# ANY SOURCE TO ANY FADER!

## THE AUDIOARTS ENGINEERING D-16 IT LOOKS EXPENSIVE — BUT IT'S NOT!

THIS NEW RADIO CONSOLE from Audioarts combines the benefits of a ROUTER and an AUDIO CONSOLE into one COST-EFFECTIVE digital package, letting you route any input to any fader or to any monitor feed, with all sources clearly shown in bright LED dot matrix displays right above the faders and monitor level controls.

A COMPACT TABLETOP DESIGN, the D-16 has the features you need: both analog and digital PROGRAM and AUDITION stereo outputs, 2 MONO analog outputs, 14 input faders plus 2 caller faders, 4 mic preamps, control room and studio monitoring, built-in cue and headphone amps (with concealed headphone jack) —even four internally generated mix-minus outputs!

WITH 24-BIT A/D and D/A inputs and outputs and sample rate converters on every AES digital input, the D-16 will work with virtually any digital source gear you have. It can run your source machines too (up to eight of them) — all opto-isolated. Its DSP DIGITAL METERING simultaneously displays VU columns and peak hold fullscale digital so you can be assured of pristine performance. Its powerful caller tools generate mix-minuses automatically, and you can program any of its four MXM outputs to be pre or post fader.

And with Wheatstone's extensive digital background and reputation you can be assured that the D-16 is a great console!

### ON THE COVER:

Innovative, practical, affordable, relevant. The Radio magazine Pick Hit Awards, now in their 20th year, recognize the top products that meet these criteria.

Cover design by Michael J. Knust.

*True Sound is...*

- Semi-isobaric design
- Dual 5.25" drivers
- 8.5" x 15" x 8.25"
- 200 watts RMS cap.
- .25" Acrylic construction

The most unique and versatile book shelf speaker available today. The LB-100 utilizes liquid gel technology for increased performance and an outstanding sound. The compact design allows for easy placement in the listening environment. Available in over 35 different colors to choose from. Call us or visit our web site for a dealer near you, or to request a catalog.

THE WORLD'S 1st

# STEREO POTS

## AUDIO CODEC

### Introducing the all new iMix G3

iMix G3 features a brand new super charged DSP platform that combines studio mixing power and new POTS/ISDN/GSM and data codec capabilities never before offered in a 16 x 9" sized remote mixer at such a low price.

The world's first 15kHz stereo POTS audio codec can deliver live stereo remotes or stereo studio links over dual POTS lines. A new Dual Mono feature also enables the use of one 15kHz POTS channel for main program and the second 15kHz POTS channel for a range of on-board IFB including production/engineering talkback and live on-air callers. You can even send your broadcast program to two locations.

A miniature expansion slot accepts a range of new hardware modules to suit individual remote applications such as GSM to landline for wireless remotes, Stereo/Mono ISDN, Stereo or Dual Mono POTS plus new IFB and front panel controlled live on-air caller facilities.

The on-board six input digital mixer can be easily configured for non-technical users or as a fully featured studio mixer including on-off channel buttons, cue, intercom, telephone caller control, LAN/RS232 interfaces and one button control of local and remote control relay inputs "and" outputs. You can even adjust your remote talent's audio input levels from the studio to ensure their levels are always perfect.

An optional Digital Router software kit will allow any of the six audio inputs to be routed to any audio output, giving you the tools to create a powerful and flexible studio environment in the field. iMix G3 will also connect to your existing Comrex\* or Musicam\* POTS codecs.

**Call Tieline or your favorite dealer for a free demonstration.**

## When hi-fi meets Wi-Fi

**T**he classic model of a radio station's operation considers the singular function of providing a source of audio entertainment to a listening audience. Programming is created in the studio and transmitted via the station's transmitter. While this model is still in use today, the singular function can be divided into two separate elements: creation and transmission.

These two functions are actually separate. We have seen this in a small way with Internet streaming. The program material is still created in the same way, but the program stream now feeds a transmitter for terrestrial transmission and a Web server for Internet distribution. With this in mind, single stations can function more like networks by creating the program stream regardless of the transmission scheme.

In time, I expect that radio stations will realize the disconnect between content creation and delivery. The programming will be delivered via alternate means in addition to wide-area coverage of the single transmitter. Cable systems, Internet providers and even cellular telephone networks are only some of the possibilities.

Internet radio has already proved itself as a means of reaching a mass audience. I listen to Internet radio stations quite often. And, like many online listeners, I do it while sitting at my PC. While it has seen some obstacles with content licensing issues, and it has yet to be shown as a viable method of revenue generation, several attempts have been made to market this delivery mechanism in a form that is familiar to radio listeners.

Remember Kerbango? This was an Internet appliance designed to emulate a traditional radio but used to listen to online stations. The product never came to fruition after floundering for a few years before being bought by 3Com and then being officially killed. The Kerbango never shipped. Other products, such as those

from Sonicbox and Penguinradio, had similar functions, but they actually shipped to the market. To my knowledge, none of these were that successful. These were products ahead of their time.

I believe that the main reason for these efforts not making radio history was due to the lack of broadband connectivity in homes. It was available, but not common and rather expensive. Today this has all changed.

With the increased use of home networking, and now wireless home networking, there is a renewed interest in streaming media delivery in the home, not to mention a better chance of it being widely accepted. New products are bypassing the radio-only thinking and moving to media control centers, which are something like boom boxes on steroids. Available and inexpensive broadband connectivity certainly helps, but newer technologies add more freedom and flexibility to the system: wireless networking in the home.

With Wi-Fi connectivity, attached devices are portable within the range of the network. A laptop can access anything stored on the network anywhere around the house. Depending on the configuration, even your neighbors can connect.

Home listeners have access to music stored on the PC or from Internet radio stations. With the concepts introduced by the Kerbango, other companies have introduced the function of a media player with the familiarity of a boom box. A few such systems have been unveiled from Linksys, Philips and Reciva. With downloaded (legally or otherwise) music, ripped music libraries and Internet streams, several listening options are available.

The timing on this comes as IBOC is reaching critical mass. Whether you like IBOC or hate it, the point is that consumer listening is moving ahead. Terrestrial radio needs to move ahead as well, and radio stations need to look ahead to supplemental transmission paths for the future. Digital transmission is the immediate step in that direction. IBOC may or may not be the perfect solution, but with every other form of audio entertainment media moving to enhanced features and capabilities, terrestrial radio runs the risk of being left behind.

# GET IN ON THE ACTION

Delivering the sound of the finish line to listeners around the world is as simple as pressing a button. The Comrex Matrix, equipped with our optional GSM Module, combines an integrated mobile phone and an advanced Comrex codec to deliver broadcast quality 7kHz audio over standard cellular connections (15kHz over POTS).

The results? Your listeners hear the sweat pouring off the winner – the sound of a skin-of-the-teeth victory with detail that's unprecedented.

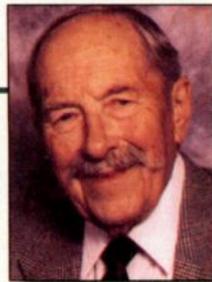

Grab your audience by their ears and give them the full experience – not just a story.

**Doing a remote? Put Comrex on the line.**

## Antenna currents and field strength

By John Battison, P.E., technical editor, RF

www.beradio.com

Anything metallic can be made to carry RF current and to radiate some sort of RF signal. But what quality of signal will it be? It can depend on the construction and size of the tower, as well as the antenna tuning-unit circuits. RF currents induced in a nearby metallic structure can deform a nominally circular radiation pattern and affect coverage in positive or negative ways. While this is going on the RF antenna ammeter may indicate the licensed antenna current, but listeners may be hearing a distorted signal.

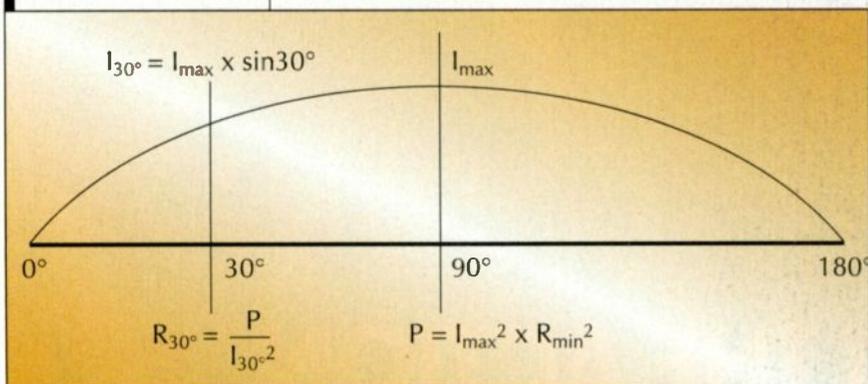

Engineers tend to talk glibly about RF current and field strength in millivolts per

induced in a one meter long wire placed parallel to the lines of flux. This induced shortage results from the movement of the flux across the wire.

Two fields are developed around an antenna. The induction field exists in the immediate vicinity of the antenna, and consists of lines of flux that connect back into the antenna twice each cycle. This is not the field that the engineer generally wants. In fact, it is this induction field that often produces the unwanted effects of high currents or voltages in close by metallic objects. It is a reactive field in which the electric and magnetic fields are 90 degrees out of phase.

The radiation field consists of detached lines of flux that move out as an electromagnetic wave. This is the emission that is of greatest interest to the radio engineer. It is this field that contains the real power because the electric and magnetic fields are in phase with each other. The intensity of this field is inversely proportional to the distance from the antenna, and diminishes far less rapidly than the induction field; this is the radio signal.

If we want to compare developed field strengths we must compare them at the same distance. Originally, engineers used one mile as a convenient distance. This distance is sufficient to be well outside the induction field and provides a good solid measuring signal.

Halfwave antenna showing the relationship between current and resistance.

meter (mV/m) but sometimes we don't get the millivolts per meter that we expect from the power delivered to the antenna. We talk about the antenna resistance, but sometimes the antenna resistance and the radiation resistance are noticeably different. When we supply RF current to our antennas we expect to get a definite return for the power expended. If this doesn't happen it is sometimes difficult to find a reason, especially if it is a nondirectional station.

### Clarity of thought

Sometimes we lose sight of the relationship between current in an antenna and the resulting field strength value. The level of our electric field is measured in terms of millivolts per meter, or volts per meter depending on the requirements. This term expresses the voltage that would be

### What's your sine?

We are all familiar with the normal sinusoidal distribution of current in an antenna. Although, under some circumstances, non-sinusoidal current distribution may have to be assumed because unusual antenna configurations such as top loading can affect current distribution.

The radio engineer is generally most interested in the impedance of an antenna and the real part of this term, which is the radiation resistance. This resistance multiplied by the square of the antenna current tells us the power developed in the antenna circuit.

Much of our broadcast work involves vertical radiators around 90 degrees to 120 degrees of electrical height. We try to measure the antenna current at the base of the tower. It is common practice to place an RF ammeter or other current-measuring device in the output leg of the base-matching network. We then measure the antenna base impedance at this point and use the resistance thus obtained to calculate the power into the antenna.

When we use a bridge to measure antenna impedance, what we actually measure is the antenna impedance (the R term), plus any resistance in the actual antenna connections and structure, and the ground connections and

# Prophet Systems

## If you haven't looked at us lately.

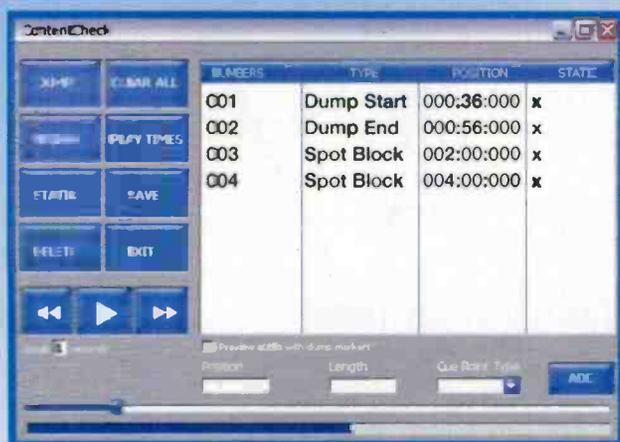

If you haven't looked at Prophet Systems lately, you probably don't know that we've not only reinvented digital automation systems, but we've changed the way stations look at music scheduling, news gathering and content delay systems.

### Here's a revolutionary concept.

How about an automation system that's easy to install, easy to use, and easy to buy. Powerful. Flexible. Affordable. From a company you trust.

### Change is good... why live with outdated technology.

content 

ContentCheck is an advanced content delay system with over 60 minutes of configurable delay time, perfect for today's anti-obscenity climate.

ProphetSales@prophetsys.com

Buying a digital automation system doesn't have to be complicated and expensive. Isn't it time to upgrade your old system to a Prophet?

Be sure to check out our line of broadcast software and hardware accessories. [www.prophetsys.com](http://www.prophetsys.com)

system. Dirty and corroded connections, small-diameter cables and connections that have corroded to small conductors, rusted connections between tower sections and inadequate ground system with damaged ground screen and broken or missing radials will add to the I<sup>2</sup>R losses. Power that should be radiated will be dissipated in heat. Therefore the value of R used as antenna radiation resistance actually consists of R<sub>ant</sub> + R<sub>misc</sub>. The FCC allows a certain amount of system loss to be included in directional antenna operations.

An antenna's measured impedance depends on exactly where along the antenna it is measured. The indicated current in the antenna varies with the measuring location.

Consider the radiation resistance of a half-wave antenna that is about 73.1Ω. This is the value that can be measured at the center of the antenna. However, this is the only position that will produce this resistance. All the other points on the antenna will exhibit a lower current and higher resistance. This can be calculated by multiplying the current measured at the center

by the sine of the distance from the end of the antenna. However, you must specify the reference part of the antenna. This is called the point of maximum antenna current, but it is not always the same thing as the resistance of the driving point of the antenna, which is the point at which we place our impedance bridge.

Remember the textbook introduction to vertical radiators in which a quarter-wave radiator is shown above ground with an image below it? The total length of the real antenna and the image equals one-half wavelength. An antenna one-half wavelength long with one amp at the center will produce about 37.5mV per meter at a distance of one mile from the antenna. The radiation resistance of this antenna is around 73Ω.

If we take half of this antenna, i.e. a quarter-wavelength also with one amp at its base, we shall find about 37.4mV per meter at a distance of one mile. The radiation resistance (the R term in the antenna impedance) will be half of the ideal half-wave dipole, or about 36.6Ω. With 1A flowing the power will be 36.6W.

In terms of millivolts per meter with 1kW power at 1 mile:  
 $37.42 \times \sqrt{1000/36.6} = 196 \text{ mV/m}$

If we increase the power to 10kW, we multiply the field strength at one mile by the square root of the power increase. Therefore,

$$196 \times \sqrt{10} = 196 \times 3.16 = 619.36 \text{ mV/m}$$

# RoadStar™ & NetStar™

On the road or in the studio, deliver perfect stereo via IP or ISDN

Both RoadStar and NetStar come complete with IP and ISDN connections, AAC, AAC Low Delay, MPEG 2, MPEG 3, G.722 and G.711 encoding, and can even send and receive linear uncompressed audio. Both are effortless to operate, with automatic recognition of the calling codec and a built in Web Server for remote control from anywhere. Both give you 8 contact closures and ancillary data. Both can automatically switch from IP to ISDN, or vice-versa, if the primary link becomes unreliable.

NetStar is rack or tabletop mount. RoadStar is portable, with a built-in 4-channel mixer, 48 VDC phantom power, analog and AES/EBU inputs and outputs and a dual headphone monitoring system. Now, you can take your *stereo* show on the road and deliver spectacular audio your way.

## 290 FM channels on the auction block

By Harry Martin

The FM auction initially announced almost four years ago, but postponed four times, is now back on the calendar for Nov. 3, 2004. The auction is described in an April 15 public notice available on the Audio Division's Web page (under "Audio Headlines") on the FCC's website ([www.fcc.gov](http://www.fcc.gov)).

The Commission will conduct the auction in consecutive rounds, with all channels being available to be bid on in all rounds. To bid on a particular channel, a bidder must have made an upfront payment large enough to ensure it has sufficient bidding units to cover the minimum opening bid for that channel. If a bidder wishes to bid on more than one channel in a given round, the bidder must have made an upfront payment sufficient to purchase enough bidding units to cover the to-be-bid-for channels. Here are some examples of how the system works.

- In the Form 175 (auction qualification statement), you specify only one channel that you want to apply for, and the upfront payment for that channel is \$10,000. You submit an upfront payment in that amount. When the auction starts, you can only bid on that one channel, because that is the only one you specified in the Form 175.

- A slight variation. In the Form 175, you specify two channels, each of which has an upfront payment of \$10,000. If you submit an upfront payment of \$20,000, you would be able to bid on both channels in each round of the auction. In fact, you would have to bid on both in each round, because your maximum eligibility would be 20,000 bidding units (based on your total upfront payment of \$20,000), and the rules require that in each round you must be active (*i.e.*, either place a bid or be the standing high bidder from the preceding round) in markets whose upfront payments equal your maximum eligibility. Because you would be able to bid in only two markets (since those are the only ones listed in your Form 175), and because those two upfront payments for those two markets equal your maximum eligibility, you would have to bid in both markets during each round, or risk losing eligibility.

- Suppose in the Form 175 you specify a total of 15 channels, 10 of which have upfront payments of \$10,000 each, four of which have upfront payments of \$50,000 each, and one of which has an upfront payment of \$200,000. You submit an upfront payment of only \$200,000, which gives you maximum eligibility of 200,000 bidding units. During each round of the auction you would have to be active with respect to markets totaling in the aggregate \$200,000. Thus, you could bid on the \$200,000 channel. Or you could bid on all four of the \$50,000 channels. As long as you are "active" in each round in markets having an aggregate upfront value of \$200,000, you remain able to bid, in the next round, with respect to any of the channels you specified in your application.

- In the first two rounds you might elect to bid on the \$200,000 channel alone. Because a bid in that market would exhaust your maximum eligibility, you would not be able to bid on any other markets during those rounds. But let's say that, by the end of round two, you feel that the \$200,000 channel is being priced beyond your limits by other bidders. In rounds three-five, you might then decide to bid on the four \$50,000 markets. Because such bids would again exhaust your 200,000 bidding units, you would not be able to bid on any of the other markets (*i.e.*, any of the \$10,000 markets, or the \$200,000 market) during that round. But let's then say that one of the \$50,000 markets gets priced out of your league by other bidders. In round six, you could then continue to bid on the other three \$50,000 markets, but also place bids in five of the \$10,000 markets.

- By the time you get to round seven, you may have determined that the price for the \$200,000 channel, which you stopped bidding on after round two, really isn't all that high. At that point, as long as you are not the high bidder in any other market you're bidding on, you could jump back in and bid on the \$200,000 channel, even though you had not been active there since round two. But because the \$200,000 value of that market would exhaust your maximum eligibility, you would not be able to bid in any other markets during that round.

*Martin is an attorney with Fletcher, Heald & Hildreth, PLC., Arlington, VA. E-mail [martin@fhhlaw.com](mailto:martin@fhhlaw.com).*

### Dateline:

Radio stations in Illinois and Wisconsin must file their renewal applications on or before Aug. 1. Their EEO program reports and ownership reports are due with the renewals. Also on Aug. 1, stations in Iowa and Missouri must begin their pre-filing renewal announcements.

# OMNIRAX

## BROADCAST FURNITURE

"When I was researching furniture for our new flagship facility in L.A., I looked at all the usual suppliers. We had unique custom requirements and not all of the existing furniture vendors were able to help us. Then someone suggested that I call Omnirax. Upon visiting their facility in Sausalito I was delighted with what I saw. Although a mass production woodshop complete with CNC woodworking equipment, I found them eager to help with our most unique design requirements. I had only some crude sketches of what I wanted, but David Holland at Omnirax took these and in days presented me with full computer renderings of what the furniture could look like from several view angles. After we made quite a few changes over several weeks we had it. I was happy to have found them; working with them was a real pleasure. The studio our interior designers had envisioned became a reality - and all of the technical details had been addressed. I knew when I first saw the first produced furniture I had made the right choice. Our collaboration from design to production resulted in more than I had originally hoped for. Everyone at Entravision is thrilled with the result. I wholeheartedly recommend Omnirax to everyone."

# The Pick Hits of NAB2004

Reported by Kari Taylor,  
associate editor

*The best in show  
from the best  
at the show*

This year's Pick Hit Award winners have more to celebrate than ever before because 2004 marks the 20th year that the Pick Hit Awards have been presented. The Pick Hits are the original technology award from the convention and still the most respected.

The award winners' products, the rules, the judges' comments and a list of the judges are provided on the following pages. The Pick Hits are the only awards that disclose our rules and our judges' names. Note that there is one new addition to the Pick Hits Awards this year. The Pick Hits judges decided, during their selection meeting, that there were some emerging technologies that were implemented in various products that deserved recognition. While the Pick Hit Awards recognize specific product introductions, the panel also wanted to recognize three emerging technologies, which are called the Technology Honors, and recognize the achievements in applying new technology in a broad range of products.

So put on your party hat, eat two pieces of birthday cake and help these winners and *Radio* magazine celebrate the achievements of 2004

2004  
**PICK HIT**

## **IBOC monitor Belar**

**HD Radio Monitor:** This 2RU monitor is designed to decode and analyze AM and FM IBOC signals. The frequency-agile front end can accept signals off the air or through a high-level input for use at the transmitter site. The graphic display provides measured results of the signal and includes basic spectrum analysis. Level metering is displayed as horizontal bar-graphs in percent with a user-select-

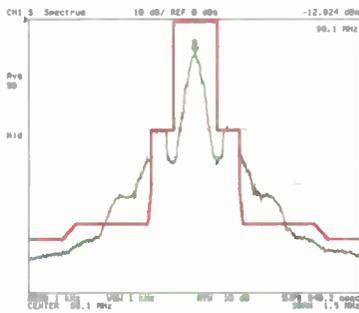

able dBFS level used as the reference. Capability to display SIS data, quality of service information, MPS data and bit-error data are standard. An RS-232 serial and RJ-45 Ethernet connection are included. Belar plans to include firmware update capability.

### **What the judges had to say:**

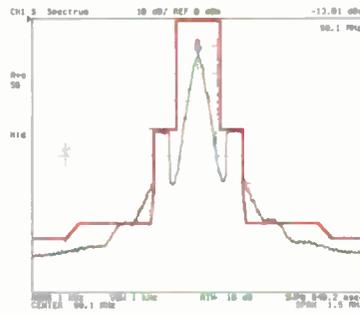

*"A long-awaited device for HD Radio stations"*

*"A must-have for any IBOC installation."*

**Gone.**

## Introducing Nautel's Newest Cutting Edge FM Technology – Digital Adaptive Pre-Correction

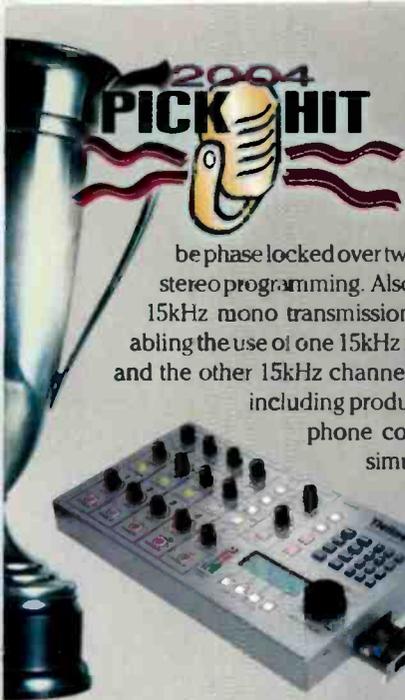

V10 with M50

Worried about not meeting the HD Radio™ mask requirements? After all, you wouldn't want to interfere with someone else's signal. Nautel's new M50 digital FM exciter samples the all-digital or hybrid HD Radio™ output of the V10, 10 kW FM transmitter and dynamically applies digital adaptive pre-correction. This means no expensive external bandpass filter and no additional tuning. Even better, because the M50 continuously monitors and adjusts the RF output, your performance is optimized regardless of environmental changes and your signal will always be within spectral limits.

To learn more about how we can perfect your HD Radio™ signal, visit our website [www.nautel.com](http://www.nautel.com).

**15kHz POTS  
stereo codec  
Tieline America**

I-mix G3: With the I-mix G3, left and right audio channels can be phase locked over two telephone lines to deliver 15kHz stereo programming. Also available is the provision for dual 15kHz mono transmission from a single POTS codec enabling the use of one 15kHz mono channel for program audio and the other 15kHz channel for a range of communications including production/engineering talkback, telephone coupler for live on-air callers and simultaneous 9.6kb/s control data and 7kHz voice. This third-generation design incorporates an expansion slot allowing broadcasters to select from a range of new hardware modules to suit individual remote applications.

The modules include GSM to landline wireless, stereo/mono ISDN, stereo or dual-mono POTS plus new IFB and telephone talkback caller facilities.

**What the judges had to say:**

*"The stereo capability is impressive."  
"Its ability to communicate with other brands of POTS codecs adds to its versatility."*

**Rotating rack system  
Middle Atlantic Products**

WR series: This series consists of a detachable rack frame that is housed in its own protective host enclosure. Installers can roll the rack out and rotate it 60 degrees for easy access to rear equipment connections. Off-site integration and testing of A/V equipment in the detachable rack frame reduces labor and simplifies the installation. The roll out, rotating design of the series saves a minimum of six square feet of space per bay. In addition, the rack system is gangable, allowing installers to maximize room space. Ample laser knockouts on the side of the rack allow ganging of multiple racks and cable pass-through between each. Slots in the upper rack frame accommodate Velcro ties and the rack frame features pre-punched rackrail brackets for built-in cable management.

**What the judges had to say:**

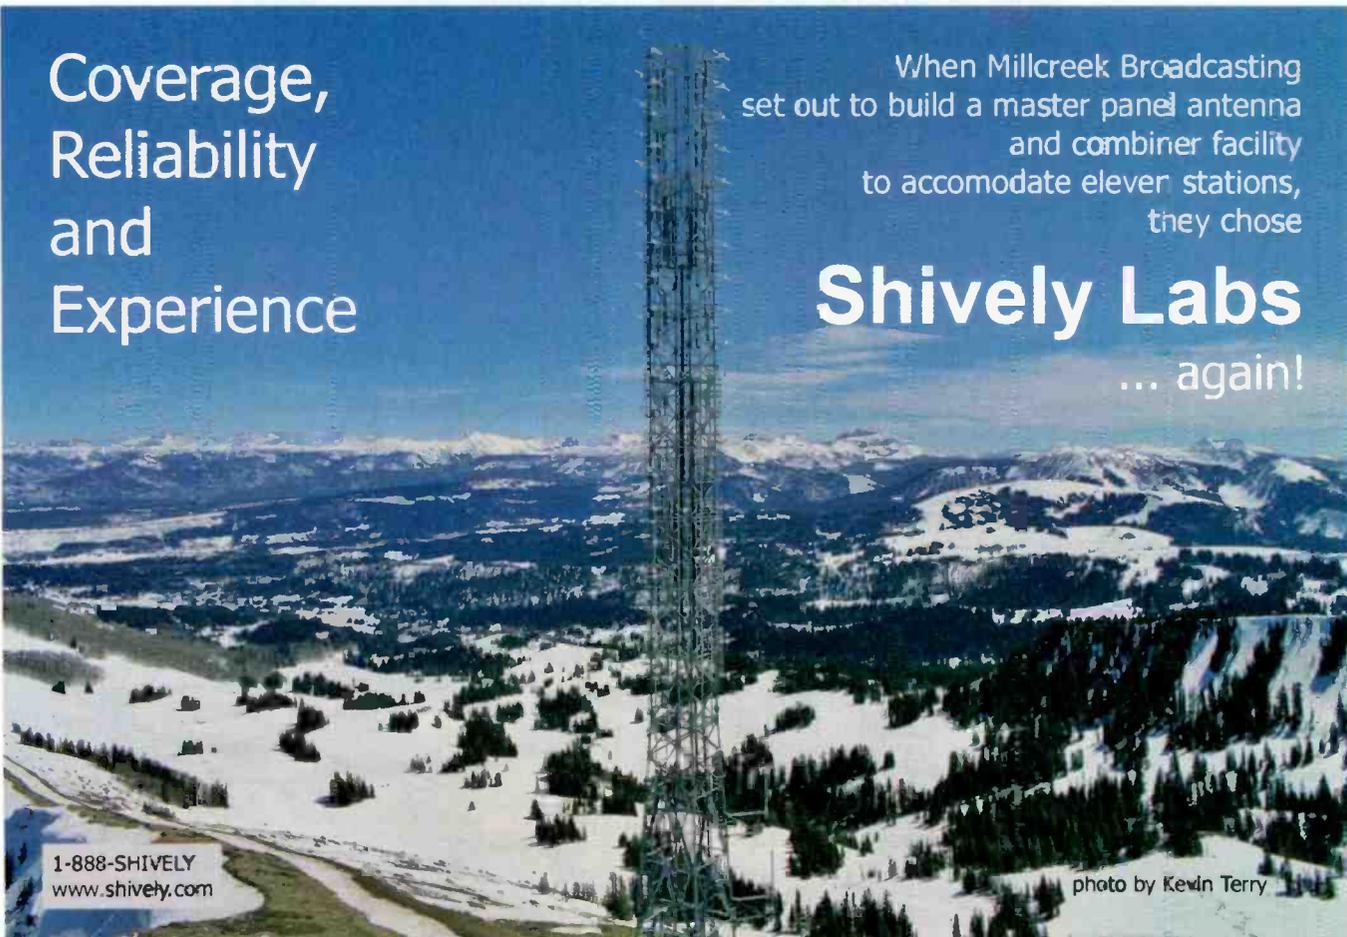

*"A perfect idea for tight installations."  
"This could provide new-found space in an existing installation."*

## 2004 PICK HIT

### Spectrum analyzer

#### Rohde & Schwarz

**FSH3:** This spectrum analyzer provides signal measurements from 100kHz to 3GHz.

The available measurement functions are suited for mobile radio base stations, on-site fault location in RF cables, IBOC measurements or lab applications. It can operate for four hours on battery power, or can operate on an ac supply. As many as 100 traces and setups can be stored in the unit. The analyzer includes software to store, review and compare data.

#### What the judges had to say:

*"A powerful instrument in a small size."*

*"The portability and accessories make this stand out."*

301-459-8800; fax 301-459-2810; www.rsd.de

### Ultra-compact mixer

#### Henry Engineering

**Studiodrive:** This stereo audio mixer fits in the drive bay area of any PC. It features six inputs (one mic and five line), and has on-air and sound card outputs. Sources can be mixed for a live broadcast or recorded and edited on the PC. There is also a built-in telephone coupler, a mix-minus output and provision for remote mic control. The monitor system features automatic muting when the mic is on, plus control of on-air warning lights.

#### What the judges had to say:

*"A good set of mixer functions in a tiny space."*

*"The logic functions and phone coupler make it suitable for use even outside a PC case."*

626-355-3656; fax 626-355-0077; www.henryeng.com; info@henryeng.com

### Web-based remote control

#### Broadcast Tools

**WRC-4:** Providing remote control, this system offers a built-in Web server with non-volatile memory, 10/100baseT Ethernet port, four channels of 10-bit analog inputs with a large monitoring range, TTL-compatible digital inputs, SPST relays, open collector outputs, front-panel status indicators and a single front panel temperature sensor. The product is supplied with removable screw terminals for connections and loaded with a generic Web page that may be edited by the end user. The remote control works with dynamic or static IP addresses. Multiple units may be used with a user-provided Ethernet hub.

#### What the judges had to say:

*"A new and convenient way to access a remote site."*

*"Another clever solution to a common need."*

877-250-5575; fax 360-854-9479; www.broadcasttools.com; bti@broadcasttools.com

## Technology Honor

### Multi-channel IBOC Audio

The continued search for the killer app of IBOC appears to be emerging. While there are audio improvements in the digital transmission over the analog system, it is still considered by many to be a replacement technology and not an enhancement. Multi-channel sound enhances the aural experience for the listener.

Three demonstrations of multi-channel audio for FM IBOC were displayed at the convention. Two were examples of 5.1 surround sound. Neural Audio and Harris showed one system in the Harris booth, while Omnia Audio provided demonstrations of a Fraunhofer encoder in a private suite. In addition, Harris demonstrated the Tomorrow Radio project, which was a partnered effort between Harris, NPR and Kenwood.

These technology applications show the potential flexibility that the IBOC data stream can provide and have been recognized for a Technology Honor from the *Radio* magazine Pick Hits judges.

## AT LAST, A BOARD GEEKS AND JOCKS CAN BOTH DROOL OVER.

Fact is, SAS packs so much sophistication and capability into the depths of the new **Rubicon™** control surface that even the most intensive major market programmer or board operator will swoon. Yet Rubicon is so intuitive, so comfortable, so easy to use, the weekend intern is sure to sound like a pro.

SAS Connected Digital Network™

Rubicon Control Surface  
32KD Digital Audio Router  
RIOLink™ Remote I/O

Here's why:  
Frequently used controls are always right at the operator's

fingertips. And for the power-user, the SAS multi-function "dynamic control matrix" provides quick access to deeper capabilities. In other words, Rubicon has a bucket load of features for the simplest or most complex of broadcast-related tasks.

And should you think form to precede function, you'll find Rubicon's clean, easy-to-understand interface wrapped up within a custom-configured, drop-dead gorgeous frame.

Best of all, Rubicon is engineered by the brand synonymous with the finest in digital audio routing and network design. When it comes to quality and reliability, our name is

**rubicon™**

all over it. Come see for yourself Rubicon's brains and beauty, power and performance. It'll be love at first sight.

**Automated profanity elimination**  
**Enco Systems**

Guardien: This automated profanity elimination and spoken word logging system for radio broadcasters is a two rack-unit device with stereo balanced analog and AES/EBU inputs and outputs. It features contact closures for control of external devices or alert mechanisms. The unit delays and monitors the air signal, looking for objectionable words, and when it finds them, mutes or bleeps them automatically. Then the Guardian logs the event, along with an audio clip, for future reference. The list of objectionable words can be edited and modified manually or through automatic means.

**What the judges had to say:**

*"Its ability to update its own dictionary is amazing."  
 "A highly practical application with the current attention to indecency."*

**RF safety analyzer**  
**Narda Safety Test Solutions**

**Selective Radiation Meter SRM-3000:**

A hand-held selective measuring device for safety analysis of RF and microwave electromagnetic fields, the unit measures the field exposure that is produced by individual services and assesses the results in accordance with the applicable standards. The SRM consists of a basic unit and a measurement probe, which evaluates the results on site. The basic unit contains a spectrum analyzer for the frequency range 100kHz to 3GHz. It can be operated using a triaxial probe from Narda or in combination with measurement antennas. The triaxial probe allows isotropic measurements in the range from 80MHz to 3GHz, covering FM radio up to the W-CDMA and UMTS services. The unit and probe are battery-operated and portable. The unit can also be used as a conventional RF spectrum analyzer for general field strength measurements.

**What the judges had to say:**

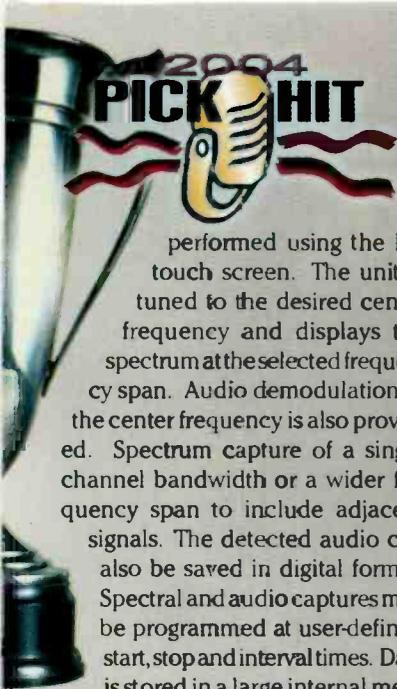

*"An affordable way to verify signal levels."  
 "The various functions enhance its usefulness."*

www.narda-sts.de; support@narda-sts.de

www.beradio.com

**Digital broadcast monitor**

**Dovetail Sciences**  
**DBM-300:** All setup and local operation of this monitor is performed using the LCD display with an integrated

touch screen. The unit is tuned to the desired center frequency and displays the spectrum at the selected frequency span. Audio demodulation of the center frequency is also provided. Spectrum capture of a single channel bandwidth or a wider frequency span to include adjacent signals. The detected audio can also be saved in digital format. Spectral and audio captures may be programmed at user-defined start, stop and interval times. Data is stored in a large internal memory, providing for long periods of unattended operation. The unit also features the ability to display captured data.

**What the judges had to say:**

*"A digital replacement of the traditional analog meter and more."*

*"The added capabilities greatly enhance its usefulness."*

610-264-0100; fax 6102648901; [www.dovetailsci.com](http://www.dovetailsci.com)

**Digital STL transmitter/receiver**  
**TFT**

**460/467:** A new addition to the STL product family, this unit offers six uncompressed program channels and a data channel to meet the requirements of consolidated operations. The digital STL consists of a transmitter and receiver pair that accommodates as many as three AES/EBU inputs or as many as six discrete audio channels. The transmitter provides a

2W output and delivers them uncompressed in a configurable digital method to the receiver. Sample rates of 32, 44.1- and 48kHz are supported. The RF system is frequency agile and set by software in the transmitter and receiver. The transmitter and receiver can be remotely controlled over an Internet or LAN connection. The 460 transmitter features six channels uncompressed, analog I/Os and 3.125kHz step size. The receiver offers a threshold sensitivity of 84dBm for 256 QAM, analog output levels at -10 to +8dBm and analog audio outputs at 600Ω balanced.

**What the judges had to say:**

*"This makes sense with shared studio and transmitter facilities."*

*"Six uncompressed channels is a great way to go."*

## WHAT'S YOUR DATA DILEMMA?

- Adding RDS?
- Installing a remote server?
- Changing remote control/telemetry?
- Need security and surveillance?

Lanlink is a bi-directional Ethernet and RS-232 serial data link operating in the license-free 900 MHz ISM band.

And it is so close to the 950 MHz STL band you can duplex into your existing antenna system.

Network your processing and even add Internet and email at the transmitter site too!

Let the digital STL experts at Moseley help you solve your data dilemma.

# 2004 PICK HIT

## On-air phone system Comrex

STAC6 and STAC12: These Studio Telephone Access Centers (STAC) for listener lines, talk shows and call-in segments incorporate two digital hybrids handling up to four callers. It is offered in six and 12 phone line versions with the ability to upgrade in the field. The control surface supports unique producer

and screener configurations. IP-based call screening and control is embedded, enabling operation from virtually anywhere. It includes an auto-attendant with message, built-in call screener hosting and support of as many as four control surfaces.

### What the judges had to say:

"The built-in screener ability makes this stand out."

"Easy to learn to operate, with obvious attention to the end-user's needs."

800-237-1776; fax 978-784-1717; [www.comrex.com](http://www.comrex.com); [info@comrex.com](mailto:info@comrex.com)

## Digital STL Broadcast Electronics

Big Pipe: This scalable, bidirectional

studio-to-transmitter link can transport up to 45Mb/s of data as analog and digital audio, HD Radio data, Ethernet, serial data and telephony. Data formats can be interchanged via a wireless or wireline path. Key product features include hot-pluggable modules for upgrades or repair; 45Mb/s bidirectional point-to-point radios for wireless applications and network access units available in DS3, OC-3C or OC-12C.

### What the judges had to say:

"This is one heck of a piece of equipment."

"It costs less than other systems for the same functions."

217-224-9600; fax 217-224-9607; [www.bdcast.com](http://www.bdcast.com); [bdcast@bdcast.com](mailto:bdcast@bdcast.com)

## FM broadcast analyzer Microgen Systems

TS9000: This analyzer provides broadcast measurements through a USB interface that allows for on-site and mobile monitoring. The unit samples the multiplex signal at 240kHz at 12-bit precision, with all measurements and calculations performed by Windows software. Modulation power is calculated with 32-bit floating-point precision. It covers the FM band from 87.5MHz to 108MHz in 10kHz steps. The unit includes a baseband FFT spectrum analyzer covering 10Hz to 100kHz. With a dynamic range of 90dB and a resolution of 10Hz, the unit can analyze the multiplex signal or be used as a stand-alone audio analyzer using the external BNC input.

### What the judges had to say:

"A ton of features and capabilities in a tiny package."

"The versatile measurements really make this unique."

+44 208 5409992; fax +44 208 5409994

[www.broadcastwarehouse.com](http://www.broadcastwarehouse.com); [info@broadcastwarehouse.com](mailto:info@broadcastwarehouse.com)

## Technology Honor

### Dual-feed IBOC Antennas

Long-term operating efficiency along with ideal compatibility performance is the reason the Pick Hits judges honored this new technology. Ideal compatibility within a receiver (digital signal back into a station's own analog signal) is achieved when both signals have identical radiation patterns from the transmitter site. Dual-feed FM antennas like those from ERI, Dielectric and Shively, bring an opportunity for efficient digital operation while ensuring matched coverage between a station's existing analog and the digital addition. An additional, separate low-power digital feed excites the same or interwoven bays of a dual-feed antenna without the large power losses of high-level combining. While the cost of the new antenna may offset the initial capital savings for a much smaller digital transmitter, the cost of operation will be greatly reduced when compared to the high-level method. Dual-feed antennas have the disadvantage of additional wind load, so stations must apply the technology judiciously.

# 2004 PICK HIT

## Signal generator Broadcast Electronics

**XPI 10:** This HD Radio signal generator is installed at the studio, rather than the transmitter, to reduce STL bandwidth and repurpose more of the existing equipment

when implementing HD Radio. Key product features include integrated Ethernet connectivity; an integrated GPS receiver; graphical touch-screen interface; interface connections for main program audio, secondary audio, program-associated data for main and secondary channels and advanced data application; and integrated audio synchronization and automated bypass functions.

### What the judges had to say:

*"Creating the IBOC signal at the studio simplifies the path to accommodate audio processing, PAD and other features."  
"This keeps the first step of the IBOC chain at the studio where it belongs."*

217-224-9600; fax 217-224-9607; www.bdcast.com; bdcast@bdcast.com

## Digital audio splitter Aphex Systems

**148:** The 1/2 rack unit can split eight channels (four pairs) of digital audio into 32 channels (16 pair) through the 15-pin D connectors. It can be mounted in a rack alone or in pairs with the Aphex 44-008SA rack kit. The splitter incorporates 20dB of saturated gain to better square the input signal and can be internally configured for 110Ω balanced or 75Ω unbalanced operation. Connections are made via DB15 connectors. It supports sample rates up to 192kHz and has an internal power supply.

### What the judges had to say:

*"Quality specs at an incredibly affordable price."  
"Utilitarian function in a compact size."*

818-767-2929; fax 818-767-2641; www.aphex.com; sales@aphex.com

# NAB2004 Pick Hits Rules

1. Products must be new and not shown at a previous NAB Spring Convention. In some cases, distinguishing a new product from a modified older one is difficult. For "Pick Hits" purposes, a new product is one with a new model number or designation.

2. Products must have some positive effect on the intended user's everyday work. Judges search for equipment intended for use on a regular basis. Products should provide new solutions to common problems.

3. Products must offer substantial improvement over previous technology. Unique circuit architecture need not be included, but some new approach or application must be involved in the product's design.

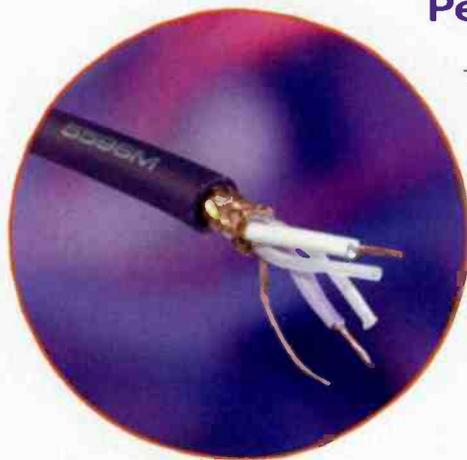

4. The price of the product must be within reach of its intended users. The judges seek products appropriate to a wide range of facilities.

5. The products must be available for purchase within the 2004 calendar year. Equipment must be on display on the show floor, currently (or imminently) in production, and some type of product literature must be available. Judges take the exhibitor's word on availability dates. Products demonstrated in private showings do not qualify.

6. The Pick Hits Judges operate independently from one another and remain anonymous to everyone including other judges until the selection meeting. This ensures that the products chosen are truly representative of the industry, that the judges were not persuaded in any way, and that the entire selection process is as fair as possible. The judge's identities are published in the June 2004 issue.

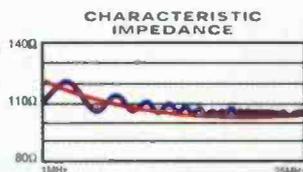

7. The editorial staff of *Radio* magazine serves only as a moderator during the final selection process and has no influence or decision in determining the winners.

## MEASURING THE DIFFERENCE in Digital Audio Cable Performance...

The critical link in digital audio interfacing, Gepeco 110Ω twisted-pair and 75Ω coax feature exacting impedance, bandwidth, and attenuation specifications to deliver low-jitter, minimal pulse rounding, and exceptional performance in high-resolution, digital audio systems.

- Precision 110Ω or 75Ω Impedance
- 25MHz Bandwidth for 192kHz Sampling Rates
- Low-Jitter
- Minimizes Pulse-Rounding
- Multi-pair Designs up to 24 Pairs

TRANSMITTING CLARITY

## RBDS Applications

A class of products that serve a purpose almost forgotten in radio, the re-emergence of RDS/RBDS products has been gratifying to those in the industry who believed in its potential and toiled to make the technology viable since its U.S. introduction in 1994. Admittedly, satellite radio's recent promotion of an artist and title display was an instigating force. There are new potential applications that are now driving the further deployment and development of this existing data broadcasting technology. One factor that has consistently hampered RBDS was the small number manufacturers of equipment and the dearth of experts who knew how to implement it. New companies, such as Broadcast Warehouse, are releasing RBDS products (the RDS2), and companies that never stopped producing RDS equipment have released new and exciting RBDS products: the Audemat/Aztec FMX480 and 410, the Inovonics Model 510 and 712 encoders for example. Dedicated leaders at companies like The New Radio Experience, Stratos Audio and others have been promoting the exciting and potentially revenue-generating uses and are offering expertise and guidance in the use of this data. It is through teaching the industry how to maximize this relatively slow data stream that the Pick Hits judges have awarded this Technology Honor to these efforts. The experiences gained here will help develop applications for the higher-speed data services available with IBOC.

# NAB2004 in review

It's a four-day convention, but the events, meetings and sessions spill over into an entire week of activities.

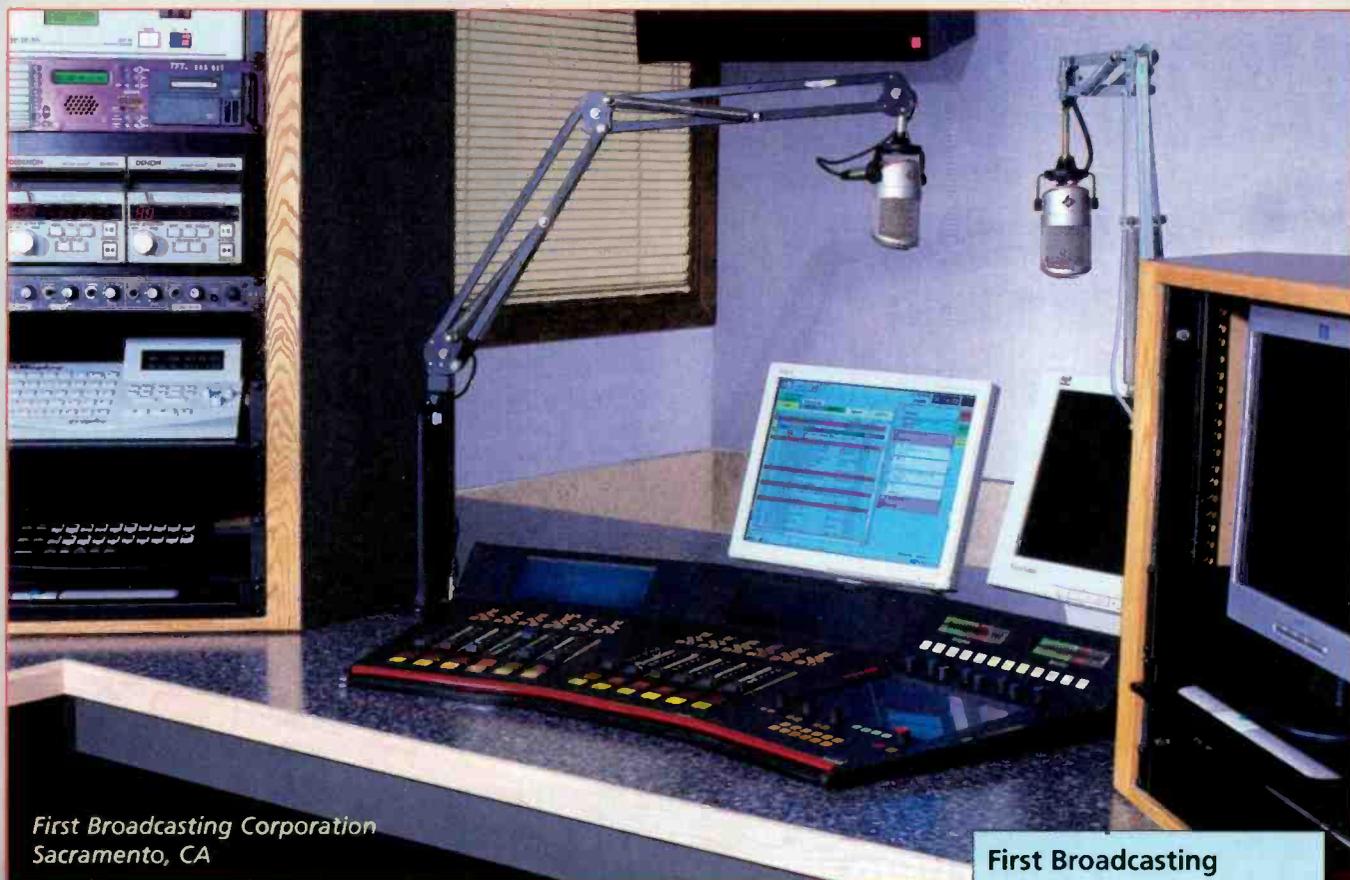

After several years of declining attendance, the NAB Convention is making a comeback. Overall, opinions of the convention are positive. With radio ad sales forecasts looking good, several new technologies showing actual progress and an increase in attendance, exhibitors and attendees agreed that it was a successful convention. Our NAB Convention review includes several sections, which cover the various aspects of the convention, from the sessions to the exhibit floor to the talk in the aisles.

- 16 — The Radio magazine Pick Hits
- 32 — Convention overview
- 34 — Overview of IBOC
- 36 — Inside the PREC
- 40 — NAB Jackpot

  
"Logitek gives me the capabilities I want."

First Broadcasting Corporation  
Sacramento, CA

#### First Broadcasting Console Configurations

- 2 Logitek Audio Engines, networked
- 6 analog I/O cards  
72 inputs & outputs
- 4 digital I/O cards  
32 stereo inputs & outputs
- 2 SharcAttack multi-DSP processing cards for EQ, dynamics processing and more
- 2 Numix-12 consoles

***"For audio consoles, I always choose the Logitek Audio Engine with the Numix control surface."***

I believe it's a product that gives a lot of bang for the buck. Its mix-minus capabilities and ease of use make it a real winner, and it looks great. We have used this board in both on-air and production rooms in many radio, TV and Webcasting facilities in two states, and I have never had any off-air time, EVER!"

# NAB2004 in review

## NAB2004 overview

By Chriss Scherer, editor

**Spirits were high, attendance was up and the industry seems to be on an upswing.**

**A**t 4:01 p.m. on April 22, I walked through the convention floor to see smiles all around. After a few years of dwindling attendance and shrinking exhibit space, the positive tone at the end of the convention was a welcome sight. NAB2004 will be remembered as a successful convention.

While the happy feelings are a good sign for the future, the attendees' practical side regarding the convention looks to the prominent technology that was shown. With this in mind, there were a few areas of technology that garnered much of the attention.

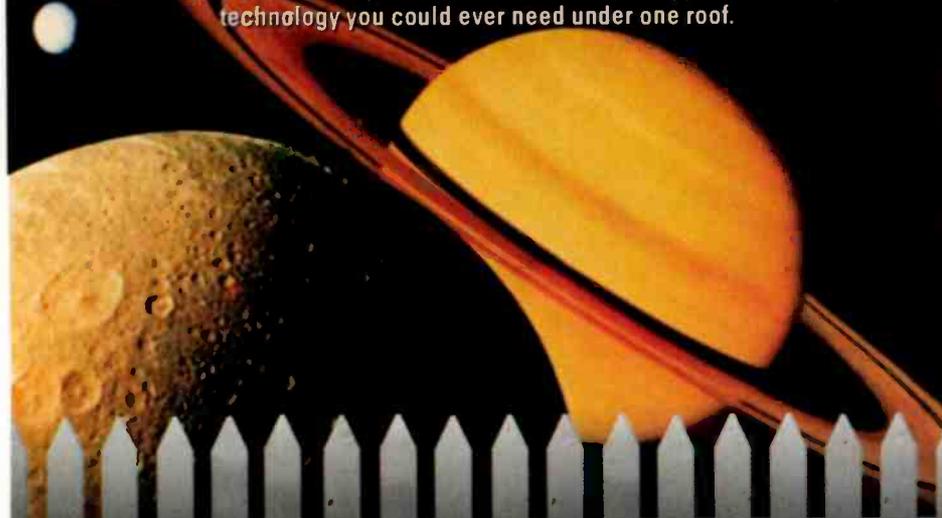

The big item, plain and simple, was IBOC. Like it or hate it, there were plenty of exhibits that had some tie to IBOC. Transmitters, antennas and STLs are the obvious part, but IBOC has ties from the studio and data side as well. (And John Battison looks into elsewhere in this convention review.)

For digital audio, the integration of the console and facility router appears to be complete. There are more systems than ever before, and many of the manufacturers have several models, options and configurations from which to choose. This shows that it is a mature technology. Even the stand-alone console manufacturers were exhibiting new digital implementations.

### IT PAYS TO KNOW WHO LIVES NEXT DOOR

ABC Satellite Services realizes just how important the right community is to our customers. That's why we offer all the service, support, flexibility and technology you could ever need under one roof.

abc **SATELLITE**  
SERVICES

For more information on how you can live next door call: 212-456-5801, fax 212-456-5807 or visit our website: [www.abcsatelliteservices.com](http://www.abcsatelliteservices.com)

**NAGRA**

#### NAGRA ARES-PII

The NAGRA ARES-PII records mono/stereo PCM linear or compressed files onto PCMCIA ATA or Compact Flash cards. Linear recording up to 48kHz (stereo) and compressed recording up to 384kb/s (stereo). The unit offers a built-in speaker, separate line and headphone outputs, powering option for 48V Phantom microphones, line input, and auto record function. Operation made simple with 4 sets of settings templates.

Please visit [www.nagrausa.com](http://www.nagrausa.com) for more information.

**Nagra USA, Inc.** 800 813-1663

On the automation side, the ability to store, manipulate and deliver program-associated data saw a heightened interest. Some of this is because of the enhanced service capability of IBOC, but it is also due to the renewed interest in RBDS. While some of the RBDS discussion focused on scrolling PS information, the general interest—largely due to the large station owners implementing RBDS—is high. Consumer radios were quietly introduced to the market, and now that owners and general managers see the data on a competing station, everyone must have it.

In addition to RBDS, another form of radio data made a showing. The ability to for a station interact with listeners has always held an attraction, but it has long eluded stations. With the proliferation of mobile phones and especially the ability to send text messages, radio may have found the portable return path to match the portable transmission medium. One example of this is RCS Mobile from RCS. By connecting listeners with the station, an increased awareness of radio may serve both sides well.

### Watch your language

The most prominent topic anywhere at the convention had to be indecency. While politicians ranted about indecency, stations were on their best behavior and tread lightly while the watchful eyes were present.

So while indecency was the buzz word, the attention turned to profanity delays as the solution. While final decisions are made about how to define indecent material, manufacturers seized the opportunity to update existing technology.

A profanity delay in its basic form is nothing new. But with the faster pace of station programming, the ability to handle a faster and more plentiful barrage of verbal offenses has a new importance. The traditional seven seconds of delay is no longer enough. The new minimum is 20 seconds with the ability dump the unwanted material several times in that window.

Delay hardware still makes the mark in addressing this. Air Tools, a relative newcomer to the delay game, showed the 6000 and 6100 delays. Building on the increased attention, Eventide's familiar BD500 is now available with up to 40 seconds of delay time. MDO displayed the Arse, a software program that offers up to 30 seconds of delay time. But the time doesn't stop there. Several new devices were shown to handle longer delay times.

By combining the recording time of a logger and adding on-the-fly editing capabilities, the next wave of profanity delays

removes the potential time constraint. With this in mind, Prophet Systems showed the Content Check, and OMT Technologies reintroduced Mdelay.

Finally, if the human element of catching all the potential on-air blunders is too risky, Enco Systems pooled its technology to create Guardian, which can automatically remove words from speech in near real time. Personally, I found it amusing to openly discuss profanity and test the software by uttering words that would embarrass even the most open-minded individuals. ■

## XPi 10: Hey, where's the signal generator?

The new BE XPi 10 Exporter installs the HD Radio signal generator at the studio, rather than the transmitter. Why? To reduce STL bandwidth and repurpose more of your existing gear when you implement HD Radio. The XPi 10 lets you take advantage of the revenue-producing opportunities of HD Radio, such as Advanced Application Services (AAS – the cool stuff on the receiver screens) and secondary audio service. Contact us for details on how the XPi 10 gives you more HD Radio migration choices, protects your equipment investment from obsolescence, and saves you money.

# IBOC at NAB2004

By John Battison

It would not be correct to say that IBOC was on everybody's lips at NAB, but there was considerable interest in it. There seems to be a hurry-up-and-wait attitude for many stations at this point.

Transmitter manufacturers were on the ball and most of them had floor models to show or planned to produce IBOC transmitters shortly. Some of the equipment on the convention floor is already second generation, showing that there are some strong commitments to IBOC.

Broadcast Electronics showed the FSI 10, IBOC signal generator. It provides correct delay for matching of analog and IBOC paths and encoding of the IBOC digital signal. It can be used with the FXI 60/250 series digital FM exciter and the IBOC plug-in card. Depending on the user's requirements it will produce an FM plus IBOC output for low level

combining systems, or IBOC only, for use in high-level combined operation. In addition, Broadcast Electronics unveiled the XPI10, which splits the IBOC generator from the exciter, allowing the IBOC signals to be generated at the studio. See more on this in the Pick Hits article on page 16. Broadcast Electronics also showed the ASI 10 AM IBOC signal generator.

Harris demonstrated its two projects with multichannel IBOC audio. One demonstration showed the Tomorrow Radio system that has been developed by Harris, Kenwood and NPR. I detailed this system in the March issue of *Radio* magazine. While Tomorrow Radio allows for two separate audio streams to be transmitted, another demonstration with Neural Audio showed a 5.1-channel surround sound application using a Kenwood radio installed in a Hummer. While only some of the program material played was in full surround, this demonstration showed that it is possible to provide more than just a stereo audio signal with IBOC.

A third multichannel demonstration was shown in private sessions by Omnia Audio. Omnia demonstrated technology from Fraunhofer in a suite in the Hilton. Those who attended the demonstration were impressed by it.

On the hardware side, Harris unveiled the MinHD transmitter, which covers power ranges from 10W to 600W.

Nautel has unveiled several IBOC offerings. The Jazz J1000 is a 1kW AM transmitter in a 19-inch rack mount package. It uses direct digital synthesis (DDS) to produce logic-level RF drive and modulation encoding. The J1000 has provision for six pre-set RF power levels.

The Virtuoso 10 (V10) is a 10kW FM IBOC transmitter that uses a linear, adjustable bias, broadband design. It is capable of

## Radius-xp ... studio furniture

the most **POPULAR** furniture lines ever...

### new for 2003

- ... all plastic surface & trim design
- ... modular for flexibility
- ... highest quality materials
- ... precision crafted
- ... professional features
- ... many options available

This new studio furniture line is engineered for studio decors where non-wood trims are a design goal. Available in a wide variety of colors, this furniture will complement any size market application. The modular design enables the furniture to be ordered in almost any configuration that can be imagined.

### System diagram of split-level combining.

as much as 3.2kW digital, 7.7kW hybrid or 11kW analog operation.

The Maestro M50 is a 50W direct-to-digital exciter for FM and IBOC. DSP and field-programmable gate array (FPGA) technology enable direct conversion of the audio source to the low-level FM signal. The exciter accepts data from Nautel's NE IBOC generator to produce either a hybrid or all-digital HD Radio signal.

Continental Electronics, having recently experienced a change in identity to DRS Broadcast Technology, unveiled a new solid-state FM transmitter, the 815D5 and 815HD5. In addition, Continental provided a demonstration of an AM transmitter producing DRM digital transmissions.

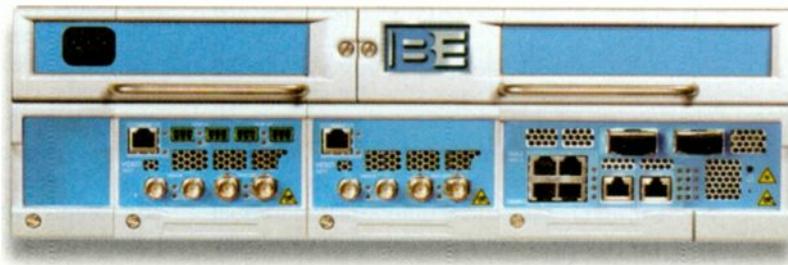

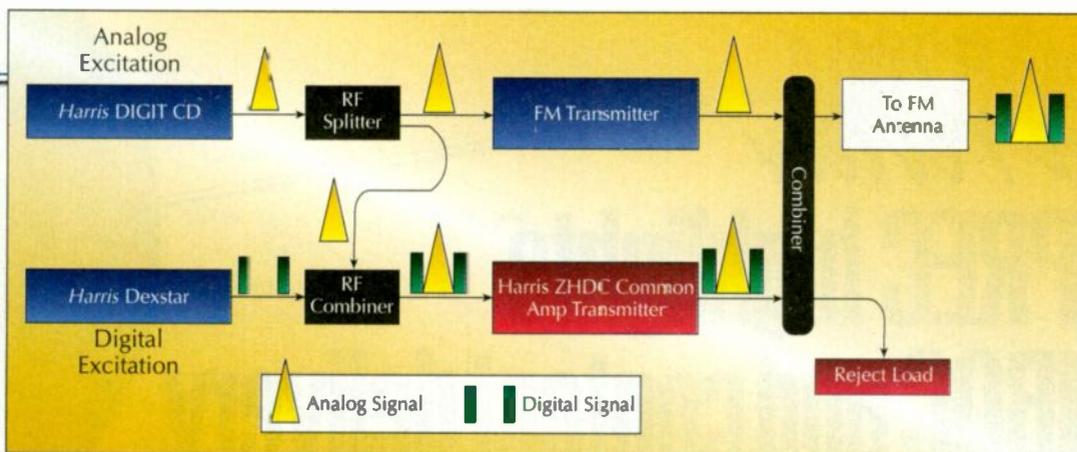

### Not just transmitters

The IBOC attention was not limited to transmitters. Developments in antenna technology were also shown. The *Radio* magazine Pick Hits judges even recognized the current work in dual-feed antennas. This work shows that IBOC is a serious issue with tremendous resources devoted to making it succeed.

STLs were also being shown to provide IBOC applications. The Broadcast Electronics Big Pipe and multichannel offerings from TFT and Moseley were unveiled. These address the added need for audio and data capacity from the studio to the transmitter.

And finally, one new development in the transmission chain was shown. A last-minute addition to the Harris booth was a discussion of a hybrid combining system called mid-level or split-level combining. While specific details were not revealed because of pending patents, the system looks to be a practical means to implement IBOC for many stations. It uses two transmitters to feed a single antenna. One transmitter is an analog-only transmitter with half the needed analog power. The other transmitter operates in a low-level combined mode to provide all the digital power and half the analog power. This system reduces the wasted power present in a high-level combined system.

*Radio* magazine is currently arranging an article that will fully describe this system. ■

## Big Pipe: This is not your father's STL.

Big Pipe is not just another studio transmitter link. With scalable bidirectional capabilities up to a whopping 45 Mb/s, you can interchange analog and digital audio, HD Radio data, Ethernet, serial data, video, and telephony via a wireless or wireline path. Scalable, flexible, and reliable, Big Pipe works just as well for studio facility interconnects and many other media transports needs. Because it comes from BE, you know that Big Pipe is designed for the realities of radio including tight budgets and rock solid performance. Contact BE for details.

# PREC highlights IBOC and content delivery

By Gordon Carter, CPBE

The annual Public Radio Engineering Conference (PREC) was held on April 16 and 17. The two main topics for the two days were National Public Radio's rollout of the Content Depot and Tomorrow Radio, an advanced application of HD Radio.

All of the sessions on Friday had to do with the rollout of the Content Depot. The first session was conducted by a number of NPR staff members, each concentrating on their own area of expertise. Speakers gave an overview of the Content Depot, from the process of submitting and acquiring material about programs, to the receiving technology and finally

interfacing the system to existing station automation systems. Recommendations were given regarding program timelines, program clocks and the differences between live programs and stored programs. Some time was also spent explaining the differences between the present DACS system and the Content Depot.

After a short break, the sessions moved to more detailed information on the system. An explanation of the concepts of program segments and cueing, file format standards and naming conventions was presented. Examples were given for integrating the Content Depot receivers with various types of computer networks and station audio systems.

The day's sessions concluded with a panel discussing various

## Burning Up Your Money On Engineering Databases & Maintenance fees?

Let **rfSoftware** show you how to put out the *fire!*

**rfInvestigator** is one of the *most* flexible programs of its type. Set the display and printing colors to suit your needs. You can display user underlays, LULC and population data, choose which city boundaries and vectors you wish to include.

**Be more thorough** by displaying and manipulating contours for multiple stations *simultaneously* with our exclusive "**Contour Manager**."

See the countour change in real time as the *automatic* "**DA Design Tool**" does its work. Then send the antenna pattern output directly to the manufacturer.

**Version 2.5** is coming soon! It will include many new features to make your work faster and easier.

### PL-SERVER

This advanced module allows you to create path-loss files for propagation analysis in **rfInvestigator**.

# Broadcast Multiple Channels of Live Audio over any LAN or WAN Network

... ANY COMPUTER ON THE NETWORK CAN TUNE IN

**AudioTX**

**MULTIPLEX**

**1** The AudioTX Multiplex Server runs on one or more PCs and Broadcasts multiple channels of live audio. Each PC can broadcast up to 30 channels.

**2** Install the AudioTX Multiplex Receiver on all of your office, newsroom and even studio PCs. And they can tune into any channel quickly and simply.

- Superior replacement for Audio Ringmain or Monitor Select systems for office/station listening.

- Greater capacity and better flexibility than RF modulated coax or multi-pair wired systems.

- Requires no additional cabling - uses your existing computer network.

- Easily and instantly add extra listening points or new channels.

- Broadcast quality, low delay audio - can be transmitted as MP2, MP3 or uncompressed.

# ISDN & IP Codec for your PC or Laptop

The AudioTX Communicator™ software turns your PC or Laptop into an easy to use, high quality, ISDN Codec - it also connects live over any IP network: LAN, WAN or the Internet.

- ▶ Compatible with CDQ Prima, Telos Zephyr and almost all other ISDN codecs
- ▶ File playback during live connections - allows you to playback pre-recorded WAV files during a live connection
- ▶ Low-cost, portable software solution - requires just a standard sound card and compatible ISDN card in your existing PC or Laptop
- ▶ Also works over any IP-based network for studio-quality audio connections and even STLs - from Ethernet to ATM, leased lines, satellite or wireless links and even over the Internet using any high-speed connection
- ▶ Live, bi-directional, low delay audio connections for outside broadcasts, studio links, voice-over work, reporting and voice-gathering

ways to take advantage of the features and capabilities of the Content Depot on the programming side of things. Ideas were presented for using content beyond audio, content localization and improving workflow.

The Saturday sessions began with a presentation of alternate methods of combining the

analog and digital broadcast signals. Harris announced that it had completed a successful on-air test of split-level combining.

Further sessions presented the results of on-air coverage and audio testing of Tomorrow Radio. The HD Radio chipset and possible strategies for marketing advanced features was presented, as were funding options for public radio stations to implement HD Radio, and some strategies for programming of Tomorrow Radio.

The afternoon sessions were a bit less unified in theme. During lunch Jeffrey Dvorkin, NPR Ombudsman, gave a presentation entitled *Ethics in the Digital Age*. Other afternoon sessions included a panel discussion on crisis event management, business implications of new technologies and some interesting new facility projects.

The regular sessions ended with a panel discussion entitled *Things We've Discovered about HD Radio*. This included two presentations on the results of Tomorrow Radio testing, a panel discussion on technical problems and experiences encountered while implementing HD Radio, and finally a discussion of low power HD testing in Los Angeles.

The conference ended with a special Night-Owl session entitled *An Audio Expedition*. Bill McQuay, NPR's Surround Sound and Radio Expeditions Technical Director, played a selection of some of the best on-location surround recordings from his collection. Attendees were invited to bring their own recordings to hear Tomorrow Radio first-hand. ■

*Carter is chief engineer of WFMT, Chicago.*

## Over 946,080,000 seconds of precision timing

**W**HEN you require the best, most accurate in precision timing look only to ESE. Designed for "Precision Timing", ESE Master Clocks & Accessories have been the industry standard for over three decades.

Whether using GPS, WWV, Modem, Crystal or line frequency accuracy – all ESE Master Clocks can drive digital or analog slave clocks, as well as interface with video and/or computer based systems. Call or visit our web site for more details.

## Field strength meter Audemat-Aztec

**Navigator 007:** This portable FM field strength meter offers built-in modulation metering, stereo pilot monitor and RBDS monitor. It is delivered with an external GPS receiver for mobile RF survey on a single FM station. While driving, RF readings and GPS coordinates are recorded on a laptop. Afterward, results can be viewed as a text file or can be exported to mapping or predictive software. The unit is accessed with any terminal program software. The unit includes a carrying case, 115/230Vac power supply and vehicle power supply.

305-692-7555; fax 305-682-2233

## Audio processor Orban

**Optimod-FM 2300:** Key features of this processor include stereo enhancement, built-in Ethernet and RS-232 serial connectivity, full-featured remote control through any Windows 2000 or XP PC and standard AES/EBU digital input/output. The processor is targeted at small and medium market broadcasters as well as non-commercial and educational broadcasters. Supplied in a compact, one rack-unit chassis, the processor offers a processing chain that includes a stereo enhancer, AGC, equalizer, program-adaptive high frequency enhancer, two-band compressor/limiter, distortion-canceling clipper, overshoot compensator and stereo encoder with composite limiting. The main clippers and overshoot compensator operate at 256kHz sample rate and are anti-aliased.

**Sound card  
Digigram**

Mixart 8ES: The newest member of the Ethersound family, this multichannel sound card features eight Ethersound inputs and outputs and eight analog inputs and outputs, including four microphone preamps with phantom power. The system supports simultaneous recording and playback as well as audio effects, metering, mixing, routing and real-time processing. Options for MPEG encoding/decoding on the card, sample rate conversion and delay are available. This system offers as many as 64 channels of 24-bit digital audio at 48kHz, plus bi-directional control information may be transported to more than 60,000 networked audio devices. The point-to-point transmission time between an audio input and an audio output in an Ethersound network is six samples (125µs at 48kHz). Latency is independent of the number of channels transmitted.

703-875-9100; fax 703-875-9161; www.digigram.com; input@digigram.com

**Audio leveler  
Ward-Beck**

Alfa: A card-based system that works with the company's rack-frame system, this audio leveler offers as many as eight AES channels of control in a 1RU frame and 20 channels of control in a 2RU frame. Control can be preset for automatic level adjustment of predetermined levels or dynamic adjustment via a physical control panel. Unlike a compressor/expander, this audio leveler responds slowly to minimize the potential to change the dynamics of the signal. Adjustments are made to the long-term average level of the audio signal. All parameters of the processor are adjustable.

# It's Zephyr's 10<sup>th</sup> Birthday

## What clients are saying about Zephyr Xport and Zephyr Xstream:

"We do a lot of remotes... we use Zephyr Xports for about half of our remote broadcasts. My remote tech tells me "It doesn't retrain or drop. The connection is very stable."

*Vic Jester, Market DoE, Radio One, Atlanta*

"We sent stereo music and two presenter microphones into the Zephyr Xstream and applied basic limiting using the built-in processor — the mixer is very flexible and easily configurable, making it simple to set up in the field."

*Alex Lakey, Chief Engineer, Virgin Radio*

"Xport's audio quality is outstanding. The *aacPlus* algorithm provides great fidelity... Every hit, the metal sticks hitting each other, conversations from the field, all were reproduced with great clarity over the POTS line."

*Michael Black, GM, WEOS, Geneva, New York*

"I was wary of using a compressed link, but the Zephyr Xstream's AAC algorithm is incredible. The on-air audio is the best we've ever had."

*James Turvaille, Chief Engineer, WAY-FM Media Group*

"We were out in the mud [at the Bonnaroo Music Festival] and the phone line had been run over by a thousand cars. But the Zephyr Xport worked great!"

*Jake Glanz, Engineer, Sirius Satellite Radio*

"Zephyr Xstream is in a class of its own, the only codec really worth having for main broadcast ISDN."

*Graham McHutchon, Senior Sound Supervisor, BBC News*

When we first married MP3 to be the most-loved audio codec, more than 10,000 Zephyr c

# NAB2004 in review

## Chassis connector Neutrik

**XLR Switch:** These five-pole XLR receptacles can be used for audio, lighting and industrial purposes and are offered with vertical PC contacts. Because the switch is activated when the plug is inserted, it is possible to indicate, monitor and control mated connections. The switch provides open and closed contact, with a current rating of 100mA and a voltage of 12Vdc. The A series comes equipped with plastic housing while the B series has a metal ring for additional RF protection.

732-901-9488; fax 732-901-9608; [www.neutrik.com](http://www.neutrik.com); [info@neutrikusa.com](mailto:info@neutrikusa.com)

## Solid state amplifier

### Energy-Onix

**SSA-100C, 150C, 330C and 500C:** This compact amplifier occupies 5 1/4" of 19" rack space. The unit's full metering front panel indicates voltages and currents of all pallets, as well as forward and reflected power outputs. Protected against VSWR, high temperature and overdrive-foldback circuitry automatically reduces RF drive when VSWR exceeds 1.5:1. Protection circuits turn the amplifier off if VSWR exceeds 2:1, or RF drive exceeds preset level, or if thermostats within equipment operate. Thermostats are located on each of the two pallets and combiner reject load. Both amplifiers use 350W sections that incorporate two pallets. Insensitive to line voltage variations, the amplifier contains independent switching power supply that work at line voltages of 100 to 250Vac.

888-324-6649; fax 518-758-1476; [www.energy-onix.com](http://www.energy-onix.com); [energy-onix@energy-onix.com](mailto:energy-onix@energy-onix.com)

## RF station monitor Coaxial Dynamics

**81095:** This microprocessor-controlled, rack-mounted Watchman monitor/alarm measures and displays forward and reflected power simultaneously in 50Ω transmission systems. Using LCD displays it also provides direct readings of VSWR. It is compatible with the company's series of 7/8" to 6 1/8" line sections and will accept elements from less than 5W to 100kW full scale from 2MHz to 2.3GHz. Installation consists of the Watchman, a dual-socket line section and two elements for monitoring forward and reflected power. The Watchman is supplied with two 25' dc cable assemblies for connection to the line section and a 6' ac power cord. An audible single tone alarm will indicate a system/transmitter malfunction. Relay contacts are provided for remote alarm and reset switching.

## Top-Value FM Monitor

Model 531 - \$2700

### THIS EASY-TO-USE FM MOD-MONITOR GIVES ACCURATE OFF-AIR MEASUREMENTS

A wealth of features makes Inovonics' second-generation 531 the undisputed value leader in FM monitoring. In addition to the high-resolution total-mod display, the 531 also shows stereo audio levels, SCA and RDS subcarrier injection, plus a relative indication of incidental AM noise. A digitally-tuned preselector with programmable presets lets you quickly compare your station's parameters with those of market companions.

Signal strength and multipath readouts simplify antenna alignment and help validate all measurements. Rear-panel appointments include balanced audio out, composite in/outs, and both antenna and high-level RF inputs. Alarm tallies are provided for overmod, audio loss, carrier loss and excessive multipath.

## PC cart wall player Action Sports Media

**Game OPS Commander:** Media buttons provide CD-quality sound effects and music in a variety of file formats. Navigation buttons keep sounds organized into as many as 12 user-defined screens. An automatic queue feature permits users to load music on the fly for unattended play-

back. On-screen mixer controls make sound management easy, including a program-mable fade button to automate difficult fades. Cross-fade automatically fades between two selections. The minimum system requirements for Game Ops Commander Version 3.0 software are a Pentium 300 processor, a sound card, 32MB of RAM, 50MB of free hard disk space, a 800 x 600 display, and Windows 98, 2000, ME or XP.

## Reverb plug-in Trillium Lane Labs

**TL Space:** By combining the sampled acoustics of real reverb spaces with advanced DSP algorithms, this plug-in offers full control of reverb parameters in mono, stereo and surround formats. The technology features a ProTools plug-in to harness as many as eight Pro Tools HD DSP engines in parallel to deliver smooth, low latency convolution processing. Internally, the plug-in uses 32-bit block floating point processing for sonic fidelity. When used with Pro Tools HD Accel systems, it provides zero latency processing. The plug-in includes a library of high quality sampled reverb spaces and effects ideal for music and post applications.

## Field recorder Fostex

**FR-2:** This recorder includes a 10-second pre-record buffer, battery power, on-board limiter and phantom-powered balanced mic inputs. The system can record up to 24-bit 192kHz and an optional time code card, which has a full-featured time-code reader/generator and external word/video references. The system records to PCMCIA 1.8" hard disk drives and Type II Compact Flash and is stereo/mono selectable. The unit uses AA-size NiMH batteries for about two hours of field operation (Compact Flash) and files can be transferred to PC/Mac via PCMCIA, CF adapter or standard onboard USB connection.

### Remote control and access Adder Technology

**Adderlink IP:** By allowing multiple computers in different locations can be controlled securely and remotely via the Internet, dial-up link or a corporate network, this unit enables users to take remote control of computers, make updates and even re-boot from anywhere in the world. This ability offers a practical means to remotely manage computer installations. Developed in cooperation with Real VNC, the Adderlink IP is compatible with Virtual Network Computing remote control software. This enables total control of a remote PC irrespective of the operating system or hardware deployed by using a Java application that does not place a software or processor burden on the remote machine.

# Flushing Away Your Audio Quality

Swishing and swirling audio is the sad result of bit rate reduction combined with the wrong processing. Unless all sources, storage media and transmission systems are linear the audio will be bit rate reduced at least once, probably several times. Each pass generates more artifacts. Lower quality processing, multiband compression, limiting and clipping can make those artifacts even more apparent. But level control is still essential.

**Introducing the new Compellor® 320D** - the world standard AGC is now available with both digital and analog i/o. For almost two decades the Compellor has sustained its unrivaled reputation for 'invisible' operation. The same cleanliness of circuitry and intelligence of processing algorithms that make it 'invisible' also make it perfect for processing in the digital domain. The Compellor will not 'unmask' the masking from upstream reductions and it will feed a signal that will sail through downstream reductions.

The 320D fits any plant from all digital to all analog and anywhere in between. Perfect for all HD applications, the Compellor 320D will help keep your great audio great at a price that won't wipe you out.

## CD recorder Tascam

**CD-RW750:** This recorder offers 24-bit digital converters, CD-R and CD-RW support, S/PDIF digital I/O, CD text, A-B repeat and single playback features in a 2RU package. The unbalanced I/O and S/PDIF digital I/O are provided in optical and coax formats. It has a RAM buffer for skip-free playback, 24-bit A/D and D/A converters and a digital fade in and fade out that is adjustable from three to 30 seconds. Its monitor section allows it to be used as a stand-alone A/D converter or sample rate converter without the need to place a blank disc in the tray.

## iMediaTouch

Broadcast Automation Software

It's no lie - iMediaTouch is the original automation system, introduced back in 1985! Our list of "firsts" in radio is unprecedented - from our broadcast automation system, to our industry leading digital logger and our award winning Internet streaming software. Our iMedia product lines provide complete solutions for radio.

iMediaTouch is the choice for radio station clusters. We make the most innovative and easy-to-use content sharing software on the market!

Purchase iMediaTouch and we guarantee your station will be prepared for the future of radio.

Midcontinent **KRRO-FM, KELO-FM, KELO-AM, KTWB-FM & KWSN-AM**

"Since our first installation of iMediaTouch in 1996, Midcontinent Radio and its five stations have gone through 3 generations of the software. And with all confidence, the system has proven itself time and time again!"

Scott Schmitt - Engineer  
Midcontinent Radio - Sioux Falls, SD

### iMediaTouch features:

- Non-proprietary hardware, use any audio card, any PC
- Support: MP2, MP3, PCM, WMA, APTx and Dolby
- Line Assist, Satellite or Full Automation
- Complete website integration with XML or HTML output
- On-Air Promo Builder for on the fly promos
- CD Ripper and complete production tools for automation
- On-Air studio or Production studio Voicecaching
- On-Air Phone bit editor with full production capabilities
- Proven onXP PC since 2002! Supports Windows 2000 & XP

# ESPN

The old studios of ESPN Radio were long overdue for an upgrade.

This facility upgrade is described as moving from the Flintstones to the Jetsons.

by Allen J. Singer

# Radio

# enters the digital age

*"Jiminy Christmas, is this place big!"*

**R**on Dibble isn't exaggerating. The co-host of the *Dan Patrick Show* on ESPN Radio was accustomed to broadcasting from a room the size of a closet. That has all changed since the sports network recently finished updating its cramped and out-of-date facility. Dibble and the rest of the ESPN Radio on-air staff now enjoy more spacious studios and modern broadcasting technology as they deliver more than 9,000 hours of annual talk and event content to more than 700 affiliates nationwide.

ESPN Radio launched in 1992. In the beginning studio size wasn't an issue. Sports fans across the country tuned into their 170 local affiliates carrying the new

Denager Audio Works 1-888-50-AUDIO

# ESPN Radio

sports network broadcasting from the ESPN Campus in Bristol, CT, home to 60,000 residents and one of the largest bell factories in the United States. ESPN's analog studios were deemed modern for 1992, but the next decade brought many changes to the sports network: more programming, more staff, more affiliates and less available room in their facility. By the turn of the new century, it was past time for ESPN to grow.

By 2000, the digital age had arrived. As hundreds of stations across the country upgraded their facilities, ESPN Radio decided their time had also come. In the early part of 2000, management and engineering considered their decade-old analog-based studios and began formulating the plans for a new state-of-the-art facility. With this major capital project, ESPN Radio would be able to provide crisp, clear audio for its affiliates with an all-digital path using modern cutting-edge equipment.

## Growing pains

Any broadcaster who has spent a decade in one facility can understand the needs of this major sports network. As ESPN's popularity grew, new

The air studio has an improved look and feel. Here we see Dan Patrick at the mic.

shows were added to the roster nearly every year, continuously increasing the size of the staff, and decreasing the physical space for announcers. For instance, Sports Center anchors had to physically

**Broadcasters  
General Store**

enter the main talk booth every 20 minutes to deliver their updates. These studios could only comfortably house three people; any more and they would be trampling on each other. Improvements to these awkward and cramped working conditions factored heavily into the new studio designs.

On the production side, the studios housed a hodgepodge of analog and digital equipment: BMX III and Yamaha 02R consoles, Minidisc decks, cart machines, CD players, 360 Systems editors, Orban DSE7000s and a Datatek 2400 router. A studio upgrade promised to bring up-to-date audio editing equipment and a new overall sound to ESPN Radio. This new sound would better serve the affiliates, listeners and most importantly the advertisers.

After the decision was made to build the new facility, the engineering crew, led by chief engineer Tom Evans, moved ESPN Radio from Building 2 to Building 5. ESPN Radio broadcast from the temporary, windowless quarters in Building 5 for the next two years. Ironically, this location offered a substantial space improvement to

the old facility. Two studios, three control rooms and the equipment room occupied about 1,000 square feet, with an additional 3,000 square feet available for office space. The engineers moved all of the equipment (except for the core routing system and patch bays) to the temporary building, one room at a time, to allow for uninterrupted on-air operations.

ESPN commissioned Tecton Architects of Hartford to design the new facility in Building 2. This firm had previously designed the adjacent ESPN News studio, and the sports network wanted the continuity of style to carry into ESPN Radio. Tecton's greatest challenge in Building 2 was space limitation, in spite of the 5,000 square feet available on the first and second floors. Of this space, 2,800 square feet were allocated for the office space, and Tecton had to maximize the functionality of what was left for four live studios, four control rooms, an isolated production room and three equipment rooms.

All of the rooms occupy a compact area of only 2,200 square feet, making ESPN Radio a modern exercise in space efficiency. Windows were installed to provide sight lines between all rooms. Each room contains cameras to further enhance visual contact, and the images are transmitted within all the studios via a closed-circuit CATV system.

ESPN Radio uses the latest in acoustic technology

**Simian 1.6 is the result of input from numerous BSI users. Thanks to their input, Simian now includes an on-screen weather display that updates from the internet.**

**The new Simian also includes sophisticated new Voice-Tracking functionality allowing Voice-Tracking days in advance, even from remote studios, and an improved ability to verify logs before air play.**

**Simian is still the most feature-rich automation system in the industry and provides powerful, reliable broadcast automation for stations in the US and around the world.**

# ESPN Radio

for the entire facility. Tecton contracted University of Hartford Acoustics to optimize the sound performance of the new studios. The design called for high-performance doors, walls, ceilings and windows to acoustically isolate each studio. A specially designed HVAC system provides quiet ventilation, and a computer floor installed throughout the facility limits penetration between rooms (and eliminates the need for ugly wire trays). Absorption and diffusion fixtures manufactured by RPG regulate the acoustic reflections on the studio walls, and no electronic equipment in the studios and control rooms contain fans.

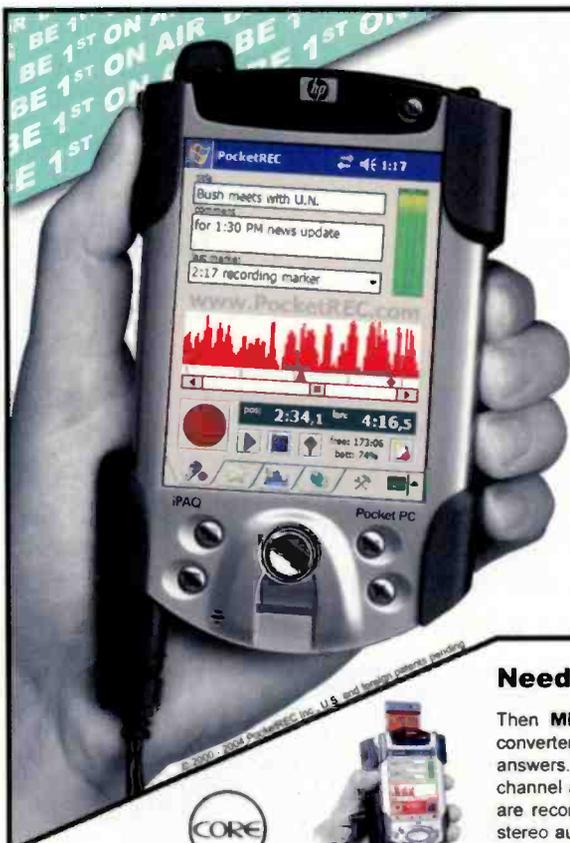

## Late call

One challenge the engineers were forced to cope with was unexpected delays in delivery of software and hardware components required for the new studios. Some of these devices were so new that they were actually still in development when they were ordered. New items would trickle in over the months of construction, and engineers were left wringing their hands, wondering when the next one might show up.

But once the construction of all the rooms was complete, the wiring and equipment they did have could be installed. Harris was contracted to build out the facility, while ESPN staff took care of the support systems for the new studios. Three equipment rooms house the Enco workstations, servers and main audio storage. Thirteen racks hold the studio phone system, ISDN codecs, the router and patch panels. Three more racks facing into the adjacent ingest/screening room are fitted with dubbing equipment. The old-fashioned way of running big audio snake cables to the rooms was modernized by running the more compact CAT5 multicables through 110 punch blocks, patchable 110 blocks and RJ45 panels. Also, fiber-optic lines carry signals from building to building, as well as some server to storage connections. Video and CATV are run on traditional coax.

Enco servers and storage devices are located in several buildings, providing a physical diversity of backup systems. ESPN Radio uses a virtual TOC still in development by ESPN and Enco Systems. The virtual TOC is a modern system of monitoring and control, with a schedule-based monitoring system that is being developed and deployed as new programming requirements arise. Scheduling of program paths will also be handled by the virtual TOC. Transmission and commercial insertion operations at ABC Radio in Manhattan is part of this virtual system, allowing even more flexibility to ESPN Radio's programming techniques.

The studios resemble something one might see in a science fiction movie. In all, the broadcast areas contain more than 100 video monitors. The second floor alone has 26 mic locations. The staff at

ESPN Radio uses the many monitors for computer displays, inter-room visual communications and to view multiple sporting events. Monitors also appear at audio workstations and office computers throughout the facility.

In addition to the vast array of video monitors, the studios contain all-new equipment except for the 360 Systems Digicart 3, a cart machine (still have to have this old standby) and two Telos Zephyr Xstreams—all carryovers from the old facility. Harris Pacific BMX digital consoles were installed in the new studios partially due to the resemblance to the BMX III, helping ease the transition into the new environment. In spite of their larger size, the new consoles provide an immediacy of button-per-function design similar to the previous BMX III consoles.

The digital signal path ultimately makes its way to the Harris Intraplex, where it joins a data stream and is sent to ABC Radio on a T1 line. Backups to the audio and data are available on diverse DSOs and KU feeds.

The all-digital environment has greatly improved ESPN's flexibility and versatility and overall sound; and most importantly an improved efficiency on the job. The staff loves the new router

Producer Phil Ceppeggia in an ESPN Radio control room. The multitude of monitors provides a great deal of information to the producers.

system with more than 2000 crosspoints, with which they can pull any source into any studio, to instantly send programming across the hall among the four studios.

# ESPN Radio

Formerly cumbersome multiple remote broadcasts are now a snap due to the way the increased numbers of ISDN connections are handled in the studio upgrade. These upgrades better serve the specific needs of their affiliates. The new equipment also helped ESPN launch its new ESPN Audio Cut service. Audio Cut is broadcast twice a day, and features the most timely, poignant news bytes from the world of sports.

ESPN Radio is now fully immersed in the 21<sup>st</sup> century. The new studios in Building 2 at the ESPN Campus are found just south of the main ESPN News room and north of the television studios. The current staff of 70 sports-minded people deliver more than 24 hours of live—never automated—programming to its 700-plus affiliates and 17 million weekly listeners across the country, including those in key markets such as Cincinnati, Chicago, Los Angeles, Pittsburgh, Dallas, Hartford, CT, New York, Phoenix, Norfolk, VA, and Louisville, KY.

Needless to say, the employees think they've died and gone to digital heaven. Following the requisite initial apprehension of moving into the new office, staff members quickly embraced the unfamiliar gear, observing noticeable time-savings on all their projects. The new equipment even challenged the staff to find better methods to perform their tasks more productively.

And whether the station personnel like it or not, the temporary facility in Building 5 is going to stay there

In an ESPN Radio news studio, Doug Brown prepares a story while monitoring television and Internet feeds. The air studio can be seen in the monitor next to the clock.

## That was then

This is the on-air studio of WFMT Chicago in 1983. WFMT was, and still is, a classic music station with cable distribution of its programming throughout the United States.

The reel-to-reel tape recorders in the foreground are Revox PR99s; those in the background are Studer A80RCs. The turntables are Technics SP-15s with Audio-Technica tone arms. The console was custom built by the chief engineer at that time, Al Antlitz. The cassette recorder is to the right of the console.

The panel below the cassette recorder and the displays above are for audio routing switcher control, designed and built by Gordon Carter, the current chief engineer at WFMT.

There were also Apt Holman phono pre-amps not seen in the picture. The CD player (behind the word update) was manufactured by Philips/Magnavox, and the microphone is an AKG D-202. Steve Reeder, a WFMT announcer, is at the controls.

## the technology behind ESPN Radio

### ENCO Systems DADpro32

DADpro32 is a scalable audio automation and delivery system, ideal for everything from small facilities to the demanding needs of radio networks like ESPN as well as groups such as Susquehanna and Salem. With unparalleled flexibility and power, DADpro32 also offers several choices

of easy to use user interfaces along with industry leading technical support.

Whether your facility is live-assist, fully automated, a mixture of the two or even a world-class digital facility like ESPN, ENCO's DADpro32 is the smart, reliable, cost-effective choice.

With long standing support for RDS and HD-Radio, ENCO Systems continues to provide broadcasters with the tools they need to compete—today and tomorrow. ENCO Systems—Fiercely Dedicated to Audio Automation.

[www.enco.com](http://www.enco.com)  
800-ENCO-SYS

### T.C. Electronic System 6000

This award-winning, four-engine stereo and multichannel processor is ideal for high-end music, post and broadcast audio. Supporting high sample rates, simultaneous stereo/multichannel processing, the highest quality analog and digital I/O, and SMPTE time code automation, System 6000 is a natural for broadcast production. Multiple System 6000 processors can be networked to create a pool of processing power and units can be controlled with the TC Icon remote or its PC or Mac software equivalent. Optional algorithms are available to expand the 6000's surround and mastering processing abilities including brickwall limiting, multiband dynamic processing, noise reduction and stereo to 5.1 conversion.

## What is the Facility Focus?

The Facility Focus provides an up-close look at the technology in use at the facilities featured in *Radio* magazine Facility Showcase articles.

The highlighted manufacturers are leaders in the industry, and the Facility Focus allows them to showcase their products and services.

Turn to the Facility Focus for the insight on today's leading products and services in use in the top radio facilities.

### Comrex Matrix & Vector

Nobody does remotes like Comrex. That's why leading broadcasters and broadcast facilities like ESPN Radio put Comrex on the line.

Whether it's the versatile Vector POTS audio codec or the multifunctional Matrix POTS/ISDN/GSM wireless audio codec, ESPN Radio depends on rock-solid connections with up to 15kHz frequency response over standard POTS and ISDN lines. While the Vector offers the functionality of a four-channel mixer with a built-in POTS codec, the Matrix offers a two-channel mixer with simple plug-in modules that add ISDN and GSM wireless functionality to its standard POTS codec. The Matrix rack-mount POTS/ISDN/GSM wireless audio codec is the perfect studio-side solution for remote broadcasts because it is compatible with all Comrex codecs and those from most other manufacturers.

## Musicam USA Netstar 500

By Bob Anderson

LIU had been using Musicam USA's CDQ Prima 220s to send programming to our sister station, WCWP, via fractional T1. This setup had been functioning reliably for the past five years with few outages. However, in January of this year the Long Island University's IT department informed us that the T1 was being replaced by an OC48 metropolitan area network link and we would have to replace the Prima's with equipment that would work over Ethernet. The university has had success with a VoIP telephone system, so I started looking at various music over IP codecs on the

of time by not having to walk people through the configuration changes if any problems should arise.

### The basics

The Netstar features analog in/outs along with AES in/out ports. These are selectable from the front panel or the browser. There is a front-panel headphone jack that is selectable for sending or receiving audio, or both simultaneously. The reference level and peak hold times for the VU meters are selectable.

The encoder can be set to match the incoming signal, therefore you can change the near end and the far end will automatically follow when reconnecting.

On the down side, the VU meters do not show up on the Web browser. Although a value can be accessed via telnet, this is only useful for assessing steady tone levels.

In addition, the Netstar is a full ISDN codec and has a built-in terminal adapter. The U interface is standard but an S interface can be activated by an internal cable change. More than 200 numbers

can be stored as user profiles with various settings stored for each number. These can also be used to store IP addresses and settings for Internet connections. These user profiles can then be dialed or connected to with two

clicks on the browser. The algorithms available for ISDN are Layer 2, Layer 3, AAC, AAC-LD, G.711 and G.722. Making ISDN calls was as easy as using IP and once the settings matched the Zephyr that we have, the call went through each time.

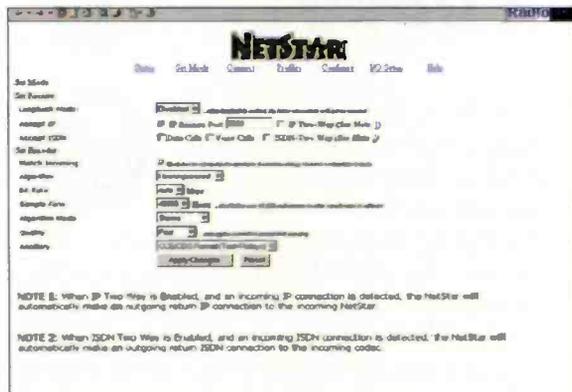

market. One unit that stood out was the Netstar 500 by Musicam USA. Because we had good results with the Primas, I decided to try the Netstars.

Once they arrived, I set them up in the shop with a back-to-back connection using a crossover cable. The units came preprogrammed with IP addresses for testing. After several minutes of getting used to the menus on the front panel, I was able to connect. I set the compression algorithms to none and used linear PCM with a 44.1 kHz sample rate. The audio sounded exactly like the source. Using the menus, it was easy to try out the different compression schemes that were included with the Netstar - MPEG Layer 2 and 3, MPEG 2 AAC, MPEG 4 AAC-LD, G.711 and G.722.

The built-in Web browser made setup a snap. At a glance you can see the status of the current connection and what configuration you have on the near end and also the far end. And you can change the settings on the far end if needed. This can save a lot

### Performance at a glance

- IP or ISDN-capable codec
- Voice mode
- Analog or AES-3 inputs
- Easy-to-use menus

The Netstar Web interface provides access to the unit's functions and settings.

Besides using the Netstar on the university's network, I tried it on the cable modem that we have. After enabling the DHCP mode and rebooting the modem and the Netstar, I was able to connect to Musicam USA's IP address over the public Internet using MPEG Layer 2 at 128kb/s. Although the audio sounded fine, the connection did not hold any longer than three minutes at a time. Cablevision noted that the signal to the modem was weak and causing packet loss. This was probably causing the disconnects.

Construction of the unit was first rate with a substantial front panel. The keypad is a membrane click type and looks like it will survive for years, unlike the Prima's spongy pushbuttons, which had no tactile feedback. Inside, the Netstar has an Intel D845 micro ATX motherboard with a solid drive memory module installed in the IDE slot. Power is supplied by a standard slim-line PC Power and Cooling supply. The proprietary Musicam cards were horizontally installed on a vertical riser on one of the PCI slots on the motherboard. The motherboard and the riser card had metal bracing to the chassis, which ensures that nothing will work loose over time.

We have been using the Netstar 500 as an STL on the university's network for the last 90 days without any dropouts or connection problems. Because the audio is uncompressed, the quality of the sound on WCWP has improved considerably over the Prima's 128k we had been using. We have also used the return feed to send live music broadcasts from the Tilles Center at the CW Post Campus to WLIU and back again to WCWP with no noticeable audio degradation. 

*Anderson is chief engineer for Long Island University's WLIU Southampton, NY, and WCWP Brookville, NY.*

## Digigram Ethersound ES8in/ES8out

By Ed Ruzumna

It is often said that Cartersville, GA, is 45 miles north and 100 years away from the hustle and bustle of Atlanta. So it is understandable that a community that has been cited as one of the 100 Best Small Towns in America would want to protect the appearances of its historical area.

Because of this, the not-for-profit station WBHF-AM (1450) was faced with some challenges when it moved its studio in 2003 from a corporate location outside of town to the bucolic historical district. The

and ES8out using the existing Ethernet. We set up a virtual LAN, which dedicated 100Mb/s of bandwidth on the network. The five satellite dishes at the corporate office travel as streams through the system and break out on the studio end.

Ethersound ES8in injects eight analog balanced audio signals into an Ethersound network, while the Ethersound ES8out extracts eight analog audio signals out of an Ethersound network. The network set-up is as easy as plugging in an Ethernet cable. System set-up, control and re-configuration are operated remotely via straightforward PC software. No specific IT expertise is required. Applications include synchronous high-quality audio distribution in broadcast facilities, fixed installations and live sound.

One hitch I encountered is that Ethersound requires a dedicated network with the same bandwidth at all times. The Ethersound devices' identity is indicated by their MAC address, and a dedicated control software (EScontrol)

community fathers were all for a station that is big on the prep sports scene and local news, but they weren't too keen about the prospect of multiple four-foot-high satellite dishes being placed on top of the studio's building.

A combination of Digigram's off-the-shelf Ethersound audio bridges ES8in/ES8out and existing Ethernet that runs the four miles between the old facility and the new studio allowed the radio station to keep its dishes in place and keep the historical-minded community happy. Plus, the station saved costs by not installing the satellite dishes at the new site.

### A tricky situation

We investigated several methods to carry the audio from the old location to the new studios, but each either required a higher ongoing cost or did not provide the reliability that we wanted. Because we had fiber running between the corporate building and the new station, we were able to install Digigram's Ethersound ES8in

### Performance at a glance

- High-quality audio distribution
- Integrates into existing Ethernet infrastructure
- Low latency: 125µsec at 48kHz sampling rate
- 24-bit, 48kHz audio performance
- Reduces cabling needs
- Easy configuration

is used to address, manage and control them. In our installation, we placed the terminals in an isolated portion of our network by creating a VLAN.

The way it is configured now, the system occupies 100Mb/s at all times, regardless of actual usage. It would be ideal if the system would dynamically occupy bandwidth as it is needed instead of holding a continuous chunk of the network. The advantages of the current method are the extremely low latency and that the bandwidth is always available to Ethersound. There is no danger of the network being too busy to accommodate the audio demand when it arises.

And as WBHF AM-1450 found out, using Ethersound ES8in/ES8out and existing Ethernet kept our architecturally-minded neighbors pleased as well.

Ruzumna is chief engineer of WBHF.

# Ring of Fire

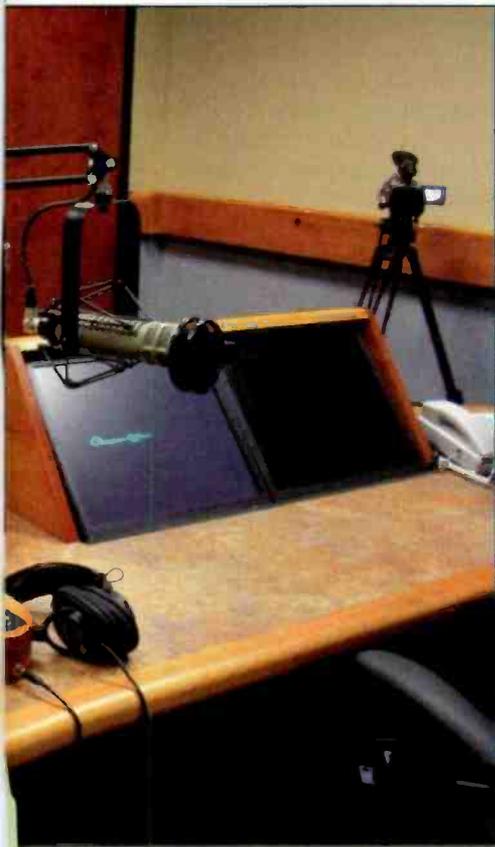

## Debuts New Talk Facility

The battle of the radio talk shows continues as new liberal-oriented hosts go on-air to combat the well-established conservative personalities. One show, *Ring of Fire*, co-hosted by Mike Papantonio and Bobby Kennedy Jr. and carried by the Air America Radio Network, will be produced in Pensacola, FL. Mike Papantonio is an attorney and senior partner at Levin, Papantonio, Thomas, Mitchell, Echsner, and Proctor, P.A. who has tried some of the most significant civil damage cases in North America and is the author or co-author of several best-selling books, including *In Search of Atticus Finch*. Bobby Kennedy Jr. has earned the reputation as one of America's most eminent and tenacious environmental, social and political advocates.

The venue for production of *Ring of Fire* did not exist when the idea for the show was conceived almost six months ago, but in late December, Papantonio allocated space for the studio within the building that houses his law offices. Because Papantonio and his staff are novices to

the details of broadcasting, they sought outside expertise to create the new studio, and that's when I came in. *Bobby Likis Car Clinic*, which now airs from the studio I built inside my 15,000-square-foot automotive service facility, has been running for more than 17 years. Car Clinic programming is currently syndicated on 296 radio stations nationwide, the Internet, Sirius Satellite Radio, the American Forces Radio Network and television. This blend of national-quality experience and local availability made me the go-to guy for talk-show

Constructed from Lyptus hardwood, a hybrid hardwood species, the talk studio furniture maintains low sight lines for a clean layout.

# Ring of Fire

facilities. In early January, Papantonio retained me to design and contract construction of the studio, as well as to equip it with state-of-the-art broadcast technology.

The finished product substantially evolved from the original concept because I felt it was essential that Papantonio and Kennedy had whatever facility they might need to produce their current program and to poise them for the future.

The control room oversees the talk studio, and was designed to maximize its flexibility in a limited area.

My goal was to build a studio that all would be proud to claim. The crews were encouraged daily to listen and provide feedback as to how to finish the project as fast as possible—and with all the specifics desired. Personally, I wanted the studio to impress the media. I believe this was accomplished.

My first call was to Rudy Agus, a broadcast engineer with whom I have collaborated with on several past projects. Agus specified and arranged for the purchase of all the necessary equipment, but when it came to furniture, we were temporarily stymied. Personalities of the stature of *Ring of Fire's* hosts demand and deserve a more sophisticated level of atmosphere and ambience than standard off-the-shelf offerings from most broadcast furniture manufacturers. Agus suggested that I speak with Balsys Wood Arts, a relative newcomer in the broadcast furniture field, but owned by people with a long and successful history in broadcasting as well as in the design and construction of fine wood cabinetry. The unique marriage of broadcast experience and master craftsmanship proved to be a superb combination.

This project was analogous to automotive service.

The Host Desk has been renamed Buddha because everyone rubs it when first entering the room.

Car owners think tune-ups can fix anything because they don't understand how sophisticated today's vehicles are, and certainly don't know the right questions to ask. This project began by asking myself, "What if I were building a replacement studio for myself?" I used this criterion throughout the project.

The first challenge was to create a radio, TV and Internet streaming facility for two attorneys who only wanted to produce a one-hour taped weekly radio show, which can be done with practically no equipment and little room. It's well known that there are a few radio talk hosts who work out of their homes.

The second challenge was turning a small office and adjacent

hallway into a studio and a control room. Rocky Barnes, the firm's investigator, provided whatever support was needed to complete the job, including knocking out walls, adding dedicated HVAC systems, electrical boxes, wiring, doors, divider glass and a host of other building modifications. All the while, Barnes had to be sure he didn't take too much of the firm's office space.

While the project progressed, there were law-office personnel working four feet away from the construction areas from day one. No doubt they were happy to see the project finally come to an end.

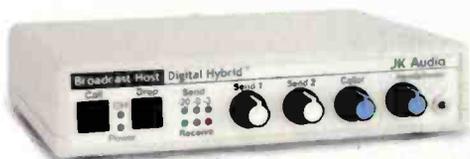

Richard Christine of Acousti Engineering Company of Florida was the building contractor. He scheduled his crews to work when business hours were over whenever noise might be involved. This was a huge challenge, but necessary because the studio is adjacent to an accounting firm.

Christine consistently under promised and over delivered, but it was his carpenter, Rick Sibley, who could do anything with wood that was responsible for building the working model of my third challenge.

The third hurdle and most challenging environ-

# Ring of Fire

mental issue to deal with was a way to conceal all the wires in the studio. Remembering that this is a fifth-floor clerical office with concrete floors and drop ceilings.

Because the existing site had no provisions or clearance for conduits, I designed and had built a novel concept for wire management between rooms. On the right wall of the studio,

we installed a hollow chair rail with drop-down doors for 25 pair CAT-5 house cables and other wiring. On the left, we completed the perimeter of the room by balancing the look with corresponding standard rail. The wood for both these rails also came from Balsys, ensuring that all hardwoods within the room would match in color, grain and finish. This feature not only simplified the installation, but also accommodates future upgrades and expansion.

From the initial call to Balsys, which launched an incredible exchange of concepts and an education on the pros and cons of various materials, to the ultimate evolution into a remarkable collaboration, the professionals at Balsys were a joy. Larry and Eric Lamoray, each an artisan in different facets of the business, soon became more than just vendors; they transformed our preliminary look-and-feel requirements into spectacular, functional designs that would fit into limited spaces and at the same time would have dynamite visual appeal.

The host desk itself was the result of several conversations and design reviews. Initially, I wanted to place twin 17" LCD screens on the host's desk, but someone suggested that they should be hidden.

The chair rail is actually a drop-down door that conceals the cable routing trough.

The remote kit sees regular use when the show takes to the road.

After some discussions, we decided that placing the monitors behind a glass panel would be too much to ask. Instead, I designed a hood, which was later named the dashboard.

studio rooms entirely cleaned prior to the official unveiling. The smile on Papantonio's face was worth all of the work and extra hours spent attending to the finer details that many may overlook on such projects.

In addition to the studio installation, a remote rack was assembled to allow co-host Bobby Kennedy to join Papantonio via POTS or ISDN using Tieline Communicators. A Zephyr Xstream is used to send the program audio to New York. The final step is an Airtools profanity delay.

The result is a showcase facility that we can be justifiably proud of and that is a testament to the quality of workmanship of all of the companies that cooperated in the construction.

Likis is the president of the Car Clinic Network (CarClinicNetwork.com), Pensacola, FL

Because there was the need for the director to be inside the studio, a desk with two screens, a computer and a head-phone jack was installed. The host has equal access and controllability of the director's computer.

Balsys delivered and set up the furniture, complete with all internal prewiring mounted and tested to streamline Agus' task of installing the equipment. (It was fortunate that Balsys had requested precise measurements of each door and hallway from building entrance to studio locations, as the last doorway offered only 1/4" clearance.) Each piece of furniture was assembled, leveled and polished, and then both

## Audio analyzer Neutrik Test Instruments (NTI)

Acoustilyzer AL1: The extended functionality of this analyzer includes acoustical measurements such as sound level metering with LEQ, SEL and short-time LEQ; real-time frequency analysis in 1/1, 1/3 octave bands; FFT analysis down to 1Hz resolution; and reverberation time measurements RT60 and delay measurements.

info@nt-instruments.com

## Mixing control surface Digidesign

Command 8: This control surface from Digidesign and Focusrite provides a space-efficient unit with faders, rotary encoders, displays and dedicated transport controls that enable users to build their ProTools mixes with the hands-on feel. A USB connection facilitates communication between the unit and a PC or Mac, while its built-in MIDI ports (1 in/2 out) comprise a MIDI interface. Each of the unit's eight bankable channels of controls includes a touch-sensitive fader, an automatable rotary encoder with an LED ring and a channel meter. The onboard analog monitor section eliminates the need for an additional audio mixer. The monitor section features two +4/-10 independently selectable stereo inputs (balanced or unbalanced), stereo speaker outputs (also +4/-10), and a separately controlled headphone amp, providing the monitoring flexibility needed to keep an ear on a sessions' development.

www.digidesign.com; prodinfo@digidesign.com

Mixcraft: Mixcraft is a Windows program that allows multitrack recording into a PC. Multiple tracks of audio can be edited with cut and paste, and effects such as reverb and EQ can be added. Productions can be burned to a CD. Mixcraft's 32-bit sound engine supports recordings at CD quality and above. Each track has its own pan, volume and effects, including reverb, delay/echo, EQ, compression, flanger and chorus. The maximum number of tracks is only limited by the processing power of the computer. The software also offers looping tools and can use loops from existing loop libraries.

## Multi-track recorder Acoustica

## Large-diaphragm condenser mic Hollywood Edge

E49: A remote variable-pattern tube mic, this product uses Soundelux's KK47 large diaphragm capsule. The output transformer provides a correct impedance match to any mic preamp input and offers lower intermodulation distortion and improved frequency linearity in the low and middle frequencies. The mic features a double shock mounting system that includes a capsule-to-electronics

shock assembly and a separate capsule and electronics package shock mount. The included universal outboard power supply has a continuous variable polar pattern control that adjusts from figure-of-eight to cardioid and then to full omni-directional.

## Broadband optimization service EXH

B-Bop: B-Bop is an acronym for broad-band optimization and allows a broadcaster to upgrade an existing rigid coaxial transmission line to broadband performance without replacing it. The process begins with a set of measurements of the transmission line that provides a set of baseline data from which a mathematical model can be generated. This model then calculates the physical dimensions of line sections that, when inserted into the transmission line run, will break up the addition of reflections from the flange joints. This, combined with the short lengths of the line sections, allows a rigging team to make the modifications using only the tower elevator, thus eliminating the time and expense of having to rig the tower with a winch.

## Two- and three-conductor mic cable Heil Sound

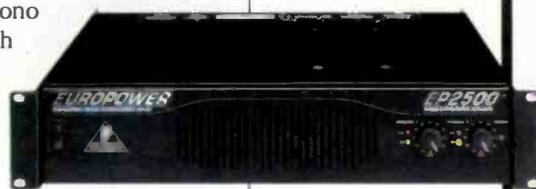

**Heil Wire:** This specialized cable is specifically for use in interfacing balanced audio lines from a professional audio mixer into the transmitter input. The cable can also carry the dc control lines from a push-to-talk circuit or a computer keying system. This wire can reduce the capacitive coupling between these two signals and shield the audio lines from the outside RF environment to reduce interference that the transmitter may create. This product contains two 18-gauge audio leads residing in a silver-braided shield. Along the side of this shield is another pair of 18-gauge control wires that can carry the push-to-talk circuits and keep the dc components away from the ac audio signals. The outer jacket is a PVC jacket that fits into the cable clamp system of the eight-pin Foster plug.

## Amplifiers Behringer

**Europower EP1500 and EP2500:** These two-channel amps can operate in parallel or bridged mono modes and feature an independent limiter for each channel, selectable low-frequency filters and high-current Toroid transformers. The EP1500 yields 2x700W into 2Ω and 1,400W into 4Ω in mono bridged mode, while the EP2500 model provides 2 x 1,200W into 2Ω and 2,400W into 4Ω in mono bridged mode. Each amp is equipped with a back-to-front ventilation system, including an air filter with automatically adjustable fan speed and balanced XLR and 1/4" TRS inputs.

# Control Freaks!!

New Relay Multipliers & Converters Distribute Control Where It's Needed

### The pREX Programmable Relay Multiplier & Function Converter

- Has 12 optocoupled inputs and 16 microprocessor-controlled relay outputs.
- Control any output or a group of outputs from a single input or from a group of inputs using logic modes like AND, OR, XOR, NOR, NAND, NXOR, Interlocked, etc.
- Output modes include: Momentary, Toggled, Leading or Trailing Edge, Pulse Stretching up to 45 hours, Input Debounce, Maximum Ontime, Minimum Ontime and more.
- Serial port for programming or controlling the relays using either terminal program or free GUI.
- 50-pin telco connector for instant punchblock connectivity. Telco block/cables also available.

### The REX Affordable Relay Expander/Multiplier

- The REX accepts a wide variety of input signals & converts them to contact closure outputs.
- REX's optocoupled inputs can be driven from active high or low incoming signals.
- Each of the six inputs controls four SPST relays for a total of 24 outputs.
- The REX features a 50-pin telco (RJ-21) type connector that interfaces directly with prewired telco punchblocks. Type 66 telco punchblocks & cables are optionally available.

## The AES-302 Digital Audio Switcher/Distribution System

- Two Input Switcher*
- Automatic or Manual Switching*
- Optional Silence Sensor*
- Status Monitor with Memory*
- Front Panel Headphone Jack*
- High Quality 24 bit 96 KHz D/A Converter*

Introducing the next generation digital audio switcher from BDI. Now you can have complete confidence in your signal path with the AES-302. Feed main and back up AES streams to the inputs and the selected feed is routed to four digital outputs and an analog stereo output. If a fault occurs, the automatic switcher selects the alternate feed. There is extensive front panel error and operational status and a headphone jack for confidence monitoring. The AES-302 has a remote control interface for easy attachment to remote control systems. The AES-302 is future proof too. The digital components mount to a plug in pc board which can be upgraded in the future should digital audio standards be enhanced or your requirements change. Call your local broadcast equipment dealer to order. Call us or visit our website for detailed information.

### NAGRA ARES-BB

Constructed from brushed aluminum, the ergonomic layout of the ARES-BB with a pivoting keyboard permits operation while over the shoulder or sitting on a table. A large LCD display gives information about the state of the card, recording levels and operating mode of the machine. Software driven menus (including 4 templates) guide the user through a visual set-up of the machine. The ARES-BB comes standard as a linear PCM recorder up to 48kHz stereo 16 bit. Mic/Line inputs and line outputs are equipped with XLR connectors. The Flash card can be formatted FAT16 and is automatically recognized by Windows or MAC O/S. Files are saved as Broadcast Wave Format (.wav).

The ARES-BB is a rugged tool for Broadcast and ENG applications. Come see for yourself.

# Contributor Pro-file

Meet the professionals who write for *Radio*.  
This month: ESPN Radio, page 50.

**Allen Singer**  
*Allen's Edge*  
*Cincinnati, OH*

In the late 1990s and early 2000s, Singer pursued a career as an installation and broadcast engineer. After graduating from college in 1996, he

worked for Harris as an installation technician. Following that, he worked for WRRM/WMOJ in Cincinnati as an assistant engineer. After getting let go after 4 1/2 years as an engineer, Singer worked for an A/V installation company in Cincinnati for nine months. After that, Singer decided to pursue freelance writing as a career because his book, *The Cincinnati Subway*, was selling so well.

## That was then

This is the on-air studio of WFMT Chicago in 1983. WFMT was, and still is, a classic music station with cable distribution of its programming throughout the United States.

The reel-to-reel tape recorders in the foreground are Revox PR99s; those in the background are Studer A80RCs. The turntables are Technics SP-15s with Audio-Technica tone arms. The console was custom built by the chief engineer at that time, Al Antlitz. The cassette recorder is to the right of the console.

The panel below the cassette recorder and the displays above are for audio routing switcher control, designed and built by Gordon Carter, the current chief engineer at WFMT.

There were also Apt Holman phono pre-amps not seen in the picture. The CD player (behind the word update) was manufactured by Philips/Magnavox, and the microphone is an AKG D-202. Steve Reeder, a WFMT announcer, is at the controls.

## Sample and Hold

### Top 25 Radio Owners by Revenue per Station

Radio magazine 2003 rank	Owner	Avg. Revenue per station (Radio Magazine) (\$000)	2003 BIA Total Revenue Rank	Radio magazine 2002 rank	2003 BIA Estimated Revenue-Owner (\$000)	Owner # Stations Present	Owner # Markets

BIA ranks owners by total revenue. Radio magazine has taken this data and then divided it by the number of stations owned, to provide a ranking based on individual station average performance, which shows the revenue efficiency of each owner. For comparison, we have included the BIA ranking, the owner's 2002 Radio magazine ranking and the average revenue per station.

\* - Not ranked in 2002.

# D-8000

## Digital Radio Console

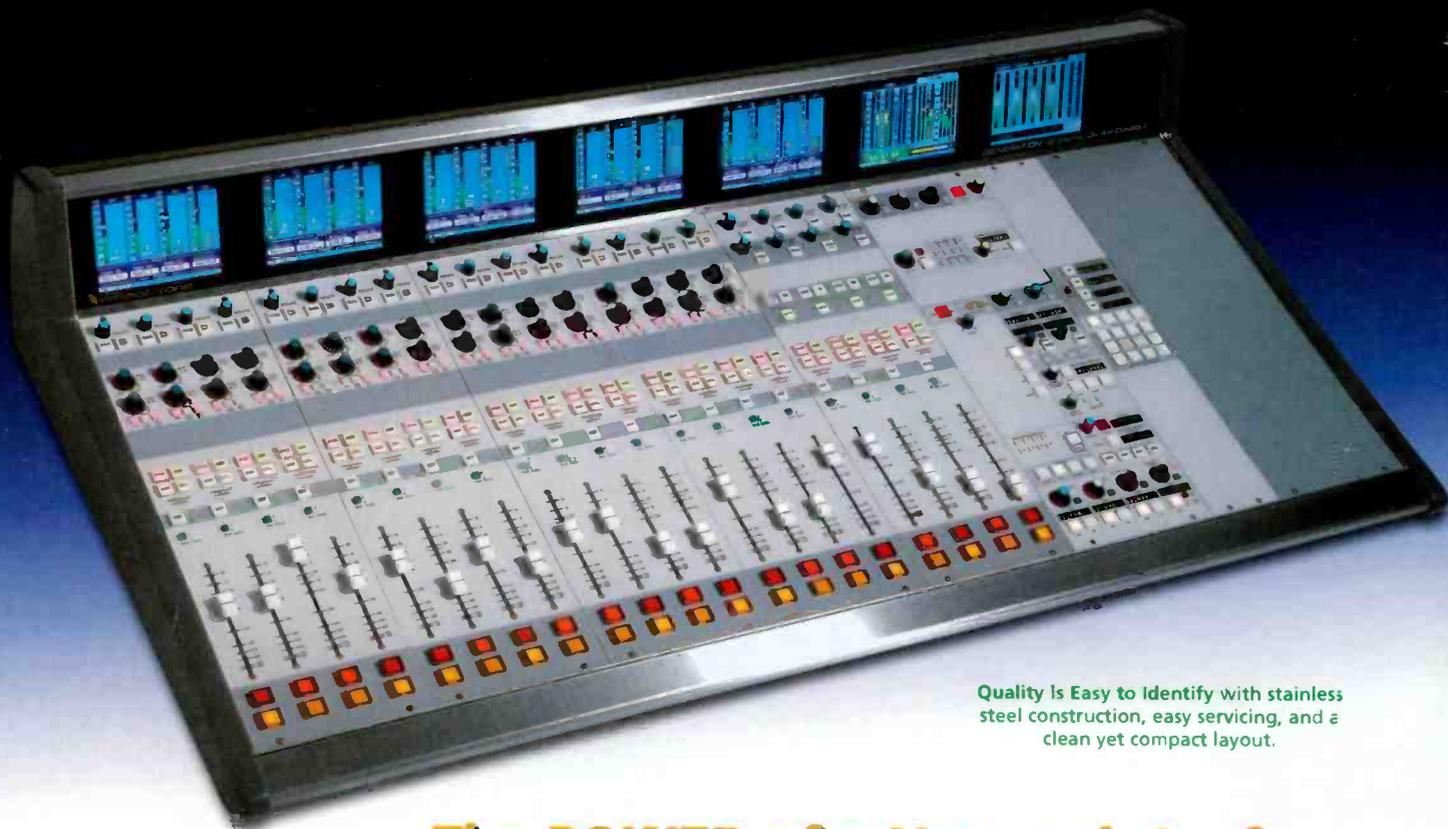

**ADVANCED TECHNOLOGY!** WHEATSTONE'S fourth generation digital console has what you need: dual-domain input modules that accept both analog and digital sources; built-in router integration with 8-character displays; a choice of features like auxiliary sends, equalization, dynamics control and event memory/recall—all without the aid of an external computer. The D-8000 is an all-modular design with no active components mounted inside. And best of all, it uses Wheatstone's exclusive VDIP® setup software, letting you easily configure individual console modules, logic modes and automatic functions. **Contact Wheatstone—the digital audio people!**

# **GENERATION-8:** The On-Air Control Surface for High-Traffic Studios

Quality Is Easy to Identify with stainless steel construction, easy servicing, and a clean yet compact layout.

## **The POWER of a Network Surface with the FEEL of a Traditional Console!**

ONE CAT-5 WIRE conveys all the control from this surface to Wheatstone's Bridge System. You can bring any system source (inputs or mixes) to any console fader or monitor pot (source visibility software controlled). You can set destinations for mixes, aux sends and MXMs to anywhere in your facility. For example, you could allow (or software disallow) your news console to go to your on-air chain, or feed any mix desired to a talent or remote position.

THIS MAJOR MARKET CONSOLE can handle all the call-ins and remotes you'll encounter. Four faders, dedicated specifically to phone segments provide errorfree interface to four callers or remotes, each with independent caller and fader feeds, user

selectable talkback communication and adjacent channel linking. A dedicated LCD display screen keeps the operator informed and in control.

YOU CAN STORE AND NAME switch and fader settings for each operator's task and recall them by simply spinning an encoder and hitting a TAKE button. And like our larger G-9, the G-8 has 12 user programmable switches for salvos and intercoms plus additional programmable TALK buttons for IFB functions. And with full color LCD display screens the operator will know for certain that his signal is clean, his sources correct, and his preset signal is ready and waiting. *The G-8 has the layout and features to let your operators work fast and accurately!*
