HOPE AND GLORY

This month, Popular Electronics turns its attention once again to that semi-annual exercise in electronics excitement known as the Consumer Electronics Show. But while the winter show, held as always in Las Vegas, had its usual complement of celebrities, perky demonstrators, and general hype, there was something else in evidence—a genuine feeling of optimism that had been decidedly missing in the recent past.

Why? There were several factors at work. Most manufacturers had a decent holiday season. There was also the general excitement that surrounded the change in the U.S. government.

But to us, the real excitement surrounded several new products. Previously, pen-based computers, widescreen TVs, digital-audio recorders, RBDS receivers, and the like existed only as "vaporware," but now real, working units were either in the pipeline or had already begun shipping. And proposed new products from Pioneer and a new company called 3DO (with backing from, among others, AT&T and Matsushita) could finally kick-start the nascent multimedia industry, if they live up to their advance billing.

However, that's a big if, and therein lies the tale of CES. Electronics manufacturers, here and abroad, are searching for something to lead them out of their recent doldrums. They are looking for the next "VCR" or "CD player," and are hoping that one of the aforementioned products or product categories fills the bill.

Only time will tell if that will happen. In the meantime, however, you can get a first-hand report on all the goings on at the show in this month's Gizmo; the story starts on page 5.
EXEMPLARY EMF TESTER

Popular Electronics and John Iovine should be commended for the informative construction feature, "Electromagnetic Fields and Your Health" (March 1993). What a great article! It gave a candid, yet thorough, look at a health hazard about which many of us were uninformed. The circuit could be built cheaply, with off-the-shelf parts from Radio Shack.

Once completed, I immediately checked out the EMF tester on the first thing at hand, my soldering iron. Whew! I'm glad I don't hold on to one of those all day. The tester would not shut off within six inches of it! The investigation did not stop there. Those wall-type power supplies and a can opener were the biggest EMF producers that I found. Some of the devices indicated unsafe levels up to 2½ feet away! After testing the TV and computer monitor, the whole family could be warned to keep to a safe range, now that I have a better idea of what that range is.

Sweeping the EMF tester back and forth around the suspected offender seems to make it more receptive. Since wire (the pickup coil) passing through a magnetic field produces electricity, I believe this made my readings even more accurate, especially with the tester held at 90° from the first pass. First thing Monday morning, the tester is going to work with me, to identify "hot spots" so I can try to reduce my exposure there.

I assembled my EMF tester on a printed-circuit board and would gladly share the pattern and parts-placement diagram with other hobbyists who wish to keep assembly neat and easy. Send a self-addressed, stamped envelope to me at P.O. Box 344, Marysville, MI 48040.

Mike Giamportone

FUEL MISER EFFICIENCY?

I found the "Fuel Miser" (Popular Electronics, March 1993) to be an interesting and novel way to reduce the fuel-consumption rate in a heating system. But most heating systems are complicated, and it is doubtful whether the Miser actually can save any useful amount of fuel without degrading the system.

For best comfort, the system should be designed so that it is running near 100% of the time during cold-weather conditions. Normally, that results in somewhat less comfortable conditions even in mild weather, especially with forced-air systems. I have heard that described as feast-or-famine operation. To counter that, some systems use an outside thermostat to reduce the gas flow to a hot-air furnace in mild weather. However, to maintain comfort it is necessary to also reduce the air flow by reducing the fan-motor speed. The Fuel Miser will reduce gas flow, but it doesn't take care of the fan-speed reduction.

In a properly designed and balanced hot-air system, the total air flow through the furnace should be just the right amount to remove all the heat available from the burner and at the same time maintain about 140°F air at the outlet vents. If the outlet temperature deviates much from 140°F, the heat level will be uncomfortable. Some people refer to heat-pump systems as "cold heat" since they usually have lower than usual outlet temperatures.

Most furnaces have a bonnet thermostat that keeps the fan from coming on until a certain temperature is reached, so that there's no blast of cold air from the vents. Some even cycle the burner on and off to maintain a desirable range of bonnet temperatures. When the room thermostat is satisfied, the burner is cut off. In some systems, the fan might keep on running until the bonnet temperature drops low enough, and in others the fan cuts off along with the burner. The heat remaining in the furnace might dissipate to the surrounding space or drift upward through the ducts, but there is not a great amount of actually energy loss in most installations. If the Fuel Miser is used, you still have the exact same situation during the time it has the burner cut off. If the Miser was installed so that it would cycle just the burner on and off, while maintaining proper outlet temperatures, it could be useful, but otherwise I see no value in it.

The article says that the Fuel Miser can be used with any kind of heating system—hot air, hot water, steam, etc. I don't see any useful application for it in hot-water systems. In most of them, the room thermostat just turns on a circulating pump, and a zone valve in a zoned system. The burner is basically cycled on and off by a thermostat that keeps the water reservoir hot within certain limits. Sometimes there is an interaction between those systems to reduce the time it takes get the burner on after a zonal calls for heat. Installation of the Fuel Miser in this kind of system would merely result in turning the circulator on and off, reducing the amount of heat to the room. Hot-water systems usually do not produce uncomfortable conditions when operating in mild weather, so there would be no benefit in cycling the circulator, and certainly no fuel savings. Further, in any type of heating system, if you use the programmable thermostats to drop the temperature during the night or when the house is empty, you will want the system to run at maximum rate to get a fast recovery when the setback ends. The Fuel Mis- er would seriously interfere in that case.

There might be some improperly designed heating systems that could benefit from the Fuel Miser, but it would take a very comprehensive study to determine that. The device is cheap enough that one could experiment with it without losing his shirt, but I think your readers should know what they are getting into when they start messing with their heating systems.

K.E.S. Cherryvale, KS

KIT BUILDER'S CHALLENGE

Among older readers (born before 1952), those who never built a Heathkit project must be in the minority. I (born in 1939) personally built three of them.

But, did I hear the story ("Kit Building Lives," Editorial, Popular Electronics, December 1992) completely and correctly? As far as I am concerned, Heathkits were not for true kit-builders!

As I heard the story, Heath never marketed a kit until it could be successfully completed by a non-hobbyist—often a secretary employed by Heath. If she could put it together, so could "dim-wit" hams, I suppose.

Heathkit's exit may bring sorrow to non-kit-builders. But for us hobbyists, can we now hope to see kits not designed for secretaries?

E.J. Vero Beach, FL

HAVES AND NEEDS

Thanks so much for printing my request for an analog delay chip, and thanks to the many readers who responded. Even before I received my copy of Popular Electronics, I had a handful of responses!

Now I have another request. I just received a Modular Circuit Technology EPROM burner card for a PC-based computer, and I need both the documentation and the software to make it work. If anyone knows where I can obtain those items, I would greatly appreciate hearing about it. Thanks again.

THE PARTS PLACE

TECHLINE™ Tools—The new standard in strength and precision!

- Precision-crafted with top-quality materials
- Designed for long life and ease of use
- Backed by Radio Shack’s 1-Year Limited Warranty

New TECHLINE tools represent Radio Shack’s uncompromising dedication to quality. Each is precision-crafted of long-lasting, hard-working materials and employs the latest design innovations for comfort and ease of use. And, each is backed by our full 1-year limited warranty.

Portable Power Inverter. For camping, fishing, emergencies. Converts car/boat 12VDC to 115VAC for powering a TV, VCR, light or tool. Compact and efficient. Rated 140W continuous. #22-132 99.99

TECHLINE Swiss Army Knife. Tool kit for your pocket! You’ll be prepared with a large blade, Phillips and slot screwdrivers, wire stripper, cutter, pliers, opener, tweezers and toothpick. #64-2001 29.95

Hi-Current Car DC Adapter. Plugs into vehicle lighter socket. Provides 6, 9 or 12VDC. With four Adaptaplugs. #270-1502 15.95

Getting Started in Electronics. A great hands-on introduction to building your own electronic circuits. #276-5003 2.99

Anti-Static Spray. By STATX® brands. New high-tech cleaner and protector repels dust — cleans without scratching. #64-3310 3.99

Mini Audio Amp With Built-in Speaker. Many uses — test amp, signal tracer, phone amp and amplified PC speaker. #277-1008 11.95

Bench-Top Soldering Iron Holder/Cleaner. Safe way to hold hot iron while working. Sponge tip cleaner. #64-2078 6.49

Speedy service and low prices on thousands of parts and accessories!

- FREE delivery to Radio Shack on orders $5 and up
- Semiconductors and ICs — Hard-to-find batteries
- CB and scanner crystals — Long-life vacuum tubes
- Phono cartridges/styli — SAMS® service books

Why pay more for mail-order? Your Radio Shack stocks 1000 electronic components, and another 15,000 are available fast from our special-order warehouse. Ordering is easy! Bring in the exact part number (or old part). We’ll check availability and order by phone. Delivery time to your nearby Radio Shack for most items is a week.

Prices apply at participating stores and dealers
Wet and Wild Winter CES

A rundown of the 1993 Winter Consumer Electronics Show with product highlights

Something seemed different at January's 1993 Winter Consumer Electronics Show. No, it wasn't the weather—although a week of rainy days certainly is unusual for the Las Vegas desert. Rather, it was a change in attitude. We sensed a feeling of optimism that ranged from cautious to unbridled, which not even the soggy weather could dampen. With the economy on the upswing, a new president about to be inaugurated, and the latest EIA figures showing that 1992 was the biggest growth year for consumer electronics since 1985 (with factory sales up 7.9%), manufacturers and retailers alike had high hopes for the coming year.

Perhaps the wet weather was an inspiration to some, judging by the watery language used in two of the opening speeches. Gary J. Shapiro, group vice president of the Electronic Industries Association's Consumer Electronics Group (EIA/CEG), urged industry cooperation with the Clinton administration's new economic policies, reminding attendees that "a rising tide raises all ships." And IBM President Jack Kuebler, referencing the once separate fields of computers and consumer electronics, declared, "Technology has allowed our two streams to form a very powerful river."

Those two seemingly disparate remarks represent one major trend at this year's WCES: As the boundaries between computers and communications, and audio and video, become increasingly blurred, strong alliances that often cross the lines between various industries and technologies are being formed. The audio industry has already experienced a boom in sales thanks to consumer demand for home theater; now even high-end audio manufacturers have begun adding video capabilities to their equipment. In a newly developing trend, computers are being integrated into all areas of consumer electronics to create devices that are, in the words of Kuebler, "people literate." (An easier task, perhaps, than creating a public that is computer literate).

To that end, IBM announced its involvement in joint projects with Polaroid (to create a camera/PC system), with Texas Instruments (to develop the MWave Multimedia system), with Blockbuster (for a retail format in which customers can preview digitally compressed audio and video material and have copies of their selections made up as they wait), with NBC and NuMedia (for an on-demand multimedia news service), and with Bell Atlantic (for the telephone-based Video On Demand system). And IBM is by no means the only company that's formed partnerships to broaden its consumer-electronics horizons, as you'll see below.

All that corporate wheeling and dealing aside, what were the hot items on the floor at WCES 93? The buzzwords were pen-based portable computer/organizers (PDA, PC, PIP), multimedia (3DO, L.I.F.E., CD-ROM), digital recording formats (MD, DCC), digital radio data (RBDS), and 16:9 TV's. If you feel like you're drowning in a bowl of alphabet soup, read on. We'll spell it all out for you below.

**PEN-BASED POCKET COMPUTERS**

If any one new product category is striving for a "people-literate" image, it's the first generation of hand-held, pen-based personal computing/communications devices, known as personal digital assistants, or PDA's. The concept is innately appealing, offering consumers and businesses people a complete, intuitive, easy-to-use, computing-write-taking/communications package. Since the announcement of Apple's Newton during the 1992 Summer Consumer Electronics Show, the competition has been heating up. At WCES 93, AT&T showed the Personal Communicator 440, and Tandy and Casio demonstrated a working prototype of the Zoomer Personal Information Processor (PIP).

The AT&T Personal Communicator 440 is a good example of cooperation between manufacturers. Designed by EO, Inc. around AT&T's own Hobbit chip and GO Corporation's PenPoint operating system, the device is being manufactured at Matsushita's assembly plant in Illinois. The Hobbit runs at 20 MHz, giving the Personal Communicator the power to provide an immediate response to any form of user input. The PenPoint operating system...
The AT&T Personal Communicator 440 is a pen-based, hand-held device that integrates computing and communications capabilities. It can draw a map of how to get to Mary’s office. Later, you might decide to leave a vocal reminder: “Don’t forget to bring the Jones file!” And if Joe doesn’t know where Mary’s office is, you can fax the map to him.

From Casio Computer Company, Ltd. and Tandy Corporation comes the Zoomer Personal Information Processor. The suit-pocketsized device uses an operating system from GeoWorks and bundled applications software and handwriting recognition software from Palm Computing, which also will develop an array of add-on products for the Zoomer. America Online will include a special ROM version of its interactive communications and consumer online services. Intuit, the developer of Quicken financial software, will support the Zoomer platform with specialized software.

The Zoomer is intended to deliver convenient information access and communications capability. While the developers were closedmouthed about the latter, they hinted at PC, fax, and E-mail communications. The device allows users to write and draw on screen, or to input data using an on-screen pop-up keyboard. By pressing on icons, users can move between various applications, including reference functions, games, note taking, phone/address book, appointment calendar, calculator, and forms. The Zoomer is said to get up to 100 hours usage from ordinary alkaline batteries. The first-generation PIP will be available this summer, at a price that’s yet to be revealed but is expected to fall “between $600 and $1000.”

Apple and Sharp provided a technical update and demonstration of the Newton personal digital assistant, which features handwriting-to-text conversion, cursive-handwriting recognition, and fax capabilities. The first Newtons are expected to ship this summer for significantly less than $1000, including some built-in software applications.

On a somewhat smaller scale, Sharp exhibited a pen-based version of their Wizard personal organizer. The $649 OZ-9600 has a touch-sensitive screen and a pen-input system, and can store notes entered in “digital ink” form. Unlike any of the other pen-based devices we’ve discussed, the OX-9600 is available now.

This Newton prototype from Apple represents the first PDA to be announced.

It remains to be seen whether PDA’s “represent a completely new direction for telecommunications” or if in the future “almost everyone will use devices like this to communicate easily and effectively with voice, data, handwriting and pictures, regardless of where they are,” as John Hanley, AT&T Consumer Products group vice president predicts for the Personal Communicator 440. But at this show, we got the feeling that the products—while not yet here—are for real. It’s certainly worth keeping a close eye on the emerging PDA field.

MULTIMEDIA MAYHEM

Just as PDA developers forecast major changes in the way people work and communicate, multimedia manufacturers expect their products to change the way folks learn and play. If you’re a regular Gizmo reader, you know all about Philips’ CD-1, Atari’s CDTV, multimedia PC’s (MPC), and CD-ROM drives, and you’ll be reading our review of Tandy’s VIS in the near future. Although many applications are available for each multimedia format, CD-1 and VIS are TV add-ons meant strictly for use in the family room, MPC and CD-
ROM are computer products, and CDTV though originally marketed as a TV adjunct, has found its niche with Atari computer users. The verdict isn't in yet on CD-I or VIS, but CD-ROM has been continually gaining acceptance and is expected to really take off this year.

Now, into the fray leap two new interactive multimedia contenders: The 3DO Company's Interactive Multiplayer and Pioneer's Laser Interactive Family Entertainment (L.I.F.E., or LaserActive).

3DO, a 32-bit computer/game platform has several things going for it: power, upgradability, backing by a team of major players, and a unique licensing arrangement. The first version of the Interactive Multiplayer, expected to be available this fall for about $700, is a CD version that attaches to a television and can play audio CD's and Photo CD's as well as game CD's and cartridges. Not just a "soup-uped version of traditional technology," the 3DO system is based on a custom graphics/animation processor designed with fast animation and graphics in mind. Other system components include a memory management system, a custom audio digital signal processor, a video processor, a 32-bit RISC (Reduced Instruction Set Computer) processor, and a double-speed CD drive. The result, according to The 3DO Company is a device that has 50 times the power of today's 16-bit games, and fast enough to allow real-time interaction without jerkiness or interruption. The system can be upgraded with the addition of separate expansion modules that enable such options as home video editing, MIDI, and MPEG-compatible full-motion video. A module planned for 1994 introduction will allow 3DO users to access network services.

Partners in The 3DO Company include representatives from the hardware, software, motion-picture, and cable and broadcast communications, and networking industries: Matsushita, MCA, Time Warner, Electronic Arts, and AT&T. Yet the company is not interested in monopolizing the new technology, but in setting a

A panel of industry insiders gave updates on the state of Digital Compact Cassette and Mini Disc.

new image for each change. 3DO promises to save time and money for the software developer and use up less memory in the game or playback device.

The bottom line: better-looking games. But that's just the beginning. The future? Quality video in a highly compressed format. Why is AT&T involved? They'll be able to download that compressed video over phone lines to provide video on demand.

Meanwhile, Pioneer was unveiling their L.I.F.E., or Laser Interactive Family Entertainment, system, dubbed LaserActive. Pioneer is positioning LaserActive as a higher-quality alternative to CD-ROM and CD-I systems, because it contains the same quality video as found on laserdiscs. The system also can store 108,000 still pictures (compared to CD-I's 7000-picture capacity), FM audio, and still have the same 450-megabyte data area found in CD-I and CD-ROM multimedia systems free.

Like 3DO, the LaserActive system consists of a main unit and optional add-ons. The main unit, however, isn't interactive; it plays back only CD's, CDV's, and LD's. Interactivity is achieved by plugging in optional control packs that include the Sega-manufactured MEGA-LD pack, the LD-ROM pack, or Pioneer's own Karaoke pack. The pack of choice is inserted into the main unit and, in the case of the game packs, operated via dedicated control pads. The MEGA-LD pack plays back 8- and 12-inch LaserActive MEGA-LD discs, SEGAS-CD discs, Genesis-ROM cartridges, and CD+G discs. The LD-ROM pack plays back 8- and 12-inch LaserActive LD-ROM discs, TurboGraphics CD-ROM discs, and CD+G discs. The Karaoke pack plays only Karaoke Laser Discs. While remaining close-mouthed about U.S. pricing, Pioneer did say that at their summer 1993 American introduction, the units would be similarly priced to those currently selling in Japan, where the main unit is fetching the equivalent of $720 and the add-ons $480 each. (At those prices, we'd be tempted to buy a laserdisc player, a Sega Genesis, a karaoke machine—and go out to dinner several times!)

In Pioneer's simulated demonstration of a LaserActive game, in which the user piloted a spaceship through the inside of a pyramid on a distant planet, the animated background graphics were broadcast-quality. In a travel/foreign language application, the user could stroll through the streets of Paris, enter shops and cafes, and interact with the shopkeepers and patrons inside, conversing in French (with help from on-screen captions) or English. Another possible application is interactive movies, in which the player could assume the role of a main character and make
Learn computer programming computer system, Windows,

Only NRI at-home training gives you real-world programming skills in three in-demand languages: QBASIC, C, and Visual Basic, today's hot new language designed for writing popular Windows applications. Best of all, you get hands-on training with a powerful new 486sx-based computer system, complete with 80 meg hard drive, Windows, and professional programming software you keep!

NRI, the recognized leader in at-home computer training, shows you how to take advantage of today's newest programming opportunities

Get in on the ground floor of one of today's fastest-growing career fields: computer programming. The Bureau of Labor Statistics forecasts that job opportunities for programmers will increase much faster than average over the next 10 years, with as many as 400,000 new jobs opening up by 2005.

And the largest number of new programming jobs will be in PC programming, fueled by the phenomenal popularity of Windows and the growth of exciting new languages such as QBASIC, C, and Visual Basic.

Now, with NRI at-home training, you can get the new skills you need to build a top-paying career — even a full- or part-time business of your own — in this high-growth, high-opportunity field.

NEW! The only programming course that includes a powerful 486sx-based computer, 80 meg hard drive, Windows, Visual Basic, and more — all yours to keep!

Right from the start, NRI gets you actively involved in the challenge of real-world programming. Step by step, you learn to create the kinds of full-featured, powerful programs today's employers and clients demand...including programs designed for use in a Windows environment!

Only NRI gives you first-hand programming experience with a state-of-the-art 486sx mini-tower computer system, complete with hard disk drive, 5 full megabytes of RAM, high-density floppy drive, mouse, monitor, and more — all yours to train with and keep!

Plus you explore the extraordinary capabilities of three in-demand programming languages. You learn to design, code, run, debug, and document programs in QBASIC, C, and Visual Basic. Best of all, since Visual Basic is specifically designed for creating Windows applications, you learn to generate fully functioning Windows programs, complete with text boxes, command buttons, and other sophisticated graphical interface elements.

No previous experience necessary

Train with NRI, and immediately start getting the money-making job skills you need to be a
as you train with a 486sx Visual Basic, and more!

By the time you complete your course, you have a clear understanding of programming methods, languages, and techniques... and you're ready to handle any programming task with confidence.

Send today for your FREE catalog
With NRI, you get the hands-on experience and the confidence it takes to master today's programming challenges. And, by creating and running your own full-length programs, you build skills you'll be proud to show any prospective employer or client.

So prepare now for a high-paying career as a computer programmer! See how NRI at-home training in Computer Programming gives you everything you need for a fast start in this top-growth field. Send today for your FREE catalog.

decisions that affect the way the plot unfolds.

Both LaserActive, with its high-quality video and 3DO, with its powerful graphics capabilities, look promising. Of course, at this point, both are still "vaporware"—there's no real product yet. Both face the challenge of creating a demand for interactive multimedia in a public that has shown little interest to date. Multimedia is a hard sell, requiring in-store demos and a patient, well-trained sales force. Yet, in a survey of buyers at the Consumer Electronics Show, when asked what advanced products their customers are aware of and/or have asked about, 50% replied multimedia computers and games. And, according to 3DO, there's a whole generation of "VidKids" out there who, upon reaching adulthood, are going to be looking for a more sophisticated replacement for their old Nintendos. The price tags of the 3DO Interactive Multiplayer and the LaserActive system are much too steep for any rapid mass-market acceptance, however. (But remember that the first CD players cost more than $1000.)

CD-ROM, on the other hand, is a well-established technology whose time has come, according to many industry experts. Although the PC-based format has a much smaller prospective-buyers' base than does TV-based multimedia devices, it will arise along with today's rapidly growing PC sales—an estimated 7.1 million PCs were sold last year, and sales are expected to rise by 10% this year. CD-ROM hardware and software exhibitors made a strong showing at WCES 93. And the arrangement between multimedia publisher Compton's New Media and retailer Major Video Concepts to start renting CD-ROM's certainly can't hurt.

A short aside: Continuing the blurred-boundary trend, Sony has announced that they will be marketing Mini Discs formatted for use in computers. The 2.5-inch recordable optical discs hold more data than many of today's hard drives: 130 megabytes. Sony also plans to develop a drive that can store video images.

Now let's take a look at the showing made by audio MDs's, and their competitor, DCC, at the show.

MD/DCC: A REPORT FROM THE BATTLEFRONT

Remember that old Vietnam-era bumper sticker that read: "What if they gave a war and nobody came?" Well, that about sums up the preliminary skirmishes in the MD/DCC conflict. The big-wigs are all in place and raring to do battle. Each side has lined up an impressive array of allies. But, as in any format battle, the ultimate winner is determined by the foot soldier—Joe Consumer—and he simply hasn't turned out in sufficient numbers yet to give either camp a decided edge.

At a WCES workshop titled "Digital Recording Formats: DCC and Mini Disc" the entire panel (Mike Vielli, senior vice president and general manager for Sony Personal Audio Products, Andy Nelkin, assistant general manager for the Technical division of Panasonic, Mike Grubbs, senior marketing director for Tandy; Ken Furst, vice president of marketing for Denon America; and Buzz O'Shea of Capitol/EMI Music) blasted the press for being obsessed with the battle instead of playing up the good points of each respective format. The panelists made up for that omission, each using most of his floor time to sing the praises of his own technology, with Furst citing MD's "high level of coolness" and Nelkin citing DCC's backward compatibility with analog cassettes. When asked the inevitable question—would DCC and MD cancel each other out or could there be peaceful coexistence between the two—Nelkin did remark somewhat wistfully, "It would be great both formats succeeded instead of having a winner/loser situation." And while one panelist pointed out that at least the well-publicized conflict was getting consumers back into the stores, Furst wryly countered that folks might be coming back to the stores due to the same instinct that makes them slow down to look at an accident on the highway!

On the shown floor, both camps were pressing hard. The DCC Group of America, a trade association formed to foster consumer awareness and understanding, was giving away T-shirts and caps and holding daily drawings for a DCC deck, with one day's prize presented by rock star Meatloaf. Sony was demonstrating the skip-resistance of MD by offering rides in the "Jaminator"—a 12-seat motion simulator equipped with a 650-watt Sony sound system that included the world's first car Mini Disc player, the MD-U1. As the vehicle rocked and rolled, a video display showed an even-more-hair-raising-than-usual drive through the streets of Manhattan, and the music played on without a hitch.

For the first time at CES, actual digital-recording products abounded. In the MD camp, Aiwa was showing the AMD-100, an $800 player/recorder; Sanyo displayed their $599 MDX-P1 play-only model; and Sony was showing their $749 MZ-1 player/recorder and their $549 MZ-2P (each of which has been selling for $50 less than its suggested retail price). In the world of DCC, home decks were exhibited by Phillips (the DCC900), Technics (the $999 RS-DC10), and Marantz (the DD-92); Tandy's Optimus DCT-2000 was shown at the DCC Groups booth.

Several others were showing products not yet available. Denon and Sharp were showing play-only MD models to be shipped in the first half of 1993. Panasonic and Philips each announced that they would begin selling a $349 portable DCC player this summer. Onkyo announced their prototype home DCC deck, while Carver, Aiwa, Fisher, Sharp, Panasonic, Sherwood, and Pioneer held back the shipping dates on their prototype home DCC units pending public reaction to the first-generation decks.

As for autosound products, Blaupunkt was showing working prototypes of both
Now an industry standard, the Radio Broadcast Data System could spur sales of a whole new generation of radios that can decode and display digital data transmitted by FM stations.

RBDS is not really a new technology. What is new, however, is the standard that will make it possible for real products to be manufactured and marketed. The industry standard was approved last September, and because RBDS falls under the FCC's existing SCA regulations, the system won't require any special FCC approval.

One snag that was holding up the standard-approval process was that AM radio, with its lack of SCA provisions, seemed to be precluded from RBDS participation. Because AM radio is having a hard enough time as it is, RBDS was opposed by the powerful National Association of Broadcasters (NAB). That problem was neatly sidestepped thanks to a technology called ID-Logic B, which is an option in the RBDS standard. With ID-Logic, a chip that holds format data for every U.S. and Canadian AM station is placed inside the AM receiver, allowing listeners to search for AM stations by program format. One FM station would then be able to update the programming information for all the AM stations in its geographical vicinity.

During WCES 93, ten Las Vegas radio stations were broadcasting on-the-air RBDS signals, and nine exhibitors were showing RBDS radios in their booths, including Axcess USA, Blaupunkt, Delco, Denon, Grundig, Kenwood, Onkyo, Philips Car Systems, and Sony. Denon showed the $600 detachable-face cassette deck with changer controller, Dolby B and C, and full RBDS capabilities, as well as the $450 DCR-720 that lacked Dolby C. Philips and Blaupunkt showed models that use the European RDS system, and Blaupunkt is leaving room in its RCM-43 Las Vegas unit for an RBDS circuit to be added later.

RBDS technology is fairly simple, and is expected to add only about $50 to a radio's retail price, so you're likely to see it in a good number of new receivers, including the OEM radio to be found in the next model of Pontiac Bonneville. There's hope that RBDS will spur a surge in radio sales.

At Thomson's booth, attendees got a glimpse of CinemaVision's many viewing options, including split screen, and picture-outside-picture.

**WIDESCREEN WONDERS**

Television sales—particularly large-screen sets—don't need any stimulus judging by 1992 sales figures. But with the coming of HDTV—and it is coming sooner than you might think—widescreen 16:9 aspect-ratio sets just might be the sales leader in the early 21st century. Beiers polled as to what advanced products they wanted to see at WCES 93 put widescreen TV at the top of their wish list (65%); asked what advanced products interested their customers, 70% said 16:9 sets. Even without HDTV, widescreen sets are ideal for viewing movies that were filmed at that aspect ratio. More than 600 laserdisc titles and an increasing number of videocassettes are available in 16:9 letterbox format.

At WCES, four companies were showing 16:9 sets. Sharp, Goldstar, and Thomson Consumer Electronics had direct-view sets, and Panasonic went with a projection model. Sharp was displaying 28-, 30-, and 34-inch widescreen sets, but no pricing was set and production has yet to begin. Goldstar has already shipped both 34- and 36-inch widescreen sets in Korea, and plans to hit the U.S. market next year. Panasonic's 50-inch, high-profile, rear-projection PT-50WX15 CinemaVision ($5499) contains two tuners, an icon-based menu system, and the company's Active Dome Sound system with subwoofer. It should be available this spring.

Thomson, long the leader in the U.S. widescreen field, plans to market its 34-inch direct-view CinemaScreen during the first half of the year. Two versions will be available: a console set will carry the RCA brand and a table-model will have the FroScan label. Each will cost about $5000. (According to Thomson, the price of widescreen sets is expected to drop—perhaps as much as 50%—with increasing customer demand.) The sets have a host of nifty features, including the ability to ex-
pand and adjust different-sized images to best fill the screen, to watch up to three picture-outside-picture (POP) images or a single PIP image, and to use an on-screen "channel guide" that displays nine channels at once. In addition, thanks to two separate tuners, the CinemaScreen sets' Split Screen feature lets you watch two programs at the same time, with the provision for separate audio reception. The sound system is no slouch either, consisting of a six-speaker audio system and a built-in, 10-watt-per-channel, Dolby Pro Logic surround-sound amplifier. An RGB input should provide HDTV-compatibility, when needed, according to Thomson.

NEAT NEW GIZMOS
Certainly not everything at WCES 93 involved complex, all-new technologies. As always, there were plenty of new products that represented interesting applications of existing technologies, or simply good ideas. Here are a few of our favorites for this year.

Panasonic has come up with an electronic solution to the perpetually unbalanced checkbook. Their KX-RC100 CPA Check Printing Accountant ($349.95) maintains two separate checking accounts, printing checks on demand. It also keeps track of credit-card purchases and other expenditures, can do simple calculations, and can remember up to 50 phone numbers. The CPA can be carried in a coat pocket or purse, and holds up to 25 checks. For making regular payments, as many as 25 payee names can be stored. A password is included for security. A "memo" function lets the user note if a transaction is tax deductible, or classify it as one of 50 common types of expenses (child care, property tax, auto loan, mortgage, entertainment, etc.) When a check is printed, the amount is automatically deducted from the account.

If your family owns a CD changer, there's a good chance that you've had the unfortunate experience of queuing up what you thought would be your favorite classical disc only to be blasted out of your seat by your teenager's Metallica CD. Addressing that problem, Fisher introduced its 24-disc CD Management System, dubbed Studio 24. The 24-disc changer stores and plays discs by names (input via an alphanumeric keypad) or by preset categories; each disc can be grouped in up to two categories (musical type, mood, occasion, disc or artist name). That allows each family member to store his own group of CD's in a subcategory. The device's vertical-loading, dust-free chamber minimizes wear and tear on discs. The Studio 24 changer is available in several different configurations: as a separate component (DAC-167, $499.95); a mid-sized shelf

Electronic Paperbacks at Special Prices

- **BP247—MORE ADVANCED MIDI PROJECTS** .... $5.95. Circuits included are MIDI indicator, THRU box, merge unit, code generator, pedal, programmer, channelizer, and analyzer.

- **BP248—TEST EQUIPMENT CONSTRUCTION** .... $5.95. Details construction of simple, inexpensive, but extremely useful test equipment: AF Gen, Test Bench Amp, Audio Millivoltmeter, Transistor Tester and six more.

- **BP309—PREAMPLIFIER AND FILTER CIRCUITS** .... $6.95. Provides circuits and background into for a range of pre-amplifiers, plus tone controls, filters, mixers and more. All are high-performance circuits that can be built at a reasonable cost.

- **BP310—UNDERSTANDING PC SOFTWARE** .... $6.95. This book will help you understand the basics of various types of business software in common use. Types of software covered include word processors, spelling checkers, graph programs, desktop publishing, databases, spreadsheets and utilities.

- **BP125—A CONCISE USER’S GUIDE TO WINDOWS 3.1** .... $7.95. Come to grips with Windows 3.1 in the shortest and most effective way. Learn how to manipulate Windows screens and DOS by Windows menus, 16-bit and 32-bit applications, the constructor’s workshop.

- **BP224—DIGITAL AUDIO PROJECTS** .... $5.95. Practical circuits to build and experiment with. Includes ADC and DAC converters, input amplifier, digital delay line, synthesizer, echo effect and more.

- **BP159—ADVANCED ELECTRONIC SECURITY PROJECTS** .... $5.95. Includes a passive infrared detector, a fiber-optic loop alarm, computer-based alarms and an unusual form of ultrasonic intruder detector.

- **BP225—POWER SELECTOR GUIDE** .... $10.00. Complete guide to semiconductor power devices. More than 1000 power handling devices are included. They are tabulated in alpha-numeric sequence, by technical specs include power diodes, Thyristors, Triacs, Power Transistors and FETs.

- **BP226—MORE ADVANCED USES OF THE MULTIMETER** .... $5.95. Use these techniques to test and analyze the performance of a variety of components. Also see how to build add-ons to extend multimeter capabilities.

- **BP311—AN INTRODUCTION TO SCANNERS AND SCANNING** .... $7.95. Radio scanners have opened a realm of exciting radio listening. Understand radio wave propagation, types of transmissions, antennas, band assignments—and above all—where to hear all! Comes complete with index, glossary of important terminology.

- **BP227—HOW TO USE OSCILLOSCOPES AND OTHER TEST EQUIPMENT** .... $6.95. Mastering the oscilloscope is not really too difficult. This book explains all the controls and functions. Other equipment is also described.

- **BP228—REFERENCE GUIDE TO PRACTICAL ELECTRONICS TERMS** .... $8.95. More than just a dictionary of practical electronics terms, the book goes a step further in getting down to fundamentals. A reference volume that can be read casually by a reader seeking knowledge.

- **BP229—PRACTICAL ELECTRONIC FILTERS** .... $6.95. Presents a dozen filter-based practical projects with applications in and around the home or in the constructor’s workshop. Complete construction details are included.

- **BP230—CONCRETE PROJECTS FOR HOME SECURITY** .... $10.00. 25 projects ranging from a single-door protection circuit that can be completed in an hour or two, to a sophisticated multi-channel security system. Each project is described in detail with circuit diagrams, explanations of how it works, instructions for building and testing, and how to adapt circuits to meet special requirements.

- **BP231—COMPUTER HOBBYISTS HANDBOOK** .... $8.95. A reappraisal of everything for the computer hobbyist to know and easy to use volume. Provides a range of useful reference material in a single source.

- **BP232—GAINING THE MOST FROM YOUR MULTIMETER** .... $5.95. Covers basics of analog and digital meters. Methods of component testing includes testers, Thyristors, resisters, capacitors and other active and passive devices.

- **BP233—PROJECTS FOR BEGINNERS** .... $5.50. Power supplies, radio and audio circuits, oscillators, timers, switches, and more. If you can use a soldering iron you can build these devices.

- **BP234—100 RADIO Hookups** .... $3.00. Reprint of 1924 booklet presents radio circuits of the era including regenerative, neutriode, reflex & more.

- **BP235—SIMPLE LED CIRCUITS** .... $5.50. A large selection of simple applications for this simple electronic component.

- **BP236—MULTIFREQUENCY CONSTRUCTION** .... $5.75. Construction details for preamplifiers and power amplifiers up through 100-watt DC-coupled FET amplifier.

- **BP237—CRYSTAL SET Construction** .... $5.50. Everything you need to know about building crystal radio receivers.

- **BP238—INTERNATIONAL RADIO STATIONS GUIDE** .... $7.95. Provides the casual listener, amateur radio DXer and the professional radio monitor with an essential reference work designed to guide him or her around the more than ever complex radio bands.

- **BP239—THEORY OF PLCs** .... $5.95. Covers the many types of programmable logic controllers and how to write and test them.

- **BP239—THEORY OF TRANSDUCERS** .... $5.95. Covers the many types of transducers and how to write and test them.

- **BP240—THEORY OF ELECTRONIC COMPONENTS** .... $5.95. Covers the many types of electronic components and how to write and test them.

- **BP241—THEORY OF ELECTRONIC CIRCUITS** .... $5.95. Covers the many types of electronic circuits and how to write and test them.

- **BP242—THEORY OF ELECTRONIC SYSTEMS** .... $5.95. Covers the many types of electronic systems and how to write and test them.

- **BP243—THEORY OF ELECTRONIC DEVICES** .... $5.95. Covers the many types of electronic devices and how to write and test them.

- **BP244—THEORY OF ELECTRONIC POWER** .... $5.95. Covers the many types of electronic power and how to write and test them.

- **BP245—THEORY OF ELECTRONIC ENERGY** .... $5.95. Covers the many types of electronic energy and how to write and test them.

- **BP246—THEORY OF ELECTRONIC INFORMATION** .... $5.95. Covers the many types of electronic information and how to write and test them.

- **BP247—THEORY OF ELECTRONIC COMMUNICATIONS** .... $5.95. Covers the many types of electronic communications and how to write and test them.

- **BP248—THEORY OF ELECTRONIC CONTROL** .... $5.95. Covers the many types of electronic control and how to write and test them.

- **BP249—THEORY OF ELECTRONIC PROCESSING** .... $5.95. Covers the many types of electronic processing and how to write and test them.

- **BP250—THEORY OF ELECTRONIC COMPUTING** .... $5.95. Covers the many types of electronic computing and how to write and test them.

- **BP251—THEORY OF ELECTRONIC STORAGE** .... $5.95. Covers the many types of electronic storage and how to write and test them.

- **BP252—THEORY OF ELECTRONIC DISPLAYS** .... $5.95. Covers the many types of electronic displays and how to write and test them.

- **BP253—THEORY OF ELECTRONIC AUDIO** .... $5.95. Covers the many types of electronic audio and how to write and test them.

- **BP254—THEORY OF ELECTRONIC VIDEO** .... $5.95. Covers the many types of electronic video and how to write and test them.

- **BP255—THEORY OF ELECTRONIC MEMORIES** .... $5.95. Covers the many types of electronic memories and how to write and test them.

- **BP256—THEORY OF ELECTRONIC PROCESSORS** .... $5.95. Covers the many types of electronic processors and how to write and test them.

- **BP257—THEORY OF ELECTRONIC COMMUNICATIONS** .... $5.95. Covers the many types of electronic communications and how to write and test them.

- **BP258—THEORY OF ELECTRONIC NETWORKS** .... $5.95. Covers the many types of electronic networks and how to write and test them.

- **BP259—THEORY OF ELECTRONIC SECURITY** .... $5.95. Covers the many types of electronic security and how to write and test them.

- **BP260—THEORY OF ELECTRONIC ENERGY** .... $5.95. Covers the many types of electronic energy and how to write and test them.

- **BP261—THEORY OF ELECTRONIC INFORMATION** .... $5.95. Covers the many types of electronic information and how to write and test them.

- **BP262—THEORY OF ELECTRONIC CONTROL** .... $5.95. Covers the many types of electronic control and how to write and test them.

- **BP263—THEORY OF ELECTRONIC PROCESSING** .... $5.95. Covers the many types of electronic processing and how to write and test them.

- **BP264—THEORY OF ELECTRONIC COMPUTING** .... $5.95. Covers the many types of electronic computing and how to write and test them.

- **BP265—THEORY OF ELECTRONIC STORAGE** .... $5.95. Covers the many types of electronic storage and how to write and test them.

- **BP266—THEORY OF ELECTRONIC DISPLAYS** .... $5.95. Covers the many types of electronic displays and how to write and test them.

- **BP267—THEORY OF ELECTRONIC AUDIO** .... $5.95. Covers the many types of electronic audio and how to write and test them.

- **BP268—THEORY OF ELECTRONIC VIDEO** .... $5.95. Covers the many types of electronic video and how to write and test them.

- **BP269—THEORY OF ELECTRONIC MEMORIES** .... $5.95. Covers the many types of electronic memories and how to write and test them.

- **BP270—THEORY OF ELECTRONIC NETWORKS** .... $5.95. Covers the many types of electronic networks and how to write and test them.
According to Consumer Reports, a $495 system intended to help busy families keep in touch. The system consists of a Base Unit transmitter and as many as three Word Watches ($39.99 each). Parents can program up to four messages (come home now, call home now, etc.) that can be transmitted to be displayed on their child’s watch/receiver. The base unit also acts as a charger for the watch’s battery and has an internal clock that can be set to signal a child at a predetermined time. C.A.D.S. has a 1.5-mile range that can be extended to 5 miles with an optional antenna. In addition to the base unit, a remote unit (Available as an option) can be used to signal the watch from any remote location.

For the ultimate in home theater, a THX sound system, certified by LucasArts, is a necessity. Unfortunately, THX-certified systems generally carry “ultimate” price tags, starting at $8000. But now Kenwood has teamed up with Altec-Lansing to create an under-$5000 THX system. Kenwood’s side of the system includes a $1000 preamplifier/THX decoder/tuner and a six-channel, 600-watt amplifier priced at about $900. Then, for the relatively cheap price of $3000, the Altec-Lansing THX-approved loudspeaker system includes the AHT-2300 subwoofer, AHT-2200 left, center, and right speakers, and the AHT-2100 surround speakers.

Of the many computer products displayed at the CES, the most interesting one that we found was the 50/50 Dual Desktop from 50/50 Micro Electronics Inc. The plug-in board lets an IBM-PC compatible computer (AT or better) run Macintosh software! It contains a Motorola 68000 microprocessor running at 16 MHz, which puts it at about twice the speed of a Mac Classic. The Dual Desktop works with the PC’s existing hard drive, treating it as a normal Mac hard disk. It also lets the PC’s 3½-inch drive to read and write both 800K and 1.44-megabyte Macintosh-formatted floppies. A terminate-and-stay-resident program (or TSR) lets the Mac screen be called up with the push of a hot key. You can even run DOS and Mac software in a split-screen mode! It seems like the best of both worlds to us.

WCES WRAP-UP

From all we saw at WCES 93, the industry has good reasons to be feeling optimistic. New technologies fuel the industry, and there were several exceptional ones announced or exhibited at the show. But, it takes quite some time for those new formats to trickle-down to the mass-market level.

Meanwhile, the industry’s bread-and-butter products are still TV’s and VCR’s, audio systems, and home-office equipment. Home theater continues to spur sales of big-screen TV’s, stereo VCR’s, laserdisc players, and the audio gear needed to complete the system. Home-office and PC sales are booming, and the car-audio industry in great shape. With the end of the recession said to be in sight, consumer confidence is on the upswing—and there’s plenty of pent-up demand to be met. All in all, there’s a lot out there to sustain the industry as it waits for DCC and/or MD to take off, for PDA’s to become necessities, for HDTV standards to be set, and for today’s media rooms to become multimedia rooms.
Graduate as a Fully Trained Electronics Professional!

If you want to learn about electronics, and earn a good income with that knowledge, then CIE is the best educational value you can receive. CIE's reputation as the world leader in home study electronics is based solely on the success of our graduates. And we've earned our reputation with an unconditional commitment to provide our students with the very best electronics training.

Just ask any of the 150,000-plus graduates of the Cleveland Institute of Electronics who are working in high-paying positions with aerospace, computer, medical, automotive and communications firms throughout the world.

They'll tell you success didn't come easy...but it did come...thanks to their CIE training. And today, a career in electronics offers more rewards than ever before.

CIE'S COMMITTED TO BEING THE BEST...IN ONE AREA...ELECTRONICS.

CIE isn't another be-everything-to-everyone school. CIE teaches only one subject and we believe we're the best at what we do. Also, CIE is accredited by the National Home Study Council. And with more than 1,000 graduates each year, we're the largest home study school specializing exclusively in electronics. CIE has been training career-minded students like yourself for nearly sixty years and we're the best at our subject...ELECTRONICS...BECAUSE IT'S THE ONLY SUBJECT WE TEACH!

CIE PROVIDES A LEARNING METHOD SO GOOD IT'S PATENTED.

CIE's AUTO-PROGRAMMED® lessons are a proven learning method for building valuable electronics career skills. Each lesson is designed to take you step-by-step and principle-by-principle. And while all of CIE lessons are designed for independent study, CIE's instructors are personally available to assist you with just a toll free call. The result is practical training...the kind of experience you can put to work in today's marketplace.

LEARN BY DOING...WITH STATE-OF-THE-ART EQUIPMENT AND TRAINING.

CIE pioneered the first Electronics Laboratory Course and the first Microprocessor Course. Today, no other home study school can match CIE's state-of-the-art equipment and training. And all your laboratory equipment, books and lessons are included in your tuition. It's all yours to use while you study and for on-the-job after you graduate.

PERSONALIZED TRAINING...TO MATCH YOUR BACKGROUND.

While some of our students have a working knowledge of electronics others are just starting out. That's why CIE has developed twelve career courses and an A.A.S. Degree program to choose from. So, even if you're not sure which electronics career is best for you, CIE can get you started with core lessons applicable to all areas in electronics. And every CIE Course earns credit towards the completion of your Associate in Applied Science Degree. So you can work toward your degree in stages or as fast as you wish. In fact, CIE is the only school that actually rewards you for fast study, which can save you money.

SEND FOR YOUR CIE COURSE CATALOG AND WE'LL SEND YOU A FREE 24-PAGE CIE ELECTRONIC SYMBOLS HANDBOOK.

FREE!
SEND FOR YOUR CIE HOME STUDY COURSE CATALOG AND RECEIVE A FREE 24-PAGE CIE ELECTRONIC SYMBOLS HANDBOOK!

Includes hundreds of the most frequently used electronic symbols. Published exclusively by CIE for our students and alumni. Yours free when you request a CIE Course Catalog.

YES! I want to get started. Send me my CIE course catalog including details about the Associate Degree Program. (For your convenience, CIE will have a representative contact you - there is no obligation.)

Value-Packed Camcorder

CANON UCS2 Hi8 CAMCORDER.
Manufactured by: Canon U.S.A., INC., 100 Jamesburg Road, Jamesburg, NJ 08831. Price: $1699.

Although camcorders haven’t yet reached pocket size, they continue to shrink in both size and weight. “Purse size” might be a good way to describe today’s crop of super-small camcorders. So what’s the big deal about size and weight? Why are manufacturers struggling so hard to win the title “smallest and lightest?”

After all, most users won’t notice an extra ounce or an extra ½ inch when they’re shooting their scenes, especially at home. But the extra size and height do become noticeable while carrying the camcorder to where the action is; on the road—whether on a cross-country vacation or an across-town visit, size and weight are important.

On a vacation, a camcorder has to compete with all of the other gear that has to be packed and carried to your destination. Then it has to be toted to each exciting stop on your trip, up the stairs at the Statue of Liberty, for instance, or down—and back up—a steep trail at the Grand Canyon. And if you’re bringing the baby across town to visit Grandma, a bulky, heavy camcorder runs the risk of being left behind in favor of extra bottles and diapers. And that defeats the whole reason of having a camcorder. The smaller and lighter the camcorder, the more often it will get used—and the better value you get for your money. And value is the most important factor in most people’s buying decisions these days.

Canon has always been on the forefront of small and light. A little over a year ago (April 1992) we gave its UCS1—the world’s lightest and smaller Hi8 camcorder—a workout. This year, Canon brings out the UCS2, which, as you might have already guessed, is even smaller and lighter. Canon managed to shave almost six ounces off the weight, bringing it down to 1 2 pounds—just over 19 ounces—without the battery. It did the same thing with the dimensions, trimming ½ inch of the width, ½ inch off the height, and ½ inch off the height, bringing the camcorder’s size to ¾ x 6 ½ x 3¾ inches. As a result, the UCS2 wins the “smallest and lightest” title—at least this month—in the Hi-band 8mm category.

The chassis of the UCS2 is similar to the others in Canon’s UC-Series. That means it uses a small-diameter video-head drum, multi-layer circuit boards, and stacked components. The layout was changed slightly to give the camcorder a slimmer profile, and the lens system was made smaller by changing the iris mechanism.

The 8 x (6-48 mm) power zoom lens features two stepper motors and a new fuzzy-logic autofocus algorithm that is designed to eliminate hunting and blurring. One of the motors controls the zooming drive, while the other controls the focusing drive. The intent is to keep the image in focus when zooming in either the manual or automatic-focus mode. The focusing motor can move at one of 127 speeds in each direction. When focusing, large adjustments are made at high speed. As the correct focus is approached, the motor switches to the slower speeds, which prevents the lens from bypassing proper focus, and then having to correct.

In the wide-angle mode, the camcorder can focus at a minimum distance of less than half an inch. At full telephoto, that distance increases to about 28 inches. Two zooming speeds are offered.

The UCS2 is very easy and comfortable to use—and ease and comfort are two more factors that add significantly to the value of a product. The zoom and the record/ pause controls are easy to reach, even for those with very small hands. Even the power switch is easy to reach with the fingers on the right hand. The left-hand side of the camcorder features only four controls, grouped together above the cassette compartment, near the front—just where you would want them to be when holding the camcorder with both hands.

The largest control is a four-position rotary exposure selector. The first selection is a full Auto mode, which provides the correct exposure for most situations. The Spotlight mode, intended for recording spot-lit scenes, sets the proper exposure to the brightest part of the scene. Normally, when shooting such a scene, the camcorder would properly expose the darker area, and the smaller, concentrated light source would appear overexposed.

A Portrait mode is intended to make a subject stand out against the background. It decreases the camcorder’s depth of field so that the foreground and background are slightly blurred while the intended image is in focus. A Sand and Snow mode properly exposes scenes with excessively bright backgrounds, such as ski slopes or sunny white-sand beaches. Except for full auto, the chosen mode is displayed in the viewfinder.

At the center of the exposure control is a Fade button, which operates differently from any other that we’ve seen. To fade out a scene, you must push and hold the button, which fades the video to white, and fades out the sound. When your fade is complete, a push of the record/pause mode stops the recording. To fade in, you first hold the fade button until the scene disappears, then press the start/stop button, and release the fade button.

The UCS2 fade requires a little more work than other camcorders, but we felt it gave us a little more control over the fade. With other camcorders, we often find ourselves forgetting to push the fade button.
before we hit the stop/start button—or having to take our eyes off the scene to find the button. The "manual" fade control seemed easier to remember. And its location was sensible and hard to miss. It is possible to make the fade feature operate like those on traditional camcorders, however; we'll see how soon.

Behind the exposure/fade control are two other buttons. First is the backlight compensation button, the purpose of which is to properly expose scenes that are backlit with bright light. It works only when the camcorder is in the full auto mode. The other button calls up the date and/or time display for recording.

The lack of buttons, and the sensible placement of those that are there, make the UCS2 a breeze to use even for people who have never used a camcorder before. As you might expect, though, there actually are more buttons. They're just hidden out of sight.

Underneath the viewfinder are four additional controls. As you swivel the viewfinder up to a 90-degree angle, four of these are revealed. First is an alternate start/stop button. If you have the viewfinder swiveled out, you're likely shooting a low-angle scene. The alternate button is conveniently located for such shots. Also under the viewfinder is a reset button for the tape counter, and a tape return button, which rewinds the tape and stops when the tape counter reaches zero. A wind-screen slide switch can reduce wind noise when recording outdoors.

A flip-down panel on the right side of the UCS2 reveals nine more controls. Near the front are three focusing controls. The first turns auto focus on and off, and the two others control the focus direction. A group of four buttons each have two or three functions. In the camcorder's play mode, the serve as the play, stop, fast forward, and rewind controls. In the camera mode, however, they take on different roles.

The fast-forward and rewind buttons become the record-search controls, which let you review the scenes that you've recorded. The stop button becomes a quick review button, which rewinds and then plays back about the last three seconds that have been taped. The play button's dual function is to call up menus on the viewfinder.

The first push of the menu button calls up a four-entry menu: edit-erase, shutter, WB lock, and BTS. The + and - record search (also the fast forward and rewind) buttons scroll through the menu. The record review (also the stop) button makes the selection. Because all of the controls are sensibly labeled, the multi-function buttons are not confusing.

The edit-erase control lets you quickly return to the point where you started shoot-

(Continued on page 24)
22

The FaceMaker program lets you create your new image.

picted by simply clicking the them. For example, when you click on the Post Office, you find yourself in a very basic E-mail system. You can send notes to other TSNers, or you can ask for help from a TSN host. Click on Tower Hall, and you find yourself in the administrative area, where you can get billing information, newsletters, and other information. Click on the Mall, and you can order goods and services.

The real fun begins in the other sections: the SierraLand amusement park, the Clubhouse for card and table games; and Media-Land, which holds a fantasy role-playing game. And then there is Larry-Land, home of adults-only gambling halls.

We would guess that the games are what bring most people onto the network. But the interactive nature of the games is what will keep them coming back. Often the games become merely an excuse to get together to chat, just as when friends visit your home to play cards. Half the night is spent talking and laughing. In fact, 50% of the traffic on the network has nothing to do with games, but with social interactions.

It's not always easy to know just who you're really socializing with, however. That's because you get to create your own on-screen persona—called a "toon" by most TSNers—before you enter any of the lands. To that end, the FaceMaker program provides a wide selection of eyes, noses, mouths, face shapes, hair styles, clothing, and accessories that you can mix and match in endless combinations. To help other users get to know you better, you can also select from a list of your hobbies and interests. The sets of physical attributes and personal interests change depending upon which land you're in, to reflect the ambience of each place. In the SierraLand amusement park, you can't help but look like a kid, for example, and your interests generally are restricted to such activities as playing, surfing, talking, video games, etc. Obviously, if you're a 50-year-old businessman, your SierraLand persona won't bear much resemblance to the real you.

Further complicating the issue—or making game-playing much more interest-

ing—is the fact that in each area of ImagiNation, you can create up to four different 'toons. A family of four, for example, could have one persona for each family member. Alternatively, a single person could be one of four different people depending on what role he wanted to play. Not only can each persona look different, but each can have a different name, age, and interests. You can never be quite sure who you're talking to online!

To help handle potential crowds, each area of ImagiNation features a number of "rooms," each of which has a maximum capacity of 50 players. When you first enter a room, a list of the players already inside comes on screen. To talk to a specific person, you can click on his/hers name and then on "talk." To say something to the whole crowd ("Anyone interested in a game of miniature golf?") you can click on "all" and then "talk," and then key in your message.

The same games are available in all the rooms in a given area. For instance, every room in the SierraLand amusement park, has games ranging from Sneak-A-Tac, a three-dimensional four-in-a-row tic-tac-toe game, to PaintBall, a strategy game that we never learned how to play. A mini-golf game is available for playing solo or against another TSN'er, and Red Baron lets you shoot other players out of the sky in an interactive dogfight. Rocket Quiz is, in our opinion, an amusing arithmetic quiz game. (Maybe just because we never found anyone who was slower than we were at doing long multiplication problems—we're certainly out of practice!) A Graffiti game lets you use computer tools to draw and save colorful pictures.

The Clubhouse also has a number of different rooms with the same games available in each one. As in SierraLand, the names help to keep people of similar interests together. Teens will likely gravitate to teen scene, while singles hoping to meet someone will go to the singles club. People who like playing bridge will go to the bridge club—even if they happen to feel like playing Go (the ancient board-control game) that evening. Other games that are available in the Clubhouse include the board games chess, checkers, backgammon, and flip-flop (an Othello play-alike). Besides bridge, other card games available are hearts and cribbage.

Medieval Land contains only a single game: Shadow of Yserbius. But the Dungeons and Dragons-like fantasy role-playing game is currently the most popular game on the network. The Sierra Network's parent company, Sierra On-Line is best known for its graphic adventure games—they currently hold about 60% of the market for IBM-PC compatibles.

Not being adventure-game players ourselves, we ignored the area except for a brief look at the interesting graphics. But that, in itself, points out one of the strengths of TSN. We had a lot of fun doing the things that appealed to us and ignoring the rest. And we're sure that the people in Medieval-Land were doing the same. That factor also helps players meet like-minded users, with whom many form fast friendships.

We must admit that the Shadow of Yserbius sounds quite interesting, even to us non-adventure-game players. One reason is that, although you can play alone, it makes more sense to play with other characters. A team that is made up of a character with magic powers teamed with one who has great physical strength and another who has great intellect will have a better chance of survival during the encounters with the dragons, monsters, and other dangers within the maze of dungeons. Hmm. Maybe we will play the game after all. (But not until we've met the deadline for this article!)

Larry-Land, where we ended up spending most of our time (we're slightly embarrassed to admit), is a completely different story. It gets its name from the popular "Leisure Suit Larry" adult-oriented games from Sierra On-Line. LarryLand is an "anything goes" kind of place. When you enter one of the gambling areas (Las Vegas, Lake Tahoe, Monte Carlo, etc.) you are presented with an announcement stating that adult language and behavior is accepted in the area, but that abusive or harassing behavior will not be tolerated. Minors are informed that they are not to enter. (Parents can password-protect LarryLand). Adults who want to gamble without being subjected to other members' adult language and behavior can check into Polite Place, where normal TSN community standards are enforced.

In the LarryLand gambling halls, poker, blackjack, roulette, and slot machines are available for playing. If you wish, you have the option, as in other areas, to play without being disturbed by other users. If gambling is not your thing, you might want to retire to Lefty's Bar for "a drink" and
Although you can play blackjack against the house, playing with real people is a lot more fun!

some bar games, or just to chat with a group of friends. As with "chat rooms" in other areas, groups of people can talk simultaneously while looking at each other's personae. If you wish to say something so that only one person "hears" you, you can choose to "whisper" to him.

As you might expect, people on TSN are real people. And the percentages of abusive behavior or language on the network, we're sure that it happens on occasion. To combat that potential, TSN offers a reactive form of "censorship." If someone says something that offends you, simple click on the Complain button in the chat box that pops up to show messages. The message, along with your comments (which you are asked to type in) are sent to a sysop (system operator). If the comment is deemed offensive, TSN will contact the offender—usually not using the E-mail system, but with a phone call. And if you simply don't like someone who insists on talking to you, it's possible to "mute" that particular person so that he can no longer communicate with you. (Those two features alone make TSN a more enjoyable, safer meeting spot than your local singles bar!) Members who want to play without being disturbed by others can click on a do-not-disturb option.

We learned a few interesting things from interacting with other users. For instance, if we created a somewhat sexy female persona, a lot more people wanted to talk to us than when our 'toon was a thirty-something man with glasses. We learned from on-line gossip that not only have there been about a half-dozen TSN-inspired marriages and about the same number of engagements, but there's also been at least one divorce due to a married player falling in love with another TSN user!

TSN had more than 18,000 subscribers when we first logged on. By the time you read this, they expect to more than 40,000, and by the end of the year, 150,000. We can understand why. All in all, TSN is fun. And trying it for three hours is free! Just call 1-800-Sierra-1 and get your starter kit. Why not give it a try?

---

**High End Defined**

**LINN KARIK/NUMERIK CD PLAYER.** Manufactured by Linn Products, Ltd., Glasgow, Scotland. Distributed in the U.S. by Audiophile Systems, 8709 Castle Park Drive, Indianapolis, IN 46256. Price: $5800.

The compact disc was such an important development in audio not only because it offered a new, convenient, and rugged way to distribute music. Perhaps the most important aspect of the CD format is that it brought high-fidelity down in price and made it available to the masses. Because even inexpensive CD players could offer superb sound, people learned what quality audio can be. As a result, the demand for high-quality sound has increased.

Not everyone saw the CD as a step forward, however. Many audiophiles criticized the "harsh. sterile" sound of CD's. How could any process that broke music up into millions of pieces and then reassembled them result in anything close to natural sound?

Even today, not everyone is convinced that converting audio to digital data permits accurate reproductions. Linn Products, a highly regarded Scottish maker of high-end turntables—you remember, those machines that play vinyl LP's—has, for the first time, put its name on a CD player. The Linn Kariik/ Numerik is not your everyday CD player, though. First there's the almost $6000 price. Second, the player is actually two separate components: a CD transport (the Kariik) and a D/A (digital-to-analog) converter (the Numerik).

In the world of high-end audio, $6000 isn't an unreasonable price for a CD player. In fact, Linn's top-of-the-line record player costs almost $7000! But, we wondered, is there any justification in paying such a high price? Could we tell the difference between the Linn Kariik/Numerik and a CD player costing a small fraction of its price? Before we get to our listening tests, let's see what the developers at Linn were trying to accomplish.

Why is the CD player housed in two boxes? Because separating the transport and the converter allowed Linn "to achieve both optimum performance and user flexibility." Both boxes are totally screened from each other to avoid interference, and each contains its own power supply. The Kariik and the Numerik can be used independently, if desired. The Numerik can decode other digital sources, and the Kariik can feed other D/A converters. Both boxes are available separately. But only if the pair is used in combination can you use the "Sync-Linc," which forces the transport to lock to the processor's clock. (An accurate clock signal is essential to reproducing the digitally stored data.) Usually, CD players operate in the opposite way; the transport sends the clock in the data. Linn's method, where the processor sends a clock to the transport on a separate cable, is said to reduce or eliminate clock jitter. Jitter is potentially audible and can reduce the dynamic range of a system.

The D/A converters in the Numerik are 20-bit, 8x oversampling chips manufactured by Burr-Brown. Why use 20-bit converters when the data on a CD are stored in 16-bit words? And why oversample the data that was recorded at a sampling rate of 44.1 kHz?

All sampled waveforms contain extraneous high-frequency information in the form of images. That quantization noise is a natural consequence of digital sampling. Although the noise is far above the range of human hearing—the first image occurs at 88.2 kHz, more than four times the top limit of what we can hear—they must be
eliminated from the output signal for numerous reasons. They could, for example, interfere with other equipment, damage tweeters, or cause amplifier instability. One way to remove the quantization noise is to use a very sharp analog “brickwall” filter to band-limit the output audio. Such analog filters were used in first-generation CD players. They are expensive, bulky, prone to drift, and have undesirable characteristics, adding ringing and phase non-linearity to the audio.

In an oversampling CD player, digital filters do most of the work. The Linn Nu- merik, an 8× oversampling player, generates seven intermediate samples between each input sample. Since eight times as many samples are present after oversampling, the sampling frequency is increased by a factor of eight, from 44.1 kHz to 352.8 kHz. That pushes the unwanted quantization noise much higher in frequency; only a simple, low-order analog filter is required to remove it. Although it’s a common misconception, oversampling doesn’t somehow increase the accuracy of the audio signals played back. It’s just a more dependable and efficient way to ensure the accuracy.

A real-world 16-bit converter cannot reproduce 16-bit audio from a CD without error. By definition, because the quantization levels are spaced 1 LSB (least-significant bit) apart, the quantization uncertainty is ±1/2 the LSB. An 18-bit D/A converter has four times as many output levels as a 16-bit converter, the Numerik’s 20-bit converters have four times as many output levels as a 18-bit converter. That reduces the nonlinearities. The error is still ±1/2 the LSB, but the LSB is one sixteenth the size of that of a 16-bit converter.

From outside, the Karik/Numerik looks clean and simple. The two units are housed in cases that are the same size. Both feature a power button on the lower right corner of the front panel. A bright green LED is alongside the switch. The transport box has a digital display on the upper left, a slide-out CD tray, and two buttons: OPEN and PLAY. Other customary CD controls are hidden behind a flip-down door. You can skip tracks, search for index points, or change the time display, for example. Missing from the controls are any programming functions. This isn’t surprising to us; it forces people to use the player much in the same way they used to listen to LP’s: Put the record on, sit back, and listen. (We agree that is the way discs should be listened to, and hardly ever use programming.) The remote control provided with the player is designed to be used with other Linn components such as its preamp and tuner.

The rear panel of the Karik contains something we’ve never seen on a consumer CD player: a 9-pin “D” connector labeled “diagnostic output.” The port does not follow the RS-232 standard, so we couldn’t examine it. It’s intended to be connected to Linn-specific test equipment. Among other things, the diagnostic port allows a properly equipped dealer to monitor the performance of the laser pick-up. (The pickup assembly was designed to be replaceable within ten minutes.) It also lets error rates be checked.

We weren’t sure what to expect from the Karik/Numerik. On the one hand, we’ve always been happy with the sound of CD. That is, the sound of the format itself. We’ve heard plenty of poor-sounding discs, though, especially in the early days of CD when recording engineers didn’t appreciate the required differences between mastering a compact disc and an LP. On the other hand, a $6000 CD player must sound better than a garden-variety CD player, right?

We’ve always thought that some of the self-proclaimed golden-eared audiophiles were full of little more than hype. Many of their explanations just don’t make sense. But who’s to say that they can’t hear what they claim to hear? We will admit that we couldn’t hear the difference when we dis-connected the Sync-Linc, yet a high-end reviewer called the sonic difference “dramatic.” Perhaps he really could hear what is inaudible to everyone else.

There is no doubt that the Karik/Numerik is a superbly designed machine. We would never argue with someone who thought that it is a good idea to oversample servo motors, power supplies, and other CD-player subsections. Building a CD player for serviceability—rather than as a disposable item—is something we’d like to see more of. Quality is visible in the cabinetry, and is evident from the feel of the controls. The quality of the shielding is readily evident from its low RF interference. Perhaps all of the visible quality is one of the reasons why—despite our prejudiced beliefs that inexpensive CD players can perform as well as expensive models—we enjoyed auditioning it so much. Having pride in your audio system can, indeed, make it sound better.

**CANON CAMCORDER**

(Continued from page 21)

...ing the current scene so that you can re-record it. Lets assume that just after starting a recording, something happens to destroy the scene—a loud, unwanted noise, or someone walking in front of the camcorder. Choosing edit-erase lets you fix it up quickly, it works only during the first minute of each scene, however.

The shutter selection lets you manually set the shutter speed to one of eight speeds from 1/60 to 1/10000 second. Fast shutter speeds are useful for shooting sports scenes or other fast motion without blurring. Selecting WB lock lets you manually set the white balance. Normally, the camera automatically sets white balance, which allows the camcorder to record whites and colors properly under a variety of light sources. It can’t, however, automatically set the white balance when you try to record subjects with a single dominant color (the sky or sea, for example), under rapidly changing lighting, or under certain types of artificial light. The manual control lets you get realistic colors even under such situations.

The final selection in the first menu, BTS, automatically searches for blank tape, a feature we find especially handy. It lets us stick a tape in, choose BTS, and sit back and wait—no more looking at what’s on the tape and trying to remember where we stopped recording.

The second menu offers four more choices: fade trigger, line in, tally, and sensor. Fade trigger changes the way the fade control works. Instead of having to hold the fade control in, you can make it operate like a traditional fade. Line in permits recording from video/audio inputs rather than the camera. Selecting tally turns off the flashing lamp at the front of the camcorder that normally indicates that the camcorder is in the recording mode. It’s useful if you’re recording near glass or other surfaces that could cause unwanted reflections of the light. The sensor selection turns off the camcorder’s remote-control sensor in the camera mode. It’s useful if other Canon camcorder users are operating their units by remote control. The infrared remote control supplied with the UCS2 can be used during recording or playback.

Although it might sound complex, the menu system is actually a breeze to use—certainly much easier than it would be to hunt through all of the additional buttons that would otherwise be required to perform the same functions.

Considering everything that Canon managed to pack into the UCS2, did they leave anything out? The most obvious omission is that of an image-stabilization system. Canon has steadfastly refused to incorporate any such system into their camcorders until they come up with a reliable system that causes no image degradation. (Actually, their engineers already have. The ingenious system is built into Canon’s UCS3, which we hope to report on in the coming months.) A couple of bells and whistles found on other camcorders—a title function, for example—are missing, as is an accessory shoe for mounting an external microphone or video light. (An accessory adapter bracket is available as an option, as are a host of other Canon accessories.)
Take Any 3 PROFESSIONAL BOOKS for only $9.95
when you join the ELECTRONICS ENGINEERS' BOOK CLUB®

As a member of the Electronics Engineers' Book Club...

you'll enjoy receiving Club bulletins every 3-4 weeks containing exciting offers on the latest books in the field at savings of up to 50% off of regular publishers' prices. If you want the Main Selection do nothing and it will be shipped automatically. If you want another book, or no book at all, simply return the reply form by the date specified. You'll have at least 10 days to decide. And you'll be eligible for FREE BOOKS through the Bonus Book Program. Your only obligation is to purchase 3 more books during the next 2 years, after which you may cancel your membership at any time.

All books are hardcover unless otherwise noted. Publishers' prices shown. ©1993 EEC. A shipping/handling charge & sales tax are added to all orders.

If coupon is missing, write to:

KELVIN-94 DIGITAL MULTIMETER

Put an entire electronics-troubleshooting lab in your coat pocket with the Kelvin-94 digital multimeter.

Multimeters have certainly come a long way. It used to be that a handheld multimeter was good for checking voltage, resistance, and perhaps current. However, over the years, manufacturers were able to add new features to multimeters, while lowering prices. Now you can buy a multimeter containing more features than you could ever imagine, all for less than $200. That's what you get when you buy a Kelvin-94 digital multimeter, which sells for $199.95.

Not only does the Kelvin-94 boast a lot of features, but most of its features go the extra distance by having above-average quality, range, and accuracy. Although Kelvin is not yet known for their test equipment, they will be when this high-performance multimeter gets noticed.

Features. Since all of the Kelvin-94’s features are worth mentioning, we may as well start with some very simple features that all multimeters should have, but usually don’t. To begin with, the Kelvin-94 is claimed to be water resistant. Curious about what that meant, we opened up the meter. We were surprised to find that not only is there a rubber gasket between both halves of the case, but that all of the screws have a washer and gasket as well. The switches, LCD lens, and test-lead sockets are also gasketed. While you certainly would not use the meter under water, with that type of construction you could actually use it out in the rain.

While we had the meter open, we noticed that it is as ruggedly built inside as it is outside. A 9-volt battery compartment and spare-fuse holder (which did contain a spare fuse) are molded inside the case. A cushioned yellow rubber holster included with the meter adds to its durability.

As you would expect, there is a meter stand built into the back of the meter. There's also a pair of ribbed rubber feet that really keeps the meter from sliding, even on an incline. The foot toward the bottom of the meter is curved to keep the meter sure-footed when the stand is in use. Although rubber feet are nothing exciting, no meter this reviewer has used up to now had feet that were useful when the stand was engaged. From years of troubleshooting, we know how extremely annoying a wandering meter is.

The Kelvin-94 has a 3¼-digit display. That ¾ digit is important. When a meter has only a 3½-digit display, as is common with most handheld units, it lets you see a maximum of 1999 in any given range, the “1” being the half-digit. By contrast, a 3¾-digit display lets you see a maximum of 3999 in any range, the “3” being the three-quarter digit. So, while the “ohms” ranges on 3½-digit multimeters are usually 200, 2K, 20K, 200K, 2 megohm, and so on, the Kelvin-94’s ranges are 400, 4K, 40K, all the way up to 4000 megohm. The extra quarter-digit essentially doubles the maximum reading in any given range, and halves the average number of times you have to switch ranges while using the meter. It makes for much more friendly operation. The display also has a 40-segment bargraph display.

The Kelvin-94 can be used to mea-
sure resistance, capacitance, inductance, frequency, logic levels, dBm, and true-rms voltage and current. There's also the usual audible continuity test and diode checker. Push-buttons enable other features such as data hold, relative measurement, and maximum-, minimum-, and average-recording modes.

The meter also has an auto power-off function and a low-battery indicator. The one thing we were surprised not to find on this meter is a transistor checker, but that is a seldom-used feature.

Use. Because we're all familiar with using common multimeters (measuring voltage, current, etc.), there's no sense in us going into the details of measuring such things. Instead, let's take a closer look at some of the more interesting features.

In many of the meter's modes, there's an audible readout option. That allows you to "hear" a measurement's relative amplitude in addition to seeing the reading on the display. A feature like that comes in handy when troubleshooting in dimly lit areas, and for quickly detecting a particular signal with a pair of trained ears without having to look at the display.

While there's nothing unusual about the way inductance is measured with the Kelvin-94, it is unusual to find a multimeter containing this feature at all. The meter has inductance ranges from 40 millhenries to 40 henries.

When the meter is set to measure AC voltages, and you press the "dBm" button, it enters the decibel mode. Normally 0 dBm corresponds to a voltage (0.7746 Vrms) that causes a 1-milliwatt dissipation in a 600-ohm load—which is the reference impedance in this mode. The meter can also be set to record minimum, maximum, and average readings. A beep will be heard each time a new maximum or minimum is recorded. You can then cycle through the recorded readings.

A data-hold function is especially convenient when you have to measure a voltage in one location, and read it in another. For example, if you measure a voltage under the hood of a car, you can then easily compare it to a chart in a shop manual without having to remember or write down the reading. It is also useful in taking measurements in hard to reach or see places.

A "relative" function is used to store the displayed reading as a reference value and display all subsequent readings relative to the stored value. This feature is also useful when measuring small capacitances or inductances because you can use it to negate the effects of the test leads and the meter itself on the reading. The meter enters a sleep mode if it has been inactive for 30 minutes. It will then display a blinking symbol for an additional 60 minutes after which it shuts off completely. The auto power-off function can be disabled to prevent it from erasing any stored minimum or maximum values.

If we had to run into a burning building to do some emergency troubleshooting and carry in only one piece of equipment, the Kelvin-94 would be it. For more information on the Kelvin-94 contact Kelvin Electronics, (10 Hub Drive, Melville, NY, 11747; Tel. 516-756-1750) directly, or circle No. 119 on the Free Information Card.

**TTL-CMOS Bonanza**

The Biggest Budget Buy an Experimenter, Circuit Designer, or Engineer would want!

5 compact pocket guides provide a comprehensive listing of all commonly used TTL and CMOS integrated circuits. All current families including: Standard, Low Power, Schottky, Low Power Schottky, Advanced Schottky, Advanced Low Power Schottky, High Speed and Fast Schottky, and all the commonly used CMOS devices.

They're easy to use! Each page describes one component only and is divided into eight parts, which offer the following: 1—The device's schematic diagram. 2—Logic description. 3—Data on the chip's operational characteristics such as signal levels, etc. 4—Major applications. 5—Summary of essential data. 6—Table of TTL families in which the component is available. 7—Device common name. 8—Type reference number highlighted at the bottom of page for rapid and easy reference.

If you haven't checked out a rear-projection TV set in some time, you might be pleasantly surprised at the picture quality, brightness, and extra features found in today's units. An excellent example of that is the Mitsubishi (5757 Plaza Dr., Cypress, CA 90630) VS-4517S, a 45-inch (measured diagonally), ultra-thin console that takes up little more space than a large-screen direct-view TV set. The receiver features picture-in-picture capability (using a second video program source such as a VCR or a videodisc player). The TV-tuner section is "cable ready" and can receive 181 channels and MTS-stereo audio. The unit provides two external video inputs, which can be either composite signals or S-video (V/C). One of the video inputs is duplicated on the front panel for easy connection of a camcorder. In addition to the conventional audio and video outputs, there is a line-level subwoofer output and outputs for two external speakers. There are also two RF inputs for antenna and cable converter signals. An unusual fold-out tray on top of the unit is intended for housing a VCR, which must be held in place by means of a supplied strap.

The unit also sports a most unusual feature for any TV set—a five-band graphic equalizer, which is set by using the remote control and on-screen menu/display. An "audio-expansion" setting is provided to enhance the sound of mono sources. Video features include a noise-reduction system (which can be switched on or off), a three-position color-temperature setting, a color-bias control for obtaining proper skin-tones, and a color-aperture improvement feature to improve color-edge definition. The rear-projection TV set is supplied with a universal "learning" remote control that can be taught the commands of other remote controls.

CONTROLS

Most of the user controls associated with this TV set's special features are accessed via the handheld remote control. The controls found on the set itself include a power switch, volume-adjustment controls, channel-scan up/down buttons, input-selector buttons, video- and audio-adjustment controls, an A/V-reset button, and a timer-reset button. Direct access to specific channels can only be accomplished via the handheld remote control. The same holds true for many of the other on-screen, menu-driven features mentioned earlier.

TEST RESULTS

As usual, the video and audio performance of this sample was carefully measured by the Advanced Product Evaluation Labs, under the direction of Frank Barr. APEL and we were particularly impressed by the maximum usable luminance, or brightness, which measured 149 foot-lamberts. That's bright enough so that the set can be comfortably viewed in a normally lit room, although, as with most projection sets, dim lighting is still recommended. That reading is substantially better than what we used to encounter with early rear-projection sets. However, if you move off-axis by a substantial angle, brightness diminishes quite rapidly. This is even more true if you try to view the picture from a standing position; Vertical brightness fall-off is even more severe than horizontal. We should point out, however, that this effect is true of most rear-projection sets and, in fact, this one is better than most.
at least in terms of its horizontal brightness fall-off. Horizontal resolution was superb, measuring 680 lines. That's better than the best resolution obtainable from any consumer video-program source, including S-VHS VCRs or videodisc players. There was only a slight amount of overscan, and that was apparent only in the horizontal direction when viewing a test pattern. It will probably not be sufficient to cause any visible distortion when viewing actual scenes of a program.

Convergence was very good, though there was a slight error of convergence in the lower left corner of the picture. Interlace was perfect, which means that you're not likely to notice TV scanning lines unless you sit very close to the screen. Tuner sensitivity was excellent.

Audio performance via the line-out jacks was excellent, with harmonic distortion at –10 dB levels measuring an inaudible 0.02%. The signal-to-noise ratio was a very high 79.4 dB and audio frequency-response extended from 23 Hz to 20 kHz. The speaker-output terminals delivered in excess of 19-watts-per-channel with less than 3% distortion and, if backed off to –10 dB below that level, distortion decreased rapidly to a mere 0.04%, with signal-to-noise measuring 50.5 dB. Even via the speaker-output terminals, response remained flat over the entire audio spectrum.

The built-in stereo de-

Tuner sensitivity was excellent, as evidenced by our "weak-signal" simulation (100 microvolts) shown in this photo.

There was only a slight amount of overscan, and that was apparent only in the horizontal direction when viewing a test pattern.

CODER also performed well, delivering a signal-to-noise ratio of around 63 dB and stereo separation well in excess of 20 dB at all modulation levels. Harmonic distortion in the stereo mode measured 0.13% for the left channel and 0.11% for the right channel at levels of –20 dB (using a 1 kHz test signal). The signal-to-noise ratio was also excellent (nearly 69 dB) in the SAP (Secondary Audio Program) channel, which is increasingly being used for narration for the visually impaired, second-language dialog, and for other special programming.

HANDS-ON TESTS

Since the Mitsubishi VS-4517S weighs some 187 pounds, we traveled out to APEL's facilities for a hands-on evaluation of this rear-projection set. Color rendition was excellent, with reds actually looking red instead of the usual orange that is encountered on many sets—both direct view and projection. The three-position white-balance control is a very useful feature, especially since not everyone agrees on just what "white" should look like, some preferring a bluish tint with others favoring a reddish hue. We found the remote control extremely easy to use, and unlike some other similar remotes, there are no hidden buttons under (Continued on page 93)

Eliminate frequent rechargeable Ni-Cd battery replacement with a charging circuit that can also restore batteries that have developed a "memory"

Build the
BATTERY BUTLER

With the widespread use of fast-charging, nickel-cadmium (Ni-Cd) battery chargers supplied with many consumer products, many consumers have found that the convenience of rapid charging has not offset the high cost of replacing destroyed batteries in their telephones, handheld transceivers, remote-control model cars, and planes. The replacement cost of the batteries that power such portable and cordless gadgets can range from 25 to 75 dollars. On top of that, with regular use, some types of fast chargers can reduce the useful life of a rechargeable battery to 20% to 50% of its normal life.

Further reducing the useful life of their Ni-Cd batteries, consumers, especially portable cellular telephone users, fail to let their batteries fully discharge before recharging them. That can cause the battery to develop what is known as a "memory"—which is caused by repeated partial discharge of the Ni-Cd battery. Each time the battery is partially discharged, prior to a normal recharge cycle, the battery demonstrates an apparent loss of capacity. However, most of the incurred loss is recoverable by subjecting the battery to a few deep-discharge cycles.

Operating and charging Ni-Cd batteries at elevated temperatures also reduces their useful life. Most Ni-Cd batteries give their best performance at temperatures between 18°C and 30°C. The high internal temperatures of Ni-Cd batteries during fast charging, often near 50°C, accelerates cell electrolyte-seal and separator deterioration and increases the probability of internal shorting. Electrolyte venting, due to high internal pressures, occurs more often at elevated temperatures. The loss of cell electrolyte, due to continuous cell venting, results in a net loss of cell capacity.

The Battery-Butler, described in this article, solves the common problems associated with the maintenance and operation of Ni-Cd batteries. The Battery-Butler, by initially discharging a Ni-Cd battery to a preset point, reduces the possibility of the "memory" effect occurring. Once discharged, a battery is then usually charged at 25% or less of the fast-charge rate. Charging at a lower rate will typically reduce the internal cell temperature rise by 25% and reduce the internal cell pressure increase by 40% or more. Once the battery is fully charged, a trickle charge is provided to maintain the battery in a fully charged state. The Battery-Butler circuit can be bypassed, and the existing fast-charger used, if needed.

Circuit Description. A schematic diagram of the Battery-Butler is shown in Fig. 1. When power is first applied to the circuit and S1 is in the off position, C2 is held discharged. At the same time, pin 14 of U3-f is held low via R2, forcing U3-f's output at pin 15 high. The high output of U3-f divides along two paths. In one path, U3-f's output is fed to U3-b at pin 5 through D3, causing the output of U3-b at pin 4 to go low. The logical-low output of U3-b is fed to the base of Q4, keeping it turned off.

In the other path, the high output of U3-f is applied to the input of U3-c at pin 7, forcing its output low, which in turn holds C1 in a discharged state through R4 and D2. That keeps the output of U1-b (at pin 9) high, which keeps LED1 dark. The reset signal (taken from pin 6 of U3-c), being low, forces both R5 latches (comprised of U4-a/U4-b and U4-c/U4-d) to return to their respective reset states. Once in a reset state, pin 4 of U4-b and 10 of U4-c go high, and pin 11 of U4-d remains low, indicating a discharge cycle.

The low output of U4-d at pin 11 forces pin 2 of U3-a high, turning Q2 on. That pulls the x or pin of U7 low, which holds the output off.

When S1 is flipped to the slow position, pin 15 of U3-f goes low, forcing pin 6 of U3-c high, while at the same time reverse biasing D3, so no current flows through that unit. With D3 reverse biased and pin 11 of U4-d low, pin 4 of U3-b goes high, turning on Q4. The battery then starts to discharge into R39 through Q4. Zener diode D7 provides overvoltage and reverse-voltage protection for Q4.
Fig. 1. The Battery-Butler is comprised seven IC’s—an LM556 dual oscillator/timer, an MC14040 CMOS 12-stage binary counter, an MC14049 CMOS hex inverting buffer, an MC14011 quad CMOS NAND gate, an LM339N quad comparator, an LM78MO5 5-volt, 500-mA, voltage regulator, and LM317T 1-amp, adjustable voltage regulator—along with their support components.
Pin 6 of U3-c, which is now high, allows C1 to begin charging. The charge on C1 is applied to the threshold input of U1-b at pin 12. The high output of U4-b at pin 4 is applied to the reset input of U1-b at pin 10. Those two signals, being high, cause U1-b to begin oscillating, which in turn flashes LED1. The displayed color of LED1 is selected by the state of pin 10 of U4-c and 11 of U4-d. With pin 11 of U4-d low, LED1 flashes red.

The Ni-Cd battery’s voltage is applied to the circuit and divided by R6 and R7, and is monitored by U5-a. When the voltage at a pin 5 of U5-a dips lower than the reference voltage at pin 4 of U5-a, pin 2 of U5-a goes low, indicating that the battery has been discharged. Note that the discharge cycle can last from seconds to hours, depending upon the type and condition of the battery. The low output of U5-a is fed to one input of an R/S latch (consisting of U4-c and U4-d), forcing pin 10 low and 11 high, which, in turn, causes the red section of LED1 to turn off and the green section to turn on, indicating that a charge cycle has begun. The high output of U4-d at pin 11 forces the output of U3-a at pin 2 low, turning Q2 off. That allows the ADJ terminal of U7 to float high, which turns the output pin on and allows current to flow to the Ni-Cd battery.

Since the initial reset cycle, pin 4 of U4-b has been high, generating the hi-rate signal. The hi-rate signal (in a high-logic state) turns Q1 on, which turns Q3 on. With Q3 conducting, R34 sets the regulator’s constant-current output at the higher charging rate.

The Ni-Cd battery’s charge voltage is divided by a resistor network comprised of R22, R23, and R25, and applied to a track-and-hold circuit, which is used to monitor the charge voltage. The track-and-hold action is initiated when the reset input of U2 at pin 11 drops low at the start of the charge cycle. That allows U2, clocked by U1-a, to begin counting. Once counting, U2, combined with R11–R20, produces a ramp voltage at pins 8 and 10 of U5-c and U5-d, respectively. That ramp continually increases until the voltage at pin 8 of U5-c is greater than that at pin 9, at which time, the reset input of U1-a at pin 4 goes low, inhibiting the clock.

As the battery continues to charge, the voltage at pin 9 of U5-c increases proportionately with the increase in battery voltage. When the voltage at pin 9 of U5-c is greater than that at pin 8, the reset input of U1-a at pin 4 pulls high, causing it to oscillate. The output of U1-a at pin 3 is fed to the clock input of U2 at pin 10. As the charge cycle continues, the track-and-hold circuit tracks the battery’s reference voltage at pin 9 of U5-c, which is slightly less than the V_ref voltage at pin 11 of U5-d. That difference can be adjusted via R25.

As the Ni-Cd battery approaches full charge, the voltage across the battery terminals begins to decrease. Since the voltage at pin 8 of U5-c and pin 10 of U5-d is held slightly below the peak V_ref, voltage, the circuit can detect when the decreasing voltage crosses the lower limit, and hence detect that the battery is approaching full charge.

Once V_ref falls below the voltage at pin 10 of U5-d, pin 13 drops low, causing the high-rate signal at pin 4 to be turned off, allowing the discharge cycle to begin.
of U4-b to go low. That signal turns Q1 off, which, in turn, turns Q3 off. With Q3 turned off, R35 sets the regulator's constant-current output at the lower charging rate. The high-rate signal brings pin 10 of U1-b low, inhibiting LED1 from flashing; LED1 remains a steady green until S1 is returned to the OFF position or DC power is lost.

If the battery is disconnected during discharging or charging, the leakage current through U7 will cause V_on to exceed the threshold voltage at pin 7 of U5-b, causing pin 1 of U5-b to go low. That low signal, which indicates a high level at the battery terminals, sets pin 1 of U4-a low, forcing the ready state as previously described. That function also detects overcharging conditions and functions as a safety feature.

Construction. The author's prototype was assembled on a double-sided, printed-circuit board. The foil patterns for the two sides of the board are shown in Figs. 2 and 3 for those who wish to etch their own board. The board is also available separately or as part of a complete kit from the supplier listed in the Parts List. Note that, in any event, it will be necessary to solder the circuit elements to both sides of the board.

Once you have the board and all the components, construction can begin. A parts-placement diagram for the project's double-sided board is shown in Fig. 4. It is wise to socket all of the DIP IC's, as some are CMOS devices and as such are static sensitive. Note: To make socket installation simpler, it is recommended that you use wire-wrap DIP sockets, elevating them slightly so that the leads can be soldered to the top, as well as the bottom, of the board. Once the sockets are in place, install the passive components (resistors, capacitors, fuse, etc.), followed by the active components (diodes, and non-socketed IC's). Be sure and use heat sinks on both U7 and Q4.

The Battery-Butler may be built with an internal DC power supply, allowing operation directly from the 117-volt AC line, or an external adapter may be used. The circuit, as described, requires 11.5-15.0 volts DC at 250 mA during charging, and less than 80 mA during discharging and when in the ready state.

Fig. 2. The author's prototype of the Battery-Butler was assembled on a double-sided, printed-circuit board, measuring about 4 by 4½ inches. The foil pattern for copper side of the board is shown here full-scale.

Note that in the author's prototype, a jumper wire has been placed in the R26 position and R27 (just below it) has been omitted. Also note that U7 and Q4 have heat sinks mounted to them.
Modifications and Limitations. As described, the circuit has been designed to operate a six-cell—a 7.5-volt DC, 1.2 amp/hr Ni-Cd battery, commonly used in several models of portable cellular telephones. In the unit used by the author, access to the battery is provided through the hands-free interface modular telephone jack on the rear of the charging stand. When using a standard RJ-11 plug and four conductor wire, the red wire is the battery’s negative lead, the black lead is the battery’s positive lead, and the yellow and green wires are not used.

The charging stand may be used with the 12-volt DC auxiliary output of the Battery-Butler. By connecting that output to a 5.5 mm × 2.1 mm DC power plug (polarized for positive tip) and inserting the plug into the DC power jack on the charging stand, the fast charger can be used normally by placing S1 in the FAST position. Some users have reported good success even with occasional use of the fast charging mode.

The circuit may be adapted for use with any Ni-Cd battery within the range of from 4.8 to 8.8 volts at 500 mA with a capacity of up to 2 amp/hr. The charge and discharge characteristics can be easily adjusted to suit the battery. The rate of discharge is set by the value of R39. The discharge level is set by the combination of R8–R10. The high-rate charge current is set by R34 and the low-rate charge current is set by R35. The output overvoltage limiter threshold is set by R26 and R27. (Note that in the version for the 7.5-volt DC/1.2-amp/hr battery described in this article, those resistors are replaced by jumper and an open circuit, respectively; i.e., the overvoltage limiter threshold is equal to 5 volts.)

The infinite range of battery types, voltages, and current ratings makes it difficult to address all possible configurations, but by experimenting and using simple calculations, the proper setting for those resistance values can be determined.

Table 1 lists modifications to the circuit for various battery voltages and number of cells. For example, for a battery with two cells and a voltage ranging from 2.40 to 2.50 volts, R6 should be replaced by a jumper wire, R7 is not installed, R9 goes from 47k to 12k, R22 is replaced by a jumper wire, R23 goes from 47k to 82k, R26 (which, in the author’s configuration, is a jumper wire) becomes 47k, and R27 (which is omitted altogether in the author’s unit) is now 68k. In addition, the voltage measured at pin 4 of U5 should be around 1.80 volts, with no more than a 0.06-volt deviation.

The discharge rate can be controlled by changing the value of R39. If the battery’s rated full-charge voltage and the desired discharge rate are known, the new value for R39 (in ohms) can be determined using the following formula:

\[ R39 = \frac{(V_{\text{batt}} - 0.7)}{I_{\text{discharge}}} \]

where \( V_{\text{batt}} \) is the battery voltage, and \( I_{\text{discharge}} \) is the discharge current in amperes. For example, if \( V_{\text{batt}} \) is 7.5 volts and \( I_{\text{discharge}} \) is .68 amps (680 mA), then:

\[ R39 = \frac{7.5 - 7.1}{.68} = \frac{6.8}{.68} = 10 \text{ ohms} \]

which is the R39 value used in the author’s prototype unit.
To charge seven- and eight-cell (8.40 – 10.0 volt) batteries, the circuit must be supplied from a 16- to 18-volt DC power source. That voltage must be regulated (via an LM317 or equivalent device). Resistor R34—which normally ranges from 2 to 47 ohms at ½ watt—sets the high-rate charge current. Resistor R35—which normally ranges from 47 to 120 ohms at ½ watt—sets the low-rate (trickle) charge current.

**Testing and Adjustments.** Set S1 to the off position. Connect the completed circuit to a 12- to 15-volt DC supply. Measure the voltage at pin 3 of U5. That voltage should be at or near 5.0 volts DC. If either of those voltages are not within the specified ranges, remove the DC voltage source and recheck the connections.

Measure the voltage at pin 4 of U5 with a high input-impedance digital voltmeter (DVM). That voltage can be set by adjusting R10. The recommended voltage at pin 4 of U5 can be determined by the following:

\[
0.90(V) \times \left(\text{number of cells}\right)/2
\]

For example, if a 6 cell, 7.5-volt Ni-Cd battery is used, the voltage at pin 4 should be adjusted to:

\[
0.90 \times 6/2 = 2.70 \text{ volts DC}
\]

That adjustment sets the level to which the battery will be discharged. Note that the battery will discharge to twice this present voltage:

\[
\text{Battery Discharge Level} = \text{pin 4 of U5} \times 2
\]

\[
= 2.70 \text{ VDC} \times 2 = 5.40 \text{ VDC}
\]

If the Ni-Cd battery is not discharged low enough, the battery will lose its ability to hold a full charge. If the Ni-Cd battery is discharged too low, it is possible that the cells within the battery may reverse and the battery will lose its ability to take a charge.

Connect a fully charged 7.5-volt, 12 amp/hr Ni-Cd battery to the proper terminals on the Battery-Butler. Be aware that reversing the battery connection will cause the battery to immediately begin discharging through D7 and R39; that should not damage the Battery-Butler.

Again using a high input-impedance DVM, measure and record the voltage at pin 5 of U5. Measure the voltage at pin 9 of U5. The recommended voltage at that point can be determined by subtracting 0.10 volt DC from the voltage noted earlier at pin 4 of U5. The proper voltage can be set by adjusting R25.

If the voltage at pin 9 of U5 is within .02 volts, or greater than the voltage at pin 5 of U5, the circuit will return to the ready state too soon, and the Ni-Cd battery will not reach a full charge. Note: If the voltage at pin 9 of U5 is 0.30 volts less than the voltage at

(Continued on page 93)
We have all experienced an electrostatic discharge of some type. If you've ever walked across a rug, touched a door knob, and received a good jolt then you have been the victim of an electrostatic discharge or ESD.

However, people aren't the only victims of ESD; advances in electronic-component design have provided us with smaller circuits that are also sensitive to ESD. Most ESD-sensitive devices are semiconductors (especially chips), film resistors, or crystals.

Table 1 lists some typical device types that are sensitive to electrostatic discharge. Note that all of the static-sensitive devices can be damaged by ESD levels of only a few hundred volts. Since static discharges of less than 4000 volts cannot be seen, felt, or heard, many devices are destroyed without the person involved even being aware that anything has happened.

The only protection we can provide ESD-sensitive devices is through prevention. Since static builds up due to common device handling, special procedures must be followed when handling such devices. But before we discuss specific ESD-prevention techniques, it would be helpful to review some of the basic principals of static electricity. Let's do that now.

**Principles of Static Electricity.** A build up of electrical charge is typically produced when two objects are rubbed together or moved in close proximity to each other. Generating static electricity in this manner is called the triboelectric effect. In triboelectric charging, electrons are stripped from one object and added to another. The object that has lost electrons will be positively charged and the other object will be negatively charged. These charges are opposite but equal.

The magnitude of the charge depends on the size, shape, composition, and electrical properties of the two objects. For example, charges on conductors are rapidly distributed over the entire surface of the substance. That keeps conducting materials from developing high levels of electrostatic charge. In the case of non-conductors, any built-up charge tends to remain in the localized area of contact for relatively long periods of time.

**Types of Failures.** ESD can cause total failure of electronic parts, intermittent failures, or erroneous signals. ESD can also cause latent or delayed failures: items partially damaged by an ESD can check out electrically fine on the repair bench, but fail in a project when subjected to wide temperature ranges or mechanical shock. When the damaged component later fails, it is usually written off as a random failure. If the failed component is analyzed in a laboratory, one would probably find that the real cause behind the failure was ESD over-stress.

There are two general failure modes resulting from ESD transients on semiconductor devices: hard and soft. Hard failures are usually immediate, devastating, and permanent. They occur in unmounted integrated circuits, transistors, diodes, and other semiconductor devices. A soft failure is generally latent, delayed, and temporary. It is generally the result of a variable of the device being shifted outside of normal specifications. Soft failures occur only during system operation and in the case of digital circuitry, can usually be cured by re-entering data, re-booting the system, or powering down to clear the glitch. Analog circuitry undergoing a soft failure usually returns to normal automatically.

**Creating a Safe Area.** All work with ESD-sensitive devices should be done in an “ESD-safe work area.” A safe area should consist of a work bench, a personal wrist strap, a conductive floor mat, and tools and equipment all connected to a single-point ground. Let's look at some of those items, one at a time, starting with work benches.

Any work bench you use for the handling of ESD-sensitive items should be grounded. An effective grounding
method is to cover the work surface with a conductive anti-static sheet or mat, as shown in Fig. 1. The mat will constantly drain any static charges to ground. It should have a grounding cable, a series resistance of at least 250,000 ohms to ground (to protect the wearer by limiting current), and be connected to the common ground of the workshop.

Anyone handling ESD-sensitive devices should wear a conductive wrist strap. The wrist strap should be connected to the table mat at the point where the mats ground lead is attached, and be long enough to permit the wearer freedom of movement. It should have a quick-release mechanism for emergency situations. It is important that the wrist strap have at least 250,000 ohms of resistance in series to ground.

The work station should have a grounded floor mat. As with the table mat, the floor mat provides a drain of static charge to ground. The floor mat should be equipped with a grounding cable to meet at a common ground point with the table mat. The floor mat should also have a resistance of at least 250,000 ohms in series to ground.

The work station should also be provided with grounded tools and equipment. Soldering irons should be hard grounded and isolated from the power line by a transformer. Other electrical equipment should be grounded, too. ESD-safe solder suckers should be used. The insulated handles of hand tools should be checked for static generation and periodically treated with an antistatic product if required. Such tools should be neutralized by contact with a grounded surface before and during use. This advice should be followed for probe leads, too.

The work area should be equipped with conductive parts trays, tote boxes, and carriers to store or transport ESD sensitive parts. Shorting bars, clips, or special shunts should be used to hold sensitive parts, leads, and hardware. Conductive foam can be used for shorting parts leads during handling.

As a further precaution, an ESD-safe area should be free of static generators. Styrofoam cups, plastic candy wrappers, common plastic bags, plastic equipment covers, and non-conductive tote boxes are all notorious static generators, so keep them away.

Smocks, gloves, or aprons of common plastic, rubber, nylon, or untreated cotton should never be used in an ESD-safe area. However, there is ESD-safe clothing such as smocks, gloves, and aprons that you can wear when performing critical work on static-sensitive components.

As we mentioned earlier, humid air helps to dissipate electrostatic discharges and lessens their generation. Relative humidity between 40% and 60% in ESD-protective areas is desirable as long as it does not accelerate the formation of rust or result in other detrimental effects in electronic assemblies.

In practice, all ESD-sensitive items must be protected from electrostatic fields and ESD with shunts such as bars, clips, conductive foams, or inside of conductive coverings during storage, shipping, and while transporting from parts storage to a grounded work bench. You should neutralize charges on all ESD packaged items by placing the packages on an insulated work surface prior to opening them. The ESD-protective covers and shunts should only be removed immediately before being installed into the circuit for which it is intended. By the way, as common sense would dictate, no power should be applied to an ESD-sensitive device during its placement or removal from a circuit.

This article should give you some idea of the potential harm of electrostatic discharges and how to prevent them. It is hoped that you will use the information to keep electrostatic discharge from ruining any of your future projects.
Ions are defined as electrically charged atoms. Positively charged ions have a deficiency of electrons, and negatively charged ions have a surplus of electrons. An ion can also be classified as an atom or molecule with an electrostatic charge. Another classification of an ion is a charged particle that is formed when one or more electrons are taken from or added to a previously neutral atom or molecule.

The Ion Detector described in this article can be used to detect the presence, and indicate the relative amount, of free ions in the air. The Ion Detector, a handheld unit about the size of a pack of cigarettes, is designed to indicate ion emissions from ion generators, high-voltage leakage points, static-electricity sources, electric-field gradients, and in other situations where the presence of ions or a measurement of their relative flux density is required.

The front cover features, a sensitivity control with on-off switch, a high-flux indicator lamp, and a panel meter. An antenna, mounted on the top of the unit, serves an external ion collector. A strip of metallic foil on the outside of the plastic enclosure touches the users hand and is used to ground the unit. For fixed applications, the strip can be replaced by a wire connected to ground.

Circuit Description. Figure 1 shows a schematic diagram of the Ion Detector—a rather simple circuit consisting of three transistors, (two PN2907 PNP units, and a single PN2222 NPN unit), three resistors, an antenna, and an LED.

In that circuit, a telescoping antenna is used as the pickup. In the presence of an ion field, ions accumulate on the antenna, causing a minute negative current to flow to the base of Q1. Capacitor C1 and resistor R1 form an RC network, whose function is to eliminate any rapid fluctuations. Once the negative current becomes large enough, it causes Q1 to turn on, connecting the negative terminal of battery B1 to the base of Q2. That forward biases Q2, causing it to turn on. That, in turn, couples the base of Q3 to the positive terminal of the battery, forward biases Q3—whose collector is in series with current-limiting resistor R2 and meter-sensitivity control R3—causing it to conduct.

With Q3 turned on, meter M1 indicates (in a non-linear manner) the relative level of ion flux, while LED1 (which is connected in series with Q3’s emitter) lights to give a visual indication of strong ion fields. It should be noted that in order for the unit to operate properly, some sort of ground is usually required.

Metallic tape is used in the prototype to provide a convenient contact for the users hand, thereby providing a partial ground. If possible, such as when the unit is used as a monitor at a permanent location, the detector should be grounded to a water pipe, or some other convenient grounding point.

The detector is set up to detect negative ions. It can be made to detect positive ions by simply reversing the polarity of the transistors that comprise the circuit, i.e., PNP units become NPN units, and the NPN transistor is replaced by a PNP unit. It should note that the performance of the detector is seriously affected by high humidity. Damp or moist air tends to impair the circuit’s ability to detect ion flux.

The Ion Detector can be used to give a quick indication of the presence of a negative ion field, aid in identifying its source, and indicate its relative strength, but it is not designed to provide an absolute measurement of flux intensity. The circuit can also be used to aid in making adjustments to ion sources, by noting the meter’s needle deflection as you attempt to increase or decrease ion emissions. The Ion Detector can also be used to ferret out residual ion fields, check for ion leakage (in shielding tests, for example), or to test for static charges (in people’s clothes, fluorescent lighting, 

---

Build an Ion Detector

BY VINCENT VOLLONO

This simple circuit lets you track down sources of high-voltage leakage, static build-up, and more
The author's prototype of the Ion Detector was housed in a small plastic enclosure, measuring about 4\% by 2\% by 1\% inches. Note the strip of tape running along the side of the enclosure, which is used to ground the circuit via the user's hand contact. The strip can be supplemented or replaced by a wire connected to the same point in the circuit and terminated at the other end with an alligator clip.

Construction. The author's prototype of the Ion Detector was assembled on a section of perfboard, using point-to-point wiring for inter-component connections. Pay close attention to the orientation of the polarized components (diodes, transistors, electrolytic capacitors, etc.), as well as the polarization of the DC source that will power the circuit, when assembling the circuit. It is very important that you verify all your interconnecting wiring.

It is highly recommended that the circuit be enclosed in a plastic project box. Once the circuit is completed, a ½-inch wide strip of aluminum is attached to the side of the enclosure, and is then connected to the circuit board (at the junction of C1, the positive lead of the panel meter, and the positive terminal of the battery) as shown in Fig. 1. The aluminum strip serves as the circuit's grounding point. That grounding strip can be replaced or supplemented by a wired alligator clip for connection to a "true" earth ground (a water pipe, for instance).

The author used a telescoping antenna as the ion pickup in his prototype unit; however, a piece of stiff wire (a wire hanger, for example) would also work. In either case, the antenna must be electrically isolated; i.e., it should not be connected to ground in any way. Note that S1 (the on-off switch) is piggy-backed to potentiometer R3 (a 5k potentiometer that serves as a the meter's sensitivity control). You can also use a potentiometer with a piggy-back switch or use two separate components.

For meter M1, the author used a small 100-mA panel meter; using a meter with a rating other than that specified may effect the performance of the unit. It is also important to remember that any leakage around the input of Q1 will reduce the circuit's sensitivity. To help prevent (or at least reduce) leakage, the circuit can be coated with a high-quality varnish. If you decide to coat the circuit, make sure that the unit is completely clean and dry before applying the varnish.

Use. To demonstrate the unit's sensitivity, run a plastic comb through your hair, and place it near the antenna of the Ion Detector. Making sure that the unit is grounded (either by the user touching the aluminum strip or by connecting an earth ground to the circuit), bring the comb near the antenna. As the comb is brought near the antenna, you'll note a needle deflection on the meter (indicating the presence of ions), and LED1 lights. As the detector is brought closer to the ion source, the meter needle should deflect harder. If the needle deflects too hard (pegs), R3 can be adjusted to bring the meter reading on scale.

That's all there is to it. While the Ion Detector is not a precision instrument, it can come in handy in your workshop or laboratory.

---

**PARTS LIST FOR THE ION DETECTOR**

Q1, Q2—PN2907 general-purpose PNP silicon transistor
Q3—PN2222 general-purpose NPN silicon transistor
LED1—Light-emitting diode
R1—100-negohm, ½-watt, 5% resistor
R2—10,000-ohm, ½-watt, 5% resistor
R3—5,000-ohm potentiometer (see text)
C1—470-pF, ceramic-disc capacitor
M1—100-mA panel meter
B1—9-volt transistor-radio battery
S1—see text

**ADDITIONAL PARTS AND MATERIALS**

Perfboard materials, plastic enclosure, 9-volt battery holder and connector, wire, solder, hardware, etc.

**Fig. 1. The Ion Detector is a rather simple circuit consisting of three transistors, (two PN2907 PNP units, and a single PN2222 NPN unit), three resistors, a telescoping antenna (which is used as the ion pickup), and an LED.**
A broken water pipe can be an expensive repair job. The repair leaves you with walls torn apart, floors ripped up, and we haven’t even mentioned the water and construction damage to rugs and furniture. In Texas where I live, the number of times during the winter it freezes hard enough to break pipes can be counted on the fingers of one hand. However, only one mishap is enough to cost significant money. Also, since freezing weather is something we Texans normally let the folks up north deal with, most of our houses (and the plumbing in them) are not really designed to withstand the week-long plunges below 20 degrees. For example, I have a few outside faucets that insist on freezing at every opportunity. Putting covers over them works for a short time, but in extended freezes, they freeze-up solid. Letting them drip is often a sure cure, but after a week of dripping, a lot of water is wasted and some mighty respectable ice cones have built up.

While there are many things you can do to winterize your house in general (see the boxed text entitled “A Winter Arsenal”) I wanted a solution to this yearly nuisance in particular. The solution had to be simple, reliable, and able to work totally unattended. My solution was to build a circuit called the Freeze Fighter that automatically warms outdoor faucets once the temperature drops to the freezing point.

The Design Process. I wanted to go on vacation, leave the house, and let the system handle any “blue norther” that might blow in. Therefore I needed a device to sense temperature and take appropriate action. Fortunately, National Semiconductor makes an integrated circuit that is designed to sense temperatures and turn devices on or off with changing temperatures. This IC is the LM3911; an 8-pin device containing a voltage reference, a temperature sensor, and an op-amp. With the addition of a few resistors, this IC can be configured into a complete temperature controller that will switch an external load with rising or falling temperatures. Now I had to figure out how to take the on/off signal generated by the controller and use it to keep the faucets warm.

Luckily, very little energy is needed to keep a faucet from freezing. A few watts of power should keep most faucets cheerfully warm. I decided to strap a 50-ohm, 10-watt resistor to the faucet using a hose clamp, and then apply enough voltage to produce about five watts of heat. I determined that a 13-volt, AC-to-AC adaptor, which will result in about 4 watts when terminated in the 50-ohm resistor, would be adequate. A 50-ohm resistor with 13 volts across it is going to pull about 300 milliamps. The adaptor is rated at 800 milliamps so the adaptor was chosen with that current rating. I do not recommend using a DC adaptor for any extended period, since in a wet environment, a plating effect could occur which would eventually destroy the connections at the resistor.

The only problem left to solve was how to take the small control voltage available from the controller, and use it to turn the 13-volt supply on and off.

The application notes on the LM3911 show a method of controlling a relay or similar device using a transistor switch. This would work fine if there was just a single faucet to protect, but my house has three that are vulnerable to freezing. I didn’t want to string wire from one to another and use multiple control relays. nor did I want to produce three copies of the control circuit.

Radio Shack’s universal interface for their “Plug’n Power” home controllers provided a solution. The interface will accept almost any kind of signal on its input, and will activate any number of remote modules through the house wiring when the signal is received. Adding a matching remote-controlled appliance module or a special wall outlet (both available from the same source) completes the system. Figure 1 illustrates the major components of the system and how they might be used to protect two faucets. Note that both a controlled outlet and...
an appliance module are shown to indicate how both are connected. Before discussing the Freeze Fighter control circuit, it would be wise to explain a little about the operation of the LM3911 and the interface modules, so I'll deal with them next.

**All-in-One Temperature Controller.** As mentioned, the heart of the Freeze Fighter is an LM3911 Temperature Controller IC. As you can see in Fig. 2, this clever IC incorporates a voltage reference, a temperature sensor, and an op-amp all in one 8-pin package. The voltage reference allows this chip to operate over a wide temperature range and also allows the unit work with accuracy over a wide power-supply range. The reference is a 6.8-volt active shunt regulator connected between pins 1 and 4 of the IC. In order to operate properly, this reference must be wired in series with an external current-limiting resistor. The selection of this resistor and the input voltage determines in part how much power is dissipated by the package. The application information on the LM3911 recommends values ranging from 3.5k to 12k depending on the application.

The sensor incorporated in the IC produces an output voltage that is directly proportional to temperature in degrees Kelvin at 10mV/K. The sensor is powered by the internal reference and feeds the positive input of the on-board op-amp. If the output of this op-amp is tied back to the feedback input on the package, the 10mV/K will be available for external use.

The internal op-amp can also be configured as a comparator. This is the mode used for the Freeze Fighter. To use this mode, the feedback input pin is supplied a voltage that corresponds to the desired temperature setting. The internal op-amp then compares this voltage to the voltage being generated by the sensor and switches high or low if the temperature is lower or higher than the set point. The passive output of the op-amp is pulled high by an internal resistor and series diode.

**Remote-Control Using House Wiring.** The universal interface controller and the remote-controlled outlet or appliance module used in the Freeze Fighter are only a few selections from a wide array of different home-automation devices available from Radio Shack, Heathkit, and other suppliers. The devices all use an interface adhering to the X-10 standard to send control signals over a home's AC-power lines. These devices have existed for a number of years and have gone through a number of refinements to make them more reliable and flexible.

The universal interface controller is a remarkable device in that it allows almost any type of control input to generate command signals to other devices in the house. The controller can accept a switch closure, or a low-level AC or DC signal at its input. It can then turn on or more devices that match the address set through switches on its faceplate. The control inputs can be momentary or continuous, and the controlled devices can be turned on or flashed.

This device was obviously designed as an interface for alarm circuits, but it is also perfect for computer control. A computer can easily generate the output signals required to control remote devices. Granted, the device can only address devices corresponding to its switch settings, but this is usually not a major limitation. For the purposes of the Freeze Fighter, the Controller works perfectly.

The remote-control devices come in a number of different packages with a variety of functions. The devices recommended in this article are designed to be used to turn an appliance on and off. Other units that are designed for incandescent lights can vary the brightness of the light over a number of steps. These devices are not appropriate for the Freeze Fighter, and can cause the user significant problems if accidentally connected to fluorescent lights or other devices that allow only on/off control.

Little difficulty should be encoun-
terminated in using the devices, since most of them just plug in. In some cases, devices plugged into different legs of the house's power line may not be able to communicate with each other. However, some means do exist to correct this problem. One method is to place capacitors across the different legs of the power line at the house's junction box. If you encounter this problem, I would recommend that you search around for outlets that do share a common supply leg, rather than paying an electrician to install the capacitors. I would never recommend attempting to install these capacitors yourself.

Winterizing.

The Freeze Fighter is only one weapon in the war against winter. A homeowner should be prepared with both active and passive defenses against freezing temperatures.

One of the best passive tools is pipe insulation. Sections of foam tubing can be bought that easily wrap around exposed pipes. This wrap helps trap the heat of the water and thus prevent freezing during mild freezes. A properly designed house will have all exposed pipes covered with this tubing or some other form of pipe insulation. Houses designed to withstand the killer freezes of the northern climates will have all the pipes protected within the warm core of the house. Faucet extensions allow the water carrying pipes to be inside the insulated walls while the controls and outlets are on extensions that are accessible from outside the house. An ideal configuration has a separate system for pipes that are in danger of freezing so that this system can be turned off and drained during winter. In milder climates, these precautions are overkill, and most of the time a foam bonnet on the exposed faucets prevents disaster.

Active defense systems consist of the Freeze Fighter described in this article and the electrical heating tape that can be bought at hardware stores. This tape is powered by house current and can be purchased in a number of different lengths, with or without built-in thermostats. This tape is an excellent defensive measure for those houses with exposed pipes that are prone to freezing. This tape should be used in accordance with all the instructions that come with it. Tape which is improperly used can destroy plastic pipes or even cause fires. The tape should not be placed in walls or other enclosed spaces, nor should it be overlapped on itself. Power consumption is minimal—the cost of warming pipes is considerably less than that of replacing them after they break.

The Circuit. The LM3911 requires very few external components to implement a full-function temperature controller. Figure 3 illustrates the simplicity of the Freeze Fighter circuit. The resistor network consisting of R1, R2, and R3 is used to provide the setpoint voltage for the feedback input of the LM3911.

Fig. 3. The LM3911 requires only a few resistors and a capacitor to turn into a full-function temperature controller.

PARTS LIST FOR THE FREEZE FIGHTER

**RESISTORS**

(All fixed resistors are 1/4-watt, 5% units.)

- R1—15,000-ohm
- R2—10,000-ohm miniature trimmer potentiometer
- R3—24,000-ohm
- R4—7,500-ohm
- R5—10,000-ohm

**ADDITIONAL PARTS AND MATERIALS**

- C1—0.1μF, ceramic or Mylar capacitor
- U1—LM3911 temperature controller, integrated circuit (Digi-Key LM3911N)

Universal interface module (Radio Shack 61-2687), a 12-volt DC adaptor, a case with perboard, jacks and plugs if desired, wire, solder, etc. For each faucet you’ll also need a 13-volt, 800-mA power transformer, a 20-ohm, 10-watt resistor, a hose clamp, and an appliance controller (Radio Shack 61-2681 or 61-2584) or remote-controlled outlet (Radio Shack 61-2685).

Resistor R4 limits the current through the internal voltage reference of the LM3911 and can be selected from a wide range of values. I chose 7.5k, which is specified in most of the application notes.

Resistor R5 pulls the output of the IC high when the temperature is below the set-point. The internal 50k resistor probably would have been sufficient for this project, but I included the external 10k resistor just to be safe. The internal resistor is in series with a diode that allows a switching voltage up to 35 volts to be used with the device. For the Freeze Fighter, 12 volts is adequate.

If ultimate reliability is required, dispensing with R2 is a good idea. To do that you should wire the circuit as shown, calibrate R2 with the procedure that follows a little later, remove R1–R3 from the circuit, and install larger values for R1 and R3 to account for the absence of R2 based on the calibration setting of R2.

Capacitor C1 is placed across the wiper of the variable resistor to limit noise that may be present. These few components complete the circuit and provide the interface required by the universal interface module. If the application had required switching a voltage on with a rising temperature, an additional transistor would have been required on pin 2 of the IC to invert the output.

Construction. Any typical method of construction (point-to-point wiring, wire-wrapping, or PC-board mounting) is suitable for this project. I chose to use point-to-point wiring on a perfboard that comes with its own plastic case. If you choose to do the same, clean the perfboard well with some steel wool or other cleansing agent to insure that the copper pads are free of all oxidation. I soldered the IC directly to the board rather than using a socket to avoid the potential corrosion problems that may develop when the circuit is used outside over extended periods.

One additional caution when working with this IC: the positive voltage is attached to the bottom leg of the package (pin 4) where most other ICs have the ground attached. The ground on this IC is attached to pin 1 which is the top pin. Confuse these pins and the temperature-controller IC becomes a fuse.

Once you have your own temperature controller mostly built, you must decide on a power source. I powered my circuit from an AC adaptor I had available. If you don’t have one in your junkbox, purchase a small 12–15 volt DC unit. The circuit draws very little current, so any adaptor rated at a suitable voltage will do.
I mounted the perfboard in the case with the components facing the plastic rather than the aluminum face plate, and drilled a number of holes in the side of the box to insure that the sensor was exposed to ambient air. Use caution when drilling these holes so as to not drill through the supports for the PC board, which are at the corners of the box. Power is supplied through a DC coaxial jack and the output is terminated in a 2-conductor miniature phone jack. These jacks are not necessary and could be replaced with direct connections. I included them because it makes it easier to string the power and signal connections through small openings.

**Calibration.** Now it's time for calibration. The relationship between the voltage at pin 3 of U1 and the desired temperature set-point is 10mV/°K. Since absolute zero Kelvin is equal to -273.4°C, a temperature of 0°C will result in an output voltage from the sensor of 2.734 volts. The resistor network values were chosen so that the same amount of voltage is obtained with the wiper of variable resistor R2 near its mid-point, so start by setting R2 to its middle position.

You will be required to check the voltage set by R2 shortly. However, be careful when measuring this value because the IC is not looking for a voltage referenced to ground, but instead is looking at the difference between the voltage at pin 4 and this set-point voltage. That seems simple enough until you fall back on old habits of connecting the black lead of the multimeter to ground and then measuring the voltage at pin 3. It took me a few minutes to realize that the circuit was working properly but that I wasn't.

That said, connect the black probe of your meter to pin 3 and the red probe to pin 4. Apply power and adjust R2. As you adjust the voltage you should find a point at which the circuit just switches on or off. At normal room temperature that should happen at about 2.98 volts, which is 250 millivolts above the zero point of 2.73 volts. The presence of 250 millivolts at 10mV/°K would indicate a room temperature of about 25°C. Now adjust R2 until you get as close as possible to 2.734 volts. This should calibrate the unit for the freezing point.

You can verify the calibration with just a little extra work. First place the sensor in your refrigerator and verify that it does not switch on, move it to your freezer and in a few minutes it should switch on.

**Set Up.** On the Plug'n Power interface connect the terminal labeled "+" to the output from pin 2 on the temperature controller. Connect the "-" terminal to the ground connection of the temperature controller. Make sure you have set the mode switches on the interface for an on/off control of the addressed device ("Input select" to 1 and "mode select" to 3), then select the house code and unit code settings you wish to use for all the devices. The remote units must be set to the same house and unit codes.

I placed the controller outside near a window and ran the wire between the window and the frame. The seals on my windows allowed this. If this won't work on your window, you'll have to find some other way of exposing the controller to the outdoor temperature. If you must drill through the wall, plug the opening with caulk to keep the bugs out, and put a loop in the portion of wire that is outside to keep the rain from following it in.

Plug a 13-volt transformer into each remote module and run its leads outside as you did for the temperature controller. Use common sense in placing the resistor's transformers (and thus the remote modules); they can get warm when operating and should not have any drapes or flammable material near them. Connect each transformer output to its intended high-wattage resistor and cover the joints with high-temperature tubing. Avoid plastic that could melt at the elevated temperature. Physically attach each 10-watt resistor to its faucet with a hose clamp and you are done.

**Improvements.** I put foam covers over the faucets and taped a temperature sensor from an electronic thermometer (Radio Shack 63-842) to the faucet to monitor the effect of the heater until I was comfortable with it. You might do the same, and then adjust R2 until the desired effect is achieved. If a you wish to have an operation indicator for each faucet station, you can put a multi-tap adapter on the remote unit and include a small night light to indicate when the unit is activated (see Fig. 4A). An even more fool-proof device is illustrated in Fig. 4B. There, the current flowing through the load resistor induces a voltage drop in a monitoring resistor. The voltage drop can be used to power an LED. Make sure the wattage of the monitoring resistor is large enough so if the load resistor shorts out, the full load current will not cause any damage.

**Summertime.** This same controller with minor modifications can be used in the summertime to help control the air conditioner in your house. To use the controller in that way, rewire it to include an inverting transistor on the output lead. Mount the heating resistor under the air conditioner's thermostat and set the thermostat to a high temperature. Now when the outside temperature exceeds the maximum you program via R2, the heating effect of the resistor will turn on the air conditioner. This will take some careful adjustment of the resistor because eventually you want the air conditioner to turn off.

The Freeze Fighter can be used in many more applications around the home and in the car. Let your imagination work, and see what you can come up with.
**CMPX-CAL: The Complex Number Calculator Program**

Key-in a program that makes short work of AC-circuit analysis by making complex numbers easy to work with.

**BY JAMES E. TARCHINSKI**

With the aid of complex numbers, AC circuit analysis is nearly as simple as DC analysis. That's because all of the well-established mathematical tools used for DC analysis can be carried-over into the world of alternating current if you have a knowledge of complex math (which we'll assume for the rest of this article). That includes the big three: Ohm's Law, Kirchoff's Current Law, and Kirchoff's Voltage Law.

Unfortunately, while the analysis methods may be precisely the same, the calculations are a little more involved. The calculations are not necessarily difficult, just time consuming. This fact becomes more obvious when you consider that complex addition and subtraction must be done in one coordinate system, while multiplication and division are more easily done in another. As much as fifty percent of the calculations required during an AC analysis are performed merely to convert numbers into the proper coordinates for further processing.

A calculator can certainly be helpful, especially if it can handle complex numbers. However, even the most expensive calculators are generally limited to storing a single complex number at a time; so pencil and paper must serve as a "storage medium." A calculator dedicated to operating on complex numbers, with enough storage to eliminate the need to write down intermediate results, would be more helpful.

The complex-number calculator program, CMPX-CAL.BAS, presented in Listing 1, was designed to act as such an aid. It is a BASIC program for IBM-compatible computers that turns a PC into a "four-function-plus calculator" for dealing with complex numbers. Up to five complex numbers can be stored in memory at any one time, eliminating the need to jot down intermediate results. Also, numbers can be entered in either rectangular or polar coordinates and are always displayed in both notations, so no time needs to be wasted on trivial conversions.

As presented in Listing 1, CMPX-CAL will operate on any IBM PC-compatible computer with either the BASICA or GWBASIC programming language. Because the program does not rely on any machine-specific statements, it could easily be converted to any machine that supports an implementation of BASIC.

**Typing-in the Program.** Before you can use the Complex Calculator, you must enter it into your computer's memory and then save it to disk for subsequent use. There are several methods of accomplishing this. If you are unfamiliar with the process, however, it is suggested that you follow the method outlined in your DOS or BASIC manual. The process should run something as follows.

First, load the BASIC language into your computer. This can usually be done by executing one of two common commands at the DOS prompt, either "BASICA" or "GWBASIC." If you have a hard drive, one of these files should be present in the DOS sub-directory. If you have only a floppy-disk-based system, one of the two should have been included with the disks that originally came with your computer.

After loading BASIC, an "OK" prompt should appear on the screen. At this point, enter CMPX-CAL into your computer's memory by typing it in exactly as it is presented in Listing 1. You may want to use the LIST command to copy your version of the program to the printer, allowing you to check for those inevitable typos.

Finally, when you've finished entering the program, save it to either your hard-disk or a preformatted floppy disk with the command:

```
SAVE "CMPX-CAL"
```

**Screen Layout.** When you type the RUN command in BASIC, the program will begin execution and should display the screen shown in Fig. 1. Note...
that the screen is divided into three distinct sections.

The left side of CMPX-CAL’s screen is the output display area; it shows the results of all data entries and operations. The letters A through E listed in this area signify the five memory storage locations utilized by the program. The complex number at each location is displayed in both rectangular and polar coordinates. For example, if the complex number 12 - j12 (or, equivalently, 16.97056 at -45°) were stored in memory location A, the program would display:

A: REL: 12 IMG: -12
MAG: 16.97056 ANG: -45

The lower section of the screen is the user-input section. In that area of the screen, you will be prompted to enter all data and commands for the program.

Finally, the right side of the program’s screen is the command reference section. That area is essentially a permanent help screen, summarizing all of the program’s available commands.

Using the Calculator. The best way to learn how to use any new computer program is to dive right in and try it out on a real-world problem. In this case, we’ll solve for voltage V2 in the circuit show in Fig. 2. This exercise will serve not only as an example of how to use the CMPX-CAL program, but also as a review of how complex numbers are used in AC analysis.

Because of the circuit’s simplicity, V2 can be calculated by repeated application of Ohm’s Law. First, we’ll calculate the total impedance of the circuit by starting with the impedance of R2, and then adding in the effects of C1, L1, and finally R1. Once the total impedance is known, the current I1 will be calculated by dividing the total impedance into the value of the supply voltage. Finally, the voltage V2 will be calculated by multiplying I1 by the combined impedance of C1, R2, and, of course, L1.

Run the program and begin by entering an “A” at the “Command:” prompt; doing that informs CMPX-CAL that we want to enter a value into memory location A. The program then prompts us to enter the real and imaginary parts of the complex number (in this case, the 20 + j0 impedance of resistor R2).

Command: A
Enter the value of A.
Real part: 20
Imaginary part: 0

If then updates the results section of the screen as follows:

A: REL: 20 IMG: 0
MAG: 20 ANG: 0

Next we need to enter the value of capacitor C1 into another memory location. We need to do this because CMPX-CAL can only perform mathematical operations on the numbers currently stored in its memory. For example, you can’t tell the program to add -6 - j11 to the value stored in memory location E. That may seem rather limiting, but as you work with the
program you will see that it’s really not. Entering the value of C1 into memory location B would be accomplished by the following sequence:

Command: B
Enter the value of B.
Real part: 0
Imaginary part: -10

Now that both C1 and R2 are stored in memory, we can add them together and place their sum into memory location C. This is accomplished with the command “C=A+B.” Note that all of the mathematical operations utilize this same command format, as indicated on the reference side of the computer’s screen. The letter before the equal sign indicates the memory storage location where the result will be placed. The two operands for the command are listed on the right of the equal sign, and separated by the symbol of the operation you wish to perform. For our example, the command line would look like the following:

Command: C=A+B

After completing this command, the value of memory location C is updated:

C: REL: 10 IMG: -10
MAG: 22.36068 ANG: -26.56505

but both A and B maintain their values.

Next, we proceed to enter the value of the inductor L1 into memory location D. The fact that L1 is given in polar coordinates will not cause any problems—the program can handle numbers in either system. To enter a number in polar coordinates, simply press the return key when prompted for real and imaginary parts of a number, and the program will assume you wish to enter the number in polar coordinates. It will then prompt you to enter the magnitude and angle of the number to be entered. The sequence would be as follows:

Command: D
Enter the value of D.
Real part: Imaginary part:
Magnitude: 5
Angle: 90

When the program updates the value of D, it will display:

D: REL: 0 IMG: 5
MAG: 5 ANG: 90

Please note that entering zeros for the real and imaginary parts of a number does not perform the same function as just pressing the return key. Entering zeros will clear the memory location you are trying to load with a new value.

Now that the impedance of L1 is stored in D, and the combined impedance of R2 and C1 is stored in C, we can calculate their total impedance via the use of the “parallel” operator, which is signified by the # symbol.

Command: A=D # C

As indicated above, the result of this operation will be placed into memory location A, overwriting the previous
So impedance \( R_2 \), section voltage and also impedance of gate impedance yields:

1. That just about does it. The Complex Calculator program should help you turn mountains of calculators into mole hills. I'm sure that with just a little practice you can easily use it to tackle even the toughest jobs. [ ]
We take an inquisitive look at the origins of the term "Ham" and other interesting facts about the king of hobbies.

BY KARL T. THURBER, JR., W8FX

Have you ever wondered why radio amateurs are known as "hams?" A few years ago, my wife ("XYL," or ex-Young Lady in ham-radio parlance) went shopping in downtown Atlanta while I attended the Atlanta HamFestival, a major annual amateur-radio convention. She happened to be wearing the HamFestival admission button, and several shoppers stopped her to inquire about the event. Many passersby thought that a hamfest meant that a pork connoisseur's taste-fest or a pig farmer's confab was in town!

Today, even with some 600,000 licensed amateurs in the United States (out of more than 2 million hams worldwide, including 1 million in Japan alone) relatively few really know what being a ham is about—even though many well-known personalities are radio hams. Check out this list of famous hams from the past and present:

- Senator Barry Goldwater, K7UGA
- King Hussein of Jordan, JY1
- Entertainer Ronnie Milsap, WB4KCG
- Astronaut Dick Rutan, KB6LQS
- Entertainer Donnie Osmond, ex-KA7EVD
- Guitarist Chet Atkins, WA4CZD
- Actor Marlon Brando, FO0GJ
- Entertainer Arthur Godfrey, K4LIB
- Astronaut Owen Garriott, W5LFL
- Broadcast Newsman Walter Cronkite, KB2GSD
- Entertainer Alvino Rey, W6UK
- Air Force General Curtis Le May, W6E2V
- Air Force General Francis "Butch" Griswold, K0DWC
- Broadcast Newsman Roy Neal, K6DUE
- Presidential offspring and former ARRL President Herbert Hoover, Jr., W6ZH

Even with such an impressive list of activists, few know what it means to be a ham. Fewer still know where the term "ham" comes from, or are aware of the hobby’s traditions and culture, understand its very distinctive lingo, or know how to become a ham. In this article, we’ll try to rectify that lack of information.

A Little Background. Amateur radio deals with communicating; amateurs operate personal two-way radio equipment from their homes and cars to communicate. Hams—who participate in what is sometimes called the "king of hobbies"—are properly called radio amateurs.

As a service, the Federal Communications Commission (FCC) regulates amateur-communication practices, and a license from them is required to operate ham equipment in the United States. The service provides an opportunity for training, intercommunication, and technical investigation for qualified people interested in using radio for non-profit goals. Amateurs may design, build, modify, and repair their own equipment, but are responsible for the quality of their transmissions. The amateur rules are found in Part 97, Title 47, of the Code of Federal Regulations.

Internationally, 27 frequency bands are allocated to the amateur service; unlike broadcasting stations, no specific frequencies are assigned. That flexibility makes it possible for amateurs to communicate with all areas of the world, even through satellites orbiting the Earth. Amateurs worldwide can exchange messages by voice, telegraphy (Morse code), television,
radio telegraphy (RTTY), radio facsimile (FAX), and sophisticated digital modes of operation such as packet-radio transmission.

**It's A Matter of Terminology.** It's intriguing that radio amateurs call themselves "hams," but rarely give any thought to the word's origin. Just where does it come from? Are hams virtuoso pork tasters, folks who live high off the hog, overacting actors and actresses, nonprofessional dabblers, or what? Unfortunately, history is sufficiently murky to prevent us from precisely tracing the word's origin, but we can at least give some clue as to its historical usage in amateur radio. Let's look at three possibilities.

To start with, Bill Johnston, who operates amateur station WB5BCB, writing in November 1976 QST noted that in the 1800's, "hamster" was slang used by railroad telegraphers to describe inexperienced telegraph operators. The word also has an equestrian meaning, and was used interchangeably with "plug," meaning green or second best, in referring to horses.

The definition of a ham as a poor operator probably first appeared in print in G. M. Dodge's classic book, The Telegraph Instructor, in 1898. The uncomplimentary term carried over to the early spark era when radio amateurs haphazardly competed with commercial stations for supremacy on a given wavelength. Amateurs were notorious for blotting out commercial signals and bringing on complaints such as "those blanketly-blank hams are jamming you." That was especially true before Congress and the Department of Commerce, which regulated early radio law, relegated amateurs to operating below 200 meters (1500 kHz). Radio amateurs, who perhaps were unfamiliar with the true, uncomplimentary meaning of the term, picked it up and applied it to themselves anyway.

Dennis Burgoyne, KE8EY, in a letter to the editor of CompuServe Magazine in the December 1990 issue, suggested an acronym-based origin. It seems that a popular early-1900's magazine called Home Amateur Mechanic featured articles on do-it-yourself projects. In one issue, an article described the newfangled radio, a device that you could build at home that might enable you to converse with other owners. The home-built radio came to be referred to as the "Home Amateur Mechanic Radio," or HAM radio for short. People who built and used radios thus came to be known colloquially as HAM-radio operators. This explanation of the term's origin has the advantage of simplicity, and the acronym certainly makes sense.

As a third possibility, the word or acronym was used as the callsign of one of the first amateur wireless stations, operated in 1908 by the Harvard Radio Club. The members were Albert Hyman, Bob Almy, and Peggy Murray. At first, they called their station "Hyman-Almy-Murray." Tapping out the name in code was tedious, so they contracted it to HY-AI-MU, or HYALMU, using the first two letters of each name.

Things went well until 1909, when confusion resulted between their callsign and signals from the Mexican ship, Myalmo. So they decided to use only the first letter of each name,

Amateurs paper the walls of their hamshacks with Wouff Hong certificates, along with their operating awards, other certificates, and rare confirmation (QSL) cards. Note the facsimile signature on the author's certificate: that of "The Old Man."

After his death in 1936, the ARRL was able to persuade the FCC to award Maxim's callsign, W1AW, to its headquarters station, which previously was W1MK. Shown here is a W1AW QSL card confirming contact with the author in October, 1957.
Hamfests—amateur-radio oriented conventions—are immensely popular, especially during the spring and summer months. The core activity of most hamfests is the swapmeet area where amateurs buy, sell, and swap old and new equipment and parts.

identifying their station as HAM. That was fine, since in the unregulated, pioneering days of wireless, amateur-radio operators picked their own call letters and operating wavelengths.

There's more to this story, though, and supposedly it's all found in the Congressional Record. The resulting interference between amateur and commercial stations generated disputes similar to the range wars of the Wild West. The thorny interference situation came to the attention of Congress, which considered legislation to limit pesky radio-amateur activity. In 1911, Albert Hyman (of station HAM) chose the controversial Wireless Regulations Bill as a topic of a thesis at Harvard. An instructor insisted that he send a copy of the thesis to Senator David Walsh, a member of the committee hearing the bill. Walsh was impressed, and he sent for Hyman to appear before the committee.

Hyman described how the Harvard station, HAM, was built, and he described the fact that if the bill were placed into law, the operators would have to close up the little station because they could not afford the license fees or meet other requirements contained in the bill. The debate began, and station HAM became a rallying symbol of the country's small amateur stations who hoped to be saved from the "menace" of the big commercial stations that didn't want meddlesome amateurs around to foul the valuable airwaves. When the bill reached the floor of Congress, each speaker talked about the "poor little amateur station, HAM." National publicity identified station HAM with radio amateurs.

I lean toward possibility number 3, but I'm not at all sure that we've solved this longtime mystery; undoubtedly, there are other hypotheses. But these three theories about the origin of the word surely are fascinating to recount, if nothing else.

Hams and Their Lingo. Just as interesting as the origin of the term "ham" is hams' own lingo. Just about every profession, and most hobbies, has its own distinctive and sometimes impenetrable jargon. Amateur radio is no exception: there is no end to the number of unique buzzwords and other terms used in "ham-speak." Let's unscramble some of this lingo.

The popular general call or attention signal made by amateurs, CQ, originated with the 19th century English telegraph system. Its classic meaning was "All stations" and it acted as a notification to all postal telegraph offices to receive a message. The term carried over into wireless and was used as a general call to all ships, being adopted by the London Convention of 1912 as the international general call or attention signal. Today, CQ means that I'm inviting anyone who hears me to reply. (CQ, by the way, also is the name of two amateur-radio magazines, one in Japan and one in the US.)

As CQ begins a radio contact, the legendary 73 "ties the ribbons on" or ends it. Even if you're not an amateur, you've probably heard of the warm, fraternal term 73. It was, and still is, a popular, all-purpose amateur salutation. It's also the source of the CB (citizens band) "three's on you" idiom of saying goodbye.

The term 73 is traceable to 19th-century railroad telegraphy usage, going as far back as 1857 when it was described in The National Telegraph Review as meaning "my love to you." It was one of the many "numerical wire signals" used in those days, and it eventually came to mean "best regards." Interestingly, there now is a popular ham magazine known as 73 Amateur Radio Today. Also, a variation on 73 is the "88" signal, which harkens closely to the 1857 telegraph definition of 73. The term means "love and kisses."

Prosigns and Prowords. Prosigns are special telegraphic expression and procedure symbols, such as AA (separating parts of a message address), AR (over), AS (stand by), SK (end of transmission), and K (go ahead). They have been word-saving shortcuts since the earliest days of commercial wireless, and they may even have been used in railroad telegraphy as well.
The voice-equivalent or "prowords" such as clear, break, over, affirmative, negative, and roger are fairly self-explanatory. However, I should point out that, contrary to popular belief and war-movie usage, "roger" simply means "I have received your last transmission correctly," but doesn't mean "yes" or "affirmative."

A three-letter series of shortcut codes collectively called the "Q-Codes" has been in use since 1912 when it was adopted by international agreement. The Q-code was designed to overcome language barriers faced by ship operators as they communicated among themselves and with shore stations around the world.

Most of the original 50-signal, universally understood codes are still in use today. Many more codes have been officially added and still more have been adopted informally by amateurs to handle situations that are not covered by the formal lists. Some of the more popular Q-code signals favored by amateurs include QTH (location), QRM (interference), QSL (acknowledgment of receipt), QSO (contact), and QST (calling all radio amateurs). Many of these codes have equivalents in the more recently developed police and CB-adapted "10-codes."

### Three Amateur Radio Traditions

Amateur radio has many traditions and legends that reflect its long heritage. Three of these are quite intriguing.

The first tradition is that of "The Old Man," or "T.O.M." This is a reference to Hiram Percy Maxim (1869-1936), who, with Clarence D. Tuska, co-founded the American Radio Relay League (ARRL) in 1914. Maxim can't be credited with coining the term "ham," but some recognize him as the father of amateur radio: he served as the League's president for 22 years until his death in 1936. Maxim (whose call sign, W1AW, was later awarded by the FCC to the ARRL for its headquarters station in his memory) was an imaginative engineer and inventor who pioneered in the development of the automobile and who also invented the Maxim silencer for firearms.

Maxim was a feisty, straight-arrow standards-setter who was highly revered in the amateur community. Many T.O.M. stories grew up around his accomplishments, principles, and philosophies, and some of the stories were authored by him under this nom-de-plume. Even today, some older amateurs judge controversial developments in the hobby by intuitively asking themselves, "What would Hiram Percy Maxim think about that?"

The first of these three stories is the "Old Man" tradition, which has been a part of the fabric of amateur radio for many decades. It is a reference to the memory of Hiram Percy Maxim, one of the early pioneers of amateur radio.

The second tradition is the "Wouff Hong," or the mythical creature that is said to move across the sky. The Wouff Hong is a legendary figure that has been associated with amateur radio since the early days of the hobby.

The third tradition is the "Ham Radio," or the "Ham Book," which is a reference to the "Ham Radio" magazine that was published in the early days of the hobby. The "Ham Radio" was a monthly publication that contained news, information, and stories of interest to the amateur community.

These traditions and symbols have been a part of the fabric of amateur radio for many decades and are still remembered and celebrated today.
on display at ARRL headquarters today.

From this mythical, mystical symbol emerged the Royal Order of the Wouff Hong, a sort of radio-amateur secret society intended to symbolize an honorary inner circle of the League. Wouff Hong initiations are still conducted during large League conventions at the stroke of midnight.

The third colorful amateur tradition is that all amateurs, regardless of how elaborate their stations may be, are said to have their equipment located in their "hamshack." Early shipboard installations and shore stations tended to be located in their own isolated radio room or building, and for good reason. Why? In those pre-World War I days, the noisy spark transmitters produced an ear-shattering crash every time the key was depressed, thoroughly disturbing all within earshot.

If the early spark-rig amateur wasn't banished to a distant out-building, cabin, or detached structure far removed from family activity, he was at least relegated to space behind the basement furnace or in an attic crawl space where he wouldn't disturb the household. Nowadays, however, you'll find modern, silent amateur stations housed in almost every conceivable spot in the home. But, even if that spot is the most luxurious and comfortable part of the house, tradition demands that the spot still is always called the hamshack.

Five Routes to a License. We've shown that there's a great deal of lore surrounding radio hams, and amateur radio definitely isn't a trifling hobby despite its obscure origins, its strange jargon, and its unusual traditions. It's one of the few hobbies in which you have to be licensed to participate, and most hams appreciate the hobby even more for its strict entry requirements. Maybe you'll give this fascinating and rewarding avocation a try, even if no one really knows for sure how the hobby was first named.

Hopefully this discussion of the term "ham" and the lingo surrounding amateur radio has whetted your appetite to learn more about the hobby. Since that might be the case, we'd be remiss if we didn't offer some suggestions as to what to do next to satisfy your curiosity and perhaps become a ham yourself. Getting an amateur-radio license is easier than you might think, especially since February 1991 as you no longer have to learn Morse code. Best of all, even beginner (Novice and Technician) licenses allow you to use voice and the latest digital and computer-based technologies on the air.

Just about anyone can become a radio amateur; there are no age limits. To obtain a license (a "ticket" in ham-speak), you must pass an exam. In 1985, the FCC undertook a program whereby licensed radio amateurs called Volunteer Examiners (or VE's)—amateurs in the community who volunteer their services as test-givers—were organized into testing teams by several authorized Volunteer Examiner Coordinator (or VEC) groups. There are about 18 VEC's, which are listed in the boxed copy entitled "VEC groups."

The VEC's are certified by the FCC to administer exams; questions are drawn from a regularly updated question pool developed by the FCC and the VEC's. The VEC's conduct exam sessions, often held at amateur hamfests. Although the FCC doesn't charge to issue or renew licenses, the VEC's may charge examinees nominal fees. But the good news is that you no longer have to travel to a distant FCC office to take amateur tests, which in many locations used to be given only a few times a year.

The VECs administer the exams for the five classes of operator license:

Here's the author's well-appointed amateur radio hamshack, as it existed in 1979. A host of digital-based technologies such as packet radio, satellite communications, computers, and the like have caused amateur radio hamshacks to change tremendously since then.

Originally spontaneous word invention by Hiram Percy Maxim, the Wouff Hong is one of three mythical instruments of torture that might be used to attack poor operating practices. It is still on display at the ARRL headquarters today.
Novice, Technician, General, Advanced, and Extra. Although you can initially qualify for any of the five operator classes, most people find the Novice and Technician licenses are the ideal entry points to the hobby.

The no-code Technician-Class exam, comprised of two written tests, has 55 questions and you don't need to know Morse code. Its prerequisites include all amateur privileges in the 6-meter (i.e., 50-MHz) and higher bands. The Technician-Class operator who also has successfully completed the Morse-code requirement is known as a "Technician Plus" and is also allowed Novice-type operating privileges in the popular 10-, 15-, 40-, and 80-meter high-frequency bands.

The Novice Class is for beginners who don't have the technical knowledge to pass the Technician-level theory and regulations exam, but who can pass the less-demanding, 30-question Novice-level FCC theory/regulations exam and the 5-WPM Morse-code sending and receiving test. Privileges include radioteletype and voice operation in the 10-meter band and Morse in the 10-, 15-, 40-, and 80-meter bands, as well as some small VHF and UHF bands. (The Novice exams are the only amateur exams that can be given outside theVEC system. Any pair of General- or higher-class amateurs may administer these exams.)

The General-Class license is a middle-of-the-road amateur license. Its key features are a 13-WPM code requirement and privileges in at least a portion of every amateur band. It offers all amateur operating privileges except for the relatively few privileges that are reserved for the Advanced and Extra Classes.

A tougher theory examination characterizes the Advanced Class, which allows some additional frequency privileges in the HF bands. At the pinnacle is the Amateur Extra Class, with a strict-stricter exam and a Morse code requirement of 20 WPM. The license authorizes full-privilege operation on all amateur bands. A little-known fact is that persons who can't pass a 13- or 20-WPM code exam because of a doctor-certified medical handicap can be excused from taking the code examinations.

Two Hundred Meters and Down, Clinton B. DeSoto, American Radio Relay League, Inc., 1938 (reprinted in 1981 as ARRL publication No. 0011, $6).

"From Whence Came Ham?" Bill Johnston, WB5CBB, QST, November 1976.

Details on getting started in amateur radio, contact your local amateur-radio club or one of the Volunteer Examiner Coordinator listed elsewhere in this article.

You also can obtain FCC Form 610 (Application for Amateur Radio Station and/or Operator License) from any of the FCC's 35 offices around the country. You can get the address of the FCC office nearest you, basic information on becoming a radio amateur, study publications, and/or the names of clubs and instructors in your area, from the American Radio Relay League (ARRL), (225 Main St., Newington, CT 06111; Tel. 1-203-666-1541).

Various amateur-license study packages, both books and software, are available from the National Amateur Radio Association (NARA) (PO. Box 598, Redmond, WA 98073-0598; Tel. 1-800-GOT-2-HAM). Complete study programs are also available from The W5YI Group, PO. Box 565101, Dallas, TX 75356; Tel. 1-800-669-W5YI.

Books and Study Aids. In preparing for the amateur exams, consider acquiring these three excellent books:

First there's Now You're Talking! Discover the World of Ham Radio This 320-page ARRL publication covers practically everything you need to know to earn a Technician- or Novice-class license. It's more than a study guide in that it also helps you select and set-up equipment for your first hamshack. It's $19 from the ARRL. The League also publishes the ARRL License Manual Series, one book for each license class (they are $6 each).

Second, check out The ARRL Operating Manual, Fourth Edition. It is an excellent primary reference covering the full gamut of on-the-air operating practices—a sort of one-stop operating encyclopedia. While not a license-exam study manual, the book makes an effort to be the entry vehicle for "no-code" technicians. It's available from the League for $18.

And third we recommend All About Ham Radio. This is an introduction to amateur radio aimed at those without prior knowledge. In about 300 pages, Harry Helms, operator of amateur station AA6FW, uses humor and a friendly writing style to guide newcomers. The book isn't a complete license-exam study course, nor is it an A-to-Z operating reference. However, unlike many other beginner texts, this one devotes as much attention to what amateurs actually do and to amateur-radio culture as it does to formal operating topics, which are covered well in The ARRL Operating Manual anyway. The Helms book is $19.95 from HighText Publications, Inc. (125 North Acacia Ave., Suite 110, Solana Beach, CA 92075; Tel. 1-619-793-4141).

Besides these three books, there's also the complete introduction to Amateur Radio teaching package, designed for youths. Caroie Perry, WB2MGP is a professional educator who has successfully introduced many youths to amateur radio. Now she offers her own training program for youngsters in grades 3 to 12. Her program is billed as a complete, ready-to-teach "plug-in" curriculum. It includes all necessary materials in-

(Continued on page 98)
Looking for a dose of radio nostalgia? How about an idea for an electronics project? You’ll find both in old electronics books and magazines.

BY LARRY LISLE, K9KZT

Collecting old electronics books and magazines can be a lot of fun. Even if you have just a few you can see how this hobby of ours has grown and changed, from a little section on “Hertzian Waves” in the back of a text on natural philosophy to a giant industry. They also give lots of ideas for projects that you can build just as they were described, or that you can update with modern components and techniques.

You might even discover something new by looking at an old idea with fresh eyes. Do we really understand how a coherer works? Can super-regeneration, point-contact transistors, or tunnel diodes suggest solutions to current problems?

Finding Them. With very few exceptions, old electronics books and magazines are not expensive or hard to come by. The first step is to let people know you are interested. Put a notice in the local ham-club bulletin—even if you’re not a member. Check out the area hamfests. Put an ad in the local newspaper. Sometimes very nice collections are simply thrown away!

Don’t forget to check with your local library. Some libraries have a policy of disposing of electronic material after so many years because it’s not current.

Finally, be sure to visit old book stores and antique shops in your area and tell the owners what you’re after. Prices tend to be very low except for very early magazines or collectibles such as past issues of The A.R.R.L. Handbook, and dealers might be reluctant to purchase collections they’re offered unless they know someone’s interested.

As you get into collecting you’ll develop your own ideas on which direction to go, but here are a few thoughts on what to look for as you get started:

First off, books from the 1800’s are becoming hard to find, so grab anything you come across from that era. There was plenty written on electricity (motors, generators, and so on) and quite a bit on telegraphy, but precious little else.

The period from 1900–1920 was the era of wireless and “King Spark,” with vacuum tubes becoming more common after about 1912. It’s fun to read some of the textbooks of the period with the benefit of hindsight. The triode was dismissed by one from 1912 with, “This detector is said to be fairly sensitive, though of short life.” This same text gave page after page to liquid barreter, and magnetic and thermo-electric detectors. It’s also interesting to read various explanations...
of how crystal detectors worked—all of them wrong! It makes you wonder if we’re overlooking something important today, or whether we think we know how a device works when we really don’t. A standard reference of the era was Principles of Radio Communication, by Morecroft. It’s often quoted in other books and is fairly easy to find today.

The twenties saw the start of broadcasting. Reading samples of the many books written at the time makes the thrill of hearing voices and music from afar new again. You’ll probably want to include some of the “how-to” books of the period in your collection.

The twenties also saw the division of amateur radio from broadcast listening. A copy of QST Magazine from early in the decade and one from the later years will show the technical growth.

The thirties really bridged the gap between antique and modern radio. Broadcast sets at the beginning of the period still had the classic look of the twenties, while by the end of the decade, the all-American five-tube table radio was becoming more common. In amateur radio, the thirties started with self-controlled oscillators and regenerative receivers, and ended with stable transmitters and superheterodyne receivers. All of these changes were recorded in the electronic literature of the day and in magazines such as Radio-Craft and QST.

Books devoted to repairing radios became common in the thirties and if you’re into antique-radio collecting you’ll definitely be interested in acquiring some service manuals from the era. I’d especially recommend books on radio repair by Abraham Marcus and John T. Frye.

The forties began with the war years, and though plenty was happening in electronics, most of it wasn’t made public until later. Since ham radio was officially off the air for the duration, amateur-radio magazines had a problem: What do you write about? For this reason, a copy or two of QST from the early forties should be in your collection. All magazines from the war years are scarce because of paper shortages and scrap drives.

The late forties and fifties were a boom time for electronics. The wizardry of the war years was revealed and led to even more inventions. The general prosperity of the country also put electronics in more and more homes.

Many magazines were started or retitled to reflect the new age and every month consumers would read articles on FM radio, high-fidelity music systems, and television. All of these products needed servicing, so there was a heavy emphasis in many magazines on helping the “radio repairman” with a VOM and signal generator become an “electronics technician” with equipment that had only been in the laboratory just a few years before.

For hobbyists it was a great time. (Continued on page 98)
Build the DIGITAL BOWL BOX

BY WILLIAM L. CALL

This circuit brings the old "College Bowl" concept of first-response answers to a moderator's questions into the '90's.

Many contests and game shows are based on the old "College Bowl" concept of first-response answers to a moderator's questions. Usually two teams are assembled, typically with four contestants each; a question is read, and the first person to respond gets the opportunity to answer the question. Middle and High Schools have gotten into the action with Math Bowls and Academic Bowls; even churches have gotten into the act with "Bible Bowls." In individual classrooms, many teachers have used the Contest Bowl idea to build excitement into classroom activities.

A key component of the Contest Bowl is an impartial judge to determine which participant responded first. Usually each contestant is given a pushbutton switch that is connected to an electronic device that determines which button was pushed first. Such a system can be quite elaborate (incorporating large and colorful displays, impressive sound effects, etc.) and complex. The system presented here, on the other hand, was designed to be compact and inexpensive. Since the heart of the electronic system is a digital IC often used in computer circuits, the unit has been dubbed the Digital Bowl Box.

Circuit Description. Figure 1 shows a schematic diagram of the Digital Bowl Box. At the heart of the circuit is a 74LS373 low-power Schottky octal (or eight-input) transparent latch, U1. At power up, U1's output-enable (OE) terminal at pin 1 is held low via pull-down resistor R2 and the latch-enable (CE) terminal at pin 11 is high, via pull-up resistor R1 (part of a 9-resistor network). That allows any signal presented to U1's data-input (DB-D7) terminals to be passed to its respective output. Since all of the data inputs of U1 are held high via pull-up resistors (R1-a-R1-h), each output of U1 is high. That reverse biases LED1-LED8 so all of them remain dark; only LED9 is illuminated.

Let's say that S1 is the first switch to close. That low pulls U1 pin 3 low, causing its corresponding output (pin 2) to go low. The low output on pin 2 forward biases LED1, causing it to light. At the same time, a voltage drop developed across R8 (as a result of current flow through LED1), turns Q1 on, which then causes Q2 and Q3 to turn on.

When transistor Q2 turns on, pin 11 (CE) of U1 is pulled low latching U1 in its present state, keeping LED1 on, identifying the contestant who responded first, while locking out all subsequent respondent signals. With Q3 turned on BZ1 sounds. The 74LS373 and transistors have a response time of a few nanoseconds, making it highly unlikely (though not impossible) that a "tie" could occur.

After noting which contestant responded first, the moderator momentarily presses reset (S9), which pulls pin 1 (CE) high, clearing U1. That causes the highs presented to the data inputs of U1 (as a result of the pull-up resistors) to once again be passed to their corresponding outputs. As before, the LEDs are now reverse biased, so no voltage drop develops across R8. That removes the bias from Q1, which causes Q2 and Q3 to turn off, turning off BZ1 and deactivating the latch.

Power for the circuit is provided by a traditional transformer, rectifier, and voltage-regulator system. As designed, the Digital Bowl Box supports up to eight contestants. An expansion jack (J3) is included in the circuit, allowing you to daisy-chain two Digital Bowl Boxes together up to 16 contestants (eight for each team). The expansion jack parallels the control signals of the two Boxes. Only one LED will light, corresponding to the first switch depressed; full lockout of all other switches remains in effect. The expansion jack could be omitted if that option is not desired.

Construction. The majority of the Digital Bowl Box's circuitry was assembled on a printed-circuit board,

www.americanradiohistory.com
Fig. 1. At the heart of the Digital Bowl Box is a 74LS373 low-power Schottky octal (or eight-input) transparent latch, U1. Note that instead of 9-individual 1k resistors, the circuit uses a 10-pin 1k × 9 SIP bus-type resistor network.

Fig. 2. Most of the Digital Bowl Box’s circuitry was assembled on a printed-circuit board, measuring approximately 4 5/16 by 2 7/8 inches. A template for that printed-circuit layout is shown here full scale.
PARTS LIST FOR THE DIGITAL BOWL BOX

SEMICONDUCCTORS
U1—74LS73 low-power Schottky, octal D-type latch, integrated circuit
U2—7805T 5-volt, 1-amp voltage regulator, integrated circuit
Q1—2N3906 general-purpose PNP silicon transistor
Q2, Q3—2N3904 general-purpose NPN silicon transistor
LED1—LED4—Red light-emitting diode
LED5—LED8—Yellow light-emitting diode
LED9—LED12—Green light-emitting diode
D1, D2—IN4004 1-amp, 400-PIV rectifier diode

RESISTORS
(All fixed resistors are 1/4-watt, 5% units, unless otherwise noted.)
R1—1000-ohm × 9 SIP bus-type resistor network
R2—R7—2200-ohm
R8—120-ohm
R9—180-ohm

CAPACITORS
C1, C2—0.01-µF, 1000-WVDC, ceramic-disc
C3—220-µF, 25-WVDC, radial-lead electrolytic
C4—100-µF, 10-WVDC, radial-lead electrolytic
C5—0.1-µF, ceramic-disc

SWITCHES
S1—S9—SPST momentary-contact, pushbutton switches
S10—SPST toggle switch

ADDITIONAL PARTS AND MATERIALS
BZ1—12-volt buzzer (Mouser 251-0012)
F1—0.125-amp fuse
J1, J2—Panel-mount 5-conductor, DIN jack
J3—Panel mount, RCA phono jack
PL1, PL2—5-conductor DIN plug
PL3—3-conductor, molded AC power plug with line cord
T1—18-volt, center-tapped, 300-mA, transformer (Mouser 41WJ300)
Printed-circuit board materials, enclosure, strain reliefs, fuse holder, LED mounting clips, #6 × ½-inch sheet-metal screws, #6-32 × ½-inch BH machine screws, 20-pin IC socket, 2 × 6-inch pine wood (see text), aluminum sheet metal, threaded aluminum #6-32 × ½-inch standoffs, #24 4-conductor shielded cable, wire, solder, hardware, etc.

Fig. 3. In this parts-placement diagram for the printed-circuit board, note that the power transformer (T1) and the buzzer (BZ1) are mounted directly to the board. That means that due to physical space tolerances, the vendor-referenced components specified in the Parts List are required.

measuring approximately 4⅛" by 2⅛" inches. A template for that printed-circuit layout is shown in Fig. 2. A parts-placement diagram for the printed-circuit board is shown in Fig. 3.

Note that the power transformer (T1) and the buzzer (BZ1) are mounted directly to the board, eliminating interconnecting wires. Although that simplifies construction, it also requires (due to space tolerances) that the vendor-referenced components specified in the Parts List be used. Non-vendor-referenced parts are not critical. The switches, cabinet, switch wiring, and switch housings should be rugged enough to withstand the rigors of constant use.

Start by mounting a socket where U1 is indicated. Follow that by installing the passive components. Note that R1 is a 10-pin SIP bus-type resistor network, which is available from Digi-Key Electronics (701 Brooks Ave., PO Box 677, Thief River Falls, MN 56701-0677; Tel. 800-344-4539) as well as other sources.

After the passive components, mount and solder the active components to the board as indicated in Fig. 3. Once that's done, attach the transformer to the board with #6-32 × ½-inch screws and ½-inch threaded metal standoffs; the transformer mounting holes double as the board-mounting holes. Install screws and standoffs at the other mounting holes. After first tightening the mounting...
screws to the stand-offs, solder the transformer terminals to the appropriate circuit-board pods. After that solder 4-inch lengths of pre-stripped hookup wire for the LEDs, jacks, and power switch to the board.

The printed-circuit board assembly is now complete.

**PCB Enclosure.** Before the board can be mounted in its enclosure, it will be necessary to do a little preparatory work: e.g., holes must be drilled in the front- and rear-panels of the enclosure to accommodate the off-board components. Figure 4 shows the front and rear panel layouts for the author's unit. You can layout your enclosure's front and rear panels in a similar manner, or follow any scheme that you choose.

In any event, prepare the enclosure by punching or drilling nine ¼-inch holes in the front panel for the LEDs. To promote the team concept, red LEDs were used for one group of four outputs, and yellow for the other. (The corresponding switches, which we'll get to shortly, were mounted on plates that were painted red or yellow.) The LEDs and switches can be labeled 1–8 or red 1 through red 4 and gold 1 through gold 4. If the application is for individual contestants rather than teams, like-colored LEDs and plates might be preferable. The cabinet was labeled with embossed tape labels.

Mount the LEDs into the front panel using plastic LED-mounting clips, and connect the anodes of all but LED9 (the power indicator) together with bare bus wire. Run the reset and power cords loosely through their cabinet holes and solder their ends to the board. Maneuver the board into position in the cabinet, and install the bottom mounting screws into the other end of the standoffs. Install clamp-in strain-relief bushings on the reset and power cords, and then install a pair of DIN jacks and the power switch.

Now the final soldering can be completed. The easiest way to solder to the LEDs is to first melt some solder onto the end of the connecting wire and then separately to the LED lead. After that, retflow-solder them together. The switch jack terminals work well with this method too. Once the printed-circuit board has been mounted, and the connections between the circuit board and the off-board components have been completed, move on to the final phase of the project's construction.

**Contestant Switches.** Figure 5 shows one unit of the four-contestant switch arrangement used in the author's prototype. The contestant switches were housed in wood blocks (approximately 2½ inches square) that were cut from 2- × 6-inch pine lumber using a table saw. However, if you happen to have some scrap 2- by-4 lying around, that can be used as well. The blocks were then drilled out using a drill press. A router with a 0.25-inch veining bit was used to cut a groove into the wood to hold the switch wiring snugly clamped under a metal, switch-mounting plate.

The switch-mounting plates were fabricated from ½-inch sheet aluminum, and cut just slightly smaller than the wood blocks. A hole was then punched in the center of each mounting plate for the switches, and smaller holes in each corner for the
Fig. 5. Shown here is one unit of the four-contestant switch arrangement used in the author's prototype, which was wired together using an approximately 14-foot length of 4-conductor shielded cable for each team. Each switch within that arrangement has one terminal connected to one of the color-coded inner wires of the cable. The other switch terminal is connected to the cable shielding. After connecting the contestant switches to the cable, a heavy-duty DIN plug was connected to the free end of the cable.

The four-contestant switch arrangement (see Fig. 5) was wired together using an approximately 14-foot length of 4-conductor shielded cable for each team; that arrangement is less prone to tangling than individual switch cables. Shielded cable was used to lessen the chances of static discharges causing false triggering.

Prepare the cable by removing about 1.5-inch of insulation at three locations (each switch should be about 24 inches apart) along the multi-conductor cable. The fourth switch connects to the very end of the multi-conductor cable. Strip one color-coded inner wire for each switch. The color-coded wire is then soldered to one switch contact, and the bare shield wire is looped out and soldered to the other contact. A heavy-duty DIN plug was then connected to the other end of the cable.

Conclusion. The design that has been described is the result of many successive improvements over the years. The Digital Bowl Box was developed in response to requests by local school systems for an affordable, compact, easy-to-use quiz-bowl apparatus, and nearly 100 similar systems are now in use in our area. Needing to build so many in a part-time operation, considerable attention was given to easy assembly methods. The unit reportedly has met its need well, and helps make contesting very exciting.

The Sky Buddy Gets an Alignment

This month's column continues a project that has been occupying our attention for some time now: the restoration of a Hallicrafters Model S-19-R—better known as the Sky Buddy. That well-known, low-end shortwave receiver of the late 1930s was a favorite "starter set" for budding hams and shortwave listeners of the pre-World War II generation. See last month's column for a little more background on the set, plus a bibliography of the issues that have been devoted to the restoration so far.

By the beginning of last month's column, the receiver was in very nice physical shape, having been cleaned up to display-ready condition. However, there were still some electronic problems: audio gain was very low and, in addition, only a couple of strong local signals could be picked up on the broadcast band. Except for the weak audio, reception on the three shortwave bands seemed normal.

**LAST MONTH'S PROGRESS**

Through systematic troubleshooting, working backwards from the receiver's audio-output stage, the audio problem was traced to the coupling capacitor between the detector and first audio amplifier stages. Replacement of that leaky capacitor brought back the Sky Buddy's audio gain, but did nothing to clear up the broadcast-band reception problem.

What could cause this receiver to operate in a normal manner on its three shortwave bands (bands 2, 3, and 4), but not on the broadcast band (band 1)? The most obvious suspect was the primary of the broadcast-band antenna coil, which might well have been left connected to an outside antenna during a thunderstorm and damaged by a static charge from a nearby lightning strike.

That possibility, however, could almost be ruled out by a glance at the Sky Buddy's schematic. It turns out that the band 2 (1.7-5.6 MHz) and band 1 antenna coils share a primary winding. Since the set seemed to operate normally on band 2, the winding was probably okay.

Just to be on the safe side, I did check out the antenna-coil primaries during last month's troubleshooting session. That was accomplished by connecting a low-range ohmmeter across the set's "A1" and "A2" antenna terminals.

Those terminals connect to the primary of whichever antenna coil is selected by the Sky Buddy's bandswitch. So the three primaries could be checked for continuity simply by rotating the bandswitch through all positions. The ohmmeter did show continuity at each position, confirming my judgment that all antenna-coil primaries were good.

**ALIGNMENT WITH THE LM21**

With the antenna-coil primary given a clean bill of health, the next sensible move seemed to be to check the Sky Buddy's alignment. Such a move is always appropriate when servicing a receiver of this age since tube replacement over the years, deterioration of insulating and dielectric materials, and the absorption or loss of moisture content can all affect the resonant frequencies of the various tuned circuits.

In addition, the various screw-adjusted trimmer and padder capacitors used to tweak the tuned circuits are favorite targets for amateur "repair experts," whose uninformed twiddling can easily cause disastrous results.

My favorite signal source for the alignment of simple AM receivers is a World War II-vintage Navy surplus LM21 frequency meter. I have to admit that this an ungainly looking unit, lacking the trim packaging of the better-known Army Signal Corps.
version, the BC221. The latter unit is housed in a trim wooden case, complete with a protected lantern-style housing for the unit's all-important calibration book and a handy compartment that can be used to hold an AC power supply.

However, LM21 units come with switch-selectable 400-Hz tone modulation. This is a feature that is quite important if one is to monitor the strength of the frequency meter's signal in the radio under repair by the usual method of connecting an AC voltmeter to the audio-output stage. Few BC221s have either tone modulation or an AC power supply built to government standards.

Apparently, in government service, that handy compartment was generally used for battery storage—AC power being a lot more common on shipboard than under army field-communications conditions. Admittedly, the Navy power supply for the LM21 is a true boat anchor. It's housed in a case the same size as that of the LM21 itself, and is connected to the LM21 and the power line by a clumsy system of cables and plugs. Yet its battleship-like construction and custom-engineered design are comforting to have when operating an extremely sensitive and accurate instrument such as this frequency meter.

The LM21 (there are also earlier and similar models with lower "LM" numbers) and BC221 generate a signal whose frequency is within a percent or two of that indicated by the setting of the smooth-operating vernier dial. The official usable frequency range is 125–20,000 kHz, though higher frequencies can be attained through the use of harmonics. Accuracy is maintained through comparison with calibration signals generated by an internal 1000-Hz crystal.

The frequency-meter signal can be picked up by a receiver under repair and used for testing and calibration. But the LM21 or BC221 can also be used in a manner somewhat similar to that of a modern frequency counter. A signal from a transmitter or oscillator under test can be received at the meter's antenna terminal and its frequency measured (by comparison with the meter's own signal).

I hadn't intended to digress so far on the subject of the LM21. But the fact is that the instrument is a very valuable tool for the antique-radio restorer. These instruments still turn up in surplus catalogs, and are very commonly found at hamfests and other electronic flea markets. You'll usually find them at very reasonable prices because they are so under-appreciated and (I have to admit it) ugly. When considering the purchase of an "LM" frequency meter, check to see that the calibration book is present and that its serial number matches that on the frequency meter itself. The books are not interchangeable.

The government power supply, with the necessary interconnecting plugs and cables, should also be part of the deal. A manual would help, too. And after you get your meter home, take it apart and see if the reference crystal inside (this is a replaceable plug-in unit) is in a seamless, hermetically-sealed case. The accuracy of non-hermetically-sealed units can't be trusted. If you're in doubt about yours, use it to set up your meter on one of the WWV frequencies or on the known frequency of a local radio station. Pick up the frequency meter signal on a receiver tuned to one of those stations and check for zero beat. If you hear any kind of a whistle, even a slow "growling" noise, your crystal may be off.

One good mail-order source to check for crystals, manuals, interconnecting plugs, and even the frequency meters and power-supplies themselves is Fair Radio Sales, 1016 E. Eureka St., Lima, Ohio 45802.

RESULTS OF THE ALIGNMENT

I started the alignment, as is standard procedure, with the IF channel. The LM21 was set to the manufacturer's specified IF frequency of 455 kHz, and its output coupled into the Sky Buddy by wrapping the wire from the meter's antenna terminal a couple of times around the body of the 6K8 oscillator-mixer tube (grid cap removed). I was readily able to hear the LM21's signal in the Sky Buddy's speaker and to observe a reading on the audio voltmeter I had connected across the speaker's voice-coil leads.

One Cool Drawing Tool

Visio, a superb new drawing program, is my nomination for the best new Windows application of the year. Visio was developed by a company called Shapeware, which was started by several of the founders of Aldus Corp. (of PageMaker fame). What makes Visio so great is its user-centered focus. Visio uses direct representations of everyday objects to achieve simplicity of use, but has an object-oriented underpinning that allows advanced users and corporate managers to customize its behavior extensively. I predict a huge success for this program, as well as a rash of imitators that are certain to follow.

Traditional CAD, presentation, and drawing packages (e.g., AutoCAD, Freelance, and Designer, respectively) typically provide tools for creating primitive geometric shapes (lines and arcs, rectangles and ellipses, and so on), and manipulating them. That's great for mechanical engineers, draftpersons, and professional illustrators. But those of us who lack the time, talent, or inclination have long needed a higher-level approach. Visio provides that approach—brilliantly, yet simply.

The program lets you add shapes of arbitrary complexity to your drawings simply by dragging them from a stencil and dropping them where desired in your drawing. Visio comes with more than a dozen stencils with useful shapes for creating flow charts, network diagrams, block diagrams, office layouts, and more. You can customize the builtin stencils, purchase additional ones, and/or create your own.

By way of analogy, consider house building. The traditional approach gives you raw materials: wood, concrete, and the like, and wishes you good luck, Visio. On the other hand, gives you high-quality prebuilt doors, windows, and fixtures. You can build a house either way, of course, but the Visio approach takes you farther faster.

Inside Visio

A Visio drawing consists of a foreground page and zero or more background pages. The background pages can be shared among several foreground pages; a Visio drawing file can contain multiple foreground and background pages. You can associate a template with a drawing. A template contains page setup information: text, line, and fill styles; a link to a stencil file; a color palette; and more. You can convert among drawings, templates, and stencils quite easily, which simplifies the process of creating your own templates and stencils.

A Visio drawing contains one or more objects (line, rectangle, arc, ellipse, or complex shape). You can create objects from scratch (the wood and cement approach), or drag and drop them from a stencil; you can also have several stencils open at once. Visio objects are intelligent. Each object has an associated ShapeSheet—i.e., a spreadsheet that specifies various aspects of that object's behavior.

Some behavioral characteristics are simple; others are complex and based on attributes of the object itself, other objects in the drawing, and mathematical formulae. For example, you can specify line width, text font, and ability to be resized. One sample object is a grid that does not change relative row heights and column widths, but actually adds rows and columns as you resize it. Other shapes grow and shrink as you add text to them.

In addition, Visio objects have connecting points to which you can glue other objects. For example, you could create a network diagram by dropping several computers, servers, hubs, and printers into a drawing and connecting them by drawing lines or using the auto-connect feature. You could subsequently move the symbols around, and the connecting lines would resize and move to maintain the connections. How many times have you re-
drawn connecting lines when the computer could have done it for you? What a great feature!

Another extremely useful feature of Visio is the master shape. After you drop a shape from a stencil onto a drawing, the connection between the two is lost. However, each drawing maintains its own local stencil that contains one copy of every object in the drawing. By changing the master shape, you change every copy in the drawing. You can change line width, text font, color scheme, and any other attribute in that way.

**OTHER FEATURES**

Like traditional drawing programs, Visio includes tools for grouping, ungrouping, aligning, and rotating objects to any arbitrary angle. You can also include bitmaps in a Visio drawing; and you can use DDE and OLE to link Visio drawings to documents in other applications, as well as objects from other applications to Visio. You can also import and export files in several common formats (CGM, DXF, PCX, TIF, and Macintosh PICT).

Visio borrows several ideas from Microsoft's Word for Windows, including the template concept, retention of descriptive information about a drawing (title, subject, creator, keywords, and description) and fields. A field is a textual place holder for some value that gets updated dynamically. For example, print date and time, object name and ID, and line length. The latter gives you the ability to create mechanical drawings with automatic dimension lines. And the program supports scaling and automatic dimensioning in common units (e.g., 1 inch = 1 foot).

Visio also includes several traditional tools for creating and manipulating geometric primitives. One cool tool is the pencil, which uses Shapeware’s gesture-recognition technology to decide whether you’re drawing a straight or curved line. Another is the rubber stamp, which allows you to drop instances of an object as fast as you can drag and click. Features like that make using this program a joy.

**USER INTERFACE**

I’ve always admired PageMaker’s user interface, and Visio continues the tradition—although I do miss the floating tool palette. In addition, some of the keyboard shortcuts are random. On the other hand, multi-level undo and redo are very useful. My biggest complaint with the software is the limited number and method of specifying line widths (except in a ShapeSheet). You may specify line widths only in units of 1, 3, 5, 9, 13, or 17 pixels. Unfortunately, the relationship between “pixels” and common real-world units (e.g., points) is unspecified. However, given Visio’s overall strength, I can easily live with that limitation.

So who is a good candidate to use Visio? Anyone who needs to create drawings out of standard components. Visio can’t do what CorelDraw or Adobe Illustrator can do for highly stylized, one-of-a-kind drawings. But for anyone in a technical discipline, this is a must-have program.

**Earn Your B.S. Degree in ELECTRONICS or COMPUTERS**

**By Studying at Home**

Grantham College of Engineering, now in our 43rd year, is highly experienced in “distance education”—teaching by correspondence—through printed materials, computer materials, fax, and phone.

No commuting to class. Study at your own pace, while continuing on your present job. Learn from easy-to-understand but complete and thorough lesson materials, with additional help from our instructors.

Our Computer B.S. Degree Program includes courses in BASIC, PASCAL and C languages — as well as Assembly Language, MS DOS, CADD, Robotics, and much more.

Our Electronics B.S. Degree Program includes courses in Solid-State Circuit Analysis and Design, Control Systems, Analog/Digital Communications, Microwave Engr, and much more.

An important part of being prepared to move up is holding the right college degree, and the absolutely necessary part is knowing your field. Grantham can help you both ways—to learn more and to earn your degree in the process.

Write or phone for our free catalog. Toll free, 1-800-955-2527, or see mailing address below.

**LM3909 Applications**

This time around, I'd like to share with you a number of circuits based on the LM3909 oscillator/flasher, an 8-pin IC that was originally designed to flash LED's from a low-voltage source while using very little energy. The LM3909, an efficient low-voltage oscillator, requires only a single external timing capacitor to get it oscillating, and can be operated from any DC power source that falls in the range of 1.5 and 6 volts. Once activated, the IC will continue to operate until the supply voltage drops to about 1 volt. Its power requirement is so low that a single C-cell battery will flash an LED for over a year.

**DUAL LED DRIVER**

Figure 1 shows a circuit in which the LM3909 is used to drive a pair of series-connected LED's. In that circuit, C1 (a 470-µF capacitor) sets the operating frequency of U1's internal oscillator to about 1 Hz; a 100-µF unit would increase the frequency to about 14 Hz, and a 47-µF unit would push the operating frequency to about 20 Hz. Larger capacitor values can be used to lower the circuit's oscillating frequency.

The circuit's power source can be 3 to 5 volts with two LED's, and as low as 1.5 volts with only one. The average operating current for the circuit is less than 1 mA.

**LIGHT/SOUND CIRCUIT**

Figure 2 show another application of the LM3909, wherein it is used to drive both an LED and a speaker. In that circuit, each time that LED1 blinks, SPKR1 (an 8-ohm speaker) gives out a sharp tick. When S1 is placed in the fast position, the LM3909's internal timing resistor is shorted out, causing the oscillator's frequency to increase by more than two to one. You can experiment with different values of electrolytic capacitors to obtain a desired frequency.

**VARIABLE AUDIO-FREQUENCY OSCILLATOR**

Our next circuit, see Fig. 3, shows a variable audio-fre-
However, timing capacitor's lower frequency can tor. with a given resistors (pin actually two by upper-frequency the value of rent-ohm speaker through frequency functions (which functions he Fig. +3

frequency oscillator built around the LM3909. In that circuit, the output of U1 at pin 2 is used to drive an 8-ohm speaker through R2 (which functions as a current-limiter).

A pair of internal timing resistors set the oscillator's lowest attainable frequency with a given timing capacitor. Therefore, the oscillator's frequency can only be lowered by increasing the timing capacitor's value. However, the frequency

---

**PARTS LIST FOR THE VARIABLE AUDIO-FREQUENCY OSCILLATOR**

| U1 | LM3909 LED flasher/oscillator, integrated circuit |
| C1 | 0.47-µF, ceramic-disc capacitor |
| R1 | 4700-ohm, ½-watt, 5% resistor |
| R2 | 47-ohm, ½-watt, 5% resistor |
| R3 | 50,000-ohm potentiometer |
| SPKR1 | 8-ohm, 4-inch speaker |

**ADDITIONAL PARTS AND MATERIALS**

Perboard materials, enclosure, 3–5-volt power source, wire, solder, hardware, etc.

---

**PARTS LIST FOR THE ELECTRONIC SIREN**

| U1 | LM3909 LED flasher/oscillator, integrated circuit |
| R1 | 100-ohm, ½-watt, 5% resistor |
| R2 | 47-ohm, ½-watt, 5% resistor |
| C1 | 0.15-µF, ceramic-disc capacitor |
| C2 | 470-µF, 16-VWDC, electrolytic capacitor |
| S1 | Normally open pushbutton switch |
| SPKR1 | 8-ohm speaker |

**ADDITIONAL PARTS AND MATERIALS**

Perboard materials, enclosure, 3–5-volt power source, wire, solder, hardware, etc.

---

**PARTS LIST FOR THE CODE-PRACTICE OSCILLATOR**

| U1 | LM3909 LED flasher/oscillator, integrated circuit |
| C1 | 0.2-µF, ceramic-disc capacitor |
| R1 | 47-ohm, ½-watt, 5% resistor |
| S1 | Morse-code key |
| SPKR1 | 8-ohm speaker |

**ADDITIONAL PARTS AND MATERIALS**

Perboard materials, enclosure, 3–5-volt power source, wire, solder, hardware, etc.

---

**CODE-PRACTICE OSCILLATOR**

With only a minor circuit change, the basic LM3909 oscillator configuration can be turned into a code-practice oscillator. Refer to Fig. 5. With a key switch (S1) added to the basic circuit and the right timing capacitor, the circuit can be made to produce the desired tone. The circuit can be powered from a pair of AA batteries.
batteries (which will run the circuit for a good while) connected in series. And since there’s no battery drain when its not in use, an on/off switch isn’t required for this circuit.

**LAMP PULSER**

In Fig. 6, the LM3909 is configured as a timing oscillator, whose output is used to pulse a 117-volt AC lamp on and off. The pulsed output of U1 is fed to the input of U2 (an MOC3010 optoisolator/coupler), causing its internal LED to turn on in time with the signal’s positive alteration. Light from the internal LEDstriking the output device (in this case, a Triac driver) causes it to be turned on and off in time with the oscillations of U1. That, in turn, feeds a pulsed signal to the gate of TR1 (a 6-amp, 200-PIV Triac), causing that Triac and U1 (a 100-watt lamp) to turn on with each positive-going transition of the oscillator signal.

The circuit can easily handle three 100-watt lamps; by heat sinking the Triac, loads of up to 6 amps may be controlled. As before, the oscillator’s output frequency can be changed by varying the value of capacitor C1.

Take a close look at the LM3909 circuits and see if you can incorporate one into a future project or you might consider spending an hour or two trying out one or more of the circuits just for fun. In any case, I believe that you’ll find the LM3909 a very versatile and useful device.

Well, that’s about all the space allotted to us for this month, but be sure to join us again . . . “same time, same station.”

---

**PARTS LIST FOR THE LAMP PULSER**

U1—LM3909 LED flasher/oscillator, integrated circuit

U2—MOC3010 optoisolator/coupler with Triac driver output, integrated circuit

TR1—6-amp, 200-PIV Triac

R1—180-ohm ¼-watt, 5% resistor

C1—100-µF, 16-VWDC, electrolytic capacitor

II—100-watt AC lamp (see text)

**ADDITIONAL PARTS AND MATERIALS**

Perfboard materials, enclosure, IC sockets, 3–5-volt DC power source, AC molded power plug with line cord, wire, solder, hardware, etc.
As I promised last time, I'll continue to describe the key differences between the bipolar-logic and CMOS-logic families. This month, I'll also present some pinewood-derby circuits submitted by participating readers.

To quickly review, I've already pointed out that bipolar devices are driven by current, while CMOS devices respond to voltages. That allows CMOS devices to operate over a range of power-supply voltages, while bipolar circuits can only be designed to operate at a specific supply voltage (5 volts is the established standard).

That fact also forces the voltage ranges used to represent bipolar highs and lows to be rigidly defined, while CMOS highs and lows are defined as percentages of the supply voltage. As you'll see, the difference in power-supply requirements is directly or indirectly responsible for almost all the other differences between the two families as well.

For example, since a bipolar device depends on significant current to operate, by Joule's Law, a bipolar IC will generate more heat than a similar CMOS circuit operating at the same speed with the same supply voltage. That also means the transistors in bipolar-logic circuits must be spaced far enough apart to keep them from affecting one another or even causing a catastrophic break down. That, in turn, limits the amount of bipolar circuitry that can be crammed into an IC package.

While there are similar limits for CMOS circuits, those limits are much broader, so much more CMOS circuitry can be crammed into the same IC package. Furthermore, the FETs in CMOS chips are physically simpler and thus smaller than bipolar transistors. As a result, CMOS circuits can be designed smaller still.

Since bipolar ICs consume more current and generate more heat than CMOS units, they also require more power. On the plus side, though, that also means that bipolar-logic circuits are capable of handling significant current. Therefore, depending on their architecture (which we won't discuss now), bipolar circuits can generally provide more output current than CMOS circuits.

There are two other key drawbacks to CMOS circuits: speed and sensitivity to electrostatic discharges (ESD) or electric shocks. While ESD damage can be prevented by observing good handling procedures (such as grounding all nearby objects and people in a workshop to create a "static-free environment"), little can be done to overcome the speed limitations of a true CMOS circuit. When you consider all the great advantages of CMOS circuits, it seems a shame that one of their shortcomings is so significant (think about it—operational speed is the one thing we demand from a logic circuit).

Fortunately, IC designers have struck a compromise between bipolar and CMOS logic, resulting in hybrid IC's—circuits that are a combination of bipolar and CMOS components. Such designs seek to minimize the disadvantages of both families by combining their strengths. A rather elegant compromise that we'll explore in more depth in a later issue.

**DESIGNATIONS**

The only difference between the two families that is not based on their power-supply requirements is how they are designated; the designation for TTL chips have the prefix "74," while CMOS chips have the prefix "4." Often there is a letter or two before a prefix that represents the manufacturer. For 74-series chips, there might also be a couple of letters immediately following the 74 that tells you the chip's architecture. The numbers that follow all that tell you the
The functional chip. There may be up to three additional letters or a letter and a number following the designation that tell you more detail about the chips inputs, outputs, and/or package style.

For example, consider the designation AM74S182-S3. The letters "AM" indicate the chip was made by Advanced Micro Devices, the "74" tells you the device is based on bipolar transistors (as opposed to FETs), the "S" stands for "Schottky" architecture (which we won't get into yet), the number 182 indicates the chip is a look-ahead carry generator, and the "S3" indicates that the chip has low-leakage outputs (which we'll also discuss at some other time).

Now let's turn our attention to the reader mail. As mentioned, the letters all deal with pinewood-derby circuits.

**THE WINNER IS ...**

The enclosed circuit (see Fig. 1) was developed on request to determine the winner in close races of a pinewood derby. A bridge over the track (see photo) was constructed to support the infrared LED's (LED1–LED4) and the winning-car lights (11 and 12). The two pairs of LEDs are aimed down at two IR phototransistors (Q3 and Q4), each of which is embedded in a lane of the derby. When a car moves down a lane and passes under the bridge, it momentarily prevents the IR from reaching its corresponding phototransistor.

Pins 1 and 13 of U2 are held at a logic 1 whenever the IR detectors are illuminated by the IR LED's. The 1's are inverted by U2-a and U2-b and the resulting logic 0's are applied to pins 1 and 5 of U1. Since those pins are low, the outputs of those gates (pins 3 and 6) will be at logic 0 regardless of the logic of pins 2 and 4. Those outputs (pins 3 and 6), thus keep transistors Q1 and Q2 off, so the indicator lights remain off.

If a car interrupts the IR beam of lane 1, pin 1 of U2-a is pulled to a logic 0 by
R1, and pin 2 produces a logic 1 that is passed to pin 1 of U1-a. Since there was already a logic 1 on pin 2 of U1-a (provided by U1-f which inverts the output of U1-o), U1-a's output goes high. That turns on Q1, allowing the indicator lamp for lane 1 to light, declaring the winner.

The output of U1-a is inverted by U2-e and the logic 0 produced is applied to pin 4 of U1-c. The car coming in second on lane 2 results in a 1 being applied to pin 5 of U1-c. However, since pin 4 is at a logic-0 level and pin 5 is at a logic-1 level, pin 6 of U1 will also be at a logic-0 level. So the signal at pin 4 has locked out the signal from the second car (lane), preventing its light from coming on.

The cross coupling between the indicator circuits allows the circuit for the winner's lane to lock-out the data from the losing lane when the winning car is in lane 2 also. So there can only be one indicator light on at a time.

Capacitor C4 provides a pulse on power-up to ensure that when the unit is turned on neither light comes on. The switch (S1) marked "clear" is a momentary pushbutton that is used at the end of each race to extinguish whichever light is on and prepare the circuit to judge the next race.

—Roy R. Worrall, Ocala, FL

Definitely a very stable design. I like the use of the diode pairs (like D6/D8) that act like or gates to reduce the number of chips used. The circuit can be simplified further if U2 is dispensed with. To accomplish that, the phototransistors should be swapped with their current-limiting resistors, C4 and S1 should be swapped with R4, and U2-e and U2-f should be replaced with inverting transistor circuits.

**PUSHY SOLUTION**

Although it is unfair to the other writers of this great magazine, the first sections I look at when *Popular Electronics* arrvies are "Think Tank" and "Circuit Circus." I've been on an off subscriber to the magazine since the 1950's. I designed one of the simplest circuits to determine which of a group of pushbuttons was pressed first (see Fig. 2). Using one resistor and one neon lamp per player (or whatever will activate the switches), only the first switch closed will light its lamp. The characteristics of the neon lamp, requiring 60 to 100 volts to ignite and very little current, make this simple circuit work. (If a low-voltage neon lamp is used, put two lamps in series. Otherwise use a larger value resistor.) The first switch closure ignites the appropriate lamp, and after that happens there is insufficient voltage to fire any of the others. Have fun with this one!

—Tom Karg, Oil City, PA

Thank you for such a fan of the column. As you surely know, your circuit can be readily adapted for pinewood derby use. One simple method for doing so would be to mount a small magnet on the underside of each car and replace the pushbutton switches with reed switches embedded in a car lane. With that done, when a car passes over a reed switch, its magnet will activate the reed switch, lighting the appropriate lamp.

**QUICK-DRAW MCGRAW**

Quick Draw McGraw is a game of agility. The object of the game is to prevent your opponent from lighting the LED on your side of the circuit before you light his (see Fig. 3). When you yell "draw," the first one to press his or her switch (S2 or S3) wins the contest. The results are registered by LED1 or LED2.

To make the game even more exciting, you can try replacing S1 with a pair of contacts located on the surface of a channel wide enough to accommodate a ball bearing. When a ball bearing rolls down the channel and completes the circuit, you go for your trigger switch. Or you can leave S1 closed and hold both S2 and S3 closed. The first one to release his switch wins the game.

—Nolan Friedland, Cambridge, MN

Note the cross coupling between the circuitry for each player. That duplicates the cross coupling in the circuit of Fig. 1; albeit, this circuit is much simpler in execution.

Now let's change pace just for a moment to address a request from a reader.

**A NEED**

Every year my community has a pinewood derby for the kids. The children are given a standard block of wood, from which they carve a car of their own design. Unfortunately, as each "heat" proceeds, it becomes increasingly difficult to judge which car is the winner.

We have six cars racing at a time. What I need to find is a way to electronically judge and display first through sixth place. It doesn't need to be anything fancy, a simple light on each lane would suffice. Do you have any schematic diagram of a circuit that might do the job or have any suggestions?

Any help that you or your readers can provide would be greatly appreciated.

—Stephen Guye, Galt, CA

It's really nice that you take such a vested interest in your community and its youth. It's paradoxical to note that electronic technology, which has made the world a smaller place (with FAX's, satellites, TV etc.), has taken a little of the friendliness out of most communities (folks are too "busy" thanks to TV VCR's, video games, at-home shopping, etc.). I suppose, it only makes sense to use electronics to set things straight by bringing people together again.

I'm sure Stephen is not alone in his quest, so if anyone out there can help him, please send your comments or plans to this column. I'll try to group the responses together and dedicate a column to two or the circuits.

All of the contributions that fit Stephen's criteria and appear in these pages will be rewarded with a special MCL1010 chip, mentioned back in my first column (April 1991). Of course, you will also receive the usual book.

That's all until we get together next time. In the meantime, if you have other circuits, comments, or questions please address them to: Think Tank, *Popular Electronics*, 500-B Bi-County Blvd., Farmingdale, NY 11735. If your letter appears in Think Tank, you'll receive a book from our big pile.
By Don Jensen

What’s In the Future For Shortwave Broadcasters

Where do the big boys go? What do they do now? That’s a question that many of the world’s major shortwave broadcasters are asking themselves these days. For decades, many of the large international shortwave defined themselves—and when it came to funding, justified their existence—in Cold War terms.

Ironically, the dismantlement of the Iron Curtain, break-up of the Soviet Union, and the democratization of Eastern Europe changed all of that. In years gone by, broadcasters like the Voice of America, the BBC, and Radio Free Europe battled the Iron Curtain’s jamming of their signals. Ironically, not long ago Bulgaria, once one of the most vehement of radio’s “cold warriors,” announced that it hopes to lease air time to western commercial broadcasters on two surplus shortwave transmitters, which once were used only for jamming.

To address these concerns, a few months ago the Voice of America convened a gathering of some 100 international broadcasters in Washington D.C. The New York Times reported that Robert Coonrod, deputy director of the VOA, summarized the conference by saying it “helped us to think through how to present ourselves to our own societies, and explain why what we do is important.”

Explaining themselves, and their importance, to homefolks has become a necessity for shortwave broadcasters in the post-Cold War era. In the “good old, bad old” days, most Western governments were more than willing to fund expensive international SW services to counterbalance extensive and powerful propaganda broadcasts from behind the Iron Curtain.

Today, though, that battle of the airwaves has been won. In some ways, western shortwave operations are victims of their own successes. Taxpayers in many countries are now asking why they should continue to finance their foreign SW services.

The broadcasters’ conference in Washington responded, calling attention to the need to continue broadcasting to areas of ethnic conflict and political turmoil, the New York Times article recounted. Longtime and well-known shortwave-broadcasting consultant George Jacobs told the gathered station representatives that their programming during the past decades had been vital. Western broadcasters, he said, had taught people in the former Communist nations how to take apart the old economic system. “Now they’d like to hear how to put it together,” Jacobs said.

Another reason for continuing international broadcasting, said Susan Roehm of Radio Free Europe/Radio Liberty, is that SW radio from the West often still acts as “a stabilizing element in the lives” of listeners in areas of unrest, such as Uzbekistan and Tajikistan, which was set adrift with the fall of the USSR.

But the big international stations are looking at different ways to get their programming to audiences in developing nations such as those, and, in general, to listeners around the world. Not far in the future, many observers believe that direct satellite-transmission systems will deliver these programs to foreign listeners. At the moment, more and more of the major international stations are leasing time on ex-Soviet and Eastern European shortwave transmitters to get better audience penetration in these areas. But the Times also reports that international broadcasters, large and small, are faced with competition from
Shelby, Frederick, MD, reports in the "WDXC Contact" that phoneticist Arthur Lloyd James lectured BBC announcers on the subject, leading to a request for a full-time pronunciations adviser. A committee on spoken English was established, which, over the years, included the likes of dramatist George Bernard Shaw, poet Robert Bridges, and other world-class writers.

The group also had language scholars, phonics professors, Shakespearean actors, and other notable experts. Eventually the committee grew to more than 30, an unmanageable number. Today, the Pronunciation Research Unit has a staff of three linguists and a clerk, led by Graham Pointon, who used to lecture on English phonics at a Norwegian university, Shelby says.

The office deals mostly with the pronunciations of foreign names that pop up in BBC newscasts. It keeps an index of a quarter million entries (phonetically sounding out the names), with additional cards added each week as new places and personalities crop up in the news. The rule of thumb on pronouncing names, Shelby says, is to ask the owner whenever possible, even when, as it happened, a person is a convicted criminal.

Traditional world-band radio will not be phased out, said the VOA's Myrna Whitworth. In the event of political upheavals anywhere in the world, local AM/FM stations can be forcibly shut down. Experienced listeners know that those stations usually are the first targets of both revolutionary hotheads and reactionary dictators. Shortwave, Whitworth said, remains a reliable broadcasting tool since news and information programming that originates from outside the affected area can still get through. The coming century will bring real challenges to broadcasters, but shortwave radio, doubtless, will continue to have a major role.

What do you think world-band broadcasters should do in the years ahead? Should they emphasize news to a greater extent? Has shortwave a greater role to play in education, world culture, or tourism? Specifically, what types of programs—or program formats—would you prefer to see developed or expanded? Drop me a note with your thoughts on shortwave's future. I'll include the best ideas in a forthcoming column. The address, as always, is Don Jensen, DX Listening, Popular Electronics, 500-B Bi-County Blvd., Farmingdale, NY 11735.

THE BBC'S NEW MAG

For many years, SWL's who are special fans of the incomparable British Broadcasting Corporation programs have subscribed to its program guide known as "London Calling." It was, frankly, the best way to insure that you didn't miss any of the fascinating informational, entertaining, dramatic, or musical programs aired on BBC's all-English-language World Service on shortwave.

The 28-page monthly disappeared last fall! However, it is not dead. The familiar London Calling was simply folded into a new 100-page magazine called "BBC Worldwide." A preview by Dan Smith, writing in the "World DX Club bulletin," says the new BBC's magazine is not only larger, but "much brighter and nicer to read."

As usual, readers will find listings of specific BBC programs scheduled for the month ahead, program highlights, five pages of frequency charts telling listeners where to tune, plus summary details of other language services. There are also numerous articles related to BBC programming. An early issue included features on Cuba, composers Gershwin and Kern, collecting news items on audio tape, sports events, a semi-technical article on sunspots, science and popular culture stories, plus book reviews, a crossword puzzle, and letters from readers.

DOWN THE DIAL

Looking for some interesting listening on shortwave? Try these.

BHUTAN—5,025 kHz. Bhutan Broadcasting Service is a very difficult catch in much of North America, but it has been heard in California from 1410 until its 1450 UTC sign off, with popular music and English news.

GUATEMALA—3,380 kHz. Radio Chorus broadcasts all in Spanish, but if you enjoy lots of the lifting marimba music so typical of Central America, try this station from around 0230 to its 0300 UTC sign off.

LEBANON—6,543 kHz. Voice of Lebanon broadcasts in both Arabic and French. It has been reported here with Arabic music, advertisements, and identifications from about 0335 UTC.

UNITED ARAB EMIRATES—11,945 kHz. Radio Dubai can be heard with its English program from 0328 until 0355 UTC. If that frequency doesn't work for you, try one of these alternatives—13,675, 15,400 or 15,435 kHz—airing at the same time.

*Credits: E. Newbury, NE; Mike Westdal, CA; Hans Johnson, MD; Scott Newman, NY: North American SW Association, 45 Wildflower Road, Levittown, PA 19057; World DX Club, c/o Richard D'Angelo, 2216 Burkey Drive, Wyomissing, PA 19610.
For a long time, ham operators have delighted in "loading up" nearly anything they think might radiate a signal. Loading up basically means that some method is found whereby the impedance of some strange object can be matched to the output of the transmitter. In the vacuum-tube days, pi-net-work output circuits made it easy. Even today (when a rig's outputs are untuned), an antenna-tuning unit (ATU) can be used to match very odd impedances. And what kind of strange "antennas" have been loaded up? Loaded bedsprings were popular in the 1930s.

In about 1963, I participated in a hidden-transmitter hunt in Norfolk, VA where the "fox" (hidden mobile unit) loaded up a long chain-link fence around a factory lot. And the year before, I was told that the same character had loaded up the railroad tracks on 75-meters!

Many amateur radio and other stations use rotateable beam antennas mounted on three-sided towers, which typically range in height from 30 to 120 feet. In my locale, towers of 30 feet, or less than three feet above the roof line (whichever is taller) can be erected without a permit, as long as they are attached to the house and are located so that they will not fall onto power lines or across the property line in a catastrophic failure. Higher towers must be erected under permit and properly inspected by the county.

The towers typically support a two or more element (three is popular) Yagi/Uda beam antenna, quad, or some other highly directional antenna. But the tower itself can also be treated as a vertical antenna under the right circumstances.

If the tower is close to 66-feet high (which is a popular height for amateur-radio towers), then the tower is already 1/4λ at 75/80 meters, so it can be used as a resonant vertical on that band. The same tower can also be used on lower frequencies if the proper antenna-tuning unit (ATU) is provided.

RADIO TOWERS

Figure 1 shows a situation in which an 80- to 110-foot tower—which is considered a random length, vertically polarized, Marconi antenna—is insulated from ground. Like other such antennas, it is fed using a simple L-section or reverse L-section ATU. Note the configuration of the circuit and approximate values of the inductor and capacitor used in each configuration.

On the 40- and 75/80-meter versions, the tower is too long, so a series capacitance and shunt inductance are used for the ATU (i.e., reverse L-section coupler). But, for 160-meters, the tower is too short, so the inductor and capacitor are reversed. There is only one small problem with the design illustrated in Fig. 1: insulated towers are expensive to buy and install compared to grounded towers. In addition, lightning protection is probably better in the grounded tower.

So how do we load up a grounded tower? See Fig. 2. Note that in that illustration, the tower is grounded at its base. If the tower is mounted to a concrete pedestal (the usual arrangement), then a separate ground rod and ground wire adjacent to the pedestal must be provided. (Concrete is not a good insulator, but it is not a good conductor either). A delta-feed system (a single wire from the ATU connected to a point on the antenna where an impedance match can be achieved) is normally used with such an antenna.

It is important that the ATU be placed away from the tower base (as shown) and that a wire be run straight to the antenna feedpoint. That system is an example of several possible shunt-feeding systems.

Fig. 1. This 80- to 110-foot tower (considered a random length, vertically polarized, Marconi antenna) is insulated from ground, and is fed using a simple L-section or reverse L-section ATU.

Fig. 2. This 80- to 110-foot tower is grounded at the base. If the tower is mounted to a concrete pedestal, a separate ground rod and ground wire adjacent to the pedestal must be provided. A delta-feed system is used.
the tower-lowering mechanism.

SAFELY ERECTING A TOWER

Radio towers are dangerous devices, and care should be used when working on them. Always use the "buddy system" and work with one or more friends.

Always use a safety belt when on the tower. And always make sure that the tower will not fall over power lines, structures, or your property line if it gets away from you. Follow all of the manufacturer's recommendations; they are good sources of advice about their products. And be sure to obey all local codes, rules, regulations, and laws.

If you have a slip up tower, and intend to climb it (whether in retracted or extended positions), place a safety bar in it (as shown in Fig. 3) to prevent it from slipping (and possibly cutting off your arms and/or legs), even if the tower has locking features. Locking features can fail. The safety bar used in Fig. 3 is a 1-to-3-inch hard steel, thick-wall section of pipe placed so as to prevent the tower sections from slipping (collapsing).

That's all for now; see you next month. In the meantime, if you want to know more about towers and antenna-tuning units, you might want to obtain my books "Receiving Antenna Handbook" (HighText Publications, 7128 Miramar Road, #15, San Diego, CA, 92121; Tel. 619-693-5900) and "Practical Antenna Handbook" (TAB/Mc-Graw Hill, Blue Ridge Summit, PA 17294; Tel. 800-233-1128).

If the tower is a tilt-over or slip-up type, then it might be a little difficult to excite it with RF power because the mechanism that makes it tilt or slip is discontinuous electrically. Those towers are quite popular, even though costly, because they allow the antenna to be worked on at or near ground level, rather than up in the air. They allow you to run a wire across the junction or up the entire length of the tower. You simply have to make sure that the wire clears and does not interfere with
When the Realistic PRO-43 handheld scanner came out, it was hailed by many aficionados as the most wonderful thing since the discovery of the Doublestuf Oreo. The 200-channel deluxe handheld covers virtually all bands, including the 225–400-MHz UHF aeronautics band (used by the military). While all of that is great, not every scanner owner is interested in the UHF aeronautics band.

Radio Shack's answer is the Realistic PRO-39 handheld scanner. It is a deluxe scanner with features very similar to the PRO-43, but there are two major differences. First, the PRO-39 doesn't include 225–379.995 MHz in its coverage. Second, at $299.95, it sells for $50 less than the PRO-43. Otherwise, the two units have a lot in common.

The PRO-39 covers 30–54, 108–174, 380–512, and 806–960 MHz (minus the cellular bands). The 200-channel (10 banks of 20 channels) scanner features HyperScan (25 channels-per-second scan/50-cps search), two-second scan delay, priority channel, a backlit LCD readout, a flexible antenna with BNC connector, and a belt clip. The PRO-39 will retain its memories for an hour after the batteries are removed. It uses six "AA" batteries, or it can take rechargeable types.

The Realistic PRO-39 is a fine scanner. For those who like the PRO-43, but don't figure to get any use out of the UHF aeronautics band, the PRO-39 is definitely the scanner to investigate as a very suitable replacement. It performs just as nicely as the PRO-43 on the bands that they have in common.

Your nearest Radio Shack has the PRO-39 right on the counter.

WON'T ACCEPT PROGRAMMING
Readers regularly write to report being baffled by the fact that some scanners refuse to accept the frequencies that they try to program in. That happens most often when a frequency with four digits after the decimal (such as NASA's 173.6875 MHz) is attempted. The scanner might take the frequency, but it shows up on the display as 173.685 MHz.

At that point, they become frustrated and think that they did something wrong, only to realize that any similar frequency they attempt to program in won't be accepted that way. Some scanners, especially handhelds, "round off" all entered frequencies to the nearest 5-kHz point. If the frequency is something like 155.88 or 154.325, it will be accepted "as is." It is only when stations operate on frequencies between the 5-kHz points that some scanners balk at the programming.

Scanner owners then fear that they won't pick up the communications on those frequencies because of their rebellious radios. That is not a real problem, however. The frequency that the scanner is displaying can't be more than 2.5 kHz from the frequency that it had refused to accept as programmed. FM signals are 16-kHz wide, which means that they extend at least 7-kHz above and below their center assigned frequency. With the scanner tuned a mere 2.5 kHz away from the center frequency, any sig-
nals that occur there still will be heard normally, without suffering from the very slight detuning.

**FEDERAL FREQUENCY DIRECTORY**

The new eighth edition of the Top Secret Registry of U.S. Government Radio Frequencies is out. This is the book, the standard reference to federal agencies such as the FBI, DEA, Customs, Secret Service, BATE FCC, FAA, Immigration, Treasury, Border Patrol, Marshals, EPA, NRC, USPS, GSA, CIA, State Department, national parks, and other agencies. It also has Canadian federal listings. It has complete UHF aeronautical (225–400-MHz) band listings, and U.S. military listings, now worldwide. It has CTCSS tones, paging, bug, and vehicle-tracking frequencies, plus a lot more! This huge, 268-page, professional-grade monitoring directory is relied upon by law-enforcement agencies, private-security personnel, the news media, the communications industry, and the leading scanner monitors.

If your local communications dealer doesn't carry the book, order it from CRB Research Books, P.O. Box 56, Commack, NY 1172. It costs $21.95 plus $3.50 shipping ($4.50 Canadian). Residents of NY state must add $2.45 sales tax. Phone orders are accepted weekdays (except Wednesday) from 10:00 AM to 2:00 PM EST at 516-543-9169; 24-hour fax: 516-543-7486.

**TV TIP**

Mike Giamportone, of Marysville, MI, reminds readers that if they place their scanners into WFM mode, they can pick up the audio of TV channels. TV Channel 2 comes in on 59.75 MHz, Channel 3 on 65.75 MHz, Channel 4 on 71.75 MHz, Channel 5 on 81.75 MHz, Channel 6 on 87.75 MHz, Channel 7 on 179.75 MHz, Channel 8 on 185.75 MHz, and Channel 9 on 191.75 MHz were the examples he passed along.

While Mike's idea might sound a bit odd, last week I had to drive somewhere at night and missed an important program that I wanted to catch. I took Mike up on his concept and programmed the TV station's audio channel into my mobile rig. I had no video, but all I missed was seeing Marge's blue hair and Bart's crew cut.

**MORE MAIL**

From M.J.C., Registered Monitor KCA6BH, of Glendora, CA, sent along some frequencies of interest. Glendora Police are on 154.845, local government on 153.86, and Fire Dispatch on 470.5375. He also has the Pasadena Police on 482.3375, with the Fire Department on 153.89. West Covina Police are on 506.3375 MHz and Fire Department on 156.165 MHz. Montebello Police use 482.2125 MHz.

Zeb Morris, of Marion County, AL, advises that the Haleyville Police are now on 154.74, 155.64, and 460.025 MHz, with the Fire Department using 154.13 MHz. The Sheriff uses 155.625 and 158.955 MHz. Ambulances are on 155.16 MHz in the area, with hospitals using 155.34 and 158.895 MHz. The Bear Creek Police use 155.01, 155.055, and 155.64 MHz, with the Fire Department on 154.13 MHz.

Be with us next month. Send in your frequencies, questions, ideas, and scanner-related material to Scanner Scene, Popular Electronics, 500-B Bi-County Blvd., Farmingdale, NY 11735.
All Thumbs Guide to VCRs
by Gene B. Williams

Written for the average homeowner whose budget doesn't allow for costly appliance repairs, this book explains basic maintenance procedures intended to reduce the number of malfunctions and prolong the life of your VCR. In addition, the book explains how to perform basic repairs. The heavily illustrated guide takes readers step-by-step through all the necessary maintenance tasks and those repairs that can be tackled by novices. Beginning with a chapter on safety precautions, the book describes standard VCR features and explains how a VCR works, before getting into maintenance and repair instructions. The book explains how to clean and lubricate VCR components, repair worn idlers and belts, replace blown fuses, salvage damaged video cassettes, eliminate snowy or distorted pictures, fix faulty buttons, and adjust takeup reels. It also includes quick and easy VCR programming tips.

All Thumbs Guide to VCRs costs $9.95 and is published by TAB Books, Division of McGraw-Hill Inc., Blue Ridge Summit, PA 17294-0850; Phone: 1-800-822-8138.

1993 COAXIAL PRODUCTS CATALOG
from Pasternack Enterprises

This 62-page catalog features a line of coaxial cable, switches, adapters, detectors, connectors, attenuators, terminations, and cable assemblies; amplifiers; breakouts; cutting tools; patch cords; programmable attenuators; push-button attenuators; waveguide adapters; and twinaxial adapters and connectors. Pricing on more than 3000 standard catalog items is supplied. New products include a wide variety of adapters and connectors. The catalog also contains information on more than 500 new types of cable assemblies.

The 1993 Coaxial Products Catalog is free upon request from Pasternack Enterprises, P.O. Box 16759, Irvine, CA 92713-6759; Tel: 714-261-1920; Fax: 714-261-7451.

MAKING MS-DOS WORK FOR YOU
by N. Kantaris & P.R.M. Oliver

Aimed at those who are already comfortably using the MS-DOS operating system, this book focuses not on the basics but on customizing the DOS to get the most efficiency, productivity, and enjoyment out of computing. The book presents the information that busy readers are most likely to need first, although it isn't necessary to read the book from front to back. It explains how to write customized batch files that allow you to display what you want on your screen, in the form and order that you want it; how to design and set up a fast, interactive, professional-looking menu system so that you or anyone else can easily run utility applications or commercial software packages; how the ANSI display and keyboard commands can be used to position the cursor on any part of the screen, change the intensity of the displayed characters, or change their color; how the Edit screen editor or Edlin line editor can be used to enter escape commands into simple ASCII files to allow control of both your screen display and your printer; and how to control the operation of dot-matrix and HP-compatible laser printers. In addition, the book explains how to use several practical routines, such as moving and finding files, protecting files from accidental erasure, a screen saver, and a disk-cataloging system. Detailed coverage of the Debug...
The sections log of mathematics, this book provides an easy, concise explanations of electronics concepts, with new terms explained as they are introduced. Mathematics isn’t ignored; in fact, the book’s first section is devoted solely to developing the necessary math skills, from choosing the correct calculator to mastering trig functions and understanding logarithms. Two subsequent sections are devoted to elementary DC and AC electronics. The book’s final section introduces more electronic building blocks, covering semiconductor materials, diodes, bipolar transistors, field-effect transistors, integrated circuits, and vacuum tubes. The four main sections are divided into chapters, and those chapters are further divided into stand-alone lesson modules, generally two pages in length. Throughout the book, the text is accompanied by drawings, cartoons, and other illustrations to demonstrate the concepts being taught. Readers are encouraged to learn without pain and, perhaps, to consider electronics as a hobby or even a career.

Understanding Basic Electronics costs $17.00 and is published by the American Radio Relay League, 225 Main Street, Newington, CT 06111.

Providing the largest amount of federal frequency information assembled in a single volume, this book has become the standard reference guide used by law-enforcement agencies, private security personnel, the news media, the communications industry, and scanner hobbyists. It includes frequency listings for the FBI, DEA, Customs, Secret Service, FCC, IRS, CIA, Immigration, Coast Guard, U.S. Marshal, Treasury Department, federal prisons, national parks, the Postal Service, NOAA, the Border Patrol, FEMA, the Armed Forces, the Department of Energy, the U.S. Mint, the Bureau of Indian Affairs, the White House, the Federal Reserve, the U.S. Attorney General, the State Department, the EPA, and more. In addition, the book provides foreign-government military listings for hot spots in the Caribbean, Latin America, and the Middle East; agent’s codes and lingo; military buzzwords; Canadian listings; military frequencies at civilian airports; and a listing for the secret USAF facility named on national TV as the site where UFO’s are being studied and tested. The book also includes maps, monitoring tips, and by-frequency listings of key VHF-UHF channels. The 8th edition contains updated and new listings.

The “Top Secret” Registry of U.S. Government Frequencies, 8th Edition is available for $21.95 plus $3.50 shipping and handling ($4.50 to Canada) from CRB Research Books, P.O. Box 56, Commmack, NY 11725; Tel: 516-543-9169, (Monday, Tuesday, Thursday, Friday: 10 AM to 2 PM); 24-hour fax: 516-543-7468. NY residents please add $2.16 sales tax.

A series of four compact DC power sources as well as a new 3½-digit, true-RMS, 4000-count DMM with bar-graph display are among the more than 50 test instruments featured in this 40-page catalog. It includes specifications and features, clearly defined for all product categories, and spells out vital information for oscilloscopes, spectrum analyzers, digital and analog multimeters, frequency counters, pulse and audio generators, temperature and digital panel meters, insulation breakdown testers, clamp-on current meters, and power supplies.

The Test Instrument Catalog is free upon request from HC Protek, Inc., P.O. Box 59, Northwood, NJ 07648; Tel: 201-767-7242; Fax: 201-767-7343.

Heathkit will provide the easy and affordable way from the Masters in Electronics Training - Heathkit*. From Basic Electricity to Advanced Microprocessor Applications and more, Heathkit will provide you with an unparalleled learning experience at a fraction of the cost of other programs.
NEW PRODUCTS

Computer-Enhanced Telephone

Combining telecommunications, consumer electronics, and computer technology, Philips' Enhanced Telephone (ET) represents the next generation of telephones. The screen-enhanced phone offers visual telephony features and text telephone capabilities that comply with the Americans with Disabilities Act. It also will enable the eventual delivery to homes and businesses of a new range of consumer and business services such as home banking and making airline reservations. The phone is compatible with the Analog Display Services Interface (ADSI), currently under development by Bellcore, which will permit automatic switching between voice and data for seamless interaction between users and network services.

About the size of a standard full-feature desk phone, the Philips ET incorporates a five-inch, tilt-up LCD screen, a slide-out QWERTY-style keyboard for entering messages, an auto-answer modem, and an auxiliary port for connecting printers or other peripheral devices. The telephone also comes with a built-in, industry-standard memory-card reader, so that new software applications can be added as they become available. That feature will allow the phone to meet changing consumer and business needs.

Using Smart Card technology, powerful local processing, and message-based communications, the Philips ET makes it easy for users to access new transaction-based services including information services, banking, shopping, bill paying, and travel reservations—for the cost of a local call. Smart Cards, which have password protection and a coded security system, offer coded security and privacy. With up to 3K of user memory, Smart Cards can store information ranging from telephone and account numbers to ticketing and transaction data. Philips envisions such future applications as booking and confirming a flight from your home, then bringing your Smart Card to the airport where it can be inserted in a reader/printer that will print out a boarding pass.

The text telephone capabilities allow businesses to comply with the Americans with Disabilities Act without having to buy dedicated devices. The Philips ET provides one-key switching between voice and text communications to allow the use of the voice-carryover capability offered by network carriers' Telecommunications Relay Services. It supports offline text preparation, so users can type ahead of incoming text messages and can send stored messages.

Call management services such as call forwarding, three-way calling, caller ID, automatic busy recall, automatic call return, selective call waiting, do not disturb, and calling-number display blocking are supported and enhanced by the phone display screen. The Philips ET also provides a clear visual calling indication and supports distinctive ringing for such services as TeenLine and protected number service.

The Philips Enhanced Telephone costs $639 and is being distributed by Information Access Systems of Atlanta, GA. For more information, call 404-962-3517.

DIGITAL-SYNTHESIZER KIT

Aimed at electronic designers and hobbyists, Novatech Instruments' Model DDS-3 Direct Digital Synthesizer Kit provides a precision 12-MHz signal source at a reasonable, do-it-yourself price. It can be programmed to output sine and TTL/CMOS signals from 2 Hz to 12 MHz in 2-Hz steps. The output frequency is determined by setting a 23-bit binary word using either a DIP switch or a parallel ribbon cable input. The output amplitude is 1.4 volts peak-to-peak into an open circuit. The user can obtain fast switching of the output frequencies because the transition time for changing frequencies is less than 250 ns. Spectral purity is better than −90 dBC phase noise at 1-kHz offset, −45 dBC spurious and −40 dBC harmonic. Stability is better than 10 ppm.

The kit includes a 3.5 × 4.5-inch printed-circuit board and all parts needed for assembly. It requires +5 volts DC and −5-volts DC.

Introducing Australia's Leading Electronics Magazine...

Silicon Chip, the most popular hobby electronics magazine south of the equator is written for you; if you are fascinated by building projects, increasing your understanding of theory, fixing consumer electronic products, and keeping up-to-date with world-wide trends within your electronics interests.

Silicon Chip, an Australian publication, is reprinted in the United States offering the best of selected articles suitable for North American readers.

Silicon Chip is available exclusively by subscription. So take advantage of this great opportunity and start your Charter Subscription today.

Packaged in a specially prepared format guaranteed to excite the electronics hobbyist with new ideas, novel projects, extraordinary features and down-right good reading.

Inside Silicon Chip you will discover how the other side of our world—down under—approaches the same hobby interests as you do, with ramifications that will amaze you.

Detailed construction projects to appear in upcoming issues of Silicon Chip include:

- 4-Channel Guitar Mixer
- Adjustable 0-45V, 8A Power Supply
- Interphone Digital Telephone Exchange
- 1.5V to 9V DC Converter
- Multi-Sector Home Burglar Alarm
- 1-Megabyte Printer Buffer

Exciting and imaginative Features like:

- Understanding Computer Memory
- How to Interlink Musical Instruments
- What's New in Oscilloscopes

If you are fascinated by electronics, especially the hobby aspects related to construction projects, theory, applications in home and shop, and latest developments, if you are compelled to experiment and “fix-it,” then Silicon Chip is your kind of magazine.

Silicon Chip is available exclusively by subscription. So take advantage of this great opportunity and start your Charter Subscription today.

Silicon Chip, 500 Br County Boulevard, Farmingdale, New York 11735

I'm convinced! Enroll me as a Charter Subscriber. Enter my subscription as designated below.

**TRUE-RMS DMM WITH FREQUENCY COUNTER**

A 4½-digit, true-rms digital multimeter from American Reliance, the Model 700T features a built-in frequency counter. The sophisticated DMM provides high measuring accuracy (0.5% basic accuracy). Functions include DC and AC voltage measurement, direct and alternating current measurement up to 20 amps, diode check, audible continuity check, and data hold. The DC voltage ranges are 200 mV, 2 volts, 200 volts, and 1000 volts, with resolutions of 10 µV, 100 µV, 1 mV, 10 mV, and 100 mV, respectively. The AC voltage ranges are 200 mV, 2 volts, 200 volts, and 750 volts with resolutions of 10 µV, 100 µV, 1 mV, 10 mV, and 100 mV, respectively.

**HAMLINK TELEPHONE INTERFACE**

With the HamLink telephone interface from A.R.E., you can control your transceiver or receiver from any TouchTone phone in the world. The device goes between the telephone line and the computer port of your radio. HamLink can share a telephone line with an answering machine without a problem. Once in place, it can control the radio's frequency, mode, band, and scan memories, and can operate in split-mode. A secret access code prevents unauthorized use of your equipment; if you like, you can share that code with friends to let them use your gear remotely.

HamLink allows you to monitor the DX frequencies and work all of the rare ones from your office. If you live in an apartment or condo where you can't have an HF station, you can put the HamLink at a friend's home or at a club stand and use it by telephone. The device even has a synthesized voice that announces frequency and mode, so you always know where you are operating. You can command your radio to go to a specific frequency, or you can tune your radio in 10-Hz, 100-Hz, 1-kHz, or 5-kHz steps.

The HamLink telephone interface costs $2669. For additional information, contact Amateur Radio Engineering, Inc., P.O. Box 169, Redmond, WA 98073; Tel: 206-882-2837.

COLOR LAPTOP

The first color laptop to be offered by Radio Shack is the Tandy 3830 LS/C. The active-matrix color laptop features the 25-MHz Intel 80386SL microprocessor as well as an optional 80387 SX-25 coprocessor slot; four megabytes of standard memory expandable to 8MB; 16K of cache memory; an 84-key keyboard; an integrated mini track ball; a 3.5-inch 1.44MB floppy-disk drive; and an internal 19-ms, 80MB hard drive. For vivid color in all lighting conditions, the 3830 SL/C has an active-matrix TFT LCD with fluorescent backlighting, built-in VGA graphics from 640 x 480 resolution in 256 colors, and an 8.4-inch diagonal screen. The laptop weighs 6.9 pounds with its rechargeable battery. That battery provides up to two hours of continuous use and can be recharged in just two hours, or six hours while in operation. A universal, worldwide 110/220-volt AC adapter is included. Other standard features include an external mouse port; an external, 101-key keyboard port; an internal modem slot; one serial port; and one parallel port that supports either a printer or an external 5.25-inch floppy-disk drive. Bundled software pre-installed on the hard drive includes MS-DOS 5.0, Microsoft Windows 3.1, America Online, and utility programs. An expansion bus connector attaches to the optional Tandy Docking Station, which provides two 16-bit expansion slots for Super-VGA graphics cards, external CD-ROM drive interface cards, network, and other AT-style cards.

The 3830 SL/C costs $3299 and can be ordered for second-day delivery at nearly 7000 Radio Shack stores nationwide.

For more information, contact Radio Shack, 700 One Tandy Center, Fort Worth, TX 76102.

THX-CERTIFIED POWER AMPLIFIER

Approved by LucasArts Entertainment Co. for use in HomeTHX audio systems, NAD's 2700THX is a 150-watts per-channel stereo power amplifier with impressive dynamic power, excellent current-producing capability, and high reliability. The Home-THX concept brings to home theater performance equivalent to that heard in LucasArts-licensed commercial THX theaters. The program establishes strict specifications that must be met by audio-video components. The existing 2700A design required only minor changes to meet the rigorous Home-THX standards. Those refinements primarily affect sensitivity and gain structures, and additional improvements were made in terms of high-frequency clarity, low-bass definition, and rejection of RF interferences with unusual cable or speaker loads.

The 2700THX is based on the NAD Power Envelope design, which delivers enormous dynamic headroom with real-world musical transients. The 2700THX can deliver as much as 600 watts per channel (at 4 ohms) IHF dynamic power. The design works particularly well in home-theater applications, where film special effects can exceed the dynamic range of music and overtax the capabilities of standard power amplifiers. Both normal and THX inputs are supplied.

The Model 2700THX has a suggested retail price of $829. For additional information, contact NAD, 633 Granite Court, Pickering, Ontario, Canada L1W 3K1; Tel: 416-831-6936; Fax: 416-831-6936.

CIRCLE 106 ON FREE INFORMATION CARD

HIGH-CURRENT DC POWER SUPPLY

For powering high-current demand products such as autosound units, two-way radios, cellular phones, and 12-volt DC appliances, the Model 1686 3-14-volt, high-current DC bench power supply from B+K Precision offers good regulation and low ripple. The device eliminates the need to have a car battery or unregulated supply at your bench when servicing a device or just powering it from AC mains. For versatility, the plus and minus outputs are fully isolated, so either polarity can be floated or grounded. Two Model 1686 power supplies can be connected in parallel to double the current output, or in series to double the voltage output. The device has reverse-polarity protection from an external DC source, overload protection, short-circuit protection, and current limiting.

The Model 1686 is conservatively rated for continuous operation at maximum power output without overheating. It is designed to output 12-amps maximum at 13.8 volts DC (the maximum current is lower at lower voltages). With two analog meters, the Model 1686 provides simultaneous monitoring of voltage and current output. Voltage is continuously adjustable over the output range.

The Model 1686 DC power supply has a suggested price of $199. For further information, contact B+K Precision, 6470 Cortland Street, Chicago, IL 60635; Tel: 312-889-1448; Fax: 312-794-9740.

INSTRUCTION FOR PLACING YOUR AD!

HOW TO WRITE YOUR AD
TYPE or PRINT your classified ad copy CLEARLY (not in all capitals) using the form below. If you wish to place more than one ad, use a separate sheet for the additional ads (a photocopy of this form works well). Choose a category from the list below and write that category number into the space at the top of the order form. If you do not specify a category, we will place your ad under Miscellaneous or whatever section we deem most appropriate.

We cannot bill for classified ads. Payment in full must accompany your order. We do permit repeat ad or multiple ads in the same issue, but in all cases, full payment must accompany your order.

WHAT WE DO
The first two words of each ad are set in bold caps at no extra charge. No special positioning, centering, dots, extra space, etc., can be accommodated.

RATES
Our classified ad rate is $1.00 per word. Minimum charge is $15.00 per ad per insertion (15 words). Any words that you want set in bold or caps are 20¢ each extra. Bold caps are 40¢ each extra. Indicate bold words by underlining. Words normally written in all caps and accepted abbreviations are not charged as all-caps words. State abbreviations must be Post Office 2-letter abbreviations. A phone number is one word.

CONTENT
All classified advertising in the PE Market Center is limited to electronics items only. All ads are subject to the publisher's approval. We reserve the right to reject or edit all ads.

DEADLINES
Ads received by our closing date will run in the next issue. For example, ads received by April 14 will appear in the August, 1991 issue that is on sale June 18. The PE Market Center is published monthly. No cancellations permitted after the closing date. No copy changes can be made after we have typeset your ad. NO REFUNDS, advertising credit only. No phone orders.

AD RATES: $1.00 per word, Minimum $15.00.

Send your ads with payment to:
Popular Electronics Market Center, 500-B Bi-County Blvd. Farmingdale, NY 11735

THE BATTERY BUTLER
(Continued from page 36)

pin 5 of U5, the circuit will never return the ready state and the battery will be overcharged. The total amount of charge that the Ni-Cd battery receives can be adjusted by R25. The maximum charge level can be determined by starting with the voltage at pin 9 of U5 near the level of voltage at pin 5 of U5 and adjusting R25 to obtain a greater voltage difference each time the battery is cycled, but still allowing the circuit to come to the ready state. Note that as a Ni-Cd battery ages, its ability to hold a complete charge will decrease and R25 may have to be reset to compensate for the aging battery.

Set S1 to the slow position. LED1 should begin flashing red, indicating that the battery is being discharged via R39. In a few minutes, transistor Q4 and resistor R39 should be warm to the touch; that's normal. Connect the DVM across the battery terminals, and note that the voltage should begin decreasing towards the present discharge limit. Once the voltage across the battery is at the discharge level, LED1 should begin flashing green and the voltage across the battery should rapidly start moving up.

Depending on the type of battery, the circuit will reach the ready state, which is indicated by LED1 being in a steady green state, in 4 to 5 hours. If it does not, adjust R25 to bring the voltage at pin 9 of U5 closer to the voltage at pin 5 of U5.

The battery can remain connected to the Battery-Butler for prolonged periods without damage to the battery. A 20-mA trickle charge is maintained across the battery after the unit returns to the ready state. However, it is recommended that the battery once charged, be removed from the circuit if the charger is to be turned off. The input circuit load will drain a small amount of current from the battery over extended periods.

The Battery-Butler can hold a battery on a trickle charge to offset the internal losses of Ni-Cd batteries incurred during storage. To use that feature, apply power to the circuit without a battery connected. Place S1 in the slow position. LED1 should immediately go to a steady green state. The Ni-Cd battery may now be connected. A 20-mA trickle charge will be maintained across the battery until the circuit is reset.

Operating Tips. Avoid making or disconnecting DVM connections to the circuit or the battery once a charge/discharge cycle has started. The circuit detects very small changes in voltage in the comparator section, and DVM connections and other external noise sources can cause erratic circuit operation. Operate and charge your Ni-Cd batteries at normal room temperatures. Avoid extreme heat and cold. Ni-Cd batteries will recover from occasional dips to near-freezing temperatures. However, extreme heat (above 40°C) will dry out the seals of most Ni-Cd batteries, resulting in electrolyte loss.

MITSUBISHI TV
(Continued from page 29)

flip-open panels or doors. The on-screen menu displays are almost self-explanatory, but if you do need help, the 96-page owner's manual is well-organized and offers plenty of illustrations. There are 20 pages of hook-up instructions and diagrams alone. Some of the text is not quite idiomatic English, but it is all quite understandable.

While there are many projection TV sets that deliver bigger pictures, in most home environments, 45-inches is adequate for full enjoyment of the "home-theater" experience. This Mitsubishi set is not inexpensive, but its performance rivals that of sets costing even more. For more information on the Mitsubishi VS4517S contact the manufacturer directly, or circle No. 120 on the Free Information Card.

VCR Repair Can Payoff Big
You Can Earn $1000.00 a Week Working Part Time from Your Own Home
Secrets Revealed...
No Special Tools or Equipment Needed.

Sounds impossible but it's true. VCR technicians report earning $80.00 an hour for simple VCR repairs. You can learn to be a VCR Technician in just a few short weeks. Enroll in the Foley-Belsaw Institute of VCR Repair where you learn by the Viejo Method. Designed in a VCR Repair Shop to teach individuals with no electronic or VCR repair skills, the Viejo Method has been proven fast and efficient.

The Viejo Method works on the principle that the vast majority of VCR repairs are simple mechanical or electro-mechanical problems. You learn these simple repairs first to start earning money right away. These simple repairs than serve as the foundation for more complicated repair work.

You earn top dollar with your new skills. Just think, a cleaning procedure that takes less than an hour can earn you $80.00 to $120.00. If you are not happy or feel you can't reach your full potential in your present job, now is the time to act.

For your FREE Information Kit, mail the coupon below to: Foley-Belsaw Institute of VCR Repair, Dept. 62005, 6301 Equitable Road, Kansas City, MO 64120

□Send me my FREE Information Kit on VCR Repair. There is no obligation and no salesman will call. Dept. 62005

IF YOU'RE NOT RECYCLING YOU'RE THROWING IT ALL AWAY.

A little reminder from the Environmental Defense Fund that if you're not recycling, you're throwing away a lot more than just your trash.

You and your community can recycle. Write the Environmental Defense Fund at: EDF-Recycling, 257 Park Avenue South, New York, NY 10010, for a free brochure that will tell you virtually everything you need to know about recycling.

ANTIQUE RADIO
(Continued from page 67)

After each oscillator adjustment, the matching mixer trimmer is adjusted for maximum indication on the audio-output meter (as before, the signal is kept as weak as possible during this process to avoid overloading).

After setting the high end of each band, the LM21 is set to a frequency (specified by the manufacturer) much lower in the band, and the dial setting checked. On bands 1 and 2, a screw-adjusted pedestal capacitor is provided to adjust the dial setting to conform to this lower frequency, if necessary (after which, the oscillator and mixer trimmers may need readjusting because of interlocking effects). On the higher bands (3 and 4), no padders are provided, but these are supposed to be unnecessary.

The RF alignment of this receiver was an extremely frustrating experience. Once again, I saw no sign of misadjustment due to tampering, but I found it impossible to arrive at a perfect setting for each band within the adjustment range of the trimmers and padders provided. I found myself screwing some of the capacitors all the way closed and opening others to the maximum to get settings that—while close to acceptable—are definitely a compromise.

To top it off, no amount of tweaking helped the broadcast-band problem. The LM21 signal simply came in over a broad area of the dial, and was not tunable by the trimmers or padder. We'll look into the matter further next month!

Until then, I'll look forward to receiving your letters. Write me c/o Antique Radio, Popular Electronics, 500-B B-County Blvd., Farmingdale, NY 11735.
ELECTRONICS MARKET PLACE

FOR SALE

LASER & special effects products. Lasers from $9.95. We specialize in laser and solar energy products for commercial and hobbyist applications. Free catalog!

WHAT'S A HAM?
(Continued from page 58)

including a teacher's manual, code-practice oscillator, code-practice audiocassette, and a videotape showing classroom use. The package is priced at $99.95. Also available are Novice- and no-code Technician-licensure courses for the IBM PC; these are $49.95. Contact Media Mentors, Inc., (PO. Box 131646, Staten Island, NY 10313-0006; Tel. 1-718-983-1416) for further information.

Other examination study books and aids are published by Ameco Publishing Company (PO. Box 350, Mineola, NY 11501-0350; Tel. 1-516-741-5030), Gordon West Radio School/Radio Amateur Callbook (PO. Box 2013, Lakewood, NJ 08701; Tel. 1-908-905-2961), and VIS Study Guides (119 Comanche Drive, PO.Box 16646, Hattiesburg, MS 39404; Tel. 1-601-261-2601).

There are other useful publications, too numerous to discuss individually, so we've listed them in the boxed text entitled "Further Reading." So if your interest has been piqued by this article, you have plenty of resources to help you follow through.

COLLECTING OLD BOOKS & MAGS
(Continued from page 60)

There was plenty of war-surplus electronic equipment at incredibly cheap prices. radio-control model was finally practical due to miniaturization, and the availability of low-cost transistors began a new era in building simple projects.

All of these changes were documented and presented in a then-new magazine: Popular Electronics. Copies of that magazine belong in everyone's collection.

There were many other electronics magazines and books published during the fifties. Unfortunately many are being lost because they aren't old enough to be antiques, but aren't current. They're well worth saving though, if only for the thousands of projects they contain. The transistors often recommended, the CK722, 2N35, and 2N107 or 2N170 are long gone, but they can be replaced by modern small-signal types without other changes in the circuit.

Whenever you need electronic products, make your initial call to a distributor. Distributors help speed up your time to market, providing the convenience, the economy, the value, and above all, the service that helps make you competitive.

The sponsors of this message know how important it is — to us and to your MRP — to get product ASAP or JIT. Another important abbreviation is EIA. Our participation in the Electronic Industries Association’s Components Group makes us all more competitive, through fostering better working relations and coherent industry standards, and through the sharing of ideas to help both buyers and sellers.

In choosing your component supplier, look for the marks of leadership — availability through distribution and membership in the EIA.
Wake up! You may be the victim of stolen words—precious ideas that would have made you very wealthy! Yes, professionals, even rank amateurs, may be listening to your most private conversations.

Wake up! If you are not the victim, then you are surrounded by countless visionaries who need your help if you know how to discover telephone taps, locate bugs, or “sweep” a room clean.

There is a thriving professional service steeped in high-tech techniques that you can become part of! But first, you must know and understand Countersurveillance Technology. Your very first insight into this highly rewarding field is made possible by a video VHS presentation that you cannot view on broadcast television, satellite, or cable. It presents an investigative program prepared by professionals in the field who know their industry, its techniques, kinks and loopholes. Men who can tell you more in 45 minutes in a straightforward, exclusive talk than was ever attempted before.

Foiling Information Thieves
Discover the targets professional snoopers seek out! The prey are stock brokers, arbitrage firms, manufacturers, high-tech companies, any competitive industry, or even small businesses in the same community. The valuable information they utilize may be marketing strategies, customer lists, product formulas, manufacturing techniques, even advertising plans. Information thieves cavedrop on court decisions, bidding information, financial data. The list is unlimited in the mind of man—especially if he is a thief!

You know that the Russians secretly installed countless microphones in the concrete work of the American Embassy building in Moscow. They converted

The professional discussions seen on the TV screen in your home reveals how to detect and disable wiretaps, midget radio-frequency transmitters, and other bugs, plus when to use disinformation to confuse the unwary listener, and the technique of voice scrambling telephone communications. In fact, do you know how to look for a bug, where to look for a bug, and what to do when you find it?

Bugs of a very small size are easy to build and they can be placed quickly in a matter of seconds, in any object or room. Today you may have used a telephone handset that was bugged. It probably contained three bugs. One was a phony bug to fool you into believing you found a bug and secured the telephone. The second bug placates the investigator when he finds the real thing! And the third bug is found only by the professional, who continued to search just in case there were more bugs.

The professional is not without his tools. Special equipment has been designed so that the professional can sweep a room so that he can detect voice-activated (VOX) and remote-activated bugs. Some of this equipment can be operated by novices, others require a trained countersurveillance professional.

The professionals viewed on your television screen reveal information on the latest technological advances like laserbeam snoopers that are installed hundreds of feet away from the room they snoop on. The professionals disclose that computers yield information too easily.

This advertisement was not written by a countersurveillance professional, but by a beginner whose only experience came from viewing the video tape in the privacy of his home. After you review the video carefully and understand its contents, you have taken the first important step in either acquiring professional help with your surveillance problems, or you may very well consider a career as a countersurveillance professional.

The Dollars You Save
To obtain the information contained in the video VHS cassette, you would attend a professional seminar costing $350-750 and possibly pay hundreds of dollars more if you had to travel to a distant city to attend. Now, for only $49.95 (plus $4.00 P&H) you can view Countersurveillance Techniques at home and take refresher views often. To obtain your copy, complete the coupon or call.
