Practically new ranch house with 200-foot, poured-concrete, spirally curled, exponential bass horn; 12-foot multiscellular midrange horn (24 cells); large inventory of assorted dynamic and electrostatic tweeters; three 2,000-watt water-cooled amplifiers; infinite-attenuation electronic crossover networks; master control-mixer-preamplifier console; two 1,500-lb. belt-driven turntables suspended in mercury bath; vacuum-sealed record-positioning chamber with servo-controlled record lifters and nuclear-reactor record deionizer; foam-rubber base-

ment for acoustical feedback isolation; also complete blueprints for construction of identical house for stereo.

Will sacrifice; or trade for NORELCO speaker, which owner of house has discovered to be ideal for delightful hi-fi listening without electronic anxiety neuroses or showdowns with the loan company. For detailed and convincing confirmation of latter viewpoint, write to North American Philips Co., Inc., High Fidelity Products Division, 230 Duffy Avenue, Hicksville 1, Long Island, N. Y.

NORELCO loudspeakers

a complete line of 5" to 12" high-fidelity speakers and acoustically engineered enclosures
Can you think faster than this Machine?

Be careful before you answer. GENIAC® the first electrical brain construction kit is equipped to play tic-tac-toe, cipher and en- cipher codes, convert from binary to decimal, reason in syllogisms, as well as add, subtract, multiply and divide. Specific problems in a variety of fields—actuarial, policy claim settlement, physics, etc., can be set up and solved with the components. Connections are solderless and are completely explained with templates in the manual. This covers 33 circuits and shows how new ones can be designed.

You will find building and using GENIACS® a wonderful experience; one kit user wrote us: “this kit has opened up a new world of thinking to me.” You actually see how computing, problem solving, and game play (Tic-tac-toe, nim, etc.) can be analyzed with Boolean Algebra and the algebraic solutions transformed directly into circuit diagrams.

A MACHINE THAT PLAYS NIM

Yes every GENIAC® comes complete with the materials and circuits for wiring up a machine that plays NIM. No extra charge. See article in January Popular Electronics.

You create from over 400 specially designed and manufactured components a machine that solves problems faster than you can express them.

Schools and colleges, teachers of science or math, engineering, philosophy or psychology will find these excellent demonstrators of circuitry solutions in symbolic logic, theory of numbers, cybernetics, and automation.

Note: Teachers take advantage of our 10% discount to educational institutions and for group purchases.

Send for your GENIAC® kit now. Only $19.95 with over four hundred components and parts, fully illustrated manual and wiring diagrams. We guarantee that if you do not want to keep GENIAC after two weeks you can return it for full refund plus shipping costs.

NEW—A MACHINE THAT COMPOSES MUSIC

Our amazing machine that composes music was designed by one of the people (a sixteen year old boy) who bought the GENIAC® to learn how to design computers. Use it to make up your own tunes automatically with the GENIAC® computer kit, 1958 Model.

Some Firms and Institutions that have ordered GENIAC:

Other machines you can build with your 1958 Model GENIAC® Computer Kit.

Machine for a Space Ship’s Airlock—Special Combination Lock—Adding-subtracting and dividing machinery—Comparing and reasoning machines—intelligence testing machines—Uranium Shipment and the Space Pilots—Machine to play Tic-Tac-Toe—Translator from binary to decimal and degree of others.

What Comes With Your 1958 Model GENIAC?

Here, shown in pictures: parts tray; guaranteed long lasting American Manufacturing bulbs; porcelain sockets; special wipers and contacts; tools; baskets; uniquely designed holder plus seven catalogs and publications including: 61 page GENIAC® manual; full length book; Minda and Machines describing computers; robots, and automation; GENIAC® Wiring Diagrams; Beginners Manual for the person who has little or no knowledge of circuits; GENIAC® Study Guide—the equivalent of a full course in computer fundamentals. Lists additional readings; and exclusively in 1958 Model GENIAC® Symbolic Logic and Circuits Design by Claude Blumham.

SEND for your GENIAC® now. At only $19.95 a bargain. Comes complete with over 400 parts and components, 1 Books and manuals. We guarantee that if you do not want to keep GENIAC after two weeks you can return it for full refund.

Coyne offers LOW COST TELEVISION RADIO - COLOR TV Training in Spare Time AT HOME

The future is YOURS in TELEVISION!
A fabulous field — good pay — fascinating work — a prosperous future in a good job, or independence in your own business!

Coyne brings you MODERN QUALITY Television Home Training; training designed to meet Coyne standards at truly lowest cost — you pay for training only — no costly "put together kits." Not an old Radio Course with Television "tacked on." Here is MODERN TELEVISION TRAINING including Radio, UHF and Color TV. No Radio background or previous experience needed. Personal guidance by Coyne Staff. Practical Job Guides to show you how to do actual servicing jobs — make money early in course. Free Lifetime Employment Service to Graduates.

Send Coupon for Free Book

HOW TO BUILD A
Transistorized
40-watt supply

Easy to build, this modern power supply is as big in performance as it is little in size. Two CBS 2N256 power transistors, operating from a 12-volt battery, deliver 450 and 250 volts simultaneously. Combined output is 40 watts continuous service.

Features: compact and light ... 85% efficient ... instant-starting ... cool-running ... long-lived. No moving parts ... vibrationless, noiseless and troublefree. You'll find this supply ideal for mobile or portable transmitter and/or receiver, sound system, etc.

Free Bulletin E-279 gives complete how-to-build-it details. Get it today with your 2N256 transistors from your CBS Tube distributor.

2N256...$1.50
2N255...$1.35

He who is fortunate enough to own the Garrard 301 Transcription Turntable and the Garrard TPA/10 Tone Arm can enjoy the unique pleasure of knowing that his is the finest . . . the handsomest . . . record-playing combination in the entire high fidelity galaxy.

A pair of great products... great because they reflect 35 years of skill and the standards of leadership. No gadgets... no compromises... only the time-proven features which guarantee continuing, undeviating excellence.

Garrard
WORLD'S FINEST
RECORD PLAYING
EQUIPMENT

Model 301
PROFESSIONAL
TRANSCRIPTION TURN TABLE

- Features continuously variable control of each speed . . . the record can be "tuned" to match a musical instrument
- Heavy-duty 4-pole shaded motor is entirely Garrard-built
- Cast aluminum turntable is a full 6 1/4 lb. . . . dynamically balanced
- Motor and connected levers are completely isolated from unit by an exclusive damping system of tension-compression springs
- Exclusive built-in pressure lubrication system
- Performance of each 301 is certified with a written individual test card

$89.00

Model TPA/10
TRANSCRIPTION TONE ARM

- Built to insure professional quality performance, with traversing and vertical friction reduced to absolute minimum by special cone-type ball-bearing pivots, as in the finest chronometers
- Takes any cartridge
- Fits into more installations than any other professional tone arm, since it is adjustable in length and tracking angle . . . plays up to a full 16" record
- Simple to install, with specially designed templates

$24.50

High School Graduates:

A.S. DEGREE IN 2 YEARS!

For a high-pay career, security, interesting work, advancement... ELECTRONICS, America's fastest-growing major industry, has more to offer you than any other field. Accelerated crash programs in Missiles and Satellite development, plus increased emphasis on scientific research, demand additional thousands of technically trained men. Central's practical course, designed for the man whose time and budget require maximum training at minimum cost, will qualify you for valuable Associate of Science Degree and immediate employment in only two years. (For an even greater savings, you may complete first year by Home Study...without giving up present occupation.) Housing assistance...part-time employment available. New resident class forms every 8 weeks.

Send for FREE book shown above. It will tell you all about Electronics...show you the wide range of careers open to trained men. Check the positions held by these recent Central grads:

Over 50,000 successful graduates since 1931.

Clip and Mail TODAY—No Obligation!

Always say you saw it in—POPULAR ELECTRONICS
Model (simplified) illustrates basic structure of magnetic “Twistor” memory—magnetic and copper wires interwoven as in a window screen. Twisted condition of the magnetic wire shifts preferred direction of magnetization from a longitudinal to a helical path. One inch of twisted wire, thinner than a hair, can store as much information as ten ferrite rings. “Twistor” was invented at Bell Laboratories by Andrew Bobeck, M.S. in E.E. from Purdue University.

New twist in memory devices

An ingenious new kind of magnetic memory has been developed by Bell Laboratories scientists for the storage of digital information. Known as the “Twistor,” it consists basically of copper wires that have been interwoven with magnetic wires to form a grid.

“Twistor” gets its name from a characteristic of wire made of magnetic material. Torsion applied to such a wire shifts the preferred direction of magnetization from a longitudinal to a helical path. This helical magnetization has been applied to produce a magnetic storage device of unprecedented capacity for its size.

In a magnetic memory, information is stored by magnetizing a storage element. In conventional memories the storage elements consist of rings of ferrite. In the “Twistor,” they consist of tiny segments of hair-thin magnetic wire. At each intersection of the grid, one such segment is capable of storing a binary digit.

The “Twistor” is simple and economical to fabricate, and its minute energy requirements are easily supplied by transistor circuits. Bell Laboratories engineers see important uses for it in future telephone systems which demand the compact storage of much information, as well as in digital computers for civilian and military applications.
Carl & Jerry (Continued from page 8) out there on the edge of the garage roof? It's a moisture-sensing unit. Actually it's just a sheet of tin foil glued to a piece of insulation with a very narrow zigzag strip cut out of the foil so that the sheet is separated into two pieces. Binding posts make connection with each half of the foil. That shielded, rubber-covered wire leads from the sensing unit up to this little gadget here, and this flashlight battery maintains a small potential across the two pieces of the foil. Am I getting through to you so far?"

"I read you loud and clear. Carry on."

"If a drop of rain water falls so that it bridges the tiny gap between the sections of the foil, the battery drives a small current through the conducting water. The current is amplified by the little transistor and causes this sensitive single-pole double-throw relay to pull down and close the bottom set of contacts. That applies current to the small reversing motor which, in turn, drives this speed-reducing gear train that turns this shaft made of a piece of broom-handle. Sash cord is wrapped around the broom-handle and works over the little pulleys fastened to the top of the window frame so that when the motor runs one way it pulls the window down. When it turns in the other direction it pulls the window up."

"But does it work?"

"Does it ever! Just let me show you."

As he said this, Carl picked up a glass of water from the dresser and made an
DeVry Tech CAN PREPARE YOU IN SPARE TIME AT HOME... for a Profitable Future in Electronics as used in Guided Missiles ETC.

No Previous Technical Experience or Advanced Education Needed!

If you think you need a "pull", advanced education or previous technical experience to prepare for a profitable career in the fast-growing, big opportunity field of Electronics—you're mistaken. The most important thing is a sincere desire to be somebody and to get somewhere.

During the past 27 years we have successfully trained farmers, store clerks, factory hands and men of practically every calling from 17 to 55. If these men can do it in their spare time, why can't you?

Regardless of your experience, we urge you to fill in coupon below for full FREE facts about our modern training that follows the same basic method used in our Chicago and Toronto Laboratories. It will cost you nothing for information that may prove to be the turning point in your career. Act now! Send coupon TODAY!

April, 1958
experts without the contents so that some of the water splashed on the sensing unit. Instantly there was a loud whirring noise, and the window slammed shut with a bang.

“What stops the motor after the window is down?” Jerry exclaimed.

“See this switch here on the casing? It’s operated by the two little nails driven in the top and bottom of the sash. Notice that when the window comes clear down a nail flips the switch one way. That cuts the current off the pull-down winding of the motor and connects the pull-up winding so that current will go to it when the transistor-operated relay releases and the top contacts close. When the window is opened wide, the switch is flipped back by the other nail so that current is cut off the pull-up winding and everything is ready for the current to go to the window-closing winding when the relay armature is pulled down again. So the window will close when it starts to rain, and when the rain—”

As though on cue, there was a repetition of the whirring noise, and the window shut to the wide-open position.

“The water has dried off the sensing unit,” Carl explained.

“Carl, that is a slick contraption,” Jerry applauded, “and I’m going to fix up one for my room, too. Right now, though, I’ve got to eat supper. How’s about taking in that show at the ‘State’ tonight?”

“Fine. I was going to suggest that myself. See you about seven.”

“Okay, and I’m going to take along my water pistol and give that nasty-tempered little dog at the corner of Spear and Ninth Street a surprise when he runs out and tries to bite us. Unless someone breaks him of that habit, he’s really going to harm some kid one of these days. Water won’t hurt him, but I know he hates it.”

But the boys were doomed to disappointment. The little terrier did not show up to snarl at their ankles, even though they went around the block three times in the hope of tempting him out. Like most dedicated teachers, they were very eager to impart a needed lesson!

The show was a double feature, so it was quite late when it was over. Being none too eager for their parents to know the lateness of the hour, they walked very softly on the grass between their two houses, staying in the deep shadows. Just as they were preparing to part and steal quietly in their respective back doors, Jerry clutched Carl’s arm and pointed at a ladder

---

New Transcription-Type Tone Arm Makes Collaro World’s First True High Fidelity Changer

From Collaro Ltd., world’s largest manufacturer of record playing equipment—comes the most significant development in years—the exclusive new transcription-type tone arm, which transforms the conventional record changer into a TRANSCRIPTION CHANGER, with features of the finest professional equipment.

The arm is a one-piece, spring-damped, counter-balanced unit which will take any standard high-fidelity cartridge. It is free of any audio spectrum resonances.

Stylus pressure between the first and last records in a stack remains virtually constant at less than a gram of difference, compared to 4 to 8 grams on conventional changers. Vertical and horizontal friction are reduced to the lowest possible level, insuring longer life for records and stylis.

In its superb performance, the new Collaro Continental, Model TC-540, meets the rigid requirements for high fidelity equipment, offering professional quality at a record changer price. The continental is $46.50. Other Collaro changers are priced from $37.50 up. (Prices slightly higher west of Mississippi.)

Collaro CONTINENTAL, TC-540
FREE: Colorful new catalog, containing guide on building record library plus complete Collaro line.

Cast your ballot for a successful future!

256 I.C.S. COURSES

Whether you stand at a machine or sit at a desk ... whether you're making $75 a week or $75 a hundred a year ... whether your interest is Power Plants or Paper Pulp, Advertising or Electronics ... chances are I.C.S. has exactly the course you need to get ahead.

I.C.S. is not only the oldest and largest correspondence school. It also offers the most courses, 256 in all. Each one success-proved by graduates who rose to top technical and administrative positions. Chief engineers. Superintendents. Foremen. Managers. Executive assistants.

I.C.S. Courses cover bedrock facts and theory plus practical, on-the-job applications. No skipping. Texts are prepared by leading business and industrial authorities working with I.C.S. editors and educators. They are constantly being reviewed and revised in line with current developments.

As an I.C.S. student, you study in your spare time, set your own pace. No time lost getting to class or waiting for slower students to catch up. If you wish, I.C.S. will make progress reports to your employer. You win recognition as a "comer," one who is ready to move ahead. Thousands of students report pay increases and promotions within a few months of enrollment. All graduates win the coveted, approved I.C.S. diploma.

3 FREE BOOKS! Check the subject that interests you in the coupon below. I.C.S. will rush you (1) a special book outlining your opportunities in this field, (2) the 32-page gold mine of career tips, "How to Succeed," (3) a sample I.C.S. lesson (Math.) demonstrating the famous "I.C.S. Method." "X" MARKS OPPORTUNITY.

April, 1958
CARL & JERRY (Continued from page 12)

leading up to Carl’s wide-open window.

“Holy cow! Someone’s been burgling the house!” Carl gasped.

“Yeah, but the question is: is he still in there or has he gone?” Jerry whispered.

“Let's go in my house and call the police.”

Before they could turn away, they heard a slight noise at the window, and in the faint illumination of the alley light they could make out a dim form swinging a leg over the window sill.

“He’s going to get away,” Carl groaned.

The shadowy figure got both feet on the ladder and then turned around and leaned back inside the room to pick up something from the floor. At that instant Jerry pulled his water pistol from his pocket.

“Are you nuts?” Carl hissed. “Put that thing away. You can't fool anyone with it.”

Without replying, Jerry pulled the trigger; and a silvery spray arched through the air and fell on the roof of Carl’s garage. Instantly there was a whirring sound from the top of the ladder and then a loud grunt. The window had come squarely down across the small of the burglar’s back and pinned him to the sill. The whirring continued as the motor kept grinding away with the sash cord undoubtedly slipping on the broom-handle.

In a flash Carl darted forward and pulled the ladder from beneath the wildly waving feet. At the same time Jerry bolted into his house to call the police. When he got back outside, the burglar’s feet were still kicking futilely at the siding, and Carl had gone inside to alert his family to the situation. A squad car jerked to a halt in front of the house and two policemen piled out of it. One accompanied Jerry and Carl up to the latter’s room while the other took up a position beneath the window.

IT WAS A STRANGE sight that flashed on when Carl snapped the light switch in his bedroom. Half in and half out of the window was a rat-faced man whose arms were flailing the empty air like the flippers of a turtle lying on its back. On the floor in front of him rested a pillow-case bulging with his loot.

“Get me out of here,” he pleaded. “This thing is cutting me in two.”

Gingerly Carl edged around until he could work the limit switch and then raise the armature of the relay manually so that the window released its victim. The policeman hauled him into the room by the collar and snapped a pair of handcuffs on his wrists.

“You boys have a real prize here,” the officer remarked. “This is none other than Ghost Gargan, one of the slipperiest second-

IT WAS A STRANGE sight that flashed on when Carl snapped the light switch in his bedroom. Carl & Jerry (Continued from page 14)

story men ever to grace a prison cell. How on earth did you ever trap him?"

Quickly the boys explained the operation of the automatic window. The other officer had come up by this time, and when they had heard the whole story, the two policemen laughed and slapped each other on the back until tears came into their eyes.

"Oh, wait until we tell this!" one of them gasped. "The great Ghost Gargan taken by a couple of kids with a water pistol!"

"So, okay, you wise guys," Ghost snarled; "but just remember it don't make you badge-toters look too good either. You couldn't catch me. And I've got news for you: kids are smarter now than they used to be. Take these punks for instance. You'd think they would be going around letting air out of tires, tin-canning dogs, breaking windows, and doing other things like that. But are they? Oh, no! Not these two! They're fooling around with this electronic jazz, keeping a man from making a living."

"Never underestimate the power of H2O," Carl said smugly as the officers started toward the door with Gargan between them. "Remember that little rhyme about:

`Little drops of water,
little grains of sand
Make the mighty ocean
and the mighty land.'"

"Come on; let's go to jail," Gargan groaned. "I've had all I can take."

EARN MORE MONEY...GET INTO TELEVISION ELECTRONICS-RADIO

Learn ALL 8 PHASES in ONE MODERN HOME-STUDY COURSE
At Home — In Spare Time

YOU GET ALL THIS NEWEST PRACTICAL EQUIPMENT
- Parts to build a modern TV set, including all tubes plus a large screen Picture Tube
- Parts to build a powerful Superhet Receiver, standard broadcast and short wave
- Parts to conduct many experiments and build Continuity Checker, RF Oscillator, TV Circuits, Audio Oscillator, TRF Receiver, Signal Generator
- A Valuable Professional Multimeter

YOUR NATIONAL SCHOOLS TELERAMA COURSE COVERS ALL 8 PHASES
1. TELEVISION, INCLUDING COLOR TV
2. RADIO, FM AND AM
3. INDUSTRIAL ELECTRONICS
4. SOUND RECORDING AND HI FIDELITY
5. PREPARATION FOR FCC LICENSE
6. AUTOMATION
7. RADAR AND MICRO WAVES
8. COMMUNICATIONS

YOU ARE NEEDED IN THE TELEVISION-ELECTRONICS-RADIO INDUSTRY!
You can build a secure future for yourself if you get into Electronics NOW! Today's shortage of trained technicians creates tremendous opportunities. National Schools Shop-Method trained technicians are in constant and growing demand for high-pay jobs in Broadcasting and Communications, Electronic Research, Servicing and Repair, and many other branches.

Let National Schools, a Resident Technical School for over 50 years train you for today's unlimited opportunities in electronics! Our Shop Method trains you to be a MASTER-TECHNICIAN. Completely up to date, developed by experienced instructors and engineers, your Telerama Course will teach you all phases of the industry quickly, clearly and correctly. You can master the most modern projects, such as Color TV, printed circuits - even prepare for FCC License without taking a special course. You can handle sales, servicing, manufacturing, or make good money in your own business. SEND FOR FACTS TODAY!

EARN AS YOU LEARN. Many of our students earn their entire tuition and more in Spare Time jobs we show them how to do while learning.

YOU GET EVERYTHING YOU NEED —
Clear, profusely illustrated lessons, shop-tested manuals, modern circuit diagrams, practical job projects - all the valuable equipment shown above - many other materials and services - consultation privilege with our qualified staff, and Graduate Employment Service. EVERYTHING YOU NEED for outstanding success in Electronics.

RESIDENT TRAINING AT LOS ANGELES
If you wish to take your training in our Resident School at Los Angeles, the world's TV capital, start NOW in our big, modern School. Labs and Radio TV Studio. Here you work with latest Electronic equipment, professionally installed, in the most complete facilities offered by any school. Expert instructors. Personal attention. Graduate Employment Service. Help in finding home near school and part-time job while you learn. Check box for coupon for full information.

NEW RECORD CHANGER ACHIEVES HIGH FIDELITY TURNTABLE PERFORMANCE

GLASER-STEERS GS Seventy Seven

offers fully automatic operation and added record and stylus protection

At last, the quality performance of a turntable has been combined with flawless record handling convenience. The result is—the new Glaser-Steers GS Seventy Seven. Wow and flutter are virtually non-existent. Rumble, for all practical purposes, has been eliminated, and automatic features such as the amazing ‘SPEEDMINDER’ mark the GS-77 as the most advanced record changer of our time.

‘SPEEDMINDER’ does your thinking — prevents you from using the wrong stylus with your records; selects the correct turntable speed...and intermixes and plays 33 and 45 rpm records automatically, without regard to size or sequence.

Another important GS-77 feature is that the turntable pauses during change cycles and doesn’t resume motion until next record has come into play position and stylus is in lead-in groove. This eliminates record surface wear caused by grinding action of record dropping on moving disc — a common drawback in other changers.

Other GS-77 features include — CHANGE CYCLE — only 8 seconds — fastest in the field. MOTOR — 4-pole induction; dynamically balanced, hum shielded and shock suspended. ARM — acoustically isolated; has vernier adjustment for stylus pressure, and convenient finger lift for manual play, as well as indicator to facilitate location of stylus on groove; variation in stylus pressure between first and tenth record is less than 1 gram. MUTING SWITCH & R/C NETWORK — maintains silence except when record is being played. IDLER — automatically disengages in ‘off’ position to prevent flat spots. PRE-WIRED for easy installation, replaces most other changers.

The new GS-77 is absolutely jamproof. A single knob controls all automatic and manual speed operations. $59.50 less cartridge and base (base illustrated, $9.60). See and hear the new GS-77 at your local high fidelity dealer, or write for further information. Dept. PE 4

information. This volume includes discussions and examples of the application of oscilloscopes, bridges and a number of less familiar instruments.

Recommemded: to those interested in the application of laboratory measurement techniques to the industrial domain.

"TV TUBE SUBSTITUTION AND TROUBLE CHASER CHART" compiled by H. G. CISIN, Amagansett, N. Y. Chart, 35 cents.

This chart performs three functions. As a picture guide, it shows at a glance 22 common picture faults due to tube trouble. As a TV tube trouble chaser, it shows which tubes to test; and it also indicates tube substitutions where exact types are not available. Over 256 different types of tubes are listed.

Recommended: to all P.E. readers, who may obtain a copy at the special price of 10 cents by writing directly to H. G. CISIN. Say you saw it in POPULAR ELECTRONICS.

**Free Literature Roundup**

You'll find information on the new polymerized and tri-polymer cones used in the Hartley 217 full-range speaker and the Hartley-Luth "Holton" speaker system in new illustrated folders published by Hartley Products Co., 521 E. 162nd St., New York, N. Y. Details and illustrations of this company's complete line of cabinets, including some new designs, are included.

University Loudspeakers' complete line of high-fidelity speaker systems and factory-assembled enclosures is covered in a new brochure. Styling features of each cabinet are presented and the acoustic design is discussed. Technical specifications of the speaker components are also given. Write to University Loudspeakers Inc., 80 S. Kensico Ave., White Plains, N. Y., for your copy.

Photos, schematic diagrams and detailed descriptive data on the Viking amateur equipment and accessory line are presented in Catalog #957 (28 pages) available from E. F. Johnson Co., Waseca, Minnesota.

A new catalog describing the Karlson Ultra-Fidelity line of loudspeaker enclosures has recently been issued by Karlson Associates Inc., 1610 Neck Rd., Brooklyn 29, N. Y. Models ranging in price from the $26.70 bookshelf-type unfinished model to the $249 console for 18" speakers are illustrated. All cabinets feature newly patented Karlson acoustic transducer.

THE MOST FLEXIBLE TUNER EVER DESIGNED

Use it as a Stereo-Stereophonic FM-AM tuner
Use it as a Dual-Monaural FM-AM tuner
Use it as a straight Monaural FM or AM tuner
- 11 Tubes + Tuning Eye + Selenium Rectifier
- Separately Tuned FM and AM Sections
- Armstrong Circuit with FM/AM/AF and AF/AM Defeat
- 12 Tuned Circuits
- Dual Cathode Follower Output
- Dual Double-Tuned Transformer Coupled Limiters.

More than a year of research, planning and engineering went into the making of the Lafayette Stereo Tuner. Its unique flexibility permits the reception of binaural broadcasting (simultaneous transmission on both FM and AM), the independent operation of both the FM and AM sections at the same time, and the ordinary reception of either FM or AM. The AM and FM sections are separately tuned, each with a separate 3-band tuning condenser, separate flywheel tuning and separate volume control for proper balancing when used for binaural programs. Simplified accurate knife-edge tuning is provided by magic eye which operates independently on FM or AM. Automatic frequency control "locks in" FM signal permanently. Aside from its unique flexibility, this is, above all else, a quality high-fidelity tuner incorporating features found exclusively in the highest priced tuners.

The 5 controls of the KT-500 are FM Volume, AM Volume, FM Tuning, AM Tuning and 5-position Function Selector Switch. Tastefully styled with gold-brass escutcheon having dark maroon background plus matching marble knobs with gold inserts. The Lafayette Stereo Tuner was designed with the builder in mind. Two separate printed circuit boards make construction and wiring simple, even for a complete home. Complete kit includes all parts and metal cover, a step-by-step instruction manual, schematic and pictorial diagrams. Size is 13/8" x 13/8" D x 4 1/6" H. Shpg. wt., 18 lbs.

The new Lafayette Model KT-500 Stereo FM-AM Tuner is a companion piece to the Models KT-300 Audio Control Center Kit and KT-400 70-watt Basic Amplifier Kit and the "Triumvirate" of these 3 units form the heart of a top quality stereo hi-fi system.

LAFAYETTE MASTER AUDIO CONTROL CENTER with BINAURAL CHANNEL AND DUAL VOLUME CONTROL

This is not only the finest hi-fi preamp characterized by unmatched features, but it has been functionally designed to keep pace with the conversion of your present hi-fi system to binaural (stereophonic) sound. Incorporates an extra channel and dual volume control for binaural reproduction. Features include DC on all tube filaments, negative feedback in every stage, dual cathode follower output stages and Lafayette Constuction. Less than 0.09% J1 distortion and less than 0.07 harmonic distortion at 1V. Hum and noise level better than 80 db below 3V. Uniformly flat frequency response over entire audible spectrum. 7 inputs for every type of phone, tuner or tape. Tasteful styling, brilliantly executed. Size 12 1/2" x 9 1/6" x 3 1/2". Shpg. wt., 10 1/2 lbs.

KT-300—Lafayette Master Audio Control Kit Complete with cage and detailed assembly instructions. Net 39.50
LT-30—Same as above completely wired and tested with cage and instruction manual. Net 59.50

DELUXE 70 WATT BASIC AMPLIFIER

Here's ultra-stability in a 70 watt basic power amplifier employing highest quality components conservatively rated to insure performance and long life. Features matched pair KT 88's and wide range linear Chicago output transformer, variable damping control, meter for bias and balance and gold finish chassis. Frequency response 10-100,000 cps ± 1db. Hum and noise 90db below full output. Harmonic distortion less than 1 1/2% at 70 watts, less than 0.3% below 30 watts. Harmonic distortion less than 3% at 70 watts from 20 to 100,000 cps ± 1db.

KT-400—Lafayette 70 watt Deluxe Basic Amplifier Kit complete with cage and detailed assembly instructions. Net 69.50
LA-70—Same as above completely wired and tested with cage and instruction manual. Net 94.50

NEW! 6 TRANSISTOR SUPERHET RECEIVER with LATEST NPN-PNP TRANSISTORS

- GE 2N188A AUDIO OUTPUT TRANSISTORS
- 100% SUBMINIATURE PARTS — NO COMPROMISES!
- LABORATORY DESIGNED — SENSITIVE, SELECTIVE, STABLE!

Superb Performance! Incomparable Value!

Transistor-wise Lafayette proudly presents its newly revised 6 Transistor Superhet Receiver Kit KT-119A. This improved model uses the latest GE NPN-PNP Transistors in an ingeniously engineered, laboratory tested circuit providing superb performance and an amazing superior commercial quality. The circuit features a specially matched set of 3 IF transformers, Oscillator Circuit, High-Q Loop, Class B Push-Pull Audio Amplification and optimum Transformer Coupling in audio and output stages. Has efficient 2/4" speaker for example reproduction and earphone jack for private listening. Complete with all parts, transistors, pre-punched chassis, but less battery and leather case. New 28 page easy-to-follow step-by-step instruction book. Size 6 x 3½" x 1½". Shpr. wt., 3 lbs.

NEW! WORLD’S SMALLEST PM SPEAKER 1-3/16" DIAMETER — ONLY 9/16" THICK!

- COMPLETE WITH MINIATURE TRANSFORMER
- HIGHLY EFFICIENT AS SPEAKER MICROPHONE

Ideal for extremely thin transistor radio, miniature intercom, telephone-type handsets, hearing aids and other miniature applications. As a dynamic microphone it delivers 0.5 milliwatt output and may either be directly connected to amplifier circuits or for best performance, amplifier supplied may be used as matching transformer. Speaker handles up to 1000 volts and has response 500-9000 c.p.s. at 10 db with resonant frequency 1000-7000 c.p.s. Voice coil impedance is 14 ohms. The single ended miniature transmitter output transformer has 3000 ohm primary, 1" W x 3/16" D x 3/8" H with 800,000 ohm secondary. Net 1.95

NEW! CRYSTAL MICROPHONE WITH BUILT-IN VOLUME CONTROL

A quality crystal microphone for P.A., recorder and other applications, sets scope and personnel by fingertip control of volume of remotely located amplifier. Has response 30-19,000 cycles and output level of 32 db. 5 ft. shielded cable and 1/2-27 thread fitting. Easily replaceable cartridge and volume control. Handsome black plastic case with chromed grill. Size: 2½" H x 4" D x 2½" grill diameter. Shpr. wt., 2 lbs. PA-44 — MICROPHONE... 3.95

LETTERS
FROM OUR READERS

Fast Worker
I have just completed calibration of the lean pocket neon voltmeters (January '58). I finished the construction within a week after getting the magazine. Both are housed in 3 x 2 x 1” plastic boxes which I painted with a spray can. I plan to build the whole series.

Dudley Glass III
Beverly Hills, Calif.

Audience for WWV
I read “Can You Spare the Time” by Myron Joseph in the February issue of Popular Electronics and thought it was a fine article. I use both WWV and WWVH in my work.

M. Sgt. Allen M. Raymond
USAF

Some Changes Made
By adapting a few minor changes to Bradford Van Ness’ instructions in “Tune on the Nose,” (January ‘58 Popular Electronics), I attached a tuning meter to my Heathkit FM-3 tuner (he describes the FM-3A). The results are excellent. The addition of this tuning meter is the best thing that ever happened to Heath’s reliable tuner. My compliments to Van Ness.

M. M. Mason
Grosse Pointe, Mich.

Turntable Belt Wanted
Can you or any of your readers tell me where I can obtain a 5/8”-diameter fabric or plastic endless belt approximately 34” long (total length)? This is for a turntable I built. I am now using a spliced belt which is about gone.

Walter Ray
Shreveport, La.

The Semi-Quad’s Good
I would like to tell you how much I enjoy your very fine magazine and your excellent articles, such as “DX with a D-Q” in January ’58, page 65.

I built the Semi-Quad antenna for a little over $5 (boy, that junk box comes in handy). I made only one change in it; I used 300-ohm twin-lead.

Always say you saw it in— POPULAR ELECTRONICS
FIND OUT what the FCC license means

Your FCC license is recognized by employers as proof of your technical ability.

FIND OUT how the FCC license helps you get a better job or increase your pay on your present job

When Jim enrolled, he was a temporary employee of the City of Tacoma, Washington. He was helping wire and install an interoffice phone system. In the space of 14 months, he completed the Master Course and received his first class license. He is now installing and maintaining mobile and microwave equipment.

James S. Glen, Jr.
2920 Knob Hill Rd., Tacoma, Wash.

FIND OUT how to get your FCC license in a minimum of time

John H. Johnson, Boise City, Okla.
Prentice Harrison, Lewistown, Delaware
Herbert W. Clay, Phoenix, Ariz.
Thomas J. Bingham, Finley, N. Dak.

FIND OUT how we guarantee your FCC license

The Master Course in Electronics will provide you with the mental tools of the electronics technician and prepare you for a First Class FCC License (Commercial) with a radar endorsement. When you successfully complete the Master Course, if you fail to pass the FCC examination, you will receive a full refund of all tuition payments.

(Continued from page 24)

in place of the coax because my receiver (Halli-
crafters S-38) takes only 300-ohm line.

With the antenna pointing in an east-west direc-
tion, I have logged over half of the states, eight of
the call areas (1 need W1 and W2 land), and
quite a bit of choice DX. In two years of SWL'ing
I have never run across a better single-band
antenna.

JOHN DALEY
30 River Road
Pittsfield, N. H.

* Thanks for the "Demi-Quad" antenna in your
January issue. It was just what I needed. I built
it and it works like a charm. Up until now I've
been using two 50' straight-wire antennas.
I have rigged the "D-Q" to turn by two lengths
of heavy twine running into my bedroom window.
Since I'm a SWL (W1), I did not use a balun
transformer.

Bob Nickelson, Jr.
New Bedford, Mass.

Club News

* I have often wondered if anyone would be in-
terested in forming a DX club for AM radio. I
enjoyed your article on TV DX'ing (January,
1958) and that is what gave me the idea of maybe
starting a DX club for AM.

Using a Heathkit tuner, during the past few
months I have logged 106 stations coming from
the U.S., Canada, Bermuda and Mexico. So far,
about one-half of the stations have verified my
reports, either with letters or DX cards. The DX
cards look like the ones hams send out.
I would appreciate hearing from anyone inter-
ested in starting such a club.

JIM ERNST
563 Park Ave.
Scotch Plains, N. J.

Anybody interested? Write Jim if you are.

Which Microphone?

* In your February 1958 issue, you had an arti-
cle entitled "Wireless Mike for Short Distances."
The microphone specified in the parts list was
a PA-27. Wasn't the smaller MS-108 shown?

MICHAEL HOFFMAN
KN8DYY
Cincinnati, Ohio

Yes, Mike, you're right. Lafayette's MS-108 is
a much better fit.

You Can Help

* Every week we have a one-hour tape-recorded
program for all patients with tuberculosis here at
the San. It's made up of doctors' talks, news and
music. We wondered if some of your readers
would send us tapes, up to approximately 15 min-
utes in length, on any subjects which would be
of interest to 250 people from all walks of life.
These could include hobbies, sports, occupations,
interests, etc.

Our entire program is recorded at 3/4 ips, so

Learn BASIC TELEVISION

The whole world of black-and-white television is before you for only $10!

New 5-volume Rider "picture book" course by Dr. Alexander Schure teaches the complete basic principles and practices of black and white television easily, rapidly and thoroughly with this "learn by pictures" training course.

It's so easy to learn!

Here's how easy, illustrated course works. Every page covers one complete idea! There's at least one big illustration on that same page to explain it! What's more, an imaginary instructor stands figuratively at your elbow, doing "demonstrations" that make the theory easy for you to follow and understand. Then, at the end of every section, you'll find a review that highlights the important topics you've just covered. You build a thorough, step-by-step knowledge at your own pace—as fast as you yourself want to go.

No experience, education needed!

BASIC TELEVISION uses the same methods that have proven so successful in the famous Rider "picture books" on electricity and electronics. This comprehensive course presents Basic Television in simple, down-to-earth language that everyone can understand—regardless of previous education. All that is assumed is that you have a knowledge of radio. Every phase of television is made instantly clear—explained in plain English supported by carefully prepared, large and exciting drawings that make every idea crystal-clear.

3 complete volumes

It starts with the transmitter and discusses in detail the following subjects: Volume 1 deals with the transmitter; the handling and the operation of the camera; formation of the picture signal and the general content of the trans-
mitter. Volume 2 covers the organization of the entire TV receiver treating each section individually from an-
tenna to picture tube. Volumes 3, 4 and 5 contain the TV receiver circuit explanations. Each volume covers a specific number of sections in the receiver. In effect, the presentation is like a spiral — first an overall view of the whole, and then the detailed explanation of each part. The most perfect modern teaching technique. The result — maximum understanding.

Order by mail—no correspondence

This course is so complete, so different — there's no need for the usual letter writing, question and answer corre-
respondence. You learn in the comfort of your home, in your spare time ... at your own pace.

10-day examination—Money Back Guarantee

Send today for these exciting new training courses — you risk nothing! When you receive the volumes, ex-
amine them in your own home for 10 full days. If, at the end of that time, you're not completely satisfied, we will simply return your full purchase price! Total cost for this 5-volume course is only $10.00! In Canada, prices approximately 5% higher.

ORDER TODAY

These books are sold by electronics parts jobbers and book stores. IF YOUR dealer doesn't have these books, mail this coupon to us.

Letters (Continued from page 26)

this speed would be preferable. Anyone who sends us tapes that he wants to have returned should enclose a letter with the tapes. If the tapes do not have to be returned, we will be happy to forward them on to other groups or institutions requesting them, anywhere in the world.

Here’s a project for all tape recorder fans that will be very much appreciated by a great number of persons who are not healthy enough to enjoy the things you can hear, see and do in every-day life.

ROBERT C. SHELLSNA
Baker San
Calgary, Alta., Canada

Can any of our readers spare some prerecorded tapes? It’s for a worthy cause.

Tape Correspondence

I am writing to you in the hope that you may be able to assist me in contacting some one interested in tape recording. I thought it possible that you might know of some club I could write to with a view to corresponding with recorded tapes. I have two recording units, a Ferrograph Model 2A/N, and a Motek “Elizabethan,” both of which employ standard twin track systems at 7½ and 33½ ips. By trade I am an electrician, and my hobbies are tape recording, music, radio experimenting and servicing.

I would also like to say how much I enjoy your magazine, especially the construction articles, which are so easy to follow. My only regret is that a lot of the parts described are not available here. To my mind POPULAR ELECTRONICS is the best of its kind available in this country.

Neil A. Kerr
Kihi Kihi, Te Awamutu
New Zealand

Again, anybody interested?

Help Needed

I have a tetrode transistor which I have tried in many circuits, such as the one in P.E., May 1957, p. 90. I tested the fourth electrode with an ohmmeter, using the base, emitter, and collector separately as the other electrode. It registered nothing. Can any of you “Votees” help me out?

Stanley Livingston
71 Lakeland Ave.
Patchogue, N. Y.

You didn’t give any information on the make and type of tetrode transistor that you have, Stanley. Perhaps some reader has had some experience in this respect and can assist you.

PLEASE!

POP’tronics receives nearly 1000 letters a month from readers. Many request plans for special construction projects, analysis of service problems or opinions of commercial equipment. We wish it were possible to comply with individual personal attention but we do not sell plans, analysis or advice.

NOW YOU CAN SECURE A
HIGH SALARIED • TOP PRESTIGE
CAREER IN ELECTRONICS
IN ONLY ONE YEAR!

ELECTRONICS is the fastest growing industry in America today, creating unlimited opportunities for high salaries, with rapid advancement in INDUSTRY AND THE ARMED FORCES for Bailey Trained electronic engineering technicians.

LARGE CORPORATIONS from coast to coast, and BRANCHES OF THE ARMED FORCES send recruiters to visit each graduating class at Bailey Tech, offering unusually high starting salaries.

BAILEY GRADUATES ARE BEING HIRED for such fascinating and interesting work as technical salesmen, research and development of guided missiles, electronic business machines and automatically controlled manufacturing plants, etc., also good RATINGS IN THE ARMED FORCES.

UP TO SEVEN TECHNICIANS are needed for every engineer...this, plus superior training is why Bailey Graduates are being paid more to start, and are advancing more rapidly than many men who have spent four years in training.

Resident training is easier and costs less than you may think! We provide housing and part-time jobs while in school, plus free nationwide employment service for graduates. If you want to quickly enter America’s fastest growing and most exciting industry, write for free booklet...no obligation.

NOTICE!
DON’T BUY A NEW

high fidelity phonograph cartridge until you’ve read this vital stereo report...

THE MISSING LINK to popular-priced stereophonic sound reproduction has been found: It's the new Electro-Voice TOTALLY COMPATIBLE Stereo Cartridge... plays the new stereo discs superbly... LP's too... even better than existing cartridges.

By breaking the stereo cartridge cost bottleneck, Electro-Voice has made popular-priced quality stereo a reality. E-V's ceramic stereo cartridge (Model 21D with .7 mil diamond stylus) sells for only $19.50 (Audiophile net) and is available now at your audio dealer or from your serviceman.

Here are some of the answers to your questions concerning stereo:

Q How does the COMPATIBLE E-V Stereo Cartridge differ from CONVENTIONAL cartridges?
A It has the ability to play both the new type stereophonic discs and conventional records. Inherent in its design is an improved monaural performance. Exclusive design for rumble suppression of 15 db or better will permit the use of Electro-Voice's Stereo Cartridge with any type of changer or transcription player.

Q Are stereo discs compatible with conventional cartridges?
A Most cartridges damage the stereo record. DO NOT BUY STEREO DISCS UNTIL YOU HAVE AN E-V STEREO CARTRIDGE. You may then play monaural or stereo discs monaurally. Add a second speaker and amplifier, and you have stereophonic sound.

Q What about record availability?
A Recordings by major record manufacturers will be available in mid-1958.

Q What effect will stereo cartridges and records have on your present equipment?
A Only your cartridge will be obsolete. All other components are compatible with stereo.

Q What if you don’t have a HI-FI system now... should you wait?
A No. Proceed as before—with one exception: you should insist on a stereo cartridge initially. When you are ready for stereo, merely add a second speaker and amplifier.

Q How do you go about getting your Electro-Voice Stereo Cartridge?
A Visit your dealer. If you don’t know the name of your nearest dealer, please write Electro-Voice. Ask for E-V Stereo Model 21 D with .7 mil diamond stylus or E-V Stereo Model 28 DST Turnover with .7 mil diamond Stereo tip and 3 mil sapphire tip for monaural 78 rpm records ($22.50).

STEREO IS HERE!
don’t buy an obsolete cartridge... replace with the totally compatible Electro-Voice stereo cartridge

Leo says: “By TEST or TESTIMONIAL
the finest transmitter
in its price & wattage range”

I bought one of your Globe Chiefs last
December 23. I had finished building this
kit by the night of the 25th. The simpli-
city of this kit and operation seem almost
unbelievable according to the results I have
had. I had another transmitter for the first
half of my novice license, with the DX
result being 3-WH6’s and one KH6. Since
then on the novice bands with the Globe
Chief, I have had close to 600 contacts
and my DX is a VE3, VE6, 2-KL7’s,
KV4, 4-KH6’s and 8 more WH6 contacts.
I thank you and the WRL Staff for
taking ‘time to serve me, and the
motto of World Radio, “World’s most personalized radio
distributor”, certainly holds true.

TEST LEAD SWITCH

A snap switch in series with one or more
of your test leads permits temporary dis-
connection of an instrument without actu-
ally removing the test clip. This is often
desirable in checking for intermittent
defects or when tests must be momentarily
interrupted.

H. L.

SAVE BURNED-OUT EARPHONES

Chances are that only one phone of a
pair is burned out, and you can still use
the other one. The burned-out phone can
serve to keep outside noises out of one ear
while you listen to the good phone with
the other ear. Since both phone units are
connected in series, you can determine
which is burned out by connecting a wire
jumper across the terminals of one unit at
always say you saw it in—POPULAR ELECTRONICS
NORELCO® presents
the world's second
finest pickup cartridge

a new MAGNETO-DYNAMIC design by
Philips of the Netherlands

"The world’s finest pickup cartridge is carefully
guarded at the great Philips audio research center in Eind-
hoven, the Netherlands. It is the laboratory prototype of the new
NORELCO "Magneto-Dynamic" pickup cartridges—a special pilot
model hand-built to zero tolerances by Europe’s most renowned electro-
acoustic research team. This reference standard must, of necessity, be a shade
superior to the production models, which are constantly quality-controlled against it.

It is an indispensable laboratory tool that obviously cannot be sold. But the world’s second
finest pickup cartridge—meaning any and every NORELCO production model—can be and is
sold by leading hi-fi outlets everywhere, for the astonishingly low price of $29.95.

THE MAGNETO-DYNAMIC PRINCIPLE—The armature is
a thin rod M, 1/32" in diameter and approximately 1/2" long, made of "Ferrodure," a special high-coer-
civity ferrite material developed by Philips. This arma-
ture is magnetized perpendicularly to its axis (s — n) and
is rotated about the axis by the transverse vibra-
tions of the cantilever stylus bar L, which is driven by the 1-mil diamond stylus N. This rotation induces a
varying flux in the core J, which results in the develop-
ment of a corresponding AC voltage in the coil S. The
inherent advantages of the system include very high
compliance (more than 5 x 10^6 cm/dyne), very low
dynamic mass (2.8 milligrams), high output (35 milli-
volts at 10 cm/sec), low stylus force (5 grams), and
vanishingly low distortion. Frequency response is flat
within 2 db from 10 to 20,000 cps.

High Fidelity Products Division, Dept. PC
230 Duffy Avenue, Hicksville, L. I., N. Y.

April, 1958
Tips (Continued from page 30)
a time. When you have found the good phone, connect the wire jumper across the terminals of the bad phone securely, and leave it there. —A. T.

MAKING NEAT WIRE SPLICES
When making a splice in lamp or appliance cords, the connection will have a neat, manufactured appearance if you cover it with a short length of rubber tubing. Slip the latter over the wire beforehand; after soldering the connections, cover the bare metal with rubber tape tightly wrapped so as to avoid a bulge. Apply talcum powder so that it will be easy to slip the tubing over the splice. The same neat finish can be secured by using small Bake-lite tubes if you are sure they will not be stepped on when the cord is in use.—K. M.

INSULATING PIGTAIL FUSES
A blown pigtail-type fuse on a crowded chassis (especially if the equipment is mobile) can often be traced to shorting of the metal tip of the fuse to chassis ground or other nearby uninsulated components. There are several ways this can be prevented. Wrap the entire fuse with tape, slip a length of split spaghetti over the fuse, and so on. But about the best method to use in insulating the metal tips is to spray them with a coat or two of antieorona dope. The dope will insulate the fuse but will not hamper visual observation of the fuse. —J. A. C.

BOTTLE SERVICE TOOL
Need an applicator with a long snout for squirting cleaner into noisy controls? A squeeze-type deodorant bottle with a few modifications will serve the purpose ideally. Carefully pry out the plug from the bottle's neck, remove the spray tube, and drill the hole in the plug slightly larger to receive the tube. Insert the tube and cement it in

better reception on 1, 2 or 3 tv sets...
with one antenna
NEW B-T LABS B-23
TWO-SET BOOSTER only $23.95

From B-T comes the most important advance in better TV reception for 1958—a broadband TV amplifier that boosts signal strength on all VHF channels and operates 1, 2 or 3 TV sets with one antenna—no tuning required.
Combines two functions in one—
• BOOSTS signal strength on 1 or 2 TV sets—up to 6 db gain operating two TV sets from one antenna.
• COUPLES 2 or 3 TV sets—using the present antenna. Outperforms non-powered couplers in any reception area by more than 2 to 1.
Check these B-23 features:
• Ideal for color—add a color TV set and keep present black-and-white set, use the same antenna—the result, sharper, clearer pictures on both sets.
• Low noise figure—works with new VHF sets.
• Reduces interference.
• Easily installed at antenna terminals of set. Mounts out of sight at rear of set.
• Automatically amplifies channels 2-13.
• Ideal small TV system.

For operating 3 to 8 TV sets, use the DA8-B—more than 10 db gain on all VHF channels
The DA8-B Distribution Amplifier is a broadband, all-channel unit that requires no tuning, impedance matching devices, pre-amps or other special fittings. Ideal for all small TV systems (garden apartments, motels, TV showrooms). For color. Only $94.50.
The B-23, the DA8-B, and other B-T quality engineered products, are available at parts distributors.

This complete training in BASIC ELECTRICITY is the "KEY" you need to unlock the mysteries of Radio TV-Electronics.

BRINGS YOU COMPLETE ELECTRICAL "KNOW HOW"

Includes Basic Electronics... in one big, easy-to-understand home training guide.

Learn your Basic Electricity FIRST! Learn it right! Then everything else in electronics, radio, TV, communications, hi-fi, etc. comes to you 10 times as easy... because they're all based on the same fundamental electrical principles! That's why, no matter what you want to do in electronics, this new 306-page BASIC ELECTRICITY manual represents the most important training of all.

Think how often you've been stumped by a technical talk, by a book, by some complicated equipment, or by things like reactance, impedance or phase relations—simply because you're not exactly clear about the basic principles involved.

The kind of training that pays off BIG!

From basic circuits and currents to electromagnetism... from capacitance to resistance... from polyphase to phone principles... from ammeters to oscilloscopes and measurements of all sorts... from tubes to transistors... BASIC ELECTRICITY covers the entire field. Essential elements such as motors, generators, batteries and polyphase are clearly explained—and you don't need to be a mathematics expert to understand them.

More than 300 pictures make subjects doubly clear. "Set up" diagrams explain many procedures. Basic electrical problems and their solutions are included. Every chapter ends with a Self-Test Review of all essential points. A skilled instructor standing by your side could hardly do better.

See for yourself! If not more than satisfied, simply return book in 10 days and your money will be refunded promptly, without question. You can't lose!

---STUDY 10 DAYS FREE---

Tips

(Continued from page 32)

place. Fill the bottle with solvent and snap the plug assembly back into the neck. You'll find that one light squeeze will put a tiny stream of cleaner in just the right place and in the right amount for proper cleaning.

J. A. C.

ARMORED CABLE

When short lengths of insulated wire should be protected from mechanical injury on a small wiring job, and it would not pay to buy a coil of armored (B.X.) cable, cover the regular wire or wires with inexpensive linoleum edge binding. This is a metal strip that is easily wound in a tight spiral which will remain in place. If desired it may be grounded. But use B.X. cable for 115-V. lines. —K. M.

CLIP DISABLES OSCILLATOR

When a superheterodyne receiver is aligned with a signal generator, the set's oscillator has to be disabled to avoid possible interference. A simple way to do this is to clamp a test clip to one of the plates of the oscillator's tuning capacitor, and turn the dial until the clip makes contact with one of the stator plates. The clip won't bend the plates as a piece of solder, wire, or screwdriver might. —J. A. C.

BUILD 16 RADIO CIRCUITS AT HOME with the New Deluxe 1958 PROGRESSIVE RADIO "EDU-KIT"

ONLY $22.95

A Practical Home Radio Course

NOW INCLUDES

★ TRANSMITTER
★ SIGNAL TRACER
★ SIGNAL INJECTOR
★ CODE OSCILLATOR
★ No Knowledge of Radio Necessary
★ No Additional Parts or Tools Needed
★ Excellent Background for TV
★ School Inquiries Invited
★ Attractively Gift Packed

YOU DON'T HAVE TO SPEND HUNDREDS OF DOLLARS FOR A RADIO COURSE

The "EDU-KIT" offers you an outstanding PRACTICAL HOME RADIO COURSE at a reasonable price. Our Kit is designed to train Radio & Electronics Technicians, making use of the most modern methods of home training. You will learn radio theory, construction principles and practice. THIS IS A COMPLETE RADIO COURSE IN EVERY DETAIL. You will learn how to build radios, using regular schematics; how to wire and solder in a professional manner; how to service radios. You will work with the standard type of punched metal chassis as well as the latest development of Printed Circuit chassis.

You will learn by actual radio construction. You will construct, study and work with RF and AF amplifiers and oscillators, detectors, rectifiers, test equipment. You will learn and practice audio using the Professional Code Oscillator. You will become a successful trouble-shooter using the Printed Circuit Radio & Electronics Tester and the accompanying instructional material. You also will receive a copy of the F.E.C. Radio Amateur License. You will build 16 Receiver, Transmitter, Code Oscillator, Signal Tracker and Kits, and learn how to operate as an excellent background for Television, Hi-FI and Electronics.

As an added knowledge of radio or science is required, the "EDU-KIT" is the product of many years of teaching and engineering experience. The "EDU-KIT" will provide all you need to learn, build and install in and into many of the problems that exist at the price of $22.95. The Signal Tracer alone is worth more than the price of the entire Kit.

THE KIT FOR EVERYONE

You do not need the slightest background in radio or science. Whether you are interested in electronics merely because you have a business or a job with a future, you will find that this kit will pay you handsomely. Many thousands of individuals of all ages and backgrounds have successfully used the "EDU-KIT" in more than 70 countries of the world. The "EDU-KIT" has been received with enthusiastic approval. You cannot make a mistake. The "EDU-KIT" allows you to learn at your own rate. No instructor is necessary.

PROGRESSIVE TEACHING METHOD

The Progressive Radio "EDU-KIT" is the foremost educational radio kit in the world, and is universally accepted as the standard in the field of electronics training. The "EDU-KIT" uses the "Learn by Doing" Method. Here you construct, learn schematics, study theory, practice trouble-shooting—all in a closely integrated program. You will find easily learned, thorough and interesting background in every phase of your future work. You will learn theory, function and wiring of these parts. Then you build a simple radio. With this first set, you will learn how to practice basic radio work, learn theory, build, function and trouble-shooting. Then you build a more advanced radio, learn more advanced theory and wiring and how to incorporate it in your work. You will find yourself constructing more advanced multi tube radio circuits, and doing work like a professional technician.

Included in the "EDU-KIT" course are sixteen Receiver, Transmitter, Code Oscillator, Signal Tracker and Printed Circuit circuits. These are easily constructed in a few simple experiments, but genuine radio circuits, constructed by means of professional wiring andMillwiring method. This is the new method of radio construction known as "Printed Circuitry." These circuits operate on your regular AC or BC house current.

THE "EDU-KIT" IS COMPLETE

You will receive all parts and instructions necessary to build 16 different radio and electronics circuits, each guaranteed to operate. Our Kits contain tubes, tube sockets, variable, electrolytic, mica, ceramic and paper dielectric condensers, resistors, tie strips, coils, hardware, tubing, punched metal chassis, Instruction Manuals, hookup wire, solder, etc.

In addition, you receive Printed Circuit materials, including Printed Circuit chassis, special tube sockets, hardware and instructions. You also receive a useful set of tools, a professional electric soldering iron, and a self-powered Dynamic Radio and Electronics Tester. The "EDU-KIT" also includes Code Instructions and the Progressive Code Oscillator. In addition the "EDU-KIT" contains 24 exclusive Printed Circuit lessons for servicing with the Progressive Signal Tracer and the Progressive Code Oscillator. The "EDU-KIT" also includes a High-Fidelity Guide and a "Do-It-Yourself" Radio-TV Club. Free Consultation Service, Certificate of Merit and Discount Privileges. You receive all parts, tools, instructions, etc. Everything is included in the "EDU-KIT." We are so confident of the quality of our Kit that we offer the UNCONDITIONAL MONEY-BACK GUARANTEE.

ORDER DIRECT FROM AD—RECEIVE FREE BONUS RESISTOR AND CONDENSER KITS WORTH $7

Send "EDU-KIT" postpaid, I enclose full payment of $22.95.
Send "EDU-KIT" C.O.D. I will pay $22.55 plus postage.
Send me FREE additional information describing "EDU-KIT."

TOOLS and GADGETS

VACUUM-TUBE VOLTMETER

The Model "77" vacuum-tube voltmeter is equipped with a 6" meter and comes complete with all accessories including test leads, probe, portable carrying case and full instructions for use. It has an 11-megohm input d.c. voltmeter, an r.m.s. and peak-to-peak a.c. voltmeter and electronic ohmmeter, and db and zero center alignment scales. Operating on 110-120 volts, 60 cycles, its frequency range is from 30 cycles to more than 5 mc. Price, $42.50. (Superior Instruments Co., 2435 White Plains Rd., New York 67, N. Y.)

"AUTOMATED" PENCIL-SHARPENER

Machined out of a sugar-cube size nugget of solid brass alloy and fitted with a scalpel of surgical steel, the "Tipster" has a multiposition selector dial which adjusts the shaving head to turn out anything from a needle point for drawing schematics to a stub for pictorials. Price, $1.50, in a genuine leather case. (Mr. Wink, Private Eye, P. O. Box 252, Cos Cob, Conn.)

CARBON RESISTOR KIT

Thirty boxes of the most used 11/2-, 1- and 2-watt resistors are included in the "G-C Carbon Resistor Kit." The hinged-cover plastic boxes make it easy to determine re-
AT LAST!

RADIO-TV and ELECTRONICS TRAINING

...AT A PRICE YOU CAN AFFORD!

Yes, this great course costs far less than any training of its kind given by other major schools! Radio-Television Training School will train you for a good job in Television or Industrial Electronics—AT HOME IN YOUR SPARE TIME.

Think of ‘it—a complete training program including over 120 lessons, Eleven Big Radio-Television Kits, Complete Color-TV Instruction, Unlimited Consultation Service... ALL at a really big saving to you. How can we do this? Write to us today... and find out!

And what's more—you can (if you wish) OPEN YOUR OWN RTS-APPROVED AND FINANCED RADIO-TV SERVICE SHOP

We Want 100 More Shops This Year

This 35 year old training organization—called RTS, that's Radio-Television Training School—wants to establish a string of Radio-TV Repair Shops in principal cities throughout the U. S. So far, 36 such shops are NOW IN BUSINESS AND PROSPERING. We are signing contracts with ambitious men to become future owners and operators of these shops in all areas.

FOR UNSKILLED INEXPERIENCED MEN ONLY—WE TRAIN YOU OUR WAY!

We must insist that the men we sign up be trained in Radio-TV Repair, Merchandising and Sales by our training methods—because WE KNOW the requirements of the industry. Therefore, we will TRAIN YOU... we will show you how to earn EXTRA CASH, during the first month or two of your training period. YOU KEEP YOUR PRESENT JOB. TRAINING TAKES PLACE IN YOUR OWN HOME, IN YOUR SPARE TIME!

ACT NOW!

Tools (Continued from page 36)

sistor values through novel color-coding and labeling while giving the resistors and their leads full protection against damage and careless handling. These Stackpole resistors meet EIA, MIL and ASEA specifications.

An all-metal bench or wall rack to hold the resistors is furnished free of charge with the kit (Catalog No. 5245), which is available through leading electronics distributors. Net price, $18.00. (G-C Electronics Mfg. Co., Div. of General Cement—Textron Inc., 400 S. Wyman St., Rockford, Ill.)

MULTIPLE CONNECTOR

The "AMP-lok" self-anchoring multiple connector eliminates the necessity for supplementary mounting devices in through-

panel applications. Its contacts are identical and self-cleaning. Recessed for safety, the AMP-lok is polarized to eliminate circuit error. And it is designed to accommodate a wide spread of panel thicknesses—only one simple mounting hole is required. (AMP Incorporated, Harrisburg 20, Pa.)

RIPPLE FILTER KIT

The Heathkit Model BE-1 is an L-type filter circuit designed primarily for use with the Model BE-4 battery eliminator or comparable units. Adding extra filtering to the d.c. output for powering transistors and "hybrid" automobile radios, it functions at 6 or 12 volts, and will supply up to 5 amp. current—which is adequate for most transistorized equipment. Price, $10.95. (Heath Company, Benton Harbor, Mich.)

Listen to Satellites with 108-mc. Converter

This three-tube satellite converter (SC-3) is a highly sensitive unit that will receive and amplify the 108-mc. telemeter signal of an earth satellite or missile and convert it to a frequency that can be found and identified on the dial of your short-wave receiver.

Figure 1 (on page 42) is a block diagram of the converter circuit. Accuracy of the frequency of reception is determined by the frequency of the conversion crystal (fixed by the manufacturer) and the precision with which you tune your receiver to the conversion frequency of 10 megacycles.

If you tune your receiver near the easily identified signals of Station WWV (whose operating frequency is 10 mc.), you can obtain optimum 108-mc. reception with the SC-3. A simple connection between converter and receiver will feed the signal into the antenna circuit of your receiver.

Assembly

Before starting to assemble the converter, the chassis should be completely drilled according to the layout in Fig. 2. To insure proper wiring and assembly, the
Above-chassis view of completed converter. Tube line-up from front to rear is 6BS8, 6AN8, and 12AT7.

The following instructions are given in a step-by-step sequence. The notation (NS) indicates that a connection should not be soldered, as other wires or components will be added shortly. The notation (S) indicates that a connection should be soldered before starting the next step. Mark each step off in the space provided when you have completed it, and always check your work against the schematic diagram (Fig. 3). A drawing of the terminal strips (TS1 and TS2) is shown in Fig. 4. Use a clean, hot iron, and beware of "rosin" joints!

( ) Mark the drilling layout (Fig. 2) on the paper wrapper of the chassis. Drill the chassis as shown. Remove the paper and clean away all burrs.

( ) Install 9-pin sockets in holes D, F, and J, using 4-40 hardware. The blank pin of each socket faces the rear of the chassis. Place a metal tube shield base above chassis on socket D. Install coaxial connector J1 in hole E, using 4-40 hardware. Place a ground lug under connector nut closest to ground lug 2 of socket D.

( ) Install output receptacle J3 in hole G, using 6-32 hardware. Mount test jack J2 in hole I. Mount the 8-lug insulated terminal strip TS1 in holes B and C, using 6-32 hardware. Position lug terminals facing socket F. Mount crystal socket at position L, using 4-40 hard-
Two views of the underside of the converter. Note point-to-point wiring and the short component leads. Follow layout shown as closely as possible to reduce possibility of spurious oscillations and regeneration.

EDITOR'S NOTE
The construction of this project has been simplified as much as possible, but at the high frequencies involved there are many intangible pitfalls. For example, mounting wire connected to a grid or plate circuit close to the chassis might add enough capacitance to prevent the tuned circuit from being adjusted properly later. An extra half inch of wire connected to a coil might similarly prevent proper operation.

If you have built units operating at similar frequencies, you have learned how to handle such critical circuits. Equipped with a VTVM and a grid dip oscillator, you are off to a good start.

The ground leads should be wired with #22 tinned, solid wire, as follows:

Connect a wire between lug E at receptacle J1 (NS) and ground lug 2 (NS) of socket D. Pass a wire through the center stud of D (NS), through pin 4 (NS) to ground lug 2 (S). Pass a second wire through the center stud of D (NS),

ware. Mount the 5-lug insulated terminal strip TS2 in hole K using 6-32 hardware. Position terminals facing socket J.

Install switch SI in hole A using hardware provided with switch. Place 9/16" rubber grommets in holes O and P. Install holder fuse for F1 in hole R. Mount selenium rectifier S1 in hole Q using 1¼" 6-32 bolt. Position lugs of S1 toward TS2, with positive terminal (cathode) toward retaining nut.

Pass leads of transformer T1 through grommet O. Mount T1 above chassis, using 6-32 hardware through holes M and N. Install ground lug under nut M. Mount the single-terminal tie point in hole S behind socket D. This completes the mounting of the larger components.

Wiring

The ground leads should be wired with #22 tinned, solid wire, as follows:

Connect a wire between lug E at receptacle J1 (NS) and ground lug 2 (NS) of socket D. Pass a wire through the center stud of D (NS), through pin 4 (NS) to ground lug 2 (S). Pass a second wire through the center stud of D (NS),
Fig. 3. Complete schematic of converter shows how dual tubes give six-tube performance.

**COIL DATA**

L1, L4, L5 and L8 are cut from sections of prefabricated air-wound coil stock. 1/4" in diameter. 16 turns per inch (Air-Dux #416—Illuminotron Engrg., Sunnyvale, Calif.). L1 has 4½ turns with 1/8" leads; L4 has 4½/3 turns with 3/8" leads; L3 has 2½/3 turns with 3/8" leads; and L8 has 3½ turns with 1/8" leads. L2, L3, and L7 are close-wound with #30 enamelled wire on 1-megohm, 1-watt resistors approx. 7½" in diameter by 9/16" long (IRC Type BTA). Coil leads are soldered to resistor leads close to body of resistor. L2 has 15 turns of wire, L3 has 33 turns, and L7 has 10 turns.

L6 has a value of approx. 44 microhenrys (L. W. Miller adjustable r.f. choke #4562)
through pin 9 (S) to ground lug 4 (S). Pass a third wire through the center stud (S), through pin 7 (S) to socket mounting ring below pin 7. Solder wire and pin 7 to ring.

( ) Connect a wire from center stud of socket F (NS) through pin 4 (S) to ground lug 2 (NS). Connect a wire from ground lug 2 (S) to ground terminal (outer) of J3 (S). Pass a wire through center stud of F (S), through pin 9 (S) to ground lug 4 (S). Connect a wire from ground lug 3 (NS) of F to nearby ground lug 7 of terminal strip TSI (S). Press this lead against chassis.

( ) Connect wire to ground lug 1 of socket J (S), pass through pin 2 (S) to center stud of socket (NS). Connect wire to center stud (S) and pass through pin 9 (S) to ground lug 4 (S).

Wire the filament and power leads next with #22 stranded, insulated wire. Make sure the wire ends are twisted to avoid an accidental short circuit.

( ) Run a wire from pin 5 of socket D (S) to pin 5 of socket F (NS). Run a wire from pin 5 of socket F (S) to pin 5 of socket J (NS). Install jumper of solid wire between pin 5 (S) and pin 4 (NS) of socket F. Run one green lead of transformer T1 to pin 4 (S) of socket J. Attach other green lead of T1 to terminal 3 (ground) of strip TS2 (NS).

( ) Wire terminal 5 of TSI (NS) to terminal 1 of TS2 (NS). Wire terminal 1 of TS2 (NS) to pin 1, socket F (NS). Wire terminal 8 of TSI (NS) to test jack J2 (S). Attach one black lead of T1 to one lug terminal of fuse F1's holder (S). Attach the other black lead of T1 to terminal 5 of TS2 (NS). Attach the red lead of T1 to the unmarked (negative) terminal of rectifier SRI (S). Attach the red/yellow lead of T1 to terminal 3 (ground) of TS2 (S).

( ) Twist together two 14" lengths of hook-up wire. Strip and tin both leads at one end. Attach one lead to each terminal of switch S1 (S). Press the leads along the chassis edge and back to TS2. Attach one lead to terminal 5 of TS2 (S). Attach the other lead to terminal 4 of TS2 (NS). Pass the 117-volt line cord through grommet. P. Tie a knot near the end of the cord. Attach one lead of the cord to the free terminal of fuse F1's holder (S). Attach the other lead to terminal 4 of TS2 (S).

Mounting

You are now ready to install some of the smaller components.

( ) At socket D: Install capacitor C2 between pin 1 (NS) and pin 8 (NS). Trim leads as short as possible. (Lead length of all of the following connections should be kept at absolute minimum.) Install capacitor C3 between pin 8 (NS) and the single terminal tie point S (NS). Install resistor R1 between pin 8 (S) and tie point S (NS).

( ) Install coil L2 between tie point S (S) and pin 2 (NS). Install coil L1 between pin 2 (S) and ground lug E of J1 (NS). Install capacitor C20 between pin 4 (S) and pin 5 (S). Mount capacitor C5 in hole T. Attach wire lead from stator of C5 to pin 6 (NS). Mount coil L4 between pin 6 (S) and terminal 3 of TSI (NS). Mount coil L3 between pin 1 (S) and terminal 5 of TSI (NS).

( ) Examine capacitor C4. The outer ring is one terminal, and the two inner lugs comprise the other terminal. Slide one inner lug of C4 through the hole of pin 3 of socket D (NS). Orient the outer ring of C4 so that it touches ground lug 2 of socket D. Holding C4 in this position, solder pin 3. Next, solder the outer ring to ground lug 2. Trim the leads of R2 and attach one lead to the free inner...
HOW IT WORKS
A high-gain v.h.f. dual triode (V1) operates as a neutralized cascode amplifier with the input circuit (L1-C1) and output circuit (C5-L4-L5) tuned to 108 mc. Neutralizing coil L2 in conjunction with the grid-plate capacitance of the first triode section forms a parallel-resonant circuit at the operating frequency, preventing interstage feedback and parasitic oscillation of the stage. The noise figure (ultimate sensitivity) is optimum when this circuit is properly adjusted.

The second triode section of V1 functions as a grounded-grid amplifier whose plate circuit is coupled to the pentode section of V2 serving as a frequency converter from 108 mc. to 10 mc. The oscillator uses a 12AT7 (V3) in a "hot-cathode" crystal circuit, employing an overtone crystal oscillating at 49 mc. V3's second section acts as a frequency doubler, delivering 98-mc. energy which is capacitively coupled to the input grid circuit of V2.

A 10-mc. "difference frequency" is created between the incoming signal and the local oscillator signal (108-98=10) in the mixer circuit, and is extracted across the tunable plate circuit inductor, L6. This 10-mc. signal is coupled into the triode section of V2 which serves as a cathode follower, providing a low-impedance signal source suitable for coupling the output signal of the converter into the antenna terminals of your receiver. When the latter is tuned to 10 mc., it "hears" the 108-mc. signal received by the SC-3 converter.

Half-wave power transformer T1 and selenium rectifier S1, together with a simple resistance-capacitance filter system, provide approximately 120 volts d.c. required to operate the converter. Filament power is also supplied by T1. The converter is designed to operate from the normal 117-volt, 60-cycle power line.

lug of C4 (S); attach the other lead to ground lug E of J1 (S).

( ) At terminal strip TS1: Install resistor R3 between terminal 3 (NS) and terminal 5 (NS). Install capacitor C6 between terminal 3 (S) and terminal 6 (NS). Slip insulated tubing over capacitor leads. Install resistor R5 between terminal 6 (NS) and terminal 7 (ground) (NS). Install R4 between terminal 6 (NS) and terminal 8 (S). Install capacitor C12 between terminal 5 (NS) and terminal 7 (ground) (NS). Slip insulated tubing over leads. Install C7 between terminal 6 (NS) and terminal 7 (S).

( ) At socket F: Install capacitor C11 between center terminal of J3 (S) and pin 3 of socket F (NS). Install C10 between ground lug 1 (NS) and pin 1 (S). Install resistor R8 between ground lug 1 (NS) and pin 2 (NS). Install capacitor C9 between pin 2 (S) and pin 6 (NS). Slip insulated tubing over capacitor leads.

( ) Install resistor R7 between ground lug 1 (S) and pin 3 (S). Install coil L6 between pin 6 (S) and terminal 5 of TS1 (NS). Use lengths of solid wire for coil leads. Install capacitor C8 between ground lug 3 (S) and pin 7 (NS).

( ) Install resistor R6 between pin 7 (S) and terminal 5 of TS1 (S). Slip insulated tubing over resistor leads. Install coil L5 between pin 8 (NS) and terminal 6 of TS1 (S).

( ) At socket J and TS2: Install capacitor C16 in hole H. Attach wire lead from stator of C16 to pin 6, socket J (S). Install capacitor C15 between pin 8 of socket F (S) and the lead of C16 (S). Install resistor R12 between terminal 1 of TS2 (NS) and terminal 2 of TS2 (NS). Install coil L8 between terminal 1 of TS2 (NS) and the lead of C16 (S). Install capacitor C14 between pin 1 (NS) and pin 7 (NS). Install resistor R11 between pin 7 (S) and ground lug 4 (S).

( ) Install capacitor C17 between terminal 1 of TS2 (NS) and ground lug 2 of socket J (S). Insert capacitor C13 in hole U. Attach lead from stator of C13 to pin 1, socket J (NS). Install coil L7 between pin 1 (S) and terminal 1 of TS2 (NS). Install resistor R9 between ground lug 1 of socket J (S) and adjacent pin of crystal socket (NS). Install R10 between ground lug 4 (S) and free pin of crystal socket (NS).

( ) Run wire from pin 3 (S) to nearest pin of crystal socket (S). Run wire from pin 8 (S) to remaining pin of crystal socket (S). Install capacitor C18. Attach negative lead to ground lug M (NS) and positive lead to terminal 1 of TS2 (S). Install capacitor C19. Attach negative lead to ground lug M (S) and positive lead to terminal 2 of TS2 (NS). Install resistor R13 between pos-

(Continued on page 103)
The Lady is a Ham
Her rig is a magic carpet to a Caribbean cruise, a moonlit night on the Moroccan desert, and other exciting places

HERE I AM, a young Midwest secretary with an average salary and no inheritance. Yet just last week I passed the time of day with a Buckingham Palace guard on his day off . . . discussed monsoon weather with a sailor in Yokohama . . . debated the advantages of an ocean cruise with the purser of a luxury liner basking in the Caribbean . . . and listened eagerly while an enthusiastic young Frenchman in Paris tried to explain to me precisely why his city is the only place in the world to be in the spring. What's more, I confidently expect this week and all the weeks to follow to be just as filled with exciting globe-trotting as was the last.

How is it done? It's easy. My flying carpet is a neat collection of electronic equipment in one corner of the dining room, and my passport is a small, official-looking bit of paper issued by the Federal Communications Commission stating that I am the holder of an Amateur Radio License and have been issued the call letters K9AMD. Yes, I am proud to say I am a "ham," for in this case the term does not mean a poor actor, the second son of Noah, or the southwest corner of a porker. It means that I am a radio amateur, one of 160,000 people in this country alone who engage in this fascinating hobby; and there are thousands more of us scattered all over the globe.

It's a Personal Thing. Amateur radio offers a wide variety of attractions and interests. But to me, a woman, its main
attraction is a personal thing. While I am perpetually thrilled by the globe-shrinking magic of electronics, the warm companionship of friends scattered all over the face of the earth means still more. And I may as well confess that the exaggerated, flattering chivalry with which I am treated by fellows on the air does wonderful things for my ego—even though I know in my heart that most of it is due to the novelty arising from a 30-to-1 ratio. Yes, that’s right: there are 30 men amateurs to every woman. Competition is stimulating, but having it ease off now and then can be pretty refreshing, too!

If you want proof that men amateurs pamper the girls in their midst, hear this: in abbreviated ham lingo an unmarried woman, whether 16 or 60, is called “YL” for “Young Lady.” A male ham calls himself an “OM,” or “Old Man.” But when a YL marries an OM, does she become an “Old Woman?” She does not! She becomes an “XYL,” or “Ex-Young Lady,” and she stays one the rest of her life! How’s that for chivalry?

What do hams talk about? Practically every subject under the sun! The only limitations are those of good taste. Tuning across one band, I can hear a woman in Hawaii frankly admitting to a Minnesota housewife that on first contact the famed native poi may look and even taste a little like wallpaper paste. A gardener in Belgium is swapping tulip-raising tips with an amateur in Holland, Mich., and a grandmother vacationing in Florida is describing her seashore cabin to her grandchildren back in Kansas. Poetry, fashions, children, pets, television programs—these and a hundred other topics are discussed.

A Participation Hobby. Usually I do not listen for long. After all, amateur radio is primarily a participation hobby. If I choose, I can take part in the conversations, sure that I shall be welcome, for amateurs are the friendliest group of people in the world.

Often, though, I prefer to start a conversation of my own, so I switch on my transmitter, pick up the mike, and say, “CQ, CQ, CQ; this is K9AMD calling CQ and standing by.” This means that I will talk to anyone who hears me and answers. I have called “CQ” hundreds of times, but I still can’t help holding my breath in anticipation when I switch the transmitter off and the receiver on. I may hear the lonesome voice of a GI in Germany repeating my call letters... they may be spoken in a Cockney accent from the shadow of Big Ben... or the call may come in the deep caressing tones of a caballero from Argentina.

Many times the conversation that follows is more entertaining than an evening at the movies. I still recall vividly the contact I had with the wife of a mining engineer in South Africa one Saturday at lunch time. She had a way with words that lifted me right out of my chair and transported me to her side. It was already 9 p.m. there, and we both peered apprehensively at the dark and forbidding jungle surrounding us in the moonlight as she explained that we were the only white women within a hundred miles.

Static broke the contact, and what a relief it was to be called by a ham aboard a liner cruising in the sunny Caribbean! He was the purser of the ship, and as he described the gay captain’s party he was planning—complete with dining, dancing, and champagne—I pictured myself in a pale pink chiffon evening gown whirling about the dance floor in the arms of my handsome escort. We had just stepped outside for a stroll on the moonlit deck where the gentle lapping of the waves blended with the muted strains of the orchestra when the shrilling of the telephone brought me back to land with a thud!

Cooking Lessons. Another thing I like about my hobby is the way it abets my other interests. Shortly before Christmas I struck up a conversation with two Scandinavian homemakers who talked surprisingly good English. Before I knew it I was in my apron dashing madly back and forth between the kitchen and the transmitter as
It may seem a trifle odd, mixing cookery with ham radio (left), but Carole lands many strange and exotic recipes this way, though she may have to clean up a trail of flour afterwards. Just think of that streusel kuchen and bouillabaisse!

the delighted pair gave me spoon-by-spoon instructions for producing their own extra-special streusel kuchen. It turned out to be so delicious that I didn't even mind mopping up the trail of flour between the microphone and the mixing bowl.

Alma, a housewife on a large Nevada ranch, has taught me how to prepare barbecued ribs in true Western style. And my bouillabaisse recipe comes directly from a ham in a French seaport village who fiercely assures me that all others are barbarian imitations of his savory fish stew. Radio has developed into such a fascinating way of learning to cook that my conventional cookbook now gathers dust.

One day, on impulse, I turned my beam antenna south and brashly called CQ in my high-school Spanish. Immediately I got an answer in Spanish spoken so rapidly that it sounded like a stick dragged along a picket fence. After I managed to convey to the Bolivian senor that I spoke his language only un poco, he slowed down and we had a delightful chat. Upon its completion, I dug out my Spanish book and started a serious review of the language.

Lots of Traveling. But I do not want to leave the impression that ham radio is purely an indoors, sit-at-home hobby. It is far from that. Traveling is lots more fun in our car which is now equipped with a complete mobile station. It's a real thrill on a trip to make contact with a ham a hundred miles ahead, accept an invitation from him to stop by for a cup of coffee, and then have him "talk you in" right to his front doorstep.

During another emergency (of sorts), Carole jumps into the fray. She keeps tabs on the first Sputnik, tracking its position on the globe (below) as she monitors the "beep-beep."

Not only does Carole have a fixed station—she also has a mobile rig in her car (left), which she uses to contact fellow hams while traveling.
New Transistor Flash Unit

The newest in transistor flash units (below) has an unusual feature—built-in rechargeable batteries. The hermetically sealed nickel-cadmium Voltabloc unit provides up to 300 average flashes per charge and can be recharged from any 110-volt a.c. line. Two power transistors in a novel circuit are used in the Vanguard, made by Romal Electric Products, New York.

All About Satellites

The story of man’s attempts to conquer space is being told to a vast audience in department stores, schools and fairs by the traveling show “Earth Satellites.” Produced with the assistance of the U. S. Armed Forces and manufacturers, the show traces man’s efforts to break the chains of gravity that bind him to Earth. Balloons, gyroscopes (above), satellite models, an animated solar system, working models of a satellite tracking system and Sputnik recordings are used. The show has been commended by the American Rocket Society.

Portable Stereo System

A complete, portable stereo system, designed for all-purpose use, has been introduced by Bell Sound Systems, Columbus, Ohio. It consists of a tape transport unit and two matched amplifier-speaker systems (above). The setup allows recording and playback monaurally as well as recording and playback in stereo. The unit has inline heads as well as provision for offset tape. Each of the amplifier-speaker systems can be used separately with a tuner and record player to make a complete music system.

Birdman’s Helmet

It may look as if the U. S. Army pilot below is wearing a Navy pilot’s helmet. He is. But he’s also wearing an electronic package. Design of the helmet calls for a dynamic, noise-cancelling mike which can swing out of the way. Dynamic earphones, cushioned to cut noise, are adjusted to head size. Work continues on making the headgear protective against shrapnel and small arms.
IMPROVED THREE-WAY CROSSOVER

By LARRY KLEIN
Technical Editor

In response to numerous requests from our readers, we are presenting an improved version of the three-way crossover described in the November, 1957, issue of POP'tronics. The second inductance mentioned in the text, but not shown in the original diagram* of the crossover, has been added for sharper frequency separation between the tweeter and mid-range speaker; and to eliminate interaction between the “brilliance” and “presence” adjustments, the level control circuitry has been redesigned. See Fig. 1.

The crossover construction table has been extended downward toward the lower frequencies for those who wish to “cut off” their woofer at about 250 cycles, as shown in Table 1. The advantage of a lower crossover will usually be realized in a “cleaner” lower mid-range. Values of components for 500 and 1000 cycles have also been shifted slightly to improve response. See original table for values above 1 kc.

Speaker Phasing. Several readers have mentioned that there seems to be relatively little material available explaining the “why’s and wherefore’s” of speaker phasing. Most writers on the topic tell you that speakers should be phased properly—and little else.

In simple terms, the story is this. Sounds (music, voice, etc.) at the frequency of the crossover issue from both speakers. For example, the crossover frequency between your woofer and mid-range speaker might be 800 cycles. This would mean that in the area of the crossover, if the speakers are (Continued on page 116)

* The schematic and pictorial on page 66 of the November issue should have shown the plus (+) terminal of the tweeter connected to the capacitor, not to the center arm of the control. Inductor winding data is correct.

Table 1. Calculate LI-C1 for a lower crossover, L2-C2 for a higher crossover.

C is in microfarads; L is in millihenries.
You'll have to remove the dust cover to get at the heads, pressure rollers and tape guides. Carefully inspect the area for dust and bits of tape. Blow out as much as you can, then use a small artist's brush (above) to brush away any remaining dirt or foreign matter. Next, dip the brush in alcohol [Tandberg recommends this, but the manufacturer of your tape recorder may advise some other cleaner], and carefully wipe down the erase head of your machine.

Follow the same procedure with the record head (above), making certain in both cases that you don't use too much cleaning fluid. And remember to clean just the faces of the heads.

PREVENTIVE maintenance can save dollars and headaches for the tape enthusiast. That goes without saying. But to save time, there is a certain amount of such work that can be done in the home—if you know how to do it. In this picture story, a Precision Labs technician demonstrates proper preventive maintenance on a Tandberg tape recorder. If you follow these simple steps, you will add years to the life of your own machine, in addition to obtaining better sound reproduction from it.
3. Hold the rubber pressure roller with the index finger of your left hand, and clean the roller with a piece of cheesecloth or similar material dipped in the fluid, rotating the roller slowly with your finger as you work.

4. In the same manner, clean the capstan and the tape guides. Only a minimum amount of cleaner should be employed in each step.

5. There may come a time when you will want to check your tubes. To do this, you'll have to pull the chassis. This procedure will vary with the machine (with the Tandberg, the whole chassis comes out of the case) but in most instances it will require removal of several bolts from the top. When you pull or replace a tube (left), be sure to support the socket mount with your fingers to prevent it from breaking or bending.

6. Warped reels may damage tape and mar the recorder. Frequently you can hear a warped reel scuffing the machine or rubbing against the tape. To check, line up your eyes with the reel and start the machine. You should be able to detect significant warping. Replace any such reels, and the job is completed.
Automatic Wiring Tester
Developed to speed testing of junction boxes, Du Mont's new multiple-function automatic tester makes up to 30 individual wiring checks a minute. Previously, an operator had to check as many as 300 wires and 30 connectors individually. The unit consists of a tape reader which programs the operation on tape, the main machine whose selector switches receive and follow the instructions, and a readout printer which records results.

Low-Frequency Converter
Pilots and others to whom up-to-the-minute weather information is essential will find the Boulevard Electronics TC-1 converter just the thing. The transistorized unit hooks into an auto antenna and to the auto radio, and tunes the 200 to 400 kc. band. Self-contained and easily mounted under the dash, it picks up weather broadcasts, radio range stations, beacons and control towers. Price is $44.95. See photo below.

Transistor Tape Recorder
Weighing less than two pounds, Tel Tape, a transistorized tape recorder, is now on the U. S. market. Imported from West Germany by Filnor Products, this portable device (shown below) records, plays back and erases—all off battery power. It even has variable speed controls. Included in the package are earphones and a microphone at a total price of $29.95. Available accessories are a patchcord at $2 for playback through radio, phono or TV, and a lightweight headset—which leaves the hands free to type—at $6.95. Included with the recorder are two tape reels and a small sample of tape as well as batteries—four C cells. The device measures about 8” x 6” x 2”.

Photocell Relay Kit
A photocell relay is the newest in the line of Lafayette Radio kits. This versatile light-controlled switching device (see photo above) can be used in constructing burglar alarms, door openers, automatic controls for lights, counting devices and other such gadgets. The cadmium sulfide photocell has high sensitivity and requires no special high-intensity light source. It can operate on a flashlight beam at 250 feet, and has a sensitivity adjustment as well. The kit comes complete with all parts at $12.95.
How to Make PARTS SUBSTITUTIONS

Part 1—Resistors and Batteries

By EUGENE RICHARDSON

MOST electronics hobbyists have several junk boxes full of perfectly good electronic components, including resistors, capacitors, and all kinds of hardware. Yet these home builders often have given up or postponed construction projects because they didn't have enough "long green" in the kitty to purchase all the parts specified.

The designer, when developing a new project, generally will use parts he already has on hand in preference to buying new ones. Thus, while it is always best to use the exact parts specified by an author when assembling a project, you often can make substitutions which will not affect performance, yet which will reduce your cash outlay considerably. In fact, by making judicious use of your junk box you may be able to find enough "on-hand" parts to limit your purchases to just three or four essential items.

In describing an electronic circuit, we identify components by names which indicate their use or function. For example, in receiver and amplifier circuits, we may speak of a tuning capacitor, a grid resistor (or grid-leak), a coupling capacitor, plate load resistor, bypass capacitor, decoupling resistor, filter capacitor, and a bleeder resistor.

These functional names may give a clue to the value of the parts, but they don't identify them specifically. To identify a component properly, we need to know its basic electrical specifications, its type (fixed, variable or adjustable), and, often, its construction. With this information, we can decide on possible substitutes.

RESISTORS

There are three specifications which apply to all types of resistors: resistance, tolerance, and wattage rating.

The resistance is the opposition the unit offers to a flow of current and is given in ohms or megohms (millions of ohms). Generally, symbols are used to simplify
Resistors are also identified according to the resistance material employed in their manufacture. Two basic materials are in common use—a composition, which may include carbon, and high resistance wire, such as Nichrome. Resistors of the former material are known either as composition or carbon resistors, the terms being used more or less interchangeably. If the resistance element is wire, the resistors are called wire-wound units.

Both types are available in a wide variety of styles, resistance values, tolerances, and wattage ratings.

Regardless of type, if the resistor's value cannot be altered without physical damage, it is a fixed resistor. If its value can be varied easily, it is a variable resistor. These are made in two styles—continuously variable resistors (rheostats or potentiometers), and semi-fixed adjustable resistors. The latter have movable “taps” which, once set, are left fixed in position.

Continuously variable resistors have an additional specification which sometimes proves confusing to the beginner, especially since such resistors are widely used as volume and tone controls. This is taper.

Taper is the relative variation in resistance as the control is turned through its range, and is independent of the unit's total resistance. For example, if we have a potentiometer with a value of 500,000 ohms, and we measure 10% of this value (50,000 ohms) at 10% rotation, 20% (100,000 ohms) at 20% rotation, 50% at 50% rotation, and so on, the control has a linear taper.

While most controls are made to one of about a half-dozen standard tapers, two are of maximum importance in most electronics work—the linear (described above) and audio tapers. When a control has an audio taper, its resistance variation with rotation follows a more or less logarithmic curve.

If a linear taper potentiometer is used as an audio volume control, the effect is as if all the control is concentrated at one
end—the volume seems to jump from "zero" to maximum with relatively little rotation of the control. This is because apparent loudness is not a direct function of the voltage tapped off by the volume control. It is approximately logarithmic.

Making Substitutions. First, except in critical circuits—such as r.f. amplifiers and oscillators—you can use fixed wire-wound and carbon resistors interchangeably. When a potentiometer is specified as a volume or tone control, however, it is best to stick to a composition resistor to minimize noise.

You can always use a higher wattage resistor of the same resistance value in place of a lower wattage unit. Suppose a circuit calls for a 47,000-ohm, ½-watt resistor, and you have several 47,000-ohm, 1-watt resistors on hand, but no ½-watt units. You can use the 1-watt resistors—or even 2- or 5-watt resistors if space permits!

A series, parallel, or series-parallel combination of resistors can replace a single resistor as long as the net resistance is the correct value and relative wattage ratings are maintained. Suppose you needed a 100,000-ohm, 1-watt resistor, but had only 50,000-ohm and 200,000-ohm resistors on hand. You would have a choice. You could use two 50,000-ohm resistors in series to obtain 100,000 ohms, as long as both resistors were rated at ½ watt or larger (1 watt total), or two 200,000-ohm resistors in parallel, again as long as each was rated at ½ watt or larger. You could even use five 50,000-ohm resistors in parallel.

Often, a resistor with a higher (or lower) rated value but a closer tolerance can be substituted for a specified unit. Say that your parts list calls for a 220,000-ohm resistor, 20% tolerance. With this tolerance, its actual value can range from 176,000 to 264,000 ohms. You can use either a 240,000-ohm or a 200,000-ohm resistor for the specified unit, provided the substitute has a 10% tolerance. Similarly, a 47,000-ohm resistor can be substituted for a 50,000-ohm unit, and vice versa.

Finally, in the case of potentiometers, we can substitute a unit with the same total resistance but a taper different from the one specified, if we want a different type of control action.

Batteries

Dry-cell batteries are used extensively in transistor circuits and portable vacuum-tube equipment. Strictly speaking, a single cell, such as a common flashlight "battery" should be called a cell, with the name battery reserved for a "battery" of individual cells connected together. But, today, it is common practice to say battery for both individual cells and true "batteries."

The voltage delivered by a cell (or battery) depends on its chemical composition, while the power it can deliver, in general, depends on its physical size. The larger the battery, the greater its capacity.

A battery's capacity is generally specified in ampere-hours or in milliamper-hours. This figure indicates the product of current drawn by hours of operation under normal operating conditions. A battery with a capacity of 500 ma./hr. (milliampere-hours) could deliver a current of 1 milliampere for 500 hours, or a current of 5 ma. for 100 hours.

Aside from physical size and shape, the (Continued on page 105)
for playing STEREO RECORDS

By ERWIN JOHN DREISKE

HOW IT WORKS

This type of stereo recording and reproduction is called the 45-45 method, illustrated above. The groove is V-shaped with an included angle of 90°. The left channel is recorded with a motion parallel to the right side of the groove; and the right channel with a motion parallel to the left side of the groove; hence, one channel is recorded on each side of the groove.

To reproduce such a recording, we need a cartridge which will give an output from one channel when displaced in a direction 45° on one side of the vertical, and an output from the other channel when displaced in a direction 45° on the other side of the vertical. The easy way to accomplish this is to link, to a single stylus, two conventional pickups whose axes are parallel and whose directions of movement are perpendicular to each other.

Stereo cartridge developed by Electro-Voice will play either the new stereo records or conventional discs.

UTILIZING two separate amplifier and speaker systems, stereophonic music literally surrounds the listener and provides that elusive third dimension. The difference between "stereo" and even the best "hi-fi" is said to be the difference between listening through an open window in a concert hall and actually sitting in front of a live orchestra.

Stereo music has been available only on experimental tapes. Recent developments of experimental stereo discs have now made possible the mass production of stereo records.

"Compatible" Cartridge. But stereo discs cannot be played on conventional phonographs without ultimate damage to the records since ordinary styli are too big and not compliant enough for the grooves of the stereo disc—they would tend to erase the stereo effect. Featured on the cover this month is a cartridge developed by Electro-Voice Inc. which is completely "compatible"—it can be used to play either an owner's present library of records or stereo discs.

The new stereo records, which are identical in appearance to existing LP records, contain a single groove. Two separate microscopic music tracks are cut into the sides of the one groove. The Electro-Voice stereo cartridge contains a single diamond stylus and two high-fidelity ceramic ele-
Make your own PICKUP

In playing, the stylus "rubs" against both tracks and feeds the separate music signals through the separate amplifiers and to the properly spaced speaker systems.

Motor Rumble Conquered. One of the worst bug-a-boos confronting phono turntable manufacturers, particularly in the case of record-changer mechanisms, has been motor rumble. This is compounded in the stereo disc which involves vertical play of the needle in the groove. However, the vertical rumble component is claimed to be virtually eliminated from playback by the characteristics of the new cartridge.

After the E-V cartridge is made available in production quantities to phonograph set manufacturers, it will go on the market for $19.50—the approximate cost of a conventional hi-fi cartridge with diamond stylus. Hi-fi owners can adapt their present equipment to stereo by the simple addition of a second amplifier and speaker system, plus the new cartridge. Existing home record collections will not be obsoleted by the new stereo developments since the coming stereo phonos will contain completely compatible cartridges.

DO IT YOURSELF

In one evening, you can put together the necessary parts of a pickup for playing the new stereo records. The parts are readily obtainable and, although tiny, they can be assembled without much more than a steady hand and a bit of patience.

The pickup unit uses two standard Electro-Voice Power Points and a replacement stylus for an Electro-Voice Model 84 cartridge. If you buy the parts new, the cost will be about $7.50 (for sapphire stylus).

Power Points are color coded to indicate the size of styli with which they are supplied. Any of the following types are recommended for this cartridge: Model 51-1, red, .001-.001 sapphire; Model 56, blue, .001-.003 sapphire; Model 56DS, orange, .001 diamond-.003 sapphire.

Assembly. Begin by carefully cutting off the end of each case as shown in Fig. 1(A). Use a sharp knife, and take care that no damage to the ceramic element results. With a heated knife, or razor blade, cut ¼" off the end of each needle cap. Bend the stylus shank almost straight, as shown in Fig. 1(B).

With an epoxy-type cement, or with a rubber type cement such as Pliobond, or...
Fig. 2. Assembly of modified parts should be done carefully.

Fig. 3. Frequency response curve of home-built cartridge on a standard LP test record.

Fig. 4. Method of switching from stereo to monaural. Resistor $R$ should be at least 3 megohms.

with one of the contact cements now available, fasten the two Power Points together and to the mounting plate. The plate is a small piece of plastic about $\frac{3}{2}$" thick, with holes drilled to match the pickup mounting in your old tone arm. Make sure that the needle caps are oriented 45° each way from the surface of the mounting plate.

Do not turn the elements in the cases, but rotate the whole case to get the proper angle. Attempting to turn the elements may result in fracture of the ceramics.

The rubber stylus hinge is cut from inner tube stock. After sharpening the small end of the stylus shank, pierce a hole with it through the length of the rubber hinge. Then cement the hinge to the Power Points, as shown in Fig. 2.

Bend the drive yoke from .004" music wire around the stylus. Fasten it to the Power Point needle caps by heating the needle caps and wire yoke with a small soldering iron, and allowing the wire to

imbed itself in the soft plastic. The stylus should be a snug fit in the drive yoke. To remove the possibility of rattles, place a small amount of cement at the junction of the yoke and stylus.

**Connections.** Lead wires can be soldered directly to the contacts if the Power Points have metal contact blades. If your Points have conductive rubber contacts, a fine wire may be inserted between the blades and case to make contact.

The frequency response of the cartridge built by the author is shown in Fig. 3. On most musical selections, distortion is inaudible.

A standard monaural record can be played with this pickup, but no attempt should be made to play a stereo record with a standard cartridge. Damage to the stereo record will result. Standard monaural cartridges have a vertical compliance which is too low to follow the modulation on a stereo record.

Figure 4 shows the method of connection to two amplifiers. The stereo-monaural switch allows the two channels to be connected together when monaural records are played.
TIME WAS when the carrier pigeon provided the fastest link between a newspaper reporter and his editor. But while the use of birds had the advantage of speed, it suffered from a major drawback. Rival papers hired marksmen to wing the birds in flight. Result—no story.

Today the press has grown with the times—and the New York Times has grown even faster. There are those who complain that the Times is somewhat antique, but there is nothing old-fashioned about its newsgathering system.

An outstanding example of its pioneering may be found in the radio room, a setup which would be the envy of radiomen everywhere for its completeness and convenience of operation. As far as can be learned, no other newspaper has an operation approaching this in size or thoroughness.

Major equipment in the radio room includes:

- Three transmitters;
- Nine receivers;
- Six disc recorders (for voice);
- Two Morse-tape recorders;
- One Hellschreiber recorder (which can receive teletypewriter transmission under adverse conditions); and two television receivers.

**Finger on the Pulse.** The radio room serves a dual purpose: it takes the pulse of the news by monitoring the transmissions of the official radio stations in many of the important world capitals—especially Moscow—and it transmits news summaries to outposts and out-of-the-way areas such as ships at sea, remote air strips, lighthouses, and the like.

The room is under the supervision of Reginald J. Iverson, who has been associated with the Times for 36 years. (Mr. Iverson has been a radio amateur since 1910, and owned one of the first licenses in Chicago. His call at that time was 9AU; he now operates as W2LDR.) Under Mr. Iverson are three other first-class operators, as well as two transcribers, who record and transcribe the millions of words received by the station yearly.

Here's how the newsgathering system works. A battery of
nine short-wave receivers—mostly Collins 51J4's and National HRO's—are used to listen to the radio transmissions of such cities as Moscow, London, Paris and other vital news centers. This material is summarized and serves as a check on the regular news stories filed by the paper's own correspondents and the news services.

From time to time such information serves as a tip on an important story before the local man gets it, and he will be apprised of the "break." At other times, if the information is considered reliable, it is used to fill in the background of the news.

**Printing Complete Speeches.** The *Times*, of course, is noted for printing the complete texts of important speeches. For instance, when Nikita Khruschev, Soviet "boss," makes an important declaration, a *Times* man will take it off the air on one of the disc recorders, and it will be translated and run complete in the next day's paper. Other newspapers must be satisfied with the frequently incomplete texts transmitted by the news services.

In this country, when President Eisenhower, for instance, speaks to the nation, his address is recorded from the audio circuit of one of the two *Times* TV sets. It is then transcribed and run complete. This is in contrast to many other papers which run the official release distributed in advance. Such releases sometimes differ from the addresses delivered.

The radio room also maintains direct radio contact with some of its correspondents. For instance, when one of its top-flight men, Walter Sullivan, was with the Navy in the Antarctic, he set up a regular daily transmission schedule from the icebreaker "Atka." He filed stories daily over 14,000 miles of land, sea and ice.

The *Times* radio room maintained contact with him by using one of the battery of three 1-kw. transmitters built by Mr. Iverson. They operate on 4, 6, 8, 13, 16 and 22 mc., and use the call WHD.

Most of the major expeditions of this century have been followed by the *Times* in the same manner, including the Byrd Antarctic expedition in 1928, and Operation Deepfreeze currently. It is the only newspaper which gives such coverage.

The transmitters are also used to transmit news summaries in code twice daily, as a public service. Reports are sent at 1900 Greenwich Mean Time on 13.02 and 16.96 mc., and at 0500 GMT on 6.51 and 13.02 mc. Letters have been received from outposts in all parts of the world thanking the *Times* for this service, since in many areas it is impossible to receive directly news broadcasts by radio from cities involved.

**"Doria" Signal Heard.** One of the nine receivers constantly monitors the 500-kc. distress band. In 1956, a *Times* operator picked up the distress call of the "Andrea Doria" when the big liner was struck and sunk by the "Stockholm." The operator remained on duty for the full time the ship (Continued on page 109)
Catch the Vanishing Ball

Wooden cabinet conceals electronic and mechanical components. Dimensions of cabinet are not critical.

It eludes your grasping hand as it gets whisked away by electronics

This proximity-activated ping-pong ball is guaranteed to startle and amuse young and old alike. It sits quietly on its little box—sits quietly, that is, until a grasping hand approaches, and then—PLOP—it’s gone! When the hand is withdrawn, the ball reappears. It’s as simple as that, and the small cost of construction will more than be compensated for by the delight of the youngsters and the mystification of adults.

All of the parts for this project are easily available. Most of them probably can be found in your junk box. Of course, many variations on the setup shown are possible as long as the basic principles are observed.

The mechanical section can be built first. Start by cutting a 3" circle out of the top panel (see drawing on page 64). The center of the circle is midway between the two long sides of the panel, 5 1/4" from either short side. If a good circle cutter is carefully used, the cutout disc can later serve as the ping-pong ball platform.

Wind the solenoid coil on a commercially available coil form. After the Bakelite capping squares have been cemented in place and allowed to dry, wind on the enameled magnet wire. Use a B & S gauge (between #34 and #40).

If the coil form is chucked on a 2" bolt, and you use your electric drill to wind it, you'll find that it goes very fast. Since the coil should measure about 400 ohms, wind several hundred turns, check the resistance, then continue until the ohmmeter shows that you've arrived. If no ohmmeter is available, try about 1000 feet of #36 wire. Scramble-winding works just as well as any other kind, so you needn't be fussy.

Cut and assemble the wood parts as shown. Drill the iron armature 1/4" from one end to take a 6-32 1" machine screw. Correct alignment of the lever and lever
posts is essential for smooth action. Cement the return stop block along the circumference of the disc platform to prevent the platform from swinging above the panel.

The last step in the mechanical construction is the adjustment of the return elastic band. See photo above for details of its placement.

With the panel assembly complete, the table side walls may be cut and secured to the top panel. To test the action, connect the coil leads to a 117-volt line cord through a switch. Each time power is applied, the ball platform should drop at least three inches; the return should be smooth and accurate when power is removed.

The electronic construction is not very critical but certain mounting and wiring precautions should be observed for sensitivity and stability. Keep stray capacitance between the probe or sensor connection and the ground at a minimum! Careful isolation of the sensitivity control and rigidity of component mounting are important. The layout shown should be followed as closely as possible.

Variable capacitor C2 is secured to the chassis by means of its built-in mounting bracket. Set it as far back from the front panel as possible with its shaft connected by a ⅛" to ⅜" metal coupling and a ⅛" Bakelite rod long enough to pass through the front panel bearing. Homemade coil L1 mounted on the rear apron of the chassis with its tuning slug projecting through the back of the case.

Three adjustable clips which come with the coil form are set in place and 50 turns of #40 enameled wire are wound between either end clip and the center one. A center-tap connection is made to the middle clip, and another 50 turns are added between the center and the remaining clip.

Make sure that the mounting of the re-
Rear and interior views of relay assembly. Front panel, not shown, mounts sensitivity control and pilot lamp. Note insulated shaft extension and panel bearing used with frequency-adjusting capacitor C2.

Pictorial diagram of the unit. Mounting lugs of the two-terminal tie points are used as circuit grounds and must make good chassis connection.
After installation, potentiometer R2 is adjusted through hole in cabinet top. Note use of half-wave rectifier in proximity relay schematic at right.

HOW IT WORKS

The left-hand 6SL7 triode is a Hartley oscillator using C1 as a coupling capacitor. C1 is also part of a voltage divider; the probe-to-ground capacitance forms the second part.

With no grounded object near the probe sensor, the probe-to-ground capacitance is quite small while C1 is relatively large. Most of the r.f. energy from the L1 tank circuit is therefore applied to the grid of the oscillator. The large r.f. voltage which appears at the cathode of the oscillator tube is rectified by the crystal diode and applied as positive bias to the grid of the d.c. amplifier 6SL7 section through control R1. This bias keeps the plate current of the right-hand part of the tube well below the pull-in point of the relay.

Should a grounded body come into the vicinity of the probe screen, the effective probe-to-ground capacitance increases, causing a voltage-radio change which bypasses more of the r.f. to ground. The rectified voltage from the diode therefore decreases, the grid of the d.c. amplifier becomes less negative, and increasing the plate current energizes the relay. R1 determines the fraction of the voltage applied to the d.c. amplifier as bias and is used as a fine adjustment.

Remaining parts does not interfere with the free action of variable capacitor C2. It is important that the wire connecting to the probe terminal be kept clear of other leads. Check the polarity of the crystal diode (CRI) and electrolytic capacitor C7.

Adjust the relay by setting R1 fully clockwise (wiper farthest from ground) and C1 at minimum capacitance. Screw the coil slug about half-way in. Connect a wire from the probe terminal to any point on the screening material under the ball panel. Apply power and allow about 30 seconds for warm-up; during this interval you will hear the relay click in as the d.c. amplifier portion of the 6SL7 begins to draw current through the relay coil.

Now slowly rotate C1 toward maximum capacitance. At some point in the rotation, (Continued on page 115)
WITH THE NATION launching a multi-million dollar superhighway building program, it becomes important to examine the problem of road safety. Such highways seem to exert a hypnotic effect on the ordinary driver, which frequently leads to chain collisions. Perhaps with the expenditure of just a few extra millions—a drop in the bucket compared to the over-all cost—these concrete ribbons might be made as nearly foolproof as possible through the use of a new safety system proposed by Dr. Vladimir K. Zworykin of Radio Corporation of America.

Heart of the setup would be an electronic warning net which would tell drivers the position of cars ahead and behind them by means of a string of lights at intervals along the side of the road. An additional safety factor would be a guidance system to keep cars centered in their lanes.

While the setup would be used initially to flash warning signals to drivers, later changes could actually control the vehicles if auto manufacturers build in the necessary servo equipment. A special test installation has been completed near Lincoln, Neb., by the State Department of Roads, using equipment designed and built by RCA.

**Warning Net.** In such a network, detectors consisting of rectangular wire loops are buried in the pavement. Each connects to an associated circuit at the edge of the road. A 300-kc. voltage is applied to each loop. When a vehicle passes over a loop, it causes a variation in current which is detected by the associated circuit. The result is an output signal which controls an indicating device, such as a warning light, and at the same time switches on a radio warning system for following cars.

The radio warning system includes a transistor switch and an antenna extending back under the pavement from each of the detectors for any desired length. When the detector responds to a passing vehicle, the switch is closed and power is supplied to the antenna, causing it to radiate a 110-kc. signal.

The switch remains closed for an interval after the car has passed. During this time the antenna continues to radiate, forming a radio "tail warning" behind the car. This "tail" could be used to actuate warning lights along the side of the road or it could be picked up by following cars with properly tuned receivers. The length of the "tail" might be preset or controlled by the speed of the vehicle.

In the present system, the signal actuates lights alongside the road, but ultimately it could be used to control acceleration or brakes—or both—in following cars.

**Guidance System.** This consists of a cable laid down beneath the center of a traffic lane, continuously radiating another signal. To use the system, a car is equipped with two pickup loops, one mounted on each end of the front bumper.

(Continued on page 98)
THE NUMBER of transistor applications in non-entertainment commercial electronic equipment is increasing by leaps and bounds. For instance, two firms are now marketing fully transistorized business dictating machines. A Dictaphone unit, intended for office use, operates from a standard power line outlet, while a battery-operated SoundScriber machine is suitable for portable use.

Several transistorized clocks are available on the domestic market. You'll even find some listed in the catalogs of the larger mail order "department" stores. A transistorized clock developed in Germany requires so little current that its single self-contained dry cell has an operating life equal to its shelf life (about five years). A permanent-magnet gravity pendulum moves into a coil at the extreme end of its swing. This action generates a current which is amplified by the transistor and which, in turn, provides a "kick" for the pendulum's swing.

In England, an electronic vehicle speed-measuring system has been developed by Venner Electronics, Ltd. which uses 54 transistors. Basically, it is an electronic counter. The circuit is designed to measure the number of pulses which a crystal-controlled oscillator delivers during the time it takes an automobile or truck to pass over a pair of rubber tube switches laid parallel to each other a measured distance apart across a road or highway. This instrument has an accuracy of ±1% at 100 mph, and is even more accurate with lower speeds.

A fully transistorized portable paging device, called the "Transi-page," has been introduced by the Irwin Products Co. of Chicago, Ill. A self-contained weatherproof unit, it is equipped with microphone, handle, carrying strap, and volume control.

On the Civil Defense front, a transistorized Dosimeter Charger has been ordered into production by the Federal Civil Defense Administration in Battle Creek, Mich. These units are being made by Universal Transistor Products Corp., Westbury, N. Y.

One of the "brightest" items is a transistorized lighting system developed by Westinghouse Electric which should be available commercially within a few months. Basically, it is a high-frequency (1500-cps)
fluorescent lighting system. In operation, the a.c. line power is converted to d.c. by a bridge rectifier. This d.c. power, in turn, operates a 1500-cps transistorized power generator. The resulting high-frequency a.c. power operates the lighting system. Compared to conventional fluorescent lighting, the new system is much more efficient. In addition, the bulk, weight, and heat losses of the ballasts can be reduced appreciably.

**Reader's Circuit.** Many readers like to dream up interesting names for projects they assemble. Last month, you may recall, we featured the “Handy Audi,” developed by S/Sgt. Jack W. Yundt. The three-transistor radio receiver shown in Fig. 1 this month is called the “Simplatran” by its designer, reader/author Forrest H. Frantz, Sr., of 105 W. Park Row, Arlington, Texas. According to Forrest, it will provide usable loudspeaker volume on strong local stations without an external antenna and can be assembled in an hour or so.

This receiver achieves its high performance by using an r.f. transistor as a regenerative detector, with the audio output signal fed to a two-stage resistance-coupled audio amplifier. The second stage of the amplifier drives a PM loudspeaker.

In operation, signals are picked up and selected by the $L1-C1$ tuned circuit (or picked up by an external antenna, if one is used). A tap on $L1$ provides an impedance match to the comparatively low input impedance of the first stage. The r.f. signal appearing at the tap is coupled through capacitor $C2$ to the base electrode of a Raytheon Type CK768 r.f. transistor.

Some detection as well as r.f. amplification takes place in the first stage, which is operated without base bias. The r.f. component of the amplified signal is coupled back to the tuned circuit by feedback coil $L2$, strengthening the original input signal and thus providing the regeneration necessary for increased sensitivity.

The audio component of the detected signal appears across volume control resistor $R1$ and is coupled through capacitor $C6$ to the base of the first audio stage. Base bias current for this stage is supplied through $R2$, while $R3$ serves as the collector load resistor.

The amplified audio signal appearing across $R3$ is coupled through $C4$ to the base of the second audio stage. Bias for the second stage is supplied through $R4$. An impedance-matching transformer ($T1$) serves as the collector load for the second (Continued on page 112)
Photoflood Light Saver

Constructed from simple, easily obtainable parts, the "light saver" will greatly increase the normally short life expectancy of your photoflood lamps. It can be mounted breadboard style or enclosed in a plastic cabinet. The d.p.d.t. toggle switch (S1) should have a rating of 6 amperes at 125 volts. Number 16 or larger gauge wire should be used.

Test the light saver by plugging each of two floodlights of equal wattage into the separate sockets, then plugging the unit into a 117-volt outlet. With S1 in one position (High), the two lamps are wired in parallel and light with full power. Throwing S1 to the opposite position (Low) will connect the lights in series, causing them to light dimly. Because of the series circuit in the Low position, neither bulb will light if one is burned out. When four lamps of equal wattage are used, the unit operates in a similar manner.

Use the light saver at the Low position for setting up and focusing the camera and subject, snapping it to High before taking the picture.

—Carleton A. Phillips

"Cigar Box" Code Practice Oscillator

Since most boys play out-of-doors, a code oscillator that has to be plugged into the a.c. line becomes a nuisance. Simple to build and carry, this battery-operated unit can be mounted in a cigar box. It's ideal for the kids.

In order to set up a station at a remote position, twisted-pair wire can be connected to the two terminals on the side of the cigar box that is normally shorted when the unit is used as a straight code practice oscillator. At the remote end, a telegraph key and 2000-ohm earphones are added in series across the twisted wire. To receive at the remote end, the key is held closed, and vice versa.

—Edward H. Marriner
SUCCESSFUL public address installations don't just "happen." They are carefully planned in advance. The designer-installer must consider many factors when choosing a system: area to be covered, background noise, type of service needed (voice only, voice and music, etc.), and economics. It is just as poor design to "over-install" a system, using too much power, too many loudspeakers, and so on, as it is to skimp, installing an undersized and inadequate system.

Any p.a. system contains three major sections: input equipment, amplifier, and output equipment. The input equipment consists of one or more microphones and, often, such accessory items as a phonograph or broadcast-band tuner. The audio amplifier is the heart of the public address system—it receives the weak electrical signals delivered by the microphone (or microphones), record player, or
tuner, then amplifies and in some cases modifies these signals (by means of tone controls), delivering a powerful audio signal to the sound reproducing equipment. The output equipment is an electromechanical sound-reproducing device of some type: a cone-type loudspeaker similar to those used in home radios or hi-fi installations or a horn or trumpet-type speaker.

**CHOOSING A MICROPHONE**

Aside from differences in design, microphones can be classified in two ways: according to principle of operation and according to their pickup or polar response pattern. Basic popular types include carbon, velocity (or ribbon), dynamic, ceramic, crystal and condenser microphones. All of these convert sound vibrations into weak electrical signals.

**Principles of Operation.** The carbon mike depends on the alternate compression and release of carbon granules for its operation. Although it has the highest output level of any standard type, it is inherently noisy and has relatively poor frequency response.

Consisting of a corrugated "ribbon" of metallic foil suspended between the poles of a permanent magnet, the velocity mike has excellent frequency response and low noise level, but its output signal level is also low. A rather fragile instrument, it can be permanently damaged by a sudden puff if a performer blows against it.

The dynamic type operates much like a miniature loudspeaker in reverse. Its basic element is a small coil attached to a dia-
phragm and arranged to move back and forth in the gap of a permanent magnet. When sound vibrations strike the diaphragm, the coil moves, generating an appropriate electrical signal. It has good frequency response, moderate output level, low noise, and is fairly rugged.

Both ceramic and crystal microphones depend on the compression or twisting of a piezoelectric element attached to a small diaphragm. They feature a moderately high output level, low noise, fair-to-good frequency response, and high output impedance. Of the two, the crystal mike is the least rugged and can be damaged by excessive moisture or high temperatures.

The condenser type, while it has high performance characteristics, is not generally used in p.a. work, as it is too expensive. It operates on the principle of the capacitor, using the diaphragm as one plate with a heavier plate backing it up. Vibration of the sound waves causes the diaphragm to vary in its distance from the second plate, thus varying the capacitance of the system. An amplifier is usually mounted in the same housing with the pickup unit to obtain sufficient output and low impedance.

For general p.a. work, the usual choice is either a good-quality dynamic or a ceramic microphone. Crystal mikes can be used in lower cost installations if care is taken to avoid hot or humid environments.

**Polar Patterns.** The second important factor in choosing a microphone is the polar pattern of the unit, for a microphone does not have the same sensitivity in all directions. Looking down from the top, we can measure the radial distance from the instrument at which a given sound will always produce the same output. A graph drawn around the microphone as a nominal “center” showing these relative distances is called the polar pattern of the unit. The three basic polar patterns are: cardioid, bidirectional, and omnidirectional.

A unit having a cardioid (heart-shaped) response has maximum sensitivity directly in front, with a dropping off in pickup of sounds from the sides and very little pickup to the rear. With a polar pattern similar to a figure "8," a bidirectional microphone responds equally well to sounds coming from the front or back, but is relatively insensitive to sounds from the sides. If a microphone responds equally to sounds from all directions, its polar pattern is essentially a circle, and it has an omnidirectional response.

Microphones with a cardioid pattern are useful for solo performances, for talks, or whenever you want to reduce the pickup of sounds from the audience. A bidirectional microphone is best for person-to-person interviews, or where pickup of audience applause is desirable. Omnidirectional microphones are good for general pickups, as in the middle of an orchestra, band or chorus.

For most p.a. work, both cardioid and (Continued on page 106)
Transistor Portables for the SWL

THE SWL's will have a field day with this new crop of transistor portables. Motorola's Weatherama (left) covers the broadcast band as well as the long-wave aircraft and beacon band. It has six transistors and three germanium diodes. Cost is $79.95. Philco's Trans-World (below) covers the broadcast band and a total of six short-wave bands from 2 to 18.2 mc. The lid carries an unusual polar projection world time map. This set employs six surface barrier and three audio-frequency transistors. Cost is $225. Zenith's Trans-Oceanic (bottom) covers the broadcast band and seven short-wave bands from 2 to 22.4 mc. It utilizes nine transistors and contains a unique built-in logging compartment with time dial and also space for a personal station log.
AN ENGINEER may call them accessories or an experimenter may call them gadgets but by any other name they can be just as handy. Your 'scope's usefulness can be extended many times over by special probes and input devices.

Basically, the probe is a means of coupling a signal from the equipment under test to the input of the oscilloscope in such a way that no useful information is lost. At the same time, it will protect the input circuits of the 'scope from overload and damage. Some of the traces illustrated on these pages during the past months have required the use of such probes.

To enable 'scope users to become better acquainted with these attachments, we will describe two probes and a calibrator that can be easily assembled. Even though very simple, they are necessary for many special measurements.

**Demodulator Probe.** Many times it is desirable to check v.h.f. or microwave signals at frequencies above the range of the 'scope. Or you might want to be able to view the audio or video component that is modulating a high-frequency carrier. A demodulator probe is illustrated in Fig. 1.

This type of probe makes a very good signal tracer on any modulated carrier up to several hundred megacycles. The oscilloscope used must be capable of displaying the modulating frequency.

All parts can be mounted in a piece of
\[ \frac{1}{2} \text{" fiber tubing several inches long. Maximum voltage applied to the probe is determined by the type of crystal diode used, but in most cases it should be limited to 20 volts or less.} \]

**High-Impedance Probe.** If unshielded leads are used to the input of a 'scope, noise and ham pickup will usually make the trace unreadable. If shielded leads are used, complex waveshapes may have their high-frequency components distorted and their true shape may never appear on the face of the 'scope tube. A high-impedance (low-capacitance) probe, as in Fig. 2, will eliminate these problems.

Full details on this probe were contained in the November, 1957, issue of POP'Tronics, but sufficient information for the experimenter is given in the schematic. It can be constructed in a tube shield. The padder capacitor is adjusted to give the correct waveshape with a square-wave input to the probe.

**Voltage Calibrator.** If the amplifier gain of an oscilloscope remained constant, the 'scope could be used as an excellent a.c. voltmeter with wide frequency range. Although very few 'scopes can be calibrated for input voltage, this can be overcome by the use of a "calibrator." A calibrator is another accessory, not a probe, that is used to supply a known a.c. voltage to the 'scope.

In use, the unknown signal voltage is applied to the 'scope and the height of the trace measured. The unknown signal is then removed and the calibrator voltage fed to the 'scope and adjusted to provide the same trace height as that of the unknown voltage. The voltage read on the calibrator scale will be equal to the unknown voltage.

Although the more complicated calibrators using square waves are desirable, a less expensive unit can serve for most applications. With a little care in calibration and construction, the one shown in Fig. 3 will give very good results.

Transformer T1 must supply at least 70 (Continued on page 102)
AS OUR NATION plunges deeply into the serious business of building satellites and guided missiles, it becomes increasingly urgent that every technically minded American devote some of his time to the fundamentals of these potential civilization-wreckers. There is much to learn! But an excellent beginning can be made by studying the devices that actuate the missile’s aerodynamic control surfaces and thrust gear. These are the synchros, the “muscles of the beast.”

Fundamentally, synchros may be described as either electric motors or generators, depending upon their position in the system. A synchro comprises a stator, or stationary set of coils, and a rotor that can turn freely on its bearings. The most common synchro type employs a stator with three magnetic poles and a two-pole, bobbin type of rotor (Fig. 1).

**Current Paths.** Consider first the magnetic effect of passing an alternating current through only the rotor coil while the stator terminals are disconnected. With the flow of current, an alternating magnetic field will develop in the rotor core; and the stator coils, however, since the terminals are open. To see what happens next, let us connect the inside stator terminals together to form a so-called “wye” (like the letter “Y”) and add a “load box” to complete the stator circuits (Fig. 3). It doesn’t matter what the load box contains—resistors, capacitors, inductors, etc.—because we are interested only in current directions at this time.

Current paths now exist for each of the stators of the synchro. In accord with Lenz’ law, we know that the induced currents in the stators must flow in such a direction as to produce a new magnetic field that op-

---

**Fig. 1.** A common type of synchro motor or generator. The stator consists of three windings spaced 120° apart with three poles facing inward toward the two-pole rotor.

**Fig. 2.** One part of cycle in which the magnetic field produced by the a.c. in the rotor follows path of least “resistance” through the permeable cores of the stator windings.

since the stator core-irons are physically close to the rotor, this field will follow the permeable paths they offer (Fig. 2). Note that the direction of the field indicated by the arrows is the instantaneous direction selected at random during one part of the a.c. cycle.

As the rotor’s field passes back and forth through the stator cores, an alternating e.m.f. is induced across each stator winding by transformer action. No current flows in

April, 1958
poses the original field. Thus, the stator magnetic fields must oppose the rotor field, and the current that flows in the stator must have the direction required to give rise to this opposition. To check the current directions as given in Fig. 3, apply the left-hand rule: wrap the fingers of the left hand around the coil in the direction of the indicated current, and the thumb, held perpendicularly to the hand, will point in the direction of the field. (This rule is explained in most physics textbooks.)

Combined Effects. Magnetic fields are capable of exerting forces along the field. Like any other forces, those due to magnetic fields produce a certain net effect or resultant force when they act in combination. Think of two boys pulling a sled by means of two ropes that make an angle with each other. The net effect or resultant of this double pull can be represented by a single force in the direction shown in Fig. 4(A). Similarly, three magnetic fields acting at an angle may also be summed up by replacing them with a single resultant magnetic field, as in Fig. 4(B).

Applying this idea to the fields induced in the three stator cores of Fig. 3, it is evident that the resultant stator magnetic field may be represented by an arrow pointing in a direction opposite from that of the rotor field (Fig. 5).

Our next step is to replace the load box with another synchro identical to the first and connect all three corresponding stator points together (Fig. 6). Observe that we have changed nothing else; the stator currents now flow through three corresponding pairs in the same directions as before. Applying the left-hand rule to the newly added synchro, however, demonstrates that the magnetic fields in the second set of stators are opposite to those of the first set, producing thereby a resulting magnetic field opposite to that of the resultant in the original stators.

It is also important to note that the direction of the field in the first rotor is exactly the same as the field direction of the resultant for the second set of stators. No matter how the original rotor is twisted and turned, the magnetic field resultant of the new set of stators will always line itself up in the same direction.

As a final maneuver, we connect the rotor of the second synchro in parallel with the first, adjusting our connections so that the fields of both are in the same direction, as shown in Fig. 7.

Synchro System. Now we shall be able to see what a synchro system like this can accomplish. Suppose that the first rotor is straight up-and-down, as in Fig. 7, and that its field is in an upward direction as we have been assuming all along. The magnetic field of the second rotor is, therefore, also vertical and in line with the resultant of its stators. When magnetic fields are aligned in this fashion, they are in a state of equilibrium and there is no tendency for motion.

Now assume that we take hold of the first rotor shaft and twist it through 45°. The currents induced in the stator windings of the first synchro will change, causing a similar modification in the second set of stators which, in turn, causes the second rotor to line itself up so that it points in exactly the same direction as the first, i.e., 45° from its initial position. Thus, such a synchro system provides a means whereby an
angular change in the position of one shaft can be made to duplicate itself at some remote point with only electric wires between the two points.

This is a really significant achievement. For example, imagine that you want to know the position of your rotary beam antenna at a given instant. One synchro, which we may now call the generator, is coupled to the antenna so that its shaft turns with the rotation of the beam; the other is in your operating room with its shaft terminating in a direction-indicating compass needle. As the beam is made to rotate by its drive-motor, you know at a glance just what its orientation is with respect to compass direction.

Without a synchro system, remote indications of any angular position would necessitate a solid connecting shaft between the driven device and the indicator. More often than not, this kind of mechanical connection is very inconvenient if not impossible.

The Missile Picture. Returning to missile control now, we might ask: "Just how do synchro systems enter the missile picture?" A simple example will demonstrate one such function.

Consider a missile that is flying a predetermined compass course, say directly west. Assume that it has been driven off course a few degrees to the north by a sudden gust of wind. In the body of the airframe is a gyroscopic compass that was initially adjusted to point due west; and as the missile begins to deviate from its course, this compass remains steadfastly pointing in the direction for which it was set. Thus, the missile has turned under the gyroscope so that, effectively, the gyro compass makes an "error" angle with the air-frame.

If the gyro is coupled to a generator synchro that in turn is connected to a motor synchro, the latter may be used to move the appropriate air-foils so that the missile be-

(Continued on page 111)

Fig. 6. When the second set of stator windings is joined to the first, the stator field in #2 is opposite to that in #1, and therefore in the same direction as the rotor field of #1.

Fig. 7. After connecting the rotor of #2 with the rotor of #1, the second rotor will line up so that its own field matches that of its stator. This means that the first and second rotors always point in the same direction.

Hide Your Bench Until Needed

A compact folding workbench for the crowded hobbyist

THE ELECTRONIC HOBBYIST without a cellar or workroom has a problem. His test equipment is apt to be stored in a closet, his resistors and capacitors in a drawer, and his tools—heaven knows where! The kitchen table is his usual workbench, and he's forced to compete with Junior's homework and Mother's cooking for a space to work.

What is needed is a workbench which is out of the way when not in use and yet provides sufficient elbow room when required. The solution to the problem is a wall unit with a drop-leaf "door" as shown in the photographs. When the door is open, a Masonite work surface is revealed which can stand plenty of abuse from soldering irons and tools. The front of the door has a small ¾" flange into which an aluminum leg is fitted for support.

Storage Space. Test equipment can be stored on the bottom shelf. There is an a.c. outlet near the rear which is very handy and offers space for several plugs.

(Continued on page 98)
Tape recording hobbyists run into a number of technical problems while in pursuit of their hobby. The recorders will sometimes act up in weird and disturbing ways—emitting squeals, squeaks, quavers and hisses. Or a machine which has been operating perfectly for a number of years will suddenly go completely dead—on record, playback, or both.

What can you do about it? What tests can you make? And more important, what cures can you effect?

Troubles and Cures

By WARREN J. SMITH

A PROBLEM that has many a tape-recorder enthusiast biting his nails in frustration is tape sticking to the recording and playback heads. This difficulty usually appears as a squeak or “pig squeal” in the playback, but later it may become so severe that it actually stalls the transport mechanism. Cleaning the heads with solvents, lubricants, and so forth, is a temporary remedy at best and may result in making the sticking more troublesome.

Sticking tape is generally due to nothing more than a type of adhesion. After the heads have become smooth with wear, intermolecular forces of considerable magnitude develop between the moving tape and the heads, giving rise to spurious sounds in the playback and quite often broken tape. To remedy this situation, carefully burnish the heads with a piece of good grade crocus cloth; then clean thoroughly with the fluid recommended by the manufacturer. Do not assume that either carbon tet or alcohol is the proper cleaner.

Worn Erase Heads. A worn erase head which does not make complete contact with the tape over the entire area may cause an increase in the playback noise level, or if badly worn, allow portions of previously recorded material to remain audible.

If your erase head can be disassembled, as it can in the Magne cord recorder, for example, remove the section containing the surface which contacts the tape, and carefully hone it flat with a fine-grit honing stone or 00-sandpaper backed by a piece of smooth hardwood. The head will work like new.

Speed Instability. There are many portable tape recorders of the Minitape variety now in general use whose owners frequently complain of the difficulty of maintaining speed stability once the machine begins to age. After much experimentation, it has been found that carefully cleaning the motor armature (especially between the commutator segments) with carbon tet and installing a new set of brushes after each 35 to 40 hours of opera-

April, 1958
tion will keep the recorder running with almost 100% speed stability.

**Tape Storage.** Metal cabinets for storing 8-mm. motion picture film also make very convenient containers for magnetic recording tapes. Available at nearly every photographic supply house, they come in a variety of sizes and price ranges, some holding up to 12 of the common reels.

Stored in these cabinets, tapes are always ready for immediate use and, because the cabinets are usually made of a ferrous metal, the tapes are not only protected from dust and dirt but from stray magnetic fields as well. I use Brumberger #1010 cabinets which were originally made to hold 400' reels of 8-mm. film but now hold 12 7' reels of tape.

If more than one cabinet is needed and they are stacked to conserve space, rubber feet can be added to allow the doors to swing open without interference.

### Check Your Recorder Heads

**By EUGENE F. CORIELL**

Don't use an ohmmeter to check continuity of recorder heads suspected of being open-circuited. The d.c. from the ohmmeter battery may magnetize the heads. Use the checks described below.

Most home recorders have a single recording-playback head. There may be separate coils in the head for each function, or a single winding may serve both purposes. Check your recorder wiring schematic when testing these circuits.

If there is only one winding and the machine will record but not play back, or vice versa, obviously neither the head winding nor the common record-playback amplifier which serves both functions is at fault. The trouble may be in the switching circuits. Some record-playback heads have a separate winding for the bias current; in such a case, an a.c. milliammeter inserted in series with this winding will indicate current flow and hence continuity in the bias winding.

**Record Head Check.** If the head has separate windings for record and playback, test the record winding by having someone talk into the microphone with the recorder controls set for "record" and connect a pair of phones across the record head terminals.

If the signal can be heard in the phones but does not produce even a distorted recording on the tape, the head winding is at fault. Absence of signal in the phones would indicate trouble in the amplifier or in the record-playback switching circuits. However, dead phones might also indicate a shorted recording winding; you can check this possibility by determining if there is a signal in the phones after the head winding is disconnected.

**Playback Head Check.** Test the separate playback winding by bringing the tip of a plugged-in soldering iron or gun (a.c. only) near but not too close to the head with controls set for playback. Proper functioning of the entire playback system will be indicated by a hum in the speaker. Assuming that the common record-playback amplifier and switching circuits were found to be okay during the recording winding checks described above, absence of hum points to a defective playback winding on the recorder.

While an ohmmeter would cause less trouble in the erase head than in the record-playback head, it is still a good idea to keep ohmmeters away from all of the heads. See if the head will erase a recorded tape run through the machine set up for recording with the volume control turned down. Failure to erase with proper erase voltage on the head indicates an open or otherwise defective head.
Among the Novice Hams

By HERB S. BRIER, W9EGQ

WHEN their amateur licenses arrive, many new amateurs—Novices and Generals—make a surprising discovery. They realize that they have only a very hazy idea of how to make contacts with other stations.

In theory, this is an easy thing to learn. It is only necessary to imitate more experienced amateurs. In practice, this theory has a serious defect. Experienced operators usually send so fast that a beginner just cannot copy them. Therefore, he must imitate amateurs who send slowly. Unfortunately, such hams are usually newcomers themselves and their operating procedures are not too good either. The net results are some of the weird calling procedures that are often heard on the amateur bands.

Fortunately, it is not hard to learn good calling procedures. And it pays to do so, because they produce the best results with the least effort. Therefore, let us outline the proper techniques for working other amateurs from the initial call to the final sign-off. In the process, we will use the following standard procedure signals: CQ (meaning "general call"); DE ("this is" or "from"); AR* ("end of transmission"); K (invitation to transmit—"go ahead"); SK* (end of work). Also, of course, there will be your own call-sign and the call and sign of the station you wish to work.

Calling "CQ." For example, say that W9EGQ wishes to talk to any station within range and transmits a "General Call," as follows: "CQ CQ CQ CQ CQ DE W9EGQ W9EGQ CQ CQ CQ CQ DE W9EGQ W9EGQ CQ CQ CQ CQ DE W9EGQ W9EGQ K." The ending signal "K" means: "Go ahead any station. I am listening for replies."

If another amateur, W9XXX, hears the CQ and wishes to answer, he will transmit: "W9EGQ W9EGQ W9EGQ DE W9XXX W9XXX AR." He uses the ending signal "AR" to indicate that two-way contact has not yet been established.

W9EGQ will then respond: "W9XXX DE W9EGQ;" and start the conversation. In the initial transmission, which is usually quite short, he will probably give W9XXX a signal report, his location and name, and will stand by to find out how well W9XXX (Continued on page 117)

Two amateurs (?) and their equipment. Ron, KN7BYZ, above, uses a 33' vertical transmitting antenna in conjunction with his DX-20 transmitter and SX-99 receiver (see page 119). And with the help of John [3], Vince, KNOLHG [38] has worked 37 states with his WRL Globe Chief and Hallicrafters SX-100.
HELP US OBTAIN OUR HAM LICENSES

Prospective amateurs requesting help and encouragement in obtaining their licenses are listed here. To have your name listed, write to Herb S. Brier, WSEGQ, % POPULAR ELECTRONICS, One Park Ave., New York 16, N. Y. Please print your name and address clearly. Names are grouped geographically by amateur call areas.

To help prospective amateurs obtain their novice licenses, the Electronic Industries Association (formerly RETMA) offers a set of code records (recorded at a speed of 32 s/3 rpm) and a Novice Theory Course for $10.00, post-paid. The complete course or more information on it is available from EIA, 1721 DeSales St., N.W., Washington 6, D. C.
COST of establishing and maintaining an amateur station today has risen proportionately to other living costs; and in this era of "dollars per watt," any efforts aimed toward achieving a more potent signal are likely to become prohibitive—especially if there is an XYL in the background who is taking a narrow view of things.

However, hams are noted for their ingenuity and XYL's are born bargain hunters. Let's use these two traits to multiply our signal power many times and at a cost ratio more to our liking—"watts per dollar"!

Effective Power. Many amateurs think of signal strength in terms of transmitter power. To get a stronger signal, they increase the power output. This is the "brute force method" and, generally speaking, will often do the job. However, it's an expensive way to increase the effectiveness of a transmitter.

Hams seeking greater DX laurels might profitably take a tip from radio and television station engineers. These professionals cast their lot with "Effective Radiated Power," otherwise known as E-R-P. Skipping the mathematical formulas, E-R-P is simply the amount of signal power being radiated in the desired direction. Basically it is the E-R-P, and not necessarily the transmitter power, that must be increased in order to cut through QRM and work that DX.

How can E-R-P be increased without increasing transmitter power? It is done with the one piece of equipment solely responsible for the efficiency of signal radiation—the antenna.

Loss Means Gain. There is no such thing as an antenna that radiates equally well in all directions. True, the antenna engineer has imagined such a paragon, which he fondly calls an isotropic radiator, and he treasures it because such an antenna makes a fine standard for comparison. But the isotropic radiator exists only in the engineer's fancy. So we must consider a practical antenna: the half-wave dipole.

(Continued on page 114)
Complete timing unit, with built-in rectifier and pilot light, fits inside plastic box. This is its actual size.

How Long Did You Use It?

Miniature electroplating unit shows the length of time your electronic equipment is operated.

A "CHRONISTOR" is a tiny elapsed-time indicator with the size and appearance of a glass clip-mounting radio fuse. It is suitable for direct wiring into a home or industrial device, and it mounts in a standard fuse clip for convenience of observation and replacement.

By means of a time scale calibrated in hours which is printed directly on its glass side, the Chronistor indicates by an electroplating process the amount of time current has been applied. With a d.c. flow of about 1 milliamperere through the unit, metal ions from the anode are carried through the electrolyte and deposited on the cathode. The "growth" of the cathode provides the visible indication of elapsed time. Standard ranges are 500, 1000 and 2500 hours; other ranges are available on special order.

**Current Requirements.** Current needed to activate the Chronistor can be obtained from any d.c. source. The better regulated the current source, the higher the accuracy of the indicator. In most applications, however, an unregulated supply will be adequate.

A resistor in series with the indicator in conjunction with the applied d.c. voltage will determine current flow through the plating unit and hence its elapsed time indication. See Table 1. Resistors shown are all 5% 1-watt units and calculated to the nearest EIA (RETMA) value.

The Chronistor cartridge is available separately from Bergen Laboratories, 247 Crooks Ave., Clifton, N. J., or as part of a complete assembly known as a "Chrono-stat." Packed into the 2⅛"x1⅛"x1⅛" plastic case of the Chronostat is a 10-ma. rectifier, a pilot lamp, the indicator and its series-limiting resistor.

Shown in Fig. 1 is the circuit of the Chronostat. It operates directly from the a.c. line. The limiting resistor is chosen to (Continued on page 104)

POPULAR ELECTRONICS
MOST KITS are bought and assembled by people who have an intense interest in electronics: experimenters, servicemen or amateurs. They have at least a smattering of technical information; they have done considerable soldering while working on past projects; and they know how to think "electronically" when any little problems are encountered that need solving.

After taking a quick look at the Model 83Y766 Knight-Kit five-transistor portable radio (Allied Radio, 100 N. Western Ave., Chicago 80, Ill.), we were tempted to give it an acid test and let someone who had no experience whatever put it together. Design of the kit and the instruction manual looked good enough to suggest that a real beginner might be able to do a fair job.

The kit was presented to a young man who had never connected wires to even a battery and buzzer, never soldered any portion of an electrical circuit, nor assembled any type of construction toy as a boy. No special warnings were given to him, and the only instruction he received took about five minutes. That concerned the use of a small soldering iron of the pencil type.

The assembly of the kit took him one evening and part of an afternoon. Here are his comments on the job.

**Putting It Together.** The parts of the Model 83Y766 Knight portable radio kit come carefully packed in a cardboard carton. Most of them are packed separately to avoid damage in shipping. For example, the loudspeaker was in a cardboard sleeve to protect the cone from damage, and the tuning capacitor was in a small box to prevent the plates from becoming bent.

The chassis is a printed-circuit board with letters or numbers on each hole and on each spot where ceramic disc capacitors, resistors, transistors, and transformers are mounted.

Five transistors and one diode are em-

---

**Kommentar.**

April, 1958

---

**Completion of assembly and soldering takes a beginner about seven hours.** The handle at the left side of the cabinet pulls out for carrying the set. Springs inside cabinet retract it automatically when set is placed on table.
ployed in the superheterodyne circuit. The transistors include a 2N252 converter, a 2N308 i.f. amplifier, a 2N309 audio amplifier, two 2N185's for the audio output stage. The detector diode is a 1N257.

On the whole, the construction of the set was simple although some problems arose during the process. Resistor \( R_4 \) (100,000 ohms) was mounted too close to the board. Later, when a nearby capacitor lead was inserted in a hole under the resistor, it was a tight squeeze to pull it through. The lead can be bent over the copper section of the printed circuit, however, and soldering it is not difficult.

Another problem which arose was the mounting of the gang tuning capacitor. Two of the three holes on the capacitor aligned perfectly with the holes on the printed-circuit board, but the third pair of holes did not line up. It was decided that the two screws would provide enough support.

Comment. The instructions are simple and easy to follow, with ten pictorial diagrams showing the various steps in the assembly.

When the kit was completed, about seven local stations could be picked up before alignment. After alignment, 21 local stations were picked up with good volume.

THE TV SERVICEMAN would be lost without his tube tester, and even the home repairman who finds himself looking after three or four TV sets can find a tube tester to be a time- and money-saving investment. Since most TV service calls require only the replacement of a tube, a portable tester can be a handy part of a serviceman's tool kit.

The Paco Model T-60 tube tester is a unit flexible enough to test the latest TV tube or the old 5-pin tube from Grandpa's favorite radio. Construction of the kit is fairly easy, and with the exception of some minor details, to be described later, this builder found little difficulty in putting the kit together.

Since there is little close wiring, this kit is ideal for the beginner who wants to acquire some equipment and also some experience in soldering. Most of the wiring consists of interconnecting pins of the eight different size tube sockets with the set of control switches at the front panel. This group of three-position switches selects the pins to which test voltages will be applied and is also used to connect the tube heater voltage to the proper pins. Settings of these switches are determined from numbers on a built-in roll chart.
With the switches in position, the tube is connected as a diode with plate and grids as one element and the cathode as the second element. The indicating meter on the front panel is connected in series with the tube so that the current through the diode-connected tube is indicated. This shows the general condition of the tube. Another position permits checking for shorted elements in the tube.

**Putting It Together.** Assembly of the tube tester took about three evenings' work. Some difficulty was encountered in installing the tube sockets on the front panel. The sockets are of the snap-ring type with a groove on the side to accept a circular snap-ring. After attempting unsuccessfully to install the snap-ring on two sockets, it was found that the panel hole had been cut slightly smaller than the base of the socket and would not let the socket seat far enough into the hole to permit the snap-ring to be installed. A little filing with a half-round file solved the problem.

You might use one of the corrugated cardboard panels that come with the packing as a work surface for installing parts on the panel. This prevents the face of the panel from being scratched on the work table.

When installing the 300-ohm power potentiometer, be sure to select the right one, since two 300-ohm potentiometers are used. The unit with the ceramic housing is the power-handling unit.

Wiring is fairly repetitive for each pin on the tube sockets, and it seemed faster, after wiring one or two rounds, to wire a set of pins without referring to the manual and then use the instructions as a check on the wiring. This is not usually good practice, but the type of wiring used here is easy to follow once the pattern is known.

Two resistors were found with no value marked on them. Fortunately they did have part numbers and it was possible to identify them from the parts list.

In wiring the transformer, be sure to follow instructions as given in the manual. Placement of this wiring is quite important for proper installation of the transformer.

The roll chart caused little trouble in installation, but care must be taken to get it on the rollers straight. Otherwise it can jam against the sides of the track. Be sure that all of the wiring is placed away from the chart so there is no chance of wires rubbing against it.

**Comment.** The Paco T-60 tube tester operated well as soon as it was completed. Only minor problems were encountered during assembly of parts.

This reviewer would have liked to see a precut wiring harness for the tube-socket leads. It could have cut considerable time from the wiring and might have resulted in a much neater job.

The kit itself is well designed and quality components are used throughout. I doubt if even a beginner in kit building would find any of the difficulties encountered too much to handle.
VERIFICATIONS, or QSL's—as they are often called, are letters (or cards) issued by short-wave stations in reply to reception reports sent to them from listeners all over the world. Many are fancy while others are plain, but they are all welcome additions to the listener's collection.

Some DX'ers try to collect a QSL from every station in the world. While this probably has never been accomplished, there are SWL's who have amassed hundreds of confirmations from nearly every type of station ranging from privately owned ones to the largest of the short-wave broadcast stations.

If you include the following points of information in your reception reports, it will help you to enlarge your collection while, at the same time, the stations will receive reports of maximum use to them. Keep in mind that a station is not obliged to verify; however, if your report is of sufficient value to a station, you'll be fairly certain to receive a QSL.

First, mention the name of the station (slogan or call-sign) and its location. Give the exact frequency whenever possible. State the exact times that you heard the station, and show the time in GMT (Greenwich Mean Time: Eastern Standard time plus five hours). If you cannot compute the correct time in GMT, be sure that you state in which time zone you live.

Your report should be based on a listening period of at least 30 minutes unless the station is on the air for a shorter period. Give a resume of what you heard, and give the time for each item. (Sample: "News in English at 1848-1855, marimba music to 1900 station break, with a Spanish program following to 1930.")

A report which is broken down in this manner will convince the station personnel that you were listening to their station and not tuning in a different station with similar programing.

Include a signal strength and readability report. If there was any interference or jamming, try to learn the identity of the offending station. Many reports of interference will often result in a station altering frequency slightly to make reception better for listeners. Also mention any peculiar effects noted, such as deep fading, distortion, over- or under-modulation.

Give the station a brief resume of your equipment, including the make and model of your receiver and the number of tubes in it. Tell your general location and the type of terrain surrounding your area (mountainous, flatlands, etc.). If you liked or disliked any particular program, say so, along with your comments on the programing in general.

The report should be made in letter form and should be as interesting and informative as possible. Postcard or SWL-card reports usually contain little useful information. Do not demand a verification but rather suggest that your report be verified.

(Continued on page 122)

Bernard Koenig, of Regina, Saskatchewan, who listens with a Hallicrafters SX-25 and an RCA AZS, has collected verifications from 34 countries. His antenna is a 100' long wire.
New! A MACHINE THAT COMPOSES MUSIC

BUILD IT YOURSELF in a few hours!

Yes, you build any one of 33 exciting electric brain machines in just a few hours by following the clear-cut, step-by-step directions given in a thrilling booklet! No soldering required ... no wiring beyond your skill! GENIAC® is a genuine brain machine—not a toy. The only logical logic, not only adds, subtracts, etc., but presents the basic ideas of cybernetics, Boolean algebra, symbolic logic, automation, etc. So simple to construct that even a twelve-year-old can make a machine that will fascinate people with advanced scientific training! With the special circuitry of GENIAC, the Electric Brain Construction kit, you can compose tunes automatically. These new circuits were never available before!

OVER 400 COMPONENTS AND PARTS. Circuits operate on one flashlight battery, and the use of ingeniously designed parts makes building circuits one of the most fascinating things you've ever done! You set up problems in a variety of fields—and get your answers quicker than you can set them up! Play games with the machine—nim, tic-tac-toe, etc.—and pit your brain against its logic! Solves puzzles in a few seconds that would take you hours without the aid of the machine. You actually see how computing and problem-solving is analyzed with algebraic solutions transferred directly into circuit diagrams.

YOUR COST FOR GENIAC® KIT: only $19.95 postpaid. The 1958 Model GENIAC KIT contains: (1) a complete 100-page text, “Minds and Machines”—a basic introduction to computers. (2) “How to Construct Electrical Brains At Home”—a fully illustrated text book on basic computer design theory and circuits with specific instructions for building circuits. (3) Wiring Diagrams Manual. A special booklet with full scale diagrams that you can tear out and place on your work bench for easy assembly. (4) Beginners’ Manual. Starting from scratch, the manual adds extra experiments, thoroughly tested using GENIAC components to teach the basic symbols of electric circuits. (5) Over 400 components and parts.

So—mail the coupon for your GENIAC today! Your money back if not delighted!

THE COSMOTRON MINIATURE ATOM SMASHER

• PRODUCES 75,000 VOLTS

• ABSOLUTELY SAFE

In no sense of the word a toy or gadget. The COSMOTRON is a scientific instrument capable of producing 75,000 volts—makes sparks up to 2' long—yet it is absolutely safe because the current is infinitesimal. The science teacher—science lover—or hobbyist can perform experiments to astound students—friends—family. Makes smoke disappear—defies gravity—turns propellers at a distance—transforms atoms—energy into light—makes artificial lightning—smashes atoms—demonstrates ionic space ship drive—and many other experiments. Constructed of the finest materials. Will do exactly—for instruction purposes—what generators that cost 3 to 10 times more will do. The perfect device to teach the secrets of atomic physics and electricity. Will hold an audience spellbound as it performs trick after amazing trick. Includes an experiment kit and illustrated experiment manual. Manual explains the “how” and “why.” You will invent many new experiments of your own. A fine research tool that will give years of beneficial service to the institution or individual who owns one. In kit form or assembled. Kit form, $19.95; Assembled, $19.95; plus $0.50 postage in U.S.A. or $1.00 abroad.

"BASIC" SPEAKER SYSTEM

A-9C 20-WATT AMPLIFIER

RANGE EXTENDER
HEATHKIT "BASIC RANGE" HIGH FIDELITY SPEAKER SYSTEM KIT
This amazing speaker system can fulfill your present needs and still provide for future expansion. Fine hi-fi performance the result of using high quality speakers in an enclosure especially designed for them. Features two Jensen speakers to cover 50 to 12,000 CPS within ± 5 db. Power rating is 25 watts, and impedance is 16 ohms. Enclosure constructed of veneer-surfaced plywood, ¾" thick, and measures 11¾" H x 23" W x 11¾" D. Precut and predrilled for quick assembly. Shpg. Wt. 30 lbs.

HEATHKIT RANGE EXTENDING HIGH FIDELITY SPEAKER SYSTEM KIT
Designed especially for use with SS-1 "Basic" system. Contains 15" woofer and compression type super tweeter. Extends basic unit to 35-16,000 CPS, ±5 db. Impedance 16 ohms. Measures 29" H x 23" W x 17¾" D, and is constructed of ¾" veneer-surfaced plywood. Model SS-10. Shpg. Wt. 80 lbs. $99.95

HEATHKIT A-9C HIGH FIDELITY AMPLIFIER KIT
This model incorporates its own power supply and preamplifier. Plenty of power with full 20 watt rating. Four separate inputs, selected by panel-mounted switch, and separate bass and treble controls. Ideal for home or PA applications. Output transformer, tapped at 4, 8, 16 or 500 ohms. Response within ± 1 db from 20 to 20,000 CPS. Model A-9C. Shpg. Wt. 23 lbs. $35.50

HEATHKIT HIGH FIDELITY FM TUNER KIT
Now you can have full-fidelity FM performance from 88 to 108 mc at reasonable cost. Features temperature-compensated oscillator—built in power supply, and beautiful cabinet. Components prealigned at factory. Model FM-3A. Shpg. Wt. 8 lbs. $25.95 (with cabinet)

HEATHKIT BROADBAND AM TUNER KIT
Tunes standard AM band from 550 to 1600 kc with fine sensitivity and broadband characteristics. Features include built-in power supply and low-distortion detector. All RF circuits prealigned for simplified construction. Model BC-1A. Shpg. Wt. 8 lbs. $25.95 (with cabinet)

HEATHKIT "MASTER CONTROL" HI-FI PREAMPLIFIER KIT
Provides extra amplification, selection of inputs, volume and tone controls, and turnover and rolloff controls, for Williamson-type amplifiers. Beautiful satin-gold enamel cabinet. Derives operating power from amplifier. Model WA-P2. Shpg. Wt. 7 lbs. $19.75 (with cabinet)

HEATHKIT 25-WATT HIGH FIDELITY AMPLIFIER KIT
Outstanding 25-watt Williamson-type amplifier employs KT66 tubes and Peerless output transformer, tapped at 4, 8, and 16 ohms. A fine amplifier for the "deluxe" system. WA-P2 preamplifier required for operation. Express only. Model W-5M. Shpg. Wt. 31 lbs. $59.75
Choose your own “Do-it-yourself” project from the world's largest kit manufacturer

HEATH COMPANY
A subsidiary of Daystrom, Inc.
BENTON HARBOR 10, MICHIGAN

Now you can have radio wherever you go—with the portable that plays anywhere!

HEATHKIT TRANSPORTABLE RADIO KIT
A new concept in radio reception! Now you can forget about external electrical connections and have fine radio performance anywhere! Low-drain circuit using regular flashlight cells makes battery operation cheaper than power-line operation of table model sets. Tunes 550 to 1600 kc and features a 4" x 6" speaker for "big-set" tone, six Texas Instrument transistors for fine sensitivity and selectivity, built-in rod-type antenna, and unbreakable molded plastic cabinet in "Holiday" gray. Measures 9" L x 8" H x 3 1/2" D. Appearance and performance are unmatched at this price level. Easy to build! Shpg. Wt: 4 lbs.

HEATHKIT BROADCAST BAND RADIO KIT

Model BR-2
$18.95

(less cabinet)

HEATHKIT CRYSTAL RADIO KIT
Features a sealed germanium diode to eliminate critical "cats whisker" adjustment. Employs two tuning condensers for good selectivity, and covers the broadcast band from 540 to 1600 kc. Requires no external power. Kit price includes headphones. Shpg. Wt: 3 lbs.

Model CR-1
$7.95

HEATHKIT ENLARGER TIMER KIT
The dial of this handy timer covers 0 to one minute calibrated in five-second gradations, so that the timing cycle of a photographic enlarger can be electronically controlled. Built-in relay handles up to 350 watts, and enlarger merely plugs into receptacle of front panel. Also provision for plugging in safe-light. An easy-to-build device that makes a fine addition to any dark room. Shpg. Wt: 3 lbs.

Model ET-1
$11.50

Always say you saw it in—POPULAR ELECTRONICS
HEATHKIT FUEL VAPOR DETECTOR KIT

The FD-1 is a safety device to detect fuel vapor in the engine compartment or other sections of your boat. The detector unit mounts in the area to be checked, and the indicating meter and controls mount on the control panel. Will operate intermittently or continuously, and indicates dangers of fire or explosion to protect your boat and its passengers. Models FD-1-6 (6 volts DC) and FD-1-12 (12 volts DC) operate from boat batteries. Kit even includes spare detector unit. 6-volt FD-1-6, Models FD-1-6 (6 volts DC) and FD-1-12 (12 volts DC) operate from boat batteries. $35.95 each

HEATHKIT RF POWER METER KIT

This handy device measures the RF field in the vicinity of a transmitter, whether it be marine, mobile, fixed, etc. Requires no electricity, nor direct connection to the transmitter. Provides a continuing indication of transmitter operation. Merely place it in proximity to the transmitter antenna and it will produce a reading on its 200 ua panel meter when the transmitter is in use. Operates with any transmitter between 100 kc and 250 mc. Includes a sensitivity control for meter. Shpg. Wt. 2 lbs. Model PM-1 $14.95

HEATHKIT TRANSISTOR RADIO DIRECTION-FINDER KIT

The Heathkit Transistor Radio Direction-Finder model DF-1 is a self-contained, self-powered, 6-transistor super heterodyne broadcast radio receiver incorporating a directional loop antenna, indicating meter, and integral speaker. It is designed to serve primarily as an aid to navigation when out of sight of familiar landmarks. It can be used not only aboard yachts, fishing craft, tugs, and other vessels which navigate either out of sight of land or at night, but also for the hunter, hiker, camper, fisherman, aviator, etc. It is powered by a 9-volt battery. (A spare battery is also included with the kit.) The frequency range covers the broadcast band from 540 to 1600 kc and will double as a portable radio. A directional high-Q ferrite antenna is incorporated which is rotated from the front panel to obtain a fix on a station and a 1 ma meter serves as the null and tuning indicator. The controls consist of: tuning, volume and power (on-off), sensitivity,heading indicator (compass rose) and bearing indicator (antenna index). Overall dimensions are 7½” W x 5½” H x 5½” D. Supplied with slip-in-place mounting brackets, which allow easy removal from ship bulkheads or other similar places. Shpg. Wt. 4 lbs. Model DF-1 $54.95

NEW! Heathkits for the boating enthusiast
HEATHKIT DX-20 CW TRANSMITTER KIT
This Heathkit straight-CW transmitter is one of the most efficient rigs available today. It is ideal for the novice, and even for the advanced-class CW operator. It employs a 6DQ6A tube in the 50-watt final amplifier circuit, a 6CL6 oscillator and a 5U4GB rectifier. Single-knob band switching covers 80, 40, 20, 15, 11, and 10 meters. The DX-20 is designed for crystal excitation, but may be excited by an external VFO. Pi network output circuit is employed to match antenna impedances between 50 and 1000 ohms.
Shpg. Wt. 18 lbs. $35.95

HEATHKIT GRID DIP METER KIT
An instrument of many uses for the ham, experimenter, or service technician. Useful in locating parasitics, neutralizing, determining resonant frequencies, etc. Covers 2 mc to 250 mc with prewound coils. Use to beat against unknown frequencies, or as absorption-type wave meter.
Shpg. Wt. 4 lbs. $19.95

HEATHKIT RF SIGNAL GENERATOR KIT
Produces rf signals from 160 kc to 110 mc on fundamentals on five bands, and covers 110 mc to 220 mc on calibrated harmonics. Output may be pure rf, rf modulated at 400 CPS, or audio at 400 CPS. Prealigned coils eliminate the need for calibration after completion.
Shpg. Wt. 8 lbs. $19.95

HEATHKIT HANDITESTER KIT
Measures AC or DC voltage at 0—10, 30, 300, 1000 and 5000 volts. Direct current ranges are 0—10 ma and 0—100 ma. Ohmmeter ranges are 0—3000 and 0—300,000 ohms. Sensitivity is 1000 ohms/volt. Features small size and rugged construction in sleek black bakelite case.
Shpg. Wt. 3 lbs. $14.95

HEATHKIT ETCHED-CIRCUIT VTVM KIT
Sensitivity and reliability are combined in the V-7A. It features 1½ precision resistors, large 4½ panel meter, and etched circuit board. AC (RMS) and DC voltage ranges are 0—1, 5, 15, 50, 150, 500, and 1500. Peak-to-peak AC ranges are 0—4, 14, 40, 140, 400, 1400 and 4000 volts. X1, X10, X100, X10k, X100k, and X1 megohm.
Shpg. Wt. 7 lbs. $24.95

HEATHKIT ALL-BAND RADIO KIT
This receiver covers 550 kc to 30 mc in four bands, and is ideal for the short wave listener or beginning amateur. It provides good sensitivity and selectivity, combined with good image projection. Amateur bands clearly marked on the illuminated dial scale. Employ power supply—electrical board spread —antenna trimmer—separate rf and af gain controls—noise limiter and headphone jack. Built-in BFO for CW reception. Cabinet, as shown, available separately.
Shpg. Wt. 12 lbs. $29.95

HEATHKIT "GENERAL PURPOSE" 5" OSCILLOSCOPE KIT
This oscilloscope sells for less than the previous model, yet incorporates features for improved performance. The OM-2 provides wider vertical frequency response, extended sweep generator coverage, and increased stability. Vertical channel is essentially flat to over 1 mc. Sweep generator functions from 20 CPS to over 150 kc. Amplifiers are push-pull, and modern etched circuits are employed in critical parts of the design. A 5BP1 grid-ray tube is used. The scope features external or internal sweep and sync, 1-volt peak-to-peak reference voltage, three-position step attenuated input, and many other "extras."
Shpg. Wt. 21 lbs. $42.50

SONIC REALISM—NOW AVAILABLE AT LOW COST

ULTRON COMPANY'S NEW REVERBERATION UNIT PROVIDES STEREO EFFECT FROM SINGLE SOURCE OF PROGRAM MATERIAL.

AT LAST...

The high price of realistic sound reproduction can be materially reduced through application of the Model U-2 Reverberation Unit now being produced by Ultron Company. By taking advantage of basic natural principals, this unit makes possible the much sought after illusion of presence without requiring two sources of program generation. Music acquires a depth and sparkles unknown to those accustomed to a so-called monoaural sound system.

WORKS WITH ANY SYSTEM

The Ultron reverberation unit is adaptable to any existing sound system. The unit simply hooks in between the output of the basic amplifier and the input of an auxiliary amplifier and speaker combination. In fact, any ordinary radio having a "phone" jack can be used as the auxiliary equipment if optimum fidelity is not required.

Hook-up is a simple matter covered in full by installation instructions accompanying each unit. If unit does not perform as specified, it may be returned within ten days of receipt for refund of purchase price subject to inspection to assure undamaged condition.

Hide Your Bench

(Continued from page 80)

The a.c. line has a 5-ampere fuse on each side for safety.

The second shelf has room enough for 24 parts drawers to store resistors, capacitors, hardware and miscellaneous items, while the third shelf will hold copies of P.E., books, schematics and catalogs.

At the top is an adjustable shelf that you will find handy for storing larger tools and projects. The adjustment feature can be installed using commercially available shelf supports.

Assembly. Comparatively simple to put together, the unit should take only three or four hours to construct. The entire cabinet is made of 1" by 10" pine shelving and assembled using nails (8d or 10d size) and wood glue. The drop-leaf door is 3/4" plywood.

When the door is closed, it is held tight by a hook-and-eye catch. Brass hinges

2" x 1/2"

are screwed to the front of the bottom shelf so that the door will close flush with the shelf. Glue a 3/4" piece of tempered Masonite to the back of the door to serve as the work surface.

Mount a 3/4" flange on the front panel into which an aluminum pipe can be inserted. The pipe shown was cut from a discarded antenna mast and a cork was set in one end to prevent marring the floor. When not in use, the pipe can be stored on the side of the unit and held there by a broom-handle clip. You can determine the exact length of pipe needed after mounting the cabinet.

The cabinet is held on the wall by means of brackets and rawl plugs and screws, Moly or toggle bolts. The type of fastener used will depend upon the type of kitchen wall you have. If in doubt, consult your landlord or superintendent.

As a finishing touch, the outside of the cabinet can be covered with wallpaper or painted to match the wall.

Servicing or Communications
by Practicing at Home in Spare Time

Without Extra Charge you get special NRI kits developed to give actual practice with TV-Radio equipment. You build, test, experiment with receiver or broadcasting circuits. All equipment yours to keep.

Have the High Pay, Prestige, Good Future of a Skilled TV-Radio Technician

People look up to and depend on the Technician, more than ever before. His opportunities are great and are increasing. Become a TV-Radio Technician. At home, and in your spare time, you can learn to do this interesting, satisfying work — qualify for important pay.

A steady stream of new Electronic products is increasing the job and promotion opportunities for Television-Radio Technicians. Right now, a solid, proven field of opportunity for good pay is servicing the tens of millions of Television and Radio sets now in use. The hundreds of TV and Radio stations on the air offer interesting jobs for Operators and Technicians.

More Money Soon — Make $10 to $15 a Week Extra Fixing Sets in Spare Time

NRI students find it easy to start fixing sets for friends a few months after enrolling, pick up $10, $15 and more a week extra spending money. Many who start in spare time soon build full time TV-Radio businesses.

Act Now — See What NRI Can Do for You

NRI has devoted 40 years to developing simplified, practical training methods. You train at home, learn-by-doing. NATIONAL RADIO INSTITUTE, Washington 16, D.C.

NRI Has Trained Thousands for Successful Careers in TV-Radio

Have the High Pay, Prestige, Good Future of a Skilled TV-Radio Technician

The Tested Way To Better Pay

Sample Lesson AND Catalog BOTH FREE

This card entitles you to Actual Lesson on Servicing, shows how you learn Television-Radio at home. You'll also receive 64-Page Catalog. LARGEORDER.

NATIONAL RADIO INSTITUTE, Dept. 3DD4
Washington 16, D.C.

Please mail me the FREE sample lesson and 64-Page Catalog. (No Salesman will call.)

ACCREDITED MEMBER, NATIONAL HOME STUDY COUNCIL
For Higher Pay, Better Jobs
Be a Television-Radio Technician

Broadcasting Offers Satisfying Careers
4000 TV and Radio stations offer interesting positions. Govt. Radio, Police, Two-Way Communications are growing fields. Trained TV-Radio Operators have a bright future.

Servicing Needs
More Trained Men
Portable TV, Hi-Fi, Transistors, Color TV are making new demands for trained Technicians. Good opportunities for spare-time earnings or a business of your own. Enjoy prestige.

Train at Home the NRI Way
Famous for Over 40 Years
NRI is America's oldest and largest home study Television-Radio school. The more than 40 years' experience training men, the outstanding reputation and record of this school—benefits you many ways. Successful graduates are everywhere, in small towns, big cities. You train in your own home, keep your present job while learning. Let us send you an actual lesson, judge for yourself how easy it is to learn.

No Experience Necessary — NRI Sends
Many Kits for Practical Experience
You don't have to know anything about electricity or Radio to understand and succeed with NRI Courses. Clearly written, illustrated NRI lessons teach Radio-TV-Electronic principles. You get NRI kits for practical experience. All equipment is yours to keep. Mailing the postage-free card may be one of the most important acts of your life. Do it now. Reasonable tuition, low monthly payments available. National Radio Institute, Wash. 16, D.C.

Oscilloscope Traces

(Continued from page 76)

steering of the car, to keep it automatically on course.

Using such techniques, it would be possible for a car moving in a fog to light a series of lights for about 400 feet behind it, warning approaching cars to slow down. In the same way, a car ascending a hill can light a series of lights ahead of it, over the brow of the hill, not only warning drivers approaching on the opposite side of the oncoming vehicle, but also, by the rate at which the lights go on, giving the drivers an idea of the speed of the other car. This system could well eliminate the passing hazard on hills. The same technique could be used around hazardous curves, of course.

Eventually, these visual signals could be replaced or supplemented by a radio signal which could act on the controls of a car in a dangerous situation to prevent a collision.

volts at 10 ma. to the meter circuit. This can be obtained from a 1 to 1 isolation transformer or by using a 6.3-volt filament transformer connected in reverse, with the 6.3-volt winding fed from the heater supply of the 'scope and the primary winding supplying the meter.

In use, the a.c. meter is set at 70 volts by the 10,000-ohm potentiometer. This is an r.m.s. value and is equivalent to 100 volts peak across the divider network. A linear wire-wound control (1000-ohm) adjusts the output from 0 to 10 volts.

The scale can be divided into 100 divisions of 0.1 volt each. Each step of the tap switch will add 10 volts to the output. Any peak voltage value between 0 and 100 volts can be obtained in steps of 0.1 volt.

The voltmeter in the calibrator is used only as a reference setting. Voltages applied to the 'scope are read from the position of the scale and step switch. Peak values of voltage are used because the 'scope trace responds to peak values of a signal.

Accuracy of measurement will depend upon the type of resistors used and the voltmeter. Any ordinary multimeter can be used if set on the appropriate scale. A vacuum-tube voltmeter is not recommended because of grounding problems that may occur.

Although the circuits covered above are not complicated, they will add considerably to the number of measurements possible with your 'scope. Additional uses will be suggested in the near future.

Always say you saw it in—POPULAR ELECTRONICS
Listen to Satellites
(Continued from page 46)

d. terminal (cathode) of rectifier
SR1 (S) and terminal 2 of TS2 (S).

Final connections: Install antenna compensating capacitor C1 in panel holes using 4-40 hardware. Make sure rotor of capacitor does not touch chassis. Install wire from rotor lug of C1 (S) to center terminal of J1 (S). Install wire from one stator terminal of C1 (S) to tap point on coil L1 (S). Place knob on shaft of capacitor. Install tube V1 in socket D and place shield over tube. Place tube V2 in socket F and tube V3 in socket J. Place overtone crystal in socket. Place 1-ampere fuse F1 in fuse holder.

Circuit Adjustment

Before applying power to the converter, check your wiring against Fig. 3. For circuit adjustment, you will need a high-impedance vacuum-tube voltmeter and a grid dip oscillator.

Plug a dummy antenna, as shown in Fig. 5 (A), into receptacle J1. All of the following tests should be conducted using the dummy antenna.

Turn on the converter and make sure that all tubes light. Measure the various d.c. voltages as indicated at the bottom of Fig. 3; a reading within 10% or so of the indicated value will be considered normal.

Finally, adjust the VTVM to the –5 volt scale, and insert probe in test jack J8. This reading gives an indication of the oscillator injection into the converter stage.

Capacitor C13 should be slowly adjusted until a reading is obtained on the meter. The multiplier stage capacitor, C16, is now tuned to maximize the reading. With proper adjustment of these two controls, a reading of –3.5 volts should be obtainable.

Under proper operating conditions, circuit

SATELLITE PATHFINDER

You can calculate precisely when a satellite will pass over any particular spot in the Northern Hemisphere with a "Satellite Pathfinder." Consisting of two rotatable discs mounted on a base, this device is available from the Library of Science, 59 Fourth Ave., New York 3, N. Y., or from leading book and department stores for $1.98.

The top disc of the Pathfinder, clear acetate, is for plotting the orbital paths of satellites. The second disc, a map, is rotated beneath the acetate disc, showing how the earth rotates beneath the satellites. You plot an orbit from information given out by the radio and newspapers. Anyone can do it.

AT LAST! MONEY-MAKING "KNOW-HOW" ON TRANSISTORS, COLOR TV AND SERVICING

Coyne's great 7-volume set gives you all the answers to servicing problems—quickly! For basic "know-how" that's easy to understand, you'll find everything you want in Volumes 1 to 5 on over 6000 practical facts and data. Every step is clearly explained from fundamentals to installing, servicing and trouble-shooting all types of radio and TV sets. Up-to-date it covers COLOR TV, UHF and the latest information on TRANSISTORS. All this plus Volume 7—COYNE TECHNICAL DICTIONARY with over 4000 definitions of the latest terms, symbols and abbreviations in radio-TV, electronics and electricity.

EXTRA 66 PAGE TV CYCLOPEDIA INCLUDED!

For speedy on-the-job use, you get Vol. 6—famous Coyne CYCLOPEDIA. Answers problems on servicing, alignment, installation, etc., in easy A-B-C order. Use this 7-volume TV RADIO LIBRARY FREE for 7 days: get the Servicing Book FREE!

FREE! New Supplements

With your set you also get Coyne's special Supplement Servicing FREE for 5 years. Keep up-to-date on latest radio and TV servicing improvements, absolutely FREE if you act now.

C13-L7 is tuned to 49 mc, and circuit C16-L8 to 98 mc.

Because of minute variations in tubes and components, and because the trimmer capacitors (C5, C13, C16) cover only a limited range, the resonant frequency of a circuit might fall just outside the range of adjustment of the trimmers. Under normal circumstances, the trimmer slugs should resonate about half-way in the capacitor. If the slug appears to reach resonance when it is fully within the capacitor, it indicates that inductance of the coil is a little too low. The addition of one turn to L7 (if the setting of C13 is out of line), or the addition of ¼-turn to L8 (if the setting of C16 is out of line) will bring the circuit into alignment. Conversely, if the slug of either capacitor resonates when it is fully withdrawn from the shell, the inductance of the associated coil is a little too great. Turns should be removed as suggested above. When both tuned circuits are "on the nose," the required voltage will be obtainable at the test jack.

When the converter is connected to your receiver, as shown in Fig. 5 (B), the "background noise level" of the receiver should increase sharply. A random-length wire can be attached to input receptacle J1 for this test. If the GDO is now tuned to 108 mc., its signal should be audible in the receiver. Many cities have test transmitters operating on 108 mc. If one is available in your locality, you may be able to hear it by tuning your receiver a few kc. either side of 10 mc.

The test signal will resemble an unmodulated carrier. When you find it, tune capacitors C1 and C5 to enhance the signal level. Resonate the slug of coil L6 to 30 mc. to provide maximum signal into the receiver. A slight adjustment (perhaps ½-turn) of coils L1 and L2 may be required for exact resonance.

A simple dipole antenna, (Fig. 6) can be used for testing the converter on the air and listening to test signals. Next step is to construct a high-gain beam antenna suitable for satellite tracking.

How Long Did You Use It?
(Continued from page 86)

compensate for the use of unfiltered d.c. from the half-wave rectifier used as the current source. Its value is 75,000 ohms.

Construction. If you would like to build your own Chronostat, you can use the circuit in Fig. 1. Make sure that the rectifier and indicator polarities are correct.

This simple series circuit should present no difficulties, but it is necessary to use
To determine the timing with a variable series resistor, the resistor required is different in higher or lower efficiency rectifiers. When using a d.c. supply, the best way to determine the needed resistance value is to insert a milliammeter in series with the indicator and adjust a variable series resistance to the correct current flow as shown in Table 1. Top trade-in allowance: liberal budget terms — Trade in your old SWL receiver for a new National NC-188!
OSCILLOSCOPES ARE "GOLD MINES"
when you learn to use them RIGHT!

Learn to use the oscilloscope fast and accurately on all types of AM, FM, and TV work—and watch your efficiency soar!

In easily understood terms MODERN OSCILLOSCOPES AND THEIR USES teaches you when, where and how to use 'scopes . . . how to interpret patterns . . . how to test better and faster. No complicated mathematics. First you learn all about 'scopes. Then you learn exactly how to use them in locating troubles in a jiffy, handling tough realignment jobs or fixing color TV sets. You learn to make connections . . . how to adjust circuit components . . . how to analyze patterns. 370 illustrations including dozens of pattern photos make things doubly clear. 326 pages. Remember! 'Scope experts get better jobs—carry bigger pay. This is the book that can help you be one!

smaller battery of the same voltage for the specified unit. But the battery operating life will be reduced. In addition, discretion must be exercised in choosing a substitute.

For example, an automobile storage battery, rated at approximately 6 volts, can supply a steady drain of 10 to 20 amperes. The Z4, mentioned earlier, would be exhausted rapidly by a current drain of as little as half an ampere. Thus, the Z4 would not be a suitable substitute for a storage battery, even though both units are rated as 6-volt batteries.

Part 2 of this series will deal with the substitution of capacitors.

How to Plan a P.A. System
(Continued from page 73)

omnidirectional microphones should be available. If you are limited to a single unit, a cardioid mike is your best choice.

CHOOSING AN AMPLIFIER

An audio amplifier in a p.a. installation need not meet the stringent requirements of one designed for hi-fi work. It should, however, provide ample power, have acceptable frequency response, and introduce a minimum amount of distortion.

Frequency Response. If it is to be used only for voice reproduction, as in a paging system, the amplifier should be reasonably "flat" (within 2 db) from 100 to 8000 cps. If it is intended for both voice and music, it should be flat from about 40 to 15,000 cps.

Distortion. For voice work only, distortion levels up to 10% can be tolerated but, in general, a p.a. amplifier should have less than 5% distortion at full output.

Hum. This should be as low as practicable, at least 50 db below rated output. Even lower levels are preferred, and many quality units are available with hum levels of 70 to 80 db below rated output.

Inputs. At least two are mandatory, one for a microphone and one for a phonograph, with separate controls. For a larger installation, two or more mike inputs should be available, with separate gain (fader) controls, plus phone and tuner inputs. Where more than one microphone input is provided, there should be a master gain control. A tone control is also desirable.

Gain. This will vary with manufacturers' specifications, but most commercial units will supply sufficient gain for normal applications. In general, the unit should provide at least 100-db gain in the mike channel, or channels and at least 65-db gain in the phonograph channel.

Output Impedances. Since a p.a. amplifier might be used in a variety of installations, each requiring a different number
of speakers, several output impedances ought to be available. Typical units should provide taps at 4, 8, 16, 250 and 500 ohms.

**Power Rating.** The power required will depend on several factors: whether an indoor or outdoor installation is planned, background noise which the p.a. system must override, and efficiency of sound producers used. A good rule-of-thumb is to allow one watt for each 200 sq. ft. of floor area on indoor installations using cone-type loudspeakers, and 1 1/2 watts for each 200 sq. ft. when using trumpets outdoors. In noisy locations, these figures might need to be doubled or tripled.

For example, if you plan on covering a small auditorium or club room measuring 50' x 40', the total area would be 2000 sq. ft., and a 10-watt amplifier would be used. In a noisy location, a 20- or 30-watt unit might be necessary.

Small differences in amplifier power rating are relatively unimportant. A 3-db change in power is required for the human ear just to notice a change in sound level. To obtain a 3-db increase, the power level must be doubled. For practical purposes, there is little or no difference between, say, an 8- and a 10-watt amplifier, or between a 24- and a 30-watt unit. When in doubt, use an amplifier with the next highest pow-
er rating above that calculated by the rule-of-thumb.

**CHOOSING THE LOUDSPEAKER**

For an indoor installation, 4" to 8" (di-ameter) cone-type loudspeakers can be used for paging and similar voice-only applications, but 10" or 12" speakers are preferred for voice-and-music work. Usually, large speakers are more efficient. A small cone-type loudspeaker has an efficiency of about 2%, a 12" speaker about 5%.

Regardless of speaker size, a suitable baffle must be provided. Small wall baffles or ceiling-installed radial baffles may be used for general installations. Where the system is primarily for background reproduction, better quality sound can be obtained with wall-mounted bass reflex or similar enclosures.

A trumpet can have an efficiency ranging up to 15%. Over-all frequency response depends directly upon the length of the trumpet's air column and on the final bell diameter. The lower the frequency response, the larger the trumpet. Because of this, small paging trumpets for indoor use generally cut off at about 300 to 500 cycles (upper frequency range may be 10,000 to 15,000 cycles), thus limiting their application to voice reproduction. Outdoors, large

MAKE TINY GENIUS COMPUTERS WITH BRAINIAC

a new and electric BRAINIAC CONSTRUCTION KIT

Makes 104 computing, reasoning, arithmetical, logical, puzzle-solving and game-playing machines. Includes 13 GENIACS (1955), 60 ALL NEW BRAINIACS (1957)

- Scientific Fun & Instruction - Sale
- Reusable solderless Parts - Full Plans

THIS IS A BRAINIAC. With our BRAINIAC Kit (K 15), you can build over 100 small electric machines and toys which "think," compute, reason and display intelligent behavior. Each one works on a single flashlight battery... is FUN to make, FUN to use and play with, and TEACHES you something new about electrical computing and reasoning circuits. Originated and produced exclusively by Berkeley Enterprises, Brainiac is the result of 7 years' development work with miniature mechanical brains, including Geniacs, Tynees, Tic-Tac-Toe Machines, Crews, Computers, Combination Locks with 15,000,000 combinations, etc. PUZZLE SOLVING MACHINES: Tic-Tac-Toe, Nim, Black Match, Wheelie Bandit, etc. COMPUTERS: You add, subtract, multiply, divide, perform combinations and permutations, binary numbers, or work with fractions, decimals or binary numbers. Forty-Year calendar, etc. CRYPTOGRAPHIC MACHINES: Code, Decoders, Combination Locks with 15,000,000 combinations, etc. PUZZLE SOLVING MACHINES: The Binoculars and the Cannibals, Age Guessing Machine, Submarine Rescue Chamber, Daisy Petal Machine, Fox-N-Non-Gorn & Hired Man, and Geniacs. BRAINIAC MACHINES: History, geography, trigonometry, etc.

WHAT DOES YOUR BRAINIAC COMPLETE plans and instructions... Manual by E. C. Berkeley on small electric brain machines... Over 150 circuit diagrams including 48-lamp tuning lamps... An introduction to Boolean Algebra for designing circuits... Every part needed to build Geniats, Brainiacs—over 400 pieces including control panel, switch discs, jumpers, improved wipers, bulbs, socket, washers, wires, battery, special tools, Price: $17.00 (For shipment west of Mississippi and 800—Outside U. S., add $1.80)

TRY THIS: Send me BRAINIAC Kit K 15. (Returnable in 7 days for full refund if not satisfactory. If in good condition. I enclose $... ... in full payment.

My name and address are attached.

trumps are preferred over cone-type loudspeakers because their higher efficiency minimizes the amplifier power required to overcome the higher background noise.

In addition to the type of program material—voice or music—and the place of installation, choose your speaker or speakers according to the amount of power needed. In general, a speaker system should be capable of handling the full output of the amplifier.

ACCESSORIES

Although the microphone, amplifier and speaker make up the basic p.a. system, a number of accessories should be considered when planning an installation.

Mixer. An accessory for an amplifier having a limited number of inputs, this unit has several inputs with separate gain controls, and is used to combine the outputs of several microphones.

Phonograph. This provides background music. Often, a "phono top" can be purchased which fits on the amplifier. A manual record player (turntable and pickup arm) is preferred for general applications, or where records are played between voice announcements. For continuous background music, a record changer is useful.

Radio Tuner. Used both for background music and the distribution of special news broadcasts, a tuner is a radio receiver less its audio amplifier and loudspeaker. For most p.a. work, either an AM or FM tuner is satisfactory, but a combination AM-FM unit may be preferred for de luxe installations and varied programing.

Stands. Except for hand-held and lapel microphones, a mike must be equipped with a stand of some type for support. Three basic ones cover most needs. A desk stand holds the mike from 4" to 10" above a table or desk top, and is used by someone sitting at the table. A banquet stand holds the microphone from 12" to 15" above a table top for someone sitting at the table—an "after-dinner" speaker, for example. A floor stand holds the mike up to 65" above the floor for a standing speaker or singer.

The well-equipped p.a. installation should also include spare shielded microphone cables, extension power line cords, and "spares" for any parts likely to become defective in use—fuses, vacuum tubes, and so on—and might include a tape recorder as well.

In a future issue we will discuss actual techniques of making a p.a. installation... how and where to place microphones, loudspeakers, and amplifiers... how to run the various connecting cables... and how to make special installations.
Getting the News—Fast!
(Continued from page 62)
kept up transmissions, and his paper was the only one to print the full log of messages.

The roof of the Times Building on West 43rd Street is a maze of antennas, all installed under the direction of Mr. Iverson. They are 380 feet above ground.

Although he admits that Midtown New York is not the best site in the world for a radio station, Mr. Iverson finds that cutting his half-wave dipole antennas for the frequency to be monitored gives satisfactory reception. He has installed a large four-element beam antenna for working a specific area—such as the South Pole. For most news transmissions, doublets are used. To increase efficiency, antennas are fed through coaxial cable from the third floor, where the radio room is located, to the 13th floor roof.

The Times has come a long way from the carrier pigeon in its striving to gather “All the News That's Fit to Print.” Its radio room is one important link in making certain that this newspaper gets “all the news.”

The Lady Is a Ham
(Continued from page 49)
and their families attend all-day “ham-fests” held at picnic areas across the country. There are games for the children and prizes for all, but the chief attraction is the opportunity to meet face-to-face the people with whom you've talked. Rarely does one's mental picture match up with the real thing: you find that the deep, resonant voice which thrilled you so much came from a little, dried-up man, while the fellow you have been more or less passing over on the air because his voice sounded monotonous and uninteresting may turn out to be a real dreamboat.

But that just makes hamfests all the more interesting. In fact, it is this business of never knowing whom you are going to meet next on the air that makes the hobby so stimulating.

One experience of a friend of mine, a radio operator on an oil tanker, illustrates what romantic surprises the ham bands can hold. He was chatting with an amateur in Saudi Arabia who mentioned that he was the Minister of Communication in that country and who extended an invitation to my friend to visit the capital city the next time the tanker was in port. It was not until my friend received a handsomely engraved card verifying the contact that he
THOUSANDS OF SATISFIED CUSTOMERS have bought GENIACS on a 7 DAY REFUND guarantee.

We are proud to offer our 1938 Model, with you to the minute improvements for the thousands of new customers who can use them.

WHAT IS A GENIAC? (®)

Here is a picture of the 1938 Model GENIAC in the display rack ($3.00 each) which comes with every kit. GENIAC stands for Genius self-teaching Computer. A kit of applications circuits which permit the user to construct more than thirty different machines, following directions and wiring diagrams, no end to the imagination of the constructor himself. These machines demonstrate the applications of electronic circuitry.

APPLICATIONS OF GENIAC

SIMPLE COMPUTER CIRCUITS of binary, decimal adding, subtracting, dividing, multiplying machines, PROBLEMS in symbolic logic, resolutions, GAME OF LIFE, COMPUTER APPLICATIONS, ELECTRONIC CHECKBOOK (for ill-it-doar and him). ACTUAL ANALYSIS.

Always say you saw it in—POPULAR ELECTRONICS

learned that "Talal" to whom he had been talking was actually Prince Talal, son of King Saud. Now I ask you: where else but in ham radio would a poor working girl have a chance to talk to a real live prince?

Public Service. We have been talking mostly about the sheer fun of ham radio, but it is more than that. Whenever a flood, tornado, sleet storm, or other disaster disrupts communications, hams always take over and provide emergency communication. When the first Sputnik started circling the globe without warning, hams leaped into the breach and collected valuable information on the orbiting satellite until Moonwatch could take over.

Slightly less tangible than public service but just as important is the way this hobby pulls people together for mutual enjoyment and better understanding. My own family is united by the hobby, for the frisky little "hambug" which first bit Dad was not satisfied until my mother, brother, sister-in-law and I were all enthusiastic hams. More husband-and-wife teams are heard on the amateur bands each day. It's not at all unusual to hear the wife at the home station talking with her husband as he drives back from work, relaying to him the small events of the day or asking him to stop at a store for a loaf of bread.

The friends of an amateur are not confined to his neighborhood, his town, his state, or even his country. One time he talks to a chum across town, the next time he may be exchanging views and ideas with someone halfway around the world. This brings home most forcibly how alike people and their problems are, no matter where they live, and the regional and national differences between them shrink to insignificance.

Thinking about these things makes me proud of my hobby, but most of the time I am content just to enjoy it. Half the fun comes from telling the girls at the office about my "ether" adventures. You should have seen Marcia, who works at the desk next to mine, the winter morning I casually mentioned that I had just kept a rendezvous in Casablanca.

While she listened breathlessly, I related how I sipped my morning coffee at my transmitter as I kept an early morning schedule with Greg, a young research scientist on a special mission in Morocco. This boy really has a line; and as I nibbled my toast he told me of beautiful desert nights and the sight of a full African moon shining on the white sand. He hinted strongly that only one thing was lacking to make such a night perfect.

Of course, I guessed that he meant cit-
ronella, and we laughed and joked the minutes away until I had to go or be late for work. I took my necklace and earrings from where they had been warming atop the transmitter, and as I put them on I signed off with "88", which means "love and kisses" in ham parlance; but I lingered long enough to hear Greg say hastily: "Roger, Carole, and I'll be looking for you tomorrow, same time, same frequency," before I snapped off the switches and dashed for the door.

My Other World. After one of these interesting conversations with someone in a faraway place, it is often almost a physical shock to come back to the everyday world. But it is wonderful to know that my other world is always there, waiting for me. While I'm transcribing dictation at the office, battling through the lunch line at the cafeteria, or helping Mom with the supper dishes, there is always the warm knowledge that whenever I wish I can step onto my electronic flying carpet, rejoin my waiting friends, and roam the world.

If you are looking for a hobby that is truly different, one that will broaden your horizons, spice your conversation, and enable you to make friends by the dozen . . . if you want a hobby that is as interesting as people and as glamorous and exciting as world travel . . . then I most heartily recommend amateur radio.

After Class

(Continued from page 79)

gins to rotate back toward the east. Here a synchro system starts the correction action by accepting the gyro's error angle, transmitting it to the synchro motor in the form of electrical "information," and adjusting the position of guidance surfaces to correct the error.

Servomechanisms. Synchro motors are not very powerful devices. They are quite adequate for moving light loads such as pointers, dials, and small control surfaces. If the working load is a heavy one, however, such as the rudder of a passenger ship or a large bomber, the synchros cannot operate it directly. In such cases, the synchro motor is used to control the power input to and the direction of a driving motor of greater horsepower.

In such applications, the synchros form only a part of a larger and more complicated system termed a servomechanism. Servomechanisms often contain, as part of the complete system, devices called differential generators and control transformers. These will be described and explained in a future issue.

April, 1958
Transistor Topics

(Continued from page 69)

stage. This transformer couples the amplified audio signal to a small PM loudspeaker. Note that p-n-p transistors in the common-emitter arrangement are used throughout the receiver.

$L_1$ is a Vari-Loop transistor antenna coil (Lafayette No. MS-299). Feedback coil $L_2$ is wound on the form of antenna coil $L_1$. First unwind the short antenna lead provided with $L_1$, then wind about eight turns of #28 enameled wire loosely on $L_1$'s form, twisting the output leads together so there is no tendency for $L_2$ to unwind. Make sure that $L_2$ is readily movable along $L_1$'s form, but the winding should not be so loose that it tends to wobble.

With wiring completed and checked for errors, the battery can be installed. The receiver is then turned on and volume control $R_1$ turned full “up.” After tuning to the weakest local station that can be received, $L_2$'s leads should be interchanged, with the final connection made using the arrangement which gives maximum volume.

If oscillation occurs, $L_2$ is moved away from $L_1$'s winding. If there is no change in volume when $L_2$'s leads are interchanged, this coil should be moved closer to $L_1$. Once $L_2$'s optimum position is determined, it may be secured with a drop of cement.

For maximum performance, you may also want to experiment with the adjustment of $L_1$'s tuning slug. Forrest indicates that he obtained good results with about 5/8" of the slug's screw protruding from the coil.

A few tips, Forrest . . . it might be a good idea to add a base resistor to the CK768 stage. Try a 1-megohm resistor, connecting it first between base and emitter, then between base and the minus side of $B_1$, using as the final connection the arrangement which gives the best results. In addition, you may find it worthwhile to connect a 0.005-mf d.f. bypass capacitor across $R_1$.

Transistor Biasing. The base bias current supplied to a transistor amplifier is extremely important in determining such things as stage gain, collector current, power output, and overload points. If too little bias current is supplied to a common-
emitter stage, for example, the collector current may be cut off on alternate half-cycles of the input signal, severely distorting the amplified output signal. If too much bias is supplied, the collector current may be so high that most of the supply voltage is dropped across the collector load. This, in turn, can cause “clipping” of the amplified signal on alternate half-cycles.

A basic transistor amplifier stage is shown in Fig. 2. In this case, base bias current is supplied through resistor \( R_1 \). The input signal is applied to the stage through d.c. blocking capacitor \( C_1 \), with the amplified output signal obtained through \( C_2 \). Operating power and bias current is supplied by battery \( B_1 \). The output load can be a resistor, the primary winding of a transformer, or an i.f. or r.f. coil, depending on the application of the circuit.

If you have trouble in obtaining good performance from home-built equipment, you may find it worth your while to experiment with the size of base bias resistor \( R_1 \). In most cases, this resistor will have a value of from 100,000 ohms to 1 megohm, depending on the transistor used and on the value of the power supply voltage.

The simple bias circuit in Fig. 2 gives satisfactory results in home-built experimental equipment. In commercial and military circuit design, more complex biasing techniques may be used to improve the stability of circuit operation.

**Product News.** Magnavox has introduced a fully transistorized portable short-wave receiver which retails for about one hundred dollars less than the Zenith and Philco receivers mentioned last month.

On the components front, Lafayette Radio (165-08 Liberty Ave., Jamaica 33, N. Y.) has introduced two components which should be of interest to every transistor experimenter. One item is a new subminia
ture PM loudspeaker measuring only 1\( \frac{1}{16} \) in diameter by \( \frac{3}{4} \) deep. This loudspeaker (SK-96) is supplied complete with a matching output transformer having an 8000-ohm primary impedance, and nets for $1.95 complete. It can be used either as a subminiature loudspeaker or as a miniature dynamic microphone.

The other Lafayette item (PA-47) is an ingeniously camouflaged crystal microphone, which looks and is worn like a real wrist watch. The watch case is chrome-plated with modern gold-finish numerals and hands and is equipped with a tan leather wrist strap. It comes complete with a thin, flexible, light-colored cable about 6\( \frac{1}{2} \) feet long.

Allied Radio (100 N. Western Ave., Chicago 80, Ill.) has released its new low-cost

---

**WALKIE-TALKIE RADIOPHONES**

**General specifications applying to all models:**

- Highest quality workmanship and materials, silver plated coils, ceramic capacitors and advanced design assures maximum performance with the longest battery life. Sensitive receivers can detect signals as small as one microvolt and feature automatic volume control and noise clipping. Transmitters use high level amplitude modulation, have a power input of one watt to the R.F. stage and will radiate a signal for 1 to 5 miles (depending on obstructions) using antennas supplied. Up to 40 miles have been reported by some of our customers when communicating with stations having directional beam antennas. Radiophones can be used singularly or to communicate with fixed stations or two or more to communicate with each other providing they are for the same frequency band. Fully portable, no external connections needed. Uses standard radio and flashlight batteries available at your local store. Total weight of completed unit including an accessories is less than 5\( \frac{1}{2} \) lbs.

**Model TC-144.** Meets F C requirements for general class amateur license. No minimum age requirement. Variable frequency transceiver circuit, Tuned from 144 to 148 mc. Wired, tested and guaranteed electronic chassis complete with two high frequency triodes. (3 A5). $6.98

**Model TR-144.** Similar to above but with independently tuned receiver and transmitter circuits. Permits receiving frequency to be changed without affecting transmitting frequency. $9.98

**Model TRX-50.** Crystal controlled transmitter and variable frequency receiver with R.F. stage. Tuned from 50 to 54 mc. Available also on neighboring frequencies at slight extra cost on special order. Meets F C requirements for general and technician class amateur license as well as for civil defense and other special services. Wired, tested and guaranteed electronic chassis complete with six high frequency triode. (3 A5A). $14.98

**Model TRX-50-A.** Similar to above but with transistorized audio booster stage for extra loud reception. $16.98

"Trans-Midge" radio kit. Another item in the growing line of Knight-Kits, the Trans-Midge (83 Y 767) is slightly larger than a package of cigarettes and is assembled in an attractive plastic case. Operating power is supplied by a single penlight cell which has a life of many months. Requiring an external antenna and headphones, this kit should be a good "first project." Net price is $2.45 (plus postage).

One further thought before I sign off... with Spring approaching... and Summer close behind... now is the time to start that transistorized portable receiver you've been planning to build...

Low

Bargain Power
(Continued from page 85)

The half-wave antenna has a radiation pattern possessing two lobes (favored directions) of equal intensity, with the greatest field strength appearing at right angles to the wire axis. In other words, a dipole running north and south will radiate best and with equal efficiency to the east and to the west. As the angle of direction from right angle decreases, the intensity of radiation drops off until at the ends of the antenna, north and south, there is minimum radiation.

Now we come to an interesting characteristic of antennas. The power that is not radiated to the north and south is actually added to the power that is radiated to east and west, and we have achieved a power gain in signal strength.

Redesign. We refine our antenna until we finally arrive at a design that squirts the signal in just one general direction. We then construct it, hook on the feedline, crank up the rig, and our E-R-P has been multiplied fully six and one-third times.*

Is the signal actually 6.3 times better than it was with the old half-wave dipole? Yes! At least, it is 6.3 times more effective, and that's what we want.

If we shove 100 watts of transmitter power into the new little antenna, we will have just as good a signal at any given point of reception as the fellow down the block who is running 630 watts into his half-wave dipole. This is only true, remember, if both antennas are oriented so that their favored directions are toward this point of reception and if both are the same height above ground.

We haven't made something from nothing. We have simply taken most of the

* An antenna with 8-db signal gain gives a power gain of 6.3.

Always say you saw it in—POPULAR ELECTRONICS
signal radiation away from unwanted directions and added it to the radiation in the wanted direction, thus multiplying its strength and effectiveness.

As a sort of bonus, in the process of redesigning the antenna we made it so compact and easy to handle that it can actually be rotated, and the favored direction of maximum signal strength can be in any compass direction we choose.

**Bargain Beam.** This miracle antenna is a rotary beam, of course, and we'll guarantee that you can increase the effectiveness of your station with it at far less cost than that of multiplying your transmitter power for equal results using the "brute force method."

Your XYL will practically insist that you put up a beam when you read this article to her. If she is still hard to convince, here's the clincher! A beam antenna also does wonderful things for your receiver. It will reject or, at least, greatly attenuate signals from all directions but the wanted direction! Think what that will do to QRM.

Catch the Vanishing Ball
(Continued from page 66)

The relay will release. Then R1 should be adjusted until the relay just operates, and rotated back until it releases again.

When a hand is brought within six inches of the screen cylinder, the relay should pull in. If it remains latched when the hand is removed, back R1 off slightly and try again. With careful adjustment of C1 and R1, reliable sensitivity will be obtained for distances of about one foot. Now the leads from the ball solenoid should be connected in series with the relay contact binding posts (Lower and Common) and the a.c. line cord as shown in diagram above.

The device you've just built is a gadget and its basic purpose is amusement. But notice that we've designed the relay section so that it can easily be removed and utilized elsewhere. Sales displays can be activated by people approaching store windows, burglar alarms can be set off, safety systems for machine shops can be devised. With a little ingenuity, you'll find that its possibilities are limitless!
INFRARED SNIPERSCOPE
TELESCOPE and PARTS

See in the dark—without being observed. War surplus Sniperscope M-2. Gov't cost about $1200. Used for industrial plant security; research lab experiments; infrared photography; spectroscopy, etc. Instrument complete, ready to use. Includes Power Pack, infrared light source. Will operate from 6 V auto battery. Battery or transformer available.

Improved Three-Way Crossover
(Continued from page 51)

connected in phase, both cones (or diaphragms) will push and pull the air in unison. See Fig. 2 (B). However, if an out-of-phase hookup is used, there will be a dip in the output in the region of the crossover frequency because one speaker will "pull" the pressure wave while the other speaker "pushes" it. See Fig. 2 (A).

Few experimenters are aware of the best way to check for improper phasing. All you need is an audio generator with a range covering the crossover frequencies. Hook up your speakers and connect the generator to the input of your crossover (or amplifier). Then sweep the generator's frequency dial through the crossover point. If a drop in volume is heard in the area of the crossover frequency, you can bet you're misphased somewhere!

Solving the Problem. The solution, happily enough, is a simple one. In a two-way system, it's only necessary to switch the leads of one of the improperly phased speakers to fill in the "hole" in response. In a three-way system, the job may be a little bit tricky, because as you bring the woofer and mid-range into phase you may throw the tweeter out. However, keep switching, and you'll make it.
In general, it's a good idea to mount the speakers all in the same plane—and fairly close together. Installing the speakers too far apart might actually throw them out of phase.

In some instances you'll find that with certain types of crossover networks, such as a series quarter-section, it's advisable to mount the tweeter three to ten inches behind the plane of the woofer mounting, to compensate for phase shift in the crossover itself. The audio fan, however, needn't concern himself with crossover phase shift when using a circuit such as that in Fig. 1.

For those who don't have an audio generator, the standard battery phase testing technique is recommended. Touch leads of a flashlight battery directly to the voice coil terminals of your speaker. The speaker cone will move in or out when contact is made. Mark the terminal connected to the positive pole of the battery with a spot of fingernail polish. Then check the midrange and tweeter in the same manner, making sure that the cones move in the same direction each time. You can check a horn-type tweeter (in which the diaphragm isn't visible) by covering its mouth with thin tissue paper and noting the direction of its deflection when battery connection is made.

---

Among the Novice Hams

(Continued from page 83)

is receiving him, in this manner: "... AR W9XXX DE W9EGQ K."

The "AR" between the comments and the call signs indicates that the call signs are not an integral part of the remarks, and the "K" tells W9XXX to transmit. W9XXX will then transmit "W9EGQ DE W9XXX," make his remarks, and stand by for W9EGQ exactly as above.

These two amateurs will then alternately transmit and listen to each other until they have finished their conversation, when they will sign off with each other, so: "... AR SK W9XXX DE W9EGQ," and "SK W9EGQ DE W9XXX."

Length of Call. The above "CQ" is known as a 5X2X3 call—CQ five times, the call-sign twice, and the combination repeated three times. Five CQ's to two call-signs is a good ratio, as it results in the letters "CQ" being sent for almost half of the entire call. More than five CQ's before sending your call-sign is undesirable, as the listening operator wants to know who you are without too long a wait.

Sending your call-sign more than twice per round is unnecessary. If conditions are too poor for it to be copied in two attempts,
a successful contact is highly doubtful, anyway.

Theoretically, a long CQ will be heard by more stations than a short one. However, as soon as a prospective customer tunes in your CQ, he wants you to stand by so he can answer you. If the CQ drags along too long, he will usually tune away, looking for another CQ, or he will call CQ himself. Also, when a CQ is too long, interference frequently builds up around it so badly that no operator can tell when the transmission is finished.

The 5X2X3 CQ is a good compromise length. It is long enough to give a listener a reasonable time to locate it, yet not so long that he will get tired waiting for it to end. Another popular length of CQ is the 3X3X3 one, which takes about the same time to send.

**Answering CQ's.** In answering a CQ, the length of your call should depend upon how far your frequency is from the frequency of the CQ'ing station and how much activity there is on the band at the time. After calling a CQ, most operators listen first on their calling frequency and then on either side of it for replies. Thus, if you reply on or near that frequency, you will be heard quickly if you are going to be heard at all. But if you call on a different frequency, it will take a slightly longer call, to give the operator time to tune to your frequency.

When a band is crowded, answering a CQ more than 20 kc. away from the CQ'er's frequency is usually a waste of time. If he is getting out, he will probably receive a reply very near his own frequency. If not, most operators do not think the results justify the time and effort necessary to comb through a mess of signals off their frequency looking for stations that probably are not there anyway.

When the band is lightly occupied, however, it is usually possible to raise stations quite a distance from the calling frequency. Even then, a long call is not required, as it does not take much time to cover 50 or 100 kc. in a lightly occupied band. A single 5X2 call is usually sufficient. If it is not, you can always make a series of short calls, pausing between them to see if you are successful.

**Individual Stations.** Whether it is more productive to call CQ or to call an individual station depends on many variables.

If all hams called CQ when they wanted to make a contact, there would be no one to answer them. On the other hand, if they all waited for CQ's, there would be no one to call.

If you have a stronger-than-average signal, a good receiver to dig out the replying stations from the interference, and an easy-
to-read “fist,” you will normally get excellent results from calling CQ’s, especially if you have several transmitting frequencies in the bands you work and try to use the one with the least interference on it.

With a strong signal, your results from calling individual stations will also be good. Being able to select the stations you wish is particularly helpful when you are looking for DX or new states to work. Foreign stations, especially, are much easier to contact by individual calls than by calling CQ.

In any event, your percentage of replies to DX calls is going to be less than to “local” calls because of heavy competition. An important thing to watch out for with foreign DX stations is whether or not they are answering calls on their own frequencies.

If your signal is a bit weak, because you have a very low power transmitter or a poor antenna system, you will get many more replies from calling individual stations than you will from CQ’s. Many amateurs who hesitate to answer weak CQ’s, because of the possibility of losing them in interference, will reply to any station they hear calling them directly, no matter how weak the signal may be.

A Good “Fist.” The value of a good “fist” can never be overestimated in making successful contacts. This is especially true when calling CQ, for if an operator cannot copy your call letters, he cannot answer you. Or, if it is difficult to copy them, he will probably decide that it wouldn’t be much fun to try to work you, since you cannot even send your own call letters well.

If you send too fast, many listeners will be unable to copy you, no matter how good your sending is. Also, if you send faster than you can receive, the replies will usually be too fast for you to copy, because good operators adjust their speed to that of the other fellow’s CQ.

News and Views

It took six weeks for Ron, KN7BYZ, to receive his Novice license. But in his first week on the air he made 26 contacts in five states. He excites a 30’ vertical “ground plane” antenna with his Heathkit DX-20 transmitter running 50 watts and receives with a Halli-crafters SX-99 connected to a 136’ receiving antenna . . . . Bill, W7ZDP, must be a DX chaser. His Heathkit DX-35 transmitter and National NC-98 receiver have accounted for 25 countries in all continents, but his WAS total is only five states! Africa was the hardest continent for him to work—he had it with a 75-meter dipole antenna . . . . Al, K2UNR, has worked 46 states, 45 confirmed, and six countries—including Hawaii, England, Italy, and Germany—in 14 months on the air. He transmits with a WRL Globe Scout feeding an 80-meter “Windom” or a 20-meter folded dipole, and receives with a

you'll get VALUE plus DEPENDABILITY with MOSLEY AMATEUR EQUIPMENT

NEW! Mosley "Trop-Mobile"
Here is the ultimate in mobile operation! 3-Bands—10, 15 or 20 and... you change bands at the transmitter and receiver. No gadgets or relays! Radiating qualities are equal to 8' whip on each band. New anti-sway design and slim profile styling cuts wind resistance. Stainless steel construction and weather-proof traps provide lifetime beauty and service. Low SWR over full bandwidth.
model MA-3 $19.95

Mosley Trop-Vertical Antenna
Automatic bandswitching on 10 thru 40 meters. Sturdily built with 6/ST6 Aluminum element sections. Two weather sealed aluminum enclosed traps. Takes 1 kW and maintains an electrical quarter wave length over full width of each band. Only 20 ft. high. Comes complete with hardware, guyline and instructions. Requires no tuning!
model V-4-6 $27.95

RME-69, plus a preselector. Al has a 25-wpm code certificate and would like to arrange schedules with North Dakota and Wyoming to complete his WAS.

Paul, KN8DIF, lost his Novice license recently but hopes to get his General soon. As a Novice, he worked 32 states, Canada, and Mexico on 40 meters. Most of his contacts were made using a Knight "Ocean Hopper" receiver. Now he has a Heathkit AR-3 and a DX-20 transmitter. Bud, KN8SM, who forgot to include her address, reports that KN9HOB made 71 contacts in 14 states in his first month on the air and wonders if he should get any credit for it. Well, the record speaks for itself, and KN9HOB must have had a lot of fun making so many contacts.

Bud, KN45SM, works 15 meters almost every afternoon and has worked 11 states. He runs 75 watts to his WRL Globe Chief transmitter and receives with a National HRO-60. He has that "beam gleam" in his eye, as he wonders how a Cubical Quad would work with the Globe Chief.

Richard, WN6NQM, decided while reading the News and Views section of this column before getting his license that 15 meters was the band for him. In three and a half months on the air, all on 15 meters, of course, he has made 90 contacts in 30 states, Hawaii, and two Canadian provinces. Dick is a junior in high school and does most of his operating on Saturdays. The equipment at WN6NQM includes a Heathkit DX-100 running 75 watts and feeding a 15-meter folded-dipole antenna. He receives on an AR-3, and there is a 15-wpm code-proficiency certificate on his shack wall. Flash! Dick just put up a Cubical Quad antenna and added two new states to his total with the first two contacts on it. And, as soon as he gets a 40-meter antenna, he will be on 40 meters, too.

From Anchorage, Alaska, Jim, W7CIW, has worked 32 states, Russia, Holland, and a large number of Japanese amateurs in three months on 15 meters. He uses a Globe Chief transmitter feeding a 15-meter dipole. Jim is looking for schedules in the fourth and fifth call areas. About all he has been able to work there so far is Texas. Doug, KN4QDZ, has two peeves. They are hams who won't "rag-chew" and those who have never tried to learn anything about good operating procedures and apparently do not intend to do so. He has worked 15 states in a couple of months on 40 meters and is about ready to try 15 meters with his DX-20 and old RME-69 receiver.

Stissing Lake Camps is looking for an amateur with a General Class license and at least 20 years old who will come up for the summer. This is a co-ed camp, with radio as one of the activities. Previous camp experience is desirable but not essential. If you are interested, write to: Norman B. Weingrow, Director, 70 Stratton Road, Scarsdale, N. Y.

Pat, KN4RWO, who is not a YL (young lady: girl), runs 75 watts to his Globe Chief transmitter to excite a 87" antenna on 40 and 15 meters, and receives through an SX-99. In a few weeks, he has worked both coasts.

Bob, KN3BYY, averages about two...
hours a day on the air and has worked 29
states with 25 confirmed, mostly on 15 meters.
When he gets "brave enough or crazy enough
to fight" the QRM (interference), he oper-
ates on 40 meters, too. Bob's transmitter is a
Johnson Adventurer and his receiver is a
Hallicrafters SX-100 . . . . . . Pete, KNØMGA,
has been beating a hole in the 40-meter band
with his "Sandwich Box" transmitter run-
ning 10 to 12 watts input. In 3½ weeks of
operation, Pete has made 63 contacts in 13
states. He drags in the stations he works
with a Hallicrafters S-85, and the signals
get in and out of KNØMGA through a 40-
dermeter dipole, 30' high.
Frank, KNØJPJ, is now a member of MARS
(Military Affiliate Radio System) with the
call letters of AAGJPJ and WR10AA, and is
active in traffic work. He has a selection of
six antennas to feed his Johnson Adventurer
into, and he receives on an S-85. His DX
record is Hawaii, Alaska, Puerto Rico, Can-
da, and Newfoundland . . . . . . . . . Rusty, K4QIF,
received his General ticket after five months
as a Novice and offers to help prospective
Novices get their licenses. He will sked any-
one needing a North Carolina contact and
card. Rusty is now on 40 meters but will be
on all bands when his new Adventurer trans-
mitter comes . . . . . . . . . . . . . . . . . . . . . . . Nick, KN9KLR,
jumps around between 15, 40, and 80 meters.
In a month of jumping, he has worked 30 states,
22 confirmed. His transmitter is a WRL
Globe Scout-66, feeding a 40-meter doublet
30' high. He receives on an S-85 with a
Heathkit Q-Multiplier added for additional
selectivity. Nick also offers to help prospec-
tive amateurs get their licenses.

Stephen Cohen, K2CYZ, 1900 Quentin Road,
Brooklyn 29, N. Y., offers to help prospec-
tive amateurs with theory, and John A. Baro-
let, W3BUD, 32 Salamana Court, Lexington
Park, Md., reports that St. Marys County,
Md., RACES program needs more hams.
John, who can be reached by telephone at
C.D. headquarters, Leonard Town, offers help
and advice to prospective amateurs too.

Short-Wave Report
(Continued from page 90)

if it is considered of value to the station. Be sure to include return postage. In letters going to other countries, an International Reply Coupon—which costs only a few cents and is available at your Post Office—should be enclosed. There are some stations that do not require return postage but many of the smaller stations are operated on a limited budget.

The most agonizing part of the short-wave hobby is waiting to receive that verification. How fast your reply comes often depends on how much a station values your report. Subsequent reports are always appreciated for they tell the station owners whether their signals are still reaching into your area.

Current Station Reports

The following is a compilation of the latest reports received. All times shown are Eastern Standard and the 24-hour system is used. Although all schedules are as correct as possible at time of writing, we cannot guarantee 100% accuracy as stations often change their schedules with little or no advance notice being given.

Afghanistan—A verification from Kabul lists the Eng. session as being at 1040 on 18,640 kc. They state that their reception in Texas and other southern states is satisfactory but that they receive only occasional reports. (DT)

Andorra—Radio Andorra can be heard daily in Spanish from 1530 fade-in to 1730. ID is a gong followed by the animit: "Aquí Radio Andorra—Roc de les Anellides Andorra la Vieja—Principado de Andorra." This @he is on 5978 kc. (104)

Angola—CR6RF, R. Clube de Benguela, Benguela, 9502 kc., reports that they have been undergoing a reorganization and have been unable to answer reports during the last few months. QSL cards are on order in Lisbon and will be sent out upon arrival. (7)

Australia—VLCX, Perth, (Home Service Regional station), has moved from 6130 kc. to 6140 kc. and operates as follows: 0520-1030 weekdays (Sundays from 0430) and 0515-1100 on Saturdays. (61)

British Guiana—ZFY, Georgetown, is widely reported on 5891 kc. with commercial programs in English. News at 0545. (DF, RM, 393, 348)

Canary Islands—Radio Atlántico, REM34, Las Palmas, sends a nice QSL card showing a relief map of the Canary Island chain. The schedule is: 0800-1030 and 1400-1900 on 7000 kc., 30 watts; and 0800-1030 and 1700-1900 on 9490 kc., 300 watts. (MEC)

China—Peking is being noted at 2000-2100 on 17,745 and 15,060 kc. to South America in Spanish and Portuguese. This is especially strong on the West Coast. (460)

Costa Rica—TIFC, San Jose, 9645 kc. (good), and 6037 kc. (rarely heard), carries an Eng. program at 2300-0000. They are ask-
ADVANCE NOTICE: This new 1958 Edition of the Electronic Experimenter's Handbook will go on sale March 27. If you like to build useful, profitable electronic devices, reserve your copy of the new Handbook now. Last year's edition sold so fast many hobbyists, experimenters and students couldn't buy a copy... and this year's Electronic Experimenter's Handbook contains even more projects, more pictures, more guidance! Each device has been pre-tested and operated by readers of Popular Electronics. You'll find step-by-step instructions, hundreds of photos, drawings and unique "pictorial diagrams."

60 Devices . . . Nearly 200 pages . . . a Practical "File" of Electronics Ideas and Information

COMING SOON - Only $1 Reserve Your Copy Today at Your Newsstand or Radio Parts Store
YOUR COPIES OF POPULAR ELECTRONICS ARE VALUABLE!

KEEP THEM NEAT . . . CLEAN . . . READY FOR INSTANT REFERENCE!

Now you can keep a year’s copies of POPULAR ELECTRONICS in a rich-looking leatherette file that makes it easy to locate any issue for ready reference.

Specially designed for POPULAR ELECTRONICS, this handy file—with its distinctive, washable Kivar cover and 16-carat gold leaf lettering—not only looks good but keeps every issue neat, clean and orderly.

So don’t risk tearing and soiling your copies of POPULAR ELECTRONICS—always a ready source of valuable information. Order several of these POPULAR ELECTRONICS volume files today. They are $2.50 each, postpaid—3 for $7.00, or 6 for $13.00. Satisfaction guaranteed, or your money back. Order direct from:

AM-FM QUALITY ELECTRONICS QUALITY ELECTRONICS

ELECTRONICS ARE VALUABLE!
xmans in the s.w. bands during 1958, according to a letter from the station. The only outlets are from Godthab (570 kc.), Godhavn (650 kc.), and Frederikshab (630 kc.). The s.w. outlet formerly was on 9526 kc. (7)

Guatemala—TGNA, Guatemala City, has an Eng. religious program at 2200-2345 on 5955.5 and 9688 kc. Other outlets are on 11,850 and 720 kc. The stations on 15,100 and 17,870 kc. are inactive. Spanish broadcasts from TGNA were noted at 0730-2200 (replacing 0730-0900 and 1730-2200). (W.D, JF, JM, 196, 223, 348)

Honduras—R. Morazan, HRNQ, Tegucigalpa, moved from 6200 kc. to 6086 kc. and is being well heard at 1900-2300. (AN, 100)

India—All India Radio, Delhi, has Eng. newscasts on 15,105 kc. at 1045, on 11,710 and 5955 kc. at 1445 (to United Kingdom) and on 17,850 and 15,105 kc. at 2130-2145. (348, 400)

Iraq—Baghdad has a high-power transmitter on 6190 kc. that is being well heard in Arabic at 2255 s/on, in parallel to the new 7180-kc. channel. (100)

Italy—Radio Roma operates to N.A. at 1930-1950 with Eng. news and music and from 1950 with French to Canada on 15,400 and 11,905 kc. Reports go to Radio Roma, P. O. Box 320, Rome, Italy. (CK, 286)

Kashmir—R. Kashmir, Srinagar, has moved from 4860 kc. to 2277 kc. and operates in Kashmiri, Urdu, and Eng. at 0930-1330. Eng. news at 1030. Stateside listeners won't stand much of a chance of hearing this but reports from Europe indicate fairly good reception. Before the change of frequency, the station was noted on the West Coast at about 0830 with All-India Radio relays at times. (31, 61, MEC)

Liberia—ELWA, Monrovia, is being tuned in western states as follows: 1100-1430 on 11,980 kc. with Eng. news at 1300; 0000-0130 on 11,980 kc. with Eng. to 0100 and French to s/off; 0145-0230 on 4770 kc. with Eng. news at 0200 and fade-out by 0230. (400)

Libya—Radio Tripoli is heard weakly from 1430 but with a better signal at 0015 s/on to 0100 s/off. This xmn is also in Arabic. (AN, 166)

Luxembourg—R. Luxembourg, Villa Louigina,

Henry Lehmg, Feasterville, Pa., uses a Hammarnlund HQ-120 receiver and a RME DB-22A preselector.

Shrinks Hemorrhoids
New Way Without Surgery

Science Finds Healing Substance That Relieves Pain—Shrinks Hemorrhoids

For the first time science has found a new healing substance with the astonishing ability to shrink hemorrhoids and to relieve pain—without surgery.

In case after case, while gently relieving pain, actual reduction (shrinkage) took place.

Most amazing of all—results were so thorough that sufferers made astonishing statements like "Piles have ceased to be a problem!"

The secret is a new healing substance. (Bio-Dyne)—discovery of a world-famous research institute.

This substance is now available in suppository or ointment form under the name Preparation H. Ask for it at all drug counters—money-back guarantee.

*Reg. U. S. Pat. Office

is noted on 6000 kc. with religious and musical programs in Eng. to England until 1930 s/off. (324)

Madagascar—The latest schedule of Radio Tananarive is: French network—at 2230-0030, 0400-0600, and 1000-1430 weekdays and 2230-0245, 0330-0600, and 0915-1430 Sundays on 9515, 6172, and 3232 kc. (3232 kc. is 5 kw., the others 1 kw.); Malagache Network—at 2230-0000, 0320-0530, and 0900-1200 weekdays and 2200-0045, 0330-0600, and 0900-1200 Sundays on 7155 and 3386 kc., both 1 kw. (MEC)

Malaya—British Broadcasting Corporation Far Eastern Service, Singapore, is noted on a new channel of 11,780 kc. at 0615 with BBC news relay. (158)

Radio Malaya, Singapore, 9650 kc., is tuned from 0615 with classical music but covered by the VOA-Honolulu outlet from 0825. (166)

Morocco—Radio Sebaa-Iboun, Rabat, has been tuned on 5968 kc. from 0225 in Arabic to 0330 s/off. Listen carefully for the Arabic TD Huna Sebaa-Iboun Maroc. (61)

Norway—R. Norwegian, Oslo, is heard daily to Norwegians abroad at 0600-0700 and in the Home Service at 0700-0720, Sundays with "Norway This Week" in Eng. at 0700-0725, all programs on 11,735, 15,175, 17,825, 21,760, and 25,900 kc. (CG)

Pakistan—R. Pakistan, Lahore, is on the air with three xmsns as follows: 4807 kc. at 2100-2230 weekdays, 2100-0030 Saturdays; 7225 kc. at 0130-0330 daily; 7086.6 kc. at 0530-0815 and 4807 kc. at 0830-1200. The xmrtr used on 4807 kc. is a 1-kw. RCA unit. (MEC)

Karachi is being heard on the following channels: 15,280 and 11,915 kc. at 1030-1045 with dictation-speed Eng. news; 15,335 and 11,885 kc. at 1930-2015 and 2045-2200 with Eng. news at 2000 and 2130; 21,580 and 17,750 kc. at 2245-2345 in Urdu; and 11,674 and 9705 kc. at 1315-1400 with Eng. news, being broadcast at 1300-1400.

Another new outlet for Karachi has been noted on 15,155 kc. at 0845-1015 with a Home Service relay. (100)

Portugal—Lisbon is now using 6374 kc. for the 1300-1900 Home Service relay, replacing 11,896 kc. (100)

Spain—Radio Nacional Espana, Madrid, has returned to 9363 kc. in the N.A. service at 2215-2250, 2315-2350, and 0015-0050, and has vacated 5585 kc. for the time being. The 9363-5585 kc. channel is dual to 6130 kc. (EL, AN, MR, DS, 59, 61, 192, 223, 298, 333)

Another xmr was noted from the Voice of...

GOVERNMENT Surplus Receivers, Transmitters, Squelches, Test, Parabolic Reflectors, Picture Catalog 10c. Moshna, Maiden 48, Mass.

ARMY Double Headphones $2.98 Supply, Bergen Box 118, Jersey City 4, New Jersey.

“IS TESTED One-tube Circuits” with catalog—25¢. Laboratories, 1131-L Valota, Redwood City, California.

ELECTRIC Guitars, amplifiers, wholesale, free catalog. Carvin PBS, Covina, Calif.

TUBES—Television, Radio, Guaranteed, Boxed, 75% off, Bell Electronics, 40 Canal, New York City 2.

WANTED

CASH Paid! Sell your surplus electronic tubes. Want unused, clean transmitting, special purpose, receiving, TV types, magnetrons, klystrons, broadcast, etc. Also want military & commercial lab test and communications gear. We swap too, for Tubes or choice equipment. Send specific details in first letter. For a fair deal write, wire or telephone: Barry, 512 Broadway, New York 12, N. Y. Walker 5-7000.

CRYSTAL-Radio experimenters. Write to Hult, 305 Hope, Lakewood, New Jersey.

INVENTIONS WANTED

ELECTRICAL EQUIPMENT & SUPPLIES

SPECIAL SERVICES

BOOK Manuscripts Considered for national distribution. All subjects welcomed. New authors encouraged. Attn. Mr. Blythe, Greenwich Book Publishers, 489 Fifth Avenue, N. Y., N. Y.

50 MATH problems in electronics. Formulas and detailed solutions included $1.00. Ascot—School of Electronics, Box 29092, Los Angeles 29, California.

CORRESPONDENCE COURSES

CORRESPONDENCE course in Radio, Television, Electronics. Includes first class license preparation. Total price $72.00. Details free. No salesman will call. Ascot—School of Electronics, Box 29092, Los Angeles 29, California.

TAPE & TAPE RECORDERS

DISCOUNTS to 50%, tapes, recorders, Hi-Fi, components, consoles, photograph equipment. Request specific prices only. Long Island Audio-Camera Exchange, 5 Bay 26th St., Brooklyn 14-L, N. Y.

$1.00 PLANS. Record stereo with any stereo playback recorder. Automobile FM, Organ Generators, Special Circuits, etc. Free list from Hi-Fi Information, 2238 N. San Antonio Ave., Pomona, California.

PLASTICS

BUSINESS OPPORTUNITIES

HIGH Paying Jobs, Opportunities, foreign, U.S.A. All trades. Companies pay fare. For Information write Dept. 57N, National Employment Information, 1500 Broadway, New York, New Jersey.

TO $100.00 Weekly. Sparetyme, Home Operated Mail-order Business. Successful "Beginner's" Plan: Everything Supplied. Lynn, 10420-E National, Los Angeles 34.

VENDING Machines—No Selling. Operate a route of coin machines and earn amazing profits. 32-page catalog free. Parkway Machine Corporation, Dept. 12, 715 E. 40th St., Baltimore 2, Md.

MAKE $25-$50 Week, clipping newspaper items for publishers. Some worth $5.00 each. Particulars free. National, 81-PF, Knickerbocker Station, New York City.

OPERATE profitable mail-order business! Write: Thomas Bond, 1637-X West Vernon, Phoenix, Arizona.

INSTRUCTION

ENGINEERING Degrees, EE Option. Electronics earned through home study. Residence classes also available. Pacific International University (Operating as a College of Engineering only at present), 5719-J Santa Monica Boulevard, Hollywood 38, Calif.

ELECTRONIC training course. Laboratory material included. Now $49.50. Sam Brewer, Couch, Missouri.

CODE Courses designed and recorded by former U. S. Navy Radio Operator and R.R. Telegrapher. Both sides V.H. 1200' reels. Learning to six W.P.M. or six to sixteen W.P.M. $6.00 each, postpaid in U. S. Elham Inc., P.O. Box 98, Hawthorne, Calif.

CODE Worries Over. 2 hour tape recorded courses unevaluated. Novice $6.50, Advanced $7.50, Both $11.00. Taped code, Box 918, Langhorne, Penna.

MAGNETIC Amplifiers: Used in missiles, atomic submarines and automation. Send $1.00 for simplified theory of operation. Box 3087, Long Beach 8, Calif.

BEST Taped Courses Offered. 2 Hour. Novice, General, Technician, Advanced. Code or Theory Courses on Tape, $6.00 each. 1 Hour $3.50, Sample $1.50. Ridge Recordings, Box 15, Park Ridge, Illinois.

HIGH FIDELITY

LEARN Hi-Fi Installation and service. Lessons and complete Hi-Fi system furnished. Free details: W. E. Kelsey, 47 Belle Avenue, Boston 20, Massachusetts.

DISGUSTED of "HI" Hi-Fi Prices? Unusual Discounts on your Hi-Fidelity Requirements. Write Key Electronics, 120 Liberty St., New York 6, N. Y., Evergreen 4-6071.

HELP WANTED

JOBS on Merchant ships. Big Pay. Box 4062, Jacksonville, Florida.

MISCELLANEOUS

TRADE-IN TV, ship anywhere. Color sets $125, others $9 up. Write Justin Bros., Newport, Dela.

"WINEMAKING: How to Make Beer, Ale," Illustrated. $2.00. Eaton Books, Box 1242-G, Santa Rosa, California.

SONGPOEMS And Lyrics Wanted! Mail to: Tin Pan Alley, Inc., 1650 Broadway, New York 19, N. Y.

SAVE Your Hair Through Exercise. Instructions $1.00. Bedward, Box 637-G, Detroit 31.

DIAMONDS, Watches, Jewelry, Discount Catalog 25c. Walden-Jewelry, 1111 S. Main St., Bloomington, Illinois.

DIAGRAMS: For burglar alarm system $1.00. Carlson Bros., 303 Ridgewood Ave., So. Minneapolis, Minn.

GROWING... GROWING... GROWING...

...by leaps & lines

Yes... Consumer Response to sales messages placed in PE's classified section is greater than ever... and still growing... as many new advertisers every month can attest to.

POPULAR ELECTRONICS must be the place for your sales story. After all, it is the world's largest selling electronics publication.

Superior's New Model 76

IT'S A CONDENSER BRIDGE
IT'S A RESISTANCE BRIDGE
IT'S A SIGNAL TRACER
IT'S A TV ANTENNA TESTER

Specifications
- CAPACITY BRIDGE SECTION
  4 Ranges: 0.0001 Microfarad to .005 Microfarad; .001 Microfarad to .5 Microfarad; 1 Microfarad to 5 Microfarads; 20 Microfarads to 100 Microfarads. Will also measure the power factor of all condensers from 1 to 10 Microfarads.

RESISTANCE BRIDGE SECTION
- 2 Ranges: 100 ohms to 50,000 ohms; 10,000 ohms to 5 megohms.

SIGNAL TRACER SECTION
- With the use of the R.F. and A.F. Probes included with the Model 76, you can make stage gain measurements, locate signal loss in R.F. and Audio stages, locate distortion and hum, etc.

SUPER-METER
A Combination VOLT-OHM MILLIAMMETER PLUS Capacity,
Reactance, Inductance and Decibel Measurements

D.C. VOLTS: 0 to 7.5/15/75/150/750/1,000/7,000 Volts  A.C. VOLTS: 0 to 15/30/150/250/1,500/3,000 Volts. D.C. CURRENT: 0 to 1.5/15/150 Ma. 0 to 1.5/15/50/1,000/10,000 Ohms; 0 to 10 Megohms. CAPACITY: .003 to 1 Mfd; 1 to 30 Mfd. (Good Bad-scale for checking quality of electrolytic condensers.)

REACTANCE: 100 to 3,500 Ohms. 2,500 Ohms to 2,500,000 Ohms. 1 Megohm to 10 Megohms.

INDUCTANCE: 0 to 2,000/20,000/200,000/2,000,000/20,000,000 Henries. 10,000 Henries to 100,000 Henries. 100,000 Henries to 1 Meghenry.

DECIBELS: 50,000 Ohms, 10 Megohms, 100 Megohms.

SUPER-METER

20,000 OHMS PER VOLT
ALL METER

Includes services never before provided by an instrument of this type. Read and compare features and specifications below!

FEATURES:
- Giant six inch 40 Microampere meter with mirrored scale.
- Built-in isolation transformer.
- Use of the latest type printed circuit and 1% multipliers assure unchanging accurate readings.

8 D.C. VOLTAGE RANGES: (At a sensitivity of 25,000 Ohms per Volt) 0 to 15/ 30/150/250/1,500/3,000/10,000/30,000 Volts.

7 A.C. VOLTAGE RANGES: (At a sensitivity of 5,000 Ohms per Volt) 0 to 15/ 30/150/250/1,500/3,000/10,000 Volts.

3 RESISTANCE RANGES: 0 to 2,000/20,000/200,000 Ohms.

2 CAPACITY RANGES: .0005 Mfd. to 30 Mfd.

3 D.C. CURRENT RANGES: 0 to 75 Microamperes; 0 to 7.5/15/75 Milliamperes; to 15 Amperes.

MODEL TV-60 comes complete with pair of instructions: pair of standard test leads; high-voltage probe; detachable line cord, R.F. Signal Tracer Probe and Audio Signal Tracer Probe. Plastic bag for all above accessories is also included. Price complete. Nothing else to buy. ONLY $28.40

USE APPROVAL FORM ON NEXT PAGE

We invite you to try before you buy any of the models described on this and the following pages. If after a 10 day trial you are completely satisfied and decide to keep the Tester, you need send us only the down payment and agree to pay the balance due at the monthly indicated rate.

NO INTEREST OR FINANCE CHARGES ADDED
If not completely satisfied, you are privileged to return the Tester to us, cancelling any further obligation.

PRINTED IN U.S.A.
TUBE VOLTMETER

The sensitive V. T. V. M. meter scale enables easy discrimination alignment and calibration. Complete with all accessories, the measurement tolerance is +0.5% of reading. It is the ideal unit for the maintenance and repair of electronic equipment and circuits.

DC VOLTS 0-1,000 Volts +/- 0.5% of reading
AC VOLTS 60/120 Vac; 0-1,000 Volts +/- 0.5% of reading
AC VOLTS (50/60 Hz) 0-1000 Volts +/- 0.5% of reading

AS A VOLTMETER: The Model 77 is capable of measuring AC and DC voltages from 0 to 1,000 Volts with precision. It is ideal for use in circuit testing and troubleshooting.

AS A CURRENT METER: The Model 77 is capable of measuring AC and DC currents from 0 to 1000 Amps with precision. It is ideal for use in circuit testing and troubleshooting.

MODEL 77

Price: $19.25

In the circuit

TESTER WITH A METER FOR MEASURING DEGREE OF EMISSION—ATT ONLY $15.95

Not A Gadget—A Make-Shift Adapter. But A Wide Picture Tube

Superseded by

PICTURE TUBE TESTER

Price: $14.95

Use to test your TV and Hi-Fi Amplifier circuitry. The circuit can be checked for shorts and inter element shorts and leakages. The circuit can be checked for shorts and inter element shorts and leakages. The circuit can be checked for shorts and inter element shorts and leakages.

MODEL 72

Price: $11.95

In the circuit

VACUUM TUBE VOMETER

With NEW 6" FULL-VIEW METER

MODEL 77

Price: $22.95

In the circuit

Superior's New Model TD-55 TUBE TESTER

EMISSION TYPE
The Experimenter or Part-time Serviceman, who has delayed purchasing a higher priced Tube Tester THE PROFESSIONAL SERVICEMAN, who needs an extra Tube Tester for outside calls. The busy TV Service Organization, which needs extra Testers for its field men.

Speedy, yet efficient operation is accomplished by: 1. Simplification of all switching and controls. 2. Elimination of old style sockets used for testing obsolete tubes (26, 27, 57, 59, etc.) and providing sockets and circuits for efficiently testing the new Naval and Sub-Minar tubes.

You can't insert a tube in wrong socket. It is impossible to insert the tube in the wrong socket when using the new Model TD-55. Separate sockets are used, one for each type of tube base. If the tube fits in the socket it can be tested.

"Free-point" element switching system The Model TD-55 incorporates a newly designed element selector switch system which reduces the possibility of possible errors to an absolute minimum.

Checks for shorts and leakages between all elements.

Superior's
New Model
TW-11

• Tests all tubes, including 4, 5, 6, 7, Octal, Lockin, Hearing Aid, Thyatron, Miniatures, Sub-miniatures, Naval, Sub-minars, Proximity Fuse Types, etc.

• Uses the new self-cleaning Lever Action Switches for individual element testing. All elements are numbered according to pin-number in the R.M.A. base numbering system. Model TW-11 does not use combination type sockets. Instead individual sockets are used for each type of tube. Thus it is impossible to damage a tube by inserting it in the wrong socket.

• Free-moving built-in roll chart provides complete data for all tubes. Printed in large easy-to-read type.

NOISE TEST: Phone-jack on front panel for plugging in either phones or external amplifier detects microphonic tubes or noise due to faulty elements and loose internal connections.

EXTRAORDINARY FEATURE
SEPARATE SCALE FOR LOW-CURRENT TUBES Previously, an emission-type tube testers, it has been standard practice to use one scale for all tubes. As a result, the calibration for low-current types has been restricted to a small portion of the scale. The extra scale used here greatly simplifies testing of low-current types.

Housed in hard-rubbed oak cabinet
