<td>Complete training from basic fundamentals to home entertainment equipment: You learn to fix radios, hi-fi and stereo, black-and-white and color TV, etc. A profitable field full or part time.</td>
<td>From basic principles to computers. A comprehensive training plan that teaches you the fundamentals, then takes you into such modern-day miracles as servos, telemetry, multiplexing, pulse circuits, data processing, other important subjects. A brief course for engineers and technicians who need a quick review of the essential mathematics used in industry, communications, government jobs. Basic arithmetic review, short cut formulas, modern digital number systems much, much more.</td>
<td>Designed to teach and provide you with actual practice in operation, service, and maintenance of AM, FM, and TV broadcasting stations. Also covers marine, aviation, mobile radio, facsimile, microwave, radar.</td>
<td>This course is not for beginners. Offered f men with some fundamental knowledge of Electronics who want better understanding of Automation in present day use. Covers process control, ultrasonics, telemetering, and remote control, electromechanical measurements, other subjects.</td>
<td>Covers transmitters, direction finders, depth indicators, radar, sonar, other equipment used on commercial ships and thousands of pleasure boats. Prepares you for a First Class FCC License with Radar Endorsement.</td>
<td>Prepares you to install, maintain service aircraft communications equipment Covers direction finders, ranges, markers, Loran, Radar, landing systems. Earn your First Class FCC License with Radar Endorsement.</td>
<td></td>
</tr>
<tr>

### Skilled Technicians Are In Demand

There has never been a time when ambitious men with specialized Electronics knowledge were as much in demand as they are today. From television service shops to launching pads, there's a profitable place for you as a skilled technician to help service, operate, install, and supervise Electronically-controlled equipment. The NRI diploma is respected and recognized in business and industry. It can be your key to success in America's "glamor" industry.

### Achievement Kit Gets You Started Fast

As soon as you enroll with NRI we deliver to your door everything you need to make a fast start in the Electronics training of your choice. This new Achievement Kit is an unparalleled example of the value of NRI home-study training. No other school has anything like it. Find out about the NRI Achievement Kit, about NRI training equipment, about NRI courses, about opportunities for success in Electronics. Send for the NRI catalog. There's no obligation. No salesman will call. NATIONAL RADIO INSTITUTE, Electronics Division, Washington, D. C. 20016.

### Make $3 to $5 An Hour in Spare Time

You don't have to wait until you get an NRI diploma to start earning. As many others have done, you can be making $3 to $5 an hour in your spare-time as you train, fixing radios and TV sets for friends and neighbors. You learn how to install, maintain, and service stereo hi-fis, radios, TV sets (including color), even how to charge for service and how to set up your own spare-time or full-time business. Many students pay for their NRI training out of spare-time earnings long before they graduate.

MAIL POSTAGE-FREE CARD NOW
with the world’s most powerful all-directional base station antenna for Citizens Band...

**hy-gain’s CLR2**

With a Hy-Gain CLR2, any 5-watt transceiver delivers all-directional power equivalent to what you’d get with a 12.55 watt rig. *That’s “TALK POWER!”*

For maximum range and greatest reliability in your communications, Hy-Gain’s CLR2 is the one all-directional, non-rotating antenna that is built to do the job. It is loaded with electrical and mechanical features that clearly put it in a class all of its own. Take for example the electrically extended 5/8 wavelength vertical radiator. In test after test conducted by every authoritative source in the electronics field, a 5/8 wavelength radiator has conclusively proven to deliver a stronger signal over a greater area than either a 1/4 wavelength or 1/2 wavelength radiator. The chart graphically shows how power wasted in the atmosphere by 1/4 wavelength and 1/2 wavelength radiators is concentrated into a lower, more extended arc close to the horizon by a 5/8 wavelength radiator thus providing a stronger signal over a greater area.

What else does the CLR2 have that makes it deliver maximum “Talk Power”? It has the original static-removing “Top Hat” that drastically cuts receiver noise...a moisture-proof matcher that insures total electrical reliability...a unique electrical system that puts the entire antenna at DC ground for maximum static removal and lightning protection...rugged, heavy duty, all-weather construction rated to withstand winds up to 100 mph. For maximum “Talk Power”—greatest readability—you’ll want a CLR2...a bargain in power at $29.95 Net.

DEVRY TECH NOT ONLY TRAINS YOU... BUT HELPS YOU GET STARTED AT NO EXTRA COST IN THE BIG-MONEY FIELD OF ELECTRONICS!

PREPARE AT HOME

Whether you want to prepare for a good-paying new job or for advancement in Electronics with your present employer, DeVry Tech offers specialized educational programs designed to meet your needs. You set up your own HOME LABORATORY and work over 300 construction and test procedures to develop on-the-job type skills. You build a quality Transistorized Meter, a 5-inch Oscilloscope and a special Design Console. DeVry also includes modern "programmed" texts, instructive motion pictures, Consultation Service. Effective? Yes!

RESIDENT SCHOOL

If you prefer you may get all of your training in DeVry's U.S. or Canadian resident schools under the close guidance of friendly, experienced instructors. You work with a wide variety of commercial equipment similar to that actually used in Industry as you prepare in our laboratories for a technician's job in Communications, Microwaves, Radio-Television, Automation, Radar, Computers, or other branch of Electronics. DeVry even provides part-time job placement service to those who wish to earn extra money while attending day or evening classes.

PLACEMENT SERVICE

Meet W. E. Bartz, who has helped thousands of DeVry men toward exciting, profitable careers in Electronics. When YOU complete your program, he will help you too. As Placement Manager in touch with business and industry across the nation, Bartz knows the employer demand for DeVry-trained men. He has cooperated in placing our graduates with thousands of firms!

Men 18-45, start preparing NOW for this vast opportunity field. Soon you should be ready for DeVry's valuable employment help!

BUILD YOUR OWN LIGHT-OPERATED SWITCH

In and Around the House
For Dozens of Applications

Light up the night with RCA SCR Experimenter's Kits. These kits, containing a full complement of active components, rectifiers, transistors, a silicon controlled-rectifier, and a photocell, plus other readily available passive components and hardware enable you to build a light-operated switch for garage, yard or path, or even a sign that can be activated by auto lights. RCA Experimenter's Kits offer considerable flexibility in the number and kind of control circuits you as a hobbyist can build. With just three RCA kits, you can build any of 14 different circuits with hundreds of applications. Easy-to-follow directions for all 14 circuits are given in RCA Experimenter's Manual, KM-70.

Your RCA Semiconductor Distributor has Basic and Add-On Kits as well as the RCA Experimenter’s Manual on display. See him about the solid-state circuit you have in mind. Do it today!

"Sure, you work hard, but that's not enough...

...you need more education to get ahead in electronics"

No matter how hard you work, you can't really succeed in electronics without advanced, specialized technical knowledge.

Going back to school isn't easy for a man with a full-time job and family obligations. But CREI Home Study Programs make it possible for you to get the additional education you need without attending classes. You study at home, at your own pace, on your own schedule.

CREI Programs cover all important areas of electronics including communications, servomechanisms, even spacecraft tracking and control. You're sure to find a program that fits your career objectives.

You're eligible for a CREI Program if you have a high school education and work in electronics. Our FREE book gives all the facts. Mail coupon or write: CREI, Dept.1206-D, 3224 Sixteenth Street, N.W., Washington, D.C. 20010

VERSATILITY

This is the Amphenol 650, a 5 watt solid state CB transceiver.

Here the same 650 is mounted in an Amphenol Portable Pak. Fully portable—only 16 lbs. with transceiver and battery.

Using this gutter-mounted antenna, the 650 becomes a rugged mobile unit.

This 40" telescoping portable antenna is ideal for field operation.

In CB, Amphenol means versatility. Choose from a wide line of solid state radios: hand-held or mobile, AC or DC, 100 mw to 5 watt. Add to these the industry’s broadest accessory lineup—and you’ll see why Amphenol CB equipment helps you do more jobs in more places. Your Amphenol dealer will show you how.

MUCH ADO ABOUT HERTZ

In “Old World Standards Breaking Through” (April, 1966) you question the sensitivity of adopting hertz as a unit of frequency. If cycle and hertz were equivalent, you might have a valid gripe. Actually, hertz is equivalent to cycles per second, and is a true frequency unit. Too often frequency is specified in cycles and the per second factor tacitly assumed. This may justify, in part, the creation of a new unit.

DANNY W. MCDONALD
Silver Spring, Md.

I agree that the term cycles is time-honored and sensible. Since one hertz equals one cycle, however, no real change is being made, so it’s kind of unimportant. But wow! When I got down to the bottom of the article, I darn near fell over. It actually looks like you said you don’t like the metric system! Incredible!

WILLIAM H. ROBERTS, III
Reno, Nev.

In reference to the term “Hertz” in place of the word cycle, I get the feeling there is almost nowhere to turn in an effort to do something about this sort of thing. The tone of the announcement in the April issue is as if you have raised your eyebrows, shrugged your shoulders, and then turned the other way. Perhaps this isn’t quite true but you leave me with the thought that you have a “hands tied” attitude. Is there no editorial objection to a thing like this?

C. S. STOCKSLAGER
Brookfield, Ill.

We have no disagreement with you, Danny. You do admit that while the “old” frequency designators did infer cps, they generally did

POPULAR ELECTRONICS
Choose Your Tailor-Made Course in N.T.S. "PROJECT METHOD" ELECTRONICS!

Now! N.T.S. — one of America's oldest leading home-study and resident technical schools — offers you GREATER CAREER OPPORTUNITIES IN ELECTRONICS. N.T.S. 'Project Method' home training lessons are shop-tested in the Resident School in Los Angeles. You work on practical job projects, learn to use shop manuals and schematics. Your N.T.S. training is individual. You proceed at your own pace. The Schools' practical methods, plus more than 60 years of experience, have helped thousands of students all over the world to successful careers. Prepare now for a secure future in one of 8 N.T.S. Electronics Courses designed to fit your own particular needs.

CHOOSE YOUR FIELD - INSURE YOUR FUTURE!

1 ELECTRONICS-TV-RADIO-SERVICING & COMMUNICATIONS A basic course thoroughly covering fundamentals of electronics, radio, TV servicing and communications.

2 MASTER COURSE IN ELECTRONICS-TV-RADIO, PLUS ADVANCED TV & INDUSTRIAL ELECTRONICS This course covers everything included in Course No. 1 plus Automation and every phase of the Electronics industry.

3 FCC LICENSE Preparation for this government license essential for interesting jobs in radar, radio, television, communications, guided missiles, many others. Upon completion of this course, if you do not pass the FCC exam for a 1st Class Commercial Radiotelephone License your tuition will be refunded.

4 RADIO SERVICING (AM-FM-Transistors) Train for radio sales and service with dealer or distributor.

5 TELEVISION SERVICING (Including Color) Covers installation, adjustment, repair and servicing of black and white and color television ... prepares you for your own sales and service business.

6 STEREO, HI-FI AND SOUND SYSTEMS A growing field. Prepares you to build, install and service modern sound equipment for home or industry.

7 BASIC ELECTRONICS Gives you the fundamentals you must know to build on for a future Electronics career. Also offers an excellent background for Salesmen, Purchasing Agents, and others in Electronics.

8 ELECTRONICS MATH Simple, easy-to-follow instructions in the specialized math you need in many electronics jobs.

CLASSROOM TRAINING AT LOS ANGELES

You can take classroom training in our famous Resident School at Los Angeles in Sunny Southern California. N.T.S. is the oldest and largest school of its kind. Associate in Science Degree also offered in our Resident Program. Check Resident School box in coupon for full details.

MAIL COUPON TODAY FOR FREE BOOK AND SAMPLE LESSON In Field of Your Choice. You enroll by Mail — and Save Money. No Salesmen. This means lower tuition for you, accredited Member N.H.S.C.

LETTERS (Continued from page 6)

not carry the per second notation. Could be the term hertz is a step in the right direction, but it too will infer "per second." Bill, honest and truly, we have nothing against the metric system. See "Comes The Revolution" (May, 1966) for some very good reasons why we should use the metric system. We just didn't want to upset our printer, at least for another month. There is no way to turn, C.S., except maybe in cycles. There are many very fine electronic products on the surplus market that have been shunted aside by an ever-expanding technology, and electronics magazines that don't keep up with the changing standards will be competing for shelf space with these products.

ULTRASONIC OMNI-ALARM

In the explanation of how the "Ultrasonic Omni-Alarm" works (April, 1966), the last sentence in the first column on page 43 should read "resistor R5 isolates the transducer," not R8. Resistor R8 is part of the biasing network for Q2.

George Corning
Redondo Beach, Calif.

The Parts List for the Ultrasonic Omni-Alarm calls for a 0-15 volt d.c. voltmeter. The front cover of the magazine shows a 0-10 ma.

meter on the alarm. Which is correct? Please send your answer as soon as possible so I can get started on this wonderful project.

Jim Varrone
Miami, Fla.

Thank you, George; you're right. Jim, the Parts List is correct even though the cover does show a 0-10 ma. meter. It's possible that the author monitored current instead of voltage with the original model. Actually, the meter is optional, but it does make it easier to adjust alarm operation.

ELECTROMAZE WINS AGAIN

In response to your invitation for comments on the "Electromaze Puzzle" (April, 1966), let me tell you what happened to me the first time out. Starting at "Start," I tried hard to think of a 20-letter synonym for oscil-
The ideal base/mobile combination for CB radio

FOR BASE STATIONS where
117 V 60 cycle AC current is available...

FOR MOBILE UNITS where low
power consumption is important...

The Low-Cost
RCA Mark VIII and Mark NINE
- 9 crystal-controlled transmit and receive channels.
- Tunable receiver for reception of 23 CB channels, dial marked in both channel numbers and frequency.
- Exceptionally good voice reproduction.
- Highly selective superheterodyne receiver with one RF and two IF amplifier stages.
- Electronic switching—no relay noise or chatter.
- Illuminated "working channel" feature.
- Light and compact—only 3 3/4 inches high, weighs only 9 pounds with mike.
- Improved Automatic Noise Limiter.

Plus these EXTRA features in the Mark NINE
- Combination "S" Meter and relative RF Output Meter (indicates relative strength of incoming signal) and Relative RF Output Meter (indicates relative strength of signal being transmitted).
- Spotting Switch. Permits precise manual tuning of receiver without use of receiver crystals.
- External Speaker Jack. Lets you connect an external speaker to set, so that incoming calls can be heard in remote locations.

Mark VIII: $99.95*  
Mark NINE: $114.50*  

The all-solid-state
MARK 10
- All silicon transistors assure low power consumption, dependable communications at temperatures from —23° to +130° F.
- Compact, lightweight. Fits easily under dash of any car or truck. Only 3 3/4" high, 5 3/4" deep, 8 1/2" wide. Weighs less than 4 1/2 pounds.
- 12 crystal-controlled transmit and receive channels with illuminated channel selector.
- Combination "S" Meter and relative RF Output Meter.
- Operates from 12-volts DC power source (positive or negative ground).
- Crystal-controlled double conversion, superheterodyne receiver provides frequency accuracies greater than 0.004%.
- Separate AGC amplifier eliminates blasting and overloading. Minimizes fading.
- Six-stage IF bandpass filter for maximum selectivity without ringing.
- Low-distortion, series-type noise limiter with automatic threshold adjustment.
- Receiver power regulated for maximum stability.
- Acoustically designed cabinet with audio characteristics shaped for maximum intelligibility.
- External speaker jack (de-activates internal speaker).

Mark 10: $189.95*  
*Optional distributor resale price.

CIRCLE NO. 7 ON READER SERVICE PAGE

LETTERS (Continued from page 8)

loscope. I skipped down to Exit 1 and tried to work backwards. Obviously I had to be "neutron," but I had a heck of a time trying to think of a 20-letter synonym for "align." So then I skipped down to Exit 2 and found that I had a choice of either of two synonyms for "mica," one with 10 letters and one with 19 letters, the fourth letter being "a" in either case. Down I went to the final exit; the nut to crack here seemed to be an 11-letter synonym for "radian."

In the firm conviction that your magazine must be intended for intellects much more powerful than mine, I crawled like a miserable 10-fingered mass of brainless tissue toward p. 107 and the solution. You know what I found—vast expanses of white squares gaping where I had tried to fit in the weirdest of etymological concoctions! I will eventually recover from the bone-crushing blow to my ego, and my subscription will still be running, so let's have some more "Electromaze Puzzles" by all means.

Stuart W. Kellogg
Lexington, Mass.

ANTENNA STUBS

For years our television set has been "haunted by ghosts." We tried everything: noise filter, interference filters, additions to the antenna, etc. Nothing worked. Then we read the item in your Tips and Techniques column (March, 1966) entitled "Mismatch Stub Chases TV Ghosts." It works.

Harry Goldstein
Toronto 3, Ont., Canada

REFLEXED REFLEXOMETER

The "Reflexometer" (March, 1966) presented an immediate challenge because of the rather obvious waste of relay contacts. With a little rearranging, I was able to use d.p.d.t.'s in place of your 4p.d.t. relays. I hated to see half of the second set of contacts wasted, so I added a buzzer to liven things up.

Carl Stanislawski
Adelphi, Md.

If you are really ambitious, you can add four more players, hook up a bell and a buzzer, and you can play College Bowl.

John Poranz
Athens, Ohio

Although this circuit is an unusual application of electronics to the world of games, the use of relays seems wasteful, since they are very expensive, and their price far outweighs the toy's possible play value. With the
Hallicrafters' new CB-19 transceiver is about as sleek and trim and compact as an infantry boot.

That's why there's room for the "S" meter, the receiver tuning VFO, the king-size communications speaker and unsurpassed basic performance—for only $149.95

You'll get a boot out of these features!
- 8 crystal-controlled channels. 23-channel receiver tuning with frequency spotting switch.
- Built-in, amateur-type "S" meter. All-electronic push-to-talk circuitry. Dual conversion, superheterodyne receiver. Superior sensitivity—less than 1 microvolt for 10 db S/N.
- Hallicrafters' exclusive "Racket Buster" built-in noise limiter.

Hallicrafters
5th and Kostner Aves.
Chicago, Ill. 60624

"Quality through Craftsmanship"

June, 1966
LETTERS  (Continued from page 10)

use of the "amazing" NE-2 neon bulb, however, this circuit can be constructed without relays at a small fraction of the original cost, and with the advantage of faster response.

GARRY BORESS
Nanuet, N. Y.

Interest in the "Reflexometer" is running high. We have received several modifications and will try to present a number of them in the September or October issue. We are thinking of offering cash prizes for the best or most unusual modifications. A penciled diagram and a brief explanation of how it works is all that is necessary, but a photo of the unit you built will also be useful. Send them to: Letters Editor. POPULAR ELECTRONICS, One Park Avenue, New York, N. Y. 10016.

DISCOURAGING PATENT PROCEDURES

I have several of what I feel to be more than just useful good ideas that I would like to patent. I have tried going through lawyers' offices and find that they have too long an arm and I have too short a pocketbook. Can you give me the ABC's of getting patent work done so that I might reap some financial gain?

DON PECK
Pilot Rock, Oreg.

Don't obtaining a patent is a highly specialized form of legal endeavor. There is no inexpensive substitute for a good patent attorney.

NOT ENOUGH HOURS IN A DAY

Your magazine is a "trouble maker." Almost every issue has a project in it that I have to construct in order to satisfy myself. It interferes with my work and study courses. On the other hand, your projects have taught me how to handle transistors, and I have enjoyed myself. I should very much like to see more R/C projects and possibly a transistor tester that can show frequency cutoff.

DONALD L. BEABOUT
St. Louis, Mo.

Donald, it looks like you are going to be absent from work and flunk some of your study courses, because we have more trouble for you in the works.
BUILD 20 RADIO CIRCUITS AT HOME with the New Improved PROGRESSIVE RADIO "EDU-KIT®"

ONLY $26.95

A Practical Home Radio Course

Now Includes
- 12 RECEIVERS
- 3 TRANSMITTERS
- SQ. WAVE GENERATOR
- SIGNAL TRACER
- AMPLIFIER
- SIGNAL INJECTOR
- CODE OSCILLATOR

You DON'T HAVE TO SPEND HUNDREDS OF DOLLARS FOR A RADIO COURSE

The "EDU-KIT" offers you an outstanding PRACTICAL HOME RADIO COURSE at a realistic price. Our experienced instructors are trained in Radio and Electronics technicians, making use of the most modern methods of home training. You will learn radio theory, construction practice and servicing. THIS IS A COMPLETE RADIO COURSE OF EVERY DETAIL.

You will learn how to build radios, using regular schematics; how to wire and solder in a professional manner; how to service radios. You will work with actual parts to provide a thorough knowledge of the development of Printed Circuit chasses.

You will learn the basic principles of radio. You will construct, study and work with RF and RF equipment. You will learn the theory and practice of working with Printed Circuit Tracer, Progressive Signal Tracer, Progressive Dynamic Radio & Electronics Tester, Square Wave Generator and the accompanying instruction Manual.

You will receive training for the Novice, Technician and General Classes of F.C.C. Radio Amateur License. You will build Receiver, Transmitter, Square Wave Generator, Code Oscillator, Signal Tracer and Signal Injector circuits, and learn how to operate them. You will receive an extensive background for television, hi-fi and electronics.

Absolutely no previous knowledge of radio or science is required. The "EDU-KIT" is the product of many years of input and engineering experience. The cost of Printed Circuitry and Radio, worth many times the low price you pay. The Signal Tracer alone is worth more than the price of the kit.

THE KIT FOR EVERYONE

You do not need the slightest background in Radio & Electronics because you want to start a new hobby, or a well-paying business or a job with a future, you will find this kit a worthwhile investment.

Many thousands of individuals of all ages and backgrounds have successfully used the "EDU-KIT" and passed F.C.C. examinations to the surprise of themselves and their friends.

PROGRESSIVE TEACHING METHOD

The Progressive Radio "EDU-KIT" is the foremost educational radio kit in the world, and is universally accepted as the standard in the field of electronic training. The "EDU-KIT" uses the modern educational principle of "Learn by Doing." Therefore you construct, learn schematics, study practice, practice trouble shooting—a closely integrated program designed to provide an easily learned, thorough and interesting background in radio, television, and electronic theory. Laid out in an easy-to-understand manner, you will build radio parts of the "EDU-KIT." By the time you finish the "EDU-KIT," you will be ready to operate a complex radio. With this first course, you will enjoy listening to regular broadcast stations. Learning radio is a simple matter of practice testing and constructing electronic components under your own control.

Gradually, in a progressive manner, and at your own rate, you will find yourself building more and more complex multi-tube radios under your own full control. You will work under the guidance of a professional Radio Technician.

In the "EDU-KIT" course are Receiver, Transmitter, Code Oscillator, Signal Tracer, Square Wave Generator and Signal Injector Circuits. These are not unprofessional "EDU-KIT," which are not intended for commercial use or as a hobby. You will discover, you will learn how to solder and repair radio circuits, construction, theory and practice of trouble shooting and servicing on metal chassis, plus the latest method of radio construction known as "Printed Circuitry." You will be ready to operate on your own and run DC house current.

THE "EDU-KIT" IS COMPLETE

You will receive all parts and instructions necessary to build twenty different radio and electronics circuits, each guaranteed to operate. Our kits contain tool, tube sockets, variable, electrolytic, mica, ceramic and paper dielectric condensers, resistors, the straps, hardware, tubing, punched metal chassis, instruction Manuals, hook-up wire, solder, selenium rectifiers, coils, volume controls and switches.

In addition, you receive Printed Circuit materials, including Printed Circuit chassis, special tube sockets, hardware and instructions. You also receive a useful set of tools, a professional electric soldering iron, and a self-powered Dynamic Radio and Electronics Tester. The "EDU-KIT" also includes Code instructions and the Progressive Code Oscillator. In addition to F.C.C. Radio amateur license training. You will also receive lessons for servicing with the Progressive Signal Tracer and the Progressive Signal Injector. A High Fidelity Guide and a Quiz Book. You receive Membership in Radio-TV Club, Free Consultation Service, Certificate of Merit and Discount Privileges. You receive all parts, tools, instructions, etc. Everything is yours to keep.

PRINTER CIRCUITY

At no increase in price, the "EDU-KIT" now includes Printed Circuitry. You build a Printed Circuit Signal Injector, a unique servicing instrument that can detect many Radio and TV troubles. This is a revolutionary new technique of radio construction is now becoming popular in both radio and TV sets.

A Printed Circuit is a special insulated board on which has been deposited a conducting material which takes the place of wiring. The various parts are merely plugged in and soldered to terminals.

Printed Circuitry is the basis of modern Automation Electronics. A knowledge of this subject is a necessity today for anyone interested in Electronics.

SERVICING LESSONS

You will learn trouble-shooting and servicing in a progressive manner. You will practice repair of the sets that you construct. You will learn symptoms and causes of trouble in home, portable and car radios. You will learn how to use the professional Signal Tracer, the code, the Progressive Signal Tracer, Progressive Dynamic Radio & Electronics Tester, while you are learning in this practical way, you will be able to do a repair job for your friends and neighbors. Charge less which will far exceed the price of the "EDU-KIT." Our Consultation Service will help you with any technical problems you may have.

FROM OUR MAIL BAG

J. Stattonis, of 25 Poplar Pl., Waterbury, Conn., writes: "I have repaired several sets for my friends, and made money. The "EDU-KIT" paid for itself. I was ready to spend $240 for a Course, but I found your ad and sent for your Kit. I am pleased with this kit." A. J. Cardinal, of 730 Broadway, New York City, writes: "The "EDU-KIT" is wonderful. Here I have saved $100 in new sets. The "EDU-KIT" has saved me $200 on repairs. I also fixed the wire and all the parts at the local radio store. I have quickly failed to repair radios with your Kit, and I have been able to work with Radios, and like to build Radio Testing Equipment. I have sold your Kit every minute I worked with the different kits: the Signal Tracer works well, and I leave you to know that I feel proud of becoming a member of your Radio TV Club." A. J. Cardinal, of 730 Broadway, New York City, writes: "The Trouble-Shooting Tester that comes with the Kit is really sweet, and I made the trouble, if there is any to be found."}

END-OF-TAPE SIGNALS TELL YOU WHEN TO STOP

There's nothing more aggravating when you're recording a program than to discover that the end of the tape has come off the reel—unless it's having the tape come off the rewind reel when you are rewinding. Fold two pieces of Scotch tape in the shape of a "U" and slip them over the tape—sticky side touching both sides of the tape—about 10 feet from each end. They should be long enough so that they protrude about ½" from the top of the tape. When the tape reaches either point, there will be an unmistakable click—which will tell you it's time to stop the machine. If you use red Scotch tape, you can also make a visual check.

—William S. Gohl

HOODED SCOPE SHIELDS TRACE FROM SIDELIGHTS

If your oscilloscope has a projecting rim around the CRT face, you can easily make a viewing hood to improve trace definition in a lighted room. Drill a clearance hole for a sheet metal screw at the top center of the rim as shown, and drill a tap hole for this screw in an empty coffee can (a 2-lb. can is just the right size for a 5" scope) to line up with the hole in the rim. Remove the bottom of the can and dress the edges to prevent cuts and scratches. Paint the inside flat black to eliminate re-

(Continued on page 20)

TURNER +2 "The CB World's new Favorite."

That's what many +2 owners say, and we're glad they're so enthusiastic. It's the only microphone on the market that actually increases the output of your microphone up to 50 times at the twist of a dial. It makes a world of difference on CB (and amateur), so why in the world don't you get one? List Price $49.50

RCA TRAINING can be the smartest investment you ever made!

Start building a profitable career in electronics now! New RCA "AUTOTEXT" programmed instruction will help you learn faster and easier!

If you're considering a future in electronics, now is the time to start! A great new teaching aid—"AUTOTEXT" programmed instruction developed by RCA and introduced by RCA Institutes will help you master the fundamentals of electronics almost automatically. Even people who have had trouble with conventional home training methods are finding it easier and more fun to start their training in Electronics Fundamentals the RCA way. Prove it to yourself as others throughout the country are now doing. An interest or inclination in electronics is what you need. RCA "Autotext" helps you to do the rest. You'll be ready to go on to advanced training sooner than you ever thought possible! The future is unlimited; the jobs are available. The important thing is to get started now.

Founded in 1909, RCA Institutes is one of the largest technical schools in the United States devoted principally to electronics. The very name "RCA" means dependability, integrity, and scientific advance. RCA Institutes offers the finest facilities of home training. A Service of the Radio Corporation of America, RCA Institutes gives you the technical instruction you need to plan, build and realize the career you want in today's fastest growing field.

Investigate your future now at RCA Institutes. It can be the smartest investment you ever made.
HOME TRAINING COURSES

RCA Institutes offer this complete selection of Home Training Courses

- Electronic Fundamentals
- Electronic Fundamentals (in Spanish)
- TV Servicing
- Color TV Servicing
- Transistors
- Communications Electronics
- FCC License Electronics
- Mobile Communications
- Automation Electronics
- Automatic Controls
- Industrial Applications
- Nuclear Instrumentation
- Digital Techniques
- Computer Programming
- Drafting

Liberal Tuition Plan. All RCA Institutes Home Study courses are available under a Liberal Tuition Plan. This plan affords you the most economical possible method of home study training. You pay for lessons only as you order them. If, for any reason, you should wish to interrupt your training, you can do so and you will not owe a cent until you resume the course. No other obligations! No installment payments required.

RCA Personal Instruction. With RCA Home Study training you set your own pace in keeping with your own ability, finances and time. RCA Institutes allows you ample time to complete the course. Your lesson assignments are individually graded by technically trained personnel, and helpful comments are added where required. You get theory, experiment, and service practice beginning with the very first lesson. All lessons are profusely illustrated. You get a complete training package throughout the entire course.

You Get Prime Quality Equipment. All kits furnished with the course are complete in every respect, and the equipment is top grade. You keep all the equipment furnished to you for actual use on the job...and you never have to take apart one piece to build another.

CLASSROOM TRAINING IN NEW YORK CITY

No previous training required. You are eligible even if you haven't completed high school.

RCA Institutes Resident School in New York City offers training that will prepare you to work in rewarding positions on research and production projects in fields such as automation, transistors, communications, technical writing, television, computers, and other industrial and advanced electronics applications. If you did not complete high school, RCA will prepare you for such training with courses specially designed to provide the basic math and physics required for a career in electronics. Check classroom training on attached card, and full information will be rushed to you.

Coeducational Day and Evening Courses. Day and Evening Courses are available at RCA Resident Schools in New York City. You can prepare for a career in electronics while continuing your normal full-time or part-time employment. Regular classes four times each year.

SEND POSTCARD FOR FREE ILLUSTRATED BOOK TODAY!

TIPS (Continued from page 14)

Reflections. (For a more professional appearance, you can paint the outside of the can as well.) The hood can be quickly installed and removed without any tools.

—Charles Erwin Cohn

ICE TONGS COOL HOT FINGERS

The last time I got burnt pulling a hot tube with my bare hands, I decided to prevent it from happening again. I glued two small strips of foam rubber packing inside the jaws of an old ice-cube picker-upper to make a tube puller. And do you know what? No more burnt fingers.

—Ken Weitzenhoffer

SALVAGE TERMINALS FROM OLD BATTERIES

Why not save a few pennies and salvage the terminals from your worn-out batteries, for use in construction projects? It’s a cinch to remove them. Some batteries, such as the 9-volt transistor type, have male and female connectors mounted on an insulated strip. You can remove this strip without breaking it, or cut it in half, according to your needs. Terminals and sockets from other types of battery packs can be salvaged in a similar manner. Be sure to use care when opening the batteries to avoid messing up your clothing and your work area.

—William S. Gohl

“TIPS” WANTED

Do you have a favorite “tip” or “technique” that you would like to pass on to other readers? It may be worth money to you. Send it in (about 100 words or so, with a rough drawing and/or a clear photograph), and if it is accepted, you will receive a check in return. The size of the check will depend upon the originality of the idea and how practical it is. Material not accepted will be returned. Address the “package” to: Tips & Techniques Editor, POPULAR ELECTRONICS, 1 Park Avenue, New York, N. Y. 10016.
A COMPLETE SELECTION OF ANNUALS, YEARBOOKS, DIRECTORIES AND HANDBOOKS from the world’s largest publisher of special interest magazines. They’re all editions that have escaped many of our readers in past years and are still on their most wanted list. Take a moment to review the titles still available. You’re sure to find many of your favorites.

TO PLACE YOUR ORDER, circle the numbers of the annuals you wish to receive on the coupon, clearly print your name and address and enclose your remittance. Please be sure to enclose an additional 15¢ shipping and handling for each copy ordered. Add 50¢ per copy for orders outside U.S.A.

Ziff-Davis Publishing Co.—Dept. 50
One Park Avenue, New York, N.Y. 10016
I am enclosing $ for the annuals circled below. My remittance includes an additional 15¢ per copy for shipping and handling (50¢ for orders outside U.S.A.). I understand quantities are limited and orders will be filled on a first-come-first served basis.

NEW PRODUCTS

Additional information on products covered in this section is available from the manufacturers. Each new product is identified by a code number. To obtain further details on any of them, simply fill in and mail the coupon on page 15.

CAR RADIO CONVERTER

Want to know where the fish are biting? You can tune to ship-to-ship broadcasts at the flick of a switch if you install Pearce-Simpson's "Monitor" in your car. It converts an ordinary domestic or foreign car radio into a powerful marine receiver. Only 4 1/2" x 1" x 2 1/4", the solid-state, self-powered unit weighs just 6 ounces and can be installed in 10 minutes. It draws 200 times less current than an ordinary flashlight bulb. The "Monitor" will enable you to receive marine weather reports, Coast Guard emergency signals, marine operators, and time checks (from Station WWV).

Circle No. 75 on Reader Service Page 15

FIVE-CHANNEL MIXER-AMPLIFIER

A well-known loudspeaker manufacturer, R. T. Bosak, has announced its first entry in the electronic field: the Model CMA-5-50 mixer-amplifier. This solid-state unit combines on a single chassis a mixer with five individual level-controlled input channels and a 50-watt power amplifier. The input channels are modular plug-in circuit cards; any of three types of channel can be plugged into any of the five inputs. Both low-level microphone input, with RTAA equalization, and high-level input are available. Overall frequency response of the amplifier is within 1 1/2 db from 20 to 20,000 cycles. Portable case optional.

Circle No. 76 on Reader Service Page 15

FET AM/FM STEREO RECEIVER

Virtually total elimination of all cross modulation and drift, plus greater usable sensitivity, is promised by H. H. Scott's 382 solid-state AM/FM/FM stereo receiver—the 65-watt 382 is the first receiver to utilize new field-effect transistors in both AM and FM front-end circuitry. Features include the automatic adjustment of tuner bandwidth for the quality of the incoming signal and an automatic gain control. The tuner section includes a silver-plated FET front end for 2.5-µv. sensitivity (11IP) with 85 db cross modulation rejection. The solid-state amplifier stage delivers a conservative 32.5 watts music power per channel into a 4-ohm load (22.5 watts per channel at 8 ohms).

Circle No. 77 on Reader Service Page 15

25-CHANNEL CB TRANSCEIVER

Two emergency H.E.L.P. channels are featured in Lafayette Radio Electronics' imported "Comstat 25" transceiver in addition to the regular 23 CB channels. The "Comstat 25" utilizes a frequency synthesizer circuit to provide crystal control for all 25 channels on both receive and transmit functions. Its dual-conversion receiver has 0.8-µv. sensitivity, selectivity of 6 kHz at 26 db down, illuminated tuning dial and S-meter, variable squelch and variable fine tuning. The transmitter features an advanced "Range Boost" circuit, modulation indicator, and a switch for p.a. work. "Comstat 25" is supplied with all crystals, mobile mounting bracket, and ceramic push-to-talk microphone.

Circle No. 78 on Reader Service Page 15

MAGNET-BASE CB ANTENNA

The Alnico magnet in the base of Hy-Gain Electronics' "Magna-Topper" mobile CB antenna permits instant installation on any car, truck, tractor, or other vehicle. There are no holes to drill, no special tools required. You simply hook up the feedline furnished with the antenna to any CB transceiver, place the antenna on the roof top, trunk deck, or any other metal surface, and that's it. Tests have shown that the magnet will hold the antenna in place even at speeds of over 80 mph. And the antenna can be easily moved from vehicle to vehicle. Just 29" tall, the "Magna-Topper" has a durable stainless steel whip section...
Who makes the only great amplifier for $99.50?

You do... with the new Fisher KX-90 StrataKit.

Now, for the first time in high fidelity history, you can own a truly distinguished stereo control-amplifier for less than $100—if you are willing to build it yourself.

Fisher refuses to compromise quality. Therefore, even at $99.50, the Fisher KX-90 StrataKit incorporates the same basic standard of fidelity as the most expensive Fisher components. Take away its price tag and it would still excite the admiration of the fastidious audiophile.

With 40 watts of clean power, the KX-90 can drive even inefficient speakers to their maximum performance level. Superior output transformers make certain this power will not fall off steeply at the frequency extremes. Advanced preamplifier features, including rocker switches and complete phono/tape facilities, provide unlimited flexibility.

It's all yours if you follow directions. And that's no problem with the exclusive Fisher StrataKit method. No experience is necessary. Assembly takes place by simple, errorproof stages (Strata). Each stage corresponds to a separate fold-out page in the uniquely detailed instruction manual. Each stage is built from a separate packet of parts (StrataPack). Major parts come already mounted on the extra-heavy-gauge steel chassis. Wires are precut for every stage—which means every page. All work can be checked stage-by-stage and page-by-page, before proceeding to the next stage.

The end result is a Fisher stereo control-amplifier that is fully equal in performance as well as reliability to its factory-wired prototype. Fisher guarantees this. And who should know better than Fisher?

FREE! $1.50 VALUE!
Send for The New Kit Builder's Manual, an illustrated guide to high fidelity kit construction, complete with detailed specifications of all Fisher StrataKits.

ponents hold adjusted just like the horizontal and vertical hold controls on a TV set. Powered by "C" cells that are replaceable from outside the unit, the "Lo-Boy" provides the five basic patterns used in convergence: ten standard RCA-type color bars, individual horizontal and vertical lines, crosshatch, and adjustable-size white dots. A variable interlace control allows for the correction of the interlace found on some TV sets.

Circle No. 81 on Reader Service Page 15

VERSATILE VACUUM BASE
There are a great variety of uses for Edmund Scientific's inexpensive vacuum base. It permits the attachment of many tools and appliances to most flat surfaces in seconds, yet allows instant removal. The bottom of the base is a neoprene pad; the top is a metal plate to which you affix the appliance. A slight pressure on the top as you push down a lever on the side creates a vacuum which resists a force of 200 pounds perpendicular to the base, 50 to 75 pounds parallel to the base.

Circle No. 85 on Reader Service Page 15

AMATEUR RADIO MOBILE ANTENNA
Designed for five-band amateur operation, the "Lancer 1000" mobile antenna announced by Mosley Electronics ranges in length from 8 feet on 10 meters to 9 feet, 7 inches, for 15 to 80 meters. The corrosion-proof antenna is power-rated for 1 kw. AM/CW and 2 kw. PEP SSB input to the final on the five amateur bands. The top and bottom whip sections screw together for use on 10 meters. Operation on the other amateur bands is accomplished through interchangeable waterproof coils. When the antenna and all four coils are purchased simultaneously, a protective coil caddy is furnished free of charge.

Circle No. 85 on Reader Service Page 15
Plain Talk from Kodak about tape:

**Giving your tape library a longer prime of life**

How long can you keep a recorded tape? As of today, nobody knows for sure. Recording companies have tapes dating back to the late 1940s that are still in fine shape. Actually, the aging problem for tape is somewhat akin to the ones faced by movie-makers. Their problems are tougher, though...movie-makers have to worry about latent chemical reactions, greater mechanical strains, etc. And yet, we can see movies made more than a half century ago if the films have been given proper care and expert duping. Like photographic films, many audio tapes are made on acetate base. Ours is Kodak's famous DUROL Base, the stronger, tougher triacetate (we also make KODAK Tapes with a tempered polyester base for extra toughness or for long-play applications). Lab tests show that DUROL Base holds up as well as photographic film. So...tape wise, there's no reason your great grandchildren won't be able to enjoy your present efforts.

**T.L.C. makes the big difference.** Tender loving care is a must when saving anything worthwhile. The same goes for tapes. One obvious safeguard is to keep tapes away from strong magnetic sources like large electric motors or transformers which could demagnetize a recording.

**Keep it clean.** Tapes hate dirt just as much as regular records do. Thanks to sturdy, one-piece construction, Kodak's new “library décor” box helps keep dirt out...won't fall apart over the years as conventional tape boxes sometimes do. And this new box looks better. Play it clean too, of course. Clean your recorder heads, capstans, rollers and guides regularly with a cotton swab moistened with one of the commercial cleaners sold for that purpose. Use a degaussers periodically to remove any magnetization of recording heads.

**Keep it cool.** Tapes should be kept away from extremes of temperature and humidity. High temperatures may affect the plastic support and increase the possibility of print-through...the transfer of magnetic signals from one layer of tape to the next.

**Keep it “backwards”.** For truly valuable recordings, a good trick is to keep your tapes in the “tails out” format rather than rewinding them. The uneven winding induced in the tape by fast rewinding can cause physical warping of the tape over a period of time. Here too, you're better off with KODAK Tapes because KODAK 5" and 7" Thread-Easy Reels are of dynamically balanced, one-piece construction. This gives you freedom from wobbles and pulsations on both “record” and “rewind”...keeps the tape under smoother tension...just what the doctor ordered for long tape life. The need for smooth winding cannot be overemphasized.

Last but not least, it's a good idea to dupe your really old tape recordings onto fresh KODAK Tape in order to standardize on KODAK Tape quality. That's an interesting subject all by itself, and we'll try to devote a "Plain Talk" to it soon! KODAK Tapes on DUROL and polyester bases are available at electronic, camera and department stores. To get the most out of your tape system, send for free 24-page "Plain Talk" booklet which covers the major aspects of tape performance. Write Department 940, Eastman Kodak Company, Rochester, N. Y. 14650.
FULLY EQUIPPED FOR IMMEDIATE OPERATION ON ALL 23 CHANNELS
reach way out with
the NEW Cobra CAM-88

23-CHANNEL CB mobile and base station
AM TRANSCEIVER

GREATER RANGE POWER with the exclusive new DYNABOOST circuit that intensifies speech signals and extends the signal range.

The new Cobra CAM-88 is rugged, handsome and field proven. Compare it, feature for feature, with other CB equipment and you’ll be convinced that the Cobra CAM-88 is by far the best.

Outstanding Features
- Fully-Equipped for Immediate 23-channel Transmit and Receive
- Double Conversion Superheterodyne Receiver
- Transistorized 117V AC/12V DC Power Supply
- Speech Compression with Switch
- Delta-Tune Fine Tuning
- Squelch Control and Standby Switch
- Illuminated Dual-Purpose Meter
- Power-in (Receive)-Power-out (Transmit)
- Modulation Indicator
- Detachable Press-to-talk Microphone
- Convertible to a Public Address Amplifier

Carefully engineered design makes the Cobra completely reliable and easy to operate. Completely self-contained. No additional crystals needed. $21,495

OPERATION ASSIST

Through this column we try to make it possible for readers needing information on outdated, obscure, and unusual radio-electronics gear to get help from other P.E. readers. Here’s how it works: Check the list below. If you can help anyone with a schematic or other information, write him directly—he’ll appreciate it. If you need help, send a postcard to Operation Assist, Popular Electronics, One Park Avenue, New York, N.Y. 10016. Give maker’s name, model number, year of manufacture, bands covered, tubes used, etc. State specifically what you want, i.e., schematic, source for parts, etc. Be sure to print or type everything legibly, including your name and address. Because we get so many inquiries, none of them can be acknowledged. Popular Electronics reserves the right to publish only those items not available from normal sources.

McMurdo Silver Model 700 transmitter, circa 1950; tunes 144-240 MHz. Schematic needed. (A. Fukushima, 704 Casa Loma, 105 Ward Pkwy., Kansas City, Mo.)

Hammarlund receiver, surplus; tunes 34 to 54 MHz on 6 bands; has 20 tubes. Tech manual TM1/851 needed. Motorola Model 401 car radio, ser. 43694, circa pre-war; has 7 tubes. Operating manual needed. (J. Penney, Box 713, Anchorage, Alaska 99501)

Philo Model 38-8 receiver, circa 1938; tunes AM from 5.5 MHz to 19.5 MHz; has 6 tubes. Schematic and parts list needed. (S. K. Clarke, 619 Jefferson Ave., Rahway, N.J. 07065)

BC-AN-229 receiver made by Western Electric; has 6 tubes. Schematic and power supply hookup connection diagram needed. (J. Grunden, Rt 2, Box 545, Yakima, Wash.)

Philo Model 620 receiver, ser. E27336; tunes BC and s.w.; has 6 tubes. Schematic needed. (Dale Davis, 4534 Ave. B. Austin, Tex. 78751)

RT-350 A/URC 14 walkie-talkie, made by Philharmatic. Schematic needed. (Neil Lewbel, 8130 S 58 St., Glendale, N.Y. 11227)

Philo Model 42-350 receiver, code 121; tunes BC and s.w.; has 8 tubes. Schematic needed. (Edward F. Yarnall, Jr., Box 174, Mildred, Pa. 18632)

AN/ART-13 transmitter, made by Collins Radio; tunes 2 to 18 MHz.; has 813 final and two 811 modulators. Maintenance manual needed. (Jim S. Horn, 519 Rainier Way, Issaquah, Wash. 98027)

Airline Model 04BR-907A receiver, circa 1940; tunes BC and s.w. Tuning dial scale, pointer, and 2 plastic push buttons needed. (Garnet W. Frank, Route 1, Potsdam, N.Y. 13676)

E. H. Scott Model SLR-H receiver, surplus, ser. 4611; covers 3 bands from 0.53 MHz to 15.6 MHz. Schematic needed. (John J. Hangat, 35 Alder St., Yonkers, N.Y. 10701)

Webster Model W945 amplifier, ser. 50789; has 13 tubes. Schematic and service manual needed. (Louis M. Giudice, 45 Heathcote Rd., Elmont, N.Y. 11003)

Philo Model 37-630 receiver, code 121; tunes from 540 to 22 MHz; has 6 tubes. Schematic needed. (Gary Luthardt, 3201 Sherman St., Marinette, Wis. 54143)

POPULAR ELECTRONICS
WELCOME ABOARD!

International’s “FLYING SHOWROOM 66” will visit your area soon. Welcome aboard this fabulous electronic flying display.

During 1966, International’s Martin 202 Flying Showroom will tour cities throughout the United States, bringing with it displays of International electronic equipment and products, plus a technical staff available for consultation. A space age electronic show for Citizens Radio dealers and users, Amateur Radio operators, users of commercial 2-way radio, manufacturers requiring special electronic products, radio experimenters and hobbyists. If you are a manufacturer, radio equipment dealer, Amateur or Citizens Radio Club, or other interested groups, we will attempt to schedule a specific time and date to visit your area. Watch for announcement or write International Crystal Manufacturing Co., Inc. for details.

Discuss your technical and engineering requirements with International's staff. See how International electronic products can work for you.

COMPARE THESE FEATURES!

- "Rare-earth" 21" color tube for brighter colors
- 24,000 volt regulated picture power • Tunes channels 2-83 • Automatic color control & gated automatic gain control for steady, "jitter-free" pictures • Deluxe "turret-type" tuners with "push-to-fine-tune" that "remembers" so you don't have to readjust each time you return to a channel • All critical assemblies prebuilt, aligned & tested • just 3 simple circuit boards to wire • requires no special skills or knowledge • 1-year warranty on picture tube, 90 days on all other parts

No Need To Wait... Enjoy "True-To-Life" Color TV Now! Until recently, this unique color TV kit has been on a reservation basis due to the nationwide shortage of color tubes. Now we have them in stock and can fill your order immediately.

The Only 21" Color TV You Can Align & Maintain... eliminates costly TV service calls for simple color picture adjustments and minor repairs. Exclusive built-in self-servicing facilities coupled with simple-to-follow instructions and detailed color photos show you exactly what to do and how to do it. You become the expert! Results? Clean, true-to-life color pictures day in and day out.

From Parts To Pictures In Just 25 Hours! As easy to build as an audio amplifier. And you enjoy the savings (quality compares to sets costing up to $200 more). You even set-up and converge the picture... another cost-saver! Easy credit terms available, too. Use the coupon to order now!

Kit GR-53A, 125 lbs., all parts except cabinet, for wall or custom cab. mounting..........................$375.00
GRA-53-7, 82 lbs., deluxe walnut cab. (illust.) . . . . $108.00
GRA-53-6, 51 lbs., economy walnut-finished cabinet ..................................................$46.50

23-CHANNEL 5-WATT SOLID-STATE CB TRANSCEIVER

23 crystal-controlled transmit & receive channels for the utmost reliability. Low battery drain... 0.75 A transmit, 0.12 A receive. Only 2 ½" H. x 7" W x 10½" D... ideal for car, boat, any 12 v. neg. gnd. use. "S" meter, adjustable squelch, ANL, built-in speaker, PTT mike, aluminum cabinet. 8 lbs.

Kit GWA-14-1, 5 lbs., optional AC power supply for base-station operation ............................$14.95
GWA-14-2, 1 lb., 23-Channel Crystal Pack (46 crystals) ... reg. $137.50 value ..........................only $79.00
GWA-14-4, 3 lbs... 6 to 12 v. DC converter for GW-14 .................................................$14.95
CB crystals only $1.99 with any Heathkit CB Transceiver order.
The Other 244 In FREE Catalog!

Deluxe All-Transistor, 10-Band Shortwave Portable!

10 bands tune longwave, standard AM, FM and 2-22.5 mc shortwave. 16 transistors, 6 diodes, and 44 factory-built & aligned RF circuits. Separate FM tuner & IF strip same as used in deluxe Heathkit FM tuners. Two built-in antennas, 4” x 6” speaker, battery-saver switch. Operates anywhere on 7 flashlight batteries, or on 117 v. AC with optional charger/converter GRA-43-I @ $6.95. Assembles in 10 hours. 17 lbs.

Kit GR-43
$159.95

New Deluxe Shortwave Radio!

Compare it to sets costing $150 and more! 5 bands cover 200-400 kc, AM, and 2-30 mc. Tuned RF stage, crystal filter for greater selectivity, 2 detectors for AM and SSB, tuning meter, bandspread tuning, code practice monitor, automatic noise limiter, automatic volume control, antenna trimmer, built-in 4” x 6” speaker, headphone jack, gray metal cabinet, free SWL antenna. 25 lbs.

Kit GR-54
$84.95

Low Cost Shortwave Radio!

Covers 550 kc to 30 mc—includes AM plus 3 shortwave bands. 5” speaker; bandspread tuning; signal strength indicator; 7” slide-rule dial; BFO; 4-tube circuit plus 2 rectifiers; noise limiter; external antenna connectors; Q-multiplier input; gray aluminum cabinet; AM antenna. 15 lbs.

Kit GR-64
$37.50

New “Q” Multiplier!

Use with matching GR-64 (opposite) or similar SWL receivers with IF circuits from 450-460 kc. Creates extra-sharp selectivity through an efficient “Q” of 4000 and provides a notch for adjacent signal attenuation. Includes built-in power supply. Charcoal cabinet gray front panel. 3 lbs.

Kit GD-125
$14.95

FREE 1966 Catalog!

**ELECTRONICS LIBRARY**

**TRANSISTOR ETCHED-CIRCUIT PROJECTS**
by James Kyle

The experimenter/hobbyist who doesn't try building his own printed circuit board projects is missing a lot of fun. In this book, Jim Kyle has assembled the plans for some 30 different projects—all on printed circuit cards—some unbelievably simple, some moderately complex, but all of them interesting. A noteworthy feature of the volume can be found in the last eight pages, which are really overlays to assist in the etching of your own boards.

*Published by Howard W. Sams & Co., Inc., 4300 W. 62 St., Indianapolis, Ind. 46206. Soft cover. 152 pages. $2.95.*

**RADAR—PRINCIPLES AND PRACTICES**
by F. Jonathan Mivec

Many electronic technicians are reluctant to attempt the repair or adjustment of radar circuits because they can't help feeling that such circuits are too complex for them. This volume was prepared to acquaint the average technician with the basic circuits used in radar and to explain their operation in simple terms. It is surprising how much similarity there is between many of these circuits and the circuits usually found in TV sets, test equipment, etc. Liberally illustrated.

*Published by Techpress, Inc., Brownsburg, Ind. 46112. Soft cover. 260 pages. $4.95.*

**DICTIONARY OF ELECTRONICS**
by Harley Carter

If you don't believe that electronics has developed a language of its own, take a look at this dictionary. Thousands of definitions have been worked into this British publication—definitions ranging from the simplest and most commonly used expressions to Dyads, Lenard Rays, and Schottky Effects.

*Published by Hart Publishing Co., Inc., 510 Sixth Ave., New York, N.Y. 10011. Soft cover. 410 pages. $2.65.*

KNOW YOUR SIGNAL GENERATORS
by Robert G. Middleton

Signal generators are among the most versatile and frequently used pieces of test equipment. In this book, you will find explanations of generator circuits and details on some of the more basic applications. Bob Middleton tells you how to calibrate the various hands, analyzes common troubles, and gives practical tips on keeping a generator in top operating condition. The book is intended for the beginner as well as for the old-timer who wants to know what makes the newer type of generators "tick." However, it is assumed that the reader has a basic working knowledge of electronics.

Published by Howard W. Sams & Co., Inc., 4300 W. 62 St., Indianapolis, Ind. 46206. Soft cover. 144 pages. $2.50.

SEMICONDUCTOR CIRCUITS HANDBOOK, Volume II

Over 50 simple manufacturers' circuits—power supplies and regulators, power converters, logic circuits, and nonlinear circuits—are presented here. Each circuit is fully explained for ease of construction, and all components used are readily available. Portions of this book were reprinted from the U. S. Department of Defense MIL-HDBK-215.

Published by Techpress, Inc., Brownsburg, Ind. 46112. Soft cover. 128 pages. $1.95.

PRACTICAL TRANSISTOR SERVICING, Second Edition
by William C. Caldwell

This book tells you how transistors work and how to isolate troubles in all types of transistor radios—including auto radios. It also tells you how to service all types of transistorized equipment (now including FM sets) better and faster by using pre-tested procedures. Circuit components and their functions are discussed, as are the causes of improper voltages, and the testing of transistors. Actual case histories are given.

Published by Howard W. Sams & Co., Inc., 4300 W. 62 St., Indianapolis, Ind. 46206. Soft cover. 192 pages. $2.95.

BIG NEWS IN A SMALL PACKAGE!

ALL SOLID STATE CB TWO-WAY RADIO

New "TOUCH-TAP" TUNING for instant channel selection. Push the button and channel changes automatically. Solid state—lowest power drain.

OUTSTANDING FEATURES: "Touch-tap" tuning
• Electronic switching • Compact size and front panel speaker permits dash mounting where no other radio can fit (Dim: 2¼" H. x 8⅛" W. x 6⅝" D.—Wt. 3 lbs.)
• Push-pull audio • L-C filter • 2 RF stages in receiver
• Modern design—heavy chrome plate front panel

Now Available—The all-new Spring 1966 Edition of ELECTRONIC EXPERIMENTER'S HANDBOOK! Another big package of over 30 fascinating do-it-yourself construction projects for:

- Amateur Radio
- Photography
- Test Equipment
- Automotive Electronics
- HiFi/Stereo & Audio
- Short-Wave Listening

You'll build such valuable units as... a super photo flash... a simple auto light minder... a transistor FM multiplexer... compact BCB DX antennas... an electric fence charger... and a self-regulating lighting controller.

Each has complete, easy-to-follow schematics, parts lists and how-to instructions that guarantee you perfect finished products! Plus—dozens of professional pointers, tips and techniques to increase your electronics skills and proficiency.

In all, more than 148 pages of challenging projects that will deliver hour after hour of sheer fun... and provide you with economically-built, useful items (to keep, or sell for a profit) after you've finished.

Make sure you receive your copy of this valuable handbook. Fill in the coupon and mail it today! $1.25

A DELUXE, GOLD-EMBOSS LEDERFLEX-BOUND EDITION... just $3.00 postpaid

This deluxe edition is a permanent, handsomely-bound collector's item that belongs in your electronics library! Check appropriate box on coupon.

PAYMENT MUST BE ENCLOSED WITH ORDER.
In today's electronics boom, the demand for men with technical education is far greater than the supply of graduate engineers. Thousands of real engineering jobs are being filled by men without engineering degrees—provided they are thoroughly trained in basic electronic theory and modern application. The pay is good, the future is bright... and the training can now be acquired at home—on your own time.

How to become a “Non-Degree Engineer”
The electronics boom has created a new breed of professional man—
the non-degree engineer. Depending on the branch of electronics he's in,
up he may "ride herd" over a flock of computers, run a powerful TV trans-
mittor, supervise a service or mainte-
nance department, or work side by side with distinguished scientists on a
new discovery.

But you do need to know more than soldering connections, testing
circuits and replacing components. You need to really know the funda-
mentals of electronics.

How can you pick up this neces-
sary knowledge? Many of today's
non-degree engineers learned their
electronics at home. In fact, some
authorities feel that a home study
course is the best way. Popular Elec-
tronics said:

"By its very nature, home study
develops your ability to analyze and
extract information as well as to
strengthen your sense of responsibil-
ity and initiative."

Cleveland Method Makes It Easy

If you decide to advance your
career through home study, it's best to
pick a school that specializes in
the home study method. Electronics
is complicated enough without trying to
learn it from texts and lessons that
were designed for the classroom in-
stead of the home.

The Cleveland Institute concen-
trates on home study exclusively.
Over the last 30 years it has devel-
oped techniques that make learning
at home easy, even if you once had
trouble studying. Your instructor
gives the lessons and questions you
send in his undivided personal atten-
ton—it's like being the only student
in his "class." He not only grades
your work, he analyzes it. And he
mails back his corrections and com-
ments the same day he gets your les-
sions, so you read his notations while
everything is still fresh in your mind.

Students who have taken other
courses often comment on how much
more they learn from CIE. Says Mark
E. Newland of Santa Maria, Calif.:
"Of 11 different correspondence
courses I've taken, CIE's was the best
prepared, most interesting, and easi-
est to understand. I passed my 1st
Class FCC exam after completing my
course, and have increased my earn-
ings by $120 a month."

Always Up-to-Date

Because of rapid developments in
electronics, CIE courses are con-
stantly being revised. This year's
courses include up-to-the-minute les-
sions in Microminiaturization, Laser
Theory and Application, Suppressed
Carrier Modulation, Single Sideband
Techniques, Logical Troubleshooting,
Boolean Algebra, Pulse Theory,
Timebase Generators...and many
more.

CIE Assures You an FCC License

The Cleveland method of training
is so successful that better than 9 out
of 10 CIE men who take the FCC
exam pass it—and on their first try.
This is despite the fact that, among
non-CIE men, 2 out of every 3 who
take the exam fail! That's why CIE
can promise in writing to refund your
tuition in full if you complete one of
its FCC courses and fail to pass the
licensing exam.

This Book Can Help You

Thousands who are advancing their
electronics careers started by read-
ing our famous book, "How To Suc-
cceed in Electronics." It tells of many
non-degree engineering jobs and
other electronics careers open to men
with the proper training. And it tells
which courses of study best prepare
you for the work you want.

If you would like to cash in on the
electronics boom, let us send you
this 40-page book free.

Just fill out and mail the attached
card. Or, if the card is missing, write to:

VETERANS

If you had active duty in any branch
of the Armed Forces after January
31, 1955, you may be entitled to Gov-
ernment-paid tuition for any CIE
course.
Year after year, the reliability built into Johnson Messengers keep them on the air long after other units have departed.

Whether it's a compact hand-held Personal Messenger; a portable field pack unit with rechargeable batteries; a popular priced tube-type or solid state transceiver; the new Messenger 350 single sideband unit; or one of the many Johnson accessories, Johnson's quality and reliability will insure your equipment will enjoy a long and healthy life.

Look to Johnson for the most versatile, most reliable two-way radio equipment and accessories available today! FCC type accepted. Prices as low as $99.95.

**MESSENGER**
A best seller for years. Five crystal controlled channels. For 115 Volts AC and either 6 or 12 Volts DC.
Now only $99.95 NET

**MESSENGER TWO**
Ten channels and tunable receiver. Full 5-watt input. For 115 Volts AC and either 6 or 12 Volts DC.
Now only $149.95 NET

**MESSENGER III**
Use it base, mobile or portable! All solid-state design throughout. For 12 Volts DC. Accessory 115 Volt AC power supply available.
Now only $189.95 NET

BREAKTHROUGH!
SOLID-STATE
CAR VOLTAGE REGULATOR

With no springs to adjust, and no relay contacts to erode, wear, or stick, the solid-state voltage regulator with all-electronic switching is an ideal replacement for the older electromechanical units.

By BRIAN C. SNOW
Engineering Development Services
Delco Radio Division
General Motors Corporation

COVER STORY

EVER HEARD of a regulator that's designed to outlast your car—even if it's a Cadillac? Maybe you haven't because the concept is new—so new, in fact, that you can't even buy this regulator from your dealer . . . yet. But you can make one—an all-electronic device with no moving parts—for about $15.

This new solid-state design for 12-volt, negative-ground, generator-equipped cars does away with constant regulator failures that cause your generator to burn out prematurely, or your battery to keep on discharging. It prevents excessive charging or failure of the generator due to regulator contacts that pit, stick, or oxidize. Voltage and current regulation are accomplished quietly, electronically!

Conventional Regulator. To understand how a solid-state (electronic) regulator works, you must first understand how the ordinary current and voltage regulator (Fig. 1) works. The regulator contains a circuit breaker (cutout) relay, a current regulator relay, and a voltage regulator relay. The circuit breaker relay acts like an automatic switch between the generator and the battery. It closes the charging circuit when the generator is charging, and opens it when the generator is not charging, i.e., when the engine is just idling or not running at all. Thus, the battery is prevented from discharging through the generator during these periods.

The purpose of the current regulator is to limit the generator output current to a predetermined maximum level—nominally, 30 amperes. When this limit is reached, the relay picks up, removing the short across the resistance. And since this resistance is in series with the generator field coil, the field current is reduced, thereby reducing the generator output.

The reduced current causes the relay to drop out, shorting out the resistance once more, and causing the current to
The voltage regulator acts to hold the voltage of the car's electrical system constant within close limits. When the generator voltage rises to a predetermined value (approximately 15 volts), the voltage relay contacts open and close at a rapid rate, cutting a resistor in and out of the field circuit to limit the generator output.

The disadvantages of this electromechanical device are immediately apparent. Contact erosion and wear introduce resistance into the circuit. Metal fatigue of springs causes voltage and current sensing levels to change. These combinations of changing relay characteristics cause erratic relay operation that can be directly attributed to failure of the regulator to limit voltage and currents to acceptable levels.

**Solid-State Regulator.** In the solid-state regulator (Fig. 2), diode D1 acts as the circuit breaker. When the generator output is low, or non-existent, the cathode of D1 is reverse-biased by the car battery voltage, and no current can flow through the generator circuit to discharge the battery. But when the generator is charging, its output overcomes the reverse bias and D1 conducts to charge the battery.

The generator field is excited by the output of Q3, whose base is biased "on" by the voltage divider consisting of R7, R8, and R9. Diode D4 provides reverse bias to Q3, allowing it to operate at a much higher temperature. Diode D2
break down and fire, placing a forward-biasing voltage on $Q1$'s base.

As $Q1$ conducts, the drop across $R8$ again reduces the forward bias on $Q3$, reducing its output just enough to once again readjust the generator output. Because this action occurs at a very rapid rate, the generator output is maintained within the required limits.

**Construction.** The author suggests that you use a $5\frac{1}{4}'' \times 3'' \times 2\frac{1}{4}''$ Minibox to house the regulator. Layout and mounting dimensions are given in Fig. 3. After

Although the Minibox enclosure measures a scant $5\frac{1}{4}'' \times 3'' \times 2\frac{1}{4}''$, it provides ample room for mounting all of the components without overcrowding. The coil you see on the right-hand side of the chassis is $R5$, which has a d.c. resistance of only 0.01 ohm.

---

Prevents any voltage spikes produced by the inductive field from damaging $Q3$.

Transistor $Q2$, which is normally biased "off," acts as the current regulator. When the generator output tends to rise above the established 30-ampere limit, the drop produced across $R5$ causes base current to flow. As $Q2$ conducts, the drop across $R8$ is increased, and $Q3$'s collector current is reduced; this, in turn, reduces the field current to limit the generator output.

Potentiometer $R2$ is adjusted to obtain the desired generator output. When the generator output tends to exceed this limit, as in the case of high-speed driving, the thermistor resistance goes down because of increased power dissipation; as a result, a greater voltage is developed across $R2$. This causes $D3$ to

---

Fig. 3. The layout of the author's design provides proper spacing of mounting dimensions to give finished product good appearance and balance, while providing greater ease during wiring and assembly.

---

June, 1966
Fig. 5. Suggested mounting arrangement for the diodes and transistors in the regulator circuit. Except for the heat sink, mounting components shown in (a) are usually furnished with each 1N1183 diode. In (b), the 2N441 transistor requires a TO-36 type mounting kit, and in (c), a standard rectifier mounting kit is used for the 1N1612 diodes.

punching and deburring the chassis, you can proceed to assemble the regulator (see Fig. 4).

Mount D1 on a heat sink following the mounting arrangement shown in Fig. 5(a). Apply a thin layer of silicon grease on all mica washers supplied with the mounting kits. Use the heat sink mounting hardware to secure TS1 and TS2 on the inside of the chassis, as shown in Fig. 4. Mount a ¥6 solder lug under the ground lug of TS2.

Mount the 2N441 transistor (Q3) on a heat sink following the mounting arrangement shown in Fig. 5(b). Mount the remaining two transistors (Q1 and Q2) directly on the chassis at the locations shown in the photograph. Secure the L-shaped bracket on the inside back panel, and then install D2 and D½ on the bracket in accordance with Fig. 5(c).

You can now wire up the unit. Be sure to use ¥14 rubber-covered wire from the anode of D1 to TS2. Except for the interconnecting harness, which is made from ¥10 color-coded wire, you can use ordinary ¥20 solid or stranded hookup wire for all other connections.

To make up resistor R5, wind a 48" length of ¥14 rubber-covered wire evenly on a 1½"-diameter by 1¾"-long thread spool. At a point approximately 1½" from the wire ends, twist the leads together to prevent them from unraveling on the spool. Then mount the coil on the panel using an 8-32 x 2¼" screw with nut and flat washer.

Decide where you want to mount the regulator—anywhere under the hood, away from engine heat, will do—and prepare an appropriate length of ¥14 three-conductor color-coded wire, with a three-prong automotive-type connector at one end.

Insert a ¾" rubber grommet at the location shown (Fig. 4) and run the free ends of the harness through the grommet to the indicated terminals. Solder all connections properly. Now recheck the entire circuit against the pictorial to make sure the wiring is complete, and that there are no shorts.
Modification. If you have a Ford car, remove the cover from the old regulator and examine the resistors inside the case to see if one side is grounded as shown in Fig. 6. If the resistors are not grounded, no changes are required.

But if the resistors are grounded, you'll have to modify the generator circuit slightly, as shown in the inset (Fig. 6). Remove the field (F) connection at the point indicated, and connect the ground side of the field directly to the engine or frame. Cars other than Fords do not require any modification.

Hookup. Refer to Fig. 7 and install a mating male connector at the ends of the wires previously removed from the old regulator. Be sure the field, battery, and armature wires are not reversed at the connector pins.

To protect the regulator from foul weather and eventual corrosion, apply two or three coats of clear lacquer on all exposed surfaces. But before you apply the lacquer, check to make sure the regulator is properly grounded to its supporting frame.

Testing. After the regulator has been installed, measure the battery voltage with a voltmeter. It should measure about 12.5 volts. Then start the car and measure the voltage again. If the battery is close to being fully charged, the reading should rise to between 14.0 and 14.8 volts within a few minutes, and should remain within these limits at an ambient temperature of approximately 75°F. A substantially lower or higher temperature will result in a voltage difference of plus or minus a few tenths of a volt.

Depending on your area of the country, and the time of the year, you may require different standards. For example, at 50°F the reading should be be-

(Continued on page 92)
Suppress man-made noise to increase the effective range and readability

By ROBERT L. RUYLE, WØFCH

Electrical interference prevents clear reception and reduces the working range of mobile communications equipment. Efficient suppression of mobile radio interference can only come about when you identify the source and determine how it is getting into your radio.

The term "mobile" covers a wide range of vehicles: cars, trucks, trains, tractors, etc. Mobile radio installations are generally afflicted with noise from ignition systems, charging systems, switching circuits, moving metal parts, metal-to-metal contacts, and other electrical noises.

Each of these noise makers can be identified, and steps can be taken to suppress them.

Ignition System Noise. Ignition system noise usually originates from one or more of four places: spark plugs, wiring, distributor, and the ignition coil.

Spark plug interference is heard as a popping noise in the radio receiver which increases to a loud buzz as engine speed is increased. Use of a resistor-type spark plug is an effective way to suppress this kind of interference. The
One of the drawbacks to engine noise suppression is loss of power. Just like dirt inside the distributor cap, shields over the spark plug cables do cause a certain amount of high voltage loss. Near the resistor to the spark gap, the more effective it is; the resistor tends to isolate the cable from the noise in the spark plug. The less noise in the cable, the less it radiates. Also, the high frequency part of the spark is "chopped off."

You can insert carbon-type suppression resistors in the ignition leads between the distributor cap and each spark plug, or use suppressor-type cable in the wiring harness, but resistor-type spark plugs prove to be more effective and the easiest to troubleshoot when something goes wrong.

Distributor interference also causes popping, and its pitch also varies directly with engine speed. Check to see that the distributor cap and rotor are clean. The distributor cap and rotor should be replaced every 25,000 miles for best performance. After 25,000 miles, the inside of the distributor cap usually becomes impregnated with millions of tiny metal particles.

To suppress the popping noise caused by the distributor, you can use a 10,000-ohm resistor or resistor-type cable between the distributor cap and the ignition coil. However, never use an external suppressor at the distributor cap center tower if the cap contains a molded-in resistor.

Wiring between spark plugs and distributor cap and between the distributor cap and ignition coil can radiate noise. A shielded ignition system offers the most effective suppression of ignition noise. For maximum voltage at the plugs, keep your high tension leads as short as possible. If shielding causes marginal engine performance, it may be necessary to install a higher output coil or a transistorized ignition system.

Ignition coil interference can be easily filtered by installing a 0.1-µf. coaxial-type capacitor. Attach the capacitor to the supporting band of the ignition coil and mount it as close as possible to the
Alternators generally do not create a noise interference problem; but when they do, it's hard to suppress the resulting noise. The trouble, heard as a whine, usually comes from static buildup on the internal alternator elements. The best remedy for this condition is to insert a coaxial feedthrough type capacitor in each alternator lead, between the alternator and the rectifier. Install a 0.5-µf., 50-volt, 50-ampere rated capacitor.

Generators are common offenders;

Feeder capacitors and shielded cable can be used to suppress generator and regulator noise. If noise persists, a resistor-capacitor type filter can be attached to the regulator's field terminal.

Generating System Noise. Noise from the generating system can usually be traced to alternators, generators, and voltage regulators.

Alternators are usually equipped with a special filter to protect the rectifiers and to suppress radio noise. The generator's field terminal also requires a special filter. Do not use ordinary capacitors.

Coil terminal. Disconnect the battery lead from the coil and connect it to the capacitor terminal. Connect the other terminal of the capacitor to the ignition coil using a short length of #10 copper wire. Also connect a 0.02-pf., 1000-volt, ceramic capacitor between the low voltage terminal on the coil and the ground lug of the coaxial capacitor. Be sure to keep the leads as short as possible.

Voltage regulators cause an annoying interference when the relay contacts arc. The resultant popping noise in the receiver changes very little even when the engine speed is varied. You can relate this source of noise to ammeter movement while listening to the receiver.

Generating System Noise. Noise from the generating system can usually be traced to alternators, generators, and voltage regulators.

June, 1966
Shields and bonding straps properly used are effective noise suppression devices. If not installed correctly, they can introduce new troubles. Mechanical and electrical connections must be well made.

If the noise occurs at the same time that the ammeter needle swings to charge or discharge, chances are that the trouble is in the regulator.

Here again, proper connection of a filter to the regulator is important. Do not install an ordinary capacitor on the field terminal of the generator or the regulator; it may eliminate the noise, but it can ruin the generator and the regulator in short order. Instead, use a special resistor-capacitor filter especially designed for this purpose.

Accessory Interference. Electric windshield wipers, blowers, tachometers, sensors for "idiot" lights, and a host of other electrical gadgets are all potential noise makers.

Accessory motors, such as the electric windshield wiper motor and blower motors for the heater and air conditioner, can usually be taken care of in short order by placing a 0.5-µf. capacitor between the hot-lead terminal and ground. Tachometers can only be cured by using a good shielded wire from the engine pickup to the transmitter unit, and from transmitter unit to the meter indicator.

Idiot lights, particularly the one for oil pressure, are frequent offenders. These lights are turned on by sensors that are placed at different points on the engine. The sounds from the sensors can be recognized by a "clicking or hissing" sound in the receiver. Find the "noisy" sensor and install a 0.5- or 0.25-µf. capacitor.

Instrument gauges such as the gas gauge can also cause a load of static, just like a noisy volume control. Use a 0.5-µf. capacitor to bypass the noise from the instrument to ground.

Metal-To-Metal Contact. The best way to eliminate noise from metal-to-metal contact is to electrically bond the two pieces of metal. To check all the joints in a car requires a long and tedious search. Some of the most common trouble spots will be found along the exhaust system, particularly the tailpipe, and be-
Static Discharge. If you hear a "rushing" noise when your car is traveling down the road, and the noise disappears when you apply the brakes, chances are that your car's wheels are building up static electricity. Check inside the outer wheel bearing dust cover on the front wheels to make sure that you have static springs installed and that they are in good condition.

You can also inject graphite powder into the tires. To do this, let the air out of the tires, remove the valve core, squirt graphite into the tire, re-install the valve core, and finally, re-inflate the tires.

Interference Suppression Devices. There are five basic components or devices used to suppress radio interference: capacitors, filters, resistors, shields, and bonds. Capacitors are classified according to their internal configuration and their electrical properties. For noise suppression work, they are commonly referred to as either bypass or feedthrough types.

Bypass capacitors have been with us for a long time. Normally, the metal case of the bypass capacitor serves as the ground terminal, and is secured to the equipment by means of a wraparound bracket. The live terminal is usually a single wire lead that is connected to the line to be cleared of interference. The short lead wire on this type of capacitor becomes resonant at about 10 MHz and therefore limits its effectiveness to frequencies below this value. Typical bypass capacitors range in size from 0.01 to 2 µf.

PARTIAL LIST OF MANUFACTURERS

Your local distributor and mail-order houses can usually recommend and supply suitable radio noise suppression components and kits. Additional information can generally be obtained directly from the individual manufacturers.

Birnbach Radio Co., Inc., 145 Hudson St., New York, N.Y.
Cornell-Dubilier Electronics, 50 Awe. "L," Newark, N.J.
Estes Engineering Co., 1639 W. 135th St., Gardena, Calif.
GC Electronics Co., Div. Textron Electronics, Inc., 400 S. Wyman St., Rockford, Ill.
Hallett Mfg. Co., 5910 Bowcroft St., Los Angeles, Calif.
E. F. Johnson Co., 2525 Tenth Ave., S.W., Waseca, Minn.
New-Tronics Corp., 3455 Vega, Cleveland, Ohio
Ohio Carbon Co., 12508 Brea Rd., Cleveland, Ohio
Philmore Mfg. Co., Inc., 130-01 Jamaica Ave., Richmond Hill, N.Y.
Herman H. Smith, Inc., 2326 Nastrand Ave., Brooklyn, N.Y.
Sonar Radio, 73 Wortman St., Brooklyn, N.Y.

June, 1966
Resistive elements are used to suppress noise from spark producing circuits. This type of suppressor should be placed as close to the spark source as possible to reduce radiation.

Ultimate solution to ignition noise is shielding and filtering. While it may be more expensive to put everything under cover, there is less chance of losing engine power due to spark suppression.

Feedthrough capacitors differ from bypass capacitors in that the line from which interference is to be cleared is brought through the center of the capacitor, eliminating the additional connecting lead. As a result, this type of capacitor has no upper frequency limitations, and should be used if possible.

Proper installation of capacitors is of great importance. Always keep lead length as short as possible, and be sure to fasten a capacitor securely to obtain a good electrical ground connection and to minimize loosening effects of vibration.

Filters combine the bypass action of capacitors and the reactance of inductors and resistors. Also available are some special types of filters which are tuned to act as low-pass or high-pass devices for use in very difficult situations.

Resistors are used in the spark-producing circuits. Carbon or composition resistive elements are generally enclosed in an insulated housing. External-type resistor-suppressors are normally designed for temperatures over 85° C, but internal types—as in spark plugs—can work under higher temperatures, up to 150° C.

Most resistors, whether external or internal, are in the 5000- to 10,000-ohm range. Suppressor-type high-tension ignition cables have a resistive center conductor instead of wire—on the order of 4000 ohms per foot—but age, temperature, vibration and rough handling cause short life. When the resistance value exceeds 18,000 ohms per foot, the cable should be replaced.

Shields for radio interference are usually made from solid metal sheeting, wire mesh, or braided metallic wire.

Bonding is accomplished by electrically connecting two metallic surfaces to provide a continuous low-impedance path for spurious currents to flow from one to the other. Direct bonds (welds), jumper bonds (tinned copper braid straps), and special bonds (brushes, slip rings, etc.) are the three most common types of bonding methods used.

Corrosion is the number one enemy of a good bond. Where possible, moisture-proof all connections to make them more permanent.

The author acknowledges contributions to this article by Champion Spark Plug Co., P. O. Box 910, Toledo, Ohio, and Hallett Mfg. Co., 6910 Bowcraft St., Los Angeles, Calif. 90016. Champion’s excellent booklet called “Giving Two-Way Radio Its Voice” and Hallett’s booklet entitled “Nothing But Noise”—which will answer most of your questions about a commercial noise suppression system—are available for the asking from these companies.
Our basement technician says to treat electricity with the respect it deserves

RINGING Ziggy Carmichael's doorbell brought no response, as usual. I'll probably catch him in the basement, I thought, making my way in through a side door with a defective CB rig in tow. Ziggy ran a TV service from his home, and he spent much of his spare time with our local CB club members, fixing their gear and sometimes giving lectures. He was president of the club and, as far as most members were concerned, the best repairman around—in spite of the fact that he charged club members little or nothing for his services.

Ziggy looked up as he heard me descend the stairs to his workshop. "How do you like this?" he asked, pointing to a shiny new CB transceiver sitting on the workbench.

"Is it yours?"

"No, it belongs to my father. He's got the CB bug, but he doesn't like to build things, so I did it for him.... Be with you in a minute, soon as I finish checking it out," he said, noticing the CB rig cradled under my arm.

I watched as Ziggy probed around the new set with a VOM, poking in and around the controls and chassis. Then, seeing him reverse the unit's plug in the wall socket and start to probe again, my curiosity got the best of me and I asked him what he was looking for.

"Shock hazards," he replied. "It's a little safety check I make on all units leaving the shop. I'm making sure there are no potentially dangerous hot spots."

I glanced at the face of the small meter. "Doesn't register, or does that mean it's good? How does this thing work, anyway?"

"I'm using a 1000 ohms-per-volt a.c.
VOM shunted with a 1500-ohm, 10-watt resistor,” he said, shifting his glance between the unit and meter. “One meter lead is tied to a good ‘earth’ ground, and with the other lead I probe the parts of the unit that are exposed to the operator. A meter reading of 7.5 volts or more indicates a potentially dangerous current leak existing between the unit and ground which needs fixing. The 7.5 volts is based on the maximum allowable leakage current in the minimum safety requirements set up by the Underwriters Laboratory.”

I couldn’t help but grin, and Ziggy, noticing it, snapped out: “I know what you’re thinking. I’m a worry wart and this is just a waste of time. But a little prevention goes a long way when you’re playing around with electricity. Using this little gimmick can darn well save your life.”

Ziggy was always in the habit of quoting facts when he wanted to get a point across. This time it was no different as he told me that this year, according to the National Safety Council, about 1000 people will lose their lives due to accidental electric shock. I was amazed, but I was even more surprised to learn that ordinary 117-volt house current was the biggest single cause of such fatalities.

“Once in a while I read of something happening to someone in the paper,” I said, “but frankly, I’m probably like most people and just take electricity for granted.”

“Don’t take it for granted.” By now his tone was pedantic. “Fact is, in electrical accidents, one out of 14 disabling injuries results in a fatality. That’s a death rate two-and-one-half times the death rate of those injured in auto accidents. Food for thought, eh?”

Nodding my head in agreement, it occurred to me that Ziggy taught electrical safety and resuscitation methods to interested groups—the Boy Scouts, for one. Here was an opportunity to bolster up my electric shock I.Q.

“Ziggy, while we’re on the subject, let me ask you a few questions. How many volts are dangerous? What makes shock so hazardous when you’re wet? What—”

“Hold it, one question at a time,” Ziggy cut in. “But first, let’s take a look at your CB rig. What’s the problem?”

“Probably a bad filter capacitor—it’s picked up a loud hum.”

After trying the rig out, Ziggy agreed. “Getting back to your questions,” he said, “if there’s one rule to remember about electricity, it’s that you should treat 75 volts as you would 750 volts. It doesn’t take much of a shock to be lethal. In fact, as little as 25 volts at 70 ma. can be fatal. And under optimum conditions, 15 to 20 ma. will do the job if the current passes through the heart and the victim can’t let go.”

“Why can’t the victim let go?” I asked, watching him take my set apart.

“The shock contracts the muscles and paralyzes the nerves of the victim. If a sufficiently large number of nerves are involved, sudden violent contractions of the muscles throw him away from the shock source.”

Examining the 50-μf. filter capacitor, Ziggy’s face was practically buried in a maze of wires. “It doesn’t look too bad for an old rig. We’ll bridge it with another capacitor and see what happens. I have a couple of used ones around here somewhere. Ten will get you twenty you have a bad rectifier, too.”

I made my way over to a small box hidden under his workbench where he kept his good used tubes and fished out
a 6X4—just in case he would have to replace the rectifier, too.

"Can't keep any secrets from you guys," Ziggy snorted. "You know just where to look."

"Call it experience. But let me ask you something else. How does shock affect the human body?"

"Most shock fatalities," he said resignedly, "involve the heart. You see, the heart generates a small current which keeps it pumping the blood throughout the body. An outside current across the heart easily disrupts this minute current, causing the heart to flutter and stop altogether. This is called ventricular fibrillation, and once it occurs, it's very hard to start the heart beating rhythmically again. On the other hand, a shock through the brain or other parts of your breathing apparatus can stop your breathing."

"You could also say that a shock can cause you to drop what you're carrying or fall off a ladder, as well as give you painful burns," I added.

Ziggy agreed. "Okay, smart guy, which would you say is the controlling factor of shock severity—current or voltage?"

I thought I didn't have to think this one out. "Voltage!"

"Wrong," he shot back. "Amperage. But skin resistance, voltage, current path, and shock duration all have a hand in determining its severity. All these factors work together."

"How much amperage is dangerous?"

"Most authorities say 15 ma., and more."

"Fifteen milliamps! That's not much."

"Well, look at it this way," Ziggy said. "Current as small as 0.2 ma. will pass safely through the body but can be felt as a tap on the skin, and those as little as 1 ma. will cause a tingling sensation. Current stronger than 1 ma. will start to grip, and 15 to 20 ma. will cause pain and the victim might not be able to let go."

He explained that usually as little as 20 to 70 ma. can be fatal, and that most medical authorities flatly state that 70 to 90 ma. is fatal.

"Currents between 100 and 200 ma. are doubly dangerous," he continued, "as they tend to cause ventricular fibrillation and respiratory paralysis. But, strange as it may seem, those greater than 200 ma. are often less dangerous as heavier currents cause heart contractions so severe that the heart is clamped for the shock duration, thus preventing ventricular fibrillation."

"Do different voltages act the same way?"

"Pretty much the same," Ziggy answered. "Contact with a 117- or 220-volt, 60-cycle a.c. line tends to cause ventricular fibrillation, while contact with 220 to 1000 volts usually results in both ventricular fibrillation and respiratory paralysis. Shocks of 1000 volts and more tend to cause only respiratory paralysis as high voltage clamps the heart."

After much searching, we found a replacement capacitor for my rig. Ziggy blew the dust off it and started soldering it in.

"It's not hard to understand," he continued, "why most fatal shocks involve water in some way when you consider that, ordinarily, dry human skin is highly resistive to current. But when the skin is wet, its resistance drops tremendously and more current can flow through the body."

(Continued on page 55)
RESUSCITATION

VITAL SECONDS IN WHICH YOU CAN SAVE A LIFE

Respiratory Paralysis
Apply Artificial Respiration

1) Lay the victim on his back. Place one hand under neck and lift. Tilt head back as far as possible so that the neck is extended.

2) Pull chin upward until the head is extended as far as possible. Keep victim in this position.

3) Pinch the victim's nostrils and place your mouth firmly over his mouth. Blow hard enough to make his chest rise. With an infant, place your mouth over his mouth and nose.

4) If the victim's chest does not rise, recheck his head and jaw position. The air passage may be blocked. Turn the victim on his side or face down with head in a down position, tongue pulled forward. Slap victim to dislodge any foreign matter. If the victim is a child, hold him momentarily head downward over your arm or lap and slap child on the back.

5) With adults, blow one vigorous breath every five seconds. With small children, blow shallow breaths every three seconds. Continue procedure until help arrives.

Ventricular Fibrillation
Apply Cardiac Massage

1) The most accurate indication of ventricular fibrillation is the lack of pulse. Place the pads of your fingers alongside the victim's "Adam's Apple" and check for a pulse. If there is no pulse, check victim's pupils. If they are enlarged and do not narrow in response to light when you open the lids, immediately apply closed chest cardiac massage. Do not apply it if the victim has broken ribs.

2) Place the victim on his back on a hard surface. Kneel at the victim's side and give him a few quick breaths of mouth-to-mouth artificial respiration.

3) Place the heel of one hand on the lower third of the victim's breastbone and the other hand on top of the first hand.

4) Flex your fingers so no pressure is applied to the ribs. Press down firmly and quickly, depressing the breastbone 1½"-2". With children, use one hand; with babies, use two fingers. Then release pressure. Repeat this cycle every second.

5) If you are alone, interrupt cardiac massage every 15 to 20 strokes to force two or three breaths of air into the victim's mouth. If another rescuer is present, concentrate on giving 60 strokes a minute and let him apply artificial respiration (12 times per minute). Continue procedure until help arrives.
"What is the normal skin resistance?"

"It averages between 100,000 and 600,000 ohms for the human body when dry, but drops to 1000 ohms or so when wet. Figure it out. Suppose your body was wet and you happened to handle a defective a.c. radio. More than 100 ma. would shoot through you. That's enough current to stop the heart and clamp your lung muscles. Most likely you'd be dead before you hit the floor."

"What about the body's internal resistance?" I asked.

"The internal resistance is much lower than the skin resistance. That's why electric current becomes more dangerous if it enters the body through a cut on the skin, or if it burns through the skin—as it will do if contact with the current source is continuous. From hand to foot, the internal resistance might measure 500 ohms; from ear to ear, about 100 ohms. Your skin resistance varies from point to point also. Measure it yourself sometime with an ohmmeter; wet the skin where the probes contact, and watch the resistance drop."

"But for a current to be dangerous, it has to take a path across the brain or heart area, right?"

Ziggy nodded. "The path from the head to the left leg is particularly dangerous as it involves both the heart and brain. That's why it's a good idea to keep one hand—preferably the left—in your pocket when working around electricity."

He finished soldering the capacitor in. "The longer an electric shock lasts," he went on, "the more the heating along the path. The skin resistance drops, and more current flows through the victim. Always remove a shock victim from the source of shock as soon as possible—without, of course, giving yourself a shock."

He stated that resuscitation should be started immediately. "The longer you delay, the poorer the victim's chance of revival. You have four minutes at the most to act."

He went on to explain mouth-to-mouth artificial respiration and how it is applied to a victim whose breathing has stopped, and how closed chest cardiac massage is used with ventricular fibrillation.

"Just a few years ago," he added, "ventricular fibrillation was irreversible. Today, it's different. Hospitals use what they call a defibrillator to shock the heart back to normal. But the trick is to keep the victim alive until he can be helped."

"And that's where cardiac massage comes in," I deduced.

"Right. Cardiac massage substitutes externally applied pressure for the rhythmic contraction of normal heart muscles, thereby maintaining circulation at a level sufficient to maintain life. Everybody should know how to apply resuscitation—you never know when you or a member of your family may need it. The YMCA, Red Cross, and a lot of other organizations teach these methods."

"Well, in your experience, which would you say is worse—an a.c. or d.c. shock?"

"Make no mistake about it," Zigzy answered. "They're both deadly. Fact (Continued on page 94)"
IN THE LAND of "1001 Nights," Jinn were revered spirit creatures who could perform outstanding feats of magic. The most famous was—you guessed it—Aladdin's slave, the condescending genie in a lamp. That was yesterday; nowadays genies are as rare as hens' teeth. But we do have the Jinniflash, a slave flash unit which triggers at everything from a clap of the hand to a drop of water.

If you're a photographer, you'll have a ball using the Jinniflash as a wireless remote flash or for special open-shutter shots to capture wild life or other fast-breaking action. If you are not a photographer, you can still put the Jinniflash to plenty of uses. For example, it can serve as an outdoor sensor to warn you of rain. Or you can make a burglar alarm out of it. Frankly, the applications for this device are limited only by your own ingenuity.

How It Works. The Jinniflash (Fig. 1) consists of a pair of d.c. amplifiers (Q1 and Q2) working in a Darlington configuration to trigger an SCR (SCR1) which, in turn, fires a flash bulb connected at jack J1.

The control signal to the amplifier can come from any one of a number of devices, including a microphone, photelectric cell, or temperature or humidity sensor. The sensitivity of the sensor element can be set by a biasing voltage established by potentiometer R3 and applied through limiter R2 to the sensing device plugged into socket SO1.

With switch S1 closed, capacitor C1 charges through resistor R4 to the battery (B1) voltage. With the SCR normally in its nonconducting high-resistance state, it suddenly switches to a low-
resistance conducting state when a signal from the amplifier output is applied through R1 to its gate electrode. This fires the flash bulb in J1, discharging C1.

With its anode circuit now open, the SCR switches back to its nonconducting state, and C1 charges up again through R4, ready for its next trigger.

Construction. The Jinniflash is amazingly easy to build. It can be assembled in the $5.25 for $1.25. Alisc.-Etched 1-5" 1-Crystal 1-Moisture 1-Standard S1-On-off R4-1500-Ohm 1-1-megohm 1-R2-40,000-Ohm 1-2N3228 1-23) SDI-Four-prong P1-Phono plug 1/2-Four-prong plug (Amphenol 71-4S or equivalent) Q1, Q2—TI416 transistor (or equivalent) R1-47-Ohm, 1/2-watt resistor R2-47,000-Ohm, 1/2-watt resistor R3-1-megohm potentiometer (with on-off switch S1) R4-1500-Ohm, 1/2-watt resistor S1—On-off switch (part of R3) SO1—Four-prong socket (Amphenol 78-S4S or equivalent) SCR1—2N3228 silicon-controlled rectifier T—Standard flashgun (surplus) 1—Moisture sensor plate 2—General Electric X6 or equivalent cadmium sulphide photocells 1—Crystal or dynamic microphone cartridge (Share R7 or equivalent) 1—5" x 1" x 2½" Minibox (Bud CU-2106A or equivalent) Misc.—Etched circuit board*, 1/4" Moly stud, standoffs, knob, battery connector, wire, etc.

* A pre-etched circuit board is available from DEMCO, 430 Redcliffe Dr., San Antonio, Texas, 78216 for $1.25, postpaid. A complete package (less flashgun and sensors, but with sensor plugs) is available for $8 postpaid.

If you use a flashgun, you can use the capacitor taken out during modifi-
unit for slave operation, set it up on a tripod and direct the triggering light source from the desired distance at the photocell. Then turn on the unit and adjust its sensitivity control (R3) until the flash goes off. That is the proper sensitivity for the particular sensor.

**Slave Flasher.** If you want to fire the unit by means of an external light source, you can use a cadmium sulphide photocell, such as a GE X6, connected across inputs 2 and 3 of SO1 as in Fig. 5 (a). Best results are obtained if the photocell is shielded from all direct lighting, except, of course, the activating light source.

A small flashlight can be used at distances of up to 20 to 25 feet to trigger the unit. If a much brighter light, such as a...
When the beam is interrupted by an intruder, the unit shifts from a low-resistance to a high-resistance state, increasing Q1's base bias, and resulting in the triggering of the SCR to fire the flash bulb.

**Audible Triggering.** The Jinniflash can also be set off by a sharp sound if you use a standard high-impedance microphone cartridge as the noise sensor. The mike should be wired as shown in Fig. 5 (c), using shielded cable. With the proper microphone and a loud noise source, such as a starter pistol, the unit can be triggered from distances on the order of 25 or more feet. The practical applications of this sound-activated flasher are virtually limitless.

**Touch or Moisture Sensing.** If you want the Jinniflash to go off at the first drop of rain, high moisture, or body contact, simply connect a moisture sensor between terminals 1 and 3 of P2 as shown in Fig. 5 (d). Then adjust R3 for the proper sensitivity by trial.

As a touch sensor, the unit will fire a flash bulb remotely, when photographing wild game life, for example, or merely to perform tricks on a stage if you are practicing to be a magician.

In another application, you can use the arrangement of Fig. 5 (b), replacing the photocell with a fine piece of wire or foil. If you adjust R3 properly, a break in the wire will fire the flash bulb.

Naturally, you'll have to do a little experimenting with the different sensors for best results. But whatever you do, remember: the Jinniflash is your slave! You can do with it as you wish... but please, let your conscience be your guide.

---

Fig. 4. If you employ the BC flashgun, remove battery and capacitor from the case. Then connect a shorting wire across the capacitor connecting leads.

Fig. 5. These plug-in sensing elements facilitate interchangeability. In (a) photocell is wired for slave flash operation; in (b) arrangement is for burglar alarm applications; in (c) a microphone is the sound pickup device; and in (d) the pickup unit operates from body contact, water, or moisture.
ADVANCED EXPERIMENTER’S CORNER

INTERSTATION HISS SUPPRESSOR

FOR FM TUNERS

By JAMES T. SAMUELSON

IF YOU HAVE a hi-fi FM tuner similar to the Heathkit PT-1, the addition of only four parts will kill the “Niagara Falls” sound effect heard between stations. This interstation hiss is unwelcome and unnecessary. A hiss suppressor can be added to most FM tuners equipped with a built-in tuning meter amplifier.

Referring to the schematic diagram, you simply open the cathode-to-ground connection of V15 at pin 3, and wire in the parts as shown. A small piece of phenolic board can be used to support the added components. Connect the collector of Q1 to pin 7 of V16. Then set potentiometer R1 to a desired threshold level, and button up the set.

Interstation hiss, or “white noise” as it is often called, is usually heard when r.f. or i.f. amplifiers are operating under maximum gain conditions. When no signal or a very weak signal is present, little or no a.g.c. voltage is developed and the amplifiers run wide open. A strong or medium signal, on the other hand, develops a negative voltage which biases the amplifiers to a lower amplification level and reduces white noise accordingly.

When negative a.g.c. voltage is weak or missing, V15 also runs wide open, and a relatively large current runs through R1, V15, and the meter, developing a relatively large voltage across R1. This voltage at the junction of R1 and Q1 is positive with respect to Q1’s emitter and causes Q1 to conduct, “shorting” the signal input (which is now nothing but noise) on the grid of V16 to ground.

But when a signal is present, a.g.c. voltage cuts down the current flow through V15, reduces the voltage drop across R1, removes the forward biasing voltage on the base of Q1, and Q1 stops conduction. When Q1 doesn’t conduct, collector resistance to ground is very high and the audio amplifier operates as though the anti-hiss circuit doesn’t exist.

Threshold level is determined by D1 and D2 (general-purpose silicon diodes), and the setting of R1. Once R1 is adjusted, it does not have to be reset, except perhaps to compensate for tube aging. A fixed resistor can be substituted for R1 after it has been properly adjusted and the amount of resistance needed in the circuit is determined.

This circuit can be added to any FM tuner with a tuning meter amplifier and a cathode follower or audio amplifier output. Only four components are needed and they can be mounted on a small piece of punched phenolic board measuring only 1” x 2”. The “subchassis” can then be attached to a convenient support under the chassis deck of the FM tuner. To keep the size small, a low-cost, multiple-turn potentiometer is suggested for R1; after several months of use, as the tuner tubes began to age, this control still did not require resetting.
Low-cost, high-efficiency calibrator also serves as portable signal source

By FREDERICK FORMAN and EDWARD NAWRACA

SIMPLE, useful, accurate... that about sums up this versatile oscilloscope calibrator which puts out a selectable 10-volt, 1020-Hz square-wave or a 50-microsecond, 1- to 2-volt amplitude, 1020-Hz pulse. With this $18-to-build instrument, you can not only check the vertical calibration and time-base (horizontal) linearity of your oscilloscope, but get this... you can even check its basic sweep frequency! The calibrator can also serve as a portable signal source with one thousand and one applications.

How It Works. The scope calibrator (Fig. 1) is basically a simple solid-state astable multivibrator designed to close tolerances. Transistors Q2 and Q3 comprise the multivibrator, whose frequency is determined essentially by the values of timing components C1, C2, R3 and R4.

The nominal 1020-Hz frequency can be reduced to an exact 1000-Hz signal by merely shunting C1 and C2 with a 20-pf. capacitor.

Emitter follower Q4 serves to isolate the multivibrator from the loading effects of the output circuit while functioning as an impedance-matching device. Transistor Q1 serves only as a battery condition indicator. It is employed in an emitter follower configuration with a 10-volt lamp (11) serving both as an indicator and as the emitter resistor.

As the source battery deteriorates, its output gradually approaches the zener

Actual photographs of square-wave (left) and pulse (right) produced by solid-state scope calibrator.
(D1) voltage, reducing Q1's base bias, and thus causing the lamp to glow more and more dimly. This can be observed by pressing the battery test switch (S2). However, because the calibrator would normally be used only on occasion, rather than continuously, the life of the battery can be expected to approach its no-use or shelf life.

**PARTS LIST**

- **B1** — 22 1/2-volt battery
- **C1, C2** — 0.001-μF, 2% disc capacitor
- **C3** — 100-μF disc capacitor
- **C4** — 10-μF, 25-volt electrolytic capacitor
- **D1** — 12-volt zener diode (Sarkes Tarzian 'R12A or equivalent)
- **D2** — 1N457 diode
- **I1** — 10-volt indicator lamp (Sylvania 10 ES or equivalent)
- **Q1** — 2N404 transistor
- **Q2, Q3, Q4** — 2N697 transistor
- **R1** — 1500-ohm, 1/2-watt, 10% resistor
- **R2, R3** — 27,000-ohm, 1/2-watt, 10% resistor
- **R3, R4** — 698,000-ohm, 1/2-watt, 10% resistor
- **R6** — 250,000-ohm carbon potentiometer
- **R7** — 100,000-ohm, 1/2-watt, 10% resistor
- **R8** — 3900-ohm, 1/2-watt, 10% resistor
- **S1** — 2-pole, 3-position rotary switch
- **S2** — S.p.s.t. momentary-contact push-button switch
- **1** — 5" x 4" x 3" utility cabinet (Bud C-1795 or equivalent)
- **1** — 2 1/2" x 4" printed circuit board
- **Misc.** — Binding posts, battery holder, machine screws, solder, hookup wire

*Available from Fred Forman, 2421 West Berwin Ave., Chicago, Ill., for $2 drilled or $1.50 undrilled.

---

**Fig. 1.** Essentially a square-wave generator, the scope calibrator also produces a positive-going pulse for test purposes. The battery condition is monitored by means of the test lamp (I1) in Q1's circuit.

**Fig. 2.** Be sure to observe polarities of diodes D1 and D2, and capacitor C4, as shown above. An actual-size photo of the foil side of the printed circuit board appears below.
Series resistor $R1$ drops the battery voltage to within 0.1 volt of the nominal 12-volt zener diode level.

The multivibrator square-wave output which appears at the collector of $Q3$ measures approximately 12 volts. This is reduced to the required 10 volts by adjustment of $R6$. To produce the 50-µsec. pulse, the square wave at $Q3$ is differentiated by $C3-R7$, and rectified by $D2$ to remove negative overshoots. The output is switched to $Q4$ by $S1$, and coupled to the external circuit through $C4$.

**Construction.** Although the model shown uses a printed circuit board (which the author sells for $2—less parts), you can lay out the circuit on a printed circuit board, these will be the only wiring connections you will have to run. Jumper wire shown on the circuit board should be mounted on the component side of the board.
When you use the calibrator, connect its output to your oscilloscope’s vertical input. Be sure to place a plastic graticule, ruled 10 lines to the inch, over the face of your scope for greater accuracy.

piece of 2½” x 4½” unclad perforated phenolic board if you wish. Use flea clips or solder lug strips for the connections.

The calibrator is housed in a 5” x 4” x 3” utility cabinet. The selector switch (S1), battery test switch (S2), and output binding posts are mounted on the front panel. You can also mount the battery test lamp on the front panel, to the left of the selector switch, although it is shown here mounted on the top of the unit. Calibration potentiometer R6 is on the unit’s back panel, and the battery can be secured at any convenient spot inside the cabinet.

Mount the parts on the component side of the circuit board in accordance with Fig. 2. Then install the circuit board in the cabinet (Fig. 3) and complete the wiring connections as shown in Fig. 4.

Adjustment. With the battery installed, adjust the amplitude of the square wave to exactly 10 volts, as follows:

1. Set selector switch to SQUARE and connect a jumper between QS’s base and ground to disable the multivibrator.
2. Connect an accurately calibrated d.c. voltmeter across R8 and adjust potentiometer R6 (on the rear of the unit) for a 10-volt meter reading. Then remove the jumper and voltmeter.

After calibrating your scope, you can use it to measure the pulse at the calibrator’s output. You cannot adjust the pulse amplitude independently since this is a function of the square-wave frequency.

---

FREQUENCY-TO-METER CONVERSION CHART FOR HAMS & SWL’S

By JAMES G. LEE, W6VAT

When you’re planning to install antennas for various frequencies, it’s useful to have a rough idea of the equivalent wavelengths. You could use the formula: wavelength (meters) equals 300 divided by frequency (megahertz), but this quick-look chart will give you almost as precise an answer. The formula is only necessary when you want to cut an antenna to the nearest fraction of a meter. Calibrated to cover the 3.0- to 300-MHz range, this chart makes it possible to convert from frequency to meters or vice versa. Read up and across for meters, across and down for MHz.

64 POPULAR ELECTRONICS
Here's a new kind of crossword puzzle designed to test your knowledge of electronic terminology. Refer to the clues given and fill in the word called for by the first clue. Start at the arrow. Thereafter, fill in each new word called for by the following clues perpendicular to each preceding word. The first or last letter in each preceding word will be common to the first or last letter of each new word, and all words will read vertically downward or from left to right. The tenth word will have a letter in common with the word at the first exit. Nine more correct entries will take you to the word at the second exit, which will also share a letter with the last of these nine words. In each case, the first or last letter of the exit word will be the first or last letter of the next word. An additional nine correct entries will put you at the final exit for a perfect score. A correct entry may or may not fill up all of the white spaces available.

Solution appears on page 101

CLUES:
1 Noise in a radio receiver, sometimes caused by atmospheric conditions.
2 Metal surface on which electronic circuits are mounted.
3 Abbreviation for the effective value of an alternating current or voltage.
4 Instrument for electrical measurements.
5 Unit of resistance measurement.
6 Synonym for a sine-wave generator.
7 A revolvable device on which recording tape is wound.
8 Conductor used with test equipment.
9 To hinder or prevent oscillation or vibration, such as the quivering of a meter pointer.
10 One end of a bar magnet.

Exit 1, Polarity resulting from excess of electrons.

Exit 2, Device for mixing carrier frequency and signal frequency to produce sideband frequencies.

20 Negative or battery side of a telephone line.
21 A long, narrow channel or depression.
22 A transistor element.
23 Scientific research/development center (abbreviation).
24 Unit of length equal to one-thousandth of an inch.
25 Microwave amplification by stimulated emission of radiation.
26 Undesired low-frequency vibration, usually associated with turntables.
27 May be transformed from one form to another, but usually cannot be created or destroyed.
THE rapid advances in computer technology—being made almost on a weekly basis—are dumping thousands of dollars' worth of electronic components into the "distress" market. Practically all computer circuits are on printed circuit boards, and with a little care the experimenter can uncover a gold mine in reusable parts.

High-grade capacitors, precision resistors, and top-quality transistors and diodes are but a few of the components the author has salvaged from computer PC boards. The secret of a successful salvage operation lies in preventing the heat from reaching the components while desoldering. An obvious way to do it is to use one of the new desoldering irons with a rubber suction bulb attached to the iron. Another way is to prepare a bath to absorb the heat from the component leads before they get too hot.

An effective heat sinking bath can be set up by placing the PC board in a shallow, flat-bottomed pan of water—supporting the board so that the foil side with the soldered connections just breaks the surface. Desolder with a hot iron or gun and brush the molten solder aside with a small wire brush—or suck it up with a rubber suction bulb.

If you choose your computer PC board wisely, you will be astonished at the harvest you can reap. Recently the author worked over three boards that yielded 27 transistors, 48 diodes, and dozens of 5%—or better—resistors, at a total cost of only $1.50! —Paul H. Fuge

Note that the reverse side of this printed circuit board was dip-soldered, indicative of the fact that hundreds of such boards are available in the "distress" market. The 300-K Endeco desoldering kit in this photograph contains a variety of tip sizes.
VHF/FM
MARINE
RADIO
SERVICE

IF YOU, too, have shied away from marine radiotelephone gear because you just couldn’t stand the sight of that awesome-looking 20-odd foot antenna drooping over on your boat, or your boat wasn’t big enough to carry such a long antenna, why haven’t you installed VHF/FM radio equipment? It requires no more than a 17-inch whip . . . and no ground plate at all!

Illustration by Andre Dusan

More channels, less noise, smaller antennas, less crowding, and more reliable communications for pleasure boating

By RICHARD HUMPHREY
In spite of the fact that the VHF/FM Maritime Radio Service has been around since 1962, it was not until quite recently that this new service began to catch on, thanks mainly to the relentless efforts of the U.S. Coast Guard and the Federal Communications Commission. And, if the 1966 Boat Show at the New York Coliseum—with its impressive exhibit of two-way radio—is any barometer, VHF/FM marine radio has finally come into its own.

Aside from the wide variety of radio equipment the recreational boater has to choose from, he can, for a few extra dollars, boost the radiated signal of any equipment he selects by using one of the many high gain antennas that are available to him. Communications Products, GAM, Prodelin and White are but a few of the manufacturers who offer such units. In addition to the basic 17" quarter-wave whip for the VHF marine frequencies, you can also get a 34" whip with a 3-db gain which doubles the effective radiated power.

Frequencies Covered. The VHF/FM Maritime Radio Service covers 18 channels in the 156 to 174 MHz band. Specific frequencies, channel designations, points of communication, and authorizations that are available for assignments are listed below.

While the 2-3 MHz marine band was terribly overcrowded, as are the CB radio frequencies and the old VHF marine band with only eight assigned channels, the new 18-channel VHF/FM marine radio service includes ship-to-bridge and lock tender facilities in addition to a marina channel (channel 9, 156.45 MHz). A chart of VHF frequency allocations is listed below.

1. Business and operational in the Great Lakes area; in other areas, navigational only.
2. Authorized for call, reply, and safety purposes; if necessary, for distress messages also.
3. Not available in Puerto Rico or Virgin Islands.
Five channels and 35 watts of radiated power are features of Hartman’s “Hurricane” transceiver.

MHz), the latter specifically requested by the U.S. Power Squadron.

Until quite recently, the most active promoter as well as user of the new VHF/FM facilities was the United States Coast Guard. Said Captain Charles Dorian, Coast Guard Chief of Communications, in a recent address before the North Atlantic SAR Seminar: “Every

operational shore unit will have installed a four- or six-channel transceiver. Every Coast Guard vessel 16 feet long, and above, will have VHF/FM capability ranging from single-channel portable transceivers to 28-channel transceivers!”

By all indications, the words of Captain Dorian are being fully implemented not only aboard ship, but also on shore. According to Commander H. J. LeBlanc, East Coast Area Communications officer, U.S. Coast Guard, who presented a comprehensive station list at the January 16th Maritime Communications Companies VHF Conference in New York, local Coast Guard communications facilities will gladly supply complete information. (Consult your nearest U.S. Coast Guard facility for a listing of stations in your area.)

Small Craft Users. According to James E. Barr, Chief of the FCC’s Safety and Special Radio Services Bureau, there are approximately 5000 licensed transmitters at the present time, representing an increase of approximately 1000 over the 1964 total. Furthermore, the number of stations is increasing at a rate of over 30 per month. One conclusion that can be drawn from the rapid expansion of the VHF/FM Maritime Radio Service is that the recreational boatman has finally begun to make use of these radio facilities.

The U.S. Coast Guard Auxiliary, having been granted use of the Coast Guard primary VHF working frequency, 157.1 MHz, is offering free classes to train the pleasure-boatner in the mysteries and wonders of the VHF/FM marine radio band. You can get more information on the classes offered from your nearest U.S. Coast Guard Station.

Also, the U.S. Weather Bureau has expanded its 5:30 a.m. to 10:30 p.m. taped weather forecast service on 162.55 MHz to a 16-station network, of which 16 stations will ring the eastern coast of the United States, from Boston to Brownsville, Texas, in time for the 1966 hurricane season.

Telephone Network. “So now,” says the skipper of Little Neil, “I’ve got 156.3 MHz (safety) on channel 1 of my five-channel rig; 156.45 MHz (marina) on channel 2; 156.65 MHz (bridge-to-bridge) on channel 3; 156.8 MHz (Coast Guard and calling) on channel 4, leaving channel 5 unassigned. What do I put on

Konigsberg Electronics’ KR-53V transceiver features 10 message channels at 50 watts output power.

Although RCA Radiomarine’s VHF P19A is essentially a commercial rig, it would be right at home aboard bigger yachts. Control head features push-button channel selection and telephone handset.

June, 1966
Aerotron's "Sea Line" transceiver delivers 35 watts to the antenna, has four channels, and is compact.

it?" Replied the skipper of the Sea Wolf: "For seven bucks a month, which entitles you to 120 message units, you can tie into the Bell System's worldwide telephone network. This is what you put on channel 5!"

If you've ever experienced a nerve-wracking fight to get a phone call through on the old 2-3 MHz band, you'll appreciate how nice it is to switch to VHF/FM and just tap that mike button once and hear your local marine operator come back at you loud and clear over static-free FM radio in a couple of seconds.

Unfortunately, the telephone compa-
nies have been slow to react to the "communications explosion" taking place under their very noses, and are therefore passing up a lucrative business to common carrier interests. Of the 79 stations publicly licensed for this service, 33 are common carriers. An FCC spokesman recently confirmed that, of late, the bulk of applications received for Public Correspondence, as the telephone service is called, are from common carriers.

Nor has the Bell Telephone Company shown any desire to expand beyond their present use of two channels out of the five which are available for Public Correspondence. "We are presently refusing service for land mobile stations aboard vessels," says E. F. Mattern, Communications Consultant for the New York Telephone Company, "since we feel that shipboard stations should properly use the VHF marine radio facilities that are available to them." This seems to indicate that land mobile stations aboard vessels will be using the VHF Marine Operator more and more—at least in the New York area.

In spite of the view expressed by Mr. Mattern, there is a strong possibility that the five channels authorized for Public Correspondence will be in full use in the not-too-distant future. For at this writing, the FCC has just approved (Continued on page 92)

Electronic technicians, hobbyists, and experimenters are constantly required to make measurements using test instruments with a variety of dial calibrations. For in addition to the voltmeter, ammeter, ohmmeter, wattmeter, vu meter, etc., there are other instruments which, though seldom used by the average hobbyist, are of equal importance to the technician or experimenter. The micrometer is one of these.

(Answers appear on page 99)

Before testing your skill at reading meters, note the following useful procedures:
(1) Locate the zero index.
(2) Examine the scale to determine if it is linear or not.
(3) Determine the value of each major division and its subdivisions.
(4) Try to be as accurate as possible when approximating position of pointer or index within a scale division.

Now, see how accurately you can read the following meter scales, to the nearest tenths or hundredths.
"HOME-BREW" WEATHER STATION—Wendell Anderson, RCA engineer and ham operator, holds up a weather picture transmitted from an orbiting satellite. Using a vintage ham receiver (1938) and $250 worth of such mundane parts as a rolling pin, an argon lamp, and a $15 microscope, he has been able to pull in signals from the NIMBUS and TIROS weather satellites and reproduce them as the U.S. Weather Bureau does. Said Anderson: "To build a TIROS ground station for a few hundred dollars, when commercial ones run $30,000 and more, shows that any country that wants TIROS weather data can get it."

ELECTRONIC "BUILDING BLOCKS"—Only 1/8" square, this circuit array can contain as many as 1500 components, including up to 750 transistors. Developed by Fairchild Semiconductor, these silicon monolithic circuits are being standardized to make it possible to satisfy the needs of different users without having to design a new circuit for each application.

10,000 VOICES—Combat soldiers using Hughes Aircraft's lightweight "Manpack" transceiver have 10,000 individual voice channels in the 2 to 12 MHz range to choose from in order to overcome enemy jamming. The SSB transistorized unit can work on ordinary flashlight cells. In field tests, sets have operated efficiently between points 500 miles apart.
ATOM-POWERED WEATHER STATION—A nuclear-powered unattended weather buoy (NOMAD), developed by the National Bureau of Standards, broadcasts weather data from Gulf of Mexico to monitoring stations for protection of ships and aircraft.

MICROMINIATURE CORES TO GUIDE SATURN—To get the most guidance information into the smallest possible space, IBM engineers designed microminiature cores for the Saturn IB launch vehicle's guidance computer. Some 545 cores fit on a dime.

COMPUTERS AT THEIR FINGERTIPS—Without having to leave the financial district, businessmen in the New York Wall Street area now have access to ITT's giant multi-purpose computer complex in Paramus, N.J., where their investment and other business problems will be analyzed in a matter of seconds.

ELECTRONIC INSECT? Not quite, but one of RCA's new integrated circuits intended for home entertainment equipment can perform functions of all 26 electronic components shown in the background. Units will sell for as little as $1.25 in production quantities.
BUILD LIGHT-TO-SOUND

Convert blinker lights to audible dots and dashes to get higher code speed and one-man operation

By LUIS VICENS

LIGHT-SIGNALED Morse code has many advantages, but as any scout or sailor will tell you, it can be downright tough to copy, and it is usually a two-man job. One man watches the blinking lights and calls out the letters, while another man writes them down. Eyeball response to speeds greater than 8 or 10 words a minute is extremely difficult. Audible dots and dashes, on the other hand, can be copied at much faster speeds, and it takes only one person to do it. For a few dollars' worth of parts, you can build this code translator to convert the blinking light to an audible tone.

Signals from an ordinary flashlight can be "seen" 50 feet away and more, depending upon focus, aim and ambient light conditions. Greater distances can be spanned with a brighter light source. The translator is an ideal science fair project to demonstrate communications by light, photocell operation, and transistor amplifier action. You can also use it in your auto as a light dimmer reminder.

How It Works. Figure 1 is the schematic diagram of the translator, which—in this application—serves as a receiver. It is a two-transistor direct-coupled amplifier that acts like a switch to turn the sounder on when a light strikes the silicon photocell.

In the presence of light, the cell puts out a small voltage (up to about 0.4 volt at 10 to 16 ma., in full sunlight)
and forward-biases Q1. Transistor Q1 conducts through the base-emitter junction of Q2 and forward-biases Q2. Transistor Q2 conducts and energizes the sounder. Resistor R1 serves as a current limiter.

A transistorized code practice oscillator can be “keyed” by this type of circuit, as can a relay and buzzer device. However, the sounder used here draws little current, and calls for a minimum number of parts. Sounder frequency is on the order of 2500 Hz and is sufficiently loud enough for most applications. No, it isn’t as loud as an auto horn.

The transmitter can be any sharply focussed light source that can be keyed on and off easily. There is really no limit as to how elaborate or simple you can make a blinker. You can cover the light source with an infrared filter so as to make the light beam invisible to “eyes-droppers”; you can place a lens in front of the light to intensify the beam; and you can place a long cardboard tube in front of the light to obtain a very narrow beam to make the unit extremely directional.

Construction. All the translator components, including the battery, are housed in a Minibox measuring 5” x 2 3/4” x 2 3/4” as shown in Fig. 2. Drill a 1/4” hole in the center of one end of the

(Continued on page 93)
The Western New York Pioneer Citizens Band Association, Lockport, N. Y., has been reported to your CB Editor as being one of the most civic-minded CB organizations in the country. Its past record bears out the report. The achievements of this group might serve as a guideline to recently organized CB associations and to veteran clubs interested in working for the good of their own communities.

The PCBA had an unusual beginning. It was organized specifically to aid needy children. However, the first attempt at organization, in 1963, was nearly disastrous; as membership began to swell, some members lost sight of the original purpose of the club and concentrated more on social functions. Sound familiar?

To avoid a permanent departure from their original plan, membership in the reorganized PCBA has been limited to 50. The purpose of the club is carefully explained to all applicants, and each application requires the approval of the board of directors. Many of the current members are businessmen using CB 2-way radio. Although the Pioneers are primarily interested in helping children, their services are offered to any charitable organization seeking aid.

The club's past performances are highly commendable—one might even say enviable! In February, 1965, for example, the club donated $100 to the Rehabilitation Center Fund for Children in Buffalo, N. Y. In April, members joined a drive to collect clothing for flood victims in Portland, Oregon; three tons' worth was collected.

At Eastertime the club bunny visits the homes of children in the area with candy baskets for all, and makes a similar visit to children confined in Lockport Memorial Hospital. And when the club held its jam-boree last May, honored guests for the two-day event were children from St. Rita's Home for Retarded Children and Wyndham Lawn Home for Children. The guests were treated to a picnic lunch, and given free rides and entertainment, including a special...
Last December the Pioneers donated $50 to the Lockport Veterans of Foreign Wars for use at their children's Christmas party. A 19" portable TV receiver was donated to St. Rita's Home the same month.

To kick off the new year, club president Pete Russell, KIC1734, reported the Pioneer group's donations for the month of January: Hope fund, $200; Salvation Army, $50; Rehabilitation Fund, $100. Total: $350. And in February members participated in an annual Children's Rehabilitation Fund Telethon broadcast aired over WKBW, Buffalo, N. Y., by picking up more than $3000 in pledges with their CB mobiles, then donating $100 on behalf of the club. The total pledged by New Yorkers during the drive amounted to more than $250,000.

Publicity director Vernon Batt, KIC5311, announces that the club's 1966 jamboree will be aimed at raising a net profit of $5000 for—you guessed it—needy children. As this column is being written, the event is tentatively set for June 12. One of the highlights on the bill will be a show from the Grand Ole Opry. Interested CB'ers should contact CB'er Batt at 321 Miller St., North Tonawanda, N. Y.

Yes, the club is CB-active, too. Members do have CB equipment and can be heard on the air, but mostly for business purposes, occasionally with a personal note. The important thing is that the members of the group were brought together through an interest in Citizens Band 2-way radio, and

*Photos by Al Shaen*
OVER THE YEARS semiconductor prices have followed a steady downward trend as production techniques have improved and more efficient manufacturing methods have been introduced. The original point-contact transistor (now obsolete) sold for well over $100. Today, however, a far superior transistor is available in small production quantities for less than 25 cents each.

An interesting example of how semiconductor prices can change over a few years is shown in a recent General Electric advertisement. The ad traces the cost of basic semiconductor devices used to control 600-watt loads, when purchased in quantities of 100 and up, from 1957 to 1965.

When the silicon-controlled rectifier (SCR) was first introduced back in 1957, a pair sold for $290. These early units, Type ZJ39A, were supplanted in 1958 by Type ZJ39L, priced at the much lower figure of $214 a pair. By March of 1959, the ZJ39L price had dropped to only $100 a pair.

Later, in July of 1959, the C36B was introduced at $22.20 a pair and, later, in June, the C11B at only $20.00 a pair. The C15B was introduced in July of 1961 at $13 a pair, its price dropping to $9.50 by December, and then to $8.40 by January of 1962.

Another small price drop came in January, 1963, when the ZJ265B was introduced at $7.80 a pair. Just about a year later, costs were cut almost in half with the production of the C22B at only $3.50 a pair. Finally, in February of 1965, GE introduced the SC41B Triac, a bi-directional control device capable of handling a 600-watt load, at only $2.75 each.

How about that! From $290 to $2.75 in eight years! Too bad automobile prices don't follow a similar trend—if they did, we'd all be driving Cadillacs!

Reader's Circuit. Ever wonder what makes your automobile directional signal flasher burn out so often? In a nutshell, it's because of the relatively large current required to operate the standard electromechanical flasher. To overcome this limitation, reader Emil E. Knospe (77 Laverack Ave., Depew, N.Y.) has come up with a design for an all-electronic flasher that he says is far superior to the ordinary flasher (See Fig. 1). Here are some of the advantages he lists: (1) variable load capability premitting its use for hazard light switching (all directional lights flashing at once); (2) a stable flashing rate not affected by load or battery voltage variations; (3) independently adjustable on and off cycles; (4) instant warm-up; (5) noiseless operation; and (6) long life.

Transistors Q1 and Q2 form an astable

![Fig. 1. Electronic flasher submitted by Emil E. Knospe features adjustable flashing rate.](image-url)
multivibrator circuit, with $R1$ and $R4$ serving as respective collector loads, and $R2$ and $R3$ being the base bias resistors. Capacitors $C1$ and $C2$ provide cross-coupling feedback. The multivibrator's frequency, which establishes the flashing rate, is determined by the value of the base resistors ($R2$ and $R3$), and the value of $C1$ and $C2$. Zener diode $D1$ and series resistor $R5$ provide a regulated voltage to insure a stable multivibrator operation.

Transistor $Q2$'s output is emitter-coupled to buffer amplifier $Q3$ which drives $Q4$ acting as a power switch. In operation, $Q3$ is saturated during the off cycle, dropping the full supply voltage across collector load $R6$, and applies only a fraction of a volt to $D2$, which acts as a high-resistance device. Thus, $Q4$'s base, returned to its emitter through $R7$, receives essentially zero bias and the transistor is cut off. With $Q3$ at cutoff during the on cycle, a portion of the supply voltage is applied through $R6$ to $D2$, causing this diode to conduct, and thus placing a forward bias on $Q4$'s base. With $Q4$ now conducting, its collector current is limited only by the flasher load.

Transistors $Q1$ and $Q2$ are 2N217's, $Q3$ is a 2N176 and $Q4$ a 2N277. Diode $D1$ is a 10-volt, 1-watt zener unit and $D2$ is an ordinary rectifier with a 500-ma, 200-PIV rating. Except for $R6$, which is a 5-watt wirewound resistor, all resistors are 1/2-watt types. Both $C1$ and $C2$ are 10-volt electrolytic capacitors. Switch $S1$ is a heavy-duty s.p.s.t. type, and $F1$ is a 10-ampere fuse.

Emil used a Cordover HSD-2B combination heat sink and chassis to house the unit. He removed the inner fins to provide space for mounting the components. Neither layout nor lead dress should be critical, but be sure to observe the polarity of the battery, capacitors and diodes, and use relatively heavy wire for the power, load, and ground connections.

Designed for automobiles with negative-ground electrical systems, the flasher assembly can be mounted at any convenient point away from engine heat. Many users will prefer to mount the unit to the firewall under the car's dash. According to Emil, the circuit will handle load currents from a fraction of an ampere to as high as 10 amperes (maximum) without modification. The flashing rate, with the component values given, is about 60 flashes per minute, with the on cycle about one-half the off time (1/2 second on, 1/6 second off). The on-off ratio, as well as the flashing rate, can be changed by using different values for $C1$ and $C2$; in practice, $C1$ controls on time, $C2$ off time.

**Manufacturer's Circuit.** Figure 2 shows a simple audio signal generator suitable for servicing or testing intercoms, p.a. systems, record players and other types of audio amplifiers. The circuit was abstracted from Motorola's "Solid State Projects" manual. Priced at 50 cents a copy, the manual is available through all franchised Motorola semiconductor product dealers.

Transistors $Q1$ and $Q2$ comprise the basic multivibrator circuit, with $R2$ common to both emitters. Resistor $R3$ is the collector load for $Q2$, whose base bias is provided by voltage divider $R4$-$R5$ and bypass capacitor $C4$. The signal generator's operating frequency is determined essentially by the feedback network comprising $FREQUENCY$ potentiometer $R1$ and one of the three capacitors ($C1$, $C2$ or $C3$) selected by the $RANGE$ switch ($S1$).

The output of transistor $Q2$ is direct-coupled to emitter-follower $Q3$ which serves as a buffer amplifier. A variable resistor,

ENGLISH-LANGUAGE BROADCASTS TO NORTH AMERICA

Prepared by Robert Legge

Best reception of the year becomes possible as stations utilize higher frequencies favored by warm weather propagation conditions. The latest addition to stations beaming broadcasts to North America in English is Radio Cairo, as listed below.

Radio New York Worldwide (WRUL) will soon be the most powerful privately owned broadcast station in the country. The International Educational Broadcasting Company has been granted a construction permit by the Federal Communications Commission for a 700,000-watt transmission plant projected to cost in excess of $2,300,000. It will have an effective radiated signal equivalent to 5,000,000 watts.

The new plant is to be located on a 785-acre tract of land in the New Jersey Pine Barrens near Chatsworth. It will include two 250-kw., one 100-kw., and two 50-kw. transmitters that will beam programs directly to Europe, Africa, and Latin America through curtain and rhombic antennas which are to be the most modern in the world.

This is the second major expansion that has been announced recently for the station; in February, Radio New York Worldwide revealed that it had contracted for the entire third floor at 485 Madison Avenue in New York City for new studios and offices. The station currently broadcasts 17 hours daily on each of five overseas transmitters in English and Spanish, but plans to add Portuguese in a few months, and then German and French when the transmitting plant in New Jersey goes on the air in 1967.

Basutoland. The Lesotho Broadcasting Corporation started installing transmitters here earlier this year, and expects to be in operation by the end of 1966. Considerable competition is anticipated from the South African Broadcasting Corporation, which has transmitters at the doorstep of Maseru, and whose FM transmitter at Ladybrand can be heard all over Basutoland.

Philippine Islands. Radio Veritas is building three transmitters in the town of Malolos, 40 miles north of Manila—two 100-kw. units for the short waves, and one 100-kw. unit for the medium waves. The station, which is preparing to go on the air in July, will cost about 17 million dollars and will broadcast in 17 languages. Studios will be located in Manila's Pius XII Catholic Center.

Solomon Islands. The Solomon Islands Broadcasting Service is planning to erect a new 8-element antenna for use on 3995 (Continued on page 102)

At left: Bob Thacker, WPE81SX, of Dayton, Ohio, uses two receivers—a Heathkit GR-64 and a Knight-Kit “Span Master.” His record: 21 countries verified (28 logged) and 20 states verified (25 heard).

Below: Bertram Heiser, WPE8ITB, Ypsilanti, Mich., usually DX'es with a Hammarlund HQ-100A receiver; a Hallicrafters S-38E does standby service. To date, Bertram has 20 countries verified, 22 logged.

June, 1966
FOREIGN-LANGUAGE BROADCASTS TO NORTH AMERICA

Prepared by BILL LEGGE

The Editors of POPULAR ELECTRONICS would like to know how much interest there is in the publication of the schedules of broadcasts beamed to North America in languages other than English. A listing of these broadcasts, with the frequencies expected to be used during June, is given below. If you would like to see these foreign-language broadcast schedules published in the future, drop us a postcard and tell us so.

CONTESTS, GRIPES, AND THE FCC

SUBJECTS of conversations in the amateur bands range from how to work new states to how to make money in the stock market to the airing of pet gripes. So far as the latter is concerned, you are liable to hear such remarks as “AM phone should be outlawed” . . . “SSB should be restricted to small segments of the phone bands” . . . “CW has too many frequencies” . . . “CW is more accurate than phone” . . . “Nets are a waste of time” . . . “All contests should be outlawed” . . . and so on and on.

Actually, most gripes heard on the air are not intended to be taken seriously. Occasionally, however, someone becomes so convinced of his own wisdom that he petitions the Federal Communications Commission to make his whim the law for all amateurs.

For instance, the FCC recently dismissed a rule-making petition—RM-562, dated January 23, 1964—aimed at outlawing all amateur awards and on-the-air contests, even though certificate chasing and contests are two of the more popular amateur radio activities.

In dismissing the petition, the FCC noted that contests may well help amateurs to attain the objectives of FCC regulation #97.1 (recognizing and enhancing amateur radio as a voluntary, noncommercial communications service in emergencies and encouraging amateurs to become better communicators and technicians to increase the nation’s reservoir of trained operators, technicians, and electronics experts). “Field Day,” for example, gives participants practice for communications emergencies and serves as a proving ground for emergency equipment. The FCC also stated that non-contest operators could always find available channels for their desired operations.

VHF QSO Party. There are two popular contests in June: the VHF QSO Party (June 11-12) and ARRL Field Day (June 25-26). To participate in the VHF QSO Party, you must be able to operate above 50 MHz. You get on the air at 2 p.m., local standard time, Saturday, June 11, and operate until 10 p.m., local standard time, June 12. Work as many different stations as possible; you earn one point per contact on 50 and 144 MHz.

(Continued on page 96)

When John Hill, WA4PMK, Emory, Va., was 10 years old, he found the amateur exams a little too much for his fifth grade education, but he talked his father, Jim, WA4PM, into enrolling with him in an electronics course at Washington County, Va., Technical School. Upon completing the course, they both passed their General Class examinations. They share a Johnson Viking “Ranger II” transmitter and a Hammarlund HQ-100A receiver, and divide their time between 10 and 75 meters. Jim and John will receive a one-year subscription for submitting this winner in our Amateur Station of the Month contest. To enter the contest, send us a clear photo of your station with you at the controls, accompanied by some details on your ham career and on the equipment you use. Entries should go to: Amateur Photo Contest, c/o Herb S. Brier, P.O. Box 678, Gary, Ind. 46401.
"Finally got my own shack!"

"That one's from Ed Smith over on the north end of town... That one's from Bob Brown on the east side... That one's from Jim Duffy right near the city limits."

"But it's unnerving. Why can't he sign off with '73' instead of '88'?"

CQ NOW! PAY LATER!

"Oh, thank you! I don't know how I can ever repay you."

"I'll probably be back on the air by 0200 dollars!"

THE UBIQUITOUS HAM

as seen by
WALT MILLER
TIME WAS—and not too long ago—when you paid for the operating convenience of an amateur SSB transceiver (unless it was a premium price unit) by sacrificing numerous features common to separate receiver-transmitter combinations. On “receive,” some transceivers had marginal selectivity and sensitivity and poor a.v.c./a.g.c. characteristics; on “transmit,” carrier and unwanted sideband suppression left something to be desired, the transmitted signal was wider than necessary, and output efficiency was low.

Today the gap between the performance of good CW/SSB transceivers and separate receiver-transmitter combinations has been significantly narrowed. And in any tabulation of transceivers based upon performance the new Heathkit SB-100 transceiver* would appear near the top of the list.

Features of the SB-100. This transceiver is the latest addition to the Heath Company’s “SB” series of amateur equipment and matches other items in the line in size and appearance. Ready for work, the unit weighs 17 1/2 pounds, its dark green panel measures 14 3/4” x 6 1/4”, and it is packaged in a gray, perforated aluminum cabinet. A welcome feature of the cabinet is its full-size, hinged cover.

Reviewing the SB-100 specifications reveals that this 20-tube and 16-diode (12 of the tubes are multipurpose) transceiver will operate on any amateur band and closely adjacent frequencies between 3.5 and 30 MHz with CW and upper or lower SSB. Transmitter power is 170 watts, CW, and 200 watts, peak envelope power (PEP), SSB, to a pair of 6146’s. Rated carrier suppression is 50 db, and unwanted sideband suppression is 55 db.

Rated receiver sensitivity is a 15 db signal-plus-noise to noise ratio for a 1-µv. signal at the antenna terminal. Selectivity, obtained by means of a hermetically sealed crystal lattice filter, is 2.1 kHz; this is also the transmitted SSB signal bandwidth.

Furnished as standard equipment with

*The Heathkit SB-100 transceiver and matching power supply kits are available by mail from the Heath Company, Benton Harbor, Mich. 49022.
the kit are all crystals required for normal operation on any frequency within the transceiver's range, and the components for a 100-kHz crystal calibrator and smoothly functioning VOX control system.

Keying on CW is via grid-blocking. The key also controls an audio oscillator that delivers a keyed tone to the speaker or phones to permit the operator to monitor his sending. In addition, the tone is fed to the VOX system. When the key is first pressed, the VOX relay immediately switches the transceiver from "receive" to "transmit" and holds it in this condition during normal keying. But a slightly longer than normal pause allows it to revert to the "receive" mode.

The "hold-in" time is adjustable on both CW and phone; non-VOX operation is also available on both modes by turning the function switch to "Push to talk" (PTT).

Besides its normal VFO control, the SB-100 offers optional crystal control of the transmit mode only or of both transmit and receive by the use of crystals in the 5 to 5.5 MHz region. This optional crystal control permits the transceiver to be used by Novice operators in the 15-, 40-, and 80-meter Novice CW bands. (Reducing power to the 75-watt Novice limit is merely a matter of retarding the front-panel "drive" control so that the amplifier plate current does not exceed 100 ma.) In addition, the crystal-control feature allows the SB-100 to be operated on the MARS channels within 25 or 30 kHz of the various amateur bands—frequencies which cannot be reached with VFO control.

The SB-100 requires 700 to 850 volts @ 250 ma. and 300 volts @ 150 ma., d.c., and 12.6 volts @ 5 amperes, a.c. or d.c. These requirements are easily filled by the matching HP-25 120-volt, 60-cycle a.c. supply and the HP-13 12-volt d.c. supply.

**Assembling the Transceiver.** The Heath Company recommends assembling the SB-100 as a project for the experienced amateur. Maybe the word *patient* might be better than *experienced*, because assembling the kit is not particularly difficult for any person reasonably adept with a soldering iron who has the patience to follow the very clear instructions in the instruction/operating manual. Patience is a must, because there are over 550 components to be installed.

Your reviewer estimates that it will take the average constructor approximately 80 hours to complete the SB-100. Trying to rush the assembly could turn a pleasant task into a disagreeable chore, and it would increase the chances of making errors. No special tools are required.

Before the days of printed circuit boards, wiring the a.f., i.f., and r.f. circuits in a unit as complex as the SB-100 would demand considerable skill. With circuit boards, however, the builder preassembles each board in an hour or two and then places it aside until the time comes to install all of them in the chassis.

Another potentially difficult task—building and calibrating the VFO—is completely bypassed because the Heath Company furnishes a preassembled and calibrated "linear

*(Continued on page 90)*

Feature-loaded SSB transceiver includes a preassembled and calibrated linear master oscillator (LMO) to simplify task of calibrating the VFO. Use of printed circuit boards speeds and simplifies construction. As in any well-designed transmitter, the final stages are well shielded. You can even work some of the MARS frequencies with this rig. Barefoot, the pair of 6146 finals runs at 170 watts for SSB and 200 watts for CW. You can drive a linear amplifier to obtain maximum legal power, or cut back to permit Novice operation.
THE MOST COMPLETE AND UP-TO-DATE GUIDE TO THE EXCITING WORLD OF SPECIALIZED RADIO COMMUNICATIONS!

ONLY $1.25

FACT-PACKED SECTIONS
Short Wave Listening
Amateur Radio
Citizens Radio Service
Business Radio Service
148 PAGES...

All new and better than ever, the 1966 COMMUNICATIONS HANDBOOK brings you exclusive information on such vital subjects as getting started in SWL—buying equipment and station reporting; establishing your CB station, public service activities; ham license applications procedures, learning the code; typical business radio installations...

PLUS a special nation-wide listing of 250 amateur radio clubs offering code and theory courses and a roster of 400 CB clubs—both lists available nowhere else!

...and much, much more. Everything you need to know about your specialty is covered by a leading authority in the field—from basic instruction for the beginner through the most advanced data and techniques.

Complete with charts, tables and illustrations galore, it's a big, valuable "encyclopedia" of communications information you'll use all year long.

Just what you've been looking for? Then clip the handy coupon below and send for your copy today!

ASSIST (Continued from page 26)

Sansei Electronics "Zephyr" receiver; tunes AM & FM; has 6 tubes and 2 diodes. Schematic needed. (Lee P. Hunt, 463 Pammel Ct., Ames, Iowa 50012)

Knight transceiver, circa 1934; covers 5 meters; has 1 tube. Schematic needed. (Nick Miho, 830 Almasy Dr., Campbell, Ohio 44405)

AM-864/U amplifier made by Federal TV Corp.; has 4 tubes. Schematic needed. (Arthur Karl, 14 Caldwel St., Pittsburgh, Mass. 01420)

Atwater Kent Model 46 receiver; ser. 23 10654; has 8 tubes. Schematic needed. (Edward Elffstrom, 76 Waterworks Rd., Freehold, N.J. 07728)

Grundig Model 87USA receiver; tunes AM and FM; has 3 tubes. Schematic needed. (Howard Lythe, 1700 Harrison Ave., Bronx, N.Y. 10453)

TCS-X transceiver, made by Collins. Schematic needed. Superior Model 600A multimeter. Schematic, operating instructions needed. (J.J. Ulmon, 607 Aspen St., Vandenberg AFB, Calif. 93437)

National Union RK34 tube and Hytron HY312 tube. Both tubes have 2 plate caps. Specification sheets needed. (David Hamilton. River Rd., Rt. 1, Paw Paw, Mich. 49079)

Transvision TV kit. Sources for T-2 or I.F. strip and brass escutcheon plate needed. (Robert F. Pierce, ET2-82, USC&G Loran Transmitting Sta., APO New York, N.Y. 09023)

Healthkit Model QF-1 Q-multiplier; has 12AX7 multiplier tube; tunes 430 to 460 kHz. Assembly manual needed. (Robert Kort, 59 Glenwood Ave., Poughkeepsie, N.Y. 12603)

Hewlett Packard journals from 1949 to 1955 needed: Vol. 1, No. 4, Vol. 2, No. 1; Vol. 2, No. 4; Vol. 3, No. 2, 4, 9, 10; Vol. 4, No. 1, 2, 9, 10; Vol. 6, No. 10. (J. Landia, Route 2, Clayton, Ga. 30525)

Teletype Model 2B simplex printer. Operating manual, end of line indicator, and source for parts needed. (Donald Porter, 230 Merritt Dr., Oradell, N.J. 07649)

Wire for wire sound recorder needed. (David Reiland, 417 Strodman Ave., Wisconsin Rapids, Wis. 54494)

Royal Controls Model 16 and Model 24B garage door control; has 5 tubes. (E.B. Stark, 530 Bell Ave., Altona, Pa.)

Browning Model R-2700A receiver and Model 23/S-nine transmitter. Operating manual needed. (Thomas Sedivy, R.R. #4, Box 238, Lockport, Ill. 60441)

Bosch Model 402-5 receiver; covers 0.55 to 1.7 MHz; has 9 tubes. Schematic needed. (Joe Pinner, 1349 Vin- ton, Memphis, Tenn. 38101)

Dumont cathode-ray oscillograph, type 322, circa 1952. Operating manual and schematic needed. (Bob Smilin- ski, 6 Carmichael St., Amsterdam, N.Y. 12010)

Motorola Model R-394-U receiver, part of AN/FRC-27 and AN/TRC-34 set; covers 152 to 174 MHz. Audio and squelch subassembly needed. (Robert W. Merdler, 916 S. Jefferson, Saginaw, Mich. 48611)

E.H. Scott Model RCH receiver, ser. 2845, built for Navy; tunes 90 kHz to 23 MHz on 5 bands; has 11 tubes. Schematic needed. (Richard Szatkowski, 62 William St., Trenton 5, N.J.)

Link transceiver, type 2365-6D 3A, ser. 1467; has 2 tubes. Schematic and conversion data from 47.2 to 53.6 MHz needed. (K. R. McCord, 3315 Oleanda Ave., Louisville, Ky. 40216)

Eight easy-to-build Projects for Electronic Hobbyists

PHOENIX, ARIZ.—Motorola Semiconductor Products, Inc., has published a 66-page book on useful solid state hobby projects as a part of their HEP program. The projects are simple and feature easy to follow instructions and pictorial diagrams.

In addition to projects on a code practice oscillator, panic button, signal generator, minifi amplifier, regulated power supply, intercom, motor speed control and 6-meter converter, the book contains builder's hints and a chapter on semiconductor fundamentals.

On sale at all Motorola franchised HEP sales outlets for 50 cents, the book is also available by sending the coupon below with 50 cents plus 10 cents for handling to HEP, Box 955, Phoenix, Arizona 85001.

Gentlemen:
Enclosed is 60 cents for my copy of “Solid State Projects From Motorola.”

HEATHKIT TRANSCEIVER

(Continued from page 85)

master oscillator" (LMO) as part of the kit. The builder simply removes the LMO from its box, bolts it to the chassis, and attaches it to the dial. Incidentally, the dial turns as smooth as butter and is calibrated in 1-KHZ increments; it can be read to within a few hundred hertz or better.

Aligning and adjusting the SB-100 is a straightforward operation, using just a VTVM and a 50-ohm dummy load capable of dissipating 100 watts for short periods of time. The receiver is adjusted first, then the transmitter. Assuming that there are no "bugs," the entire operation is easily completed in an evening. Unfortunately, we were temporarily slowed up by a defective crystal, which we tracked down by systematically following the troubleshooting procedures outlined in the SB-100 instruction manual. The Heath Company immediately sent a replacement, of course.

Test Results. In the transmit mode, the completed unit easily met its performance specifications. Phone quality was excellent, warm-up drift from a cold start undetectable in normal operation, and both carrier and unwanted sideband suppression extremely high. On CW, the signal was T9X and free of clicks and chirps.

These results were no more than we expected on "transmit" after inspecting the circuit diagram. What we wanted to do was to check how closely the SB-100 met the high claims made for it as a receiver. As its claimed 15 db signal-plus-noise to noise ratio for a 1-μv. input signal is the same as the verified performance of the Heathkit SB-300 receiver (see page 85, Popular Electronics, August, 1964), we arranged to switch from one unit to the other and started listening.

Any signal—no matter how weak—that could be copied on either the SB-100 or the SB-300 could be copied equally well on the other one using either a beam or a multiband doublet as an antenna. But the 5-meter readings were far different; the SB-300 meter always read four to six "S" units higher than the SB-100 meter.

Most of the difference between the meter readings is due to the fact that the SB-100 has less absolute front-end gain than the SB-300 has. The only time that this lower gain might possibly be important would be if the SB-100 were used strictly as a receiver with an extremely inefficient antenna—maybe a piece of wire a foot long. Such
an antenna would be useless on "transmit," however.

Naturally, the SB-100's selectivity does not match the selectivity of the SB-300 when the latter's 400-hertz CW filter is switched into the circuit. But the Heath Company can supply a 400-hertz filter for CW buffs who want to use the SB-100 on CW only.

Conclusions. On performance, the SB-100 must be rated A+. Although it lacks provision for tuning the receiver a few kilohertz on either side of the transmitter frequency or for using an external VFO, these are minor disadvantages. The optional crystal control will take care of many of the conditions where a second VFO might be used; besides, many operators prefer to use a separate receiver in conjunction with a transceiver for split-frequency operation, such as DX chasing.

The SB-100's power on "transmit" is sufficient for successful work on both CW and SSB on all bands. And for future expansion, its power output will drive any "linear" amplifier to the full legal amateur power limit.

On a cost basis, the SB-100's $360 price tag (plus $39.95 for the matching HP-25 120-volt a.c. power supply or $59.95 for the HP-13 transistorized, 12-volt d.c. supply) should also be highly attractive to the amateur who is willing to invest 50 to 100 hours of his time in assembling the transceiver and power supply and save about $200. —

CIRCLE NO. 5 ON READER SERVICE PAGE

VHF/FM MARINE RADIO
(Continued from page 70)

the application of the Florida Telephone Corporation to provide Public Correspondence service for channels 24 and 25 in the VHF/FM maritime radio band.

Equipment Offered. The fact that almost all tugs, tankers and commercial craft have VHF/FM radio communications equipment aboard should be the best recommendation for their use by the recreational boater. With Coast Guard installations ringing the country, the streamlining of FCC regulations, the Coast Guard Auxiliary training programs, and an industry awakening to the enormous potential of the pleasure boat VHF/FM radio equipment potential, manufacturers are beginning to have a field day.

Already in the race for the recreational boatman's dollar are Canadian Marconi through Kaar Electronics, its American subsidiary; Aerotron; Konigsberg Electronics; Aircraft Radio Corporation; Pearce-Simpson; Communications Company; Hartman Marine; Fisher Research Labs.; RCA Radiomarine; Raytheon; and many others. A partial listing of some currently available equipment is given on page 70.

Because more and more companies are entering the VHF/FM marine radio equipment market, the recreational boater will have the widest selection of radio gear to choose from, at the lowest prices ever, during the present boating season.

CAR VOLTAGE REGULATOR
(Continued from page 44)

tween 14.2 and 15 volts, and at 100°F, the reading should be within the limits of 13.8 and 14.6 volts.

Adjust the potentiometer (R2) for an initial reading of 14.4 volts, and later readjust the potentiometer, as the battery becomes fully charged, to maintain the same nominal reading. Be sure to tighten the lock nut on the potentiome-
Minibox to accommodate the sounder. Drill or cut a hole in the center of the other end to conform to the size and shape of the photocell. The on-off switch (S1) and a ½" hole for a tripod mount can be located approximately as shown, or in any other convenient place. The battery can be held in place by a battery holder or tape.

One of the sounder's terminals is used to support a small perforated phenolic board on which the two transistors and R1 are mounted. (See Fig. 3.) Vector push-in terminals serve as wiring points. Resistor R1 can be any value from 80 to 150 ohms, and almost any small-signal transistors can be substituted for those used here, provided that one is an npn and the other a pnp type. Also, an ‘S3M’ photocell can be used instead of the ‘S1M’ to increase sensitivity.

You can boost both sensitivity and range by applying a bias voltage to the photocell. Connect a 50,000-ohm potentiometer across the B+ and B− points; disconnect PC1's black lead from Q1's emitter, and connect it to the center arm of the pot.

Mount a 6"- to 12"-long tube in front of the photocell to prevent ambient light from setting it off. A ½"-diameter aluminum or cardboard mailing tube painted black on the inside will do. Small angles, spade lugs, or cement can be used to hold the tube and photocell in place.

Operation. To use the translator, simply mount it on a tripod and align it with the light blinker. If you don't know the Morse code, you can do what Paul Revere did—one if by land and two if by sea.

LOOK OUT! IT'S HOT!
(Continued from page 55)
is, at household frequencies, authorities say that a.c. is roughly three times as dangerous as d.c. at the same voltage, but d.c. brings about ventricular fibrillation in a much shorter period of time. You'll also find that as the frequency of an a.c. source increases, the injurious effects of shock decrease. Medical reports have shown that a person tolerates only 30 ma. at 11,000 hertz, but 500 ma. at 100,000 hertz. But now we're getting up into the r.f. regions. And r.f., as you know, can give you a nasty burn."

Ziggy finally finished my CB unit, plugged it in, and tried it out. The hum was gone. We listened as a waspy-voiced CB'er tried to reach her itinerant husband with a message to pick up his mother-in-law at the railroad station. Seems she decided to pay an extended visit. I thought I heard Ziggy mutter something about "poor guy."

"This time you test the rig for shock hazards." Handing me the voltmeter probe, he added thoughtfully: "If people used more common sense and took time out to make a simple test as you're doing, there would be a heap less accidents. Take ordinary house current, for instance. Many people still believe that the electricity entering their homes is confined to two or three wires. They don't realize that the earth or ground is an important part of the distribution system, as power companies connect the neutral wire to many places along the line. The earth can be looked upon as a third or neutral wire in a two-wire system in parallel with the neutral or ground wire."

"That's why it's just as easy to get a shock by coming in contact with a grounded pipe while touching a 'hot' chassis as it is if you simply put both hands across a line," I commented.

"Right. Best protection you have is to use a ground wire with your electrical tools and appliances to drain off stray current. Small appliances wear out in time and are frequently a source of trouble. In fact, the Underwriters Laboratory states that no tool or appliance
should be used in wet or other hazardous areas without special insulation and adequate grounding. It's also a good idea to buy only those appliances approved by the Underwriters Laboratory.

"Suppose your house hasn't a three-wire system?" I asked.

"That's no problem. A three-wire cord plugs into a two-slot receptacle using an adapter with its own ground wire. The wire is attached to a ground screw on the faceplate of an outlet box."

"How's to tell you have a grounded faceplate?"

"Easy. Normally a receptacle box is grounded if the house wiring is armored cable or rigid metal conduit. If it isn't, use a simple neon indicator—the type found in most hardware shops—to check. Touch one lead of the indicator to the faceplate screw and insert the other lead into each slot. If the indicator lights when contact is made on either slot, you have a ground. If you're using two-wire cord tools, make your own ground. Attach a length of No. 18 insulated single-conductor stranded copper wire to a screw on the tool's shell. The other end is tied to a grounded screw. It's not hard."

He went on to say that workshops, ham shacks and the like with damp concrete floors should be covered with wood or rubber mats as added protection. "Safety is largely a matter of habit. Learn to use common sense. Stay away from grounded pipes and other metal fixtures when near voltage. Always pull the plug out of a unit before doing anything to it, and use an isolation transformer when working on line-operated equipment. Make it a practice to consider all leads as hot leads until you have determined otherwise."

"I just thought of something," I interrupted. "How about a lecture for our CB club members on shock hazards. We could use some pointers."

Ziggy laughed. "I did give a little talk—at the last meeting. But, of course, you wouldn't know—you weren't there."

"I couldn't make it. I had a blind date that was supposed to be something special," I admitted, somewhat embarrassed.

"What happened?" Ziggy grinned.

"It turned out to be quite a shock."

His laugh followed me all the way up the stairs.

June, 1966
two points per contact on 220 and 420 MHz, three points per contact on the higher frequencies. The same station can be worked once per band, and your total score is the sum of your contact points multiplied by the sum of the different ARRL sections worked on each band.

You can operate from your home or pile your VHF equipment into a station wagon and head for a mountain in the nearest "rare" section. This is a move sure to please all other contestants. Either way, you will have fun.

For complete rules on the VHF QSO Party, and for the ARRL Field Day which is discussed below, see the June issue of QST, or write to the Amateur Radio Relay League, 125 National Ave., Newington, Conn. 06111, for official log sheets.

ARRL Field Day. The basic rules for Field Day are simple: you set up a complete, emergency-powered amateur station in a temporary location and work as many stations as possible. The affair starts at 2100 GMT, June 25, and ends at 2400 GMT, June 26. You can operate during any consecutive 24-hour period.

Of course, the serious purpose behind Field Day is to demonstrate the amateur's ability to supply communications under conditions closely approaching those that would prevail in an actual emergency. To emphasize this point, bonus points are given for low-power operation and the use of completely battery powered gear.

But Field Day is also a lot of fun, as attested by the thousands of amateurs who participate in it each year. Most participation is a cooperative club or other group effort. Each member contributes to the success of the operation by finding a suitable
Field Day site, lending equipment, erecting antennas, operating, keeping logs, feeding the crew, etc. Small groups keep a few transmitters in simultaneous operation, while large clubs frequently keep 12 or more transmitters in simultaneous operation on the different amateur bands during the contest period.

If your club has a club call-sign, use it. But if your group does not have a club station, you may use the call letters of any member of the group who has the authority to operate on all the bands and modes your group intends to use and who will remain at the operating site during the entire operation.

**NEWS and VIEWS**

To describe all the equipment in the field (Armond Lowell, WB2STEP) and son (Abbe, WB2TEO) ham station, 2536 Hyacinth St., Westbury, L.I., N.Y., would take up half our space. But in eight monttow times after 25 states on two and six meters, plus what they have worked on the lower frequency bands with a 75-watt transmitter; Armond reports that being a ham and running up high Novice VHF scores in several contests, studying for his General ticket, and building a 220-MHz transmitter and converter has not hurt Abbe's school work; he maintains an "Honors" average. . .

**Rodney Harmon, WA9GODD**, Box 5, Lane, Ill., has picked up a lot of operating into his first year on the air. In five months as a Novice, he made 600 contacts in 49 states, running 50 watts to a Johnson "Adventurer" transmitter feeding a 40-meter dipole antenna. The hold-out state was Alaska. As a General, Ray has moved up to a Johnson Viking-II transmitter running up to 180 wattf. For antennas, he has a Mosley TA-33-Jr. tri-band beam and 40- and 80-meter dipoles, and he receives with a Hallicrafters SX-140. Of course, he now has his WAS certificate and has worked over 41 countries.

**Joseph G. Polso, K3WRY**, 60 Tapered Oak Lane, Levittown, Pa., is also NOWAY in Navy MARS, and has a CB license, too. Joe is a member of the Levittown Fire Company L-100 and of the Falls Township Civil Defense Net. Among his ham equipment is a Johnson Viking 6N2 with home-brew modulator and power supply and a home-brew 1-kw., 6-meter amplifier. A 50' tower supports beam antennas for six and two meters and one end of a "long wire" for the lower frequencies. A Hammarlund HQ-110, a Hallicrafters SX-140 and a S-95, plus a couple of AMECO converters, give him lots of things to listen to. Putting them all together resulted in 32 states and 3 countries worked and confirmed . . .

**Walter and Irene Hryniewicz, W9LAG/K9CCS**, Route 2, Box 101A, Chippewa Falls, Wis., have been on the air for 20 years. They have a 500-watt "Globe-King" transmitter and a 1000-watt, home-built transmitter, a Model 19 RTTY set, and a National NC-183 receiver. Walter flies his own plane—an "Aeronca Chief"—and is on 24-hour-a-day-seven-day-a-week call as an installer and maintenance engineer for Wisconsin's microwave radio system. In addition, he is a member of MARS, RACES, and the Civil Air Patrol. In his spare time, he just "hams." Make your own guess as to when Irene gets on the air.

**Alberto Corrissio Alegino, HK3BAE, P. O. Box 584, Bogota, Colombia, received his class license (40 meters only) and took second place in the Colombian Independence International Contest on July 30, 1965. On August 31, he qualified for his second class amateur license, which allows him to work 10, 15, 20, and 40 meters. Using a home-built "Apache" transmitter and an SB-10 SSB adapter, a Lafayette HA-350 receiver, and a Hallicrafters SX-99 receiver, Alberto has worked 31 countries in five continents and 36 states of the USA. His antenna farm has sprouted a 40-meter dipole and a 3-element ground plane antenna for 10, 15, and 20 meters. Then there is his prize exhibit: the HK3BAE special, a home-brew, 9-element, 3-band, directional, vertical ground plane, which certainly sounds impressive . . .

**Marc S. Webb, WB2PHO, 645 Arnow Ave., Bronx, N.Y., considers the 21-MHz band as home, from which he makes excursions up and down in frequency—to 40 meters, 10 meters, and 2 meters. On the lower frequencies, Marc uses an EICO 720 transmitter to feed a "long wire" antenna via an antenna coupler and a National NC-109 receiver, and has nine countries and 30 states worked. On 40 meters, he uses a war-surplus ARC-5 transmitter running 20 watts to feed a home-built, 3-element beam.

**Philip Tucker, WA5FIT, 12834 Fingstaff, Houston, Texas, receives on a Collins 75SI and transmits on a Johnson Viking II "Valiant" running about 300 watts on phone and CW. Combining them with a 9-element beam and some sharp operating has produced a country total of 80 and all states worked. Alaska has the 50th state. Check with Phil if you need a Texas QSL card.**

**John Gussman, WB6PBI, 2512 Miller Ave., Pacifica, Calif., started his radio career as WPE6GAU, held a Novice license for four months, and is now a General. He uses a Heathkit DX-100B transmitter, which he holds down to 100 watts or less input, because he is a member of the QRP (low-power) club, and he receives on a Hallicrafters SX-140. The WB6PBI antenna is a 40-meter dipole, 15' high. So far, John has worked 20 states and 3 Canadian provinces.**

Will be reading your "News and Views" next month? The first step is up to you; write that letter and send that picture. (And thanks for having your "two-do's" in your club paper.) The address is: Herb S. Brier, W9EGQ, Amateur Radio Editor. POPULAR ELECTRONICS, P.O. Box 678, Gary, Indiana 46401.

73, Herb, W9EGQ

**NOW—250 WATT AC FROM CAR, BOAT, PLANE 12V BATTERY**

**Operate TV, CB, Tools, Lights, Phonos, PA Systems, Appliances, etc.**

**NEW ELECTRO TRANSISTORIZED 250 WATT INVERTER**

$89.50 Complete with connecting leads. 10" w., 4 1/2" h., 7" d.

At electronic, appliance, auto or marine supplier. If out of stock, send us his name.

### Full 250 watts/300 watts intermittently

- Solid state design for higher output loads—less battery drain.
- "Start" switch for rapid starting for lights and motors.
- Indicator light gives low battery charge and overload warning.
- Remote control available. Details on request.
- Automatic electronic overload protection.
- First line, 2N2152 transistors for long, dependable life.
- Fused for battery and inverter protection.

Free Bulletin "T" by 306

**ELECTRO PRODUCTS LABORATORIES, INC.**

CIRCLE NO. 10 ON READER SERVICE PAGE
R6, is used as Q3’s emitter load and acts as an output level control. Capacitor C5 serves as an output coupler and d.c. blocker. Operating power is furnished by a 9-volt battery, B1, controlled by switch S2.

Readily available low-cost parts are used throughout the design. The three transistors are all Motorola HEP-250’s. Except for the potentiometers (R1 and R6), all resistors are 1/2-watters. Capacitors C1 and C4 are 15-volt electrolytic types, while C2, C3 and C5 are 200-volt tubular paper types. Switch S1 is a single-pole, 3-position rotary unit, and S2 is a simple toggle or slide switch. Standard binding posts are used as output terminals. The power supply is a standard 9-volt transistor battery.

The circuit can be assembled on a conventional chassis or on a perforated phenolic chassis board, as preferred. If a perforated board is selected, push-in Vector terminals can be used for individual connection points. After wiring the unit and checking it for errors and accidental shorts, mount it in a plastic or wooden case or in a standard metal Minibox.

The audio signal generator operates in the frequency range of from approximately 7.5 Hz to 20 kHz in three ranges, and the instrument can be used for both signal injection and frequency response tests of audio amplifiers. The output signal is essentially a square wave, so the instrument must be employed in conjunction with an oscilloscope for transient response tests. If desired, the FREQUENCY control can be calibrated against a known standard. A multiplier switch, S1, provides multiplying factors of X 1, X 10 and X 100 as C1, C2 and C3 are alternately switched.

Transitips. Noise in any form can be annoying. Unfortunately, there are no sure methods for eliminating all noise from any high-gain circuit. If the noise—whether it be hum, hash, cracks and pops, or steady “rushing”—is from an external source, then shielding, bypass filtering, and line filtering (if line power is used) may be required to block out the undesired signals. In some cases, it may be necessary to install filters at the source of the noise (as on a motor). In receivers, more selective (higher Q) circuits and wave traps can be used to reduce external noise.

If the noise is generated internally, circuit and/or layout redesign may be needed. The layout should be modified as necessary.
to eliminate feedback paths and undesired interstage coupling.

As a general rule, most of the noise will start in the input stages. Once these stages are properly isolated by shielding and interstage filter networks, the final step is circuit redesign. Use special premium-priced low-noise transistors where possible, adjusting bias currents and load values for optimum low-noise performance rather than maximum gain. The following observations, based on practical experience, should help:

1. Low-gain circuits are less noisy than high-gain designs.
2. Low-impedance circuits develop (and pick up) less noise than high-impedance circuits.
3. Low temperatures are preferred—keep the input stages away from power transistors, high-wattage resistors, and other heat sources.
4. In general, the lower the bias currents and supply voltages, the lower the noise level... but some low-noise transistors require an optimum bias, with higher (or lower) values generating more noise.

Until next month—may your amplifiers be both noise-free and distortion-free.

—Lou

**METER QUIZ ANSWERS**

*(Quiz appears on page 71)*

The meter pointer (or index) indication is determined partly by counting the number of divisions—which is exact—and partly by estimating. Therefore, you may come up with a slightly different reading than the answers given below:

1. 0.29 ma.
2. 1.65 megohms
3. -8.4 db (38%)
4. 7.7 volts
5. 6.984 mm. The smallest division on the sleeve (stationary part) of this metric micrometer is 0.5 mm.; therefore, the reading is 6.500 mm., plus the reading of the thimble (rotating part). The smallest division on the thimble is 0.01 mm., giving a reading of 0.484 mm. for a total of 6.984 mm.
6. 76.7 Reading from the zero index mark on the vernier (stationary tab), the indication is between 76 and 77 on the dial. Observe that the seventh division mark on the vernier is the only mark that coincides precisely with a dial scale division mark. This indication adds 0.7, for a reading of 76.7.

CIRCLE NO. 3 ON READER SERVICE PAGE
ON THE CITIZENS BAND
(Continued from page 77)

have found a worthwhile way to use their “off-the-air” time collectively!

CB Bullseye. Citizens Band operators around Fairfield, Calif., are still smiling about a medieval robbery attempt that was staged in their area. The proceedings came to an abrupt halt when modern-day CB radio came to the rescue.

A CB'er, stopping to refuel his auto, was asked by the attendant to notify the police that he was being held up. The CB'er flipped the switch and placed the call while gasoline still poured into his tank (a dangerous practice—whew!)

In short order, a nearby police squad apprehended three youths who had been trying to rob the station attendant with a hunting bow and a steel-tipped arrow. Back to Sherwood Forest with ‘em!

Jamboree Coming Up? Don’t forget to let us know well in advance if you’re planning a special event or get-together so we can list it in the OTCB Jamboree Calendar.

1966 OTCB CLUB ROSTER

The following clubs are represented on the OTCB Club Roster for the first time. Active CB clubs not yet registered with this column are urged to fill us in on their operation, giving us the club history, membership totals, public service assists that have been made, and a listing of current officers. Include a good, clear photograph if you can shake your publicity chairman loose, and we’ll show the rest of the CB word what your operation really looks like. Send all material to Matt F. Spinello, CB Editor, Popular Electronics, One Park Avenue, New York, N.Y. 10016.

Machias, Maine—Machias Valley CB Club. Organized in November, 1965, this club boasts 40 members to date. Meetings are held bi-weekly, and the club members are available to assist in emergencies. Most members are connected with Civil Defense. Present officers are: Mrs. Agnes Johnson, KKA7344, president; Mrs. Lee Clemmons, KMA2942, vice president; Mrs. Esther Johnson, KMA4079, treasurer; and Mrs. Effie Drisko, KK831534, secretary.

Bronx, New York—Inwood-Bronx Chapter of the Citizens Band Radio Relay League. Current officers recently elected are: Marvin White, KLP1531, president; Wm. Robson, KKD9533, first vice president; George N. Raybin, KB10854, second vice president; Josephine Litvinoff, KKD8242, secretary/treasurer; Elizabeth White, KLP1532, corresponding secretary; and Cecil Ramsey, 2Q2124, business manager. Club meets on the second Friday of each month.

Brooklyn, New York—Brooklyn REACT Squadron. Entire squadron of 70 participated in aiding New Yorkers during the Eastern Seaboard power failure last November. Members directed traffic, placed flares at intersections to prevent accidents, and took people who had been stranded in total darkness to their homes. They drove doctors and nurses to emergency cases, patrolled streets to
discourage looting, tried to keep people calm and off the streets. One of their more important assignments during this emergency was a request to procure dry ice, as inoperative refrigeration units threatened to ruin supplies of rapidly warming blood plasma. Mobile units delivered the goods. In addition, several mobiles delivered such items as batteries, flashlights, drugs, and candles to those in need. Captain of the group is Lewis Frumoff, KKE0195.

Portland, Oregon—Oregon Citizens Band Association. Organized in the fall of 1962, and incorporated in March, 1964, this group has been active in helping people left homeless by fire, collecting food for the hungry, and assisting Toy & Joy makers in collecting toys and groceries to be delivered to the needy on Christmas morning. The OCBA was recently honored by the Red Cross for blood donations given in 1965; the club received an award certificate and was told that it was the only CB club in the area to have formed its own blood bank.

Many thanks this month to W. Don Curtis and members of the GBRCCA for a personal lifetime membership in the Greater Baton Rouge (La.) Citizens Communications Association, Inc.

I'll CB'ing you,

—Matt, KHC2060

Compact Scrulox Screwdriver Sets
Increasing use of Scrulox square recess screws in appliances, radios, TV sets, electronic instruments... even the control tower at Cape Kennedy... has created a need. A need for compact, versatile driver sets. Small enough to tuck in a pocket. Complete enough to be practical on shop bench or assembly line.

Now, here they are... from Xcelite, of course.
The World. For the newcomer to the hobby, as well as for the old-timer who wants to be brought up to date, Gilfer Associates is now offering a special SWL package. Included is a copy of the 1966 World Radio TV Handbook, the New Guide to Short-Wave Listening (How to Listen to the World), the North American Radio TV Guide, reporting letters (in pad form), and a 100-sheet package of SWL log sheets. Purchased individually, these items would cost $13.43. As a package, you can obtain them for only $12.00. The address is: Gilfer Associates, P.O. Box 239, Park Ridge, N.J. 07656.

CURRENT STATION REPORTS

The following is a resume of current reports. At time of compilation all reports are as accurate as possible, but stations may change frequency and/or schedule with little or no advance notice. All times shown are Greenwich Mean Time (GMT) and the 24-hour system is used. Reports should be sent to SHORT-WAVE LISTENING, P.O. Box 333, Cherry Hill, N.J., 08034, in time to reach your Short-Wave Editor by the fifth of each month; be sure to include your WPE Monitor Registration and the make and model number of your receiver.

Albania—English is scheduled from R. Tirana at 0000-0030 on 7265 kHz, and at 0600-0630, 2000-2030, and 2200-2330 on 7365 and 9390 kHz.

Australia—Utility station enthusiasts will be interested in knowing that VLF 2, the Overseas Radio Terminal in Sydney, will verify correct reports. The station operates single sideband on 10,420 kHz with 30-kw. power. Reports go to Overseas Radio Terminal, Third Floor, G.F.O., Sydney, Australia.

Austria—R. Austria, Vienna, is broadcasting to the east coast of N.A. on 6155 kHz at 2200-0430 and on 9770 kHz at 2200-0200 and 0200-0400. Broadcasts to the northeast coast of South America are on 11,785 kHz at 0000-0200, 9525 kHz at 0200-0500, and 15,240 kHz at 1700-1900. These are all-Eng xmas. Another Eng. period, beam to S. Africa, is heard at 1640-1650 on 17,750 kHz (this may be on Mondays, Wednesdays, and Fridays only).

Brazil—R. Jornal do Comercio, Recife, has replaced 15,145 kHz with 11,825 kHz, where it is heard until 0130 s/off. R. Guabi, Porto Alegre, has be-

come active on 11,785 kHz. R. Sociedad da Bahia, Salvador, is now on 11,871 kHz.

Canada—R. Canada has begun a new and experimental xman beamed to the BBC, London, for simultaneous rebroadcast to West African listeners. On 5850 kHz, at 0730-0745, this “feed” will consist of the first 45 minutes of the daily Australian Service which operates on the same frequency.

Colombia—Una Voz de Cultura en el Sur de Colombia, Emisora Mariana. Pasto, has moved from 4761 to 4707 kHz, where it is noted around 0200; it still gives an ID only for HJH2. 1250 kHz. R. Nacional, Bogota, 4935 kHz, is generally excellent from 0321 to 0355 s/off with symphonic music, the next day’s schedule, then s/off. The ID seems to indicate HJCT for this frequency and HJCC for 49 meters.

Cyprus—The BBC relay, Limassol, 17,885 kHz, was heard (not well) ending the BBC news at 1710; s/off was at 1745. This is reportedly a 100-kw. outlet beamed to E. Africa.

Egypt—Cairo has Eng. to N.A. from 0130 to 0200 on 9565 kHz with news at 0145 and 0230. English to Europe is given at 2130-2315 on 9470 kHz, with news at 2146. Another outlet at 9550 kHz carries the “Sawt el Arab” program at 2120-2140, dual to 9495 kHz.

Gabon—The station on 6030 kHz is located at Franceville, not Libreville. The only channels now in use are 4777 and 6030 kHz; 7270 kHz is no longer utilized. And the s/on time is now 0530 instead of the listed 0500.

Germany (East)—R. Berlin International is now operating on 11,785 kHz for the 1600-1645 Eng. xman to Africa although the xman is buried after 1630 by R. Vaticano; this xman is listed for 11,785 kHz but that channel is already covered. The schedule for the east coast of N.A. is 0100-0130 and 0200-0300 on 9560 and 9650 kHz; for the west coast of N.A., 0345-0415 on 9600 and 0850 kHz.

Guatemala—Station TGBA, R. Maya, Santa Cruz Barillas, 2380 kHz, is noted at 0230-0254 with hymns in Spanish, closing anmts at 0255, and s/off at 0530. This station has “The Lord’s Prayer” sung in Spanish.

Honduras—Station HRVC, La Voz Evangelica de Honduras, has an Eng. xman on Mondays at 0300-0330 on 4820 kHz which is evidently beamed to the Caribbean. S/off time is 0530. This station is having QSL cards printed, and reports are requested. Station HROE, La Voz de las Fronteras, Ocotepique, 5035 kHz, cuts off immediately following a clear and complete ID at 0130 in Spanish.

India—English for Europe from All India Radio

Bill Bordes, WPE4IGW, Somerset, Ky., DX’es with a National 121 receiver. He also uses a Westinghouse “Portatape” tape recorder. Bill’s record to date: 20 countries logged, and 16 of them verified.

in use are 4777 and 6030 kHz; 7270 kHz is no longer utilized. And the s/on time is now 0530 instead of the listed 0500.

VALPARAISO TECHNICAL INSTITUTE
DEPARTMENT PE, VALPARAISO, INDIANA

The listening post of Robert Culbertson, WPE3GRX, Seneca, Pa., features a Hallicrafters WR-600-W receiver. Bob has 30 countries heard, 28 verified.
St. Pierre et Miquelon—R. St. Pierre, 1375 kHz, 4 kw., may be audible at times to DX'ers in northeastern N.A. Programs are in French and the schedule is: Mondays, Tuesdays, Wednesdays, and Fridays at 1000-1130, 1500-1630, and 2130-0100; Thursdays at 1000-1130, 1500-1700, and 2130-0100; Saturdays at 1000-1130, 1500-1800, and 2130-0130; Sundays at 1230-0500. You'll probably need a crystal filter to cut through this split channel.

Sweden—Current Eng. xmsns from Stockholm are scheduled to Europe at 1100 and 1400 on 9620 kHz and at 2200 on 6065 kHz; to the Far East at 1100 on 15,195 kHz, at 1230 on 15,195 and 11,945 kHz, and at 2200 on 11,810 kHz; to S. Asia at 1445 on 15,315 kHz; to the Middle East at 1615 on 15,240 kHz; to Africa at 1456 on 11,705 kHz; to the east coast of N.A. at 1400 and 1445 kHz, and at 0145 on 9705 kHz; to the west coast of N.A. at 0315 on 9705 kHz.

Uruguay—R. Sarandi, CX468, Montevideo, operates on 11,885 kHz at 2100-0200 and 0930-0500. This station is also using a new channel, 9885 kHz, (CX471) at 2000-2300 (varies) on Saturdays, Sundays, and holidays.

U.S.A.—Voice of America reception is not always routine. Some relatively low powered xmsns, which make good DX targets, are still in operation. Following is a schedule for those xmsns which have less than 30 kw. power: Munich, 8 kw., at 0200-0730 and 1400-2345 on 3980 kHz; Philippines, 7.5 kw., at 1000-1600 on 6125 kHz, and 15 kw. at 2200-0100 on 6185 kHz; Okinawa, 15 kw., at 1000-1600 on 7125 and 9740 kHz; Colombo, Ceylon, 10 kw., at 1200-1500 on 15,285 kHz and at 1530-1800 on 7275 kHz. It might be a good idea to log and verify these xmsns since they will eventually be replaced by more powerful stations.

Venezuela—Station YVKA, R. Jurundu, Barquisimeto, 4900 kHz, is good at 2230-0115 with news, sports, and many musical programs, all-Spanish.

HOW SHARP A DX'ER ARE YOU?
The following stations have all been heard at various points in the continental United States. But it takes a good bit of ingenuity and lots of patience to dig some of them out of the air waves. Try your hand at locating these stations and let us know what kind of results you get. They are listed by frequency in kilohertz.

9710 Forest Side, Mauritius (0400-0430/fade: Eng. news at 0400)
7104 Stani Withayas Thoraphap Hang Prathet Thai, Bangkok, Thailand (1140-1200 with Oriental music and some Hawaiian music)
5949 YNRG, R. Zelaya, Bluefields, Nicaragua (0100 with Latin American programming; s/off at 0204; also heard around 1145)
5041 Rangoon, Burma (1200-1245, all-Burmese; also at 1430 in English)
4220 Urumchi, China (1155 in native language: 1200 with time pips; weak)
4165 Ulan Bator, Mongolia (1100-1130 in unidentified language; and at poor level)
4020 Peking, China (IS at 1100, anthem, then native language)
3900 Inner Mongolia (1115 in Asian language; short march at 1130; may possibly be Huhehote)
3385 VLSCD, R. Wexuk, New Guinea (1150 with South Seas music; Eng. ID and time given at 1200; Western pop music in local language until 1230 s/off)
3277 Srinagar, Kashmir (All India Radio IS at 0135; opening in Indian language; Eng. news at 0230 but signal fades before that time)
3332 Tananarive, Malagasy Republic (around 0305 with pop music and native language)

YOU CAN HEAR AND SEE THE DIFFERENCE

SONAR FS-23 CITIZENS BAND RADIO

COMPLETE . . . 23 Frequency Synthesized Crystal-Controlled Channels

Continuous one control channel switching • Low noise dual purpose transistor supply • Low noise Nuvisor receiver R. F. stage • Provisions of accessory VOX control and 2-tone squelch • High stability and frequency accuracy • Crystal controlled receiver fine tuning • Rugged heavy duty construction • Size: 113"Wx53/4"Hx113/4"D • Wt. 15 lbs. • 1 year warranty.

SONAR RADIO CORPORATION, 73 Wortman Ave., Bklyn. 7, N.Y. Please send complete information on FS-23 Citizen Band Radio.

FX STATES AWARDS PRESENTED

To be eligible for one of the DX States Awards designed for WPE Monitor Certificate holders, you must have verified stations (any frequency or service) in 20, 30, 40, or 50 different states in the U. S. The following DXers have qualified for and received awards in the categories indicated.

**FIFTY STATES VERIFIED**

Dennis Ashworth (WPE7BZB), Corvallis, Oreg. Charles J. Matterer (WPE6DGA), San Leandro, Calif. Steve Solo (WPE8BH1U), Detroit, Mich. P. Kilroy (WPE3F0B), Washington, D. C. Robert Lauzon (WPE2MWS), Pittsford, N. Y.

**FORTY STATES VERIFIED**

Randy Burg (WPE6GAR), Beverly Hills, Calif. Louis Votto, Jr. (WPE1GAI), Miami, Fla. Court Benefaid (WPE4GPO), Heflin, Ala. Phil Raczka (WPE8BFL), Cleveland, Ohio Jack Page, Jr. (WPE5DXH), Pontotoc, Miss. Robert Astmann (WPE2LWS), Kenmore, N. Y. Walter N. Pratt (WPE1FHE), Shrewsbury, Mass. Stuart Grade (WPE0DDD), Sioux City, Iowa Jim Smedley (WPE3SB), Sykesville, Md. Arthur W. Peterson (WPE6FMV), San Pablo, Calif.

**THIRTY STATES VERIFIED**

**TWENTY STATES VERIFIED**

DX AWARDS PROGRAM RULES

Here’s an easy way to get a copy of the rules and regulations for each of the three phases of the DX Awards Program to date (Countries, States, and Provinces). Just supply a postage stamp or return envelope, and your Short-Wave Editor will send you a leaflet containing the rules for all three phases-plus a copy of the official Countries List for DX Awards. The stamp or envelope, with your request, should go to: DX AWARD RULES, P. O. Box 333, Cherry Hill, N. J. 08034.

powerhouse on 13,214 and 11,277 kHz from 2145 to 2202 close. Basque and Spanish are used alternately; the s/off annals are given twice in both languages. Tune for the musical ID of “do re do ti do re sol do” on chimes.

Recent reports to R. Libertad at Miami Beach have been returned with the postal notation “Box closed by order of Post Office Department.” The Miami Beach address, however, is still being given over the air.

SHORT-WAVE CONTRIBUTORS

Terry Henry (WPEICGC), Keene, N. H.
Christopher Lobell (WPEICGI), Reading, Mass.
Ronald Boisvert (WPEIOTB), Manchester, N. H.
Eric Lebowitz (WPEJUXF), Jackson Heights, N. Y.
Paul Goodman (WPEJULTE), Oneonta, N. Y.
Robert Harris (WPEJULMG), Swneeset, N. Y.
John Sgrulletta (WPEJUXF), Bedford Hills, N. Y.
Allan Kachel (WPEJUNIH), New York, N. Y.
Alan Coles (WPEJUNY), Leonia, N. J.
Bob Hurwit (WPEJURP), Plainview, N. Y.
Stephen Toder (WPEJUR1R), Kingston, N. Y.
Ray Schlegel (WPEJURAO), Rochester, N. Y.
Richard D’Angelo (WPEJUOR), Brooklyn, N. Y.
John Zapisek (WPEJUKD), Wading River, N. Y.
Bob HeFi (WPEJURMD), Farmingdale, N. Y.
Peter Macinta, Jr. (WPEJURH), Kearny, N. J.
N. S. Jortner (WPEJUR), New York, N. Y.

Michael Mattes (WPEJY1S), East Williston, N. Y.
George Sprout (WPEJYBWX), Reading, Pa.
Eugene Radice (WPEJYGXX), Bloomsburg, Pa.
Grady Ferguson (WPEJYHC), Charlotte, N. C.
Chuck Edwards (WPEJYBXK), Fort Lauderdale, Fla.
Steve Jones (WPEJYDXX), Lawrenceburg, Ky.
Jack Keene (WPEJYBMPI), Houston, Texas.
Del Hirst (WPEJYCFU), Snyder, Texas.
John Callarman (WPEJYH), Pampa, Texas.
John Stephenson (WPEJY3X), Oklahoma City, Okla.
Stuart Mac Kenzie (WPEJ64A), Huntington Beach, Calif.
Shaler Hanisch (WPEJ6BPY), Pasadena, Calif.
Clifford McKinstry (WPEJ6CXS), San Bernardino, Calif.
Trev Cleen (WPEPJYAF), Fresno, Calif.
John Starley (WPEPJYCHO), Ogden, Utah.
Joseph Arndt (WPEPJYCO), Lima, Ohio.
Scott Kees (WPEPJY7Z), Clyde, Ohio.
S. L. Smothers (WPEPJYUFS), Kankakee, Ill.
A. R. Niblack (WPEPJYKM), Vincennes, Ind.
John Beaver, Sr. (WPEPJYBE), Pueblo, Colo.
Clarence Wall (WPEPJYBO1), Wichita, Kan.
Luis Baco (KPEPJYB1), Mayaguez, P. R.
Harold Allen (WPEJY1E), St. John’s, Newfoundland, Canada.
Robert Jones (WPEJY2W), Belleville, Ontario, Canada.
Ron Hopkins (WPEJY7YP), Trail, B. C., Canada.
E. J. Chapman, Pierrefonds, Quebec, Canada.
Joel Glass, New York, N. Y.
Glenn Hauser, Albuquerque, N. M.
Bob Hill, Washington, D. C.
Bill McDaniel, Markham, Ill.
Tony Title, Dallas, Texas.
Dowl Waller, Richmond, Va.
Canadian Broadcasting Corp., Montreal, Quebec, Canada.
Radio Sweden, Stockholm, Sweden.

RCA Hi-Lite color picture tubes bring OEM quality to your replacement tube customers

Odds are that when you're called to replace a customer's color picture tube and you replace it with an RCA Hi-Lite, you're giving him a better product than he had when his set was new.

That's because RCA Hi-Lite picture tubes are RCA's best... the same quality... the same tubes... that go into today's original equipment sets. RCA Hi-Lites are all-new... glass, gun, the works! And incorporate the continued advancements in picture tube technology achieved by the world's leading color picture tube manufacturer. So you literally "up-date" your customer's color set when you install one.

Here's picture brightness and color fidelity at its finest, available for the service trade in 19-inch and 25-inch rectangular and 21-inch round tube types.

How about you? Are you offering your customers today's color?

RCA Electronic Components and Devices, Harrison, N.J.

The Most Trusted Name in Electronics
You call it tiny.
We call it progress!

This is the new E-V 1177. An FM Stereo tuner and 50 watt stereo amplifier. All in one neat package.

Don't let its calm exterior fool you. The inside is packed with action. Solid-state circuitry born of our lengthy experience in aerospace electronics. Nothing wasted. Every ounce contributes to superb sound reproduction.

You can tackle the biggest musical sounds on record with the 1177. It's more than equal to the challenge. When teamed with a pair of famed Electro-Voice speakers, you've achieved a matched high fidelity system of rare excellence. And the E-V approach to high fidelity design makes installation easy and operation effortless.

Oh. One other thing about the E-V 1177. The price. It's right in line with the size. Small. Just $280.00 including the walnut-paneled case. See your E-V dealer for a demonstration. Or write for our complete high fidelity catalog. It's big!

ELECTRO-VOICE, INC., Dept. 664P, 630 Cecil Street, Buchanan, Michigan 49107
