Ex-British Army

TELESONIC XMTBR/RCVR. YA9411-YA915
Designed for the transmission and reception of audio frequencies. No R.F. is employed. The transmitter unit YA9411 with valves 2/ARP12's (VP23), 2/ATP4's (V248A), (loop aerial not supplied), H.T. 60v, V2 120v, V3 and 4 180v, L.T. 2v.
Space for batteries is provided inside. Size 14½ X 11 X 8", fitted with handles, khaki finish.
The receiver unit YA9415 with valves 3/XH1, 5v (HIVAC), 1/XPI. 5v (HIVAC) which are in series parallel for 3v audio supply. H.T. 67.5v. Space for batteries is provided inside the unit. Dimensions 7½ X 2¼", finish khaki, with pick-up coil.
Clydesdale's £3 Carriage Price only paid for both units, with Rcvr. (PU) coil only. Receiver and PU coil, 3½/6

CO-AXIAL CABLES
Any length supplied
12 mm. 52 ohms. Solid core, at 6d. per yard, minimum 20 yards., 10/-, post paid.
12 mm. 80 ohms. Airspaced core, at 9d. per yard, minimum 20 yards., 15/-, post paid.
12 mm. 90 ohms. Airspaced core, at 7½d. per yard, minimum 20 yards., 11½/-, post paid.
10 mm. 110 ohms. Airspaced core, at 7½d. per yard, minimum 20 yards., 11½/-, post paid.

Johnson "Jumbo" Valve-holder for CV57, CV174, CV1293, etc.
H.V. porcelain base, with retaining clamp. 3½" X 2½" X 2½".
Clydesdale's 2½/- each Post Price only paid 25/- per dozen.

Brand New

REFLECTOR AERIAL (M-X-137/A)

E.175. A First-class Transmitting and Receiving Omnidirectional Antenna, in original moisture-proof carton with assembly instruction. Height assembled, 6' approx.
Width assembled, 4' approx.
Clydesdale’s 5/6 each Post Price only paid

For those 144mcs. experiments

BRAND NEW RACK MTG. VHF. R.T. RECEIVER UNITS
R1481. Frequency 65-86 mcs.
R1132. Frequency 100-124 mcs. Each a 10-valve (plus stabilizer) superhet with 4/VR53's (EF39), 2/VR65's (SP61), VR54 (EF34), VR57 (EK32), VR66 (P61), VS70 (7475), plus precision S.M. tuning dial assy. 3½" meter, screened R.F. unit, 4 tuned circuits, 5 I.F. trans. (12 mcs.). B.F.O., etc., etc., etc.
Present range covered by airspaced inductances and variable ganged micromenders, could be changed to suit personal requirements. Rack-mtg. enclosed chassis.
19½ X 10½ X 11". Finish (R1481) dark grey, (R1132) light grey. Circuit supplied, all units tested and guaranteed working before despatch.
Clydesdale’s £4/19/6 Carriage Price only paid (either)
Power requirements are H.T. 210v 55 ma., smoothed D.C. L.T. 6-3v 3-5A, provision to just plug in.

Ideal as SHORT WAVE CONVERTERS

Brand New in maker's carton
R.F. Unit, type 26, for 65-50 mcs. 5-6 metres.
Variable tuning 2/VR136 (EF54). VR137 (EC52). Output approx. 7-8 mcs. in metal case, 9½ X 7½ X 4½".
Clydesdale’s 35/- each Post Price only paid.
R.F. Unit, type 25, for 50-40 mcs. 6-7½ metres.
R.F. Unit, type 24, for 30-20 mcs., 10-15 metres.
Switched tuning, 5 pre-tuned spot freq. 3/VR136 (SP61). Output approx. 7-8 mcs. in metal case, 9½ X 7½ X 4½".
Clydesdale’s 19/6 each Used 12/6 each

Brand New in maker's carton
"SIROCCO" BLOWER, WITH SHUNT MOTOR
27v D.C. 1-5A. 1/50 H.P. 3,000 R.P.M., continuous running, multi-bladed fan, outlet dia. 2½".
Size overall, 7½ X 5½ X 4½". On rack 16 X 12", with fixing screws, aluminium construction.
Clydesdale’s 17½/6 each Post Price only paid
A comprehensive instrument built into one compact and convenient case, which will test any standard receiving or small power transmitting valve on any of its normal characteristics under conditions corresponding to any desired set of D.C. electrode voltages. A patented method enables A.C. voltages of suitable magnitude to be used throughout the Tester, thus eliminating the costly regulation problems associated with D.C. testing methods. A specially developed polarised relay protects the instrument against misuse or incorrect adjustment. This relay also affords a high measure of protection to the valve under test. Successive settings of the Main Selector Switch enable the following to be determined:

**Complete Valve Characteristics** including $I_a/V_g$, $I_a/V_a$, $I_s/V_g$, $I_s/V_a$, Amplification Factor, Anode A.C. Resistance, 4 ranges of Mutual Conductance covering $mA/V$ figures up to 25$mA/V$ at bias values up to $-100v.$, together with “Good/Bad” comparison test on coloured scale against rated figures.

WIRE RECORDERS. You've all heard about these instruments, and the ones we are offering were made for the U.S. Navy by the Brush Development Co., to Western Electric design. They consist of an amplifier/recorder/playback/erase unit, with a detachable recording head, and are ruggedly constructed from first quality components to give long, trouble-free use.

AMPLIFIER UNIT 165... still a few of these units left... they consist of 2 AF amplifiers mounted on a small chassis, and are complete with push-pull EL 32's, 2 EF36's and 1 EBC3... and circuit diagram. ONLY 19/6, carr. 1/6.

DISPLAY UNIT 198... complete with 3" (short persistence) VCR138A CRT, 4 SP61's, 1 VR54, 3 EAS0's, and hundreds of parts; in original cartons for less than the value of the tube! 35/-, plus 5/- carr.

RF 25's, you know all about them, but why not modify them for "30" 1/4... BRAND NEW, in original cartons, for 15/-, and 2/- carr.

HEADPHONES. DLR, 2/6. CLR, 2/6. Moving coil, 5/-, post 1/- per pair.

The amplifier, with an output of approx. 34 watts, has provisions for feeding-in mike (with built-in pre-amp) or pick-up; the head contains sufficient wire for approx. 45 mins. recording, and the quality is absolutely first class!

They are designed for 115v AC operation, and we supply a step-down transformer, for 20-250v, and a mike! COMPLETE, £45, carr. free.

POWER UNIT NO. 19. Again designed for the 19 set, they provide 540v at 40mA, and 275v at 110mA, fully smoothed from a rotary transformer, AND 275v from a vibrator pack, with OZ4 rectifier. Input is 12 or 24v. Fuses, lamp and switch on front panel. ONLY 15/., and 3/6 carriage.

VARIMETERS, designed for the famous W/S 19, they contain coils, condensers, pots and W/Elements... and are first-class aerial coupling units. ONLY 2/6, carr. 1/-. TR9 RECEIVERS. 6-Valve battery operated receivers, covering 6-9 mc/s; ideal for standby, easily converts for other frequencies; complete with valves, and metal case. PRICE 15/., carr. 3/6.

TELEPHONES DMKY. A self-contained telephone, with bell, buzzer, key and standard P0 type handset. In attractive, metal case. Ideal for "Shack To XYL." ONLY 25/- each, plus 2/6 carr.

All goods sold as used unless otherwise stated.

RADIO EXCHANGE CO. 9, CAULDWELL STREET, BEDFORD. Phone: 5568
Telescopic to powerful mains motor. 300v at 4A.

Type Extend to 7'. High grade input motor hole new type and 5v secondaries useful board. Connections brought 60 secondaries new for Type Mains wafer, 115v the Lyons fixing. With 60 transformers whilst 115v B1235. B5880.

Outputs: 12v. Make sure Admiralty fully guaranteed. 70 tap each top shroud, 12v.

Primary: 75v - 125v, 115v mA. cont. Outputs: 275-0-275v at 5A. Primary: 75v, 125v 240mA.

New Radio Publications
World Radio Station List, giving frequency, wave-length and power of 3,000 long, medium and short-wave stations, including the Copenhagen plan. Price 1/7, postage 9d.

V.H.F. Dipole
A useful dipole for the V.H.F. Experimenter. Each element is 13 cms. long and can be extended to 24 cms. Price 2/9, postage 9d.

Milliammeters
Brand new, made by Sangamo-Weston, 0/1 milli-amp moving coil meters, 2" round with panel fixing ring. Price 10/6 each, postage 9d.

Easibinders
- BEGIN NOW to create your own reference library by binding your copies of "Short Wave Magazine" in the Easibinder.

Your journals will remain clean and undamaged, pages open flat and journals can be inserted or removed at will with steel rods supplied with the binder. By means of a special patented device the binder is just as useful when only partly filled and therefore never loses its book effect.

Easibinders for "Short Wave Magazine" hold a complete volume neatly bound in green binding cloth, and gold-blocked with title and year on the spine (any year can be supplied). Price 11s. 3d. (post free).

Easibinders can also be supplied for other journals, including: "QST," "Amateur Radio," "Radio News," "Wireless World," etc. Particulars supplied on request. Easibinders can be sent to any part of the world.

Some interesting lines from the EDDYSTONE Component Catalogue

EDDYSTONE SEMI-AUTO. MORSE KEY No. 689
A well-made "bug-key" streamlined in both appearance and operation. The perfect "Speed" action, appreciated by the expert operator, is obtained by first-class engineering and attention to detail £3/17/6

EDDYSTONE TRANSMITTING CONDENSERS
These three types have the minimum of metal consistent with mechanical rigidity. End plates are ceramic 2½ in. square. Single point rotor earthing connection. Vane spacing is 08 in. All three types are split-stator, readily usable either in push-pull circuits or single-ended by parallel connection.

No. 612. 50pF per section ... £1/5/-
No. 614. 100pF per section ... £1/9/-
No. 611. 25pF per section with built-in neutralising condensers ... £1/7/6

EDDYSTONE METAL CABINET No. 644
The ideal container for small equipment such as preselectors, monitors, V.H.F. converters, etc. Well finished ripple black. Hinged lid at top. Height 7 in. and takes chassis 8½ in. x 5½ in. ... 19/6

ALL EDDYSTONE MATERIAL AVAILABLE FROM STOCK AT:

FOR FREQUENCY SUB-STANDARDS
Type JC1/200, 100 Kc/s Available from stock adjusted to ±0.01%. Higher accuracies supplied to special order.

FEATURES
Low temperature co-efficient—less than 2 in 10° per °C.
Patented nodal suspension.
Mounted in vacuum; performance independent of climatic conditions.
Exceptionally high Q value.
High stability.
Small size, 3½ x 4½ overall excluding pins.
Fits standard miniature deaf aid valve socket.

Price £2-15-0

GENEMOTORS, TYPE 33. Ideal for car radio. Input, 6-12v. Output, 200v. Fully suppressed. 11/-.

MAGNETRONS, TYPE 725A. Complete with magnet assembly and pole pieces. 3cm, 50/-.

SPEWRY GYRO PILOT UNITS. Contain valuable ball races, gearwheels, worm drives, differentials, gyroscopic, etc. A must for model makers at 19/6.

AERIAL TUNING UNITS, TYPE 12A. Rotatable inductance. RF ammeter. Tune 2.5-13mc, 7/6. Also American type BC306A, part of TX BC735. Variometer type. Slow motion dial, 11/-.

NEW AMERICAN ASTRO COMPASSES. May be usefully employed as a theodolite. In moulded case, with full instructions. 16/6.

RESIN-CORED SOLDER. Best quality. 1 lb. reel 4/6.

NEW VALVES. At 37/6, 715B. At 28/-, 703A doorknob. At 10/-, 6AK5, 1B24. At 7/6, 524 metal. 6AG6, 6AG7, 6F7, 6G6, 6K7, 6QV, 6V6, 717F, 717T, 717A, 718, 765, 865, EF36, EF54, Pen46, KT33C, 9002. At 6/6, 3Q5, 685, 615, 6K7G, 6Q7GT, 657, 1625, EF50, 5U4, RL7/ESC5. At 5/-, 6AC7, 657, 652, 657, 1625, EF50, 5U4, RL7/ESC5. At 2/-, 6AC7, 657, 652, 657, 1625, 12SG7, 12517, 1257, 12857, 8P61, 9690, 1033, 956, 9001, 9003. At 4/6, 2X2, 657GT, 6B2, 12C8, 12J5. At 2/9, 6H6, 7193, DI, SP41. All guaranteed. Two or more valves post free, otherwise add 6d.

POWER RESISTORS. 800 ohms. 2 amps. Double elements, wound on porcelain formers. Sliders are actuated by threaded rod, driven through bevel gears by a spring which is supplied. Suitable for chargers, etc. 15/-.

NEW AMERICAN AIR IDENTIFICATION INSTRUMENTS. A precision navigational instrument, complete with charts for all latitudes in north and southern hemispheres. In leather case. We are practically giving this away at only 3/-.

AVIATION INSTRUMENTS AND GAUGES. Large variety. Send stamp for illustrated list.

NEW BUNNELL MORSE KEYS. Fully enclosed action. Platinum contacts. The finest obtainable. 7/6.

NEW BLANK RECORDING DISCS, 12". Finest quality. Zinc base. Acetate coated. 15 discs packed in metal box. £1/2.

NEW AMERICAN HYDROGRAPHIC BALLONS. Inflate to 6 ft. Useful for hoisting aerials, or stratosphere and radar experiments. Complete with hydrogen generators ready for immediate employment. Only 7/6.

NEW RECEIVERS. Type 76-3 valves, inc. freq. changer CH355. Dust proofed. If. Illuminated slow motion dial. Two wavebands, switched. Complete with circuits, cased, 28/-.

NEW CLOCKWORK CONTACT UNITS. Precision movement, of great accuracy. Incorporates electric switch closing twice a second. Useful for flashing signs, timing devices, etc. 7/6.

BRAND NEW PETROL ELECTRIC PLANTS. QNH, 600 watts, 12-15v DC. Single cyal four-stroke motor, of robust construction, capable of providing years' trouble free service. Self starter and automatic switch. Voltage control. Ammeter. This compact semi-mobile plant is ideal for farmsteads, country chasels, etc., and provide adequate power at low running cost. Complete with tools, extensive spares and instruction manual, in maker's cases. £28.

Terms: CWO. Prices include carriage. Send stamp for lists.

TYPE BC 65A RECEIVERS. Absolutely brand new by GUNDIVX. etc. Valve line-up: 12AX7, 12AU7, 120C, 30008, 30008, making 10 valves in all. Frequency coverage 60-150mc. Can be supplied at a truly low price of 9/-, plus 5/- carriage and packing.

VALVES TYPE 813. By Canadian Westinghouse, boxed. Absolutely brand new, guaranteed and tested. 50/- each.

VIBRATOR POWER UNITS. 2 volt. As for Canadian 8B set. Completely smooth, output 1-5v, L.T. and 50 and 180v H.T. at 35 ma. Complete in grey metal box. Size 8 x 3½ x 4½. 50/- only.

TOPNO 4 SHEET. First grade, polished finish, size 21½ x 16 x 3'/4. Weight 10lbs. Priced at intervals around the edge for 4BA countersunk screws, 15/- per sheet.

FAXOLINE SHEET. High grade, polished finish. Sizes 19 x 19½ x 1/10. 2/8 sheet, 19½ x 19½ x 1/10. 2/6 sheet only. 15/- by order, post minimum lot of 2 sheets please.

U.S. ARMY MIDGET LIGHT-WEIGHT HEADPHONES.

200 ohms, resistance. Suitable for 10-ohm. Brand new and boxed. 7/6 each pair only.

POCKET VOLTMETERS. Ex-Govt. Two-range, 0-15v, 0-250v. D.C. Brand new and complete in Web carrying case, only 10/-

EX-GOV'T. VALVES. The following brand new and guaranteed valves are in stock:
- VU11, VU123, VU13, VU14, 5S4GY, 827, 807, 6A45g, all 9/- each. 524, 573, MU14, 6F30, 6F34, 6L5, 6L5C, 6L2, 6L3, 6BQ3, 6W6, all at 7/8 each. 2050, 12L32, EF27, RGD3, all at 6/- each. Also LNJ2C, B.B. 697, 7, 4D1, 6L4, 6A40, 6K2, 6K4, at 5/6 each. DI Diode at 2/- each.

And the niche range of 1-4v battery valves. 145 at 6/- each. 185 at 7/-6. 184 and 284 at 9/- each. Most of these valves are boxed. Please note for current popular circuits, we also have in stock LND10, at 8/- and HIVAC 18/4 at 10/-. Both these latter are new and boxed. In addition we have 10,000 new boxed RCA valves in stock at current Board of Trade prices. Let us have your enquiries.

SPECIAL OFFER. F.M. SPEAKERS. By leading manufacturers, 8? H.T. Transformers, 20/-, with Trans. 10/-; 6½, 10c Trans, 20/-; 8, 2c Trans, 40/-, with Trans. 25/-; 6½, 2c Trans, 45/-, with Trans. 35/-; and the new Trovo 6½" Speaker at 25/-, 10c Trans, 21/- 13c Trans, 15/-; 33" at the absurdly low price of 9/-.

H.T. TRANSFORMERS. Output 2,500v, 5 ma, 4v, 11-amp. 6v. 2c (for VOR/07), 35/- only. Output 3,350v 5 ma, 0-3v, 1a, 2-5v, 2a (for VOR/07), 35/- only. Output 4,000v, 10 ma, 2-6v, 2a, 45/-, Output 5,000v, 10 ma, 2-8v, only 85/-. All input 200/250v, and fully guaranteed.

VOR 87 C.R. TUBES. Please note we are still able to supply these Ex-Govt. Tubes, brand new and guaranteed. Each tube is tested for television suitability prior to dispatch. Price 35/- each, plus 7/- carriage and packing. Black rubber masks are in stock for these tubes, at 3/- each.

6in. ENLARGING LENS. Owing to a large purchase of these items, we are now able to supply at 25/- only plus 1/- carriage and packing.

Send stamp for current Component List. Probably the most comprehensive in the trade.

Introduce AN IMPROVED PATTERN TYPE P5 CRYSTAL UNIT

The type P5 Quartz Crystal Unit is now fitted with a low temperature co-efficient crystal, having a co-efficient of two cycles per Mc. per degree C temperature change. It is available in an extended range of frequencies, and each crystal is acid etched finished and artificially aged for permanence of performance and calibration.

When used in the Colpitts oscillator-multiplier circuit, with a 6AG7 valve at an anode voltage of 300v, sufficient output is available on the fundamental frequency, and 2nd, 3rd and 4th harmonics to drive any of the usual tetrode valves as a further frequency multiplier or power amplifier. Details of this circuit, and an official certificate of calibration are included with each crystal.

The P5 unit is available in the following ranges —

- 1,750 to 2,000 kc/s, for use on the fundamental frequency (1,800-2,000 kc/s) and with frequency multipliers in the 3-5, 7, 14, 21 and 28 Mc/s bands.
- 3,500 to 3,800 kc/s, for use on the fundamental frequency (3,500-3,800 kc/s) and with frequency multipliers in the 7, 14, 21 and 28 Mc/s bands.
- 6,000 to 6,083 kc/s, for use with multipliers stages (x 24) in the 144 Mc/s band.
- 6,740 to 6,820 kc/s, for use with multipliers in the 27 Mc/s model control band.
- 7,000 to 7,425 kc/s, for use on the fundamental frequency (7,000-7,150 kc/s) and with multiplier stages in the 14, 21 and 28 Mc/s bands.
- 8,000 to 8,111 kc/s, for use with multiplier stages (x 18) in the 144 Mc/s band.
- 8,987 to 9,093 kc/s, for use with a tripler stage in the 27 Mc/s model control band.
- 12,000 to 12,166 kc/s, for use with a quadrupler stage in the 144 Mc/s band.
- 14,000 to 15,000 kc/s, for use on the fundamental frequency (14,000-14,400), and with a doubler stage in the 28 Mc/s band.
- *12 and 14 Mc/s bands, £2/-6. All other ranges, £1/17/6.
- *12 and 14 Mc/s ranges, £1/15/-. All other ranges, £1/12/6.

THE QUARTZ CRYSTAL CO., LTD.
63-71 KINGSTON ROAD, NEW MALDEN, SURREY
CHOKES
Introducing a new range of L.F. chokes, all new and unused, each one individually marked.

- Type CG4, 10Hys, 75mA, 150ohms
- Type CHB, 10Hys, 100mA, 300ohms
- Type CH10, 15Hys, 250mA, 250ohms

HEATER TRANSFORMERS
(All new and guaranteed)
- 2v 2amp. Pri 230V 50c/s. Size 21/2 x 2
- 4v CT, 1.75amp. Pri 230V 50c/s. Size 3 x 1
- 4v 3amp, Pri 210/230/250 50c/s. Size 21/2 x 2 1/2
- 6-3v 1-Samp, Pri 230V 50c/s. Size 1/2 x 3/4 x 3/4
- 63v 1-Samp, Pri 230V 50c/s. Size 21/2 x 3 x 2 1/2 (Postage 1/- extra)

B.E.C. MINIATURE CAN

16-8mfmd 450v 2/6. Size 1" x 1/2" high excluding tags, complete with mounting clip, 5/- post free.

PAPER CONDENSERS

4mfd 500v 2/5, 3/3 post free. 4mfd 1000v 13/6, post free.

DENCO POLYSTYRENE SOLUTION

2 oz. Bottles, 2/- post free.

Midget “Ceramicon” Condensers

Type VALLANCES ELECTROLYTIC

3" x 2" x 3 1/2".

RADIospares

Taylor Junior 120A, £8/8/-.

Fiocco Radiometer (AC-DC), 25/-, plus 1/6 postage and packing.

Radiospares Vibrator Transformers

Suitable for synchronous or non-synchronous vibrators. Output 280-0-280v at 80m/a. Fully shrouded. 3" x 2 1/2" x 3" high. When ordering, please state whether you require 6 or 12v input, 20/-, post free.

Radiospares, 100 watt. Auto-transformer "Ported" construction. Voltage adjustment panels for 200-230/250 input and 100-115/150v output. A first-class job finished in grey stove enamel and fitted with input and output leads. 29/-, post free.

Pick-Up Lead

A specially flexible lightly screened lead, with silk outer cover. Specially designed for use with gram pick-ups. 1/- per yard.

F.W. DINKIE SPEAKER

Die-cast cabinet, finished in black crakle and silvery mesh wood. 5" concentrated flux unit. 2/4 ohm voice coil. Size 6" x 7" x 2" deep. Ideal for communication receivers or extensions speakers. Price £2/-/3, post free.

EDDYSTONE MEDIUM LOUDSPEAKER

Consisting of 5" P.M. Unit, mounted in a die-cast housing, 2 1/4" dia. A special acoustic baffle is fitted giving exceptional performance. Finished in black or grey ripple with chrome feet. 3 ohm voice coil. Ideal for communication receivers or extension speakers. Cat. 628 (Black), Cat. 629 (Grey). Price £3/9/- each, post free.

BLACK CRACKLE SPEAKER CABINETS

6", 19/6; 8", 22/10; 10", 27/10. All post free.

STANDARD RACK CHASSIS

17" x 10" x 2". Gloss black finish. 10/-, post free.

STANDARD PANELS

Black crakle finish. Two slots each end for mounting. 3", 7/6; 7", 8/6; 8", 9/6; 10", 11/6. All post free.

Standard Angle Brackets

9/6 per pair, post free.

PAXOLINE SHEET

Brown 6" x 6" x 1/8" 1/9 8" x 6" x 1/8" 2/3 8" x 6" x 1/6" 2/10 12" x 8" x 1/6" 2/5 10" x 6" x 1/4" 3/5 10" x 8" x 1/4" 4/3 9" x 6" x 1/2" 8/3

ELSTONE MT100/EA MAINS TRANSFORMER

A beautiful job finished in black crakle and fully shrouded. Fitted with mains adjustment panel and output panel. Can be mounted in three different positions without removing shrouds. Primary, 200-230/250v 50-100 c.p.s. Secondary, 350-0-350v 100m/a.

6-3y 4 amps or 4y 4amps.

ENAMELLED COPPER WIRE, 1lb REELS

16SWG, 1/6; 17SWG, 1/6; 18SWG, 1/6; 19SWG, 1/6; 20SWG, 1/6; 21SWG, 1/6; 22SWG, 1/9; 23SWG, 2/1; 24SWG, 2/5; 25SWG, 2/7; 26SWG, 2/9; 27SWG, 2/3; 28SWG, 2/3; 29SWG, 2/4; 30SWG, 2/4; 32SWG, 2/4; 33SWG, 2/4; 34SWG, 2/4; 35SWG, 2/10; 36SWG, 3/-; 37SWG, 3/3; 38SWG, 3/4; 39SWG, 3/6; 40SWG, 3/9.

Goods can be sent C.W.O. or C.O.D. When ordering Paxoline sheet, copper wire, screened or co-axial cable, please include sufficient extra for postage and packing.

VALLANCE'S

VALLANCE & DAVISON LTD

Dept. S.W.M.

144 BRIGGATE, LEEDS

Tel: 29428/9
Introducing

"PREMIER"

The Television Kit

YOU can build for

£17.17.0

This Receiver consists of 4 units:-

Type: Sound Receiver, Vision Receiver, Time Base and Power Pack. As is usual in all Premier KITS, every single item down to the last bolt and nut is supplied. All chassis are punched and layout diagrams and theoretical circuits are included. The cost of the KITS of Parts is as follows:-

The Vision Receiver with valves 3/12/6

The Sound Receiver with valves 2/14/6

The Time Base with valves 2/7/6

In addition you will need:-

A V.C.R. Cathode Ray Tube 1/15/6

A Set of Tubes 12/6

And a 6" PM Moving Coil Speaker 2/6.

The Instruction Book costs 2/6, but is credited if a Kit for the complete Televisor is purchased.

Any of these KITS may be purchased separately; in fact any single part can be supplied. A complete priced list of all parts will be found in the Instruction Book.

A GLANCE AT THE PRICES WILL SHOW THAT THIS IS THE GREATEST VALUE OFFER PREMIER HAS EVER MADE.

20 Valves are used, the coils are all wound and every part is tested. All you need to build a complete Televisor Receiver is a screwdriver, a pair of pliers, a soldering iron and the ability to read a theoretical diagram. Working models can be seen during transmitting tests at our Pleaf Street and Edgware Road Branches.

VALVES AT BARGAIN PRICES

Set of four 14-valve types - 28/6 set.

LOCTAL BASED.

1205 (Pentagrid Converter).

12N3 (RF. Pentode).

12DS (Diode Pentode).

33D (Cuadrid Pentode).

12N3 Valves. 144-loctal based RF Pentode. 3/6 each.

144 Valves. Bulboid based 1.4V 2.9v. Power Pentode. Load resistance 8000 ohms. 6/6 each.

All other types previously advertised are still available.

LOUDSPEAKERS—by Rolls, Trapez, W. & B. 30" x 44" 8", £1 15s. £8 6/6; 24" x 24" 6", £1 6/6; 18" x 18" 6", £1 11s. 6d. Transformers for any of the above, 2/2 each. Special offer of Trapez 16" Speakers, 15/11 each.

METERS.—Additions to our usual range: 0-50v 2½" c.d., moving iron 4½d. 0-60v 8½d, 0-150v 10½d, 0-600v moving coil meters with external resistance 4½" c.d. 17½d each.

METER KIT.—A FERRANTI 500-MICROAMP MICRO INJECTOR, with separate high stability, high accuracy, resistors to measure 15, 60, 150 and 600V D.C. Scale length 11", diameter 2½", 1½" the complete kit.

Short Wave micro variable condensors. All values from 10PF to 1000PF, 2/6 each.

0000mf 9-gang Variable condensors. Without trimmers, 16/6 each; with trimmers, 2/6 each.

Clyde transmitting condensors. 200PF.

Ceramic insulation, 27" spacing, 4½. Marconi split slip plate transmitting condensors. 200PF. Each section 152" spacing, ceramic insulation. 2/6 each.

AUTHORS' MSS

Articles submitted for editorial consideration must be typed double-spaced with wide margins, on one side only of quarto sheets, with diagrams shown separately. Photographs should be clearly identified on the back. Payment is made for all material used, and a figure quoted in the letter of acceptance. It is a condition of acceptance that copyright of all material used passes to the Short Wave Magazine, Ltd., on publication.

THE SHORT WAVE LISTENER ASSOCIATED WITH THIS MAGAZINE IS SPECIALLY FOR THE RECEIVING ENTHUSIAST
for radio amateurs

The types illustrated are, reading from left to right:—
TT15, DET20, TT11, DET19, KT8C, KT66, DET18, DET12, PT15.

Technical data on these and other valves will gladly be supplied upon request.

The requirements of amateurs in both standard practice and experimental work, including V.H.F., can best be met from the wide range of electronic devices manufactured by the G.E.C.

EDITORIAL

Rejoinder

Those who may spare time to glance over this space will have seen our comment last month on the subject of the BBC’s operations in the 7 mc band.

That Editorial has inspired official replies from both the BBC and the GPO. The gist of these is given below.

From the BBC:

"The question was raised in the House of Commons recently, and the Assistant PMG pointed out that no amateur wavelengths had been transferred for the purposes of supplementing broadcasts in the Russian language.

"The wavelengths on which the BBC carries out its transmissions are allotted to this Corporation by the GPO, and we are, therefore, not in a position to comment on the manner in which they are allotted."

From the GPO:

"Of the frequencies mentioned in your Editorial in the Short Wave Magazine for June, 7120 kc has been used for Russian transmissions since March 24, 1946, and for other purposes since 1942. Neither of the other frequencies you mentioned is being used by the BBC for the Russian service.

"The Postmaster-General is, of course, well aware of the difficulties arising out of the operation of transmitters in bands other than those allocated to them... he is doing what he can to minimise these difficulties which... are not peculiar to use of the amateur bands by broadcasting stations. Conditions in the field of international radio are still very far from normal... it is doubtful whether any real improvement will be possible until... the Atlantic City Conference is fully implemented.

"... the Postmaster-General will continue to keep the matter under review and as soon as conditions enable him to take some action with a view to improving the position, he will do so."

From all this, it is clear that the BBC is not responsible for its frequencies; that the GPO can at present do nothing to improve the position; and that amateurs are not alone in having their bands occupied by other agencies.
Single Sideband Working

Some Practical Considerations

By H. C. WOODHEAD (G2NX)

There is no need to stress here the advantages of Single Sideband Suppressed Carrier working over the more normal DSB methods as used in Amateur Radio. These have been covered adequately by G3VG (Short Wave Magazine, July, August, 1948) and it is not proposed to recapitulate them here, though it may presently appear that it is possible to eliminate some of the disadvantages which are normally held to weigh in the balance against SSB systems.

It would, perhaps, be as well at the outset to make clear the distinction between Single Sideband Suppressed Carrier and Double Sideband Suppressed Carrier. The present article will be concerned entirely with the former.

In the case of DSBSC, as distinct from SSBSC, the carrier must be reinserted at the receiving end at the correct frequency and phase or the resulting speech will be so distorted as to be unrecognisable.

For this reason alone, therefore, it is extremely unlikely that the system suggested by G3VG, as a simplified system of SSBSC but being in fact DSBSC, would be adopted as suitable for amateur operation.

In Fig. 1 are shown diagrammatically the four different conditions to which it will be necessary to refer in the course of this discussion. At (a) is the Double Sideband system normally employed by the amateur. In this example the carrier is shown situated at 50 kc and the sidebands extent from 47 kc to 53 kc, occupying a space in the high frequency spectrum of 6 kc but having an audio transmission band of 3 kc. In (b) the case is much the same, except that no carrier is transmitted and this must be reinserted at the receiving end correct both in frequency and phase.

In (c) both the carrier and upper sideband have been removed and for reception the carrier must be reinserted, but there is some latitude regarding the frequency and an error...

Fig. 1. Showing four different types of telephony transmission. (a) Double sideband, with carrier; (b) Double sideband, carrier suppressed (DSBSC); (c) Single sideband, carrier suppressed (SSBSC); (d) Single sideband, with carrier.

Fig. 2. Showing how the form of an asymmetric sideband signal may be determined by the shape of the HF filter response.

Fig. 3. Crystal filter as used in a communications receiver. T1, input transformer tuned to pass-frequency; T2, output transformer tuned to pass-frequency; C1, tuning capacity for T1; C2, Balance or phasing condenser; C3, tuning capacity for T2.
of perhaps 100 cycles may not render the speech unintelligible, though, of course, the speech frequencies will all be translated up or down by the amount of the error and the quality will suffer accordingly. For example, a transmitted audio frequency of 1,500 cycles would be received as 1,600 or 1,400, depending on which side of the correct frequency the reinserted carrier erred by 100 cycles. In (d) is shown a single sideband complete with normal carrier. This can be taken on a normal receiver and is barely distinguishable from (a). In actual practice combinations of these four conditions are often encountered, which are so close to one of them as to be barely distinguishable from it. Such a case, for example, is the Single Sideband Pilot Carrier, which is between (c) and (d) but more nearly resembles (c). On the other hand, Asymmetric Sideband, shown diagrammatically in Fig. 2, is a combination of (a) and (d), and must be considered as a separate case.

Now the methods of producing the condition shown in Fig. 1 (c) so far adopted have been:

(1) By removing the unwanted carrier by balancing and the unwanted sideband by filtering;

(2) By removing the unwanted carrier by balancing and the unwanted sideband by phasing.

Method (1), as far as the author is aware, has not yet been adopted for amateur use because of the difficulty encountered in constructing a suitably narrow filter to remove the unwanted sideband. Method (2) appears to be meeting with some success in the United States, though the author has never yet worked a W using this system, nor has any other amateur of his acquaintance. It does not appear to have met with much support on this side of the Atlantic due, presumably, to its complexity. It depends for its operation on a network capable of producing a 90-deg. phase change equally in all frequencies in the audio range of, say, 100 to 3,000 cycles. Such a network is quite possible of construction, though it is difficult to maintain the output in exact quadrature over the entire audio band.

The Crystal Gate

It is proposed to explore further the possibilities of Method (1) for amateur use by consideration of a crystal filter of the type used in the average communications receiver for so-called "single-signal" reception.
The arrangement for such a filter is shown in Fig. 3, where both the input and output circuits are tuned to the resonance frequency of the crystal and the condenser C2 is adjusted to have the same value as the inherent capacity of the crystal in its holder. Thus, for any frequency except the narrow pass-band of the crystal, the circuit is balanced and no output results. In the pass-band the reactance of the crystal branch of the circuit is very much reduced and so the bridge is unbalanced. The response of such a filter is shown in Fig. 4, from which it will be seen that the band width which may be expected from a 465-kc filter may be of the order of 300 cycles. This figure can be varied to some extent by adjustment of the impedances of the input and output circuits, but it is obviously too small to be of any use as a sideband filter. If, however, such a filter is constructed with a crystal of ten times the frequency, the pass-band would be about ten times as great. So a 5-mc filter would give a pass-band of the order of 3 kc, which is something like the required figure, but the sides of the curve are still not sufficiently steep to cut off one sideband and leave the other intact.

There is, included in the average communications receiver, a “phasing” control which is none other than the condenser C2 of Fig. 3; this has the effect of modifying the response as shown in Fig. 5 or of tilting it the other way, according to whether C2 is increased or decreased on the central balance position. One of these curves (No. 7) for a 5 mc crystal, has been plotted to a larger frequency scale in Fig. 6 and it will be seen that a circuit so adjusted offers a discrimination of some 20 dB for 400 cycles on its steep side and the band width on top is at least 3 kc.

Such a filter can be used to produce an asymmetric sideband, as shown in Fig. 2, from which the carrier can be balanced out. The further inclusion of an audio filter to remove all frequencies below, say, 200 cycles would leave only a single sideband as shown in Fig. 7.

Selection of Suitable Crystals

The components of the circuit of Fig. 3 are a matter for some experiment but to obtain a sharp cut-off the input and output circuits of the crystal bridge should have an impedance of only a few thousand ohms. It is for this reason that T1 is a step-down transformer with its primary tuned and T2 is a step-up with its secondary tuned. The ratio will, of course, depend on the other circuits with which the filter is required to work. It is not possible to give precise constructional details as these will depend on the frequencies of the crystals which may be available.

In the case of one experimental filter for use with a crystal of 5-655555 mc, the values were as follows:

- **T1-Pri.** = 30 turns 28 SWG DSC, in. dia. former
- **Sec.** = 15 turns 28 SWG DSC, in. dia. former
- **T2-Pri.** = 8 turns 28 SWG DSC, in. dia. former
- **Sec.** = 30 turns 28 SWG DSC, in. dia. former
- C1 = 100 µµF variable condenser
- C2 = 30 µµF variable condenser
- C3 = 100 µµF variable condenser

In order to improve the discrimination against the unwanted sideband still further, it is preferable to have two of these filters in cascade. They may be arranged as two parts of the same filter or they may be inserted separately in two successive valve anode circuits. In any case their effect will be additive. By this means the discrimination may be increased to 40 dB and the transmission may be regarded as truly SSB, though the addition of the second crystal may introduce fresh difficulties.

Unless the two crystals are identical in frequency the two response curves will not coincide and the maximum discrimination will not be obtained. But identical crystals are not easily come by and in the case of three in the possession of the author, all calibrated as 5-655555 mc, there are differences of some 400 cycles. The ideal would be two identical crystals for the filters and one about 1,500 cycles away for use as the carrier oscillator though it will probably be found possible to trim the oscillator crystal by this amount to bring it to the correct position for the carrier.

There is another alternative in the band-pass circuit of Fig. 8 which uses two crystals with slightly different frequencies to obtain a band-pass with steep sides as shown in Fig. 9 and while 5 mc is quite a suitable frequency for the narrow single-crystal circuit, it is probable that for the wide-band circuit of Fig. 8 a lower frequency of the order of one or two megacycles would be required. The choice of type of crystal filter and the frequency employed will depend on the availability of suitable...
about a gate
requirements.
the hope
and therefore available for

about 30 μF; C4, C5, tuning capacities for T2.
crystals and the best method is probably to
choose some frequency around 5 mc (known
to have been commonly used in ex-Service
equipment but of no use for amateur bands
and therefore available for a few shillings),
and to obtain as many of them as possible in
the hope of picking three that suit the
requirements.
To sum up, then, the receiver type crystal
gate offers considerable possibilities for use as
a filter for SSB working provided a frequency
about 5 mc is chosen and the phasing con-
denser is adjusted to give the steepest side of
the response curve to coincide with the carrier.
Alternatively, a band-pass crystal filter may
be used at a lower frequency. Either of these
filters is operated in conjunction with a
balanced modulator for removal of the carrier
and a high-pass audio filter to remove the
lower frequencies which remain in both
sidebands.
It is hoped in a subsequent article to describe
the construction of an SSBSC Drive Unit for
use on 80, 20 and 10 metres based on the
principles outlined above.

ZC6 QSL COLLECTION

We are informed by 4X4BX, as QSL
manager of the Israeli Amateur Radio Club,
that he holds about 300 cards for ex-ZC6
operators whose incoming QSL's have now
fetched up in Tel-Aviv; as these ex-ZC6's
(many of whom were under cover) have
spread out all over the world, 4X4BX asks
that the eighty operators concerned should
send their ZC6 call, present QTH and an
IRC to the QSL Manager, P.O. Box 4099,
Tel-Aviv, Israel, when the cards will be
 forwarded.

IDENTIFY YOURSELF!

When writing us on any subject whatever,
please sign your call if you have one. Apart
from the fact that it helps you and helps us,
the tradition of Amateur Radio has been
built up on the individual callsign, and is that
by which Amateur Radio lives. A callsign is
both a distinction and a privilege, and should
be used and treated as such.

CARDS IN THE BOX

If your call appears below, it is because
we are holding QSL card(s) for you and
have not got an address for mailing.
Please send a large stamped, self-addressed
envelope with name and callsign, to
BCM/QSL, London, W.C.1., which is a
full and sufficient address for our QSL
Bureau from any part of the world. And
if you would like your call to be listed in
"New QTH's", please mention that at the
same time. It ensures eventual appearance in the Radio Amateur Call Book.

NBFM Adaptor Unit
Applicable to Existing Equipment

Designed and Described by G4LU

The merits and demerits of NBFM have been adequately dealt with in previous articles which have described complete NBFM exciters, but whereas these articles have included a VFO or crystal drive the present one describes a unit which can be inserted between an existing VFO and the driven portion of the transmitter. With this arrangement the stability of the mean carrier frequency remains unaffected and is determined solely by the stability of the VFO itself or the crystal drive in use.

The writer's NBFM unit was designed to work with a VFO at 3.5 mc, which had an output impedance of 75 ohms, and which was normally coupled by means of coaxial cable to a following broad band exciter. The NBFM adaptor can remain in circuit permanently even when the transmitter is used with AM on the lower frequency bands, it only being necessary to break the microphone circuit.

The phase modulation system is employed, together with simple audio-frequency correction in the microphone amplifier stage, to give the equivalent of frequency modulation. No originality is claimed for the circuit except in so far as was required by the particular valve types used, which in this case happened to be types available from ex-Service equipments. The phase modulator uses a pair of SP61's (VR65-CV1065) and the output amplifier an EL32 (VT52-CV1052). The audio line is 6J7 (VT74-CV1074) microphone amplifier and 6SN7-GT (CV181-CV1986) phase inverter.

The Phase Modulator

The 3.5 mc input is fed to the two SP61 grids via a phase-splitting network comprising C1, C2, R1, R2, the function of which is to produce a phase difference of approximately 90 deg. between the two grid voltages. The output of each valve is then separately amplitude modulated by means of audio voltages applied to the suppressor grids of the SP61's. The two audio voltages are, of course, supplied 180 deg. out of phase by the 6SN7 phase inverter. The outputs of the two modulator valves are combined in the common...
anode tuned circuit resulting in a phase modulated signal.

(All condensers, except C24, 350 volts working.)

R1, R2, R5 = 200 ohms, ½ watt
R3, R4, R9 = 10,000 ohms, ½ watt
R6 = 3,000 ohms, ½ watt
R7 = 2,000 ohms, ½ watt
R8, R11 = 100 ohms, ½ watt
R10, R12, R19 = 2,000 ohms, 1 watt
R13, R16, R20 = 0.5 megohm
R17, R18 = 47,000 ohms, ½ watt
R21, R22 = 0.25 megohm, ½ watt
V1, V2 = SP61
V3 = EL32
V4 = 6J7
V5 = 6SN7GT
L1, L2 = 29 turns, 22 SWG enamelled, 1 in. diam.
L3 = 4 turns over-wound on L2
RFC = 2.5 mH

There is a slight degree of amplitude modulation present in the output of the modulator stage, but this is removed by the action of the output amplifier and the subsequent doubler stages, which are normally run under Class-C conditions and perform the limiting function very efficiently. Since the SP61 has a sharp cut-off control grid characteristic and an extended cut-off suppressor grid characteristic, different static values of grid bias must be used on the two electrodes. This point is taken care of by returning the control grid circuit to a point above earth potential on the cathode resistor chain. Approximately two volts bias is supplied by the cathode resistor to the control grid circuits and about 30 volts bias to the suppressor grids. Grid leak bias is also provided by R3, R4, to enable the valves to work under Class-C conditions when the RF drive is applied.

Approximately 8 to 10 volts RMS RF voltage is required by each SP61 valve and can be supplied by a VFO or crystal drive capable of delivering 1½ to 2 watts into a 75-ohm load. In the event of the station VFO working on 1.6 mc and not 3.5 mc it
will be necessary to double the values of $C_1$ and $C_2$ in order to retain the desired phase difference between the two SP61 control grid voltages. It will also be necessary to change the anode tuned circuits to cover the lower frequency.

The output amplifier is quite straightforward and no difficulty should be experienced with this stage provided a grid stopper resistance of about 50 to 100 ohms is put in close to the grid terminal of the valve.

**The Audio Stages**

The input amplifier is designed for use with a carbon microphone, but no energising battery is required since the microphone is in the cathode circuit of the valve, the control grid of which is earthed. This circuit is capable of good quality reproduction, especially when used with some of the American Service types of microphone inserts. Obvious changes will be necessary if it is desired to use a crystal or other type of microphone.

An RF filter is included in the microphone input circuit to prevent unintentional FM from rectified RF when the transmitter is used on AM. $C_{12}$, which is effectively in parallel with the input amplifier load resistance, provides the falling audio frequency characteristic necessary to transform the phase modulation to frequency modulation. The phase inverter uses a conventional circuit which provides two approximately equal voltages, but of opposite polarity, to the modulator valves.

The Adaptor can be comfortably accommodated on a chassis 8 in. by 6 in. by 2 in., but if it is desired to incorporate a power supply a somewhat larger assembly will be necessary. The power supply requirements are moderate, being about 45 mA at 250 volts for HT and 2 amps at 6-3 volts for the heaters. The unit as described and illustrated has been used for a number of QSO's on ten metres and to date only one adverse report, due to overswing, has been given.

Underneath the NBFM unit, showing construction and arrangement of parts. Note the shield at the side of the amplifier tuning condenser, left.
Quad for Ten
A Practical Design

By B. C. COOPER (G3TC)

SOME months ago the writer was astonished to hear, whilst in contact with a W station, that he was using a " Cubical Quad " aerial. This was the writer's introduction to a system with a name reminiscent of the geometry class.

Interest was stimulated by a note in "VHF Bands" in the November, 1948, issue of the Short Wave Magazine, that a two-metre Quad 25 ft. high had given a performance equal to a four-element beam at 50 ft. If this performance could be duplicated on Ten here was an aerial with possibilities.

The necessarily rather sketchy information in the article referred to was gradually supplemented with further details garnered during the course of many contacts with operators in the States, until finally the basis for an experimental design emerged.

Design
The sketch shows the main features of the structure. The beam consists of two squares, a radiator and reflector, each square containing four quarter-wave sides 8 ft. 3 in. long, lying in the same plane and spaced one quarter-wave from each other. 16 SWG aluminium wire was used for lightness, but this is very susceptible to the weather, and corrodes quickly. Copper wire, although somewhat heavier, is a better proposition. The supports for the wire were 7-ft. lengths of bamboo cane, obtainable from any market gardener, and cut to size. A bakelite tube 8 ft. 5 in. long and 1½ in. in diameter was utilised for the boom. Half-inch holes were drilled an inch from each end, and ½ in. to the rear and at right angles to the original holes a further set was drilled. The bamboo canes were then slotted through and bound together with wire at the centre to provide good support for the elements. Small pieces of perspex at each tip of the canes served to insulate the wire from the frame. The canes from tip to tip when bound together measured 12 ft.

In the original version, the radiator was fed with 70-ohm coax cable. At a quarter-wave spacing the proximity of the reflector to the radiator has little effect on the impedance at the feed point of the latter. The reflector was made 5 per cent. longer than the radiator, the additional length taking the form of a stub at the bottom of the reflector. A shorting bar was moved along the stub until maximum forward gain was indicated on a field strength meter.

Mounting
The Quad was mounted on a 16-ft. light wooden mast, subsequently reduced to 12 ft. to facilitate adjustment. The whole array was so light that it could easily be raised into position with one hand.

Results
Comparative checks against a dipole 27 ft. high and aimed in the same direction as the Quad showed a spectacular gain on reception. On changing over to transmission the results on reception were more than confirmed. A series of tests were undertaken with stations in the States, and the average improvement by the use of the Quad could be conservatively rated at two S points. On one QSO a W7 remarked that the Quad was putting the only G signal through to the West Coast on the top end of the ten-metre band. In the course of a few days many reports were received that the system was radiating the strongest signal into W on the HF end of the band. The input for these tests was 75 watts to a pair of 807's.

Frequency Sensitivity
The original version was found to tune very sharply on the resonant frequency, and at any wide departure from this frequency the system would not load. To overcome this defect, and in order to obtain wide-band coverage the original radiator was replaced with 300-ohm cable and fed with the same material on the folded dipole principle. This method was eminently successful—the performance of the original radiator on the peak frequency was preserved with the added advantage that the tuning of the whole system was reasonably flat over the entire ten-metre band.

Stub Tuning
While the Quad was down for this modification opportunity was taken to remove the shorting bar from the tuning stub on the reflector, replacing it by a 50-µF variable condenser. Field strength measurements showed a marked increase in forward gain at the optimum setting of the condenser.

Unfortunately, at the writer's location, with an aerial only 16 ft. high, radiation is restricted to the north-west; this caused a misinterpre-
Adapting High-Cycle Transformers

Surplus Unit Application Note

POWER transformers from ex-Government surplus equipment designed for high mains frequencies are often discarded. Use has been made of two types by the writer, which are discussed below.

The first was obtained from a surplus power unit which supplied both EHT and HT voltage to some radar equipment. The transformer is marked TDS25M but the more usual "section of ref." is not visible.

The mains supply (210 volts 50 cycles at the writer's QTH) is connected to the outer points of the winding marked 550-0-550. The voltage from the normal 80-volt primary winding is 14 volts and each of the four heater windings gives approximately 1 volt. These windings and the original 80 volts primary are connected in phase so that output voltages of 14, 15, 16, 17 and 18 are obtained. This output is rectified by the usual type of surplus selenium rectifier rated at 1 amp and costing 5s, and is used either to charge a 12-volt accumulator or to operate ex-Government surplus relays of up to 1,000 ohms.

The second type was obtained from an Admiralty modulator unit type W6331. The transformer is Admiralty pattern W5465. The normal ratings and connections are shown in Fig. 1. The voltage obtained from each winding on application of 232 volts to the normal HT winding is shown in Fig. 2. By connecting the various windings in the correct phases the auto transformer arrange-
ment of Fig. 3 is arrived at and is used to operate a BC342 receiver from the 210 volts 50 cycles supply. A range of alternative connections (Fig. 4) of the primary winding sections G and H, and the heater sections C, D, E, F about the points X and Y respectively, can be made to obtain an output most suited to the local prevailing mains voltage. An aerial coupling switch from a BC375 tuning unit is modified by fitting stops (and an additional location slot for an “off” position, if required) for the output voltage adjustment.

Sketches showing details of the Admiralty transformer type W.5465, with alternative connections to give different voltage outputs. The power units discussed in the accompanying notes are amongst those designed for high mains frequencies, and as such cannot be used to give the rated outputs on a normal 50-cycle supply. By connecting the windings as suggested in the text and shown above, they can however be adapted for a number of useful purposes.
Cleaning Up the Speech

Discussing Amplifier-Modulator Design

By J. A. PLOWMAN (G3AST)

COULD you disconnect your speech amplifier from your modulator and listen to a symphony concert without demur? The author can, and very often does. Ask yourself this question, and if your answer is in the negative, then it is time you were busy in the speech section of your rack!

A great deal has been said and written about the high efficiency of modulators, but it seems that unnecessary stress has been laid upon this fact.

While we all appreciate that some amateurs are not very fortunate as regards facilities, it is felt that insufficient data have been published on modulator design.

The author's own requirements were found to be thus:

(1) A power capability of 50 watts audio; 75 watts to be available with little alteration.

(2) Wide frequency range with level response.

(3) Low harmonic distortion.

(4) Elimination of circuits critical or difficult to adjust.

If the modulator was to be constructed to these rather exacting standards, the choice of microphone needed some thought. Of those available on the market the velocity type was dismissed as being rather too expensive, leaving a choice of condenser, crystal or moving coil. As matching problems present themselves with a moving coil microphone, and the condenser type needs such a tiresome polarising voltage, a crystal microphone was chosen. The type in use is a D104. Some amateurs have little time for this model, but it is interesting to note that the results from these tend to vary more than somewhat. The author was very fortunate in this respect.

Considering the speech system as a whole it was hoped that no transformers would need to be used except for the modulator itself, but calculations showed that the speech amplifier...
output valves could not realise the required grid-to-grid swing for the modulators without a coupling transformer.

**Choice of Modulator Valves**

Tetrode modulator valves were dismissed owing to (a) excessive harmonic distortion, and (b) critical anode load. High amplification Class-B triodes were also written off as (c) they have to be run at constant maximum level for distortion to be a minimum, and (d) the widely differing current demands on the power supply are most severe.

The remaining and really logical choice for "hi-fi" (as the Americans would say for high fidelity) is therefore low *mu* triodes, preferably running Class-A. These have the advantages of introducing practically no distortion (except at abnormally low anode loads); impose a constant drain on the HT supply; are not in the least critical in respect of anode load (above a reasonable figure); Class-A triodes are not prone to parasitics on peaks; are very easy to adjust (there are no adjustments!); and they will work first time.

In fact, there are very few valves suitable for this service, as a long search through the catalogues showed.

The obvious choice is the RCA 845; there is a British equivalent, the STC 4242A, replacing the STC 4211E. These valves have 10-volt heaters, graphite anodes—and lend a very professional appearance to the rack! The output from a pair of 845's in Class-A is very nearly 50 watts with negligible harmonic distortion. In Class-AB1 the output is 105 watts at 1,250 volts HT—still with negligible distortion.

---

Fig. 1. Circuit of the equipment designed by G3AST to give high fidelity with full modulation. Details are discussed in the text, and G3AST shows that average amateur quality can be much improved. Note: In this diagram, the grid returns for V5, V6, should be completed with 100,000 ohm resistors, taken from each grid to earth.
Response

The modulation transformer is a Woden type UM3; however, at the high anode-anode loads as encountered in a pair of 845's, the bass response drops off owing to low primary inductance; this has been corrected earlier in the amplifier itself by a separate bass boosting valve.

At the other end of the frequency spectrum, top loss returned due to the "small" mica RF by-pass condenser from the centre of the PA tank to ground; this was corrected with a suitable network in the speech amplifier.

The Speech Amplifier

The speech amplifier is hardly original—little bits having been taken from this handbook or that. The high-gain stage is a 6SJ7 pentode, though a 6J7 may be used with slight modification; but a 1620 is to be preferred. Coax lead is used from the grid to jack line, and indeed right up to the microphone. The shielded lead supplied with the microphone checked at 50 μF per yard on a bridge, which is a lot of capacity in a 5-megohm circuit. The two following triodes V2, V3 are looking after different parts of the frequency spectrum. V2 is responsible only for the range 400 cycles and below, being controlled by the bass attenuator R13. V3 handles 400 cycles and above, while the treble may be brought up with the treble attenuator R10. Resistor R7 controls the level and is independent of response settings. The outputs of V2 and V3 are fed into the grids of V4 in the correct phase relationship; this valve, a 6N7, is in the popular cathode-coupled paraphase phase splitter circuit and needs no explanation. The output of V4 feeds a pair of 1622's; 6L6's can be used, but are slightly inferior to the former.

The coupling transformer is 1 : 4·5 step-up to feed the 845 grids. The secondaries are bled with two swapping resistors; these reflect the correct anode-anode load for the 1622's and should not be omitted on any account. The coupling transformer should be ordered with split secondaries for separate biasing. The diodes V3, across the input transformer secondary, are a protective device to limit positive-going excursions of the grid. As soon as the grid becomes positive to the cathode in either valve, the respective anode conducts and the audio is by-passed to ground. The valve used is a 12H6, this being run from the 845 10-volt filament transformer without any trouble. If Class-A operation only is anticipated, the modulation transformer can be a Woden UM2, but once again the lack of primary inductance at high anode load may become a factor to be taken into consideration.

Construction

The system was constructed in two sections the speech amplifier and the modulator. No doubt both the units could have been squeezed into one chassis, but this was considered undesirable. Both units are on standard chassis with 10-in. panels. It will be noticed that on the speech amplifier all the valves are metal, and that no power supply components are brought anywhere near the deck; to do so will only lead to headaches and is considered bad practice anyway for high gain amplifiers.

By virtue of the fact speech amplifiers are often in strong RF fields, the wiring was made extremely short and direct. Resistor boards lead to rambling wiring and are "out." A metal underlay was made for the amplifier to shield the wiring from stray RF, but this has since proved unnecessary and has been omitted, allowing the resistors to run cooler. Incidentally, all resistors, except the 1622 cathode bias, are 1R6 miniature, the latter being Erie 3-watt.

Fig. 2. The modulator proper, using a pair of 845's with a 12H6 limiter, as suggested by GJAST. Note: The junction R1, R2, must be earthed in this diagram.
The speech amplifier used by G3AST for fidelity tests, in conjunction with a 10-inch speaker and an acoustic labyrinth; The circuit of this amplifier is at Fig. 1.

The modulator shelf is a much more formidable proposition. Here, a steel chassis with welded corners is a "must." Two layouts came to mind for this deck; first, a symmetrical disposition across the centre line of the chassis, secondly, the layout suggested by the photograph. After weighing some of the individual components, and realising that, to be fair to the front panel, the transformers would need to be very near the front, reducing leverage, the layout shown was adopted. This put the 845's well in the rear, which turned out to be a good thing, as tremendous heat is dissipated by these valves when running.

All wiring on the modulator deck is done with 7-mm auto ignition cable, except the 12H6 circuit.

The output valve sockets are first mounted on a plate of 8 SWG dural and then bolted to the chassis by steel brackets. This protects the operator from the terminals which are very large and exposed. The cathode bias resistor consists of two 0.2-amp "mains dropper" resistances used for AC/DC sets. Adjust the bias with care, and never allow the plates to show any colour.

Operation and Results

The speech amplifier should be checked first by testing on a speaker. For these tests the author uses a 10-in. speaker in conjunction with an acoustic labyrinth. This gives very good results and allows appreciation of very low frequencies.

The final job is adjustment of the modulator valves. After the wiring in this stage has been
carefully checked and the secondary of the modulation transformers shorted out, HT up to a maximum of 1,480 volts may be applied to the plates, and the consumption checked. If necessary the common cathode bias resistor should be adjusted (with HT off) until the plate current is 104 mA for the two valves. The speech amplifier may now be connected, the anode load for the modulator matched to the PA in the conventional manner, and the modulator is ready to use. The response on the air may be adjusted to suit individual taste by listening on a phone monitor.

This modulator has evoked interest and comment over the air for many months since it has been in use. It is free of all the vices common to amateur modulators, it does not possess that boomy “ham” quality too prevalent these days, and provides a standard of fidelity of which any amateur may be proud.

For the QRP man, the modulator (output) stage may be omitted, the 1622 valves connected as tetrodes, and battery biased Class-AB1 to provide 34 watts of audio with less than 10 per cent. total harmonic distortion.

For those with high-power licences, the 845’s can be battery biased to class AB1 and will give enough audio to modulate a DC carrier input of 250 watts.

---

Two-Element Beam for Twenty

Full Constructional Data

By P. PENNELL (G2PL)

Many people who have only a limited space for aerial erection must have wondered how they might obtain improved results on the 14 mc band. Without doubt, an all-metal two-element beam is the solution for confined spaces, but how can one get it airborne? The following description is intended to show an easy and cheap solution.

A few articles on “folded beams” have appeared in Amateur Radio literature, but they are never as satisfactory as the full span types, and are usually far more complicated mechanically.

Fig. 1 shows a plan view of the two-element system. The central boom is made of duralumin channel 3 in. wide with 1½ in. sides. Several beams have been built using 3 in. tube with the elements pushed through holes at the ends. Experiments in high gales have shown that the ½ in. wall channel, which is slightly heavier, is far more satisfactory than tubing; the elements have less tendency to pull the duralumin boom. Furthermore, the holes can be drilled through the channel for fixing directly on to the mast. With tubing, either a separate clamping bracket must be used, or an inner reinforcement tube must be pushed down to the point where the fixing holes are drilled through—and often with this method the beam does not finally appear level on the mast.

When drilling the boom for fixing, it is necessary to ascertain where the centre of gravity lies, otherwise the beam will tend to lean over on one side when erected. This may easily be done by balancing the beam on the thin edge of a piece of wood, and changing the position of the boom until a perfect balance is obtained.

The T-match has been selected for feeding the aerial with 300-ohm ribbon. This form of impedance matching may be criticised electrically because of the difficulty of obtaining a perfect match over the whole band, but mechanically it is ideal, especially as it reinforces the radiator; because the feeder line will normally be short, the loss in the efficiency of the system is very small. The dimensions shown in Fig. 2 are a reasonable compromise and do not produce a bad standing-wave ratio on the feeder line.

Construction

A few words on the constructional details of the beam may be helpful. Where joints or screws occur, care has been taken to avoid the use of dissimilar metals, or if that has been unavoidable, the joints and connections have been painted over in order to exclude the air. (It is interesting to look over a beam aerial which has been exposed to the weather with no protective paint and which has dissimilar metals in contact with each other.) Two coatings of aluminium paint should be applied to the whole of the metal work before erection. Some may think that too much fuss is made of this point, but experience counts, and the writer was astounded to see a description, in
an American magazine recently, of an excellent beam which would undoubtedly crumble from erosion after a year of use!

The elements are constructed from 1 in. o.d. duralumin tube at the centre; as shown, a reduction in diameter occurs at W and X, and Y and Z (Fig. 1). The size of the remaining tube is not critical; telescopic is ideal, but if this is not available, then the tube may be packed up rigidly as shown in Fig. 3; odd scraps of duralumin tube 2 or 3 in. long are cut in half, lengthwise, for this purpose. Jubilee clips should be used to ensure that the tube is held firmly at the joints, and the screw of the clip should be well greased, in case the system has to be dismantled at some future date. Finally, it is advisable to apply some sealing compound to the joints, in order to prevent undue corrosion. Bostik or any similar good sealing composition can be recommended.

The holes drilled through the duralumin boom should be a "push fit" and it is only necessary to use two U-clamps for the final anchoring. In order to keep the rain out, the ends of the tubing should be plugged with corks which may be painted over—these are easily obtainable from any chemist.

The T-connection is shown in Fig. 2. Polystyrene is used at the centre and every effort has been made to avoid water traps. When a 300-ohm ribbon feeder is employed, these gatherings of moisture often cause very noticeable changes in impedance.

It is well worth while to take a little care in the connection of the 300-ohm feeder to the T-match—the wire ends of the feeder should be sweated into telephone type spade terminals, then some wasted feeder can be moulded around the terminals to make a rigid termination. Some 2 BA screws should be fixed through the 1 in. o.d. T-match tube, for fixing the terminals to the tube. In this position there is usually trouble from the corrosive action of dissimilar metals in the presence of moisture, and it is recommended that the terminals should be coated with polystyrene solution, after the connection has been made.

At this stage it is advisable to make a slight upward set in the elements—when erected, there is bound to be a certain amount of sag (as no strainers are used) and this helps to counteract the natural sag; at the end of the elements this is relatively unimportant.

Having described how the beam is constructed, it is now necessary to show how it may be erected in as small a space as 16 ft. by 40 ft.

**Erection**

Fig. 4 shows a 2 in. o.d. steel section type of pole, 35 ft. long. (A better one could be made by using 2 in. o.d. hardened duralumin.) Guys should be fastened as shown, while the
pole is on the ground. As only two people are required for the erection of this beam, elementary calculation will give the length of the back guys when the aerial is erected. The angle between guys and pole will vary according to each location, but as large an angle as is conveniently possible should be used for maximum safety. A small groove should be made in the ground at the base of the mast to prevent it from slipping when it is being pulled up.

Fig. 5 shows the pole raised to a height of approximately 16 ft. Care must be taken to keep the centre of the pole from bending by pulling upon the centre guy through the required pulley. A ladder 15 ft. high may be temporarily guyed in a vertical position or, as the author has done, an "inverted-V" step ladder may easily be constructed and again temporarily guyed. It should be in such a position as to permit easy access to the T-junction at the end of the pole.

Everything is now ready for placing the beam on top of the mast. Keeping the elements lengthwise down the garden, climb the ladder and place the channel boom on the T-junction at the end of the pole; with the aid of a friend the elements may be pulled down so that the beam is in the position shown in Fig. 6. It will then be easy to locate the fixing holes—\( \frac{1}{2} \) in. carriage bolts should be used to fix the beam on to the mast. The step ladder may be removed after this operation. A "steering" handle should be added at the base of the mast, consisting of any odd piece of metal bent into the form of a clamp.

The stage of final erection has now been reached. One person should hoist up on the pulleys while the other "steers" the direction of the beam lengthwise down the garden. As previously mentioned, care must be taken to keep the centre from sagging and, accordingly, the person who steers the beam can also pull up on the centre portion of the pole. The final position is shown in Fig. 7.

The guy ropes, hitherto unmentioned, should be made of waxed rope. Grade 4 waxed sash cord is to be recommended. Shrinkage is kept to a minimum, and as for wear—some guys were recently examined after

---

Fig. 4. Side view of the mast before fixing the beam assembly. Fig. 5. The aerial mast in position for attaching the beam section, as described in the text. Fig. 6. How the structure should appear with the beam mounted, before hoisting. Fig. 7. The whole assembly finally in position. To get it there need only be a two-man operation.
two years’ continuous use, and they were found to be in excellent condition.

When in position, provision must be made for anchoring the beam in the desired direction; it is surprising how much a moderate wind can change the direction. The above assumes only a manual method of turning the beam, but as can be seen it would be quite easy to add a motor at the base of the mast for remote control; in fact, this method of control is to be recommended, although as yet the author has not tried it.

**Results**

Results seem to be very reasonable; in some cases the beam will be over one half of the house. In the author’s case the roof is only 7 ft. below the aerial head and when swung over the garden, it lies over a metal garage. But even in such conditions a great improvement has been found over a simple dipole, and it certainly enables one to hold one’s own with other stations using beams. The difference in gain between a two- and a three-element beam is not as great as the difference between a two-element beam and a dipole.

Mechanically, the aerial has proved its worth by coming unscathed through several gales, when on at least two occasions gusts up to 80 m.p.h. were recorded. Under windy conditions, the elements certainly bend and bow, especially when broadside on to the wind—but no harm results, and they always return to their normal positions.

It might possibly be worth while adding wire strainers (broken by insulators), to the elements in order to stop the bending under high winds, and experiments will be carried out on this shortly.

Finally, a word about cost. Duralumin tube is easily obtainable from most scrap metal merchants, and at present-day prices an outlay of £2 should amply cover the cost of the beam; and further expenditure of £2 10s. should be more than sufficient for the pole, guy ropes and so on— but not including the ladder, which most amateurs, or their neighbours, possess!

", . . . QRX, OM. the VFO's taking off again . . . ,"
G3EGR, the Bedside Station, at Mundesley, Norfolk. Arranged for keying in comfort, G3EGR (three score years and three) says he likes to keep snug when the cold winds of winter blow across the grey North Sea.

when he came in like a DL1 at mid-day it was too much!

G4QK (Croydon) says he didn't raise AC4AR, perhaps because he added "/D" to his call; and, he asks, how about Oscar, SP5RA, giving QTH as Warsaw and having a party with East Coast W's?

G5OQ (Tunbridge Wells) sends quite a screed about AC4AR, and describes him as having "same squashy note, all dots, same fist, same lid" as ZA1A, heard just before on the same frequency. He came up and called "CQ DX No G de AC4AR" and said "QSL via ARRL."

Then an unknown station came up and called AC4AR/ZA1A/I1??/EA??/Pirate Pse QRT, to which AC4AR replied with a QRZ? And so it went on. After such a display of virtuosity it is almost a pleasure to recall some of the really clever piracy such as occurred on 80 metres early in the year; this corny AC4 stuff doesn't even give one a run for the money!

7 mc Activity

This is best summed up by saying, "Not much, if any." G5FA (London, N.11) is about the only correspondent, and he mentions working FT4BF but thought the call sign somewhat sinister. All the rest of the letters were on the subject of local phone, which we have already dealt with and will henceforth eschew in no mean fashion.

The DX on 14 mc

G4CP (Dudley) sends a report that makes the band seem better than it has been, until we see that most of the dates are in March or April. Eight new countries put him nearly at the head of the list, and if Jules of ON4JW has not reported by next month it looks as if G4CP has a chance of being Top Man. He has 160 confirmed, but would like to know if anyone has a card from FF8GP, ET3Y, EA6AZ, VR2BD, FM8AD, YN1MH or VS4WL.

G8OJ (Manchester) filled up some of his time with CT3AV, MP4BAD, SV1VS/MM (near Chagos Isles), FE8AB, KG6DI, FF8GC and EL3A, who has just ordered 3,000 QSL cards! G2SO (Leigh-on-Sea) admits to a good location, but says he can't understand how some of the fellows report the super-DX month after month. He is rock-bound on three frequencies, but his CQ's have raised HC1DN (0300), OA4CJ (0535), ZD4AD (1800) VS2CH (1825), TI2EXO (0040). By calling them he has raised some even better pieces of
DX. 'SO asks whether QSL's come from VR6AB, KB6AD, OX3BC and W8OZG/C6.

G4QK (Croydon) weighs in with FM8AD (2330), PZ1Z (1950), KZ51P, EK1DO, VS1BJ, VP5HQ and lots more. He also raised KH6IJ, but admits that at the time one could raise him “by striking a match.” From G3BNE (London, N.W.3) comes a list including XZ2FK, TA3GVU, EA8MC, CR6AI, 2D2RYG, VS6AC, KG6DI and UA0KFD—all between 1800 and 2100 GMT. So 'BNE has just passed his Century, and all with 45 watts to a dipole which is 6 ft. above the lead roof at one end and 2 ft. 6 in. at the other.

G81P (Hampton) is now busy on 145 mc, so DX suffers slightly. But he comments on the evening of June 5, when all signals were watery and the more distant G's had pronounced echoes. Then two “beefy” and conspicuous signals started to come through and turned out to be PY7WO and PY7WS. PY7WO was worked—off the end of a dipole—and an S8 report received. Just another of these queer ones! 'IP is pleased with life, having just received his WAZ Certificate—No. 120.

From Malvern G8QX reports adding to his score on 14 mc phone with ZD4AD, MP4BAC, CR6AI, CR7BB, OQ5RU and ZA1AR(!).

28 mc Still Kicking

Quite a few of the followers of Ten have worked some good DX; those who haven’t been filling up gaps in their List of Countries by collecting Europeans during the short-skip openings. DX from G5FA includes VU2DX, SV6AJ, KZ5PA, VQ4CUR, VS9AL and lots of PY’s and ZS’s.

G2VD (Watford) discovered, during a short-skip period, that a host of DL phone stations were working between 28100 and 28200. Small wonder, as he says, that CW activity is not very productive in this region.

G8QX has been raising a few VK’s and mentions the excellent signal from PK4KS

</table>
A. Oblifork, on the Rx at G6QB, not a thousand miles from Bexhill, Sussex. A.O.'s other name is Crystalmike—though he is better at rabbits than DX.

on Banka Island, which, by the way, does not count as a separate country—yet. QX has just received his Phone DXCC—No. 81. Very nice, too.

G3ATU (Sunderland) reckons it was his 150th call that raised AR8AB. He has been calling him for two years!

And now here's another Hornet's Nest, stirred up by G8KP last month concerning KL7's on 28 mc. G2FLC (Newmarket) worked KL7DY in October, 1947; report was S9-plus-30. G2ZF (Bramhall) had a similar QSO at about the same time. G4JZ (Witcombe) mentions a five-way contact (also in October, 1947) with himself, G2BY, G5JY, G8DT and KL7DY. At that time the KL7 mentioned that he had worked two G's in the winter of 1946. G2PL (Wallington) worked him round about the same time in 1947 but thinks he was the tenth or eleventh QSO; G5UX and G6LX both preceded him. From all of this it seems that KL7DY was probably the only one to achieve contacts of this sort, and it would be interesting to know why. Can it be that the rarity of 10-metre QSO's with Alaska is just due to lack of activity at the far end?

News from Overseas

From VK9NR on Norfolk Island, via G2ZC, comes an interesting letter in which he says that ex-ZL2FP will shortly be set up as another Norfolk Island station; Noel won't be sorry to have someone to share the work, and, of course, he himself will be able to QSO Norfolk Island. VK9NR has been listening on 3·5 mc for Europeans in the evenings (this was prior to May) but heard nothing but W's and one South American. He is only running QRP at present, and seems to find it easier to work Italians than anyone else on 14 mc. But he does nearly break our heart by saying that he called G6QB ten times without result—and we've never heard him yet. (See last month: "If I could only hear him I could work him!")

VS2CH is, by now, well on the way back to England and G2CQJ. He appeared to be on the air right up to the last day before sailing, but we have not heard direct from him since May. His worry then was whether VE8MA was in Zone 1 or 2; if it's Zone 2, he has worked them all.

Peter Lovelock, ex-G2AIS, who is one of the ops. of K2UN, met ZC8PM early in June. ZC8PM, strangely enough, was operated by Pat Miller of W2AIS, and now he's leaving for the Virgin Islands. During his spell in Palestine he was not licensed by the Iraq Government (within whose military area he worked) but had the sanction of the United Nations communications chief.

K2UN went off the air for overhaul some time back, and when the Secretariat moves into buildings in New York it is planned to move K2UN as well.

Peter Lovelock asks us to mention that he will be delighted to welcome visiting G's; so if you find yourself in the vicinity of N.Y.C., just phone GRamercy 5-4127.
Cap'n Harry of VQ4CUR reports that it is easier to raise G these days, and at the time of writing he had worked G8GJ 143 times, only missing their sked twice on account of conditions. All contacts were on 28 mc, and CUR asks me to tell those G's who still, apparently, use super-regen receivers for ten metres that the device is now obsolete and that they will hear stations calling them if they get a receiver.

VS1AY writes from Singapore with some interesting sidelights on conditions out there. He runs 120 watts and apparently, use super-regen receivers for ten metres that the device is now obsolete and that they will hear stations calling them if they get a receiver.

East African Awards

From the Radio Society of East Africa comes news of yet another certificate, but this is rather special and an annual affair. It is offered to any amateur proving contacts with one VQ3, one VQ5 and three VQ4's in one year. Each certificate will be in the form of a special souvenir card bearing a large photo-graph of East African big game, and so on, with a different photograph for each year. The possession of five of these certificates, together with proof of contact with one VQ1 station, will entitle the holder to claim the WEA (Worked East Africa) Award, which will be a very special trophy.

Limited finances out there make it impossible to offer these certificates free, so you are asked to remit $5 with your claim to the address below. Log extracts (not QSL cards) are required for confirmation. Two certificates are now ready—one for 1946-47 and one for 1948. Claim for 1949 when you have enough contacts. Any profits that may accrue will be devoted to providing and maintaining a Headquarters Station for the East African Society.

Further details may be had from VQ5PB, c/o the East African QSL Bureau, Box 1313, Nairobi. We wish them luck in their venture.

And now to West Africa, where Harold of ZD4AM is still receiving G's on 7 mc despite the static. He says that some of the boys are getting very impatient for their QSL's these days; he replies to every one, so please hold your horses and don't chase him before the return card has had time to come through.

Roger Thorn (s.s. Student) writes from CR7, where he has been having personal QSO's with CR71S, 7IZ and 7LV. From 7LV's shack he heard numerous G's calling CQ DX on 7 mc, and went back to lots of them, but with no result! But why, he asks, do these characters who call "CQ DX" go back almost immediately to another G? If only they would dig!

As Roger joined his present ship at Mombasa, and restrictions on personal luggage were stringent, he has no receiver with him on this trip, and regrets that the ship's gear is useless for the amateur bands.

G3ERB (Wirral) will be in California from August until December, and wants to arrange skeds from there with stations in the Liverpool/Birkenhead area. He will also be glad to forward reception reports to specific stations if time permits. We hope to hear more of him from W6.

Another traveller will be G2AVP (Milden-hall) who is off to SU and HZ for a month until August 7; he hopes to try Eighty during the evenings with an HZ call, and may also be heard from ST2—the lucky chap!

Vive Le QRP!

There is much enthusiasm for QRP work from time to time, generally damped down in due course by the steamroller effect of QRO stations who take no interest in the little fellows. In an interesting letter, G5OQ (Tunbridge Wells) points out that had he worked all the stations he lists on 1 watt
WESTON PRODUCTS
(LIVERPOOL) LTD.

To Our Clients . . .

Many thanks for the fine response to our June advertisement. We apologise for any delay in delivery, especially in regard to the Bargain Parcels. We were frankly overwhelmed with the immense amount of orders which started over the Whit Holiday when we were closed for three days, and this put us back a bit on delivery at the start. However, everybody has had their Monster Parcel by now, and in view of the many repeat orders we are having, both by post and wire, we have decided to clear some more space and are repeating our offer on the next page. We should also like to thank those who write to us in such complimentary terms regarding our value, we regret that we cannot answer all letters individually, but we do like to receive your comments. We trust that this month you will find many further interesting offers and we assure you that our buyers are working overtime to maintain our unbeatable price levels.

Yours truly,
H. S. WESTON, Managing Director

71, Great George Street,
Liverpool
Telephone: ROYal 5754/5

HUGE PURCHASE OF THE FAMOUS RAVON MULTI-RANGE TEST METER . . .

These splendid Meters, although listed at £16 6s. each and Brand New from the manufacturers, are now offered to you at an astounding price representing a saving, for keen buyers, of nearly 50%, and this is without doubt the best bargain of its class in the United Kingdom.

Specification as follows:—
D.C. Millivolts, 0-100. D.C. Volts, 0-1, 10, 100, 500, 1,000. D.C. Current, 0-5, 10, 50, 100, 500 m/a. A.C. Volts, 0-10, 100, 500, 1,000. Wattage Output up to 4 watts. Resistance, 2 ohms to 20 megohms in four ranges, without external batteries. Capacity, -0001 to 1 mfd., 2 ranges. A master rotary switch controls all ranges. The movement is sapphire jewelled, and anti-parallax is incorporated on the large scale. Attractively finished in black bakelite case with carrying handle. Size 8"×6"×3". Brand New in box.

REGARDING—all Spares Parcels, kindly remember that these have to be carefully packed and some delay in despatch is inevitable. Please order early to avoid disappointment.

○ MONSTER ELECTRONIC SPARES PARCEL!

In view of the immense response in last month’s issue, we have decided to again offer this wonderful “No Profit Parcel.” The components contained in this package are extracted from a huge purchase of Surplus Radio Equipment and stripped, mixed U.S.A. and British Spares. In order to make room for necessary Mail Order Development, the Directors of this Company have given instructions to again pack lots as they arise, into cartons and cases, irrespective of the value. They will then be sent out as packed, and no two lots will contain the same assortment. It is again stressed that this is probably the greatest offer that we have ever made, or will be able to make to our customers. It arises in exceptional circumstances essential for space clearance which is forcing us to clear a section of our stock. A pleasant surprise awaits the alert buyer, and we can tell you that many of the “A” Parcels that have already been despatched have weighed as much as 60 lbs. Our Guarantee stands on this offer in the usual manner. Needless to say, we have had no returns up to the present.

Parcel ‘A’ 40/-  Parcel ‘B’ 20/-

Please state “A” or “B” when ordering and remember that the lot you receive cannot be repeated. Repeat orders will contain another assortment.

Grand Purchase of U.S.A. AIRCRAFT CAMERA Type K24

This high-grade apparatus was made to first class specification and incorporates an ECTAR f 2-5 LENS, with iris diaphragm. We are informed that the original cost was nearly £100 each, and seeing is believing. The lens is 7” focus, the picture being 5½” x 5¼”, on roll film. Can be either manually operated or by 24v motor which is incorporated on each camera. Finished U.S.A. green crackle, complete with lens hood. These cameras have been used, but are in excellent condition.

AMAZING VALUE  £7/10/0
Makes Ideal Enlarger.

NOTE to readers of above. We have just purchased 400,000 spare parts for the above type cameras, and these are all brand new. If any of you are possessors of a K24 and wish for any spares, apart from the lenses, write to us giving part number and description and we will quote our price.

ASTOUNDING OFFER of BRAND NEW U.S.A. SPARES Packed in Steel Chests or Wooden Chests!

The container in which these spares are packed will either be suitable for a deed chest, or tool box, etc., and is very well constructed. A host of new spares inside the container will give hours of pleasurable use and sorting. In some of the cases there are as many as 200 to 300 parts, which include among other articles resistors from ½ to 200 watt, various condensers of the mica, paper, pyranol and electrolytic types, L.F. Transformers, Indicator Lamps and bulbs, switches, including 2 and 3 bank with silver contacts, toggle, and heavy duty types, keying relays, coils, electric motor spares, insulators, springs, potentiometers, valve bases, silver contacts, and other parts too numerous to list. Nearly every article is individually packed inside. The case with only six of the content parts is worth our price.

WORTH £20

We offer this amazing parcel for Only £3/10/0 Per Case

CARRIAGE PAID on all orders in U.K. For Eire and Export, additional charges must be added for despatch, or we will quote if required.

WESTON PRODUCTS (LIVERPOOL) LTD. • • • •
Receiver R.3206 for T.V.
Use. This excellent receiver incorporates the use of 20 Valves including the following types: 1 CV66, 1 VR136, 1 VR137, 6 VR65, 1 5Z4, 3 6Q7, 2 6J7, 1 VR54, 2 VR116, 2 VR92, and is hinged in the middle for ease of internal examination and approximately servicing. An R.F. Unit tuning from 180 mc/s to 230 mc/s variable, feeds into 5 I.F. Stages of 12 mc/s, and the whole would make a complete sound unit for television. There are only 100 of these units and they are in good used condition.

BUY NOW at the special price of 75/- Complete

LARGE PURCHASE
Genuine 100 watt Auto Transformers.
230v. A.C. Input to 115v. A.C. Output. Completely shrouded and compact in size 3" x 3" x 3". Definitely worth 25/- Note our price! 14/- Only.

GRAND METER PARCEL
All Moving Coil Rejects. One each of the following: 5A. R.F., 1A. R.F., 5 m/a and 200 m/a. These are all with faults, e.g., loose glass, open circuit, or need internal cleaning. These could easily be passed into our workshops for speedy overhaul, and made good, but we offer you the job and so save yourself a pound note.

PARCEL OF FOUR 10'/!

STUPENDOUS TEN POUND VALVE OFFER. These are definitely 75% off list. 200 parcels to offer only.
One each type: 6Y6, 6SL7, 6K7, 6G6, 6SH7, 71A, 6AG5, 6H6, 12A6, 12SG7, 12J5, 713A, 7193, 9006, 955, 6L5, 7V7, 3Q5.
18 Brand New Valves for 50'/!
Parcel of clips, clamps, washers, burnishers, spanners, bolts, fasteners, etc., etc., packed in a sturdy 2-gallon tin with lever lid.

OUR GUARANTEE of money back if not completely satisfied stands on all goods we offer.
WESTON PRODUCTS (LIVERPOOL) LTD.

Compact Control Unit...
Type 108
This excellent unit contains some very nice spares including two meters, one 5 m/a and the other 20 or 40 volts, both moving coil 2½" flush mounting. In addition there are two switches, and two potentiometers, the whole encased in grey metal container with a three-pin 5 amp. standard mains plug attached to each. The unit has a perforated metal back to cool the nichrome resistor incorporated internally.

Worth 25' - OUR PRICE 10/- New!

ELECTROLYTIC CONDENSER PARCEL. Contains one each following values. All Brand New.
8 x 8 x 0 mfd 400v working 16 mfd, 450v working 32 mfd, 350v working 25 mfd, 25v working 1,000 mfd, 15v working All aluminium cans.
Worth 25' - 5 for 9'6!

Massive Chassis only with One Cathode Ray Tube, Type ID17
RADAR INDICATOR
We offered last month a similar Chassis type R49, these are all sold and we now offer a similar line at a low price. This huge Chassis of Spares contain 45 Valve Octal bases, 24 Switches and Potmeters, H.V. Condensers, Chokes, Transformers and over 200 resistors and capacitors and a huge two-bank aluminium chassis, approx. 24" x 24". Will take about 24 hours continuous work to dissemble. Think of the pleasure! Components easily worth £15, and include immense sets of gears of ratios 2:4:8 and 16 to 1. Beautiful job.

ONLY 35'

GRAND CABLE OFFER!
Nine strand 0.12 tinned copper rubber-covered semi-flat cab tyre type. List price 11d. per yard.
OUR PRICE:
12 yards for 3'6
or 100 yards for 25' roll
STOCK PURCHASE OF MAINS TRANSFORMERS

A total output purchase from a manufacturer enables us to offer you the following cut prices in BRAND NEW AND GUARANTEED Transformers. These are Not Government surplus.

Output: 250.0.250v, 5v 2 amp., 6v 3 amp. 15/- each
Output: 350.0.350v, 5v 2 amp., 6v 4 amp. 20/- each

THESE TRANSFORMERS ARE DEFINITELY THE BEST VALUE OFFERED IN THE HOME TRADE

12 VOLT VIBRATOR UNIT with Amplifier Pack. This excellent and compact mobile or stationary Amplifier uses 6K6 Output and is fed by a 12v non synch. Vibrator using O.Z.4 Rectifier. Fully smoothed and beautifully made, complete in blue-grey metal case with jewel type indicator light on front with manual volume control. Definitely worth £5.

We offer 200 at 15/- each

L.F. CHOKES

6H 60 m/a open type ... ... 3/- each
4/6H 250 m/a. Fully Shrouded ... 5/- each
3/4H. 150 m/a. Fully Shrouded ... 3/6 each

ALL BRAND NEW

FILAMENT TRANSFORMERS

Large 500 watt type with standard 200/230v 50/60 cycles A.C. Mains input. Output. 4-0-4v and 6-3-0-6. 3v with 3 sets of 4-0-4 and 3 sets 6-3-0-6. 3v tappings.

Brand new, but soiled in depots. Only 15/- each

U.S.A. SIGNAL GENERATOR, TYPE 1-72-J ★ BRAND NEW

Special offer of U.S.A. Signal Generator, Type 1-72-J.

This portable Meter has a range of 100 K/C to 32 m/ohm with 400 cycle modulation. R.F. output voltage is maximum over 30,000 microvolts in all bands excepting 10/20 m/c band where maximum output is 10,000 microvolts. It operates from 110/125v 50/60 cycle A.C., and with Auto Transformer can be plugged in for immediate use. A shielded Output Lead and Spare Fuse is included. Weight 22 lbs. Size 15°x7°x9°. Finished in green crackle with metal front case cover to prevent damage. Brand new, complete with Instruction Book.

ABSOLUTE SNIP - £10'10'0 EACH

ONLY 25 AVAILABLE

Booklet (Returnable) upon request

POCKET TYPE U.S.A. "SUPREME" VOLT OHMMETER

5°x 3°x 2°. This instrument is a completely self-contained multimeter for measurement of D.C. Voltage and Resistance with basic movement of 100 microamps. Following readings can be taken:

From 1 ohm to 1 megohm in four ranges. From 1v to 600v in 4 ranges.

Finished in black Bakelite and crackle with 3° full vision scale. Complete with lead and Instruction Book

instead of 45 watts, he would have got a huge kick out of it—especially if an indoor aerial had been used. He adds that several people have only very poor aerial facilities, and also that there are people who can’t afford high power and expensive gear. They should be catered for by “One-Watt Contests,” “Indoor-Aerial Only Competitions” and so on.

We agree, and will think very seriously over it. As ‘QO’ says, if everyone reduced power the QRMI would abate and the old original amateur spirit might stir once more. So have a shot at WAZ on 1 watt, some of you big noises—and if you find it too easy, use an indoor aerial on the ground floor.

G2HKU (Sheerness) has at last found a receiver he can run on his DC mains—a National NC81X. He is a “25-watt Max” station and also pleads the cause of QRMI.

G5UJ (Rotherham) is likewise interested mainly in QRMI, and on 7 mc with about 10 watts he has worked all Europe plus VO, CN, LU and TF3. The transmitter uses a 6J5 and 6V6!

Finally, on this subject, we hear from G3EIZ that GC2CNC recently put out a CQ on 14 mc, using 20 watts and a screwdriver as an aerial. Yes, back came a W . . . Anyone tried a rusty nail yet?

Miscellany

From G4JZ comes the news that Ben Wallich of G6BW has passed on from ZL to VK and expects to settle there . . . G6BB (Streatham) has a VFO going at last, and now wonders how he ever worked DX before . . . He would like to be told how to raise EL3A on 28 mc.

GM6IZ (Aberdeen), who is a real Old Timer, is gathering in DX as KH6, YK1, TA, LU, CP, KG6, KZ5, TI, OA, KP6, KV4—all called into a (no CQ’s) and all raised on 100 watts Class-B to a half-wave horizontal J fed with co-ax. Plenty of life in the old dog yet, it seems . . .

Harry Pain, ex-ZB2A, ex-XZ2HP, now V75SPH, is now back in England and G3ATH once more. He has had to order another 500 V75PH cards, which shows that a DX man’s lot may be happy but can be expensive! Catching up on his QSL’s is also responsible for keeping him off the air.

G2BJY (West Bromwich) is displeased with the QSL situation and says some of the worst offenders are the W’s in remote parts of the world. We agree, with feeling—we just can’t get cards out of KW6, KM6, KB6 or KJ6.

G2HIF (late of Didcot) is now in Wantage and has been on 28 mc with a four-element beam. He finds summer conditions on Ten preferable to the cacophony on the other bands. ‘HIF’ refers to our remarks about thermo-ammeters last month and says that he has been led up the garden by some co-ax; he found that RF current into the feeder bore no relation to what came out top, even with a low standing-wave ratio. Since changing over to flat 300-ohm line his worries have ended.

Will amateurs in or near Gateshead please look out for W8QH? He was born there and wants to QSO his birthplace (this from G3BDS of Worcester).

GM3CSM (Glasgow) sends in a two-months’ list of DX on 28 and 14, and he also managed to work all over Europe on 7 mc with 6 watts to a doubler—best DX Leningrad!

GC2CNC (Jersey) wants to see a Top-Band column added to the Four-Band Table, and

he would like a contest for working Counties (some 96 of them) on that band. This is quite an idea, although there are rather a lot of Top-Band Contests already. What do 1.7 mc operators think? We will certainly lay something on if there is sufficient support.

G6AT (Hampton) says it is time we settled "What is a contact?". There is no doubt between a 100 per cent. one or a complete failure, but many of them come on the border line owing to QRM or QSB or local noise. This query was prompted by the fact that quite a lot of stations put "QSO No. . . ." on the QSL. Doubtless these were all 100 per cent.—or were they?

And that seems to be the extent of this month’s news. So please start getting together your facts and figures for the next issue, and let me have them by first post on July 13, addressed DX Commentary, Short Wave Magazine, 49 Victoria Street, London, S.W.1. Until then, 73 and Good DX.—SK (or VA)!  

---

**FIRST CLASS OPERATORS’ CLUB**

The new membership list has now been distributed to every FOC member. In the event of anyone not having received his copy, a duplicate will be sent on application. Blank pages have been provided in the list for the insertion of new names, and changes of QTH: as each Circular Letter contains the latest information, members are asked to keep their copies up-to-date. A reprint of the Rules and By-rules of the Club will also be distributed at an early date.

On behalf of all members, we would like to express our appreciation to the Old Timers who, at their dinner in May, were courteous enough to include the well being of the FOC as one of their toasts. It is interesting to note that in the "Zones Worked" listing in the June issue of the Magazine, out of the first five named, four are members of the Club. Congratulations to ON4JW who (despite having recently got married) still manages to keep in front.

**Club Dinner**

While some months have yet to elapse before we hold our second Dinner, a number of reservations are in and already we know that at least three of our overseas members wish to attend. Will all who think they have a reasonable chance of getting there please notify the Honorary Secretary as soon as possible. Any such bookings made now will of course be treated as provisional. On the other hand, the Dinner Secretary must know approximately the number to be catered for, as the booking of the accommodation has to be fixed a long time in advance.

This year we are arranging a "Hospitality List" of those living in or near London and prepared to act as hosts to members coming from afar. This plan should solve the problem of some who last year could not attend the dinner owing to the impossibility of returning home the same night. Will those who can be "hosts" and those who wish to be "guests," inform G2ZC as early as possible, so that from the two lists, mutual arrangements can be made in advance. This particularly concerns overseas members, who will be given priority; in fairness to all concerned, all such accommodation bookings should be definite, and not provisional.

**Election Notices**

As FOC Notes only appear in alternate issues of the Magazine, the Editor has agreed to provide space in the intervening months for the names of those newly elected to membership of the FOC. This will avoid the gap and keep the election notices up to date.

In accordance with the Rules of the Club, the following are declared elected to the active membership list of the FOC:

- J. P. Wilson, G1BGP (Canterbury)
- R. V. Ducebury, G3CTE (Roker)
- L. R. Harper, GMS5JK (Aberdeen)
- P. J. Smyth, E19J (Cavan, Eire)
- J. H. Goodliffe, G6LF (Sheffield)
- C. W. Dickinson, G3EQQ (Tenn)
- C. W. Howes, G2CG (Reynston)
- G. F. Eglesfield, G2CLL (Feltlham)
- G. B. Moss, G4NB (Coventry)
- R. Cambell, VK4RC ( Brisbane)
- J. C. Evans, G3BKO (Manchester)
- A. G. Wood, G2RZ (Leighton Buzzard)

All correspondence regarding the First Class Operators’ Club should be addressed direct to Capt. A. M. H. Fergus, G2ZC, 89 West Street, Farnham, Surrey.
Transmitter Design

General Planning & Choice of Valves

By W. R. JOSS (G2AJ)

MONTH by month articles appear in Amateur Radio publications describing various pieces of equipment, many of which can form, or do form, part of a complete transmitter. Few articles, however, deal with the principles involved and problems encountered when designing one's own equipment, or when combining a number of units together to form a complete high-power transmitter. In the notes following it is intended to cover some of the aspects of transmitter design and to provide the newly licensed amateur with some at least of the basic information required to evolve a transmitter suited to his own particular needs and pocket.

Approach to Design

When designing a complete transmitter to which no additions are to be made, it is undoubtedly best to decide, first, upon the final amplifier and then to work back from there, as the drive requirements of the final stage largely determine the design of the preceding exciter. However, as many amateurs do not actually start off with high power, and as a newly licensed station in this country is restricted to 25 watts, it is more often necessary to consider the exciter first and then the addition of a high-power final at a later date. This fact is in no way a disadvantage to the new station as a 25-30 watt low-power transmitter is ideally suitable as the exciter for a higher-power amplifier running in the region of 150 watts. There is never any disadvantage in having an over-abundance of drive available for a final stage, but there is a distinct disadvantage in not having enough. As in so many other aspects of life, it is always as well to have a little in hand.

The choice of valves for a proposed transmitter is often governed by what one already possesses or what the pocket will allow. Low-

Operating position at VE3HC, Guelph, Ontario. The transmitters are ranged round the back of the room.
power exciters invariably use receiving types for the sake of economy, and the general tendency in this country is to employ the American 6L6, 6V6 or 6F6 types, together with the 807, which falls into the low-power transmitting class.

There are other valves, some of them of British manufacture, which deserve wider use, and they are well worth considering when a rebuild is in view. The 6AG7 makes a very good crystal oscillator and has a high harmonic output, while the Mullard EF50 and QV04-7 are excellent types for the earlier stages of an exciter. Of more recent design, many of the B7G (button base) valves offer possibilities where space is at a premium. The Mullard EL91 output pentode is particularly useful.

For final stages many prefer to run beam tetrodes such as the 807 previously mentioned. The 814, 813 are probably the best known American types in this class, the latter having two British equivalents made by Standards and Mullards respectively. Eimac's have some newer tetrodes which are not at the moment available in this country but which should become popular in due course. The 4-65A is the smallest of these, being capable of a 150-watt input with 600 volts on the plate up to 200 mc. Tetrodes have the advantage of requiring far less drive than triodes of equivalent plate dissipation and price, but it must always be borne in mind when planning a transmitter that much more attention must be given to shielding and elimination of parasites when using tetrodes than with hard-driven neutralized triodes. This is, of course, due to the very much greater power sensitivity of the beam tetrode.

When considering valves for use as modulators it should be remembered that good emission and plate dissipation are very important while inter-electrode capacities matter little. The most popular type of modulator is that running in Class-B, and the use of types with a high $\mu$ obviates the need for a bias supply, as these types can be run at zero bias. The TZ20 or TZ40 are useful valves with this characteristic, the latter having its British equivalent, the Osram DA41. Another type which can be run at zero bias is the familiar 807. This is not so generally known, and the reader is referred to the February 1948 issue of the Short Wave Magazine, where full details are given of zero bias operation of 807's. Economy in design can often be achieved by running both the final stage and modulator stage from the same power supply. This results in considerable saving in expense and need not be detrimental, provided the supply has good regulation and is capable of giving the current required at the voltage. Before leaving the question of valves, one warning: Always choose types which are capable of efficient and safe operation at the highest frequency to be used; all manufacturers specify ratings at upper frequency limits.

Drive Requirements

As stated earlier, it is always advisable to have a small reserve of driving power in order to be on the safe side, and any exciter should be capable of furnishing enough drive on the band on which its output is least. This in most instances is the highest frequency band.

The drive requirements for final stages vary according to the type of circuit and valves selected, and whether or not modulation is to be applied. Plate modulated Class-C amplifiers require the most excitation and the full maximum rated grid current is necessary. Where the full plate input is run at least two to three times cut-off bias is required. For CW working, as well as in buffer amplifiers, the full amount of grid current is not essential and one or two times cut-off bias is sufficient. There is no harm, however, in running the maximum amount when this is available.

When using cathode or grid modulation the drive requirements are considerably reduced and such forms of modulation are much more economical so far as drive and audio power are concerned. A little more bias is required, however, and up to four times cut-off is not uncommon. Plate efficiency, of course, is not as high as that achieved with anode modulation.

The following data are quoted as a matter of interest. The grid drive required for a triode amplifier running at 200 watts input varies as follows:

- With plate modulation: 35 watts
- CW or Buffer operation: 20 watts
- Cathode modulation: 15 watts
- Grid modulation: 8 watts

Before leaving the question of drive, a word concerning doubler stages would not be out of place.

Excitation depends very largely on the efficiency desired and many amateurs do not
On frequencies above 3.5 mc, with higher frequency bands should be used. This should have a good value for the efficiency. For mercury vapour rectifiers, the beaters of Fig. 2. Thermal delay HT switching for protection of mercury vapour rectifiers, the heaters of which must be run for an appreciable period before HT is applied.

Choosing Components

Great care should always be exercised when choosing components, especially for final stages where the HT voltages are high. Condensers, both variable and fixed, are probably the most important. The value of the variable tank condenser depends largely on the frequencies to be covered. When selected for one particular frequency the condenser should have a capacity of about one micro-microfarad per metre when the tank is tuned to resonance. This should give the circuit a Q of about 12, which can be considered about right for good efficiency. Thus, a 20 μF condenser tuning at mid-capacity would be satisfactory for 28 mc. For all-band operation the condenser should be just large enough to cover the LF end of the 7 mc band. This will also cover the higher frequency bands 14, 21 and 28 mc and with addition of fixed padding condensers the 3.5 mc or even the 1.7 mc band may be brought in as well.

By-pass condensers for a modulated final stage should have a test voltage of two and a half times the full working HT voltage. To put in a condenser with a lower rating is a risk.

The insulation material used in the construction of components and transmitter is also important and should be considered. On frequencies above 14 mc where insulation is necessary, ceramic or polystyrene is recommended, although the very best insulation, where this is mechanically possible, is air.

Coils where possible should be air-spaced, and to obtain the best Q the winding should be such that its length is approximately equal to its diameter. Interstage coupling should be reduced by placing coils at right angles to each other, or one coil may be placed above a metal chassis and the other beneath.

Transmitter Control and Protective Devices

Many operators seem to pay little attention to this subject judging by the time they take to change from transmit to receive. With a little thought and re-arrangement it is not difficult to adopt a method of single-switch control, and it is certainly worth while. There are two possibilities. If all filaments in the transmitter are supplied from separate transformers then the matter is easy, and a circuit similar to Fig. 1 may be adopted. Here S1 applies AC to all filament transformers and S2 applies AC to all HT transformers only after S1 is closed. The only drawback being that if S2 is closed at the time S1 is closed there is no protection for any mercury-vapour rectifiers that may be in the circuit. The remedy for this is to install thermal time delays as shown in Fig. 2. These prevent AC being applied to the HT transformer until a predetermined time has elapsed.

Another safety method which can be used with lower voltage supplies is shown in Fig. 3. This, of course, is not fool-proof for mercury vapour rectifiers, but it does ensure that no matter which switch is closed the filaments always come on first and go off last.

For greater versatility and to facilitate remote control the writer uses relays on all power supplies. This permits any supply to be switched on or off individually from a remote control panel and gives a greater degree of flexibility for control purposes.
Simple Top-Band Tx
Stand-By Phone Transmitter for 160 Metres

By A. P. KERFORD-BYRNES (G6AB)

SOME time ago the writer decided to build a compact phone transmitter which would be suitable for taking on holiday, to enable contacts to be made with the Top Band lot in the evenings using the /A call sign.

The first consideration was size. The Tx had to be reasonably small and suitable for phone or CW. A sheet copper chassis was constructed, 6\(\frac{1}{2}\) in. long by 4\(\frac{1}{2}\) in. wide by 4 in. high, and four 1\(\frac{1}{2}\) in. holes were punched at the corners to accommodate the valve-holders. Other holes were also drilled for the tuning condenser, microphone jack, crystal holder and keying jack. The various components were gathered together from the junk box and valveholders and components were screwed into position. The wiring was then commenced and this was found easier than was anticipated—the whole rig was wired and on the air in one evening.

Circuit and Construction

The circuit consists of a 6V6 crystal oscillator choke modulated by the Heising method, with a 10 Henry choke and a 6L6 modulator valve. The 6J5 speech amplifier was transformer coupled to the modulator by an old R.I. "Hypermu" audio transformer, the last component to be fixed under the chassis.

Should anyone consider building a similar transmitter, it is recommended that the fixing holes for the audio transformer be made in the vertical "back wall" of the chassis, leaving the actual fixing of the audio transformer until all the other wiring is completed. The leads from the audio transformer terminals should be left sufficiently long for the transformer to be kept in circuit with the chassis upside down and the transformer hanging by its leads over the side.

This is no new circuit technique! The whole idea is that the transformer fixing screws can be removed so that it is out of the way, and all the other mounted components can be reached with test prods or soldering iron; the transmitter can be tested on the air in the upside-down position.

The microphone in use is an American T17, fairly plentiful on the surplus market. One advantage of this microphone is that a pressure switch is incorporated in the handle, of the two-pole "on-off" type, with one pair of large contacts and another pair of small. A twin plastic flex with a jack plug is connected to the larger pair of contacts, and when operating phone this plug is inserted into the keying jack, which is mounted underneath the crystal sockets. Another length of plastic twin flex with a second jack plug is inserted into the microphone jack. Thus, when the pressure switch on the microphone handle is squeezed, the microphone battery is brought into circuit, and the cathodes of all the valves are brought down to HT negative, so putting the carrier on the air by pressing the switch. A twin lead terminating in a pair of crocodile clips is brought out from the rig and clipped on to an Ever Ready Type 800 3-volt cycle lamp battery for energising the microphone. It is advisable to have the two flexible twin leads from the microphone of a different colour, to ensure that the plugs are inserted into the correct jacks.

The layout above the chassis and the position of components underneath the chassis do not matter much. Direct wiring between all components was used and although none of the wires are screened it is impossible to detect any trace of hum.

The circuit diagram and aerial coupling are shown and the method of coupling the rig to the aerial is the usual one in use at this station. A four-turn link on the oscillator coil L1 is coupled by means of a three-turn link to a coil 1\(\frac{1}{2}\) in. diameter, close-wound with 55 turns of 18 gauge enamelled wire. One end of this coil leads to the fixed vanes of a 0.005 \(\mu\)F broadcast-type variable condenser, with the moving vanes connected to a 102 ft. counterpoise; the other end of the coil goes to a long-wire aerial 132 ft. in length.

Operation

A small torch bulb in a basebound mounting holder has been incorporated in the rig as a resonance indicator. The clearance between the loop and the oscillator coil is about \(\frac{1}{4}\) in. The lamp lights up nicely when the crystal oscillator tank circuit is tuned to resonance with the crystal frequency and it can be left in circuit to give the operator some idea of
Complete circuit of the 160-metre transmitter described by G6AB. It can be built up on a very small chassis, as explained in his article.

the modulation when using phone. When on CW the writer removes the modulator and speech amplifier valves and inserts a key into the keying jack.

Some excellent reports have been received on the phone on tests at considerable distances. The power supply required for the rig is but 230-250 volts at 80-100 mA and 6.3 volts at 2 amps. The power line is run in four-core cable to an old British four-pin valve base, to make it interchangeable with all the other gear at this station.

This little rig has given the author lots of fun, both in the construction and the operation, and is quite a useful thing to have on hand should the main Tx develop some complicated fault—and it takes up very little room in a suitcase when going on that summer holiday.

GIFT SUBSCRIPTIONS

If you have a friend overseas to whom you would like to make a useful present, why not buy him a subscription to the Short Wave Magazine? It costs 22s. only, guarantees him a year's useful reading on every aspect of Amateur Radio, and is a constant reminder of your thoughtfulness. Send your order, with the necessary details, to the Circulation Manager, Short Wave Magazine, Ltd., 49 Victoria Street, London, S.W.1.
VHF BANDS

By E. J. WILLIAMS, B.Sc. (G2XC)

G3BLP/GM3OL Achieve New GDX Record on Two—
Extending Seventy-Centimetre Coverage—
Better GDX Conditions—
Nottingham VHF Meeting

The past month has seen two outstanding dates for 2-metre working and some very commendable achievements on the 70 cm. band. The good 144 mc conditions occurred on June 6 and 19/20 and numerous DX contacts were made. The morning of the 19th was probably the peak period and (as so often has occurred in the past) it caught your conductor having to write "VHF Bands" while the DX was on the receiver!

First, there is a new GDX record for Two—G3BLP (Selsdon, Surrey) worked GM3OL (Dumfries) over the 296-mile path on the evening of June 20. Just a year ago, these same two operators established the then GDX record on Five. What an achievement! They will have the congratulations of all VHF men on this fine performance—and who, twelve months ago, would have thought it could be possible. With the progress now being made on Two, one feels that even this record may be broken before very long.

The 70 cm. news which arrived after most of these notes had been written, tells of some excellent contacts between portable stations in Southern England on June 19. How much this was helped by the prevailing tropospheric conditions on that day is uncertain, but it falls to be recorded that G2FKZ/P operating three miles S.E. of his home QTH worked G3BEX/P on Devil's Dyke, north of Brighton, over a distance of 38 miles. Also contacted from G2FKZ/P was G2WS/P at Crowborough (28 miles). The latter station was heard by G3AHB/A at Hayes, Middlesex, 41 miles away, at RST559. G3BEX/P worked G2WS/P at 22 miles with S9-plus reports. All this is excellent work and we congratulate the operators concerned, who are among the pioneers on 420 mc.

"One-Way Paths"

Chief topics of discussion in the general correspondence have again been one-way paths and the G3CYY Band Plan. Of the former phenomenon numerous explanations have been put forward. It is, of course, entirely possible that one-way propagation does occur under certain circumstances, though several writers point out that no such paths were encountered in Service VHF experience. That, however, may not be conclusive evidence of their non-existence, as first, Service VHF was most often over the sea, and secondly, these links were usually over reliable line-of-sight paths and were not dependent on getting the most out of that fraction of a microvolt with which we are mainly concerned. (It is also within the experience of many that unusually long distances were at times covered on VHF.)

Nevertheless, it is felt that we should not accept the existence of one-way transmission until we have eliminated all other possible explanations. One or two have written protest against what they feel to be the allegations last month that bad operating technique at the Rx end may be responsible for many missed calls. In order to avoid any possible misunderstanding it should be stated that it was not intended that all the instances of one-way traffic could be put down to bad operating.

In general, the explanation must lie among one or other of the following:

(a) Poor equipment, (b) Bad luck, (c) Bad operating, (d) One-way propagation. Considering each of these in turn, under the heading of equipment, receivers are probably the easiest items in which to lose those precious dB, and it is suggested that all those who are being heard by many more stations than you are able to hear at your end, should have another look at the Rx. Run your eye through the 2-metre Activity Report at the end of these columns and see how many DX stations have heard you and whom you have not heard in return. Secondly, it is becoming usual to assume that any old Tx will do. Maybe it's not quite as vital as the Rx, for a fourfold increase in output will only produce about one S-point

improvement at the other end, but when signals are getting down to S3, even half an S-point may make the difference between readability and non-readability. What sort of tank circuit do you use? Have you tried a linear circuit or have you coil and condenser, and if so how much condenser? Thirdly, there is the aerial and its feeder. Is the matching correct at both ends? Is your cable lossy? What sort of change-over relay have you? How do you tune the Tx for maximum output? Experience at G2XC shows that any sort of measuring device inside the station can be very misleading. Have you tried a field-strength meter some distance away? Our apologies if all this is very elementary, but it is worth saying even if it only helps one or two to get those DX contacts. Do not blame it all on the other man!

Under the heading of bad luck can be included fading and local interference. The former can be minimised by a more repeated searching of the band and/or by a more restricted band to search. (A point here in favour of the G3CYY Plan). Interference from local stations does lose calls. In the Portsmouth area it is truly amazing how the DX comes up on locally-used frequencies and is often unworkable as a result. (This again would be less liable under the Band Plan.) Ignition and other electrical interference also plays its part.

Bad operating was considered in detail last month, and the last possibility, namely, that it is due to a propagation characteristic, has yet to be proved, but must not be entirely ruled out. The whole problem is one on which those who are keeping regular schedules might be able to provide useful information in due course.

Two-Metre Band Plan

Some interesting letters on the proposed Zone Scheme have been received. The majority show unqualified approval of the revised plan which was set out in these columns last month. Some half-dozen letters reject the scheme, mainly on the score of a general dislike of planning, and the contention that no case has been made out for it. In the main these letters come from locations where local QRM is very slight. Undoubtedly, your conductor's personal liking for the scheme is primarily due to the fact that he has at least 12 very active local, or semi-local, stations whose S9-plus carriers make DX working extremely difficult, and, often, impossible.

It seems ridiculous when, with 2 megacycles at our disposal, the only three DX stations audible a few evenings ago were all within one or two kc of a local. Contact was made with all three, but only about 20 per cent. of their transmissions could be read. This is but one example and one point in favour of the Plan, and the same situation arises in every area of high activity. Space will not permit a more lengthy discussion here. However, it is hoped that the matter will be fully discussed at the Nottingham Fiveband Club meeting on July 9 and it would be appreciated if those with definite views on the scheme (either for or against) would come along prepared to take part in the discussion. In the light of the general opinion of the gathering and of the correspondence received, a definite proposal will be made in the August Short Wave Magazine. If the scheme is adopted it is thought likely that it could be implemented by about October; it is fully appreciated that there will be a good deal of frequency shuffling involved.

VHF Contest

Several requests for a VHF Contest have been made and it is proposed to hold the annual Short Wave Magazine VHF Contest, once again, in November. Consideration is being given to making it a two-band affair

Northern and Midland Counties
next month

was first worked by G5MA (Ashtead) on June 9, and heard by one or two others in the
Surrey area. G2BJS and G3CZZ (both in
Redruth) are on 144-027 and 145.63 mc
respectively. The Rx side is catered for with
converted RF27's, while the Tx's have
VR135's in the final. A 3-ele. beam serves
both Tx and Rx. More powerful transmitters
are under construction and G3CZZ intends
to modify a G1481 with two tuned RF stages
(the first, a CV66) and then hopes to raise
some DX.

G3EHY (Banwell) comments on the out-
standing conditions on Whit Monday, June 6. Stations could be heard from all
directions, except Hampshire! G2NH was
roaring in at 1630 and G2IQ was an excellent
signal an hour later. The schedule G2NH-
G3EHY has now passed its 100th contact
and both evening and lunch-time QSO's
have been equally successful. The new 5-ele.
beam is up. It is close-spaced and has three
directors and one reflector, and fed by 80-ohm
coax into a folded dipole. G3EHY finds it
two 5-points better than his old beam. Next
advance will be a 16-ele. job. G3EHY
considers the hills to his south are the cause
of his poor showing with the South Coast
stations. G4AP (Swindon), on the other hand,
thinks that the hills to his north prevent him
having much success in that direction. He
also found June 6 outstandingly good. G5QA
(Exeter) hopes to have an outdoor beam up
shortly and then anticipates working to the
East as well as to the South-West. He would
greatly appreciate listeners' reports, by the
way.

G8QX (Malvern) has been on the band and
has provided several with a new county. He
comments on the excellent TV on June 6.
We agree, and it tied up nicely with the 2m
GDX on that evening.

G2ADZ is busy moving to GW2ADZ in
Montgomery and anticipates that there will be
a queue for him if, as he hopes, he manages
to put out as good a signal as he did from
his previous QTH. Operating times will be
mainly 1930-2030 BST. From his old QTH
he found it easy to work Hull, which he
points out is nearly as far north of him as
London is south. He suggests this disposes
of any idea there may have been that north
and south working is difficult. Further comment
is that when the London stations call CQ
West, or South West, they are still audible in
Oswestry. (And when they call "CQ North," they
can still be heard in Portsmouth however
many elements they have in their beams!)

G8KL (Wolverhampton) has worked
G3BLP at last. He has a broadband RF
amplifier using 6AK5's in front of his 522
Rx. He claims a gain of 10 dB with no increase
in noise. G3CXD (Newcastle-under-Lyme) is a strong signal in Wolverhampton.

We regret the geographical error which put G5CP and G6TL in the wrong county in last month’s Activity List. They are, of course, in Cheshire. G5CP (Sale) and G3DA (Liverpool) have both been heard in GI by SWL W. A. Kane (a member of the VHF Listeners’ Club), at Ballywater, Co. Down. This is believed to be the first reception of its kind. G3DA was first heard on May 29 at 1815, and his listener relayed G3DA’s signal back to him on the landline. Then G5CP was heard in Ballywater on June 4. Congratulations to all concerned. G3DA asks whether slugs in coils at VHF are a desirable feature. His tests say they are not.

G5MQ (Liverpool) informs us that G5BM/GW5SA was not the first G/GW on Two. It now appears fairly certain that the first contact was G5MQ/GW5UO on October 22, 1948, and we are accordingly inserting that in the table of “Two-Metre Firsts.” G5MQ is, at present, inactive on 2 metres.

G6LC (Lowton St. Mary’s) has worked GM3OL about 10 times and comments that as a result the Cumberland hills can be cleared of the charges laid by G20I, namely, that they were a barrier to 2-metre signals coming from GM. G6LC also thinks he heard G2XC! He certainly deciphered the G, the 2, and the X, but as there are also G2XS and G2XY on the band, G2XC is keeping calm!

G2IQ (Sheffield) has been beaming north of the Newcastle stations. To the West he cannot get out at all well due to the 1,500 ft. hills. He recently visited the Devonians G2BMT and G6WT, and was astonished at the length of the former’s 22-element Yagi. G6TF (Sheffield) has been busy moving from the spare bedroom into a special edifice he has erected in the garden. For Two he has a couple of converters available. The first has 6AK5, 6J6, while the other is an all-icorn line-up. A new lattice tower has been erected and a 5-ele. w.s. beam is at 36 ft., above his 10-metre beam, fed by 52-ohm cable. A reversible AC motor at the top of the mast does the rotation. G6TF intends to try out a 6J6 broadband amplifier mounted on the beam in a waterproof box. If this is found worth while on the Rx side, two separate beams will be used for Tx and Rx. All this is what one would call an enterprising approach to Two, and should pay a dividend in results.

Two-metre activity continues at a high level in Hull and reports come from G3ALY, 3COJ, 3CUJ and 5GX. Taking them in that order, G3ALY comments on the remarkable consistency with which G5WP and G6VX are received. G3ALY has worked 22 stations in 10 counties during the past month, using an 852 final in the Tx, a 4-ele. beam and the G6VX 6J6 converter. G3COJ says the QRM problem is getting bad in Hull. His beam is now at 40 ft., but he still cannot get such consistent results as others nearby. So a 16-ele. beam will shortly be up on the pole. G3COJ has measured the noise factor of his Rx and makes it 6-5 dB; he uses 6J6 RF and 6J6 mixer. At his request, it is pointed out that G3COJ and G3CUJ are both active...
and are on very nearly the same frequency, and only ¼ mile from each other. The latter hears London stations without difficulty every night. He bemoans the lack of activity between 2030 and 2230. G5GX is using a 522 Tx and a 12-ele. beam 35 ft. high. The converter is CC, with 6J6 and 3 x 954 RF stages, into an AR88.

In Newcastle, G3CYY has worked G5GX for his first DX in eight months on the band, and has heard G2MA, while G4LX has logged G2IQ, 2MA, 5GX and GM3OL. The Tx at G3CYY is SCR522, and this feeds a 4-ele. beam. The Rx is the 522 with a modified front-end.

G2XS (King’s Lynn) tells us that G5MA, 5WP and 6VX are the only consistent southern stations in Norfolk. (Noticing a serious omission in this list of calls, we wrote to G2XS, and there followed an exchange of views on the efficiency of the Tx at G2XC and the Rx at G2XS, but two days later two-metre contact was established and honour satisfied at both ends!) G2XS remarks, anent the long CQ’s, that frequent signing is essential especially when QSB is prevalent. Agreed!

G3VM (Norwich) beams on London and on the Midlands every evening from 1830 to 2130 GMT. He maintains daily contact with G2CPL (Lowestoft). G2FLC (Cheveley) is building a new beam and enquires when some of his QSL’s for last November will arrive? Tut-tut!

G3DAH (Herne Bay) has worked the Hull group on ‘phone in mid-afternoon. G5MA (Ashfield) in addition to a fine QSO with G3AGA (Falmouth) has climbed four rungs up the Counties ladder while G2NH (New Malden) has risen five places. G6NB went /A in Bucks and gave many of us a new county, and G8KZ operating /P on June 19 in the same county was kept very busy working everyone except G2XC!

G5WP (Woking) draws attention to the importance of some of the regular schedules that are in operation. He mentions the following:

- **G2NH/G3EHY** 1400 & 2230 BST
- **G2NH/G2CPL** 1930 BST
- **G5BD/G5WP** 2230 BST

They are most certainly useful in determining whether the band is “open” or not. As a result of his tests with G5BD, G5WP reports that so far two metres has proved nearly as consistent as Five, and when conditions are good, gives a louder signal. What do others think?

In addition to the fine GM3OL QSO already mentioned, G3BLP (Selsdon) has worked a lot of other DX, although he found the latter half of May to be rather dull. Three counties have been added. Regarding CQ calls, he thinks long ones necessary on VHF, but emphasises the need for frequent signing. This applies equally when calling another station as well as to CQ’s. How often have you heard some one calling you for two minutes or more with no mention of his own call and then go down into the QSB just as he signs? (It happened to G2XC three times yesterday.) G6CB (Wimbledon) again points out that stations do not tune as low as his frequency, 144-036. (They often do not get as far as 144-92.) By the way, he reports that MF2AA in Trieste is active on Two from 1800 daily—with 1 kW!

**Late News**

GM3OL (Dumfries) just makes it with a report of working G5GX and G8AO on the East Coast during a recent good opening, and he has been hearing the Preston Police on 146-2 mc at S9 consistently, in spite of those Cumberland Hills. He still wants 15 cards for his VHF CC.... G3CYY (Newcastle) worked GM3BDA (Airdrie) on June 16, through a mass of mountains.... G2JU (West Wittering) is now at sea level on the Sussex coast and so counts as a new station for VHF CC purposes. 

... G2NH (New Malden) logged many Midland stations engaged in local phone on the morning of June 19, and apparently unaware of the good DX conditions. Among them were three Notts stations, so 'NH still wants a Notts contact!....

In a letter from PA0/JU comes a report that DL3FM, Mulheim, near Duisburg, has been heard in PA on several occasions on
G8RS, Reading, a well-known VHF worker at present on detached duty in HB, is equipped for our highest frequency band—10,000 mc (3 cm.). The paraboloid is 14-inch, with two 1852's as IF pre-amplifier at 30 mc. A 725A/B klystron with potentiometer controlled reflector voltage is used.

144.7 mc. PAOUL is using 29 watts to an 829A. He says several of them in PA are interested in 70 cm. but lack 832A's.

During the Air Defence exercises which took place during the week from Sunday, June 26, the attack bombers were to employ the reflection device known as “Window” (a war time code name) to confuse the defending radar. If the bombers did succeed in forming Window clouds of any density, it is conceivable that unusual “propagation conditions” on the two-metre band might have been noticed for short periods; a Window cloud of sufficient density and duration would have had some reflection efficiency at the frequencies in which we are interested.

Six-Metre Opening
For a final news item, we are indebted to G3BYS (Southend-on-Sea) who reports an interesting 50 mc opening, effective G/SM, during the late afternoon of June 18. G3BYS worked SM5VL on 28 mc, who relayed back the A.P. TV signals on both channels. SM5VL then changed over to 50-04 mc transmission and worked G3BYS duplex at 89-plus, G3BYS being on Ten and finding it possible to receive SM5VL on a 5 ft. piece of wire dangling on the floor; the Rx at the G end was an S27. SM5VL's QSL has arrived to confirm the QSO, and shows that he was using 100 watts with a 3-element beam.

Fiveband Club
Membership of the Fiveband Club has now passed the 100 mark, and by the time this appears in print all members may have received Club Circular No. 3 and the latest list of two-metre band frequencies. A few PA
frequencies which reached us too late for the Circular are printed in this column.

The Midland area Five Band Club meeting will be held in Nottingham on July 9 at the Victoria Station Hotel. There will be some VHF gear on show, and as already mentioned dinner will be followed by discussions on the Band Plan and the November Contest, amongst other things. Anyone who intends to be there and who has not yet notified G3APY should do so immediately. His QTH is J. Spragg, Wendover, Frederick Ave., Kirby-in-Ashfield, Notts.

In Conclusion
Thank you for the load of mail this month—and both G6FO and G2XC hope to meet many of you at Nottingham. Latest date for next month's reports and comments is July 15. Address is E. J. Williams, G2XC, Short Wave Magazine, 49 Victoria Street, London, S.W.1.

**TWO-METRE ACTIVITY REPORT**

To maintain the usefulness of this section, please set out your list on a separate sheet and exactly as shown below. That is, with call signs in numerical and alphabetical sequence, arranged horizontally, repeating the numeral but not the prefix, and divided into *worked* and *heard* listings. And please print all calls clearly!

G3EHY, Banwell, Somerset.

**WORKED:** G2ADZ, ZA1, 2IO, 2MR, 2NH, 2MN, 2OL, 3ABA, 3BKP, 3BY, 5MA, 5NP, 5SW, 6NB, 6VX, 6VT, GWSA.

**HEARD:** G2BUJ, 2XC, 3DAH, 3DEP, 4RO, 6UH, 6VC, GM3OL. (May 13-June 14.)

G2FLC, Newmarket, Cambs.

**WORKED:** G2XS, 2NV, 4MW, 5JO.

**HEARD:** G2PU, 3DAH, 3WW, 5UD, 5WP.

GSBY, Bolt Tail, Devon.

**WORKED:** G2NM, 3AGA, 3ALP, 3DEP, 3EHY, 3EJL, 3LV, 4GR, 4QI, 5MA, 6DA, 8AT, 8JB.

**HEARD:** G2AOK/A, 2NH, 2WI, 3DAH, 4DC, 5NP, 5PB, 6MA, 6VX.

G3DAH, Herne Bay, Kent.

**WORKED:** G2ADZ, 2AJ, 2BMZ, 2CPL, 2IQ, 2KG, 2UJ, 2WJ, 3LY, 3FL, 3CG, 3RQ, 3CQJ, 3CUI, 3GP, 4AP, 4AU, 4DC, 4RO, 5BD, 5GK, 5MA, 5MA, 5MI/W, 5TP, 5UD, 5WP, 6MD, 6NB, 6NB/A, 6OA, 6OP, 6P, 6VQ, 6VX, 6YQ, 8JB, 8KZ, 8QU.

**HEARD:** G3AUA, 3BBA, 3RKO, 3DEP, 6XY. (May 16-June 13.)

G3BLP, Solent, Surrey.

**WORKED:** G2ADZ, 2ATK, 2BUI, 2HCQ, 2IO, 2XC, 2XH, 3DUP, 3EEZ, 3EHY, 4AP, 4GR, 4LU, 405, 4BM, 5BY, 5JU, 6LC, 8KJ, 8QK.

**HEARD:** G2AV, 3EGP, 3FVD/A, 8JB.

G3EJL, Southampton, Hants.

**WORKED:** G2NH, 2NM, 2XC, 2AF, 3CGE, 3RI, 4QI, 5PB, 5SP, 6DT, 6WT, 8AI, 8BD, 8JB.

**HEARD:** G2JU, 2OI, 3AUS, 3BQK, 3EHY, 3FDVA, 5MA, 5WP.

G2XC, Portsmouth, Hants.

**WORKED:** G2ADZ, 2AQO, 2BMD, 2IQ, 2WJ, 2XS, 2XV, 3DAH, 4LI, 4RO, 5BM, 6NB/A, 6VT, 8IO.

**HEARD:** G2QO, 2QV, 3DKO, 3DA, 3EHY, 4AP, 5JU, 8UZ. (May 15-June 20.)

G3DA, Speke, Lancs.

**WORKED:** G2ADZ, 2IN, 2MA, 2OI, 3ALY, 3AYT, 3CQJ, 3EIO, 40S, 5BD, 6CP, 5XK, 6LC, 6OSA, 6TJ, 6YO, GM3OL, GW3ELM.

**HEARD:** G3BY, 3DMU.

G3G, Malvern, Worcs.

**WORKED:** G2ATK, 2AQO, 2NH, 3BLP, 4DC, 4RK, 5WP, 6FK, 6XY, 8QY.

G6L, Lowton St. Mary's, Lancs.

**WORKED:** G2ADZ, 2AYT, 2IQ, 2OI, 3BLP, 3CHY, 3CUI, 3CPF, 3DA, 3DH, 3FET, 3XV, 5CP, 5GK, 6TL, 6YO, GM3OL, GW3MUS.

**HEARD:** G2BUJ, 2DRG, 3ALY, 3BYK, 3BD, 5BM, 5KX, 5TP, 6MI, 8AQ, GM3BDA. (Five weeks to June 14.)

G3CUI, Hull, Yorks.

**WORKED:** G2ADZ, 2IO, 2MA, 2TJ, 2XS, 3APY, 3DAH, 4CJ, 4DL, 5BD, 5UP, 5WP, 6BX, 6LC, 6VX, 6YO, 5YP, S8P.

**HEARD:** G2AJ, 2AUA, 2OI, 3AX, 3DA, 4JB, 5CP, 5MA, 5UD, 8AQ.

G5S, Leven, Yorks.

**WORKED:** G2ADZ, 2FZL, 2MA, 21K, 3ABA, 3AID, 3ALY, 3CUI, 3CYY, 3DMU, 5BD, 6OS, 6VX, 6VP.

**HEARD:** G2AJ, 2IQ, 2MR, 2NH, 2OI, 2XS, 3AXQ, 3BQO, 3BW, 3DA, 3DAM, 3DH, 3IDQ, 3EHI, 3ENS, 4DC, 4LX, 5BM, 5CP, 5MA, 5UD, 5WP, 6BX, 6DH, 6LC, 6NB, 8AO, 8QY, 8S3, GM3OL.

G6NB, Chertsey, Surrey.

**WORKED:** G2ADZ, 2IQ, 2OI, 2JW, 2XS, 2XV, 3ABA, 3EHI, 5BD, 8JB, 8QY. (Four weeks to June 14.)

G2OL, Eccles, Lancs.

**WORKED:** G2ADZ, 2BUI, 2IQ, 2NH, 3AYT, 3BLP, 3BW, 3CNY, 3CDX, 3DA, 3EHI, 4OS, 5BM, 5MA, 5WP, 6LC, 6NB, 6TL, 6VX, 6YO, 8QY, GM3OL, GW3USO.

**HEARD:** G2AOA, 2AQO, 2MA, 2XQ, 3ABA, 3AQQ, 3BEJ, 3DP, 3DH, 3EEZ, 3FET, 4DC, 5CP, 5JU, 8WV. (May 9-June 10.)

G2ADZ, Oswestry, Salop.

**WORKED:** G2AJ, 2BUJ, 2IQ, 2MA, 2NH, 2OI, 2XC, 3ALD, 3ALY, 3BY, 3CP, 3CQJ, 3CUI, 3CDX, 3DEP, 3DMU, 3EHI, 4OS, 5BD, 5BM, 5GK, 5MA, 5UP, 6NB, 6UH, 6VC, 6VX, 8KL, 8SM.

**HEARD:** G3BEEZ, 3TF, 5ML.

G8KL, Wolverhampton, Staffs.

**WORKED:** G2ADZ, 2AUE, 3EGP, 4RK, 5BM, 5JU, 5WP, 6VX, 8WV. (June 5-June 12.)
7193’s on Two Metres  
Triode Push-Pull RF Stage

By J. H. JOWETT (G3CFR)

Many amateurs have no doubt come into possession of an excellent little valve now obtainable quite cheaply in the surplus market; they may have wondered just what it was and how it could be used. The valve in mind is the 7193. It is designed primarily for VHF purposes and has two top caps—one for the grid, the other for the anode; the cathode and filaments are brought out to the usual connections on the base. The actual connections to the grid and anode may easily be checked through the glass envelope.

Some idea of its useful characteristics at VHF may be gathered by considering inter-electrode capacities of the 7193. They are as follows: Capacity grid-to-anode, 3.6 µµF; capacity grid-to-cathode, 2.2 µµF capacity anode-to-cathode, 0.7 µµF. Thus a low-capacity high-efficiency output circuit can be built round these valves.

The writer has noticed 7193’s used in numerous VHF applications around 200 mc, e.g., in a push-pull self-excited oscillator using Lecher bars for tuning grid, anode, and cathode circuits; and for the variable sweep oscillator in American II F equipment. They are capable of output of the order of 5-6 watts when used in this manner, with efficiencies of 40-50 per cent. easily obtainable. The writer has also seen them employed for super-regenerative reception, where they are as good as acorn valves like the 955.

Having seen these valves working so happily, it was decided to incorporate a pair of 7193’s,

circuit using 7193’s.

Table of Values

| C1, C2 | 20 µµF, split stator |
| C3, C4, C5 | 0.0005 µF |
| NC | Neutralising condensers (see text) |
| RFC | See text |
| R1 | 2,500 ohms |
| R2 | 200 ohms |
| L1 | 3 turns 16 SWG, ⅛ in. diameter, spaced ¼ in. |
| L2 | 2 turns 16 SWG, ⅛ in. diameter, spaced ⅛ in. |

These 7193’s are triodes of a type frequently found in surplus VHF equipment. The author of this article shows how they can be applied to a low-power push-pull neutralised RF amplifier for the 145 mc band.—Ed.
Cathode Follower for the VFO

Better Isolation for the Driver

By J. HUM (G5UM)

Nearly every user of a variable frequency oscillator employs some sort of buffer stage between the oscillator and the driver stage. Dissatisfaction with the buffer stage is commonly expressed, either because it gives no amplification (what do you expect anyway? It is a buffer stage!), or more seriously, because it does not provide the degree of isolation hoped for. Again, it may appear to be functioning properly and the VFO may seem to be stable, but when the latter is keyed the resulting chirp quite clearly indicates that it is not.

In most VFO buffer positions a pentode is generally used. Very few amateurs appear to have considered employing a cathode follower instead—perhaps because they regard a cathode follower as an occult bit of circuit trickery derived from radar techniques and not to be used by a straightforward amateur for communication work.

In practice the cathode follower is an extremely simple device demanding nothing more than three resistors, three fixed condensers and one triode valve. As an isolating buffer stage in a VFO it is hard to surpass and certainly much more effective than the more usual pentode. The circuit diagram shown here reveals the simplicity of the thing. Any medium impedance triode will serve, the ubiquitous 6J5 being as good as any. The output from the oscillator is fed to the grid and drive is produced from its cathode; the anode circuit is earthed through the fixed capacity.

Theoretically the cathode follower cannot give a stage gain exceeding unity. Be that as it may, the user will find that its output is
BRITISH OLD TIMERS' CLUB

Membership now stands at the total of 156, a considerable increase since the first list was issued six months ago. It is much to be hoped that as they achieve "20-year status," those eligible to join will make themselves known to us. Membership costs nothing, as the Club exists only to bring on record all those who, having been first licensed not less than 20 years ago, still hold a radiating permit. It does not matter if there has been a break, or if the callsign is different, or even if it has not been issued by the same authority as the original licence—so long as it has always been a British ticket. This means that our VE, VK and ZL cousins are all eligible for membership of the British Old Timers' Club if they qualify under the 20-year rule.

This month there are ten new members to enrol, as follows:

- J. N. C. Bradshaw, G2NY (1919)
- F. A. Bird, G4WA (2KP in 1921)
- F. E. Goodge, G5H/G2T2C (1922)

It is with deep regret that we record the death of one of the original members of the B.O.T.C.—G4MH, Blackpool. He obtained his first licence in 1913 and belonged to that very exclusive band of pre-1914 W ar amateurs, of whom there are still quite a number active to-day.

NEW QTH'S

As we have started to run behind again with the new callsigns and changes of address for this feature, we propose taking some extra space for "New QTH's" in the August issue, which should enable us to absorb most of the back-log. Entry in this feature is open to any operator who cares to send us the necessary information, but addresses are never published except at the direct request of the owner of the callsign. Appearance in "New QTH's" also ensures eventual publication of the address in the Radio Amateur Call Book.

DX OPERATING MANUAL

All those who aspire to an understanding of the vast subject of DX on the amateur bands need a copy of the DX Operating Manual, which is a work of reference complete in itself. The Manual sets out to guide the beginner and inspire the uninitiated. Of seven chapters and 36 pp., it tells you everything you want to know about DX—so far as that is possible by the printed word. The price is 2s. 8d. post free, of the Circulation Manager, Short Wave Magazine, Ltd., 49 Victoria Street, London, S.W.1.
NEW QTH's

This space is available for the publication of the addresses of all holders of new callsigns, or changes of address of transmitters already licensed. All addresses published here are automatically included in the quarterly issue of the Call Book in preparation. QTH's are inserted as they are received, up to the limit of the space allowance. Please write clearly and address on a separate slip to QTH Section.

CORRECTION

Correction Note

Two errors that have crept in recently need to be put right. On page 188 of the May issue, G2HNO quite properly points out that he did not say (in his original manuscript) that a beam one-half wavelength above ground will give the required low angle of radiation. The passage should read “a system one half wavelength above ground will give an excellently low angle of radiation”—the point being that though a half-wave of height is not the optimum, it is the best G2HNO could manage and does give him satisfactory results.

In G2PL’s article in our June issue, the sketch on page 263 should show a dimension of 16 ft. 9 in. for that section of the aerial hanging down parallel to the pole. The total length given by G2PL is thus made up to the required 134 feet.

More Paper

With this issue of the Magazine, we are able to print a small number of extra copies by reason of our increased paper allocation. This certainly does not mean any spectacular improvement in the position, but it does enable us to increase home circulation—which is a step in the right direction.

As the format in which the Magazine has appeared since our issue for March this year—the beginning of Vol. VII—has enabled us to give approximately a ten per cent. increase in actual reading matter, we have in effect already enlarged each issue by an average of nearly five extra pages of text.

Reprint Articles

As mentioned here some time ago, we can always provide reproductions of any article now out of print, though the cost, at 3s. 6d. per page, is necessarily high in such circumstances. Readers requiring reproductions should ask for a quotation, which we are glad to give before putting the work in hand. Incidentally, it should be explained that we undertake this service at its bare cost to the Magazine.

Post-Graduate Research

That the great firms in the Electronics Industry have a deep appreciation of their obligations and responsibilities in the field of technical education is shown once again by the Standard Telephones endowment of a Readership in Telecommunications at the Imperial College of Science and Technology. This will be known as the Henry Mark Pease Readership, after one of the pioneers of the British telephone industry, who was managing director of Standard Telephones & Cables, Ltd. until 1928, and also on the original Board of the BBC.

Mr. E. C. Cherry, M.Sc., A.M.I.E.E. has been appointed to the Readership. During the war period, he was attached to T.R.E.

For Small Advertising

Our Short Wave Listener enjoys the steady support of a wide circle of readers; it is now well into the third volume and has become established as the only periodical of its kind in the world. The Short Wave Listener is a particularly useful medium for small advertising in the readers’-disposals-or-wants category, for such items as are of interest to SWL’s. Rates are only 2d. per word (minimum charge 3s.). Date for the next issue is July 8, and for the issue following August 5. Address copy to the Advertisement Manager, Short Wave Magazine, Ltd., 49 Victoria Street, London, S.W.1.

Death by Electrocuting

From time to time, it is our sad duty to record the passing of some amateur who has met an untimely death due to an accident with his gear. On Sunday, June 12, VE3ZM of Guelph, Ontario, was electrocuted while operating his station. He was in QSO with VE3IY on 75-metre phone, and was killed instantly. The path taken by the 1250 volt HT was final tank-modulation monitor-headphones-body-microphone case-earth. If only that tank had been parallel-fed, or the microphone fully insulated...

Well known over here on Ten, Mac Gammon was an amateur of the finest type, and will be much missed; during the war he held a commission in the R.C.A.F. and latterly was on the staff of the Ontario Agricultural College at Guelph.

Radiocraft Services

The firm of Radiocraft, Ltd. offer three services of considerable value—Construction, Maintenance and Calibration, covering all requirements in the Amateur Radio Field. They are also always ready to advise on any matter relating to Amateur Radio.
The other man’s station  G8NY

This is an impression of G8NY, the station owned and operated by L. H. Luscombe at 98 Denton Road, Hornsey, London, N.8. G8NY incorporates a number of very interesting design features, and includes the use of a two-element 14 mc rotary beam with both elements driven, but out-of-phase as distinct from the in-phase connection of the G8PO system. The Telcon 300-ohm ribbon feeders are T-matched to the elements built as folded dipoles, with the vertical feeder lengths each 27 ft. 9 in. and a 65-in. delay section; the spacing between elements in G8NY’s system is 86 in. The beam itself, which is electrically rotated by remote control with a direction indicator at the operating position, is carried on a short lattice tower on the roof of the house. It has given exceptionally fine results on Twenty from a poor location.

The transmitter at G8NY runs Franklin VFO 6SN7-6D6-6V6-6V6-807-P/P 807’s-P/P 35T’s, with a pair of 807’s in AB2 push-pull as parallel-fed modulator. The speech amplifier-sub modulator is 6L7-6J5-6J5-6J5.

The whole station is relay-controlled and except for the HRO receiver and BC-221 frequency meter, is home-designed and built. It shows a well-planned operating layout, with built-in phone/CW monitors, modulation indicator and 100-1,000 kc crystal sub-standard.

Sad part of it all is that G8NY has just had to QRT for a twelvemonth, so will be reading this brief outline of his fine outfit during a period of enforced inactivity! He was first licensed in April 1937, and after serving as a Captain, Royal Signals, during the war years, came on the air again in January ’47 with 14-28 mc CW and phone. Specialising in phone on Twenty, he had collected 35 Zones and over 100 Countries by May 1948.

Mention the Magazine when writing to Advertisers—It Helps You, Helps Them and Helps Us
THE MONTH WITH THE CLUBS
FROM REPORTS

Activity reports from 31 Clubs have been received this month. Many of them took part in NFD and many more are arranging portable Field Days and D/F Hunts during the summer season.

This high level of activity shows that there need be no close season for an energetically managed Club, and we are very glad to see enthusiasm maintained so well.

Next month’s reports should be addressed to the Club Secretary, Short Wave Magazine, 49 Victoria Street, London, S.W.1, and posted to reach him not later than first post on July 13. Photographs will, as always, be welcomed.

Kingston & District Amateur Radio Society.—Meetings are still well attended: a recent Brains Trust produced some interesting queries and much general amusement. The Club now runs a “net” on Sundays, 12 noon, on 3750 kc. Next meetings, July 6 and August 3, both 7.30, at the Kingston Hotel; note QTH of new Secretary—in panel.

Clifton Amateur Radio Society (South London).—A very enjoyable evening was recently spent with Grafton in North London, who gave a cordial welcome to the Clifton members. Other activities have included a lecture on the CRT and the usual Morse classes. New members will be welcomed at any meeting.

Enfield Radio Society.—Members of this Club visited the Grafton Radio Society during May, and were much impressed with the array of equipment on show and the spacious accommodation. The Club meets on alternate Tuesdays at Chase Side School, Enfield, and new members will be welcome at any of these meetings.

Cannock Chase Radio Society.—At recent meetings there have been discussions on varied topics and a talk on Valve Theory. Morse practices at all speeds are now a regular part of every meeting—alternate Tuesdays at the Unicorn Inn, Cannock.

Reading Radio Society.—During May the usual meetings were held; on the 12th a visiting team of experts formed a Brains Trust; on the 14th Dr. Lemon gave the first talk to the Instructional Section, on the Complete Frequency Spectrum of radiant Energy. May 28 saw G8TH lecturing on the directivity and gain of aerial arrays, with demonstrations. Visits were paid to the BBC at Caversham Park and to the Grid Switching station at Earley.

We have also received a letter from the Reading and District Boy Scouts’ Signals Group extending their grateful thanks to the amateurs who co-operated in working their portable station, G3BHK/P, during the Whitsun holiday.

Lincoln Short Wave Club.—Membership is improving, but the Committee still feel that too many people, some of whom had a lot to say about the forming of the Club in the first case, fail to come forward and pull their weight. It has now been decided to run a Morse class from 7 to 7.30 before each meeting; a Club library has also been formed. Several offers to build mobile receivers for the 1-7 mc band (for a D/F Hunt) have been received, and it is hoped to run such an event during August. Note the Secretary’s change of QTH—see panel.

London Short-Wave Club.—This Club’s headquarters is now at Ostade Hall, Brixton, where much more space is available, and it is hoped that the membership will increase accordingly. Meetings will in future be held every Thursday at 8 p.m.

Southport Radio Society.—On May 16 G2ART demonstrated a home-built communications receiver and a very successful Junk Sale was held afterwards. On June 20 there will be a Film Show, and plans are now being made for “Open D/F Day” on July 26. The annual contest will be held on August 9. The Club transmits is operating a good deal of interest—it is on the air on Monday and Wednesday evenings.

Solihull Amateur Radio Society.—A discussion on D/F receivers was the highspot of the meeting on June 1. The visit of Mr. Griffith of Slade Radio, who related some of his experiences, was also greatly enjoyed. The second D/F of the season is now being held on June 19. The Hon. Treasurer, G5TU, has presented to the Club a new Headquarters building, 60 feet long, in which every form of amateur activity can be indulged in. This gift was received with great appreciation and the Club is looking forward to a record season.

B.T.H. Recreation Club (Rugby).—The main activity now devoted to D/F Field Days. One of these was held on May 28 in the spacious grounds of Stanford Park, Warwickshire, and proved a very exciting day, with G3BJQ’s party in the lead and G8VN’s party following. On June 19 the Club’s D/F Shield Contest is being held, and any other Midland Clubs are cordially invited to attend. “Open D/F Day” on July 23, details of which are available from the Hon. Sec.

Gillingham Telecommunications Society.—This Club now has eleven members, eight of them being licensed. The
subject of TVI was hotly debated at the last meeting, and it was decided to approach the GPO for an official ruling. Several members, in spite of trying all the usual precautions and with full co-operation from the viewers themselves, are still causing interference, and some outside assistance as to the official attitude is hoped for.

South Manchester Radio Club.—New members are still appearing, and the Club is approaching its first anniversary with some pride. On May 27 there was an interesting talk on Valves; on June 10 there will be a Junk Swap/Sale; on June 24 a start is being made on the Club station; and the A.G.M. is booked for July 8.

Rhigos & District Radio Club.—Rhigos is now one year old, and has fourteen licensed amateurs among the members. In May a lecture was given on Methods of Modulation, and another meeting was held on June 9. Morse lessons and theory classes for the Radio Amateurs' Examination are “available” if required by members.

Isle of Man Amateur Radio Society.—The A.G.M. was held on May 17 and the 1949-50 officials were balloted for and elected. The First President is GD6IA, the Chairman Mr. L. A. Higgins, and the Hon. Sec. GD3FBS. The Club now operates its own station, GD3FLH, at The Nook, Quarter Bridge, Douglas.

Hayes, Middlesex.—The first Hamfest of the Hayes Group took place late in May and was a great success. Well over 100 attended; the guest of honour was Air Commodore R. L. Phillips, and the principal speakers were G6CJ and G6OT. Regular meetings are held on the first Monday at the Vine Hotel, Uxbridge Road, and the Top Band net works on Thursdays from 8.30 p.m. onwards.

Basingstoke & District Amateur Radio Society.—During May the Club visited the residence of Mr. J. A. Lowe to see the “Electronic Television” that he has built. The “televised lecture” given was perfect in every way and a very instructive evening was spent. At another meeting Mr. E. Bull gave a talk on the Basic Principles of the Superhet.

Gravesend Amateur Radio Society.—Weekly meetings continue at the Clubroom, at which regular talks are given by members, and the Morse class is also a feature. The Club visited the Medway society during the month and now plans to visit a number of radio firms in the near future. Strength is approaching the 40 mark, with some keen juniors.

Edgware & District Radio Society.—A recent Top Band contest was highly successful, and one of the June highlights was a visit by about 15 members of Grafton. A return visit followed, and later the Wanstead club is being met on its home ground.

Wirral Amateur Radio Society.—A Film Show sponsored by the C.O.I. included films on Radar, BBC Wavelength Changing, and Electro-Magnetic Induction. A successful Junk Sale was also held. The July meetings are on the 6th and 20th at the YMCA, Whetstone Lane, Birkenhead,
Grafton Radio Society.—Three Clubs, Barnet, Harrow and Clifton, recently visited Grafton and all expressed the desire for a "repeat." NFD also kept many of the members quite busy. The Club closes for the entire month of August, but members can keep in touch with the Hon. Sec. by post for all the latest information.

North-West of Ireland Amateur Radio Society.—This Club now has eleven licensed members, and three more recently sat for the R.A.E. Recent lectures by members have included one on FM by GI3ECD. Others are being arranged for future meetings at the A.T.C. Headquarters, 11 Pump Street, Londonderry—every Saturday at 8 p.m.

West Somerset Radio Society.—An unofficial Field Day was
held on the Quantocks Hills on June 12. This event was attended by some fifty members and friends. G3SB/P was operating, and various discussion groups were formed and a useful exchange of ideas took place.

Medway Amateur Radio & Transmitting Society.—Meetings of the M.A.R.S. are still held every Monday evening at Luton Road, Chatham. Talks and demonstrations on UHF gear have recently been given, and the Club transmitter (1.7 to 28 mc) will be on the air by this time. Plans for another exhibition are under way, and listeners’ contests form yet another scheme which will be tried.

Chester & District Amateur Radio Society.—This Club now has a membership of 35 and recently welcomed G2YS, former Secretary of the Coventry Society. The search for permanent Club premises continues, but meetings are still held fortnightly at the United Services Club, Watergate Street. The next is on July 12.

New faces will be welcomed at any meeting.

Thames Valley Amateur Transmitters’ Society.—The June meeting was informal and mostly concerned the affairs of NFD. In future lectures will take place every other month, with the alternate months free for discussion among members. Plans are under way for a visit to a seaside town and also to places of interest to the Club in general.

West Bromwich & District Radio Society.—This Club has been reorganised, with its new Headquarters at the Lewisham Hotel, High Street, West Bromwich. Meetings will take place on the last Saturday in each month, and a full programme of talks has been arranged.

Romford & District Amateur Radio Society.—NFD was spent at Havering-atte-Bower on the 1.7 and 3.5 mc bands. Sleepless members went in for country walks and listened to the nightingale! It was suggested, after this week-end, that more portable events should be arranged for Club members.

Wishaw & District Radio Club.—After many months this Club has acquired premises of its own at 8 Father Street, Wishaw. Renovation is under way and the Club hopes to be on the air shortly with its call GM8JW/P. Meetings are held on Friday evenings at 7.30 p.m.

Coventry Amateur Radio Society.—The Club has been presented with a new Trophy by G2FDC—this will be awarded to the member producing the best piece of home-made equipment. Two stations were operated for NFD during the full twenty-four hours. Club meetings continue to be held at the BTH Social Club, Holyhead Road.

Cheltenham & District Amateur Radio Society.—Activity is on the upgrade, and a County Social was recently held at Berkeley. On July 17 there is a D/F Hunt, with the Gloucester and Stroud Clubs

NAMES AND ADDRESSES OF CLUB SECRETARIES:

BASINGSTOKE : L. S. Adams, 16 Brambley Drive, Basingstoke.
BRIGHTON : L. Hobden, 17 Hartington Road, Brighton.
CANNOCK CHASE : W. Whetall, 94 Cannock Road, Pype Green, Hednesford, Staffs.
CHESTER : H. Morris, G3ATZ, 24 Kinsellas Road, Boughton Heath, Chester.
CHELTENHAM : S. Kelly, G3CZO, 10 London Road, Cheltenham.
COVENTRY : K. Lines, 70 Stepping Stones Road, Coventry.
CLIFTON (S.E. LONDON) : W. A. Martin, 21 Brixton Hill, London, S.W.2.
EDGWARE : R. H. Newland, G3YW, 3 Albany Court, Montrose Avenue, Edgware.
ENFIELD : F. Tickell, 10 Cowdrey Close, Enfield.
GILLINGHAM : R. A. Lucas, G2B3W, 97 Milton Road, Gillingham, Kent.
GRAVESEND : R. E. Appleton, 23 Laurel Avenue, Gravesend.
KINGSTON : R. Babbs, 28 Grove Lane, Kingston, Surrey.
ISLE OF MAN : H. Gris, GD2FBR, Broadway House, Broadway, Douglas.
LONDON (SOUTH) : R. Nance, G3FLJ, 6a Oozar Road, London, S.W.6.
MEDWAY : R. Farrow, 55 Windmill Street, Farnborough, Rochester.
NORTH-WEST IRELAND : C. Castles, G3FPL, 9 Academy Road, Londonderry.
READING : F. Ihill, G2FZI, 997 Oxford Road, Reading.
RHIGOS : F. Hamer, G2BWB, 7 Neath Road, Bungalows, Aberdare, Glam.
ROMFORD : D. L. K. Coppersale, G3BNL, 9 Morden Road, Chadwell Heath, Essex.
SOLIHULL : G. Hardwick, 121 Bradbury Road, Olton, Birmingham.
SOUTHPORT : F. P. Cawson, G2ART, 113 Waterloo Road, Southport.
SOUTH MANCHESTER : M. I. Wilks, 57 Longley Lane, Northenden, Manchester.
WEST BROMWICH : G. Johnson, G2BJY, 22 Lynton Avenue, Halesowen, West Bromwich.
WEST SOMERSET : T. C. Bryant, G3SB, 16 The Parks, Minehead.
WIRRAL : R. A. Browning, 24 Norbury Avenue, Bebington, Cheshire.
WISHAW : A. R. T. Williamson, 14 Coronation Road, New Stevenston, Motherwell.
The combined stand of the four Societies at the Liverpool Amateur Radio Exhibition, which drew an attendance estimated at 7,000 participating. On July 22 the subject of the meeting is Polar Diagrams, and practical plotting will be discussed. This is a follow-up on the theoretical talk on Aerials fixed for July 8.

Brighton & District Radio Club.—More interesting talks and demonstrations have been given during the last few weeks, with Valve Theory and Oscilloscope construction being the main attractions. Morse classes are held every Club night, and much time and labour were put into NFD.

"PSE QSL"

Those operators who may want SWL reports on their transmissions are invited to send us full details for appearance in the appropriate section of the Short Wave Listener. Give band, time, method, distance or direction from which reports are required, any points for special attention, and the QTH for reports. It is a condition of appearance in "Pse QSL" that all useful SWL reports received through it are acknowledged by QSL card.

DIRECT SUBSCRIPTIONS

We are able to accept direct subscriptions for the Short Wave Magazine, to commence with the next (August) issue. A direct subscription guarantees despatch by post on the day of publication, the first Wednesday in the month, and costs but 20s. post free for a year of twelve issues. Apply, with remittance, to the Circulation Manager, Short Wave Magazine, Ltd., 49 Victoria Street, London, S.W.1.

CONTRIBUTOR NOTE

Those who may be contemplating an article for the Magazine (or the Short Wave Listener) may have a copy of our "Notes on the Preparation of Articles" if they indicate the subject in mind for it. Writers who may already have contributed paid work to our publications will be sent a copy of these Notes on request. Since they contain a great deal of information which any intending contributor requires in his own interests, they should be on hand. Please apply "Attention of the Editor."
RADIO CLEARANCE LTD.
27 TOTTENHAM COURT ROAD, W.1

MUS 9188

U.H.F. RECEIVERS R.1481

To clear space in our warehouse prior to rebuilding, we are offering the remainder of our stock of these well-known receivers at clearance price. Freq. range, 65-86 Mc/s, 6" S.M. Dial, 10 6-3v Valves, 2 VR656s, 4 VR33, 1 VR66, 1 VR54, 1 VR57, 1 VR67. I.F. Freq. 12 Mc/s. B.F.O. These receivers are 19" rack mounting, brand new in transit cases, with circuit diagram. £4/4/-, carriage paid.

RECEIVERS R.U. 19

6-valve straight receiver with 3 R.F. stages, using plug-in coil packs, H.R.O. type. Valves: 3 78's, 2 77's, 1 1642. Black cradle case, 15" x 8" x 8". Provision for remote or local control. Dial cal. 0-100. Supplied new, complete with valves and 4 coil packs covering: Q, 524-844; E, 1285-2155; G, 2960-4620; H, 3865-6265; M, 5075-7780. £3/2/6, carriage paid.

MASTER OSCILLATORS

V.F.O. by Wilcox Gay, Type M1. 19467A. Uses 807 electron-coupled osc., very stable, well screened. Employs 2 circuits: (a) Using cath. grid, screen, tuning 1-5 Ms in 6 bands. (b) Plate circuit as multiplier; tuning 2-10 Mc/s in 3 bands. Incorporates grid choke, grid leak, grid current meter (0-10 Ma) for intermediate amplifier. Supplied brand new in original cartons, with installation accessories and instruction book. £5, carriage 5/-.

CRYSTAL MULTIPLIERS

Wilcox Gay, Type M1. 19468. This is a xtal osc. using 807. Freq. range 2-7 Mc/s. Also incorporates 0-10Ma grid current meter, etc. Supplied brand new in original cartons, with accessories, book, etc., £4/6/-, carriage paid.

MAINS TRANSFORMERS

Primary, 0-110-200/250v 50 c/s. Secondaries, 230-0-220v, 100 Ma, 5v 2A, 6v 3v 2A, C.T. 15/6.

F.S.D. scaled megohms -4-2-5m-inf., 18½; 0-500 microamp, 16½; 0-30ma, 7½; 7½; 0-1mA, 8½; 0; 100Ma, 9½; 0-200mA, 10½; 0-1mA, 18½; desk type, 15½; 0-15v, 7½; 100-130v, century zero, 1mA F.S.D. 7½.

MODULATORS AND MIXER UNITS W6332A

Ex-Admiralty Units with 7 valves, 1-5U4G, 1-VR54, 2-6J5, 2-P61, 1-VR65. On chassis 10½ x 11½. Also 5½ 200mA choke, large mains trans., 500 c/s, pots, res, cond., etc. in metal case with louvres, 10½ x 11½ x 6½, 21½/- carr paid.

MODULATORS AND 10-VALVE RECEIVERS R28/ARC5

Covers 100-150 Mc/s. Supplied New with valves (including 4-7/17A's), 42½.

ROTARY POWER UNITS

Input 24v D.C. Output 230v A.C. 50 c/s. Rating 75 watts. In metal case, 16½ x 12½ x 11½, with 24v 0-250v meter on output. Auto trans., slydlock fuses, output control switch to raise or lower volts. £3/10/-, carriage paid.

2W702, 6v D.C. input, 190v 80mA output, smoothed, D.C. In metal case 14½ x 9½ x 4½ with on/off switch, 16½/- carr paid.
Type 104. 12v D.C. input, outputs 250v 6-5mA, 6-5v 2-5A. D.C. P.M. Rotary on chassis with cover, size 8½ x 4½ x 6½, 6/11 post paid.
Type 87, Input 24v. As Output as Type 104, 5½/- post paid.

CERAMIC SWITCHES

2P 3W 1 Bank ... ... ... 2/- 3P 3W 1 Bank ... ... ... 2/6
2P 6W 4 Bank ... ... ... 4/- 3P 6W 2 Bank ... ... ... 3/6

VIBRATOR PACKS

Input, 12v. Output, 250v 65mA, with 12v vibrator and QZ4 rectifier. Mounted on chassis 5½ x 3½ x 1½, with 8ft. screened cable, on output. Brand New, boxed, 17½.
Vibrator Power Units Type 173. Input 24v D.C. Output 120v. Stabilised by S.130. With 12v vib. and metal rect., in metal case, 6½ x 10½ x 3½, 11½/- post paid.

S.M. DIALS, as used on R.F.26, etc., less Curser, 3/11.

WESTERN GATEWAY HEADQUARTERS
FOR RADIO AND TELEVISION EQUIPMENT

G2BAR

MOTORS AND GENERATORS. 24 D.C. input, 250v, 50 m/a, output. Choice and condenser smoothing, enclosed in metal cabinet. 4" x 6" x 8½", 7½/6 each, 1½ feet. 23 D.C. input, 200v 50 m/a, smoothed with choke and condensers, VS110A Voltage stabilizer. Also 13 v at 1.8s L.T. Cast aluminium chassis and cabinet, 5" x 7" x 10½", 12/6 each, 1½ carriages. 27 v A/C/D.C. input, Shunt motor. 1/135 h.p. 5,000 r.p.m., size 25 x 15 x 8", 6 driving spindle, 5/6 each, 1½ post. 24 v A/C/D.C. input. Motor driven fan, size 4" x 2½", 10½ each, 1½ post.

VALVES. CV677, 75 watt Tetrode, similar to 813, working conditions supplied with each valve, complete with base, 5/6 each. VU508/U33, Half wave 1,000v Rectifier, 7½/6 each. VU120, Half wave 5,000v, VU111, Half wave 5,000v Rectifiers, 7½/6 each. 807 and 6V6, 7½/6 each. VR65 and VR65A, 2½/6 each.

CONDENSERS. -01, -02, -04, 5,000 Kv working, 4½ each.

VARIACS. Ferranti and General Radio. 0-270v, 2Kva, 2½/10½ each, mounted in cast iron case, with direct visual control.

RADIO INTERFERENCE MAINS SUPPRESSORS. Neat aluminium case, two wires in and out. 7½/6 each, postage 9½.

EIMAC & JENNINGS. High voltage vacuum condensers. 50 pf. and 100 pf. 7½/6 each.

BC610 EXCITER TUNING UNITS. Brand New. TU 61, 1-5-2-0 Mc/s, 8½/6 ea. TU 62, 1-01-1-5 Mc/s, 6½/6 ea., postage 1½.

TANK COILS. BC 610 Top Band, 5-pin on ceramic strip, swinging link, made by Barker & Williamson, 7½/6 ea., 1½ postage.

CHANGE OVER RELAYS. 6-pole 2-way, as used in the 1154 transmitter, operates on 6/9v, will switch complete transmitter and receiver station, including aerials, 7½/6 ea.

VIBRATOR UNITS. 1½ voltage. Output, 120/150v, 50/30 m/a, including G.B. and L.T. For battery valves, U.S. made by Jefferson-Travers Co. A.M. spec. 19½/6 each, plus postage.

SPLIT STATOR CONDENSERS. 15pf. + 15pf., 40pf. + 40pf. As used in 1151 Transmitter. Will handle full amateur P.A. transmitting on 10 metres, 100pf. + 100pf., ideal for grid circuits. All with ceramic base and insulation.

New at 7½/6 each.

PI-WOUND TRANSMITTING R.F. CHOKES. 250 m/a, 1½/9 each. Pi wound choke 1-25 m/h, 50 m/a, 1½/each. U.H.F. choke, 1¾/each.

TWIN FUSE HOLDER. Complete with 2.a fuses, 2½/6 each.

YAXLEY SWITCH. One-pole, six-way, two-bank, 2½/6 ea.

TELEVISION LEAD-IN CABLE. 90 Ohms twin co-ax cable. Any length cut. New, 9½/ per yard, postage 1½ per 10 yards.

5-PIN PLUG AND SOCKETS. Centre locating pin, excellent insulation, with plated connecting pins, 2½/ per pair, 20½/ per dozen pairs.

5-WAY RUBBER INSULATED CABLE. Cotton covered for use with the above connectors, 9½/ per yard.

We guarantee satisfaction with all our equipment. Write to us for all your requirements.

ARE YOU PREPARING?
Now that summer is here and DX activity low, most "hams" are making their preparations for the winter DX Season. Rebuilding, modifying, checking over present equipment and putting up new antennas takes a lot of time, and this is where we can help. We undertake to build, rebuild, modify and overhaul any item of your equipment and will gladly submit quotations upon receipt of the details. We can also supply low or high power rigs to our standard or special design.

Do you need a little rig to use whilst rebuilding or planning the main TX? RADIOCRAFT TRANSMITTERS, TYPES 44, 45, 44P or 45P, fill the bill nicely, and our List M/9 gives full details.

With more and more stations becoming active the competition is greater and this means that your station must be "on top line." RADIOCRAFT ECO and CLAPP VFO's are available to help you to clear QRM and "bag" the rare ones.

We can still supply 1/4 s.w.g. enamelled copper aerial wire and the new 300 ohm ribbon feeder as mentioned in our recent advertisements.

We are sure that we can help you and no task is too large or too small. May we quote you?

Radiocraft Ltd
25 Beardell Street, Westow Hill,
Upper Norwood, London, S.E.19

HT.300 TRANSMITTERS. Manufactured by Federal Telephone & Radio Corp. U.S.A. Four RF units operating on C.W. simultaneously at 3 kW output each. 2Mc to 20Mc.

RCA TRANSMITTERS. 2Mc to 20Mc, 350W c/w, 250W r/t, two 813's output. Separate speech amplifier. Two 805 modulators. Rectifier—four 866's.

HALLICRAFTERS. BC610 with speech amplifiers, aerial tuning units, tuning boxes and coils.

HRO'S. 5 or 9 coils, loudspeaker, power pack, 100 per cent efficiency.

All above items in excellent working condition with new valves. Large stock of transmitting condensers, valves and other components. Alignment and repair of communication receivers and all other amateur equipment.

Your Signal Report

If you are seriously interested in Sending and Receiving Morse code read the excellent contribution on this subject which appeared on pages 186 and 187 of the May issue of The Short Wave Magazine.

The Candler System of

MORSE CODE TRAINING

has helped thousands to become highly skilled W/T Operators.

Read these extracts from letters sent us by students.

REF. No. 7125: "I have completed the first 5 Lessons of the Junior Code Course and I would like you to know that I have made very good progress. I am now able to copy the G.P.O. station GFO 760 kc/s, making very few mistakes." — P.W.

REF. No. 7161: "I must add that the first three Lessons have been a great help and have completely changed my outlook as regards Code. A friend, an ex-commercial operator, has already noticed a vast improvement, especially in my 'Style', as he terms it. This is quite encouraging, and I am looking forward to the further Lessons" — J. R. D.

You are invited to send for the CANDLER "BOOK OF FACTS". It gives details of Morse courses for Beginners and Operators.

THE CANDLER SYSTEM CO.

(55S.W.) 121 Kingsway, London, W.C.2
Candler System Co., Denver, Colorado, U.S.A.

MAGNIFICENT OFFER
