ACKNOWLEDGEMENTS

SECRET CB Wishes to gratefully acknowledge the following people FOR THEIR HELP AND CONTRIBUTIONS TOWARD GETTING VOLUME 17 IN PRINT, Their encouragement and contribution of material has been invaluable,

## INTRODUCTION

Thanks to my new Co-Author, William G. Wentz, Ir., we have another great volume of SECRET CB for you to enjoy. I am very grateful to Bill for sharing his knowledge with us and for his diligence in preparing this volume. Bill has surely saved SECRET CB from extinction. I am also grateful to all of our readers, especially those that have shared their knowledge and experiments with us. Without you we would not have this volume, and with your continued support we can keep going on $\varepsilon$ on $\varepsilon$ on.

We are trying very hard to keep up with new information and new ideas. And again we need your help with schematics and any new information you can pass on to us.

We now have some good instructions for installing SECRET CB Kit \#27 into the Realistic TRC-490. We also have two kits that will fit the Stalker IX Export model, SECRET CB Kit \#13 and Kit \#33.

If you like to work CROSSWORD PUZZLES then you will want to turn to page 79 and get started on the one we have in this volume. Also, if you are one of the first ten to get it correct you will win one of our famous SUPER DIODES. All entries must be postmarked by December 31, 1983 and the answer will be published in SECRET CB Volume 18. We are planning to put a new puzzle in each volume if we get a good response from this one. So let us know if you like the idea.

We advertised in volume 16 about a Buy/Sell/Trade NEWSLETTER that we thought all of you readers would be interested in. We needed 100 subscribers to get it off the ground, but as of this writing we have not reached that figure. We are going to extend the subscription period up to the time we come out with SECRET CB Volume 18 which should be around the last of January 1984. If we have not reached the 100 mark by then we will abandon the idea. So let us hear from you!!!!!!

All of us here at SECRET CB want to wish all of our readers a VERY SPECIAL HAPPY HOLIDAY SEASON.

Until next time......

Always Sincerely yours,

Doris Selman

## "B" KIT by CARD_KIT ELECTRONICS

READ the article; all F申's are in MHz-unless otherwise noted...
As stated in the announcement (Vol. 16, pg. 8) the principles used in the development of the " $\mathrm{B}^{\prime \prime}$ Kit are quite simple. All PLL Chips using a .455 off-set shift, can be reversed in their shifting direction.

The VCO output is normally used during receive as the Local Oscillator (L.O.) Frequency. During transmit it is shifted up by .455 and combined with the Reference Oscillator Frequency (Ref. F) of 10.24, to generate the Transmitter Frequency (TX-F).

During receive the L.O. Freq. is beat with the incoming RF signal which creates the lst Intermediate Frequency (IF) 10.695... This lst IF is then beat with the Ref. F. (10.24) to create the 2nd IF of . 455... The 2nd IF is then rectified/detected and the .455 is filtered out to create the Audio Prequency (AF)...

However, there is a second frequency that can be received that if it is allowed to combine with the Ref. $F$ will also create a 2nd IF of $455 .$. . This frequency is referred to as the Anti-Image Frequency.

This is what occurs: Symbol- ) (, = Mixed or Combined with.. IMAGE.......... 27.075 ) ( $16.380=10.695$ ) ( $10.24=455 \mathrm{KHz}$ ANTI-IMAGE.... 26.165$)(16.380=9.785)(10.24=455 \mathrm{KHz}$

The Anti-Image is prevented from entering the 2nd Mixer Stage by a ceramic or crystal filter. This filter passes the 10.695 and blocks the 9.785...

Now, if we change the direction of shift on the PLL Chip, the L.O. is 455 KHz higher than normal during receive. Transmit is 455 KHz lower than normal.

Example: 27.075 (Ch-10) becomes 26.620 TX-Fo.
During receive the VCO Output of L.O. Frequency 16.380 becomes 16.835... Now to look at it graphically....

IMAGE.......... 27. 530 )( $16.835=10.695$ )( $10.24=455 \mathrm{KHz}$
ANTI-IMAGE.... 26.620$)(16.835=9.785)(10.24=455 \mathrm{KHz}$
Now the Anti-Image becomes desirable and the Image is undesirable frequency. Since the lst IF of 9.785 is blocked by the 10.7 ceramic filter, it must be replaced.

The above information is strictly to remove any mystery about what the "B Kit" is designed to accomplish. Namely to reverse the direction of PLL shift and switch filters.

At present, there is one other requirement needed within the unit to be modified, besides having a 455 KHz offset shift. The unit must also have a tuning tank preceeding the ceramic filter. This requirement will hopefully be eliminated in the future, and add more units to list of those modifiable.

This change to the "B Kit" has already been tested. Delay is getting the necessary components to replace the filters.

Additional units made possible to modify by the component change will be featured in up-coming volumes of "Secret CB".

Order your kit from Selman Enterprises - ask for Kit \#136"B".

GENERAL INSTRUCTIONS:
Before starting your modification you should decide if you wish to make a straight installation, which gives frequencies 26.510 thru 26.950 in 10 KHz steps. Or to be compatible with older sets and have 26.515 thru 26.955 also. All that is needed is to install the SPDT switch provided or mount the variable capacitor on one of the existing switches.

If you do not wish the 26.515 thru 26.955 , omit all instructions under 5 KKHz OFFSET and do CHANNEL CONVERSION only.

How to make up the SPDT switch is illustrated in "Secret CB"; Vol-14. Pg. 21... "B Kit" will use both a new switch and capacitor; Capacitor is smaller in size, but same value; Switch now has only two terminals. oo.When making up the switch it is advisable to first solder wires to it, then solder the capacitor...

## EQUIPMENT REQUIRED:

As written these modifications call for a Counter and Signal Generator. We realize that many persons don't own a sig. Gen. but there is an alternative.

Instead of modifying one unit, do two at the same timel Make the complete installation in both units except the receiver tuning. (Use one of the units as a Sig. Gen. as you calibrated it with Counter). Put one on a separate power supply, set at a distance from the other. Install a 50 ohm, 4 W dummy load, avail. at $\mathrm{R} / \mathrm{S}$., and there is your Sig. Genoookey it up and do your alignment on the other, then reverse units.. Note: Turn volume down on the receiving unit to prevent feedback.

## MOUNTING HINTS:

1. Since extra space is almost non-existant in the smaller units it is difficult to mount any kit. But usually in most units just above the PLL Chip on the chassis there is sufficient space to mount the epoxy pack of the "B Kit". If you wish to add the 5 K OFFSET; may have to use an existing switch (NB, etc.); or use SPDT switch provided.
2. When mounting the Epoxy pack leave the washer on the inside of the chassis. Only the outer locking nut will be outside.
3. When you are ready to mount the Epoxy Pack permanently bring out the wires of the pack on the side next to the PCB. Also, it is helpful to put a blob of silicon glue on each side of the switch toward the ends. This will isolate the pack from chassis and also help in securing tightly.
4. When punching, drilling or otherwise preparing the cover: allow space for the switches to toggle without making contact with the covers. If you wish to make your finished product neat and professional, you might use a piece of patching rubber (Black) to cover the hole. Using a spur type leather punch (generally the largest spur) punch a hole in the center of a small patch. This will fit over the barrel of the switch like a switch boot. Then install covers, not only looks good - but helps lock the nut..

## SERVICE HINTS:

If the switch becomes intermittent, remove nuts and washer. You will find a collar mode of masking tape on the switch, move this up to form a type of cup around the barrel. Fill the barrel and "cup' with lighter fluid, toggle the switch back and forth until the problem clears up. Shake out the excess and replace...

NOTE: IF ANY TECHNICAL ASSISTANCE IS NEEDED TO COMPLETE THE MOD OR IF
YOU THINK YOU have a fauliy Kit. - CALL THE NUMBER LISTED ON THB KIT.
"CARD KIT" ELDCTRONICS WILL BE HAPPY TO ASSIST.......

## SK OFFSET

1. Wire up the SPDT switch and the variable capacitor(supplied) as shown above.
2. Remove C-205, Move C-204 to where C-205 was.
3. Cut the printed circuit trace as shown while making sure the 10.24 crystal and pin 11 of the PLL chip are connected. 4. Solder the two wires from the SPDT switch across this cut. 5. With the unit on channel 10 , and the $S P D P$ switch in low position, apply power to the unit. Check the TX frequency for a reading of 27.075 . If it is too high add a small capacitor across C-205 on the circuit side of the board. If it is too low change C-205 to a smaller value capacitor.

Note: 1 pf change in value will shift the frequency approx. 200HZ. If your reading is within

500HZ it is well within tolerance.
6. Switch the SPDT switch to Hi. position and adjust VC for a TX frequency reading of 27.080 .

Note: On the Colt 355 we suggest that the existing switch be used for the 5K Offset.

## CHAMEL COIVERSION - COBRA 19XS, MIDLAND 103M, COLT 355

1. Renove CF-1 ( 10.7 ceramic finter). Solder cable \#1 in its place. Put the white or yellow wire on the side that is connected to L-103.
2. Renove the jumper connected to pin 20 of the PLI chip. You will find it just under the notched end of the chip.
3. Separate the three wires in cable \#2. Connect the orange wire to pin 20 of the PLL chip and the brown wire to the other point where the jumper was removed.
4. Connect the red wire to pin 18 of the PLI chip.
5. With the channel selector on ch. 10, the SPDT switch in low position and the epoxy pack switch in normal, apply power to the unit. Peak the receiver in your normal manner. Mark the setting of I-103.
6. Switch the epoxy pack switch to low position. Inject a low signal level of 26.620 or use a previously modified unit, sane settings. Now repeak the receiver usine l-103 only. yote the amount and direction of adjustinent needed. When you have achieved peak, back the adjustment off by $\frac{1}{2}$ of the signal level increase.
7. Nount the epoxy pack using the mounting hints.

Note: The Midland-103in has a plastic cover. Drilling is suggested.

1. Wire up the SPDT switch and the variable capacitor (supplied) as shown above.
2. Cut the printed circuit trace as show, between the 10.24 crystal and $C-76$.
3. Solder the two wires from the SPDP switch on each side of
the cut trace.
4. With the channel selector switch on ch. 10 and the SPDT switch in low position, apply power to the unit. Check the TX-frequency for a reading of 27.075. If it is too low change C-76 (47pf) to a smaller value capacitor, about 39pf. Now add small capacitance if needed in parallel to bring the reading back down.
5. Switch the SPDT switch to the Hi position and adjust the VC for a TX-frequency reading of 27.080 .

Iote: The COBRA 18IND, President-AK 4 , $\&$ Stalker 3 may be modified in this same manner except you will have to add a 10.695 tank in the place provided and remove the collector load resistor.

1. Remove Fir-1 (10.7 Ceramic Filter). Solder cable \#1 in its place. Pu.t the white or yellow wire on the side that is connected to L-16.
2. Remove R-63.
3. Separate the three wires in cable 2 . Connect the orange wire to the point where $\mathbb{R}-63$ was connected to pin 8 of the PLL chip. Connect the brown wire to the other point where $\mathrm{R}-63$ was removed.
4. Connect the red wire to pin 1 of the PII. chip.
5. With the channel selector on ch. 10 , the SPDT switch in low position and the epoxy pack switch in normal position, apply power to the unit. Peak the receiver in your normal manner. Mark the position of $\mathrm{I}-16$.
6. Switch the epoxy pack switch to low position. Inject a low signal level of 26.620 , or use a previously modified unit on the same settings. Repeak the receiver using L-16 only. Note the amount and direction of adjustment required. When you acheive peak back off the adjustment by $\frac{1}{2}$ of the signal level increase. 7. Mount the epoxy pack using the mounting hints.

Hote: In most cases the epoxy pack will have to be mounted on the opposite side from the PLL chip.
 PRESIDENT ANDREW J.

1. Wire up th SPDP switch and the variable capacitor (supplied) as shown above.
2. Cut the printed circuit trace as shown between the 10.24 crystal and C-111 and its parallel capacitance.
3. Solder the two wires from the SPDT switch on each side of the cut as shown.
4. With the channel selector on ch.10and the SPDT switch on low position, apply power to the unit. Check the TX-frequency for a reading of 27.075 . If the reading is too low adjust $V C-1$ or change the size of the fixed parallel capacitor to bring the reading within tolerance.
5. Switch the SPDT switch to the Hi position and adjust VC for
a TX-frequency reading of 27.080 .
Note: These units, being the larger units, can easily accommodate both the "A" \& "B" Kits, but when using bothkits we suggest that IF 5K OFFSET is to be used, use one of the existing switches.

6. Remove CF-1 ( 10.7 ceramic filter). Solder cable \#1 in its place. Put the white or yellow wire on the side that is connected to L13.
7. Remove R-58.
8. Separate the three wires in cable \#2. Solder the orange wire to the point where $\mathrm{R}-58$ was connected to pin 8 of the PLL chip. Solder the brown wire to the other point $R-58$ was connected. (If you are using both kits solder the brown wire to the center contact of the DPDT section that is being used for PLL $T / R$ shift.)
9. Solder the red wire to pin 1 of the PLL chip or to the red dot of the "A" Kit epoxy pack.
10. With the channel selector on ch. 10 , the SPDT switch in low position and the epoxy pack switch in normal position, apply power to the unit. Peak the receiver in your normal manner. Mark the settings of $\mathrm{I}-3$ \& $\mathrm{I}-4$.
11. Switch the epoxy pack switch to the low position. Inject a low signal level of 26.620 or use a previously modified unit on the same settings. Repeak the receiver. First use I-3. Bring it to peak and then back it off by $1 / 3$ of the distance of the change in tunning. Now peak again using $1-4$. Peak it and then back it off by $1 / 3$ of the change in tunning.

12. Kount the epoxy pack using the mounting hints.

13. Wire up the SPDT switch and the variable capacj.tor (supplied)
as show above.
14. Cut the printed circuit trace as shown between the 10.24
crystal and R-109 paralleled by I-24.
15. Solder the two wires from the SFDT switch on each side of
the cut as shown.
16. With the channel selector on ch. 10 and the SPMT switch in low position, apply power to the unit. Check the TX-frequeacy for a reading of 27.075. If needed adjust I-24 to obtain this reading.
17. Switch the SPITT switch to the Hi position and adjust the VC for a TX-frequency reading of 27.080 .

IIOTE: Although this is a large unit and can easily accommodate both the "A" \& "B" Kits. you can not acheive evenpower tracking over the entire range fron 26.510 to 27.860 and it is not for the same reason as other kits (like of VCO tracking). It is due to the narrow band-pass of $\mathrm{L}-20$ and $\mathrm{L}-21$.

## CHANIEL CONVERSION - COBRA 29 GTL \& LTD

1. Remove FL-1 ( 10.7 ceramic filter). Solder cable ${ }^{* 1}$ in its place. Put the white or yellow wire on the side connected to L-5
2. Cut the printed circuit trace between the anode of $D-15$ and pin 9 of PLL chip.
3. Separate the three wires of cable \#2. Solder the orange wire to pin 9 of the PLL chip and the brown wire to the anode side of D-15.
4. Solder the red wire to pin 11 of the PLL chip.
5. With the channel selector on ch. 10, the SPDT switch in low position and the epoxy pack switch in normal position, apply power to the unit. Peak the receiver in your normal manner. Mark the settings of $\mathrm{L}-5$ \& $\mathrm{L}-6$.
6. Switch the epoxy pack switch to low position. Inject a low signal level of 26.620 , or use a previously modified unit on the same settings. Repeak the unit. First bring L-5 to peak and then back it off by $1 / 3$ of the increase in signal strength. Now bring $\mathrm{I}-6$ to peak and then back it off by $1 / 3$ of the gain in signal strength.
7. Mount the epoxy pack using the mounting hints.

NOTE: If you have a unit with the "ZAPPER" 9000 installed in it. The "B" kit is compatiable, but do not use the 5K OFFSET.

```
COBRA -19X, COIT -210, GE-3-5805B, MAXCOM-4A
    MIDLAND 100M, 102M, 150M, 151M, 800M, 2001, 3001,4001
```

5K OFFSET (not recommended for the Midland 800M)

1. Wire the SPDT switch and the variable capacitor (supplied) as shown above.
2. Cut the printed circuit trace as shown between the 10.24 crystal and C-302 withits parallel capacitor if present. 3. Solder the two wires from the SPDT switch on each side of the cut as shown above.
3. With the channel selector switch on ch. 10 and the, SPDT switch in low position apply power to the unit. Check the TX-frequency for a reading of 27.075 . If the reading is too low decrease the value of C-302 or if there is a selected parallel capacitor, change its value. If the reading is too high then increase the value of $\mathrm{C}-302$ or its parallel capacitor.
4. Switch the SPIDT switch to the Hi position and adjust VC for
a $T X$-frequency reading of 27.080 .
HOPR: The Colt-355 is a very small unit. Space to mount even the epoxy pack is difficult, so we suggest that IF 5K OFFSTM is to be used that you use the existing switch.

AISO
Most of these units are large enough to accommodate both the "A" 只 "B" kits. Read modification for COBRA-21825GTL \& ITD. Adapt in the same manner except there would be a cut where the $\mathrm{R}-58$ was.

1. Remove CF-1 (10.7 Ceramic filter). Solder cable \#1 in its place. Put the white or yellow wire to the side that is connected to L-103.
2. Cut the printed circuit trace running between the Anode of D-206 and pin 20 of the PLL chip. (On most of these units this run is right on the front edge of the mother board and can easily be nicked.)
3. Separate the three wires of cable 湖. Solder the orange wire to pin 20 of the PLJ chip. Solder the brown wire to the side of the cut connected to the adode of D-206.
4. Solder the red wire to pin 18 of the FJiJ chip.
5. Uith the channel selector on ch. 10, the SPDT switch on
low position and the epoxy pack switch in normal position, apply power to the unit. Peak the receiver in your normal manner. Mark the settings of $\mathrm{I}-103$ \& L-104.
6. Switch the epoxy pack switch to the low position. Inject a low signal level of 26.620 or use a previously modified unit on the same settings. Repeak the receiver. First peak using I-103. Brine i.t tc peak then back it off by $1 / 3$ of the increased signal strength. How peak using l-104, bring it to peak and then back it off by $1 / 3$ of the increase in signal strength.

7. Mount the epoxy pack using the mounting hints.

## MIDLAND 200M

SK OFFSET

1. Wire up the SPDT switch and the variable capacitor (supplied) as shown above.
2. Cut the printed circuit trace as shown between the 10.24 crystal and $R-88$ withits parallel tank I-21.
3. Solder the two wires from the SPDT switch on each side of the cut as shown.
4. With the channel selector on ch. 10 and the SPDT switch in low position, apply power to the unit. Check the TX-frequency for a reading of 27.075. If needed ajust $L-21$ to obtain this reading.
5. Switch the SPDT switch to the Hi position and adjust the VC for a $T X$-frequency reading of 27.080 -

NOTE: This being a large unit, can easily accommodate both the "A" \& "B" Kits. Refer to material covering the Cobra 21\& 25 GIL \& LTD. It will be the same except substitute $\mathrm{R}-92$ in place of R-58

1. Remove FL-1 ( 10.7 ceramic filter). Solder cable \#1 in its place. Put the white or yellow wire on the side connected to L-3
2. Remove R-92.
3. Separate the three wires in cable \#2. Solder the orange wire to the point where $\mathrm{R}-92$ was connected to pin 8 of the PLL chip. Solder the brown wire to the other point $R-92$ was connected.
4. Solder the red wire to pin 1 of the PLL chip.
5. With the channel selector on ch. 10 , the SPDT switch in low position and the epoxy pack switch in normal position, apply power to the unit. Peak the unit in your normal manner. Mark the settings of $\mathrm{L}-3$ \& $\mathrm{L}-4$
6. Switch the epoxy pack switch to the low position. Inject a low signal level of 26.620 or use a previously modified unit on the same settings. Repeak the receiver using first I-3. Bring the signal level to peak and then back it off by $1 / 3$ of the acheived increase in signal strength. Now using L-4 bring the receiver to peak. Again back it off by $1 / 3$ of the gain in signal strength.
7. Mount the epoxy pack using the mounting hints.

5 K OFFSET

1. Wire up the SPDT switch and the variable capacitor (supplied) as shown above.
2. Cut the printed circuit trace as shown between the 10.24
crystal and $\mathrm{C}-47$ with its parallel VC-1.
3. Solder the two wires from the SPIV switch on each side of this cut as shown.
4. With the channel selector on ch. 10 and the SPDT switch on low position apply power to the unit. Check the TX-frequency for a reading of 27.075 . If needed adjust VC-1 to obtain this reading.

MOMT: These are larger units and can easily accommodate both the "A" \& "B" kits. Refer to the data on Cobra 21 \&: 25 GTH \& ITD. The removed resistor would be R-71 instead of $\mathrm{R}-58$.

1. Remove CF-1 ( 10.7 ceraric filter). Solder cable 范 in its place. Put the white or yellow wire on the side that is connected to $L-3$.
2. Remove R-71。
3. Separate the three wires of cable $\$ 2$. Solder the orange wire to the point where $R \sigma^{\top} 1$ was connected to pirı 8 of the MTM chip. Solder the Prown wire to the other point where R-71 was connected.
4. Solder the red wire to pin 1 of the PIL chip.
5. With the channel selector on ch. 10, the SPDP switch in low position and the epoxy pack switch in normal position, apply power to the unit. Peak the receiver in your normal manner. Mark the settings of $L-3 \& L-4$.
6. Switch the epoxy pack switch to its low position. Inject a low signal level of 26.620 , or use another unit that was previously modified on the same settings. Repeak the receiver. First use $L-3$ and bring the receiver to peak, then back it off by $1 / 3$ of the increase in signal strength gain. Next, bring the receiver to peak agin using $I_{1}-4$, then back it off by $1 / 3$ of the increase in signal strength.
7. Nount the epoxy pack using the mounting hints.

5 K OFFSET

1. Wire the SPDT switch and the variable capacitor (supplied) as shown above.
2. Cut the printed circuit trace as shown between the 10.24 crystal and C-42.
3. Solder the two wires from the SPDT switch on each side of this cut as shown.
4. With the channel selector on ch. 10 and the SPDT switch in low position apply power to the unit. Check the TX-frequency for a reading of 27.075 . If the reading is too low replace C-42 with a smaller value capacitor (approx. 47pf.), then trim on frequency by adding very small value capacitors in parallel with it. (printed circuit side.)
5. Switch the SPDT switch to Hi position and adjust the VC for a TX-frequency reading of 27.080 .

NOTE: These units are mid-size units but_it might be difficult to mount the epoxy pack on the same side of the unit as the PLL chip is located. You will find sufficient space on the opposite side.

## CHANNEL CONVERSION - GE 3-5804F \& President AR-7

1. Remove FL-1 (ceramic filter). Solder cable $\neq 1$ in its place. Put the white or yellow wire on the side the is connected to L-4. 2. Remove R-47.
2. Separate the three wires of cable \#2. Solder the orange wire to the point where $\mathrm{R}-47$ was connected to pin 8 of the PLI. chip. Solder the brown wire to the other point where $R-47$ was connnnt.ed 4. Solder the red wire to pin 1 of the PLL chip.
3. With the channel selector on ch. 10 , the SPDT switch in low position and the epoxy pack switch in normal position, apply power to the unit. Peak the receiver in your normal manner. Mark the settings of $\mathrm{I}-4$ \& $\mathrm{I}-6$.
4. Switch the epoxy pack switch to the low position. Inject a low signal level of 26.620 , or use a previously modified unit on the same settings. Repeak the receiver. First bring it to peak by adjusting $I-4$, then back it off by $1 / 3$ of the increase in signal that the adjustment made. Next bring the receive to peak again using L-6. Again back it off by $1 / 3$ of the gained signal strength.
5. Mount the epoxy pack using the mounting hints.

$$
\mathrm{K}-40 \text { 's } \mathrm{K}-401
$$

5K OFFSET

NOTE: This unit like the Colt-355 is an extra small unit and it is hard to even find space for the epoxy pack. We strongly suggest using the existing switch IF 5K Offset is desired.

1. If you do select to incorporate the 5 K Offset, cut the printed circuit trace between the 10.24 crystal and $C-310$ with its selected trimmer. as shown above.
2. Solder the two wires from the installed VC to each side of the cut trace.
3. With the channel selector on ch. 10 and the switch in the position that would short across the VC, apply power to the unit. Check the TX-frequency for a reading of 27.075 . If the reading is too low remove or replace the sel. parallel capacitor . A change of 1 pf . will shift the frequency $\pm 100$ to 200 Hz . 4. Switch the existing switch to its other position and adjust the $V C$ for a reading of 27.080 .

## CHANNEL CONVERSION - K-40's K-401

1. Remove CF-1 ( 10.7 creamic filter). Solder cable \#1 in its place. Put the white or yellow wire on the side that is connested to $\mathrm{L}-203$.
2. Cut the printed circuit trace between the anode of $1 \mathbf{~}-401$ and pin 20 of the PIL chip.
3. Separate the three wires of Cable $i^{2}$. Solder the orange wire to pin 20 of the PII chip. Solder the brown wire to the side of the cut trace connected to the anode of 10401 .
4. Solder the red wire to pin 18 of the FLI chip.
5. With channel selector on ch. 10, the existing switch on shorted position and the epoxy pack switch on normal position, apply power to the unit. Peak the unit in your normal manner. Nark the settings of $1-203$ \& I-204.
6. Switch the epoxy pack switch to the low position. Inject a low signal level of 26.620 or use another unit previously modified on the same settings. Repeak the receiver usingL-203 and I-204 only. First peak using I-203 then back it off by $1 / 3$ of the achieved gain in signal strength. Then peak again using I-204. Back it off by $1 / 3$ of the increase in signal strength.
7. Mount the epoxy pack using the mounting hints.

## 5K OFFSET

NOTE: Since this is a remote unit, the prime concern is that the unit will be located properly in order the switch or switched can be reached for operation.

1. Wire up the SPDT switch and the variable capacitor (supplied) as shown above.
2. C'ut the printed circuit trace between the 10.24 crystal and C-69 as shown.
3. Solder the two wires from the SPDP switch to each side of the trace cut as shown.
4. With the channel selector on ch. 10 and the SPDT switch in low position, apply power to the unit. Check the TX-frequency for a reading of 27.075. If the frequency is too high, add a small value trimner in parallel with $\mathrm{C}-69$. If the reading is too low replace $C-69$ with smaller value capacitor (approx 39 pf ) and if need be add parallel capacitors across it to bring the transmitter on frequency.
5. Switch the SPDT switch to the Hi position and adjust the VC for a TX-frequency reading of 27.080 .

## CHANUET, CONVERSION - PRESIDENT AX-11

1. Remove FI-1 ( 10.7 ceramic filter) . Solder cable $\neq 1$ in its place. Put the white or yellow wire on the side connected to J. -3.
2. Cut the printed circuit trace between the anode of $D-21$ and pin 20 of the PII chip.
3. Separate the むinree wires of cable $\# 2$. Solder the orange wire to pin 20 of the PI, chip. Solder the brown wire to the side of the trace cut connected to the anode of $\mathrm{D}-21$.
4. Solder the red wire to pin 18 of the PisI chip.
5. fith the channel selector on ch. 10 , the sPig switch in low position and the epoxy pack switch in normal position, apply power to the unit. Peak the unit in your normal manner. Mark the position of $1-3 \& 1,-4$.

6 Switch the epoxy pack switch to the low position. Inject a low signall level of 26.620 or use a previously modified unit on these same settings. Repeak the receiver using $\mathrm{I}-3$ \& J -4 only. First bring the receiver to peak with $\mathrm{I}_{\mathrm{m}}-3$ then back it off by $1 / 3$ of the increase in signal strength gained. Next, bring the receiver to peak using $L-4$ and again back it off by $1 / 3$ of the increase in signal strength gained.

7. Mount the epoxy pack using the mounting hints.

1. Wire up the SPDT switch and the variable capacitor (supplied)
as shown above.
2. Cut the printed circuit trace as shown between C-62 and the 10.24 crystal.
3. Solder the two wires from the SPDT switch across this cut as shown.
4. With the channel selector on ch. 10 and the SPDT switch in low position apply power to the unit. Check the TX-frequency for a reading of 27.075. If the reading is too low change $C-61$ to a smaller value capacitor (approx. 39pf.) then if needed add or trim it on frequency by paralleling it with a small capacitor on the printed side of the board.
5. Switch the SPDT switch to the Hi position and adjust the

VC for a TX-frequency of 27.080 .
NOTE: Since this is a remote unit, the prime concern is that the unit will be located properly in order the switch or switches can be reached for operation.

1. Remove CF-l ( 10.7 creamic filter). Solder cable\#\#1 in its place. Put the white or yellow wire on the side connected to L-3
2. Cut the printed circuit trace between the anode side of D-17 and pin 9 of the PLL chip.
3. Separate the three wires of cable \#2. Solder the orange wire to pin 9 of the PLI chip. Solder the brown wire on the side of the cut connecting to the anode of $\mathrm{D}=17$. 4. Solder the red wire to pin 11 of the PLus chip. 5. With the channel selector on ch. 10 , the SPDT switch in low position and the epoxy pack switch in normal position, apply power to the unit. Peak the unit in your normal manner. Mark the settings of $I-3$ \& $\mathrm{L}-4$.
4. Switch the epoxy pack switch to low position. Inject a low signal level of 26.620 or use a previously modified unit on these same settings. Repeak the receiver using L-3 \& L-4 only. First bring the receiver to peak using $L-3$ then back it off by $1 / 3$ of the acheived increase in signal strength. Next, bring the recdiver to peak again using $L-4$ then back it off by $1 / 3$ of the signal strength increase.
5. Mount the epoxy pack using the mounting hints.

SK OFFSET

1. Wire the SPDT switch and the variable capacitor (supplied)
as shown above.
2. Lift the leg of $\mathrm{C}-90$ that is connected to the 10.24 crystal
3. Solder the two wires from the SPDT switch on each side of this break. One to the point the leg of $C-90$ was lifted from and the other to the lifted leg of $\mathrm{C}-90$.
4. With the channel selector on ch. 10 and the SPDT switch in low position, apply power to the unit. Check the TX-frequency for a reading of 27.075. If needed adjust $V C-1$ to obtain this reading.
5. Switch the SPDT switch to the Hi position and adjust the VC for a TRX-frequency of 27.080 .

HOTE: This unit, being one of the larger units can easily accommodate both the "A" \& "B" Kits, but when using both kits we suggest that IF 5K OFFSET is to be used, use one of the existing switches.

## CHANNEL CONVERSION - PRESIDENT "OLD HICKORY"

1. Remove XF-1 (10,7 ceramic filter). Solder cable \#1 in its place. Put the white or yellow wire on the side that is connected to L-3.
2. Cut the printed circuit trace between the anode of $D-10$ and pin 9 of the PLL chip.
3. Separate the three wires in cable \#2. Solder the orange wire to pin 9 of the PLI chip. Solder the brown wire to the side of the cut that connects to the anode of $\mathrm{D}-10$.
4. Solder the red wire to pin 11 of the PLI chip.
5. With the channel selector on ch. 10 , the SPDT switch in low position and the epoxy pack switch in normal position, apply power to the unit. Peak the unit in your normal manner. Mark the setting of $\mathrm{L}-3$.
6. Switch the epoxy pack switch to low position. Inject a low signal level of 26.620 or use a previously modified unit on the same settings. Repeak the receiver using L-3 only. Bring the receiver to peak and then back it off by $\frac{1}{2}$ of the gain in receiver signal strength.
7. Mount the epoxy pack using the mounting hints.

5 K OFFSET

1. Wire the SPDT switch and the variable capacitor (supplied) as shown above.
2. Cut the printed circuit trace on the ground side of the 10.24 crystal as shown.
3. Solder the two wires form the SPDT switch on each side of this cut as shown.
4. With the channel selector switch on ch .10 and the SPDT switch on low position, apply power to the unit. Check the TX-frequency for a reading of 27.075 . If needed adjust CT-801 to obtain this frequency.
5. Switch the SPDI switch to the Hi position and adjust the

VC for a TX-frequency reading of 27.080 .
NOTE: This unit, being one of the larger units, can easily accommodate both the "A" \& "B" Kits we suggest that IF 5K OFFSET is to be used, use one of the existing switches. For drawings and notes see Cobra 21 \& 25 GTL \& LTD.

## CHANNEL CONVERSION - REALISTIC TRC-425

1. Remove $\mathrm{F}-301$ ( 10.7 Ceramic filter). Solder cable $\# 1$ in its place. Put the white or yellow wire on the side connected to $T-301$.
2. Cut the printed circuit trace between the anode of $\mathrm{D}-802$ and pin 8 of the PLI, chip.
3. Separate the three wires of cable $\not \approx 2$. Solder the orange wire to pin 8 of the PII chip. Solder the brown wire to the other side of the cut connected to the anode of $1 D-802$.
4. Solder the red wire to pin 1 of the PLL chip.
5. With the channel selector on ch. 10, the SPDT switch in low position and the epoxy pack switch in normal position, apply power to the unit. Peak the unit in your normal manner. Mark the setting of $\mathrm{T}-301$.
6. Switch the epoxy pack switch to low position. Inject a low signal level of 26.620 , or use a previously modified unit on these same settings. Repeak the receiver using T-301 only. Bring the receiver to peak then back off the adjustment by $1 / 2$ of the gain in signal strength acheivedby the adjustment.
7. Mount the epoxy pack using the mounting hints.

NOTE: This is a phone type unit. The best place to mount the switches would be on the back chassis wall. Drill the holes at the point where the two clam shell covers meet.

1. Wire up the SPDI switch and the variable capacitor (supplied)
as shown above.
2. Cut the printed circuit trace between $\mathrm{C}-802$ and the 10.24 crystal as shown above. Remove Q-804. Lift the leg of C-809 that is connected to this same point. (Note this disables delta tune) 。
3. Solder the two wires from the SPDT switch on each side of the cut made as shown above.
4. With the channel selector on ch. 10 and the SPIII switch in low position, apply power to the unit. Check the TX-frequency for a reading of 27.075. If needed adjust CT-801 to obtain this frequency.
5. Switch the SPDP switch to Hi position and adjust the VC for a TX-frequency reading of 27.080 .
6. Remove $\mathrm{F}-301$ ( 10.7 ceranic filter). Solder cable $\not \approx 1$ in its place. Put the white or yellw wire on the side connected to T-301.
7. Remove R-808.
8. Seqarate the three wires of cable 做. Solder the orane wire to pin 8 of the PII chip. Solder the brown wire to the other point where $\mathrm{R}-808$ was connected.
9. Solder the red wire to pin 1 of the PII chip.
10. With the channel selector on ch .10 , the SPDP switch on low position and the epoxypack switch in normal position, apply power to the unit. Feak the unit in your normal manner. Mark the position of $\mathrm{T}-301$.
11. Switch the epoxy pack switch to the low position. Inject a low signal level of 26.620 or use a previously modified unit. Repeak the receiver using $T-301$ only. Bring the receiver to peak then back it off by $1 / 2$ of the acheived increase in signal strength.
12. Mount the epoxy pack using the note on the previous page and the mounting hints.

## SPECTFIC TUNTEUPS

REALISTIC TRC-211. $5 \mathrm{~W} / 6 \mathrm{Ch}$. Walkie Talkie - NEW for $844_{e}$
RF/Battery meter; Hi/Low Power; External Jacks: Mike, Speaker, Power, Charger and Antenna.

TX Adjustments: Power switch HIGR; T6, L3, I6, L7, VR5
AMC - High Power: VR3
Low Power: VR2
Modulation Limiter Disable: R49 (IK)
RX Adjustments: T1, T2, T3, T4
SQ RNG - VRI
FIMAI is a 10 Watt/3 Amp., push its
REALISTIC TRC-212. $5 \mathrm{~W} / 40 \mathrm{Ch}$. Walkie Talkie (TC9109BP-PLL) - NRW for 884 ICD Ch/RF/Battery indicator; Hi/Low Power; External Jacks: Mike, Speaker, Power, Charger, and Antenna.

TX Adjustments: Power switch HIGH; T5, T6, T7, L8, Lll, L12, VR4

RE：Schematic on Vol 15，pg． 58 is the correct one for 747.
Mod．\＄1 A．Remove RI8（18K），no replacement．
B．Remove D7，no replacement．
C．Remove D6，replace with solid buss wire．
D．Remove Rl7（68K），no replacement．
E．Replace D1（Varactor Diode）with a＇Super Diode＇．
F．Solder a Red wire from un－used terminal on the clarifier pot，to emitter of $Q 38$（ 9.4 VDC ）．
THAT＇s it．．．．．
Mod． 2 A．Disconnect D6 and D7＇s cathodes from PCB．
B．Disconnect the wire coming from the center terminal of the Clarifier pot at the PCB．

C．Connect this wire to where D6＇s cathode was removed； （or to point 7 on the crystal board）．

D．Connect the unused terminal of the clarifier to 038 ＇s emitter（9V Reg．）．

E．On the crystal board，replace R7（100K）with a 10K納 5\％resistor．

F．If more slide is desired，place＇Super Slide＇in series with DI＇s anode and ground．Or just replace Dl with a ＇Super Diode＇．
THAT＇s it．．．．。

## COBRA 25LDD（UPDATE）

Following changes add more power／modulation．．
1．R76（3．3K），change to 2 K ．
2．R53（ 47 K ）．change to 22 K ．
3．C89（．033MFd），change to 2．2MFd（Note：make sure the ＋side isn＇t nosit to the I．C．）．

4．If more drive is needed the final may be changed to 2SCl307 or ECG－236．。

NOTE：Sehematic of this unit is needed for our files．．．

This unit;, according to my sources is the last type of SSB to be sold by Radio Shack; unless the trend of sales improves drastically It is similar to the President AR144 and Cobra 146GTL, but people are still having problems with Kit \$106. Have obtained such a unit for checkout of this and found that as usuall - ignorance or laziness on part of individual who installed kit.

The kit does work, however have found that in this unit the VCO would not operate over the entire frequency range. Simple changing of D-25 in the VCO circuit eliminated all problemsl 'Super Diode' to the rescue again.....following proceedure is for installation of Kit \$106 in the Realistic TRC-451 ONLY...

Kit \$106 for TRC -451 , uPD 2824C chip-0NLY Installation instructions and 'Slide' modification

1. Kit will mount directly over the PLL chip with crystals facing rear of chassis (no need to drill chassis - only enlarge present hole in the cover)t
2. Kit wiring: Black - to nearest D.C. ground (used case of L8). DON'T USE the case of any PLL circuit can or the filtor....
White - to junction of C-72/L13 (see drawing):

Red - 13VDC (B+), take from the ON/OFF switch, OFF sidel Check with VOM - was inside contact on this unit. and wire colors are the same.
Brown - to CENTER contact on the clarifier pot. Cat all wires to length after routing, then solder in place carefullyt
3. Switch position-mounting with component side of PCB up so you can work on units Down-Low Fo; Middle-Normal CB Fo; Op-High Po.. Using the Frequency Chart and both selector/kit switches for a reference: Adjust L-13 and I-14 only at this time to get the FO 's in.
(NOTE: IN THIS TEST UNIT; S/N: 130004XX, Run \$3Al; had trouble getting the entire frequency range. If you have trouble, the solution is: Replace D-25 with a 'Super Diode'..o.ohad no further problem with entire modificationo)
Once you get the frequency range in; tume L15. I40, L39, L38, L37, and 127: for overall LDIEAR power output in SSB MODE1
This unit comes with the 'El Cheapo' Driver and FYnal, also '90-day wonder's'...suggest leaving them all until they go out, then change to 2SC1306/1307 and mica insulators. Unless you want to change nowl All VR's adjustments are printed on the PCB...

A 'Slide' is required due to no trimmers being on the kit, and a SSB should have the capability anyway....
4. This 'slide' modification is for the TRC-451 ONLY:
A. Remove R-422 (3.9X) on the Ch. Sel. PCB - replace with solid buss wire.
B. Trace White wire from Clarifier pot to PCB - remove wire from that location. Pull wire out of the bundle and rearoute to the etch side of board - solder to etch at spot indicated in drawing below:

White wire from clarifier pot, it will strotch this far if you removed and didn't out it...
C. Remove D-32 - no replacement...
D. Remove R-122 (15K) - no replacement. .
E. (*) Remove D-31; replace with solid buss wire. Cheok out the slide in AM mode - regular CB Fo's, should be approximatelys $-2.5,+1.7 \mathrm{KHz}$ of the center.
F. (*-I) Replace D-30 with "Super Diode". Slide should now be approximately: -4.7. +4.9 KHz of the center.
PERRPORM FOLLDOWING IN NORMAL C.B. FO's.
(*) Do following only if original varactor ( $D-30$ ) is loft ins Put clarifier knob 'ident' to center position, adjust L-16 for center Fo in AM mode (Regular CB Fo's). Do the same in SSB modes but adjust OSB (L-17) for 1 KHz above center; and (I18) LSB for lKHz below center. This way you have a starting point for SSB and a true center calibration for AM - but only in normal CB channels. Will have to slide for other switch positions.
(*-1) Do following only if you change D-30 to a 'Super Diode'. Remove knob on the clarifier pot. Turn shaft fully CCW, adjust L-16 for -5 KHz of the center frequency in 1 M mode. turn shaft fully CW , ohock to see if reading is +5 KH 位 of center. (Balance out CCW and CW positions - using L-16). Turn shaft to center frequency and replace knob so that the 'IDENT' is at $120^{\circ}$ clock position - recheck, might have to do a few times. Leave at center and adjust USB (Iml7) for +1 KHz above center $\mathrm{FO}_{\text {, adjust }}$ LSB (L-18) for -3 KHz below center Fo. This will give you a true center for Normal CB operation, with 'slide' capabilities in SSB/AM.

The frequency chart is for use with switch installed in unit as writemps Soe diagrams below.......

| Solootor | IOW | MOPYMI | H19H |
| :---: | :---: | :---: | :---: |

Overall performance of the TRC-451 is good, with a solid 4W-NA, and 13.1W-SSB over the entire bandwidth is possible on a finely tuned unit...

Note: 1 'Super Diode' was needed in this particular unit to make the VCO operate over the entire frequency range, but do not know if all will need this part..

This update was performed in same type unit as mod in Vol 16. pg. 33; GE 3-5801A. Isolate Pin 14 of the PLL chip - has no effect on $\mathrm{Fo}^{\prime}$ 's in this conditionl By taking Pin 14 to D.C. Gnd. thru a switch yields the following frequencies (All even). To get the odd frequencies must add capacitance or inductance to 11 series crystal. If you have a pair leave as-is; for a better commo set-up; (uncluttered Fo's) s

## FORGOTIEN ACCIDEIT

(Int.-withheld by request)..
Many years ago I discovered this by accident. Never thought of it again until some 'Hunters' wanted cheap conversion, and had old 23 ch. xtal rigs laying around to do it witho...

This can be used on any 23 channel crystal unit with the following crystal set-up.

| TX \& RX | TX Only | $\frac{\text { RX Only }}{10.180}$ |
| :--- | :--- | :--- |
| 37.600 | 10.635 | 10.170 |
| 37.650 | 10.625 | 10.160 |
| 37.700 | 10.615 | 10.140 |

37.800
37.850

If you swap the 10 Mnz Tx crystalsi with the 10 MHz Px crystals; will get the following Fp's per selector position:

| $1=27.420$ | $9-27.520$ | $17=27.620$ |
| :--- | :--- | :--- |
| $2=27.430$ | $10-27.530$ | $18=27.630$ |
| $3=27.440$ | $11-27.540$ | $19=27.640$ |
| $4=27.460$ | $12=27.560$ | $20=27.660$ |
| $5=27.470$ | $13=27.570$ | $21=27.670$ |
| $6=27.480$ | $14=27.580$ | $22=27.680$ |
| $7=27.490$ | $15=27.590$ | $23=27.710$ |
| $8=27.510$ | $16=27.610$ |  |

Enjoy, new life for the old rigs, (a further conversion to FM would be ideall)

It seems that it is a 'jungle' at 'COBRALAND', and $\underline{2}$ versions of this unit may existl Here we go again; just like the 148GTLKDX; but this may straighten some of it out.

The main discrepancy seems to be in the clarifier circuitrys The skematic I have available shows only one crystal (X-2, 10.0525 MHz ) in the circuit. Information received-says that there is sometimes two crystals and switching is done by the Tone switch or labeled Band HI-LD. Two different clarifier modifications exist also. With a discrepancy between them also: D6 and D7 (per schematic D6 is the one in direct foed from Clarifier pot.) Suggest lifting either one; if you lose transmit; that one stays in - remove the other.

The following 2 diagrams are for clarifior modification:
*1 (Sent in:)

\#1. Cont...
A. Remove Red/White and Yellow wires from clarifier pot, soldor together and sleeve.
B. Run a wire from where wires removed to the emitter of Q-28.
C. Remove R154, no replacement.
D. Remove D6, no replacement.
E. Remove Di, REpLuce wiut solid guss ware
\$2. (Per Schematic/Theory) o...Want some feedback on this for Vol. 18 if any discrepancies/additions....NOT TESTED OR PROVEN, as have no umit to work withd

A. Remove all wiring at PT. A (If more than one wire, solder all together and sleeve.)
B. Run a new wire from Enittor of Q28 to PT. A....

D6 $\rightarrow$ C. Remove D7, no replacement.
D. Remove R154, no replacement.
E. Unit should now 'slide' on transmit..... If it does, lot's go
$D\rangle \rightarrow$ the whole route: Remove D6 and replace with solid buss wire. Remove D5 and replace with 'Super Diode'. Remove VR3 and replace with 10-turn pot. Remove Cl5, no replacement.
F. If you do everything in stop E., use following adjustments for aligning the transmit $F \phi$ to get a center on the pot, or any way you want... CT5 - ISB; CT6 - USB/AM; and CT2.
G. Check the transistors for Mica type insulators, if not-replace.
H. Change Driver and Final if you want to: 2SC1306 and 2SC1307. RV- 4 is Final Bias (2SC1307 - set for 60 ma ).
I. Check PLL logic levels on the following pins, schematic shows no connection: Pin 4 - Mreq. Select Steps; l-10KHz, $0-5 \mathrm{KHz}$.

Pin 6 - Lock Detector
Pin 7 - P8 ( $25^{\prime \prime}$ s bit) program pin.

## Cobra 148GTLRB (Export).e.Conte

2. Cont.
J. If Pin 4 has no connection, change logic state. (ground thru a 5.1 K resistor; check for frequency changes on TX/RX.)
Note: This does not work all the time... If it does-plenty of extra switches on the front panel.
K. THIS IS PROVEN: Break feed line to Pin 9 of chip, with selector should now go: $27.615-28.245 \mathrm{Miz}$ 。
PROVEN $\rightarrow$ L. Change R44 (270K), to 39 K , if you are going to $\mathrm{F} \mathrm{\phi}$ expand the unit. Located near IC-4.
M. Don't forget Pin 7, and Pin 8-which is tied high. Pin 8; break the linembridge with 5.1K and switch at the pin to D.C. ground.

Remember: Feedback wanted on these mod's.....as worked from schematicl

- NEW EXPORT MODELS -

COLT MDL.-510; AM/FM 120-Ch.
IDENPICAL to the Commtron XII, refer to it for all information.
COBRA GTL-150; AM/FM/SSB
IDENTICAL to the Tristar 747, refer to it for all information. NOTE: SCB still needs more information on oither unit, Owner's Manual/Factory Sorvice - have schematic..

## PALOMAR MDL. 2400

1,200 TOTAL - Advertised channels! AM/SSB/FM/CW unit, with an "un-advertised DEALER PRICE of $\$ 450^{\mathrm{N}} 1 . \ldots .$. SPECS are as follows: Cybernet Chassis, crystal switching for Freq. Rng. Shift; and the familiar "El-Cheapo" Driver/Final.
Freq. Selection in conjunction with LED Ch. Sel. and Band SW:
Pos. 1: $26.065-26.505 \mathrm{MHz}$
2: 26.515-26.955MHz
3: 26.965-27.40 5MH2
4: 27.415-27.855MHz
5: $27.865-28.305 \mathrm{MHz}$
6: 28.315-28.755MHz
RF Gain: Operated by switching (local-mid-DX)....?
Clarifier: Variable Transmit $\pm 5 \mathrm{KHz}$; Coarse varies $T X$ and $R X$, Fine varies $R X$ only.
Power Output Switch: Lo-1W, Middle-4W, High-7! 5 W in AM mode. FM mode is 10W...
Meter: Standard - S/RF
Other switches - On/Off-Volume, Squelch, Mode, Tone, Tx/Rx-PA, ANL, and NB.
PERSONAL OPINION: FOr $\$ 450$ dealer price should have at least the following:...OSWR/Modulation/S/RF meter, Frequency Readout, and at least quality Driver and Finsl.o..

Schematic is printed in this volume.....

Schematic

SCHEMATIC DIAGRAM

## hinrs / KInes / G00Fs

Have received great response to this colum. Some items sent
in were utilised elsewhere, as more of SERVICE/UPDATE nature.
(Remsurber tems in $\mathrm{H}-\mathbb{K}-G$; do not receive a free volume; also this column is not indexed...)

Realistic PRO-2002 50-Ch. Prog. Scan.: There is a mod. for this unitl BUF - you lose the 30-50MHz band permanentiy at this time... When a solution to this problem is found will print the mod. (BW)
Problem: 02A AM Chassis: Low Power, Reverse Mod., when expanding the F ${ }^{\text {Ps. }}$ Solution: Replace C4 (68pf) with 100pf, replace C22 (2pf) with 5pf.........
Problem: 858 SSB Chassis: Warble on 'uppers', O.K. on normal Fo's in the SSB mode?
Solution: Readjust the VCO (Im17) a hair...Don't insert 3.3K resistors in series with C140/141 as some techs dol
Problem: 148GTINDX: Regulator Circuit Transistors, hard to find Solution: TR-5i, 2SA1012: ECO-378. TR-50, 2SB525: ECT-294.
Vol. 13, Pg. 52-55: Re.-Gunn Oscillator...CHEAP SOLRCE FOUND-Radio Shack
'Household Burglary Warning System' W49-320. Has a 10GRe Gunn Oscillator $\triangle N D$ a 12V/1.2AH Gel Cell insidel (Units are discontinued and ofton discarded by storys-as uneconomical to repair! I bought one for $\$ 2.00$ ) 1 Red wire is B+, Black wire is DC Gnd.. DON'T adjust the Gunn cavity serews unless you have a good Spectrum Analyzer! Will have to back out the two screws on the feed horn for a good Tx pattern (BW). Note: See Regulated Voltage/Current project in this issue...
Problem: Teaberry Stalker 9 (Export): Low Modulation?
3olution: Remove TR-32 SCB STIIL NIGBS SCHEMATIC ON THIS UNLT......
HAZAROUS TO YOUR HEALTH: The common practice of running a mobile inside the house with car battery.. Rewcharging a battery has a very dangerous by-product - HYDROGEN GASI One spark, and you might not be able to read SCB anymore.... Go buy a good regulated power supply....

Wanted: Low F $\phi$ mod for Teaberry Model T (4011); Buy Vol.16, pg. 41; See Bristol BCB-2271.....
Feedback: Re_"MI WAY SLIDE ${ }^{\text {m }}$, Vol 16 pg 38 . I didn't believe it either so 'borrowed' back a modified unit that converted 3 years ago. Worked like a charm - had to put a 10-turn pot in unit - also got a little less on the upswing: (ONLY 21.4 KHz - Colt 1200, Excalibur)....
Courier-Centurian 40D; Re: Vol 10 pg. 53, 124 alignment is extremely critical...be very careful when broadbanding, doublemeheck the SSB TXI
When Junking-out the Junker's that are un-economical to repair: Remove the following and put in a plastic bag marked with Make/Mdl. Coils, Chips, Zener's, Wire-wound 's, Switches, otc... Have found it to be better than having $50+$ units laying around...I use them for LandFilli

RE: Above idea - This is another reason for the Newsletter being needed as factory doesn't have parts, and if they do usually is a back-order item. I had to send back a TRC-57 to customer because the factory didn't have a VCO block (sealed unit), I was out the repair bill and he's out a radio - also everyone was out because had the go-ahead to do a full blown mod on unit for writemp to clear up the problem with modificationl

EARLY: A. S/N Range: 03000001-4498 to 13000001-1504
B. PLL Chip is MB8719
C. Crystal switching for LOW/MID/HIGH $F_{0}$ ranges.
(for further frequency increases the the standard 8719 modification may be utilized. © 0 fust switch the crystals.)
*Here is a discrepancy that would like to get cleared up as haven't run across an "Early' unit to check it. If anyone can help on this; please do; and give serial no. of unit. (XX- the last two numbersi).

1. Schematic shows $X-2$ as 15.03 MHz ; $X-3$ as 15.48 MHz ; and X4 as $15.93 \mathrm{MHz} . .$. .if this the case 14.58 MHz will take you down another 40 ch. , and 16.38 MHz will take you up 40 more..
2. Board layout diagram and Block diagram show X-2 is $15.48 \mathrm{MHz} ; \mathrm{X}-3$ is 15.93 MHz ; and $\mathrm{X}-4$ is 16.38 MHz ..... to go down another 40 ch . use 15.03 MHz , and 16.83 MHz for additional higher channels.

Of the 6 units I have seen all were 'Late' DX's, haven't even heard of anyone having an "Early' yet......

LATE: A. S/N Range is above 13000001-1504
(Unit utilized for modification in Vol. 15 was \$130150..)
B. ALL, (with exception of line-up) published in Vol. 15 and Vol. 16 of SCB was for 'Later' version (See OOP's this Vol.).
C. PLI Chip is MC145106P; with 2 - MC14008BCP, 4mbit full adders to accomplish logic switching via selector/range switch.
D. PLL Pinout below:

|  | $\begin{aligned} & 18--V s s(D . C . G n d) \\ & 17--P 0 \\ & 16--P 1 \\ & 15--P 2 \\ & 14--P 3 \\ & 13--P 4 \\ & 12--P 5 \\ & 11--P 6 \\ & 10--P 7 \end{aligned}$ |
| :---: | :---: |

*Logic $1=10 \mathrm{KHz}$ steps, Logic $0=5 \mathrm{KHz}$ steps, -SOMETDMES 1
Using above and information in Vols $15 \& 16$, can 'custom" modify the unit as you see fit with no problem... known frequency ranges on some 'Late' units are from 25.785018 to $28.245 \mathrm{MHz} .$. Power output linearity??

## BURGIAR ALARM

This is to answer requests; and questions; as to why SCB has not published Burglar Alarm Skematics sent inl The main reason is that not associated with communications. I personally have seen over one dozen different designs sent in by individuals, some are very goodcomplex, costly, eter But printing them all would take up too much room, and don't have it to sparel So instead have printed just one simple, PROVEN, and cheap to build unit..

I know this alarm, and back-up supply for home use worksl Have had it in पy home for over 6 years with no failure or repairl Current drain on this curcuit is about $.5 A$ when activated, the AC supply has battery back-up for use in case of power failure。

AC Supply, Back-up Skem.

## CUSTOM REGUTATED (VOLTAGE \& CURRENT) POWER SUPPLY

This is another "Quality" piece of test equipment for bench use. I.C. Chip (LM317), limits are 37VDC and 1.5Amps. Design limits of power supply give plenty of "Coasting" room; for maximum use; and minimum repair. (My own initial unit has been running for $5 \frac{1}{2}$ yrs, with no repair necessaryl)

I utilized a Radio Shack Metal Cabinet ${ }^{4} 270-253$ to build entire unit. The base of case served as heat sink for both IC's and bridge rectifier. A panel mount fuse holder was also used-on the front. (Since then I have built a larger unit, utilizing the same basic design. $- \pm 35 \mathrm{~V} .3 \mathrm{~A}$ with voltage/current meters.)

Skematic is in 2 sections: Regulated Adjustable Power Supply, and Adjustable Current Regulator.

## Theory of Operation

Reg. P/S: Rl is voltage output adjustment, (adjust for minimum voltage). At minimum voltage should read l. 2 VDC or lessi If not, change value of $R 2$ until it does.. (put 500 ohm adjustable resistor in place-vary until you get l. 2 VDC or lessmremove and measure the resistance. Insert that value resistor into $R 2$ position, DO NOT leave the variable resistor in placel). The reason for have 1.2VDC or less minimum-Nickle Cadmimum batteries are l.2V and can deepcycle just one if needed. (D3, R3 is bleeder network...)

Switch S2: for non-current regulation of voltage output. (D4 is to prevent 'feedback' to power supply from item being powered.)

Current Regulator: This is drawn separately as may want to incorporate into any existing equipment on hand. Voltage in/out is the same, only the current is regulated/adjustable by R4, at 1.5A MAX. Current is read with either external or built-in meter - your choice.

This unit is not hard to build, most parts can be found in the 'Junk box', but have added Radio Shack P/N's to most items. DO NOT DE-RATE the parts ${ }^{\circ}$ voltage/current ratings!

Parts List: IC 1, 2 - LM317 (TO-220), R/S 276-1778

Transmit - Receive Frequencies may be anywhere within the GYPSY chart. Maximum Bandwidth of unit is usually 1.5MHz......

GYPSY - AM Unit 25.155-27.705MHz 02A/G PLL chip ahassis。
These units are modified in such a way that the bandwidth is 'field-tunable" with minimum of equipnent anywhere within the "GYPSY" range. Usually can be re-tuned; Tx and Px in less than 5 minutes....... Survivalist's are the persons most likely to have these units.

NOTE: "Custom Conversions" has 2 new kits for the "GYPSY' frequency range.
\#83-1: 25.155-26.425MHz 116-channel. \$83-2; 26.115-27.405MHz 118-channel.

I buy, rebuild, and sell; a lot of Tram D201/201A's. One common problem on both units is located on the receiver board. I have found on most that resistors; R502, R503, R507, and R508 are mounted too close to the PCB. (I replace them, and mount $\frac{1}{2} n$ above the board - for heat disappation, and protect the PCB.)

On D201 ( 23 ch. ): I remove the $2-47 \mathrm{~K} 3 \mathrm{~W}$ Metal Oxide resistors; R-418 and R-419. . Replace each with $2-100 \mathrm{~K} 2 \mathrm{~W}$ resistors in parallel, mounted $\frac{1}{2}$ " above board. See Drawing:

BA BOARD: Measure values of R-638/R-639 (220 ohm 2W); also R-611/ R-612/R-613 and R-614 (10K 2W). Replace if needed with $2 \%$ tolerance and mount off PCB.

AUOIO BOARD: R-6, 100 ohm 7W wire wound. If mounted flat on PCB, lift $\frac{1}{4}$ to permit air flow. NOTE_make sure BA Board seats properly afterwards。

## TRAM XLR 23 Ch . SSB

For extra channels, use crystal charts: SCB Vol. 1 and 2 (Y201-Y206). Slider Mod: Tie Green wire from wiper of clarifier pot to junction of R222/1203. Remove R228 completely; replace CR-203 with "Super Diodens also add a "Variable Choke" (2-8uH) in series with Anode to D.C. Gnd. Adjust choke for desired slide range.... R616-AMC (defeat C611, 4.7Mf electrolytic), AIC-RI30, Mike Gain-R617, Adjust Ll08, Ll06 for max forward drive on $L S B$, with 1 KHz audio input to mike.

## PUBLISHER'S NOTE

We have been getting some requests for crystal rig modifications. To do this "reprinting" would be a dis-service. Obtain SGB Vol 1 \& 2.

## COBRA 148GTLEDX (IATE) - UPDARE

Both of these modifications are proven

1. Pin 6 of PLL chip has no connection...take to D.C. ground thru a switch. (Plenty of switches on the front that can be hard-wired. and used for switching puposes.)

Yields these new frequencies on: LOW... 26.555-26.775 MHz
MID... 26.780-26.960MHz
These new frequencies are in 5 KHz steps!
2. Change the original crystal X-2 ( 15.0000 MHz ) to a 15.4800 MHz
crystal. This changes the main bands: Low/Mid/High to the following frequency ranges: Low $-26.965-27.405 \mathrm{MHz}$

Mid - 27.415-27.855MHz
High $-27.865-28.305 \mathrm{MHz}$
Now Truth Table for TP-3, vs. old: with the crystal change.o.

## UPDATE: TRC-448. 'Erpanded Slide'

If you have done the Custom Conversion in Volume 16. pg. 25-30 and not satisfied with the slide: Do the following steps 24A-C.

24-A. Remove R32 and R39, both (47K): no replacement.
B. Remove TC4 and TC5: no replacement.
C. Suggest "Super Slides' instead of "Super Diodes" in this particular unit, for bigger swing.

If you have not done the "Custome Conversion" in Vol. 161 Obtain a copy, and follow Steps 17-24 on page 28. (Will also need $8^{\mathbf{n}}$ of Blue wire): then follow steps 24A-C printed above. DO NOT REPLACE D13 or D14 with solid buss wirel
(Note: You have an 'Early' unit if serial number is between the following ranges: $03000001-4498$ to 13000001-1504) Secret C.B. Vol. 16, has complete alignment proceedures, for the 'Early' version.

## Complete Alignment Proceedures for the 'Late' Version of 148GTLmDX

...any additional contributions would be appreciated.. T.U.

How I made a quick $\$ 402$ "PROFIT" off SECRET C. B. by: P.R.

Had a customer requiring 4-AM units with "lower" frequencies in the $26.7-\mathrm{MHz}$ range. Conditions of sale were: all identical units, Mo extra switches, P.A. functional, and 2 year warranty-limitod Price not to exceed $\$ 500$; excluding antennas, external P.A. horns, and installation.

In one weekend I found 6-PACE 8010's at flea market/yard sales, and after haggling had only $\$ 48$ tied up in them. Usuall problems: protector diodes, finals, audio chip, mike cables; only real trouble was making brackets for mounting. Repair and clean-up of 2116 units cost me another $\$ 35$.

Getting it to go down was a B-a-l Gave up and contacted "Custom Conversions"..--said I had the right pin, but wasn't isolating it correctily. Obtained skematic/parts locator/PLL logic codes, and other "tips/hints" on unit. (Also permission to write-up for SCB). Pin-10 of PLL is down conversion; was breaking etch in wrong place; is fed under the chip by another linel Had it up and running in 10 minutes flat... I utilised the ANL push-button for conversion.

Romove following wires from ARL ONLI, leave the others-are used 28 a tie point-not in circuitry: Green-remove-trace to PCB, remove. Yellow (both)-remove-solder/splice together and sleeve. If you want ANL off, solder the Yellow's to Green. Follow diagram below and re-route the new wires to etch side near PIL chip..

PACE 8010/8015.. (Cont.)
Follow diagram below for PLL chip etch modification:

That's all there is to it...actually the fastest and simplest mod., I've ever donel For maximum broadband coverage PLL and RF coils will have to be realigned slightly. Also all the transistor insulators should be changed to 'Mica' type. For 'beefing/mod. increase' the following also: Remove R218, R215A, C216.. Change to 1/2W; R207, R208.. Change C205 to 3.3Mifd/50V. . For better noise limiting change C125 to 3.3Mfd/50V, or higher value, but be careful of audio loss...

Frequency is as follows with the ANL switch in.....per selector..

| $26.695 \mathrm{MHz} . . .5$ | 26.845MH2... 17 |
| :---: | :---: |
| 26.7056 | 26.85518 |
| 26.715......7 | 26.865..... 19 |
| 26.7358 | $26.885 \quad 20$ |
| 26.745......9 | 26.895...... 21 |
| 26.75510 | $26.905 \quad 22$ |
| 26.765..... 11 | 26.915...... 24 |
| 26.78512 | 26.925 .25 |
| 26.795.... 13 | 26.935...... 23 |
| 26.80514 | $26.945 \quad 26$ |
| 26.815..... 15 | 26.955...... 27 |
| 26.83516 |  |

I made a quick $\$ 402$ profit with 2 spares put up in plastic bags for the warranty - which I doubt will need.

WHO SAY'S SECRET C.B. DOESN'T PAY 11111

Don't convert until warranty period is over, as will void it...
No special test equipment is needed for conversion...
Parts Needed: 10Mfd/35VDC Electrolytic Caps (2-Axial)
Slide Switch: R/S 275-403
Chassis Mount Jack: R/S 274-1549
Standard Power Cord: R/S 270-1533
Fuse: 1/4a 3AG
Diode: 1A, 50 PIV
Solderless Ring, Insulated tongue: R/S 64-3032
Misc. 10" Black stranded 22ga wire
12" Red stranded 22ga wire
Directions: Follow to the letter...

1. Disconnect AC Power Cord from sounce.
2. Turn ON/OFF switch ONe
3. Remove bottom eover.
4. Remove Red wire on the On/Off switch-clean where removed.
5. Cut the two cable ties and pull Red wire to rear of chassis.
6. Twist the two 10Mfd/35VDC capacitors' leads together, and solder across the speaker terminals. Observe polarity per drawing below:

7. Check first to see which of the two chassis jacks fit the power cords' jack (two different sizes in pkg.). Using the one that fits wire up per diagram below-easier to solder wires to diode first:

NOTE: make sure Black wire is a short to outer conductor of the jack...

## R/S_Pro-54 Scanner (Cont.)

8. Mount both slide switch and chassis jack on rear of case per drawing below: DRILI CAREFULLY and use lock washers...

9. Clean all plastic shavings that may have fallen into the unit out carefully. Label back of the unit, above the power selector switch. (D.C.-Left, A.C.-Right)..
10. Finish wiring the selector and power switches per diagram below, -careful with solder-don't get on the P.C. board.

11. Turn On/Off switch off. Check to be sure you put a $1 / 4$ Amp 3AG fuse in the new D.C. cable. Check continuity also from the tip to inside of plug..(some have been wired backwards!)

## R/S Pro-54 Scanner (Cont.)

12. Put plug into jack, apply power to jack. (If you don't have a separate power supply, take out to your car and put in the cigarette lighter). Turn on and check all functions...
13. Check function in A.C. also; tie up the cables carefully: put cover back on the unit.....Enjoy...

## - - FLASH <br> VIDEO "DUBBING/COPYING" TIPS

## NOTE: COPYING OF COPYRIGHTWD MATERIAL IS STRICTLY HLEGALe..e.

In $98 \%$ of all cases can usually 'dub/copy' all video tapes without an "Equalizer/Stabilizer/Enhancer". (Personally haven't found any worthwhile)\& There is a "Special Cable" that will do more good than anything found so far - usually can tell difference between original and copy - barely with this cable if taped at same speed. Have seen third copies of original that were excellent by use of it. Will not be found on the Video Dealers shelves, as are in the business of selling "Gadgets", that don't make it.

Using "THE" cable/s and diagram below - follow instructions and you can make quality copies, (have seen 4 movies on 8 -hr tape that looked original).

1. Receive machine (Copier) - set recording speed, - IMPORTANT, set "tracking" to middle position and leave alone.
2. Transmit Machine (Original) - use tracking on this unit to adjust for best quality picture (Make a short run of copy to check your quality on playback).
3. Be sure to rewind the tapes on both machines before you start.

- . Set-up Diagram . .

Another note on these cables is: not CHEAP, but worth the costl $\$ 9.88$ for $6^{\prime}$ and $\$ 0.22$ for $10^{\prime}$ - EACHI Don't bundle up after buying them; stretch out flat for couple of days; store when not in use in a wide loop, and in large sealable plastic bag. Are best investment you could make for use with your VCR.... ........We can supply these on special order, but do not stock at present time. If demand is sufficient. will in the future

## SPECIFIC TUNE-UPS

Sears 934. 38060700 ( 861 PLL).oUse SAMS-236. 934.38062700
Be careful working on this unit - the slugs in TX section have square holes and very easily broken..... TX - Peak TII, T12, T13, T14, T15
RT-1, Mixer Gain
RT-2, S Meter adjust
RT-3, RF Meter adjust
*There is no AMC adjust; remove D-7: replace with solid buss wire. If final is blown - don't skimp - replace with 2 SCl306!

Midland 1001 (77-001) and Midland 103M (77-103) IC7131-PIL
TX - Peak L205, L-204, L-206, L-207, L-203
RX - LlO1, Ll02, Ll03, Ll04
RV102 - S Meter adjust. RV103 - Squelch Range adjust
RV202 - RF Meter adjust. RV201 - Modulation adjust (Ql06-defeat)

* SELMAN ENTERPRISES

VCR VIDEO MODIFICATION
IRS-80 12" VIDEO DISPIAY (26-1201)
With this display showing up more and more in the neighborhood flea-markets it is a cinch to fix/modify for using to monitor your VCR or any video source, and still retain the computer use of itb It is really a RCA $B / W$ T.V. without the tuner, and usually these can be picked up for spare parts at local T.V. shops by just hauling them away for freel Cheaper for people to buy new $B / W T . V$. than to have the old one fixed-so parts are no spares-just be sure to get R/S's Factory Service Manual on the unit so can cross reference to RCA, then to SAMS.... CAUTION: To anyone who tries this modification and hasn't any T.V. repair experience: be careful: as you will be working lOKV + in the chassis when turned on. and can still bite=offl I built mine for $\$ 2.48$, including cost of display, using junk-box parts.

## PARTS LIST

IED'S: Red-I, Green-1
Disc Capacitors: . $1 \mathrm{mfd} / 50 \mathrm{~V}(2)$, .01mfd/50V (1) Electrolytic Caps: 1000Mfd/20VDC-1, 250Mfd/35VDC-1
Bridge Rectifier: VMO8 or equivalent
Transformer: ll7VAC Pri-12VAC Sec. 300ma Min..
Voltage Regulator: LM7805 and heat sink (make out of beer can tabl) Resistors: 680 ohm and $220 \mathrm{ohm}, \frac{1}{2} \mathrm{~N}$ 10\%
Jack: RCA Female, chassis mount-with ground lug..
Switch: Double Pole-Single Throw, DO NOT TRY SPST...
Mini-RF Coax: 16"
Perfboard: any size you think you can breadboard the $\mathrm{P} / \mathrm{S}$ mod on is $\mathrm{O}_{\mathrm{o}} \mathrm{K}$. Misc. Wire is also needed, along with mounting hardware...

Diagram below is for wiring of the new Video input to Video Isolation Board.

Use the following parts for this and wire it correctly using the other diagrams for locations to mount...

## VCR VIDEO MOD. (Cont.)

Follow schematic/diagram below for building/wiring of Power Supply modification..DO NOT CHANGE IN ANY WAY THE WIRING.....

Follow Drawings for front and rear view of component mounting and for drilling holes:

Note: When drilling hole for Red IED, obtain a rubber grommet to mount the LED in.

Directions for use:
Under no circumstances should the computer be plugged in when red LED is ON. When light is OFF can be used as usuall with the computer, just be sure nothing is plugged into the new video jack.

For use as video monitor - remove plug from computer - Note: if you don't have computer just remove the plug and install new wiring to have an extra video jack for "video mixing" of the input (get some wierd pictures).. Just come out of Video Out jack of VCR to the new RCA jack and you got it.oo

VCR VIDEO MOD. (Cont.).
VIDEO ISOLATION CARD MODIFICATION

- . Early to Late Version + . .

Check the card to see if it has a Zener diode above R-5 on the component side. If not, is early version - perform the following:

All resistors 1/2W 5\%: Change R-16 to 2.2K
Change R-13 to 6.8 K
Remove R-3, replace with $1 N 4742$ Zener
(See diagram below for polarization-12V, 1W)
Add $68 \mathrm{~K} 1 / 2 \mathrm{~W} 5 \%$ as shown in diagram.

(*) Do on late version if not done....。
Correct orientation
Zener.

Add 68 K resistor
