firsts
make learning Electronics at home fast and fascinating—give you priceless confidence.

Some NRI firs in training equipment

first to give you Color Television training equipment engineered specifically for education—built to fit NRI instructional material, not a do-it-yourself hobby kit. The end product is a superb Color TV receiver that will give you and your family years of pleasure. You “open up and explore” the functions of each color circuit as you build.

first to give you a unique, exciting digital computer with memory built especially for home training. You learn organization, trouble shooting, operation, programming as you build and use it. Performs the same functions as commercial computers. Lessons stress computer repair. You conduct a hundred experiments, build hundreds of circuits. A solid-state VTVM is included among ten training kits.
NRI's "discovery" method is the result of over half a century of leadership simplifying and dramatizing training at home

The FIRSTS described below are typical of NRI's half century of leadership in Electronics home training. When you enroll as an NRI student, you can be sure of gaining the in-demand technical knowledge and the priceless confidence of "hands-on" experience sought by employers in Communications, Television-Radio Servicing and Industrial and Military Electronics. Everything about NRI training is designed for your education . . . from the much-copied, educator-acclaimed Achievement Kit sent the day you enroll, to "bite-size" well-illustrated, easy to read texts programmed with designed-for-learning training equipment.

YOU GET YOUR FCC LICENSE OR YOUR MONEY BACK

There is no end of opportunity for the trained man in Electronics. You can earn $6 or more an hour in spare time, have a business of your own or qualify quickly for career positions in business, industry, government. And if you enroll for any of five NRI courses in Communications, NRI prepares you for your FCC License exams. You must pass or NRI refunds your tuition in full. No school offers a more liberal money-back agreement. The full story about NRI leadership in Electronics training is in the new NRI Catalog. Mail postage-free card today. No salesman is going to call.

NATIONAL RADIO INSTITUTE, Washington, D.C. 20016

APPROVED UNDER NEW GI BILL If you have served since January 31, 1955, or are in service, check GI line on postage-free card.

designed from chassis up for your education

first to give you true-to-life experiences as a communications technician. Every fascinating step you take in NRI Communications training, including circuit analysis of your own 25-watt, phone/cw transmitter, is engineered to help you prove theory and later apply it on the job. Studio equipment operation and troubleshooting become a matter of easily remembered logic.

first to give you completely specialized training kits engineered for business, industrial and military Electronics. Shown above is your own training center in solid state motor control and analog computer servo-mechanisms. Telemetering circuits, solid-state multi-vibrators, and problem-solving digital computer circuits are also included in your course.

APOLLO WITHOUT ELECTRONICS

By the time this appears in print, any excitement that may have been generated by the successful flight of Apollo 16 to the moon and back will have been dissipated. Even while the flight was going on, all it meant to most people was reading a couple of newspaper headlines or watching briefly the TV coverage. But how blasé can we get? Maybe it's just the enormity of the achievement or because men have walked on the moon before. Or, maybe it's because there were more important things to be concerned about at the time. Whatever the reason, most people simply accepted the moon flight as a matter of course.

However those of us who are interested in electronics, either professionally or as hobbyists, should pause for a minute or two. Would it all have been possible without electronics?

There would have been no Saturn countdown computers monitoring more than 3000 parameters during the countdown leading to the takeoff. There would have been no inertial guidance system to keep Saturn on course. We would not have been able to track the flight from beginning to end using ground and shipboard radars. We would not have been able to monitor the astronauts on the moon without the color-TV camera assembly which was controlled on the earth. There would have been no lunar communications relay unit to transmit voice, telemetry and color TV from the surface of the moon and receive transmissions from the earth. What about the lunar module communications system which transmitted and received voice, telemetry, biomedical data, commands, ranging signals and television to and from the earth on a microwave carrier a little above 2000 MHz, and to and from the command module orbiting overhead on a little under 300 MHz?

There would have been no vhf ranging system to tell the distance between the lunar module and the command module. And no backpack radios for the astronauts to use while exploring the moon's surface. And no rendezvous radar/transponder, and no lunar module landing radar. And on and on the list goes.

We are not saying that the electronics was the most important thing on the flight, but we are saying that without it, the flight as we knew it would have been impossible. And that goes for the upcoming flight of Apollo 17 too.
Sams guides you through the highways and byways of electronics

MODERN DICTIONARY OF ELECTRONICS
4th Edition
by Rudolf F. Graf
Completely updated definitions of approximately 18,500 terms used in the fields of communications, microelectronics, fiber-optics, semiconductors, reliability, computers, and medical electronics. Over 2000 terms have been added, and hundreds of definitions have been updated. An invaluable reference.
No. 20852 $12.95

REFERENCE DATA FOR RADIO ENGINEERS
5th Edition
Covers transistors, electro-acoustics, microelectronics, electronics, space communication, navigation aids, quantum electronics, reliability and life testing. Completely revised by over 100 experts. 50% more data than previous edition. Over 400,000 copies in use. 1666 pgs., 1350 Illustrations
No. 20678 $20.00

ABC'S OF ELECTRONICS
2nd Edition
by Fari J. Waters
Clearly explains the principles of electricity, functions of atoms and electrons, magnetic forces and their relationship to electronics; basic components and their applications; fundamental electronic circuits and how they work. Latest information on solid state devices.
No. 20865 $3.95

COLOR TV TRAINING MANUAL
3rd Edition
by the Howard W. Sams Editorial Staff
A step-by-step education in the intricacies of color-tv. Its explanation of the basic principles of each circuit leads to a clear understanding of the overall function of the set. A widely used text for schools and self study, it embraces modern developments in color-tv circuitry.
No. 20736 $6.95

PHOTOFACT® TELEVISION COURSE 3rd Edition
by the Howard W. Sams Editorial Staff
This basic and comprehensive explanation of black-and-white television has helped thousands become proficient in television theory and servicing. Includes timely information on transistor circuits.
No. 20595 $4.95

STUDY GUIDE FOR CET EXAMINATIONS
by J. A. Wilson, CET and Dick Glass, CET
A programmed text giving full coverage of typical questions encountered in the CET examination, together with the answers. For background information, the chapters are keyed to the two Sams television courses described at the right.
No. 20834 $5.95

AUGUST 1972

CIRCLE NO. 31 ON READER SERVICE CARD
ON THE INSIDE LOOKING OUT

Enclosed you will find a copy of a check for a subscription to POPULAR ELECTRONICS which appears to have been deposited in June of last year. Now, that's a long time to be without PE! The judge so far (while making of me a bonafide "convict") has made me do without girls for ten years, but being without POPULAR ELECTRONICS for five months constitutes "cruel and unusual punishment." Please do something to relieve this situation before I have to take the matter up with a higher court.

Name Withheld

Higher courts notwithstanding, we have had to go to a lower authority to put things to rights. By the time you read this, you should be wallowing in PE's.

GOING BEYOND THE BASICS

"What Makes The Transistor Tick?" (November 1971) has several misconceptions in the text which need clarification. The statement that "... In their pure states, germanium and silicon crystals are electrically inert and behave in the manner of an insulator" is quite vague and, I believe, misleading. Intrinsic Ge and Si are classed as semiconductors—not insulators.

Later, discussing a pn junction, the author states: "With no voltage applied to the diode, no voltage difference exists between the two types of material." This is incorrect. At equilibrium, a pn junction does have a voltage drop across it. Because of the migration of majority carriers across the junction, a potential barrier is formed, on the order of a few tenths of a volt. Attempts to observe this potential with a voltmeter fail because of the contact potentials formed between the meter and diode leads.

L. Arthur A. Read
Physics Dept.
Waterloo Lutheran University
Waterloo, Ontario, Canada

Both points made by Mr. Read are, in essence, technically correct. However, for purposes of the published article, aimed as it was toward the novice to solid-state electronics,
the discussion presented was more than adequate. No statement was made to the effect that Ge and Si are insulators—only that they behave that way when in their pure states. Regarding the potential barrier across the pn junction, discussion of the potential difference is best left to technician and engineering level texts.

A SATISFIED CALCULATOR OWNER

In response to those critics (Letters, March 1972) of the November 1971 Electronic Calculator, I would like to state that I am most satisfied with my kit purchase of the MITS calculator. I assembled the kit without a hitch; the parts were all of excellent quality; and the assembly instructions were perhaps the very best I have ever seen.

CARL E. DOYLE
Duarte, Calif.

DOCTOR LENDS HIS SUPPORT

In response to your poll on a home study course in medical electronics (Letters, March 1972), let me state that I am definitely interested in lending my support. If some school can devise such a course, and make it really worthwhile, I will be one of the first to subscribe.

I am a psychiatrist who feels that medical electronics offers some great opportunities for breakthroughs in definitive treatment approaches. In putting together a home study course in medical electronics, I feel that it should offer some information on building instruments such as a brainwave detector. I know that this might appear to be a bit farfetched, but it would be folly to underestimate the ability and determination of the student.

PAUL A. SAXON, M.D.
Clinical Director
Wyoming State Hospital
Evanson, Wyo.

Most of the responses to our poll have been enthusiastic, to say the least. But we have some bad news to report. At the time of this writing no more than 30 responses have been received; and of that 30, six were from medical electronics engineers and technicians and practicing physicians. This is hardly a figure with which to approach a home study school.

A HELPFUL HINT

With all the cables and connectors used in the average hi-fi/stereo system, there is a very real need for keeping them identified. My solution in the past has been to use the small plastic "tags" used to close plastic bread wrappers and the like. These tags can be marked with any waterproof marker then slipped over the cable lead.

CARL S. BLUM
Ames, Iowa

From the PACE U.S. Engineering Team that introduced the first all transistor CB transceiver, the Model 223 offers another breakthrough in both Price and Quality. Taking advantage of U.S. mass production techniques and engineering knowhow, the PACE Model 223 provides the truly great bargain for today's CB operator who wants performance and price with the quality guarantee of a U.S. manufacturing firm. With a NO compromise design approach the PACE engineers built a double conversion receiver with a full 6 section tuned filter network for maximum receiver performance even under adverse conditions - we can guarantee performance for 2 years because we shake every one in the roughest QC test procedure ever designed for 2 way radios.

If you compare before you buy you'll join the Proud Pace owner's club!
More job.
If you qualify, we can guarantee you any one of 68 job fields. What's more, we'll send you to a school that will make you a real pro. That way, you get more jobs in the Navy and when you get out, you've got somewhere to go.

More guarantees.
You can be guaranteed East or West Coast and choice of sea duty or airman recruit work.

More travel.
See Africa. See Europe. See Japan. Join the Navy and see the world. (It's still true.)

More choice.
There's a new 3 year Navy enlistment. So you can come in for 6 years or 4 years or now, 3 years.

More bread.
New guys now earn $288 a month. (Congress gave us a raise.)
More hair.
You can wear a beard (nicely trimmed) if you want to. It's a Naval tradition. It's also a brand new Navy.

More freebies.
Besides free travel and free education and that $288 a month, you get free food and free clothing and free housing and free health care and 30 paid vacation days per year.

If you think you've got what it takes to make it in the new Navy,

Call: 800-424-8880

It's toll free, there's no obligation, and a real live Navy recruiter will answer all your questions 24 hours a day, seven days a week.

Or:
See your Navy man right now. He's listed in your phone book under U.S. Government, Navy. He's got all the answers—or he knows where to find them.

Or:

Send to: Captain Donald E. Oglevee
Building 157, Fourth Floor,
Washington Navy Yard,
Washington, D.C. 20390

I want to know more about:
☐ More job, training, education.
☐ The new 3 year enlistment.
☐ More travel.
☐ Guaranteed East or West Coast home port.
☐ More bread.
☐ Enlisting now, reporting 6 months later.
☐ I want to know more right away. Call me.
My phone No. (_________). ☐ If you really don't want to wait, call us
toll free right now at: 800-424-8880

**Summary**

Voltage ratings are standard CODES for some manufacturers, but may vary for other manufacturers.
Ecstasy. At a price that won’t cause too much agony.

Before the ecstasy of listening to your new stereo equipment comes, alas, the agony of shopping for it—the frustration of wanting this feature, and that spec, and finding that your budget won’t quite cover it.

Sony has something to ease the pain. The STR-6036. An FM Stereo/AM-FM receiver for the man with a small room, a small budget, but big ears nonetheless.

It’s an inexpensive receiver that doesn’t sacrifice performance, specifications, control flexibility, sound quality, or even looks.

What it does sacrifice, of course, is just a bit of power. The STR-6036 delivers 50 clean watts of IHF dynamic power at 4 ohms*. That’s quite enough to drive even most low-efficiency "bookshelf" speakers, even if it’s not enough to rival the power company, or to let you bust your buttons bragging about it.

The tuner, though, makes no concessions: It has a sensitive, overload-proof FET front end. And ceramic i.f. filters that increase selectivity and never need realignment. Plus a tuning meter for both AM and FM.

The controls have all the flexibility you’d expect from Sony: tape monitor, main/remote speaker selector, switchable loudness, even front-panel microphone input jacks.

And the control feel is typical Sony, too—firm, silky-smooth and positive. So the pleasure begins at your fingertips, even before your ears can start enjoying. Your pleasure will deepen to ecstasy when you hear the low price. As will your dealer’s when you buy one. Sony Corporation of America, 47-47 Van Dam Street, Long Island City, N.Y. 11101.

*IHF standard constant supply method.
IN MY LAST "Stereo Scene," we saw how your personality type—introvert or extrovert, sensitive or cloddish—might affect the kind of reproduced sound you like. This time, we'll consider how to choose a system that sounds that way.

If you've done any amount of component auditioning, in stores or in friends' homes, you will have noticed that loudspeakers differ more in sound from model to model than any other component in the audio chain. There are audible differences between pickups and tape decks, too; and even amplifiers and preamplifiers exhibit audible, although less conspicuous, differences. But since loudspeakers are the most highly colored and thus distinctive-sounding components, your choice of speakers will determine, to a major extent, how your audio system will sound.

We can divide loudspeakers into three basic sonic types, on the basis of the apparent distance that they seem to place between you and the sound. Some put the sound very close, giving the impression that the reproduced instruments are right in the room with you. Others have a noticeably distant perspective, giving the illusion of a good balcony seat in an auditorium, while others have a neutral perspective, making the instruments sound as far away from you as they were from the recording mikes. Most systems fall somewhere between the extremes of ultra-close and ultra-distant.

(You can vary the apparent distance of many speakers by adjusting the tweeter balance controls.) In terms of absolute fidelity, we can argue that the most neutral reproducers are the most accurate. But the absolutely accurate system may not produce the best illusion or reality for you, for a couple of reasons.

First, if you have a preference for a close listening seat at a live concert, close-up sound will be your criterion for reality, and the more distant sound of a neutral loudspeaker won't seem natural to you. Conversely, if you prefer and are accustomed to the kind of richness and breadth that you hear from a balcony seat at a live performance, close-up sound won't be realistic to you, either. You may find a few recordings whose miking makes them sound sufficiently distant or close to suit your taste, but most recordings aren't this extreme in either direction, so you're better off letting the speakers provide the perspective you prefer.

Second, there is the matter of the appropriateness of the reproduced sound's apparent distance. There are some kinds of musical performances that could conceivably take place right in your living room. A six-piece combo, a folk singer with guitar, or a string quartet could fit into a larger-than-average living room. So there is nothing unnatural about reproducing this kind of music with extreme closeness, giving the impression that the musicians are out in the room in front of the loudspeakers. A neutral loudspeaker cannot do this, for it maintains the original mike-to-instrument distances, and these distances can never be less than zero feet. Thus, the neutral system could place instruments that are miked extremely close right behind the loudspeakers, but could never bring them out into the listening room. Of course, you don't have to bring small performing groups right into the room with you, but the option
Introducing the expensive dual-trace scope that doesn’t cost a lot.

The B&K Precision Model 1470.
A solid-state 5-inch scope that combines dual-trace triggered sweep with vectorscope capability.
Our DC to 10 MHz bandwidth with 10 mV/cm sensitivity makes the 1470 exceptionally versatile. And its TV-H and TV-V positions are a special plus.
Dual-trace lets you observe input and output wave forms simultaneously in the same circuit. And 16-position triggered sweep, from 1 sec/cm to 0.2 sec/cm lets you sync them instantly.

On the other hand, you might prefer our Model 1465 single-trace, triggered-sweep scope at $359.95. It has many of the same features and our patented CALI-BRAIN® automatic voltage readout system.
Everything about our scopes is expensive except their price.
For complete technical data, call your local B&K distributor. Or write Dynascan Corporation.

Very good equipment at a very good price.

Product of Dynascan Corporation
1801 West Belle Plaine Avenue, Chicago, Illinois 60613

CIRCLE NO. 7 ON READER SERVICE CARD
is there, and the effect would not stretch one's credibility too much.

No Room for an Orchestra. But consider a full symphony orchestra, with maybe a 200-voice chorus thrown in to add interest. By no stretch of the imagination could this assemblage be squeezed into your living room, and to attempt to create a right-in-the-room illusion here would be ludicrous. For large performing groups, the object is to try to transport the listener into the concert hall, rather than bringing the instruments into the living room. Consequently, the apparent perspective of the loudspeakers should be such that they give an illusion of listening from a distance, either from a close seat in the auditorium or (according to your preference) a more distant seat.

Whichever you choose, bear in mind that closeness in a loudspeaker goes hand-in-hand with coloration, and extreme closeness means extreme coloration. This will impress itself on the instrumental sounds themselves and may change their quality enough to constitute a gross distortion of the original musical sounds. So, after you've found some speakers whose apparent closeness or distance seems to suit you, listen to them for naturalness of sound, using familiar program material.

The typical advice to the hi-fi shopper—that he listen and then buy what sounds "good" to him—is worthless to anyone who is looking for a semblance of fidelity in a system. "Good" is a value judgement, and what you feel to be good may be nothing more than what you are accustomed to hearing, or what your mind's ear thinks of as high fidelity. It takes a very well-trained ear to tell whether reproduced music sounds like live music, because most of us who get to hear live music enjoy it for its over-all effect, rather than listening analytically to its sonic details. This is not the case with natural sounds however.

Ever since birth, our brains have been storing recognition clues about the sounds that are part of our lives until, by early adulthood, we are able to tell the approximate size and weight of an object merely from the noise it makes landing on the floor in another room. We can even guess what the object was made of, or whether or not it broke. Our ears can tell us the size of a stream, the distance of a train, and (by the sounds of tires on the street) whether it is hot, cool, or raining outside. Our ears can also tell us, very easily, whether or not a natural sound sounds natural. For this reason, good sound-effects recordings can often give an instant and accurate impression of the fidelity of a reproducing system. Of course, you should still base your final decision on how the system sounds with music, but sound effects such as street traffic, fizzing soda pop, and hammering and sawing (for example) can usually be used to weed out the dross of the system and allow you to narrow the final choices to two or three likely contenders.

How Much Noise Do You Want? If your demands for audio quality are very high, there is much to be said for buying a high-power amplifier even if you don't plan to use your system for rattling windows. Even at low power levels, high-power amplifiers are usually better—that is, lower in distortion—than low-power ones, simply because they are generally designed to more stringent standards. If you plan to do a substantial amount of your listening at high to very high levels, a high-power amplifier is mandatory, as is a loudspeaker that will handle the kind of power you must feed it in order to produce the necessary listening levels.

If you're looking for live in-the-room listening levels, you should be wary of speakers with very low efficiency. These may burn out if driven loudly for protracted periods of time. Speakers aren't usually rated in terms of efficiency, but if you do need efficient speakers you can spot them instantly in a listening comparison in your dealer's showroom. Without changing the volume-control level, switch to each of the speakers whose other qualities you feel you could live with, and choose the one that sounds the loudest over the entire audio range. (Some "efficient" speakers are that way only throughout their middle range, and may have low efficiency at low frequencies.) Then choose an amplifier whose continuous power output rating is no greater than the signal or program power rating of the speaker. Huge, brute force amplifiers may be safe to use for a while, but unless you exercise constant caution, there is always the possibility of their demolishing your loudspeakers. (Of course, you can always fuse the loudspeaker.)

For extremely high listening levels, you should probably not even consider buying conventional hi-fi speakers. Special loud-

POPULAR ELECTRONICS Including Electronics World
speaker systems are made for high-quality, high-level use, and if that’s what you have in mind, you’re best off buying a pair.

Are You a Didder or a Listener? While we all pay lip service to the idea that high-fidelity equipment is intended for listening to music, there are many audiophiles to whom the possession and manipulation of hi-fi equipment is the primary interest. So, before jumping in with both feet and buying an expensive system with hosts of knobs, flashing colored lights and myriads of screwdriver adjustments to diddle, consider for a moment just what you want from your system.

Are you an inveterate knob twiddler, who spends his evenings trying different loudspeaker placements and checking the phasing of his tweeters? If so, then by all means consider a complex system with all the controls you can pay for. If you have a good listening ear as well, and hear a lot of things in commercial recordings that you don’t like, you might even include in your system one of those multi-band equalizer devices that divide the audio range into 9 or 10 segments and allow you to control each one independently.

Your diddling proclivities, or lack of them, should influence your choice of a primary music medium, too. Discs are simple to use, but the louder you play your system, the more audible their surface noise will be, and it takes care to keep disc surfaces in new condition. They must be handled with scrupulous care (no fingers on the grooves and no grit in the sleeves) and kept perfectly free from dust while playing.

It takes a persnickety person indeed to observe the cleaning rituals that are necessary to keep a disc in mint condition, and if you are not so inclined, you’re better off with one of the tape formats, none of which have quite the potential for top fidelity that discs have and all of which have somewhat higher hiss than discs. Generally speaking, open-reel tape offers the best fidelity of the tape formats, but many people like the tape-threading ritual even less than the disc-cleaning ritual; and, for them, cassettes are probably the best choice (unless they wish to plunge into 4-channel sound with RCA’s Q-8 cartridges). Bear in mind, though, that at present, discs still offer by far the widest variety of available program material, so this factor alone may outweigh the other disadvantages of the disc medium.

---

**THE MOST ADVANCED FULLY AUTOMATIC LOCKING SYSTEM ON THE MARKET TODAY!**

**UNLOCKS ON APPROACH . . . LOCKS ON WITHDRAWAL OF TRANSMITTER**

**PROX-LOCK**

**MODEL 161/171**

Patent Applied For

**Receiver**

**Transmitter**

Antenna

(Transmitter Carried by User Weighs Only 2¼ Oz.)

"FAIL SAFE" Design

A PROVEN LOCKING SYSTEM

USED SUCCESSFULLY ON:

- AUTOMOBILES
  (car must have electric locks)
- BEVERAGE TRUCK DOORS
- BANK CASH DRAWERS
- CASH REGISTERS
- ANYWHERE YOU FIND A NEED FOR SECURITY

SECURITY THROUGH THE USE OF PULSE-CODING

NICAD BATTERY POWERED TRANSMITTER

ONLY $179.95 with installation instructions and 1 year warranty

PULSE DYNAMICS MFG. CORP.
FULTON & DEPOT STREETS
COLCHESTER, ILLINOIS 62326

☐ Please send the PROX-LOCK with complete installation instructions.

Next to a willingness to work, nothing will improve your chances of success in electronics more than a college-level education. But family obligations and the demands of your job may make it very difficult for you to attend classes. That doesn't mean you have to forget about getting ahead. CREI makes it possible for you to get the college-level education you need without going back to school.

Learn at home
At your own pace, your own schedule ... without giving up your present job. CREI lessons are written to be clearly understood without the presence of a teacher. Your problems are anticipated. Your instructors will work with you in a very personal manner and give you all the individual attention you need. Many men learn far more readily through home study than they ever did in the classroom.

Not for beginners
CREI programs are written for men familiar with basic electronics, but who want to get the advanced, specialized knowledge they must have to move up to engineering-level positions and engineering-level pay. All CREI training material is developed with the help of top engineers and scientists from private industry and government laboratories. Each of these men is an expert in his field of electronics. He knows exactly what level of specialized knowledge a man needs to work successfully in that particular field today. This is your assurance that what you learn from your CREI study can be applied on the job.

You can have confidence in CREI
Since 1927, CREI has helped tens of thousands of men move ahead in every phase of the electronics industry. You'll find CREI graduates and students in key jobs wherever up-to-date knowledge of electronics is demanded. Leading companies recognize the quality of CREI education. Many pay all or part of CREI tuition for their employees.

CREI education is up-to-date education
CREI courses are continually being revised. New developments are included as quickly as they occur. Right now, CREI students are getting the latest information on cable TV, LSI chips, microminiaturization, lasers and masers, telemetry systems, servomechanisms and data links. If it's new in electronics, CREI—and you—will know about it.

Send for free book with complete information on CREI programs
Use postpaid card; no stamp needed. If card is detached use coupon or write: CREI, Dept. E 1208C, 3939 Wisconsin Ave., N.W., Washington, D.C. 20016

APPROVED FOR TRAINING UNDER NEW GI BILL
The twelve years of university research that led to the design of the BOSE 901 and BOSE 501 DIRECT/REFLECTING speaker systems revealed five design factors which optimize speaker performance:

1. The use of a multiplicity of acoustically coupled full-range speakers — to provide a clarity and definition of musical instrument sounds that can not, to our knowledge, be obtained with the conventional technology of woofers, tweeters and crossovers.

2. The use of active equalization in combination with the multiplicity of full-range speakers — to provide an accuracy of musical timbre that can not, to our knowledge, be achieved with speakers alone.

3. The use of an optimum combination of direct and reflected sound — to provide the spatial fullness characteristic of live music.

4. The use of flat power response instead of the conventional flat frequency response — to produce the full balance of high frequencies without the shrillness usually associated with Hi-Fi.

5. Acoustical coupling to the room — designed quantitatively to take advantage of adjacent wall and floor surfaces to balance the spectrum of radiated sounds.

To appreciate the benefits of these five design factors, simply place the BOSE 901 directly on top of the largest and most expensive speakers your dealer carries and listen to the comparison.

You can hear the difference now.

More Quartz Crystal Wristwatches

Ever since the announcement by Bulova some months ago of a $395 quartz crystal wristwatch, other companies have been rushing to announce their versions. One of these is the Waltham Watch Co., which has announced the marketing of a quartz crystal controlled watch at under $200. Unlike the Bulova version with its conventional moving hands, the Waltham version uses a liquid crystal digital display to show the time. The liquid crystal segments forming the numerals become reflective when a low voltage is applied to them. Since there is little or no current flow, this type of display is very economical of battery power. The colon between the hours and minutes numerals blinks once a second to show the passage of time. Accuracy of the watch is within five seconds a month.

Also announced recently was a line of electronic watches by Ebauches S.A., Switzerland, with cooperation from the company's partner, the Longines Watch Co. Ebauches S.A. has quartz crystal controlled watches with moving hands display or with liquid crystal digital display. These watches not only show the hours and minutes but also the seconds and the date as well. The company does not sell watches directly to the consumer but sells movements to watch manufacturers. Retail prices are expected to be below $300. Watches from both companies use IC's as frequency dividers for the crystal oscillators. Replaceable batteries operate the watches for at least a year.

TV Receiver with Memory Vision

A double-screen television receiver that permits instant, pushbutton freezing of action without interrupting normal viewing has been announced by Hitachi. The basic chassis is a standard black and white TV receiver with a 13-in. picture screen. To the left of this is a second smaller (9 in.) picture tube. Both CRT's are housed in a single cabinet. When a pushbutton is pressed, the image on the main screen at that moment is transferred to the second screen, frozen and locked in indefinitely until the pushbutton is pressed again. Normal viewing of the main picture tube goes on without interruption. Heart of the stop-motion system is a 4-in. rotating magnetic disc on which the video signal is constantly being recorded.

Russian Bank Orders U.S. Computers

The national bank of the U.S.S.R., Gosbank, has ordered two large-scale Honeywell computer systems, valued at approximately $5 million. The computers will be installed at Gosbank's computation center in Leningrad and will service the three main branches of the state-operated bank—the bank of foreign trade, the savings branch, and the industrial, agricultural and administrative branch. The order includes 100 terminals, which will be linked by telephone lines to the computer center from branch offices within a 180-mile radius.

Electronic Manufacturers Support Metric System

U.S. electronic manufacturers continue to be in favor of efforts currently underway to convert this country to the metric system of...
measurement. According to a membership survey completed by the Electronic Industries Association, manufacturers overwhelmingly approve of House Joint Resolution 1092 which states that the policy of the U.S. will be to facilitate and encourage the substitution of metric measurement units for customary measurement units in all sectors of the economy with a view toward making metric units predominant. Most responders favor a plan that calls for government legislation with targeted changeover dates and voluntary industry participation in the changeover.

First Ham to Slow Scan Color Globally

William DeWitt (W2DD) recently transmitted a color photo by means of slow scan television (SSTV) to another ham in South Africa, who then recorded the signal and transmitted it back to DeWitt's Fairport, N.Y. station. For color SSTV, the picture to be transmitted is scanned by a camera through red, green and blue filters. The resulting monochrome information is translated into audio tones which modulate an SSB FM transmitter. To playback the picture, the receiving station photographs the sequential images through color decoding filters. For color image reproduction, a triple exposure of the three filtered images is made onto appropriate Kodak color films. Then processing is required to reconstitute the color photograph.

GE Files with FCC for Four-Channel Broadcasting System

The General Electric Audio Electronics Products Dept. has filed a technical report with the FCC covering field testing of its four-channel discrete FM broadcasting system. The tests were conducted at the company's FM station, WGF, at Schenectady, N.Y., during non-broadcast hours. The transmission is compatible with existing monophonic and stereophonic receivers and music systems. The system transmits four discrete full-frequency 30-to-15,000-hertz audio channels by adding an ultrasonic subcarrier above the present stereo subcarrier used for stereo FM broadcasting.

Equipment Announced for Discrete Four-Channel Disc

The discrete four-channel disc developed by Victor Co. of Japan has three proponents so far. They are subsidiary JVC America, as well as Panasonic, and RCA Records. RCA has already announced the release of a four-channel disc, with more to come. Now the other two manufacturers are announcing their equipment to play the disc. JVC is offering a demodulator at $100, a special cartridge at $70, and a combination record changer with built-in demodulator and cartridge at $190. Panasonic is making available a demodulator at $135 and a combination record changer with demodulator at $200.

Satellite Helps Save Two Patients

An earth-orbiting ATS (Applications Technology Satellite) recently helped save the life of one woman in Alaska and relieve another seriously ill patient on the same day. The satellite is functioning as a switchboard-in-the-sky in a statewide Alaskan communications experiment under a cooperative program between NASA, the State of Alaska, and the Lister-Hill National Center for Biomedical Communications (HEW). Some 26 terminals located in remote villages and hospitals equipped with vhf transmitters and receivers use the satellite for communication to central locations in Alaska. During a routine educational program, the two emergency medical problems were reported. The satellite was kept in operation continuously while a doctor at the District Medical Center in Tanana, Alaska, provided instructions to the local nurse and an aide on the emergency treatment of the two patients.
NEW Heathkit Color TV — the best TV kit ever offered

Kit GR-800, less cabinet $599.95.* Kit GEA-800-6, remote control $79.95.*

NEW Heathkit 8-Digit Calculator

Adds, subtracts, multiplies, divides, chain and mixed operations. Seven 7-place decimal plus, minus, and overflow indicators. Overflow protection of most significant 8 digits. Clear-display key to correct last entry. Standard keyboard. American LSI circuitry. Bright 1/4" red digits. 120 or 240 VAC operation. Desktop black and white cabinet. 3 7/8" h x 6 1/2" w x 10 1/2" d.

Kit IC-2800 $129.95.*

NEW Heathkit FET Tester

Tests transistors, diodes, FETs, SCR's, triacs, unity gain junction transistors in or out of circuit. 5 current ranges measure leakage as low as 1 uA and collector currents as high as 1A. Gain (DC Beta), transconductance (GM), and leakage operate read directly on large meter face. Special battery testing circuit gives meter indication of self-contained power supply.

Kit TF-121, 6 lbs. $49.95.*

NEW Heathkit Timing Light

Features extra bright daylight-use flash and an all new triggering mechanism. Special low-voltage inductive trigger pickup-up switch you connect light while engine is running, eliminates direct connections to spark plug, prevents interference with other test instruments connected to engine. High-impact, shock-proof plastic case.

Kit CT-1040, 4 lbs. $29.95.*

See them all at your Heathkit Electronic Center...or fill out the coupon below.

AUGUST 1972

CIRCLE NO. 18 ON READER SERVICE CARD

Watch, listen, calculate, tune-up, or test with 8 great new kits from Heath

NEW Heathkit component-quality stereo for cars

Mobile FM stereo tuner features clean 7 watts (3.5 W per channel) with less than 2% THD; frequency response ± 2 dB, 3 Hz to 15 kHz; 3 uV sensitivity; 60 dB selectivity; 40 dB min. separation. Stereo cassette deck offers hi-fi stereo cassette entertainment plus single-channel dictation while you drive. Single stereo amp powers either or both units. Choice of 5" door mount or 6" x 9" rear deck speakers ($19.95* the pair).

Kit CR-1000, tuner, 6 lbs. $64.95* Kit CR-1001, cassette deck, 9 lbs. $89.95* Kit CRA-1000-1, amplifier, 3 lbs. $28.95*

NEW Heathkit Digital FM Tuner

Another Heathkit "first" in consumer electronics. Pure digital computer design including digital frequency synthesizer tuning employing phase-lock-loop techniques, FET varactor FM RF front end, digital discriminator and readout result in performance specs and tuning convenience that already are the talk of the audio world: channel frequency accuracy better than 0.005%; less than 1.8 uV sensitivity; distortion levels of 0.1%; selectivity and IF rejection better than 95 dB; image & spurious rejection better than 90 dB. S/N ratio better than 65 dB; separation better than 40 dB. One of a kind, the AI-1510 "computer tuner" is the only tuner offering you 3 distinct tuning modes; keyboard, computer-type punch cards up to 31, plus automatic band scanning with variable speed and stereo-only capability. The 55 ICs, 50 transistors and 50 signal diodes mounted on 10 modules with 7 plugging into a master board for optimum computer modularity & ease of assembly. Join the computer generation of audio equipment — order your AI-1510 today.

Kit AI-1510, tuner only $599.95* AIA-1510-1, cabinet $24.95*

NEW Heathkit Solid-State FET VOM

Dual FET portable multimeter with lab grade accuracy, 10 megaohm input and the ranges you really need. 9 DCV & ADV ranges, 0.1 to 1000 V, ± 2% accuracy, 6 DC & AC current ranges, 10 microamps. to 5 amp. 7 resistance ranges, 5 (0 ohm center) to 10Mg. 9 dB ranges, —40 dB to 62.1% precision metal-film dividers. 4 1/2", 100 uA, ruggedized taut-band meter, diode & fuse protected. Battery check. Kit IM-104, less batteries, $79.95.*
ANY motorist who travels the expressway system of this country can make good use of a class D Citizens Band (CB) radio transceiver. Easy to acquire and operate, CB is a fast and convenient means of summoning aid for yourself or any other motorist in an emergency. Channel 9 is being used for this purpose. Many groups such as REACT (Radio Emergency Associated Communications Teams) monitor this channel to provide emergency communications. Other uses are numerous—from home you can keep in touch with the family car; from the store, you can contact the delivery van.

A class D Citizens Band license is for citizens who are over 18 years old. The other requirements are covered by the filing of a simple form with the FCC and paying the fee of $20.00. No written test is required. The application form is usually included with the transceiver and may also be obtained from any local FCC office.

The accompanying chart covers many models of mobile AM CB transceivers. Units that are designed for base use with 12-volt supply capability are not included. They tend to be too large for most mobile applications. Units that cover less than the full 23 channels are not included.

All figures given in the chart were supplied by the manufacturers. Where a manufacturer did not answer our questionnaire or followup phone calls, his products were not included.

Since space in the chart is at a premium, code letters often provide the desired data. Typical codes are “C” for calibrated, “X” for not available, “S” for switched, “V” for variable or adjustable, and “Y” for available. A question mark means the data were not supplied.

1. Manufacturer and Model. Among the models listed, the price and the number and quality of features offered in each model can help in your selection of a satisfactory unit.

2. Price. The price is given in even dollars and in all cases is the manufacturer’s net. It includes the cost of a full set of crystals where they must be ordered separately. With crystal synthesis it is possible to provide 23 channels of transmit and receive with only 11 crystals. This makes
CB Transceivers

By Gladden B. Houck, Jr.

the set more economical than the sets which use a separate crystal for each transmit and receive channel. The 36 extra crystals would cost about $75 more.

3. Dimensions. As an aid in determining where this equipment will fit into your car, the height, width and depth are given in inches. A box built to these dimensions will help you to check for mounting in your glove compartment, next to your stereo, or other handy location.

Other necessary installation data includes the location of the mike connector and whether the speaker grill opens right or left, up or down. Code letters "L", "R", "U", "D", "M", and "S" represent left, right, up, down, mike and speaker.

4. Meter. A meter is available on many units to indicate the received signal strength "S" and the relative r-f power output "R" of the transceiver. The received signal may be calibrated. In this case, we give the number of microvolts input required to read S9. There is no standard requirement so the value can be whatever the designer chooses. The application to mobile units is to aid in selecting a site for transmitting since the signal strength can vary enough over a few feet to help in a marginal condition.

For the transmitter power the "R" indicator serves to monitor the output. The meter reading will be affected by load variations that may occur if the antenna is damaged. The power output on most models is also affected by the battery voltage. Where the scale is not calibrated the "R" is used. For example, "55R1" means the S meter is calibrated for S9 at 55 microvolts and the meter indicates relative r-f output.

5. Power Supply. The current drawn while transmitting and the receiver standby current are given. The "±" before the first reading tells that the unit can be operated on positive ground systems. All can be used on common negative ground. If your car has a positive ground, this may be an important feature.

6. R-F Power (Min. Watts). This is a measure of how well you are transmitting. The FCC rules limit the maximum power output of the transmitter to 4 watts. If the power input to the final amplifier is measured, the limit is 5 watts. The difference between a 3-watt and a 4-watt output results in a negligible difference in signal. The effective range would be increased only by about 10% for this power increase. More important is the protection of the output transistors from overload. If the unit is so protected a "P" comes after the power reading.

7. Automatic Modulation Control (AMC). One method of legally improving the effective output is to keep the percentage of modulation as high as possible. However, overmodulation (more than 100%) produces distortion and interference with other stations, which, incidentally, is illegal. For this reason an automatic modulation control is an important feature of a transceiver.

Some units have a light on the panel to indicate modulation. An "I" is indicative of this feature.

8. Output Filters. The rules of the FCC require that the harmonics and other frequencies outside of the CB channel be limited to 50 dB below the on-frequency output. The figure thus presented should equal or exceed −50 dB.

The output filters used to accomplish the required attenuation may also be used to match the antenna impedance to the output transistors. The "P" stands for the pi type of low-pass filter, while "T" stands for trap type used to filter one frequency.

Abbreviations:
- **G**—Gate, series
- **I**—Indicator, not calibrated
- **M**—Mike
- **N**—None, or not available
- **P**—Pi network, protected
- **R**—Right, relative output power
- **S**—Speaker, switched
- **T**—Trap
- **U**—Up
- **V**—Variable, or adjustable
- **Y**—Yes, or available
- **—**—Information not supplied
Sometimes more than one section is used; for example, 2PT stands for two pi sections and one trap.

9. Sensitivity. No single figure will describe just how weak a signal the receiver will pick up. Noise and interference from other signals have a lot to do with reception of a weak signal. However, a figure can be given in microvolts required to make the signal plus noise 10 dB stronger than the noise alone. Thus, a low figure indicates a more sensitive receiver.

10. Spurious Responses. The reception of signals not on the desired channel can present problems that limit the use of the CB set. Signal image and i-f are the worst offenders. Other spurious signals may be a problem if the offending transmitter is close. The greater the minus dB figure on these values, the better. The blocking of the front end of the receiver from very strong signals is very bad when an r-f noise blanker is used. If it is turned off, the reception may improve. Blocking also appears as distortion of very strong signals. The higher the blocking voltage, the better.

11. Selectivity. The audio frequencies transmitted are less than 3 kHz. Actually 2 kHz is adequate. For this reason the-6 dB points should be at least ±2 kHz. If one considers that the stations can be legally off frequency by as much as 0.005% (1.35 kHz), it is obvious that a bit more bandwidth is needed for the worst case. If delta tuning is available, this can be used to compensate for the frequency tolerance.

The second figure is the amount of attenuation for a frequency 10 kHz from the center. This is indicative of how well a station on the next channel can be eliminated. Ceramic or mechanical filters are usually used for this purpose.

12. Delta Tune. This is sometimes called a clarifier as it is used to make the signal clearer. Since the previous paragraph indicates that the transmitter can be as much as 1.35 kHz off the center frequency, this frequency shifter can be quite useful. It also can be used to enhance the amount of adjacent channel rejection. “V” is for the variable control, “S” is for step or switched control. The number is the frequency change from the center.

13. Noise Limiters. The best method of eliminating noise is to suppress it at its source. When the transceiver is installed, ignition suppressors and generator filters are installed to reduce the impulse type of noise generated in your car. This still leaves the other vehicles around to cause interference. For this reason every mobile CB set has some type of built-in impulse noise limiter. The most common is the series diode gate “G”, although some sets also have circuits that blank out the set momentarily during noise peaks. These r-f blankers “B” are very helpful. They must be switched out “S” if a strong local station is present or they will blank each time the station comes on.

LASER MACHINING PRODUCES ELECTRONIC CIRCUITS

A new laser “machining” process devised by Bell Laboratories engineers is capable of forming tiny electronic circuit patterns directly onto ceramic substrates. The new process, still in the experimental stages, makes use of a laser assisted by information stored in a computer that is programmed to describe the type of circuit pattern to be machined. In the process, substrates coated with a thin film of metal are mounted on a circular drum; and as the drum rotates, each substrate is successively exposed to a focused laser beam that is modulated, or switched on or off. Thus microscopic areas of the metal are either vaporized or left intact. A mirror steps the beam from line to line.
The Dolby Technique for Reducing Noise

by Mannie Horowitz
Eico Electronic Instrument Co., Inc.

Several companies are solving the tape-noise problem with special circuits in their recorders. Here's how one of the most successful systems works.

Noise can be defined as any undesired transmission which accompanies a desired signal. Should the amount of noise be minute when compared with the signal, it is unobtrusive and considered negligible. However, even when it is not at all comparable in magnitude to the intelligence to be reproduced, it will interfere with the program material. Hence, noise must be reduced to the smallest possible levels.

Noise may be due to various factors. Radio and tape recordings occasionally suffer from noise generated by radiation or induction from electrical equipment. More important than this, the coating on the tape used for recording consists of tiny closely packed particles. Although they are almost identical in size and magnetic characteristics, there are variations in the number of particles at different places on the tape. These variations are of all frequencies, but are most obviously reproduced as high-frequency noise or "tape hiss."

Theoretically uniform noise is known as "white noise." Interference of this type appears as a hiss and identical power is delivered at all frequencies. Tune your FM receiver between channels and the sound you hear, if your receiver does not have a quieting circuit and you can disable the deemphasis circuit, is similar to white noise.

In addition to noise due to tape, the semiconductors in a tape recorder are the source of two types of noise. One, partition noise, is caused by the irregular division of the total transistor emitter current between the elements (base and collector) in the device. The second important source of noise in the transistor is shot noise. This is due to the discrete particle nature of electricity and the statistical variations in the motion of these electrical particles as they pass through the semiconductor device.

Noise interference is a wide-band phenomenon. The ear responds to noise at all audible frequencies but the most annoying is high-frequency hiss, above about 5000 Hz. Elimination or reduction of noise present in the top octave of the audio range is a desirable goal and various circuits have been designed to accomplish this.

Schemes To Minimize Noise. Before any method is applied to reduce noise, the amplifier must be designed so that it will be as noise-free as possible. Once circuit noise is minimized, the next step is to reduce noise originating from tapes or from any
other medium used to reproduce program material.

One of the most widely used methods to minimize the reproduction of high-frequency noise employs a low-pass passive filter. Low frequencies are passed freely to the output of the amplifier while the upper portion of the audio band is attenuated. A common arrangement consists of one resistor and one capacitor in a circuit designed to reduce high frequencies, letting them roll off at the eventual rate of 6 dB per octave. That is to say, every time the frequency doubles, the gain of the circuit is reduced by an additional 6 dB. If, for example, you wish to reduce noise by 10 dB at 5000 Hz, noise will be reduced by about another 6 dB at 10,000 Hz when the filter is used.

However, not only is the interfering noise reduced at these frequencies the desirable music or program content is reduced as well and high-fidelity qualities are lost. In fact, some attenuation begins to become quite evident at the frequency where the gain is reduced by 3 dB, or at 1600 Hz in this case.

The situation is improved by using two resistor-capacitor networks so that the eventual rolloff is at the rate of 12 dB per octave (twice the 6-dB-per-octave rolloff rate of one network). If the gain at 5000 Hz is reduced by 10 dB with such a circuit, the frequency at which the attenuation becomes evident (circuit gain reduced by 3 dB) is now about 2100 Hz. This is an improvement over the previous case, but the output from the amplifier is still badly limited in bandwidth.

One method used to improve the signal-to-noise ratio when recording on tape is to "ride the gain." A maximum limit on the size of the signal that can be fed to the record preamplifier is set by the distortion or saturation characteristics of the tape. Weak signals which might be lost within the tape noise can be increased manually before being fed to the record amplifier. These signals can be boosted sufficiently before being recorded so that they can later override the noise during playback. Average and high-level signals can be manually limited in amplitude when fed to the recorder so that they will not saturate the tape. These signals are usually sufficient to mask any tape or record playback amplifier noise similar to them in frequency.

A variation of this procedure uses an electronic compressor to limit the output as the gain increases. The relative output-level difference between the loud and soft passages of music is reduced. Extremely loud passages of music are subdued so as not to overload the tape or tape amplifiers, while relatively low intensities of sound are recorded at comparatively higher levels. The opposite of the compressor—the expander—is placed at the output of the tape recorder to restore normal amplitude relationships.

One big drawback to this system is the time it takes for the compressor and expander to go into action. Another defect is "breathing" or noise modulation. Background noise is alternately increased and decreased, producing very annoying listening conditions.

Another very successful means of improving the signal-to-noise ratio uses preemphasis and de-emphasis in the recording and playback processes, respectively. Standard curves specify that the high frequencies be emphasized a fixed amount while recording on tape. These same frequencies are reduced by an equal amount during the playback process so that the overall frequency response is level. Noise is overriden by the large high-frequency signals placed on the tape in the record process and is reduced during playback due to attenuation of the high end of the band. This system is used on all tapes and playback equipment that is currently available on the market.

The Dolby System. Perfecting the procedure just described, and adding some additional brilliant features, Dr. Ray Dolby evolved an excellent method of reducing noise and hiss, along with any other type of undesirable low-level material found on tapes.

First, let us state the one thing this method of noise reduction cannot do. It cannot eliminate noise already recorded on the tape.
Similar to the compressor/expander and pre-emphasis/de-emphasis methods, the program material must be processed before it enters the recorder electronics and after it emerges. Here is how the Dolby B-type system used in home recording equipment works.

However annoying, noise on tape is usually at a much lower level than the music or other program material. On loud passages, noise is masked by the program material. You do not hear the noise which may be 40 or 50 dB below the level of the desired sound.

During quiet passages, however, the level of noise is comparable to the level of the music. It is quite objectionable. The Dolby noise-reduction system discriminates between loud and soft passages and attenuates noise only when it can be annoying, as is the case when low levels of material are being reproduced.

Tape hiss, being a high-frequency phenomenon, is poorly masked by the low frequencies in the program material, even when the amplitude of the signal is high. Therefore, the Dolby system separates the high-frequency band from the low frequencies. Large signals at low frequencies will not keep the high-frequency noise from being attenuated. Only high-frequency amplitudes determine when noise will or will not be reduced.

Should fixed-filter circuits be used to determine or separate the high-frequency band from the low frequencies, breathing can become evident. Instead of a fixed filter, a variable type is used. The frequency characteristic automatically adjusts itself, by use of a feedback circuit, for the best performance.

Briefly, the input to the tape recorder takes the form shown in Fig. 1. The input signal follows two paths in the Dolby circuit before being fed to a summing or adder network. One path is directly to the adder. The second path is through a network which separates the high-frequency but low-level input signals from the rest of the material to be recorded. The output of the network is significant above 1 kHz, rising to its maximum level at 5 kHz and above. The selected signals are amplified and fed to the adder. The sum of the direct signal and the amplified low-level, high-frequency signals, is then fed to the input of the tape recorder.

Let us say that the high-frequency filter, for those frequencies above 5000 Hz, and the level-selective network are actuated when any signal over 5000 Hz falls to 1% or less of the maximum input signal. This low-amplitude signal will then actuate the level-selective network and all frequencies of 5000 Hz and above are then amplified 2.16 times. The low-amplitude portion of the signal, instead of being 1% or less of the maximum input signal, is now 1% + 2.16% or 3.16% which is equivalent to increasing the low-amplitude signals by 10 dB. A compressor-type action is accomplished here as the low and high levels of the signal feeding the tape recorder approach each other in amplitude. Even though a wide gap exists between maximum and minimum amplitudes, the difference is narrowed by a factor of 3.16 or 10 dB. (See Fig. 2)
It should now be obvious that any signal 1% or less over 5000 Hz will be increased 10 dB while those signals over 1% will be allowed to pass through without any Dolby action. The direct opposite will be true on playback. Any signal that is of 10 dB level or below will again actuate the level-selective network and, in this case, attenuate all high frequencies to their previous normal level.

The simple description above implies that the circuit has a sharp threshold at the 1% level. In practice, as the high-frequency signals rise above the 1% level, so the amount of boost introduced falls progressively from the 2.16 times. At levels of -20 dB and above, the boost is negligible, avoiding any over-modulation produced by higher peak signal levels than normally used.

The output from the preamplifier stages of the tape recorder feeds a network with frequency characteristics similar to the one at the input (Fig. 3). However, this time the path is through a subtractor. All the factors added to the signal by the network in Fig. 1 are now reduced by an equal amount. The original program material is restored in proper amplitude proportion, expanding the difference between the high- and low-amplitude portions of the signal. However, noise introduced by the tape and electronics is reduced by about 10 dB over what it would have been without the intervening Dolby circuits. The amplified high-frequency signals introduced at the input of the recorder are capable of overriding much of the noise normally generated while recording. Reducing gain of these frequencies at the output also diminishes the audible noise.

Although the system is complex, it can be made as a relatively simple and inexpensive circuit. The 10-dB reduction in hiss and noise makes it quite worthwhile. When playing back a Dolbyized tape through conventional equipment, it is only necessary to reduce the treble response somewhat, using the tone control.

BATTERY-POWERED LOCATOR BEACON FOR AIRCRAFT

A NEW crash locator beacon for aircraft is being used to help speed search and rescue operations in airplane accidents. Called the "Pointer," the battery-powered device is a self-contained crash-proof unit which automatically sends out signals from downed aircraft, regardless of the pilot's condition. Designed for survivable and non-survivable accidents, the Pointer can also be manually operated.

The line-of-sight transmission range of the Pointer is up to 125 miles at an altitude of 10,000 feet; at 25,000 feet, the range increases to 200 miles. The operating frequencies of the unit are 121.5 and 243.0 MHz. Reliable operation is obtainable over a -40°F to +150°F temperature range.

The Pointer is made by Aero Electronics of Phoenix, Arizona. It employs as a power source a Mallory "Duracell" 8.10-volt mercury battery which has a storage life rating of two years.
Solid-State Radiographic Screens

It only takes a moment to have an X-ray taken. However, it takes quite a bit longer to have the film developed and ready for observation. If multiple X-ray photos are required, the time can really stretch out. Recently, the Westinghouse Electric Corp., Electronic Tube Division, came up with two new solid-state radiographic screens that can convert X-ray images to visible images without significant time delay, but with energy gain and either storage or non-storage features.

Essentially, this means that X-rays can now be used for inspection or non-destructive testing at almost any time. Not only is the radiation exposure time greatly reduced, relieving one major medical problem, but the resulting picture will have a much higher “readability.” Resolution is about 6 to 8 lines per mm, while the contrast sensitivity easily meets the specs for non-destructive testing.

One screen, used for storage, displays its visible image for several hours, or until it is electrically erased. If a permanent record is required, the screen can be conventionally photographed.

The non-storage screen is a direct replacement for existing fluoroscopic screens and provides up to 10 times the brightness, three times the contrast, and about three time better resolution than the conventional screen. Having a fast response, the non-storage screen is effective for both static and dynamic X-ray images. Its main application will be in production-line inspections and non-destructive testing. The non-storage screen can also be photographed if a permanent record is required. The speed of either screen is equivalent to that of high-contrast, high-resolution photographic film.

The photoconductor-electroluminescent (PC-EL) screens have a photoconductive portion which is sensitive to X-rays. The EL layer provides the visible image and is deposited on top of the PC layer to form a sandwich. A voltage is applied across the sandwich and, when the PC layer is exposed to X-rays, its electrical resistance decreases. This causes more of the applied voltage to be dropped across the EL layer, thus causing it to emit more light. The resulting light pattern exactly corresponds to the pattern of the incident X-rays.

The new amplifier screens are thin, lightweight, and shock resistant; and their development was supported, in part, by NASA.

Dr. Zoltan Szepesi, of the Electronic Tube Division of Westinghouse Electric Corporation, shows how the contents of a woman’s purse appear on a new type of radiographic amplifier storage screen for viewing X-rays.
CIE graduate builds two-way radio service business into $1,000,000 electronics company!

How about YOU? Growth of two-way transmitters creates demand for new servicemen, field and system troubleshooters. Licensed experts can make big money. Be your own boss, build your own company. And you don’t need a college education.

Two-way radio is booming. There are already nearly seven million two-way transmitters for police cars, fire department vehicles, taxis, trucks, boats, planes, etc., and Citizens Band uses. And the number keeps growing by the thousands every month. Who is going to service them? You can—if you’ve got the know-how!

Why You’ll Earn Top Pay
One reason is that the United States Government doesn’t permit anyone to service two-way radio systems unless he’s licensed by the FCC (Federal Communications Commission).

Another reason is that when two-way radio men are needed, they’re really needed! A two-way radio user must keep those transmitters operating at all times. And, they must have their frequency modulation and plate power input checked at regular intervals by licensed personnel to meet FCC requirements.

As a licensed man, working by the hour, you would usually charge at least $5.00 per hour, $10.00 on evenings and Sundays, plus travel expenses.

Or you could set up a regular monthly retainer fee with each customer. Your fixed charge might be $20 a month for the base station and $7.50 for each mobile station. Studies show that one man can easily maintain at least 135 stations—averaging 15 base stations with 120 mobiles! This would add up to at least $12,000 a year.

Be Your Own Boss
There are other advantages, too. You can become your own boss—work entirely by yourself or gradually build your own fully staffed service company. Of course, we can’t promise that you will be as successful as Ed Dulaney, but the opportunities for success are available to qualified, licensed men in this expanding field.

How To Get Started
How do you break in? This is probably the best way:
1. Without quitting your present job, learn enough about electronics fundamentals to pass the Government FCC exam and get your Commercial FCC License.
2. Then get a job in a two-way radio service shop and "learn the ropes" of the business.
3. As soon as you’ve earned a reputation as an expert, there are several ways you can go. You can move out and start signing up and servicing your own customers. You might become a franchised service representative of a big manufacturer and then start getting into two-way radio sales.

Cleveland Institute of Electronics has been successfully teaching Electronics for over 37 years. Right at home, in your spare time, you learn Electronics step by step.
CIE's AUTO-PROGRAMMED® Lessons remove the roadblocks by using simple, concise examples. You learn in small, compact steps — each one building on the other!
You'll learn not only the fundamentals that apply to all electronics design and servicing, but also the specific procedures for installing, troubleshooting, and maintaining two-way mobile equipment.

You Get Your FCC License... or Your Money Back!
By the time you've finished your CIE course, you'll be able to pass the FCC License exam. A recent survey of 787 CIE graduates reveals that better than 9 out of 10 CIE grads passed the FCC License exam. That's why we can offer our famous Money-Back Warranty: when you complete any CIE licensing course, you'll get your FCC License or be entitled to a full refund of all tuition paid. This warranty is valid during the completion time allowed for your course. You get your FCC License — or your money back!

It's Up To You
Mail the reply card for two FREE books, "Succeed in Electronics" and "How To Get A Commercial FCC License." If card has been removed, mail coupon or write: Cleveland Institute of Electronics, 1776 E. 17th Street, Cleveland, Ohio 44114.

APPROVED UNDER G. I. BILL
All CIE career courses are approved for educational benefits under the G.I. Bill. If you served on active duty since January 31, 1955, or are in service now with more than 180 days of active duty, check box for G.I. Bill information.

Cleveland Institute of Electronics
1776 East 17th Street, Cleveland, Ohio 44114
Please send me your two FREE books:
1. Your book on "How To Get A Commercial FCC License."
2. Your new catalog "Succeed In Electronics" describing the job opportunities in Electronics today, and how your courses can prepare me for them.
I am especially interested in:
☐ Electronics Technology  ☐ Electronic Communications
☐ Broadcast Engineering  ☐ Industrial Electronics
☐ First Class FCC License  ☐ Electronics Engineering
☐ Electronics Technology with Laboratory

CIRCLE NO. 6 ON READER SERVICE CARD
The mystery of how a speaker works leads to many fallacies. Here are the facts.

By Victor Brociner

The loudspeaker is a relatively simple electro-mechanical device. But for most people, the manner in which it operates presents a mystery which has given rise to and perpetuated a number of peculiar fallacies. To describe a loudspeaker, we need very few words: It consists of a magnet assembly with a voice coil which drives a cone. The cone is elastically suspended in a metal frame in a manner which centers the voice coil/cone assembly in the magnet assembly's air gap. Try describing the typical hi-fi receiver in as few words. It can't be done.

In spite of their complexity, receivers are fairly well understood. The same cannot be said of the loudspeaker. There are two reasons for this state of affairs. The first is that the input and output of a receiver are electrical signals which can be measured with a meter and observed with an oscilloscope. While the input to a loudspeaker is an electrical signal, its output is an acoustical (sound) wave which radiates into the listening room in all directions and is reflected many times before it dies out. How then does one go about measuring the sound wave?

The second reason for the prevalence of false conclusions regarding loudspeaker design lies in the fact that the difficulty in grasping the theory encourages intuition and experimentation. Unfortunately, intuition is frequently pursued along the wrong lines. As for experimenting—a loudspeaker will operate in some fashion in any kind of a housing, short of being imbedded in concrete; and someone may well like the resulting sound. This may account for some of the "revolutionary" developments that have appeared, the claims for which contradict some of the basic laws of physics.

In this article, we will be dealing with 50 of the most popular facts and fallacies pertaining to loudspeakers and speaker system designs. To cover as much ground as
possible, the article is being presented in two parts: Part I here; Part II next month.

The first facts and fallacies have to do with the function that a loudspeaker is meant to perform.

1. A loudspeaker should "sound good."

**Fallacy:** The function of a loudspeaker is to reproduce, as acoustic energy, the electrical energy fed into it. It must be neutral, neither adding to nor subtracting from the original signal.

2. If I want to modify the sound to suit my own preferences, I have a perfect right to do so.

**Fact:** Your preferences may vary from time to time and for different types of program material. It would make more sense to modify the sound by means of the amplifier's tone controls.

3. The Fletcher-Munson curves (see Fig. 1) show that the ear is less sensitive to the bass than it is to the midrange audio frequencies. Hence, loudspeakers should boost bass to make up for the characteristic.

**Fallacy:** A good look at the curves reveals that human hearing has less sensitivity to low frequencies at moderate or low sound levels. But if the same is true when listening to a live performance, it makes no sense at all to design a speaker with bass boost in an attempt to make up for the ear's deficiency when listening to a recording.

4. The previous statement implies that sound should always be reproduced with all frequencies amplified equally (flat response).

**Fallacy:** If we listen to reproduced sound at the same loudness level as that of the original, the frequency response should be flat. But a lower loudness level alters tonal balance as shown in Fig. 1. Suppose the original sound was at level A where the ear requires 2 dB more power at 50 Hz than at 1000 Hz for a given loudness sensation. If the reproduced sound level were at B, 50 Hz requires 12 dB more power than 1000 Hz for equal loudness. There is now a deficiency of 10 dB, and the reproduction appears to be deficient in bass response. To restore tonal balance, 50 Hz must be boosted 10 dB as with a compensated loudness network. Since the amount of boost required is dependent on the volume level, the loudness compensation network should not be built into the loudspeaker where it would have a fixed characteristic. Also, loudspeakers should not be compensated to make up for the deficiencies of human hearing as is so often stated.

Another set of facts and fallacies has to do with loudspeaker size and shape and the material used to make the enclosure.

5. Musical instruments that produce low tones are large; therefore loudspeakers must be large to produce good bass.

**Fallacy:** The analogy is incorrect; musical instruments depend on resonance to produce low tones and they must be reasonably efficient so that they can be heard. Loudspeakers do not generate sound in this sense; they reproduce it, and efficiency is rather unimportant. A small loudspeaker can be designed to have bass response that extends as low as a large loudspeaker.

6. Large loudspeakers have advantages for bass reproduction.

**Fact:** Although this sounds contradictory to the preceding explanation, large speakers can be played louder without excessive distortion. They have higher efficiency so that they require less amplifier power.

7. Horn loudspeakers are better in the bass range than are direct radiators.

**Fact:** This is true only if the horn speaker is large enough, however. By this we mean that the horn speaker must have several times the cubic volume of a large direct-radiator speaker.

8. Loudspeakers should be shaped like the instruments whose sound they reproduce.

**Fallacy:** Ideally, perhaps something like this is true, at least for monophonic reproduction. The directional characteristic of reproduced sound might well be made to match that of the instrument sound reproduced, but when several different types of instruments are playing at once, the principle is not practicable.

9. The shape of the loudspeaker should match that of the ear.

**Fallacy:** There is no conceivable basis in physics to support this statement. One might well ask, why not shape it like the mouth which at least produces sounds?

10. The type of wood used in making the enclosure has an important effect on loudspeaker performance.

**Fallacy:** The only requirement is that the enclosure be rigid and massive enough to prevent its walls from vibrating. The sole function of the box is to contain or provide a separate path for the sound wave coming from the back of the speaker.
An elliptical speaker or linear array of speakers has wider sound distribution in the plane of its long axis.  

**Fallacy:** According to Huygen's principle, each point of a sound radiator can be considered as a point source producing spherical waves with the combined wavefront tangent to these spherical wavelets. In Fig. 2 is shown how an array of small sources produces a narrow beam of sound. This effect is used in sound reinforcement speakers (columns and line loudspeakers) to restrict the vertical spread of sound. The distribution angle is narrowed only for frequencies above the range in which the wavelength is comparable to the length of the source. So, for better horizontal distribution, stand an elliptical speaker so that its long axis is vertical.

**Fact:** Reflections inside the cabinet can reinforce or reduce response in many narrow bands of frequencies, producing uneven response. A long narrow box can act like an organ pipe, causing undesirable resonances. Overhanging front edges produce diffraction effects whereby sound waves following different paths interfere with each other. So can decorative grilles. The ideal shape for the front of a speaker box is something like a hemisphere—not exactly a shape to excite decorators or enclosure designers.

Regarding loudspeaker operation.

13. A loudspeaker has to move a lot of air, especially for good bass reproduction.  

**Fallacy:** Speakers do not move air. What they do is cause local air molecules to vibrate back and forth, producing a wave-front which spreads out and away from the speaker. There is no air flow.

14. High frequencies are inherently directional, while low frequencies are omnidirectional.  

**Fallacy:** Omnidirectional waves are created by vibrating objects which are small compared to the wavelength of the sound being produced. If the dimensions of the vibrating object are several times that of a wavelength, the wave produced is nearly plane and progresses in a straight line without much spreading out. Since frequency is inversely proportional to wavelength, high-frequency waves are short in wavelength compared to ordinary speaker dimensions. Hence, the high notes tend to be directional. The converse is true for low frequencies.

15. A point source is associated with directionality.

**Fallacy:** A theoretical point source radiates sound equally in all directions.

16. We can determine the location of a loudspeaker in a room because that is where the sound is coming from.

**Fallacy:** When listening to a typical speaker in the average room at a distance of, say, 8', our ears actually receive most of the sound after it has been reflected one or more times from the floor, walls, and ceiling. The reason we can detect the location of the sound source is that sounds coming directly from the source reach our ears before the reflected sounds arrive. This is known as the Precedence Effect.

17. The ideal loudspeaker is one which behaves like a perfect piston at all frequencies.

**Fallacy:** A uniformly vibrating diaphragm becomes directional in response in the upper midrange, and its output power drops off markedly. A perfect 10"-diameter piston would be usable only up to about 800 Hz, which may be acceptable for a low-frequency driver but not for a wide-range speaker. Even a 3" tweeter would be good only to about 3000 Hz. Speaker cones are designed so that their outer regions are progressively "decoupled" as the frequency increases, allowing smaller and smaller portions of the cone to vibrate while the rest of the cone area stands still as frequency goes up. In this manner, the speaker becomes effectively smaller to permit both response and directional characters to remain good. The upper frequency limit is extended to about four times the piston range.
18. A speaker placed at a junction of a wall and the floor has more bass output than one in the center of the floor or wall, and bass output is still further increased by locating the speaker in the corner of a room.

**Fact:** In the bass range, the reflections from the room surfaces occur in such a way that they are in phase with and reinforce the direct wave from the speaker. For higher frequencies, the times of travel along different paths differ in a random manner which does not permit this degree of reinforcement.

19. Some speakers must be driven hard to sound good.

**Fallacy:** The frequency response, directional characteristics, and distortion of speakers are never worse at low volume levels than when driven hard. Of course, a speaker that is somewhat deficient in bass response will sound even more so at low volume, but this is because of the Fletcher-Munson loudness characteristic of the ear and not as a result of a property of the speaker.

![Fig. 2. Each point of a line type of radiator produces a spherical wave, with the latter combining to produce a narrow beam at high frequencies.](image)

20. High efficiency is desirable in a speaker.

**Fact:** A high-efficiency speaker demands less power from the amplifier for a given loudness than does a low-efficiency speaker. But high-efficiency direct-radiator speakers tend to have less bass response than does the low-efficiency speaker.

21. Speakers work best with amplifiers which have very high damping factors.

**Fallacy:** Damping factor is a measure of the ability of an amplifier to keep the speaker cone from continuing to vibrate after the signal has stopped. Very high damping factors can make some speakers lose bass response, especially high-efficiency direct radiators. In theory, there is an optimum damping factor for each speaker design. But most speakers will work well with amplifiers which have moderately high damping factors, say about 10. Nothing is gained by increasing the damping factor, and, in fact, amplifiers with very high damping factors tend to be somewhat unstable.

22. Speakers can be rated in terms of the minimum power required to drive them.

**Fact:** But this does not mean what it at first appears to mean. Speakers do not require some minimum power to produce sound. As power is reduced, the sound simply becomes less loud. So, minimum power refers to the minimum power required to drive a speaker to a loudness corresponding to average listening levels in an average listening room without excessive amplifier distortion on peaks. Although vague, the minimum-power rating is useful in guiding the user in choosing an amplifier; it is not the maximum power the speaker can withstand, which is expressed in terms of maximum power handling capacity. Actually, a speaker can be safely driven by an amplifier whose power output exceeds this rating provided the volume control is never turned up to full capacity.

23. The power rating of a speaker indicates the maximum permissible power rating of the amplifier with which it is used.

**Fact:** This was pointed out above.

24. Horn-type speakers are more efficient than are direct radiators.

**Fact:** A horn acts somewhat like the transmission in an automobile. It enables the speaker to operate under more favorable conditions.

25. Because they are more efficient, horn-type speakers take up less space than do direct radiators.

**Fallacy:** Efficiency has nothing to do with size. It involves only the ratio of power output to power input. It happens that for a given frequency range horn-type speakers are more bulky than are direct radiators. This is one of the prices paid for higher efficiency.

This ends Part I of our discussion about speakers. In Part II, we will discuss 25 more facts and fallacies relating to this most often misunderstood device.
IN THE CENTER of Florida, about 15 miles southwest of Orlando, Walt Disney Productions has created what it calls the "Vacation Kingdom of the World." Its official name is Walt Disney World. In an area three miles wide and more than two miles long, Disney has built a complete theme park with resort hotels, water sports, and numerous other outdoor recreation activities.

While some of the 35 major attractions in the park will be familiar to the more than 100-million people who have visited Disneyland in California, many more are unique to Disney World. The park is the largest recreation enterprise ever undertaken by a single company, costing $300-million as of the opening date. It permanently employs 10,700 people. Its parking lot capacity is 12,000 cars; and there are 225 campsites, 4.5 miles of beaches, and two 18-hole golf courses.

Disney World has many unique technological features also. For example, it has the nation's first officially designated STOL-port designed for exclusive use by short takeoff and landing planes. And it has an all-electric elevated monorail transportation system which interconnects major areas, attractions, and accommodations.

Two major hotels or theme resorts are attractions in themselves. The 1057-room Contemporary and the 500-room Polynesian Village were built by U.S. Steel from preassembled rooms. The Contemporary is shaped like a hollow Mayan pyramid and has a gigantic lobby appropriately called the "Grand Canyon Concourse." Monorail trains travel directly through this lobby to pick up and debark hotel guests. Closed-circuit TV keeps conventioneers accommodated in the hotels in touch with business proceedings and schedule changes.

Information-Communication System. As you might expect, the electronic systems in operation in Disney World range from the conventional to the futuristic. RCA, the prime electronics contractor, has worked with the Disney people to plan and build the "first 21st Century information-communication system," providing instantaneous information on activities. Designed to serve both guests and park personnel, this electronic system—called WEDCOMM—blends computer, telephone, automatic monitoring and control, mobile communications, television, and wide-band systems into one totally integrated system.

One coaxial cable carries telephone traffic, automatic monitoring and control system signals, computer data, and the audio and control signals for the attractions.

Telephone & Mobile Communications. With the exception of a few miniature relays, the telephone system (built by Stromberg Carlson) is the nation's first all-electronic network. Some of its features, either currently in use or planned, include: callback to tell you when a busy phone is free; 2- or 3-digit abbreviated dialing for numbers most frequently called; automatic transfer or following which allows calls to be transferred to any neighbor's phone while you are away; three-party calls; and utility meter reading by remote control.

Mobile communications equipment supplied by RCA includes six fixed stations, 50 mobile units, and 150 portable personal size units. The equipment operates on five channels between 450 and 470 MHz with duplex service.
Electronics at Disney World

HOW ELECTRONICS IS HELPING TO MAKE DISNEY WORLD A SUCCESS

BY EDWARD A. LACY

Hotel Room TV Receivers. Hotel TV receivers are connected to a unique master antenna television (MATV) system called DISCADE, built especially for Disney World by Ameco. In this system, a guest dials the channel he wants. That channel and no other is transmitted to his receiver over a 6-MHz bandwidth coaxial line from a central switching system. (By restricting the cable bandwidth in this manner, distribution amplifiers are simpler and more care-free.)

Guests now have a choice of four channels, but the system can be expanded to 30. Three of the channels provide local area TV programs; the fourth channel gives hotel information.

The color TV receivers, built by RCA for Disney World, do not have r-f tuners since down-converting is not necessary.

Computers & Automatic Monitoring. Video data terminals are planned for the Contemporary and Polynesian hotels to handle guest reservations, registrations, and checkouts. As a guest prepares to leave, for instance, he could check out at any one of the data terminals located in the hotel lobbies merely by punching his room number into the terminal keyboard. The terminal would then automatically print out an itemized statement for payment at the cashier's window.

Presently, the terminals are connected by telephone line to RCA Spectra 70/45 computers in Burbank, Calif. A computerized automatic monitoring and control system built by RCA monitors the operating conditions of everything from fire alarms to golf course sprinklers. Should an equipment malfunction or an alarm condition such as a fire hazard occur, the system will identify the problem by flashing a coded message on video data terminals located at two fire stations, two security locations, and the maintenance console in the main service area.

Audio Animatronics. "Audio Animatronics," a patented Disney invention, is not part of WEDCOMM, but it is just as futuristic. Certainly, it is one of Disney's most important and popular contributions to the entertainment world. In this system, voices, music, and sound effects are electronically combined and synchronized with life-like movements of three-dimensional objects ranging from birds and flowers to humans.

Eight major attractions use Audio Animatronics—the Mickey Mouse Revue, the 36 Presidents in Liberty Square’s Hall of Presidents, Country Bear Jamboree, Haunted Mansion, Sunshine Pavilion, Flight to the Moon, It's a Small World, and Peter Pan's Flight.

Essentially, the character movements are hydraulically actuated from electronic signals on magnetic disks. Characters in the foreground obviously are the most sophisticated and have the most elaborate circuits and functions. Mickey Mouse, for example, has 38 functions and even keeps time with the music.

In a typical 45-minute show, there can be up to 1000 analog functions—character movements, stage effects, and sound effects. Signal routing is accomplished through the use of 250 binary addresses. To compose a show, an animator sits at the programming console of the digital animation control system which uses a general-purpose computer with a 32,000-bit memory and activates the functions he wants. This informa-
ion is recorded on magnetic tape. Data on this tape is then copied on magnetic discs (up to four per show) which are used to play back the complete show. The tape itself is sent to Disney headquarters to be kept in a safe.

**Future Plans.** As exciting as these systems are, it should be noted that they are just the beginning. “We have additional projects and concepts on the boards for many years ahead,” says Donn B. Tatum, President of Walt Disney Productions. “We can confidently say that there will always be something new for families to see and enjoy on future visits to Walt Disney World.”

RCA, for example, is building a multimedia show to depict future advances in electronics and communications as they will serve the consumer at home and away. The show, which will be in Tomorrowland, will feature Audio-Animatronic figures, movies, cartoons, three-dimensional effects, and holographic-type techniques.

Phase one of the master plan calls for development of the vacation resort over a five-year period. Later phases include a leisure-oriented residential community, a showcase industrial park, and, finally, EPCOT—the Experimental Prototype Community of Tomorrow.

EPCOT is planned to be a “living blue-

Programmers at work before a console that is used to control some 30 separate movements. ©Walt Disney Prod.

print of the future,” a complete community of more than 20,000 population. Here, new concepts and technologies will be introduced and tested, years ahead of their application elsewhere.

To make it possible for Disney to do this, the Florida legislature has passed 500 pages of special legislation, giving the Reedy Creek Improvement District, which covers the Disney property, many of the powers of a county government, including zoning, building codes, and the like.

Actually, the complete Disney site is the size of a small county. It takes in 43 square miles, an area roughly the size of San Francisco, or twice the size of Manhattan Island. The Magic Kingdom, hotels, golf courses, beaches, and campsites take up just a small part of the Disney acreage.

“There’s enough land here to hold all the ideas and plans we can possibly imagine,” said Walt Disney back in 1964. “With the technical know-how of American industry and the creative imagination of the Disney organization, I’m confident we can build a living showcase that more people will talk about and come to look at than any other area in the world.”

With Magic Castle in background, RCA engineer checks mobile radio system.
BUILD THIS
X10 AMPLIFIER TO INCREASE SCOPE USEFULNESS

Frequently, when using an oscilloscope to check low-level signals, we wish that our scope had more gain. Suppose, for instance, that the scope’s maximum vertical sensitivity is 50 mV (peak-to-peak) per inch or centimeter. With a typical low-capacitance probe (10 megohms, 8-35 pF) which has an attenuation of 10:1, one scope division may represent half a volt. Of course, the gain can be increased by using a straight-through probe instead of the low-capacitance probe. Unfortunately, this may be impractical with a high source impedance or at high frequencies.

So how do we get higher gain? We use a scope preamplifier. The low-cost preamp whose schematic is shown in Fig. 1 can be used to fill the probe-sensitivity gap. It has a voltage gain of 10 and a bandwidth of about 5 MHz; and it can be used with any scope. The integrated circuit used was developed for the 45-MHz i-f range in TV and has high gain and low noise. With careful layout and choice of components, the bandwidth can easily be extended to 30 MHz or more. The IC also has automatic gain control, which can be adjusted.

How It Works. The input connector (J1) should fit the probe you are going to use with the preamp. The output connector (J2) is a BNC type, which should be used on the scope vertical input if it is not already there. If your scope uses a pair of banana jacks, now is the time to upgrade it with a good shielded coaxial connector.

The input stage is a field-effect transistor. It may be necessary to add extra capacitance (C2A) at the input, as discussed later under “Alignment.” The signal at the source of Q1 is connected to the input of IC1 through C3. Resistors R4 and R5 are the load resistors for the IC, and the output signal is taken from the non-inverting output.
at pin 8. Transistor Q2 has a high input and a low output impedance and is used to couple the amplifier to the scope. The low output impedance helps to reduce the frequency limiting effect of the capacitance of the coaxial cable. The length of the output cable should be less than four inches—even less if you want to have a bandwidth of 30 MHz.

The dc voltage at pin 5 of IC1 determines the gain and, therefore, must be carefully adjusted. The upper end of R6 is held at 12 volts by zener diode D1, but a variation of only a few millivolts on pin 5 will change the gain of the preamp. So it may be necessary, after the unit is constructed to make adjustments easier by reducing the value of R6 and adding a fixed resistor on either side of the potentiometer. To do this, once the final gain has been adjusted, get an accurate measurement of the voltage needed at pin 5. Then use a 500-ohm potentiometer for R6 and add end resistors to make the total value 4000 or 5000 ohms. Since the IC supply is stabilized by D2, the gain setting is stable at normal line voltage fluctuation.

Construction. The preamp is built in two separate sections: the amplifier in one shielded box and the power supply (Fig. 2) in another. The circuit shown in Fig. 1 is

Misc.—Mounting hardware, PC board, coax cable, line cord, chassis (see text), 11-pin in-line IC socket, etc.
built on a 3½" × 1½" piece of printed circuit board. To minimize circuit capacitances, wiring is without pins. The IC socket is mounted on the non-foil side of the board after first drilling the necessary holes. With the exception of pins 3 and 7, all holes should have the copper cleared from around them. Use a larger bit (manually) to do the scraping. Note that IC1 only uses pins one through four and 11 through 14 of a conventional 14-pin in-line socket. Solder socket pins 3 and 13 (IC1 pin 7) to the foil. All the other components are mounted on the foil side using point-to-point wiring of the component leads and the foil as ground.

The completed board is mounted with standoffs in a 4" × 2½" × 1½" metal enclosure. Before installing the board, drill holes for input jack J1, selector switch SI, and the power leads and coaxial cable. The last two holes must be fitted with grommets.

The power supply shown in Fig. 2 is optional if the required 15 volts at 85 mA is available elsewhere. However, if this supply is used, do not turn it on unless it is connected to the amplifier. Without D2, the supply can reach about 36 volts, which might damage electrolytic capacitor C10.

**Alignment.** Using a 10:1 probe as the input to the preamplifier, supply power and connect the probe to a source of 1 volt, peak-to-peak, at about 1 kHz. Adjust R6 to obtain a 1-volt peak-to-peak indication on the scope.

Now connect the probe to a 0.5-volt peak-to-peak square wave and place SI in the DIRECT position. You should see a 50-mV square wave on the scope. Adjust the probe frequency-compensation trimmer capacitor for sharp corners without overshoot. Switch SI on the preamp to the X10 position and adjust C2 to obtain a clean square wave without overshoot. If C2 cannot be adjusted for the desired effect, add another small capacitor (C2A) in parallel—try 33 pF. In some cases, the scope vertical input compensation trimmer may also have to be adjusted.

If you now replace the 10:1 probe with a direct probe, a 50-mV signal will produce a 0.5-volt deflection on the scope. The direct output of a magnetic cartridge (approximately 5 mV) can be seen easily on the 50-mV input position of the scope’s vertical input.

Do not allow the dc voltage at the input of the preamplifier to exceed the voltage rating of CI and do not apply more than 1 volt, peak-to-peak, to the probe if SI is in the X10 position.

If desired, the preamp can be built directly into the scope, with the scope’s vertical gain switch changed accordingly.

---

The power supply is in one chassis (left) and the preamplifier in another. Note how component leads in the preamp are soldered together for mounting.
CONSTRUCTION OF A SWITCH THAT CONTROLS UP TO 450 WATTS AT THE TOUCH OF A FINGER

ONE of the best features of electronics experimenting is acquiring the ability to make useful household devices. The Touch-Plate Switch described here is particularly interesting since it can be used to turn power on or off merely with a touch of the finger—or the elbow, if a person’s hands are full. The switch is activated by the ac field potential that is normally found on the human body—picked up from the power-controlled environment in which we live. This is the same field that shows up as a sine wave when you touch the vertical input of an oscilloscope or that makes an ac hum when you touch the input connector of an audio amplifier. Although the signal can have a high voltage level, the associated current is extremely low.

Depending on the type of SCR used, the touch switch can handle from a few watts to several thousand watts. This also makes it very useful for stage lighting control where sharp on-off transitions are required.

Circuit Operation. Transistor Q1 (see Fig. 1) is an insulated-gate MOSFET having an extremely high input impedance. Voltage gain is not required in this circuit, but current gain and impedance transformation are. When the touch plate is contacted, the ac signal on the body is passed through the high resistance of R4 to one gate of Q1. Resistor R5 completes the input voltage divider. The total of R4 and R5 is about 20 megohms.

The source of Q1 is connected to a voltage divider (R3, D3, and R2) at a point that is about 4 volts positive. This makes the gate four volts negative with respect to the source so that, in the absence of an input signal, Q1 is fully cut off. The drain load (R6) supplies the trigger pulse for the toggle input of IC1 and holds the T input at about +2.5 volts. When the touch plate is contacted, the 60-Hz field is applied to the gate of Q1. The positive peaks cause Q1 to conduct at 60 Hz, with a negative pulse on the drain. Filter capacitor C3 integrates the pulse to a smooth dc to toggle the IC.

The J, K, and clear inputs of IC1 are connected to the common point because placing a logical zero on these inputs is the most direct way of setting up the flip-flop for simple toggling. Note however that the ground pin (4) of the IC is taken to the anode of D3 in the voltage divider. The cathode of this diode is at the same voltage level as the source of Q1; and, because the forward breakover voltage of D3 is about 0.6 volt, this biases the source of Q1 negative with respect to the ground pin of IC1. The negative-going trigger pulses are thus assured of falling to zero or slightly below to provide a clean toggle.

Both the Q and not-Q of IC1 are loaded by electrolytic capacitors C4 and C5. This is necessary for two reasons. First, the fall time of the input pulse is no faster than the 60-Hz signal used to drive the toggle input and is far too slow to trigger the flip-flop. The capacitors provide reliable toggling, even at a low rate. Second, since the power supply is not regulated, the capacitors give the flip-flop some immunity to power-line transients.
The Q output drives the gate of SCR1 through R8, while the cathode of SCR1 is connected through R9 to the not-Q output. Resistor R7 slightly biases the Q output to meet the worst-case SCR triggering requirements. Thus, when the not-Q output is low and Q is high, the gate of SCR1 is forward biased and the SCR is on. The next toggle pulse (when the touch plate is contacted) toggles ICI so that not-Q goes high and Q goes low to turn off SCR1. Since the fan-out of ICI is limited, an SCR with a sensitive gate must be used for SCR1. Even so, up to 1400 watts of 120-volt ac power can be controlled, depending on the SCR used.

When SCR1 is on, it applies power to the load and charges C2 through D2. During the next (reverse) half cycle, C2 discharges through R1 and the gate and cathode of SCR2. Thus SCR1 and SCR2 supply power during alternate half cycles to provide full-wave ac power, up to 450 watts.

Construction. So that the touch switch can be installed within a conventional 3" × 2" × 2" metal junction box (such as wall

![Diagram of the circuit](image)

Fig. 1. In switch circuit, the flip-flop in ICI is triggered by MOSFET Q1 which has high input impedance. Two SCR's supply load power on alternate half cycles.

**SCR1, SCR2—IR106B1** (Allied Stock No. 779-3008) or similar, 200 PRV, 0.5mA gate current silicon controlled rectifier

- T1—Filament transformer; secondary: 6.3V at 300mA (Radio Shack 273-1384)
- Misc.—Aluminum bar 3/4" wide x 1/2" thick x 3 3/4" long, transistor mounting insulation and silicone grease, mounting hardware, #4-40 screws and nuts, 1/2" insulated spacer (2), suitable metal touch plate, plastic junction box cover.

**Note:** Etched and drilled printed circuit boards are available from Metrotec Electronics, Inc., 33 Cain Dr., Technical-Industrial Park, Plainview, NY 11803, at $2.25 each board.
switches are in), two PC boards are used. These are shown in Fig. 2, with component mounting details.

The smaller board is built first, taking care that the electrolytic capacitors and semiconductors are properly installed. Although most MOSFET's must be specially handled, the one called for in the Parts List has internal protection so it can be treated as any other transistor. Use a low-power soldering iron and fine solder. Before installing any components, be sure there is a small hole drilled through the board at the center for the touch plate mounting and contact screw (size 4-40).

After installing components on the larger board, make a heat sink for the two SCR's. Use a 3½” long piece of 3/8” wide by ½” thick aluminum bar (available at most hardware stores) and bend it into a C shape so that it contacts each tab on the SCR's and clears the transformer shell. Drill holes in the aluminum bar exactly opposite the SCR tab holes. Use conventional power transistor insulation and silicone grease to attach the two SCR's to the ends of the heat sink.

The two boards can now be interconnected with short lengths of wire (just enough slack to permit board mounting) between similarly marked terminals. Connect conventional ac leads to the neutral, hot, and load terminals.

Obtain a plastic cover for the junction box and drill a hole (for a 4-40 screw) at the center. Drill two more holes 2½” apart along the center line and centered on the first hole. The touch plate can be any of a number of metal plates, medallions, etc. It must be metal, and any protective plastic coating must be removed. Use a 4-40 screw long enough to pass through the touch plate, the plastic cover, and into the PC board. Since the electrical contact to the touch plate will be on the under side of the small PC board, fix the touch plate screw in place and use a nut to make the actual electrical contact. Another small nut is used to secure the small board in place.

Cut a small piece of cardboard or plastic sheet to cover the components on the small board. Mount the larger board over the smaller one (over the insulation just installed) using 4-40 hardware through the other two holes in the plastic cover. Use ½” insulated spacers. Check that the board-to-board interconnections are still good.

**Test and Installation.** Wire the unit in ac-
Bend a piece of aluminum to make heat sink for the SCR's.

According to Fig. 1, with the hot and neutral lines to the ac source and the load line to a 117-volt lamp or similar load. Be sure that all exposed ac line connections are thoroughly insulated to prevent shorting or contacting.

When the touch plate is contacted, the load should go on. When the plate is contacted again, the load should go off. If this does not happen, reverse the connections to the ac line.

When the touch control works properly, it can be installed in a standard wall conduit box. Before installation, be sure to shut off the power on that circuit by removing fuses or throwing the circuit breaker. The existing wiring must be opened, with the touch switch installed—fully insulated—in accordance with your local electrical code. When you remove the wall box plate, you will find a pair of wires coming from the main source, with the switch in series with the hot lead. With all power removed from the circuit, remove the two wires from the switch, noting which one goes to the load and which goes to the main source. The one from the main source is the hot connection point. The one to the lamp is the load connection. If you open the other pair, usually secured and insulated with a plastic nut, this is the neutral line. If there is no other pair, connection to the metal box itself will provide the neutral side of the circuit.

If you have any doubt about the wiring conditions in your home or the proper way to install the touch switch, consult a professional, licensed electrician. Attempts to do it yourself, unless you are sure, at this point may lead to physical harm in case of shock and/or negation of fire insurance.

In operation, the unit may run slightly warm. This is normal. The heat is similar to that generated by many power dimmers found in modern lighting installations.

3. In a class A output stage, dissipation is always highest when there is no ac power output.
   (a) True (b) False
4. Mesa and planar epitaxial transistors give high-speed switching and good saturation characteristics at relatively high voltage ratings.
   (a) True (b) False
5. The configuration used most often for a transistor switching circuit is:
   (a) Common collector (b) Common base (c) Common emitter
6. Many mesa and planar transistors exhibit negative resistance after breakdown voltage is reached.
   (a) True (b) False

7. Voltage feedback from the collector of a transistor stage tends to increase the output impedance of that stage.
   (a) True (b) False
8. Below (top) is schematic symbol for:
   (a) Unijunction (b) SCR (c) Tetrode (d) Npn transistor
9. Below (left) is schematic symbol for:
   (a) FET (b) SCR (c) SCS (d) Npn transistor
10. Below (right) is schematic symbol for:
    (a) Symmetrical zener (b) SCS (c) Npn transistor (d) SCR

(Answers below)
10 Reasons why RCA Home Training is your best investment for a rewarding career in electronics:

Performing transistor experiments on programmed breadboard—using oscilloscope.
1 LEADER IN ELECTRONICS TRAINING
When you think of electronics, you immediately think of RCA...a name that stands for dependability, integrity, and pioneering scientific advances. For over half a century, RCA Institutes, Inc., a subsidiary of RCA, has been a leader in technical training.

2 RCA AUTOTEXT TEACHES ELECTRONICS FASTER, EASIER, ALMOST AUTOMATICALLY
Beginner or refresher, AUTOTEXT, RCA Institutes’ own method of programmed Home Training will help you learn electronics more quickly and with less effort, even if you’ve had trouble with conventional learning methods in the past.

3 WELL PAID JOBS ARE OPEN TO MEN SKILLED IN ELECTRONICS
RCA Institutes is doing something positive to help men with an interest in electronics to qualify for rewarding jobs in this fascinating field. There are challenging new fields that need electronics technicians...new careers such as computers, automation, television, space electronics where the work is interesting and earnings are greater.

4 WIDE CHOICE OF CAREER PROGRAMS
Start today on the electronics career of your choice. On the attached card is a list of “Career Programs”, each of which starts with the amazing AUTOTEXT method of programmed instruction. Look the list over, pick the one best suited to you and check it off on the card.

5 SPECIALIZED ADVANCED TRAINING
For those already working in electronics or with previous training, RCA Institutes offers advanced courses. You can start on a higher level without wasting time on work you already know.

6 PERSONAL SUPERVISION THROUGHOUT
All during your program of home study, your training is supervised by RCA Institutes experts who become personally involved in your efforts and help you over any “rough spots” that may develop.

7 HANDS-ON TRAINING
To give practical application to your studies, a variety of valuable RCA Institutes engineered kits are included in many programs. Each kit is complete in itself. You never have to take apart one piece to build another. They’re yours to keep and use on the job.

8 FCC LICENSE TRAINING— MONEY BACK AGREEMENT
Take RCA’s Communications Career program—or enter with advanced standing and prepare immediately for your 1st, 2nd, or 3rd class FCC Radio Telephone License examinations. RCA Institutes money-back agreement assures you of your money back if you fail to pass the FCC examination taken within 6 months after completing the course.

9 CONVENIENT PAYMENT PLANS
You get a selection of low-cost tuition plans. And, we are an eligible institution under the Federally Insured Student Loan Program.

10 RCA INSTITUTES IS FULLY ACCREDITED
RCA Institutes is an accredited member of the National Home Study Council. Licensed by N.Y. State—courses of study and instructional facilities are approved by the State Education Department.

AUGUST 1972

CIRCLE NO. 29 ON READER SERVICE CARD
How many times have you used mobile radio equipment for long periods of time and then tried to start the car engine only to find the battery dead or nearly so. This is a problem not too uncommon to members of communications nets or ham field-day operators. One of two things can be done to avoid this problem: you can keep the engine running all the time (which can be dangerous if you are inside with the windows closed) or you can run the engine intermittently just enough to keep the battery charged. The latter is preferable, but how do you know when it is necessary?

The electronic device whose schematic is shown in Fig. 1 is a battery voltage-level detector that can be preset to turn on a warning light when it is time to start the car engine for battery recharging. The unit is designed around a low-cost quadruple 2-input positive NAND gate IC having open collector outputs. Three of the gates in the IC are used with the level detector; the fourth can be used to operate a low-power relay for an acoustic alarm if desired. The voltage monitor can be built for under $15.00 if all parts are purchased new—much less if a well-stocked junk box is on hand.

The voltage monitor can be made to operate with either negative or positive ground 12-volt systems.

Circuit Operation. A conventional series-pass regulator (Q1) controlled by a zener diode is used to supply +5 volts for the detector and indicator lamp. Potentiometer R4 is used to adjust the detector operating level. When the junction of R2 and R3 is more than 6 volts but less than 9 volts, and with R4 set to minimum resistance, pins 2 and 3 of IC1A is at low voltage or logic

![Image of circuit diagram]

Fig. 1. When level at R2/R3 drops below 1.7 volts, warning light goes on.

Note—A set of all four semiconductors is available for $3.00 from Semitronics Corp., 265 Canal St., New York, NY 10013.
The fourth gate in the IC can be used to drive a second lamp or other alarm.

zero. Pin 1 of IC1A, as well as pins 5 and 6 of IC1B and 8 and 9 of IC1C are at a higher voltage causing a lower voltage at pins 4 and 10. In this case, current flows through R1 causing it to light. Sections B and C of the IC are in parallel to permit sufficient current drive for the lamp.

When the voltage at R2/R3 goes above 9 volts (battery charged up) or if the resistance of R4 is increased so that the voltage on pins 2 and 3 exceeds about 1.7 volts, then the states of the gates are reversed and the output at pins 4 and 10 is high so that no current flows through the lamp.

Resistor R3 serves to prevent shorting the IC input to ground if R4 is set to minimum resistance. Diode D2 is provided to insure that the IC input voltage never exceeds 5 volts since a higher voltage could damage the IC, especially over long periods of time. Since the IC is of the open collector type, resistors R5 and R6 serve as pull-up resistors to maintain proper switching action of the IC.

**Construction.** The prototype was built on perf board as shown in the photo, though any other type of construction could be used. The board assembly was then mounted in a small chassis box having holes for the adjustment of R4 and for the lamp. The board assembly should be isolated from the chassis box unless the car battery system is negative ground, in which case the box can be used as ground and must be firmly connected to the vehicle ground. Do not do this if the system has a positive ground.

It is important that a suitable socket be used for the IC since its leads are short and heating them for soldering can cause damage. All of the components are soldered and wired in place before the IC and Q1 are installed. The transistor can be soldered direct if each lead is heat-sunked (with long-nose pliers) while soldering. The same technique is used in soldering D1 and D2. Be sure to use the heat sink called for in the parts list for Q1.

**Installation and Adjustment.** The voltage monitor can be mounted in any convenient location—just so the lamp can be seen. If switch S1 is used, it and the lamp can be mounted separately with the rest of the unit tucked away out of sight. Another idea is to mount these components on the radio equipment panel so that, when the equipment is on, the monitor is also on.

Connect the monitor positive lead as directly as possible to the battery positive or to ground if the system has a positive ground. Connect the negative lead similarly. Of course, if S1 is used, the ungrounded detector lead goes through the switch first. The detector can be permanently connected and on all the time since current drain is very low.

The voltage monitor is adjusted by using a variable dc power supply with an output of at least 12 volts. Connect the supply to the monitor as if it were the car battery. Using a voltmeter across the supply, reduce the voltage to what you consider to be the maximum battery voltage drop that would still allow you to start the engine. The prototype was set at 11.5 volts which worked well for engine starting. Then, adjust potentiometer R4 to the point where warning lamp 11 comes on. If the warning lamp comes on prior to adjustment of R4, adjust R4 until the lamp goes out. Set the power supply voltage again, and adjust R4 again until the lamp comes back on. When the adjustment is satisfactory, either lock the potentiometer shaft or touch it with a bit of glue to keep it from moving.

As the car battery runs down to the monitor's triggering level, the warning lamp will turn on, telling you to start the engine to recharge the battery. Note that as soon as the engine starts, the lamp will go out since the charging system is at a higher voltage level. Either watch the car's ammeter or (if there is no ammeter) run the car for 10 to 15 minutes at a slightly fast idle to recharge the battery.
Rise-Time Measurements

WHAT YOU SEE MAY NOT BE WHAT YOU'VE REALLY GOT

S U P O S E you feed the output of a pulse generator through a probe to an oscilloscope. You adjust the scope time base for a fast sweep. (This is the typical setup for measurement of rise time.) The result is the easily recognized rise-time waveform shown in Fig. 1.

**Question:** If the time base is set for a sweep of 50 nanoseconds per division, what is the rise time of the generator's output pulse—ignoring any inherent scope inaccuracies.

"That's easy," you say, quickly multiplying 50 ns/div times the two divisions covered by the pulse's leading edge. "100 ns is the rise time of the pulse. Right?"

Maybe yes; and maybe no!

Although 100 ns is the correct reading of the scope display, this value may not be the true rise time of the pulse. So ignoring scope inaccuracies, what other reason is there for suspecting that the measurement is not the real rise time?

Basically it is that, when the pulse passes through the probe, the scope amplifier, and even the scope CRT, it suffers rise time deterioration. Thus, the displayed waveform can't represent the true, original signal.

Although this is an unfortunate circumstance, it has one saving grace: it can be predicted. So, if you erroneously said that the rise time in the example was 100 ns, it should be both interesting and informative to learn how to determine what the error might be.

**Fig. 1.** Pulse rise time is measured between the 10% and 90% points on the leading edge of oscilloscope trace. In this case, rise time is 100 nanosec.

**Rise-Time Formula.** True rise time can be determined by the use of the tongue-twisting formula known as "the square root of the sum of the squares." In mathematical terms:

\[ T_{rt} = \sqrt{T_{rg}^2 - T_{re}^2 - T_{ro}^2} \]

where

- \( T_{rg} \) = true signal generator rise time
- \( T_{re} \) = displayed rise time
- \( T_{re} \) = probe rise time
- \( T_{ro} \) = oscilloscope (amplifier and CRT) rise time

For a low- to medium-priced general-purpose oscilloscope, a typical rise time is 35 ns.

For a standard probe, rise time is 5 or 10 ns. Putting these values into the formula, we get

\[ T_{rt} = \sqrt{100^2 - 35^2 - 10^2} = 93.1 \text{ ns} \]

Thus, the actual rise time of the generator pulse is 93.1 ns and not the 100 ns displayed on the scope; and the measurement was in error by 7.4%.

It is important, therefore, to keep in mind that the displayed rise time is greater than the actual rise time. The amount of error is shown in Fig. 2, where per cent of error is plotted against the ratio of the input signal's rise time to test equipment rise time. In our example, this rise time ratio would be 93.1 divided by the square root of \( 35^2 + 10^2 \) or 2.56.

Knowing that the measurement devices do introduce an error and with the aid of Fig. 2, you can determine just what error to expect. Conversely, to make a measurement within a given accuracy, Fig. 2 can be used to find what rise time response is needed in the test equipment.

**More About Rise Time.** We often concern ourselves with only the frequency response of an oscilloscope or an amplifier when, as we have seen, rise time is also important.

In using Fig. 1, we measured rise time between the 10% and 90% points of peak value on the leading edge of the pulse. These two points are used as standards for waveform measurement in the industry.
Looking at Fig. 1 again, you will note that the pulse rises linearly from the 10% voltage level to the 90% level. Such a characteristic is known as a Gaussian response. When an ideal unit step pulse (one with zero rise time) is applied to an amplifier (or cascaded amplifiers) whose frequency response is RC limited, the response is Gaussian. For a Gaussian response, there is a relationship between rise time and frequency (also called bandwidth):

\[ 0.35 = t_r \times \text{bw} \]

where \( t_r \) = rise time in microseconds

\( \text{bw} \) = frequency bandwidth in MHz

Oscilloscope vertical amplifiers consist of cascaded RC stages so the above formula applies. For instance, if a scope has a 10-MHz bandwidth, its corresponding rise time would be 0.035 microseconds or 35 ns.

The 0.35 constant in the formula results from a combination of two factors:

- RC rise time = \( t_r = 2.2RC \)
- \(-3\) dB frequency = \( F_r = 1/(2\pi RC)\)

Consider first the 2.2RC factor and look at the universal time constant curve in Fig. 3. This curve will readily be recognized as the capacitor charging voltage in a series RC network with an applied ideal step pulse. Recalling that, in rise time measurements, the 10% and 90% points were used, we find the corresponding RC value for these two points: namely 0.1 RC and 2.3 RC. Taking the difference between these two values, we get 2.2RC—the time in which rise time is resolved.

But wait just a moment! The curve in Fig. 3 is not Gaussian, so how can it be used in our calculations? Well, irrespective of Gaussian—or whatever—the universal time constant curve serves only as a reference for the 2.2 RC value. It is not the signal pulse to be measured (as in Fig. 1) and thus does not have to be Gaussian.

Remember that what we did say about Gaussian response was that it pertained to an amplifier stage whose frequency response is RC limited.

This brings us to the second factor in the 0.35 constant: the \(-3\) dB frequency, or the frequency at which an amplifier’s gain is down 3 dB from mid-frequency gain. The influence of the stage’s resistance and capacitance is shown in the \(-3\) dB frequency formula: \( F_r = 1/(2\pi RC) \).

Having defined these two factors, let’s see how they determine the 0.35 constant. First, transpose \( F_r = 1/(2\pi RC) \) into \( RC = 1/(2\pi F_r) \). Then from \( t_r = 2.2RC \), we get \( t_r = 2.2 \cdot \left[ 1/(2\pi F_r) \right] = 0.35/F_r \). Finally, \( 0.35 = t_r \times F_r \). Or since frequency response is bandwidth, \( 0.35 = t_r \times \text{bw} \).

**Fig. 2.** Measurement error is inversely proportional to the rise-time ratio.

**Fig. 3.** This is time constant curve for charging capacitor in series RC circuit.
BARRY OTT is a field service representative for Digital Equipment Corporation, or DEC, a major manufacturer of electronic computers. With approximately 18,500 computers manufactured by DEC located throughout the Free World, and on the high seas, it is important for the company to have a trained staff of specialists who can service the computers. Ott works at a DEC field service facility, one of 120 located across the U.S., through most of Western Europe, and in Canada, Japan, and Australia.

DEC's computers can be found in a wide variety of environments, from sedate air-conditioned business offices to oil fields, luxury ocean liners, steel mills, or baseball stadiums. Consequently, Ott's equipment is compact and highly portable. When he goes on a job, he generally takes a tool kit in a small suitcase-size carrier, a portable oscilloscope, a set of solid-state components capable of being used to repair the majority of DEC modules (logic cards) in the field, spare modules, and a set of computer tapes to permit him to run performance checks at the computer site.

The range of different situations that Ott encounters is quite large, primarily because his company's customers vary in degrees of sophistication. Some customers can perform maintenance without outside aid. They call for a field service representative only when something major happens to the system.

By contrast, most customers are less knowledgeable about computers. Many view computers as "black box" solutions to their problems. And even among those who have programming experience, the ability to repair their computers is limited. Just as the average user of a tape recorder or TV receiver does not need a detailed understanding of the "works" to operate it effectively, many users of computers are in the dark when it comes to knowing just how the system operates.

A Professional Consultant. There are two ways that a man who is called in to correct a malfunction can be viewed: as a repairman or as a professional consultant. The field service representative belongs in the latter category. Before a man can become a field service representative at DEC, he is screened carefully. He must have at least an Associate degree or the equivalent. Further, he must have broad experience in some phase of related electronic activity, preferably with experience in such items as computer core memories, magnetic tape units, disk storage systems, etc.

The screening process also includes a written examination on basic computer tech-
Starting out on a typical field service call, the representative carries all the tools of his trade to his car. In his right hand are three boxes containing component parts to repair computer logic modules and his tool kit. An attache case with the computer programs and a portable oscilloscope make the rest of the load.

Compact tool kit contains variety of items for mechanical inspection, assembly, and disassembly. In addition to tools, there are lubricants, etc. Probes and leads are in box at right.

AUGUST 1972
“generalist,” with an understanding of a wide variety of computers and peripheral devices. Even though a generalist learns about a lot of different computers, he tends to lean more toward certain machines than others, as his interests dictate. Thus, if he wishes to specialize, he may find himself in a position to train to become a field service support specialist in those computers which interest him.

**A Typical Day.** A typical day in the life of Barry Ott starts at about 8:15 a.m. when he checks the status board at the field service office to determine what is scheduled for the day. Knowing with what machines he will be involved, he checks to make sure that he has the correct programs and servicing manuals for the job. He then makes sure that he has all the hardware and tools necessary.

For all practical purposes, all the computers and systems that Ott will be called upon to service are located geographically close to him. This is true for most field service representatives. Only in a region of sparse population where the field service regional territory is naturally larger, or in a region that does not normally have a field service office, will a representative be asked to travel any appreciable distance.

One interesting example of an unusual case was when several minicomputers were installed aboard ships that had to leave port before the complete maintenance routine could be completed. For the next day or so, the field service representative found himself at sea while he finished up. Thus, a field service representative has what amounts to his own territory. In Barry Ott's case, it is the greater Boston area.

With regard to his future, if Ott decides to become a support specialist, he will be required to do more extensive traveling since there is no one territory that will be likely to contain sufficient models of any machine or machines to justify an exclusive support specialist.

Ott understands the characteristics of the computers within his territory. As a result, he knows many of the things to expect when visiting his well-established customers. This in turn helps him to plan his schedule to permit him to work at maximum efficiency.

A routine call generally lasts 2-3 hours, permitting Ott to perform preventive maintenance to ensure that the computer will not malfunction at a critical time and allowing him to make minor repairs should these be necessary. In addition to looking at the computer itself, Ott must look after the entire system, including teletypewriters, storage and display devices, and line printers.

The field service representative performs a very useful function. His annual salary ranges from $8000 to $12,000, and he generally gets time-and-a-half for any work performed in excess of 40 hours per week. The field service support specialist or field service engineer, who generally specializes in one particular type of equipment, is salaried at $9000-$14,000 a year. A slightly higher technical level product support engineer is salaried at $10,000-$16,000 a year.

Most of the computers which a field service representative works with are used in a variety of jobs that are “on line”; that is, they are connected directly to an instrument or process. When a computer is being used to monitor the vital processes of a patient in an intensive care ward of a hospital, or when a computer is used to switch messages between aircraft in flight, the owner cannot afford to have it malfunction. By using men like Barry Ott who have an enthusiasm for working on computer systems, DEC's field service organization can be assured that the company's computers will always be working at the peak of their performance capabilities. And the field service representative finds himself in a highly satisfying line of work.
IF REPUTABLE sources can be believed, the Federal Communications Commission will release shortly a proposal which will require all transmitters, including CB amateur, marine, aeronautical, etc., to have a tamper-proof, permanently installed, integrated-circuit module which will automatically identify a station without the operator's even being aware of it.

The identifier module will be mounted in a 24-pin plastic package 1.2" × 0.6" × 0.185" and will transmit every thirty seconds a three-letter, four-number, "coded-for-computer" binary "blip" lasting 5-7 milliseconds. This seven-character identifier is capable of over 78 billion combinations.

Obviously aware of possible adverse reactions from the communications community the FCC has been emphatically denying plans to release a Notice of Proposed Rule Making making automatic identification of transmitters mandatory. Unfortunately, the FCC—excellent at supervising the airwaves—has trouble hiding its tracks.

Item: In June of 1970, Daniel K. Child (Chief, Aviation & Marine Division, FCC) told the writer "we are presently looking for an automatic identification system to be used in the maritime mobile service."

Item: On July 17, 1970, Curt Plummer, Chief of the FCC's Field Bureau said: "Identification of two-way radio stations must, in the long run, be taken out of the hands of the individual operator."

He then went on to discuss in depth the automatic ID methods the Commission was studying (the "continual running" ID using frequencies of 40 to 300 Hz keyed at a 25 word-per-minute rate; the "burst" method triggered when the microphone is keyed) and the problems the FCC was encountering.

Item: Without exception, manufacturers of integrated circuits—among them Texas Instruments, Motorola and Sylvania—have admitted that the FCC has been in contact with them for assistance in developing an automatic ID system.

Two Important Discoveries. Then—on March 20, 1972—two important discoveries were made. One was a document which discussed in detail the FCC intention of amending certain rules and regulations "to provide a mandatory system for automatic identification of transmitters (ATIS) used for radiotelephony other than those used for radionavigation." The other was a photograph of what will probably be the 24-pin integrated circuit module.

The document—dated July 9, 1972—states that "the Commission has developed the system for rapid automatic identification of transmitters" and that it will be "binary coded in USA Standard Code for Information Interchange (USASCII) which (will be) transmitted automatically at the end of each transmission, or at intervals of approximately thirty seconds in the case of longer transmissions, at a rate of 600 bits per second."

The FCC, says the document, is using only a portion of the USA Standard Code grid. The letter "K" in the USASCII would
be transmitted as “1001011(1)”. The number in parenthesis is the “parity bit” which is transmitted to give an odd number of 1’s so that the computer will accept the signal as being valid.

An FCC monitor station or prow car will—when the system is operational—record the binary ID of a violator, feed the information into its computer, and come up with the name and address of the licensee in a matter of seconds. The entire signal sequence will consist of the prefix “SYN” sent twice (this synchronizes the computer to the ID signal), then the seven-place identifier. Finally, “ETB” (End of Transmission Block) is sent twice. Each bit pattern will have a parity bit added. Thus, the automatic ID signal of the mythical call “WBN-2703” in binary form would be:

| SYN | 0010110(0) |
| W   | 1010111(0) |
| B   | 1000010(1) |
| N   | 1001110(1) |
| 2   | 0110010(0) |
| 7   | 0110111(0) |
| 0   | 0110000(1) |
| 3   | 0110011(1) |
| ETB | 0010111(1) |
| ETB | 0010111(1) |

One of the suggestions offered by the industry is that “ETB” be changed to “ETX” (0000011(1))—End of Text—to make it more distinctive and avoid computer confusion. Since the prefix and suffix symbols will appear in all automatic ID signals, they will probably be permanently programmed into each IC by the semiconductor maker. The three-letter, four-number portion will undoubtedly be programmed into the IC by the manufacturer of the transmitter since the FCC document calls for the identifier to “be installed in each transmitter by the manufacturer of the transmitter”.

**Comments from Manufacturers.** Here’s what’s facing the transmitter manufacturers in this program. They will have to: buy the integrated circuit; buy the equipment to program the IC; train personnel to do the programming; program and install the IC; assume the responsibility of correctly matching—by card or plate attached to the transmitter or by some other foolproof means—the transmitter to the ID code; and apply for type-acceptance of their transmitters and describe “the measures employed to limit or preclude the capability of field or servicing personnel to adjust the . . . functions or to change the . . . identifier.”

Comments from equipment manufacturers interviewed ranged from, “We think the FCC is out of its mind,” through, “It’ll be a mountain of paperwork but I suppose we’ll have to do it,” to, “We intend to file a comment in support of the measure”.

There’s nothing much facing the semiconductor manufacturers except deciding whether they want the money in large bills or small ones. With basic research already behind them and a potential multi-million unit market, they aren’t complaining.

**What About the End-User?** Here’s what’s facing the end-user: an inevitable increase in equipment cost. One industry source says that any cost to a manufacturer is usually reflected by a 3.2 increase in the over-the-counter price. This means that if the automatic ID integrated circuit costs a transmitter manufacturer $10 including installation, equipment amortization, etc., the man who buys a CB set or a ham rig or what-have-you will pay $32. In a $100 piece of equipment, this represents a 32% increase in price.

Reactions from user groups are as varied as those encountered from equipment manufacturers. An increase in equipment cost irked those interested in lower-priced units (CB’ers, many hams). After all, a $32 increase in a $100 CB rig is quite different from a $32 increase in a $900 transceiver. The commercial marine vessel owners welcomed the news as did land-mobile operators. These groups seldom give their call-signs because of the press of business but would just as soon be legal. Operating procedures of airline and private pilots wouldn’t be changed. They’ve got to voice-identify to keep one another sorted out. Pleasure boat owners were the most reactionary (“I’ll tear the damned thing out! I dare ‘em to put me in jail!”).

**Tamper-Proofing Problems.** Tamper-proofing will present problems. Technicians who have no qualms about “hopping up” a CB set for $10 under-the-counter aren’t about to be fazed by a programmable read-only-memory IC. The semiconductor industry offered two programming methods to the request the FCC didn’t make. One uses the “fuzable link” technique which, once programmed, cannot be changed. The
other method uses an electrically implanted negative charge which acts as a barrier (giving a "0") in a so-called "floating gate". The advantage of this method is that the IC can be completely tested prior to use. Then it is erased and sent on to the equipment manufacturer. The only trouble: The IC can be erased by merely exposing it to ultraviolet light or X-rays—an open invitation to the unscrupulous technician.

With all these problems it's no wonder the FCC doesn't want anyone to know about its no-Notice of Proposed Rule Making. If it thinks the refusal of an engineer for a major semiconductor firm to work on the project ("It smacks of Big Brotherism.") or the opinion of a major communications equipment manufacturer ("It makes about as much sense as gun control laws; the violators will go on violating while the rest of us have given up some more of our rights!") are jibes from a small group, wait until the general communications public hears about it. This is the public that's going to be footing the bill for this trip into 1984.

**LOW-BUDGET RADIOTHERAPY UNIT**

Radiation therapy technician Cain Chan of Memorial Hospital, Modesto, Calif., makes an adjustment of a Varian Associates Clinac (TM) 4 linear accelerator for cancer radiation therapy, which was recently installed at the small community hospital. Advanced microwave techniques and solid-state electronics have been used to provide a fully mechanized, easily operated unit, specially designed for small hospitals and treatment centers. Radiation intensity is up to 350 rads/minute.
MAC was so busily engaged in what he was doing at the workbench that he actually jumped when he heard the voice of Barney, the second banana of the shop, who had entered quietly and was standing behind him.

"So! You sneaked out and bought something new!" Barney was saying accusingly as he levelled a finger at the impressive little black instrument, bristling with push-buttons, dials, switch knobs, a magic eye tube, and a large meter sitting on the bench surrounded by all sizes and shapes of capacitors. "What is it?"

"A Sprague Model TO-6 Tel-Ohmike Capacitor Analyzer," Mac answered. "The other day I replaced a 0.1-μF coupling capacitor in a tape recorder with one from our stock and found the new one had less insulation resistance than the one replaced. I tried three more of our capacitors, and every one showed objectionable leakage, but a fourth was fine. Right then I decided we needed an accurate method of evaluating capacitors we planned to install in critical locations. The fact that a capacitor is unused obviously does not mean it is good. Moreover, many surplus capacitors can be purchased today at such tempting prices that they represent bargains—if we have a means of separating the sheep from the goats. This little instrument is just the ticket for telling us all we need to know about surplus capacitors or the ones we get from our jobber.

"It measures capacitance from 1 pF to 2000 μF, and the applied voltage is low enough that capacitors rated at 3V can be tested without damage—an important point with capacitors designed for transistorized equipment. The power factor and leakage current of electrolytics can be accurately measured at their exact rated working voltage. Finally the insulation resistance of paper, ceramic, and mica capacitors can be read directly on a meter with two ranges: one up to 10,000 megohms at 30 V for low-voltage capacitors and the other up to 50,000 megohms at 150 V for higher voltage types. Incidentally, those leaky paper capacitors of ours have insulation resistance of less than 2 megohms, while they should have a minimum resistance, when new, of 5000 megohms. This is according to data given in the TO-6 operating manual as to what constitutes minimum insulation resistance for all types and values of paper, mica, silver mica, ceramic, oil-filled, subminiature capacitors, etc."

"We must have got a bummer batch of 0.1-μF capacitors, huh?"

"I doubt it. Those capacitors were probably OK when new but simply deteriorated in the bin. I have no idea how long they've been there. We don't use many 0.1-μF 600-V units any more, and I have the bad habit of ordering new paper capacitors when any one type is running low and dumping the new ones in on top of the old. Then I use the new ones off the top of the pile and leave the old ones down at the bottom; and I do this over and over. We're going to quit that."

"You think paper capacitors go sour on the shelf?"

"Nothing good nor bad lasts a hundred years," the Spanish say. All things deteriorate with time—except service technicians, of course! At any rate, I became curious about the shelf life of several items we use regularly and dashed off letters to capacitor, battery, tube, and solid-state manufacturers asking them for information as to the shelf life I could reasonably expect from their products, what conditions affected shelf life, and what recommendations they had regarding storage.
Returns are still coming in, but I already have a good response from capacitor and battery manufacturers. After all, they know that customer satisfaction and confidence comes from installing components when they are new and fresh. Trying to use an over-age, gone-sour component breeds dissatisfaction, no matter how unfair that feeling may be."

**Shelf Life of Capacitors.** "Okay, so what have you learned about capacitors?"

"I've learned the normal shelf life for paper tubular capacitors used in TV/radio is about five years, as is the normal shelf life for micas (both dipped and molded) and small ceramic capacitors. The decrease in insulation resistance with time takes place chiefly in the dielectric material. Heat and moisture are great villains in this regard. Every effort is made to seal moisture out of the capacitors, and modern techniques do a good job of this; but if the capacitors are exposed to temperature cycling under conditions of high humidity, some moisture is eventually bound to penetrate the seals and degrade the insulating quality of the dielectric."

"Then these capacitors should be stored away from heat and moisture."

"Right. As one capacitor manufacturer wrote me, 'I suppose that one way of looking at it would be for you to keep the capacitors under similar conditions to that under which your wife would keep spices—not near any heat, such as a stove or radiator, and as dry as possible.' You and I can believe this because we both know that when we get a radio in for service that has been stored in an attic or basement, we are certain to find several leaky capacitors in it."

"How about dry electrolytics? Should they be stored under the same conditions?"

"As far as keeping them away from high temperature, yes; but here we are not so much concerned with keeping the moisture out as keeping it in. Let me explain. A dry electrolytic really might be called a 'damp' electrolytic because the electrolyte inside it is in the form of a moist paste. The actual dielectric is a very thin oxide film that normally forms through the combined action of an applied voltage and the chemical action of the electrolyte. The anode constitutes one plate of the capacitor, the electrolyte forms the other. Therefore the drying out of the electrolyte
destroys the capacitor, and the presence of heat speeds up this drying process.

"Manufacturers seem to agree that the normal shelf life for dc electrolytics is one to two years. However the drying up of the electrolyte is not the limiting factor here as much as is the gradual deterioration of the dielectric film under the eroding action of the electrolyte when no polarizing voltage is present to maintain that film. The life of an electrolytic capacitor on the shelf can be materially extended if a polarizing voltage is applied to it through a current-limiting resistor every few months. Heat increases the chemical action of the electrolyte on the oxide film under storage conditions and shortens the normal shelf life."

“What happens if the capacitor is stored at extreme low temperatures?”

“The series resistance goes up and the capacitance goes down due to ionic immobility because of the freezing of the ionizing agent. Capacitors that have been out of service at extreme low temperatures react as though open circuited at first but start returning to normal with the temperature rise of the equipment.”

What About Batteries? “Okay, now tell me about the shelf life of batteries. Transistorized equipment has made this an important subject.”

“I'm indebted to Union Carbide, maker of Eveready Batteries, and to RCA for the information I have on this subject. Union Carbide defines the shelf life as the period of time, at a storage temperature of 70° F, after which a given battery retains 90% of its original energy content.

Shelf life is reduced by high temperatures because of wasteful zinc corrosion and side chemical reactions within the cells and because of moisture loss from the cells through evaporation. The shelf life of a battery stored at 90° F may be 1/3 that of one stored at 70° F.

“RCA has conducted some interesting tests on the effect of temperature on shelf life of carbon-zinc cells. For example, an A-size carbon-zinc cell stored at 70° for 24 months retained only 50% of the rated capacity, but cells stored at 45° F and 0° F retained 70% and 90%, respectively, of their rated capacity. Other tests showed carbon-zinc cells stored at 48° F were in better condition at the end of five years.

In the important upper audio frequencies, some cartridges suffer as much as a 50% loss in music power.

So, there's a lack of definition in the reproduction of violins, oboes, pianos, and other instruments which depend on the overtones and harmonics in the upper frequencies for a complete tonal picture.

The Pickering XV-15 cartridge delivers 100% Music Power 100% of the time. Which is why we call it "The 100% Music Power Cartridge." At 100% Music Power, all the instruments are distinct and clear, because Pickering XV-15's have no music-robbing output drop anywhere in the audio spectrum.

Pickering XV-15 stereo cartridges are priced from $29.95 to $65.00, and there's one to fit anything you play records with. For more information write: Pickering & Co., Inc., Dept. E, 101 Sunnyside Blvd., Plainview, L.I., N.Y. 11803.
than those stored at 104° F at the end of one year.

"UC says the shelf life, as defined previously, of silver-oxide, mercury, or alkaline batteries is one year. The shelf life of carbon-zinc batteries is slightly less than that. Other types of batteries mentioned do not benefit as much from cold storage as do the carbon-zinc cells.

"RCA, on the other hand, while agreeing on the shelf life of silver-oxide cells, finds mercury cells have a shelf life of two years and that alkaline cells have a shelf life almost as good. RCA further states that the shelf life of mercury cells can be extended by storing them at lower than room temperature, provided suitable precautions are followed. Since both companies concur in these precautions, let me list them: (1) Don't handle frozen batteries any more than necessary and be gentle with them to avoid cracking the internal and external seals which may become brittle at low temperatures. (2) Allow the cells to reach room temperatures in the containers in which they are stored to avoid excessive condensed moisture, which will generally destroy the jackets and increase electrical leakage. (3) Do not put the cells into service until they have reached room temperature."

"How about recharged primary cells? Is their shelf life as good as it was originally?"

"Definitely not. RCA says such recharged cells have a very poor shelf life and should be put into service immediately after recharging."

"Well," Barney said, "this certainly has convinced me that capacitors and batteries should be purchased from a source that moves these items rapidly and keeps a close tab on how long they have been on the shelf. By the same token, we should buy in small enough quantities that they will not be long on our shelves. And we should work on a first-in-first-out basis. But now tell me about the tubes and transistors"

"I'm afraid that is going to have to wait," Mac said, starting to put the capacitors he had finished testing back into their bins. "I haven't heard from all the people I wrote to in those fields yet, and it is high time we got to work. But I promise that someday soon we'll talk about the shelf life of tubes, transistors, IC's, etc."
Changes come fast in electronics.

Take a look at the race in circuit technology. In the 1960's the tubes at the left made way for the transistors at the right. Today, transistors are surpassed by the large scale integrated circuit (LSI) at the far right. This circuit, less than a quarter inch square, replaces over 6000 transistors!

There's big money to be made by the men who stay ahead of this technology race. Put yourself ahead with NTS Home Training! You get the latest, most advanced equipment (at no extra cost). More solid-state units, and more advanced technology. Plenty of training with integrated circuits, too! As an NTS graduate, you enter a world of electronics you're familiar with. You have a thorough working knowledge of solid-state circuitry. You're ready to tackle bigger jobs at higher pay!

**NTS COLOR AND B & W TV SERVICING**

Learn sophisticated solid-state circuitry as you build this B & W TV receiver. Lo-Silho "Superhet" Radio, FET Volt-Ohmometer, Solid-State Radio, Electronic Tube Checker, and Signal Generator, TV and all other equipment are yours to keep.

**NTS ELECTRONICS & COMPUTER TECHNOLOGY**

Build and keep this exclusive NTS Compu-Trainer. It teaches you the same principles used in million-dollar systems. Contains 14 integrated circuits! All Solid-State! You perform all wiring and patchcording. No shortcuts. No pre-wired circuit boards. Your training is complete! Also receive an FET Volt-Ohmometer and a 5" wide-band Solid-State Oscilloscope.

**NTS ELECTRONICS COMMUNICATIONS**

Gain the prestige and earning power of owning an F.C.C. First Class Radio-Telephone License. Two comprehensive NTS courses cover the big opportunity field of transmitting and receiving.

You build and keep 14 kits, including this amateur phone 6-meter VHF Transceiver, NTS's exclusive 6-transistor Solid-State Radio, and a fully transistorized Volt-Ohmometer. Also, learn 2-way radio, Citizens Band microwaves, and radar.
NTS Home Training puts you in the lead.

NTS INDUSTRIAL & AUTOMATION ELECTRONICS
Automation is the future of industry and you can play an important part! Learn industrial controls by training on the NTS Electro-Lab (a complete workshop). You also build and operate this 5" Solid-State oscilloscope. And you perform experiments that involve regulating motor speeds, temperature, pressure, liquid level, and much more. All equipment is yours to keep.

NTS AUDIO ELECTRONICS SERVICING
Learn basic sound theory—how it works in home radio, car tape decks, stereo multiplex component systems, and more! Set up a spectacular music system. Learn about sound distortion, amplification and control, loud-speaker baffles, problems of system installation, etc. Included is Volt-Ohmmeter, In-Circuit Transistor Tester, and Solid-State Radio. Prepare yourself for great opportunities in the Home Entertainment Industry!

CLASSROOM TRAINING AT LOS ANGELES
You can take classroom training at Los Angeles in sunny Southern California. NTS occupies a city block with over a million dollars in technical facilities. Check box in coupon below.

Big, Colorful NTS Guide to new opportunities in Electronics. Yours FREE!

EVER since its introduction, the field-effect transistor has been creating quite a stir in electronics. Devices and systems heretofore impossible to produce with bipolar transistors had to be built around vacuum tubes—if at all. Now, the FET is changing the situation.

The FET has many of the qualities and advantages of both the vacuum tube triode and the bipolar transistor. It is as compact as most small-signal transistors. It operates at low voltages, thus eliminating most of the bulk and expense of the power supply. Its input impedance can be rigged to fall into the desirable multi-megohm category. Recent developments have produced FET's which are capable of dissipating several watts of power; and since they exhibit the property of having a negative temperature coefficient, it is hard to make them succumb to thermal runaway.

Viewed as a design element, the FET is a semiconductor device which behaves in the manner of a variable resistor. As shown in Fig. 1, current flow between the source and drain is controlled by the gate voltage which is applied to both p sections simultaneously. As the reverse bias increases, the space charge area starts to pinch off, causing the source-to-drain current to fall almost to zero. Thus, the gate "field" has a direct "effect" on the source-to-drain current—hence the term "field-effect" transistor.

Fig. 1. FET acts as variable resistor in which the gate field has a direct effect on source-to-drain current flow.

Types of FET's. There are basically two types of field-effect transistors in regular use today. The most common is the junction field-effect transistor, or JFET, which has a direct ohmic contact at the gate. The MOSFET, or metal-oxide field-effect transistor (sometimes known as an IGFET for insulated-gate field-effect transistor) has an electrically isolated gate.

In the JFET category, there are p- and n-channel types (see Fig. 2). The n-channel FET is very similar in voltage polarities and biasing to the vacuum tube triode as shown in Fig. 3.

The MOSFET, a long-needed semiconductor device, even more closely approximates the input impedance of the typical vacuum tube. It can be fabricated to yield gate impedances well into the several hundred megohm region—beyond the usual capabilities of the common JFET. As shown in Fig. 4, there are currently two types of MOSFET's available. The one on the left is a single-gate type, while the one on the right has two gates.

The MOSFET's substrate is usually connected internally to the source; if not, the substrate is externally connected to the source or to ground. Great care must be exercised in handling the MOSFET since the gate input impedance is so high and the gate insulation is so thin that any static charge introduced at the gate can perforate

Fig. 2. Shown here are the schematic symbols for a p-type (left) and an n-type junction field-effect transistor.
Fig. 3. Biasing arrangements for n-type JFET and vacuum tube triode are same.

the oxide insulator barrier and destroy the device.

The dual-gate MOSFET finds its most popular application as the mixer stage in AM, FM, and TV tuners where it provides a convenient means of "beating" two frequencies in a nonlinear device while maintaining isolation between the two signals. Also the MOSFET appears to exhibit less noise and cross modulation problems than do conventional transistors and vacuum tubes.

Virtually all MOSFET's produced for large current conditions are contained in single packages—not integrated circuits. The reason for this is that the FET needs roughly ten times the active area required by bipolar transistors to provide the same current capabilities.

It is well to note that as r-f amplifiers, FET's are immune to strong-signal overloads. Some FET's are so symmetrically constructed that their drain and source leads are interchangeable.

The past few years have witnessed some remarkable developments in the semiconductor scene. It will be interesting to see which directions research and development will take in the future.

NEW HOLOGRAM CRYSTALS PERMANENTLY STORE IMAGES

DEVELOPMENT of a crystal capable of storing hologram images as atomic patterns which can be read out, one by one, by slow rotation in a laser beam has been announced by RCA. The development may ultimately lead to a new document storage system in which files of statistics, engineering drawings, computer data, and other graphic material are permanently stored in crystals the size of sugar cubes.

The significance of the announcement is that crystals 500 times more sensitive than ever before and a system for permanently "fixing" images stored in them have been developed. Though holograms have been stored in crystals before, a very powerful laser was required and the holograms tended to erase during the readout process.

The RCA holograms can be retrieved relatively easily by the same low-power gas laser used during the storage process. Furthermore, a display from such a hologram can be 15 times brighter than that from a conventional photographic-film negative.

Metallic impurities in the lithium niobate and barium niobate crystals are responsible for the increased sensitivity. Storage capacity is theoretically a trillion bits per cubic centimeter of crystal.

AUGUST 1972
HITACHI, a major Japanese manufacturer of electronic equipment, has entered the consumer hi-fi component market in the United States with a deluxe integrated stereo amplifier, their Model IA-1000. This handsomely styled unit, sporting a brushed aluminum, satin-finish panel with rosewood side trim plates retails for $319.95.

The IA-1000 has a number of interesting design and construction features. It has a 140-watt IHF music power rating into 8-ohm loads. This works out to 55 watts per channel continuous power with one channel driven. Its tone controls are true step-type switches, unlike the mechanically detented potentiometers used in some amplifiers and receivers. The balance control, a potentiometer, also has a slight detent at its center-of-rotation position.

The input FUNCTION SELECTOR has positions for two high-level inputs, a tuner, and two magnetic phono cartridges. Three different input sensitivities on PHONO can accommodate almost any magnetic stereo cartridge ever made. The nominal sensitivities of the two phono inputs are 5 mV and 2 mV with 50,000-ohm impedances, but the latter can be converted to an input for moving-coil cartridges simply by flipping a switch located on the amplifier's rear apron. This increases the sensitivity to a nominal 0.25 mV at 200 ohms impedance. Most moving-coil cartridges which normally require step-up input transformers with all but a very few amplifiers can be connected directly into this input circuit of the IA-1000. A single hybrid integrated circuit, manufactured by Hitachi, is used in each phono preamplifier channel.

The MODE switch has positions for both normal and reversed stereo and for driving both speaker systems with the L (left), R (right), or both channel signals in the mono mode. A microphone input jack, located on the front panel with its own level control/on-off switch, mixes a single microphone signal into both channels, together with any other program source. This microphone signal, however, does not appear at the tape recording outputs.

A number of lever-type switches is used for power on/off, activating either or both of two pairs of speaker systems independently, switching in and out low and high filters and the loudness compensation, reducing the output level by 20 dB (a convenience when answering the telephone or doorbell), and controlling the tape monitoring function. A headphone jack located on the front panel is always energized.

A distinctive feature of the Hitachi IA-1000 is its pair of softly illuminated VU meters which are used to monitor the output signal levels. A switch allows selection of HIGH, MEDIUM, or LOW meter ranges in addition to allowing the meters to be switched out of the circuits altogether.

The rear apron of the amplifier contains all the usual preamplifier/amplifier inputs and outputs, including a DIN-type recorder input/output connector, center-channel output, and preamplifier-out/main-amplifier-in jacks which are normally connected together electrically. An adjacent slide switch allows the user to break this connection for inserting an equalizer or other accessory into the signal path.

The insulated speaker output connectors are spring-loaded, eliminating the need for a screwdriver when making the hookups. There are three ac outlets, two of which are
Distortion in Hitachi IA-1000 receiver is shown at various power levels and frequencies in the above graphs.

switched. Two fast-acting fuses protect the output transistors in the event an overload situation occurs, while a slow-blow fuse is used in the ac power line.

Lab Test Results. Our measurements on the Hitachi IA-1000 showed the per-channel clipping power output at 1000 Hz with both channels driven to be 46 watts into 8 ohms, 51 watts into 4 ohms, and 32 watts into 16 ohms. The harmonic distortion, masked by noise at very low power levels, was 0.055 percent at 10 watts, 0.1 percent at 30 watts, and 0.25 percent at 50 watts per channel. The IM distortion levels were generally similar.

Using 50 watts per channel as a reference full-power output, distortion was below 0.6 percent in the midrange, rising to 1.0 percent at 100 Hz and 4000 Hz. Although the distortion curves would have looked better with a lower full-power level, we felt that 50 watts was a realistic choice for the relatively undistorted midrange output. At half power, or 25 watts per channel, distortion was 0.75 percent at 20 Hz, fell to about 0.1 percent at frequencies between 300 and 2000 Hz, and rose gradually to 0.24 percent.

We know today's CBer is looking for real value. So we redesigned our Messenger 123 where it counts—on the inside. Our engineers gave the model "A" new improved circuitry. With a new acoustically isolated speaker and voice-tailored audio that cuts noise—increases clarity. Plus a new ceramic selectivity filter that rejects adjacent channel chatter. And, of course it has built-in electronic speech compression for famous Johnson "talk power." At $149.95, the Messenger 123A is a real value. And come to think about it, it's still a great looking CB radio just the way it is.

CIRCLE NO. 19 ON READER SERVICE CARD
at 20,000 Hz. At one-tenth power, the distortion was less than 0.1 percent from 20 Hz to several thousand hertz, rising to 0.29 percent at 20,000 Hz.

The tone controls had excellent characteristics, with a sliding inflection point on the bass control which allowed useful correction at frequencies less than 100 Hz with negligible effect on the higher frequencies. The loudness compensation circuit boosted both the low and high frequencies at reduced volume levels. The filters had a desirable 12-dB per octave slope, with the −3-dB points being at 90 Hz on the low end and 4000 Hz on the upper end. The RIAA phono equalization was accurate to within ±0.5 dB from 50 Hz to 15,000 Hz and was down 3 dB at 30 Hz. Measurements for the RIAA equalization were taken at the tape outputs.

For an output of 10 watts, the required inputs were 68 mV on AUX, 2.25 mV on PHONO 2, and 0.94 or 0.25 mV on PHONO 1, this last depending on the setting of the moving-magnet/moving-coil cartridge selector switch. Phono overloading occurred at 165 mV, 68 mV, and 21 mV for the three phono input sensitivities, providing complete assurance against overdriving the preamplifier from any properly installed phono cartridge. The noise level, relative to 10 watts output, was 65 to 67 dB down on the phono inputs and 71 dB down on the high-level inputs. The microphone input required 1 mV for 10 watts output for a −56-dB noise level at maximum gain.

We measured the VU meter calibration against power output, basing our results on the use of 8-ohm loads. The two meters differed in their readings by 1 to 3 dB at the same power levels. In the high range, 0 dB corresponded to 50 watts and −6 dB to 10 watts. The mid range read 0 dB at 10 watts and was down 7 to 8 dB at 1 watt. The low range read about −2 dB at 1 watt and −10 dB to −15 dB at 0.1 watt. Although the calibrations are not accurate enough for any critical level setting purposes, they do provide an interesting insight into the actual power output required for different listening levels.

The construction of the IA-1000, both internally and externally, was excellent. Its finely finished metal knobs and switch levers operated with a smooth, positive feel. Sound reproduction was excellent, even when driving some rather power-hungry speaker systems. With just about every feature one could expect in a stereo control amplifier, coupled with a very attractive appearance, the Hitachi Model IA-1000 integrated amplifier is a worthy entry into the stereo component market.

HEATHKIT SOLID-STATE TRIGGERED-SWEEP OSCILLOSCOPES
MODEL 10-103 SINGLE-TRACE AND MODEL IO-105 DUAL-TRACE

IN THE recent past, such niceties as wide bandwidth, fast rise time, and triggered sweep could be found only in multi-thousand-dollar oscilloscopes designed for R&D laboratories. Now, however, there are two low-priced scope offerings featuring these and many other characteristics. They are both made by Heath and are designated as the Model IO-105 (duaTrace) and the Model IO-103 (single-trace). Respectively, they are listed in the catalog at $429.95 and $229.95. For these prices, you get scopes that are just as at home in general-purpose use as they are on the lab bench.

Leading off with the IO-105, we can state that this is the scope kit to end all scope kits. With respect to functions and technical specifications, this scope is comparable in performance to many of the higher-priced commercial units presently being used in R&D labs. Yet, its low cost puts it within the reach of the serious experimenter and service technician.

The IO-105 features two broadband channel inputs, each having a frequency response

POPULAR ELECTRONICS Including Electronics World
from dc to 15 MHz, rise time of 24 ns, nine-position attenuator in a 1-2-5 sequence providing a range of from 0.05 V/cm to 20 V/cm, ac/dc coupling, and the choice of either channel 1 or channel 2 or both in alternate and chop modes. Each channel is fully independent of the other, with its own gain, ac/dc input switch, and trace positioning control.

The time base, which is common to both input channels, is a true triggered sweep system which has 18 calibrated rates from 0.2 µs to 100 ms/division in a 1-2-5 sequence with a continuously variable rate which can be switched in as desired. Sweep triggering can be accomplished from either channel, and the user can select the "auto" mode in which the sweep is triggered at the average dc voltage of the input signal or the "normal" mode where a front-panel trigger level control permits starting the trace at almost any point desired. A conventional stability control permits "fine tuning" of the triggered sweep.

Additionally, there are an X-Y mode in which the two inputs are coupled in a vectorscope fashion with channel 1 on the vertical axis and channel 2 on the horizontal axis, and a TTL-compatible blanking input and gate output, this last located on the rear apron.

The IO-103 general-purpose scope is only slightly less sophisticated than the IO-105. A single-trace, triggered-sweep affair, its frequency response extends from dc to 10 MHz at 3 cm deflection (dc-8 MHz at 6 cm deflection). Sensitivity is specified at 50 mV, while rise time is 50 ns. Like the IO-105, the IO-103's attenuator has nine positions in the 1-2-5 sequence; it yields a range of from 0.05 V/cm to 20 V/cm. The time base sweep is a seven-position switching arrangement which covers a range of from 100 ns/cm to 100 ms/cm. At one of the front panel jacks, there is available a 1-volt peak-to-peak, 60-Hz reference/test signal which is used for calibrating the IO-103's vertical deflection circuits and, later, for whatever you have in mind.

Similar Yet Different. There are some basic similarities between the IO-105 and IO-103 scopes. First, of course, is that they are both all solid-state (except the CRT). Each has a variable-intensity/off calibrated graticule over the flat screen of the CRT, held in place by a rectangular camera-mount bezel. Aside from the usual complement of scope controls, each model has a series of switches which are used to select internal or external source triggering, ac or dc coupling arrangement, + or − triggering slope, and normal or automatic triggering.

Both the IO-105 and IO-103 have display expansion; in the IO-105 the magnification factor is X5, while in the IO-103, it is X2. This welcome feature allows the user to examine critically any waveform displayed. In the IO-105, the magnifier function is on an independent switch, while in the IO-103 it is an attachment on the horizontal positioning control and is activated by pulling out the control knob. In both cases, the magnifier is defeatable.

The input connectors on both scopes are BNC female types. The coaxial input cables have mating male-type BNC connectors on one end and alligator clips on the other end. (Heath also makes available their Model PKW-101 high-frequency compensated probe for use with both scopes at $23.95. It comes completely assembled and has a bandwidth of dc to 30 MHz.)

The differences between the two scopes are mostly subtle. Aside from the obvious differences in frequency response, rise time, magnifier figure, and input channel capabilities, the two are different mainly in cosmetics. For example, while the two are almost the same size—the IO-105 measures 15" × 12½" × 10¾" and the IO-103, 16¾" × 12½" × 9¾"—the dual-tracer is a block-like affair with projections only on the front panel, while the single-tracer has a raised ridge along the top, topped off by the carry-
ing handle and a rear-projecting plastic cup over the neck of the CRT, in addition to the front panel projections. (On the IO-105, the handle is recessed into the case top.)

The graticule on the IO-103 has a 6 × 10-cm grid, while the IO-105 has an 8 × 10-cm grid. For reasons which will become obvious, the control grouping on both scopes is different, but in neither case are the controls difficult to find or awkward to use.

The IO-105 is designed along the traditional lines of the laboratory scope. Hence, it is really a two-part system, consisting of a basic main frame containing the CRT, associated controls, and power supply, and a "plug-in" input module containing the separate channel preamps and processors. Interconnections between the two assemblies are made via appropriate connectors. (Incidentally, with this plug-in arrangement, we assume that the Heath people have other input modules in mind for use with the main frame section. It would not be difficult to replace the dual-trace module with, say, a curve tracer, spectrum analyzer, etc.)

Assembly and Calibration. It is difficult to believe that, after building either of these oscilloscopes, they are such highly sophisticated test instruments. The IO-105 and IO-103 kits are actually easy to assemble, even if the builder has only limited experience in assembling kits. This is due in large part to the fact that almost all components mount on printed circuit boards which are interconnected with factory-prepared wiring harnesses, and to the excellently written and illustrated assembly manual.

The IO-105, due to its higher order of sophistication and complexity, took the longer of the two kits to assemble. Using careful assembly techniques, total building time was 27 hours. The IO-103 took just under 18 hours. The initial checkout and calibration, requiring the aid of only a VTVM or TVM, ate up another 30 minutes for the IO-103 and about 45 minutes for the IO-105.

Once we had our scopes in operating order, we could not resist the temptation to compare the manufacturer's published specifications with actual performance tests. To do this, we used laboratory-standard equipment of known accuracy. We can now categorically state that both scopes performed well within their published specifications. In fact, in most of the vital areas, the published specifications were very conservative, which is not really surprising in light of the fact that the Heath people traditionally publish conservative ratings.

DYNASCAN COBRA 130 CB TRANSCEIVER

The Dynascan Cobra 130 is a synthesized 23-channel CB transceiver designed for use on conventional AM or on SSB (upper or lower sideband). It is a solid-state unit designed primarily for mobile use with power derived from a 12-volt negative-ground dc source.

The operating features of the Cobra 130 are those which are now becoming more or less standard with this type of transceiver. They include r-f and a-f gain controls; a selector switch with positions for AM, SSB/USB, and SSB/LSB; adjustable squelch; voice-lock (fine tune); AM noise limiter and SSB noise blanker; built-in speaker; jack for external speaker with receiver for PA operation; detachable microphone; and a transmitter-on/modulation indicator lamp.

Technical Notes. No schematic diagram was supplied with our test unit, but we were otherwise able to determine the following: The 130 employs three FET's, 32 bipolar transistors, an integrated circuit, and 62 diodes. Double conversion is used on receive for AM with 7.3 MHz and 455 kHz for the first and second i-f's, respectively. Ceramic filters provide the required selectivity at the second i-f, whereby a 6-dB band-pass of 5 kHz is obtained with a rated adjacent-channel rejection of 50 dB. In our test unit, however, the selectivity response was found to be somewhat unsymmetrical, resulting in an adjacent-channel rejection of 20 dB on the low-frequency side and 80 dB on the upper side.

A separate i-f section at 7.8 MHz is engaged
for single conversion on SSB with selectivity and sideband selection obtained with a 2.1-
kHz bandpass crystal filter. Since this filter
provides all the selectivity required (with
the unwanted-sideband rejection measured
as 60 dB at 1 kHz), there is no need to go
to a second conversion at a lower i-f.

A product detector is engaged for SSB,
an envelope detector for AM. DSB,
suppressed-carrier signals can also be copied
in the SSB mode. Adjustable squalch operation
is provided for each mode of operation
with a threshold sensitivity down to less than
0.5 µV.

The same “front end” (r-f input ampli-
fier and mixer) is employed for both modes
of reception with the separate conversion
sections and detectors switched in indi-
videntally for SSB or AM. The setup provides
a measured sensitivity of 0.15 µV on SSB
and 0.5 µV on AM for a 10-dB (S + N)/N.
The circuitry, plus the following i-f, pro-
vided an image rejection of 80 dB.

Individual series-gate type noise blankers
can be switched into the system inde-
dependently for SSB or AM to ensure optimum
performance in each case. Anyone who has
handled gear with a good noise blanker,
such as the ones used in the 130, will ap-
preciate how much more effective this
method of noise silencing is over the usual
type of noise limiter.

Combinations of frequencies obtained
from a crystal-controlled frequency synthe-
sizer provide the heterodyning signals at
the mixers as needed for the particular con-
version. A “voice-lock” control at one group
of crystals is designed to permit the re-
ceiver frequency to be varied 600 Hz either
side of the center frequency, enabling the
receiver to be tuned exactly to the received
signal for proper demodulation on SSB.

Transmitter Section. The initial carrier
for the transmitter is produced at 7.8 MHz
with the frequency synthesizer signals used
for conversion to the channel frequency.
SSB signals are generated with the initial
carrier using a balanced modulator and a
crystal-lattice filter. Different groups of crys-
tals are engaged at the synthesizer for either
lower- or upper-sideband operation on the
various channels. The SSB signals are
brought up to a 15-watt PEP input at the
r-f power-output amplifier with a measured
PEP output of 8 watts into 50 ohms with

CIRCLE NO. 22 ON READER SERVICE CARD
operation from a 13.6-volt dc source (normal battery potential when a vehicle's engine is running). With a 12-volt source, it drops to 6 watts output.

The unwanted-sideband suppression at 1 kHz was found to be 50 dB and the carrier suppression, 60 dB. The second- and fifth-order distortion products were 25 and 40 dB down, respectively; better than the manufacturer's rating of 20-25 dB and than that usually found with solid-state CB transceivers.

There is an automatic level control (alc) system designed in to maintain relatively uniform modulating levels and prevent power amplifier overdrive; however, flattopping of the SSB signal (which increases the distortion products) can still occur at high speech levels.

The voice-lock control at the synthesizer also varies the transmitter frequency, automatically placing the transmitter on exactly the same frequency as that of a received SSB signal properly tuned in. For our money, this is the preferred arrangement as opposed to others where only the receiver section's frequency can be shifted.

The synthesizer crystals are held to a closer tolerance than usual in order that the maximum possible deviation with the voice-lock will maintain the transmitter frequency within the legal tolerance. With our test unit, the maximum possible deviation from the exact frequency on any channel was -900 to +1350 Hz, thus holding to within the required 0.005 percent limit.

AM Operation. For AM, the SSB-producing section of the transmitter is disabled and the r-f driver and PA are modulated by the receiver a-f power-output amplifier. The AM input runs up to 5 watts with a measured carrier output of 3.75 watts using a 13.6-volt dc power source. Good modulation up to 100 percent was attainable with clipping at this point for a heft-sounding signal.

When the AM carrier is on, a red lamp comes on and blinks brighter when modulation is applied. With SSB, because of the suppressed carrier, the lamp does not come on until modulation is applied, at which time it lights to a brilliance determined by the modulation peaks.

When a loudspeaker is plugged into the external speaker jack, it cuts off the built-in speaker and permits the signal to be heard only on the external speaker. A PA/CB switch on the front panel cuts off the receiver output and sets up the transceiver for PA service using an external speaker at another jack. We measured the a-f output as a good 3.5 watts into 8 ohms.

Performance. The preceding discussion contains much data on what to expect from the Cobra 130 in the way of performance. In addition, the age holds the a-f output to within 10 dB and 2 dB with an r-f input change of 20 dB (1-10 μV) and 60 dB (10-10,000 μV), respectively. On the other hand, there is sometimes not sufficient control to prevent overload with distortion on strong local SSB signals. However, this can be alleviated by turning down the r-f gain control.

The Cobra 130 is a good-looking, easy-to-use and operate transceiver made in Japan. It measures 11½” X 9” X 2½” and weighs 6½ pounds. It is list-priced at $349.95.

BIRD “HAM-MATE” MODEL 4350 R-F WATTMETER
(A Hirsch-Houck Lab Report)

The widely used Bird “Thruline” r-f directional wattmeters employ plug-in sensing elements for different power and frequency ranges. The elements rotate in their sockets to read forward or reflected power in a coaxial transmission line. Elements are available for full power ranges from 1 watt to 10,000 watts, covering frequencies from 450 kHz to 2200 MHz.

The relatively high price—typically $150 or more—of the commercial Bird Thruline r-f wattmeters has limited their use in amateur radio stations. Now, however, the Bird “Ham-Mate” Series 4350 r-f directional wattmeters have brought the basic performance of the commercial instruments to the amateur radio market in terms of cost.

The Bird 4350 is a compact, self-contained unit, measuring 5½” X 4” X 3½”. It weighs 1½ pounds. The meter face is slanted for easy viewing. On each side of the case, there is a female SO-239 uhf connector, one of which goes to the transmitter while the other goes to the antenna or dummy load rated at between 50 and 52 ohms. The meter can be left permanently con-
nected in the transmission line since it has no effect on the transmission system's performance.

The Model 4350 contains a 4" section of rigid air-dielectric coaxial line coupler which is designed for an accurate 50-ohm impedance. The rotating sensing element is inserted into the side of the coupler and is capacitively coupled to the inner conductor of the rigid coax.

The Ham-Mate has two power ranges (200 watts and 2000 watts) which can be alternately selected according to the positioning of the slider on a high-low switch. The sensing element is not removable, but is turned by a knob to read forward or reflected power. The rated frequency range is from 1.8 MHz to 30 MHz. A similar unit to the Model 4350, the Model 4351, has a 1000-watt high range instead of 2000 watts, and another, the Model 4352, has ranges of 40 watts and 400 watts and a frequency range of 50 MHz to 150 MHz. All models carry the same $79 price tag. And all have a published rated accuracy of ±8 percent full-scale.

**Comparison Tests.** Lacking an accurate r-f standard wattmeter, we were unable to verify the accuracy of the Bird 4350 Ham-Mate in a rigorous manner. However, we did make substitution measurement comparisons between it and another popular r-f wattmeter designed for the amateur market, using a Heath “Cantenna” 50-ohm dummy load and several antenna systems. The signal source was a Heath Model SB-400 exciter.

**SAVE MONEY!**

A Delta Mark Ten Capacitive Discharge Ignition (CDI) System On Your Car Slashes Maintenance Costs And Increases Performance.

Put a Mark Ten on your car and save by eliminating 3 out of 4 tune-ups. Save as gasoline mileage increases (up to 20%). The Mark Ten CDI system also extends spark plug life, promotes more complete combustion and assures instant starts in all weather. It operates on any 6 or 12 volt negative or positive ground system.

The Mark Ten B affords additional money saving advantages by drastically reducing combustion contaminants and restoring power lost by the use of smog control devices. Equipped with handy switch for instant return to standard ignition, the Mark Ten B works with ANY 12 volt negative ground engine. Both systems install in ten minutes without rewiring.

Order your Mark Ten or Mark Ten B today. Save money while you enjoy low maintenance and increased performance.

- Mark Ten (Assembled) $44.95 ppd.
- Mark Ten (Deltakit) $29.95 ppd. (Kits available in 12 volt only, positive or negative ground)
- Mark Ten B $59.95 ppd. (12 volt negative ground only)

Superior Products at Sensible Prices
Mfg. in U.S.A.
and, when necessary, a Heath Model SB-200 linear amplifier.

On the 14-MHz amateur band, where Bird suggests calibrating their Model 4350, the two meters agreed very closely at power levels from 10 watts to 200 watts. The total “spread” between the two units never exceeded 10 percent of their average readings and was usually much less. On the high power ranges, the differences were greater, typically 15-20 percent. Since the accuracy rating of the Bird 4350 is ±8 percent of full-scale, which would permit an error of 160 watts at any point on the high range, no firm conclusions can be drawn as to the accuracy of either unit. On the other hand, if either was considered to be the reference standard, the other was also within its published accuracy specification. In all cases, the reflected power reading was zero, as would be expected with the 50-ohm dummy load used.

To check the Ham-Mate under the less-than-ideal conditions of an antenna load with an appreciable standing wave ratio (SWR), we again compared the two units on the 10-, 20-, 40-, and 80-meter amateur bands. On 10 meters, the Bird and comparison units indicated, respectively, 75 watts and 78 watts with both showing 1 watt of reflected power. On 20 meters, both indicated 120 watts forward and 12 watts reflected power. On 40 meters, with a badly mismatched antenna, the Bird indicated 190 watts forward and 100 watts reflected power, while the comparison unit indicated 200 watts forward and 110 watts reflected power. The net radiated power (90 watts) was identical as measured with both instruments. The corresponding SWR’s, calculated from the power readings, were 6.4 with the Bird and 6.8 with the comparison unit—certainly close enough for any practical purpose. On 80 meters, both units indicated 120 watts forward, while the reflected powers were 8 watts for the Bird and 6 watts for the comparison unit. Since the latter readings were near the bottoms of the meter scales, no significance can be attached to the small discrepancy.

Even though our tests could hardly be considered a proof or disproof of any of the Bird specifications, we have not the slightest doubt that the 4350 does exactly what is claimed for it, probably with an error much smaller than its ratings would allow. At about half the price of the commercial Thruline r-f directional wattmeters, the Model 4350 does practically the same job, with very nearly the same accuracy, over the range of power levels and frequencies encountered in h-f ham communication.

EICO SS-500 SECURITY ALARM SYSTEM

It may take many hours of searching through various catalogs to piece together a security system to suit your particular needs. After looking at the various sensors, bells, buzzers, and switches, you may start to wonder just how such a system can be integrated and how it will work. What with ac and dc bells, normally open and normally closed switches, fire and smoke sensors, and the multitude of window and door sensors available in various configurations, putting together a system can become, at best, a difficult task.

Now, for the do-it-yourselfer, Eico has come out with their Model SS-500 security alarm system retailing for $99.95. This system includes the company’s assembled Model FC-100 security control center containing all the electronics for monitoring the intrusion or fire warning system and the Model A-75 ac power supply in a compact wall-mounted security box. The Model SD-10 door-window magnetic contact reed switches supplied are two-piece units consisting of a normally open reed switch enclosed in a plastic housing. A bar magnet for controlling the open/close conditions of the switch is encapsulated in a similar plastic housing.

As long as the magnet is kept close to the reed switch, the switch contacts are held closed magnetically. When the magnet is moved far enough away from the reed switch so that its magnetic field is weakened considerably, the contacts spring open. The distance by which the magnet needs to be removed from the reed switch to cause the contacts to open is very small to insure proper security.

When the contacts of the reed switch open, the FC-100 security control center senses the interruption and the alarm system activates.

The SD-20 fire sensors included in the system are designed for a normally open circuit condition. When heated to their
operating temperature (135°F or the optional 190°F level) they automatically close, arming the independent fire-warning system and sounding the associated Klaxon horn.

The SD-40 door cords supplied with the SS-500 system are 12'-long flexible leads used to connect a movable door or window to its contacts on the adjoining jamb. SD-50 tamper switches are provided for mounting on the control center or the external bell housing to sound the alarm automatically if either of these units is moved from its preset mountings.

Two control stations (Model A-65 remote and Model A-45 entrance) have lamps to indicate the state of the system and provide means of entering the protected areas using the special key provided. A-45 emergency buttons, sometimes called "panic buttons," allow operation of the alarm from any location within the house and override the other sensors. Besides these and other sensors, 250' of hookup wire is also supplied.

Available separately for $2.95 is the A-95 "Home Security Handbook" which illustrates the various methods which can be used to protect a house or other premises. If you are considering putting in your own alarm system, take a look at this informative manual.

There are also available a number of optional accessories to the basic security system. These include additional remote stations, Klaxon horns, high-temperature (190°F) heat sensors, freeze-up and water flood sensors, and window tape. All of these can be seen on your local Eico dealer's display rack. If you do not want to purchase a complete SS-500, you can pick and choose from among the components displayed according to your needs.

Installing the System. We found that installing the security system is easy, and the only tools we needed were a screwdriver and a knife. We picked an arrangement from the manual, suitable to our needs, and went to work. In a matter of hours, the job was completed. Using the instructions supplied with the SS-500, the system was tested and found to operate properly as each protected door and window was opened. The alarm bell's clanging was reassuring. The fire alert system was tested using kitchen matches. It, too, operated with reassuring promptness. We had no real need for the "panic buttons," but we could well see how such a button placed at bedside could offer the bedridden, elderly, or infirm some consolation when they are home alone.

The intrusion and fire alerts are two completely independent systems. When the intrusion alarm is disabled—as it usually is when the family is at home—the protection of the fire alarm system remains in readiness at all times.

The Model FC-100 control center is available separately. Alone, it retails for $49.95.
New Products

**XCELITE COMPACT DRIVER SETS**

Just added to their tool line of "compact convertibles" are three new all-purpose Xcelite screwdriver/nutdriver sets. Each consists of an assortment of color-coded midget tools and a unique "piggy-back" torque amplifier handle. The PS-6 screwdriver set includes miniature drivers for No. 00, 0, and 1 Phillips; 3/32", 1/8", and 5/32" slotted screws. The PS-140 screwdriver and nutdriver set contains a popular assortment of drivers for No. 4, 1, and 2 Phillips screws; 3/32", 1/8", 5/32" and 1/4" slotted screws; and 1/4", 5/16", and 3/8" hex nuts. Finally, the PS-130 screwdriver and nutdriver set is similar to the PS-140 with a larger assortment of nutdrivers, including 3/16", 1/4", 5/16", 11/32", and 3/8" hex sizes, plus drivers for No. 1 and No. 2 Phillips screws and 1/8", 3/16", and 1/4" slotted screws.

**METROTEC UNIVERSAL DECODER/AMPLIFIER**

Metrotec's Model SD4A-Q is a truly "universal" 4-channel stereo decoder/amplifier on a single chassis. Capable of fully and faithfully decoding CBS, SQ, and Electro-Voice encoded records, it also provides 4-channel ambience recovery from any 2-channel source. The SD4A-Q is the first synthesizer to retain full bass response in the rear channels by utilizing a special 300-Hz turnover in the matrix/phase-shift circuit. The low-distortion, full-response rear channel amplifier has 10 watts rms/channel and provisions for discrete tape and 4-channel headphones.

**REALISTIC VHF SCANNING RECEIVER**

The Realistic Patrolman PRO-9 vhf scanning and tunable receiver from Radio Shack automatically scans up to seven crystal-controlled channels plus one selected eighth channel in the 148-174-MHz band. It is said to be the first and only professional vhf scanning monitor with both crystal control and full-band coverage tuning. Any one of eight channels can be selected as a priority channel on which constant check is maintained. At the touch of a button, any channel can be instantly locked out of scan and skipped over. A 2-second delay prevents missing call-backs. There is also a channel selector button, and illuminated indicators show which channel is being monitored. Scanning rate is 10 channels per second.

ANTENNA SPECIALISTS MOBILE CB ANTENNA

A new mobile antenna, guaranteed not to burn out in CB installations, is now available from Antenna Specialists Co. The Model M-410 antenna is designed around an industrial type loading coil twice the size and weight of the conventional CB type and a stainless-steel whip employing an exclusive new copper and nickel coating process which provides super conductivity. The high-capacity design offers increased efficiency and, thus, more effective signal radiation. The antenna is equipped with the company's "Quick-Grip" mount for a no-hole trunk installation with the cable completely hidden.

FOURTH GENERATION MITS CALCULATOR KIT

MITS, the original manufacturer of kit electronic calculators, recently announced their latest unit, the Model 1440. Easily assembled in less than 10 hours, the 1440 provides outstanding computational versatility with straightforward operational procedure. Its 15 LED readouts (14-digit entry and readout) and powerful computational decimal system provide high accuracy. In addition to the four basic arithmetic functions, the 1440 has square and square-root functions, and an independent data memory which can store complex equation elements for later recall. The 1440 is also available factory assembled.

LAFAYETTE POLICE & FIRE RECEIVER

Lafayette Radio Electronics Corp. recently introduced a custom-styled 3-band UHF/VHF/IF Public Service communications receiver with crystal control or tunable frequency selection. Designated the Model PF-300, it provides FM...
coverage of 30-50 MHz, 144-174 MHz, and 450-470 MHz segments used by police, fire, and public service utilities, U.S. Weather Bureau, and amateur radio operators. Adjustable broad and sharp selectivity is available on all bands, while 1 µV sensitivity is typical. Features include a multiple selector switch for a choice of two crystal positions on each band, or tunable operation; variable squelch; rear-panel accessories (including tape recording output jack); etc.

COURIER SSB/AM CB TRANSCEIVER

Courier has entered the SSB field with their compact high-performance “Gladiator” trans-

ceiver. High sensitivity and selectivity in both SSB and AM receive modes assure positive pick-up of distant on-channel signals and provide freedom from adjacent-channel interference. A lattice crystal filter in the SSB receive mode virtually eliminates interference, while a mechanical ceramic filter in AM receive performs a similar function.

SONY PORTABLE CASSETTE RECORDER

The Sony Model CF-350 is an extremely compact ac/dc cassette recorder with a combination AM/FM receiver. Introduced by Superscope, the CF-350 features a built-in condenser microphone as well as a microphone jack. It also has differential-balanced flywheels which stabilize the sound quality when recording or playing back, automatic shut-off, and a variable sound monitor which permits the user to adjust the speaker volume without affecting the recording level. The CF-350 Cassette-Corder has a servo-controlled motor which maintains accurate tape speed.

Circle No. 78 on Reader Service Card

CONCORD CASSETTE RECORDER

The newest of the Concord solid-state cassette tape recorders available from Benjamin Elec-
tronic Sound is the monaural Model F-21 which weighs only 3 lb, yet delivers up to 1 watt of high-quality output. The F-21 features pushbutton controls, remote-control microphone, auxiliary input jack, and automatic level control. It has a capstan drive with dual-track recording and playback. A 2½" loudspeaker assures that the recording capabilities of the F-21 are faithfully reproduced during playback.

CIRCLE NO. 12 ON READER SERVICE CARD
Be your own boss. Build your own company.

Earn extra money part time... or start a full time business of your own! Bell & Howell Schools has helped many thousands of people start new careers or businesses of their own in electronics. Earn extra money or start a full time business of your own— with the skills you build through this exciting new Home Entertainment Electronics Systems program from Bell & Howell Schools.

Build yourself a beautiful 25-inch color TV As part of your program, you build and keep a Bell & Howell solid state 25-inch color TV. Not just a kit. A practical, "hands on" project—integrated into your program—that gives you the experience you need with solid state circuitry. You'll enjoy it! And you also build a complete electronics laboratory-in-the-home. See details below.

Detach postage-free reply card and mail today for free information about...

- Solid state Bell & Howell 25-inch color TV Ultra-rectangular 25-inch diagonal with full 315 sq. inch screen. Lets you view more of the transmitted image. 25,000 volts. 45 transistors... 55 diodes... 4 advanced IC's... 3-stage solid state IF... solid state VHF, UHF tuners... automatic fine tuning and many other quality features.
- Design Console Use this to rapidly "breadboard" circuits without soldering. Equipped with built-in power supply... test light... speaker... patented plug-in modular connectors.
- Oscilloscope Portable 5-inch wide-band oscilloscope offers bright, sharp screen images... calibrated for peak-to-peak voltage and time measurements... 3-way jacks for leads, plugs, wires.

- Transistorized Meter Combines most desired features of vacuum-tube voltmeter and quality multimeter. Registers current, voltage and resistance measurements on a large, easily-read dial. Features sensitive, 4-inch jewel-bearing d'Arsonval meter movement.

Consider these special advantages:

Help Sessions We've scheduled "help sessions" every few Saturdays at the Bell & Howell Schools and in many other cities throughout the U.S. and Canada. Top instructors give you expert guidance and you meet other students, too.

Resident Study After you complete your program, you can transfer to any of the resident schools for more advanced study, if you wish.

Lifetime National Placement Service When you complete your course, we help you locate a position in the field of Electronics that fits your background and interests. This unique service is available at any time after you graduate.

Veterans' Benefits We are approved by the state approval agency for Veterans' Benefits. Check the box for details.

Student Financial Aid We are an eligible institution under the Federally Insured Student Loan Program. Check the box for details.

BUILD YOUR OWN BELL & HOWELL 
SOLID STATE 25-INCH COLOR TV!

Not just a "kit"—a complete at-home learning program in home entertainment electronics! You'll enjoy the challenge of this new learn-at-home program from Bell & Howell Schools. Not just a "kit"—a complete learning program prepared by skilled instructors.

Enjoy the personal satisfaction of building your own color TV! You'll find it especially absorbing to build this superb color TV set. And you'll take pride in it because you did it yourself!

Follow simple, step-by-step instructions! This color TV project is part of a complete step-by-step program prepared by skilled instructors. If you'd like some personal advice, attend a special "help session" and meet a Bell & Howell Schools instructor in person!

Master the most up-to-date solid-state circuitry! As color TV moves more and more in the direction of total solid-state circuitry, you'll be thoroughly familiar with the most advanced "troubleshooting" techniques for these sophisticated circuits.

Fix stereo systems...FM-AM radios...phonographs...tape recorders! The thorough knowledge of electronics you gain from completing this course and building your own color TV set will be more than enough to service any type of home entertainment electronic device.

Exclusive Electro-Labs—yours to keep! To make sure you get practical experience with instruments used daily by professionals, we've integrated into your program three precision instrument kits you assemble yourself and keep: a Design Console, an Oscilloscope and a Transistorized Meter.

Check here for information on: 
- Veterans’ Benefits 
- Student Financial Aid

Please send me free information about the solid state color TV kit—and the complete electronics laboratory-in-the-home—I build and keep as I prepare for a profitable TV service business of my own.
Your key to a brighter future in electronics:

the exclusive Bell & Howell Schools Electro Lab®. It’s a complete electronics laboratory-in-the-home you build and keep as you prepare for a new career or color TV servicing business of your own!

For free information about how you can build and keep the Electro Lab—and a 25-inch color TV—detach and mail postage-free card opposite.

Here’s your chance to get into one of the fastest-growing fields in industry today: electronics. Your key to a brighter future is career-oriented training. Find out now how you can get that training from Bell & Howell Schools using the exclusive Electro Lab® electronics laboratory-in-the-home!

Exclusive Electro Lab gives you practical experience at home—two ways! First, you build your home electronics laboratory yourself—with sixteen shipments of top-quality electronic components. As you assemble your lab, you learn electronics theory... build new manual skills... learn how each instrument works so you can maintain and repair it yourself. Second, you actually use your Electro Lab® as the "tools of your trade" while you build your Bell & Howell solid-state 25-inch color TV. You gain experience using these instruments as they’re used daily by professional technicans. And you’ll continue to use them throughout your career.

No need to give up your present paycheck! With your Bell & Howell Schools Electro Lab®, you can prepare for growing opportunities in electronics right in your own home. You don’t have to leave your present job or travel miles to classes. Everything comes to you by mail. You build your own lab... use it to help you assemble a 25-inch color TV... then start a new career or business of your own in color TV servicing.

Here’s what you build and keep:

**Design Console** Use this to rapidly “breadboard” circuits and perform over 300 electronics experiments. No wiring or soldering. You simply plug and unplug modular units to create different circuit designs. The fast, easy up-to-the-minute way to master basic electronics.

**Oscilloscope** This is standard equipment for professionals in electronics. Once you’ve built it, you’ll use it throughout your career. Helps you assemble, wire test and check electronic equipment. Offers bright, sharp screen images calibrated for peak-to-peak voltage and time measurements.

**Transistorized Meter** After you’ve assembled this sensitive instrument, you’ll use it to measure current, voltage and resistance. Registers measurements on a large, easily-read dial. Combines most desired features of a vacuum-tube voltmeter and a quality multimeter. It’s portable, too!

YOU ALSO BUILD AND KEEP A BELL & HOWELL SOLID-STATE 25-INCH COLOR TV.

FOR FREE INFORMATION, MAIL POSTAGE-FREE CARD OPPOSITE
ABC'S OF ELECTRONIC POWER
by Rufus P. Turner

The text in this book clearly explains just what electronic power is and how it is measured. The first chapter deals with fundamental ideas of power in resistive and reactive circuits. Dc power, being much simpler than ac power, is allotted one chapter. Ac power, having the added considerations of power factor, single phase and polyphase, and audio and radio frequency measurements, is given three chapters for discussion.

Published by Howard W. Sams & Co., Inc., 4300 West 62 St., Indianapolis, IN 46268. Soft cover. 96 pages. $3.50.

THE RADIO AMATEUR'S HANDBOOK, 49th Edition

This latest edition of the amateur radio operator's "bible" contains the most extensive revision and update ever attempted. Thirteen chapters have been rewritten to cover new devices and techniques, and the material has been completely reorganized to make individual material easier to find. Among the new sections are discussions of digital logic devices, linear IC's, hf and vhf antennas, broadband amplifiers, filter networks, converter designs, and SSB techniques. A new 28-page chapter on frequency modulation and repeaters is also included, and 200 new drawings and charts have been used to present the current state of the art in all areas of amateur communications.

Published by American Radio Relay League, Inc., Newington, CT 06111. Soft cover. 704 pages. $4.50.

UNDERSTANDING RADIO ELECTRONICS
Fourth Edition
by Milton Kaufman et al

In this extensively revised edition of a popular book, updated to include solid-state concepts, the authors provide complete coverage of the communication electronics field. The book itself is designed for either self-study or classroom use and is specifically written for vocationally oriented high school or community college students with little or no previous training in electricity or electronics. Included are 300 new illustrations and self tests to help students re-
view important material and increase their comprehension.

SHORTWAVE LISTENER’S HANDBOOK
by Norman Fallon

This book offers the beginning listener a complete introduction to shortwave equipment and techniques and many valuable tips for even the experienced SWL. Topics covered include descriptions of the full range of SWL equipment, evaluation of all types of receivers and antennas, tuning and logging stations, coping with listening conditions, hunting weak signals, and getting reception reports, station schedules, and other useful data. The world’s major SW broadcast stations are listed by country and frequency. There is a glossary of SWL terms and a unique selection of 10 do-it-yourself projects complete with parts lists and diagrams.

Published by Hayden Book Co., Inc., 116 West 14 St., New York, NY 10011. Soft cover. 144 pages. $3.95.

COMMERCIAL RADIO OPERATOR THEORY COURSE
by Martin Schwartz

A complete course in radio theory, this book is written in a simple style, supported by numerous diagrams, that requires no technical background. It begins with the basic concepts of electricity, and proceeds to transmission and reception. At the end of each lesson, an exam, based on questions presented in exactly the same manner as they are on the FCC exams, tests the reader’s comprehension of the material covered. Two final exams—one for the First and another for the Second Class license—are also provided.

Published by Ameco Publishing Corp., 314 Hillside Ave., Williston Park, NY 11596. Soft cover. 448 pages. $3.95.

SOLID STATE ELECTRONIC DEVICES
by Ben G. Streetman

Electrical engineers and scientists, as well as newcomers to electronics, constantly need updated understanding of electronic devices. This book provides the background for this type of continuing study. Beginning with second-year college physics, the text develops techniques for keeping up to date on future electronic devices and applications. The reader becomes better equipped to gather new data from current periodicals and professional literature in the electronics field.

AVANTI ANTENNA CATALOG
Avanti's new Citizens Band Communications Catalog features the company's complete line of base station, mobile, and marine antennas, trunk lids and deck mounts, and co-phasing harness kits and accessories. The catalog is in full color, and each entry is fully described both electrically and mechanically. Address: Avanti Research & Development, Inc., 33-37 W. Fullerton Ave., Addison, IL 60101.

STANCOR CROSS REFERENCE GUIDE
The new 64-page Stancor Color and Monochrome Television Parts Replacement Guide is now available from Essex Controls Div. It lists more than 500 Stancor transformers and deflection components for 200 TV receiver brands, providing the technician with replacement data for more than 14,000 original parts. A separate section covers the Stancor line of flybacks, deflection yokes, vertical outputs, filter chokes, power, and output transformers. Address: Essex Int'l., Inc., Controls Div., Stancor Products, 3501 W. Addison St., Chicago, IL 60618.

MOTOROLA HEP CROSS-REFERENCE GUIDE
Approximately 38,000 semiconductor devices are cross-referenced to HEP replacements in the new 1972 Motorola HEP Semiconductor Cross-Reference Guide & Catalog. Included in the listings are 1N, 2N, 3N, JEDEC, manufacturers' regular and special "house" numbers, and many international devices. Some 467 HEP items are listed, including hardware, accessories, technical manuals, and hobby project books. The catalog is free at local HEP dealers, or write to: Motorola Inc., Semiconnector Products Div., 5005 E. McDowell Rd., Phoenix, AZ 85036.

ATLAS SOUND MIKE STAND BROCHURE
A four-page brochure exclusively devoted to its line of microphone stands, stands accessories, adaptors, and fittings has just been released by Atlas Sound. It outlines the functional and mechanical details for 14 commercial and professional floor stand models, 12 desk stands, four boom stands, and more than 50 stand accessories. For a copy of Form 7201, write to: Sales Dept., Atlas Sound, 10 Pomeroy Rd., Parsippany, NJ 08054.

IRC CROSS REFERENCE AND DATA BOOK
The Spring Edition of International Rectifier's "Semiconductor Cross Reference and Transistor Data Book" contains more than 33,000 listings, including 10,000 not previously shown, making it one of the most comprehensive cross-reference books in the industry. Listings include transistors, diodes, zener diodes, capacitors, rectifiers, and SCR's. Copies of the 64-page book, No. JD-431, can be obtained from authorized IRC dealers or by writing to: Semiconductor Div., International Rectifier Corp., 233 Kansas St., El Segundo, CA 90245.

METROLOGIC LASER CATALOG
A new illustrated catalog available from Metrologic Instruments, Inc., lists and describes seven laser models, including a new modulated type, and a wide range of accessories to extend their use for education and research. In addition to six ready-to-use models, the catalog describes low-cost educational kits which capitalize on laser light to teach optics and light theory. Other listings include holographic equipment, laser kits, accessories, and optics bench equipment. Address: Metrologic Instruments, Inc., 143 Harding Ave., Bellmawr, NJ 08030.
**Surplus Scene**

By Alexander W. Burawa, Associate Editor

**IN THE BATTLE FOR FIRST PLACE, THE BUYER WINS**

As electronics hobbyists, we are accustomed to thinking in terms of numbers. We measure parameters which have numerical quantities and design circuits and networks which require manipulations with numbers. But perhaps the most important numbers we deal with are the dollar and cents figures which ultimately control the degree of our involvement in the electronics hobby. To put our designs into practice requires spending our hard-earned cash for parts and equipment. Obviously, the less we spend for a given project, the more projects we can build. It is fortunate that military, government and commercial obsolescence as well as production overruns have created a surplus scene which can save us a great deal of money on parts expenditures.

Keeping abreast of which company happens to hold the number one spot with the lowest price for any given electronic device at any given moment is no easy task. The market is currently so competitive that the dealer with the lowest prices this week may well have the second or even third lowest prices next week. With what appears to be a price "war" on, the buyer—you and I—are the big winners. In the past few months alone, there has been a marked reduction in both unit and quantity cost of various items ranging from transistors, MSI and LSI integrated circuits, and all types of numeric readout indicators to the basic items like resistors, capacitors, switches, relays, transformers, and controls. In some respects, the price reductions have reversed the late inflationary trends of the economy—today, your dollar buys more than it did this time last year, but only if you are a smart shopper.

Some of the most stimulated competition has been in all types of solid-state devices. Among the top contenders for the "mostest for the leastest" are such companies as Solid-State-Systems, Inc. (Box 773, Columbia, MO 65201), B & F Enterprises (Box 44, Hathorne, MA 01937), and Poly-Paks (Box 942E, Lynnfield, MA 01940). All three companies are strong on diodes and transistors but excel in their diversity of IC's especially the 7400 series of digital TTL integrated circuits and their compatible readout indicators.

On the balance sheet, John Meshna, Jr. (19 Allerton St., Lynn, MA 01904) and Delta Electronics Co. (P.O. Box 1, Lynn, MA 01903) are also close contenders for the low-price top spot in the semiconductor area. Their offerings are just a bit less diverse in the very popular digital IC line.

For switches, resistors, potentiometers, capacitors, relays, transformers, and the like, Meshna, Delta, and Poly-Paks seem to share the laurels with the widest assortment of offerings.

For test equipment and communication gear, we shouldn't pass up Fair Radio Sales Co. (P.O. Box 1105, Lima, OH 45802), Surplus Center (P.O. Box 82209, Lincoln, NB 68501) R. E. Goodheart Co., Inc. (Box 1220, Beverly Hills, CA 90213), and Baynton Electronics Corp. (2704 North Broad St., Philadelphia, PA 19132). Incidentally, Baynton stocks perhaps the widest selection of professional commercial test equipment available anywhere.

Now that the trend toward lower parts and equipment prices has been set, can we expect the market to improve even more? The answer is a qualified "Yes." While it is quite possible that the day is not long into the future when you will be able to buy IC's by the dozen, diodes by the hundred, etc., for only a dollar or so, the real improvement will come in the form of state-of-the-art items filtering down to the consumer parts markets.

AUGUST 1972
ELECTRONICS MARKET PLACE

NON-DISPLAY CLASSIFIED: COMMERCIAL RATE: For firms or individuals offering commercial products or services, $1.50 per word (including name and address). Minimum order $15.00. Payment must accompany copy except when ads are placed by accredited advertising agencies. Frequency discount: 5% for 6 months; 10% for 12 months paid in advance. POPULAR ELECTRONICS Including Electronics World
THIS MONTH'S FEATURE ITEM

POCKET CALCULATOR KIT

This is the kit you have been waiting for. So compact it actually fits in your shirt pocket (3 1/16 x 5 1/2 x 1 1/4). It performs every function you would expect a desk calculator for, including constant and chain calculations, and full decimal arithmetic. The unit is powered by two small mercury cell batteries included. To use, it is simply plugged into any standard 120 volt AC socket. A student, engineer, technician, accountant, or bookkeeper will find this kit invaluable. Includes 2 batteries and instruction manual.

Order Code: CALK

Price: $7.50

RECHARGEABLE BATTERY/CHARGER KIT

This option allows the throw away alkaline battery to be recharged with a nickel cadmium and includes a charger to recharge this battery. The unit may be run during the recharge cycle. Also available on request.

Order Code: B/CH

Price: $17.50

LOGICAL AND OPERATIONAL AMP SUPPLIES

We have made an extensive purchase of various brands of operational amplifiers and istoric amplifiers. Each item is available in different forms, with each form having different characteristics. We have made an extensive purchase of various brands of operational amplifiers and istoric amplifiers. Each item is available in different forms, with each form having different characteristics.

Order Code: SASP

Price: $0.00

LIGHT EMITTING DIODES

We have a complete line of the most popular LED's. Suitable for filament-type bulbs. This lamp will withstand a high voltage. This lamp is available in various forms, with each form having different characteristics. We have made an extensive purchase of various brands of operational amplifiers and istoric amplifiers. Each item is available in different forms, with each form having different characteristics.

Order Code: LED

Price: $0.00

HIGH POWER SCR's

SCRs are available for high power applications, motor speed controls, switching circuits, welding equipment, etc. Before using this type of device, it is important to understand the characteristics of the device and its application. It is important to understand the characteristics of the device and its application.

Order Code: HPS

Price: $0.00

SANKEI HIGH POWER, HIGH PERFORMANCE HYBRID VOLTAGE REGULATORS

These hybrid regulators are used to generate voltage by using a combination of conventional voltage regulation circuits and modern high-performance hybrid regulators. The hybrid regulators are designed to provide a high level of performance and reliability. They are available in various forms, with each form having different characteristics. We have made an extensive purchase of various brands of operational amplifiers and istoric amplifiers. Each item is available in different forms, with each form having different characteristics.

Order Code: SHPR

Price: $0.00

ALL ITEMS WHERE WEIGHT NOT SPECIFIED

Shipping charges are $5.00 for the first $100.00 and $1.00 for each additional $100.00 or fraction thereof. For orders under $100.00, add 50% of the freight charge. For orders over $100.00, add 25% of the freight charge.

AMAZING INVENTION!
- Non-Electric!
- Interchangeable Tips – 8 Irons in 1!
- Heats To 862°F Within Seconds!
- No External Heat Of Any Kind!

"Quick-Shot" Cartridge Heated Soldering Iron. Used commercially for years — now available to you for the first time. 1001 uses — Indispensable where electric power is unavailable — where a torch can't be used — anywhere. 8 tips gives you the right tool for any soldering job at 1/3 the price of an additional iron. Cartridge activates in seconds — is non-flammable, non-explosive, emits no fumes, shelf life exceeds 4 years. It's the tool you can't afford to be without. Complete kit includes Soldering Iron, 1/4" Tip, 8 Cartridges — Only $19.95 Postpaid. Send order & payment to Komen Manufacturing Co., Dept. E, 409 Railroad Ave., Westbury, N.Y. 11590.

YOUR Classified or Display Classified Ad in these columns will be seen, read and regularly responded to by America's largest audience comprising Electronics Professionals and Hobbyists. Cost is low, results high (most advertisers repeat 12 times each year). Send copy and payment now to address indicated at beginning of ELECTRONICS MARKET PLACE.

ABOUT YOUR SUBSCRIPTION

Your subscription to POPULAR ELECTRONICS is maintained on one of the world's most modern, efficient computer systems, and if you're like 99% of our subscribers, you'll never have any reason to complain about your subscription service.

We have found that when complaints do arise, the majority of them occur because people have written their names or addresses differently at different times. For example, if your subscription were listed under "William Jones, Cedar Lane, Middletown, Arizona," and you were to renew it as "Bill Jones, Cedar Lane, Middletown, Arizona," our computer would think that two separate subscriptions were involved, and it would start sending you two copies of POPULAR ELECTRONICS each month. Other examples of combinations of names that would confuse the computer would include: John Henry Smith and Henry Smith; and Mrs. Joseph Jones and Mary Jones. Minor differences in addresses can also lead to difficulties. For example, to the computer, 100 Second St. is not the same as 100 2nd St.

So, please, when you write us about your subscription, be sure to enclose the mailing label from the cover of the magazine—or else copy your name and address exactly as they appear on the mailing label. This will greatly reduce any chance of error, and we will be able to service your request much more quickly.

Here's an easy and convenient way for you to get additional information about products advertised or mentioned editorially (if it has a reader service number) in this issue. Just follow the directions below... and the material will be sent to you promptly and free of charge.

1. On the attached postage-free card, print or type your name and address on the lines indicated.

2. Circle the number(s) that corresponds to the key number(s) at the bottom or next to the advertisement or editorial mention that is of interest to you. (Key numbers for advertised products also appear in the Advertisers’ Index.)

3. Simply cut out the card and mail. No postage required.

THE 'STORAGE PROBLEM' SOLVERS
DELUXE MATCHING STORAGE CASES FOR YOUR 12" RECORDS, 7" REELS, CASSETTES AND 8-TRACK CARTRIDGES.

Here's the ideal solution to the problem of keeping all your records and tapes stored neatly, safely, conveniently and attractively. A complete set of matched storage cases, designed by the editors of STEREO REVIEW magazine, for your records and all your tapes: cassette, cartridge and 7" reel. Now you can keep them side-by-side on your bookshelf or cabinet, easy to identify and readily available. These cases are sturdily constructed and covered in a handsome leatherette. The outer case is elegantly embossed in gold and comes in your choice of three popular decorator colors – black, brown and green – so that they lend themselves readily to the decor of any room.

1. (A) 60-unit cassette case.
   13⅛" h. x 12¾" d. x 5¼" w.
   Compartments are tilted back to prevent spillage. Includes pressure-sensitive labels for titling. $14.75 each. 3 for $42.00.

2. (B) 30-unit cassette case.
   13⅛" high x 6½" deep x 6⅛" wide. Tilted compartments, labels included. $8.40 each. 3 for $24.00.

3. (C) 12-unit cartridge case.
   13⅛" high x 6½" deep x 4⅜" wide. Tilted compartments, labels included. $5.25 each. 3 for $13.75.

4. (D) 6-unit 7" reel case.
   8" high x 7½" deep x 5¼" wide. Holds reels in original boxes. $4.75 each. 3 for $12.65.

5. (E) 20-unit 12" record case.
   13⅛" high x 12½" deep x 3½" wide. Holds records in original jackets. $5.25 each. 3 for $13.75.

STEREO REVIEW large capacity storage cases are just what you've been looking for – they're the ideal solution to keeping your records and tapes neatly stored for easy use.

Use the postage-paid order card located at the top of the flap to the right to order your Storage Cases.
To get more from your high fidelity system... put more of yourself in it.

Can the EVX-4 4-Channel Decoder face up to records encoded for Columbia SQ, Sansui, Dyna, and all the rest?

Yes. Listen. Play "their" best demonstration records through the EVX-4 or the E-V 1244X add-on decoder/stereo amplifier.

In most cases you'll hear little or no difference. Some records may even sound better to you through our decoder than through theirs! How can this be? Because you're listening to music... not ping-pong or algebra. And our decoding is basic.

STEREO-4™ decoders can do the best job at the lowest cost for all 4-channel matrix records and FM broadcasts. Not to mention how well they enhance your present stereo records, tapes, and FM.

But don't take our word for it. Listen carefully. Make your own discovery that "their" records can make the best case for "our" decoders!

In these days of instant everything, the idea behind Electro-Voice Custom Loudspeakers is a refreshing change of pace.

The custom loudspeaker concept asks you to do more than buy. It suggests that you participate directly in choosing the very best speaker system for your own special listening needs, speaker by speaker.

There's a complete, logical range of woofers, tweeters, mid-range drivers and accessories. And, with the help of your E-V dealer, you create the performance that suits you best.

You have the option of installing the speakers in new or existing furniture, or building them into walls, closets, or wherever.

Write today for our literature and list of E-V Custom Loudspeaker dealers.
