Choose From NRI’S
Specialized Instruction Plans

Television-Radio Servicing
Learn to fix black-and-white and color sets, AM-FM radios, stereo hi-fi, etc. A profitable field for part or full-time business of your own.

Industrial-Military Electronics

Complete Communications
A comprehensive program for careers in broadcasting or mobile, marine, aviation communications. Learn to operate, maintain transmitting equipment. Prepares for FCC license.

FCC License
Prepares you quickly for First Class license exams. Every communications station must have licensed operators. Also valuable for Service Technicians.

Math for Electronics
A short-course of carefully prepared texts going from basic arithmetic to graphs and electronic formulas. Quick, complete, low in cost.

Basic Electronics
Abbreviated, 26-lesson course covering Automation-Electronics, TV Radio language, components, principles, ideal for salesmen, hobbyists, others.

Electronics for Automation
For the man with a knowledge of basic electronics who wants to prepare for a career in process control, ultrasonics, telemetering and remote control, electromechanical measurement, others.

Aviation Communications
For the man who wants a career in and around planes. Covers direction finders, ranges, markers, loran, shoran, radar, landing system transmitters. Prepares for FCC license.

Marine Communications
Learn to operate, repair transmitters, direction finders, depth indicators, radar, other Electronic equipment used on commercial and pleasure boats. A growing, profitable field. Prepares for your FCC license.

Mobile Communications
Learn to install, operate, maintain mobile equipment and associated base stations as used by police, fire departments, taxi companies, etc. Prepares for FCC license.

Read the story of NRI’s 50 years of pioneering and leadership in training men at home for careers in Electronics. Read about NRI’s philosophy of training; its reputation among leaders of the Electronics industry; read about our specialized instruction plans and see pictures of equipment you get. Whatever your age or status, the continuing increase in career opportunities in the ever-growing, ever-changing Electronics industry should interest you. Mail the postage-free form today.

SPECIAL CUSTOM DESIGNED TRAINING EQUIPMENT INCLUDED

Since NRI pioneered equipment units to provide ACTUAL ON-THE-JOB EXPERIENCE in home training, NRI instructors have invested many thousands of man hours in testing, changing, retesting, improving NRI equipment to simplify and speed training. Unlike other schools “stock” or “standard” equipment is not good enough. NRI equipment is custom designed EXCLUSIVELY FOR TRAINING. It demonstrates theories, circuit action, defects; you get experience in operation, maintenance, trouble shooting.

These Men Trained for Success with NRI—YOU CAN, TOO

“I want to thank NRI for making it all possible,” says Robert L. L’Heureux of Needham, Mass., who sought our job consultant’s advice in making job applications and is now an Assistant Field Engineer in the DATAmatic Div. of Minneapolis-Honeywell, working on data processing systems.

His own full-time Radio-TV Servicing Shop has brought steadily rising income to Harlin C. Robertson of Oraville, Calif. In addition to employing a full-time technician, two NRI men work for him part-time. He remarks about NRI training, “I think it’s tops.”

Even before finishing his NRI training, Thomas F. Favaloro, Shelburne, N.Y., obtained a position with Technical Appliance Corp. Now he is foreman in charge of government and communications divisions. He writes, “As far as I am concerned, NRI training is responsible for my whole future.”

“I can recommend the NRI course to anyone who has a desire to get ahead,” says Gerald L. Roberts, of Champaign, Ill., whose Communications training helped him become an Electronic Technician at the Coordinated Science Laboratory, U. of Illinois, working on Naval research projects.

NATIONAL RADIO INSTITUTE
Oldest and largest school of its kind
Discover new operating performance with International's Executive 750 citizens band transceiver. Turn the illuminated Channel Selector dial... transmit and receive on any one of 23 crystal controlled channels.

Set the HI-LO switch in the LO position... dial Channel 1 through 12. Set the switch in the HI position... dial Channel 13 through 23.

The Remote Console, installed under the auto dash, gives you complete remote operation. It turns the set (in the trunk) on or off, adjusts speaker volume and squelch at the desired threshold.

The Executive 750 is complete with crystals, external 4" speaker with cabinet, mounting rack for Remote Console, trunk mounting rack for set, push-to-talk microphone, DC power cable, plus all necessary connecting cables.

International takes pride in introducing the Executive 750... engineered for mobile operation... 23 crystal controlled channels... operates on 6 vdc, 12 vdc, or 115 vac.

Available at your International dealer... $229.00

Electronics
TECHNICIAN
OVER 6,000 FIRMS HAVE EMPLOYED
DeVRY TECH GRADUATES!

Thousands of companies in the United States and Canada who have
employed DeVry Tech men prove two most important facts: (1) Electronics
is one of the biggest, fastest growing opportunity fields of our time;
and (2) DeVry Tech graduates are "WANTED" MEN.

Whether DeVry Tech prepares you in spare time at home or in its modern
Chicago or Toronto Laboratories, your training is designed to get you
ready to meet the exacting standards of industry. You get practical
training that not only helps to fit you for a job or a service shop of your
own—but also gives you a foundation for a career that can be profita-
able the rest of your life.

Thousands of companies in the United States and Canada who have
employed DeVry Tech men prove two most important facts: (1) Electronics
is one of the biggest, fastest growing opportunity fields of our time;
and (2) DeVry Tech graduates are "WANTED" MEN.

Whether DeVry Tech prepares you in spare time at home or in its modern
Chicago or Toronto Laboratories, your training is designed to get you
ready to meet the exacting standards of industry. You get practical
training that not only helps to fit you for a job or a service shop of your
own—but also gives you a foundation for a career that can be profita-
able the rest of your life.

You work over 300 learn-by-doing experiments at home, using DeVry
Tech's exclusive Electro-Lab method. You build and KEEP valuable equip-
ment. With another DeVry Tech exclusive, you have the benefit of
training movies that you can show over and over until basic points are
crystal clear. Special texts guide you every step of the way as well.

HOW DeVRY TECH CAN "BLUEPRINT" YOUR CAREER!
DeVry's faculty not only know how to teach Electronics, but they also
understand men. They most likely know the type of problems you
face. From this staff you get help, advice and understanding. It is this "human"
side of DeVry's program that has caused many of our
graduates to say: "DeVry Tech not only trains you for a job, they actually help you blueprint
a profitable future!"

NO ADVANCED EDUCATION NEEDED!

Why don't you write for FREE FACTS today? Learn how you TOO can be a member of
the great fraternity of DeVry Tech graduates across the continent... men who were
properly trained, encouraged, appreciated and understood! SEND IN COUPON NOW!

solid state reliability...

Cadre
(CB Transceivers)

Solid state circuitry means that Cadre CB receivers can be bounced over rough roads in mobile installations; and can take plenty of rough use at base stations and in portable field use.

Solid state circuitry means that Cadre transceivers draw about as much power as an electric clock. Not only do auto or marine batteries last longer, but when batteries get low, Cadre solid state transceivers operate where others might not.

Reliability is one reason why Cadre solid state CB transceivers are your best buy. Performance is another part of the story—plenty of transmission punch on 5 crystal controlled-channels—long distance reception with the dual conversion superhet receiver. And unwanted noise and adjacent channels are effectively suppressed.

FOUR POWERFUL SOLID STATE 5-WATT, 5 CHANNEL MODELS for every possible application—base station, mobile, field. New Cadre 510-A—AC/DC 23 channel manual tuning $219.95. Cadre 515 same as 510-A less manual tuning $199.95. Cadre 520 DC only with battery cable and mounting kit. For mobile and portable use from 12 volt batteries $187.50. Cadre 525 model 520 in portable pack carrying case with built-in battery/power supply, recharge, AC cord and telescoping antenna for complete field portability. $269.95.

FULL POWER, 1.5 WATT HAND HELD RECEIVER CADRE C-75 Solid-state throughout. Two crystal controlled channels. Sensitive receiver, powerful transmitter with one watt output to the antenna. $109.95. Recharger and set of (2) nickel-cadmium batteries. $31.85. Cartridge for (9) penlite cells. $2.95.
For your next promotion in electronics, will this be the answer?

If you're doing a routine job that anyone who knows a little electronics can handle, you're not worth more money. And you won't be worth more unless you get more training in electronics. Maybe you can't go on to college—but you can learn advanced electronics—even the new field of space technology—and increase your earning power through a CREI Extension Program in Electronic Engineering Technology. You're eligible if you have a high school education and work in electronics. If your knowledge of fundamentals is rusty, CREI includes a refresher course. Our Free book gives all the facts—mail coupon today or write: CREI, Dept. 1203-B, 3224 Sixteenth St., N. W., Washington 10, D. C.

March, 1964
Combination Simple Superhet

Since the two receiver construction projects, "Simple Superhet for 6" (April, 1963) and "2-Meter Simple Superhet" (September, 1963) were quite similar, why not combine the two with a bandswitch to save the builder on his cash outlay?

DEAN R. McQUEEN
Minneapolis, Minn.

Bandswitching receivers are more difficult to design and construct, Dean, especially for home builders with limited test equipment. Stray inductance and capacitance pose a formidable problem. Also, the 6-meter receiver had a 2-mc. i.f., while the 2-meter version employs a 6 mc. i.f. in order to get reasonable image rejection. However, there's no reason why the same power supply and audio stage couldn't be used for both receivers. If you'd like to experiment further, you might try designing plug-in coil-capacitor combinations for the two bands in place of a bandswitching arrangement.

Master Magnet Lauded

Many thanks for "The Master Magnet" by Walter B. Ford (September, 1962). The magnet I built won first place at the local science fair and an award at the Hawkeye State Science Fair. Getting back to P.E., how about an all-amateur radio issue and an all-SWL issue in the near future? Congratulations on your 1963 Space Station and Metrocomet: two new CB units from Metrotek. Space Station is a walnutencased transceiver which fits handsomely into any office or home; Metrocomet, a handy, compact mobile unit designed to fit neatly into any vehicle. Together, these two transceivers make the most reliable and economically practical system in CB equipment today. And to make it official, Metrotek fully guarantees all specifications. Dealer inquiries are invited.

Space Station Specifications—Fine-grain walnut cabinet/Gold satin finish on desk mike/New 2½" S-meter and zero control/Unique cathode-coupled mike pre-amp clipper for max. modulation, even when 2 ft. from mike.

Metrocomet Specifications—Built-in 117 volt AC—12 volt DC power supply/Illuminated S-meter/"Quick-change" crystal socket for 23-channel operation/Ceramic mike with push-to-talk operation.

Technical Data on Both Units—Full five watts input to transmitter/Fi network output for maximum power transfer to antenna/Receiver sensitivity better than 0.6 microvolts for 10 DB signal-to-noise ratio/Three-watt minimum audio output/Temperature-compensated tunable receiver for full 23-channel coverage.

Two companion units for effective, economical CB communication
This **Weller**®

Heavy Duty Soldering Kit

has a professional

240/325 WATT

Dual Heat Gun

No other soldering set offers you such versatility. The heavy duty Weller gun is the same professional tool used by technicians. Two trigger positions let you switch instantly to either 240 or 325-watt heat. In this single tool you have a choice of heat to suit the job, and tip temperature high enough to handle the tough ones. Instant heat saves time and current.

Kit includes 3 different tips for soldering, cutting, sealing and smoothing; tip-changing wrench and supply of solder. Everything is in a sturdy plastic carrying case. $1.295

Communications Handbook—when does the 1964 edition go on the stands?
STEVEN HAMILTON, WN0GZX, WPE0DLV Lenox, Iowa

Congratulations on your science fair awards, Steven. You’ll note that another of author Ford’s intriguing projects appears in this issue. Concerning special issues of Popular Electronics, the idea—especially that of having an amateur radio issue—is under active consideration. Glad you asked about the 1964 Communications Handbook—it goes on sale the end of March.

Answer Please?

As a newcomer to electronics, I would like to ask the following: Are the “WPE” letters used by SWL’s issued by P.E.? What are the qualifications? Here are a few more questions: (1) Why is the U.S. “K” call-sign rarely used for amateur stations compared with the “W”? (2) Why is there no channel 1 in TV? (3) What is the difference between the Novice, General, and Technician amateur radio licenses in the U.S?

BILL WHITE
Qualicum Beach, B.C.

For details on “WPE” registrations, Bill, see page 112 of this issue. Concerning “W” and “K” call-signs, the “W” calls were issued first. When the “W” series became exhausted, “K” calls were issued in some areas. Concerning the mysterious channel 1, additional frequencies in the 30-30 mc. region were required for various utilities—gas and oil companies, police and fire departments, etc. Rather than renumber the previously allotted channels, channel 1 was simply dropped. The 5-meter ham band was moved down into part of the slot (becoming 6 meters) that would have been channel 1. So far as the licenses are concerned, the Novice license requires only a simple theory and 5-wpm code test; it’s good for only one year and privileges are restricted. The Technician license requires more theory; it’s restricted as to available bands, but is good for five years. The General ticket allows unrestricted operation; a code test of 13 wpm must be passed to qualify.

Proper Mobile ID Procedures

Herb Brier did a good job of clearing up the misconceptions many hams have regarding the use of assigned station calls (“Across the Ham Bands,” Decem-
In any CB application...you'll outperform 'em all with a MESSENER

Compact, hand-held 100 milliwatt or 1½ watt models! Rugged and reliable - 11 transistors, 4 diodes. Twice the sensitivity and 40% more range than similar units with conventional circuitry - more output than similar units with same rated inputs!

Letters (Continued from page 8)

ber, 1963), but he touched on one subject—mobile and portable operation—that should be further clarified. For telegraphy, the slant or portable sign, “DN,” and the call area must follow the call-sign of the station. For phone operation, however, Section 1.62 indicates that the station call letters “shall be followed by an announcement of the geographical location in which the portable or mobile station is being operated.”

Dewey Gilleland, Jr., ARRL Official Observer Jacksonville, Fla.

Out of P.E.'s, He Subscribes

About a year ago you published my letter offering back issues of Popular Electronics for sale. Needless to say, they were grabbed up almost immediately, and I had so many offers to buy and sell that I could have gone into business. Lately I've been receiving more inquiries—could my letter have gotten published again this year? You'll be happy to know that after all this I just couldn't stay away from P.E. any longer. Last week I subscribed again for three years.

Lawrence Churchill Watseka, Ill.

Welcome back, Larry. Old issues of Popular Electronics seem to enjoy a long life—no doubt that's why you're still receiving offers.

Ham Band DX'ing

As an SWL and steady reader of P.E. for over two years, I've noticed there is little or no coverage of ham band DX'ing. I find it hard to get started in this field, and I'm sure many others are in the same position.

Tim Kerfoot, VE3PEITH
Toronto, Ontario

Several years ago, Tim, Popular Electronics did publish a special column for SWL's interested only in the ham bands. It was edited by Roger Legge, but had to be withdrawn because of lack of reader support. However, we are reconsidering the situation and may have some promising words on new SWL columns in the near future.

Refinishing Old Equipment

I have an NC-125 which shows its age—largely due to its battered cabinet. I would like to know how I can refinish the unit, and what means can be taken to preserve the lettering on the front panel.

Barry Day, WPESFKP
Cincinnati, Ohio

If the old paint is badly scratched or chipped on your receiver, you will probably have to remove it to get a
Features fast action speedy 3-way ratchet handle that operates in either direction or locks. Tempered steel-alloy screwdriver blades; 8 durable sockets. Does the work of 18 tools, yet fits in a 5½ " x 4½ " case. Indispensable for handymen, hobbyists or craftsmen!

SOCKETOOL'S versatility gives unlimited uses!

terado POWER INVERTER
Actually gives you 110 volt, 60 cycle A.C. from your 6 or 12 volt D.C. battery. Plug inverter into cigarette lighter, and operate lights, electric lighters, record players, tape recorders, electric tools, portable TV, radios, testing equipment, etc. Frequency will not change with change in load or input voltage. Models from 15 to 300 watts, priced as low as $12.95.

Letters
(Continued from page 10)
good finish, but paint over the old paint if at all possible. If the cabinet and panel are removable, liquid paint remover can be used; otherwise, a paste-type remover is required to avoid getting it in the "works." A number of suitable paints—both in aerosol cans (Krylon, for example) and in containers for brushing on—are available from electronics dealers and mail-order houses, and from hardware stores. You can even get a crackle finish if you wish. To avoid running, face the front panel up when painting it; carefully mask areas that are not to be painted. If you're painting the panel with the receiver behind it, be doubly careful, using masking tape around controls from the back. If the control markings are engraved in the front panel, you simply rub in a bit of white lead after the paint is dry, being careful not to smear it around too much. Otherwise, you'll have to buy a decal kit (also available from electronics distributors and mail-order houses) and reletter the panel.

Electronic Stop Watch—Counter

I built the "Electronic Stop Watch" (October, 1963) with a magnet and reed switch instead of a cam and microswitch for quieter operation. I also added circuits for individual counting, photoelectric counting ("1-2-3 Totalizer," August, 1962), and a circuit for latching on and off the timing network for a truly "electronic timer" without human error on starting and stopping. I'm very satisfied with the finished project, and use it to time events during physics experiments. Thank you for the ideas.

HENRY LATHORE
Seattle, Wash.

Thank you for the photo, Henry. Your project sounds like a worthwhile instrument. Perhaps other readers will be interested in making such a combination.

Antennas for TV and FM

Is there any difference between an ordinary TV antenna and a color TV antenna? Similarly, what is the difference, if any, between an FM and an FM stereo antenna?

STEPHEN SCHWAB
Clarksville, Md.

No difference in principle, Steve. The only thing to remember is that you may need a better antenna (higher gain) for good reception of color TV or FM stereo than you do for black-and-white TV or monophonic FM. This is due to the fact that color TV or multiplex stereo signals form a rather small part of the composite signal used to modulate the station carrier—for proper detection they must arrive at the receiver undistorted and at a relatively high level.

SOLUTION TO STEREO CABLE CONFUSION

A stereo hi-fi installation made up of several components cabled together may sound great, but the cabling “backstage” often becomes a snarled mess hard to trace when a change or test is to be made. A low-cost way to keep the corresponding stereo signal cables paired along most of their length is to use several of the plastic spirals sold in dime stores to protect telephone cords. By using different-colored spirals, you can color-code the various pairs for ready identification. And a dab of red nail polish on the jacket or connector shell at both ends of each right-hand cable in cabled pairs takes care of the channel identification problem. —Tim Callan

EMERGENCY FILAMENT SUPPLY SUBSTITUTES FOR TRANSFORMER

If you’re stuck for a 6.3-volt supply for the heater of any of the dozens of tubes requiring a nominal 300 ma, this jury rig can be quickly hooked up to permit a test of the circuit. Wire it as shown in the drawing, making sure that the lamp socket is between the tube heater and the “hot” side of the a.c. line. This is necessary to avoid hum and the risk of heater-to-cathode breakdown. If no polarized line plug is available, check for correct hookup with (Continued on page 20)

VOID AFTER MARCH 31, 1964

March, 1964
A NEW WORLD OF OPPORTUNITY AWAITS YOU WITH
N.T.S. ALL-PHASE HOME TRAINING IN ELECTRONICS

The N.T.S. Master Course enables you to do more, earn more in
ELECTRONICS • TELEVISION • RADIO
YET N.T.S. TRAINING COSTS NO MORE
THAN OTHER COURSES FAR LESS COMPLETE
THERE'S A GOOD REASON WHY N.T.S. Master-
Training opens a wide new world of opportunity
for you in Electronics, Television, Radio.
EVERYTHING YOU LEARN, from start to finish,
can be applied DIRECTLY to ALL PHASES of the
Electronics Industry.
AS A RESULT, the N.T.S.-Trained Technician can
move ahead faster, IN ANY DIRECTION—from
TV-Servicing to Radio Communications to Space-
Missile Electronics and Automation for industry
and defense. You can go wherever pay is highest
and opportunity unlimited.

ELECTRONIC CIRCUITRY, for example, is one of
science's miracles that IS BASIC to the entire
field of Electronics. It is used in satellites, com-
puters and space capsules as well as in today's
Television sets and high-fidelity equipment. N.T.S.
SHOWS YOU HOW to service and repair electronic
circuitry for all electronic applications.
YOU WORK ON MANY PRACTICAL JOB PROJ-
ECTIONS. You build a DUAL SPEAKER, standard
broadcast-short wave receiver (dual speakers for
better sound distribution), plus a large-screen tel-
evion set from the ground up. N.T.S. training
kits contain all the parts you need...at NO
EXTRA COST. (See box next page.) You also re-
ceive a PROFESSIONAL MULTITESTER to use
during training and on the job.

READ THESE TYPICAL "SUCCESS REPORTS"
FROM N.T.S. STUDENTS AND GRADUATES:
"Your home study course in Electronics has been
very beneficial to me... I earn top wages as Elec-
tronic Installer at Douglas Aircraft... my success
is due to National Technical Schools' excellent
training..." — Arnold Jones, Los Angeles, Calif.
"...My employers are expanding and plan to
open a new department within the next 2 years... they
have urged me to complete your course as
soon as possible... my supervisor says that your
course is by far the finest one he has seen..."
— E. P. Gardner, No. Battleford, Canada
"...I am now in charge of Instrumentation, a new
field for my company... my training has paid off
better than I had hoped for..."
— W. F. Fitzpatrick, Waco, Texas

START NOW. A wide, new world of opportunity
awaits the man trained in Electronics by National
Technical Schools—a recognized leader in tech-
nical training for 58 years. See next page.

ACCREDITED MEMBER—NATIONAL HOME STUDY COUNCIL
Always say you saw it in—POPULAR ELECTRONICS
N.T.S. GIVES YOU EXTRA BENEFITS
— IN TRAINING, ON THE JOB, IN DAILY LIFE

1 TRAINING BENEFITS

The N.T.S. Master Course embraces ALL PHASES of Electronics—Industrial, TV-Radio Communications, Servicing. You become that indispensable man—the all around technician.

ONE MASTER COURSE COVERS THE FIELD. ONE LOW TUITION INCLUDES EVERYTHING—lessons, manuals, counselling, all equipment. (We do not divide the field into separate courses with separate tuitions.)

YOU GET 19 KITS OF LATEST, PROFESSIONAL EQUIPMENT; including a professional, factory-made, precision Multitester and a new, wide-screen TV picture tube. All yours to keep.

VITAL ASSET: N.T.S. HOME TRAINING IS BASED ON METHODS USED IN SHOPS AND CLASSROOMS OF THE N.T.S. RESIDENT SCHOOL AT LOS ANGELES. No other method of teaching has proved so successful for home study.

The newest, professional equipment—19 kits in all. Yours to keep.

2 ON-THE-JOB BENEFITS

ALL-PHASE training puts you in an enviable position. You can pick and choose your career. Specialize or go into business for yourself. Your services will always be in demand wherever you go—and you can go anywhere. Electronics is a vital part of almost every business today.

Earn while you learn. Many students start earning extra money within a few weeks and help pay for their tuition. You can, too.

3 LIFETIME BENEFITS

Your success is ours. N.T.S. Graduate Advisory Service stands ready to help in solving technical problems of your job, in securing an FCC License, in establishing your own business, in countless other ways. No charge for this lifetime service.

Detach, fill in, and mail the postage-paid card today. A complete, fully-illustrated "Opportunity" Book and Actual Lesson will be mailed to you. Go over them carefully. We believe you will make the right decision... that ONE Master Course at ONE low tuition is the best way to become the "Man in Demand" in Electronics, Television, and Radio.

CAR BATTERY SAVER: Is your spouse in the habit of leaving the parking lights turned on when the engine isn't running? Have you ever gone to the garage to find the headlights glowing and not enough battery capacity to turn the engine over? If so, you'll want to build this ultra-simplified construction project in a hurry. The “Car Battery Saver” consists of a single transistor, one capacitor, a miniature speaker and three resistors. Turn on the ignition, turn on the lights, turn off the ignition—and the “battery saver” lets out a distinctive, loud, clicking sound until the lights are turned off.

FIVE SPECIAL CB FEATURES ON IMPROVING YOUR CB RECEIVER PERFORMANCE:

How to add the fabulous Makino Noise Limiter
Build a tuner for your rock-bound receiver
Add an economy S-meter
How to construct a crystal bank
Vernier tuning helps separate the channels

Tips
(Continued from page 14)

your voltmeter, and mark both the wall socket and the plug so that you can plug it in right every time. —Walter Brown

IMPROMPTU PIN PLUG FROM CROCODILE CLIP

Usually the test lead you grab has the wrong kind of fitting on one end or the other, following Murphy's Electronic Law, which says that whatever can go wrong, will. When the lead you have to use ends in an alligator or crocodile clip, and you need a pin plug, just pick out a finishing nail of the right diameter, and grip it with the clip, as shown. It will serve until you again need the clip feature.

—Jerome Cunningham

KEEPERS FOR SMALL TAPE RECORDER REELS

Tape reels frequently drop off the spindles of the less expensive portable tape recorders when they are carried from place to place, for lack of a retaining device. Such retainers are made for large reels, but are not readily available for the smaller sizes. However, the slip-on type of pencil eraser sold in ten-cent stores fits the tape spindles of many machines well enough to fill the bill when slipped into place as shown. Avoiding the risk of spilled tape is more than worth the trouble.

—David Armstrong

IMPROVISED LATHE FOR SMALL ELECTRONIC JOBS

Many electronic jobs such as coil winding could be speeded with a small lathe, but

Always say you saw it in—POPULAR ELECTRONICS
The commanding presence of Sony sound

Now enter the world of the professional. With the Sony Stereocorder 600, a superbly engineered instrument with 3-head design, you are master of the most exacting stereophonic tape recording techniques.

Professional in every detail, from its modular circuitry to its 3-head design, this superb 4-track stereophonic and monophonic recording and playback unit provides such versatile features as: vertical and horizontal operating positions • sound on sound • tape and source monitor switch • full 7" reel capacity • microphone and line mixing • magnetic phono and FM stereo inputs • 2 V.U. meters • hysteresis-synchronous drive motors • dynamically balanced capstan flywheel • automatic shut off • pause control and digital tape counter—all indispensable to the discriminating recording enthusiast. Less than $450, complete with carrying case and two Sony F-87 cardioid dynamic microphones.

Sony tape recorders, the most complete line of quality recording equipment in the world, start at less than $79.50.

For literature or name of nearest dealer, write Superscope, Inc., Dept. F, Sun Valley, Calif. In New York, visit the Sony Salon, 585 Fifth Avenue.

CIRCLE NO. 39 ON READER SERVICE PAGE
National's new NC-77X is the perfect beginner's receiver, incorporating the same time-tested conservative design found in the most sophisticated National equipment! 115 V.A.C. transformer operation, a National exclusive at this price, eliminates the hum and polarity problems, shock hazards and grounding difficulties associated with AC/DC receivers. The NC-77X features continuous coverage from 540 KC to 31 MC with separate electrical bandspread to copy amateurs, foreign broadcast stations, ships at sea, emergency messages, and our astronauts! Built-in 5" speaker, and front panel headphone jack. Only $69.95. In optional oiled walnut case, $89.95.

P.S. For more advanced shortwave listeners and amateurs, National's new NC-121 features edge-reading signal strength meter, noise-limiter, variable BFO, audio and RF gain controls, exclusive Tuner Output for use as a shortwave tuner with Hi-Fi equipment, and peaking Q-multiplier for optimum selectivity. Only $129.95. With oiled walnut case. $149.95.

Tips

(Continued from page 20)

few electronics men feel that the added convenience justifies the cost of the lathe. Press the lowly ¼" hand drill into service by strapping it to the bench with bands of scrap metal, or even gripping the handle in the vice (but don't overtighten and crack the casting). Chuck the shaft of the work piece if it has one. If not, clamp it between large washers on a long ¼" x 20 machine screw as a mandrel, and chuck that. Now connect a soldering iron or incandescent lamp of 60- to 100-watt rating in series with the drill, and start it. The torque will be low enough to permit easy control with your hand on the chuck, as you guide the wire with the other. This method works for light sanding and filing, too.

—Robert K. Dye, W8YLN

PROTECT YOUR RECEIVER ANTENNA COIL FROM BURN-OUT BY HIGH POWER

If there's a high-power transmitter feeding an antenna located near your receiving antenna (such as that full-gallon rig next door), the antenna coil of your receiver can be burned out, even if the receiver is turned off! And nearby lightning strokes can play the same costly trick, even if your antenna is not actually struck. You can end this risk easily with no loss of performance or resale value by connecting two NE-51 neon lamps across the antenna terminals at the input, as shown. High voltage on the line from any cause will be limited to the breakdown voltage of the lamps, yet they present a negligible shunt impedance when not conducting.

—Bruce Balk
COMING IN MARCH:

THE UNIQUE PUBLICATION THAT IS OUT OF THIS WORLD—

Here's the most comprehensive handbook ever published in the field of specialized radio communications. Four big sections, a total of 148 pages, cover in depth each of the main branches of communications:
- Citizens' Band
- Short-Wave Listening
- Ham Radio

THE 1964 COMMUNICATIONS HANDBOOK will be on sale in mid-March at newsstands and electronics parts stores. But you can reserve your copy now by using this handy coupon.

Price, only $1.00.

Ziff-Davis Service Division, Dept. CH
589 Broadway, New York 12, New York

Please send me ______ copies of COMMUNICATIONS HANDBOOK, at $1.00 each—plus 15¢ mailing and handling charge on each. (Canada and Overseas: $1.25 plus 25¢ for postage.)

I enclose ______ (I understand my order will be filled from first-of-the-press copies on the day of publication.)

New Products

Additional information on products covered in this section is available from the manufacturers. Each new product is identified by a code number. To obtain further details on any of them, simply fill in and mail the coupon which appears on page 15.

40-WATT STEREO AMPLIFIER

75 A 40-watt stereo amplifier has been added to the new "Allegra" line of hi-fi amplifiers and tuners now being offered by Grooves, division of Precision Electronics, Inc. The "Allegra 40" provides 20 watts per channel IHFM, rated 0.5 dB, 20-20,000 cycles at 1 watt. Eleven controls are featured: selector for tape, phono, tuner and two auxiliaries; balance, loudness, bass and treble controls; stereo-mono switch, filter switch, contour switch, off-on switch, speaker off-on switch, and phones (stereo). Also available is the "Allegra 25," a 25-watt stereo amplifier providing 12 1/2 watts per channel IHFM.

METER BURN-OUT PREVENTER

76 Used to prevent meter movement burn-out by overloads up to 10,000% f.s.d., the "Metergard" put out by Lectro-tech, Inc. acts as a meter shunt only when overload currents are present. Under conditions of overload, the excessive or damaging current is bypassed around the meter, thus preventing damage to the movement. The Metergard will work with any make of multimeter and will cause less than 1/4 of 1% change in the accuracy of the movement. It takes only a few minutes to install — you simply connect the Metergard across the movement terminals, disregarding polarity. And once installed, application of even 1000 volts to the 10-volt scale cannot burn out the meter movement. Price, $2.95.

18-INCH, 16-CYCLE WOOFER

77 The new Hartley-Luth 218MS speaker is an 18" woofer with a response down to 16 cycles. Manufactured by Hartley Products Co., and designed to operate with the 10" Hartley 220MS speaker in the new "Concertmaster" system, the 18" woofer can also be used with other tweeter-midrange combinations. The 218MS features a large 14-pound magnet, a cast aluminum frame, a plastic cone, and utilizes the magnetic suspension principle. The 218MS speaker is priced at $195; it is also included in the Concertmaster, which sells for $595 (walnut enclosure) or $795 (ebony Chinese chest).

GENERAL-COVERAGE RECEIVER

78 Designed for the beginning SWL or Novice ham, Lafayette Radio Electronics Corporation's HA-63 7-tube receiver covers four bands from 550 kc. to 31 mc. The BFO permits c.w. reception as well; BFO pitch is fixed-tuned. Full electrical bandspread on all frequencies with a 0-100 logging scale and built-in S-meter assures accurate tuning. The superheterodyne circuit includes an r.f. amplifier and three-section ganged tuning capacitor with separate coils for each band, providing good selectivity and a sensitivity of 1.5 microvolts. Price, $59.95. Optional speaker (an external speaker is required), $7.95.

TURN INDICATOR CANCELLER

79 Do you sometimes forget to switch off the turn indicator on your car after making a turn? "BLINK-OFF" will do it
for you. It's an automatic auto-truck turn indicator canceller which is produced by Burson Electronic Manufacturing Co. It counts the number of flashes, and after a preset number, will stop your turn signals and hold them off until you flip your turn indicator direction switch to "off." "BLINK-OFF" is housed in a high-impact styrene plastic box about 4" x 6" x 2½", and can be installed at any convenient spot beneath the instrument panel, on the fire wall, or beneath the seat. It comes complete with hookup wire, mounting screws, and instructions. Price, about $14.98.

TRANSISTORIZED CAR RADIO

80 Instant warmup, rich tone, superior long-range reception through an r.f. stage, and rugged durability are claimed for the Channel Master Model 6540 AM car radio. The six-transistor set has no vibrators which can break down, assures trouble-free, long-life performance. Price, $39.95.

"LIFETIME" LIGHTNING ARRESTER

81 Hy-Gain Antenna Products Corporation has introduced a lightning arrester that will effectively reduce static build-up around any communications antenna system and safely bypass to ground 10 or more direct lightning strokes. Adapted from a surge arrester originally designed to protect electronic gear aboard military aircraft, the Model LA-1 can be installed in the 52-ohm or 72-ohm coaxial feed line leading to any communications system. Its current surge bypass ability is 10 or more surges of 15,000 amperes in 5 microseconds at 21 coulombs—each surge being equivalent to a major stroke of lightning. Price, $19.95.

STEREO TAPE DECK

82 Available as a kit or factory-wired, the Model 2400 announced by Eico Electronic Instrument Co., Inc., is a compact four-track stereo and mono recorder-player which incorporates a three-motor tape transport with electrodynamic braking. Full record and playback equalization on both 7½ and 3⅞ ips permit the greatest possible use of the economic lower speeds. Maximum reel size: 7 inches. Signal-to-noise ratio: 45 db. Frequency response: ±3 db, 30 to 17,000 cycles at 7½ ips; ±3 db, 30 to 12,000 cycles at 3⅞ ips. Wow and flutter is under 0.2% at 7½ ips, under 0.3% at 3⅞ ips. Prices: $189.95 in kit form; $269.95 factory-wired.

INTERFERENCE ELIMINATOR

83 The Model A-1 "Hush-Gate" manufactured by Reach Electronics, Inc. is a compact (3⅛" cube) all-silicon transistor accessory circuit for FM communications receivers. In use, it is actuated when an off-channel signal is present, and acts to prevent such signals from appearing in the receiver output. Noise bursts, intermodulation distortion signals, etc., are also eliminated if they result in an average discriminator output voltage other than zero. Connection of the "Hush-Gate" to the receiver does not in any way affect normal reception of an on-channel signal, regardless of the deviation used. The Model A-1 will function properly in virtually any communications receiver employing a discriminator and a squelch circuit. It is simple to install, requiring only the connection of four leads and no rewiring of the receiver. Price, $13.85.

GREATEST SOCKET WRENCH

111 pc. FORGED SELECT STEEL...

FULL PLATED 12 Pc. 1/4" DRIVE SOCKET SET
From 1/8" to 3/8" sockets, 4" L handle, 3 1/4" extension, 8 pc. combination spinner handle and screwdriver. Sealed plastic case with hinged lid.

21 Pc. CHROME ADJUSTABLE HACKSAW SET
Includes chrome plated frame and sure-grip handle. 10 medium blades, 10 coarse blades. Adjustable from 10" to 12".

2 Pc. OFFSET SCREWDRIVER SET

18 Pc. IGNITION SET

10 Pc. SET SCREW WRENCH SET
From 1/8" to 3/8" wrenches. Snap-tite plastic carrying case.

10 Pc. FEELER GAUGE SET
From .002 to .025 blades.

YOU GET ALL THIS
10 1/4" Square Drive Sockets, 7/16" to 1 1/2".
1 5/16" Extension
1 10" Extension
1 Reversible Ratchet
1 1 1/2" Swing Head Handle
6 1/4" Drive Sockets, Hex Openings: 1/4" to 1/2"
2 3/8" Drive Sockets, Square Openings: 1/4" x 1/2"
1 Combination Plastic Spinner Handle and Screwdriver
1 4" L Handle
1 3/4" Extension
1 Plastic Socket Holder

8 Pc. OFFSET SCREWDRIVER SET

3 Pc. SCREWDRIVER SET

5 Pc. OPEN END WRENCH SET
10 openings from 1/8" to 3/8".

10 Pc. BOX WRENCH SET
8 openings from 3/8" to 1/2".

YOU GET ALL THIS

1 Plastic Carrying Roll
1 6" Combination Plier
2 Offset Screwdrivers: 1/4" Regular, 52 Phillips type
1 Hacksaw
10 Coarse Hacksaw Blades
10 Medium Hacksaw Blades
2 Cold Chisels; 1/2" x 3/4"
1 Long Taper Punch
2 Plastic Handle Electrician's Screwdrivers
1 Plastic Handled Philips Type Screwdriver
8 Ignition Wrenches: 13/64" x 15/64" to 11/32" x 3/8"
1 Ignition Screwdriver
1 Ignition Point File
7 Piece Spark Plug Gap Setter and Gauge, Blades: .025 to .040
1 Plastic Carrying Roll
10 Piece Feeler Gauge, Blades: .002 to .025 and steel ruler in stock holder
1 Metal Tool Box
1 Removable Tote Tray
mechanics...production men...

TOOL VALUE EVER OFFERED!

SOCKET WRENCH and TOOL SET

HEAVY GAUGE METAL HIP ROOF TOOL CHEST

Also ideal for use as a Picnic Pack, Tackle Box or Storage Chest. Rugged, lasting construction with attractive durable finish. With removable metal carrying tray. Specially designed to hold complete 111 piece set as well as additional equipment. 8" x 7½" x 19½".

ALL CHROME
14 Pc.
½" SQUARE DRIVE SOCKET SET

From ¾" to 1" sockets, ¾" reversible ratchet, 15½" swing head handle, 5½" and 10" extensions.

FREE!
CONTINUITY TESTER

You can't lose! This valuable Continuity Tester is yours FREE—even if you return the Socket Wrench Set after using it for the full trial period. Send for yours today!

CLIP AND MAIL TODAY
FINGERHUT PRODUCTS CO., 3104 W. Lake St., Minneapolis 16, Minn.

Send me your complete, 111 piece Sloan-Ashland Socket Wrench and Tool Set plus the free Continuity Tester. I understand I may use it for ten days free, and return it at your expense if I am not fully satisfied.

If I agree to keep it, I will pay only $5.00 a month until I have paid the low price of just $49.95 (plus shipping and handling). The Continuity Tester is mine to keep whether or not I decide to keep the Socket Wrench and Tool Set.

I am enclosing full payment of $49.95 with the understanding that you will pay all shipping and handling charges. (Full money back guarantee!)

COMBINATION PLIERS
THROUGH THIS COLUMN we try to make it possible for readers needing information on out-dated, obscure, and unusual radio-electronics gear to get help from other readers. Here’s how it works: Check over the list below. If you can help anyone with a schematic or other information, write him directly—he'll appreciate it. If you need help, send a post card to OPERATION ASSIST, POPULAR ELECTRONICS, One Park Avenue, New York 16, N. Y. Give the maker's name, the model number, year of manufacture, bands covered, tubes used, etc. Be sure to print or type everything legibly, include your name and address, and be sure to state specifically what you want. i.e., schematic, source for parts, etc. Remember, use a post card; we can handle them much faster than letters. And don't send a return envelope; your response will come from fellow readers. Because we get so many inquiries, none can be acknowledged, and POPULAR ELECTRONICS reserves the right to publish only those requests that normal sources of technical information have failed to satisfy.

Schematic Diagrams

Always say you saw it in—POPULAR ELECTRONICS
A MESSAGE TO ELECTRONIC BUFFS—

DON'T JOIN THE ARMY UNLESS

unless you want to build a career in Electronics. The sky's the limit in this field, if you have the right training. The Army is the place to get that training. And the Army will keep you trained as you move up to positions of increasing responsibility.

unless you want your future to be automation-proof. No matter how far automation goes, men with electronics training will still be in demand in tomorrow's Army.

unless you want premium pay for doing work that you'll enjoy. As you advance in grade and increase your skill, you can earn from $50-100 extra per month in proficiency pay.

unless you want to travel... adventure...and responsibility. Army electronics specialists are stationed in many countries throughout the Free World. Doing work that is exciting, stimulating, and vital to everyone's safety.

unless you care enough about your Country to serve it.

If that sounds like just what the doctor ordered, talk to your Army Recruiter soon. And ask him about Army electronics training.

If you're good enough to get in...a proud future can be yours in the new action

Army

Operation Assist

(Continued from page 28)

Link Radio FM transmitters, type 25, ser. 4239, and 21415, about 1945. (Michael McCarthy, 21 Bel Air Drive, Orinda, Calif.)

GE Model GD-60, 6-tube superhet, no date. (Noel M. Moss, 3355 Henry Hudson Parkway, New York, N.Y.)

Dumont RA-101-A TV, BC, FM, and s.w. console, about 1946. (Frank Demarest, 162 Mountain Ave., Summit, N.J. 07901)

Lafayette Model FE-157, no other data. (C. Profenno, 51 Tilton St., Everett, Mass.)

Special Data or Parts

Zenith Model 68501 a.c./d.c. and battery radio, about 1940, output i.f. transformer needed (95-1086FA), also schematic. (Larry C. Cuffin, 146 Whipple St., Pittsburgh, 18, Pa.)

McMurdo Silver Model 900 "Vomax" VTM, need operating data, schematic. (Alan Michel, 33-74 191 St., Flushing, N.Y. 11356)

Moss Model 246 portable tube tester, instruction manual needed. (Emile W. Germaine, 221-21 106th Ave., Queens Village 29, N.Y.)

R-1155 communication receiver, military surplus, need any technical data, equivalent tubes, manual, or schematic. (Ivan T. Payne, Box 146, Station E, Toronto 4, Ontario, Canada)

Philco Model 111, 11-tube radio, about 1929, alignment data, schematic needed. (P. G. Descher, Box 7 Estuary, Saskatchewan, Canada)

RCA Radiola Model AR-812, about 1925, 6 C-299 and UV-199 tubes, need tubes and any data. (Terry Kirkpatrick, Rte. 2, Cardington, Ohio 43315)

Hallicrafters Model S-52 receiver, about 1948, need 3-gang variable tuning capacitor. (Frank Pascale, 374 Rockaway Parkway, Valley Stream, L.I., N.Y.)

Zenith Model 6-G-501M, 6-tube BC radio, date unknown, need operating instructions and schematic. (C. W. Lingard, P.O. Box 853, Brookings, Ore.)

Heathkit Model 0-8 oscilloscope, need construction manual and schematic. (William Phillips, 341 Rose Ave., Staten Island 6, N.Y.)

BC-659 FM transceiver, Signal Corps surplus, need maintenance manual and parts list. (P. M. Stacey, 22 Village St., Marblehead, Mass.)

McMurdo Silver Masterpiece VI BC and S.W. receiver, need alignment data and schematic. (Archie Gani, 1206 Daingerfield Dr., Daingerfield, Texas)

Kolster Model K-20, ser. 19221, about 1925, need manual and schematic, any other data. (Jack LaVeile, 4816 W. 152 St., Oak Forest, Ill.)

Splittdorf Model R-500 radio about 1920, need 201A tubes and matching speaker. (Ervin Kotiranta, 37 4th St., Cloquet, Minn.)

Pierce Model 556-6 wire recorder, need recording wire and any technical data. (Robert Stupka, 102 Julia Drive, Milton, Florida)

Meissner Model 9-1085 6-tube, 2-band receiver, manual needed. (Sparks Model 9) 5-tube, 2-band receiver, manual and schematic needed. (Larry Kane, 3249 S. Schultz Drive, Lansing, Ill.)

RCA Model 155A and 155B oscilloscopes, about 1950, manual needed. (Mark H. Artukovic, 8301 Arroyo Drive, S. San Gabriel, Calif.)

Solar Model C-F Exam-eter capacitor analyzer, need operating manual and schematic. (Timothy J. Murphy, 282 W. Second St., Oswego, N.Y.)
Cracked cadenzas in your concerto?
...then "bargain" recording tape's no bargain!

Mistakes you can buy cheap. And tape-making mistakes you're almost sure to get in recording tape sold dirt cheap without the manufacturer's name. The dangers for audiophiles? Fade out of high and low frequencies. Distortion. Background hiss. Even tape flaking, or worse, abrasiveness that can damage your recorder. Worth the gamble? Hardly.

You can make fine performance, long-life crystal-clear recordings a certainty by specifying "Scotch" Brand Recording Tapes. All "Scotch" Tapes must pass over 100 quality tests to earn their "brand"... tests no bargain tape could hope to pass!

Thinner, more flexible coatings of high-potency oxides assure intimate tape-to-head contact for sharp resolution. Precision uniformity of coatings assures full frequency sensitivity, wide dynamic range, plus identical recording characteristics inch after inch, tape after tape. Lifetime Silicone lubrication further assures smooth tape travel, prevents squeal, protects against head and tape wear. Complete selection of all purpose tapes—from standard to triple lengths, with up to 6 hours recording time at 3 3/4 ips. See your dealer. And ask about the new "Scotch" Self-Threaded Reel. Remember... on SCOTCH® Brand Recording Tape, you hear it crystal clear.

GETTING STARTED WITH TRANSISTORS
by Louis E. Garner, Jr.

If you have ever had occasion to experiment with transistors while reading P.E., this author needs no introduction. Lou is one of POPULAR ELECTRONICS' Contributing Editors, and has written the monthly "Transistor Topics" column since 1956. In addition to his column, Lou is a prolific author of books and magazine articles aimed at the electronics hobbyist. Typically, this latest work does him credit. Written in the free and easy style that characterizes the author's sure grasp of transistor theory, this book is different in that it doesn't back into the subject of transistors through vacuum tubes, but forges straight ahead—just as if tubes never existed. It brings the reader along from the fundamental fundamentals of semiconductors, through routine project-building, to all of the latest solid-state innovations. Either as a reference or an introduction to transistors, this volume will make an excellent addition to your workshop bookshelf.

Published by Gernsback Library, Inc., 154 West 14 St., New York, N.Y., 10011. Soft cover. 160 pages. $3.95.

MODERN DICTIONARY OF ELECTRONICS,
Second Edition
by Rudolf F. Graf

The task of keeping a dictionary abreast of the rapidly changing and expanding field of electronics is next to impossible—new terms are coined almost daily. However, Rudolf Graf certainly deserves an "A" for effort. The second edition of his Dictionary includes up-to-date, well-written definitions for 12,400 terms, catchwords at the top of each page, and extensive cross-referencing. An excellent reference text of its type, it (Continued on page 38)

NOW...GET THE FINEST
STEREO TEST
RECORD ever produced
for just...$4.98

Featuring Tests Never Before Available
To The Hobbyist

Why We Make the Model 211
Available Now

Although there are many stereo test records on the market today, most critical checks on existing test records have to be made with expensive test equipment. Realizing this, HI/STEREO REVIEW decided to produce a record that would allow you to check your stereo rig, accurately and completely, just by listening! A record that would be precise enough for technicians to use in the laboratory—and versatile enough for you to use in your home.

The result: the HI/STEREO REVIEW Model 211 Stereo Test Record!

Stereo Checks That Can Be Made With the Model 211

Frequency response—a direct check of eighteen sections of the frequency spectrum, from 20 to 20,000 cps.

Pickup tracking—the most sensitive tests ever available to the amateur for checking cartridge, stylus, and tone arm.

Hum and rumble—proof tests that help you evaluate the actual audible levels of rumble and hum in your system.

Flutter—a test to check whether your turntable's flutter is low, moderate, or high.

Channel balance—two white-noise signals that allow you to match your system's stereo channels for level and tonal characteristics.

Separation—an ingenious means of checking the stereo separation at seven different parts of the musical spectrum—from mid-bass to high treble.

Stereo Spread
Speaker Phasing
Channel Identification

PLUS SUPER FIDELITY MUSIC!

The non-test side of this record consists of music recorded directly on the master disc, without going through the usual tape process. It's a superb demonstration of flawless recording technique. A demonstration that will amaze and entertain you and your friends.

Why Fred got a better job...

I laughed when Fred Williams, my old high school buddy and fellow worker, told me he was taking a Cleveland Institute Home Study course in electronics. But when our boss made him Senior Electronic Technician, it made me stop and think. Sure I'm glad Fred got the break ... but why him ... and not me? What's he got that I don't. There was only one answer ... his Cleveland Institute Diploma and his First Class FCC License!

After congratulating Fred on his promotion, I asked him what gives. "I'm going to turn $15 into $15,000," he said. "My tuition at Cleveland Institute was only $15 a month. But, my new job pays me $15 a week more ... that's $780 more a year! In twenty years ... even if I don't get another penny increase ... I will have earned $15,600 more! It's that simple. I have a plan ... and it works!"

What a return on his investment! Fred should have been elected most likely to succeed ... he's on the right track. So am I now. I sent for my three free books a couple of months ago, and I'm well on my way to Fred's level. How about you? Will you be ready like Fred was when opportunity knocks? Take my advice and carefully read the important information on the opposite page. Then check your area of most interest on the postage-free reply card and drop it in the mail today. Find out how you can move up in electronics too.
How You Can Succeed In Electronics

... Select Your Future From Five Career Programs

The "right" course for your career

Cleveland Institute offers not one, but five different and up-to-date Electronics Home Study Programs. Look them over. Pick the one that is "right" for you. Then mark your selection on the reply card and send it to us. In a few days you will have complete details ... without obligation.

1. Electronics Technology
   A comprehensive program covering Automation, Communications, Computers, Industrial Controls, Television, Transistors, and preparation for a 1st Class FCC License.

2. First Class FCC License
   If you want a 1st Class FCC ticket quickly, this streamlined program will do the trick and enable you to maintain and service all types of transmitting equipment.

3. Broadcast Engineering
   Here's an excellent studio engineering program which will get you a 1st Class FCC License and teach you all about Program Transmission and Broadcast Transmitters.

4. Electronic Communications
   Mobile Radio, Microwave, and 2nd Class FCC preparation are just a few of the topics covered in this "compact" program ... Carrier Telephony too, if you so desire.

5. Industrial Electronics & Automation
   This exciting program includes many important subjects such as Computers, Electronic Heating and Welding, Industrial Controls, Servomechanisms, and Solid State Devices.

An FCC License ... or your money back!

In addition to providing you with comprehensive training in the area indicated, programs 1, 2, 3, and 4 will prepare you for a Commercial FCC License. In fact, we're so certain of their effectiveness, we make this exclusive offer:

The training programs described will prepare you for the FCC License specified. Should you fail to pass the FCC examination after completing the course, we will refund all tuition payments. You get an FCC License ... or your money back!

Cleveland Institute's new "Check-Point Plan" helps you learn faster and better

Cleveland Institute uses the new programmed learning approach. This "Check-Point Plan" presents facts and concepts in small, easy-to-understand bits ... reinforces them with clear explanations and examples. Students learn more thoroughly and faster through this modern, simplified method. You too will absorb ... retain ... advance at your own pace.

Job placement service ... another CIE extra to help you get ahead in electronics

Once enrolled with CIE, you will get a bi-monthly listing of the many high-paying interesting jobs available with top companies throughout the country. Many Cleveland Institute students and graduates hold such jobs with leading companies like these: American Airlines, American Telephone and Telegraph, General Electric, General Telephone and Electronics, IBM, Motorola, North American Aviation, New York Central Railroad, Raytheon, RCA and Westinghouse.

Electronics is a fast moving, dynamic industry ... Cleveland Institute keeps you current

The Electron Bulletin is CIE's bi-monthly digest of new developments in the world's fastest growing industry. As a CIE student, you will get a free copy throughout your training to keep you up-to-date on Masers, Lasers, Solid State Devices, and other new inventions.

Full accreditation ... your assurance of competence and integrity

Cleveland Institute of Electronics is accredited by the Accrediting Commission of the National Home Study Council. You can be assured of competent electronics training by a staff of skilled electronics instructors.

CONCEPT IN AMATEUR ANTENNAS!

3 MODELS - NEW LOW PRICE!
El Toro is available in three models. TW-3X, TW-3X Jr. and NS-3 at prices you can afford. Model TW-3X is just $19.95. Models TW-3X Jr. and NS-3 are only $14.95.

3 BAND OPERATION!
Models TW-3X and TW-3X Jr. operate on 20, 40 and 75/80 meters. Model NS-3 (novice special) operates on 15, 40 and 80 meters. All antennas are pretuned, in kit form, and have excellent broad band characteristics.

2 POWER RATINGS!
Model TW-3X has a rating of 1000 watts input to the final amplifier on AM, 2000 watts P.E.P. on CW or SSB, Models TW-3X Jr. and NS-3 are rated to 300 watts AM and 1000 watts input to the final amplifier on CW or SSB.

INSTALLATION WILL MEET YOUR REQUIREMENTS!
Mosley El Toro antennas are trap type grounded quarter wavelength antennas that, when properly installed, will equal or surpass the performance of any good vertical, depending on the type of mounting. These remarkable antennas can be mounted in varied positions to fit most any location. Mounted at ground level, no radials are needed if a good ground is provided. The maximum length of El Toro is 58 ft. and is fed with 52 ohm coax. El Toro is easily adjusted to resonate at any portion of the rated bands.

would be a good investment for anyone with an interest in one or more branches of electronics.

Published by Howard W. Sams & Co., Inc., 4300 West 62 St., Indianapolis 6, Ind. Hard cover. 435 pages. $6.95.

MAGNETIC RECORDING FOR THE HOBBYIST

by Arthur Zuckerman

If you have recently become the owner of a tape recorder, or if you intend to buy one in the near future, you can gain considerable insight into the techniques of successful recording from this small volume. This book would be of more value to the general consumer than to the advanced electronics hobbyist, but it does contain much useful information.

Published by Howard W. Sams & Co., Inc., 4300 West 62 St., Indianapolis 6, Ind. Soft cover. 128 pages. $2.50.

Free Literature

Whatever your hobby, interest, or sport, Edmund Scientific Company's latest catalog (No. 641) should have something in it for you. It's crammed with the latest buys in more than 4000 product areas. For your free copy of this handy 148-page source for hard-to-find items, write to Edmund Scientific Company, 101 E. Gloucester Pike, Barrington, N.J., 08007 . . . A new eight-page brochure available from Empire Scientific Corp., 845 Stewart Ave., Garden City, L.I., N.Y., describes the technical features of their latest line of record playback components. You'll also find in it helpful hints on the care and evaluation of record playback systems and recommendations for a basic stereo record library . . . Leece-Neville's eight-page booklet entitled "What's This Alternator Talk Altogether?" explains the operation of a typical automotive electrical system in layman's terms, and discusses the operation and advantages of today's automotive alternators. You can get a copy from The Leece-Neville Co., 1374 East 51 St., Cleveland 3, Ohio . . . And POLY PAKS, P. O. Box 942E, So. Lynnfield, Mass., has available an eight-page catalog of new and surplus bargains which lists the latest in semiconductor merchandise and offers a $1 special sale. —30—

GET 250 HOURS WORTH OF PROJECTS FOR ONLY $1.00... THE COST OF THE 1964 EDITION OF...

If you like the challenge of working on your own construction projects, this is the publication for you! It's chock full of projects, detailed charts, circuit diagrams, cutaways, and photographs — all in one handy, compact 164-page magazine. Your copy of ELECTRONIC EXPERIMENTER'S HANDBOOK offers you hours and hours of enjoyment while you build fascinating projects like these:

ELECTRONICS AROUND THE HOME:
- Power Failure Emergency Lighting
- BC Photoflash Slave
- Thermistor Fish Finder
- Low Power Metal Locator

HiFi-STEREO:
- Amplifier Modules
- "Mello" Monster
- New Design Bass Reflex
- Silent Hi-Fi Listening
- Salvaging Old Cabinets

COMMUNICATIONS FOR THE HOME HOBBYIST:
- In-Flight Eavesdropper
- 50-mc. Simple Superhet
- Wired Wireless for Colleges
- Technician Band Transceiver
- Pep Up Lazy Crystals
- The Best from W9EGQ

ELECTRONICS IN THE WORKSHOP:
- Listen to the Ultrasonics
- Super Magnet Picks Up Aluminum
- CB/Ham Crystal Test Set
- Loudness Continuity Checker
- Sound A Above Middle C
- Little Voltger Power Supply

...PLUS MANY MORE

The 1964 ELECTRONIC EXPERIMENTER'S HANDBOOK is now on sale. Be sure to get a copy of this fast-selling, much-in-demand HANDBOOK at your favorite newsstand. Or use this handy coupon for ordering.

Always say you saw it in-POPULAR ELECTRONIC
Startle your friends with this dynamic demonstration of low-frequency resonance and other dramatic a.c. effects. This Science Fair project works on ordinary 60-cycle house current.

NEARLY EVERY electronics experimenter is familiar with the process of adjusting a circuit to resonate at a specific radio frequency—you do this every time you tune in your favorite radio or TV station. Much more mysterious and surprising, however, are resonant circuits operating at the low 60-cycle frequency of our home lighting circuits. The repulsion coil—resonant engine described here reveals some of the secrets of this fascinating phase of electronics and provides a unit that can be used for a number of exciting experiments.

The values and dimensions given here are from the author's working model, and while they may be varied, changes are not recom-

By WALTER B. FORD
the ends and tubing together with epoxy glue. This step is important because there will be considerable pressure against the ends when the wire is in place on the coil. Drill \(\frac{1}{16}\)" holes through one end of the coil form for the coil leads as indicated in Fig. 1. Drill and tap two holes for 6-32 machine screws in the same end of the form to hold the completed coil to its base (if wood is used, wood screws can be used and the threaded holes will not be needed). Wind the coil form with 2½ pounds of 24-gauge magnet wire. While it is not necessary to wind the coil perfectly, like thread on a spool, it should not be allowed to pile up at any point.

**Constructing the Cores.** Uncoil enough 16- or 18-gauge soft iron wire to make the engine core, grip one end in a vise, grasp the opposite end with a pair of pliers, and pull until you can feel the wire stretch somewhat. This will straighten the wire. Cut the wire into 4\(\frac{1}{4}\)" lengths and make forms to hold the bundle in cylinder form from pieces of thin-wall metal or plastic tubing. Holes (\(\frac{3}{8}\)") drilled in small pieces of wood or hardboard can also serve the purpose. Since the forms must be cut away after the core is glued, keep their outside dimensions down to a minimum.

Bundle the 4\(\frac{1}{4}\)" wires together and insert them in the forms. Press the end of a screw eye into the center of one end of the core, and cut off the ends of the wires forced out of the core at the opposite end. Withdraw the screw eye—it will be fastened permanently later. Apply epoxy glue to the areas of the core not covered by the forms holding the core wires and allow the glue to set. The type of epoxy glue that will set with artificial heat is preferred for this, since

Acknowledged unless the experimenter understands what effect the changes will have on the operation of the unit. If, for example, capacitors of lower value are used, the stroke of the engine piston will change. This will mean that there will have to be a proportionate change in the length of the flywheel crank.

**Making the Coil.** The inductive part of the series-resonant LC circuit used in the unit is in coil \(L_1\). Begin by making up a coil form as shown in Fig. 1 (page 43). Although plain wood discs may be used for the ends, plywood, fiber, or Micarta is preferred, since there is less chance of breakage if the coil is accidentally dropped. The center tubing can be Micarta, bakelite, or fiber, or can be made by drilling a \(\frac{5}{8}\)" hole lengthwise in a piece of \(\frac{3}{4}\)" dowel rod. Whichever material is used, make sure the inside surface is smooth, sanding if necessary, so the engine piston will travel freely.

Complete the coil form by drilling holes in the end discs that make a snug fit around the center tubing, and gluing
Coil form may be made of fiber or a laminated plastic. End plates must be strong and firmly glued to center.

Both cores are made of #16- or #18-gauge soft iron wire. Straighten the wire as shown in the photograph on the bottom of the facing page.

This arm couples the flywheel to the core, which acts as the piston. Prototype was cut from brass stock.

Several small parts must be fabricated to connect the arm to the flywheel. At right, below, are two possible ways of constructing the engine crankshaft.

The flywheel weighs about 15 ounces. The author used aluminum, but plastic or brass would serve as well. War surplus stores or machine shops may have such flywheels for sale.
The size of the stand necessary to hold the flywheel for experiments will depend on the length of the shaft (Fig. 3) and diameter of the flywheel (Fig. 6).

**BILL OF MATERIALS**

C1—1-µf., 600-volt non-electrolytic capacitor  
C2—2-µf., 600-volt non-electrolytic capacitor  
C3—10-µf., 600-volt non-electrolytic capacitor  
J1, J2, J3, J4—Insulated pin jack  
L1—30-inch brass rod  
R1—10,000-ohm, 10-watt resistor  
S1—D.p.d.t. (center-off) 10-amp toggle switch (motor start type)  
1—2½-lb. spool of 24-gauge magnet wire, cotton- or enamel-covered  
1—1-lb. spool, 16- or 18-gauge soft iron wire  
2—3½-inch diameter, ½-inch thick discs of fiber, Micarta, or wood  
1—¾-inch i.d., 4½-inch long piece of fiber or Micarta tubing, or wood dowel  
1—3½-inch diameter, 1-inch thick flywheel; aluminum, brass or plastic—see text  
Misc.—Brass rods for crankshaft and connecting rod, wood for bracket and base of engine, brass bearing, wood screws, machine screws and nuts, wire, solder, a.c. line cord, epoxy glue, etc.
A small coil connected to a flashlight bulb illustrates transformer action of mutual inductance.

Permissible changes in certain component values are discussed in text. However, do not eliminate discharge function of the d.p.d.t. toggle switch.

drying time is shortened and because surplus glue may be more easily pared off. After the glue has set, remove the forms and apply epoxy to the uncovered core areas. When this second application is dry, remove any rough spots on the core with a coarse file. Solder a screw eye in the hole that was made in the end of the core. The finished core should look like Fig. 2, on page 43.

For the repulsion coil experiments, make another core following exactly the same procedure outlined, but using 12” iron wires and omitting the screw eye.

Parts for the Engine. The connecting rod (Fig. 3, page 43) is made with ½” brass tubing soldered into pieces of ¼”-square brass, the ends of which have been drilled and shaped as shown. This construction was used to “dress up” the prototype, and need not be duplicated exactly. A rod made from a single solid piece of brass will work as well.

The engine crankshaft is shown in two forms in Fig. 4. If you want to experiment with different values of capacitors, or longer or shorter piston travel with a corresponding change in speed, build the slotted version so you can adjust its length. The two parts are held together with a small machine screw and nut. Since this is made of lighter material, it is not recommended for permanent use. If all the values and measurements given for the engine are followed, make a solid crankshaft exactly like that shown.

The engine flywheel is made of brass or aluminum, and is 1” thick and 3½” in diameter. It is supported by a ¼” brass shaft 3” long (see Figs. 5 and 6, page (Continued on page 100)
MINIATURE LASER (above) shows increasing sophistication of laser technology. A helium-neon gas type developed by Bell Labs, it measures just two inches, operates on d.c. at room temperature, and emits a single frequency of visible red light. Precise tuning within a 1500-mc. range centered at 473,000 kilo-megacycles is accomplished with a piezoelectric transducer attached to one of the end mirrors forming the laser’s resonant cavity.

THE SUN may be a source of electrical power for astronauts, as a Hughes scientist shows. Firm is developing inflatable solar collectors for space.

ULTRASENSITIVE TV TUBE that almost “sees in the dark,” by Westinghouse. Accelerated photoelectrons from a cathode, which responds to light, generate large numbers of secondary electrons in a thin, porous target which, in turn, is swept by an electron gun. The tube can tolerate wide variations in lighting and builds up weak images over a period of time, making it ideal for space missions such as photographing dark side of moon.

WORD-SYNTHESIZER capable of saying “Mary” or any other word up to four phonemes in length. Developed by Philco, the electronic device will generate synthetic speech to aid researchers in unlocking the secrets of ordinary human speech.

ELECTRONIC HUMAN HEART, actually a mathematical model, devised by Drs. John J. Osborn and James G. Defares in cooperation with Beckman Instruments. An analog computer was used to simulate the complex mechanical functions of the heart chambers, blood volume, elastic properties of arteries, pumping characteristics, blood flow. It has given good results in confirming heart defect diagnoses and in predicting patient reaction to various types of treatment.

HOME TV PROJECTOR may result from research into light-modulating cathode-ray tubes being done by Motorola. The revolutionary CRT’s would use crystals on which a picture could be developed, and an external light source—with no limitations on brightness—to project a picture.

FLEA-POWER TELEMETRY has been proven practical by experiments conducted by ITT. Reliable reception of digital data over 600 miles from radio-equipped buoys transmitting less than one watt of power on a frequency of 6970 kc. was recently reported at the firm’s Long Island facilities. In hundreds of tests buoys radioed data on ocean currents.

ELECTRON MICROSCOPE designed for biologists by Associated Electrical Industries Ltd., England. A short focal length objective lens lowers to 2.2 angstroms the limit set to resolving power by diffraction and spherical aberration.

WIDE-BAND PHASE-SHIFT AMPLIFIER using a varactor, by David K. Adams of the University of Michigan. Other amplifiers based on the varactor (parametric types) do not have the bandwidth or stability of the phase-shift type, it is claimed.

STABLE MAGNETIC FIELD that can also be readily changed, by Bell Labs. A strong magnetic field is applied along the axis of a thin-walled superconducting tube, inducing a current flow in it. Once the current is started, it will persist as long as the tube is kept cooled to --269° C. The current creates a magnetic shield around the portion of the field within the tube, keeping it constant even if the applied field changes slightly.
THE DEMANDS upon the lead-acid battery in the American automobile are ever-increasing. In wintertime, the ampere-hour capacity is reduced by freezing temperatures. Summertime woes include more frequent short trips, more use of radio equipment, and last—but not least—the electrical requirements of air conditioning. Recharging the battery with a typical generator setup is usually not enough for year-round trouble-free battery performance.

Electronics experimenters are aware of the good and bad things about battery chargers. Low-cost, low-amperage chargers selling for around $5 are sometimes helpful—if you want to wait five to ten times as long as necessary for the battery to recharge. Higher-amperage chargers (3-6 amps) are better built, but must be watched.
closely since only the most expensive models have provisions to eliminate the hazards of overcharging. Leave a high-amperage charger connected to the battery for too long and either the electrolyte boils away, or the plates start to warp.

If you have been plagued with any of the above problems, you need the "X-Line Charger." This is an all-electronic gadget that is set up once for your optimum battery charge. It need never be set again. When connected to the car battery, it senses the battery's condition. If it is low and needs a charge, the X-Line Charger automatically goes into operation. As the charge level comes up, the charging rate goes down. When the preset level has been reached, the X-Line Charger automatically turns itself off.

No relays are used in the circuit of the X-Line Charger; instead, it is built around silicon-controlled rectifiers now offered at moderate prices by the General Electric Company. These SCR's—and other semiconductors—are sold in numerous radio stores as the GE "Experimenter Line."

The basic circuit of the charger was obtained from the GE "Hobby Manual." Cost of building this project will vary between $25 and $45—depending upon refinements and whether or not the charging rate is metered.

How It Works. The circuit surrounding transformer $T1$ and rectifiers $D1$ and $D2$ is that of a full-wave rectifier. Connected to the primary of $T1$ is a fuse, switch, neon pilot light indicator, and Thyrector ($F1$, $S1$, $I1$, and $D4$, respec-
Transformer is bolted to bottom of box. Rectifier heat sink is at left and heat sink for SCR1 is attached to the side.

Prior to attaching the back panel, the completed X-Line Charger looks like this.

Transformer is bolted to bottom of box. Rectifier heat sink is at left and heat sink for SCR1 is attached to the side.

Relatively). Any one—or all—of these components may be eliminated from your working model—depending upon the conditions under which your X-Line Charger will be operating. Thyrector $D_4$ is a special semiconductor consisting of two selenium diodes mounted back to back. Rated at 120 volts, $D_4$ protects the solid-state rectifiers in the charger from harmful a.c. power line surges.

Heavy-duty $SCR_1$ is operated as a switch in series with the battery and rectifiers. A positive-voltage gating signal to turn on $SCR_1$ comes from $SCR_2$ through $R_3$ and $D_5$. The gating signal to turn on and off light-duty $SCR_2$ is established by the battery voltage according to the setting of $R_1$ and the charge held by capacitor $C_1$. As the battery voltage rises and the charge of $C_1$ increases, zener diode $D_3$ conducts, turning on $SCR_2$. Since $R_2$, $R_3$, and $SCR_2$ are all in series, a voltage divider is formed; and when current flows through this circuit, the gate of $SCR_1$ cannot receive a positive signal and is therefore turned off—preventing further battery charging.

Construction. All components can be made to fit comfortably into a 6" x 9" x 5" box. A Premier gray hammertone Model PAC-695 suited these requirements. Four rubber feet were attached to one 6" x 5" end of the box. A metal handle salvaged from the junk box was affixed to the opposite end. The box now rests so that both the front and rear panels (9" x 5") are removable.

A drawing of the cutout dimensions for a front panel is shown on the next page. Sufficient room is left near the top of the panel to mount any 0-10 ampere meter, although the cutout shown is for an edgewise Simpson Model 1502 meter.

Mounted in the three holes below the meter are $S_1$, $R_1$, and $I_1$ (from left to right). Near the bottom are two holes on ½" centers for heavy-duty binding posts. Attached to the front panel is a small open-end chassis used to mount some of the small components. Transformer $T_1$ is bolted to the bottom of the
Front panel dimensions are those of a Premier PAC-695 aluminum box. An oblong cutout near top of panel is for an edge-wise Simpson meter. Any round or square meter can be mounted in this position by adjusting the necessary cutout size. See text for data on three holes directly below meter. Holes near bottom are for heavy-duty output lead binding posts.

Small open-end chassis holds socket for SCR2 and other miscellaneous components. Hole in lower right corner is grommeted to pass leads above and below chassis deck. Two holes in lip align with holes in panel for rigidity when assembly is complete.
X-Line Charger has clean-cut appearance. Although not visible in photos, two screened 3/4" holes are cut in the bottom and back panel for ventilation.

At these points. The sink retaining D1-D2 is electrically isolated from the box by Steatite stand-off insulators. Cathode connection to D1-D2 is made to a soldering lug that also serves to hold the sink to the insulator. An insulator manufactured by E. F. Johnson (Type 501) works well in this application. Controlled rectifier SCR1 is electrically isolated from its heat sink, but it is also held away from the aluminum box with stand-off insulators (Type 500). A lead is soldered to the anode before mounting the sink to the box wall.

Wiring of the X-Line Charger is not difficult as long as the polarities of the diodes and SCR's are observed. Details on mounting and wiring SCR1 are included in the GE "Experimenter Line" X-3 package.

Operation. After double-checking your wiring, bench-test your X-Line Charger by inserting a high-wattage, very low ohm wire-wound resistor across the output terminals. Read the output amperage—a 3-ohm resistor should give a reading of about 4 amperes.

Now make sure your car battery is fully charged by measuring the specific gravity. Connect the charger to the battery and rotate R1 until the meter reads zero. Turn on the bright headlights and see if the charger operates. Turn off the headlights and the charging rate should slowly taper off and gradually return the meter to a zero reading.

March, 1964
THERE'S a large and growing group made up of SWL's and other radio enthusiasts who like to eavesdrop on the goings-on in the 30-54 mc. and 108-148 mc. bands, but who find the receiver problem a tough one. A good commercial receiver for a part of this region of the VHF spectrum can cost from one-tenth to one-third of a kilo-buck, a non-trivial sum for most of us.

In addition, home construction of a good superhet, such as the "VHF Adventurer" (POPULAR ELECTRONICS, October, 1963) requires a rather uncommon amount of test gear and experience. The usual alternative, the very simple superregen receiver, has serious shortcomings. It tends to be unstable, seldom gives equally good results all across its tuning range, causes interference in other receivers, and hisses like a nest of angry copperheads when there's no signal input.

If these obstacles have kept you from the VHF listening ranks in the past, the "VHF Listener" is the answer to your prayers. For sensitivity, simplicity, and low cost, the superregen circuit has been retained, but with modifications that cure its major ills.

The actual unit described here covers the 108-130 mc. aircraft communications band, but the basic circuit can be built to cover other bands between 10 and 170 mc. with very little change other than the use of different values of inductance and capacitance in the tuned circuits. Required departures from the values used in the unit are given later in this article for similar receivers to cover the Citizens Band and 2-meter ham band.

About The Circuit. Signals picked up by the extendible whip antenna are applied via C2 to a tap on L1, shown in Fig. 1. Capacitor C1 resonates L1 at the center of the band covered, and once set, does not need retuning. Coil L2 is a single turn of wire which acts as a low-impedance secondary to L1, to match Q1's input impedance.

Transistor Q1 is the r.f. amplifier, operating in a grounded-base circuit. Power is shunt-fed to the collector via L3, which has relatively high impedance across the band covered. Resistors R1, R2, and R3 set Q1's operating bias.

The Q1 output is applied to the Q2 detector stage via C5, shown in Fig. 2. Tuning capacitor C6 and coil L4 make up the oscillator tuned circuit which is connected to the Q2 collector. Capacitor C7 is the feedback path for superregeneration. The 60-kr. quench frequency is determined mainly by the values of C8, C9, and resistor R7.

This detector differs from most superregs by providing, in addition to the audio signal, a d.c. output proportional to the r.f. input. This d.c. component controls the squelch circuit, which silences the set when there is no input. The audio signal and d.c. squelch control voltage are taken from the detector through a filter made up of C10, C11, and R8. This prevents the 60-kr. quench frequency from reaching and overloading the audio amplifier input.

The squelch circuit is a d.c. amplifier
VHF LISTENER

There's exciting listening in the VHF bands. Here's a potent transistor receiver that will let you in on it for under $30

By WALT HENRY

that controls diode D1, which acts as a gate. The audio signal reaches D1 via C13, but cannot pass through when the diode is reverse-biased. When a signal is received, the d.c. level at the junction of L4 and R4 rises. This rise is amplified through Q3 and Q4, overcoming the reverse bias on the D1 diode gate. This permits the audio signal to pass to the audio amplifier input. If the incoming r.f. signal is cut off, D1 is again reverse-biased by the voltage at the junction of R17 and R18, and the detector hiss cannot pass through.

The audio amplifier shown in Fig. 5...
Fig. 3. Signal from Q1 stage left of shield is coupled to detector by wire through hole in shield. R.f. and squelch circuit transistors mount in sockets on front face of circuit board.

was made by the author, but the manufactured units given in the Parts List are equally good, and require less work.

Separate batteries are used to power the r.f. and audio sections. Use of a single battery tends to cause some motorboating due to interaction between the squelch circuit and the audio amplifier when the battery internal impedance increases with age and use.

Construction. The mechanical construction of the author's unit includes staked nuts for holding the circuit board and shield in the case. These are not readily available to most home constructors, but the small angle brackets sold in the "five-and-ten-cent" stores will serve just as well. Alternatively, short lengths of aluminum or brass angle bracket can be used with either self-tapping or machine screws.

The r.f. and squelch circuits are assembled on a 2½" x 5½" piece of insulated circuit board. The author used a non-perforated board and drilled 1/16" holes for small push-in terminals for solder connections. However, a piece of pre-punched Vectorbord and the "flea-clip" terminals made for it are ideal, and are called for in the Parts List.

The only part of the circuit that must be laid out with care is the r.f. amplifier shown in Fig. 2. Such a grounded-base amplifier stage works very well at VHF, but is inherently slightly regenerative and may tend to oscillate if leads are not kept short and direct. The 2N1517 transistor has an internal shield which should be grounded. This may be done by connecting the shield lead directly to ground, or by connecting it to the base lead, which is, in turn, effectively grounded by C4. The metal shield between r.f. and detector stages provides a convenient ground for both.

The detector stage may be laid out almost any convenient way as long as the leads are kept reasonably short, as shown in Fig. 3. During construction, omit R5 temporarily, as its optimum value will be determined by experiment. It probably will be approximately 22,000 ohms. The shield lead of Q2 can be wired to ground, but this step is not vital.

In case you have some high-frequency transistors in the spare parts box, any of the following types will work quite well in either the r.f. or the detector stage. Tested examples include Philco's 2N502, 2N1742, 2N1743, and 2N1744, the Amperex 2N2084, and Texas Instruments' 2N797. Silicon npn types 2N743 and 2N744 will also give excellent performance. If npn transistors are used in your version of the "Listener," however, the polarities of B1, C12, C14, and D1 must be reversed, R6 must be 3300 ohms, and Q3 and Q4 must be interchanged.
PARTS LIST

B1-9-volt manganese transistor battery (Burgess 2MN0 or equivalent)
B2-9-volt transistor battery (Eveready 216 or equivalent)
C1-12 pf. ceramic trimmer capacitor
C2, C4, C5-0.001 pf., 100-volt disc cer. cap.
C3-0.0033 pf., 100-volt disc cer. cap.
C5-15 pf. tubular ceramic capacitor
C6-2.8-17 pf. variable capacitor (Hammarlund APC-15B or equivalent, modified as per text)
C7-4 pf. tubular ceramic capacitor
C9-27 pf. silver mica capacitor
C10, C11-0.02 µf., 100-volt disc cer. capacitor
C12-3 µf., 100-volt electrolytic capacitor
C13-0.47 µf., 100-volt tubular paper capacitor
C14-10 µf., 100-volt electrolytic capacitor
C15-0.01 µf., 100-volt disc cer. capacitor
D1-1N270 germanium diode
I1-Subminiature phone jack, shorting type
L1, L2, L4—See text
L3, L5, L6, L7, L8-4.7 µh.—see text
Q1, Q2-2N1517/0C171 Amperex transistor (available from Newark Electronics Corp., 223 W. Madison St., Chicago, Ill., stock nr. 21FX2612—see text)
Q3-2N388 germanium transistor
Q4-2N1309 germanium transistor
R1, R2, R5, R8-1000 ohms
R2-5600 ohms
R4, R16-5600 ohms
R5—See text
R7-220 ohms
R9, R13-10,000 ohms
R10, R12-2700 ohms
R11-3000-ohm potentiometer (IRC Q11-112 or equivalent)
R14-3900 ohms
R15-15,000 ohms
R17-1200 ohms
R18-8200 ohms
R19-10,000-ohm potentiometer, with switch (Mallory US-20, with US-27, or equivalent)
S1, S2—D.p.s.t. switch, on R19 (Mallory US-27 or equivalent)
1-7" x 5" x 3" Minibox (Bud 80P350 or equivalent)
1-Transistor audio amplifier (Lafayette PK-543 or equivalent)
1-Vernier dial mechanism (Lafayette F-753 or equivalent)
1—Shaft coupler (Lafayette MS-201 or equiv.)
1—Extension shaft (Lafayette MS-197 or equiv.)
1—Telescoping whip antenna (Lafayette F-440 or equivalent)
1—2-inch speaker (Lafayette SK-189 or equiv.)
Misc.-3-lug terminal strip, hookup and coil winding wire, transistor sockets, knobs, screws, etc.
Note: For Citizens Band. R5 is 680 ohms, C5 is 51 pf., C7 is 10 pf., and C9 is 62 pf.
The specified tuning capacitor (C6) should be modified for use in the 108-132 mc. aircraft or 2-meter amateur bands. Remove all but one of the rotor plates, and all but two of the stator plates, the rotor plate meshing between the two remaining stator plates.

Coil L1 is made by winding 6½ turns of #18 tinned copper wire on a ½" rod, spaced ¾" long. After removing the-forming rod, solder the tap at a point 2½ turns from the ground end of L1.

Coil L8 is ¾ of a full turn of #18 around the ground end of L1. It should be grounded at the same point as L1, but should not contact L1 elsewhere. Coil L4 is 3 turns of #18 wound on a ¾" rod, in a ½" length.

For the Citizens Band, L1 requires 23 turns of #28 enameled copper wire on a J. W. Miller 20A000RBI form, tapped 8 turns from the ground end. Coil L8 is 2½ turns of the same wire close-wound over the ground end of L1. Coil L4 is 17 turns of the same wire on the same type of coil form.

Chokes L3 and L5 are 23µh. units, Miller 9310-44 or equivalent, and L6, L7, and L8 are omitted. Also, C6a must be added in parallel with C6, which is not modified for the Citizens Band.

If you decide to build the unit for the 2-meter band, simply use one less turn in making both L1 and L4, and tap L1 two turns from the ground end. No other construction changes are necessary.

R.f. chokes L3, L5, L6, L7, and L8 may be commercial 4.7-µh. units, but cheaper ones that work just as well can be made by winding 36-gauge copper wire on one-megohm resistors. Wind the turns closely and cover the full length of a half-watt resistor. Strip the enamel off the ends of the wire with fine sandpaper, wind around the resistor leads, and solder. Note that different choke values are required for the Citizens Band.

Layout is not important in the squelch circuitry, but the construction shown in Fig. 3 is compact and neat. If you are leaving out the squelch feature, omit all circuitry in the dotted rectangle on the schematic, and connect point 1 directly to point 2. Also connect point 3 directly to point 4 and eliminate B1 and S1.

The color coding given on the schematic is for the Lafayette PK-543 pre-assembled audio amplifier. It comes with two orange leads which are meant to be connected to a volume control on-off switch. Since a different arrangement is used, cut off the orange lead running to one of the (now disconnected) battery leads and leave the other one intact. Save the battery clip for connecting to the battery leads later on. The other needed battery clip may be salvaged from a worn-out battery of the same type.

The phone jack is connected so that the speaker is turned off when the phones are plugged in.

THE SECRET TUBE THAT CHANGED THE WAR

Today it's junk—a bargain-priced surplus special—but it is also history, the WW II tube no one knew about

By WILLIAM I. ORR, W6SAI

THE YOUNG RADIO AMATEUR saw the dull glint of glass in the bottom of the dusty box and immediately plunged his hand into the receptacle, searching for the unknown object that caught his attention. Grasping something, he slowly drew forth a curious, large misshapen radio tube. Holding the dusty object up to the bare light bulb dangling from a faded sign that read "UR CHOICE—29¢," he examined his find carefully. Puzzled, he turned to the proprietor. "Hey, Sam! What do you know about this tube? Can I use it on two meters?"

"Surplus Sam," owner of the radio junk shop, took the tube and examined it as if it were a fine jewel. He sighed. "Who knows? Buy it! I don't know what it is, but you can't go wrong for twenty-nine cents!"
WHERE SHALL WE start the story of the curious tube? On a June morning twenty years ago in Normandy? Or before that, at the Panama Canal, or years later on the slope of a numbered hill in Korea? It's a strange tale of a unique tube, an Army major and American ingenuity—a true story whose obsolete residue was finally found by the inquisitive amateur in a surplus shop.

Panama, 1940: America is not yet at war, but it is obvious to some that we soon will be. The Panama canal is a tempting and vulnerable target from the air. Radar, the radio eye, had been invented a few years before, but the only available equipment worked on the relatively low frequency of 110 megacycles, and then not very well. The safety of the canal could not be trusted to this primitive, unsensitive gear which showed an almost complete blindness in detecting low-flying airplanes.

A decision is made to construct a small number of radically new and powerful radar sets capable of locating and detecting small planes, and to put these sets aboard picket ships located in the approaches to the canal. Laboratory experiments show that a good frequency for the new sets would be 600 megacycles, but no available tubes can produce the required power at what was then regarded as an unusually high frequency.

By a stroke of fortune of the kind that often changes history, a radar tube is invented by young Major Harold Zahl of the Army Signal Corps that can produce the power required. A prototype of the vital search radar employing the major's radically new tube is to be secretly built and tested as fast as humanly possible.

On the M.S. Nordic off the New Jersey coast: The vessel is equipped with the new radar, and testing is going forward. Suddenly, a German submarine, intent on spying, surfaces close by. It does not go unnoticed, and as the sub's periscope turns, it sees a destroyer closing in together with a blimp overhead, both carrying depth charges. The sub crashes as the depth charges drop. The new radar and those aboard the Nordic—shaken up by the explosions—are safe. The tests continue. The search radar can detect a single bomber over one hundred

The powerful high-frequency Zahl tube was used in critical radar applications—to detect low-flying aircraft, and to trace the sources of deadly mortar barrages.

Courtesy Eitel-McCullough Inc.
miles away with the radar antenna mounted only fifteen feet above the surface of the water!

The SECRET, revolutionary canal radar equipment was so successful that the Air Force asked the Signal Corps to repackage the equipment into a light-assault type radar which could be airlifted to a battle zone and then hand-carried to the front. A prototype of the repackaged radar was built in February, 1943. To prove it was air-transportable, the unit was loaded aboard a bomber at the Newark (N.J.) airport and flown to Florida. It was up and in operation four hours after it arrived at Orlando.

This cleared the way for a crash program to construct a small number of the secret radars (by now called the AN/TPS-3) for immediate shipment to critical war theatres. Twelve sets were built at Camp Evans Signal Laboratory in New Jersey with the aid of GI operating crews who later flew into combat with the equipment. The AN/TPS-3 could be assembled and put on the air by a crew of four men in thirty minutes.

(Continued on page 103)

The AN/TPS-3, known as "Tipsy Three" is shown below installed in a tent. It was the first radar set to operate at high power in 600-megacycle range.

The Zahl tube and its inventor, Dr. Harold A. Zahl, now director of the Army's Research and Development Laboratories, Ft. Monmouth, N.J. The radically new tube—four triodes in parallel with tuned plate and grid lines to make an oscillator—marked a point of departure for modern tube designs containing resonant circuitry within the tube. Fortunately for the Allied cause during World War II, the Germans never obtained a Zahl tube intact, or guessed its secret. It was, without doubt, one of the factors that won the war and saved countless lives.
Lensless Laser Photography

Juris Upatnieks, left, and Dr. Emmett Leith adjust lensless camera. Film is placed in opening below Leith's hand; object to be photographed is in device to left. Reference beam of light reflects from mirrors Upatnieks is adjusting, past object and onto film, producing interference pattern with all phase and intensity data.

THE LASER—fantastic forerunner of a new generation of electronic devices—has played an important role in a new discovery: that of lensless photography. Recently announced by a team of researchers at the University of Michigan, lensless photos offer great promise in recording important phenomena where glass or magnetic lenses are impractical or impossible. In addition, lensless cameras, enlargers, and microscopes—completely free of distortion inherent in lens systems—may someday become a reality. Also noted as a possibility with the new technique is the storing of several different "negatives" on the same frame of film.

The researchers, Dr. Emmett N. Leith and Juris Upatnieks, used a lensless camera to photograph the defraction pattern produced when a transparency was illuminated by an intense beam of single-hue laser light. Since ordinary film cannot record the phase of the light used to illuminate an object, Leith and Upatnieks converted phase variations to intensity variations by diverting part of the laser beam through a prism and part through the transparency. The mingling of the two beams produced an interference pattern containing all necessary phase and intensity data. To convert the defraction pattern—which looks like a series of smudges—into a picture, it's only necessary to project it with laser light.

Another point of interest reported by the researchers is that by changing the position of the film each time a picture is taken several scenes can be recorded on the same film without deterioration of quality.
The materials? Oh, yes. A cardboard shipping carton, packing crepe, paper tape, and a bit of glue!

THE PROBLEM of how to make an inexpensive—as a matter of fact, cheap—speaker system is intriguing. In the author's case, previous experience had singled out a speaker that had good response and cost very little. The enclosure was, of course, another matter.

Since small size was important, a vented enclosure was the logical choice;

the use of a ducted vent further reduced enclosure size requirements. Then came the problem: how to build such an enclosure and still keep the author's “low-price special” in the low-price class? Considered were the use of a wastebasket, a garbage can, a built-up wood enclosure, a small ready-made cabinet, and any number of zany choices. They all had disadvantages—too large, poor performance, too costly, etc.

The light dawned when a hasty search for materials revealed a corrugated cardboard shipping carton. It looked like what it was—the measurements proved to be 17 3/4” x 13” x 13”—roughly the two cubic feet of air space needed. Admittedly, a shipping carton doesn’t have sides as rigid as you’d like for a speaker enclosure, but with a little trickery you
can beef them up. And what's less expensive than a cardboard carton you get for free?

Shipping Carton Enclosure. Assuming you use the speaker referred to in the Bill of Materials (the Lafayette SK-97) or another speaker with roughly the same resonant frequency (70 cycles), use a box with the same amount of space as the author's. Larger or smaller cartons or speakers with different resonant points will introduce new design problems too extensive to cover here.

The foremost objectives in building the enclosure are to make it as stiff and as airtight as possible. Seal the bottom and any cracks in the box with gummed paper tape, glue the flaps together, and strengthen the bottom with fill-in cardboard (obviously you'll need some extra corrugated cardboard for this and other parts of the structure).

The next step is to cut holes for the speaker and ducted vent in the bottom of the box which becomes the front of the enclosure. Using a sharp knife, cut two holes 5 1/4" in diameter, spacing them as shown in the photos. To simplify forming a circular duct, roll a 3 1/2" x 35" piece of cardboard, with the corrugations running across the 3 1/2" dimension, into a two-layer pipe with a 5 1/4" inside diameter. Use gummed tape to hold the duct in shape and to seal the corrugation openings on the ends. Glue the duct into the enclosure over one of the holes. When the glue is dry, apply more to fill the corrugation openings around the edges of both enclosure holes.

Final Assembly. Punch mounting holes for the speaker with an ice pick, and mount it with four 6-32 1 1/4" machine screws and nuts. Place the washers furnished with the speaker under the screw heads and tighten the screws till the cardboard just seems to start to give. Line the inside of the enclosure with a 1/2" layer of sound-absorbent material such as soft multilayer packing crepe, cotton, packing sponge, or plastic foam.

You'll often find some of the materials mentioned in packages you receive, or in the shipping department of any store or business. If you can't get the stuff free, you can buy a big roll of soft cotton at a reasonable price in the sewing sections of some stores.

The binding posts for the system are mounted at the rear in a place where...
The duct is made by rolling a strip of 3\(\frac{1}{4}\)" x 35" cardboard into a 5\(\frac{1}{4}\)"-i.d. tube; fasten with tape.

they won't interfere with the inner box flap. Connect them to the speaker terminals, place glue on the inner flaps, and close the back. Place the enclosure bottom-down on a table (terminals at the edge) and slip weights into it to hold down the inside flaps until the glue dries. Finally, seal the back of the cabinet with gummed tape.

The system is now ready to use, but you can make it better by reinforcing it by gluing pieces of corrugated cardboard (with corrugations running in opposite directions to those in the box) to the sides and back. This measure will stiffen the box considerably.

Finally, to increase your chances of continuing to live at home, you may want to dress up the box with grille cloth, paint, adhesive-backed contact paper, or by covering the entire front, sides, and top with cloth. On the other hand, if you're the kind of nut (like the author) who's proud of making something good out of nothing, you have no problems. Beatniks may also prefer an unabridged enclosure. Of course, if you can hide the speaker system behind a drape, you can eliminate the decorating.

The 8-ohm speaker is rated at 5 watts and shouldn't be driven beyond this point. Response range for plus or minus 5 db is roughly 50 cycles to 16,000 cycles, which is pretty good for less than eight bucks!
AMPLIFIER QUIZ PART 2

By ROBERT P. BALIN

Old-timers had a slight edge in the tube amplifier quiz last month. The Young Squirts with ink still damp on their diplomas get a break here, as transistors came in after the oldsters left school. Try to match the circuits (A-F) with the names (1-6) widely (but not universally) given them in electronics handbooks. Four right without cracking a book is par; five without guessing is excellent. Next month's brain busters will deal with metals used in electronics.

1 Compound-connected amplifier
2 Reflex amplifier
3 Bridge amplifier
4 Push-pull amplifier
5 Complementary symmetry amp.
6 Paraphase amplifier

(Answers on page 99)
Across the Ham Bands

ANNUAL ARRL DX CONTEST

As you read this, the first half of the annual ARRL DX contest (0001 GMT, February 8, to 2400 GMT, February 9, on phone, and identical hours on February 22 and 23 on c.w.) has probably ended. Many successful DX-minded hams are now impatiently awaiting the second half of the contest (March 14 and 15 on phone, and March 28 and 29 on c.w.), so they can rack up more countries and build up a big multiplier.

But many other hams who entered the first round with high hopes are moaning the blues in frustration at their inability to snag those DX contacts that make the multiplier grow. If this is your problem, maybe a few tips will help you hook those rare ones, both during the contest and after.

Any time a DX station puts a signal into the U.S., it’s an odds-on bet that a "pile-up" of W and K calling stations will build up around, and probably on top of, the DX station's frequency. Such pile-ups can reach staggering proportions during a DX contest, yet some stations consistently succeed in working the DX station despite the bedlam. And quite a few of these successful DX chasers run far less power than the legal full gallon, too.

How do they do it? Mainly by dint of superior operating ability, which is something you can't buy in any store. This is one aspect of ham radio where the size of the bankroll just does not count; you have to make yourself into a good operator. You can do it, too, with patience and will power, and plain common sense.

First of all, put yourself in the DX station operator's position for a minute. With ten or twelve powerful stations calling him dead on his own frequency, who can he read? Why, someone calling a little above or below his frequency,

"I wish I had discovered ham radio 30 years ago," is the wistful complaint of 48-year-old Fred G. Godfrey, WN2GAL. Fred operates out of Fort Edward, N.Y. A tugboat captain by profession, he is home only one week out of every three. To increase his limited on-the-air time, Fred is planning to have a maritime/mobile rig installed on his tugboat. The equipment at WN2GAL includes a Hammarlund receiver and E.F. Johnson transmitters. For submitting the winning photo in our March Novice Station of the Month contest, Fred will receive a one-year subscription to POPULAR ELECTRONICS. If you would like to enter the contest for future months, just send us a clear photo of your station—preferably one showing you at the controls—along with some information about yourself, your equipment, and your operating achievements. All contest entries should be addressed to: Herb S. Brier, W9EGQ, Amateur Radio Editor, POPULAR ELECTRONICS, Box 678, Gary, Indiana.

March, 1964
that's who. And that fellow can be you, if you listen a bit first and note how he is working.

Most veteran DX station operators know perfectly well that regardless of how carefully they specify "ans 10U" or "5D" (meaning "answer me 10 kc. above my frequency" or "5 kc. down"), that most of the pack will blindly zero-beat them and blast away. It goes without saying that if you answer him on the frequency to which he has his receiver tuned, you've a reasonable chance to be heard, even though a few other smart operators may be there, too.

If he comes back to you, may have a very rough time reading him, for there will still be stations calling him on his frequency, even if he gives you a long call. If, instead, he comes back to some other station, DON'T try to break into their contact to make yourself known. Now is the time to play it cool! Note carefully the exact dial setting of the DX station, and when he signs, tune your receiver quickly to find the frequency of the U.S. station to which he responded, which will be acknowledging the report from the DX station. Without putting your transmitter on the air, tune it zero-beat with this station, and the instant he finishes signing (if that ends their contact) give the DX station a quick call, at the same time retuning your receiver to the DX station's frequency. This kind of "tailgate" call is resented by a very few DX stations, but is depended on by many others as a means of making at least a few contacts in the clear, before the pack moves in again.

Here are some shorter tips. Don't make the call of the DX station you are after more than two or three times before making your own call. Doing so will advertise his presence to the dozens of receivers in other stations that are tuning that part of the band. Besides, if you're on the right frequency, he will probably hear the first call if he can hear you at all.

Don't call CQ DX! DX stations will not come back to this unless yours is the only signal they can hear on the band. Instead, make sure that your equipment is in good order, that you really know how to get the most out of it, and listen, listen, LISTEN! And when you hear a pile-up, don't assume that's where to call and jump on top of the heap.

These few tips won't make you a real DX wizard overnight, but chances are they will help you improve your score in the last half of the DX contest.

CLASSIC HAM CIRCUITS

In the early 30's, practically every ham had a variable-frequency oscillator in his transmitter. In fact, the oscillator was often the whole transmitter, and fed the antenna directly. Raucous and unstable signals were naturally the rule rather than the exception. Heat, vibration, voltage changes, and the wind blowing the antenna (among other things)
caused their frequencies to quiver and quake, and the receiving operator to mutter unprintable things as he twisted the tuning knobs.

The dream of the average ham in those days was, therefore, to own a crystal-controlled transmitter with its distinctive, rock-steady signal. And by the start of World War II, crystal-controlled transmitters were generally standard equipment in most ham shacks.

After the war, however, the rapid increase in the ham population and the resulting crowding in the ham bands made the ability to shift the transmitter to any frequency in the band look more and more attractive—if the VFO could provide stability comparable to a crystal-controlled signal. This was a big "if," as the chirpy, wobbly, jumpy, hummy signals emitted by most VFO-controlled transmitters in those days amply demonstrated.

**Evolution of a VFO.** Actually, there were a few first-class VFO's in the hands of skilled amateur engineers even in the middle 30's. Practically all of them used the electron-coupled oscillator (ECO) circuit first described by J. B. Dow in the article "A Recent Development in Vacuum-Tube Oscillator Circuits," which appeared in The Proceedings of the I. R. E., December, 1931.

The ECO (Fig. 1) gets its name from the fact that the coupling between the frequency-determining portion of the circuit (C1, C2, and L1) and the load is via the electron stream between the cathode and plate inside the tube—the screen grid shields the plate from the control grid (and cathode) of the tube. As a result, variations in load have little effect on the oscillator frequency. Also, the proper ratio of d.c. plate-to-screen voltage minimizes frequency changes caused by variations in power supply voltages.

**The Clapp Oscillator.** Over the years, many other VFO circuits were devised and tested. Most of them worked well enough, but the ECO was at least as good as any, until the series-tuned oscillator developed by J. K. Clapp was introduced in The Proceedings of the I. R. E., March, 1948.

One cause of instability in a self-controlled oscillator is variation in the oscillator tube's interelectrode capacitances as the tube heats up, particularly the grid-to-cathode capacitance. Any change in this capacitance changes the oscillator frequency, since it is effectively a part of the tuned frequency-control circuit.

In the Clapp circuit (Fig. 2), the control grid and cathode of the tube are connected across (in parallel with) large values of capacitance (C1 and C2) in the tuned circuit. The effect of tube input capacity variation is therefore very small because it is a small fraction of the total capacity across the coil. Then, by having a variable capacitor (C3) in series with the coil (L1) to tune the oscillator, a comparatively large inductance can be used, in spite of the large values of... (Continued on page 97)
Jacks In Box

HERE'S A WAY to get rid of those problems that crop up every time you attempt to patch together two cords that terminate with different types of connectors—simply build a "Jacks In the Box" incorporating all types of connectors and a volume control for good measure! As shown in the photo, the author mounted an RCA phono jack, tip jacks, a standard phone jack, and a coax-type mike connector in a small Minibox along with a miniature 10,000-ohm volume control. As the schematic indicates, all four connectors are in parallel, so any combination of jacks can be used. The volume control is not strictly necessary, and it may be desirable to delete it for some applications. This handy gadget can be built in an evening for a few dollars. —James A. Fred

New Life for Electrolytics

EVER RUN ACROSS an electrolytic which—while not open or shorted—has much less than its rated capacity and a high power factor? Many minor hum problems due to poor filtering can be traced to just such a defective unit. Loss of capacity is caused by the drying out of the electrolyte, which consists of borates, acids, and water. All that is required to restore it is a hypodermic needle and syringe, distilled water, and boric acid. Mix two ounces of boric acid to one quart of distilled (not tap) water. With tubular cardboard electrolytics, insert the needle through the side of the capacitor, being careful not to go too far and short it out—this is quite critical. Capacitors encased in metal cans are more difficult, but most have a gas port in the positive end where you can inject the solution. —Jerrel T. Doster
VACUUM TUBE and pilot lamp filaments seem to have the unpleasant habit of burning open at unexpected times—in the middle of a favorite radio or TV program, for example. In fact, however, filament burn-out generally occurs when power is first applied. Why does this happen and how can it be prevented?

A filament is usually a length of flat or round high-resistance tungsten wire which may be coiled, suspended in “V” or “W” fashion, mounted as a short, straight wire, or, in the case of high filament-voltage tubes such as the 50CS, folded back and forth along its length many times. Support and connection points and sharp bends are weak spots in filament construction; breaks often occur at these points.

Other causes of burn-out are mechanical and electrical stresses. Mechanical stresses occur when the tube is subjected to vibration or shock and whenever power is applied or removed. Current surges, for example, may result in strong electromagnetic forces which pull a filament away from its terminals. In addition, a heated filament expands while a cold one contracts. This expansion-contraction cycle causes cracks to develop at weak spots.

Electrical Stresses. A filament has a much lower resistance when cold than when heated to operating temperature. The result is that a heavy surge of current takes place each time power is applied. As an example, consider a pilot lamp rated at 6.3 volts, 150 ma. When hot, its resistance (by Ohm’s law) is: \[ R = \frac{E}{I} = \frac{6.3}{0.15} = 42 \text{ ohms.} \] When cold, on the other hand, its resistance may measure a tenth (or less) of this value—typically about 4 ohms. In this case, the current surge would be:

\[ I = \frac{E}{R} = \frac{6.3}{4} = 1.57 \text{ amperes!} \]

But this is only part of the story. When a filament is powered by a.c., the peak voltage is 1.41 times the r.m.s. value. If power is applied at the instant when line voltage is at its peak, the voltage is 1.414 x 6.3 = 8.9 volts. The surge current is then:

\[ I = \frac{E}{R} = \frac{8.9}{4} = 2.2 \text{ amperes, over fourteen times normal rated current.} \]

Lamps suffer from yet another major electrical stress—the development of small-diameter hot spots due to uneven evaporation of the tungsten filament. Such spots run hotter and hotter and even more tungsten evaporates until the lamp filament breaks, often when power is first applied.

Minimizing Burn-Out. Mechanically, tubes and lamps should be mounted to eliminate vibration. Electrically, filaments can be operated at slightly less than rated voltage. Where equipment is used on a semi-continuous basis, filaments can be kept heated at all times to eliminate “turn-on” surges and repeated expansion and contraction. Finally, special resistor-thermal relays can be connected in series with tube filaments to reduce current surge by applying power gradually. Low-cost commercial versions (Surgistors) are available for use in radios, TV sets, and other pieces of equipment.
FOUR-THIRTY A.M. on a raw March morning found Carl and Jerry walking briskly along the dark campus of Parvoo University toward the electrical engineering building.

"There's gotta be some good reason why I'm staggering around in the dark at this unholy hour." Carl muttered, turning up his coat collar to ward off the cold, damp wind, "but you better spell it out again. I was pretty sleepy when you explained it to me last night."

"The local Tuncan Meter Company is making very compact, highly accurate running-time meters for a government agency—possibly NASA," Jerry said. "These meters record the running time of an electrical device to which they are connected down to a small fraction of a second and cost almost a thousand dollars each—and they're no bigger than biscuits. For the past two weeks someone has been stealing them at the rate of about one a day. The plant manager dropped in last night while you were on a Coke date with Jodi and said the police chief suggested we might help catch the thief. I went with him to the factory to look the setup over."

"What would anyone want with the things?"

"They could be easily converted into very accurate electric stop watches for timing just about anything. Anyway, I found out why they're having so much trouble keeping track of them. They've got a crash program going, and the meters are practically built by hand in one small section of a large factory. Thirty-three men assemble, paint, calibrate, test, and box them. The meters are simply handed from one operator to another. If a test shows that something is wrong with a meter, that meter is taken back to the station which has the equipment to fix it."
“In other words, the meters are constantly moving back and forth and up and down the whole line. Watching all of them would be like trying to keep track of the disappearing peas in a dozen shell games all going at the same time. The only thing the management has found out is that the meters disappear between four and five in the afternoon, just before quitting time, when things are the most hectic.”

“Why not search the men on their way out?”

“That’s a ticklish business. Honest workers would resent the implication. Besides, with only a little warning, the guilty one could easily get rid of something as small as one of those meters. Even if he didn’t, he couldn’t technically be charged with stealing the instrument until he took it out of the plant. The company needs a way of knowing that the thief has the meter with him when he passes through the gate. Then they can arrest him and try to recover the rest of the loot. The manager thought maybe we could rig up an electronic metal detector at the gate that would show when the thief went through with a meter, but the trouble is that a gadget sensitive enough to react to the small amount of metal in the meter would also react to lunch buckets, keys, or even pocket change.”

“So what did you suggest?”

“I came up with the idea of tagging the meters with a slightly radioactive substance and then secretly checking the men with a scintillation detector as they passed through the gate. We called Doctor Bowers, head of the department of nuclear engineering, and he got in touch with Professor Dailey, supervisor of the nuclear reactor in the EE building. They agreed to go along with it, and Professor Dailey said we should meet him here at five this morning to start the ball rolling.”

“Why so early?” Carl asked, but before Jerry could answer they saw Professor Dailey and two young men waiting for them at the door.

“Mr. Johnson and Mr. Selden here are graduate students,” the professor said, as he led the way down a flight of steps to where the reactor was housed in the old high-voltage lab. “Two people, one licensed by the AEC, must be present when the reactor is activated.”

Jerry estimated that the windowless room they entered would measure about 30 by 35 feet with at least a 20-foot ceiling. Rising waist-high from the floor was a thick-walled circular concrete basin some eight feet in diameter filled with clear, glass-blue water. At one side a cluster of large-diameter metal tubes emerged vertically from the water. Moving closer, the boys saw that the bottom of the tank was several feet below the floor level.

“This is called a ‘swimming pool’ reactor,” the supervisor explained. “You can see the reactor core, about the size of an egg crate, there at the bottom of this seventeen-foot-deep tank with the control rods inside their guide tubes going down into it. Six thousand four hundred gallons of crystal-clear pure water provide effective shielding against radiation released by the core, yet leave the core clearly visible.

“The core itself consists of sixteen fuel assemblies, each containing uranium two thirty-five in the form of long, thin plates. Outside the core are the isotope tubes in which materials to be irradiated are placed. Surrounding the entire assembly are twenty pieces of high-purity graphite that reflect neutrons back into the core to prevent their escape from the system.”

“Is it working now?” Jerry asked.

“No. Three of those tubes going down to the core contain stainless steel rods which can be raised or lowered by electric motors. Two of the rods also contain boron, which is an even better absorber of neutrons than stainless steel. When the rods are shoved all the way into the core, as they are now, they absorb (Continued on page 90)
Transistor Topics

By LOU GARNER, Semiconductor Editor

Many experimenters think of photocell applications only in terms of burglar alarms, light meters, and power supplies (solar batteries). In actual fact, however, these versatile semiconductor devices can be used in a wide variety of projects, including even such exotic applications as the remote control of models. As an example, last year one prominent manufacturer (International Rectifier Corporation, El Segundo, Calif.) introduced a light-controlled model car kit (see photo). Light-operated remote-control circuits can be applied equally well to model trains and boats, to home appliances, and even to shop and hobby equipment.

As a general rule, most light-controlled circuits are similar. A photocell senses a change in light intensity and delivers a corresponding electrical signal. This signal, then, is amplified and used to actuate an electrical or electromechanical output device, such as a relay, motor or meter. If the output device is a relay, it, in turn, can serve as a simple switch to operate other equipment, including lamps, motors, electromagnets, solenoids, counters, or alarm buzzers and bells.

Two basic photocell relay circuits are illustrated in Figs. 1 and 2. Either of these circuits can be used for general control applications, depending on the degree of sensitivity needed, and either can be modified easily for special purposes. Each requires relatively few electrical components.

In Fig. 1, a self-generating (voltaic) photocell, PC1, is direct-coupled to a pnp transistor amplifier, Q1. The common-emitter configuration is used, with the coil of K1 serving as Q1's collector load, and operating power supplied by battery B1. In operation, light striking the photocell generates a small signal current. Transistor Q1 amplifies this small signal current and the resulting larger collector current closes the relay. The relay's contacts, in turn, serve to switch power to the controlled device, such as a small motor, M1.

A much more sensitive control circuit is shown in Fig. 2. Here, two transistors (Q1 and Q2) are connected in cascade as a two-stage direct-coupled amplifier. Transistor Q1 is used as an emitter-follower and Q2 as a familiar common-emitter stage, with R1 serving as Q1's emitter load. Except for the added stage, the circuit's basic operation is similar to that of the one in Fig. 1. Again, a small signal current is supplied by the photocell when light strikes it; this signal is amplified by the two-stage amplifier and the resulting collector current of Q2 closes the relay.

In practical circuits, PC1 can be any of a variety of small selenium or silicon photocells . . . typically, International Rectifier Types B3M (selenium) or SiM (silicon). Virtually any general-purpose small signal pnp transistors can be used for Q1 and Q2, including low-cost experimenter types such as the CK722 and 2N107. Resistor R1 (Fig. 2) is a half-watt unit. The relay should have a high-resistance (3000 to 5000 ohms) coil and, for best results, should be a sensitive type similar to those used in radio control work. The battery can be a 6-, 9- or 12-volt unit, depending on the type of relay chosen.

Either circuit's over-all sensitivity—the amount of light required for operation—depends on a number of factors, including photocell efficiency, transistor gain (beta),

An unusual example of a photocell application is this light-controlled model car kit placed on the market by International Rectifier Corporation.
and the electromechanical relay’s sensitivity. For maximum sensitivity, choose a high-
efficiency silicon photocell, high-gain (but low-leakage) transistors, and a sensitive-
type relay. If desired, a large lens can be
used in front of the photocell to gather
light and focus it on the cell’s sensitive
surface.

The circuits can be assembled on a
conventional metal chassis, on a plastic or
Bakelite sheet, on an etched-circuit board,
or even breadboarded on perforated Mason-
ite, as preferred, since neither layout nor
lead dress is critical. Care must be taken to
observe d.c. polarities, or course, and to
avoid accidental heat damage when solder-
ing components in place.

A number of modifications can be made
to meet special needs. For example, trans-
parent optical filters can be used in front
of the photocells to restrict circuit sensitivity
to specific light colors. If desired, npn tran-
sistors can be substituted for the pnp types,
provided both battery and photocell polar-
ities are reversed. Other types of relays may
be substituted for the simple s.p.d.t. type
shown, including d.p.d.t. units, latching
types, and stepping relays. Finally, a low-
current d.c. motor may be used instead of
a relay in the second circuit (Fig. 2).

The completed circuits are adaptable to
a wide variety of applications. If the relay’s
normally-closed contacts are employed for
switching purposes, for example, the basic
circuits will serve in burglar alarms, door-
way annunciators, automatic door openers,
counters, industrial production and safety
controls, and automatic light switches. In
these applications, a drop in light intensity
(or breaking a light beam) initiates opera-
tion. On the other hand, if the relay’s
normally-open contacts are employed, the
circuits may be used in “commercial killers”
(shorting a radio or TV loudspeaker’s
lead when light is focused on the photocell),
darkroom safety alarms, controls for model
cars, trains and boats, slave photoflash
units, garage door openers, and so on. In
these latter applications, an increase in
light intensity initiates operation.

Readers’ Circuits. In response to con-
tinued reader interest, we are once again
featuring a pair of limited-range AM
“broadcaster” circuits: a wireless micro-
phone and a phono oscillator. Both circuits
employ a single npn transistor in the
common-emitter configuration and both are
relatively simple. Either can be assembled
in a single evening by the average hobbyist.

The wireless microphone circuit in Fig. 3
was submitted by Richard Sady (783
Newbury St., Springfield, Mass.). He writes
that his model had a range of about 30 feet
when used with a short whip antenna.

The circuit’s operating frequency is

---

**Fig. 1.** Basic single-transistor photocell circuit can be used for general
control applications or easily modified.

**Fig. 2.** This two-transistor photocell circuit is more sensitive than that of Fig. 1 but
operation is similar except for the added stage.

**Fig. 3.** Wireless microphone circuit sub-
mitted by reader Richard Sady can be
assembled in one evening. Other npn
transistors can be substituted for Q1 pro-
vided that resistor R1’s value is changed.
determined by tuned circuit LI-Cl, while base bias is furnished through LI and R1, the latter bypassed by C2. The audio signal is injected in Q1's emitter circuit by means of a carbon microphone. In operation, the feedback necessary to start and maintain oscillation is provided by the part of LI below the tap, which drives Q1's base in the correct phase. Power is furnished by a single battery, BI, controlled by push-to-talk switch SI.

Standard components are used. Coil LI is a tapped broadcast-band Vari-loopstick, while Cl and C2 are small ceramic or mica capacitors. Resistor R1 is a half-watt unit. A type 2N170 is used for Q1, but other npn transistors should give acceptable performance if R1's value is changed. A standard carbon microphone cartridge is employed. Switch SI is a push-button s.p.s.t. switch, while the power supply is a small 9-volt transistor battery (typically, a Burgess 2N6).

Eugene Richardson (Alexandria, Va.) submitted the phono oscillator circuit in Fig. 4. (Eugene has contributed to this column on several previous occasions.) He indicates that this circuit is one he adapted from several suggested by GE a few years ago. The unit is designed for use with a high-output crystal phono cartridge and has an effective range of from 6 to 20 feet, depending on receiver sensitivity.

Transistor Q1 is used in a "tickler feedback" arrangement, with L2 serving as the feedback coil and operating frequency determined by tuned circuit LI-C4. Transistor Q1's base bias is established by voltage divider R2-R3 in conjunction with emitter resistor R4. Capacitor C2 serves as an r.f. bypass and C3 as a coupling capacitor to LI. The audio signal from the phono cartridge is coupled to Q1's base through load resistor R1 and d.c. blocking capacitor CI. Power is supplied by BI, controlled by SI.

As in Fig. 3, readily available components are used here. Coil assembly LI/L2 is a Stanwyck #1129. Capacitor C4 is a 360-pf. padder, while C2 and C3 are small disc ceramics or micas. Capacitor CI is a paper tubular (100- or 200-volt) unit. The resistors are all half-watt units. Transistor Q1 is a type 2N170, and the power switch, SI, may be any standard s.p.s.t. type... toggle, slide, or rotary. The 6-volt battery (BI) is made up of four penlight cells connected in series (a single Burgess Z4 may be used if preferred).

Both broadcaster circuits can be assembled either on small boards or metal chassis, for neither layout nor wiring is critical. Good wiring practice should be observed, of course. Many builders will prefer to assemble the wireless microphone in a hand-sized case, the phono oscillator on a small board suitable for mounting in a record player's base. The phono oscillator antenna connection is not shown since, in many cases, a separate antenna lead will not be necessary. If an antenna is required, however, it may be connected either to Q1's collector or to the "hot" side of LI.

In operation, the broadcasters' frequency should be adjusted for pickup at a "dead spot" on a standard AM receiver (where no local stations are received). The wireless microphone's frequency is adjusted by means of LI's slug, while the phono oscillator's frequency is set by adjusting C4.

Transitips. Semiconductor devices are quite susceptible to heat damage, whether applied externally or generated internally. As a result, care must be taken to avoid excessively high temperatures in storage as well as during installation and operation. Thus, transistors, diodes and similar devices—or equipment containing these units—should not be kept near furnaces, radiators, hot air registers, or similar high heat sources.

Heat sinks are frequently used to conduct generated heat to the air during operation. Temporary heat sinks conduct heat away from a device's leads during installation and thus serve to protect against externally applied heat.

A heavy alligator clip or a pair of long-nose pliers make excellent temporary heat sinks. The basic method for using them is shown on page 95. The heat sink is attached to the lead being soldered at a point between the body of the semiconductor de-

(Continued on page 94)
It's night. Suddenly a tire blows. You pull over to the side, but another car is coming up fast from behind...

By LOUIS F. CORTINA

For Greater Safety—Flash Those Lights!

If you've ever had to stop your car on or near the road while driving at night, you know how nerve-wracking this experience can be. Most of us have thought at one time or another of buying flares for use in such an emergency, but how many drivers actually carry them? The news stories concerning rear-end collisions with stalled vehicles point up the danger involved in not having some positive means available to alert other drivers.

Of course, you can pump your brake pedal to flash your rear lights, but this becomes tiresome very quickly. However, there is a practically tireless device on almost all cars which can be used to perform the same job—the flasher which operates your turn-signal lights. Some stalled drivers have the presence of mind to use this device in its normal manner, that is, to operate the turn signals. The danger here is that the driver in back may not realize until too late that the car is not moving, but standing still.

Two-Light Flasher. The additional wiring needed to make the flasher operate both rear lights is quite simple. The

Fig. 1. A two-light flashing arrangement requires only the connection of a s.p.s.t. switch between the flasher and brake-switch leads.
usual turn-signal switch has six leads; one from the flasher, one from the brake switch, and four leads to the various exterior lights. When the turn signal switch is in the center—or neutral—position, there is continuity between the brake-switch lead and the two leads which go to the rear lights of the car. If a path is provided from the flasher lead to the brake-switch lead, the rear lights will receive power through the flasher and will blink on and off in the same manner as the turn-signal lights, making an attention-getting device.

Figure 1, on page 75, shows a typical wiring layout and the necessary modification. The switch used is a s.p.s.t. type, and may be a toggle, rotary, or push-pull device rated to carry 3-5 amperes. Since most cars normally use two lights for signaling, one in the front and one in the back, the flasher will be operating under its normal load when flashing the two back lights.

One exception is some General Motors cars which normally flash two lights on either side in the back, and one on either side in the front. If the flasher is connected to the four back lights, it will be operating with an overload and will run fast. To overcome this deficiency, one of the heavy-duty, variable-load flashers, designed for truck service or for vehicles towing a trailer, can be substituted for the original flasher. These variable-load units, which are manufactured by Ideal and Tung-Sol, will operate from one to eight lights of 21 or 32 candle power while maintaining a constant flashing rate. Replace a 6-volt flasher having three terminals with a Type 535 or 2535, a 12-volt unit having two terminals with a Type 536 or 2536, and a 12-volt unit having three terminals with a Type 550 or 2550.

Most cars made since 1949, as well as some earlier models, have a flasher socket under the instrument panel on the driver's side. It is only necessary to remove the original flasher and plug in the heavy-duty unit. Chrysler products from 1949 to 1954 have the flasher mounted on the engine side of the firewall. For those cars which do not use a flasher socket, remove the leads from the original unit and wire them to the corresponding terminals of the replacement unit.

Four-Light Flasher. While the simple hookup illustrated in Fig. 1 can be used in most states, California requires that any warning-light setup include "four or more approved turn-signal lamps . . . at least two of which must be toward the front and at least two toward the rear of the vehicle." Your local motor vehicle department can tell you the rules that apply in your area.

The added wiring needed to connect the flasher to all four light leads is not very involved. A three-pole, single-throw switch, either rotary or toggle, will do the job. An advantage of this method is that the panel indicator lights, which are usually paralleled with the corresponding front light on late-model cars, will also be energized. This keeps you from

(Continued on page 96)
PLANS are already under way for the Corn Belt Citizens Banders, Inc., fourth annual banquet to be held this coming November. "Early-bird" planning is probably one of the big reasons for the success of this annual event. Plus the well-coordinated efforts of six different planning committees who, in turn, enlist the help of the rest of the CBCB membership.

For the record (and for those who have asked for hints on planning large "indoor" fests), the CBCB organizes its annual hoopla under the direction of two dinner cochairman, prize committee (5 members), tickets and registration committee (4), display (3), entertainment (4) and publicity (2) committees.

Last year's banquet was held on November 23 near Bloomington, Ill., home of the CBCB. Publicity chairman Jim Brook, KHA4158, informed us long before the "zero" date that 525 tickets had been sold (the limit) forcing them to refuse additional requests. Publicity for the event drew CB'ers from 75 different communities representing the states of Illinois, Kentucky, Texas, Wisconsin, Indiana, South Carolina and our northern neighbors, in this case from Traffordsville, Ontario, Canada. Your CB editor was booked to speak before this assembly of CB enthusiasts, and we spoke, although we were not present at the event. In clarification of the last statement, circumstances beyond our control found us traveling several hundred miles (almost in the opposite direction) from the event at the time it took place. However, a recording session with audio engineer Bill Nicholls, KHD4706, placed our apologies and our speech on a reel of audio tape the day before the banquet. Thus, while we physically were being propelled at 20,000 feet and 500 miles an hour, our voice delivered a message to several hundred CB'ers, "technically reproduced!"

To produce a successful banquet of your own, you might follow a few well-chosen tips from the CBCB'ers. They (1) plan early, (2) delegate responsibilities, and (3) work hard at it. "A lot of work but well worth the effort" were the feelings left with CBCB club members after the 1963 event.

Publicity chairman Jim Brook gained a new title for his efforts at this gathering. With six hours sleep in a 48-hour period which caught Jim up in the hurry-scurry of last-minute details to be ironed out, he decided to lose his voice—most of it at least. At any rate, club officers dubbed him with
the moniker “Bullfrog Brook!” That's gratitude for you, Bullfrog!

Walkie-Talk. Twenty members of the Nineteeners Citizens Radio Service of Akron, Ohio, manned the official communications network for the 26th All-American Soap Box Derby. Sponsored by Chevrolet, newspapers, radio, TV and nonprofit organizations, the event required the use of four CB base stations and 16 walkie-talkies. Derby Week kept the Nineteeners busy relaying Soap Box Derby Champions' names and home towns as they arrived from all over the world. The relays were received by a booth announcer in front of the Sheraton Mayflower Hotel where the champs were officially welcomed by the city.

On the Friday preceding the main event, Akron residents watched as some 1500 Soap Box Derby marchers paraded down Main Street, also known as All-American Boulevard. Parade marshal George Brittain was able to keep an eye—rather an ear—on the entire parade movement through a walkie-equipped Nineteener member stationed at his side. Several other club members were perched atop two of Akron’s largest department stores to coordinate the shower of confetti poured down upon the marchers, while several other Nineteeners positioned at strategic points aided in controlling the crowd of some 65,000 onlookers.

When Derby Day came, Burt Woodring, 19A8358, activities chairman for the Nineteeners, supervised network communications operations from a topside command post using base stations on channels 10 and 18. Traffic handled on these two network channels included coordination of a two-hour pre-race parade, assistance in ushering 80,000 spectators to their seats, distribution of programs for the big event and supplying transportation of “chow” for the other Derby workers. The Jam Handy Organization, which filmed the event for General Motors, also used the CB walkie-talkie net to keep informed of pertinent information regarding the Soap Box Derby.

All Nineteener club participants were experienced in handling the communications needed, having operated the radio net for the Akron Beacon Journal's local Soap Box Derby race the past two years. Club president Harold Baringer, 19Q1972, stated that the Nineteeners expect to set up communications for several other local sporting events this year, including collegiate football, cross-country races, swimming competition, and Akron's Junior Olympics. Plans for this year's Soap Box Derby are already being made, and the operation is expected to expand to four networks, including a 465-mc. CB net.

Club Chatter. The latest CB addition to the state of Texas has ridden (on a hoss, I guess) its way into being with the title of "White Rock Two-Way Radio Club of Dallas." The group has already assisted officials by manning the state fair Citizens Band network. This club monitors channel 11 twenty-four hours a day; meetings and coffee breaks are on Friday evenings. Those interested in saddling up with the group should contact Bob Schumann, KEH1135, 9929 Bethany Drive, Dallas, Texas.

The Arkansas Citizens Band Radio Club has published a 92-page CB directory of members and area clubs throughout the state. The state-wide organization conceived the idea back in 1961, and the culmination of their efforts appears in this descriptively detailed directory of information. Arkansas groups mentioned in the directory include Blytheville CB Club, U. S. Coast Guard Flotilla No. 87, Central Arkansas CB Radio Club, Dixieland CB Club, Grand Prairie (Continued on page 105)
EDITOR'S NOTE: Five years ago, most of the countries engaged in international broadcasting agreed to make major schedule changes four times a year. Schedule changes (frequencies and times) are necessitated by seasonal trends in radio wave propagation conditions.

For the past year, Stanley Leinwoll has been preparing month-to-month predictions of radio receiving conditions. To enhance the use of his material, the editors of POPULAR ELECTRONICS have decided to delete the monthly tabular listing and in its place publish a quarterly report. This report will conform with the practices established by the Geneva Radio Regulations and will appear in our March, May, September, and November issues.

MOST of the international broadcasting stations scattered throughout the world will make schedule changes on Sunday, March 1. These changes will be in effect during the months of March and April and will be revised on May 3. Frequency and broadcasting time schedules set up in May will continue throughout the summer season of May, June, July, and August. Changes will also be made on September 6 and November 1.

Utilizing the latest computer techniques to predict radio transmitting conditions, we have analyzed the international broadcasting bands and prepared the following summary for the spring of 1964.

11 Meters (25.60-26.10 mc). This international broadcasting band has been useless for the past few years. Since we are at the minimum of our sunspot cycle, very poor conditions will persist for another two or three years. No DX stations should be heard in this band.

13 Meters (21.45-21.75 mc). If you tuned to this band during the winter of 1963-64, you may have heard a few weak DX stations. These should have been audible only during the daylight hours. There may be some DX openings in the spring, but these will be confined to the reception of a few South American stations. For the most part, however, this band will be dead.

16 Meters (17.70-17.90 mc). There is considerably more international broadcasting activity in this band than in either the 11- or the 13-meter bands. In general, some DX can be expected during the daylight hours. Best results should be observed from stations transmitting in austral Asia, South America, Latin America, and Africa.

19 Meters (15.10-15.45 mc). This will be the best DX band during the daylight hours in March and April. Considerable DX should be heard from stations in the southern hemisphere and from transatlantic or transpacific DX stations from early morning to late afternoon.

25 Meters (11.70-11.97 mc). Expect to see less and less DX audible on this band during the spring. Signal strengths will be low and, during the daylight hours, the atmospheric noise will be high. Some DX may be heard from Latin America around sunset and in the early evening hours. Close-in stations (800-2000 miles) will be heard in the United States and Canada throughout the daylight hours.

31 Meters (9.50-9.77 mc). During local daylight hours, this band will be useful for short distances (500-2000 miles). At sunset and in the early evening hours reception will vary from very good to barely marginal. Expect to hear stations from the southern hemisphere and occasionally high-power broadcasters in Europe.

41 and 49 Meters (7.1-7.3 mc and 5.95-6.20 mc). In the hours of local darkness, these two bands will be very active. At sunset the best DX will be from the east—since the path of the radio signal is entirely in darkness. Around dawn, with darkness to the west, most DX heard on these bands will come from that direction. In the daylight hours, reception will be restricted to a range of 500-750 miles. All listeners can expect extremely severe interference levels due to the channel crowding on both bands. This is the same condition that persisted throughout the past winter.

March, 1964
HOW AND WHY OF BROADCAST-BAND DX

During the past winter, DX'ing for stations in the standard AM broadcast band was especially good. Listeners east of the Mississippi reported that numerous European stations could be heard shortly after sunset. On the West Coast, broadcast-band stations in Japan, the Philippines, and Australasia could be intercepted.

Broadcast-band DX is possible only during the periods when most—or all—of the path between the transmitter and receiver is in total darkness. During the daylight hours, the ionosphere absorbs all of the sky-wave signal radiated by AM broadcasting stations. Around sunset, the D layer changes character; instead of absorbing radio waves, it reflects signals below about 1000 kc. Signals on the high-frequency end of the AM broadcast band pass unhindered through the D layer (during the nighttime hours) and are reflected by that part of the ionosphere called the F layer.

The maximum distance of D layer reflected signals is about 1200 miles. Signals reflected by the F layer will occasionally cover 2500 miles in a single hop. DX from more distant stations involves multiple reflections between the ionosphere and the earth.

60 and 90 Meters (47.5-5.0 mc and 3.2-3.4 mc). Conditions on both of these bands during the nighttime hours have been the best observed in the past decade. With the coming of spring, there will be an increase in atmospheric noise levels and a slow deterioration of conditions. On quiet nights when noise levels are down, excellent DX should still be heard. Listen for stations to the east after sunset and stations to the west just before dawn.

Standard Broadcasts. Scores of listeners had an opportunity in December, January, and February to hear their first transatlantic regular AM broadcast-band DX. Some stations from Europe may still be heard during the first few weeks of March. Atmospheric noise levels will be increasing, and by April practically all European DX stations will no longer be audible. Listen occasionally for AM broadcasting stations from Latin America and the countries bordering the Caribbean along the South American coast.

Wrap Up. Summaries of radio receiving conditions will now appear in the March, May, September, and November issues of POPULAR ELECTRONICS. In addition to these summaries, a short discussion of general band conditions to be expected for that particular season will be included in each column. Our topics will range from sunspots, the ionosphere and ionospheric disturbances, to any other material thought to be of interest to the DX listener.

Your comments, questions and suggestions are always welcomed. Address them to the attention of Stanley Leinwoll, Radio Propagation Editor, POPULAR ELECTRONICS, 1 Park Ave., New York, N.Y. 10016.
IF YOU were to ask nearly any DX'er who he considered to be the best known person in short-wave listening, he most likely would answer: "O. Lund Johansen." Mr. Johansen's annual edition of the World Radio TV Handbook (his 1964 issue is the 18th) receives nearly as much use as the equipment in an average listening post. But while his name is synonymous with DX'ing, little is actually known in the U.S.A. about this respected Dane. Olaf Johansen is 70 years of age and is a grandfather 16 times over. He has a long history of activity in the field of radio publishing which goes back almost to the birth of radio itself. As early as 1920 he published several technical handbooks on radio and a series of yearbooks on Danish broadcasting. In 1924 he published the first European radio journal, Radiolyttern. Later he was an editor with Breling'ske Tidende, one of Scandinavia's largest newspapers.

The idea for WRTH (formerly World Radio Handbook) was born about two years before the end of World War II, as a way to promote world peace and understanding. Considering his past efforts, it is not surprising that Mr. Johansen chose broadcasting as the best means to achieve this end. If radio listeners were to come to understand people in other countries and their way of life, through radio broadcasts, he felt that they would have to know what stations were on the air and when and where to tune for them. The natural answer was a book containing schedules, frequencies, and program information about the world's radio stations.

It wasn't that easy, however. It took two years of writing letters, contacting stations, telling them about the idea, and then getting them interested enough to cooperate. The larger broadcasters were immediately enthusiastic; others took more time and effort to convince.

The WRH appeared in print initially in 1947 with a small edition, due to its experimental nature. Today, after 17 years of publication, cooperation from most stations is good, although it is still difficult to get information from some of the Latin American stations. Mr. Johansen writes some 15,000 letters each year to insure...
An active Far Eastern DX'er, Hiroshi Kato of Kuse, Okayama, Japan, is also a radio amateur (JA4AKL). He uses a 6146 transmitter rated at 16 watts, and a 12-tube crystal-controlled double-conversion receiver, both homemade.

that the information in the book is as complete and up-to-date as possible.

News of stations appearing in *WRTH*, which is published yearly, is obtained from broadcast organizations, DX clubs, and listeners, as well as from the stations themselves. The primary responsibility for the accuracy of the information lies with the stations, of course. However, Mr. Johansen has much praise for short-wave listeners because of the help they have given him. (If you are interested in becoming a monitor for *WRTH*, write to Mr. Johansen at Lindorffsalle 1, Hellerup, Denmark).

In the beginning, Mr. Johansen was *WTH*. Now a staff of eight people is kept busy preparing the material for *WRTH* and other World Radio publications. It takes them an entire year to prepare one edition of *WRTH*.

Where does *WRTH* get the most use? Mr. (Continued on page 107)

"... by far the best of any kit I have ever built"

"(Performance) excellent beyond expectations ... (Instructions) very satisfactory ..."

"... reproducing quality, ease of adjustment is excellent ... best laid out kit (of several kits I've built)."

"Terrific ... such a pleasure to build, I was almost sorry to see it finished."

"Better than my expectations, the sound is of the utmost quality ... much easier than other kits I have built."

"... excellent from the first time I plugged it in ... a wonderful piece of equipment ... I feel very proud."

"Perfect ... the first kit I have ever assembled ... next is KG-70 AM-FM-MX Tuner." (names on request)

the incomparable knight-kit KG-870 solid-state 70 watt stereo amplifier kit

ONLY $99.95

From the world's most experienced producer of solid-state hi-fi components—a years-ahead all-transistor stereo amplifier kit featuring 70 watts of IHFM music power directly coupled to your speakers...

PROOF OF SUPERLATIVE VALUE

- Features direct-coupled output—no transformers or DC blocking capacitors in output stage—you get superb bass + 22 transistors and 4 diodes for instant, virtually heat-proof operation + 4 silicon pre-driven transistors for high audio stability + Output circuitry with thermal stability to protect transistors + Full controls and stereo inputs for complete flexibility; jack on front panel for stereo headphones + Absolutely no microphones; virtually no hum or noise + Individual dual-concentric clutch-type bass and treble controls + Variable loudness control for full-range response at low listening levels + Tape monitor input switch + Rumble and scratch filters + Speaker phasing switching + Power output: IHFM music power, 70 watts; 35 watts per channel; sine wave, 28 watts per channel, 140 watts peak power + Response ± 1 db, 20-25,000 cps at rated power output + Harmonic distortion, 0.5%; 1m below 1% at rated power output + Hum and noise: Tuner—60 db; magnetic phone —68 db; tape head—60 db + Inputs: Tape head (NAB); Mag phone (R1A); Tuner; Aux 1; Aux 2 + Separation exceeds 30 db on all inputs + Easy-to-build modular design + Plug-in transistor sockets + Specially engineered printed circuit board + With all parts, transistors, wire, solder, and famous step-by-step Knight-Kit instructions + Precision look, styling; handsome Sierra Gold and Charcoal panel + Size: 21/2 x 13 x 11" + For N0.10-125-v, 60 cycle AC. Shpg. wt., 15 lbs.

Thousands have built the KG-870 with complete satisfaction. Hundreds have written to describe it, using these words repeatedly: "Beyond expectations." In terms of proved experience—for pure and true musical reproduction, and for sheer ease of building, the KG-870 is truly beyond expectations. At the price, there is nothing comparable—for proof, you have only to check the actual specifications (box at left). You can buy and build the KG-870 with absolute confidence—order it today ... an exceptional $99.95 buy in kit form at only $99.95 (less cost).

Matching KG-70 AM-FM-MX Tuner Kit

Solid-state tuner kit for sparkling multiplex FM, plus wideband FM and sensitive AM. Pre-wired and pre-aligned front-end and IF circuits. Packed with latest design features. 2¾ x 11 x 9½". Shpg. wt., 13 lbs. 83 YX 704GK - KG-70 Kit, less case 9995

satisfaction guaranteed or your money back

Exclusive with RCA ... AUTOTEXT® the faster, easier way toward a career in electronics

Amazing home training method makes learning almost automatic

Exclusive with RCA. "AUTOTEXT" the revolutionary home training method introduced by RCA Institutes, Inc., is stirring the interest of thousands. Every day, "AUTOTEXT" is helping people like yourself join the thousands of other successful electronic students who are working toward profitable careers right now! This faster, easier way to learn electronics uses the latest scientific development in the field of home training—and "AUTOTEXT" is exclusive with RCA.

New trend in education. This exciting new trend in education represents a significant advance in teaching electronics. People who have been interested in careers in electronics in the past, but have had difficulty with conventional home training methods, can now begin to master the fundamental principles of electronics almost automatically. Tested in schools throughout the country, checked out and proved with thousands of students, programmed instruction is helping people learn more quickly and with less effort.

Prove it to yourself now! If you have a natural inclination or interest in the exciting field of electronics, that's all you need. RCA "AUTOTEXT" will help you do the rest. And the future is unlimited. Jobs are available for qualified technicians in Space Electronics, Communications, TV, Computer Programming, Automation, and many other electronic fields. The important thing is to get started now!

Complete course available. Right now, RCA Institutes offers you a complete Home Training Course ("Introduction to Electronics") using the "AUTOTEXT" method. You get a complete set of theory lessons, service practice lessons, experiment lessons, and all the kits you need. And most important, "AUTOTEXT" takes most of the effort out of learning the all-important groundwork of the electronics field.

Get complete information now without obligation. Send the attached postcard and check "AUTOTEXT".

Always say you saw it in—POPULAR ELECTRONICS
Wide choice of Home Training courses in Electronics:

- Autotext
  Introduction to Electronics
- TV Servicing
- Color TV
- Communications Electronics
- FCC License Preparation
- Mobile Communications
- Automation Electronics
- Electronic Fundamentals
  (also available in Spanish)
- Computer Programming
- Transistors
- Electronic Drafting
- Industrial Electronics
  Automatic Controls
  Industrial Applications
  Nuclear Instrumentation
  Digital Techniques

RCA Institutes Home Training Courses are complete step by step easy-to-understand units. You get prime quality equipment in the kits furnished to you, and all of it is top grade. It's yours to keep and use on the job.

Liberal Tuition Plan. RCA Institutes Home Training Courses are available under a liberal tuition plan that affords you the most economical possible method of home training. You pay for lessons only as you order them. If, for any reason, you should wish to interrupt your training, you can do so and you will not owe a cent until you resume the course. No long-term obligations!

Set Your Own Pace. RCA Institutes Home Training takes into consideration your own ability, finances and time. You learn at your own speed, in the most effective manner, with personalized instruction every step of the way. You get theory, experiment, and service practice beginning with the very first lesson. All lessons are profusely illustrated—a complete training package in every way.

CLASSROOM TRAINING

RCA Institutes Resident Schools in New York City, and RCA Technical Institute in Cherry Hill near Camden, N. J., offer classroom training that will prepare you to work in rewarding research and production positions in many fields of electronics. No previous technical training required for admission. You are eligible even if you haven't completed high school.

Free Placement Service. RCA Institutes Resident School graduates are now employed in important jobs at military installations, with important companies such as IBM, Bell Telephone Labs, General Electric, RCA, in radio and TV stations and in communications systems all over the country. Many other graduates have opened their own businesses. A recent New York Resident School class had 92% of the graduates who used the FREE Placement Service accepted by leading electronics companies, and had their jobs waiting for them on the day they graduated!

Coeducational Day and Evening Courses are available at Resident Schools. You can prepare for a career in electronics while continuing your normal, full-time or part-time employment. Regular classes start four times a year.

SEND POSTCARD FOR FREE ILLUSTRATED BOOK TODAY! SPECIFY "AUTOTEXT", HOME STUDY OR CLASSROOM TRAINING.

VHF Listener
(Continued from page 56)

The case shown in the photographs was handmade in an effort to give the “Listener” a professional appearance. However, the Minibox specified in the Parts List is quite satisfactory, and saves much work.

The dial is a 2” aluminum disc cut from sheet material, but heavy artist’s board or stiff sheet plastic is equally good. If you use metal, sand the surface with very fine sandpaper and put the calibration marks on with India ink. A light priming coat of clear krylon spray will make the ink flow on perfectly. After the ink has dried, spray several coats on the dial to protect the markings.

Testing and Calibration. Temporarily connect a 0.1-µf capacitor between point 1 and 2 on the schematic. This will bypass the squelch circuit while the detector is being tested. Connect a 10,000-ohm resistor in series with a 100,000-ohm potentiometer and temporarily substitute this combination for bias resistor R5. Attach the fixed resistor end of the combination to the base of Q2. Turn C6 to minimum capacitance and connect the antenna. With the audio volume turned up full, vary the 100,000-ohm test bias potentiometer. At some point a loud hiss will indicate correct detector operation.

With the temporary bias potentiometer still in place, calibrate the dial. If a grid dip meter is used, keep the signal weak by keeping dipper and Listener well separated. With a generator, a short antenna plugged into the output may be needed. When the signal source is tuned to the detector frequency, the audio hiss will drop noticeably in volume. The frequency range tuned by the detector may be adjusted by squeezing or stretching L4 slightly to change its inductance. You may also need to readjust the bias on Q2 with the temporary bias potentiometer. For the Citizens Band version, set the frequency range covered by adjusting L4 and C6a in alternate steps.

Tune near the center of the band, and adjust antenna capacitor C1 for loudest volume (or lowest hiss level if your signal source is not modulated). It will not be necessary to change this setting when tuning other parts of the band.

Now measure the total resistance of the temporary resistor-potentiometer bias combination, and install a fixed resistor (R5) of the nearest standard value. The optimum value for R5 depends slightly on the voltage of battery B1, and the detector may fail to operate near the high end of the band when the voltage of an aging battery begins to drop.

If this happens with a relatively fresh battery, lower the value of R5 slightly. The current drain on both batteries is only about 5 ma., so they will give many hours of service. A manganese-alkaline battery such as the Burgess 2MN6 is ideal for B1 since it holds an almost constant voltage until the end of its long life.

When the detector is working satisfactorily, remove the temporary capacitor between points 1 and 2. With squelch control R11 fully counterclockwise, the detector hiss should be heard. When fully clockwise, the audio output should be silent. Check squelch operation over the entire tuning range. If it does not operate properly over the full range, a slight adjustment in the value of R12 may be necessary.

For most sensitive receiver operation, the squelch control should be set as close as possible to the turn-on point. If the receiver is left on for extended periods of time, check the squelch setting periodically.

Thanks to the relatively broad tuned circuits of the Listener, tuning to a given channel is not critical. Also, the broad tuning and very low warm-up drift make the set stay “put” on a selected channel without constant retuning.

If you have built the unit for the aircraft band, here’s a word of caution. Even though the r.f. stage cuts detector radiation to a relatively low value, very sensitive aircraft receivers may still pick it up and experience troublesome interference when they are very close.

For this reason you should never operate the VHF Listener while in a commercial airliner, or closer than several hundred feet to a control tower or airport. If you are interested in listening at this close range, refer to “Airline Eavesdropper,” POPULAR ELECTRONICS, April, 1963, for a suitable circuit.
Heathkit's great base station deserves an equally fine working partner!

In a two-way radio communications system, overall performance is only as good as its weakest link. The deluxe Heathkit GW-42 "Master Station" CB Transceiver teamed up with the powerful GW-52 1-watt "Walkie-Talkie" brings you Citizen's Band radio facilities of outstanding capability with complete freedom and mobility of operations. Check and compare the many features offered in Heathkit equipment with any other...see why Heathkit is your best buy in CB!

"Master Station" CB Transceiver
- 5 Crystal-controlled transmit & receive channels
- Built-in 3-way power supply
- Built-in 4-tone selective call circuitry
- All-channel receiver tuning
- Built-in tuning meter
- Adjustable squelch control
- Switchable automatic noise limiter
- Push-to-talk microphone
- Beautifully styled
- Easy-to-build.

Kit GW-42...23 lbs.......................... $119.95
Assembled GWW-42...22 lbs................ $189.95

1 Watt Walkie-Talkie
- Rugged 10-transistor, 2-diode circuit
- Long-range transmitter—1-watt input
- Sensitive superheterodyne receiver with RF stage
- Adjustable squelch control
- Automatic noise limiter
- Crystal-controlled transmit & receive channels
- $20 rechargeable battery included
- Built-in 117 v. AC battery charger
- Built-in battery condition meter
- Easy circuit board assembly.

Kit GW-52...4 lbs.......................... $ 74.95
Assembled GWW-52...4 lbs................ $124.95

CIRCLE NO. 12 ON READER SERVICE PAGE
enough neutrons emitted by random fission to prevent any chain reaction. However, when the rods are pulled far enough out of the core, a mixture of plutonium and beryllium contained in that other long guide tube furnishes sufficient neutrons to start a chain reaction, and the reactor becomes critical. Once started, this chain reaction is self-sustaining, and its energy level is controlled by how far the rods are pulled from the core.

"While the reactor is rated at ten kw.," Professor Dailey continued, "we are only licensed for one kw., so that's the maximum amount of nuclear energy we generate. Four neutron detectors near the core constantly monitor the rate at which the uranium is fissioning. This information is displayed on meters and also operates recording devices in that cabinet next to the control console to keep a detailed record of the core's activity."

"Is the thing pretty safe?" Carl asked a little nervously from where he stood near the console.

"Three scintillation detectors—over the pool, under the console, and there by the water processing system—monitor radiation continuously, and the radiation level in this room is always about equal to that from a luminous-dial wrist watch. Many cities at high elevations receive far more radiation from space. All air entering and leaving this room is filtered. Water in the pool is continually filtered by a process that removes all dirt particles which might eventually interfere with a clear view of the core, become irradiated, or corrode the aluminum parts. A de-mineralizer also removes salts. You could fall into the pool without receiving a lethal dose of radiation. Actually, you're safer standing here than you are crossing the street."

"Then how come this big red button on the console says SCRAM?"

"It's not what you think," Professor Dailey said, grinning. "It doesn't mean 'Head for the hills, the dam's busted!' Automatic controls hold the radiation energy at any desired, preset level; but if the operator, for any reason, wants to stop the reactor quickly, he can do so by pushing that button. It drops the two boron rods into the core and stops the chain reaction immediately."

"Well, we'd better get on with our little project," the professor declared. "I decided we should irradiate about a tenth of a gram of indium powder and mix it with paint used on the meter cases. We often use indium foil for measuring neutron flux. It has a half-life of sixty-four minutes, which is to say, its induced radioactivity is halved every sixty-four minutes. I estimate that with the reactor running at one kw. the indium powder will be saturated in eight to ten hours. It should remain sufficiently radioactive for your purposes for at least five hours."

"So we'll start the reactor now. Then, at about three p.m. we'll mix the radioactive indium powder into a small amount of the quick-drying lacquer used on the meter cases. You'll rush this to the factory. The meter painter has been stalling so as to have a good batch of painted meters in his booth. He'll brush some of the blending radioactive paint on the back of each meter case and start the specially painted meters down the line before four o'clock. If one is stolen, it should be from this batch; and when it's carried through the gate shortly after five, it will still be sufficiently radioactive to register strongly on a scintillator."

While speaking, the professor picked up a powder-filled medicine capsule and placed it in a watertight aluminum container. As the rest watched, he used a long handling tool to lower the container to the reactor and place it in one of the
Heathkit High Fidelity Color TV For As Low As $349

25 hours of relaxing fun! That's all! And you've built the new Heathkit High Fidelity 21" Color TV with the finest color circuitry, components, and performance possible today. Goes together quickly, easily. No special skills or knowledge required! And you enjoy quality features and "true-to-life" color pictures comparable to units costing $600 or more!

Compare These Heathkit Features With Others! 27 tube, 8-diode circuit with optional UHF • High definition RCA 70° 21" color tube with anti-glare, bonded-face safety glass • Degaussing coil & built-in dot generator for perfect picture adjustments • Automatic Color Control • Gated Automatic Gain Control for peak performance • 24,000 volt regulated picture power • Hi-Fi sound with outputs for speaker and hi-fi amp • Deluxe Nuvistor tuner with "push-to-tune" fine tuning for individual channels • 3-Stage high gain video I.F. • Line thermistor for longer tube life and thermal circuit breaker for component protection • All critical circuits factory built & tested • Can be custom mounted (requires GRA-53-3 mounting kit) or installed in handsome walnut finish hardboard cabinet • One year warranty on picture tube, 90 days on parts.

Learn Color TV Theory—Save on Maintenance Costs! The Heathkit instruction manual contains circuit diagrams, alignment, and theory sections so you can easily make necessary adjustments with confidence.

Enjoy The Beauty Of Color TV with the added fun and satisfaction of a Heathkit! Order now!

cylindrical tubes surrounding the core. Then he sat down at the console and began to throw switches and turn knobs while his assistants called out meter readings. Motors inched the control rods from the core until suddenly jumping meter pointers indicated that the reactor was critical. Carefully, the energy level was raised to the one-kw. maximum.

"Now," Professor Dailey said, "I'm going to get breakfast, and I presume you two want to do the same. Johnson and Selden will keep things cooking here until we come back at three."

Carl continued to stare down into the pool for a few seconds before turning toward the door. "You can't tell that a thing's going on down there," he said. "It seems like there ought to be a loud humming sound, metal glowing red hot, lights flashing, or something. This thing's spooky!"

THE BOYS were back at the reactor promptly at three with a quarter-pint of paint from the factory. The reactor was shut down, and Professor Dailey removed the aluminum container from the isotope cylinder, took out the powder-filled capsule, and dropped it into the paint.

"The capsule will dissolve quickly and release the radioactive powder beneath the surface of the paint," he explained. "That way there's no danger of radioactive particles getting into the air and possibly being inhaled. Now you better take off; but let us know what happens."

Carl and Jerry drove along the speedy highway bypass to the Tuncan Meter plant and delivered the paint to the plant manager. They waited around until nearly five and then took up positions near the exit gate, each with his own theatrical "props." Jerry, wearing dark sunglasses, stood to the right of the gate cradling what was ostensibly a bag of groceries in his arms—at least, a stalk of celery was sticking out of the top. In the bottom, though, where he could easily see its meter, was a sensitive radiation detector borrowed from the nuclear engineering department. Carl idly dribbled a basketball about the parking lot close by.

While the men filed past, Jerry kept his eyes, hidden behind the dark lenses, glued to the meter of the scintillator, but almost all the workers passed through and the line began to thin out without the meter giving any indication, and he began to fear that something had gone wrong. Then a sallow-complexionioned man wearing a heavy Mackinaw and a pair of ill-fitting large white cotton gloves came through carrying a dinner bucket in his left hand, and the meter pointer swung over sharply.

Thinking that the meter was probably in the dinner bucket, Jerry casually lowered his meter to waist level and walked to the left side of the man. The meter reading was much lower. When he moved back to the right side, the original reading was restored; and when the man raised his hand to settle his hat on his head, the meter pointer dipped sharply.

"He must have the meter in the palm of his hand inside that oversize glove!" Jerry thought to himself. Carl, who had been dribbling the basketball along in front of the man to distract his attention from Jerry's maneuvering, was watching out of the corner of his eye. When he saw Jerry staring pointedly at the big glove on the man's right hand, he began to dribble, feint, and wheel madly. Suddenly he lurched backwards and crashed into the sallow-complexionioned man, knocking him to the asphalt-covered parking lot.

"Oh, I'm sorry!" Carl exclaimed, reaching down to help the man up. The latter instinctively reached for Carl's outstretched hand, but Carl managed to clutch only the tips of the glove fingers and give them a jerk. The glove slid off the man's hand, and a dove-colored running-time meter fell from the empty cuff and went bouncing across the lot. As if by magic, but actually through careful planning, a plain-clothes detective appeared out of the crowd and placed the man under arrest.

"Well," Carl remarked as they watched the detective hustling his prisoner into a waiting squad car, "the man knew that meter he stole was hot, but he didn't know how hot! You know I kind of go for this nuclear engineering jazz. It seems to fit in mighty well with electronics. We can't work around the reactor until we're at least seniors, but let's go see if Professor Dailey won't suggest some books we can be reading to sort of bone up on it!"
It's easy to see why the new Heathkit SSB Single Band Transceivers are heard so often on the air today—in both fixed and mobile operation! They are compact (less than 1/2 cubic foot), lightweight (only 12 lbs.), loaded with versatile features and pack more input power-per-ounce than any other comparable unit (200 watts PEP). And best of all you save two thirds the cost of three band units by buying only the band you need. Assembly is a marvel of simplicity (only 15 hours) with over 90% of the components mounted on a heavy-duty circuit board. The rugged one-piece steel chassis is welded and braced to withstand plenty of abuse...dependable operation with maximum stability. Choose 80, 40, or 20 meter models, or all three, now and enjoy versatile, power-packed performance at lowest cost!

Check These Features!

- True Transceiver for one-band, one sideband operation
- 200 watts PEP RF input
- Crystal filter type SSB generation
- Automatic level control
- PTT and VOX circuits built-in
- Low frequency VFO (1.5-1.75 mv) for greater stability
- 2 kc dial calibration
- 6" of bandwidth
- Vernier tuning
- Provision for operation with Linear Amplifier
- Fast, easy, circuit board assembly
- Complete with one-piece steel cabinet and "gimbal" mounting bracket.

Transistor Topics
(Continued from page 74)

vice and the point where the soldering iron is applied. Once the soldering operation is completed, the temporary heat sink is removed.

A variety of heat sink assemblies designed for permanent installation are available commercially. Unfortunately, the hobbyist doesn't always have access to these devices and must seek substitutes. Several useful techniques are illustrated in Fig. 5.

The use of a fuse clip, metal cable clamp and coil spring as heat sinks for small transistors is shown in Figs. 5(a), 5(b) and 5(c), respectively. In each case, the heat sink is attached to a metal chassis to aid heat dissipation.

Use of a small "U" chassis and a drawn

Fig. 5. You can make a heat sink using any of these methods: (A) fuse clip; (B) cable clamp; (C) coil spring; (D) small chassis; (E) aluminum can.

Always say you saw it in—POPULAR ELECTRONICS
This is the proper way to use long-nose pliers to conduct heat away from the leads while soldering.

aluminum can as power transistor heat sinks is illustrated in Figs. 5(d) and 5(e). Small chassis suitable for use as heat sinks are available commercially, or may be bent from scraps of aluminum from the junk box. The kitchen is a good source of drawn aluminum cans for several types of foodstuffs are now packed in such containers.

In some cases, the heat sink must be electrically insulated from the equipment’s main chassis. This can be accomplished by using Nylon screws and nuts and flat fiber washers, as in Fig. 5(d), or flat and shoulder washers, as in Fig. 5(e). In other cases, the semiconductor device itself is insulated with respect to the heat sink, generally by means of a flat mica washer and suitable insulating washers for the mounting screws. Heat-conductive silicone grease can be spread on the heat sink and device mating surfaces to improve heat transfer.

**New Literature.** A number of major manufacturers have published good-sized books covering semiconductor circuit design and applications. As a general rule, these are “best buys.” for they contain an exceptional amount of practical information. Several recent offerings are listed below.

**Switching Transistor Handbook**—Published by Motorola Semiconductor Products, Inc. (5005 East McDowell Rd., Phoenix 8, Ariz.), this 365-page book covers switching transistor circuit design and characteristics. It sells for $2.50 through franchised Motorola distributors.

**Silicon Controlled Rectifier Designer’s Handbook**—Selling for $2 per copy, this book covers the SCR and its application in considerable detail, with data on SCR operation and construction, design techniques, characteristics, test methods, and—of particular value to the hobbyist—a considerable

March, 1964
number of practical circuits, with parts values given. It's published by the Semiconductor Division of Westinghouse Electric Corporation, (Youngwood, Pa).

Tunnel Diodes—Identified as Technical Manual TD-30, this $1.50 book is published by RCA's Semiconductor and Materials Division (Somerville, N.J.). It contains 160 pages of valuable technical information and circuit data.

As a famous film cartoon character is wont to say . . . "That's all, folks!" Back next month.

—Lou

For Greater Safety

(Continued from page 76)

inadvertently leaving the emergency switch on. Figure 2, page 76, shows the necessary changes for a four-light flashing switch.

The most convenient way to connect the leads from the emergency switch to the turn-signal switch leads is to strip the free ends about ¾", fan out the strands, and insert the lead into the socket half of the proper bullet connector. Then reassemble the connector, making sure no bare wire is left exposed.

To keep from distorting the connectors, light gauge wire (#22 or #24) should be used on the emergency switch. Since these leads will probably be less than a foot long, no appreciable voltage drop will be introduced. To make the job even easier, it's a good idea to prewire the switch with the proper length leads for the mounting location chosen, then mount the switch.

The author's car, a 1962 Ford, already had cutouts in the lower face of the instrument panel for mounting accessory controls. These were concealed by an aluminum trim panel, making it easy to bore a hole for a three-pole rotary switch. To give the installation more of a built-in look, a matching replacement knob was purchased and the switch shaft turned down to fit into it.

No matter how simple or elaborate your installation, the important thing is the large amount of safety that can be bought with a light-flashing switch costing literally pennies.
capacitance across the oscillator tube terminals. These two features help give the Clapp oscillator good dynamic frequency stability.

Modern VFO's. Most modern, commercial VFO's use the Clapp circuit with modifications dictated by the ideas of the individual engineer. For example, some de luxe VFO's use precision-type fixed capacitors in the tuned circuit, and the dial drives a ferrite slug in and out of the coil by means of an accurate lead screw to vary the oscillator frequency, instead of using a fixed inductance and a variable capacitor as in conventional circuits. Although costly to make, this system provides an extremely linear dial calibration.

Minor circuit variations in a VFO are not too important. The difference between a mediocre VFO and a superb one depends almost entirely on the quality of the components, the mechanical rigidity of the tuned circuit assembly, and the auxiliary circuits—such as voltage regulation, temperature compensation, and isolation amplifiers—employed to protect the oscillator from factors that will degrade its performance. These facts explain why a good VFO cannot be acquired for pennies.

WORLD UNDERSTANDING WEEK

In cooperation with the Radio Club Peruano, “El Rimac,” the Rotary Club of Lima, Peru, is sponsoring a “World Understanding Week” from March 15 to 19, 1964. During this period, the club’s stations OA4A and OA4O will be on the 40-, 20-, and 15-meter bands to work participating amateurs. If you want to participate, contact your local Rotary Club, obtain its name and Rotary district number, and send this information to either OA4A or OA4O. In return, you will receive a number. After you QSO one of the stations, write the assigned number and your local Rotary Club’s name and district number on your QSL card. Mail the card to: Radio Club Peruano, P.O. Box 538, Lima, Peru. They will send you a special commemorative QSL card, and your local Rotary Club will receive a colorful display banner and an informative pamphlet.

ASSEMBLE THIS ALL BAND BATTERY SHORT WAVE RADIO FOR $9.95

tenna and his electronic transmit-receive switch were built from specs in past Across the Ham Bands. Thirty-two states (including Hawaii), Canada, and Mexico appear in Bob's log book . . . Bill Nason, WNSHYT, 261 East Drive, Baton Rouge, La., really made time his first month on the air—35 states and seven countries worked, including Guatemala, Mexico, Venezuela, Canada, Puerto Rico, and the Canal Zone. A Johnson Ranger transmitter feeding a 40-meter "inverted V" antenna and a Hallicrafters SX-111 receiver occupy the honor spots on Bill's operating table.

Rich, K1ZXS, 29 Evergreen Ave., Somerville, Mass., samples all bands within the range of his Heathkit DX-40 transmitter and Gonset 211 receiver, but he likes 15 meters the best. Rich is working for a WAS (Worked All States) certificate to go with his Ragchewers' Club certificate and has 14 states to go. . . . To John, VE5Z, Ken Barton, and the other Canadian hams who pointed out that there are 10 provinces in Canada—Canadians-on or off, and stated last November, my thanks and apologies. I confused the number of ARRL "sections" (7) in Canada with the number of provinces (10).

Vito Colantuono, WA2PFJ, 79 Boston Ave., Massapequa, L.I., N.Y., works 20 and 40 meters with an EICO 720 transmitter and 730 modulator exciting 40- and 20-meter dipole antennas; he receives on a "surplus" Hammarlund SP-200 receiver. He has 30 states and three countries worked, although college chores at Southern Tech limit his time on the air. An active member of the QRP (low-power) Club, Vito will schedule anyone working for one of the QRP Club awards. He is WA2PFJ/4 during the school year, when his address is P.O. Box 8667, Southern Tech, Marietta, Ga. . . . Greg Greenwood, W6FZH, 260 Tiburon Blvd., San Rafael, Calif., should have the "N" knocked out of his call by the time you read this. As a Novice, Greg ran up a record of 44 states and 12 counties. And if his Johnson Ranger transmitter seems to glow with pride, it may be because of all the RST-599 reports it earns. A Hallicrafters SX-110 receiver and three antennas—an 80-meter "long wire" and dipole for 40 and 15 meters—complete Greg's equipment. Would-be Novices and Technicians are invited to contact Greg for help, and he'll seek anyone needing a California QSL card.

A radio amateur made a technical breakthrough! At the October, 1963, meeting of the Aeronautical Center Amateur Radio Club in Oklahoma City, Okla., L. J. Weisenberger, WA6RNM, demonstrated a coaxial cable he developed. The device gives a visual indication of the condition of coaxial cable connected to it, and it is used to test all coaxial cable purchased by the Federal Aviation Agency. Commercial firms who have attempted to design such a device are reported to have declared it impossible to do. Thanks to Collector and Emittor, the ACARC's club bulletin, for this item.

Bob Farley, W86CGP, 831 Coronado Ave., Coronado, Calif., really had a hectic first year as a ham. He was originally licensed as WN0DSW, which was quickly changed to

Always say you saw it in—POPULAR ELECTRONICS
KG4BB, Guantanamo Bay, Cuba, where his father was stationed. A month later, Bob was evacuated from the base during the Cuban crisis to Los Angeles, where he received the call of W6CGP. Next, he went to Norfolk, Va., where he signed WN6CGP/4 until he obtained the call of WN4MUI, which was changed to WA4MUI when he earned his General Class ticket. Soon after that, Bob's dad was transferred to California, where Bob operated as WA4MUI/6 until the FCC issued his present call of WB6CGP, which Bob hopes to keep for a few years. Bob's well-traveled station consists of a Drake 2B receiver and a Hallicrafters HT-40 transmitter. . . . BILL SHECKET, WAB1HX, 16620 Aldersyde Dr., Cleveland 20, Ohio, worked 31 states and six countries as a Novice. Most of his DX was on 15 meters, of course, and Bill learned that the way to work DX was by good, hard listening, not by endless CQ's. That's all for now. Until next month, remember, send your "News and Views" and pictures to: Herb S. Brier, W9EQQ, Amateur Radio Editor, Popular Electronics, P.O. Box 678, Gary, Ind., 46401. 75.

Herb, W9EQQ

Don't let the SMALL size fool you!

This tape recorder is BIG quality through and through.

It's the all-new Norelco, transistor, battery portable.

Big in performance...Big in versatility...Big in reliability...Big in everything but size. Think of it. A 7-pound cordless, over-the-shoulder tape recorder that lets you record anything from conferences to concerts with big machine fidelity...that gives you playback through its own wide-range loudspeaker so outstanding you will hardly believe your ears.

This new all-transistor Norelco Continental '101' works on ordinary flashlight batteries. It records and plays back up to 2 hours on a single 4" reel. Simple to use? Push two buttons and you're recording...one, and you're playing back. Its dynamic microphone picks up any sound within a broad radius with astonishing fidelity. Its bass and treble-control allows you to adjust the tone to your own taste. The '101' also records directly from your radio, TV or phonograph. Its constant-speed motor with capstan drive insures distortion-free performance and broadcast-quality tapes. Ruggedly built...handsomely styled...surprisingly low-priced.

See it, hear it, try it...at your camera store, hi-fi dealer or wherever good sound is sold. Send for brochure R to: North American Philips Company, Inc., High Fidelity Products Division, 100 East 42nd Street, New York, N. Y. 10017.

March, 1964
Resonance Engine

(Continued from page 45)

43. Although the weight of the flywheel should not be too critical, some experimenting may be in order. The author’s was made of aluminum and weighed one pound. Drill and tap one end of the flywheel shaft for a 6-32 machine screw and thread the opposite end with a 1/4”-20 die.

The flywheel shaft bearing—a 1 1/2” brass rod 1/4” in diameter with a 1/4” hole drilled through the center—is mounted in the bracket shown in Fig. 7 and in the assembly drawing. The bracket is made with a stiffening buttress so that it will stand up under the vibration of the engine. In the author’s unit, the bracket was mounted to the coil platform by tapping three small pieces of brass rod and cementing them into holes drilled into the bottom of the bracket. Wing bolts thread into the holes from the bottom of the coil platform, making it easy to disassemble the engine for other experiments. In any case, drill a 1/4” hole in the bracket at the height shown in Fig. 7, and cement the bearing in it with epoxy glue.

Mounting Stand: Make a double-deck stand as shown in the photos and secure the capacitors, C1, C2, C3, to the lower section. Mount the d.p.d.t. toggle switch, S1, and four pin jacks, J1, J2, J3, J4, on the upper deck of the stand in front of the coil position. Drill holes in the upper deck for coil leads, coil mounting screws, bracket mounting screws, and for the engine piston. The piston hole should be large enough to provide ample clearance.

Mount all of the parts on the stand as shown in the assembly view on page 45. Solder the end of the flywheel shaft to the end of the crankshaft where the two join together. To hold the long 12” core in place for repulsion coil experiments, drill and tap the top disc for a setscrew that extends from the outer rim into the center hole.

Connect the parts as shown in the schematic diagram on page 45. You will note that the diagram shows a “discharge” position for S1. This is a safety
device to discharge the capacitors after the unit has been in use. Label S1's positions (S1 is a center-off type) "On," "Off," and "Discharge."

Testing the Engine. When the assembly and wiring are done, spin the flywheel by hand to make certain there is no undue friction. Use light oil on all bearings and piston surface. With everything ready to go, plug the unit in, turn the switch on, and give the flywheel a turn in either direction. The flywheel will pick up speed and be on its way. Like most single-cylinder reciprocating engines, your engine will require an initial start, unless the crank is turned to its upper position and slightly off center.

Theory. How does the resonant engine operate? One of the laws governing a series-resonant circuit is that when the reactance of the capacitor equals the reactance of the coil, the maximum amount of current will flow in the circuit. The reactance of the capacitors is fixed; the reactance of the coil depends on the piston core's position.

When the piston core is slightly above its lowest point of travel, or the same distance below its upper point of travel, the reactance of the coil equals that of the capacitor, and the circuit is resonant. In operation, the piston is drawn toward one of the resonant positions, but the flywheel carries it beyond that point and the circuit drops sharply out of resonance. From there on, the piston is carried by the momentum of the flywheel to the next resonant position.

The value of the capacitance needed for the resonant engine is 10.6 μF. As shown in the schematic, the author got this value by connecting 1- and 2-μF units in series, and then connecting them in parallel with a 10-μF. unit. Other combinations can, of course, be used to arrive at 10.6 μF.

Other Experiments. Want to make a step-down transformer? Wind a 40-turn coil of wire and connect it to a flashlight bulb. Position the long core in the engine coil, tighten the setscrew, and slowly bring the flashlight bulb and coil down over the core. An interesting variation is to try the same thing with the capacitor shorted out by means of a jumper across the two capacitor pin jacks. The increased brilliancy of the bulb with the capacitor in the circuit shows how much more efficiently a.c. circuits operate at resonance.

Another intriguing experiment using the transformer principle is the repulsion coil. Secure a piece of ¼"-i.d. aluminum tubing 2" long. Place the tubing over the long core, turn the switch on, and it will shoot skyward. Adjust the center core to get maximum upward thrust if necessary.

The transformer principle involved here is that of mutual induction where a varying current flowing in a coil induces a current in another coil placed in the same magnetic field, such as the primary and secondary of a transformer. The induced current is always in an opposite direction to the original current; thus, the magnetic fields set up by the two currents will be in opposition. The aluminum tubing acts like the secondary of a transformer, and, since it is free to move, opposing magnetic fields send it flying.

A similar piece of aluminum tubing

3" long can be made to oscillate up and down the center core for approximately 8" by adjusting the core to proper height. The height is critical—1/4" either way may prevent the tubing from oscillating.

If you have an A.C. voltmeter with a maximum range of at least 500 volts, it can reveal some startling facts about series resonant circuits. Connect the meter to J3-J1/2 across the coil and adjust the long center core until the meter gives a maximum reading. Change the meter to the capacitor jacks J1-J2 and note the reading. Readjust the center core until the coil and capacitor voltmeter readings are the same. The circuit is now at resonance, and the voltage indicated across each unit should be about 400 volts.

In a series resonant circuit such as this, the maximum current will flow at resonance. At 60 cycles, the reactance of the capacitor bank comes to about 250 ohms; and at resonance, the reactance of the coil will also be 250 ohms. However, at resonance, these reactances cancel one another—the current flow is limited only by the small resistance in the circuit. It is this current flow in combination with the reactances of the coil and capacitor—which may be said to build up the voltage by 'handing it back and forth'—that accounts for the exceptionally high counter electromotive voltages.

The experiments and demonstrations suggested above are just a few of those that can be performed with the unit. As you become familiar with it, many more will suggest themselves to provide further exploration of this intriguing phase of electronics.

Always say you saw it in—Popular Electronics
The first twenty-five production units—followed by many more—were built by Zenith Radio Corporation, and went to England and then to the beaches of Normandy.

A part of the Normandy radar-support operation ended in tragedy—and it was feared that the set and its tube had fallen into enemy hands—when four radar-carrying gliders crashed during the ill-fated Arnhem expedition. Fortunately for the Allies, the destruction of the sets was so complete that there was little left for the Germans to study.

THE SUCCESS of the “Tipsey Three,” as it was known to its operators, was due to the secret tube invented by Major Zahl. Essentially four triode tubes connected in parallel, the tube envelope also contained tuned plate and grid lines which made it an oscillator. As much as 250,000 watts peak power could be extracted from the tube during a radar pulse. Because of the plate dissipation and cathode emission required to produce the 250-kilowatt pulse, the anode elements of the secret Zahl tube ran red hot.

Once the tube had been proven, Major Zahl brought a hand-made version of his invention to Eitel-McCullough, Inc., a pioneer manufacturer of high-frequency transmitting tubes located near San Francisco. He asked the engineers of the company if the tube could be mass-produced on a crash basis. The entire resources and ingenuity of the company were thrown into a program of producing Zahl tubes in quantity, and in secrecy. The production tube—also produced in appreciable quantities by Machlett Laboratories—was designated the VT-158.

The exact number of VT-158’s produced during the war is no longer known, but it is said that at one time the entire output of the Tantalum Defense Corporation was being used to make the heat-resisting elements of the secret tube. Many problems were encountered in mass-producing the revolutionary
104

VT-158, but the tube was soon given the unconditional Joint Army-Navy (JAN) approval and placed on the “Preferred List.”

Doctor Zahl, now the Director of Research at the Army’s Electronics Research and Development Laboratories, Ft. Monmouth, N.J., wrote recently, “Within my recollection, this tube passed through its entire life cycle of usage without ever having been the subject of an unsatisfactory report from the field. Eitel-McCullough did a superb job in the production-design of this tube. Even now, I wonder how they did it.”

THE TUBES, still unknown to the public and the enemy, saw action in the Pacific Theatre as well as Europe. In Doctor Zahl’s article, “One Hundred Years of Research,” published in the October, 1960, IRE Transactions on Military Electronics, he said, “But with all the assistance total mobilization brought (to the development of new electronic systems) there were many problem areas where the most learned hesitated to travel, lest the war be over before the problem could be solved—if it could be solved at all. Riding high in this category was the location of enemy mortars, the deadly devices which caused the majority of our ground casualties.

“The problem was one of finding metal objects the size of a small tomato can, loaded with explosives and fired at our troops in bursts of hundreds, with nothing more complicated than a large shotgun shell at the bottom of a piece of iron pipe. Finding these clouds of deadly torpedo raindrops coming unannounced from miles away was the first part of the problem; the next was to establish definitive trajectories, trace the various shell paths back to their points of origin and by coincidence methods, to saturate these coordinates with overwhelming counterfire so that peace and quiet would prevail in these particular areas—and many thousands like them!”

With Major General R. B. Colton challenging his scientists and engineers, and with Captain John Marchetti leading the design group as he had previously done with the AN/TPS-3, Signal Corps Research took on the mortar locating problem when much talented advice said there was no solution. Within six months

Always say you saw it in—POPULAR ELECTRONICS
the problem was solved. Under the personal urging of General Stilwell to hurry the equipment into emergency overseas freight, Captain Marchetti’s task force of twenty Signal Research scientists worked for an unbroken stretch of ninety-six hours—to the verge of collapse—on the first prototype radar unit. The deadly problem of enemy mortars had a solution—the Zahl tube used in the AN/TPQ-3 mortar radar set.

During the Korean conflict, the Army again called on the aging Zahl tube and the semi-obsolete AN/TPQ-3 mortar radar—both resurrected from World War II.

The Zahl tube is no longer manufactured, but the concept has not been forgotten. While the once-secret, revolutionary VT-158 may now be found in dusty surplus bins, work is still being done on powerful new ultra-high frequency radio tubes that contain the resonant circuitry within the tube.

One, the new X-841D giant klystron tube, designed for multi-megawatt, frequency-agile radar, is a modern descendant of the secret Zahl tube. Using six integral cavities resonant in the 40-megacycle region, this eleven-foot, 1000-pound giant is the latest development in the long, continuing search for more power at higher frequencies that started in Panama so many years ago.

BECOME A RADIO TECHNICIAN
For Only $29.95

BUILD 20 RADIO CIRCUITS AT HOME only $29.95
with the New Progressive Radio “Edu-Kits”®
ALL Guaranteed to Work!

A COMPLETE RADIO COURSE

HERE’S WHAT THE “EDU-KIT” OFFERS YOU
The “Edu-Kits” offers you an outstanding PRACTICAL HOME RADIO COURSE at a rock-bottom price. You will learn radio theory, construction and servicing. You will learn how to build radios, using realistic schematics; how to solder and wire them; how to align them; how to install and tune the equipment. You will learn how to work with punch and metal tools. The “Edu-Kits” are designed to give you a professional background and trade in radio and television. You will learn and practice code, using the Progressive Code Oscillator. You will build 20 radio receivers. Transmitter, Code Oscillator, Signal Trainer, Square Wave Generator, Amplifier and Signal In- jeector circuits, and learn how to operate them. You will find an excellent background for TV. In brief, you will receive a basic education in electronics and communications worth many times the small price you pay, only $29.95 complete.

PROGRESSIVE TEACHING METHOD
The Progressive Radio “Edu-Kits” are the foremost education- al radio kit in the world, and is universally accepted as the standard in the field of radio education. The “Edu-Kits” are among the finest educational principles of “Learn by Doing.” You begin by building a simple radio. Gradually, in a progress- ive manner, and at your own rate, you construct more ad- vanced multi-tube radio circuits, learn more advanced theory and techniques, and do work like a professional radio technician. These circuits operate universally accepted professional radio technician. These circuits operate

THE “EDU-KIT” IS COMPLETE
You will receive all parts and instructions necessary to build 20 different radio and electronic circuits, each guaranteed to oper- ate. Our kits contain tubes, tube sockets, variable capacitors, ceramic and paper dielectric capacitors, resistors, the astatic, coils, hardware, tuning, push-to-talk switch, battery, hookup wire, solder, tools, printed circuit board, instructions, a complete price list, and a full line of additional parts and accessories. You will receive Printed Circuit Material, including Printed Circuit Chassis, special tube sockets, hardware and instructions. You will also receive a useful set of tools, a pair of cutters, an alignment tool, professional electronic soldering iron, a complete parts list, and a self-powered, dynamic radio and TV Tester. The “Edu-Kits” also include Code instructions and the Progressive Code Oscillator. You will also receive lessons for serv- ing with the Progressive Signal Trainer and the Progressive Sig- nal Injectors. A High Fidelity Guide, FCC Amateur License Training Book, and a Quiz Book.

All parts, components, etc., of the “Edu-Kits” are 100% uncondi- tionally guaranteed. A clean, carefully selected, tested and practical home radio and electronics course is only $29.95.

TROUBLE-SHOOTING LESSONS
You will learn to trouble-shoot and service radios, using the unique Signal Injector, and the complete Radio and Elec- tronic Trainer. Our Consultation Service will help you with any technical problems. To help you save time and money, we send you a complete price list of parts and accessories. As a bonus, you will receive a copy of the “Edu-Kits” Training Book, “Edu-Kits” Training Book, and a full line of additional parts and accessories.

ORDER FROM AD—RECEIVE FREE BONUS RESISTOR AND CONDENSER KITS WORTH $7.00

- Send the “Edu-Kits” C.O.D. I will pay $29.95 plus postage.

Philo Technological Center

Ontario & C Sts., P.O. Box 4730, Philadelphia 34, Pa.

Gazette, issued monthly. Recently installed officers of the organization include: Al Kamosa, 4W0856, president; Lou Hoster, KCF0691, vice president; Estelle Smith, KCG0535, secretary; and Rita Mancini, 4W2094, treasurer. The group also has a sergeant-at-arms and executive committee of three.

The Groundplane, a bimonthly publication of the Virginia State Citizens Band Radio Association, Inc., reports an assist by Virginia area CB'ers when the town of Crozet was left drought-stricken. It appears that the town's only supply of drinking water was supplied without interruption due largely to the efforts of CB'ers who kept a 'round-the-clock watch on an emergency substitute source. In order to assure an uninterrupted supply of water through a 6" pipeline running to a pond, each of three pumping stations maintained constant communications with one another. CB'ers voluntarily operated their equipment at the stations for periods of eight hours after working full-time day jobs, and many of the volunteers traveled 50 or more miles to take over their shifts.

A member of the Suburban Mobile Radio Association, Royal Oaks, Mich., recently hinted within the columns of the club's newspaper that it might not be a bad idea for CB'ers to adopt a self-policing citizen committee program similar to the American Radio Relay League's Official Observer program. The ham group has a committee which selects applicants for Official Observers (licensed amateurs) who monitor other amateurs for possible FCC violations. Different classes of observers check such specifics as signal quality, operational procedures, and out-of-band operation.

The Official Observer has a supply of postcard forms to be sent to stations which might get in trouble with the FCC. The card (filled out) relates the condition observed, time and date, and the observer's name and address. A printed paragraph informs or reminds the recipient that the card is merely a "friendly notification," not a bawling out or citation. Observers then forward their monthly reports to the program committee. Neither this report or a committee report is sent to the FCC. The program is designed to help amateurs help one another in avoiding FCC citations. Food for thought?

We're Sorry! You asked for it, and we promised it, but it was very late in coming. To those of you who sent us your card many moons ago with a request for us to "Pse QSL"—the war's over. This is directed especially to those of you who threatened to drive a thousand miles to take your cards
back if we didn't send ours soon. Now you

Short-Wave Report

Johansen says that Europe, the United
States, Canada, South Africa, Australia,
New Zealand, and Japan take the honors.
In the U.S., WRTH is sold in 25 radio stores
and via mail order from Allied Radio, Ra-
dio Shack, etc. It may also be ordered di-
rectly from Gilfer Associates, P.O. Box 239,
Park Ridge, N.J., 07656. It's priced at $3.50
a copy.

Olaf Johansen's other publications
(WRTH Summer Supplement, WRTH Bul-
etin, and How to Listen to the World came
into being six years ago. The WRTH Bul-
etin and the WRTH Summer Supplement
were added to keep the listener up to date
on the latest changes in frequencies, sched-
ules and program information. His newest
publication is called News from Around the
World.

Speaking of the future of short-wave
broadcasting, Mr. Johansen believes that
stations will be turning more and more to
the use of higher powered transmitters in an
attempt to increase the size of their audi-
ences. As for short-wave listening, he feels
that it is on the increase, since more and
more people are becoming interested in for-
egn foreign affairs and the life, activities, and
view-
points of people in other countries. He wishes
he had more time to devote to it himself,
but his publications keep him pretty busy.

Matt, KHC2060
Current Station Reports

The following is a resume of current reports. At time of compilation all reports are as accurate as possible, but stations may change frequency and/or schedule with little or no advance notice. All times shown are Eastern Standard and the 24-hour system is used. Reports should be sent to P.O. Box 254, Haddonfield, N. J., 08033, in time to reach your Short-Wave Editor by the eighth of each month; be sure to include your WPE Monitor Registration and the make and model number of your receiver. We regret that we are unable to use all of the reports received each month, due to space limitations, but we are grateful to everyone who contributes to this column.

Afghanistan—Kabul has been noted on 9595 kc. at 0625 with music and some Eng. anmts. An ID was given at 0629 s/off.

Bangladesh—Tirana is being heard fairly well on 7090 kc. at 1400 in Russian, at 1430 in Arabic, at 1500 in Eng. (news around 1520), at 1530 in French, at 1600 in Italian, at 1630 in Eng., and at 1700 in Italian. All xmsns are a few moments short of the 30-minute scheduling.

Austria—World Radio Handbook sends this new schedule for Österreichischer Rundfunk: to Europe at 2300-1900 on 6000 kc., and at 0000-1700 on 6155 kc.; to Europe and the Middle East at 0100-1500 on 7245 kc., and at 0400-1200 on 9770 kc.; to N. Africa and the Middle East at 0400-1200 on 11,785 kc.; to N. A. at 1800-2330 on 6155 kc., at 1900-2300 (Saturdays) on 9770 kc., and at 1700-1800 (Mondays and Saturdays) on 6155 kc.; to S. America at 1900-0000 on 9526 kc., and at 1400-1600 (Mondays, Wednesdays, and Fridays) on 11,785 kc.; to the Middle East at 0100-0400 on 15,410 kc., at 0600-0900 on 15,240 kc., and at 1200-1500 (Sundays, Mondays, and Saturdays) on 9545 kc. Other xmsns are broadcast on Mondays, Wednesdays, and Fridays to S. Africa at 1000-1200 on 17,785 kc., and at 1200-1400 on 15,325 kc.; to Japan at 0000-0200 on 11,785 kc., and at 0200-0400 on 15,320 kc.; to India and Indonesia at 0400-0600 and 0800-1000 on 17,735 kc.; and to Australia and New Zealand at 0600-0800 on 17,745 kc.

Cambodia—R. Cambodge is planning a European service around 0100 in the 16-meter band. Further details are not yet available.

Canada—The Northern Service of R. Canada is on at 2000-0200 on 11,720 and 9585 kc., with the additional frequency of 5970 kc. now being used only at 2000-2130.

We have been receiving reports of a R. Canada xmsn on 4950 or 4960 kc. with s/off at 2300. This xmsn, in Spanish, is unconfirmed; does anyone have definite information on it?

Colombia—Station HJCF, Bogota, 5960 kc., has been noted with an apparently new ID: El Canal De Color. It is heard well at 0515-0530.

Cuba—Havana's changeable schedule now reads in part: to Northern Europe at 1520-1640 on 11,865 kc. (replacing 15,230 kc.); to N.A. at 2200-0100 on 6135 kc. (replacing 11,960 kc.); and to S. America at 1600-1700 on 15,400 kc. This is the Eng. schedule.

Always say you saw it in—POPULAR ELECTRONICS
Czechoslovakia—Prague broadcasts to N.A. daily at 2000-2055 and 2230-2325 on 9795, 9550, 7345, 6005, and 5930 kc. The 6005-kc. channel will be replaced by 11,905 kc. in March. A DX program and a stamp collector’s program are aired on alternate Thursdays. There is also a Sunday xmsn at 1000-1055 on 15,285 and 17,830 kc.

Dahomey—The latest schedule from R. Cotone reads: Monday to Friday at 0015-0145, 0615-0730, and 1200-1700; Saturdays at 0015-0145 and 0700-1800; Sundays at 0200-1700; all on 4870 kc.

Dominican Republic—R. Libertad, Santiago de los Caballeros, 6080 kc., is noted at 0515-0530 with an anti-Communist program. Other

Medium Waves

Here is a partial list of European stations currently being noted in East Coast areas. Most of the following stations were tuned from one to two hours after local sunset and again from approximately 0100-0400. (We would welcome a similar listing of trans-Pacific stations heard on the West Coast.) The figure in parentheses indicates the power rating in kilowatts. The figure preceding the location is the frequency in kilocycles.

584 Madrid, Spain (200)
647 Daventry, England (150)
665 Lisbon, Portugal (155)
674 Marseillaise, France (150)
684 Madrid (100)
755 Lisbon (155)
764 Sottens, Switzerland (150)
784 Mirimar, Portugal (100)
818 Cairo (300)
845 Rome (150)
863 Paris (150)
935 Sebaa Aioun, Morocco (25)
844 Toulouse, France (100)
1034 Parede, Portugal (25)
1088 Droitwich, England (150)
1196 Munich, Germany (150)
1205 Bordeaux, France (100)
1295 Cowbor, England (150)
1376 Lille, France (150)
1385 Kaunas, U.S.S.R. (150)
1457 Clevedon, England (20)
1466 Monte Carlo, Monaco (200)
1538 Mainflinger, Germany (300)
1554 Nice, France (60)
1578 Porto, Portugal (100)

reports, some conflicting, show R. Santiago, HRBZ, on 6060 kc. at 0500-0600 with music and to 0630 with news (Spanish) but with QRM from HRUC, Honduras, which, in turn, is reported by others to be operating on 6155 kc.

Ecuador—The “DX Party Line” from HCJB, Quito, is now aired on the first and third Monday of the month at 1630-1730 on 9745, 11,915, and 15,115 kc. “Ecuadorian Echos” is heard at 2100-2330 and again from 0130 on the same frequencies.

England—Your Short-Wave Editor apparently led many DX’ers astray by our comment last June that the BBC had no intention of operating between 75 and 100 meters. We meant to convey the fact that the BBC was

---
not planning to resume any operations in the two-megacycle band (such as they once had) although broadcasts would continue on 3952.5 and 3975 kc. These two channels are heard well evenings.

**Gobon—** R. Gabon, 6030 kc., has been noted in Brazil with test xmsns, closing as late as 1900; the language used is French. This station is located in Moanda and is rated at 5000 watts.

**Germany (East)**—The winter schedule for R. Berlin International in Eng. reads: at 1230-1300 and 1515-1545 daily on 6080, 6115, 7300, and 9730 kc., and at 1700-1730 daily on 6080, 6115, and 7300 kc. Xmsns to N.A. are at 2000-2030 and 2130-2200 (East Coast) on 9560 kc., and at 2245-2315 and 2345-0015 (West Coast) on 6080 kc.

**Germany (West)**—Here are some recent changes from Cologne. To the East Coast at 2035-2115 in Eng. and at 2115-2155 in French daily on 9640 and 0170 kc. (replacing 6175 kc.) in German at 1900-2200 on 9545, 6100, and 6000 kc. (replacing 5955 kc.) To the West Coast in German at 2200-0100 daily on 9640, 6100, and 6000 kc. (replacing 5955 kc.). Spanish to Latin America is now on 6145 and 9545 kc. (replacing 9735 kc.) daily at 0040-0140. Other Eng. xmsns changes: to East Asia, Australia, and New Zealand at 0345-0440 on 11,925, 17,845, and 15,185 kc. (replacing 15,410 kc.); at 1610-1700 on 5980 and 7205 kc. (replacing 7235 kc.). To S. Asia at 1050-1120 on 9735 and 7205 kc. (replacing 7235 kc.). To Africa at 0105-0135 on 11,785 and 9640 kc. (replacing 9685 kc.), and at 1520-1550 on 9735 and 7160 kc. (replacing 7290 kc.).

According to overseas sources, there is a station on 6615 kc. (announced as 6686 kc.) operating from the tower of the Luftansa radio exhibit around 0945. Has anyone heard it?

**Iceland**—R. Reykjavik, 11,780 kc., is tuned at 1530-1600 in Iceland for Icelanders abroad. This is a daily schedule.

**Israel**—Station 4XB3I, Jerusalem, 9009 kc., is on the air at 1100-1130 with world news and reports from Israel. The Eng. xmsn starting at 1515 has been changed to 1500 but still runs for 30 minutes.

**Ivory Coast**—Abidjan is the best heard African here (in Illinois); reception is best from 1300 to 1900 on 11,820 kc.

**Kuwait**—R. Kuwait can be heard on 15,150 kc.

---

**DX Awards Presented**

The following DX'ers have qualified for awards this month (150, 100, 75, 50, and 25 countries verified). Congratulations, and welcome to the Awards List!

### One-Hundred-Fifty Countries

Nathan Rosen (WPE2CY), New York, N. Y.

### One Hundred Countries

William S. Sparks (WPE6EXY), San Francisco, Calif.

### Seventy-Five Countries

Joe Russo (WPE8NHO), Trenton, Mich.

the medium-wave DX'ers, on 1439 kc. The 15,350-kc. outlet has been noted at 1640-1740 with pop music and annmts in French. Some sources claim that this station is located in England; our records indicate it to be Villa Louvigny, Luxembourg.

**Malaysia**—Stara Malaysia, Kuala Lumpur, is scheduled in Indonesian at 1830-1900, 0300-0530, and 0930-1130; Eng. at 1900-1930 and 0230-0259, and Mandarin at 1930-2000 and 0200-0230; all broadcasts being on 6105, 7110, 9635, 9750, and 11,900 kc. To date, reports indicate reception in N.A. only on 11,900 kc. Reports go to Radio Malaysia, Department of Radio, P. O. Box 1974, Kuala Lumpur, Malaysia.

**Mexico**—Station XEUDS, operated by the University of Sonora, Hermosillo, has moved from 6140 kc. to 6115 kc. to avoid QRM. It is best heard evenings with classical Mexican and light music and requests for reports in Eng. and Spanish.

Station XESC, Mexico City, is again active on 15,200 kc. and relays medium-wave XEMC.

Station XECMT, Ciudad Mante, 6090 kc., is heard at 1700-1800 with pop and folk music, frequent annmts and musical fanfares. They relay XECM, 1450 kc.

**Netherlands**—Hilversum now operates to N.A. in Eng. daily except Sunday; at 1625-1720 on 9715 and 6085 kc. (replacing 11,800 kc.). Another outlet, 11,710 kc., carries Dutch at 0700, 0830, and 1130. Dutch lessons are given on Sundays.

**Niger**—According to a QSL from Radio diffusion de Niger, the latest schedule is: Monday to Friday at 0030-0800 and 1400-1600, Saturdays at 0030-0800 and 1400-1700; Sundays at 0900-1600.

**Nigeria**—The Voice of Nigeria, Lagos. has been testing in Eng. and French at 0800-0900 on both 11,900 and 11,915 kc. Reports are requested. The Overseas Service in French is broadcast at 1400-1500 on 9690 kc.

Kaduna, 6090 kc., was noted from 0000 to 0200 with Eng. news at 0030-0040, BBC news and comment at 0100-0115. This channel has long been inactive.

Enugu is heard on 4855 kc. at 0000-0100 with Eng. music and commercials; a newscast is given at 0045.

**Peru**—Station OAX8E, R. Loreto, Iquitos, has moved from the 9-mc. band to 4735 kc.

March, 1964

111
and is readable at 2100-2300 with music and Spanish language.

Station OAZQ (call believed actually to be OAX8Q), R. Pulcallypa, is heard only when conditions are good, on 9580 kc., from 2135 to 2155 s/off.

R. Del Pacífico, OAZ4L, Lima, is a new station rated at 500 watts. Operating on 9675 kc., their schedule is 1200-2230.

Another new station is R. Pacasmayo, Pacasmayo, 4750 kc., noted around 2200, all-Spanish and few commercials.

South Africa—Stations currently being reported are: on 7270 kc. in Afrikaans with Eng. commercials in the African service at 2230-2300 s/off; on 9530 kc. at 0000-0100 and later with news, weather, sports news, no commercials; on 9595 kc. at 0015 in Eng., and on 9720 (R. Springbok) around 0000-0115 with mostly local programming.

Switzerland—There are now two xmsns to the United Kingdom and Ireland at 0630-0730 daily on 9665 and 7110 kc., and at 1430-1545 daily on 7110 and 6055 kc. Other changes in the Eng. schedule include: to Australia, New Zealand, and Japan at 0400-0515 on 21,520, 17,720, and 9665 kc. (replacing 17,795, 15,315, and 11,775 kc.); to the Far East at 0745-0900 on 11,865, 15,315, and 17,845 kc. (replacing 17,795 kc.); to the Near and Middle East at 1145-1300 on 9665 and 6055 kc. (replacing 11,865 kc.); to Africa at 0200-0315 on 17,795, 15,305, and 15,315 kc. (replacing 11,715 kc.). There are two new xmsns: to Spain in Spanish at 0600-0635 and to Africa in French at 1345-1415, both on 7110 and 9665 kc.

**SHORT-WAVE MONITOR CERTIFICATE APPLICATION**

All radio listeners interested in furthering the hobby of SWL'ing—regardless of whether you DX on the BCB, VHF, TV, SW, or FM bands—are eligible to apply for a POPULAR ELECTRONICS "Certificate of Registration." You must have verified (have QSL cards from) a minimum of five radio stations, of which one was outside the borders of the United States. There is no age limit, or special equipment qualification; the only requirement is that the applicant have a sincere interest in radio communications.

A new certificate processing procedure is currently in use. All certificates are filled in and lettered before mailing. All certificates are now mailed flat and unfolded. If you want to register and receive your WPE identification sign, fill in the new application blank below before April 15, 1964. Mail with 25 cents in coin to: Monitor, POPULAR ELECTRONICS, One Park Avenue, New York, N. Y., 10016. Canadians should use their own currency. All other applicants not in the U. S. A. should use five International Postal Reply Coupons. Allow 2-4 weeks for processing.

World Radio Handbook

Vatican City—Here is the Vatican’s latest ENG schedule with a few changes: to the U.S. at 1950 on 6145, 7250, and 9645 kc.; to the British Isles at 1000 on 7250, 9645, and 11,740 kc.; to Africa at 0500 and 0705 Central Africa at 0520 on 17,840 kc. (replacing 17,735 kc.) and 21,490 kc.; to Australia and New Zealand at 0630 on 15,120 and 17,720 kc. (replacing 17,840 kc.) and 1700 on 9645 and 11,740 kc. The broadcast to India, Pakistan, and Ceylon is now listed as being weekdays (previously Monday, Wednesday, and Saturday) at 1100 on 11,740 and 15,120 kc. The Philippine schedule remains intact.

Venezuela — La Voz de la Patria, YVKK, Caracas, is generally strong on 3315 kc. at 2300-2345 with news. The signal is much stronger than the listed 3000 watts would indicate. Station YVKK, R. Rumbo, Caracas, is also good on 4970 kc. any time after local sunset.

U.S.S.R.—Moscow is noted in Russian at 0800-1000 on 15,460 kc. with a program believed to be for Russians in the Western Hemisphere.

Clandestine—R. America, Swan Island, has moved up to 6050 kc., according to late reports.

RANGE GAIN—
POSITIVELY THE FINEST CB TRANSCIEVER YOU CAN BUY

RANGE GAIN is today the most popular and most wanted CB unit of all... offers every feature you could want in 2-way radio—and the power to make it really meaningful. Get the all-exclusive advantages of double side band reduced carrier as proved by Army, Navy, and Air Force communications; greater range, clarity of signal! 23 crystal controlled channels—transmit and receive included. Full 12-month warranty on unit and crystals. $269.95.

NEW RANGE GAIN TRANSCEIVER

NEW FLIGHT MONITORADIO AIRCRAFT RECEIVER

FOR THE AVIATION ENTHUSIAST OR PROFESSIONAL PILOT

No gimmicks here—you get solid voice communication where others fail! Clearly hear control towers, aircraft, approach control, etc. Nuvisor front end provides superior signal to noise ratio... 1µv sensitivity is best there is! The professional Flight Monitoradio outperforms “commercial grade” aircraft receivers with no-drift performance. Illuminated slide rule calibrated dial. 108 to 136 MC. 12-month guarantee. $79.95.

NEW FLIGHT MONITORADIO AIRCRAFT RECEIVER

NEW MONITORADIO FM EMERGENCY RECEIVERS

FRESH NEW STYLING FOR "BEST BUY" EMERGENCY RECEIVERS—FIXED OR MOBILE

Listen as police and fire calls tell of emergencies in your area... taxi and radio telephone calls reveal the busy activities of people on the go. Choose the receiver that best fits your needs from a Regency assortment providing a wide range of job-tested professional models. Select high or low band, crystal controlled or tuneable... from $59.95 to $169.95.
