but are functioning well.

No other interest is of any real significance except that of the public. I would hate to be in the Congress or on the Federal Communications Commission on the day when the 30 million or more television set owners are told, "Your sets are now all obsolete. Hie yourself to the store and spend your money on a new set or on a UHF converter, antenna, and installation."

To digress a minute, I wish to say that from figures we have been able to find it costs roughly about $100 to make a conversion. There are some few instances where it is less, but generally it is about $100.

A freeze on VHF television cannot be sugar coated by calling it a hiatus, or by predicting it will last only a short time. Today it is significant to recall that the 1948 freeze was expected to last only 6 to 9 months; but it actually lasted 3 1/2 years.

The FCC also imposed a freeze on certain clear channel radio applications in 1946—and that freeze still continues because the North American Radio Broadcasting Agreement has not been ratified by the United States, and until this treaty becomes effective the FCC is powerless to act.
Our company believes that the elimination of any existing VHF television service is unthinkable in terms of the "public interest," and we feel with equal vigor, that a present freeze or hiatus upon the licensing of VHF facilities is equally repugnant to the public interest and can only serve to retard the normal growth of the television art, UHF as well as VHF, within the economic framework of the country.

What, then, is the future of the UHF television service?

This, in our opinion, can only be answered on a market-by-market basis, and the answer will depend upon the size and economic structure and limitations of each community or area served. Where VHF service is limited or inadequate, or where there is no existing or potential VHF service, and where requisite advertising support exists, UHF can and will be successful.

In intermixed markets UHF will face competitive problems of conversion and limitations upon both propagation and reception, but these obstacles can all be overcome in time if a real need for service exists and is economically feasible. Where UHF is presently competing for survival against VHF in intermixed communities, and only one, and not both, can survive in the economic market place, it is only logical that the superior VHF service will be successful in securing public acceptance, and this reality must be accepted. Improvement in UHF transmitting equipment, higher power, and other technical developments will undoubtedly ultimately equate some of the present disparity between UHF and VHF, but this is not yet at hand.

To those of us who lived through the early days of radio there is nothing either new or insurmountable in the present UHF situation. There was a time years ago, when existing radio home receivers could not be turned above 1500 kilocycles nor below 550 kilocycles. Nevertheless, I, along with others, built stations to broadcast in the kilocycle band above 1500 kilocycles and below 550 kilocycles in areas where the service was needed and could not be otherwise supplied.

In due time, because of good programming, effective promotion, and new home receivers available for purchase by the public, we were ultimately successful in our efforts. I can think of no reason why the same formula will not be successful for UHF in those areas where the service is needed, cannot otherwise be supplied, and where requisite economic support exists. I must say that it never occurred to us in radio to suggest that the kilocycle band above 550 kilocycles or below 1500 kilocycles be abandoned, and all existing radio receivers obsoleted in order that we might achieve competitive parity with the greater majority of other broadcasters utilizing the regular bands. I believe any such proposal would have been contrary to the public interest.

I believe with equal conviction that any proposal today for the abandonment of VHF television service, either on a nationwide or limited per market basis, is equally repugnant to the public interest and to the development and growth of the television broadcasting art.

There have been, and will continue to be, fatalities in television broadcasting, both among VHF and UHF operators. Wherever broadcasters fail to gage the economic and competitive limitations of their markets, or are insufficiently financed for pioneering, financial failure is inevitable. This is regrettable and even tragic from an
individual point of view, but this mortality experience appears always to be present in the growth and development of any new industry, and no solution exists which will rectify basic mistakes in economic business judgment.

If this statement seems hardheaded and unfeeling, may I hasten to say that I most deeply appreciate the concern of the UHF broadcasters who are now in the pioneering stage of a new service. We also have pioneered, not only in VHF television but in AM and FM radio as well, and no one better knows the strain and anxiety which attend such efforts.

Moreover, we intend, if the Commission rules will permit, to pioneer in the UHF service also. When our company determined to enter television broadcasting in 1947, we borrowed $1,800,000 from banks to finance construction of 3 television stations. This sum represented very nearly the entire capital and surplus accumulated by our company over a twenty-odd-year period. Moreover, to secure this financing, I was required personally to endorse the company note.

Our first station went on the air in Toledo on July 1, 1948, followed by Detroit on October 24, 1948, and Atlanta on March 8, 1949. As of December 31, 1950, we had accumulated operating losses in Toledo of $234,000, $147,000 at Detroit, and $226,000 at Atlanta. At Toledo regular operating losses continued for 18 months; at Detroit, for 11 months; and at Atlanta for 21 months. It was not until 1951 that our television operating statement showed black ink, and we believe our experience was fairly typical of the experienced radio broadcaster who then pioneered the new VHF television service.

I have here a table of losses sustained by the industry generally throughout the years 1948 through 1950, taken from FCC reports, which further illustrate the enormous cost of pioneering VHF television service.

Senator Potter. It will be made a part of the record.

(Television station losses and profits are as follows:)

<table>
<thead>
<tr>
<th>Year</th>
<th>Number of stations</th>

</table>

1 Parentheses denotes loss. Comparable data not available for years prior to 1948.

Source: Television Digest Factbook No. 18, Jan. 15, 1954, p. 370, summarized from FCC financial data reports.

Mr. Storer. During the freeze period, when television broadcasting achieved substantial success, it apparently became an accepted fact that anyone who could acquire a television grant anywhere automatically was assured of financial success. So naive a business judgment was bound to founder upon reality in many cases.

Since removal of the freeze, there have been 17 television stations which commenced operations and which subsequently terminated their service and surrendered their licenses. Three of these stations were in the VHF band, the remainder in UHF.

A table of these stations is submitted at this point, and I call the attention of the subcommittee to the fact that only 1 of the 17 operated
for as much as 12 months, and that the average abandoned operations after 5 or 6 months, and several of them after only 2 or 3 months.

Senator Potter. That will be made a part of the record at this point.

(List of postfreeze stations terminating operations is as follows:)

List of postfreeze stations terminating operations

The following is a chronological list of postfreeze TV stations (both VHF and UHF) showing the date they commenced operation and the date they went off the air:

</table>

Mr. Storer. I strongly suspect that lack of adequate financing for pioneering television service was responsible for most of these fatalities, and I think it fair to compare this experience with the average period of operating losses 18 months or more which most of us in VHF endured. I point out further that in some cities, notably New York and Los Angeles, the red ink still flows for certain prefreeze VHF operators.

A number of assertions have been advanced in these hearings to date which our company feels should be most carefully examined in the light of economic reality. First, it is asserted that no television station can be assured of financial success unless it is affiliated with 1 of the 2 leading major networks. Second, that preservation of a nationwide competitive television system requires that a four-network system be assured.

It is also claimed that no network will affiliate with a UHF station in any market where VHF service is available, and unless this is in some way compelled by governmental edict, a 4-station, 4-network system is doomed, and a 2-station, 2-network system is inevitable. To assist this subcommittee in properly appraising these contentions, we have prepared an analysis of the 100 leading television markets in the United States, generally using the classification of markets made by Chairman Hyde of the FCC in this hearing.

This data is submitted herewith but may be generally summarized as follows: In 36 of the first 100 markets containing almost one-third of the country's population, 3 or more VHF stations are allocated and available for network affiliation.

Senator Potter. That will be made a part of the record at this point.

</table>

1. 1950 population is based on preliminary 1950 census, as compiled by J. Walter Thompson Co. in The 102 Most Important Markets of the U. S.
2. TV households are taken from J. Walter Thompson Co. report on, TV Households in the U. S. as of Jan. 1, 1954. (4th edition.)
3. Percent of saturation indicates the percent of TV-owning families as compared to the total families in the area, as compiled by TV Households in the U. S. as of Jan 1, 1954.
4. Detroit, Mich., includes the VHF channel assigned to Windsor, Ont., but only the United States population and set figures are included. Similarly, San Diego, Calif., includes the two VHF channels assigned to Tijuana, Mexico.
5. Dallas-Fort Worth, Tex., are combined, inasmuch as 2 VHF channels are assigned to each market and all 4 VHF channels will serve both markets.

1 Fort Worth included in Dallas.
Mr. Storer. In another 35 of the first 100 markets, to which only UHF or no more than 1 VHF channel have been allocated, 3 or more services can likewise be available for network affiliation, provided economic support exists.

Only in the 29 2-VHF cities do the 2 major leading networks have a distinct temporary advantage, and if these cities are large enough to support 3 or more services, then, in our opinion, both UHF and VHF will be feasible and available for affiliation with the third and fourth networks.

It is to be noted that during the freeze years, only 63 television markets were available for network service, yet, with this limited circulation, all 4 network services were established and have developed. We fail to see why no opportunity exists for the third and fourth networks. What actually has been urged here is a plea, not for opportunity, but for economic and competitive parity.

Competitive parity in the free enterprise system, however, can only be achieved through attainment of comparable or better products and services. This is particularly true in radio and television where public acceptance of program service is the sole determining factor of success. As a matter of fact, the status of the 4 networks, as evidenced by a tabulation of their total billings for the years 1949 to 1954, which I have here submitted, indicates to the contrary, that a continuing growth of all 4 networks in each successive year has occurred.

Senator Potter. That will be made a part of the record at this point.

(Network television billings, 1949-54, is as follows:)

Sources of Station Television Billings

The following is a tabulation of material shown in graph form in Annual Data Book for 1954 of Television magazine, page 81. Concerning this survey, Annual Data Book states:

"What share of station billings come from the networks—from national spot advertisers—from local accounts? Charted below are the results of a nationwide survey made by Television magazine. Based on reports from 200 stations, including all types of operations and markets, the percentages on the chart represent the share of billings averaged in each market-size category. Markets are grouped according to set circulation as of January 1, 1954. Since the billings picture in new markets differs considerably from that of the prefreeze stations, the two groups have been analyzed separately."

Mr. Storer. The controlling question in the development of the nationwide television service is how many stations can be operated profitably in each market. The answer to this question controls the future not only of UHF but of VHF as well, and in turn the future of nationwide networks and other program services. We think an analysis of several market situations is best calculated to illustrate the economic realities which basically control these questions.

In New York City, seven VHF stations were allocated and are now operating. Four of these are owned and operated by network organizations; three are independently owned and without network service. Five of the seven, including all four network stations, are, we understand, operating profitably in varying degrees. Two stations are still operating at a loss.

This situation simply illustrates that in areas of large concentrations of population, affiliation with 1 of the 2 major networks is not an absolute requirement for profitable operation. It illustrates also, that even in the country's most populous metropolitan area, seven VHF stations are beyond the present limits of economic support. As we drop down the line in the first 100 markets, the economic limitations become increasingly severe as the population in each successive market declines.

Currently, affiliation with 1 of the 2 major networks is a definite advantage in any market, but the third network right today is showing great signs of improvement and growth; and in our opinion, both the third and fourth networks will grow and develop just as rapidly as the economy will support a similar extension of the nationwide television service.

The experience of the third station in Atlanta, Ga., affords a good index of the problem facing new television stations—both VHF and UHF. Atlanta is the 23d city in population rank, with 664,033 persons in the metropolitan area. Our company operates WAGA-TV on channel 5 in Atlanta. The Atlanta Journal operates WSB-TV on channel 2. Crosley Broadcasting Corp. has operated WLWA on channel 11 in Atlanta since January 1953, taking it over from a group of local persons who had operated the station since September 1951.

As I have testified, WAGA-TV, our station, showed regular operating losses for 21 months before it got out of the red in September 1950.

Crosley is a capable and experienced radio and television station operator. It owns and operates three prefreeze television stations in Cincinnati, Columbus, and Dayton, Ohio. Nevertheless, Crosley is still operating in the red in Atlanta and we are informed has had only 2 months in which it showed a very small profit. I checked on that just recently as yesterday or the day before yesterday, and found those
small profits were on the order of $294 one month and about $2,000 the other month.

The obvious conclusion, borne out by our experience in other cities, is that Atlanta cannot profitably support more than three television stations at this time. We cannot predict the future. The advent of color television and the growth of television advertising generally may change this picture, but at the present time the 23d market in the Nation cannot support four television stations. UHF would be out of the question in this market, or in smaller markets. A fourth VHF station would also be in serious trouble.

In our opinion, the problem is not the absence of four nationwide networks serving Atlanta. The problem is that in a market the size of Atlanta, television revenues are limited due to the cost-per-thousand of serving the population involved. A division of the audience, due to the existence of 4 networks on 4 separate stations in Atlanta, would not assure the success of the fourth station. At the present time, the programs of all 4 networks are carried by the 3 stations. Our station and the Crosley station both carry Du Mont programs in addition to their regular CBS and ABC programs.

Large capital investments are required to build television stations and operating costs are comparably high. Mr. du Mont has suggested that a television station can be operated at a slight profit on an income of $270,000 a year or $22,500 per month. If this be true, then our company operations need an immediate overhauling, because the average cost of operation for each of our television stations for the current past month of April 1954 was more than 3 times Dr. du Mont's $22,500 figure.

I might add, also, that in order to better serve the people in Detroit, Mich., and to give new rural service, we have just concluded building a new 1,000-foot tower and an installation to achieve maximum power of 100,000 watts on channel 2 at an approximate cost of $750,000, and this is in addition to our original investment.

I might additionally say that we are currently equipping for color, building a new studio building to adequately present television programs of all kinds and color in particular, which will add another $750,000 onto this investment. We are finding that the business of being in television is a constant reinvestment matter and is becoming more and more accentuated due to the technical problems of color.

Approximately 450,000 more television homes are now included within the coverage of our Detroit station in areas where service theretofore was at best, limited and inadequate, and in a substantial number of areas where no television service was previously available. We are making similar expenditures in other cities just as fast as the financial ability of our company will permit. Since 1927, the commencement of operations of our company, we have plowed back over 75 percent of our earnings in bringing better service to the public.

As long as investments of this size and operating costs of this magnitude exist, the number of stations which each individual area can support will be limited accordingly, but these present limitations are by no means the gage of the future, in my opinion. I look for a pattern of development much the same as that which attended the growth of radio.
I well remember the time when it was economic suicide for a local independent radio station to compete against major network affiliates with greater power and coverage in most markets. As radio became an increasingly important factor in the American home, the number of radio stations increased from approximately 600 to 2,700.

I look in television for technological developments which in time will reduce the cost of operating equipment and for new techniques and laborsaving devices in technical operations. I look also for new, diversified, and cheaper program sources and services on the one hand, and increased effectiveness of the television service as an advertising medium on the other.

All these factors, in my opinion, will in time permit the extension and expansion of a better television service, with increasing opportunity for more stations, both UHF and VHF, to serve and survive in each individual community. This probable expectancy will, in my opinion, however, only mature if the development of the television broadcasting art is left to evolve under a free competitive system where the ingenuity and creative ability of the broadcasting and related industries are given free play and opportunity, limited only by the "rules of the road" which the FCC has established and which it has effectively and fairly policed. This has been the pattern of development in the history of radio broadcasting and it will, I am sure, be the pattern for the future growth of television.

This brings me to the several suggestions which in the considered opinion of our company will be helpful to the development of the nationwide television service, both as to UHF and to VHF.

At the present time it is not possible for a television operator to remove the station which he operates from an overserved area to an underserved location. The past short period of television broadcasting has clearly demonstrated the fact that a concentration of television facilities in one geographical area, even as large as New York, may result in substantial loss, particularly for some independent non-network operations. Other areas close by, to which it would be practical to move the unprofitable service, are currently deprived of the service by the inflexible rules of the Federal Communications Commission.

As a case in point, I am personally acquainted with a television operator in New York City whose operating losses have run high into six figures each year to date, and this selfsame service could be moved to some other nearby area which is at present greatly underserved and both the public and the operator would benefit. This would be a natural sequence of events based upon the economic law of supply and demand. Other instances of the same situation can be cited.

In the radio business, the Federal Communications Commission has permitted and even encouraged such improvement of service to the public by geographical changes of assignment, but in television such is not the case. We believe that the rules of the Federal Communications Commission should be amended forthwith to permit them to decide upon a case-by-case basis whether the public interest would be served by the adjustment of their allocation table. Presently, a television operator, such as my friend in New York, cannot remove his station to another area without being confronted with the necessity of first shutting down the service in New York and secondly, facing
a comparative hearing with other applicants for the proposed service elsewhere.

It may well be that a number of present UHF operators can improve their service by utilizing VHF facilities which will fit in their market and which may become available as a result of certain minor changes in the present allocation table.

The same inflexibility exists in licensing policy. Our company, for example, was denied the right to apply for a television channel in our hometown of Miami because we then owned five VHF stations, even though we represented and agreed that we would accept a grant upon condition that we first dispose of one of our other television stations to comply with the multiple ownership rules. This meant that even to become an applicant, we would have had to sell and dispose of one of our operating properties before we could apply for a "bird in the bush." Our ox was gored here, so possibly we are unreasonably prejudiced, but the same point is equally applicable to Mr. Poller's situation in Milwaukee, and in his case, we thoroughly agree that it is both unreasonable and inequitable that he should have been denied the right to apply for the new VHF channel at Whitefish Bay, which will well serve Milwaukee, without first disposing of his UHF station.

In terms of public interest, cessation of this UHF service to Milwaukee would have been unthinkable, yet Mr. Poller, under the Commission's rules, was denied the right to apply for the superior VHF service which, as he points out, may for this reason endanger the continuing successful operation of his present UHF station in this competitive market. Under the rules in radio, Mr. Poller would not only have had the right to apply for the VHF service to improve his existing service, but his effort to do so would have weighed heavily in his favor as an applicant.

We appreciate that the Commission's rule was designed to prevent "strike" applications, but here also we feel absolute inflexibility should not outweigh and foreclose consideration of a situation such as Mr. Poller's. I might explain that "strike" application is one which is put in primarily to prevent an applicant from obtaining a service in a community, sometimes at the instigation of people who already have the service in the community. I know of no way to avoid that, but usually the Commission can ferret out a strike application or a phony application, and I have to agree 100 percent with Mr. Poller that he should have been permitted to upgrade the service if he had the courage to commence.

We feel that the right of present UHF licensees to apply for new VHF facilities, and even to request reallocation of VHF channels where the same can be accomplished within the limits of the Commission's engineering standards, may well be a solution to the individual competitive problems of UHF broadcasters in a number of communities. Moreover, a switch from UHF to VHF wherever possible will inevitably result in an improvement of the television service to the public in every area.

The Commission for several years has been strongly attracted to the solution of its technical and licensing policies by inflexible rule. While the radio service prospered under a flexible policy in the administration of the radio rules, the television service is confined within relatively ironclad rules. In addition to the inflexibility in per-
mitting changes in the allocation plan, which I have mentioned above, the Commission presently has other rules which, in my opinion, hamper the development of the television service:

1. The rules do not permit the use of satellite or booster stations for the purpose of increasing the coverage of television stations, either VHF or UHF, where such additional coverage is needed by the public. Boosters or satellites can be designed in many areas as a means for equalizing the coverage of UHF and VHF stations, especially where they could be effective in filling in "shadow" areas caused by rough terrain. In case that has not been discussed in prior presentations by other witnesses, the boosters are very low-power television stations on the same channel, usually behind hilly areas, and satellites are very low-power stations on different channels which pick up the signal by means of a microwave arrangement, and in the case of very remote rural areas would be a great service to farms and ranches.

I happen to have spent a good deal of time and grew up part of the time out in Colorado. I feel that the addition of low-power boosters and/or satellites would be of immense value to the rural population.

2. The present multiple ownership rules preclude the grant of two television stations to the same person where the two stations serve "substantially the same area." In addition, the rules limit to five the total number of television stations owned by one person. If these rules are applied literally, as we must except they will be, the Federal Communications Commission would not authorize satellite stations in conflict with the multiple ownership rules, because a satellite station operates on a separate frequency from the master station and might well be counted as a second station.

3. The rules also limit the use of directional antennas by television stations very strictly. The restrictions in the rules are so severe that as a practical matter directional antennas are not used in VHF television with one or two minor exceptions.

Finally, in the area of flexibility, there is the question of absolute numerical limitation upon the number of stations which may be owned by any one licensee or licensees under common control. Under the present Federal Communications Commission rule, the ownership of more than 7 AM and 5 television stations is absolutely prohibited and deemed by the Commission to be a concentration of control contrary to the public interest.

The Commission has pending, however, a notice of proposed rule making to extend the ownership from 5 to 7 television stations, no more than 5 of which can be in the VHF band. The Commission has stated that this proposal to relax the multiple ownership rule is intended as an incentive to multiple owners, including networks, to participate in the ownership and development of UHF television stations. Our company supports the proposed rule as a step in the right direction and is in complete agreement with the Commission that the proposal will result in more impetus and support to the UHF service in many markets. Comments filed to date in this rule making proceeding indicate that other multiple owners, including major networks, are of a like mind and will under take to build or otherwise acquire UHF stations in markets where the service is economically feasible.
Our company has already taken a major step in this direction and has pending before the Commission an application for the transfer of UHF station KPTV in Portland, Oreg. I might add, that if this application is approved, our company will pay upwards of $2 million to the present licensee of KPTV, for the privilege of going forward with UHF service, and this is the most persuasive evidence we have to offer that we believe in the future of the UHF service and in its ability to compete against VHF, even in Portland where there will be three VHF services available.

It is very likely to be a long pull before all of the handicaps of the UHF service are fully equated, even in a market such as Portland, Oreg., where the UHF service came first in point of time, and the conversion problem is thus minimized. A substantial investment to improve the facilities of this station must be made at the earliest possible moment if it is to survive against present and anticipated VHF competition. We are willing to take the gamble and to risk our capital upon the outcome. We feel certain the networks and other multiple owners will make similar ventures as soon as they are permitted to do so.

Reverting to the multiple ownership rules, we originally had an unwritten limit of seven for radio. When FM came along the limit was fixed at six. In television the limit was first 3 and later increased to 5. The Commission's proposed rule is again to be 7 in television, no more than 5 of which can be in the VHF band.

Senator Johnson's bill, S. 3095, proposes a flexible rule of 5 VHF or in lieu of 1 VHF, that a licensee be granted 2 UHF stations on a graduated scale of 2 for 1 up to a maximum of 10 UHF stations. One witness here has proposed a limit of 5 VHF stations plus 50 percent interests in 5 additional UHF stations. One witness thinks no person should be allowed to own more than one radio or television station.

Dr. Du Mont urges that networks should be entitled to own more television stations than independent operators because, in his opinion, a network service makes a greater contribution in the public interest than do the independent broadcasters. Dr. Du Mont would peg the upper limit for network at 11 television stations. We and other independent broadcasters could as well urge that we should be entitled to own more television stations than networks for equally valid reasons.

Now, where do all these different opinions lead us? We think they lead to the conclusion that only on an individual, case-by-case basis can these questions of multiple ownership be intelligently and effectively resolved in the public interest. We point to the Commission as eminently qualified to make these decisions and as a matter of basic licensing policy we feel that the Commission should accept and discharge this responsibility.

The inflexibility of television rules is a reversal of the policy which the Federal Communications Commission followed in radio for many years. The merits of flexible administration was proved conclusively by the growth and development of the radio broadcast service. In all fairness to the Commission, we recognize that this present policy of inflexibility has been borne of administrative convenience and, no doubt, the Commission would use the term "administrative necessity."
We fully appreciate the multiplicity and complexity of the problems which have confronted the Commission these past few years. The workload has been tremendous, but it is our considered opinion that the dynamics of the television broadcast service during this vital period of growth and development must not be subordinated to administrative convenience or even necessity.

Let me tell you also what these numerical limits have done to our company from a practical business point of view. We owned and operated 7 radio stations when the limit on television stations was fixed at 5. In each of our seven radio communities the public looked to us to go forward with the development of television and provide the same type of service in this new medium that we had rendered in radio. Moreover, our staff in each of these seven stations regarded television as a natural and necessary extension of our radio service. Because we were limited at the outset to 5 television stations, we had to decide which 2 of our 7 children would be denied this opportunity. In both Miami and in Wheeling where we have operated radio stations for 10 and 23 years, respectively, we have had cumulative reason to know that the public feels we let it down because our 5 television stations were acquired elsewhere. Our employees at these two radio stations feel equally resentful that they will be denied participation in the television broadcasting service, and this has been increasingly evidenced by a decline in morale and business at both stations.

Unless we sell these two radio stations to other persons who can qualify as television licensees, no combined radio and television operation is possible for these stations. From a business point of view, combined radio-television operation under the same management and control is a natural development. It permits and creates definite advantages in terms of cost duplication and integrated service to the community.

I might say also that radio and television are both in a period of transition. It is not unlike the silent motion-picture transition into the sound and sight movies. We hope and we anticipate that radio due to the fact that it has mobility can be used in automobiles, plus a large in-the-house audience away from the main television receiver, and the fact that you can also perform other functions in the home, particularly the ladies in their homework can follow radio whereas it is difficult to do that when they are looking at a television set. We do hope that radio will continue to be a strong service.

However, I must confess that latterly the impact of television in the markets that we operate has been most severe and we only hope that we can continue to give good radio service.

Truth to tell, in one of our operations television currently is supporting one of our radio operations which would otherwise be unprofitable.

We will never understand why it was in the public interest that we be permitted to serve 7 communities in radio, yet be limited to 5 cities in television. It is, of course, problematical whether or not we would have received grants or otherwise have acquired television stations at Miami and Wheeling.
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

Our complaint is—we were and are denied the opportunity to apply for or acquire television stations in these communities, and what our future business policy must be in respect of these two radio stations we have not as yet been able to determine.

Before I forget it, I would like to insert these two charts on the status of VHF educational television reservations.

Senator Potter. It will be made part of the record at this point.

(Status of VHF educational television reservations is as follows:)

**Status of VHF educational television reservations**

1 United States possessions and Territories not included.
Mr. STORER. We well recognize the fear and concern of both the Congress and the Commission that multiple ownership will achieve monopolistic proportions and wield an unreasonable power and influence over the dissemination of public intelligence through control of the radio and television medium.

From a practical point of view, the measure of this concern on the part of the Commission is evidenced by its present policy of inflexible limitation upon ownership. Not only do we think that this limitation is too extreme, but it fails to take into account the many diverse factors which might constitute unreasonable concentration of control or monopoly.

We fail to see, for example, why ownership of 10, 20 or even more local radio or television stations located in relatively small cities throughout the country poses a greater threat to the public interest as a concentration of control than does ownership of a lesser number of high power stations serving the great metropolitan population centers.

I want to emphasize in using the figure 10 or 20, we have no ambitions in our company along those lines. Our chief concern is to be allowed to parallel our radio with TV stations.

Somewhere the public interest will undoubtedly require that a line be drawn and an individual licensee told "this far and no further."

We feel that the Commission was intended, and should be required, to make this decision in each individual case and we would even urge, as a matter of policy, that this subcommittee give serious consideration to an amendment to the Communications Act which will preserve continuing flexibility in the exercise of the licensing power and vest responsibility for its administration in the Commission.

I think one other matter should be carefully reexamined if we are to achieve maximum utilization of all VH channels and this is the matter of the allocations for noncommercial educational use.
To date, only a limited number of educational institutions have either applied for or found it financially possible to go forward with educational television grants.

The educational groups throughout the country should be given every reasonable opportunity to utilize these allocations, but it is certainly not in the public interest that these channels reserved for education remain unused indefinitely.

The educational allocations were made in June 1952 and, although 2 years have already elapsed, many of these allocations remain unapplied for.

I might say, in passing, also, that our company in Birmingham, Ala., has agreed to turn over a transmitter and tower and some $175,000 worth of equipment, plus the use of our studios, for 1½ hours per day, 5 days a week.

In San Antonio we have made a similar offer to the educational interests there. In fact, our policy, without enumerating every city, is substantially that.

We want to help. We feel the Commission and the radio and the television business have been good to us and we want to do our part; but we do feel that some cutoff date should be fixed beyond which these noncommercial educational channels, if not then utilized, will thereafter become available for commercial use.

Our company also supports Senator Johnson's proposal for the removal of the excise tax on UHF receivers and commends this subcommittee for its like support and recommendations to the Senate Finance Committee for its inclusion in the current revenue act.

Our company has no doubt that the inclusion of all channel tuners in home television receivers is the ultimate answer to the UHF conversion problem, and, however this result may be achieved, it is clearly of vital importance to the growth and development of the UHF service.

We join with this subcommittee in hoping that the manufacturers of UHF receiving equipment will resolve this question by voluntary action, and any tax or other incentive to achieve this result is, in our opinion, most desirable. It is the very crux of the present UHF situation, and we feel the only serious area of present concern.

In summation, I respectfully recall the following six points of observation to the attention of the subcommittee:

(1) The Federal Communications Commission has acted not only wisely but with a singular degree of understanding and intelligence in providing nationwide television service based upon 3½ years of study during the so-called freeze period—and I am not making this statement to butter up the FCC. It is a fact.

(2) The American public is the chief party in interest. They have billions of dollars invested in the present good and improving television service. Neither the Congress, the FCC, nor the broadcasters can now break faith with those millions of people who enjoy this wonderful source of intelligence and entertainment.

(3) Because the VHF television service is technically superior to UHF, the right of the public to receive the best possible service at all times must be the sole measure of the future growth and development of both the VHF and UHF service. The future of UHF can
only be determined by the need which exists for this service in each
individual community and by the measure of economic support which
is coexistent. The public must not be shortchanged to compensate
or improve the economic problems of individual broadcasters.

(4) Flexibility in the application of the Commission’s allocation
rules and in its licensing policies will achieve more effective and
diversified utilization of existing VHF and UHF channels. This
policy of flexibility should be initiated at once.

(5) Limitations upon multiple ownership should be resolved on
an individual basis in light of all of the circumstances which are
material to the public interest and should not be determined by arbi-
trary numerical limitation.

(6) The allocation of VHF channels for noncommercial educational
use should be reexamined in the light of present need and a cutoff date
should be fixed, beyond which all educational channels not then utilized
should be released for commercial purposes.

Again, our company wishes to express its appreciation for your
courtesy in permitting us this opportunity to present our views.

Thank you.
Senator SchoeppeI. Senator Bowring, do you have any questions?
Senator Bowring. No. Thank you.
Senator SchoeppeI. Thank you, Mr. Storer, for your statement.
Mr. Storer. Thank you.
Senator SchoeppeI. We have a number of witnesses here, and we
want to move on through; and I might say Senator Potter was com-
pelled to leave, to be in attendance at another important committee
function and he will return as soon as that is concluded, which looks
like it might be today.

The next witness is Ted Pierson, of Pierson & Ball of this city.

STATEMENT OF W. THEODORE PIERSON, PIERSON & BALL, WASH-
INGTON, D. C., REPRESENTING 82 OPERATING VHF TELEVISION
STATIONS AND 20 PERMITTEES FOR VHF TELEVISION STATIONS
AND 33 APPLICANTS FOR VHF TELEVISION FACILITIES

Mr. Pierson. Mr. Chairman, my name is W. Theodore Pierson.
The last name is spelled P-i-e-r-s-o-n.
I am a member of the law firm of Pierson & Ball, in Washington,
D. C.

I have been engaged in the practice of law for approximately 15
years before the Federal Communications Commission.

I appear here on behalf of 82 VHF operators, 20 VHF permittees
who are in the process of building their stations but have not yet
commenced operation, and 33 VHF applicants who are currently
engaged in the course of hearings.

I would like to state this is an informal group that was formed for
the sole purpose of presenting testimony to this committee.

I have circulated to the committee what we have marked “VHF
Group Exhibit No. 1,” so that the committee will have before it the
basis for the composition of the group.

The exhibit contains telegrams sent to all VHF stations, to all VHF
permittees, and to all VHF applicants. It then contains a list of the
stations, the permittees, and the applicants who responded to the tele-
gram shown in the first part of the exhibit and stated their support for the position stated in the telegram.

There is a slight qualification on that. I believe in 1 or 2 instances a respondent did not approve the position we took in its entirety. We have indicated that by a footnote in the list.

I request that the exhibit be made a part of the hearing record.

Senator Schoppel. Without objection, that will be done.

(The exhibit referred to is as follows:)

(Administrator sent to all permittees of VHF stations not yet on the air:)

**Pierson & Ball, Washington, D. C., May 28, 1954.**

The undersigned informal group has determined to participate through its representatives in the Potter hearings—Senate subcommittee investigating UHF problems—and has retained the law firm of Pierson & Ball for this purpose. In general we will oppose the following proposals made by the UHF group and its advocates: The elimination of internixture of VHF and UHF; the allocation of all television stations to the UHF band exclusively; the imposition of any freeze upon application proceedings or upon the issuance of operating authority covering permits already granted; and the reduction and limitation of the coverage areas of VHF stations. We propose to support the following proposals made in the hearings: All reasonable and proper steps to encourage production and distribution of receiving sets having all-channel tuners, and the use of booster stations to improve service inside a station's coverage area. We intend to make as many constructive suggestions as possible as to how the economic and program resources of the industry will be expanded, but intend to oppose those proposals that would have an adverse effect upon the whole medium in its attempt to get revenue and programs.

If you support these views will you please wire Pierson & Ball, 1007 Ring Building, Washington, D. C., to that effect, and authorize them to disclose your support to the Senate committee. In addition we believe it desirable to incorporate into the record any facts and views you individually may wish to express in a signed written statement, particularly with respect to the amount of money already spent and additional amounts obligated in performing the construction authorized in your permit, and the adverse effect upon the public should your authority be delayed or obstructed. It would be appreciated if such a statement would be limited to 1,000 words; and to be useful, it should be in possession of our counsel not later than June 2.

(Telegram sent to all VHF applicants for television stations:)

Pierson and Ball,
May 28, 1954.

The undersigned informal group has determined to participate through its representatives in the Potter hearings—Senate subcommittee investigating UHF problems—and has retained the law firm of Pierson and Ball for this purpose. In general, we will oppose the following proposals made by the UHF group and its advocates: The elimination of intermixture of VHF and UHF; the allocation of all television stations to the UHF band exclusively; the imposition of any freeze upon application proceedings or upon the issuance of operating authority covering permits already granted; the reduction and limitation of the coverage areas of VHF stations. We propose to support the following proposals made in the hearings: All reasonable and proper steps to encourage production and distribution of receiving sets having all-channel tuners, and the use of booster stations to improve service inside a station's coverage area. We intend to make as many constructive suggestions as possible as to how the economic and program resources of the industry will be expanded, but intend to oppose those proposals that would have an adverse effect upon the whole medium in its attempt to get revenue and programs.

If you support these views, will you please wire Pierson and Ball, 1007 Ring Building, Washington, D. C., to that effect and authorize them to disclose your support to the Senate committee. In addition, we believe it desirable to incorporate into the record any facts and views you individually may wish to express in a signed written statement, particularly with respect to the history of your interest in television, the circumstances of your decision to apply for VHF instead of UHF, the amount of the cost or estimated cost of prosecuting your application, and the amount of money already spent on application proceedings with an estimate of the total cost to a final decision. It would be appreciated if such a written statement would be limited to 1,000 words, and to be useful, it should be in possession of our counsel no later than June 2.

Mr. Pierson. Of those who support the views of this group, 65 of them desired themselves to present information and express their views to this committee. Obviously, such a large number of witnesses would have been a tremendous burden upon this committee and we had no desire to offend to that extent. What we have done, therefore, is to suggest to those 65 interests that they prepare written statements, from which we have selected a list of 7 witnesses to present testimony which we hope fairly reflects the positions taken in the 65 written statements.

The job has been assigned to me to give the background for the opinions we here express and to generally explain the position of the group with respect to each proposal made to this subcommittee—I should say with respect to each principal proposal.

Six other witnesses will follow my testimony and will address themselves to particular situations which we believe are somewhat typical of the problems presented by the proposals made here.

I have not reduced all of my testimony to writing but only that portion that covers the background material of a legal and business nature.

I wish to read that statement first and then proceed with an extemporaneous discussion of the proposals that have been made here by some UHF stations and their advocates.

I would like then to call the other six witnesses, after which I would like the opportunity to offer the written statements into the record.

Senator Schaeppel. Those are the written statements that you have had forwarded to the committee?

Mr. Pierson. As I understand, the committee has copies of the written statements, which will not be read here. I don't wish to alarm the committee, but we will ask they be copied into the record at the conclusion of our last witness, who is Mr. Reinsch.

I don't know whether Mr. Zapple has changed the listing. There was one of our witnesses omitted from the list this morning, and that
is Mr. John W. Guider, of Mount Washington Television, Inc., and if our order works satisfactorily, he will appear after Mayor David Lawrence.

The 70th Congress of the United States established the legal framework of a system of broadcasting for this Nation by the passage of the Radio Act of 1927, which legal framework was incorporated by the 74th Congress in the Communications Act of 1934.

I believe we might say in view of that that the Communications Act is a rather nonpartisan effort.

These legislative actions placed in legal focus the part that was to be played by each social force that is a factor in the success or the failure of the system. These social forces are the public, the Government, and private enterprise. The powers, the rights, and the functions of each are clearly established by this law.

It would seem that in considering further legislative action or legislative persuasion in connection with this system of mass communication, we should have clearly in mind the elements, the purposes, and the modus operandi of this concept with which we are dealing.

The only proper purpose and objective of any system of broadcasting is to provide the means by which the public need will be satisfied. Not only the American system, but any such system has certain essential elements which can be rather accurately characterized as consisting of technical capacity, programs, and money.

By technical capacity, we mean that it requires that radio waves be made available that are free of interference and that equipment be supplied that can transmit and receive the signals carried by these waves.

The element of programs embraces a public need for information via broadcasting and the ability to satisfy this need from our program resources.

The element of money covers the requirement of economic resources sufficient to finance the broadcasting plant and the job of obtaining and transmitting the information the public needs and demands.

The task of creating and supplying these various elements is one that might be assumed by government alone, by private enterprise alone, or by a division of function between the two.

There have been a number of systems of broadcasting adopted throughout the world which might be classified generally as consisting of:

(1) A government monopoly—that is, government ownership and operation of all of the facilities;

(2) Private monopoly protected and regulated by government after the fashion of common carriers and public utilities; and

(3) The operation of the system by private enterprises with government performing only those functions that it alone can perform.

The method adopted by this country to create and compound these elements of technical capacity, programs, and money into a system of broadcasting can be classified under a third category mentioned above; that is, free enterprise was assigned the function of operating the system of broadcasting, with government performing only those functions that it alone could perform.

The government allocates the frequencies; it checks to make certain that they are used for the public purposes intended, and main-
tains a watchful eye to make certain that monopolistic obstacles do not raise that limit the potential capacity of the system to serve the public.

Private enterprise with government encouragement develops, produces, and distributes the equipment that is necessary to complete the technical capacity to communicate.

The public demand for programs is voluntarily asserted by the public without restriction or mandate from government.

The money—that is, the economic resources that are necessary to establish all elements of the system—is left to private enterprise to voluntarily supply. This includes the manufacture and distribution of equipment, the building and operation of broadcasting plants, and the suppliers of the services and products needed by each. Stations’ operating costs are offset by revenue from those advertisers who voluntarily find the medium useful.

It is important to remember that, under this method of providing a broadcast service to the public, government requires no person to engage in any facet of this business and exercises the power in a few areas of permitting private persons to engage themselves if they, of their own volition, decide so to do.

Government does not supply the programs or the capital; it does not order manufacturers to produce equipment, the public to buy it or tune it in, persons to build and operate stations, or others to produce and supply programs. It does not regulate programs, rates, profits, or lawful business practices, but leaves this to competition, within and without the medium, to be the natural regulator of the quantity and quality of service that is furnished to the public and furnished to those who otherwise rely upon it as a means of communication, such as advertisers.

The motives for the adoption of such a system would seem to lie both in the devotion of our people to the principle that free enterprise, with only necessary governmental interference, is the soundest system for providing the public with the services and the products it requires; and also, in certain constitutional limitations upon the power of the United States Government.

Whatever the motive, experience to date has clearly established that there is great genius in this system. It is the most free and the most comprehensive system of broadcasting in the world. Our television broadcasting is the most advanced in the world. It has accomplished in its short life fabulous achievements in terms of satisfying the needs of our national community for rapid and accurate communication of information.

We assume, therefore, that any solutions to the problems that have been posed here are to be found within the framework of this system and in consonance with its concept of the division of function between the public, government, and private enterprise; and that it will not be found by substituting a new and different system. In any event, the presentation of the VHF group is based upon this assumption.

As in the case of our whole economic system, there are certain unhappy incidents that frequently occur and excite the sympathy of all but the most mean.

I would like to add that the group of stations supporting this presentation finds it easy to sympathize with somebody who is in distress since many of them have been through the same experience and all the
applicants and permittees that support this statement are now confronted with the same possibility. They are doing nothing but spending money, and nothing is coming in.

Persons engaged in any phase of this industry, whether it be in the manufacture of equipment, broadcast station operation, program supply, or advertising, may make or lose money in widely varying degrees as the result of voluntary business decisions that they make or the particular economic and social conditions they encounter; but we believe this is a necessary concomitant of being free to make the decision in the first place.

If one asserts the right to voluntarily go into the business and to keep the profits he makes therefrom, he cannot at the same time insist that government has responsibility for his failures.

We believe it is not the part of government to deprive or relieve these people of the freedom or the fruits of their voluntary decisions.

On the other hand, we hasten to make clear that we believe government should take care that its action or inaction in the performance of its proper duties is not the unnecessary cause of failures and distress. Fickle and arbitrary action could destroy the confidence of free enterprise in the industry and its voluntary engagement in the essential facets of the business would not be forthcoming. This obviously would tend to reduce the economic support, the ingenuity and the competition that are necessary if the public is to obtain the maximum of service from the use of its channels.

Government action that is not required by public considerations and that harm private interests is wholly unwarranted; but, on the other hand, we believe that government should take such action, as is within its proper power and within its proper sphere, which tends to encourage, foster, and develop the system without, however, destroying it or taking it over in the process.

This hearing was brought on by the financial distress of certain television operators who have lost money in television or, as in the case of Mr. Poller, who are now making money and fear they will suffer losses unless the Government acts to prevent, obstruct, or hinder others from engaging in the same business.

I do not mean that all of the many persons who have lost many millions of dollars in one facet or another of this industry are organized here and in unison demanding that government save them from their losses. As a matter of fact, those who have here complained are but a minute portion of the persons who have lost money in this business.

We believe it of primary importance to inquire whether their distress endangers the success of the whole system and its capacity to serve the public, and, if so, what action, if any, can be taken by government to better secure the ultimate success of this industry's achievement of its public goals.

We have the view that no action can be justified that would constitute a greater danger to the system or that would merely shift the distress from one private party to another without improving the system.

Before attempting to give the views of the VHF group on these questions, a general understanding with respect to the terms we employ would be desirable, as well as a brief reference to certain practicalities of industry operation.
During the course of this hearing the predictions of an earlier witness that certain phrases would be much hackneyed have come true. There has been constant reference in this record to a "national competitive television system" and to a "national allocation plan." At times during the course of the presentation of views here it seems that these two terms are treated as synonymous and coextensive, which we believe is completely erroneous.

A national competitive television system in our view is that system which is required at any given time to satisfy the needs of our national community and that is within our technical, economic, and program capacities to supply.

The public need or demand, the economic capacity and the program capacity are all dynamic, not static, facets of this system. On the other hand, because of limited spectrum space and the inflexibilities imposed by priorities in use of channels, our technical capacity to supply channels tends to be static.

The national allocation plan represents an attempt by the Commission to assign spectrum space in a manner and quantity that over a substantially long period in the future will accommodate the system required from time to time by public need and that it is hoped will ultimately be enabled by our program and economic capacities.

Senator SchoepPel. You do not mean to imply by that they never should be under control if it becomes necessary to get the greatest service to the greatest number of people or to prevent it from getting into a few hands so that it might become unreasonable in the advertising media, expenses, or something like that?

Mr. Pierson. You are referring, I take it, Senator, to economic capacity and program capacity?

Senator SchoepPel. That is right.

Mr. Pierson. I believe if free enterprise is unable to provide the capacities available to support this system another system must be substituted, but not within the framework of our present concept. We must go to the common carrier or public utility concept or we must go to government ownership and operation, and I hope I made clear in the earlier part of my statement that one of the definite functions of government under the concept that we are now pursuing is that they shall take care that monopolistic tendencies do not develop because that is necessary if free enterprise is to function and to render the service that is expected of it.

The Commission did not, in considering its national allocation plan, make any substantial attempt to determine with exactness the system that our economic and social capacities and requirements would support or permit at all times or at any given time in the future. It made what could have been no more than an educated guess as to what these factors that defy accurate prediction and that are completely beyond the control of government would ultimately require in terms of frequencies or spectrum space.

The Commission could have done nothing else because it cannot be imagined that government could attempt a more futile thing than to try to predict over a long period in the future what our social and economic fates will dictate in the way of a national television system.

This national allocation plan, therefore, is not the national television system itself; it is merely the most static and predictable facet thereof. It does not mean that if at any given time we have fewer
stations than the plan will technically accommodate we do not have a national television system. The national allocation plan is merely the maximum technical capacity of the system insofar as present technology indicates. It is the technical horizon within which the national television system must grow.

We wish to emphasize that if the public demand at any given time is less than the allocation plan will accommodate there is nothing the Commission or Congress can do about it without changing the whole concept of the function of and relationship of government in and to this essential industry and without depriving our people of their constitutional freedom to choose how they will occupy their time.

I would like to explain that point further by adding that what I mean is that if people are not interested in tuning in or buying sets and cannot, therefore, be caught with an advertiser's message, our Government, with its present constitutional limitations, cannot order them to do so.

If the economic resources and program capacity at any given time are less than those required to completely use the facilities provided in the allocation plan, the help the Government can give it is limited unless we are to adopt a system of Government ownership and operation.

Within the limits of the allocation plan, this national television system is a dynamic thing, not static; it will be ever changing. It is affected by the growth and location of our population, which is ever changing. It is affected by the changing tastes and interests of our people in information, entertainment, and diversion, which are never constant. It is affected by the economic condition of the Nation and all facets of this industry, which are far from static.

It would seem clear, therefore, we cannot take a month or 6 months, or a year, or any short period of time in the short history of this industry and say that this truly represents either the public requirements or the private capabilities of the industry. It is no more correct to take the first 3 months of 1954 as indicating the constant and insoluble problems of the industry than it would be to take the first 3 months of any year from 1946 to the present date.

The only thing that is constant, looking back over the short life of the television industry, is that at each stage of its development there have been serious problems that have constantly changed from time to time.

We hold that it is remarkable and almost beyond belief that in the short period of 8 years so many solutions have been found by an industry beset with so many different problems.

Problems in the spring of 1954 may be different in some respects than those of the spring of 1946, 1949, or 1952, but we believe that the system itself has demonstrated the vigor and capacity to solve them.

The industry is in its infancy and its ability to provide this dynamic national system, we think, is quite promising. Just a short 8 years ago there were only 5 television stations in the United States and, in spite of a deadening 4-year freeze imposed by the Government, there are now 384 stations.

We should take some lesson from the clear fact that this accomplishment of free enterprise was much limited by the Government's imposition of a freeze over approximately one-half of this period.
By the end of 1953 nearly $200 million had been invested in tangible broadcast property alone. The advertising revenue of the television industry increased from $8,700,000 in 1948 to $430,800,000 in 1953. It is estimated that the public has invested $12 billion in receiving equipment, though I heard an estimate this morning of six billion. In any event, it is more money than I can imagine.

The program resources of the industry were increased from practically zero in the year 1946 to a relatively great multiplicity of program hours at the end of 1953.

The testimony of those engaged in the development and manufacture of technical equipment, who have already appeared in this proceeding, gives eloquent evidence of the tremendous advances in the equipment and technology of the industry.

These accomplishments by the industry in its infancy hardly indicate a child with a congenital illness that can never grow up to achieve the goals of its maturity. One of the legs of this infant might be said to be suffering from some rather painful sores; but this, on the basis of current diagnosis and experience with similar ulcers in the past, would hardly seem to justify the amputation of the good leg to save the bad. We believe that these sores, painful as they are to the leg that bears them, will disappear and leave only faint scars if we allow the health and vigor of this infant to overcome the infection with probably no more than the application of some hot packs and a substantial amount of loving care. In any event, such a drastic remedy as radical surgery or such despair as calling for the undertaker hardly seems justified.

I would like to point out there that the elimination of intermixture, the elimination of VHF, the reduction in the coverage of VHF stations, is what we call radical surgery.

The freeze is a numbing anesthetic and the Du Mont proposals are the call for the undertaker.

Senator Schoepfell. What do you say about requiring some kinds of arrangements, voluntary or otherwise, that these sets be developed so that they might take both types of service?

Mr. Pierson. We fully support and urge Government to take every step within its proper power, including the exercise of the taxing power, to encourage VHF-UHF sets.

Senator Hunt. Don’t you think that is primarily the business of the industry and that they should apply themselves very energetically to getting that job done and not make the Government compel them to do it?

Mr. Pierson. I believe so: and I suppose if we had the concept, Senator Hunt, that the taxing power should be used only for the purpose of raising revenue we would not want to use it for the purpose of regulating or encouraging the private industry; but it is my impression that concept of the taxing power only for revenue has long since been deserted. I, therefore, think if the Government can find, by use of its taxing power, it can encourage the result devoutly desired by the public, then it should do that.

I have been informed by people to whom I have talked in the manufacturing industry that the probable result from the lifting of the 10-percent excise tax, which has been proposed, would be that all television sets, of whatever price classification, would have UHF capabilities.
At least, that seems to be the view of some of the larger manufacturers in the field.

We would like to touch briefly upon the practical aspects of operation in the television industry to the extent of inquiring what it sells and how it acquires the thing it sells.

As has been pointed out on numerous occasions in this record, a television station sells circulation. We would define this as being people equipped with receivers and the wonderful habit of tuning in. People become equipped with receivers and develop the habit of tuning in only if the station is prepared to furnish them with the programs they need or desire through an electrical signal that is strong enough to activate the receiver.

Except for an attractive program delivered by a signal that will activate a receiver, the public is not going to buy sets, or, having them, will not tune them in.

This is a basic condition and the great challenge that has faced all pioneers in radio, AM and FM, and all pioneers in television, VHF and UHF.

Getting the public to tune in is now, and always will be, the fundamental task of every TV station, new or old, VHF or UHF, operating in small or large markets.

This is the ultimate task that our concept of the service left to private enterprise. The elimination of the risk of this task by Government would cut deeply into the very heart of the American concept of free, competitive, commercial broadcasting.

Let us briefly consider how a station goes about procuring the programs that will meet this challenge and defeat this risk.

Program sources are generally divided into two categories as to origin—local and national.

At the local level the station can produce and perform programs either live or on film. In order to do this, a local station operator must risk money.

The national suppliers of programs again are divided into two principal categories: There are what are called the national networks, which for the purpose of our understanding of that term we suggest be defined as companies supplying programs to a multiplicity of stations by way of physical interconnection through wire or microwave relays.

The programs that the network transmits over its fixed system of electrical communication may be originated either in the form of live or in the form of film.

To conduct this type of program supply requires the risk of money by both the network and the station.

We do not mean to imply that money alone is sufficient to insure success, because the job of producing something that will be attractive to the public is an art and not an exact science; but the fact remains that with all the ingenuity and artistic talent in the world it cannot be accomplished without the risk of money.

The other principal category of national program supply is what we shall call film syndication. In this category all programs are on film, but are not delivered to stations simultaneously over wire or microwave relay; rather, they are delivered by mail or express to a multiplicity of stations. An undertaking in this type of program
supply likewise requires money as well as ingenuity, and the money must be risked by both the stations and the film distributors.

It would seem clear that the basic weapon for defeating the problem that confronts every broadcaster at every moment of his existence is the willingness to risk money on programs. This is a joint risk to be undertaken by the producer of the programs, by the distributor of the programs, and by the broadcaster himself.

We would next like to pass to a brief consideration of the persons to whom a broadcaster sells this circulation he strives to acquire. Under the present development of our industry his buyers are advertisers, wherever they are—local advertisers, regional advertisers, and national advertisers.

The advertiser may patronize the station in a variety of ways. He may buy time on a program already being broadcast, and that program may be from a national or a local source of supply. He may buy the time only and supply his own program, or he may buy time or the program or both through a network or film syndicate, or buy it directly from the station. If the national advertiser buys it through the network, it is what the industry calls a network sale. If a national advertiser buys directly from the station and not through a network, it is called a national spot sale.

We believe it will further clarify the issues here to attempt briefly to place in their proper sphere these national agencies for programs and revenue.

First, there are currently operating in this country four national networks. The function they serve in this industry is dual—they are a national program source and an agency for the sale of stations' time to national advertisers. Since their programs are used over a multiplicity of stations, the cost per program per station is less than where use is by a single station, and, of course, this furnishes an economic base for higher-quality programs. The network, in addition, serves the advertiser by clearing time over the stations in the markets the advertiser desires to buy. Its functions can be summarized then as program supply, national selling, and clearance of station time.

The measure of the extent to which any given network satisfactorily fulfills these functions is ultimately based upon the quality and quantity of their programs and the effectiveness of their selling and clearance operations. This, in turn, is based in substantial part upon the money the network has been willing to risk, upon the ingenuity of its program producers, and upon the effectiveness of its salesmen.

But it is not the networks alone that risk money. A station that affiliates with a network also risks money or its equivalent in substantial but varying degrees.

The cases are numerous in the past or present where a station in order to obtain a network affiliation must guarantee the network the cost of the line connecting the station with the network.

There are instances where the network delivers its programs by film and the station must bear the cost of processing and delivering the film.

There have been numerous instances in the past and there are some at the present where a station must pay a fixed affiliation fee before it can even get the affiliation.
It is a very usual and standard provision that a station give up a substantial part of the normal revenue from its time to the network in order to obtain the network affiliation.

It might be desirable to note in passing that from a revenue standpoint the quantity of programs a station takes from a network reaches a point of diminishing return. Because of the compensation that a station must give to a network, a station generally receives substantially less from time sold by the network than it receives from time sold directly to national advertisers, or in some instances to local advertisers. The reason, however, that a station will nevertheless seek and accept a network affiliation is that the quality of the programs it is thus enabled to broadcast increases the circulation of its station and, therefore, the value of its nonnetwork time and spots. Since the station is in effect selling a portion of its time to the network at wholesale rates and frequently at less than cost, it obviously reaches the point in the volume of its network broadcasts where it would be poor business for it to take.

We believe this is important because there definitely is a limit to the volume of network programing that a station can normally take.

Let us turn now to a consideration of the functions that normally are or can be performed by an organization engaged in film syndication.

Like the network, the film syndicate constitutes a source of programs that can be less costly and generally of higher quality than local originations because of their use by a multiplicity of stations. In addition, a film syndicate can if it chooses provide national salesmen for the stations with which it deals, and can if it chooses provide a station time clearance service to national advertisers. It is directly competitive with networks in terms of talent procurement, program production, and program distribution. It can if it chooses be competitive with the network in selling national advertisers and in providing a clearance service to national advertisers.

The only real and necessary difference between the two is not so much in the services they do or can perform, but in the manner by which they deliver the programs they supply. A network delivers them principally by wire or microwave; a film syndicate by parcel post or express.

I should point out, however, that some networks or perhaps all of them—I am not certain—also engage in film syndication to some degree and that, pending the development of the means of physical interconnection, all of them have used film deliveries to nonconnected markets.

There would appear to be certain advantages and disadvantages in both of these principal methods of performing the function of national program supply and commercial selling. First, the networks were established much earlier in point of time and had fixed relationships with a number of broadcasters throughout the country, so that when the supply of stations was short they had a tremendous clearance advantage by virtue of that position alone. This advantage decreases as the number of stations and the number of hours of programing demanded by the public increase, and as contractual arrangements run out.

It is obvious that a program of value produced live can only be performed once without duplicating cost, whereas a program per-
formed on film can have any number of runs over any period of time that may be demanded.

This is not an advantage, however, that is exclusive to film syndication because the networks more and more have been placing the programs they originate on film so that after they have been performed on the networks they will be available for subsequent broadcast by any number of stations. This is what is called the residual value of a program and can only be preserved by recording the program.

There are those who believe, although I am not certain it has been or can be established, that the cost of film delivery by way of land or air transportation will be substantially less than the cost of a fixed circuit of coaxial cable and microwave relay. It does clearly appear, however, that while fixed wire or microwave relay connection with the top markets of the country may be economically feasible, such fixed connections with the 200 or more markets in this country that may ultimately have television stations raise questions of economic feasibility.

This suggests that, while networks may have advantages in the economics of their delivery in the early stages of television operations when the markets or number of stations were relatively small, the advantage may turn to film syndication as markets and stations become more numerous.

The progress of film syndication as a national source of supply of programs and as an agency to perform national selling and station clearance has lagged substantially behind the progress of the development of network performance of this function. A number of explanations are at once manifest.

First, all but one of the networks were established in radio and thus possessed the potential energy of a going business consisting not only of revenue, but established relationships with stations, advertisers, and program sources.

While those networks enjoyed a competitive advantage from this potential, it also supplied us with daring pioneers who might have been long in coming from less well-situated sources.

Each of the networks has owned from 1 to 5 stations in the principal markets of the country and thus had not only an individual use for the programs it originated, but had the economic support of such local operations.

Those interested in establishing themselves in film syndication, however, did not to any substantial extent, enjoy these advantages possessed by the networks. When the number of stations was few and the supply of air time, therefore, was short, the networks were in a vastly superior competitive position.

First, there was little time that a newcomer could hope to clear for advertisers who might want to use the program material in stations over the country.

Second, the stations’ time was almost saturated with network program material and they had little use for film program material; and what use they had for it was in the low-rated periods of time that could not economically support substantial charges for program material.
The recording of any program on film substantially adds to the cost of the program and can only be justified economically if there is a substantial demand for subsequent performances or runs.

Some idea of this cost is indicated by the fact that a fair-to-good quality half-hour dramatic film program will average about $25,000 to produce. This means then that, for a film producer to provide 1 half-hour program per week for a period of 1 year, he has to underwrite a cost of about $1,800,000.

With station operations averaging about 100 hours per week each, it is easy to see that substantial amounts of money must be risked by anyone undertaking to be a substantial source of film supply.

During the period of the Commission's freeze when the number of markets and the number of stations were limited, when many stations were oversupplied with program material, no prudent investor would have set out to establish himself as a substantial source of quality film supply.

No prudent person would risk such vast amounts of capital just to put inventory on the shelf against some indefinite future date when there might be a demand for it.

The real development of film syndication as a national program source naturally awaited the termination of the Commission's freeze, but the tremendous increase in the number of persons venturing into this field in the short time since the lifting of the freeze is, I believe, one of the most phenomenal developments in the industry.

We can expect many persons who venture into this field of program supply to lose very substantial sums of money and we know there are a host of problems inherent in this facet of the industry, but the growing public demand for programs and the growing demand caused by the increase in the number of television stations and markets will support no other belief than that this form of national program and selling service will become an important factor in the industry, provided we are patient and give free enterprise an opportunity to develop its full potential and provided we give it the freedom to succeed or fail.

A certain concern has been stated in the course of these hearings that under its present framework there is great danger that competition in the various areas of the television industry is or will be nonexistent, and there have even been assertions that a monopoly now exists. We have been unable to learn from the record or to apprehend from the statements therein the precise nature of this trend toward monopoly that seems to be feared. Perhaps, therefore, our understanding of the competitive conditions, existing or potential, in the industry will tend to explain our failure to be impressed with these statements of alarm.

As we have previously stated, the facets of this industry involve the production and distribution of equipment, the national production and distribution of programs, the national sale of advertising, the local production of programs, and the local sale of advertising. Let us examine each one of these areas with respect to existing and potential competition.

We are aware of no substantial showing that has been made by any person, public or private, that in the business of manufacturing and producing transmitting and receiving equipment in the television industry there exists anything but the keenest and most vigorous competition.
In the field of national program production and distribution all of the four national networks compete with each other; the film syndicates compete with each other; and the networks as a whole and film syndicates as a whole compete with each other.

In the area of national advertising sales there would seem to be no doubt that the networks compete vigorously with each other and also compete with the national representatives who are attempting to make spot sales as distinguished from network sales. These national selling agencies for stations compete with each other and the markets they represent do also. Furthermore, all who are engaged in attempting to sell television time to national advertisers are competing with all other national advertising media—newspapers, radio, periodicals, billboards, and direct mail.

In the area of local program production, all stations in the area compete with each other and, by Commission regulation, two stations in the same market cannot be owned by a single interest. If a community now has only one station and a monopoly, therefore, exists, it generally arises from one of two causes.

The first cause is that, while the Commission may have allocated more stations to the community, the Commission’s freeze, the redtape, and the procedures that have been necessary have delayed the establishment of a competitive station.

In other instances, we undoubtedly have and will have situations where the community will not support more than one station. In these situations it seems that, in order to avoid a monopoly, two courses could be adopted: First, we could hope that community growth, lower cost of operation, and increased revenue potentials may at some future time economically justify the establishment of a competing station in the community. The alternative, which we would not recommend, is to say that since the community can have only one station, it will be denied any in order to avoid this monopoly forced by natural laws.

In the area of local advertising sales, all television stations providing a signal to the listeners in the locality compete with each other and they in turn each compete with other media—the radio, newspaper, billboards, and direct mail.

We are unable to find one bit of evidence in the existing or reasonably foreseeable situation in the television industry that forms any basis for the belief that monopolistic control over program sources and advertising revenue either at the national or local level is the remotest possibility.

There is another area that involves a somewhat different concern than the concern about economic competition. This is a social factor that the Commission has recognized over the years and involves the desirability of avoiding a concentration of control of the media available for mass communication of news and views to the people of the Nation or to the people of any community. It expresses a proposition with which we can all agree: That it would be highly dangerous to this country, our form of government, and our political, social, and economic institutions if one interest or a very few controlled all channels for mass communication of ideas and information.

We think a brief consideration of our present circumstances in this connection devestates any cause for alarm.

48550—54—49
Information, ideas, news, and views are presented to the people of this country by a variety of sources, which include television, radio, newspapers, periodicals, theaters, and direct mail. The barrage of words and pictures that assail the American public is so tremendous and stems from such a multitude and variety of sources that it is possible to say that no single interest or small group of persons has anything remotely approaching control of the many channels of communications now employed with various degrees of effectiveness in this country.

We are unable to find any facet of this industry in which a monopoly now exists or is threatened.

Since I completed this statement I have not stopped my attempt to apprehend the dangers that have been stated in the record.

Under my most recent understanding, it seems that the monopoly of which they speak is what they call a VHF monopoly; and, if I understand the contentions, they go substantially beyond my concept of a monopoly, although I may have a narrow, legalistic view of that, because one fact that is clear is that the VHF stations are not owned by a small group of people. Their ownership is widely diversified. The fact also is that these VHF stations compete with each other wherever the circumstance of economics and social factors calls upon them to do it.

Senator Schoeppel. But they are limited to a rather small group, that is, small range?

What is it—13 or 14 channels?

Mr. PIERSON. Yes, but there are 500, Senator Schoeppel, stations possible, as I understand it.

Now, 500 stations, assuming that the ownership and control of those stations is not concentrated in the hands of a few, certainly will provide substantial competition because, bear in mind, under the Commission's licensing policies and practices, no two of them could be owned by the same interest in any market. That means that all of them that cover the same area will be in competition with each other. It also means, under the Commission's policies, that only a small group, five in number, can be owned by any single or connected interest.

Now, I submit that in the VHF operations there is now and there is great potential for very substantial competition, and there exists no basis for contention that there is a VHF monopoly.

VHF itself is a means. It is an element of nature. It has no capacity to form a monopoly. So long as the ownership of those stations are diversified and not concentrated in a few people, I do not see how, under my understanding of the term "monopoly," one could be said to exist.

To summarize, we have under this Nation's concept of broadcasting the Government performing the limited function of laying out the rights-of-way, keeping them clear of technical and monopolistic obstacles, and leaving it to private enterprise under competitive conditions to venture money, time, and ingenuity, free of governmental interference, pampering, or management, to provide the mass communication service the Nation needs or wants. Thus far, no other concept of broadcasting in the world can even approach its achievements. In its television operations, its phenomenal infant growth can only confirm the genius inherent in this system.
There is no justification now to interrupt its growth, to degrade the concept, or to weaken it by governmental tampering with the natural laws that regulate free competitive enterprise. Above all, to give free enterprise its full chance, we must avoid fickleness in government regulation and instability in the means that are provided by government.

The dynamic potential of private enterprise is inversely proportioned by the extent of fickle, arbitrary, and unstable actions and positions by government.

This, then, we believe to be the American concept of broadcasting which is incorporated in present law. If we are wrong in our understanding of that concept, then the views we express here with respect to the proposals already made will have no validity. If we are right or substantially right in the concept we have here described, then we believe that the views we here express are most compelling and should be given substantial weight by this committee.

We would like now to state and discuss our position with respect to the principal proposals made by those who express fear for our system because of the difficulties of some UHF station operators. Our position with respect to these matters can be summarized as follows:

1. We oppose the elimination of the intermixture of UHF and VHF in the same market.
2. We oppose the allocation of all television broadcast service to the UHF frequencies.
3. We oppose any reduction or limitation upon the coverage of VHF stations beyond that now imposed by the Commission's rules.
4. We oppose a freeze on the further issuance of permits and of authorizations to operate pursuant to outstanding permits.
5. We oppose the so-called Du Mont proposals.
6. We approve the encouragement of the production and distribution of UHF-VHF receivers by the lifting of the excise tax on such receivers.
7. We approve the use of booster stations within a television station's own area where it can be found by the Commission to be technically feasible.
8. With respect to proposals made to the subcommittee that involve highly complex, technical, social, or economic considerations, or that cannot be fully evaluated at this point because of the lack of empirical knowledge, or that require much more careful study and research than is possible in these proceedings, we recommend that such proposals be referred to the Commission by the subcommittee without recommendation.
9. We favor the adoption and continuance by the Commission of lawful procedures that are designed to establish at the earliest possible date a comprehensive national television system by the elimination of time-consuming procedures and redtape.

That concludes the written part of the statement.

I would like now to extemporaneously explain the reasons that we have for the positions that I have just recited.

Senator Schoppe1. Might I ask you, sir, about how long do you anticipate that might be?
Mr. Pierson. I suspect it will take about an hour or an hour and a half.
Senator Schoeppel. In that event, what we better do, because I think this is an excellent place to conclude this part of your presentation, is recess this hearing until 2 o'clock, at which time we will then hear you.

We will reconvene at 2 o'clock in this room.

Mr. Pierson. Thank you, sir.

(Whereupon, at 12:02 p.m., the hearing was recessed, to reconvene at 2 p.m. of the same day.)

**AFTERNOON SESSION**

(The hearing reconvened at 2 p.m., Senator Potter presiding.)

Senator Potter. The subcommittee will come to order. I first wish to apologize for leaving this morning, but there is another committee that I happen to have membership on, and we hope that this is the last day of their sessions. I was informed when I went over there this morning to make a final statement that they hoped to finish it today. However, I think they will be going on this afternoon, and I still think they will conclude today, and I apologize for having missed some of the testimony here this morning, but I hope to be able to devote my full attention this afternoon.

I understand that Mr. Pierson had made his statement and you have some further observations you would like to make, is that correct?

Mr. Pierson. That is correct. What I had done was really to state our background.

Senator Potter. It might be well to announce at this time that after the conclusion of the witnesses tomorrow, we will allow a half hour for one of the representatives of the UHF people to make rebuttal statements, and also a half hour for persons representing the VHF people, to make rebuttal statements if they care to, and also a half hour for representatives of the Federal Communications Commission to make rebuttal statements.

I would appreciate it if in your rebuttal statement that you limit it to rebuttal statements. I think that it will be fairly complete as to the arguments that you have used, and if there is conflict in testimony or conflict in observations, you can use that rebuttal period for making those corrections.

Proceed, Mr. Pierson.

**STATEMENT OF W. THEODORE PIERSO—Continued**

Mr. Pierson. Before the noon recess, I had completed a statement with respect to the background upon which we base the views that we entertain with respect to the proposals made here by the UHF advocates.

I had also completed the summary of our position with respect to each principal proposal that has been made. Before passing to the consideration of the principal proposals that have been made thus far in the record, we would like to disagree with certain basic assumptions that seem to us to be implicit in the arguments and proposals of the UHF proponents—I should say the UHF stations that are here making the proposals. There is implicit in their arguments and proposals an assumption that our population and our economy
is static. We hold that this assumption is wholly invalid for reasons that I have stated in my presentation this morning.

There is also implicit in their arguments and proposals the assumption that we must have four national networks, all operating at a profit.

For the reasons indicated in my presentation that I have already made, we believe that this contention is wholly invalid, particularly in view of the multiplicity of alternative sources, existing and potential with respect to program and revenue supply on a national basis.

There is also implicit in their proposals and argument the assumption that revenue capacity of television has leveled off or is now predictable. We hold that this assumption is wholly invalid.

One need only to turn back to the economic and social predictions that were made in 1946, 1948, and 1950 and 1952 to readily come to the conclusion that these prognosticators of boom or bust, whichever they were, have not perfected an exact science for prediction so that we should base our legal system of broadcasting or television upon their predictions at any given moment.

There is implicit in their arguments and proposals the assumption that program production and distribution sources are static and subject to no further growth. We believe this assumption invalid. Every indication is precisely to the contrary.

There is also implicit in their argument and proposal the assumption that if present UHF fails in any particular enterprise, no one else in the future, after the industry has grown or population has grown and many problems have been solved, will be able to succeed where our contemporaries have failed.

I think the history of the broadcasting industry itself particularly and AM radio in particular and the history thus far of television shows that that is indeed an invalid assumption.

The first four proposals that I recited in my presentation this morning, namely, the elimination of intermixture of UHF and VHF, our opposition to their proposal that all television be moved to UHF, reduction and limitation of VHF stations, and their proposal for a freeze, I would like to treat for the most part together.

These four proposals all have a common purpose. They all seek to reduce the coverage or delay the establishment of a large number of television stations for one single purpose, to eliminate competition of the people who propose it.

Now the thing that rather strikes me about these proposals on their part is the temerity of a group of people who can come here and excite this committee about the threat of a monopoly or lack of competition, and then make proposals designed to prevent anyone from competing with them.

I would like to illustrate that with the Greenville situation.

In Greenville there are two stations, a VHF and a UHF station. A representative of the UHF station appeared here and asked this committee or the Commission, or both, to take action to prevent a station that was allocated to Spartanburg, a few miles away, from rendering service to the people of Greenville. They also went on to say that they did not want any stations outside of Greenville to render a service to the people of Greenville.
Now I can understand the private interests that would dictate a desire of that kind. I can understand why these two operators would like to have this cozy and comfortable situation for themselves, but I am wholly incapable of understanding how they can say that that promotes competition, or how they can say that that is in the public interest of the people of Greenville for this committee or the Commission to say to them you can never have more than two signals.

Now another quite astounding thing to me was the people who joined in the advocacy of these proposals and point out that one of the reasons we are likely not to have four national networks is that there are not enough stations upon which time can be cleared to be sold by the networks.

If the Greenvilles, the Atlantic Cities, and the other markets in the same situation have only two stations operating in their area, by law or by Commission regulation no station outside of those markets can serve it, I want someone to tell me how under those circumstances we have more than two national networks.

Now, if we assume that all the hoped-for technological improvements in the service to be rendered by UHF operators are accomplished, I believe that the technical evidence in this record clearly demonstrates, as well as the admission of our opponents, there will not in any event be facilities existing in this country able to reach the many remote or gulley areas of the country that have no reasonable hope of ever obtaining television service except through VHF.

There can be no gainsaying that there is a tremendous need on the part of these isolated rural areas for television, a need that I believe exceeds the need of any person located in an urban area.

The possibility of obtaining information, the means of communication and the means of entertainment, and the diversion for these people are much less. It is unfortunate that nature did not equalize the coverage potential of all parts of the spectrum, but it did not.

The lower part of the spectrum will serve relatively long distances and reach into remote rural areas. It also has the facility that the upper part of the spectrum does not have, and that is a folding into the gulley areas of our country. It has the disadvantage in the fact that we have not enough spectrum space there to provide for the number of stations that are needed in the principal markets of the country, particularly those that are crowded together in the northeast section of it.

So you have the capacity of VHF to serve the remote and gulley areas, but an incapacity to provide the right number of stations for heavy populations and towns.

Senator Potter. How small a community can a VHF station serve successfully?

Mr. Pierson. I think that all depends upon the coverage that the VHF station is able to fold in from its hinterlands.

Senator Potter. How many receivers would you have to have to get your signal?

Mr. Pierson. I do not pretend to be an expert, but I have heard the statement made that to be economically sound, they should have access to 100,000 receivers. I believe that that is at best a guess, because obviously all of that is affected by a multitude of factors. It depends upon the cost of operation which we hope will go down. It depends on the cost of obtaining programs which we hope will go
down. It depends on the attitude of the public toward television and its interest in tuning it. It also depends upon how effective television is with other media with which it must compete.

All those factors are not static. They are dynamic. I believe it is impossible for anyone to say now what is possible and what is impossible in terms of the future economy because our population will not stop its growth. Our economy will not stand still. People are moving from one place to another, and we will probably have something in the nature of ghost towns and boom towns.

Senator Potter. Do you contend that in order to have a nationwide competitive system that we must have UHF?

Mr. Pierson. Indeed, I do; and I also contend, by the same token, that we must have VHF.

Senator Potter. There is quite a bit of this discussion and it has been a little difficult for me to know just where you feel that UHF could live. Is it right in the rural areas? Should it provide a service in the remote areas, or can it live in a metropolitan area, particularly where there is competition from the VHF’s?

Mr. Pierson. I think I would find it difficult to build a pigeonhole on the basis of what we now know. They have one disability in a rural area. Let us say there is a town of 30,000 people, and let us assume that it is a mountain area of the United States or out in the Great Plains. Since they cannot reach over long distances, they have trouble in obtaining within their service areas a large enough potential audience to become a successful factor.

That is with respect to national advertising sales. So I would think they would experience difficulty in those kinds of areas. It seems to me that they are most likely to have their earliest successes in the more concentrated areas such as we have in the eastern part of the country; and in the eastern part of the Midwest, where towns of 20,000 and 30,000 and 40,000 and 50,000 people are located 5 and 10 and 15 miles apart, and the distances to which you have to serve to obtain a substantial number of people are relatively short.

Senator Potter. We have been confronted with this main problem, and I think the UHF people who have testified have said that they have had successful operations, and that has been in the areas where they have not had to compete with the VHF’s.

I was wondering if it was your testimony that they should be relegated to areas outside the signal of the VHF?

Mr. Pierson. No, indeed. I think the problem as they have stated it is a problem that results from going into markets where VHF has obtained set circulation and until there are conversions they are going to have that problem. That was a clear problem when the Commission adopted its sixth order. It should have been a problem clear to anyone who applied for a UHF permit. But rather than be disturbed about the lack of progress by the UHF people in getting conversions, I have been tremendously impressed in what has been accomplished in a period of less than a year. To me the set conversions and things that these people have been able to do, some of them at least, to promote their operations to induce people to buy sets, doesn’t show that they are going to fail. It may mean and it most certainly will mean that they will have to underwrite losses for a longer period of time than some of them have, and it might be an underwriting that would exceed the amount that they had originally hoped for.
But I believe that the fact that they are now having those difficulties does not mean any permanent disability or require any permanent reallocation. It requires some patience with the length of time it takes the free enterprise to develop an industry and some patience with the people being informed and becoming aware of the services that are made available, and it takes selling to national advertisers, also.

Senator Potter. What experience have you had with, and what knowledge do you have as to the effectiveness of the all-channel tuner, that is, the receiver?

Mr. Pierson. My knowledge is only second hand in that respect, Senator Potter, as I stated. That was in response to a question of Senator Hunt this morning, and the information that I have been given has been that if the 10 percent excise tax is lifted, the tendency will be, the result will be that most large manufacturers will produce nothing but sets with UHF capabilities, and that being true, I think it would tend greatly to aid in the earliest solution of this problem of circulation.

The technical problem involved in these tuners—I can operate a knob, but what is inside of it I haven't the slightest idea.

Senator Bowring. Might I ask a question?

Senator Potter. Yes, surely.

Senator Bowring. Do you think that the Federal Communications Commission needs more legislation to undo the mess that they seem to have made by mixing UHF? Do they not have the authority to straighten out the mess they made?

Mr. Pierson. I do not believe they made a mess.

Senator Bowring. You think it is a mess for them to be in direct competition? VHF seems to be blanketing out the UHF. Please, if you will be patient with me, I want to tell you that I know very little about this business. I have watched the map and if you will be patient with me I would like to ask you a few questions.

Mr. Pierson. I would love to have the questions asked.

First, the problem confronting the Commission was this, and it was well known at that time, that if they used VHF only, they could not get sufficient stations so that they could have allocations for these cities in the northeastern part of the United States located close together. If they had gone to UHF, they had a substantially greater amount of spectrum space with the result that they could get many more stations, but if they used UHF only, they would not be able or could not reasonably expect that a lot of rural areas in the country and a lot of people living in the gullies of the country would ever receive service from UHF.

Under section 307(b) of the statute, the Commission is instructed to make a fair, efficient, and equitable distribution of service to the various communities and States in the United States.

It seems to me that it was clear that the statute required that they adopt an allocation plan that would give a reasonable assurance that every person in this country had the technical possibility of receiving a signal.

Now the difficulties of these remote areas are actually best demonstrated in the Great Plains of our country and the Rocky Mountain area or the northern New England area, where they have towns fairly far apart. If you go through Nebraska, west of Omaha, I suspect
you have difficulty finding anything but Lincoln that is above 50,000 people.

Senator Bowring. We have no difficulty in finding our towns. We just haven't multiplied as fast as you have in New York. Our towns were set out as being 12 miles apart. We haven't filled them up yet.

Mr. Pierson. Senator Bowring, I am particularly appreciative of that, because I am not from New York. I lived for 21 years across the river from Nebraska.

The problems there are that the concentrations of population that would be needed to support a station are spread out over long distances. I suspect that you have become acquainted with the problems in a city such as Lincoln. Therefore, a station located, for instance, in the city of Lincoln, in order to become a factor so that it will compete with other markets for national revenue and can compete for networks, has to get a reasonable number of people within its service area or a competitive area. In order to do it, it has got to reach out much farther than if the station was located in New Jersey or Pennsylvania. It has got to transmit its signal over a very long distance.

If you reduce the coverage potential of a station in Lincoln, Nebr., or Hastings or Grand Island or whatever, and if you say, can you serve 20 miles from your area, or you must go to UHF, because you are serving more area than you are capable of, and you must do that in order that we can level off competitive opportunity, then you have prevented the stations in that area from being able ever to assemble a sufficient number of listeners to attract national advertising and to become self-supporting.

As a matter of fact, the thing that has been difficult for me to understand is how in the name of heaven a UHF station that could not compete with a VHF station because the VHF station had greater coverage, so you say that the VHF station must cut down its coverage to be the equal of the UHF station, and then neither one of them will be able to attract national advertising, and then the newspapers and the radio, of course, will pick up the business. You have by that move made both of the stations, the UHF and the VHF failures.

Senator Bowring. You do not think it was a mistake to mix the stations?

Mr. Pierson. I do not think it was a mistake, but it was dictated by the statute. The Commission had to be certain that the rural areas had service which could be assured only with VHF, and they had to be certain that they had a proper number of stations in order that they could make assignments in the crowded areas in the East, and one part of the spectrum would do one thing, but not both.

Senator Potter. Along that line, how many receivers would you have to have to receive your signal in order to be a profitable operation, and I believe you said it is more or less a rule of thumb, of about 100,000. It seems to me that whether it be UHF or VHF, that the Commission should be more flexible in granting licenses and conditions to operate, and I assume that in some areas these booster stations might be an answer to both UHF and VHF.

Mr. Pierson. That is correct.

Senator Potter. If we are going to be able to cover the area and make it that no one will operate unless he can make a profit out of it, then it has got to be a successful operation irrespective of whether it
is UHF or VHF, and I am thinking of northern Michigan for example, and I think we have an allocation of a couple of VHF stations in the Upper Peninsula. I think Marquette is the largest city of about 30,000.

Mr. Pierson. I think there have been some applications of Bay City or Saginaw.

Senator Potter. That is not the Upper Peninsula.

Mr. Pierson. Oh. For example, Escanaba.

Senator Potter. For anyone to be successful, they would either have to have a lot of power or else possibly some booster stations to reach out into the area where people would like to have the television service, and also so that the company could be able to have a successful operation.

Mr. Pierson. I think the Upper Peninsula of Michigan offers an excellent example or possibility of extending coverage sufficiently far to obtain enough listeners to make it economically sound, and it is much greater on VHF than on UHF and with respect to the question of flexibility and the Commission's rulings on allocation, that would involve a several-hour argument itself, and I can only speak for myself and can't speak for the VHF companies because they have not been queried on this point, but I do have some agreement with the contentions that the rules on allocation tend to be much more inflexible to meet these needs as they appear.

I must confess, however, that I realize the tremendous problem that the Commission had at the onset, that they had to have some basis from which to proceed. I am hopeful that, as we progress, we will lose that inflexibility to a substantial extent.

Senator Potter. My suggestion was not made, by any means, to criticize the Commission, because, I think, probably, at the time of the allocation they had no way of knowing at that time just where the gaps would be, but I do think we are reaching a point now where that should be given serious consideration.

Mr. Pierson. I think that the other problem of the Commission was that there were poised about 1,000 applications to be filed and the Commission had to indicate to each applicant of a channel just what channel he might be able to apply for in that community. Otherwise, there would have been complete chaos. I think the inflexibility has primarily resulted from that problem, and that problem, we hope, if the Commission is not instructed to impose a freeze, will be solved because they are getting pretty well to the end of their processing problems.

Senator Bowring. We have heard a lot about making the sets so that they can receive both signals, and they have talked about every type of converter from the small and inexpensive type that I can afford, up to the larger and better type of the kind that you can afford.

We had a witness testify that it would cost $6.50 for an 82-channel tuner to cover all the channels. Is there any reason why the Federal Communications Commission or this committee cannot ask these licensees of these valuable stations to produce these sets, and wouldn't that force the manufacturers to make them? If you can make them for $6.50, it seems to me we are worrying about something unnecessarily.

Mr. Pierson. In the first place, I think it would be desirable for you to ask them.
Senator Bowring. I am asking your opinion, sir, not theirs.

Mr. Piereson. And I am giving my opinion. I think it would be desirable for them to do that.

Secondly, I think they will do it if the proposal to lift the excise tax is done.

Thirdly, I think it is of doubtful propriety without a tremendous amount of study for Congress to instruct anyone to build anything in a particular way. I think the best you can do is to try to set up the climate under which they will do the things you hope they will do.

Senator Bowring. It seems to me if they can make these for $6.50, that it would be most helpful to the people if the sets were able to receive all these signals. It seems to me that the manufacturers are cutting about 85 percent of the television channels.

Mr. Piereson. I am afraid I am probably in an area with respect to the problem, an area of lack of knowledge that I should probably pass over the question.

While $6.50 seems to be a relatively small sum of money, it is my understanding that the average radio manufacturer has a margin, or is deemed to be an efficient operator if he has a margin in terms of gross income of 6 percent above his costs.

In other words, if you take all the money that they take in, and if he efficiently operates and is successful in the business, the amount of profit he now gets out of his total gross is about 6 percent in a good year.

Well, $6.50 may not seem like a lot of money, to put the $6.50 in the set without changing the price, or to put the $6.50 in the set and boost the price, and therefore not sell as many, or to put them in and increase substantially inventories that cannot be sold, you easily turn your business from a profit to a loss. The $6.50 is not such an incidental figure.

Senator Bowring. It seems to me, as a buyer and not as a manufacturer, that if I were buying a set that cost $400 that in order to receive more channels I would be very happy to add $6 to receive more than one signal.

Mr. Piereson. That would not be the result. The $6 figure, as I understand it, was the bench cost to the manufacturer. That is what it costs him. From the time the set leaves the factory bench and it gets in the hands of the public, the price multiplies somewhere between 4 to 8 times. In other words, in terms of final retail price, that $6 could be $48 or $24, whatever the factor is.

Senator Bowring. If the excise tax were taken off, it would take care of that, and with the taking off of the excise tax, then if they had the direction that all these sets be made that they could receive all channels, and I recall someone said yesterday it is like having two different types of railroads with the different widths of the track, and I am not insistent that they make 6 percent. As a matter of fact, the cattlemen have not made 6 percent, but if we could sell twice as many cattle as we did before, we thought that was pretty good business.

Mr. Piereson. If cattlemen started losing money——

Senator Bowring. We did lose money, and we stayed in business, and we keep losing it.

Mr. Piereson. We think that if they fail to earn a profit, they generally do not continue long in business.
Senator Bowring. I would hate to think that they would fail in this business. It seems to me that the manufacturers could broaden the field there. It seems to me that some requirement should be made that the sets could receive all these signals. It is not much benefit if you cannot receive them.

Senator Potter. It seems to me that is the core of the whole thing. If all sets could receive the UHF as well as the VHF signal, there would be no problem.

Mr. Pierson. That is right, and I do not want to be misunderstood. The VHF group that I represent are very much in favor of lifting the excise tax on the basis or belief that that will result in the manufacturers making all sets that have full UHF capability.

Senator Potter. I can imagine if you did for television sets, there might be manufacturers in other businesses who might think it might be helpful for them.

Mr. Pierson. I think that is probable.

Senator Potter. I think some of them have received relief, and as a matter of fact, I understand it is in the rumor stage that in this present tax bill the committee will resist any effort to have any excise tax included in the tax bill, but I understand they will receive a promise that the next tax bill that will come up in this session, and there will be others, that this will definitely be considered.

Mr. Pierson. I think that is very encouraging.

Senator Potter. And I am hopeful that that will happen.

I would like to ask this further question: Take for example the city of Philadelphia, where you have 3 VHF stations, or St. Louis where they will have 3 VHF stations—do you believe a UHF operator can operate successfully in either one of those communities and, if so, how can they?

Mr. Pierson. If it were my money, I wouldn't invest in a fourth VHF station in Philadelphia, and therefore I would have to say that I do not think UHF would have a substantial opportunity at the present time.

But perhaps a long-range answer is by comparison to the AM version in radio, and I think there is a singular analogy. In AM radio they had a very similar problem. They needed a large number of stations so that they could have sufficient stations for the concentrated cities of the East, and yet in the Far West and the Middle West they needed stations that would reach out long distances. The Commission adopted an allocation plan when AM radio was about the same age as television was in 1952, and here is what they did. They set aside certain frequencies upon which a large number of stations would operate, but with low powers and low coverage, and those stations would generally serve only the cities in which they were located.

They set aside other channels, what they called regional channels, with regard to which a fewer number of stations could operate, and those stations served large urban areas and regional areas.

Then they set aside I believe at that time about 40 frequencies upon which only 1 station in the country or at least a very few would be permitted to operate. They called those clear-channel stations.

They therefore adopted an allocation plan that would give a sufficient number of stations in the crowded areas, and at the same time give wide rural coverage in the areas in which the people's only hope for service is to obtain it over long distances.
The reason that I think that experience is particularly encouraging here is because today we have many markets in this country in which a 250-watt local station, a 5,000-watt regional station, and a 50,000-watt clear-channel station are operating in the same market and competing with each other.

Many stations in each class are very, very successful. Now what was not done in AM was to say that in order to equalize competitive opportunity, we are going to prevent people in the remote rural areas from getting service. Rather, we are going to adopt an allocation plan that will technically assure them a service and hope that private enterprise can find the means of making them wrong. I submit that it is the concept of the present act. It was the proper thing for the Commission to do and I submit that free enterprise has made it work and if given the opportunity, if given the opportunity in television, we are satisfied that it will make it work here.

Senator Potter. However, if you did that as you did in AM, if the same receivers can receive the same signal—

Mr. Pierson. We did not always have that. In AM some of the receivers would not take the top part of the band and there was, as Mr. Storer related this morning, a conversion problem in their sets, their receivers, which did not all have the same fidelity and the same characteristics.

The one thing that I think is important to remember is that the Commission did not decide that in order to equalize the opportunity for private investors, they would adopt a system that would forever preclude certain people in our country because of their location of getting service, and I think that was a sound approach.

Senator Browning. Mr. Cullum yesterday said that ultra high frequency was for rural areas. If that was so, why did the Federal Communications Commission mix up VHF and UHF in the large cities?

Mr. Pierson. I believe his testimony was that VHF was for rural areas.

Senator Browning. Maybe I misunderstood him. Where there is a big circle and a concentration of population then it looks to me when you get into this area where you have the larger cities and you enlarge these big circles, you seem to block out the little ones.

Mr. Pierson. When this big circle blocks out the little circles, we must remember that while you are furnishing competition to the people operating in the little circle, which may be good, they are also blanketing in people who might not otherwise get service, and one difficulty in our country is that you cannot say that all the rural areas are entirely out in the Great Plains or the Rocky Mountains, although being from there I sort of tend to think so.

Senator Browning. You can understand that I might be interested in that area, also, slightly.

Mr. Pierson. Oh, yes, indeed. But there are rural areas in the northern part of Pennsylvania, rural areas in the northern part of New England that have great difficulty in even getting radio service, and greater difficulty in getting television, and for that reason you can hardly take any part of the country where there is not some necessity for long-distance service.

Senator Browning. As an engineer, do you think that the Federal Communications Commission, if they thought it was desirable to
unscramble this thing, do you think they can do that? Do you think they have the authority to do that?

Mr. Pierson. I do not want to be traveling under false colors. I am not an engineer. I am a lawyer.

Secondly, I think they have full authority to modify their allocation plan if they find that the public interest will be served. I have serious doubt that the public interest—and I thoroughly believe that it would not be served by such an attempted unscrambling at the time.

Senator Bowring. I am awfully sorry to have called an attorney an engineer. I saw so many things that you said here that I thought maybe you missed your calling.

Mr. Pierson. I think there has been substantial representation already made in the record with regard to the tremendous costs to the public in the obsolescence of the sets that would result from a shift of all stations to UHF or from the eliminating of intermixture.

There was some contention that this might have been solved by extending the period over which this would be accomplished, over a period of 5 years or so.

One difficulty is that we have no evidence to show how long it takes the public to junk their sets. We do not know that there have been any positive results on that. We do know that there have been very few trade-ins and there are very few used sets on the market.

Mr. Roberts gave some testimony to the effect that they buy a new set and then they move the old set to the bedroom or the back porch.

Senator Bowring. Might I ask another question, Senator Potter?

Senator Potter. Certainly.

Senator Bowring. While I did not take it that 5 years was the point on which they had definitely set upon which they had come to a conclusion, I thought perhaps it was something which could be worked from.

Mr. Pierson. I do not think they have any basis now to determine what that period would be.

Senator Potter. The Commission just put out some data, and the answer to the question "How long do television set owners keep their sets before buying a new one?" was that it is estimated that the average television set is turned in for a new set, average 6 or 7 years.

I would assume one way to get a new set is to have an increase in the size of the screen. At least, that is the way my wife looks at it.

Mr. Pierson. I want to turn now to the question of the effect of the elimination of intermixture, the effect that it would have upon those who have made investments in existing VHF operations. I believe there is a factor involved in what would seem to be the results from that change. The investment in the plants that have been made to date on VHF were made in prospect of specific VHF channels, and the business decision of each one of those people was based on what they figured was the economic potentiality of the specific VHF channel that they applied for.

I believe it is quite clear from the record that the economic potentials of VHF and UHF are different. I believe the record also shows that generally UHF investors risk less money on plant, which obviously reflects the general judgment that UHF justifies a lower risk, risk of money.
Now these UHF investors having had the rules of allocation of the Commission, and it took them 4 years to decide them, in which the Government said, "Here are the channels that will be used in this town, and then decide that they are going to go ahead upon a basis of the channel that the Government says is available and spend a substantial amount of money on the economic potential of that channel, I believe it is highly injurious and unfair to those investors to now adopt ex post factor Government action that substantially decreases the value of their investment and may well turn what was a profitable investment into a loss.

I do not think that they took any risk that Government would, within less than 2 years after it stated its allocation plan, would change the thing around completely. I have read testimony in the record by some of the UHF advocates that they felt that they had an equity in the fact that they did not expect the Commission to cut through the redtape and give the public this service as fast as it did, and therefore this was changing the rules of the game because they thought Government delays would be so extensive that they could operate for several years without fear of competition.

Now if they have an equity in that, I submit that the VHF investors have a greater equity in the fact that they invested money on a very deliberate plan promulgated by the Government that had every appearance of being final.

Senator Bowring. I hope you understand, Mr. Pierson, that I am interested in both of the "theys, " and including "they" the people. I am interested in "they" the UHF and "they" the VHF, but the people also.

Mr. Pierson. I would like to address myself for the moment to the effect upon "they" the people of what I would think would be a highly unstable Government position in this business, if we change it now.

It is said that under our present concept tremendous sums of capital are required from the private free enterprise if the system is going to work. The potential, the capital potentially available from free enterprise is inversely proportionate to the fickleness and instability of Government in whatever regulatory position it must assume in the industry.

It has always been true in the history of both radio and television that the principal money markets have not been easy for broadcast operations to tap and one of the most frequently given reasons is that they have only temporary licenses and that they are subject to changeable Government regulations, and we as prudent investors do not want to invest in a business with those hazards.

Now if the Government makes another change—and this has been going on since 1946, changes for the third time the basic means with which the industry does business, I submit that most prudent and conservative investors are going to decide that other industries are a better place to put their capital.

In my opinion, they will tend definitely to leave us to the fringe investors who, I think, are not participants in this business, desirable participants. I believe, therefore, that if the subcommittee agrees that private enterprise must furnish tremendous sums of capital in purchasing equipment and purchasing programs and in building stations, the Government can best serve it by taking a stable position, and
not changing it from month to month or year to year. I believe that it would tend ultimately to destroy the confidence of capital in the business, and since the business depends upon that, it would be in derogation of servicing the public.

Senator Bوارینگ. And I presume you mean that a stable position should be taken, and in respect to that do you think it was stabilized as of now?

Mr. Pierson. The last 9 years of history is this, that immediately after the war the Commission set out to make a study of the frequencies with which to start at the earliest possible moment a television system, and they came out with an allocation plan in 1946.

On the basis of that plan, a number of people applied. In 1948 Government said they thought they might have made a mistake, and now they were sure. So they said they were holding everything up in the industry. No more stations until we have completed this allocation plan.

Senator Bوارینگ. That was beneficial to some people, was it not?

Mr. Pierson. I am merely reciting now without attempting to criticize the instability of the Government that takes this position up to date. They took 4 years to decide what kind of an allocation plan they would adopt, and they finally adopted one and put it into effect in July of 1952.

Now 18 months later the proposal is that we overhaul the whole thing and go back and change the means by which these things are to be accomplished under a completely different means, and at the same time not only harming a lot of private investors who based their investment upon that plan, but changing an industry, having a tremendously adverse effect upon the business in its investment in receiving means and that is what I mean, that after 9 years of instability it seemed it might be a desirable thing to give free enterprise a chance to work this thing out for a period of a few years, before we start overhauling the whole thing all over again.

Senator Bوارینگ. I presume the people who objected to the Federal Communications Commission plans, are doing what they were doing at that time, are they not, Mr. Pierson?

Mr. Pierson. I think that is true. I suspect that this is also true, and the Commission can scarcely take any action but that someone doesn't object.

Senator Bوارینگ. Do you think that the lawyers and the engineers were keeping the Federal Communications Commission informed at the time they took this action? They messed up about 85 percent of our television channels, although I take it you do not think it is messed up.

Mr. Pierson. No, I do not think there is any mess. I think that the Commission did a wonderful job with the very difficult problems.

Senator Bوارینگ. And with the very best information that they could have gotten out of the lawyers and engineers at that time?

Mr. Pierson. Well, the Commission has a large staff of its own upon which they principally rely. Engineers testified before them with respect to the plan, and lawyers were there representing business interests that had some information to give to the Commission, and it is fair to say that all the lawyers were not in agreement with each other, no more than they are now, nor were the engineers.

Senator Potter. That makes for good lawyers.
Senator Bowring. Thank you for your patience.

Mr. Prien. Thank you for your patience. I am afraid I have not completely covered the point.

I would like to speak more specifically with regard to the proposals to freeze the issuance of further construction permits and authorizations to cover outstanding permits. The adverse effect of such a proposal upon both public and private interests is appalling.

The public investment in receivers has already been stated in the record, and we must remember that every one of those receivers has a limited use so long as they are stations that the Commission has allocated, and the people are willing to build but not actually to put into operation.

There are 22 cities in the top 100 markets that only have 1 VHF station. The proposal there, and I should add that in each 1 of those markets there are either applications pending for 1 or 2 other VHF stations, or there have been applications granted and the VHF stations are in the course of construction.

The freeze, so far as the listeners in this area are concerned, would mean that from 1948 to whatever date in the future this freeze would be lifted, those people would be left without the use of their channels. The receivers would have limited value.

They propose that this freeze should be imposed, for the benefit of people who took a risk in free enterprise and now desire to avoid the competition that would be established if the freeze is not imposed.

In other words, as much as we might fear for the people who are experiencing losses in television, the fact remains that the freeze proposal is nothing more or less than a proposal to pass the injury that they are suffering from their own voluntary decisions onto the public and to their potential competitors.

I do not believe that this is in accord with the concept that has been adopted in the present legislation regulating the industry, and I believe also that during the period of the freeze, the freeze itself tends to promote monopoly. It must promote that, because the very purpose of the freeze is to prevent competition with the people who proposed it.

I would like now to consider the case of the applicants. An applicant was generally confronted with certain problems when he decided to file an application. He first could decide whether he wanted to get into the business or not.

Secondly, the Commission gave him notice of the facilities available and various communities so he could pick his community. And if it was an intermixed market, he could apply for either VHF or UHF.

If he applied for VHF, the prospect was that because of the greater number of applications for VHF channels, he would have to go through a comparative hearing. These comparative hearings are tremendously complex, and time-consuming. I have seen estimates varying from $10,000 to $200,000 per applicant in the cost of prosecution, and I believe the record to date in one comparative hearing case was 62 days actually spent in hearing. The hearing started in the fall of 1952, and there is not yet an initial decision of the examiner.

Most of the persons who applied for VHF realized that this cost and this gamble were there. Those in UHF who got in the market.
earlier, they knew they would have the advantage to be established earlier and have the advantage of established relationships with all the elements in the industry that make up a going business.

But they knew, or at least it was generally thought and believed and now proven, that the economic potential of VHF would be greater, so that the one who decided to go for VHF felt he would take the gamble and the disadvantages with the hope of ultimately prevailing as one of the applicants.

The applicant for UHF had the same information before him. He realized that in most cases if he filed his application for UHF there would be practically no prosecution costs at all.

The lawyers and engineers would make practically nothing. His money could be spent for actual productive purposes, that is, building the station instead of wasting it on litigation. He knew that there was a good chance that he would probably get on the air earlier. He also should have known since these were things that were bruited about from one end of the country to another, that there were problems in connection with circulation, programs, and revenue for UHF.

I think we must realize that by and large everyone had the same opportunity to make his choice. I submit that the tremendous amount of money that is now invested by those who took the VHF route of application proceedings before the Commission certainly justifies the contention that they should not be delayed further, and further injured because somebody else decided to take another risk, the UHF people, that they now have decided it is bad.

The injuries upon permittees who have gotten applications granted after spending much money in prosecuting their applications and now have committed many thousands of dollars to get their permit and go ahead and construct the station are even greater in my opinion.

They say we will have only a 90- or 180-day freeze. In 1948, when the Commission instituted the freeze to do a similar reallocation job as has been suggested here, it was predicted it would be concluded within 3 to 6 months. It lasted 4 years, and I believe the job that the Commission would have to do in determining this matter would take substantially longer than 90 or 180 days.

I submit that not only would the freeze injure those applicants and the permittees who are partially built, but that it would deny to the public the use of the facilities of the applicant that the Commission is ready to grant, and which the free enterprise is ready to support. It would harm the public by reducing the competition in every market where it had any effect whatsoever.

Senator Bowring. I have over a long time interested myself in highways and I am thinking about people putting up hamburger stands and gas stations and all that type of thing that go along the highways. I do not recall the highway department ever saying anything to those people when they desired to put the highway some place else. I don't know whether they said anything to you or not, but I thought you might be interested in what is going on in my mind.

Mr. Pierson. I am first aware of the fact that roads are located generally for getting the public with the most facility to where they want to go.

Senator Bowring. And we want to do that with this medium also.

Mr. Pierson. And persons who invest with the hope that a road will stay are never insured, I assume, against when a road will be
moved. I know they are not in my State of Iowa, and I assume not in the other States of the Union.

But I think the comparison ends there, because the State does not hold out to people whom it invites to file applications to locate filling stations or grocery stores where they are going to locate the roads.

Here we have the Government performing a permissive function. You cannot, like in the case of a filling station, go out and build one if you can buy the land and have the capital. First you have to go to the Government and you have to apply for the right to use the space along the road.

Now the roads are laid out by the Government as a basis for attracting free enterprise to use the space on them and along them to render a public service, and I think the responsibility of Government there is vastly greater than in the case of the fellow who builds the filling station along a highway.

Senator BOWRING. I go along with you that there may be a different degree.

Mr. PIERSON. Actually I want to make sure that it is understood. I think this case must be based upon the public equities and perhaps our emphasis on private equities is primarily brought about by the fact that those who testified before us placed great emphasis upon their private equities, and it is an effort to show that even if it were to be decided on private equities, the equities are at least even or I, obviously with the bias of advocacy, think that they are on our side, but to continue, the public equity must control and there are no private equities here that can override the public interest.

There has been an attack upon the Commission’s effort to reduce red tape to a minimum in its attempt to give the public its earliest possible use of channels that had been denied the public as a result of more than four years of a freeze period.

To understand what the Commission did and how well it did its job in this connection we should have an appreciation for the tremendous processing task with which it was faced in 1952. As of July of 1952 there were only 108 stations in the country located in 63 markets and 40 of those markets were single-station markets.

Because of this scarcity in facilities, the development of the whole industry was delayed, the development of the program, the development of networks, the development of revenue sources were more or less held in abeyance as a result of the lack of physical means to establish a full system that could be a medium of mass communications and an attractive medium to advertisers. There was the public demand for service which grew louder and louder.

Free enterprise was poised with tremendous amounts of capital ready to go into business as soon as the Commission would issue the means by which the business could be done. We had then a situation where everyone that was an essential element and prepared to make this system work was ready to go except the Government.

Under these circumstances, I do not see how anyone can possibly criticize the public’s representatives in Congress for urging upon the Commission the need for all deliberate speed in meeting this public demand.

Why should Government take longer than necessary to perform its functions in this system, and what evil, I submit, is greater than Government red tape that prevents people from getting the produc-
tion and the services that they demand? I submit no Congressman or Senator need apologize for urging the Commission, staying within the lawful processes set out by the act, to cut the red tape to the maximum possible if it gets television to the people that they so much demanded, and that free enterprise was willing to furnish.

Senator Potter. Along those lines, I believe that the Congress last year appropriated additional funds, $300,000, for 25 extra examining teams, I believe, to expedite and clean up the backlog.

Mr. Prieston. That is correct. I would like to spend a small amount of time on what the Commission did next, after it lifted the freeze.

First, a tremendous volume of applications were filed, and the Commission had to examine the applications to determine whether or not each applicant had the qualifications required by law.

Now, if upon examination of the application, they found that the applicant did have such qualifications, then they could grant the application under the law without a hearing, providing there was no application pending that was in conflict with it.

If there was an application in conflict with it, the Commission, as a matter of law and as a matter of due process, had to give the applicant, who ultimately will be denied, an opportunity to be heard before he is denied. This is what resulted in the comparative hearings, which, as I have stated before, were tremendously complex, tremendously long, tremendously costly to the public in loss of service and to private litigants and the Government in the cost of litigation.

One other thing, I think, should be borne in mind; that it is a rare exception in these comparative cases where the Commission has not found all the applicants who were applying fully qualified under the requirements of the law in which the only necessity for a hearing resulted primarily from giving the one to be denied his day in court.

The Commission adopted procedures that were designed to expedite to the maximum possible extent the time spent in these hearings, and to procedures that would accommodate settlement as between private parties.

It has been a characteristic of our advanced judicial system in this country to do everything they can to encourage settlement of private controversies without the use of court processes. We have had provisions all the time that frivolous actions and cases that were not really controversies were not entitled to use the processes of the court.

Now, the people who have criticized the Commission's procedures that were designed to make earlier the date when the public would receive service and were designed to eliminate the financial, economic, and social waste of litigation, have said that one of the primary duties of the Commission is to encourage comparative proceedings because it is through comparative proceedings that you can find an applicant who is better qualified.

I submit that is not the principal function of the Commission, nor even an important function of the Commission if we look at the realities of the situation.

As I have said before, these applicants are equally well qualified under the law, so the Commission must decide which one of them will render the best public service and the Commission does that by drawing inferences from the proposals that they make or inferences from their background qualifications.
Because of the practicalities of the situation, both of these qualifications tend to equivalence. When a person files an application that will go through a comparative proceeding, he knows that to succeed he must present proposals that will be superior to those of the people with whom he is competing, or at least equal. Generally, in all these comparative cases, all the applicants propose about the same number of hours of operation, the applicants proposing about the same staff and the same plant.

The same is true in connection with their background qualifications. A lot of these television applicants are newly formed enterprises, and they very carefully pick their constituents so that they will present the best posture that they can in terms of background qualifications.

The net result is that—

Senator Potter. I am going to have to break into your testimony and declare a recess for 10 minutes.

(A short recess was taken.)

Senator Bowring. I am sorry to have to tell you this, Mr. Pierson, but a matter has come up on the floor of the Senate and we have to attend. We will be in recess until 9:30 tomorrow morning, when we will continue with your testimony.

(Thereupon, at 3:32 p.m., the committee took a recess until tomorrow, Friday, June 18, 1954, at 9:30 a.m.)
The subcommittee met at 9:38, pursuant to recess, in room G–16 of the Capitol, Senator Charles E. Potter (chairman of the subcommittee) presiding.

Present: Senators Potter (chairman of the subcommittee), Schoeppel, Bowring, and Hunt.

Also present: Bertram O. Wissman, chief clerk; and Nick Zapple, counsel for the subcommittee.

Senator Potter. The subcommittee will come to order.

The chairman would like to announce that, unfortunately, while the curtain has gone down on the other show, we have an important executive session at 10:30. I will have to leave at 10:30, and I probably will not be able to be back until the beginning of the afternoon session.

I have talked with Senator Schoeppel. Senator Schoeppel will be here and, in order to expedite the hearings, I would suggest we continue with the hearings. I can assure you, however, any testimony that is given in my absence will be read thoroughly by me as soon as time permits, which will be this weekend.

I regret, however, it will be impossible for me to be here during the full day, but you can well appreciate we have to divide ourselves in many parts in order to do our work here in the Senate.

We have a statement from Mr. Ansel E. Gridley, vice president of the Salisbury Broadcasting Corp., which I would like to submit for the record.

(The statement referred to is as follows:)

**Statement of Ansel E. Gridley**

Television station WWOR-TV operates on channel 14 in Worcester, Mass., having commenced operation on November 16, 1953. I make the following statement on behalf of Salisbury Broadcasting Corp., licensee of WWOR-TV.

**A. Transmitter Power**

I personally consider the transmitter power problem to be a lesser problem, and one on which generalization is dangerous. As in AM radio certain 250-watt stations are giving excellent coverage of their markets while some 5-kilowatt directionalized stations are producing substandard market coverage, so in television the same principles may obtain. With proper site selection and antenna height, especially on the lower UHF channels, many stations are delivering excellent market coverage with 1-kilowatt transmitters. Obviously, this depends
on terrain, size of market, etc. Many secondary market stations do not need maximum area coverage properly to serve their markets and to have no in-the-market VHF competition. In large markets, and especially markets with direct VHF competition, power becomes much more important, in order to convince clients of comparable coverage. I believe that higher power UHF transmitting equipment will be available in most cases as early as sensible economic feasibility dictates its use by growing UHF operators.

B. THE RECEIVER PROBLEM

Of the technical problems, I believe the receiver problem is perhaps the most acute.

1. The cost of converting VHF receivers for UHF reception are in general too high, although they have been materially reduced in the past year.

2. Continued sale of VHF-only receivers in new UHF areas is a real problem. It is my belief that anyone in a UHF market who purchases a VHF-only set has been sold an obsolete receiver. If the FCC, perhaps in conjunction with manufacturers, better business bureaus and others could require all VHF-only sets in such areas to be advertised and plainly marked as tuning only part of the TV stations it would be helpful. Over a period of time, if all-channel receivers were sold almost exclusively in the area as a result of this, even stations not fortunate enough to be able to program excitingly enough to cause fast conversion, would build a sizable audience.

3. Price differential for all-channel versus VHF-only receivers has been greatly narrowed and further mass production, induced by greater percentage all-channel sales, should enable even further reduction in differential.

4. Standardization of IF frequencies and radiation reduction and quality control in manufacture should be of great concern to the Commission as well as the telecaster, to insure maximum consistent service to the public.

5. RF amplifier tubes capable of operating at UHF frequencies are now in production. However, few all channel receiver or UHF converter manufacturers are using these as yet. While these tubes do provide some gain and a better noise figure than many crystal mixers, this is still one of the weakest links in really good UHF coverage. It is imperative that designers attempt as quickly as possible to design UHF receivers which will obtain noise figures more nearly comparable to present-day VHF front ends, and that manufacturers place them into production as soon as possible. This is doubly important when considering the fact that the tendency is to use physically small antennas for UHF reception, providing comparably small capture area and far less voltage at the antenna terminals of the UHF receiver. It appears that most UHF antennas used are single bow-tie reflector combinations, and seldom is anything as large as even a 4-stacked unit seen. Even a full 32-element colinear antenna for UHF provides less capture area than the widely used stacked VHF arrays.

6. Poor installation techniques are a major problem. Installation crews, used to working with large VHF arrays and flat line, install haphazardly small UHF antennas, poor lead-in lines, high-loss lightning arresters, substandard converters, etc., and if the picture is less than perfect, blame it on UHF, low station power or anything except their own deficiencies. This problem is most acute in brandnew markets, and as the competent crews install good operating equipment it becomes more difficult for the fly-by-night installer to convince customers of supposed UHF or station difficulties, especially when neighbors are obtaining excellent reception.

C. ECONOMIC CONSEQUENCES OF PRESENT ALLOCATION SYSTEMS

Stations cannot obtain necessary operating revenues without sufficient public acceptance to provide enough viewers to attract advertisers. Yet insufficient viewers cause advertiser reluctance to provide the very programs which are necessary to build this audience.

Programing and promotion are the keys to building audience. Both are very expensive. Thus, when a UHF broadcaster finds himself blocked from obtaining network programs because of a VHF station, he not only loses a chance for audience development, but must provide additional costly film or local programing.

It would seem that in the long run the networks have a major stake in the development of a nationwide competitive television system, of which UHF is a necessary part. So far, in general, I do not believe the networks have rec-
ognized this responsibility. They should not be allowed to sit by and wait until the station builds audience and then affiliate when they feel the selling job will be easy. Since both the network and station stand to make money in a market where substantial audience is obtained, I believe that the networks should take an active part in development of new television stations, whether VHF or UHF by affiliating at an early date and working together with the station to develop a profitable operation and to deliver maximum service to the public. Most stations cannot do this job without network support. Eventually, the network may also need these stations who need them so desperately now. With proper cooperation, there is no reason to assume that even in mixed UHF-VHF markets, ultimately a well-managed, aggressive UHF station may not be a more valuable affiliate, delivering a larger audience, than many VHF stations. Thus, something definitely should be done to obviate the situation where existing VHF stations carry the choice of network programs, even on a delayed basis, rather than allow the UHF station to provide live clearance at the time of broadcast.

It seems quite apparent that existing VHF stations are loath to give up even a small portion of their fringe coverage, even though their billings could scarcely be affected because of the importance of their own markets. Because of their present importance to the networks and advertisers, in many cases the influence of these stations is great enough to sway network affiliation thinking and to discourage advertisers from buying new TV stations in their fringe areas.

In our own case during the period when our application was pending before the FCC, NBC through its stations relations vice president, Harry Bannister, indicated they were prepared to offer Salisbury a full NBC affiliation on a basic "must buy" basis as soon as the CI was forthcoming. A full discussion among the principals was had as to the exact meaning of "must buy," proposed network rates and other details of the proposed affiliation.

By the time the construction permit was actually received however, the reception of NBC has become quite cool and Salisbury was subsequently informed that NBC was not further interested in affiliating in Worcester at that time. Copies of correspondence concerning this point are attached hereto (exhibits A-E).

We cannot help but believe that in large measure this complete about-face of thinking at NBC was largely due to the power and influence of Westinghouse, whose WBZ-TV was delivering a fringe signal to Worcester and contemplated and has since received further power boosts improving this fringe coverage. Worcester is a proud and autonomous market with few if any Boston ties and geographically lies nearly as far from Boston as does Providence. R. I. Worcester is the 32d most important market in the United States. We submit that Worcester is an important enough market to warrant NBC coverage from its own local station and that support of such a network would have been of great value in building audience and prestige for the station. NBC is currently reconsidering the possibility of affiliating.

Because the ABC television network has no regular outlet in Boston, Salisbury was able to obtain a primary affiliation with that network and also a supplementary agreement with the Du Mont television network which also presently has no full time Boston affiliate. Just what will happen to this picture if and when a further VHF permit is granted for the city of Boston is problematical.

Presumably the same sort of fringe coverage for CBS from Boston's WNAC-TV and the necessity for maintaining good relations with that station as well as CBS's own application for Boston had something to do with CBS's attitude of noninterest in affiliating in the Worcester market.

From the advertisers' standpoint a specific example is here cited. Soon after Salisbury commenced operation on channel 14 in Worcester, a client in Boston wanted the Salisbury facilities for one of its programs. This program was being carried by WBZ-TV and the client offered to pay them a fee for allowing channel 14 to pick up the program from their station and retransmit it for increased Worcester coverage. Permission for this off-the-air pick up was denied by WBZ-TV on the basis that they felt they were covering the Worcester market adequately. Thus even though the sponsor desired coverage from the Worcester station, the VHF station did not see fit to allow the pickup. Correspondence concerning the above incident is attached hereto (exhibits F-G).

More liberal terms on equipment purchases would be very helpful to new UHF stations who must go through a prolonged loss period. Insured loans or more liberal credit availability from normal banking sources as a result of sensible action insuring UHF's orderly growth, would also be helpful to many operators.
Program costs, most particularly feature and syndicated film costs, are also prohibitive in many cases. Suppliers, used to extracting high prices from the "fat cat" VHF operators find it difficult to get realistic, especially in intermixed markets. Since advertisers buy largely on cost-per-thousand and thus most UHF rate cards are comparatively very low and sales hard to come by, it would seem only fair that program suppliers also adjust their costs to reflect the number of sets in a market capable of receiving the station, rather than on a total market population. Few stations will object to paying increasing prices with audience increase, as presumably commercial commitments will increase commensurately.

The way things stand today, I agree that unless adequate measures are instituted, the extinction of many additional UHF stations is threatened by quick assignment of additional VHF channels through merger or otherwise in intermixed markets or by granting of further high-power VHF stations in UHF markets or with towers situated to cover these markets from outside.

The UHF Industry Coordinating Committee has made certain suggestions.

My reaction to these follow:

1. The public, UHF broadcasters, UHF station personnel, television dealers, distributors, servicemen, and manufacturers should be considered by the Senate subcommittee and the Commission in its recommendations and action.

2. The whole allocation plan, and most especially that portion providing for intermixture of UHF and VHF in the same market should be studied and revised where indicated.

3. Further grants, either VHF or UHF should be suspended, pending results of the overall study and especially a detailed study of the allocation plan.

---

**EXHIBIT A**

Mr. PAUL RITTENHOUSE,

*Station Relations Department,*

National Broadcasting Co., New York 20, N. Y.

DEAR PAUL: It was a pleasure to talk to you again.

I shall be anxious to hear of the outcome of your field engineering study in the Worcester market.

Here are a few points which I should like to reemphasize:

1. It is my opinion that regardless of field intensity of outside signals, once Worcester is served by local UHF television, viewership will rapidly swing to the local station. Worcester has always demonstrated itself to be a very proud and autonomous market with no outside ties. Its reading and listening habits in newspaper and radio have demonstrated this, and local interest in the forthcoming local television service is extremely high. This pattern will repeat itself, I am sure, and in very short order to sell Worcester by television, it will be necessary to utilize a local television station. Since Worcester is 32d most important market in the United States (JWT), it would seem to me that NBC would want to be certain in the future to be able to deliver this important market to its television clients.

2. I have personally observed the comparable quality of UHF signals versus VHF signals in several markets, and the superiority of the UHF picture is startling. We believe that this superiority is really something salable, and that with proper promotional effort, conversions will be quite rapid throughout the Worcester market area.

3. We plan to do a careful, comprehensive, and complete job of promotion of UHF as a medium, and of programs, including network, film, and local. We also plan a well-integrated additional campaign directed to dealers, jobbers, and wholesalers of television receiving equipment.

We are of course anxious to set our network affiliation plans as quickly as feasible so that we will be in a position to start promotion and sales activities at the earliest possible date. I shall keep in touch with you from time to time, and, in the meantime, should you come to any conclusions one way or the other, or have any further questions to ask or further information to impart to us, we trust that we shall hear from you.

Kind personal regards.

Sincerely,

ANSEL E. GRIDLEY, Vice President.
Mr. Harry Bannister,
Vice President in Charge of Station Relations,
National Broadcasting Co., New York 20, N. Y.

Dear Mr. Bannister: When I was in New York this week I had a further discussion with Paul Rittenhouse. I am sorry that it was impossible to see you at that time.

I was rather disappointed, however, and not a little surprised that the NBC attitude toward Worcester has apparently been somewhat changed since our talk with you.

It would seem to me that the desirability of including Worcester for NBC is becoming more important rather than less important now that the demonstrated superiority of UHF television signals has been so dramatically documented. We expect to deliver large viewership in the Worcester market very quickly and are preparing careful plans to that end. Since Worcester has always demonstrated itself to be a very autonomous market, it would seem to me that NBC would be very interested in being able to deliver this market now and in the future to its clients.

I should appreciate the opportunity at your earliest convenience to talk to you further personally.

Kind personal regards.

Sincerely,

Ansel E. Gridley, Vice President.

Exhibit C

National Broadcasting Co., Inc.
New York 20, N. Y., July 2, 1953.

Mr. Ansel E. Gridley,
Vice President, Salisbury Broadcasting Corp.,
Worcester 8, Mass.

Dear Mr. Gridley: Thank you for your letter of June 24 concerning a possible affiliation for the Salisbury Broadcasting Corp., with the NBC television network. The report received from our fieldman who recently spent some time in Worcester indicates that we have considerable and desirable service in this market and therefore we do not believe it feasible from a sales point of view to affiliate with your organization at this time.

Sincerely yours,

Harry Bannister,
Vice President, Station Relations.

Exhibit D

July 16, 1953.

Mr. Harry Bannister
Vice President, Station Relations,
National Broadcasting Co., Inc., New York 20, N. Y.

Dear Mr. Bannister: This will acknowledge your letter of July 2 in which you advised that you do not believe it feasible from a sales point of view to affiliate with us at this time.

From a sales point of view at present, we shall agree that selling Worcester for NBC will not be easy. Before that becomes easy, it will require considerable audited circulation in the form of UHF converted receivers. We intend to do our full part to see that this occurs as rapidly as possible. We submit that NBC should do its part to help us achieve this objective, because once this is accomplished, both NBC and ourselves stand to make substantial money from the Worcester market for years to come. We plan a careful campaign of cooperation with dealers and distributors, sensible promotion locally and nationally and program development locally to supplement network to build audience as rapidly as possible. This effort would obviously be aided by an affiliation with NBC at this time.
Here are some important facts for consideration:

1. Worcester is the Nation's 32d most important market. (JWT)
2. Worcester is a completely proud and autonomous market, and cannot be effectively reached from out of the area. Check newspaper circulation from outside, Hooper ratings of WBZ in Worcester.
3. Signal strength from outside is not important. Worcester has demonstrated a strong desire for its own television service, and will look at perfect local UHF pictures in preference to any sort of coverage from outside.
4. National advertisers are now educated to buying Worcester as a market in its own merits. Thus Worcester supports 4 AM stations; WTAG has 1 of the highest grosses of any station in its class in the United States, and WNEB is one of the best 250-watt independents in the Nation. Potential of the market for NBC is very excellent.
5. Salisbury plans excellent sales staff with full-time New York representative to aid in network and national spot sales. Paul Raymer Co. will also aid in network sales. We believe we can together with the NBC sales staff deliver a minimum of 15 hours of network programming in class A time to start the station off.
6. Because of intense interest in Salisbury in the Worcester area, and complete local acceptance of the group and its plans, we expect set conversions to channel 14 to move very rapidly. If you have not studied carefully the makeup of the group and their individual positions, it might be well to do so. Information is in a brochure in NBC station relations' hands now and in the enclosed newspaper article. This should answer why local acceptance is so complete, and why these stockholders are so important not only locally but nationally and internationally. Many sit regularly on the boards of some of the Nation's largest corporations.
7. The promised and demonstrated cooperation from the Worcester Telegram and Gazette will be very helpful in promotion locally.
8. An adequate budget for promotion is planned, to cover: dealer meetings; talks to clubs and groups; local newspaper, radio, car-cards, billboards, and other advertising; trade journal advertising of station and programs, local and network; contests; organization of dealer group; "conversion clubs" in cooperation with local banks for financing retail sales of UHF receivers and converters; sales brochures and material for use by network and national spot sales representatives; surveys and audited figures on UHF receiver status constantly, etc.
9. If the network works with us, we shall work with it in promoting and selling network shows in any way possible.
10. Salisbury has faith in UHF-TV and its ability to build audience with proper programing and promotion. We know the importance of the Worcester market, and its desire for its own television service.
11. We believe it is a matter of time only until NBC will need Worcester TV to deliver any appreciable audience in the area.
12. If NBC feels it desires to deliver the Worcester market in the future, we believe NBC should not expect Salisbury or any other group to carry the entire burden of building the audience and then expect affiliation only when sales are relatively easy. If NBC considers Worcester important, and believes in UHF, we submit it should be willing to do its share to establish this service and potential profit by affiliation now, and working with Salisbury as a team to achieve a mutually satisfactory and profitable association as quickly as possible.
13. While the importance of WBZ-TV and Westinghouse to NBC is obvious, it would seem to be unrealistic to let them dictate to NBC regarding Worcester. The same would apply, of course, to WJAR-TV if it were a factor. Worcester is going to be served by local TV anyway, and eventually WBZ-TV must face loss of audience there. It would seem that NBC should be willing to acknowledge that, and make the move now, in the interest of sensible and orderly growth of high-quality television service to Worcester which can be offered to NBC clients now and in the future.
14. If it would be helpful in minimizing overlap at present and if we can adequately thus service the Worcester market area, we would consider commencing operations with an RCA 1-kilowatt transmitter.
15. I should like to call your attention to the letter from Ralph McKinnie dated June 29 and addressed to you, and the coverage maps which were forwarded to you with that letter. The coverage of the outside stations is based on measurements and definitely shows no grade A coverage in metropolitan Worcester and the western half of Worcester County. Incidentally, much of the western half of Worcester County, because of topography, does not even receive satisfactory
fringe area VHF reception. This entire area will receive its first satisfactory television coverage from our station.

16. Continuing a realistic approach, if at present a basic affiliation is considered unwise by NBC, we should be glad to consider a supplementary agreement with NBC.

I hope that you will give careful reconsideration to an affiliation for Salisbury and that we may hear from you in the very near future.

Sincerely,

Ansel E. Gridley, Vice President.

Exhibit E

National Broadcasting Co.,

Ansel E. Gridley,
Vice President, Salisbury Broadcasting Corp.,

Dear Mr. Gridley: Thank you for your letter of July 16, reopening the question of a television affiliation for the Salisbury Broadcasting Corp. with the NBC network.

We have given the matter of a television station located in Worcester our serious consideration, and quite frankly we feel that the market is being adequately served. If the present situation should change, making it desirable from a sales and network standpoint to add a station in Worcester to our television network, we will certainly get in touch with you.

We appreciate your continued interest in NBC service and wish you success with your proposed operation.

Sincerely,

Harry Bannister.

Exhibit F

January 20, 1954.

John Steen,
Westinghouse Radio Stations, Inc.,
Washington, D. C.

Dear Mr. Steen: We are counsel for Salisbury Broadcasting Corp., permittee of UHF station WWOR-TV, Worcester, Mass., which recently commenced operation.

I am informed by Ansel E. Gridley, vice president of Salisbury Broadcasting Corp., that the Massachusetts Hospital Service, Inc., through the Sutherland Abbott Agency, contracted with WWOR-TV to have the program, You and Your Health, broadcast by WWOR-TV on Tuesday evenings for 23 weeks between 7 and 7:15 p.m., the first telecast to commence December 29, 1953. The contract provides that the program was to be picked off the air from WBZ-TV, Boston, and rebroadcast over the facilities of WWOR-TV. The order was made expressly subject to the approval of WBZ-TV to the rebroadcast and WBZ-TV was to be paid the sum of $50 for pickup charges.

On December 22, 1953, Mr. Gridley wrote Mr. W. C. Swartley, station manager of WBZ-TV, advising of the program and requesting permission for the off-the-air rebroadcast. Mr. Gridley's letter indicated that it was his understanding that "any charges you may assess for this privilege, I am sure will be absorbed by the client." Subsequently, on December 28, 1953, Mr. Gridley sent a telegram to Mr. Swartley stating that no reply had as yet been received and asking Mr. Swartley to indicate his reply by return wire. On December 28, 1953, Mr. Swartley replied stating that he was unable to grant the permission and that a fuller explanation would be set forth in a letter to follow. Subsequently, Mr. Gridley received from Mr. Swartley a letter dated December 28, 1953, stating as follows:

"We have recently completed a measurement study of our television signal which, in addition to our own audience studies, indicates that we are rendering a very good service to the residents of Worcester, Mass. Your letter of December 22, 1953, requests our permission to pick up the Blue Cross program, You and Your Health, and rebroadcast the same over WWOR-TV. This is a regular commercial program scheduled by WBZ-TV on Tuesday evenings, 7 to 7:15 p.m.
With the exception of occasional programs of outstanding national interest, it has consistently been a policy of this station not to grant the right to rebroadcast its programs by other stations serving substantially the same audience. Consistent with this past practice, it is our decision not to issue the permission you have requested since this program is generally available to the public in the Worcester area direct from the signal of WBZ-TV."

As you are aware, the rules of the FCC covering rebroadcasting were recently the subject of an investigation (docket No. 9508), following which the Commission issued a report and order on May 15, 1952, and a memorandum opinion and order on October 30, 1952. In the latter of the two documents the Commission considered circumstances under which refusal of rebroadcasting permission may be justified or unjustified, and stated as follows:

"Such determinations will obviously depend upon the facts of particular cases and upon an evaluation of such factors as whether licensee or stations, through express or implied agreements or understandings, act in concert with each other or with other interests in refusing rebroadcast requests, whether requesting stations serve the same or a different area as the station whose program they wish to rebroadcast, whether the request is for permission to carry a simultaneous rebroadcast or to rebroadcast a program at some subsequent date, whether the requesting station has indicated a willingness to pay a reasonable share of the legitimate costs of the originating station, whether or not other persons having interests in the program have requested or agreed to the rebroadcast, and whether the program concerned has public-service aspects that make its wide dissemination to the public clearly desirable."

Boston and Worcester, of course, are distinct cities, each with its separate interests. Each has been classified by the 1950 United States census as a metropolitan area. The population of the Worcester standard metropolitan area in 1950 was 276,336, of which 203,486 resided within the city of Worcester. Further evidence of the distinct and separate existence of Worcester apart from Boston may be found in the fact that there are 4 AM and 2 FM stations in Worcester (3 of the AM stations are affiliated with ABC, NBC, and CBS respectively) and by the fact that the Federal Communications Commission has allocated 2 UHF channels to Worcester, each of which has been granted.

An additional factor to be considered is that, I am informed, WBZ-TV has authorized the rebroadcast of the program, which is of a public-service nature, by a station serving the Springfield-Holyoke area, thereby recognizing that the program has an appeal beyond that of the Boston audience.

In the opinion of Salisbury Broadcasting Corp., the refusal to permit WWOR-TV to pick up WBZ-TV and rebroadcast this program is contrary to the public interest. On behalf of the Salisbury Broadcasting Corp., I am making this request of Westinghouse Radio Stations, Inc., to reconsider its denial and to authorize the rebroadcast.

Very truly yours,

JAMES A. MCKENNA, JR.

EXHIBIT G

WESTINGHOUSE BROADCASTING CO., INC.,

JAMES A. MCKENNA, Esquire,

McKenna & Wilkinson, Washington, D. C.

DEAR MR. MCKENNA: I wish to reply to your letter of January the 20th in reference to the request of the Salisbury Broadcasting Corp., permittee of UHF Station WWOR-TV, Worcester, Mass., to pick up the signal of WBZ-TV, Boston, and rebroadcast the program, You and Your Health, on Tuesday evenings, from 7 to 7:15 p.m. You ask that this decision be reviewed and it has been. The original decision of Westinghouse in this instance was reached after careful study which also took into consideration the memorandum opinion and order of October 30, 1952, issued by the FCC (docket No. 9508) from which you quoted at length in your referenced letter.

Contrary to the statement in your letter, I am advised by NBC that it has no radio affiliate in Worcester. This area is adequately served by WBZ. As to television, our network contract provides that WBZ-TV "shall have the right of first refusal, good for 72 hours, as against any other television station serving substantially the same area as the station, etc." This network provision has been approved by the FCC. I am also sure that, as a result of your years of
MEASURED FIELD INTENSITY
CONTOURS
WBZ-TV
BOSTON, MASS.
CHANNEL 4 100 KW ERP

WESTINGHOUSE BROADCASTING COMPANY, INC.
ENGINEERING DEPARTMENT
experience as counsel for the ABC network, you are aware of the economic necessity for, and public interest in, the FCC's approval of such network arrangements and the right of a station to have exclusive rights to its normal programs within its service area.

Attached hereto is a photostatic copy of a map showing the measured field intensity contours of WBZ-TV. These measurements were recently completed by our engineering department and clearly show that Worcester lies not only within the grade B contour but is immediately adjacent to the grade A contour. This study, together with the personal observations we have made in Worcester and the mail count received from that city, conclusively proves that station WBZ-TV adequately serves the city of Worcester. To permit station WWOR-TV, under these circumstances, to pick-up and rebroadcast the signal of WBZ-TV would not be in the public interest since the audience in that area would then be denied the choice of a second program which would otherwise be broadcast by WWOR-TV. We concur in the announced policy of the FCC that a diversification of program material permitting the public freedom of choice is in the public interest.

It is true that the right to rebroadcast this program was granted to a station serving the Springfield-Holyoke area. You will note from the attached map, however, that this area is not only outside of the grade B contour of WBZ-TV but is actually outside of the 100 uv/m contour line. Since WBZ-TV does not serve this area with an adequate signal the request to rebroadcast in that case was granted. I am further advised that rebroadcast privileges have been granted to a television station in Portland, Maine (involving other programs), for similar reasons.

I would like to point out further that the refusal of Westinghouse to grant the rebroadcast privileges requested does not in any way prevent WWOR-TV from bringing this program, or a similar one, to its audience if it so desires, at least insofar as the rights of Westinghouse are concerned. This program originates at the studios of WBZ-TV in Boston. It is sponsored by the Blue Cross. However, the rights to the program and its format are not owned by Westinghouse and therefore, insofar as Westinghouse is concerned, we see no reason why WWOR-TV cannot make similar arrangements with the owners of the format to originate the same or a similar program at WWOR-TV at the same or at a different time.

The program You and Your Health, like many other programs originating at WBZ-TV, is of a public-service nature, as you stated. However, it is not in the classification of programs that are of immediate national interest, such as a speech by the President of the United States, news of a major event, announcements of vital concern to public safety, etc. In the latter case it has always been the policy of Westinghouse to freely grant rebroadcast privileges to any requesting station.

Therefore, since the choice of two programs in Worcester is in the public interest and since the refusal of the rebroadcast request, of itself, does not prevent WWOR-TV from broadcasting the same or a similar program if it so desires, it is the decision of Westinghouse that the right to rebroadcast this program under these circumstances will not be granted at this time.

Very truly yours,

JOHN W. STEEN, Counsel.

Senator Potter. I have also an addendum to the testimony given by Mr. Raymond M. Wilmotte to miscellaneous inquiries raised during his testimony, and I would like to make that a part of the record at this point.

(Addendum to Mr. Wilmotte's testimony is as follows:)

Addendum to the Testimony Given by Raymond M. Wilmotte, Consulting Engineer, on June 16, 1954

Mr. WILMOTTE. There were two questions that I was asked that I feel should be amplified.

1. The Senator from Nebraska asked whether a sparsely populated area such as is found in the State of Nebraska could be served economically by polycasting. In reply I referred to my calculations on a 4-station polycasting arrangement which I had calculated would serve a population of 66,000 in the State of Nebraska. Such an arrangement of stations it is estimated can serve about 5,500 square miles. I should have explained that such is not the limit of polyc-
casting. More than four stations can be used. Earlier in my testimony I explained the possible use of 12 stations, each radiating 2 kilowatts of power at 300 feet. That arrangement is estimated to serve an area of 19,000 square miles, which in Nebraska would contain a population of over 200,000. No practical single station could possibly cover such a big area; calculations indicate that to cover this area, the power required with a single station is 200 million kilowatts.

While there are at this time no reliable figures of cost for each station in a polycasting system, it is estimated that each station transmitting 2 kilowatts of power would cost about $25,000. This price would undoubtedly drop considerably if a substantial number of such stations were to be installed.

2. The chairman asked why the Federal Communications Commission had not permitted the use of multistation operation and polycasting in particular. In answer I explained the official findings of the Federal Communications Commission given after the "freeze" hearings. I should have added that earlier an operator approached me to set up a polycasting system, to try the system out. It was an ideal area where there had been no VHF service and many UHF receivers were in the hands of the public and where there were many unused UHF channels. The answer was along the lines of long-established FCC policy. The Commission, they indicated, would be unlikely to grant the use of another UHF channel except 1 in the 800-megacycle band. When it was pointed out that no commercial UHF receiver could tune to such a high frequency, the reply was that that was one of the principal reasons why such a frequency was selected.

The FCC insists that experimental work be carried out without any tinge of commercialism, particularly on a channel different from the one commercially licensed. That concept, of course, killed the proposal, because it would not be practicable or valuable to broadcast over a vacuum of receivers, and the cost of distributing specially designed receivers was out of the question.

I recommended against making an official request to the Commission because of the cost of such a process and the likelihood of months or even years of delay.

Some experiments are being carried out, I understand, on satellite operation. The areas selected have been such that the population density near the satellite and lying between the satellite and the main station is small. These areas are not very valuable to the advertiser, but it is nevertheless in the public interest to serve these areas. The economic interest is to forget them. The policy of the FCC should be to insure that they are served well, if it is possible to do so, and to stimulate the development of techniques which make this possible.

There are numerous and large areas of this kind in the country and it should be the responsibility of the Federal Communications Commission to see, even if there are relatively few families in them, that they are properly served if it is economically and engineeringly possible to do so.

It is my contention that such service is economic and can be engineered in almost every case. It is my further contention that trying to serve any large area with a single station is the worst technique that can be devised and is the only one permitted by the FCC.

3. I would like to take this opportunity to emphasize again:

(a) That when something goes wrong, as has happened to the UHF band, there is a tendency to meet the problem by "patching up" the trouble. Such "patching up" tends to bring up new problems which later in their turn have also to be patched up. The eventual result is a lot of work, an unwieldy administration and generally damage to the service to the public.

(b) It is possible to force unwilling producers of programs to put them on UHF stations; it is possible to subsidize the public into buying UHF sets; it is possible to have only UHF stations competing with each other in an area; but all these schemes merely lead to the public having poorer service, or in additional burdens to the taxpayer. Moreover, if such "favoritism" type of legislation is enacted, there will be no end to the pressure groups who will seek all kinds of favored legislation. This turns our free-enterprise economic system, not to remunerate the least operator, but the one who has the most persistent and persuasive lobby.

(c) There is only one basic solution in the long run, in my opinion. It is to carve out areas which have large enough populations that they can be served economically, and to give the operator sufficient frequency space to serve that area well and to leave him free to do so in the most economical manner, provided he carries out his contract to provide good service with no more than a specified amount of interference.
(d) It is usual for man to solve the immediate needs and leave the more difficult fundamental issues for later. I sincerely request that this committee tackle and solve the fundamental issues.

Senator Potter. I have also a letter from Mr. William L. Putnam, of the Springfield Television Broadcasting Corp., which I would like to make a part of the record at this time.

(The letter referred to is as follows:)

SPRINGFIELD TELEVISION BROADCASTING CORP.,

Hon. CHARLES E. POTTER,
Chairman, Subcommittee on Communication,
Senate Office Building, Washington, D. C.

Dear Senator Potter: I spent several days in Washington, a while ago, with other UHF people before your subcommittee. While I did not testify I did submit, for the record, our position.

I realize that you are a busy man and may never get to see this material, however, I hope you will have time to read the enclosed copy of a letter we just sent out to the FCC. I am sure that you have gotten the general trend of remarks from the UHF broadcasters, to the effect that we just aren't able to compete with VHF. This enclosed letter should give you further proof of what we are all up against.

The VHF people can increase power and cover vastly more territory than they are assigned to and thus put us out of business. It's that simple.

I am sure that you will find some solution, which despite all the ballyhoo, will be fair.

Very sincerely yours,

WILLIAM L. PUTNAM, Treasurer.

Senator Potter. Unfortunately, with many interruptions yesterday, we were not able to conclude with as many witnesses as we had expected. Therefore, I think it only fair to announce that probably we will have to have sessions tomorrow, on Saturday. I hope that won't inconvenience any of the participants. If it will, I wish you would notify Mr. Zappel here, and possibly we could continue on Monday rather than Saturday, if you so desire; but we will leave that to your judgment. If you will contact Mr. Zappel during the noon recess, we will have a pretty good idea by that time what witnesses will be left over.

When we recessed yesterday, Mr. Pierson was on the stand. He is still on the stand.

I am sorry we have had so many interruptions during the course of your testimony, Mr. Pierson. We have many witnesses left, and your statement is well thought out and we are pleased to receive what further information you have.

STATEMENT OF W. THEODORE PIERSON—Continued

Mr. Pierson. Mr. Chairman, I think you, unfortunately, could not be here yesterday when I commenced my statement, and I would like to repeat some of the introductory remarks that I made so that you will understand the somewhat difficult position we have been in, in attempting to present the views of the people who have retained us. We represent 82 VHF licensees, 20 permittees who have not completed construction, and 33 applicants for VHF facilities.

Now, I stated yesterday that 65 of them wanted to present their views and information to the subcommittee.
Senator Potter. Surely.

Mr. Pierson. Actually, the accurate count was 71. We knew that would be too great a burden upon the committee. So, what we attempted to do was to extract from them the general views which I have attempted to state and then to reduce or to take typical examples from six witnesses.

I stated yesterday that six witnesses would follow me, the testimony of each of whom would be substantially less than mine. That number as of today has been reduced.

We had intended to present the testimony of Mr. Hulbert Taft and Mr. J. Leonard Reinsch. In view of the fact that material they will present will be somewhat repetitious of that that will be presented by Mr. Murdock and others, we have decided, in order to aid this problem of time that the committee has, to ask that their testimony be written into the record as though orally given at the conclusion of the testimony of Mr. Murdock, or Mr. Tierney.

Now, there is another problem in respect to Mr. Tierney. He had to return last night to Charleston because of an engagement that he could not cancel. His statement, I believe, is important in the fact that he is the only permittee under construction who is appearing; and I, therefore, ask to substitute the name of his attorney, Mr. Tom Wilson, who will read his statement into the record.

Senator Potter. That will be perfectly all right.

Who was the other one?

Mr. Taft will not testify?

Mr. Pierson. Mr. Taft will not testify, and Mr. Reinsch will not testify.

Senator Potter. Yes.

Mr. Pierson. The result is we have four more witnesses besides myself and the total length of time they will take will be about 1 hour.

At the recess yesterday I was discussing the problem the Commission had in terms of processing applications.

I referred to the fact that these procedures had to be concluded before the public could get the use of the facilities that had been frozen for 4 years and that there was a tremendous flood of applications.

The Commission, I think, was woefully understaffed for the peak job that then confronted it.

I referred to the fact that their first job was to examine the applications to be certain if they had the qualifications required by law, and I think the Commission did a very excellent job in a short period of time in getting that done. I think it was an outstanding achievement on the part of the Commission.

In the event they found that an applicant had the qualifications required by law, they could then grant the application unless there was a conflict; and if there was a conflict they had, as a matter of due process and as a matter of statutory requirement, to go through a hearing.

Now, there have been contentions made here that one of the principal purposes and functions of the Commission is to encourage comparative proceedings because in that manner they presumably get a better qualified applicant.

I have stated I believe in the face of realities it was not a principal function of the Commission; I didn't believe it was important, for
this reason: That competing applicants tend to make proposals that are substantially equivalent to all others.

Bear in mind they voluntarily decide to go in business. They sit down and prepare their proposals well knowing they have got to outmatch or at least equal their opponents.

The same thing tends to be true with respect to background qualifications. The result is in comparative proceedings, instead of there being really important, significant differences between applicants, in many instances the differences tend to be insignificant. Therefore, the comparative proceedings, so far as finding a better qualified applicant in the practicalities of the situation, rarely result in that effect.

Now, this is not merely a theory that we present. I think that if anyone will take the time to read the few initial and final decisions the Commission has issued since the lifting of the freeze, they will find that one of the principal problems that obviously has confronted the Commission is to find a basis of superiority on the part of any one of the applicants that would be a substantial difference and, therefore, would justify their decision in the selection of one applicant. In other words, I have heard a lot of comment that some of the final decisions or initial decisions seem to rest on small, insignificant matters.

Senator Potter. Small differences?

Mr. Pierson. Like a parking lot, or parking space, or something like that.

Senator Potter. If you didn't use the comparative hearing to determine who should receive the license, what criteria would you use? The first person who applied, who was qualified?

Mr. Pierson. I think the comparative hearings must be used where the parties who are applicants insist that they be given a hearing. I am not suggesting any substitute for that.

I am suggesting this: That where it is possible for the parties applicant to make an agreement with respect to dropouts or mergers and thus leave surviving only one application, the Commission should not, nevertheless, go ahead and require a hearing. They should not at that point say, "Well, we invite somebody else to come in and put us to the necessity of going through this expensive litigation in a comparative case for the purpose of finding an applicant whose qualification is very likely to be insignificantly different that the one that they have before them."

I am suggesting, therefore, that the Commission acted properly when they decided upon the procedure. On the one hand, there were two factors in favor of expeditious proceedings. One factor was a need of the public for the establishment of a service and the other was the fact that the whole industry was being retarded in the development of programs and in the development of advertising revenue, until more stations were established.

They had against that the theoretical possibility of a better applicant through a comparative hearing.

Now, wherever they could make a choice, wherever the applicants were reduced to one, I think the Commission made the right choice in deciding that the public would not benefit, the industry would not benefit, by expensive and extravagant litigation.

The Commission had another problem at this same time, in what has been referred to as strike applications that have been filed.
A strike application, as I understand it, is one that is filed not primarily for the purpose of getting a facility but primarily for the purpose of causing delay in the establishment of the facility.

Obviously, there are many people who do not want competition with them any sooner than they have to be confronted with it.

One can examine the files of the Commission and come to at least the suspicion that in a lot of cases applications were in the nature of a strike application. However, they are not easy to prove because you are really dealing with the bona fides of an applicant.

Senator Potter. Isn't it also true that certain strike applications are made in an effort to get bought off?

Mr. Pierson. That is correct.

There are two reasons for a strike application:

1. A person who has no intention of building and hopes that by filing the application somebody will pay him to get out.

2. The second reason—

Senator Potter. That is where nuisance value is a value?

Mr. Pierson. That is right.

The second reason is that someone files an application or talks somebody else into filing one, if he cannot appear directly, in order to prevent or delay the establishment of a competing facility.

Now, you can examine the Commission files and easily come to the conclusion that a lot of suspicion exists in some cases with respect to both types of action.

Senator Potter. There has been information to the effect that in many of the mergers that have taken place either stock has been granted to a strike applicant or a payoff has been made.

Now, to me that is a vicious practice and the Commission, I hope, can remedy that.

Do you have any suggestions as to how that can be remedied?

I wouldn't grant an application; if I were a Commissioner, to any merger, where they paid off a striker.

Mr. Pierson. Well, I would suppose, Mr. Chairman, if you could prove he was a striker in the first instance that this would be a very easy matter to remedy.

The problem is—and I might try to give an example: Let's assume there are four applications pending before the Commission, for a specific channel, and the applications were filed at various times. Finally they are getting close to designation or they have been designated for hearing.

Now, it is a rather usual thing that those competing with each other at this point, as is usual in litigation, always tend to suspect the motives of the opposing applicant because they are in the process then of showing that the opposing applicant is no good and this is an easy attitude to develop. However, if you attempt to prove that any one applicant did not file its application with the idea of building the station, if granted, certainly I think you will have to concede that they can readily say, "If we get this grant, we're going to build it."

Let's assume it is one of these valuable facilities that we have heard about. Now, how in God's name you are going to prove his mental processes. I don't know, how you are going to prove whether he, in good faith, intended to prosecute the application to completion, whether he, in good faith, intends to build the station if he is granted.

It is one of those things that is almost impossible of proof.
Now, obviously, you are never going to get admissions or confessions out of these people. What you have to do is try to build up a circumstantial case. You have to have a hearing for that purpose.

Now, the Commission says, "We have some suspicion that this application was a strike application that was involved in this merger and got an option on stock, or was paid cash," then presumably they will say, "We will go ahead and have a hearing to determine it."

Now, you don't go ahead and have a hearing unless you feel there is a reasonable opportunity of proving it was a strike application, and I say it is one of the most difficult cases in the world to make. It is just like trying to prove by the proffer of evidence that someone has good or bad intentions, I think, therefore, while I have got no impression that the Commission condones this practice of strike applications, it has been very much alarmed about it, but the question is whether they should delay the proceedings through long and what I think in most cases would be futile hearings to try to establish what they probably can't establish, or shall they let the fellow take the $5,000, if that is what they think he is getting, and let the public have the service.

The practice is evil; the practice is bad, but I don't believe long and extensive hearings in an attempt to prove a thing of that sort—I believe it would be futile to try to prove it—is the remedy.

I also understand that the Commission has given a lot of attention to this and is attempting to adopt methods of finding a remedy.

Now, one of the remedies they did adopt is one that has been characterized as unethical in this hearing heretofore.

I would like to refer now to the so-called quickie grants.

Senator HUNT. Mr. Pierson, may I ask you a question?

Does the Commission look into the background of legitimate financing of the applicants?

Mr. PIERSON. Indeed, they do.

Senator HUNT. They go to the bankers; they go to their sources of revenue, income, moneys available.

Mr. PIERSON. The Commission relies upon the sworn statements of applicants.

Senator HUNT. They don't go back of that?

Mr. PIERSON. No; they do not go back of it.

Senator HUNT. That would be, I would think, a very effective way to get at a strike application.

Mr. PIERSON. Oh, Senator Hunt, I don't think it follows that in every case there is a strike application that the strike applicant is not financially qualified. Frequently they are very well financially qualified.

Senator HUNT. I don't think in every case either I would agree with you on that.

Mr. PIERSON. But if you have a thousand applications on file and you attempt to conduct a full field investigation of the financial facts submitted by the applicants, I suspect you would have to enlarge the Commission staff three or four times and take a period of 2 or 3 years to conduct it.

Now, that type of investigation might yield two or three strike applications—but whether it would be in the interest of the public for the Commission to devote all of that time to the field investigations of
financing and delay service in the course of doing it, I have some question.

It seems to me the most we can say is that it is a very difficult problem. The Commission, confronted with it, has not failed to realize the problem, but they have acted in a manner that has necessarily involved compromises between what course of action would most help the public in terms of getting early service.

Senator Hunt. It is a very difficult one. It is a very vicious one, and it is a very profitable one, it would seem to me.

Mr. Pierson. I don't agree it is that widespread, Senator Hunt, that it is a highly profitable one. I think, as a matter of fact—

Senator Hunt. It has been in some circumstances that I know of.

Mr. Pierson. Well, I am not aware of particular circumstances in which there were strike applications. We don't represent them.

Senator Hunt. I am not saying that.

Mr. Pierson. But I suspect there has been a few thousand dollars, Senator Hunt, that people have made; but I think the public cost of ferreting them out and holding up service in the meantime would be many times in excess of what any of these evil persons might have gained in dollars, and a lot of them have been unable to because the Commission has taken steps when they had this suspicion in some cases to eliminate that possibility.

I think one of the definite steps that they took in this connection was the action that they have taken with respect to what has been called quickie grants.

I would like to give an example of that, a hypothetical example.

The Commission started accepting applications July 1, 1952, and let's assume by the middle of 1953 there has been four applications filed for a given channel in town X.

Now, I think it is reasonable to say that all the people who wanted to apply for that channel should have applied for it within the 12 months.

The parties are confronted with a comparative hearing. They decide that the litigation cost, the delay is just not worth while. So, of these four applicants, one of them drops out and asks for his prosecution cost back, and he is paid. So, he comes out even. The other 3 merge into 1 corporation.

Now, all of these three applicants' qualifications have been examined by the Commission. So, since each one of them are qualified, I think you can pretty well assume that the survivor is qualified.

After they have made this merger, everything they have done to avoid the litigation and establish the service at an earlier date can be completely frustrated by the filing of one more application before the Commission has an opportunity to act upon the merged application. This was the practice, that to me gave grounds for greater suspicion of strike applicants. It frequently happened that the moment the three applicants dropped out and the one applicant remained, there would be a new application filed.

Now, that new application might have been bona fide; there might be explanations that can be given for them waiting until they feel there is going to be no comparative hearing before they file, but I think it is reasonable to believe that in a lot of cases the application that was filed under that circumstance was filed for 1 of 2 purposes: To make certain a comparative hearing would be held in order to delay compe-
tion either to a station they were operating or that a friend was operating, or, two, to get a payoff—and there are examples where those very things did cause payoffs.

So, what the Commission did, they said:

When the competing application problem is eliminated in a given case and we can grant that application without a hearing, we're not going to let it lay around the Commission any longer than is absolutely necessary before we take the application up and determine whether we can grant it.

So, they adopted the policy of considering such applications at the very next meeting of the Commission, and the very reason the Commission did that was to try to protect their processes from strike applications.

Now, I submit that a procedure such as that is not only not unethical, but the procedure was properly taken to defend the Commission's processes from strike applicants and it was properly taken in the interest of the establishment of early service.

I did intend to devote some time to the Du Mont proposals.

Perhaps we have already disposed of the Du Mont proposals in our earlier statement by stating that we believe that they are contrary to the present concept of the law.

Plans A and B of Du Mont substitute a common-carrier concept.

What plans A and B in effect do is to say that there shall be no further competition in the network industry unless the Commission issues a certificate of public convenience and necessity to some competing network.

It suggests, also, that these networks should be regulated in the charges that they make and the practices they follow with stations.

It suggests, also, that they be protected by the Government from competition that they seem to fear.

Now, I don't believe that there is any basis in the industry today to lead us to believe that our present concept of free broadcasting has failed and that we should turn to the common-carrier or public-utility concept for any facet of the industry.

Senator Schoeppel. Would you say that would be true with the new economic factor coming into this picture, which I think the big boys are watching for—and I don't blame them—and that is subscription television?

Would your statement hold true in the face of what is likely to come about with subscription television, which would involve the telegraph, the telephone, and all of that?

Mr. Pierson. Senator Schoeppel, I would like to be permitted to make rather guarded comments about subscription television.

Senator Schoeppel. Well, you made a statement about the concept—

Mr. Pierson. May I explain, Senator?

Senator Schoeppel. Of public utility, or something like that.

Now, I am asking you that question. You are an expert, up here representing 70 or 80 of those people who are in here.

Sure; I well understand everybody is guarding against it, but it is coming.

Mr. Pierson. Well, I would like—

Senator Schoeppel. They say within 3 or 5 years you are going to have double the stations on the air if they utilize this. Now, I want an answer from some of the boys who are in this business for hire,
and I am for them because they are good or they wouldn't be in this game.

I would like to have some of the answers on this record before we finally close it. I am going into that phase of it.

Mr. Pierson. Senator, may I say, since I represent the Zenith Radio Corp., I certainly urge that you do it.

Senator Schoeppel. We want some information on that phase of it.

Mr. Pierson. When I said I would like to be guarded in my statements, it was because I have a possible conflict of professional commitments.

Senator Schoeppel. Oh, I didn't know that.

Mr. Pierson. I represent here some VIIF operators who may have some varying views on subscription television. I also represent Zenith, whose views are well known, and I can only say I share theirs, and they filed a statement.

Senator Schoeppel. But don't you recognize—

Mr. Pierson. I don't believe that would create the necessity for a common carrier concept in the network business. I think, rather, that would supply more competition and cut out the need for regulating the industry as a common carrier.

Senator Schoeppel. But does it not utilize common-carrier service to dispense the service?

Mr. Pierson. Oh, yes.

Senator Schoeppel. And, therefore, it is tied into it?

Mr. Pierson. Well, so do the networks. So do the broadcast stations today.

Senator Schoeppel. So, there is a legitimate basis for some of these folks saying there is a common-carrier aspect to some of this economic phase.

Mr. Pierson. I didn't understand that was their contention.

I don't mean to be understood to say that common carriers that deliver the programs, AT and T, Western Union, or whomever is used should cease to be regulated as common carriers. What I am saying is that broadcast stations and networks and film syndicates should not be made common carriers also because I do not believe there is any basis in the facts and circumstances of the present industry or its potential that justifies that at the present time.

Senator Schoeppel. I want to ask you this: You are representing a group of the industry here. If educational television has two-hundred-and-some stations, or two-hundred-and-some channels that it sought to be allocated to them, and let's assume—and I think we ought to guard and protect a proper place for that: I think it is a very necessary thing—that subscription television comes in—doubles or triples the need for stations, because of the greater service that can be rendered, and also taking care of the economic factor; namely, some type of return which will justify the programing and all of that sort of thing; don't you agree with me some arrangement has to be worked out for greater opportunities for these advanced or accelerated number of stations coming into existence and going on the air?

Mr. Pierson. Well, I certainly agree wholeheartedly that the real problem that must be solved in this industry is to establish some means by which television programs are carried. That means, therefore, that the Commission should make every effort to cut short the Government red tape in the establishment of those stations.
Senator Schoeppel. Which goes to the very thing you are talking about?

Mr. Pierson. That is correct.

Senator Schoeppel. Or were talking about a while ago?

Mr. Pierson. That is correct.

Senator Schoeppel. With respect to these long, drawn-out proceedings?

Mr. Pierson. That is correct, and I think the industry's problems are going to be solved by more stations and more competition and more air time and more programs for the people, not less, and I submit the proposals for a freeze, the proposals of elimination of intermixture, the proposals of reducing coverage areas, all have the effect of limiting the number of signals that are available to our people and reduce the competition that individual stations will have, with whom they must compete.

Now, with respect to the Du Mont proposal, Mr. Roberts suggested that it really doesn't protect the networks from competition in the future from newcomers because they can always go in and get a certificate of public convenience and necessity. I assume he was referring to the type of a certificate that an air carrier or a rail carrier has to obtain.

Now, the significant thing about that is that before you can establish an airline, a new airline or a new railroad or a new bus line, you have got to establish to the satisfaction of the agencies two things:

1. That the service you propose to provide is required by the public; and
2. That you will not divert revenue from people who are already engaged in it.

Now, I think that would be a very cozy and comfortable position for Mr. Du Mont to require anyone who wants to compete with him to show that, but I scarcely see how it encourages people to go into the production and distribution of programs. It certainly results in government getting into the economic field in which I don't think it has shown any great capacity.

Senator Hunt. Mr. Pierson, I would like to ask you: What place do you think State jurisdiction, complete State jurisdiction, will have in the new community antenna television systems that are literally going into all the communities, small communities in my State, while we only have one broadcasting station?

Mr. Pierson. I must confess—I suppose this will surprise everyone—I don't have any comment on that.

Senator Hunt. If it is a question you have not given any thought to, I will withdraw that.

Mr. Pierson. I have not, Senator.

Senator Potter. Do you think, Mr. Pierson, the networks should make their programs available to any person who wants to buy them?

Mr. Pierson. I think the manner in which a network has adopted its method of doing business is one that is generally calculated to enable it to deliver to an advertiser something that he will buy. I think it is very important for this industry that the networks be left in that position to compete with newspapers and magazines.

I believe the practices they have adopted are generally designed to better enable them to accomplish that purpose, and I also point out the fact that in the year 1938 the FCC commenced an investiga-
tion into network practices and policies. This investigation lasted for a period of about 2 or 3 years, and they adopted network rules and regulations which went into effect, I believe, in 1941. I may be wrong about the date, because there was Supreme Court litigation with respect to the matter.

Now, the Commission examined every one of those practices and proposals such as you have now recited. I think the Commission's investigation was exhaustive. I think their feeling with respect to what the public required from the industry and what the industry required in terms of practices was very sensitive, and I am inclined to think that subject has been well covered; and unless new practices have arisen, I think it is a very complex and delicate field for Government to tamper with, except after very close study.

Senator Potter. Just using the factor of public interest, would the public interest be better served by allowing any individual who wants to purchase a program to purchase it?

Mr. Pierson. Any individual station?

Senator Potter. Yes.

Mr. Pierson. It might be.

My point is: If that kind of requirement imposed upon the networks would make them less able to compete with other media in selling the national advertiser, which they must do to have the program in the first place, it wouldn't help the public because the time wouldn't be sold and the program wouldn't be there.

Now, whether or not such a requirement would have that result upon the networks, I don't feel competent to say.

Now, I think we have made clear we support the lifting of the excise tax.

We support the use of boosters.

Senator Hunt. Mr. Pierson, may I ask you: You support the lifting of the excise tax on what particular production?

Mr. Pierson. The lifting of the excise tax upon any receiver that has full UHF capability.

Senator Potter. That has been about the only item everyone has agreed upon.

Mr. Pierson. While I don't want to take further time from the subcommittee, I had intended to suggest that if the subcommittee is interested in recommending that Congress use its taxing powers to get us some more circulation and more programs, arguments can be made that tax inequities exist with respect to the supply and the release of motion picture film product and television film product.

I think actions could be taken, though I am not certain I, personally, would fully support them, but arguments can be made that actions could be taken with respect to certain alleged inequities in the tax laws that would tend to bring about a greater flow of program product from Hollywood.

Now, if the subcommittee would be interested in views on that point, I would be glad to submit a memorandum in writing.

Senator Potter. I would appreciate it if you would.

Mr. Pierson. And I would like now, finally, to get to conclusions.

We believe that with respect to the proposals for the elimination of intermixture, the proposals for the reduction in coverage area, the proposals for the elimination of VHF entirely, and the proposals of the freeze would harm private investors if those proposals are
adopted; it will obviously harm private investors if those proposals are not adopted.

Now, I don't think this subcommittee need to make any determination of whether the UHF people will be hurt more if the proposals are not adopted than if the VHF people will be hurt if they are adopted, because I submit the interest of the public is the thing that should be controlling here and you should pass over those private injuries immediately without further attention.

I submit also that the four proposals that I outlined would result in a smaller number of services to every section of our country if they were adopted.

I submit also that the proposals, if adopted, all or any one of them, would result in less competition to every operating station and would, therefore, be a tendency toward monopoly.

I submit also that it would leave many persons, if the proposals are adopted, who live in the rural and gully areas of our country, without any service at all and that, furthermore, the instability that it would represent in Government action would discourage the investment that industry should make if the public is to have this service.

I submit that those are the public factors involved in this case and that those factors are controlling.

I also suggest one other thing: I believe that in the seven members of the Federal Communications Commission there rests approximately 130 years of experience and knowledge in the broadcasting business. I think those members are all devoted to the public interest. I think they are very knowledgeable, and I suggest many of these problems are vastly more complex and complicated, both with respect to social and economic factors than one could expect five busy Senators to solve in a 7-day hearing. We think, however, this hearing has been a tremendous value, in the fact that it has brought out issues and we believe the record here will be of a great value to the Commission and to the industry, but we earnestly suggest, except with respect to a favorable exercise of your taxing power, that you submit this record to the Commission without recommendations.

Senator Potter. To carry your suggestion to the extreme, we would destroy representative government, wouldn't we?

Mr. Pierson. Oh, no; no.

I don't wish to be misunderstood in that respect.

I think that the Commission deserves a lot of confidence and I believe this committee, after they have examined this, will have a lot of confidence in what the Commission has done.

I don't believe that legislative action is required, because I think we have a good law. I think the Commission has attempted to administer it correctly.

Senator Potter. Do you have any questions?

Senator Hunt. No; I don't think, after the last statement the gentleman made, we should ask him any more questions.

Mr. Pierson. That is why I saved it until the last.

Senator SchoeppeL. I would like to ask a question: You, I take it, of course, think there is no merit in the suggestion that was made that maybe because there is a transition coming here between television in universal usage as we now find it and color television, which is around the corner and coming—I take it you think and feel there is no reason for alarm or doing anything legislatively that might
require a greater utilization or provision on the part of the manufacturers to move out and take care of the sets or give the greatest coverage possible, say, to UHF as has been testified here?

You don't think there is any justification for a feeling there should be maybe a stop, look and listen period in here.

If it is going to be done some place, before we make this transition to color you still feel that nothing should be done about it?

Mr. Pierson. I believe the stop, look, and listen, Senator Schoeppel—if you mean by that phrase a freeze—will do vastly more damage than we can find cures for the present problems through the freeze—the freeze keeps people from obtaining service that they are entitled to; it endangers tremendous investments made by both the public and private interests; it has no possible effect except to numb and retard the industry.

We need more stations, soon. We need more program time. We need more programs.

If Government says, "We're going to stop the means by which this industry functions right in its tracks while we spend a year, 2 or 3 or 4 years trying to redo what we just finished 18 months ago," it seems to me it will have the same effect that it did in 1948. It will hold up the industry.

Senator Schoeppel. I mentioned that because it has been testified to here a number of times by people who are allegedly skilled in the industry.

Mr. Pierson. That is right.

Senator Schoeppel. And I was just wondering, if there is any justification for anything like that, in view of the discordant factors that were developed, and now coming to light, what is your judgment before we move into this big field of color television, which they say is around the corner.

Personally, I don't know. I really and truly don't know myself.

Mr. Pierson. I believe, Senator Schoeppel, none of the problems we have and none of the prospects of future problems justifies Government imposing a freeze.

Senator Potter. Thank you kindly.

Mr. Ball.

STATEMENT OF FREDERIC J. BALL, REPRESENTING ZENITH RADIO CORP.

Mr. Ball. Mr. Chairman, members of the committee, this statement is made by the Zenith Radio Corp. manufacturer of radio and television receivers; holder of a commercial license for radio station WEFM, Chicago, and an experimental license for VHF channel 2 in Chicago, as well as a license to broadcast experimentally in the UHF band in the Chicago area. Zenith is also an applicant for a commercial license on channel 2 in Chicago.
It is against this background of interest and experience that Zenith has observed the proceedings of this hearing into certain important and basic aspects of current television broadcasting practices. In the interest of helping the committee amass as full and informative an array of evidence and opinion as possible as a basis for its conclusions, we offer the following statement of views, based on our own observation and analysis of the broadcasting problems under examination by the committee.

**IMPORTANCE OF NETWORK PROGRAMING**

As we have followed the extensive testimony at this hearing, it would appear that the continuous availability of network programs constitutes a major ingredient for the successful operation of a television station, regardless of whether it operates in the VHF or UHF band.

Some of this testimony contained the implication that if network programs had been available to them, many of the 61 UHF stations which, by May 19, 1954, had surrendered their construction permits or suspended operations, could have continued in business.

It is obviously true that any television station's success depends on good programing, and as the networks are presently the main source of supply for good programing, the networks' position in television broadcasting is indeed a very important one, if not a controlling one. Hence, it seems to us both relevant and important to point out at the outset of this statement our views:

(a) That the problems presented at this hearing are not unique to UHF.

(b) That national advertising economics have caused the basic problem confronting the expansion of television. National advertising, carried by the television networks, logically concentrates television advertising in a limited number of metropolitan markets.

(c) That as long as the networks remain the only prime source of good programs, there never will be a nationwide competitive system of television broadcasting in this country, regardless of the number of networks in operation.

(d) That, consequently, further television expansion is only feasible if the economic base on which television broadcasting rests, is broadened.

(e) That this broader base can only be found in a new source of high quality programs, provided these programs are competitive to network programing and are not subject to national advertising economics.

(f) That subscription television can provide this new source of programs, and also meet all other essential requirements.
Because the key position of networks in the current patterns of television not only influence the nature of programming but also the amount and extent of advertising support of programming, we believe it also essential to the conclusions of this committee to have a clear picture of the basic relations between advertising economics and broadcasting economics for all stations, both UHF and VHF.

In the final analysis it is a company's advertising budget and more specifically the percentage allocated to television advertising, which determines the extent to which a particular company will undertake the sponsoring of television programs.

Within the limitations of this budget, the advertiser must determine:
1. The amount of money he is willing to spend for the program itself.
2. The amount of money he is willing to spend in the purchase of television broadcasting time in order to transmit his program together with his advertising message.

It is a matter of individual judgment whether an advertiser will place the emphasis on program quality or on market coverage. In any case the two factors are always closely related.

In the purchase of broadcast time, and the market coverage it will represent, advertisers are guided by the yardstick of "cost per thousand" viewers or television homes. The "cost per thousand viewers" is derived from a figure, usually referred to as "circulation." It indicates the number of television homes in a station's reception area.

While the "cost per thousand viewers" enables an advertiser to evaluate individual markets—or television station—the circulation figures enable him, simply by adding up the most desirable markets, where the cost per thousand viewers is lowest, to determine the total number of markets—or television stations—necessary to reach as large a percentage as possible of the United States population.

Naturally, in selecting his station it is financially more attractive to an advertiser to prefer metropolitan areas where a very dense population prevails. The following figures illustrate vividly how large a segment of the United States population can be reached with only a few television stations:

Note.—Total number markets, 54; total United States TV homes, 28,500,000, as of February 1954.

As the above table shows, the top 10 markets include a total of 13,231,500 television homes, or approximately 46½ percent of all television homes. Thus, with only a relatively few television stations, a large percentage of the United States population can be reached.

As the logical part of their own sales efforts, the television networks never fail to drive this point home with national advertisers. It also
finds logical expression in the limited number of basic network affiliates of the CBS and NBC television networks, as per May 1954:

<table>
<thead>
<tr>
<th>Basic required affiliates</th>
<th>Basic optional affiliates</th>
</tr>
</thead>
<tbody>
<tr>
<td>CBS</td>
<td>43</td>
</tr>
<tr>
<td>NBC</td>
<td>52</td>
</tr>
</tbody>
</table>

The basic required affiliates are a group which an advertiser is forced to take if he wants to avail himself of the network's facilities. In case he wants coverage beyond that of the basic required group, he can, at his own choice, add stations from the optional group. In practice, most national advertisers use less than 75 stations to cover their national market. The following table which lists 23 of television's leading programs, reveals the number of stations the advertiser uses, and the number of television homes covered.

**Table II.—Coverage of leading TV programs 2 weeks ending Apr. 10, 1954**

</tr>
</tbody>
</table>

As a significant footnote to the above table, it should be noted that a varying number of stations can reach approximately the same number of television homes. I Love Lucy with 132 stations is in the range of over 27 million homes. In contrast, the Garry Moore Show has a coverage of nearly 26 million television homes utilizing only 52 stations. As could be expected from these circumstances, television stations in major metropolitan markets profit first, stations in secondary markets are mostly ignored.
According to FCC statistics, during the week of March 14 to 20, 1954, the average postfreeze VHF television station, operating at a profit in a market of over 500,000 people, carried a total of 45 network hours, as against 22 hours for a similar station in a market with less than 100,000 people. For UHF television stations, the figures are 43 and 17 network hours, respectively.

In the past, the argument has often been advanced that television will continue to attract larger advertising budgets, and that more and more stations will eventually participate in network broadcasting. This argument collapses in the face of the following two facts:

1. With most companies serving a "national market", it does not make economic sense to use more television stations than are essential to cover a certain large but fixed percentage of the population. Beyond that point the company's market is scattered and clearly marginal. In addition, the "cost per thousand viewers" in markets at the bottom of the list, may be such that it does not permit stations in those markets to compete successfully against other advertising media which offer more attractive "cost per thousand" rates in scattered markets.

2. As has happened in the past, a considerable percentage of any increase in television advertising from year-to-year is siphoned off by the major markets. This results from:

A. Higher saturation of sets in the metropolitan areas.
B. Increases in metropolitan stations' power with resulting increase in coverage.
C. Pushing back of the fringe reception areas, as performance of receivers improves.

The time rates of a New York television station, as they have developed over a period of years, make it quite obvious that although the "cost per thousand" may have remained equal, the total cost to an advertiser to promote his product in this vast market has been climbing steadily.

<table>
<thead>

</tr>
</tbody>
</table>

Because of the very nature of these market coverage factors which give natural advantage to (1) the networks and (2) stations in larger metropolitan areas, it is hardly surprising that postfreeze stations, both UHF and VHF, have found it difficult to secure an economic foothold in television, even though it is a new and dynamic industry. It should, therefore, be instructive to this committee to analyze the market size and location of stations which have so far surrendered their construction permits or suspended operations. A study of the following data will reveal that their difficulties have little, if any, bearing on UHF, but are primarily caused by a situation in which the economics of network broadcasting militates against small communities.
Per May 19, 1954, a total of 12 VHF and 61 UHF stations returned their construction permits or went off the air. The following table classifies these stations in terms of population:

<table>
<thead>

</tbody>
</table>

In the top 52—the total number of NBC basic affiliates—metropolitan and urban markets, Wheeling-Stevensville is found at the bottom of the list with a population of 354,092—1950 census data. Using this figure as a yardstick, only 13 of the 73 stations which are analyzed above are about as large or larger than Wheeling-Stevensville. To put it another way, only 13 appear to be of “network standing,” in terms of basic affiliation. This conclusion does not even allow for such factors as “cost per thousand viewers,” coverage from nearby metropolitan stations, and so forth.

As far as the remaining 63 stations are concerned, their chances of obtaining a basic network affiliation seem quite remote. Some of them could have become optional affiliates, which is a most unstable relationship at best.

But even more significant is the fact that, in most cases, these stations would have encountered most of these same difficulties if they were on the VHF band.

They are not in the wrong band, but in the wrong towns, at least from the networks’ point of view, who are guided by the economics of national advertising.

It is perhaps unfortunate that this committee has placed upon itself the limitation of investigating UHF only. Although some of the problems, as presented by other witnesses, are unique to UHF, they all have their roots in the economics which govern every type of television broadcasting. It seems likely that the failure of the 12 VHF stations was principally caused by the same factors as caused the failure of the 61 UHF. Narrowing the issue to UHF brings danger of giving UHF stations preferential treatment, creating further inequities between VHF and UHF.

It must be recognized also that the present list of “returned CPs” overlooks the many operators who studied their local economic prospects and, because of the uncertain future, did not even apply for licenses. These stations differ from those who actually failed only in that they either did not have access to the necessary risk capital or because they merely did not have the economic courage. Regardless of whether one should or should not admire their judgment, the fact today is that a man who plans to operate a television station in an area of less than 100,000 people, is considered foolhardy by most observers. Nevertheless, the FCC, in setting its allocation table, anticipated that there would eventually be hundreds of television stations in these small communities, as evidenced by the fact that of approxi-
mately 1,232 cities listed in the Table of Assignments, 891, or almost three-fourths, are cities of 25,000 population or less. These same cities received over half—55.3 percent—of all commercial television channel assignments.

The following table compares, by population groups, the number of channels assigned, and the number of channels covered by license applications, as per May 1953:

<table>
<thead>
<tr>
<th>City size</th>
<th>Number of channels assigned</th>
<th>Number of channels applied for</th>
<th>Percent (2) of (1)</th>
</tr>
</thead>
<tbody>

<td></td>
</tr>
</tbody>
</table>

A note of further interest is the fact that in cities below 25,000, there are a total of 101 VHF channels in 89 cities for which no applications were filed as of May 1953. This seems to emphasize that economic problems in television broadcasting are not confined to UHF.

Although these figures are already 1 year old, the situation has worsened rather than improved.

Even among those stations who have construction permits issued to them there is now little indication of enthusiasm. According to Television Digest of May 8, 1954, of the 220 construction permits still outstanding, only 80 reported target dates within 1954 for station construction. Only as few as 18 are known to have equipment on hand, while another 45 have stated they have equipment on order.

THE BLAME LIES WITH THE ECONOMIC FACTS OF LIFE

It would be unfair to both the networks and the advertisers to lay the blame on their doorstep. Both are guided by sound economic principles and it is not their fault that many broadcasters believed that television would largely repeat the history of radio.

Present comparison between the two media now reveals more difference than similarities. Radio’s cost per thousand viewers is considerably lower and, therefore, attracts a larger number of advertisers. Radio stations not affiliated with networks—clear channel stations—generally were and are able to operate profitably. But television has not as yet found the equivalent for radio’s low-cost disk jockey shows and other program techniques which contribute to radio’s thrifty economics. In this connection, it should also be pointed out that the number of potential national advertisers is limited. According to the Publishers Information Bureau, there were in 1952 only 52 advertisers with total television advertising budgets of over $1 million. In view of this fact, it is hardly surprising that that presently 35 percent of network television advertising is sponsored by only 10 companies. It needs no emphasis here that from an economic point of view these circumstances provide a precarious future for new television stations, especially in small markets.
FUTURE TELEVISION PATTERNS

It has been stated at this hearing that the Government is anxious to see a "nationwide competitive television broadcasting system."

As long as the future of television is chained exclusively to the economics of network broadcasting, it would appear that the chances of realizing this objective are virtually nonexistent.

As long as certain network affiliations remain of vital importance to a station's economy, the number of stations in this country will be limited to those which the networks can support. This number may well remain as small as some figure between 300 and 400. It will rarely include small communities some of which, if they are lucky, will have to content themselves with fringe-area reception from nearby metropolitan television stations. In short, the networks and the advertisers, and no one else, are dictating today how many stations there shall be and which towns shall or shall not have television.

POSSIBLE SOLUTIONS

The addition of more networks does not seem to solve the problem, except for those UHF stations which are located in the top markets. Television, as a mass communications medium, is continually challenged by other mass communications media. Consequently, any network will always seek the conditions most favorable to such competition. These conditions exist primarily in major markets, not in small towns.

Regulation of nonessential aspects of television broadcasting is merely an evasion of realities, rather than a statesmanlike expression of congressional guidance.

Therefore, the conclusion would seem to be inescapable that, if this committee confined itself exclusively to the "advertising-sponsored network" concept of television broadcasting, it automatically places itself in the position of favoring a limited system of television broadcasting.

Needed is a new source of high quality programs, competitive to network programing and not subject to the economics of national advertising.

In this connection, this committee may wish to give serious consideration to a complementary system of television broadcasting which shows strong promise both of introducing competition to network broadcasting and, not being dependent on national advertising, of bringing service to areas where coverage is now considered uneconomical.

This complementary system of television broadcasting is usually referred to as subscription television.

Subscription television is basically a technique for coding or scrambling the transmitted signal so as to produce a distorted picture and unintelligible sound at any receiver not equipped with appropriate decoding or unscrambling devices. Subscribers can purchase "decoding information" on a per program basis.

With subscription television the public pays directly, at its own free selection, for high quality programs now unavailable on television. Under the present system of advertising-sponsorship, the cost of television entertainment is charged indirectly to the public in the price of the products advertised, and regardless of whether the individual watched or listened to the program.
The Chairman of the FCC, Mr. Rosel Hyde has himself mentioned subscription television in his testimony before this committee. Mr. Hyde, in commenting on subscription television said, "In addition, it is alleged that subscription television will free stations of their dependency on networks." He also informed the committee that the FCC recently commented on subscription television in a letter to the chairman of the House Interstate and Foreign Commerce Committee regarding a bill introduced by Representative Hinshaw of California.

The most pertinent aspects of this communication were:

1. At the present broadcast station licensees cannot transmit radio or TV programs for public reception on home sets wherein programs can be received only by those willing to pay a specified fee.
2. The entire problem of subscription television is now under active study by the FCC.
3. Neither FCC nor the courts have defined subscription television as "broadcasting" under the Communications Act. But FCC thinks it can do so should it deem subscription radio and/or TV to be in the public interest.
4. FCC intimated that there is little reason to consider that box office broadcasting is not "intended to be received by the public" just because there is a fee charged. The absence of any charge for the program is not a prerequisite of "broadcasting," it was explained.
5. "The reliance of the broadcasting industry upon advertising revenue, rather than upon direct charges to the public as its principal source of revenue, has not been the result of any action by either Congress or the Commission, but rather the result of the natural development of the industry," FCC said.
6. Subscription services would be a type of broadcast service because while they might have a special appeal to a segment of the potential audience, "this is equally true of a substantial portion of the programming now transmitted" by stations.
7. "The exclusion of subscription services from the classification of 'broadcast' operations"—which the Hinshaw bill would accomplish—would not in itself bar subscription authorization, according to FCC, which emphasized:

The Commission may authorize other services on the broadcast bands if it determines that the public interest will be served thereby.

The Commission also noted "subscribing members of the public would be paying for the programs rather than for the use of communication facilities." The FCC referred to its present authority to regulate number and type of hours during which subscription television programs can be broadcast by a station; the number of stations in a community which could be so engaged; and the adoption of transmission standards.

**THE POTENTIALS OF SUBSCRIPTION TELEVISION**

Because subscription use of television represents a wholly new approach to solving both the economic support and cultural uses of television, yet would do so in addition to rather than as a substitute for present television usage, we believe that its authorization would do the following:

1. Establish a new television broadcast service which will compete for audience with the existing services and offer an economic solution to the weaker networks and independent stations.
2. Make more telecasting stations economically possible, especially in the smaller communities.

3. Build a bigger television audience and one more flexibly available to the advertising sponsors.

4. Provide an economically sound solution to the mounting problem of retaining or adding the “premium-type programs” to what is now available on television. Hence—

5. Solve the sports world’s problem of the declining gate receipts at the stadium—thus a means of returning the big league football games, the championship prize fights, and so forth, to home television.

6. Solve not only the short-run problem of putting the best feature motion pictures on TV, but the long-run problem of producing more and better motion pictures for all types of exhibition.

7. Provide a solution to the shrinking status of the stage and a return of the legitimate theater from a few houses on Broadway to virtually all of the houses in America.

8. Solve the similar economic problems that have even further reduced the status of the opera and sympathy.

9. Furnish a fresh and practical solution to the long unsolved problem of how to develop the obviously great educational uses of television. By charging a modest “tuition fee” for a few of the best weekly programs that could be developed out of the wealth of knowledge on a college campus, the wherewithal could finally be obtained to build the much-discussed educational stations. Operated as non-profit stations, they could still avoid commercial sponsorship, and yet obtain sufficient subscription revenue to operate most of the time without fee on a truly public-service basis.

In conclusion, subscription television will supply a second source of revenue to VHF and UHF stations who now have to depend exclusively for income on advertisers. They must have two sources of income—the advertiser and the subscriber. Subscription television supplies that second source of income that is so vitally necessary especially to the weaker networks and the outlying stations in the smaller communities. Subscription television will bring to the most humble homes grand opera, front row seats on opening nights on Broadway, top movies and other great events too costly to be sponsored by the advertisers. Only subscription TV can deliver such attractions into the homes at a mere fraction of what is now paid per viewer at the box office.

Subscription television, in other words, offers not only an economic but also a cultural solution to television’s basic problems.

No greater catastrophe could befall the weaker VHF stations than to have this given exclusively to the UHF stations.

Senator Potter. Thank you very much, Mr. Ball.

Mayor Lawrence.

Mr. Mayor, we are delighted to have you before the committee representing your great city of Pittsburgh and I know of your fine record there as mayor. I regret, however, that I have another hearing, and I will turn the hearing over to Senator Schoeppel. I would love to stay but I have a conflict of interests here this morning.

Mayor Lawrence. I realize that.

Senator Schoeppel (presiding). All right, Mr. Lawrence, you may proceed.
STATEMENT OF HON. DAVID L. LAWRENCE, MAYOR OF THE CITY OF PITTSBURGH, PA.

Mayor Lawrence. Mr. Chairman, members of the committee; first, I would like to state that I am not a lawyer; I am not an engineer, and I happen to be in the insurance business, and at the moment mayor of the city of Pittsburgh.

I cite all that to indicate to you that I know very little, probably less than anyone in the room, about the technical features of television.

The city of Pittsburgh ranks as the 12th largest in the United States with a population of 676,806, according to the last census. Its standard metropolitan area, which includes Allegheny, Beaver, Washington, and Westmoreland Counties, contains a population of 2,213,236. A survey conducted by the J. Walter Thompson Co. showing the television households for the 340 top markets in the United States as of January 1, 1954, listed Pittsburgh as the eighth such market.

In other words, we are 12th in population and 8th in the television world.

In spite of this large concentration of population, Pittsburgh had only one operating television station from January 1949 to August 1953. The Allen B. Du Mont Laboratories, Inc., began operation on VHF channel 3 in January 1949, while two UHF stations commenced operation during the summer of 1953.

It is, therefore, obvious that this vast number of persons residing in the Pittsburgh standard metropolitan area were deprived of the television to which they were entitled. The so-called television freeze, lasting from September 1948 until April 1952, was the principal reason why these persons were deprived of this service.

Prior to the freeze, the Federal Communications Commission had allocated 4 VHF channels to Pittsburgh. The Commission had already authorized Allen B. Du Mont Laboratories, Inc., to use channel 3, thereby leaving 3 channels for which interested persons could apply.

When the freeze order was adopted there were no less than 7 applications pending for these remaining channels, at least 1 of which had been on file since October 1945.

These Pittsburgh applications were designated for hearing in early 1948, but a hearing had not yet been held when the Commission imposed the freeze on any further processing of television applications.

A substantial amount of money had been spent by each applicant in preparing its original application and its hearing material. When the freeze was lifted, the Commission ordered all the pending applications removed from the hearing docket and the applicants were requested to file amendments in accordance with the new procedures. These applicants then had to spend additional funds in preparing amendments to their applications, and it was not until recently that these Pittsburgh applicants were designated for hearings for the unassigned VHF channels.

The freeze was not ended until April 1952, when the Commission assigned 3 VHF channels and 3 UHF channels to Pittsburgh, 1 of the VHF channels being allocated for educational use. Subsequently, as mayor of the city of Pittsburgh, I interested myself in obtaining
another channel for the city and the Commission, as a result of that, assigned channel 4 to Irwin, Pa., a nearby suburb, to provide additional service to Pittsburgh and its metropolitan area.

As stated earlier, Pittsburgh currently has only 3 operating commercial television stations—1 VHF and 2 UHF.

A construction permit for a third UHF channel was granted in October of 1952, but that station has not yet commenced operation.

Station WENS, operating on channel 16, has recently announced that it is canceling all of its local shows, except for certain Pittsburgh Pirate National League baseball games for which telecasts have been scheduled—I don't know why because nobody is particularly interested in the Pirates.

I learned this morning that is a temporary change in program until September or October.

The television service that is presently provided to the nearly 2 1/4 million persons residing in the Pittsburgh metropolitan area is inadequate to meet the needs of the communities served.

The remaining commercial channels assigned to the Pittsburgh area—channels 4 and 11—are each now being sought in competitive proceedings by a total of 8 applicants. While hearings on both channels have proceeded through the preliminary stages, it is estimated that the two winning applicants will not be able to begin commercial operation for at least 2, or more probably, 3 years. That is the estimated minimum length of time that it will take to arrive at final decisions plus the time it will take to construct the stations.

In the meantime, the people of Pittsburgh and the surrounding areas will receive only those programs broadcast by stations now on the air.

It is for this reason, and supporting testimony will come from many other similar areas, that any temporary or permanent freeze on the processing of television applications should be opposed.

The public in the Pittsburgh area, as well as the public in a large number of other areas, have already suffered from the results of one freeze, and they do not wish to go through another.

I have heard discussions of the amounts expended by some of the applicants, and it is my best judgment that the 8 applicants now going through hearings for the 2 VHF channels mentioned have already spent more than $450,000 and will spend at least an additional $500,000 in expenses directly connected with the hearings before any final decisions are reached.

And, of course, only 2 of these 8 applicants will be successful, with the result that 6 applicants will have spent vast sums of money and will have nothing to show for it.

This is the type of gamble that the 2 UHF stations and 1 UHF station permittee did not take, as in each case their applications were unopposed.

The eight applicants now in competitive hearings for the Pittsburgh and Irwin channels have pledged a total of more than $14 million to cover their respective costs of construction and the initial stages of operation. This amount that has been pledged is in the form of monies paid into or on hand by the respective applicant corporations, stock and bond subscriptions, and loans from banks and others.
In view of the fact that only 2 of the 8 applicants will be successful in these hearings, only approximately one-quarter of this amount will actually be used to finance the costs of constructions of the 2 stations and the initial operation. However, because of the collateral required for both corporate and personal bank loans, because of the commitments of the stock and bond subscribers, and because of moneys pledged out of corporate assets, a large proportion, if not all, of this total of $14 million must be held in a suspended state pending the results of these hearings.

In the absence of these personal and corporate commitments, these moneys could be employed for other productive purposes.

The combined construction costs of the proposed stations as stated in the applications of these eight applicants total more than $12,500,000, for which the above amount has been committed. When such a vast amount of money is multiplied by the number of cities wherein competitive proceedings are pending or are in process throughout the country, the committee will realize what a serious and inequitable hardship would result if another freeze were imposed.

Senator Schoeppel. Mr. Lawrence, might I inject there; I think that is a situation that should certainly be taken into consideration, but in all fairness to the Commission downtown, or the agency downtown, if they sought to preclude somebody coming in and contesting one of these stations, they would be over a barrel, too, wouldn't they?

There has to be a degree of latitude to the applicants, consistent, of course, with the time element that goes into all of this; but what I take it you are objecting to or forewarning against is a freeze that might come at this stage of the game with these applicants in the present position they are, not only in your community but a lot of other sections of the country?

Mayor Lawrence. Exactly.

Senator Schoeppel. But you do agree that it is not really the thought of the agency downtown or the Commission downtown?

Mayor Lawrence. I am not critical of them, but we have been just the innocent sufferer from just one thing after another, with the result that here Pittsburgh, which was the pioneer broadcasting city of the world in radio, is today still with 1 VHF and 2 UHF stations.

There has just been a series of things happening that deprived us of people having the proper facility.

Senator Schoeppel. Yes; but let me remind you there are other sections of the country in the same situation.

Mayor Lawrence. Exactly.

Senator Schoeppel. Maybe not in the magnitude of yours.

Mayor Lawrence. Exactly.

Senator Schoeppel. But that has happened in other sections of the country.

Mayor Lawrence. Exactly.

I remember distinctly when I was fighting for the stations we have got and the educational station. I happened to lead the fight for the educational station. I was then president of the United States Conference of Mayors, and we have a station operating in Pittsburgh—WQED. I then got somewhat of a survey of the situation. I found a city like Denver at that time had none. Portland, Oreg., had none.

I remember that distinctly.
To continue with my paper, a survey conducted by the A. C. Nielsen Co. for CBS-TV, showing the number of television families by counties in the United States as of November 1, 1953, stated that there were 501,960 sets which received only VHF broadcasts in the 4 counties comprising the Pittsburgh standard metropolitan area. At an average cost of $250 per set, these 501,960 VHF sets represent an investment of more than $125 million by the public of the Pittsburgh area.

Should the Federal Communications Commission require, as a result of these hearings, that all television channels be in the UHF band, this investment of more than $125 million can be only partially salvaged through set conversions to UHF at a tremendous additional investment by the set owners, which, on the basis of conversations I have had with people in both the radio and television business, would amount to another 30 or 40 millions of dollars.

Senator Hunt. Mr. Lawrence, how many sets in that same area have been converted to receive UHF?

Mayor Lawrence. I don’t have that figure, Senator Hunt.

Senator Hunt. Do you have some idea of the relationship between the two in your area?

Mayor Lawrence. No. You would have to get that from somebody in the television business.

The word “partially” is used because of a comprehensive—

Senator Hunt. May I ask one more question?

Mayor Lawrence. Yes. Pardon me.

Senator Hunt. Is your city served by television from other cities at all?

Mayor Lawrence. Some people can pick up, I understand, from Johnstown; but a great many of the sets can’t. You see, our terrain is quite hard. We are in hills and valleys there and it makes it somewhat difficult to pick up other places.

The word “partially” is used because a comprehensive field survey was conducted in 1949 in the Pittsburgh area by Westinghouse engineers which indicated that the signal coverage of UHF in a rough terrain is substantially inferior to that of VHF in similar terrain. Therefore, it is reasonable to assume that the conversion of sets to UHF would not insure that many persons residing in the area would receive satisfactory service.

It has been estimated that a move of all channels to the UHF band would destroy an investment of nearly $10 billion—I was originally told that was 3 to 5 billion, but I understand that Dr. Du Mont stated here it was closer to $10 billion—made by persons throughout the United States in VHF sets.

The committee should realize that the ultimate beneficiaries of this or other similar hearings should be the public—and I am sure that is your concern.

The Communications Act of 1934, as amended in 1952, states that the Commission should administer the act and its own rules and regulations for the public interest, convenience, and necessity. Any requirement that would eliminate an investment of $10 billion would not be serving, we all recognize, the public interest, convenience, and necessity.
Several proposals were made before this committee during the hearings held on May 19–21 to the effect that the coverage of both VHF and UHF should be reduced and limited.

The present coverage provided to the Pittsburgh area by the three operating stations is not as satisfactory as desired. This results in part from the extremely rough terrain in the area and in part from the present low power of one of the UHF stations.

To reduce or limit the power of television stations, or to eliminate VHF stations, would result in the rendering of an inferior service to the Pittsburgh area, and the same result would occur in many similar areas throughout the United States. It is the public that would be damaged by such proposals.

Pittsburgh has contributed, as I stated before, a great deal to the development of the radio. It has the two oldest commercial broadcasting stations in the United States and it is a great embarrassment to me to think that our great city and community has been treated so badly in the allocation of channels. Any further delay in the processing of the pending applications would be a great injustice to us.

In conclusion, we should not lose sight of the fact that television is a new industry and is still experiencing its growing pains. The early years of operations of both prefreeze and postfreeze VHF stations were filled with many hardships, not the least of which was severe economic losses.

It is my belief that this industry can best serve the public interest if it can proceed, without further delay and without further governmental restriction, to expand the television facilities of this Nation.

Senator Schoeppel. Senator Hunt.
Senator Hunt. I have no questions.
Thank you, Mr. Chairman.
Senator Schoeppel. Thank you, Mr. Lawrence.
Mayor Lawrence. Thank you, Senator.
Senator Schoeppel. The next witness, I think, is John Guider of the Mount Washington TV Co., of Poland Springs, Maine.
Mr. Guider, you may be seated, sir.
I note you have a written statement.
Mr. Guider. I have; yes, sir.
Senator Schoeppel. You may proceed in any manner that you desire.

STATEMENT OF JOHN W. GUIDER, PRESIDENT, MOUNT WASHINGTON TV, INC.

Mr. Guider. My name is John W. Guider. I am a lawyer and practice law before the Federal Communications Commission since the old days when it was the Federal Radio Commission.
I have been associated with the radio industry in one way or another for about 30 years.
I presently live in New Hampshire, and I am the president of Mount Washington TV, Inc., which holds a construction permit for a television broadcast station on channel 8, a VHF channel with our transmitting facilities to be located on the summit of Mount Washington, which is the highest mountain in the eastern part of the United States,
6,280 feet. That summit is about 4,000 feet above the average terrain of the surrounding countryside. So, our antenna will be approximately four times as high as that of the Empire State Building and the antennas located thereon.

This presentation, which is not a long one, is perhaps something that particularizes the generalities that were in Mr. Pierson's testimony.

We are showing you here a specific example of how these proposals work in an actual case that is in existence at the moment.

I, personally, am the owner and operator of a 250-watt standard broadcast station, FM station, located in Berlin, N. H., at the foot of Mount Washington. Most of my associates in the Mount Washington venture are also owners and operators of small standard broadcast stations in northern New England—WABI and Bango; WCOU in Lewiston; WFAU in Augusta; WPOR in Portland, Maine; WTVL in Waterville; and WRKD in Rockland in Maine; and WKBK, Manchester; WTSV, Hanover; and WTSV, Claremont, in New Hampshire.

My associates and I are engaged in the challenging venture of establishing a TV station in a sparsely settled part of the country on a mountain which is snowbound from October to June every year and has the worst weather in the country.

Unless you think I am prone to exaggerate that, let me say the highest winds ever recorded on the face of the earth, 231 miles an hour, have been recorded at the top of Mount Washington before the equipment was damaged. A sustained gust of 180 miles an hour has been recorded up there for a period of 5 minutes. The average wind for the 365 days of the year up there is around 58 miles an hour, and the hurricane force is 70 miles an hour.

So, that gives you an indication of the kind of weather we have up there.

In addition to that great wind area up there, you have, of course, extreme cold weather. So, the Government has recently been conducting all kinds of cold-weather experimentation work on top of Mount Washington, and has put several big activities up there.

In the more than 2 years we have been pursuing the project, we have proceeded far in flicking many of the severe construction and operating problems involved in this unique TV station.

It has been sometimes called the Zsa Zsa Gabor of all TV stations because of the unusual glamor it possesses and the many characteristics about it that are really unique.

After expenditure of much time and money we are now on the threshold of establishing a TV service which will be of a tremendous value to an underprivileged radio and TV area—at least so far as radio and TV is concerned.

It is, accordingly, with some concern that we read of proposals before this committee which, if applied to our station, would kill off the entire project and with it the public benefits it will provide.

These UHF proposals include:
- Abolishing VHF assignments and moving all TV stations to UHF;
- A freeze on any more VHF construction for an indefinite period;
- A reduction or limitation of coverage of VHF stations.

They appear to have been advanced as remedies for UHF's problems, capable of general application on a nationwide basis and without re-
gard to the varying circumstances and conditions in different parts of the country.

I am not qualified to pass judgment on whether some of these proposals may be helpful to the development of UHF in certain localities without being to the detriment of TV and the public generally; but I am sure—and the facts are clear—that to apply them to northern New England and to Mount Washington TV, in particular, would benefit nobody. On the contrary, it would cause serious and irreparable public and private loss.

Adoption of any of these UHF proposals would wipe out not only the very substantial investment my associates and I have made in Mount Washington TV, but it would also wipe out the only TV service of any kind which will ever be provided for a very large number of farmers and other rural residents and small communities in the States of Maine, New Hampshire, and Vermont—all this to no gain, because no compensating benefit to UHF in our part of the country will be gained by it and no proposal has been made by UHF to substitute for this VHF service that is contemplated by our project.

Any proposal which will require a reduction in Mount Washington TV's service area is definitely contrary to the public interest in northern New England. Mount Washington TV's survival depends upon the wide coverage it will provide.

Northern New England is predominantly a rural area and sparsely settled. The broad reaches of Maine, New Hampshire, and Vermont lack the concentration of population to support broadcast stations, and they have always suffered from inadequate radio service.

I will leave my notes for just a minute to tell you in my home in Littleton, N. H., with the best of radio equipment and antennas, there is no certainty I can receive any particular station on any particular night.

I am talking about broadcasting now.

At this late date there are great areas in Maine, New Hampshire, and Vermont where you never know where you are going to get and if you want to listen to the Columbia news, you reach down into New York and get it at 11 o'clock at night, or some other night you get it from New Orleans, or you get it from Charlotte, or somewhere else. You never know what you are going to be able to get up there.

There is a need up there for some better share of radio facilities, and we are trying to bring to the people good TV when they have never yet had good radio.

Senator SCHOEPPEL. That means, of course, there are certain phenomena that exist which the scientists have an explanation for, but we haven't got the equipment and sets, and one thing and another yet, to provide the good type of service?

Mr. GUIDER. No, Senator. I think the main reason is that we up there are a little too far away from the populous centers that can support a broadcasting station.

Senator SCHOEPPEL. Yes; I recognize you have got that factor there.

Mr. GUIDER. Then you have the mountainous terrain which does introduce some scientific problems.

Senator SCHOEPPEL. You mentioned, for instance, you got stations from New Orleans up in that area.
Mr. Guidér. Yes; you get what is called the skywave—skip distance.

Senator Schöeffel. Yes.

Mr. Guidér. One night you will get Chicago; another night you will get Pittsburgh.

Now, another program I listened to today is the 6:45 news, and I sometimes think I am getting it from Boston, WBS, which comes from a pretty reliable station, from about 180 miles away but I am just as apt to be listening to Pittsburgh carrying the same program and won’t get Boston at all.

We get freak reception. There must be some scientific explanation to it. I am not sure I can put my finger on it, except I know we are outside the good service areas of any station strong enough to reliably serve us.

Unable to support radio stations, communities in this area will even less be able to support TV stations, individual stations.

Mount Washington, in northern New England, however, provides the natural height whereby a TV service can be rendered over a wide area and thus encompass sufficient people in the aggregate to make a station economically feasible, and only by such a station will large portions of northern New England ever receive a television service.

As Federal Communications Commissioner Sterling stated publicly when we received our permit to build a station on Mount Washington:

This station on Mount Washington will no doubt, taking into account the economy of the area and the high cost of establishing a TV station, provide the only TV service the population of these areas may ever receive.

I certainly know that is a correct statement and it is the reason we are here today.

If, however—

Senator Hunt. May I ask you what date that statement was made?

Mr. Guidér. That decision, Senator, I think, was July 8 of last year, when we got our grant.

Senator Hunt. Last year.

Mr. Guidér. At the time we got our grant, from what was a press release.

Senator Hunt. I take it, from that, the Commissioner doesn’t feel the community antenna services will ever blanket your area then?

Mr. Guidér. No, sir, because even they need a better signal than would be coming in.

A community antenna usually relies on getting up on some local hill or something and picking up a signal, but we are not going to be close enough to anything to even get it up on the hill with very good success.

We know now about what we are getting up there because a lot of sets have been sold on the strength of the promise of Mount Washington, and these sets are now operating in a fringe area, and some people up on hills get pretty good results; other people down in the valleys are getting nothing but snow.

So, we know about what a community antenna would do up there and it wouldn’t do too much.

Getting back to the statement: If we are to be prohibited from using the natural advantage of height provided by Mount Washington, or we are otherwise forced to reduce coverage, we would be forced to abandon our plans.
Our only chance of getting the necessary financial support to operate the station is to incorporate an audience big enough to justify the advertiser buying air time at the station. Washington TV station covers only, for the UHF signals would be so unsuitable to provide service in the mountainous areas of northern New England and the area and population which UHF would reach would be so limited that the station would lack the wide coverage which alone makes a TV service economically feasible in this sparsely settled area.

Accordingly, any limitation on Mount Washington's TV-wide-area coverage, by preventing the use of the mountain which makes that coverage possible, by requiring a reduction in power, or by forcing a move from VHF to UHF, would destroy the TV service which Mount Washington TV will render; and—I ask you to note this point—none of these remedies advanced in behalf of UHF will serve to replace that service with any UHF substitute.

Moreover, most of the TV sets in the States of Maine, New Hampshire, and Vermont—a total of—I think the figures on the 31st of May were 247,000—are capable of VHF reception only. I am perfectly sure more than 200,000 of these receivers are not adapted for UHF.

Senator Schepel. Might I ask there, sir, in reference to the last statement you made there on page 3—"and none of these remedies advanced in behalf of UHF will serve to replace that service with UHF service."

Is that because there is no application for UHF permits in there?

Mr. Guider. That is right. There are presently operating in our service area 2 UHF's with low power, 1 in Portland and 1 in Lewiston, Maine.

A person would have to be a little short of insane to try to put a UHF station up into that north country area, with the small population, and try to get his programs up there and try to sell it to anybody for enough to operate a station; and when he got up there he would be operating in a terrain which would drive the signal right back under his towers and he would get to very few people.

I don't believe anybody would be tempted to put UHF up there.

Another UHF suggestion is the freeze on VHF construction.

Now, it is unthinkable and, as somebody said yesterday, appalling that any freeze would be applied to a case like ours. Not only would the freeze be fatal to the establishment of the service which large areas of northern New England are waiting for, but it would not replace it with UHF service. Moreover, it would prevent us from completing our construction and getting on the air as planned, and that would be grossly unfair to Mount Washington TV.

Now, I know you gentlemen realize when you take a construction permit you accept an obligation to complete your station at a certain time, and you have only 6 months to do it in. So, you are obliged,
if you are operating in good faith, as most applicants do, to go out and start spending money right away to meet that deadline. We have done that.

Our deadline is in September. We hope to go on the air in August.

I would like to mention very briefly what we have done.

For over 2 years we have been very active in proceedings before the Commission, in making the necessary surveys, economic, engineering, and programming to carry out the proposal, in preparing and processing an application, in working out conflicts with other applicants, in conducting experimental transmissions from the mountaintop, and since getting our grant the last of July, we have done extensive work to provide power and housing on the mountain.

I think you will be interested to know we are prefabricating a very strong building and moving it up in sections so it can be speedily erected during the short building season in the summer the mountain affords us.

That construction is under way on the mountain. We have got a concrete foundation that is going to cost us $50,000 just for the function. Everything up there has to be very strong.

Our whole building has been certified by the scientists at MIT that it will not sway more than a quarter of an inch in a hundred-and-fifty-mile wind, but we are not building anything sparingly and it hasn’t been easy to plan it and know how to make it work up there.

All told, we have so far expended—and we were not involved in any hearing—this is not hearing money—over $200,000 on the project, and we have signed commitments covering equipment, housing, facilities, and so forth, for an additional $500,000.

Much of our equipment, costing over $400,000, has been shipped to us, and the balance of it will all be delivered within the next 30 days.

We are not now in the position of being able to wait and see what is going to happen to this hearing. Weather conditions afford us only the next 3 months to build our transmitter house and get our equipment installed.

If we are to get the station on the air this year, we must proceed energetically and without any delay so we can have our construction completed before the mountain gets snowed in again in October.

If we don’t get on the air this summer, it will be not practical from the business point of view to ever go on the air.

I won’t elaborate on that in the interest of time, but I can, if you want me to.

Hence, my association and I must proceed with our plans to complete construction of the station just as rapidly as possible. We are doing so, confident that this committee will not take any such unwise or unfair action as recommending a freeze which would prevent us instituting the very valuable TV service we are already so far along with, and to do this without offering a UHF substitute.

My associates and I are engaged in the pioneering of a VHF station which challenges the imagination, not only in the problems involved but in the benefits it will bring to that large area of the country.

Whatever merit proposals advanced to solve UHF problems in particular locations in other sections of the country may be thought to have in those particular cases, these proposals cannot fairly be applied to the situation in our case. To do it would benefit no one. To do so would cause the most serious injury not only to those who have ven-
tured our time and capital, but to the hundreds of thousands of people who are waiting for it.

Mr. Guider. Now if I might make one small supplementary statement to quote a word used in another hearing here recently, I do not want to sound pious and I do want to say that I am one of the smaller investors in this company, although the amount invested is quite a large amount to me, but I would rather lose whatever I have got in there than to have this thing delayed. I would hate to face all the people in that north country who have waited for this station and whom I have been telling that we would have it in August and have to explain to them that we will not go on the air, and we will have to stop, look, and listen before the situation is settled.

I can tell you of hundreds and hundreds of people who have been saving pennies for downpayment on their television sets, and I am not exaggerating when I say that, when we go on the air.

Senator Schoeppel. I gather that there is a feeling of a fear of a freeze. As I recall the testimony, and I have been able to read some of it and have been able to listen to a lot of it, there was no recommendation or suggestion on the part of the UHF people or those testifying that a freeze, if ordered or thought about, should apply to any of the permits now granted. Maybe I am wrong, but I think the record will bear me out.

Mr. Guider. Mr. Pierson can answer that better than I can.

Mr. Pierson. My understanding is that there was a proposal to freeze the issuance of any further construction permits, and also a proposal to freeze any further authorization covering construction permits. I can get the exact citation in the record for you.

Senator Schoeppel. The impression that I have, as I have said, is that it does not stop construction on the granting of any permits.

Mr. Guider. I certainly hope you are right.

Senator Schoeppel. And we will certainly take a look at the record on it.

Do you have any questions, Senator Hunt?

Senator Hunt. I have three quick questions.

How high is your tower?

Mr. Guider. We are using a tower originally built for an FM station. The base of the tower is 50 feet high, and the antenna is a specially designed heated antenna which eliminates the ice and the sleet, which melts on it. The antenna on top of the old FM antenna comes in four 9-foot sections, a total height of 36 feet for the 4 sections.

Senator Hunt. What is the power?

Mr. Guider. One hundred and five kilowatts for the aural, and 50 on the sound.

Senator Hunt. How far do you expect to reach?

Mr. Guider. One hundred miles in all directions.

Senator Hunt. What population will you reach?

Mr. Guider. One million, five hundred thousand people.

Senator Schoeppel. Thank you very much for your statement, Mr. Guider.

Mr. Guider. Thank you, gentlemen.

Senator Schoeppel. The next witness is Mr. Lennox Murdoch, manager of station KSL-TV, of Salt Lake City, Utah.
STATEMENT OF D. LENNOX MURDOCH, VICE PRESIDENT, RADIO SERVICE CORP. OF UTAH

Mr. Murdoch. My name is D. Lennox Murdoch. My home and business addresses are Salt Lake City, Utah. I am a vice president of Radio Service Corp., of Utah, licensee of KSL, KSL-FM, and KSL-TV. I am the officer in direct charge of KSL-TV and am a small stockholder in Radio Service Corp. of Utah.

I might add that I have been with the Radio Service Corp of Utah for 24 years, and that since March of 1949 I have actively devoted my full time to the development and progress of our television operation.

Although the subcommittee is concerned with the television problem on a national scale, it has seemed to my organization and myself that the best contribution we can make is to tell you the experience we have had in operation of a VHF television station in a somewhat limited market, and on the basis of that experience, comment on some proposals made to you. With your indulgence that is what I propose to do.

Salt Lake City is the geographic and trade center of the Great Basin, an area bounded by the Rocky Mountains on the east, the high mesas of Arizona and New Mexico on the south, the Great American Desert to the west and the head waters of the Columbia River to the north. This is truly an enclosed inland empire.

This inland empire was settled first by the Mormon pioneers 107 years ago. The village system developed by Brigham Young called for key nucleus towns with a chain of supporting and interdependent settlements to be located wherever life and agriculture could be sustained within the limit of water resources. These towns were satellites of larger cities, coming together in a linked system of integration to the center which is Salt Lake City. The service and distribution techniques set up in those early pioneering days are still predominant.

The geographic isolation of the Great Basin area is demonstrated by the fact that Salt Lake City is 538 miles from Denver, 870 miles from Portland, 770 miles from San Francisco, and 750 miles from Los Angeles. There are no population centers between those cities sufficient to support the volume of wholesale and retail trade carried on in Salt Lake City.

The map attached hereto as exhibit A shows the grade A, grade B, and 100 microvolt per meter contours of KSL-TV.

Senator Schoeppel. That map will be made a part of the record at this point.

(The map referred to, exhibit A, is herewith inserted.)

Mr. Murdoch. You will note that although the Federal Communications Commission's rules limit KSL-TV to a maximum power of 29.5 kilowatts, KSL-TV is able to serve a large area. This results from the fact that the licensee of KSL-TV has pioneered in a mountain-top transmitter installation which is located on Coon Peak in the Oquirrh Range of mountains west of Salt Lake City. The transmitter site is at an elevation of 9,619 feet above sea level and 4,420 feet above the average elevation of the surrounding terrain.

If my memory serves me well, I believe that is the highest commercial transmitter site in the United States in operation at the present time.

COMPUTED COVERAGE CONTOURS
(Showing Population Density)

KSL-TV
Radio Service Corporation of Utah
Salt Lake City, Utah

Channel 5  23.5 kw  4238 feet

A. D. RING & ASSOCIATES
CONSULTING RADIO ENGINEERS
WASHINGTON, D.C.
The map marked "Exhibit B" has been prepared from the United States Population Density map of 1950 and shows in its unshaded portions the extent and location of population density for some areas under two persons per square mile, and indicates population density for other area service by KSL-TV.

Senator SCHOFPEL. That map will be made a part of the record at this point.

(The map referred to, exhibit B, is herewith inserted.)

Mr. Murdoch. It will be noted from the exhibit that the approximate center of the low population area is Salt Lake City, Utah, a natural center from which to serve this general area. Superimposed upon this are the service contours of KSL-TV. This illustrates the strategic position of Salt Lake City to furnish television service to many of the sparsely settled areas of the intermountain West.

Following World War II, Radio Service Corp. of Utah began its plans to apply for and operate a television station in Salt Lake City. We were well aware that in order to make such an operation profitable, it would be necessary to serve a substantial number of persons outside Salt Lake City for even at that early date it was apparent that operation of television stations was an expensive business and we desired, if we were to get into the business, to do the best possible job.

In order to determine the feasibility of wide area coverage, we conducted extensive studies to determine the feasibility of locating a transmitter site on one of the mountains in the area of Salt Lake City. But the cost of such an installation seemed prohibitive, and instead, on May 26, 1948, Radio Service Corp. of Utah filed an application with the Federal Communications Commission to operate a television station, specifying that the transmitter would be located on top of a building in downtown Salt Lake City. This application proposed a power of 18 kilowatts on channel 5. We estimated that this would serve approximately 275,000 persons and the installation would cost in excess of $200,000.

That application was granted in due course, and KSL-TV began commercial operation on June 1, 1949, at a time when there were approximately 2,000 homes equipped with television receivers within the proposed service area of KSL-TV.

And I might add there was one other commercial station in operation in that area.

Then began a period of 3 years and 7 months during which KSL-TV sustained heavy operating losses.

May I digress just a moment to tell you gentlemen that we have always recognized at KSL-TV that the value of good local programing, and although we received limited service from the networks the first 2½ years of our operation, we did endeavor to honor our trust and give to the public what they were entitled to in good programing, so we went in for local programing and were pleased to note the reception and satisfaction of that programing.

Despite these losses, KSL-TV did as good a job as possible on programing, having faith throughout that eventually the operation would begin to produce some return for the stockholders while doing the best possible job for the viewing public.

I am happy to say that some of these local live shows have rated as some of the highest in our area.
Senator Hunt. I think I can say from experience that I do not believe there is any community in the United States that has the talent locally that you have in Salt Lake City.

Mr. Murdoch. Thank you, Senator. We have endeavored to make good use of the territory.

Senator Hunt. You and I both understand why.

Mr. Murdoch. Thank you, sir.

During 1949, KSL-TV sustained losses averaging $9,787.04 per month for a total loss of $68,508.33 for the 7 months during which it operated in that year.

In 1950 the operating losses averaged $10,600.62 per month for a total loss of $127,207.54 for the year. During 1951 the losses averaged $11,042.61 per month for a total loss of $55,962.88 for the year. Finally, during 1953, 3 years and 7 months after KSL-TV began commercial operation, it showed a yearly profit.

While still losing money, KSL-TV expended substantial sums to enlarge its service.

During the years we were sustaining heavy operating losses, we became convinced that it would be difficult if not impossible for the station to operate at a profit unless we found a means of enlarging the service area. This conclusion coincided with pressure from residents outside Salt Lake City who desired to obtain television service. Accordingly, after further studies and surveys, Radio Service Corp. of Utah obtained a lease on Coon Peak in the Oquirrh Mountain Range, 17 miles west of Salt Lake City, and began plans to apply for and move its transmitter to that point.

This planning continued and the determination to apply for permission to move its transmitter to Coon Peak was made even while KSL-TV was continuing to suffer heavy operating losses.

On November 15, 1952, KSL-TV started transmitting programs from Coon Peak. From this location it was able to render service to 39 counties located in Utah, Idaho, Nevada, and Wyoming. With this larger service area, the station was able to increase its rates and move into the profit column.

The move of the KSL-TV transmitter site to Coon Peak was something of a pioneering venture—and there were some within the television industry who felt we were impractical idealists. In fact, the venture was not without costly experiences.

As an example, the 374-foot tower and antenna first installed on Coon Peak was blown to the ground during a violent windstorm on December 7, 1952, only 3 weeks after KSL-TV started transmitting from that location.

To summarize the financial experience of KSL-TV, installation costs have totaled approximately $828,800. Until January 1, 1953, KSL-TV had sustained operating losses of $384,190.15. During 1953 we made a net profit of approximately $65,000. Considering that we have had installation and operating losses of over $1 million, it will be many years before this capital investment can be retired.

KSL-TV presently is 1 of 2 operating VHF stations in Salt Lake City. The third VHF station is scheduled to commence commercial operation in October 1954. The allocation plan for Salt Lake City provides for 3 commercial VHF stations, 1 noncommercial educational VHF station, and 2 commercial UHF stations.
To date there has been no applications filed for the noncommercial educational station or the two commercial UHF assignments. The allocation plan for the State of Utah provides for 7 VHF stations and 10 UHF stations, 3 of which are reserved for noncommercial educational use. Aside from the three VHF stations in Salt Lake City, there have been very few applications submitted for television assignments in Utah.

One VHF grant has been made for Provo, and the last I knew there was still one application pending for Ogden. Both of these involve VHF allocations. Somewhat the same picture is shown for Idaho, Wyoming, and Nevada, the other States partially served by KSL-TV.

In Idaho the Commission has allocated 14 VHF assignments, including 1 educational, and 13 UHF, including 1 educational, assignments. There have been eight applications for VHF assignments, none for UHF.

Of the 8 VHF assignments, 3 stations are operating. In Wyoming there are 10 VHF assignments allocated, 1 educational and 17 UHF. There have been two applications, both have been granted, and I believe that both are now operating. In Nevada there are assignments for 14 VHF stations, 1 education, and 8 UHF, 1 educational. There are now single stations operating in Las Vegas and Reno, one in each city.

The other VIIF assignments, 1 in Reno and 2 in Las Vegas are, according to the latest information available to me, involved in competitive hearings.

UHF will not provide wide area coverage required in intermountain West.

Nor does it seem to us that there is any merit to the proposal that all VHF frequencies be eliminated and that all television broadcasting be relegated to the UHF band. In fact, as we see it, such a development would be clearly contrary to the public interest in our area.

In the first place it is necessary, in a market such as ours that a station be allowed to cover a fairly wide area in order to obtain advertising revenue sufficient to keep it on the air.

Secondly, a UHF installation tailored to serve the same or even a smaller area would involve a prohibitive cost. Our studies indicate that to approach our present class B coverage of an approximate radius of 100 miles, utilizing power of 29.5 kilowatts from a transmitter altitude of 4,420 feet above average elevation of the surrounding terrain, we would require 1,500 kilowatts of power on a UHF frequency to approach a similar radius from the same location.

The equipment for such a UHF installation would cost approximately three times that of the present KSL-TV installation. Operating costs could be well in excess of three times our present costs.

Third, we are advised by competent engineers that in the mountainous area served by KSL-TV there is little likelihood that such a UHF installation would serve the same area because of the mountainous terrain. There are some areas which do not consistently receive our VHF signal but it has been fortunate that in some cases knife-edge diffraction produces satisfactory reception behind mountains 10,000 feet or higher. Engineers advise us that we would not be likely to obtain such fortunate results on a UHF channel.
Fourth, the latest figures indicate that there are approximately 163,000 television sets within the KSL-TV coverage area, but, we are informed by distributors, only about 30 of those sets are capable of receiving UHF signals without modification. As you know, modification requires internal additions or unsightly external tuners. All such receivers would require new antenna installations for optimum performance.

We believe it is conservative to estimate that such modifications would average at least $40 per set. This would mean an expenditure of at least $6,520,000 for the receiver set owners in the KSL-TV service area.

To require this would approach a breach of trust to the set owners. It would result in less service to the residents of the area involved and would benefit only the limited group advocating such a move—if, indeed, it would benefit them.

A reduction in maximum authorized power would deprive many intermountain residents of television service.

We are also advised that the UHF operators have advocated a reduction in power and consequent limitation of coverage of VHF and UHF stations. Looked at from the viewpoint of the intermountain area, no single proposal could be as unsound as that. If anything, the situation in the intermountain area required the opposite treatment.

The only feasible method of providing television to isolated rural communities is through centrally located wide-coverage installations. Only VHF installations are presently capable of this within the market potentialities of the intermountain west.

It is the experience of KSL-TV that this closely parallels the necessity for wide-coverage clear channel broadcasting stations to guarantee adequate service to sparsely settled areas and provide the backbone of the CONELRAD civil defense system.

The goal this subcommittee does and should face is the goal of obtaining and maintaining the best possible coverage for the most people in the United States. We submit that this cannot be achieved by: (1) the elimination of intermixture of UHF and VHF in the same market, (2) by allocating all television stations in the UHF frequencies, or (3) limiting the coverage of VHF or UHF stations.

We think that the type of station epitomized by KSL-TV is the only hope for sparsely settled areas such as the intermountain west. We have pioneered; we have lost money for a longer period than any UHF station in existence, and so long as we handle properly our public trust—which is what the operation of a television or broadcasting station involves—we think we should be allowed to continue to operate in the only manner we believe is possible in our market.

If operations of the type of KSL-TV are not allowed to continue in our region, the outlying areas will not be served by UHF or any other method. Since the Communications Act calls for a fair, efficient, and equitable distribution of service to the greatest number of people, those in the industry who are willing to install costly stations to serve thinly settled areas must be allowed to continue if the purpose of the Communications Act is to be achieved.

Senator SCHOEPEL. Senator Hunt, do you have any further questions?
Senator Hunt. I have no further questions. I would just like to say to the gentleman that I have been a listener of KLZ for 30 years, and I am glad to have this opportunity to thank you for this splendid service you send into my home.

Mr. Murdoch. Thank you, sir.

Senator Schoeppel. Thank you, Mr. Murdoch. You present a practical situation here that I am sure will be most helpful indeed to this committee.

Mr. Murdoch. Thank you, Senator.

Senator Schoeppel. The next witness will be, as I understand, Mr. Wilson, who will present the statement of Mr. Lewis C. Tierney, who, by reason of circumstances beyond his control, was unable to be here. You may proceed.

Then, I understand, that previous to your presenting Mr. Tierney's statement, that Mr. Hulbert Taft, Jr., of Cincinnati, was asked to testify, but he will not be here.

Mr. Pierson. I would like to take care of that at the conclusion of Mr. Wilson's statement.

Senator Schoeppel. Very well. You may proceed, Mr. Wilson.

STATEMENT OF LEWIS C. TIERNEY, PRESIDENT, WCHS-TV, INC., AS PRESENTED BY THOMAS W. WILSON, WASHINGTON, D. C.

Mr. Wilson. My name is Thomas W. Wilson, and I am an attorney, a member of the law firm of Dow, Lohmès & Albertson, of Washington, D. C., and I have engaged in practice before the Federal Communications Commission. Our firm represents Mr. Lewis C. Tierney, who was here yesterday, and who was unavoidably called away from Washington, and he regrets very much that he cannot be here to testify himself.

I will now present Mr. Tierney's statement:

I am Lewis C. Tierney. My principal business is that of radio broadcasting and, within the next month, this will also include television broadcasting.

This, too, represents a practical situation that was covered in a broader way by Mr. Pierson's testimony.

Since December of 1949 I have engaged in the operation of radio station WCHS in Charleston, W. Va., which station is affiliated with the Columbia Broadcasting System. I am president of the Tierney Co., licensee of station WCHS, and, also, president of WCHS-TV, Inc., permittee of television station WCHS-TV.

We are presently engaged in the construction of a television station in Charleston, which will be operated in conjunction with station WCHS though the license will be held by a separate corporation. Our television station will operate on channel 8 with 316 kilowatts, and our plans contemplate that this station will be ready to commence commercial operations on approximately July 15. Our situation in Charleston is similar to that of approximately 75 other potential television broadcasters throughout the country, each of whom is now in the process of constructing a VHF television station pursuant to governmental authority, at a cost of many hundreds of thousands of dollars. I would estimate that the combined cost of these seventy-odd VHF television stations which are now in the process of construction would exceed $50 million.

Several preceding witnesses have criticized the Federal Communications Commission's expedited television processing procedure. In my opinion, the Commission is to be complimented for its foresightedness and progressive planning in working out modifications of its legal procedures which have enabled applicants to avoid years of litigation before qualifying for the issuance of construction permits for television stations.
Our case is illustrative of how these Commission procedures work and of how the public and the industry have benefited thereby.

Charleston, W. Va., is assigned one VHF frequency which is channel 8, and UHF channels 43 and 49, the former of which has been reserved for educational television use.

The Tierney Co., the licensee of radio station WCHS, refiled for television channel 8 in Charleston on June 30, 1952. Within a span of several weeks thereafter, three other applicants also filed for this very same channel.

Before the television freeze was lifted by the Federal Communications Commission on July 1, 1952, it published a list of the cities to which television frequencies had been assigned and giving the order in which applications would be processed. This list, also, indicated the order in which hearings would be held where hearings were necessary. Charleston was the 48th city in group A-2 which meant that under then existing procedure, we had no chance of qualifying for a television station construction permit for a matter of years, inasmuch as 4 applicants for 1 channel indicated the absolute necessity for a competitive hearing to be held before a construction permit could be issued by the Federal Communications Commission.

We were, indeed, discouraged by the prospect of these years of delay. In one hearing which was held for a channel assigned to Wichita, Kans., which was the sixth city on the Commission's list, the proceeding commenced the early part of November 1952, and to date the examiner's initial decision has not yet been issued.

We are advised that this case, which is not unusual, is still probably more than a year away from final decision and certainly much longer if it is appealed to the courts.

Senator Schoeppel. I hope that will not be the usual procedure.

Mr. Wilson. I certainly join you.

Senator Schoeppel. I have heard a lot about that one.

Mr. Wilson (continuing):

Inasmuch as Charleston was the 48th city, we reasonably estimate that had we gone through a competitive hearing, this channel 8 could not have been placed into operation in Charleston for at least another 2 years and possibly longer.

The Federal Communications granted us to consider seriously a plan of merger which was made possible by newly revised Commission procedures. The resulting merger which was effected made it possible for us to obtain a grant of our television construction permit on February 11, 1954.

Going back a moment to relate the chronology of events leading up to the grant of our construction permit, in July of 1952 one of the applicants for channel 8 withdrew its application and amended to UHF channel 49, which application was later granted in March of the following year.

As a result, Joe L. Smith, Jr., Inc., the owner of radio station WKNA in Charleston, was able to avoid a competitive hearing and to build his UHF station on channel 49. This station, which is now operating under the call letters of WKNA-TV, commenced telecasting on October 12, 1953, and since that time has been the only operating television station in the Charleston area.

Just prior to our merger, there was one other application on file for channel 8, the applicant being Capital Television, Inc. The agreement of merger which was executed on January 7, 1954, provided that a new corporation would be set up to be known as WCHS-TV, Inc., and that our company, the Tierney Co., would own 60 percent of this new corporation, and the remaining 40 percent would be owned by Capital Television, Inc.

Immediately after receiving our construction permit, this past February, we undertook an ambitious program of construction which is now nearing completion. WCHS-TV, Inc., is now in the process of completing the construction of WCHS-TV, which will, when it is completed, have cost about $825,000. The greater portion of this $825,000 has already been expended.

Our planning for this television construction program has extended back over the past 3 years and we expect that our television station will necessarily experience operating losses for an indefinite period of time and possibly for as long as a year after operations commence. We are aware of the fact that it takes time to build any new business, and, more particularly, it takes time and is costly to educate the public in a new media.

Charleston, which is the 50th market in the United States, is situated in the western part of West Virginia, which is an extremely mountainous section of our
State. It is a generally accepted fact in the television business that UHF television coverage is more seriously restricted in mountainous areas such as ours than is VHF coverage.

Consequently, we believe that it will be possible for our channel 8 station to cover areas within West Virginia which presently receive less than completely satisfactory television service from existing facilities.

We are now experiencing a great amount of enthusiasm on the part of the public in the area which will receive service from our station and we receive numerous daily inquiries as to when our station will be ready to commence program service.

It is our conviction that stations WCHS-TV and WKNA-TV can both enjoy prosperous operations in Charleston, but it is also our belief that the public will receive the greatest benefits when our television station commences operations due to the fact that we will undoubtedly cover many areas now without dependable television service due to the mountainous terrain.

Some of the witnesses who have previously appeared before this committee have recommended that an immediate freeze should be imposed upon the further construction of VHF television stations.

I might depart from this statement for a moment to give you a citation. The transcript of this proceeding, at page 414, contains a statement by a previous witness, Mr. A. Roberts, and I believe that reference to that citation will show that Mr. Roberts in his testimony recommended that a freeze be imposed of some 90 to 180 days, effective upon all applicants and holders of construction permits who have not yet requested authority to conduct equipment tests.

Briefly, to explain the significance of that, after a construction permit is issued by the Government and the station is constructed, it is yet necessary for the permittee to go to the Federal Communications Commission and get authority to operate that station. That is necessary so that the Government can ascertain that the station has been built in accordance with the specifications of the construction permit, and Mr. Roberts recommended that where stations have been built or have been practically nearly completed, but that authorization has not been issued by the Government for testing and for programs, that the freeze should be imposed on that category of stations.

Other witnesses have recommended that all television stations should be moved into the UHF frequency range within a span of years. I wish to address myself to these two recommendations which have been presented to this honorable committee.

There is no denying that should either one of these recommendations be effectuated, the result would be disastrous to us. We have legally binding contracts which commit us to the expenditure of the remainder of the $825,000 which has not yet been spent. If a freeze were imposed, such action would not release us from our legally binding commitments which now exist.

In fact, any such freeze would wrought grave hardships on our company and on the seventy-odd other VHF television stations which are now under construction, not to mention the disastrous effect it would have on the public which is now anxiously awaiting television service from these stations and, particularly, those members of the viewing public who are not able to obtain reliable television service from presently existing television facilities.

It is our conviction that Charleston, W. Va., needs both UHF and VHF television stations in order to serve the public adequately and we are, indeed, fortunate in having only two commercial frequencies assigned to our section, because we believe that the 59th market in the United States can support both stations quite successfully.

Preceding witnesses before this committee who are operators of various UHF stations have pleaded hardship. I am confident that none of them could relate a story of any greater hardship than would be inflicted upon my company, should we not be permitted to proceed with our plans for early operations on channel 8.

We applied for channel 8 in good faith and for a period of years have done everything within our power to make it possible for us to render a much needed
VHF television service to the Charleston, W. Va., area and to that end it has been necessary for us to obligate our corporation to the extent of the best part of a million dollars.

In the final analysis, the public has the greatest stake in this controversy and the public interest, in our opinion, requires the fullest possible utilization of all VHF frequencies and certainly channel 8, which is the only VHF channel allocated to the capital of the State of West Virginia.

There would certainly have to exist some overpowering reason directly related to the public interest before serious consideration should be given to the imposition of a television freeze, and I urge that no such reason exists at this time.

In its simplest form, this committee has heard testimony by a number of UHF television broadcasters who due to the interplay of a number of complex factors which cannot be cured by any action this committee might choose to take, have found themselves unable to stand the strain and solve the problems which confront every television station at the commencement of operations.

In laying our plans during these past 3 years, we have made provision for the adequate financing of our operations during this initial period and we are confident that our planning has been sufficiently sound to permit us to emerge from this initial period of operations with a television station which will be able to provide a valuable public service to the viewers in our area and which will also prove to be a successful business.

In conclusion, I wish to urge this committee to permit the growth of the television system which has been laid out by the Federal Communications Commission and I believe that it is much too early for anyone to cry “wolf” because it will take a much longer period of time than has thus far elapsed for a sound television system ultimately to develop.

I wish to express my appreciation for the courtesy of this committee in permitting my company and me to have this opportunity to present our views on the very serious question of whether or not the thriving television industry which presently exists in this country shall be permitted to continue to grow and become an increasing important part of our industrial postwar expansion.

Senator SchoeppeL Thank you very much, Mr. Wilson. As you have indicated, this statement will be in the record, and it is most helpful.

Mr. Wilson. Thank you, Senator.

Senator SchoeppeL I understood Mr. Pierson wanted to make a statement at this juncture.

Mr. Pierson. As I stated earlier, Mr. Taft and Mr. Reinsch were to appear and make themselves available for questions with regard to their particular areas. They have been here all week, but in order to conserve the time of the subcommittee, we have decided to request that their statements be copied into the record, but I would like to have Mr. Taft and Mr. Reinsch introduce their statements personally.

The subcommittee has had them for about 3 days now, and they would like to make themselves available for questions.

Senator SchoeppeL Very well.

Mr. Taft, will you please take the stand.

STATEMENT OF HULBERT TAFT, JR., PRESIDENT, RADIO CINCINNATI, INC.

Mr. Taft. I am Hulbert Taft, Jr., and I am the president of Radio Cincinnati, Inc., which operates television station WKRC-TV on channel 12 at Cincinnati, Ohio.

Radio Cincinnati, Inc., owns 100 percent of WTVN, Inc., which operates television station WTVN on channel 6 at Columbus, Ohio.

In order that the members of this committee may have the fullest background of facts in the current hearing on the problem of UHF television, a reasonable perspective demands that full testimony covering the early days of VHF operations be presented.
As an operator on the air in Cincinnati since April 1, 1949, I believe our experiences in the early years were typical of the industry at that time and may throw a truer light on the tribulations of the postfreeze operators.

It was not easy to make the decision to plunge into TV in 1947, when we filed our application for channel 11 in Cincinnati. Channels were not hard to get. Two were available in our city, a third having been accepted by the Crosley Broadcasting Corp. Programs as we saw them in those days were not promising, sale of receivers was proceeding at a trickle and TV advertisers were all but unheard of.

Coming on top of some months of losses in FM and after investigations into the gloomy picture presented by those few TV stations actually operating, it was difficult to recommend to our board of directors that we enter TV. I remember that board meeting very well. It was on November 20, 1947. The directors, who had heard of numerous TV construction permits being relinquished, and who had read reports of the astronomical costs of TV operation were persuaded with the greatest difficulty to give me authorization to file.

In that meeting the director who was the largest stockholder in our parent company reckoned that we would have to expect to lose $2 million in television before getting into the black. It was on a basis of this expectation that the authorization was voted.

Early operations were no picnic. Much of the gear we received was full of the bugs inherent in newly designed technical equipment. It seemed to me at that time that we could scarcely get through an hour on the air without that familiar sign or spoken phrase, "Just a minute, please; technical difficulties."

Simply, the equipment was too new and the personnel available too inexperienced in its operation to render a reasonably consistent service. One of the consolations was that when we went off the air, which we were doing all the time, we lost very little revenue. There wasn't any. Talent personnel and programs were what you could find by dredging around among the public institutions of the city, plus what could be adapted from radio.

Network service was, of course, practically nonexistent, because there was no cable interconnection. But the worst aspect of our particular operation was the fact, undiscovered until we had been on the air a few days, that practically none of the 12,000 receivers in the area could receive our signal.

The difficulty then was twofold. In the first place, all the receiving antennas actually in the field at that time had been designed for the low band of the VHF, while our station on channel 11 operated on the high band. It took time, a lot of promotion with the servicemen and the development of improved receiving antennas, to attain even an approximation of the receiving-end efficiency of our low-band competitor. As our chief engineer used to say, "You can hang your ears out of the window and get channel 4."

Channel 11 was a far more difficult matter. Our own engineers made literally thousands of calls upon homes and tried every trick in the trade to keep complaining viewers happy with our signal. Their success was painfully gradual and is not even now complete, in spite of a tenfold increase in transmitter power. This is the very sort of difficulty now being experienced in the UHF.
A second difficulty with our signal occurred when channel 7 came on the air in July 1949. It created what the engineers called oscillator radiation. This occurred when 2 stations, 4 channels apart in the high band, operated in the same city. It meant that when a receiver in our area was tuned to channel 7, that receiver was likely to become a miniature transmitter, which sent out interfering signals on the fundamental frequency of channel 11.

In an apartment building, for instance, one receiver tuned to channel 7 could prevent a dozen others in the building, and even in a whole block, from receiving channel 11. This was a heartbreaking thing to cope with, particularly because there was nothing we could do about it. We had to wait for new standards set up by RETMA affecting the intermediate frequencies used in receivers, and eventually for a shift in channels from 11 to 12, which occurred with the new allocation.

During these early years, even after the cable to Cincinnati was completed, we had difficulty in obtaining program ratings on the top CBS shows which came up to half the national averages.

This problem was caused almost entirely by faulty design of TV receivers, which is the same difficulty causing much of the concern of UHF operators today.

About this time my morale was not improved by a meeting I had in downtown Cincinnati with one of the veteran radio broadcasters in our area, who had declined to go into television. "Boy, how does it feel to be a pioneer," he said, with the aggravating smug chuckle of one who is going to let the other fellow do the pioneering. "How much did you lose last week?"

It wasn't funny. The week before I had received a kit put out with the best of intentions by one of the trade magazines for the use of television operators. The kit contained an inventory in miniature of various items. I remember the bottle of red ink, a small package of bromo seltzer, aspirin, a roll of scotch tape to hold the station together and finally a revolver to use as you saw fit.

Although we did not lose $2 million, in the almost 2 years of TV operations from April 1, 1949, to February 1951, we had an operating loss of $518,448.97. This included depreciation. Our cash loss was $397,266.82. This loss I believe to have been very moderate in the industry.

I know personally of several stations in the major markets which lost 2, 3, and 4 times that amount before rounding the corner into black ink. And, of course, there are numerous VHF stations, including our own in Columbus, which are still losing after 5, 6, and more years on the air.

Nor was there any assurance at that time that TV would ever be profitable. In fact, the Phonevision people and some others bombarded us with facts which proved conclusively that there was not enough advertising money in the country to support TV. Their arguments were depressingly impressive.

I would be willing to wage that, with a handful of exceptions, no prefreeze television station lost less than the greatest loser among the postfreeze UHF operators.

In addition to operating losses, of course, we have had to spend considerable sums to date in improvements and additions to technical equipment and facilities as we have improved our operations and
increased our power toward the limit allowed by the FCC. In this
field, we have invested in the period from our date on the air to the
present time $274,732.91 in addition to our original cost of getting
on the air.

Nor are we by any means through with capital investments. We
now have a contract with General Electric to supply additional trans-
mitter facilities at a cost of $146,050 and calculate that conversion to
color will in the near future cost in excess of $200,000 more. These
figures also, I believe, to be moderate in the industry.

Television is inherently a blue-chip business, even in the smaller
markets, and I believe a failure to realize this fact is at the basis
of much of the woe among the present day UHF operators. A lot
of them evidently have forgotten the anguish and staggering losses
of the early days in TV. A lot of them, seeing only the developed
product and hearing of large earnings on the part of a few, seemed
to have sailed into the business financially and psychologically unpre-
pared for the facts of life.

There has obviously been a lot of bad business judgment and a lot of
thin financing in the business. And there have been presented some
extremely half-baked solutions to the obvious and real difficulties of
the UHF.

One of the suggested solutions: Let's all move to the UHF now.
This, and variations of this solution completely ignore the real owner
of all television channels—the public. There are 490,000 VHF re-
ceivers in the Cincinnati area, almost all of them unconverted for
reception on the UHF. The cost to the public of conversion would be
enormously burdensome and would certainly result in a justified
public howl if such conversions were suddenly necessary. Moreover,
and even more importantly, there would suddenly be large gaps where
there is now solid service. I can imagine no greater disservice to
the general public than to deprive thousands, even millions, of people
of TV service, when they have been enjoying such service over a
period of years. This would be true in large sections around the
fringes of present service areas if UHF were now to supplement VHF.

Well, then, someone suggests, let's compel the VHF operators to
duplicate their equipment with UHF equipment and to transmit both
VHF and UHF for a period of 5 to 10 years, after which they would
close down the VHF. This variation of the first solution seems to
me just as preposterous.

Assuming that there is reasonable VHF coverage now, few fami-
lies would convert their VHF receivers until the week or day before
the deadline. At least they would be no more likely to convert imme-
diately than they are now. Meanwhile, the UHF operator's prob-
lem would remain unchanged, and he would have sufficient time to
go just as broke as without this solution.

Proposals to reduce the coverage of VHF stations in order to equal-
ize them with UHF seem to me just as unthinkable for the same
reason. If you try to deprive the public of a service it has enjoyed
for a period of years, you are in for real trouble.

Likewise, it seems very late in the game to attempt a reallocation of
channels so as to eliminate intermixure of VHF and UHF. There
is certainly a question as to whether it can be done and still provide a
truly national competitive TV service. Intermixture was probably
a mistake in the first place, but, practically speaking, I do not see how
it can be changed now without enormous dislocations both at the operating level and with the public.

As for another freeze, this time affecting VHF only, the same public considerations should weigh, along with those of the benighted would-be operators who have gone through the agonies and expense of competitive hearings. There are many areas, now unserved, where keenly anticipated VHF operations are soon to begin. If the people in these areas are now asked to wait out another freeze, I can only imagine their reactions. We have already had our experience with freezes.

The above remarks, of course, are not intended to create the impression that the UHF operators do not have a serious technical and economic problem. They do. And with the troubles we had in VHF, I believe I am in a good position to sympathize with them. But it seems to me that the solution does not lie in downgrading VHF service. Rather, it lies in upgrading the UHF, just as we had to upgrade our service.

Obviously, if the UHF signal were reasonably comparable with the VHF, none of us would be here today. But it should be pointed out and emphasized that TV service from one band of frequencies to another will never be identical.

The low band is still easier to receive than the high band in the VHF, and the low end of the UHF will undoubtedly be far superior to the high end of the UHF. In fact, though I am not an engineer, I think it quite possible that from a technical viewpoint the ratio of desirability between channels 13, the highest VHF, and 14, the lowest UHF, is no greater than that between channel 14 and channel 83 at the top of the band.

The problem then is to upgrade the UHF insofar as possible. Until now, UHF transmitters of relatively low power only have been available, whereas the Commission anticipated that UHF would require effective radiated power in the order of a million watts to make it reasonably competitive with the 316,000 watts of the high band VHF and the 100,000 watts of the low band VHF.

Although this is technical fact, obviously a lot of UHF operators went into the game with two strikes against them, using low power and therefore relatively low-cost transmitters. This has proved the worst possible place to save money.

I have no doubt that if there were sufficient demand for 50-kilowatt UHF transmitters, such transmitters would be put on the market within a reasonable time. The cost of such a transmitter should not be much more than that of the 50-kilowatt VHF transmitter which we have on order.

Such a transmitter, with the higher gain antenna possible in the UHF, would produce the required million watts. If the UHF operators need economic salvation, would it not be possible to work out classes of stations, providing that no less than full power be used where UHF must compete with VHF, and at the same time permitting lower powers in smaller and more remote markets?

Such an arrangement is not new in the radio field, where we have various classes of stations, operating with various orders of power. Most of the radio operators seem to be reasonably happy under this system. And, in fact the trend in radio today seems to be running in favor of the local operator who covers his market from within, as opposed to the big fellow who attempts to cover it from without.
The UHF receiver problem is one on which there seems to be some degree of agreement on all sides of the current controversy. But the receiver problem is not only one of producing or equipping VHF with UHF tuners. The problem is also one of quality. The UHF "front end" of these receivers has proved relatively insensitive and noisy. High quality receivers can be manufactured at these frequencies, as witness radar equipment, but the problem of marketing such quality in mass is also obviously economic. High quality equipment is expensive.

I understand that the chairman of this committee, along with some others, has already attempted to obtain tax relief for those who manufacture UHF receivers and tuners. If there is still any possibility of such relief, would it not make more sense to upgrade quality along this line by providing tax exemption only for those UHF receivers which comply with a set of standards, drawn up perhaps by RETMA and approved by the engineering staff of the FCC?

These solutions will undoubtedly take time. In order to ease the road of those in UHF who have turned back their frequencies or those who have held up construction, could these operators not be given reasonable time extensions in which to await improvements in equipment?

It is not with the idea of perpetuating any monopoly in television that I am here to testify today. If additional VHF channels can be found by the Commission or anyone else, I could and would have no objection to the assignment of one, or a dozen, additional frequencies to my own city. There is certainly a limit to how many stations a market will support, but undoubtedly the theory should be that there will be sufficient channels to permit those to go broke who wish to.

However, I am here to protest any destruction or crippling of the service it has cost us 5 years and so much sweat and money to create and upon which the public has come to depend.

As Mr. Pierson has said, the subcommittee has run a little late, and I know you want to conclude this week.

Senator Schoeppele. I might say that if we do not conclude this week a matter of such great importance as this, I am sure that the chairman of this subcommittee will find some time.

Mr. Taft. I am sure he will, Senator, and yet there is a great deal more testimony to put in, and I will be glad to answer any questions that you have. Therefore, I will make myself available for questions, if you have them.

Senator Schoeppele. Thank you, Mr. Taft.

Mr. Pierson. Mr. Chairman, I wanted to make sure that Mr. Taft's statement was in as though read.

Senator Schoeppele. Yes, sir, it will not be in fine print, either.

Mr. Pierson. Next we have Mr. Reinsch.

STATEMENT OF J. LEONARD REINSCH, MANAGING DIRECTOR OF THE JAMES M. COX STATIONS

Mr. Reinsch. Mr. Chairman, my name is J. Leonard Reinsch. I hold the position of managing director of the James M. Cox stations, including television stations WSB-TV, Atlanta, Ga., and WHIO-TV, Dayton, Ohio, which stations have been operating since September 1948, and January 1949, respectively. My present association with
these stations extends from November 11, 1934, and I have been associated with the broadcast industry in various positions for the past 30 years.

Various proposals have been presented to this committee which, in my judgment, are designed to serve the private interests of a few, without proper and sufficient regard to the welfare of the American broadcasting industry and the public interest of the millions of people who have invested in television receivers.

These proposals, in part, seek to jeopardize the very large investment in television transmitting and receiving equipment and they ignore the tremendous expenditures of time, money and energy of those who dared to pioneer the television industry in this country.

Further, insofar as they would attempt to limit the ownership of television stations and to discriminate against ownership and operation by persons engaged in certain other business activities, these proposals would constitute an extension of monopoly and antitrust regulation far beyond that ever considered by the Congress or any department of this Government.

Finally, they contemplate, by virtue of possible legislation or new agency regulation, the institution of rigid controls which are the antithesis of a free interplay of economic forces and which would, without regard to fair competition, foresight, enterprise, good management, and sound business judgment, attempt to guarantee economic equality for all television stations.

It is respectfully submitted that those who have appeared here seeking drastic revisions and pronounced changes in the current structure of television broadcasting are not of the hardy breed and stamina of those who expended millions of dollars in money and great effort to actually launch and pioneer what is probably the fastest growing industry this country has ever known.

Stations WSB-TV and WHIO-TV were constructed at an initial cost in excess of $1,250,000. Several additional hundred thousand dollars were invested in equipment and plant improvements prior to the time that either of these stations experienced their first profitable operation.

Initially, there was no network service available to either of these stations and, even following the advent of network service, there was a substantial period during which such service was limited.

In those days, as distinguished from the present time, there was no abundant supply of syndicated film product. In the earlier days there was, of course, only limited set circulation and we expended considerable money and energy in promoting this new medium.

We experienced very considerable difficulties with our transmitting equipment and the early UHF receivers, most certainly were not as dependable and capable of excellent reception as those manufactured today. These technical difficulties during those early days were certainly comparable to the problems mentioned by the persons who are commencing UHF operations during 1953 and 1954.

As a consequence of these early difficulties, the capital investment for stations WSB-TV and WHIO-TV, plus operating losses prior to 1951, exceeded $2 million.

There has been presented to this committee the statement of the principal owner of the company which received a construction permit for UHF television station WIFE in Dayton.
That statement, in my judgment, did not present the complete story of the demise of the UHF station in Dayton. It is respectfully submitted that all of the facts are essential to a considered and informed decision by this committee.

Further, it is believed that the merits of the proposals advanced on behalf of this particular UHF station must be considered in the light of all the factors which contributed to the establishment and the cessation of operation of station WIFE.

Dayton is served by two established VHF television stations. In addition, Dayton and the surrounding territory comprising a metropolitan market is substantially served by three VHF stations operating at Cincinnati, Ohio. There was no compulsion, of course, which required any person to undertake the establishment of an additional television service in this area which possessed nearly complete saturation of VHF receiving sets.

The existence of these multiple services, plus the facts of the Commission's rules relating to maximum power and antenna height, which rules have not been modified since 1952, were known at the time application was made for the UHF facility at Dayton.

It would have to have been recognized by any prudent person that the establishment of a successful UHF station in this market would require, over an extended period of time, substantial outlays of capital, extensive promotion and the best management available.

Previous reference has been made to the early experiences of stations WSB-TV and WHIO-TV. Particularizing briefly with respect to Dayton, application was made for station WHIO-TV in November 1947.

No other applicant appeared who was willing to assume the then obvious and very substantial risk of a VHF television operation; accordingly, a permit for station WHIO was granted in February 1948.

It could be noted that, at approximately the time the WHIO-TV application was granted, the principals in the more recent UHF operation were making application for an aural broadcast station in Dayton.

Approximately $660,000 was invested in equipment, buildings, and land prior to the time that WHIO-TV commenced operation in January of 1949. More than a million dollars had been invested in this television station by September 1950, when the first profits were realized.

Prior to that time, increasing revenues had been immediately plowed back into additional programs in an effort to develop the widest possible set circulation. The cable necessary to provide network service to Dayton was not available until September 1949; but, even so, station WHIO-TV was operated at a loss for an additional 12 months following that date.

Listed among the alleged reasons for the inability of station WIFE to compete in the Dayton market is the claim that that station was unable to compete with the established VHF stations in the market in the purchase of quality film.

Reference to the program schedule of station WHIO-TV for the week of May 16 through 22, 1954, inclusive, indicates that 30 hours and 8 minutes of film programing were offered.

It is logical to assume that a substantially similar amount of film programing was presented by the other operation VHF station in
Dayton. A partial tabulation of the film product available for television produces the following results:

(1) Thirty-one distributors with 2,132 features.
(2) Thirty-one distributors with 713 westerns.
(3) Thirty-five distributors with 121 different series of half-hour syndicated programs, many with 52 in a series.

This list does not include the thousands of shorts, serials, cartoons, and films that are now available. Further, in the syndicated field, there are as many quarter-hour shows as there are the half-hour films which are included in the above tabulation.

It is submitted that these facts require the obvious conclusion that, if station WIFE had made any serious effort, there was ample quality film available for top programing to attract viewers.

The statement presented on behalf of station WIFE referred to the affiliation of WHIO-TV with CBS, ABC, and Du Mont networks and alleged that there was little or no network programing available for station WIFE.

During the week of March 14 to March 20, 1954, inclusive, there was presented on station WHIO-TV 69 hours and 30 minutes of network service.

There was available from the ABC network 25 hours of programing not carried on station WHIO-TV. There was also 19 hours and 35 minutes of network programing available from the Du Mont network which was not presented over station WHIO-TV; likewise, there was 12 hours and 45 minutes of CBS programing which were not carried by WHIO-TV.

In summary, WHIO-TV did not carry a total of 57 hours and 20 minutes of the network programing available from the three listed networks.

As a comparison, station WHIO-TV, during its first month of operation, had a total of 7½ hours of total network commercial programing.

It is not possible, of course, to dictate to network, national spot, and local advertisers where and when they expend their advertising budgets, but the advertising dollars essential to a meritorious broadcast operation follow the development of a substantial audience.

That audience cannot be made available by legislation or agency regulation, but it must be earned by the development of quality programing.

The WIFE statement contends that it was denied such features as the University of Dayton basketball games. Reproduced here as appendix 1 is a copy of a letter directed to the University of Dayton to the general manager of station WHIO, which letter is substantially that sent to all television stations in Dayton, which letter reflects that the University of Dayton basketball games were available to the highest bidder.

Station WIFE did not submit a bid and, accordingly, it cannot be properly said that that station was denied the opportunity to telecast these sporting events.

It is further contended, on behalf of station WIFE, that the established VHF stations were in a position to outbid that UHF facility for programing talent, features, and manpower. Station WHIO-TV hired no new talent during the period when the UHF station was in
operation, so it is impossible that WHIO-TV was outbidding the
UHF station for the services of such personnel.

The failure of the channel 22 facility to become established in
Dayton is also partly attributable, in my opinion, to a lack of promo-
tion and enterprise on behalf of the permittee of that facility. It is not
believed that the efforts of station WIFE in this direction are com-
parable to the expenditures and endeavors of the majority of the
early VHF operators.

When stations WHIO-TV took the air on channel 13 in 1949, very
considerable difficulty was experienced in getting the receivers ad-
justed and antennas properly located. To meet this problem, nu-
umerous meetings were held with distributors and retailers, and
station WHIO-TV engineers were frequently sent into the field for
the purpose of making adjustments.

The difficulties which beset the channel 22 operation in Dayton
are also believed to have resulted, in part, from a lack of proper
planning in placing the station in operation.

There were repeated delays in the commencement of operation fol-
lowing the public announcement of the opening dates, which post-
ponements very likely contributed to the loss of interest on the part
of the public, as well as the receiver distributors and dealers.

Summarizing briefly the UHF experience in Dayton, the prin-
cipal problems confronting a prospective UHF operator were obvious
when application was made to the Federal Communications Com-
mission.

Nevertheless, the UHF permittee in Dayton has been unwilling
or unable to underwrite the necessary expenditures which appeared
obvious to successful competition with established operations. Cer-
tainly, the capital outlays and losses by the permittee of station WIFE
are not comparable to those experienced by the pioneers of VHF op-
erations in this market.

As a part of the argument that the current UHF difficulties are
attributable to the multiple ownership of television stations and the
ownership thereof by newspaper interests, it has been alleged that
such multiple ownership and newspaper-owned stations have now
shown a proper recognition of their public-service responsibilities.

One such specific argument was directed to the programing of
station WHIO-TV in Dayton. The programing record of our sta-
tions, both radio and television, had been reviewed by the Federal
Communications Commission periodically over many years and these
operations have continually been found to be in the public interest.

On one occasion, when a substantial number of television stations
were placed on a temporary license because of their failure to present
certain types of programs, the Commission publicly complimented
stations WSB-TV and WHIO-TV for their attention to public-
service programing.

Our stations have received national recognition for outstanding
public service and we feel that these stations are recognized for their
readiness to serve community interests.

We will not attempt to burden this record with details of our pro-
graming record, but our stations' files are loaded with voluntary let-
ters of heartfelt appreciation relative to our community service pro-
graming. Just to cite one example, however, in Dayton, station
WHIO-TV has canceled an entire evening's schedule, including com-
commercial spot announcements, to promote the local Infantile Paralysis drive.

Proposals have been advanced before this committee for the adoption of legislative prescriptions directed against the ownership of television stations by newspaper interests, and, also, against the ownership of more than one station by any single individual or entity.

In considering these proposals, the committee should keep in mind that these groups, in principal part, contributed the vast capital and sustained the substantial losses which were necessary to promote this relatively new industry.

Insofar as a stringent limitation is sought on the number of stations owned by one entity, any such regulation or restriction would be an extension of monopoly and antitrust regulation far beyond that authorized by laws enacted by this Congress.

The courts of this country have consistently refused to consider bigness or size along as a per se violation of the antitrust statutes. It is ridiculous to allege that the common ownership of 2, 3, 4, or even 5 television stations in widely scattered markets constitutes a monopoly in this highly competitive field.

Finally, the matter of discrimination against the newspaper ownership of broadcast stations was considered by the Senate Committee on Interstate and Foreign Commerce of the 81st Congress. S. 1973 included a specific provision providing in pertinent part that:

The Commission shall make or promulgate no rule or regulation of substance or procedure, the purpose or result of which is to effect a discrimination between persons based upon race, religious, or political affiliation or kind of lawful occupation or business association.

That proposed legislation was dropped, according to the committee report, because of the strong denial of discrimination made by the Commission and because it was recognized that any such discrimination on the part of the Commission was of questionable constitutional validity.

Similar provisions directed against discrimination against newspaper ownership were included in S. 658 in the 82d Congress. This so-called newspaper agreement was dropped from the Communications Act amendments, 1952, with the following explanation from the conference report:

The Senate bill contained no such provision, and the provision is not included in the conference substitute. This provision was omitted from the conference substitute because the committee of conference felt that it was unnecessary. It is the view of the conference committee that under the present law the Commission is not authorized to make or promulgate any rule or regulation the effect of which would be to discriminate against any person because such person has an interest in, or association with, a newspaper or other medium for gathering and disseminating information. Also the Commission could not arbitrarily deny any application because of any such interest or association.

It is respectfully submitted that no probative reasons have been advanced in these proceedings which should disturb the consistent congressional expressions opposing the discriminations against newspapers in the ownership of broadcast stations.

The problems confronting the UHF stations today are substantially those we met and overcame in the pioneer VHF operations. In this proceeding, however, proposals are advanced by only a small percentage of UHF stations to serve the private interests of a particular segment of the industry and to the detriment of the majority of sta-
tion operators and the public who have invested approximately a billion dollars in television receivers and antennas.

I believe the conclusion is obvious that more industry and self-help should be required prior to any serious consideration of the principal proposals which have been advanced here.

I sincerely suggest that these proposals are found lacking in merit when judged by considerations of the overall needs of the television industry and the public.

(Appendix A, referred to previously, is as follows:)

**Appendix A**

**Mr. Robert Moody,**

_Radio Station WWHO, Dayton, Ohio._

**Dear Mr. Moody:** This letter is being sent in order to draw your attention to some decisions of the athletic board of the university in regard to radio and television coverage of intercollegiate football and basketball games during the 1953-54 respective seasons. The home football games are available to radio stations only for $1,000 for the season. This rate is not divisible—and does not apply to non-Dayton stations. Radio stations are invited to cover the 16 home basketball games, and the charge is $1,600 for the season or any part thereof. Television coverage, if any, of the home basketball games is to be limited to four games, with the choice of games to be determined by the station concerned. Television rights to four basketball games is hereby offered to the highest bidder. No single game coverage is available. Written bids may be submitted at any time until noon of Friday, August 14. The highest bidder will then be awarded the games and no further negotiations would be possible. This rule is necessary in view of the fact that only one station can be accommodated. All bids are to be made with the acceptance of the following conditions:

1. The space available for television camera(s) is limited to the platform already erected in the fieldhouse for television purposes, viz., the platform suspended from the rafters on the north side of the fieldhouse.

2. The university reserves the right to reject all bids.

The university follows the policy of not granting any publicity channel exclusive rights. In the case of television for basketball games, space limitations oblige us to reach some method of dealing with one station, while giving other stations equal consideration.

A copy of the 1953-54 basketball schedule is enclosed, so that bids may be accompanied by an indication of the games preferred. Correspondence on this subject should be directed to the undersigned.

Sincerely yours,

**Rev. Charles L. Collins, S. M.,**

_Coach, Athletic Board._

Mr. Reinisch. I will be glad to cooperate with you in answering any questions that I may.

Senator Schoeppel. Thank you very much, sir. Let the record show that your statement will appear in its entirety as if you had testified, too.

Mr. Reinisch. Thank you, Senator.

Senator Schoeppel. I do appreciate you gentlemen making yourselves available for further questioning.

I might say that when we get down and search this record, as I am sure that we will, there may be some questions that may come up that we will call on somebody to answer.

Mr. Reinisch. I spend quite a bit of time in Washington, so I will be glad to answer them.

Senator Schoeppel. Thank you very much.

Mr. Pierson. As I stated earlier, we had about 65 people who are interested in testifying. We have requested them to reduce their
statements to writing. They typify stations from one end of the
country to the other, and they state in there the effect that the proposal
would have upon them and the communities they serve.

We have submitted those statements to the subcommittee some time
ago. I have attached to the statements an index of the stations that
have made the statements, and their particular status, whether an
applicant or a permittee, or a station operator.

I would ask that those statements be incorporated into the record
as though read in the order in which they have been furnished to the
subcommittee.

Senator Schoeppel. And you have given them to the subcommittee
in the order in which you desire them to appear as is shown on the
index sheet?

Mr. Pearson. That is correct, sir.

Senator Schoeppel. Let the record show that they will become a
part of the record in that order.

(The material referred to is as follows:)

**STATEMENTS**

The Television Corporation, Station WABT, operator, channel 13, Birmingham, 
Ala.
The Mobile Television Corp., applicant, channel 5, Mobile, Ala.

THE TELEVISION CORP., STATION WABT, BIRMINGHAM, ALA., OPERATOR OF CHANNEL 13

Channels allocated to community: 6, 10, 13, 42, 48.
VHF stations operating in community: Channels 6, 13.
UHF stations operating in community: None.
Channels applied for: Channel 10, 11.
Channels contested: None.
Construction permits outstanding: Channel 48.

STATEMENT OF HENRY P. JOHNSTON, PRESIDENT OF THE TELEVISION CORP.

My name is Henry P. Johnston. I am the president and managing director of the Television Corp., licensee of radio station WAPI, FM station WAFM, and television station WABT, all in Birmingham, Ala.

2 Reserved for noncommercial educational use.
The purpose of my statement is to point up to the subcommittee the particular television situation which exists in Birmingham, Ala., and the difficulties which would exist in our community—and undoubtedly in many others—if there is an attempt by the Congress to solve the problems of UHF on a nationwide basis. In my opinion, the problems suggested by the UHF spokesmen were adopted, they would not, in my opinion, solve the problems of UHF, but they would cause substantial mischief and hardship to the public in my part of the country.

In Birmingham today we have only VHF service. We estimate that there are, within the service area of television station WAFT, 275,000 receivers in the hands of the public, representing a total investment of $8 million. There are no UHF stations in operation in Birmingham, and therefore, to my knowledge, no UHF receivers.

Birmingham, therefore, has no television receiver conversion problem at the present time. However, such a problem would be created if the proposal to move all of television to the UHF were adopted. Then every single receiver in our area would be rendered obsolete and every family would be forced, by Government order, to spend additional funds for a UHF converter and for a new receiving antenna.

Even more important to the public than the expense which would be involved in purchasing new UHF equipment is the fact that large segments of the population would lose the only television service which is available to them. In our part of the country there are relatively few cities large enough to support television stations. As a result, a great many people living on farms and in small communities must look to Birmingham for their television service. We know that people living as far away as 100 miles from Birmingham depend upon the stations in our city for television service. If our station is forced to move to the UHF or to reduce its coverage, one result would be that a lot of our good friends in rural areas would lose the only television service available to them.

It is apparent that neither the proposal to move all VHF stations to the UHF, nor the proposal to reduce the power and coverage of VHF stations would add UHF in Birmingham because there is no UHF there. On the contrary, these proposals would seriously and adversely affect the public in our area. It is clearly not in the public interest for either of them to be adopted.

This committee has heard a great deal of testimony concerning the financial plight and financial problems of the UHF broadcasters. Under the circumstances I hope it will be appropriate for me to show the committee the other side of the coin, namely, the financial plight and financial problems of one VHF broadcaster.

The Birmingham News Co., our parent corporation, operated station WSGN in Birmingham from 1936 to 1953, and station WSGN-FM, from 1947 to 1953. Both of these stations were sold in 1953 so that we could acquire the radio and television stations which we now operate.

During the period of our operation of stations WSGN and WSGN-FM, I believe that both stations acquired an outstanding record for community and local public service. This was particularly true of our FM station which was programmed separately to a large extent and was promoted and supported by us in every way feasible. I doubt whether any FM operator in any other community in the country did as much as we have done and are still doing to promote FM. Incidentally, the operation of FM has involved us in substantial expenses and substantial operating losses. However, neither we nor any other FM operator, to our knowledge, ever came to the Congress or to any other Government body to ask for financial relief or assistance. It may be, however, that if the Senate does give the UHF broadcasters the type of relief requested by them, that the committee may next be called upon to hold comparable hearings for the relief of FM and other broadcasters.

Our company, during the period of its operation of stations WSGN and WSGN-FM, also developed an interest in television. The top officials of our company, including myself, made extensive studies of television, including problems of station, equipment requirements and the like. We participated fully in the FCC's hearings on channel allocations and sought to bring additional VHF channels to Birmingham. However, when we were unsuccessful in this, we applied for and received a grant of permit on UHF channel 42. We sought, in all sincerity, to build the finest—and, I might say, the most expensive UHF station—with full power of 1000 kilowatts. We did this because we knew, based
upon our experience in FM, that in order to pioneer in this new service, maximum power and coverage were necessary.

Prior to the time construction on channel 42 was to begin, we were offered the opportunity to acquire, by purchase, the AM, FM, and TV stations we now operate. We were faced with the choice, therefore, of buying existing facilities at a substantial price or of pioneering in developing UHF in the market—probably also at substantial cost.

After substantial study of the business problems involved, we decided, in April 1953, to buy the stock of the Television Corp. at a cost of $2,500,000. Immediately after acquiring these properties, we expended well over $250,000 additional to increase the power of station WABT to 316 kilowatts, the maximum permitted by the Commission.

I think the committee will understand the large financial stake we have in the continued success of VHF. We made a business judgment to buy rather than to build, based upon the facts then known to us. We hoped and expected that this situation would continue for some years, so that we could properly amortize our investment. Now it is proposed to change the rules of the game, to abolish VHF or to limit its power, its coverage or its freedom to negotiate for programing. The adoption of any of these steps would be, at best, unfair and, at worst, ruinous to us.

APPLICANT FOR CHANNEL 5—THE MOBILE TELEVISION CORP., MOBILE, ALA.

Channels allocated to community: 5, 10, 42, 48.

VHF stations operating in community: Channel 10.

UHF stations operating in community: Channel 48.

Channels applied for: Channel 5.

Channels contested: Channel 5.

Construction permits outstanding: None.

HUE E. POTTER,
Chairman, Subcommittee No. 2 on Communications,
Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

GENTLEMEN: The Mobile Television Corp., through its general management, has given consideration to its position with respect to the problems alleged to be presented by the allocation to certain markets in the United States of television channels both in the very high frequency band and in the ultra high frequency band, and the proposals that have been made looking toward the solution of these problems. The company understands that among the proposals made are the following:

(a) The imposition of a freeze upon application proceedings now before the Federal Communications Commission and upon the issuance of operating authority covering construction permits already granted.

(b) The allocation of all television stations to channels in the UHF band.

(c) The elimination of allocations in both the VHF and the UHF band in the same cities.

(d) The reduction and limitation of coverage areas of stations licensed to operate in the VHF band.

The company is of the opinion that the adoption of any of the proposals above listed would have the effect of retarding rather than stimulating the development of the television industry and, thus, would have an adverse effect upon television services to which the public is entitled.

In addition, it feels that the adoption of these proposals or any of them would have an unjustifiably adverse effect upon persons, firms, and corporations who have major investments in the establishment of their respective stations operating in the VHF band as well as many companies, such as the Mobile Television Corp., who have made major expenditures in prosecuting applications for a construction permit to operate in the VHF band.

The Mobile Television Corp. is a company embracing, among its stockholders, many individuals who are residents of the city of Mobile, Ala., as well as a corporation owning a newspaper and a radio station in that city.

1 Reserved for noncommercial educational use.
In addition, its stockholders include the owners of WDSU Broadcasting Corp., a company which has been a pioneer in the development of the art of telecasting and Dwight Martin, who has been active in the operation of television stations since the inception of commercial television.

These individuals have spent countless hours in the preparation and prosecution of the company's application for a construction permit to operate a television station in Mobile. The application of the company for a grant on channel 5 was filed with the Federal Communications Commission in July 1952, and has been vigorously prosecuted since that date.

At the time the application was filed, in the opinion of the company, the development of transmitting and receiving equipment designed to operate in the UHF band had not progressed sufficiently to guarantee that maximum or even adequate service would be given the public or received by the public.

For this reason, and for the reason that in the opinion of the directors of the company an operation of a VHF channel be more profitable, a determination to seek a grant on a UHF channel was made.

In the summer of 1953 the company, through its officers and directors, participated in a lengthy competitive hearing, seeking to establish the fact that the public interest would be served better by a grant being made to it rather than to an applicant competing for the same channel in Mobile. This hearing resulted in an initial decision by the examiner favoring the application of the Mobile Television Corp., which initial decision is presently under consideration by the Commission. To date, the company has spent in excess of $75,000 in the prosecution of this application, in addition to which it has deposited in excess of $6,000 with an equipment manufacturer in order to assure the delivery of the equipment if and when a final grant is made (the amount of this deposit will be returned to the company if the grant is not made). The company estimates that an additional $5,000 to $10,000 will be spent in prosecuting the application to a final decision.

In the opinion of the management of the company, the adoption of the proposals which the company opposes could place in jeopardy the investment of time and money which has been made by the company in good faith upon the supposition that if it could establish superiority over the competing applicant for channel 5 in Mobile, it would be given a grant. Certainly any provision of law that would reduce the value of a VHF grant or would make a VHF channel unavailable in Mobile or would postpone further consideration of the application for an indefinite period of time would materially reduce the value of this investment.

Accordingly, having in mind both the fact that in its opinion, the financial investment of the company is placed in jeopardy by the above-listed proposals and its conviction that the interests of the television industry and the public will be adversely affected by their adoption or the adoption of any of them, the company respectfully urges that they be rejected and that a solution to the UHF problem be sought that will be of constructive benefit to the entire industry.

Sincerely,

Dwight W. Martin, President.

South Arkansas Television Co., Inc., Eldorado, Ark., Permittee of Channel 10

Channels allocated to community: 10, 26.

Construction permits outstanding: Channel 10.

Magnolia Broadcasting Co.,

Person & Ball,
Washington, D. C.

Gentlemen: I wish to go on record as opposing any current proposed change in the regulations of the FCC which are applicable to the VHF stations. It is my belief that there is insufficient evidence to warrant a conclusion that the majority would be served by any alteration or abolition of existing VHF channels. In addition, I believe any so-called inequality between VHF and UHF channels will disappear in time due to the economic growth of the television industry, the technological advancements in electronics, and the varied tastes.
of the American people, who will both demand and support by their interest the localized programing which UHF will afford in each community. I have always had confidence in the forward-looking attitude taken by the members of the Commission. I do not feel they will be deterred, misled, or influenced by these transient difficulties of the television industry.

Sincerely yours,

W. M. Bigley, Secretary-Treasurer.

KERN COUNTY BROADCASTERS, STATION KERO-TV, BAKERSFIELD, CALIF.

OPERATOR OF CHANNEL 10

Channels allocated to community: 10, 29.

UHF stations operating in community: Channel 29.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: None.

Bakersfield, Calif., June 1, 1954.

Mr. W. Theodore Pierson,
Pierson & Ball, Attorneys, Washington 6, D. C.

Dear Mr. Pierson: We wish to join in the support of the informal group that has organized to participate in the Potter hearings of the Senate subcommittee investigating UHF problems. We understand that your firm has been retained to represent us in opposing the destructive proposals made by the UHF group and its advocates. This is to advise that you have our support, and, in addition, that you are hereby requested to make known our feelings as contained in this letter.

Prior to the time that there were any television stations operating in Bakersfield or the San Joaquin Valley, and up to the middle of 1953, it was estimated there were some 17,000 VHF receivers in the greater Bakersfield area which were receiving programs from Los Angeles television stations. As you know, we are considered a fringe area for Los Angeles television, and it was this early infiltration of VHF television in this area which was helpful in getting us off to a good start in our operation. After the granting of channel 29 here in Bakersfield, as well as channel 10, the set saturation went up considerably, but there are many indications that net conversion of the initial group of television sets that were not in this area has not been rapid. In fact, information indicates that perhaps we have a 60 to 65 percent conversion at this time in the greater Bakersfield area. To my way of thinking, it would be a great disadvantage to the people who own the many VHF-only television sets if no VHF transmissions were available to them.

A recent ARB study that we had made of this market indicates a substantial portion of Bakersfield viewers still watch Los Angeles stations at various times throughout the day and evening.

We went to a great deal of trouble, time, and money in placing our television transmitter on the top of Breckenridge Mountain. Breckenridge Mountain is 7,600 feet high and is located 22 miles east of Bakersfield. One of the main reasons why we put our facility in this location was so that we could serve thousands of people who otherwise would not receive television. We have been informed by many people as far north as Porterville, that we are the only television signal that they can see. This is true of many small communities along the eastern edge of the San Joaquin Valley. While other television stations, operating on UHF from Fresno, put a good signal in that direction, most of it is blanketed out by the mountainous terrain. We also have many reports from the mountain communities to the east and north of our transmitter and many other reports from the eastern desert area, that we are the only satisfactory television signal that they have to watch. We feel that with our VHF transmissions, we are providing a service that would otherwise be denied to these people inasmuch as the electrical characteristics of a UHF signal would not give the necessary fill-in throughout the mountainous terrain involved.

We were the second station on the air in this market, with the UHF station going on the air approximately a month ahead of us. We have had a very real problem in obtaining good film material, inasmuch as our competitors were
 quite successful in purchasing most all of the reasonably priced material prior to the time we received our CP.

We have been more successful than they, however, in utilizing and selling half-hour features on our station. We are still at a loss finding good feature film, inasmuch as the supply has apparently been exhausted.

I know that a number of people are under the impression that a VHF grant is an automatic ticket to a profit operation. I think many of them fail to realize, however, that practically all of the same problems exist with a VHF grantee as exists with a UHF. We have a very small operation and all of us take a very active part in the day-to-day operation of the business.

Even with a small operation and complete diversification between our radio station and television programing staffs, it might be surprising to realize that in 1953 we dissipated all of our profits of our radio station in that year to support our television operation for the 3 months that it was on the air. In addition to losing all our radio profits in 1953, we lost an additional $44,000 in making up the operational cost for that 3-month period. I am happy to say that since the first of 1954 we have succeeded in carrying the television operation into the black, and each month we have been able to show a small increase in our margin of profit. Our radio operation has suffered a good deal from a profit standpoint since we have entered television, and I must report that we do not have all of our old profits of radio to add to those of television. That, of course, is a problem that would be present with an operator of either a UHF or a VHF television station.

We realize that we are doing a good deal better job, both from a programing as well as profit standpoint, than our UHF competition is here in Bakersfield. As far as we can determine, the main reason that our results have been so much better than theirs is due to the fact that we went to the extra expense of a mountaintop location.

This location gives us coverage of 3 or 4 times as many sets as our UHF competition.

Prior to the time that they received their CP we invited them to join us on our mountaintop, but they felt that such a location was impracticable. In January, when we made our last set-count survey, it was indicated that we had some 100,000 television receivers in our primary coverage area while they had about 25,000. Naturally, it is a great disadvantage to them if they are trying to sell network or national or even local advertisers on the use of their facility when a comparison of the set coverage is made. We feel the advantage we have obtained is one we deserve and one that is the result of the extra effort and additional investment we made in our facility to provide maximum coverage and maximum use of the channel granted to us by the Commission.

We are a primary affiliate of the National Broadcasting Co. and a secondary affiliate of the Columbia Broadcasting System. The UHF station in this market is an affiliate of the American Broadcasting Co. and the Du Mont television network. Our UHF competitor carries a good many programs from his two networks that are not available to us and under the new ownership of the Chronicle Corp. they are showing signs of a much more intelligent and progressive operation.

The previous owners did very little to build the UHF station into the type of facility that could be considered a good television operation. I have personally spent many thousands of dollars and a great deal of time in the last year, in an effort to get additional network shows for our station.

I have been rather successful with NBC and CBS, but even at that we have more half-hour syndicated programs sold on our station than we have from either of the two major networks. Frankly, it looks to me that personal effort and perseverance, as well as equal physical coverage of a marketing area, is the answer for these UHF stations who seem to be having so much trouble.

This market was developed primarily as a VHF market out of Los Angeles and to consider it in the same category as the rest of the San Joaquin Valley, where there was no television available prior to the granting of CP's, would be entirely wrong. Loss of VHF coverage in this area would undoubtedly obsolete some 17,000 to 20,000 television sets that are not converted to receive UHF signals.

If there is any other information on our operation or information about this market that you feel could be helpful in presenting facts to the Senate Subcommittee Investigating UHF Problems, please do not hesitate to get in touch with me.

Yours very truly,

Gene DeYoung,
Channels allocated to community: 12, 18, 24, 47, 53.

Paul R. Bartlett,
President, Pierson & Ball,
Washington, D. C.

Gentlemen: This will serve to give you our written endorsement of the stand being taken by the informal VHF television group in their appearance before the Potter committee when the UHF television hearings resume. You are hereby authorized to incorporate the name of our station into the record in support of the VHF group's position and to put into the record any portion or all of the following statement outlining our own individual experiences and views on the matters under discussion.

HISTORY OF KFRE INTEREST IN TELEVISION

Station KFRE's interest in television dates back to 1944 when it was the first applicant for any television channel in Fresno, and when it acquired a mountain-top site which is considered to be ideally suited for television transmission to the entire central California area. After remaining on file for almost 2 years, the KFRE 1944 application for VHF channel 2, then assigned to Fresno, was withdrawn because of the uncertainties due to the first FCC color hearings and their ramifications.

In April of 1948, KFRE was again the first Fresno applicant for TV, applying at that time for VHF channel 5, 1 of 4 VHF channels then allocated to Fresno. Action on the KFRE application for channel 5, which was at that time unopposed, was expected at about the time the FCC imposed the "freeze." During the freeze KFRE participated in FCC rulemaking procedures looking to the establishment of a new allocation plan. In its comments on the proposals made by the Commission, KFRE urged the establishment of at least two VHF channels in Fresno in order to provide the area-wide coverage which would not be available from UHF transmissions. The final report and order designated 1 VHF channel to Fresno and 3 UHF channels.

After the lifting of the freeze, KFRE amended its application from VHF channel 5, which was no longer available in Fresno, to channel 12, the only VHF channel allocated to the Fresno area. Subsequently, another Fresno radio station also applied for channel 12.

On the 3 remaining channels allocated to Fresno, all of which were UHF, there were 5 applicants; 2 each for 2 of the channels and 1 for the remaining channel. In the fall of 1952, the unopposed UHF applicant was granted a construction permit, and in the months which followed the contests which remained for the other two UHF channels were resolved by mergers or buy-outs in both cases, with the result that the first UHF station began actual operation in Fresno in June of 1953; the second, which resulted from a merger or buy-out, in the fall of 1953; and the third early in 1954.

II. REASONS FOR KFRE DECISION TO APPLY FOR VHF

The following were the principal reasons KFRE decided to apply for the only Fresno VHF channel:

1. Such knowledge as was available indicated that only a VHF channel would adequately serve the entire central California area, which is now served by KFRE radio station.

2. VHF equipment was readily available and television service to the Fresno area could be provided on VHF within a matter of a month or two after an authorization, whereas UHF equipment deliveries were uncertain.

1 Reserved for noncommercial educational use.
3. KFRE believed the business future of the VHF channel was more certain than that of the UHF channels, and therefore believed that sound business judgment made it advisable to risk the great loss and delays which might be involved in comparative hearings for the VHF channel rather than take a UHF channel, which would probably have been available without hearing costs or delay.

III. THE PRESENT FRESNO TELEVISION SITUATION

Since early in 1954, there have been 3 operating television stations in Fresno, all UHF, and 1 UHF station operating in the nearby city of Tulare, thus providing 4 UHF services to the Fresno area. No television receivers were sold in Fresno prior to the commencement of the first UHF station here, and consequently every set in the central California area was capable of UHF reception.

The first UHF station to start was affiliated with NBC network as a primary affiliation and also took programs from CBS as a secondary affiliate. The second UHF station to begin operation became a primary affiliate of the ABC network, and now also takes programs from the Columbia television network. The third Fresno station is independent, and the station in Tulare is an affiliate of the Du Mont television network. All television networks are currently represented in the Fresno area and all on UHF stations.

IV. STATUS AND COSTS OF LITIGATION FOR VHF CHANNEL 12 IN FRESNO

KFRE was notified by the FCC in the fall of 1952 that a comparative hearing to determine the final licensee for channel 12 in Fresno would be necessary, and the hearing was scheduled in mid-1953 to begin in the fall of 1953. The hearing began in October of 1953 and the record was closed in March of 1954 and an initial decision is now awaited. To date the KFRE application has represented an expenditure of approximately $75,000 and we anticipate that as much as $100,000 may be required before a final decision is obtained.

Throughout the long period of delay KFRE has attempted to encourage an interim type of operation which would have provided early television service on channel 12 while litigation continued for the final authorization.

V. COMMENTS

All UHF applicants and grantees knew at the time they filed their applications that VHF channel 12 had been allocated to Fresno and would eventually be used there with whatever competitive complications might occur. All grantees who constructed their UHF stations in the Fresno area proceeded to do so at their own business risks, fully aware of the pendency of the Fresno VHF channel 12 application.

All of the original applicants and grantees of UHF channels in the Fresno area had an equal opportunity to apply for channel 12 in an attempt to secure the admittedly prime facility in the area. All the UHF applications of present grantees who failed to apply for channel 12 did so in order to avoid the costly proceeding and still more costly delay of a hearing.

Thus all of the present UHF grantees in the Fresno area decided to take the business risk involved in the operation of the admittedly less valuable UHF channels and to face the eventual competition of VHF channel 12 rather than to take the risk involved in spending substantial amount for a hearing, undergoing the long delay, and eventually ending up with no channel at all.

KFRE is content to stand with its business judgment and asks only that the ground rules not be changed at this late date. KFRE believes the UHF grantees or licensees should likewise be content to live with the decisions they have made.

Sincerely,

PAUL R. BARTLETT.

WRITTEN STATEMENT OF SACRAMENTO TELECASTER, INC., SACRAMENTO, CALIF., APPLICANT FOR CHANNEL 40

Channels allocated to community: 3, 4, 6, 10, 40, 46.
VHF stations operating in community: None.
UHF stations operating in community: Channel 40.

1 Reserved for noncommercial educational use.
Channels applied for: Channels 3, 10.
Channels contested: Channels 3, 10.
Construction permits outstanding: Channel 46.

SACRAMENTO TELECASTERS, INC.,

MESSRS. PAUL R. BARTLETT ET AL.,
Care Pierson & Ball, Washington, D. C.

GENTLEMEN: Thanks for your wire and for your alertness in protecting the interests of a very important segment of the TV industry.

By all means, add our firm's name to the list of those opposing the UHF committee's move for special privilege legislation. We approve all of your measures with the exception of that one referring to booster stations. The use of booster stations, we feel, is again special privilege; is not an industrywide problem, and is certainly not fair to the UHF group and would further injure them. We stand firmly against this measure and do not want our name used as supporting it. The rest of your platform, however, we support without reservations.

We are a local group of business and professional men, with broadcast experience well represented in our organization, applying for VHF channel 10 in Sacramento, Calif.

We have gone through an extended comparative hearing in Washington (the longest two-party case in the limited history of TV hearings). We have expended over $65,000 in preparatory and hearing costs alone and expect to expend another $10,000 before final grant. This will be, of course, a total loss should we not prevail; we also have completed oral argument before the entire Commission. Our total anticipated costs will be in the neighborhood of $800,000. At the outset we had to choose between U and VHF (this was just before the freeze was lifted) and chose VHF knowing full well that it would entail long hearings and heavy expenses with only two alternatives: an unfavorable decision or a grant with its speculative results—there is no assurance of success or profit in a VHF grant.

Our reasons for choosing VHF were:
1. 80,000 VHF sets in the area with only fringe reception.
2. Experience to draw from (prefreeze operations).
3. Availability of VHF equipment.
4. No actual UHF stations on air—no precedent.
5. Potential coverage requirements.
7. Proven VHF engineering, results, experience.

Two VHF (channels 3 and 10) and two UHF (channels 40 and 46) were available to us at the time of filing.

We feel that a freeze at this or any other time would be most unjust to not only us and others in our position who have in good faith, gone through long and expensive comparative hearings to prove our qualifications and abilities to operate in the public interest but to the general public who, because of public announcement, have purchased sets in anticipation of the channel going on the air.

We feel further that:
1. A great number of the UHF complainants are opportunists who have applied and received uncontested UHF channels with the hopes of quick profits.
2. A great number of the UHF complainants applied for and received grants without proper study and advice regarding markets, competitive factors, etc., and are now suffering the results of poor broadcast and business judgment.
3. A great number of the UHF complainants are outsiders (have no previous connection with the market in which they are operating) and applied on a multiple basis (e.g., John Poole who filed for five UHF stations and received grants in 3 or 4 markets (unopposed) and is sitting on grants without constructing).
4. UHF operators are unwilling to spend the necessary pioneering expenses and do the proper promoting job for their medium; that the "quick buck" didn't materialize, and they are now yelling wolf (VHF) and asking for special privilege legislation, so that they can profit (no FCC grant even implies a profitable operation) by keeping out the legitimate, experienced broadcaster.
5. All UHF stations are not operating at a loss and conversely, all VHF stations are not operating at a profit—the difference is that the VHF operators have faith in their future and are not asking for help. (See table 6 B-T May 24, p. 150.) Also the heavy percentage of UHF loss stations are in markets
of less than 100,000 where perhaps no TV station either VHF or UHF could be supported at this time.

6. A blanket freeze is not the answer even though more study of the problem might be indicated; e.g., in Sacramento and Fresno, Calif., UHF only is in operation and making large profits. To keep VHF out would be only to grant a monopoly to UHF and to guarantee them continued, protected profits and to deny the rights of free enterprise to VHF operators plus denying the public the use of sets already purchased. There are many similar examples throughout the country and any freeze should be on a market-to-market basis. This, of course, would be difficult; therefore, no freeze at all.

7. All turn-ins of grants have not been UHF. Some VHF grants were turned in after realizing that the market would not support the operations—not because VHF would smother them.

Very truly yours,

J. H. Schacht, Vice President.

Standard Radio & Television Co.,
Permittee of Station KQXI,
San Jose, Calif.

Pierson & Ball,
Ring Building, Washington, D. C.

Gentlemen: Standard Radio & Television Co. is in accord with the position stated by the informal VHF group in its telegram dated May 28, 1954. The position of this group is to be presented at further hearings to be held by the Communications Subcommittee headed by Senator Potter.

Standard Radio & Television Co., (KQXI), San Jose, Calif., is the permittee of VHF channel 11, and it vigorously opposes any suggestion that it be forced to move to UHF. KQXI also vigorously opposes any suggestion of a moratorium on the construction of VHF television stations which might be construed to prevent it from being authorized to commence telecasting upon completion of construction.

Standard Radio & Television Co. proposed to bring to the San Jose community and the Santa Clara Valley area localized television service designed to meet the needs of that community. The community is of rugged terrain and experience has shown that VHF is the type of television service that can best serve such an area. At the present time, San Jose does not have a television station of its own.

Therefore, it would definitely not be in the public interest for the Senate subcommittee investigating UHF problems to take any steps that would interfere in any way with the establishment of a satisfactory television service at San Jose, Calif.

Very truly yours,

A. T. Gilliland, President.

[Telegram]

SANTA BARBARA, CALIF., June 5, 1954.

PIERSON & BALL.
Washington, D. C.:

Santa Barbara Broadcasting & Television Co., licensee of Key-T. channel 3, serving coastal area of California from Monterey to Mexican border, earnestly supports position stated by the informal group of television operators who have engaged your firm to represent them in hearings of subcommittee of Senate Interstate and Foreign Commerce, Senator Potter, chairman. Please convey to the committee that our gross investment for television is $628,000 and to change to UHF would cost another $200,000 with no UHF transmitters in our area and with virtually no sets along the coast equipped to receive UHF. Local investors courageously ventured risk capital to build this station on 4,200-foot mountain to make maximum use of this natural resource. This station serves a sparsely settled remote area. If by legislative or regulatory fiat we were required to decrease our power and hence coverage would be to penalize pioneering spirit due to deprivation of property without due process both of licensee and of tens of thousand of enthusiastic owners of television sets who in northern part of area have virtually no other source of television. We will end first year operation July 1954, moderately in the red but we will succeed if left to pursue in an orderly manner the American system of free enterprise.

Sincerely,

HARRY C. BUTCHER,
Chairman of the Board, Key-T.

TELEVISION DIABLO, INC., STOCKTON, CALIF.

PERMITTEE OF CHANNEL 13

Channels allocated to community: 13, 36, 42, 64.

Re Senate subcommittee investigating UHF problems.

PIERSON & BALL.
Washington, D. C.

GENTLEMEN: I am a majority owner of station KHOF, channel 13, Stockton, Calif., and was recently given a construction permit by the Federal Communications Commission. We are now in the process of putting this station on the air. We have expended $400,000 to date and will expend an additional $400,000 before we are fully on the air. This station must of necessity serve the greater Sacramento and San Joaquin Valleys.

Any action on the part of the Senate investigating committee or FCC on the various proposals suggested to date, such as the elimination of intermixture of VHF and UHF, the allocation of all television stations to the UHF band exclusively, the imposition of any freeze, and the reduction and limitation of the coverage areas of VHF stations would all prejudice the investment we have made to date in this activity and materially reduce the proposed service to this important area that is not now being fully served by any station.

We are an independent VHF station. We would like a network affiliation; however, we do not believe the way to get it is through legislative or political action.

We also believe we can render a public service and operate a financially successful station as an independent. We are in no way sympathetic with the pro-

---

\(^{3}\) Reserved for noncommercial educational use.

48550--54---55
gram that is being considered of attempting to make the weak strong by making the strong weak. We do not believe the economic problem of overpopulation of television stations can be corrected by any political action any more than the overpopulation of television manufacturers can be corrected by anything other than the law of supply and demand.

The economic problem of too many stations in the market, regardless of whether they are ultra high frequency or very high frequency, or regardless of how long they have been on the air, is well illustrated by the fact that only three of the television stations in Los Angeles are making money at the present time. I understand that a similar situation exists in New York City. I have never heard of their asking for any legislative help to correct their red figures.

It seems to me that whether a television station succeeds or fails is based on the service it renders to the consumer. This, in turn, is recognized by the sponsor whose dollars determine the financial status of the station.

I would also like to comment, as president of Hoffman Radio Corp., that at the present time we are selling our all-wave tuners at the same price as our regular tuners even though they cost more. We are doing this for two reasons, first, the sale of these sets has not developed to be as great as we had anticipated they would, and second, we feel we should give some assistance in getting the new UHF stations started in some of our markets. I would like to report this has very little effect on the increased sale of all-wave sets at the retail level.

Our industry has been working diligently to bring the cost of the all-wave sets down and the price differential has already been reduced from $60 to $30 and I am confident this will continue to be reduced.

The major problems seem to be the lack of coverage and programs and I do not think you are going to help the coverage of the UHF stations by limiting the coverage of the VHF stations. This would, by its very nature, limit the public service that a VHF could afford without expanding the public service of the UHF station.

Relative to programing, I think that there may be an area to explore for the second and third run of the network programing that would be helpful to independent stations at the present time whether they are VHF or UHF. The union implications of the second and third run need to be answered in order to deliver programs at low cost.

It appears to us that the answer to success for any television station must continue to be based on the service the individual station renders in its own local community.

Sincerely yours,

H. L. Hoffman, President.

GRAND JUNCTION, COLO., June 5, 1954.

PIERSON & BALL,
Washington, D. C.:

The fundamental basis of our American system of radio and television is a private enterprise. There is bound to be a calculated risk in entering either field, particularly where competition is keen. The plight of the UHF is not unlike that of the VHF operators in the smaller markets. I operate one of the smallest TV stations in America on a VHF channel. I am faced with problems no less perplexing by comparison than the UHF stations in multiple markets created than the original condition for which a remedy is sought. I earnestly oppose imposition of a freeze reconciliation of the artificial limitation of present VHF
coverages. This would solve nothing and undoubtedly would result in complete chaos in the industry, with resultant losses to the public of staggering sums. Please present this wire as part of your testimony before Senate committee.

Rex Howell,
President and General Manager, KFXJ-TV.

The Elm City Broadcasting Corp., Station WNHC-TV, New Haven, Conn.

Operator of Channel 8

Channels allocated to community: 8, 59.
VHF stations operating in community: Channel 8.
UHF stations operating in community: None.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: Channel 59.

Testimony of Aldo De Dominics, Secretary-Treasurer and General Manager of the Elm City Broadcasting Corp., New Haven, Conn.

The undersigned, on behalf of the Elm City Broadcasting Corp., owner and operator of WNHC-TV, channel 8 (formerly channel 6) New Haven, Conn., opposed to the four proposals advocated by the UHF television group.

Seven years ago, before WNHC-TV, the major portions of western Massachusetts and Connecticut, the first State in per capita family income, had no television service. A number of interests contemplated entering the telecasting field in both New Haven and Hartford. Advice from experts was negative. Investment sources closed their doors and pocketbooks. Networks gave little or no assurance of either sustaining or commercial service. There were no receivers. One by one, potential applicants canceled out their interest and intention to apply for a construction permit.

Only the Elm City Broadcasting Corp. refused to relinquish its faith in the desirability of television for Connecticut and western Massachusetts.

This, plus belief that the public should be provided with television service and that a balanced television fare would be adequately supported by viewers, caused the Elm City Broadcasting Corp. to apply for channel 6 facilities. What subsequently transpired is history: In June 1948 television was at last long brought to Connecticut and western Massachusetts.

In less than four years over 250,000 homes were enjoying television. In 5 years, over 400,000 homes were being served by channel 6. Then, in January, 1954, at the direction of the Federal Communications Commission, WNHC-TV was obliged to scrap its channel 6 equipment (which represented an investment of one-quarter of a million dollars) install a new tower, new antenna, new transmitter, and provide enlarged transmitter quarters to telecast on channel 8.

In addition to a new capital and labor cost of three-quarters of a million dollars, many thousands of dollars were devoted to advertising and promoting the change from channel 6 to channel 8, and in advising and instructing viewers on the readjustments necessary to their antennas and receivers. As a result there are now nearly 725,000 homes that are able to receive channel 8 programs. Alterations in the present system of telecasting, of the nature promulgated by the UHF group, would, in this area, not only obsolete over one-half million receivers but would contribute further to the financial inconvenience and discomfort of the public by causing to be jacked several thousand new antennas, not to mention the replacement cost factor of UHF bow ties.

The case for the present system of television in Connecticut and western Massachusetts is simple and strong. According to CBS Television Research, which commissioned A. C. Nielsen Co. to conduct a national television set survey, 76 percent of Connecticut families are TV families, of which 7 percent are UHF families; while in Massachusetts 78 percent of all families have TV, of which 3 percent is UHF.

It seems conclusive that the main party in interest, the viewing public, has been and is being adequately served. Reference to the May 1954 United States Pulse TV survey disclosed that of the top 15 regular scheduled once-a-week

---

1 November 1, 1953.
shows, channel 8 carries 13; of the top 10 regularly scheduled multi-weekly shows, channel 8 carries 7. The 5 programs in both categories not telecast on channel 8 are carried over either channels 30, 55, and/or 61 in New Britain, Holyoke, and Springfield.

Examination of the channel 8 program structure reveals a substantial and favorable balance of children's, educational, religious, and public service programming, most of it in family viewing time. Further examination will disclose that the few programs in the above categories not carried by channel 8 can be seen on one or more of the UHF channels mentioned above. If the law of supply and demand has any merit, it must be concluded that the viewing public in Connecticut and Massachusetts either is being served 100 percent or has access to all television material now on the air through the simple expedient of buying an all-channel receiver if it desires to do so earnestly enough. None of the changes advocated by the UHF television group will materially aid the viewing public. On the contrary it appears that any such action, if it were to become a reality, could be construed in no light other than detrimental to the viewing public.

Since the Commission has historically refrained from tampering with the economics of broadcasting and telecasting, except for its natural basic concern about financial adequacy of applicants, it should refrain from so doing now since to do so would adversely affect the interest and convenience of the viewing public. Also severely affected will be this corporation's present capital investment which while only incidental is nevertheless substantial.

The majority, if not all, of the suggestions advocated by the UHF television group, would be, in effect, a Government-sanctioned subsidy of UHF broadcasters and at the expense of not only the presently successful operators who have done the pioneering work, but at the expense of the viewing public as well. And any mechanical stimulus designed to enliven an economy by artificial means seems to be premised on the belief that the industry, the public and the American advertiser have unlimited wealth which should be tapped and raided for what is, in effect, and inordinate and unnecessary expansion of telecasting properties.

Since in this area, at least, service will be ample for everyone concerned through the two VHF assignments, if it is not already adequate through channels 8, 30, 55, and 61, it is respectfully suggested that FCC attention should be directed to areas where no service is available with a view of helping the residents of those sections to receive TV programs.

To that end we support and encourage efforts to step up production of new and better all-channel receivers and the use of booster stations to improve telecasting service in existing TV areas; but we are opposed to any proposals that would negate the investments and efforts of the past 7 or 8 years on the part of telecasting pioneers and the public alike, or that seek to substitute a man-made dictum for natural, economic laws. Anyone who wishes should still be free to enter the business of telecasting, especially where a need for additional service can be proved. It does not appear fair or sound, however, that the electronic laws or standards be constantly remade unless the benefits to the public can be shown to far exceed all other considerations.

ALDO DE DOMINICIS.

North Dade Video, Inc., Miami, Fla.

Applicant for Channel 10

Channels allocated to community: 2, 4, 7, 10, 27, 33.
VHF stations operating in community: Channel 4.
UHF stations operating in community: Channel 17 (Fort Lauderdale).
Channels applied for: Channels 7, 10.
Channels contested: Channels 7, 10.

1 Reserved for noncommercial educational use.
Hon. Charles E. Potter,
Chairman, Subcommittee on Communications,
Senate Committee on Interstate and Foreign Commerce,
United States Senate, Washington 25, D. C.

Dear Senator Potter: It has been brought to our attention that Messrs. Paul R. Bartlett, Hugh Half, Jack Harris, J. Leonard Reinsch, L. H. Rogers, P. A. Sugg, H. W. Slavick, and Robert D. Swezey, have organized an informal group to present responsible comment concerning the problem of both the ultra-high-frequency and very-high-frequency telecasters.

North Dade Video, Inc., is an applicant for very-high-frequency channel 10 at Miami, Fla., and agrees with the views of the aforementioned gentlemen that there should be no elimination of intermixture of very high frequency and ultra high frequency; that all television stations should not be allocated to the ultra-high-frequency band exclusively; that there should be no further freeze on application proceedings nor upon the issuance of operating authorities to cover permits already granted, nor should there be any limitation or reduction of the carefully calculated and recommended coverage areas of very-high-frequency stations.

North Dade Video believes that all reasonable and proper steps to encourage production and distribution of all channel receiving sets should be made; that booster stations should be authorized so as to improve service areas.

Before North Dade Video, Inc., made application to the Federal Communications Commission for a construction permit for channel 10 in Miami, it and its officers, directors, and stockholders thoroughly investigated the allocations in the greater Miami area. Its investigation fixed the conclusion that it should file its application for facilities on channel 10, which, as you know, is in the very-high-frequency band.

From the date of the preparation of the application filed by North Dade early in 1953, up to and including the present date, at which time its application is in a consolidated-comparative proceeding, North Dade Video, Inc., has expended funds approaching $50,000. Expenditures cover technical and legal research and consulting fees. Not one cent has been spent for public relations or promotion. All expenditures were made in preparation of the application and in the hope of terminating the consolidated-comparative proceeding successfully. It is expected that before the proceedings are over, North Dade will incur considerable expenditures beyond those already made.

The allocations announced by the Federal Communications Commission on April 14, 1952, for television channels, were made after long and serious study and should not now be upset. It should be well noted that the Federal Communications Commission did not request anyone to file an application for an ultra-high-frequency television station. All applications were filed not at the behest of the Federal Communications Commission but by the insistence of those persons filing each application.

Very truly yours,

Walter Compton,
Vice President and General Manager.

WEAT-TV, INC., STATION WEAT-TV, WEST PALM BEACH, FLA.,
PERMITTEE OF CHANNEL 12

Channels allocated to community: 5, 12, 15, 21.
VHF stations operating in community: None.
UHF stations operating in community: None.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: Channels 5, 12.

1 Reserved for noncommercial educational use.
GENTLEMEN: You are hereby authorized to notify the Senate subcommittee considering TV allocations that WEAT-TV, Inc., permittee of channel 12 in West Palm Beach, Fla., supports the present FCC television allocations in all respects, including VHF and UHF assignments, peak powers and policy on transmitter locations.

It is our firm belief that there is no regulatory substitute for business judgment. The Commission in establishing regulations acted with unusual prudence and good judgment at the time. For any investor considering entering television complete information as to markets, receivers, program availability, cost of operation and technical state of the art in both VHF and UHF were available. Entering any business is a risk and the investor should require only that it be a calculated risk.

It is our belief that UHF can and will provide an excellent service for its coverage area. Television should not expect to suddenly appear as a full-blown economically sound nationwide system. The present AM system grew slowly with new stations coming into each market 1 by 1 as the situation enabled it. For this to occur in television it is imperative that all receivers be equipped to receive UHF as well as VHF. This will enable the UHF station to get on the air in an intermixed market when the economics of the industry warrant.

May I point out that our situation is highly competitive and that limitation of the power of Miami VHF's and UHF's would reduce our competition. However, it would also reduce the service available to the public.

We carefully analyzed the area in view of the rules laid down by the Commission and decided that the calculated risk was worth the investment. We are willing to live under the rules as presently set forth since all of our calculations are based on these rules. Any basic change would create a complete upset of carefully calculated risks and values not only in this market, but all over the country, and cause incalculable harm to the industry. It seems most likely that under any present new proposals the public would also suffer.

WEAT-TV, Inc., has spent over $25,000 in application, hearing, and equipment costs, most of which would not have been spent under different rules. We will shortly obligate ourselves for $200,000 additional. Should we spend this same amount on UHF at the present state of the art the area served would be materially reduced and the public would have to spend more to receive us.

I would like to take this opportunity to commend the Federal Communications Commission for its impartiality, fairness and good judgment which I have witnessed in my 10 years in broadcasting.

Sincerely,

J. R. Meacham, President, WEAT-TV, INC.

SOUTHEASTERN BROADCASTING CO., STATION WMAZ-TV, MACON (WARNER ROBINS), GA.

OPERATOR OF CHANNEL 13

MACON, GA., June 1, 1954.

PIERSON & BALL, Washington, D.C.: We join with you in opposing any limitation of VHF television service. We have made a substantial investment to serve the set owners in our area and expect to go full authorized power before the end of our first year of operation, September 27. In spite of the loss of approximately $100,000 in our first 3 months, we are continuing to lose in order to operate a 17-hour day because we believe our area is entitled to this service. Latest pulse survey of a 14-county area shows about 15 percent UHF conversion in all homes, which means there are more than 50,000 sets depending entirely on VHF television. It is inconceivable to us that anything as satisfactory to the public as VHF television should be disturbed in any way.

GEORGE P. RANKIN, JR., President, WMAZ-TV.

IDAHO FALLS, IDAHO, June 3, 1954.

PIERSON & BALL, Washington, D.C.: Please be advised that KID-TV will firmly support every effort to prevent any change in the present VHF allocation structure. One-half million dollars has been invested in an operation that would provide television service to the people of southeastern Idaho. To accomplish this it became necessary to locate 32 miles west of Idaho Falls atop a mountain 6,600 feet above sea level in a centrally located spot so that the 220,000 people within 110-mile radius might be served economically. Two hundred thousand people is small to support TV—we must have them all. To my knowledge there are no UHF sets here, as KID-TV is the only station now serving this area. If VHF is eliminated, a large number of these people would never have television. It appears we could not meet FCC engineering standard for our two primary markets of Idaho Falls and Pocatello.

C. N. LAYNE, General Manager, KID-TV.

ROCK ISLAND BROADCASTING CO., Station WHBF-TV, Rock Island, ILL.

ROCK ISLAND BROADCASTING CO., Station WHBF-TV, Rock Island, ILL.

OPERATOR OF CHANNEL 4

Channels allocated to community: 4, 6, 42. (Davenport-Rock Island-Moline.) VHF stations operating in community: Channels 4, 6. UHF stations operating in community: None. Channels applied for: None. Channels contested: None. Construction permits outstanding: None.
GENTLEMEN: WHBF-TV began operations July 1, 1950, marking the on-the-air culmination of 18 months to 2 years of work and worry as to:

1. Where were we going to get the money to sustain the heavy losses which we envisaged?
2. How long would we have to operate at a loss before the break-even point and profit phase (if any) would be reached?
3. How could a market as small as this one, internally, support two television stations?
4. When would we secure network service, live or film, and how much would there be—how big would be the program gaps to fill, and with what—and at what cost?
5. When would the telephone company put through its micro relays or coax so as to bring us live network service?
6. How were we going to get materials—such as steel, then scarce—in time to meet the FCC deadline for beginning operations?

Our story is simple. We debated long and seriously before making the decision to proceed in television. As a radio station, ours had never been a big moneymaker. For 8 years, after acquiring the radio station in 1932, we lost money every year—due to our effort to give better radio service to this community under the constant policy of being a paying and active member of the business fraternity in our city and county. In the 8th year, 1939, we sustained our heaviest loss.

However, despite these annual operating losses, we plowed much money into better equipment, more power, better quarters, and better service for more capable and numerous personnel. We had no network service or affiliation for 7 of these years, or until January 1, 1939, at which time Mutual gave us a contract. Until then we had made numerous approaches to the then existing networks in an attempt to negotiate a contract. We felt sure that if we had a network affiliation and good program service on a competitive level, we would soon be in the black—or at least in a good fighting position to sooner attain this long-sought objective.

Under the Mutual contract, we agreed to pay the line costs, amounting to approximately $10,000 for the year, without any guarantee of network revenue—only an assurance of network sustaining program service. The gamble was ours but we were glad to take it. In that first year we were able to recoup about half of our line costs in paid network programs which, with the most rigid economy in operations consistent with good public service, saw us in the black for the first time in 9 years.

All this is a prelude to our advent into television—an event which forced us to forego for the time being a plan to really promote and program FM for a period of at least 2 years, in which we felt it could be determined whether FM would or could be profitable.

When we decided to go into television, we had $50,000 tucked away from radio operations. (This after recouping our losses in the first 8 years of radio operations.) On the basis of the experience of others already in television, this amount of money seemed pitifully inadequate.

Frankly, we were scared—but determined, because we believed television was an advance in the art of broadcasting; and as broadcasters, we should either get into television or sell our radio station to someone who had the courage, foresight, and money to bring this service to our community. We had faith, so we mortgaged our future as well as all our assets to enter this new but compatible field.

Let it be noted that not once in our efforts to make radio broadcasting profitable, or in our consideration of entering television, did we consider:

1. Coming to the FCC with an appeal for help in an attempt to force a network affiliation;
or
2. Running to our Congressman or Senators or Congress crying for subsidy or preferential treatment when the going got rough.

We had studied the matter carefully and determined upon our policy. We felt that we had estimated as well as we could the risks involved, and that we had prepared for those risks. If our judgment was faulty, we had no one to blame but ourselves; and no matter how bitter the medicine might be, we were prepared to take it.

That the resolve and decision proved sound to date cannot be charged against us as a fault or as a desire to monopolize television operations or channels in
our community. At the time, three VHF channels were available in the Quad Cities. Anyone who could meet the FCC requirements as did we and WOC-TV, Davenport, could have secured the additional VHF channel, very likely without a contest. As it looks now—after nearly 4 years of operation—a third TV channel in this market, either VHF or UHF, would be economically hazardous indeed.

On the basis of present costs and business potential, the market, although a good one, would not, in our opinion, profitably support three strong stations. One would be hanging on and the other two would be hurt. The public interest would not, therefore, be well served.

A condition such as the present is one which we believe to be substantially economic and not subject to solution by an attempt of Government to regulate business or free competitive enterprise. Only future growth of our communities holds the answer.

The situation is not a new one. Newspapers faced it for years. Not so many years ago, cities of the size of ours had two or more newspapers; and the total number in the Nation was far in excess of what it is today. Failures, mergers, and sales brought the number of daily newspapers down to what their communities could support, and, in doing, brought out the strongest possible managements and soundest public policies. The result is that the public is better served today, with fewer but economically sound newspapers, than ever before in the Nation’s history.

In the war of economic attrition which all business must face under our free-enterprise system, the newspapers which failed or had to quit did not rush to the Government asking for help so that they could continue at the expense and weakening of their competition. They took the calculated risk—and the result—in the traditional American way.

As it happened, while WHBF-TV had only a short period of loss before breaking even and then into the profit phase, we had no assurance whatever that this might occur so soon, if at all, when we entered the field.

The opportunity to get in was open to all; but it was not until profits—big profits—materialized for the early pioneers who faced and survived staggering initial financial losses, that the rank and file swarmed to get on the bandwagon.

Because the picture has faded under the onslaught of added competition and rapidly rising costs—and, indeed, is gone completely for many—there has been a rising clamor for help from the FCC and the Government to the end that the weak be kept economically alive through other than their own abilities and resources and capacities.

Mark you, there has been no public clamor—the noise is coming from the operators.

WHBF-TV has moved steadily forward until as of now we have more than a million dollars in our radio-television investment. We face and have prepared to make additional investment this year and next of from one-quarter to half a million dollars in equipment necessary for color, plus improvement in our present facilities. This is a conservative estimate.

The Quad City market on a national basis is rated as the 82d in size populationwise. It is an important industrial and defense center. In sales it ranks high; in effective buying income it ranks high and above the national average. It is the farm-implement manufacturing center of the world.

The two VHF stations serving this market on channels 4 and 6 are operating with 100 kilowatts and delivering an excellent signal and service in this area. Reliable survey sources and distributors estimate that our two stations adequately serve 262,000 television homes. With the best programs of all 4 networks available to viewers during operations carried on for nearly 5 years, virtually all of the receivers in this market area are VHF. No UHF stations place a signal into this area sufficient to cause a demand for UHF receivers or converters, with the result that here you find but very few so equipped and virtually no demand, according to the retailers and distributors of TV receiving sets.

More VHF upstairs would work a severe economic hardship on these thousands who now are happy with their television service; and from our experience as to their reaction when this service is curtailed or interrupted—from whatever cause—the FCC and Congress would be deluged with burning missives from outraged citizens in a veritable killing frame of mind. We would shrink from being on the receiving end of the clamor thus precipitated. It would make the present illusionary UHF operators’ gale seem by comparison only a soft and whispering breeze.
If the present VHF industry is to be moved bodily from one sphere to another, then it is up to Government to foot the bill, paying all involved—operators and set owners—the full amount of their investment, plus damages, if any, which occur as a result of such a wholesale displacement. That is only fair, because the mistake, if any was made by Government—certainly not by the operators who have complied with the FCC regulations and requirements, and the people, who have proceeded enthusiastically and lovingly to embrace television, having faith in those who have provided it—both Government and private enterprise.

The present situation, we are convinced, will right itself if permitted to proceed along democratic, free enterprise lines—just as has been the history of radio and all other business. The people will be served—and those who have the ability and facilities will serve them—if left alone by other than fair rules of the game.

The engineering brains of the electronic industry will evolve ways and means so that the public demand is met, in all parts of the country, without subsidies or protection or preferential treatment to those who through mistaken judgment or limited abilities and experience, or both, seem to feel that they should be maintained in business despite economic realities and at the expense of those who had the courage and willingness to pioneer in the field.

After all, who is complaining and raising all the hubbub? Certainly not the public. Let us not be carried away by the clamor of the few who are not crying out in behalf of the people, but rather because of their own economic plight and selfish interests.

CENTRAL BROADCASTING CO., STATION WOC-TV, DAVENPORT, IOWA

OPERATOR OF CHANNEL 6

Channels allocated to community:
(Davenport-Rock Island-Moline): 4, 6, 12.
VHF stations operating in community: Channels 4, 6.
UHF stations operating in community: None.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: None.

STATEMENT OF CENTRAL BROADCASTING CO., DAVENPORT, IOWA

The Central Broadcasting Co., licensee of WOC-TV, Davenport, Iowa, wishes to go on record as opposing proposals made by UHF group to eliminate or change present VHF-UHF plan.

WOC-TV, Davenport, Iowa, went on the air in October 1949, the first station in its area. Receiver population was an estimated 400. Since no live interconnected network was available, program resources were limited to what could be produced locally, plus film and kinescope service that could be purchased from suppliers or provided by network. Lack of live network interconnection had effect of slowing down growth of set population as compared with cities with live network.

Economic support of station during first 18 months of operation was very slow, and station experienced an operating loss of approximately $200,000 during that period. Initial investment in studios and equipment amounted to more than $600,000.

Further difficulties were incurred when reallocations of channels by FCC caused change from channel 5 to channel 6. Cost of this changeover, combined with increase to maximum power, required an outlay of an additional $300,000.

Any reduction or limitation of coverage area would seriously and adversely affect this station’s operation and service to the public interest.

We estimate that at least 25 percent of the area’s sets or more than 65,000 would be obsolete with advent of exclusive UHF transmission. If all remaining sets were converted, cost would be $40 to $60 per set or total of $6 million. Also, it would take 5 years or more for the UHF stations to deliver service to 265,000 homes now receiving the WOC-TV picture.

Respectfully submitted.

RALPH EVANS,
Executive Vice President.
Inexpensive and successful depend on metropolitan centers that must count. Counties could receive UHF signals if sufficient stations were allocated. Damage to our stockholders would definitely injure our company and its many viewers, and would irreparably damage our company.

Television operations are expensive. Each station must serve a sufficient number of homes to justify the investment and the operating overhead. It is our opinion that we serve the minimum number of homes necessary for a proper television operation.

Situation in regard to UHF and VHF in this State was revealed in November 1 survey by Nielsen. As of that date only 9 percent of the homes in television counties could receive UHF signals; but 37 percent could receive VHF signals.

It must be clearly understood that a market such as ours in central Kansas must cover much more geography than stations where there are many metropolitan centers close together. Almost two-thirds of the KTVH coverage potential is located in small towns and on farms. In our opinion these communities are far too small to afford television of any description and therefore they are dependent upon UHF or VHF signals for their television.

Building a television station in a minimum-sized market is difficult and expensive. Success and proper service are possible only if our station continues on its present course. Any restrictions upon it for coverage, power, etc., would, in effect, be punitive.

The Radio Station KFH Co., Wichita, Kans.

Applicant for Channel 3

Channels allocated to community: 3, 10, 16, 22.¹
VHF stations operating in community: None.
UHF stations operating in community: Channel 16.
Channels applied for: Channel 3.
Channels contested: Channel 3.
Construction permits outstanding: Channel 10.

¹ Reserved for noncommercial educational use.
The radio station KFH Co. of Wichita, Kans. is an applicant for the VHF channel 3. VHF channel 10 and UHF channel 16 are also assigned to Wichita. This company owns and operates KFH, a regional AM station, which just celebrated its 32d anniversary. It also owns and operates KFH–FM which is soon marking its sixth anniversary.

This company in the early days of operating the AM station, endured financial losses, whereas had it been a clear channel outlet profits would have been assured; however, typical American enterprise and business ingenuity prevailed and losses were turned into profits. This company has been operating an FM station for almost 6 consecutive years, 10 hours every day. To date our FM station is a complete financial failure but we regard this as our responsibility and we are not seeking relief from any senatorial group. We believe that we still might find a solution to our FM dilemma just as we did for our AM property in the early thirties. We do not believe that the solution to our FM problem is to shift all AM station assignments into the FM band, nor do we contend that some sections of the country should be assigned all AM channels and some sections all FM channels. We were assigned an FM license by the FCC for the express purpose of rendering a public service with the hope of financial reward. We assumed completely all financial and programing risks. No one guaranteed FM network program service at a profit.

This company decided to enter the television field in the summer of 1948 but before the application could be finalized we were caught in the freeze. Upon the issuance of the revised allocation plan this company decided to take the longer and the more expensive route into television by applying for the more sought after and proved VHF facility rather than the untried UHF channel because it was patent to our business judgment that the VHF channel incurred fewer financial risks. Every AM, FM and TV broadcaster knows that given the opportunity to serve a larger number of people, and by rendering a better service, attracts more advertisers. Many advertisers use network service and the networks wanting to serve their advertisers best, choose that station which reaches the largest audience. However, as a channel 3 applicant, we have not been guaranteed network service nor has any network official even implied to us that we could expect service. No one has guaranteed to us that we will make a profit. In fact, if we are fortunate enough to be awarded a VHF license, we anticipate a substantial loss for our first period of telecasting. These are normal business risks which we are willing to assume. We have invested many thousands of dollars in our TV hearing for a VHF channel. This, too, is a normal business risk, but a little out of the ordinary. However, a new freeze on VHF assignments or a new reallocation plan simply for the purpose of affording financial or programing relief to a few UHF broadcasters would create for this company an unfair burden. Let American ingenuity prevail for the ultimate solution of the problems of the UHF broadcasters.

FRANK V. WEBB, 
Vice President and General Manager.

WAVE INC., STATION WAVE–TV, LOUISVILLE, KY.

OPERATOR OF CHANNEL 3

Channels allocated to community: 3, 11, 15, 21, 41, 51.
VHF stations operating in community: Channels 3, 11.
UHF stations operating in community: None.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: Channels 21, 41.

STATEMENT OF NATHAN LORD, OF LOUISVILLE, KY.

I am and have been during the periods herein mentioned, the executive vice president of WAVE, Inc., Louisville, Ky.; WAVE, Inc. began telecasting in Louisville, Ky., on November 24, 1948, on channel 5 pursuant to authority of the Federal Communications Commission; at that time the best estimate obtainable indicated there were no more than 2,000 television sets capable of receiving signals from WAVE–TV.

1 Reserved for noncommercial educational use.
WAVE, Inc., sustained an operating loss on its telecasting operations for the year 1948 in the amount of $65,306; for the year 1949 WAVE, Inc. spent $275,173 for technical equipment used in its television operations.

During the year 1949, WAVE, Inc. lost $74,744 on its television operations and spent an additional $88,712 on property used in its television operations.

For the first 5 months of the year 1950 WAVE, Inc., lost $2,081 on its television operations; over the first 18 months' period of its operation the number of television sets capable of receiving its signal had increased to 34,000.

During the initial 18 months' period of loss, WAVE, Inc. relied heavily on local sports programs and other local origination rather than on network programs although for a major portion of that time WAVE, Inc. was affiliated with four networks; that a report furnished the Commission after its 1949 operations indicated that only 25.94 percent of its total broadcast time or the period covered by that report was serviced by network commercial and sustaining programs.

At the end of May 1954, there were estimated to be 386,791 television sets capable of receiving its signal; any change in the present allocations of wavelengths or reallocation would seriously affect its present viewers adversely and therefore would not be in the public interest; any change in the present rules relating to network affiliation would seriously affect the quality of its present program service and would therefore not be in the public interest.

For the reasons hereinafter set forth, he opposes any proposals which might directly or indirectly affect televisioners in the WAVE-TV present service area by degrading or reducing the service presently available to 386,791 set owners.

He opposes any change in the basic economic pattern (private enterprise) by way of subsidy or other governmental assistance because he believes such would not be in the public interest nor would conform to the United States system of free enterprise.

He favors any reasonable proposals which would aid in the production and distribution of television sets, and any technological developments by way of booster stations or other methods of improving service.

STATEMENT OF CALCASIEU BROADCASTING CO., LAKE CHARLES, LA.

PERMITTEE OF CHANNEL 7

Channels allocated to community: 7, 19, 25, 60.
VHF stations operating in community: None.
UHF stations operating in community: Channel 25.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: Channel 7.

CALCASIEU BROADCASTING CO,
Lake Charles, La., May 31, 1954.

PIERSON & BALL.
Washington, D. C.

GENTLEMEN: We have been advised that an informal group composed of prominent telecasters have employed your firm to represent them in connection with the Potter hearings, the Senate subcommittee investigating UHF problems.

We are most anxious to join with these gentlemen in opposing the elimination of intermixture of VHF and UHF; the allocation of all television stations to the UHF band exclusively and the imposition of any freeze upon application proceedings or upon the issuance of operating authority already granted and the reduction and limitation of the coverage areas of VHF stations.

The FCC granted to our company a construction permit for the building of a VHF television station on channel 7 in Lake Charles. We have already purchased our equipment and, with the exception of the antenna itself, practically 95 percent of the equipment is on hand. A self-supporting tower with an overall height, including antenna, of 474 feet has been purchased and the tower is in the process of being delivered this week; pouring of the foundations for this tower will start within the next day or so. This, coupled with the fact that we purchased property at a cost of $75,000 and have entered into a contract.

1 Reserved for noncommercial educational use.
for the remodeling of this property, work on which has already started, in an amount which will exceed $80,000, would make our position untenable, should the FCC eliminate the intermixture of UHF and VHF stations since there is now a UHF station operating in Lake Charles, as well as the imposition of any freeze which would in any way prevent us from carrying out the contracts which we have made and which are in effect and being fulfilled at this time.

Any action which might be taken by the United States Senate or FCC which would have the effect of stopping or holding up the construction of our VHF station on channel 7, construction permit for which has been previously granted by the FCC, would have a disastrous effect financially on our company, as well as result in many viewers throughout this area being unable to get grade A television service. We have spent, or obligated our company to spend, approximately half a million dollars to carry out this construction permit granted by the FCC and we most certainly hope that no action will be taken by the Senate subcommittee which would in any way hold up construction as has been previously authorized by the FCC.

Yours very truly,

DAVID WILSON.

STATEMENT OF WDSU BROADCASTING CORP., STATION WDSU-TV, NEW ORLEANS, LA.

OPERATOR OF CHANNEL 6

Channels allocated to community: 4, 6, 8, 20, 26, 32, 61.
VHF stations operating in community: Channel 6.
UHF stations operating in community: Channel 61.
Channels applied for: Channel 4.
Channels contested: Channel 4.
Construction permits outstanding: Channels 20, 26, 32.

STATEMENT OF WDSU BROADCASTING CORP.

WDSU-TV began its air operations on channel 6 on December 18, 1948, as the first television station in the city of New Orleans, in the State of Louisiana, and also in the 4-State area of Louisiana, Mississippi, Alabama, and Arkansas.

The present owners of the WDSU properties acquired the AM and FM stations in New Orleans from E. A. Stephens, Fred Weber, and H. G. Wall in November 1948. Among the assets and liabilities acquired with AM and FM properties was a construction permit for television channel 6. Mr. Weber has testified in this hearing as the ex-operator of UHF channel 46 in Atlantic City, N. J., which station went off the air in May of 1954.

At the time WDSU-TV began operations, there were only 47 other television stations on the air in the entire country, and approximately 1 million receiving sets were in the hands of the American people; most of them in New York, Chicago, Los Angeles, and other cities where television was at least 2 or 3 years old. There was at that time considerable doubt as to how soon, if ever, televising would become a profitable business.

The WDSU-TV management had estimated that its television station would probably have to operate at a loss for a period as long as 5 years. It is noteworthy that construction permits issued for channels 4 and 7 in New Orleans in January 1947 and January 1948, respectively, were surrendered by their holders in 1949, rather clearly indicating that they too viewed a venture into television at that time as a very dubious business risk.

From the very beginning of its operation, WDSU-TV faced a hard battle on several fronts. It had virtually no program material; a program schedule for the week of December 19, 1948, is attached and marked exhibit A. The increase in the number of receiving sets was painfully slow, as indicated by the circulation figures compiled by New Orleans Public Service, Inc., on the list attached and marked exhibit B. It was extremely difficult to interest either local or network advertisers in purchasing a facility with so little circulation, even at the pitifully low rate of $100 per hour. It was also slow and painstaking work to assemble and train a competent staff for the operation and management of the station in an area where television was virtually unknown.

1 Reserved for noncommercial educational use.
For the year ending December 31, 1949, the losses on WDSU-TV were $243,898.58; for the following year, they were $116,333.07. For the year 1951 and thereafter, the television operations have shown a profit. The station has been affiliated with all four national networks, and has carried network programs originated by each of them. In addition to its commercial and sustaining network traffic, the station has carried a large number of locally produced live and film programs on both a sustaining and a commercial basis. A copy of its current program schedule is attached and marked exhibit C.

In November of 1953, a UHF station, WJMR-TV, commenced its operation in New Orleans on channel 61. That station is presently broadcasting some of the network programs hitherto broadcast by WDSU-TV, other network programs not previously seen in the New Orleans market, and various local programs, primarily on film. The set circulation figures attached as exhibit B indicate that as of the present time there are in the New Orleans area 45,966 sets capable of receiving the UHF signal. Subtracting these from the total estimated by New Orleans Public Service to be in the WDSU-TV area, there remain 208,518 sets which rely upon WDSU-TV for television service.

In addition to channels 6 and 61, the FCC has also allocated to New Orleans VHF frequencies 4 and 8, and UHF frequencies 20, 26, and 32. Channel 8 has been reserved for educational purposes. Channel 4 is involved in a contest among three applicants. Construction permits have been granted without contest to applicants for channels 26, 28, and 32; thus far we have received no information that any of the grantees have proceeded with construction.

The owners of WDSU-TV are solely engaged in the business of radio and television broadcasting. They have made a close study of the television channels available in communities in the Deep South, with a possible view of engaging in other operations in certain of those communities. In this connection it has been incumbent upon them to make a thorough investigation of the relative desirability of UHF and VHF facilities. By and large, they have concluded that at the present time UHF is not equally competitive with VHF with respect to the efficacy and coverage of its signal, the availability of comparably developed transmitting and receiving equipment, and with respect to its relative attractiveness to advertisers.

We are inclined to view that time will cure, in very large measure at least, these relative deficiencies. We also believe that there are certain existing situations in which a UHF operation can be successful. For example, the only investment which we have thus far concluded in a radio and television operation other than that in New Orleans is the purchase of approximately 20 percent of the Modern Broadcasting Co., which operates a radio station (WAFB) and UHF television station (WAFB-TV, channel 28) in Baton Rouge. At the present time, and for well over a year now, WAFB-TV has been the only television station operating in Baton Rouge. There is one VHF channel allocated to that city. In the circumstances, it appears that there will be sufficient two stations, and we are inclined to believe that WAFB-TV is entitled to anticipate securing a sufficient percentage of the volume of business to sustain a profitable operation.

As we have indicated above, any investment in television made as of 5 or more years ago was subject to such great uncertainty that very little risk capital was available for that purpose. As soon as some of the earlier operations began to show profits, however, a new and unbounded optimism developed about the future of television. Many people rushed to make applications in situations where any thorough scrutiny of the technical and economic issues involved would have restrained them. The relative difficulties of operation in the ultrahigh frequencies was apparent to all who had made any study of it. One had also only to look at the operations in multiple-station markets such as New York, Los Angeles, Chicago, and Atlanta to determine that there were apparently very few cities in the country which could profitably sustain more than three television stations regardless of whether these operations were in the very high or ultrahigh frequencies.

As we look forward into the future, we are convinced that, because of the large capital investments involved in television operations, enhanced as they soon will be by investments in color equipment, the number of television stations which will ultimately survive will be in hundreds rather than thousands, the total probably roughly comparable to the number of daily newspapers. We believe that in none but the largest metropolitan markets will there be more than three stations, and that a total of six or seven hundred stations will be all that can survive economically. Natural limitations of program resources and adverti-
ing revenues will, in our opinion, necessarily bring about this result. It is significant to note that a single television network produces each year many times the number of clock-hours of entertainment produced by the entire motion-picture industry. The number of new shows appearing on Broadway each year could not program a single network for a week.

If our prediction is correct, there will undoubtedly be many television operations in both the very high and ultrahigh frequencies which will, in the natural course of things, be unable to sustain themselves. This is a necessary characteristic of free competition. It is our frank opinion that any attempt, however well meaning, artificially to support a system, the elements of which cannot sustain themselves in free competition would, ultimately adversely affect the public interest.

Respectfully submitted.

ROBERT D. SWEZEE,
Executive Vice President.

NEW ORLEANS PUBLIC SERVICE, INC.,
New Orleans, La., May 24, 1954.

Mr. ROBERT D. SWEZECY,
Executive Vice President,
WDSU Broadcasting Services, New Orleans, La.

DEAR BOB: During the month of April, 4,479 television receivers were sold in the area served by WDSU-TV (including 1,893 sets sold by dealers in the New Orleans area) bringing the total number of sets sold as of May 1 to 254,484.

Of the number of sets sold in the New Orleans area during April, 1,893 are equipped to receive UHF, bringing the total number of sets equipped to receive UHF as of May 1 to 27,237.

Tuners and channel 61 strips reported sold by these sources during the month of April total 705.

This report does not include UHF receivers or conversion equipment sold outside the New Orleans area.

UHF summary

Number of UHF-equipped receivers reported sold to date.................. 27,237
Number of UHF tuners and strips reported sold to date.................... 18,729
Total................................................................................. 45,966

Sincerely,

E. N. AVEANO, Dealer Sales Manager.

STATEMENT OF KTBS, INC., SHREVEPORT, LA., APPLICANT FOR CHANNEL 3

Channels allocated to community: 3, 12.
VHF stations operating in community: Channel 12.
UHF stations operating in community: None.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: Channel 3.

RADIO CENTER BUILDING,
Shreveport 77, La., June 4, 1954.

PIERSON AND BALL,
Attorneys, Washington, D. C.

GENTLEMEN: KTBS began in April 1948 to pursue its application for one of the lower VHF band channels. At that time Shreveport was allocated 5 VHF channels, and after careful deliberation from an economic and engineering standpoint it was decided to file for channel 4. This was accomplished and grant of the construction permit was awaited. However, the application was held up October 1948 as a result of the freeze on new station applications imposed by the Commission. This freeze, which was to have lasted only 3 months, was not lifted until July 1952.
In July 1952 a new allocation plan granted to the Shreveport area only 2 VHF channels, Nos. 3 and 12. Again KTBS selected and reaffirmed its previous decision to keep effective its application for the low-band channel, channel No. 3. Our reason for this preference is the greater efficiency and lower operating cost of this channel, particularly as it bears upon public service to our predominantly agricultural area. KTBS surveys indicate channel 3 will cover an 80-mile radius and bring much-needed service to approximately 700,000 people.
We have already expended approximately $75,000 in prosecuting our application and plan to spend $750,000 or more in constructing our station. Our actions have been based on the expectation that the allocation plan would be permanent,
and that we would not be required to sacrifice time and money only to endure another prolonged freeze and then be given our choice of a less efficient UHF channel.

The people of Shreveport and its rural population numbering in the hundreds of thousands have need of an efficient and powerful VHF station to serve them. In anticipation of such a station, many suburban and fringe area dwellers have expended large sums of money in the erection of tall VHF receiving antenna towers. They expect and will demand an all-purpose VHF station designed and built with them in mind and programed to fulfill their community desires.

KTBS has been endeavoring for many years to build a first-class television station, programing to the needs of our people, and requests that it be permitted to proceed without the imposition of a further period of construction permit freeze, and without facing the prospect of its low-band channel being removed and a less efficient UHF channel (that it is felt will not perform proper service) substituted therefor.

Accordingly, it is respectfully requested that our views be given proper consideration.

KTBS, INC.,
Revenue Newton Wray,
President.

WESTINGHOUSE BROADCASTING CO., INC.,
Washington 6, D. C., June 10, 1954.

Hon. Charles E. Potter,
Chairman, Subcommittee No. 2 on Communications,
Committee on Interstate and Foreign Commerce,
United States Senate, Washington 25, D. C.

Dear Senator Potter: Reference is made to the hearing held by your subcommittee May 18, 1954, et seq., in the matter of VHF-UHF television broadcasting and on Senate bill 3085 dealing with multiple ownership. It is our purpose in writing to you to set forth our position on some of the suggestions made by witnesses in their testimony.

Westinghouse Electric Corp., the founder of commercial broadcasting with the advent of KDKA, November 2, 1920, has been continuously interested in radio and television both as a broadcaster and as an equipment manufacturer. Working with television methods since 1926, Westinghouse successfully demonstrated, in 1928, the first all-electronic television system, made possible by a new television tube (Iconoscope) invented by Doctor Zworykin in our research laboratories. Westinghouse, in conjunction with the Glenn L. Martin Co., in 1945-49, developed and successfully demonstrated the television broadcasting system known as "Stratovision" in which television transmitters were installed in high-flying aircraft. At 30,000 feet, television service can be rendered over an area having a radius of 200 miles. Westinghouse built a television station in Boston (WBZ-TV) in 1947 and has been operating it since that date. We see no problems now facing the industry which are either fundamentally different from many problems previously faced and solved or any which cannot be solved by American ingenuity without any drastic action necessary on the part of either the Senate subcommittee or the Federal Communications Commission.

The present allocation plan may not be perfect but it represents more than 3 years of intensive (and expensive) cooperative efforts between the entire industry and the FCC. It should not be lightly or hastily cast aside because of a few protests from those who are unable or unwilling to face life in a free competitive economy.

Westinghouse, along with many other pioneers, in the early days of radio and again in the early days of television, faced exactly the same problems being presented to the Senate subcommittee by UHF protagonists. The problem then and now is an adequate number of sets in the hands of the public and attractive programing which the advertising industry is willing to support.

The Westinghouse experience in television at Boston is typical. Although our investment was approximately $1 billion, we operated at a loss from sign-on in June through the balance of 1948 and all of 1949 for a total in excess of $300,000. This loss was not recovered until October 1950. We had faith in the future of the industry. Even as late as the first quarter of this year, according to FCC statistics, only 46 of 175 postfreeze TV stations reporting made a profit and only 33 VHF stations (37 percent) were operating in the black. After the normal
shakedown period inherent in any new industry, this condition will improve and stabilize.

It has been proposed to require all VHF stations to now reduce their existing coverage area to avoid overlap of a nearby UHF station. This would result in inestimable damage not only to the stations but to the members of the public living in the present service areas. For instance, if the coverage area of channel 4 in Washington, D. C., were so reduced, thousands of citizens living in Hagerstown, Md., and in the surrounding area, would be denied service they have been enjoying and relying upon for so many years.

These citizens (and those in any other similar community in the United States) have a right to, and will demand, a freedom of choice among multiple-program sources. Since Hagerstown has been assigned only 1 channel (and it certainly could not support more than 2), it is clear that additional programs to permit freedom of choice (and a competitive broadcasting system) must come from outside areas. This service can best be furnished by the existing VHF channels located in cities large enough to support multiple-program sources. The effect of this reduction of service area proposal on rural America would, to us, be comparable to suddenly denying them radio service by requiring all clear channel broadcasting stations to reduce power to the equivalent of a local station. If the principle be established that the coverage of the VHF stations in Washington is limited to eliminate overlap with the UHF station in Hagerstown, then it follows that the UHF station allocated to Frederick, Md., must be limited to prevent overlap with the UHF station allocated to Hagerstown. Under such a philosophy the citizens of Washington would receive four competing services, the citizens of Frederick and Hagerstown, respectively, would each receive a single service, and the vast rural audience living between these cities would be denied any service.

Furthermore, such a philosophy is physically impractical in a situation like Allentown, Bethlehem, and Easton, Pa. Two stations have been allocated to Allentown, one to Bethlehem, and one to Easton, Pa. Under the present plan this should afford 4 competing services to the residents of 3 cities and the rural areas surrounding them. It seems to us inconceivable that anyone could seriously propose that the coverage areas of these stations be so reduced as not to overlap (assuming this was physically possible), thereby reducing the citizens of a community in a city to a single service and Allentown, Bethlehem, and Easton to 4 single services. The theory becomes even more untenable when we realize that most cities in the United States have been allocated but a single television channel, and in the whole State of New Hampshire only 1 city gets more than 1, and in the State of New Jersey only 2 cities get more than 1 channel. The public interest lies in the direction of making every effort possible to increase the coverage of each station.

In 1928 there were approximately 600 radio stations in the United States surviving upon approximately 1 percent of the Nation's total advertising dollar. Today there are over 3,000 stations in operation, and the overall gross billing of the broadcasting industry, radio and television combined, is almost at the $1½ billion mark. Many a community which does not have a local newspaper has a local radio station. We have seen this growth take place in America, under the American system, without equal coverage and without any attempt to nullify the law of physics with arbitrary restrictions on coverage.

It has been suggested that the FCC now move all television stations into the UHF band. A determination of all of the remaining applications pending before the FCC will add approximately only 100 more stations over those now in existence or authorized. As now discerned, the television industry will consist of about 670 stations in 325 communities (based upon present applications and licenses). The total dollar damage, not to mention the inconvenience that would result to the industry and to the public should such a suggestion be approved is beyond imagination. Twenty-seven million receivers are now in the hands of the public.

It is a useless suggestion. Requiring all stations to move into the UHF band would not equalize the services. The power ratio for approximately equal coverage between the lower end of the VHF band (channels 2 to 6) and the upper VHF band (channels 7 to 13) is approximately 3 to 1. The ratio between the upper portion of the VHF and the lower UHF band (channel 14, etc.) is again approximately 3 to 1. And the ratio between the lower UHF band and the upper VHF band is again approximately 3 to 1. Therefore, to force all existing VHF stations to abandon their present service and to move to the UHF
band solves nothing and destroys existing television service. Rural and suburban America will not accept such a decision.

It has been suggested that the FCC declare an immediate freeze—suspending all new station grants and existing station requests for modifications. There are now 377 TV stations operating in 237 communities in the United States and additional sums have been invested or obligated to construct many of the remaining 200 stations which have been authorized by the FCC. The bulk of the industry as it is now discernible is either on the air or has been authorized by the FCC and only about 100 new stations are awaiting disposition of hearing procedures. Such a freeze, at this time, is a useless locking of the barn door. Furthermore, many of those awaiting final orders must be in the same position as we are. In the Portland, Oreg., TV hearing now awaiting decision, our expenses were over $270,000 and we have frozen risk capital of $1,015,000; in the Pittsburgh TV hearing now under way our expenses to date are over $180,000, and we have frozen $5 million of risk capital pending a final decision. A freeze at this time would fatally injure many applicants.

It has been suggested that compulsory network affiliation is the solution. Radio has grown from six-hundred-odd stations to over 3,000 stations and networking has developed simultaneously under four national networks and many hundreds of smaller networks are serving the American public today—all without any mandatory instructions from a governmental agency. We believe that the history of radio is conclusive proof that the public interest requires the history of television to follow the same path of free and open competition. The radio industry has seen the birth, growth and struggle for top position among national and regional radio networks. We have seen the relative positions of networks change union to union, decade after decade over the years. This free play of economic forces has been in the public interest. The poorest man in the United States now enjoys free daily entertainment unavailable to the richest man in any other country in the world. And, of equal importance, this growth has taken place within the framework of our antitrust laws which, in our opinion, have proved adequate to prevent monopolies.

It has been suggested that stations be required to accept the affiliation with a predetermined network organization. This proposal, in its ultimate conclusion, means Government owned and controlled broadcasting in the United States. Assuming a station is required to affiliate with a named network and a dispute between the parties as to the rate payable and acceptable, the Government will be immediately in the rate-setting business, with all of its complications—technical facilities available, coverage, constantly changing set statistics, etc. In the next step, the individual station's popularity (or lack of it) and its consequent ability to attract revenue from local advertising sources, will depend upon the program furnished by the network. Since it was required to sign the network contract, the station would surely be granted the right to require Government control of the programs. And the final step, assuming the Government required the network to produce more expensive and attractive programs, the network would soon be obliged to demand Government subsidy.

In 1953, 14.4 percent of all Westinghouse TV production featured built-in all-channel UHF-VHF tuners. In addition, more than 80 percent of our 1953 sets which did not contain built-in all-channel UHF tuners, contain provision for internal adaptation to UHF and our distributors in UHF areas regularly stock coils for this internal UHF adaptation. The balance accept external adapters. For the first half of 1954, approximately 24.6 percent of our Westinghouse TV production features built-in UHF tuners, and the trend is apparent. For more than a year, our sales department has maintained market development teams in the field to assist in the development of new UHF markets. When a new UHF station is about to go on the air in an area not previously served, our market development team moves in; our sales and marketing experts aid and instruct the local distributors and dealers by bringing them up to date on the latest methods of TV merchandising, and our technical representatives train the local service technicians in modern television servicing techniques.

This development of UHF markets has not been without its problems. When the station did not open on the day predicted (in some instances opening was delayed several months) great dissatisfaction was created among purchasers, distributors, and dealers. In other cases the signal from new stations were not technically acceptable, resulting in unsatisfactory reception at consumer level. As new signals have been turned off, screen television and until expense to dealers, distributors, and ourselves in attempting to solve consumer problems. In cases where the signals were adequate, many programs were unattractive and the public quickly lost interest, dwindling consumer desire for ownership of UHF sets.
However, these problems are not new to the television industry nor are they unique. Patience and ingenuity solved them in the past and will do so again.

In our opinion the greatest shot in the arm that Government could give to the UHF operators at the moment, without disrupting existing investments or changing the American broadcasting system as it is known, would be to repeal the excise tax on UHF-VHF television receivers. We endorse the position presented to the Senate subcommittee on this point by Mr. Glen McDaniel, president of RETMA. Since a UHF receiver costs more to manufacture than a VHF receiver under present known manufacturing processes, the elimination of this tax would practically eliminate the manufacturing cost differential and the set thereby becomes more attractive to the manufacturer and to the purchaser.

We believe that the complete solution of all problems presently facing the industry lies in placing more UHF-VHF receiving sets in the hands of the public and more television stations on the air as quickly as possible.

Sincerely yours,

CHRIS. J. WITTING, President.

STATEMENT OF FETZER BROADCASTING CO.,
OPERATOR OF WKZO-TV, CHANNEL 3, KALAMAZOO, MICH., KOLN-TV, CHANNEL 12, LINCOLN, NEBR.

Channels allocated to Kalamazoo: 3, 36.
- VHF stations operating in community: channel 3.
- UHF stations operating in community: None.
- Channels applied for: None.
- Channels contested: None.
- Construction permits outstanding: None.

Channels allocated to Lincoln: 10, 12, 18, 24.
- VHF stations operating in community: Channel 12.
- UHF stations operating in community: None.
- Channels applied for: None.
- Construction permits outstanding: Channel 10.

The imposition of the proposals made by the UHF group upon the operations of WKZO-TV would seriously affect television service to 2 million people in western Michigan and would impose catastrophic economic hazard upon the future existence of the Fetzer Broadcasting Co. which has to date invested more than $3 million in television. The imposition of a freeze upon applications before the FCC would stagnate current construction of the Fetzer Broadcasting Co. involving the expenditure of approximately $1 million in the Kalamazoo, Mich., and the Lincoln, Nebr., area.

The allocation of all television stations to the UHF band exclusively would necessitate the repurchase or conversion of nearly 400,000 sets in the WKZO-TV area and nearly 100,000 sets in the KOLN-TV, Lincoln, Nebr., area.

Any such move upon the television industry would bring about widespread public indignation, the impact of which would resound with furor throughout Capitol Hill and would cut across party lines.

The advocates of the drastic proposals during the course of the UHF hearing to date must have forgotten what the situation actually was at the time 108 operating companies chose to put television stations on the air prior to the TV freeze. This was an era wherein the original founders of television stations were losing thousands of dollars each operating month. In the case of WKZO-TV, when it went on the air in 1950 there were practically no receiving sets in our area. The Fetzer Broadcasting Co. undertook television at great economic hazard. It has spent literally hundreds of thousands of dollars to promote television in order to create the vast audiences that now exist in western Michigan. It did this contrary to the advice of its advertising station representatives who said that it would be economic suicide for us to enter the television business. We entered this field of communication at a time when national network service was unavailable and the A. T. & T. Co. at great expense, developed its own microwave system and pioneered the bringing of television problems into western Michigan at a time when technical, legal and other advice in that day was negative.

1 Reserved for noncommercial educational use.
In 1953 the Fetzer Broadcasting Co. lost $350,000 at KOLN-TV, Lincoln, Nebr., due to competition from Omaha stations and the refusal of certain national networks to give us an affiliation. We could have come to Congress and asked that the networks be regulated. We might have advocated laws to reduce power or remove network affiliations from the Omaha stations. This we didn't do. We chose, instead, to analyze our own market. We relocated our transmitter and increased its power so that the advertiser would consider the Lincoln market as a sound buy. We thus solved our network problem as well as the economic problem. Any telecaster, whether he be UHF or VHF, who fails to recognize the law of supply and demand in the market place, is asking for difficulties which he cannot under the free-enterprise system assign to anyone but himself.

It is our personal belief that the technical problem involved in the matter of UHF allocations is so complicated that the Senate subcommittee should turn this matter back to the FCC. Most certainly the enterprise of pioneer companies, who have made present-day television possible, should not be penalized in hasty and unwarranted moves to satisfy what could well be defined as a defect in the business judgment of the few.

Operator of Channel 6

Channels allocated to community: 6, 54.
VHF stations operating in community: Channel 6.
UHF stations operating in community: Channel 54.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: None.

Bank of Lansing Building,

Pierpont & Ball.
1007 Ring Building, Washington, D. C.

Gentlemen: Please consider this letter as your authority to list us among other supporters of the views to be expressed by you in behalf of the VHF stations before the Senate subcommittee. If statements from individual stations are to be filed with the committee, we would like the following included in behalf of WJIM-TV:

"Most important, we believe, for your committee to consider is the basic economic principles which govern the television industry.

"Television is supported by the advertiser who buys circulation, or markets. The first 50 to 55 markets of the country cover 70 to 75 percent of the population and buying power. To get another 10 percent the advertiser must buy an additional 50 markets. The cost to an advertiser for the first 100 markets for a weekly half-hour program for 1 year is about $4,620,000. The committee should realize that the number of advertising budgets capable of this expenditure are limited.

"The television industry competes with newspapers, magazines and other media for these budgets and VHF stations with area coverage and high circulation are essential to the financial stability of the industry. To limit all stations to UHF coverage would be like telling newspapers that their circulation must be limited to the county in which they are located.

"There can never be as many television stations as there are radio stations. The smaller communities of the Nation cannot support a television station, and must be served by VHF area stations in larger nearby markets. The reason is simple, and again economic—the tremendous costs involved in constructing and operating a television station. For example, WJIM just purchased a new radio transmitter, cost $2,900. We also purchased a new TV transmitter, cost $163,000 plus another $40,000 for additional switching and test equipment. Two men can put on a radio show. The same show on television takes 15.

"There will always be a small percentage of people who do not receive good television reception, but these are the people who live in isolated areas and are also without rural electrification, improved roads, etc.

"Television is a big business. It takes big men to operate it. Little men who ignored basic economic facts when they applied for UHF licenses should not be penalized to break it down, nor should pioneers of the industry be penalized for the progress they have made to date. Color is on the horizon; it will take
more vision, more pioneering, more money, more losses to bring this terrific development into millions of TV homes.

"The two most important parties to be considered by the committee should be (1) the viewing public. (2) the advertiser who makes the programs possible. We are sure there is no demand from the viewers of Michigan for additional UHF facilities—on the contrary, it is our considered opinion that any deletion of present VHF service would create overnight a violent public reaction."

If we can be of any further assistance or furnish you with any other information, please advise.

Sincerely yours,

Harold F. Gross.

Channels allocated to Community: 6, 17.
VHF stations operating in community: None.
UHF stations operating in community: None.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: Channel 6.

Peninsula Television, Inc.,
Marquette, Mich., June 1, 1954.

Person & Ball,
Ring Building, Washington 6, D.C.

Gentlemen: Peninsula Television, Inc., is heartily in accord with the position stated by the informal group in its telegram dated May 28, 1954, in connection with the Potter hearings.

Peninsula Television, Inc., is the permittee of WAGE-TV at Marquette, Mich., on VHF channel 6 and we vigorously oppose any suggestion that we be forced to move to UHF and we also oppose vigorously a freeze which might prevent our being authorized to commence telecasting upon completion of construction.

We propose to bring to the Marquette area the only type of television service that would thoroughly cover the relatively sparsely populated land area containing a population in excess of 300,000. At the present time, this population receives no satisfactory consistent television service, since there is no television station in operation in this area, and consistent service from outside the area is not received. Only VHF can bring a satisfactory service to such an area, and it would definitely not be in the public interest for the Senate subcommittee investigating UHF problems to take any steps that would interfere in any way with the establishment of such a service at this remote and sparsely settled area.

Very truly yours,

Jerome Sill, President.

Applicant for Channel 10

Channels allocated to community: 10.
VHF stations operating in community: None.
UHF stations operating in community: None.
Channels applied for: Channel 10.
Channels contested: Channel 10.
Construction permits outstanding: None.

My Dear Senator Potter and Members of the Senate Subcommittee on Communications:

My name is C. Wayne Wright. I am president of Triad Television Corp., which has applied to the Federal Communications Commission for a construction permit to erect a new television station on VHF channel 10 in Parma, Mich. I would like to briefly object to any proposals that the FCC place a freeze on
further VHF hearings or that the nationwide television system be limited to UHF.

In the television allocations adopted by the Commission in its Sixth Report and Order in Docket 8736 et al., no VHF allocations were provided for that section of Michigan surrounding Parma-Onondaga. UHF channel 48 was allocated to Jackson, the nearest large city, and UHF channels 58 and 64 were allocated to Battle Creek. The nearest VHF allocation was channel 6 in Lansing, with UHF channel 54 also allocated to that city. I have worked in radio and television stations in Michigan for several years and became interested in forming a group to apply for a television station serving the area of which Parma is roughly the center. I found upon study that it would be possible to allocate VHF channel 10 to the Parma-Onondaga area without doing violence to any of the mileage separation requirements of the FCC rules and standards. Accordingly, a group known as Triad Television Association was formed and we petitioned the FCC to allocate VHF channel 10 to this area. After some delay and objection, our allocation request was granted.

We thereupon incorporated Triad Television Corp. and on February 23, 1954, filed an application with the FCC for channel 10 at Parma. At present, there are 3 other applications on file for this frequency so that it appears necessary to have a 4-party comparative hearing for the channel 10 frequency. Two of these applicants, by the way, have present interests in Michigan UHF stations. One of the applicants owns Station WBKZ-TV on channel 64 in Battle Creek and the other has an interest in Station WILS-TV on channel 54 in Lansing. Station WBKZ-TV ceased operating shortly before its Parma channel 10 application was filed; and while WILS-TV still operates in Lansing, the applicant represents that this UHF permit will be surrendered for cancellation in the event its channel 10 Parma application is granted.

Triad Television Corp. is comprised of 28 stockholders residing in the area which we propose to serve on channel 10. We incorporated solely to file the application for this frequency allocated to Parma at our request. Our stockholders are active in community life and interested in rendering a needed television service in the area. WHM, Inc., which had been granted a permit for channel 48 in Jackson, surrendered this permit in December 1953 so that at present there is no station in Jackson, Parma, or Onondaga. There are two UHF permittees in Battle Creek, neither of which is operating. There is 1 on VHF station in Lansing, WJIM-TV on channel 6, WILS-TV on channel 54, and 1 educational station, WKAR-TV, operating on channel 60 in East Lansing. Kalamazoo, which lies beyond our proposed grade A service area, has one station, WKZO-TV on channel 3.

We believe there is a real need at this time for a locally owned and operated television station to serve our area. Since it is anticipated that our 4-party hearing will not commence for the next 30 to 60 days and since it is anticipated a number of months will be required to complete the hearing process and obtain a decision, considerable time in any event will elapse before the channel 10 station can commence operation. We see nothing to be gained in our area by the imposition of an artificial freeze on the commencement and completion of the channel 10 hearing followed by a decision in normal course. There can be no doubt that the public of our area will greatly benefit from the institution of the channel 10 program service as soon as possible.

Apparently, since the Jackson UHF permit has already been relinquished and since WBKZ-TV and WILS-TV are involved in the contest for channel 10, no real problem is presented by going forward with our VHF hearing. The only remaining commercial UHF permittee in the area, WBCK-TV on channel 58 at Battle Creek, has not yet commenced its operation.

As a matter of business judgment, we might have applied for UHF in the area and obtained a grant without hearing or the expenditure of substantial time and money. Instead, after careful study of Commission allocation plans and principles, we concluded that the use of channel 10 in Parma was feasible. Upon petitioning the Commission to adopt this allocation, we chose to cast our lot with VHF. Having done so, we do not think we should now be penalized through the imposition of a hearing freeze, particularly when two of our competitors for channel 10 have already obtained UHF permits and operated in UHF. Such economic hardships as UHF may have encountered are hardly justification for penalizing our efforts.

We oppose removal of all television to UHF because we think VHF has proven its worth and is best suited to providing maximum service and coverage to the American people. To equal on UHF the coverage we now propose to channel 10
would cost our corporation substantially more than the sums we estimate will be required for the VHF frequency. Moreover, the technical characteristics of VHF are well known and certain, whereas it is our understanding many difficult engineering problems have been and are being encountered in UHF. Finally, we feel that since the American public has invested heavily in VHF receiving sets and antennas, it would be very unfair to wipe out his investment by removal of all television to UHF. Certainly the public investment in VHF far exceeds the capital investment and the operating losses to date of the UHF stations.

Very truly yours,

C. WAYNE WRIGHT, President.

WCCO RADIO AND TELEVISION, Minneapolis 2, Minn., June 7, 1954.

PETERSON & BALL,
WASHINGTO, D. C.

GENTLEMEN: We wish to go on record as strongly supporting the general position of the informal committee which you represent as outlined in your wire of May 28 opposing the elimination of intermixture of VHF and UHF; the allocation of all television stations to the UHF band exclusively; the imposition of any freeze upon application proceedings or upon the issuance of operating authority covering permits already granted; and the reduction and limitation of coverage areas of VHF stations.

Further, we are in full accord with the proposal that all reasonable and proper steps should be taken to encourage production and distribution of receiving sets having all-channel tuners, and that efforts to improve service inside a station's licensed coverage area should be continued and expanded.

In general, we feel that it is inconsistent with the spirit of free enterprise that telecasters and broadcasters who have made unhappy investments should be asking Congress to rewrite the laws of the country to take them out of the red and put them into the black.

The Federal Communications Commission, in our opinion, has done as competent a job in regulating the industry with due regard for the best interests of the public as any governmental agency could possibly do and we only fear that its usefulness may be impaired if Congress yields to the demands of a small but vocal minority to impose upon it alien procedures favorable to a single pressure group.

Cordially yours,

F. VAN KONYENBURG.

STATEMENT OF STANLEY E. HUBBARD, PRESIDENT AND GENERAL MANAGER, KSTP, INC.

In 1938, we started to experiment and to do our own development work on television; in fact, we bought what was known as a "jeep" which is a camera and control unit. With this equipment we made television demonstrations and taught our staff the technique of television broadcasting.

By 1946 the art of television had developed to a point where we were convinced that unless we went into television our future would be jeopardized. Going into television required a considerable sum of money so after about a year I obtained a personal loan, which at the bank was classified as a character loan, in the amount of $1,200,000 to make possible the building of our studios and the acquiring of equipment to enable us to go into television. In addition, I spent almost $300,000 making up losses in the early days of our television operations.

Going into television required not only finances but day and night work for a period of several years. It required promoting and experimenting; in fact, it was a continuous headache. Had I guessed wrong on television and its effect on mass communication and its acceptance by the public, I would not only have lost all my time and money, but I would have been out of business, and most of my associates would have been out of jobs. I did not receive help from the Government nor did I ask for it. I exercised my prerogative as an American and invested my capital and took a gamble on a calculated risk which proved successful.

The UHF's have gone into television with their eyes wide open expecting to make a great deal of money. Some have been successful—some have failed. I might add that this is also true of VHF. I cite as an example 2 stations in the State of Minnesota and 1 in Wisconsin—VHF's which are losing considerable money. The two Minnesota VHF's have been hurt to such an extent I doubt if they will last through the summer.

There are about 400,000 sets in the area around the Twin Cities which today cannot pick up UHF. If VHF stations were to be eliminated and replaced with UHF, the investment of the public in these sets would go to waste.

STATEMENT OF L. M. SEPAUGH, MANAGER AND TREASURER, WSLI-TV

Television station WSLI-TV began operations on March 27, 1954, as authorized by the Federal Communications Commission. WSLI-TV operates on channel 12, with 214,000 watts ERP visual and 112 kilowatt aural.

An expenditure of $800,000 was made in building this station and the first full month's operation showed a net loss of $18,000. The State of Mississippi is largely rural with many very small towns and a large station with adequate coverage area is needed to bring television service to the many people in these outlying areas.

The management of WSLI-TV is very sympathetic with the problems of all television station operators. Stations, like our own, which have made large expenditures in television are very desirous of recovering a fair return on their investment, and it is our considered opinion that no obstruction should be placed in the way of any group, and that no special favors should be shown any group of television stations.

In the section of the United States in which we operate, it would be impossible to serve the rural areas and small towns without high-powered VHF stations.

1 Reserved for noncommercial educational use.
Any action on the part of this committee or the Federal Communications Commission to curtail the effectiveness of VHF service would do a great disservice to these people. Such curtailment or any devices tending to favor UHF stations over VHF stations would also work a great hardship on stations such as ours, which are even now losing a great amount of money and need every possible help in getting on at least a break-even basis.

In closing, we wish to make very clear, however, that we are asking no special favors which would tend to help us at the expense of any other segment of the industry, and we do sincerely hope that no special favors will be granted to any other segment of the industry that will make it more difficult for our station, and other VHF stations in a similar position.

Pierson & Ball,
Washington, D. C.

Re Potter hearings. We at KSWS-TV are against the elimination of intermixture of VHF and UHF, the imposition of any freeze or chill upon application proceedings, the restriction of operating authority of permits already granted, or the reduction and limitation of VHF coverage. We believe the industry should encourage production and distribution of all channel sets and converters and that UHF stations prepare to wait for conversion of sets and purchase of all channel sets by the viewers in order to build up on a long-range basis their audience in the same manner that VHF stations did in the early days of television. Our station began operating about a year ago with practically no set circulation only through good programing and patience have we been able to build our set circulation to 21,683 at the present. Should VHF be eliminated all of these sets would become obsolete, and the loss in coverage area plus public resentment would definitely force us to cease operations and lose the $400,000 already invested on a long-range risk.

J. C. Porter, KSWS-TV.

Pierson & Ball,
Washington, D. C.

Gentlemen: Our coverage area is in the heart of a hilly terrain. The hills are 1,200 to 2,000 or more feet high. Most of the population lives in narrow, deep-cut valleys. These valleys twist and wind their way in a multiplicity of

---

1 Reserved for noncommercial educational use.

48550—54——57
directions. The inherent differences between UHF and VHF carrier waves make it virtually impossible for UHF in this terrain to render more than a limited service, covering the population of one valley and the hillsides bordering that valley. The other side of the hills and adjacent valleys are bereft of the UHF service. That's why WNBF-TV on channel 12 renders a service not duplicated by UHF in the Scranton, Wilkes-Barre, and Elmira areas. If WNBF-TV's VHF service were curtailed or limited, a substantial portion of the present audience would be deprived of service. Our consultant engineers in Washington, Jansky & Bailey, could be called upon as qualified and expert witnesses to substantiate the foregoing.

In addition there are rural inhabitants in small towns not situated close in to the UHF cities who could be deprived of television service in this area if our VHF station wasn't in operation with full power.

Due to the large investment required in building television stations to full power, height of tower, and oncoming color, together with reserves for operating expenses until such time as an established audience has been obtained for a TV station, it is apparent that substantial coverage fundamentally is necessary for a television station in order to encompass a large population with sets. The number of sets is the basis for the card rate charged advertisers for time and announcements on television stations, and until a station arrives in its progress to such a position, the going is bound to be rough.

A thumbnail sketch of our own economics in 22 years of experience in radio and 4½ years in TV:

We purchased a 100-watt station on 1,500 kilocycles in 1932, and in December 1949 we went on the air with channel 12, since which time there has never been a dividend paid to stockholders. Before television the bulk of our profits were plowed back. This permitted us to advance from a 100-watt to a 5,000-watt station on 1,290 kilocycles in radio and also provided some money sine which we unsuccessfully flexed in FM. Six years ago, when we decided to launch an effort on channel 12 in television, profits which had accrued over the years in radio, together with other subsidies provided by John C. Clark, president of our company, amounted to approximately $300,000. The money thus provided purchased a transmitter, tower, antenna, and studio equipment to start our television operation. Up to date, we have expended, in round numbers, $700,000. This additional $400,000 was invested in television equipment and the purchase and alteration of a building where our present offices are housed.

Still ahead of us must be added at least $600,000—$400,000 to complete our construction permit for full power, and $200,000 for more adequate studio facilities to improve local programs for television. This does not take into consideration investment necessary for color as the art expands in that direction. Our television expansion has been possible because again profits have been plowed back and stockholders have been devoid of dividends.

In our area there are now 274,000 television sets. According to the best estimates we can make, we are giving almost exclusive service to 178,000 of these sets; the other 100,000 sets are divided either between VHF (channel 12) and UHF, or are completely UHF. The population of this area is still spending substantial sums for new receivers. The end is not in sight. But certainly television is progressing and in our opinion WNBF-TV has done substantially a good job, and its curtailment might seriously affect the public in getting adequate television reception.

Sincerely yours,

Cecil D. Mastin,
Vice President in Charge of Radio & Television, Clark Associates, Inc.

STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

WBEN, INC.,
Buffalo 2, N. Y., June 1, 1954.

Messrs. Pierson and Ball,
Washington, D. C.

GENTLEMEN: In general we agree with the views the committee headed by Paul R. Bartlett has authorized you to present to the Potter subcommittee of the Senate Interstate and Foreign Commerce Committee on behalf of certain VHF television stations. We wish to be included in that representation.

We wish, additionally, to submit the enclosed statement in relation to the effect of antenna height and power, especially as it relates to zone 1, so the Potter committee may have a broad view of the television problem which to date has been discussed only from a narrow angle.

We take the position not of an entrenched interest but of a licensee obligated to give the best service possible to the largest number of people that most of the evidence to date has overlooked the fact that the VHF stations are serving the public. To cut back their power or antenna height, or to fail to allow full power in zone 1, will deprive the people who have invested in television receivers of service they have a right to expect from licensees.

In far too many areas today the public receives a degraded television service, not comparable with grade A service from either VHF or UHF stations in the metropolitan areas. The rural sections of the country are entitled to service and, if anything, need it more than the cities do. To cut back the VHF service, or to freeze it in zone 1, will deprive millions of viewers of anything approaching grade A television service.

VHF stations can and will help fill some of these niches, and they should have every encouragement wherever anyone has the courage and business sagacity to venture into that field. They, however, have no more claim to special assistance at the expense of reduced service to the viewers in their areas than the operators of VHF stations would have had to claim assistance in the periods when they were losing money in considerable sums during the early days of pioneering in television.

I call attention to the fact that Gary Cohen, vice president of WBUF-TV, a UHF station in Buffalo, N. Y., appeared at the initial session of this committee and testified:

"We did not make the mistake that is ascribed to other permittees of trying to get on the air too soon and with inadequate preparation. The day we took to the air—I am proud to say—the quality of our picture was as good as that of the VHF stations, and the quality has remained good to this day. Moreover, the quality of our programing the day we started operation was as good as that of the VHF station and has so remained to this very day."

He went on to say:

"It is our experience that when we have good programing available to us that the public cannot receive from any VHF station, they will pay the extra money needed to buy UHF equipped receivers and once they buy those receivers, we can take care of ourselves."

This VHF station went on the air August 17, 1953. At the end of 6½ months on the air, it had an audience of 60,073 receivers on the basis of generally accepted power company statistics.

WBEN-TV, which pioneered television in Buffalo unassisted and in fact with the benefit of not a few barbs and criticisms, at the end of a comparable period of time was able to state that 7,955 VHF television receivers had been sold in the comparable area.

At the end of 1 year WBEN-TV claimed with considerable pride that 21,000 VHF receivers had been sold in this area.

Over a longer period, it took WBEN-TV 19½ months to be able to claim on the basis of statistics used from the same source throughout that more than 60,000 VHF receivers had been sold in this area. When the going was tough, we did not go to Washington to ask for help in promoting television interest: we didn't ask anyone else to assist us in developing interest in TV. We felt that it was the obligation of the station, if it wished to meet its public service obligations and to meet the economics of the situation, to work and work to increase receptiveness to television. Yes, there has been a ground swell in recent months and years, but that is what has helped the UHF station to reach the point where on the one hand it boasts of success and on the other joins in the lament that UHF stations are having a hard time.
The nominal method of permitted.

Here the action of the Commission decided, mulgating the interruptions actually substance, number to radiated 1,000 on required of proposed rulemaking which provided stations.

In the hearings it was realized that, with the allocation plan first used, there was interference between stations, resulting in a reduction in service area of each station, and that increased interference should be expected with additional stations. In 1948 a freeze was placed on the construction of new television broadcast stations while the interference and allocation problems were studied. It was intended that the studies would develop a method of increasing the television service. Two conflicting possibilities had to be balanced. On the one hand increased separation between stations would have the effect of reducing the interference and thereby would increase the service area of individual stations. On the other hand there would then be fewer total stations and therefore less total service.

In the hearings held during the "freeze" it was developed that, by the use of increased antenna heights, greater service areas would be possible for individual stations without a proportionate increase in the interference caused to other stations. It was proposed that antenna heights up to 2,000 feet be permitted. There were no objections to the proposal.

In March 1951, the Federal Communications Commission issued a new notice of proposed rulemaking which provided for a flexible maximum antenna height. The nominal limitation of 500 feet was retained, but it was proposed that greater heights be encouraged and that a reduction in effective radiated power not be required unless objectional interference would be caused to stations operating on the same or adjacent channels. With the 150-mile minimum cochannel separations then proposed, the use of full power with heights well in excess of 1,000 feet would be permitted. The minimum adjacent-channel separations proposed, if actually experienced in practice, would require a reduction in effective radiated power with heights in excess of 500 feet. Practically, however, the minimum adjacent-channel separations are rarely experienced. Except in a few instances, requirements on adjacent-channel interferences would not serve to limit the antenna heights used. In the phases of the hearing that ensued, a number of objections were raised to the adjacent-channel limitation. These, in substance, claimed that the problem of adjacent-channel interference was not actually serious as contemplated by the previous proposed rule.

In April 1952, at the conclusion of the hearings which had continued with interruptions since 1948, the Commission issued its sixth report and order promulgating the rules under which the television-broadcasting industry is now operating. With respect to the problem of adjacent-channel interference, the Commission decided, on the basis of the testimony received and referred to above, to delete all provisions from the rules which would prevent the use of higher antennas because of adjacent-channel interference. Next, the Commission gave consideration to the problem of antenna heights greater than 500 feet. Here the action of the Commission is incomprehensible. In the northeastern portion of the United States, antenna heights were effectively limited to 1,000 feet, while in all other parts of the country, heights of 2,000 feet were and are permitted.

MEMORANDUM REGARDING EFFECT OF TALL TELEVISION ANTENNA.

After World War II the Federal Communications Commission issued rules permitting commercial operation of television broadcast stations in the VHF band. These rules provided for operations with a maximum radiated power of 50 kilowatts, a maximum antenna height of 500 feet, and a minimum separation between cochannel stations of 150 miles. In cases where the antenna height exceeded 500 feet the rules required that the power be reduced. As a result of experience gained in the operation of television stations, it was realized that, in the allocation plan first used, there was interference between stations, resulting in a reduction in service area of each station, and that increased interference should be expected with additional stations. In 1948 a freeze was placed on the construction of new television broadcast stations while the interference and allocation problems were studied. It was intended that the studies would develop a method of increasing the television service. Two conflicting possibilities had to be balanced. On the one hand increased separation between stations would have the effect of reducing the interference and thereby would increase the service area of individual stations. On the other hand there would then be fewer total stations and therefore less total service.

In the hearings held during the "freeze" it was developed that, by the use of increased antenna heights, greater service areas would be possible for individual stations without a proportionate increase in the interference caused to other stations. It was proposed that antenna heights up to 2,000 feet be permitted. There were no objections to the proposal.

In March 1951, the Federal Communications Commission issued a new notice of proposed rulemaking which provided for a flexible maximum antenna height. The nominal limitation of 500 feet was retained, but it was proposed that greater heights be encouraged and that a reduction in effective radiated power not be required unless objectional interference would be caused to stations operating on the same or adjacent channels. With the 150-mile minimum cochannel separations then proposed, the use of full power with heights well in excess of 1,000 feet would be permitted. The minimum adjacent-channel separations proposed, if actually experienced in practice, would require a reduction in effective radiated power with heights in excess of 500 feet. Practically, however, the minimum adjacent-channel separations are rarely experienced. Except in a few instances, requirements on adjacent-channel interferences would not serve to limit the antenna heights used. In the phases of the hearing that ensued, a number of objections were raised to the adjacent-channel limitation. These, in substance, claimed that the problem of adjacent-channel interference was not actually serious as contemplated by the previous proposed rule.

In April 1952, at the conclusion of the hearings which had continued with interruptions since 1948, the Commission issued its sixth report and order promulgating the rules under which the television-broadcasting industry is now operating. With respect to the problem of adjacent-channel interference, the Commission decided, on the basis of the testimony received and referred to above, to delete all provisions from the rules which would prevent the use of higher antennas because of adjacent-channel interference. Next, the Commission gave consideration to the problem of antenna heights greater than 500 feet. Here the action of the Commission is incomprehensible. In the northeastern portion of the United States, antenna heights were effectively limited to 1,000 feet, while in all other parts of the country, heights of 2,000 feet were and are permitted.

ALFRED H. KIRCHHOFFER, Vice president, WBEN-TV.
The order recognized and pointed out that the ratio of service area gained to service area lost increases with increasing antenna height. It was found that—

"When two stations are operating cochannel and one station is allowed to increase its antenna height greatly in excess of the other, the increase in area covered by the first station will greatly exceed the loss in service to the second station."

Then, further—

"Again it should be emphasized that in all cases the service areas are not unduly reduced when the minimum spacings are maintained."

On the basis of these findings the Commission has provided for effective antenna heights up to 2,000 feet throughout most of the United States.

With no previous notice or indication, the Commission, however, designated the northeastern portion of the United States as zone I and in zone I provided for minimum separations between cochannel stations of 170 miles and for a limitation on the effective antenna height to 1,000 feet. The reasons given for this action have no basis in the findings of the hearing. The ruling states:

"In view of the fact that station separations in this zone are lower than in zones II and III and in view of the fact that cities in zone I are more closely located than cities in zones II and III, until a larger body of data is available with respect to operation with antenna heights over 1,000 feet with higher powers, we are unable to permit operation with such powers at heights over 1,000 feet."

Even with the station separations specified in zone I it is still a fact that increasing antenna height results in a net increase in area served. The fact that the station separations are less in zone I is, therefore, not a valid reason for requiring restricted antenna heights. The fact that cities are generally closer together in zone I does present the possibility that one station may serve several cities. It is not clear that this is an evil.

Detailed studies and data have been presented to the Commission showing for all VHF assignments in zone I, that the potential service area would be increased approximately one-third if the arbitrary height limitation were removed in zone I.

The reasons given for the limitation do not now justify its continuation, and in fact they never did. The rule apparently is an attempt to encourage the development of VHF television broadcasting in certain of the cities by arbitrarily restricting the service possible with VHF facilities. If this is the case, it has completely failed to take cognizance of the fact that, because UHF television broadcasting will always have a more restricted area than VHF broadcasting, its character will have to be largely local and its success in competition with VHF depends upon the ability to provide programs of local interest at a competitive commercial cost. Whether or not this can be done is yet an economic enigma. In the meanwhile, the service provided by VHF stations in zone I is arbitrarily restricted. A list of the States affected is attached.

We should point out that, with full power and greater heights, not only is the service area of a VHF television station increased, but also the quality of picture provided throughout the service area is improved. In many areas this improvement would permit the viewing public to avoid the cost of installing outdoor antennas to receive satisfactory pictures. If in the service area of any one VHF station, 10,000 set owners could avoid the necessity of outdoor antennas, the net saving to the public in that area would be approximately a half-million dollars. This is not an unreasonable assumption. If this saving could be realized throughout a large portion of the area of zone I, the saving to the United States public would amount to untold billions of dollars. This consideration has been completely outweighed by a desire to encourage the beginnings of UHF television broadcasting.

We believe provision is necessary to permit the expansion of television broadcasting in the UHF band. When the demand for additional service is great enough, and the cost sufficiently reasonable, then and only then, will UHF television be practical. Until that time, artificial stimulants will be of little or no help. Restriction of VHF service can only act to the detriment of the public interest.

Respectfully submitted.

ALFRED H. KIRCHHOFFER, Vice President.

STATEMENT OF GEORGE F. GOODYEAR ON BEHALF OF VHF GROUP

My name is George F. Goodyear, president of WGR Corp., known until May 3, 1954, at Niagara Frontier Amusement Corp. (NFAC). NFAC was organized in March 1953 for the purpose of bringing additional television broadcasting facilities to the Buffalo area. Instigated by Myron P. Kirk of New York City, it was formed by myself, Mr. Kirk, J. Fred Schoellkopf, and Paul A. Schoellkopf, all except Mr. Kirk being Buffalo area residents. When NFAC's application for Buffalo channel 2 was filed with the FCC in July 1953, 60 percent of its stock was held by 4 residents, including the 3 above mentioned and Seymour H. Knox, and 40 percent by 7 nonresidents headed by Mr. Kirk. The 4 residents are prominent in the business, civil, and philanthropic life of the area, holding numerous directorships in corporations and civic institutions, including the presidency or chairmanship of the following: University of Buffalo, Buffalo Society of Natural Sciences, Buffalo Fine Arts Academy, Niagara Share Corp., and Marine Trust Co. of Western New York. Two of them were combat officers during World War II. While none of the residents had any previous experience in the broadcasting or television field, this lack was satisfied by Mr. Kirk, who at one time had participated in the management of several radio stations. Mr. Kirk is now senior vice president and head of the radio and television department of the Kudner Agency, the 14th largest advertising agency in the country.

At the time NFAC filed its application for channel 2, there were three competing applicants for the channel. These were: Victory Television Corp. (a group of six prominent Buffalonians), Niagara Falls Gazette Publishing Co. (newspaper owner), and WGR Broadcasting Corp. (owner of radio station WGR, the oldest in Buffalo, enjoying a fine reputation both in the trade and among the public). Although each of the four applicants felt that it had the best chance of receiving a construction permit (CP), the delay and cost of a "comparative hearing" finally induced them to merge, all except NFAC withdrawing their applications. The original NFAC stockholders retained 50 percent interest, with Victory and the Gazette each having the right to purchase a 25-percent interest. The assets of WGR were purchased for $1,450,000. Although this was perhaps somewhat higher than the actual value of the radio station by itself, it was felt that the combination of a TV station on channel 2 and a 5-kilowatt radio station on 350 kilocycles would be well worth the price. The merger agreement was consummated on November 2, 1953.

The decisions of NFAC and the other-mentioned applicants to file for a VHF rather than a UHF channel were based on the following reasons:

1) The pioneering efforts of WBEN-TV, the only existing station in the area, had already built up a large market of VHF viewers.

2) It was known that WBEN-TV had sustained substantial losses in the early period of building up this market. As UHF might initially experience similar losses, although to a lesser extent, economic wisdom decided for VHF.

3) The prestige of participation in VHF was important for the following reasons:

(a) It offered diversified television facilities to Buffalo area viewers at no additional cost (the cost of "converting" receivers to UHF).

Remark: 1 Reserved for noncommercial educational use.
(b) Buffalo would no longer be in the humiliating position of having only a single VHF channel, while many smaller communities had two or more.

(4) The prestige and economic advantages of VHF more than offset the following disadvantages:

(a) The presence of competing applicants for the channel appeared to require a comparative hearing, thus considerably delaying and increasing the cost of additional TV.

(b) As only one applicant could win a comparative hearing, the other applicants would lose their entire investments in the venture.

After the merger, it was hoped that the FCC would grant a CP the following day (November 3, 1953). Through no fault of any of the parties to the merger, however, unforeseen circumstances prevented the immediate grant of a CP.

The FCC found it necessary, in fact, to set the application for hearing, so that a CP was not granted until more than 5 months later, or on April 7, 1954. Ownership of station WGR was formally transferred to NFAC on April 30, 1954, and a few days later the name of the company was changed to WGR Corp.

Until April 30, 1954, substantially all of NFAC's activities had been directed toward the securing of a CP. From its organization to this date, it had received no income. Its expenses, undergone in connection with securing a CP, including legal fees, travel and other expenses, have been in excess of $50,000. In addition, it is estimated that the expenses in the same connection of the other parties to the merger agreement have aggregated in excess of $25,000.

WGR Corp (formerly NFAC) is now taking active steps to commence commercial telecasting operations as soon as possible. It has obligated itself to rent studio and office space for a term of 15 years at a rental of $90,000 per year, with an option to buy these facilities for $800,000 at the end of the first 5 years. It is estimated that, if it were necessary to convert these facilities to other uses, the rental which could be charged would be less than $45,000 per year. In addition, the company has become obligated, for the purchase of television equipment, in the aggregate amount of more than $500,000, from which it has not yet of course received any income.

It is expected that WGR Corp will commence commercial telecasting operations not later than August 1, 1954.

(Signed) GEORGE F. GOODYEAR.

STATEMENT OF GENERAL ELECTRIC Co. STATION WRGB-TV, SCHENECTADY, N. Y., LICENSEE OF CHANNEL 6

Channels allocated to community (Albany-Schenectady-Troy) : 6, 17, 22, 35, 41.
VHF stations operating in community: Channel 6.
UHF stations operating in community: Channels 35, 41.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: 17, 23.

DEVELOPMENTAL YEARS OF WRGB-TV, SCHENECTADY, N. Y., 1939-40

The full history of WRGB traces back to the early months of 1928. However, the modern era of the station, which may be considered as starting in 1930 is of particular interest at this time. And this statement traces our economic and program growth during the 11 years from 1930 to 1950.

It is significant to note that the station lost money every year during these first 11 years and it should be underlined that the loss continued during the first 3 years and 1 month of commercial operation—from late 1947 to the end of 1950.

During this 11-year period, the owners invested over $1 million in capital equipment, while our total operating loss for this same period was $2,181,823.

Some of the obstacles which it was necessary for us to overcome during these early years were:

1. Small audience

There were fewer than 100 receivers in use from 1930 to the end of the war. By the spring of 1948 set distribution had reached 2,000. One year later circulation had jumped to 25,000, doubling to 52,000 by January of 1950. At the end of 1950—the first year in which the station "broke even"—receiver installations

1 Reserved for noncommercial educational use.
had reached 133,000. Since then a steady rise has continued until today there are approximately 365,000 receivers capable of watching WRGB regularly. The UHF operators in this area estimate there are about 75,000 converted receivers. Thus there are now more converted sets in this area today than there were sets of any kind after we had been operating 10 years. But there are still over a quarter of a million receivers in use today not equipped to receive a UHF signal.

2. Program development

WRGB had to develop as a completely self-sustaining unit during its first years. An almost complete lack of film material, coupled with only extremely limited network service, put the full weight of programming on the local staff. It was even necessary for WRGB to build and operate its own intercity relay system from New York City to secure the infrequent network programs which were available.

3. Personnel training

There was no trained labor market for either program or technical personnel during the early years of WRGB. It was necessary for the station to secure the best available people from other allied arts and build and train a staff from the ground up.

4. Equipment limitations

During the early years of WRGB, commercially manufactured equipment was not available. It was necessary for the station to use equipment which was in its first stages of development and much of it had to be built by the station staff.

5. Advertiser support

Advertisers were reluctant to use WRGB because of the absence of audience. It was necessary for WRGB to break the vicious circle by investing its own money in program development and audience promotion until the quality of the programs attracted a large enough audience to warrant advertiser participation.

Like the pioneer VHF stations, to achieve substantial audience, the pioneer UHF stations will have to develop a strong local program service meeting specific community needs.

WRGB believes that progress in the electronic field, supported by an all-industry campaign seeking the expansion of economic and program resources, will within a reasonable time place the UHF stations in a strong competitive position.

---

**Statement of Skyway Broadcasting Co., Station WLOS-TV, Asheville, N. C., Permittee of Channel 13**

Channels allocated to community: 13, 56,2 62, 78.
VHF stations operating in community: None.
UHF stations operating in community: Channel 62.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: Channel 13.

**Asheville, N. C., June 9, 1954.**

**Pierson & Ball, Washington, D. C.**

GENTLEMEN: As we wired you this morning you have our support of your views as outlined in the wire of May 29 from the informal committee to be presented before the Potter subcommittee investigating UHF problems.

For the record, WLOS-TV has presently spent $62,381 on construction and is committed to spend an additional $330,000 on construction authorized by our CP. This construction, which is now in progress, includes a 3,000-foot inclined plane railway up Mt. Pisgah in western North Carolina which will provide a transmitting antenna over 6,000 feet above sea level to adequately serve the mountainous terrain. This station will provide service to over 2 million people within its predicted grade B contour. It will provide the first primary TV signal to most of western North Carolina.

---

1 Reserved for noncommercial educational use.
The need for this station was vividly demonstrated by public support of the people of western North Carolina of our efforts to obtain Mount Pisgah as a transmitter site. Over 2,000 people of this area, either in person or by written statement, provided overwhelming evidence to the United States Forestry Service of the need for this station in its authorized location.

WISE-TV, UHF outlet in Asheville, owned by Harold P. Thoms, who is president of the UHF group, is presently affiliated with all four networks.

It appears that in this instance, anyway, the networks have shown willingness to affiliate with a UHF outlet and have provided WISE-TV with a wonderful opportunity for service and profit.

If there is any further information which might be helpful to you or if there is anything further we can do, please let us know.

Sincerely yours,

CHARLES B. BRITT, Executive Vice President.

STATEMENT OF CAPITOL BROADCASTING CO., INC., RALEIGH, N. C., APPLICANT FOR CHANNEL 5

Channels allocated to community: 5, 22, 28.
VHF stations operating in community: None.
UHF stations operating in community: Channel 28.
Channels applied for: Channel 5.
Channels contested: Channel 5.
Construction permits outstanding: None.

STATEMENT ON BEHALF OF CAPITOL BROADCASTING CO., INC., APPLICANT FOR CHANNEL 5, RALEIGH, N. C.

Capitol Broadcasting Co., Inc., is applicant for channel 5 VHF station in Raleigh, N. C. area. It is proposed to serve counties having $296 million farm income. According to statement of January 5, 1954, of Hon. L. Y. Ballentine, commissioner of agriculture, State of North Carolina, the proposed service area will include counties producing more than one-half of the farm income in North Carolina.

Commissioner Ballentine is himself chairman of proposed agricultural programming council and council members include outstanding leaders in the agricultural field who are connected with North Carolina State College and the extension services of the United States Department of Agriculture, all of whom, with two exceptions, reside in Raleigh and are therefore available for service to the entire State of North Carolina.

The same arrangement obtains between said applicant and leaders in the educational, religious, and fine-arts fields.

Total population to be served: 1,435,242. No UHF station can serve so many North Carolina citizens. Applicant has agreed, subject to obtaining grant, to feed its programs to UHF stations in its grade B coverage area as a public service, thus making the tremendous talent pool and program resources peculiar to the capital of the State and to North Carolina State College located therein available to nearly half of the State's population.

As a practical matter, a UHF station only would localize such programming and would deprive a large percent of this area of the advantages above outlined.

Of importance also is the fact that this applicant has been planning for more than 6 years to enter the VHF television field and has spent more than $25,000 to date and has incurred liability for more than $25,000 additional in prosecuting its application, now in its fifth week of hearing in the city of Washington, D. C.

There is a place for both VHF and UHF and we earnestly hope, regardless of who may be the successful applicant for channel 5 in Raleigh, that the Senate Subcommittee Investigating UHF Problems will not make it impossible for a VHF station in the Raleigh area to render the service proposed. We also hope that it will not vote to destroy the large investments made by both applicants for channel 5 by canceling or delaying the use of the VHF frequency assigned to this area.

Respectfully submitted.

A. J. FLETCHER, President.
STATEMENT OF DURHAM BROADCASTING ENTERPRISES, INC., DURHAM, N. C., PERMITTEE OF CHANNEL 11

Channels allocated to community: 11, 40, 46, 73.
VHF stations operating in community: None.
UHF stations operating in community: None.
Channels applied for: Channel 73.
Channels contested: None.
Construction permits outstanding: Channel 11.

STATEMENT ON BEHALF OF DURHAM BROADCASTING ENTERPRISES, INC., VHF CHANNEL 11

On January 20, 1954, the Federal Communications Commission issued a construction permit to Durham Broadcasting Enterprises, Inc., to construct a television station to be operated on channel 11 in Durham, N. C. At the time of the lifting of the freeze and with the announcement of the allocation of VHF and UHF channels for the Durham market, it was then our studied opinion that we could best serve the area with channel 11. To this end, we have devoted more than 2 years of time, effort, and money. We have endured the expense and effort incident to a hearing. In this connection and in the interest of bringing television to this community at an early date we participated in a merger-type agreement, a part of which required the sale of our radio facility WTIK. This sale has taken place. It is thus that we find ourselves presently with no source of broadcast income to help pay for our television construction costs. Currently, we have obligate ourselves to repay $150,000 in debentures and have ordered $300,000 worth of television equipment. On the strength of the construction permit issued by the FCC we have further obligated ourselves to leases in the amount of $34,000 and have incurred preoperating expenses in excess of $80,000.

At the time of the lifting of the freeze one commercial UHF allocation on channel 46 was made to Durham along with the reservation of UHF channel 40 for an educational station. Since that time the FCC has made an additional allocation on UHF channel 73 to Durham. The Commission has granted a construction permit covering the original commercial UHF allocation on channel 46, and the construction permit for the UHF channel 46 has been returned to the Commission.

At the present time Durham Broadcasting Enterprises, Inc. represents the only authorized effort being made to bring television to Durham, either UHF or VHF. Any deterring action on the part of the FCC would not only deprive the citizens of our area of a service to which they are entitled but would also impose an extremely severe economic hardship on Durham Broadcasting Enterprises, Inc.

Respectfully submitted.

HARMON L. DUNCAN, President.

STATEMENT OF WDAY, INC., STATION WDAY-TV, FARGO, N. DAK.

OPERATOR OF CHANNEL 6

Channels allocated to community: 6, 11, 34, 40.

UHF stations operating in community: None.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: None.

WDAY, INC.,

PIERSON & BALL,
Washington, D. C.

GENTLEMEN: We at WDAY-TV are following with interest the questions involved in the Senate subcommittee investigating UHF problems.

The wider coverage provided by the VHF bands is extremely essential, both from the public interest standpoint, and the economic standpoint, particularly for stations such as ours located in areas that are not densely populated. Wide

1 Reserved for noncommercial educational use.
rural coverage is absolutely necessary for stations located in agricultural areas, and particularly true in agricultural areas where large farms are prevalent.

Actually, more than half our viewers are widely scattered farmers, and we are convinced that they need and appreciate the services of TV more than the urban residents, and most of these could not be reached with the UHF signal.

We sincerely hope that the committee will do nothing to disturb the present VHF allocations.

Sincerely,

TOM BARNES, Manager.

STATEMENT OF CROSLEY BROADCASTING CORP.

Operator of WLT-T, channel 5, Cincinnati, Ohio; WLW-D, channel 2, Dayton, Ohio; WLW-C, channel 4, Columbus, Ohio; WLW-A, channel 11, Atlanta, Ga.

UHF stations operating in community: None.

Channels applied for: Channel 30.

Channels contested: None.

Construction permits outstanding: Channel 36.

The Crosley Broadcasting Corp. submits respectfully for the record of this hearing basic information regarding its development of four television properties, WLW-T, Cincinnati, WLW-D, Dayton, WLW-C, Columbus, and WLW-A, Atlanta, now VHF channels 5, 2, 4, and 11, respectively.

The activities of Crosley in the field of television broadcasting commenced as early as April 1937 when it began experimentation relating to equipment design and development, leading to the establishment February 1, 1939, of a regular television division in its engineering department. On February 3, 1939, Crosley filed its original application for a construction permit for an experimental television broadcast station, receiving a grant on August 28, 1940, with the call letters W8XCT. Even before this date, as early as April 26, 1939, Crosley gave public demonstrations of the use of television equipment with wire rather than wireless transmission.

Crosley's WLW-T, Cincinnati, was not only the first commercial television broadcast station in the State of Ohio, but also the first in the area served by WLW-radio, including Indiana, Kentucky, and West Virginia, the application for same being filed originally on November 15, 1944, with the original grant to Crosley dated November 21, 1944.

Crosley filed the original application for a television station in Dayton on February 26, 1945, the grant being received from the Commission April 4, 1947.

Crosley's WLW-C was the first station in Columbus, Ohio. The application was filed on January 2, 1945, and the grant received November 21, 1946.

To construct these 3 television stations, Crosley expended $1,939,723.77, excluding here the man-hours of its staff and its legal fees. The capital investment to November 30, 1953, for these stations totaled $2,608,692.34.

1 Reserved for noncommercial educational use.
The operating losses of these 3 stations amounted to $1,642,129.75 before the first dollar profit was realized. The Cincinnati station was operated at a loss from the first broadcast, February 9, 1948 (Cincinnati had but 1,300 TV receivers at that time) to November 1, 1950, losses totaling $951,920.70. The Columbus station was operated at a loss from the first broadcast, April 4, 1949 (then only 2,000 TV receivers in Columbus), to November 1, 1950, losses amounting to $371,534.15. The Dayton station was operated at a loss of $318,074.90 from beginning of operations, March 15, 1949 (then only 4,000 TV receivers in Dayton), to November 1, 1950. Actually, the losses experienced were much greater than set out above in view of the fact that early development costs and initial television broadcasting expenses were borne largely by WLW-radio.

Following the original construction and upon receipt of "show cause" orders following the Commission's sixth report and order, Crosley spent in total $290,000 in making channel changes and another $500,000 to increase power to maximum with new high gain antennas in Cincinnati, Dayton, and Columbus. All TV set manufacturers participated in the promotion to make the public more television conscious. Yet all costs were borne by the Crosley Broadcasting Corp.

As the result of such aggressive leadership, these 3 cities (as of March 1954) have a higher percentage of set saturation than has Chicago, not only a much larger city but 1 having 4 TV stations.

On February 11, 1953, Crosley purchased WLTV, Atlanta, Ga. (then VHF channel 8, now 11), from Broadcasting, Inc., at a cost of $1,450,000. Immediately, Crosley invested $130,000 in program development and as of April 13, 1953, lengthened its programing schedule from 73 hours to 107 hours per week and opened its broadcast day at 9 a.m. rather than at 1:50 a.m., forcing the 2 competitive stations to commence early newsing service. Again, Crosley has just recently extended its Atlanta schedule and is now broadcasting 114 hours a week and is signing on at 8 a.m., Monday through Friday.

WLTV-TV was, and still is, without full DuMont and ABC network service. The station is expending additional funds to bring such service from the networks through a costly cable arrangement.

Capital investments for WLW-A have been considerable and will before long approach the total originally paid for the property. Investments include a new 50-kilowatt transmitter and allied equipment, new studio equipment, a new studio building (under lease) and property for a new high tower. Construction of which is the next step contemplated in improving the service of the station to the public.

Exclusive of intercompany sales, in 15 months of operation, WLW-A has made a profit only 2 months, March 1954, amounting to $272,83, April 1954 amounting to $2,259.20. Yet capital investments will continue to be made, including the erection of a new tower of maximum height. Crosley has faith in Atlanta's future and as a company feels financially able and competent to continue VHF pioneering in that city, looking ahead to the time when it will prove to be a profitable operation.

In summary, before Crosley made a profit on any of its television operations, it sustained total losses of $1,642,129.75, excluding Atlanta. In spite of these losses, it made capital investments beyond the initial construction cost ($1,939,723.77) of $668,965.57.

In the opinion of Crosley and in view of this record, UHF development, of necessity, must undergo similar stages and must be in the hands of licensees of financial stability in order to bring it to the level which VHF enjoys today. Crosley is not acquainted with all other VHF operations but is familiar with scores of them and is aware of their experience of similar losses during the costly stages of development prior to the attainment of the present status of VHF.
In the field of UHF, Crosley has granted the use of the tower of WLW-T to the Greater Cincinnati Educational Television Foundation for WCET, channel 48. It has also granted the use of a considerable portion of its transmitter building for this educational group and has contributed both air time (on WLW-T) and all production costs for a series of programs to promote this proposed UHF station.

Crosley has cooperated closely with UHF station WHIZ-TV, Zanesville, Ohio, and has, since that station commenced operation, cooperated with it in order that it might receive NBC program service directly from the tower of WLW-C, Columbus, even though Crosley’s Columbus station renders service to Zanesville.

Additionally, we respectfully submit that in order to include and provide receiver facilities for UHF reception, we are informed that the manufacturing division of AVCO expended considerable sums in pioneering as early as 1950 in ultraratum converters and licensed two other companies to manufacture it. The manufacturing division, in company with other manufacturers, has incurred very substantial losses in order to further the ability of UHF stations to have available sets able to receive their transmissions.

The policy of this company will continue to be one of the closest cooperation with UHF stations, both educational and commercial.

Statement of Tulsa Broadcasting Co., Station KTVX, Muskogee, Okla., Permittee of Channel 8

Channels allocated to community: 8, 45, 66.

VHF stations operating in community: None.

UHF stations operating in community: None.

Channels applied for: None.

Channels contested: None.

Construction permits outstanding: Channel 8.

Statement of L. A. Blust, Jr., Vice President and General Manager, Television Station KTVX, Channel 8, Muskogee, Okla.

My name is L. A. Blust, Jr. I am vice president and general manager of the Tulsa Broadcasting Co., operators of radio stations KTUL, Tulsa, Okla., and KF PW, Fort Smith, Ark., and permittee of television station KTVX, channel 8 in Muskogee, Okla. KTVX was granted a construction permit by the FCC on April 9, 1954, and is presently under construction.

The Tulsa Broadcasting Co., permittee of KTVX, is owned by the principal stockholders of Griffin Grocery Co. of Muskogee, Okla. John T. Griffin is president. James C. Leake, vice president, Marjory Griffin Leake, vice president, and Bryan Mathes, secretary and treasurer. All the officers and principal stockholders of the Griffin Grocery Co. live in Muskogee, Okla., the city to which KTVX is assigned.

The Tulsa Broadcasting Co. applied for channel 8 at Tulsa shortly prior to the 1948 freeze. At that time there was no VHF channel assigned to Muskogee and channel 8 was then available for Tulsa. After the sixth report and order, channel 8 was taken away from Tulsa and assigned to Muskogee. Because the principal stockholders of the Tulsa Broadcasting Co. lived in Muskogee, it was decided to dismiss its application for channel 8 at Tulsa and apply for the Muskogee channel 8. This application was filed in June 1952.

There were UHF channels available in both Tulsa and Muskogee at the time the Tulsa Broadcasting Co. applied for VHF channel 8 in Muskogee; but since our intentions were to serve the greatest number of people possible, and since the UHF channels at that time did not seem to us to fill these requirements, we filed for the VHF channel 8 at Muskogee.

Two other applicants applied for channel 8 in Muskogee and the FCC finally set the hearing on January 6, 1954, to begin on February 5, 1954. On March 6, 1954, the examiner issued an initial decision in favor of the Tulsa Broadcasting Co., and this decision was made final by the FCC on April 9, 1954. Thus much effort and planning have gone into the television project of KTVX, channel 8, Muskogee, Okla., by the Tulsa Broadcasting Co.

It is estimated that over $30,000 has been spent on legal fees, engineering fees, salaries, surveys, traveling expenses, hearing costs, and consultant fees to process and bring the KTVX project to a successful conclusion.

* Reserved for noncommercial educational use.
In our application for ITVX before the FCC we have indicated that we intend to spend approximately $800,000 to build our television station. Substantial sums of money have already been spent on equipment and buildings and the balance is either contracted for or will be contracted for by the time the station goes on the air early in September 1954.

We, therefore, respectfully request that this committee take into consideration the case of KTVX as well as many other VHF operators before any action is taken.

In general we will oppose the following proposals made by the UHF group and its advocates:

1. The elimination of intermixture of VHF and UHF channels.
2. The allocation of all television stations to the UHF band exclusively.
3. The imposition of any freeze upon application proceedings or upon the issuance of operating authority covering permits already granted.
4. The reduction and limitation of the coverage areas of VHF stations.

We propose to support the following proposals made in the hearings:

1. All reasonable and proper steps to encourage production and distribution of receiving sets having all channel tuners.
2. The use of booster stations to improve service inside a station’s coverage area.
3. We intend to make as many constructive suggestions as possible as to how the economic and program resources of the industry can be expanded, but we intend to oppose those proposals that would have an adverse effect upon the whole medium in its attempt to get revenue and programs.

All the rules and regulations of the FCC have been followed by the Tulsa Broadcasting Co. in their long struggle to obtain a television permit. It would be grossly unjust to change the ground rules after the game has been played. The VHF operators have also invested millions of dollars and much time and effort on facilities, which were won in fair contests before the FCC. They are rendering a service to many areas and communities which would not receive a service if their stations were required to operate on the UHF band.

There is an element of risk in the operation of any business. Some will succeed and some will fail, depending upon the resourcefulness, the energy, their know-how, and many other factors. It would seem unwise, however, to impose restrictions on the successful operators to the end that all would fail. This would be giving the television industry a blow that might well kill it instead of curing any minor ills it might have.

It is, therefore, respectfully requested that this committee thoroughly investigate the foregoing facts before taking action on the proposals of the UHF group, and that both sides of the question be thoroughly investigated before any decisions are reached. The city of Muskogee should not be further delayed in having its only television station.

---

**Statement of WKY Radiophone Co., Station WKY-TV, Oklahoma City, Okla., Operator of Channel 4**

Channels allocated to community: 4, 9, 13, 19, 25.
VHF stations operating in community: Channels 4, 9.
UHF stations operating in community: Channels 19, 25.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: 2, 13.

**Statement of WKY Radiophone Co., Licensee of Television Station WKY-TV, Operating on Channel 4, Using Maximum Power Permitted by the Federal Communications Commission**

Prior to the decision of our company to apply for a construction permit, we contacted existing stations to determine their financial history, as well as their evaluation of the future of the television industry. Among these stations were: WBKB, Chicago; KSD-TV, St. Louis; KFI-TV, Los Angeles; WTMJ-TV, Milwaukee; KLIE-2TV, Houston; KBTX, Dallas; and KRSC—TV, Seattle.

It is interesting to note that not one of the stations listed above gave us any encouragement, but to the contrary we were counseled not to enter the television business because of the financial burden to the parent company.

---

2 Reserved for noncommercial educational use.
Our early investigations proved:

(a) Apathy on the part of potential advertisers toward the television media.
(b) High cost of television receivers.
(c) Small picture tubes. (Some were 10 inches and other were even as small as 7 inches).
(d) No estimate as to when cable facilities would be extended to the Southwest.
(e) Program sources were practically nonexistent.

It will be noted that some of the obstacles confronting our station in 1948 were confronting UHF licensees at the present time with the exception of program sources, receiver cost and size of picture tubes.

Despite the gloomy future our president, E. K. Gaylord, decided the people of Oklahoma deserved television, and that regardless of the cost our company should provide television service to Oklahoma. When this decision was made not a single television receiver was available in the State of Oklahoma.

On April 18, 1948, we filed an application for a construction permit with the Federal Communications Commission requesting channel 4, and on June 2, 1948, a construction permit for this channel was granted and the call letters WKY-TV assigned. In less than 6 weeks, or on July 12, 1948, we had placed an order with the Radio Corp. of America for television equipment that obligated our company for $288,378.83.

Prior to receipt of the television equipment the Federal Communications Commission, on September 30, 1948, issued its freeze order. Despite an uncertainty caused by this order, construction was commenced in accordance with the construction permit issued by the Federal Communications Commission, and commercial operation of WKY-TV began June 6, 1949.

The largest sum we lost during a single month was $34,791.15 and the first year of our operation, 1949, we lost $186,777.43. In 1950 we lost $82,808.35, or a total of $269,645 before a modest profit was shown in October 1950. Therefore, it required 16 months of continuous losses to find a month in which we broke even.

During the 5 years WKY-TV has been in operation we have obtained every technical improvement developed by the industry engineers and authorized by the Federal Communications Commission.

Currently we are operating at the maximum power permitted by the Federal Communications Commission, and recently have obligated our company for approximately $300,000 in order to pioneer color television. WKY-TV was the first station to receive color cameras which permit the production of live color telecasts, and at present we are producing 5 hours per week of live color programming which is in excess of the combined operations of the 4 so-called national networks.

During the 5 years of our television operation we have paid only 1 dividend to our stockholders, and with this exception all of the net income has been expended to improve our television facilities and our program service to the people of Oklahoma.

We retained Pulse, Inc., of New York, to make a survey of 29 counties in Oklahoma. This survey was made in January 1954. The survey included the following counties:

<table>
<thead>
<tr>
<th>Caddo</th>
<th>Logan</th>
<th>Okfuskee</th>
</tr>
</thead>
<tbody>
<tr>
<td>Kingfisher</td>
<td>Payne</td>
<td>Hughes</td>
</tr>
<tr>
<td>Noble</td>
<td>Blaine</td>
<td>Pontococ</td>
</tr>
<tr>
<td>Grady</td>
<td>Garfield</td>
<td>Murray</td>
</tr>
<tr>
<td>Oklahoma</td>
<td>McClain</td>
<td>Stephens</td>
</tr>
<tr>
<td>Seminole</td>
<td>Lincoln</td>
<td>Comanche</td>
</tr>
<tr>
<td>Canadian</td>
<td>Pottawatomie</td>
<td>Kiowa</td>
</tr>
<tr>
<td>Cleveland</td>
<td>Major</td>
<td>Washita</td>
</tr>
<tr>
<td>Dewey</td>
<td>Pawnee</td>
<td>Custer</td>
</tr>
<tr>
<td>Garvin</td>
<td>Creek</td>
<td></td>
</tr>
</tbody>
</table>

This research company also determined the television penetration of these counties and found the VHF penetration to be 58 percent while the UHF penetration was 7.9 percent. There are approximately 250,000 receivers in this area.

In a survey also conducted by Pulse, Inc., in January, 1954, for Oklahoma City, this research company reported the VHF penetration for Oklahoma City was 73.1 percent, while UHF penetration was 14.5 percent.

Our initial operation provided approximately 18 hours of programming per week. At present we are providing 18 hours and 15 minutes of programming per day, being on the air from 6 a.m., to 12:15 a.m., Monday through Friday, with a slightly reduced schedule on Saturday and Sunday. Our total programming efforts per week amount to 121 hours and 15 minutes.
STATEMENT OF OKLAHOMA TELEVISION CORP., STATION KWTV, OKLAHOMA CITY

OKLA., OPERATOR OF CHANNEL 9

Channels allocated to community: 4, 9, 13, 19, 25.

Construction permits outstanding: Channel 13.

KWTV,
OKLAHOMA TELEVISION CORP.,
Oklahoma City 14, Okla., June 7, 1954.

Mr. W. Theodore Pierson, Pierson & Ball,
Washington, D. C.

DEAR MR. PIERSON: When the KWTV construction permit was granted on July 23, 1953, there was only one VHF channel in Oklahoma City. As a consequence, many of the top network and transcribed television shows were not available to viewers in this area.

Realizing the importance of the situation, KWTV proceeded with the greatest possible speed, and at an extra expense of approximately $100,000 to build temporary studios, to purchase a special 345-foot tower, and all of the other equipment necessary for the installation. This was done to make CBS shows, as well as other transcribed programs, available to this market. We are now completing our new building at a cost of approximately $450,000. Construction on our new, 1,572-foot tower is now underway. The cost of the tower alone is $600,000, and while we are presently operating on a 10 kilowatt transmitter, installation of a 50 kilowatt transmitter is also under way. When our plant is completed and we are operating with full power of 316 kilowatts from our 1,572-foot tower, KWTV will have an investment of almost $2,000,000.

The construction of the 1,572-foot tower was approved by our organization to enable KWTV to give television service to areas in Oklahoma that otherwise might never have been served.

When KWTV went on the air on December 20, 1953, we spent approximately $15,000 publicizing and advertising the new channel—and a full list of CBS programs along with other film shows would be available to the viewers in our area. Just as soon as we can determine a definite starting date (which is now projected for October 1, 1954) from our new tower, KWTV will launch another newspaper and advertising campaign—using practically every daily and weekly newspaper in Oklahoma.

Without any question, the inauguration of television service by KWTV has meant a tremendous improvement of program service to people in this area. It brought about a competitive situation that had not existed for approximately 4 years.

The viewers and listeners have profited greatly by the coming of KWTV. Needless to say, all of the troubles, trials, and difficulties were part of KWTV's problems. They were increased by the fact that we were crowding construction to make service available at the earliest possible moment.

On December 20, when KWTV inaugurated service, there were practically no UHF converters in this area. However, the best evidence that KWTV or the ViF stations in this market have not retarded UHF progress is the fact that in the last issue of Broadcasting Telecasting, it is stated that more than 100,000 sets have UHF converters in this area.

The source of this statement comes from no one other than Mr. John Esau who operates a UHF station in this market. Assuming that his figures are correct—that almost 50 percent of the television sets in the Oklahoma City have been converted in the face of two ViF stations. KWTV found with the operation of channel 4 during the 4 years prior to our channel 9, made a problem for many viewers in our class B and fringe areas. These people had all installed low-band, channel 4, antennas. We will meet this situation again when we start our operation from our 1,572-foot tower. In other words, thousands of television-set owners have found for the best reception in the outlying areas, that the installation of a channel 9, or high-band antenna—or the installation of an all-service antenna, is advisable for the best reception.

1 Reserved for noncommercial educational use.
We feel that any change in the present allocation of television channels—or any freeze for any additional channels to be issued, would be a serious obstacle for the advancement and further progress of the television business.

Our attorney in Washington, D. C., Mr. Frank Fletcher, has been authorized to represent us in the hearings and is also authorized to cooperate with you to the fullest extent.

Cordially yours.

EDGAR T. BELL,  
General Manager.

Channel 4 has been granted.

Construction permits outstanding: Channel 47.

TESTIMONY OF EDWARD J. HIRSHBERG, PRESIDENT OF IRWIN COMMUNITY TELEVISION Co., IRWIN, PA.

I am Edward J. Hirshberg, president of Irwin Community Television Co., an applicant for VHF television channel 4, Irwin, Pa. I desire to oppose the suggestions which I understand have been made to this subcommittee that (1) the FCC freeze VHF hearings and grants, and (2) that all television should be removed from the UHF band.

Irwin Community Television Co. is comprised of 156 stockholders, the bulk of whom reside in Irwin and the surrounding area outside of Pittsburgh. Our company was incorporated in May 1953, for the purpose of filing application with the FCC for a television station on channel 4, which has been allocated to Irwin. Our stockholders are business and civic leaders who wish to render a television expression. Irwin is more than 15 miles from Pittsburgh—and we feel there is a definite need for a television station such as we propose which will be locally owned and operated. As you may know, Pittsburgh already has two VHF stations, WDTV on channel 2 and educational station WQED on channel 13; and two UHF stations, WENS on channel 16 and WJKP-TV on channel 53. In addition, VHF channel 11 has been allocated to Pittsburgh, with the three applicants now in a hearing contest for the frequency specifying Pittsburgh as the main studio location. The remaining Pittsburgh allocation, UHF channel 47, has been granted to WTVQ but the station is not yet in operation.

On April 21, 1954, our application for channel 4 was designated for comparative hearing with 4 other applications for this frequency. The hearing commenced May 21, 1954, with a prehearing conference, and a further hearing is scheduled for June 15, 1954. Much time, effort, and expense have been incurred by our company and its stockholders both prior to and since the filing of our application on June 23, 1953. It should be noted that all three of the Pittsburgh UHF stations were granted in a relatively short time without contest and without hearings. The time, effort, and expense incurred in obtaining such grants are small compared to that which is required of the 5 applicants going through the comparative hearing for channel 4. Moreover, present indications are that a final decision on channel 4 cannot be anticipated for a number of months.

No public purpose would be served by freezing the hearing on channel 4 now under way, or by freezing the decision upon completion of the hearing. The Irwin area needs a local television service now. The Pittsburgh stations have not endeavored to meet this need. Channel 4 represents the only possibility for local television service in our area; and to freeze the channel would indefinitely deprive the area of such service. The delays required by the hearing process in themselves are detrimental; but the imposition of a freeze would be disastrous from the public standpoint.

Reserved for noncommercial educational use.

48550—54——58
Moreover, consideration should be given to the considerable effort and expense already incurred by the 5 applicants for channel 4, which applied in reliance on the FCC allocation of the frequency to Irwin. The UHF permittees in Pittsburgh concluded, as a matter of business judgment, to apply for UHF and obtain quick uncontested grants, knowing full well they would have immediate competition from the existing VHF station WDTV, as well as competition from channels 11 and 13 in Pittsburgh when grants were made on those frequencies. It now would be unjust for them to contend that because of economic difficulties they may have encountered, a freeze should be placed on further VHF hearings or grants for stations serving the area which they serve. UHF permittees have taken a business risk; but it is not the American system to freeze competition to bail out business risks, particularly when, as here, potential viewer competitors have invested substantial time, effort, and money in reliance on a Government allocation made after careful deliberation and with full opportunity for public objections to such allocation.

Irwin community opposes any suggestion that all television be moved to the UHF band because it believes that VHF is much better adapted to serving the public in areas such as Irwin where the terrain is rugged, and because the American public has expended millions upon millions of dollars in VHF receiving sets and antenna installations. It has been proven beyond doubt that VHF can do the coverage job required in hilly areas such as ours, but there is some question whether UHF, because of its technical limitations, can do as good a coverage job. In any event, the expense of obtaining equivalent coverage in the two bands is much greater for UHF. Furthermore, the loss to the American public of its investment in VHF receivers and antennas would be many times the losses of the present UHF stations were all television to be moved to the UHF band.

Hon. Senator Charles E. Potter,
Chairman, Communications Subcommittee,
Senate Office Building, Washington, D. C.

DEAR SENATOR: In view of the many statements made by the UHF Telecasters Committee before your distinguished body, we feel it necessary that certain of our views be incorporated into the record of your hearing.

We brought television to central Pennsylvania beginning September 15, 1949, when there were approximately 1,500 sets in the entire area. Four years later, the UHF station came on the air with the set count in the neighborhood of 675,000, none of which were equipped to receive UHF. We have been exceptionally proud of the program standards held by our station, and brought out by the innumerable letters received from viewers. We have consistently carried all the top shows. Needless to say, this has made it difficult to obtain conversions for UHF reception. However, we should point out that with the type of terrain in our area, if every television set owner in metropolitan Johnstown and metropolitan Altoona were to obtain a converter and attempt to receive the UHF signal, a minimum of 40 percent of the homes would be without television. We are conservative in our figure, and from all engineering information available we know it to be true.

As you can see, in the neighborhood of $50 million worth of television sets plus the many millions of dollars already invested in antennas would become obsolete. It is certainly inconceivable that the distinguished Members of the United States Senate on your committee would consider anything that would result in a loss of this nature to the residents of just one small area of the United States.

We might also point out, although we believe it is not necessary, that we began our television operation without any assurance whatever that we would ever make money. We had only our faith in the industry and the people of our country. This assurance and faith has been the beginning of many successful enter-
prises, and we believe, further, that it is the desire of your committee that a faith of this type remain part of the American way.

Your sincere consideration on the problems of the VHF telecasters in a terrain such as ours is most respectfully requested.

Yours very truly,

Alvin D. Schrott,
Treasurer and General Manager.

STATEMENT OF ALLEGHENY BROADCASTING CORP., APPLICANT FOR CHANNEL 4 AT McKeesport, PA.

Channels allocated to Irwin: 4.
Channels allocated to Pittsburgh: 2, 11, 13, 16, 47, 53.
VHF stations operating in community: Channels 2, 13.
UHF stations operating in community: Channels 16, 53.
Channels applied for: Channels 4, 11.
Channels contested: Channels 4, 11.
Construction permits outstanding: Channel 47.

STATEMENT OF LEE W. ECKELS, ALLEGHENY BROADCASTING CORP.

I am secretary-treasurer and a member of the board of directors of Allegheny Broadcasting Corp., Pittsburgh, Pa. Allegheny Broadcasting Corp. is licensee of standard broadcast station KQV, Pittsburgh, Pa., and since October 1945, has been an applicant for a permit to construct a new commercial television station in the Pittsburgh area. Its application now requests the use of channel 4 with main studios in McKeesport, Pa., which city is a part of the Pittsburgh standard metropolitan area.

Under the Table of Assignments set forth in the rules of the Federal Communications Commission VHF channels 2, 11, 13, and UHF channels 16, 47, and 53 are allocated for use in the city of Pittsburgh, with channel 13 being allocated for noncommercial educational use; and channel 4 is assigned to Irwin, Pa., a suburban community situated in the Pittsburgh metropolitan area. The Pittsburgh standard metropolitan area, according to the 1950 United States Census, has a population of 2,213,296. It comprises Allegheny, Beaver, Washington, and Westmoreland Counties.

The situation with respect to the channels already assigned to the Pittsburgh area is summarized as follows:

Station WDTV, licensed to Du Mont, operates on channel 2 and for more than 4½ years was the only television station in the Pittsburgh area. It carries programs furnished by the four national networks, Du Mont, Columbia, American, and National. It commenced operation in January 1949.

On July 14, 1953, station WQED commenced commercial operation on UHF channel 53. It carries some network programs furnished by the National network.

On August 25, 1953, station WENS commenced commercial operation on channel 11, and carries programs furnished by the Columbia and American networks.

There is also a construction permit outstanding for station WTVQ on channel 47, which permit expires on July 6, 1954. The station is not yet on the air, and I do not know the status of its construction.

Noncommercial educational station WQED commenced operation early in April 1954.

The two unassigned channels in the Pittsburgh metropolitan area are 4 and 11, both of which are now involved in public hearings before the Commission. There are 5 applications, including that of Allegheny Broadcasting Corp., requesting use of channel 4 and 3 applications requesting the use of channel 11.

An attempt has been made to determine the number of television sets distributed in the areas served by Pittsburgh television stations. The information available is not adequate to permit an accurate estimate of the number of VHF sets in use in the area or the number which have not been converted or are not capable of UHF reception. However, it is noted that station WDTV claims that there are 990,000 sets in its service area and station WENS claims approximately 307,000 television sets in its service area capable of UHF recep-

1 Reserved for noncommercial educational use.
tion. On this basis it would appear that approximately 680,000 sets in the service area of WDTV are presently unconverted and incapable of UHF reception.

The fact that there have already been grants of stations on the 3 UHF channels, 2 of which have been in operation for about 16 months, may raise a question as to why, at the termination of the so-called freeze in 1952, Allegheny continued to request the use of a VHF channel rather than to apply for the use of one of the UHF channels assigned to the area.

This matter was carefully considered. The factors which led to our decision can be summarized as follows:

The advice given by our chief engineer and consulting engineers was to the effect that UHF channels could not, within any reasonably foreseeable time, be expected to provide as adequate a service in the Pittsburgh metropolitan area as could be provided by the VHF channels. Our engineers were aware of field surveys conducted by Westinghouse engineers in 1949 which indicated that propagation on UHF channels over the rough terrain of the Pittsburgh metropolitan area was not as indicated by the Commission's curves as then proposed and was decidedly inferior to that experienced on VHF channels. While we considered as a certainty that both UHF transmitting and receiving equipment would improve and that the difficulties presented by the rough terrain would probably be largely overcome, we had no reasonable assurance as to when such improvements might be expected. Weighing all these factors, we concluded not to abandon the prosecution of our application for a VHF channel in favor of a UHF channel.

It has been suggested, in this record, that the Commission adopt another "freeze" policy with respect to VHF. It has also been suggested that the Commission suspend action for a year upon the Pittsburgh area channel 4 application. The following of either of these suggestions would unnecessarily conflict with our chief engineer, and resulted in further injury upon the more than 2 million people residing in the Pittsburgh metropolitan area. It must be remembered that, because of the television "freeze" in effect between 1948 and 1952, for a period of 4½ years these people had available to them the service of only 1 station, WDTV; and in view of the fact that more than 50 percent of the sets in the area are incapable of receiving UHF, it cannot be said that the 2 UHF stations now in operation have fulfilled the need for additional television service in the Pittsburgh area.

Moreover, the interests of Allegheny Broadcasting Corp. would also be further injured. In this connection, Allegheny Broadcasting Corp. has had pending before the Commission an application for a television station since October 1945. Throughout April 1954, the corporation has paid out over $92,000 as charges incident to the preparation and prosecution of such application. In addition thereto, a total sum of $1,850,000 has been committed to the project; and the corporation is currently paying a commitment charge upon $1,250,000 of such total amount. Thus, a further "freeze" or delay would result in extreme hardship to Allegheny Broadcasting Corp.

It has also been suggested that all television broadcasting be moved to the UHF band. This action would not serve the public interest insofar as the Pittsburgh metropolitan area is concerned. This is especially true considering the fact that, in the rough terrain of the area, UHF is substantially inferior to VHF from a technical standpoint. This has been established by the Westinghouse field measurements taken in 1949 and has been fully confirmed by the operation of other UHF stations in this and other areas of similar rough terrain. Moreover, such action would result in completely unjustified, severe economic hardship and injury to the VHF-only set owners in the Pittsburgh metropolitan area. Such sets undoubtedly represent an investment of well over $100 million. As to many, complete loss could be avoided only by the expenditure of additional sums for conversion to UHF. But, as to others, conversion would be to no avail and their sets would be rendered obsolete.

There is no merit to the implication in this record to the effect that Pittsburgh UHF station operators were lured into their positions upon the assumption that there would be but two conventional VHF stations in the area against which they would have to compete, as indicated by the allocations set forth in the sixth report and order of the Commission. Such UHF station operators for some weeks before receiving their grants were aware of the Commission's allocation of channel 4 for use in Irwin (or some other city within 15 miles thereof) and that the station ultimately assigned the channel would serve the Pittsburgh metropolitan area. With full knowledge of this allocation, they chose to prosecute their unopposed applications for UHF facilities as an alternative to being subjected to a competitive hearing on either channel 11 or channel 4.
In conclusion, it is the position of Allegheny Broadcasting Corp. that (i) a further "freeze" on the processing of applications and construction permits, or (ii) suspension of the channel 4 proceeding in the Pittsburgh metropolitan area, or (iii) any action to restrict television broadcasting to the UHF band would not serve the public interest.

LEE W. ECKELS,
Secretary-Treasurer.

STATEMENT OF WCAU, INC., STATION WCAU-TV, PHILADELPHIA, PA.

OPERATOR OF CHANNEL 10

Channels allocated to community: 3, 6, 10, 17, 23, 29, 35.

WCAU,
Philadelphia, June 1, 1954.

PIERSON & BALL,
Washington, D. C.

GENTLEMEN: In regard to the present Senate committee hearings on the problems of UHF, I feel it is important that the same committee be shown some of the difficulties that VHF operators encountered in their early days of telecasting. WCAU-TV officially started commercial broadcasting as of May 28, 1948. Prior to that time, for approximately 2 months, we had been broadcasting experimentally. At that time, we had an investment in equipment and studio conversion of approximately $650,000. Our operating loss during the year of 1948 was $439,289. In 1949, our operating loss was $391,357 and our operating loss through April of 1950 amounted to $25,000. These losses were despite the fact that our radio operation carried 75 percent of all administrative overhead including real-estate rentals, building maintenance, light, heat, air conditioning, and such dual-capacity departments as administrative auditing, promotion, engineering, music, etc.

On May 28, 1948, according to the best estimates at that time, there were only about 35,000 sets in our market. Currently, in the coverage area of WCAU-TV, there are approximately 1,600,000 sets. Obviously, this large number would cause an insurmountable conversion problem if thought were given to changing all VHF broadcasting to UHF. So far as we know, there is no exact figure for the possible number of sets that have been converted to UHF.

Yours most sincerely,

DONALD W. THORNBURGH.

STATEMENT OF WCSC, INC., STATION WCSC-TV, CHARLESTON, S. C.

OPERATOR OF CHANNEL 5

Channels allocated to community: 2, 5, 13, 17.

UHF stations operating in community: None.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: Channel 2.

STATEMENT OF JOHN M. RIVERS, PRESIDENT, WCSC, INC., ON BEHALF OF WCSC-TV, CHANNEL 5, CHARLESTON, S. C.

WCSC-TV, licensed for 100,000 watts on channel 5, in Charleston, S. C., commenced construction in December of 1953. Broadcasting operations commenced June 19, 1953, under an interim authorization of 31,000 watts from a tower height of 525 feet with a 6-bay RCA antenna. Our investment, by the time we

1 Reserved for noncommercial educational use.
begin to operate at our maximum licensed power, will be approximately $400,000 for equipment alone, plus another $100,000 in specially designed studio built for WCSC's use and rented to WCSC for a period of 35 years. As of April 12, 1954, based on the Nielsen nationwide surveys and the monthly releases from RETMA, there are 114,000 VHF television receivers within a radius of 100 miles of this station, representing an investment of approximately $35 million on the part of the people in this area. Approximately 40 percent of the homes are now equipped to receive television and it is reasonable to expect that there will be invested in VHF television receivers an additional $20 million in the next 1 or 2 years.

We oppose any freeze on the granting of VHF licenses, we oppose the allocation of all television stations to the UHF band exclusively, particularly in our own case the junking of $400,000 worth of equipment would 'do us irreparable damage, the economic injury being of such proportions as to probably cause the failure of this enterprise, and we can see no reasonable justification to obsolete $30 to $70 million of receivers in the hands of the public, bought in good faith in the expectation of receiving continuing service from stations in the VHF band.

The undersigned recalls that the Columbia Broadcasting System several years ago released a statement regarding their position about affiliation with UHF stations. This statement was widely circulated in the television trade press and a prudent investor in UHF facilities had ample warning that at least one network seriously doubted the soundness of investment in UHF equipment.

No committee of Congress, or manufacturers, or the public, have offered to underwrite our investment in frequency modulation. We made such an investment in the hope that it would prove to be profitable. The fact that frequency modulation has not in our case been profitable does not justify our asking that AM radio be moved into the FM band, nor does it justify our asking Congress to reimburse us for our unfortunate investment. WCSC has experienced substantial difficulty in gaining recognition from advertisers, from the network, from the national spot level, and from the local level. We are, at the moment, the only station in the South Carolina coastal area and within the first year of operation we have been successful in gaining recognition from sufficiently large numbers of advertisers to give us a profitable operation.

We are faced with competition in the fall of 1954, and depending upon the policies of our competitor our business may either continue to be a profitable one or it may very well, and quickly, be changed into substantial losses, therefore, an investor in television, inasmuch as it is a new medium, by the very nature of the business, takes substantial economic risks, and in secondary markets such as the coastal area of South Carolina, we know of no positive assurance that television, regardless of its class of station, will automatically earn substantial returns on invested capital. We urge upon the committee every possible help that Congress can give to have manufacturers build all channel tuners to the end that the public may have the widest selectivity of program material, but we can see no reasonable justification for the elimination of intermixture of UHF and VHF and the allocation of all television to the UHF band exclusively, and respectfully ask the Congress that no such punitive step be taken to destroy our own investment and the millions invested by the public to receive programs from this and other similarly situated stations.

John M. Rivers,
President, WCSC, Inc.

Statement of Carolina Broadcasting System, Inc., Station WNCT,
Greenville, S. C.

Operator of Channel 9

Channels allocated to community: 9.
VHF stations operating in community: 9.
UHF stations operating in community: 3.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: None.
Carolina Broadcasting System, Inc., owners of WNCT, Greenville, N. C., channel 9, desires to join informal group you represent in protesting move of all television to UHF. Greenville is town of 18,000 in eastern North Carolina and depends completely upon population area within 60 miles to have adequate base for support television for this area. Undoubtedly would be denied if reduced in area served by moving to UHF it would obsolete more than 30,000 sets. We desire committee to take any and all measures to secure future of UHF short of destroying VHF. Please remember millions of citizens throughout Nation will be denied any television if VHF service is discarded.

A. Hartwell Campbell, Manager.

STATEMENT OF MOUNTAIN CITY TELEVISION, INC., CHATTANOOGA, TENN.,

APPLICANT FOR CHANNEL 3

Channels allocated to community: 3, 12, 43, 49, 55.
VHF stations operating in community: Channel 12.
UHF stations operating in community: None.
Channels applied for: Channel 3.
Channels contested: Channel 3.
Construction permits outstanding: None.

STATEMENT OF RAMON G. PATTERSON, PRESIDENT OF MOUNTAIN CITY TELEVISION, INC., APPLICANT FOR A VHF TELEVISION STATION AT CHATTANOOGA, TENN.

Mr. Chairman and members of the Senate Subcommittee on Communications: In view of the fact that your committee has been offered many proposals designed to cure the economic ills of those persons engaged in UHF television operation, I thought that in order to get a complete picture, you would be interested in receiving the views of persons like myself who would be severely injured should some of the recommendations made by the UHF proponents be adopted by your committee.

The most alarming suggestion, to me, was the recommendation that an immediate freeze of VHF grants be instituted by the Federal Communications Commission in order to give UHF operators an opportunity to commercially exploit their stations without VHF competition. This, to me, is certainly not the normal concept of American competition and while on a conjectural basis, it may be of some assistance to the UHF operators, it would certainly be disastrous financially to me and my associates.

Chattanooga, Tenn., has been assigned channels 3, 12, 43, 49, and 55. Channel 55 is assigned for noncommercial educational use. Mountain City Television, Inc., could, if it had desired to do so, have applied for any of the foregoing channels with the exception of channel 55. Obtaining a UHF grant in Chattanooga would have been comparatively easy however, it would have been a gamble as to whether or not the VHF channels allocated to the city were to be granted in a short time by the Commission or whether they would be so tied up in prolonged bitterly fought hearings as to give the UHF operator time to establish himself. The reason he would need time to establish himself is because fair television signals in the VHF band are received in Chattanooga from Atlanta stations. Most of the UHF operators thus knew or should have known when they applied for their stations that they were engaging in not only the television business, but in a risky gambling enterprise.

Based upon the best advice it could obtain from all available sources, Mountain City, in March of 1952 filed an application requesting VHF channel 3. When it filed its application, it knew it would have to compete with any other applicants who might file for this channel; two applications were filed for channel 3 in Chattanooga and a hearing, therefore, became mandatory.

The hearing on the Mountain City application and that of its competitor commenced before an examiner of the Commission on April 20, 1953. The hearing

1 Reserved for noncommercial educational use.
consumed many days and the record in the case was finally closed on August 20, 1954. Besides the sessions held in Washington, depositions in support of its application and its competitor’s applications were taken in Chattanooga, Tenn., during May 1953 and one deposition was taken in Chattanooga in August 1953. Proposed findings of fact and conclusions of law were prepared on behalf of Mountain City Television, Inc., and were filed with the examiner. The case has been in the examiner’s hands for some months and an initial decision is expected momentarily.

The expenses which Mountain City has incurred in the filing and prosecution of its application have amounted to more than $20,000. These expenses include attorneys’ fees, engineering fees, transportation of witness to Washington, D. C., hotel bills, options on land and buildings, court reporter costs, printing costs, labor costs in connection with the preparation of exhibits for the hearing and interest on money borrowed. When the examiner’s initial decision is released, there undoubtedly will be additional fees and costs amounting to many more thousands of dollars before a final decision is released by the Commission.

At the present time, there are no UHF stations operating in Chattanooga. There is one VHF station operating. Assuming it is successful, Mountain City Television, Inc., can complete with this station if its application should be granted within a reasonable period of time; if, however, the granting of VHF stations should be frozen for an indefinite period so the UHF operators in other communities can operate until they show a profit, then it is doubtful whether the Mountain City station will ever be able to effectively complete with the VHF station, which by then will already be firmly established in Chattanooga. Moreover, the freezing of VHF grants in Chattanooga would not only result in giving the existing VHF station a monopoly in the area for an indefinite period of time but would also deprive not only the viewers, but the commercial interests of Chattanooga of a choice of local television stations.

As has been pointed out above, since there are no UHF stations in the city of Chattanooga, the freezing of VHF grants would in no wise benefit UHF operators either in Chattanooga or elsewhere.

Another suggestion has been made to the effect that all UHF stations should be transferred to the UHF band. This also would be disastrous to Mountain City Television, Inc., since in order to get on the air as quickly as possible (should its application be granted), approximately $100,000 worth of television equipment has already been purchased by Mountain City and is in storage in Chattanooga, Tenn. This equipment was purchased in good faith on the premise that there would be VHF stations and, therefore, should the Mountain City application be denied, then in that event, the equipment could undoubtedly be sold, even at a discount, to some other VHF applicant. A large part of the money already invested in this equipment is represented by a transmitter and antenna which are only usable for VHF operations; consequently, any transfer of all television stations to the UHF band would again cause irreparable economic injury to my associates and me.

I should like the Committee to know that I am sympathetic with the plight of the UHF operators, even though they should have known that operation in mixed areas was a risky venture and could result in great losses and am hopeful that in some way a solution to their difficulties may be discovered. However, I think it would be quite unfair to endeavor to straighten out the UHF difficulties by any method which will cause serious economic injury to other persons who in good faith, have already expended many thousands of dollars.

---

STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

HON. CHARLES E. POTTER,
Chairman, Subcommittee of the Interstate and Foreign Commerce Committee, Washington, D. C.

DEAR SIR: In connection with the hearings now being conducted by the subcommittee of the Senate Interstate and Foreign Commerce Committee investigating the problem of the ultra-high frequency television operations, the undersigned desires to submit the following information and data which may be of some help to the committee in its determination of the problem that is presently studying.

Television station WBAP-TV located at Fort Worth, Tex., was licensed to Carter Publications, Inc., and began operation under date of September 29, 1948. At the time of such operation there was a total of 500 receiving sets in the Fort Worth-Dallas area, which area had a combined population of 1,115,312. Source: Sales Management Survey of Buying Power, May 1949. Since the beginning of operations and by diligent effort as well as constant promotion in cooperation with both manufacturers and distributors, receiving sets circulation has increased in the area so that there are now some 376,000 television receivers. Since there is no ultra-high frequency television station serving the community, there has been no conversion of VHF receivers to accommodate UHF reception.

Carter Publications, Inc., originally invested in the construction of its VHF television station the sum of $1,500,000, such expenditure covering land, construction cost, and television operating equipment. Since that time and for the sole purpose of keeping abreast with the television art, the licensee has invested an additional sum of $1,200,000 so that its invested capital in television station WBAP-TV as of this time is $2,700,000. The sum of $2,700,000 so invested represents capital investment only as distinguished from any expenditure for operations.

From the date of operation, namely, September 29, 1948, and until October 31, 1950, the VHF television station continuously operated at a loss, which loss aggregated the sum of $230,550. The average monthly loss during the 2-year period of time was $9,583.33. In the month of November 1950, the financial picture changed so that there was a gross profit for such month of $122,09. Since that time the station has continued to make money; however, such earnings have been of a slow and progressive nature as distinguished from a sudden and rapid return. The success of the VHF operation can be attributed to the policies initiated by its owner with respect to the furnishing of an outstanding program service (irrespective of cost) which the viewing public will accept as meritorious and worthwhile; the constant adding of additional capital to replace obsolete equipment and in keeping abreast with the new technological developments in the industry, to the end that the public receives the finest in program service.

Very truly yours,

CARTER PUBLICATIONS, INC.
Harold Hough, Vice President.

PIERSON & BALL,
Washington, D. C.

GENTLEMEN: We wish to express our individual view regarding the proposal before the Potter Committee for the elimination of coverage of power of VHF stations.

Our market is an isolated area, agricultural in nature, and is stretched over a 75-mile area. VHF coverage at lower power is, in our opinion, the only method that can afford to operate in this market.

JUNE 4, 1954.
This organization invested money and time during the channel-allocation hearings to get a VHF channel moved to the center of the area. We went to considerable expense and time to consolidate radio facilities here to get channel 4 without a hearing. Although KGHT-TV was the first station operating here on the American side of the Rio Grande, our situation was made easier somewhat by channel 7 having been in operation from Matamoros for 2 years prior to our opening. Channel 7, from Mexico, used American programs from all networks and American films. This created a set count of approximately 25 percent saturation at the time we opened, October 4, 1953. However, with the start, we sustained some severe losses while getting network and local programing and to move our set count to a 40- to 45-percent saturation.

For the size of the market, we have a large investment in VHF equipment and in programing. All sets in the area are VHF sets. In our opinion, no UHF combination sets have been sold in the area. A switch from VHF to UHF would be the same as starting in a new area with no sets in the market. The loss in transmitting equipment and future operational losses would make operation under such a change doubtful. A reduction in coverage would segment the market and make operation possible only on such a reduced schedule as to lose much of the effectiveness of a station.

Sincerely,

TROY MCDANIEL, General Manager.

STATEMENT OF WICHITA FALLS TELEVISION, INC., STATION KWFT-TV, WICHITA FALLS, TX.

OPERATOR OF CHANNEL 6

Channels allocated to community: 3, 6, 16, 17.
VHF stations operating in community: Channels 3, 6.
UHF stations operating in community: None.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: None.

KWFT-TV began telecasting on VHF channel 6, March 6, 1953. An interim operation with single-bay antenna and 135-foot tower was necessary until FM tower could be rebuilt and 5-bay antenna delivered. KWFT-TV began operating on full authorized power as of July 17, 1953.

At the time we went on the air, there were very few sets in the community. Our best guess was that there were probably about 500. The owners of these sets had high towers with antenna installed to receive Oklahoma City, Dallas, and Fort Worth stations. During our first month's operation, we devoted a great amount of effort and expense to promoting the sale of sets in this area. This was accelerated to some degree when our competitor, KFDX-TV went on the air April 12, 1953.

KFDX-TV is affiliated with NBC television and ABC television, and KWFT-TV is affiliated with CBS television and Du Mont.

In the early days of our operation it was very difficult to get network programs because advertisers felt that we did not have enough sets in the market. It has only been recently that our network schedule has begun to improve. There are a great many of the better programs which we have been unable to get orders for this market even though a great amount of effort has been put forth in this direction.

For the period March 1, 1953, through April 30, 1954, our total operating loss was $89,241.68. Our loss for the month of April was $7,632.62. We are hopeful that we will reach a break-even figure by fall.

Our total investment in television is approximately $400,000, and we feel that it will be necessary to spend an additional $100,000 to go to maximum power in order to provide adequate service to the area.

There are now approximately 75,000 sets in the area which we service, and since there is no UHF service at all in this area, the elimination of VHF would mean that all these sets would have to be converted. To our best knowledge there have been very few sets sold in this area which will receive UHF.

June 8, 1954.

Chairman of the Senate Subcommittee on Communications and Its Members:

Pertaining to the subcommittee’s investigation as to UHF television, the undersigned, Fisher’s Blend Station, Inc., licensee of channel 4, KOMO-TV in Seattle, Wash., respectfully submits the following observations:

1. As of May 1 there were an estimated 351,100 sets in our service area. In the event all VHF stations in this area were required to convert to UHF at least 95 percent of these sets, or 333,000, would become obsolete and require conversion for UHF at a cost ranging from $15 to $50 per set.

2. The 2 existing television stations in Seattle, channel 4 and channel 5, are of necessity situated on the top of one of the highest hills in Seattle with the maximum antenna height allowed by the Federal Communications Commission of 1,000 feet. Seattle is an extremely hilly terrain and even with the height of the existing television towers, a very considerable area served by these stations is unable to obtain a good signal, because of shadows and obstructions. This difficulty will be multiplied manyfold if only UHF television is obtainable since the bending characteristics and the propagation of UHF signals are distinctly inferior to that of VHF signals.

3. The television set owners in this area have invested very substantial sums in home antennas situated upon their roofs in order to receive VHF signals; in many instances they have gone considerably beyond normal costs to eliminate ghosting and other reception problems caused by the hilly terrain. UHF conversion would render the present receiving antennas obsolete and would require new antennas at an additional average cost of at least $30 per home. Even with good antennas the problem of ghosting and fill-in behind the hills could not be met with UHF. It is the opinion of competent engineers, including our own, that a very substantial percentage of homes in our primary service area would not be able to receive a satisfactory UHF picture. UHF conversion of these channels would be ruinous to the commercial value of television in Seattle.

4. KOMO-TV represents an investment in buildings and equipment alone totaling in excess of $1,249,000. This does not include the preparation and planning costs involving a large number of personnel under a period of 5 years in anticipation of the ending of the three-year freeze. Our original application for television was filed in April 1948. Over one-half million dollars was expended in studio facilities in anticipation of our early entry into television. Our investment was predicated upon the availability to us of a VHF channel, thus enabling us to adequately cover the hilly area of Seattle and to operate as a regional station as well. Had we known or been advised that a UHF channel would be assigned to us, we would not have made the investment nor would we have applied for a television channel. In the event we are deprived of our VHF assignment of channel 4, we in effect by governmental edict have suffered a very substantial loss which in our opinion amounts to completely unjustifiable confiscation.

5. Because of the freeze we were delayed in our entry into television until December 10, 1953. While there was then a sizable ownership of television receiving sets established in the area, the profit picture to date for KOMO-TV has not been overly attractive. Our profits in fact have only approximated one-half in percentage to sales as compared to our profits in radio prior to television. A long period of risk faces us in view of the imminence of color, requiring transmitter conversion and heavy costs of studio and originating color equipment.

6. In the last analysis the value of a television station to the advertiser is in terms of cost per thousand viewers. The increasingly high cost of network programming and the very competitive situation which exists in the Seattle market today, further complicated by the addition, in the near future, of another competitive VHF station, together with the competitive bidding for film material and local talent is bringing about a steadily increasing cost to the advertiser.

1 Reserved for noncommercial educational use.
This can only be justified on the basis of increasing set ownership at the same or greater rate. If UHF is the exclusive television signal for the Seattle area, a very substantial number of people will refuse to buy television sets, and many will discard their present sets because of inability to receive a satisfactory UHF picture. In other words, television in Seattle would be in very serious jeopardy.

It is respectfully urged that the present channel assignments arrived at in a period of over 3 years' study by the Federal Communications Commission should not be disturbed. The people in this area with 3 commercial and 1 educational VHF channels and 2 UHF channels assigned to Seattle together with 2 VHF and 2 UHF channels assigned to Tacoma are more than adequately served under the present assignments. No benefit and only harm will result to the public if all channels are converted to UHF or if part of the channels are assigned to UHF.

Respectfully submitted.

DONALD G. GRAHAM.

PERSO & BALL,
Washington, D. C.

GENTLEMEN: Pertinent to the Potter hearings—Senate subcommittee investigating television problems.

I have read with great interest some of the preposterous proposals made by the UHF group and its advocates. In the first place, each and every applicant for a UHF channel made his or her application fully realizing that there was a difference between UHF and VHF. For these licensees and permittees to now suggest that the very high bands be abandoned is just as practical as all FM licensees requesting that AM licenses be canceled and moved to FM bands.

The complaint of the UHF licensees and permittees is akin to the age-old struggle between high and low band AM broadcasters, regional and clear channels. These debates, protests, and hearings have been going on since the organization of the first Federal Radio Commission.

In point, I personally operated an AM station on what has always been known as graveyard frequency, namely, KGA at Spokane, at a loss for many years. While it is true that I attempted to improve the frequency of the station during my period of ownership, I did not request that all licenses from 900 kilocycles to 550 kilocycles be moved into the poor band that had been allocated to me.

At this moment I am constructing a television station under a construction permit issued in March. I first made application for a television station in Spokane in May 1952, and was obliged to go through with comparative hearing in order to obtain the construction permit. The total cost of obtaining this construction permit for final decision was $114,000. I am not engaged in constructing this television station and expect to have an investment of at least $750,000 when it is completed. The uncertain position that I find myself in due to the improper claims and demands made by the UHF group are extremely disturbing and cause me to give serious consideration as to whether I should go forward with construction at this point.

Very truly yours,

LOUIS WASMER.

UHF stations operating in community: None.
Channel applied for: Channel 13.
Channel contested: Channel 13.
Construction permits outstanding: None.

My name is Lawrence H. Rogers and I am the vice president and general manager of Station WSAZ-TV at Huntington, W. Va.

I. DECISION TO ENTER TELEVISION

WSAZ, Inc., filed for a television construction permit in May 1948, requesting facilities of 12-kilowatt ERP visual on channel 5, assigned to Huntington, W. Va. The permit was issued on July 29, 1948.

II. QUESTION OF THE FREEZE

The now famous freeze order was issued shortly after our construction permit arrived. Naturally this caused consternation among the stockholders, who naturally anticipated that the permit might be subject to major revision after a quarter-million dollar investment had been made. This subject was discussed with the then Chairman Coy, who said, in effect, that it was our money, and we were free to spend it any way we chose. As for any indication as to what might come of the freeze, he didn't know. We decided that the obvious potential impact of television, the tremendous importance to a town of 85,000, the know-how of a successful radio operation, outweighed the gloomy atmosphere; construction was commenced.

III. HOW OF TELEVISION, 1954

A far gloomier aspect than that of the UHF operation of today faced us in 1949. There were 154 sets in our area, and the area of that day was perfect thought to be our hometown of 85,000 since TV signals were line-of-sight signals only according the best informed sources. No one had ever built a television station in such rough terrain as ours, or in such a small city. The gamble was made on the theory that if we covered Ashland, Ky., and Ironton, Ohio—adjacencies in the home market—we might squeak through; if we also could reach Portsmouth, Ohio, and Charlestown, W. Va., we were sure of a potential that could put us in the black.

At that point, our primary problem was the physical task of getting a signal behind the sharp ridges and into deep valleys. What to put on that signal was another matter. There was no network available to us. There was no likelihood of network connection even if they wanted to affiliate us. No one of our home communities was large enough to boast a large entertainment circuit or availability of talent. This was simply a start-from-scratch operation.

Some operators had reported considerable savings by combining studio and transmitter operations. We planned likewise. But to do so meant sacrificing all hope of success by limiting coverage to only the hometown; or to put our transmitter in a location that could not be readily reached. Thus, when matters of access of personnel, feeding personnel, access of talent or visiting dignitaries, shipment of film, and many other daily operating problems were considered, we decided to build downtown studios, and a mountaintop transmitter. New studios were required on theory that combining with radio studios would seriously hamper radio operations; furthermore not enough space was available for an adequate TV studio.

1 Reserved for noncommercial educational use.
Lack of local talent required thinking of sports coverage as a sure-fire set builder. This meant in addition a complete remote unit.

Foregoing resulted in a third of a million dollars being spent to put on the air a station which in essence was as complete as any metropolitan area station in a small town—at that time underpromoted and underexploited by the national distributors and advertisers as private enterprise.

The present situation, we are convinced, will right itself if permitted to proceed along democratic, free-enterprise lines—just as has been the history of radio and all other business. The people will be served—and those who have the ability and facilities will serve them—if left alone by other than fair rules of the game. The engineering brains of the electronic industry will evolve ways and means so that public demand is met, in all parts of the country, without subsidies or protection or preferential treatment to those who through a mistaken judgment or limited abilities and experience, or both, seem to feel that they should be maintained in business despite economic realities and at the expense of those who had the courage and willingness to pioneer this field.

After all, who is complaining and raising all the hubbub? Certainly not the public. Let us not be carried away by the clamor of the few who are not crying out in behalf of the people, but rather because of their own economic plight and selfish interests.

However, it was noted that our signal was penetrating hills, and our coverage was reaching points 75 miles distant with some regularity. Thus it was felt that if service could be provided beyond the weak half-million dollar efforts to date, it might reach homes by the hundred thousand, thus becoming an effort capable of returning the investment and providing an important service.

Plans were devised for the erection of an intercity microwave relay system to interconnect us with the Cincinnati stations. Even without network orders we could then provide Cincinnati baseball and other events of similar magnitude. An additional revenue source might be advertisers who used the Ohio Valley area on a regional basis. This project was undertaken at an approximate cost of $150,000, and not without some soul-searching and blind faith on the part of stockholders and management. There were no startlingly successful precedents to offer us hope.

VI. NEW ERA OPERATIONS

The mere fact of interconnection did not spell success. It did build the set population; but it didn’t sell advertising at such a rate as might have been hoped for. As a result, expanded service hours, more regional efforts, and more showmanship, were decided upon as the answer to profitable operations. We were spending in excess of $30,000 per month before we found the formula for profit. To attract the public’s attention it was necessary to give them everything they asked for and more of it.

VII. CONTINUED TECHNICAL PROGRESS

WSAZ-TV has installed every major development for the improvement of television as it has been developed. Working closely with the Commission after the sixth report, we installed the first postfreeze transmitter and accomplished a shift from channel 5 to channel 3 with the minimum disruption of service.

As soon as conditions permitted, we built and occupied a complete new production center with facilities for every type of local program. We have continued to pioneer in local and regional news and public affairs programing, and went on the air with network color in March 1954, 6 months ahead of schedule.

VIII

All of the foregoing projects have been carried on at the expense of the total earnings of the corporation in both television and AM broadcasting. Even now, an additional $350,000 is being spent to improve and solidify the technical facilities with regard to dependable coverage in very difficult terrain. It has been seen that the corporation risked a third of a million dollars to get into television, only to see the operation lose over $100,000 before it found the formula for profit. Then, it was as a result of spending an additional $100,000 and more for facilities. Faith in the future of this project has prompted the company to invest almost an additional $1,000,000 of earnings and added capital to provide permanent quarters and the greatest possible transmission facilities within the ability of our engineering force to create, and within the present and predictable regulations of the FCC.
IX. SCOPE OF SERVICE TO PUBLIC

From the risky beginnings of a “minimum” operation, we have expanded to a complete round-the-clock broadcasting service employing 150 persons and bringing new fame and fortune to the area covered. We have made every effort to promote areawide understanding and unity through an aggressive program of news, special events, and public affairs programs, via live, remote, and film operations.

We telecast nearly 120 hours a week of which nearly a quarter is live local. At last count we had 114 separate live local shows a week. To demonstrate the scope and seriousness of our public service efforts we have full-time experts serving as: Educational program director; religious program consultant; public affairs director; farm director; news and special events director.

The educational director coordinates, produces, and sometimes participates in daily programming which is presented in coordination with colleges and county boards of education from all major communities of our area. The religious director coordinates Sunday worship services, semiweekly religious advice programs, and devotional activities and special events. The farm director is a man who served for 40 years as county agent; known and revered throughout the area, he contributes much to the rural viewer. Public affairs director’s duties range from production of special programming in conjunction with chemical industry, to special shows for collection of blood for Red Cross. He coordinates all public service campaigns on the station and represents the station in public service groups.

In the field of news and special events, WSAZ-TV maintains a full staff of news reporters and cameramen, with an editorial supervisor under the news director. The editorial supervisor comes to us with a background as assistant professor of journalism at West Virginia University. In addition, a staff of movie photographers is supplemented by a group of a dozen or more “stringers” in towns and villages all over the West Virginia-Ohio-Kentucky area. Daily film reports are received on all manner of local news events, customs and activities.

In addition WSAZ-TV staff and executives, as well as the company, are active in every major community or area activity for civic betterment. We have been instrumental in the success of projects as diverse as a new airport in Huntington, and a new symphony association in the village of Pomeroy, Ohio.

X. EXISTENCE THREATENED

There are over 400,000 families equipped with VHF receivers within range of WSAZ-TV. Of these, not more than 10 percent are equipped for UHF reception at present; indeed, not more than 20 percent are within range of a UHF signal even if they were so equipped. Thus a change of channel to UHF now would mean an immediate total loss of service to some 300,000 homes—representing an investment in TV installations by the public of our area of over a $100 million. The permanent loss of service that could result in such a change in channel would be felt by as many as a quarter of a million homes, representing a public investment in sets, antennas, and service of as much as 75 million. This estimate is based upon the coverage differential in our terrain of the channel 3 signal on 60 megacycles as against an ultra-high-frequency signal perhaps 10 times as high. The UHF signal simply will not penetrate the rugged hills, and thus must depend upon the more compact centers of population. But our area population is scattered over many thousands of square miles of hills and hollows through eastern Kentucky, southern West Virginia, and the Virginia panhandle. It does not seem feasible to deprive these Americans altogether of this TV service.

Because of the terrain difficulties scores of mountain communities have built their own multifamily antenna systems at great effort and cost. This method of picking up the WSAZ-TV signal provides these people’s only contact with the outside world—a whole new world that has been opened to them by this electronic miracle. The effort and expense in some of these home installations is prodigious. I have visited the home of one mine foreman in Logan County, whose antenna lead, like hundreds of his neighbors, runs 4,000 feet up the almost sheer face of a mountain. This man’s television means so much to him that he spent an entire summer of leisure hours and weekends hacking a path up the mountain for this lead wire—and in the process killed 27 rattlesnakes whose skins he proudly displayed on the backyard fence. This man, and dozens of thousands like him, would lose his investments, the fruits of his travail and his entire contact with modern-day America and the world if VHF television were abolished. The responsibility for such an action by this com-
mittee, or the Commission, must be accepted with the consciousness of the fate of the dollars spent by the mountain people, of our Nation who happen to live beyond presently possible UHF signal propagation.

The scope of operations of WSAZ-TV, constituting as it does a major contribution to every major civic area improvement program, is dependent wholly and absolutely upon the continuance of its regional coverage nature and the national advertising revenues derived therefrom. Every facet of our experience dictates that a change from this coverage picture would force the drastic reduction in personnel, operating hours, public service activities, and overall scope of programming. Retention of large staff of entertainment talent and above-listed public service specialists would be impossible, and the public would be the greatest loser. Any effort to improve nationwide service by destroying the efforts of the pioneer stations must necessarily depreciate rather than improve the benefit to the public.

LAWRENCE H. ROGERS,
Vice President and General Manager.

STATEMENT OF WKBH TELEVISION, INC., LA CROSSE, WIS.

PERMITTEE OF CHANNEL 8

WKBH,
La Crosse, Wis., May 29, 1954.

PIERSON & BALL,
Washington, D. C.

GENTLEMEN: We have already wired you indicating our wholehearted support of the policies advocated by your group and being presented before the Potter committee hearings.

Our proposed TV station has received a construction permit and plans to go on the air August 1, 1954. As of April 30, 1954, we had already expended over $146,000 and, in addition, had undertaken obligations pursuant to performing the construction authorized in our permit in the amount of $315,000. I may say here that it would be financially impossible for us to pay the interest on our obligations and pay other expenses currently being incurred, should any freeze be placed upon our station materially delaying the time when we could begin commercial operation. Should a material delay or freeze be imposed upon us, it could possibly be serious enough to prevent our ever getting on the air.

As of April 2, 1954, there were over 23,000 TV sets within a 57-mile radius of La Crosse, a majority of which will not receive a good signal until we get on the air. A very large majority of these sets are not equipped to receive UHF stations, since there are no such stations within this area, and consequently should the committee propose to force all stations into the UHF band practically all of these set owners would be forced to invest more money in order to be able to receive a TV station. This would involve a large investment on their part in the purchasing of different antennas, sets, or other equipment necessary to enable them to receive UHF signals. It would obviously also involve large expenditures on the part of our company, which were never anticipated.

We would like to state here that although we are definitely opposed to Government subsidy of any kind for any type of radio or TV station, that should the Potter committee give serious consideration to this matter, we would like to point out that there will also be a given number of VHF stations who would benefit from such a subsidy as well as an appreciable number of AM and FM stations. We furthermore respectfully request that the committee, if it should ever seriously consider the matter of subsidies, that it not forget that there are many good Americans engaged in various types of enterprise outside of the radio and television field who might also benefit from financial assistance by the Government. However, let us point out here again and emphasize more

1 Reserved for noncommercial educational use.
our very definite opposition to any thought of any type of subsidy for any American by the Government of the United States.

Very truly yours,

WKBH–WKBT,
Howard Dahl, Manager.

WIBA,
BADGER BROADCASTING CO.,
Madison 5, Wis., June 3, 1954.

Re VHF Committee

PIERSON & BALL,
Washington, D. C.

GENTLEMEN: In reply to the telegram of May 28 from the informal VHF group, the undersigned desires to present the position of Badger Television Co., Inc., of Madison, Wis., an applicant for VHF channel 3 in Madison.

Badger Television Co., Inc., is a consolidation of Badger Broadcasting Co.—WIBA, AM and FM—and Television of Wisconsin, Inc. There is one other competitor for the channel 3 allocation in Madison, Radio Wisconsin, Inc., WISC. A comparative hearing was conducted in Washington during the month of December 1953, and at this moment we are awaiting the examiner’s initial decision.

Badger Broadcasting Co. first applied for a television station in Madison in February 1948. This application was for channel 9, then assigned to Madison, and before a grant could be made the FCC freeze was imposed and the application lay dormant until 1952 when the Commission announced a new allocation plan. Under this new plan, Madison was assigned VHF channel 3 and UHF channels 21, 27, and 33, with channel 21 set aside for educational use. Prior to and subsequent to the sixth report and order, our competitor, Radio Wisconsin, Inc., endeavored, through numerous petitions, to change the FCC allocations, requesting the Commission to set aside channel 3 for education and set up UHF channels 21, 27, and 33 for commercial use. These petitions all were denied. During this period, Badger Broadcasting Co. filed with the Commission a lengthy statement supporting the Commission’s allocation plan insofar as it related to the channels in Madison. It was then, in 1952, and is now the opinion of this organization that channel 3 is the only channel assigned to Madison which will completely serve the Madison area, and, since Madison is the capital city of Wisconsin, also the home of the University of Wisconsin, it is essential that the rural areas of southern Wisconsin be served as well as the urban areas. It is our opinion that a VHF channel can do this job whereas several UHF channels would be necessary to accomplish the same objective. The probability of covering these outside areas through UHF is quite unlikely.

It is a little difficult to estimate how much Badger Broadcasting Co. has spent in its television efforts since 1948, but it would amount to not less than $5 million. Badger Television Co., Inc., of which Badger Broadcasting Co. is a part, has spent in excess of $65,000 to date. This amount includes legal and engineering fees, travel, and incidental expenses. In addition, the company has spent approximately $10,000 as deposits on an equipment contract. What expense is involved from this point up to a construction permit is difficult to estimate since we do not know at this time what appeals may be taken from the examiner’s decision. It is quite unlikely that such expenses would be under $10,000.

We are in agreement with the group which you represent in that there should be no further freeze at this time; also that the present allocations and inter-mixture of VHF and UHF channels be maintained.

1 Reserved for noncommercial educational use.

48550—54—59
I would suggest that if further information is needed with respect to the Madison situation you contact Mr. Thomas W. Wilson or Mr. John P. Carr at the office of Dow, Lohnes & Albertson. The information contained in this letter may be used by you or the VHF group in any presentation to the Senate committee.

Sincerely yours,

KENNETH F. SCHMITT, General Manager.

STATEMENT OF CREAM CITY BROADCASTING CO., INC.,1 MILWAUKEE, WIS.

APPLICANT FOR CHANNEL 6

Channels allocated to community: 4, 10, 12, 19, 25, 31.
Channels allocated to Whitefish Bay: 6.
VHF stations operating in community: Channel 4.
UHF stations operating in community: Channels 19, 25.
Channels applied for: Channels 6, 10, 12.
Channels contested: Channels 6, 12.
Construction permits outstanding: None.

PIERSON & BALL,
Washington 6, D. C.

GENTLEMEN: We understand that you represent the informal group consisting of Paul R. Bartlett, Hugh Halff, Jack Harris, J. Leonard Reinsch, L. H. Rogers, P. A. Sugg, H. W. Slavick, Robert D. Swezey, which has determined to participate through its representatives in the Potter hearings—the Senate subcommittee investigating UHF problems. We understand that the group that you represent opposes certain of the proposals made by the UHF group, including the elimination of internixture of VHF and UHF, the allocation of all television stations to the UHF band exclusively, the imposition of any freeze upon application proceedings or upon the issuance of operating authority covering permits already granted, and the reduction and limitation of the coverage areas of VHF stations. We also understand that your group proposes to support all reasonable and proper steps to encourage production and distribution of receiving sets and all-channel tuners and the use of boosters to improve service inside a station’s coverage area.

We are writing you this letter in order to support your views and to authorize you to disclose our support to the Senate subcommittee.

Cream City Broadcasting Co., Inc., operates standard broadcast station WMIL in Milwaukee, Wis., and previously held a construction permit for UHF channel 31 in Milwaukee. On December 4, 1953, Cream City Broadcasting Co. surrendered its construction permit for UHF channel 31 to the FCC for cancellation in order that we might be in a position to apply for VHF channel 6 which the Commission had allocated to Whitefish Bay. We are inclosing herewith a copy of our 2-page letter dated December 3, 1953, that we filed with the Federal Communications Commission on December 4, 1953, requesting the cancellation of our construction permit for UHF channel 31.

On April 7, 1954, Senator Potter wrote us a letter asking us our reasons for surrendering our construction permit on UHF channel 31, and on April 12, 1954, we replied to Senator Potter and transmitted to him a copy of our letter on December 3, 1953, addressed to the Commission. We are also inclosing herewith a copy of our letter of April 12, 1954, to Senator Potter.

We have been advised that our letter of April 12, 1954, was introduced by Senator Potter as one of the exhibits at the start of the hearings.

On December 4, 1953, at the same time that we requested the Federal Communications Commission to cancel our construction permit for UHF channel 31, we filed with the Commission our application requesting a construction permit for a television station on VHF channel 6 at Whitefish Bay, Wis., approximately 5 miles north of Milwaukee. There are two other applicants for this channel and a competitive hearing on the three applications has been ordered by the Federal Communications Commission. That hearing commenced on May 28, 1954.

1 Cream City Broadcasting Co., Inc., is the former permittee of channel 31, Milwaukee.
2 Reserved for noncommercial educational use.
We are prosecuting our application for VHF channel 6 at considerable expense and we join with your group in opposing those proposals of the UHF broadcasters which would have an adverse effect upon the whole television medium.

It is our opinion that a freeze upon further authorizations would definitely be adverse to the public interest.

Very truly yours,

Cream City Broadcasting Co., Inc.,
By Jerome Sill, Secretary-Treasurer.

Milwaukee, Wis., April 12, 1954.

Senator Charles E. Potter,
Committee on Interstate and Foreign Commerce,
United States Senate, Washington, D. C.

Dear Senator Potter: In response to your letter of April 7, I am attaching hereto a copy of the petition for dismissal of our grant on UHF channel 31, addressed to the Federal Communications Commission. This outlines, in detail, our reasons for turning back the grant.

I would like to add one further observation. You cannot, by legislation, force an advertiser to pay too much for his advertising. To attempt to do so would be a repudiation of our way of life. If an advertiser has available a VHF station covering 600,000 homes and also has available, in the same market, a UHF station covering 200,000 homes; if, as is always the case, the cost per thousand reduces as the circulation increases, that advertiser will buy the VHF station.

By the same token, a network cannot be forced—or should not be forced—to affiliate with a station that technically offers fewer potential listeners because the network, too, if it is to survive, must offer advertisers the most economical purchase available. I have seen no evidence to indicate that superpower to UHF is economically feasible or that it would make it possible for a UHF station to cover the same number of persons as a competing VHF at the same cost to the advertiser. Nor do I find good reason for expecting consumers to pay a premium for all-channel sets and special receiving antennas.

Perhaps the fault lies in the basic Federal Communications Commission philosophy of mixing VHF and UHF stations in the same market. There may be well a technical reason for this but, from the basis on which your committee is investigating the matter, therein lies the harm.

Sincerely yours,

Jerome Sill, General Manager.

Milwaukee, Wis., December 3, 1953.

WM. P. Massing,
Acting Secretary, Federal Communications Commission,
Washington, D. C.

Dear Mr. Massing: Cream City Broadcasting Co., Inc., filed its application for construction permit for a commercial television station on UHF channel No. 31 on November 13, 1952. After considerable delay, the application was granted on August 19, 1953. At the time the application was filed there was only one television station on the air in Milwaukee: WTMJ-TV on VHF channel No. 3. In the Commission's sixth report and order, WTMJ-TV was ordered to move to VHF channel No. 4, and the only other commercial television channels allotted to Milwaukee were VHF channel No. 12 and UHF channels No. 19, 25, and 31.

Immediately after the Commission granted the application of Cream City Broadcasting Co., Inc., for construction permit on UHF channel 31, we undertook to take the necessary steps looking toward the construction and operation of the station. We paid General Electric a deposit on the UHF television equipment, including the UHF transmitter. We employed Adler Communications Laboratories of New Rochelle, N. Y., to do preliminary work in connection with our UHF installation. We undertook to find additional studio space and commenced lease negotiations for such space. We interviewed several potential key personnel for our UHF station and also negotiated with a number of program sources for film programs. We met with representatives of American Telephone & Telegraph Co. and Wisconsin Telephone Co. to discuss the availability of leased lines and microwave facilities to be used for program origination. Mr. Jerome Sill, our general manager and secretary-treasurer of the company went to New York and negotiated with ABC, CBS, and Du Mont looking toward an affiliation contract for our proposed UHF station and he also discussed with several national sales representatives their availability to represent our proposed UHF station nationally.
On October 8, 1953, the Commission released its proposal to allocate VHF channel 6 to Whitefish Bay in the Milwaukee area. We consulted with our communications attorney and our consulting engineer and were advised that from an engineering and legal point of view the proposal to allocate VHF channel 6 to the Milwaukee area has changed the entire situation and has caused us to reassess the television situation in Milwaukee.

It was our purpose in filing our application originally to be in a position to render service to the greatest number of persons and we believed then that UHF would be an important factor because it appeared that there would be only two commercial VHF stations. It now appears that since there will be three commercial VHF stations that it will not be possible to carry out our original plans through the medium of UHF television.

A UHF signal can be received by only a fraction of the persons who can receive a VHF signal, because of the physical limitations of UHF propaganda and because of the economics involved in attempting to obtain superpower on UHF, even were superpower equipment now available from the equipment manufacturers. Moreover, only a percentage of the families among the 500,000 who now view WTMJ-TV on VHF channel No. 4 could receive a WMIL-TV signal on UHF channel No. 31.

Moreover, the addition of VHF channel No. 6 to the Milwaukee area will, in the opinion of WMIL-TV, slow down considerably the conversion to UHF in Milwaukee. Conversion can be accomplished at considerable costs only through the purchase of converters of all-band receivers and special antenna.

There are in excess of 350,000 radio homes within the half-millivolt contour of WMIL. We had hoped to serve through the medium of television as many of these persons as possible with TV. It is apparent that it is not possible to do this on UHF channel 31 but it is feasible and possible to do so with a VHF channel. For these reasons, Cream City Broadcasting Co., Inc. has decided to file an application for VHF channel 6 and requests that the Commission cancel its outstanding construction permit for UHF Channel 31.

Very truly yours,

CREAM CITY BROADCASTING CO., INC.,
By Gene Posner, President.

STATEMENT OF MIDCONTINENT BROADCASTING CO., STATION KELO-TV, SIOUX FALLS, S. DAK.

OPERATOR OF CHANNEL 11

Channels allocated to community: 11, 13, 38, 44.1
VHF stations operating in community: Channel 11.
UHF stations operating in community: None.
Channels applied for: None.
Channels contested: None.
Construction permits outstanding: None.

STATEMENT OF KELO-TV, SIOUX FALLS, S. DAK., JUNE 2, 1954

In regard to our operation in Sioux Falls, S. Dak., telecasting date set at May 19, 1953, our main problem was to get proper circulation to maintain a substantial rate from the networks that would allow telecasting to be done on a break-even basis in this area. We started out originally with 4,500 sets in a radius of 60 miles. We know at the time of our telecasting that our entire strength would lay in our surrounding area much more than in our immediate city. This is because we are a rural community and we are thinly populated in the city in comparison to other markets. We actually have in this area a city population of 50,000 and a population of approximately 300,000 within the area of 67 1/2 miles. This made it necessary for us to put all our operating investment into signal strength, transmitterwise, tower height, and so forth. This was so important that we were unable to afford live cameras for this market when we originally started.

Our entire area at the time of telecasting had about 4,500 sets out of a potential of 100,000 homes. We now find that we have, after a year of broadcasting, 67,000 sets in the area of which 8,000 of these sets are in the city of Sioux Falls,

1 Reserved for noncommercial educational use.
12,000 sets are in the county of Minnehaha which is the home county, which means there is a total of 55,000 sets in our rural area which would be impossible to reach 50 percent of these with a UHF signal. We have a town of Mitchell, S. Dak., that is getting a fair signal from us now and it is 70 miles west and they are requesting us to increase our power so they can get proper service. We have a town we are servicing on the north which is Watertown, 80 miles distant, with approximately 1,200 sets in the town which is requesting more power so they can install more sets. These are fringe installations. On my desk here I have a signed affidavit by more than 250 people from the town of Estelline, S. Dak., which is approximately 80 miles from Sioux Falls, requesting that we increase our power so they will have better service in the area.

It is my personal opinion that a UHF installation in the rural communities such as ours would be practically useless as far as proper set coverage is concerned and it is highly impractical because of the amount of area that is required for a station to cover to make it economically possible to have set circulation to operate on. Our original rate starting in this station was $150. We received an increase to $200 after 6 months of operation on the air and from our experience of operation we were losing money at the rate of $150, however, with careful economy we have found that combining our radio operation and television at a $200 rate, gives us an opportunity to practically break even. If we are unable to cover a large area where we could get set saturation that would bring our rate up, we could not operate and we would have to discontinue television operations in this particular Sioux Falls region.

We do not feel this market is large enough for two stations because it has only been within the last month we have been able to operate on a break-even basis. With two stations in the market, this would be actually prohibitive. However, may I reiterate, our only chance of survival is the fact that we can have a VHF signal that will take us out approximately 60 to 70 miles with fair reception so that we can get set coverage that is required to maintain a very basis but still a low rate.

Mr. Pierson. That concludes the witnesses of the VHF group.

Senator Schoeppe. Thank you very much, Mr. Pierson, and this does expedite the matter materially, and when it becomes a matter of record, then we will have the entire picture before us.

We have about 15 minutes here before we go down to the next operation downstairs. I note that Mr. Woodall from Columbus, Ga., is the next witness. I would like to take your testimony before we recess. You may proceed as you wish.

**STATEMENT OF ALLEN M. WOODALL, PRESIDENT OF WDAK-TV, COLUMBUS, GA.**

Mr. Woodall. My name is Allen M. Woodall, and I am from Columbus, Ga. I am executive vice president of WRDW-TV, a VHF station in Augusta, Ga. I am president of WDAK-TV, a UHF station in Columbus, Ga. These two Georgia cities are 250 miles apart, just in case the thought of duopoly might arise.

I have the same financial interest in a UHF station as I do in a VHF station and I think I can speak impartially. I have to stay down the middle of the road since I am working both sides of the street.

It is generally understood that a trip to Washington is educational. This one is no exception as far as I am concerned, for I really had no idea how bad the UHF situation was in certain markets until I attended these hearings.

WDAK-TV is a successful UHF station. We have been in the black since we went on the air last October. There are two television stations in Columbus, Ga.—WDAK-TV on channel 28, and WRBL-TV on channel 4. Our VHF competition came on the air 6 weeks after our first program.
We went into UHF with our eyes wide open. Not a single soul pushed us in. The Federal Communications Commission gave us no verbal, written or implied promises that we could make money. In fact, we didn't even discuss it with them. We took the UHF channel because our radio competitors were both applying for channel 4. We thought they would be tied up for years, but they fooled us; they merged.

When this happened, we were surprised but not too unhappy. We had known all the time that eventually one of them would be our competitor; it ended up with both. In the merger, a family which owns both daily newspapers in Columbus owns 51 percent and control of the VHF station. This was not altogether unfavorable for us for there are many people unsympathetic to concentration of control of advertising media. If we had it to do all over again, we would take the same course.

We have had very few local problems. There were not very many television sets in the Columbus market because reception from Atlanta, 90 air miles distant, was poor. The old sets were quickly converted and practically every new set purchased was equipped to receive channel 28. In January 1954, 3 months after we had been on the air, American Research Bureau reported 87.6 percent conversion. This was confirmed 2 weeks later by Pulse. There have been no further surveys in Columbus, but we honestly believe that 95 percent of the television receivers in the Columbus area can receive WDAK-TV, our UHF station.

Senator Schoepfel. I think that is splendid. That shows what can be done. The distributors, as well as the manufacturers down there must be cooperating and at least must have given the public buying sets a utility value because of your local situation.

Mr. Woodall. That is right.

Senator Schoepfel. That demonstrates what can be done.

Mr. Woodall. I would like to state that the gentleman from Salt Lake City made reference to unsightly external tuners. These tuners may be very unsightly out in Salt Lake City, but they are terribly pretty in Columbus, Ga.

As you might imagine, Columbus people were quite excited with the advent of television. We did not have too much trouble signing up a considerable number of advertising contracts. In our favor, we already had the confidence, respect, and friendship of local advertisers through our many years of association in radio.

Our AM radio station carries more local business than any other Columbus station and at times we have been favored with more business than all the other stations combined.

We held our advertising contracts despite the fact that our competitive VHF station undercut our UHF rates by 25 percent. I guess Columbus is the only market in the country where it costs more to buy advertising on a UHF station than on a VHF station.

This is justified by our program structure plus conscientious service to our advertisers. We honestly try to see that every firm who spends a dollar with us gets more than a dollar in return. The Pulse survey of January showed that we had the largest listening audience from 7:30 to 10 p. m.—Mondays through Fridays. We acquired these listeners through network programs, live local shows, plus good,
syndicated programs. In Columbus, Ga., there is no UHF or VHF—it's just television—either channel 28 or channel 4.

And I hope you note that I put channel 28 first, Mr. Chairman.

We have no complaint with the networks. We have affiliation contracts with NBC, ABC, and Du Mont. Since the VHF station also operates a radio station affiliated with CBS, they are likewise CBS-TV affiliates, too. The VHF station carries no NBC or Du Mont programs.

They do carry one ABC program for which we could not clear. The program was offered to us by ABC but since we could not clear for it, we can certainly understand that they should then offer it to the other station.

But, if my UHF friends are under the impression that a network affiliation is an open sesame to programing, some of these days they'll have a rude awakening. The average network order is for 50-odd stations.

Lever Bros. is using only 72 stations on Lux Video Theater. Since Columbus is the 101st market in the United States, you can see that we don't get network orders automatically.

Every single one is a selling job. We couldn't expect NBC, ABC, or Du Mont to spend a lot of time selling WDAK-TV in Columbus, Ga. Their sales departments are busy selling network programs, not individual markets. All in all, they have given us a lot of cooperation. The VHF station certainly has the same problem as evidenced by the fact that they have less network programs than WDAK-TV.

We have lost no business to superpower claims. If WSB-TV in Atlanta covers 5 States, it's all right with us, but they certainly don't cover Columbus which is Georgia's second largest market with a metropolitan population of 170,000 people.

In the January Telepulse, the largest percentage of the Columbus audience for any program on WSB-TV was less than 6 percent. On one of the top NBC programs, Colgate Comedy Hour, WSB-TV came up in Columbus with a nice, big, fat, juicy goose egg. This figure helped us to get the Colgate order.

On network programing, our problem has been to sell our 101st market when the network advertiser is using only 50 to 75 stations. I will say, however, that the attitude of a few network advertisers toward UHF is depressing as well as unfair.

For instance, Firestone has a set policy to use no UHF stations. This deprives people in a UHF market of good programs. Getting back to Firestone, you can understand that we were pleased when NBC made their decision to place a different program in the Firestone time.

Senator Schoeppel. Do you have any idea why they did that? Of course, I suppose we can find out from Firestone. They surely do not have any objection to the television viewers on UHF.

Mr. Woodall. Why Firestone does that?

Senator Schoeppel. Yes.

Mr. Woodall. No, sir, I cannot tell you, Mr. Chairman. All I know is that that was the reply we got from Firestone. We made every effort we could to get the program from recommendations of the local Firestone dealers, and from a recommendation of the district office in Atlanta. That was the reply, and I have a letter in my file.
Senator Schoepeppel. The reason I mentioned that, and it was not facetiously, was because I have received some letters as a member of this subcommittee, as well as the full committee, drawing my attention to the fact that Firestone was pushed off one network, and was having difficulty finding another spot. It drew my attention to the fact that here was something that ought to be looked into.

Mr. Woodall. I have nothing to say about them being pushed, except to say that I am glad they were pushed off, since they would not give me their program.

Senator Schoepeppel. Their public-relations man will probably be looking you up.

Mr. Woodall. Our No. 1 and worst problem is Madison Avenue, and when I say that, Mr. Chairman, I use the term typifying the people on Madison Avenue who buy time.

There are too many time buyers who are under the impression that there are no good UHF stations. When a person goes before a jury, he is presumed to be innocent until he is proved guilty.

In UHF, you are automatically guilty until you prove yourself innocent. It is a hard job to cover all the agencies and all the time buyers, but we are making every possible effort toward this end and we believe in time that we will justify our position. We know that if the average time buyer would take a good, careful look, he would find a lot of pretty sorry VHF operations, too.

From all this, you can assume that we are not too unhappy with UHF. And despite everything you have heard, we are not the only exception. There are many other successful UHF operators.

Two UHF stations are doing well in Columbia, S. C., against a VHF competitor. The UHF station in Jackson, Miss., needs no help either. Montgomery, Ala.; St. Petersburg, Fla.; Wilkes-Barre, Harrisburg, and Scranton, Pa.; Milwaukee, Wis., and Peoria, Ill., are other stations in this category of which I have knowledge.

There must be many others. Regardless of which this committee recommends and what the Commission does or does not do, we intend to stay in business and be successful in Columbus, Ga. The late Gen. Nathan Bedford Forrest gave us our television slogan, "Fastest with the mostest." We intend to continue to get there fastest with the mostest.

On the other hand, Mr. Chairman, some of our UHF brothers haven't been so fortunate and we would like to see them get some help. Of course, if any sunshine is being scattered, we won't dodge out of the way. I read the testimony from the last hearing and I have listened all this week.

In my considered judgment, many of the plans proposed to you are utterly impractical—in fact, most of them. I know that this committee is sympathetic and reasonable. I have no doubt but that the Commission would be happy to render any possible assistance to the UHF industry if it is possible.

At this point I would like to say that the Commission has been criticized on the allocation. I ended up with a UHF station, but I can certainly say, Mr. Chairman, that the Federal Communications Commission had an awfully difficult job with allocations, and I don't know if I or anyone else could have done any better.

I am sure I could have done better as far as Columbus, Ga., is concerned, but not on the overall picture.
Four suggestions have been made to the committee which sound reasonable.

1. The elimination of the excise tax on all-channel television receivers.

2. Harold Fellows asked you to explore the possibility of providing good, all-channel receivers, and nothing except good, all-channel receivers. A directive from this committee or the Commission to the manufacturers might do the job.

3. Elimination of intermixture in specific markets would certainly give the UHF station equal opportunity with his competitor. If such a thing happened in Columbus, Ga., our first thought would be of the thousands of people who have bought all-channel sets or converters. It would not be fair for them to have gone to this expense and then have UHF service eliminated. This might well be taken care of in this manner: The UHF station could be turned over to the school systems for educational television.

4. We would like very much to see the Commission allow the networks and people like George Storer and Westinghouse to operate 2 additional UHF stations along with their 5 VHF outlets. Unquestionably, this would add a lot of stature to UHF television.

Thank you very much for the privilege of appearing before you.

Senator SCHOEPPEL. Thank you very much, Mr. Woodall, for your very splendid statement.

Mr. WOODALL. Thank you, Mr. Chairman.

Senator SCHOEPPEL. Those of you who are here ready to testify, might I say that we will recess this hearing until 2 o'clock today in this room, when we will continue.

I think the first witness will be Mr. Ernest L. Jahncke, Jr., of the American Broadcasting Co.

(Whereupon, at 12:03 p.m., a recess was taken until 2 p.m., the same day.)

AFTERNOON SESSION

(The hearing reconvened at 2 p.m., Senator Potter (chairman of the subcommittee, presiding.)

Senator Potter. The subcommittee will come to order.

First, I would like to incorporate telegrams from the following into the record at this point:

STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

(The telegrams referred to are as follows:)

Senator CHARLES E. POTTER,
Senate Building:

UHF needs help. The FCC created the situation as it exists today, and unless something is done, television will become a monopoly—the private property of two networks. There is room and a need for four networks.

JAMES M. DOLAN,
Piandome, Long Island, N. Y.

Senator CHARLES E. POTTER,
Senate Building, Washington, D. C.:

Economic disaster to UHF will materially affect the competitive television industry. This condition is directly result of defective planning which would appear designed to eliminate rather than promote competitive operation. Urgent you now investigate this situation.

TOM McMAHON, Tenafly, N. J.

Senator CHARLES POTTER,
Senate Office Building, Washington, D. C.:

Re UHF hearings Subcommittee on Communications. Hope you dig to bottom of monopoly situation which threatens to destroy competitive network television by perpetuating monopoly position of two networks. This monopoly situation is direct result of FCC sixth report and order. Fast action is needed.

RICHARD HUBBELL, New York, N. Y.

Senator CHARLES E. POTTER,
Senate Building:

As an editor in the television industry I strongly protest the monopoly of two networks on the facilities of this new medium. Urge investigation to insure fair competition.

JOAN BLOWER, New York City.

Senator CHARLES E. POTTER,
Senate Building:

Stop, look, and listen. Break up the two-network monopoly. The UHF station has a right to survive. Only guaranteed programs from “four-network delivery” can accomplish this.

DOROTHY BORDER,
Queens Village, Long Island.

Senator CHARLES E. POTTER,
Senate Building, Washington, D. C.:

Since the airwaves belong to all the people why not give them a chance to see what they want on television? Break the two-network monopoly and give the UHF stations a break.

LOUIS ROSSILO,
Brooklyn, N. Y.
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

Senator Charles E. Potter,
Senate Building, Washington, D. C.:

In connection with the current Potter committee hearings on television respectfully submit my opinion for your consideration. While the problem is one that is complex and complicated from the technical point of view I believe that the only solution that could be in the best public interest culturally and economically is one that would encourage four networks and both UHF and VHF stations to exist in a truly fair traditional American competitive manner.

James P. O'Brien,
Woodside, N. Y.

Senator Charles E. Potter,
Senate Building, Washington, D. C.:

Believe it imperative your subcommittee now hearing testimony on UHF television problem initiate necessary action to stop present monopolistic trend and insure programming from two major networks be provided to UHF television stations. This is critical situation and action is vital to development of truly nationwide free-enterprise system of television broadcasting.

Gladys Lombardi,
Ozone Park, N. Y.

Senator Charles E. Potter,
Senate Building, Washington, D. C.:

I urge that United States Senate take intelligent action to correct the ultra-high frequency station problem which is currently restricting free and equal competition in television broadcasting.

Merriman Holtz,
Brooklyn, N. Y.

Senator Charles E. Potter,
Senate Building, Washington, D. C.:

As a veteran of the television industry I strongly recommend the immediate passage of legislation that will stop the two-network monopoly that exists today. It certainly is not the American way of life to stand by and watch UHF stations emerge bankrupt as a result of not receiving a proportionate share of programs. Four networks can and should exist, but will they, Mr. Senator? That's up to you.

Carmine Frank Patti,
Brooklyn, N. Y.

Chairman E. Potter,
United States Senate Committee on Communications,
Washington, D. C.

Request aid from your committee to restore four networks in active competition in accordance with our free-enterprise system of government. This end may best be served by your aiding UHF.

Ed Lieberthal.

Chairman E. Potter,
United States Senate Committee on Communications,
Washington, D. C.:

Kindly consider assistance for UHF stations. Without aid for UHF, a monopolistic situation will prevail and service to the public will suffer.

A. L. Hollander.
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

Senator CHARLES E. POTTER,
Senate Building, Washington, D. C.:

As a student of commercial and industry, I feel it is my duty to urge an investigation into monopolies in television. Solution I believe could be found in the equitable allocation of VHF and UHF channels to the now available four network system.

ROBERT FISH JONES,
Montclair, N. J.

Senator CHARLES E. POTTER,
Senate Building, Washington, D. C.:

Strongly urge adoption of Dr. Du Mont's plan for resolving inequity in channel allocation in top 100 markets in the United States. Public interest not served under present setup. A healthy competition between all networks can only be obtained by permitting equal opportunity for four television networks in the major markets of the country.

ROY SHARP,
Clifton, N. J.

Senator CHARLES E. POTTER,
Senate Building, Washington, D. C.:

Violently protest discriminatory practices in TV industry. Strongly urge that intelligent action be taken immediately rather when it's too late.

J. REGINALD COX.

Senator CHARLES E. POTTER,
Senate Building, Washington, D. C.:

Senate committee now completing hearings on problems of UHF stations. If we are to have nationwide competitive television service it is imperative that UHF television stations receive aid from committee in their efforts to secure programing from the two major networks. Urge you give full support to this.

ROBERT L. COE.

Senator CHARLES E. POTTER,
Senate Building, Washington, D. C.:

Protesting what appears to be a monopoly in television channel allocation. Urge investigation for possible solution.

JOAN DONOVAN.

Senator CHARLES E. POTTER,
Senate Building, Washington, D. C.:

Break up the two-network monopoly. Give the UHF stations a break. Enact immediate legislation in that direction.

ETHEL VETTER.

Hon. CHARLES E. POTTER,
Chairman, Senate Subcommittee on Communications,
United States Senate, Washington, D. C.

My dear Senator: As a veteran agency man and TV producer respectfully suggest that 4 competing networks essential to the American free-enterprise system and that national economy can support 4 networks with 4 stations in major markets. Unless UHF stations receive prompt assistance television will
Becoming a monopoly in the hands of NBC and CBS. The FCC will have created such a monopoly through the sixth report and order. TV has demonstrated conclusively its ability to raise our standard of living, but this will cease if this medium is sold out to monopolistic interests. As a responsible citizen I urge you not to deny full access to the spectrum to the American people who own it. Please vote for a plan which restores fair competition to us broadcasters, large and small, who work by permission and tolerance of 165 million Americans.

Werner Michel.

Senator Charles E. Potter,
Senate Building, Washington, D. C.:

I urge that the proposals made regarding the monopoly of two networks be carried out by the FCC. The duopoly of these networks will certainly strangle all competitors. Each station is entitled to their share of network programming. Whether UHF or VHF. I suggest immediate Senate action to relieve current situation.

Charles B. Hilton,
Do-re-mi Farm, Danbury, Conn.

Senator Charles E. Potter,
Senate Building, Washington, D. C.:

May I urge that you and your Senate Subcommittee on Communications find some way to strengthen ultra-high frequency television, to the end that you may prevent a monopoly from developing in the medium which, in turn, would create a monopoly in the distribution of goods and services and be extremely harmful to our economy.

Such a monopoly could very easily result from the present trend in telecasting, which, as you know, sees 2 networks getting stronger and 2 networks getting weaker. If only 2 networks were to survive, they would be dominated by 15 to 20 national advertisers, thus barring this potent medium to their competitors as well as all regional enterprisers. Such a situation would force these competitors and regional firms to utilize less effective media and thus put them at a great disadvantage. Moreover, a monopoly in television would put a great medium of public service and information in the hands of a few men, with results that you can gauge from your experience during the recent Army hearings. As you are aware, the two dominant networks did not cover the sessions at all on a live basis, but instead used filmed versions at hours too late to serve a mass audience.

Gerald Lyons.
Monopoly will result unless you do something drastic and quickly regarding ultra-high-frequency stations, both network and local. Immediate action on your part is essential for the free-enterprise system to keep these competitive networks alive which our national economy can support. A minimum of four TV outlets of similar frequency in all the major markets should be established just as quickly as possible. As my representative, I urge you to move in this direction.

Harry Potter.

Senator Potter. I would also like to incorporate in the record a statement submitted by Mr. Larry H. Israel, vice president of WENS, Pittsburgh.

(The statement referred to is as follows:)

**Supplemental Statement of Larry H. Israel, Vice President and General Manager of Television Station WENS, Pittsburgh, Pa.**

My name is Larry H. Israel. I am vice president and general manager of Telecasting, Inc., permittee of UHF television station WENS, channel 16, Pittsburgh, Pa. In my original statement in this hearing I outlined both a short-range and a long-range plan of actions which should be taken in order to prevent the demise of UHF television and thus preserve the possibility of a nationwide competitive television service. In this supplemental statement I would like very briefly to call attention to the serious competitive disadvantages under which UHF television stations are now laboring.

In Pittsburgh proper WENS competes with WDTV, a VHF station which has been on the air since before the television freeze. The competition of WDTV alone has been a formidable obstacle to the success of WENS, particularly since during the years when WDTV was Pittsburgh's only station, the area became heavily saturated with VHF-only sets. Recently, however, it has become apparent that WENS is faced with the competition not only of WDTV but of other VHF stations located outside of Pittsburgh. The substantial coverage advantages which VHF stations have by reason of their lower frequencies and more powerful equipment coupled with the increase in power which the Commission has been granting VHF stations have made it possible for VHF stations in Steubenville, Ohio, Johnstown, Pa., and Wheeling, W. Va., to claim coverage of Pittsburgh. Their coverage claims are sufficiently convincing that WENS has lost a number of network programs to out-of-town stations.

Attached hereto is a copy of an advertisement by WSTV-TV, Steubenville, Ohio, which appeared in the May 31, 1954, issue of Broadcasting Telecasting. It will be noted that the advertisement contains a picture of Pittsburgh's Golden Triangle and that the entire advertisement is devoted to the coverage which WSTV-TV claims in Pittsburgh and other distant cities rather than its coverage of Steubenville which is the community WSTV-TV is licensed to serve. Similar advertisements have appeared on behalf of VHF stations in Johnstown and Wheeling. None of these stations contributes anything in the way of public service to the city of Pittsburgh. Their contribution is rather to extract advertising dollars from Pittsburgh to the detriment of the Pittsburgh stations. This they are able to do because of the tremendous advantage which they enjoy by reason of the excessive antenna height and power which the Commission has authorized—heights and powers far beyond what is necessary to permit them to serve the markets in which they are located.

If UHF stations are compelled to compete not only with the VHF stations in their own markets but with every VHF station within a radius of 50 miles they cannot long survive. Because of the difficulties associated with UHF transmission and reception many advertisers and a large section of the public appear to prefer distant VHF coverage and service to local UHF coverage and service. This means that if something is not soon done to redress the competitive balance between UHF and VHF the UHF stations will be driven off the air. The Commission's VHF allocation policies, particularly the excessive heights and powers which have been granted VHF stations are a threat not only to the UHF but to local television service of any kind in the smaller cities.

The attached copy of an advertisement which appeared in the May 31, 1954, issue of Broadcasting Telecasting shows the severe disadvantage which UHF sta-
tions are under even as against distant VHF stations. The advertisement shows that a Dayton, Ohio, VHF station commands the lion’s share of the Lima, Ohio, market even though Lima is almost 70 miles from Dayton and has its own UHF station. Finally, I should like to refer to a telegram which WENS received on March 13, 1954, which indicates the attitude which many advertising agencies and advertisers have toward UHF television. That telegram read as follows:

We understand your station was VHF. We have just learned you are a UHF facility. Therefore, due to misunderstanding will not start Tafon wrestling schedule. Please accept this as formal notice. We will not honor or accept any billing.

FRANK J. MILLER, President, Frank J. Miller, Advertising, Inc.

Senator Potter. I would also like to place in the record a speech that was made by Honorable Edwin C. Johnson on Television’s New Dimension.

(Senator Johnson’s speech is as follows:)

TELEVISION’S NEW DIMENSION

(Address of Hon. Edwin C. Johnson, of Colorado)

President Malarkey, ladies, and gentleman, when I was invited to speak to this Third Annual Convention of the National Community Television Association, I was quick to accept. In fact I was almost immodest about my eagerness.

Without community antenna service that large and important segment of our population living in the outer precincts and away from the larger centers of population would wait a long time for satisfactory television in their own homes. I am from the country and proud of it. The large city is not for me. I think in terms of the small towns and small communities of this great country of ours. In my book they represent the very heart and soul of America and what is good for them is good for this Nation.

The work in Washington has been so heavy this session that this is my first appearance away from the Potomac. But I could not resist the very great challenge to speak to the pioneers of this New Look in television—this new industry within an industry. Not that what I say will be important but rather that this gives me the opportunity officially to pay tribute to the importance to the Nation of community television service. I have a weakness for pioneering. In the usual sense of that term I have the honor of being pioneer in the most rugged part of the undeveloped West.

This is the electronic age, just as surely as past eras were the stone age, the bronze age, and the iron age. Centuries from now mankind will record this era as the turning point in history, perhaps the most important turning point for earth dwellers. For electronics is opening to us the secrets of nature, of earth, of space, of our own solar system and of far distant solar systems. Without electronics the secret of the atom would still be an enigma. Electronics is the key that mankind has dreamed about for centuries; it is the philosophers’ stone, the alchemists’ catalyst, the miracle which discloses and explains other miracles.

To most of us, television is the most remarkable, and certainly the most widely appreciated of the handmaidens of electronics. No one in his right mind will believe for 1 split second that television is not humanity’s greatest single blessing. In my judgment, it will have a far greater impact on the way we live than any other invention or development of modern times. It has restored the home to its rightful place as the center of family entertainment and pleasure. Any institution that makes the American home more than a place to eat and sleep is precious to national welfare and life generally.

Russian claims to the contrary notwithstanding, television is as strictly an American invention as the hotdog. If it weren’t, we might not have made some of the mistakes in the way we went about developing it commercially.

Torn between an understandable desire to put no roadblocks in the way of its technical development, and at the same time anxious to insure a nationwide competitive system, the regulating agency made the insane decision to mix UHF and VHF as a child might attempt to mix oil and water and the FCC still stubbornly maintains that its original decision is correct. It’s easy for the least of us to be Monday-morning quarterbacks but mistakes are still being made.

The Commission put together a mixed system. It entered 2 horses in the race; 1 a thoroughbred with breeding lines which showed it could run a long race
superbly well; the other electronically fit, but hobbled by the big boys with monopoly in their hearts. Already the eggs have been scrambled and the omelette is on the way to being fried. It would take a wizard to put the eggs back into the shell and start over now. Once you start down Niagara Falls you do not retrace your steps. So the Commission clings to the hope that by some miracle the Jockey on the second horse will push him into running a dead heat.

What were the facts? First, the 12 remaining VHF channels could not provide a nationwide competitive television system. Second, the then known engineering facts about UHF indicated a clear technical advantage for the VHF station operators. Third, notwithstanding, the most optimistic beliefs of the RCA people who were the experts and knew the most about UHF, it was thought unlikely UHF could ever provide the range coverage of VHF, and that it would be many years before all receiving sets would receive both kinds of signals. Fourth, the then existing and subsequent VHF stations would become, in effect, a kind of clear-channel television station with all of the advantages and prerogatives that clear-channel radio stations enjoyed. That was the clincher. Fifth, it was thought that through the use of satellite and repeater stations in UHF the whole country could be blanketed with TV. No one thinks that now. But community television service has found a practical way to expand and extend television service without satellites and without UHF. So now we are to have what really amounts to a monopolistic clear-channel operation in television.

Both UHF and VHF television in their original aspects were primarily large city systems. Their stupendous costs of installation and operation confined them to the densely populated areas. No community of 25,000 or less could make them pay. They could thrive only on national and big-city advertising. They were not for the village and the small city. Unlike radio, their beams are limited to short distances. Hills and rolling topography are not suitable for television radiation. Satellite stations in UHF positively are not the answer.

But the scientists and electronic technicians came to the rescue and found a way to provide the whole Nation with television service. When there was an insistent demand for color television, the electronic wizards gave us color. The burning desire for television in the smaller communities challenged their ingenuity, and they suggested a practical way to extend and expand television into the far corners of our beloved country.

Now that we know how to do it, it is up to industry to accomplish the huge task of actually bringing television of excellent and even superior quality to the farms and country towns and smaller cities. Companies and corporations must be organized, finances raised, equipment manufactured, legal and political problems resolved, and associations such as we see here, created.

But every dynamic human endeavor has problems. Community television is no exception. Some of these problems seem pretty tough and roadblocks are beginning to appear. Ours is a selfish world and the chiseler and the fellow who cuts corners and does not respect the rights and the best interests of his neighbors is ever present. Ninety-nine people do not need a policeman, but the last man in the hundred needs to be supervised and regulated and regimented, or he will run roughshod over everyone.

But I recite this bit of broadcast television history for another reason. I think there may be a lesson in it for community antenna television today.

The general merit in community antenna television service is that it enables the public to receive television signals in areas where (for technical reasons or where the laws of economics make normal television broadcasting infeasible) satisfactory signals are not received from the nearest television station.

Always there will be communities, or even parts of communities, which do not now receive, and will never receive, a satisfactory television signal, either from the television station station right in that community or from a station in a neighboring community. And it is becoming increasingly clear that advertiser revenues alone can never meet the upkeep for broadcast television stations in thousands of other communities.

That should make it clear why the freeze gave impetus to the building of community antenna television service. It also explains why there is a boom market today for community television and why it may see its biggest growth in the years ahead.

Unless by some magic, satellite stations can be operated with greater satisfaction, areas with no TV service and those which cannot support a station will be potential market for community antenna television service.

A recently published survey of TV households showed that as of January 1 of this year 84 percent of all the television homes in the country were located in
340 leading markets. Thus, while 57 percent of the 47,500,000 households in the country had TV sets, 84 percent of these were clustered in 340 markets. Moreover, only 215 of these markets had 1 or more television stations, and the 356 stations operating in these 215 cities serviced the total 340 markets.

What this means to me is that the big national advertisers on television already are reaching more than 84 percent of television homes with 356 stations. How much more, in terms of additional station cost, is the remaining 15 percent of television homes worth to these national advertisers? Since the largest markets are already covered, how soon does additional station coverage reach the point of diminishing returns for national advertisers? And does this signify that the newer stations going on the air in smaller and smaller markets will have to rely exclusively on local advertising? And does this mean that the community antenna system is the only method whereby the public can be given television service.

But local programs always will be popular and there will be pressures to find a way for local communities to have their own television stations. Undoubtedly some communities can be served with boosters or satellites. There is even the possibility that the costs of television station construction and operation will be lowered so materially that economic operation may become possible from local advertising revenues in medium-sized communities. It is possible, however, that there is as strong a probability that the community antenna service may some day operate a special-occasion local studio program in connection with its piped-in programs and thereby satisfy the pressing demand for entertainment by local talent. I shall be surprised if this is not done. When that day is here, it can be said truthfully that you have outgrown your swaddling clothes. And yet, even now, you are not exactly an infant industry. With more than 300 separate systems serving some 275,000 households, you are reaching the volume of service where you no longer can be ignored.

Television licensees and would-be licensees, the Federal Communications Commission, the State regulatory agencies, the Senators and Congressmen, are beginning to raise their eyebrows. Yours is a risk business. It takes venture capital to go into the community antenna television business. There have been losses: some systems have failed, and many others are scratching along, hoping for better days. Nevertheless, those systems which picked the right spots, free from the inroads of direct station competition, and have set about to increase their subscribers, are continuing to pay handsome dividends; and, what is more important, they are serving the public interest well and faithfully.

Community antenna service is premised upon picking up the signals of operating television stations and relaying the signals to subscribers through closed circuits. So, one of the burning questions today is: What rights have you to those signals? Perhaps a better way to put it is: What are the proprietary rights of the originating station or the network in the programs you deliver to your subscribers?

To put it simply, your function and role is to strengthen the signals of the originating station for distant areas where otherwise the reception would not be satisfactory. A station's programs are free, waiting for, and available to anyone with a receiver to tune in on them and view them. In fact, stations are anxious that more and more people buy receivers and tune in their programs. They use the number of listeners they serve to attract advertising. If one of your subscribers desired, he could rig up an antenna or install a cable and bring the signals to his home with the enthusiastic blessing of the originating station. But since it is less expensive for him to join his neighbors in such an undertaking,
you have constituted yourself a sort of modified utility as an agent for the neighborhood to install the required equipment for a fee, and to deliver the service to each of them for another fee. That saves everyone time, bother, and money. Your function is one of providing a technical service which results merely in an extension and expansion of the coverage of the station and thus is helpful to the station and at the same time serves the public interest.

Your service is neither a broadcast nor a common carrier operation and, therefore, should not be subject to regulation by the Commission, or by a State utility agency in the case of a solely intrastate operation. Certainly you are not engaged in radio broadcasting nor in interstate communications for hire, but are simply furnishing a purely local antenna service. And you are no more a common carrier than is a hotel with one master antenna, which serves its 100 rooms.

However, in at least two States, such an intrastate operation has been held to fall within the regulatory scope of the State utility commission. Another arm of government, the Internal Revenue Division, assesses the same excise tax on your operations that it imposes on the communication common carriers under the theory that you are a common carrier. While neither of these actions automatically makes you a common carrier, you should take them seriously.

The Internal Revenue Division is now restudying their previous decision to impose a common carrier excise tax on you. I think their original decision was in error and that your association should make every effort to reverse it. Not only because the tax is onerous but for the more important reason that the community antenna service is not a common carrier regulation and you should not permit any decision to rest on such a premise.

Nevertheless, if your operation actually or theoretically injures any one, heavy pressures will be exerted to bring you within the scope of the Federal regulatory agency. It seems to me that prudence would command your consideration of that possibility.

Since I am not a lawyer, I prefer not to pass judgment on the question of proprietary rights. It seems likely that one of these days it will be the subject of judicial interpretation. I understand that such a test case may be in the making now, and I am sure that its outcome is going to be watched with interest by all. I merely want to observe that your business would suffer a body blow if it should be held by the courts that the proprietary right to programs permits the broadcaster to control the means by which the public receives those programs, should the broadcaster choose to assert an equity in them.

Recently in the so-called Belnap case, in which a memorandum and order was released on May 6, 1954, the Commission, with cautious evasiveness, stated:

"It should be understood that, in making this determination, the Commission is not making any express or implied decision as to the existence or extent of any jurisdiction it may have with respect to the installation and operation of any community TV distribution systems."

Belnap was not to be the operator of the community antenna distribution systems but merely to act as a sort of a little A. T. & T. carrier of signals. The issuance of a permit to install a "microwave system to furnish common-carrier service to a community antenna system might very well, and probably does, give the Commission regulatory authority over a purely intrastate or interstate community antenna television system. " So far as I know, no community antenna service itself is a microwave owner or operator, but purchases its common-carrier service from others. In the Casper, Wyo., operation and one other the telephone company, a regulated utility, furnishes the antenna company and, accordingly, both would be subject to FCC regulation, in my opinion.

There is still a third question which involves the regulatory concept. It was brought to the fore at the recent hearings before the Senate Communications Committee studying the problems of UHF broadcasters. I am sure you all are familiar with it. It concerns a situation in West Virginia, where the Fairmont UHF station now faces competition from Wheeling, Pittsburgh, and Johnstown stations, because the Fairmont community antenna television system pipes the program of those three stations into Fairmont. There is an example of the Commission's allocation plan being set to naught, resulting in an unregulated media giving a struggling station unexpected but deadly competition. If this Fairmont UHF station "bites the dust" as we say in the West, there will be no doubt about who killed Cock Robin.

In my judgment this is a serious matter, and one which should give you grave concern. I am a firm believer in local enterprise in everything, including radio and television. If it were economically feasible, the ideal would be a locally
owned and locally operated radio and television station in every community of any size in this country. That can never be, and Community Antenna Service need not encroach on other stations.

Community Television Service is only asking for trouble when it attempts to serve an area already being served by its own station. Nonnetwork stations cannot withstand network competition from distant stations.

The FCC cannot sit idly by and permit one of its licensed stations to be driven off the air because distant stations have expanded their coverage into its territory. When the Fairmont station was licensed and built there was no intimation that it would have to compete with the Wheeling, Pittsburgh, and Johnstown stations. As a consequence, in good faith the station operator invested hundreds of thousands of dollars to get his station on the air so that he might bring the miracle of television to the people of Fairmont.

The philosophy back of regulation of public utilities is that since competition can destroy, it must be limited, and that a franchise or license must rest on protected territory.

There is, of course, another side on the coin. Those of us who believe in the free American competitive system find it hard to argue against competition, no matter how onerous it may be. The viewing public will have a more varied program and be better served if someone pipes in network programs from afar. The Commission now has under way a rulemaking procedure concerned generally with spurious radiation. Some of your system, due to careless and improper installation, emit radiations which interfere with the reception of those who are not subscribers to the community-antenna systems. In my judgment, your industry cannot afford this type of shoddy operation. You must in your own interest and in the interest of your relations with television broadcasters and the public who own receiver sets, so engineer your systems as to repress completely spurious radiations. Anything less is a clarion call to the policeman, which in this case is the FCC, to regulate you. Also, you must watch carefully your installation costs and rates. I do not mean to suggest that installation costs ranging from $75 to $150 are exorbitant, or that monthly service charges from $2.75 to $7.50 are unfair. It is understandable that in a business where investors have reason to fear a limited life, initial rates and charges are made high enough to recoup their capital expenditures as quickly as possible. But continued high monthly service charges are the rock on which community-antenna systems may founder. Your business is too delicate an operation to earn the opposition of a public which might demand price regulation for its own protection.

Higher than necessary rates will compel cooperative associations to enter this field and render a nonprofit service. Farm cooperatives have brought electric energy to 90 percent of the farm homes of this country. Rural telephone cooperatives are serving millions of farm families because the telephone companies neglected them. They will do precisely the same thing with television.

One of the outstanding developments of your business is your friendly and cooperative relations with the television broadcast industry. So far as I know, only one station license has sought to deny the pickup of his programs. This cordial relationship is understandable when it is realized that you provide the station with an additional audience and market not ordinarily reached by his signal. Most licensees with whom I have talked feel that community antenna television systems constitute a very desirable adjunct to their business.

In my own State of Colorado construction of the Climax system was thrilling and heartwarming. Prime mover in this project was Robert VerSteeg, electrical foreman for the Climax Molybdenum Co. Climax lies more than 11,000 feet above sea level, hemmed in by the tallest peaks in the continental United States. VerSteeg’s effort to bring television to the 2,000 residents in Climax involved the construction of an antenna on Mount McNamee, a 13,000-foot peak, the laying of 12,000 feet of coaxial cable from the mountain to the town, and an additional 60,000 feet of cable running out to service the homes. Today, using the tallest community antenna in the world, the people of Climax enjoy identically the same four television programs afforded the metropolitan city of Denver. This is a true example of the benefits flowing from a community antenna system.

The Casper, Wyo., project should be singled out for special attention. It employs the longest microwave relay yet built for any system. Casper is over 200 miles distant from Denver by highway. The fact that the operator has obligated himself to pay the telephone company more than $50,000 in annual tolls, backing it up with a 5-year performance bond, demonstrates investment courage of a high order. Indeed it indicates good faith in the future.
of the community television business. And I, too, am genuinely enthusiastic about the community antenna television business. To me, the significant aspect is the splendid record of bringing diversified television program service to locked-in communities whose residents would otherwise be denied the magic of television.

When this business resolves the legal problems which inevitably face it, and as it continues to build up its operations so that even the smallest of its systems performs an A-1 job technically, and as it continues to render good and dependable service to the public at low rates, its future development will sweep even its most optimistic boosters off their feet.

The potential market for your services can only be described by the superword "vast." You can profitably in communities with as few as 5,000 people. In this country there are more than 2,000 such cities and towns. It is doubtful that half or even three-fourths of these communities will ever have television stations of their own, or receive satisfactory service from nearby cities. Here, there is a vast market of millions of people who will demand the blessings of good television entertainment in their own homes, once they learn that there is no technical reason against it.

If legal decisions involving proprietary rights in programs go against you, and circumstances force intolerable burdens upon you, there is an escape avenue for the community antenna television service. It involves doing your own programing and becoming a pay-as-you-see television service. The recent experiments by the Telemeter promoters in Palm Springs, Calif., while designed to test out audience reaction to paying for specific movie programs, may have some valuable lessons for closed-circuit operations such as yours. The problem of piping a special program into homes once, twice, or even several times a week, offers neither technical difficulties nor legal problems, since no governmental regulatory question is involved in intrastate closed-circuit operations. For example, you may be able to work out arrangements with local motion-pictures exhibitors for the showing of special features, with both you and the theater exhibitor sharing the proceeds. In smaller communities, where the movie house already is suffering from drops in attendance, you may be able to open a new home market for him. It is, of course, no simple matter, but it does have tremendous possibilities, both for you and the motion-picture industry.

This has been an interesting and fruitful experience for me. It has restored my confidence in the future to meet you pioneers in this new offshoot development of television, which in the years ahead is certain to carve a special and unique niche of its own in the fields of homemaking and electronics. And now, may I say in closing what I tried to say in the beginning—any institution that effectively restores the American home and dedicates it to family use as the center of all of its activities has earned the highest tribute of God and man.

Senator Potter. The first witness this afternoon is Mr. Jahncke.

Mr. Jahncke, we are pleased to have you here, and I am sorry we got behind a little bit and kept you waiting.

STATEMENT OF ERNEST LEE JAHNCKE, JR., VICE PRESIDENT AND ASSISTANT TO THE PRESIDENT OF THE AMERICAN BROADCASTING CO.

Mr. Jahncke. Thank you, sir.

My name is Ernest Lee Jahncke, Jr. I am vice president and assistant to the president of American Broadcasting Co. My duties at ABC include supervision of the personnel engaged in station relations and I am familiar with the status and development of the ABC television network and its 196 affiliated stations, 66 of which operate on UHF channels.

ABC welcomes the opportunity to join with you, Senator, and other interested persons in a discussion of the present and future of television broadcasting. The future of television, we believe, will be vitally affected by the recommendation and actions taken by your committee.
The emphasis in this hearing has been on the UHF channels and the difficulties being experienced by many UHF operators. Although the UHF problem is the most critical in the television industry today, it is but a part of the larger problem of making available the widest possible choice of television service to the largest possible number of American citizens or, as so often has been stated in this hearing, of assuring the development of a truly national totally competitive television service.

You have heard the UHF problem described as being a vicious circle of not enough listeners, not enough all-channel receivers, not enough programs, not enough advertisers, not enough listeners, and so forth, and you have also heard that unless certain actions are taken this circle will not be broken and UHF will be destined for the same fate as FM. ABC concurs in this conclusion, and I can state to you our conviction that unless prompt remedial action is forthcoming UHF in most intermixed markets is closer to that fate than is generally realized even by informed persons in the industry.

UHF AND THE PROBLEM OF COMPETITIVE NETWORK SERVICE

The UHF problem is the principal facet of the problem facing ABC as the growing third network and it is also the principal facet of the problem facing the fourth network and whatever new networks may come along in the future.

The statistical information already supplied by the FCC and Du Mont shows conclusively in our opinion that, while two networks can exist and prosper without UHF, the third, fourth, and other potential networks will have great difficulty in becoming fully competitive unless we have UHF or unless means are found to expand the number of VHF stations.

Senator, I would like to say I appreciate the many kind things that have been said about ABC by previous witnesses, and I think, lest I give you the wrong impression, I would like to refer to the comment of Mr. Storer in pointing out the great strides that ABC has been making.

What we are talking about here is the ultimate development to a full national parity and status.

We are doing all right. We are not about to go out of business. We just signed up $8 million worth of new business this past week.

In testimony heretofore given in this proceeding, a number of reasons have been assigned in explanation of the critical position of UHF broadcasters in intermixed markets and correspondingly many suggestions have been made as to remedies which will solve this situation.

Later on in this statement I will comment on the suggested solutions that have been offered and I will make certain recommendations which ABC believes are practicable, desirable, and necessary. Before turning to those matters, however, I would like to discuss the problem of competitive network service, which is also the problem of UHF television.

The position of dominance enjoyed by the two major television networks finds its origin in network radio broadcasting.

The problem of encouraging competition in radio network broadcasting has occupied the time and the attention of the Federal Communications Commission for many years, and, in fact, it led to the
establishment of ABC radio in 1943 as an independent, competitive network.

What are now the ABC radio and television networks originated on January 1, 1927, when NBC created the Blue Network in order to provide listeners with another choice of radio fare from that offered by its Red Network.

In 1941 the FCC in its Report on Chain Broadcasting found that it was not in the public interest for 1 company to own 2 networks. Pursuant to this report, and in its decision and order approving the sale of the Blue Network to ABC, the Commission stated that this transfer would “mean a much fuller measure of competition between the networks.” (10 F. C. C. 212, 213 (1943).)

In this same report, the Commission also pointed out that the many improvements which have taken place in program quality, in engineering, and in the broadcasting of special events of national and regional interest have been due, in a considerable measure, to the advertising revenues brought to the radio broadcasting industry by the national network method of broadcasting.

The Commission concluded that radio network broadcasting “plays an essential part in the development of the broadcast industry,” that “the network method of program distribution is an integral and necessary part of radio.” (Report on Chain Broadcasting, supra, pp. 4, 88.)

In television, networks are even more important since individual stations would be unable to supply the high-quality program service provided by the network organizations. The commercial revenue received by the stations from network programing in turn enables them to supply locally originated services which in many instances they could not otherwise afford.

Network service alone has enabled nationwide audiences to see such special events as the Kefauver hearings, the coronation, sports programs, the forum programs participated in by Members of Congress, political leaders, Government officials, and business executives.

Without ABC, it would not have been possible to bring to the country the recent hearings involving Senator McCarthy and the Army, for the first two networks chose not to broadcast these hearings.

If I may, Senator, I would like to read an editorial which appeared in this morning’s New York Times. It is entitled “The Hearings on TV”:

With the close of the Senate subcommittee hearings on the Army-McCarthy dispute, congratulations are very much in order for the American Broadcasting Co. and the Du Mont Television Network. These two video networks faithfully covered on a live basis the prolonged sessions and enabled the individual to have the best possible seat at an event of vital national importance.

In suspending their normal operations for so many weeks, there can be no doubt that the financial sacrifice of the networks was substantial; but ABC and Du Mont can take pride in a public service well done and one that has added immeasurably to television’s stature as a constructive educational force.

I think that says better than anything else I can say why at least 3 network program services are essential to perform television’s true potential and mission in serving the public of this country, Senator.

Senator Potter. I can well appreciate the fact that both ABC and Du Mont made quite a financial sacrifice to bring the hearings to the people in the television audience, and I wish to commend you for doing so.
Since it was a long hearing, I don't know whether it is a type of public service that even your networks could afford to do again or would want to do again; but I am sure the people received a much better knowledge of what was transpiring than they would otherwise.

Mr. JAHNCKE. Thank you, Senator.

This television service encompassed 184 hours of broadcasting, and I think it might be of interest regarding the future possibility of our being able to perform a comparable service to introduce, if I may, as part of the record an article by Jack Gould in the New York Times which appeared in the Sunday, June 13th issue, which I won't read.

Senator POTTER. Without objection, that will be placed in the official files of the committee.

Mr. JAHNCKE. Perhaps an even better illustration of the need for more than 2 networks is that afforded by the recent decision of NBC to discontinue the Voice of Firestone program because that program of fine music does not have the mass appeal that NBC expected to obtain from the program it selected to replace it. The Voice of Firestone, which is in its 26th year in radio and 6th year in television, had now moved to the ABC television and radio networks. If there had been only 2 networks, the program would either have been discontinued entirely or moved to a time when it would not have been able to reach as wide an audience.

Senator, I would like to comment on the remarks of Mr. Woodall who testified this morning, in which he indicated Firestone had no interest in UHF stations.

The Firestone program on ABC is ordered for 70 of our stations. Of these 70, 46 are VHF stations and 24 are UHF stations. Thus, the percentage of UHF stations is about 34 percent; and, if you will recall, we have 196 affiliates, of which 66 are UHF. That percentage is just a little less, about 33 1/2, something like that.

So, you can see the Firestone program is using a slightly higher percentage of UHF stations than the percentage of the two types of stations that are affiliated with ABC.

I think the main point here is the problem of television's growth.

The Firestone Co. ordered 70 stations on ABC. We have 196 affiliates. Obviously, there were a great many UHF and VHF stations that did not receive that order; and unless there be discouragement about how to program those other stations that didn't get this order, we feel there is going to be a gradual increase in the lineup.

There were those who only in the last year said television would never reach beyond the top 60 markets of the country. It has already gone well beyond that, and we are convinced that the economic base will be there to support a network that goes into the small markets.

We have consistently affiliated small stations, whereas that has not necessarily been the policy of the other networks.

Perhaps it is our affiliation with these smaller markets that has highlighted ABC network's service in this hearings, because obviously there are more problems the smaller market during this developmental stage of television.

Senator POTTER. Is there a reluctance on the part of advertisers to purchase time in a UHF market?

Mr. JAHNCKE. Advertisers differ. I think there is definitely a psychological block on the UHF situation today.
I know, personally, from calling on national advertisers who have
told me they will just not buy a UHF station—"What VHF stations
have you got to order?"
I know of other, I think, more reasonable advertisers who approach
the problem with a more logical basis. They are buying circulation;
and if they can buy it on UHF at a reasonable cost and it suits their
needs, they will buy it.

The problem of UHF is not only the psychological block, but also
the fact there is a limit to the budgets of all advertisers.

Senator Potter. Is there a difference in the rate structures to the
UHF as compared with the VHF?
Mr. Jahncke. All stations have different rates, both UHF and
VHF, depending on the—
Senator Potter. Circulation?
Mr. Jahncke. Circulation.
Senator Potter. Is that their only criteria, the circulation?
Mr. Jahncke. Let's use Pittsburgh as an example, Senator. The
VHF station has a rate of $1,400 an hour; the UHF station has a rate
of $500 an hour. The circulation of the VHF station is in the order of
600,000, perhaps as much as 700,000, sets; the UHF conversions
in Pittsburgh are around perhaps 250,000 to 260,000. So, you relate that
down to how much it costs to reach a set. Perhaps they are equal buys.

There are some advertisers who want the whole market, and it is not
a question of the relative buy, which is a problem for the UHF sta-
tion until conversion proceeds to the extent it apparently has in
Columbus, Ga.

As television continues to grow, we will find more and more in-
stances of outstanding programs being forced from the choice time
in NBC and CBS. The consequences of such a result if we do not
have other networks are self-evident.

In the 11 years in which ABC has operated as an independent radio
network, it has made substantial progress. While it has not been able
to provide the full measure of competition to CBS and NBC that was
hoped for, its growth has been worthwhile. However praiseworthy,
ABC would be first to admit that it has not been able in radio, pri-
marily because of the dominant position of CBS and NBC and their
ownership of and affiliation with the key clear-channel stations, to
provide the amount of competition which the Commission hoped
would flow from the establishment of ABC as an independent com-
petitive network.

It is this dominance of NBC and CBS in radio which is already
represented in television and which ABC fears will continue to exist
in this new medium unless corrective steps are taken.

The disparity in the competitive situation of the four networks is
well illustrated by a comparative tabulation of their published gross
billings in millions of dollars for the 5-year period 1949 to 1953,
inclusive.

Certainly you can see when 2 networks have 85 percent of the bill you have some less than a full 4-network service.

Admittedly the $21 million credited to ABC in 1953 will look better in 1954 because of new advertisers which are coming to us because of new programing and the fact we do have more and more stations all the time available.

Senator Potter. Would this be a good time to buy stock in ABC?

Mr. Jahncke. I would suggest, Senator, you consult your investment counsel on that, although we are closing the gap rapidly particularly for the fall of 1954, since our merger last year with United Paramount Theaters. We are handicapped by the artificial limitation of comparable station clearances which restricts our ability to compete and is beyond our power to remove.

ABC recognized after the publication of the allocation plan adopted by the Federal Communications Commission in its sixth report and order that the objective of developing a truly competitive national television network system could only be accomplished through the use of UHF stations. We have, therefore, given UHF operators every possible support short of arbitrary action which would alienate our advertisers.

We can't tell our advertisers they have got to buy a UHF station if they don't want to.

An analysis of the third week of January 1954, based on Nielsen research, showed that on the average ABC commercial list of network stations 33 1/3 percent were UHF as compared with 27 percent for Du Mont, 20 percent for CBS and 19.3 percent for NBC.

ABC published in October 1953 a brochure entitled "The P's and Q's of V's and U's." In this book we attempted to clear up misunderstandings and provide basic information to assist the growth and appreciation and promotion of UHF.

I would like to submit a copy of that brochure for the record.

Senator Potter. Without objection, that will be made a part of the official files of the committee.

Mr. Jahncke. Despite our consistent support of UHF, some broadcasters have felt that ABC should have made even greater efforts on their behalf, even at the risk of seriously damaging the entire network.

Some of the suggested solutions to the UHF problem advanced at these hearings have been directed toward the relationship between networks and their affiliates and I believe that an explanation of that relationship as it exists between ABC and its affiliates would be helpful in understanding the problem.

It has been traditional in both radio and television to consider the network-affiliate relationship in the three basic areas of program costs, sales costs, and distribution costs. Each station pays a proportionate share of these three basic costs. This share is usually paid in terms of free hours, under an arrangement whereby the station, in return for the network programing and other benefits, agrees to carry a certain number of network commercial programs each month without compensation. The network keeps the compensation derived from the sale of these hours to defray in part its cost of maintaining the network. The network and the station divide the revenue derived from the sale of broadcast time in excess of the free hours.
In the case of the ABC television network our standard interconnected contract specifies compensation to stations of 30 percent of gross for all network programs carried in excess of 22 hours per month, or 5 a week. The 30 percent of gross is a much larger percentage of the net revenue, of course, since the network absorbs all the discounts, annual rebates, agency commissions and other costs involved in the program.

Since compensation is expressed in terms of a percentage of rate, the stations in the more important markets with wider circulation and higher rates receive more compensation for their time.

The free hours have a value only if used, but the network has fixed costs whether or not the free hours on various stations are utilized for commercial business. Therefore, wherever there is reasonable doubt of our ability initially to obtain sufficient business to use all the free hours, we have adopted a sliding-scale arrangement under which a dollar value is placed on each of the free hours, and in the event we are unable to use the free hours the station agrees to reimburse us at the agreed-upon value.

I might add, Senator, this reasonable business principle applies in our contracts to VHF stations just the same as it does to UHF stations. It is our analysis of the market, not a question of which type of station it is, and it is also obvious that if we didn't anticipate, over a period of growth, going well beyond a mere 22 hours a month, there wouldn't be much point in the affiliation in the first place.

Another normal provision of the affiliation agreement is that the affiliated station is given first call on all programs scheduled to be broadcast in its community. In many of our UHF affiliation contracts, this first-call provision has been eliminated because of the necessity, in those markets where our advertisers so demand and where we are able to secure clearance, of being able to place our programs on VHF stations which, in the present state of television development, have much greater circulation.

Because of these serious differences in circulation, we could not survive if we tried to force advertisers to buy UHF and make them forgo up to as much as 90 percent of their circulation in order to promote UHF. Therefore, wherever this problem exists, we have left the choice of the station—V or U—up to the advertiser. Any other course would have driven advertisers from out network and destroyed the every economic and programing support needed by both UHF and VHF affiliates throughout the country.

In this connection, it is not completely black or white. We have 31 UHF affiliates that we do give first call to, and 35 that we do not give first call to because of this problem.

Senator Potter. Is that right in your contract?

Senator Jahncke. Yes, sir.

There are no “must” buys on ABC. The advertiser is free to choose the stations he wishes, whether to go into a market or stay out, whether to buy V or U.

It must also be pointed out that ABC’s ability to serve not only the UHF broadcaster but also the VHF broadcaster has been severely limited because of the very high cost of A. T. & T. television program transmission facilities.

ABC’s current expenditures are running at the rate of $6 million a year and by fall of 1954 will be running at the rate of almost $8 million a year.
While the A. T. & T. charges to NBC and CBS are higher in total, they are much lower for those two networks in proportion to their network billings, their number of program hours, and their program expenditures. The amount ABC spends for this type of distribution alone now runs in excess of our programing costs.

Senator Potter. There is a difference in the rate to NBC and CBS. Is that discrimination or is it due to a graduated—

Mr. Jahncke. We all operate under the same tariff, Senator. It is the difference in its application to the small and large users, which I will describe.

Statements have been made in this hearing about the cost of an ABC-TV affiliation. This cost barely covers the additional cost of interconnection without any proper contribution to programing and other network services, and obviously it doesn't include such tremendous costs that all networks have in supplying what you might call trunkline facilities, such as our transcontinental cable that cannot be assigned against any one station.

The cost of feeding one 15-minute program to the west coast on a live basis is about $2,000.

This is an actual program that we have on the air at the moment.

In fact, in some cases these costs are so high that we have not been able to interconnect some stations and must serve such markets by kinescope on a noninterconnected basis.

One of the most important factors delaying the rapid growth of the ABC network has been this disadvantageous position in making inter-connected service available to its affiliates. We believe that the A. T. & T. tariffs favor the larger consumers at the expense of the small customers. As the following will show, ABC is being penalized because of these tariffs.

All live television programs are distributed throughout the country for all networks by A. T. & T. This FCC regulated monopoly provides these distribution services under tariffs approved by the FCC. The services, briefly, are as follows: At the originating point a local loop is provided between the broadcast studio and the telephone company building. At the telephone company building there is a connection which hooks up the program to the long lines. The long lines then carry the program to the telephone company building in the distant city, where a receiving connection is provided and again a local loop is used from the telephone company building to the studios of the local television station.

These services require two sets of facilities:

One to transmit the television picture, which is done by either coaxial cable or microwave relay, equally expensive, I might add; the other to transmit the audio portion of the television program, on the same type of line as is used for radio broadcasting.

Senator Potter. Did ABC challenge the tariffs when they were submitted to the FCC?

Mr. Jahncke. No; we did not. We have learned since, sir.

Senator Potter. You would do it if they did it again?

Mr. Jahncke. Yes, sir.

We can't challenge A. T. & T's cost, sir. I don't think we are in a position to know what the costs are. It is the operation of the tariffs I am referring to, not the basic cost. I have no way of knowing whether A. T. & T. charges the right amount, too much or too little.
These services can be purchased in 1 of 2 ways—on an occasional-use basis or by contract service.

The use of occasional service is the leasing of lines on a per program basis for each use.

The contract service is on a monthly basis which provides for 8 consecutive hours of use per day throughout the month at a flat charge.

The occasional-use charge is $1 per mile per hour or fraction thereof for video, plus 15 cents per mile per hour or fraction thereof for audio, or a total charge of $1.15.

The monthly 8-hour per day contract service is $35 per mile per month for video and $6 per mile per month for audio, or a total charge of $41 per mile.

In addition to these long-line charges there are charges for local loops and connections as follows:

- Receiving connection video—$500 per month;
- Receiving connection audio—$75 per month;
- Video and audio receiving loops priced according to the distance from the telephone company building.

The average cost of these local receiving facilities for each television station is approximately $1,200 per month.

Without dwelling on it, Senator, I think you will understand why Mr. Woodyard, with WIFE, Dayton, was really being subsidized by ABC, because we were only charging him a thousand dollars a month, and he mentioned he was paying an exorbitant price for ABC programs. He wasn't paying enough to get the local telephone company's switchboard, much less the other costs involved in supplying the service, however limited we supplied him.

The heart of this problem is illustrated by the growing network that needs more service than that provided under the occasional-use rate formula and has not yet grown to the point where it can make efficient utilization of the full 8-hour per day contract service.

It is readily apparent how prohibitively expensive this occasional-use service is for the small user when it is realized that the cost of a full 8-hour per day service for an entire month is only 41 times more expensive than the cost of a single 15-minute program. In other words, you can buy 960 15-minute periods for only 41 times the price of a single 15-minute period. The difficulty is that you have to pay on one basis or the other—there is no middle ground.

ABC television network has used, under normal circumstance throughout the past telecasting season, an average of 4 hours per day on a full month order basis in the feed of live programming. We have thus been charged for an average of 4 unused hours of video circuits and 12 unused hours of audio circuits per day.

That 12 hours, Senator, is based on the fact that the audio line, the radio line, that tariff is based on a 16-hour day rather than an 8-hour day.

These 4 hours fall within the consecutive time bracket of our contract cable. In addition, we have purchased an additional hour per day for morning programing on an overtime additional cost basis. In contrast, NBC and CBS are using well over the minimum 8-hour contract time and, therefore, have a much more efficient purchase.

If ABC did not have to pay for this unused cable time, which it is not currently in a position to use, its cost could be reduced sufficiently
to give improved and enlarged service to both its UHF and VHF affiliates.

While, in many cases, the problems experienced by UHF broadcasters have been beyond their control, it must also be recognized that in other cases they are only the normal problems of any business and are not attributable solely to the fact that the broadcaster operates in the UHF rather than the VHF portion of the spectrum.

These general business problems include commencing operations with insufficient capital, insufficient knowledge of the television business, poor engineering installations and disregard of market potential. It is submitted that the solution to such problems is not the responsibility of the Government.

Surely, it would be against every fundamental tenet of our present economic system for the Government to guarantee success to a given class of businessmen regardless of the manner in which the business operated by them was conducted or whether they had planned wisely in going into an overserved market.

At the same time it must be recognized that the problems of many UHF operators are completely beyond their individual power to correct regardless of their competence. It is in this area that both industry and Government action are both proper and necessary, and it is to proposed solutions which have been made to these problems that I now turn.

PROPOSED SOLUTIONS

There are before you various regulatory, economic and engineering proposals to solve the UHF problem. In general, they may be grouped in six categories.

(a) Changes in the multiple-ownership rules to encourage ownership of UHF stations by multiple-VHF owners;
(b) New network regulations to force networks to affiliate more UHF stations;
(c) Tax and Government subsidy assistance for UHF;
(d) Engineering and equipment improvements;
(e) A freeze on new stations; and
(f) Revised allocation plans.

ABC has the following comments on the various proposals:

A. CHANGES IN THE MULTIPLE OWNERSHIP RULES

(1) The FCC proposal. ABC supports the FCC's proposal to amend its rules to increase the maximum permissible ownership of television stations from 5 to 7, of which not more than 5 may be in the VHF band.

On January 31, 1952, ABC originally made this suggestion to the Commission. Twenty-three months later, on December 23, 1953, the Commission proposed an amendment to its rules to adopt ABC's suggestion. On February 1, 1954, ABC filed a statement with the Commission in favor of the proposed amendment. In that statement urged earliest possible finalization of the proposal, pointing out that "any increased impetus to UHF given at this time will snowball and produce an effect far greater than could be achieved by any encouragement at a later date."
ABC suggests no arbitrary rule or limitation on the size of market in which multiple owners may acquire UHF stations, but obviously ownership of UHF stations in the largest intermixed markets of the country that have fewer than four VHF stations would contribute most to the promotion of UHF.

(2) The sliding-scale proposal of Senator Johnson, S. 3095.

In essence, this proposal would permit the ownership of up to a total of 10 UHF stations, on a 2-for-1 ratio, such as 4 V’s and 2 U’s, 3 V’s and 4 U’s, and so forth.

ABC believes that the FCC proposal is a better approach, since Senator Johnson’s bill would require persons who have 5 VHF stations to relinquish 1 of such stations for each 2 UHF licenses to be acquired. We doubt that this would provide incentive to acquire UHF ownership.

(3) Partial-ownership proposal of Mr. Garrison of KACY, Festus, Mo.

This proposal suggests that multiple V owners be permitted to own up to 50 percent of 5 additional U stations.

This variation of the FCC plan has the advantage of bringing strong ownership into a total of 5 UHF stations rather than a total of 2, and deserves careful consideration, since it is designed to combine the advantages of network partnership and programing with local identity.

(4) Du Mont plan C. This is a plan which would authorize network ownership of 1 additional station for every 7 UHF stations affiliated by the network in the top 100 markets of the country. This proposal is described by Dr. Du Mont as permissive, since it could be put into operation by the FCC under its present granted powers simply by amending its multiple-ownership rules, and without requiring the detailed Government supervision and regulation necessary under Du Mont’s other plans.

ABC prefers the FCC’s proposal, however, since it believes that artificial limitations on the freedom of stations and networks to affiliate with each other are not the correct approach to this problem.

We concur completely with the viewpoint of Dr. Du Mont that networks are entitled to special consideration in the application of the multiple-ownership rules, for it is the networks that provide program service and need revenues from station ownership to support their program expenditures.

To illustrate, ABC has over the past 6 years million of dollars in the operation and programing of its television network; in contrast, other multiple owners that are not network organizations have profited greatly from the programs provided them by the networks. However, the purpose of the proposed amendment to the multiple-ownership rules is to aid UHF and we believe that it should be broad enough to attract all multiple owners to enter UHF.

B. CHANGES IN THE NETWORK RULES

(1) Senator Bricker’s bill, S. 3456. This bill would grant to the FCC direct authority to regulate networks. At the present time, networks are regulated indirectly by the FCC through control of the types of contracts and arrangements which stations may enter into
with networks. The FCC's authority over station network relationships has been sustained by the Supreme Court.

ABC considers the Bricker bill unnecessary legislation, for it believes that the FCC already has sufficient authority to do what is necessary and desirable to aid UHF. It also believes that the solution to the problem of a competitive nationwide television service lies not in increased regulation but in making changes in the allocation plan so that the natural workings of our free-enterprise system may operate with the present artificial restrictions of unequal access to the market place removed.

Senator Potter. Do you believe that a station operator should be able to buy programing from any company it wants to, any network?

Mr. Jahncke. Senator, in effect, a station does do that through an affiliation with that network.

Senator Potter. Let's take Pittsburgh, for example. There are three V's there; is that correct?

Mr. Jahncke. In Pittsburgh at the present time there is 1 V and 2 UHF stations in operation. There are allocated to Pittsburgh or nearby suburbs two additional V's. So, if ultimately things proceed as they probably look, it will be a 3-VHF market and a 3-UHF market.

Senator Potter. Three and three?

Mr. Jahncke. Three and three.

Senator Potter. Now, we will assume that the other two V's go in. One will have an affiliation with NBC, 1 with CBS, and 1 with ABC, and then I assume 1 of the U's would have it with Du Mont. You have two other U's in that area if all the stations go on the air. Do you think that those stations should be able to buy programs from any of the networks?

Mr. Jahncke. No; I don't.

Senator Potter. Would you explain your reasons for your answer?

Mr. Jahncke. Well, Senator, our problem is just the reverse. We spend all of our time trying to persuade stations to take our program. Our whole activity is just the reverse. The last thing we could conceive of is trying to restrict the distribution of our programs. We want them to have the widest possible distribution. That is what our advertisers want.

This is our business—getting them around the country to as many stations as possible.

The whole problem at the moment is that we don't have access. We can't get programs, such as United States Steel, or any one of them, in some of the markets today because of the lack of facilities.

It is just the reverse. It is not the question that we are depriving any station of service. It is the question primarily that there are not enough stations to carry our service and, therefore, in many parts of the country ABC's fine television service is not available to the public.

Senator Potter. We have had a certain amount of testimony here that some of the stations that have had an affiliation with one of the networks that—take a U station—when a V would come into the market they would lose their affiliation and go to the V.

Now, I am just bringing this up as a matter of discussion. There has been discussion that possibly networks should be the same as the Associated Press, for example, so that anybody who wants to purchase the service can purchase it.
Mr. JAHNCKE. Well, Senator, as I understand it, the Associated Press service is available to more than one purchaser or user in any given community.

Senator POTTER. That is what I am talking about.

Mr. JAHNCKE. I don't think it would be in the public interest, in view of the scarcity of channels available, to permit the duplication of programs in any market and thereby eliminate the choice of programs that would otherwise be available to the public served by those stations.

The most popular programs would be bought by every station in time. You destroy the whole concept of a choice of programs.

However, it goes, I think, much deeper than that. Our whole operation is based on advertiser support. Now, when we go out to sell an advertiser, we sell an advertiser the time of day he wants, depending on what audience he wants to reach. He buys circulation. He is interested in what program on our schedule he follows, and he is interested in what program on our schedule he receives, and he is interested in what programs on other stations he competes with at the time of the broadcast. He is also interested, if you will, in the efficiency of the circulation of each individual station that comprises his lineup.

Now, if he wants to buy the ABC network—and I will use United States Steel as an example—and he wants, because his home office is in Pittsburgh, the widest possible circulation in Pittsburgh, he buys the VHF station, WDTV.

It just seems to me it is not logical to deprive him of that opportunity because a UHF station in Pittsburgh would bid higher or would be able to buy for the same price.

Actually, stations don't buy our service. We pay them to carry the programs. The advertiser pays it, and we in turn divide that revenue with the stations.

So, it is not a question of the stations having to buy service from networks. They get them not only without charge; they get paid for broadcasting them.

That is the whole concept of the network affiliate relationship in both radio and television.

Senator POTTER. It is you testimony, then, it wouldn't be in the public interest to—

Mr. JAHNCKE. No, sir. I think it would reduce our industry to a state of great chaotic confusion.

I will say this, Senator: There is the area in which a program is not being broadcast in a market for various reasons. I would certainly like to see that worked out, but again I don't think that should be worked out by mandate or rule.

There are a lot of practical problems involved here; but if you have a program, like Firestone, which I cited, which is broadcast on 70 stations—those are the number of markets that Firestone has purchased from us. Naturally, any extension of the station list to permit more stations than those 70 to carry Firestone would be desirable; but, as a practical matter, Firestone decides how many stations carry their program, because it is their money that is supporting that program.

Senator POTTER. Say you have an affiliation with one of the stations in Detroit—take your Firestone program—and they don't want to run that program; they want to run a local program, or whatever it might be. Can you go out and place that program with another station in Detroit?
Mr. Jahnecke. Yes, sir.
I will admit Detroit is a bad example. We own our station there. They usually carry our programs, but that is correct. When our regular affiliate does not or cannot carry our program, it is not a question of allowing any other station to carry it. We are usually the first ones to go out and try to persuade someone else to carry it.

As example of that: Our station is a UHF station, WENS, in Pittsburgh. They were unable to clear the Firestone program because they are carrying the CBS Arthur Godfrey program, and, therefore, we placed the Firestone program on the Du Mont station, WTV, to show you how many network programs you cut across in one-half hour there in Pittsburgh.

Senator Potter. It seems to me I recall testimony that if a station had a prime contract for one of the networks, even if they didn’t use that program, that other stations in that market area were precluded from getting it.

Mr. Jahnecke. Senator, I can’t speak for the other networks, but our obligation to a station under our first-call contract we feel is completely satisfied once we have offered the station that program. If they turn it down, they have no further right or hold on that program, and we feel completely free to put it on any other station we can find in that market, and we do it as a matter of everyday policy.

Senator Potter. You don’t know the policy of any other network?

Mr. Jahnecke. No, sir.

Senator Potter. Suppose I am an advertiser and I wanted a certain type of program. Let’s say I wanted a certain news commentator. Could I get him or do I have to order just a news commentator?

I want one specific person.

Mr. Jahnecke. No, sir. I will speak for ABC, sir. We have our own news commentators, such as John Daly, whom we offer for sponsorship to advertisers. On the other hand, if an advertiser wants to buy time and make arrangements—either have us make the arrangements or he makes the arrangements directly—for some other news commentator that is not a regular ABC commentator, that is equally permissible, providing, of course, we feel he qualifies as a commentator.

You just can’t put on anybody. We feel a responsibility to make sure it is a reliable and reputable commentator; but it can either be brought in by the advertiser on ABC or an ABC commentator, such as John Daly, and it is perfectly obvious we try to sell our own first.

Senator Potter. What network has Henry J. Taylor?

Mr. Jahnecke. ABC, sir.

Senator Potter. I heard a rumor that a sponsor of a program wanted to secure Taylor, Henry J. Taylor, and was told they could sponsor a news commentator, but they couldn’t specify the person they were to receive. Now, is that from the advertising end of it, the advertising agency, or is that the network?

Mr. Jahnecke. No, sir; I think that is the agency.

Henry J. Taylor has been identified with the General Motors Corp. for a long period of time. Henry J. Taylor is employed by General Motors, not by ABC, and I assume—it is reasonable to assume—that General Motors does not want Henry J. Taylor’s identity with that particular sponsor to be diluted by his use elsewhere.
This is not a matter of network policy at all. It is even quite possible that Henry J. Taylor himself would not agree to be available for another sponsor. I doubt if he would because of his very close association with General Motors.

Senator Potter. The question was raised to me that the network had forbidden Taylor to be used by another sponsor.

Mr. Jahncke. That is not correct, sir.

Senator Potter. All right. I am glad to clear that up.

Mr. Jahncke. I think it is an unwritten rule and, in addition to the excise tax removal, one obvious point that everyone in this room would agree with: we love all of our advertisers.

Senator Potter. Like we love all of our constituents.

Mr. Jahncke. Yes, sir.

Senator Potter. All right.

Mr. Jahncke. (2) The Du Mont plan A. This plan would force all networks to affiliate UHF stations to an equal degree in the major markets. Under the plan, the 4 networks would be required to take turns in affiliating the UHF stations exclusively wherever less than 4 VHF stations exist in any 1 market. The plan is intended, as are all of Dr. Du Mont's proposals, to increase NBC's and CBS's program time on UHF stations and to increase ABC's and Du Mont's program time on VHF stations.

ABC supports Dr. Du Mont's objectives, but believes that the best approach to this problem is through voluntary industry action on a case-to-case basis rather than through inflexible regulatory measures.

Senator Potter. Is any of that being done now?

Is there any voluntary action on that like being done now by the networks?

Mr. Jahncke. No, sir; not that I know of.

Each network has whatever affiliations with stations of either class that it wishes or can acquire, and——

Senator Potter. But you think it is desirable to have it done on a voluntary basis?

Mr. Jahncke. Yes, sir.

There is evidence that the best-intentioned rules often create results different from planned, and sometimes directly opposite.

We believe that the proposal is unworkable, discriminatory, unduly disruptive of business relationships, and not likely to produce the result intended. In any event, there are better solutions.

(3) Du Mont plan B. This plan would require each VHF station in markets having fewer than 4 VHF stations to make available 25 percent of its time to the network not having a VHF affiliation.

ABC believes that this plan is preferable to Du Mont plan A, but it also is fundamentally the wrong approach. It would be extremely difficult to administer, and we are not convinced that it will accomplish the objective intended; that is, forcing network programing to the UHF stations.

It has been our experience that advertisers in many instances would forego buying the market entirely rather than place their program on the UHF station.

Furthermore, Dr. Du Mont in his description of the plan stated that it probably would require rate regulation. ABC believes that this is an area that should not be entered by the Government.
(4) Proposal requiring networks to affiliate a fixed minimum percentage of UHF stations: This proposal would require each network to have at least one-third of its affiliates in the UHF band within 1 year and within 2 years to have this percentage gradually increase to at least 50 percent.

It is of interest to note that at the present time one-third of ABC's affiliates are UHF stations.

We believe that this proposal also takes the wrong approach. Moreover, it does not go to the core of the UHF problem because the inevitable tendency would be to maintain the required minimum percentages by affiliating a greater proportion of UHF stations in the smaller markets without helping UHF in the larger markets.

The solution of the UHF problem, in our opinion, must come in the major markets and the small market solution will follow as a byproduct.

This proposal also would discriminate unfairly against VHF stations if networks were forced to drop VHF affiliates in order to comply with such a rule.

I think it would be appropriate to point out here, Senator, that we have adopted from the beginning a policy that television was for everybody, large and small markets, and we have adopted by policy that even where satisfactory alien signals were available to serve the community we thought that local television had a place and an importance, and we have affiliated, therefore, stations like UHF stations in places like Akron, Worcester, and Bridgeport, and Flint.

(5) Proposal to preclude the use of VHF station for delayed broadcast where a UHF station in the market is available for live-time clearance: The adoption of this rule would tend to perpetuate the dominance of NBC and CBS. ABC's only access to many 1- and 2-station VHF markets is by delayed broadcast.

Senator Potter. What do you mean by "delayed broadcast"?

Mr. JAHNCKE. Senator, where we can't clear the time that the program usually goes over the line—

Senator Potter. I understand.

Mr. JAHNCKE. We make a kinescope recording and arrange to put that program on at some other time.

Senator Potter. Yes; I understand.

Mr. JAHNCKE. To give you an idea of the extent of this problem, if you recall Mr. Storer's testimony, his appendix, where he listed the number of 2 V markets—in the top hundred, there were 29—or in places where the ABC-UHF affiliated has ceased operations—how would we get our programs into Louisville and Dayton today, for example, where the UHF stations have gone off the air and there are only two V's; how would we get our programs into Rochester or Syracuse, or markets like that, or Birmingham?

If we were deprived of this access, our entire network operation would be seriously impaired, with the corresponding result that our ability to serve both UHF and VHF stations generally throughout the country would suffer.

With one minor exception, neither NBC nor CBS has ever affiliated a UHF station in markets where there are two VHF stations.

The proposed rule would damage the two networks which have the greatest number of UHF affiliates—ABC and Du Mont.
(6) Proposal to preclude network ownership of stations: The history of broadcasting shows that station ownership is essential to network operation. Without owned and operated stations in the key markets, networks would lack the facilities and the revenue to produce the superior programs that have been largely responsible for the growth and development of radio and television.

If ABC were forced to elect between station ownership and network operation, it would choose the former.

The proposal would retard, not aid UHF development.

**TAX AND SUBSIDY AID FOR UHF**

(1) Repeal of the 10 percent excise tax on all-channel receivers, both monochrome and color: ABC endorses this proposal for the reasons already advanced in this hearing.

(2) Government subsidy: A proposal has been made that instead of reducing the 10 percent excise tax on all-channel receivers, the money so collected be made available to subsidize UHF operators. Subsidy would be a step in Government control of program content, and ABC strongly opposes it.

Senator Potter. So do I.

Mr. Jahncke. I am delighted, sir.

(3) Government loans: Government loans are an indirect form of subsidy. We have serious doubt that any short-range benefits that might flow from aid of this type would be worth the inherent risk of ultimate Government ownership of television stations.

D. ENGINEERING PROPOSALS AND EQUIPMENT IMPROVEMENTS

(1) Proposed minimum of 5 kilowatt transmitter in UHF: ABC agrees that higher power is needed in UHF, but the proposed requirement of a minimum of 5 kilowatts would work hardship on many UHF operators who find difficulty in financing their present operations. Most low-power UHF operators not only would be happy to increase their power to 5 kilowatts, but actually want and need much more power. However, we believe that it would be wiser at this stage of UHF development to leave power increases to normal growth rather than to make them mandatory by rule.

(2) Authorization of booster or satellite stations: ABC endorses any proposal that will bring UHF nearer to parity with VHF. It is hoped that this experiment will be tried.

(3) Improved UHF receivers: ABC agrees that the greatest advances in improved UHF reception can be made at the receiver end rather than at the transmitter end. The present UHF receivers are greatly inferior to their VHF counterparts. New tubes and other developments are in the offing and it is in the power of the manufacturers to speed up the timetable under which they will come into widespread public use with minimum or no price differential.

It is pertinent to observe that three of the television networks—NBC, CBS and Du Mont—and several important television station licensee manufacturers manufacture and sell television receivers.

ABC is engaged exclusively in the broadcasting business with no manufacturing division.
(4) Reduction of the VHF station coverage: This proposal envisions the reduction of VHF antenna height and power to approximate the range presently obtainable by UHF stations.

ABC believes that the disadvantages of this proposal outweigh its benefits. It entails depriving large numbers of the public in outlying areas of television service they now enjoy. Its concept is negative in that it proposes to reduce everyone to the lowest common denominator rather than seek a policy of improving service for all.

E. THE FREEZE PROPOSALS

A discussion of this subject should start with a statement of the fact that television has spent most of its formative years in cold storage. The first commercial television authorization was granted in June 1941. Less than a year later, in April 1942, a wartime freeze was imposed, prohibiting new construction. This wartime freeze remained in effect until April 1946, as which time the first postwar construction permit was granted. From April 1946 until September 1948, slightly more than 2 years, television was permitted normal development. On September 30, 1948, the Commission imposed the second freeze which lasted until July 1952, almost 4 years, at which time the present allocation plan went into effect. In sum, since its inception 13 years ago, commercial television has had only 5 years in which to grow, and has spent 8 years on ice.

To those who remember the Commission's expectation of a short freeze of 60 to 90 days' duration in 1948 and who saw this grow into a freeze of almost 4 years' duration, the prospect of another temporary freeze is frightening.

We are also haunted by the fact that in AM the Commission has had the clear channels frozen since 1942, with the exception of a few months in the 1945-46 period, and the ABC radio network in particular has been the victim of this inaction.

ABC believes that another freeze is neither necessary nor desirable. Furthermore, it is manifestly unfair to the many applicants for VHF facilities who, through no fault of their own, have been held up in the judgment of their applications since as far back as 1947.

The UHF problem cannot be solved by artificially retarding the normal growth of the industry.

A freeze would preserve the dominance of NBC and CBS and retard the development of ABC. It also would remove the incentive to a quick solution that would be present in an emergency atmosphere.

F. REVISED ALLOCATION PLANS

(1) Reallocation of all television to the UHF band: The transfer of all television to the UHF band has the appeal of being the theoretically best solution. If accomplished it would eliminate the economy of scarcity and provide ample and equal facilities to all communities in the United States, large and small. It would create a true parity of facilities which would enable competition to flourish in its best environment with the rewards going to those who produce the best program service. The question is whether or not it is practical.

There certainly are many well-founded objections to this proposal. In some localities, particularly those with rough terrain, VMF is
simply a better part of the spectrum in which to broadcast television. Seattle, Portland, Pittsburgh are examples of that.

Substantial question has also been raised in this hearing whether, because of allocation standards on which the UHF plan is based, there are enough UHF channels to permit a nationwide service in the UHF band alone. We believe changes in these standards to make them more comparable to the VHF standards would enable the 70 UHF channels to fill the need without any difficulty. The proposal also contemplates a gradual transition to UHF. All VHF operators would be assigned a UHF channel and given the opportunity over a period of years to broadcast either in VHF or UHF or as a simulcast, with the understanding that as of a certain date the VHF channel would cease operation. This would impose an important financial problem on every VHF operator, both on capital investment and the additional costs of operation during the transition period. In addition, many VHF towers and antenna sites might not lend themselves to the addition of a UHF antenna.

Of the 29 million television sets in the hands of the public, approximately 3 million are equipped for UHF. Therefore, this proposal would envision the conversion or replacement by all-channel receivers of about 26 million VHF-only sets over the transition period, with accompanying home antenna modifications.

The proposal imposes such large burdens on a substantial portion of 26 million American families and several hundred VHF broadcasters that ABC believes it should be considered only if other less drastic remedies are first tried and proven inadequate.

If a decision is made to switch to an all-UHF system, color television should immediately be restricted to UHF. The advent of color on UHF-only would hasten the distribution of all channel receivers.

A modification of this proposal which might spur UHF development without losing the advantages of VHF and causing the major disruptions of a switch to an all-UHF system would be to permit color on UHF-only for a period, say, of 3 to 5 years, following which color would be permitted to be broadcast on VHF as well.

VHF broadcasters who desire to duplicate programs on a UHF station during this transition period so as to broadcast color would be permitted to do so.

(2) Reallocation of the FM band to television. VHF television is presently divided into two bands: Channels 2 to 6 occupy the space between 54 and 88 megacycles; channels 7 to 13 occupy the space between 174 and 216 megacycles.

Between these two VHF bands is an area of 86 megacycles. FM occupies 20 megacycles of this space, 88 to 108 megacycles. This band would accommodate 3 additional VHF channels with a surplus of 2 megacycles which could be used to accommodate all the FM stations now in operation.

Senator Potter. Is that right, that it will take care of all the FM stations now in operation?

Mr. Jahncke. That is my understanding, according to the engineering department. I am not an engineer myself.

The present FM service provides little that is not already available via AM radio. In a situation where there is no ideal solution, this proposal has merit.
(3) VHF channel 4½. ABC would endorse this proposal but we understand and the space between channels 4 and 5 will not be available for new uses until 1963. That is too far in the future to merit consideration at this time.

(4) Directional antennas. These proposals also look to a partial solution of the UHF trouble areas through the squeezing in of a few additional VHF stations. If through a combination of directionalization and less than maximum permissible power additional VHF channels can be provided in key markets, it would go a long way to solving the competitive problem of ABC. However, alone it does not provide an overall solution to the problem. Its primary merit, in our opinion, rests in its use in combination with the proposal to obtain three more VHF channels by utilizing the FM band.

(5) Reallocation of VHF educational channels: the concept behind the initial reservation of a reasonable number of stations for educational broadcasting was commendable, but perhaps the time has come to take a more practical approach to a problem to which, as we have said, there is no ideal solution. We cannot escape the fact that the spectrum is crowded and will become more so. This fact poses the question of whether it is in the public interest to continue to reserve precious VHF channels for an uncertain future use at the expense of depriving the public of their immediate utilization for the excellent television service now available.

The concept of educational television must be weighed against the practicalities of the present situation. Of the 83 VHF channels reserved for educational television, only a handful have been sought by educators.

The report of the New York State Commission on Educational Television shows that there is serious question whether noncommercial educational television is feasible. We believe that the interests of educational television would better be served by making additional time available for educational programs on commercial stations.

I might add again referring to the 29 markets in the top hundred, to which are allocated only 2 VHF stations, that this use of presently unused VHF educational channels would solve and permit a third VHF station in 10 of these 29 markets, and certainly through possible relaxation of the Commission’s present inflexible rules and with directionalization probably virtually every one of these problems could be solved.

ABC’s recommendations:

ABC recommends, therefore:

That the excise tax on all channel receivers and tuners be abolished.

That the FCC adopt revisions of its multiple ownership rules to permit multiple VHF owners to acquire UHF stations;

That boosters and satellites be authorized; and that a freeze not be imposed.

With respect to the more fundamental question of whether any of the revised allocation proposals should be adopted, we believe that, in the last analysis, the answer must depend upon the definition given the concept of a truly national, totally competitive television service.

If, as a matter of policy, it is determined that only two program services are necessary to meet this definition, then the present alloca-
tion of VHF channels will provide such service, with no important exceptions.

Should this definition of totally competitive be adopted, it would strengthen the position of NBC and CBS and might mean the rapid elimination of UHF.

This, of course, is not the answer.

The second possible policy determination of what would constitute a national competitive television service would be a plan which would permit three fully competitive broadcast services. Such a system would require revisions in the present allocation plan.

The addition of relatively few VHF channels would make such a concept practical. These channels could be obtained through use of that part of the VHF spectrum between channel 6 and channel 7 presently assigned to FM broadcast, plus the possible use of educational VHF reservations.

The conversion to the new channels would be relatively simple compared to the UHF conversion problem, and would have the advantage of an absolute long-range parity once the conversion is accomplished.

Some relief could be obtained even within the limits of the existing 12 VHF channels by utilizing more flexible allocation rules, including the use of directional antennas and, in some cases, lower power.

I may be wrong. Senator, but it is my understanding that it is the application of completely inflexible and arbitrary allocation rules that create the proposals to put up television stations in phantom towns such as were referred to yesterday.

Obviously, the plan is to bring the third VHF station to Norfolk. The arbitrary and exact mileage limitation won't let them bring it any closer to Norfolk than Princess Anne, which is close enough; but if there were a slight modification of that rule, it would be a Norfolk station, which is their plan, which I think is perfectly proper.

Senator Potter. These policy decisions that you have mentioned here—would they provide a nationwide competitive system that the FCC has recommended?

Mr. Jahncke. It depends on the definition. It would certainly provide three services; yes, sir.

Senator Potter. Would it also be nationwide?

Mr. Jahncke. Yes, sir.

Senator, just in passing, one point: Obviously, if you solve the problem in the congested northeastern area of the country, where large metropolitan areas are very close together, automatically that solves it in the rest of the country where distances are greater, with very few exceptions.

That is the problem. You solve the Northeast and you have got in most cases more than enough for the rest of the country.

A third definition of a nationwide competitive television system would be one that requires four or more national program services. Theoretically, such a concept could best be realized by:

(a) The addition of many more VHF channels so that we might have an all-VHF system; or

(b) The shift of all television to UHF.

To obtain sufficient VHF channels, we think the entire portion of the spectrum between channels 6 and 7—88 to 174 megacycles—now employed by other important services, would have to be utilized.
While such reallocation would create 14 additional VHF channels, the attendant disruption of the other services presently using this spectrum space appears to render this plan impractical.

The alternative of moving all of television to UHF also has substantial practical difficulties and because of its expense to the public and VHF broadcasters, it should be adopted only if it appears that no other solution will work.

ABC believes that it is too early to conclude that it is necessary to abandon as unworkable our present allocation concept of using both VHF and UHF stations.

If I may refer back to the analogy of the filling station, before we moved the road away, perhaps we might be able to find a solution by just widening the road, providing one more lane on the road presently in front of the filling station.

ABC is aware that UHF television is in a critical position and that the patient may die while the doctors are debating what to prescribe. It also recognizes that while there have been many general proposals made to this committee, there is not before it definitive evidence on whether it might be possible to devise modifications of the present plan which would minimize VHF-UHF intermixture in UHF trouble areas without at the same time weakening UHF to the point that the revisions would do more harm than good. The FCC has personnel qualified to investigate these matters.

ABC, therefore, recommends that this committee request the Commission to prepare as soon as possible a report on a revised plan utilizing both VHF and UHF but reallocating to cure UHF trouble areas, such as Dayton and Louisville, in intermixed markets to the extent possible without impairing the long-range development of a national competitive television service.

Senator Potter. Do I understand your suggestion there is that the Commission might look over their present allocation of channels that haven't been picked up as yet?

Is that what you mean? Or channels for which licenses have been turned back?

Mr. Jahncke. Look over their present allocation, with the thought, by modifying their present inflexible standards, to permit perhaps less than the present separation stands, distances between two stations on the same channel, through the use of directionalization and lower power, perhaps a VHF channel to solve a problem in a market such as Dayton.

Senator, as a practical matter how are you going to solve the problem of providing a third service to places like Dayton and Louisville?

UHF has tried and failed there.

Whether rightly or wrongly, this is just a present fact. I am not editorializing.

How do we get our present programs into those markets?

I think the solution there, where the odds seem to be against UHF, is to try by substituting VHF for UHF in those trouble areas.

We think if that is done in a few of the key markets it will go a long way toward solving the problem.

At the same time we recognize you shouldn't go too far because if you substitute all VHF you are simply destroying UHF, because UHF has to be solved in some of the big markets for it to be able to remain as a byproduct in the smaller markets.
There I might go back to the multiple-ownership proposals. Nobody will say any multiple owner would say where they would buy or acquire a UHF station, if so permitted, but I think it is obvious and traditional that the multiple owners and the networks, a special type of multiple owners, would normally seek to acquire those UHF stations in the larger markets.

This is where the importance of owning a station, as far as the network is concerned, applies; and, obviously, without mentioning any one market, if you have the 4 networks buying and acquiring ownership of an operation, with their programing of UHF stations in, say, the top 10, 15, or 20 markets of the country, you have really struck a blow for UHF, because those are the networks and organizations that are in the best position to give UHF the greatest support. If you support UHF in markets that big, it certainly will automatically solve it in the smaller markets as a byproduct; but, coupled with that, I think a realistic revision of the Commission’s present standards to solve problems, such as Dayton and Louisville, certainly are indicated and would go a long way to improving the television service and the choice of services available to the public in those problem areas.

Senator Potter. You think in some areas, such as you have mentioned, they could squeeze in another VHF, I assume, probably with low power and direction-alizing it?

Mr. Jahncke. Yes, sir.

This, I understand, is quite practical, although I can’t comment on it from an engineering point of view, sir.

In approaching such a reallocation we recommend that the Commission abandon the rigid and inflexible concepts on which the present VHF plan is based, so that channels may be moved or applied for as they are in AM broadcasting. In addition, so that the information before the committee will be complete, we suggest that the Commission should also be requested to report on whether additional VHF channels can be obtained and whether an all UHF allocation plan would be technically feasible.

The proposals made above are designed to speed the difficult period of transition during which competitive facilities will become available. When that occurs, ABC will take its competitive chances in the market place of public good will with full confidence in its ability to originate and develop a television service second to none. ABC believes that it has a television program service comparable in quality to those of its competitors and desires only a fair opportunity to demonstrate that fact.

In conclusion, ABC again desires to point out that it is now an independent network because of the FCC’s recognition 13 years ago that the public interest would not be served by concentration of radio stations under the dominance and control of a single network organization.

For reasons unrelated to the merits of its television service, ABC finds itself handicapped due to the lack of competitive television outlets.

The competitive advantages enjoyed by NBC and CBS are basically attributed to denial of fair opportunity for access to the market, rather than to the superiority of their program offerings.
We can't get our programs into a market that we are not even judged; we are not even in the game.

This committee, therefore, is faced with an extraordinary decision of policy, for determinations reached now in the present period of television development will determine the availability and quality of competitive service in the future.

There may be those who will oppose any remedial action by this committee or by the Federal Communications Commission on the ground that it might deprive those who were first in the field of the fruits of their resourcefulness and labors.

The fruits currently enjoyed in limited facilities communities are not as much the result of individual initiative or superior ability as they are of VHF channel scarcities and the artificial freeze imposed between 1948 and 1952.

It is one thing to be the first in the field where competitors are free to follow. It is another thing to enjoy a clear field because competitors are enjoined from pursuit.

Senator Potter. You have presented an excellent statement, and there are bound to be many questions that I think the committee will like to consider.

I believe you stated that you favored the multiple-ownership rule?

Mr. Jahncke. Yes.

Senator Potter. And did you suggest that the multiple owner go into only the big market, the big city mixed market area?

Mr. Jahncke. I suggested that no arbitrary limitation or rule be laid down, but that obviously the bigger the market such a multiple owner went into, to acquire his UHF ownership, the more it would help UHF; and I think it is probable that the entrance of the multiple owners into UHF ownership beyond their VHF ownership would be in the larger markets and certainly in mixed markets.

Senator Potter. I have been requested here to ask you a few questions. I haven't had a chance to read them myself.

On page 26 you say there should be three networks and to get them you must reduce intermitture by reallocation and an addition of channel 6½. Will you accept the new channel for ABC?

Are they receivers for it?

Mr. Jahncke. At the very bottom of that same page, Senator, I point out conversion to the new channels would be relatively simple compared to the UHF conversion problem. The addition of a channel 6½ or 6¼ would present an additional conversion problem. Not one television set in the entire country could tune it in at the moment.

In my opinion, the conversion to enable a television set to receive that channel would be relatively simple compared to the conversion necessary to receive a UHF signal; and once accomplished, that station would have a complete parity with other VHF stations.

You have heard testimony regarding the propagation characteristics of the various channels all the way from 2 to 83.

Senator Potter. Yes.

Mr. Jahncke. And the shadow problems faced, particularly in the upper part of the UHF spectrum.

All of that would be solved, and when the conversion problem is completed you could look forward to an absolute one class of stations in these trouble markets.
Senator Potter. It would be a regular VHF station?
Mr. Jahncke. Sir?
Senator Potter. It would be a regular VHF operation?
Mr. Jahncke. That is correct; ultimately.
The other part of that question, Senator: Would ABC affiliate such a station?
What is our choice at the moment?
Certainly we would.
Senator Potter. On page 23 you say put color only on UHF. Wouldn't that require operation of two transmitters in all large cities?
Mr. Jahncke. Yes; it would.
This is not a recommendation of ABC's. This is pointing out certain possibilities.
Certainly you start with the point that if you are going to consider a transfer of all television to UHF, it just seems logical to put out the fire in color before it starts.
That is the first point.
Senator Potter. If I recall your statement, you suggested it might be desirable to put color in for 3 or 5 years, limited color to UHF for 3 or 5 years; is that correct?
Mr. Jahncke. That is correct, sir.
The thought back of that idea is not to transfer television to UHF, but if color is going to come with such a mad rush and be so exciting, as I am convinced it will be, and every color set automatically is an all-channel tuner, you have gone a long way to solving the UHF problem, which ultimately gets back to an all-channel tuner.
Senator Potter. The second part of this question, referring to the two transmitters, says: "If so, why would two transmitters for transition to UHF be so burdensome?"
Mr. Jahncke. I think, under this idea of putting up a UHF transmitter for color only, it would be burdensome to the same degree if you were switching ultimately and in a transition period.
It might be possible on some antenna sets. Certainly it would be a problem, but it would promote the distribution of all-channel tuners, and that is the thought back of it.
Senator Potter. Then another question that was submitted to me: On page 20—would you confine boosters or directional antennas to the use so as to enable them to give wider and equal coverage?
Mr. Jahncke. Again, Senator, I am not an engineer, but I certainly would not put any flat limitations on the use of boosters as satellites. I would suggest again the FCC consider that on a case-by-case basis, whether VHF or UHF, to accomplish the job.
If a VHF station has a blind spot or a shadow area, certainly it should be permitted for VHF as well as UHF.
Both the boosters and satellites are designed to extend coverage. They don't contribute to conversion, which is the UHF problem.
Senator Potter. Do you have any questions?
Senator Bowring. I have no questions.
Senator Potter. I wish to thank you for your statement.
Mr. Midlen.
STATEMENT OF JOHN H. MIDLEN, REPRESENTING TELEVISION STATION WTVR, RICHMOND, VA.

Mr. MIDLEN. Yes, sir.

Mr. Chairman, if I might have just a minute to make a submission, I have here the original copy of the history of television station WTVR, Richmond, Va. I would like to submit that and request that it be incorporated in the hearing record in this proceeding. (Various exhibits are in the official files of committee.)

Senator Porter. Without objection, it will be so ordered.

(In re hearing on problems concerning the status and development of UHF TV channels)

THE HISTORY OF TELEVISION STATION WTVR, RICHMOND, VA.—JUNE 18, 1954

HAVENS & MARTIN, INC.,
Richmond 20, Va.

City of Richmond,
State of Virginia, ss:

Wilbur M. Havens, being first duly sworn on oath according to law, deposes and says that he is president of Havens & Martin, Inc., licensee of Television Broadcast Station WTVR, Richmond, Va., and is general manager of station WTVR; that the following parts I to V, inclusive with related exhibits have been prepared by him or under his supervision and direction, and that the facts stated therein are true to the best of his knowledge, information and belief.

Wilbur M. Havens.

Subscribed and sworn to before me this 14th day of June 1954.

[Seal]

Katherine H. Germain, Notary Public.

My commission expires on June 22, 1957.

Part I.—Early WTVR History

On March 11, 1944, Havens & Martin, Inc., owners and operators of AM Station WMBG, Richmond, Va., filed an application with the Federal Communications Commission for a television station at Richmond. At the same time an application was also filed for a construction permit for a frequency modulation station.

Two days later the company ran a full-page advertisement (exhibit 1) in the Richmond News Leader headed "WMBG's Answer to 'What About Television.'" That same night Mr. Wilbur M. Havens, president of Havens & Martin, Inc., stated in a 15-minute broadcast that: "Of all the postwar developments promised by the progress of the art and science of radio, television presents the greatest opportunity" (exhibit 2).

Exhibit 2

EXCERPTS FROM WMBG RADIO PROGRAM MARCH 6, 1944

Mr. Havens

The No. 1 job for American business at present is to cooperate wholeheartedly in the winning of the war. Nothing can be permitted to obstruct that end. When this war ends, we will find ourselves in a new world, filled with many great inventions for the comfort, pleasure, and enlightenment of all mankind. Our interest this evening is confined to Virginia and Richmond. My announcement is directed particularly to those who are in the service area of this radio station. It is evidence of what the postwar era promises for you and your radio. The WMBG Planning Board has investigated all phases of postwar radio broadcasting. Many new and novel innovations have been thoroughly studied, including television, frequency modulation and facsimile. Of all the postwar developments promised by the progress of the art and science of radio, television...
presents the greatest opportunity. The addition of sight to sound in radio is as
revolutionary as was the addition of sound to sight on the motion picture screen.
Television will open a new era of broadcasting entertainment, information, and
education to the home. Furthermore, it will be a development of great economic
and social significance to labor, industry, and Government.

Television can be discussed now only as a postwar development. And even as
a post-war development, television services will face many technical and eco-
nomic problems. Time will be required for their solution, and for the full real-
ization of the vast possibilities of sight-and-sound broadcasting. Millions of
dollars already have been invested in the foundation now laid for postwar

You will see your radio programs as well as hear them when the war is over.
I cannot conclude with the mere announcement that you of Virginia and Rich-
mond will have television, for there is something even greater in store for you.
I have just returned from a 4-day stay in New York where the entire planning
board of WMBG and myself held conference with Mr. Niles Trammell, president
of the National Broadcasting Co., and many of his officers and engineers. We
have been assured that in the immediate postwar era, the National Broadcasting
Co. will deliver sight and sound television programs of the world’s best entertain-
ment, sport events and educational features to you here in Virginia and Richmond
through the medium of WMBG’s television transmitter. Because of its extensive
coverage and accepted type of highly developed program service there is no fore-
seeable period when sound broadcasting will become unnecessary. Therefore,
WMBG will continue to maintain its sound broadcasting services at the highest
peak of technical entertainment and educational excellence.

Television, bringing sight as well as sound to the many services of mass com-
munication, adds a new dimension to radio. In conclusion I promise you the
best in radio television of the future even as WMBG listeners are receiving
the best in radio today.

Mr. Wood

The technique of television broadcasting will be entirely different from that
of the present day broadcasting. The studios will be larger, more spacious, and
equipped with high-intensity liquid-cooled mercury arc lighting. The current
consumed by this lighting will more than exceed that consumed by the trans-
mitter. The studios will be equipped with dressing and makeup rooms. There
will be also a carpenter’s shop to construct scenery and sets.

The personnel required to produce a television show will far exceed the num-
ber of persons required now for a sound show. It will take from two to five
cameras on each production and each of these will be manned by an engineer.
These cameras will be faded in and out by another engineer working with pro-
duction men in a large control booth.

Important news, sports, and entertainment features in other cities will be
brought to you by television network connections.

An eastern network will extend from Boston to Richmond, with stations
located at such intervening points as Worcester, Providence, Hartford, Schene-
tady, New York, Philadelphia, Wilmington, Baltimore, and Washington. A Mid-
west network will develop with Chicago as its hub, and a Pacific Coast network
at the great talent center of Hollywood. The regional networks will stretch out
over wider areas and will themselves become linked together.

Television networks have been in operation for some time by America’s No. 1
network—the National Broadcasting Co.

Networking will be accomplished through the use of coaxial cable, radio relay,
or a combination of both.

I was asked to mention the receivers you will use in your home. The prewar
receivers used small screens; however, when the war is over larger screens will
be used by projecting the images with plastic lens on plastic screens. The prices
should start at $100. The picture will be very clear and with surprising detail.
The sound receiver will be built in and a part of the sight receiver. The movement
of the artist and the sound will be perfectly synchronized.
Today, we only hear those programs. Tomorrow, we will see them as well as hear them.
That is the promise of television and WMBG.

Mr. Mitchell

With his usual modesty, Mr. Havens has just announced the coming of television to Richmond, an historic event. But, he didn't tell you of the financial and material gamble this decision will require of him. Why? Well, believe it or not, oldtimers in the radio business place financial gain second to successfully giving the people what they want. Radio, to those who have been in the business for 20 years, is something living. It was born and reared only because those who first made contact with it were determined it would live and that it would add to the pleasures and education of the masses. That little baby—radio—had a tough time making the grade. There were many times when its voice was almost silenced by those who thought more of their own selfish interests than the joy and happiness of the masses. Radio, therefore, became a challenge. Those who toiled and sweat, and sacrificed not of financial gain, their uppermost thought was to keep their baby—radio—alive.

The March 1944, issue of the WMBG Transmitter—the company's house organ—was devoted completely to television, pointing out TV is here, it is not a postwar experiment (exhibit 3).

(Exhibits 3–23 and parts II–IV are on file with the committee.)

The NBC program schedule (exhibit 24) is reasonably typical of the network programming available for this period. From this it can be seen that NBC's New York station carried no programs 5 days out of 7.

The six original companies operating television stations in Boston, Schenectady, New York, Philadelphia, Baltimore, Washington, and Richmond were invited to meet with Mr. Niles Trammell, then the president of NBC, in his office in New York on September 3, 1948, to discuss a TV network and a contract for 1949.

On that date representatives of NBC, Westinghouse, General Electric, Philco, Hearst newspapers, and Havens & Martin, Inc., met with Mr. Trammell and were informed that if we wanted a regularly scheduled program service, all of us would have to pay for it. It was unanimously decided that we would have a minimum of 4 hours per day of network programing or 28 hours per week, and each station would program itself locally from 6 to 7:30 p.m., each night at its own expense with the network service starting on a regular basis January 1, 1949. A quota system was developed for payment of the network with the individual stations being assigned units for a total of 617 units, which was later revised to 525. WTVR's share of the cost was 34/525. Havens & Martin, Inc., signed the first NBC connected affiliated contract as is shown here by exhibit 25.

By June 1949 the network was extended to Lancaster, Pittsburgh, Cleveland, Toledo, and Chicago where 4 or 5 other stations were already connected. This brought the NBC network up to 16 television stations.

Before the end of 1949, CBS and ABC sought allocation of time on the coaxial cable, and as there was only one cable at that time, the result was the A. T. and T. allocation of this facility to the various networks. Each allocation of time brought with it program problems for Station WTVR—namely, if the cable was shifted from the network for which Station WTVR was carrying the program and the network which received the cable facilities for that time did not supply Station WTVR with its program, the station was left without a network program service and had to fill in with a local origination, frequently with little or no advance notice.

By the end of 1949 Station WTVR was carrying 5 hours per week of CBS programing and 1 hour a week of ABC programing from which the station received its only network compensation during 1949. This means that during 1949 Station WTVR did not receive one penny from the NBC-TV network which supplied most of its network television programs.

PART V.—CLOSING STATEMENT OF MR. WILBUR M. HAVENS

A. PRELIMINARY STATEMENT

In the last several years a number of persons, including many postfreeze television station applicants, seem to have had the belief that a television station construction permit was an automatic key to the road to riches irrespective of how little work or time might be spent thereafter on such television station. Obviously such believers have forgotten what we were never acquainted with the early vicissitudes and enormous business risks facing the 108 VHF pioneer television stations during the first several years of operation of these stations. Pioneering television station WTVR, which is authorized to operate on VHF channel No. 5 at Richmond, Va., feels that the long-range planning, lengthy hours, hard work, resourcefulness, and general public service that were required and still are required in the operation of station WTVR are not materially unlike the case histories of many other pioneer VHF stations. The foregoing recounting of some of the significant aspects of the construction and operation of station WTVR to date, in our opinion, illustrates that the problems of present UHF operators for the most part are no greater—and in many instances considerably less—than those faced by the pioneer VHF operators in the early days. In view of the testimony developed in this hearing by certain UHF operators and the somewhat radical proposals offered by some as a suggested stimulant or cure-all for UHF operations, we believe that this presentation of the significant aspects of the WTVR construction and operation serves to develop the other side of the story, and will assist this Senate subcommittee in its study of the UHF situation. For the convenience of the subcommittee in the following paragraphs there is summarized the WTVR history as set forth in the foregoing parts I to IV, inclusive, and the position of WTVR in this matter.

B. SUMMARIZATION OF HISTORY OF WTVR

1. Early WTVR history

The planning for television by the owners of station WTVR was not a spur-of-the-moment or overnight reflection, but commenced as early as 1936. Then
on March 5, 1944, Havens & Martin, Inc., filed an application with the Federal Communications Commission for a television station construction permit. The application for such construction permit was granted by the Commission on May 16, 1946, at a time when many were refraining from filing television applications or dismissing those on file. In addition, a considerable number of television station construction permits in those early days were surrendered by the grantees. Many of this group that ran away in the early days of television subsequently re-entered the picture as UHF operators, and presumably some are now complaining before this subcommittee concerning the position of UHF television service.

Construction of station WTVR was started promptly following the issuance of the construction permit therefor, and the station was completed in April 1948. In those days relatively little manufactured equipment was available, and much of the studio equipment and the antenna was built in the basement of my home where I have a modern hobby machine shop.

The television projectors were purchased at an Army auction, and they were redesignned and converted by the station's engineering staff from 24 frames to 30 frames per second. In addition, the WTVR engineering staff constructed certain other equipment at the studio and transmitter including visual and aural antennas, the camera equipment, and a microwave unit.

All of these technical obstacles, however, were overcome and station WTVR presented its dedicatory program on April 22, 1948.

2. Initial WTVR operational problems

While the station commenced operation in April 1948, it was not until June of that year that the coaxial cable to our studios was installed so that until that time there was no live network programing. In those early days the National Broadcasting Co. was the only network offering any television program service, and that offered amounted to only a few programs per week.

As a result of negotiations between NBC and 6 original television permitees in Boston, Schenectady, New York, Philadelphia, Baltimore, Washington, and Richmond, a regularly scheduled network program service was developed consisting of a minimum of 4 hours per day. A quota system was set up for payment of this network with units allocated to each of the six stations, and Havens & Martin, Inc., signed the first NBC television connected affiliation contract.

Later in 1949 Columbia Broadcasting System and American Broadcasting Co. presented network programing over the coaxial cable under an allocation of the facility to the 4 television networks, as there was only 1 cable at that time. This resulted in programing problems for station WTVR as when the cable was shifted from the network for which our station was carrying the program and the network which received the cable did not supply its program to WTVR, we then had no network service for that period, and had to fill in with local programing, frequently with little or no advance notice.

By the end of 1949 station WTVR carried 5 hours a week of CBS television programing and 1 hour a week of ABC television programing from which the station received its only network compensation during that year.

3. Commercial obstacles to initial WTVR operation

In early January 1948 there were no known television receiving sets in Richmond, and six model 290TS television receivers were obtained from RCA as a result of a special trip to its Camden offices. Six more of these RCA receiving sets were received about a month later, and these were the only receivers known to be in Richmond at that time.

It was recognized that dealer education meetings were necessary prior to the commencement of the operation of station WTVR and a number of such meetings were held in the WTVR auditorium studio. By the WTVR commenced operation on April 22, 1948, Richmond dealers had sold 1,000 receiving sets; in January 1949, the number of television sets in Richmond had increased to 3,600 and a year later WTVR had 15,549 sets in its service area.

In the early days there was considerable sales resistance from the local businessmen to television advertising, and national spot business was almost non-existent. It was not until late 1949 and early 1950 that the interest of national spot advertisers began to increase appreciably, and the same was true for local advertisers in the Richmond area. In 1948 and 1949 as a result of the programing and other operational costs and the relatively small amount of revenue received station WTVR operated at a heavy financial loss.
4. Present WTVR facilities and operation

After WTVR went on the air, the studio building at 3301 West Broad Street, Richmond, Va. was enlarged and redesigned to house the most modern studios and equipment obtainable. After that followed our most remendous undertaking—the building of the new television transmitter plant adjacent to those studios and in the heart of the Richmond business district together with the construction of the tallest self-supporting structure of its kind in the country. Station WTVR is now authorized to operate with an antenna 1,049 feet above sea level and 844 feet above ground, and having an effective radiated power of 100 kilowatts.

From 21 hours of operation a week in April 1948, the WTVR program schedule has been extended to the present operating hours of 7 a.m., to midnight daily for a total of 119 hours a week. This program schedule was built from night to day rather than from morning to night by a program at a time. Moreover, such 119 hours a week programming are being presented despite the fact that the maximum requirement of operation for a television station under the Federal Communications Commission's rules is 28 hours a week.

The important thing to remember, however, is that this development did not come overnight. It was preceded by 12 years of long-range planning before television operations began, approximately 2 years in constructing the original WTVR facilities, and then after the station began operating there were long hours, hard work, the necessity to overcome countless difficult problems of varying nature, and heavy economic losses in 1948 and 1949.

C. Suggestions for the Development of the Finest Nationwide Television Service

The television broadcasting industry relatively speaking is still in its infancy, and as it grows and prospers the individual stations are benefited accordingly. The ownership of station WTVR is interested, consequently, in seeing developed the very finest local and nationwide television service.

As more and more television receiving sets capable of tuning in all VHF and UHF channels are manufactured and sold to the public, the need for set conversions for UHF will be lessened and the position of the UHF broadcaster will be improved. Because strips and tuners to make possible UHF reception are readily available at this time the plight of the present UHF broadcaster commencing operation is not nearly so dire as was that of WTVR in April 1948 when there was only a smattering of any television sets in the hands of the public in the Richmond area.

As did WTVR, it is incumbent upon UHF stations to cooperate fully with the local distributors and dealers for the sale, installation, and servicing of sets with UHF characteristics to stimulate such dealer interest for UHF sales and conversion.

Moreover, by the presentation of detailed and accurate economic data concerning the individual station's service area to networks and agencies, there is enhanced the obtaining of a representative share of the desirable commercial television programs. Lastly, by presenting a type of programming which is different or superior to other programming and reception in the area, a UHF station may build a UHF audience thereby not only rendering a public service but achieving a successful economic operation.

D. Arbitrary Curtailment of VHF Service Can Only Result in Harm to the Public

Havens & Martin, Inc., has just completed the construction of the new WTVR 100-kilowatt facilities, pursuant to a construction permit from the FCC, and has pending before the Federal Communications Commission an application for license for these new facilities. To place an artificial freeze on the issuance of a license under such circumstances would constitute a gross breach of good faith.

Likewise, the suggested modification of the television allocation plen to eliminate all VHF channels in favor of UHF channels would mean obsoleting millions of dollars worth of transmitting and receiving equipment without any cogent reason, and it is inconceivable that the American public would passively tolerate such a situation. Not only would it be a criminal waste of equipment
and the financial investment in such equipment, but it would represent a waste of valuable spectrum facilities by reason of the greater coverage areas inherent to VHF propagation. Also, the suggestion by some that intermixture of UHF and VHF stations in the same area be eliminated so that the country would consist of a conglomeration of individual VHF and UHF areas would result in chaotic confusion, and with the widespread manufacture of all-channel receiving sets would be completely needless.

There has also been presented to this subcommittee proposals which would result in the forced allocation of station time to and affiliation with national television networks, irrespective of the desires of the individual station and its responsibility as a licensee to serve the public interest in the manner it deems best. Not only would this infringe the freedom to contract, but would result in the concentration of control of the television broadcasting industry in the hands of a small group of television network organizations. Moreover, if allocated as suggested there is no guaranty that such networks would actually use the time. One network might want the time and would use it, while the network with the time would not use it. The result would be a loss of service to the public.

E. CONCLUSION

From my experience in the construction and operation of television station WTVR in Richmond, Va., since 1948 there is no substitute, in my opinion, for any television station—be it UHF or VHF—for capable management, willingness to work, adequate technical facilities, and good programing. The so-called station pioneers of today that have recently commenced or are now commencing operation may face some competitive aspects not presented to the early pioneers, but they are not faced with the obstacles of scarcity of manufactured equipment, no receiving sets, and relatively few programing sources. If these 1954 television pioneers will count their blessings and go to work as is necessary to achieve success in almost any business, there is no reason why in this land of free enterprise they should not receive the same rewards as their predecessors in the industry.

Mr. MIDLEN. WTVR is one of the original 108 VHF stations, and we feel this presentation of the early obstacles of construction and operation will help to present the other side of the story for the VHF stations.

Senator POTTER. Thank you. It will be made a part of the record.

Mr. MIDLEN. I might also add if there is any question or additional testimony required Mr. Wilbur Havens, the president of the licensee corporation, will be only too happy to attend.

Senator POTTER. Thank you.

The next witness is Mr. Frank Stanton, president of Columbia Broadcasting System.

We welcome you to the committee.

I know that you probably have heard or been informed of much of the testimony that has taken place not only this week but about 2 weeks ago, and we are looking forward to hearing your statement.

STATEMENT OF FRANK STANTON, PRESIDENT, COLUMBIA BROADCASTING SYSTEM, INC.

Mr. STANTON. Thank you very much, Mr. Chairman. I have read and kept in touch with the developments and hope that I am up to date.

Mr. Chairman and members of the subcommittee, my name is Frank Stanton. I am president of Columbia Broadcasting System, Inc., which, through its television division, is engaged in both television networking and operation of the three television stations which CBS owns in New York, Chicago, and Los Angeles.
Present with me to my left today is Mr. J. L. Van Volkenburg, president of CBS Television, and slightly to my left and rear is Mr. William B. Lodge, vice president in charge of engineering of that division of our company.

As I understand it, these proceedings before this subcommittee are concerned primarily with the problems relating to the status and development of the UHF channels. Partly because UHF problems bear directly on it, and partly for reasons only remotely or indirectly related to UHF, problems and issues concerning television networking have also loomed large in the testimony before this subcommittee.

We are of course vitally interested in both these problems—UHF and television networking. We are grateful for the opportunity to appear before you. We are prepared to try to answer the questions you may have in your search for a solution to the perplexing problems before you.

We recognize the immense importance of these hearings, and we recognize too that the results of these hearings may shape, for good or for ill, the pattern of television for many, many years to come. The success of our business and the question, in my opinion, of whether we are going to have a nationwide live network television service, depend upon the sensible solution of many of the problems which have been laid before you—a solution which helps all segments of television broadcasting and which does not, for the temporary benefit of a few broadcasters, tear down the entire temple.

It is your duty to see that as much of the public as possible has the widest possible choice of television services. It is our business to try to deliver the best possible programs to the most homes possible. We want UHF to succeed; we want station facilities to be available so that nationwide competitive networks can have full opportunity to reach the public.

Thus, I believe the objectives of this subcommittee and of CBS Television are the same.

But the issues are complex; the proposed solutions are many; the public stakes in correct solutions are enormous; and the dangers of hasty and superficially attractive solutions are very great. I shall deal with these problems as briefly as I can, but the importance of these problems—to us, to the thousands of people who work for us, and to all the public—is so great that I wish to deal with them comprehensively. For the sake of convenience and clarity, I would like to divide my testimony into two parts—the first relating to UHF, and the second dealing with networking, not only as it bears on the UHF problems but also as it bears on some of the other proposals which have been suggested here and which I believe have only an indirect relationship to UHF and yet have been presented because of it.

I. At the outset I want to say as forcefully as I can that CBS Television is for UHF and wants UHF to succeed. We are for its rapid, healthy, and profitable development. That is more than lip service—our record establishes that we have long acted consistently with that position.

I should like to point out that in the 1950-52 hearings, which resulted in the present television allocations, along with others in the industry we advocated nonintermixture, urging that UHF be assigned exclusively to some of the markets and the VHF channels exclusively
to the others. Recognizing the need for UHF to provide sufficient channel assignments for maximum nationwide television service, but at the same time foreseeing the difficulties which now face UHF stations and indeed are responsible for these hearings today, we expressed the opinion that it would not be wise to assign both types of frequencies to the same market. We felt then that in general it placed too great a burden on UHF stations to require them to compete with VHF stations in the same markets.

This concept of nonintermixture, however, was not the unanimous opinion of the industry or of engineers and, as you know, the Commission for reasons which it set out in its allocations decision decided that intermixture was desirable.

It is unnecessary for me to dwell at any great length on the present status of UHF and the plight in which some of the UHF station operators now find themselves. They have already painted their own pictures quite vividly to this subcommittee.

I do think, however, that it might be useful, without in any way belittling the unhappy state in which some of them find themselves, for me to provide a more comprehensive frame of reference. Perhaps in this way I can pinpoint more accurately just what the difficulties of some of them UHF stations are and, having isolated those difficulties, point to cures which would believe the patient’s headache by means short of chopping off his head.

First, there can be no question, as to the testimony of previous witnesses have established, that a number of UHF station operators have lost and are losing money. But, if we put aside the emotion which seems to have impregnated this whole issue, this is not in itself enough to warrant Government intervention. I think all will agree that one of the hard but inescapable facts of free competitive enterprise is that there can be no guaranty of profits. There has unfortunately been a measure of perhaps unconscious expectation on the part of some broadcasters that all one has to do is press the button of a television station, no matter where, no matter by whom, and no matter in what circumstances, and by the next day the profits should flow in.

This is not the way it works in the automobile business or in the broadcasting business. After all, there are many radio stations which were not and are not now successful and some VHF grants have been surrendered. It is particularly pertinent to recall the experience of the pioneer VHF station operators and the enormous obstacles which they had to face in the beginning. Some—WCBS-TV, the station owned by CBS in New York City was one of them—began regular operations as early as 1941. Many more began operations in 1946–48.

During these early days—which are not so long ago—there were far fewer television receivers in the hands of the public than there now are UHF sets. There was very little network programming. Television receivers were much more expensive than they are now.

Television stations and networks operated for many years before they made a penny. Stations and networks lost millions annually during the years in which television was getting established. For the 3 years 1948–50 the aggregate operating losses reported by television stations and networks to the FCC were $48 million. Of these losses, $27,500,000 were sustained by the 4 networks including their 14 owned and operated stations and $20,600,000 by the remaining 93 television stations. It was a long, hard pull and we did not then have the hind-
sight which we have now to comfort us in the thought that ultimately it would be worth it. Yet I cannot recall that it was ever suggested that any sort of legislative relief was due VHF broadcasters.

The mere fact that some UHF stations are losing money does not justify drastic Government action to guarantee them profits or to take away from existing stations the success which those stations worked so long and so hard and so expensively to attain. After all, only a few of these UHF stations have been on the air for more than a year; most of them have been operating for less than 12 months.

It is unrealistic to assume that any new service or any new business would automatically and immediately prosper and we are on dangerous grounds when we try to reverse some of the natural economic forces of free competitive enterprise.

Thus I think that we must put aside those cases, and there have undoubtedly been some, where the lack of present financial success is due to the reasons which obtain in all businesses and do not reflect on the viability of UHF as a part of a television broadcasting service. There undoubtedly have been such failures that have been due to attempts to operate in markets which simply cannot support any kind of television station at the present time. Some have been due to attempts to operate in markets which will not now support the number of stations allocated to those markets. It is well to recall that even the largest market in the country—New York City—does not now and never did support all seven VHF stations on a profitable basis.

In some cases the lack of success has been due to management deficiencies. The plain fact is that television broadcasting and station operation is a tough business requiring a measure of skill and a good deal of sweat, capital, and imagination. It is reasonable to assume that, like all other business, these ingredients have not been present in the case of every management.

I know that this subcommittee shares our regrets that such failures, because of these factors, do occur. But I assume, also, that the subcommittee agrees that this cannot be a matter of governmental concern warranting legislative or administrative intervention.

So, let us pass on to the special obstacles which stem directly from the particular characteristics of UHF station operation. In general, these obstacles, as previous testimony has indicated, are two in nature. First is lack of what we call circulation. The fact that of the 31,370,000 receivers now in the hands of the public, about 27 million, or over 85 percent, are not capable of receiving UHF signals. It costs the public money—a rather substantial amount—to convert these existing receivers so as to permit them to receive UHF signals; there is also quite a spread between the price of a VHF-only receiver and an all-channel received. This, of course, makes it hard for a UHF broadcaster in a market where VHF has been established and there are a large number of VHF-only receivers in the homes. In such a market a VHF broadcaster can go on the air and be assured that every receiver in the market can tune him in; on the other hand, a UHF broadcaster has only so much of the audience as has been persuaded to spend up to $100 for a converter, antenna, and installation to change his set to receive the UHF signal.

The second obstacle which faces the UHF station comes from the laws of nature. We are not yet fully familiar, the engineers tell me,
with the exact characteristics of UHF propagation. One sure way of getting a lively discussion among any two or more engineers in this industry is to ask them how UHF coverage compares today and will compare tomorrow or 5 years from now with VHF coverage. There are a great many strongly held opinions on that issue. I believe, however, that there are two points of unanimous agreement today: (1) that UHF is capable of providing a reasonable and useful service; and (2) that even though UHF can get within striking distance of VHF in terms of coverage, it cannot, at least at present and for the foreseeable future, equal the coverage of VHF. This is so, both in terms of the distance out from the transmitter which the signal will reach and in terms of the solidity of the coverage within the reachable area. By this latter I mean that, owing to what the engineers refer to as shadow effects, absorption by trees and buildings and greater inability of UHF to reach behind hills and similar obstacles, there are more holes or blind spots within the coverage area of UHF than of VHF.

As I say, there does seem to be considerable unanimity on these two points. But there is a great deal less unanimity on the extent of this disparity in coverage between VHF and UHF. The disparity is there, but I have had great difficulty in getting even our own engineers to hazard a specific quantitative guess on the difference between the two. And, of course, the significance of the difference is greater or lesser, depending on the particular area involved. For example, it should be of no significance that a VHF station can reach, let us say, 10 miles further than a UHF station if that extra 10 miles of circle is a desert with nobody living on it. But it may be extremely important, competitively, for the UHF station if there is a heavy concentration of homes in the 10-mile area.

For the long run, the disparity between VHF and UHF coverage may well tend to become insignificant. These engineering problems have a way, ultimately, of being solved, although it is not always possible to predict precisely how and when. But there is reason to believe that ultimately the technical differences between UHF and VHF coverage will substantially diminish.

These then are the two crosses which UHF stations have to bear today—the inability of the vast majority of present sets to receive UHF with the consequent necessity for the public to spend money to change their sets; and the more limited coverage of UHF at present.

How serious are these two problems and what can be done about them?

Again, the testimony of the witnesses who have appeared before you establishes that these obstacles are not insuperable. You have heard some UHF operators tell you that they are in the black and have been almost from the first day of their operations. They have told you, and the known facts certainly bear them out, that within a relatively short time the job that they have done—vigorous, aggressive and in the best American tradition of courageous pioneering—has resulted in conversions by well over the majority of set owners in their areas. Their stories compel the conclusion that it is by no means necessarily fatal to be consigned to the UHF.

But when one analyzes the facts which the UHF witnesses have presented and the facts relating to similar situations, a pattern begins to emerge which seems to us to be almost inescapable. It is this: where
there has already been established a multiple VHF service in a community—at least 2 and certainly 3 or more VHF stations—the success of a new UHF station is exceedingly doubtful. On the other hand, where UHF comes in first with no existing VHF station in the community, in normal circumstances this station does well. The Portland, Oreg., and Peoria, Ill., UHF stations are examples of this. Further, where there is only one VHF service, even though it has been in the community for a considerable length of time, a vigorously and aggressively managed new UHF station in that community can do well. Station WCAN-TV, a UHF station in Milwaukee, is an example of this.

But even in cases similar to Portland, Peoria and Milwaukee, we know also that unless there has been very substantial conversion, the future of a UHF station which, after its establishment, then has to meet the competition of new VHF stations in the same city, is speculative although not by any means and in all circumstances hopeless.

I think that the lesson to be withdrawn from this plain and both the members of the subcommittee as well as many of the witnesses who have preceded me have drawn the lesson. It is that primarily because of interim problems of conversion but also because of problems of coverage, a UHF station will have difficulty in competing with reasonable equality with a number of VHF stations in the same market.

The basic problem, therefore, is what to do about it. Can this competitive inequality be ameliorated without endangering the entire medium of television—and if so, how? A variety of suggestions has been made, each with the purpose of ameliorating the inequality. Some, however, would achieve that purpose in so drastic a way that it would involve not only a serious threat to all of television broadcasting as a national public service and as a competitive medium but also would mark the sharpest kind of departure from the normal principles of free competitive enterprise on which this Nation has been built. The operation might be a success, but the patient will die. Other suggestions would at least in a measure avoid this danger of fatalism but might keep the patient on crutches for life. I would like to take each of the proposals up in turn.

1. The proposal to abandon the VHF portion of the spectrum and move all stations to the UHF.

I cannot quarrel with the contention that to move all television stations to the UHF would most certainly and most clearly remove the competitive inequality between the two. But this is like saying that since the new Douglas DC-7 going into service on several airlines outperforms the DC-6, passenger service should be restricted to the slower and less efficient plane. It seems to me to be an astonishing concept that the way to achieve equal competition is to cut all sizes down to the smallest; although this proposal would indeed create a kind of unnatural and artificially stunted equality, it would have disastrous effects on the medium of television and on the public itself.

By artificially cutting down on the potential full circulation and refraining from making use of the best possible frequencies available, all of television is inevitably weakened. Obviously this will not do any television station operators any good. If we so upset the present scheme by turning our backs on VHF we may critically, if not fatally, weaken television. In an attempt to help some, we will be seriously endangering all.
This, of course, means that the public will be hurt; the advertising dollars which make possible not only the sponsored programs but which make it possible for networks and stations to put on public affairs programs in the national interest would be diminished and hence both the quantity and the quality of the programs would be lessened. Further, the 27 million set owners who have not yet converted to UHF would have to spend anywhere from $40 to $100 more to get fewer and perhaps poorer programs. The extra expenditure on the part of the public required by this proposal would probably exceed $1.1 billion. This extra cost will accordingly be about 25 to 30 times as large as the total amount invested to date in the tangible broadcast property of all UHF stations. In fact, the extra cost to the general public of this proposal will probably be more than four times as large as the total amount that can be expected to be invested in the tangible broadcast property of all television stations in this country when all stations that have been applied for are finished and operating.

Aside from these costs to the public, some 3 to 5 million television set owners who are now within range of VHF signals would not, because of the lesser coverage of UHF, be able to get any signals at all if we all went to UHF. Their investments of a half billion to a billion dollars will have become lost. I for one—and, I know, the members of this subcommittee—would not like to have to face the tens of millions of people who are forced to spend a billion dollars to get less than they have been getting, let alone the 3 to 5 million people who, regardless of their expenditure, will not be able to get anything at all and will not be able to salvage their investments in their sets unless new stations, nearby, can grow and survive.

In any even, it is not established that the UHF provides sufficient space fully to accommodate the number of stations which are necessary to achieve the objective of getting as close as possible to a nationwide, multiple service, competitive television system. Indeed there is very substantial opinion to the contrary—I believe it to be the consensus that both UHF and VHF are requisite if we are to approach that objective.

Therefore, whatever surface attraction and logic there may appear to be in cutting everybody down to size by moving to UHF seems to be overwhelmingly outweighed by these compelling considerations against it.

2. The proposal to reduce the presently permissible antenna heights and power of VHF stations.

This proposal is cut from the same cloth as the proposal to move everything to UHF. Again it has a spurious attraction of equality, but it also is an extremely artificial equality of cutting everyone down to the smallest size. Such a course of action would be financially disadvantageous to many VHF stations and would prevent others from achieving their maximum potential. It would reduce the attractiveness of television as an advertising medium because it would reduce circulation. As in the case of the first proposal, limiting VHF power would deprive large segments of the public of existing and future television service—all those who live in that area which can be reached by higher-power VHF and not by UHF or low-power VHF. And it may be noted that in any event this proposal does little good in those areas where there has already been established multiple VHF
television service, since conversion would still remain the primary problem for any newcomer UHF.

3. The imposition of a freeze on VHF grants.

I am not quite clear concerning the precise limits of the proposal to impose a new freeze. I do not understand whether its purpose is to maintain the status quo while some satisfactory solution to the UHF problems is found, or whether its purpose is to attach hundred pound weights to new VHF stations in order to give new UHF stations a good head start. If it is the former, I can see almost an endless freeze because these problems are exceedingly complex. We had 40 months of freeze trying to solve them; apparently we have not solved them to everyone’s satisfaction yet. Positions are held so strongly on these issues that I see little hope of ever finding a solution that is satisfactory to everyone. I am frightened by the prospect of another ice age which will leave little but rocks and stubble behind it.

If the purpose is the second one—simply to hobble new VHF stations in the competitive race in order to give UHF a head start—again I find this a rather amazing concept. It is like saying that Congress should pass legislation forbidding a filling station which has found itself a good location on a busy intersection from opening for 3 or 4 or 5 years until a competing filling station which was unfortunate enough to find space on a less well-traveled highway got a foothold. Further, a freeze of this nature would intensify the present advantages of existing VHF stations—protecting them from the competition of new VHF stations in the same market.

I think that such a freeze would be unfair to the public which would be deprived of service it would otherwise have. It would provide only temporary relief to a relatively few UHF broadcasters and, worst of all, would postpone the date on which a large part of the population will receive television service or additional choice of programs.

4. The elimination of intermixture.

As I have already indicated, it is our belief that many of the basic difficulties which now confront UHF broadcasters arise from intermixture—the term which we use to describe the assignment of both UHF and VHF channels to the same communities. We are persuaded that the events since the lifting of the freeze confirm the correctness of our view, expressed in 1950–52, that the UHF portion of the spectrum should not be used in such a way as to require it to compete with the VHF portion of the spectrum in the same markets. All the present facts relating to the experience of UHF stations seem to establish that UHF stations can do well if they are not forced to come into a market, or survive in a market, where they must compete with multiple VHF services. Hindsight, quite clearly, has confirmed the wisdom of nonintermixture.

But a lot of water has gone over the dam since the lifting of the freeze. The problem no longer is whether the policy of intermixture should or should not be adopted. The fact is that it has been adopted, and the present allocations are based on it. Thus we are faced with the far more troublesome and vexing problem whether, having gone this far in intermixing, it is now, at this date, desirable or practicable to try to force the milk back into the bottle through a process of what I shall call deintermixture.
In brief, deintermixture involves a reallocation of channel assignments so that any one community will be either all VHF or all UHF; no single community would have both UHF and VHF stations. It may well be possible, at least in virtually all of the top 150 markets, to reallocate on a deintermixed basis in order to provide in each of these markets either at least 4 VHF services or at least 4 UHF services.

It seems to me inescapable that as a theoretical matter, such a program of deintermixture may well be the only workable solution to the present UHF difficulties. Deintermixture has some very important advantages. It also has some very serious disadvantages.

Its primary advantages are two: First, it would assure a far more stable future to UHF, and on a broader basis, since it would substantially eliminate the great competitive disadvantages which a UHF station now faces as against VHF stations in the same market.

Second, deintermixture would increase the opportunities for competitive television services—both among stations and among networks. As far as station facilities are concerned—that is, whether they are VHF or UHF—each of the present networks would be on an equality in each of the important markets; full opportunity for network competition among at least four networks would thus be afforded.

Deintermixture would be far less drastic and upsetting than shifting all stations to the UHF. It would protect the vast majority of present set owners, who would continue to receive service from their present sources. Possibly not more than 10 or 15 percent of the present set owners would have to convert. Further, far fewer set owners—possible less than a million—would lose service altogether, while somewhere between 3 million and 5 million would lose such service if there were a complete shift to UHF. And of course far fewer stations, perhaps less than 100, would have to shift from the portion of the spectrum which they currently occupy than would be the case if all had to shift to UHF.

But the process of disentangling is never easy; I cannot minimize the seriousness of the problems which would be involved. Some set owners, as I have said, would lose service altogether. Several million would lose service unless they converted their set. This is hard on them; they bought their receivers assuming that it would provide them a regular service. Deintermixture would frustrate their expectations—in some cases altogether, in more cases unless they spend money to convert their receivers.

Nor can I minimize the hardship which deintermixture would impose on some stations. Stations whose owners had the foresight or the superior qualifications which won for them assignments in VHF would be shifted to UHF despite their planning, their investments and their reasonable expectations. In some cases—although perhaps the number is very small—there may be deletions of stations altogether. Thus there may be some few markets where the total number of UHF and VHF stations now on the air exceed the number of VHF channels or UHF channels which can be made available in the community under a deintermixture plan. For example, there may be a community where there are 3 VHF stations and 2 UHF stations now in operation. It may be that the process of deintermixture may yield only 4 VHF assignments to that community. If that be the case, one existing licensee would have to be eliminated.
The problem is not made easier practically or politically by the fact that not all members of the public and not all licensees will be treated equally. In most areas, owners of television receivers will not be affected; they will continue to receive all the programs they now receive—and probably even more than they have been receiving—and without any expenditure on their part. But their neighbors in another area may have to spend money to convert or may lose service altogether. So, too, some licensees will bear a heavy burden; others will be unaffected.

For example, some UHF licensees may benefit by being shifted to VHF; on the other hand, some VHF licensees would be shifted to UHF. This unequal impact on set owners and licensees will inevitably be troublesome. It is small consolation for a set owner or a station licensee to be told that while he is being singled out to be hurt, it is a sacrifice for the national interest.

In addition, in order to accomplish the objective, arising out of the exigencies of providing full opportunity for network competition, of providing at least 4 channels to each of the top 100 or 150 metropolitan areas, it will undoubtedly be necessary to move present VHF and UHF assignments in smaller towns to the larger cities.

It is interesting to note that a tabulation shows that 3 out of the original 4 have not yet been spoken for or applied for. Only about 25 percent of the communities that were assigned VHF or UHF channels in the market have been spoken for.

Senator Potter. In other words, they made assignments in the market where the markets can afford the station.

Mr. Stanton. At any rate, local management or local enterprise has not seen fit to apply in those markets. I was surprised myself to see that the number was that large.

This involves a sacrifice of the principle of providing to the smaller communities local outlets for local expression. But I am not at all certain that, in television, this is a feasible principle in any event. As I will discuss in detail in another connection, there is serious doubt that small communities can economically support a television station at this time.

Because of these multitudinous practical problems, while deintermixture may well be the only workable, long-range solution for the problems which now confront us, it is not hard to understand why nobody is anxious to be the father of this child. No one wants to be responsible for the injury which it may do. And although the injury, as I have indicated, may be limited, and the ultimate benefits great, the blow will fall heavily on a number of members of the public and on a number of station licensees.

It would take the patience of a Job, the wisdom of a Solomon and the courage of a David to find the right way, or if there is no one right way, the best way, to accomplish deintermixture. The pressures on whoever might have the thankless task of deintermixture would be enormous and perhaps intolerable. There are bound to be difficult areas which might seem to defy solution. Certainly not everybody would be satisfied; certainly any particular plan will be vigorously criticized by those who are hurt and they will be the ones to find alternatives which would shift the injury to some other victim.

We do not know yet the full or precise dimensions of the problems of deintermixture. We do not know just who will be hurt, and how
much. We do not even know whether the price is so great that the purchase of its advantages becomes extravagantly foolish.

Because we do not know these things, and because deintermixture does appear to have such countervailing attractions, I suggest that it be immediately explored. I suggest that certain criteria can be agreed on at the outset if such an exploration is undertaken:

(1) That at least the first 100 markets, and as many more additional such areas as possible in descending order of size, be provided with 4 or more nonintermixed channels—the first 100 such areas, it may be noted, could on a deintermixed basis of at least 4 UHF or VHF channels, provide outlets for each of the 4 networks, each of which would thus serve all but 10 to 15 percent of the entire population which might reasonably expect to receive any television service at all;

(2) That, in accomplishing (1), first priority of consideration be given to preserving present investments of set owners, so that the greatest number of VHF set owners continue to receive VHF signals;

(3) That in accomplishing (1), second priority of consideration be given to preserving present investments of existing licensees, so that as few VHF licensees as possible be shifted to UHF, and, wherever shifts occur, provision be made to the greatest extent possible for substitute assignments in the same or a neighboring community to those licensees who must be shifted.

With these criteria or guideposts, it should be possible rapidly to devise one or more de-intermixture plans so as to ascertain the full dimensions—and the feasibility—of the project. I believe that all the energies and abilities of all those interested in the problem should be immediately brought to bear on this problem. Representatives of the Congress, of the Commission, and of the industry should confer promptly to test the desirability of de-intermixture.

If the decision is to go forward with de-intermixture, the greatest of self-restraint will be required. Perhaps sacrifices of which human nature is simply not capable may be necessary. Perhaps it will be found that the price is too great, and that whatever the benefits of de-intermixture, the time has passed and it is no longer possible. But it should be explored, with an open mind and with intensive effort at once. And meanwhile, it might well be wise for the Commission to adopt a liberal policy of permitting UHF licensees now having financial difficulties to suspend operations but still hold their licenses pending resolution of the question of de-intermixture.

5. Other suggestions to aid UHF.

We believe that there are other steps which might well speed the solution of the present problems.

First among these supplemental proposals, we support the suggestion that the manufacturer's excise tax be removed from UHF converters and from television sets equipped to receive both VHF and UHF. We urge that the proposal continue to be pressed by this subcommittee. If the tax is removed, the price differential between VHF and all-channel sets will be materially reduced in the case of the lower priced sets and altogether eliminated in the case of medium and higher priced sets. While we do not yet have sufficient experience to know what the rate of obsolescence and turnover is in the television receiver field, and hence cannot measure how long it would take for all of the present 31,379,000 sets to be replaced, it is clear that if all-band
sets are not more expensive than VHF-only sets, in a number of years—at least 7—virtually all sets will be capable of receiving UHF. This, of course, would by that time wholly solve the difficult problem of conversion and meanwhile each new set that is purchased would, by 1, ameliorate this problem, while now almost 8 out of each 10 sets, being VHF-only, simply accentuate the problem.

Second, the possibility of satellite stations licensed to UHF licensees should be quickly explored. Satellites may well go far toward solving the problem of unequal coverage between UHF and VHF. For example, WRGB-TV, a VHF station, serves the entire Albany-Schenectady-Troy area. None of the present UHF stations in that area can do so. If, however, the licensee of an Albany UHF station were permitted to operate two or three UHF transmitters—each one on a different channel—that licensee might well be able to deliver substantially the same potential circulation as WRGB-TV at a small increase in operating cost.

Third, we believe that there would be very considerable benefit to UHF if networks and other multiple owners of television stations were permitted to own and operate UHF stations. In order to save this subcommittee’s time, I am submitting herewith as exhibit I our comments filed with the Commission in support of the Commission’s proposal, which is still pending, to change its multiple-ownership rules to permit a single entity to own 2 UHF stations, in addition to the present permissible quota of 5 VHF stations. In exhibit I, we set out in full the reasons why we believe that such a proposal would be of real help to UHF.

Senator Potter. Are you familiar with Senator Johnson’s bill to trade in one VHF for two UHF stations?

Mr. Stanton. Yes, sir, and I am going to that subject right now.

Senator Potter. Your exhibit I will be made a part of the record at this point.

(Exhibit I is as follows:)

**Before the Federal Communications Commission**

Washington 25, D. C.

Docket No. 10822

In the Matter of Amendment of Section 3.636 of The Commission’s Rules and Regulations relating to multiple ownership of television broadcast stations

STATEMENT OF COLUMBIA BROADCASTING SYSTEM, INC.

Columbia Broadcasting System, Inc., hereinafter called CBS, favors the amendment of Section 3.636 of the Commission’s Rules and Regulations relating to multiple ownership of television broadcast stations as proposed by the Commission. CBS suggests that the rule be amended to provide for a greater increase in the maximum permissible ownership of television stations.

The principal reasons that CBS supports the proposed amendment of rule and suggests more extensive liberalization are as follows:

1. CBS believes that it is in the public interest to impose as few restrictions as possible on the ownership of broadcast stations.

2. Increased utilization of UHF stations will make possible the maximum competition between television broadcast services.

3. Ownership of UHF stations by broadcasters of proven experience and ability should promote development of the UHF service.
Relaxation of restriction on ownership

CBS does not believe it is appropriate to argue here the desirability or undesirability of imposing a numerical limitation upon the number of television broadcast stations which may be owned by any person. The Commission resolved that question in its Report and Order released November 27, 1953, in Docket No. 8967.

CBS has advocated consistently, and will continue to advocate, that it is in the public interest for ownership of broadcast stations, both radio and television, to be subject to as few restrictions as possible. It bases its advocacy upon the conviction that, except for regulations required by the nature of broadcasting, broadcasters should not be limited by governmental action in their ability to compete with newspapers, magazines and other media which are competitors for advertising revenue.

CBS believes that no business operation can remain healthy and dynamic if it is prevented from growing. This belief leads inevitably to the conclusion that any numerical limitation upon ownership of broadcast stations should be imposed only with the greatest of reluctance and that the maximum number of stations which may be owned should be as large as possible.

Accordingly, to the extent that the proposed amendment relaxes the numerical limitation upon ownership of stations CBS supports that amendment.

Maximum utilization of the UHF band should increase competition

It has long been obvious, and the Commission recognized in its Sixth Report and Order, that the VHF band is not capable of providing a sufficient number of television broadcast channels to make possible nationwide competitive television broadcasting service. That this is so is readily apparent from Exhibit A attached. In addition, many communities are wholly dependent upon the UHF band for competitive local television service—and in some cases for their only television service.

Ownership of UHF stations by experienced broadcasters will promote growth of that service

The acceptance and success of any broadcast service is dependent upon a number of factors, among the most important of which are the programs furnished by that service and the impetus given to development of that service by the willingness of the leaders of the industry to participate in its development.

At the present time the potentialities of VHF can be predicted with a fair degree of certainty. It is an established service with an established audience in many areas. Its programs can be received on all outstanding receivers without conversion or adaptation.

The UHF television broadcast service, on the other hand, is, by comparison, a service whose ultimate potentialities can be realized only through practical operating experience. It is estimated that as of November 1, 1953, approximately 27,500,000 television families in this country have television sets which are unable to receive UHF. The sets of these families can be adapted to receive UHF service only at a conversion cost of $20 or more per set.

In addition, while most models of sets currently being produced are available in models which will receive both UHF and VHF, there is a significant price differential ($25 or more) between a set capable of receiving VHF only and a set of the same model capable of receiving both VHF and UHF.

Accordingly, it is only natural that persons having a choice between operating a VHF and a UHF station would select the former.

For that reason an amendment of the present multiple-ownership rule which permits ownership of UHF stations in addition to the maximum permissible ownership of VHF stations should encourage the operation of UHF stations by established broadcasters—broadcasters who have a wealth of actual operating experience and program know-how. It would enable such broadcasters to operate UHF stations without reducing the number of VHF stations they may have.

CBS believes that its experience in the operation of radio and television broadcasting and its attention to the development and production of radio and television programs have given it preeminence in the program field. Its stations have been uniformly successful in producing high quality programs which have won wide public acceptance. It believes that the experience of other multiple owners have enabled them to produce high quality programming.

Insofar as networks are concerned, it is only natural that their economic interests should impel them at the present time to seek VHF affiliates in markets
having both VHF and UHF stations. On the other hand, if a network is the licensee of a UHF station in a combination UHF and VHF market its economic interest would impel it to make its own station the network outlet in that city. Hence, that UHF station would receive the benefit of both superior local programs and popular network programs.

In the event that the rule is amended, as suggested, or to permit even greater ownership of UHF, the programing of UHF stations should attract larger audiences for those stations.

Furthermore, in addition to the program know-how of multiple owners, such owners ordinarily have resources to enable them to staff the UHF stations with exceedingly competent technical personnel. Many of them also have reservoirs of highly-trained engineering personnel. Such personnel should insure that the maximum technical potentiality for UHF stations owned by them and thus encourage ownership of receivers capable of receiving UHF signals.

In addition, the mere fact that multiple owners of television stations are willing to invest funds, time, and energy in the operation of UHF stations should foster confidence in UHF on the part of others and thus increase the number of UHF stations.

With an increase in the number of UHF stations in operation and with assured high quality programing for many of such stations, it is natural to expect that a greater number of present sets will be converted so that they may receive UHF and that the number of purchasers of new sets capable of receiving UHF will be increased. As the production of sets capable of receiving UHF is increased, it is only reasonable to expect a reduction in the price differential between such sets and VHF-only sets. Such reduction should have a cumulative effect in giving additional impetus to the purchase of UHF sets.

**Further relaxation of rule**

As pointed out above, CBS advocates the minimum restriction on ownership of television stations. It believes that the benefits which would flow from modification of the rule as proposed by the Commission would be increased if the limitation on the maximum ownership of stations were also increased. In view of the present limitations upon the coverage of UHF stations and in view of the aggregate number of commercial television assignments, it would seem that no undue concentration of control of television broadcasting would result from limiting maximum ownership to 10 television broadcast stations, no more than 5 of which may be in the VHF band. As appears from exhibit A, attached, an aggregate of 6 or more commercial television channels have been assigned to each of 12 of the first 20 cities in order of size and an aggregate of 5 commercial television channels have been assigned to each of 8 of such cities.

**Ownership and operation of UHF stations by CBS**

In view of the present relative status of VHF and UHF, CBS, as a corporation, believes that its obligation to stockholders requires that it seek to own the maximum possible number of VHF stations.

However, if it is permitted to operate UHF stations in addition to the maximum permissible number of VHF stations, CBS is willing and eager to do so.

It believes that its technical and program experience and personnel make it highly qualified to do so. It further believes that its programing will spur the industry to high program standards and also believes that its engineering experience and personnel will attain the maximum technical performance of UHF.

It also believes that its position of leadership in the industry, its willingness to invest in and to operate UHF stations will provide an inducement to others to do so.

**Need for modification of footnote 10**

The willingness of CBS to apply for authorization to operate UHF stations is qualified by its desire to own the maximum permissible number of VHF stations. Accordingly, in the event that the rule is amended to permit ownership of UHF stations in addition to the maximum permissible number of VHF stations, provision should be made to permit CBS and others similarly situated to apply for and own UHF stations and, at the same time, to prosecute present applications for UHF facilities to the same extent as is now permitted under footnote 10 to the Commission's Report and Order in Docket No. 8067.

Respectfully submitted.

COLUMBIA BROADCASTING SYSTEM, INC.,
By JULIUS F. BRAUNER,
Secretary and General Attorney.

1 Includes channel 13 allocated to Newark, N. J.
2 Includes channel 50 and 60 (educational) allocated to Gary, Ind. and channel 56 allocated to Hammond, Ind.
3 Including channel 54 assigned to Belleville, Ill.
4 Assignments are listed as San Francisco—Oakland.
5 Including channel 4 assigned to Irwin, Pa.
6 Includes channel 6 allocated to White Fish Bay.
7 Buffalo including assignments to Buffalo—Niagara Falls.
8 Assignments will be listed as Minneapolis—St. Paul.
9 Channel 13 allocated to Newark, grouped with New York City totals to the list of first 50 cities.
10 Allocations for Oakland grouped with San Francisco totals in the list of first 50 cities.
11 Allocations for St. Paul grouped with Minneapolis totals in the list of first 50 cities.
12 Includes Portsmouth and Newport News, Va.

Mr. Stanton. We believe that the Commission’s proposal in docket No. 10822 is a more desirable approach to ownership of UHF stations by multiple owners than is the approach embodied in Senate bill S. 3095. This bill provides that no entity may be the licensee of more
than 10 television units; it counts a UHF station as one unit and a VHF station as two units. Presumably a VHF licensee who dropped a VHF license would receive preferential treatment on his application for two UHF licenses. But we do not believe that such legislation would offer any great present inducement to UHF operation by multiple-station owners. I think that all of you have heard enough testimony to establish that there would be very few takers because of the present advantages of VHF. It seems clear to us that the Commission's proposal offers a far greater and surer inducement to multiple owners to own and operate UHF stations. I might point out that in our comments offered to the Commission and attached as exhibit I, we have already committed ourselves to seeking two additional UHF stations at once if the Commission proposal should become effective.

Up to this point, as you have no doubt noticed, I have said nothing about the relationship of network and UHF stations, and the impact of networks on the status and development of UHF stations. Nor have I commented on any of the rather reckless proposals which have been made and which would utilize CBS and NBC as the donors in a sort of forced feeding process to help UHF stations grow. I would like to devote this section of my testimony to those problems.

At the outset, however, I want to make it crystal clear that CBS believes, and has always believed, in competitive broadcasting for both radio and television—in the greatest possible opportunity for, and encouragement of, competition not only among stations but among networks. The more stations and the more networks—and there is no magic in the number four, since if the economy permits, four most certainly should not be the ceiling—the better off all the broadcasters are, and even more important, the better off the public is. Again, this is more than mere lip service.

After all, CBS reached its present position of leadership because of the opportunity for competition and because we seized on that opportunity to compete as vigorously as we knew how. And as Dr. Allen B. Du Mont has pointed out, in the 1950-52 allocations proceedings before the Commission, CBS explicitly took the position that a controlling factor in determining an allocation plan should be the need to provide an opportunity for the greatest number of networks to compete with each other.

We are willing to meet all comers and we welcome the chance to compete on a fair and open basis. We want to compete for viewers, for station affiliations, and for advertisers. We want each network—and new networks not yet in existence—to have the greatest possible opportunity to affiliate with stations which, so far as assignments in the spectrum are concerned, are on equal footing. This puts the emphasis squarely on programing—which is where it should be.

In the testimony which has preceded mine, you have learned a good deal about station operations. While I regret that it does take time, however, I think it is important, in order for you to consider these proposals in the light of all the facts, that you also have in the record some of the basic facts of television network life. It is only against such basic facts that these proposals relating to networks can properly be considered.

The fact is that getting CBS television programs to UHF stations in order to help those stations is somewhat more complicated than just turning on a spigot and letting the programs flow. If that were all
that was involved, we would be delighted to program all the UHF stations in the country. But there is a great deal more involved. The television networking business is a complicated and delicate business. Profit margins are relatively small—particularly when one takes into account the enormous investments and operating expenditures involved.

It is easy to upset the balance of television networking and sink it altogether.

Essentially a television network is an organization which is able to arrange for the broadcasting of the same television program over a number of stations. In most instances these programs are broadcast simultaneously over the stations; in some cases they are broadcast on a delayed basis over some of the stations.

Most of the stations are interconnected by American Telephone & Telegraph Co. facilities—either coaxial cable or microwave relay. The cost of such circuits for CBS television is approximately $10 million a year. The stations which are not so interconnected or which, though interconnected, are unable to broadcast a particular program at the time of its original broadcast, are furnished with television recordings. These television recordings are films of the original program, photographed, so to speak, off the end of the picture tube. In fact, CBS television uses 16-millimeter film for this purpose at the prodigal rate of more than 50 million feet—over 10,000 miles—a year.

It is not often realized by the public that although the CBS television network, for example, comprises 163 stations in the continental United States, those stations are not owned, operated, or managed by CBS television. Of these 163 stations, CBS television owns 3, with a minority nonvoting interest in 2 other stations. All the rest are independently owned and are affiliated with CBS television through affiliation agreements.

These affiliates carry our network programs in accordance with the terms of their agreements. The agreements provide for the furnishing of the programs by the network to the stations, the broadcasting of those programs by the stations, and the payment by the network to the stations for broadcasting sponsored programs—that is, the programs for the broadcasting of which the advertiser pays the network.

I am attaching hereto as exhibit II a typical form of affiliation agreement between CBS television and a station.

Senator Potter. Exhibit II will be inserted in the record at this point.

(Exhibit II is as follows:)

EXHIBIT II

CBS TELEVISION

A division of Columbia Broadcasting System, Inc.

TELEVISION AFFILIATION AGREEMENT

Agreement made this _____ day of __________, 19____ by and between CBS TELEVISION, a division of Columbia Broadcasting System, Inc., 485 Madison Avenue, New York 22, New York (herein called "CBS Television") and ________________ (herein called "Station") licensed to operate television station at __________ full time on a frequency of _____ on Channel number ______.

CBS Television is engaged in operating a television broadcasting network and in furnishing programs to affiliated television stations over program trans-
mission facilities leased by CBS Television, by “off-the-tube” TV recordings, or otherwise. Some of such programs, herein called “sponsored programs”, are sold by CBS Television for sponsorship by its client-advertisers. All non-sponsored programs are herein called “sustaining programs”. “Network sustaining programs”, “network sponsored programs” and “network programs” as used herein mean network television programs. Station and CBS Television recognize that the regular audience of Station will be increased, to their mutual benefit, if CBS Television provides Station with television programs not otherwise locally available.

Accordingly, it is mutually agreed as follows:

1. CBS Television will offer to Station for broadcasting by Station network sustaining programs as hereinafter provided, without charge, and CBS Television network sponsored programs for which clients may request broadcasting by Station and which are consistent with CBS Television’s sales and program policies. Network sustaining programs made available by CBS Television are for sustaining use only and may not be sold for local sponsorship or used for any other purpose without the written consent of CBS Television in each instance.

2. (a) Station will accept and broadcast all network sponsored programs offered and furnished to it by CBS Television during “network option time” (as hereinafter defined); provided, however, that Station shall be under no obligation to accept or broadcast any such network sponsored program (i) on less than 50 days’ notice, or (ii) for broadcasting during a period in which Station is obligated by contract to broadcast a program of another network. Station may, of course, at its election, accept and broadcast network sponsored programs which CBS Television may offer within hours other than network option time.

   (b) As used herein, the term “network option time” shall mean the following hours:

   (i) if Station is in the Eastern or Central Time Zone, Daily, including Sunday, 10:00 A. M. to 1:00 P. M., 2:00 P. M. to 5:00 P. M. and 7:30 P. M. to 10:30 P. M. (expressed in New York time current on the date of broadcast);

   (ii) if Station is in the Mountain or Pacific Time Zone, Daily, including Sunday, 10:00 A. M. to 1:00 P. M., 2:00 P. M. to 5:00 P. M. and 7:30 P. M. to 10:30 P. M. (expressed in local time of Station current on the date of broadcast).

3. Nothing herein shall be construed (i) with respect to network programs offered pursuant hereto, to prevent or hinder Station from rejecting or refusing network programs which Station reasonably believes to be unsatisfactory or unsuitable, or (ii) with respect to network programs so offered or already contracted for, (A) to prevent Station from rejecting or refusing any program which, in its opinion, is contrary to the public interest, or (B) from substituting a program of outstanding local or national importance. CBS Television may, also, substitute for one or more of the programs offered hereunder other programs, sponsored or sustaining, of outstanding local or national importance, without any obligation to make any payment on account thereof (other than for the substitute program, if the substitute program is sponsored). In the event of any such rejection, refusal or substitution by either party, it will notify the other by private wire or telegram thereof as soon as practicable.

4. Station will not make either audio or visual commercial spot announcements in the “break” occurring in the course of a single network program or between contiguous network sponsored programs for the same sponsor where the usual station break does not occur.

5. CBS Television will pay Station for broadcasting network sponsored programs furnished by CBS Television as specified in Schedule A, attached hereto and hereby in all respects made a part hereof. Payment to Station will be made by CBS Television for network sponsored programs broadcast over Station within twenty (20) days following the termination of CBS Television’s four or five week fiscal period, as the case may be, during which such sponsored programs were broadcast.

6. CBS Television will offer to Station for broadcasting such network sustaining programs as CBS Television is able to deliver, or cause to be delivered, to Station over coaxial cable or radio relay program transmission lines under arrangements satisfactory to CBS Television. CBS Television shall not be obligated to offer, or make available to Station hereunder, such network sustaining programs as it may have available in the form of TV recordings, unless CBS
Television has the right so to do and Station shall agree to pay CBS Television’s charges therefor.

7. When, in the opinion of CBS Television, the transmission of network sponsored programs over coaxial cable or radio relay program transmission lines is, for any reason, impractical or undesirable, CBS Television reserves the right to deliver any such program to Station in the form of TV recordings, or otherwise.

8. Station agrees to observe any limitations CBS Television may place on the use of TV recordings and to return to CBS Television, transportation prepaid by Station, immediately following a single broadcast thereof, at such place as CBS Television may direct, and in the same condition as received by Station, ordinary wear and tear excepted, each print or copy of the TV recording of any network program, together with the reels and containers furnished therewith. Each such TV recording shall be used by Station only for the purpose herein contemplated.

9. Neither party hereto shall be liable to the other for claims by third parties, or for failure to operate facilities or supply programs for broadcasting if such failure is due to failure of equipment or action or claims by network clients, labor dispute or any similar or different cause or reason beyond the party’s control.

10. The obligations of the parties hereunder are subject to all applicable laws, rules and regulations, present and future, especially including rules and regulations of the Federal Communications Commission.

11. If Station applies to the Federal Communications Commission for consent to a transfer of its license, or proposes to transfer all or any of its assets without which it would be unable to perform its obligations hereunder, it will procure the agreement of the proposed transferee that, upon the consummation of the transfer, the transferee will assume and perform Station’s obligations hereunder, unless CBS Television shall waive this condition in writing.

12. All notices required to be given hereunder shall be given in writing, either by personal delivery or by mail or by telegram or by private wire (except as otherwise expressly herein provided) at the respective addresses of the parties hereto set forth above, or at such other addresses as may be designated in writing by registered mail by either party. Notice given by mail shall be deemed given on the date of mailing thereof. Notice given by telegram shall be deemed given on delivery of such telegram to a telegraph office, charges prepaid or to be billed. Notice given by private wire shall be deemed given on the sending thereof.

13. This Agreement shall be construed in accordance with the laws of the State of New York applicable to contracts fully to be performed therein, and this Agreement cannot be changed or terminated orally.

14. As of the beginning of the term hereof, this Agreement takes the place of, and is substituted for, any and all television affiliation agreements heretofore existing between the parties hereto, subject only to the fulfillment of any accrued obligations thereunder.

15. The term of this Agreement shall begin on and shall continue for a period of two (2) years from such date; provided, however, that unless either party shall send written notice to the other at least six months prior to the expiration of the then current two-year period that the party sending such notice does not wish to have the term extended beyond such two-year period, the term of this Agreement shall be automatically extended upon the expiration of the original term and each subsequent extension thereof for an additional period of two years; and provided further, that this Agreement may be terminated at any time by CBS Television by sending written notice to Station at least twelve months prior to the effective date of termination specified therein.

In witness whereof, the parties hereto have executed this Agreement as of the day and year first above written.

CBS TELEVISION,
a Division of Columbia Broadcasting System, Inc.

----------------------------------------------------------------------------------

SCHEDULE A

(Attached to and forming part of the agreement between CBS Television and __________________________. This Schedule A contains provisions supplementary to said agreement and in case of any conflict therewith, the provisions of this Schedule A shall govern.)
I. CBS Television will pay Station for broadcasting network sponsored programs furnished by CBS Television during each week of the term hereof, thirty per cent (30%) of the gross time charges for such week, less the “converted hour” deduction and the ASCAP and BMI deduction.

II. The “converted hour” deduction for any week shall be one hundred fifty per cent (150%) of the amount obtained by dividing the gross time charges for such week by the number of “converted hours” (as hereinafter defined) in such week.

III. The ASCAP and BMI deduction for any week shall be the amount obtained by (i) deducting the “converted hour” deduction for such week from thirty per cent (30%) of the gross time charges for such week, and (ii) multiplying the remainder by the ASCAP and BMI percentage.

IV. As used herein, the term “gross time charges” for any week shall mean the aggregate of the gross card rates charged and received by CBS Television for broadcasting time over Station for all network sponsored programs broadcast by Station during such week at the request of CBS Television.

V. As used herein, the term “gross time charges” for any week shall mean the aggregate of the gross card rates charged and received by CBS Television for broadcasting time over Station for all network sponsored programs broadcast by Station during such week at the request of CBS Television. An aggregate period of one hour during which there shall be broadcast over Station one or more network sponsored programs for which CBS Television shall charge and receive its Class A time card rate for broadcasting time over Station. An aggregate period of one hour during which there shall be broadcast over Station one or more network sponsored programs for which CBS Television shall charge and receive a percentage of its Class A time card rate, such as its Class B time card rate, shall be the equivalent of the same percentage of a converted hour. Fractions of an hour shall be treated for all purposes as their fractional proportions of a full hour within the same time classification.

VI. As used herein, the term “ASCAP and BMI percentage” shall mean the aggregate of the percentages of CBS Television’s “net receipts from sponsors after deductions” and of CBS Television’s “net receipts from advertisers after deductions” paid or payable, respectively, to American Society of Composers, Authors and Publishers (ASCAP) and Broadcast Music, Inc. (BMI) under CBS Television’s network blanket license agreements with ASCAP and BMI. (Currently such percentages are 3.025 and 1.2, respectively, so that the ASCAP and BMI percentage is 4.225%, but such current ASCAP percentage may be reduced by as much as .525 during each calendar year of the term hereof.)

VII. In the event that CBS Television shall have license agreements with ASCAP or BMI which shall provide for the payment of license fees computed on a basis other than a percentage of CBS Television’s “net receipts from sponsors after deductions” or “net receipts from advertisers after deductions,” as the case may be, CBS Television shall deduct from each payment to Station, in lieu of the ASCAP and BMI deduction, the proportionate share of music license fees paid or payable by CBS Television which is properly allocable to such payment.

VIII. The obligations of CBS Television hereunder are contingent upon its ability to make arrangements satisfactory to it for facilities for transmitting CBS Television network programs to the control board of Station.

Mr. Stanton. All networks—to a greater or lesser degree depending on the particular network—are something more than mere conduits by which a program gets from a certain place to its affiliates. They are in addition engaged in the important creative business of producing television programs. Most of these programs are offered by the network to advertisers for sponsorship. Programs which are not bought by advertisers but which are nevertheless carried over the network are called sustaining programs.

Under CBS television policy, some of our sustaining programs are not available for sponsorship—for example, we do not believe it appropriate to sell religious programs or to sell time for the broadcasting of such programs.

This business of creating and producing programs is, we believe, a very important part of networking. We do it partly because we believe that we can produce high quality entertainment programs as well as, if not better than, other outside organizations which do not
have the same continuous relationship to the broadcasting industry and to stations and to the viewing public, that we have.

Often we produce programs because no one else is willing to invest the time, effort and money necessary to insure the production of high quality programs. After all, the business of creating and producing programs and getting them off the ground and into the air can be, and often is, a long, tedious and expensive process. We have spent many, many months in shaping some of our programs, engaging writers, producers, directors, and talent for what we call auditions or tests. Sometimes these fall by the wayside and never see the light of day. Sometimes it is a year or two before we finally have gotten programs to where we want them in terms of quality.

As an example, I would point out to you a series which we call the Search in which we plan to do a series of 26 half-hour programs each in cooperation with a different college or university, showing the field of research or activity in which that college or university specializes and which will broaden man's horizon. We began planning that program 20 months ago; we have had 34 members of our staff working on it. We hope to begin it next fall. By then we will have spent in excess of a half million dollars on its preparation. I would think it a reasonable guess that if a network did not do that, nobody else would.

The basic reason for our engaging in the production of television programs is the recognition of our responsibility to provide individual programs of high quality and to arrange our network program schedule so that we will be able to provide a program sequence which will be attractive to listeners. This matter of program sequence is very important. An audience is built up and retained through an appropriate flow of programs. I believe that CBS more than any other organization, has pioneered and focused its primary energies on creative programming. We believe that this is the way for a network to be successful. If we have good programs, we get the listeners, and the advertisers. And for present purposes and what is even more immediately relevant, it is through good programing that we can compete successfully for the best possible stations to affiliate with us. For stations, like ourselves, are interested in getting the largest possible and most loyal audience, and the way to get the largest possible and most loyal audience is to provide them with the best possible programs. We have found by and large that the greatest assurance of such quality programing is for us to do it ourselves.

I would like to give you some idea of just what the CBS television network is in terms of facilities, departments and personnel. We supply a total of 78½ hours of network programs per week. Not all of that is commercial. About one-third of that is sustaining. Behind this number of programs are more than 60 different departments: Accounting, business affairs, construction, development of new effects, engineering, executive, graphic arts, network operations, news, press information, sales, special events, sports, station relations, television recording, and wardrobe, to name only a few. CBS television has 28 studios; 116 live black-and-white cameras; 31 black-and-white film chains; 17 live color cameras; and 5 color film chains.

We employ more than 3,700 persons of various crafts and skills such as writers, directors, producers, singers, actors, announcers, techni-
cians, stagehands, scenic editors, editors, film cutters. In order to give you some idea of the scope of these operations I have prepared as exhibit III a diagram which shows the flow of the activities and personnel that go into one typical half-hour dramatic program broadcast by CBS television.

Senator Potter. Exhibit III will be made a part of the official files of the committee at this point.

Mr. Stanton. As you will see from exhibit III, this typical CBS television half-hour dramatic program is the product of 1,374 man-hours, involving 154 people exclusive of the services of other CBS television departments such as sales, advertising, press information and traffic. You will see the variety of skills involved, the number of personnel and the man-hours which each group must spend. For example, for this 1 half-hour, 7 members of the program staff must spend 280 man-hours, 13 stagehands must spend 195 man-hours, 10 cameramen operating 3 cameras must spend 90 man-hours; scenic construction and painting takes 24 men and 52 man-hours; and so on down the line, and across the chart.

Further, to illustrate what is involved in getting a program on the air, I have had prepared a graphic summary of all the planning, the preparations, the arrangements and the personnel which went into our broadcasting of the 1952 conventions—a type of broadcast which I have chosen because it can only be live and which I doubt could be done at all if there were no networks.

Exhibit IV represents the man-hours devoted by CBS television to cover the 1952 national political conventions.

Senator Potter. That exhibit IV will be made a part of the official files of the committee.

Mr. Stanton. You will see that planning began in May 1951, well over a year before the conventions. It required 41,750 man-hours for 118 hours and 11 minutes of actual convention broadcasting.

Finally I have had prepared exhibit V to illustrate to you what is involved in putting on Douglas Edwards and the News, which is broadcast from 7:30 to 7:45 each week night, and which also seems to me to be a job which requires a network for it to be done at all.

Senator Potter. Exhibit V will be made a part of the official files of the committee.

Mr. Stanton. Exhibit V-A shows that there are 259 people involved in putting on that program and that number is exclusive of the facilities and services of the operations, engineering, reference, and other departments of CBS television.

Senator Potter. Exhibit V-A will be made a part of the official files of the committee.

Mr. Stanton. Of these 259 people, 94 are staff members and 165 are foreign and domestic camera correspondents. Exhibit V-B shows the variety of skills represented among these 259 people who contribute to this 15-minute broadcast.

Senator Potter. Exhibit V-B will be made a part of the official files of the committee.

Mr. Stanton. Exhibit V-C may serve to give you some idea of the geographic distribution of personnel, scattered all over the world—Europe, India, South Africa, Australia, Japan.

Senator Potter. Exhibit V-C will be made a part of the official files of the committee.
Mr. Stanton. I hope that these exhibits will give you some idea of what an immense task television network programing is and how great and complex is its scope. Each of these exhibits represents only 1 program or 1 program strip. In each week, however, the CBS television network provides 153 programs. Network programing, thus, takes skill; it takes imagination; and it takes a tremendous amount of money. Success in television networking does not come to those who will not work at it and take risks to gain it.

As I say, all of this takes money. To maintain these facilities, to employ these people, and to put on these programs we must have income. And that income comes from one source and one source alone—from advertisers. If advertisers will not support CBS television or any other television network, CBS television would cease to exist and so would every other network.

It must not for a moment be forgotten that network television is competing for the advertiser's dollar with all other advertising media—radio, magazines, newspapers, billboards, and many other media. In evaluating network television as one of these many media advertisers examine their costs very carefully. Their touchstone, like yours and mine, is what are they getting for their dollar? If television cannot furnish circulation at competitive costs, advertisers will not use network television; the advertisers' dollars will go elsewhere and television networks will cease to exist.

Then there would be no facilities for bringing to the people on a nationwide basis television broadcasts, presidential speeches, speeches and discussions by legislators, sports events and other special events as they occur. True, as I will discuss a little later, many methods of programing television stations can bring entertainment and local events to the television audience. But I want to stress live network programing is the only method by which events of national interest can be seen throughout the country as they happen.

I will not deny the entertainment and informative qualities of film programs. Some programs as a matter of fact require film and are better because of it. But good as they are, it is the live quality, the sense of seeing the event or the play, at the same time that it takes place, in front of your eyes as you sit in your living room, which is the real magic of television. Take the live quality out of television and you have diluted its excitement and impact. And more importantly, you have destroyed the single most effective means of communicating to the entire country in times of national emergency.

Next is the problem of affiliation. It is what the affiliate can deliver in terms of circulation that is the crux of what a network can offer to the advertiser. We cannot be arbitrary, whimsical, or eleemosynary in our choice of affiliates. We must do our best to affiliate with those stations which will give to the national advertiser the largest circulation at the lowest possible cost. The advertisers insist on lowest possible post-per-thousand.

By cost-per-thousand we mean the dollar cost to the advertisers for the facilities—that is, for the stations—which carry the programs; and the computation is made for each thousand of television homes. This is what is known as cost-per-thousand of circulation. A television's circulation is the total number of homes in which the station is viewed.
It is these hard facts of circulation, coverage area, and cost-per-thousand which must determine our selection of affiliates. If we selected on any other basis, we would be ignoring the advertiser whose litmus paper test is, as I have said, cost-per-thousand.

We do not discriminate in favor of VHF stations or against UHF stations. We must accept the potential circulation of each station as we find it. We must attempt to select the affiliates in such a manner that each of them provides the maximum amount of circulation which is unduplicated by any other affiliate. The public is not best served by a duplicated service. And except in unusual circumstances, duplicated circulation is a wasteful luxury and an advertiser does not want to pay twice for the same thing.

Thus, putting together an effective nationwide network of stations as to provide the largest possible circulation without overlap and duplication is like putting together pieces of geography of different size and shape in a jigsaw puzzle.

As a result, in some instances—though frankly I am afraid that for quite a while those instances will be few in number—our basis of selection will result in picking a UHF station in preference to a VHF station. An example is Erie, Pa. There the circulation of VHF station WICA is greater than the circulation of the UHF station WSEE. However, the excess of the WICA circulation over the WSEE circulation is almost entirely a duplication of circulation of other CBS television affiliates in Buffalo and Cleveland. Hence, we affiliated with the UHF station WSEE.

At the present time, CBS television has affiliation agreements or arrangements of one kind or another with 51 UHF stations in 47 markets. In 37 of these markets, CBS television is using only UHF affiliates. Wherever we can do so without seriously injuring our network business and without making it impossible for us to meet the demands of advertisers for the lowest cost-per-thousand, we do affiliate with UHF stations. And, while you have heard 1 or 2 witnesses who would create the impression that we have some distaste for affiliating with UHF stations and that we are uncooperative, I can assure you that no considerations enter into it other business considerations. To indicate to the subcommittee that this is not all one-sided, and that at least some UHF Stations with which we have affiliated do not share the views concerning our attitudes which have been expressed by some of the previous witnesses, I am attaching hereto as exhibit VI a letter from H. Moody McElveen, Jr., of WNOK-TV, a UHF station in Columbia, S. C. This letter came to us in the midst of these hearings completely unsolicited and out of the blue.

Senator Potter, Exhibit VI will made made a part of record at this point.

(Exhibit VI is as follows:)

Exhibit VI

Stations WNOK and WNOK-TV,
Hotel Jefferson, Columbia, S. C.,
May 28, 1954.

Mr. Frank Stanton.
President, Columbia Broadcasting System, Inc.,
485 Madison Avenue, New York, N. Y.

Dear Mr. Stanton: We have been acutely aware for some time and more recently have become quite disturbed by the criticism being directed at the networks in reference to alleged discrimination against UHF television stations.
I would like to go on record in behalf of WNOK-TV as offering any active assistance that you may desire in showing that in the case of this UHF station we have always received courteous, sympathetic, and understanding treatment from the CBS television network.

I should like to chronologically set forth our dealings with CBS for the past year and a half. This station received its construction permit from the Federal Communications Commission on September 18, 1952. On September 19 I had an appointment with Mr. Akerburg in his office in New York to discuss the possibility of an affiliation contract between WNOK-TV and the CBS television network. It was brought out in our conversation that the day our construction permit was granted the Federal Communications Commission also granted a construction permit for WCOS-TV on channel 25. It was also noted that in the not too distant future VHF channel 10 would be assigned to either WIS or WMSC, both of which had applied. At that time we had been advised by Allen B. Du Mont Laboratories that equipment would be available to allow us to be on the air in January of 1953. On September 24 WNOK-TV entered into an affiliation contract with the CBS television network with an effective date of January 1953. By the latter part of November 1952 it became apparent to us that Du Mont would not make delivery of equipment as promised by January. After several trips to the transmitter division of Allen B. Du Mont Laboratories in Clifton, N. J., we were promised delivery of a 5,000-watt UHF transmitter in April of 1953. The first week of December I arranged again for an appointment with Mr. Akerburg in his office in New York and during that meeting I explained to him our situation and because of the delay I offered to return the affiliation contract and consider the affiliation null and void. We, of course, were extremely anxious for the affiliation with CBS but felt in fairness to the network we should make the offer of termination. Much to our delight Mr. Akerburg was exceedingly gracious and understanding of our problem and informed me that the network regretted, as we did, the delay but would go along with us and for me to go back to Columbia, S. C., and not worry about the affiliation.

As it turned out we were not on the air in April as the manufacturers had promised, nor in June as promised, nor in August as promised. The network was always very considerate and as each subsequent delay appeared imminent we discussed it with either Mr. Snyder or Mr. Akerburg. At no time did the network ever question our integrity and good intentions. The latter part of July 1953, a very disturbing situation arose with reference to Lever Bros. It seems that the VHF station, which was not then on the air but planned to be the latter part of the year, had contacted the advertising manager of Lever Bros. and had persuaded him to demand that CBS television order his facilities for LUX Video Theater and Big Town rather than to order WNOK-TV which was and is the CBS affiliate in Columbia. Although this account exerted tremendous pressure on the network CBS television at no time wavered from the position that either Lever Bros. could buy WNOK-TV in Columbia or not have its programs released in this market. The network flatly refused to allow its programs to be fed to the station which was not its affiliate although that station was a VHF station. In passing, I think it should be noted that several months after this situation arose Lever Bros. decided to place their program on a competitive network.

The above indicates to me beyond a shadow of a doubt that as far as this station is concerned the CBS television network not only has not discriminated against UHF but rather has championed the cause.

At the present time WNOK-TV is carrying approximately 23 hours of network commercial time per week from the CBS television network which is comparable to the amount of commercial time that the VHF station here in Columbia is carrying from the NBC network.

I trust that some of the facts enclosed in this letter will be of some value in dispelling, at least as far as CBC television is concerned, the idea that there is network discrimination against UHF stations.

Cordially,

H. Moody McGlynn, Jr.

Mr. Stanton. Obviously, therefore, there are cases, and a rather substantial number of them, where we find it good business to affiliate with the UHF station, where we do so and where our relationships are excellent. But candor compels me to report the obvious fact that in the majority of the markets, business reasons have compelled us
to affiliate with a VHF station in preference to a UHF station, where we had the choice.

We have always been perfectly frank with potential affiliates about this. For example, immediately after the lifting of the freeze and the opening up of the UHF in 1952, we told our radio affiliates who were contemplating entering television that the hard facts of networks economics would often require us to affiliate with VHF station, where we had the choice, even though our radio affiliate of long standing might have acquired a UHF license.

This choice is compelled simply because the circulation of a VHF station is generally greater than the circulation of a UHF station. Let me give you an example of this: Exhibit VII is a rough engineering map showing the comparative contours of KWTV and KTVQ, Oklahoma City and KRLD-TV, Dallas.

Senator Potter. Exhibit VII will be made a part of the official files of the committee.

Mr. Stanton. Illustrated is the important difference of coverage between KWTV, the VHF station with which CBS television made its affiliation, and the other alternative, KTVQ, a UHF station in the same market. In respect to the open area of approximately 25 miles between the 2 contours of KWTV and KRLD-TV (VHF), Dallas, one should not get the impression that homes there are being denied television service. It is a well-established and accepted fact that actual viewing of a station extends out beyond the more conservative engineering definitions of coverage.

From this exhibit, it becomes obvious why we affiliated KWTV for Oklahoma City in preference to KTVQ. Not only do we realize greater coverage, but KWTV puts us on a par with NBC’s WKY-TV.

Now wholly apart from the differences which may obtain at present between UHF and VHF, there are other considerations, which I would like to describe briefly to the subcommittee which led us to conclude that we cannot economically affiliate with some particular stations. These fall roughly into two types of cases and, I repeat, they have nothing to do with whether the station is VHF or UHF.

The first type is represented by the small station—the station which can deliver unduplicated circulation but the market is not sufficiently large to attract advertisers. It is a well-known fact that as the size of a market decreases—that is, as its potential circulation is smaller—the cost per thousand of circulation increases. Obviously, there comes a point where the increase of cost for the particular station makes it uneconomical for the advertiser to use it at all. In such a case, whether the station is VHF or UHF, we just cannot afford to affiliate with the station. Let me see whether I can explain the reasons for this.

It is important because I think a number of complaints which have come to you about our not affiliating with certain stations come from these small stations which cannot understand why we will not affiliate with them. As I say, it stems from this inevitable fact that the smaller the market, the greater the cost per thousand for the advertiser.

First, let us consider this from a theoretical standpoint. Station A has a television homes circulation within an effective reception area of 400,000. With a base hour rate of $1,200 at night, its cost per thousand would be $3 ($1,200 divided by 400,000). Station “B” with
half that circulation—200,000 television homes—could have a rate around $700; its cost per thousand would then be $3.50 instead of $3.

In practice, it works out this way: WCBS-TV, New York, with a base rate of $5,500 and a television homes circulation of 4,170,300, has a cost per thousand of $1.32. Minot, N. Dak., however, with a circulation of 5,500 television homes and a base rate of $150 has a cost per thousand of $27.27; $1.32 per thousand for New York, $27.27 per thousand for Minot, N. Dak.

You will note that one of the factors which we must have present in order to determine the cost per thousand is the station rate. It is the relationship between station rate and circulation which establishes cost per thousand. The process of establishing station rates is complicated, reflecting as it does the necessity for satisfying both the station owner as the seller and the advertiser as the buyer. It must not only satisfy each of them but it must be set so that it can successfully meet the competition of other broadcasters in the same medium and the competition of other media. The precedent established in radio and the methods of pricing magazines and newspaper rates enter into the problem. It may be surprising to you to learn that rates are not proportional to station circulation. Actually, television rates do not decrease as rapidly as circulation. If they did, stations in small markets would find it difficult or impossible to obtain sufficient revenue and this is why you find on the one hand that stations with larger circulation do not have a card rate proportionately higher than that of a smaller station.

In other words, it simply is not true that a station with, let us say, one-hundredth the circulation of a New York station will have a rate which is 1 percent of the New York station rate. This pattern of increasing cost per thousand as circulation decreases is consistent with other media.

All this, I admit, is not very simple and may be a little confusing. The determination of rates is complex and even the measurement of the actual circulation or number of homes delivered by the station requires a great deal of judgment and skilled use of slide rules. I believe, however, that we at CBS television have approached this on a businesslike and scientific basis in an effort to be fair to our affiliates, to be competitive within our medium and to give our clients fair value for their expenditures.

We have been wrestling with this problem of cost per thousand ever since our operations began. As I have said, it is crucial in the whole business of network advertising. It may seem to be hard on the little stations that they cannot offer a cost per thousand more nearly equal to that of stations in larger markets. But our success in keeping costs per thousand down is indicated by the fact that for CBS television, the cost-per-thousand circulation has dropped from $3.93 in 1949 to $2.03 in 1951 to $1.50 in 1953. But that is a factor which one must constantly take into consideration is seen in the fact that in January 1954 our cost per thousand went up 16 cents to $1.75, although our projection for January 1955 is that we will get the costs back to $1.50.

We are met quite often with the question, why, if the cost per thousand stems from the rate which the advertiser is charged for the particular station, we cannot solve the problem by accepting the sta-
tion's offer to carry our commercial programs free. In fact, I have noticed that one or two witnesses who have appeared before this subcommittee have stated with rather shocked dismay that we were not even willing to put our programs on their station free of charge.

It is quite true that this would solve the problem of increasing our overall cost per thousand which occurs by taking on very small stations. But it should not be forgotten that the basis of the economic relationship between network and station is that while the advertiser is charged the total of each station's rates which he uses for his program, the money which the station and we receive comes from a sharing, controlled by contract, of that station rate paid by the advertiser. In other words, if an advertiser uses a station whose rate is $500, we get a part of that $500 and the station gets a part of the $500. If the station's rate is zero, not only does the station get nothing; we do not get anything either. Not only do we get nothing, we lose money in such an arrangement.

Let me try to show you why taking stations on a free basis is a losing proposition for the network by showing you the network costs involved in handling 22 of our small market stations. Even if we allocate to these smaller affiliates only their share of incremental expenses in special servicing of those stations, we find that such out-of-pocket expenses per smaller-market station come to $50 a week. This ignores any assignment to them of any share of selling, programing, or administrative costs.

But this $50 per week per station is only a minor portion of our out-of-pocket expense. To the weekly incremental overhead of $50 per station must be added the costs of getting the program to the affiliate—that is, the A. T. and T. charges which CBS television must pay. The cable or relay cost on an occasional basis is $1.15 per mile per hour.

Let us assume a station is 100 miles away from the nearest service point. Let us assume also that, as is often the case, the station does not qualify for full-time use of the cable. An examination shows that our 22 small-market affiliates average approximately 2 hours of commercial business each per week. For purposes of determining profit or loss, let us consider that these 2 hours are contiguous hours so as to compute cable costs on the most economical basis. The weekly cable cost for our example would be $230. To this must be added approximately $170 per week—the A. T. and T. connection charge and local loop on a part-time basis. Therefore, including the $50 overhead figure, the weekly cost of such an affiliation to CBS television would be $450.

Senator Potter. I wonder if it might not be desirable that we take a little break at this time. I know how tiresome it is. I think probably you might like just a slight break at this time.

Mr. Stanton. I would welcome it.

Senator Potter. We will suspend and recess for 5 minutes.

(Whereupon a short recess was had.)

Senator Potter. The subcommittee will come to order.

Before Mr. Stanton continues with his statement, I would like to announce that we will not be able to conclude the hearings tonight as we had originally planned, so rather than meet tomorrow we will meet the first available day that we can receive the committee room, which will be Wednesday afternoon at 1 o'clock.
NBC will be the first witness and then the rebuttal statements by the UHF, the VHF, and Commissioner Hennock and Chairman Hyde of the Federal Communications Commission will be presented.

Proceed, Mr. Stanton.

Mr. Stanton. Mr. Chairman, this figure of $450 is almost twice the gross time receipts CBS television would realize after advertising agency commission and network discounts from 4 half-hours of commercial time on this station with an hourly rate of $150. With 22 such small-market stations presently on our lineup, this means a total weekly loss of over $4,500—or almost a quarter of a million dollars a year, even on the limited basis of allocating to them only our incremental expenses.

You can see, in these circumstances, why it is expensive for us to affiliate with stations which cannot pay their own way—and why we cannot afford to take on stations on a free basis.

I hope that these rather detailed figures will throw some light on why it is more difficult than it sounds, and a great deal more uneconomical, for us to affiliate with stations which offer to take our programs with no charge. That may be fine for those stations; it may be fine for advertisers. It cost neither of them anything. But it's a mighty poor way to run a railroad.

Thus far I have dealt with the case of the small station which cannot support a rate which would justify our affiliating with it. That is the first type. The second type of station where we have refused affiliation is the station which is located in a different city from a present affiliate and may be able to deliver what appears to be a reasonably large circulation which would justify a rate of $150 or more. But the fly in the ointment in this second type of station is that its circulation, while seemingly large, does in fact significantly duplicate the circulation of other existing affiliates.

Here again, the principle is the same, whether the station is UHF or VHF. In such cases we ordinarily deny affiliation to the station because its circulation is costly and of little value to advertisers or the public. In other words, it does not fit our jigsaw puzzle of national coverage.

We have had a number of complaints when we have refused to affiliate in this type of situation. I think it may be helpful, therefore, for me to give you an example of what is involved here. Such an example is KCEN-TV, Temple, Tex., which recently approached CBS television for an affiliation and was refused. KCEN-TV, incidentally, is a VHF station operating on channel 6.

Exhibit VIII to my statement will help explain why we considered affiliation with this station unwise.

Senator Potter. Exhibit VIII will be made a part of the official records of the committee.

Mr. Stanton. The exhibit has several transparent overlays which may be interleaved with the map of a portion of Texas. The large, blue, crosshatched area on the top transparent sheet shows the area which our engineers compute will be served by our Dallas affiliate, KRLD-TV, operating on channel 4. This station is building a new transmitting station almost midway between Fort Worth and Dallas, and the blue crosshatched area represents the conditions that should exist when this construction is completed later this year. The blue,
crosshatched area in the lower right shows a similar service area for
our affiliate in Galveston, KGUL-TV.

The second transparent sheet illustrates the engineers' computed
service area of KTBC, our affiliate in Austin, Tex., which operates on
channel 7, with a power of 100 kilowatts and an antenna height of 740
feet. This service area is shown crosshatched in green. You will
notice a shaded ring around the service area of each station, intended
to show the tapering off or gradual deterioration of service in the ex-
treme fringe.

It would probably be advisable for me to be more specific as to the
basis for these computations. To be precise, the outer boundary of
the KRLD-TV and KCEN-TV crosshatched area corresponds to a
computed field intensity (signal strength) of 100 µv/m (also described
by engineers as 40 dbu). Similarly, the outer boundary of the
KTBC-TV and KGUL-TV service areas corresponds to a field in-
tensity of 316 µv/m (50 dbu). The higher field intensity is required
for service in the fringe on channels 7 to 13.

I might add that the relationship between the engineers’ compu-
tations and actual tune-in or listener habits has been checked rather
thoroughly by our engineers and audience research experts and there
is a high positive correlation.

When the third transparent sheet is placed over he map, you will
see the relationship of the area served by KCEN-TV with respect to
that served from Dallas and Austin. The small, hourglass-shaped
area is in the extreme fringe of KRLD-TV and KTBC-TV, and in
this area KCEN-TV will give a better signal. Of the total homes
served by the Temple station, approximately 76 percent would be
served by the affiliates we already have in Dallas and Austin.

Furthermore, many of the homes in the hourglass-shaped area (the
remaining 24 percent of KCEN-TV's total) have usable, though less-
than-perfect, reception of CBS television programs from KRLD-TV
or KTBC-TV.

Thus you will see that while KCEN-TV might at first blush appear
to make a good case for affiliation on the basis of its circulation, when
duplication with the existing affiliates in Dallas and Austin are elimi-
nated, plain, ordinary economic business judgment compels us to
deny an affiliation. After weighing these factors, along with such
factors as television-set ownership, buying power, importance of
market, familiarity of the station city to advertising time buyers, the
strength of competing television signals and the probable circulation
we would have throughout the area, we decided the number of homes
which would be added by KCEN-TV, the salability of the market and
the wasteful duplication in the areas already receiving good television
service would not justify affiliation of KCEN-TV.

While all this description of the factors which govern our determi-
nations concerning affiliations may seem rather detailed, I can assure
you that I have really oversimplified it and have only scratched the
surface. But I do hope that I have said enough to indicate to you the
basic fact which I want to drive home—that is, that we must do the
best possible job in putting together a network and that this best
possible job can be done only by careful, conscientious and reasonably
scientific decisions on our part in respect of each proposed affiliation.
And I hope that what I have said indicates to you that it is a complex, delicate and difficult job to which we bring to bear the careful thought and skills of many departments in the CBS television organization—engineering, research, station relations and sales.

I hope further that I have been able to indicate to you, therefore, that these difficult and in many ways unique business judgments which we must make go to the heart of networking. They simply do not lend themselves to broad and arbitrary formulas imposed from without. I do not believe that this is an appropriate area for Government regulation. For the Congress or the Commission to intervene in this field to command with whom networks should affiliate, and when and how many and in what circumstances, is to interpose the Government in what will inevitably be a morass of the most detailed business regulation and a substitution of Government fiat for what has been, and must be, careful business discretion.

Before turning to some of the particular proposals for network regulation in the field of affiliations, however, I would like to treat as briefly as I can two other topics which seem to me from reading the testimony up to now to have played a substantial part in the notion that there ought to be some regulation in this field. The first is the concept, usually implicit but sometimes explicitly stated in these hearings, that a station cannot survive unless it has a network affiliation.

I must confess that quite naturally I am delighted that what CBS television has to offer is considered to be so desirable that it is a matter of life or death for a station to get it. I must also confess that I find that the facts compel me to deny that there is a full measure of truth in the concept that we are indispensable to the success of a station.

It is a little hard for me to come before you and state publicly that we are not quite as invaluable as some people say we are. But I think that that is the fact.

First, and this is something which is particularly true of some of the stations whose representatives have appeared before you, an affiliation with CBS television is by no means a guaranty of financial success for the station. While some stations in major markets form a “basic required group” which an advertiser who wishes to use the CBS television network must buy, this group obviously cannot include stations in smaller markets. For the latter type of station, the advertiser has an option of picking any one or more.

Therefore, in order for an affiliation with such an “optional” station to ripen into any programing or economic return for the station, there is still the not inconsiderable problem of getting the advertiser to order that station. The mere fact that we affiliated with such a station does not mean that the advertiser will order it automatically. I think we find vivid illustration of this in the fact that, as I have already pointed out, we have on our network rate card some 22 affiliates in small markets which average only about 2 hours of commercial business a week.

Second, it is unpleasant for me as a network spokesman to have to remind you that networks are not the only sources of programs. The number of outside packagers making films for television is legion and is increasing. Some managements of local stations, with ingenuity, imagination, and drive, have found that they have a real role to play in the community and can build up an important and loyal audience through local live programing as well.
Many radio stations have been exceedingly prosperous without network programs; some of these nonnetwork stations have earned far higher profits than the network affiliates in the same city. While the problem may be somewhat more difficult at this stage of television's development, we are certain that there are nonnetwork television stations that have done well financially without a network. Certainly it takes more work for a station which does not rely on a network. It is far easier to patch in the network and have a full day and a full night's programing. I do not blame stations for preferring that course of life. I would myself. In fact, we try our best to make this an attractive way of life. But it is well to emphasize that perhaps there is a substitute of self-reliance, good management, and plain hard work.

There is another premise which is, I believe, wholly false, and yet which has apparently loomed large in the thinking of some who have appeared before you. I think it is clear not only from the testimony in these hearings but from some of the comments which have been made outside these hearings, that some of these proposals for network regulation have been colored and have been rationalized by the demagogic slogan that something ought to be done, that anything is justified, because there is a monopoly. CBS and NBC, it is said, are a "monopoly." And I must say that I find it extremely disturbing to read that this charge has been made publicly and in the context of these hearings by one of the very people, an experienced lawyer, who, as a member of the FCC, sits in judgment on us in determining whether or not our applications for licenses should be granted and renewed.

Yet by no stretch of the imagination can the word "monopoly" be accurately applied to us. I have asked our lawyers what a monopoly is. They tell me that the law says that where facts like those here are involved, mere size is not an offense against the antitrust laws unless it does amount to a monopoly. And there is no monopoly at least until a single entity in an industry controls more than two-thirds of the market.

As exhibit IX clearly shows, it is obvious that CBS television does not control anywhere near two-thirds of the market—even if the market is defined as merely limited to network billings—without taking into account other competing methods by which the national advertiser advertises his products either through television or through other media.

Senator Potter. Exhibit No. IX will be made a part of the official files of the committee.

Mr. Stanton. The gross billings of CBS television network fall far short of two-thirds of the total television network billings. It is a travesty of reality to lump the gross billings of the CBS television network with the NBC television network in order to justify this monopoly charge. I would suppose that no fact in the broadcasting industry is better known than the intense—and that word is an under-statement—competition between CBS and NBC. We fight each other—we fight each other hard—and we never stop fighting. We try to take audience from NBC, programs from NBC, advertisers from NBC, stations from NBC. They try to take them from us. While sometimes some people think that the competition between us is so bitter that it becomes absurd, I have never heard anybody say there is not enough of it. And I believe that this intense competition,
despite what some people may have thought are excesses, has kept us all on our toes and has benefited the public in terms of the programs and the services which they have received.

Because these issues of monopoly have been raised, I believe it would be useful to trace as rapidly as possible just how the networks got where they did in this competitive race. The fact is that there is nothing sinister about it. In the customary and natural way which prevails both in American business and in track meets, it is nothing more than the race going to the swift.

Let me start at the beginning. Television networking is not very old; it goes back only to 1948. Each of the present four television networks were in business then. That is an important fact, because this is not a case of a latecomer trying to get into a closed market. As a matter of fact, I note with interest that the Du Mont network testimony claims that Du Mont itself was the first actually to engage in television networking.

At the end of the first quarter of 1949—the first days of television networking—the position of the four networks in terms of gross billings was this:

The network gross billings of NBC for that quarter were just a little over $1 million; the gross billings of CBS were $431,000; the gross billings of ABC were $51,000; and the gross billings of Du Mont were $250,000.

As you will see from exhibit IX, for 1949 there was no very great dollar difference between the network billings, and the combined total billings of CBS, ABC, and Du Mont were less than NBC alone. Although CBS was second, it was not a very good second. The gross billings of NBC for the third quarter of 1950 were a little under $4.5 million; the gross billings of CBS were a little over $1.5 million; the gross billings of ABC were just under a million, and the gross billings of Du Mont during that period and in fact during the whole year were not reported. Thereafter, the gross billings of NBC and CBS television rose very rapidly with CBS finally passing NBC in the second quarter of 1953. The two other networks also rose, although far less rapidly and now ABC is beginning to outstrip Du Mont.

We all started from scratch. I don't know what the facilities of the other networks were back in 1949 and 1950. But I do know that we certainly were no giants of the television earth then; at the end of 1949, our personnel devoted to television network broadcasting numbered 409; we had only 4 studios and only 17 cameras.

There was no magic which accounts for the way these lines rise on the graph. There was nothing but the hardest kind of work, the most courageous kind of investment in plant, facilities, talent, and creative programming; there was the most vigorous pavement pounding and the hardest kind of selling. This is a business in which there are no free rides; you must spend money to make money, and you must work awfully hard at it to boot. We made tremendous investments in programming and in such plants as Television City in Hollywood. Those who were more cautious, or less courageous, thought we were foolish and extravagant. But we took the chance where some of the others did not. And it paid off—as this chart shows. Some of the others who made no such investment and had no such courage now complain that we should get no return on our investment in order to cut us down to their level.
It is important for this subcommittee and the public to realize that we invested over $43 million in television prior to 1952 before we got back a single penny in profits. And CBS television did this under a handicap that was unique among the four networks. It is an established fact that the backbone of profits in the television broadcasting business is not networking at all, but in the profits from station ownership.

Even today, despite our enormous investments and enormous expenditures, the profits attributable to television networking are relatively modest. While we are not privy to the profits of individual stations, I am sure that it would be very easy for us to pick three independent stations affiliated with us whose combined profits in 1953 exceeded the profits of the entire networking operation of CBS television.

Yet, despite the importance to a network of owning stations, in terms of revenues, CBS television, alone among the 4 networks, only owned 1 station until 1951, and even now we own only 3, with a minority interest in 2 others. Du Mont owns and has owned 3 from the beginning; NBC and ABC each owns and has owned 5.

We were under another important financial disadvantage: We were 1 of the 2 - ABC was the other - of the 4 networks which did not have the immense financial advantage of being in the television receiver manufacturing field during these critical formative years of television broadcasting. It is also a well known fact that until 1952, it was not the television broadcaster but the set manufacturer who reaped the profits from television.

I call to your attention a few interesting facts which we have gleaned from the annual reports of Du Mont, which now urges that our television network should be cut down to its size. In 1948, Du Mont, whose business was exclusively in television-manufacturing and broadcasting - earned net profits of $2,700,000 - when television broadcasters were losing their shirts. In 1950 its gross income exceeded $76 million. Its current assets exceeded $31 million and its net earnings after taxes were just short of $7 million. In that year 1 note that the net earnings of the entire operations of CBS were only $4,100,000.

So Du Mont, which now advances these drastic proposals, was hardly a little business which was struggling along at a loss in television. Its profits from television were very substantial. What actually happened was that it chose for reasons of its own not to take its profits from television manufacturing and invest them in network broadcasting - while we, with no television manufacturing profits, and no television station ownership profits, did invest in network broadcasting. I find the policy adopted by Du Mont stated in its 1952 annual report, in which it is said that the “primary aims” of Du Mont “are maximum service and volume from advertisers within the structure of divisional operation at a profit.”

I think that one can find a rather vivid illustration of the attitude of DuMont - its unwillingness to take the risks and make the investments and do the job which some of the rest of us in the early days took and did - in Du Mont’s Pittsburgh story. For a number of years, beginning on January 11, 1949, Du Mont had about the purest monopoly in the broadcasting business; it had the only television station in Pittsburgh - the sixth largest market in the country, and the largest
single station market. And yet despite the obligations that one would think would be accepted by the only television broadcaster in such a large community—the obligations to serve the local needs of the community—it was not until November 1950, when there were about 140,000 receivers in the market that Du Mont's Pittsburgh station even got around to acquiring a single live studio camera. Bear in mind too in relation to that fact that Du Mont manufactured studio cameras and equipment at the time.

I think that these contentions that the Congress should now intervene to bring other networks down to the level of Du Mont must be judged in the light of these facts. It seems to me wholly inconsistent with the principles of American free competitive enterprise, that circumstances such as these warrant Government intervention to induce artificial equality by reducing all to the lowest common denominator.

Because the short of it—and I think that this conclusion is inevitable—is that the proponent of these suggestions does not like and does not want competition at all. Under the guise of equalizing competition, it wants to discourage competition by depriving those who have competed from the fruits of their successful competition. It chose not to start running at post time; now it wants to start the race all over again by bringing everybody back to its position behind the field. And it asks the Government to do that job for it.

And I would call to this subcommittee's attention that there is nothing in the present affiliation agreements which would prevent any network, old or new, from making a good try at entering the race now. It is important to recall that even where a network has a primary affiliation, which gives it option time during certain hours on the affiliated station, no other network may be precluded from that option time.

The Commission's network regulations specifically provide that no option time given to a network is good against any other network. Experience shows that where a network does a good job of producing outstanding programs and a good job of selling itself to advertisers and to stations, there is an opportunity to come in even on stations which have primary affiliations with a competing network. CBS television's programs are accepted on a number of primary affiliates of NBC; and vice versa. ABC, too, has managed in the last year to gain time during our option hours for some of its programs on our primary affiliates.

With these facts as background, let me turn specifically to the proposals which have been made under the guise of helping UHF stations.

First is the proposal—referred to as Du Mont plan A—that in each of the first hundred cities where there are less than four VHF stations the networks should be compelled to take turns in selecting UHF affiliates. As I understand the proposal, it would work out something like this, using the city rankings selected by Du Mont:

In each of the first 3 cities there are 4 or more VHF stations. Accordingly, each of the four networks could have a VHF affiliate in each of those cities.

In Philadelphia there are 3 VHF stations and 3 UHF stations so that networks 1, 2, and 3 could have a VHF affiliate and network 4 would be compelled to take a UHF affiliate; in Boston there will be 3 VHF stations and 4 UHF stations. Networks 1, 2, and 4 this time
could have a VHF affiliate and network 3 would be required to take 1 of the UHF stations as an affiliate; in Detroit there are 3 VHF stations and 2 UHF stations. Networks 1, 3, and 4 could affiliate with the VHF stations and network 2 could be compelled to affiliate with a UHF station; in Pittsburgh there will be 3 VHF stations and 3 UHF stations. Network 1 would be required to take a UHF station as an affiliate and networks 2, 3, and 4 could affiliate with VHF stations. The same procedure would be followed in each of the remaining 93 cities.

It seems to me that the difficult and exacting task of putting together a network hardly lends itself to a procedure of choice by lot. But in any event, the proposal is unwise, impractical, and unsound. It creates an apparent present equality by taking away the advantages which have been earned. In some instances stations would be deprived of their present desirable network affiliations for the benefit of other stations in their own communities and would be required to accept network programs which they believe to be less desirable than those furnished by the network of their choice. In other instances, networks would be deprived of affiliations which they had obtained through free competition.

As a matter of fact, under the Du Mont plan A, in those cities where there are less than four VHF stations, competition among networks for affiliates and among stations for network affiliations would be seriously restricted. For example, in Philadelphia none of the three VHF stations could compete for an affiliation with network 4, in my earlier example, because network 4 would be obligated to affiliate with a UHF station in Philadelphia.

Even more important is the threat, inherent in Du Mont plan A, to the survival of live network television itself. This is a subject with which I shall deal in more detail in connection with my discussion of S. 3456—the bill which proposes to license networks. Suffice it to say here that Du Mont plan A, by making it impossible for any network to offer to an advertiser the largest possible circulation—and by necessarily excluding him from a substantial portion of television homes in a number of important markets—may well drive some advertisers either away from network use or away from television altogether.

The same objections obtain to an even greater degree to Du Mont plan B, the remarkable proposal that each station must relinquish on demand of a network 25 percent of its network class A time, 25 percent of its network class B time and 25 percent of its network class C time to the network which makes the demand. This is not competition; this is not free enterprise. This is the antithesis of both.

This radical proposal turns its back on the basic concept which has always controlled: The Commission itself has always insisted that a broadcasting licensee must, to perform his statutory obligation to operate in the public interest, exercise his own judgment in deciding what programs to accept and what programs to reject. Yet this proposal is directly contrary to the established principle of licensee responsibility. It would force the licensee, in picking programs from one network to take an equal percentage of programs from each other network regardless of the relative desirability and content of those programs.

This not only would destroy the entire concept of licensee responsibility but it would inevitably redound to the disadvantage of the
public by forcing down its throat whatever the law says that station
has to take. To determine how this would ignore public tastes and
preferences, one need only turn to those cities where each of the net-
works has a VHF outlet—where, in other words, in terms of station
facilities, each is competing on an equal basis, and where the public
thus has an opportunity most clearly to indicate its choice among the
network stations. Consistently the network programs of one net-
work far surpass the popularity of the programs of another net-
work by huge margins. There the public makes its own choice. But
under this proposal of requiring each station to divide its time among
the networks, where there are not four VHF stations, the public choice
is ignored; instead the viewer would be required to look at the pro-
grams for which the same public in another area has expressed little
enthusiasm.

Du Mont plan B, like Du Mont plan A, also gravely threatens the
very future of live television networking—and television itself—by
driving advertisers to seek other means of advertising.

I would like also to comment on S. 3456. On its face this bill is a
simple one, providing for the licensing of networks. But since the
Commission already exercises rather considerable powers over the net-
works through its licensing of the stations owned by networks, as well
as through its licensing of stations affiliated with networks, the impli-
cations of S. 3456 are rather large.

In effect, it would license anyone entering into the business of net-
working irrespective of the fact that that network owns no stations
and thus makes no use of any portion of the spectrum. And it is the
use of the spectrum which has always provided the basis in law for
licensing of broadcasters. This concept is abandoned by S. 3456—
which thus enters into a novel and dubious realm. Perhaps the bill
can most clearly be viewed as though it proposed to license a network
as a supplier of programing material—just as do film producers, in-
dependent program packagers, or advertising agencies which produce
programs.

This I believe is an extreme concept and we have a number of
comments about it. But I think that for the present I should limit
my comments here to the particular context of these hearings—that
is in the context of the regulation of network affiliations.

If the bill is designed to empower the Commission to require net-
works to supply particular stations with programs or is designed to
require stations to give up particular portions of their time to each
network, this is an extremely radical proposal. Constitutional prob-
lems of free speech are involved. Keeping in mind that this is an
attempt to regulate networks per se and wholly apart from station
licensing, it is no different from saying that newspaper wire services
or newspaper syndicates should be licensed in order to permit a rule
which would provide that if a newspaper chose to carry AP dispatches,
it must carry UP and INS dispatches, or if it chose to carry Walter
Winchell, it must also carry Drew Pearson, Walter Lippmann, and
Leonard Lyons.

I cannot believe that such a proposal can be seriously considered.
After all, television and radio are media of communication and in-
formation. Any regulation of networks is necessarily a regulation
of freedom of speech. There has been no showing that so extreme a
proposal is required in the public interest.
I hope that my testimony up to this point has made it clear why we believe so strongly that in any event proposals to regulate affiliations, at least in the form and the substance in which they have been presented so far, present extremely serious threats to television networking as we know it. They are attempts to solve a relatively limited, albeit serious, problem; but they have within them the seeds of total destruction of television networking. For if the advertiser finds that no network can give him substantially full circulation on a national basis, he will either turn away from television altogether, or he will turn to film programs placed on a spot or market-by-market basis, simply choosing in each market that station which will give him the largest circulation.

This will hardly help the weaker stations; the business will flow more swiftly to the stronger stations. And it will destroy all of networking, whether by CBS television or by any of the other networks. With such destruction all of live networking is likely to disappear—not only the great live entertainment programs but also the program which can only be done live: The public events, the conventions, and those other types of programs which have become so much a part of American social and political life but which by themselves cannot economically justify the maintenance of a network.

Further, proposals such as this may well critically weaken television as an advertising medium. As I have described to you in some detail, it is the cost per thousand which is so important to an advertiser. If perforce we limit an advertiser's potential circulation, inevitably his cost per thousand increases. And if that cost per thousand does increase, it is also inevitable that, short of national spot purchases—placement of film on an individual-station basis, without networking—the advertiser may well find television broadcasting uneconomical and hence at least some advertising dollars will flow to competing advertising media. That will not help UHF stations either; but it will critically hurt all of television.

These proposals, thus gravely endangering all of television networking, also threaten to abort the newest and most exciting development in this art—color. It costs a station only about $25,000 to $30,000 to equip itself to carry network color broadcasts. But it costs many times that for a station to equip itself to originate local live color broadcasts. I have heard of only a handful of stations which have immediate plans to broadcast live local programs.

Thus at least at the outset, and for a considerable time to come, it will be the networks which will bear almost the entire burden of getting color television started. This, too, will cost an immense amount of money. It is costing us a million and a half dollars to equip and prepare a single studio in New York City for the origination of network color broadcasts.

If networks do not make these expenditures and accept the heavy burden of broadcasting color—as CBS television and NBC are now doing—color will be indefinitely delayed. And the public will be deprived of this important new dimension in television. Yet networks could hardly afford these tremendous investments, if, through these proposals, advertisers were driven away from use of television networks.

In sum, the problems which this subcommittee faces are complex and vexing; they lend themselves to no easy solution. That is in-
herent in the television business and networking, which themselves are exceedingly complex and difficult.

It is just for such reasons that I urge most vigorously that the emotions and tribulations of the moment not tempt us to seek short-sighted cures. Let us not throw out the baby with the bath water.

I hope I have made it clear how strongly I hold the conviction that some of these proposals are just that—that in the excitement of the moment and probably with the best of good intentions, those who think they would save themselves may well destroy television. Sober second thought would help. Television has come a long way in a very short time. I can find nothing in our economic history which matches the rapid and dramatic growth of television. Television has still further to go—much further—and with color there are new opportunities and new horizons.

Intemperate or hasty proposals should not be permitted to cut short the life of television even before its prime.

Senator Potter. Mr. Stanton, that was a very informative and comprehensive statement.

I wish to state that I recognize how difficult it is to give a statement of that length. You have words floating in front of your eyes after a while.

You have covered many of the questions that I had in mind, and I have no questions at this time.

I originally announced that we would recess until Wednesday afternoon. However, if we are able to secure a committee room we will try to hold them Monday or Tuesday. If we can find out tomorrow, we will notify you.

If there is no announcement until tomorrow, the hearings will not be held until Tuesday. If you do not hear by Monday, they will be held on Wednesday.

Congress appropriates money for buildings downtown but we never have enough space for our committee assignments.

We will stand adjourned until further notice.

(Whereupon, at 5:39 p.m., the subcommittee stood in recess until further notice.)
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

TUESDAY, JUNE 22, 1954

UNITED STATES SENATE,
SUBCOMMITTEE NO. 2 ON COMMUNICATIONS OF THE
COMMITTEE ON INTERSTATE AND FOREIGN COMMERCE,
Washington, D.C.

The subcommittee met at 1:30 p.m., pursuant to recess, in room
G-16 of the Capitol, Senator Charles E. Potter, chairman of the sub-
committee, presiding.

President: Senators Potter (chairman of the subcommittee) and
Bowring.

Also present: Bertram O. Wissman, chief clerk, and Nick Zapple,
counsel for the subcommittee.

Senator Potter. The subcommittee will come to order.

At the opening of this phase of the hearing, I want to state for the
record the extreme regret that I, personally, have, and some in the sub-
committee, for the passing of one of our members of the subcommittee,
Senator Lester C. Hunt. I think he had as many friends in the Senate
as any Member has, and all of us regret his passing.

I know that he was deeply concerned with the problems that are
now being heard by this subcommittee, and we will miss his wisdom
and his encouragement and clear thinking. He was a tower of strength
for all of us.

In spite of his busy schedule, Senator Hunt spent a great deal of
his time and energy during the past week attending these hearings.

I am sorry the hearings were postponed yesterday, but it was done
out of respect for Senator Hunt. I want to read into the record at this
time a telegram I received from Mr. P. A. Sugg, WKY-TV, Oklahoma
City, Okla.:

Senator Potter,
Senate Office Building:

Upon my arrival in St. Louis, I learned that Senator Hunt had passed away
and, therefore, when the Senate subcommittee No. 2 is called together Monday,
i suggest for your consideration that on behalf of the VHF informal group we
suggest that you ask those present to stand in silence 1 minute to the memory
of the late Senator Hunt.

Senator Hunt, while seriously ill, spent a great deal of his time and energy
this past week in determining the merit of issues before your committee. His
questions were motivated by his interest in providing television service to the
majority of the people in the country, and it is our opinion our country, as well
as its television stations, should mourn for the loss of a great American.

This may be entered as a part of the record if you desire or deem appropriate.
A similar wire has been directed to his widow’s address.
I think the wire is entirely appropriate and, while I don't think we need stand, we will observe one minute of silent prayer for Senator Hunt.

(At this point an observance of one minute of silence was entered into in memory of the late Senator Hunt.)

When we concluded Friday, we had concluded all the witnesses scheduled with the exception of NBC's participation, and we are happy today that Mr. Heffernan, of NBC, is with us. That will conclude the regular schedule of witnesses. However, we agreed to allow a rebuttal statement to be made by a representative of the UHF and a further rebuttal statement to be made by a representative of VHF, and the two commissioners will have an opportunity to present their views, if they so desire.

Before Mr. Heffernan presents his statement, I would like to submit for the record statements from the following:

Mr. S. Payson Hall, Meredith Publishing Co., Des Moines, Iowa;
Mr. Otto P. Brandt, vice president and general manager, King Broadcasting Co., Seattle, Wash.;
The Crosley Broadcasting Corp., WLWT, Cincinnati, Ohio;
Philip Merryman, Southern Connecticut & Long Island Television Corp., WICC-TV, Bridgeport, Conn.;
UHF Stations WNOW-TV, and WSBA-TV, York, Pa., and WCMB-TV and WHIP-TV, Harrisburg, Pa.; and
Dr. Allen B. DuMont, president, Allen B. DuMont Laboratories, Inc., Clifton, N. J.

(The statements referred to are as follows):

STATEMENT OF S. PAYSON HALL, MEREDITH PUBLISHING CO., DES MOINES, IOWA

I am S. Payson Hall and I am appearing on behalf of Meredith Publishing Co., of which I am the director of radio and television, as well as treasurer.

Through its subsidiaries, Meredith Publishing Co. is the owner of television and standard broadcast stations located in Syracuse, N. Y.; Omaha, Nebr.; Phoenix, Ariz.; and Kansas City, Mo.

Meredith Publishing Co. has a long and consistent record of serving the general public through mass communication media, supported in part by the sale of advertising. For over 50 years we have published Successful Farming, a farm service magazine with editorial devoted entirely to the business of farming and the art of farm living. For more than 30 years we have published Better Homes and Gardens magazine, now serving over 4 million reader families with editorial material dedicated entirely to better homes and better family living.

During 1947 and 1948 we made an intensive study of the potentialities for public service inherent in television. We also thoroughly investigated the sections of the United States that we might be able to serve, having in mind the limitation on the number of stations that we could create or acquire.

These studies and investigations culminated in the preparation and filing of several applications for television facilities. This work was done at very considerable expense. We received one grant in Syracuse, N. Y., and the remainder were held up by the freeze.

It must be remembered that during the period of time I am discussing, the economic aspects of television were obscure beyond the fact that heavy operating losses were inevitable over an indefinite period. The establishment of a television station meant a tremendous original capital investment with no real assurance of any return on the investment. Obsolescence was an immediate consideration, there were few receiving sets in existence, and sources and amount of revenue were indeterminable. A television enterprise had to be considered as highly speculative on purely business considerations.

It is difficult indeed to recapture the atmosphere of those days, but there is no doubt as to the record: Comparatively few stations were actually established, and a large percentage of those stations were sold under distressed circumstances. Some permits were abandoned.
Because of the freeze and of the delays inherent in the hearing process, we have subsequently been forced to follow the route of buying established television stations to fulfill our pioneer’s faith in the industry.

The members of the subcommittee are quite familiar with the famous sixth report and order of the Federal Communications Commission in the matter of the amendment of section 3.906 et cetera of the Commission’s Rules and Regulations. We believe that the sixth report and order, which was based upon several years’ hearings and earnest consideration by the Commission, is a sound document even in the posture of present day conditions. One of the most significant findings of that report is that which declares that the utilization of the UHF spectrum is essential to a nationwide competitive television broadcasting system.

We see no technical method of eliminating intermixture of UHF and VHF in the same market where there isn’t sufficient spectrum space in the VHF band of frequencies. On the other hand we believe that there is sociological and economic necessity for such intermixture, because of the very necessity of establishing a nationwide, competitive television broadcasting system.

We are opposed to any plan which would eliminate all the VIHF channels and permit television broadcasting only in the UHF spectrum. Wholly aside from the fact that pioneers who really established television in the United States should not be at this late date faced with an extreme penalty, it is obvious that the tremendous investment of the citizens of the United States in all manner of VHF equipment should not be destroyed. There is simply no good reason to support such a lethal proposal.

There has been some suggestion that the service areas of VIHF and UHF stations should be reduced for the purpose of permitting the establishment of a larger number of stations. We believe that the Commission in its sixth report and order provided for minimum service areas, and the implementation of this suggestion would only mean that rural dwellers in the fringe areas of television reception would be further penalized.

In view of the necessity for an adequate national competitive television broadcasting service, it is obvious that every assistance should be made available to those who have the courage and the pioneering spirit to render television service in the UHF spectrum. As I understand it, one of the problems in connection with UHF coverage is the penetration of blank spots. I am advised that booster or satellite stations will be helpful in this connection, and therefore the Commission may wish to consider instances in which their authorization is of particular importance in the public interest.

The Commission might well relax its policy with respect to authorizing microwave relay links between the station transmitter and a program source, such as a network interconnection point.

We suggest that the Federal Communications Commission permit UHF permittees or licensees to apply for modification of their permits or licenses to change to a VIHF channel if such a channel should become available. I can well understand the emotions of many UHF operators throughout the United States in the light of my own misadventures when we invested great sums of our company’s resources to establish a television station in Syracuse, N. Y., with no real assurance of financial return. We undertook this risk in the spirit of American free enterprise. Now, as then, I believe it extremely difficult to arrive at a program of subsidy without doing violence to the fabric of our free enterprise system and a disservice to the objective of such subsidy.

Statement of Otto P. Brandt, Vice President and General Manager of King Broadcasting Co., Seattle, Wash.

I am Otto P. Brandt and I am appearing on behalf of King Broadcasting Co., licensee of KING-TV, Seattle, Wash. I am vice president and general manager of King Broadcasting Co.

KING-TV is one of the oldest television stations in the United States. For many years it was the only television station throughout the entire Pacific Northwest. When the station was established there were no receivers in the area, and for a long while thereafter the number of receiving sets available was extremely limited. This lack of set circulation rendered the station unattractive to commercial advertisers and, as a result, the station operated at a constant loss.
The first owner sold the station to the present owner during this critical period of time. The present owner acquired the station with full knowledge of operating losses and with complete awareness of the necessity for large additional investments and with no real assurance that the station ever would be profitable.

It is our feeling that anything that is for the overall good of television reacts to the benefit of KING-TV. We are anxious to see television develop to maturity and achieve its full position on the American scene. We cannot agree however, that the present plight of some television operators justifies Government subsidy, in effect, any more than at the similar distressed conditions of the pioneer VHF television broadcasters.

We see no method of eliminating intermixture of UHF and VHF in the same market where there is not sufficient spectrum space in the VHF band of frequencies. The matter of providing additional VHF spectrum space is deserving of the most serious consideration and study.

The present VHF band should not be disturbed. There is simply no adequate reason to move the VHF stations to the UHF band. The American public has a huge investment in VHF receiving and associated equipment. This investment should not be destroyed. The UHF station operators include the pioneers who really took the risk and established television in this country. Furthermore, such a move would run contrary to public interest in an area such as Seattle where the hilly terrain in heavily populated areas makes high frequency television reception extremely difficult.

Another proposal is made that service areas be reduced to permit more stations in the VHF band. In its sixth report and order the Commission provided for minimum service areas. The reduction of these service areas would only result in injury to rural dwellers.

We believe that every proper assistance should be given those who desire to establish stations in the UHF band. For example, the Commission might well authorize in proper cases the use of booster or satellite stations and it also might authorize intercity relays for program transmission to be operated by UHF stations.

The Congress might still afford some relief in the form of elimination of the 10 percent excise tax on the UHF receiving sets and components.

The Federal Communications Commission in its proposed rulemaking of December 23, 1933, in effect recommends that any party may own, in addition to the VHF stations, 2 UHF stations. This is a step in the right direction as something of a premium is afforded to the UHF stations in that those who desire to expand, have a greater opportunity in the UHF spectrum.

The Federal Communications Commission might well take another look at its procedural rules with the thought that UHF permittees or licensees will be permitted to apply for modification of their permits or licenses to change to a VHF channel if such a channel should become available.

It is not difficult to appreciate the emotions of many UHF operators throughout the United States. We too had our misgivings when we appropriated large sums of our company’s assets to continue operation of KING-TV when the losses were substantial and the future bleak. We undertook this risk in a spirit of American free enterprise. Sometimes these ventures succeed and sometimes they fail.

It is extremely difficult to resort to a program of subsidy without endangering our free competitive system.

STATEMENT BY THE CROSLEY BROADCASTING CORP.

The Crosley Broadcasting Corp. submits respectfully for the record of this hearing basic information regarding its development of four television properties, WLS-T, Cincinnati, WLW-D, Dayton, WLW-C, Columbus; and WLW-A, Atlanta, now VHF channels 5, 2, 4, 11, respectively.

The activities of Crosley in the field of television broadcasting commenced as early as April 1937 when it began experimentation relating to equipment design and development, leading to the establishment February 1, 1939, of a regular television division in its engineering department. On February 3, 1939, Crosley filed its first application for a construction permit for an experimental television broadcast station, receiving a grant on August 28, 1940, with the call letters WSXCT. Even before this date, as early as April 26, 1939, Crosley gave public demonstrations of the use of television equipment with wire rather than wireless transmission.
Crosley's WLW-T, Cincinnati, was not only the first commercial television broadcast station in the State of Ohio, but also the first in the area served by WLW, including Indiana, Kentucky, and West Virginia, the application for same being filed originally on November 15, 1944, with the original grant to Crosley dated November 21, 1946.

Crosley filed the original application for a television station in Dayton on February 26, 1945, the grant being received from the Commission April 4, 1947. Crosley's WLW-C was the first station in Columbus, Ohio. The application was filed on January 2, 1945 and the grant received November 21, 1946.

To construct these 3 television stations, Crosley expended $1,939,723.77, excluding here the man-hours of its staff and its legal fees. The capital investment to November 30, 1953, for these stations totaled $2,608,692.34.

The operating losses of these three stations amounted to $1,642,129.75 before the first dollar profit was realized. The Cincinnati station was operated at a loss from the first broadcast, February 9, 1948, (Cincinnati had but 1,300 TV receivers at that time) to November 1, 1950, losses totaling $951,920.70. The Columbus station was operated at a loss from the first broadcast, April 4, 1949 (then only 2,000 TV receivers in Columbus), to November 1, 1950, losses amounting to $371,534.15. The Dayton station was operated at a loss of $318,674.90 from beginning of operations, March 15, 1949 (then only 4,000 TV receivers in Dayton), to November 1, 1950. Actually, the losses experienced were much greater than set above in view of the fact that early development costs and initial television broadcasting expenses were borne largely by WLW radio.

Following the original construction and upon receipt of show cause orders following the Commission's sixth report and order, Crosley spent in total $200,000 in making channel changes and another $300,000 to increase power to maximum with new high-gain antennas in Cincinnati, Dayton, and Columbus.

Since the initial broadcast on these three stations, Crosley has pioneered in the extension of operating schedules and has invested hundreds of thousands of dollars in program development.

To bring the best talent and special events to its viewers, Crosley spent $128,560 from March 11, 1949, to June 27, 1951, to construct and operate its own microwave relay system in the absence of regular Bell System relay and cable service.

In addition to the aforementioned expenditures to stimulate an interest in television and, therefore, the purchase of receivers by the public, Crosley expended in promotion alone, $48,000 in staging a 3-way TV jubilee in each city, Cincinnati, Dayton, and Columbus. All TV set manufacturers participated in the promotion to make the public more television conscious. Yet all costs were borne by the Crosley Broadcasting Corp.

As the result of such aggressive leadership, these 3 cities (as of March 1954) have a higher percentage of set saturation than has Chicago, not only a much larger city but one having 4 TV stations.

On February 11, 1953, Crosley purchased WLTV, Atlanta, Ga. (then VHF channel 8, now 11), from Broadcasting, Inc., at a cost of $1,450,000.

Immediately, Crosley invested $136,000 in program development and as of April 13, 1953, lengthened its programing schedule from 73 hours to 107 hours per week and opened its broadcast day at 9 a. m. rather than at 1:50 p. m., forcing the two competitive stations to commence early morning programing service. Again, Crosley has just recently extended its Atlanta schedule and is now broadcasting 114 hours a week and is signing on at 8 a. m. Monday through Friday.

WLW-A was, and still is, without full Du Mont and ABC network service. The station is spending additional funds to bring such service from the networks through a costly cable arrangement.

Capital investments for WLW-A have been considerable and will before long approach the total originally paid for the property. Investments include a new 50-kilowatt transmitter and allied equipment, new studio equipment, a new studio building (under lease) and property for a new high tower, construction of which is the next step contemplated in improving the service of the station to the public.

Exclusive of intercompany sales, in 15 months of operation, WLW-A has made a profit only 2 months, March 1954 amounting to $272.83, April 1954 amounting to $2,259.20. Yet capital investments will continue to be made, including the erection of a new tower of maximum height. Crosley has faith in Atlanta's future and as a company feels financially able and competent to continue VHF
pioneering in that city, looking ahead to the time when it will prove to be a profitable operation.

In summary, before Crosley made a profit on any of its television operations, it sustained total losses of $1,642,129.75, excluding Atlanta. In spite of these losses, it made capital investments, beyond the initial construction costs ($1,939,723.77), of $688,968.57.

In the opinion of Crosley and in view of this record, UHF development, of necessity, must undergo similar stages and must be in the hands of licensees of financial stability in order to bring it to the level which VHF enjoys today. Crosley is not acquainted with all other VHF operations but is familiar with scores of them and is aware of their experience of similar losses during the costly stages of development prior to the attainment of the present status of VHF.

In the field of UHF, Crosley has granted the use of the tower of WVLW-T to the Greater Cincinnati Educational Television Foundation for WCET, channel 48. It has also granted the use of a considerable portion of its transmitter building for this educational group and has contributed both air time (on WVLW-T) and all production costs for a series of programs to promote this proposed UHF station.

Crosley has cooperated closely with UHF station WHIZ-TV, Zanesville, Ohio, and has, since that station commenced operations, cooperated with it in order that it might receive NFC program service directly from the tower of WLW-C, Columbus, even though Crosley's Columbus station renders service to Zanesville.

Additionally, we respectfully submit that in order to include and provide receiver facilities for UHF reception, we are informed that the manufacturing division of AVCO expended considerable sums in pioneering as early as 1950 in ultratuner converters and licensed two other companies to manufacture it. The manufacturing division, in company with other manufacturers, has incurred very substantial losses in order to further the ability of UHF stations to have available sets able to receive their transmissions.

The policy of this company will continue to be one of the closest cooperation with UHF stations, both educational and commercial.

STATEMENT OF PHILIP MERRYMAN, SOUTHERN CONNECTICUT & LONG ISLAND TELEVISION CORP., WICC-TV, CHANNEL 43, BRIDGEPORT, CONN.

Time alone will not solve the television industry's problems as the two major network officials and the VHF group contend. There are basic inequities in the allocations plan for national television and these inequities must be resolved if television broadcasting is to become a truly beneficial public service. Competition between networks is not the primary basis of good public service. Competition must exist in the total area of television broadcasting and not just the limited area in which NBC and CBS compete. NBC and CBS compete for dominance in entertainment. Elloquent witness to this is NBC's willingness to drop the Firestone Hour in favor of a program that would produce a higher audience rating. The real opponents of free private enterprise and the real pleaders for special privilege in these proceedings are those VHF broadcasters who insist the public interest would best be served by continuing their special privileges. They do not recognize the problem, therefore they cannot provide constructive solutions. The least they could have done would have been to endorse the use of directional antennas on VHF frequencies even though the use of such antennas may have encroached slightly on their coverage in communities beyond their own and they could have agreed it was in the public interest to limit the development of color television broadcasting until a better basis for competitive broadcasting had been worked out. The major networks and the VHF group have contended that more people would have television service by continuing the present system. I submit that the opposite is true and that if competitive conditions are provided such that each community throughout their land can have its own television station or stations more people will be provided with television service and a wider selection of television services.

They say that VHF stations struggled through lean months and even years and if we UHF broadcasters are good Americans we would do the same. I wonder how long they would have continued to struggle if they could not see a tiny glimmer of hope in the distance but on the contrary saw the flame of hope being gradually extinguished. They say that even VHF stations have failed and I submit, Mr. Chairman, that if a VHF station which competes
for 100 percent of the available audience could not succeed then how can a UHF station which competes on the national average for less than 10 percent of the audience possibly survive? It has been said here by these opponents of competition that they would hate to be a Member of Congress of a member of the Federal Communications Commission should the 30 million families in the United States learn that their television reception was to be tampered with. Mr. Chairman, we must also look at the problem from the possible context of history. Let us not, by failing to act now, make it possible for some historian of the future to write “One of the great contributing factors to the extinction of a free society of men was their failure to utilize fully the new channels for public communication.” In the United States toward the end of a 20-year period during which the people were led ever closer to socialism a few people were allowed to monopolize television broadcasting. Thus the stage was set for governmental control of this greatest public communications medium and the eventual rise of a dictatoral form of government.”

STATEMENT ON BEHALF OF UHF STATIONS WNOW-TV, AND WSBA-TV, YORK, PA., AND WCMB-TV, AND WHP-TV, HARRISBURG, PA.

This statement is being submitted on behalf of four UHF television permittees in York and Harrisburg, Pa. These permittees are: Helm Coal Co., permittee of WNOW-TV, York, Pa.; Susquehanna Broadcasting Co., permittee of WSBA-TV, York, Pa.; Rossmyrne Corp., permittee of WCMB-TV, Harrisburg, Pa.; WHP, Inc., permittee of WHP-TV, Harrisburg, Pa.

Except for WCMB-TV, which plans to commence operation in the near future, all the above stations are in operation.

This subcommittee has already been told of the severe competitive disadvantages under which UHF television stations are laboring. We believe, however, that the subcommittee will be interested in the following example of how the Commission’s VHF allocations and rules can be and are being used, or rather, as we contend, misconstrued, to place UHF stations at a further disadvantage and to build upon the early difficulties of UHF, monopolies which may become so entrenched that they cannot later be dislodged.

York and Harrisburg, Pa., have been allocated UHF channels only. In fact the entire State of Pennsylvania is largely a UHF-only area. Of the 33 Pennsylvania cities which are listed in the Commission’s Table of Assignments only 7 have been allocated VHF channels. These are Philadelphia with 3 commercial VHF channels, Pittsburgh with 2 commercial VHF channels; and Altoona, Erie, Irwin, Johnstown, and Lancaster with 1 VHF channel each. It is apparent that if Pennsylvania is to enjoy competitive television, and especially if the majority of Pennsylvania cities are to have their own television stations, UHF must survive. It would seem also that UHF had a reasonable chance of survival in Pennsylvania, particularly in York and Harrisburg, which are both substantial UHF-only markets. However, a recent action by the Commission has created a serious threat to UHF in both York and Harrisburg, as well as other Pennsylvania cities.

Station WGAL-TV in Lancaster, Pa., was fortunate enough to obtain a VHF assignment prior to the television freeze. Three of the five Harrisburg and York UHF stations were also applicants for VHF stations in their respective cities prior to the freeze, but unlike WGAL-TV were held up in their VHF applications because there were more applicants than channels in Harrisburg and York. The present allocation plan, issued after the freeze, did not assign VHF channels to Harrisburg and York, thereby making it necessary for the Harrisburg stations either to operate in UHF or forgo bringing television to their cities. VHF, however, was continued in Lancaster by moving prefreeze channel 8 from York to Lancaster for use by WGAL-TV. Originally WGAL-TV operated on Channel 4 as a community station.

Under the Commission’s prefreeze rules television stations were divided into two classes, metropolitan stations and community stations. A metropolitan station was defined as being designed primarily to render service to a single metropolitan district or a principal city, and to the surrounding rural area. A community station was defined as being designed primarily for rendering service to a small metropolitan district or principal city. Metropolitan stations were limited
in their power and antenna height to 50 kilowatts at 500 feet above average terrain. Higher antennas were permitted only with a reduction in power. Community stations were limited to 1 kilowatt at 500 feet above average terrain. In its sixth report and order which terminated the freeze the Commission proposed to shift WGAL-TV to channel 2 under a special temporary authority, operating with a relatively modest power and antenna height (7.2 kilowatts and 270 feet above average terrain) from a site close to Lancaster. In connection with this change in frequency WGAL-TV filed an application for authority to increase its power and antenna height to the maximum permissible; that is, to 316 kilowatts and 1,000 feet above average terrain, and to change its transmitter location. This application was granted January 28, 1954. The new transmitter location proposed by WGAL-TV is more than 15 miles closer to York, Pa., than its present transmitter site, almost 14 miles closer to Harrisburg, and more than 16.5 miles more distant from Lancaster. As the following table shows, the proposed operation of WGAL-TV will result in a substantial increase in the strength of the signals which will be received in York and Harrisburg, Pa.

It will be noted that the WGAL-TV signal will be stronger in York than it is in Lancaster and in Harrisburg it will be only insignificantly weaker than in Lancaster. It is also to be noted that with the increased power and height, WGAL-TV will provide a weaker signal to Lancaster than with its old station, solely because it has moved its transmitter closer to York and Harrisburg so as to serve those cities.

It is clear that WGAL-TV's purpose is seeking greater power and greater height and a new location for its antenna is to establish an areawide coverage embracing Harrisburg and York, as well as other cities, rather than to improve its service to Lancaster. Current advertisements of WGAL-TV in the trade press emphasize that this is its purpose and intention. These advertisements include claims that WGAL-TV serves Harrisburg, York, Lebanon, and Reading as well as Lancaster. Their slogan is "5/5 profit"—the numbers refer to the five Pennsylvania metropolitan areas listed above and the 5 years of previous operation of WGAL-TV. Thus WGAL-TV bodily emphasized that in addition to its entrenched position gained through 5 years of monopoly operation it will have a service area far greater than that of any of its UHF competitors in York, Harrisburg, Lebanon and Reading.

The program service of WGAL-TV is highly commercialized and is predominantly comprised of network shows. Service of a local nature to Lancaster is limited. WGAL-TV regularly broadcasts programs from all four of the national networks. This is so despite the fact that many UHF stations in the area have concluded affiliation agreements of various types with all the networks. Thus WHP-TV in Harrisburg is a CBS affiliate; WNOW-TV in New York is a Du Mont affiliate; WSPA-TV in York is an ABC affiliate; and WTPA in Harrisburg is an NBC affiliate. Surveys indicate that Station WGAL-TV is presently received in nearly all homes in York and in a substantial number of those in Harrisburg. Operating as proposed, WGAL-TV will serve completely each of these two communities, as well as many others. Consequently, the networks and their advertisers will have the opportunity of selecting merely 1 station and yet reaching the entire 5 markets. For example, WHP-TV, a CBS affiliate, does not carry the following top CBS programs though WGAL-TV does: Toast of the Town, Arthur Godfrey and His Friends, Strike It Rich, and Blue Ribbon Fights. WTPA, an NBC affiliate, does not carry such top programs as Colgate Comedy Hour, Robert Montgomery Presents, Kraft Theater, Fireside Theater, and Judge for Yourself, although these programs are carried by
WGAL-TV. If the grant of the proposed change in transmitter location and the increase in height and power is permitted to stand, its control over network shows will be increased, and indeed, will threaten the continued ability of several of its UHF competitors to carry network programs at all.

By the same token, the concentration of WGAL-TV on network programs causes a program imbalance, which, among many evils, most severely affects adversely the local programming to the community of Lancaster. Monitoring of the station during the week of February 14, 1954, indicated that, during the period 6 to 11 p.m., the prime listening time, WGAL-TV operated commercially approximately 97 percent of the time and that network programs were carried during 75 percent of the total sustaining time during these hours (35 in all) amounted to less than 1 hour. There were a total of 3 sustaining programs during the week between the hours of 6 and 11 p.m. These programs were (1) a 15-minute program concerning a Lancaster hospital; (2) a 5-minute weather program; and (3) a 30-minute church program. During this same period, except for news and sports, there was apparently a total of one live commercial program. Considering the entire broadcast week, according to type of program, there appears to have been but one discussion program, or less than one-half of 1 percent of the total broadcast time. As to agricultural programs, there appears to have been approximately 1½ hours devoted to this type of programming, or approximately 1 percent of the total broadcast time. These figures clearly show a tendency to overcommercialize and overemphasize network programs, to the disadvantage of local public service programming. Indeed, it would seem this result is inevitable where a dominant VHF station carries all four networks.

The proposed operation of WGAL-TV will not only place UHF stations in York and Harrisburg at a severe if not insuperable competitive disadvantage; it will also constitute an abuse of the Commission's television allocation policies. Section 3,806 of the Commission's rules and regulations assigns channel 8 to Lancaster. It is basic, therefore, that WGAL-TV must serve the residents of Lancaster and immediate vicinity, the principal community to be served. Service under the Communications Act of 1934, as amended, particularly section 307 (b), means the presence not only of reception but also of transmission facilities. Lancaster is entitled to look to its local television station to provide not only a signal of sufficient intensity, but also an outlet for local expression. In its Sixth Report and Order the Commission discussed section 307 (b) of the act and made clear that its allocation plan was intended to provide to as many communities as possible the transmission element as well as the reception element of service.

As has been shown above, the proposed operation of WGAL-TV will not only fail to provide a satisfactory local television outlet for Lancaster, it also threatens to destroy any local television service whatever in York and Harrisburg. It is not our position that arbitrary limits should be placed upon the maximum permissible antenna heights and powers of VHF stations. This could well result in an inefficient use of the VHF band. We believe, however, that increased heights and powers, and particularly remote antenna sites, should not be permitted where their principal effect is to prevent the VHF station from performing its proper function under the Commission's allocation plan and to destroy the possibility of local television service in other communities.

Statement of Dr. Allen B. Du Mont, President, Allen B. Du Mont Laboratories, Inc., Clifton, N. J.

Members of the United States Senate Subcommittee on Communications, my name is Allen B. Du Mont. I am president of Allen B. Du Mont Laboratories, Inc. On May 20 I appeared before your committee along with Dr. T. T. Goldsmith, Jr., vice president, research, and Mr. Ted Bergmann, director of broadcasting. Our testimony disclosed that our company is in all phases of television and exclusively in television. We endeavored to present to you comprehensive, historical, and current facts and draw therefrom certain obvious conclusions. Others whose testimony followed ours, for the most part, reiterated the facts as we had stated them and drew substantially the same conclusions.

By the end of the first 3 days of hearings, there had been written into your record sufficient facts to warrant the conclusion by any objective and reasonable person that some action is required to bring about equality and opportunity for UHF broadcasters to compete, to the end that this country shall not be deprived of a fully competitive nationwide television service.
It was not until hearings were resumed last week and in subsequent sessions that there was testimony presented which took the form of self-serving statements with conclusions and recommendations unsupported by facts, and even at times relying upon half truths and distortions of facts.

It is because of that situation that I feel it is necessary to present this further statement as a means of supplying information necessary to the whole picture and to point out that when the whole picture is presented, the conclusions which the proponents of the philosophy of "let nature take its course—the free enterprise system will take care of everything" will be exposed as fallacious reasoning. I have attempted to lead you to believe that the successful VHF operators and the two dominating networks have reached the positions they now occupy because of superior skill, business acumen, and greater courage in the risk of money. As a matter of fact, Dr. Frank Stanton, president of the Columbia Broadcasting System, was so bold as to make the statement that "we all started from scratch." From that point he develops the fantastic idea that the reason CBS achieved its dominant position was through "the hardest kind of work, the most courageous kind of investment in plant, facilities, talent and creative programing," whereas Du Mont did not achieve an equal position because it chose "not to take its profits from television manufacturing and invest them in network broadcasting." It is not particularly relevant but before I present the facts which will disclose the reasons for the dominant position of the two large networks, I would like for you to know that our company has invested an amount in television broadcasting which is greater than all of the earnings of its manufacturing operations since the company went into business. This has been done because we had the courage of which Dr. Stanton is so proud and because we also had faith in our Government's integrity and policy which would manifest itself, in time, by giving us an equal opportunity to compete with other networks and broadcasters.

The reasons why NBC and CBS have been able to achieve their dominant positions were written into economic history several years before television networking became a reality. They were written in a field of business endeavor in which Du Mont has never engaged, by a field which has played a vital part in determining the course of television broadcasting. I refer, of course, to radio.

By the time television networking began in 1948, both NBC and CBS had established positions of preeminence as radio networks. In that first year of television networking CBS had more than 175 radio affiliates. CBS sales for that year were just short of $100 million (a higher annual volume than Du Mont with all of its manufacturing and broadcasting activities has ever achieved). CBS's net profits after taxes that year amounted to more than $5 million. The facts with respect to NBC follow the same general pattern. Before television networking such had been underway a year, before the end of 1948, the Federal Communications Commission applied the notorious freeze.

When the freeze went into effect, there had been 108 construction permits issued. The 108 stations which were on the air or which went on the air shortly after the freeze were situated in 63 markets—40 of those 63 markets had only 1 station; 11 of those 40 markets had only 2 stations; 8 markets had only 3 stations, and 4 markets had 4 or more stations. Of the 40 stations in the single-station markets, 37 were owned by interests having radio stations. An overwhelming majority of them were affiliated with NBC and CBS radio networks, and those affiliations were carried over into affiliations with those two television networks. Of the 22 stations in the 2-station markets, 21 were owned by radio interests with an overwhelming majority of those 21 stations having affiliations with NBC and CBS radio networks.

These are important facts which members of the subcommittee should keep in mind as you weigh the testimony of those who would have you believe that it was their great wisdom and foresight which made them dominant in television broadcasting. And here is why it is important: This situation meant that the freeze reserved to 2 networks the almost exclusive right to broadcast in all but 12 of the 63 markets which had television service. It meant that the two other networks did not have and have not had since the fall of 1948 more than the ghost of an opportunity to get its programs into the markets so necessary if high-quality programs are to be produced, and attract advertisers from whom revenue and profits must come.

I would not say anything to detract from the fine ability of those responsible for the management of either NBC or CBS, nor would I say any words of condemnation for the exercise of their ability to take advantage of the situation which presented itself to them in 1948. However, if I were to take Dr. Stanton's...
words in his testimony at their face value when he spoke so glowingly of the
desire of CBS for competition, I might raise an eyebrow as I think of the steps
which were taken to induce the Federal Communications Commission to drop
consideration of allocation plans and proposals for lifting the freeze, and to
chase a myth in the guise of mechanical color television.

When I think about the long months which dragged by as the FCC put
the progress of television on the shelf thereby permitting NBC and CBS to
strengthen its hold on television broadcasting and build their dominance at the
expense of two other networks who were fighting to stay alive until the doors
to opportunities should be opened again, I am impelled to wonder if the injection
of color at that stage was more than a coincidence. And when the FCC finally
made its ill-advised decision against the judgment of most of the industry's top
engineers, I wondered why mechanical color was not allowed to go to its pre-
ordained doom with the greatest possible haste, until I thought about how the
court action which followed and which was instituted by those charged with
the management of NRC served to prolong the freeze, which in turn gave
greater opportunity to NBC and CBS to achieve their stranglehold.

A pertinent fact in connection with this aspect of the problem is that the
FCC made it clear in the early days of the freeze that it intended to open up the
ultra-high frequency portion of the spectrum and add new channels. At that
time there were fewer than 800,000 receivers in the hands of the public. There
would have been no very great problem of conversion, and, consequently, no
very great problem of getting UHF started and on the road to successful oper-
tion, if prompt action had been taken to establish a new allocation table and lift
the freeze. There would not have been the suppression of the "courage and
daring" of the two smaller networks had the FCC acted promptly.

It is somewhat significant, therefore, that it was the managements of the two
dominant radio networks at that time, and now the two dominant television
networks, that induced the FCC to devote its time to other matters, and for such
a long time that the number of VHF-only equipped receivers in the hands of the
public increased from fewer than 800,000 to more than 17 million.

I would like to point out that since Dr. Stanton likes to refer to annual reports
that within the years included in the freeze period CBS reported total profits
after taxes of more than $25 million which is a sum greater than the profits re-
ported by Du Mont since it has been a company. These figures have a bearing
on the contention that CBS backed its "courage and great investments in
programming" while at the same time disparaging Du Mont's efforts or "lack of
efforts" in that field.

I would be the last to do other than commend CBS for its fine programs and
the progress which they have made in program development. Nevertheless,
there is more to that problem than Dr. Stanton would have you consider. He
did not mention, for instance, in his efforts to educate you in networking, that
the amount of money which can be expended in the development and production
of a program is and must be determined in a large measure by the opportunities
for exposing that program in a large number of markets.

It is much more simple to justify the expenditure of $50,000 in the production
of a program which the network knows it can get into stations in a majority of
the top markets of the country than it is to justify the expenditure of $10,000
in a program that can reach only a handful of markets. Hence, it is understand-
able that CBS can spend these vast sums in the development of programs because
it knows before the expenditure is made that the program, when developed, can
be broadcast in most of the major markets of the country. Du Mont has never
enjoyed the opportunity to justify the expenditure of a large sum in the develop-
ment of a program with the knowledge that it could get a program into anything
like a majority of the markets of the country on a live basis.

I have taken great pains to point these things out to you because I think it is
important that the whole picture be in front of you when you make your im-
portant decisions, and because it is so easy to recognize that Dr. Stanton and the
other proponents of the "let nature take its course" philosophy have neglected to
fill in the loopholes which allowed their fallacious conclusions to seep out.

There is one other facet to this problem which also was ignored. That is the
program advantages which accrued to the two top television networks from their
radio relationships. The television part of the operations fell heir to such
programs and talent as Arthur Godfrey, for years the largest single moneymaker
in the broadcasting medium. Jack Benny, Amos and Andy, Our Miss Brooks,
and other radio programs, all in the situation enjoyed during the freeze, it
is interesting to note that 34 of the CBS radio affiliates in the top 100 markets now
own television stations, and are affiliated likewise with the CBS television net-
work. There also were values which accrued to NBC and CBS television, and which were not mentioned in testimony, which have to do with the relationships with advertisers and advertising agencies which have been built up over the years and which, by virtue of the 2 strong networks' monopolistic position, have given them a hold which 2 weak networks cannot break.

Dr. Stanton endeavors to brush off the charges of monopoly by quoting a tailor-made definition of monopoly. I believe that it has been established that where one or a group of companies have such a dominance in a field that the opportunity of others to compete with them is killed, a monopoly exists. I submit that the door of opportunity to two networks to compete on an equal footing with NBC and CBS was closed by the FCC in 1948, and that it has not been opened by the FCC or anybody else since. I also submit that if Dr. Stanton is sincere and genuine in his claim of desire for competition, then he should join with us and the many others who have recommended that action be taken to equalize competitive opportunities in the television broadcasting field. In making that suggestion I would like to make it clear that contrary to Dr. Stanton's contention that it is our desire to bring "the other networks down to its level," we seek the opportunity to raise the level of all broadcasters to the point where the maximum in service and the highest quality of programing can bring to the American public a full and free choice of the very best programs and services.

There is just one other allusion made by the CBS testimony which my pride compels me to mention. We have been very proud of our Pittsburgh station, the station which had a monopoly in its market. We have been very proud of our accumulated files which are filled with letters and expressions of commendation from virtually every civic source in that part of Pennsylvania. Those letters of commendation have come unsolicited from charities and welfare organizations, churches, civic and educational institutions, business and industrial groups, and individuals. They express their appreciation for the many hours, on a regular and continuing basis, which we have devoted to their services and their interests. They give recognition to the fact that we gave up many dollars in revenue, because in Pittsburgh every minute of the broadcasting day was in demand by commercial interests. With the record of local service which has been written, it is surprising to learn that Dr. Stanton would stray so far from the facts as to imply that we claimed desire for competition, then be said, join with us and that we did not have a live program in operation in Pittsburgh until long after.

The facts are that we rushed an installation in Pittsburgh to be on the air early in January of 1949. While we were not able to acquire studios for live programing at that start, we had at work from the beginning a crew of motion-picture cameramen, putting on film each day, current local affairs of interest to Pittsburgh. Live programing went into effect at the earliest possible moment that we could acquire space for a studio and get equipment installed. In fact, our live studio operation went into effect 15 months earlier than Dr. Stanton said it did.

Turning now to some of the technical phases of the problem, there were references and exhibits by CBS, an engineer and others, designed apparently to lead you to believe that the coverage of UHF, and the quality of UHF pictures are insufficient to supply the television needs of the people. In fact, some of the testimony presented to you amounted to a complete disavowal of the usefulness of UHF as a broadcasting medium. Such testimony and the conclusions which have been drawn from it are completely in error. It just isn't so. UHF is a satisfactory medium now under most circumstances, and on these points there is substantial agreement among most engineers of the industry.

During the course of the hearing, it has been repeatedly emphasized that the UHF problem is primarily an economic rather than a technical one. Television broadcasting is, however, a highly technical matter, and any solution to the economic problem which fails to take cognizance of the technical factors cannot be successful.

This fact has been recognized by others and a small amount of technical testimony has been included in the record.

In particular, 2 companies have described their recent improvements in the UHF art, and 1 witness has discussed the differences in UHF and VHF coverage. It is our conviction that the optimistic side of the UHF picture has not been properly presented from an engineering point of view. In the interest of assuring a complete record, I want to present this side.

A transmission system consists essentially of three parts:

(1) The transmitting equipment.
(2) The propagation medium.
(3) The receiving equipment.

Let us examine these three components individually, both as to current and anticipated limitations.

The transmitting equipment consists of signal generating equipment (cameras, motion-picture machines, slide scanners, etc.), a television transmitter and a transmitting antenna. The signal-generating equipment is the same regardless of the transmitting frequency. The transmitter generates the radio frequency waves, and the big problem is the development of high power with a band width appropriate to television.

During the approximately 5 years of commercial television in this country, available VHF transmitter power has increased from a fraction of a kilowatt in 1938 to 50 kilowatts in 1954. Using an appropriate antenna, this represents the maximum power permissible under the FCC rules. During 2 years of commercial UHF television, the available transmitter power has increased from 1 kilowatt to 12 kilowatts. Again using the appropriate antenna, an e. r. p. of approximately 250 kilowatts can be realized. This is only one-fourth of that permitted in the FCC rules. There can be no doubt, however, that, given the proper incentive, manufacturers will shortly achieve the maximum power permitted under the rules. As an example, one of the parties to the hearing testified that a new high-gain antenna would shortly be available which would permit 400 to 600 kilowatts e. r. p., thus doubling the power currently available.

The fundamental limitation of a receiver to produce clear, snow-free pictures is the "noise figure" obtainable. The noise figure is a measure of the amount of noise (or snow) produced by the signal by the receiving antenna. Obviously the smaller the noise figure, the better the receiver. Early VHF receivers had noise figures of the order of 20 decibels and as late as 3 years ago, the industry average was approximately 14 decibels. 1954 receivers range between 5 and 10 decibels. Last year the industry average of UHF noise figures was 20 to 24 decibels. This year it ranges from 14 to 18 decibels. Another party to the hearing has testified that he has constructed a UHF receiver with a noise figure less than 7.5 decibels throughout the UHF band, but that this receiver would cost $175 to $200 more than presently available sets. Given the proper incentive, there can be no doubt that UHF noise figures will follow the VHF pattern. Mass production invariably leads to smaller costs and a lower price for the finished product.

A signal factor at the receiving end is the receiving antenna. Let us compare the conditions at channel 4 (approximately 70 megacycles) and channel 52 (approximately 700 megacycles). If simple receiving dipoles are used in equal strength fields from the two stations, the UHF antenna will pick up only one one-hundredth the power that the VHF antenna will pick up. However, the UHF antenna will be only one-tenth as long as the VHF antenna. Because of this small size of the UHF antenna, it is a relatively simple matter to increase the capture ability of the antenna. For example, a commercially available UHF antenna, the double di-fan with reflectors, has a power gain greater than 10. Using this antenna, in equal fields, the UHF antenna can receive one-tenth the power of the VHF antenna. The Commission has recognized this differential and has compensated for it by permitting 10 times the power on channel 52 as is permitted on channel 4. It is, of course, possible to use higher-gain antennas at VHF, and this is frequently done. However, such antennas are bulky and there is no reason to believe that still higher-gain UHF antennas will not be manufactured. Thus the wavelength factor is essentially canceled out by the higher gain UHF antenna and the greater power permitted on UHF transmissions.

The remaining factor in the transmission system is the propagation path. The effect of this factor on the signal is extremely complex and its solution has been called one of the most difficult problems facing the engineer. Between the transmitting and receiving antennas, the signal may be refracted in the earth's atmosphere and ionosphere, it may be reflected from natural and manmade irregularities in the terrain, and it may be diffracted or bent over and around obstacles on the earth's surface. Furthermore, the signal at the receiving antenna is, in general a resultant of many signals which have arrived over many different paths.

Because of the complexity of the problem, it has been necessary to obtain most of our information on VHF and UHF propagation by experiment. According to diffraction theory, it was predicted that as the frequency is increased the tendency for waves to bend over and around obstacles is decreased. Measurements proved this to be so. Accordingly UHF coverage in rough terrain is somewhat more spotty than is VHF coverage. It is not true however, that the VHF signals fill in the valleys and the UHF signals do not. Both signals are
attenuated when they are required to bend over hills and the difference in the amount of bending has frequently been exaggerated.

According to theory, the UHF signal should suffer less from manmade interference than the VHF signal. This also has been proven in practice. Commutator interference from rotating machinery, diathermy, electric razors, and so forth, all cause considerable interference on low band VHF and virtually none on UHF.

Possibly the most significant difference between UHF and VHF reception is the absence of multipath effects at UHF. This was not predicted by theory and came as a considerable surprise to several of the early investigators. Multipath (the arrival at the receiver of several signals which have traveled over different propagation paths) manifests itself in several ways. When only two or three clearly defined paths exist, the effect is the familiar "ghost" or displaced image. When a large number of paths of approximately the same length exist, the result is usually a smeared picture. Although the United States television standards provide for a picture having 375 line resolution, this smearing effect of multipath results in only a very small percentage of the viewing audience realizing this quality picture. Almost without exception, engineers and the public alike express amazement at the clarity and sharpness of UHF pictures.

On monochrome transmissions, multipath effects are observed as smearing and ghosts. On color transmissions, color contamination is added to these effects. During the recent work of NTSC, Du Mont transmitted color over its experimental UHF station in New York City on a regular schedule for many months. Experimental color transmissions have also been made using channel 5 in New York City. It has been our experience that the UHF color transmissions have been greatly superior to the VHF color transmissions. An example of this was given at the NTSC color demonstration for the FCC during the week of October 11, 1953. While lambing the color transmissions generally, TV Digest singled out the Du Mont UHF transmissions as "exceptionally fine."

A careful analysis of the foregoing leads to the following conclusions:

1. Given the proper incentive, manufacturers of UHF equipment will shortly produce transmitters capable of delivering maximum power under the FCC rules and receivers having noise figures comparable, if not equal to, VHF receivers.

2. Under these conditions, the service areas given in the FCC sixth report and order will be essentially realized; i.e., the UHF grade A service area will be approximately 140 percent of the VHF grade A service area and the UHF grade B service area will be approximately 70 percent of the VHF grade B service area.

3. In a great many locations, the UHF picture will be appreciably sharper and clearer than the VHF picture both in monochrome and color transmissions.

In conclusion, I want to express my appreciation to each member of this subcommittee for the courteous, attentive, and fair hearing which you have given to us. I am aware of the involvements of the problem, and I know your task is not an easy one. I am also aware of the fact that there are many and powerful pressures being applied to prevent a determination that action to correct the situation shall be taken—pressures which have both economic and political significance. My faith and confidence in our capitalistic system, which is made operative by our most fortunate political system, leads me to a further expression of confidence that our present political regime will not do anything as disastrous as doing nothing.

Senator Potter. I would like also to submit for the record, letters and telegrams from the following: H. C. Millholland, New York City; William M. Kible, Glenwood Landing, N. Y.; R. I. Brown, Cresskill, N. J.; John J. Bachem, Port Washington, N. Y.; H. Malcolm Stuart, New Rochelle, N. Y.; Mrs. Charles Christenson, Montclair, N. J.; Mrs. Robert Gould, Brooklyn, N. Y.; Norman Knight, Weston, Conn.; Mr. Kenyon Brown, President, KWFT, Wichita Falls, Tex.; Mr. Milton S. Trost, First Vice President, Mid-American Broadcasting Co., of Louisville, Ky.; Mr. Paul F. Thielen, director of public relations, the American Legion, 812 East State Street, Milwaukee, Wis.; Howard S. Kaser, New Rochelle, N. Y.; and Arthur W. Deneke, Glenn Rock, N. J.
(The communications referred to are as follows:)

Senator Charles Potter,
Chairman, Subcommittee on Communications,
Washington, D. C.:

Two television networks, National and Columbia, have a virtual monopoly stranglehold on the industry. Our economy can and should support a minimum of four major networks in the best interests of all the people. To accomplish this, help from the Communications Subcommittee must be given to ultra-high-frequency stations by some plan that will not allow all the programing cream to gravitate to the very-high-frequency stations.

Howard S. Kasier.

Senator Charles E. Potter,
Subcommittee on Communications,
Washington, D. C.:

I respectfully request and plead for your cooperation to prevent the monopoly which will continue to exist unless the Senate UHF Investigating Committee makes strong programming available to the UHF broadcasters through four truly competitive networks.

Arthur W. Deneke.

Senator Charles E. Potter,
Chairman, Subcommittee on Communications,
Washington, D. C.:

It is important that UHF television stations receive aid from your Subcommittee on Communications to prevent a monopoly by NBC and CBS in both local and network telecasting. A monopoly of this kind is dangerous to both the public interest and the economic welfare of the country.

H. C. Milholland.

Senator C. E. Potter,
Senate Office Building, Washington, D. C.:

Strongly urge adoption and recommendation by your committee of whichever proposal before you seems best able to bring about equality of opportunity for four national TV networks so vital to our economy.

John H. Bachem.

Charles E. Potter,
Senate Building, Washington, D. C.:

The existing FCC order stifles network television competition. As now written it creates a monopoly and denies the benefits of broader programming which now rests in the hands of only two networks. New strong and financially sound networks are essential to provide necessary educational and public service television for the American public. The national economy not only can support but will support 4 networks and minimum of 4 TV outlets in all major markets of the country are essential to substitute competition for monopoly. I strongly urge you amend the existing order which is dangerous to the public interest and economic welfare of the country.

H. Malcolm Stuart.

Senator Charles E. Potter,
Washington, D. C.:

Afford equal opportunity to all four networks in order that they may survive to give the American public free choice in TV viewing. Unless UHF stations receive aid from this committee this is an impossibility.

Mrs. Charles Christenson.
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

Senator CHARLES POTTER,
Washington, D. C.

Equal sharing of time on all channels both VHF and UHF, plus minimum of 4 channels per major market will abolish monopoly and bring viewers in such areas full choice of living-room entertainment.

MRS. ROBERT GOULD.

New York, N. Y., June 8, 1954.

Senator PURTELL of Connecticut,
Senate Office Building, Washington, D. C.

Free enterprise can be well served by four competitive television networks. The United States economy can support 4 networks and a minimum of 4 TV outlets in all major markets. The key to the situation is strong programing now resting in the hands of NBC and CBS. Unless the UHF stations receive aid stations will die. It is essential that the Senate act to insure a fair opportunity for UHF stations. Please give this matter your earnest consideration. Thanks

NORMAN KNIGHT.

Senator CHARLES E. POTTER,
United States Subcommittee on Communications:

In order to continue in public service such as recent congressional hearings and to present suitable program schedules to satisfy all groups and personal interest this country needs minimum of four television networks. Sixth order and report makes the success of four television networks doubtful because of the station allocation restrictions. I respectfully request your aid in correcting this condition through your committee.

R. I. BROWN.

GLEN COVE, N. Y., June 20, 1954.

Senator CHARLES E. POTTER,
Chairman, United States Subcommittee on Communications:

Unless UHF stations receive aid from your committee, network and local telecasting will be a permanent monopoly. This pattern is already established between NBC and CBS. It is necessary to the public interest and national economy that four networks should operate freely.

WILLIAM M. KIRLENZER.

Henry Clay Hotel,

HON. CHARLES E. POTTER,
Chairman, Communications Subcommittee,
Washington, D. C.

DEAR SENATOR: Herewith enclosed is a copy of letter dated June 15, 1954, from the Mid-America Broadcasting Corp., to Mr. Rosel Hyde, Chairman of the Federal Communications Commission. This letter sets out the exact status of the UHF situation in Louisville, Ky. We sincerely believe that this situation warrants careful scrutiny by your committee. If we can be of any service to your committee in working out a solution of the UHF problem, please call on us.

Very truly yours,

MID-AMERICA BROADCASTING CO.,
MILTON S. TROST,
First Vice President.

June 15, 1954.

Mr. Rosel Hyde,
Chairman, Federal Communications Commission,
Washington, D. C.

DEAR MR. HYDE: Mid-America Broadcasting Corp. had a construction permit for a radio station in 1941, but due to the wartime freeze and the fact that we turned over to the Armed Forces at their request certain equipment necessary to the installation of a radio station, construction was delayed until 1948. Before we were on the air with WKLO-AM, we filed an application for a TV station
on channel 13. Before this was granted the now famous freeze was put into effect. When the freeze was lifted in 1952, we were disappointed to learn that no VHF channels were allocated to Louisville other than to the two existing stations. Believing that the people in the area were entitled to more than two choices of programs, we applied for and received a grant for UHF channel 21. We immediately began construction and went on the air with test pattern in September 1953, with the full authorized power of 251,000 watts.

With this power of 251,000 watts and an almost ideal transmitter location, the coverage from a technical standpoint was about what was predicted. Being a radio affiliate of the American Broadcasting Co. we were led to believe that we would become a basic television affiliate. However, just prior to our going on the air with television we learned from ABC that we would not be a basic affiliate, but a competing television station in Louisville would be given first choice on all commercial programs. Naturally the VHS station chose to skim the cream. We proceeded to program to the best of our ability and promote the purchase by the public of sets capable of receiving our UHF station, as well as the conversion of existing sets.

We began programing with full authorized power in October 1953, and we were compelled by economic necessity to request a temporary suspension of television broadcasting in April 1954. During that period we lost on the operation of the television station alone $196,732. This loss was in spite of the fact that we did what was considered an outstanding job in obtaining UHF conversions. This operating loss of $196,000 was in addition to capital expenditures of more than $300,000. When we suspended operations there were in this territory approximately 8,000 sets capable of receiving UHF television. In this market, with 2 established VHF's, 1 claiming more than 20,000 receivers, and one claiming 309,634 receivers, we were unable to persuade advertisers to use our station, even though the rates were well in line, per thousand of receivers, with the other stations. On occasions the reports came to us that certain national advertisers and agencies refused to use any UHF stations. Some network advertisers refused to use our facilities even when there was no charge for same.

Our experience seems to indicate that it is not economically practical to operate a UHF station in this city in competition with 2 established VHF stations, which, between them, have the first call on all 4 of the networks. We think that the only practical solution for the Louisville situation is to eliminate the mixture of UHF and VHF television. Assuming that the two existing stations will remain VHF and in view of our years of operation in radio and of our efforts to make UHF television work in this market, we feel that we are entitled to consideration for a VHF station. This may be accomplished in one of the following ways:

1. Grant WKLO-TV the right to operate with a directional antenna on channel 6. It is true that some slight interference would be caused to a station in Indianapolis operating with full power and full antenna height, but this interference would be considerably less than the interference already existing between WAVE-TV, Louisville, on channel 3, and WTTV, Bloomington, on channel 4. Evidently, since neither WAVE-TV nor WTTV recognizes this interference in their set counts or coverage maps, the standards set up by the Commission are too conservative. General Electric Co. says they can design and construct an antenna to radiate less than one-hundredth power in the protected direction with no undesirable reflections.

UHF television stations seem to cover the amount of territory predicted under the FCC standards, but VHF seems to cover vastly more territory than provided for under the FCC rules. As an example; in the latest issue of Broadcasting Magazine, WAVE-TV claims to furnish service to 369,634 television homes. Taking the class B coverage of WAVE-TV and using the county-by-county census of 1950, there are 316,424 homes in WAVE's class B contour. Using the CBS-American Research Bureau county-by-county television set penetration figures, the number of television homes inside this service contour is 101,792. From this we believe it is fair to assume that the Commission was too conservative in the case of VHF coverage. Evidently WAVE has 177,012 (almost 100 percent) television homes outside the area set up by the Commission for their coverage.

2. Grant channel 6 or some other channel to WKLO-TV with reduced power and also reduce the power of the cochannel station in another city. This reduction of power can be made without cost to the other cochannel station.

3. A reallocation of some of the VHF channels to accommodate another channel in Louisville.
4. A combination of one or more of the above methods or some other method, such as the addition of channel 4½, or space in the spectrum between 6 and 7 and adjacent to channel 6 or 7.

A community of the size of Louisville is entitled to full television service and under the present allocation arrangement is not receiving it, and we doubt that more than a choice of two programs ever will be available to the people of this area.

We respectfully petition your favorable action in this matter.

Very truly yours,

Mid-America Broadcasting Corp.,
Milton S. Throst, First Vice President.

Wichita Falls, Tex., June 14, 1954.

Hon. Charles E. Potter,
United States Senate,
Washington, D. C.

Dear Senator Potter: Your letter of April 6, 1954, directed to Little Rock Telecasters, Inc., Little Rock, Ark., has finally reached my desk. This letter was sent to me since I was president of Little Rock Telecasters, Inc., during the operation of UHF Station KRTV, which left the air March 31, 1954.

In answer to your question as to why we decided to return our construction permit, I think I can tell you that the principal reason was that we reached the conclusion that we could not operate successfully with three VHF stations in the market. Had we been operating a VHF station, we may have reached the same conclusion as it was our opinion that four television stations in the Little Rock area are too many.

Additional problems confronted us with a UHF operation, in competition with high-power VHF operations. The principal problem was the lack of high-power transmitting equipment which would deliver a signal competitive with VHF. Another reason was inferior receiving equipment available which would receive UHF signals. Probably one of the most important considerations was the lack of acceptance on the part of national advertisers in New York of UHF. It became rather apparent to us that they were content to use a UHF station in a market only so long as a VHF station was not available.

When we applied for and constructed the UHF station in Little Rock, we anticipated much better progress in the development of higher power UHF equipment. We also depended on the greater improvement in the UHF receiving equipment. It seems to me that very little progress has been made in this regard even to date.

I sincerely hope this is the information that you desire.

Kindest regards.

Sincerely,

Kenyon Brown, President.

The American Legion,
Department of Wisconsin,
Milwaukee 2, Wis., June 14, 1954.

Senator Charles E. Potter,
Chairman, Senate Communications Subcommittee,
Senate Office Building, Washington, D. C.

Dear Senator Potter: I am writing this letter in an effort to add my sentiments to others you must have heard relative to the necessity of granting a license for VHF television channel 6 to the city of Milwaukee.

I am sure that despite whatever organized opposition you may have heard from sources whose motives are purely selfish, you must see that to permit only one VHF station in a city the size of Milwaukee is almost ludicrous. You are aware, of course, of various cities much smaller than Milwaukee with two or more VHF television stations.

People in the fringe area of Milwaukee County and in adjoining counties have great difficulty in receiving UHF stations and many of them are thereby compelled to see a single station. While this is no criticism of the excellence of the programing and facilities of that station, the situation is far from ideal.
This letter is not to be construed as representing an official position of the Wisconsin Department of the American Legion, although thousands of Legionnaires in this area, I am sure, join in this personal view.

Thanking you for any consideration you might give this letter, I remain

Sincerely yours,

Paul F. Thielen,
Director of Public Relations.

Senator Potter. I would like to make this announcement: I have a wire from Frank Stanton, of CBS, and I wish to read the wire to those present.

In reviewing my testimony before your subcommittee on Friday, June 18, I note an error at page 51 of my statement in that I testified that “It was not until November of 1951, when there were about 350,000 receivers in the market, that Du Mont Pittsburg station even got around to acquiring a single live studio camera.” The date and hence the number of receivers are incorrect. The statement should read: “It was not until November of 1950, when there were about 140,000 receivers in the market, that Du Mont Pittsburg station even got around to acquiring a single live studio camera.”

I regret the error and would in fairness to the Allen Du Mont Laboratories appreciate it if the record could be corrected promptly.

That correction will be made in the record.

I sincerely hope that this will be the last afternoon of the public hearings and after the conclusion of Mr. Heffernan’s statement, I am going to insist that the persons making the rebuttal remarks limit themselves to 30 minutes. I am a heavy man with the gavel, if I have to be, and I am going to pound you down at the end of 30 minutes. So, I am forewarning you now.

Mr. Heffernan, it is a pleasure to have you here and we will be looking forward to your statement with a great deal of interest.

STATEMENT OF JOSEPH V. HEFFERNAN, VICE PRESIDENT,
NATIONAL BROADCASTING CO., INC.

Mr. Heffernan. Thank you, Mr. Chairman.

Mr. Chairman, my name is Joseph V. Heffernan. I am a vice president of the National Broadcasting Co., Inc. It happens that in this proceeding I am the last witness. There have been many differences of opinion expressed in this record, but I am sure I speak for all who have appeared here when I say how deeply we feel the loss of Senator Hunt. He was a fine public servant, of rich experience, and he will be missed by all who knew him.

I am appearing at the invitation of the subcommittee to discuss some of the aspects of television which you are considering.

I want to say at the outset that we at NBC appreciate the opportunity to come here and tell our story. We think this hearing can serve a very constructive purpose in providing a forum to develop the facts.

I would like, first of all, to tell you briefly about NBC and its activities.

Broadcasting is our business. We have been in it for over 27 years, both as a network and as the operator of stations. As a network we compete with other advertising media, such as magazines and news-
papers, for the dollar spent by national advertisers. In this competition we offer for sale advertising announcements in programs on our own and on independently owned stations affiliated with us and located throughout the country.

In supplying these programs on a national basis we offer the advertiser national distribution of his advertising message. Just like newspapers and magazines, we sell circulation. If the advertiser feels that one of our programs best meets his requirements, he may buy it; but if he feels that newspapers or magazines or direct mail or billboards will serve his particular needs better, he can and does buy them.

I might say, Mr. Chairman, I have attempted only to indicate some of the competitive media to network broadcasting. I have not attempted to list them all. There are, of course, other networks which directly compete with us, and there are, in addition, the national spot operations, which is an interesting operation because if an advertiser wants to conduct a national advertising campaign on television, he doesn't have to buy even any network. He can go to the national spot organizations, and the reason they are called spots—is that an advertiser, through their services, can spot his advertising in any number of cities he desires throughout the country he wants.

Senator Potter. And he doesn't have to go through the network?

Mr. Heffernan. He doesn't go through the networks at all. National spot is directly competitive with the networks, and thereby the advertiser can advertise nationally via television without using networks.

Senator Potter. Are most of your spots sold that way?

Mr. Heffernan. National spot business is a very extensive and substantial advertising business. Their revenues run into many, many millions, and they are directly competitive with network television and have, in fact, cost advantages in the sense that they do not, as we do, attempt to provide public service programs. They are straight commercial. They do not, for example, clear for the President, because they don't have interconnected lines via the telephone company, but they are directly competitive to us and our costs must be competitive to theirs; otherwise, the advertiser, in choosing his advertising media, can buy them instead of us.

Senator Potter. And they sell directly to the stations?

Mr. Heffernan. They sell directly to the stations, and they ship their product by the mails, whereas we distribute ours via the American Telephone & Telegraph Co.'s cables or relays, which the networks lease, on a contract basis at a cost, in the case of NBC alone, of more than $10 million a year.

Only as we succeed in selling against this competition do we get revenue to meet our costs. And these are by no means limited to the selling and administrative costs which go with any business. They include such major items as the cost of cable and relay facilities we lease from A. T. & T. in order to distribute our programs throughout the country, the amounts paid our affiliated stations as their share of the advertising revenue, the cost of the programs themselves, and the cost of the plant and electronic equipment required for the production of programs.

NBC presently owns five VHF television stations. It does not own any UHF television stations. That, however, is not because of any lack of interest in UHF on our part. At the time we were granted
authority to operate stations only VHF authorizations were being issued. The five grants we received constitute the limit permitted to one person under the present rule of the FCC.

NBC has been able to contribute to the development of UHF through its network operations. We believe NBC has done more for UHF than any other network. The first commercial UHF station to begin regular program service, KPTV, Portland, Oreg., has been an ABC affiliate since it went on the air in September 1952. It has continued to be an NBC affiliate since that time.

As of June 1, 1954, the NBC television network had 46 UHF affiliates. This represents more than one-third of all the UHF stations on the air.

There are 122 on the air. We are glad to be able to report that, in taking on these UHF affiliates, we have on the average succeeded in selling them to advertisers substantially to the same extent as our VHF affiliates in comparable markets.

You might be interested, Mr. Chairman, in the figures on that.

We ran a sample in the week of May 20, and we found that in a group of UHF affiliates, 40 in the sample, they averaged for that week 10.6 hours a week, whereas the comparable VHF stations averaged 11 hours, just 0.4 of an hour more.

Now, the inference I draw from that is that, for the most part, advertisers are interested in buying markets.

Chairman Potter. If it has the circulation, you can get the advertising?

Mr. Heffernan. Yes. Understand, of course, price normally varies with circulation—now, not a hundred percent, as Dr. Stanton pointed out the other day.

Chairman Potter. Do you find a reluctance on the part of the advertisers to advertise in the UHF market, even though it has the circulation, or is that good salesmanship on the part of NBC?

Mr. Heffernan. We, as this paragraph indicates, Senator, have succeeded here in selling these UHF stations, which the advertiser is not forced to buy, substantially as well as their counterpart VHF stations, in comparable markets. You must take them in comparable markets.

Chairman Potter. Yes.

Mr. Heffernan. There is no doubt that advertisers do inquire about and are interested in circulation because with absent circulation their advertising message is not received, and insofar as any advertising medium is handicapped in circulation, it is handicapped in selling its service.

**NBC PIONEERED TELEVISION DEVELOPMENT**

NBC pioneered the development of television. To many people the television industry is considered a postwar phenomenon. But NBC was operating television from atop New York City's highest structure, the Empire State Building, in 1931, more than 22 years ago. NBC's transmitter is still located on Empire State, which now also houses the transmitters of six other television stations.

NBC's developmental work in television continued over a period of several years, and in April 1939 NBC, in cooperation with RCA, introduced television as a service to the public at the opening of the New York World's Fair. The following year, NBC used the coaxial
cable for the first time to televise the Republican National Convention in Philadelphia and transmit scenes over its New York station. The FCC authorized commercial operations to begin on July 1, 1941. From that very first day the NBC station in New York has provided commercial television service.

**NBC AND VHF TELEVISION**

During the war years commercial television remained at a standstill. Toward the close of the war, however, NBC officials held regional clinics in all parts of the country with affiliated radio stations. NBC urged affiliates to make their plans to enter commercial television as soon as the FCC should begin to grant authorizations after the war.

In 1944, the President of NBC concluded an address to affiliated stations with these words:

The National Broadcasting Co. believes that television service should be brought as soon as possible into every American home. Television promises to be the greatest medium of mass communication yet evolved, with unparalleled opportunities for services of entertainment and education. It is our belief that NBC affiliates will join in these activities and share in that faith.

After the war, NBC continued to pursue a policy that "the radio industry must lead, not lag, in the establishment of this great new service of sound and sight.

In September 1947, at the first national convention of NBC affiliates, Brig. Gen. David Sarnoff, chairman of the Board of RCA and NBC, made the keynote address.

As many of you know, General Sarnoff has been engaged in all phases of communication for nearly 50 years, and his vision and courage were major factors in the creation of two new industries—radio and television. On that occasion in 1947 he urged the affiliates to consider television as an added new service, vitally necessary to insure their existing business and the great opportunities for your present and future business if you do the right thing."

NBC left no doubt among its affiliates or in the industry as to what it considered the right thing to do. It proceeded at once to get five television stations of its own on the air.

At the time the freeze was lifted in April of 1952, NBC had a television network consisting of 63 stations. More than 60 percent of these, 39, had companion radio stations which were affiliated with NBC.

As of the same time, of the 61 television stations on the next largest national network, only 13 had radio affiliates with that network.

This is one way to show what is well known in the industry—that NBC and its affiliates went into television at an early date and did a substantial amount of the spadework in its commercial development.

The responsibility for urging long-standing radio affiliates to embark upon a television operation, with its attendant heavy investment and larger operating expenses, was a great one.

In retrospect, despite early reverses and losses, it is satisfying to us that most of the persons NBC encouraged to get into VHF television have eventually brought their television operations to the point of success. And it is deeply gratifying to know that NBC and its affli-
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

Ates were in the forefront in bringing this new service to the American people.

**NBC AND UHF TELEVISION**

In September 1948, NBC in cooperation with RCA instituted tests of UHF propagation characteristics in Washington, D. C. In May 1949, the FCC issued to NBC the first permit for an experimental UHF television station to operate with regular program service.

This station was established near Bridgeport, Conn., and was truly the "nursery of UHF."

The station was operated by NBC for 2 years and the experience we gained at Bridgeport was shared with the FCC and the entire industry. We believe this operation established the technical feasibility of UHF channels for commercial use.

In November 1951, several months before the television freeze was lifted and UHF channels allocated to commercial television, NBC set up a temporary UHF transmitter and installed receivers converted to UHF at another affiliates' convention. This was done to demonstrate the quality of UHF reception to those radio affiliates who had not inspected the NBC Bridgeport operation.

**GROWTH OF UHF**

The expansion of commercial UHF service in the 20 months since the first UHF station went on the air has been considerable. As of June 1, 1954, there were 122 UHF stations on the air. At the same time there were 244 VHF stations in operation in the United States. In other words, in 20 months, UHF has grown to a point where it comprises half the number of VHF stations in operation.

In this respect the rapidity with which UHF expanded outstrips the developments of VHF. The freeze date of September 1948 is, for VHF, roughly comparable to today's date for UHF in comparing the two services. At the time of the freeze, there were 124 VHF authorizations outstanding and operating stations numbered but 33. At June 1, 1954, there were 238 UHF authorizations outstanding and 122 UHF stations on the air.

This rapid growth of UHF, however, has spent itself, and there is a considerable number of UHF channels for which no application has been filed.

**NBC SEeks TO DEVELOP UHF STATIONS**

In January 1952, 3 months before the UHF channels were allocated by the FCC for commercial use, NBC filed a petition requesting the Commission to change the rule limiting television station ownership to five so as to permit it to participate in the commercial development of UHF.

The NBC request was the first of several similar petitions to be filed. Although the Commission has not granted these petitions, it has invited comments on a proposed rule which would permit the owners of 5 VHF television stations to own 2 UHF stations as well.

Of the UHF channels for which no application has been filed, many are located in major markets of the country. At June 1, 1954, these
totaled 58 UHF channels in 37 of the first 100 metropolitan areas. A list of these communities and channel availabilities is attached, Mr. Chairman, as an exhibit.

Senator Potter. That will be made a part of the record.

(The exhibit referred to is as follows:)

37 cities among the 1st 100 metropolitan markets—58 UHF channels not applied for (June 1, 1954)

Mr. Heffernan. NBC feels it would promote the public interest in UHF broadcasting for the Commission to lift its five-television-station limit and permit experienced broadcasters to develop the UHF stations.

NBC is willing to operate UHF stations in intermixed markets and promote them to the fullest. It realizes that in doing this it would be taking on a loss operation for some time. It regards that loss as related to the money it has already spent to develop this phase of the industry.

In fact, we know of no other business in which one organization has spent millions of dollars to develop the art technically and is at the same time forbidden to develop it commercially.
NBC TELEVISION NETWORK'S CONTRIBUTIONS TO UHF

NBC has entered into affiliation agreements with a large portion of the new UHF stations. As I have pointed out, 46 UHF stations, or more than a third of all UHF stations in operation, were affiliated with NBC at June 1, 1954, and we have succeeded in selling advertisers these stations substantially as well as VHF stations in comparable markets.

In addition to its technical and program contributions to the success of UHF, NBC has extensively promoted the use of that medium. In June 1953, NBC affiliated with WVEC-TV, a UHF station for Norfolk. This station replaced the VHF affiliate NBC previously had in Norfolk. At the time NBC affiliated with the UHF station, there were around 150,000 television sets in the Norfolk area, none of which could receive UHF.

NBC officials and members of its press, advertising and promotion, and merchandising departments cooperated with WVEC-TV in an intensive campaign to build up a demand for UHF conversion, even before the station went on the air with a test pattern. Dealers were offered solicitation and selling help.

NBC also aided WVEC-TV in a cooperative advertising campaign, helped prepare newspaper ads and display material and organize exploitation efforts for conversion.

NBC's promotional activity on behalf of UHF has not been confined to Norfolk or to NBC's own affiliates. NBC has prepared and widely distributed a 45-page handbook of station experience and methods entitled "Circulation Promotion for Television Stations—UHF—VHF," compiled by its audience promotion department.

I would like to submit to the subcommittee a copy of that booklet.

Senator Potter. Yes; the booklet will be received and made a part of the official files of the committee.

Mr. Heffernan. I think, Mr. Chairman, this kind of a booklet is particularly helpful because it represents a distillation of the experience of many operators who had gone on the air and it points out how costly the mistakes of others are and how they can be avoided.

Senator Potter. What type of distribution do you have of this?

Mr. Heffernan. We have very broad distribution, Mr. Chairman. For example, there is a list available of all applicants for UHF stations and we distribute it not only to our own affiliates, but throughout the industry.

This book is based on case-history information reflecting the actual experience of a number of stations. It sets forth what we believe should be done and what should be avoided in launching new stations, in working with dealers and distributors, in advertising, public relations, merchandising, local tie-ins, and other audience promotion methods before and after a station is on the air.

This record of fundamental circulation problems and solutions based on the experience of early UHF stations, shows new and old members of the industry how to avoid costly blunders. Its value has been attested by enthusiastic replies from scores of recipients from all sections of the country.
ECONOMICS OF TELEVISION BROADCASTING

Television broadcasting is a new business. There were just 6 television stations on the air at the beginning of 1947, and only 16 by January 1948. Consequently, television stations, whether they be UHF or VHF, are confronted with problems that all new business must face and overcome.

First, a station must go through a period of growth and development before it can hope to attain profitable operation. During this period a station operator must be prepared to sustain financial losses until his circulation justifies a compensatory rate. This happened to VHF stations in their period of development just as it is happening to UHF stations today.

A summary of the financial experience of VHF television stations over a 5-year period, based on information released by the FCC, shows the following:

<table>
<thead>
<tr>
<th>Year</th>
<th>All stations reporting</th>
<th>Number reporting loss</th>
<th>Aggregate loss</th>
<th>Loss per station</th>
</tr>
</thead>
<tbody>
<tr>
<td>1948</td>
<td>50</td>
<td>50</td>
<td>$10,700,000</td>
<td>$213,000</td>
</tr>
<tr>
<td>1949</td>

</tr>
</tbody>
</table>

You will note in the first years, Mr. Chairman, of the 50 stations reporting, all 50 were operated at a loss and the average loss per station in the last column was $213,000.

The next year, out of 98 stations reporting, 93 operated at a loss. The average loss was $157,000 per station.

In the third year of operation, of 107 stations reporting, 53 operated at a loss. Just barely under half in the third year of operation still operated at an average loss of $132,000.

In the fourth year of operation, 14 VHF stations were still operating at a loss, and the same in the fifth, 14 still operating at a loss after 5 years of operation.

Senator Potter. Do you have any idea why these 14 stations are still operating at a loss? Is it because the market is insufficient for a station or poor management, or do you have any knowledge of it?

Mr. Heffernan. I should say, Mr. Chairman, it is in large part the factor of the economics of the situation, the factor of competition.

We call our American system the profit-and-loss system, and we tend to think of it sometimes as the profit system, but it is also a loss system.

It is not unusual in a cross section, if you take the totality of businesses, that several businesses operate at a loss.

We have that today in the automobile business, and it does happen, and it is a function of the competitive system.

I deal with that a little later in my statement, Mr. Chairman.

Senator Potter. I assume 3 of these stations are in New York and 3 in Los Angeles, is that correct?

Mr. Heffernan. That is a good guess. The figures of the Commission do not show the location.

Senator Potter. Yes.
Mr. Heffernan. These are by groupings, but I do think that is a good guess.

In dealing with these loss figures for station operations, as distinguished from network operations, I don't want to leave the impression that the profit is in the network end of the business.

The fact is that, to the best of our knowledge, the four television networks as a group were in the red last year on their network operations.

Taking the NBC television network alone, that too was in the red for the period commencing with the beginning of its operations in 1947 through the end of 1953.

Television network economics are still precarious, and, in addition, the networks face heavy capital and operational costs to develop the newest phase of the art, the broadcasting of network programs in color.

Senator Potter. How much of that are you doing at the present time?

Mr. Heffernan. Mr. Chairman, in the season just concluded we broadcast our entire schedule in color on the rotational basis, that is, we took every advertiser on the air and offered him an opportunity to appear at least once in color.

Senator Potter. Yes.

Mr. Heffernan. Next season we will step it up considerably more.

Senator Potter. How many sets can receive color in the country?

Mr. Heffernan. RCA has shipped—and I refer to that later in my statement—about 5,000 sets.

Senator Potter. About 5,000.

Mr. Heffernan. Others have sold in totality perhaps two or three thousand, maybe as much as 5,000 or more.

Senator Potter. How much does the average color television set cost?

Mr. Heffernan. RCA sets were sold to the public at approximately a thousand dollars each. The manufacturing cost was more.

Senator Potter. Do you expect that will come down?

Mr. Heffernan. We expect it will come down. I might refer further, Mr. Chairman, to two of the color programs. There were many color programs in which we have great pride, but among those of our sponsored service last year, we put on, at a cost of a half million dollars, 8 operas, of which 2 were done in color—one was scenes from Carmen, and the other the Taming of the Shrew, a new opera, but cast in the old Italian scene—and they were both beautifully done in color.

Senator Potter. Do you mind if I digress a little bit from your statement? What are your views on subscription television for special cultural programs, such as the opera and things of that kind?

Mr. Heffernan. Our views have been stated of record on that, Mr. Chairman, and we feel, in general, that subscription television presents a substantial economic problem, in addition to problems which have been discussed before the Commission.

There are now 30 million television sets outstanding. To convert those, it would require a conversion job for subscription television which might cost, say, $50 per conversion. Now, suppose a million of them were to be converted. That cost is $50 million, and where the $50 million of capital is to come from is something that is not clear up to now.
Some of those who have advocated subscription television have indicated they feel they, themselves, are not the ones to come forward and provide the capital to organize a system of subscription television.

There is, therefore, a very substantial economic problem to get it started. I have taken only 1 million of 30 million sets.

Senator Potter. Do you think subscription television would be a competitive factor with a network program, or do you think it would be an adjunct, or provide better service—additional service?

Mr. Heffernan. I am happy for the amendment, Mr. Chairman. We think we provide very excellent service. It could, of course, provide a supplemental service, and it is possible for special events, such as the Marciano fight, that subscription television might be able to bid more money for such a special event than our present system of television; but bear in mind those special events come rather infrequently, and to set up a system at very heavy capital cost to carry an occasional program raises in itself a difficult economic problem.

Insofar as it would be competitive with the regular system of broadcasting, we would, of course, welcome the competition, because we feel that competition is good for this business. It keeps everybody on his toes and makes for better programing for the public.

Insofar as subscription television would offer a competing service, we think that would be fine.

Senator Potter. Do you feel this is a field that eventually either the FCC—and I am sure that FCC has made studies on this problem—or the Congress might look into?

Mr. Heffernan. My understanding is that there are 1 or 2 petitions before the Commission at present.

Senator Potter. Yes.

Mr. Heffernan. There may be a question as to whether the law is completely clear on the status of subscription television from the standpoint of whether it is a common carrier or whether it is the free enterprise system as our present system of broadcasting clearly is and expressly is under the Communications Act.

Senator Potter. I believe there is a bill in the House now putting it as a common carrier. I was just asking for your views on it.

Many requests have come to me suggesting exploration as to the responsibility of subscription television. I am not going to make any promises of what we are going to do this year, but I think possibly it is something that might be looked into sometime next year.

I am sorry to divert you away from your statement.

Mr. Heffernan. That is perfectly all right, Mr. Chairman.

Senator Potter. You may continue.

Mr. Heffernan. Based on these facts of the table to which I have referred, Mr. Chairman, it would appear that a station which does not commence operation with a ready-made circulation must be prepared to suffer financial losses for the period of time. If VHF experience is any indication, it may take at least 3 years before a UHF station reaches the break-even point. Some no doubt have done it in less, however.

There is a second fundamental economic problem facing television stations, whether UHF or VHF. That is the problem of competition, which is common to most businesses.
Any given service area will support just so many commercial enterprises of the same kind—whether they be television stations, newspapers, drugstores or what have you.

This principle applies to all markets, large or small. It is convincingly brought home by FCC financial data for the year 1952, the latest for which information on this point has been published. This shows that 9 of the 14 stations in New York and Los Angeles reported losses.

Your guess was good, Mr. Chairman. It is a little more.

Mr. Heffernan. The average loss, as reported by the Commission, was $457,000 for each of the 9 stations for the single year.

These are all VHF stations, and they have been in operation for several years. They have good managements and operate in 2 of the 3 largest markets in the United States. But, after years of operation, these nine VHF stations were still in the red.

I suppose if you asked the UHF broadcasters who have appeared before you here these two questions:

1. Would you like a VHF station in lieu of your UHF?
2. Would you like to be in the largest market in the United States instead of your present market?

you would get affirmative answers from most of them.

But the record of these nine stations in New York and Los Angeles will not support the proposition that a VHF channel alone is any guaranty of profits, not even in two of the most populous markets in the country.

The same point is illustrated in other markets. Lincoln, Nebr., is served by two VHF stations in Omaha. In the spring of 1953 two VHF stations also went on the air in Lincoln. On March 13, 1954, one of the Lincoln VHF stations, which was under the same management as a local radio station and had a television network affiliation, went off the air. According to the trade press "the Omaha-Lincoln area with 153,000 households * * * apparently couldn't support 4 VHF."

I have referred to examples of competition by one television broadcaster against others. But his field of competition is broader. He must compete and must survive in the fierce fight that constantly goes on for the advertiser's dollar. His competition is not just other television stations. It includes newspapers, magazines, billboards, direct mail, and specialized publications such as farm journals and business trade papers.

Similarly a network must compete with other advertising media for the advertiser's dollar. The only way we can get revenue as a network is to convince the advertiser he should buy our medium rather than a campaign in newspapers, magazines, or some other competing advertising means such as direct mail.

Senator Potter. How much of the advertising dollar goes to television?

Mr. Heffernan. I have some figures on that, Mr. Chairman. For the year 1953, the figures for national television were approximately $29 million out of a total for advertising of $7,800 million. So, that is less than 10 percent.

Senator Potter. I assume, however, that is constantly growing. isn't it?
Mr. Heffernan. It has been growing in relative position. The total for newspapers, however, in 1953, was $2,600 million.

I come to that point next.

I wish we could claim that network broadcasting outsells other media in this competitive race; but the fact is that, on the basis of figures for 1953, newspapers still get the biggest slice of the advertiser's dollar and magazines and direct mail campaigns take a big slice, too.

This is the kind of competition we have to meet. As I have indicated, only as we succeed in selling against this competition do we get revenue to meet our costs.

**SPECIAL PROBLEM OF MANY UHF STATIONS**

In a large part of the United States UHF has a special problem, in addition to the developmental phase applicable in any new business and the aspect of competition which is common to most business. This is the conversion problem, which stems from the long "freeze" on the grant of new television stations.

The freeze was imposed in September 1948. Only VHF grants had been made up to this time, and 108 such stations took to the air.

By the time the freeze was lifted and UHF stations began to come on the air, VHF had a circulation lead over UHF of 21 million sets. There is no use in blinding this fact. It means that in the areas where the VHF stations were operating, 64 percent of the families already had television sets when UHF operations commenced. And the 21 million sets they had could not receive UHF.

To get that service, the owner of a set has two alternatives: To buy and have installed a converter and antenna, or to buy a combination of UHF-VHF receiver. The cost of conversion varies considerably, depending on the requirements of particular situations.

If the job is done by a serviceman, it can cost anywhere from around $25 to $100 and sometimes more. If done as a promotion by the station, the cost would be considerably less, as indicated by Mr. Sarkes Tarzian in his testimony here. The cost of combination VHF-UHF receivers varies from about $20 to $60 more than VHF-only receivers.

A television station—like any advertising medium—sells circulation. Unless there are UHF sets in the area, the UHF operation has nothing to sell advertisers.

As a result, advertisers will not place their best programs on these stations. The stations need outstanding programing to stimulate conversion, but they also need circulation via conversion to attract such programing.

But I don't want to paint a pessimistic picture of conversion. The problem does not exist at all in many areas of the country. And where it does exist, a number of UHF stations, aided by good programing, have done a fine job of inducing conversions.

The conversion problem does not exist in those areas where VHF did not operate during the freeze and, consequently, VHF did not get a strong circulation lead over UHF. Examples of these areas are Portland, Oreg., Wichita, Peoria, Rockford, Decatur, Jackson, Miss., Fresno, Wilkes-Barre, South Bend, Fort Wayne, and Columbus, Ga.

As I have indicated, where the conversion problem does exist, a number of UHF operators have done a great job of inducing conversions.
In justice to these fine operators, I hesitate to mention specific cities lest someone feel he was left out. But, to aid the committee with concrete examples, I want to name some. I am sure there are still others. Examples which come to mind in this group include:

Harrisburg
Springfield, Mass.
Milwaukee
Norfolk
Asheville
Pittsburgh
Youngstown
York
Saginaw-Bay City
Sacramento
Muncie

Montgomery
Mobile
Madison
Macon
New Britain-Hartford
Greenville, S. C.
Des Moines
Danville, Ill.
Charleston, W. Va.
Zanesville, Ga.

Now, Mr. Chairman, you might be interested in some of the outstanding examples: Harrisburg had 86 percent conversion—that is, 86 percent of the sets in the area that could receive a VHF signal could receive UHF; Youngstown had 75 percent; Muncie, 79; Montgomery, 98; Mobile, 91; Madison, 98; Greenville, 70; Danville, 87; and Zanesville, 78.

Those were some of the particularly highest percentages.

Senator Potter. How many of these were mixed markets? Do you have any idea?

Mr. Heffernan. All of these were mixed markets.

Senator Potter. All?

Mr. Heffernan. All of these are mixed markets.

I dealt first with cities that are not mixed markets.

Senator Potter. Yes, I see.

Mr. Heffernan. Those are not mixed markets, where their problem was simpler. These are mixed markets, where the problem is more difficult.

The case of Madison, Wis., which has 98 percent, a particularly outstanding one—that was accomplished in 9 months.

Senator Potter. Ninety-eight percent conversion?

Mr. Heffernan. Ninety-eight percent conversion.

Much has been said here about the plight of UHF stations, based in part on the number of paper grants returned to the Commission. We feel that too much significance may be attributed to the surrender of these paper grants for UHF stations which were never built. Of the permits returned, however, 14 did represent stations which were built and actually began operations. The balance are the paper grants.

We think, Mr. Chairman, it is important to bear in mind the distinction between those two statistics. You have heard about a great number of permits that were turned back. Sixty-five of those were simply paper grants, where they had filed an application to the Commission and received a grant, but had not built a station.

Senator Potter. Did a comparable situation exist in the early days of VHF?

Mr. Heffernan. I refer to that; 33 VHF paper grants were turned back.

I do not regard the 65 or the 33 as the really significant figures. I think the 14 UHF stations, which did get built, did go on the air and did cease operations—is a significant figure and one that deserves examination, and I propose to go into it.
Some of these paper grants were returned in order to get VHF stations. Others were for communities with a population which might have difficulty supporting a television station of any type of the present stage of development. How many had insufficient financing from the start is difficult to tell.

When we come to assess the significance of the surrender of paper grants for UHF stations, we should realize that the same thing happened, as you suggested, Mr. Chairman, to a considerable extent in VHF. Thirty-three paper grants for VHF stations have also been surrendered.

As indicated, 14 UHF stations actually began operations and later went off the air. Nine of these have indicated they will attempt to resume operations, and the others may or may not. These instances deserve closer examination.

The city in which these stations are located, the number of months each station operated, and the number of their competitive television stations at the date of termination are as follows:

<table>
<thead>
<tr>
<th>City</th>
<th>Months of operation</th>
<th>Competitive television stations</th>

</tr>
</tbody>
</table>

The competitive stations are both UHF or VHF—in most instances VHF.

Senator Potter. You find in most cases you have had quite a good deal of competition?

Mr. Heffernan. In most instances they did. There were 1 or 2 unusual instances.

Little Rock was a very unusual instance. The fellow had only one station competing with him. He was in the black; he was making money; but he was like the fellow playing poker who wanted to quit while he was a winner, and he quit.

I do not suggest, however, that is typical of the other UHF's that went off the air. I do not think it is.

Senator Potter. I assume a good deal of this competition is from other cities?

Mr. Heffernan. It is.

Senator Potter. Rather than local competition?

Mr. Heffernan. Yes. For example, in the case of Dayton, which is the fourth town, I have included not only the 2 VHF stations within Dayton; I have included also the 3 VHF stations in Cincinnati, which the witness stated here get into his market, and I am taking his testimony that they do.

Senator Potter. Yes.

Mr. Heffernan. In the case of Atlantic City, I am including the 3 Philadelphia stations, which the witness testified get into his market.

There are UHF stations in markets which are not as large as some of these and where there is also competition from VHF stations which
appear to be doing well or which foresee prospects of favorable operation. The committee has heard from some of these stations.

The record of television station operating failures in relation to that of competing media may be significant. Since 1946, when commercial television began to expand, 17 television stations, 14 UHF and 3 VHF, have suspended operation. In the same period 93 daily newspapers and 87 weeklies and semiweeklies have ceased publication.

Newspapers face the same problems of building circulation and gaining advertising revenue as television stations. The fact that economic casualties are relatively common in the business of mass communication suggests that this is indeed a field where the risks are great and where there can be no assurance of profitable operation.

I might, at this point, Mr. Chairman, refer to a question which you asked the other day as to how many sets are regarded as necessary economically to support a station.

We have one affiliate in Roswell, N. Mex., who has 20,000 sets, and who informs us that he is making money.

Senator Potter. Is that right?

Mr. Heffernan. There was a figure referred to here the other day of a hundred thousand sets. Actually, of the 177 affiliates that we have, 98 of those, or more than half, have less than 100,000 sets.

Senator Potter. I assume in the Roswell, N. Mex., case that there is no competition. I would be interested in knowing how much of their advertising is national advertising and how much of it is local.

Mr. Thomas E. Knode (manager, station relations, National Broadcasting Co., Inc.). It is about half and half, local and national.

Senator Potter. About half and half, local and national?

Mr. Knode. Yes.

Senator Potter. That has an affiliation with NBC?

Mr. Heffernan. It is an NBC affiliate; that is correct.

While we are diverted, Mr. Chairman, I might answer one other point.

Some point was made here of the fact that in New Jersey the people had to go into New York, which seemed to be very distasteful to some for New Jersey public officials to broadcast. Actually, the facts are there is a VHF channel, assigned to Newark. There is a Newark station. Its studios are in Newark. They have no studios in New York, and that station happens to have a regular weekly program on which the Governors, Senators, Congressmen appear, and they do not have to go into New York to appear on that station.

Senator Potter. But is really a New York station, however, isn’t it? It is announced as such and such a station, New York; is that correct? Or is it Newark?

Mr. Zapple. I think it is Newark, N. J. It is listed as Newark.

Mr. Heffernan. It is assigned to Newark, Mr. Chairman, and is listed as such. It has happened, for competitive reasons, that it has located its transmitter on the Empire State Building after first locating its transmitter on a high spot out in New Jersey, but it found in order to better compete——

Senator Potter. For all practical purposes, it is a New Jersey station?

Mr. Heffernan. It is; yes, sir.

Conclusion:
Commercial UHF television is a new business. It got off to a rapid start. Many of the new UHF broadcasters are doing fine. On the
other hand, 14 stations terminated their operations after a comparatively short period on the air.

At NBC we are convinced that the success of UHF is important to the public and the entire television industry. We feel therefore that the position of UHF at the moment only emphasizes the need for an effort by interested parties to do what they can to make UHF a success.

The leader in this effort should of course be the broadcaster himself. Others who are concerned include advertisers and their agencies, manufacturers, dealers, and the networks. And, I might add, the public itself has a part to play. It can help by recognizing that in this fast-growing art UHF is a new service which deserves public support through the conversion of sets to receive UHF.

Senator Potter. We have heard a lot of testimony about—I assume this back to the set manufacturers or to the dealers of television sets—advertising practices that are harmful to the development of UHF—in other words, that you can buy this set without getting a converter, or something of that kind. I believe it has been mentioned that even other television VHF stations, when they are putting on additional power, advertise that you can hear this station without a converter.

That would tend to be in conflict with your statement, although I guess you made this as a suggestion, that these people should convert.

Mr. Heffernan. That is right.

It is not really a conflict, I believe, Mr. Chairman.

Senator Potter. Yes.

Mr. Heffernan. I think all facets of this industry should realize that it is in the interest of all that UHF be a success, and they should do all they reasonably can, within the limits of human nature, which will always be with us, to make it a success.

Senator Potter. Do you feel that if all new television sets included the all-channel tuner, it would put the UHF people in a better competitive position?

Mr. Heffernan. I am sure it would, Mr. Chairman.

I have a reference to that in a moment as an example of what one company has done. I assume you are referring, of course, to voluntary action by them to help out.

Senator Potter. Yes.

Mr. Heffernan. By this time I am sure it is evident to the committee that there is no magic cure-all for the problems which have been discussed here. There has been a number of solutions presented, many of them tailored to cure specific problems of the private operators proposing them.

At this late date in the hearings we don't believe it would serve a useful purpose for us to go through all these proposals and repeat the arguments for and against them. Rather, we will limit ourselves to a few points:

**Senator Johnson's Excise Tax Bill**

Senator Johnson has proposed to remove the excise tax on television sets equipped to receive UHF and on UHF converters.

This is a most constructive proposal, and we fully and heartily endorse it. The proposal if enacted, could help UHF so greatly that
we commend this committee for its prompt and vigorous resolution in support of the bill.

That action by the committee and Senator Johnson's alert followup before the Finance Committee reflect a practical awareness of what can be done to help UHF. We hope that this committee, with the continued assistance of Senator Johnson, will be able to bring home to their colleagues in the Senate the points that are so convincingly made in the preamble to their resolution endorsing Senator Johnson's bill. If that resolution and its preamble have not yet been made a part of this record, may I suggest they go in before the record is closed.

Senator Potter. It has been made a part of the record.

Mr. Heffernan. The early adoption of Senator Johnson's bill is particularly timely because of the advent of color television.

The replacement of existing VHF receivers may be tremendously accelerated as the demand for color receivers develops. To date, RCA has manufactured about 5,000 color television receivers. All of these were equipped at the factory to receive UHF as well as VHF. The removal of the excise tax on all-channel receivers would encourage other manufacturers to follow this example.

While on the subject of color television, we would like to say something about the suggestion to limit color television broadcasting to the UHF. We believe this is the most unsound proposal put forward by anyone.

Color television has had a struggle to be born for more than 15 years. At last the new baby is here. It is only 6 months old but it is growing fast.

NBC and others are already broadcasting color programs regularly. On the NBC Television Network alone the 5 stations we own and 36 of our affiliated stations will be equipped to broadcast network color shows by the end of this month. All but 4 of these 41 stations are VHF. By the year end this figure of 41 is to be increased to 62, of which 52 will be VHF and 10 UHF.

I am sure, Mr. Chairman, the committee understands, however, the ratio is not that of 10 to 52, but the significant fact here is that these color programs originate with the network, and there is great capital cost required for the origination of a color show as distinguished from simply arranging that a station along the route of the cable can take the program off the cable and broadcast it locally.

As Dr. Stanton pointed out, the cost of doing the latter, simply taking it off the cable, is perhaps around $25,000, whereas we are spending in NBC alone more than $5 million to build and equip color television studios for operation this fall.

Two are already completed, and they were used during our broadcasts of last year. We are building one large new studio in California, and we are equipping a large studio for color in New York.

Senator Potter. Will it be economically feasible for the individual stations to originate color programs?

Mr. Heffernan. I am glad you asked that question, Senator, because, in fairness to some stations, I wanted to add, in addition to simply equipping them to take it off the cable as it goes by, a number of stations have bought equipment, color equipment, to originate programs, local programs, in color, and those stations deserve credit for their pioneering work. A number of them have done that.

Senator Potter. But it takes quite a substantial investment?
Mr. Heffernan. That is right. It is considerably more expensive than the $25,000 operation to which I referred. A color camera alone, for example, would cost more than that at the present time.

To limit color to UHF would not help that medium, and it would stop abruptly the growth of color.

It is easy enough to say that a VHF operator could be given a UHF channel so that he could broadcast color in UHF but to accomplish this would take a long time. New York, for example, would require 7 UHF channels. To find these channels, to decide which station should get which channel and to get the new stations built and on the air would require a lot of time and a lot of capital which might or might not be forthcoming. It is significant that the only network which has suggested that color be confined to UHF has yet to broadcast a color program.

The people are entitled to color television now. There is great public interest in this new scientific advance. We feel strongly that color television should not be made a hostage in the contest here between UHF and VHF.

Senator Potter. I am sensitive to that word "hostage."

CHANGE IN MULTIPLE OWNERSHIP RULES

Mr. Heffernan. As I have already said, we feel it would promote the public interest in UHF broadcasting for the Commission to lift its five television station limit and permit experienced broadcasters to develop UHF stations. We prefer the Commission proposal to Senator Johnson's other bill on this point. We do not believe that multiple owners would be encouraged to enter UHF broadcasting if they were forced to surrender VHF stations as the price of admission.

BOOSTERS AND SATELLITES

We favor the adoption of engineering standards under which UHF and VHF stations would be permitted to use boosters and satellites to provide complete and comparable coverage of their areas.

STUDY OF ELIMINATION OF INTERMIXTURE

A number of witnesses have proposed a study of the possibility of eliminating intermixture of UHF and VHF channels in the same market. One was candid enough to recognize the great practical problems which the elimination of intermixture would entail.

As the committee knows, Dr. Du Mont proposed to the FCC, before the adoption of the present allocation plan, two methods of eliminating or at least minimizing intermixture. His organization made a more elaborate presentation to the Commission on that point than any other.

It seems highly significant that Dr. Du Mont, who had made the strongest plea before the Commission for the elimination of intermixture, told this committee it is not now practical. And, in fact, no one has definitely said that elimination is possible. Those who have dealt with the subject propose a study to see if it is possible.

We do not oppose a study of this by the Commission. We do suggest, however, that the institution of the study should not raise false hopes that it can yield a quick solution of problems that have been
mentioned here, or that the elimination of intermixture can be accomplished without a major wrench to the viewing public and the broadcast operators who would be affected.

We believe also that, before concluding to make such a study, everyone concerned should give careful thought to the effect the very institution of the study might have on UHF itself.

Would conversion to UHF continue—or would the public just wait and see and all conversions stop? Would advertiser interest in UHF be further dampened while the industry waited for the development of a new allocation plan?

Mr. Chairman, we feel that this committee has done a constructive thing in holding these hearings so that all segments of the industry could be heard. Again I want to thank the committee for its consideration in permitting NBC to present its views.

Senator Potter. Mr. Heffernan, I want to thank you for your statement.

I wish to apologize for the many delays we have had during the course of the hearing, and you have all been most patient.

Senator Bowring, do you have any questions?

Senator Bowring. No, thank you.

Senator Potter. And I sincerely hope we haven’t interfered too much with your proposed trip.

Mr. Heffernan. Not at all, Mr. Chairman. I appreciate your courtesy very much.

Senator Potter. Thank you. Now we will get into the rebuttal phase, and let me again state that I am going to be heavy on the gavel if anybody transgresses that half-hour period.

First, we will hear from Mr. Cottone.

Mr. Cottone, it is good to have you before the committee again. I understand you are going to split the time with Mr. Roberts. Is that correct?

Mr. Cottone. Yes, I am, Mr. Chairman.

Senator Potter. All right.

STATEMENT OF BENEDICT P. COTTONE, COUNSEL FOR THE UHF INDUSTRY COORDINATING COMMITTEE

Mr. Cottone. It is most gracious of you, Mr. Chairman, to say what you just did, and it is most gracious of the committee to allow us this additional time.

Senator Potter. We are happy to do it. We want to have all the facts we can, or as many facts as we can, before the committee, and we realize there is bound to be a certain conflict in testimony, and it is only right that the participants have a right to make any corrections they feel they should make.

Mr. Cottone. Mr. Chairman, let me say I want to avoid being banged by your gavel, but I have a statement which will run more than 15 minutes.

Senator Potter. Would you speak just a little louder, Mr. Cottone?

Mr. Cottone. Yes, sir. Let me say my statement, as written, and which I regret is not available in mimeograph form at the present time to the committee—it is now being mimeographed—will run more than 15 minutes. However, I do not wish to intrude upon Mr. Rob-
erts' time, and I expect, if I am to be limited to the 15 minutes, to put the remainder of my statement in the record.

Senator Potter. Yes; that will be fine.

Do you want me to give you a signal at the end of 15 minutes?

Mr. Cottone. Yes, sir, unless you forget it.

Senator Potter. All right.

Mr. Cottone. Mr. Chairman, I might say the mimeographed copies will be here today before the conclusion of the hearings, and those who are interested in having them will have copies available.

Senator Potter. Fine.

Mr. Cottone. I would like to point out at the outset, Mr. Chairman, before going into the presentation, that we have had, I think, quite a bit of discussion about the New York situation, and the question as to whether New York has 7 stations or 6 stations, and New Jersey 1. We were rather interested in Mr. Heffernan's comment about there being 6 stations in New York and 1 in New Jersey, because when he was proceeding to discuss the question of losses among the 14 stations between New York and Los Angeles, he drew no distinction as regards Newark, and when he was discussing the question of the ability to provide 7 UHF stations to New York, he did not distinguish between New York and Newark in that discussion.

Senator Potter. That is the beauty of statistics. You can use them as you wish.

Mr. Cottone. Yes, sir.

Mr. Chairman, the subcommittee has generously afforded the UHF group this additional opportunity to give what has been described as a rebuttal presentation. May I say at the outset that the UHF industry coordinating committee is most grateful not only for this opportunity but for the patience, tolerance, and understanding which this subcommittee has shown in hearing our evidence and that of others on the grave problem before it.

It is not entirely accurate, however, to describe what we now have to say as a rebuttal. For we believe it should now be plain that, with one possible discordant note, namely that sounded by the so-called VHF emergency defense group speaking through its counsel, Mr. Pierson, there has been substantial harmony upon the basic fact that there is a critical situation today stemming from the present television allocation plan.

The factual evidence you have heard, and I place emphasis on the word "factual," establishes convincingly the basic proposition that where UHF stations are in direct competition with multiple VHF services, a situation which today exists in virtually all parts of the country under the present intermixture plan of allocation, UHF stations simply cannot survive such competition, because of the overwhelming handicaps and disadvantages created by the disparity of facilities. This disparity is the knife in the very heart of UHF's ability to compete on a fair basis for the advertising dollar, for network programs, and for the other wherewithal which makes possible local program service in the public interest.

The so-called UHF success stories which you have heard given by the gentlemen from Muncie, Norfolk, and Columbus have, in fact, forcefully corroborated rather than disproven the basic proposition. For these situations vividly demonstrate the converse of the basic proposition by proving that in the rare instances where UHF stations
have to date remained relatively unexposed to the direct competition of established multiple VHF services, they have been able to live. But their present ability to live does not mean immunity from the fate which has stricken some and threatens many others.

Experience with what has happened in the past betokens even for the Muncies, the Norfolk's, and the Colombuses the possibility if not likelihood, that all will not continue to go as well for them when there begins to occur the inevitable invasion of their markets by additional superpower, superheight VHF stations. We venture to suggest, therefore, that if the Woodalls persist in the bland and supine attitude here expressed in regard to the present allocation, they may soon find that they have been living in a fool's paradise.

Except for the discordant note introduced here by the belatedly organized so-called VHF emergency defense group, speaking through Mr. Pierson, there has been substantial unanimity of responsible opinion that the situation today is chronically inherent in the present allocation scheme and, either implicitly or explicitly, the brunt of such responsible opinion, with the exception noted, recognizes that the cure must be found there. I choose the word "responsible" advisedly, because I think that the VHF group's analogy of the problem to "painful sores" on an infant's legs is nothing short of a shocking disregard of the realities recognized by almost everyone else from whom you have heard.

The overwhelming unrefuted facts, again (I use the word "unrefuted" advisedly also, because there were no facts given by the VHF group except inapplicable analogies to past experiences of VHF operators), I say the overwhelming and unrefuted facts have shown that UHF simply cannot now compete, and cannot reasonably be expected in the future to compete, against multiple VHF services under the present allocation, and that something must be done to change that allocation if nationwide competitive television service is to be a reality rather than a mere hope. Notwithstanding the understandably complacent attitude of the VHF group, it is safe to predict that when all VHF stations are operating under the present allocation the trend of today will be aggravated in most areas of the country.

In recognizing that the allocation scheme is the critical focal point, the responsible opinion here expressed similarly recognizes that merely through such measures which, at best, furnish only a hope that the public will buy all-channel receivers, UHF cannot be reasonably expected to develop beyond the point in which UHF finds itself today. On the contrary it is more reasonably to be expected that it will regress toward the point at which it started 2 years ago when the freeze was lifted. Without UHF, television will be confined ultimately to the scattered few hundred tremendous coverage VHF stations limited to the top major markets, a situation which may aptly be described as the large national advertiser's dream but the local public's nightmare.

We cannot and do not deny that the problem is one of great complexity. But the complexity of the problem cannot in good conscience forestall or frighten away any attempt at solution. We are sure that the Senate committee which sought to undertake this very inquiry into the problem and this subcommittee are not susceptible to being
frightened away from its solution because of its complexity. Had it been so disposed, it could have left the matter where it stood because there was then, as far as we know, no clamor either from the Commission or UHF operators, that this inquiry be undertaken. This subcommittee must therefore be presumed to have been prepared, as its members have been at various times during these hearings indicated, to do whatever is possible to place television on the right tracks toward the universally recognized desirable goal, a nationwide competitive system. We earnestly and sincerely believe that this occasion will be the last clear chance presented to do so. Neither the Congress, the Commission, the industry nor the public can afford to let this chance slip by. For the pattern that will crystallize from here on out, in the event of inaction or the type of desultory action suggested by the VHF group, will seriously affect generations to come.

I think it is fair to repeat at this point, that there is virtual unanimity of substantial segments of this industry on the proposition that equality of competitive opportunity among television stations is the sine qua non of nationwide competitive television service to the public and that reallocation is the logical means to the desired end. The UHF industry has demonstrated substantial unity on this point. The NARTB recognizes the necessity of action toward the desired end although it does not suggest the method. The Du Mont network implicitly concedes that reallocation is logical and essential although its specific proposals are along other lines with which we do not agree because we believe those proposals attack the basic problem at its fringe rather than its core. The ABC network similarly recognizes the need for reallocation as the means to competitive service and the CBS network, through Dr. Stanton, has come forward most forthrightly and stated that prompt combined efforts toward a more sound allocation must be undertaken if the public's position is to be protected. And I note from Mr. Heffernan's statement that he at least nods in the direction of attempting a reallocation. The differences of opinion go only to the kind of reallocation which should be sought.

Dr. Stanton agrees that the moving of all television stations to the UHF spectrum will most certainly and most clearly remove the competitive inequality between the two services. However, Dr. Stanton dismisses this solution because he claims that it will hurt the public through obsolescence of receivers. The UHF group has proposed the move of all stations to UHF over a transition period because this is, we believe, the only sound method of assuring a truly nationwide competitive television system. This proposal was intended, through an orderly method of transition, to achieve the admittedly logical and desirable ultimate result without serious injury to public investments.

Not so long ago, Dr. Stanton was urging that the long-range benefits to the public of a then incompatible color system justified obsolescence of a substantial public investment in television receivers. Dr. Stanton then advocated what he believed was best for the ultimate service to the public upon a basis which, in complete fairness to him and to CBS, was designed to minimize the serious effects to the public. That basis was early establishment of the CBS color system before too heavy a public investment in black and white sets was made. We submit that the UHF industry coordinating committee proposal, in precisely the same manner as the CBS proposal of not so long ago,
is designed to do two things: First, to lay at the earliest possible date the groundwork for the system of television broadcasting likely to be most beneficial to the public interest on a long-range basis; and, second, to accomplish this with the least possible injury to public investment. But in complete fairness to our position, Dr. Stanton should have recognized that we urge orderly transition over a period of time so geared to amortization of investments and normal replacement of existing receivers that private and public injury would be minimized to the greatest extent possible and that we should be credited with the same basic concern for public interest as he had.

Dr. Stanton's purpose in seeking to give the public the benefits of color was tempered by a desire to avoid complicating the problem of obsolescence. Indeed, the possibility of obtaining the long-range benefits of color television before the situation had become too seriously frozen accounted for at least 2 years of the freeze. We are not critical of the detour taken in order to solve this problem because we believe the purpose was sincere. But by the same token, Dr. Stanton should not quarrel with our suggestion of a freeze where its sole purpose is to avoid complicating a solution of the basic problem. It is hardly cricket, in this frame of reference, to shear away from a freeze urged for the ancillary purpose of facilitating a reallocation, and I wish to assure you that is our only purpose in suggesting a freeze by the argument that because the last freeze lasted 40 months, most of which was occasioned by the color issue, any new freeze must be avoided because it might again last that long.

We believe, however, that in the final analysis, Dr. Stanton's presentation was most forthright in that he recognized that a grave problem exists which can only be met by serious consideration of reallocation measures. We certainly accept his premise that reallocation is the proper method by which to achieve nationwide competitive service. We have felt and feel that this premise must lead logically to a single spectrum system because the availabilities in VHF are so limited that UHF alone can bring about the equal opportunity to compete for the maximum possible public service. But we nevertheless endorse Dr. Stanton's recommendation of a study to determine whether any feasible de-intermixture plan can accomplish the necessary goal of a truly nationwide competitive system provided that such study is speedily accomplished so that it may promptly be determined whether it will or will not be necessary to go to a single spectrum system in order to provide a truly nationwide system providing equal competitive opportunity to broadcasters.

In order that there be no misunderstanding as to our position, we should like to make clear again that we do not suggest solutions which we have stated merely seek to cure the results rather than the cause of the problem. The networks have explained that the good and bad experiences reported by UHF and small market VHF stations stems from the basic disparity and inequality between VHF and UHF stations where UHF stations are forced to compete with VHF stations. The necessity of providing the more choice and most acceptable facilities that may be available for the advertiser compels networks to favor VHF stations wherever a selection or choice is possible. Accordingly UHF stations find themselves increasingly in an unfavorable position wherever VHF facilities are or become available for network use. And this situation impairs whatever disposition networks may sin-
cereley have to accord UHF stations equitable treatment in making programs available. In view of these facts, we have not and do not urge measures designed to regulate network practices or their relationships with stations because it is our belief that such measures merely seek to cure the results rather than the cause of the problem.

I would now like to deal with what I have referred to as the discordant note. The presentation of the so-called CHF Emergency Defense Group, made through Mr. Pierson, demonstrates a somewhat shocking philosophy. They have come before this subcommittee with an attitude which would virtually deny to Congress any responsibility to act to protect the public interest. It opposes everything and favors nothing except a single measure pertaining to excise taxes on all-channel receivers which concededly can give no assurance of solving the serious problem this subcommittee has set out to solve. This group's attitude is reflected in its recommendation that after holding these may days of hearings, this subcommittee should now refrain from exercising any deliberate function, and merely refer the entire record to the Commission for such action as the Commission may see fit to take. We believe this attitude was aptly characterized by Senator Potter in his remark at the end of Mr. Pierson's testimony of several hours, when Senator Potter analyzed the philosophy expressed as one which, carried to the extreme, would "destroy representative government."

The VHF group came to you with a discourse on free enterprise, predicated on the fallacious concept that Government should keep its hands off anything and everything that affects the status quo. The fallacy of Mr. Pierson's free-enterprise philosophy is that it conveniently ignores that where Government must of necessity, lay the basic groundwork upon which an industry must operate, as it does in the radio field through allocations of facilities, there can be no true free enterprise if the pattern prescribed does not and cannot provide opportunity for free and equal competition. Although Mr. Pierson would have you believe that the proposals of many witnesses for reallocation are alien to our traditional free enterprise philosophy, we assert that on the contrary our case is firmly grounded on the premise that free enterprise must be the basis upon which the American system of broadcasting must continue.

Free enterprise, by definition, means the availability to all who desire to enter a business, of equal opportunity to compete with others in that business. The greatest threat that exists today to a continuance of free enterprise in broadcasting is that because of the greater advantages given by the Government, through allocation of frequencies, to some in this business, a large part of all the existing and potential entrepreneurs who are willing to go into this business, will be forced out of it, or will refuse to get into it. This means inevitable monopoly, and as we have said, monopoly breeds public distrust and invites vigorous Government regulatory controls. This is what we are trying to avoid by suggesting equal competitive opportunity to serve. And in suggesting reallocation as the proper method of providing equal competitive opportunity, we are not asking Government to guarantee profits; we are not asking Government to eliminate or protect us from competition; and we are not trying to deprive the public of service, but are rather trying to assure to the public for the future, the measure of diversified competitive service to which it is entitled.
Mr. Pierson’s strained argument that we seek monopoly (which he sought to illustrate by the Greenville situation) borders on absurdity, because it was predicated on his premise that unequal facility advantages, made possible only through governmental action, should be accepted supinely.

Mr. Pierson looks down his nose at the small entrepreneurs who would be willing to stay in, or go into UHF, if equal facilities were provided. At one point, he in effect referred to these entrepreneurs as undesirables. Why were they undesirables? Because, Mr. Pierson says, if the Government should now seek to equalize the situation, the VHF stations who are, in his mind, the “undesirables,” because they are backed by tremendous financial resources, will be unwilling to stand for such “fickleness” on the part of the Government.

Mr. Cottone. It is obvious that what Mr. Pierson means is that his clients could not be sure of the ability to get returns of up to 300 percent on their investments or to be able to sell their VHF stations for prices up to $8,500,000 within a relatively short time after the Government gave them this favored opportunity to serve the public.

Senator Potter. How much more time do you have?

Mr. Cottone. I am afraid, Mr. Chairman, that I will have at least 10 minutes time and at this point, if I may, I would like to conclude.

Senator Potter. All right. I hate to go ahead and rescind my own ruling but I will give you the opportunity. You can continue and I will give Mr. Pierson the right to equal time.

Mr. Pierson. It will be entirely satisfactory to me if Mr. Cottone will give me an opportunity to digest his remarks before I am called.

Mr. Cottone. I have no objection to that.

Senator Potter. All right, proceed, Mr. Cottone.

Mr. Cottone. He also means that those who are in the small group now taking the bulk of the total television revenues might put their financial backing elsewhere if the Government were to become so fickle as to change the present situation so that some others, through equal competitive opportunity, might get a chance at a small part of these revenues.

If these are the kind of “desirables” that Mr. Pierson is talking about, and we doubt that all his VHF stations really share this attitude, it might be much better for the public for those who do feel this way to pull up stakes and go elsewhere, for such an attitude can hardly be characterized as public spiritedness.

Would Mr. Pierson suggest to one of his clients that in the event of such fickleness on the part of the Government, his client should announce to his viewing audience that he does not wish to continue to run a TV station because he might have his returns cut down to 50 percent instead of 100 percent or 300 percent on his investment?

In his testimony of several hours Mr. Pierson skillfully avoided a direct statement or an answer to the question: How can UHF stations ever be able to compete against VHF stations in the same area? How, if all or substantially all, of the UHF stations now in operation shut down, can the public ever be induced in the future to buy sets which receive UHF? When, in the timeless timetable constructed on his foundation of patience, does he expect that if present UHF stations shut down, any existing or new entrepreneurs will ever want to touch UHF even with the proverbial fork or 10-foot pole? Mr. Pierson
cannot possibly be referring to his VHF stations as those who will bring UHF back. For he told us himself that these are the kind of entrepreneurs who, if the Government should become so fickle as to try to equalize opportunities for all TV broadcasters so that their own 75 percent, 100 percent, and 300 percent returns might be cut down somewhat, they would not want to continue to risk their capital in this business. I am sure he is not referring either to the UHF broadcasters who tried, and “lost their shirts,” because even he would probably concede that even the small child who is burned does not stick his finger in the same fire.

Mr. Pierson, without making the slightest effort to show, by any facts, how even more entrenched VHF monopoly which is now developing can be averted unless something is done, then proceeds to oppose everything and favor virtually nothing. With lawyerlike logic, and except for occasional slips under questioning, he constructs a thesis based upon his fallacious premise that Government has no business doing anything to create a climate of free enterprise in which competition is possible. He differed with Senator Schoeppel's suggestion that Government might have a responsibility to do something to assure a more equal distribution of network programming because that raised in his mind the specter of common-carrier regulation. Yet in the next breath he volunteered that Government does have the responsibility, under the antitrust laws and under the public-interest concept in the Communications Act, to avoid monopolistic practices. I agree with Mr. Pierson that the issuance of certificates of convenience and necessity under the common carrier concept could well create the undesirable result of limiting to four the number of networks which would be permitted to operate. But it surpasses human understanding how Mr. Pierson can become horrified at the possibility that we may only have four networks and then go on to say that there is nothing wrong with the present allocation scheme, also prescribed by governmental regulation, which limits the number of equal stations in most of the major markets of the country to two or less stations. Indeed, we were told, in the face of the tremendous returns of a small group of VHF stations in these markets, that more than two UHF stations may be too many.

Now, Mr. Pierson after many pages of dissertation of his free-enterprise concept, concludes that every constructive suggestion made to this subcommittee for solving the serious calamity threatening the industry and the public should be opposed. But he then momentarily casts off his free-enterprise robes, momentarily recognizes that there is a problem and is willing to concede that Government should do a little something about it. Up to now, this whole “mess,” as Senator Bowring described it, was to Mr. Pierson's mind none of the Government's business. What does he suggest? Remove the excise tax on all-channel receivers. He did not tell you how this could reasonably be expected to solve the problem. He did not suggest how the public could be assured the benefit of the saving that would result. He vaguely implied that elimination of the tax might remove the whole amount of the present differential in cost between VHF and all-channel receivers. But he did not tell you that, even if the differential in the receiver cost would inure to the public's benefit, by far the greatest amount of the cost for getting a UHF receiver in operation in the homes is the much greater cost of antennas, installation and
servicing. Apparently, Mr. Pierson does not believe that the Government should be throwing out bones to anyone unless the bone is small enough to stop the dog from barking for a few moments only. While he champions his concept of free enterprise, he is not troubled by governmental intrusion so long as it doesn’t help the other fellow too much. In this instance, he fell out of the free-enterprise saddle for a moment. But when he was asked, by Senator Bowring, I believe, whether something more shouldn’t be done to make sure that the public would be able to obtain the all-channel receivers, he suddenly found the stirrups again, and was back in the saddle riding the old horse again. Going any further, he says, would be getting the Government too far into the sacred domain and the public should be left to shift for itself.

Mr. Pierson, for his 135 clients, would also appear to be willing to step up his bone throwing; even though it means a little more Government intrusion, by voicing a hope for boosters. Here again he fails to tell us how it helps. I am sure some of his VHF clients would like some boosters to increase their coverage and boost their revenues. They can afford to wait for them, too. And I rather doubt that they would have too much difficulty in raising the money to establish and operate them.

Mr. Pierson as his final suggestion, would like to see the Commission eliminate more red tape. Frankly, after his valiant defense of the so-called quickie grants and the Commission’s overnight merger-payoff procedures, I was a bit puzzled at this suggestion. I only conclude that Mr. Pierson regards the present procedures as only a step in the right direction and that to eliminate what else remains of what he chooses to call redtape, he would bolt the Secretary’s doors at the moment that the merger-payoff deal was filed, and instead of waiting until the next day for a grant, he would have the seven Commissioners on hand in the Secretary’s office at 5 P. M. Tuesday night, read them the signatures on the applications, and then call for a vote.

In view of Mr. Pierson’s description and justification of the quickie grants, I believe it should be presented in its proper light. I am preparing a memorandum on this subject which I hope the subcommittee will permit me to submit for the record when it is completed.

With regard to the question of the inevitable payoff involved in these mergers, Mr. Pierson was aware of no serious problem. In view of the concern shown by this subcommittee in the questioning of Mr. Pierson on this subject, we would earnestly like to urge that before these hearings are concluded, the Commission be requested to furnish the details as to each of the merger transactions which have been approved under its current procedures with a showing of amounts paid to withdrawing parties and just what considerations were shown to have been given for these amounts. In one instance of which I am personally aware, sums in excess of $205,000 have been agreed upon as the price of withdrawal. If Mr. Pierson is not disturbed by these, there are at least two present Commissioners who have been, and who have dissented in such payoff cases.

What is Mr. Pierson’s justification for the procedure? He says it is designed to beat out the filing of strike applications. But in the next breath he sanctions the encouragement of strike applications which he admits the procedure does, by finding nothing wrong with rewarding the strike applicant or getting into the same bed with him.
by merging. I find it most difficult to follow through logically to this result from the public interest premise on which Mr. Pierson purports to predicate his argument.

Mr. Pierson says you can’t prove the other fellow is a strike applicant. Therefore, under his reasoning, you should reward him. The concept is, to say the least, a shocking one. The simple answer is that an applicant who is really a strike applicant will not wish to be smoked out by the most effective means yet developed in our jurisprudence for getting at the truth: a public hearing where witnesses are placed under oath and subjected to the test of cross-examination of the lawyers for the several applicants, and Commission counsel.

Mr. Pierson has less concern about the public-interest aspects of mergers of this kind and payoffs than the courts have traditionally had, and than the Commission at one time had. In my memorandum, I hope to be able to show definitively that courts and other public bodies have regularly frowned upon procuring the withdrawal of competitive requests for Government privileges or franchises by the buying out of the competition and have refused to lend their processes to such practices.

Senator Potter. Thank you very much, Mr. Cottone.

Mr. Cottone. Thank you, sir.

Senator Potter. How long will you take, Mr. Roberts?

Mr. Roberts. Fifteen minutes.

Senator Potter. We are happy to have you with us back before our committee and I sincerely regret the time limit put on this type of rebuttal but I found if we do not have time limits we will be continuing for some time. I will be looking forward to hearing what you have to say.

REBUTTAL STATEMENT OF WILLIAM A. ROBERTS, GENERAL COUNSEL OF UHF TV ASSOCIATION

Mr. Roberts. May I have your permission to use a few of the precious minutes allocated to us for rebuttal, to express the dismay and regret we feel at the departure of a fine and courageous man, Senator Hunt. Only those of his friends who knew the great strains under which he has been laboring for the past several months can appreciate his devotion to the work of this subcommittee and his deep interest in the basic purposes of these hearings. It was my privilege to work with Senator Hunt within the past 2 years when he was engaged in a prolonged and intensive study of the manner in which public opinion can be controlled and distorted through media of communication. He devoted many days to the study of the abuse of privilege within legislative agencies and with his profound belief in the dignity and importance of the functions of the Senate. He was most concerned with ways and means by which the effectiveness of the investigatory process could be increased and the rights and freedoms of all of the people and our constitutional democracy preserved. He was with us in the last session of this subcommittee, and I feel that in losing him, we have lost a friend of great understanding. Perhaps in that other land where election results are not counted, and all is devoted to the good and true, we may still have his assistance and his friendship.
Mr. Chairman, it is conventional for lawyers to summarize at the conclusion of a trial by repeating the points which they announced in the beginning, implying what logic they may possess to the evidence bearing on these points. I know of nothing in the original presentation of the UHF Association which I desire to retract or modify. The principles have stood the test of challenge and the need for immediate congressional support has been demonstrated. Here is the case by subjects—intermixture, for example. The presentation of Mr. Cullom is the key to the attitude of the VHF networks and VHF broadcasters with respect to UHF. He reaffirms his conclusion that UHF is presently and permanently an inferior service incapable of serving rugged or rural areas better adapted to the equivalent of 250-watt standard-broadcast philosophy and unfit for his clients. He further holds that the Commission's allowable powers and tower height for UHF as compared with VHF, are inadequate. In these conclusions he is diametrically opposed to the findings of the Federal Communications Commission upon which the entire present allocation system is based. I refer you to paragraphs 197 to 200 inclusive, of the Commission's sixth report and order.

There is room for argument, and its is assumed that lawyers will select the arguments more favorable to the interests of their client. I most emphatically deny that this course is available to engineers, and believe that they must be governed by the facts and only the facts. They must not blow hot and cold on matters of technical truth.

I refer you also to a publication of the Radio Corporation of America, known as Broadcast News, volume No. 71, September-October 1952, in which there is an official report on the test experience in the installation of UHF in Portland, Oreg. Among other things stated in the RCA report are the following:

**A Quick Summary**

What did I find out? The whole story is told in detail in the following pages. However, for those who can't wait here's a quick summary.

(a) In general the performance of KPTV has been such as to startle the industry. Most of the experienced radiomen investigating it in person have agreed that it is "much better than expected."

(b) More specifically, KPTV is delivery class A coverage (74 dbu) to about 20 miles in all directions where there is population, and class B coverage (64 dbu to 30 or more miles in the directions where there is favorable terrain.

(c) Although there are local "dead spots" the total population in these areas is probably less than 5 percent of that in the city proper, and less than 12 percent of that in the whole trading area.

It is a well-known fact that with VHF operation also, there are "dead spots" within the class A coverage, and as higher gains are used, that these "dead spots" become a serious problem. However, the essential conclusion to be reached from the criticism of UHF is that there is a present difference in UHF; that if it is less desirable to reach remote areas, then it must be used in the heavily populated and congested areas where the mass of population may be well served, and VHF in the lowest frequencies might be placed in the remote areas where its greater range and adaptability to varying terrain could be best utilized.

Basic to the consideration of the Cullom theory which underlies the refusal of the VHF supporters to offer service on UHF stations, is the
present inadequacy of power and the present inadequacy of receivers for UHF operation. These will be and are being corrected, and the services become constantly more nearly comparable.

The presentations in general on behalf of all of the VHF advocates and those who urge that there is no need for governmental action, are skillful and thorough. It is to be expected that men of such high caliber and with such enormous resources would exercise their greatest talents in the interest of continued control of the billions of dollars involved in the television industry. But the net effect of their factual statements is that they acknowledge and desire substantially complete control of the television broadcast industry in themselves. It is suggested that sufficient competition exists between the two major networks, although ABC concedes that there is need for a third network. Nevertheless, the evidence is conclusive that all of these parties emphasize the clear channel theory of network operation. They desire the maximum power to cover great areas from conveniently located antenna in the big communities, and they emphasize the economic impossibility of extending service to the smaller communities and the sparsely populated areas. This theory is inconsistent with the basic premises of the allocation by the Commission, and it is inconsistent with the testimony supporting local stations, local news, and local public-service prograning. The most democratic broadcasting system and the one most useful to the people, is afforded by a multiplicity of stations and with a reduction of fringe area reception.

This can best be accomplished by a substantial elimination of the technical results of intermixture and the redistribution, until competitive status can again be established, of the control of network programing. I cannot see how free speech is less impaired by governmental regulation of networks than it is by such regulation of licensees. I cannot see how public communication can be more offensively controlled by the Government than by private interests.

The immediate solution lies in action by this committee to indicate the absolute necessity for use of all of the UHF channels in an efficient manner, and for the adoption by the Commission under its existing powers of regulation governing network broadcasting and network affiliation agreements which will permit the economic development of UHF.

As I stated before Mr. Chairman, lawyers customarily make their final argument by referring to their initial presentation, presenting as well as they can the facts that have been offered in support of or against it and, finally, they culminate by trying to say that everything they said in the first place was correct and true. I am not going to depart from that custom.

I stand precisely behind the recommendations made to the committee initially by the UHF Committee and I see no reason to depart from that presentation.

The most important issue before the committee as this hearing is about to adjourn is the question of whether or not the television requirements of this country should be provided by a limited number of national agencies operating superpower stations in the nature of clear-channel-type operations, or whether or not that service should be provided by stations located as closely as possible to the people who are going to serve all, with due regard to the technical limitations of television.
Are you going to take the system advocated by Mr. Stanton of trying to cover the largest audience profitably from a single source, extending that audience on VHF stations because that is what they have by way of boosters and other devices, that is what they have suggested and there is no need for the use of UHF stations or, on the contrary, will you retain the basic philosophy of the Commission and place those stations in accordance with need so as to give the entire country coverage in a free manner? That is the issue.

In support of all the basic representations of the VHF stations, I believe you will find that the Cullom engineering theory is the source, that is the foundation. That foundation says in effect and in substance through Mr. Cullom's mouth as adopted by the others in one form or another that UHF is not only inferior presently but UHF is inherently inferior and under any standards you can attain, UHF is an inferior service which should be limited only to fill in the rural districts.

I desire to challenge that statement.

I desire to say that while I feel lawyers have some right to select their arguments, engineers have no right. Engineers must take the basic technical facts and stick to them, regardless of who pays them, and Mr. Cullom's testimony could not stand that test.

I offer you the empirical evidence in which RCA and NBC, its subsidiary, have stated that they have aided UHF. They have. You have heard some able testimony by very able men trying to support and maintain a multi-billion-dollar investment, but you have got to be consistent.

If UHF is inherently inferior, then obviously there must be a reallocation and a maximum use must be made of the superior system.

But right at the time when NBC had supported the Portland station, the first commercial UHF station, which had a 1-kilowatt transmitter, there was published and widely distributed in this splendid magazine entitled "Broadcast News," put out by RCA, an article on how good UHF was.

I want to read you some of the things said to the industry at that time. This article was written by John P. Taylor, manager of the advertising section of RCA engineering products department. This particular issue is the September-October 1952 issue, volume No. 71.

Now, the article starts out by saying:

Then going on over in the story a little bit, the article by Mr. Taylor has this to say:

**UHF in Portland—How Is It Doing?**

**A quick summary.**

What did I find out? The whole story is told in detail in the following pages. However, for those who can't wait, here's a quick summary.

(a) In general, the performance of KPTV has been such as to startle the industry. Most of the experienced radio men investigating it in person have agreed that it is "much better than expected."

(b) More specifically, KPTV is delivering class A coverage (74 dbu) to about 20 miles in all directions where there is population, and class B (64 dbu) to 30 or more miles in the directions where there is favorable terrain.

(c) Although there are local dead spots, the total population in these areas is probably less than 5 percent of that in the city proper, and less than 12 percent of that in the whole trading area.
There are other comments with reference to VHF, but I would like to go on to this statement:

Lack of sufficient good UHF receivers and difficulty with makeshift conversions have caused some trouble. Most of this, however, is attributed to inadequate deliveries on the part of some manufacturers. It is felt that these difficulties will be largely cleared in a matter of weeks.

In like manner, men in the industry told the industry that UHF did remarkably well and UHF was giving satisfactory service in a brand-new art and with only kilowatts of power.

RCA went to the industry before the color decision came out, which deals with the entire subject of color and which is a very massive and important compendium from which one might have assumed that RCA did everything in the industry, of course, but in that they put certain documents.

The inference of Mr. Cullom was that he was conveying to this committee the consensus, the accepted consensus of the entire engineering profession. He did not at anytime indicate that he had unique or unusual discouraged views about UHF, although he did say things concerning certain criteria of his that I will mention.

In the petition of Radio Corp. of America and the National Broadcasting Co., Inc., for approval of color standards for the RCA color-television system, at page 525 of that document it says:

In order more fully to test various facets of color broadcasting, NBC transmitted a total of 100 hours of color programs and technical tests over its UHF experimental transmitter located at Bridgeport, Conn. As a result of these transmissions, it is our belief that color broadcasts on UHF can be accomplished as successfully as on VHF and should present no particular problems.

This is not a comparison of UHF with VHF on lower channels. This is a comparison of the entire VHF spectrum with the entire UHF spectrum and an engineering statement tendered to the Congress and the industry that UHF is just as good as VHF for color. In fact, I will tell you that it is better for color than VHF and the tests do show that because of the freedom of the difficulties from portions of the multipath that results from degradation makes it better for color.

UHF has its place in color and that was established, not by one engineer but by all the engineers in the industry.

With regard to other of these basic engineering facts, I would like to refer to the testimony of Mr. Cullom particularly, beginning on page 1083, and in his testimony Mr. Cullom makes a comparison in which he indicates that the Commission did not sufficiently allow discrimination between low VHF, high VHF, and UHF and that the present 1,000-kilowatt standard will not permit UHF to adequately serve the territory which the Commission assigned to each UHF station and which could be used by each UHF station, but statistics are remarkable things, even engineering statistics, and Mr. Cullom’s comparisons on page 1084 of the transcript is of channel 2 as compared with channel 13. Then he takes channel 14 on UHF and compares it to channel 83. Thereby he gets comparisons in which he purports to show that the relative area of channel 83 is only 26 percent of the relative service area of channel 2.

But read that with his quoted statement above which is that this order was constructed in the light of the present-day receiver scien-
tifically. The VHF receivers have had all the time to develop, and that was shown in the testimony and it has been remarkable in the elimination of noise and other things. The UHF receivers have shown a constant, definite improvement in all channel receivers, and there is no scientific reason why UHF should not attain the degree of proficiency and perhaps of superiority for reasons that are very technical over the VHF receivers.

Had Mr. Cullom taken comparative receivers, the same in UHF and VHF, he would have gotten different results.

Furthermore, the fact remains that in nearby areas before attenuation of UHF is quite as severe, UHF with 1,000 kilowatts can give wider coverage than can VHF on the average for the channel.

Furthermore, the Commission, in its report, as I have cited the paragraph of the memorandum which is specifically paragraphs 197 to 200 inclusive, states that UHF is fully utilisable throughout the entire United States and is a part of the Nation's broadcasting system, and that was the reason that they supported it, the transfer to UHF and they considered it in all respects to be comparable to VHF. Then they went ahead with their conclusions which, unfortunately, embraced intermixture.

Mr. Cullom and others have inferred that UHF cannot serve the rural areas and VHF is superior for serving rural areas. It might be that we should have VHF in the rural areas and UHF in the big cities. In that event, I think you would find a rapid change from the network affiliations at the present time.

I wanted to turn to the question of what you could do immediately and presently. I submit that there can be presented to you an adequate document to show that the Commission has plenty of authority to act at the present time, particularly with respect to getting major network programing to the UHF stations. I submit that the empirical test that there is no need for any more networks is to count from the top and you get the number they want—down below three.

You were told that the networks space their allocations and base affiliations so that they do not interfere with the next location regardless of the channel in which they desire an affiliate.

That obviously implies that a very substantial number of people, as far as network programs are concerned, are going to get fringe reception. They have to get fringe reception because otherwise there is a degree of interference with some other adjacent city.

I submit to you that that, plus the fact that the programs have not been available to the third or fourth station, is the reason why it is difficult to remain in business today and if you can live through this transitional period and the regulations such as the Commission gives.

My last word, standing on my feet, is that it is a terrible story about how free enterprise is being destroyed and freedom of speech is being destroyed by any regulation of networks. Nobody had such sympathy for the licensee. What is the difference between control of communications in a network and then a licensee.

Senator Potter. Thank you very much, Mr. Roberts.

Mr. Roberts. Thank you, Mr. Chairman.

Senator Potter. We will now hear from Commissioner Frieda Hennock. It is always a pleasure to get your words of wisdom.
STATEMENT OF COMMISSIONER FRIEDA B. HENNOCK, MEMBER, FEDERAL COMMUNICATIONS COMMISSION

Commissioner HENNOCK. Mr. Chairman, I want to join in Mr. Roberts' eloquent tribute to the late Senator Hunt. As you, yourself, stated, the Senate certainly felt that way in adjourning in his memory yesterday. I was very deeply affected by it. I am sure all of us were, especially when his viewpoints are so badly needed here.

Senator Potter. He was very interested in this problem.

Commissioner HENNOCK. Very much interested in this problem, and had a real grasp of it. I have a complete faith in the remaining Senators. I know each of you have worked hard and have grasped the true meaning of UHF and VHF to almost everyone's surprise and to the unanimous applause of almost all of us.

Senator Potter. Thank you.

Commissioner HENNOCK. To the departing woman Senator who will not be here next year and is not standing for reelection, I want you to know that you will be a great loss not only to the women of our country but to the entire Nation. I have never seen anybody come here on a temporary appointment who has so studiously worked on a problem in the interest of the country.

I want you to know that it has been a real pleasure for me, who has studied so hard and worked so hard to understand the little I understand about communications, to see how much you have grasped in the short time you have been with us.

Mrs. Bowring. Thank you.

Commissioner HENNOCK. Mr. Chairman and Members of the Committee; I want to thank you for this opportunity to appear here again.

Colonel Roberts addressed himself to Mr. Cullom's testimony with his expert knowledge of engineering. I thought he did a splendid job.

Mr. Pierson did a very splendid job and a very difficult job.

I am referring my testimony to anybody to whom it applies, whoever the remarks fit, take them in good stead. I have pulled no punches whatsoever.

Senator Potter, you were absolutely right when you stated that these hearings were more important than the other far more publicized hearings in which you were a key member. The other hearings were on television, while these hearings are television itself and its entire future. Less than 2 years after the lifting of the freeze and only 9 years after the FM fiasco, we are up against another critical crisis, this time involving 85 percent of all television.

The record of these hearings is replete with evidence of the cruel fate that befell those UHF broadcasters who were attempting to bring a new television service to the people of this country with back-breaking energy and against insurmountable odds. The pattern may be not altogether accidental. For this pattern was successfully tested and established in the struggle of FM.

Not in my memory have there been more effective hearings in so short a time as these. Never any hearings that compiled so much evidence to complete a picture as complicated and important as this one. Although these hearings may determine the future of the most
important medium of mass communications, they have received very little mention in the general press.

The prophets of gloom and doom are at work again in the trade press. Some questions have been raised, they admit, and it has been grudgingly acknowledged that there is a problem in UHF. But, after all, they say, it is foolish to think that the Senate will bother to attempt to solve so complicated and technical a problem at this stage of the legislative session.

I am sure that these prophets will be proved wrong again, just as they were when they predicted that not a single channel would be reserved for educational television.

The long history of fine public service of this committee is well known. Its great leaders—Senator White, Senator Ed Johnson, Senator Bricker—and the members of this subcommittee who, in the course of these hearings, have demonstrated, through their skillful questioning, great understanding of the problem, are not fazed by the technical phrases and men of an art whose basic problems are economic and social.

As far back as 1938, by mere resolution, this committee did away with superpower AM stations, and but a few months ago, again by resolution, you were able to prevent the adoption of broadcast license fees. Only last year you made a major contribution to the cause of education when you gave your wholehearted backing to the courageous action of the Federal Communications Commission which reserved over 240 channels for noncommercial educational television.

There is, therefore, every reason to be confident that you will meet the challenge of UHF with resolute action as you met similar crises in the past.

As I listened here to the testimony unfold, the ill-fated story of FM seemed to be reenacted.

FM, like UHF, started as a service after a freeze. The freeze which preceded FM licensing was occasioned by the second World War, and lasted almost 4 years.

I think it was more than 4 years. It was about 5 years.

The television freeze lasted just about as long. The dramatis personae are similar, and the similarity is not, perhaps, purely coincidental. Here are the clues: When the war freeze on aural broadcast licensing was lifted, there was a great cry for bringing radio service to the public. Apparently at that time radio service was synonymous with AM. When the television freeze was lifted, there was a similar cry for bringing television service to the public. This time television service synonymous with VHF.

In both cases, two new services were awaiting a chance to get going in a new spectrum space, whose virtues were proclaimed far and wide. In the case of FM it was generally assumed it would become the future home of aural broadcasting; and in the case of UHF, it involved 85 percent of all television.

By the way, Mr. Chairman, it was 3½ years before the conclusion was arrived at as to who to distribute these 85 percent of UHF, including VHF, to. Why should not the people believe it was to be the whole of all television. But in both cases, new expediting procedures favorable to the old service were devised. And that includes FM. They did the same thing.
In AM, the favored device was "drop-ins" of new AM stations, made possible by the ingenuity of the engineering profession in devising directional antennas. In television, the favored devices became mergers and "drop-outs" thanks to the ingenuity of the legal profession. That is why I said Mr. Pierson had a very difficult job.

Through quick processing and by "drop-ins", there were more than 1,000 new AM stations licensed in the 2-year period after the FM spectrum space was opened up for licensing. This figure exceeded the total number of AM stations licensed since the inception of the medium in 1912. And I want to interpolate, needed development and encouragement. Instead of that, there was a rush to license FM. It exceeded the total number of AM licenses since the inception of the AM media in 1912. And in 2 short years they licensed 1,000 new ones while they were trying to get FM started.

Lest there be a misimpression that there was a dearth of interest in FM, I hasten to add that there were plenty of applicants for FM stations. As a matter of fact, I will come to these paper applications, that Mr. Heffernan spoke about, in a few minutes.

As a matter of fact, the interest was so great that the commission during the same 2-year period licensed 769 FM stations. Similarly, there has been no lack of interest in UHF. Three hundred and fifty applicants have applied for authorizations to build UHF television stations in a medium that is much more expensive than radio and must therefore, move more slowly.

I found out that there were 420 applications in VHF and no more. Up to this very minute, you see that there have been no more than that so you can see that there is plenty of interest in UHF. And, believe me, in order to get the construction permits in UHF or VHF you have got to get a lawyer or an engineer and I would like to know what makes those construction permits just paper permits. Maybe the networks can answer that.

Three hundred and ten of these applicants obtained construction permits. There are, today, 127 left on the air.

The clues are the same with respect to receivers. In a four-year period, from 1946 to March 31, 1950, there were only 179,000 FM sets produced. Faulty and expensive they were indeed. During the same period there were 4,600,000 AM—FM sets made. But the production of AM-only sets was a remarkable 46,655,000 during that period.

The retail cost of many AM receivers was $15 or less, while the FM sets to this day are many times more expensive. Perhaps you know why Professor Armstrong is in his grave at an early age. He invented FM.

Thus, FM was confronted with virtually the same insoluble set problem in a fast-growing AM world that UHF encountered in the VHF world. Out of some 16 million new television sets sold in the less than 2 years since the TV freeze was lifted, only 2½ million are UHF, and I submit, Mr. Chairman, that is an optimistic figure. I don't know the correct figure, in many cases inefficient.

In addition, 15 million VHF sets were acquired by the public before the freeze was lifted, more than 14 million of those during the freeze itself.

Like UHF stations, the FM stations as a class have not been successful in obtaining network programing and the advertising revenues that go with it. Nine years after the aural freeze was lifted, there are, as
far as I know, no FM-only stations that are affiliates of a network. And, Mr. Chairman, I want to say here I am not quite sure about one station which may have network programs in all of FM but nobody is sure. He gets some kind of programing from CBS.

Senator Potter. Did they when they started out?

Commissioner Hensock. Why, of course not. That is my point.

The term "FM only" is used to denote the 60 FM stations that are operated as an independent broadcast service, as distinguished from the approximately 540 FM stations that are used solely to duplicate the AM stations’ programing, for which they receive no network advertising revenue. Again, I want to stop for a moment. They always say there are over 600 FM stations. Five hundred and forty are simply duplicating the programing of AM stations. They are used as little auxiliaries.

This record is replete with evidence as to the small amount of program service rendered to the existing UHF stations and the niggardly advertising dollars doled out to UHF broadcasters by the networks. The term "network affiliate" as applied to most UHF stations is a sham and a farce. Just look at the figures they get from them in advertising.

Last but not least, FM, like UHF, was a victim of intermixture and, needless to say, was caught in the same vicious circle—no sets because no programs, because no advertising, because no sets.

I will not repeat the various solutions for the UHF problem that have been recommended during the course of these hearings. And by the way, Mr. Chairman, I, as a Commissioner, consider every licensee’s financial and economic problems my own and, if I can help them, I am here to do so.

I would like, however, to say, lest it be misunderstood, that these remedies are intended not only to come to the rescue of those UHF permittees who, as individuals or isolated operators, have suffered financial losses, but also to save a television system whose nationwide competitive character admittedly depends on the use of UHF.

Every witness has admitted that.

I cannot emphasize too strongly that we are talking here about preserving the very essence of our traditional business economy; an economy in which the growth of an industry is governed by normal competitive forces instead of being artificially restricted.

I would like briefly to comment on some of the contentions that have been advanced against the recommendations made in behalf of UHF.

You have heard testimony to the effect that UHF is merely going through growing pains which are no different from those the early VHF operators experienced.

There is no comparison; the perfect analogy is FM, which I have already described.

True, the first VHF operators were pioneers. But they also had a fair opportunity to pioneer. They had a chance to get network programs; their construction permits were repeatedly extended until they were ready to get on the air; sets were being rapidly manufactured and improved; and for 3½ years, while the freeze was in effect, they were sheltered from competition.

The UHF operators, who are also pioneers of a service in a new portion of the spectrum, not only have none of these advantages, but
also have to overcome such obstacles as VHF quickie grants, mergers, and dropouts. And this is not a small obstacles, considering the inordinately large number of such VHF grants. You merely have to look at the number of them to see how many were "quickies" and mergers and "dropouts."

It has been said here that these UHF operators are not pioneers, but gamblers.

Senator Bowring. Why would they be gamblers in UHF if they not gamblers in VHF?

Commissioner Hennock. That is a very good question and I am just going to get the answer to that one.

In reply, suffice it to say that by definition a gambler has the very thing UHF stations are pleading for in this hearing—a chance to win, which they have not got. That is why they are gamblers; that is the answer. In other words, these are no longer gamblers. They are pioneers.

Suppose they get a VHF station in a big city, Mr. Henley, Mr. Russell, Dr. Stanton. They are not gamblers any more. All they want is the gambler's chance to win.

The UHF problems will not be solved by attaching labels. The fact is that when the early venturers in the VHF field decided to enter television, they performed a commendable public service. The UHF operators, who decided to cast their lot in the further development and betterment of television service, deserve the same commendation and recognition. In each case, those who entered the field obviously hoped for a successful business venture, and the problem here is simply to make it possible for the enlightened business aspirations of the UHF operators to result in providing better television service to the American people.

It has been stated here that there is no evidence of the existence or likelihood of monopolistic control over TV program sources and advertising revenue. Let me say this: You heard Dr. Du Mont testify that his network cannot survive without a healthy UHF, and that there was doubt whether a weak third network could exist. Suppose two networks should constitute virtually the sole source of popular programs, so that the life or death of a television station would depend on the nod of one or the other of these two networks, and, in fact, they and not the Commission would determine the number and location of television stations, would this be evidence of free competition or monopoly?

I will make one concession; under such circumstances, if two networks were to dominate the field, the more proper term would be duopoly. But, whatever the name, the result is the same—no competition. Of those who seek enlightenment as to the meaning of monopoly,

I was referred to as a lawyer and a commissioner and perhaps I am not a great economist.

I ask whether, in the public domain of television communication, the control of 85 percent of all TV network advertising revenue by two networks is evidence of healthy economic base for the industry.

You have been warned that a move of all television service into the UHF band is a drastic step which would cause terrible dislocation to the industry and public alike. Let us see whether this is really so.
At the outset, let it be understood that nobody has proposed to accomplish this shift overnight. All proponents of the shift agree that an amortization period must be provided. I believe that 5 years would be all that is needed. The average cost to a VHF station of such a change would be approximately $100,000. This would pay for the changes in the transmitter and the radiating portion of the antenna. No other equipment changes are involved.

Sometimes it does not need any studies or anything else new except for transmitters to tune into another channel.

This surely is not an unreasonable expense considering the healthy financial state of the VHF broadcasters, and the rapid rate at which they amortize the investment in the physical plant. In other words, an expenditure of $25 million over a period of 5 years by 250 VHF stations which earned $74 million net last year, and whose profits are bound to increase—that means $5 million a year by these 250 VHF's—especially for the 140 of them which are new stations, should not be cause for legitimate complaint by licensees privileged to use this great medium.

I might say that they only get a 3-year license to use these channels. They never have a vested interest under the terms of the Federal Communications Act.

When you asked Mr. Pierson what is the right of that little hamburger stand on the main road when we decide to move that stand over to the other side of the road, you should have added, provided he only had a 3-year interest in that place and had no vested interest.

As for the 80 million set holders, I would rather entrust their fate to you, Senators, than to those who have suddenly become the trustees of the public's investment in television, and who at the same time deny programing to 85 percent of TV channels. A shift to UHF after a stated period of years would not have a serious adverse effect on them; I mean on these 80 million sets.

The life expectancy of a television set is calculated as not more than 5 to 6 years. And, by the way, I was amazed that they do not want to get color to UHF when they have only 5,000 sets in the hands of the public, according to Mr. Heffernan. They don't want to give even that to UHF and they say that it will delay it. If, during that period, color TV makes headway, this in itself would to a large extent obsolete the monochrome sets.

In any event, I hope they do, because it is a great improvement.

In any event, the Commission's present allocation plan, in which 85 percent of all television channels are in the UHF, contemplates that the public would make an investment in sets capable of receiving UHF signals. As a matter of fact, that is the only reason why I voted for intermixture, the vote for which I apologized very profusely.

Is it unreasonable, therefore, to expect the public, after it has received several years of service from a VHF set, to buy a UHF set or to invest in a converter at the reduced price 5 years hence? You know how quickly these price reductions, especially mass production, come about, and these people are geniuses of mass production.

Surely this is not too high a price to pay for a nationwide television service with the variety of programs resulting from an increased number of stations. The mere announcement that the future home of television in 5 years will be in the UHF band will be an incentive for manufacturers to make, and for the public to buy, all-channel sets.
This, in itself, would, during the 5-year transition period, place some 25 million to 30 million UHF sets in the hands of the viewers and, thus, gradually build a mass audience for UHF.

In speaking to a well-known manufacturer of television sets within the last few days, I was advised by him that he would put on the market this week a VHF set retailing for as low as $129.50—for a 17-inch set. I asked what would be the cost of an all-channel receiver of the same size, and was told that if the excise tax on all-channel receivers were removed, this manufacturer could immediately provide such a set for the same price—$129.50 in American money, and retail at that.

Mr. Chairman, I want to say something more. The question of the price of the antenna has arisen and I immediately telephoned the same manufacturer this morning. After 2 hours of difficulty in reaching him at a convention, I said to him, “What about the cost of antennas for UHF’s?”

Of course, you need separate antennas, as you know.

He said, “Well, that is included. I will make and give them that $129.50 set with UHF and VHF antennas included, provided the excise tax is removed. There is no question about that antenna at all.”

By the way, I want to point out that in certain VHF sets today, the lower VHF channels and the higher VHF channels need separate antennas but the ingenuity of this industry, and I like to give the devils their due, is so great that they have mastered that completely and they have those antennas in the sets today for the lower and upper VHF channels and he said I have seen it already inserted for the UHF. I thought you would be glad to hear this.

You have also been told about allocation difficulties that would exist in carrying out any shift from VHF to UHF. These difficulties are greatly exaggerated. Engineering talent to verify the feasibility of such reallocation is readily available to this committee. I suggest that some of our greatest engineers—while we are claiming our share and I think we have some wonderful ones in the Commission—would be available to you and I suggest that you check with the engineers in the Army and the Navy and other engineers. They know more about UHF and VHF and I would be interested in your getting their disinterested views and asking them what they think about UHF for complete nationwide service.

I am sure the Commission itself can supply all the technical data that is needed, and that will provide full substantiation for the contention that UHF can provide an adequate nationwide TV service.

There was a tendency in the testimony of the VHF operators to detract from the performance of UHF. Those who would have you believe that UHF signal cannot reach far out are doing you and UHF a great injustice. Engineeringwise, such views are without foundation. You heard Dr. Hunter’s testimony that his signal at Michigan State was received 60 miles away with its present antenna and transmitter. I found it very amusing because he said it was received as far as Ann Arbor. You know what that meant—the University of Michigan.

Senator Potter. Yes, and I bet they did not tune in on him.

Commissioner Hennecke. And only recently RCA has announced the development of an antenna that is capable of a gain of between 40 and 50, which means that commercially available 12-kilowatt UHF transmitters will provide 500 kilowatts of radiated power.
And today there are plenty of them in the hands of these UHF operators. We only allow the stations to go to 1,000 kilowatts of radiated power to make the UHF and already this antenna will take a mere 12-kilowatt transmitter and build the signal out that far. That is one of the most amazing developments and only recently they, themselves, announced it.

De-intermixture has been suggested here as a remedy for the ills of the UHF. It will not do. For the problem is not city intermixture, but area intermixture. And de-intermixture will not eliminate the latter. Let me illustrate.

If city A and city B each presently have both VHF and UHF channels, and intermixture is eliminated in both cities, the problems of intermixture are eliminated in the immediate vicinity of each city. But if city A is exclusively VHF and city B is exclusively UHF, a large percentage of the viewers between city A and city B will still have the problem because they will be receiving city A and city B both.

And, Mr. Chairman, I am concerned about the obsolescence of the sets in each of these areas. If you were suddenly to switch the city of Washington to UHF from VHF, then what would happen to all the sets around this city? I don’t know what would happen and by the time they concluded these studies on a city-by-city basis and a case-by-case basis, as is suggested—and I don’t know if you have any children or grandchildren, but I don’t think that they in their lifetime would complete that process.

It is ironic indeed that in this hearing, which is concerned with preserving a nationwide competitive television service, the proposal to raise the limit on the maximum permissible ownership of TV stations should be endorsed. The adoption of this proposal would, of course, do nothing to help UHF. It would only increase further the power of multiple owners.

It would be small comfort to a UHF operator unable to obtain network programs to know that the same network owns additional UHF stations, undoubtedly located in the best UHF markets. Recently, one of the networks acquired a UHF station in a major city for $1. That was in Kansas City.

But, unfortunately, it was in a three-VHF-station market and it had to shut the station down. In other words, if you gave it to them in bad markets, they will drop them. Give them some more good UHF’s and take it away from the few good UHF’s that are around.

Covetous eyes have been cast on the VHF channels reserved for educational TV. I am confident that this committee will give short shrift to those who have been ungracious enough to attempt to use its forum to destroy educational television. I want to remind those who would place their selfish interests above the rights of the people of the late Senator Tobey’s proposed 11th commandment: Thou shalt not covet thy neighbor’s educational television channel.

For cooperative use of one educational channel in any one given city on a completely noncommercial basis, all segments of education must organize, acquire public funds, and mold together a new school system of the air.

By the way, Mr. Chairman, in Detroit the Detroit public schools, Father Steiner of the Catholic schools, and the Protestant schools, have been working together for 2 years.
Senator Potter. And they are doing an excellent job.

Commissioner Hennock. Yes, and you know how long it takes them to get together through the use of cooperative meetings. They are doing it beautifully today.

Nevertheless, today there are any number of major cities which have taken steps to build educational television stations. To expect education to move faster than it has, to spend money in the public interest to develop this medium for its use as a nationwide school system of the air, is to negate the very necessity for a reservation—to give educators time which they so badly needed to get this system started.

There is testimony in the record which shows that if UHF dies, 15 States some of them the most populous, will be without educational reservations.

You remember Mr. Cohn of Pennsylvania, who produced that very fine exhibit.

In conclusion, there are the measures that can and should be taken at once. I need not tell you what that will do on a nationwide basis to educational stations. It will cut the heart out of it.

1. Stop all mergers, dropouts and dropsins.
2. Make network programs available to UHF stations.
3. Reinstate the canceled construction permits of those UHF permittees who had previously requested that they be extended.
4. Increase the coverage of UHF stations by means of boosters.
5. Announce a program of moving television into UHF, to be completed at the expiration of 5 years, and institute an appropriate allocation proceeding at once.

I referred to many other measures in my first statement when I appeared here.

I have absolute faith that this committee will not permit UHF to share the fate of FM, with the terrific consequences to television as a nationwide competitive service that will go with it.

I might say here that this medium is the synthesis of all the mass media of communications. It is a combination of radio, newspaper, movies, magazines. It is greater than all of them or any of them.

The public acceptance has been so great, Mr. Chairman, that despite the fact that during the freeze we moved television to UHF and changed our standards to accommodate a color system, the public bought 15 million sets to tune in these 108 stations.

What does the public expect now, just a little monopoly, or does it expect to use all the channels that I suggest? I think this medium is greater than any of us realize and certainly has the dynamics beyond almost conception. Even the industry itself never realized how important television was. Many of them even today did not go into as many VHF stations as they could have and they were the smartest in the business.

There should be a Senate resolution urging the immediate attainment of these objectives. In addition, insofar as any of these suggestions are proper subjects for legislation, this committee should take steps to introduce appropriate bills as quickly as possible.
I have various bills in mind, such as not allowing in interstate commerce any sets that are not all-channel sets. There may be some constitutional questions raised, but I think we could iron those out and I think the courts would sustain us.

I am in favor of the Johnson bill and I think the Bricker bill is good. The pattern of FM is apparently being repeated. Witnesses before this body have testified that we should be wary and take time to consider all the possibilities.

I am amazed at Mr. Heffernan's statement where he says:

We believe, also, that, before concluding to make such a study, everyone concerned should give careful thought to the effect the very institution of the study might have on UHF itself.

But that is even before you think about thinking about a study. Take your time now. Don't be hasty.

Under ordinary circumstances I would be the first to agree that we should not make hasty decisions on matters such as these. However, it is clear, in view of the testimony which this committee has heard, that things have reached a stage where, if a solution requires a year to work out, it is no solution at all. You have heard that within 60 days 40 UHF stations are likely to go off the air. The impact on the rest, if this takes place, I need not tell you. Every day's delay helps to weaken UHF beyond the point where recovery is possible.

But there is no need for any delay. The testimony is before you. It shows conclusively that action is needed now. A few deft strokes by this committee are all that is needed. The enactment of the Johnson bill to remove excise tax on all UHF sets, which I wholeheartedly endorse, cannot alone do the whole job. This committee must move swiftly in several directions, not the least of which are network program availability and advertising. Also, an announcement should be forthcoming that the applicants now in competitive hearings for VHF channels would be subject to change to UHF.

Now, Mr. Chairman, with your permission, I would like to incorporate in the record the statement on UHF I made recently before the NARTB convention in Chicago.

Senator Potter. We will be happy to have it.

(The statement referred to is as follows:)

Statement of Commissioner Frieda B. Hennock, FCC Panel at the NARTB Convention, Chicago, Ill., May 27, 1954

You have gathered here to take stock of your accomplishments and to discuss your problems as broadcasters. You can be justly proud of the nationwide radio service you have built. You have given this nation some 2600 AM stations providing hundreds of communities with local means of expression. You now face the challenge of creating a nationwide television service. This is a challenge worthy of a great and free broadcasting industry.

Your convention was preceded and will be followed by the fateful hearings before Senator Potter's subcommittee. These hearings will decide whether UHF will live or die. If the UHF lives, a nationwide competitive television service will flourish; if it dies, competition in television will die with it and this powerful medium will wither into a rigid pattern of monopoly.

In my statement before the subcommittee, I made five specific recommendations to help save UHF. While I continue to believe that their adoption would alleviate UHF's plight, I am now firmly convinced that only the eventual move of the TV-service into the UHF band can save the patient.

It was the testimony of the UHF broadcasters that caused the crystallization of this conviction. They brought forth not only the urgency of their immediate problems, but also the realization that palliatives will no longer suffice; that
nothing short of drastic action, with long range objectives, will do. And the long range objective is now, as it always has been, a nationwide competitive television service.

Plans to move television into UHF should be made now, so that there would be a minimum of delay in taking the steps necessary to accomplish it. This does not mean, however, that the actual shift should be made now. On the contrary, a reasonable period, 5 or even 10 years, if necessary, must be allowed to amortize the broadcasters' and the public's investment in VHF. By setting our sights on this goal we must not overlook any interim measures that would help the existing UHF operators whose difficulties were so dramatically laid before the country last week. I cannot emphasize enough the importance of the Johnson bill to remove the excise tax from UHF sets. Also the FCC should do everything in its power under the Communications Act immediately to bring network programming to the existing 127 UHF stations on an equitable and competitive basis. Otherwise we will have the same vicious cycle—no sets because no programs, because no advertising, because no sets.

The Commission has long recognized that the 12 VHF channels are woefully inadequate to provide a healthy nationwide competitive television service for the people of the United States. During the 1948-52 freeze, we in the Commission and you in the industry devoted most intensive efforts to the problem of providing for an expanded television service. The result was the decision to utilize the entire portion of the ultra-high-frequency band which had been set aside for television broadcasting to achieve that end. So the freeze was lifted, and we all hoped that UHF television would develop to achieve its necessary place in American television broadcasting.

Although this was our hope, the methods we used to bring quick television service to the people of the United States achieved just the opposite result. It has now become painfully apparent that to continue on the course we embarked on when the freeze was lifted will result in a television service limited to the same 12 VHF channels that have been considered inadequate for a nationwide service.

As far back as 1945 the Commission anticipated that eventually the UHF band would become the home of television. Three years later we imposed a freeze during which we devised an 82-channel VHF-UHF allocation plan. How can we possibly in 1954 be content with what will slimmer down to a 12-channel service if UHF is not saved? Will the public which has so enthusiastically responded to television accept such restrictions on this powerful means of expression? Will it accept a few hundred stations where it could have 2,000? Will you as independent broadcasters accept it? Of course not! This country is too big, its needs and interests, both economic and cultural, are too diverse to be satisfied with a television service from some 200 large VHF stations in the first hundred major city markets, and with no opportunity for local means of expression in the countless hundreds of smaller markets and communities.

The question has been raised as to whether or not the 70 available UHF channels can technically provide for a nationwide television service. I have no doubt that they can. Roughly the loss of the 12 VHF channels would represent a percentage reduction of the total assignments. The over 2,000 allocations that we have made today do not represent the complete saturation expected in limited metropolitan areas, so that there is room for more channel allocations. Furthermore, a great many are mere paper allocations made to sparsely settled areas which will not be used in the foreseeable future. Many of these allocations could be shifted to fill pressing needs. So, even in the densely populated north-east section of the country, UHF channels could be found to replace the existing assignments.

I admit that if we could have a nationwide television service in the 70 UHF and the 12 VHF channels, that would be fine. But the way things have developed since the Commission resumed the licensing of TV stations in July 1952—the way VHF has been permitted to stifle other UHF—you and I know that this is no longer possible. Where the choice is between 70 channels or 12 channels, who could argue in favor of 12? You have 107 channels in AM, why should you be satisfied with 12 in TV—a medium so much more powerful than radio?

The only course open now is the severe and drastic action of moving all television into the UHF band. The sooner the necessity for this action is recognized by all concerned the easier it will be to accomplish. The longer we wait the more dislocation such a move will cause. For I am convinced that ultimately the need for this move will become apparent to all of us.

So why not start immediately? In order to implement a complete UHF television plan, the Commission would have to draft a nationwide allocation table.
which would provide sufficient service throughout the country and, at the same
time fluid, if necessary, substitute assignments for VHF licensees and possibly
some UHF licensees. This new allocation table could be put into effect in a
comparatively short time, providing we get the necessary cooperation from the
industry. In the meantime, of course, no additional assignments would be
made on any TV channels. After the new table of allocations is in effect, there
would come the job of assigning channels to existing licensees in exchange for
those that they have and then the determination as to the details of transition.

Every possible measure should be taken to make sure that VHF stations are
not unduly harmed during the transition period and that they are treated
equitably. Appropriate provisions should be made for amortization of VHF
equipment in the hands of the industry and the public. The period and allow-
ances for amortization would have to be reconciled with the objective of shift-
ing over to UHF with the least disturbance and upheaval to existing licensees
and the 27 million VHF set holders. This orderly transition with proper safe-
guards should be the prime interest and concern of the Commission. With the
cooperation of the existing licensees and the entire industry, I am sure that this
would be accomplished.

That this action must be taken is the conclusion which I have drawn from the
gloomy picture that was so vividly and forcefully presented last week to the
Senate committee, the Commission, the broadcasting industry, and the people of
the United States.

Commissioner Hennock. Thank you for your patience and courtesy.
Senator Potter. Thank you very much.
We will now hear from Mr. Ted Pierson, representing the VHF
group.

REBUTTAL STATEMENT OF TED PIERSOHN, REPRESENTING THE
VHF GROUP

Mr. Pierson. Mr. Chairman, on the calendar distributed this morn-
ing, the 30 minutes' time for VHF which was assigned for our group
was put opposite my name and I think it would be a little presum-
tuous for me to use all of it, because I think there have been appear-
ances by some people who had some disagreement with the UHF
proposals.
I suggest, if I may, that the three networks are now represented. I
am not informed as to whether they desire any time.

Senator Potter. You don’t know? We have had no request from
the networks for any time.

Mr. Pierson. I am suggesting it be charged to my time if they do
desire time.

Senator Potter. Yes; you would have to give them the time. I
might ask now, Is there anyone here from the networks who would
like to utilize some of Mr. Pierson’s time?

Mr. Heffernan. I would like to use 1 minute if I could, and it
should not necessarily be charged against Mr. Pierson.

Senator Potter. We have tried to split up the time as best we
could between the two groups. Would you like, at the conclusion of
Mr. Pierson’s statement, to present your statement?

Mr. Heffernan. Anything you like.

Mr. Pierson. I think he might go ahead and, if it runs over 1
minute, charge it to me.

Mr. Heffernan. I believe Commissioner Hennock may have mis-
interpreted the reason we made and the reference we gave to a study.
We have in mind such points as this. We are now engaged—I think
almost all of us—in the hope that some means can be found to build
all-channel receivers.
Now, when we consider the wisdom of eliminating intermixture, we should have in mind that if we embark on that and that becomes the official action of the Commission, the inducement to manufacturers to make all-channel receivers may be lost because, presumably, out of that study will come some markets that are all UHF and some that are all VHF. I am suggesting that there are considerations that should be weighed pro and con.

I am not suggesting that there should be delay.

Senator Potter. All right, thank you, Mr. Heffernan. You may proceed, Mr. Pierson.

Mr. Pierson. I perhaps should apologize that I created a discordant note in these proceedings. I think I might put our appearance and views somewhat in context.

I believe that both VHF and UHF operators would agree with the statement that they generally make appearances before Government agencies and subcommittees of Congress when they have a personal interest in pending legislation or pending regulations.

I think in this case that the UHF people were distressed at their losses and that, for this reason, it caused them to appear before this committee and state that personal interest and, in addition, advance reasons in terms of public interest why relief should be given to them.

They also made proposals. Those proposals, by and large—that is the first four I referred to in my analysis before the Commission the last time was the elimination of intermixture, the elimination of VHF, the freeze and the reduction in coverage area of VHF stations—all would vitally affect the private interests of the VHF people.

I have no hesitation in saying that their decision to make an appearance resulted from these proposals that would cost them millions of dollars. I think we are entitled to state what that interest is.

I agree completely, however, that to the extent that our views here with respect to their proposals cannot be determined solely on the basis of the public interest factors we should lose.

As I said, I think, it is clear that if their proposals are not adopted, any one or all of them, some UHF people are going to lose money. If their proposals are adopted, some VHF people are going to lose money.

I do not think it is possible for this committee to appraise the difference between them and I do not think it is important for this committee to do it.

I do not apologize for the private interests that actuated the appearance of the VHF group. I do insist, however, that what we have attempted to do is to state our views on the basis of public interest.

Now I am somewhat at a loss, after the rebuttal statements, to understand precisely the problem that is presented here by the UHF proposals. It was my understanding that UHF operators had a difficult time in competing and that one of the reasons for the difficulty was that they did not enjoy as much coverage as VHF stations. I was quite surprised to hear Mr. Roberts state that they actually were better. I was quite surprised to hear Mr. Cottone insist at one time and the same time that intermixture cannot survive and yet UHF is as good or a better facility for serving the people.

Mr. Roberts is a lawyer with a substantial engineering background, but he is hardly in a position to rebut Mr. Cullum. I personally don't
know whether Mr. Cullum's testimony is correct or would be agreed to by all consulting engineers or all engineers acquainted with the problems. I do suggest that if there is any doubt on the part of this committee as to the accuracy of the testimony of Mr. Cullum that they will best find that out, not by statements by me or Mr. Roberts, but, by consulting engineers who have the stature and the experience in the industry that Mr. Cullum has.

In that effort to consult them there is a question in my mind whether it makes any difference. Because if the committee finally finds that UHF can supply as much coverage as VHF—in other words, if it is a fully competitive medium from a technical standpoint, then it seems to me there is no reason to be concerned about intermixture except on the question of set circulation.

In other words, if they are equal then there is no inequality in the means that the Commission has furnished. There is inequality in terms of the time that they came in and their opportunity to date to get set circulation.

If, on the other hand, this committee finds as a result of its consultation with engineers that you believe competent to advise you that there is a difference between the coverage potential of UHF and VHF, taking into consideration all the possible foreseeable developments of UHF, then I submit that our position that if you take away the superior medium you would tend to deprive people of coverage that they now have and would tend to deprive many people in many areas of our country from coverage which they have not yet got but might get through VHF. So, perhaps in either case I should say that I believe that the finding of the engineers tends to defeat the proposals made here.

Mr. Cottone made a remark about my principal desire here seemed to be to defend people in selling their stations for $8,500,000 and making 300 percent profit.

In the first place, I know of no existing licensee in our group who sold his station for $8,500,000, or he would not still be a licensee so he would not be a member of this group.

Secondly, if any of them have been involved in any such transactions, they paid $8,500,000, they did not get it.

Also, I would like to point out there are 33 applicants and there are 20 permittees that are included in the 135 interests that have supported the group presentation. Those people have not their first dollar of income. All they have done is spend money for prosecution in the application proceedings and the permittees have spent money in the attempt to build their stations.

I would put them in the category of the UHF people. They are spending a lot of money. They have only hopes of making a profit.

In addition to that, there are a number of VHF licensees—that still have not turned in profits and I suspect that there are many of them that have no prospects of selling their property for $8,500,000, or earning a 300 percent profit.

It was alleged that I stated that Congress has no responsibility in this matter and I must confess that my suggestion was rather blunt. I should have been more careful because it did not actually portray my feelings or the thoughts of the group. What I meant to say and now say is that it is very important for committees of Congress to keep
a close check on its administrative agencies and hearings such as this performing a very vital function in our whole system of Government.

I think the hearings were desirable. I think they have done a lot of good. But I do believe this, that once you investigate the trusteeship of a particular agency and find that it has handled a very difficult problem in a particularly exemplary way, that you do justify further confidence in that commission or agency.

I was suggesting that in these complex economic, technical, and social matters that it would be highly desirable, in my opinion, to obtain the further views of the Commission and the views of any other experts that you might desire before you attempt, on the basis of the record so far, to make a final disposition of the problems.

Miss Hennock's statement: While I would say its principal thrust was that there is an analog in the fate of FM that predicts the fate of UHF, I must respectfully disagree with this very charming lady, because I think the analog does not exist. The difference is this: At the time FM was adopted, there was not a paucity of channels in AM in this country in respect to a nationwide service. There were enough AM channels and frequencies to provide a service nationwide and there had been for a long period of time.

FM came into existence primarily because it offered superior fidelity in terms of reception and there were certain—and I am transgressing on engineering grounds now—but as I understand it, it was relatively noise-free as compared to AM. There is greater fidelity in transmitting and receiving sound which had its major effect obviously in the musical programs and the wide range that it would transmit and that was the principal advantage that FM had.

It was not that people were not getting an aural radio service in many areas of our country that made it necessary. It was just that they could get a higher fidelity service out of FM than they could out of AM.

I submit that that is not the status of UHF. As we testified before, and still state, UHF is needed to provide a nationwide service. Nationwide service is demanded by the public and I am satisfied that that demand is going to be met.

Now, Miss Hennock referred to the late Major Armstrong. I happen to recall that Major Armstrong very strenuously opposed the moving of FM operations from a lower band to a higher band and my recollection is that, until the day of his death, he assigned that move as the thing that destroyed FM.

If we must use the FM analogy, if we must use Major Armstrong as an authority, I think he is a rather slender and slight authority here.

Again, in Miss Hennock's testimony, the problem of the hamburger stand was revived, I confess a very inept previous answer. I concede, Senator Bowring, that in the interim I have perhaps thought more about no other question than that which was put to me at the hearing concerning the hamburger stand.

What seems to me to be a more perfect analogy would be in the case of the turnpikes where the State government outlines the right-of-way or where they may be established and then grants a permit to privately financed corporations to build the road, hamburger stands, and stations. That, it seems to me, is what the Federal Communications Commission is doing. It has not built the roads, it just told
people where it can build these stands and the roads. It has also invited capital to come in and bid to offer to build the roads and the oil stations and the hamburger stands.

I believe that if any State government attempted to say that 1 year after the turnpike was built with this fabulous investment, that it should be put someplace else, that there would be a considerable question as to whether the Government would not at least be morally liable and I would have sufficient confidence in their legal liability to take the case, the case of the people who made the private investment and built the road, the hamburger stands, and the oil stations.

Also, Mr. Chairman, I would like to refer to the report you had from the Commission about the life expectancy of television sets which was 6 or 7 years. I have not seen the study but it seems to me that, since there were few up to the year 1947 that we have had very little time to determine what life expectancy was.

Senator Potter. I would assume, also, that a lot of the turn-in of sets prior to that time was to get larger screens. I would imagine that the screen size has about stopped. I don't know.

Mr. Pinson. I suspect so, or else we will have larger living rooms, but I think that during the course of this period of trading in of sets and junking of sets, it was inspired by the desire to get a larger set.

We believe, Mr. Chairman, that that record fairly shows that many UHF operators are confronted with the problem of breaking the vicious circle of circulation, programs and revenue.

I want to make clear that we believe it is important to the entire industry that this circle be broken. We still believe that it can be broken by means that are consonant with our present methods of broadcasting.

We believe that some remedies are contrary to that concept and have stated our reasons heretofore and I will not attempt to repeat them.

We believe that the remedy of de-intermixture is a drastic one and one that we think would be of doubtful use even as a last resort. If given time, along with the help of Congress and the Commission and the industry does not defeat this problem, then perhaps de-intermixture must be seriously considered and perhaps even adopted.

I think its great injury upon the public requires that we exhaust other remedies first.

In any event, I would think that a program of de-intermixture would require very careful study and research and, to that end, I suggest that the committee immediately refer the matter to the Federal Communications Commission for study and, in order that the committee might have independent advice from experts, that the committee set up an ad hoc committee of experts, engineers, and those acquainted with the problem to make a study of the actual effect it would have in the various areas.

There would seem to be two areas of action by Government that would better industry's chances of breaking this vicious circle without such drastic remedies.

We refer to the action that might be immediately taken by the Government, first, in more distribution of UHF set; secondly, more television film programs.

In the UHF set circulation problem, it seems to me that it is clear from the record that if a substantial number of UHF stations closed
down, it will tend critically to reduce UHF circulation so long as there are VHF only sets being sold. I do not think that the closing down of those stations would have that result if on the market there were only VHF UHF sets.

Therefore, it would seem to me to be that one of the primary objectives should be to try in every manner possible that is legal and appropriate to limit the circulation of VHF-only sets.

One of the ways that has been suggested is lifting the excise tax.

Another way is voluntary agreement between the manufacturers and the Government.

Another way is a regulation of receiving sets that are involved in interstate commerce, which I assume would be all of them.

We believe that the regulation of the manufacturing and distribution of receiving sets, that is, their transportation in interstate commerce, introduces a new field of governmental regulation and control that would have many great hazards and I believe requires much further study and, in any event, should only be used as a last resort, and only considered as a last resort.

The lifting of the excise tax from the receiving equipment, both UHF and VHF, certainly, according to our information, would tend to drive VHF-only sets out of the market but we are practical enough to realize that there is no certainty that Congress will adopt this remedy, at least in this present session, and I agree that all that can be accomplished in driving the VHF sets off the shelves is desirable.

I suppose we must say, in perfect frankness, that the lifting of the excise tax at this point is just a hoped-for remedy.

It seems to me that voluntary agreement among manufacturers may provide a means by which this can be done but it has certain problems that I am not sure are insurmountable. The television manufacturers are subject to the antitrust laws, the Federal Trade Commission Act and the Congress saw fit to include such sections in the communications act with respect to the requirement that they not enter into any agreements that would tend to restrain competition.

I suspect, therefore, that if this committee or the commission attempts to call manufacturers into a conference for the purpose of all agreeing about this matter, that many of them will be highly concerned about possible law violations in which they would be involved as a result of the conferences or as a result of any agreements that resulted.

I am not certain that the narrow scope of the agreement here would actually result in a violation of the antitrust laws, but it seems to me that the lack of certainty that there would be, would be what would create the concern.

Senator Potter. Bring about a fear in their minds?

Mr. Pierson. It seems to me they should immediately consult the Attorney General and ask the Attorney General's opinion on whether a conference or an agreement conducted along the lines that would be necessary to accomplish this purpose would be in violation of the antitrust laws.

If the Attorney-General's opinion should be that it is not, then I think this committee should make that finding and I think expression by the full committee would be desirable in guarding against future private suits or government suits.
Then I believe the way would be fairly open to do it and to hold the conference.

If he holds otherwise, then it seems to me that the only hope to hold these conferences and the only chance for success would be legislation exempting such conferences and agreements from the application of the antitrust laws.

This practice was followed with respect to a lot of the emergency legislation during the war years, in which price-fixing and standardization of products were involved.

We have submitted to the committee a rather hastily drawn section, and whether it would be an amendment to the Communications Act or the antitrust laws or a bill or an amendment, is not yet certain. I am satisfied that something of that nature encourages and makes possible the success of a conference.

There is no pride of authorship and probably, on more careful study, it should be changed.

I suggested earlier that we did discern a possible field for tax relief that would tend to increase the availability of film programs to the industry. I am confronted with the same problem that I was heretofore in that reference, and that is the lack of time to fully explore it.

We have prepared a memorandum which attempts very briefly to state what has happened to some people in the industry and appeared to them to be a problem, a situation that tends to block to a substantial extent the flow of old and new film to television.

I believe that to the extent that aid is possible through consideration of this type of tax inducement, it would tend to break in another part of this vicious circle.

We have made no attempt to study and reconcile that proposal with the present governmental policies, but I do believe it offers a possibility.

Senator Potter, I would like to make this memorandum entitled, "Opportunities of Increasing Television Film Program Supply Through Tax Inducements," a part of the record at this point.

Memorandum

Opportunities of Increasing Television Film Program Supply Through Tax Inducements

In many instances Congress has granted tax benefits to accelerate the growth of infant industries or for the purpose of inducing expansion of existing industries where it found that the public interest would benefit as a result thereof.

Thus, we are all familiar with the accelerated depreciation rates which were granted to emergency facilities during the war and more recently to the builders of grain-storage facilities. The granting of depletion allowances to induce exploration for oil and various minerals has also become a standard inducement in congressional tax planning. Similarly, suggestions that the excise tax be removed from television sets adaptable to receiving UHF for the purpose of inducing the production of such sets have been favorably received in this hearing.

One of the more important sources of television is the filming of shows. This source of program is relatively in its infancy, and at the present time requires the taking of substantial financial risks by persons, such as established stars, writers, and producers, having no incentive to take such risks because of the tax inequities involved. It appears that much could be done to increase the quantity of film now available for television programs by the adoption of certain tax inducements.
Generally speaking, there are two sources of filmed programs currently available to television: (1) the thousands of reels held in storage by the motion-picture companies, and (2) special filmed programs currently produced for television release.

To date, the television stations have not had too much success in obtaining the pictures held in storage by the motion-picture companies. The motion-picture producers owning such film have been slow to release it to television stations for several reasons. First, producers owning such film apparently fear reprisals from motion-picture exhibitors, and up to the present time have apparently felt that television would not be able to tack up any slack that might result if the motion-picture exhibitors were injured as a result of the release of the pictures to television. This resistance of the motion-picture producers to releasing film to television seems to be slowly breaking down and will perhaps be not too serious a problem in the near future. However, even where the motion-picture producers have indicated a willingness to release such film now held in storage for television use, the asking price is often so high as to make prohibitive its use by the average television station during its infancy. It is here that it appears that Congress might be in a position to do something that might reduce the price of such film as might be released by motion-picture producers through the granting of certain tax inducements to the owners thereof.

As an illustration, while motion-picture producers are permitted to amortize the cost of production of films while they are being rented the same as if they were capital assets, upon the sale thereof the Commissioner of Internal Revenue treats them as inventory; and the proceeds from any such sales, therefore, are ordinary income for tax purposes. As the bulk of film now held in storage by the motion-picture industry has been amortized to zero, every dollar that might now be, by motion-picture producer from the sale of such films would be ordinary income. Thus, assuming that the majority of such films are held by corporations, 52 percent of every dollar received from the sale of films would be paid in Federal taxes. There is little doubt that in setting a price for films the motion-picture companies will take this tax factor into account, as they are interested primarily in after-tax dollars. We believe, therefore, that if the taxes were less on the sale of motion pictures now held in storage, the price the motion-picture company would charge for the films would also be less. The importance of this to the television industry is that it would have the effect of making the cost per picture less to the television station.

The simplest way of making motion-picture film now held in storage available to television stations at a lower cost would be to permit the motion-picture companies to sell film now held by them to television stations at a capital-gain rate. This could be accomplished by amending the law so as to provide specifically that motion-picture films previously released for theater exhibition could be treated as capital assets rather than inventory when sold for use in television. As there is an immediate need for filmed programs held in storage by the motion-picture companies, the term of any such tax amendment might well be limited to sales made within 1 or 2 years after the date of the enactment of any such amendment. Such a short term might tend to spur the motion-picture companies to sell some of the film product now held by them in the immediate future, which is the period of greatest need.

Of course, the release of film now held in storage by the motion-picture companies for television programs would have to be supplemented and ultimately supplanted by new film produced primarily for television; and in the long run it is this latter source that will fill the greatest need. Up to the present time one of the greatest problems encountered in producing new television-film programs is that it is difficult to induce competent and established stars, writers, and directors to enter into the new field because of their personal tax problems. As an illustration, the majority of the more capable motion-picture stars, directors, and writers have such substantial incomes from producing theater motion pictures that they would keep less than 10 cents on the dollar from any additional income that they might receive from participation in television-film production. The quality of film program necessary at the present time requires the services of the stars, writers, and directors who generally are in the highest of tax brackets, and, therefore, have no incentive to come to the aid of the television industry.

There would appear to be some justification in establishing tax inducements for the stars, writers, and directors who would engage immediately in the production of television films in order to eliminate one of the most serious problems confronting the infant television industry. It would not be necessary that such tax inducements be permanent, but they could be granted for a period of
several years until television stations as a whole are on a firmer economic footing to support quality programs than they are at the present.

Perhaps the simplest and one of the most effective tax inducements that could be adopted by Congress which would tend to bring competent stars, producers, and writers into the field of television film production would be to permit them once again to use the so-called collapsible corporation, the use of which was prevented by the Revenue Act of 1950 as a result of the adoption of section 117 (m), Internal Revenue Code. Prior to 1950 there apparently had been no bar to the use of a corporation by motion-picture stars, writers, and producers for the purpose of converting ordinary income into capital gains. This technique was used primarily in the motion-picture, construction, and farm industries. The procedure then followed was for the motion-picture stars, writers, and producers to form a corporation in which they were the stockholders to produce a picture or group of pictures. Generally speaking, the stars, writers, and producers would work for the corporation for a nominal sum. After the pictures were produced, but before their release, the corporation would liquidate and the assets would be turned over to the stars, writers, and producers. As a result, when the pictures were sold, gain normally taxable as ordinary income would be converted into a long-term capital gain.

The tax benefits from the collapsible corporation device can be seen from the fact that if a motion-picture star is able to collapse a corporation and realize a capital gain, he will have as many after-tax dollars from a long-term capital gain of approximately $106,000 as he would have from ordinary income of $500,000. If permitted to use the collapsible corporation in producing television films, there is little question that many competent stars, writers, and producers would quickly turn to the production of television films. Moreover, the tax benefits that would accrue to such persons would also benefit the television industry, as the cost per film program would be substantially reduced.

To spur the production of television film by qualified persons, there would appear to be ample justification for adopting legislation that would lift the prohibition set forth in section 117 (m), Internal Revenue Code, against the use of the tax device of collapsible corporations at least to the extent that the use of such device would be permitted by production companies devoted solely to the production of television film for a reasonable period of time in the immediate future.

PIERSON & BALL,

Counsel for informal group composed of: 82 VHF licensees, 20 VHF permittees, 33 VHF applicants.

JUNE 21, 1954.

Senator Potter. Mr. Pierson, I would like to ask you a question that was submitted on your memorandum.

In your memorandum you state that the production of television film by qualified persons would be accelerated if the tax laws were revised so as to authorize collapsible corporations by production companies devoted solely to the production of television film for a reasonable period of time in the immediate future.

If such legislation were enacted, in your opinion would it make more film programming available and would that help the UHF stations?

Mr. Pierson. In my opinion, it would, for two reasons, and incidentally, the device of the collapsible corporation was lawful and used up to 3 or 4 years ago.

In my opinion, the results would be that not only would the quantity and quality of production increase because of the people who would choose that production rather than motion-picture production, but also the cost of the film itself would be reduced.

I believe the increase in the supply of high-quality films at a lower cost cannot help but assist all stations that need program filler, and I admit it will also help VHF stations, but I have not been dissuaded in suggesting it because of that.
Senator Potter. Thank you very much, Mr. Pierson.

Mr. Pierson. Thank you.

Senator Potter. We will now hear from Chairman Hyde of the Federal Communications Commission.

REBUTTAL STATEMENT OF ROSEL HYDE, CHAIRMAN, FEDERAL COMMUNICATIONS COMMISSION

Chairman Hyde. I have not asked for rebuttal time and it is not my purpose to build up the record that has been made up to this point.

There are some matters that have been submitted having to do with the Commission’s procedures, which I think should be the subject of a statement at this time.

I do want to say, though, that the Commission is intensely interested in the evidence that has been adduced in this hearing. The Commission as such will endeavor to cooperate in every way with this committee in the conclusions and actions that might be decided upon as a result of the hearing.

I believe that if I should give a very brief history of the Commission’s processes in the licensing of television stations it would be helpful.

The Commission’s sixth report was issued in April 1952.

It was decided upon by the Commission on the 12th of April and released to the public on the 14th.

At the same time, the Commission announced that the processing of applications would begin on July 1. There is no one interested in going into the television business who has not had a fair opportunity to apply for any channels made available in the sixth report, beginning with the announcement in April 1952 and protected until July 1, 1952 against any quick grants that would cut off the opportunity.

In other words, there was ample opportunity for anyone who wanted to apply for a channel in any category in any city to apply for it before any grants were made. That principle has been followed through by the Commission. In other words, there has been adequate opportunity and adequate notice in all instances.

At the time the Commission released its sixth report, it was faced with a great public demand in this new and wonderful communication service, television.

The 108 stations that had been authorized prior to the freeze in 1948 had given the public a taste and they reached a substantial part of the population.

The public generally, the Congress and communities were all very much concerned with the possibilities of having this new service brought into all the communities of the Nation. It was a challenge to the Commission.

This committee that is holding these hearings and which are now coming to a conclusion rapidly, asked the Commission to come in and see what could be done to facilitate the expansion of this industry and to take away the limitations of Government upon the expansion of the industry by private enterprise.

At the time the sixth report was released, we gave consideration as to how the hearings should be conducted. There were very vocal proponents of the idea that in every community, where there were more applications than channels, all channels should be put in one pot, and
a battle royal hearing conducted to determine which of the applicants should get the channel. If there were 5 applicants for 4 channels, which 4 should receive grants?

The Commission, however, found—the majority—found it advisable to take its cue from the provisions of law, from the policies set out by Congress in the Communications Act which requires that an applicant should state the channel on which he proposed to operate. The Commission restricted the consideration of applicants to the channel applied for. That made it possible for the Commission to go through the file of applications and, in those instances where an application for a particular channel was not contested, to make a grant.

Now, the law specifically provides in section 309 that it is the Commission's duty to grant an application upon examination if it finds that it is in the public interest to do so. It does not provide that the Commission should look around and see if there are some other applicants who might become interested if the matter was held up or if a hearing was held.

Consequently, the Commission, following as I say the policy of the law of moving rapidly through the file of applications, granted those that were not contested. It set up a system of priorities for the consideration of applications in contest, believing that those communities with no television service at all had some equity and some right to television as against those communities who had television but were interested in a second or a third service.

Also, it was necessary to set up a schedule because the order of filing did not provide one. Normally, applications are considered in chronological order as they are filed by applicants but after a freeze and a big filing on a given date, they were without an order of filing which could be used for this purpose and the Commission set up an arrangement based upon the relative needs of the communities. The hearings were set up on that basis and there were a very large number of applications in which we had conflict of interest, two or more applicants applying for the same channel in the same community.

An experience we had with a contest will illustrate the origin of a change in procedural rules which permitted early termination of a hearing case which has become uncontested.

In the Wichita Beacon case where 3 applicants applied, 2 still remained in contest when the case went into hearing. When the examiner proceeded to take the testimony, 1 of the 2 remaining applicants elected to withdraw. The hearing officer then thought it was appropriate to complete a very brief examination with a view of submitting the recommendation to the Commission for the disposition of the remaining application.

The Commission, however, thought that the examiner had no justification for conducting a hearing on a contest which had been washed out, ordered that application be returned to the processing line. The application was returned to the processing line and became the subject of another contest when another application was filed.

This was about April or May of 1953.

Very soon after this decision, the Commission decided that it would be good policy in the case where an application in hearing status becomes uncontested, to have the hearing officer complete his report on that case, looking toward a determination of the application on its merits. This procedure was mentioned to the committee and I am not
presuming by this recitation to ask the committee to share the Commission's responsibility in adopting the procedure, but I will note that the committee gave unanimous approval in the discussions informally, of course.

Senator Potter. That is right.

Chairman Hyde. That helped the Commission a good deal in the consideration of hearing cases, and I believe that it tended to eliminate abuses of process. By abuses of process, I mean the filing of applications for the purpose of creating a conflict in the hope of being paid off or some such advantage as that.

Later, it occurred to the Commission, and I recommended it to the Commission, that these same principles might very well apply to a large file of other applications in a position of contest but not yet in the process of hearing. They were not in the process of hearing for the simple reason that in our large filing of applications, we had not been able to reach them and schedule the hearing and begin the taking of testimony.

But, nevertheless, any action on applications in conflict was held up by the conflict of interest. The Commission, a majority, became convinced that the longer this situation obtained, the greater the opportunity for the filing of applications of doubtful sincerity. We were also convinced that the Government's task of processing these applications would only be made more difficult, more costly, and that the long delay which the public was experiencing in getting the advantage of television would be lengthened by leaving these applications on file, scheduled whenever they could be reached, for a laborious hearing.

The Commission announced, in a change of rules as to procedure, dated May 25, 1953, that one of those cases, in those cases where an application became uncontested, the Commission would take it up on its merits at the next business day, the next official meeting day.

The notice—and I have a copy of it here—was published in the Federal Register so that all interested would have notice of it.

The procedure was not put into practice until it had been published in the Federal Register and, moreover, it was made clear in the Commission's action, that it was not an opportunity for the granting of applications filed on Wednesday—that this was not an opportunity for new applications filed on Tuesday to be granted on Wednesday.

It was a procedure which permitted an application which had been on file for a respectable period to be considered on its merits on the following Wednesday.

I have a copy of the Commission's change in rules and I think it would be appropriate for this to be included in the record because statements which have been made here would indicate that applications first filed on Tuesday could be considered and granted on Wednesday.

Senator Potter. That will be made a part of the record at this point.
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

(The material referred to is as follows:)

MAY 25, 1953.

Before the Federal Communications Commission
Washington 25, D.C.

FCC 53–627, No. 89887 (Corrected)

In the Matter of Amendment of Footnote 10 of Section 1.371 of Part 1 of the Commission's Rules (Temporary Processing Procedure for Television Broadcast Applications)

ORDER

1. The Commission desires to amend Footnote 10 of Section 1.371 of its Rules by the addition of a subparagraph (m), which reads as follows:

“(m) Where an application upon which processing has been temporarily suspended because of mutually exclusive applications becomes unopposed, or where an amended application becomes unopposed, or where an amended application or a new application is filed in place of the several competing applications and the applicant formed by such a merger is composed of substantially the same parties as the parties to the original application or applications, the remaining application may be available for consideration on its merits by the Commission at a succeeding regular meeting as promptly as processing and review by the Commission can be completed.”

2. In accordance with its temporary processing procedure, as amended, pursuant to the Sixth Report and Order, mutually exclusive applications (i.e., those which compete for the same channel in the same community or require competitive hearing for other reasons) have been passed over. This has enabled the Commission to process noncompetitive applications so that TV service could be made available in the shortest possible period of time, and the Commission is virtually current in the processing of noncompetitive TV broadcast applications. The provision here made is of a clarifying nature and is a further step designed to bring television service to the public as promptly as possible consistent with basic requirement of public interest.

3. Authority for the adoption of this amendment is contained in Sections 1, 4 (1), 4 (j), and 303 (4) of the Communications Act of 1934, as amended.

4. In view of the fact that the amendment adopted herein is procedural in nature, constituting a clarifying amendment, prior publication of notice of proposed rule making under the provisions of Section 4 of the Administrative Procedure Act is unnecessary, and the amendment may become effective immediately.

It is ordered, This 22d day of May 1953, that, effective upon publication in the Federal Register, Footnote 10 of Section 1.371 of the Commission's Rules and Regulations is amended as set forth herein.

FEDERAL COMMUNICATIONS COMMISSION,
T. J. SLOWIE, Secretary.

Released: May 25, 1953.

Commissioner Henning dissenting and issuing a dissenting opinion.

Commissioner Bartley concurring in the Commission action and stating: "I do not believe, however, the adoption of a rule is necessary. There has been no rule preventing prompt consideration of nonconflicting applications heretofore. I do not oppose public notice of this fact."

Chairman Hyde. This is an illustration of a Government agency finding it necessary and appropriate to cut redtape in the interest of facilitating the expansion of service.

Redtape is dear to some people who practice redtape technique and sometime develop some themselves, and it lends itself to the purpose of folks who want to condemn the practice as well. But for a Government agency to eliminate redtape is not a violation of antitrust
laws and, in my opinion, it is not something on which to get emotionally disturbed. I think it is a highly constructive thing, too.

The fact of the matter is that the Commission recognized the overall public interest in the expansion of this new and important communications medium and made appropriate changes in procedures. The Commission has made it possible for this country to have a nationwide television system in a very short period.

A year ago attorneys, engineers, applicants were talking about 2, 3, or 4 years. Committees of Congress were appropriating additional funds to the Commission to supplement the personnel with additional people to process applications. $350,000 above our previously indicated appropriation was appropriated by Congress.

A substantial part of those funds have been used, but not all of them. The point of referring to the appropriation is that the Commission had a mandate from Congress to do something about the backlog, the log jam, and the bottleneck which existed with respect to the expansion of television service.

We have handled approximately 1,600 applications in this process. I am including the applications for major changes in stations as well as the applications for new stations.

As of now, 85 percent or 86 percent of the task of processing the backlog of applications which was the subject of concern a little more than a year ago has been accomplished.

As of now, there are 274 commercial television stations operating and 5 noncommercial television stations located in 237 communities.

The number of postfreeze stations was 108 located in 63 communities.

In 40 instances the communities were 1-station communities. I might say 40 monopoly situations.

This expansion of the industry has permitted the removal of these monopoly conditions in larger markets. We have a number of one-station communities but they tend to be in smaller cities where the number of stations is limited by economic conditions rather than inability of the Commission to act.

The Commission has authorized a total of 565 stations. The total number of stations in the commercial category that can come out of the total file of applications which have been submitted to the Commission is 630. If you add the educational stations, applications, and grants that have been made, the total would be 705.

The total potential of all applications now pending and applications granted in terms of commercial stations is 650. The division as to channels is 404 stations on very high frequency; 255 on ultrahigh frequency.

In other words, the television service contemplated by applications granted or now pending before the Commission for commercial operation is 650 stations, 404 very high frequency, 255 ultrahigh frequency.

I believe that there is a real economic challenge for the television industry as to all classes of stations, not just UHF, which will have to be met before we will have a television service with anything like the number of stations which would be permitted under the Commission's sixth report.

The total number of station assignments engineeringly available, and that is all that the Commission undertook to say in that report, is 2,053. That includes the territories.
In continental United States the total is 2,002.
The division as to classes of stations as between VHF and UHF is
569 VHF stations and 1,433 UHF stations.
I thought that these statistics as to the potential of all applications
on file would be helpful in giving some perspective to the economic
problem. I thought it would be appropriate for me to call atten-
tion to the fact that the Commission does not grant applications with-
out prior notice. It does not think it is in the public interest to hold
hearings not required by law and hearings which will not serve a use-
ful purpose.
* We rather think it is the desire of the Commission, the duty, rather,
to facilitate the expansion of the industry to permit the expansion of
service to the public and that it is in the public interest to have expedi-
tions proceedings rather than delays which tend to aggravate and
encourage abuses of process.
Thank you very much.
Senator Potter. I wish to thank you, Chairman Hyde.
I have received here a request from Mr. John Johnson, the general
manager of radio station WTOB and television station WTOB-TV
at Winston-Salem, N. C.
His statement will be made a part of the record at this point.
(The material referred to is as follows:)

**STATEMENT OF JOHN JOHNSON, GENERAL MANAGER, RADIO STATION WTOB, WINSTON-SALEM, N. C.**

My name is John G. Johnson, I am one of the owners and general manager of
radio station WTOB and television station WTOB-TV at Winston-Salem, N. C.
We operate a television station on UHF channel 26 and have been on the air
since September 1953.
I have been asked to outline the history of our operation and to point out the
specific problems we have encountered.
It is my opinion that most people, not actively engaged in the UHF television
industry are, quite naturally, confused as to the reason why so many UHF
stations are having difficulties. Some of the many explanations I have heard
include improper planning, lack of experience, inadequate financing, poor manage-
ment, and so forth. But basically, these are not the reasons why UHF stations
are having trouble and they are not applicable to our station.
I think I can best present the story of our station by attempting to answer
some of these questions in the light of our experience of about 8 months' oper-
ation. In so doing, I hope to bring out the more fundamental causes for the
difficulties of UHF.
1. Was the operation of our UHF television station well planned.
I think it was. My principal associate, Mr. James Coan, and I are both law-
school graduates and we each spent about 6 years as special agents with the
Federal Bureau of Investigation following graduation from the University of
North Carolina Law School in 1940. Together we opened radio station WTOB
about 7 years ago. So we approached the idea of this television station with
several years of broadcast experience.
We originally prepared an application for VHF channel 6 at Winston-Salem
back in 1947 and 1948, but when the freeze was instituted by the FCC in 1948
we decided, on the advice of counsel, that it was needless to file the application.
Thereafter, the FCC proposed a reallocation plan which called for moving VIIF
channel 6 from Winston-Salem and substituting therefor UHF channel 26. This
plan left only one VHF channel, channel 12, in Winston-Salem. We protested
this plan in a strong petition to the FCC but our petition was denied, the proposal
was made final, and Winston-Salem was left with only one VHF channel—
channel 12.
We applied for channel 12 along with 2 other applicants. When it appeared
several years would be required to resolve the 3 conflicting applications and
grant a permit for a television station in Winston-Salem, we began to consider
the idea of amending our application to UHF channel 26. It appeared that only
in this way would Winston-Salem have its own television station for many years.
With this in mind, Mr. Coan and I personally visited and studied 3 of the 4 or 5 UHF stations then operating in the country.

We also talked with Mr. Frank Stanton, president of Columbia Broadcasting System, and Mr. Joseph McConnell, who was then president of NBC. We conferred with a former Commissioner of the FCC; with the Broadcast Bureau of the FCC; and with Mr. Rosel Hylie, now Chairman of the FCC, along with members of the engineering staff at the FCC.

We had several conferences with the vice presidents in charge of engineering at both CBS and NBC concerning the technical aspects of UHF television.

We had a consultant make a study of the Winston-Salem market and the economic advisability of establishing a UHF station there.

We talked with station sales representatives and advertising agencies concerning the sales potential of a UHF station in a city the size of Winston-Salem. We also talked with many individual consulting engineers and attorneys, as well as manufacturers of television transmitting equipment and television receivers.

We spent several months studying the entire picture and when this study was completed we reached the decision to ask for permission to build a UHF station as our survey indicated that UHF had the forces behind it to make it a competitive television system. We went on the air in September 1953 and, due to mergers of conflicting applications, the VHF station went on the air a few days after we did.

2. Does our station suffer from lack of experienced personnel?

I think not. As I said earlier, my associate, Mr. Coan, and I actively managed the station; we are both natives of Winston-Salem and each has about 7 years broadcast experience operating a radio station. In addition to our radio experience, Mr. Coan and I personally visited about 25 television stations. We studied these stations and spent as much as a week or 10 days, in some cases, studying the station’s operations.

Seven of our key personnel have had an aggregate of more than 70 years experience in radio broadcasting.

Our television director has had several years experience in one of the country’s leading television stations. He joined our organization several months before we went on the air and spent this time training our staff and setting up our organization.

I do not think our staff lacks adequate experience.

3. I have heard it said that many UHF television stations are in difficulty because of inadequate financing at the outset.

I submit that our station was started with ample financing for all reasonably foreseeable risks. For example, we filed applications with the FCC for 3 UHF television stations and all 3 of them were granted to us. However, we have constructed only one of these stations, the one at Winston-Salem. Our company owned 100 percent of 2 of the permits and 50 percent of the third. One of the necessary qualifications to obtaining a construction permit from the FCC is financial ability. If the FCC found us financially qualified to construct and operate 3 stations, it logically follows this same company should be able to construct and operate just 1 of these stations. In addition to new capital, we also have a profitable radio station.

4. It is frequently reported that UHF stations are suffering from poor management.

I do not believe this accounts for much of the UHF problems. I cannot say how good our management is but I do know it is as good as we know how to make it.

Our radio station has been successful and Mr. Coan and I have each put in 12 to 15 hours a day to make our television station a success.

We started the third radio station in Winston-Salem in 1947 as a daytime only station affiliated with the Mutual Network and operating with only 1,000 watts. For several years now, we have been operating a full-time radio station—both night—and have increased our power to 5,000 watts, and are affiliated with both the CBS and Mutual networks. In many respects, our radio station is considered the dominant station of the four now operating in our city. Last year, our radio station won a first-place award for public service promotion in a nationwide contest.

This year, our television station won a second-place award for television promotion in a nationwide contest. We were competing with all television stations, both VHF and UHF, in this contest.

In television sales, we carry considerably more local advertising than does the VHF station in our city. We outsell them on a local basis. However, in national spot business—nonnetwork national advertisers—we find it almost
impossible to obtain any business. We have called on many advertising agencies and attempted to point out the sales successes we are able to achieve for our local advertisers, but we find that, generically speaking, they refuse to buy time on UHF stations.

What is the reason for this attitude in our particular case? The answer lies in the greater circulation offered by the VHF stations serving our area. While we claim approximately 50,000 television sets adapted to receive channel 26, our VHF competitors claim in excess of 200,000 receivers. Of course, we offer our time at a much lower rate than the VHF stations but, regardless of cost, the national buyer prefers the VHF station almost every time.

Insofar as network business is concerned, I quote the president of the ABC television network who tells me we carry considerably more network traffic than the average UHF station because we are more active and aggressive in contacting the advertising agencies. In any event, we do carry a major portion of the ABC network commercial schedule. Our station is the only ABC affiliate in the tricities area of Winston-Salem, Greensboro, and High Point, N.C.

In the field of local programming, I think ours compared favorably with any television station in our section of the country—whether VHF or UHF.

We certainly have the finest facilities of any station in the State of North Carolina.

We originate live Golden Gloves boxing matches in our studio for 1 hour each week. This has stimulated tremendous interest in boxing in our white and colored schools and YMCA's in Winston-Salem, as well as in neighboring cities. I have been told ours is the only television station in the Southeast to originate boxing in its own studios—and one of the few in the Nation.

We carry a full, hour-long Negro talent program each week. In a city where almost 50 percent of the population is composed of Negroes, ours is the only station with a regular all-Negro television program.

Last fall, a Winston-Salem High School football team tied for the State championship. Our station was the only one to film these games and present them on television. This included both home games as well as those played out of the city. As you can imagine, with a winning team, these programs created tremendous local interest.

We offer daily religious programs to the churches in our city and they seem to be most grateful for this opportunity.

Each day we have a regular program for school children in both city and county schools. These programs include spelling bees, talent contests, development of various hobbies and a variety of other things. School children troop in and out of our station by the busload.

We offer the first local television news featuring photographs of local people and events. I believe this is still the only television news program in our city which emphasizes pictures of local news events.

There are many other program features I could mention but I wanted to bring out these highlights to demonstrate that, insofar as possible, we are endeavoring to give our station the very best management of which we are capable. This is reflected in the large number of sets converted to channel 26, our physical plant and facilities, network program, local sales, and locally originated program.

Up to this point, I have attempted to point out that, in my opinion, our station was well planned, is staffed with experienced personnel, was adequately financed, and is soundly managed. I have done this because so many people have attributed "the UHF problem" to these factors. I submit that our station suffers from none of these difficulties and, basically, the UHF situation does not stem from these factors but largely to reasons beyond the control of the individual station operator.

The principal problem with us is our inability to secure national nonnetwork revenue and the technical deficiencies of UHF receivers and converters, along with the almost prohibitive expense of some of this equipment.

As one UHF station manager told me: "There is nothing wrong with our station that a few good national accounts won't cure."

The inability of UHF stations to compete for national business is due to inferior circulation. This, in turn, is caused by the cost of converting existing sets to receive the UHF channels. This cost runs anywhere from $15 to $85 in our area and I believe would average $40 to $60. A new receiver with UHF built in costs $30 to $40 more than a VHF-only receiver.

Another contributing factor is the technical deficiency of the UHF converters. Just last week, 1 serviceman in our city told me that of 9 conversions he made the previous week, he had already been called back to service 7 out of the 9
installations. The president of our company used one of the best known brands of converters and after 3 of them went bad within a few weeks, he gave up and bought an entirely new television receiver.

We have received literally hundreds of complaints from the public who invested money to be able to see our station only to find the equipment did not work properly or caused so much trouble they gave up attempting to tune in our station. It seems to me some standards should have been, or should now be, set up for all conversion equipment in an effort to bring up the quality of the converters.

We are severely handicapped because of the failure of the manufacturer to be able to deliver higher powered transmitting equipment. We do not cover anywhere near the area covered by our VHF competitors. We are operating with a 1,000-watt transmitter which is the highest power transmitter being made available by RCA at this time. Yet our competitor covers more than twice our area operating with only about 40,000 watts effective radiated power and they can increase this power at almost any time to 316,000 watts. The power and coverage differential is so great that we cannot hope to compete for national business.

This coverage problem is further compounded in our area by the failure of the manufacturers to build only VHF-UHF television receivers. So long as the public can continue to buy a VHF-only receiver it means our conversion problem is endless. For example, in the many cities and towns just outside our present coverage area, the people are buying VHF-only receivers because our signal cannot now reach this area. In turn, we cannot reach this area because the higher powered transmitter is not yet available. Thus when we are able to extend our UHF signal into these cities and towns, we will find all VHF-only receivers and must start anew the conversion process. Thus, instead of gaining new audience with each stepup in power, we gain only new problems—problems of converting these receivers. There is no end to this vicious cycle unless, and until, the manufacturers build only a VHF-UHF, all-channel television receiver.

This inability to get national business is a growing problem with most UHF operators with whom I have talked. It is a downward spiral that is beginning to have its effect on the station's local business. For example, a local bottler in our area had been advertising most successfully with the UHF station. Then one day he talked to his New York advertising agency who advised him to discontinue using the UHF station. The station lost this previously happy client. In another case I know of, a local food broker who recommended the UHF station as his choice as the station who would do the best job for their product—the manufacturer of the food product in an eastern market hundreds of miles away answered "We don't use UHF stations." So the station lost this business even though the food broker who was on the local scene was personally familiar with the performance of the UHF and the VHF stations was convinced the UHF station was the better buy. I know of many similar cases where the local merchant wanted to use the UHF outlet but the out-of-town manufacturer, or distributor, refused to share the cost of the advertising except on the VHF station.

So you can readily see that if this trend continues—and it is an accelerating one at the moment—a local UHF station relying to a large measure on local advertising, will be unable to get even this business, although the station may be doing an excellent job for the advertiser.

I thank you, gentlemen, for the opportunity to tell you about the operation of our UHF station.

Senator Potter. I have here a telegram addressed to me from the National Grange which will be made a part of the record at this point.

Senator Charles E. Potter,
Senate Office Building, Washington, D. C.:

The National Grange opposes (1) allocation of all television broadcast services to UHF frequencies; (2) the reduction or limitation of coverage of UHF stations beyond that now imposed by Federal Communications Commission rules; and (3) any hasty action that would lead to deterioration of further limitation of TV reception in rural areas.

Herschel D. Newton,
M. Master, The National Grange.
I would also like to make a part of the record at this time the comments of the General Accounting Office, on the bill S. 3095.

COMPTROLLER GENERAL OF THE UNITED STATES,

HON. JOHN W. BRICKER,
Chairman, Committee on Interstate and Foreign Commerce,
United States Senate.

MY DEAR MR. CHAIRMAN: Reference is made to your letter dated March 10, 1954, enclosing a copy of S. 3095, 83d Congress, and inviting any comments I may care to offer concerning the proposed legislation. The bill is entitled “A bill to regulate multiple ownership of television broadcast stations,” and would amend the Communications Act of 1934 by inserting a new section after section 309.

Legislation regulating multiple ownership of television broadcast stations would not directly affect any fiscal functions of the Federal Government, and since the General Accounting Office does not have any detailed information with respect to the matter, I have no comments to offer.

Pursuant to your request, three carbon copies of this letter are forwarded herewith.

Sincerely yours,

LINDSAY C. WARREN,
Comptroller General of the United States.

Senator Potter. Before we adjourn the meeting today which will conclude the hearings, I would like to say to the various segments of the television industry that I know they will have various points of conflict with the individual members of the Commission. But I do think it well that we all recognize that the Commission is a commission made up of individual members and there will be conflicts of views.

I think we have a commission with integrity, a commission that is honest, a commission that is devoted to the public interest, and that goes for all members of the Commission.

I hope and I know that there will be many times when certain segments of not only the television industry but other mediums of communications which come under the regulatory powers of the Commission will have some personal views which are contrary to the views of the Commission. You may be right and they may be wrong. But I wish to state publicly and to the members of the Commission who are here that we all recognize the fact that you are dealing with a most complex problem and certainly many people will not be satisfied with decisions that are made, but no one is going to question the integrity and the honesty or the loyalty or the public interest shown by the individual members of the Commission.

I would also like to announce that the various arguments of the industry, those who have testified before the committee, have presented the committee with an outstanding record.

I can assure you that I, as one, and I am sure the other members of the committee have a greater outlook on the entire television problem than we had before we began these hearings.

We recognize that the problems that we are faced with are not easy to solve. However, I have found very few problems that are easy to solve.

I assume that whatever recommendations the committee might make will not be in accord with the various conflicting interests that are here. I wish to assure you, however, that the committee—I am sure—and any recommendations that it makes will be guided by the funda-
mental principle behind which any committee action should be guided, that is, of the public interest.

Although we may have a great sympathy for an individual segment, and we may have a great admiration for the abilities and talents of certain people, certain groups, the public interest is the overpowering interest which the committee has to weigh in deciding any problem.

I can assure you that we are not going to make any half-cocked decisions, but we are going to act immediately. Our full committee on the Interstate and Foreign Commerce Committee will meet tomorrow. I assume that possibly a replacement will be designated for the late Senator Hunt's place on the committee.

We will then go into executive session, either the latter part of this week or the first part of next week.

We will possibly call upon the good office of the Commission and possibly seek the advice of the best counsel we can secure on points that we need to search deeper into than the hearings that we have had so far have brought out.

I can assure you that not only the members of this committee but all members of the Congress are greatly concerned about this problem, if the communications that I have received from the various Members of Congress is any indication.

I wish to thank you for your patience and the many interruptions that we have had to endure with this hearing. You have been gracious and I sincerely hope that we can all work toward bringing about that grand new industry, television, to its ultimate height as a medium of communications in this country.

The record will be kept open for 5 days to submit any additional statements.

(Whereupon, at 4:57 p.m., the public hearing was closed.)

(The following material was submitted for the record:)

**STATEMENT OF FRANK C. CARMAN, TELEVISION STATION KUTV, SALT LAKE CITY, UTAH, ON THE JOHNSON BILL, S. 3065, AND RELATED PROPOSED LEGISLATION**

I am Frank C. Carman, president of Utah Broadcasting and Television Corp., the permittee of KUTV, Salt Lake City, Utah.

We are presently building a television station to serve the Salt Lake City area. We face competition with at least two other Salt Lake City stations, and from stations in surrounding communities, which also may serve substantially the same area. We have planned the coverage to be most extensive so that people living in distant areas will receive diversified program service.

The members of the subcommittee are quite familiar with the famous Sixth Report and Order of the Federal Communications Commission in the matter of the amendment of section 3.606, et cetera, of the Commission's Rules and Regulations. We believe that the sixth report and order, which was based upon hearings extending over many months and upon several years of earnest consideration by the Commission, is a sound document even in the posture of present-day conditions. One of the most significant findings of that report is that which declares that the utilization of the UHF spectrum is essential to a nationwide competitive television broadcasting system.

Although the problem does not exist in Salt Lake City, we see no technical method of eliminating intermixture of UHF and VHF in the same market where there isn't sufficient spectrum space in the VHF band of frequencies. On the other hand, we believe that there is sociological and economic necessity for such intermixture, because of the very necessity of establishing a nationwide, competitive television broadcasting system.

We are opposed to any plan which would eliminate all the VHF channels and permit television broadcasting only in the UHF spectrum. Wholly aside from the fact that pioneers who really established television in the United States should not be at this late date faced with an extreme penalty, it is obvious that
that nationwide broadcast service it is obvious that every assistance should be made available to those who have the courage and the pioneering spirit to render television service in the UHF spectrum. As I understand it, one of the problems in connection with UHF coverage is the penetration of blank spots. I am advised that booster or satellite stations will be helpful in this connection, and therefore the Commission should, in proper instances, authorize such necessary auxiliary facilities.

The Commission might well relax its policy with respect to authorizing microwave relay links between the station transmitter and a program source, such as a network interconnection point.

The Congress might still afford some relief in the form of elimination of the 10 percent excise tax on the UHF receiving sets and components.

The Federal Communications Commission in its proposed rulemaking of December 23, 1953, in effect recommends that any party may own, in addition to 5 VHF stations, 2 UHF stations. This is a step in the right direction as something of a premium is afforded to the UHF stations in those who desire to expand, have a greater opportunity in the UHF spectrum.

The Federal Communications Commission might well take another look at its procedural rules with the thought that UHF permittees or licensees will be permitted to apply for modification of their permit or licenses to change to a VHF channel if such a channel should become available.

I can well understand the emotions of many UHF operators throughout the United States in the light of our own misgivings when we appropriated great sums of our company's assets to establish a television station in Salt Lake City, where the competition is great and we have no real assurance of financial profit. We undertook this risk in a spirit of American free enterprise. Sometimes these ventures succeed and sometimes they fail. I believe it is extremely difficult to arrive at a program of subsidy without doing some violence to the fabric of our free competitive system.

June 22, 1954.

STATEMENT OF WILLIAM P. WRIGHT, SACRAMENTO TELECASTERS, INC., APPLICANT TO ESTABLISH A NEW TELEVISION STATION IN SACRAMENTO, CALIF., ON THE JOHNSON BILL, S. 3095, AND RELATED PROPOSED LEGISLATION

I am William P. Wright and I am appearing on behalf of Sacramento Telecasters, Inc., an applicant to establish a new television station on channel 10 in Sacramento, Calif. I am president of the applicant corporation.

The application of Sacramento Telecasters, Inc., was filed on June 30, 1952. A hearing was had before the Federal Communications Commission to determine whether that application or the competing application of McClatchy Broadcasting Co., for the same facility should be granted. The hearing commenced on November 17, 1952, the record was closed on June 5, 1953, and the case is now awaiting final decision of the Commission. The application has been prosecuted with the greatest diligence, large sums of money have been expended on the hearing, and it would be very inequitable to be faced with a freeze at this time when we are on the threshold of a decision.

The members of the subcommittee are, of course, quite familiar with the sixth report and order of the Federal Communications Commission which ended the freeze and made possible the advent of what we believe to be a soundly based, nationwide method of bringing television to the people of the entire country. We believe that the sixth report and order, based as it was upon extensive hearings extending over a period of many months and upon mature deliberation by the Commission extending over an even longer period of time, is sound in principle and the most practical method that could have been devised to bring into being a nationwide competitive television broadcasting system. A careful reading of that report, and particularly consideration of the premises upon which it is
based, shows that, unless the UHF spectrum is utilized, such a nationwide system is not possible.

Intermixture—the use of both UHF and VHF frequencies to the exclusion of the use of either band alone—is, as a matter of practicality, a necessary basis for a nationwide television broadcasting system, although it is theoretically possible to have all television in the UHF band. We are opposed to any plan which would eliminate all the VHF channels and permit television broadcasting only in those channels which fall within the UHF part of the spectrum. One has but to look at the investment of the citizens of Sacramento and the surrounding territory, in VHF receiving antenna installations and sets (it is possible on an intermittent basis to receive television signals from San Francisco) to realize the tremendous investment of the citizens of the United States in all manner of VHF equipment. It would be against all principles of sound economics to junk at this late date what can only be described as a tremendous investment. All this is apart, of course, from the investment of those pioneers of television who, at considerable financial sacrifice to themselves in the early stages at least, made possible commercial television in this country. It should not be forgotten that the VHF operator went through a phase of no return and sizeable losses before a market for his product—television programming—was achieved. There is no sound reason why the UHF operator should not expect to undergo some of the difficulties a VHF operator had to go through. It must not be forgotten that it is the public interest that is paramount here and not the desire to have the way smoothed out at the expense of a large segment of the population. Competition has always been the keynote of American industry. Given a sound basic system—and we believe the system of the sixth report and order is that—the workings of the free competitive system, skill in management and good business practices, will enable the operator of a television station, whether he be UHF or VHF, to take his place in the American economy. Any scheme to favor one segment of the telecasting industry at the expense of another is not in the best traditions of the American competitive system.

We sincerely hope that a freeze, which would prevent the establishment of television stations in communities which have looked forward to its advent with such great anticipation, will not be forthcoming. The idea is without sound basis and can only be characterized as the somewhat hysterical palliative of those who do not know just what they desire.

There has been some suggestion that the service areas of VHF and UHF stations should be reduced for the purpose of permitting the establishment of a larger number of stations. We believe that the Commission, in its sixth report and order, provided for minimum service areas, and the implementation of this suggestion would only mean that rural dwellers in the fringe areas of television reception would be further penalized.

This is not to say that every assistance should not be made available to those who have the courage and the pioneering spirit to render television service in the UHF spectrum. As I understand it, one of the problems in connection with UHF coverage is the penetration of blank spots. I am advised that booster or satellite stations will be helpful in this connection, and therefore the Commission should, in proper instances, authorize such necessary auxiliary facilities.

The Commission might well relax its policy with respect to authorizing microwave relay links between the station transmitter and a program source, such as a network interconnection point.

The Congress might still afford some relief in the form of elimination of the 10 percent excise tax on the UHF receiving sets and components.

The Federal Communications Commission, in its proposed rulemaking of December 23, 1953, in effect recommends that any party may own, in addition to 5 VHF stations, 2 UHF stations. This is a step in the right direction as something of a premium is afforded to the UHF stations in that those who desire to expand have a greater opportunity in the UHF spectrum.

The Federal Communications Commission might well take another look at its procedural rules with the thought that UHF permittees or licensees will be permitted to apply for modification of permits or licenses to change to a VHF channel if such a channel should become available.
JOINT COMMITTEE ON EDUCATIONAL TELEVISION,
Washington 6, D. C., June 22, 1954.

Senator Charles E. Potter,
Communications Subcommittee of the Senate Committee on Interstate and Foreign Commerce, United States Senate, Washington 25, D. C.

My Dear Senator Potter: I am writing to you in my capacity as counsel for the Joint Committee on Educational Television for the purpose of amplifying in one respect the statement I submitted on May 21, 1954, to your subcommittee studying the problems concerning the status and development of UHF television channels.

Certain of the witnesses representing commercial UHF stations who have appeared before your subcommittee have pointed out that one of the major difficulties encountered by UHF commercial stations has been their inability to secure a sufficiently large number of high quality network commercial programs from the major networks. This problem is not present in the case of the UHF noncommercial educational television stations because educational stations do not rely upon the commercial networks for their programs. The noncommercial educational television stations (both UHF and VHF) will rely upon their own local live educational programs and, in addition, to the kinescope and film programs available to them from educational sources.

The most important of these sources is the Educational Television and Radio Center established by a grant from the Fund for Adult Education and which for several months now has been actually distributing film programs from its headquarters at Ann Arbor, Mich. The film and kinescope program service of the Educational Television and Radio Center at the present time is distributing to educational television stations 5 hours of programs per week; and it is expected that the amount of film programs available to educational television stations will be increased substantially before the end of the year. This program service includes such programs as the award-winning series on Shakespeare by Professor Baxter of the University of Southern California, and the Great Ideas series by Professor Mortimer Adler, and other programs in the fields of political science, the physical sciences and international relations, which represent the best of the educational television programs now being produced by educational television stations, colleges and universities over the United States.

The sources of programs of the center are threefold: (1) programs produced by educational television stations and distributed to other such stations through the center; (2) programs produced for the center by educational and commercial television stations, by universities and colleges, and by commercial film producers; (3) programs selected from the great variety of film resources already available and which have been, or can be, cleared and acquired for educational television uses.

At the present time the center has available to it programs of the educational television stations operating in Houston, Tex.; Pittsburgh, Pa.; Los Angeles, Calif.; East Lansing, Mich.; and Madison, Wis. In the near future it is expected that educational television stations will go on the air on a regular basis in San Francisco, Calif.; Chicago, Ill.; Cincinnati, Ohio; St. Louis, Mo.; and Boston, Mass. As the rich program resources of these large cities are translated into educational programs over the educational television stations in these cities, these programs will become available in kinescope form in increasing number to the center for distribution to noncommercial educational television stations throughout the United States. In this way, the center will make available for broadcast to noncommercial educational television stations an increasingly large number of high quality educational programs.

Since the noncommercial educational television stations do not rely for their programs upon network commercial sources, it is reasonable to expect that the UHF educational television stations will not be faced with this particular difficulty that the UHF commercial stations have encountered.

Of course, UHF educational stations will have to rely upon the manufacturers of transmitters and receivers and upon commercial broadcasters for the solution of the engineering problems that are facing UHF. In the basic problem of at-
tempting to bring UHF up to the level of VHF in technical quality and in the effort to increase the number of sets that are equipped to receive a UHF signal, the educational UHF station has problems that are similar to the commercial UHF station. It is not expected that the availability of fine programs from the Educational Television and Radio Center will solve these technical difficulties facing UHF; but the availability to the UHF educational stations of these fine programs should be of considerable assistance in the development of UHF educational television.

Respectfully yours,

Seymour Kreischer,
Counsel for the Joint Committee on Educational Television.

The Fauth Company, Inc.,
New York City, June 21, 1954.

Hon. Andrew F. Schoeppe,
Senate Office Building, Washington, D. C.

My dear Senator Schoeppe: Because in the past you have expressed some interest and agreement with my views on certain aspects of the economics of television, may I without undue presumption offer some further observations on this subject which are particularly related to the current hearings before the Senate subcommittee on communications. May I emphasize that these are purely personal opinions and conclusions and are offered as such.

Being both avocationally and professionally interested in the current and future patterns of television, I have followed closely the testimony to date in these significant hearings, especially as they have broadened from their initial concern with the special problems of UHF.

That they have broadened so widely is, I believe, significant evidence that the economics of UHF are intertextically a part of the total television pattern, and therefore UHF's problems cannot be solved basically by special treatment formula.

At the same time and by the same evidence these hearings have revealed facet after facet of a basic fact; namely, that the communications miracle, television, is economically sterile. That is to say, television has no life-giving economic organs of its own. For all of its accomplishments, and they can surely be far more miraculous than yet revealed, television must draw its economic support from some other commercial consideration. Without the advertising function and advertising economics to support it, our extant TV service would not exist (unless subsidized outright as in England).

It is hardly surprising, therefore, that the voluminous testimony so far offered in the hearings amounts as much or more to a detailed treatise on the economics and social patterns of advertising as of television. That this is so is of course no reflection on advertising. To the contrary, it is to be marveled at, in view of the vast dimension already achieved by TV in the United States of America, that advertising has been able to nurture so great a growth or so extensive a service.

But it is equally clear that the advertising function alone cannot, nor should it be obligated or expected to, underwrite all of the potentials of service that television holds for society. As the hearings have abundantly shown, the advertising revenue potential is insufficient to bring television service to many of our smaller communities and sparse population areas.

Because of such patent limitations on this single method of supporting television, I have for some years been exploring the theory and watching the various technical efforts to find alternative and supplementary methods of overcoming television's economic sterility.

The most promising of these, a prodigiously promising one in my view is to utilize television as a much-needed modern, instantaneous, economical electronic distribution system. To do this requires only the addition to a television broadcast, at its receiving end, of a practical method of collecting revenue for the program so delivered. And, since the necessary technical knowledge and devices to do this are now at hand, needing only authorization for their use, I should think—and am indeed surprised—that these new potential solutions for the basic economic problems of television have not been explored in greater detail during the committee hearings.

That subscription use of television—as such uses have come to be known—holds great promise for helping solve, not only UHF's problems, but all the
economic shortcomings of TV—including the vast new economic problems of
color TV—stems I believe from the following factors, which I itemize for brevity:
1. Subscription use of TV to deliver premium quality or unique programs,
now beyond the scope of sponsored TV, would be an addition to, not a substitute
for, any present TV service.
2. It would therefore add a totally new, and I believe a very great, service
of revenue to TV;
3. Thus making many more stations economically possible, especially in the
smaller communities.
4. It would require no separate or exclusive channels.
5. It would be an added service and added source of revenue to present and
future television stations.
6. It would increase the advertising usefulness of TV by adding more stations
and a larger net audience—since the average viewer would buy only an occasional
premium show, as compared to his continued viewing of the regular sponsored
shows—probably 90 percent of the time at least.
7. Yet the available opportunity to derive consumer support for the premium
shows would provide a wholly new economic approach to a number of auxiliary
problems of television; namely,
8. How to utilize TV to add to, rather than restrict as it now does, the economic
distribution of spectator sports, Broadway plays, opera, symphonies, first-run
motion pictures, etc.
9. Surely of great significance to the Nation at a time when our way of life
is in danger of dying of ignorance, the utilization of subscription TV to collect
 tuition for educational television could finally overcome the economic iron cur-
tain which now hangs between us and the full utilization of the TV allocations
set aside for educational television stations. At the same time, academic institu-
tions, museums, great libraries, etc., could also utilize subscription time on regu-
lar stations for new types of cultural programs now too specialized or costly for
commercial sponsorship.
10. In summary and in essence such subscription use of TV as an electronic
distribution service therefore offers the prospects of (1) new services and (2) new
and direct sources of revenue to television—yet without curtailing any of its
present uses or revenue; indeed with a good chance to expand them all and
reduce their costs. The advertisers would be relieved of carrying the whole
economic burden of TV, yet the public would pay far less for the subscription
shows delivered to their homes on TV than they now pay for the same types of
shows in public places.
Since the technology now exists to put these hopeful hypotheses to the test,
I believe the public interest, convenience, and necessity justifies their fullest
exploration. If in such inquiry I can be of any service to you or the committee,
I shall be most happy to serve.
Respectfully,

MILLARD C. FAUGHT.

TESTIMONY OF THEODORE G. BERGMANN, DIRECTOR OF BROADCASTING, ALLEN B.
DU MONT LABORATORIES, INC., CLIFTON, N. J.

The following material is respectfully submitted in reply to requests made
by various members of this committee during Mr. Bergmann's testimony:
1. Question from Senator Pastore: "Are the rates higher where you have one
channel in the city than where you have several channels?"
In answer to this question, the attachment marked "Exhibit 1" indicates
markets contained within the top 100 markets in the United States which have
either all UHF or all VHF television facilities broken down into categories of
4-station markets, 3-station markets, 2-station markets, and single-station
markets with their accompanying rates.
An analysis of this compilation indicates the following:
A. The average class A, 1-hour rate per 1,000 television homes in the 4-station
markets is $1.32.
B. The average class A, 1-hour rate per 1,000 television homes in the 3-station
markets is $1.85.
C. The average class A, 1-hour rate per 1,000 television homes in the 2-station
markets is $2.66.
D. The average class A, 1-hour rate per 1,000 television homes in the single-station markets is $2.66.

2. Senator Hunt: "I would just like to know the exact impact of television on radio broadcast advertising."

Exhibit II attached indicates national advertising expenditures in millions of dollars for all media as reported in Printers Ink from 1935 to 1953 and projected by the Du Mont Television Network Research Department from 1954 through 1958. It will be noted from these compilations that during the rise of television in 1940, 1950, and 1951 radio billing also increased. However, in 1952, radio billing dropped back to a level which it is expected to maintain through 1955. A rise is indicated in 1956 due to the fact that this is a presidential election year and experience has shown that radio billing normally can be expected to increase in a national-election year.

3. Question of Senator Pastore: "Could you give us statistics on how many radio stations own television stations?"

Exhibit III shows State the television stations owned by corporations who are operating AM stations. A second part shows the group owners of television and AM stations, and for both of these lists, we have indicated the affiliation of the radio stations.

4. In answer to the question from Senator Schoeppel: "Have the television advertisers gotten together on a kind of uniform scale of charges for television advertising?"

The answer given indicated that rates in television are set to be commensurate with the amount of circulation that each station delivers within its own market, and there is no uniformity. Exhibit IV shows markets with equal television facilities (either all UHF or all VHF) in descending number of television homes.

It will be noted from this compilation that for the most part, the rates are approximately commensurate with the circulation delivered except that where a station is affiliated with NBC or CBS, a higher rate usually prevails than where it is affiliated with ABC or Du Mont.

1106 STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

NEW YORK CITY 17.

Senator CHARLES E. POTTER,
United States Senate.

My DEAR SENATOR POTTER: The subject of subscription uses of television, as a new approach to solution of the economic problems of TV stations, especially in smaller communities, has come up during the hearings of your subcommittee on UHF and related matters.

However, since the many ramifications of this new potentiality were discussed only briefly in the hearing, may I respectfully request that the attached article from the July 1954 issue of the Reader's Digest (entitled "Television: The Best Is Yet to Come") be entered in the record of the subcommittee hearings. It summarizes many of the most salient aspects of this emerging potentiality of subscription use of television.

Respectfully yours,

MILLARD C. FAUGHT.

{Reader's Digest, July 1954}

TELEVISION: THE BEST IS YET TO COME

Condensed from The American Mercury, by Millard C. Faught.

At the flick of a TV dial some 100 million Americans now can get free seats at a major-league baseball game or a star-studded variety show. But TV's magic screen has one vital part missing: it has no direct source of income.

A single program may cost $100,000 per hour. So far the advertising sponsor or TV station has picked up these prodigious bills. But because of TV costs, few advertisers can afford it. (About half of TV's total income comes from less than a score of national advertisers.) Color TV will spiral costs even higher.

Further, as long as the programs are paid for by the advertiser, who can sponsor only the programs the most people will watch, the individual viewer has little control over what programs will be on TV. He can merely accept or reject what is offered.

The answer to this unique headache may soon be subscription, or pay-as-you-see television: you'll pay for some of the new programs you want by means of a gadget on your set. The gadget itself is already perfected. With it, in addition to the programs you now see, you will be able to view first-run movies, Broadway shows, championship prizefights, public-service programs—features that are now too specialized or too costly for commercial sponsors or that are banned from TV by producers.

As things now stand, the home viewer is in danger of losing some of the programs he prides most. Theater television has already removed many of the big prizefights, and again this fall only one major college football game will be shown each Saturday. Even the world series may disappear from home television when the present contract for commercial TV sponsorship expires next year.

The trouble is that with its Zoomar lens the TV camera can improve even on a 50-yard-line seat; its long-distance closeups can watch every play of a ball game as closely as an umpire; it can almost ride the derby with the winning jockey. All of this is fine for the fans, but it keeps too many of them at home. Said a big-league baseball owner, "The trouble with television is that we have to give away our ball game to sell the sponsor's beer."

The National Collegiate Athletic Association concedes that restricting the number of football games televised is an unhappy solution to the problem of diminishing gate receipts. But until TV gets its own box office to substitute for the stadium turnstiles the colleges cannot let the public see all big games free.

When TV does get its own ticket taker, however, its box-office prices may be as low as one-tenth of stadium admissions. If 25 cents could be collected from every home set tuned in to a championship fight, the return would make the million-dollar gate look small. Apply the same principle to a Broadway show: if all of us who now have sets paid only the price of a bus ride to and from a theater as our admission fee to South Pacific on TV, the total revenue would far exceed all that this great musical show grossed in 5 years on Broadway. And millions of people would still want to see the play itself.

At least three companies have demonstrated devices which will provide the home TV set with its own cash register. One of these, the Zenith Radio Corp., has had a request pending for some time before the Federal Communications Commission to authorize such an added service. Recently a group of telecasting
could have decoding do stations week is possess grams. jumbled improvement competition from the on TV average No. library, owner, half million. of lous audience. see now is. colorado With subscription With television today views of people is economic. With subscription income to defray part of operating costs, advertising rates on TV might well be lowered to permit more sponsors to use it. At least the competition from the paid shows might induce the advertisers to offer better shows of their own. Competition is the greatest stimulant we have to the improvement of service, and it should do wonders to improve TV programing. Veteran movie producer Samuel Goldwyn has repeatedly forecast that when TV gets a home box office it will be an ally of movies rather than the rival it now is. There is evidence back him up. Limited tests of subscription TV, using quality movies, suggest that this new way of exhibiting films could at least treble the market for the movies. (On any given night there are more people who are ill, too old, too remote or who can't get a baby-sitter, but would like to see a movie, than there are customers for the movie theaters.) A new film like Gone with the Wind released on TV would command a fabulous audience. If it were released at $1 per family, and even if only one-third of all set owners decided to pay to see it, in 2 hours the program would gross $10 million.

If television today has feet of clay it is simply because it has no economic lifeblood of its own and must continually be sustained by financial transfusions from other businesses. But in a society such as ours, in which a free choice by people is essential, TV should be allowed to serve the public interest in more and better ways than as an adjunct to advertising.
II. With specific reference to Utah Broadcasting & Television Corp., it should be noted that “We are presently building a television station to serve the Salt Lake City area. We face competition with at least two other Salt Lake City stations, and from stations in surrounding communities, which also may serve substantially the same area. We have planned the coverage to be most extensive, so that people living in distant areas will receive diversified program service.

II. With specific reference to Television East Bay, doing business as Television California, it should be noted that “Television California is a pioneer applicant and a pioneer television experimental operator.” Its application was initially filed on May 5, 1948. It actually broadcast the first television program in San Francisco on May 25, 1948, over the facilities of KQFXD, which Television California owned and operated. This experimental station was operated for a period of 5½ years and the equipment finally was donated to the University of California along with a cash endowment to operate the equipment for scientific purposes.”

IV. JOINT VIEWS

We believe that the Sixth Report and Order of the Federal Communications in the matter of amendment of sections 3.606, etc., of the Commission’s rules and regulations should not be disturbed by the congressional committee, but should be left for further consideration and action by the arm of Congress, namely the Federal Communications Commission. We believe that the Sixth Report and Order in itself is a workmanlike document but, like all regulatory orders, it must be reassessed from time to time in the light of progress and in the light of dynamic changes in civilization. The problem of “inter-mixture” of UHF and VHF is not critical in any of our operations. Nevertheless, we believe that a nationwide competitive television broadcasting system is essential, and if adequate spectrum space is not available in one or the other of the television bands, intermixture is essential. The solution of this problem requires the highest degree of expertise, and here again we recommend that the solution of the problem be left to the discretion of the Federal Communications Commission, as an arm of Congress.

The citizens of the United States have a very large investment in VHF receivers and related equipment, and this investment should not be destroyed by eliminating the VHF television broadcasting stations.

If any policy change with respect to coverage is recommended by Congress, such recommendations should be in the direction of increasing service areas instead of reducing service areas. This is obvious from the plain scientific consideration, namely, that the rural dwellers and the suburban dwellers should be afforded adequate television service and such service cannot be delivered unless the transmitting stations are permitted to emit an adequate signal.

There is no good scientific reason why the Commission and Congress should not demand and require that “blind spots” in VHF and UHF coverage be removed through booster or satellite operation. There is no good regulatory or scientific reason why television broadcasting stations should not be permitted, through intercity relay circuits or otherwise, to pick up adequate program material. Restrictions on such proposals are indefensible.

STATEMENT OF MRS. HUGH M'CCLUNG, PRESIDENT OF THE M'CCLUNG BROADCASTING STATIONS, SAN FRANCISCO, CALIF.

I am Mrs. Hugh McClung and I am appearing on behalf of the McClung Broadcasting Stations which include station KHESL-TV, Chico, Calif.

Chico is one of the smallest cities in the United States having a television station. The decision to establish a television station in Chico could not be justified on economic grounds alone, but we proceeded nevertheless because of our consistent policy of endeavoring to render the best in public service.

The members of the subcommittee are quite familiar with the famous Sixth Report and Order of the Federal Communications Commission in the matter of the amendment of section 3.606 of return of the Commission’s rules and regulations. We believe that the Sixth Report and Order, which was based upon hearings extending over many months and upon several years of earnest consideration by the Commission, is a sound document even in the posture of present day conditions. One of the most significant findings of that report is that which declares that the utilization of the UHF spectrum is essential to a nationwide-competitive television broadcasting system.
We see no technical method of eliminating intermixture of UHF and VHF in the same market where there isn’t sufficient spectrum space in the VHF band of frequencies. On the other hand we believe that there is sociological and economic necessity for such intermixture, because of the very necessity of establishing a nationwide, competitive television broadcasting system.

We are opposed to any plan which would eliminate all the VHF channels and permit television broadcasting only in the UHF spectrum. Wholly aside from the fact that pioneers who really established television in the United States should not be at this late date faced with an extreme penalty, it is obvious that the tremendous investment of the citizens of the United States in all manner of VHF equipment should not be destroyed. There is simply no good reason to support such a lethal proposal.

There has been some suggestion that the service areas of VHF and UHF stations should be reduced for the purpose of permitting the establishment of a larger number of stations. We believe that the Commission in its Sixth Report and Order provided for minimum service areas, and the implementation of this suggestion would only mean that rural dwellers in the “fringe areas” of television reception would be further penalized.

In view of the necessity for an adequate national competitive television broadcasting service, it is obvious that every assistance should be made available to those who have the courage and the pioneering spirit to render television service in the UHF spectrum. As I understand it, one of the problems in connection with UHF coverage is the penetration of blank spots. I am advised that booster or satellite stations will be helpful in this connection, and therefore the Commission should, in proper instances, authorize such necessary auxiliary facilities.

The Commission might well relax its policy with respect to authorizing microwave relay links between the station transmitter and a program source, such as a network interconnection point. The Congress might still afford some relief in the form of elimination of the 10 percent excise tax on the UHF receiving sets and components.

The Federal Communications Commission in its proposed rulemaking of December 23, 1953, in effect recommends that any party may own, in addition to 5 VHF stations, 2 UHF. This is a step in the right direction as something of a premium is afforded to the UHF stations in that, those who desire to expand, have a greater opportunity in the UHF spectrum.

The Federal Communications Commission might well take another look at its procedural rules with the thought that UHF permittees or licensees will be permitted to apply for modification of their permits or licenses to change to a VHF channel, if such a channel should become available.

I can well understand the emotions of many UHF operators throughout the United States in the light of my own misgivings when we appropriated great sums of our company’s assets to establish a television station in Chico, when the set circulation was entirely negative and we had no real assurance of financial return. We undertook this risk in a spirit of American free enterprise. Sometimes these ventures succeed and sometimes they fail. I believe it is extremely difficult to arrive at a program of subsidy without doing some violence to the fabric of our free competitive system.

STATEMENT OF DONALD A. NORMAN OF TELEVISION EAST BAY DOING BUSINESS AS

TELEVISION CALIFORNIA

I am Donald A. Norman and I am appearing on behalf of Television East Bay doing business as Television California, an applicant to establish a new station in the San Francisco-Oakland area. I am executive vice president of the applicant corporation.

Television California is a pioneer applicant and a pioneer television experimental operator. Its application was initially filed on May 5, 1948. It actually broadcast the first television program in San Francisco on May 25, 1948, over the facilities of W6XJD, which Television California owned and operated. This experimental station was operated for a period of 5½ years and the equipment finally was donated to the University of California along with a cash endowment to operate the equipment for scientific purposes.

We have prosecuted our application most diligently every inch of the way. We expended large sums of money on the initial hearings, and we were expecting Commission action the very period of time the last “freeze” was ordered. We sincerely hope there will be no “freeze” at this time—just as we are prepared to proceed again.
The members of the subcommittee are quite familiar with the famous sixth report and order of the Federal Communications Commission in the matter of the amendment of section 3.606, etc., of the Commission's rules and regulations. We believe that the sixth report and order, which was based upon hearings extending over many months and upon several years of earnest consideration by the Commission, is a sound document even in the posture of present-day conditions. One of the most significant findings of that report is that it which declares that the utilization of the UHF spectrum is essential to a nationwide competitive television broadcasting system.

Although we have no problem along this line in San Francisco-Oakland, we see no technical method of eliminating intermixture of UHF and VHF in the same market where there isn't sufficient spectrum space in the VHF band of frequencies. On the other hand, we believe that there is sociological and economic necessity for such intermixture, because of the very necessity of establishing a nationwide, competitive television broadcasting system.

We are opposed to any plan which would eliminate all the VHF channels and permit television broadcasting only in the UHF spectrum. Wholly aside from the fact that pioneers who really established television in the United States should not be at this late date faced with an extreme penalty, it is obvious that the tremendous investment of the citizens of the United States in all manner of VHF equipment should not be destroyed. There is simply no good reason to support such a lethal proposal.

Having once been the victim of a "freeze," we hope that no such hysterical and unnecessary measure will be again forced upon those citizens who desire, at their own risk, to establish television service for the public of the United States.

There has been some suggestion that the service areas of VHF and UHF stations should be reduced for the purpose of permitting the establishment of a larger number of stations. We believe that the Commission in its sixth report and order provided for minimum service areas, and the implementation of this suggestion would only mean that rural dwellers in the "fringe areas" of television reception would be further penalized.

In view of the necessity for an adequate national competitive television broadcasting service, it is obvious that every assistance should be made available to those who have the courage and the pioneering spirit to render television service in the UHF spectrum. As I understand it, one of the problems in connection with UHF coverage is the penetration of blank spots. I am advised that booster or satellite stations will be helpful in this connection, and, therefore, the Commission should, in proper instances, authorize such necessary auxiliary facilities.

The Commission might well relax its policy with respect to authorizing microwave relay links between the station transmitter and a program source, such as a network interconnection point.

The Congress might still afford some relief in the form of elimination of the 10 percent excise tax on the UHF receiving sets and components.

The Federal Communications Commission in its proposed rulemaking of December 23, 1953, in effect recommends that any party may own, in addition to 5 VHF stations, 2 UHF stations. This is a step in the right direction as something of a premium is afforded to the UHF stations in that those who desire to expand, have a greater opportunity in the UHF spectrum.

The Federal Communications Commission might well take another look at its procedural rules with the thought that UHF permittees or licensees will be permitted to apply for modification of permits or licenses to change to a VHF channel if such a channel should become available.

I can well understand the emotions of many UHF operators throughout the United States in the light of our own misgivings when we appropriated great sums of our company's assets to establish a television station in the bay area, which after 7 years is still a speculative enterprise. We undertook this risk in a spirit of American free enterprise. Sometimes it is extremely difficult to arrive at a program of subsidy without doing some violence to the fabric of our free competitive system.
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

WRTV, Channel 58,
Walter Reade Theaters, Inc.,
New York, N.Y., May 18, 1954.

Hon. Robert C. Hendrickson,
United States Senate,
Senate Office Building, Washington, D. C.

DEAR SENATOR HENDRICKSON: I noted in the newspapers earlier this week that Senator Bridges of New Hampshire had asked the Federal Communications Commission to comment on a suggestion that television set manufacturers install a combination VHF-UHF tuner in every color television set they make. He made this suggestion in a letter to the FCC Chairman, Mr. Hyde.

A respectfully call this to your attention because the apparent reluctance or hesitancy on the part of television set manufacturers and distributors to furnish television sets (with or without color) which have all-channel bands capable of receiving UHF as well as VHF stations, has been one of the major problems of securing listeners for WRTV. Not only do we, as well as virtually all other UHF stations, have the problem of securing conversions of existing sets to receive our UHF signal, but the problem is being constantly compounded by the influx of new sets which also have to be converted.

If manufacturers and distributors would send only all-channel sets into our area as well as other UHF areas, this problem, within a relatively short time, would disappear as listeners traded in old sets or bought new ones.

May I respectfully request your consideration of supporting Senator Bridges' inquiry as being vital to the future of UHF television. I would also point out that this will be one of the prime suggestions from UHF stations at the forthcoming hearings to be conducted by Senator Potter.

Your efforts would be tremendously appreciated.

Very sincerely yours,

Walter Reade, Jr., President.

Senator Charles E. Potter,
Senate Subcommittee on Communications,
Senate Office Building, Washington, D. C.

DEAR SENATOR POTTER: Several ill-advised witnesses before the Senate Subcommittee on Communications have persisted in proposing the FM band as a likely source for 2 or 3 additional VHF-TV channels. They have neglected to mention what disposition they suggest for the 663 operating FM stations. Of those 663 operating FM stations, 114 are noncommercial stations operated by educational institutions. This cure-all for TV presumably would, in the Chicago area, casually eliminate 16 FM stations and substitute 1 additional TV channel instead.

It is difficult to understand how any intelligent person could make such a proposal, but if the Senate subcommittee plans to give serious consideration to something of that sort, as an FM broadcaster, I would like to request an appearance before the committee. I don't believe that any inquiry into TV's woes should be expanded to include the FM picture, but if you want appearances from several hundred FM broadcasters, I think they would be happy to appear.

I would like to state in passing that those of us who stayed in FM long enough to make it profitable, did not go to the Senate to request alleviation of the problems that were just as serious to the FM broadcasters as are the present difficulties of the UHF people.

I get a little tired of hearing people voice the prediction that UHF will suffer "the same fate as FM." In the first place, FM hasn't suffered any fate. When operated properly, it can be and is a profitable operation in the public interest.

In comparing UHF to FM, one extremely important point of dissimilarity is never noted, that is, while UHF provides inferior coverage to VHF, FM provides vastly superior coverage to over 80 percent of the AM signals on the air.

48550--54--71
It is particularly ironic to read of E. L. Jahncke, vice president of ABC, advocating the elimination of FM. For years the only full-time radio outlet ABC has had in Chicago, the Nation's second market, has been WENR-FM. Many fine ABC programs have only been available on WENR-FM in Chicago. However, ABC never saw fit to publicize that fact or even operate that station beyond the minimum 6 hours per day required by the Commission. Is that operation in the public interest?

If anybody wants to bring out all the dirty laundry with regard to several of the networks and FM, that in itself would make quite a hearing.

FM is here to stay and the sooner the powers that be stop trying to figure out how to avoid it and start promoting it and using it to support and even increase their radio rates, the better off everyone, including the public, will be.

Yours truly,

EDWARD A. WHEELER, President.

J. H. WHITNEY & Co.,

Senator CHARLES E. POTTER,
Chairman, Subcommittee on Communications, Committee on Interstate and Foreign Commerce, United States Senate, Washington, D. C.

DEAR SENATOR POTTER: It has come to our attention that J. H. Whitney & Co. were referred to in testimony given by Mr. J. Patrick Beacom of Fairmont, W. Va., on May 21 in the hearings on UHF problems which are being concluded today by the subcommittee. We obtained a copy of the statement delivered by Mr. Beacom and have written to him today a letter in which we seek to correct certain factual inaccuracies. A copy of our letter to Mr. Beacom is enclosed.

I am sure that the subcommittee will want to have all of the facts on the questions raised by Mr. Beacom and we therefore request that the enclosed letter be made a part of the record of the hearings.

Sincerely,

WILLIAM H. JACKSON, Managing Partner.

J. H. WHITNEY & Co.,

Mr. J. PATRICK BEACOM,
Station WJPB-TV, Inc., Fairmont, W. Va.

DEAR MR. BEACOM: One of the members of the press who attended the hearings before the Subcommittee on Communications of the Senate Interstate and Foreign Commerce Committee in Washington on May 21, 1954, gave us one of the mimeographed copies of the statement you delivered to the subcommittee on that day. Our reading of it indicates certain factual inaccuracies which we wish to invite to your attention in the interest of keeping the record straight.

You testified in part as follows:

"Now the situation becomes complicated, because the Jock Whitney interests of New York, through their Jerrold Electronics Corp., in Philadelphia, have come into West Virginia and under the name of the Fairmont Television Cable Corp., in Fairmont and the Clarksburg Television Cable Corp. in Clarksburg, have built a network offering closed circuit television service to these communities with programs from Wheeling, Pittsburgh and Johnstown stations."

Jerrold Electronics Corp., is a manufacturing company in Philadelphia founded and headed by Milton J. Shapp. Mr. Shapp is a stockholder in the Fairmont and Clarksburg companies. Among other things, Jerrold Electronics Corp. engineers, manufactures and services community television antenna equipment. It has sold to the Fairmont and Clarksburg corporations the equipment in use in those two communities and renders certain engineering services in connection with maintaining the equipment in proper working order. J. H. Whitney & Co. has no financial or other interest in Jerrold Electronics Corp. While J. H. Whitney & Co. is an investor in both the Fairmont and Clarksburg corporations, there are also other investors. In Fairmont there are very substantial local investors of the highest standing in the community, as I am sure you are aware.

We cannot agree with your statement concerning the adding of station WJPB-TV to the Fairmont television cable system and its subsequent removal from the system. The essential facts are as follows:

(1) On March 26, 1954, the Fairmont company ran a full-page advertisement carrying the banner headline "The Fairmont Television Cable Corp. Welcomes Fairmont's Own TV Station WJPB-TV and Will Carry WJPB-TV Pro-
grams on the TV Cable.” Immediately under this headline was the following statement:

“In order to provide the widest possible choice of TV programming to our subscribers and to enable them to receive the signals of our new local Fairmont station without the expense of UHF set conversion or antenna installation, the Fairmont Television Cable Corp. will carry WJPB-TV’s programs during the station’s broadcast hours.

“In order to do this, the Fairmont station will be substituted for Pittsburgh WDTV, from 4 p.m. daily (WJPB-TV’s sign-on time) until midnight. Since many of the evening network programs to be carried on WJPB-TV will duplicate those of the Pittsburgh station, subscribers will gain local programming without loss of these Pittsburgh programs. The Pittsburgh station will continue to be carried from 7 a.m. to 4 p.m. daily. This plan will continue as long as the majority of our subscribers wish it.”

(2) Immediately upon the publication of this announcement the Fairmont Television Cable Corp. began receiving telephone calls and visits to its office by its subscribers protesting the adding of WJPB-TV to the cable system in place of WDTV Pittsburgh. Tabulations of these protests show the following totals:

<table>
<thead>
<tr>
<th>Date</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mar. 20</td>
<td>312</td>
</tr>
<tr>
<td>Mar. 27</td>
<td>142</td>
</tr>
<tr>
<td>Mar. 28</td>
<td>15</td>
</tr>
<tr>
<td>Mar. 29</td>
<td>223</td>
</tr>
<tr>
<td>Mar. 30</td>
<td>323</td>
</tr>
</tbody>
</table>

Total: 1,015

Phone calls to the home of the general manager, the office being closed on Sunday.

(3) In response to these protests the company on March 31 did not carry WJPB-TV but restored WDTV Pittsburgh to the system. The general manager states that the telephone protests immediately stopped and that 50 to 76 subscribers called to thank the company for restoring the Pittsburgh station to the system. On March 31 and succeeding days the company received a total of 17 protests over discontinuance of WJPB-TV.

(4) The company then mailed a letter to all subscribers explaining why WJPB-TV was added to the system and why it was taken off. This letter included the following statement:

“In the future should there be a change in subscriber sentiment we will be guided by your wishes. Within the next few weeks we will give all subscribers an opportunity to vote again on the question of substituting WJPB-TV for 1 of the 3 metropolitan stations now carried on the cable.”

(5) In keeping with this promise, the company on June 11, 1954, sent a letter to all subscribers, a copy of which is attached, asking them to express their wishes by June 15, by checking and returning a ballot card enclosed with the letter. This card asked the subscriber to check one of the four following combinations of channels:

Pittsburgh, Wheeling, and Johnstown
Fairmont, Wheeling, and Johnstown
Pittsburgh, Fairmont, and Johnstown
Pittsburgh, Wheeling, and Fairmont

As of today approximately 60 percent of the subscribers have signed and returned their cards, and of those responding 83 percent voted for continuation of Pittsburgh, Wheeling, and Johnstown.

From these facts it should be clear to anyone that the Fairmont Television Cable Corp. has been and is motivated only by the desire to provide its subscribers with the service they want. Your testimony might be construed by some to imply that the company removed your station from the system in an arbitrary or spiteful manner. The above facts prove that the company acted reasonably and fairly and had no choice but to abide by the wishes of the subscribers. As far as J. H. Whitney & Co. is concerned we assure you that we favor the policy of carrying on the system those stations which our subscribers want, and if the subscribers vote to carry your station in place of one of the ones now being furnished, we would expect the Fairmont Television Cable Corp. to make that substitution.

The statement from your testimony quoted above also implies that the situation of WJPB-TV became complicated because the Fairmont cable system was built after your station was in operation. This is not in accord with the facts. The Fairmont system began construction work on March 20, 1953. The first sub-
status of uhf and multiple ownership of tv stations

subscribers were connected on may 19, 1953. you received the construction permit for station wjpb-tv about july 1, 1953, and went on the air in march 1954, more than a year after the first construction work on the system. thus there is no element of surprise to you as might be inferred from the language of your testimony.

i am sending a copy of this letter to senator potter with the request that it be made a part of the record of the hearings on uhf broadcasting problems before the subcommittee of which he is chairman.

very truly yours,

william h. jackson, managing partner.

fairmont television cable corp.,
fairmont, w. va., june 11, 1954.

dear subscriber: several weeks ago when the fairmont station went on the air, it was added to the cable system, and pittsburgh was dropped. the station, was carried for several days. during that time we were flooded with telephone calls from subscribers who said they preferred pittsburgh to the local station.

as we wrote you then, we felt we had no choice but to reinstate the pittsburgh station. that is what we did. we said also that we would, within a few weeks, poll the subscribers and again ask their opinion.

quite evidently we have only one purpose—that is to give you the kind of television service you are most interested in. this company has the finest equipment there is for bringing you high quality pictures from three stations.

you should have the three you want most to watch.

would you therefore express your wishes on the enclosed post card. since these cards will be tabulated next tuesday, please mail the card within the next four days—that is by june 15.

if you care to send any other thoughts or ideas, we'd be very glad, as always, to have them.

sincerely,

ned Pence, general manager.

Hon. Charles E. Potter,
Chairman, Senate Subcommittee,
United States Senate, Washington, D. C.:

now that uhf television hearings have been concluded in Washington we, the operators of michigan's last remaining commercial uhf television stations, urge that immediate action be taken by Senate subcommittee in an effort to remedy the present television dilemma.

Believing intermixture of uhf and vhf channels is the primary cause of the problem, we respectfully request that serious consideration be given to the plan submitted by WFMZ-TV, Allentown, Pa.

Intermixture has been the result not only of FCC allocations but by outside VHF stations covering uhf designated markets by means of superpower increases. We also believe that a plan of confining color to the uhf band deserves immediate study at this time before the American public invests tremendous sums of money in buying color receiving TV sets. Two Michigan uhf stations in Flint and Battle Creek have ceased operations within the past 60 days and the uhf stations in Lansing and Ann Arbor will be forced to immediately discontinue operating for economic reasons leaving saginaw as the sole uhf market unless constructive action is taken to solve the uhf problem without delay.

We believe that a system of nationwide competitive television in the true American tradition is now in jeopardy and will be lost unless immediate remedial action is taken.

Respectfully yours,

Edward F. Baughn, WPAG-TV, Ann Arbor, Mich.
John C. Pomeroy, WILS-TV, Lansing, Mich.
Senator CHARLES E. POTTER,
Chairman, Interstate Senate Commerce Subcommittee,
The United States Senate, Washington D. C.

DEAR SENATOR POTTER: Unfortunately, we find ourselves in the old radio AM and FM story as far as television goes. Again we are faced with trying to prove to the people that they should convert their television sets because of a better type of telecasting. As far as we have been able to find out, the average person likes television very much, but when he finds he has to spend between $50 and $100 to convert to get the new UHF stations, he finds there are things around the house that have to be repaired first. This puts spending of money for conversion as the last possible expenditure.

Therefore, if there is going to be no monopoly in the art of telecasting, there had better be a decision to put all telecasting on the UHF band. Besides the money angle, as far as the individual family is concerned, consider what a complicated thing a television set is going to be in the future for the average home person when he has two dials to tune in order to get the stations, plus the fact when he gets color he will have to adjust the color dials.

In a recent survey here in the Lehigh Valley it was found that women in the home were at a loss as to how to tune in a converter or a VHF or UHF set, and that the questions regarding UHF ownership and usage of sets were answered mostly by men. It is not feasible, therefore, to think that you are ever going to have a happy situation between broadcaster and listener when you have two systems of television. It is all right for some of our association members to talk about the fact that you ought not make any distinction between UHF and VHF television. However, when the customer goes to the store to buy a new set and it costs him approximately $50 more than the VHF set, he is going to ask the question “Why?”

It seems that some of the prefreeze VHF stations that sent signals into our area are playing up their coverage for all they are worth; some have slogans such as “Covering the Delaware Valley four-State area.” As far as I am concerned I can’t see what great value this has as far as the listener is concerned, but it has great value as far as the station is concerned and the national and regional sponsor who is buying his time. As we all know, there has been a tendency upon VHF stations in big markets to keep smaller stations (within 35- to 50-mile range) from getting network programs. This in turn allows them to concentrate on three types of advertisers, i.e., national network, national spot, and regional spot, where a lot of the gravy is in the broadcasting business.

I cite, for example, the raising of rates of one Midwestern station who had done the following gross in 1953: local business—some $200,000; national and regional spot—some $580,000; national network—some $475,000. They increased their power to 100,000 watts and the problem then arose whether they should raise their rates or not. They decided to raise their rates because of the added coverage and then were confronted by the fact that the local advertiser couldn’t go along with the increased rate setup. In order to make more availabilities for national spot campaigns they would build more local live shows so that they could carry more spot business. This station printed their theory in one of the national advertising magazines.

Therefore, assuming that any small UHF station was to start within 35 miles of this station’s range it would not only have a fight to get conversions, but it will have a fight to get any national spot business. Without a bit of doubt, if you have a television station that most people can pick up, 75 percent of your battle is won because then the local advertiser will readily use you and the local advertiser is the one that is missing from the present UHF scene too. Local advertising pays the cost of operations, so that a station can bring its public service or whatever it wants to do.

There are other dangers that come from too much concentration of power in big VHF’s as they are presently set up: (1) it can cause big political monopolies, and (2) business monopolies. In regard to political monopolies we can all understand what can happen there. By business monopolies I mean this: for instance, if one of the department stores in the city of Philadelphia decided to do some
terrible merchandising in certain household products and they used all three Philadelphia stations, they can reach right into the Allentown-Bethlehem area and hurt our local department stores. People will either travel to Philadelphia to buy or the department store can use the phone method to sell. This is happening now in the beer situation; nationally advertised beers are making it touch on local Lehigh Valley breweries. You see, it is quite impossible for the local brewers to go to Philadelphia and pay the Philadelphia rates on television when they have no market in Philadelphia. On the other hand, the local brewery is hesitant to invest his dollar into the local stations (UHF) because of the lack of conversions and audience.

Due to the cost of telecasting it is hard for any local station to keep up losing of money for 4 or 5 years, and I truly believe that if we in the Lehigh Valley area operate under the present circumstances it will be 3 or 4 years before we get 50 percent to 60 percent conversion, the percentage which is now being demanded by any national spot advertiser before he buys time.

Those on the VHF side will hold, “But look what we spent to develop it.” However, when they were spending television was new and the sale of sets was fantastic. Add one other thing to that—the fact that a lot of the original licensees of TV stations were television set manufacturers, so their investment in the art of telecasting was written off against their production of television sets.

Some VHF stations (not all) in big markets also have a wedge over certain networks and have used it to keep a network from picking up additional stations within the VHF’s service area. This wedge is feeding the network program origination.

In the early days of the VHF stations the costs were comparatively low; most stations were of the 500 watt or lower power type; programing wasn’t on a large scale; and what programing was around was either wornout films or a network origination. Today as your new films come out on the market the moneymaking VHF gets the first opportunity to buy and if a UHF is starting out, it has to pay approximately the same price, but then can’t deliver the number of homes to the advertiser.

In summing it all up I believe, as Commissioner Frieda Hennock has pointed out, the eventual solution is to put all television stations in the UHF band and give those VHF’s the right to operate on both VHF and UHF for a period of a year so they can get people to convert their sets. Of course, there is another alternative—by assigning what is left of the old FM band, three additional VHF channels could be made, and then by using directional antennas more markets could have VHF stations.

For the immediate relief of the UHF stations in the Lehigh Valley I would suggest that the power of VHF’s in Philadelphia be regulated so that they cover the Philadelphia market only, and that the 610,000 people or the 173,000 households in the Lehigh Valley could have their own area TV stations, supported by local people.

This statement is for the record since I was unable to appear before your committee on June 15 as scheduled.

Sincerely yours,

FARRIS E. RAHALL.

WELCH, MOTT & MORGAN,
WASHINGTON D. C., JUNE 23, 1954.

SENIOR CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
Committee on Interstate and Foreign Commerce,
United States Senate, Washington 25, D. C.

DEAR SENATOR POTTER: The following remarks are submitted on behalf of Milton J. Sharp, president of Jerrold Electronics Corp., Philadelphia, Pa., for consideration by the Subcommittee on Communications in connection with its investigation of the status of UHF television broadcasting. These remarks relate to a portion of a statement submitted for the record of the proceedings of the subcommittee by Mr. J. Patrick Beacom, Fairmont, W. Va., permittee of television station WJPB-TV, on May 21, 1954. The subject remarks are for the purpose of correcting certain inaccuracies in that statement, as well as to supply additional information in order that the subcommittee may be more fully advised on matters set forth therein. It would be appreciated if you would have this letter included in the record of the subcommittee’s proceedings.
It was pointed out in above-mentioned statement that Fairmont, W. Va., is located geographically approximately 78 miles from Wheeling, W. Va., 115 miles from Pittsburgh, Pa., and 125 miles from Johnstown, there being a television station in each of these cities. It is also stated that the stations in the above-mentioned cities should not, according to the calculation of the Commission engineering staff, provide a signal of sufficient strength to serve Fairmont, and that thus Fairmont would not expect to have a television service other than that furnished by its own UHF station, WJPB-TV, on channel 35. The further assertion is made that "the Jock Whitney interests of New York, through their Jerrold Electronics Corp. in Philadelphia, have come into West Virginia and under the name of the Fairmont Television Cable Corp., in Fairmont, and the Clarksburg Television Cable Corp., in Clarksburg, have built a network offering a closed-circuit television service to these communities with programs from the Wheeling, Pittsburgh, and Johnstown stations." J. H. Whitney & Co. has no interest whatsoever in the Jerrold Electronics Corp. of Philadelphia. Jerrold Electronics Corp. is a company organized to manufacture, install, and service community antenna television equipment. Mr. Shapp personally has a minority equity interest in the Fairmont Television Cable Corp. together with J. H. Whitney & Co., among others, including several residents of Fairmont and the surrounding areas. The Fairmont residents have participated substantially in the financing of Fairmont Television Cable Corp. and, in addition to being stockholders therein, are represented on the board of directors of that corporation. Moreover the company is managed by local people of the highest reputation in the community. Notwithstanding the fact that the television stations in Wheeling, Johnstown, and Pittsburgh might not be expected to provide sufficient signal strength to serve Fairmont, there are 3,500 to 4,000 residents of the area, more than twice the number of subscribers to the community television service, who receive television service from these stations utilizing their own antennas, thus providing substantial and effective competition for the Fairmont Television Cable Corp. In considering the impact of the community television system on Station WJPB-TV, it should also be borne in mind that as of May 28, 1954, Fairmont Television Cable Corp. had 1,492 subscribers rather than the "several thousand subscribers" specifically alleged in the above-mentioned statement. It is further to be noted in this connection that on the June 21, 1954, issue of Broadcasting-Telecasting magazine (p. 112) that a claim of 34,500 sets within the service area of the Fairmont station is made on the basis of information furnished to the magazine by the station. Also, in an article published in a Fairmont, W. Va., newspaper, the Times, on May 30, 1954, announcing that Station WJPB-TV had affiliated with the National Broadcasting Co., it was stated that 27,000 homes are equipped to receive the channel 35 signal in the Clarksburg-Morgantown-Fairmont area. If the claimed potential sets in the service area of Station WJPB-TV approaches either figure, it would seem doubtful that a community television system numbering approximately 1,400 subscribers could constitute a serious economic threat to the existence of the station. A point was made in the subject statement of the fact that the Fairmont Television Cable Corp. advised its subscribers that it would be able to transmit to them the signals of WJPB-TV when it came on the air in Fairmont and of the fact that 2 days after the station commenced broadcasting the community television company discontinued the transmission of that station's signals. Some further data in connection with these facts might be helpful to the sub-committee. Prior to the time that WJPB-TV went on the air, various newspaper announcements sponsored by the station advised that the station would re-broadcast the signals of station WT!TV in Pittsburgh, whereupon the Fairmont Television Cable Corp. advised its subscribers that it would discontinue transmission of the signals of the Pittsburgh station during the broadcast hours of WJPB-TV and that it would transmit the signals of the local station during that period. Since a single conversion could be made of the channel 35 signals to a VHF channel at the antenna site, eliminating the necessity for subscribers to the antenna service to convert their VHF sets for UHF reception, they were so advised. Station WJPB-TV did not broadcast the full schedule of the Pittsburgh station as had been represented. Within 2 or 3 days several hundred complaints were received from the subscribers to the service of the Fairmont Cable Corp., regarding their failure to receive the Pittsburgh station. More specifically, WJPB-TV went on the air March 28, 1954, and by March 31, 1954, the general manager of the community television system had received 417 tele-
phone calls requesting restoration of the Pittsburgh channel. Accordingly, it was concluded that the Pittsburgh channel should be restored. Since that time a pool of the approximately 1,400 subscribers of the system seeking to ascertain the majority preference of signals to be received over the Fairmont community system shows that a substantial majority desire the Pittsburgh, Wheeling, and Johnstown service. Since the system is not technically capable of transmitting the signals of more than three stations, Fairmont Television Cable Corp. has found it necessary to abide by the requests of its subscribers.

To the extent that there is an implication in the statement which has been submitted to the subcommittee that the service furnished by Fairmont Television Cable Corp. had not been anticipated by the permittee of station WJPB-TV it might be noted that the community television system was operating and providing television service to initial subscribers in Fairmont as early as May 19, 1953, 6 weeks before station WJPB-TV received its construction permit on July 1, 1953.

It has been the experience of the Jerrold Electronics Corp. that the community television service substantially benefits UHF broadcasting. Community television systems are bringing UHF service to many areas where it would be otherwise impossible for the stations involved to serve because of geographic as well as other technical limitations on coverage. There are attached hereto two appendixes showing the added potential coverage of several UHF television stations made possible by community television systems and a list of community television systems utilizing Jerrold community television equipment which distribute UHF television signals.

The situation which has arisen at Fairmont, W. Va., resulting in the Fairmont Cable Television Corp. finding it necessary to discontinue transmitting the signals of that station, is very unfortunate and the community television industry as a matter of policy constantly seeks to avoid such situations by attempting to cooperate fully with local stations in those few cases where community television systems and a television station exist in the same community. It has been and continues to be the policy of the Fairmont Television Cable Corp. to cooperate to the fullest extent possible with station WJPB-TV.

The foregoing is for information for the subcommittee.

Very truly yours,

MILTON J. SHAPP, President,
JERROLD ELECTRONICS CORP.,
By E. STRATFORD SMITH,
His Attorney.

**Senator CHARLES POTTER,**

**Washington, D. C.**

**Dear Senator Potter:** Just a short note from the Hoosier State and, although the writer is not one of your constituents, he feels that he is next door to that. At any rate, note that you are heading a hearing regarding UHF and VHF television and wanted to add my small voice to what we hope Congress will not do. This is not to decrease the power of the pioneer VHF stations nor their antenna heights because of only one important factor to this writer, i. e., these stations are the only ones that can give the public in rural areas, such as the writer lives in, a good and usable signal all of the time.

Miss Hennock’s suggestion that all television move to the ultrahigh band would mean that millions in the rural areas would be without this marvelous medium.

In another vein, your opinion expressed at the end of the McCarthy-Army hearing was most apt and lucid.

Yours sincerely,

**PHILIP S. JOHNSON.**

**ANGOLA, IND., June 21, 1954.**
Hon. Guy M. Gillette,
Senate of the United States,
Senate Office Building, Washington, D. C.

My Dear Senator: June 13, the day Senator Potter's committee resumes hearings on UHF and its many problems, may well be "D" day—down-the-drain day—for UHF unless that committee takes immediate action.

There are at least two things that should be done at once in fairness to UHF as a system and in fairness to the thousands of investors who have bankrolled the 127 UHF stations now on the air and in fairness to the millions of viewers who have invested a lot of money in sets. Finally certain things should be done to assist UHF to preserve for all Americans, those now living and those yet unborn, a free and competitive TV system. There are no two ways about it, most of us are in a bad spot.

We suffer from several disadvantages. Some are inherent in the system, some are present because we are starting a new system in an area already equipped to some degree for an older and in some respects better system. UHF in the present stage of the art does not get out as far as VHF. Out of the 30 million sets in the hands of viewers only some 2 or 3 million are equipped for UHF and the cost of conversion, which so far hasn't been too well done, is high—I mean anywhere from $35 to $75 or $80 a set. Because VHF goes farther, has its audience established, it has been hard to get network affiliations. I still have none, although I am hoping for NBC any day.

On the other hand VHF stations have done what all of us would do—they have not been interested in helping us—rather they have hoped we would die on the vine—and have held on tenaciously to all network affiliations they could.

If we are to live, a little pump priming is in order. First, priming of the pump—remove the Federal tax from all UHF-VHF sets. Leave it on the VHF sets only. This works no hardship on VHF but does help us and we need this help. Second, in order to retain a license have the FCC require stations in UHF-VHF areas to divest themselves of all but one network if there are UHF or VHF stations in the area that wish network service and have none. This would be a big leg up to UHF stations and would also be a help to the networks, while it would not injure the VHF stations. In fact, I can think of one VHF now prosperous that may need this help as badly as I do within a matter of a year.

To bring these matters into sharp focus and to secure the instant action needed, I would be in favor of a temporary cessation of all licensing activities until these matters are worked out—this hiatus should also apply to power, antenna boosts, and issuance of construction permits.

Please see what can be done. We need help.

With best wishes, I am Yours very truly,

Edward Breen, President.

Hon. Charles Potter,
Chairman, Subcommittee on Communications
Senate Interstate and Foreign Commerce Committee,
Senate Office Building, Washington, D. C.

Dear Senator Potter: The American Farm Bureau Federation since the inception of radio has taken great interest in broadcasting with particular emphasis on seeking the type of operation that would insure adequate coverage to rural areas.

We are somewhat familiar with the proposals being advanced by some of the UHF broadcasters. Farm Bureau has long-standing policy favoring laws and regulations which would encourage and promote broadcasting service to the more remote rural areas. This means that we oppose regulations or laws that would to all practical purposes, limit or prevent the providing of service to such areas.

American Farm Bureau Federation,
Further limitations of tower height and power to VHF stations would limit service to rural areas. In fact it may prevent some rural areas from ever receiving service even though such areas could receive service if a station were located strategically within it, because the economy of that area would not be able to support the kind of facilities required to provide such service.

We hope the committee will not propose the enactment of any legislation which to practical purposes would prevent rural areas from receiving adequate television service.

We respectfully request that this letter be made a part of the committee record in regard to this subject.

Sincerely yours,

JOE BETTS, Legislative Assistant.

HUNTINGTON, W. VA., June 24, 1954.

Respectfully urge your earnest endeavor to oppose proposals by UHF group before Potter Subcommittee on Communications which will gravely injure public interest in matter of television program reception. In areas now reached by WSAZ-TV signals, adoption of either major premise of UHF group, to wit, change all television to UHF or restrict VHF coverage to city area, will result in immediate loss of all television reception in 92 out of 102 counties of West Virginia, Virginia, Kentucky, and Ohio. Counting all presently authorized facilities including those not yet built, television will be lost to receivers in 34 counties of West Virginia, lost in 39 counties of Kentucky, lost in 8 counties Virginia panhandle, lost in 11 counties southern Ohio. All present stations operating or authorized will provide service to only 10 of these 102 counties if proposals are allowed. This serious blow to your constituents in these counties must not be allowed, only to serve selfish interest of few distressed operators. Map illustrating problems in mail to you. Earnestly request problem be returned for consideration of FCC technical staff.

Respectfully,

LAWRENCE H. ROGERS,

Radio-Electronics-Television Manufacturers Association,
Washington 5, D. C., June 29, 1954.

DEAR SENATOR POTTER: Since my testimony on May 19, 1954, before the subcommittee, later witnesses have made two suggestions which would directly affect manufacturers of television sets and upon which I would like to comment.

The first suggestion was that the subcommittee should seek an opinion from the Attorney General looking toward antitrust exemption for manufacturers of television sets who agree to make only television sets that contain all-channel tuners. In effect, the suggestion is that the Attorney General should issue a clearance in which he would consent not to enforce the antitrust laws against manufacturers of television sets insofar as those laws would apply to such an agreement. Even assuming that the Attorney General has the authority for such an action and would consent to a suspension of the antitrust laws, I think it would be a serious mistake for the subcommittee to suggest that it be done.

The basic purpose of the antitrust laws is to preserve free competition. The members of this industry are in full sympathy with that objective and believe that the antitrust laws are a necessary and valuable part of the laws of the United States. This industry, which has been referred to with good reason as being “the most competitive of American industries,” adheres to both the spirit and the letter of the Federal antitrust laws. As I stated in my previous testimony, “We believe that a system of free competition is best for the public in the long run.” In short, we believe any weakening of the application of the antitrust laws is contrary to the best interests of the American public.

A second proposal which was suggested to the subcommittee was that the power of Congress to control interstate commerce should be used to prohibit the
interstate shipment of any sets that are not all-channel receivers. We believe that acceptance of the suggestion and exercise of such a power by Congress would be an abuse of Federal power, would mean the intervention by Government in the regulation of the manufacture of television sets and would be of doubtful constitutionality. Each of these consequences in itself is ample justification for rejection of the suggested action.

The manufacturers of television sets are aware of the serious problems confronting many broadcasters today. We are vitally concerned in the economic well-being and healthy growth of television broadcasting and hope that these problems can be solved so that growth can continue. But under no circumstances do we believe that it would be proper or desirable to solve the problems by carving out exceptions to the antitrust laws or by imposing Federal regulation on the manufacture of television sets.

We respectfully request that this letter be made a part of the record of the hearing.

Sincerely yours,

GLEN McDaniel, President.

ADDITIONAL STATEMENT OF PAUL R. Bartlett, President, KFRE

Gentlemen, already in the record of this hearing is a statement of KFRE (California Inland Broadcasting Co.) made by its president, Paul Bartlett. The statement was prepared before the commencement of the second session of the hearings, and KFRE now desires to augment the statement in the light of testimony given at further sessions of the proceedings.

In its original statement KFRE dealt almost entirely with the private equities involved in the current UHF-VHF dispute; whereas, this statement is intended to deal almost exclusively with the public policy aspects of the problem. We believe it obvious that where public interest comes in conflict with private interest, the Congress and FCC are obligated to find in behalf of the larger public good. This belief does not mean that private equities ought to be ignored, but suggests rather that arguments based on private equities should only be compelling against arguments similarly based.

Because there would already appear to be in the record a plethora of arguments indicating that the public interest and national policy would not be served by a freeze restricted further VHF grants at this time, or by moving all television to the UHF frequencies, further discussion of these two points by us seems unnecessary here. Sufficient it to say, with respect to these two proposals, we wholeheartedly and vigorously endorse the CBS position as outlined so succinctly in the comments of Dr. Frank Stanton.

On the other hand, the record is almost wholly silent on certain aspects of the UHF-VHF intermixture problem, while many statements in the record on this subject show fuzzy and contradictory thinking. Consequently, we shall address ourselves hereafter largely to the public-policy aspects of the present intermixture allocation system.

We believe intermixture of UHF and VHF channels in the same cities is not bad but good, and that the policy of intermixture was wisely adopted by the FCC as the only national policy which can assure the Nation a fully competitive television system capable of meeting the national needs over a long period of years. We believe this to be true without regard to any of the economic difficulties or private injustices which would arise from any attempt to invoke what has been called deintermixture at this time. Although we agree that even if the original policy had been unwise, it is both too early and too late to change it now.

Thus we disagree utterly with the CBS position on intermixture. Let us examine the reasons for the basic wisdom of intermixture.

Separation of the country into UHF and VHF only cities would foster the growth of two separate noncompatible television systems in this country.

If, as every witness in these proceedings has seemed to indicate, the national goal is to have every television receiver in America capable of receiving every television station in the country, it is obvious that intermixture of the two types of facilities in the same cities will hasten the achievement of the goal. It is likewise axiomatic that separating the country forever into two types of television cities will make the goal almost impossible of attainment. If there were no UHF stations allocated to New York City or its environs, UHF conversion would not be the problem it now is in New York—instead, it would be impossible. On the other hand, the present allocation which provides for one educational UHF
The chaos and inconvenience possibility will often result in the universal use of railroad cars capable of using both gages. And, likewise, in television only the need for all listeners to have all-channel sets will bring eventual complete conversion and its benefits.

We submit that the additional time required for the Nation to reach this utopian point is not too big a price to pay for a fully compatible, fully competitive, nationwide television system.

II. Separate UHF-VHF city allocations would lead to waste of the natural resource represented by the VHF channels. The cochannel and adjacent channel problems incident to any allocation plan preclude the use of more than seven channels in any given closely confined area. Thus it will be found that attempts to create all-UHF or all-VHF cities will often result in the arbitrary placement of one or more valuable VHF channels in cities not geographically or economically capable of providing useful service with these facilities.

The situation in central California brings this problem into the sharpest possible focus. Seven UHF stations have now been on the air for some months, and those in Fresno, Stockton, and Sacramento have no current VHF competition, although VHF channels are allocated to those cities. Consequently, conversion to UHF in some of these areas is virtually 100 percent. If, for the purpose of creating idealized all UHF markets, the California central valley cities of Fresno, Sacramento, Bakersfield, and Stockton were to be allocated only UHF stations, 4 of the 5 VHF channels so released would be virtually wasted because they would be technically unusable in the populous southern California or San Francisco Bay areas. Reassigning them to small towns, which couldn't possibly support any station, might satisfy the planners and make a pretty picture on a map. It wouldn't put many pictures on television sets. It would seem completely ridiculous to throw four valuable VHF channels out the window and deprive the public of service where conversion is already complete. One would ask, are we seeking more service or less competition?

We believe that engineering studies would reveal numerous other situations of similar character where the reassignment of one or more VHF channels would result in having to find places for them in markets where they would never be used. Do we now have so many of these valuable VHF channels that we want to throw some away?

III. Elimination of intermixture will also eliminate competition or the possibility of future expansion for both commercial and educational stations.

The New York metropolitan area is now allocated seven VHF channels (including the one in Newark) and two UHF channels, one of which has been reserved for education. If these two UHF channels were to be removed to make New York an all-VHF city, one of the present commercial channels would have to be converted to educational use or the largest city in the world would be without an educational channel. The same situation obtains in the Nation's third largest city, Los Angeles, which, like New York, is an educational center.

Even if we assume there is no need for an educational channel in these cities both markets would be permanently limited to seven commercial stations. The
fact that they do not comfortably support seven now would not provide justification under our growing society for limiting them to that number for all time. Here again we may ask, are we seeking more service or less service and less competition? Why shouldn’t viewers in San Francisco, Chicago, New York, Los Angeles, and other cities be entitled to more stations when and if there is risk capital to build them? This expandability of the service for more than seven stations in a given area cannot be had in any proposed VHF only city. All proponents of de-intermixture obviously intend that the major markets will remain VHF only. How anomalous to have a maximum limit of 7 commercial and educational stations assigned to New York and Chicago and the possibility of 19 or 15 UHF stations in some hamlet.

Only complete intermixture will provide for maximum expansion and maximum competition in television with all attendant public benefits of the widest program selection.

IV. Separation of the country into UHF and VHF only markets, either originally or at any later date, can only be predicated on economic considerations.

No one can logically argue that governmental regulation of natural resources is unnecessary or undesirable, whether these resources be radio frequencies or trees in our forests.

But there are many who will argue as we do that Government attempts to regulate the use of these natural resources should not be predicated on attempts to “equalize competition,” but rather on the desire to make the fullest possible use of the resources for the public good.

In this proceeding so are every argument advanced for de-intermixture advocates this change in allocation in order to equalize competition. Even Dr. Stanton urges a study of de-intermixture for the very reasons he himself condemns in his convincing attacks on moving all television and in opposing a freeze. To turn his own example around, instituting de-intermixture would be like ruling that only DC-7’s can serve some cities and only DC-6’s may serve other markets. Or again, like saying that no one should be permitted to build a service station on the best corner in town because the other three corners at the intersection are not also available to service-station owners. Does CBS really believe all airlines serving a city should be required to use the same type aircraft, or that service stations should be on side streets in one town and on the main street in another? And, if so, how is public policy served by this arbitrary and unnatural restriction proposed wholly for economic reasons?

When CBS argues that television should not be moved to UHF just to create equality of facilities and then claims that separate UHF and VHF markets should be created solely for that purpose, it would seem to want to walk on both sides of the street at the same time.

If there are those UHF supporters who argue that UHF and VHF are not sufficiently dissimilar in their characteristics to render these examples appropriate, then one may ask why either service should be protected against the other.

The plain fact seems to be that the FCC in its original allocation plan attempted to create a pattern that would make the greatest number of television services available to the greatest number of people in this land without regard to economics except to assure a sufficient number of channels to provide for full competition. In a free enterprise system, this is as it should be and is the basic reason for the soundness of the present allocation.

So far our comments have assumed that the commonly held belief is basic propagational differences between VHF and UHF channels is true. Yet not one of the basic reasons for retaining intermixture is predicated on an inherent difference in the channels.

If it be true, as we believe, that VHF channels will provide greater coverage by virtue of their propagation characteristics, then there is yet another compelling reason for retaining VHF channels as presently allocated on an intermixed basis, which is that some areas because of topography will never receive good service without the use of one or more VHF channels. Mr. Pierson in his VHF group presentation and others of that group pointed this up.

In the Central Valley of California where seven UHF stations are already operating there are numerous foothill and rural areas where set owners are still awaiting the commencement of the few VHF stations allocated there because they do not now have adequate service from present UHF stations. This is true despite the fact that the Central Valley is widely claimed by UHF enthusiasts to be “ideal for UHF” and a place where there is no difference between the 2
types of coverage, despite the use of nearly half a million watts by 3 of the stations.

De-intermixture here will leave many people with no service. Worse yet, the viewers so abandoned live in the isolated areas where radio and television are their primary ties to the metropolitan areas. What crime have they committed to deserve such abandonment?

Let us now turn for a moment from the philosophy of allocation to some of the practical aspects of de-intermixture.

In our earlier remarks we said it is both too early and too late to attempt de-intermixture now; too late because too many public and private interests have been staked on the present allocation plan and attempts to change the ground rules now would create uncertainty and disquiet that would seriously affect the health of the whole industry and prove to be upsetting and unpopular with the public; and too early because less than half of the stations authorized since the last change of rules have completed a full year of operation. So far no UHF station has yet achieved the maximum power authorized by the Commission. Only after maximum power has been reached by UHF stations and only after other UHF and VHF stations now under construction or still in hearing have come on the air will it be possible to fully assess such problems as may then remain.

Even a recommendation from the committee to the FCC to study deintermixture or any other change in allocation before sufficient time has passed to allow full development of the industry on the present plan would prove to be a highly unsettling influence on every aspect of the business.

In summary, we believe that complete intermixture of UHF and VHF channels in the same cities is essential to the fullest development of television in this country and that the pains so far experienced by this Gargantuan of the communication industry are only growing pains—not indicative of serious disorders.

---

WONE AND WIFE-TV,
SKYLAND BROADCASTING CORP.,
Dayton, Ohio, June 21, 1954.

Senator Charles E. Potter,
Senate Office Building, Washington, D. C.

My Dear Senator Potter: The Dayton Daily News, which is owned by the same interests who own WITO-TV, and the only other daily newspaper in this city, the Journal-Herald, carried the enclosed story last night. It in effect states that Leonard Reinsch attempted to repudiate testimony which I recently gave before your subcommittee.

Therefore, I shall appreciate this letter being made a part of the record of the UHF hearing.

I respectfully suggest your subcommittee take the following steps:
1. That it call me back before the subcommittee and under oath request me to affirm every single statement which I previously made before the committee. At the same time Mr. Reinsch should be required to follow the same procedure. If the committee does not desire this, then I suggest Mr. Reinsch and myself be requested to furnish sworn affidavits that our testimony was the truth. It will then be up to the Department of Justice to ascertain what part of my testimony was false.

2. I further respectfully suggest your subcommittee send its investigators to Dayton, Ohio, and have said investigators make a thorough investigation of all the facts that brought about the closing of WIFE-TV. If this is done I believe your committee will have the full facts of why not only WIFE-TV, but practically all UHF television stations in these United States are failing. I think the true facts will be startling to Members of the Senate whose duty, in my opinion, is to represent all the people of these United States.

3. If the committee does not desire to send its investigators here, I suggest you request the Federal Communications Commission or the Department of Justice to conduct this investigation.

No matter what decision your committee may reach as a result of the UHF hearings, at least one good thing has come out of it which, in my opinion, justifies the time and expense involved. It is that for the first time in my more than 20 years in this business many of the little people have found the courage to testify openly before the elected representatives of the people regarding some of the
conditions that exist in this business. Heretofore the little people in the broadcasting business have always had a fear of challenging the special interests in broadcasting.

In conclusion, please allow me to say the shocking manner in which the failure of UHF stations apparently has been ignored up to this time has led me to formulate plans, which I hope will be successful, to organize for the first time, to the best of my knowledge, a Citizens Broadcasting Committee in each of the 48 States to try and see in the future that the American people have a voice in the use of their airways. It is my intention to attempt to do this job through all types of civic and cultural groups, such as unions, churches, schools, and many other types of organizations. If this can be accomplished, then the day, in my opinion, of special interests dominating broadcasting to the detriment of the people will be brought to an end.

I attach the true facts pertaining to our inability to carry the University of Dayton basketball games. I stand ready to respond at my own expense to comply with any wishes of your committee.

Very truly yours,

RONALD B. WOODYARD.

STATEMENT REGARDING WIFE-TV'S EFFORTS TO TELEVISE UNIVERSITY OF DAYTON BASKETBALL GAMES

I wish at this time to give you the entire facts regarding the inability of WIFE-TV to televise the University of Dayton basketball games. Early last spring Mr. Louis G. Froelich, commercial manager of this station, contacted Rev. Charles L. Collins, S. M., chairman of the athletic board of the University of Dayton, and informed him we desired to televise all of the University of Dayton basketball games and asked for the rights charges on these games. Various stockholders of our company, who are directly and through financial help active in the University of Dayton affairs, also contacted people at the university in an effort to have WIFE-TV televise these games. Various members of the athletic board of the University of Dayton, who had this decision to make, were contacted in an effort to secure the televising of these games. At this point I would like to state that the sports editor of the Dayton Daily News is a member of this athletic board.

After many months of earnest effort on the part of stockholders and officials of WIFE-TV we were informed the university would not permit the televising of all their basketball games. The reason given was that it conceivably could effect the next year's sale of tickets. This naturally caused considerable controversy in this community on the part of some very loyal supporters of the University of Dayton.

Under heading of July 18, 1953, Father Collins wrote a letter to our station in which he offered all Dayton television stations the right to bid on only 4 basketball games out of a total schedule of 16 home games. Naturally, this decision could only please the VHF stations in this city, since they were already carrying all four networks' programs. We did not accept this offer, because we knew we were the only television station in the city that could televise all these basketball games and felt this was merely a gesture of appeasement.

In an effort to keep good faith with the University of Dayton we then agreed to underwrite any deficiencies in box-office returns caused by our carrying the entire basketball games' schedule. This was rejected by the university officials. In this connection it is interesting to note that WHIO-TV, which carried the services of ABC, Du Mont, and CBS, did not choose to carry a single one of the four games offered.

Since Mr. Reinsch has taken exception to my testimony, according to the newspaper article which appeared in the Dayton Daily News, I respectfully suggest that if Mr. Reinsch is called back to testify under oath before this committee, he explain how he justifies their determined and successful effort to take the basic CBS and the bulk of ABC and Du Mont programs in this city. There is no doubt in our minds why WIFE-TV failed. I hope at some time we have the opportunity to state under oath the full story of the ruination of WIFE-TV and why this great metropolitan city is now, and apparently will be for future years, serviced by only two VHF stations, which in turn means a denial of full television service to the people of the great Miami Valley.
1128 STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

UNITED STATES SENATE,
COMMITTEE ON POST OFFICE AND CIVIL SERVICE,
June 25, 1954.

Hon. Charles E. Potter,
United States Senate, Washington, D. C.

Dear Senator Potter: The enclosed material has come to me from Mr. Lawrence H. Rogers of Radio Station WSAZ and Television Station WSAZ-TV. I would appreciate it very much if this were made part of the record of your subcommittee so that the subcommittee may have this information available to it.

With kindest regards, I am
Sincerely yours,

John Sherman Cooper.

EXPLANATION OF MAP

Shaded area represents counties in which WSAZ-TV and/or other television station service is received at present. All shaded areas would lose all TV service now in effect or now authorized but not yet started if UHF proposals are adopted. Following breakdown of service is noted.

1. In Kentucky only 1 county (Boyd) out of 40 shown would continue to receive any service from only 1 station (WSAZ-TV). Present or immediately imminent service is received in some or all of these counties from stations as follows: 3 in Louisville, 3 in Columbus, 2 in Dayton, 1 in Huntington, 1 in Charleston, probably 1 in Oak Hill, as well as possible signals from Knoxville and Johnson City.

2. In Virginia none of 8 counties shown would continue to receive any existing service from Huntington, Roanoke, Bristol, Knoxville, or Johnson City.

3. In West Virginia 34 out of 41 counties would lose all existing service or service from stations in immediate prospect. Only 7 counties not shaded would continue or be able to receive service from WSAZ-TV Huntington, WCHS-TV and WKNA-TV Charleston, WOAY-TV Oak Hill, WBLK-TV Clarksburg, WJPB-TV Fairmont, WTAP-TV Parkersburg, and WSLS-TV Roanoke. In addition, severe loss of coverage would injure northern panhandle viewers of WTRF-TV in Wheeling and eastern panhandle viewers of stations in Washington, D. C., and Cumberland, Md. These are omitted since they were not inside area under immediate consideration.

4. In Ohio 11 out of 13 counties listed would lose all television service, and a 12th, Washington County, would receive only fragmentary service. Lawrence County (Ironton) would receive only minor coverage from WSAZ-TV. The great Scioto County area would be entirely without television service. These 13 counties now receive signals from WTRF-TV Wheeling, WSTV Steubenville, WTAP-TV Parkersburg, WCHS-TV Charleston (under construction), WSAZ-TV Huntington, as well as 3 stations in Columbus, and 3 stations in Cincinnati.

Nothing in the proposals before the Potter Subcommittee would make service via television to these shaded areas either technically or economically feasible. They would serve only to eliminate a present service which is growing daily more adequate and more highly competitive.

Respectfully submitted.

WSAZ, INC.,
Lawrence H. Rogers II,
Vice President and General Manager.

(Exhibits in official files of committee.)

Hon. John Sherman Cooper,
United States Senate.

Respectfully urge your earnest endeavor to oppose proposals by UHF group before Potter subcommittee on communications which will gravely injure public interest in matter of television program reception. In areas now reached by WSAZ-TV signals, adoption of either major premise of UHF group, to wit, change all television to UHF or restrict VHF coverage to city area, will result in immediate loss of all television reception in 92 out of 102 counties of West Virginia, Virginia, Kentucky, and Ohio. Counting all presently authorized facilities including those not yet built, television will be lost to receivers in
34 counties of West Virginia, lost in 39 counties of Kentucky, lost in 8 counties Virginia Panhandle, lost in 11 counties southern Ohio. All present stations operating or authorized will provide service to only 10 of these 102 counties if proposals are allowed. This serious blow to your constituents in these counties must not be allowed, only to serve selfish interest of few distressed operators. Map illustrating problems in mail to you. Earnestly request proposal be returned for consideration of FCC technical staff.

Respectfully,

LAWRENCE H. ROGERS.
WSAZ, Inc.

MARINETTE, WIS., June 24, 1954.

Hon. Charles Potter,
United States Senator, Washington, D. C.

DEAR SENATOR POTTER: I am sending you the attached brochure, which describes the area that will be served by station WMBV-TV operating on very high frequency (VHF) channel 11. WMBV-TV should be of special interest to you, Senator Potter, for we will be covering a great part of the Upper Peninsula of Michigan.

WMBV-TV expects to be in operation some time around the middle of August, and because we will cover so much of your own State's area, it is my hope to have a special message from you telecasted on our opening day. However, we will be in contact with you and your office on this matter as soon as we are more definite on our opening.

Our company, Senator Potter, has invested over a half million dollars in the hope that WMBV-TV will be able to bring new television enjoyment and serve the public interest in our area in every adequate fashion. Within recent weeks, hearings have been held before your committee, and I noted these meetings were concluded Monday night, concerning the ultimate status of the ultra high frequency (UHF) channels. I have learned that on June 28, your subcommittee will hold an executive session to even further consider the UHF matter.

Because of WMBV-TV's situation, I would like to go on record with you in my capacity as general manager and secretary-treasurer of WMBV-TV, to urge your support of the very high frequency position, a feeling based on the following conclusions.

(1) WMBV-TV opposes the elimination of the intermixture of VHF and UHF stations in the same market.
(2) WMBV-TV opposes the allocation of all television broadcast services to the UHF band.
(3) WMBV-TV opposes any reduction or limitation beyond the coverage of VHF stations beyond that now imposed by FCC regulations.
(4) WMBV-TV opposes a freeze on the further issuance of permits and on authorizations to operate pursuant to outstanding permits.
(5) WMBV-TV opposes the so-called Du Mont proposals.
(6) WMBV-TV approves the encouragement of the production and distribution of UHF-VHF receivers by lifting of the excise tax.
(7) WMBV-TV approves the use of booster stations within a television station's own area where it is found by the Commission to be technically feasible.
(8) WMBV-TV feels with respect to the proposals made to the subcommittee that involve highly complex, technical, social, or economic consideration, or that cannot be fully evaluated at this point because of the lack of empirical knowledge or that require much more careful study or research than is possible even in your proceedings. We recommend that such proposals be referred to the Commission by the subcommittee without recommendation.
(9) WMBV-TV favors the adoption and continuance by the Commission of lawful procedures that will design to establish at the earliest possible date, a comprehensive national television system by the elimination of time consuming procedures and unnecessary redtape.

May I hope that this letter will personally reach you, Senator Potter, and that you will find my comments and feelings of some value in your deliberations on this question.

Cordially,

JOSEPH D. MACKIN,
General Manager, Station WMBV-TV.

(Exhibits in official files of committee.)
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

WSAZ AND WSAZ-TV,
Huntington 18, W. Va., June 23, 1954.

HON. CHARLES E. POTTER,
Senator from Michigan, United States Senate, Washington 25, D. C.

MY DEAR SENATOR POTTER: Having spent all last week in attendance at the hearing of your Subcommittee on Communications, I should like to take the liberty of commending you for your calm deliberation and patient interest in all of the testimony presented by all sides of the controversy. Additionally, I should like to thank you personally for the privilege of presenting written testimony into the record together with the rest of the VHF station group.

Listening to the proposals presented to your committee for a week was necessary in order for me to bring into sharper focus the possible immediate effects of such proposals on the immediate area now being served by WSAZ-TV. Also, they gave me a better opportunity to present facts which I feel were definitely, if not deliberately, misrepresented about the WSAZ-TV situation. With this thought in mind, I am enclosing an exhibit which will demonstrate the results of eliminating the widespread coverage of VHF stations which seems to be so greatly feared by a relative handful of marginal operators but which, nevertheless, are providing the service to the public which has caused them to take so avidly to television in a short span of 5 years.

The enclosed map shows in outline form those areas in four States where the WSAZ-TV signal is now reached in some form. It does not indicate an area where only this signal is reached for, indeed, there are perhaps 30 television signals now serving various parts of this area. In the normal course of events within the next 2 months, there will be no parts of this area that do not receive two or more highly competitive services with the exception of eastern Kentucky.

In effect, a restriction of the output of the VHF stations covering this area, and briefly they number, 1 in Huntington, 1 in Charleston, 2 in the Wheeling area, 1 in the Roanoke area, 1 in the Bristol, Va., area, and a multiplicity of them in Columbus, Dayton, Cincinnati and Louisville, will not add anything to anyone's television service from a public standpoint. Instead, it will destroy a service for probably more than a quarter of a million home viewers who have made extremely expensive installations in order to get the reception of any signal in the extremely rough terrain.

Realizing that this is but a minute part of the overall problem, if indeed it is a problem, I thought it served as graphic illustration that might well be applied to the entire Nation, how the hysterical proposals of a few unhappy men could deprive 90 percent of a geographical area of its existing, perfectly satisfactory service. These proposals would not help a single UHF operator in any of these areas under consideration since it is my information that those present operators in Charleston, Parkersburg, and Fairmont are making good progress and expect momentarily to turn the corner for success—if they have not already done so.

I sincerely appreciate the opportunity to get this additional information into the hands of the committee and assure you that my company stands ready to offer any assistance in the matter of upgrading the service via television to the public of this four-State mountain area.

With sincere best wishes,
Respectfully yours,

LAWRENCE H. ROGERS.

EXPLANATION OF MAP

Shaded area represents counties in which WSAZ-TV and/or other television station service is received at present. All shaded areas would lose all TV service now in effect or now authorized but not yet started, if UHF proposals are adopted. Following breakdown of service is noted:

1. In Kentucky, only 1 county (Boyd) out of 40 shown would continue to receive any service from only 1 station (WSAZ-TV). Present or immediately imminent service is received in some or all of these counties from stations as follows: 3 in Louisville, 3 in Columbus, 2 in Dayton, 1 in Huntington, 1 in Charleston, probably 1 in Oak Hill, as well as possible signals from Knoxville and Johnson City.

2. In Virginia, none of eight counties shown would continue to receive any existing service from Huntington, Roanoke, Bristol, Knoxville, or Johnson City.

3. In West Virginia, 34 out of 41 counties would lose all existing service or
service from stations in immediate prospect. Only seven counties not shaded would continue or be able to receive service from WSAZ-TV, Huntington; WCHS-TV and WKNA-TV, Charleston; WOAY-TV, Oak Hill; WBLK-TV, Clarksburg; WPJB-TV, Fairmont, WTAP-TV, Parkersburg; and WSLS-TV, Roanoke. In addition, severe loss of coverage would injure northern panhandle viewers of WTRF-TV in Wheeling and eastern panhandle viewers of stations in Washington, D. C., and Cumberland, Md. These are omitted since they were not inside area under immediate consideration.

4. In Ohio, 11 out of 33 counties listed would lose all television service, and a 12th, Washington County, would receive only fragmentary service. Lawrence County (Ironton) would receive only minor coverage from WSAZ-TV. The great Scioto County area would be entirely without television service. These 13 counties now receive signals from WTRF-TV, Wheeling; WSTV, Steuben- ville; WTAP-TV, Parkersburg; WCHS-TV, Charleston (under construction); WSAZ-TV, Huntington; as well as 3 stations in Columbus, and 3 stations in Cincinnati.

(Exhibits in official files of committee.)

Nothing in the proposals before the Potter subcommittee would make service via television to these shaded areas either technically or economically feasible. They would serve only to eliminate a present service which is growing daily more adequate and more highly competitive.

Respectfully submitted.

WSAZ, INC.,
LAWRENCE H. ROGERS II,
Vice President and General Manager.

UNITED STATES SENATE,
COMMITTEE ON FOREIGN RELATIONS,
June 25, 1954.

Hon. CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
Interstate and Foreign Commerce Committee,
UNITED STATES SENATE, WASHINGTON, D. C.

Dear Mr. Chairman: I have received a telegram from Mr. A. J. Mosby, manager of TV station KGVO of Missoula, Mont., which reads as follows:

"Respectfully urge you call Senator Potter and urge support of the VHF position. A television freeze now would wreck us as we have tremendous investment about ready to take the air. Thanks for your support."

(Signed) A. J. MOSBY, KGVO-TV."

I would appreciate your giving Mr. Mosby's views every consideration during your hearings on the television industry.

With best personal wishes, I am
Sincerely yours,

MIKE MANSFIELD.

CONGRESS OF THE UNITED STATES,
HOUSE OF REPRESENTATIVES,
WASHINGTON, D. C., JUNE 25, 1954.

Hon. CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
Interstate and Foreign Commerce Committee,
UNITED STATES SENATE, WASHINGTON, D. C.

Dear Senator Potter: Many of my constituents in the area of Lake Charles, La., are alarmed at the possibility of retroactive action in regard to the previously approved use of channel 7 by TV station KPLC at Lake Charles, La.

After formal approval was given to the owners of this station to begin operations, they have procured land and equipment involving the cost of many thousands of dollars. Construction has been under way for some time and this station should be operative in the very near future. I have assured the owners and my constituents who have appealed to me in this instance that I felt sure that your subcommittee, or you as chairman, would certainly never act in such extreme fashion as to cause unduly the loss of as large an amount of money as
they have invested in this station and, more important, to deny the many thousands of persons throughout southwest Louisiana acceptable television service which they could not otherwise receive.

I do appreciate the fine work that you and your committee are doing in protecting the interests of the American public and I shall greatly appreciate it if you could at an early date give me indications which I could pass on to my constituents which will assure them of having this previously approved service without modification.

With kindest personal regards, I am

Sincerely yours,

T. A. THOMPSON,
Member of Congress.

WFMZ-TV—WFMZ (FM),
PENN-ALLEN BROADCASTING CO.,
Allentown, Pa., June 24, 1954.

Hon. CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
Committee on Interstate and Foreign Commerce,
United States Senate, Washington 25, D. C.

DEAR SENATOR POTTER: Inasmuch as the time for rebuttal arguments in the open hearings on UHF-VHF television was expended entirely by counsel for the UHF Coordinating Committee and the UHF Television Association, respectively, we would like to presume upon the courtesy of your committee in allowing us to present our further views by means of this written statement.

First, may we explain that WFMZ-TV is not a member of either of the UHF groups. Prior to the hearings we listened carefully to the views of these groups and found that on some fundamental points we could not, as a matter of conscience, ally ourselves with them. We refer specifically to the matters of “Government loans to distressed UHF operators” and “the immediate imposition of a freeze on television grants and construction permits.” This is not meant as criticism of these groups for both presented excellent arguments seeking the common objective which we all hold, namely, the oft-repeated phrase, “a nationwide, truly competitive television system.” We hope your committee understands our decision to present our views independently, for we felt we could do so better by exercising complete freedom of thought and judgment unfettered by compromise to group agreements.

After listening to every witness in every session of oral testimony and after reading all available testimony submitted in writing for the record we have come to the conclusion that no honest person could come out of this hearing holding the identical views with which he entered it. For the president of a great network down to the president of a small company like WFMZ-TV in Allentown the views and facts presented were an education. No one could fail to learn something about the other side of the problem that he did not appreciate before—no one, with any humility, could help but wish he could retract some perhaps intemperate statement which he had made to illustrate a point. With so many industry leaders present the effect of this hearing in this respect alone will be greatly beneficial to the cooperation needed in carrying out whatever recommendations your committee may feel is necessary to achieve the desired objective for nationwide television.

We would estimate that fully 50 percent of the testimony submitted on both sides dealt with the question of financial injury to individual operators. As great as this aspect is in a personal way to those affected (certainly including ourselves) we would like to repeat what we said before in making our presentation namely, that “We think it pertinent but not material to this controversy who utilizes what channels but that all channels necessary to a nationwide, truly competitive system be utilized.” [Emphasis added.] We were gratified to hear and we commend the chairman’s statement that “The primary consideration of Congress will be to find ways and means to give the best possible television service to the public without trying to especially protect the interests of VHF or UHF broadcasters.” If this goal prevails, these hearings, so mengerly publicized except in the trade press, will be of great historical moment, for no one can guess except with underestimation the importance that a proper television system now has and will have to the greatness of this country.

We would like to comment briefly in rebuttal to certain points made in reference to the WFMZ-TV proposals.

1132 STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS
1. Mr. Pierson, representing the VHF informal group, incorrectly referred to our proposal on power and antenna heights as limiting grade A service areas for VHF stations to a 20-mile radius. He pointed out that this was not feasible or practical in many areas of the country. He produced 4 witnesses in oral testimony (all from rural, sparsely settled areas) to illustrate his point. Practically all of the other VHF operators in written testimony also attacked this proposal to limit power and antenna heights on the same grounds.

We respectfully call the attention of the committee to our testimony on page 11 in which we said, "At the very heart of the UHF problem, we believe, is the excessive power and antenna heights granted to existing VHF stations, especially in major markets. It is our proposal that the Commission first enter into a rulemaking proceeding which would in effect fix new antenna heights and power requirements for VHF stations, looking toward confining the influence of each signal to roughly its own metropolitan district area. This should not be a blanket requirement fixed by zone 1, 2, or 3 as is now maintained in the sixth report plan, but upon a market-by-market basis. Such a plan as we now propose would suggest that in the heavily populated areas of the Northeast grade A and grade B contours would be considerably less than, for example, in the Far West, where perhaps even greater power and higher antenna heights than those now allowed should be granted." [We have added the emphasis.]

The committee will recall that, in illustrating our proposal with the use of maps and overlays, that we specifically pointed out that the 20-mile radius for the grade A contour was an "arbitrary one" and used to illustrate only—since we did not have the preparation time to draw circles recommending a market-by-market basis, a prescribed mileage radius for each and every station.

However, we will, if the committee requests it, undertake to do just that—although we feel the FCC, with its personnel and facilities, is better able and better qualified to perform this task. It is not insurmountable.

2. We would now like to address ourselves to the letter to the chairman from Mr. Chris J. Witting, president of the Westinghouse Broadcasting Co., Inc. Mr. Witting, incidentally, up until a few months ago was director of the Du Mont television network.

Mr. Witting, as I mentioned to the committee when questioned on this letter by the chairman, was forewarned about our testimony. We are sorry that we perhaps did not make ourselves clear in the preview session because he very obviously misunderstood the whole proposal.

Our proposal did not in any way advocate eliminating all overlap among all stations. Quite the contrary—we specifically pointed out that the Allentown-Bethlehem-Easton area was one market—traditionally, socially, economically—and that, under our plan, it would receive at least four grade A signals allocated within its own market. Even with the suggested 20-mile limitation on the grade A service of the Philadelphia VHF stations, residents of the Allentown area could avail themselves of the fringe area reception of those VHF stations if they felt they wanted to (which thousands did in the earlier years of television before institution of high powers and high towers).

This application is equally true of the Hagerstown, Md., example used by Mr. Witting. If the committee will look once again at the illustrations we used—the maps and overlays—it will see that Hagerstown residents will not suffer from lack of service—at least four UHF signals will be available as well as fringe area VHF service from Washington and Baltimore.

The purpose of our proposal was not to eliminate all overlap, but to limit the grade A blanketing of so many secondary markets capable of supporting local television by VHF stations in major markets. Its objective was and is to eliminate, insofar as it is technically possible, intermixture of VHF and UHF service in the same markets.

Elimination of intermixture—or "de-intermixture" among VHF and UHF stations has been endorsed (with however varying degrees of enthusiasm) by all the four networks.

We believe this step is the only one which can technically be accomplished within perhaps a 3- to 6-month period and would, by itself, provide the first key to the survival of UHF.

3. In regard to the removal of all television to the UHF, we would like to substantiate our statement on page 7 of our testimony which reads, "Once the objective is set—the goal defined—the engineering slide rules can turn out the technical answers to make it work."

For the past month we have been in touch with a group which is one of the foremost allocation and propagation teams in the country. For its own reasons
the company has asked us not to reveal the sources of our information now, but that we can make to your committee the statement that a nationwide, competitive system in the UHF band is possible, and that preliminary studies just completed prove this contention beyond doubt. We are sure that if this committee recommends that such a shift to UHF is indicated, the expert knowledge of this firm would be put at the committee's disposal.

In conclusion, we reiterate that we gained much new information from the testimony given at these hearings. As a result we would like to suggest amendments to steps 1 and 3 of WFMZ-TV's 3-point plan.

1. Power and antenna heights
   (a) That the suggested intention of the cutback on powers and antenna heights be proposed for such period of time as to enable the development of UHF equipment to much more equally match the service of VHF. When such a time comes, a determination then can be made as to the adequacy of the service being rendered to the people of the United States, and if determined inadequate for the best television service possible, consideration can then be given for the reinstatement of higher powers and higher antenna heights.
   (b) That implementation of the principle of eliminating excessive VHF overlap may be accomplished in many markets by the relatively simple application of directional antennas. This would allow, in instances where necessary and desirable, for increased coverage in one direction while protecting the service area of another market in the opposite direction. In some cases even the application of "antenna beam-tilt" might be all that is necessary.
   (c) The use of booster or satellite stations was not mentioned in our previous testimony. We think there are many applications of this principle which would be highly desirable and we would like to amend our testimony to include the judicious use of boosters and satellite stations wherever, in the public interest, this is desirable for the adequate service of more people.

2. Gradual evolution of all television stations to the UHF band
   As the result of hearing and reading other testimony, it appears to us that, if engineering predictions are correct, retention of the VHF band to service wide, sparsely settled areas might indeed be desirable. It should not be difficult for the FCC to define those areas where vast and difficult terrain renders the ultra-high frequencies less efficient to give proper service.

   The fortunate aspect of this solution is that in practically all areas where such VHF service might be needed, there is no scarcity of VHF channels—in contrast to the geographical areas in the United States where population density and proximity of cities and towns will not allow a competitive situation using only VHF channels.

   With all the sincerity at our command we wish to endorse the chairman's statements at the conclusion of the hearings. We, as one company, now feel assured that whatever action the committee recommends will be for the express interest of this Nation and its people. We also want to wholeheartedly endorse the statements referring to the integrity and sense of public service on the part of the Federal Communications Commission. We, in our judgment, think the majority erred in its sixth report concepts, but we respect them highly.

   And, in a final word, may we commend the work of Mr. Nicholas Zapple in handling the many difficult ramifications that this hearing entailed. His demonstration of neutrality and his courteous and willing help to all witnesses deserves the thanks and admiration of all concerned.

   Thank you for allowing us to make what we earnestly hope has been some small measure of contribution toward greater enlightenment on this most important problem.

   Respectfully submitted.

   RAYMOND F. KOHN, President.

Senator Potter. I would like the comments of the Federal Trade Commission on S. 3095 made a part of the record; also correspondence from Senator Andrew F. Schoeppel; Knox La Rue, KTVU, Stockton, Calif.; Raymond F. Kohn, WFMZ-TV, Allentown, Pa., William L. Putnam, Springfield, Mass., and a technical report of an experimental investigation of engineering aspects of a UHF booster installation.
FEDERAL TRADE COMMISSION,
Washington, April 23, 1954.

Hon. John W. Bricker,
Chairman, Committee on Interstate and Foreign Commerce,
United States Senate, Washington 25, D. C.

My dear Mr. Chairman: This is in response to your letter of March 10, 1954, requesting such comments as the Commission might care to offer concerning S. 3005, 83d Congress, 2d session, a bill to regulate multiple ownership of television broadcast stations.

The proposed legislation would further amend the Communications Act of 1934 by adding a new section which would require the Federal Communications Commission to deny any application for a television broadcast station license in the event the applicant has interests in other television broadcast stations in excess of limits established by the section.

The subject of licensing television broadcast stations is outside the jurisdiction of the Federal Trade Commission. The bill does not purport to amend any of the laws administered by the Commission, and, if enacted, would not affect its duties and functions. The Commission, therefore, is not in a position to make any useful comment upon the proposed legislation.

By direction of the Commission.

Sincerely yours,

Edward F. Howrey, Chairman.

UNITED STATES SENATE,
Committee on Interstate and Foreign Commerce,
June 30, 1954.

Hon. Charles E. Potter,
Chairman, Subcommittee on Communications,
Interstate and Foreign Commerce Committee, United States Senate.

Dear Senator Potter: You will recall that I stated that John Burton, vice president, business, Cornell University, spoke to me about submitting a statement or rather, a summary of information re daytime operation of radio stations, which he desired to have presented to our committee during the present hearings.

This matter is so important and of such interest that I think it should become a part of the record of our proceedings. Accordingly, I am enclosing to you herewith 1 original and 2 copies of the same, so that the original may be incorporated into the record.

Sincerely,

Andy Schoeppe1.

SUMMARY OF INFORMATION RE DAYTIME OPERATION OF RADIO STATIONS

On February 20, 1945, the FCC commenced a rulemaking proceeding to determine the future status of clear channel and daytime stations which operate on the clear channels.

On May 8, 1947, this proceeding was enlarged to determine the existence and extent of skywave transmissions of these stations during daytime hours.

In both proceedings considerable engineering evidence was presented, and it was generally agreed by the engineers and the Commissioners that the two problems were closely intertwined.

However, on March 12, 1954, the FCC announced that it was proposing to decide the question of daytime skywave without reference to the ultimate disposition of the clear-channel question. In this proposal the Commission asserts that certain interference will result during the period of 2 hours after the sun rises, and for 2 hours prior to sunset. As a result the following has been suggested by the Commission:

1. That eight stations located in New York, New Hampshire, Missouri, Illinois, and Ohio be immediately ordered to curtail their broadcasts during the sunset period.

2. That certain engineering rules be adopted recognizing the interference during the postsunrise and presunset periods of the day and that at a later time a decision be made on whether existing daytime stations be restricted by reducing the hours of their operation.
3. That certain stations now authorized to operate unlimited time be required during these designated hours to alter the manner in which they now broadcast. A series of oral arguments is scheduled to be heard on these subjects during the next 60 days.

If carried to conclusion, this proposal may immediately affect eight stations but may ultimately affect the operation of several hundred daytime only stations. A curtail of the hours of these stations will have a drastic effect on their income, and in some cases will cause a loss of as much as 25 percent of the total revenue. This is particularly true since the hours involved are the most attractive for advertisers. In view of the limited income that daytime stations receive, such a loss of revenue would indeed be serious.

Of greater import would be the loss of service to the public from these daytime stations. In many communities, the only local broadcast service comes from the stations that will be affected. In rural areas these stations, in many cases, provide the only reliable information on weather, news, and vital happenings in the area.

In view of the Commission's recognition in 1947 that the problem of daytime skywave and clear-channel operation are intertwined, it would appear illegal and illogical at the present time to separate the two subjects. This is particularly true since it is hoped that the ultimate decision in the clear-channel case might recognize the great public need for expanding the hours of daytime stations rather than curtailing them.

Dear Senator Potter, Congressmen Moss has contacted me recently regarding my communication to you with reference to his testimony in the UHF hearings and my objections to his testimony. Congressman Moss has assured me of his good intentions in making that testimony, and, because of the nature of his statements, I am willing to accept his word that he made his statements in good faith. I would like to suggest that the charges made in my original letter be disregarded.

I wish to apologize to Congressman Moss for making these charges. They were, however, as I pointed out in my previous letter, based on press reports of his testimony and it appeared to me that such charges were warranted at the time.

The fact remains, however, that Congressman Moss' testimony is still inaccurate. There is, according to my best information, more than a single primary service available to the viewers in the Sacramento area. I submit a letter dated July 2, 1954, written by Robert L. Hammet, the consulting radio engineer whose work is accepted and recognized by the FCC. A copy of this letter is attached. Mr. Hammett, contrary to Congressman Moss's allegations, set forth that there is more TV service available in Sacramento than that of KCCC. I feel sure that Congressman Moss will wish to completely revise his testimony in view of the facts set forth, since his testimony is obviously inaccurate.

Sincerely,

KNOX LA RUE.

Copies for Congressmen Moss and Leroy Johnson.

Mr. Knox La Rue, Station KTVU, Stockton, Calif.

Dear Mr. La Rue: This is in reply to your recent request for a summary of the coverage measurements which were made on Station KTVU.

An extensive series of field-intensity measurements was made by my firm during January 1954 to determine the coverage provided by Station KTVU in the San Joaquin and Sacramento Valley areas. The measurements were made in areas chosen to provide information on coverage of the major centers of population and also to provide supplemental information on the directivity pattern of the KTVU transmitting antenna.

As a result of the above work it was found that Station KTVU provides grade A service, within the meaning of the Federal Communications Commission rules,
to an area within the Central Valley extending from approximately 7 miles north of Sacramento to approximately 10 miles south of Modesto. Grade B service is provided to a substantially greater area.

As you know, the KTVU transmitting plant was designed to give the maximum possible service to the Central Valley. The use of a 12-kilowatt transmitter and a specially designed directional antenna has resulted in an extensive service area. Based on measurements made by the General Electric Co. on the antenna system, the installation has achieved its designed power of 540 kilowatts effective radiation in the direction of Sacramento. Satisfactory television service, grade A or better, is rendered to the major cities of Modesto, Stockton, Lodi, Sacramento, and North Sacramento.

If I can provide you with further information relative to the performance measurements, please feel free to call on me.

Very truly yours,

ROBERT L. HAMMett,
Consulting Radio Engineer.

JULY 8, 1954.

Mr. Knox LA RUE,
Vice President and General Manager, KTVU,
Stockton, Calif.

DEAR MR. LA RUE: This will acknowledge receipt of your letter of June 28, 1954 in which you refer to the testimony of Congressman John E. Moss, Jr., before the Subcommittee on Communications of the Senate Interstate and Foreign Commerce Committee which held hearings on the status and development of UHF television stations.

You request in your letter that Congressman Moss’s “testimony be stricken from the record on the basis that his testimony is unqualified since he has no personal knowledge of the situation in this area.”

This is to inform you that the Congressman’s testimony is in the record and will remain part of the record. However, you can rest assured that the views expressed in your letter will be given full consideration by the committee when it considers the various proposals that were submitted during the hearings.

It should be noted that the hearings were announced on April 7 and all interested parties were invited to testify. The hearings were not completed until June 22, 1954.

Sincerely yours,

CHARLES E. POTTER,
Chairman, Subcommittee on Communications.

KTVU, CENTRAL VALLEYS TELEVISION,

Senator CHARLES E. POTTER,
Senate Office Building,
Washington, D. C.

DEAR SENATOR POTTER: I have been reading with considerable interest the accounts of your subcommittee hearings on the UHF problem. I only wish that I could afford to be there because I certainly have plenty to say about the treatment that we have received from some networks—ABC, to be specific.

I note in the June 21 issue of the magazine Broadcasting-Telecasting an account of the testimony of Congressman John E. Moss, Jr. (Democrat, California). Congressman Moss represents the district including Sacramento, Calif. Congressman Moss is either (1) lying; (2) ignorant of what he is talking about, having, undoubtedly, been coached by the VHF applicants in Sacramento, or (3) he hasn’t been in Sacramento for so long he doesn’t know what is going on. Let us give Congressman Moss the benefit of the doubt and say that he just hasn’t been in his home area for a long, long time. Congressman Moss’ statement, which is so wrong, is that channel 40, KCCC-TV, renders the only primary service to Sacramento. Since December 18, 1953 (we had an election after that—I'd think he would come home for that anyway) KTVU, channel 36, the most powerful station in the United States, licensed for Stockton, Calif., has been providing primary service to Sacramento, Stockton, and Modesto, Calif. Our consulting engineers advise us that we have sufficient signal over Sacramento to be licensed as a Sacramento station or as a Stockton station, hence, Sacramento has two primary services from UHF.

Congressman Moss’ concern about the fact that, on the one hand, people are not buying TV sets because they wish to wait until local VHF goes on the air,
and then, on the other hand, noting that KCCC would not be injured because of wide UHF set circulation already in the market, seems to be a bit contradictory. (Or did his coaching go wrong there again?)

It is true the penetration of sets in the Sacramento area is about 53 percent. I would like to point out, however, that in the past year the number of sets in the Sacramento area, and the Stockton area, too, for that matter, has doubled. All the dealers in this area have sold as many sets in the past year as they sold in the preceding 4 years when they had only a fringe signal from San Francisco to view. Let us suggest that Congressman Moss come home and find out actually what is happening in the area of California he so ably represents.

I would like to ask, altho I am sure that this is completely out of order, that Congressman Moss' testimony be stricken from the record on the basis that his testimony is unqualified since he has no personal knowledge of the situation in this area, judging from what he is reported to have said, and that his testimony is, in fact, untrue.

Sincerely,

KNOX LA RUE,
Vice President and General Manager.

KL:msl
Copies to Congressman Moss and Congressman Johnson.

HON. CHARLES E. POTTER,
Chairman, Subcommittee on Communications,
Committee on Interstate and Foreign Commerce,
United States Senate, Washington 25, D. C.

DEAR SENATOR POTTER: We know the record is closed, but we should like to submit the enclosed clipping for your information. It vividly illustrates the whole thesis of our testimony and especially the overlay exhibit concerning the eastern Pennsylvania area.

The grade A predicted contour which we used in that exhibit was 46 miles, based on procedures as set forth in the FCC Standards of Good Engineering Practices. The 35-county area coverage claimed by this press release greatly exceeds the area which we depicted. This points up how conservative we were in using the 46-mile radius.

The basic question involved here is, "Is it more important to the public interest for WCAU-TV to increase its coverage from 4 million people to 6 million people than it is for Allentown-Bethlehem-Easton, Atlantic City, York, Reading and other markets to have their own television stations, and thus provide the element of local expression to their communities?"

We know you are well aware of the effect these superpower VHF stations have on the development of UHF. We have great faith, as a result of the conscientious and thorough way the hearing were conducted, that if anything should and can be done, you and your committee will not hesitate to recommend it and follow through to see that it is done.

Respectfully yours,

RAYMOND F. KOHN, President.

[Radio and Television Daily, Wednesday, July 7, 1954]

WCAU-TV POWER UP TO MAXIMUM TODAY

Philadelphia—Doubling its coverage area to reach a total of 6 million people, WCAU-TV switches to maximum power today as it starts operating from its new 1,000-foot sky tower. The new tower is the tallest structure ever built in the City of Brotherly Love, twice as high as city hall, announces Donald W. Thornburgh, president and general manager of the WCAU stations. The increase in power to the FCC maximum of 315,000 watts and the change to maximum height brings about a tenfold increase in power. Thornburgh announces, enabling an addition of 2 million to its viewing audience.

The new, more powerful signal will reach a 4-state, 35-county area, with a clear picture to be seen as far west as Lancaster and the Appalachian foothills to the north. New sections of Maryland, and Delaware will be able to receive the channel 10 station, as will the entire southern New Jersey coast.
Construction on the sky tower and a concrete masonry building housing a newly designed 50,000 watt transmitted and a 10,000 watt FM transmitter was begun last March. During the past 2 weeks, WCAU-TV made a series of early morning air tests so that servicemen could check reception. Reports received from New York City, Richmond, Va., Buffalo and other distant points indicated that the station was being received with superior quality and brightness.

**Springfield Television Broadcasting Corp.,**

**Senator Charles Potter,**
*Chairman, Subcommittee on Communications,*
*United States Senate, Washington, D. C.*

Dear Senator Potter: I wish to thank you again for your kind consideration of my testimony and my correspondence with you.

To bring you up to date on what has happened, from our own experience, I would like to send you herewith a letter we received today from the FCC. As you will note this letter was written a month after we wrote. I do hope that your committee will, in some manner, force the FCC to act with considerably greater speed. In this case it has taken them 1 month, apparently, to do nothing.

I hope you will be able to get them to do something much quicker than that. Certainly the evidence that you have at hand indicates that drastic action is urgently needed.

Very respectfully yours,

**William L. Putnam, Treasurer.**

**Mr. Rosel H. Hyde,**
*Chairman, Federal Communications Commission,*
*Washington 25, D. C.*

Dear Mr. Hyde: I am very grateful for the personal attention you have given me in your letter of July 7, however I note that despite the length of the letter you really haven't said anything encouraging.

I realize that you have serious problems to consider regarding television allocations and power limitations, also that there are a lot of other considerations before the Commission, but it would seem to me that it is about time that you began to do something to correct these inequities. There has been a lot of talk, a lot of long letters and vast amount of testimony and no action.

I realize that my requests embody changes of your rules but it is getting rather critical for us, I know, and I wonder what you are going to do and when you are going to do it.

I hope you will accomplish something and that it is not too little, or too late.

Very sincerely yours,

**William L. Putnam, Treasurer.**

**Mr. William L. Putnam,**
*Springfield Television Broadcasting Corp.,* *Springfield, Mass.*

Dear Mr. Putnam: This is in response to your letter of June 8, 1954, regarding a recent application by television station WNHC-TV to increase power. I ask whether this is really necessary in order to permit coverage of the New Haven area and ask that action be postponed if possible because of the serious effect on the operation of UHF television station WWLP.

I am greatly appreciative of your interest in writing me further concerning UHF television and its problems. Commission rules expressly provide for power increases such as requested by WNHC-TV, and the Commission in general has encouraged the operation of all stations with maximum permissible power. Under the circumstances you will appreciate the problem that might arise in the absence of a change of existing policies, from action delaying consideration of that application. However, as you are aware, the general UHF problem has recently been the subject of a hearing now in progress before the Senate Interstate and Foreign Commerce Committee. The Commission is keenly aware of the difficulties affecting UHF broadcasting and in addition to its own consideration of the problem is cooperating fully with the Senate committee. Let me assure you that every effort will be made to find a solution that will permit effective utilization of the UHF television channels.

Sincerely yours,

**Rosel H. Hyde, Chairman.**
STATUS OF UHF AND MULTIPLE OWNERSHIP OF TV STATIONS

TECHNICAL REPORT—PTR-408

An Experimental Investigation of the Engineering Aspects of a UHF Booster Installation

RCA LABORATORIES DIVISION, RADIO CORP. OF AMERICA, Princeton, N. J.

TECHNICAL REPORT

Title.—An experimental investigation of the engineering aspects of a UHF booster installation.

Object.—The object of this project was to examine the use of a booster to fill in the area inadequately covered by the primary station. A complete booster equipment including antennas and amplifier was installed and field tested at Vicksburg, Miss., 35 miles distant from the primary station WJTV, channel 25, Jackson, Miss.

Conclusion.—The measurements and observations of the performance of the booster at Vicksburg successfully demonstrate the feasibility of this method in covering a low-signal area. The project is further confirmation that a good engineering estimate of the e. r. p. required to establish a given grade of service can be made once the topography of the given area is known.

The performance obtained with components of the booster system indicate that there are no major technical difficulties present with the approach used.

This report includes photos Nos. 9166, 9167, 9198, 9189, 9190, 9199, 9200, 9213, 9214.

INTRODUCTION

During the past year there has been an increasing notice on the part of various broadcasters of studies showing that the coverage obtained with the same effective radiated power at UHF was substantially lower than that obtained at VHF. These studies have clearly indicated that the losses caused by hills, trees, and buildings increase with frequency.

RCA has been engaged in a program to examine the use of satellites or boosters to fill in the areas not served by the primary station. The FCC has established definitions of these two terms. A satellite is a low-power transmitter operating on a channel other than the main station channel and receiving the signal by either direct reception, microwave, or cable. A booster is an arrangement of equipment located near the secondary area to be covered, which picks up the signal on a receiving antenna, amplifies the signal, and re-radiates the signal on the same channel by means of an antenna directed toward the required area.

After considering the various possibilities, we decided to experiment with booster operation. This decision was not made on the basis that the booster was superior to the satellite. The satellite operation does not raise any basic technical problems, since standard VHF and UHF equipment could be employed in conjunction with a good receiving system.

The concept of the booster is not new but, to our knowledge, this is the first time that such an operation at UHF has been reported. A VHF system similar in principle was installed and operated by WSM-TV, channel 4, Nashville, Tenn.

After a lengthy study of a number of situations, we selected WJTV, channel 25, in Jackson, Miss., as a likely candidate for a cooperative effort. This station, with an effective radiated power of 17.7 kilowatts, was said to have trouble in covering Vicksburg, Miss., located about 35 miles west of WJTV. The major portion of the town is shielded from the station by a ridge of hills.

A preliminary survey was made in Vicksburg to determine whether there were any receiving sites where a reasonably noise-free picture could be obtained. Several such locations were found.

The site chosen is located in the far northern end of town. The reason for this choice will be discussed later.

It might be well at this point to discuss the general factors which determine the components of the booster installation. The obvious starting point is the
Input power to the booster amplifier needed to obtain a noise-free picture. This, of course, will determine the required power gain of the receiving antenna for known values of field strength. The pattern of the transmitting antenna is determined by the area to be covered. In the case of Vicksburg a pattern was chosen which would roughly provide constant field strength in the required area. This then determines the power gain of the transmitting antenna. We then specify the e. r. p. needed to obtain the grade of service required. This in turn determines the power output of the amplifier and hence the gain, which in turn sets the amount of attenuation needed between the input and output terminals of the amplifier. Severe ghosting of the booster output will occur if the coupling between the receiving and transmitting antennas is sufficiently high. Experiments indicate that the attenuation required to obtain a ghost-free picture should be 15 to 20 decibels higher than the amplifier gain.

An examination of figure 1 will now indicate the reason for the site choice of the booster. The Vicksburg area is approximately at right angles to the radial between Jackson and Vicksburg. The receiving and transmitting antennas are located 100 feet apart on the radial drawn toward Jackson. Consequently the main lobes of the two antennas are approximately at right angles to one another. The coupling between the antennas for this orientation is low. Another factor of importance is that the receiving antennas in the Vicksburg area which are oriented toward the booster will receive minimum interference from WVTW because of their directivity. A similar condition prevails in the Jackson area for those antennas receiving Jackson. It will be realized, of course, that this condition only holds in a general way for the region between the booster and WVTW antennas.

The measurements made at a height of 50 feet in the vicinity of the booster location gave field strengths of the order of 66 decibels (µv/meter). This notation means that the field strength is 66 decibels above a µv/meter. On this basis it was concluded that a receiving antenna having a gain of 100 with respect to a half-wave dipole would give a noise-free picture. As a matter of good engineering one should use a receiving antenna with as high a gain as is practical. For a required power output, the gain of the amplifier is less and hence the requirements on attenuation between receiving and transmitting antennas are less stringent. The power gain of the transmitting antenna as deduced from pattern consolidations was also in the order of 100. A general estimate of the Vicksburg topography indicated that an e. r. p. of one kilowatt would be required to obtain adequate coverage. On the basis of an antenna gain of 100, this indicated that a 10-watt amplifier would be needed. Hence, on the basis of the anticipated input power, an amplifier having a gain of approximately 85 decibels would be required.

### PRINCETON TESTS

The equipment was constructed at Princeton, and the entire system was operated before shipping it to Vicksburg. The primary problems depended on our ability to amplify the picture and sound signals through the same amplifier chain without crosstalk or distortion and obtain the necessary attenuation between the two antennas. The constructional and design details of both amplifier and the antennas are given in subsequent sections.

A measurement of the attenuation between the receiving and transmitting antennas as a function of separation is shown in figure 2. A separation of 100 feet between the antennas was chosen on the basis of this measurement.

The two antennas were then located 100 feet apart and with the same relative orientation as they would have in Vicksburg. (See fig. 1.) Since it was impractical to mount the two antennas on supporting poles, the relative orientation was obtained by rotating the vertical axis of each antenna parallel to the ground. The antennas were connected to the input and output terminals of the amplifier with 1½-inch copper line. A signal generator operating at 537.25 megacycles and suitably modulated was fed into an antenna placed 200 feet from the booster receiving antenna. The output of the signal generator was set to produce field strengths of the value measured in Vicksburg. The amplified signal was monitored and observed with a TV receiver. As was expected, severe ghosting occurred with an amplifier gain of 85 decibels since the attenuation between the two antenna terminals was around 90 decibels. The additional attenuation was obtained by bridging the input and output terminals of the amplifier with a length of RG-9/U cable having the required time delay. The details of determining the time delay are given in appendix 1. The components of the system with the feedback loop shown in figure 3. The essential criteria for the successful opera-
tion of this circuit is that the phase shift versus frequency curve be linear. In order to cancel the coupled signal between antennas, it is necessary to be able to control the time delay, RF phase, and magnitude of the feed-back signal. With this indicated circuit we obtained the necessary attenuation to permit the amplifier to operate with a gain of 85 decibels. Tests were made to assure ourselves that all components were functioning normally. The equipment was then shipped to Vicksburg.

**VICKSBURG TESTS**

The booster site chosen in Vicksburg is shown in figure 4. The receiving antenna was centered on the east face of a water tower which stood on the premises. The tank shown in figure 5 is approximately 30 feet in diameter and 20 feet high, with its center 110 feet above the ground. The transmitting antenna shown in figure 6 is set on a wooden tower 100 feet away on a radial drawn between WJTV and the receiving tower. The center of the transmitting antenna is 30 feet above the ground. The test house containing the amplifier was located at the base of the receiving tower. The antennas were connected to the amplifier with seven-eighths inch Styroflex transmission line. The length of line between the receiving antenna and amplifier was 100 feet and between the transmitting antenna and amplifier, 200 feet. Provisions were made so that the physical orientation of each antenna, both inazimuth and elevation, could be made on the towers.

The measured input voltage to the amplifier from WJTV was 4.2 millivolts which is approximately 10 decibels greater than the voltage obtained for a 50-foot height of receiving antenna. The attenuation between the antennas was around 105 decibels. This made the use of a feedback loop unnecessary since the difference between the required amplifier gain of 75 decibels and the 105 decibels of attenuation is 30 decibels. A feedback loop was inserted in the interest of determining how much improvement could be made on the 105 decibel figure. The test was not successful in that no measurable improvement could be observed. It was concluded that the improvement was masked by the limits of our present measuring equipment.

The transmitting antenna was oriented so that the main beam was directed toward the location indicated in figure 4. This choice was made on the basis that optimum coverage of the Vicksburg area would be obtained for this condition.

In making the field tests, we were interested in determining several important factors. First, a thorough sampling of the field strengths in the primary Vicksburg area for both the booster and WJTV. Second, a determination of critical areas surrounding Vicksburg in which trouble might be expected because of the difficulty in discriminating against the unwanted signal. Third, a determination of the ratio of the desired to undesired signals.

The field strength measurements were made at a height of 30 feet. It is quite likely that the field strengths obtained for typical home installations would be higher than those obtained in this survey but no exact determination of this point was obviously possible.

The field strengths for the Vicksburg area for both the booster and WJTV have been analyzed statistically and are shown in figure 7. The ratio of the two signals has also been analyzed and is shown in figure 8. The conclusions are self-evident. The median ratio of booster to Jackson signals is 23 decibels. This means that WJTV would have to increase its power 200 times in order to achieve the same results as with the booster. The power required by WJTV to obtain the same coverage as the booster for a larger percentage of the locations can easily be determined from the curve. The same curve indicates that the contemplated increase in power of WJTV to 12.5 kilowatts will only recapture about 4 percent of the indicated locations. It is difficult to estimate the grade of service that would be rendered by the booster although it would appear to be grade A. It is well to consider, in light of the field strengths measured for the booster, the magnitude of e.r.p. needed to establish acceptable service in a given area. The free space signal at 2.5 miles is 95 decibels (µV/meter). The median measured field strength for the booster is 70 decibels (µV/meter) which represents a loss of 25 decibels. A pertinent question to ask is whether this loss could have been anticipated from a knowledge of profiles and the density of trees and houses.

A series of profiles extending from the booster through the main part of town is shown in figure 9. Examination of these shows that most of the receiving area is shadowed for the transmitting height used at the booster. This means that in addition to the diffraction loss, that a high loss would be expected for local
obvious was less received. Suppose, however, the signal receiving the booster signal will generally be displaced to the right of the Jackson signal. Measurements were made to determine the ratio of the desired to undesired signal required to receive a ghost-free picture indicate that this value lies between 15 to 20 decibels.

The areas in which we might expect equal field strengths from Jackson and the booster is shown in figure 4. The determination of this region was made by analyzing the data shown in figures 10, 11, 12, 13, and 14. A knowledge of specific receiving antenna patterns is necessary to properly interpret this data. Let us assume that the antenna has a pattern discrimination of desired to undesired signal of 10/1 in voltage. This would mean there would be no area in which the desired signal could not be obtained and that a ghost-free picture could be received. Suppose, however, that the receiving antenna pattern discrimination was less than 10/1. If Jackson were desired, it would be necessary to advance toward Jackson in order to obtain the desired 10/1 ratio of Jackson to booster signal. Conversely, if the booster signal is desired, one would have to move toward the booster. The area between these two contours would then represent a region where neither signal could be obtained free from ghosting. It becomes obvious then that the area in which a picture with a ghost will be received depends upon the individual receiving antenna characteristics.

Another factor of importance is a determination of how the expected field strength contours of WJTV might be affected by the booster. This curve is shown in figure 15 and is based on the FCC F (50, 10) curves for channels 14–88. These curves are conservative in that they are based on an e. r. p. of 1 kilowatt for the booster in all azimuth directions. Even so they indicate that the cochannel interference would not be materially altered since the contours of the booster lie well within those of WJTV. When WJTV increases its e. r. p. the station's contours will be even better protected. The actual contours of the booster would be directly related to the radiation pattern of the transmitting antenna.

THE AMPLIFIER

The decision to use a 10-watt amplifier that carries both sound and picture information presents certain problems. First, there must be negligible cross-modulation between the two signals. Second, the response must be relatively constant over the entire six megacycle channel. Third, the system must have adequate gain to produce normal output—with minimum noise contribution—for the minimum input level. Finally, automatic gain control should be provided to keep the output constant. A further consideration was the complexity of the equipment. Realizing that a simpler, and therefore less costly unit, could be utilized in smaller communities, one goal was to simplify the amplifier as much as possible.

METHODS CONSIDERED

Several different approaches were available. The signal could be demodulated to both video and audio frequencies and then these signals used to re-modulate two separate small transmitters. This would offer the advantages that known techniques could be utilized, the video signals could be subjected to well-known cleaning procedures and phase and amplitude corrections could be applied as desired. The difficulties would involve such things as separate frequency control (which would result in the well-known venetian-blind type of interference in some areas unless certain frequency relations are maintained) and the necessity of providing a sideband filter with its increased cost and complexity.

With regard to the interference problem just mentioned, tests have shown that for two cochannel stations with unsynchronized carriers, the desired signal must

---

1 An Experimental Study of Wave Propagation at 850 megacycles, J. Epstein and D. W. Peterson, IRE, May 1953.
be 34 decibels stronger than the undesired to make the interference just perceptible. If the carriers are synchronized, a difference of 40 decibels is required. If the carriers are offset 10½ kilocycles a difference at 36 decibels is adequate. The above information was obtained with different video information on the two carriers. From very limited observations made at Vicksburg, it appears that for synchronized carriers and pictures—such as is the case with a booster amplifier—the desired signal need be only 20 decibels stronger than the undesired to make the interfering picture just perceptible.

A second approach would be to heterodyne both sound and picture carriers down to some intermediate frequency, amplify, and then rebetaheterodyne the signals back to the original frequencies for radiation. A numerical example of this for channel 25, which extends from 536 to 542 megacycles, would be to use a local oscillator frequency of 583 megacycles. This would heterodyne the incoming signals to an IF channel extending from 47 to 41 megacycles. After amplification this band would again be mixed with the 583 megacycle local oscillator to give the difference-frequency band of 536 to 542 megacycles which is identical to the incoming frequencies. Note, however, that an upper sideband of from 630 to 624 megacycles would be produced. The advantages of this approach are the possibility of using certain standard components; for example, a UHF head-end from a receiver and the IF strip might be modified for such services. Also it might be easier to obtain the required gain at the lower frequency. The disadvantages of this approach are that the extraneous side-band, as pointed out above, must be eliminated from the output and that a high-level mixer would have to be built which carried both the sound and picture signals without producing cross-modulation. The extraneous side-band would be easier to eliminate if the IF frequency were made higher. However, this nullifies the advantage of using available components. The cross-modulation problem is minimized by working with smaller signals. This rapidly leads to the conclusion that several amplifiers must follow the mixer, and therefore there is no advantage to using the double heterodyning process.

The third approach is to use straight amplification at the carrier frequencies. The principle disadvantage to this approach is that nothing can be done to improve the video signal in passing through the amplifier. Therefore, it is essential that any distortions encountered in the amplifier be negligible. Similarly, the system must be sufficiently linear to eliminate any cross-modulation difficulties.

This last method is the one we chose to use. In order to provide a linear system, we planned to use class A amplification throughout. An additional factor which had considerable effect on the design was our interest in building this amplifier as rapidly as possible. This led us to use available power supplies and cavities that had been used previously in a small UHF transmitter. The anticipated system would utilize in cascade a low-noise preamplifier, a variable-gain voltage amplifier, several additional voltage amplifiers (these could use small receiving type tubes), and then two of the available cavities which employed type 6X50A tubes for the IFAn and power amplifier stages. Automatic gain control would operate from the composite output-line voltage to control the variable-gain amplifiers.

**The Low-Level Voltage Amplifiers**

A number of design arrangements for the low-level voltage amplifiers were considered. The method chosen was especially attractive because of the adaptability to operation over the entire UHF band. The interior of one of these amplifiers is shown in figure 16, and the circuit in figure 17. It is a grounded-grid stage utilizing a type 6AN4 tube. The input circuit is not tunable, but the component values have been chosen to make the input impedance very close to 75 ohms resistance over the channel 25 band. The output circuit uses a one-half-wave line with capacitive loading available to tune the lower UHF channels. Output coupling is provided by a series capacitor appropriately tapped on the plate line. This tap point was chosen to give a midband gain of 10 decibels and a band width flat within 1½ decibels over the 6-megacycle channel. The bandwidth of one of these amplifiers is shown in figure 18. The markers are at 1-megacycle intervals. These amplifiers have a noise figure of approximately 12 decibels. The power requirements are 63 volts at 225 milliamperes for the heater and 200 volts at 11 milliamperes (varies somewhat between tubes) for the plate. This unit type construction has proven very desirable to simplify the fabrication and for other reasons which will be apparent later. The subassembly of five of the amplifiers is shown in figure 18A.
The variable gain requirement was something of a problem. In discussing the subject with others, it was evident that TV receiver designers had encountered considerable trouble because the process of changing the gain resulted in a change in band width. Our experience turned out to be the same. However, in our case we were not limited by economics to a single stage as in the case of receivers, and found that by utilizing 2 stages appropriately tuned, the band width remained practically constant over a 50-decibel range. The physical structure of the variable-gain stages is nearly identical to the previously described voltage amplifier. The only difference consists of tying the grid of the tube to a plate which is then bypassed to ground, so that a control voltage can be applied to the grid. The channels used in this case are somewhat wider in order to accommodate this bypass condenser assembly. The gain and band width of these stages are nominally the same as the voltage amplifiers. In operation, the variable gain amplifiers are preceded by sufficient gain so that the noise figure of the overall system will not be degraded when minimum gain is used.

THE HIGH-LEVEL STAGES

As previously mentioned, we had available cavities utilizing type 4X150A tubes in grounded-cathode circuits. As plate-modulated class B amplifiers these units and had a gain of 10 decibels. When we attempted to use them as class A amplifiers, we found they exhibited a gain of 0 decibel even with the grid circuit undamped, so that the band width was very small. Nothing that we tried made any appreciable improvement in these stages. Therefore, we modified the cavities to utilize type 4X150G tubes in grounded-grid circuits. These were tuned up and matched and found to have a gain of 10 decibels and a very reasonable band width. A photo of one of these stages is shown in figure 19. Figure 19A shows the band width obtained with these two stages in cascade. The marker pipes are at 1-megacycle intervals.

With the amplifier assembled utilizing several 6A4 stages and the two 4X150G stages just described, the amplifier could be tuned for adequate band width and gain. However, the last 6A4 stage was not capable of supplying sufficient power to drive the final to 10 watts of usable power. This made necessary another medium-level stage. Another 4X150G stage in a cavity such was being used could have been employed. However, this did not fit into the physical layout already built. This made it desirable to produce a new design, so it was decided to use a 2C39A tube since it is somewhat smaller than the 4D150G and much easier to cool. Unfortunately, for the band width required and with class A operation, we could not obtain a gain of more than 5 to 6 decibels and this was not sufficient. Therefore, a second 2C39A stage was built. The circuitry of these stages follows the 6A4 design quite closely. However, in this case the input circuit was also tuned with a separate variable line. The interior of one of these stages is shown in figure 20 and one of the stages assembled is shown in figure 21. The electrical circuit is given in figure 22.

GAIN CONTROL

To arrive at a general design for booster amplifiers, one cannot predict the amount of gain that will be required. Although a variable gain of 50 decibels is included, there is no assurance that this will cover all contingencies or that it is the best approach. The advantage of the unit construction in this situation is quite evident. Additional gain can be added or the overall gain reduced simply by shifting cables within the amplifier so as to change the number of stages.

In addition to the coarse gain control mentioned, it is also necessary to provide automatic gain control to take care of changes in the incoming signal and gain variations within the amplifier. Originally, we planned to provide manual gain control (for experimenting and adjusting) and both a long time constant peak detector and a short time constant keyed automatic gain control. The development of the automatic gain control circuitry became involved in a series of events that resulted in an AGC chassis that operated quite differently than originally planned. The AGC chassis that was sent to Vicksburg contained a manual bias control and what was labeled a peak and a keyed AGC system. Although unorthodox in design, the peak AGC system operates in a conventional manner. The keyed AGC system however, is not equivalent to what is usually referred to by the term. Usually a keyed AGC system uses a short keying pulse derived from synchronizing pulses to connect a detector to the signal voltage. The detector time constants are such that during the keying pulse the voltage

48550—54——74
is brought rapidly to a value determined by the signal at that time and this voltage is maintained—by a long discharge time constant—until the next keying pulse. In our version, a short time constant detector follows signal variations quite rapidly and the keying pulse produces an output bias voltage proportional to the detector voltage at the time of the keying pulse. This system should be adequate for airplane flutter but would not be satisfactory with high noise-level conditions. Although the evidence is far from adequate, it appears that the signal changes requiring keyed AGC are not present in the Vicksburg installation in an amount sufficient to warrant the inclusion of this type of control.

**POWER SUPPLIES**

Power for the amplifier is provided by three separate supplies. The type 6AN4 voltage amplifiers are all run from the same regulated 200 volt supply. The two 2C39A stages are supplied 400 volts regulated at 80 milliamperes from a second supply. The two 4X150G stages are run from a single 1,000 volt supply, which is unregulated. The PA stage operates at 1,000 volts and 120 milliamperes. The IPA stage is fed through a dropping resistor which supplies 600 volts at 120 ma.

Although it is not known just what will be permitted with regard to automatic operation, certain provisions have been made. A time clock turns the amplifier on and off at preset times. Time delay relays turn on the equipment in the usual starting sequence: that is, filament, low voltage, and finally high voltage. There also is provided an interruption lockout. This brings the amplifier into operation immediately following any short power interruption.

**FINAL ASSEMBLY**

The complete amplifier has been assembled in an RCA Type BR-84 cabinet rack which provides 77 inches of panel space. The front of the amplifier is shown in Figure 23 and the rear in Figure 24. The power supply is in the bottom with the preamplifier and the variable gain amplifier in the shielded box immediately above. This is topped by the two shielded boxes containing additional voltage amplifiers and the two 2C39A stages. Above these are the automatic gain control circuits and the 400-volt regulated power supply. The two 4X150G stages are in the cavities which can be seen in the front view. The automatic operation and starting sequence relays are in the top panel. A total of 16 stages are built into the unit, but only 14 stages have been utilized at any one time. Under this condition, the amplifier is capable of a gain of the order of 100 decibels and a band width essentially flat over 6 megacycles. Some stagger tuning is used to accomplish this. A typical response curve of the amplifier is shown in Figure 25. The tube complement is shown in Figure 26.

The method of constructing the voltage amplifiers in separately shielded units was undertaken at the beginning as a precautionary measure against internal feedback. Later performance has justified the approach. When first assembled, we had trouble with feedback and found it necessary to use double-shielded lines between amplifier boxes. Since we have done this, there has been no evidence of instability in the amplifier. Although there are many tuning controls involved, we have found that with a little experience an operator using a UHF sweeper can align the entire amplifier in about 30 minutes.

**PERFORMANCE**

The booster amplifier was moved to Vicksburg, Miss., and installed there along with the two antennas. As previously indicated, the input signal level was higher than had been anticipated, thus making it possible to operate with approximately 75 decibels gain. To take care of fading or changes within the amplifier, some additional gain was installed, of course. The performance was most gratifying. There was no indication of cross-modulation of either the sound into the picture or synchronization of either the sound into the picture or synchronization into the sound. Test patterns observed with a well aligned receiver directly on the receiving antenna and then on the output of the amplifier showed no appreciable change in resolution or gray scale.

At the start, tests were made on an extremely experimental basis and only manual gain control was used except for short intervals. As the work became more routine, we used the automatic gain control and discovered the first defect in the booster amplifier system. When the equipment was first turned on in the morning, it was found sometimes that the AGC system was inoperative. The
developed bias was zero and gradually returned to normal over a 15-minute interval. During this warmup period the system was subject also to motorboating. These effects were found with both the keyed and the peak AGC systems. Probably this was a result of high humidity and several very high-value resistors in the gain control system. Because of this inadequate performance no details of the AGC system have been given in this report. A new chassis, which will provide only peak detection, will replace the present one as soon as it is available.

Since we were making field strength measurements, it was necessary to determine the peak video power delivered by the amplifier in order to establish absolute values. Through the process of making these measurements we noted another idiosyncrasy of the system. The following is not completely resolved, but it does appear that the gain of the amplifier is a function of the signal level at the input. For example, with just a visual signal and without the aural carrier, the amplifier may put out 16 watts of peak power. When the aural carrier is added, the peak power may drop to the order of 8 watts. This is not due simply to ordinary nonlinearity as this would be evident in the video signal, and would result in cross-modulation. As a result of this characteristic, we were forced to use unconventional means to measure peak power under operating conditions. Several different methods were used and gave inconsistent results. At this time we can only say that the video power of the amplifier at the peak of sync is within 1 1/2 decibels of 6 watts.

Since this experiment was made near the low-frequency end of the UHF television band, the question frequently arises as to whether or not the amplifier could operate at the high-frequency end of the band. We made no attempt to try this, however, the voltage amplifiers should operate throughout the entire band with minor modifications but with somewhat less gain. The coaxial cavities used were not intended to tune over a wide range but the basic design would be useful over the band. The remaining factor is the tube type used in the final amplifier. Since we have had no experience to rely upon, the tube data must be used. This indicates that the tube probably would be satisfactory but would have less gain.

GENERAL ANTENNA DESIGN CONSIDERATIONS

The zigzag type of antenna was used in the design of both the transmitting and receiving arrays because of the simplicity of construction. Basically, the radiator elements consist of a long, single wire bent at half-wave intervals into the form of a vertical zigzag. The plane of this array is spaced sufficiently distant from a vertical sheet reflector so that the line radiates in addition to functioning as a transmission line. Since a phase reversal occurs every half-wave, the horizontal components of the zigzag currents flow in the same direction and the vertical components alternate in direction. Hence the zigzag operates essentially as an array of in-phase, horizontal dipoles stacked vertically to produce a narrow elevation pattern.

A considerable number of experimental measurements have been made on various types of zigzag arrays. Based on this work, a few generalized observations on the design problems follow.

The vertical aperture of the array increases with the inclination angle of the half-wave elements for a given wire length. However, this gives a greater ratio of vertical to horizontal current components, resulting in undesirably large vertically polarized radiation at certain elevation angles.

Conversely, lowering the inclination angle decreases the vertically polarized radiation but reduces the vertical aperture. If the aperture is increased for this case by adding to the wire length, the amplitude distribution along the array falls off rapidly.

The amplitude distribution is also closely related to the spacing between the zigzag and screen reflector. For large spacings and long arrays, most of the radiation occurs from the first few radiators, resulting in poor aperture illumination. For very small spacings, the zigzag is essentially a transmission line with little radiation except near the far end.

Therefore it is seen that a compromise adjustment of the various array parameters is necessary for antennas designed for a minimum number of feed points.

From measurements on various types of zigzags, an element inclination angle of 45° and a screen spacing of approximately one-eighth wave-length have been found to be reasonable design values for antenna bays of about 6 or 8 wave-lengths in height. Although the physical length of each zigzag element is affected
somewhat by the type of standoff insulator used and size of wire, in general the length is within a few percent of a free-space half-wavelength.

For arrays made of such bay sections, stacked vertically, four times the array height in wavelengths gives an approximation of the power gain relative to a half-wave dipole. This value is about two-thirds of the power gain that would be produced by a perfect current sheet of the same dimensions.

THE RECEIVING ANTENNA

Figure 27 shows a photograph of the receiving antenna mounted on its side for field testing. A schematic layout of the antenna and feed network is drawn in figure 28.

Eight zigzag rows spaced one-half wavelength apart are mounted on a reflector screen 8 feet square. Each row is constructed of three-sixteenths inch brass rod formed with 11 right angle bends into a zigzag unit. The individual elements are 10 1/2 inches long, or 0.48 wavelength. The two middle elements are foreshortened to join with the coaxial end-seals mounted on the center line of the zigzag. The rows are supported approximately one-eighth wavelength from the screen by six ceramic standoff insulators.

The four end-seals of each half of the array are joined with equal-length coaxial lines to a 50-ohm matching transformer. These two transformers are in turn joined to a main matching transformer with two equal-length lines. The VSWR of the receiving antenna on the 50-ohm coaxial input line is plotted in figure 29.

The measured elevation field pattern plotted in figure 30 is practically identical to the characteristic produced from an ideal current sheet of the same aperture. From the measured azimuth pattern of four zigzag rows, the azimuth field pattern of the complete antenna was computed (figure 31).

The calculated power gain with respect to a half-wave dipole is slightly more than 22 decibels. The measured power gain of the receiving antenna including the slight loss introduced by the feed network was found to be 20.5 decibels.

THE TRANSMITTING ANTENNA

A photograph (fig. 32) of the transmitting antenna shows the double row of zigzag radiators attached to a steel supporting tube. This antenna, constructed previously for field tests on channel 23, was found to have radiation characteristics broad enough for satisfactory operation at channel 25 by altering the matching arrangement. The schematic diagram of figure 33 illustrates the layout of the antenna and the feed network.

Each row is made of three zigzag bays stacked vertically. The individual bay consists of 20 center-fed zigzag elements constructed similar to those of the receiving antenna.

Improved impedance characteristics were obtained by joining each pair of bays with short lengths of 75-ohm cable to a 50-ohm matching transformer. These three units were joined with three equal-length 50-ohm lines to the main matching transformer. Measured VSWR data versus frequency is plotted in figure 34. The somewhat sharper characteristic obtained is believed to be associated with mutual coupling effects between the two vertical rows, as a greater band width was originally obtained from a single row.

The measured azimuth field pattern is given in figure 35. Because of difficulties connected with obtaining a good measuring setup for the entire 38-foot array, the elevation pattern of only a single bay was measured. From this data, the elevation pattern of the complete antenna was calculated as plotted in figure 36.

The measured power gain of the complete transmitting antenna with respect to a half-wave dipole was found to be 19.4 decibels. This figure includes a cable loss of approximately 0.75 decibel in the feed network.

CONCLUSION

The measurements and observations of the performance of the booster at Vicksburg successfully demonstrate the feasibility of this method in covering a low-signal area. The project is further confirmation that a good engineering estimate of the e.r.p. required to establish a given grade of service can be made once the topography of the given area is known.

The performance obtained with components of the booster system indicate that there are no major technical difficulties present with the approach used.
ACKNOWLEDGMENT

We wish to express our sincere appreciation to the Mississippi Publishing Corp. for its generous cooperation in this project. In particular we are greatly indebted to J. R. Whitworth, chief engineer, and K. Parks, assistant chief engineer, of WJTV for the untiring effort and interest they have given to this experiment.

APPENDIX 1

MEASUREMENT OF TIME DELAY BETWEEN ANTENNA TERMINALS

For any four-terminal network having linear phase shift and constant amplitude the time delay is equal to

\[ t = \frac{d(\beta)}{d(\omega)} = \frac{\Delta\beta}{\Delta\omega} = \text{a constant} \]

where \( t \) = time delay, seconds
\( \beta \) = phase constant, radians
\( \omega = 2\pi f \)

Hence in order to determine \( t \) we must find \( \Delta\beta \) for an incremental change of frequency, \( \Delta f \). The experimental setup for determining these values is shown in figure 37. The signal coupled to the receiver via the space between the antennas is nulled by a signal of the proper phase and amplitude derived from a probe coupled to the matched transmission line. The quantity \( t \) is plotted versus frequency as shown in figure 38. Then the time delay is computed in the following manner:

\[ t = \frac{\Delta\beta}{\Delta\omega} = \frac{2\nu\Delta\lambda}{\lambda} = \frac{1}{2\nu\Delta f} = \frac{\Delta l}{\Delta f \lambda} \]

The time delay for both the Princeton and Vicksburg configuration is 0.445 \( \mu s \).

GENERAL OBSERVATIONS SUBMITTED BY HON. ANDREW P. SCHOEPPEL, UNITED STATES SENATOR FROM KANSAS, IN REFERENCE TO UHF HEARINGS

Television broadcasting in general and the UHF stations in particular need some broad and sound new economic answers to basic problems, not just a stop-gap shuffling of old answers and old mistakes.

I believe it is worth remembering at this time that the original goal of these hearings was to find some practical answers to the acute economic problems of UHF television stations.

That is still our objective, even though in the meantime we have had a liberal education in the whole subject of television broadcasting.
