Reddy Chirra improves his vision with an Apple.

Reddy is an optical engineer who's used to working for big companies and using big mainframes.

But when he started his own consulting business, he soon learned how costly mainframe time can be. So he bought himself a 48K Apple II Personal Computer.

And, like thousands of other engineers and scientists, quickly learned the pleasures of
cutting down on shared time and having his own tamper-proof data base.

His Apple can handle formulas with up to 80 variables and test parameters on 250 different optical glasses.

He can even use BASIC, FORTRAN, Pascal and Assembly languages.

And Apple's HI-RES graphics come in handy for design.

Reddy looked at other microcomputers, but chose Apple for its in-depth documentation, reliability and expandability.

You can get up to 64K RAM in an Apple II. Up to 128K RAM in our new Apple III. And there's a whole family of compatible peripherals, including an IEEE-488 bus for laboratory instrument control.

Visit your authorized Apple dealer to find out how far an Apple can go with scientific/technical applications.

It'll change the way you see things.

The personal computer.

The scope: Tektronix.
The performance: extraordinary.
The price: now just $1100!

The 2213 is the oscilloscope you've been waiting for, from the world's largest and most respected scope manufacturer.

Its advanced design makes possible an unprecedented low price for quality, performance and reliability that are unmistakably Tektronix!

Now, when you order direct via our new toll-free order desk, you can take delivery on this Tektronix oscilloscope for the lowest price ever offered!

The 2213's radical new design includes 65% fewer mechanical parts, fewer circuit boards, electrical connectors and cabling. Result: a lower price for you plus far greater reliability.

Delayed sweep measurements: Standard sweep, intensified after delay and delayed

(need dual time-base performance and timing accuracy to ± 1.5%? Ask about our 2215 priced at $1400.)

Complete trigger system: Modes include TV field, normal, vertical mode, and automatic, internal, external, and line sources variable holdoff

Probes: High performance, positive attachment, 10-14 pF and 60 MHz at the probe tip

The price: Just $1100 complete*.

Introducing the Sinclair ZX81

If you're ever going to buy a personal computer, now is the time to do it.
The new Sinclair ZX81 is the most powerful, yet easy-to-use computer ever offered for anywhere near the price: only $149.95* completely assembled.

Don't let the price fool you. The ZX81 has just about everything you could ask for in a personal computer.

**A breakthrough in personal computers**
The ZX81 is a major advance over the original Sinclair ZX80—the world's largest selling personal computer and the first for under $200.

In fact, the ZX81's new 8K Extended BASIC offers features found only on computers costing two or three times as much.

Just look at what you get:
- Continuous display, including moving graphics
- Multi-dimensional string and numerical arrays
- Mathematical and scientific functions accurate to 8 decimal places
- Unique one-touch entry of key words like PRINT, RUN and LIST
- Automatic syntax error detection and easy editing
- Randomize function useful for both games and serious applications
- Built-in interface for ZX Printer
- 1K of memory expandable to 16K

The ZX81 is also very convenient to use. It hooks up to any television set to produce a clear 32-column by 24-line display. And you can use a regular cassette recorder to store and recall programs by name.

NEW SOFTWARE: Sinclair has published pre-recorded programs on cassettes for your ZX81, or ZX80 with 8K BASIC. We're constantly coming out with new programs, so we'll send you our latest software catalog with your computer.

ZX PRINTER: The Sinclair ZX Printer will work with your ZX81, or ZX80 with 8K BASIC. It will be available in the near future and will cost less than $100.

16K MEMORY MODULE: Like any powerful, full-fledged computer, the ZX81 is expandable. Sinclair's 16K memory module plugs right onto the back of your ZX81 (or ZX80, with or without 8K BASIC). Cost is $99.95, plus shipping and handling.

ZX81 MANUAL: The ZX81 comes with a comprehensive 164-page programming guide and operating manual designed for both beginners and experienced computer users. A $10.95 value, it's yours free with the ZX81.

If you already own a ZX80
The 8K Extended BASIC chip used in the ZX81 is available as a plug-in replacement for your ZX80 for only $39.95, plus shipping and handling—complete with new keyboard overlay and the ZX81 manual.

So in just a few minutes, with no special skills or tools required, you can upgrade your ZX80 to have all the powerful features of the ZX81. (You'll have everything except continuous display, but you can still use the PAUSE and SCROLL commands to get moving graphics.)

With the 8K BASIC chip, your ZX80 will also be equipped to use the ZX Printer and Sinclair software.

**Order at no risk**
We'll give you 10 days to try out the ZX81. If you're not completely satisfied, just return it to Sinclair Research and we'll give you a full refund.

And if you have a problem with your ZX81, send it to Sinclair Research within 90 days and we'll repair or replace it at no charge.

**Does not apply to ZX81 kits.**
Introducing the ZX81 kit

If you really want to save money, and you enjoy building electronic kits, you can order the ZX81 in kit form for the incredible price of just $99.95. It's the same, full-featured computer, only you put it together yourself. We'll send complete, easy-to-follow instructions on how you can assemble your ZX81 in just a few hours. All you have to supply is the soldering iron.

How to order

Sinclair Research is the world's largest manufacturer of personal computers. The ZX81 represents the latest technology in microelectronics, and it picks up right where the ZX80 left off. Thousands are selling every week.

We urge you to place your order for the new ZX81 today. The sooner you order, the sooner you can start enjoying your own computer.

To order, simply call our toll free number, and use your MasterCard or VISA. To order by mail, please use the coupon. And send your check or money order. We regret that we cannot accept purchase orders or C.O.D.'s.

CALL 800-543-3000. Ask for operator #509. In Ohio call 800-582-1364. In Canada call 513-729-4300. Ask for operator #509. Phones open 24 hours a day, 7 days a week. Have your MasterCard or VISA ready.

These numbers are for orders only. For information, you must write to Sinclair Research Ltd., 2 Sinclair Plaza, Nashua, NH 03061.

Tilting the Future

As we write, the New Year is approaching (which will give you some idea about the lead time required to produce a monthly magazine), and a flood of trend information is coming in, as usual. Of course, we've all forgotten what last year's prognosticators had foretold, so we start fresh once again.

According to a recent study by Venture Development Corp. (Wellesley, MA), there's a trend toward a "new practicality" among upscale-income homeowners. Asked to comment on a wide range of products and services, leading the respondents' list of desirable new electronic products was intrusion/burglar alarms (27.6%). This was followed by flat-panel TV with 25.1%, home heating-cooling efficiency control/monitoring (24.1%), and home computers (23.5%). Home entertainment products of high interest following this group were projection TV (16.4%), video recorder (15.6%), and video disc player (11.6%).

If the foregoing national study rings true, we are leaning toward becoming a people who plan to spend more time at home, and would hope to do so as safely, inexpensively, and enjoyably as possible through management of electronic contrivances.

New corporate marketing concepts, too, appear with greater frequency at this time of the year, as most companies make grist for annual sales and stockholder meetings. For example, Texas Instruments announced a change in marketing strategy of its 99/4A home computer away from independent computer stores toward the general consumer marketers, now terming its computer an upscale learning aid. In another marketing move, Apple Computer required its authorized dealers to sign a contract modification prohibiting them from selling Apple products by mail so that the maker can properly support the computers. Dealers who did not sign were assumed to have terminated their dealerships effective December 4, 1981.

And what about the new FCC electromagnetic interference regulations? Did you know that it's easier on commercial/business computers than on home computers? Whereas a business computer need only comply with the FCC requirements, with existing Class A equipment given until October 1, 1983 to do so, Class B home equipment had to be certified by the FCC as of January 1, 1981. (Yes, 1981, not 1982). Compliance means that the manufacturer keeps his test data in the event the FCC wishes to see it, while certification means that the test data be sent to the FCC for approval and the hoped-for issuance of the proper certificate. Also, the FCC might still want to see the equipment before okaying the equipment so that it can be legally sold. Consequently, a "business" computer can get on the market faster than a "home" or "personal" computer. So there's an incentive for some people to call a personal computer a business computer.

Aside from computers, the world of ether has its interesting marketing moves that will influence what people will be viewing and hearing. For example, RCA became an auctioneer at the end of '81. RCA American Communications, Inc., that is. Seven transponders for its not-yet-launched Satcom IV satellite were in the gallery, with 53 bidders competing for a spot that's expected to be operational April 1982. What will this all add to TV programming? We're not sure yet, since speculators can sell their lease to any one they wish (assuming FCC approval that the whole auction is legally real). There'll be more religious programming, it seems, since a religious programmer. Billy Batts, won a transponder-lease bid with $14.1 million.

One never knows when marketing directions will greatly change our lives. A case in point is the development of a microprocessor by Intel Corp. for the now-defunct Busicom desktop calculator. The CPU—Intel's 4004—turned out to be the birth of the microprocessor industry, changing the course of technology. Oh, yes, it all started only ten years ago, with this CPU created by Intel's Marcian "Ted" Hoff, and work guided by Federico Faggin (who later founded Zilog, Inc.). Happy tenth anniversary!

Art Salberg
In a world where sound reaches new levels every day, ADC delivers the ultimate high.

The ultimate high is total control. And an ADC Sound Shaper\textsuperscript{*} Frequency Equalizer lets you control your sound and custom-tailor your music with the mastery of a pro.

And no better way demonstrates the benefits of an ADC Sound Shaper than taping. Even without a studio environment, you can recreate your personal recordings by changing the frequency response curve of the source material — making the sound more like the original and more agreeable to your ears.

Our complete ADC Sound Shaper IC line\textsuperscript{*} has an equalizer that is right for you and your system. The SS-110 ten-band full octave equalizer, a step up from our SS-1, features LED-lit slide controls and one-way tape dubbing. If you desire even more control, our twelve-band SS-II and top-of-the-line SS-III include two-way tape dubbing and sub-sonic filters. Our SS-III Paragraphic\textsuperscript{*} with 24 ancillary switches that enable you to control 36 bands per channel combines the ease and control of a graphic equalizer with the precision and versatility of a parametric. All at a price you can afford.

All of our equalizers feature LED-lit slide controls allowing for visual plotting of the equalization curve. And all ADC Sound Shapers embody the outstanding ADC technology that has made us the leaders in the industry.

To really complete your custom-tailored control-ability, our ADC Real Time Spectrum Analyzer is a must. Equipped with its own pink noise generator and calibrated microphone, the SA-1 provides a visual presentation of the changing spectrum through 132 LED displays. So you can actually see proof of the equalized sound you’ve achieved.

With an ADC Sound Shaper and an ADC Real Time Spectrum Analyzer, you can attain a new level of control. And ultimately, isn’t that the musical high you’ve always wanted?

Sound Shaper\textsuperscript{*} Frequency Equalizers and Spectrum Analyzer

Sound thinking has moved us even further ahead.

Write for a free 24-page booklet, "Shaping Sound at Home: A Guide to Equalization" (a $2.95 value.)

New from NRI!
The first at-home training in videocassette recorder repair with exclusive videotaped lessons.

Learn Video/Audio Servicing... includes RCA state-of-the-art VCR, NRI Action Video lessons, plus full training in color TV and audio repair.
Learn as you work with equipment you keep.

Now, you can learn the hottest, most wanted skill in home entertainment electronics...servicing and repairing videocassette recorders and video disc players. Well over 2 million units have already been sold and the demand is just starting! Already, qualified VCR technicians are in short supply...people are waiting up to a month for VCR repair.

Good jobs at good pay are going begging. And NRI can get you in on the action with convenient and effective at-home training.

Choice of Specialized Training

NRI offers you three Master Courses in Video/Audio Servicing, each complete, each with equipment and training for the specialty you want.

Each course thoroughly prepares you for color TV plus audio and video equipment. Then, you take the specialized hands-on training on the equipment you select.

You can get specialized audio experience as you build your own AM/FM stereo system complete with speakers. Or gain real bench experience with hands-on TV training as you build a 25" (diagonal) fully-computerized, programmable color TV and professional test instruments. Or train with your own RCA videocassette recorder and NRI's exclusive Action Video servicing lessons on videotape.

State-of-the-Art VCR

This modern VCR features high-technology design with electronic pushbutton tuning, remote control, three recording speeds with up to 6-hour capacity, high-speed visual search, built-in clock/timer, memory rewind and audio dubbing capability. Direct drive motors and azimuth recording give outstanding picture reproduction.

It's yours to keep, as part of your training. You'll not only use it to learn operation and servicing techniques, but to play the absorbing NRI Action Video lessons that come as part of your specialized training. In word and picture, you'll learn theory, construction, and service procedures, see them explained in graphic closeups. And you get this unique training only with NRI!

Learn at Home at Your Convenience

No need to quit your job or tie up your evenings at night school. No time away from your family or expensive travel. NRI comes to you. You are a class of one, getting both theory and practical hands-on training backed up by our staff of experienced educators.

NRI the Pros' Choice

More than 67 years and a million and a half students later, NRI is still the first choice in home-study schools. A national survey of successful TV repairmen shows that more than half have had home-study training, and among them, it's NRI 3 to 1 over any other school.

That's because you can't beat the training and you can't beat the value. Only NRI combines exclusive fast-track training techniques with modern state-of-the-art equipment to give you the...
LETTERS

Sources of Learning
The article “Learn More to Earn More” (October 1981) was most revealing and should be of considerable assistance to your readers. One exploding source of learning is the community college. There are some 1,200 of them now, offering scores of programs to train people for jobs in technical fields. There are short courses, degree programs, and weekend offerings. Cost is low and admissions are extremely flexible.—W. A. Harper, American Association of Community and Junior Colleges, Washington, DC.

Obtaining Assistance
Please tell your readers to try the obvious sources (the “Sams Index” and the manufacturer or his authorized service dealer) before seeking space in your “Operation Assist” column. I know you can’t research every request for information that comes in, but a few minutes spent with a “Sams Index” might save space for those of us who really need to find something that is obsolete or rare.—Michael Wilson.

Apple II+ Evaluation
In your evaluation of the Apple II+ personal computer (September 1981), why did your configuration include the use of two RAM cards (the Language System Card and the Microsoft RAM card)?—J. K. Gee, Cerritos, CA.

We only used one RAM card at a time, finding that replacing the language card with Microsoft's RAM card created no problems.—Ed.

Toxic Gas Alarms
The article “Toxic Gas Alarm” (September 1981) contained some information which might mislead some readers. First, methane is dangerous only if present in sufficient concentrations to be flammable (5%) or asphyxiating. Second, there are several components of smoke (including carbon monoxide) to which the TGS is sensitive; and, in fact, if calibrated as prescribed in the article, the sensor will probably sound off in the proximity of a cigarette smoker. The reader should also be aware that there are other common household vapors and gases (created by such things as nail polish remover, hair sprays, etc.) that may cause “false alarms.”—Norman Burnell, President, Electronic Safety Products Inc., Miami, FL.

Correcting Computer Prices
We’re pleased you covered the new Performance Business Machines Corp. CPC-1000 microcomputer in your November “Computer Bits” column. For the record, the price given ($3,450) is for quantities of 1,000, not for a quantity of one, as implied. Actual end-user price will be higher, as distributors will do final assembly and system test at their facilities and will, in turn, sell the machine in smaller quantities to computer dealers and others for retail sale.—Larry Strober, Vice President, Marketing and Sales, Performance Business Machines, San Rafael, CA.

Worth Every Bit of It
Every now and then a single issue of a magazine is worth the subscription price for a whole year. Your December issue qualifies. “The Electronic World” special on Computer Languages is one of the clearest on the subject that I’ve seen. And the Craig Stark comparison of Audio Cassette Tapes was neat and to the point.—Glenn Kirkland, Bethesda, MD.

New DX Listening Schedule
I am very sorry that you have decided to eliminate the Hauser DX column (it was not in December). The English Broadcast columns were especially useful.—Marvin T. Schmidt, Rogers, AR.

The Hauser columns have not been dropped. The English Broadcasts listing will be printed twice a year. (It was in the January issue and will appear again in July.) The regular “DX Listening” column will appear in alternate issues. It is felt that this new schedule will enable us to check and verify listings more accurately and keep them up to date.—Ed.

OUT OF TUNE

In “Melodic Telephone Ringers” (November, p 57), resistor R17 should be 3.3 kilohms in both the Parts List and the schematic. Also on the schematic, the inputs to IC1, the op-lositator, should be pins 1 and 2 not 1 and 3. In “Oscilloscope Time-Base Generator” (November, p 77), the output pins of IC3 and IC4 should be labelled 3 for the first stage of each IC and 11 for the second stage.

CLEAR. QUICK. QUIET.
ALL THREE, ONLY $1,095.*

You get sharp, easy-to-read printouts. You get them fast, over 150 characters per second, from a printer that's loaded with convenience features.

The Heath/Zenith 25 Printer is a heavy-duty, high-speed, dot-matrix printer. It produces up to 300 lines per minute with whisper-quiet smoothness. The entire 95-character ASCII set prints in upper and lower case with descenders, in a 9 x 9 matrix. All functions and timing are microprocessor-controlled.

The features described below tell only part of the story. You have to see it in action to know how good it really is.

Adjustable tractor-feed width with dual sets of tractors for smooth, bi-directional paper movement. Adjustable vertical and horizontal tabs.

Character pitch is hardware or software-selectable at 10, 12, 13.2 and 16.5 characters per inch, for a maximum of 222 characters per line. That gives you great flexibility in setting up forms.

Standard RS-232C interfacing for compatibility with most systems. Also 20mA current loop serial interface.

Uses standard edge-punched papers in single or multiple forms or fanfold.

Character set includes 33 block graphic characters for charts and graphs.

Heavy-duty construction for reliable operation and long life under daily use.

Convenient cartridge ribbon for quick, no-mess replacement.

Completely enclosed cabinet muffles sound for quiet operation.

Software- or hardware-selectable baud rates at 110, 150, 300, 600, 1200, 4800 and 9600.

Special detectors tell you when you're out of paper or when paper jams.

In kit form. F.O.B. Benton Harbor, MI. Also available completely assembled and tested at $1,595. Prices and specifications are subject to change without notice.
**NEW PRODUCTS**

Additional information on new products covered in this section is available from the manufacturers. Either circle the item's code number on the Free Information Card or write to the manufacturer at the address given.

**Ultra-Miniature Cartridges**

Audio-Technica's AT55XE is claimed by the manufacturer to be one of the smallest cartridges made, weighing 2.8 grams. It features a 0.3 x 0.7 mm elliptical diamond stylus and a low-mass tubular cantilever. Tracking force is 1.2 to 1.8 grams. The cartridge mounts on any tonearm with standard 1/2" centered mounting holes. The AT55XE is a moving-magnet cartridge with a frequency response of 15 Hz to 25 kHz, output at 5 cm/s and 1 kHz, 3.5 mV; channel separation (1 kHz/10 kHz), 28 dB/18 dB, and channel balance, 1 dB $52.5.

**Microcomputer Quay**

The Quay Model 500 is a single-board, dual double-density 5 1/4" flexible disk-drive computer that is CP/M based. A single-sided disk has a formatted capacity in excess of 400K bytes. Disk access is under DMA control, facilitating high-speed data transfers and multi-tasking CPU (Z80A) operation. Read-after-write verification is automatically performed on all transfers to the disk units. System support includes serial console (RS232C or 3850) and parallel line printer ports. Memory consists of 32K bytes of dynamic RAM, expandable to 65K. An expansion port supports two additional disk drives. The desktop cabinet is a turnkey operated for system security. $2995.

**Digital Multimeter with Analog Display**

Simpson's Model 467 is a hand-held DMM that has a 22-LCD bargraph to supplement its 3 1/2-digit display. The digital section measures dc voltage from 200 mV to 1000 V, dc current from 200 µA to 2000 mA; ac voltage from 200 mV to 750 V; ac current from 200 µA to 2000 mA; and resistance from 200 ohms to 2 megohms. Each of the ranges encompasses five divisions. Basic accuracy is said to be 0.1%. The analog section is designed for observing trends, peaking, and nulling. Peak-hold accuracy is given as approximately 1% of input. Other features include fast pulse-detection for logic analysis, and a visible/audible continuity indication, i.e., the pulse display is held for approximately 100 ms and is accompanied by a tone. Optional accessories include temperature, r-f, and high voltage probes, Amp-Clamp adapter, and carrying case. $245.

**3-Head Cassette Deck**

Radio Shack is now offering a three-head (ferrite), solenoid-operated cassette deck with double Dolby NR, the Realistic SCT-32. The unit has light-touch controls with color-coded LED status indicators. An automatic record-mute feature works in conjunction with the pause control to permit tape editing. A memory function resets the tape to the desired position, and a timer input permits unattended operation under the control of an external timer (not included). Twin two-color, 14-step fluorescent meters display either the instantaneous signal level, or a real-time view of the highest signal level encountered. A variable bias control and tape selector adjust for normal, chrome, or metal tapes. Specifications: frequency response (metal, ± 3 dB), 30 Hz to 21 kHz, wow and flutter, 0.6%; THD, 0.8%; S/N, 69 dB. $400.

**Etching System**

Stellmaker Enterprises has designed a power etching kit that includes air pump, air disperser, base with support for a 4½-pint plastic tank, and mounting screws and instructions for assembly. The system will etch pc boards up to 6" x 6". The action of the air pump in agitating the acid is claimed to make for faster and more even etching. $34.50. Address: Stellmaker Enterprises, 250 Pequot Tr., Westerly, RI 02891.

**Ear-Hanging Headphones**

Sony's E33 is a set of two individual MDR-type drivers designed to hang from
What makes this radar detector so desirable that people used to willingly wait months for it?

Anyone who has used a conventional passive radar detector knows that they don't work over hills, around corners, or from behind. The ESCORT® radar warning receiver does. Its uncanny sensitivity enables it to pick up radar traps 3 to 5 times farther than common detectors. It detects the thinly scattered residue of a radar beam like the glow of headlights on a dark, foggy road. You don't need to be in the direct beam. Conventional detectors do. Plus, ESCORT's extraordinary range doesn't come at the expense of more false alarms. In fact, ESCORT has fewer types and sources of false alarms than do the lower technology units. Here's how we do it:

**The unfair advantage**

ESCORT's secret weapon is its superheterodyne receiving circuitry. The technique was discovered by Signal Corps Capt. Edwin H. Armstrong in the military's quest for more sensitive receiving equipment. ESCORT's variable-tuned GaAs FET oscillator singles out X and K band (10.525 and 24.150MHz) radar frequencies for close, careful, and timely examination. Only ESCORT uses this costly, exacting component. But now the dilemma.

**The Lady or The Tiger**

At the instant of contact, how can you tell a faint glimmer from an intense radar beam? Is it a far away glint or a trigger type radar dead ahead? With ESCORT it's easy: smooth, accurate signal strength information. A soothing, variable speed beep reacts to radar like a Geiger counter, while an illuminated meter registers fine gradations. You'll know whether the radar is miles away or right next to you. In addition, the sound you'll hear is different for each radar band. K band doesn't travel as far so its sound is more urgent. ESCORT keeps you totally informed.

**The right stuff**

ESCORT looks and feels right. Its inconspicuous size (1.5Hx5.25Wx5D) cigar lighter/power connector and hook and loop or visor clip mounting make installation easy, flexible, and attractive. The aural alarm is volume adjustable and the alert lamp is photoelectrically dimmed after dark to preserve your night vision. And, a unique city/highway switch adjusts X band sensitivity for fewer distractions from radar burglars that share the police frequency while leaving K band at full strength.

**Made in Cincinnati**

Another nice thing about owning an ESCORT is that you deal directly with the factory. You get the advantage of speaking with the most knowledgeable experts available and saving us both money at the same time. Further, in the unlikely event that your ESCORT ever needs repair, our service professionals are at your personal disposal. Everything you need is only a phone call or parcel delivery away.

**Carrying case and visor clip included**

**Carrying case and visor clip included**

**Corroborating evidence**

**CAR and DRIVER**  Ranked according to performance, the ESCORT is first choice. It looks like precision equipment, has a convenient visor mount, and has the most informative warning system of any unit on the market. The ESCORT boasts the most careful and clever planning, the most pleasing packaging, and the most solid construction of the lot.

**FINANCIAL ROUNDUP**  The volume control has a 'silky' feel to it; in fact, the entire unit does. If you want the best, this is it. There is nothing else like it.

**PLAYBOY**  ESCORT radar detectors... (are) generally acknowledged to be the finest, most sensitive, most uncompromising effort at high technology in the field.

**PENTHOUSE**  ESCORT's performance stood out like an F-15 in a convoy of Sabrejets.

**AUTOWEEK**  ESCORT detector by Cincinnati Microwave... is still the most sensitive, versatile detector of the lot.

**The acid test**

There's only one way to really find out what ESCORT is all about. We'll give you 30 days to test it for yourself. If you're not absolutely satisfied, we'll refund your purchase as well as pay for your postage costs to return it. In fact, try an ESCORT and any other detector of your choice. Test them both for 30 days and return the one you don't like. We're not worried because we know which one you'll keep. As further insurance for your investment, ESCORT comes with a full one year limited warranty on parts and labor. This doesn't worry us either because ESCORT has a reputation for reliability. We know that once you try an ESCORT radar will never be the same again. So go ahead and do it. Order today.

**You don't have to wait**

Just send the following to the address below:
- Your name and complete street address.
- How many ESCORTs you want.
- Any special shipping instructions.
- Your daytime telephone number.
- A check or money order.

Visa and MasterCard buyers may substitute their credit card number and expiration date for the check. Or call us toll free and save the trip to the mail box.

Video Cabinet

The Model 2490 cabinet from the Gusdorf Corp. is designed for all 19" sets, plus VCR or videodisc equipment. Doors conceal a storage compartment that can house a collection of software and accessories. The VCR shelf slides out for easy access when loading cassettes or discs. Dimensions are 31 1/2" H x 27" W x 15" D. $87.

CIRCLE NO. 96 ON FREE INFORMATION CARD

Apple Mass-Storage System

The Apple III ProFile Personal Mass-Storage System is a self-contained hard-disk system featuring an intelligent controller, a 51/4" Winchester-type disk drive, power supply, read/write head, interface card, and driver software. It is said to increase Apple III's on-line storage capacity to 5-million bytes—equivalent to the amount of information stored by 35 floppy diskettes. The increased storage capacity, combined with fast access times, permits, among other things, expanded word processing and graphics capabilities, according to the manufacturer. Seven new software programs have been developed to take advantage of the system—including programs in Pascal, Business BASIC, and VisiCalc III. Profile can be used with any Apple III that has 128K bytes of RAM when used with Apple's new operating system, called the Sophisticated Operating System 1.1. Price is $3500 for the ProFile alone; $6990 for the Apple III/ProFile system.

Interface Analyzer

The Model 700 from Electro Standards Laboratory is an interface analyzer designed as a diagnostic tool for use at the standard EIA RS-232 or CCITT V.24/ M1L-188C data interface of modems, multiplexers, terminals, and computers. It monitors all data, timing, and control signals. The Model 700 features tri-state

The printer you always wanted but could never afford,

now you can afford.

Epson.

The most revolutionary thing about the Epson MX-80 isn't the bidirectional printing or the logical seeking function. It isn't even the disposable print head—although that's pretty revolutionary. The most revolutionary thing about the MX-80 is the price. How, you may ask, could a printer that does as much as the MX-80 cost less than $650? Frankly, it wasn't easy. But the MX-80 could only have come from the world's largest manufacturer of print mechanisms. Epson.

The world's first disposable print head. When it wears out, you can just throw it away, because it's one of the least expensive print heads you can buy. And you can change it yourself with one hand.

We spent three long years designing the MX-80 from the ground up to have all the functions people wanted, to be reliable like all Epson Printers, and to be produced on a scale that would allow us to charge less for each one. The MX-80 is our proof that it can be done.

Among its features, the MX-80 prints 96 ASCII, 64 graphic and eight international characters in a tack-sharp 9x9 matrix. It prints bidirectionally at 80 CPS with a logical seeking function to maximize throughput. And it has the world's first disposable print head.

If you've ever wanted a printer that could do it all at a price you could afford, you've got to see the Epson MX-80. Because seeing is believing.

3.7 million reasons why the ATARI Home Computer is something to see. The display screen used with our computers is composed of 192 horizontal lines, each containing 320 dots. Delivering color and luminosity instructions to each dot for a second requires 3.7 million cycles—a lot of work for the normal 6502 processor.

That's why the ATARI computer has equipped its 6502 with its own electronic assistant. It's called ANTIC, and it handles all the display work, leaving the 6502 free to handle the rest. What this means to you is uncompromisingly spectacular display capabilities without loss of computer power needed to carry out the demands of your program.

That's a quality you just don't find in ordinary personal computers. And it's one of the reasons some computer experts say that ATARI computers are so far ahead of their time.

There's more... which is what you'd expect from ATARI.

Language. The ATARI Personal Computer uses several programming languages to give the user maximum control of its extraordinary capabilities. PILOT, Microsoft BASIC®, and ATARI® BASIC are understood and spoken by the ATARI computer. You'll also find our Assembler Editor cartridge indispensable for machine language programming.

Sound. An ATARI computer has four sound generators, or voices, activated by a separate microchip. This leaves the principal microprocessor chips free to perform other tasks. And you can take full advantage of this capability which is designed for easy programming.

Change. ATARI Home Computers have been designed to make change and expansion easy. The ATARI computer has a modular operating system* that can be easily replaced as new technology develops. If you need it, memory expansion requires no more than inserting additional RAM modules. And the ATARI ROM cartridge system also makes it easy to change languages. In short, your ATARI computer won't be obsoleted by future developments because it already incorporates the future.

Sharing. To learn more about the amazing capabilities of ATARI computers, visit your local computer store for a demonstration. Or send for our Technical User's Notes, intended for the serious programmer. They are only $27 and contain a lot more information about our computers' special capabilities than most companies could tell. See your ATARI dealer, or send $30 ($27 plus $3 postage and handling), payable to ATARI, to Technical User's Notes, c/o ATARI Customer Service, 1340 Bordeaux Avenue, Sunnyvale, CA 94086.

1. LEDs to display the polarity, activity, and validity of key interface signals, simultaneously, in red, green, and red-green mixtures. A compartment in the aluminum case holds a folded EIA cable and mini-patch cords. Fifty test points access all 25 pins on each of the DTE or CDE connectors. A reference chart provides a description of EIA/CCITT interface signals. Powered by four 1.5-V AA batteries, the Model 700 is pocket-sized and weighs 15 oz. $275. Address: Electro Standards Laboratory Inc., P.O. Box 9144, Providence, R1 02940

Mini Stereo System

The Rotel Micro 70 comprises a tuner, amplifier, and cassette deck. The amp is rated at 20 W/ch into 8 ohms or 24 W/ch into 4 ohms, with 0.08% THD over a frequency range from 20 to 20,000 Hz. The tuner has a MOSFET front end, and phase-locked MPX circuitry. Also, an illuminated dial pointer and tape monitor switch. The tape deck is metal-compatible, uses Dolby NR, and has a 5-LED/ch peak-level indicator. Record/playback head is laminated high-B permalloy; erase head is ferrite core. Wow and flutter, 0.05%. $360.

25" Color TV kit

The Heathkit GR-2500 color receiver features remote control and on-screen display of channel/time. A PLL Varactor tuning system is said to eliminate noise, contact wear, and the need for channel-to-channel fine tuning. The tuner is capable of receiving 35 CATV service channels and the 82 standard TV channels, as well as off-frequency signals from cable systems, master antenna, or video games. A solid-state automatic fringe-lock circuit is provided for picture stability and fringe-area reception. Digital picture-hold replaces vertical and horizontal customer controls. A comb-filter circuit is said to reproduce up to 330 lines of resolution. The audio section includes two 6" by 9" woofers and two 2" tweeters. The remote control unit (included) has full channel-select, channel-scan, on/off control, and volume adjust, and gives the owner the ability to answer his phone via the optional Space Phone feature. An indicator light shows when the phone is ringing, and an audible ring can be routed through the TV's speaker system. A sensitive microphone is said to permit conversation from anywhere in the room. The kit includes a crosshatch generator for alignment but does not include the cabinet (available separately). $640 (Space Phone: $45).

CIRCLE NO. 99 ON FREE INFORMATION CARD

Radar Detector

The K40 from American Antenna is claimed to detect police radar at a range of 2.96 miles (combined X- and K-bands). The unit may be visor or dash-mounted, attaching with velcro strips. There are separate settings for city (1 mile or less) and highway driving (2 miles or more). A test switch enables a driver to verify that the detector is working properly: a red light flashes and a beeper sounds for ten seconds. The K40 features a waveguide-coupled die-cast antenna said to facilitate radar detection over long distances. Specs: frequency range (X-band) 10.525 GHz ± 100 MHz; (K-band) 24.150 GHz ± 110 MHz; sensitivity, (X-band) 112 dBm W cm; (K-band) 102 dBm W cm; current, 250 mA from 12 V dc. $380.

Save on Scanners! NEW Rebates!

Communications Electronics, the world's largest distributor of radio scanners, celebrates 1982 with big savings on Bearcat scanners. Electro-Communications, the manufacturers of Bearcat scanners is offering consumer rebates on their great line of scanners, when purchased between February 1 and March 15, 1982.

With your scanner, you can monitor the exciting two-way radio conversations of police and fire departments, intelligence agencies, mobile telephones, energy /oil exploration crews, and more. Some scanners can even monitor aircraft transmissions! You can actually hear the news before it's news. If you do not own a scanner for yourself, now's the time to buy your first scanner from Communications Electronics. Choose the scanner that's right for you, then call our toll-free number 1-800-543-BEAR to place your order with your Visa or MasterCard.

We give you excellent service because CE distributes more scanners worldwide than anyone else. Our warehouse facilities are equipped to process thousands of scanner orders every week. We also export scanners to over 300 countries and military installations. Almost all items are in stock for quick shipment, so if you're a person who prefers fast response and who needs to know what's really happening around you, order your scanner today from CE!

FREE Bearcat® Rebate Offer

Get a coupon good for a $50 rebate when you purchase a Bearcat 250 or 20/20. To receive your rebate, simply return your original dated sales receipt and the Bearcat® model number from the carton to your retailer within six to eight weeks. Offer valid only on purchases made between February 1, 1982 and March 15, 1982. All requests must be postmarked by March 15, 1982. You must include a complete household Coupon must accompany all rebate requests and may not be combined with any other offer. Offer valid only in the U.S. and Canada where taxed or prohibited by law. Resellers, companies, clubs and organizations are not eligible for rebate. Employees of Electro-Company their advertising agencies, distributors and retailers of Bearcat scanners will not be sure you receive the correct amount for your scanner. Pay the listed price and keep your receipt since your rebate will be sent directly to you from Electro. Orders received with pre-authorized returns will be processed and will be refunded. Offer subject to change without notice.

Bearcat® 250

List price $429.00/CE $275.20/52.25 rebate Your final cost is a low $254.00 6-Band, 50 Channel, Crystalless, Lights, Scan, Battery Backup, AM/FM Dual Scanning Speeds, AM/FM Dual Channel Access, Frequency Directory, Automatic Lockout. Automatic Squelch, Non-Queelchy Memory. Order your Bearcat® 250 today!

NEW! Bearcat® 350

The Ultimate Synthesized Scanner!

List price $599.00/CE $939.00/$50.00 rebate Your final cost is a low $339.00 7-Band, 50 Channel, AM/FM Dual Scanning Speeds, AM/FM Dual Channel Access, Frequency Directory, Automatic Lockout, Automatic Squelch, Non-Volatile Memory. Order your Bearcat® 350 today!

Bearcat® 300

List price $495.00/CE $349.00/$50.00 rebate Your final cost is a low $299.00 7-Band, 50 Channel, Service Search, AM/FM Dual Scanning Speeds, AM/FM Dual Channel Access, Frequency Directory, Automatic Lockout, Automatic Squelch, Non-Volatile Memory. Order your Bearcat® 300 today!

Bearcat® 160

The least expensive Bearcat crystalline scanner is offered to you at the low price of $299.00 and includes: 7-Band, 16 Channel, AM/FM AC Only, Frequency Directory, Dual Scanning Speeds, Direct Channel Access, Automatic Lockout, Automatic Squelch. The Bearcat® 160 is the least expensive Bearcat crystalline scanner on the market today. This scanner is for those who wish to go to a different scanner without the worry of losing the original unit. No knobs to turn; instead, finger-tip pads provide control of all scanning operations.

NEW! Bearcat® 10

The first new Bearcat® scanner in three years. Before another year of orders due to the high demand for this product, the Bearcat® 10 was completely revised. 6-Band, 16 Channel, AC Only, PriorityScan, Dual Scanning Speeds, Direct Channel Access, Frequency Directory, Automatic Lockout, Automatic Squelch. The Bearcat® 10 is the least expensive Bearcat crystalline scanner and is priced to knock out of any band for more efficient service search.

Bearcat® Four-Six ThinScan

List price $524.00/CE $310.00/50.00 rebate Your final cost is a low $214.00 4-Band, 6 Channel, AM/FM Dual Scanning Speeds, AM/FM Dual Channel Access, Frequency Directory, Automatic Lockout, Automatic Squelch. The Bearcat® 4-Six ThinScan is a breakthrough in crystal controlled electronics. Unique Automatic Peak Tuning Circuit adjusts the receiver filter for maximum sensitivity across the entire UHF band to allow maximum selection of CW, PHONE, and SSB signals. Bearcat® 4-Six ThinScan includes rubber dual microphones. 4-Band model MEWS-5, 440-512 MHz, 2 x 8 x 11 x 9. Includes rubber dual microphones.

Bearcat® Four-Six Slimline-HL

List price $169.00/CE $102.00/24 rebate Low Cost 4-Band, Channel Scan, AM/FM Dual Scanning Speeds, AM/FM Dual Channel Access, Frequency Directory, Automatic Lockout, Automatic Squelch. The Bearcat® Four-Six Slimline-HL is a great addition to the family of crystal controlled scanners. This unique Automatic Peak Tuning Circuit adjusts the receiver filter for maximum sensitivity across the entire UHF band to allow maximum selection of CW, PHONE, and SSB signals. Bearcat® Four-Six Slimline-HL includes rubber dual microphones. 4-Band model MEWS-5, 440-512 MHz, 2 x 8 x 11 x 9. Includes rubber dual microphones.

Increased Performance Antennas

Test your scanner by comparing the utility of the antenna that comes with your scanner to a new antenna that we carry. It is your right to compare the antennas that are included with your scanner to those that we carry. We have six bands on mobile antennas specifically designed for scanning applications, two bands on our magnet mount mobile antenna. Order #A61 is a magnet mount mobile antenna. Order #A62 is a truck mount mobile antenna. Order #A63 is a 4-inch snap mount, and #A70 is an all band base station antenna. Price: #A63 is $35.00 and $3.00 for UPS shipping in the continental United States.

Purchase with confidence

To get the fastest delivery of your scanner, you must send your order directly to our Scanner Distribution Center. Be sure to calculate your price using the CE prices in the last column. Michigan residents add 4% sales tax. Within six months of purchase, orders are accepted from approved government agencies, armed forces, and any charitable organizations. 4% sales tax on net 10 billing. All sales are subject to availability. Acceptance and verification. All sales on accessories are final, no returns allowed. Orders are subject to change without notice. Out of stock items will be placed on backorder automatically unless CE is notified differently. Most products that we sell have a manufacturer's warranty. Where not included, we are happy to provide an extender warranty. If you are interested in purchasing by written agreement, international orders are invited with a $20.00 surcharge for special handling in addition to shipping charges. All shipments are FOB Ann Arbor. Michigan No COD or outside of the United States, Resellers and distributors are invited to order our Bearcat® rebates list! You can buy these incredible bargains through Fotomat's Movies-By-Mail, a brand new club dedicated to bringing you hit films on videocassette at the most rock-bottom prices you've ever seen. In fact, at 50-60% off the regular retail price.

Our movies are from Fotomat's enormous rental inventory, a film library bigger than any other national club. These previously-rented movies are guaranteed to be top-quality and in excellent condition. If you're ever not completely satisfied with a movie, you may return it within 15 days for a free replacement.

Fotomat is able to make this offer because of our unique position as America's only national videocassette rental library. We are your best opportunity to save hundreds of dollars while building your own home video library at prices that can't be beat.

Here's how Movies-By-Mail works:

You select 2 titles for only $29.90 the pair (plus $3.95 postage and handling). And you simply agree to buy 4 more movies over the next year—at prices starting as low as $19.95 each.

Every 6 weeks you'll receive a free list of movies to choose from. Coming up, we have [94], The Blues Brothers, The Incredible Shrinking Woman and Dracula, among many others.

Ordering is quick and simple: just call Movies-By-Mail toll-free at 800-345-8500. (In Pennsylvania: 800-662-5180.) And we'll send your movies out immediately.

Or, you may handle all your transactions by using the order forms available to members.

So check off the two hits you want and fill out the coupon below. You'll be on your way to saving big bucks on the best movies.

Which will really make these hits something to remember.

---

Yes, please enroll me in Fotomat's Movies-By-Mail Club and rush my 2 introductory movies listed below. As a member of the Club, I agree to purchase 4 more movies during the next year.

Live Recording Revisited

By Ivan Berger

Back in the days when tape decks still had tubes, I used to do a lot of live recording. My activities were semi-professional, and so was my equipment: a Premier Tapesonic tape deck (half-track stereo at 15 ips on 10 1/2-inch reels), an Ampex mixer, and a variety of low-impedance mikes (mainly Shure, Electro-Voice and Bang & Olufsen, with one Sony condenser).

But now the Premier is ailing, the Ampex is in storage and most of my microphones have been ripped off. So when a cellist friend, Chase Morrison, asked me to tape her recital the other night, I had to scramble together the equipment I had handy: an Akai GX-F95 cassette deck, an Aiwa CM-30 stereo electret microphone, a pair of AKG K340 headphones, and a couple of extension cords. (Bringing the cords was the most important thing I learned in my early recording days.)

One difference became noticeable as soon as I headed out the door: a transistorized cassette deck, even a feature-packed one like the Akai, is only about one-third the weight of a big, tube-operated open-reel deck. I was lucky, though, that I had a suitable Akai's size—home tape decks don't have handles like the ones designed specifically for field use.

The mike caused the biggest hassle when I got to the hall. Not that it didn't sound good—it did. But it's designed for handheld or tabletop use with Aiwa's TP-3S0 portable stereo cassette recorder, not for this kind of recording situation. The first problem came when I tried to put it on a mike stand—there were no holes threaded for one. When I tried to clamp it to a mike stand, I discovered that this microphone has almost no vibration shielding (there isn't room for much since it's the smallest stereo mke made) and rigid attachment to a stand would make it pick up every footstep and floor vibration. Since it has a small table stand built in, I set that on a beanbag (for a bit of height) and a sponge (for isolation); that worked fine.

Again, because it was designed for use with a handheld recorder, the mike's cord was only about four feet long. But I had no time to wire up extension cables, nor even any idea how many feet I could extend them without getting into hum problems or high-frequency losses (probably not too bothersome, though, with a mike impedance under 1,000 ohms). So I was forced to keep my tape deck within four feet of the mike—which meant I had to put it on stage.

In the old days, working with very low mike impedances and balanced (separate-ground) lines, I'd have only put the mikes on stage, and run a hundred feet or so of cable to some off-stage nook where I could work inconspicuously. Now I could only be inconspicuous if I wasn't there, which meant setting levels at the start of the concert and only sidling up to start and stop the tape between pieces.

Two modern design trends helped me there. One was that, instead of my Tapesonic's thin, black VU-meter needle, the Akai had a fluorescent bargraph recording-level display. This made it possible for me to read my levels from more than 30 feet away. Two aspects of this "meter" were especially helpful: The display spots changed color above 0 VU, so I could tell at a glance when my peaks went that high. And a peak-hold feature kept the highest peak illuminated for a second or two; so I didn't have to watch the display like a hawk, but could just look up immediately after hearing each peak.

It also helped that the Akai's dynamic range is wide—not that different, in fact, from my big machine of 15 years ago. (It's rated at 61 dB on chrome tape without Dolby, plus an additional 10 dB above 5 kHz when Dolby's switched on—as it naturally enough.) With a less dynamic range, I'd have had to stay right at the controls, "riding gain" as the music got louder or softer. As it was, I had to arrive early enough for Chase to bring her cello out on stage and give me a one-minute recital so I could preset my levels—but that would be good practice even if I could be right at the controls to ride gain.

The other modern design trend I referred to above was the use of color-coded, illuminated transport control buttons. Thanks to them, when I got nervous about whether I had, indeed, remembered to push both buttons and release the pause switch at the start of the piece, I had only to glance up and see one red and one green button glowing to know that I had.

One aspect of the Akai's controls got in my way in the recording. But that's not so much the machine's fault as mine, for going out into the field with a machine designed for living-room use. The GX-F95's designers wanted it to be a living-room showpiece, as un-mechanical-looking and sleek as it could be. So they covered the tape compartment with one smooth, unbroken panel, and recessed most of the controls behind another one, leaving only the electronic displays and control buttons visible.

Even at home, I find covering up the cassette window makes a lot of sense. Once you've used them to match the deck to your favorite tapes (automatic on the Akai) and so set the line input level to match your system's tape output, you'll rarely need them. So why not cover them up?

In the field, though, some problems arose. The microphone's input level controls are the concentric, cluched-together type. This makes it easy to turn the gain up and down for both channels at once, but makes it a little hard to adjust one relative to the other—especially when the hands and cords are as here. My semiprofessional deck's controls were all big, black, separate knobs—and even then, I quickly replaced them with even bigger, color-coded ones.

The AKG phones worked out fairly well, too. They have a very true sound and wide frequency response. They also have better isolation than any other phones I use. That's doubly important in performance recording, since you can't really monitor recorded sound unless you eliminate outside sounds and you don't want the sounds inside the phone to leak out and distract the audience or performers. My only reservation about the AKGs is low efficiency—few recorders have enough headphone-output power to drive them loudly when the signal levels get low. (On my '50s semi, I found a big headache problem: since the Tapesonic had no headphone output at all, I'd added a Shure headphone amplifier, which had plenty of gain.)

How did the tapes sound? A wee bit hissier than the best of my old 15-ips ones, but less hissy than the worst—which makes me wonder how good one of today's 15-ips machines would be. There was no overload distortion whatsoever; that and the hiss suggest I set my levels too cautiously. With the controls out of reach, though, I had little chance to adjust things during the performance. I also had trouble balancing the cello and piano—if only I'd had transformers handy to use with my B&O crossed-ribbon stereo mike, I could have solved that problem, and gotten my tape deck off stage to boot. If I'd had time to tape the previous night's rehearsal, I'd have found and corrected both problems.

On the whole, though, I'd call the session a success—today's home gear matches 10-year-old semi-professional equipment in performance, if not always in convenience.
ILP Audio Power Amplifier Module

T he ILP MOS200 is an integrated, encapsulated power-amplifier module that, when operated from a ±55-V supply, can deliver 120 W to an 8-ohm load with harmonic and intermodulation distortions typically less than 0.006%. Its rated frequency response (at the −3-dB points) is 15 Hz to 100 kHz. An input of 500 mV is required for rated power output, and the input impedance is 10 kilohms. The amplifier can be used with loads of 4 ohms or higher, although its ratings apply only to 8-ohm operation.

The MOS200 is 3" square and 4.7" deep (much of the latter due to integral heat sinks). It weighs about 2 lb. Since the MOSFET output stages are inherently immune to thermal runaway problems and have no internal current limiting or other protective circuits, the amplifier should be used with external fuses in the power-supply leads to protect itself and the speakers from damage in the event of a mishap.

The ILP MOS200 modules are priced at $129.95 each. They are manufactured in Great Britain and distributed in the U. S. by Gladstone Electronics, 901 Fuhrmann Blvd., Buffalo, NY 14203.

General Description. The ILP MOS200 is one of a series of modular power amplifiers designed to permit assembly of a high-quality, high-power amplifier (in a format of one's own choosing) at a moderate cost. The importer carries suitable power-supply components, chassis and panel assemblies, and modular preamplifiers for assembling a complete amplifier.

Another application for these modules is to up-date an existing amplifier if the latter's power supply is adequate. The MOS200 requires a split power supply delivering equal plus-and-minus voltages (nominally ±55 V, and not to exceed ±60 V). Since all the amplifier components and wiring are within the encapsulated body, the external connections (to solder pins extending from the rear of the epoxy body) consist only of the plus and minus dc connections, signal input and output terminals, and a ground terminal. The amplifier must be connected using a “star ground” technique to avoid ground loops. This requires that all “0-V” connections, both of signal and power leads, and including the speaker return leads, be made at a single point at the power supply.

The recommended dc supply fuses are 2.5-A quick-blow types. These are adequate for high listening levels and will withstand full power peaks for the brief periods during which they occur, yet will protect almost any speaker of nominal 8-ohm impedance against an amplifier or power-supply fault that could place a high dc voltage across the output terminals. Although the amplifier has a 100-V input blocking capacitor, the rest of the circuit is direct-coupled.

The MOS200, having a large heat sink integral with the amplifier module, requires only the free circulation of air vertically through the fins for safe operation. In confined spaces, or when high average power levels are to be used, a cooling fan may be required.

Laboratory Measurements. We installed a pair of ILP MOS200 modules in the cabinet of an older (and obsolete) amplifier whose power supply was able to deliver ±55 V under load. The modules were entirely within the cabinet, but the fan that had been a part of the original amplifier provided internal air circulation. Every effort was made to observe the correct grounding techniques during the conversion.

Since the MOS200 is sold singly, we drove only one channel at a time. (Only the power supply would have been stressed by simultaneous operation of both channels.) Although the modules are not rated in accordance with FTC requirements, we preheated them for one hour at ½ rated power and five minutes at full power. The heat-sink fins never became too warm to touch.

Our initial tests produced disappointing distortion readings, far higher than the published ratings. We found that the amplifier was oscillating (at about 4 MHz) with an output rms amplitude of about 1 V. The total harmonic distortion (THD + N) reading was about 1% at most power levels. Some experimenting with grounding of the signal circuits and bypassing of the power supplies had no effect on the oscillation. However, reducing the supply voltage to less than ±40 V eliminated it entirely.

We therefore made two sets of distortion and power measurements, using supply voltages of ±55 V (HI) and ±35 V (LO). Both modules we tested had essentially similar performance, but we cannot overlook the possibility that the power supply and grounding configuration of our test setup (which could not be conveniently modified) was contributing to, or even causing, the instability.

The 1000-Hz clipping power output into 8 ohms was 136 W (HI) and 57 W (LO). The former corresponds to an IHF clipping headroom rating of 0.54 dB. Clipping headroom could not be measured with lower load impedances at the HI voltage, due to blowing the dc power supply fuses; but into 4 ohms, the LO clipping output was about 86 W. The dynamic power output was measured with 20-millisecond bursts of 1000 Hz, in accordance with industry standards. The low duty cycle (two bursts per second) made it practical to measure the clipping output into low load impedances with this signal. The maximum dynamic power into 8 ohms was 129 W (HI), for a dynamic headroom rating of
Harmonic distortion at three power levels with ±35-V power supply. Rated power assumed to be 50 watts.

Harmonic distortion at three power levels with high (±55 V) power supply.

Distortion for LO and HI power supply levels at 1000 Hz.

0.3 dB. With the LO voltage, it was 60 W. Into 4 ohms the HI and LO power outputs were measured at 209 and 85 W respectively; and into 2 ohms, the burst waveform clipped at 290 and 129 W.

At the rated 120 W output into 8 ohms (HI), the distortion was between 0.8 and 1% from 20 to 20,000 Hz and did not vary significantly at lower power levels. With the LO supply voltage, the distortion was about 0.35% at 20 Hz, falling to less than 0.06% in the 700-to-2000-Hz range and increasing to about 0.1% at higher frequencies. As before, the distortion was not materially different at reduced power outputs.

At 1000 Hz (LO voltage) the distortion fell linearly from 0.6% at 0.1 W to 0.055% at 50 W, just before clipping occurred. With the HI voltage the distortion was about 1% up to 25 W, rising to 2% at 125 W. The amplifier was stable with a reactive load simulating a loudspeaker, which introduced a slight overshoot and ringing on an otherwise nearly perfect square-wave output.

The low-level frequency response was down 0.6 dB at 30 Hz and 50 kHz, and −3 dB at 14 Hz and 135 kHz. The IHF slew factor was about 10, with the output waveform becoming slightly triangular at about 200 kHz when the amplifier was driven with a "full power" input signal. The input sensitivity was 43 mV for a reference output of 1 W, and the A-weighted output noise was −68 dB referred to 1 W with the input open-circuited. With the standard 1000-ohm input termination, the noise reading was −54.5 dB.

User Comment. We can assume that the high-frequency oscillation we experienced with the MOS200 modules was not necessarily typical or even inherent in the units themselves. Time limitations prevented us from experimenting with different wiring and grounding configurations, which might have corrected the problem.

Ignoring that factor, the MOS200 clearly represents a simple and direct method of obtaining a high-power, high-quality audio power amplifier. It should be especially attractive in cases where an older solid-state amplifier with a suitable power supply is due for replacement since the supply can be used as we did in our test set-up. However, we suggest taking great care to maintain a "star ground" configuration, and it would be advisable to monitor the amplifier output with an oscilloscope to check on its freedom from oscillation. (In our case, the "distortion" was not really audible as such when the oscillation was present, but it seems pointless to invest in amplifiers of this caliber and not obtain the full performance of which they are capable.) The oscillation could be seen at a rather low amplitude even on a narrow-band (500-kHz) scope, but was shown in its full proportions on a wide-band scope, which also enabled its frequency to be determined.

If the available power supply has less than the ±55-V nominal rating of the amplifier, there is no harm in using a lower voltage, except that the amplifier's capability will not be completely utilized. A lower-power version of the amplifier module (the MOS120) is available for ±45-V operation at about ½ the price of the MOS200. Judging from the dynamic power measurements we made on the MOS200, the ILP modules have exceptional current output capability, and should be able to drive the lowest load impedances one will ever encounter in a home music system to a satisfactory level.

For the user who is "starting from scratch," a complete ILP amplifier can be assembled from the power-supply component kit, a pair of MOS200 modules, and a rack-mount chassis/cabinet, for about $410.—Julian D. Hirsch
TalkTalk

Do you remember the CB fad? Six years ago Americans jammed the air waves as everybody discovered the fun of personal communications.

But like all big fads, CB soon died. People hung up their mikes and gave CB back to the truckers who started the fad in the first place.

The personal communications fad is now back with an entirely new concept. TalkTalk is a headphone with a boom mike that lets you talk hands-free with someone else blocks away. Your voice activates a transmitter. When you stop talking, the transmitter automatically shuts off and you receive. The transmitter, receiver and power supply are located in a small case thinner than a pack of cigarettes which you wear clipped to your belt or placed in your pocket.

SAFER THAN HEADPHONES

You hear the receiver through an adjustable headphone which you comfortably wear over your right or left ear. This leaves one ear free to hear the sounds around you—much safer for outside activities than the popular stereo headphones.

You can now communicate, hands-free and in safety, while you cycle, hike, jog, work or play for up to one-half mile and all on a single 9-volt battery that lasts up to 8 hours of typical use. But there's much more.

An antenna circles the headphone so there's no ugly wire protruding from the top of your head and you keep your conversations private because the range is reduced to a block. But if you want to reach out to the unit's half mile range, simply unhook the antenna wire from its clamp and presto, you have an ugly wire protruding from the top of your head.

UNIT CAPTURES SIGNAL

TalkTalk was built in Japan with the same technology used in professional communications systems. For example, the system uses frequency modulation (FM) as opposed to the amplitude modulated signal used in CB. CB frequencies tend to get crowded— with powerful stations often talking on top of each other.

Not true with FM. The system's FM receiver uses a “capture effect,” to reject all other signals letting you hear only the one signal closest to you. You capture a clear, crisp, easy-to-hear transmission. And since the Federal Communications Commission has set the TalkTalk's frequency of 49 megahertz for 100 milliwatt maximum power, no other higher power station will bury you. But wait, there's even more.

A voice-activated sensitivity switch lets you adjust your boom mike for all outside noise conditions—low for a motorcycle and medium or high for a bicycle. And a two-staged volume control lets you securely adjust the volume level with no fear of accidentally moving it.

You can keep the system's 6-ounce case in your vest pocket or clip it to your belt with its removable pagers-style clip. In fact, even the case is impressive. It's a heavy-duty device that can be slipped off when you want to keep the unit in your pocket.

The boom portion of the mike is malleable. That means you can bend it in any direction and it will stay there. Wear the mike close to your mouth, far away, or even bend it out of the way completely.

Use your imagination. We used ours and came up with over 100 activities that make the TalkTalk useful or fun. Sure, the obvious ones like cycling, hiking, sports, work and play came easy. But how about using a pair in a shopping center to keep in touch? Or how about keeping in contact with your home while you walk the dog? TalkTalk can be used for outdoor treasure hunts, or by tour directors and ski instructors. The list goes on.

PLENTY OF UTILITY

And don't forget the surprise of contacting someone else on a TalkTalk like you used to on CB. If enough people use them, you'll be able to ride your bicycle down a path and meet other TalkTalkers as well. There are five separate channels to choose from. If you order a pair, we'll send you a matched frequency set. To order more on that frequency simply specify the frequency on your reorder form.

TalkTalk is manufactured by Standard Communications—an established manufacturer of professional two-way communications systems—assurance that your modest investment is well protected. The TalkTalk was designed for rugged use but if service is ever required, Standard's convenient service-by-mail center is as close as your mailbox.

To order your TalkTalk, send a check for $119.95 per unit ($239.90 per pair) plus $4.00 postage and insured delivery to the address below. Illinois residents please add 6% sales tax. Credit card buyers may call our toll-free number below. We'll send your TalkTalk complete with one 9-volt battery, headphone, transmitter/receiver, boom mike and complete instructions along with a one-year limited warranty.

GIVE IT A WORKOUT

When you receive your unit, really give it a workout. See how far you can transmit with the antenna up or down. Use it in a shopping center, on a bike ride or in your factory. See how comfortable it feels and how safe you feel with one ear free to hear outside sounds. Then decide if you want to keep it. If for any reason you are not satisfied, return your unit in its original condition within 30 days and we'll refund your money in full including $4.00 postage and handling.

Every once in a while we discover a product that really is fun yet opens up a new dimension in convenience and utility. The TalkTalk is just that product. Order a pair at no obligation, today.

TalkTalk

The world's first hands-free consumer mobile communication system lets you keep in touch while on the go.
THE BYTE BOOK OF PASCAL. Edited by Blaise W. Liffick. 340 pp., illus. In this timely book you get up-to-date Byte articles on the subject—from a general introduction to system hardware—from top experts in the field. Includes two versions of a Pascal compiler—one written in BASIC and the other in 8080 assembly language—a 9-digit interpreter written in both Pascal and 8080 assembly language Pascal vs. COBOL a chess-playing program—an APL interpreter, and more. 789/673 Pub. Pr., $29.95 Club Pr., $22.50

MICROPROCESSORS AND LOGIC DESIGN. By Ronald L. Krutz. 467 pp., illus. First microcomputer designed for practicing engineers. This logically organized book provides a thorough understanding of microcomputer hardware, fabrication technology, software, and interfacing. 582349-7 Pub. Pr., $27.95 Club Pr., $21.50

A book that takes software and hardware out of their respective pigeonholes...and describes their interaction with the thoroughness of an encyclopedia! You'll find this is a thorough and valuable integration of data processing's "two worlds" and their fascinating relationship. 582208-3 Pub. Pr., $24.50 Club Pr., $18.95

DATA STRUCTURES USING PASCAL. By Aaron M. Tenenbaum and Moshe J. Augenstien. 544 pp., illus. This book's emphasis on structured design and programming techniques, this definitive work takes you on a trailblazing journey through Pascal. Separate chapters are devoted to the stack, recursion, queues and lists, Pascal list processing, trees, graphs and their applications. 582230-X Pub. Pr., $32.95 Club Pr., $18.50

COMPUTER DICTIONARY AND HANDBOOK. By Charles and Robert Supp. 624 pp., illus. This handy reference guide defines and explains a wide range of computer procedures, products, problems, and applications. Appendices provide a state-of-the-art guide to essential computer concepts. 582073-X Pub. Pr., $29.95 Club Pr., $14.95

ENCYCLOPEDIA OF COMPUTER SCIENCE. Edited by Anthony Ralston and C. L. Meek. 1,500 pp., 60 illus., 100 charts, 7 x 10 format. This first and only in-depth coverage of the entire field of computer science in a single volume is comprehensive and completely up-to-date. 769/01X Pub. Pr., $60.00 Club Pr., $39.95

Choose any one of these books at the special club discount, and select any other as your gift Free of Charge when you enroll

Why YOU should join now!

• BEST AND NEWEST IN YOUR FIELD — Books are selected from a wide range of publishers by expert editors and consultants to give you convenient access to the best and latest books in your field.

• BIG SAVINGS — Build your library and save money too! Savings ranging up to 30% or more off publishers' list prices — usually 20% to 25%.

• BONUS BOOKS — You will immediately begin to participate in our Bonus Book Plan that allows you savings of between 70%-80% off the publishers' prices of many professional and general interest books!

• CONVENIENCE — 12-14 times a year (about once every 3-4 weeks) you receive the Club Bulletin FREE. It fully describes the Main Selection and alternate selections. A dated Reply Card is included. If you want the Main Selection, you simply do nothing — it will be shipped automatically. If you want an alternate selection — or no book at all — you simply indicate it on the Reply Card and return it by the date specified. You will have at least 10 days to decide. If, because of late delivery of the Bulletin you receive a Main Selection you do not want, you may return it for credit at the Club's expense.

As a Club Member you agree only to the purchase of 3 books including your first selection during your first year of membership. Membership may be discontinued, by either you or the Club at any time after you have purchased the first selection plus 2 additional books. Orders from outside the U.S. cannot be accepted.

Other McGraw-Hill Book Clubs:
Accountants' and Controllers' Book Club • Architects' Book Club • Chemical Engineers' Book Club • Civil Engineers' Book Club • Electronics and Control Engineers' Book Club • Mechanical Engineers' Book Club

DICTOGRAPH, the producer of communication systems for The White House and Pentagon, introduces The Phone Controller. If you value your time and spend more than 5 minutes a day on the phone, prepare yourself for a welcome surprise.

Like only a few of the better dialers selling at twice the price, this compact brain stores 30 frequently dialed numbers in its memory for instantaneous dialing at a single touch. But that's only the beginning.

**Ends busy number frustration.**
Imagine this: if you reach a busy number, simply let The Phone Controller redial the number automatically, once a minute up to 14 times, until your connection is made.

The Phone Controller does all the work. You just pick up the receiver when you hear the voice of the person you are calling on the built-in speaker. You can also redial manually, as often as you like, using the speed redial key. There's more.

**Quartz clock, stopwatch timer.**
Each number dialed, whether by you or The Phone Controller, appears in a large bright LED display, which otherwise shows the time of day in hours, minutes and seconds. The stopwatch feature times all outgoing calls automatically and can even time a particular part of a call. This is great for keeping track of long-distance expenses or improving your time management.

**Built-in speaker.**
You don't have to pick up the phone to dial. Just push the right key and listen for the other person's voice or a busy signal on the speaker—before you even touch the phone receiver. The speaker also allows group listening, if desired.

**1-800-227-1617**
Displays numbers dialed on large bright LED display

**3-HOLD**
Places call on hold while the word "HOLD" flashes on the display

**2:45 PM**
Quartz clock is displayed when your phone is not in use. Automatically times outgoing calls

**Single or multi-line.**
The Phone Controller adds a hold feature and touch dialing to any phone, home or business. You get advanced features without adding a penny to your monthly phone bill. A three position pulse switch allows connection to any phone system in the world, single or multi-line.

The Phone Controller will also access computers and toll services such as Sprint, MCI, and others.

Simple installation procedures provide for single or business multi-line connection.

**A $119 miracle.**
The most remarkable feature of The Phone Controller is its price: just $119. Even at twice the price, there's nothing else like it! The Phone Controller is manufactured to the highest standards in the United States by a leader in the communications field—DICTOGRAPH. The system is complete with simple instructions. AC adapter, 90 day warranty and service (if ever needed) is readily available.

**Now for multi-line use!**
For use with multiple-line office phones, add only $16 for adapter.

**Two week - trial.**
Try it out first, at our risk. See for yourself! If you're not positively impressed within two weeks, simply return it at no prompt, courteous refund.

**ORDER NOW TOLL FREE**
Order product #17 VISA / MasterCard customers may use 24 hr toll free number. Or send $119 check plus $3.50 shipping. (Add $15 if multi-line adapter ordered.) Wash. residents add 6 4% tax.

Panasonic Model CT-3031
13" Color TV Receiver

THE model CT-3031 from Panasonic is a 13" color receiver that features a brand new 90° cathode ray tube and an independent picture/sound tuner that can be removed from the cabinet and used as a remote control. The set has quartz-synthesized and phase-locked-loop tuning. A ColorPilot double-pole switch automatically controls tint, color, brightness, and contrast; it is also tunable when engaged. Dimensions are 14"H × 20"W × 15½"D; weight is about 30 lb. Suggested retail price is $500.

The 90° cathode ray tube has been developed by Matsushita to overcome resolution limitations in the main lens of its regular 29-mm in-line color tubes—both in center and edge performance. Accordingly, the new overlapping field lens (OLF) gun partially merges its aperture lenses without widening normal three-beam separation (Fig. 1), offering a larger effective lens diameter, with a nearly circular cross-section. Magnification and spherical aberration are comparable to those of a standard 7.6-mm circular lens, but the OLF has an effective enlargement of 1.7 times greater. A new triode prefocus lens has also been added, improving resolution by about 20%. The spot size, too, is 20% larger than that produced by a standard high bipotential (Hi Bi) shadow-mask lens system.

ColorPilot. "ColorPilot" is actually a static dc switch, connected to inputs of video chroma processor IC601 (Fig. 2). In the ON position, ColorPilot switch S601 parallels brightness control R313 with fixed resistor R311, splitting current and increasing bias on internal IC brightness, but lowering I-detector bias by grounding one end of R641. At the same time, ground is removed from the junction of R607 and D301, releasing R607 as a shunt across R605, back-biasing D301. This raises the R307 Panabrite potential along with that of the R604 color control, and produces a general increase in luma/chroma intensity. De tint, however, is unaffected. Balloons A27 and A29 through A32 below are simply non-terminated chassis "looker" points, probably used in manufacturing checkout.

Integrated circuit IC601 is a highly complex array of large-scale integrated transistors, resistors, and diodes that does virtually all the luma/chroma amplifying, controlling, and color detection with the help of one Q302 common-emitter inverter and a Q303 low-impedance current amplifier. Video buffer Q301 is the chroma/luminance driver for the entire chip and supplies not only color and brightness information, but also composite sync to the sync separator in IC401 (not shown)—which includes both the vertical and horizontal signal oscillators.

The ac-coupled and inverted output of Q302 passes across the usual multi-microsecond delay line to an emitter peaking circuit, and then to the contrast control. The ensuing contrast block is then acted upon by sync and black-level pedestal clamping, with aid from gate pulse shaping, to ensure a stable sync/signal level during overall reception. These same gating pulses at a 15,734-Hz rate offer timing for the color-killer detector and usually open the automatic phase detector (apc) for burst, as well as governing conduction time of the voltage-controlled oscillator (vco). There is however, a reference generator, controlled by the vco for the two l and Q chroma detectors, which make use of the 3.579545-MHz color sync, or 'burst'.

Chroma also reaches the color control via the burst gate and second bandpass amplifier and, in turn, is dc-controlled by both Panabrite and color potentiometers, as well as by the color killer, which...
shuts down extraneous signals when there is no incoming burst. During normal transmissions, color output from the color control advances through an RC network above IC601 to the R-Y and B-Y demodulators.

The variable resistors (Sub. Bright, Sub. Color, Sub. Tint) above and below IC601 are simply current-limiting rheostats from dc supplies, and are used to limit potentials of the customer controls bearing those names.

**Tuners.** Here we have another pleasant surprise. There are r-f amplifiers, oscillators, and mixers in both of the 82-channel u/v tuners, along with separate age controls for each tuner. A 14-pin integrated circuit (designated "PLL" for phase-locked loop) has inputs from each tuner and a common output into the S-board tuner-controller of the main circuit board. At this point, signals are received for volume up/down, channel scan, and power on/off. Bandswitching and tuner-switching turn-on voltages are generated here, in addition to a separate isolated and fused power supply, an active low-pass filter, an optical isolating coupler for a dc amplifier, an IC comparator, and a microprocessor.

The microprocessor, of course, receives and issues commands for the channel, audio, and on/off functions. The comparator compares tuner inputs with frequency-synthesized and crystal-controlled voltages from the microprocessor and issues an afi voltage to the tuners whenever they drift above or below the broadcast video carrier. A red LED indicates channel numbers.

Also crystal-controlled, the front-panel transmitter has an 18-pin integrated circuit that responds to an infrared signal via dual diodes. The channel and audio selections are then superimposed as digital commands on the infrared carrier for virtually noise-immune transmissions to the receiver.

Here's a professional, portable DC-20 MHz Oscilloscope with build-it-yourself Heathkit savings

Compact enough to fit under an airplane seat, the Heathkit IO-3220 represents outstanding value in its class. Weighing only 16 pounds, the IO-3220 is designed for field service troubleshooters who need a light, portable battery-operated scope for use where AC power is not available.

**Dual-trace versatility:** The IO-3220 allows you to compare two different signals simultaneously - to make input/output comparisons, check phase relationships and accomplish other complex measurements. Algebraic functions add versatility.

**Special invert display function:** Enables you to compare two waveforms that are nearly 180 degrees out of phase - by inverting one of the waveforms.

**FREE CATALOG**

Complete details on Heathkit oscilloscopes - and nearly 400 other electronic kits for your home, work or pleasure - are in the new Heathkit catalog. Send the coupon at right for yours today. Or pick one up at any of the 65 convenient Heathkit Electronic Centers located throughout the U.S. and Canada.

If coupon is missing, write Heath Co., Dept. 010-866, Benton Harbor, MI 49022. In Canada write Heath Co., 1480 Dundas St. E., Mississauga. Ont. L4X 2R7

video

(Continued from page 32)

Comments. This 11-IC, 31-transistor, 13" set is, by far, the best Panasonic has produced since its very expensive 19" modular receiver of some years ago. Although its luminance bandpass is but 3 MHz (comparable to all other 13-inchers), and audio is somewhat restricted, the overall results are surprisingly good. With its new picture tube and well-designed electronics, this set will hold its own easily.

You'll like the dual-speed up/down remote control, the 75-ohm vhf input, 7-dBmV tuner sensitivity, the 98-to-100% high- and low-voltage regulation, the excellent 43-dB video signal-to-noise ratio, the 91.5% dc restoration, and the 99.8% solid convergence. With adequate surface-wave filter input, we could not record any interference on the usual 2, 4, or 5 vhf channels; and agc swing between saturation and cutoff measured a very respectable 64 dB.

We recorded a 9,000°K CRT temperature, but this may be due to a hand adjustment at the factory. A typical production-line reading would probably be nearer 8,000°K, similar to a comparable Zenith receiver. We also were unable to turn the raster completely off with front-panel contrast brightness controls, possibly again due to the hurry-up setting of the limiting controls.

Note: Instruments used in these measurements are: Tektronix 7L12 and 7L5 spectrum analyzers; Telequipment D68 and D67A oscilloscopes; Sadececo FS-30 VR/1a meter; Winegard DX-300 amplifier; Data Precision 245, 258, 1750 multimeters; B & K-Precision 1250 and 3020 NTSC & sweep/function generators; Sencore VA48 (modified), CG169 video & color bar generators and PR57 variable power supply; Tektronix C-5C, Minolta XD-11 cameras, and Gossen Luna-Pro light meter.

The chassis of the Model CT-3031 holds eleven ICs and 31 transistors.

Swept chroma patterns at detector and CRT with vector.

Multiburst at video detector and red cathode of CRT.

The 20-kHz swept audio shows dropping off at 8 kHz (2 kHz/div.)

Signal/Noise at CRT measures a solid 43 dB.
**Popular Electronics Tests**

**Xerox 820 Desktop Computer**

Workstation system operates in an Ethernet environment

Although many view the Xerox 820 as just another personal computer, it is touted by its manufacturer as a low-cost, desktop workstation for use in an Ethernet-type environment. Moreover, the 820 is designed as an adjunct to the company's Star information system and, as such, it lacks some of the frills associated with more expensive personal computers.

Specifically, the 820 offers users an upgraded electronic typewriter that trades paper for a 12" black-and-white CRT display and employs disk storage. What the 820 doesn't offer are such things as game control ports, color, and sound generation. Instead, Xerox has opted to provide what it considers three key elements in system design:

- Ease of use. The system is fully menu-driven so the untrained operator can adapt to it more readily.
- Industry compatibility. It uses a Z-80, 2.5-MHz microprocessor, and Digital Research's CP/M operating system.
- The inclusion of multiple communication features: RS-232 and parallel port interconnects.

The basic system comes packaged with a stand-alone CRT that supports a 24-line by 80-character display (1,920 characters), a detached 96-character ASCII keyboard with function keys, and a 10-key numeric keypad. It also has dual 5.25" single-density disk drives with a total capacity of 90K bytes (approximately 40 pages of typed material per drive), 64K RAM memory and 4K of system ROM, and a demonstration diskette designed to assist familiarization with the system. The price for this basic system is $2,995. Adding the Model 630, 40-eps, daisy-wheel Diablo printer brings the price up to $5,895 minus software. Optional 8" single-side, single-density dual drives can store 250K characters (approximately 130 pages of typed material per drive).

To add the software, an extra $200 is needed for CP/M, and $500 for the WordStar word-processing package. Other software packages, such as Sorcim's SuperCalc and a Xerox 871 interactive communications emulator for 3270-mode access, will be available later with prices ranging from about $195 to $300.

Although Xerox plans to have MBASIC, CBASIC-2, COBOL-80, MSORT, and possibly dBase II available soon, they weren't ready at the time of this review.

Inside the System. We were unable to fully test the 820 under various heat and electrical conditions, but we did take a look inside the main housing. This is the case that encloses the CRT screen, a single-board computer, and interfaces. The CRT is manufactured by Clinton, which is the major CRT supplier for terminal manufacturers. It's a 10-MHz type, so sufficient bandwidth is provided for a crisp 1,920-character display.

It is interesting that Xerox employed standard off-the-shelf drivers with a flyback transformer for the CRT. No attempt was made to minimize the display board, thus cooling requirements are not strict.

(Continued on page 40)
Learning electronics is no picnic.

At any level it takes work and a few sacrifices. But with CIE, it's worth it.
The best things in life are free,” was writing a song, not living a life. Life is not just a bowl of cherries, and we all know it.

You fight for what you get. You get what you fight for. If you want a thorough, practical, working knowledge of electronics, come to CIE.

You can learn electronics at home by spending just 12 hard-working hours a week, two hours a day. Or, would you rather go bowling? Your success is up to you.

At CIE, you earn your diploma. It is not handed to you simply for putting in hours. But the hours you do put in will be on your schedule, not ours. You don’t have to go to a classroom. The classroom comes to you.

Why electronics training?

Today the world depends on technology. And the “brain” of technology is electronics. Every year, companies all over the world are finding new ways to apply the wonders of electronics to control and program manufacturing, processing...even to create new leisure-time products and services. And the more electronics applications there are, the greater the need will be for trained technicians to keep sophisticated equipment finely tuned and operating efficiently. That means career opportunities in the eighties and beyond.

Which CIE training fits you?

Beginner? Intermediate? Advanced? CIE home study courses are designed for ambitious people at all entry levels. People who may have:
1. No previous electronics knowledge, but do have an interest in it;
2. Some basic knowledge or experience in electronics;
3. In-depth working experience or prior training in electronics.

You can start where you fit and fit where you start, then go on from there to your Diploma, FCC License and career.

Many people can be taught electronics.

There is no mystery to learning electronics. At CIE you simply start with what you know and build on it to develop the knowledge and techniques that make you a specialist. Thousands of CIE graduates have learned to master the simple principles of electronics and operate or maintain even the most sophisticated electronics equipment.

CIE specializes exclusively in electronics.

Why CIE? CIE is the largest independent home study school that specializes exclusively in electronics. Nothing else. CIE has the electronics course that’s right for you.

Learning electronics is a lot more than memorizing a laundry list of facts about circuits and transistors. Electronics is interesting! It is based on recent developments in the industry. It’s built on ideas. So, look for a program that starts with ideas and builds on them. Look to CIE.

Programmed learning.

That’s exactly what happens with CIE’s Auto-Programmed® Lessons. Each lesson uses famous “programmed learning” methods to teach you important principles. You explore them, master them completely, before you start to apply them. You thoroughly understand each step before you go on to the next. You learn at your own pace.

And, beyond theory, some courses come fully equipped with electronics gear (the things you see in technical magazines) to actually let you perform hundreds of checking, testing, and analyzing projects.

Experienced specialists work closely with you.

Even though you study at home, you are not alone! Each time you return a completed lesson, you can be sure it will be reviewed, graded and returned with appropriate instructional help. When you need additional individual help, you get it fast and in writing from the faculty technical specialist best qualified to answer your question in terms you can understand.

CIE prepares you for your FCC License.

For some jobs in electronics, you must have a Federal Communications Commission (FCC) License. For others, some employers tend to consider your license a mark in your favor. Either way, your license is government-certified proof of your knowledge and skills. It sets you apart from the crowd.

More than half of CIE’s courses prepare you to pass the government-administered exam. In continuing surveys, nearly 4 out of 5 graduates who take the exam get their licenses! You can be among the winners.

Associate Degree

Now, CIE offers an Associate in Applied Science Degree in Electronics Engineering Technology. In fact, all or most of every CIE Career Course is directly creditable towards the Associate Degree.

Today is the day. Send now.

Fill in and return the postage-free card attached. If some other ambitious person has removed it, cut out and mail the coupon. You’ll get a FREE school catalog plus complete information on independent home study. For your convenience, we’ll try to have a CIE representative contact you to answer any questions you may have.

Mail the card or the coupon or write CIE (mentioning name and date of this magazine) at: 1776 East 17th Street, Cleveland, Ohio 44114.

□ YES...I want to learn from the specialists in electronics — CIE. Send me my FREE CIE school catalog...including details about the Associate Degree program...plus my FREE package of home study information.

MAIL TODAY!
The power supply, located at the rear of the enclosure, is vertically mounted and surrounded by a cardboard shield. Although we couldn't be certain, it appeared to be a switching supply, rather than of linear design. This would improve overall heat characteristics of the system.

The main circuit board for the computer is mounted along the bottom and supports the CPU, memory, and interface electronics. Surprisingly, no shielding was evident for any of the active elements. Power-supply output was directly below the deflection yoke of the CRT.

Located on the back panel are four DB-25-type connectors for the disk drives, the keyboard, the printer, and one marked "communications." These are RS-232 connectors and follow the standard layout. The keyboard and printer connections are 8-bit parallel. Interconnects are handled using RG-8U cable with full shielding and AMP connectors with screw lock-downs. In addition to the connectors, there is a system reset button.

The display/processor tips the scale at 30 lb and measures 13"x14"x15". The keyboard assembly weighs 10 lb and measures 4"x10"x20". Add 10 lb more for the 5.25" disk assembly and 48 lb more for a choice of the 8" system.

Interestingly, although the 820 is designed to work with both 5.25" and 8" drives attached, on the system tested, only one or the other could be used, as no daisy-chaining of the drives was permissible.

**Evaluation.** The system we reviewed consisted of the display processor, keyboard, dual 5.25" drives, and Model 630 printer.

When power was turned on, we were greeted with a message asking us to enter A for 8" or T for 48. Tapping the T turns the 820 into a very expensive typewriter, with everything entered via the keyboard output to the printer (if attached). If the A is entered without having put in a diskette, the system generates an error message and stops. To continue requires system RESET or POWER OFF/ON.

For our evaluation, we used CP/M and the word-processing package, a special optimized version of MicroPro's WordStar. On booting, we were taken directly into the first menu screen of about 12 lines that guide us through the various attributes of the word-processing system.

When we booted the system and went into the word processor, we noticed that the display features white characters on a black background with no highlighting. All the menus in WordStar were displayed with number selections, with no highlighting distinguishing the various attributes. We found this disconcerting since we feel highlighting is a prime feature for user-oriented systems, and is so used in other WordStar applications.

Another difficulty we encountered was that the Xerox version of WordStar is designed differently in that the menus and methods of choosing a feature are redefined from conventional WordStar. This could be confusing if you are familiar with WordStar since it means virtually relearning the commands. However, due to the depth of the menus and the amount of explanation (which, incidentally, is greatly amplified compared to conventional WordStar), with the use of the HELP key, relearning takes only a few pages with a few exceptions.

To test how well everything functioned in terms of speed, we entered a document consisting of four pages of text on a 50-column line (about 3,000 characters). We found that the arrow keys used for moving the cursor did not function within the word processor. However, as usual, control keys are used to move around the document. The majority of the keys responded slowly, making it possible to type ahead of the system. Typing at 60 wpm, we found that characters were being inserted, but not fast enough.

Saving and restoring the document to and from disk took almost a full minute. This time is unusual considering that 5.25" disks are fairly slow in transfer. To find out how quickly the system responded, we entered the SPOOL mode to print the document and do further editing at the same time. Typically, the disk system will SPOOL the document to the printer until interrupted by disk access requirements or by the processor when performing movements of text in memory. Usually no interrupt takes place until end-of-line is reached and a carriage return or line feed is inserted, with little or no degradation on the output or screen input.

We ended up slowing down our typing since the system appeared not to be able to keep up with keystrokes. This signaled to us that the keyboard buffer was apparently too small, thus allowing overflow and causing an interrupt in timing problem.

What we did like about the system was the use of menus throughout. Since no cooling fans are used, the system is quiet and we found that it ran fairly cool without extra ventilation.

We believe that the system we reviewed was not really representative of the product. This is primarily because the display/processor is a kludge to provide store owners with something to demonstrate. There were no indications that the system met FCC, RFI, or EMI requirements, and based on the internal layout, we're reasonably sure it wouldn't pass because no shielding was applied.

Furthermore, the keyboard was sloppy, with the keys slow in responding. We felt that, possibly, the debounce technique used took too much time, thus producing the lateness on entered characters. The system can cause the operator to get ahead of the computer.

What we would have liked to see Xerox do is integrate the slimline floppies in the display cabinet, produce a slimline keyboard much like the IBM Personal Computer, and provide full-screen attributes of varying display intensities. In addition, we object to the necessity of buying the operating system separately. We felt that this should be an integral part of the system, and included in the basic price.

**Documentation.** The documentation that is currently available consists of an operator's manual for CP/M and instructions on how to connect everything. We thought we would see some great insight here, but Xerox is simply providing a reprint of Digital Research's CP/M manuals. We liked the section on the printer and disk drives, though, and felt that they showed what is probably coming.

In addition to the system manual, there is a user's manual for the word processor. This is a small, illustrated book that takes you through all the features of the word processor. The manual is well-written. Due to poor reproduction, key formats for showing you what to do are almost unreadable, but all the material is there.

Reportedly, manuals for BASIC, COBOL, SuperCalc, and other software products are in the making, and should reflect more attention to detail.

**Conclusion.** The Xerox 820 is a machine geared to the office environment and, therefore, should not be equated with systems designed for graphics or software development. Although the machine, as reviewed, doesn't rate highly with us—unless it is for use in an Ethernet or communications environment with access to a host computer—we expect the next generation to offer more features and will take care of the various problems we encountered.

According to sources close to Xerox, you can probably expect enhancements such as the 8086 16-bit microprocessor, a 5.25" Winchester, and a raft of application software products in the near future. In addition, you will probably see the 8087 math processor and the 80130 communication processor incorporated by midyear.

As you read this, the 820 is being delivered with the Z-80, MBASIC, Sorcim's SuperCalc, and other systems software. Currently, many of the Computerland stores are gearing up to offer a host of CP/M-compatible software on the machine, and most-important—full services. The latter is a big plus in the machine's favor.

As we go to press, Xerox has put the 820 down for the count, but expect that it will not be a major entity in the desktop world until the new enhancements are implemented.—Carl Warren

**Acknowledgements.** Special thanks to Ray Wait and Joe Resca of the Lawndale, CA Computerland, who made time and space available for this test.

**Circle No. 102 On Free Information Card**
Exciting Episode Travels Well

Should you be looking for a small computing system that fits on your desktop or can be packed up on a moment's notice, you might well consider the Episode from Epic Computer Corp. (918) Chesapeake Dr., San Diego, CA 92123. Tel 714-569-0440.

This exciting little machine uses a single-board Z-80A 4-MHz microprocessor with 64K bytes of RAM to create a standalone single-user workstation with built-in floppy, communication ports, and diagnostic (ROM-based) software. All you add is your favorite terminal and printer.

The compact unit takes up approximately the same desk space as a legal-sized tablet, weighs 15 lb and has a fold-up carrying handle. In addition, the Episode will work with literally any CRT and printer, thanks to the versatility of a fully configured version of Digital Research's CP/M operating system.

The Episode is made easy to use by the manufacturer's unique software system called Supervyz. This software package allows the user to command the computer via a series of menus, thus precluding any knowledge of CP/M.

The console I/O is handled via an RS-232C port capable of 9600 baud (available on request). In addition, an auxiliary serial port can be configured so the Episode serves either as a computer or an intelligent terminal.

An integrated real-time clock provides the date and time and it is supported by battery backup. Further enhancing the system is a 16-bit interruptable timer, 8-position configuration sense switch, console discretionary reset, type-ahead feature (supported by interrupt-driven console input), low-voltage switching power supply, and a card cage for system expansion.

In addition, the Episode has a monitor program in ROM. When the system is first turned on, the monitor copies itself into programmable memory, initializes the I/O, signs on, performs a memory test, and then boots from the disk drive.

The monitor offers bootstrap functions to load the operating system, and the ability to display memory between two given addresses in hexadecimal with the ASCII equivalent to the right of each line. You can also go to a specific address and execute a program, query an input or output port, set the console output to a serial port, read a hex file, display, alter, or test memory.

The system's eight sense switches are used for sensing parity on the modem/printer port, the CP/M list-device assignment, and setting the density of the integrated floppy-disk drives.

The Episode comes with the use, dual floppy drives, single-board computer, 2K ROM memory (expandable to 8K), 64K RAM memory, Supervyz, CP/M, dual programmable serial ports, and parallel printer port. It is priced at ($3445 with 1.2M bytes of disk storage, $2995 for 800K-byte disk drives, and $2550 for 400K-byte drives. Future options include an integrated modem, 5.25-in. Winchester disk, and multiple serial I/O. All options are slated for availability later this quarter. As of this writing, no pricing has been announced.

As indicated, Epic also supplies the Supervyz software package that makes Digital Research's CP/M and MP/M user friendly. The package accomplishes this with a series of menus that act as a preprocessor to CP/M or MP/M commands by employing the functions found in the O/S but handling them as command lines transparent to the user.

Users are greeted with a series of self-prompting, easily understood menus designed to interface directly to the installed applications. In addition, the powerful control system allows the user commands intrinsic to the O/S by specifying them as menu items.

For turnkey systems, Supervyz can come up when the system is first turned on, thus eliminating the necessity of the user's needing to know the proper boot procedures.

Besides supporting applications, Supervyz provides a time-of-day facility that interacts to the system's real-time clock. This utility is available by a simple menu entry. A computer-aided instruction technique, using tiny PILOT leads the user through the various formats required to establish a menu and all the desired help messages.

Because Supervyz uses a command line function for setting up commands to the O/S, multiple commands can be imbedded in one menu call. This feature makes it possible to perform batch-type tasks with a single entry.

Moreover, the package permits interfacing to a variety of terminals and printers and can be used to put the system in a typewriter mode. Since the Console Command Processor of CP/M or MP/M has been modified, all disks are logged in on entering the Supervyz
No doubt you've heard of Super Avilyn before. It's the remarkable formulation that goes into TDK's outstanding SA and SA-X audio cassettes and Super Avilyn videocassettes. Now TDK's advanced Super Avilyn technology has been applied to open reel.

It's called Super Avilyn EE (Extra Efficiency) open reel. SA was specially developed for use with the new open reel decks with the Extra Efficiency EQ/bias setting. On these decks, this brand new formulation actually lets you record and play back at half the normal speed. And keep all the full, brilliant sound the finest open reel delivers. Which means that you get twice as much music from a single reel of tape as you could before.

This is due to the Super Avilyn high density formulation. It offers higher MOL and lower bias noise; virtually double the coercivity of standard ferric oxide tapes.

TDK, the company that's redefined the standards of recording tape, now brings you twice as much as you expected. You'd expect nothing less from TDK.

Looking for a New Terminal? Then you'll want to contact Emulog/Phaser (48881 Kato Rd., Fremont, CA 94538. Tel. 415-490-1290) about the Alpha Star. This operator-oriented terminal includes sculptured matte finish key caps, palm comfort areas on the detached keyboard, green phosphor tilting screen with a diffusing nonreflective bezel, and contrast and brightness controls on the front panel.

The 18-lb unit displays upper- and lower-case characters with true descenders in an 80-character by 24-line format. Cursor controls permit insert and deletion of lines or characters. In addition, the terminal employs ANSI defined control and escape sequences for reduced intensity, reverse video, and foreground/background generation for specialized data entry.

The terminal's logic board is located behind the main CRT housing for ease of access and to isolate it from high voltage. The logic board includes a programmable printer port, and an RS-232C or current-loop port.

The thin, detachable, Selectric-style keyboard sports a numeric keypad and three programmable function keys. Interfacing and display characteristics of the Alpha Star are easily changed via EPROM—either user created or customized by the manufacturer. This chameleon-like characteristic of the terminal makes it possible to emulate a number of others. Pricing for the terminal is $345.

For those interested in Lear Siegler products, there is the Model ADM 21 video-display terminal. This new terminal uses Z-80 microprocessor power to provide plenty of intelligence for applications that need a low-cost smart terminal for time sharing or data-entry chores. The microprocessor control furnishes a full editing capability, including screen-oriented features such as clear screen, erase line (or page), and charac-
ter insert/delete. Furthermore, you can highlight data fields and text with reduced intensity, reverse video, blink, blank, and underline.

In addition, the terminal features a nonglare 12-in. CRT that displays 7 by 9 dot-matrix characters with lower-case descenders in 24 lines. The characters occupy a 9 by 11 dot character cell. There is also an underlining font available for the terminal. The underline appears in the ninth line and does not interfere with descenders or reverse video on the next line.

The terminal accepts data and text via an 87-key board with auto-repeat. For special functions, you can use the numeric keypad, cursor-control, edit and function-mode keys along with line/page send keys. A self-test mode is included for troubleshooting.

A combined I/O port handles both communications and a printer as two separate RS-232 ports. Communications over the port can take place at 10 distinct baud rates from 75 to 19.2K baud.

Available options include a 32-character answerback capability, current-loop communications, line graphics, and international character sets. Price: $695. (Lear Siegler Inc., Data Products Div., 714 N. Brookhurst St., Anaheim, CA 92803. Tel. 714-774-1010. Or your local computer store.)

Those who tinker with micro systems have probably run into situations where supposedly compatible RS-232 serial devices do not work correctly with a specific system. The difficult aspect of interfacing usually is the PBS and the I/O lines.

Well, Mountain Computer Inc., (300 El Pueblo, Scotts Valley, CA 95060. Tel. 408-438-6650) has solved this problem with its RS-232C DB25 Pin Reconfiguration Adapter.

This classy little unit allows almost any serial I/O device to mate with a computer by re-routing the RS-232 signals, thus eliminating the task of fabricating special cables.

The PRA consists of a circuit board with side matrix switches and a male DB25 connector on one end and a female connector on the other. In most applications, this configuration will match available cables. To achieve the proper interface, merely slide the switches to the proper position.

Although the $59.95 price tag may seem steep, the PRA is as important as your test-bench VOM.

Apple Temperature. To adapt your Apple for temperature data acquisition, Strawberry Tree Computers has introduced its Dual Thermometer system.

The Dual Thermometer interface for the Apple II microcomputer system is a combination of an interface card, two 10-foot cables with temperature probes, and sophisticated software that monitors your temperature/data requirements. The temperature acquisition system can store temperature data and time on a disk at intervals you specify for later recall, or it can print the data immediately. In addition, an alarm can be set to intervals from once every 10 minutes to once a year.

The accompanying software permits tailoring the Apple display to your specific needs. Such information as time, temperature, maximum and minimum temperatures, and alarm information for the two probes can be displayed.

Moreover, the software will support up to seven Dual Thermometer cards with a total of 14 probes (two per interface), with the screen displaying data for each probe. The data can be displayed in Fahrenheit, Celsius, or Kelvin, along with a 12- or 24-hour clock.

The Dual Thermometer card plugs into any Apple II peripheral slot with 48K RAM, AppleSoft BASIC, and at least one disk drive. The program is written in AppleSoft BASIC for specialized applications.

Although the Dual Thermometer can be used for home temperature control applications, it offers accuracy, repeatability, and a response time that make it ideal for industrial applications.

In addition, the Dual Thermometer’s probe cables can be extended up to 500 feet using AWG #18 cable without sacrificing accuracy or response time.

Dual Thermometer is available for $260 including interface card, two 10-foot cables with probes, and disk software. (Strawberry Tree Computers, 949 Cascade Dr., Sunnyvale, CA 94087. Tel. 408-736-3083.)
Productivity at your fingertips.

The NEC PC-8000 Series is the best-selling microcomputer system in Japan, a country where productivity is something of a national pastime. Now American ingenuity has provided it — and you — with an especially powerful version of Microsoft® BASIC, CP/M®, with its legendary treasure-house of languages and software, as well as a rapidly expanding family of our own application software packages, available right now.

These include general accounting, accounts receivable, inventory control, data base management, word processing, with dozens more on the way.

Hardware features 24K of ROM, 32K of low-overhead RAM, a Z80A equivalent chip, high resolution graphics in 8 colors, a 248 symbol character set including complete ASCII upper and lower case, graphics symbols, design elements, mixed text and graphics on the same screen, an 80-column character display, a set of user-definable keys, full 82-key keyboard with numeric pad, and a Centronics® compatible parallel interface, which is also perfectly compatible with the NEC PC-8023 high density dot matrix printer.

People are calling it the "end of the compromise" in microcomputers.

To see if you agree, check it out in person at an NEC America dealer.
NEW TELEPHONE DEVICES TAKE PAIN OUT OF DIALING

Options include memory bank, automatic redial, melody on hold, security dialing, amplified sound, and call time display

BY WALTER SALM

ONCE upon a time there was just one way to dial a phone—the tiresome rotary-dial twirling that made each outgoing call a chore—especially when you did a lot of calling or were trying to get a number that was often busy. With the advent of 10-digit direct distance dialing (now 11 digits in most parts of the country), the chore became even more burdensome.

Ma Bell came to the rescue a number of years ago with an automatic dialing phone that accepted a plastic punched card that did the chore for you. It was no faster, but it at least gave your fingers a rest. Naturally, this equipment called for an extra monthly rental charge, and you had to keep track of a stack of plastic cards with a lot of holes neatly punched in them.

Then along came Touch-Tone® and much of the benefit of those punched cards evaporated. However, whether you dialed a number or used pushbuttons, the need for an automatic dialer was there. This was especially true for users of the computer networks and computer-activated private toll numbers, since they require a minimum of 23 digits. The chances of a mistake on the last 2 or 3 digits are tremendous.

Privately owned dialers first emerged about a dozen years ago, but people weren't ready for them. They were expensive and difficult to program. Touch-Tone was really just as fast. Like many of today's dialers, these first of the new breed provided outpulse dialing—the electronic equivalent of a rotary dial. Manufacturers point out that this is necessary in many of today's dialers and pushbutton phones, presumably so that the instrument can be used on any telephone system anywhere. But that oh-so-slow 10 pulses per second can be a real
time-wasting annoyance, especially if the called line is busy.

But having Touch-Tone doesn’t just improve operating speed and convenience; it’s essential if you’re going to use such private toll telephone services as MCI, SPRINT, ITT City-Call and Western Union. These systems universally use computers to process the calls, and the computers will only respond to tone-type signaling. Many customers of such systems carry a pocket-size digital beeper to hold over the telephone mouthpiece when they’re traveling. It’s a nuisance, but necessary. However, it shouldn’t have to be so from your home or office.

**High-Speed Technology.** Today’s automatic dialers are mind-blowing for their speed, accuracy and other features. They’re so far removed from the dialers of a decade ago that they truly represent a totally new generation of communications equipment in concept and design. With most, a touch of a single button will access the dial tone, pause, dial the phone number quickly and accurately, and let you hear all this and the ringing tone on a built-in speaker, a must for “on-hook” dialing. You don’t have to take the phone off the hook until your party actually answers.

Automatic redial is another must. While this feature is built into most of today’s electronic phones, having it on the dialer means that any phone connected to the instrument has automatic redial. It’s maddening to try to break through a persistent busy signal. Automatic redial makes it a lot easier, and most of today’s dialers have this feature. In addition, many of them let you program an automatic redial sequence. Consequently, the instrument will keep trying that busy phone at 40-to-60-second intervals without any further attention from the user.

**Compatible Dialing.** If a dialer is “compatible” with both tone and rotary dial lines, it usually means that the

**Notes:**
- *Tone and MCI-SPRINT compatibility optional. This option eliminates last-number-redial feature.
- **Stores code names or numbers 2 to 4 characters or digits to call up stored phone numbers.
- (A) One unit works all extension phones on circuit; also works with all lines on multi-line key phones with appropriate adapter.
- (B) Pulse/tone can be programmed to start pulse dialing (such as access number to MCI computer), then switch to tone dialing.
- (D) Detects busy signal and redials number automatically.
- (P) Programmable chained memory locations for automatically redialling MCI and SPRINT systems.
telephone controllers

instrument provides output pulse only—
slower than true tone dialing and totally
useless with MCI, SPRINT, etc. Some
of today's dialers offer a choice of either
pulse or tone output models; some are
available in tone-only models; and a few
provide switch-selectable pulse or tone
output. Some even offer switchable 10-
or 20-pulse output for conventional or
fast-pulse dialing. True tone output is
still not commonplace among automatic
dialers and almost always costs more.

On-hook dialing is a great conven-
ience. Most dialers offer this by provid-
ing a built-in speaker so you can hear
the dial tone, dialing and ringing sig-
als. When the called party answers,
you can then pick up your telephone
handset. Dialers that are built into one-
piece telephones obviously can't offer
on-hook dialing; you have to take the
handset off the wall or desk to activate it
and to reach the touch buttons.

With the exception of the "Demon
Dialer" and a couple of other instru-
ments—which sense the presence of a
dial tone—most dialers listed in the
accompanying table have a built-in
pause when the sequence starts. This
pause allows time for the telephone cir-
cuit to connect with the central office
and provide the dial tone. This is rarely
a problem, except in those isolated cases
where the telephone circuits are over-
loaded and there's an appreciable wait
for the dial tone. In such cases, the dial-
er, not "knowing" that there's a dial-
tone delay, will jump the gun and dial
into a dead line. If there's an emergency,
such as a flood, massive power outage,
or other reason for the telephone compa-
ny circuits to become overloaded, it
might be a good idea to disconnect the
dialer from your phone, in spite of the
fact that manufacturers tout the instru-
ments as being "perfect" for such emer-
gencies. Perfect, they're not.

The most compact and unusual of the
current crop is the "Soft-Touch" series
from Buscom. This product was first
born as a tone encoder for rotary-dial
phones so they could be used with MCI,
SPRINT, and others. This accessory
screws onto the phone's handset, replac-
ing the mouthpiece and microphone car-
tridgues with a tiny 12-button pushbutton
pad and microphone with sound slots
between the buttons.

In its automatic dial version, the same
type of minuscule design is used to offer
up to an incredible 80 stored phone
numbers, along with tone output and run-
ing on the telephone company's line
power. A second product line from Bus-
com is a pocket-size portable dialer that
travels with you. It acoustically couples
to any phone transmitter. This device is
the ultimate in portable convenience.

Possibly the most ambitious of the
it's certainly worth it. Most dialers per-
mit you to chain numbers for longer
digit strings, and their manufacturers
promote this as a very important "ex-
tra" feature.

The ideal dialer should have an LED
display to check phone number accura-
cy, both when programming and dialing.
Once the display is there, adding a
quartz clock chip is reasonably easy for
the manufacturer, and this clock can
also be used to time phone calls. There-
fore, most dialers that have an LED dig-
ital display also feature a clock and stop-
watch.

All memory chips are volatile, so some
kind of battery backup is important to
preserve those encoded phone numbers
should the power go off. Some dialers
will not only retain the memory with the
battery, but provide operation during
power failures. Such a unit is Dicto-
graph's "Phone Controller," which con-
tinues to dial from memory with its little
9-volt transistor-radio battery. But the
unit is rated for 12 volts dc, and the
result is that during power outages the
LED display won't light, and that little
battery gets used up after just two
hours. Of course, most power failures
don't last that long anyway. Power-fail-
ure memory protection is important to
check on all automatic dialers, for obvi-
ous reasons.

Installing the Dialer. Installation is a
breeze on modular phones, and while it
can be somewhat hairy on nonmodular
types, it's not really difficult. Generally,
most dialers require that you interrupt
the telephone circuit in some way. With
the modular instruments, this is easy:
just unplug the modular card that con-
ects the phone to the wall and run it
from the wall jack to the dialer (the jack
will say "line" or something like that).
A modular cable supplied with the dial-
er goes from the other jack that says
"phone" to the telephone itself. There's
also usually an ac line cord or a power
pack converter to be plugged into the
nearest ac outlet. Some dialers, includ-
ing certain "smart" phones, operate on
telephone company line power. Some of
these provide no backup memory bat-
tery on the theory that the company's
power to the phone system will never be
interrupted.

Installing a dialer in a multi-line
office telephone system can be a little
more difficult. The dialer can be con-
ected to only one line at a time. There
are adapters available that do the job
very nicely, but be careful. While many
of the adapters have instructions that
state they can be used with phone-
answering machines and dialers, they
won't work with dialers that require line
interruption. Such adapters will operate

50
only with dialers that are connected in *parallel* with the telephone—the same way an answering machine is. This is because they provide a *parallel* connection to the line. The arrangement is fine for answering machines, but these adapters do not break the circuit so that the dialer can operate on it. Such adapters are usually sandwich-type devices designed to fit between the two halves of the Amphenol-type connectors in the connecting cable.

Only one fully compatible accessory adapter is available right now, and that's Dictograph's "Universal 100." It's designed to work specifically with the company's Phone Controller, and is said to be fully automatic in operation. Like the others, it connects sandwich-style in the Amphenol connectors. Unlike the others, it is an active circuit and requires ac power (from the Phone Controller's power pack). It automatically finds the line in use on the key-type phone and operates on that line only (whichever line button is depressed at the moment). Key telephone lights and flashers operate normally. The manufacturer points out that it won't work automatically on some older types of office phones.

Probably the best way to wire in a dialer in an office situation is to call Ma Bell and ask for an RJ-35X jack. This is a six-conductor modular jack that will access all the circuits automatically in the key telephone. A special modular

The installation of this jack may cost as much as a "smart" adapter, but in the long run it may be the only method that will keep the phone company away.

During the next year, traditional suppliers of telephones and dialers will be introducing an ever-expanding line of products, and most of them will include the features listed for the "ideal" instrument. Many of them will continue the trend toward "smart" phones that combine a compact telephone with automatic dialing function. Ultimately, these smart phones will possibly become the most popular types of autodial instruments. And they'll get smaller and smarter as manufacturers evolve new and better LSI chip designs and automatic functions.
BUILD A LOW-COST
STEREO COMPONENT
SWITCHBOX

BY BILL ARRINGTON AND LARRY SANDERS

Avoid the headaches of constant rewiring when you want to change component arrangement

If you're an audio enthusiast, you probably delight in adding external equipment to your component system. However, you'll want to avoid the trauma of rewiring the system each time a new configuration is needed. A low-cost solution to this problem, the "Stereo Switchbox" is presented here.

This device provides a simple way to deal with the interconnection problem that arises when your system contains a number of "extras" such as a second tape deck and one or more signal processors (equalizer, noise-reduction unit, dynamic-range enhancer, tick-and-pop reducer, etc.).

The switchbox allows complete flexibility for connecting the output of any device to the input of one or more other devices. For example, if you have two tape decks, there is often a need to copy from tape 1 to tape 2, or from tape 2 to 1. Or perhaps, you would like to record from disc or tuner to tape 1 or tape 2, or both. Now, add a signal processor to the system and you may spend more time behind your stereo with the cables than enjoying the music.

The switchbox is a set of switches arranged in a matrix pattern. Once it is connected to your system you can easily rearrange the inputs and outputs of external equipment with a flip of a few switches. In short, the switchbox provides you with complete versatility as well as simple operation.

Circuit Operation. To see what a switch matrix can do for you, let's look at what it is and how it works. Figure 1 is the schematic diagram of a matrix switcher with X inputs and Y outputs. Notice that each input and output is actually a stereo left and right pair and each of the input pairs can be connected to any output pair by flipping a double-pole, single-throw (DPS) switch. For simplicity, the switch matrix can be represented symbolically as a rectangular pattern of signal paths with dots indicating the locations where switches have been closed to make a connection. In Fig. 2, such a representation is used to show a phono preamp feeding a signal processor by the connection, labeled A, at input 5 and output 4. We will abbreviate this as 5,4. Then, the processed signal feeds both tape recorders through the connections at B(4,1) and C(4,2). For equalized playback, tape 2 feeds the equalizer with the connection at D(2,3) and the output of the equalizer drives the power amplifier via the connection at E(3,5). If we wish to hear the output of tape 1, simply switch off the connection at D(2,3) and complete the connection at F(1,3). Simultaneously, the tuner can be serving another room through connection G(6,6). Thus, once your system is connected to the switchbox there is no need to move the cables again. A few flips of the appropriate switches are all that is required to reconnect the system to any desired configuration.

The Design. In choosing a specific design for your switchbox there are some details to be decided. For example, how many inputs and outputs are needed? The larger the matrix, the greater the cost for switches and connectors. Since the cost of switches is proportional to the product of the number of rows and columns, it makes sense to choose a reasonable size. Except for ambitiously large systems, six rows and six columns are usually sufficient.

A standard 6×6 matrix requires 36 switches. Since good switches are expensive, the switches are the most costly item of the project. However, it wouldn't pay to use less than high-quality switches (an intermittent contact would be intolerable). It is recommended that the switches have silver- or gold-plated contacts that engage with a wiping action.

To save money on switches, don't
INSTANT PC BOARDS
WITH
E-Z CIRCUIT™ Pressure-Sensitive
by Bishop Graphics, Inc.

COPPER DESIGN PRODUCTS!

NO Artwork! NO Photography! NO Screening! NO Etching!

And It's As Easy As 1...2...3...

1. APPLY COPPER MTG. CONFIGURATIONS

Now, thanks to this revolutionary new E-Z CIRCUIT concept, you can build professional quality printed circuit boards right in your own home or shop...

...without messy chemicals
... without artwork
... without photography
... without screening or etching

Read What RADIO-ELECTRONICS Hobby Editor, "Doc" Savage Says About the E-Z CIRCUIT System!

"Those patterns are not for making artwork — they are copper. When you have press-ed them down on a board, you are ready to mount the circuit components, solder them in place and turn on the power! That is what I call instant PC boards."

"Having used this E-Z CIRCUIT system, I can report that it is quick, easy and reliable. It is the best way I have found to make one or two-of-a-kind PC boards."

The Secret? E-Z CIRCUIT's Unique Pressure-Sensitive COPPER Tapes & Patterns!

Each E-Z CIRCUIT copper mounting configuration is made of super-thin, epoxy glass with a special two-phase, adhesive on one side, and a one-ounce copper pattern laminated on the other. When applied to your PC board, these copper patterns work like the circuitry on a conventional etched printed circuit board. You solder the components directly to them.

Make A Mistake? With E-Z CIRCUIT, You Won't Waste A Board!

Thanks to E-Z CIRCUIT's special, two-phase adhesive, you have — within the first few minutes — the opportunity to reposition the copper patterns and tapes to make corrections, modifications and improvements... without harming the appearance and performance of your board.

2. SOLDER COMPONENT CONNECTIONS

Use Them For Repairing And Modifying Existing Circuitry, Too!

Besides creating an actual, professional functioning circuit board, you can use E-Z CIRCUIT Pressure-Sensitive Copper PC design products to repair or modify existing circuitry.

3. IT'S READY TO USE!

Unique E-Z CIRCUIT Technical Manual... A "Gold Mine" of Usable, "How To" Information!

We even show you how easy it is. The new E-Z CIRCUIT PC Copper Products Technical Manual & Catalog EZ-3001 leads you through every step with fully illustrated instructions written in clear, simple language to make it easy for you to produce a professional quality PC board. It's packed with invaluable technical "How To" information that tells you:

- How to build a PC board
- How to repair damaged circuitry
- How to solder professionally

(Dealer Inquiries Welcome)
sacrifice quality, rather look for a way to use fewer switches. First, consider that the total flexibility of a full matrix is not really needed or even useful. With a matrix that is fully populated with switches, a single output can be connected to more than one input; and, conversely, multiple outputs can be connected to a single input. However, summing multiple outputs to a single input is a job for a mixing console, not a switchbox. If a mixer is what you want, then an active circuit with controls to set the relative level of the various channels would be more appropriate. Since a switchbox is required and not a studio mixing console, a satisfactory design need not allow for channels to be mixed. This relaxation of requirements allows the use of half as many switches because, as shown in Fig. 3, a double-pole, triple-throw (dp3t) switch can serve two input stereo pairs. The up position connects one input pair, the down position connects the other pair and the center position is used as an off position in case neither input is wanted. This in no way reduces the usefulness of the switchbox, and it saves half the cost of switches and the time to mount them on the printed circuit board. (A 6×6 matrix needs only 18 dp3t switches.)

Construction. The printed circuit board layout is simple if a double-sided board is used. Certainly double-sided boards are more expensive, but the sheer number of jumpers that would be required for a single-sided design makes the choice very easy: use double-sided boards and save the hassle of loading 36 jumpers. Full-size foil patterns are shown in Figures 4 and 5.

If you make your own pc board, it is absolutely essential that it have plated-through holes to provide connections from the top to the bottom of the board. This is necessary because there is no room to get a soldering iron to the pads under the switches. To assemble the parts on the board, simply insert the switches from the component side of the board as shown in the top side loading diagram of Fig. 6. With all of the handles in the center position, turn the loaded pc board over onto a flat surface (a piece of cardboard may be handy here to avoid losing the switches). Before soldering, be absolutely sure the switches are on the proper side of the board.

Solder two diagonal corner pins on each switch first. Check to make sure that each switch is properly seated against the board. Otherwise, the pc board will not fit properly behind the front panel assembly. If any of the switches are improperly seated, reheat the two soldered legs while pushing the switch firmly into place. When you are sure that all the switches are properly installed, solder the rest of the pins.

The phono connectors are inserted into the board from the bottom at the locations shown in Fig. 7, and soldered on the top side. The board
Figs. 4 and 5. Full-size foil patterns for the two sides of the pc board.
switchbox

Fig. 6 Top side loading diagram shows switches inserted from the component side of the pc board.

Fig. 7. Phono connectors are inserted into the board from the bottom at the locations shown above.

attaches to the front panel with four ⅛-inch standoffs that are pressed into the sheet-metal front panel. The circuit board is attached to the standoffs with ¼-inch, 6-32 screws. The front panel and switchboard assembly are now attached to the wooden end panels with three ⅛-inch, 6-32 screws on each side, with the screw heads resting in countersunk recesses.

At this point the box is complete. Notice, however, that not all the holes in the pc board are filled. These holes are for some optional jumpers. But first let's try it out and get back to the jumpers in a moment.

Use. As a suggestion to get started, hook up your system as shown in Fig. 8. It is recommended that you either label each channel on the front panel or use a card patterned after Fig. 8 to remind you which components are connected to each switchbox channel. This is so you can keep track of which components are being hooked together. If you don't have all the equipment shown, don't worry, just adapt the general plan to what you have. Notice that in Fig. 8, the tape loop output from the receiver is connected to row 1 of the switchbox (labeled input 1 on the front panel and on the pc board). The tape loop input of the receiver is connected to vertical column 1, labeled output 1. In a similar manner the equalizer output is hooked to input 2, and the equalizer input is hooked to output 2.

There is a difference in how we wish to treat these two devices. It will do no harm to connect the receiver's tape loop input and output together (this is what happens inside the receiver when the tape monitor switch is disengaged). But it makes little sense to hook the output of the equalizer to its own input; in fact to do so will probably start a fierce speaker-blowing oscillation as the audio signals run around in circles through the equalizer. It is also not a recommended practice to connect the tape deck output to its input. If it is a two-head deck, or a three-head deck with the monitor switch in the source position, the results are much the same as with the equalizer. If the monitor switch is in the tape position, an echo is the result. The echo will grow or decay depending on how the gains are set. Therefore, with a receiver it is acceptable to connect between the tape monitor output and input. Also, in situations like that shown in Fig. 2 where a tuner and power amplifier use the corresponding input and output, it is necessary to be able to make this connection. But for most components, a connection to itself may be hazardous to the health of your amplifier, speakers and ears.

This brings us to Rule Number 1: Do not connect an output to the input of the same device without at the very least stopping to think about what you are doing. To avoid the need to stop and think each time a switch is
thrown, connections on the diagonal of the matrix, points (1,1), (2,2), etc., are omitted from the pc board. If both the input and the output of a device are always assigned to the same input and output number on the switchbox, for example the tape machine in Fig. 8, then rule I may be safely ignored. For occasions when a connection is needed, holes are provided on the pc board so that adding a pair of jumpers will enable diagonal connections. If you want to protect against forgetfulness or a child playing with all the pretty switches, leave the jumpers out. For those places where you need to connect a row to the corresponding column, add the two jumpers for the row and column you intend to use. The jumper locations are numbered on the pc board and shown in Fig. 7.

Another word of caution is appropriate here. Rule Number 2: Do not engage two switches in the same column at the same time. Even with jumpers installed only in the right places (or not at all), it is possible to have a feedback problem. In Fig. 8, a switching arrangement is shown where two devices try to feed the same input at A (2,3) and B (4,3), while tape 2 feeds another input at C (4,2). This enables a feedback path to occur even though there are no diagonal connections. The result is the same as if a phantom connection existed at D (2,2). To avoid this, remember to turn any switch in a column off before another switch in the same column is engaged.

Now that your switchbox is properly installed in your system, complete system flexibility is available at your fingertips. If you need to reconfigure your system, just flip the appropriate switches and your system is reconfigured. For example, if your system is normally set up with the equalizer before the power amplifier for speaker

and/or room equalization, it is now easy to place it into any other signal path in the system. This is extremely useful when a tape needs equalization. Or what about the tapes that were made before you bought your new signal processor? Just switch it into the tape playback path. If you want to monitor another component while recording a tape or record, just follow the example of Fig. 2. And if you are one that sets up your own bias and equalization on your tape deck, simply find an unused input and inject the signal through your switchbox. These are just a few of the 279,935 useful combinations available (there are 387,420,489 possible combinations but most are not useful because they include feeding two sources into one input). The flexibility of a switchbox in your system is only limited by your own imagination. Now that you have quit fiddling around behind your system, you can start enjoying the music.

KIT AVAILABILITY

The following are available from Sound Technics, 2115 Derby Hill Dr., Loveland, CO 80537: Complete kit of parts including 18 dp3t switches (UID part #MG-023-12-6-P-2W), 24 pc-mount RCA phono jacks, pc board, epoxy-finished front panel, unfinished walnut end panels, feet, and screws, for $55.00. Also available separately is a pc board for $24.50 (not separately available after 9/30/82); six-foot stereo-connector cables with dual-phono connectors on each end at $2.50 each or six for $13.00. Add $3.00 for shipping and handling. Colorado residents, add 3% sales tax.
It takes a lot to be a winner in the computer industry these days. When it comes to magnetic media it takes a successful magnetic coating formulation and expert manufacturing skills. It takes steady performance in critical applications, and endurance over the long run.

Wabash MAXI-MYTE™ 8" diskettes and MINI-MYTE™ 5¼" diskettes are a quality buy no matter what your criteria. In standards testing performed by 25 prestigious drive manufacturers (including the world’s largest) Wabash diskettes emerged a sure winner...with the papers to prove it.

The fact is, Wabash quality is unsurpassed in the industry, with a five year usage warranty that will keep your customers satisfied for years to come.

So the next time you’re faced with a purchasing decision, don’t take chances. Any way you look at it, Wabash diskettes are your best bet for the long run.

ONE-CHIP
R-F MODULATOR FOR
CRISP COLOR SIGNALS

Low-cost, easy-to-build circuit enables games and computers to produce excellent color on TV receivers

BY MARTY BERGAN AND BEN SCOTT

CONVERTING a baseband video signal from a computer, video game, VCR, CCTV camera, etc., into an r-f signal suitable for use by a conventional TV receiver is the job of an r-f modulator. These usually consist of a low-band (channel 2 through 6) oscillator driving a modulator and antenna matching network for connection to the TV receiver antenna input connector.

Unfortunately, most r-f modulators do not have the bandwidth to transmit a clean, crisp image to the color-TV receiver which is already somewhat limited in bandwidth. The result is usually just a passable color display.

The recently introduced MC1374 TV Modulator Circuit, shown in block diagram form in Fig. 1, has a performance that exceeds the accuracy of most TV receiver systems. Nonlinearity is less than 2%, differential phase distortion is under 2 degrees, and differential gain distortion is less than 7%. (A schematic of the circuit is shown in Fig. 2.) Driven from a 75-ohm source, there is no rolloff at 30 MHz. Unlike most r-f modulators, the MC1374 has separate inputs for video and audio, thus greatly reducing the possibility of crosstalk and unwanted mixing products.

**Video Section.** The AM video system is a basic multiplier combined with a balanced oscillator capable of operation to over 100 MHz. Since the signal inputs are not internally dc biased, the user can bias the device for the required video dc level and polarity. This, plus the separation of the inputs, keeps the video and intercarrier sound sources from interfering with each other. Chip temperature and voltage stability are excellent with respect to output frequency, thus no supply regulation is required.

The r-f output is directly proportional to the voltage difference between pins 1 and 11. Consequently, short leads are required to these pins. A long lead might introduce carrier shift, a result of output r-f being picked up on the lead. If the video source impedance is low, pin 11 can be shunted to ground via a low-value (47 pF) capacitor to reduce the possibility of oscillator feedback. Reasonable layout care will yield carrier rejection ratios of 36 to 40 dB below sync tip level carrier.

Resistor $R_g$, connected between pins 12 and 13, is for gain adjustment, and is selected so that only about half the dynamic range can be used at sync tip level to avoid modulator saturation. For example, the FM oscilla-
r-f modulator

Fig. 2. Schematic of the complete modulator circuit. There are separate inputs for video and audio.

Misc.—4-pin socket, mounting hardware, suitable enclosure, 12-Volt power supply.

Note—The following are available from Circuit Specialists, 730 S. Perry Lane, Tempe, AZ 85281 (Tel: 602-966-0764): printed-circuit board at $4.95; IC MC1374 at $3.50; diode MPN3401 at $0.70.

Operation in this region is necessary when using a 5-V power supply, but should be avoided when a higher supply voltage is available.

A biasing divider to pin 1 and another to pin 11 can be chosen to establish nominal conditions for a static picture, so that a test pattern signal can be ac coupled to the input. The relative polarity and exact difference between these dc levels is critical to the establishment of standard levels. A positive-going (sync) video signal requires a dc bias on pin 11 that is approximately the average value of the video with respect to pin 1 bias. A negative-going video signal requires that pin 11 be biased below pin 1 by the same amount. If Vcc changes, divided voltages will change proportionately, as will the difference between them. This is unacceptable because it changes modulation depth. Similar difficulties occur if the video input signal changes in average value, as for a full white or full black scene.

In many cases, the video source itself is d-c referenced, and can be made to provide both pin 1 and pin 11 reference levels. If not, the two divider voltages must be regulated, and the signal sync tip clamped to the pin 11 bias by diode D2. The divider impedance should be kept low to minimize the time constant of clamping corrections, as video content changes.

The output frequency can be selected from channel 3 or 4 by a dc control circuit. Selection is accomplished by changing the C of the tank circuit with a switching diode, D1. When the diode is forward biased, it effectively parallels C7 with C2 thereby lowering the frequency of the oscillator (Ch. 3 selected). When D1 is reverse biased, its impedance is very high, eliminating C7 from functioning in the circuit and raising the frequency (Ch. 4 selected). To align this circuit, first select Ch. 4 (C7 switched out) and tune L1 to 67.25 MHz (Ch. 4). Then switch to Ch. 3 and adjust C7 to obtain 61.25 MHz (Ch. 3).
FM Sound Section. The FM system was designed specifically for the TV intercarrier function at 4.5 MHz, and will operate from 1.4 to 14 MHz. Performance of this system compares favorably to many laboratory generators and exceeds the distortion performance of varactor modulators by several times. For example, at 4.5 MHz, a deviation of ±25 kHz can be achieved with 0.6% distortion.

The oscillator center frequency is approximately the resonance of inductor L2 and the effective capacitance C3 from pin 3 to ground. Include approximately 6 pF (internal) when making frequency calculations. For overall oscillator stability, it is best to keep \( X_L \) in the range of 300 to 1,000 ohms.

One added convenience in the FM section is the separate "oscillator B+" (pin 4), which permits disabling the sound system during alignment of the AM section. Usually this pin is hard-wired to the \( V_{CC} \) source without decoupling.

Standard practice is to provide preemphasis of higher audio frequencies at the transmitter and a matching deemphasis in the TV receiver audio amplifier. This is to counteract the fact that less energy is usually present in the higher audio frequencies, and also fewer modulation sidebands are within the deviation window. Both factors degrade signal-to-noise ratio. Preemphasis of 75 µs is standard. For cases where preemphasis is not provided, a suitable network can be made from a parallel-connected 0.0012-µF capacitor and 56,000-ohm resistor between C6 and pin 14.

Modulators of this type, when operated at 1 kHz, introduce substantial second harmonics in the r-f output. At 67 MHz, the second harmonic is only 6 to 8 dB below the maximum fundamental. This poses no real impairment of performance as it would be ignored by the TV receiver's selectivity, but it would not meet FCC requirements. To compensate, a simple double-pi filter is used at the chip output.

The schematic of Fig. 2 includes a simple and almost lossless second harmonic r-f filter formed by L3, L4 and their associated capacitors. Gain resistor R8 was selected for an intended video input of approximately 1 volt peak at the sync tip, and biasing is arranged for negative-going sync. This produces a signal at the output filter of about 12 mV rms, about 12 dB greater than FCC rules permit. Therefore it must be padded down for commercial applications.

The intercarrier sound signal is coupled to the AM modulator by C4. The input impedance at pin 1 is very high so the intercarrier level is determined by the source impedance at pin 3 (about 2000 ohms). This drives into the bias circuit impedance of R4 and R5 (about 2200 ohms) through C4. This provides an intercarrier level of nearly 500 mV peak-to-peak, correct for the 1 volt peak video level selected. This audio input for a full 25 kHz FM is about 0.2 volt peak-to-peak. If the preemphasis circuit previously discussed is used, the audio input will have to be increased approximately 10 times.

Construction. The modulator can be assembled on a pc board such as that shown in Fig. 3. If you elect to create your own layout, keep all leads as short as possible. The completed board can be mounted in any selected enclosure.

The circuit can be powered from any regulated 12-volt source having good filtering and bypassing. With a typical 12-volt regulated source, measured r-f carrier deviation was less than 10 kHz between 0° and 50 °C for any video input level.

POPULAR ELECTRONICS
DECIMAL MULTIPLICATION FOR THE ZX-80

A program to expand the range of your microcomputer

BY LOYD REDMAN

ALTHOUGH the Sinclair ZX-80 performs only integer arithmetic, it can be made (via software) to perform decimal multiplication. Pages 35 and 36 of the ZX-80 operating manual show a program that multiplies two integers and displays the two integers, then determines the location of the decimal point in the product (no more than four decimal places).

Lines 10 to 120 enter and display the multiplier and multiplicand (without decimal points) and the number of decimal places in the product. All you need to add to this program are instructions telling the computer where to place the decimal point in the product. Make sure neither the multiplier nor the multiplicand contains more than five digits. Remember, the ZX-80 will not perform a multiplication if the product is larger than 32,767 due to internal arithmetic limitations.

The program shown here multiplies two integers and displays the decimal places in the product. Lines 130 to 190 find the value of the integer (whole-number) portion of the product. Lines 200 to 280 instruct the ZX-80 to examine the portion of the product to the right of the decimal point to determine the proper format for displaying the complete answer. The routines at lines 300, 400, 500, and 600 show the format used when printing the product.

WITH the cost of electricity constantly rising, you might want to check how many hours an appliance or the TV set has been on during the day. An ideal way to do this is with the Time-On Recorder described in this article. Unlike many mechanical timers, which you have to stop and start yourself, this recorder is triggered on and off by the appliance itself.

The recorder is a relatively simple device to build. It has a single clock chip which performs all timing functions. This chip, an MX 2509, has a 24-hour LED display format. The chip times only when an appliance plugged into the recorder is turned on. A circuit in the recorder senses that the appliance is on and "enables" the clock chip. The recorder displays a continuously changing time until the appliance is shut off. At this point, the clock chip is disabled but it holds the time count. The displayed time remains unchanged until the appliance is turned on again, at which point the clock continues timing. This is how the recorder displays the cumulative "time on" of the appliance for the entire day.

Circuit Operation. To use the Time-On Recorder, an appliance must be plugged into socket S31 of the recorder and the recorder plugged into an ac outlet. When the appliance is in use, its current flows through fuse F1 and the triac (Fig. 1). Fuse F2 protects the triac and also disconnects the circuit from the line in the event the primary of T2 becomes shorted. The triac is held on constantly by resistor R1 as long as current is flowing through the device. The drop across the triac is approximately 2 volts, which remains relatively constant despite changing current. Most of this voltage is across R2, but a portion excites the 8-ohm winding of T1.

The 100K-ohm, center-tapped secondary of T1 produces an ac voltage that is rectified by D1 and D2, filtered by C1, and applied through current limiter R3 to the base of Q5 an npn transistor. Fuse F2 protects T1 in the event the triac should open while a load current is flowing. If this happened, the entire current would be forced to flow through T1 causing a great deal of damage.

When there is no load, Q6 receives no base current and is off. Under this condition, pin 19 of the clock chip is brought up nearly equal to Vcc through resistors R4 and R5. Pin 19 of the clock chip is the 50/60-Hz input. (See Fig. 2 for the pin-out configuration of the clock chip.) When it is held at Vcc, the clock's time will not change. If a load is present and drawing current, transistor Q6 receives a base current which forces it on. With Q6 on, pin 19 of the clock chip is grounded. This condition allows the
Watt Wizard Saves Energy! How?
Your AC induction motors run at a nearly constant speed. Using the same current for light or heavy loads. Watt Wizard Power Factor Controller is a remarkable device that saves energy by sensing the motor's power factor and reducing the supply voltage for light-load conditions. The current drawn is then more in phase with the supply voltage...the current and voltage are reduced. LESS ENERGY is consumed by the motor saving the user energy cost!

The Power-Factor Controller Was Developed and Tested by NASA.
The amazing energy-saving device was developed at NASA by Frank Nola as part of a program to reduce power consumption in spacecraft motors. NASA tested the Power-Factor Controller on 40 types of motors with POWER-SAVINGS, incredibly verified at UP TO 60%! The motors tested were both single-phase and three-phase induction motors—THE MOST COMMONLY USED MOTORS IN MAJOR HOME APPLIANCES AND INDUSTRY...the motors you use in YOUR HOME...YOUR BUSINESS! The Power-Factor Controller is, in essence, a POWER-SAVER!

Watt Wizard Saves Money! (Your Money.)
No one knows better than you—the cost of electric power keeps rising...and rising! The Watt Wizard, by saving up to 60% of the power needed to run motor-operated appliances, saves up to 60% of the costs of running them too. Look at your recent electric bills. Typically, you are paying monthly about $20.74 to operate a 16.5 cu. ft. frost-free freezer. $29.00 to run a 23 cu. ft. frost-free refrigerator and about $60.00 to run an air conditioner for the summer. Now count all the motor-operated appliances in your home or business. Think of reducing the costs of running them by 20%—40%—60%! Think of your SAVINGS! Then you will know WHY you need a Watt Wizard for any of them...ALL OF THEM! (Just by looking at the Watt Wizard's exclusive LED readout you will KNOW AT ANY GIVEN MOMENT HOW MUCH POWER—HOW MUCH MONEY—you are actually saving!

It's So Easy to Use.
Just choose the right model Watt Wizard and you're ready to save money EVERYDAY. For less than 1 H.P. motors (the motors used in most freezers, refrigerators, fans, swimming pool pumps, vacuum cleaners, sewing machines, etc.) Cynex offers the 110V AC model. Watt Wizard, when plugged into a wall outlet, is ready to start saving you energy and money. Washers and dryers require the Cynex wire-in Watt Wizard, which you might need an electrician to install. Both come with a "power-on" light and are solid-state.

Watt Wizard Saves Machines!
Because the Watt Wizard senses the power-factor of your motor and applies only the exact voltage required to run it at a constant quieter speed, your MOTOR RUNS COOLER AND MORE EFFICIENTLY...AND HAS AN ENHANCED LIFE EXPECTANCY! Too. Watt Wizard replaces the need for conventional electro-mechanical motor starters and virtually eliminates the burn-out of starter parts. Watt Wizard is solid-state, fail-safe and has an anti-stall circuit which makes it virtually impossible for a motor to burn out.

Independent Studies Prove Power Savings of Up To 60% Of Watt Wizard's Efficiency.
Independent studies by a reputable testing laboratory prove that in commercial and industrial applications Watt Wizard results in power savings of up to 60% while an average of 37,000 hours of mean-operating time elapsed before a failure occurred to any of Watt Wizard's major components! MORE! WATT WIZARD IS FUSED—Won't burn out. Comes with "power-on" light.

You NEED to save energy.
You NEED to save money.
You NEED to save machines.
YOU NEED WATT WIZARD!
ORDER IT TODAY! Only $39.99 plus $2.50 for postage and handling.

Watt Sensor... plugs you into electric costs... plugs you into savings! $29.95
Limited Supply
Watt Sensor: A simple-to-use accurate device that takes you out of the dark about electric bills by plugging you into the cost per hour of operating your 110V pluggable appliances. Unless you know the cost of running your refrigerator, hair blower, toaster, etc. you need Watt Sensor! Just insert the Watt Sensor into the nearest 110V outlet closest to the appliance you want to check, plug appliance into Watt Sensor and LEARN IN CENTS PER HOUR HOW MUCH THAT APPLIANCE IS COSTING YOU TO RUN!

30-DAY MONEY-BACK GUARANTEE
Try the Watt Wizard for up to 30 days. If not completely satisfied, return it (insured) for a full refund.

The sooner you send for the Watt Wizard, the more you can save on your electric bills. To order, send your check or money order to the address below. Or charge it to your Visa or Mastercard credit card. If using your charge card, you can also order via our toll-free phone number: 800-453-4000.

CIRCLE NO. 15 ON FREE INFORMATION CARD
clocking pulses produced from the 60-Hz line to pass through diode D3. These pulses cause the clock’s time to advance. As soon as the load is turned off, Q6 turns off, and the clock stops timing.

The clock chip, an MM5309, has multiplexed, 7-segment outputs which are used to directly drive a five-digit numeric, monolithic display. The digit-enable outputs of the clock chip are used to drive npn transistors Q1 through Q5. These transistors in turn drive the individual digits. Tens of hours and minutes and units of hours, minutes, and seconds are displayed. Units of seconds are displayed so the user can verify, at a glance, if the circuit is timing. Components R7 and C4, connected to pin 26 of the clock chip, provide an RC network for the internal multiplex oscillator. Together, R7 and C4 determine the rate at which the display is multiplexed.

The dc supply voltage is provided by IC2, a full-wave bridge rectifier, and capacitor C2. The latter not only filters the voltage from IC2 but, more importantly, it raises the average dc voltage from 11 volts to 17 volts, which is a functional voltage level for the MM5309. The MM5309 does not require a voltage regulator.

Switch S1 is connected to pin 16 of the clock chip and is used to reset the clock to all zeros. Normally pin 16 is tied high internally allowing the clock to time. Depressing S1 shorts pin 16 to ground performing the reset function. Switch S2 is optional and can be replaced with a jumper wire if the builder prefers to see units of seconds displayed all the time. (I found displaying units of seconds confusing without also displaying tens of seconds when trying to interpret the display.) Switch S2 is depressed by the user to see if the clock is timing and then released.

Pin 14 of the MM5309 is tied low so the timer will time correctly with a 60-Hz clock signal on pin 19. Pin 27, the 4/6 digit select, is tied low to enable the units and tens of seconds outputs (pins 21 and 20) along with the minutes and hour outputs. Lastly, pin 13, the 12/24 hour select, is left disconnected (the pin is pulled high internally) so the timer will time to 24 hours before recycling.

**Construction.** Building of the time-on recorder is not complicated. A printed-circuit board such as the one shown in Fig. 3 greatly simplifies wiring. However, the circuit is simple enough that it can be hard-wired on perfboard if desired. The mounting of all components except F1, R1, S01, the triac, and the switches on the board helps reduce the amount of off-board wiring. Figure 4 shows component placement for the pc board. Take care in inserting IC’s in case the leads must be bent to match holes.

**Fig. 1** Schematic diagram of the Time-on Recorder.

The following resistors are ¼-W, 5% tolerance carbon-composition resistors:

- R3, R7—220 kΩ
- R4—47 kΩ
- R5—1 MΩ
- R6—100 kΩ
- R8 through R14—1.8 kΩ

SO1—Polarized ac socket with ground

S1, S2—Normally open, momentary-contact, pushbutton switch

T1—Miniature audio-output transformer (Radio Shack 273-1380 or equiv.)

T2—12-6-V, 300-mA transformer

Triac—400-V, 6-A (Radio Shack 276-100C or equivalent)

Misc.—Suitable enclosure, circuit board, standoff, line cord, strain relief, IC sockets (one 28-pin, one right-angle 14-pin), panel-mounted fuse holder, pc-mounted fuse holder, mounting hardware, terminal strip, solder, etc.

Note—The MM5309 clock chip is available from Jameco Electronics, 1355 Shoreway Rd., Belmont, CA 94002.

*Fig. 2. Pin connections of the two integrated circuits.*

The triac's MT2 terminal. Then, as shown in the schematic, the triac's MT1 terminal is connected to the neutral. The ground wire of the line should be electrically fastened to the metal chassis enclosure (if one is used) and to the grounding screw of SO1. All of the wiring just mentioned should be 18- or 18-gauge stranded wire. (Solid wire of this gauge is difficult to work with in the chassis box.) Other ac wiring is not as critical size-wise (24 gauge will work fine), but care should be taken to follow the schematic closely.

The time-on recorder pictured in Fig. 5 was assembled in a 3/4 x 9 x 6". 20-gauge, aluminum cabinet such as Radio Shack's part number 270-261. Whichever cabinet is chosen, it should be of easily machinable material since square holes are required for the outlet and the display. If the display is mounted on the board, it should be located at a side and mounted with a 14-pin right angle socket. This way the board can be mounted flat and positioned on standoffs so the display appears in the cabinet front.

The triac must be heat sunk. The metal chassis itself functions well as a heat sink if the triac is mounted with a nylon bolt on a mylar spacer. The triac can be connected to a terminal strip for all the connections to it. Also recommended is that the clock chip be mounted in a socket, with the chip placed in the socket only after all wiring is complete.

**Using the Time-On Recorder.** To use the recorder, plug it in and reset the clock so the display shows all zeros. Then plug an appliance into the recorder's socket. Turn the appliance...

Fig. 5. An RC shunt on the triac improves operation with inductive loads.

Some loads, such as a dehumidifier may be rated at 5 A but when first turned on will draw in excess of 6 A. This will cause fuse F1 to blow. In this case, the time-on recorder cannot be used. Also, if the ac line has noise spikes on it (from appliances such as a dehumidifier) the recorder may be accidentally reset and lose its count. To remedy this add capacitors C3 and C4 as shown in the schematic. These components may also be needed if the load is a fan. These capacitors shunt the noise spikes on the ac line to ground. Note also that there is a minimum load requirement to start the recorder timing. A load as small as 10 watts will activate the recorder, while a load of 7 1/2 watts will not.

Although the recorder can be used to tell you how much television the family is watching or the like, it can also tell you how much the television is costing you to use. To find the cost, take the total time in hours, multiply it by the power rating of the load in kilowatts and then multiply by the kilowatt-hour in your area.

Going Further. The circuit shown in Fig. 1 uses a triac to produce the signal that enables the clock chip. The triac was selected because of its easy availability. It does, however, restrict the types of loads that can be timed. That is, the triac will prevent large inductive loads such as fans and other motors from starting.

If you want to avoid this, the circuit can be changed. Shunting the triac with a series RC circuit as in Fig. 5 would eliminate the problem mentioned with inductive loads. This solution, however, requires two additional components and creates the problem of finding the values of the two components. Therefore, the circuit shown in Fig. 6 is preferable. If the diodes are available, use the circuit to replace the part of the original circuit which uses the triac. No other change in the circuit is necessary.

If one of the diodes in Fig. 6 fails, fuse F2 will blow to protect T1. In this case, the bad diode and F2 will have to be replaced before the circuit will operate. This type of circuit failure should be kept in mind if F2 blows but there are no wiring errors present.

Photo of the Internal arrangement of the author's prototype.
HAVING designed and built the interface for receiving Morse code, into the CPU, it is now necessary to program the CPU program memory. There are several types of read-only memory (ROM), each of which has its unique way of being programmed. One type is the mask programmable ROM in which the desired binary state of each memory cell (bit) is programmed by selectively including or excluding a small conducting jumper in the cell during manufacture. This type of ROM programming is permanent and the bit pattern cannot be altered once programmed. A change of even one bit requires that a new custom mask be made, which is a relatively expensive process (about $1,000). This type of ROM is generally used only in high-volume production applications where the desired bit pattern has already been proven and the probability of pattern changes or updates is very unlikely.

A second type of ROM is the Programmable Read-Only Memory (PROM). This device is similar to the mask programmable ROM, but has the advantage of being field programmable—that is, the customer can program it himself. This is done by selectively “blowing” fusible links (made of polycrystalline silicon or nichrome) in each memory cell with a relatively high-current pulse to obtain the desired bit pattern. Needless to say, the PROM must be discarded and a new one programmed if any bit changes are to be made which would otherwise require the repair of a blown fuse link. The PROM shares the same disadvantage of the mask programmable ROM—it is not reprogrammable.

The last type of ROM we will examine is the Erasable and Programmable Read-Only Memory (EPROM). As its name suggests, the EPROM can be programmed by the user. However, rather than “blowing” fusible links as in the PROM, a small electric charge is selectively deposited in each memory cell. The EPROM has the property that when its chip surface is exposed to ultraviolet light, any charges deposited in the memory cells are removed, which completely “erases” the memory. This unique property of the EPROM gives it the added feature of being reprogrammable. The EPROM chip is covered by a transparent quartz lid (rather than the conventional opaque metal or plastic cover) which allows it to be exposed to ultraviolet light. The erasing process (exposure to UV light) normally takes from 20 to 30 minutes, and will set all of the EPROM’s memory cells to a logic 0. Programming a cell to a logic 1 is done electrically by depositing a small electric charge in that cell. However, the only way a programmed cell can be changed from the 0 state to the 1 state is by erasing the entire device.

The EPROM is generally used in prototype systems, where bit pattern changes are likely to be made. Because of the distinct advantages the EPROM offers, it is this type which is used for the CPU module’s program memory.

Program Development Board Design. In a 2K EPROM, there are over 16,000 memory bits to be programmed (depending on the length of the user’s program), and there are strict timing requirements that must be adhered to when programming. To solve these problems the Program Development Board (PDB) was designed. Its objectives are:

1. To provide a “program-development memory area” where 8080 programs can be conveniently stored and edited. This memory area should exist in the same address space as the CPU’s EPROM, and the CPU must be able to execute any program stored in this area. In this way a new program can be loaded, tested, and debugged before it is copied (“burned”) into an EPROM.
(2) To monitor the status of the Address, Data, and Control busses at all times.

(3) To single-step the CPU one instruction at a time, thereby enabling the programmer to observe the results of each program instruction as it is executed. This provides an instructional tool as well as an aid in debugging new programs.

(4) To single-step and monitor the execution of a program already contained in the CPU's EPROM.

(5) To provide a fast and efficient means of burning a newly developed program into an EPROM.

To satisfy design objective 1, a 2K-byte ROM emulator and a 20-key keypad were incorporated into the PDB design. The ROM emulator (Fig. 25) is comprised of the same type of RAM used in the CPU module, but begins at memory address 0. Although the CPU cannot write data into this memory area, it can read program instructions and data previously stored there. This provides built-in protection to prevent a bad program from completely wiping itself out. It is only possible to begin program execution at memory location 0, just as the CPU module does when first power-up. In these ways, the program development memory simulates the CPU's EPROM from which the CPU normally obtains its instructions, even if a programmed EPROM is installed in the CPU module. This ensures that programs which run successfully in this memory area will also run properly when they are transferred to the CPU's EPROM. Program instructions and data are loaded into the program development memory via the keypad interface.

---

Fig. 25. The ROM emulator is comprised of the same type of RAM used in the CPU module, but begins at address 0.

Fig. 26. Program instructions and data are loaded into the program development memory via the keypad interface.
opment memory via the keypad (Fig. 26). It is also possible to examine the contents of any memory location in the program development or scratchpad memory via the keypad (Fig. 27).

A four-digit hexadecimal display monitoring the CPU's Address Bus, a two-digit hexadecimal display monitoring the Data Bus, and four LED's monitoring four of the five Control Bus lines satisfy design objective 2 (Fig. 28).

Through the use of a special key of the keypad it is possible to single-step the CPU in one of two selectable modes (Fig. 29). The first of these modes causes the CPU to execute one instruction with each depression of this key. The second mode causes one 8080 machine cycle to be executed with each depression of the key. The states of the CPU busses are always displayed in these modes to aid in monitoring an executing program's progress.

To satisfy design objective 4, the PDB allows the programmer to select the "memory bank" the CPU will use to obtain its program instructions from; the program development memory or an installed CPU EPROM. The CPU scratchpad RAM area beginning at memory location 800, is always accessible to a running program, regardless of the memory bank selected.

When the programmer is satisfied with the operation of his new program, the depression of a single key of the keypad will burn the entire contents of the program development memory into an erased EPROM installed in the CPU module in less than two minutes (Fig. 30). After a successful burn, the programmer can separate the CPU module and interface(s) from the PDB (Fig. 31) and connect the CPU module directly to the interface(s). The programming of the CPL module in this particular application is now complete, and so are the design objectives of the PDB.

**Functions.** There are two primary modes of operation of the PDB—edit and execute. The edit mode allows program instructions and data to be loaded, examined, and altered in the program development memory. The PDB enters the execute mode whenever the CPU is single-stepped or run. Here are the PDB functions:

0 through F (numeric): Used to enter hexadecimal memory addresses and load program instructions and data into the program development memory area. The destinations of the numbers entered with these keys are governed by the A/D key.

A/D (Enter Address/Load Data): Places the PDB in the edit mode and also determines where subsequent nu-
numeric entries will be sent. Each key depression alternately lights a decimal point in the display corresponding to the destination of subsequent numeric entries (address or data). Actuating this key while a program is running will momentarily reset the CPU, restarting the running program.

SS (Single-Step): Places the PDB in the execute mode and allows the CPU to execute one instruction or one machine cycle (as selected by the instruction cycle switch) each time the key is actuated. A program can be restarted in the single-step mode at memory location 0 by depressing the A/D key followed by the SS key.

P (Program): Depressing this key will burn the contents of the program development memory into an erased EPROM installed in the CPU module. The keypad is disabled until the burn cycle has ended.

EX (Examine): Operates only when the PDB is in the edit mode. It allows the contents of the next sequential memory location (as displayed on the Address display) to be viewed on the Data display.

BANK: Determines which memory bank the CPU will use to obtain its instructions and data when single-stepped or run. Closing the switch will select the EPROM installed in the CPU module; otherwise the PDB’s program development memory is selected.

INSTRUCTION CYCLE: Operates in conjunction with the SS key. Closing the switch causes the SS key to operate in the instruction-cycle mode; otherwise it operates in the machine-cycle mode.

SLOW: Also operates in conjunction with the SS key. Closing this switch

Fig. 28. The display logic drives a four-digit address display, two-digit data display, and four of the five LEDs on the control lines.

Fig. 29. The CPU can be single-stepped in one of the two selectable modes.
Interested in computers or robotics? Looking for info on hardware, software, theory, and applications?

The Computer Book Club offers an incredible range of computer books and a huge variety of tapes and disks... ALL at low, low member prices!

Select 6 fact-filled books for only $2.95 (total value up to $108.70)

7 very good reasons to try The Computer Book Club
Blue Ridge Summit, PA 17214

- Reduced Member Prices. Save up to 75% on books sure to increase your know-how.
- Satisfaction Guaranteed. All books returnable within 10 days without obligation.
- Club News Bulletins. All about current selections—mains, alternates, extras—plus bonus offers. Comes 10 times a year with dozens of up-to-the-minute titles you can pick from.
- "Automatic Order." Do nothing, and the Main selection will be shipped automatically! But... if you want an Alternate—or no books at all—we'll follow the instructions you give on the reply form provided with every News Bulletin.
- Continuing Benefits. Get a Dividend Certificate with every book purchased after fulfilling membership obligation, and qualify for discounts on many other volumes.
- Extra Bonuses. Take advantage of added-value promotions, plus special discounts of software, games, and more.
- Exceptional Quality. All books are first-rate publisher's editions, filled with up-to-the-minute info.

Please accept my membership in the Computer Book Club and send the 6 volumes circled below. I understand the cost of the books selected is $2.95 (plus shipping/handling). If not satisfied, I may return the books within ten days without obligation and have my membership cancelled. I agree to purchase 4 or more books at reduced Club prices during the next 12 months and may resign any time thereafter.

CIRCLE NO. 53 ON FREE INFORMATION CARD
allows execution of instruction or machine cycles at a rate of approximately two cycles per second for the duration of the reset key's depression.

RUN: Places the PDB in the execute mode and allows the CPU to exit the Wait state, so that the program contained in the selected memory bank is executed at full speed (approximately 500,000 machine cycles per second). All keypad functions except A/D are disabled.

ADDRESS DISPLAY: A dual-function display of either the contents of the CPU Address Bus (execute mode) or the address of the addressed location of the program development and scratchpad memory areas (edit mode).

DATA DISPLAY: A dual-function display of either the contents of the CPU Data Bus (execute mode) or that of the addressed location of the program development and scratchpad memory areas (edit mode).

MI: Indicates the CPU is in machine cycle one of an instruction cycle.

PGM: Indicates the PDB is in the process of burning an EPROM.

INTE: Indicates the CPU signal INTE is active.

The following LED's display the status of the control bus signals:

MR: Indicates the CPU signal MEMR is active.

MW: Indicates the CPU signal MEMW is active.

I/O: Indicates the CPU signal I/O is active.

IOW: Indicates the CPU signal I/OW is active.

Power Supplies and Adjustments. The PDB can be powered from the CPU module's supplies (J2), but an unregulated +30 volt supply is also required for programming an EPROM. The latter supply must be between +28 and +40 volts for the on-board 25 volt regulator to operate properly. Three (preferably four) fresh 9 volt transistor radio batteries connected in series will give satisfactory operation if you don't want to build a separate ac-powered supply.

Two adjustments must be made on the PDB to ensure proper programming of EPROMs. First remove any EPROM that may be installed in the CPU module and attach the CPU module to the PDB. Apply power to the CPU module and depress the Program key on the PDB. (The unregulated 30 volt supply must be connected to the PDB for this adjustment.) Adjust R16 on the PDB for +25 volts at pin 13 of J3 (Vpp). (This voltage must lie in the range of +24 to +26 volts or damage to the EPROM could result.)

The second adjustment can be performed with the 30 volt supply disconnected. Depress the Program key while monitoring pin 11 of J2 (PGM) with an oscilloscope. A low-frequency rectangular waveform should appear. Adjust R5 so that the positive portions of this waveform are 5O ms ±5 ms in duration. These are the programming pulses to the EPROM which, in conjunction with the 25 volt programming supply, burns each memory location of the EPROM. There are 2048 program pulses during a complete burn cycle (corresponding to...
New LM-4.
The 40-Channel Logic Monitor you hold in your hand.

Now, there's a unique new way to speed and simplify your work with complex digital circuits. By simultaneously monitoring up to 40 points in a logic system with a compact, easy-to-use instrument that's faster than a scope and safer than a voltmeter. It's our new multi-family LM-4. At our factory introductory price of $199.00, one of the best buys in logic today!

Simply slip its 40-pin IC test clip over your CMOS or TTL ROM, RAM, microprocessor or MSI/LSI chip and instantly see the logic state of each pin on a big, easy-to-read liquid crystal display.

But that's only the beginning. You can wire the LM-4 into a computer bus; fit it with two 16-pin test clips or sockets for comparing known good and questionable ICs; use it as a clip-on display for micros, minis and other computers during design, setup, testing, troubleshooting...there's no limit to the ways LM-4 can save you time and money!

Measuring just 5.9 x 3.2 x 1.2", the pocket-sized LM-4 comes with a 24" 40-conductor ribbon cable terminated in a 40-pin IC test clip, plus instructions/applications manual and high-impact carrying case. (An optional Universal Cable Kit is also available for special interfacing requirements, priced at $75.00!)

So whatever the job—in design, production or service—simplify your testing with the power of 40-channel monitoring. Order your LM-4 today.

GLOBAL SPECIALTIES CORPORATION

*FACTORY INTRODUCTION SPECIAL: ONLY $199.00
the 2048 memory locations of the EPROM). The adjustment of R5 can be made with an EPROM installed if the unregulated 30-volt supply is left disconnected. The EPROM will not be programmed without this supply. (If an oscilloscope is not available, R5 may be adjusted by setting it to the point such that the time interval between the initial actuation of the Program key and the PGM LED extinguishes is 108 seconds).

Using the PDB. Operation of the PDB is fairly simple once its functions are understood. As an illustration of its use we will load and run the program shown in Table II of last month's installment of this series. This program tests the Morse interface.

Before the program is loaded, the CPU module and Morse interface should be connected to the PDB (P1, P2, P3 of the CPU module connect to J1, J2, J3 of the PDB; P1, P2, P3 of the PDB connect to J1, J2, J3 of the interface). Set the PDB Run, Instruction Cycle, and Bank switches to off and apply power to the CPU module. The RUN LED of the CPU module should be off, indicating that the CPU is in a Wait state. The PDB should display address 0000 and the contents of this location, which is indeterminant now. The M1 and MR LEDs should be lit, indicating that the CPU is in an "instruction fetch" cycle.

To begin loading the program at the first memory address, depress the A/D key twice (the decimal point in the Data display should then light), which places the PDB in the Load Data mode. Subsequent numeric entries will now be deposited in the addressed memory location as an instruction (or data) and displayed in the Data display. Load the first part of the program by entering each instruction machine code with the numeric keys of the keypad. After each byte is deposited in its memory location, depress the Examine key to increment the address to the next sequential memory location (i.e., 3-1-EX, F-F-EX, and so on). After the byte at memory location 0008 has been loaded, it will be necessary to alter the normal sequential loading sequence by entering the subroutine's starting address (A/D, 0-1-0-0) and then continue by loading the subroutine instructions (A/D, 3-EX, 4-EX, and so on). After the subroutine's RET instruction has been loaded, the program will be ready to be executed.

Begin single-stepping the program by pressing the ss key. The first time this key is depressed the CPU will be reset and the PDB will go into the Execute mode (neither decimal point lit). Fur-
ther actuations of the ss key will allow the CPU to execute one machine cycle each time the key is depressed. (Machine cycles are small units of processing activity which comprise each instruction cycle. Every instruction cycle consists of one to five machine cycles, depending on the type of instruction involved. A machine cycle is required each time an instruction requires the CPU to access memory or an I/O port).

Table III follows the program's execution one machine cycle at a time using the PDB displays to monitor the CPU's activities (refer to the program listing and the individual instruction descriptions as necessary). Remember that the Address and Data displays are monitoring the CPU's Address and Data busses, respectively.

After single-step through the program once, examine memory locations 0BFD and 0BF, noting their contents. This is where the CALL instruction stored its return address. One may load different codes at memory location 0101 to view the different characters that can be displayed on the Morse interface display (Fig. 24). Note also how the PDB single-step mode can be used to troubleshoot an interface.

To burn this program into an EPROM for permanent storage, an erased EPROM must be installed at IC3 in the CPU module and the unregulated 30-volt supply connected to the PDB. Pressing the Program key will then completely program the EPROM in a little less than two minutes.

After programming an EPROM it is wise to verify its contents by selecting it for a "test run" by the CPU (Bank and Run switches closed). The content of the program development memory is left intact after a burn cycle, making it possible to repeat the burn if necessary. If an EPROM won't verify properly after it is programmed (the program contained in it will not run properly), it is possible that it was not fully erased to start with. Re-erase and try again, or try another EPROM.

Once it has been determined that an EPROM contains valid information, a small piece of electrical tape or other opaque material should be placed over its transparent window to keep out ambient light. Sunlight and some types of artificial light can cause the EPROM's data to slowly decay and eventually become erased.

This series of articles has laid a foundation for one to design an interface and write his own machine-language programs for the popular 8080 family of microprocessors. What is built on this foundation is solely up to one's imagination and ingenuity.

"MULTI-MODE™" describes an improved Crown output circuit that is audibly superior. It instantaneously changes its mode of operation as the signal level changes, for totally clear, undistorted sound.

The MULTI-MODE circuit makes at-home listening more real. From Bach to Bee Gees, you'll hear more of the music with MULTI-MODE.

At low signal levels, the MULTI-MODE circuit operates in a Class A mode, free from switching or notch distortion. As signal current increases, the circuit smoothly configures itself as an A + B amp, again with clear, clean output. At high signal levels, MULTI-MODE operates in an AB + B mode, providing all of the undistorted power needed.

Three new Crown POWERLINE amps bring you the sonic accuracy of MULTI-MODE and other circuit improvements. New ideas in front-panel displays and rear-panel convenience will enhance your enjoyment.

MULTI-MODE theory and operation, and the POWERLINE amps are described in the Crown Information Package. It also contains data on all Crown products for the home, a factory "tour," reprints of reviews, technical discussions of audio problems, prices and dealer lists. Send us the coupon and $5 for your complete copy. Get ready for real.

EQUIPMENT AND TRAINING
NO OTHER SCHOOL CAN MATCH.

NTS HOME TRAINING INVITES YOU TO EXPLORE MICROCOMPUTERS,
DIGITAL SYSTEMS AND MORE, WITH STATE-OF-THE-ART EQUIPMENT
YOU ASSEMBLE AND KEEP.

Without question, microcomputers are the state of the art in electronics. And NTS is the only home study school that enables you to train for this booming field by working with your own production-model microcomputer.

We'll explain the principles of trouble-shooting and testing your microcomputer and, best of all, we'll show you how to program it to do what you want.

You'll use a digital multimeter, a digital logic probe and other sophisticated testing gear to learn how to localize problems and solve them.

Send for the full color catalog in the electronics area of your choice – discover all the advantages of home study with NTS!

NTS also offers courses in Auto Mechanics, Air Conditioning and Home Appliances. Check card for more information.

We believe that training on production-model equipment, rather than home-made learning devices, makes home study more exciting and relevant. That's why you'll find such gear in most of NTS's electronics programs.

For instance, to learn Color TV Servicing you'll build and keep the 25-inch (diagonal) NTS/HEATH digital color TV.

In Communications Electronics you'll be able to assemble and keep your own NTS/HEATH 2-meter FM transceiver, plus test equipment.

But no matter which program you choose, NTS's Project Method of instruction helps you quickly to acquire practical know-how.
1. The NTS/Rockwell AIM 65
Microcomputer A single board unit with on-board 20 column alphanumeric printer and 20 character display. A 6502-based unit 4K RAM, expandable. 2. The NTS/KIM-1 Microcomputer A single board unit with 6 digit LED display and on-board 24 key hexadecimal calculator-type keyboard. A 6502 based microcomputer with 1K RAM, expandable.
Popular Electronics Tests

Two Albia Instrument Modules

USING the ubiquitous digital multimeter as the central section of a test instrument system is a fine way to reduce costs. One need only add the proper external circuits to get a brand new measurement facility, reading off the numbers on your existing DMM. The same holds true for an oscilloscope. Here are two add-on modules that can be used in just that way with your DMM. From Albia Electronics, the Low-Ohm Meter and Scope Multiplexer will truly expand the utility of your existing instruments at low cost.

The Albia DM-10 Low-Ohm Meter, is designed to work with a conventional 3½-digit voltmeter to make resistance measurements between 10 milliohms and 20 ohms in three ranges. Accuracy is ±3% of the reading, ±1 digit, plus the voltmeter error. The battery powered unit is 6¼"W x 2"H x 3¾"D and it weighs one pound. Suggested retail price is $63.

**General Description.** The ZERO CAL and three-position RANGE controls, along with the PUSH TO MEASURE push-button, and the DVM and RX binding posts are mounted on the top cover. Before operation, a 9-volt battery must be installed.

The RANGE switch selects from 0.2-, 2.0- or 20-ohm ranges while the ZERO CAL allows zeroing the DMM readout either at the RX binding posts, or at the end of the cables used to make the measurement. A pair of binding post test clips are provided for measuring physical resistors.

**Comments.** At first it would appear that a requirement to measure very low resistances would be a rarity. Actually, it is a long-standing requirement, but we never did anything about it since our resistance-measuring instruments never really gave us a good indication at these very low values. Now, with the DM-10 we can check the slender foil patterns on a pc board (or interconnecting wiring) to make sure that they really are almost zero resistance instead of an appreciable part of an ohm which could cause circuit interaction. It also allows us to check the relatively low resistance of vehicle and boat grounding systems to make sure that they are within their prescribed limits. On the bench, we can now make sure that the low-resistance winding of a coil, transformer, or relay is not a short circuit, as a standard meter will indicate, but does have some resistance. Since we do have a decent DMM, it is the 0.2- and 2-ohm ranges of the DM-10 that get the most use.

True, we do not use the DM-10 very often, but when we do, it has been a lifesaver in removing low-resistance doubts.

THE second Albia module, DM-12 8-Channel Scope Multiplexer was designed to enable a digital-circuit designer or troubleshooter to use a conventional single-trace scope to observe the timing between eight time-related digital signals as an aid to troubleshooting. The instrument can also be used by an instructor to display the operation of a digital circuit. The device is 3¾"D x 2"H x 6¼"W and it weighs one pound. Suggested retail price is $63.
DM-12 8-Channel Scope Multiplexer

**General Description.** All controls, selector switches, power, and input/output connections are made via the top cover. Power is applied from a wall-mounted dc source, cable-connected to the POWER INPUT jack. Dc-coupled signal connections to the eight external circuits are made via color-coded 24-inch lengths of insulated lead, terminated with insulated alligator clips. A separate signal ground lead is also provided. Connection to the scope is made via a BNC connector labeled OUTPUT.

The PULSE AMPLITUDE control determines the height of the signal being displayed, while the CHANNEL SPACING control, as its name implies, sets the spacing between the selected number of traces. The INPUT SELECT switch enables the user to select all eight traces for display, or just the upper or lower four. In the event that the signal being displayed is harmonically related to the internal chopping rate, thus producing a blurred display, a SAMPLE RATE switch has been included to change the sample (chop) rate to clear the observed display.

The input threshold for all channels is TTL with 2.4 volts a logic 1, 0.7 volt a logic 0, and with 5.5 volts the maximum signal input. Input circuit loading is one low-power Schottky TTL load, minimum pulse width is 150-nS, and the maximum input frequency is 3 MHz.

**Comments.** We connected the DM-12 to one channel of our dual-trace scope, and several of the eight input connectors to a digital circuit we had operating on the bench. When the DM-12 is powered up, and the INPUT SELECT switch is set to the 1-8 position, all eight traces are displayed, including the signals being monitored. The scope was externally synchronized from the lowest digital waveform under observation. The scope vertical input and the DM-12 CHANNEL SPACING were adjusted for a full-screen display. The PULSE AMPLITUDE control was adjusted to set the displayed signal heights to the desired height.

**Using the DM-12,** it is easy to observe the timing of up to eight digital signals; and, if desired, the INPUT SELECT switch can be operated to examine either the top or bottom four sets of waveforms. We found that clean trace activity occurred at a signal amplitude of about 1.5 volts. Overloading, which causes all the traces to blur, occurred at about 4 volts input. There was a faint "ghosting" visible when the signal amplitude reached about 1.75 volts, but this was not bad enough to disturb the observation. The DM-12 cannot be used for analog signal observation, as any signal reaching threshold is automatically squared off. There was some vertical nonlinearity in the channel spacing as its control was varied, but this occurred only at the extremes of this control.

If you do any digital troubleshooting, there is no question that the DM-12 is superior to a simple LED-type logic probe. The mere presence of a signal at a given point does not necessarily mean that a circuit will function properly. It is the combination of the signal and its timing with respect to other signals in the circuit that makes the circuit operate properly. It is in this coverage that the DM-12 is superior to a logic probe.

After using the DM-12 for a while, we made some slight mechanical changes to assist in its use. We removed the relatively cumbersome insulated alligator clips from the signal input leads, and replaced them with plastic-covered mini-clip connectors. This made attachment to IC leads, and other tight points on a crowded pc board much easier. We then used IC clamp-on connectors to ease lead connections to an IC. Other than this modification, the tester is exactly as it came from the factory.

If you are doing any practical digital work, take a look at the DM-12. You'll discover how easy it is to check out a digital circuit when you can watch the complete operation at one time.

—Les Solomon

CIRCLE NO. 104 ON FREE INFORMATION CARD
languages can be used. The operating system, called Snap, is derived from Forth. The internal memory can be expanded externally using bus-connecting modules with up to six 8K RAM modules attached at the same time. Special circuitry keeps the RAM up, even when the system is turned off, and the CPU is shut down when not actually being used. Power is from an internal set of NiCad cells. The 2K version (RL-H1000) is $500, the 4K (RL-H1400) is $600, with the AC Adapter/Charger (RD-9498) at $58.

Among the peripherals are a thermal printer at 15 characters per line, an RS-232 I/O port that allows communication with other devices (RL-P3001 at $254), an acoustic modem (RL-P4001 at $285), a video/r-f adapter that connects to a baseband video monitor or a TV receiver antenna and allows display of 16 lines of 32 characters, or up to 48 by 64 picture element graphics in 8 colors and black (RL-P2001 at $349), and an I/O Adapter for multiperipherals (RL-P6001 at $158). A 4K RAM (RL-P9001) is $221, with an 8K RAM

DON'T BLAME YOUR TAPE RECORDER FOR WHAT'S PROBABLY YOUR MICROPHONE'S FAULT.

Is your tape recorder delivering something less than scintillating sound?

The simple truth is that all you may need to make it better is a better microphone.

Like the new Sony "Stereo Mic" or "The Mic:"
Both are good, all-purpose microphones that will fill the needs—and ears—of novice recording enthusiasts.

Both come with Sony Unimatch plugs that allow them to be used with any kind of recorder, stereo or amplifier.

And the stereo microphone is actually two mics in one, which allows you to record in full-fidelity stereo from a single point.

Admittedly, selling microphones may not be good for our tape recorder sales.

But it should do wonders for your recordings.

Now with added words! * ELECTRIC MOUTH 

ELF II VERSION

for $100, Elf II, Apple TRS-80. Level II

Now — teach your computer to talk, increasing interaction between you and your machine.

That's right, the ELF ELECTRIC MOUTH actually lets your computer call you by name. It is an installed, fixed-line telecommunication device that allows your computer to talk directly to you. The ELF ELECTRIC MOUTH is a peripheral, expandable, communicating device that can be plugged into your TRS-80 and will allow you to communicate directly with your computer.

The ELF ELECTRIC MOUTH is designed to be compatible with all TRS-80 models (up to Level II), as well as Apple II. It consists of a single microprocessor that is capable of communicating with your computer through the built-in terminal ports. The ELF ELECTRIC MOUTH includes a built-in memory card that contains all its necessary software, allowing you to plug it into your computer and immediately begin communicating with your computer.

The ELF ELECTRIC MOUTH is designed with a user-friendly interface that makes it easy to use. It includes a built-in microphone and speaker, allowing you to speak to your computer or listen to what your computer has to say. It also includes a built-in display, allowing you to see what your computer is saying.

The ELF ELECTRIC MOUTH is ideal for use in a wide variety of applications, from home and office use to educational and research purposes.

The ELF ELECTRIC MOUTH is available for $99.95, and includes all necessary software and hardware. It is compatible with all TRS-80 models (up to Level II), as well as Apple II.

The ELF ELECTRIC MOUTH is a must-have for anyone who wants to communicate directly with their computer. It is easy to use, easy to install, and affordable. Don't miss out on this opportunity to communicate with your computer in a whole new way. Order your ELF ELECTRIC MOUTH today!
names and space. The EXTRACT program lists a portion of a file with two label names, STRIP will remove the hex code from a PRN file and turn it into an ASM file, SORT will create a symbol table from an assembly done with ASM so that it can be listed with SOD. CONVERT changes all uncommented lowercase characters to upper case, while STATUS provides information on the current operating system such as memory available, TPA size, top of memory address, I/O assignments, etc. Single density 5¼" or 8½" diskettes, $35 plus $1.50 shipping/handling. Address: Eliam Associates, 24000 Bessemer St., Woodland Hills, CA 91367 (Tel: 213-348-2787).

**H8 BASEX.** The BASEX compiler for the Heath H-8 system runs 10 times faster than similar BASIC programs and overhead is only 2K bytes for the execution routines. It includes a custom console driver, and commands to save and load on tape. The cassette is 1200 baud. Manual alone is $8. It is also available for the TRS-80 Level II, Sorcerer, SOL, Poly 88, and Meca Alpha systems. It also comes on 4½" North Star and 8½" single-density CP/M. Address: Interactive Microware Inc., Box 771, State College, PA 16801 (Tel: 814-238-8294).

**6800/6809 Utilities.** Super Sleuth operates with 6800/6809 systems and disassembles programs in a form suitable for changes and reassembly. Object and source code are provided. $49 for 5½" and $150 for 8½" diskette. Debug-68 and Debug-69 provide software emulation for the 6800 or 6809. A wide range of options are available to permit fast debugging of any assembly language program. In object code only: $49 for 5½" $150 for 8½". Address: Smoke Signal broadcast, 31336 Via Colinas, Westlake Village, CA 91362 (Tel: 213-889-9340).

**Model III SuperScript.** This software enables the TRS-80 Model III to use SuperScript which features Directory and Kill files without losing text; pause while printing and insert text from the keyboard; serial drivers using the EAX/ ACK protocol for 1200 baud communications; drivers for the NEC5510, NEC5530, Daisy Wheel 11, Lintype 11, Centronics 737, Epson MX80, and Diablo printers; custom serial/parallel drivers; and depending on the printer, superscript, subscript, underline, boldface, select (9½) pitch, and slash zeroes. You can also enter a number of special characters including 500 double braces, brackets, etc. Works with TRS-80 Model I or III, 32K, or one more disk drives, lower case modification, and Model I Script. $50 plus $2 postage and handling. Address: Acorn Software Products, Inc., 634 North Carolina Ave., S.E. Washington, DC 20003 (Tel: 202-544-4259).

**Audio Modules**

### Power Amplifiers

#### MOSFET

**Compact preamps and mixers for every audio application!** These modules are complete in cases and include last design clipped edge connections. S/Pot time and money and give excellent performance. All modules fully compatible with each other and with IBM personal computer and power amplifiers. Typical performance of all types includes frequency response 15 Hz - 50 kHz, distortion typically less than 0.005% at 1 kHz, and Signal to Noise Ratio better than 80 dB. Modules HY6 to HY17 measure 1¼ x 1¼ x 1¼. HY66 to HY77 measure 3½ x ¼ x ¼. Complete connection data provided. All modules operate from a 15V to 30V maximum, HY66 can only be used with PSU30 power supply unit. For easy mounting we recommend B6 mounting board for modules HY6-HY77 or HY8 HY9 at $3.75, and B66 (for HY66, HY77) at $4.75. These modules are so reliable they carry a 5 year replacement warranty! HY6 Mono PreAmp, Mic/Mag cartridge, Tuner/1AUX + Volume/Bass/Treble. 10 mA. $25.95

HY7 Mono Mixer. To mix eight signals into one. 10 mA. $18.95

HY8 Stereo Mixer. Two channels, easy adjustment of volume. Into one. 10 mA. $24.95

HY9 Stereo Preamp. Two channels mag. cartridge/Mic + Volume. 10 mA. $26.95

HY10 Stereo Mixer. To mix eight signals into one. 10 mA. $26.95

HY12 Mono Preamp. To mix two signals into one + Bass/Midrange/Treble. 10 mA. $26.95

HY13 Mono VU Meter. Programmable gain, LED overload detector (meter not included). 10 mA. $23.95

HY14 Stereo Preamp. Mic/Mag cartridge/1AUX + Volume/Bass/Treble/Balance. 20 mA. $42.95

HY15 Stereo Headphone Amplifier. Will drive headphones in the range of 0 ohm - 2K ohm. 80 mA. $49.95

HY16 Stereo Mixer. Two channels, each mixing signals into one. 20 mA. $31.95

HY17 Dual Stereo Preamp. Four channels of mag. cartridge/Mic + Volume. 20 mA. $42.95

HY18 Guitar Preamp. Two Guitar (Pass/Bass). Mic + separate Volume/Bass/Treble/Mix. $48.95

HY19 Stereo Mixer. Two channels, each mixing signals into one + Treble/Midrange/Bass. 20 mA. $45.95

HY75 Stereo Preamp. Two channels, each mixing two signals into one + Bass/Midrange/Treble. $45.95

HY77 Stereo VU Meter Driver. Programmable gain/LED overload detector. 20 mA. $36.95

**AUTOSOUND Power Amp Module**

$39.95

The kind of reliability and performance you have been waiting for in a 12 volt automotive power amplifier! Use as power booster or drive direct from tape-deck/preamp out. Like all ILP modules, the C15 power booster is encapsulated with integral heatsink, and guaranteed for 5 years. Features include automatic switch on; selectable input level (200V, 300V or 450V), low level (200 or 300V), high level (2000, 3000, or 4500V) inputs; and automatic cut-off. See specifications. Modules HY6-HY14 can be used for complete audio systems, with the ILP Amplifier HY17 as a master drive circuit, and HY66 as a master drive circuit.
Scope Demodulator

Q. My oscilloscope will not respond at the frequency of my transmitter. Can you show me a simple probe that will allow me to see the modulation of the rig? I want to see when I start clipping, or if I am not modulating high enough.

—Charles Pen, Mendicino, CA

A. Although commercial demodulator probes are inexpensive, this circuit will work, when closely coupled to the r-f output of the transmitter. Do not make a direct connection to the transmitter antenna, but use the probe tip as a short antenna.

Universal DC Meter

Q. I have an old, but good, analog multimeter that I use for servicing appliances. Sometimes I measure ac and sometimes dc, but when measuring dc, I usually have to exchange the leads to avoid meter needle damage. I understand that I can use a bridge to enable the analog meter to measure both ac and dc without changing the leads. Can you show me the circuit?—Alf Meek, Toledo, OH

A. The circuit you requested is shown below. It will enable your analog meter to measure ac and dc of either polarity as you desire, without moving the leads.

Keep in mind that the silicon diodes used in the bridge have a small voltage drop, so do not make exacting measurements unless you also introduce the missing voltage.

Have a problem or question in circuitry components, parts availability etc.? Send it to the Hobby Scene Editor, Popular Electronics, One Park Ave. New York, N.Y. 10016. Although all letters can't be answered individually, those with wide interest will be published.
Get Stereo Review and Popular Electronics at whopping discounts!

Stereo Review is the music-lover's best friend. Equipment evaluations help you select the best audio gear for your needs. Reviews of important recordings in every category of music help you select the best to build your library at the least cost. Columns by experts help you understand the music industry, the ins and outs of tapes and equipment and the technical side of audio.

Order one or both magazines. Just complete and return the postage-paid order card today!

With this special introductory offer, you can save up to 40% off the full one-year subscription price of Popular Electronics...and a big 50% off on a year of Stereo Review!

Popular Electronics is the magazine for the serious electronics buff. Its scientific tests by Hirsch-Houck Laboratories help you select audio equipment. Articles help you with electronics experimenting, DX listening, video and personal computing. And the do-it-yourself electronics projects plans are the best anywhere! It's no wonder Popular Electronics is the world's largest selling electronics magazine!
FUNDAMENTAL FACTS

Operational Amplifier Fundamentals

The op amp is basically a high-gain amplifier with negative feedback. Reduced gain, increased bandwidth, improved stability and a variety of different amplifier functions are made possible by proper choice of the feedback elements. Figure 1 shows the basic op amp connections and the gain \( G_1, G_2 \) relationship of input and output voltages.

Op Amp Parameters.

Open-Loop Gain. Usually stated at dc or as a graph of gain versus frequency.

Input Impedance. Accurately stated as parallel RC network, it is often stated as resistance only.

Input Offset Voltage. The ratio of output error and theoretical gain at a fixed feedback resistance. Can often be reduced to zero by adjustment of a trimming potentiometer.

Common-Mode Rejection Ratio (CMRR). Measures op amp's rejection of signals common to both inputs. The ratio is expressed as \( V_o/V_c \) (Fig. 2.)

Bias Current. The current from an infinite source impedance that will drive the output to zero.

Difference Current. The difference in bias current between the op amp's two input terminals.

Full Power Response. Sine-wave output at maximum frequency, unity gain and specified distortion into the rated output load.

Settling Time. Period from step voltage input until output reaches specified error range of its final value.

Slew Rate. The maximum rate of change of the output voltage in response to a step input, usually given as volts per microsecond.

Basic Op Amp Circuits. Five of the most elementary applications of op amps are shown in Fig. 3.

Inverting Op Amp. Provides an output directly related to the ratio of the input and feedback resistor. Output is inverse of input.

Noninverting Op Amp. Polarity of input and output are the same, but amplitude is not a simple resistance ratio.

Voltage Follower. Basically used for impedance transformation, with unity gain.

Summing Op Amp. Utilizes the high-impedance input to connect several signals together with very low current.

Integrator. Uses frequency dependent feedback elements. Although a single capacitor is shown, more complex RC networks can be used to provide specific characteristics. By cascading such op amps it is possible to implement various functions, including inductance effects and active filters.

Practical Op Amp Applications.

The inverting op amp of Fig. 3A is used when we want a stable amplifier with fixed gain, such as that used to indicate remote temperature from a kiln described in the November 1981 issue of Popular Electronics.

A good example of the utilization of the voltage follower of Fig. 3C was illus-

fundamental facts

trated in the same issue on page 48, where a simple RC network at the input to the op amp resulted in a first-order active filter, used for bass boosting.

Fig. 3. Op amp applications: (A) inverting; (B) Noninverting; (C) Voltage follower; (D) Summing; (E) Integrator.

The voltage summing circuit of Fig. 3D can be used in audio mixing applications, as described in the December 1981 issue in "Experimenter's Corner." Here the two potentiometers of a joystick act as the two series input resistors to the inverting op amp, mixing two audio signals.

Op amp integrator circuits are used in all types of analog-to-digital converters where they generate the ramp which converts voltage into an analogous time period.
Now, make your phone do more, faster, for less!

Bell invented the telephone. Now Dictograph controls it.

Dictograph—the Canadian communication specialists since 1902 who invented the intercom, the hearing aid and the smoke detector now presents the Phone Controller, the ultimate low price telephone control system that saves you work, time and money.

Here's how to teach your old phone new tricks.

1. Multi-function timing system. When was the last time you made a five minute phone call that took half an hour? Now, The Phone Controller puts you in control. The built-in digital clock also times your calls to help keep them short.

2. Reach a busy signal? Meant to call back and forgot? The Phone Controller does it for you, retelling every 60 seconds until your call is answered.

3. Memory Dailing. At the touch of a single button, reach up to any one of 30 frequently called people. Dials fast in Touch Tone® or rotary dial pulse, local or long distance. Emergency Numbers. Friends. Suppliers. Numbers where your babysitter or your children may reach you when required. Even your rotary dial phone to touch without phone company charges.

5. Monitor Speaker. To dial, there's no need to lift the receiver until you hear your call answered. No answer? The Phone Controller disengages the line automatically. Even less others in the room listen in, when required.

8. Easy Installation. For single line phones, just plug into modular jack. For Multi-Line phones, (1) call 1-800-888-1801 or (2) mail in your self with Universal, 100 Amendment for $39.95 or (3) have Bell install. When ordering, specify if for single or multi-line installation.

9. Low, Low Factory Direct Price. All this and more for only $199.95. Buy 1 with a friend and get 2 for $199.95 (prices slightly higher in Canada). This is a special offer for this issue only. Complete 90 day Parts and Labour Warranty direct from Dictograph. You're buying direct from the manufacturer and we back all the way.

10. Money Back Guarantee. We're so sure you'll be delighted we offer you the use of The Phone Controller for 15 days. If you're not completely satisfied with its time and money saving features simply return it, within 10 days, in its original carton and in new condition for an immediate refund, including shipping both ways. You have everything to gain! Over 60,000 already in use around the world.

Limited Offer — order direct from the manufacturer
In USA call toll free: 1-800-888-1801
In Canada call toll free: 1-800-888-9085

Shipping $3.95 (USA), $4.95 (Canada). For Multi Line add $3.95. Canadian users please add 7% GST. For orders under $39.95, add 10% Canada Postage. Mississippi residents add 7% sales tax. Hawaii, Alaska residents add 4% sales tax.

The New Power FETs

JUST as CMOS integrated circuit technology is making major inroads into traditional TTL territory, a new generation of superior field-effect transistors (FETs) is beginning to replace conventional bipolar (pnp and nnp) transistors in many applications. It's important to understand the operation of these new power FETs because they are turning up in many new power supplies and switching circuits. A FET may even solve some of your own circuit design problems.

The new power FETs are collectively known as VMOS devices, a name whose origin is somewhat confusing and requires an explanation. MOS, of course, means metal-oxide-semiconductor (or silicon) and refers to the mechanical structure of a FET having an insulated gate.

Thanks to the silicon dioxide film between the gate electrode and the device's silicon channel, MOS field-effect transistors or MOSFETs have a much higher input impedance than junction FETs and bipolar transistors. The vulnerability of the gate's thin insulating film to damage from static electricity is the chief drawback to MOSFET technology.

The V in VMOS originally referred to vertical-groove MOS technology, an integrated circuit structure pioneered several years ago by American Microsystems, Inc. In this process V-shaped grooves reduce the size of transistors and permit higher component packing densities than the conventional flat, two-dimensional approach. The V-grooves are etched into the silicon, and aluminum gate electrodes are deposited on their walls. A VMOS transistor therefore requires less chip area than a conventional MOS transistor having the same gate area.

Though the VMOS process was originally intended to provide integrated memory chips with high component densities, it was soon learned that the technology is well suited for power applications. This is because the VMOS geometry gives faster switching speeds and much lower channel resistance than conventional MOSFETs.

These advantages are related to the stacked arrangement of the source, gate and drain and not the presence of the V-groove. In conventional MOSFETs, the current flow is lateral (across the silicon) while in VMOS structures, the flow is vertical (through the silicon). The vertical configuration provides a much shorter current path, hence switching speed is much faster. The vertical arrangement also simplifies heat sinking since the bottom of the chip doubles as the device's drain.

The advantages provided by the vertical geometry of the VMOS structure soon led to the development of vertical-structure MOS transistors without a V-groove. These transistors were also dubbed VMOS devices, hence the confusion over the name VMOS.

Now that the nomenclature is behind us, let's compare the various MOS and VMOS structures more closely. Then we'll look at a few VMOS circuits.

Comparing VMOS Structures. Figure 1 shows the construction of a standard MOSFET transistor. Note how the source-to-drain current flows laterally through the transistor. The length of the channel region between the source and drain is responsible for the relatively high on-resistance of this structure. The fact that all the contact electrodes are on one side of the chip imposes design constraints and restricts maximum power capability due to the difficulty of extracting heat generated in the chip.

Figure 2 shows the construction of a basic VMOS transistor. As in a standard MOS transistor, current flows through the p-type channel region when a voltage is placed on the insulated gate electrode. The silicon dioxide layer between the metal gate electrode and the p-type region acts as the insulator.

The V-groove can introduce both mechanical and electrical stresses which...
limit the power handling capability of VMOS transistors. An alternative is to eliminate the V-groove as we observed earlier and utilize the structure shown in Fig. 3. The latter is sometimes called DMOS after double-diffused MOS. In both DMOS and VMOS, the current flows vertically through the transistor from source to drain.

To achieve high power capability, many VMOS or DMOS cell patterns are formed on a single chip. International Rectifier has introduced a series of DMOS transistors having hexagonal cells which it calls the HEXFET. Motorola DMOS transistors have square cells and are called TMOS devices. Siemens also makes a series of square-celled DMOS transistors which it has designated SIPMOS. Many other variations of the VMOS/DMOS structure have been introduced by other companies, but all rely upon vertical current conduction through the transistor.

Figure 4 is a pictorial view of Motorola's TMOS power MOSFET. Note the arrows denoting the direction of current flow which give rise to the TMOS label. The four cells shown in the figure are replicated many times across the surface of the chip to provide hundreds of parallel DMOS cells. The actual cell count may exceed 100,000 per square inch.

Figure 5 is a microphotograph of the surface of a TMOS transistor chip revealing a pattern of hundreds of individual DMOS cells. The large size of the chip explains its high power capability. The square regions on either side of the chip are the gate and source contacts. The chip's substrate is the drain. The chip is shown on a header in Fig. 6.

Advantages and Disadvantages of VMOS/DMOS. It is important to understand the relative advantages and disadvantages of the new generation of vertical-current MOS transistors. Here are some of the advantages:

1. Their high input impedance and

Fig. 5. A photomicrograph of Motorola's TMOS transistor chip.

Fig. 6. The TMOS chip atop the metal header. (Motorola)
You know the problem. Station fading...picket fencing...generally poor and frustrating FM car radio reception in the country and suburbs. We've ended all that with our great little space-age Stereo Expander devices. Hooked up between the radio and the broadcast antenna, they create a tremendous boost in sensitivity—over 15 dB—bringing in far-away FM stations sharp and clear. Simple, effective. Model ASC-100 hides completely out of sight; Model ASC-100DX mounts neatly anywhere underdash, has an off switch when the boost isn’t needed.

**FREE McIntosh STEREO CATALOG and FM DIRECTORY**

Get all the newest and latest information on the new McIntosh catalog. In addition you will receive an FM station directory that covers all of North America.

If you are in a hurry for your catalog please send the coupon to McIntosh. For non rush service send the Reader Service Card to the magazine.

CIRCLE NO. 38 ON FREE INFORMATION CARD

solid-state developments

low voltage drive requirements make VMOS/DMOS transistors easy to drive and interface.

2. The "on" resistance can be as little as a few tenths of an ohm.

3. Nanosecond switching speeds are possible.

4. Since drain current decreases as chip temperature rises, they are more thermally stable than bipolar transistors.

5. They can be connected in parallel without special design procedures or constraints.

6. Up to hundreds of volts and tens of amperes may be safely switched.

7. They may be operated as both switches and linear amplifiers.

VMOS/DMOS transistors have two principal drawbacks:

1. They require special handling due to their susceptibility to electrostatic discharge.

2. They require more processing steps than other power transistors and, therefore, are more expensive.

**Some Simple Circuits.** Figure 7 shows an ultra-simple lamp dimmer designed around a Siliconix VN67 VMOS transistor. R2 controls the voltage on the gate of the VN67. This permits the VMOS FET to be operated over a range of full off to full on, thus providing a linear light dimmer controlled by a single potentiometer. For best results, \( V_{DD} \) should be from 6 to 12 volts.

The circuit in Fig. 7 works well, but is inefficient because the VMOS transistor dissipates considerable power even when the lamp is dimmed. An alternative approach is to drive the lamp with variable width pulses from a simple CMOS 7555 oscillator as in Fig. 8.

In operation, the 7555 switches the VN67 full on and full off. When the switching rate exceeds several tens of hertz, the lamp appears to be on continuously to the human eye. By varying the pulse rate, and thus the width, the lamp may be dimmed or brightened.

The circuit can be controlled by adjusting \( R1 \) or \( C1 \) or both \( R1 \) and \( C1 \). Note how the VN67 is connected directly to the 7555 output pin with no coupling capacitor or pullup resistor. This illustrates the simplicity of driving a VMOS transistor.

Figure 9 shows an ultra-simple lamp
flasher designed around a VN67 and a two-gate CMOS oscillator. The enable input to the oscillator permits the flasher to be started or stopped by a logic signal or a mechanical switch.

The pulse rate is controlled by R1 and C1. For a very slow on-off cycle, increase C1 to 10 or more microfarads. VDD should be from 6 to 12 volts. As in the previous circuit, this application also demonstrates the ease of interfacing a VMOS transistor to a CMOS gate.

Other Applications for VMOS. The three circuits presented here are merely representative of what can be done with VMOS transistors. Many other applications are possible, and I plan to present additional ones in a future “Experimenter's Corner.” If you wish to experiment on your own, most VMOS manufacturers publish application notes that will help get you started. A good book on the subject has been written by Robert Stone and Howard Berlin. It's called Design of VMOS Circuits with Experiments (Howard W. Sams, Inc., 1980).

Several of the major VMOS/DMOS power transistor makers are mentioned in this column. Obtaining actual transistors, however, may pose somewhat of a problem unless you can find an electronics distributor willing to order them for you.

I have obtained VN67's and VN10's, two Siliconix VMOS power transistors, from Radio Shack. It seems that sales of these devices are relatively low, apparently due to a lack of published circuits suitable for experimenters. This situation should eventually change as more circuit designers and hobbyists discover the impressive advantages of VMOS/DMOS power FETs.

**THE ROI FACTOR**

(*Return On Investment*)

A small investment can upgrade the sound of your entire hi-fi system.

If you're one of the millions who have bought a Shure V15 Type III, M97 Series, M95 Series, or M75 Series phono cartridge, we have a way of making it perform better than it ever has before. It's the Shure Hyperelliptical (HE) upgrade stylus (needle) series. We've taken all the high trackability/low distortion benefits of the HE stylus tip (first introduced on the famous V15 Type IV), and put them into a stylus that will match perfectly with your cartridge, for an audible improvement in your system's sound at an absolutely minimal cost to you!

Upgrading your phono cartridge with an HE replacement stylus will give a large return on a very small investment. You already own a phono cartridge with proven performance; now you can get even better performance from that same cartridge. Ask your dealer for the Shure HE replacement stylus that's right for you, and take advantage of the ROI factor.

Shure Brothers Inc., 222 Hartrey Ave., Evanston, IL 60204

Manufacturer of high fidelity components, microphones, speakers, sound systems and related circuitry.
A Pulse-Frequency Modulated Infrared Communicator

If you've ever built and operated an amplitude-modulated lightwave communicator, you were probably impressed with both the simplicity and high-quality sound transmission of the system. Several such projects have appeared in Popular Electronics since 1970.

This magazine's first voice-modulated laser communicator was described by C. Harry Knowles in a May 1970 cover story. Harry's breakthrough project used a low-power helium-neon laser he offered for a bargain price of only $50.50 postpaid! Harry's company, Metrologic Instruments, Inc. (143 Harding Ave., Bellmawr, NJ 08031) has since become a leading manufacturer of HeNe lasers and related products.

The first infrared LED communicator described in Popular Electronics also made the cover. The system was called the Opticom, and it was designed primarily by H. Edward Roberts and described by Ed and me in the November 1970 issue. Incidentally, a kit version of the Opticom was one of the first products offered by MITS, Inc., the company that introduced the ALTAIR 8800 microcomputer (and the S-100 bus) in 1975.

This column has described many amplitude-modulated LED communicators over the years. See, for example, the April, May and June 1980 installments. Also see the May 1980 "Project of the Month." (Try your library if you don't happen to have these back issues.)

Amplitude modulation is ideal for ultra-simple lightwave links through either fibers or free space. In free-space systems, however, amplitude modulation is susceptible to noise from both artificial and natural light sources. Furthermore, the transmission range controls the volume of the receiver's audio output unless some form of automatic gain control is provided. Finally, the average power consumption of an amplitude-modulated system is high since the LED or injection laser source is continuously biased.

All these objections can be overcome by selecting one of the various forms of pulse or digital modulation. Though pulse modulation requires more complex transmitter and receiver circuitry than amplitude modulation, its advantages are significant. They include a very high degree of noise immunity, low average power and duty cycle of the optical source and simplified multiplexing.

**Pulse Modulation Methods.** There are several major pulse-modulation methods suitable for lightwave communications (Fig. 1). Here is a brief description of each method:

- **Pulse-Amplitude Modulation (PAM).** In this modulation scheme the amplitude of the pulses is directly proportional to the amplitude of the modulating signal. PAM is closely related to amplitude modulation in that PAM can be achieved by simply sampling, at a uniform interval, brief segments of an analog signal. An obvious application of PAM is in the transmission of two or more signals over a single light-wave channel.

- **Pulse-Width Modulation (PWM).** This is also known as pulse-duration modulation (PDM). The duration of individual pulses within a pulse train is made proportional to the amplitude of the modulating signal.

- **Pulse-Position Modulation (PPM).** Here the amplitude of the input signal controls the relative position of individual pulses in a pulse stream. Unlike PAM and PWM, all the pulses in PPM have precisely the same amplitude and duration. This means the PPM receiver can be optimized for the processing of identically shaped pulses. This gives a higher degree of noise immunity than that provided by PWM and...
especially PAM. Another advantage is that high peak power optical sources such as injection lasers can be used to full advantage.

The detection of PPM pulses by a receiver may require synchronization with the transmitter. This implies the necessity to transmit a clock signal along with the data or on a separate channel.

Pulse-Frequency Modulation (PFM). This modulation method resembles that used in FM radio in that the transmitter emits a steady train of pulses called the carrier. Information is superimposed on the carrier by altering the frequency of the pulses.

Detection of PFM is straightforward since, unlike PPM, no clock signal from the transmitter is required. Since the pulses have uniform duration and intensity, PFM offers many of the same advantages of PPM. PFM is particularly well suited to audio bandwidth light-wave links.

Later in this column we'll assemble and evaluate a PFM LED communicator. First, however, I want to explain briefly the most important form of pulse communications.

Digital Pulse-Code Modulation (PCM). All the pulse modulation methods described thus far require that such critical pulse parameters as amplitude, duration or position be altered in response to an analog signal. PCM is a true digital modulation method which involves the transformation of an analog signal into its binary equivalent.

Voice, for example, is sampled at a sufficiently fast rate, and the amplitude at each sample point is converted into a binary word by an analog-to-digital converter. The binary word is then transmitted in serial form a bit at a time.

In PPM, PFM, and PCM, the shape of each pulse is identical. PCM, however, offers two significant advantages over PPM and PFM. First, the pulses remain fixed in time, and a pulse is either absent or present. This greatly enhances the noise immunity of the signal. Second, the predictable spacing between pulses greatly simplifies time division multiplexing. The major disadvantages of PCM are system complexity and bandwidth limitations.

Several pulse formats are used to implement PCM, the most important being return-to-zero (RZ) and non-return-to-zero (NRZ). A binary signal is either high (1) or low (0). A pulse, therefore, represents binary 1 while the absence of a pulse denotes binary 0.

Figure 2 shows three pulse formats. In the RZ mode, all bits return to zero before the next bit is transmitted. In the NRZ mode, a 1 remains high and a 0 remains low for the duration of the bit transmission interval. This means two consecutive 1 bits merge into a pulse having twice the duration of an individual bit position.

The RZ format is more efficient than the NRZ format since only half the time is required to transmit a single bit position. Both the NRZ and RZ modes require synchronized clocking at both the transmitter and receiver.

The Manchester format is a modification of the RZ format in which half of every bit position is denoted by a pulse. If the bit position contains a 0, the first half of the pulse is low and the second half is high. If it contains a 1, the first half is high and the second half is low.

Manchester coding eliminates the need for a separate clock.
Micromint will put both a computer development system and an OEM dedicated controller in the palm of your hand for only $195

20 MICROCOMPUTER
• On board tiny BASIC Interpreter.
• Parallel and serial I/O ports.
• 6 interrupts.

CIRCLE NO. 40 ON FREE INFORMATION CARD
Better quality op amps can be used in place of the 741 to give a lower transmitted noise level. The LED can be any GaAs, GaAs:Si or AlGaAs infrared emitter. For high output power, select one of the new super LEDs made from AlGaAs such as Xicton's XC880 series or General Electric's F5D1/F5E1 series. See "Solid State Developments" of February and June 1981 for more information about these high-power emitters. So far, few component dealers stock the new high-power emitters. Radio Shack, however, sells the XC-880-A (catalog number 76-1433). This diode emits 1 milliwatt at 20 mA forward bias. The XC-880-D emits a whopping 5 mW at that same current level.

The peak pulse current supplied to the LED by the SSS is about 50 to 60 mA. The pulse width is about 5 microseconds.

The circuit in Fig. 4 employs a VFET transistor to raise the pulse current to about 450 mA. Even higher current levels can be obtained by increasing the voltage at V.

Figure 5 is a PFM receiver using a 565 PLL tuned via R4 and C4 to the approximate center frequency of the transmitter. Incoming optical signals are detected by the phototransistor (Q1). The resulting photocurrent is converted to a voltage by load resistor R1 and coupled via C1 into the 741 op amp. The signal is then amplified 1000 times (R3/R2) and passed into the phase comparator inputs of the PLL.

The phase comparator generates an error voltage proportional to the difference between the PLL's on chip vco center frequency and the instantaneous transmitter frequency. The error voltage is fed back to the vco in a feedback loop which causes the vco to track the transmitter frequency. The error voltage represents the demodulated analog of the transmitter signal. It is tapased into power amplifier by the 365. Potentiometer R5 controls the gain of the system by varying the amount of signal which reaches the 365.

Several modifications can be made to the basic receiver circuit. To reduce the effect of sunlight on the detector, Q1 can be replaced by a silicon photodiode. The diode should be connected in the reverse direction.

The gain of the 741 preamplifier can be altered by changing the ratio of R3/R2. The center frequency of the PLL's vco can be changed via R4 and C4. For best results, R4 should be at or near 4 kΩ, although Signetics observes R4 can range up to about 20 kΩ.

Testing the Communicator. Before applying power to the transmitter and receiver, carefully inspect both circuits for possible wiring errors or omissions. To avoid severe interference when using a phototransistor in the receiver, place an opaque hollow tube over Q1 to keep artificial light from striking Q1's active region. A photodiode may not require this kind of protection.

For initial tests, disconnect the transmitter's microphone and connect the audio output of a transistor radio to the circuit via a 1-microfarad capacitor. The negative lead of the capacitor should be connected to R1 of the transmitter. The radio output should be connected to the positive lead of the capacitor and the transmitter's ground connection. For best results use a radio with an earphone jack and make your connections with the help of clip leads soldered to an appropriate plug.

Turn the radio on at low volume and select a station that gives clear reception. Then apply power to both the transmitter and receiver while pointing the transmitter's LED at the receiver's detector. At this point you should hear noise, oscillation or, ideally, the sound of the radio from the receiver's speaker. In any event, carefully adjust the setting of R5 in the transmitter in an effort to match the center frequency of the vco in the receiver's PLL, in this case about 40 kHz.

While adjusting R5 of the transmitter you will probably hear loud noises and whistles interspersed with very clear sounds of the radio. Select the best-quality transmission point with R5 of the transmitter and then adjust the gain of the receiver (R5 in Fig. 5) for comfortable listening. You can then experiment with the setting of the transmitter's R1 to find the optimum gain of the transmitter's preamplifier.
LISTENING

More American Shortwave Stations on the Air Soon

PRIVATE interest in shortwave broadcasting, long dormant in the United States, is growing. WRNO, New Orleans, could be on the air by the time you read this, although it has been plagued with a series of construction delays (see January PE for schedule). Both WRNO and WYFR (Family Radio) with its "Northern Mexico" and "Canadian" services are using wide-angle log-periodic antennas that efficiently cover vast areas of the U.S. where domestic shortwave broadcasting is (technically) not allowed.

Meanwhile, another private commercial shortwave station is under construction in Miami, FL. Radio Miami, whose call may become WRMF, wants to reach affluent Latin Americans who are likely to go shopping in Florida, although its parent station, WQBA, is heavily Cuban-oriented. Radio Miami may be on the air by year end, with 50 kilowatts on 31 and 49 meters.

Florida is also the likely site for the U.S. government's Radio Marti, designed to be a "Radio Free Europe" for Cuba—more credible than the Cuban exiles' clandestine stations, and more involved with Cuban issues than the Voice of America. It would probably operate daytime only from the Florida keys, using the low end of the medium-wave band (650 kHz) and would produce a high-power groundwave. However, 1040 is also being considered.

However, Cubans of all political persuasions find it offensive for the U.S. government to name this station after Cuba's 19th-century independence hero, whom they venerate. The Cuban government objects vehemently, too, and it could escalate the radio war by putting on a superpower 500-kilowatt station and several other high-power transmitters which would disrupt U.S. domestic broadcasting.

A massive tower for the 500-kw station has already been constructed in a Havana suburb, probably for 550 kHz. Other projected high-power transmitting frequencies are 900 kHz for the Radio Progreso domestic net, and 1010 kHz, for a second Moscow relay. Technical and operational standards are so low in Cuba that there's plenty of trouble even without deliberate disruption. One evening, for instance, the Radio Moscow relay (9600 kHz) was apparently mistuned and it twice landed smack on top of WWV (10,000 kHz).

Jamming of the Radio Marti signal can also be expected, since the Castro government already jams two other less offensive U.S. stations (WQBA, 1140 kHz, and VOA, 1180 kHz). The U.S. government has threatened to jam the Radio Moscow relay on 600 kHz in retaliation. (Traditionally the U.S. has left jamming to the "bad guys." Besides, domestic U.S. stations on 600 kHz would hardly welcome the interference from jamming).

The original target date for Radio Marti was January 1, 1982, but the project has run into opposition in Congress. Even the U.S. diplomatic staff in Havana has come out against it. Florida
broadcasters have offered to help offset some of the $10 million needed to start the station from scratch. Meanwhile, Radio Havana Cuba has announced the subject of its annual essay contest for 1982: "Historically, what have relations been like between the U.S. and Latin America?" The deadline is April 30, 1982. Write RHC at Box 7026, Havana, for particulars.

The most active clandestine Cuban has been La Voz de Cuba Independiente y Democrática (La Voz del Cid) for short—a play on words), with a Monday-Saturday broadcast schedule via its own secret transmitter. Programs typically last more than half an hour starting at 9 p.m. local (0200 GMT winter), on 7355 kHz (on 7350 kHz sometimes). This same group produces a different program at 0100 GMT via the commercial Dominican Republic station Radio Clarín on 11,700 kHz.

The Voice of America, known mainly...
Here's why we're Number One.

When it comes to logic probes, more people buy Global Specialties. Because no one can match us for value. Our four logically-priced probes—including our remarkable new 150 MHz ECL—deliver more speed, accuracy, flexibility and reliability than others costing considerably more! So why compromise? Discover for yourself why we're the number-one logical choice!

dx listening

as a shortwave station, is moving more and more into mediumwave to increase its audience among listeners to standard AM radio. In September 1981, a relay station went into operation in Fajardo on 621 kHz, along with two Caribbean-area relays on 1180 kHz and 1580 kHz. A third medium-wave outlet in the Jamaica or the Cayman Islands is being planned. (Political stability makes the latter site more probable.)

If you can't hear the 1580 kHz Antigua relay, you may be able to hear its "local" program at 0000-0030 GMT as fed from Washington on 17,860 kHz, and (in single sideband) on 15,652 kHz. During the period in question, programming is not parallel with transmissions on the VOA's other English-language frequencies.

USICA, the VOA's parent agency, is slated to revert to its former name, USIA. It is hoped this will lessen its confusion abroad with the CIA. While USICA is taking a 12% budget cut (like most government agencies), next to nothing will come out of special recording here. In fact, the VOA will be hiring about 100 employees (mostly technical).

Another bit of U.S. territory, Saipan, is about to become a shortwave broadcasting center, with two new stations authorized by the Federal Communications Commission. The missionary Far East Broadcasting Co., already operating in the Philippines and several East Asian countries, is expanding to Saipan. And an organization called MARCOM is building a commercial shortwave station for broadcasts to Japan. Here, shortwave listening is a relatively widespread activity.

Some Little-Known Stations. Not all U.S. shortwave broadcasting is high-powered and designed for a wide audience. For example, a little-known band straddling 26 MHz is allocated for two-way communications by broadcast stations with mobile units or remote transmitter sites for the remote pickup of broadcast programs. While most stations now use vhf, uhf, microwave, or phone lines for such purposes, we were pleased to hear one remote pickup active on a Saturday morning between 1430 and 1700 GMT, from Gus's Daughter's Grocery Store in Presque Isle, Maine, using narrowband FM on 26,240 kHz. It took a special occasion to inspire this transmission—the opening of a new building on the store's 50th anniversary. Besides the very limited groundwave at 26 MHz, this "local" signal had a potential audience of at least half the world (beyond the ski zone)!

Computer Tests. On September 10, 1981, Radio Netherlands undertook a novel experiment—broadcasting a basic computer program for range and bearing calculation, in three different formats, to find out whether listeners with home computers would be able to record and run the program successfully. Of the 235 listeners responding, 98 reported success (42%). Of the successes, 61 were with the TRS-80, 36 for the PET, and only one for the Apple II. It was necessary to use patch cords rather than phone lines, and a lot of bandwidths (over 5 kHz) were required, and treble boosting helped. Ten percent turned failure into success by re-recording their tapes at higher levels.

A second experiment, scheduled for Thursday, January 28, 1982, is a sun-rise-sunset program suitable for the Sinclair ZX-81, TRS-80 Model I Level 2, PET, and perhaps the Atari. Here are the times and frequencies: 2050 GMT on 21,685, 17,695, 17,605, 15,220, and 9,715 kHz. Also on Friday the 29th (but still Thursday in North America) at 0250 GMT on 9,590 and 6,165 kHz; and at 0550 GMT on 9,715 and 6,165 kHz. Address reports on your results to Media Network, Radio Netherlands, Box 222, 1200-JG Hilversum, Holland.

That station is also encouraging listeners to call in short comments or questions to an answering machine. The phone number is announced frequently, especially on the Tuesday "Shortwave Feedback" program where some of the taped calls are put on the air.

Belgium could easily broadcast to England right across the channel on...
dx listening

mediumwave, but until now its English programming has only been on shortwave. A mediumwave frequency was to be added January 1, entailing a retiming of the 1705-1750 GMT program (nominally for Africa but also heard in Europe and North America) to 2004-2045 and 2200-2245 GMT. During the winter, the shortwave version of these broadcasts may come in better in North America than the North American service at 0300-0315 GMT. However, the departure of David Monson has made these broadcasts less entertaining.

Soviet stations have been going out of their way to teach us their languages. The Moscow World Service has a "Russian by Radio" course Fridays at 1232 and 2132 GMT, and Saturdays 0432 and 0932 GMT. If you've already mastered Russian, try the Voice of Yerevan for an "Armenian by Radio" course that started in October. Listen GMT Fridays (Thursday nights here) after 0330 GMT on 17,870, 15,240 and 15,100 kHz.

While clandestine monitoring is among the most exciting aspects of DX listening, you often must understand languages such as Arabic and Spanish. However, two unusual programs in English have been heard recently. The Voice of Namibia, from SWAPO via Angola, is on 9,535 kHz at 1600-1630 GMT (Sundays), reports Ron Howard in California. Such long-path reception (probably erratic) is best along the west coast. Syria is one of few countries now silent on shortwave. But there is a program opposing the Syrian government (from transmitters in Iraq), the Voice of the Arab Syria, that puts a brief English segment at the end of its Arabic broadcast. Listen for this around 1950 GMT on 21,585 kHz. It is easily audible, especially in eastern North America.

Although its English department has been short-staffed, Ecuador's HCJB has been trying to broaden the appeal of its programming. DX Party Line, now less evangelical, has been reduced to two programs a week, Saturdays and Mondays at 2130 GMT. It is repeated the following GMT days at 0230 and 0630 GMT. "Música del Ecuador," reviewed favorably in this column last year, has been dropped from the schedule, returned to the air in October 1981 at 0035 GMT on the North American service Saturday nights (GMT Sundays) on 17,880, 15,155, and 9,745 kHz. The magazine show, "Passport," has been revamped to include more features about Ecuador, including "the smiles of Quito." Weeknight hours (0100-0200 GMT) include the following segments: "Ecuador Yesterday and Today" (daily), "Embassy Roundup" (Monday), "Profiles of South Americans" (Tuesday), "National Geographic News" (Wednesday), "Visiting Ecuador" (Thursday), and "Latin American Press Review" (Friday).

Another good English broadcast from Latin America comes from Brazil's Radio Nacional. Reception is usually ex-
Power Line Filters

These filters protect any sensitive electronic equipment from power line transient damage and radio frequency interference. Both models offer common mode and differential mode surge suppression for power line spikes. RF interference is suppressed using both inductive and capacitive components. Ideal for computers, test equipment or TV/LF2 a duplex outlet, 120V, 8 amps max $39.95
LF6 three separately filtered duplex outlets. 120V total fused capacity 15 amps. power switch and indicator lamp $59.95
Add $2.50 shipping and handling per order.

cellent at 0200-0300 GMT on 17,830 and 15,290 kHz. There's a good mix of Brazilian music and brief talk features. On Sundays the talks are on a single subject, alternating with music. The Sunday schedule for January is "History of Brazilian Soccer" (10th), "Classics of Brazilian Music" (17th), "Medicinal Herbs in Brazil" (24th), "Brazilian Folk Music" (31st).

The easily heard Voice of Nicaragua (5,950 kHz, evenings) was expecting to begin an English broadcast last March, but has not followed through. However Radio Zinica, a tiny station at Bluefields on the Caribbean coast, where English is the primary local language, does have an English hour, "Revolution Now," at 0100 GMT. Unfortunately, it was discovered by DX listeners just a few days before the broadcasting strike in Canada was settled last September. Now the BBC relay on 6,120 KHz has resumed, effectively blocking Radio Zinica.

English-Language Listings, the following changes and additions should be made to the listings that appeared in the June issue. To make the corrections as concise as possible, only the GMT, station name, and frequency correction are given.

Bomb-Burst Synthesizer

Here's a circuit that realistically synthesizes the whistle and explosion of an aerial bomb or shell. This attention-getting sound sequence is generated by an SN76488, the Texas Instruments complex sound generator chip. This chip is used in some video arcade games to synthesize the sounds of race cars, gun shots and explosions.

The circuit diagram for the bomb-burst synthesizer is shown below. The circuit is adapted from one suggested in a Texas Instruments application note. Closing and then opening S1 starts the sound sequence. Initially a tone having a frequency of a few kilohertz is produced. The frequency of the tone decreases over a span of several seconds. The tone is then replaced by the sudden and very realistic sound of an explosion.

The sound patterns produced by the SN76488 are governed by the RC (resistor-capacitor) time constants of the on-chip voltage-controlled oscillator (vco), super low-frequency oscillator (slof), noise-generator filter and monostable multivibrator (one-shot). The detailed operation of these and the various other circuits contained in the SN76488 is beyond the scope of this column. Consult the TR's Information data sheet (or for more information.) However, we can examine how the various RC components control the operation of the circuit.

As shown in the schematic, vco RC components R3 and C3 control the overall frequency range of the pre-burst tone. Reducing the time constant by reducing either or both R3 or C3 produces a high-pitched whistle.

The duration of the tone is determined by the RC time constant of the on-chip one-shot. Increasing the value of either or both R5 or C5 stretches the duration of the pre-burst tone (or whistle), thus simulating a high-altitude bomb drop.

The sound of the explosion is governed by the noise generator's output filter, R1 and C1. Reducing R1, for example, to less than 100 kilohms suppresses the low-frequency component of the noise and gives a sound which resembles a stretched gun shot. Increasing R1 to a megohm or more produces a deep, rumbling explosion.

Duration of the explosion is controlled by the RC time constant of an on-chip decay circuit. Reducing R2 or C2 gives a very brief explosion which closely simulates a gun shot if the low-frequency component of the output from the noise generator is suppressed by reducing R1.

For best results, R2 and R5 should be trimmer resistors or potentiometers. For even more flexibility, R1 and R3 can also be pots.

An interesting variation of the tone-explosion sound sequence can be obtained by reducing R4. When, for example, R4 is 2.2 kilohms, the gradually falling pitch of the whistle will be replaced by three up-down cycles of a siren followed by the explosion sound.

Other variations are also possible. Disconnect pins 1 and 25 and the explosion sound will be eliminated. Disconnect pin 11 to produce a continuous, nondecaying explosion after a silent delay period. Disconnect pin 20 to produce a gun shot or explosion after a silent delay. The length of the delay is controlled by R2 and C2. Substitute pin 27 for pin 28 to give a descending whistle followed by a continuous explosion.

I've had so much fun with a breadboard version of this circuit that I'm going to assemble a permanent version in a small plastic enclosure. A pushbutton will permit manual activation of the sound sequence. A 7404 (or 74LS04) hex inverter connected to pin 9 will permit the sequence to be actuated by the output port on a computer. A gadget like this will make a great gift for a youngster.
There's no place like Radio Shack's Parts Place
No waiting! Huge selection! Top quality and value!

A SPDT DIP relay

B Mercury switch
Subminiature size, rated 100 milliamps at 24 VDC. Great for anti-tamper alarms and position sensing. 275-025 .... 89¢

C Lighted switch
SPST. Looks great in projects or vehicles. Red LED in handle glows when “on.” Rated 5 amps. 12 VDC only. 275-880 .... 2.99

D DPDT knife switch
For model railroads, reversing polarity, antenna switching, and many other low-voltage uses. 275-1537 .... 99¢

E Six mini red lamps
Cute incandescents for model railroads, dial, winken-blinken boxes and more. 50 milliamps at 6 volts. 5" leads. 272-1144 .... Pkg. of 6/99¢

F “Helping Hands”
This sturdy, fully adjustable holder frees your hands for easier building and repair. Cast iron base, nickel-plated clamps. 64-2093 .... 7.95

G 25-range VOM
Ready-to-use Micronta® multimeter features a mirrored scale and 20,000 ohms per volt DC sensitivity. Measures 0 to 1200 volts DC in seven ranges, 0 to 1200 volts AC in five ranges. DC current, 0 to 250 milliamps in four ranges. Resistance in four ranges. Decibels, +20 to +63 in five ranges. 5 1/2 x 3 1/2 x 1 1/4. AA battery. 22-202 .... 27.95

H IF amplifier
MC1350. Operates from DC to beyond 60 MHz. 8-pin DIP with specs. 275-1758 .... 2.19

I Video detector
MC1330. Excellent linearity. Used in mini/micro TV receivers. Separate video and AFT outputs. 8-pin with specs. 276-1757 .... 2.49

J FM detector
MC1358/CA3065. IF amp, FM detector, audio driver in a 14-pin. 276-1759 .... 1.79

K Ohm's law guide
Pocket slide rule solves Ohm's law and parallel resistance problems—a real timesaver for your workbench! 271-1211 .... 49¢

L Three mini motors
Ideal for solar displays, models and more. 1 1/2 to 6 VDC. 273-208 .... Pkg. of 3/1.49

M Test clips
Spring action—a “must” for testing on crowded boards. 3 1/2 long. One red, one black. 270-352 .... Pkg. of 2/1.99

N IF filter
SFE10.7MHZ-A. Full spec. 3-lead ceramic device for 10.7 MHz FM IFs. 272-1301 .... Pkg. of 2/1.99

O Schottky IC sale!
All are first-quality devices, include pin-out and specs.

P Logic probe
Indicates high, low or pulsed logic states with easy-to-read LEDs. Overload and reverse polarity protected. 22-301 .... 19.95

Q Portable mini vise
Handy for soldering, gluing, drilling. Instant vacuum mount on any smooth non-porous surface. 64-2094 .... 2.99

R Tech books
Understanding Satellite Communications Systems. 256 pages. 62-2018 .... 2.95
Understanding Optronics. 62-1384 .... 2.95
Understanding Computer Science. 62-1383 .... 2.95

S Transformer
Primary: 120 VAC. Secondary: 24 VAC at 300 milliamps. Top quality. 273-1386 .... 3.49

T Binding posts
Pushbutton release and secure contact. One red, one black. 274-660 .... Pkg. of 2/1.39

U PC transfers
Simply rub strips, circles, pads on your board and etch! 276-1577 .... Set of 4/2.49

V Project cabinet
Distinctive 2-tone styling with easy-to-work end panels. 2 1/2 x 5 x 5 1/2. 270-218 .... 7.95

Data Acquisition (Continued)

DATA ACQUISITION (Continued)

DATA ACQUISITION (Continued)

Data Acquisition

Microprocessor Components

Data acquisition utilizes a National Semiconductor DAC2040A D/A converter to interface with a microprocessor via a national DAC2040A digital-to-analog converter. The DAC2040A is a high-speed, low-power CMOS D/A converter that provides accurate, high-resolution conversion of digital data to analog signals. It is designed for use in industrial, medical, and telecommunications applications where high performance and low power consumption are critical.

The DAC2040A features an internal reference, which eliminates the need for an external reference voltage. It also includes a power-on reset circuit that ensures the output is in a known state when the power is first applied.

The module includes a 16-bit digital filter, which helps to reduce noise and improve the signal-to-noise ratio of the output. The filter can be configured for different bandwidths to meet specific application requirements.

The DAC2040A is compatible with a wide range of microprocessors and microcontrollers, including the popular 8051 family. It can be configured to operate in either the 5-volt or 3.3-volt power supply range, making it suitable for use in both 5-volt and 3.3-volt designs.

The DAC2040A is housed in a 40-pin DIP package, which provides access to all of its pins, allowing for easy connection to a microprocessor or other digital components.

The DAC2040A is widely used in applications that require high-resolution digital-to-analog conversion, such as medical instrumentation, industrial control systems, and telecommunications equipment.
If you need information on outdated or rare equipment—a schematic parts list etc., another reader may be able to assist. Simply send a postcard to Operation Assist, Popular Electronics, 1 Park Ave, New York, NY 10016. For those who can help readers please respond directly to them. Thank you. (Only those items regarding equipment not available from normal sources are published.)

RCA Model RM1280 audio power amplifier. Need schematic and operation service manual. 5 A. Kluza, Dowling College, Oakdale, NY 11769.

Robertson Model 440 recorder/amplifier. Need Part No. 40-43 (solenoid is a 170 ohm coil). J.G. Morgan, 1001 Woodland Dr., Roseville, CA 95678.

NTI Model 212 VOM. Need operation manual and schematic. Mike Adams, Route 4, Box 764, Panama City, FL 32405.

COLLEGE DEGREE in ELECTRONICS by Home Study

Coldly examined credentials and then to the

Some basics about the new field of electronics are:

- Basic electronics
- How to read a circuit diagram
- How to use a multimeter
- How to solder

These topics are covered in a self-paced, modular course that allows you to learn at your own pace. The course is divided into three main sections:

1. Basic Electronics
2. Advanced Electronics
3. Specialized Topics in Electronics

The course materials include complete instructional content, practice problems, and troubleshooting exercises. Upon completion of the course, you will receive a certificate of completion and be prepared to pursue a career in the electronics industry.

American Inventors Corp.

For more information on how to start your own business, please visit our website at www.americaninventors.com.
TRY-OUT CAR AUDIO allows equipment to be checked in your vehicle before you make a purchase. A portable car stereo idea from Bose, with fast and easy setup, gives you a chance to hear its 1401 Direct/Reflecting Car Stereo System in your own car before actually plunking down the money to have one permanently installed. Lightweight and self-contained, the system includes four wired and removable speakers, a booster/equalizer, and the Bose CRC tuner/cassette player. For a test listen, you place two speakers on the car's rear shelf and two near the front doors. Volume, low-frequency and spatial adjustments can be made when the car is stationary and when it is on the road.

VCR COPYRIGHT RULING from a 3-judge panel that stated it's illegal to record copyrighted material from TV broadcasts is being challenged by Sony Corp. Sony, filing for a rehearing, urged that a full 24-member panel of the Ninth Circuit Court of Appeals consider the issue. Interestingly, the chairman of Walt Disney Productions, a plaintiff, indicated he would support legislation making it legal to use a VCR to record copyrighted material in the home.

HANDS-ON MATHEMATICS for kids and other smart people is offered in an exhibit at the Boston Museum of Science. Called "Mathematica: A World of Numbers...and Beyond," it features an array of interactive devices, demonstrations, and models that involve the visitor in basic mathematical and scientific theories and principles to help him understand them. Integral calculus, for example, is illustrated by lowering wire frames into a soap solution. The soap film stretches across the frame to form the connecting surface with the least area. The principle of the Moebius Band is demonstrated by a 15-ft high model with a three-dimensional red arrow that travels continuously over its surface. The exhibit is sponsored by IBM.

RCA SHIPS TWO-MILLIONTH CED DISC, thereby providing a basis for a production goal of 10-million discs for 1982. Also planned for 82 is a new stereo model to be introduced to retailers in May. The current monophonic model, the SFT100, will be updated and released at about the same time. To date, RCA has produced 174 video disc titles under its own and MGM/CBS labels.

QUBE INTERACTIVE TELEVISION has been expanded to allow subscribers at home to retrieve a variety of consumer information directly from data banks, including that provided by national news organizations such as The New York Times and Washington Post. The new service, which is a joint project of Warner Amex, Atari, and CompuServe, was demonstrated live in Columbus, OH. An Atari 800 personal computer was used to access information from CompuServe data banks, which then appeared on a television screen. This included: news, weather, sports, food recipes and shopping tips, financial information, computer games, etc.

LOW-POWER TV STATIONS must comply with "sure and substantive interference standards and protections" according to the National Association of Broadcasters (NAB). The FCC, to which the NAB has made its appeal, would be responsible for ensuring that the transmission of full-service TV beyond the Grade B contour continues to be protected against low-power TV interference. NAB is therefore in favor of mileage separation requirement for transmitters; and against the use of additional receiving antenna directivity as an allocations tool.

SATELLITE SPACING may be reduced to 2° if the FCC has its way. The proposal would have the effect of doubling the present number of 4/6-GHz slots in geosynchronous orbit by eliminating the present requirement that there be 4° of longitude between each satellite. The loss of signal integrity and operational flexibility would be offset by recent improvements in antenna performance, according to the FCC. The step is necessary because of the sharp increase in geosynchronous satellite traffic expected during this decade; the FCC has already approved the construction of 25 new satellites and the launching of 20 others.
FRIENDLINESS.
Informative HP manuals, helpful error messages, and automatic syntax checking make BASIC language programming easy.

FULL-SCREEN EDITING.
Edit the easy way - without retyping entire statements. Insert, change, or delete characters at the touch of a key.

INTEGRATED GRAPHICS.
Analyze a better way - with graphics. Document your results with hard-copy plots.

EXPANDABILITY.
Just plug in the HP interface bus (HP-IB) and add up to 14 peripherals without disassembly.

12-DIGIT ACCURACY.
(Not just 9!) Thanks to BCD math capability.

HP SOFTWARE.
Powerful, time-saving solutions to your everyday problems.

PORTABILITY.
Keyboard, CRT, printer and storage - all in a 20-lb. package. So you'll have computing power wherever you need it...office, lab, field, or home.

Hewlett-Packard put it all together.

The HP-85 personal computing system.
Leave it to Hewlett-Packard to put a lot of power in a little package. Plus flexibility, portability, and all the other features you'd expect to find in a personal, professional, integrated computing system.

Turn it on and the HP-85 is ready to go. You're off and running using HP software or creating your own programming solutions. There's no bootstrapping. And since the operating system and powerful BASIC language exist in ROM, they use almost none of the available RAM.

If you've been looking for a friendly, integrated computer with power and dependability, look at the HP-85.

We put it all together for you!
For further information, phone toll-free, 800-547-3400, Dept. 254F, except Alaska/Hawaii. In Oregon, call 758-1010. Or write Hewlett-Packard, Corvallis, OR 97330, Dept. 254F.

When performance must be measured by results.
In truth, your stereo is only as good as your music source. Snaps, crackles, pops and hisses caused by static on records can reduce even the best stereo to sounding like an 1877 gramophone. However, by using Discwasher® V.R.P.® Valuable Record Protectors, the Discwasher® Zerostat® Anti-Static Instrument, and the Discwasher® D'Stat® II Turntable Mat, you can effectively minimize or eliminate static problems, leaving your records static free for clean stereo sounds.

**Discwasher® V.R.P.® Valuable Record Protectors** are super smooth, scratch free inner sleeves that effectively reduce the formation of static charges when records are removed and replaced.

**The Discwasher® Zerostat® Anti-Static Instrument** neutralizes static by showering records with positive and negative charges with the simple squeeze and release of a trigger.

**The Discwasher® D'Stat® II Turntable Mat** not only reduces static charges during actual record playback but it also reduces sonic and mechanical feedback between the record and the turntable platter.
