JACKSON
the big name in PRECISION components

MINIATURE AIR TRIMMER

Jackson type C16 is a robust air di-electric trimmer of very small size. Suitable for use in high grade equipment. The standard component is designed for mounting on its base by two 10 BA (07in.) clearance holes; two other forms provide for printed-circuit mounting. 9/6

★ Capacitances: 2.7-7.5pF, 3-8pF, 3-11.5pF.
★ Air gap 0-0075in.
★ Length back to front 0-4in. to 0-58in.
★ End area 0.375in. square.
★ Silver-plated brass vanes
★ Siliconed ceramic insulation
★ Beryllium copper rotor spring
★ Temperature coefficient plus 50 p.p.m. per deg. C.
MADE IN ENGLAND

The SKYROVER RANGE
7 transistor and 2 diode superhet portables—covering full med. plus 6 SW Bands.

The SKYROVER Mk. III
(illustrated) New, styled with redesigned plastic cabinet in black, grey and chrome with edge grip controls. Controls: Waveband Selector, Volume Control, on-off Switch. Plastic cabinet, size 11 x 6 x 5 1/2in. with metal trim and carrying handle. Can now be built for £8 19s. 6d. for £3 extra. Net Price: £8 19s.

The SKYROVER De Luxe
Tone Circuit is incorporated, with separate Tone Control. Controls: Waveband Selector, Volume Control. Plastic cabinet in black, grey and chrome with edge grip controls. Controls: Waveband Selector, Volume Control, on-off Switch. Plastic cabinet, size 11 x 6 x 5 1/2in. with metal trim and carrying handle. Can now be built for £10 19s. 6d. for £5 extra. Net Price: £11 1s. 1d.

Data for each receiver: 3/6 extra; Refunded if you purchase the parcel. Post 1/2 batteries 3/4 extra. All components available separately.

REALISTIC SEVEN
Fully tunable long and medium bands. Uses 7 Moulded Transistors, plus Alpha OA170. STAR FEATURES:
1. 7 Transistor Superhet. 2. 500 Milliwatt output for Hi-Fi Speaker.
3. All components mounted on a single printed circuit board, size 8 x 3 1/2 x 3/4in. in one complete assembly. 4. Plastic cabinet, with carrying handle, size 7 1/2 x 3 3/4 x 3/4 in, in carry bag. 5. Easy to read dial. 6. Internal socket for earphone. 7. P.E.P. volume control. 8. Operates from 9V or similar battery. 9. Full components. 10. 300 hours test time and guaranteed. Each receiver: Battery 3/6 extra. (All components available separately). Data and instructions separately: 3/6, refund if you purchase any.

REALISTIC SEVEN De Luxe
With the same electrical specification as standard model—PLUS A SUPERIOR WOOD CABINET IN CONTEMPORARY STYLING covered in attractive washable material, with super chrome trim and carrying handle. Also a full vision circular dial, externally mounted. Includes 9V battery. Ordinary receiver £4 15s. 4d. Extra: Battery 3/6 extra. Both models: Battery 3/6 extra. (All components available separately). Data and instructions separately: 3/6, refund if you purchase any.

MORE SIMPLE RADIO CIRCUITS
A. T. Collins
The success of the first book in this series on radio circuits has encouraged me to produce a further selection of circuits for the radio enthusiast covering such interesting apparatus as amplifiers, power units, transistor receivers, superhets, etc. I am sure the constructor will enjoy building this apparatus as much as he did with the previous book. Contents: Two Station Radio and Amplifier - Transistorised Converter for Short Waves - Double Triode Receiver with Power Unit - Beginner's Three Transistor Reflex - Modern Three Valve T.R.F. - F.M. Tuner - Two Transistor Portable - Four Valve Superhet - Mains Power Supply for Transistor Sets - Mains Portable with Two R.F. Stages.

ELECTRONICS IN THE HOME
A. T. Collins
The popularity of electronics has increased considerably during the past few years and therefore this book has been produced for the constructor who wishes to open his garage doors by remote control, build his own intercom unit for the home, add sound to his projection of films and cutting out man-made interference on radio reception. These are a few of the many interesting chapters in the book. Contents: Unit for Remote Control - Recording Radio Receivers - Home Audio System - M.W. and L.W. Mast Head Pre-Amp - Home Intercom Unit - Variable Voltage Transformer - Electronic Timer - Mains Filter Unit - Extension Loudspeakers - 4W Amplifier for Home Films.

- Valves used E250, two 6L6S, and one 6E5. All outstanding quality parts.
- Ria of complete tuned 8 x 8 in.
- All parts sold separately. Set of parts if purchased at one time £35.19.6, plus 9/- P. and P. and insurance. Circuit diagram and instructions 1/6 post free. Mark II Tuner as above but complete with mag eye, front panel and back cabinet. Price 15/-.

Harveson's F.M. Tuner Head.

S-100 Mk 10, 10 LeF., 15 LeF., plus 9/- P. and P. (E250 series, 9/- extra).

6 TRANSISTORS AND DIODE

SUPERHET

A first-class 2 waveband transistor superhet. Printed circuit panel (size 8 x 2 in.).
- 3 prescribed 1N transistor modules.
- High gain Ferrite Rod aerial.
- All first-grade transistors. Aerial, aerial winding.
- All parts supplied with simple instructions. All parts sold separately. Set of parts if purchased at one time £10.4.6. P. and P. (2 Circuit Board and Plastic Case) P. and P. 5/-.

35 OHM SPEAKERS

Suitable for use with 5000 and 6000 ohm. Goodmans Ideal replacement for most pocket portables, 8/6, 9/18, 13/18, 7 x 4 in., 2/6.

Portable Cabinet

Size approx. by 9 x 5 in. Suitable for above using.

10/14 WATT HI-FI AMPLIFIER KIT

A stylishly fin-ished complete

amplifier with an output power of 15/10 w. Automatic Cartridge upgrade

amp 9 "LUSCIOUS" M-307. Minimum insertion loss, high quality, high stereo fidelity.

BRAND NEW CARTRIDGE BARGAINS!

KONITEK SUPERHET. Special £7.95.

Complete with two amplifiers. Original list price £79.95. Our price £24.95.

radio is supplied complete with knobs, valves, etc., wired and tested for only

H.S.L. 'FOUR' AMPLIFIER KIT

A.M. Transistors E250, 4 watt, using E250E, EL34, E251 valves.

- Heavy duty double-convex main speaker.
- High gain and stability, using electrolytic capacitors.
- Simple to construct, using 100%, British valves.
- Guaranteed by manufacturer to match pair in every respect.
- Clear and concise instructions enable even the inexperienced amateur to construct to 100% success. (Supplied complete with valves, output transformer (3 ohms only), screened lead, wire and Tune-up sheet. Additional output transformer (6 ohms only) to buy) PRICE 7/9, P. & P. 9/6.

Complete with transformers, diodes, electrolytic caps, etc., suitable for practical layout and parts list 9/6 (free with kit).

The kit although similar in appearance to HAM amplifiers entirely different and advanced circuitry.

ORDER F.M. TUNER HEAD

S-100 Mk 10, 10 LeF., 15 LeF., plus 9/- P. and P. (E250 series, 9/- extra).

COIL TRANSFORMER AND DIODE

SET FOR TRANSISTOR SUPERHET

2 TF 1141s, 70 1N407s and one diode transformer and short Ferrite (size 8 x 4 in.) and one diode.

- Peak output of 100 milliamperes at 11 watts.
- Built on printed circuit card and panel, size 6 x 3 in.
- Tuning head and dials
- Guaranteed
- Permanence two years. 20-year life expectancy... coverage. Made in England. B.C. 401. (1170-1200 kc.)
- Balanced diode rectifier.
- Tuning stage and diode.
- Atmospheric and moron gal and dial (7 mc/s famous) through a diode, using a gold
- mains transformer and valve rectifier.
- Valves used E250, two 6L6S, and one 6E5. All outstanding quality parts.
- Ria of complete tuned 8 x 8 in.
- All parts sold separately. Set of parts if purchased at one time £35.19.6, plus 9/- P. and P. and insurance. Circuit diagram and instructions 1/6 post free. Mark II Tuner as above but complete with mag eye, front panel and back cabinet. Price 15/-.

Complete ETC, UNITS WITH TECHNICAL SPECIFICATIONS OUTFITTED WITH SIMILAR AMPLIFIERS AT 1/4 TIMES THE COST

Electrical Specification:

- Output: 15kW RMS.
- Frequency Response: 20-20,000 c.p.s.
- Harmonic Distortion: 0.05%
- Noise: Negligible.
- Efficiency: 85%.
- Power Handling: 100W.

All components etc. are of a high standard and supplied by leading British manufacturers.
R.S.C. STEREO 20/20 WATT (R.M.S.) HI-FI TRANSISTOR AMPLIFIER

Pre-amp type control stages
Output for 8.7.5 and 15 ohm speakers.
Kit of parts (including all manual and all components for same finishes as British or American models) heat and
Full wiring instructions or with printed circuit diagram for 4060 c.s. (424.00)
Frequency Response: 40-30,000 cps.
Harmonic distortion: 0.5%
Hum and Noise: -80dB. Sensitivity: 7 mV.
Bass Control: +4dB to -12dB at 10 Kc.
Suitable for 2511/2 or ready built 58/6.
Price: £25.00.

R.S.C. COLUMN SPEAKERS
Covered in two-tone Rexin/Vynair. Ideal for vocalists, soloists, orchestra, jazz and classical.
Normal sale price: £10.00.
Reproduction: 4060 c.s. (154.00) speaker, £10.00.
B.S.C. BASS-REGENCY 50 WATT AMPLIFIER

AN EXCEPTIONALLY POWERFUL HIGH QUALITY ALL-PURPOSE UNIT for lead, rhythm, bass guitar and all other musical instruments. For vocalists, gram, radio, tape and general public address.

UNUSUALLY POWERFUL LOUDSPEAKER COMBINATION consisting of a PANE HIGH FLUX 15in. 50 watt unit and a 12in. 40 watt unit with extended frequency response. 4 Jack Inputs and two Volume Controls for simultaneous use of up to 4 pick-up instruments.

Cabinets covered in two-tone Rexine/Tygan with gold trimming. Fitted carrying handles. Separate bass and treble output. Send S.A.E. for leaflet. Or call at one of our many branches and compare the Base-Regent with units at more than three times the cost.

49 Gns.

R.S.C. 820 MULTI-PURPOSE AMP. especially suitable for Base Guitar.

Incorporating massive 15in. high flux loudspeaker. Dating 90 watts. Dual bass and treble controls. Two Jack Inputs and one Volume Control. Unit attractively finished in Rexine and Tygan. Suitable for use with any of our Amplifiers. Controls are spaced (frequency of interceptions, cover, volume and 4 Gns.)

TRANSISTORED SOUND MIXER Enables mixing of up to 4 standard Jack inputs, i.e., microphone, tape, gram, tuner, etc. into single output. Compact and completely self-contained. Uses standard 9v. battery.

LINEAR TRENOMO PRE-AMP UNIT Suitable for use with any of our Amplifiers. Controls are spaced (frequency of interceptions, depth, volume and 4 Gns.)

R.S.C. BATTERY CHARGING EQUIPMENT

All for A.C. Mains 200-250 v. 50 c/s

High Duty Battery Charger

60, 80, 100 amp. variable 110v. or 240v. 3 phase input. Also selector plug for 60, or 240v. charging. 12v. charged lead for use with on-the-go equipment. Complete set.

PRICE 59/9

Guaranteed 12 months

BATTERY CHARGER KITS

- 6v. or 12v. 1amp. As above with ammeter. 
- 6v. or 12v. 2amps, inclusive of ammeter. 
- 6v. or 12v. 4amps with Ammeter and selector panel with 2amp. ammeter. 

PRICE 35/6

THE B.O.T. IS THE LEADING INSTITUTE OF ITS KIND IN THE WORLD

Have you sent for your copy?

ENGINEERING OPPORTUNITIES is a highly informative 156-page guide to the best paid engineering posts. It tells you how you can quickly prepare at home for a recognised engineering qualification and outlines a wonderful range of modern Home Study Courses in all branches of Engineering. This unique book also gives full details of the Practical Radio and Electronic Courses, administered by our Specialist Electronics Training Division—the B.I.E.T. School of Electronics, explaining the benefits of our Employment Dept. and shows you how to qualify for five years promotion in one year.

SATISFACTION OR REFUND OF FEE

Whatever your age or experience, you cannot afford to miss reading this famous book. If you are earning less than £30 a week, send for your copy of "ENGINEERING OPPORTUNITIES" today—FREE.
HI-FI AMPLIFIERS — TUNERS — RECORD PLAYERS

STEREO AMP. AA-22U

GARRARD AUTO/RECORD PLAYER. Model AT-60, less cartridge £13.1.7. With Decca Daram pick-up £17.16.1 incl. P.T. Many other Garrard models available, ask for Lists.

HI-FI MONO AMPLIFIER. Model MA-12. 10W output, wide freq. range, low distortion. Use with control unit.

3+3W STEREO AMPLIFIER. Model S-33. An easy-to-build, low cost unit. 2 inputs per channel. Kit £13.7.6 Assembled £18.18.0

DE LUXE STEREO AMPLIFIER. Model S-33H. De luxe version of the S-33 with two-tone grey perspex panel, and high sensitivity necessary to accept the Decca Daram pick-up. Kit £15.17.6 Assembled £21.7.6

POWER SUPPLY UNIT. Model MPG-1. Input 100/120V, 200/250V, 40-80 c/s. Output 6.3V, 2.5A A.C. 200, 250, 270V, 120mA max. D.C.

Make the most of your leisure time...

FOR THE INSTRUMENTALIST

TRANSISTOR PA/GUITAR AMPLIFIER, PA-2. 20 Watt amplifier. Two heavy duty speakers. Four inputs. Two channels. Variable tremolo, Speed and speed controls, Weight 5lb.

19" high x 29" wide x 10" deep. Kit £44.19.0 Assembled £59.19.0

VALVE PA/GUITAR AMPLIFIER, PA-1. 50 Watt amplifier.

Kit £54.15.0 Assembled £74.8.0 Castors or legs available as extras.

TRANSISTOR RECEIVERS

"OXFORD" LUXURY PORTABLE Model UXR-2. Specially designed for use as a domestic, car or personal portable receiver. Many features, including solid leather case. Kit £14.18.0 incl. P.T.

TRANSISTOR PORTABLE. Model UXR-1. Pre-aligned I.F. transformers, printed circuit. Covers L.W. and M.W. Has 7" x 4" loudspeaker. Real hide case.

Kit £12.11.0 incl. P.T.

JUNIOR EXPERIMENTAL WORKSHOP. Model EW-1. More than a toy! Will make over 20 exciting electronic devices, incl. Radio, Burglar Alarms, etc. 72 page Manual. The ideal present!

Kit £7.13.6 incl. P.T.

"MOHICAN" GENERAL COV. RECEIVER for Amateur or Short Wave listening. Send for leaflet.

Kit £37.17.6 Assembled £45.17.6

TEST INSTRUMENTS

Our wide range includes:

NEW ** LOW-PRICED SERVICE OSCILOSCOPE. Model OS-2. Compact size 5" x 7" x 12" deep. Wt. only 9lb. "Y" band-width 2 c/s-3 Mc/s ± 3dB. Sensitivity 100mv/cm, T/B 20 c/s-200 kcs in four ranges, fitted mu-metal CRT Shield. Modern functional styling.

Kit £22.10.0 Assembled £26.8.0

5" GEN.-PURPOSE OSCILLOSCOPE. Model 10-12U. An outstanding model with professional specification and styling. "Y" bandwidth 3 c/s-4-5 Mc/s ± 3dB. T/B 10 c/s-500 kcs. Kit £35.17.6 Assembled £45.15.0

DE LUXE LARGE-SCALE VALVE VOLT-METER. Model IM-13U. Circuit and specification based on the well-known model V-7A but with many worthwhile refinements. 0.1\% peak to peak. Built-in voltmeter. Unique gimbal bracket allows operation of instrument in any positions. Modern styling.

Kit £18.15.0 Assembled £26.18.0

AUDIO SIGNAL GENERATOR. Model AG-5U. 10 c/s to 100 kc/s, switch selected. Distortion less than 0.1\%, 10V sine wave output metered in volts and db's.

Kit £22.10.0 Assembled £30.10.0

VALVE VOLT-METER. Model V-7A. 7 voltage ranges d.c. volts to 1,500, A.C. to 1,500 m.s.m. and 4,000 peak to peak. Resistance 0 to 1,000M\(\Omega\) with internal battery, D.C. input resistance 11M\(\Omega\). dB measurement, has centre-zero scale. Complete with test leads and standardising battery.

Kit £13.18.6 Assembled £19.18.6

MULTI METER. Model IM-1U. Ranges 0-1V to 1,500V a.c. and d.c.; 150uA to 15A d.c.; 0.02 to 20M\(\Omega\) 4½ 90\(\mu\)A meter. Kit £12.18.0 Assembled £20.11.6

R.F. SIGNAL GENERATOR. Model RF-1U. Up to 100 Mc/s fundamental and 200 Mc/s on harmonics. Up to 100umv output.

Kit £13.8.0 Assembled £19.18.0

NEW SINE/SQ GENERATOR Model IG-82U. Freq. range 20 c/s-1 Mc/s in 5 bands less than 0.5\% sine wave dist. less than 0.15\% sec. sq. wave rise time.

Kit £26.18.0 Assembled £36.10.0

TRANSISTOR POWER SUPPLY. Model IP-20U. Up to 50V, 1.5A output. Ideal for laboratory use. Compact size.

Kit £35.0.0 Assembled £47.8.0

Prices and specifications subject to change without notice

WHEN YOU ARE IN TOWN, WE HOPE YOU WILL VISIT US THERE
**TAPE AMPLIFIERS — TAPE DECKS — CONTROL UNITS**

**STUDIO-MATIC “363” TAPE DECK.** The finest buy in its price range. Operating speed: 1½, 33⅓ and 7½ p/s. Two tracks, “wow” and “flutter” not greater than 0.15% at 7½ p/s. £13.10.0. With TA-1M tape preamplifier kit. £31.5.6.

**HI-FI AM/FM TUNER.** Model AFM-1. Available in two units which, for your convenience, are sold separately. Tuner heart (AFM-T1—£4.13.0 incl. P.T.) and I.F. amplifier (AFM-A1—£22.11.0). Printed circuit board, 8 valves. Covers L.W., M.W., S.W., and F.M. Built-in power supply. Total Kit £27.5.0.

---

**TRUVOX D-35 TAPE DECKS.** High quality stereo/mono tape decks. D93/2, ¼ track, £36.15.0. D93/4, ¼ track, £38.15.0.

**TAPE RECORDING/PLAYBACK AMPLIFIER.** Thermostat type recording indicators, press-button speed compensation and input selection. Mono Model TA-1M. Kit £19.18.0 Assembled £22.18.0. Stereo Model TA-1S. Kit £25.10.0 Assembled £28.18.0.

**MONO CONTROL UNIT.** Model UMC-1. Designed to work with the MA-12 or similar amplifier requiring 0.25V or less for full output. 5 inputs. Baxandall type controls. Kit £5.12.6. Assembled £13.12.6.

---

**Enjoy building a Heathkit model**

---

**SPEAKER SYSTEMS**

**HI-FI SPEAKER SYSTEM.** Model SSU-1. Ducted-port bass reflex cabinet “in the white”. Two speakers. Vertical halogen models with legs. Kit £12.12.0, without legs, Kit £11.17.6 incl. P.T.

**NEW! BERKELEY” SIII-m-line SPEAKER SYSTEM,** fully finished walnut veneered cabinet for faster construction. Special 12” bass unit and 4” mid/high frequency unit. Range 30-17,000 c/s. Size 20” x 17” only 7½” deep. Modern attractive styling. Excellent value. Kit £18.10.0 Assembled £22.0.0.

**COTSWOLD SPEAKER SYSTEMS.** Outstanding performance for price. MF5: Size 30” x 16½” x 14” deep. Kit £25.12.0 Assembled £33.17.0.

**STANDARD.** Size 20” x 23” x 14½” deep. Kit £25.12.0 Assembled £33.17.0.

RADIO COMPONENT SPECIALISTS

ADAMIN
Micro Soldering Instruments

- HIGH PERFORMANCE Normal temperatures 360/375°C. 
- Some models 450°C and 500°C.
- MINIATURE SIZE Overall lengths 6½" to 7½".
- LOW WEIGHT From ½ oz. to 1 oz. less flex.
- RAPID HEATING 30 seconds to 2 minutes.
- ABSOLUTE SAFETY A & B types low voltage 
C types fully earthed and flash tested.

The ADAMIN has its element INSIDE THE BIT, so using all the heat produced, and avoiding excessive heat radiation. This means that less power is required and results in an unusually compact design.

ADAMIN instruments have a far higher performance for their size than all other types. Some ADAMIN models have the highest bit temperatures now needed to cope with POLYURETHANE COVERED WIRES and HIGH MELTING-POINT SOLDERS.

The ADAMIN handle is injection-moulded in NYLON, and is absolutely unbreakable.

NEW ROAMER SEVEN Mk IV
7 WAVEBAND PORTABLE OR CAR RADIO
★ Now with PHILCO MICRO-ALLOY R.F. TRANSISTORS

★ 9 stages—7 transistors and 2 diodes
FULLY TUNABLE ON ALL WAVEBANDS

Covers Medium and Long Waves, Trawler Band and three Short Waves to approx. 15 metres.

Push-pull output for room filling volume from rich toned 7 x 1in. speaker. Air spaced

ganged tuning condenser. Ferrite rod aerial for M & L waves and telescopic aerial for S waves.

Total leather look case with silk 120 x shoulder and hand straps. Size 9 x 7 x 5 in. approx.
The perfect portable and the ideal car radio. (Use P77 batteries available anywhere).

★ EXTRA BAND FOR EASIER TUNING OF PIRATE STATIONS etc.
Total cost of parts now only £5.19.6 (
Parts Price List and easy build plans 1½ (FREE with Kit)

NEW TRANSONA FIVE
"Home, Light, A.F.N.
Linx. all at good volume."
G.P. Durham
★ 7 stages—5 transistors and 2 diodes

Fully tunable over Medium and Long Waves and Trawler Band. Incorporates Ferrite rod aerial, tuning
denenser, volume control, new type fine

ferrite aerial, Push-
pull output. Attractive case. Size 6 1/4 x 4 x 1½. (Uses 1209 batteries available anywhere).

MELODY SIX
"... amazing at volume and performance...
has really come up to my expectations."
B.G. Stockton-on-Tees.
★ 8 stages—6 transistors and 2 diodes

Our latest completely portable transis-
tor radio covering medium and long

waves. Incorporates pre-tuned circuit set-up, heavy duty speaker, top grade

transistors, volume control, tuning
condenser, wave change slide switch,
sensitive thin ferrite aerial. Push-
pull output. Wonderful reception of

B.B.C., Home and Light, 208 and many
Community stations. Handsome leather case and shoulder straps.

Parts Price List and easy build plans 2½ (FREE with Kit)

SUPER SEVEN
★ 9 stages—7 transistors and 2 diodes

Covers Medium and Long Waves and Trawler Band. The ideal radio for

home or can be fitted with carry-

ing strap for outdoor use. Completely

portable—has built-in Ferrite rod

aerial for wonderful reception. Special

circuit incorporating 2 B.F. Stages, push-pull output, thin speaker

and will drive large speaker). Size 7 1/2 x 4 x 1½. (Uses 9V, battery, avail-
able anywhere).

Total cost of all parts now only £3.19.6 (FREE with Kit)

POCKET FIVE
★ 7 stages—5 transistors and 2 diodes

Covers Medium and Long Waves and Trawler Band, a feature usually found in

only the most expensive radios. On test Home, Light, Luxembourg and

many Continental stations were re-

ceived loud and clear. Designed round

supersensitive Ferrite Rod Aerial and

tone cut, moving coil speaker built

into attractive black case with

rope speaker. Size 6 x 4 x 1½

(Uses 1209 battery available anywhere)

Total cost of all parts now only £29/6 P. & P.
Parts Price List and easy build plans 1½ (FREE with Kit)

STOP PRESS!
Pocket 5 Med and Long wave version with miniature speaker.

29/6 P. & P.

TRANSOONA SIX
★ 8 stages—6 transistors and 2
diodes

This is a top performance receiver covering full Medium and Long

Waves and Trawler Band. High-grade approx. 5in. speaker makes listening a pleasure. Push-pull output. Ferrite

Rod aerial. Many stations difficult in one area, including Luxembourg loud

and clear. Attractive case in grey with red grille. Size 9 1/2 x 4 1/4 x 1½. (Uses P77 batteries available anywhere)

Carrying strap 1½ extn.

Total cost of all parts now only £59/6 P. & P.
Parts Price List and easy build plans 1½ (FREE with Kit)

NEW ROAMER SIX
★ 6 WAVEBAND !
★ 8 stages—6 transistors and 2
diodes

Listen to stations half a world

away with this 6 waveband portable.

Tunable on Medium and Long
waves. Trawler band and two Short

Waves. Supersensitive Ferrite Rod aerial and
telescopic aerial for Short waves.

Top grade transistors, thin speaker.

handsome case with gilt fittings.

Size 9 1/2 x 4 x 1½. Carrying strap 1½ extn.

★ EXTRA BAND FOR EASIER TUNING OF LUX, ETC.
Parts Price List and easy build plans 2½ (FREE with Kit)
Total cost of all parts now only £3.19.6 (FREE with Kit)

ONE TO BUILD YOURSELF FROM THE WHARFEDALE RANGE

Build a loudspeaker system in a concrete pipe and obtain good results. Impossible? If it were, Wharfedale would not recommend it. The fact is that experimental results of this type of enclosure were so successful that Wharfedale have produced an inexpensive kit especially for the Do-it-Yourself enthusiast. The kits come in two sizes—for 8" or 10" speakers and cost £5.0.0 and £6.5.0. In addition you will need a spun concrete pipe which costs about 12/6 from good builders' merchants. The concrete column can be decorated with a variety of finishes—paint, wallpaper, fabric etc. The top is fitted with a loose weave acoustic material.

RECOMMENDED UNITS FOR THE WHARFEDALE CONCRETE COLUMN ARE

SUPER 8/RS/DD
A highly efficient full range speaker with the latest type of ceramic ring magnet. Roll surround gives smooth low frequency response down to 40 c/s. Power handling capacity 6 watts, Impedance 15 ohms.

£7.0.0 (tax paid)

SUPER 10/RS/DD
A 10" speaker with double diaphragm, roll surround and powerful magnet. This unit gives frequency response down to 30 c/s. Power handling capacity 10 watts. Impedance 15 ohms. £11.13.4 (tax paid)
DIGGING THE PAST

FROM time to time, in these Leaders, we have commented on the varied activities of readers. A "radio enthusiast" may mean anything or nothing. He may only be interested in building equipment, or designing it; he may find his inspiration in test gear, receivers or gadgets; he may be a licensed amateur or devote his time to chasing BC band or amateur DX; he may even just like reading about radio. The permutations would fascinate a Treble Chance fan.

This month we show another facet of interest in our special feature article on The Radio Collector, in which the author opens up a novel line of research and study—that of collecting radio equipment of earlier days.

Older readers, particularly those who have grown up with radio, may realise with surprise that radio has not only grown up but has sprouted whiskers and joined the ranks of the antiques! For, in fact, radio is ageing rapidly and it is becoming increasingly important to search out and salvage the physical reminders of radio's youth.

Radio has passed that knife-edge dividing line and what was once junk has now become sought-after collectors' material. As with other currently "in" collector items, most of the more desirable pieces have long since been discarded along with the empty beer bottles, china ornaments and refuse. This makes the hunt all the more exciting and the end result is not only satisfying but educational.

Remember, too, that the radio of today is the antique of tomorrow! Your latest piece of equipment may look like the last word, but in a few years' time it may seem positively antediluvian. In pre-war days, equipment and techniques hardly changed year after year, but now—last year's equipment can often look old hat.

Therefore, it might be as well for younger readers to keep a junk box of representative parts and a few pieces of completed gear. They will then be able to amaze their grandchildren with the crudity of radio in the 1960's!

W. N. STEVENS, Editor
Money No Object

I recently mentioned to the leader of a youth club I belong to that I'd like to try my hand at making a radio receiver. Never having been interested in electronics before, I was hoping for some sound advice.

I certainly got it. The best I could have had.

"Why not get a copy of PRACTICAL WIRELESS?" he said.

I did, and immediately found a circuit that set me off on a new hobby I now intend to follow up with some studying and then some more advanced constructional projects.

That was a few months ago and now that P.W. is bigger, and I'm sure better, I think its a good buy, even for 2s. 6d.

James Houlton
Gravesend, Kent.

Spring is Here

As I see it, this is the most difficult time of the year for radio enthusiasts. If the call of the spring, with us already, and the promise of summer to come, is not enough to drag the amateur away from his workbench to the great outdoors, it usually has that effect on the rest of the family and it needs a pretty good excuse to get out of loading up the car for a day in the country.

The answer of course is mobile operation. This can apply to the short-wave listener as well as the licensed amateur, and now that PRACTICAL WIRELESS has taken on a bigger format, let's hope it helps out with a few good articles on mobile equipment.

H. S. Greaves
Halifax, Yorkshire.

Sticking With It

With PRACTICAL WIRELESS taking on a new size, it has occurred to me that there can be few magazines boasting such a long history. I remember my father reading it before me, and now my son beats me to the door when it is delivered.

It must mean something that it has stayed the course so long, and I think it means that P.W. gives its readers what they want. I know it to be so in my case, and indeed in the case of my whole family. Keep up the good work.

J. Dyer.
Salisbury, Wiltshire.

Correspondent Wanted

I would like to correspond with any Broadcast Band SWL of about 15.

Anfield,
Liverpool, 4.
NEW HANDBIT COUNTERSINK FROM VITREX LTD.

Made from finest Sheffield steel, hardened and tested, moulded into a tough impact resistant plastic handle, the new Handbit from Vitrex Ltd. is ideal for making countersinks in wood, hardboard, plastic laminates, aluminium and other metals and can also be used for de-burring holes in harder metals.

The Handbit is obtainable at leading Hardware, Do-it-Yourself and Department Stores at a recommended retail price of 2s. 6d. If you should have any difficulty in obtaining one please contact Vitrex (Sales) Ltd., 437-463 Caledonian Road, London, N.7.

VERSATILE AMPLIFIERS

Versatility is the maker’s main claim for a new high-quality amplifier. Tape, radio or record pick-up inputs can be fed direct to the amplifier, which feeds any 15Ω impedance speaker system, mono or stereo.

The amplifier, the model LL351 by LL Electronics Ltd. (5 Shakespeare Road, London, N.3) has a power output of 3W per channel and at this maximum has a frequency response of 20c/s to 35kc/s. Response is better still at lower output powers. As well as separate volume, treble and base controls, the LL351 features a balance control and a number of other facilities which adds substance to the maker’s claims for the amplifier which costs 26 guineas.

AVOMETER DESIGNER RETIRES

The man who designed Britain’s most widely used multimeter has retired. After nearly 40 years, the inventor of the Universal Avometer, Mr. H. S. Macadie, has left Avo Ltd.

Mr. Macadie designed the first Avometer in 1932, since when his successors have become familiar sights on electricians’ workbenches everywhere.

MINIATURE TAPE RECORDER FROM JAPAN

Standard of Japan make the miniature tape recorder shown right, and the UK agents are Denham and Morley Ltd. (173 Cleveland Street, London, W.1).

The recorder has a 300mW output twin tracks and at a tape speed of 1½in/sec. gives a recording time of 50 minutes. Its dimensions are 7¾in. x 4½in. x 2½in., and it will operate from mains, as well as batteries, by means of an adaptor. At £1 guinea it comes complete with case, tape and remote control microphone.

NEW HEATHKIT CENTRE

Number 233 of London’s Tottenham Court Road, that Mecca of amateur radio supplies, has been taken over by Daystrom Limited as a centre for their Heathkit range of equipment.

The Centre is equipped with a hi-fi demonstration room and besides the British Heathkit models, the visitor can see a selection from the American range. Kits and fully assembled equipment can be bought from the Centre.

Decibels and Watt-nots

I LEFT my radio construction days a long time ago although I still enjoy reading PRACTICAL WIRELESS. The other day I decided it was time I needed a new radiogram. A few years ago I would have built an amplifier myself and added a good quality record deck, but now I have decided to buy a commercial model.

In the local hi-fi centre I was treated quite courteously, at first, by a young salesman who had all the figures off pat and insisted on firing a whole list of frequency responses, output ratings, input sensitivities, decibels and watts at me, about this radiogram and then that. I tried explaining that I was old enough to be his father and that, at my age one’s hearing capabilities tend to deteriorate rapidly, but he could not see that this was of any consequence.

As it appeared that the equipment with all these wonderful characteristics generally costs considerably more than I had anticipated, I visited another, less pretentious emporium, where I purchased a simple record player for about £25. Now, whether it is a result of my inferior hearing or, as I strongly suspect, the result of a sort of hi-fi snobishness on the part of enthusiasts, I cannot notice any difference between my record player and the high-class, high-price transcription decks I heard demonstrated in the first shop. Certainly my wife, who has extremely good hearing, can detect no distortion in the reproduction.

Can it be that slick salesmanship has bred a race of hi-fi enthusiasts who are oblivious of real standards and only appreciate lists of figures?

By the way, as one who remembers the very first issues of P.W., when it was even bigger than its new format, permit me to congratulate you on its new style.

K. P. L. Rutherford.
Brighton, Sussex.

One Man and His Dog

Yes, I like it. P.W.’s bigger size, that is. It’s not so easy to shove in your pocket, of course, and it tends to get a bit battered when it is pushed through the door, but on the whole I certainly think it improves the contents.

Apart from this, it’s easier for the dog to bring in to me with my slippers and the wife finds it better for lighting fires—only after I’ve read it from cover to cover, of course!

George Lombard.

More News and Comment on Page 124
Subminiature 300 mW Amplifier

F.L. Thurston

This handy little amplifier uses a four transistor transformerless circuit. Dimensions of the complete unit are a mere 2½in. x 1 3/16in. x 1 in. There are none of those messy problems of making up a printed circuit board; the unit is built up on a Veroboard panel. The unit will pump up to 300mW into a 15Ω speaker, but alternative speaker impedances can be used if preferred, with some loss in either output power or quality.

The unit can be used on its own, as a simple amplifier, or can be built into a radio to replace the existing audio section, or can be used with a tuner, etc. To keep the cost down to a minimum, a range of good quality, low cost transistors have been used.

The Circuit

Before delving into the intricacies of this particular amplifier, it is worth while digressing a little and pointing out some of the disadvantages of the more conventional type of amplifier.

Until a couple of years ago, the most commonly used type of low power (100 to 500mW) amplifiers used a two transformer circuit, with one transformer acting as a phase splitter for driving the push-pull output stages, and the second transformer acting as an impedance changer between the output transistors and the low impedance speaker load. In order to conform to the "miniature" techniques of the rest of the transistor circuitry, these transformers were made very small in physical size; consequently, the efficiency of the transformers was low, but, more important, the efficiency varied considerably with frequency. Consequently, the frequency response and distortion characteristics of the circuits was very poor, being particularly bad at the low frequency end of the scale. The only way around this snag was to apply considerable negative feedback over the offending sections of the amplifiers, with consequent loss in gain. Additional disadvantages of these circuits were (a) that the transformers were quite expensive, contributing about one third of the total cost of the amplifiers, and (b) that the output transistors were required to operate in class 'B', and thus had to be 'matched', increasing the total cost even more.

Transformer Type

Fortunately, the two-transformer type of amplifier has now fallen out of favour with most manufacturers, although it is still quite popular in the amateur world. It should be said, in fairness, that this type of amplifier is perfectly adequate for use in baby alarms, intercoms, phone extension units, etc., where high quality reproduction is not essential.

In the modern type of amplifier, most of the snags that were inherent in the older low-power amplifiers have been overcome by changing the mode of operation of the two output transistors; they are no longer operated in class 'B', but operate either as emitter
followers or as common emitter amplifiers with 100% negative voltage feedback, either mode giving a very low (virtual earth) output impedance, thus making it possible to do away with the output transformer. Such circuits are referred to as 'transformerless' although, quite frequently, a transformer may be used in the phase-splitter stage, depending on the type of output circuit that is used. In the rest of this article, we shall consider a circuit which is completely transformerless.

**Tr3 Stage**

Fig. 1 shows the full circuit of this unit. Note that the output stage comprises one p-n-p and one n-p-n transistor. The operation of these two transistors can be understood with the aid of the simplified equivalent circuits shown in Figs. 2a and 2b.

Referring, first, to Fig. 2a, Tr3 can be seen to be connected as an emitter follower, with an emitter resistor Re which, in practice, is Tr4. The emitter follower gives a high input impedance (approx. equal to the β of the transistor times the emitter load, RL), and a low output impedance (approx. equal to the β of the transistor divided by the input source resistance, Rs). In this circuit, Rs equals 560Ω, being made up by R9 of Fig. 1. The emitter follower has a voltage gain near unity, so, when an input signal that is negative to the emitter of Tr3 is supplied to the circuit via Rs, a similar signal will appear at Tr3 emitter and will be applied, via C6, to RL, the speaker. When positive going signals are connected to Tr3, the transistor input will be reverse biased and no output will be available.

**Tr4 Stage**

Referring, next, to Fig. 2b, it can be seen that the n-p-n transistor, Tr4, is also connected as an emitter follower, but in this case it has Tr3 as its emitter resistor and has a slightly higher source resistance, Rs. All of the points outlined for Tr3 apply equally to Tr4, with the exception that this transistor con-

† Longland’s, 6 Mansfield Place, Ascot, Berkshire.

products on positive input signals and is cut off by the negative ones.

Thus, if the input signal were connected to both Tr3 and Tr4 at the same time, and RL were made common to both transistors, Tr3 would conduct on all negative inputs and Tr4 on all positive ones, and the signal appearing across RL would closely follow the input.

Returning, now, to Fig. 1, it can be seen that the 15Ω speaker, the equivalent of RL in the Fig. 2a and b diagrams, is common to both Tr3 and Tr4, and that the input signal, taken from Tr2 collector, is common to both transistors except for some small difference that is caused by R9, which is used to give a small degree of base-bias to the output transistors and thus minimise cross-over distortion.

**Pre-amp and Driver**

Tr2 is wired as a conventional common emitter amplifier, with R8 as its major collector load, and using R6-R10 as its base-bias network. It is important to the operation of the complete circuit that the common emitter junction of Tr3- Tr4 should be maintained at a mean direct voltage level of approximately half the battery supply potential, and to this end the top of R10, the base-bias resistor of Tr2, is taken to the Tr3-Tr4 emitter junction, thus forming a direct-coupled negative feedback loop which tends to stabilise all of the direct voltage levels in this part of the circuit. This loop also provides a.c. negative feedback, which tends to cancel any distortion that might otherwise tend to arise due to the slight unbalance in the drive from Tr2 to Tr3 and Tr4.

Tr1 is wired as a simple common emitter amplifier and acts simply as a pre-amp. for driving Tr2; to prevent instability, a decoupling network, R5-C3, is wired in the negative supply line between the Tr1 stage and the rest of the circuit. The input to the complete amplifier is applied to VR1, a miniature pre-set skeleton pot., which acts as the volume control, and thence on to Tr1 base via C1.
Construction

The unit is fairly compact, all components being mounted vertically on the Veroboard panel; construction is not, however, very difficult, and can be undertaken by the comparative novice (but not the absolute beginner).

Start construction by cutting the Veroboard panel to size and break the copper strips as shown in Fig. 3a. The copper strips can be broken with the aid of a small drill (about 3in.), a sharp penknife, or the special tool that is available.

Next, take VR1 and file and trim the mounting legs until they will fit in the holes in the Veroboard, then solder in position as shown in Fig. 3b, mounting VR1 on the blank side of the board and soldering the legs to the copper strips on the other side. Now solder in the rest of the components, working through the board from left to right, using insulated sleeving where necessary, and making sure to use heat shunts when soldering in the transistors.

If the unit is to be secured to a case or sub-panel, this can be done by carefully drilling mounting holes as shown in Fig. 3a, taking care to drill the holes to just clear a 6BA screw, and pushing the screw through the Veroboard from the blank side and interposing small rubber grommets between the Veroboard and sub-panel. If this method of mounting is used, make sure that nothing is shorted out by the screws.

Using the Unit

The unit is designed to operate with a 15Ω moving coil speaker, but can be used with alternative value speakers if required. If a speaker with an impedance greater than 15Ω is to be used, no modifications need be made to the circuit, but it will be found that the maximum output power will be somewhat restricted.

If a speaker with an impedance lower than 15Ω is to be used, increase the value of C6 to 1,000Ω. If a very low speaker impedance is used, i.e., 3 or 5Ω it may be found that distortion becomes quite noticeable.

Whatever speaker impedance is used, the d.c. conditions of the unit with the input shorted will be unaffected, and the voltages and currents of the unit should be checked before using the amplifier. (see table).

If preferred, the pre-set resistor, VR1, can be replaced by a 10kΩ variable resistor with a built in on/off switch, suitably placed.

PRACTICAL WIRELESS
BINDERS

The new large size "Practical Wireless" Easi-binder is designed to hold 12 issues of P.W. Please state volume number required otherwise a blank cover will be sent.

A new version of the Easi-binder with a special pocket for storing blueprints and data sheets is now available. The price is £1/6d. inclusive of postage.

Order your binder from: Binding Department, George Newnes Ltd., Tower House, Southampton Street, London, W.C.2.
DESpite their considerable and increasing importance, unijunctions, or "unijunction transistors" as they are sometimes known, seem to be very little used in this country. Unfortunately, the inexorable laws of supply and demand rule that the price of unijunctions in this country should be high, and this in turn prevents them being used in many cases where they would be useful.

Prices are coming down, however, and the cheapest unijunction in the latest lists is certainly within the reach of most experimenters. For information, this is the GE type 2N2646 available at 9s. 11d. from Jermy Industries, Vestry Estate, Vestry Road, Sevenoaks, Kent. Prices should continue to fall since the unijunction is in the USA the most common triggering device for silicon controlled rectifiers, or thyristors as they are now known, and the use of thyristors is rapidly increasing in all countries.

The unijunction is a three-terminal diode-like device in which two terminals are made to one part, the base, and one to a rectifying contact, the emitter. The symbol for the unijunction is shown in Fig. 1. The two base connections are labelled as B1 and B2; the emitter as E. In physical appearance, the unijunction is indistinguishable from a transistor.

Characteristics

The characteristics of the unijunction are fairly simple. As might be expected, there is a pure resistance between the two base contacts; this resistance is usually between 2 and 10kΩ and is, of course, the same measured in either direction, a useful point in distinguishing the unijunction from a transistor.

Since all available unijunctions are silicon rather than germanium devices, the temperature coefficent of the base-to-base resistance is fairly low, about 1% change in resistance per degree centigrade change in temperature. The temperature coefficient is positive, i.e. an increase in temperature causes an increase in resistance.

If a voltage is now placed between base 1 and base 2, the emitter junction being left unconnected, the emitter, since it is connected between the two bases, will take up a potential between the extremes of voltage. Since the bases are interchangeable some convention must be followed, and it is usually assumed that base 1 is the earthy connection.

The ratio of the voltage between the emitter and base 1 and the voltage between the bases can now be determined (see Fig. 2) and this is another important parameter, called the "intrinsic standoff ratio" or ISR. Its value is usually between 1/2 and 1.

Since the ISR = \( \frac{V_e}{V_B} \) it follows that \( V_e = V_B \cdot \text{ISR} \), so that given the ISR for any unijunction device, the natural potential of the emitter can be calculated. This calculation is of very great importance for all unijunction circuits, as will be presently shown.

Let us now examine what happens when an external voltage is applied to the emitter at the same time that a voltage is applied between the bases. If the voltage at the emitter is below the natural potential calculated above, then only a very small leakage current can flow. This current remains negligible until the voltage at the emitter is allowed to rise a little above the natural potential (about 0.2V).

When this occurs, the emitter junction starts to conduct like any other diode which has been forward-biased. The resistance between the emitter and base 1 becomes very small, and the emitter then tries to supply all the current to base 1. To prevent this surge of current becoming destructive, external resistors must be arranged in the base 1 lead or in the emitter lead, or both.

We can see that the action of the unijunction is rather like that of a thyatron in the time-bases of early TV sets. It is not surprising that our first illustration of the use of a unijunction shows it playing the part of two transistors in a time-base type of circuit (Fig. 3).

Consider the circuit of Fig. 3 when the voltage is
first applied. Since the capacitor C1 is uncharged, the potential at the emitter must be zero, and no emitter current will flow. As the capacitor charges, the emitter potential increases until the device "fires", and the capacitor discharges through the resistor in the base 1 circuit.

The emitter voltage then drops until the high current can no longer be sustained (usually at an emitter voltage of 1–2V) and the action starts all over again. The outputs of this circuit consist of an approximate sawtooth from the capacitor, and a sharp pulse from the resistor in the base 1 circuit.

If the capacitor charging resistor is replaced by a transistor, an excellent sawtooth can be obtained, especially if the output is taken via an emitter-follower, as in the circuit of Fig. 4, which shows a time-base circuit suitable for oscilloscope use with the new low-deflection-voltage oscilloscope tubes which are now available.

**Temperature Effects**

Unlike a thyratron, however, the unijunction is affected by temperature, as might be expected of any semiconductor device. The parameter most affected by temperature is the emitter firing voltage which is equal to the natural potential Ve calculated before, plus the voltage across the diode formed by the emitter and the base contact.

It is this latter diode voltage which is temperature sensitive to the tune of some 2 millivolts per degree centigrade; the diode voltage decreasing as the temperature increases and vice versa.

There are several methods of compensating for this change of firing voltage with temperature, one shown in Fig. 5 uses silicon junction diodes with the same temperature sensitivity as the unijunction to compensate. Another method is to use the temperature variation of the base 1 to base 2 resistance (which is about 0.8% per degree C) as a form of compensation, as this temperature variation is in the opposite direction.

If the base-to-base resistance is much greater than the external resistances, the current through the unijunction is set by the base-to-base resistance. Let this current be Io. Then, following Fig. 6, for a temperature rise of one degree the current must change by

---continued on page 146
If you are interested in sound mixers and you require a practical book, then this one is a bargain. A bargain because it provides a complete and practical study of precisely what the title implies. Commencing with a simple introduction to the subject, it presses on with decibels and their use; simple resistive circuits, design problems and technicalities; power supplies; installation; practical circuits; and use and adjustment. Also included is an extra 8-page appendix with useful information on logarithms, decibels, impedances, resistors, colour coding, and a glossary of terms. For the audio enthusiast and those interested in the mixing and building side of the business, this book is highly recommended.—DLG

To present a book on the subject of aerial design is no easy task. On the one hand is the vast ocean of abstruse mathematics, while on the other the danger of over-simplification. The author attempts to steer a middle course between these two extremes. The theory of aerials is developed from first principles, but where approximations are necessary in order to avoid mathematical complication the reasons are given and the significance of the approximations indicated. It opens with a concise exposition of the laws governing electric and magnetic phenomena upon the basis of field theory, and the fundamental concepts and quantities are introduced and defined. The theory and practical applications of Maxwell's electromagnetic wave equations are next dealt with (and there is an appendix which gives the derivation of the vector formulae employed). A further chapter is concerned mainly with the two important characteristics of an aerial for transmission or reception—the radiation pattern and the impedance—while the final chapter describes the practical forms which aerials take for particular uses and the various techniques employed to obtain the effect.—HCA

This book has attempted to include, in 96 pages, what should really require 296. As a result it is difficult to see that it will satisfy any reader no matter what level is considered.

Although headed the ABC's of Electronic Organs it spends the first twenty-odd pages, one-fifth of the entire book, talking about non-electronic devices, and it might have been better to condense this into far fewer pages.

The inside cover assures that items will be of special interest to the electronics technician. However the few odd parts of circuits that are illustrated are devoid of component values, except for just one isolated item.

The crowning glory for the technician is the amazing logic in the statement on page 85 which imparts the knowledge that “Failure to oscillate indicates some quite obvious defect . . .!” It is regrettable that the only parts of this book which held your reviewer's attention were the introduction by W. Oliver, and the Glossary.—LSA

This book enables the beginner to the world of radio and electronics to find out “what it's all about”. Chapter 1 introduces the reader to the principles of electric current flow and subsequent chapters cover electrical units, terms and circuits, magnetism, d.c. and a.c. electricity, inductors and transformers, capacitors. The final chapter deals with the construction and use of a simple crystal set.

In addition to the practical constructional projects, each chapter contains sufficient text to explain the basic theory necessary to understand the principles involved. So that with this book, it is possible for the beginner to observe what happens in electrical circuits and to understand why it happens.—CRR

This compact, convenient volume contains authoritative, up-to-date definitions for almost all terms used in computer technology. Included are terms for all forms of general and special-purpose computers, including analog, digital and hybrid types. Acronyms, phrases, abbreviations, etc., used in specifying coding and programming systems, memory systems, logic and notation systems, and various circuit configurations are all represented.

Students, programmers, technicians, business executives, writers and editors, secretaries or anyone interested in or working with computers, will find this dictionary a useful reference source.—HCA

105
A TRANSMITTER in the 30-60 watt range, with internal v.f.o. and high level modulation, is extremely useful, and the one described here can be constructed at much less cost than that of a ready-made transmitter of equal power. Actual building is straightforward, with no snags or particular difficulties. The whole transmitter occupies a single chassis, the power pack being separate. It covers 80, 40 and 20 metre bands, and incorporates send-receive switching to avoid the need for an external switch or relay.

THE CIRCUIT

The circuit is shown in Fig. 1 and a brief explanation of valve functions may be helpful. V1 is the variable frequency oscillator or v.f.o., operating with a regulated supply from V2, and covering 3.5—3.8 mc/s. It is constructed in a box, easily made as described. Drive from the v.f.o. cathode is through C6 to the buffer/multiplier V3.

For 80 and 40, the anode circuit of V3 is untuned. For 20, S1 introduces the broad-banded coil L2, so that V3 functions as doubler. V4 is the amplifier/driver, the coil L3 being tuned to the working frequency on all bands. VR1 allows grid drive to the power amplifier V5 to be adjusted as required. By closing the “Net” switch, h.t. is applied to V1—V4, so that tuning and grid drive may be adjusted.

V5 is the p.a., operating straight through on all bands. More than enough grid drive is available on all bands. L3 may in fact be switched to give 15m coverage, with sufficient grid drive. V5 may be operated with up to 60 watts input.

As it is essential to observe grid and anode currents of V5, two meters are provided. Surplus meters can be purchased at low cost, and this is much more convenient than having a single meter, with grid/anode switching. L4 is the switched tank coil, intended to operate into 75Ω, but actually able to work with aerial impedances up to some hundreds of Ω.

Fig. 1: Complete circuit diagram of the 3-band transmitter.
V6 is a high-gain pre-amplifier, for crystal microphone. V7 acts as amplifier and phase splitter, driving the pair of 807's which provide high level anode and screen grid modulation. The Woden modulation transformer is rated for 60W to the p.a. and 30W of audio, and gives excellent results with lower inputs.

The transmit-receive switch has five sections. S4 applies h.t. to the exciter and V6 and V7 of the audio amplifier. S5 transfers the aerial from transmitter to receiver. S6 shorts the aerial circuit of the receiver on transmit, while S7 mutes the receiver speaker. S8 switches h.t. to the p.a. V5 and modulator valves V8 and V9. There is no need to use the particular h.t. voltages shown.

**LATER MODS**

Some modifications can be made to the transmitter later. These include adding a screen clamp valve to protect the p.a. and allow keying in an earlier stage. V.F.O. coverage can also be modified for greater bandspread on 7mc/s and 14 mc/s. This does not increase efficiency, but opens out the v.f.o. scale on these bands. The transmitter has also been used on 21mc/s, but this is not included as adjustments become somewhat critical. A high/low power switch can also be added, to permit tuning up V5 at reduced power.

---continued overleaf---
METALWORK

Fig. 2 is the chassis layout, with positions of the valveholders, etc. Note ventilation holes are punched round the V5 position. The modulation transformer requires an opening about 2½ in. by 23 in. which can be made by drilling at the corners, then cutting the piece away with a metal saw.

The centre screen is aluminium, 5½ in. x 6½ in. and a ½ in. flange is bent at right angles to meet the chassis and panel. This, and two side brackets, about 3 in. wide and 7 in. high, bolted to chassis sides and panel, give a rigid assembly.

The panel was 22 s.w.g. aluminium faced with hardboard painted grey, both pieces being 14 in x 9 in. The aluminium and hardboard can be fixed together with bolts in the bracket positions, and both can then be drilled together. Also punch or drill the front chassis runner for the five control bushes located below the chassis. A clearance hole is required for the v.f.o. ball drive.

All the most important drilling should be finished before mounting any components to avoid trouble from metal fragments. These parts can then be assembled. A tag is placed under each valveholder fixing nut.

WIRING

The anti-parasitic choke is five turns of 18 s.w.g. wire, forming a coil ½ in. long and with an outside diameter of ½ in. R12 is placed inside the choke, and connected to V5 cap clip and C18 by the shortest possible leads.

A coaxial socket is fitted to a bracket at the rear of the chassis, and a piece of 75Ω transmitter grade coaxial cable runs to the transmit-receive switch. This socket should not be under the chassis. L4 and its switch are best left until the transmit-receive switch has been connected.

Ceramic disc capacitors are best for most r.f. by-pass positions, though not essential. They should be connected by very short leads.

When wiring V5, use 16 or 18 s.w.g. for the chassis return, and solder this as near the pin contact part of the sockets as possible, not to the socket tag ends. The descending lead of RFC3 must also go immediately to C15.

Heater and h.t. circuit connections run against the chassis. Wires and components carrying r.f. (notably grid and anode circuits of V3 and V4, and the grid circuit of V5) should be connected in the most direct manner.

In the audio amplifier, screened leads run from VR2 to C22 and grid pin 7 of V7. R13 and C19 are to keep r.f. out of the amplifier, and C22 and C24 are of such value as to give a strong middle frequency response. Note that R21 and R22 are five per cent, or checked as similar with a meter. This also applies to R24 and R25.

BUFFER ANODE CIRCUIT

The coil L2 has 36 turns of 32 s.w.g. enameled wire side by side on a ½ in. diameter cored former as in Fig. 3. Any other small coil which can be tuned to about 7-1Mc/s would do. Section S1 of the exciter bandswitch selects L2 for 14Mc/s and r.f.c.2 for 3-5 and 7Mc/s. Switching here is in the anode circuit, but as V4 is doubling except when V3
**LAFAYETTE HA-43 COMMUNICATION RECEIVER**

7 valves plus Rectifier. 4 Bands. 550 Kc/s. 30 Mtrs. 800W. A.C. Brand New £9 15s. 6d. 

**LAFAYETTE HA-55 AIRCRAFT RECEIVER**

100-190 M.C. High selectivity and sensitivity. Incorporates 2 F. Signal Trumpet for tuning. £8. 15s. 9d. Supplied new and guaranteed. £10. 15s. 9d. Also available in semi-Kit Form, £5. 15s. 6d.

**LAFAYETTE HA-230 AMATEUR COMMUNICATION RECEIVERS**

**TRANSPARENTIS TWO-WAY MICROPHONE INTERCOM.**

Operates over amazing long distances. Separate call and press to talk buttons. Wide connection, 1000 ft. of applications. Richly finished in ebony. Supplied complete with batteries and wall socket. £6. 15s. 9d. P. & P. 9/6.

**SNELLIN TRANSISTOR AMPLIFIERS**

213 Amplifier 89/-; Power Pack 4/-; X10 Amplifier £7. 15s. 6d. 212 Power Pack 5/-; 110 and 213 £8. 15s. 6d. 

**MAIN LONDON AGENTS FOR CODE EQUIPMENT**

All Items available as advertised.

**CLEAR PLASTIC PANEL METERS.**

First grade quality, Matching Oil panel meters, available according to size. £3 15s. 6d. R.A.E. for illustrated booklet. Discounts for quantity. Available as follows: Type A 250 V.A.C. £1 15s. 6d. Type B 250 V.D.C. £1 15s. 6d. Type C 250 V.A.C. £1 15s. 6d. 

**TE-20 RF SIGNAL GENERATOR**

**VOLTAGE STABILIZING TRANSFORMERS**

Input 70-190V; output 110-240V, Constant output 110 or 240V. 360 watts. Brand New £11. 15s. 6d.

**AMERICAN TRANSISTORIZED AMPLIFIERS**

213 Amplifier 89/-; Power Pack 4/-; X10 Amplifier £7. 15s. 6d. 212 Power Pack 5/-; 110 and 213 £8. 15s. 6d. 

**TE-51 NEW 20,000 VOLT MULTIMETER.**

0.1% / 0.2% / 0.5% / 1.0% full scale. Suitable for power supply, 1000 V. A.C. up to 1000 V. D.C. £12 10s. 6d. £11 10s. 6d. 

**TE-L-1 NEW 30 VOLT MULTIMETER.**

0.1% / 0.2% / 0.5% / 1.0% full scale. Suitable for power supply, 1000 V. A.C. up to 1000 V. D.C. £12 10s. 6d. £11 10s. 6d. 

**MODEL PV-23 VALVE VOLTMETER.**

11 seg. Input. 7 D.C. volt ranges. 1,000 V. D.C. volts. £12 10s. 6d. £11 10s. 6d. 

**TE-52 20,000 O.P.V. PUSH BUTTON MULTI-TESTER.**

Simple operation. D.C. volts up to 1,000 v. A.C. volts up to 1,000 v. Suitable for motor testing. £12 10s. 6d. £11 10s. 6d. Post paid.

**NOREMIXE EQUIPMENT.**

Transistorised Audio Generator 10-100,000 c/s. Square wave or square wave. £13 15s. 6d. 

**1G. 500/1,000v. D.C. 2/6.**

Transistorised Resistance Unit 1 G. 500/1,000v. D.C. £6 10s. 6d. £5 10s. 6d. 

**P. C.R. 3 RECEIVERS.**

**DESIGNER'S RATING.**

For operation and requirements. 

**VARIABLE VOLTAGE TRANSFORMERS**

Brand New — fully Shrouded. Input 250v. £5 6s. 8d. Volts. 

**AMERICAN AMPLIFIERS.**

213 Amplifier 89/-; Power Pack 4/-; X10 Amplifier £7. 15s. 6d. 212 Power Pack 5/-; 110 and 213 £8. 15s. 6d. 

**NEW MODEL C.**

Over 60 sets made up to date.

**CALLERS WELCOME!**

UNDoubtedly
THE FINEST RANGE OF TAPE EQUIPMENT ON THE MARKET FROM

Kedoco
COMPLETE HI-FI TRANSISTORISED TAPE RECORDING SYSTEM FROM 12 VOLTS
IDEAL FOR BUILDING A TAPE RECORDER IN YOUR CAR OR A PORTABLE UNIT.
NOTE THESE OTHER STAR FEATURES ★ LOW POWER CONSUMPTION ★ SMALL
SIZE ★ COMPLETE FLEXIBILITY IN DESIGN FROM SEVEN BASIC UNITS

TAPE PRE-AMP SSTR/7
All silicon transistor. Zero hum. High gain and equalised at 7" per sec. to give flat response output. Simple mod.
description. Suits all types of recording equipment. Equipped for use of crystal ceramic and radio.
ASSEMBLED 29/6

MINICLASSIC PRE-AMP SSPA/50
Tone controlled high gain preamplifier designed specially for application with the Kedoco Portable. Zero hum.
12 Volt, 8000 ohms. 4000 ohms. 1500 ohms. 900 ohms.
ASSEMBLED 39/6

RECORD PRE-AMP SR/8
High gain pre-amplifier designed for use with SSPHM. Record amplifier will work directly from radio,
preamp matches to any ribbon or crystal microphone.
ASSEMBLED 29/6

RECORD AMPLIFIER SSH9/3
Fully transistorised. High voltage H.T. rail derived from oscillator. Provides substantially constant output level, 1 volt input gives 1 volt output. Power consumption 1mA at 12 volts and 2mA at 24 volts. H.T. rail derived from
AMPLIFIER SSH10. ASSEMBLED 45/-

POWER SUPPLIES
12 volt, 1 amp designed to supply complete tape system. 20 volt, 9 amp designed to power Kedoco hi-fi 20 watt model.
12 volt 5w., 30 volt 8w.

MINICLASSIC SS3/10
High fidelity 4 watt main amplifier: ideal for use with SSH57 and makes complete tape amplifier.
18 chs to 20,000. Requires 12 volt + H.T. and will operate directly from crystal pickup, 6 transistors and two diodes all mounted on precision printed circuit board. Max. music power 4 watts into 8 ohms.
ASSEMBLED 69/-

MINICLASSIC SS3/10
Similar to SS3/10 but requires 18 volts and gives greater power. 8 watts peak. Also 30 volt.

TAPE OSMILLATOR SS013
Complete unit incorporating push pull transistor oscillator giving adequate erase power and recording power. Very compact. Push-pull output frequency 50-50 kc. All silicon transistor. Pro-
vided with K.V.C. Hall for operation. Record amplifier. High efficiency unit requiring 12 volts. Only unit on the market at such an economical price.
COMPLETE 69/-

KEDOCO ELECTRONICS also manufacture a range of Transistors, Generators, Rectifiers and Capacitors, See Practical Electronics for details of these other exciting Kedoco Transistorised products or send S.A.E. for leaflets.

All KEDOCO Products are fully guaranteed and if you return any product to us within seven days your money will be refunded.
is untuned on 3.5 Mc/s there is no trouble from instability.

L3 is wound as in Fig. 3. With L3 wound as shown, 14 Mc/s should be found with VC2 almost fully open. For 3.5 Mc/s, VC2 is about half closed, and 7 Mc/s falls between these positions. L3 is supported on a pillar (or long bolt).

**FUNCTION SWITCHING**

Connections for this are shown in Fig. 4. The switch has three positions. This allows the transmitter aerial circuit to be made before h.t. is applied to the p.a., while h.t. is removed before the aerial circuit is interrupted. In addition, h.t. is always present on the exciter before the p.a. is operating.

The front wafer has only two poles in use. The rear wafer needs three poles. The latter wafer was actually a 2-way 4-pole assembly, providing no contact to any circuit at "receive". An ordinary 3-way wafer is equally suitable, of course.

Wiring is most easily carried out by soldering coloured flexible leads to the tags as in Fig. 4, and taking them down through the chassis. They can then be identified and connected below. The Net switch is simply in parallel with S4. The speaker muting and receiver co-axial leads are kept clear of the aerial co-axial lead from S5. Short connections are made to the points MC by placing tags under the switch assembly bolt. Adequately insulated wire must be used for the h.t. circuits, and especially from S8 and the modulation transformer.

**TANK COIL**

The p.a. tank coil is wound as in Fig. 5, using very short leads. It is supported from the centre screen. It is most convenient to prepare the coil with projecting leads, then to cut and shape these, and solder them to the switch and capacitors.

This coil will allow loading of the transmitter by any of the usual transmitter aerials. A dipole is suitable, or one of the popular multi-band arrangements.
ON THE SHORT WAVES
MONTHLY NEWS FOR DX LISTENERS

THE BROADCAST BANDS by JOHN GUTTRIDGE

Burma: Burma Broadcasting Service (Prome Road, Kamayut P.O., Rangoon) has been heard in Burmese on 4,795. Sign off is 1445.

China: Radio Peking (Broadcasting Administration, Fu Hsin Men, Peking) reported in English 0830—0930 on 15,450/15,300/9,530 and in 25 m.b. Also 0930—1030 on 15,300 and in 19 and 25 m.b. A medium wave transmitter located in Western China and beaming Russian to Soviet Union is audible in the U.K. on 1,523.

Indonesia: Radio Republik Indonesia (P.O. Box 157, Djakarta) has English for Europe 1900—2000 on 9,865/9,690. The frequency of 9,780 has also been reported. There is also an English transmission at 1430—1530 on 9,865/11,795.

Japan: N.H.K. (Tokyo) introduced a retimed schedule at the beginning of April the most important feature of which is the return of the evening service for Europe from 1930—2030. Languages are German, English and Swedish and frequencies are 9,700/11,965. An English segment is retained in the morning transmission retimed to run from 0630—0830 on 15,135. Other retimed services in English or with English segments are: North American 2345—0045 11,780/15,135; North and Latin American 0100—0300 15,135/15,235/17,875; Hawaiian 0630—0730 15,235/17,725; Philippine, Indonesian and Malaysian 1130—1300 9,525/11,780/11,940; Southeast Asian 1230—1530 9,765/11,705/11,875; South Asian 1330—1500 9,525/9,670/11,780; African 1600—1700 9,670/11,780; Middle East and North African 1730—1900 9525/11,780. A new set of QSL cards has been produced by N.H.K.

Pakistan: Radio Pakistan (71 Garden Road, Karachi 3) has English 0030—0100 on 9,625. Dictation news in English may be heard 1335—1350 on 9,820. This frequency is also used for English news at 1500. The UK English service at 1945—2030 now uses 7,100/9,675.

Singapore: Radio Singapore (Broadcasting Division, Ministry of Culture, P.O. Box 1902, Singapore) has English 0200—0300 on 11,940.

Vietnam: (Democratic Republic): The Voice of Vietnam, (No. 58 Quan-Su Street, Hanoi) is using the new frequency of 11,720. Reported with Japanese 1330—1400. English transmissions, all on 11,840/9,840, are aired at 1000—1030, 1300—1330, 1530—1600, 2300—2330.

Australia: Radio Australia (P.O. Box 428G, G.P.O. Melbourne) now transmits in English to Europe from 0645—0745. Frequencies are 9,570/11,710. The North American 1214—1315 English transmission is now on 11,840,

New Zealand: Radio New Zealand (New Zealand Broadcasting Corporation, P.O. Box 2396, Wellington C1) uses 9,540/11,780 1700—1945; 0600—0845, 0900—1145; on 9,540 0815—0845 (Sundays only); on 11,780 2000—2230. U.K. reception is reported best on 9,540 at 0900—1030.

Canada: Canadian Broadcasting Corporation (P.O. Box 6000, Montreal). The North Canada service from 0230—0700 is now carried on 11,720/9,625. For the 2200—2245 transmission 9,625 has been replaced by 15,190. Other frequencies are 11,720/5,970. A new QSL giving all verification details is now being issued.

U.S.A.: Although strictly broadcast band stations RCA communications stations provide an interesting catch. A very good QSL is provided. Try for WES 65, New York on 15,460 and DZR 41 at Manila in the Philippines on 19,980.

Radio New York Worldwide (4 West 58th Street, New York, N.Y. 10019) expects to have the following frequency usage until September 3. On 15,300 1200—1400, on 15,440 1200—2400; on 17,780 1215—1800; on 17,845 1800—2145; on 17,730 1500—2200; on 17,840 2200—2400.

Cuba: Radio Habana, (Apartado 7026, Habana) transmits in English 0100—0330 6,170; 0330—0600 6,170/6,135; 1500—1900 15,340; 2010—2140 11,735; 2050—2150 15,300/15,270.

Haiti: Radio Station V EH (Box I, Cape Haitien) has English 1030—1400 on 11,835/9,770/6,120/2,450.

Brazil: Radio Sociedade da Bahia (Rua Carlos Gomes 57, Salvador) reported with a powerful signal 2240—2330 on 11,875. Frequent identification given during programme of Latin American music. Some reports give the frequency as 11,871. Also heard on 15,160 up to 2,000.

Radio Feira de Santana (Casilla Postale 32, Feira de Santana) can be heard over ZYN37, 4,765, at 0030.

Radio Brasil Central (Casilla Postale 330, Goiania) is reported with ZYX2 on 5,000 at 2400. The station is listed on 4,995. 5,000 is a frequency reserved for standard frequency transmitters.

Radio Rio Mar (Casilla Postale 443, Manaus) has been heard with excellent signal at 0030 on 9,695.

Clandestine: Radio Scali has been heard on 13,800 with sign off at 2205. Does anyone know anything about this station?

GARRARD 3000 AUTOCHANGER

Intended for use with high compliance cartridges and featuring a low mass arm that minimizes record wear. Four standard speeds. Finished dark grey with chrome relief. Guarantee required 12miles. Above board, below 5in. For 100/130v. Complete with STA/UE cartridge.

£8.80 Carr. 9/-

MAGNAVOX 363 TAPE TRANSPORTER

Manufactured to precise limits that permit recording and tape playback to the highest standards set by the Motion Picture Industry. Simple reliable design employs a single high-torque motor with heavy flywheels. Features include near wind on and rapid rewind, power control, 8-speed selection with interlock, built-in revolution indicator, piano key controls. Speeds: 15, 30 and 75 ips. Winder and facilities $1.50. On 75 ip. Max. speed $8.75. Playing time up to 100 mins. per reel from 15ips. standard tape. Max. 15in. x 1in. Max. 8in. x 2in. Head with 4 track heads. £10.10d. With 1 track heads. £8.18d. Add 10/- carriage and insurance.

SUPERB NEW STERNE-CLYNE FMI VHF TUNER

Equipment. Ideal for use in areas of America with large number of hostile objects. Excellent quality output and uniformly high performance at all frequencies. Available in a wide range of frequencies and sensitivity. Also suitable for use in inland stations. Complete with 9TA/HC kit. £7.9.6 Carr. 4/-

EXCLUSIVE OFFER OF TOP QUALITY RECORDING TAPE

New American bandana tape by world renowned manufacturers and absolute equality to the best obtainable anywhere. Guaranteed twice true, red oxide coated, with full flexibility. Suitable for matching with other tape materials. Includes record play back. Pre -amp and power pack. Kit parts. £10.6. Carr. 4/-

NEW ADVANCED DESIGN VERITONE

High quality, all British units with built-in tweeter crosstalk, and a high flux magnet that ensures withstanding all circumstances yet cheaper than many commercial sets. For 200/200 volts mains operation.

20 Gns. Carr. 8/6 Thd. 10/-

SF/TR3 TAPE AMPLIFIER

Really the best complete tape amplifier available to the home builder. Supplied already matched for the Magnavox 393 tape recorder, but may be readily fitted to many others. Features include pressure-swing equalization for all speeds (CTE standards at 21ips.) Treble boost provision during record. Bass boost during playback. Speaker output matched for 3.7, 5.1 and 15 ohms. Additional controls for extension speaker, phone monitoring on record and HF playback through extension speaker. £12 11/- 6d (Panels 12 6/- 6d. Power pack £1 15/- 6d. Head and panel kit £3 15/- 6d. AMPS and test kit £4 15/- 6d. Carry Case especially designed to take Magnavox 363 and 393 tape units. Suitable for use on high power amplifiers. £10 15/- 6d. Add 10/- carriage and insurance.

TAPE PRE-AMP AMPLIFIER TYPE 'C'

Specially designed by Mullard Laboratories for use with high quality recorder. Used for use with the Magnavox system, and supplied specifically 393 tape recorder. Features include: pre-amp for use on easy-to-use tape recorders. Incorporating crosstalk transformer, adjustable output for matching. £3 15/- 6d. Available with high-quality amplifier supplies, with 3x 100000, and 3x 100000 d.c. £3 15/- 6d. Available with 4x 100000 d.c. £3 15/- 6d. Complete with test leads and battery.

HIRE PURCHASE TERMS. AVAILABLE FOR ALL GOODS OVER £13.10.0.

TEST 7 POCKET MULTIMETER

39/6 Carr. 5/-

A really versatile instrument that makes a handy pocket-size tool. Measures AC or DC voltage in three ranges of 0-250-500-1000v. Resistance 0-100000 ohms, and current 0-1000 ma. £5 15/- 6d. Add 10/- carriage and insurance. Ideal for use in many different situations, particularly for RC modelling purposes. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d. £5.15/6d. £3.15/6d. £2.15/6d. £1.15/6d. £0.15/6d.
MAJOR tragedy this month. A bumper crop of "real fab" logs but not enough room on one page to get them all in. So my thanks to all those who did send in those very excellent reports and sorry if yours is not in print this month.

Top Band

Conditions all round have varied from superb to even more superb. From Portsmouth G3SED informs that topband is not merely alive—it's positively crawling. Proof of this is Mike's QSO with ZL3RB (New Zealand) when the ZL was 579. This is no freak either since ZL3RB has also worked G3RPB and G3RFS on this band. Even on 20 a ZL is DX so how does one describe it on topband? So fantastic have conditions been on this frequency that 9V1LP (Ex 9M4) sent Mike a tape of his (Mike's) sigs arriving there at 59! The log for the past couple of weeks at G3SED reads—EP2BK/MM, HK4EB, IS1FR, VE2UQ, VE3LI, W1BB/1, W1HGT, W1JX/KP4, W1MO, W2AQV, W2U1, WA4LDM, W5HGW, W9PNE, W9VXO, W9YYG, ZB2AM, ZL3RB, 4U1ITU, 9H1AE, 9H1HX, 9V1LP. Just for the record the antenna is a Marconi with 85ft. semi-vertical section and tuned against an earth mat, half a square mile in area! (Must get the XYL to knit me one for Christmas out of ex-gvt. telephone wire.)

10 Metres

At the other end of the spectrum we find those openings on 28Mc/s getting more frequent. In March openings came on the 6th, 12th, 13th, 16th, 19th and 20th. Chris Clarke comments that the openings on 19th, 20th, were just 28 days after the amazing conditions and openings to "W" land on February 19th i.e. approximately the sun's rotational period. Wonder if the real keen types phone Jodrell Bank to check what the sun's up to before switching on? The log Chris (Farnham) sends for 10 metres is as follows, all on phone too—CE8AO 55, CR6AL 54, CR6BX 54, CR7IZ 57, CX1B 54, CX2AY 57, CX7AAS 57, EA8EV 55, EL2AP 55, F87RT 54, plus scores of G's. All between 1300 and 1900hrs. Others include HK4KL, LU8EYH, PY2AQV, UA6FEG, UL7APG, VP6JC, YV5BPI, ZE1AN, ZE2JA, ZE3JS, ZS4O1, ZS6JK, ZS9J, 4X4IH, 9J2DT, 9J2VX.

Fifteen and Twenty

Fifteen and Twenty have been superb at times and sometimes so much DX about it's been difficult to decide who to listen for. An indication of these happenings can be judged from the following log from Chris Claydon (Fife) 840C, the log is not in alphabetical order, just as they queued up at the antenna for recognition on 15. VS9KRV (Kamaran Is.) ZS1ACO, CN8LK, VQ8AW (Mauritius), 9K2AD, ZC4TX, JA5BII, PY2CTF, VS9AMD, 9J2WR, KV4CI, 6W8LQ, W0KDF, 5R8CB, 7G1A, TN8AA, VO1AW, WA8MFR, VE3YD, CR36A, 9H1R, ZE1JR, CR7IZ, ZS6AAC, W6QI, W6MSM, ZB2AM, VE3AZZ, W2CSQ/MM, KP4BFF, K7UK8, CM1AR, C05FS, CX2FD, CX9AAN, FG7XX (Guadeloupe) HK7UL, MP44BEU, 0A4UQ, PJ2ME (St. Maarten) PZ1BE, TF2WJS, 9Y4LZ, 7Q7LC, 7X2AH, 9K2AD, WA1EAV/ VP9, VU2FN, VU3GC, C. Clarke (Surrey), 12 valve homebrew s/het, 33ft. piece of wire, also on 21 all on phone logged. JA–1CIA, IDQ1, IT1VS, IN1H, 2AYP, 2BBR, 7BEI, ØBLU, K–1ZKW, 2VTC, 2KZX/MM, 3NH5, 5MOH, 8AXK, 9AWK, KR6DJ, KV4CX, MP48AA, O4AKY, OD5SB, OX3JY, SV1AB, UA3KAO, UA6AW, U99H, U9JN, VE3AXF, VK2KN, VS6AJ, VS9AFR, W–1EEP, 2GZK, 3FFS, 4GHT, 5PMZ, 8DAF, 9HOG, ØYCT/MM, WY8AX, YY1SB.

Ian Black's HE30 (Kent) informed him of the following stations on 20 via his multie antenna—N8BNV, CR6CN, CR7GF, CR9AI, DU1BA, EABHF, FG7XX, H1ISO, H18XMT, HK0AI (San Andres Is.), HL7AZ, HR1UMF, HS1UMF, KG4BDL, KL7WAH, K2GNN/P/KL7, KP4RK, KZ5PW, LA2JK/P (Jan Meyen Is.), OD5SB, OH0AI, OX3YK, PJ4AC, KZ5PW, ST2BSS, VE1AED/P/SU, TF3EA, VK7RX, VK0DJ, VP2GLB, VP5RB, VP9BN, VQ8BJ, VQB9H (Seychelles), VS9KRV (Kamaran Is.), XEICCCW, XW8BM, YS1AG, ZB2AI, ZC4CT, ZD5D, ZF1XX (Cayman Is.), 4X4BL, 5A1TS, 5A3TS, 5ATJ, 5GT2, 6O1AU, 6Y5AR, 7QF/LA, 7X2MD, 9J2VX, 9K2AM, 9M2AA, 9N6Q, 9Q5HF, 9V1MY. All on phone, s.s.b/a.m.

Eighty

Eighty metres totally deserted! One of those disagreeing with this is Chris Peel (Stoke-on-Trent), S750, 45ft. Iw. he heard the following on s.s.b all around 2400hrs. W1, 2, 3, 4, 5, 8, 9, 0, VE1, 2, 3, VO1, CN8AW, EA91C (Ifni) 4S1WL, OH0NF, OX3KI, SM6CKU/MM (off Ceylon coast) VK2AVA (1900hrs). VE4FK, ZB2AO, 6W8CW, 9J2MX. F. Simpson (Hull) confesses to hearing on 80–C8NST, KP4ASP, K75FX, OH0NI, PJ3CD, TF3ST, UB5CEP, U99AF, VE1, 2, 3, VO1, VP3AA, VP7NS, VP9DC, YV5BWI, ZL4LM, 6Y5XG, 7X2AH.

Odds and Ends

Something to listen for this month? Try the following. VR6TC/15/20 s.s.b. daily skeds, KX6JI 20 c.w. (Japta) WA9QJW 29100 kc/s using 5 watts! HP9FC/MM on board ship on the New York/South Africa run. VP5GC (Grand Cayman) evenings only due to p.s.u. problems. VS9K (Kamaran Is.), VQ9HB will be visiting 7Q7 (Aladbra Is.) 6O1AU to do a jaunt round Jordan as JY1AU, 9Q5HF a missionary station starting up again with s.s.b daily skeds, ZS9J, 4X4IH, 9J2DT, 9J2VX.@
ANOTHER 24-PAGE POCKET GUIDE

TESTING TRANSISTOR AND VALVE CIRCUITS

The third booklet in the PRACTICAL WIRELESS Circuit Series. Contains all you need to know to test and trace faults in modern circuits, with emphasis on circuits of the nature of those described in the two previous booklets.

ALSO IN THIS ISSUE:

- A GRID DIP OSCILLATOR
- WIDE RANGE AUDIO OSCILLATOR
- S.W. RECEIVER FOR THE YOUNG CONSTRUCTOR
- A.G.C. IN TAPE RECORDING

MAKE SURE OF YOUR COPY! Hand this Form to your Newsagent

NAME

ADDRESS
HOW many times have you picked up a piece of faulty equipment and felt like wrapping it around the manufacturer's neck?

More and more often in latter years, we'll be bound. Built-in obsolescence, intentional or otherwise, seems to be the watchword of the "sixties"! And nowhere is it more apparent than in the radio industry — the domestic sector, at any rate.

Wrapping it around the manufacturer's neck.

These wry thoughts are sparked off by some Mullard pronouncements on the subject of servicing. A while ago, the Mullard Films and Lectures Organisation were bustling up and down the country meeting radio dealers and their engineers and warning them that the near future would bring many more solid-state devices on the market. They were concerned with the reluctance of many radio dealers to tackle the servicing of transistorised equipment. They were even more worried about the growing (we nearly said escalating) number of sets being returned to the manufacturer's service departments.

"You won't be able to send 'em back so easily when hybrid and fully transistorised TV gets into full swing—which may be sooner than many of us suspect," warned Mr. Ian Nicholson.

Wont they, indeed! Henry would not care to take bets on it. Mr. Nicholson, usually so assiduous with his homework, has not been looking at the few examples of transistorised TV at present on the market. It may not be a feasible proposition to wrap them up in brown paper and trust them to Her Majesty's Mails, but all the "mystery bits" are removable in sections, once you have managed to crack open the cabinet.

On the subject of radios, Mr. N. was also off the beam. He preferred a mild amazement that 60 to 70 per cent of returned receivers had "mechanical" faults. Broken aerial coil leads, cracked ferrite rods, poor switch contacts, faulty earphone sockets, broken components — these were just a few of the things that should have been cured "at source".

Granted—but where is the source, and why, in fact, are so many mini-midgets packed and dispatched to the manufacturer instead of to the dealer's workshop?

First, the time source is the production line at the factory, where many of these faults can be circumvented. This especially applies to dry joints, tightly wired components that strain both the foil and themselves, and cracked PC boards.

Looking deeper the prevalent fault of the broken aerial coil, the cracked rod, and even faulty switch contacts, can be the result of downright bad construction. Add to this the knobs that either invite a heavy thumb to dislodge a control from the board (or the board from the cabinet) and the other type which defies removal without something, somewhere going "Crack"!

Add the self-tapping screws machine fitted so tightly into plastic mouldings that one attempt at removal must inevitably strip the thread. Add a dozen more examples any service engineer can give you and there, Mr. N. is the reason the dealer just won't waste his time on the mini-midget set.

Dealers can be excused for risking manufacturers' service charges and postage and hoping to recoup their losses from the customer—at least, this worthy is more likely to pay if he thinks the "proper authorities" have dealt with his precious little monster.

Managed to crack open the cabinet.

As a typical Henry afterthought —manufacturers who perpetrate such atrocities deserve to have them dumped on their doorstep.

Finally, Mr. N. take heart. This state of affairs is not the fault of Mullard (or Brimar, or G.E.C.) whose original designs may be impeccable—often brilliant. We can lay the blame squarely at the door of the cost-conscious production boys who interpret the circuits in terms of cheaply available hardware. How many home-built sets based on Mullard circuits do our readers return, Mr. N?
A GREAT deal of interest has resulted from my article in the June, 1965, edition of Practical Wireless entitled “Using a Portable in a Car” and many readers have asked for circuit and constructional information for a wideband medium-frequency amplifier that can be connected between a simple car-type aerial and the aerial socket of a transistor portable.

One of the biggest problems in running an ordinary ferrite-rod aerial portable in a car lies in overcoming the screening due to the metal body. The connection of a car-type aerial direct to the aerial socket generally gives only marginal improvement due to the limited amount of signal that such an aerial can abstract from the radio wave and the poor coupling coefficient between the aerial and the set.

An amplifier can overcome these problems by boosting the aerial signal about ten times and by serving as a matching device between the aerial and the aerial socket of the set. Of course, the directional properties of the set are also outweighed when the majority of signal is by way of a boosted outside aerial.

RE-RADIATION

The article in the June edition also mentioned re-radiation of the boosted aerial signal in the car itself as a means of avoiding connection between the amplifier and the aerial socket of the set. At the present time the added complication of this technique is barely necessary because most transistor sets have an aerial socket anyway, and those that have not can easily have a coupling loop fitted, as this article shows. This ensures maximum signal transfer from the amplifier to the transistor set at all times. Thus, this article can be considered as a sequel to that in the June edition. It gives details of a circuit and suggestions for the construction of a suitable wideband amplifier. The amplifier also has facilities for the powering of a transistor portable from the car battery itself, thereby relieving the drain on the internal batteries of the set when it is used in the car.

The circuit of the device is given in Fig. 1. There is not a great deal of non-convention in this circuit, and the amplifier part follows ordinary practice.

The aerial signal is fed to the base of Tr1 via the isolating capacitor C1. This has a fairly high value to avoid attenuation of the higher frequency signals, since the impedance at the base is in order of 1kΩ. This value is desirable since the amplifier may be fed from a screened cable from the aerial (see later). A very small forward current is applied to the emitter junction of Tr1 by the fairly high value base resistor R1. This results in an emitter current of about 400µA at normal temperatures. The collector is loaded with an r.f. choke which has an impedance which is high at all medium-frequencies, falling around the 2Mc/s mark. This choke, in conjunction with its self-capacitance and the collector capacitance of Tr1, resonates around 200kc/s, thereby giving a substantial lift on the Light Programme (1,500 metres).

LIGHT PROGRAMME BOOST

A lift here is often desirable in many areas of the country where the l.w. Light Programme is not all that easily received, particularly in a car. True, the m.w. Light Programme may be receivable, but then after dusk this is often masked by a very bad adjacent station interference. The Light Programme is rather important now that the BBC is extending its “popular” programme into the early hours of the morning from this transmitter—particularly so far as late night and early morning car drivers are concerned.

The amplified signals at the collector of Tr1 are capacitively-coupled to the base of Tr2. This transistor is virtually a “buffer” stage. It is arranged in common-collector (emitter-follower) mode, so has a high input impedance and a fairly low output impedance. This means that Tr1 is not
unduly loaded so keeps its fairly high gain and that a reasonable match can be attained into the aerial socket of a transistor portable. The signal at the emitter of the transistor is fed to the aerial socket of the set through the coupling capacitor C3 and a screened coaxial lead. C4 provides decoupling, but by adjusting the value of this capacitor the gain of the device can be varied. For instance, if the value is taken down to 0.005±F the overall gain of the amplifier is reduced by about 6dB. R4 is the associated decoupling resistor and it also protects the transistors from thermal runaway, for if the temperature of transistors is caused to rise—the unit being exposed to the sun through the car windows or by it being placed in the air stream from the car heater, for instance—the emitter/collector current of the transistor is limited by a safe value by R4. Without this resistor, the emitter/collector current of Tr1 could rise to a value of destruction. The current in Tr2 is somewhat limited by R3, however.

Tr2 takes little more than about 400µA at normal temperature, so the total consumption of the amplifier is less than 1mA! The transistor currents have purposely been kept low to minimize noise, and overload problems are not all that serious in practice. If one drives close to a powerful transmitter with the amplifier working, a whistle, buzz or other characteristic breakthrough may occur, but this lasts only for a short period of time. When passing an airfield, for example, a buzz may occur when the radar aerials beam energy on to the car.

POWER SUPPLY

So much, then, for the amplifier part of the circuit. The remaining part concerns the power supply. The unit is designed to work from the car battery, and there is also a voltage regulated supply therein enabling the transistor set to draw its power from the car battery, if required.

Stabilisation is provided by the zener diode ZD1. The zener stabilises at 9.1V (from a 12V car battery, as shown in the circuit). The zener current is adjusted by the series resistor R5. It will be noticed that this diode is connected across the supply for reverse conduction. That is, with the “anode” connected to supply negative. A characteristic of this kind of diode is that at a certain value of reverse voltage there is heavy conduction. This is called the “zener voltage”, at which point the effective diode resistance is very low. The voltage then across the zener diode is independent of the applied voltage, so that should this vary the zener voltage remains substantially constant.

Such a device is necessary to operate a transistor set from a car battery for the battery voltage may vary from about 11V in a discharged state up to about 14V when fully charged. The voltage across the battery is also affected by the amount of power being supplied by the dynamo and by the load on the battery due to the electrical equipment in the car. If the amplifier is to be used solely from the car battery without the transistor set itself drawing power from the supply, then the zener diode and the 50Ω resistor can be omitted. Slight variation of voltage so far as the constant-current amplifier circuit is concerned is of no consequence.

Nevertheless some form of r.f. filtering is desirable, particularly to keep the high-frequency components of the electrical pulses produced by the ignition and electrical equipment of the car from the amplifier supply. This is taken care of by the two chokes, RFC2 and RFC3, and the 0.1µF capacitor C5.

CONSTRUCTION

The amplifier can easily be built into a small metal box, an ideal housing being a 2oz. tobacco tin. How such an amplifier can be built into such a housing is revealed in great detail in Fig. 2. This shows that the components are supported in the tin by seven tag panels, four with five tags (carrying three tags isolated from the tin) and three with three tags (carrying two tags isolated from the tin).

An important point to note is that the tin itself is not used as a common earth. That is, it is not in direct electrical connection with either the positive or negative supply. This is to avoid any possibility of a short circuit relative to the car electrical system should the metal of the car make contact with the tin. From the r.f. point of view, however, the tin is connected to supply positive through C6.

It will be noticed that the braid of the coaxial lead to the set is directly terminated to supply positive on the amplifier circuit. It is essential, therefore, to ensure that the braid of this lead does not come into contact either with the tin or with any metal part of the car. It is led out of the tin through a rubber grommet.

ZENER MOUNTING

The construction of the amplifier is so straightforward that no comment is necessary apart,
perhaps, from the mounting of the zener diode. The zener chosen is a 7W type at a case temperature of 45° C. A small heat sink is thus desirable and this is made from a piece of copper plate of about ½ in. thick measuring ½ in. by ¼ in. This is threaded to accommodate the zener and is soldered to the two isolated tags of the three-tag strip, as shown in Fig. 3. It is arranged so as to be isolated from the “earth” tag and from the tin box. Circuit connection is then made to the tags, as shown in Fig. 2. The eyelet connection on the zener is soldered direct to the tag on the adjacent strip as also accommodated by C6. The diode is thus adequately supported mechanically and is easy to connect electrically.

Rubber grommets are used for leading in the car battery cable and for leading out the wires for connecting to the battery circuit of the transistor set (in place of the internal battery).

Extreme care must be taken with respect to the polarity of the battery supply to the transistor set and with respect to the polarity of the supply from the car battery to the amplifier unit. Reversal of polarity in either case could lead to serious damage to the transistor set and the zener diode and also to alteration in the characteristics of the amplifier transistors. It may be a good idea to incorporate non-reversible plugs and sockets in the “car battery” and “supply to transistor set” leads, making reversal impossible.

**EARTHING**

In Fig. 2 the aerial socket, Sk1, is of the insulated type, catering for the plug which is usually employed on car aerials. There is no “earth” connection on this, just a single tag to C1. Fig. 1, however, shows a connection from the “earth” tag on this socket to the metal box housing the amplifier. This connection would be used only in cases of excessive car ignition interference, and would generally be made through the braid of the cable to the car aerial.

This means that if the “insulated” type of socket is used, a connection would be made between the tin box and the braid of the screened aerial lead, as shown in Fig. 4. Here there is a connection between the metal car body and the box of the amplifier, via the braid of the aerial lead.

If the amplifier is tried with an ordinary car radio, or if there is any possibility of the braid of the signal connecting lead to the transistor set coming into contact with the metal of the car (bearing in mind that this is connected to one side of the car battery), then the braid MUST NOT be connected to supply positive as shown on the circuit and in Fig. 2, but it should be connected direct to the tin box on one of the earthing tags. Indeed, this method of connection may prove advantageous even when the amplifier is used with a transistor portable should interference be particularly troublesome.

**OPERATION**

The unit does not require any adjustment, but the circuit should be very carefully checked before connection is made to the car electrical system. It is desirable to try the unit on a 9V PP4 battery with the zener diode disconnected before connecting it to the car system.

With the zener out of circuit, the total amplifier current should be a little below 1mA. The best way to check the unit is thoroughly to screen the transistor set with which it is to be used. One way of doing this is to put the set into a large metal tin (such as a biscuit tin) so as to cut off all signals via the ferrite aerial. With a 10ft. length of wire or car radio aerial connected to the amplifier and the

---Fig. 5: A simple aerial coupling coil.---
Radio construction, which of course includes making anything from short wave receivers to electronic time-bombs, is undoubtedly the pre-eminent technological hobby. This article, however, is intended to serve as an introduction to an equally fascinating, though "offbeat" branch of recreational wireless — collecting "vintage" apparatus. There is, even here, more than one field for the collector and the briefest reference to the historical development of wireless must be made.

Early Equipment

Now the two decades from 1900 to 1920 saw the first primitive spark apparatus of Marconi and others giving way to more and more sophisticated equipment, until finally conventional valve circuits were firmly established. Practically all the historic equipment surviving from this period is now safely preserved in museums and private collections. But the same cannot be said of radio receivers dating as far back as the commencement of broadcasting by the BBC in 1922. This leaves the field open to the collector: let us see how he is rewarded.

From the inception of broadcasting, until nearly 1930, the majority of receivers were homemade. This association with the world of the radio constructor as well as the very age and scarcity of the equipment makes sets and components of the "twenties" specially interesting to the collector.

Components of this period are far different in size and shape from those used today. Sometimes they also performed circuit functions which are now never required. For example, most valve receivers used a special type of holder into which were plugged two multilayer tuning coils, about 2½in. in diameter. These were wound in specially anti-capacitative modes, such as the picturesquely named "Honeycomb Dualateral".

The holder was connected so that one coil formed the detector grid tuning inductance whilst the other was in the detector anode circuit. This latter coil could be rotated through 90°, the grid coil remaining stationary. In this way, the amount of positive h.f. feedback could be increased gradually with corresponding improvement in the receiver's sensitivity and selectivity.

Reaction

This well-known arrangement (known variously as "reaction", "retraction" or "regeneration") was generally employed until the introduction of the superheterodyne circuit, though later on the variable mutual inductances needed for reaction control was replaced by a variable capacitor strategically situated in the detector anode circuit.

Coupling between audio valves was usually accomplished by using a "step-up" transformer. Complete with polished brass terminals on ebonite

Dating chart for vintage valves based on physical characteristics

Group of horn loudspeakers made by B.T.H., Stirling and Amplion. They consisted of a moving diaphragm transducer, almost identical to that used in an ordinary telephone headpiece, acoustically matched to the surroundings by a horn.

stripes and bulging black coils, the earlier ones seem vaguely to resemble Stephenson's "Rocket"! At any rate they are definitely pleasing to the eye. Foremost in the field of elegance, however, are vintage valves, of which, more later.

The constructor usually mounted his components on a wooden baseboard, with the controls on an ebonite front panel: alternatively everything was mounted on a flat ebonite sheet. Wiring was executed in heavy gauge copper, sometimes of square, rather than round, cross section, and proceeded from polished terminal to polished terminal in a succession of straight lines and right angled bends. The whole effect was most pleasing!

Collecting

It is time to say something about the actual business of collecting. Most of us radio constructors have one or two antediluvian odds and ends residing on shelves or in boxes in the work room. We probably look upon them as junk, and this is their generally accepted status.

Unlike old phonographs, vintage radios are still non-"U" for collecting, though (possibly through the agency of a well-known "period" television series) an occasional horn loudspeaker can be seen in the (very "U") Portobello Road.

It is the lowlier gathering grounds for junk, such as jumble sales, junk shops, and street markets which are "El Dorado" for the urban collector. Incidentally, experience is needed to identify a genuine
“junk” shop, but those piled to the ceiling inside with old furniture, and having an over-slip on to the pavement during the daytime is always promising. Doing a regular round of such places is, of course, time consuming, but to make a find is immensely satisfying.

Regrettably, however, most vintage sets have been used to enrich corporation dust tips and green belt beauty spots, the real addict will even give these a regular inspection!

**Literature**

“Period” receivers and components are intuitively recognisable even to those who never knew wireless in the 'twenties; but the collector soon wishes to learn more about his acquisitions. To this end, there is no substitute for contemporary literature on the subject. Manufacturers advertised their latest components in each issue of the constructors' magazines, so a set of these is invaluable.

“Harmsworth’s Wireless Encyclopaedia” (192...) is also a comprehensive guide to components and techniques, as well as giving instructions for building dozens of different receivers. This calls to mind another facet of “Wireless Collecting”; the construction of “Period” sets. It is surprising how many components drift singly into one's collection, and to build up a working receiver from them is an interesting challenge.

For those not already acquainted with it, contemporary books and magazines also give a fascinating insight into the atmosphere of “Wireless in the Twenties”. Here are one or two irresistible and revealing quotations from a “Guide to Wireless Telegraphy and Telephony” published by a manufacturer. They are labelled: “Unsolicited Testimonials”:

“Dear Sir,
I am a wireless constructor and dealer, and the first in the district to construct the 3-valve set made from your parts and diagram.
I have my place full every night with listeners, and they all say it is the best they have ever heard”.

</table>
Dear Sir,

The set l made from your parts and diagram works well on three pairs of "phones taken into the next room. I have had several wireless experts to listen in, and they all say the results are wonderful.

The Wireless Expert was quite a common figure in those days. He had sometimes only built a single receiver of his own, without having any theoretical knowledge of wireless. The booklet mentioned above hardly helped to educate him. It was at its most explanatory when in referring to "Grid condensers and bypass condensers", it stated:—

"These are condensers of small capacity—fitted in the circuit to receive higher efficiency".

Readers were subtly misled by such terminology as: "The Thermionic or Three-Electrode valve", and grossly, as in the following faux pas:

"Amperes is the word applied to the amount of current an accumulator contains".

It is very tempting to write more on the early days of broadcasting, but these are for the collector and amateur archivist to explore for himself.

Factory Built Sets

This article has so far concentrated on radio in the "twenties", as it is the receivers, components and relevant literature of that era which need collecting most urgently. Nevertheless, factory-built sets, made in the early "thirties" (particularly those with fretworked loudspeaker apertures) are difficult to resist.

Less demanding on storage space are radio valves. Making a collection of any pre-war types is to be recommended. Although most of the five- and seven-pin valves of the "thirties" are still easily obtainable, there are always the interesting ones, with anomalous features, such as mains valves with filament connections at each end of the cathode, or with two cathodes placed side by side and connected together.

Then there are the "bestsellers" which come out year after year with slight modifications to their design. For example, the author has five mutations of the famous Mazda AC/PEN.

Valves of the early 1920's were known as "bright emitters", since their plain tungsten filament had to be white hot to give a suitably high electron emission. Around 1925, they were gradually superceded by "dull emitters" whose oxide-coated filaments functioned at a much lower temperature. In the order of ten times less filament power was required to heat them: a considerable saving in those days when an accumulator was used to supply the power.

The first mains valve generally available (the Marconi "KL1") was introduced early in 1927.

Now that a battery was no longer required, it did not matter how much filament power was taken. In fact, 32W was required to heat the massive cathode of this particular valve!

Handling

There is a very important point to be made about early valves in general, which may seem incredible to anyone acquainted only with modern types. The vibration to which a bright emitter is subjected during for example a bus journey, can be sufficient to break its delicate filament. This explains the lavishly sprung valve holders which are such a charming feature of vintage receivers.

As with all objets d'art, there is a code of handling to be observed with valves. Apart from avoiding the slightest mechanical shock, it is good practice not to finger the glass envelope, as any lettering stamped on it is easily obliterated. As if this were not enough, one must even be careful of the humidity in the storage room.

The author has seen tragic cases of corrosion damage: pins eaten away, and most infuriating of all, a breakage in internal connection between base pin and envelope interior, just at the point where the wire entered the envelope.

Dating

A very rough guide to dating radio valves is given in the table. However, a definite date can clearly never be assigned to when a feature such as envelope shape changed style, as innovations in construction were not simultaneously copied by all manufacturers. Moreover, a given valve is almost sure to have at least one anomalous feature.

Since broadcasting began, the radio constructor has seen several curious pieces of equipment. There were designs for receivers to run off gas, and for "Hanging Sets" in which the bright emitters were arranged to form chandeliers!

At one time, a loudspeaker containing clockwork motors was manufactured. It was called the Frenophone and used the friction between a pad and a revolving disc as the basis for a simple, but effective mechanical amplifier. Whether or not the collector is lucky enough to find one of these curiosities, he will doubtless shortly have acquired a set of "I glamie" tuning coils. It says, on their labels:—

"What are the Wild Waves saying?"

* Bound volumes or single copies of Practical Wireless and other wireless magazines of the 1920's and 1930's are also a prolific source of material, particularly the advertisement pages. Needless to say, these should be picked up if discovered.

† Details of the Frenophone and of a "Hanging Set" can be found in Harmsworth's Wireless Encyclopaedia.

On sale 19th May 2/-
Save the Grand Old Sets

It is sad that every day fine old vintage radio sets are cast on to rubbish dumps. Often these could be put into good order at small cost and given to an old-age pensioner.

Any reader who is keen to improve his skill in radio servicing should get hold of a few such sets and restore them. I have done 25 sets in a year. These sets can often be picked up at jumble sales—my main source of supply however is the Rag and Bone Man, who is only too pleased to fetch 'em along for five shillings a time. I have had no difficulty in obtaining valves for them. Common faults are open circuit primaries of output transformers and worn out volume controls and smoothing capacitors.

To readers who have a nostalgia for the good old days, I say get an old stalwart and put it in working order.

P. J. Plater.

Wallington,
Surrey.

Another Offer

I have in my possession some 100 valves—octal, British seven-pin, B9A, B7G, four-pin and five-pin based types. I would like to offer these valves to other PRACTICAL WIRELESS readers.

For further details, please send a stamped, addressed envelope.

P. H. Du Feu

6 Tavistock Road,
Lanceston,
Cornwall.

Book Reviewed

It is not my practice to answer book reviewers, not even when their review was as gracious as that which dealt with my Tape Recorder Servicing Manual in the April issue of PRACTICAL WIRELESS, but I would like to take up one point.

I agree whollyheartedly that circuit diagrams in any magazine, service data series, or by companion volumes by any publishing house should follow a common form. There are several opposing ideas on presentation, on component numbering, on circuit layout and on general style, and it would seem that some manufacturers employ myopic spiders in the preparation of their service manuals. (Even they are better than those who issue no more than a glorified sales brochure and a cyclostyled, often incomplete circuit!) The present style employed by PW and PT, which observant readers may have noted has been "tidied up" in recent times, is an excellent example of clarity.

As your reviewer notes, the reason for the use of circuits from manufacturers' literature was the formidable expense that would have been involved in re-drawing.

H. W. Hellyer.

Bargoed,
Glamorgan.

NEWS AND..

CATALOGUE FROM HENRY'S RADIO

From Henry's Radio Ltd., comes their 1966 catalogue. It comprises 152 pages fully detailed and illustrated with over 5,000 stock items. Components, valves, quartz crystals, semi-conductors, test equipment, high fidelity equipment and accessories, ready-built units and kits to build are but a few of the items listed.

Page 2 has three discount vouchers for retail and mail order customers, so that when these are used the catalogue will have cost the purchaser nothing.

The price is 6s. post paid and copies may be obtained from Messrs. Henry's Radio Ltd., 303 Edgware Road, London, W.2.

NEW COMPONENT TESTER

The Instrument and Digital Measurement Division of Dawe Instruments Limited, as sole U.K. agents for A/S Danbridge of Denmark, are now able to supply the R-C-L Component Tester Type CPT12 which is manufactured by this Danish company.

The instrument provides a direct reading comparison bridge for comparing impedances and phase angles over a wide range of impedance and frequency.

The R.C. oscillator provides power supply frequencies of 100c/s, 1kc/s, 10kc/s and 100kc/s to the bridge circuit and facilities are provided for direct reading on two separate meters.

Typical applications are acceptance, production and grading tests on components and circuit parts. Measurements on inductors, electrolytic capacitors with superposed d-c and low-pass capacitors. The instrument is also suitable for testing and adjusting ganged components.

Impedance range is 3Ω to 5MΩ on 0-3 volt range, 100Ω to 5MΩ on 3 volt range. High impedance values up to 50MΩ may be measured to the same accuracy by calibration adjustment.

The dimensions are 13½in. x 9½in. x 9½in. and the weight is 18½lbs.
U.K. price £399.

CAMBRIDGE RELAY STATION

The BBC's new Television and v.h.f. sound relay station to serve Cambridge was brought into service on 7th March. It transmits BBC-L television on Channel 2 with horizontal polarization, and the three sound programmes on v.h.f., also horizontally polarized, on the following frequencies: Midland Home Service 93-3 Mc/s, Light Programme 88-9 Mc/s, Third Network 91-1 Mc/s.
**LIGHT-WEIGHT LEAD ACID BATTERY**

A new compact 2 volt rechargeable Exide battery originally developed for the English Electric 'Automatic Firedamp Detector and Alarm' for use in coal mines is announced by Exide Batteries. Known as Type MRP7, the battery is available for general use and should prove suitable for many electrical and electronic applications where a lightweight source of power is needed.

The MRP7 cell is completely spillable even when inverted. The alloy used in the battery plates makes it ideal for duties where it will be maintained under floating and trickle charge conditions, and for those where frequent discharging and recharging are involved. The cell is capable of standing idle for long periods without deterioration thus making it suitable for intermittent and standby work. The container is moulded in a plastic material, transparent styrene acrylonitrile.

The MRP7 cell has a capacity of 4 Ah. at the 20-hour rate of discharge. It measures 2 1/2in. wide by 1 3/8in. long by 2 3/4in. high and the weight is 12 oz. when filled. The MRP7 cell can be obtained from any Exide Service Agent.

**RADIO REPORTERS**

The “London Evening Standard” newspaper has equipped its reporters with pocket-sized two-way radios. Now “Standard” men will be able to send on-the-spot stories to their news desks without relying on public telephones.

The transceiver chosen by the “London Evening Standard” is called the Pocketfone and is made by Pye Telecommunications and works on a u.h.f. band.

**NEW RADIOMOBILE MODEL 320 CAR RADIO RECEIVER**

The new Radiomobile Model 320 Car Radio Receiver is an all-transistor compact car radio (it measures only 7in. x 2in. x 4 ½in.) which has been specifically designed for small cars such as the B.M.C. Mini and Hillman Imp. Recommended price in the U.K. for this new model is £15 tax paid.

Printed circuitry with a tuned r.f. stage is featured which with six transistors and two crystal diodes ensures good reception and full coverage of the medium and long wave bands at 2W peak output.

For 12V operation only the Radiomobile Model 320 is easily adapted to suit positive or negative earth vehicle ignition systems. Complete installation kits are available for most makes of car.

---

**“Henry” Replies**

Dear Mr. Douglas,

Thank you very much for your letter of the 5th Feb., since published, in part, in a subsequent issue of PRACTICAL WIRELESS. I bow to your superior knowledge and apologise for the time taken to afford this reply. In fact, I have been trying to turn up the particular source from which I quoted, when making reference to Frequency Synthesisers, and have failed to do so. But in the research, I have learned quite a bit on the subject, and must thank you for sparking off this interest. Among other things, I note that the principle, although basically concentrating on a stable frequency source, has now been applied, via certain defence projects, to the multi-frequency transmitter-receiver system, and allied to computer techniques, and necessarily making use of microminiaturisation. You will probably know more about this than I do, and I look forward to hearing your further comment.

Finally, thanks once again for your interest. I hope future articles will not fall below your high standard.

“Henry”.

**Anyone a Genius?**

Are there any electronic geniuses amongst your readers? If so, how would they like to design a “controlled distortion” unit for me. I believe it is the latest in sound effects and has been entitled FUZZ!

I think the way in which it works is, a signal, say from a guitar string is amplified under very distorting conditions. It is then controlled purposely to sound like the “rasp” from a trombone, and then reduced for feeding into a main amplifier.

I have excellent equipment for testing such a unit, so if any readers could design a FUZZ BOX, I would build all those designs sent to me and report the results back to the designer.

W. F. Wright.

9 Priory Road Caravan Site,
Ruskington,
Seaford,
Lincolnshire.

**VHF & UHF Enthusiasts**

I agree with S. Peat (PRACTICAL WIRELESS, March issue). There appears to be little offer to the v.h.f./u.h.f. enthusiast in P.W.

Even on the commercial market, the only v.h.f. kit available (apart from f.m. tuners) is a one-valve super-regenerative receiver. This would be ideal for the newcomer to the v.h.f. bands, but surely the more ambitious advanced constructor desires something more complicated.

R. Casey.

Co. Tipperary,
Ireland.
THE writer was faced with the problem of accurate alignment of a poorly-aligned communications receiver. A cheap R.F. signal generator and trimming tools were available. The aim was to get the receiver sufficiently well tuned so that the frequencies of amateur stations could be read to the second places of decimals. This meant an accuracy about 10 times as high as the signal generator was capable of yielding. The following method is applicable to any radio using any cheap R.F. generator. It is assumed that the ordinary alignment procedure will be familiar to the reader who wishes to get a receiver spot-on. There are a number of fairly cheap and reliable transistor R.F. generators on the market.

At frequencies of 5, 10, 15, 20, 25 and 30Mc/s there are stations whose frequency is very accurate; these usually can be identified by the continuous time signal (clock ticking one second beats) which they carry.

The first stage is to search in the vicinity of one of these frequencies (e.g. 10Mc/s) on the receiver until the time signal is heard. Now the signal generator is switched on and connected to the receiver aerial terminal. The signal generator is tuned through 10Mc/s until it can be heard on top of the time signal. At this point we know that the signal generator is giving a signal of exactly 10Mc/s. A note is made of the exact reading on the dial of the signal generator.

The set is left tuned to the time signal and the signal generator is tuned near 5Mc/s until it is again heard on top of the time signal. Now it is giving its fundamental frequency (5Mc/s) and also harmonics 10Mc/s, 15Mc/s, etc. A note is made of the signal generator scale reading which gives exactly 5Mc/s.

The receiver is left on 10Mc/s (time signal) and the signal generator is tuned to around 2Mc/s until it is again heard on top of the time signal. Now it is giving its fundamental 2Mc/s and also 4, 6, 8, 10Mc/s, etc. The exact position of 2Mc/s on the signal generator is noted.

Now if the signal generator is tuned to 10Mc/s, we know that it is also giving 20Mc/s and 30Mc/s, etc. Tuned to 5Mc/s it is giving also 10, 15, 20Mc/s, etc. Tuned to 2Mc/s, it provides us with 4, 6, 8Mc/s, etc.

Convenient tracking points can now be selected at each end of each band, e.g. for a band stretching from 4-5 to 9Mc/s we set the R.F. generator to 5Mc/s (fundamental) and 2Mc/s (3rd harmonic 8Mc/s).

Any frequency above or below the original standard time signal can be obtained in this way. Only two points need special mention. Firstly, if we want, say, 24Mc/s and the receiver is originally fairly badly out, it is easy to mistune at 22 or 26Mc/s if the fundamental chosen is 2Mc/s. A check can, however, quickly be made by tuning the 4th harmonic of 5Mc/s (i.e. 25Mc/s).

Secondly, as is always the case with receiver alignment, one must beware of tuning the image frequency. For example, with an I.F. of 450kc/s, 12Mc/s could be tuned in at 11-1Mc/s or 12-9Mc/s.

The limit to the accuracy and usefulness of this method is set by the ultimate accuracy and stability of the components and design of the receiver. The R.F. generator can be frequently checked by reference to the original time signal.

An S-meter built into the receiver is an asset because one may then use an unmodulated R.F. signal (see fig. 1). A slight sacrifice of accuracy is incurred if an A.F. modulated signal is used in conjunction with a voltmeter connected across the L.S. terminals (Fig. 2).

Once the basic frequency is established on the signal generator, the aerial may be disconnected from the receiver, except for occasional spot-checks. The basic frequency chosen will depend on the standard frequency station(s) available and on the requirements of the receiver under test. However, it was found that the 9th harmonic of 10Mc/s was satisfactory for checking 100Mc/s on the v.h.f. band. The method also applies in the usual way to the I.F. strip.
THE NEW 1966 CR.70A COMMUNICATION RECEIVER

This completely new receiver sets a new standard for performance and finish unparalleled at the price, and is a worthy addition to the outstanding range of CODAR quality communication equipment. Frequency range: 500 kHz to 30 Mc/s in 4 ranges; 960 Kc/s to 3 Mc/s; 1.5 Mc/s to 4.2 Mc/s; 4.2 Mc/s to 12.5 Mc/s; 11.5 Mc/s to 30 Mc/s. Slide rule scales for each band calibrated in frequency plus an additional logging scale in degrees. Two speed vernier tuning control with reverse slow tune action. Unique aerial input stage exclusive to the CR.70A employing 6SN7 Air-space CODAR-65A. Pan法 aerial trimmer for peakin weak signals, with covered transformers. 500 Kc/s with RF filter frame grid valve for maximum gain and selectivity, 5 valves including two twin triodes giving 7 valve line-up. Separate R.F. stage for CW and SSB reception. Calibrated signal strength 'S' meter, illuminated, Automatic Volume control. Panel phone jack for 'private' listening. 2-5 cm output for external speaker. Superb styling, metal cabinet in the new Organano Satin lustre finish. Size: 19" x 12" x 7". For A.C. 200-250v. Ready built. Not a kit at the fantastic low price of £1310. Cash. 776.

CODAR R.F. PRESELECTOR MODEL P.R.30. Considerably improves the performance of any superhet receiver over 1.5-30 Mc/s. Uses 6N7A Frame Grid Valve, and provides up to 30dB each plus substantial image rejection, improved signal/noise ratio and selectivity. Selection switch for either dipole or single wire antenna. Power requirements 100-250 volts 125A H.T. 50 volts, 3 amp. L.T. Size 4 x 10 x 2 in. Ready built complete with cables, plugs and instructions. £5.10.6. Cash. 370. MODEL P.R.50X. Self powered model for 200-250 Mc. A.C. Also provides 2ma at 200v, H.T. and 6.3v, 1 amp L.T. for other accessories £7.4. Cash. 386.

CODAR "Q" MULTIPLIER MODEL R.Q.10. For use with any superhet receiver with an I.P. between 440 and 470 Kc/s. Provides considerable increase in selectivity for either peaking or rejecting a signal on AM, CW, or SSB, WPQ. Size 4 x 8 x 5 in. Power requirements 300-350v. H.T. at 5ma 6.3v, 3 amp L.T. Ready built complete with cables, plugs and instructions. £6.15.0. Cash. 396. MODEL R.Q.10W. Self powered version of R.Q.10, for 200-350v. A.C. and also provides 2ma at 200v, H.T. and 6.3v, 1 amp L.T. for other accessories £8.6. Cash. 396.

CODAR A.T.S. 15 WATT 2 BAND TRANSMITTER. The newest, most compact transmitter for fixed or mobile use on 30-90-300 Mc/s. "The tiny TX with the big voice". Size only 6 x 7 x 4 in. (base area is less than 0.25 sq. ft. of the size). High stability germanium type calibrated VFO, 1.8-2.0 Mc/s and 3.5-5.0 Mc/s (up to 4 Mc/s export). Air-space CODAR-65A CKL plate output, P.A. Plate current meter plus neon indicator, Plate-Modulation switch, AM/CW switch and panel phone jack. Complete with changeover for either 15 or 30 watts heater supply. Ready built £45.10.0. Cash. 48-5 A.T.S. POWER SUPPLY 15 WATT 2 BAND 30-90-300 Mc/s. £20. A.C. and 12v. Solid state for Mobile use, complete with all Transmitter/Receiver changeover switching available.

CODAR-KIT T.O.K. MAINS T.V. SHORT-WAVE RECEIVER. World wide reception—North and South America, Europe, Asia, Africa, Far East. Aerials, Antennas, Filtering, etc. Separate electrical bandspread 3 slow motion vernier dials. 3 low loss polyethylene plug-in coils, factory aligned. Dials calibrated in frequencies and degrees. Power output 30 watts for 20 cm speaker. VFO, 1.8-2.0 Mc/s; 3.5-5.0 Mc/s; 7 Mc/s; E506, Size 12 x 8 x 7 in. CODAR KIT CR.65K complete with valves, 5 coils (20-35, 25-75, 60-75 metres), and 4-1/2 page instruction manual. £9.10.6. Cash. 538. Extra coils 4/6 each. Instruction Manual only 6/6 (credited on order). Can also be supplied ready built—price on request.

6.66
CUT-OUTS AND CURRENT TRANSFORMERS

by Lionel C. Waring

The high tension cut-out (Fig. 1) was first used by the writer in a stabilized power supply delivering about 200mA. The use of such a cut-out in this position is particularly advantageous, in view of the fact that high tension fuses cannot be repaired unless fuse wire of very low current rating (250mA) is available. Moreover a power supply used for experimental work is much more prone to overload than is one which is built into equipment.

The relay used in the high tension cut-out is a G.P.O. 1,000Ω type which fires at about 7V. The value of the resistor in parallel with the relay winding determines the current at which the cut-out comes into operation. If the value of this resistor is \( R \Omega \) and \( R \leq 1,000 \) then the value of the operating current \( I \) (amps) is given by:

\[
I \times R = 7 \quad \text{or} \quad R = \frac{7}{I}
\]

In the prototype cut-out \( R \) was made 33Ω and so \( I = 212\text{mA} \).

The function of the 20kΩ resistor is to hold on the relay by allowing a suitable current to flow through the winding. The capacitor connected across the relay is to prevent chatter due to the a.c. component of the current flowing through the winding.

The next logical step from a high tension cut-out is a mains supply cut-out. It is essential that in this device the voltage drop should be very small; a possible voltage drop of up to 7V in the mains supply to equipment would be inadvisable. It is therefore not possible to modify the circuit of Fig. 1 for the purpose simply by the addition of a bridge rectifier unit. Apart from the question of voltage drop the bridge rectifier would have to carry the full load current (perhaps up to 5A) and the wattage dissipation would be considerable.

The problem may however be solved neatly and simply by using a current transformer. This device is rather neglected by amateur constructors, although it is used more frequently in commercial equipment.

The current transformer, although similar in construction to the voltage transformer, works on a slightly different principle. If a current transformer has \( P \) turns on the primary and \( S \) turns on the secondary and \( I_p \) is the primary current, then the secondary current \( I_s \) is given by:

\[
I_s = I_p \times \frac{P}{S}
\]

The corresponding formula for a voltage transformer (which also applies to a current transformer) is:

\[
V_s = V_p \times \frac{S}{P}
\]

where \( V_s \), \( V_p \) are the secondary and primary voltages respectively.

Ideal Transformers

It must be remembered, of course, that these formulae apply to ideal transformers; the various losses are not taken into consideration. The losses in a small transformer such as used in the mains cut-out are of the order of 10% so due allowance must be made for this when calculating the turns ratio.

The current transformer of Fig. 2 was made from a choke which had 2,500 turns. The same type of relay was used (1,000Ω, firing current 7mA) and it was desired that the cut-out should operate with a mains load current of 2A.

i.e. \( I_s = 7\text{mA}; I_p = 2\text{A}; \ S = 2,500 \text{ turns} \)

Hence substituting in the formula

\[
I_s = I_p \times \frac{P}{S}
\]

we have \( 0.007 = 2 \times \frac{P}{2,500} \)

therefore \( P = \frac{0.007 \times 2,500}{2} \) turns

\( = 8\frac{3}{4} \text{ turns} \).

Allowing for losses, the primary should have ten turns. The current transformer was made by removing the
laminations from the choke and winding on the outside of the former ten turns of p.v.c. wire. This constituted the primary.

Since the winding of the relay was 1,000Ω and the current transformer secondary was about 200Ω the secondary voltage was, just before overload, about 8.5 volts. Hence the primary voltage was:

\[ 8.5 \times \frac{10}{2.500} \text{ volts} = 0.034 \text{ volts.} \]

This minute voltage drop is much smaller than the random fluctuations of the mains.

The bridge rectifier used in Fig. 2 may be a low current 12V battery charger rectifier. The rectifier used to hold the relay in the cut-out position must be rated at 250V r.m.s. and about 20mA current. The cut-out indicator used in the prototype was a 25W mains bulb but this could be replaced, if desired, by a neon or a bulb of lower wattage.

0.05μF capacitors are shown across the circuit breaking contacts to minimise arcing. It is very important to ensure that these capacitors do not form a series resonant circuit with the primary of a mains transformer when the cut-out has fired. This eventuality is unlikely in view of the low value of the capacitors as a very large value of primary inductance would be required for resonance. If resonance were to occur very high voltages would be produced which would destroy the capacitors and possibly damage the transformer primary.

Modified Circuit

In view of the very low voltage drop of the cut-out of Fig. 2 it is quite practical to modify the circuit for use as an l.t. cut-out. This is shown in Fig. 3. The principle of the circuit is exactly the same; the only difference being that the hold-on current is obtained from the cathode of the h.t. rectifier. The turns ratio of the current transformer must, of course, be adjusted so that the relay fires at the desired current.

No capacitors are shown across the relay contacts in Fig. 3 as they are not normally necessary at low voltages. However, if a heavy current is being drawn from the l.t. supply such capacitors may be required.

Current transformers may be used to provide an a.c. current range on home-made multimeters as is done in commercial instruments. This is a facility which is rarely found in most amateur multimeter design.

In order to avoid saturation and consequent non-linearity of scale, current transformers for use in multimeters should be fairly large; preferably not smaller than a 6.3V 2A heater transformer. Since the lowest full scale deflection generally required for a.c. current is 100mA the transformer may be designed for this minimum range. If a 1mA f.s.d. meter is to be used this will mean a turns ratio of 100:1 for the transformer; i.e. 2,500 turns on the secondary and 25 turns on the primary.

In practice it would be advisable to wind 30 turns on the primary and have a preset resistor in parallel with the meter as shown in Fig. 4. The value of this resistor should be about 6 times the value of the internal resistance of the meter. If the latter is very low (<10Ω) a resistor may be connected in series with the meter to increase its resistance to a convenient value (say 500Ω). This will not impair the performance of the circuit.

Shunts

Shunts may be switched in parallel with the meter and preset resistor as in a d.c. ammeter. The same formula may be used in calculating the value of these shunts as in the d.c. instrument. Care must be taken to make shunts with as low an inductance as possible, particularly if they consist of long lengths of wire in which case they should be wound non-inductively as shown in Fig. 5. In the circuit of Fig. 4 the range switch should be of the make-before-break type.

Trickle Charge

A current transformer may be used to trickle-charge accumulators where the expense of a conventional battery charger is not justified. In this case the current transformer is wired in series with an electrical appliance whose efficiency is little affected by operating on a

Surplus to requirements...

Gramdeck offers you an amazing clearance bargain!

The chance of a lifetime for 'do-it-yourselfers' You enjoy making things... experimenting... adapting? Then here's a truly fantastic offer—an opportunity you can't afford to miss. Limited quantities of the famous Gramdeck Pre-Amplifier/Control Unit original list price £6 6s. are available at the "give-away" price of only 26s. each Guaranteed brand new and perfect.

A Really Versatile Unit

Ideal for adding a tape-deck to an existing Hi-Fi system, or a monitor-head to your tape recorder—can be used for super-imposing sound on pre-recorded tape, making pilot commentaries or for constructing a transfer mechanism from tape to stripe, adapting a record-player for public address, etc., etc. Contains a host of useful components for the experimenter (see below) or is ready for use as supplied.

The Gramdeck Pre-Amplifier 6" x 4" x 3½", comes in a compact metal case, with simulation-wood front panel, 3 Ediswan XB 102 Transistors, printed circuit board, 6-pole 4-way switch, 8 resistors, 11 capacitors, compensating coil, bias oscillator coil, sockets, wander plugs, leads, battery clips, etc., etc. Connects directly to tape-head, 600 hours working with PP9 battery (supplied). Rotary selector switch gives "Play", "Off", "Record Radio", "Record Microphone" positions.

... and A Matching Microphone

A superb matching moving-coil Lustraphone microphone, medium impedance (nominal 600 ohms at 1 kc/s) in cream plastic casing with a fabric blast guard, 9 ft. co-axial lead, fitted Belling-Lee co-axial plug—list price £3 7s. 6d., yours for only 26s. This high-quality mike is omni-directional in the horizontal and approaches cardioid characteristics in the vertical position. Frequency response approx. 70-12,000 cycles/sec.

This offer may not be repeated—act NOW!

only

50/-

for both items!

(26/- each)

All orders in strict rotation. Rush your order now, while stocks last. This is a genuine surplus - to - requirements offer.

EARLY transistorised audio equipment gave positive indication of being switched on by virtue of loud transistor noise. Improved modern transistors are far less noisy, and do not give this positive indication of battery drainage under quiescent conditions.

Constructor and manufacturer alike tend to fight shy of filament-type indicator lamps on transistorised equipment; high current drainage often precludes their use. A low-current on/off indicator lamp could, however, be a good proposition, as it could help save batteries whilst adding aesthetic appeal to the equipment. To this end the author has constructed a neon indicator lamp which is most economical and runs from any dry battery in the region of 9 volts. Only four components need be used in the construction of this interesting device, whose theoretical circuit is shown in Fig. 1.

Theory in Brief

The circuit functions as a blocking oscillator with heavy positive feedback. When the transistor enters the "cut off" state a high voltage pulse is induced in the windings of the transformer. In the absence of a tuning capacitor, this pulse would ordinarily break down the collector junction of the transistor and destroy the circuit. An alternative path is, however, available here; i.e., the neon tube. This protects the transistor, which continues to oscillate violently, the neon tube conducts during part of the cycle, and a glow is emitted from the gas around its cathode.

Circuit is Flexible

Although this circuit is specified for 9 volt operation, it will operate over a wide range of supply voltage almost up to the "extinguish" voltage of the neon simply by adjustment of VR1, or in the higher voltage ranges, replacement of VR1 by a 250KΩ component. If the circuit is carefully adjusted, the neon will glow faintly on a supply voltage of only 1.5 volts!

The Capacitor

The circuit is very tolerant of variations in the value of C1. This component may be omitted altogether if space is lacking, or values of several microfarads electrolytic may be used. Use of a capacitor in this position may improve efficiency of the circuit by over 30%; a suitable type is indicated in the components table.

The Transformer

Here an LT44 transistor driver transformer is used. Although this is amongst the cheapest available, the author experienced no trouble at all in its use. The circuit worked upon first trial. Other transformers could certainly be tried in this circuit, and as the total power handled is almost negligible, miniature transformers are favoured. The transformer chosen should be perfectly dry and well insulated; should have a useful ratio, and impedances suitable for use with transistors at the supply voltage you intend to use.

Here, however, a word of warning. If you use a large transformer in place of the miniature LT44, the magnetic energy stored in its core and discharged with each cycle may be correspondingly greater. This means a more energetic output pulse, and a warning against electric shock if you use a larger transformer.

The Neon Tube

Several types of neon tube are suitable. The tube used should strike at below 100 volts and extinguish at a voltage above the value of the supply voltage. Use of a miniature tube such as is used in neon mains testers and panel lamps is recommended. These are usually supplied together with a series resistor as safeguard against heavy mains current. This should be omitted from the circuit, for such a resistor would cut down the useful current through the neon, and probably cause destruction of the transistor.

The Transistor

The transistor should be suitable for use with a collector voltage above 100 volts; i.e., well above the "strike" voltage of the neon. Suitable types are: Texas 2SO18; Ediswan XB121. The circuit diagram
shows use of an n-p-n transistor; e.g., 2SO18. If a p-n-p type is used (e.g., XB121) the circuit connections to the battery should be reversed, also the connections of the electrolytic capacitor if used. No heat sink is required as the power handled by the transistor does not warrant this precaution.

Construction

Construction of this device is not very critical if reasonable care is taken. Standard tagboard, breadboard or printed circuit techniques may be used to connect up the components as best suits the constructor. Heat-sinks must be used whilst soldering to ensure that the transistor and neon are not damaged, and all joints should be soldered before connection to the battery. With care, this unit may be made very compact, and tucked away in some corner of your equipment.

If the unit is to be used near the input or aerial of your equipment, it should be shielded in a small metal box, or in a cardboard pill-box, covered with metal foil, and connections to the battery and neon should be made with shielded wire.

Operation

Never operate this circuit without the neon tube as this invites almost immediate destruction of the transistor.

Before connecting the battery, trim VR1 to its highest value. If you have a milliammeter, it may be of interest to connect this in series with the unit. Connect the battery. Very little current flows and the neon does not light (unless a very high gain transistor is used). Adjust VR1 gradually to a lower value. At a certain stage the neon will begin to glow, and as VR1 is adjusted, the brilliance will increase. At a certain point, the neon will flicker on and off, or extinguish altogether. If this happens, trim VR1 back up again as a heavy current drainage is indicated.

The author found that using the components specified, maximum brilliance occurred when the total current taken was 0.7mA, and with VR1 at about 40kΩ. The neon lit with a total current of 0.25mA and VR1 at about 70kΩ. The neon flickered and extinguished when the overall current reached approximately 1.6mA. The transistor then "bottomed", and the current taken rose to a high value which could heat up and destroy the transistor if allowed to persist. If C1 was omitted, maximum brilliance occurred with a total current of around 1.2mA, and produced a slight loss of brilliance as compared with the complete circuit. It will be seen that the current drawn by this neon indicator is negligible, and the cost reasonable when balanced against possible saving in battery power. The circuit is highly reliable; the author's model has run continuously for several days from a PP9 battery with no perceptible drop in battery voltage.

CUT-OUTS AND CURRENT TRANSFORMERS

---continued from page 130---

lower voltage; for example, an electric heater or a lamp used when watching television. The circuit of such a charger is shown in Fig. 6.

The turns ratio of the current transformer for this application will vary depending on the mains load current and the charging current required. Suppose, for example, a 60W bulb is being used for illumination while viewing television, and that a 12V car battery is to be charged. If the mains voltage drop is to be restricted to 24V then the current transformer will have 1:2 turns ratio and the battery will be charged at half an amp. The number of turns per volt required to avoid saturation in a core of the size used by the writer (about the size of a 6-3V 2A heater transformer) is between 10 and 12. Hence the transformer primary would have 240 turns at least and the secondary 120 turns.

Low Charging Rates

It must be admitted, of course, that half an amp is a very low charging rate for a car battery; indeed nearly four days would be required to completely charge it. If however, the current transformer were to have a 1:1 ratio and be connected in series with a 1kW electric fire, then a charging rate of 4A would be obtained, which is the recommended rate.

Bridge Rectifier

The bridge rectifier should be a 12V type with adequate current rating. The wire used for the current transformer should be as large as can be accommodated on the former.

This type of battery charger has the advantage that if the 12V battery is replaced by a 6V or 2V accumulator the charging rate remains constant. If a battery is not being charged and the charger is left in circuit then the output terminals must be short-circuited. If this is not done fairly high voltages will be produced which will cause breakdown of the rectifier.
LEARN ELECTRONICS —AS YOU BUILD

over 40 CIRCUITS EXPERIMENTS TEST GEAR

including ...

CATHODE RAY OSCILLOSCOPE

- Valve Experiments
- Transistor Experiments
- Electro-magnetic Experiments
- Basic Amplifier
- Basic Oscillator
- Basic Rectifier
- Signal Tracer
- Simple Counter
- Time Delay Circuit
- Square Wave Generator
- Morse Code Oscillator
- Simple Transmitter
- Electronic Switch
- Photo-electric Circuit
- Basic Computer Circuit
- Basic Radio Receiver
- A.C. Experiments
- D.C. Experiments

The full equipment supplied comprises valves, transistors, photo-tube, modern type chassis board, printed circuit board, full range resistors, capacitors and inductors, transformers, potentiometers, switches, transistors, valves, all hardware, wiring and every detail required for all practical work plus CATHODE RAY OSCILLOSCOPE for demonstrating results of all experiments carried out. All practical work fully described in comprehensive PRACTICAL MANUALS. Tutor service and advice if needed.

This complete practical course will teach you all the basic principles of electronics by carrying out experiments and building operational apparatus. You will learn how to recognise and handle all types of modern components; their symbols and how to read a completed circuit or schematic diagram. The course then shows how all the basic electronic circuits are constructed and used, and HOW THEY ACTUALLY WORK BY USING THE OSCILLOSCOPE PROVIDED. An application is given in all the main fields of electronics, i.e. Radio; control circuits; computers and automation; photo-electrics; counters, etc., and rules and procedure for fault finding and servicing of all types of electronic equipment.

- NO PREVIOUS KNOWLEDGE NEEDED
- NO MATHS USED OR NEEDED
- REASONABLE FEE—NO EXTRAS REQUIRED
- COMPLETE ADVICE SERVICE
- EVERYTHING REMAINS YOUR OWN PROPERTY

MINIATURE METALLIZED POLYESTER CAPACITORS

IIdeally suitable for printed wiring panels and transistorised circuits.

Incorporating a new dielectric material and of unique construction, they are of small physical size and meet the requirements of H5 D.E.F. 6011 Specification. The windings are virtually non-inductive and the wire terminations are welded direct to the metal eliminating contact resistance and ensuring the minimum possible inductance.

Typical 250 volt range

SNIPESCOPE

Famous war-time "data eye" used for seeing in the dark. This is an infra-red image converter cell with a silver screen which makes the image (like a candle) very bright and clear. The electrons released by the infra-red strike it. A golden opportunity for some interesting experiments. 5s each, post 2s. Data will be supplied with cell if requested.

MAINS POWER PACK

MAINS POWER PACK designed to operate transistor sets and amplifiers. Adjustable output 5v.-6 to 12 volts for up to 50ma A.C. (suitable for low voltage circuits). Takes the place of any of the following: Fel., Pert., F.P.P., F.P.D., F.P.R., F.P.T., F.R., and others. Kit comprises: mains transformer, rectifiers, electrolytics and load resistor. 5000 and 5000 volt condensers, quartz cube and instruction.

Real value at only 14/6, plus 2/6 post.

SPEAKER BARGAIN

13in. High fidelity loudspeaker. High flex permanent magnet type with either 3 or 5 ohm speaker and 4000 volt insulation. Price 27/6, plus 3/6 post and insurance.

ARMCHAIR CONTROL UNIT

Remote Controller—for Philips, Shell and Croydon TV sets but adaptable to most others, and to model control. Consists of 9 rocker switches, 1,500 variable resistances and components including 45 in Mallard 5806, 10 5 way plugs, 11 7 way cables, etc. List price 28/3, yours for only 1/2/8, plus 5/s post and insurance.

STUPENDOUS OFFER—£11 for £2

The Princess superb described below is a very fine little set that has been carefully designed for high performance. Only recently under another name of course this was on offer in many radio shops for £25, but we have been fortunate in obtaining the parts at a very low price and will pass this saving on to you. If you are quick you can purchase this set for only £1.50 post and insurance. Note the following features: Long and Magnetic waves, Design of Wave; Long Short Dials, (like an arch), VARIABLE CONTROL, Switch for I.F. selection and variable tuning, TRANSMISSION CONTROL, Tuning for loudness, Switch for aerial selection. Price 19/6. Plus 3/6 post and insurance.

ANCILLARY BARGAIN

With carrying handle £4. 18in. x 4in. x 3in. Strongly made from best plywood and covered two-tone fabric—looks smart, suitable for comer—amplifier or extension speaker etc. Originally listed at £5 but offered this month at only £1.50 plus 3/6 post and insurance; also gives free with it is a printed circuit board for both I.F. and B.E.C. in the two-way receiver. Don't miss this grand offer.

FOUR-STATION INTERCOM.

With save time and improve efficiency. Ideal in house-office-shop-hanger, etc. Complete outfit comprises Master unit and three stations each of which can call the master and have full two-way working. No wiring problems as all fitted with 60in. twin flex and they plug into sockets. Also included is a pocket of extra buttons and battery. Nothing else to buy—7/15.99 plus 4/6 post and insurance.

750MW TRANSISTOR AMPLIFIER

4 transistors including two in push-pull stage for crystal or magnetic microphones or pick-up fed back loops—Sensitivity 3 m/V. Price 18/6. Post and ins. 2/6. Speakers £1.50 ea., £2/6 for two. £2/10.6 in. £14/6

Loudspeaker Matching

by Leslie Moore

Impedance matching between stages of audio equipment usually causes a certain amount of difficulty to the newcomer. Power amplifier coupling or output to some speaker system is probably the most common cause of inefficiency in such equipment.

Fig. 1 shows a series circuit of variable resistor R and battery B. Suppose internal resistance r were 2 ohms and battery voltage 2 volts. When R is zero, then current in the circuit will be a function of internal resistance and battery voltage.

\[ I = \frac{V}{r} \]

\[ \text{i.e. } I = \frac{2 \text{ volts}}{2 \text{ ohms}} = 1 \text{ ampère.} \]

When R is 0.5 Ω, \( I = \frac{2}{2.5} = 0.8 \) ampères, and so on.

Power dissipated in a resistor is given by

\[ P = I^2 \times \text{resistance.} \]

When \( R = 0 \), \( P = 0 \).

\[ \text{when } R = 0.5 \text{ Ω}, P = \frac{2 \times 0.8 \times 0.8 \times 0.5}{2.5} = 0.32 \text{ Watts.} \]

Voltage across R and r is again dependent on their values.

\[ V = 2 \times \frac{R}{R+r}, \text{ therefore when } R = 0.5 \text{ Ω}, V = 2 \times \frac{0.5}{2.5} = 0.4 \text{ volts.} \]

The table gives suitable values of variables to demonstrate the purpose of this test.

A graph drawn of power against resistance (Fig. 2) shows that maximum value of power transferred from battery to resistance R, takes place when R is equal to r, battery internal resistance. This is of importance especially when dealing with loudspeaker matching by transformer.

**Typical Output Stage**

Fig. 3 shows a typical power output stage of an audio amplifier. Suppose output resistance of the power amplifier is 4000 ohms, then for maximum power transfer, effective loading of the loudspeaker should also be 4000 ohms.

Voltage ratio of secondary to primary transformer windings is equal to \( \frac{N_2}{N_1} \).

Current ratio of secondary to primary transformer windings is equal to \( \frac{N_1}{N_2} \).

From Ohm's Law resistance \( = \frac{V}{I} \), therefore resistance ratio of secondary to primary transformer windings

\[ = \frac{N_2}{N_1} \cdot \frac{N_2 \times N_2}{N_1 \times N_1} = \left( \frac{N_2}{N_1} \right)^2 \]

If a 15 Ω loudspeaker were to be used, then to obtain maximum power transfer

\[ 4000 = 15 \times \left( \frac{N_2}{N_1} \right)^2 \cdot \frac{N_2}{N_1} = \sqrt{\frac{4000}{15}} = 16.3. \]

Therefore turns ratio of transformer used should be about 16:1.

**Impedance Matching**

Correct impedance matching is often neglected; common practice is to place additional loudspeakers in parallel with the existing one. If two 15 Ω loudspeakers were placed in parallel connection instead of one, on the output of the previous amplifier, actual resistance of parallel combination is reduced to 7.5 Ω. Effective load of two loudspeakers in parallel then

\[ = 7.5 \times \left( \frac{N_2}{N_1} \right)^2 = 2000 \text{ Ω.} \]

Exercising Fig. 2 will reveal that when load resistance

--- continued on page 142 ---
The writer, having moved into a new house, required a neat single unit housing a radio tuner, tape deck, record-player, power amplifier (2-3 watts) and two speakers. It was decided that the unit had to have the following requirements:

1. To be completely self-contained;
2. A switching system enabling the units to be connected directly to the amplifier, independently, without changing plugs and sockets at the back;
3. A switching system to record off, or play back through the power amplifier when one of the other units was connected to it;
4. A pre-amplifier and mixer for two inputs;
5. High impedance and low impedance audio output sockets;
6. Provision for external input to the tape deck;
7. Tone network.

The Circuit

Fig. 1 shows the main circuit in block form. A moment's reflection will show that it contains all the above requirements.

The heart of the unit is the main switch (S3) and the main amplifier. In position 1 either the record player or external input is connected to the power amplifier depending on S1. In this position the pre-amplifier is used. This can be bought, but is easily constructed, a suitable circuit diagram is shown in Fig. 2a and the corresponding wiring diagram in Fig. 2b. Any low noise pentode can be used providing that R2 is adjusted to suit the bias conditions recommended by the manufacturer. This information can be found by consulting a valve data manual.

The h.t. and l.t. supply is drawn from the power supply of the main amplifier. As the main amplifier will have a fairly large power pack the 3mA drawn by the 6BR7 is extremely unlikely to overload it.

When S3 is in position 2 the radio tuner is connected to the main amplifier. This may be a.m. or f.m. depending on what is to hand. If an f.m. tuner is used a fairly high quality amplifier should be used. With S3 in position 3 the tape deck output is fed into the amplifier when the deck is switched to playback. The input to the tape deck is controlled by S2. In position 1 it receives its input from the

BRAND NEW AM/FM (V.H.F.) RADIOGRAM CHASSIS AT £15.15.0 (Carriage Paid)

Chassis size 15 x 61 x 85in. high. New manufacture. Dial 143 x 45m. In 9 colours, predominately plastic. 200-520v. A.C. only.
Pick-up Ext. Speaker, A.C., E, and Dipole Sockets. Five push-button—L.N., M.W., S.W., F.M. and Bass. Aligned and tested. G.P. Transformer Tone control 800-1600m; 1000-6000m; 88-98 Mnf. 4-17 mos. EZ204 en.; EC83I, EF109, RA309, 8L34, RCK8, 4-Ohm speaker required.
9 x 9cm. ELLIPTICAL SPEAKER, 20c. + carriage to purchaser of this chassis.

NEW 6 PUSH-PUTTON STEREOGRAM CHASSIS. M.W.; S.W.; I.F.; V.H.F.; 6V6; Valve; Stereo. Two separate channels for Stereogram with balance control. Also operation with two speakers on Radio. Chas size 15 x 7 x 85in. high. 101val and red. 15 x 92in. Valves: EC801, PB232, NF399, EF99, 9 x EC896, RU804 and Silicon Rect. Price £16.16.6. Extra, 2/6d. per set of 63/. Total H.P. price £20.16.6. Cream moulded escutcheon included. 190-550m; 10-63m; 50-181m. VEF 65-109m types.

SELF-POWERED VHF TUNER CHASSIS
Covering 195-495 M.Hz. Dims. 2 x 6 x 6in. high. Valves: EC801, RA309 and 2-E882 with metal rectifier. Mains transformer. Fully wired and tested. Only £2.3.6. + carriage. £3.6.6. per dipole, 10/-6. Feeder 6d. per yard.

TAPE AMPLIFIER FOR COLLAGO OR MAGNOVOX TAPE DECKS — 2 TRACK

GLADSTONE RADIO
66 ELMS ROAD, ALDERSHOT, Hants. (2 mins. from Station and Buses.)
CLOSED WEDNESDAY AFTERNOON
CATALOGUE 13/6.

The SUPER 6
LONG & MEDIUM WAVE TRANSISTOR RADIO

A quality radio available as a kit or ready-built. The sparking performance and superb finish of the completed receiver give you values equivalent to a £15.12.0 commercial model.

- All new parts
- 6 transistors and diodes
- 360mW output
- 800Hz circuit
- Ferrite rod aerial
- Weymouth State printed circuit board
- Component parts and reference print-in the form of groups of transistors, valves and complementary parts
- Nicely styled wooden cabinet
- 11 x 7 x 4in. (17 x 17 x 10in. inc. Vinyl) cover in various colours
- 6 x 2 din. speaker giving good bass and treble response
- Pulse instruction booklet
- Bass, treble with kit
- 1/6 bandwidth
- Frequency 470 kilohz
- Lining up service if required
- All parts supplied separately
- Write for kit, S.A.E. PLUS 5/-, POST. COMPLETE KIT ONLY £4.0.0

- 8 WATT PUSH-PULL O.P. AMPLIFIER £5.5.0
(6/- Carr.)

200-240 A.C. mains. Bass, treble and vol. controls. E81K, ECC83 and 2-E882, 12ax7; EM85; 2-300B; 283A; 6G6. With o.p. tran., for 9-0 single speaker. Front panel (normally screwed to chassis) may be removed and used as passing panel. With cream/black control panel whole length of front chassis.

BATTERY ELIMINATOR for Transistor Radios requiring 9v. Fully smoothed (6900-11000mfd). 3 x 4 1/2" overall. Tapped input for 200/10, 220/30, 240/50v. Output 9v, at 60mA. Good Regulation. Price 25/- (3/-, 6/- & 10/-)

PUBLICATIONS for the Radio Enthusiast

The second printing of the latest edition of this best selling annual directory of Amateur Radio Stations in the United Kingdom and the Republic of Ireland records more than 3,000 changes since the 1965 edition.
98 pages. Price 6/- (post 6/-)

Technical Topics for the Radio Amateur
Articles for the long running feature in the RSGB Bulletin have been re-written into nine chapters comprising this new book.
Semiconductor Components and Construction, Receivers, Transmitters, Audio and Modulator, Power Supplies, Aerials, Oscillators, Fault-finding and Accessories are all covered and illustrated with more than 220 useful circuits and 220 pages.
100 pages. Price 10/- (post 10/-)

The latest edition of this annual handbook published by the American Radio League has been considerably improved and up-dated, particularly in the receiver and transmitter chapters. The Handbook literally covers the whole field of equipment for Amateurs of all classes.
704 pages. Standard binding price, 40/- (42/6)

Trade enquiries invited
Further details of other RSGB Publications, and information about membership of the RSGB, including a free copy of the monthly RSGB Bulletin, may be obtained on request from the Society:
RADIO SOCIETY OF GREAT BRITAIN, Dept. P.W.
28 Little Russell St., London, W.C.1. HOLborn 7373, 2444
main amplifier which, as previously described, obtains its input from any of the other units. In position 2 the tape recorder receives its input externally through SK6.

A tone network is shown in Figs. 3a-3b. This may be omitted if the main amplifier obtained has its own tone networks.

The dotted lines around the mains switches of the various units indicate that the mains switch is incorporated in the particular unit. Whilst on the subject of mains it must be stressed that each unit must be mains isolated; i.e. no item must be a.c./d.c. This is because of the interconnecting of chassis in this design.

A new cabinet for this design would be very expensive but a 'home-brew' design could be constructed for about half the cost. No constructional details of the cabinet are given as most constructors building this item will have their own ideas depending on the space available, the place it is likely to be used in and the ability of the individual constructor.

Construction

Details of the construction of the preamplifier and the tone network are given in Figs. 2b and 3b respectively. There should be room somewhere in the cabinet for the single stage preamplifier which only measures 7in. x 5in. The tone network is best built on the front panel around the controls themselves. All wiring should be short and direct.

Fig. 3a (left): Circuit of tone control network.
Fig. 3b (right): Wiring of tone control network.
especially to the input to the main amplifier. Some long wires are almost inevitable however and these wires will have to be screened.

Components

When purchasing components a compromise must be drawn between cheap, low quality equipment and expensive high quality equipment. If all the components have to be purchased reasonable parts can be bought for about £50, but most constructors will have some if not all of the components. Perhaps the most important item, quality wise, is the main speaker as this is where most of the distortion arises. For anything like good quality results a speaker in the £5 range is really necessary. The sub-speaker can be situated on the other side of the room to spread the sound through the room. It must be remembered however that by connecting two speakers in parallel the impedance is halved. That is, if the speaker’s impedances are both the same. If for example they were both 150 the total impedance would be 750, therefore the output transformer must be adjusted accordingly.

The main amplifier can be bought or constructed from one of the many articles in this magazine. It needs to have an output of at least 3W.

Operation and Use

After construction the unit should be fully tested and every control tried before the unit is sealed away. Suitable labelling for the front panel is shown in Fig. 4. The unit will have many uses when constructed, such as for example, being able to record at any time by turning a switch, instead of being encumbered by a large number of untidy loose wires.

LOUDSPEAKER MATCHING

—continued from page 137

of maximum power transfer is halved, power transferred is reduced, not by half, but in the example given, by 12%. Total power transferred, 88% of maximum power, would then be approximately halved when dissipated between the two loudspeakers. Therefore the sound produced by only 44% of maximum power is obtained due to adding one loudspeaker of 15Ω in parallel with an existing one. This is not the only disadvantage; in fact it may be regarded as an advantage when available power is far in excess of that required and sound dispersion of greater necessity. By halving a load, current drawn from the supply is increased. Such a load would change working characteristics of any output valve (or transistor) and probably result in distortion. The new working characteristics produced may lie outside power limitations.

OVERLOADING

The possibility also arises, especially when output transformers have been designed for a particular output circuit and the load is halved, that one of the transformer windings will fuse due to increased current. (i.e. P = I^2R and resistance of windings is approximately constant.) Similar occurrences may take place when a loudspeaker of smaller impedance than required is placed in the output.

To calculate the turns ratio for a new transformer when two loudspeakers are placed in parallel, for example given previously:

4000 = 7.5(N2/N1)^2 \Rightarrow \frac{N2}{N1} = \sqrt{\frac{4000}{7.5}} = \sqrt{\frac{533}{23}} = 23.

Therefore New turns ratio of output transformer required = 23:1.

Care must be taken to ensure correct impedance matching when fitting new loudspeakers into audio systems; nothing can be more disappointing than to build or buy a first-class power amplifier and, unknowingly, fit too low an impedance loudspeaker to the output, and listen to third rate reproduction as a result, or land yourself with an open circuit output transformer, a useless power output valve or transistor, or even a completely destroyed amplifier power supply.

It should be noted that reactances and impedances have not been taken into account in the previous example to enable this explanation to be as simple as possible.

TRANSISTOR MOBILE TRANSMITTER

(March 1966 issue)

The LA2105 Vinkor pot core is no longer in current production. Messrs. Mullard Limited recommend the LA2102 pot plus DT2151 core as an alternative. These items can be ordered from Radio Crosland, 24 Foley Street, London, W1 and NOT Mullard Limited.
How would you like to be an officer in the Royal Navy and then train to be a fully qualified Electronic Engineer?

Impossible?

Very possible!

Not many people know this; but it's possible to train to be a graduate member of the Institution of Electronic and Radio Engineers while you're an officer in the Royal Navy.

As an electrical officer, you are given a training that lasts 4 years and which costs literally thousands.

You then get the technical and administrative experience to qualify you for the standing of chartered engineer. Which is getting the best of both worlds: a commission and an excellent civilian qualification.

What of the future? The Defence Review has reaffirmed the world-wide role of the Royal Navy. The vital protection of our shipping remains its constant task. The most modern technologies of nuclear propulsion, guided missiles and electronics are developing, and Polaris will take over the deterrent role by the 1970s. Here's a career that offers you responsibility, rich opportunities—and real reward.

Entry — Qualifications: G.C.E. 'O' level in English, with (i) suitable O.N.C., or (ii) three further G.C.E. passes including 2 at 'A' level. (One 'A' level should be in an appropriate maths or physics subject.) Scottish or Northern Ireland certificates equivalent to the above. Age Limits: 17-25. Training Course: 4 years. Service Period: 16 years (pensionable) with every opportunity to put in for a permanent commission.

For full details complete and send the coupon below.

You should apply before the end of July.

Captain J. H. F. Eberle R.N.,
Officer Entry Section (608AU1),
Old Admiralty Building,
London, S.W.1.

Please send me full details about the opportunities of training for a commission in the Electrical Branch.

KITS WITH A FUTURE

The Martin Audiokit assembly you own today can become part
of an even better hi-fi system tomorrow. No other system
allows you to enlarge your installation stage by stage in the
way Audiokits do. They comprise a wide range of very well
made prefabricated units in which the connections are
standardised throughout. Each is rigorously tested to stated
specification before despatch. NEW KITS FOR ADDING
ON ARE IN COURSE OF PREPARATION NOW—so by
starting with Martin today, you insure yourself for still better
listening tomorrow.

Choose Martin for quality
- Build for 3 or 15 ohm system
- Start with Mono and add Stereo or start com-
pletely with Stereo
- Power packs available
- Professionally styled escutcheon plates
- Assembly is easy by following the well presented
  instructions

MARTIN ELECTRONICS LTD., 154-155 High Street
Brentford Middlesex

Full details of Martin Audiokits please

NAME ..........................................................
ADDRESS ....................................................

(Block letters) P.W.6
THE existence of a radio or wireless society at the Magnus Grammar School at Newark in the early 1920's is shown in the records of the Derby Wireless Club, now the Derby & District Amateur Radio Society. This Club, recently featured in Club Spot No. 1 was evidently in contact with a kindred society at Magnus.

Both Societies were operating in the early 'twenties and some details of the Magnus Club's activities are to be found in the school magazines of that time. Now, forty years later, the Magnus Radio Society is proud still to have one of those pioneers as an Honorary Member of the present society founded in January 1960.

Amongst the founder members of the Magnus Radio Society were G3SGB, G3SHY, G3TBK, G3TBM, G3TU and G3TWX. Of these, G3TBM is, today, the Club Secretary, while G3SGB is now on the high seas having trained as a Marine Radio Operator.

By 1961 the Magnus Radio Society had acquired the annexe to a room near the Laboratory for use as a shack. It started as a listener station using an 1155 but by 1962 a DX40 had been constructed and a long wire had been erected between two flag poles on the top of the building giving the school a rather ship-like appearance. The top is about 90ft. long and is some 50ft. above ground level. It is of hard drawn copper wire and with its down lead is roughly 130ft. long. It is fed through an ATU and works well on all bands.

The first contact by the Club Station G3PAW was made in February 1961 by which time we had acquired an Eddystone 840C receiver and a BC221 frequency meter. A Minimitter converter is now used in front of the 840C. In addition to the main rig we have a Codar AT5 which has proved valuable in covering top band, for experiments away from the shack and as a means of getting the newly licensed on the air quickly.

Activity varies according to the available operators and the time at their disposal but G3PAW is on the air most lunch times.

Membership of the Magnus Radio Society is kept to about twenty-five and ages range from 11—18. Meetings are held every Tuesday in a modern science laboratory which provides many basic facilities.

Programmes for the Club are planned ahead by a committee on which every age group is represented. This committee, while working the present programme, makes the plans for the coming term with such enthusiasm that there is sometimes a danger of the programmes becoming super-charged with ambition and it is quite usual for events to be held in holiday time.

The regular weekly meetings provide both for constructional and practical effort with, in addition, talks, visits, films and social activities.

Demonstrations and talks have been given to the Club by its own members as well as local amateurs and visitors from Derby, Nottingham, Worksop, Lincoln and other towns.

The R.A.C. and the police have demonstrated mobile radio and we have recently visited the Notts County Police Communications Centre. Visits made by the Club have been varied and wide ranging and have included observation of the manufacture of telephone equipment and television camera assembly and the making of loudspeakers.

We have visited, also, different types of telephone exchanges and seen watches being checked electronically but, possibly the most exciting of all was being entertained by the BBC at the Television Centre in 1963 where we were able to see many personalities as well as the technical wonders.

An adequate lending library catering for all abilities is open in the shack at all meetings and at mid-morning each Wednesday. It is here that the Clubroom atmosphere is to be found.

Stores and tools have gradually been built up and these are housed in the shack which has good storage facilities.

All QSL cards are displayed and those taken down
are classified by the QSL manager.

RAE classes are held each Friday between September and May. In this way every success has been achieved, often at the early age of 14. The ideal is for the candidates to become licensed the year before they are due to take G.C.E. "O" level, otherwise it is better left till afterwards.

All licensed members help with Morse instruction. There is a quarter of an hour each day for those who care to "come and get it". Morse records are available and we have a professional telegraphist always willing to lend a hand.

Some members of the Magnus Society join the Newark and District Amateur Radio Society and the two societies have enjoyed many joint activities. One example being d.f. contests in the summer months. Several DF receivers have been built by Magnus members and a good deal of time has been spent on d.f. experiments. We have even had one "DFpedition" during the hours of darkness. Many snags were discovered before the TX was located some 8 miles from the initial rendezvous.

DF events of course, only cater for a limited number of members, but film shows, model control demonstrations and things with a wider appeal are frequently open meetings for anyone to attend.

For two years Magnus members who belong to N. & D.A.R.S. have enjoyed trips to the R.S.G.B. Communications Exhibition at Seymour Hall.

Incidentally, being a school club, does not make us a closed shop, any amateur travelling down the A1 is welcome during our meeting times.

A three minute regional spot on the BBC in 1965 brought a request from Broxburnham Press for a photograph of some of our Club members doing constructional work. This now features on the jacket of "Illustrated Teach Yourself Radio".

Special Activity Stations. The Magnus Radio Society was affiliated to the R.S.G.B. in 1960 and took part in N.F.D. for the first time in 1964. G3PAW has taken part in the Top Band Contest on two occasions and has three times participated in the Magazine Club Contest with varying degrees of success.

We have always had Scouts among our members and for the last four years we have taken part in Jamboree-on-the-Air, acting host to Scouts in Newark and surrounding districts. Last year we joined forces with the Thieves Wood Short Wave Club which we helped to form at the Thieves Wood Special School, near Mansfield. This joint station using an AR77 and a KW Vanguard was a great success. The number of Scouts, Guides and club members from Thieves Wood, Newark and Mansfield made it an outstanding social event.

The committee has aimed to interest everyone. It has organised listening contests, demonstrations of home built equipment (Hi-Fi included), entertainments and social activities. Two mammoth junk sales have been held, the proceeds of which went to the Newark Parish Church Restoration Fund and the Winston Churchill Memorial Fund. Another is planned this year.

It is always sad to have to say goodbye to members when they leave Newark, as many of them do, to enter University or pursue their careers in radio and allied subjects but, of one thing we are confident, namely that some radio club somewhere will have the benefit of the loyalty and enthusiasm of these ex-members of the Magnus Radio Society.

If you are passing through Newark, why not drop in for a personal QSO?
A High Fidelity All Transistor Stereo Amplifier providing 10 watts R.M.S. on each channel

OUTPUT (per channel)
- 10 watts R.M.S. into 8 ohm load.
- 15 watts R.M.S. into 3 ohm load.

TOTAL HARMONIC DISTORTION
- 0.1% at 8 watts R.M.S. into 8 ohm load.
- 0.3% at 10 watts R.M.S. into 8 ohm load.

DAMPING FACTOR
- 20

FREQUENCY RESPONSE
- +1 dB 20-20,000 c.p.s.
- HUM AND NOISE
- 80dB

CROSS TALK
- 40dB

INPUT SENSITIVITIES
- 5.5 m.v. 35kHz, 80dB
- Tape Head 2 m.v. Aux. (Radio Tuner, Tape Rec, Dynamic P.U., etc.) 100 m.v. (Above sensitivities will be doubled when output load is 3-4 ohms).

THE PRE-AMPLIFIER IS A COMPLETELY NEW DESIGN
IT ELIMINATES THE NECESSITY OF MATCHED INPUTS & COMPLICATED SWITCHING ARRANGEMENTS. IT ALSO PRODUCES CONDITIONS OF MINIMUM NOISE AT HIGHEST SENSITIVITIES.

FRINGE BENEFITS!!

(Oh dear! our artist is thinking of Gloria again)

One of the fringe benefits that purchasers of the Home Radio Catalogue get is our Special List of Bargains. This is sent automatically with the first parcel of goods. Let us highlight a few items from our list:

BG6A Condenser Pack, Silver Mica Condensers values 15, 25, 50, 80, 160, 200, 240, 320, 470, 750, 1000, 1500, 2200, 4000 pf (the 470 pf are 750v). Twelve of the fourteen in each pack. Moulded Micas—values 68, 820, 1000, .002, .005, .01 (the .002 are 1050 volts test). Five out of the six in each pack, plus one .02 and one .1 paper, both 750v. All this for 5/6 plus 2/6 Postage and Packing (To-day’s value 15/-).

BG28 Jackson type 100 pf air dielectric trimming Condenser. Three for 2/6 plus 2/6 Postage & Packing. (To-day’s value 25/-).

BG42 Resistor Kit consisting of thirty different preferred values between 120 Ohms and 4.7 Megas. 2 Watt Resistors (Erie type T2). 5/- plus 2/6 Postage & Packing. (To-day’s value at least 21/-).

These are three out of about sixty Bargains offered to purchasers of our Catalogue.

Now as to the Catalogue itself... it has 210 pages containing 5,800 items, with over 900 illustrations. Price 7/6 plus 1/6 Postage and Packing. Every catalogue contains 5 coupons, each worth 1/- when used as directed.

P.S. If you are interested in the above bargains send your money, quoting the Catalogue numbers.

**Build a SINCLAIR Hi-Fi System**

By building ALL three Sinclair designs featured this month, you can become the proud owner of a unique A.M.-F.M./Stereo Hi-Fi system that will give you complete satisfaction and save pounds compared with other systems. Each unit is complete in itself and you will have two radio units, each of which can be used separately as an independent self-contained personal receiver. These designs cover all aspects.

The Micro-6. It has amazing range and power and combines readily with the Z.12.

For quality, the Micro FM gives all you want both as a tuner and a pocket receiver for personal listening.

The Z.12 more than replaces larger conventional amplifiers for price, size, and power. Two in stereo cannot be beaten.

A CONSTRUCTOR TELLS US

"I was determined to finish it (The Micro FM) at one sitting. Having completed it, I am amazed at its quality of reproduction, and am spending for too long a time listening to it; it seems as if one can be of FM radios."  
(Signed) D.Y.B., Tunbridge Wells, Kent.

---

**ALL YOU WANT FROM AN F.M. TUNER AND RECEIVER IN A SINGLE UNIT**

When Sinclair Radionics decided to design an F.M. receiver which could be carried in the pocket and yet satisfy the most stringent demands likely to be made of it, it was realized that radical departures would have to be made from conventional F.M. design techniques. The problems of alignment would have to be completely eliminated for constructors. Sensitivity had to be such that good reception could be enjoyed using no more than the telescopic aerial necessary to keep the set truly portable. Audio quality had to be at least as good as that from sets where size and price were not important considerations. Sinclair Radionics achieved this and much more in their Sinclair Micro FM. Today, it enjoys the unique distinction of being the only set of its kind in the world, it can be used as a tuner and as an independent pocket size personal F.M. receiver. In appearance, this fully-fledged 7 transistor superhet F.M. is as outstanding as it is in its performance. The brushed and polished aluminium front panel with spun aluminium tuning dial makes it the most elegant, professionally styled set ever made available to constructors. Yet with these and many other important features, the Micro F.M. costs pounds less and enables constructors to enjoy F.M. reception to the full at once.

---

**SINCLAIR MICRO-6**

**69/6**

**SIX STAGE A.M. RECEIVER**

- 1¾ in. x 1¾ in. x 5 in.
- Weight—1 oz.
- Bandspread for Luxembourg
- Build it in an evening
- Plays anywhere

---

**7 TRANSISTOR COMBINED F.M. TUNER RECEIVER**

- 2½ x 1½ x 3 in.
- Needs noAlignment
- One output for Hi-Fi
- One output for personal listening
- Tunes from 88-108 Mc/s

Complete kit of parts including transistors, case, front panel, dial, earpiece and instructions

---

**£5.19.6**

The set works perfectly from the moment the battery was connected... the standard of performance exceeds anything I have so far heard. You have clearly designed a very efficient circuit and credit is very rightly due to you. (Signed) L.E.H., Harrogate, Yorks.

---

**TECHNICAL DESCRIPTION**

The Sinclair Micro FM is a completely self-contained double-purpose FM superhet housed within a case less than 3 in. high x 2¾ in. wide with a depth of 1¼ in. It uses 7 transistors and 2 diodes in special superhet circuitry. The A.F. amplifier is followed by a self-oscillating mixer and 3 stages of I.F. amplification which dispense with I.F. transformers and all problems of alignment. The final I.F. amplifier produces a square wave of constant amplitude which is converted into uniform pulses so arranged that the original modulation is reproduced exactly. A pulse-counting detector ensures improved linearity and therefore better audio quality at the output stage. After equalization the signal is channeled to one output for feeding to amplifier or recorder and to another in which the receiver's own mini-amplifying stage enables the Micro FM to be used as an independent self-contained portable set. A.P.C. is used to lock the programme tuned in; the telescopic aerial included with the kit will be found sufficient for all but the worst signal areas.

FIDELITY PROGRAMME

sinclair Z.12 COMBINED AMPLIFIER AND PRE-AMP

An eight transistor unit of enormous power and superb quality giving

12 WATTS RMS OUTPUT CONTINUOUS SINE WAVE

For size alone, the Z.12 marks another important advance in quality design, for its amazing compactness opens up exciting new vistas in amplifier housing and application. Combined with this are the fantastic power and superb quality of the Z.12 which can provide an effortless output of 12 watts RMS continuous sine wave from its unique eight transistor circuit. Basically intended as the heart of any good mono or stereo hi-fi system, the size and efficiency of this Sinclair unit make it equally useful for a car radio (with the Micro-6 for example), a high quality radio with the Micro FM, in a guitar, P.A. or intercom system, etc. Other applications are sure to suggest themselves to constructors. The manual included with the Z.12 details many mono and stereo tone and volume control circuits by which inputs can be matched (and switched in) to the pre-amp. The size, performance and price of the Z.12 all favour the constructor seeking the finest in transistorised audio reproduction—it is in fact today's finest buy in top grade high fidelity.

Technical Specification

- 8 special HF transistors.
- Ultra-linear class B output and generous neg. feed back.
- Response—15 to 50,000 c/s ±1dB.
- Output suitable for 3.75 and 15 ohm loads. Two 3 ohm speakers may be used in parallel.
- RMS Output—12 watts continuous sine wave (24w. peak).
- 15 watt continuous music power (30w. peak).
- Input—2mV into 2K ohms.
- Signal to noise ratio—better than 60dB.

NEW

PZ.3 MAINS POWER UNIT

An entirely new design by Sinclair using a unique transistorised smoothing system giving exceptionally smooth DC output. Will power two Z.12 units for stereo etc. For AC mains 200/250v. 79/6

THREE MONEY-SAVING OFFERS TO Z.12 PURCHASERS

PACK 'A' Saves you 19/-
Comprising Micro FM and Z.12 together. Normal price £16.19.0, Special 'Pack' price £9.10.6

PACK 'B' Saves you 9/-
Comprising Micro-6 and Z.12 together. Normal price £7.9.0, Special 'Pack' price £6.0.0

PACK 'C' Saves you 11/-
Comprising two Z.12 amplifiers. Normal price £38.19.0, Special 'Pack' price £28.0.0

Guarantee

Should you not be completely satisfied with your purchase when you receive it from us, your money will be refunded in full and at once without question.

Telecommunications

Vacancies exist for Young Men keen to make Electronics their career who have not necessarily acquired great practical or theoretical knowledge, but who have suitable interest and who have possibly already constructed some equipment themselves. Training will be provided and applicants will be encouraged to take technical studies to further their careers.

Applications to Personnel Manager, Cambridge Works Ltd., Haig Road, Cambridge. Telephone Cambridge 51351.

SITUATIONS VACANT

Eastern Electricity

CHILTERN'S SUB-AREA

MEASUREMENTS and COMMUNICATIONS SECTION

A vacancy exists in the Measurements and Communications Section of the Sub-Area Engineer's Department for a craftsman who has a sound knowledge of basic Electronics and preferably experience in V.H.F./U.H.F. radio-telephone installation and maintenance. The successful applicant will be based at Leighton Buzzard, Bedfordshire.

Salary is in accordance with the National Joint Industrial Council Agreement, Group 'G', and a stagger payment pattern is in operation for which an additional payment will be made.

Basic rate of pay = £16.11s. 9d. per week including incidental overtime allowance. Plus 10s. 6d. per week productivity bonus. Plus 10s. 6d. per week stagger payment.

Total pay £18 12s. 3d.

Also an additional 7s. 8d. per week will be paid after two years' service and a further 7s. 8d. per week after three years' service.

Applications should be made, in writing, stating age, experience and present position to the MANAGER, Chilterns Sub-Area, Eastern Electricity, Prebend Street, Bedford, as soon as possible.

MINISTRY OF AVIATION

CAREER OPPORTUNITIES FOR THE SKILLED CRAFTSMAN

Opportunities now exist for craftsmen in the grade of Mechanic Examiner with initiative to work on a wide range of electronic and electro-mechanical equipment and on metallurgical work connected with the electronics and aerospace industries. There are vacancies in our well-equipped laboratories at Bromley (Kent), Woolwich and Harefield (Middx.), and at firms' premises in London and the Home Counties.

Qualifications: A recognised engineering apprenticeship or equivalent experience or training (including training in H.M. Forces).

Pay and Prospects: Greater London Area. £16.15.0 to £18.5.0 for a 5-day, 40-hour week. Overtime available in certain areas. Opportunities for promotion to higher grade posts with salaries up to £1,650 p.a. for men who possess or obtain the necessary qualifications, e.g. O.N.C. or C. & G. Cert.

Time off allowed and fees paid for attending approved courses at Technical Colleges.

Holidays: 2 weeks (80 hours) rising to 3 weeks (120 hours) after 5 years' service in the grade, plus 8½ days public holidays.

General Information: Paid sick-leave scheme in operation.

Applications, giving brief details of apprenticeship and/or experience, and stating location preferred, to be sent to:

FULL-TIME COLLEGE COURSE
IN RADIO AND TELEVISION

Our Course has now been extended to sixteen months' duration to include theoretical and practical instruction on transistor television receivers, U.H.F. television receivers and colour television.

Next course commences 6th September, 1969.

This Course is recognised by the Radio Trades Examination Board (R.T.E.B.) for the Radio and Television Servicing Certificate examinations.

Provides excellent practical experience on valve and transistor radio receivers and all well-known makes of television receivers.

To:
The Pembroke College of Electronics (Dept. P11)
34a Hereford Road, London, W.2.

Please send, without obligation, details of the Full-time Course in Radio and Television.

The New Picture-Book way of learning

BASIC ELECTRICITY (5 VOLS.)

You'll find it easy to learn with this outstandingly successful new pictorial method—the essential facts are explained in the simplest language, one at a time; and each is illustrated by an accurate cartoon-type drawing.

The series will be of exceptional value in training mechanics and technicians in electricity, Radio and Electronics.

WHAT THIS MONTH'S ENTHUSIASTIC READERS SAY

"... The composition and illustrations make what I consider an ideal set of books for my son to study..." J. A. M., Yorks.

"... I am writing to tell you how much I enjoyed reading your BASIC ELECTRICITY and BASIC ELECTRONICS. I have a set myself and we half a dozen sets for teaching at the school of which I am head of the Science Department..." S. A. D., Newark.

TO SELRAY BOOK CO.

60 HAYES HILL, HAYES BROMLEY, KENT

Please send me Without Obligation to Purchase, Basic Electricity/Basic Electronics on 7 Days Free Trial. I will either return set, carriage paid, in good condition within 8 days or send down payment of 15/- (Basic Electricity) followed by 6 fortnightly payments of 10/- (Basic Electronics) or 15/- (Basic Electronics) followed by 6 fortnightly payments of 12/6. Alternatively, I will send 6/- (Basic Electricity—6 parts) 8/- (Basic Electronics—6 parts) post free. This offer applies to United Kingdom only.

Tick against set required (only one set allowed on free trial).

Hark! Hark! —the DX is calling!

Special RX tuner 42" x 3½" x 3½"

JOYSTICK
Variable Frequency ANTENNA SYSTEM

This revolutionary and pat. pend. aerial system possesses the unique property of an even response over all frequencies between 1-60 Mhz.

Every JOYSTICK Aerial System is supplied complete with feeder and an aerial matching unit. Just connect your RX—it is ready to go and gives an unprecedented "feel" to signal strengths especially far SWL and "real" DX—EVEN FROM UNDERGROUND! Naturally the advantages of using the JOYSTICK "up-the-line" are even greater!

Now Joysticks are standard all over the world and have already shown that this is the first major breakthrough for 20 years in this field of aerials. The performance for such a compact unit (7½in assembled) is staggering. Even the sceptics have been convinced once they have understood the basic principles and have followed the simple turn-up procedure given in the detailed instructions.

New Joystick Range

There is now a whole new range of Joystick Aerial Systems—to match your QTH, your rig and your pocket! The SYSTEMS cover SWL, TX/RX, indoor and outdoor, mobile and even the 'JOYSTICK' Aerial System. The SYSTEMS are reliable and permanent! Read all about them in our new brochure.

GUARANTEE: Partridge operate a rigid, 100% Money Back Guarantee If you're not completely satisfied!

Read testimonials from all over the world: "Your different receivers showed improved performance over a dipole" reports the U.S.A.

"Excellent results, Australia, Ceylon, North Africa in good strength although lately reception conditions have been poor," W. Cunningham, Leamington, Scotland.

"At W., Henry Williams III of Houston, Texas, writes: 'The Joystick really surprised me, it really works like you said it would. I took all my dipoles down.'"

L.G. Appleton, Leighton Buzzard: "I cannot speak too highly of my internal Joystick which continues to give me extremely good reports on 160m and 80m."

READ ALL ABOUT IT!

This ticket will bring you the new brochures by return of post!

PRACTICAL WIRELESS query service

Before using the query service it is important to read the following notes:

- The PW Query Service is designed primarily to answer queries on articles published in the magazine and to deal with problems which cannot easily be solved by reference to standard text books. In order to prevent unnecessary disappointment, prospective users of the service should note that:
  - (a) We cannot undertake to design equipment or to supply wiring diagrams or circuits, to individual requirements.
  - (b) We cannot undertake to supply detailed information for converting war surplus equipment, or to supply circuitry.
  - (c) It is usually impossible to supply information on imported domestic equipment owing to the lack of details available.
  - (d) We regret we are unable to answer technical queries over the telephone.
  - (e) It helps us if queries are clear and concise.
  - (f) We cannot guarantee to answer any query not accompanied by the current query coupon and a stamped addressed envelope.

QUERY COUPON

This coupon is available until 9th June, 1966 and must accompany all queries in accordance with the rules of our Query Service.

PRACTICAL WIRELESS, JUNE, 1966
