Though the public-affairs programs often stirred controversy, the station's arts programming had a significant impact on the Bay Area's cultural scene. KPFA's first music director, Americo Chiarito, boldly mixed jazz, classical, folk, and other forms of noncommercial music throughout the broadcast day. Over a 25-year period, subsequent music director Charles Amirkhanian interviewed and gave exposure to the work of nearly every living composer of importance in the West, including Terry Riley, LaMonte Young, Steve Reich, Lou Harrison, Pauline Oliveros, and John Cage. Philip Elwood, later the jazz critic for the San Francisco *Examiner*, hosted various on-air jazz programs for nearly 40 years. Sandy Miranda's *Music of the World* program featured live music, interviews, and rare recordings that drew a large and devoted following that made significant financial contributions to the station. For nearly a quarter of a century, the station devoted considerable airtime to contemporary poetry and literature under the direction of Erik Bauersfeld.

Through the 1970s and 1980s there was a gradual, if fundamental, shift in how KPFA and the Pacifica network (which by then included stations in New York, Los Angeles, Houston, and Washington, D.C.) defined themselves and their target audience. Unlike the early days in Berkeley, when the audience

was presumed to be an elite, educated, intellectual minority, KPFA gradually became known as a "community" radio station. Its audience, and even many on-air programmers, became increasingly defined not by ideas but by gender, ethnicity, race, and class. Third-World and women's departments were eventually created at the station. As these and other groups in the community demanded a place on the broadcast schedule, bitter arguments ensued over ideology and over questions about who speaks for whom and which groups deserve access to the microphone.

In 1999 many of these questions came to a head when the Pacifica network attempted to make programming and staff changes at KPFA, removing the station's popular general manager. The network defended the changes as an attempt to increase audience numbers and diversity. Many of the staff and volunteers, as well as activist members of the community, charged that the network was engaging in strong-arm tactics in an attempt to consolidate power and avoid accountability. What started as a personnel matter soon mushroomed into a widely publicized struggle over the station's future, prompting walkouts, strikes, and demonstrations.

Although such controversies have occurred periodically at a number of the Pacifica stations over the years, it was especially ironic that an organization that has done so much to protect the broadcast of free speech would resort to censorship when its newscasters attempted to cover the story. When KPFA's investigative reporter Dennis Bernstein defied a network gag order by covering the crisis at the station, he was suspended from his job, then arrested along with 51 KPFA staff and activists who refused to leave the building. A live, open microphone caught the entire drama. Pacifica officials then cancelled regular programming and boarded up the station for much of July and September.

But faced with a demonstration of 10,000 angry KPFA supporters, Pacifica relented and permitted KPFA staff to go back to work. This and subsequent controversies at all five Pacifica stations sparked a grassroots campaign to democratize the network. By December of 2001 a new Board of Directors had been assigned the task of revising the foundation's by-laws to give the network's listener-sponsors more say over governance.

KRLA

Los Angeles, California Station

KRLA (1110 kilohertz) is a 50,000-watt AM station serving the Los Angeles market. It was a popular Top 40 station in the 1960s, featuring stand-out radio personalities such as Casey Kasem, Bob Eubanks, Dave Hull, and Bob Hudson. KRLA associated itself strongly with the Beatles at that time, sponsoring several Beatles concerts in Los Angeles. It became the number one station in that market in 1964 and held that distinction for several years. Ironically, it was during KRLA's ratings heyday that its long legal struggle with the Federal Communications Commission (FCC) began. In 1962 the FCC denied a license renewal to station owner Donald Cooke and his company, Eleven Ten Broadcasting, over questionable on-air practices. This set off a 17-year battle, during which KRLA was operated by a nonprofit interim company. The license renewal case for KRLA is a rare instance of FCC license denial based on content and behavior rather than technical considerations.

Origins

The station's history began in 1940 when J.R. Frank Burke and other investors formed the Pacific Coast Broadcasting Company in order to apply for a broadcasting license in Pasadena, California. Burke was a fund-raiser for the Democratic Party and publisher of the *Santa Ana Register*. The FCC issued a construction permit in September 1941, just months before the United States entered World War II and placed a moratorium on all new radio construction. The new station would have the call letters KPAS and operate at 10,000 watts on 1110 kilohertz. By February 1942 an operating license was issued and KPAS went on the air as an unaffiliated station with block pro-

gramming typical of the time period. Burke's accountant, Loyal King, became the station manager. In addition to music, news, and religious programs, KPAS featured dramatic sketches performed by the Pasadena Playhouse actors. Local programming and public service were hallmarks of the station in the 1940s.

In 1945, Burke sold his interest to religious broadcaster William Dumm, who in turn sold his share in the station to Loyal King two years later. The license was retained by Pacific Coast Broadcasting. The station's call letters were changed to KXLA in 1945 to suggest a more metropolitan target audience. In 1948 King began to run a popular syndicated program called *Country Crystals* and by the early 1950s, KXLA had become a country western station. Most commercial radio stations in the United States were switching to musical formats at this time, as radio talent and network financing were migrating to television.

In 1958 a major change for the station occurred when New York businessman Donald Cooke signed an agreement to purchase KXLA from Pacific Coast Broadcasting. Cooke's brother, Jack Kent Cooke, was the true interested party, but as a Canadian citizen, he was prohibited by the Communications Act of 1934 from owning a U.S. radio station. In order to help his brother finance the purchase, Jack Kent Cooke would buy the station facilities through his newly formed company, Broadcast Equipment Corporation (BEC). Don Cooke's company, Eleven Ten Broadcasting, would file for the license transfer and lease the facilities from BEC.

In March 1959, the FCC approved the transfer with the understanding that Jack Kent Cooke would have no role in

managing the station. In fact, he had already been heavily involved, and in the months to come he would play a significant role in station management by making personnel decisions and planning on-air contests and promotions. The Cookes' intention was to change the format to Top 40 rock and roll and to concentrate on the teenage demographic throughout the Los Angeles market. At midnight on 1 September 1959, the station officially switched over. Nineteen-year-old disk jockey Jimmy O'Neill announced, "You have been listening to KXLA. You are now listening to KRLA-Radio for the young at heart."

Fifteen Years of "Interim" Owner Operation

In August 1959, all southern California stations were required to submit applications for license renewal according to the regular FCC schedule of renewals. KRLA did so, but in July of 1960, the FCC notified Donald Cooke that there would be a hearing for KRLA's license renewal. The FCC was concerned about several problems, including programming promises not being met, falsified logs, fraudulent contests, and the involvement of a non-citizen in station management. Although the hearing examiner recommended a one-year probationary renewal, the FCC denied renewal in 1962. The decision was upheld on appeal and the FCC ordered KRLA off the air. Comparative hearings would be held to determine the new licensee, but the FCC was concerned about leaving the frequency vacant in the meantime, as that meant the Mexican station XERB would be allowed to increase its power under provisions of an international treaty.

Oak Knoll Broadcasting, a nonprofit company, was selected to be the interim owner and licensee of KRLA. Eighty percent of their profits were to go to KCET, an educational TV station, and the other 20 percent would be distributed to other charities. Oak Knoll took possession of the station in 1964 and continued to operate it until 1979, when a new company, KRLA Incorporated, was finally selected to take over the license, ending the interim period. Oak Knoll's long period in control stemmed from the protracted FCC proceedings required to choose between more than a dozen applicants for the station license.

The early Oak Knoll years were KRLA's strongest in terms of its position in the market. In 1964, KRLA sought to distinguish itself from KFVB, its primary competitor, by focusing on a single band, the Beatles. The station played all of the cuts from Beatles LPs rather than just the hits and provided infor-

mation about the music and the band members, promoting itself as "Beatle Radio." KRLA also sponsored three Beatles concerts in Los Angeles from 1964 to 1966. This strategy enabled KRLA to become a contender in the competitive and saturated Los Angeles AM market.

During the 1970s KRLA's format changed several times. In 1971 the station switched to album-oriented progressive rock in an attempt to appeal to young people in the counterculture. This move proved unsuccessful, as FM radio was already offering that format with better sound quality. In 1973 KRLA moved to soft rock, which was more successful, but not enough so to make the station profitable. In 1976, under the direction of Art Laboe, KRLA changed to an Oldies format in a successful move to recapture a segment of the dwindling AM audience.

KRLA Incorporated was actually a merger of five of the companies that had applied for the KRLA license in 1964. It operated the station until 1985, when it was purchased by Greater Los Angeles Radio, Inc. Greater Los Angeles Radio moved the studios from the Huntington Hotel in Pasadena, where they had been since 1942, to Wilshire Boulevard in Los Angeles. The transmitter was moved to Irwindale the following year. In 1997 KRLA was acquired by Infinity Broadcasting, a subsidiary of Viacom, and its format was changed to talk radio. Infinity sold KRLA to Disney-owned ABC Radio in 2001. The format was changed to sports programming with an ESPN affiliation and the acquisition of Anaheim Angels baseball games. ABC Radio relaunched the station under the new call letters KSPN and as of January 2003 had swapped frequencies with KDIS-AM (Disney Radio) on 710 kilohertz. KDIS, now on the 1110 frequency, is formatted for children with Disney product. The KRLA call letters were acquired by Salem Communications for its talk station KIEV-AM at 870 kilohertz.

KSL

Salt Lake City, Utah Station

In the early days of radio, one of the key groups of licensees was composed of churches. As is the case with many such stations, it is difficult to discuss the vision and role of KSL without considering its church affiliation and the dream to proselytize. The Church of Jesus Christ of Latter-day Saints (LDS; Mormon) acquired a radio station to broadcast general conferences of the LDS Church to people throughout the area without their having to come to the tabernacle on the city's Temple Square. Although the functions and operations of the station's mission have changed dramatically over the years, the religious influence can still be found.

KSL's predecessor, KZN, went on the air on 6 May 1922 and was among the first in the Western United States. It broadcast on 1160 kilohertz, and was designated a class A (clear channel) station in 1925. The station is still located at 1160 AM. At 8 P.M. on the first day of its broadcast, from atop the building housing the LDS-operated *Deseret News* newspaper, the station broadcast LDS Church President Heber J. Grant, who spoke of the church's mission and doctrine, quoting from the church's scriptures. Some observers felt that President Grant's remarks were the beginning of the fulfillment of a dream voiced earlier that the president of the church could deliver his sermons "and be heard by congregations assembled in every settlement of the Church from Canada to Mexico, and from California to Colorado" (see Anderson, 1922).

During its first years of operation, the station carried the voices of several famous figures. In addition to church authorities, other noted speakers used this new, fascinating, and promising medium. William Jennings Bryan delivered a ten-minute address on 25 October 1922. In 1923 President Warren G. Harding spoke over the station in a broadcast originating from the church's tabernacle. It was the first known instance of a U.S. President speaking over radio in that area.

In June 1924 *The Deseret News* sold KZN to John and F.W. Cope, who planned to overcome some of the station's engineering problems. The call letters were changed to KFPT. Later that year, in October, the station broadcast the general conferences of the LDS Church, an event that was to occur semi-annually through the rest of the century. Listeners could sit at home in their own living rooms next to their radio receivers and attend to the business and spiritual matters of that faith.

In June 1923 the Mormon Tabernacle Choir began its first formal broadcast on KZN (whose call letters were changed to KFPT in 1924, then to KSL in 1925) with the program *Music and the Spoken Word*, a program that continues in the early 21st century. A few years later, when KSL joined the National Broadcasting Company (NBC) as an affiliate, it began a regu-

lar Sunday broadcast of the choir. The program continued when, in 1932, KSL moved its affiliation to the Columbia Broadcasting System (CBS). (The radio station is still a CBS affiliate, although KSL-TV is now affiliated with NBC.) It continues as the oldest continuous sustained radio program in America. The program brought fame to the station and the church, as well as a wider audience for the choir and for the tabernacle organ, from their rich acoustical setting in the century-old tabernacle.

As radio developed into a commercial medium, troubles loomed for the Mormon-owned station. Although church leaders saw nothing wrong with the business operation in conjunction with its function as "a factor in the spread of the gospel of Jesus Christ across the world" (see Hinckley, 1947), the church's standards came into conflict with some commercial practices. For example, the church advocated against the use of alcohol and tobacco. Yet network programs carried by KSL contained commercials selling beer and cigarettes, and programs contained themes or characters using these products. Not to carry such programs with their commercials could mean severance from network feeds and a drastic reduction in profits and income. Continuing to carry the programs appeared hypocritical in light of the church's teachings of abstinence from these products. With CBS's position of hard business practices guiding the decision-making process, the church was poised to lose the network affiliation and become a secondary, perhaps insignificant influence in radio in the intermountain area. Policy was established not to accept spot advertising (contracted individually with the station) for beer, wine, or tobacco, but the national network ads would continue to be carried as a necessary evil. KSL would not try to restrict network advertising or interfere with network contracts. KSL-FM was Utah's first FM station, beginning operation on 26 December 1946. Its programming was different and separate from its AM outlet.

Becoming successful as a business, KSL became the flagship station in the church's broadcast ownership, Bonneville International, established in 1964. The group owned radio and television stations in Seattle, Washington, then acquired FM outlets in New York City, Chicago, San Francisco, Los Angeles, Dallas, and Kansas City. As of 2003, Bonneville had 15 stations. From the mid-1960s to 1975, Bonneville operated an international shortwave radio station reaching various countries.

KSL quickly realized that its clear channel signal of 50,000 watts AM served more than just Salt Lake City, extending to the entire Western region of the United States. It also tried to

reflect a sense of commitment to serve this extended community, as mandated by church president David O. McKay in the mid-1960s. The station moved from broadcasting high school and church basketball tournaments in the 1950s to political broadcasts of substance. Bonneville's production arm created the "Home Front" public-service messages, which sent non-denominational messages about families and values to listeners who might not otherwise tune in to religious programming. These "Home Front" features were distributed to stations throughout the country to air in a variety of programs.

The church influence in KSL's programming has brought occasional criticism of censorship and biased influence. Yet the wide range of political viewpoints, the representations of other religious denominations, and the respect garnished from its news reporting seem to quell such criticism for many observers. One KSL news director disavows any meddling in the news agenda or its coverage of stories, including those local stories critical of church policies. Although some complaints have gone to the Federal Communications Commission, none has been taken seriously enough to limit the church's operation of its stations.

Broadcast management has indicated that today KSL is a station intent to make a profit, "not to evangelize." It is a commercial broadcast enterprise owned by a religious organization "operated strictly as a business and seeking no special treatment" (see Brady, 1994). Although the station started with a dream to evangelize, the realities of commercial broadcasting make its mission for community good more general in nature.

KTRH

Houston, Texas Station

A longtime news, talk, and information station, KTRH was the starting point for the careers of several national celebrities, including the two best-known anchors on Columbia Broadcasting System (CBS) television.

The history of KTRH meshes with the history of modern Houston. KTRH was a relative latecomer when it signed on the air 5 March 1930. The city had boasted an experimental radio station as early as 1919. Several commercial stations were on the air in the early 1920s, although none lasted longer

than a few years. Only rival KPRC, launched by the *Houston Post-Dispatch* during a newspaper convention in the city in 1925, hinted at the promise radio would hold in the city.

The opportunity to build KTRH came as a result of the Great Depression. The economic downturn caused the regents of the University of Texas to decide against supporting their experimental station in Austin, KUT. Houston real estate magnate Jesse H. Jones, builder of Houston's emerging skyline and owner of the *Houston Chronicle*, purchased KUT and had the

station's equipment boxed and transported the 165 miles to Houston.

Jones hoped to house his new station at the *Chronicle*, but the paper's editor dismissed the idea. The manager of Jones's Rice Hotel, on the other hand, was enthusiastic about a station's broadcasting from his facility and wanted the station to be "irretrievably tied to the hotel," according to Jesse Jones's nephew, John T. Jones, who would ultimately inherit KTRH from his uncle. The TRH in the new station's call letters stood for "The Rice Hotel."

When Ross Sterling, owner of KPRC and the *Houston Post-Dispatch*, suffered financial reverses in 1931, Jesse Jones came to the rescue and briefly controlled the *Post-Dispatch*, the *Chronicle*, and KTRH and KPRC radio stations. Jones gained such power that when he secured the Democratic Party's national convention for Houston in 1928, he also won the hearts of Texas Democrats: all 40 of Texas's electors cast their ballots for Jones's nomination for president, even though New York Governor Al Smith would ultimately win the nomination.

In 1947 the *Chronicle* established the first FM station in Houston and called it KTRH-FM. For its first two years, it simulcast the programming of KTRH-AM, and then it launched a "fine music" program of light classics. After a few years, the station returned to simulcasting. The popularity of album rock music in the late 1960s and early 1970s prompted a change of format and call letters for KTRH-FM. The letters KLOL were chosen because they resembled the 101 dial position.

On the death of Jesse Jones in 1956, the ownership of KTRH, sister station KLOL, and the *Chronicle* passed to Jones's nephew, John T. Jones, who operated the stations under the corporate name "The Rusk Corporation" (named for the downtown street where Jones's offices were located). The *Chronicle* was operated by a private foundation, Houston Endowment, that was established by the elder Jones for charitable purposes.

A graduate of Houston's San Jacinto High School, Walter Cronkite worked part-time at KTRH on his way to a journalism degree at the University of Texas in Austin. During the early 1930s Cronkite worked for the University of Texas newspaper, *The Daily Texan*; at United Press International (UPI); and at several state capital news bureaus at the same time. Dan Rather began working at KTRH in 1950, shortly after his graduation from Sam Houston State University in nearby Huntsville, Texas, where he had been a reporter for both the Associated Press and UPI. Rather's early KTRH broadcasts originated in the newsroom of the *Houston Chronicle* with the clack of wire service teletype machines in the background. "We got (the) bright idea that it would give the news program more authenticity," said John T. Jones. The younger Jones told the story of a *Chronicle* religious editor whose desk was next to

Rather's broadcast desk. At the end of each newscast, said Jones, the editor would correct Rather's grammar. In 1956 Rather became the station's news director.

CBS-TV sports anchor Jim Nantz also began his career at KTRH, in 1981. While studying on a golf scholarship at the University of Houston, Nantz was an intern at the station and later host of the *Sportsbeat* call-in program.

KTRH is credited with originating the *Dr. IQ* radio quiz show during the 1930s. Ted Nabors, then KTRH program director, performed as the Doctor, and announcer Babe Fritsch took a roving microphone into the audience to choose contestants who won silver dollars when they answered questions correctly. Fritsch was the first to say, "I have a lady in the balcony, Doctor!" *Dr. IQ* was developed for national broadcast on the National Broadcasting Company (NBC) network beginning in 1939, with Lew Valentine performing as the Doctor and Allan C. Anthony as the announcer.

In the mid-1960s, KTRH began a move to the talk format under General Manager Frank Stewart. Although KTRH was not the first station to adopt the new format, it was an early entry into the talk arena. Texas farm and ranch industries prompted KTRH to establish a strong presence in agribusiness reporting, at first with information for area ranchers and later with lawn and garden programs.

In 1981 the station broadcast two live talk shows from the People's Republic of China, a first for U.S. broadcasters. Talk host Ben Baldwin and KTRH Vice President and General Manager Hal Kemp answered listener questions and described events of their travels, including a rare firepower demonstration by the People's Army Infantry. "They literally blew up a mountain for us," Baldwin reported. The station staged subsequent live broadcasts from China during the early 1980s and aired weekend features prepared by the English language staff of Radio Beijing.

Because KTRH had affiliated with the CBS Radio network in the first year of its operation, one of the stories the Houston radio rumor mill circulated in the 1970s and 1980s was that CBS had a blank check ready if John T. Jones ever decided to sell KTRH. He didn't—and the stories were never confirmed. At Jones's retirement, his son Jesse Jones III, known as "Jay," assumed operation of the stations and acquired properties in San Antonio and Austin, expanding Rusk Corporation holdings.

In 1989 Jacor Communications made a \$60 million offer for KTRH and KLOL, but the deal was never consummated. Ultimately, the two stations were sold in 1993 to Evergreen Media for \$51 million. Evergreen became Chancellor and later AMFM after mergers made possible by the Telecommunications Act of 1996. KTRH moved to the Clear Channel Communications roster after that company's merger with AMFM.

Kuralt, Charles 1934–1997

U.S. Broadcast Journalist

One of the most beloved of journalists, Charles Kuralt was a traveler. Most of his life was spent "on the road," a phrase that became the title of his best-known television series. But he began his career in radio, first at WUNC, the student-run station at the University of North Carolina, Chapel Hill, and later at Columbia Broadcasting System (CBS) Radio. Accompanied by a few years' newspaper experience at *The Charlotte News*, where he won a prestigious 1956 Ernie Pyle Memorial Award for his writing skills, Kuralt showed great promise as he began work at CBS Radio.

Kuralt began as a radio writer in 1957, becoming the youngest ever network correspondent just two years later at age 24 and quickly winning a reputation as a hard-news reporter. At the time he was hired by CBS, network radio's viability was uncertain. As at the other major networks, news head Dick Salant was dealing with the sweeping loss of audiences and advertisers to the upstart television medium. After dropping all its soaps and traditional programs in favor of an all-news format, CBS Radio needed unique programming to hold on to affiliated stations, and Salant's solution was a series of very short, horizontally scheduled features—"programlets" that ran four minutes or so and were embedded in commercials. The network would repeat these features as many as eight times each day, returning with fresh stories on successive weekdays. Salant picked Kuralt to do the feature series called *To Your Health*, which quickly became a popular element of CBS's successful Dimension Radio and established Kuralt as a top-notch writer and on-air reporter. After gaining television experience as host of *Eyewitness to History*, Kuralt was expected to step rapidly into the nightly network newscast—a prestigious position on the Tiffany network with the most lauded news of the day. Salant and others had tremendous expectations, touting the young Kuralt as perhaps "the next Edward R. Murrow!" Those were very big shoes for anyone to

fill, but in typical fashion, Kuralt dismissed the comparison as "ridiculous."

Because Kuralt preferred the adventure of travel to the stability of a daily news job, he moved from radio to television, covering the war in Vietnam for four tours and reporting on other world trouble spots. He became CBS's chief correspondent in Latin America and later on the West Coast, but he eventually left the hard-news side of television and radio in 1967, when he found his ideal vehicle in the famed *On the Road* series. For more than two decades, Kuralt roamed America's small towns and back roads in a CBS camper, reporting on heartwarming events in ordinary people's lives. Often called the Walt Whitman (or the Norman Rockwell) of American television, he did offbeat Americana stories, telling viewers about, for example, a school for unicyclists, a gas station/poetry factory, and a 104-year-old entertainer who performed in nursing homes. He talked to lumberjacks, cooks, poets, and farmers. He told of the Franciscan Sisters of Perpetual Adoration in Wisconsin, who have been continuously praying—in shifts—for the last 100 years. Finding everyman poetry in everyday life, his offbeat human-interest stories enchanted, delighted, and touched millions of television viewers and radio listeners. These reports became part of the *CBS Evening News*, *CBS Sunday Morning*, and the weekday *Morning* program; they also aired on the CBS Radio Network. Kuralt is said to have logged more than a million miles on the road. He is quoted as saying about CBS Radio: "Going wherever I wanted to go and doing whatever I wanted to do, CBS didn't even know where I was; didn't care much where I was. I just wandered. And that was probably the best job in journalism." After more than a decade as host of the television program *CBS Sunday Morning*, he retired, only to come back as host of *An American Moment*, a 90-second series that harked back to his radio days. He also hosted for a short time the CBS Cable

show *I Remember*, a weekly reexamination of significant news stories from the historical past. After a brief illness, Charles Kuralt died in 1997 of complications arising from lupus.

During his career at CBS, Kuralt wrote several best-selling books, won 11 Emmy Awards, three Peabody Awards, and numerous other prestigious broadcasting awards. At his death, Walter Cronkite called him "one of the true, greatly talented people in television." A month later, the North Carolina legislature passed a resolution honoring him, observing that "Charles Kuralt possessed a peculiar insight that enabled him to contribute substantially and effectively to the improvement and betterment of the world around him, enriching the lives of those with whom he was associated and came in contact." He was a truly great storyteller.

SUSAN TYLER EASTMAN

Charles Kuralt. Born in Wilmington, North Carolina, 10 September 1934. Son of Wallace Hamilton Kuralt and Ina Bishop Kuralt; attended University of North Carolina at Chapel Hill, B.A. in journalism, 1955; WUNC radio dramatist, 1953; editor, *Daily Tar Heel*; reporter for *Charlotte News*, 1955–57, received Ernie Pyle Memorial Award for writing, 1956; joined CBS as writer, 1957, news correspondent, 1959–94. Received 11 Emmy Awards, three Peabody Awards, George Polk Memorial Award, 1981; inducted into North Carolina Journalism Hall of Fame, 1981; International Radio and Television Society (IRTS) Broadcaster of the Year, 1985; John Tyler Caldwell Award for the

Humanities, 1997 (posthumous). Died in New York City, 4 July 1997.

KWKH

Shreveport, Louisiana Station

KWKH, a 50,000-watt clear channel station, played an important role in the commercialization of country music and rock and roll music during the 1940s and 1950s. In addition, as one of the first radio stations in Louisiana, it helped pioneer radio broadcasting in the state.

The station that KWKH would become first crackled on the air in early 1922. Engineer William E. Antony built the physical operations under the auspices of the Elliott Electric Company; in 1923 a team of investors led by a retailer of radio sets purchased the station, dubbing it WGAQ. One of the investors bought out his partners in 1925 and rechristened the station with his initials. William Kennon Henderson, who owned and operated the Henderson Iron Works and Supply in Shreveport,

promptly turned KWKH into his own soapbox. At arbitrary moments during the broadcast day, he often burst into his studios and grabbed the microphone from his announcer. "Hello world, doggone you! This is KWKH at Shreveport, Lou—ee—siana, and it's W.K. Henderson talkin' to you." He railed against the national debt and chain retail stores and ridiculed over the air anybody who dared to disagree with him. He condemned the Radio Act of 1927 and sparred with both the U.S. Department of Commerce and the Federal Radio Commission, claiming that both favored chain (network) stations over independent outlets.

In the late 1920s, when Henderson applied for a power boost to 10,000 watts, federal regulators turned him down,

claiming that KWKH was nothing more than a broadcaster of phonograph records. But Henderson argued that his format—which in actuality encompassed more than just record playing—satisfied his listeners' wishes. The rejection only incited the maverick's ranting resolve, and by 1930 Washington conceded to him and granted the increase in power.

As eccentric and egotistical as Henderson was, his desire to see KWKH prosper and expand its signal range helped consolidate radio's presence in Louisiana. His on-air tirades forced people to note the presence of radio, and entrepreneurs looked to the growth of KWKH as an example when they invested their own dollars in radio stations. Furthermore, it was probably Henderson's distaste for the uniformity of chain stations that led KWKH to recruit local talent to perform on its airwaves. The use of local talent, most of whom performed hillbilly music (as country music was known in the 1920s and 1930s), planted the seeds that would grow into KWKH's *Louisiana Hayride*.

In 1932 Henderson sold KWKH to the International Broadcasting Corporation, and the station changed hands again in 1935 when the *Shreveport Times*, owned by oilman John D. Ewing, took control. Under Ewing, KWKH continued the growth that Henderson had initiated, moving to modern facilities in downtown Shreveport's Commercial Building in 1936 and receiving permission to operate at 50,000 watts in 1939. (In 1934, probably much to the former owner's ire, KWKH had established a network affiliation with the Columbia Broadcasting System [CBS].) Carrying on Henderson's tradition of hiring local talent, station manager Henry B. Clay, who was Ewing's son-in-law; program director Horace Logan; and commercial manager Dean Upson established the *Louisiana Hayride*, which would become KWKH's most lasting mark on country music history and, indeed, on radio history.

KWKH's *Louisiana Hayride* was a country and western stage show that played weekly on the station from 1948 to 1960. Dubbed "the Cradle of the Stars," the program aired on Saturday nights from Shreveport's Municipal Auditorium and boasted among its cast members musical performers who would be the primary shapers of post-World War II country music. Important country music figures such as Hank Williams, Jim Reeves, and Johnny Cash appeared as regulars on the *Hayride* early in their careers; each used the program as a springboard to broader acceptance. In addition to providing a stage for important country music performers, KWKH and the *Hayride* would leave a lasting mark on the history of rock and roll in the mid-1950s, when singer Elvis Presley became a regular cast member on the show; the exposure he received as a cast member from 1954 to 1956 helped fuel his rise to national prominence.

KWKH's 50,000 watts of power gave the *Louisiana Hayride* its muscle. The station's signal stretched like a fan across the southwestern and northwestern regions of the United States and clipped across national borders to reach countries as near as Mexico and as far as Australia. A regular spot on KWKH's Saturday night hoedown, any aspiring country act knew, could attract recording contracts and generate bookings. The *Hayride*'s influence grew mightier in the early 1950s with its insertion into the schedule of a CBS regional network.

However, the *Hayride* would never be as mighty as the *Grand Ole Opry* on WSM in Nashville, Tennessee, and because of that, KWKH failed to hold on to its rising stars. As *Hayride* personalities gained momentum, they inevitably shifted their eyes toward the *Opry* and Nashville, where a colony that included booking agents and music publishers awaited to capitalize on the artists' successes. KWKH and Shreveport lacked such ancillary components of the music industry and therefore could not keep name artists on the show very long. The *Louisiana Hayride* became known as an "Opry farm club," and, largely because of the constant talent drain, it ceased regular broadcasting in 1960. The program has been reincarnated in various forms over the years, but it has never achieved the influence it enjoyed in the late 1940s and 1950s.

Today, KWKH is owned by Clear Channel Communications, which acquired the station in 1999. Although the *Louisiana Hayride* disappeared long ago from its airwaves, the station still recalls former glories with its "country gold" format, which features vintage country music from as early as the 1940s.

Kyser, Kay 1905–1985

U.S. Big Band Leader and Radio Host

Largely forgotten today, Kay Kyser's band scored 11 No. 1 records and 35 top 10 hits. Kyser hosted a top-rated radio show for 11 years on the National Broadcasting Company (NBC), and he and his band starred in seven motion pictures. He has two stars set into the sidewalk on Hollywood Boulevard in Los Angeles, one for radio and another for film work. Although best known as a musical figure, in fact Kyser could not sing, read music, or play any instrument.

Origins

Kay Kyser's roots and much of his life are based in North Carolina. Born there, he originally intended to study law while attending the state university. Instead, at the suggestion of bandleader Hal Kemp, Kyser (then a university cheerleader) formed his first small band in 1926, the group consisting of six fellow students. With this initial group, Kyser soon established his role as an energetic MC, rather than as a musician. Over the next several years, the band added some professional musicians and slowly improved, but life on the road was a series of relatively short performance gigs in Depression America.

In the mid-1930s, appearances at venues in Santa Monica and then in Chicago (at the Blackhawk restaurant and club) propelled the band to national recognition and appeal. In part this was due to the music played, but much of the band's particular appeal was built around the light-hearted humor and antics of Kyser as its energetic leader. The band was something of an extension of Kyser's outgoing personality.

Radio Years

Sometime in 1937, the "college" concept was first developed to attract more customers on otherwise slow Monday evenings at the Blackhawk. Originally called "Kay's Klass," it was a kind of amateur performers night, supplemented with questions from Kyser to the musical contestants to both relax them and amuse the audience. The classroom notion may have been the idea of Kyser's young agent, Lew Wasserman. Chicago station WGN began to broadcast the band's performances as *Kay Kyser's Kampus Class*. By this point the Kyser band had developed another unique feature that would remain for many years: the "singing song title," in which a band vocalist would sing the title's words at the beginning before a full performance of the song.

In February 1938, the Mutual Broadcasting System began an eight-week series of programs carrying the Blackhawk-based band program regionally. The American Tobacco Com-

pany took up sponsorship of the show for its Lucky Strike cigarette brand and brought it to New York City and the NBC network, with the first program airing on 30 March 1938. Now known as *Kay Kyser's College of Musical Knowledge* (sometimes *College* is rendered *College*) with Kyser cast as "The Old Professor," the program was an almost instant hit.

The *College* program's format was classic radio variety, built around the band's music but adding the related quiz feature along with comedy routines. Each broadcast began with Kyser's warm North Carolina-accented "Evenin' folks, how y'all?" "Diplomas" were mailed to listeners sending in music quiz questions used on the air.

Among the many instrumentalists and singers in Kyser's band, several stood out over the years. Perhaps best known was "Ish Kabibble" (Merwyn Bogue), who got his odd show business name from his comedy version of an old Yiddish song, "Isch Ga Bibble" (loosely translated, "I should worry?"), which he first performed after joining the band in 1931. He played the cornet but thrived on developing the rural "Ish" character with a "pudding bowl" hair cut, who constantly interrupted the show to recite nonsensical poems to a seemingly frustrated Kyser, becoming his onstage comedy foil. As is often the case with such performers, he was no dummy off-stage, and he handled the program's payroll. He stayed with the band until the program wrapped up its television series in 1951. Among the many singers heard over the years were tenor Harry Babbitt, San Antonio native Ginny Simms, who was the band's first permanent female voice and often sang duets with Babbitt, and Mike Douglas, who would go on to become a famous variety and talk show host for television.

Kyser recorded no fewer than 11 number one songs in the space of seven years. These were "The Umbrella Man" and "Three Little Fishies" (1939); "(Lights Out) Til Reveille" and "(There'll Be Bluebirds) Over the White Cliffs of Dover" (1941); "Who Wouldn't Love You," "Jingle, Jangle, Jingle," "He Wears a Pair of Silver Wings," "Strip Polka," and "Praise the Lord and Pass the Ammunition" (1942); and "Old Butter-milk Sky" and the "Woody Woodpecker" song (1946). Overall, the band recorded some 400 songs beginning in 1935, mostly on the Brunswick, Columbia (parent of Brunswick), and Victor labels.

Kyser's band became one of the first to perform at military bases even before World War II. The first such performance took place at the San Diego marine base on 26 February 1941. Kyser became a highly successful wartime bond salesman with these and other appearances—a total of more than 500 shows at military camps and bases by the time the war ended. These

“road shows” had a somewhat different sound from the earlier broadcasts. A band bus fire in April 1942 destroyed 15 years’ worth of musical arrangements, prompting a hiatus for the act. When the band reappeared, the singing song titles were gone and a newer, updated musical style became evident. Because of the pressure of the wartime appearances, the band undertook no commercial gigs (except those booked previously) for the duration, concentrating on the continuing radio show, military service shows, and the seven movies that featured Kyser and the band, all of them made within a five-year period.

Later Years

Kyser and the band moved to television with their own series, debuting in 1949. With the end of the TV series in 1951, Kyser retired at the top of his form and with nary an announcement that he was going. He was tired after years of relentless perfor-

mance, had earned more than enough money, and wanted to return to North Carolina to do other things. There was also a medical reason: Kyser had begun to have serious trouble with his feet due to an arthritic-type condition in his toes, perhaps exacerbated by his years of energetic performance. Not finding help in traditional medicine, he turned to Christian Science to find relief. He became very active in the church, managing its film and broadcast department in Boston for five years in the 1970s.

He also undertook many altruistic projects, including highway safety campaigns, a health-related campaign in North Carolina, funding scholarships and providing other support for his university alma mater, and helping to establish an educational TV station for Chapel Hill, North Carolina.

CHRISTOPHER H. STERLING

James King Kern (“Kay”) Kyser. Born in Rocky Mount, North Carolina, 18 June 1905. Graduated from the University of North Carolina at Chapel Hill in Commerce, 1928. Formed first orchestra, 1926; toured with orchestra, 1926–34; played Blackhawk Club, Chicago, Illinois, 1934; made radio debut in a band remote, 1937; known as host of *Kay Kyser’s College [or Kollege] of Musical Knowledge*, 1938–49; retired from broadcasting, 1951; managed radio and television broadcast department, Christian Science Church, Boston, 1974–79. Died in Chapel Hill, North Carolina, 23 July 1985.

KYW

Chicago, Cleveland, and Philadelphia Station

One of Westinghouse's original outlets, KYW has been described as "the wandering radio station." Though it has served the Philadelphia area for most of its life, the call letters were also found on stations in Chicago and Cleveland. KYW's wanderlust is a result of the federal government's intermittent efforts to manage how much control large broadcasters had over America's most important cities. In the end, these labors produced voluminous litigation but little in the way of permanent results.

KYW had a Chicago address for only a dozen years, but its early start earned it a place in radio history as a pioneer radio station. In fact, it was Chicago's first radio station. Legend has it that the call letters stood for "Young Warriors."

The station first broadcast from the Commonwealth Edison office in Chicago on 11 November 1921. KYW was originally started as a partnership. Westinghouse provided the transmitter and Commonwealth Edison the broadcast location. For its part, Westinghouse rushed KYW and sister stations WBZ in Massachusetts and WJZ in Newark, New Jersey, to the air as a direct result of the success of KDKA in Pittsburgh. Westinghouse's motivation was to stimulate sales of the crystal radio sets the company manufactured. For five years, KYW was operated as a joint venture, although Westinghouse dominated the partnership. In 1926 the working relationship ended, and Commonwealth Edison eventually became associated with crosstown radio station WENR.

Three notable early programming experiments punctuate KYW's Chicago history. The first broadcast by KYW featured opera, and regular weekly opera broadcasts on the station proved an immediate success. At one point, the opera broadcasts were credited with selling nearly 2,000 radio receivers a week in the Chicago area. Second, KYW featured an early version of children's programming. Early radio personality Uncle Bob (Walter Wilson) broadcast children's stories each night, being sure to finish by 7 P.M. so as not to disturb his listeners' bedtimes. KYW also featured breaking news supplied by the *Chicago Tribune*. Seeing potential in the new medium, the Tribune Company decided to get in on the business itself and launched WGN in 1924.

The Federal Radio Commission soon grew concerned about the large number of stations in Chicago. Westinghouse offered to shift KYW out of Chicago and moved the station on 3 December 1934 to Philadelphia. Then the nation's third-largest media market, Philadelphia would prove less lucrative to Westinghouse than broadcasting from Chicago, then the nation's second most important city.

In its new hometown, KYW continued its tradition of reporting breaking news. For example, KYW covered the June 1937 *Hindenburg* disaster in nearby Lakehurst, New Jersey. From a telephone booth, a KYW reporter described to the radio audience the horrific fire, and the on-the-spot report was broadcast over both National Broadcasting Company (NBC) networks.

The association with NBC would eventually set the stage for KYW's third move—to Cleveland, Ohio. On 22 January 1956, Westinghouse, under great pressure from NBC, which wanted to upgrade its own facilities to a larger market, exchanged its Philadelphia broadcast operations for NBC's Cleveland stations. In consideration for Westinghouse receiving the smaller and less profitable Cleveland outlets, NBC also paid Westinghouse \$3 million.

Later, as a result of federal investigation into NBC's actions, it was demonstrated that NBC had forced Westinghouse into the exchange. Had Westinghouse not complied, it would have lost its valuable NBC network affiliation for its budding television operations. The Federal Communications Commission (FCC) ordered the swap undone in 1964 and found NBC culpable of abusing its network power. KYW's call letters were shifted from Cleveland, and the AM, FM, and television stations to which they were attached returned again to Philadelphia in June 1965 (the Cleveland AM station is now known as WTAM, formerly WWWE).

In October 1965, KYW became one of the first radio stations to adopt an all-news format. The format change did not bring immediate ratings success, and, reportedly, the station lost money for several years. The first decade was particularly difficult, given the popularity of crosstown AM contemporary music outlets such as WFIL and WIBG.

Today, KYW's competition comes mostly from FM stations, because KYW has long been the market's leading AM station. Like other historic AM broadcasters, KYW found that information-based spoken-word programming can be effective against music-based FM competitors. In programming its all-news format, the station uses a 30-minute news wheel and features traffic reports every ten minutes. The station does particularly well in the winter season, when the station issues snow-related closing notices for schools in eastern Pennsylvania, southern New Jersey, and northern Delaware. Arbitron reports that KYW, in addition to regularly being one of the top-three radio stations in the market, has a weekly cumulative audience of well over 1 million listeners.

Though technically the radio station is not on a full clear channel frequency, the 50,000-watt signal produced from the

station's directional antenna can regularly be heard across the northeastern United States, far outside the station's primary Delaware Valley coverage area. The station has been located at 1060 kilohertz since 1941. The studios of KYW radio are housed on Independence Mall within sight of the Liberty Bell. It shares the same building as its sister television station, KYW-TV 3, now a Columbia Broadcasting System (CBS) television affiliate. The television station was Philadelphia's first when it began experimental operations just as W3XE in 1932

Despite Westinghouse's historic attempts to keep its network-owning rivals at arm's length, the company, disappointed by its prospects in manufacturing, eventually decided to concentrate on broadcast programming and merged with the CBS

network in 1995. Subsequently, the Westinghouse identity disappeared. Today, the license to KYW radio is owned by Infinity Broadcasting, the radio company closely associated with CBS.

L

Landell de Moura, Father Roberto 1861–1928

Brazilian Wireless Pioneer

In the 1890s and early 1900s, Father Roberto Landell de Moura produced a series of wireless communication devices that were as original in their day as they were unrecognized.

Origins

Roberto Landell de Moura was born in Porto Alegre, the capital of Rio Grande do Sul, on 21 January 1861. Graduating as a distinguished student from a local Jesuit high school, he moved to Rio de Janeiro to study at the Polytechnic Institute. Unable to pay tuition, however, he took a job as a store clerk.

In 1881 his brother, on his way to Rome to study for the priesthood, visited him; Roberto decided to accompany him and also become a priest. He studied theology at the seminary in Rome for students from the Americas and physics and chemistry at the Gregorian University. He also became aware of scientific developments in Italy and Europe. Ordained in 1885, he returned to Rio de Janeiro and for a brief period was a temporary chaplain in the Brazilian imperial court, occasionally conversing with Emperor Dom Pedro II, who had met Alexander Graham Bell and later introduced the telephone to Brazil.

From 1887 through the 1890s Landell de Moura had a series of parish assignments in Rio Grande do Sul and then in São Paulo. He had a difficult temperament and had to be transferred several times to different parishes.

Wireless Inventions

It was during the 1890s, while posted in Campinas, São Paulo, that he formulated theories about controlled, wireless conduction of vibratory movements and light beams, believing that any sound, including the human voice, could be transmitted over land, through the air, and under the water.

During 1893 and 1894 he demonstrated these ideas in the center of the city of São Paulo. He transmitted sound without wires between two of the highest points in the city, over five miles apart, using a type of three-electrode conductor lamp. These demonstrations occurred in the presence of the British Consul and years before similar demonstrations were made by Marconi and de Forest.

Despite presenting his inventions before a representative of one of the most inventive and commercial countries in the world, however, he failed to attract interest or investment. Worse, word about his strange, “diabolical” inventions aroused the suspicions of his parishioners. They invaded his rectory and destroyed his machines.

Undismayed, he rebuilt and refined them, by 1900 obtaining Brazilian patent 3,279 for a machine transmitting sound with or without wires via space, land, or water. Continuing to find no local interest, however, he moved to the United States. Taking up residence in New York City in 1901 and surviving on a subsistence income, he remade his inventions and obtained U.S. patents 771,917 (11 October 1904), 775,337 (22 November 1904), and 775,846 (22 November 1904) for a sound wave transmitter, a wireless phone, and a wireless telegraph, respectively. The wave transmitter produced electrical oscillations of light from sound vibrations generated by the human voice or other source. The sound waves passed through a receptor with induction coils and condensers that changed them into electric or light waves, allowing their wireless transmission to a receptor that could convert them to voice or sound or light signals. His wireless phone transmitted and received voice via light waves. The wireless telegraph transmitted and received signals via various types of sound waves.

EDWARD A. RIEDINGER

See also Early Wireless

Father Landell de Moura. Born in Porto Alegre, Rio Grande do Sul, Brazil, 21 January 1861. Fourth of twelve children of Inácio José Ferreira de Moura and Sara Mariana Landell de Moura; honors graduate of Jesuit high school in São Leopoldo, Rio Grande do Sul; moved to Rio de Janeiro to study, ca. 1879; accompanied brother to study for priesthood in Rome, 1881, specialized in theology, physics, and chemistry; ordained priest, 1885; returned to Brazil, became seminary instructor in Porto Alegre, 1887–91; parish priest, Urugaiana, Rio Grande do Sul, 1891; parish priest, Santos, Campinas, and Sant’Ana, São Paulo, 1892–99; formulated theories on and built devices for wireless sound communication; public demonstrations of inventions in capital of São Paulo, 1893–94, equipment destroyed by parishioners; received Brazilian patent for machine transmitting sound with or without wires via space, land, or water, 1900; moved to New York City, 1901–04; rebuilt his inventions and received U.S. patents, 1904; returned

to Brazil, 1905; desisted from inventing; returned to parish work in São Paulo and then Rio Grande do Sul, ca. 1906. Died in Rio Grande do Sul, Brazil, 30 June 1928.

Lazarsfeld, Paul F. 1901–1976

U.S. (Austrian-Born) Sociologist and Radio Research Innovator

“Paul Lazarsfeld,” writes one media historian, “was undoubtedly the most important intellectual influence in shaping modern communication research” (Rogers, 1994). His pioneering radio research in the late 1930s and early 1940s helped to shape our understanding of the medium’s effects and made applied radio industry research more respectable in the eyes of many academics.

Origins

Born at the beginning of the 20th century in Vienna, Austria, Lazarsfeld came of age in the lively intellectual climate of that city in the years between the world wars. Brilliant in mathematics, he earned a Ph.D. at the age of 24. But with academic jobs scarce in the mid-1920s, he taught at a Vienna high school and served as a part-time instructor at the University of Vienna while seeking a more permanent university post. He established a Research Center for Economic Psychology at the University of Vienna (where he served as an adjunct faculty member) in 1925. It became a model that Lazarsfeld would follow with later research groups in the United States. With the help of students, he directed a landmark study of unemployment in the small town of Marienthal, Austria, in 1931–32 that brought him wide attention. But because of the difficult

economic times, his socialist background, and his Jewish heritage, Lazarsfeld was facing limited opportunities in Austria.

Thanks to the Marienthal study, Lazarsfeld’s work reached the notice of the Rockefeller Foundation, which sponsored him for two years of research-related traveling in the United States in 1933–35. He visited many universities and research academics. When a political coup in Austria made his return to academic life there even more unlikely, he accepted a post as acting director at the University of Newark’s research center in 1936. It was a tiny operation—so much so that some of his published papers appeared under a pseudonym (“Elias Smith”) to disguise the fact that he was the only full-time research person working there.

Radio Research

Lazarsfeld’s active importance in radio research spanned nearly two decades. This research began without him—with a proposal to the Rockefeller Foundation of a study of “The Essential Value of Radio to All Type of Listeners,” proposed by Hadley Cantril of Princeton University and Frank Stanton of the Columbia Broadcasting System (CBS), to undertake experimental work about radio’s audiences. Cantril, busy with his own work (as was Stanton, who by then had more than

100 research people under his direction at CBS), recommended Lazarsfeld to direct the new effort. With that change, Princeton's Office of Radio Research undertook a broader approach, with survey and secondary data analysis.

Becoming very much a creature of its director's wide interests, the office combined quantitative and qualitative research approaches, including content analyses, panel studies, focused interviews, and some secondary data analysis to attack radio research questions from a variety of viewpoints and methodological angles. The office published Hugh Beville's important 1939 study of radio ratings methodologies. Lazarsfeld's first book on radio resulted from the Rockefeller Foundation's demand for product before it would extend the funding of the office beyond the initially agreed-upon two years. Building on a 1939 issue of the *Journal of Applied Psychology* that Lazarsfeld had edited to summarize two years of the office's efforts, the result was *Radio and the Printed Page* (1940), an important early comparison of the varied impacts of the newspaper and radio.

This was followed by what was intended to be a research annual, but which in fact resulted in three volumes, all co-edited by Lazarsfeld and Stanton. *Radio Research 1941* included studies of foreign-language broadcasts over local stations (most such broadcasts would disappear when the United States entered the war), the popular music industry, Theodor Adorno's initial study of classical music on radio, the use of radio and the press by young people, and the role of radio for the farmer. The second volume, *Radio Research 1942-1943*, began with Herta Herzog's important study of radio serials, discussed radio during wartime, and offered a number of studies of radio in operation and the radio audience. *Mass Communication Research 1948-49* demonstrated in its title the broader concerns of the research team; it was the final volume to appear.

One important research device came out of the office projects, based on previous work done by both Lazarsfeld and Stanton. Beginning in 1937, the two men and their assistants developed the "program analyzer" (or "little Annie," as it was soon called), which measured audience likes and dislikes of what they were hearing:

The Program Analyzer was a wooden box, two feet long, one foot wide, and one foot high, that contained a constant-speed electric meter driving a six-inch wide roll of white recording paper, which moved at the rate of one-fifth of an inch per second. . . . Mounted just above the roll of paper were ten ink pens, each connected to an electromagnet attached to a six-foot-long cord with an off-on switch at the other end. The Program Analyzer was placed on a table, with up to ten respondents sitting around the table, each with an off-on switch marked green for "like" and red for "dislike." When the dislike

(on) switch was pressed, it lifted the corresponding pen slightly off the recording paper. It thus fixed a point in time when a respondent changed his or her reaction to the radio message (Rogers, 1994).

The device and variations of it were used for years afterwards. A later "big Annie" could accommodate up to 50 respondents and was, in modified form, used to test new television programs and commercials. CBS eliminated its "Annie"-based research office in 1986.

Later Years

During and after the war, Lazarsfeld undertook research for several government agencies, including the military and the Department of State, becoming interested in the role and impact of propaganda, among other subjects. He worked closely with his Columbia University sociology colleague Robert K. Merton for more than three decades, and the two collaborated on a variety of studies over that time.

Although it had moved beyond its initial radio focus by the late 1940s, Columbia's Bureau of Applied Social Research would thrive in the 1950s and 1960s (it lasted until 1977), undertaking a variety of both academic and corporate-sponsored research. The bureau set a model of combining network and advertiser financial support with academic research.

The vast majority of its funding was external—Columbia University merely provided space (and in later years a small annual stipend). The Bureau produced dozens of books and hundreds of research articles and book chapters. Two, one co-authored by Lazarsfeld and the other by a former student, became landmark media studies: Elihu Katz and Lazarsfeld's *Personal Influence* (1955) and Joseph Klapper's *Effects of Mass Communication* (1960). Their findings of minimal media impact had begun with *The People's Choice* (1944), a Lazarsfeld co-authored study of 1940 Ohio voting behavior suggesting that media played a small role in voting decisions.

But Lazarsfeld, who stepped down as bureau director (becoming associate director) on taking the chairmanship of the sociology department at Columbia in 1949, began to lose interest in mass communications research in the 1950s. He became deeply involved in debates within the field of sociology as to what the field was about and the degree to which it should accept industry support for applied research. He became the president of the American Sociological Association in 1960, but only after two prior attempts at the office. He took an endowed chair at Columbia in 1962, retiring seven years later. The last years of his life saw him commuting from New York to teach at the University of Pittsburgh.

As Rogers (1994) makes clear, Lazarsfeld was "an academic entrepreneur spanning the boundary between the university's scholarly focus on theory and research versus the

applied interests of government and private industry. . . . more than any other individual, Paul F. Lazarsfeld directed communication research toward the study of effects.”

Let's Pretend

Children's Program

The theme song sounded each Saturday morning to the delight of children listening to this Columbia Broadcasting System (CBS) program:

Hello, hello,
Come on let's go!
It's time for *Let's Pretend*.
The gang's all here and standing near
Is Uncle Bill, your friend.
The story is so exciting from the start right to the end.
So everyone, come join the fun.
Come on and let's pretend!

Let's Pretend was so popular that it became the prototype of children's programming, and its creator, Nila Mack, became the director of children's programming for the CBS network.

Let's Pretend was a half-hour children's radio program heard on CBS during the late-Saturday-morning time slot. Its forerunner was *The Adventures of Helen and Mary*, which began on 7 September 1929 and ran until 17 March 1934, with writer Yolanda Langworthy and director Nila Mack.

One week after the end of *Helen and Mary*, *Let's Pretend* began. Using her background as a Broadway actress and vaudevillian, Nila Mack wrote and directed this children's program for most of its 20-year run. Drawing on her own childhood memories, Mack based the program on variations of familiar children's tales from the Grimm brothers, *The Arabian Nights*, Andrew Lang, and Hans Christian Andersen. She freely adapted each story to emphasize human virtues. For example, her annual Christmas show, *House of the World*, promoted the themes of brotherhood and tolerance.

Mack felt that children should tell the stories and be the voices of the characters. She established an ensemble of versatile juvenile talent with members who could easily shift from being a young princess one week to an aging witch the next. She chose her cast from auditions open to any child interested in being considered. She tested each one for the ability to be versatile and to ad lib easily—especially to cover up any production mishaps that might occur during the actual broadcast.

Many of these young performers went on to stage and screen careers. For example, Nancy Kelly scored a major hit on Broadway and in film as the mother in *The Bad Seed*, and Dick Van Patten went on to television fame in *I Remember Mama* and *Eight Is Enough*.

Salaries began at \$3.50 per show—less than half the going rate for many long-running shows. However, being on the program was considered an honor and a serious undertaking.

Arthur Anderson, an 18-year veteran of the show, wrote of this theatrical experience in glowing terms. Anderson's book, *Let's Pretend: A History of Radio's Best Loved Children's Show by a Longtime Cast Member* details the cast members' view that this was an opportunity to learn a craft while actually doing a radio program live over the airways. Other actors, such as Arnold Stang and Jimmy Lydon, have recounted the rigors of maintaining Mack's standard of excellence.

Musical conductor Maurice Brown's theme became one of the hallmarks of juvenile radio—especially in 1943, when he used the newly allowed sole program sponsor as the subject for the violin-backed lyrics:

Cream of Wheat is so good to eat.
Yes, we have it every day.
We sing this song; it will make us strong.
And it makes us shout HOORAY.
It's good for growing babies.
And grown-ups too to eat.
For all the family's breakfast,
You can't beat Cream of Wheat!

Having a sponsored children's program was a departure from the norm for CBS. The broadcast company felt that it was not prestigious to permit commercials to air on *Let's Pretend*. However, economic considerations must have won out, because Cream of Wheat became the long-time sponsor in the 1940s.

In addition to the musical commercial program introduction, the show also added an "Uncle Bill" played by Bill Adams, who greeted children with his "Hellooo, Pretenders!" The children in the studio audience would respond, "Hellooo, Uncle Bill." Then Bill would call out, "How do we travel to *Let's Pretend*?" Some child would suggest a mode of transportation—such as a magic carpet.

Imaginative sound effects were the mainstay for building effective theater of the mind for all the children tuned in each Saturday. In her article "Writing for Children," published in *Off Mike*, Mack paid tribute to sound department head Walter Pierson:

Fortunately for me, he is an imaginative person, for when I spoke of needing the effect of "moon beams shimmering," a "flying trunk," a "magic carpet," he didn't blink an eye. . . . I even had a flying trunk (on the secondhand side) that flew and zoomed, when it finally landed and bumped its way to a stop, it made the audience laugh.

After Mack died of a heart attack on 20 January 1953, Jean Hight replaced her as director. Johanna Johnston became the show's writer. The last broadcast of *Let's Pretend* was on 23 October 1954.

Mack was lauded as "the fairy godmother of radio." As a tribute to her genius during the final two years of the show, the Nila Mack Award was bestowed on the actors who gave the best performances.

Lewis, William B. 1904–1975

U.S. Network Executive

There were few more influential radio executives in the late 1930s than William Bennett Lewis. With no producing experience, Lewis seemed innately to recognize and foster talent and encourage new ideas. Though not a particularly creative radio figure himself, Lewis made it possible for the likes of Norman Corwin and Orson Welles to establish landmarks in radio history. Lewis—with William S. Paley's support—put the Columbia Broadcasting System (CBS) on the map as the locus for original, innovative programming such as *The Mercury Theater* and *Words without Music*.

After passage of the Communications Act of 1934, William Paley promised the Federal Communications Commission (FCC) that CBS would use its sustaining time for more than simply airing cheap lectures or concerts. By accident he found William B. Lewis, who had little direct radio experience, but who impressed Paley at his interview. Lewis knew radio from his experience at the J. Walter Thompson advertising agency and in 1935 signed up with CBS. Within a year Paley elevated Lewis to head all CBS radio programming.

Lewis proved to be the right man for the job. Irving Reis, a CBS studio engineer, suggested an experimental radio series with the title *Columbia Workshop*. Although previous executives had rebuffed Reis, in July 1936 Lewis took up his suggestion. In time many prominent actors, producers, directors, and writers, ranging from Archibald MacLeish to William Saroyan, Orson Welles, and Norman Corwin came to the workshop.

As such, Lewis was the corporate supporter behind such works as MacLeish's *The Fall of the City*, a fascist allegory about inhabitants of a nameless city waiting for the arrival of their conqueror. The program was broadcast 4 March 1937, not from the CBS studio, but from the Seventh Regimental Armory in New York City with a vast crowd made up of students and faculty from the City College of New York. The leads included Burgess Meredith and, as the "Radio Announcer," Orson Welles in one of his first credited roles. Scheduled for Sunday at 7 P.M. against Jack Benny's highly popular program, *The Fall of the City* did not achieve high ratings, but it did demonstrate what radio could do with a network's financial muscle. *The Fall of the City* was later printed in an edition wherein MacLeish called on poets to recognize radio as a legitimate means of expression.

Almost immediately after *The Fall of the City* was broadcast, a stream of verse plays started arriving in Lewis' office as poets of the stature of W. H. Auden, Stephen Vincent Benet, Maxwell Anderson, and Edna St. Vincent Millay gave radio a shot. According to Eric Barnouw, Lewis personally obtained huge satisfaction from this recognition, and Paley, his boss,

glowed in the fame that rival National Broadcasting Company (NBC) was *not* achieving. Emboldened by the prestige of literary programming, in the summer of 1937 Lewis announced an unprecedented Shakespeare series for CBS radio, to be directed by Brewster Morgan, starring the likes of Burgess Meredith as Hamlet, Walter Huston as Henry IV, and Brian Aherne as Henry V.

Early in 1938 Lewis announced the *Mercury Theater of the Air*, under the creative directorship of Orson Welles and John Houseman, to run on Sunday nights on CBS at 8 P.M. opposite another NBC mega-hit, the comedy of Edgar Bergen and Charlie McCarthy. *The Mercury Theater of the Air* started in the summer of 1938, with Welles producing, directing, and starring in many of the productions. On Sunday evening, 30 October 1938, *The Mercury Theater* presented, as a Halloween stunt, Howard Koch's adaptation of H.G. Wells' "The War of the Worlds," and caused a panic. But the series also performed a six-episode dramatization of Victor Hugo's "Les Misérables," and many other prestigious and experimental dramas.

Later in 1938 Lewis authorized Norman Corwin's *Words without Music* for Sunday afternoons—typically a dead network radio airtime. This half hour was for poetry production and experimentation that was unlike anything radio had tried before. Corwin had been trying to enter radio for many years, and it was Lewis who gave him his network break. Corwin is now part of radio's legacy.

World War II ended this period of network-sponsored creativity, but not before Lewis sent a young Edward R. Murrow to London where Murrow established radio's vital importance in war reporting. At about this time, Archibald MacLeish—at the request of President Franklin D. Roosevelt—created a new government agency, the Office of Facts and Figures, to help the public understand the government's war activities. MacLeish named Lewis as head of its radio activities. Lewis in turn recruited Norman Corwin for his first radio project, celebrating the 150th anniversary of the adoption of the Bill of Rights. MacLeish, with FDR's enthusiastic backing, sought to make this anniversary a symbol for the U.S. way of life, and the 15 December 1941 production starred Orson Welles, Lionel Barrymore, Walter Brennen, Walter Huston, Marjorie Main, Edward G. Robinson, Rudy Valle, and Jimmy Stewart.

Lewis would go on to produce *This Is War*, with scripts by Maxwell Anderson, Stephen Vincent Benet, Philip Wylie, and Norman Corwin. All sides praised this morale boosting. In July 1942 the Lewis unit became the radio bureau of the Office of War Information domestic branch and the principal voice of the government on radio during World War II.

After the war, Lewis did not return to CBS, but joined the Kenyon & Eckhardt advertising agency. There he produced more radio, and later TV, programs. His most famous effort—for television—was undoubtedly the “Ford Fiftieth Anniversary Show,” starring Ethel Merman and Mary Martin, in 1953.

Liberty Broadcasting System

The Liberty Broadcasting System (LBS) was created by broadcaster Gordon McLendon in 1948. Headquartered in Dallas, the network grew quickly from a state, to a regional, and finally to a full-fledged national network within three years. By then, the 458-affiliate LBS was the second-biggest radio network in America.

LBS's popularity among station affiliates and listeners centered on its heavy schedule of sports programming. LBS flagship station KLIF in Dallas had become well known for its broadcasts of major-league baseball games, most of which were expertly re-created in the KLIF studios by Gordon McLendon. Radio station owners in nearby communities reached by KLIF's signal found many of their listeners attracted to McLendon's baseball games. The owners were soon inquiring about carrying the games, and before long enough of them had signed on as KLIF affiliates for McLendon to decide to formally launch LBS.

The McLendon success with baseball game re-creations resulted from a peculiar scarcity of “live” game coverage on the established radio networks. Major-league teams during the 1930s and 1940s held tight reins over broadcast rights to their baseball games. Radio stations that broadcast these games

reached fans within a well-defined and limited coverage area. And because most major-league teams of the period were located in the Northeast and Midwest, baseball fans outside these areas had only the World Series broadcasts to satisfy their interest in major-league games. LBS stepped in to fill the void. An audience ranging in size between 60 and 90 million listeners proved that the network fulfilled a need that major-league club owners had either failed to recognize or ignored.

Although Gordon McLendon's re-created baseball games were popular, he decided in 1949 to challenge the major-league baseball establishment's prohibition of LBS live coverage from the ballparks. A complaint filed with the U.S. Justice Department, suggesting that major-league team owners were violating antitrust laws, finally opened the door for LBS to begin live game coverage. During the 1950 season alone, McLendon signed contracts to carry a minimum of 210 major-league baseball games. The games, numbering about eight per week, were split between American League and National League teams. Besides its baseball games, LBS carried a full slate of weekend college and professional football games during the fall. Noted sportscaster Lindsey Nelson was hired to announce many of these games.

McLendon expanded LBS programming beyond baseball in 1950. Expansion came when McLendon saw his network as now fully in competition with the older, more established National Broadcasting Company (NBC), Columbia Broadcasting System (CBS), American Broadcasting Companies (ABC), and Mutual networks. The traditional program fare that had made these networks popular was copied by LBS with varying degrees of success. Thus, the LBS daily broadcast hours were lengthened and filled with variety shows, musical shows, quiz shows, and soap operas. A number of these were produced in LBS studio facilities in Dallas, and a few were produced and aired from remote facilities in New York and Hollywood. An LBS repertory company supplied the talent for the soap operas; an in-house orchestra supplied live music; and a team of reporters located in Washington, D.C., supplied six daily newscasts for the fledgling network.

The early success enjoyed by LBS was described as phenomenal, especially given the network's youth and the inexperience of Gordon McLendon in running a radio network. Equally phenomenal was the network's success in competing with television's popularity at a time when NBC, CBS, and ABC were de-emphasizing their roles in network radio. What set LBS apart for the moment was McLendon's decision to concentrate his network's most popular programming during daytime hours, which had not yet been heavily infiltrated by television.

Any optimism for the network's future, however, disintegrated in 1951 when the major LBS advertiser, Falstaff Brewing Company, moved its advertising from LBS to Mutual. Loss of Falstaff's income revealed how few national advertisers—and the revenue that such advertisers provided—LBS had attracted. Too much effort had been placed in developing and programming the network, and too little effort had gone toward creating an effective and productive commercial sales apparatus.

In need of an immediate source of cash to keep LBS afloat, McLendon turned to Houston oilman and multimillionaire Hugh Roy Cullen. Cullen agreed to invest \$400,000 in LBS and to loan the network an additional \$600,000. In return, Cullen received 50 percent ownership of the network. Critics later charged that strings attached to the deal meant that Cullen would have a radio network platform by which to broadcast his ultraconservative political views. Little evidence exists to suggest that Cullen took such advantage of his LBS co-ownership.

The political issue became moot in 1952, when major-league baseball owners decided that broadcasters henceforth would have to negotiate coverage rights with individual baseball clubs rather than collectively with the National and American Leagues. The costs of coverage rights had escalated significantly over the previous year; now they were likely to rise to even greater heights. Added to Gordon McLendon's financial predicament at this point was the refusal of several major-league teams to negotiate any LBS coverage rights whatsoever. A much-reduced baseball schedule meant that LBS affiliates began departing the network. McLendon reacted by filing a \$12 million antitrust suit against major-league baseball. The suit never went to trial, however. In January 1955 major-league owners offered Gordon McLendon \$200,000 to settle the suit. McLendon had little choice but to accept, since LBS was by then in bankruptcy.

The end for LBS came quickly. Gordon McLendon announced to LBS affiliates on 6 May 1952 that LBS programming would be cut immediately from 16 hours to 8 hours daily. One week later, on 15 May, McLendon announced to affiliates that LBS was suspending operation at 10:45 P.M. on that date. The network filed for bankruptcy two weeks later.

Gordon McLendon continued in radio with great success, but he never again ventured into network broadcasting. McLendon gained much fame in later years as a radio program innovator, but he always regarded his days as an LBS play-by-play baseball announcer as the most memorable of his career.

Licensing

Authorizing U.S. Stations to Broadcast

Because they must use frequencies on the electromagnetic spectrum, and to avoid as much interference as possible, no transmitter (broadcasting or otherwise) may operate without a federal license. In the United States, such licenses have been required since 1912, although many of the details of both procedure and substance have changed since then. Since 1934, the Federal Communications Commission (FCC) has been the source of federal licenses for all who would broadcast.

Origins

The Radio Act of 1912 vested the Secretary of Commerce and Labor with the authority to license radio transmitters in the United States. Administration of this provision before World War I presented no serious problems, as there was far more spectrum available than people wanting to use it. After the war, however, the demand for frequencies increased dramatically, especially after the 1920 inception of broadcasting. By 1925 there were many more would-be broadcasters than available frequencies, and Secretary of Commerce Herbert Hoover attempted to accommodate all applicants by limiting operating power levels and permissible hours of operation. In 1926 the courts ruled that Hoover had no power to place such conditions on operations, and the situation deteriorated into chaos. In response, Congress passed the Radio Act of 1927, giving the newly created Federal Radio Commission the power to license and regulate radio broadcasting. Those powers were transferred in 1934 to the FCC.

The Communications Act of 1934, as amended, requires the FCC to license radio broadcasters in the public interest, convenience, and necessity. Originally, broadcast licenses lasted no longer than three years, but various changes in the act lengthened the license period, until with the 1996 amendments all broadcast licenses were extended to run for eight years. During the license term, the licensee has exclusive use of a particular frequency in a specific location. However, licensees do not “own” the frequencies they use; they are considered trustees of the spectrum, which is owned by the public. As public trustees, licensees must operate their stations to serve the public’s interest.

Qualifications

In order to receive a broadcast license, applicants must be legally, technically, and financially qualified, as specified in the Communications Act and in FCC rules. To be legally qualified, applicants must be citizens of the United States or corporations

with no more than 20 percent foreign ownership. Parent companies of corporate licensees must have no more than 25 percent foreign ownership. Applicants must not be in violation of FCC media ownership rules (that is, they cannot already own the maximum number of radio stations in a market) and must meet certain “character” guidelines. Character qualifications relate to certain kinds of criminal convictions and antitrust violations. Lying to the commission is considered a serious character defect—one that almost certainly would disqualify an applicant.

Applicants demonstrate financial qualifications in many ways. If the applicant is applying for a new station, financial qualification is shown by certifying that the applicant has enough money to build the station and operate it for three months without significant advertising revenues. To be technically qualified, applicants must demonstrate the technical proficiency to build and operate the station and to comply with the commission’s technical regulations. In most situations, applicants hire engineering consultants to meet their technical needs.

Getting on the Air

If an applicant is seeking a license for a new radio station, the applicant must first find an unused frequency that can be used in or near the community to be served. For AM stations, finding a frequency requires a complex engineering study to determine which frequency could be used in the proposed service area without causing harmful interference to other stations. For FM, the process of finding a usable frequency is often easier, because FM channels are allotted (positioned before licensing) across the country based on specified mileage separation requirements rather than signal interference contours.

Once a frequency has been located, the applicant files an application for a construction permit (CP) with the commission. If the applicant meets the basic qualifications for licensing and the application is not otherwise contested, the commission will grant the CP application. Once the CP is granted, a permittee typically has one year to build a station and begin technical and program testing. Assuming the testing is successful and no other problems arise, the permittee applies for the actual broadcast license, which is then routinely granted by the commission.

Complications in licensing typically arise when more than one party applies for the same frequency in the same market. These are known as mutually exclusive applications, because

only one license can be granted for use of the frequency. Prior to 1994, when confronted with mutually exclusive radio applications, the FCC decided which applicant would best serve the public interest (and thereby be awarded the license) through an often lengthy and costly “comparative hearing.” These trial-like hearings, presided over by a special FCC employee known as an administrative law judge (ALJ), involved the presentation of evidence, witnesses, and cross-examination. After the hearing, the ALJ would consider all the evidence and pick a winner based on the commission’s comparative criteria. Several levels of appeal within the commission were then available to the losing applicants.

The commission’s comparative criteria were twofold: diversification of media ownership and best practicable service to the public. The diversification of ownership criterion favored applicants with little or no existing media ownership: the commission at that time favored new owners in an attempt to diversify media ownership. The second criterion, best practicable service to the public, considered issues such as broadcast experience, efficient use of the frequency, and the extent to which the owners would also be integrated into the management of the station. In 1994 the District of Columbia Court of Appeals struck down the FCC’s comparative licensing criteria, finding no nexus between the criteria and applicant qualifications. The FCC now settles mutually exclusive application situations through lotteries and spectrum auctions.

Most radio station owners today do not receive their licenses by applying for a new frequency but instead purchase the licenses from other licensees. License transfers must also be approved by the commission in order for the FCC to determine whether the transferee meets the basic qualifications of a radio licensee.

Renewals

The most common licensing situation in the United States today involves the renewal of an existing license. Upon the expiration of a radio license, the licensee must apply to the commission for a renewal. At that time, FCC personnel review the application to determine whether the licensee has performed in the public interest during the previous license term. If the licensee has a good record and no one objects, the renewal application is routinely granted. The vast majority of licenses are renewed in this way—more than a thousand of them each year.

Non-renewal of a license, though rare, might be based on any number of factors. The commission might not renew a license if it finds that the licensee has engaged in willful or repeated violations of the act or the commission’s rules, has changed its ownership without informing the commission, or has in some way lied to the commission. If the violations are not severe enough to warrant non-renewal, the commission

has the power to issue a short-term renewal or to order special reporting requirements during the license term.

Until 1996, any time a station’s license came up for renewal other applicants could also apply for the frequency. This led to what the commission referred to as a “comparative renewal,” in which the past performance of the incumbent licensee was compared to the paper promises of the challenging applicant. As with other mutually exclusive licensing situations, comparative renewal cases were decided in a trial-like hearing. In 1996 Congress amended the Communications Act to disallow competing applications at renewal time. According to the revised law, existing broadcasters are judged as to their fitness to continue as licensees. If they continue to be qualified, their licenses are renewed. New applications for the frequency are allowed only when the incumbent licensee is judged unfit and the license renewal is denied.

In all licensing situations, interested parties, including members of the public who live in a station’s listening area, have the opportunity to challenge the grant of a license by filing a “petition to deny” the application. If the petition alleges a “substantial and material question of fact,” that is, an allegation so serious that if true it would call into question the basic qualifications of the applicant, the commission must hold a hearing on the application.

Section 312 of the Communications Act lists the actions that would justify revocation of a license during the license term. Such actions include willful and repeated violations of the Act, falsifying information, violation of relevant provisions in the U.S. criminal code (e.g., broadcasting lottery information or obscene material), and failure to provide reasonable access to airtime to candidates for federal political office.

Lights Out

Horror Series

The first radio horror serial to attract a large following was the National Broadcasting Company's (NBC) *Lights Out*, a Chicago-produced serial that began in 1934 and was broadcast nationwide by the spring of 1935. The brainchild of first Wyllis Cooper and then Arch Oboler, *Lights Out* pioneered many of the horror sound effects and stream-of-consciousness storytelling techniques that would be widely imitated by later programs. Its graphic content was new to radio, and the program's success proved to the industry that listeners' imaginations could be effectively tapped through the skillful combination of sound effects and narrative suggestion. As radio program historian John Dunning has commented, "Never before had such sounds been heard on the air. Heads rolled, bones were crushed, people fell from great heights and splattered wetly on the pavement. There were garrottings, chokings, heads split by cleavers, and, to a critic at *Radio Guide*, 'the most monstrous sound of all sounds, human flesh being eaten'" (Dunning, 1998). Audiences were indeed horrified, some even calling the police. But they were also riveted to their radios.

Lights Out aired late at night throughout its 1930s run. The opening of the show dared the audience to tune in: 12 chimes were followed by a voice announcing, "This is the witching hour! . . . it is the hour when dogs howl and evil is let loose on the sleeping world. Want to hear about it? Then turn out your lights!" The show's original creator/producer was Wyllis Cooper, a staffer for Chicago's NBC studios. Although his work on the show has been largely overshadowed by that of his successor Arch Oboler, Cooper established *Lights Out*'s basic tone and structure. He combined fantasy and the supernatural with stream-of-consciousness narration to help involve the audience in the reality of its horrors. In particular, Cooper pushed the envelope on gruesome special effects, creating a sort of "can you top this" tradition that was continued by Arch Oboler when he took over the show in 1936 (Cooper moved to Hollywood for a screenwriting career). Real bones

(spareribs) were broken on the show to simulate limbs snapping, cabbages were cut in half by meat cleavers to convey heads being bashed in, and wet noodles were crushed with a bathroom plunger to create the sound of human flesh being eaten. One of the program's most famous effects was that of a person being turned inside out, which was accomplished by stripping off a wet rubber glove while crushing a berry basket to simulate broken bones.

Oboler became one of the most famous of radio's auteurs, and his years on *Lights Out* helped establish his reputation as one of the most prolific and imaginative radio writers. Between May 1936 and July 1938, he penned more than 100 *Lights Out* scripts. Oboler continued the *Lights Out* tradition of making the supernatural and science fiction believably scary for the listener, and he has often been compared to Rod Serling and Ray Bradbury in this regard. "I didn't write about little green men," he told media critic Leonard Maltin, "monsters with dripping talons from the special effects department . . . I wrote about the terrors and monsters within each of us" (Maltin, 1997). Oboler's first play, "Burial Services," hit too close to home for many listeners. He told the story of a paralyzed girl being buried alive, and NBC received thousands of horrified letters. Although he never again touched so personal a nerve, Oboler's stream-of-consciousness style, sharp dialogue, and apt metaphors helped pull listeners in by giving his stories a psychological reality. In "Cat Wife," one of Oboler's most famous plays for *Lights Out*, Boris Karloff's duplicitous wife is transformed into an actual human-sized feline, reflecting both her monstrousness to him and his inability to cope with her.

Oboler's plays often contained messages or morals that critiqued greed or man's inhumanity to man. "The Ugliest Man in the World," for example, is not ugly to the woman who loves him. "State Executioner" suggests the horrors of capital punishment and the dangers of greed by having a state executioner execute a man he knows is innocent because he wants the pay-

ment; the horror multiplies when he finds out the man was his own son. "The Word" tells of a couple who descend from the Empire State Building to discover that everyone else in the world has disappeared; they conclude that God "got tired of the way [people] were doing things and destroyed them." This couple survived, to make Oboler's point that "plain ordinary people" could make the world a new and better place. Although occasionally heavy-handed, Oboler never hesitated to tackle weighty subjects within the framework of a mass horror genre, winning a new respect for the form.

As the 1930s progressed and the threat of war became clearer, Oboler left *Lights Out* and turned his writing skills to patriotic material. He revived the program for the 1942–43 season, broadcasting from New York over NBC. Oboler hosted the program himself, and its famous beginning became the one that has been most associated with the show since. To the chimes of a gong, Oboler spoke the words "It . . . is . . . later . . . than . . . you . . . think." As John Dunning (1998) has noted, the earlier hour of this series (all the broadcasts were at 8:00 P.M.), made it more accessible to people, and this became the best-remembered year of the series. Scripts were largely recycled from Oboler's previous shows, however, because he was busy doing war work. Its successful 1940s run also owes much to the sudden popularity and growth of the thriller/horror/suspense genre during the war period; *Lights Out* was the granddaddy—and model—of many of the more than 40 such programs that took to the airwaves during that time, most famously *Inner Sanctum* and *Suspense*.

The reputation and influence of the program remained strong long after television supplanted radio. This is due in part to Oboler's status as a celebrated auteur (most of Oboler's shows, unlike Cooper's, are available on tape). But *Lights Out* also stands as pivotal to radio history because it demonstrated the way in which radio programs could push listeners' imaginations to horrifying limits beyond those of reasoned vision. Radio, as horror author (and Oboler admirer) Stephen King has noted, has the ability to "unlock the door of evil without letting the monster out" (quoted in Nachman, 1998). *Lights Out* was the first program to demonstrate and exploit this aspect of radio, to the delight of its terror-stricken fans.

Limbaugh, Rush 1951–

U.S. Talk Show Host

Media critic Howard Kurtz says that it is not much of an exaggeration to say that Rush Limbaugh single-handedly revived AM radio beginning in the mid-1980s and led the stampede of conservative talk show hosts that followed. By the beginning of the 1990s, Limbaugh was heard on more than 650 stations, reaching an estimated 20 million people each week. He continued to achieve similar numbers in the early 21st century. Kurtz claims that Limbaugh is more influential than other talk show hosts and commentators, even TV network giants Dan Rather, Tom Brokaw, and Peter Jennings, because he defined talk radio in a way that no one ever had before.

In addition to developing a new public forum, Limbaugh's influence has been felt in a number of other areas. His radio programs are the foundation of a multimillion-dollar empire that includes everything from conservative books to T-shirts to a monthly newsletter. In a tradition similar to that in the era of *Amos 'n' Andy*, dozens of restaurants around the country reserve "Rush Rooms" for his followers (who call themselves "dittoheads") to eat and listen to his three-hour weekday broadcasts.

In 1994 Limbaugh was credited with being the most important grassroots voice for conservative Republicans, who took control of the House of Representatives after decades of Democratic control. A *National Review* magazine cover story named Limbaugh "the leader of the opposition." His drumbeat criticism of the Clinton White House and of Hillary Rodham Clinton finally prompted the president to attack talk radio in general and Limbaugh in particular (to Limbaugh's delight). The increase in one-sided attacks over the airwaves also triggered a movement to restore the Fairness Doctrine killed by the FCC in 1987. *The Wall Street Journal* described the movement as the "Hush Rush Bill."

Tom Lewis, author of *Empire of the Air: The Men Who Made Radio* (1991), argues that Limbaugh's success speaks more to the power of radio and Limbaugh's ability to use the medium in which he has worked since he was a teen. "Better than most liberals or conservatives," says Lewis, Limbaugh is "a consummate showman who understands radio and sound, especially their ability to create a picture in the minds of listeners and their potential to capture imaginations."

To bring this about, Limbaugh borrows from the word-making skills of gossip columnist and 1930s broadcaster Walter Winchell, who coined words that not only distorted reality but evoked a wild form of humor. Limbaugh's terms, such as "feminazis" (to describe those in the women's movement) and "environmental wackos," are typical of his confron-

tational but engaging manner, which attracts primarily older white males. But Limbaugh also uses satire, thumping, popular recordings, and a variety of sound effects. When he talks about abortion, for example, the sound of a vacuum cleaner is heard in the background. He offers trading cards and rock songs mocking political figures.

Lewis says that Limbaugh draws from the tradition of radio humorists such as Jack Benny, Fred Allen, and even the Great Gildersleeve. "A man, a legend, a way of life," Limbaugh repeats over his Excellence in Broadcasting (EIB) radio network as well as in books, pamphlets, and newsletters. "I am Rush Limbaugh from the Limbaugh Institute for Advanced Conservative Studies. Yes, my friends, the Doctor of Democracy is on the air." According to Limbaugh, the reason for his popularity is that he's "the epitome of morality and virtue . . . with talent on loan from God."

Limbaugh's format includes lengthy monologues that sometimes meander and consist of incomplete sentences and muddled paragraphs. Along with other conservative talk show hosts, he helps to create an almost conspiratorial approach against big government and liberals in politics and the media; at the same time he celebrates the common sense of other Americans—particularly himself. Although he does not usually have guests on his program, Limbaugh is generally polite to his callers. Larry King, a talk show host who depends on guests, says Limbaugh comes to his broadcast with an agenda. "Agenda broadcasters will do anything. They'll lie. They'll fabricate, to keep the agenda going," King says.

A self-described nerd, Limbaugh got his start in broadcasting in 1967 as a disc jockey for the radio station partially owned by his father in Cape Girardeau, Missouri, where he was born and raised. After dropping out of Southeastern Missouri State University, he worked for and was fired from radio stations in McKeesport (Pennsylvania), Pittsburgh, and Kansas City, where he was also a publicist for the Kansas City Royals and announcer for its station. Because of his controversial nature, Limbaugh was also dismissed from the Kansas City station. He went to Sacramento, California, in the fall of 1984, where he replaced Morton Downey, who had been fired for telling an ethnic joke.

In California, Limbaugh found his radio audience by attacking communism, feminism, and environmentalists, developing a style that he admits is more entertainment than news or even debate. He has repeatedly said that his principal job is not so much to champion causes and proselytize but to hold an audience. After nearly tripling his California audience in four years, in July 1988 he moved to New York City's

Rush Limbaugh

Copyright 1998 Brad Trent/Premiere Radio Networks

WABC, where his program was syndicated and his loyal following multiplied and mobilized. A nationally syndicated one-half hour television program begun in 1992 was not as successful as his radio program and was dropped.

In his programs and books, Limbaugh describes and mocks various liberal movements and the effects of their agendas on society. "I believe that in order to combat the misinformation that is so prevalent on our political landscape today we have to remain informed and alert to the things that are occurring," he writes in *The Way Things Ought To Be* (1992). "The best way to do that is to read, listen to, or watch me."

An ardent admirer of Ronald Reagan and supporter of George Bush and Robert Dole, Limbaugh provided a great service for the Clinton administration when he endorsed the North American Free Trade Agreement (NAFTA) and attacked Ross Perot's anti-NAFTA crusade. However, the *New York*

Times credits Limbaugh not only with the NAFTA victory but with helping sweep Republicans to Congressional victory in 1996 and with destroying the crime and lobbying bills of President Clinton. In his own words, he continues to serve as "a man, a legend, a way of life" and the "Doctor of Democracy."

Little Orphan Annie

Children's Serial Drama

A pioneer of the children's serial genre, *Little Orphan Annie* first bowed—or curtsied—in 1930 on Chicago station WGN. On 6 April 1931 it premiered nationally on the NBC Blue Network, later moving to Mutual Broadcasting System. Shirley Bell and Janice Gilbert portrayed Annie during the series' 11-year run; Bell from the beginning until 1940, Gilbert from 1940 to 1942.

Based on Harold Gray's popular comic strip, *Annie* featured 15 minutes of action and high adventure every weekday afternoon or early evening, initially based primarily in her adopted hometown of Tompkins Corners, and later in more exotic, faraway places. She fought all forces of evil, including gangsters and criminals, reminding her faithful listeners at the end of the show to "be sure to drink your Ovaltine." Indeed, the premium toys offered by *Little Orphan Annie* and its long-time sponsor seemed at times to compete with the stories themselves, taking up four to six minutes of the 15-minute broadcast. Children who tuned in were urged to get their own "swell Ovaltine shake-up drinking mug" by sending ten cents and the proof of purchase from an Ovaltine can.

In addition to Bell and Gilbert, other cast members included Allan Baruck and Mel Torme (Joe Corntassel, Annie's best friend), Henry Saxe, Boris Aplon, and Stanley Andrews (Oliver "Daddy" Warbucks), Henrietta Tedro and Jerry O'Mera (Ma and Pa Silo, the farm couple who cared for Annie when Daddy Warbucks was away on business), and Pierre Andre (Uncle Andy, the announcer). The voice of Sandy, Annie's dog, was provided by Brad Barker. Among Annie's favorite expressions were "Leapin' lizards" and "Jumpin' grasshoppers."

The program's writers employed a simple but very effective technique to keep listeners, especially young children, returning to hear the next installment of Annie's adventures: the cliff-hanger. Episodes seldom ended with finality or resolution. Instead, story lines "flowed" from one episode to the next, occasionally reaching a conclusion but never without the development of a new story line to take its place. Beginning with *Annie*, this open-ended approach—leaving listeners in suspense at the end of each daily broadcast—was particularly evident for decades to come in children's radio and television programming and motion picture serials. In addition, Annie's radio adventures appealed to youngsters because the episodes often articulated childhood dreams of experiencing the glamour of the adult world.

NBC's radio network connections were not completed for regular U.S. coast-to-coast broadcasting until 1933, two years after *Little Orphan Annie*'s network premiere. As a consequence, *Annie* in its infancy was actually two different pro-

grams—one originating in Chicago, the other in San Francisco. Listeners in the eastern and central areas of the U.S. heard Shirley Bell in the lead role, while listeners in the far west heard Floy Hughes. Identical scripts ensured some consistency between the two productions, but west coast listeners were no doubt startled to suddenly hear different actors after the program's operations were consolidated in Chicago in 1933.

For over five years *Little Orphan Annie* aired six times a week, going to five times weekly beginning in 1936. The series moved from NBC to Mutual in 1940, at which time Ovaltine, the show's original sponsor, decided instead to put its advertising dollars in *Captain Midnight*, a new children's suspense show. Taking the chocolate drink mix's place as *Annie*'s sponsor was the breakfast cereal Puffed Wheat Sparkies, but by this time other adventure shows were outgunning Annie at her own game. Faced with declining ratings, *Little Orphan Annie*'s last broadcast was on 26 January 1942.

Localism in Radio

U.S. Regulatory Approach

The concept of “localism,” or serving a specific community, has always been central to the practice of radio programming and to government policies concerning broadcasting in the United States. In contrast to most of the rest of the world, American radio stations were allocated to local communities and licensed to serve audiences defined by the boundaries of those communities. The Federal Communications Commission (FCC) has described its radio allocation priorities as (1) providing a usable signal from at least one station to everyone and diversified service to as many persons as possible, and (2) creating sufficient outlets for local expression addressing each community’s needs and interests. That system of license allocation remains the foundation of American broadcasting. As for programming, local service has frequently been a key element in a station’s ability to survive and prosper. Research and experience have consistently demonstrated that local content is one of the things listeners value most highly.

However, economic realities have usually impelled broadcasters toward centralized program distribution. Networks began developing in broadcasting’s earliest days, and although the traditional radio networks have long been reduced to providing news and sports for radio, a new generation of networks offering full-time formats appeared as the increased availability of satellite service in the 1980s made such a service viable. By 2000, the emergence of distribution technologies that no longer rely exclusively on nearby transmitters to reach individual audience members—such as direct-to-home satellites and the internet—and the ability of large radio groups to program clusters of stations from a central location led some to suggest that localism is an idea destined to be little more than a quaint relic of a bygone age. Larry Irving (then head of the National Telecommunications and Information Administration) told the 1999 National Association of Broadcasters convention in Las Vegas that localism has “gone the way of the buffalo.” Yet other industry observers continue to argue forcefully that the most successful radio stations are those that do

the best job of connecting with the localized needs and interests of their audiences. This view holds that localism will be even more important in a future of ever-greater competition from sources such as the satellite-based Digital Audio Radio Services (DARS), offered nationwide since November 2001 by XM Satellite Radio and since 2002 by Sirius.

These contradictory assertions may all, in fact, be accurate, depending on one’s vantage point. Much like the phrase “The public interest,” the meaning of localism has always been in the eye of the beholder—typically either the FCC or a station licensee. The very vagueness of the term has enabled a variety of regulators, industry spokespersons, and public service advocates to laud the importance of localism in different situations.

Localism in U.S. Broadcast Regulation

As a matter of policy, localism is closely tied to a number of regulatory goals. These are generally expressed as the need to limit centralized (program) power or authority in order to create more diverse content—the robust and varied “marketplace of ideas” central to the American understanding of free speech. For several decades, the FCC has pointed to the importance of localism as a means of providing diverse program content for the furtherance of the public interest. Some policy makers also argue for the need to protect local communities and smaller interests from being overwhelmed by programs developed by (and for) larger national interests. The desire to diffuse political power has been a running theme throughout American history (the federal system of government is perhaps the most obvious result). Added to the widely accepted notion that the media are capable of exerting great influence on society, the decision to dilute the power of a single broadcast entity—station or especially network—seems an obvious choice.

The commission has a specific charge in the Communications Act to “encourage the larger and more effective use of radio in the public interest.” The FCC has generally interpreted

this to mean that it should try to allocate the maximum technically feasible number of stations around the country. Thus, structural definitions of localism (in a geographic or spatial sense) have most often guided policy makers. This understanding of localism assumes that stations licensed to transmit to a geographically restricted area will focus their programming on the specific needs and interests of the citizens residing in that area. In this context, localism as policy has been put into regulations affecting the distribution of licenses to various communities. Localism is also seen in the bedrock obligation of all broadcast licensees to serve the needs and interests of their community of license (which at one time involved an elaborate process to ascertain the needs of that community) and in the preference that was granted to active local ownership when, prior to 1996, the comparative hearing process was used to choose a licensee from among mutually exclusive competing applicants.

In one of the earliest examples of localism, the Radio Act of 1927 divided the country into five “zones” and, in the case of competing license applications, directed the Federal Radio Commission (FRC) to distribute stations among the zones according to frequency, power, and time of operation, with concern for fairness, equity, and efficiency. The Davis Amendment, added one year later, required the FRC to provide *equality* of service, in terms of both transmission and reception, in each of the five zones. These sections, with slight modification, passed into the Communications Act of 1934. Although the zone system was repealed in 1936 and the law was modified to require once again that the FCC simply provide a fair, efficient, and equitable distribution of radio service to each state and community, localism was (and is) undeniably a powerful concern in Congress.

Another significant, and more recent, example of the FCC’s structural concern with localism was the decision to drastically restructure the system of FM station allocation in order to increase the number of available stations in the early 1980s. Generally referred to by its FCC docket number (80-90), this order authorized three new classes of stations and modified the interference and operational rules with the goal of allowing first (and sometimes second) FM stations in communities where none had been possible before under the original 1962 Table of Assignments. As a result, the number of FM stations in the United States grew from around 3,000 in 1980 to slightly under 6,000 by the end of 1990 and continued to climb to more than 8,500 by 2003.

Localism and the Business of Radio

However, the growth was not solely good news for the industry or the audience. Many observers lamented the increase in interference in the FM band. The rise in the number of stations

combined with the simultaneous deregulation of radio to rapidly escalate station values. Many owners found themselves too far in debt, particularly during the economic downturn in the late 1980s and early 1990s. Sometimes as a result of the significant economic hardships resulting from the combination of increased competition and debt load, sometimes in response to a perceived change in the desires of the audience, stations cut back or eliminated local air staffs and news operations. If the goal of the FCC’s restructuring was to create more local content for more communities, the result could best be described as mixed. Although many stations continue to thrive by providing their audience a programming diet heavy with local content and involvement, satellite-provided formats, other syndicated product, and the ever-increasing ease of automating a station combine to create a significant economic incentive for many licensees to reduce localism to commercials and weather forecasts.

This illustrates the inherent conflict between policy rhetoric and the changing economic realities facing licensees. Though frequently lauding localism in policy pronouncements, the FCC has seldom promulgated, and even more infrequently enforced, local program guidelines or requirements. Nearly all of those that ever existed, such as the fairness doctrine, the ascertainment primer, commercial guidelines, and news and public-affairs guidelines, disappeared by the mid-1980s. The reasons behind this deregulatory trend (critics would term it failure) have been hotly debated because they are so complex. The regulatory problem is one of accommodating the various interests—licensees, program producers, audiences, networks, regulators, advertisers—in a rule that comports with common understanding of the First Amendment. Although this task was difficult under the public trustee model of regulation that guided broadcasting’s first 50 years, it is practically impossible to set firm local content guidelines under the current regulatory philosophy, which moves much of the control from government policy to marketplace competition.

A further complicating factor is the constant evolution of the media environment. From the system envisioned at the time of the Communications Act in 1934, rigidly structured along relatively narrow geographic lines, radio in the United States moved almost immediately to a distribution system with a wider geographic frame (regional and national sources feeding the majority of programming on “local” stations). From a few hundred local stations linked with relatively new networks at the time the Communications Act of 1934 was written, radio grew decades later to a business of thousands of “local” outlets providing a relatively few national music or talk program formats. Development of internet and satellite distribution has merely enhanced the trend to national program types provided through local outlets. The degree to which any one of those outlets wishes to be truly local (reflect-

ing and projecting its own community) is left to the discretion of the licensee.

The vague nature of localism itself is a final complication. One's understanding of concepts such as "local" or "community" colors any practical application of localism. The term *can* mean full-scale involvement of a station with its community, or (as is more usually the case) it can mean mere mention of local weather (and local commercials) within a syndicated music format heard on hundreds of stations across the country. As traditionally viewed by the FCC, real localism is probably somewhere in the middle, but much closer to the former—and many argue that it's also good business. In his book *Radio Programming: Tactics and Strategy*, programmer and consultant Eric Norberg asserts that localism and human contact are the elements that listeners value most in a station and that therefore the core of what makes a station successful is the relatable local person on the air. This viewpoint takes on the air of common wisdom in the industry trade press, particularly in advice given to programmers and air talent. Researchers repeatedly find that local information (weather forecasts, traffic information, event news) is one of the top reasons people tune in to radio.

Localism as a Social Construct

Critics, and occasionally even the FCC, have suggested that the goals of localism can be addressed in a different fashion, recognizing that communities frequently form around shared tastes, interests, and ideals without specific reference to a geographic boundary. For example, in the rulemaking that eliminated many of the radio programming guidelines, the commission noted that

communities of common interests need not have geographic bounds. . . . The economics of radio . . . allowed that medium to be far more sensitive to the diversity within a community and the attendant specialized community needs. Increased competition in large urban markets has forced stations to choose programming strategies very carefully. (FCC, "Deregulation of Radio," *Notice of Inquiry and Proposed Rulemaking*, 73 F.C.C.2d 457 [1979], at 489)

This alternative view of community can also be seen in the FCC's decision to approve satellite-delivered DARS. Despite the diversity of programming alluded to above, many program interests go unfulfilled by traditional terrestrial radio because the audience for a particular type of music or information is simply too small within the service area of a single station or is otherwise unattractive to advertisers. Beginning in late 2001, however, satellite radio services included program channels

that would not be economically viable on a single station in a given market (e.g., five separate jazz channels). The technology can aggregate widely separated audiences in a fashion that does not serve traditional localism but surely adds to content diversity.

Trials of Modern Localism

Sometimes, competing concerns such as spectrum efficiency have prevailed over localism. Prior to 1978, the FCC issued Class D FM licenses to college and community stations, permitting low-power operation (a maximum of 10 watts, with a tower height less than 100 feet) in the noncommercial part of the FM band. These stations represented a variety of operational styles, from student-run stations at colleges or high schools to stations licensed to civic groups and generally run by a largely volunteer or all-volunteer staff. By their very nature, these operations were strongly committed to their community and would appear to personify the localism ideal, often featuring material not available through full-power stations.

In 1972 the Corporation for Public Broadcasting (CPB) petitioned the FCC to explore several issues related to more efficient use of the FM channels set aside for noncommercial educational stations. In comments to the commission, they argued (with the support of others, including the National Federation of Community Broadcasters) that the 10-watt broadcasters were effectively blocking more efficient use of the spectrum. Essentially, CPB and its supporters were arguing for more stations that met their qualifying guidelines for size and professionalism, at the expense of smaller operations. Supporters of Class D stations, primarily the licensees themselves, countered with various arguments for retaining the service as it was, including the point most relevant here—the truly local nature of the service.

The FCC recognized that the Class D stations were indeed meeting discrete local needs. But in this case, the commission put the emphasis on the efficiency argument put forth by CPB, announcing new rules that effectively forced existing Class D stations to upgrade their facilities to Class A minimums or else become a secondary service, facing interference or being bumped from their assignments. In the FCC's view at that time, there was not sufficient spectrum available for both full-power, larger coverage area stations and low-power operations (although the commission has long accepted the need for low-powered translator and booster stations that extend the coverage of existing FM and TV stations but are prohibited from originating any programming themselves).

It is somewhat ironic that the FCC issued rules in 2000 that will create a new class of low-powered FM or microradio stations. The rulemaking comes in response to petitions arguing that, in the wake of industry consolidation following the 1996

Telecommunications Act, radio ownership and content are insufficiently diverse, and that current stations often fail to address local needs. Although congressional intervention curtailed the number of LPFM stations that could be licensed, the FCC had issued more than 400 construction permits by the end of 2002, and 73 LPFM stations were on the air in January 2003

Local Marketing Agreements

Brokered Agreements among Stations

As part of the deregulation of radio ownership initiated by the Federal Communications Commission (FCC) during the late 1970s and early 1980s, radio station owners and operators began to sign program service and/or marketing agreements, known in the industry as local marketing agreements. In 1992 the FCC formally approved this form of ownership and operations agreements, and they became commonplace, particularly in the four years leading to the easing of ownership rules in the 1996 Telecommunications Act.

Alliances for local marketing agreements may be located in the same market, in the same region, or in the same service (AM or FM). The allied owners and operators draw up and sign legal agreements defining financial control over their allied

properties, but the owners still maintain their separate licenses and studios. After 1996, it often became simpler to simply purchase a station, but local marketing agreements were still used to make transitions to new owners cheaper, easier, and more cost-effective.

A local marketing agreement thus has become a time-brokering agreement between stations that can address either programming or advertising time. Basically, the originating or principal station in the local marketing agreement pays the "affiliate" a monthly fee either to partially simulcast programming or to air original satellite-delivered programming. This type of agreement differs from a satellite format network affiliation arrangement, wherein the affiliate pays for program-

ming. The originating station in a local marketing agreement can strike an arrangement with the leased station for either handling or sharing advertising sales.

The benefits of local marketing agreements to the originating station include expanded coverage area and thus the potential for increased sales of advertising. For example, during the early 1990s, owners of many struggling AM stations signed local marketing agreements to stabilize their flow of profits rather than take on the risks and costs involved in trying to establish a new format.

By 2000, although the number of stations and formats seems endless in major markets, in fact, local marketing agreements allowed two separate radio stations to operate jointly, and so the number of operators (or voices) was actually far fewer than the number of stations (or outlets). Usually the financially strong station reaches a combined operation and sales agreement with a financially troubled station in the same community to oversee programming and advertising time sales for a percentage of the advertising sales. Although the parties exercising a local marketing agreement are not required to file the agreement with the FCC, the licensee of the weaker partner station is still required to meet the station's maintenance and community standards (although in practice these requirements have become so minimal during the 1990s that this threat of losing a licensee over such a deal offers no risk).

The local marketing agreement policy helped redefine the institutional relationship that had formerly been restricted to affiliation. Indeed, once the FCC in 1992 formally relaxed regulations to allow local radio owners to own and control more than one station in the same service market, a wave of deals took place. One scholar calculated that over 50 percent of the commercial radio stations became involved in some aspect of consolidation between 1992 and 1996, including local marketing agreements. The pace of consolidation has increased tremendously since the Telecommunications Act of 1996 became law, with local marketing agreements used to make the transition to combinations of radio stations.

Local marketing agreements permit the parties to take advantage of cost and organizational structural efficiencies; to

dominate a market with variations of one format; to eliminate redundant jobs; to develop broader marketing plans and solutions for advertisers; and, in the end, to increase profits for stockholders and investors. One can simply buy a station, or, to be more flexible in the short run, one can set up a local marketing agreement to test whether a formal alliance might work better. Some owners delay formal merger decisions until they figure out how to consolidate personnel and facilities.

There have been, therefore, numerous examples of different uses of local marketing agreements, as owners have utilized combinations of acquiring stations to form new and, they hope, more profitable alliances. Consider a top 50 market, Charlotte, North Carolina, where in spring 1992 the market was being served by ten radio owners and operators, who owned 3 AM and 12 FM stations. Two years later, those ten had dwindled to six owners and operators. By fall 1996, Charlotte had consolidated to the point of having only four viable radio owners and operators controlling the same 15 stations. Local marketing agreements created much, though not all, of this consolidation.

Lodge, Oliver J. 1851–1940

British Wireless Pioneer

An important British physicist and mathematician of the late 19th and early 20th centuries, Oliver Lodge was one of the first people to experiment with wireless transmission, and he disseminated the pioneering work of Heinrich Hertz and his contemporaries. Because of his scientific reputation, a crucial invention, and his position in British higher education, Lodge helped to promote wireless as a practical proposition.

Early Years

Oliver Lodge was born into a comfortable middle class English family and endured four years of a hard Victorian boarding school education. In 1865, at age 14, he went to work for his father in the family's successful clay and glaze business called "Potteries." But he was attracted to science at an early age and decided to continue his education in the field of chemistry. He returned to school in 1872 seeking a university education.

At the University of London, his interest focused more on mathematics, and he earned his bachelor's degree in 1875. That same year he published his first scientific article, and four years later he wrote his first book (on elementary mechanics). These publications were but the beginning of a prolific writing career. Lodge was able to clearly explain scientific or mathematical principles to those lacking formal scientific training, and thus his published writings demonstrated both academic research and popular journalism.

For the last two decades of the 19th century, University College, Liverpool (later the University of Liverpool) became his academic base for teaching and scientific research, including his important wireless work. At this time, Lodge also demonstrated his growing interest in psychic research, which would fully occupy his final years. His university duties included considerable teaching, research, and writing, as well as extensive academic administration.

Wireless Research

In the early 1870s, while still a student, Lodge had first read James Clerk Maxwell's two-volume theoretical work that contained a complicated early concept of wireless. He worked to perfect the Branly "coherer" device used to detect electromagnetic signals, and gave it its name. Lodge followed research in this and other arms of physics, and on holiday travel in Europe he met and compared research ideas with German physicist Heinrich Hertz, who in 1888 had preceded him to publication with experiments proving the "wireless" theories of Maxwell. When Hertz died prematurely in 1894, Lodge delivered and

published a memorial lecture that would eventually go through four ever-larger editions and help introduce the world to the theory of wireless and its potential application. The lecture included a general description of Lodge's own system for wireless transmission and detection.

Three months later, on 14 August 1894, Lodge demonstrated his transmitting system by sending electromagnetic waves in the form of Morse Code signals 150 yards between buildings at Oxford during a meeting of the British Association. This was the first public demonstration of what would become known as wireless or radio telegraphy, though the eventual importance of the technology was not yet recognized by Lodge or anyone else. Lodge was merely seeking scientific parallels between the transmission of light and electrical signals. Despite his breakthrough (which was presented with little fanfare), Lodge did not immediately focus on furthering his wireless effort.

With Marconi's 1896 arrival in Britain and his soon widely publicized experiments with wireless at ever-greater distances, however, Lodge's ambitions were stoked. He was understandably jealous over the public acclaim accruing to Marconi for work that paralleled efforts Lodge had undertaken several years earlier. In an attempt to pick up his earlier wireless theorizing, Lodge began to work with electrical engineer Dr. Alexander Muirhead (1848–1920), who with his brother manufactured telegraph instruments. Lodge and Muirhead had met at the former's 1894 lecture. To Lodge's theoretical physics, Muirhead added practical technology and a clear vision of what wireless telegraphy could accomplish.

In the course of his long life, Lodge would accumulate 29 patents (some shared with others, including 11 with Muirhead) from 1883 to 1931. By far the most important two were granted in 1897 for what Lodge termed "syntony," or a telegraphy system that allowed a receiving device to select among competing transmitted signals. This innovation was an outgrowth of his recognition of the need for detectors of wireless signals to be able to differentiate among a growing number of available signals. This patent, along with several others (in 1898 Lodge also took out a patent on a rudimentary loudspeaker) was central to what would become the "Lodge-Muirhead" system that would briefly compete with Marconi, who only belatedly perceived the need to tune signal detectors. At the same time, Lodge was one of several authorities who reported to British postal authorities and the Admiralty that there were ways of operating an effective wireless system without relying upon Marconi's patents. Lodge stated several times that he was unhappy primarily with those around Mar-

coni, not the Italian inventor himself. Along with many other critics, Lodge felt that Marconi tried to take on too much and overestimated what the crude technology of the period could provide.

Lodge and Muirhead established a syndicate (a limited company) in 1901 to develop and manufacture equipment based on their jointly developed patents in wireless telegraphy. After considerable testing of improved detectors at growing distances, early in 1903 the Lodge-Muirhead Syndicate announced its system of wireless telegraphy, said to be effective at distances up to 60 to 80 miles. The system was tested (though not adopted) by the British Army and was actually put into practical use in 1904 by the colonial Indian government to communicate several hundred miles to some off-shore islands. Steady improvements were made. But other than a few experimental stations, the Lodge-Muirhead Syndicate never became an active operating entity as did Marconi, its chief competitor. The need after 1904 to obtain a license from the British Post Office (which utilized Marconi equipment) for any transmitting station was one stumbling block to expansion, as was the entrenched market position of the Marconi interests.

Lodge's vital syntony or tuning patent expired in 1911, although under British law and after a patent trial (in which the judge found in favor of Lodge's priority over Marconi in the basic tuning principle) it was extended to 1918. Because they were vital to its own expanding Empire wireless operations, however, rights to the Lodge patent were then purchased by the Marconi company. As a part of the deal, the Lodge-Muirhead Syndicate was closed down. Despite having lost the legal case, Marconi had managed to buy out its chief potential British competition.

The lack of lasting success with wireless was disappointing but not central in Lodge's life. He had been approached at the turn of the century to help found a new university in Birmingham, and after having turned down the offer twice, he finally accepted it. As he later wrote, "I was too busy with teaching work to take up telegraphic or any other development nor had I the insight to perceive what has turned out to be its extraordinary importance to the navy, the merchant service, and indeed, land and war services too." Further, he felt strongly it was not the role of a scientist to pursue commercial ends. That innovative role he left to others, chiefly Marconi, as it turned out.

Later Years

Lodge was deeply involved in helping to develop the new university after 1900. He remained active on many research and writing fronts in addition to his wireless work, demonstrating a growing interest in and concern over such social issues as poverty. After 1910 he focused increasingly on his psychic

research and writing, especially after the 1916 death of his youngest son Raymond in World War I. His efforts to communicate with his dead son were widely reported and were the focus of one of his better-known books. His interests extended to the relationship of science and religion, extensive work with mediums, and spiritualism. In these areas, however, he was more a philosopher than a practical investigator.

Lodge "retired" in 1920, although over the next few years he turned out a dozen books, including a 1931 autobiography, and considerable magazine journalism, some dealing with the expanding radio business. He also presented many broadcasts over the BBC about radio, among other subjects. A related area of concentrated interest and research was his theorizing about the behavior of the "aether" or atmosphere.

London Broadcasting Company

First British Commercial Radio Station

In early 1973 LBC—the London Broadcasting Company, largely owned by Canadian-backed Selkirk Communications—was awarded the United Kingdom's first independent local radio franchise, with a contract from the Independent Broadcasting Authority to provide a news, talk, and information service for the greater London area. It was also to be the home of Independent Radio News—a wholly owned LBC subsidiary—the monopoly provider of international and national news for an expected chain of some 60 local radio stations. This service was financed by a subscription levied on the size of the audience to each station.

LBC—the first authorized commercial radio station in the United Kingdom after more than 50 years of British Broadcasting Corporation (BBC) monopoly—went on the air at 6 A.M. on 8 October 1973 from studios in London's Gough Square, just off the famous Fleet Street, then home to most of the United Kingdom's national newspapers. The station was awarded the "speech" franchise in contrast to the "general and entertainment" franchise that was awarded to Capital Radio. Like Capital and the other franchises offered in the 1970s, the station was allocated both AM and FM frequencies. By U.S. standards, the programming was a hybrid format—a mixture of rolling news, current affairs features, celebrity interviews, sports, personality-led talk, and magazine programs, including a weekly round-up of London's arts scene.

Unfortunately, it was launched at about the worst possible time for a new media enterprise relying on advertising income. The Middle East war, which led to a quadrupling of oil prices, had just begun, and Prime Minister Edward Heath launched his controversial Phase Three prices and incomes policy. Shortly afterward, a miners' strike led to widespread power blackouts and to the country's being put on a three-day working week. In addition, the station was credited with disappointing audience figures, and within a month of its launch Labour Member of Parliament Gerald Kaufman called for the

station "to be put out of its misery." In the first three months of 1975, union disputes over staff cutbacks temporarily put the station off the air five times.

The station was relaunched in 1978. It gradually settled down and built a loyal audience base, with much-praised coverage of major news stories, including Irish Republican Army terrorism, the siege at London's Iranian embassy, and political developments such as the sudden resignation of Prime Minister Harold Wilson in March 1976 and the turbulent life of the Greater London Council. However, it was probably the station's coverage of the 1982 Falklands War that, above all, ensured that the station was reawarded the London "speech" franchise in September that year.

In 1988 Crown Communications bought out Selkirk, and the new management made the fateful decision to end simulcasting on its AM and FM frequencies and to drop the now well-established name of LBC. In October 1989 the FM service was named Crown FM; it was to be in direct competition with the BBC's network speech service, Radio 4. The AM service was renamed London Talkback Radio and was aimed at a more downmarket audience with a populist talk-back format. The first audience figures for the new services, published four months later, showed a drastic drop in overall listening. In June that year, a number of Australians from Crown Communications were drafted in; the AM and FM services were simulcast over the weekend, and the FM service's name was changed to LBC News Talk 97.3 FM. The financial hemorrhage continued unabated, however, with losses for 1992 posted at £2.5 million, and in January the following year Crown went into receivership. Chelverton Investments took over, chaired by Dame Shirley Porter—a controversial figure in Conservative local politics and heiress to the Tesco supermarket company.

Just two months later the new regulator, the Radio Authority, announced that LBC had lost its license to London News Radio (LNR), although LNR would not take over until the fol-

lowing year. LNR planned a rolling news service on FM and a phone-in format on AM. Meanwhile, LBC said it would bid for the new national commercial speech service. In March 1994 it failed to win this license, Dame Shirley resigned, and two weeks later LBC went into receivership, although the station stayed on the air. In April 1994 LBC and LNR struck a deal so that the services could continue until the formal handover, and in May Reuters made a bid for LNR's two licenses, before the new services had even gone on the air. The Radio Authority agreed to this change of ownership, provided that the new owners kept to the program promises made by LNR when it was awarded the licenses. In August 1994 the new managing director announced that the channels were to be rebranded yet again, to London News 97.3 FM and London News Talk 1152 AM. Further changes in share ownership and a failed management buyout eventually led, by April 1996, to the Great Western Radio (GWR) group and Independent Television News' gaining control, with the *Daily Mail* and General Trust and Reuters owning 20 percent each. In July that year the much-loved name LBC reemerged as the AM service, and in October 1998 the station celebrated 25 years on the air.

In the Fall of 2002 both stations were bought from GWR by the Chrysalis group, and the new owner soon announced that, after agreeing a "frequency swap" with the Radio Authority, it would reformat both services. It believed that the stations were on the "wrong" frequencies—a rolling news service more "naturally" belonging to AM and the more general talk and lifestyle service on FM, which it intended to pitch against national commercial station TalkSport and the BBC network Radio 5 Live. Consequently, in January 2003, the two stations were relaunched as LBC 97.3 FM and LBC News 1152 AM. The management hoped to return the overall LBC brand to its 1980s heyday when 2.4 million listeners tuned in each week. In 1989 revenues had stood at £11 million; by the end of 2002 they were just £4million. However, although there had undoubtedly been some major mistakes in both financing and programming in those 13 years, with a consequent disillusionment on the part of staff, investors, and audience, the period had also seen greatly increased competition in the London radio market, both in the overall number of services and specifically those offering talk and news. In addition, the arrival of rolling TV news channels, as well as the general

expansion of media and the consequent fragmentation of audiences, must make the return to former audience and revenue levels questionable.

Throughout this turbulent history, the station has been host to some of the best-known names in British broadcasting, including Frank Bough, Douglas Cameron, Anne Diamond, Brian Hayes, Bob Holness, Pete Murray, Michael Parkinson, and Janet Street-Porter. In addition to its basic fare of news and news-talk programming, the station has been one of the last bastions in U.K. commercial radio for drama productions, which have won international awards. However, its major influence has been in the editorial and production practices of radio news—adapted from U.S., Canadian, and Australian commercial services—providing a new model of informality for the commercial sector that the BBC was to learn from and incorporate in its own networks, particularly Radio 5 Live and its news bulletins on the youth network, Radio 1. Specifically, the use of shorter, "crisper" reports, greater use of "actuality" (clips of interviewees, including eyewitnesses) contrasted with the BBC's then more ponderous, formal approach. Indeed, the whole notion of and demand for "rolling news" in the United Kingdom was pioneered by LBC, which was able to broadcast events as they happened and to stay with the story with live reports, interviews, and audience reaction, rather than having to return to regular programs. Many of what are now commonplace conventions on both radio and television in the United Kingdom were pioneered and developed by LBC.

The Lone Ranger

Western Adventure Program

The Lone Ranger originated at WXYZ in Detroit, Michigan, in 1933. The program gained in popularity with both child and adult listeners and reached a national audience when it played an instrumental role in the creation of the Mutual Broadcasting System in 1934. In the early 1940s, *The Lone Ranger* moved to the National Broadcasting Company (NBC) Blue Network, which became the American Broadcasting Companies (ABC) in 1945. The Ranger evolved into a variety of media forms, becoming the subject of comic strips, comic books, books for children, novels for adults, films, and television.

In 1932 George W. Trendle, one of the owners of WXYZ, decided that the station could increase its profitability by breaking ties with the Columbia Broadcasting System (CBS) network and locally producing its own programs, including dramatic shows. Trendle called station manager Harold True, dramatic director James Jewell, and other station personnel together to outline the concept for programs to be developed. One concept that emerged from this conference was a show to be aimed at children. Trendle specified several characteristics he felt were essential. The program should be a western and should feature a leading character who would exemplify model behavior for young listeners. This hero should be mature and possess some of the qualities of Zorro and Robin Hood. In subsequent meetings, details were further developed. The hero was to be a lone operator, perhaps a former Texas Ranger. Finally a name emerged—the Lone Ranger.

With this basic format in mind, Trendle turned to Fran Striker, a script writer in Buffalo, New York, to bring a fully developed Ranger to the radio audience. Striker's scripts for the *Warner Lester, Manhunter* series had gained national attention. Striker had also created his own radio western for WEBR in Buffalo, and elements of this series, *Covered Wagon Days*, may have influenced the content and tone of *The Lone Ranger*. For many years, however, George Trendle countered implications that anyone besides himself could be considered the creator of *The Lone Ranger*, and he insisted that Striker, as well as other WXYZ personnel, sign over legal ownership of the program.

Trial airings of *The Lone Ranger* on WXYZ received limited publicity, and sources disagree as to the exact date of the first actual broadcast of a complete and polished program, with some specifying 30 or 31 January and others 2 February 1933. As the program evolved, the Ranger was given a white horse named Silver and a "faithful Indian companion," Tonto, who addressed the Ranger as "kemo sabe." This gave the Ranger someone to talk to, lessening the need for an announcer's narration of action for the radio audience. Rossini's "William Tell" Overture became the theme music for

the show, another example of using classical music in the public domain in order to avoid royalty payments. The music was accompanied by the announcer's enthusiastic and authoritative description of "the daring and resourceful masked rider of the plains who led the fight for law and order in the early western United States." Listeners were invited to "return with us now to those thrilling days of yesteryear. . . . From out of the past came the thundering hoofbeats of the great horse Silver! The Lone Ranger rides again!"

The fame of the Ranger spread beyond Detroit as WXYZ fed the show to the Michigan Radio network. The program was the most important attraction to WLW Cincinnati, WGN Chicago, and WOR New York when they joined WXYZ in creating the Mutual Broadcasting System in 1934. When more distant stations signed up with Mutual, the Ranger's popularity reached a national level.

The show had already gained a huge following before the Ranger's background and the reason why he wore the mask were fully developed. These questions were answered in a 1938 Republic film serial portraying an ambush on a group of five Texas Rangers. They were all believed dead, but one survived. When this lone surviving Ranger recovered, he wore a mask to protect his identity and anonymity. This version of the Ranger's origin was also reflected in the radio program by 1941. The Lone Ranger's secret silver mine provided the means for supporting himself and was the source of his silver bullets.

A basic skeleton plot that was reflected in many scripts featured the development of a complication or problem and a failed attempt at its solution by a character in the story before the Ranger came onto the scene. When the Ranger did appear and successfully resolved the difficulty by the end of the program, someone would ask, "Who was that masked man?" Another would explain, "That was the Lone Ranger!" He was also a master of other disguises, further confounding villainous attempts at revealing his true identity.

Fran Striker, the show's chief writer, involved the Lone Ranger in getting telegraph lines strung across the West, in helping build the Union Pacific Railroad, and in carrying out special assignments for President Lincoln. The Ranger also assisted Buffalo Bill and Wild Bill Hickok. Furthermore, he provided advice to Billy the Kid, General Custer, and Sitting Bull.

One memorable plot concerned the Lone Ranger's discovery of his nephew, Dan Reid, who had been saved from an Indian attack on a wagon train. Reid had been brought up by a pioneer woman who, with her dying breaths, described his family, revealing that the boy's father was the Lone Ranger's

brother. Dan Reid's son, Britt, became the Green Hornet, another masked man in a later radio show that was also scripted by Fran Striker.

For much of its radio existence, *The Lone Ranger* was broadcast live on the NBC Blue network (later ABC) on Mondays, Wednesdays, and Fridays. Because of time zone differences, this schedule required three separate live feeds, the first beginning at 7:30 Eastern time. The second feed was produced for the Mountain zone, and the third for the West Coast.

Long, Huey 1893-1935

U.S. Senator and Radio Speaker

Huey Pierce Long, one-time Louisiana governor and U.S. senator, was one of America's most colorful and controversial political figures. He was one of the first American politicians to master the young medium of radio and to artfully manipulate and exploit radio's potential as a political tool.

Huey Long ran unsuccessfully for Louisiana governor in 1924 but parlayed his support among rural voters into winning election to that office in 1928. As governor, Long worked rapidly to take control of political patronage and to develop populist programs to shore up his political base. Powerful

opponents in the state legislature impeached but failed to convict Governor Long in 1929.

Huey Long launched his second gubernatorial campaign in a 3 August 1927 speech carried over radio station KWKH in Shreveport. The station, owned by Long's friend William K. Henderson, played a major role in many of Huey Long's future radio addresses, all of which—like his 3 August speech—were carried free of charge and for unlimited time.

Huey Long's radio skills were honed to perfection during his years as governor. His unique oratorical style fit perfectly with the expectations of his listeners. Long often spoke effortlessly and without notes for two or three hours at a time. His rapid-fire monologues freely moved from quoting Bible verses, to joking, to harsh name calling of political foes. He even resorted to deliberately mispronouncing words and ignoring accepted rules of grammar in order to identify himself more closely with his audience.

Many of Huey Long's radio addresses were broadcast over KWKH by remote control from the Governor's Mansion in Baton Rouge or from a hotel room. He often began his remarks by telling listeners that Huey Long (or the "Kingfish"—a sobriquet that he began using in the late 1920s that came from a character's name on the popular *Amos 'n' Andy* radio show) was going to be talking and that they should phone a friend who also might tune in. He then would spend several minutes in small talk while calls were made and listeners gathered.

Huey Long was elected to the U.S. Senate in 1930 while serving as Louisiana governor. He retained the governorship for another year and was finally sworn in to the U.S. Senate in January 1932. Soon after his arrival in Washington, Long made waves by proposing what he called his "Share-Our-Wealth" plan as a means of redistributing wealth in America. He told a Depression-weary America of his plan during a 30-minute February 1934 nationwide radio broadcast on the National Broadcasting Company (NBC) network. Time for the broadcast was donated, following the practice of both NBC and the Columbia Broadcasting System (CBS) to supply such time to members of the U.S. Congress. The enormous number of letters that flowed into Senator Long's office following his radio address required some 48 secretaries and typists to answer, and by 1935 Long had a bigger office and more employees than any other U.S. Senator. Although economists berated his "Share-Our-Wealth" plan as unworkable, the noto-

riety that Long was gaining nevertheless persuaded the radio networks to allow the senator more airtime.

Network radio proved to be more than just an excellent forum to push his economic plan, though, when in August 1935 Senator Long announced his break with President Roosevelt over policy issues and his plans to run for the presidency himself. His chances of defeating Roosevelt seemed good, according to knowledgeable observers who placed Huey Long's political strength as second only to the president's. Long departed from his short-lived campaign in September 1935 to be present during a special session of the Louisiana legislature. While hurrying through a hallway of the state capitol on 8 September, he was gunned down by an assassin, a Baton Rouge physician named Carl Weiss. Other than a presumed dislike for Long's dictatorial politics, no definite reason for the assassination has ever been determined. Huey Long remained conscious for two days after the shooting but died on 10 September at age 42.

Lord Haw-Haw (William Joyce) 1906–1946

World War II Propaganda Broadcaster

During World War II, William Joyce, known to his British listeners as “Lord Haw-Haw,” was one of the most famous expatriate radio propagandists for the Axis powers (others included “Axis Sally,” Ezra Pound, and “Tokyo Rose”). After the war, Joyce was found guilty of treason and executed by the British.

Origins

William Joyce was born in 1906 in New York City to Irish parents who were naturalized American citizens; he was thus a citizen himself, an issue of import at the end of his life. When he was three, his family returned to Ireland, eventually settling in Salthill, Galway.

Joyce was educated at the College of St. Ignatius Loyola in Galway, but his education was interrupted by the bitter struggle for Irish independence. By his own later admission, Joyce worked as a spy for the British “Black and Tans” in 1920–22. This was a despised military force sent to Ireland in the summer of 1920 to reinforce the Royal Irish Constabulary. Joyce’s support of and cooperation with such an intensely despised organization was enough to force the Anglophile family to move to England after the Irish achieved independence in 1922. There Joyce first attended Battersea Polytechnic and later Birkbeck College of University of London, from which he received a first class honors degree in English in 1927.

While in college, Joyce became politically active in conservative and then far-right circles. He eventually dropped out of graduate study and in 1933 joined Sir Oswald Mosley’s British Union of Fascists, rising to be director of propaganda and later deputy leader. He later fell out with Mosley and was dropped from the party. In 1933 he made what became a fatal mistake: declaring he was a British citizen (and one born in Galway when Ireland was part of Britain) to obtain a British passport to ease his ability to travel as political tensions rose. He renewed the passport (and in essence, the citizenship vow) in August 1939. The fraudulently acquired passport was later a central element in the post-war charge of treason.

Broadcasting for Germany

In August 1939, Joyce and his second wife, fearing arrest as avowed fascists while war loomed, fled England and went to Germany. He soon found a position with German radio, broadcasting anti-British propaganda beginning on 18 September 1939. In 1940 he became a naturalized German citizen. Both he and his wife worked for the Nazi regime for the rest of the war.

His voice was beamed to Britain on a program called *Views on the News*. Broadcasts featured war-related news and ad hominem attacks on Allied leaders, Jews, and communists. His signature opening, “Germany calling, Germany calling,” became well known to the British public. The “Lord Haw-Haw” appellation came first from a *Daily Express* correspondent who referred to his “speaking English of the haw-haw, dammit-get-out-of-my-way variety.” British listeners were at first amused at his somewhat affected high-class and sneering tone as he attacked Jews and other enemies of Germany.

Through 1942, as the Third Reich enjoyed a number of military successes, Joyce related events to his overseas listeners with considerable candor. As war-related news was then being censored by the British government and the BBC, many Britons turned to Joyce to ascertain the facts. As the war turned against Germany, however, Joyce’s broadcasts—nearly always made from studios in Berlin—grew more pointed and shrill, and the declining number of British listeners no longer trusted what they heard.

Joyce’s final and arguably most dramatic broadcast was recorded at a transmitter near the Danish border in April 1945 after Hitler’s suicide. Though never broadcast, in it Joyce railed yet again against the dangers of Bolshevism and reflected upon Germany’s role in the war. He was quite clearly agitated and may have been intoxicated. A few weeks after the war ended in May, he was captured by British troops as he tried to flee Germany.

Trial and Execution

Joyce was returned to England and tried for treason in a three-day London jury trial in September 1945. He was quickly found guilty and sentenced to death. The trial and appeals of the judgment were widely followed, and transcripts were published in two contemporaneous books. The tricky citizenship issue was over-ridden by arguments that in fraudulently seeking a British passport before the war, he had placed himself under the protection of—and thus in a position of loyalty to—the British crown. After all appeals were exhausted, in January 1946 Joyce was hanged at London’s Wandsworth prison.

Joyce’s propaganda role is significant. For one thing, his broadcasts served as something of a radio role model for Ezra Pound, who later performed analogous services for Italy. Second, Joyce’s broadcasts (and those of both “Axis Sally” and “Tokyo Rose,” who were Americans and were also tried for treason) raise the question of whether broadcast polemics and editorializing necessarily constitute treason. Joyce’s execution

poses a third question: is it possible for the victors in any given struggle to try the vanquished in such a way as to ensure fair treatment for the defeated?

Lord, Phillips H. 1902–1975

U.S. Radio Actor, Writer, Producer

SOUND EFFECTS: [Marching feet, machine-gun fire, siren wail.]

VOICE: Calling the police! Calling the G-Men! Calling all Americans to war on the underworld!

ANNOUNCER: *Gangbusters!* With the cooperation of leading law-enforcement officials of the United States, *Gangbusters* presents facts in the relentless war of the police on the underworld.

Loud and urgent openings such as this signaled another episode of the radio program *Gangbusters*, which aired for more than 20 years. This fast-paced drama was renowned for snappy dialogue and realistic sound effects, particularly at the show's beginning. (These features gave rise to the expression "coming on like gangbusters" to describe anything with a rapid start.) The creator of *Gangbusters* was Phillips H. Lord, a radio actor, writer, producer, and developer who was one of the industry's most successful artists during the "Golden Age" of radio in the 1930s and 1940s.

As Lord explained when the show (called *G-Men* for its first year) debuted on 16 September 1935, the series was based on actual FBI cases provided by Director J. Edgar Hoover. Lord and his assistant Helen Sioussat had an office in the

Department of Justice next to Hoover, who allowed them unprecedented access to FBI case files. "I went to Washington, was graciously received by Mr. Hoover, and all of these scripts are written in the department building," Lord told listeners during the inaugural program, which was about the killing of John Dillinger. "Tonight's program was submitted to Mr. Hoover, who checked every statement, and made some very valuable suggestions."

However, Hoover almost backed out of the project after the first broadcast, in the wake of scattered criticism about this new style of radio entertainment. Lord hastily wrote Hoover to mollify him, vowing "There is NOTHING that I won't do to win your respect and confidence." What Hoover required Lord to do was to use only the material provided by the FBI and nothing more. Moreover, all scripts had to be approved by Hoover or one of his aides, and all had to show that every criminal was punished, either with death or a long jail sentence.

Lord endured these stringent guidelines because he recognized the importance of the new show—as a new genre of radio entertainment and a legacy for his career. "This series, Mr. Hoover, means more to me than anything else in the world," Lord explained in private correspondence. "My whole future will be based on the success of this program, and there

isn't a stone I'll leave unturned toward making it the finest thing in radio."

Before he created this crime drama, Lord's future had seemed secure in a different broadcast format. He was one of the brightest stars on radio with a loyal nationwide audience for *Sunday Evening at Seth Parker's*. Lord played the elderly preacher from Jonesport, Maine, who discussed local happenings with his family and neighbors in the parlor. The *Seth Parker* broadcasts conjured up images of white, steepled churches, modest cape-style homes, and vessels plying the harbor, as the friendly folks prayed, sang, and discussed morality. The dialogue and plots hearkened to a simple, old-fashioned way of life during the uncertainty of the Depression. Lord created and wrote the series, and even wrote some of the hymns. It spawned a 1931 movie, *Way Back Home*, which starred a 29-year-old Lord in heavy makeup.

Lord based *Sunday Evening at Seth Parker's* on his own experiences. The son of a Connecticut Congregational minister, Lord developed his narrative skills from his grandfather, Hosea Phillips, a traveling salesman "whom none could beat in story telling, witticisms, and good common sense," Lord later wrote. After education at Bowdoin College and stints as a high school principal and candy maker, Lord got his break when the National Broadcasting Company (NBC) approved his proposal for a radio show about small-town life. "An old-fashioned cottage gathering of friends and neighbors coming together to sing hymns and discuss news of the town," Lord described it. The show became a huge success, as ten million listeners tuned in weekly to the cottage by the sea.

After five years Lord decided to have the Parkers and their Jonesport neighbors take an around-the-world cruise while Lord and his cast did so in real life. They departed on 8 December 1934, in the four-masted schooner *Seth Parker*, with sophisticated shortwave broadcasting equipment aboard that enabled them to continue their weekly broadcasts. This remarkable and highly publicized voyage was cut short two months later when a hurricane disabled the boat in the South Seas, 300 miles from Tahiti. The schooner's passengers were rescued by the Australian heavy cruiser *HMS Australia*, which carried one of King George's sons. Convinced that the ship's SOS calls were a publicity stunt, Australian officials demanded that Lord be brought up on charges. He was exonerated after the cruiser's captain asserted that Lord's maritime distress was real.

Embarrassed by this international incident, Lord abandoned the *Seth Parker* show and changed career paths. He developed the fast and violent action show *G-Men* in 1935 as a sharp contrast to the leisurely and gentle *Seth Parker*. After renaming the show *Gangbusters*, Lord and his production company, Phillips H. Lord Inc., developed other programs. The factual human-interest show *We the People* debuted in 1936 and aired for three seasons. It was soon followed by the

serial drama *By Kathleen Norris*, the aviation adventure *Sky Blazers*, and the crime dramas *Treasury Agent* and *Counterspy*. Lord even revived *Seth Parker*. Before he turned 40, Lord had become one of the most successful writers, actors, and producers in radio.

Amid the flurry of development, Lord produced a new courtroom drama set in New York, entitled *Mr. District Attorney*. Horror-fiction writer Alonzo Deen Cole sued Lord for appropriation of literary property, claiming that he had submitted the idea to Lord but was never compensated or acknowledged. Lord won in trial court, but the verdict was overturned on appeal. The New York Court of Appeals ruled that Lord had indeed stolen the idea from Cole.

Lord tried to make the transition to television as a producer, but after two failed series he retired to coastal Maine, where he found contentment promoting community dances and sing-alongs. ("I'm exceedingly ambitious," he once told a reporter, but then added, "I'd swap all I have for contentment.") After suffering from myasthenia gravis, he died on 19 October 1975 in Ellsworth, Maine, just a short drive from Jonesport.

Low-Power Radio/Microradio

Small Community Radio Stations

Microradio is a political movement with the goal of putting low-power FM transmitters into the hands of community activists, minority groups, and those with no hope of getting a traditional Federal Communications Commission (FCC) license to broadcast. Under the leadership of Free Radio Berkeley (FRB) founder Stephen Dunifer, instructions are readily available to anyone who wants a low-cost transmitter kit, programming help, and legal representation. Microradio broadcasters are often students and street people without property, and when ordered by the FCC to cease operations, they simply move to another location. FCC enforcement is uneven and has been complicated by recent court rulings. In *United States v Dunifer* (July 2000), the court ruled against Dunifer's right to broadcast without a license. That decision led activists to pressure the FCC more strongly for a licensed low-power FM service.

Origins

The history of unlicensed radio goes back to the early radio-telephone experimenters who simply went on the air without asking anybody's permission. By the end of the 1920s, the radio spectrum had been divided between commercial, amateur, and experimental users. All were required to have licenses, first from the Federal Radio Commission and after 1934 from the FCC. But there have always been scofflaws, mostly referred to as "pirate broadcasters." From ships anchored offshore with powerful transmitters to radio hobbyists broadcasting entertainment on amateur radio frequencies, there is a long history of unlicensed broadcasting. The most blatant of those illegal operators were usually caught and fined, and their equipment was confiscated. Unlike the modern microradio movement, most such "pirates" were not political activists.

For a time, however, small radio stations were not only allowed, they were actively encouraged. With the inception of FM radio, the FCC encouraged noncommercial operations.

When frequencies went begging, the FCC in 1948 initiated a low-power category of stations, the so-called Class D outlets, that might use as little as ten watts of power and cover a very small area with a usable signal. But they were broadcast outlets, often held by nonprofit groups unable to afford anything larger. By the 1970s there were several hundred such stations on the air.

Low-power stations were increasingly resented by the FM radio business, which was rapidly expanding in the 1970s and 1980s. Tiny stations took up valuable frequencies that full-power outlets coveted. In 1978 the FCC began to reverse course, requiring these stations to use at least 100 (and more likely 1,000) watts or give way to full-power stations that would provide more services to more listeners. By the mid-1990s, only a handful of the old Class D stations remained, and most of those were preparing to use the required higher amounts of power.

A model for what could develop with radio was borrowed from television. As a result of experiments originating in Canada in the 1970s, the FCC became interested in and eventually approved a class of low-power television stations in the early 1980s. These were to use very low power on VHF channels or up to about 1,000 watts on UHF channels that would be "dropped in" among already allotted full-power channels in such a way as to keep interference at a minimum. After years of legal wrangling over how best to handle the mountain of conflicting applications, the FCC was granted the right to hold lotteries among mutually exclusive applications. By 2000 there were hundreds of low-power television outlets on the air, some providing original programs but many connected by satellite and offering typical entertainment programs otherwise not receivable in isolated rural areas.

Ted Coopman (1999) tells of the beginning of the modern microradio movement:

The modern micro broadcasting movement began on November 25, 1986 in a public housing development in

Springfield, IL. Put on the air for about \$600, the one-watt station broadcast openly on 107.1 FM as Black Liberation Radio (now Human Rights Radio). The operator, Mbanna Kantako, a legally blind African-American in his mid-thirties, started the station because he felt that the African-American community in Springfield was not being served by the local media. Kantako felt that because the African-American community had a high illiteracy rate, radio would be the best way to reach this community.

According to FRB founder Dunifer, the goal of the microradio movement was to have so many transmitters in use across the country that the FCC would be overwhelmed, finding itself in a situation similar to one it faced in the early 1970s, when the FCC was unable to control the widely popular citizens band radio service. Licensing for that service was eventually dropped. Unlike the "pirates" of the past, who hid from the FCC, microradio proponents act in open defiance of the law, challenging the government to arrest them, to shut them down. They believe that they are entitled to the airwaves; that they are shut out of the current allocation of FM licenses; and that, because of scarcity and resulting high cost, licenses are available only to the wealthy.

Dunifer was successful in convincing the National Lawyers Guild that the right to broadcast was a civil rights issue, one of giving access to all people, especially those disenfranchised by licensed media. In 1993 Dunifer's ten-watt radio station started operation at 104.1 FM, offering music and political commentary while actively challenging the FCC. In June 1993, the FCC issued a *Notice of Apparent Liability* to Dunifer for unlicensed broadcasting and fined him \$20,000. Dunifer was represented by the Lawyers Guild, and in 1995 a U.S. district court in Oakland, California, heard arguments on constitutional issues in Dunifer's case, arguments stating that the FCC had not proved that his broadcasts caused harm to licensed broadcasters. The FCC responded, saying that siding with Dunifer would cause thousands more to go on the air, and the resulting interference would be chaotic.

The attorney arguing the case for Dunifer raised other issues in the hearing that would eventually cause the FCC to study the possibility of a licensed low-power FM service. One such issue was that the 1978 elimination of the Class D ten-watt educational license in favor of licenses for stations over 100 watts was overly restrictive and violated Dunifer's First Amendment right to free speech. It was argued that the commission's failure to provide a low-power service did not provide for the public interest, convenience, and necessity required under the Communications Act of 1934. It was further argued that the financial qualifications required for an FM station license violated the equal protection clause of the Constitution. The FCC disagreed on all counts.

In November 1997 Federal District Judge Claudia Wilken ruled in favor of Dunifer, saying the FCC had failed to prove Dunifer had done harm to existing broadcasters. Buoyed by this victory, Dunifer continued to help others get on the air and to promote the creation of a low-power service. But in June 1998 the FCC prevailed in court, and Dunifer was taken off the air, based on the fact that he had applied for neither a license nor a waiver to broadcast and therefore lacked standing to challenge the FCC. In July 1999 Dunifer's attorneys appealed, arguing that the FCC had not acted in good faith when dealing with microradio, citing as evidence a San Francisco applicant's request for such a license, which had been ignored by the FCC.

Development of the microradio movement has been based on a common belief that stations very low in power escape the jurisdiction of the FCC. This misconception is based on Part 15, Subpart D of the FCC rules, which permits unlicensed operation of very low power transmitters. This rule only allows, however, for an effective service range of 35 to 100 feet in the FM band. On AM frequencies, unlicensed transmitters cannot cover a radius larger than about 200 to 250 feet. The FCC argues that if microradio stations are able to reach listeners, they are almost certainly operating illegally.

Low-Power FM

As the number of microradio stations grew and complaints from the National Association of Broadcasters (NAB) increased, the FCC closed a number of unlicensed microradio operations. Both the protests and the microbroadcasting movement continued to grow, however. Media reports suggested that between 500 and 1,000 microradio stations were on the air in 1998, although five years earlier only a handful existed.

In spite of NAB protests, FCC Chair William E. Kennard suggested that proposals to establish a legal microbroadcasting service were worthy of consideration. The FCC issued a *Notice of Proposed Rulemaking* on 28 January 1999 to authorize an LPFM broadcast service. The FCC's *Notice* cited concern about the increasing concentration of ownership of media properties, with concomitant loss of diversity, in addition to suggesting that smaller communities outside metropolitan areas were often deprived of local focus in programming.

In response to its *Notice*, the FCC received thousands of comments representing the views of community groups, labor unions, religious organizations, state and local government, and others. The commission announced that response to the petition had indicated a broad interest throughout the country in the LPFM proposal. Further, the commission's webpage on "Low Power Broadcast Radio Stations" was accessed more than 15,000 times in 1998 alone. The FCC received thousands of additional phone and mail inquiries each year regarding the legality of low-power broadcasting.

The commission's decision was released 20 January 2000 with the announcement that such a service would, in fact, be established. In spite of aggressive protest and threatened legal action by the NAB, the FCC voted to create an entirely new type of radio station, with the intention of enhancing service to underrepresented groups and local communities. The FCC's restrictions were as follows:

These (LPFM) stations are authorized for noncommercial educational broadcasting only (no commercial operation) and operate with an effective radiated power (ERP) of 100 watts (0.1 kilowatts) or less, with maximum facilities of 100 watts ERP at 30 meters (100 feet) antenna height above average terrain (HAAT). The approximate service range of a 100 watt LPFM station is 5.6 kilometers (3.5 miles radius). LPFM stations are not protected from interference that may be received from other classes of FM stations (www.fcc.org).

Several years after the initial announcement of the Low Power (LPFM) service, the FCC had received several thousand applications. Most of the applicants have been from religious organizations, the rest from community foundations and educational entities. A current list is on the FCC database (www.fcc.gov/fcc-bin/fmq?state=&serv=FL&vac=&list=2). Approximately 200 Construction Permits (CP) had been issued and 40 applicants had received actual licenses. Most of these were in the L1 category, 100 watts or less. Only a few have been under the L2 designation, 10 watts or less. As of the beginning of 2003, the FCC was not taking any additional applications.

While at least some of the original impetus for the LPFM service was to either legitimize or remove from the air the so-called pirates or micro broadcasters, based on the list of applicants, CPs and licenses issued, many observers suggest that the following will likely happen: former big city pirate/micro

broadcasters will not receive licenses due to interference concerns in crowded FM markets; most licensees will be religious organizations, schools, and community foundations. And if the experience from the educational FM "boom" of the 1970s is repeated, most of these LPFM broadcasters will eventually lose interest and funding and abandon their licenses, many of which will be taken over by larger NPR broadcasters and well-funded networks and religious organizations.

Lum 'n' Abner

Comedy Show

A party line rings, two "backwoods" voices respond ("I-grannies, Abner, I believe that's our ring." "I-doggies, Lum, I believe you're right."), and the announcer gently brings us up to date with the latest events here in Pine Ridge, Arkansas, home of the "Jot 'Em Down Store" run by Columbus "Lum"

Edwards and Abner Peabody. On *Lum 'n' Abner*, Chester Lauck (Lum) and Norris "Tuffy" Goff (Abner) performed their homespun country characters for more than 20 years, starting on a local Arkansas station and eventually airing for a time on every major radio network.

Chester Lauck and Norris Goff broadcast another episode of *Lum 'n' Abner* in 1947–48 as organist Ralph Emerson awaits his cue
Courtesy National Lum & Abner Society

Lauck and Goff met as boys in a Mena, Arkansas, grade school, and they were performing impressions and blackface comedy together by the early 1920s. In 1931 an Arkansas radio station invited locals to perform for a flood-relief benefit, and Lauck and Goff planned to do their blackface act. Seeing the station overrun with other blackface teams, they instead performed an “Ozarkian humor” routine to great listener response. They were signed to a weekly 15-minute program on KTHS in Hot Springs, Arkansas, and by late summer of that year they had both a sponsor (Quaker Oats) and a foothold on a regional National Broadcasting Company (NBC) station, Chicago’s WMAQ. From then on, *Lum 'n' Abner* became an increasingly hot property; whenever Lauck and Goff were not pleased with their time slot, pay, or sponsor, another network gladly wooed them away.

The show’s style was wry and folksy, deriving much of its humor from a combination of misfiring schemes and “countri-

fied” misunderstandings of aspects of the everyday lives of their listeners, as when Lum and Abner try to do their taxes or when the town blacksmith, Cedric Weehunt (Lauck), tries to become a ventriloquist without realizing that ventriloquists are supposed to change the dummy’s voice and try not to move their lips. The characters were not stooges, though (despite Abner’s regular catchphrase—“Huh?”—often uttered after Lum’s long and involved explanation of his latest plan): the folks of Pine Ridge always ended up on top. There was a gentle tone to the humor and a relaxed pace to the steadily rolling plot arcs that made the program a long-lived and reliable performer in the ratings.

Some plotlines were self-contained in a single episode, as when Lum and Abner struggle to do their 1942 taxes, first concluding that they owe “the givverment” 8,912 sacks of sugar, then realizing that the government actually owes them (though they decide instead to send along the extra cash in the till to

help the war effort). However, more often the plots wove their way onward for weeks, as when the town's richest man, Diogenes Smith, holds a campaign to discover and reward the kindest person in town, which begins a complex train of events in which Lum eventually becomes an unwitting courier of counterfeit money.

Lauck and Goff performed the voices of most of the program's major characters. In fact, for the first six years they performed all of the characters, and those they did not perform (the female characters in particular) were only talked about in the store and never actually appeared on the show. NBC executives were continually pushing to broaden the program's scope; one 1933 memo read, "I have impressed upon the boys the necessity of more action and other characters. Their scripts from now on will have both. They are afraid of women characters, for they feel they can't write the dialogue. However, we will work hard to accomplish this." In the late 1930s female characters did begin to appear occasionally, most often voiced by Lurene Tuttle.

The program was particularly popular in its home setting, rural Arkansas. In 1936, to celebrate *Lum 'n' Abner's* fifth anniversary on the air, the unincorporated Arkansas town of Waters officially changed its name to Pine Ridge at a ceremony attended most notably by the governor of Arkansas, Lauck, Goff, and town resident Dick Huddleston, a fictionalized version of whom was voiced by Goff on the program. To this day one can visit the "Jot 'Em Down Store" in Pine Ridge, which serves as a *Lum 'n' Abner* museum and which is where the National Lum and Abner Society holds conventions for aficionados. There is also a country store in Kentucky's Fayette County that styles itself the "Jot 'Em Down Store"; it dates back to a 1937 visit by Lauck and Goff on their way through the area to buy some horses.

The show's popularity was parlayed over the years into a series of seven feature films starring Lauck and Goff (with appearances by performers such as Zasu Pitts, Grady Sutton, Franklin Pangborn, and Barbara Hale) and produced by RKO, beginning with *Dreaming Out Loud* in 1940 and ending with *Partners in Time* in 1946. One additional film was released by "Howco Productions" much later, in 1956, an odd installment that found Lum and Abner out of the familiar territory of Pine Ridge, traveling to Paris and Monte Carlo. It was actually an edited-together version of three *Lum 'n' Abner* television pilots that the Columbia Broadcasting System (CBS) had originally produced in 1949 to no great acclaim.

In late 1948, during its second stint on CBS, *Lum 'n' Abner* changed from its 15-minute serial-comedy format to a half-hour comedy variety program, including for the first time such trappings as an orchestra and a studio audience. This was how the program seemed to end its days, going off the air in the spring of 1950. But three years later it reappeared once more

in its traditional 15-minute format, first for a limited 13-week series and then for a final six-month run.

Lum 'n' Abner is one of the radio programs for which many recordings and scripts still survive. Some tapes are available from commercial sources, but there are also thriving collections circulating in the hands of ordinary fans. *Lum 'n' Abner* may not have the instant modern name recognition of programs such as *Amos 'n' Andy*, but it has made its mark—not only among radio fans, but also on the map of the United States.

Lux Radio Theater

Anthology Drama

One of the most popular and prestigious radio programs for two decades, *Lux Radio Theater* was a dramatic anthology that mainly presented movie adaptations with big-name Hollywood stars.

Lever Brothers had been using celebrities to endorse its Lux Toilet Soap in magazine ads throughout the 1920s, and in 1934 the J. Walter Thompson Advertising Agency proposed to Lever Brothers an extension of this promotional tactic, the sponsorship of a radio drama presenting stars of the stage and screen. The resulting program, *Lux Radio Theater*, aired on the National Broadcasting Company (NBC) and originated from downtown Manhattan, premiering on 14 October 1934. Given its New York locale, the program presented mostly Broadway talent and properties in this early period. During the first season, the show's host was a fictitious character named Douglass Garrick, played by John Anthony and billed as the show's producer. Peggy Winthrop, another fictional character played by Doris Dagmar, supplied commercials. In addition to commercials, the show's framework included a scripted chat session between Garrick and each particular episode's stars.

By the end of its first season, *Lux Radio Theater* was a critical success, but given their sizable investment in the show, Lever Brothers had hoped for higher listener ratings. When the Columbia Broadcasting System (CBS) offered them the advantageous 9 P.M. Monday night slot, *Lux* made the switch to that network and time. The second season brought a few other changes: a new actor, Albert Hayes, played Douglass Garrick; Art Millett was added as announcer; and the Peggy Winthrop character was eliminated.

By the end of the 1935–36 season, ratings still were not where Lever Brothers wanted them. Under the assumption that film stars would draw larger national audiences than Broadway stars, in 1936 *Lux* moved to Hollywood, specifically to

the Music Box Theater on Hollywood Boulevard. Producers also hoped to bring in a famous Hollywood name to replace the Douglass Garrick figure as host. They settled on famed movie director Cecil B. DeMille, who, although he was assigned the title of producer, was simply a host figure and often appeared only for dress rehearsals and the actual recordings. It was hoped that DeMille's famed persona as creative tour de force would help lend a prestigious, glamorous image to the show. Additionally, by specifically presenting him as a producer, essentially an authorial voice, *Lux Radio Theater* posed the show as a first-rate cultural experience on par with DeMille's epic film productions. Equally important, framing DeMille as a creative force helped to elide the fact that the show was really created by an ad agency concerned mainly with advertising revenue, rather than solely a culturally beneficial endeavor.

As a result of these changes, the 1936–37 season brought a plethora of stars in movie adaptations, such as Errol Flynn and Olivia de Havilland in “Captain Blood,” Irene Dunne and Robert Taylor in “Magnificent Obsession,” and Fredric March and Jean Arthur in “The Plainsman.” Cooperation between J. Walter Thompson and the Hollywood studios made this possible. The studios would offer the broadcast rights to film properties for a fee (usually no more than \$1,000), though sometimes the rights would be offered for free in exchange for publicity on the air. The show's most substantial expense came from talent costs. DeMille made \$2,000 per show in this period, and each headlining star received \$5,000. (The average yearly salary in the U.S. in 1937 was \$1,327.00) Given that a minimum of two headliners per episode was the general rule, talent costs could reach as high as \$20,000 per episode.

In 1940 *Lux Radio Theater* changed recording facilities to the Vine Street Playhouse. This venue offered a more spacious

*Lux Radio Theater, Spencer Tracy, Fay Wray, and Cecil B. DeMille
Courtesy CBS Photo Archive*

stage, and the actors would thus all stand on the stage throughout the whole program, even if their parts were completed in the first act. DeMille sat off to the side at a card table, and an offstage mike provided sound effects and some commercials. The New York version of the show had not been presented in front of an audience, and a change in this policy upon the move to Hollywood resulted in a furious weekly demand for tickets.

The next period of upheaval for *Lux Radio Theater* came in 1944, when DeMille left the show. His departure stemmed from a dispute with the American Federation of Radio Artists (AFRA). A proposition on that year's state election ballot would have allowed a Californian the right to obtain employment without first gaining union affiliation. AFRA strongly opposed this measure and charged all members one dollar to fund a battle against its passage. The right-wing DeMille resolutely objected both to AFRA's stance and to their demand that members fund it, and he refused to pay his dollar. This resulted in a suspension of his AFRA membership, meaning he was also barred from any radio work. *Lux* first turned to guest hosts in the interim, including Brian Aherne and Lionel Barrymore, but when it became clear that neither AFRA nor DeMille would relent, the producers settled on a permanent host in William Keighley, a lesser-known Hollywood director. Keighley took on DeMille's role as host and faux-producer; however, he could never match the famed director's prestigious presence and vaunted image.

Keighley retired in 1952 and was replaced by Irving Cummings, a fellow Hollywood director. However, *Lux Radio Theater's* ratings began a precipitous slide, particularly into 1954, as Lever Brothers and J. Walter Thompson were giving more attention and money to the television version of the program, *Lux Video Theater* (1950–57). In 1954, NBC reclaimed *Lux Radio Theater* and tried to resurrect the show's stately image with a marketing campaign and presentation of "twenty of the greatest Hollywood pictures" during the 1954–55 season. However, this did little to stem the show's decline, and the show aired its final broadcast on 7 June 1955. The television version carried on until 1957, but it never reached the popularity of the radio version, particularly because it could not offer

the caliber of stars the radio show had. Only the radio version could tout a history of 926 episodes starring the most famous talent of the era.

Mankiewicz, Frank 1924-

U.S. Broadcast Executive, President of National Public Radio

Frank Mankiewicz, the third president of National Public Radio (NPR), led the organization from obscurity to national significance. Mankiewicz took over leadership of the seven-year-old NPR in August 1977.

Public radio, as represented by NPR and the Association of Public Radio Stations, had just emerged from two years of internal strife by merging to create a “new,” more powerful National Public Radio to provide political, promotional, technical, and programming leadership. The fresh start required a new president, someone who was “somebody,” preferably a politician, a journalist, a showman, a promoter, and a celebrity whose phone calls would be returned. The new NPR board found that individual in Frank Mankiewicz, scion of the Hollywood family, press secretary to the late Senator Robert Kennedy, director of George McGovern’s 1972 campaign for president, and a syndicated columnist and author. Along the way, Mankiewicz had spent six years as a Hollywood lawyer, had directed Peace Corps operations in Latin America, and had run unsuccessfully for the California state legislature and the U.S. Congress from Maryland. His name was also to be

found on the enemies list of President Richard Nixon, about whom Mankiewicz had written two books.

Mankiewicz did not disappoint. He transformed public radio in four critical areas: publicity, programming, politics, and satellite delivery.

Publicity

The news media finally discovered NPR after having virtually ignored it for its first seven years. Much of the publicity centered on Mankiewicz as a personality. He was good copy, always ready with the quick quip and the memorable sound bite. More fundamentally, his programming and political exploits gave the media something interesting to write about.

Programming

Mankiewicz persuaded President Jimmy Carter to participate in a two-hour national call-in program from the White House on a Saturday afternoon, 13 October 1979. For those two

Frank Mankiewicz
 Courtesy AP/Wide World Photos

hours, all media focused on the previously unknown NPR. In addition to publicity, the president's exclusive appearance gave the obscure network much-needed credibility. Similarly, Mankiewicz persuaded the Senate leadership to allow NPR to broadcast live its debate on the Panama Canal Treaty. Although the Senate had always excluded cameras and microphones from its chambers, Mankiewicz broke that barrier, creating what he described to the press as a historic broadcast of a historic event.

In entertainment, Mankiewicz reached back to his boyhood, when his father, Herman Mankiewicz, teamed with Orson Welles on the *Mercury Radio Theater* and its most famous production, "War of the Worlds." NPR would collab-

orate with George Lucas on a radio adaptation of the *Star Wars* film trilogy. The series brought new attention and new listeners to NPR.

Of most lasting consequence, however, was Mankiewicz's decision to move NPR news into radio's prime time, morning drive. *Morning Edition's* debut in November 1979 more than doubled NPR's news output, its budget, and its staff, and it focused those resources where they could reach the most potential listeners. *Morning Edition* indirectly transformed both NPR and the programming on its member stations. NPR became a competitive 24-hour news organization for the first time, changing its public image and its internal psychology from that of an ancillary alternative service to that of a pri-

mary source of breaking news. To make room for *Morning Edition* in prime morning hours, stations were forced to rethink and refocus their entire approach to programming. For the most part, they eliminated their weakest program elements and concentrated on their strongest. A combination of these changes doubled public radio's cumulative audience from 4 million to 8 million a week between 1979 and 1982.

Politics

After almost a decade of struggle between public radio and public television over the division of federal funds between the two media, Mankiewicz boldly persuaded Congress to earmark 25 percent of its funding for public radio. Public television had argued that radio should receive only 10 percent; prior to Mankiewicz, public radio had felt victorious when it won 17 percent. The extra money made possible *Morning Edition* and other dramatic improvements in the public radio service.

Satellite Delivery

Congress also agreed in 1979 to fund a satellite delivery system for public radio, the first radio network to use that technology for network distribution of programs. The satellite not only improved the technical quality of NPR programming but also provided the flexibility to produce programming from a variety of locations around the country, making possible such important innovations as the live broadcasts of Garrison Keillor's *A Prairie Home Companion* from Minnesota each Saturday night.

Despite all his success, the Mankiewicz presidency did not end happily. The election of Ronald Reagan in 1980 resulted in a 25 percent reduction in federal funding for public broadcasting in 1983. With typical brashness, Mankiewicz proposed to meet that challenge not by reducing service but by expanding it. He planned to raise the necessary money from the private sector, through increased "underwriting" of programming and through business ventures that would utilize NPR's satellite capacity to provide a variety of commercial services to the public. The concepts had merit, but Mankiewicz did not have the time or the money to realize them. None would produce significant revenue for several years, and all required significant investments right away.

By early 1983 NPR found itself running a \$3 million deficit, which increased to \$6 million and threatened to reach \$9 million if drastic action were not taken. NPR was insolvent. Ulti-

mately, member stations and the Corporation for Public Broadcasting bailed NPR out of its difficulties, but a condition of that bailout was the firing of Frank Mankiewicz in April 1983. Although he had hoped to leave NPR to become commissioner of baseball, Frank Mankiewicz instead formed an alliance with Republican political operative Robert Gray to spend the rest of his career in one of Washington's most influential lobbying organizations.

Ma Perkins

Serial Drama/Soap Opera

A widow whose homespun wisdom guided her family, friends, and neighbors in the fictitious rural community of Rushville Center, *Ma Perkins* was also one of radio's most enduring soap operas, captivating American and, at times, overseas audiences for 27 years, from 1933 to 1960. Throughout its entire run of 7,065 episodes, Virginia Payne portrayed the leading character.

A 15-minute daytime serial drama, *Ma Perkins* premiered on NBC radio on 4 December 1933, three months after its local debut on WLW in Cincinnati, Ohio. Cincinnati-based Procter and Gamble Company, makers of Oxydol soap flakes, initially sponsored the broadcast. The drama was so popular it was picked up by competing networks, CBS and Mutual, at various times, while continuing its broadcasts on NBC as well. CBS acquired exclusive rights to the show in 1949, where it remained until its final broadcast in 1960.

Ma had three children, John, Fay and Evey, whose husband Willie Fitz (portrayed by Murray Forbes, also for all 27 years of the broadcast) managed Ma's lumber yard business. Shuffle Shober, Ma's business partner, was portrayed by Charles Egleston for 25 years, until his death in 1958. Edwin Wolfe succeeded him for the remaining run of the show. Writer Orin Tovrov wrote the scripts for more than 20 years.

Ma Perkins' roots can be traced not only to Cincinnati, but also to Chicago, where advertising executives Frank and Anne Hummert created the program. It was in Chicago that the Hummerts also originated other popular daytime drama serials in the early 1930s, including *The Romance of Helen Trent* and *Just Plain Bill*. Though each of the serials offered different characters with different story lines, they were all products of the Hummerts' desire to present familiar themes that had proven popular with Depression-era listeners seeking some measure of assurance and security in an unstable world. According to Marilyn Matelski, the Hummert approach was a simple formula. "[It] combined fantasies of exotic romance, pathos and suspense with a familiar environment of everyday life in a small-town or rural setting. Combined with an identifiable hero or heroine, this formula produced an overwhelming audience response" (see Matelski, 1988).

The story lines for *Ma Perkins* often reflected the turbulence of the times. In one broadcast during World War II, for example, Ma learns that her son John was killed in combat in Europe. The "news" prompted a flood of letters from devoted listeners expressing their sympathy. Throughout its run, *Ma Perkins* conveyed the vulnerability of life in ways not depicted before on radio. It did so while reaffirming the belief that people could solve their problems so long as they believed in one

another. In 1938, Ma offered this observation: "Anyone of this earth who's done wrong, and then goes so far as to right that wrong, I can tell you that they're well on their way to erasing the harm they did in the eyes of anyone decent."

Virginia Payne was only 23 years old when the serial drama premiered, and, remarkably, she never missed a performance in its 27-year run. A Cincinnati native and graduate of the University of Cincinnati, she faithfully dressed the part at countless public appearances and even personally answered many of her listeners' letters. Her down-home language included such expressions as "I ain't sure I understand it" and "Land sakes!"

U.S. audience interest in radio soap operas declined during the 1950s because of the growth of television, and *Ma Perkins* was no exception. By 1960 CBS radio cut three of its ten serials, and NBC dropped its last surviving soap opera; ABC had ended all of its daytime serials the year before. The sponsors that owned the programs abandoned radio in favor of television because of its increasing audience appeal. The transition to television created a vacuum in radio advertising sales, and by 1960 only one quarter of network radio advertising time was being sold. Local radio, meanwhile, was blossoming: disc jockeys replaced radio network programs in large numbers by the end of the 1950s, and radio station managers discovered that the locally hosted music program proved cheaper for advertisers and more popular to listeners as well. By the 1955-56 season, *Ma Perkins'* radio audience share had fallen to one quarter of its all-time high in 1944-45. On 25 November 1960, the show's final broadcast featured the family at its traditional Thanksgiving meal:

"I look around the table at my loved ones and to me the table stretches on and on. Over beyond the other end past Shuffle I see faces somehow familiar and yet unborn, except in the mind of God... Someday, Fay will be sitting here where I'm sitting, or Evey, or Paulette... They'll move up into my place and I'll be gone, but I find right and peace in that knowledge... I give thanks that I've been given this gift of life, this gift of time to play my little part in it," Ma said at the table.

Virginia Payne was only 50 years old when *Ma Perkins* ended. During the 1960s and 1970s she remained active in show business, appearing in radio commercials and touring in such productions as *Life With Father*, *Becket*, and *Oklahoma!* Shortly before her death in Cincinnati on 10 February 1977, she appeared on radio one last time on *The CBS Radio Mystery Theater*.

The March of Time

Network Docudrama Series

The *March of Time*, a radio forerunner of today's television "docudramas," was a widely heard and imitated news dramatization program—a "radio newsreel"—that lasted 14 seasons on network radio (1931–45) and led to a famous motion picture documentary series of the same name. *The March of Time* is best remembered by the words of the title spoken by the mellifluous narrator Westbrook Van Voorhis, who also spoke on the newsreel version and ended both by saying "Time marches on."

Origins

The idea for a digest of the news for radio broadcast originated with Fred Smith, the first station director at WLW in Cincinnati. Smith wrote and directed dramas for WLW and introduced many program ideas at the station. In 1925 he hit upon the novel idea of reading various items taken (without permission) from newspapers and magazines. Smith called the

program *Musical News*; after each story, a brief musical piece was played by the staff organist.

About the same time, a similar idea was put into print in a new kind of weekly magazine. Henry R. Luce and Briton Hadden, friends since prep school and Yale, quit their jobs at the *Baltimore News* in 1922 to found a magazine that summarized the week's news—an idea they had discussed since their days in boot camp during World War I. The magazine was *Time*, and its first issue appeared 3 March 1923. (Luce ran *Time* alone after the death of Briton Hadden in 1929.)

In 1928, Fred Smith at WLW got permission from *Time* to use an advance, or "makeready," copy of the magazine sent to him by airmail (then just begun) so that he could rewrite items for a weekly news summary on WLW. Soon Smith was hired by Time Incorporated and traveling the Midwest, signing up stations for a daily news summary the magazine would syndicate to radio stations. Beginning on 3 September 1928, 10-minute scripts were delivered by airmail to be read by local announcers on more than 60 stations. In New York, WOR called the program *NewsCasting* and broadcast it from 5:50 P.M. to 6:00 P.M., Monday through Friday. Smith himself was WOR's reader for the first year.

The radio program's title was apparently the first use of the word *newscast*, and it was listed in the *New York Times* radio logs by that title. While at WLW, Smith had coined *radarios*, after *radio* and *scenario*, for original radio plays he wrote and produced. (*Time* was even better known for its neologisms, coining *cinemaddict*, *newsmagazine*, and *socialite*, among others.) By the spring of 1929, the ten-minute summaries were being carried on as many as 90 stations (up from 60 stations just a half-year earlier)—the first large-scale regular daily news broadcast carried in the United States—but it was never a true network program because each station developed its own script.

Fred Smith next conceived of dramatizing the news. In September 1929 he produced a five-minute "news drama" in cooperation with *Time* and submitted his audition program to a number of stations with the title *NewsActing*. Although *newsacting* did not become a household word, the program idea caught on. By December 1929 Smith and a crew of six to eight actors were producing a weekly five-minute drama for distribution by electrical transcription. These programs were not full-scale dramatic productions, but they included sound effects, occasional music, and the portrayal of the voices of actual people involved in the news stories. Within a few months the *NewsActing* records were being broadcast over more than 100 stations nationwide. At the time, other network programs were dramatizing history, but none had tried a weekly presentation of current news.

Henry Luce wanted to advertise *Time* on the radio networks, and on 6 February 1931, an experimental program was sent via telephone wires to the home of a Time Inc. executive

where a small group was gathered that included CBS president William S. Paley. Exactly a month later, on Friday, 6 March 1931, *The March of Time* was fed from CBS's New York studios and carried on 20 of the network's affiliates (there were then about 80) at 10:30 P.M. EST. (The program's title was taken from a Broadway show tune of the same name.) After a five-second fanfare, the announcer said:

The March of Time. On a thousand fronts the events of the world move swiftly forward. Tonight the editors of *Time*, the weekly newsmagazine, attempt a new kind of reporting of the news, the re-enacting as clearly and dramatically as the medium of radio will permit some themes from the news of the week.

Network Years

This first program dramatized the reelection of William "Big Bill" Thompson as mayor of Chicago, the sudden death of the *New York World* by merging with the *New York Telegram*, and shorter segments on French prisoners sent to Devil's Island, revolution in Spain, prison reform in Romania, a roundup of news of royalty, an auction of Czarist possessions in New York, and the closing of the 71st United States Congress.

During the first season the program ran 13 weeks. It returned on 8 September 1932, but as a sustaining feature because *Time* executives had decided that they could not afford advertising, which they said the magazine no longer needed. In the magazine the editors justified the radio show's cancellation by asking, "should a few (400,000 *Time* subscribers) pay for the entertainment of many (9,000,000 radiowners)?" In the 29 February 1932 issue, *Time* also argued, "For all its blatant claims to being a medium of education, radio contributes little of its own beyond the considerable service of bringing good music to millions." In November 1932 the magazine resumed its sponsorship. *The March of Time* did its part to promote magazine sales: at the end of each program, listeners were reminded that they could find more details in the issue of *Time* magazine soon to be on newsstands.

On 1 February 1935, the *March of Time* newsreel began as a monthly film series in movie theaters. It began as a typical newsreel with several items in each issue, but the January 1938 issue focused on a single topic, "Inside Nazi Germany." After October 1938, single subjects were being treated exclusively as the series became a documentary rather than strictly a news series. The documentary series ran until 1951. Time Inc. also produced historical television documentary series, such as *Crusade in Europe*, based on the book by General Dwight D. Eisenhower (1948). The title *March of Time* was also used for a syndicated series of television documentaries produced by David Wolper.

During the 1933–34 season, *March of Time* was sponsored by Remington-Rand, and Westbrook Van Voorhis became the voice of the program. In 1935 there was a variety of sponsors when a daily 15-minute version was tried for one season. In 1938 the program was sponsored by Time Inc.'s *Life* magazine (purchased by Luce in 1936), and the announcer worked that title in to the opening of the program: "Life! The life of the world, its conflicts and achievements, its news and fun, its leaders and its common people." The program was not aired during the 1939–40 and 1940–41 seasons. After seven years on CBS, it moved to the NBC Blue network. In July 1942 the format was changed to only one or two dramatized segments and many more live, on-the-spot news reports. By the 1944–45 season, *March of Time*'s last, listeners were hearing the actual voices of newsmakers on many network programs.

At the century's end much was being made of the "synergy" of cross-media ties, the idea being that the interaction of a

media corporation's units (say, a magazine division feeding story ideas to a film company) would encourage the making of products and profits greater than the sum of the corporation's parts could make by acting alone. *The March of Time* was one of the first examples of synergy. Fred Smith's idea of reading a few news items accompanied by musical selections that became *Musical News*, *NewsCasting*, *NewsActing*, and *March of Time* led to the many "dramatized news" programs—documentaries and docudramas—on television today.

Marconi, Guglielmo 1874-1937

Italian Wireless Inventor

Marconi's daughter Degna Marconi published an account of the prophetic revelation given at the future inventor's birth: as the household servants joined family members in crowding into the birth room, a servant tactlessly commented, "What big ears he has!" Guglielmo's mother, Annie, although spent from a difficult labor, is said to have defended her newborn by saying, "He will be able to hear the still, small voice of the air." Little did she know that 21 years later, he would be sending messages across distances of more than a mile with no wires, but only air between the transmitter and receiver.

Youth

Marconi's early years afforded little formal education. He was born in the Italian countryside to an Italian father and an Irish mother. Although he attended an occasional school, he rarely got along well in such settings. Most of his education was gained either under his mother's tutelage, lessons that included readings from the Bible and English language instruction, or from books in his father's library. In the library, he was introduced not only to Greek mythology and history, but also to heroes of electricity such as Benjamin Franklin and Michael Faraday.

Marconi's father was impatient with his son's excessive interest in electricity and his constant tinkering with mechanical apparatuses. While constructing experiments based on Franklin's writings about electricity, the young Marconi succeeded in getting high-voltage electricity to vibrate a series of dinner plates to the point of destruction. Thereafter, his father began to systematically ruin Guglielmo's experimental equipment whenever he found it. It was his mother who worked to nurture her son's interest in exploring science. She helped him protect and hide the scientific devices he built.

The First Wireless Transmissions

At about the age of 20 Marconi was given the attic in the family's house as a private workspace where he could dabble in his hobby. He spent many secluded hours there working on experiments inspired by an article about the electromagnetic wave experiments of Heinrich Hertz. Marconi realized the possibilities for wireless communication if he could improve on Hertz's work. Although Hertz had showed that an alternating electric current in a closed electrical system could cause sparks to result in a totally separate loop of wire a few feet away, he had not conceived of the communication possibilities. However, others were making a communication connection. Even before Marconi had read about Hertz's experiment, others were building more powerful electromagnetic demonstrations and showing that the waves traveled for many feet without wires. None of the other experimenters, however, actually created anything practical in a communication sense.

Marconi began by duplicating Hertz's experiments in his attic. One night in 1894 he woke his mother and led her to the attic. There he tapped a telegraph key on one side of the attic. From the far end of the attic came the sound of a bell ringing every time the telegraph key was struck. While Marconi was said to lack the theoretical capacity of others experimenting with electromagnetic waves, his persistence and his ability to make his mechanical apparatuses do what he wanted them to do made him successful where others were not.

A neighbor, Professor Augusto Righi of the University of Bologna, provided informal tutelage on electromagnetic waves and gave suggestions for improving Marconi's early experiments. But Righi was also one of those who discouraged Marconi, suggesting that he would not succeed in making wireless communication practical. Such discouragement served to

Guglielmo Marconi

Courtesy Marconi International Fellowship Foundation

solidify Marconi's resolve to find a solution. Marconi's signals soon began to reach from the attic to the lowest corner of the home's interior. By the spring of 1895, Marconi began to experiment with communicating over longer and longer distances outdoors. By summer, he could send signals several hundred yards.

Much of the ability to advance the distance at which signals could be received was based simply on increasing the electrical power used by the transmitter, a very inefficient mode of sending signals over distances. It was at this point that Marconi made one of his most important early breakthroughs. In an attempt to transmit radio waves over greater distances, he used two large sheets of iron, placing one on the ground and holding the other in the air. Suddenly the distances the waves traveled were vastly multiplied. Marconi realized that placing part of the transmitter in the ground reduced the electrical resis-

tance, allowing the signal to travel up to a mile and a half. He had invented the grounded antenna. Soon he was sending signals more than two miles, even over and around hills and other obstacles.

Selling the Wireless Idea

Because Marconi did not have the high-level connections that a formally educated scientist would have developed, he and his mother relied on the advice of the parish priest and the family physician to decide how to pursue promoting his new invention. They chose to send a detailed document describing the invention to the Italian Minister of Post and Telegraph in early 1896. The invention, however, was rejected, and Marconi took this as a rejection by his country. (He may have fared better had he submitted the invention to the Italian Navy, which may

well have recognized the invention's tremendous potential for ship-to-shore communication.) Based on that initial rejection, and probably also at the urging of his Irish mother, they decided that England, the greatest maritime power of that time, was most likely to be interested in the invention.

After applying for a patent in London, Marconi presented his invention to William Preece, an official of the British postal system. Preece arranged for Marconi to present his invention to many prominent scientists, who were impressed with his achievements. As the commercial possibilities began to be realized, Marconi was asked to sell his invention, but instead he formed his own company, the Marconi Wireless Company, and sold only a minority interest to investors. He achieved a wireless link across the 8.5 miles of the Bristol Channel in 1897 and began to install radio towers on the coast to warn ships in dangerous waters.

Marconi was also invited to demonstrate his invention to the Italian Navy, a right that he had reserved for his invention when his patent was filed. In his demonstrations and tests in Italy, he first proved that his signals could pass beyond the horizon through, it would seem, a wall of ocean. This finding would prove crucial in forecasting his eventual transatlantic communication.

Marconi was not only an inventor, but also a shrewd businessman. When asked to set up a transmitting station on a ship off the coast of England to transmit reports on a yacht race, he was quick to take up the challenge. Although this move did little to advance his scientific knowledge, he knew it would provide immense publicity for his invention. Queen Victoria picked up on the idea of ship-to-shore communication and adopted its use for the royal family between Osborne House on the Isle of Wight and the royal yacht.

In 1899 Marconi established a wireless link across the 32 miles of the English Channel. But simply conquering greater and greater distances became somewhat less important for Marconi, who had realized that the nature of wireless communication allowed only one transmitter at a time to operate in an area without interference. If two stations operated simultaneously, they would cancel each other out. Therefore, Marconi began to fix his attention on both focusing the direction of the signal and tuning the signal. Shortly after his Channel link was established, he wrote to Preece that he had made some advances in tuning the radio signal. He received a patent for this tuning invention a few years later.

While Marconi was in the process of experimenting with tuning in 1899, he took his first trip to the United States at the invitation of American businessmen who encouraged him to set up wireless systems for the America's Cup yachting races. In addition to these publicity-oriented transmissions, Marconi also met with the U.S. Navy and Army for demonstrations.

During these tests, Marconi experimented with the tuning components of his system but refused to let navy personnel in

on the full details, because he had not yet applied for a patent. The navy, although only mildly enthusiastic, ordered several ships to be outfitted with wireless devices, but a deal with the Marconi company later fell through because of the high cost—ten cents per word—for using the devices. Shortly after his departure after his two months in America, an associate filed papers to charter the American Marconi Company.

On the return voyage from the United States, Marconi established a couple of other firsts in wireless transmission. The *St. Paul*, on which he sailed, was outfitted with a wireless to contact the English coast upon their approach. From 66 nautical miles away, the wireless connection was made. This allowed enough time for news of the South African War to be telegraphed to the ship, copies of the *Transatlantic Times* printed with the news, and the copies sold to passengers so that they could catch up on the news hours before they reached port.

Crossing the Atlantic

Marconi continued to focus for the next couple of years on developing his tuning device, but he was also aiming toward his next major target, transatlantic communication. Many great minds in the scientific community had determined that transatlantic wireless would be impossible because of the inability of radio signals to follow the curvature of the Earth. Marconi had of course already demonstrated to himself that he was sending signals that would bend around the Earth over bodies of water. To make this transatlantic leap, he first built a transmitting station at Poldhu, on the coast of southwestern England. He then tried to build a receiver on Cape Cod, Massachusetts, in early 1901, but he was beset by storms that destroyed his stations.

He then took a shortcut to prove his theory correct. He sailed to Newfoundland and, using a kite, hoisted a wire 400 feet in the air. At 12:30 P.M. on 12 December 1901, Marconi and one assistant heard the three distinct clicks of the letter S telegraphed according to a preset schedule from Poldhu to St. Johns, Newfoundland, a distance of more than 2,100 miles. The transmission was received repeatedly that afternoon. Two days later, Marconi released his results to the press, results that were heralded by some and belittled by others (critics credited static electricity as the cause of the signals).

Though Marconi initially planned to build a permanent receiving station in St. Johns, threats from transatlantic cable companies to institute legal action persuaded him to move south to Nova Scotia. There, the Canadian government worked to help him build a permanent receiving station. The funding they provided also helped finish the facility being completed on Cape Cod. Still, there were many unknowns in the technical aspects of transatlantic signals. In 1902, on a trip from England back to North America, Marconi discovered

that signals traveled better at night than during a clear day. This was an important, if misunderstood, discovery. Try as he might, Marconi could not overcome the daytime impediment to his long-distance transmissions for several years, because he did not understand the impact of various frequencies on the propagation of electromagnetic waves.

Later Life

The Marconi companies faced considerable financial pressures through these years because the promise of transatlantic wireless seemed uncertain owing to problems with dependability in the system. To make these transmissions commercially viable, they had to be available on demand at any time. It was 1907 before commercial transmissions began in earnest between Glace Bay in Nova Scotia and a new station in Clifden on the west coast of Ireland. The Marconi company continued to concentrate on wireless telegraph service, with all ships required to have telegraph service by 1911.

All his work on creating a practical wireless method of international communication earned Marconi the Nobel Prize for physics in 1909. When the liner *Republic* went down after a midocean collision that same year, all passengers were saved thanks to wireless distress calls. The *Titanic* similarly used its wireless in 1912 to summon help that saved one-third of the passengers. Marconi sought further developments, including a portable wireless that could be used from lifeboats at sea, automatic warning alarms for untended wireless equipment, and triangulation techniques that would pinpoint a ship's position more accurately.

The early 1910s were filled with patent fights and business battles, but they were also largely profitable ones for the Marconi companies. Incorporating the inventions of others, Marconi's companies even began sending some wireless telephony messages of voice and music, a practice becoming known as "radio." After Italy entered World War I in 1915, Marconi was made an officer on the engineering staff responsible for wireless. Because of the need for secrecy in communication, he worked on developing shortwave communication and direction finders for the Italians and secured funding to update and expand the insufficient quantity of wireless equipment.

After the war, in 1920, the British rescinded a Marconi experimental license for broadcasting an opera performance, saying that it interfered with legitimate services. Thus, the U.S. got a two-year head start on Britain in regular radio broadcasting and the mass production of receivers. In 1922 Marconi was again allowed to begin limited broadcast service. By this time he was performing many of his radio experiments on his yacht, *Elettra*, which he had purchased in 1919.

Marconi's personal experiments continued to improve on his wireless inventions. He was eventually able to send directional signals and could make them circle the globe using

shortwave technology. He capitalized on this achievement by establishing permanent communication links between territories of the British Empire. He also helped to establish Vatican Radio on shortwave so that the pope could speak to the whole world at once.

By 1927 Marconi's health began to fail. He continued to work on experiments in radar and with microwaves. He again overcame the doubts of theoreticians about the ability of microwaves to travel long distances, and he set up the first microwave communications link at the Vatican. Marconi died in 1937.

Market

Radio markets are defined in geographic, demographic, and psychographic terms. Often, the definition of a radio market involves all three factors.

The primary definition of a market for radio is geographic—the area served by the transmitter's coverage, whether one city, a group of counties, or an entire region. Within that "market," the station establishes its listener base and sells advertising to attract those listeners to area retailers.

The second definition for radio derives from the medium's ability to target individual audience segments. Demographically drawn markets allow stations to focus programming on specific age groups: young adult women, for example, or teenagers. National radio programs define their markets using demographics.

Some markets defy geography and demography and consist of people of similar interests and tastes—psychographics. These similarities are often referred to as "lifestyle characteristics." However, consultant George A. Burns cautions radio marketers to understand the differences: "A group of nude skydivers may have only that in common. Their radio tastes can vary widely. While there may be broad commonalities among listeners to an individual radio station, it seems almost impossible to define them." Burns (1980) suggested that lifestyle characteristics of a particular group "*converge* at an individual radio station, *as far as radio listening is concerned*."

As radio emerged in the 1930s as a viable—and valuable—medium for advertisers, geographic divisions were the most effective and most often used because of network radio's national reach. A 1939 promotional flyer from the National Broadcasting Company (NBC) showed the percentage of radio ownership in each of nine regions of the United States. The same flyer divided radio families by each of the four standard time zones, by size of city, and by whether listeners were in rural or urban locations.

Geography

The specific geographical definition of a market begins with guidelines set by the U.S. government's Office of Management and Budget (OMB). Radio's ratings services base their market areas on OMB's "Metropolitan Statistical Area" (MSA), "Primary Metropolitan Statistical Area" (PMSA), and "Consolidated Metropolitan Statistical Area" (CMSA). The government assigns each county surrounding a major population area to a specific MSA, PMSA, or CMSA.

For purposes of radio and television ratings, the definitions are modified by the Arbitron Company for radio and Nielsen Media Research for television, based on the needs and desires of their subscribers. Stations subscribing to the ratings service vote on which counties are included in a ratings report and which are excluded or assigned to another market area. Modern media markets are typically defined in three ways: for radio, the Metro Survey Area ("Metro") and the Total Survey Area (TSA); for television, the Designated Market Area (DMA).

As an example, the San Francisco, California, Arbitron ratings report contains data from Sonoma County listeners, and Sonoma County is considered part of the San Francisco Metro in Arbitron ratings reports. Sonoma County radio station operators, however, elected to define their county as a radio market, too. The result was a ratings report for San Francisco and an additional report for Santa Rosa (the largest city in Sonoma County). The ratings for Santa Rosa are duplicated in the San Francisco report, creating what is called an "imbedded market."

In contrast, Philadelphia and Wilmington, Delaware, are similar in that they are geographically side by side. Just as Sonoma County listeners hear San Francisco stations as easily as local outlets, Wilmington listeners can hear Philadelphia stations. However, the two are separate and distinct radio markets, as elected by Arbitron's subscribers in each area. The Philadelphia report and the Wilmington report have no duplication.

The Federal Communications Commission (FCC) generally defines a market area based on the signal contours of individual stations and overlapping signals. The FCC definition thus often differs from the Arbitron definition.

Targeting

Targeting was first found in advertising texts of the early 20th century. There was clear awareness of the use of different periodicals to target various populations: children, farmers, college students, and religious people, for instance. There were “trade” or “class” magazines such as those aimed at plumbers or Masons. Small-town newspapers targeted their audiences specifically, giving local influence to the advertisements. In 1915 Ernest Elmo Calkins suggested “canvassing consumers” in different cities around the country in order to gather information for an ad campaign. Calkins was a pioneer of targeting specific types of people as audiences and creating non-geographic markets.

General Motors advertising was an early example of targeting and segmentation. Trying to work out of a sales slump in the 1920s, the company reorganized its strategy based on price segments. Chevrolet, Pontiac, Buick, and Cadillac automobiles were priced differently and advertised to different markets based on socio-economic criteria.

This led manufacturers to support magazines and radio stations that reached the consumer segments they wanted for their products. Radio at the time was more mass than segmented; however, it became an ideal demographic and segmentation medium, creating communities of like-minded listeners. Writing in *American Demographics* magazine, Joseph Turow recognized the benefit of targeting to specific communities: “Target-minded media help advertisers [target a specific audience] by building primary media communities formed when viewers or readers feel that a magazine, radio station, or other medium resonates with their personal beliefs, and helps them chart their position in the larger world.”

Just as media has changed since targeting and segmentation began, so has research. The statistical tools available to the researcher have grown tremendously over the years. The plunging cost of computation makes it both economically and logistically feasible to merge large databases and create new analyses. Researchers are now able to uncover relationships among demographic, attitudinal, behavioral, and geographic elements of the population. Those relationships are called “clusters.”

Clusters

The saying “birds of a feather flock together” represents the idea of clustering. By combining demographic data, a market

can be grouped into clusters, also known as “geodemographic segmentation systems.”

Cluster systems take many demographic variables and create profiles of different individual or household characteristics, purchase behaviors, and media preferences. Most clusters used in media sales and analysis have catchy, descriptive names in an attempt to make them easier to remember. Examples are “Elite Suburbs,” “2nd City Society,” “Heart Landers,” and “Rustic Living”—all from Claritas’ PRIZM cluster system.

Marketing Tools magazine claims that cluster systems

are especially powerful when used in conjunction with business mapping. Sophisticated mapping software programs easily link demographics to any level of geography (a process called “geocoding”). Some software can pinpoint specific households with neighborhoods from . . . customer data and then create schematic maps of neighborhoods by cluster concentrations.

The geographic element distinguishes clusters from psychographic segments. Another difference is that cluster categories are based on socio-economic and consumer data, not attitudinal data.

When mapping and media mix, Zip codes are often used as a targeting tool. Radio stations tend to use Zip codes to target potential Arbitron diary keepers, but this is not an exact science. In *The Clustering of America* (1988), Michael Weiss introduced the use of Zip codes as a clustering device. His work introduced marketers to age, education, and buying segments originally developed by Claritas Corporation for their PRIZM database. As effective as Weiss was in describing clustering, the net result among media sellers was his Zip code analyses.

With more than 36,000 Zip codes in the United States, precise segmentation is difficult. A Zip code does not constitute a segmented market, even though a single Zip code can contain 35,000 addresses or more. In New York City, because of the density of the population, Zip codes are somewhat cohesive in terms of ethnic and socio-economic mix. In the smallest towns, there may be only one Zip code, thus defying segmentation. That is why the cluster systems were developed.

Lifestyles

Cluster analysis is often confused with psychographics, and the words *psychographics* and *lifestyles* tend to be used interchangeably. There is a difference, though: *psychographics* usually refers to a formal classification system that categorizes people into specific types based largely on psychological characteristics; *lifestyle* is more vague and generally refers to organizing people by attitudes or consumer behavior—“politically

conservative,” for example, or “avid golfer.” Cluster systems are based on purchase behavior (i.e., “owns a cell phone”) and demographics (age, sex, income, and education).

According to researcher James Fletcher, qualitative information about lifestyle includes data collected in one or more of the following categories: (1) activities: work, hobbies, social events, vacations, entertainment, club and community activity, shopping, sports; (2) interests: family, home, recreation, fashion, food and wine, media, personal achievement; (3) media behavior: light, medium, or heavy users of electronic media; local newspaper readership; magazine subscriptions; (4) recreation: sports fans, sports participants, travel for recreational purposes, live theater, concerts, movies; (5) social activity: joiners who frequent the social scene or participate in clubs and organizations, house bodies who concentrate on do-it-yourself projects and gardening; (6) purchase patterns: recent purchases, intention to purchase, likely choices when the purchase time arrives; (7) opinion: social issues, politics, business, education, products, culture, the future; (8) demographics: age, sex, education, income, occupation, family size, rent or own housing, geography.

In radio, demographics are often equated with age and sex. In general use, however, the additional elements listed above are all part of demographics. Given radio’s ability to create communities of people with similar tastes and attitudes, it can be said that the medium not only serves markets, but also creates them.

Marketplace

U.S. Public Radio Program

Marketplace: *The International Magazine of Business and Finance* is a daily program on U.S. public radio billed as the “first truly global program using business and economics as its prism to understand the world.” The program’s trademark is its non-Wall Street approach, designed, in the words of program originator Jim Russell, “for normal human beings, not CEOs.” It is known for its hip and sometimes irreverent reporting; it is short on statistical market data and long on feature reporting and analysis. *Marketplace* went on the air on 2 January 1989 and quickly became the fastest-growing national program on public radio, entering 2003 with nearly 6 million

listeners per week. *Marketplace* airs five days per week, with a 30-minute evening program and five 9-minute reports in the morning. It is carried on more than 355 stations throughout the United States and is also heard in Europe on the public radio satellite channel America One and worldwide on the Armed Forces Radio Network. The program is hosted by David Brancaccio and produced by J.J. Yore. *Marketplace* originates in Los Angeles and is distributed by Public Radio International of Minneapolis. In April 2000, Marketplace Productions was acquired by Minnesota Public Radio, which built a new program production center in downtown Los Angeles.

Origins

Marketplace was born at a time when public radio programmers were looking for a business program suitable specifically for public radio. During the summer of 1988, officials at Public Radio International (then the American Public Radio Network [APR]) approached former *All Things Considered* producer Tim Russell with a request that he provide a critique of its daily business program, *Business Update*, which was being produced for public radio by Columbia Broadcasting System (CBS) Radio. Russell's report concluded that, although the program featured solid reporting and was well produced, it had an unquestionably "CBS sound" that did not match the style that listeners had come to expect on public radio. Russell outlined in his report an alternative vision of a public radio business program that was slightly more witty and smart. This type of program, Russell felt, would not necessarily appeal to business professionals, but it could be targeted to a much broader, but still well-educated, audience.

In the fall of 1988, APR officials gathered a group of public radio programmers together at its Minnesota headquarters to discuss Russell's report and his idea for this new kind of business program. The concept won the group's endorsement, though it was agreed that, in order to avoid domination by the media establishment, the program would be produced neither in the Twin Cities nor on the East Coast. Instead, the new show would be produced in California so that it might develop its own voice and foster access to the Pacific Rim business markets. It thus became the first, and only, national daily news program to originate on the West Coast. The name *Marketplace* was selected as the main title specifically because it did not carry the strong Wall Street connotations of the words *business* or *finance*, which were relegated to the subtitle of the program. Russell was hired as the new program's executive producer and general manager, and within three months a staff was hired and the program went on the air, debuting 2 January 1989 from Long Beach, California. The program nearly went off the air after just a few months, but in 1990 USC Radio at the University of Southern California stepped in, offering money, new studios, and help in finding corporate underwriters. The program's original host, Jim Angle, left for a job at ABC in 1993 and was replaced by David Brancaccio, a former KQED public radio reporter (and a San Francisco rock disc jockey before that) who had opened the show's London bureau.

Covering Business

Marketplace draws from international bureaus in Tokyo, London, Beijing, and in South Africa; it has five domestic bureaus. The program features a number of key elements: it defines business as "*anything* having to do with money." It takes an

international perspective on the assumption that business shapes world events. The program producers avoid statistics, operating on the maxim of "no data without context." Instead, the show uses an "op ed" approach for background and analysis by featuring a roster of about 75 commentators from a spectrum of cultures, political backgrounds, and ethnicities. It also maintains unique editorial relationships with such traditional sources as the *Economist Magazine*, London's *Financial Times*, and Reuters.

The fact that it is a "business program for the rest of us" is typified by reporting that shows the human side of economics and that attempts to demystify the world of finance (both general manager Russell and morning host Glaser promote their barely passing grades in college economics classes). Host David Brancaccio brags about not having an MBA, and on-air mentions of his home on USC's Fraternity Row and his daily commute to work on a bicycle add to the hip, quirky approach. The program's trademark irreverence is typified by the background music played when its hosts "Do the Numbers" each day: the song "Stormy Weather" is used when the Dow Jones Industrial Average is down, and "We're in the Money" is played when the Dow is up. It features a variety of non-economic feature stories on the assumption that every topic has some financial or business angle.

Forty-one percent of *Marketplace* listeners are women, and its audience is relatively young: almost 20 percent of its listeners are in the 25–34 age demographic, and nearly 30 percent are 35–44 years old. Its weekly audience, approaching 6 million listeners, is said to be the second-largest audience in the United States for a TV, cable, or radio business program, behind PBS's *Nightly Business Report*. In 1998 *Marketplace* won a Silver Baton award for broadcast journalism from Columbia University. In 2000, general manager Jim Russell received a Missouri Honor Medal from the University of Missouri's School of Journalism. In 2001 the program won the prestigious Peabody Award.

Markle, Fletcher 1921–1991

Canadian Writer, Producer, and Director

Fletcher Markle was a leading producer/writer/director (and sometime actor) during commercial radio's "second wave" in the 1940s. Inspired by the protean hyphenate Orson Welles, who later became a friend, Markle sustained the tradition of dramatic adventure exemplified by the *Mercury Theater*. When network radio died in the early 1950s, Markle was able to shift his dramatic vision to television and film.

Markle was one of the pioneering Canadian broadcasters who journeyed across the border to make a major impact on American entertainment. Born in Winnipeg and raised in Vancouver, the young Markle had a speech impediment, which was corrected by constant listening to and imitation of the narrator of the *March of Time*, Westbrook Van Voorhis. The adolescent also paid attention to the speech patterns of the entire program's cast and was especially entranced by the resonant tones of Orson Welles. Soon he was speaking and writing in the Wellesian style. He began writing, directing, and acting for a local program on Sunday afternoons, *Imagine, Please*. Impressing the radio community in Vancouver, he again emulated his distant mentor and sold adaptations of *Jane Eyre* and *Treasure Island* to the regional dramatic series *From the Bookshelf*.

One of the leading producers in Canadian radio, Andrew Allen, took notice, and Markle was hired to write radio plays for the Canadian Broadcasting Corporation (CBC) series *Baker's Dozen*. Writing for an ensemble, Markle also based scripts on his own life, including "There Was a Young Man," which was influenced by "lost generation" literary lions F. Scott Fitzgerald and Ernest Hemingway. In 1942 he enlisted in the Canadian Royal Air Force and wrote scripts for the documentary series *Comrade in Arms*. Replacing Edward R. Murrow, he wrote narration for a British Broadcasting

Corporation (BBC) short film about German air attacks, *The V-1: Story of the Robot Bomb*, which was nominated for an Academy Award in 1944.

After the war, Markle continued his work for Allen, writing and directing for an anthology series, *Radio Folio*. His words captured the ear of legendary writer Norman Corwin, and he was invited to write and direct shows for the Columbia Broadcasting System's (CBS) experimental series *Columbia Workshop*. While in New York, he first met his hero, Orson Welles, and played for him transcription discs of a Canadian production, *Life with Adam*, a fictionalized account of Welles' radio and Broadway exploits. Welles hired Markle to produce and direct the satire for his *Mercury Summer Theater of the Air*, with regulars including conductor Bernard Hermann and actress Mercedes McCambridge, whom Markle would later marry. Over the years, he assisted Welles in numerous projects, including writing scenes for *The Lady from Shanghai* and researching two television pilots.

In 1947 CBS programmer Davidson Taylor contracted Markle to produce and direct the most ambitious anthology series in postwar radio, *Studio One*. Again with Wellesian flair, Markle assembled his own repertory company of solid radio professionals, including Everett Sloane, Anne Burr, Hester Sondergaard, and Robert Dryden. Markle was given complete freedom in the selection of scripts, and he opened the series with an adaptation of Malcolm Lowry's autobiographical *Under the Volcano*. He took a chance on novices, hiring Agnes Eckhardt, for example, to adapt novels of Sinclair Lewis. Eckhardt, who would later use her married name Nixon, became one of daytime television's legendary creators. Markle received the George Foster Peabody Award for his production of Robert Ardrey's *Thunder Rock*.

Markle resisted casting stars on the New York-based *Studio One*. When Ford began sponsoring the show in October 1948, the automobile manufacturer demanded big names, and production was shifted to Los Angeles under the new series title *Ford Theater*. The inaugural broadcast, an adaptation of *Madame Bovary*, featured Marlene Dietrich, Van Heflin, and Claude Rains. No longer an ensemble, the main attraction was star power: Burt Lancaster (*Double Indemnity*), Lucille Ball and James Garfield (*The Big Street*), Ingrid Bergman (*Camille*), Gene Kelly (*The Gentle People*), and Montgomery Clift (*Wuthering Heights*). Markle returned to acting, appearing opposite Helen Hayes in *A Farewell to Arms*. He also developed a friendship with Jack Benny because of their successful radio adaptation of Benny's notorious movie, *The Horn Blows at Midnight*. Even with movie luminaries and familiar plots, *Ford Theater* lasted less than a year; radio drama was doomed because of the invasion of television.

Markle switched to directing motion pictures and employed many of the actors he had worked with on the *Ford* series. He directed the caper movie *Jigsaw* (1949) for United Artists and the social drama *Night into Mourning* (1951) for Metro Goldwyn Mayer. In 1952 he returned to CBS and New York, having been hired to produce the fourth season of the television anthology series *Studio One*. Working with directors Franklin Schaffner and Paul Nickell, he produced approximately 40 live telecasts. For the production of the romantic teleplay "Rendezvous," he gave fellow Canadian Lorne Greene his first starring role in the United States.

Markle's success with *Studio One* led to his directing the first live color series from Hollywood, the nostalgic *Life with Father* (1953–55), in which Markle showed his directorial versatility by supervising this comedy starring Leon Ames and Lurene Tuttle. Throughout the 1950s he was hired to direct a wide array of genres: Broadway adaptations for *Front Row Center* (1955), suspenseful episodes of the *George Sanders Mystery Theater* (1957), police action on Lee Marvin's *M-Squad* (1957), and epic adventures on *Tales of the Vikings* (1959). In the early 1960s he produced a pilot for Boris Karloff's *Thriller* and directed the situation comedy *Father of the Bride*, with Robert Maxwell. During this period Markle directed one of Disney's most popular animal films of all time, *The Incredible Journey* (1963).

In the early 1960s, the onset of diabetes prevented Markle from undertaking demanding productions, and he returned to Canada. He created and hosted the long-running interview series *Telescope*. He conducted over 300 filmed interviews, including rare talks with Buster Keaton and Walt Disney. In the early 1970s, he was appointed head of the television drama department of the CBC. In 1976 he produced four specials for the CBC on the history of the Olympics, narrated by Christopher Plummer.

In 1979 Markle and Elliott Lewis tried to revive radio drama by producing and directing *Sears Radio Theater* on CBS. Broadcast every night from Los Angeles and divided into such theme nights as "The Western," "Love-and-Hate," and "Adventure," this hour-long series featured such established names as Howard Duff, Eve Arden, Daws Butler, and Hans Conried. After a year Sears and CBS withdrew support, and the series switched networks, continuing for nearly two years as *Mutual Radio Theater*. Again, Markle and his generation learned the sad fact that there is a small audience for any type of drama on radio.

Fletcher Markle was one of those creative individuals whose sensibility was formed by radio. He was able to revive the tradition of national drama on radio for several years after World War II. When the possibilities for creative expression became limited, Markle showed that directing techniques learned in radio could be transferred to film and television. To the end though, his heart belonged to his first medium; he was very active in the Society to Preserve and Encourage Radio, Drama, Variety, and Comedy (SPERDVAC) before his death in 1991.

Maxwell, James Clerk 1831–1879

Scottish Physicist and Theorizer of Radio Waves

James Clerk Maxwell was a physicist best known for his contributions to electromagnetic theory, including predictions of electromagnetic radiation that Heinrich Hertz later demonstrated in the laboratory and that Guglielmo Marconi and others applied in developing wireless communication systems. The influence of his experimental and theoretical work reached beyond these applications, paving the way for Einstein's theory of relativity and for theories about the structure of atoms and molecules.

Origins

James Clerk Maxwell was born on 13 June 1831 in Edinburgh, Scotland. His father, John Clerk, assumed the name Maxwell in legal proceedings after inheriting land not far from Edinburgh in southwestern Scotland. A house was built there and the estate named Glenlair. From time to time throughout his life, Maxwell returned to the quiet country life at Glenlair and did much of his writing there.

Maxwell's mother, Frances Cay, who supervised his early education, died when he was eight years old. After spending two years with an unsatisfactory tutor, in 1841 Maxwell was sent to Edinburgh Academy, where he took honors in English, English verse, and mathematics. Maxwell's father, a lawyer and fellow of the Royal Society of Edinburgh, took an active interest in his son's progress, taking him to meetings of the Royal Society. When Maxwell was 14, his father showed the boy's paper describing a new method for drawing ovals to J.D.

Forbes, professor of natural philosophy at Edinburgh University. The paper was read at a meeting of the Royal Society and printed in the April 1846 proceedings.

In 1847 Maxwell entered the University of Edinburgh. In October 1850 he went to Cambridge (Peterhouse College for one term, then Trinity College). During this time, his experiments in geometrical optics led to the discovery of the "fish-eye" lens. In 1854 he graduated second wrangler (awarded for excellence in mathematics) and first Smith's prizeman (for an essay incorporating original research). He then became a fellow at Trinity and a lecturer in hydrostatics and optics. In a paper read to the Cambridge Philosophical Society in 1855, Maxwell provided a method of approaching electrical problems by using mathematical language to discuss the lines of force surrounding the electrical and magnetic fields Michael Faraday had demonstrated. In *On Faraday's Lines of Force* (1855–56), Maxwell used an analogy of space as filled with a medium or with an imaginary, massless fluid. Electric and magnetic fields could then be understood as analogous to motion in this incompressible fluid. He worked out a series of equations to account for the continuum that the lines of force seemed to create within that medium. In an essay that won the fourth Adams prize at Cambridge, Maxwell used mathematical proofs to demonstrate that Saturn's rings could not be solid but must be composed of a multitude of small satellites.

In 1856 Maxwell accepted a professorship of natural philosophy at Marischal College in Aberdeen and in 1858 married the principal's daughter, Katherine Mary Dewar. When a reor-

ganization of the college eliminated his position at Aberdeen in 1860, Maxwell became a professor of natural philosophy at King's College. There, in London, he renewed an earlier interest in color mixing, set up a laboratory in the attic, and with his wife's help began a series of experiments in color vision. Using what he called his "colour-box" he investigated variations in color sensitivity across the retina. In a lecture to the Royal Institution on the theory of three primary colors, he demonstrated the first color photograph. His wife also assisted in his experiments to measure the viscosity of gases.

Electromagnetic Theory

Maxwell continued his work on electromagnetic theory, producing two more significant papers. *On Physical Lines of Force* (1861–62) was the result of his attempts to illustrate Faraday's law of induction. Maxwell constructed a mechanical model and attempted to demonstrate that there is in principle a physical mechanism in space that carries transverse waves and accounts for what was known about electromagnetism. Calculating the speed at which these waves travel, he found that it was very close to the speed of light and concluded that what we perceive as light is actually another phenomenon of electromagnetism. In *A Dynamical Theory of the Electromagnetic Field* (1864), Maxwell departed from the idea of a physical medium and instead advanced the concept of field as an energy-bearing continuum. To describe the electrical field, he developed a group of equations. In their final form, Maxwell's Equations provided a method to predict the behavior of electricity and magnetism under given conditions.

In 1865, following an illness, Maxwell retired to Glenlair. Although he took periodic trips to London to serve as external examiner for mathematical exams at Cambridge, he devoted much of his time to scientific writing, including *Theory of Heat* (1870) and *Treatise on Electricity and Magnetism* (1873). In 1871 he was appointed Chair of Experimental Physics at Cambridge University. There he designed and oversaw the creation of the Cavendish Laboratory, where experimental work done under his direction emphasized precision in measurements.

Maxwell died of abdominal cancer at the age of 48 on 5 November 1879 and was buried in a small churchyard in Par-ton, Scotland.

Although some of his contemporaries received more public recognition during his lifetime, James Clerk Maxwell's influence on 20th-century physics has been more far-reaching. Those who had corresponded with him and would carry on his work and keep his memory and research alive became known as the "Maxwellians." His theories predicting electromagnetic radiation led directly to the experimental and applied work underlying our entire system of radio communication. He speculated about the effect of the motion of the emitter of light

on the velocity of light, and his theories paved the way for Einstein's special theory of relativity. He made significant advances in the kinetic theory of gases, contributed to the development of quantum theory, and conducted innovative studies in several other scientific fields. On the 100th anniversary of Maxwell's birth in 1931, the importance of his work was described in a tribute by Einstein as the most profound and fruitful change in the conception of reality in physics since the time of Newton.

Mayflower Decision

FCC Radio License Renewal Decision, 1941

The *Mayflower* decision, issued by the Federal Communications Commission (FCC) in 1941, is most noted for its conclusion that, as public trustees, broadcasters could not use their stations to advocate their own causes. In other words, broadcasters should not editorialize.

In 1939 the Yankee Network filed an application to renew the license of its Boston radio station, WAAB. At the same time, the Mayflower Broadcasting Corporation filed an application with the FCC to operate a radio station on the same frequency used by WAAB, thus challenging the renewal of WAAB. In its challenge, Mayflower claimed that WAAB was violating federal law by broadcasting editorials that endorsed certain political candidates for public office.

WAAB did not deny broadcasting the editorials in 1937 and 1938, but the station had discontinued the practice after being questioned by the FCC. As a result of this change in station policy and because Mayflower was found not to be financially qualified, WAAB's license was renewed. But the *Mayflower* decision sent a signal to broadcasters that station editorials were not considered to be in the public interest.

In writing the *Mayflower* decision, the FCC pointed out that the broadcaster has the initial responsibility for the conduct of the station. But because radio frequencies are limited, the interests of the public must be paramount over those of the licensee. Therefore, according to the FCC: "[T]he broadcaster cannot be an advocate. A truly free radio cannot be used to advocate the causes of the licensee. It cannot be used to support the candidacies of his friends. It cannot be devoted to the support of principles he happens to regard most favorably."

In the language of the *Mayflower* decision, the FCC was expressing its interpretation of the Communications Act of 1934 and the phrase "public interest, convenience or necessity." Broadcasters are public trustees who have the privilege of using public property—frequency space on the electromagnetic spectrum. Therefore, they are licensed to operate their stations in the "public interest" (as the phrase has been shortened over the years). In *Mayflower*, the FCC stated: "Indeed, as one

licensed to operate in a public domain the licensee has assumed the obligation of presenting all sides of important public questions, fairly, objectively and without bias." This was the basis for the FCC policy prohibiting radio editorials.

But that policy was to be challenged when the FCC encountered more station renewal petitions involving coverage of public issues. In the 1945 *WHKC* case, a station license renewal was challenged on the basis of a policy prohibiting the sale of commercial time for programs that discuss controversial subjects. In resolving the case, the FCC accepted an agreement between the station and the labor-union petitioner. The station agreed to change its policy and consider each request for commercial time on an individual basis. The commission noted that "the operation of any station under the extreme principles that no time shall be sold for the discussion of controversial public issues . . . is inconsistent with the concept of public interest established by the Communications Act."

In the 1946 *Scott* decision, the FCC was petitioned to revoke a station's license based on its refusal to make program time available for the discussion of atheism. The licensee of the station defended the refusal based on its "firm belief that it would not be in the public interest to lend our facilities to Mr. Scott for the dissemination and propagation of atheism." The commission stated that the station could not have a policy that denied views "which may have a high degree of unpopularity." Again, balanced coverage of controversial issues became the central point of the petition.

By the late 1940s, the FCC had decided to hold hearings to clear up confusion about its policies in this area. In 1949 the commission issued what came to be known as the "fairness doctrine." The doctrine established the policy that "broadcast licensees have an affirmative duty generally to encourage and implement the broadcast of all sides of controversial public issues over their facilities, over and beyond their obligation to make available on demand opportunities for the expression of opposing views." Ironically, the fairness doctrine also reversed FCC policy banning station editorials.

As a result of broadcaster complaints, the National Association of Broadcasters asked the commission to reconsider its policy on station editorials. After reviewing its policies on coverage of public issues, the FCC concluded that “overt licensee editorialization, within reasonable limits and subject to the general requirements of fairness detailed above, is not contrary to the public interest. . . . Licensee editorialization is but one aspect of freedom of expression by means of radio.”

McBride, Mary Margaret 1899–1976

U.S. Radio Journalist and Program Host

A broadcast journalist and what would today be called a talk show host, Mary Margaret McBride projected a warm, down-home personality on her highly popular, long-running radio programs. For some 20 years she was the best-known woman in radio, although today she is almost forgotten.

Origins

McBride was born at the very end of the 19th century in Missouri. As a child, she moved frequently from farm to farm with her family. She entered William Woods College (then a preparatory school) in 1906. In 1916 she entered the University of Missouri, from which she graduated with a degree in journalism in 1919.

After a year as a reporter for the *Cleveland Press* (Ohio), she worked as a reporter for the *New York Evening Mail* until 1924. She then turned to freelance magazine writing, soon becoming very successful, with her work appearing in *The Saturday Evening Post*, *Cosmopolitan*, and *Good Housekeeping*, among others. McBride also edited the woman's page of the

Newspaper Enterprise Association syndicate from 1934 to 1935. She became one of the best-paid women of her time, but the Depression cut into her income, as it did many others', and opened up another option.

Radio Career

McBride's radio career began in 1934 with a competition among 50 women to host an advice and interview program on New York City radio station WOR. Successful in the competition, she appeared as “Martha Deane” (a name owned by the station), playing the role of a grandmother with several children and grandchildren. After three weeks she gave it all away on the air and admitted that she was no grandmother, merely “a reporter who would like to come here every day and tell you about places I go, people I meet.” This did not seem to hurt her rising popularity one bit.

Paralleling much of her magazine journalism (which continued), the program offered daily advice directed largely at women. Her advice was readily accepted by listeners due to the

Mary Margaret McBride
 Courtesy CBS Photo Archive

combination of her clear knowledge about the matters discussed, her homey Missouri accent, and her ability to project (even as a young woman) a kind of grandmotherly kindness combined with wit. And she could think rapidly, making a new art of the ad-lib interview and program (none were scripted). As radio historian Erik Barnouw put it, her career “was built on a unique ability to draw others out.”

McBride’s program began to appear three times a week on the Columbia Broadcasting System (CBS) network in 1937 as a 45-minute amalgam of ad-lib commentary and interviews that soon drew an audience in the millions. (She continued daily on WOR until 1940 when other women took over the Martha Deane role.) It also allowed her a greater degree of freedom from network oversight than most program hosts enjoyed. Celebrities from all walks of life appeared (or sought to appear) on McBride’s program, and her own folksy and plain-

talking commentary made her an excellent saleswoman for sponsors’ products. Although advertisers eagerly sought to have their products touted on her program, she would not promote any product that she had not personally tried and liked. And Mary Margaret (as she was known to her listeners) refused to advertise tobacco or alcohol.

McBride’s daily radio program was carried on NBC from 1941 to 1950. In 1948 NBC attempted to transfer her radio popularity to television by placing her talk and interview program right after Milton Berle’s hotly popular *Texaco Star Theatre*. But as a conversationalist, her program was all interviews and discussion—“talking heads” primarily—decades before such talk programs became a staple of television. McBride never left her seat for the entire 50-minute program, after first telling her TV viewers that she looked “better from the table up.” The program was canceled after three months, and

McBride became one of the first of many radio stars who failed to make a successful transition to television. But she had staying power on radio—her tenth anniversary program was held at Madison Square Garden, and her 15th anniversary show in 1949 was broadcast from Yankee stadium, “the only facility large enough to hold the 75,000 people who filled every seat and formed huge crowds outside” (Hilmes).

In 1950 McBride left NBC—taking many of her sponsors with her—and went to the struggling American Broadcasting Company (ABC) network. She finally retired from network radio in 1954 after the death of her longtime business manager and partner, Stella Karn. From 1953 to 1956 McBride wrote a syndicated newspaper column for the Associated Press. After 1960 she was heard on a syndicated program of the *New York Herald Tribune* radio operation. In her last years she conducted a thrice-weekly radio show from her own upstate New York home. She died in early 1976.

McDonald, Eugene F., Jr. 1886–1958

U.S. Radio Manufacturer and Broadcaster

One of the founding fathers of the broadcasting and consumer electronics industries, “Commander” Eugene F. McDonald, Jr., guided Zenith Radio Corporation for almost 40 years as its founding president. McDonald also played a significant personal role in the adoption of the shortwave spectrum for long-distance communications, the formation of the National Association of Broadcasters (NAB), and the creation of the Federal Communications Commission (FCC).

Born in Syracuse, New York, 11 March 1886, McDonald was fascinated as a child with electrical and mechanical devices and in high school had a business repairing electric doorbells. In 1912 McDonald organized a company to finance car purchases on time payments, a first in the auto industry. He enlisted in the navy during World War I and held the rank of Lieutenant in Naval Intelligence.

In 1921 McDonald joined two young radio amateurs, Karl Hassel and R.H.G. Mathews, who had formed the Chicago Radio Laboratory and were manufacturing and selling radio receivers. In 1923 they formed the Zenith Radio Corporation with McDonald as president. In the same year, McDonald founded pioneer Chicago station WJAZ to broadcast music and to communicate with the 1923–24 Arctic expedition of his close friend, Donald B. MacMillan. WJAZ broadcast messages and entertainment programming to the expedition during the long Arctic night, and these programs also became wildly popular to a national radio audience. The national exposure from the expedition was invaluable in McDonald’s drive to develop Zenith as a national brand. Also in 1923, McDonald formed and became the first president of NAB.

McDonald, then a Lieutenant Commander in the Naval Reserve Force, played a seminal role in the development of shortwave radio for long-distance communications when Zenith developed shortwave receivers and transmitters for the 1925 MacMillan Arctic Expedition. He also persuaded navy communications chief Admiral Ridley McLean to send a radio amateur equipped with similar gear on the fleet’s 1925 Pacific cruise. The communications over the 12,000 miles between the MacMillan expedition in northern Greenland and the fleet in New Zealand waters had much to do with the adoption of the shortwave spectrum for global communications. The 1925 MacMillan Arctic Expedition, with McDonald as both cosponsor and the second in command, also marked the first use of ship-to-ship shortwave telephonic communications, the first use of aircraft in major geographic exploration, and the first successful use of shortwave communications in polar regions; furthermore, the expedition served as a training ground for American polar explorer Richard Evelyn Byrd.

At the same time, McDonald became concerned about the seemingly dictatorial powers of the Secretary of Commerce over the radio industry and was upset that WJAZ was forced to share airtime with a station in Denver. Hoping to force legal action that would lead to a different approach to the government regulation of the emerging radio industry, McDonald intentionally shifted the frequency of WJAZ to a channel reserved for Canadian broadcasters. Secretary of Commerce Herbert Hoover responded by taking McDonald to court, where McDonald’s view of the limited powers of the federal government, based on the 1912 Radio Act, prevailed. In the congressional hearings that followed, McDonald was one of several people who suggested the formation of a federal commission to regulate the radio industry. In his testimony, McDonald was the first person to use the name “Federal Communications Commission.” Following the hearings, Congress formed the Federal Radio Commission in 1927, which in 1934 became the Federal Communications Commission (FCC).

McDonald’s genius for leadership, coupled with the financial and managerial acumen of Zenith executive Hugh Robertson, enabled Zenith to withstand the crash of 1929 and the early years of the Depression with much more resilience than most of their competitors. Zenith emerged from the Depression as a major force in the consumer electronics industry. The company prospered in the latter part of the Depression, producing the famous Big Black Dial radios.

McDonald’s private life was as flamboyant and public as was his effect on the radio and broadcasting industries. Long one of the wealthiest and most attractive bachelors of his generation, McDonald lived aboard a series of ever-larger yachts, culminating in his 1928 purchase of the 185 foot long *Mizpah*. McDonald’s fascination with the entertainment industry, and not incidentally with showgirls and singers, led to lifelong friendships with many of the nation’s leading entertainers, who were regular guests aboard the *Mizpah*. At the beginning of World War II, McDonald contributed the ship to the U.S. Navy, where she served as an armed convoy escort and command vessel throughout the war. McDonald married rather late in life and had two children.

McDonald’s personal interest in world affairs combined with the gathering clouds of war to lead the Zenith Corporation to develop the Zenith Trans-Oceanic radio line, which was introduced almost simultaneously with Pearl Harbor. In the early months of World War II, the ever-patriotic McDonald led most radio manufacturers to contribute their patent holdings to the government for the duration of the war. Unlike

Eugene F. McDonald, Jr.
Courtesy of Zenith

many of his competitors, McDonald also established a design and planning unit early in the war to design the initial postwar commercial lines. This planning unit also allowed Zenith to maintain employment for a number of engineers who had families in occupied Europe and thus could not qualify for war production work. This kind of generosity coupled with enlightened self-interest was typical of McDonald's approach to life.

Commander McDonald's lifelong passion for television began in 1933. Zenith went on the air with W9XZV in 1939, and in 1941, the first color broadcast was transmitted. Because of McDonald's interest in FM radio and his friendship with Edwin Howard Armstrong, Zenith's FM station went on the air on 2 February 1940, operating under the call letters W9XEN (later W51C and WEFM). McDonald is probably best remembered today as the first and most vocal advocate of what was to become cable and pay-per-view television. Thanks to his personal persistence and political acumen, Zenith received permission to conduct a limited commercial test of "Phonevision" in 1951. Also under his direction and guidance,

Zenith invented the first wireless television remote control in 1956, named Space Commander in McDonald's honor (later Space Command).

From his earliest days in radio, McDonald's close associates remarked on his uncanny ability to predict the future of this very innovative and volatile industry. McDonald was inducted posthumously into the Broadcast Pioneers Hall of Fame on 4 April 1967, nine years after his death. Among the accomplishments listed in the citation were his roles as founder, president, and first chairman of the board of Zenith Radio Corporation; his dynamic merchandising strategies; his inventions (29 patents) and innovations; his role as explorer; and his role as the first president of NAB. He was also cited for having established one of the nation's pioneer radio stations (WJAZ) and for fostering the development of shortwave radio, international communication, ship-to-shore, FM, VHF and UHF television, radar, and subscription television. In 2000 the Commander was an inaugural inductee into the Consumer Electronics Hall of Fame by the Consumer Electronics Association.

McGannon, Don 1921–1984

U.S. Broadcasting Executive

Don McGannon was the long-time head of Westinghouse Broadcasting (Group W) and a respected member of the industry's leadership in the 1960s and 1970s. He sought quality programs and public service as well as profits. He is best known for Group W's successful introduction of the all-news format to radio and for developing a stronger commitment to public affairs by the Group W stations. He was a strong believer that broadcasters should serve in the public interest.

Origins

Donald McGannon was born in New York City in 1921. One of four children, he attended Fordham University (which would decades later name a communications research center after him), earning a B.A. in 1940. As with many others of his generation, he served in the U.S. Army during the war (becoming a major), returning to Fordham to earn a law degree in 1947. Admitted to the Bar in both New York and Connecticut, McGannon became a practicing attorney for several years. He worked briefly for a Connecticut democratic congressman, but when the politician suffered a fatal heart attack, McGannon was out of work. Here family ties helped out. McGannon's dentist brother had a patient who was a DuMont television executive, seeking some help. On learning of the out-of-work attorney, he agreed to interview McGannon and hired him.

Thus McGannon's broadcasting management career began in 1951 when he became the assistant director and then general manager of the several owned-and-operated television stations for the struggling DuMont Television Network. Just months before that network closed operations in 1955, he moved to Westinghouse Broadcasting Company as vice president and general executive, and he was elected president later that year.

Developing Public Service

One of McGannon's first major actions at Westinghouse—masterminding the retrieval of former Westinghouse property KYW-AM-TV (then in Cleveland, Ohio) from the National Broadcasting Company (NBC)—was indicative of the confrontational stance he would take with the titans of the industry. The Federal Communications Commission (FCC) found that Radio Corporation of America (RCA) Chairman David Sarnoff, who had been quoted in print threatening to withdraw his network's affiliation with Westinghouse, had coerced the company into swapping for NBC facilities in the smaller market of Cleveland; the FCC ordered the trade undone.

In 1956 McGannon took the bold step of severing the network affiliations of all Westinghouse radio stations and beginning to build an independent news-gathering operation. A well-staffed Washington bureau was soon established. Facilities for foreign operations began building in 1961.

Under McGannon, Westinghouse Broadcasting Company (by 1963 known as "Group W") was both admired and disliked in the industry. It was admired because the company was a leader in public service. To many it was the model of what a broadcasting group should be. The company was disliked because this willingness to do more than the law required put the company at odds with most of the industry and with the National Association of Broadcasters (NAB), which fought the FCC on every rule it imposed. McGannon had a keen awareness of Westinghouse's historic role in the birth of commercial radio (KDKA), and he imbued his employees with a sense of mission and social responsibility. As a corporation, Westinghouse believed that the right of the federal government to regulate the airwaves was legitimate. The broadcast spectrum was indeed a public resource to be managed for the good of all, and McGannon cast himself as the "good steward" who obeyed all

Donald H. McGannon
Courtesy AP/Wide World Photos

the rules—who in fact did more than the rules required—and yet managed to give an enviable return to his stockholders. This undercut the argument propagated by the NAB, *Broadcasting* magazine, and others that the fairness doctrine, license renewal requirements, “equal time” regulations, and other government stipulations were onerous and financially burdensome.

McGannon’s position was simple. The station licenses were what made Westinghouse broadcasting possible, so they must be protected. If the FCC wanted half an hour of community-oriented programming per week, then McGannon would give them two as insurance. McGannon often stated that the more public service his company did, the more money it made. It was almost embarrassing, he joked.

In keeping with this approach, McGannon also instituted something called the Public Service Conferences. These were held regularly beginning in 1956 in cities where Westinghouse owned stations. Multi-day events, the conferences brought together radio and television personnel, scholars, and politicians from around the country to discuss the role broadcasting should play in dealing with issues of concern to the nation. The first conference was held in Boston and featured addresses by Senator John F. Kennedy and Vice President Richard Nixon. These conferences were important in their own right and enhanced the reputation of Westinghouse immeasurably.

Instituting All-News Radio

In July 1962 Westinghouse Broadcasting Company purchased WINS-AM for a reported \$10 million. Westinghouse at first experimented with various music formats in an unsuccessful

effort to top market leader WABC-AM. Then, on Monday, 19 April 1965, WINS-AM went to an all-news format, becoming one of the first stations to make what was then considered a radical format transition. Importantly, WINS-AM pioneered the all-news format in the largest media market in the United States.

WINS-AM became the place on the dial where New Yorkers tuned to learn about breaking news. In November 1965, when a major blackout darkened northeastern cities, WINS-AM kept millions informed during the crisis as they listened on battery-powered portable radios. Eventually, three of Group W’s radio stations adopted the format. WINS-AM continued to broadcast “all news, all the time” in 2000.

McClendon’s all-news radio stations broadcast mostly hard news in 15-minute blocks. Each block featured its own reporter, who compiled and edited wire-service copy and read it on the air. McGannon’s version of the all-news format differed in that it made extensive use of Westinghouse’s growing news-gathering capabilities, which included Washington and foreign bureaus as well as news staff in the large cities where Westinghouse owned outlets. An established network of stringers was also available when needed. Because of this, Westinghouse presented a much more varied slate of material, including local, national, and international features; sports; education; religion; finance; and “actualities.” The Westinghouse/Group W approach to the all-news format was an immediate success.

Impact

During his long tenure heading Westinghouse, McGannon developed and refined the broadcasting group as a recognized entity within the industry. Previously, the two main organizing principles of radio and especially of television were the network and the individual station, which was almost always a network affiliate. Westinghouse Broadcasting Company was neither fish nor fowl. Although its television stations were network affiliates, they were first and foremost Westinghouse stations. This group identity was even more pronounced in Westinghouse’s radio properties, which dropped all network ties in 1956. The previously mentioned Public Service Conferences were actually seen as a way of establishing the “Group” concept in the mind of the industry and the public.

McGannon’s Westinghouse was ahead of its time on several issues. In a mostly white male world of button-down shirts and blue suits, McGannon sought diversity. To this end, he founded a job-training program to help minority workers get a start in the industry. Called the Broadcast Skills Bank, its name was later changed to the Employment Clearinghouse. McGannon also ordered all Westinghouse properties to drop cigarette advertising several years before legally required to do so.

McGannon resigned the position of president in 1978 and stepped down as chairman of Group W in December 1981. He consulted for the company for a time before declining health forced a permanent reduction in his activities. Donald McGannon died on 23 May 1984 at the age of 63, of Alzheimer's disease.

McLaughlin, Edward F. 1926-

U.S. Radio Network and Station Executive

Edward F. McLaughlin is a recognized leader and innovator in the radio industry who played a crucial role in redefining network radio from the 1970s to the 1990s. He developed a new program distribution system and began a revival of long-form network programming that changed the face of the industry.

A native of San Francisco, McLaughlin attended San Francisco State University, then went to work at radio station KTIM in San Rafael, California. He later joined national radio sales firm Peters, Griffin and Woodward in San Francisco, and then went to station KGBS in Los Angeles. He returned to San Francisco in 1964 as sales manager of KGO Radio and was promoted to the position of general manager.

McLaughlin was instrumental in establishing the talk format that moved KGO into profitability and ultimately to the number one rank in the market. His background in talk radio would come into play again at the American Broadcasting Companies (ABC) Radio Networks and later at EFM (for "Edward F. McLaughlin") Media. In 1972 he was named president of the ABC Radio Networks and moved to New York City. McLaughlin served as ABC Radio Networks president from 1972 to 1986. He was well known for building relation-

ships with affiliates that became fundamental links in his success at ABC and later in establishing the nationally syndicated *Rush Limbaugh Show*.

McLaughlin's first major innovation during his tenure as a network executive was to change the method of network program distribution from telephone lines to digital satellite. McLaughlin secured readily available space on satellite Satcom 1-R, created a digital distribution system called Advanced Digital Distribution System (ADDS), and set in motion a timetable for all ABC affiliates to install satellite dishes to receive ABC programming. Later all radio networks adopted the ADDS system, abandoning analog technology.

Having created a revolutionary distribution system, McLaughlin sought ways to reestablish long-form network radio programming as a means of expanding sales inventory. He formed the ABC Radio Network's Special Programming Department and named Richard A. Foreman as vice president in charge of producing long-form network specials. These shows included *Elvis Memories*, *The Barbra Streisand Special*, *The Neil Diamond Special*, *Country Greats in Concert*, and *The Silver Eagle*. Simultaneously, McLaughlin negotiated the purchase of Watermark Inc. by ABC and acquired long-form

Edward F. McLaughlin
 Courtesy Radio Hall of Fame

programs *American Top 40* with Casey Kasem and *American Country Countdown* with Bob Kingsley. He also brought Dr. Dean Edell from KGO to network radio and expanded the Paul Harvey news broadcasts to include the program series known as *The Rest of the Story*.

McLaughlin's network programming innovations also included the return of live sports broadcasts. In 1978 the ABC Information Network broadcast the Mohammed Ali–Leon Spinks rematch live from New Orleans, Louisiana. It was the first live sporting event broadcast by ABC in over 18 years. He also negotiated the first exclusive live radio network rights to the 1980 Winter Olympics in Lake Placid, New York, and the 1984 Summer Olympic Games in Los Angeles. In addition McLaughlin acquired for ABC the radio broadcast rights to the Triple Crown of horse racing, the Kentucky Derby, The Preakness, and The Belmont. During this period of expansion other networks quickly followed ABC's lead in satellite digital

programming distribution. McLaughlin was chosen to become the first chairman of the newly created Radio Network Association, an organization designed to advance network radio's marketing image.

McLaughlin left ABC in 1986 when it was purchased by Capital Cities and in 1987, with his wife Patricia, formed EFM Media. Their initial product was the syndication of the *Dr. Dean Edell Show*. McLaughlin contracted with ABC for both studio and satellite distribution facilities and began a search for additional talent for EFM Media.

Rush Limbaugh was brought to McLaughlin's attention in 1987 by Bruce Marr, a radio consultant based in Reno, Nevada. Limbaugh was hosting a highly successful conservative local radio show on KFBK in Sacramento, California. In April of 1988 McLaughlin signed an options contract with Limbaugh stipulating that EFM Media deliver either a New York or Los Angeles outlet for Limbaugh, who was first brought to New York by McLaughlin in July 1988 to host a local two-hour show on WABC radio. A national two-hour show was added a month later. After a year, the national show was expanded to three hours, and WABC agreed to carry the national program, thus ending the local show. A year later the *Rush Limbaugh Show* was being aired in 100 markets, which grew to 500 markets by 1991. When McLaughlin was presented with the National Radio Award by the National Association of Broadcasters in 1996, he was cited for his many innovations, including the tremendous success that the *Rush Limbaugh Show* and EFM Media had made in reversing AM radio's long slide in audience share and reestablishing national personalities in radio broadcasting.

In 1997 the assets of the *Rush Limbaugh Show*, the *Dr. Dean Edell Show*, and the *Limbaugh Letter* were sold by McLaughlin to Jacor Communications.

Edward F. McLaughlin. Born 12 October 1926, in San Francisco. Attended San Francisco State University, B.A. 1958; promoted to general manager, KGO Radio, 1964; president of ABC Radio Networks, 1972–86; introduced return of live radio sports broadcasts with Mohammed Ali versus Leon Spinks fight, 1978; negotiated exclusive live radio network rights to Olympic Games, Lake Placid, New York, 1980, and Los Angeles, California, 1984; formed EFM Media with wife Patricia, 1987; signed contract with Rush Limbaugh, 1988. Received National Radio Award from National Association of Broadcasters, 1996.

McLendon, Gordon 1921–1986

U.S. Radio Programming Innovator

Gordon McLendon is considered one of the greatest radio program innovators. His major contributions to radio, coming at a time when the older medium was struggling to compete with the brash new medium of television, are credited with renewing radio's vitality and with popularizing program formats that remained staples of the radio industry for the latter half of the 20th century.

Early Radio Career

McLendon became interested in radio as a youth in Atlanta, Texas, listening to his idol, sportscaster Ted Husing. McLendon decided that he too wanted to be a sportscaster, and he spent the better part of his youth preparing himself for such a career. His first real chance to work in radio came as a student at Yale University in the late 1930s. There he spent time as a sportscaster and reporter for Yale's radio station WOCD. McLendon's stint in the U.S. Navy during World War II allowed him to polish his radio skills as an announcer in the South Pacific. A one-year postwar stint at Harvard Law School convinced McLendon that radio was his true calling, and so he returned to his native Texas to enter the radio business full-time.

McLendon's first venture into radio station ownership occurred in Palestine, Texas, where he became part owner (by way of a loan from his father) of KNET in 1946. McLendon's father, Barton R. (B.R.) McLendon, continued a partnership with his son for the rest of Gordon's career. B.R.'s name was rarely mentioned when Gordon was lauded for one of his many successes in the radio business, but B.R. McLendon was a silent partner in these successes. It was the father's financial expertise and support that made possible much of what the son accomplished.

Gordon McLendon's stay in Palestine was short-lived. Within one year he sold his part ownership of KNET and moved to Dallas, Texas. Before leaving, however, McLendon had begun developing a skill that in a short time would make him famous—that of re-creating major-league baseball games. Reading a game summary supplied by Western Union teletype and utilizing sound effects that approximated a baseball game, McLendon became adept at re-creating baseball games that sounded nearly identical to live coverage of the real thing.

McLendon arrived in the Oak Cliff section of Dallas in 1948 and immediately acquired a license to construct radio station KLIF. McLendon's baseball game re-creations quickly became the station's most popular programming—so popular, in fact, that radio station owners in nearby towns began

requesting permission to carry them. An informal network soon developed that carried the KLIF baseball games to states bordering Texas, then to the entire Southwest and Southeast, and within a year to most of the United States. McLendon formalized the upstart network by naming it the Liberty Broadcasting System (LBS), a patriotic name suggested by B.R. McLendon.

The LBS appeal centered on McLendon's baseball game re-creations. Because major-league team owners prohibited radio stations beyond a limited distance from their ballparks from carrying live broadcasts of ball games, re-creations were the only means by which most radio listeners could hear major-league games. McLendon was happy to oblige listeners, but his interest in broadcasting live from the major-league ballparks led him to file a complaint with the U.S. Justice Department in 1949, charging major-league owners with violation of federal antitrust laws. The antitrust implications convinced team owners to open their ballparks to LBS for live game coverage. McLendon's optimism about the network's future was dashed in 1951, when LBS suffered the loss of its major advertiser and the major-league baseball establishment agreed to allow each team to independently negotiate broadcast coverage rights to its baseball games instead of allowing the American League or National League to negotiate coverage rights collectively. This meant that LBS could ill afford to pay for programming vital to the network's livelihood. LBS had little choice but to cease operations and file for bankruptcy.

Fate had dealt McLendon a more beneficial blow than he realized. Within a few years television's popularity had forced national radio networks into a much-diminished media role. And besides, McLendon now could turn full attention to running KLIF.

Development of the Top 40 Radio Format

McLendon's idea for KLIF was to determine what listeners wanted to hear and then to program the station accordingly. Rather than relying on programs that by chance might appeal to listeners, McLendon approached the process much as a scientist approaches an experiment. His tinkering with program elements was McLendon's initial foray into what came to be called "formula" or "format" radio. McLendon soon became an expert at crafting radio formats, but the first that he is credited with helping to create—Top 40—remained his most important.

Todd Storz and his assistant Bill Stewart are credited with inventing the concept of Top 40. The idea came to them, so the

Gordon McLendon
Courtesy of Bart McLendon

story goes, as they observed bar patrons repeatedly playing their favorite tunes on a 40-record jukebox. Storz and Stewart transferred the idea to radio, where a program director would prepare a 40-record playlist from which a disc jockey would choose selections to play during a four-hour "board" shift. The Top 40 idea was tried initially on Storz's Omaha, Nebraska, station KOWH at some point in 1952. The station quickly zoomed to first place in the market by 1953.

Gordon McLendon picked up on the Top 40 idea and hired Bill Stewart away from Storz to install the format at KLIF. Working together, McLendon and Stewart meticulously developed Top 40 in such a way that KLIF soon became the home of what many in the radio industry regarded as the format's most popular and successful version. To the playlist idea was added a fast pace, carried along by a cadre of outstanding disc jockeys who provided patter between records, read commercials and public service announcements themselves, and participated in KLIF promotions. McLendon also incorporated specially produced jingles throughout the program day to remind listeners that they were tuned to KLIF.

The McLendon brand of Top 40 was identified most easily by the stunts and station contests that KLIF constantly promoted and by KLIF's unique concept of Top 40 news. KLIF promotions were notorious for stirring up interest and excitement. A money-filled balloon drop from a downtown Dallas hotel that tied up traffic for hours and a treasure hunt contest that had thousands of Dallas residents digging up property in search of buried money are two examples of promotional stunts that kept KLIF in the public eye. KLIF news was no less attractive to listeners. Newscasts were localized, prepared by a well-trained staff of writers, and delivered at the same rapid clip as used by KLIF disc jockeys. McLendon was also the first to build a fleet of mobile units that allowed KLIF reporters to drive to news events around Dallas and to report live from their remote locations.

McLendon periodically wrote and delivered editorials that were inserted into KLIF newscasts. The editorials allowed the well-read and opinionated McLendon an opportunity to address important local and national issues. From the 1950s into the 1960s, he delivered approximately 5,000 editorials. McLendon did not shy from controversial subjects, and he did not hesitate to tell listeners he was wrong whenever subsequent thought and investigation proved to him that an initial opinion could no longer be supported. McLendon's editorials often created a stir among his listeners, which, of course, served his intent to promote KLIF.

KLIF began broadcasting the Top 40 format in late 1954. Within 60 days KLIF was the number-one radio station in Dallas. The station's prominence as one of the highest-rated stations in the United States continued for years and attracted station owners and program directors alike, who traveled to Dallas to learn how they too could implement Top 40 in their

own markets. They were assisted by a growing collection of McLendon policy manuals that contained explicit details on every facet of KLIF's operation.

The McLendon brand of Top 40 radio began appearing throughout America, and many of the most successful Top 40 stations belonged to Gordon and B.R. McLendon. The McLendons bought and sold some 25 radio and television stations during their two decades in broadcasting. Gordon's insistence on creating policies to direct his program decisions applied as well to the manner in which he and his father acquired radio stations. B.R. McLendon handled the financial side of all transactions, and Gordon handled the programming and management side. Gordon's policy was to find a station with mediocre ratings in a market where he wished to expand and then to make an offer to purchase the station. Once the station was purchased and the license transfer approved, Gordon directed his staff to rebuild the station according to the McLendon plan, often changed the station's call letters to a more attention-grabbing combination, fired practically the entire existing staff, and replaced them with veteran McLendon employees. The most important station acquisition step, however, was to install the new Top 40 format and to launch a promotional blitz to introduce market listeners to the McLendon sound. Time after time McLendon used this method to turn moribund radio stations into market leaders.

Other Radio Ventures

Gordon McLendon made radio history of an offbeat nature in 1961 when he decided to provide citizens of Sweden with commercial Top 40 radio. An earlier visit to the country had convinced McLendon that the government-operated radio service there was not providing listeners with the programming they wanted to hear. McLendon subsequently purchased an old herring boat, equipped it with a radio studio, transmitter, and personnel, and positioned it in international waters off the Swedish coast where its signal reached Stockholm. McLendon's objective to make money with this "pirate" operation proved successful. The station, called Radio Nord, was a huge programming as well as commercial success, but the Swedish government was not amused. Failing to find any particular violation of international law, the government finally passed laws that prohibited Swedish merchants from associating with the pirate operation. Thus deprived of any means to resupply Radio Nord, McLendon closed his operation and set sail for friendlier waters in 1962.

McLendon's Radio Nord venture was indicative of his creativity and willingness to push new ideas to their limit. McLendon's innovative nature led to experiments with a number of new radio formats—some of which succeeded and some of which failed miserably. One of the most successful was the beautiful music format introduced on San Francisco's KABL in

1959. The format was a blend of Top 40 and easy listening music especially designed for the sophisticated West Coast audience. The format was tried with equal success at WWWW in Detroit and WNUS in Chicago. However, when the beautiful music format was imported into the Buffalo, New York, market via WYSL, it fell flat. An effort to replace the format with the telephone discussion format proved equally unsuccessful. The idea of the new format was to allow listeners to engage in on-air discussion by phone. The format, which was nearly identical to the later talk radio format, proved Gordon McLendon's prescience for program ideas.

One of the most successful McLendon formats was all-news radio. He did not invent the format, but he perfected it at station XTRA in the Los Angeles area. XTRA was physically located near Rosarita, Mexico, just across the border from San Diego, California. From there its signal reached Los Angeles with enough clarity to make listeners think that XTRA was broadcasting from their midst. And McLendon made certain that XTRA station identifications were muffled in such ways as to disguise the station's Mexican origins. Despite its distant location, XTRA served Los Angeles reasonably well with news provided by several wire services. The XTRA operation allowed experimentation with the all-news format to the extent that the all-news format became a fixture at McLendon's WNUS in Chicago by 1964.

One of Gordon McLendon's biggest failures was the all-want-ad format he introduced in 1966 at KADS in Los Angeles. The format required that listeners call the station to advertise items they wished to sell. In true classified ad fashion, KADS clustered its time segments for specific product or service categories. The format lasted for little more than a year, failing primarily because its success depended on listeners' ability to recall information from memory or from hurriedly scribbled notes in order to respond to the ads. Radio could not supply a handy reference tool comparable to the newspaper's classified ad section. This design flaw doomed the all-want-ads format.

Departure from Radio

A major player in the radio industry by the 1960s, McLendon chose that decade to begin his departure from the medium. He and B.R. McLendon actually started divesting their radio station properties in the early 1960s, and by 1967 the McLendons announced plans to sell their prize possession, KLIF. The station was sold to Fairchild Industries in 1971 for \$10.5 million. Gordon McLendon gave several reasons for his departure from radio. First, he felt he had achieved all that he had wanted in radio and had few challenges remaining in the industry. Second, he was tired of the many struggles he had endured with the Federal Communications Commission (FCC). Being a radio maverick had required that he push FCC rules to their limit and

occasionally beyond, and the results had been several prolonged clashes with the Commission. McLendon felt that he no longer wanted to cope with federal regulators, for whom he had a very low regard. A third reason was McLendon's wish to explore opportunities outside of radio.

Gordon McLendon's extra-radio interests were apparent by the early 1960s. He and B.R. McLendon had developed a small group of East Texas outdoor movie theaters into one of the country's biggest chains of outdoor/indoor theaters. As an outgrowth of that business, Gordon McLendon produced hundreds of movie promotion spots for major motion picture studios. McLendon also tried his hand at movie production in the late 1950s, turning out such forgettable titles as *The Killer Shrews*, *The Giant Gila Monster*, and *My Dog Buddy*. All were set at McLendon's ranch Cielo, and all were packed with characters played by KLIF employees, including Gordon himself. McLendon also tried his hand at politics, running unsuccessfully for the U.S. Senate in 1964 and for Texas governor in 1968. These and other assorted ventures as well as money accumulated during his years in radio combined to put Gordon McLendon on the *Forbes* magazine list of the wealthiest Americans in 1984.

Gordon McLendon was proud of his accomplishments, but he admitted near the end of his life that his achievements in radio meant more to him than anything else. McLendon was diagnosed with esophageal cancer in 1985 and died from the disease at his ranch in September 1986. One year later, the National Association of Broadcasters bestowed its highest honor on Gordon McLendon by naming him to its Hall of Fame. And in 1999, *Broadcasting and Cable* magazine placed McLendon on its list of the "100 individuals who made signal contributions to the Fifth Estate during the 20th Century."

McNamee, Graham 1888-1942

U.S. Announcer and Sportscaster

Announcer and sportscaster for two decades beginning in the 1920s, Graham McNamee has been called the "father of sportscasting." He was the first network sportscaster and, of necessity, one of the inventors of play-by-play and color sports announcing ("color announcing" being everything aside from the play-by-play, nowadays often provided by a retired player to give the sportscast an "inside" perspective). Trained as a baritone singer, McNamee's voice commanded attention, aroused emotion and excitement, and inspired great affection. Indeed, his announcing of the first broadcast of a World Series, in 1923, generated more than 1,700 enthusiastic letters to WEAf in New York (then owned by American Telephone and Telegraph [AT&T] and later flagship station of the National Broadcasting Company's [NBC] Red network). His announcing of the 1925 World Series brought in an astonishing 50,000 letters (Gorman, Calhoun, and Rozen, 1994). His signature sign-on, "Good evening, ladies and gentlemen of the radio audience," and sign-off, "This is Graham McNamee saying good night, all" became widely recognized.

McNamee was active in sports in school, but at the urging of his mother, he turned to piano and then to singing. He sang in church choirs, in a Broadway show, and for an opera company, and he gave his own concert at New York's Aeolian Hall. At the beginning of the 1920s he undertook a multi-city concert tour.

In May 1923 McNamee visited the WEAf radio studios on a break from jury duty nearby, bearing an introduction from

the music supervisor of the New York public schools. He was given an audition and, after a decade in a professional singing career, he was hired as a utility announcer and singer. Deciding he would try the new medium for a few summer months when music bookings were limited, he soon captured the affection of thousands of sports fans with his mellifluous voice. Within months he became the "color" or background announcer for the first broadcast of a World Series and astounded listeners with his play-by-play of the 1923 middleweight championship match between boxers Harry Greb and Johnny Wilson at the Polo Grounds. His particular talent was his remarkable ability to capture the ups and downs of tension in a game or match, speeding and slowing to match the rise and fall of intensity in action. He became the model for many of the next generation of sportscasters, including such Hall of Fame luminaries as Red Barber, Mel Allen, and Lindsey Nelson. Sports historian Curt Smith rated McNamee as being as influential to his generation as Curt Gowdy was in the 1960s and 1970s (see Smith, 1987, revised 1992).

McNamee was equally versatile in live news reporting. He became NBC's chief announcer when it was formed in 1926 and he covered national political conventions and important live news events of the day. He covered Calvin Coolidge's 1923 address to Congress and both political conventions in 1924, including the 14 days of Democratic balloting. A 1925 WEAf recording by the Victor Talking Machine Company of Chief

Graham McNamee (right) seated with Phillips Carlin
Courtesy Library of American Broadcasting

Justice William Howard Taft's oath of office and inaugural address has McNamee's voice in the background, saying "We are ready." Another classic recording includes McNamee's breathless description of Charles Lindbergh's return to U.S. soil after his historic 1927 solo flight across the Atlantic.

It was as a sportscaster, though, that McNamee was most widely known. He covered World Series games from 1923 to 1935, major college football games (including the first Rose Bowl broadcast in 1927, which was also NBC's first coast-to-coast broadcast), significant tennis matches, and momentous prize fights, including the second "fight of the century" between Gene Tunney and Jack Dempsey in 1927. His colorful broadcast of that match for the 73-station NBC Red network reached an estimated 50 million people, a staggering number given the relatively few radio sets then in use.

As was common for early journalists, McNamee tended to embellish the moment to create emotional impact, but his style fit with the times and made the announcer as much a star as

the athletes he covered. His mere presence conveyed to listeners that an event had importance. In describing the players, he cultivated heroic images that outshone many athletes' actual achievements. The mythic aura around such legendary giants as Babe Ruth and Jack Dempsey was largely the creation of a generation of sportscasters known for their hyperbole. McNamee and his contemporaries spun a web of adulation for sports heroes that endures among fans today.

After covering a dozen World Series between 1923 and 1935, as well as hundreds of boxing and tennis matches and football games, McNamee's sports announcing ended with the rise of a new group of radio announcers. The times demanded terse and factual reporting of sports in the style of such greats as Red Barber and Lindsey Nelson, and NBC pulled him from covering the 1935 World Series and moved him to other tasks. McNamee had become dated and controversial because he talked so much and because many sportswriters and fans found his vivid game dramatizations unwarranted. At the

same time, subsequent sportscasters idolized him for his great voice, his historic sportscasts, and his ongoing achievements in developing play-by-play and color sports announcing. McNamee's role in creating the celebrity sportscaster and building the national fan base for major sports has not been forgotten.

His final years at NBC were largely given over to announcing for Rudy Vallee's variety program and appearing as a straight man for Ed Wynn. He occasionally did spot news reporting, as with the maiden voyage arrival in New York of the *Queen Mary* in 1936 and a pier-side description of the burning of the French liner *Normandie* in February 1942. On 24 April 1942 he announced *Elsa Maxwell's Party Line*—his final broadcast. He died shortly thereafter of an embolism of the brain, just two months before his 53rd birthday. Obituaries and editorials on his death appeared across the country; "Mr. Radio is Dead" is how the *Cleveland Plain Dealer* headlined its story.

McNamee was one of the first celebrities of the new medium, touted as "The World's Most Popular Announcer" on a cup from *Radio Digest* in 1925 after winning a national competition over 132 other announcers (listeners were fickle: two years later he was ranked ninth in another poll; in 1931 he was ranked fourth, but second among sports announcers, after Ted Husing). Long after his death, McNamee was recognized with the first group of notables inducted (in 1977) into the National Association of Broadcasters Hall of Fame. A national award in his honor was established for a sportscaster who achieved success in a second field of endeavor, just as he had gone from singing to announcing. The Graham McNamee award has gone to such noted individuals as President Ronald Reagan, Walter Cronkite, Bryant Gumbel, and Larry King, all of whom were sportscasters at some point in their careers. Heywood Hale Broun wrote that "McNamee justified the whole activity of broadcasting," adding that he "has been

able to take a new medium of expression and through it transmit himself—to give it vividly a sense of movement and of feeling. Of such is the kingdom of art" (cited in Smith, 1987, 1992).

McNeill, Don 1907–1996

U.S. Radio Morning Show Host

For 35 years, many Americans woke up to the easygoing banter of Don McNeill, the genial host of the Chicago-based *Breakfast Club* program. To a considerable degree, he created the morning radio format that became widely popular throughout the industry.

Origins

Born in Illinois in 1907 and raised in Wisconsin, McNeill moved around to a number of radio stations in the Midwest, San Francisco, and New York for several years. He struck it

Don McNeill
Courtesy of family of Don McNeill

big (though that was anything but clear at the time) when NBC-Blue asked him to take over *The Pepper Pot*, a struggling morning show in Chicago that had no advertisers and precious few listeners. Starting at \$50 a week, McNeill began hosting the program on 23 June 1933 and renamed it *The Breakfast Club* a few months later.

Breakfast Club Years

Right from the start, McNeill made changes that greatly helped turn the program into a huge success. For its hour-long slot, he fairly quickly developed what he called the “four calls to breakfast,” which divided the program into quarter-hour segments, each of which emphasized something different. It started with an opening song that usually began:

*Good morning, Breakfast Clubbers, we're glad to see ya!
We wake up bright and early just to howdy-do ya*

The first segment offered interviews with the studio audience (added in 1938); the second featured “memory time” with sentimental poetry and prayer time (added in 1944 and retained after the war, along with hymns provided in a nonsectarian fashion); the third was “march time”; and the fourth and last was dubbed “inspiration time” and also often included more sentimental poetry. Although the audience never knew it, no breakfast was ever consumed on the program.

After the first few years, McNeill sought and was granted permission to move from a scripted program to a variety program that was both unrehearsed and spontaneous. *Breakfast Club* took on greater charm at that point, as McNeill's ability to ad-lib in almost any situation came through. So did his genial nature and easygoing tone, along with that of the rest of the regular cast, which sometimes included his wife and young sons. One singer on the program, Charlotte Reid (known on the air as Annette King), later became a member of the Federal Communications Commission and of the U.S. Congress. Other regulars at one time or another included Fran Allison and singers Patti Page, Johnny Desmond, and Anita Bryant. Some cast or orchestra members stayed around for decades. While the jokes were often bad and the program corny, it was appealing for its ability to seemingly speak to each listener individually. Many of the segments were enlightened by listener mail that amounted to thousands of weekly letters by the 1940s. And on occasion, the program left Chicago to go on tour, broadcasting from other cities.

The show's huge popularity became very evident with a 1944 promotional offer. As John Dunning writes: “When the sponsor offered *Breakfast Club* membership cards, 850,000 people wrote in. No more than 15,000 were expected, and McNeill had to go on the air and beg out of the promotion. It still cost the sponsor \$50,000 to retreat” (see Dunning, 1998).

Luckily by then there *were* sponsors. Through the 1930s the program lacked advertising support. During most of the war years, only about a quarter of the program was sponsored. Indeed, it was not fully supported by advertising until 1946—13 years after McNeill had taken it over and demonstrated he could build big and loyal audiences. Saturday broadcasts were dropped in 1945, by which time McNeill was making \$1,000 a week.

The show was clearly aimed at middle America, just as it was broadcast *from* middle America. The program was first broadcast (until 1948) from the 19th-floor NBC studios in Chicago's huge Merchandise Mart building, then for five years from the Little Theater in the Civic Opera Building. In 1953 it moved to the Terrace Casino of the Morrison Hotel and two years later to the College Inn at the Sherman House, and finally in 1963 to specially rebuilt Clouds Room on the 23rd floor of the Allerton Hotel, all in downtown Chicago. But its heart and content were clearly not in the city, but rather in rural America. And the do-good nature of the program came through in constant appeals to visit those in retirement homes or hospitals, to collect food for the starving refugees in post-war Europe, and to help the poor at holiday time at home. Listeners and often studio audiences came through every time.

Final Years

In 1950, by then making \$100,000 a year, McNeill signed a 20-year contract with the network to continue the program, one that gave him two months of vacation per year. *Don McNeill's TV Club* aired on ABC-TV in 1950–51 and a brief attempt to simulcast the successful radio program on television as *The Breakfast Club* failed after just one season on ABC in 1954–55. In 1957, the program began to be tape recorded a day before broadcast. Toward the end of the program's run, McNeill was receiving upwards of 10,000 letters each month. The program was still being carried on more than 220 stations when it ended its 35 year run on 27 December 1968, the last regularly scheduled network radio broadcast originating in Chicago. The old-fashioned sound of *The Breakfast Club* no longer fit a radio industry largely devoted to popular music formats, or a country facing the height of the Vietnam War and political assassinations.

McPherson, Aimee Semple 1890–1944

U.S. (Canadian Born) Radio Evangelist

The Pentecostal evangelist Aimee Semple McPherson, known as "Sister Aimee" to her followers, was an early celebrity of mass media religion. She was the first woman both to preach by radio (1922) and to hold a station license (1924). She founded the third radio station in Los Angeles, the still-extant KFSG, as the mouthpiece for her new denomination, the International Church of the Foursquare Gospel. At the time of her death in 1944 she had made plans for the United States' first televangelist network.

For this extraordinary career as one of the first modern media-savvy evangelists, her early preparation seems rather unremarkable. She was a dutiful missionary wife and later was a little-known itinerant preacher. Born Aimee Elizabeth Kennedy in 1890 in rural Ingersoll, Ontario, she was converted to Pentecostalism by her future husband, Robert Semple, during a 1907 revival. The Semples set off in 1910 to evangelize China, but Robert died shortly after their arrival and just weeks before the birth of their first child, Roberta Star Semple. Aimee Semple then left the ministry for about five years, during which time she went to the United States, married again, and had a second child, Rolf. By 1915, however, she was back on the road working full-time as an itinerant preacher on the Pentecostal tent circuit. Her travels and spreading fame eventually took her to Los Angeles in 1918, which remained her home for the rest of her life.

By 1921, when McPherson broke ground for Angelus Temple on West Sunset Boulevard, she was already famous for her faith-healing meetings ("stretcher days," as she called them), which packed stadium-sized crowds in San Diego, San Jose, and Denver. Her fast-growing organization, now called the International Church of the Foursquare Gospel, was the largest private relief charity in Los Angeles during the Depression years (and has since become a thriving worldwide church). At Angelus, to the accompaniment of a huge organ, a 14-piece orchestra, a brass band, and a 100-voice choir, she performed "illustrated sermons" every Sunday night for 20 years. These illustrated sermons were stage spectacles and Biblical dramas with elaborate costumes rented from Hollywood studios and with huge sets and special effects.

McPherson had first preached on Oakland's Rockridge radio station (now KNEW) in April 1922. She preached occasional services over *Los Angeles Times* station KHJ while raising \$75,000 to construct a 500-watt broadcasting facility inside Angelus Temple. Her own radio station, KFSG, began broadcasting on 6 February 1924. A Class A 500-watt transmitting station, with unlimited broadcast time, the station could be heard over much of the western United States and the Pacific, even as far away as Hawaii. Like other early radio pioneers in the 1920s, McPherson occasionally "wandered" the airwaves in search of a clearer broadcast frequency. In reply to Secretary

Aimee Semple McPherson, 21 August 1930
Courtesy AP/Wide World Photos

of Commerce Herbert Hoover's 1927 directive to keep to her assigned frequency, she fired off an infamous telegram that read, "PLEASE ORDER YOUR MINIONS OF SATAN TO LEAVE MY STATION ALONE. YOU CANNOT EXPECT THE ALMIGHTY TO ABIDE BY YOUR WAVELENGTH NONSENSE. WHEN I OFFER MY PRAYERS TO HIM I MUST FIT INTO HIS WAVE RECEPTION. OPEN THIS STATION AT ONCE." Eventually Sister Aimee learned to be more diplomatic in her dealings with the federal regulators; renewal of Sister Aimee's license to operate KFSG was never denied.

KFSG featured nearly round-the-clock programming; there were Sunday devotional and revival services simulcast in their entirety from the main auditorium, programs of sacred music, programs designed for children, a "family altar call," civic talks, and weekly divine healing and baptismal services. Later, McPherson added travel shows, a religious news program, and even live studio serials patterned after popular radio dramas of the time, with titles such as *Jim Trask: Lone Evangelist*. Perhaps more so than any other fundamentalist media preacher, she duplicated the genres of commercial radio. But faith healing, in particular, set McPherson apart as a radio phenomenon. Listeners were invited to kneel by their radios, touching the speakers to receive cures for their ailments. Prayers for healing were a regular part of the programming of KFSG and brought heavy mail response claiming cures for every known disease. Speaking in tongues was also a regular feature of KFSG programming, except during World War II, when McPherson stopped airing speaking in tongues because of wartime prohibitions against coded messages.

Sister Aimee's regional following was numbered at 30,000 by 1930, and her radio audience was certainly much larger. In 1937, on her license renewal application, McPherson claimed that KFSG constituted a "church of the air" with a registered membership exceeding 50,000. Most of her adherents and regular listeners came from the ranks of the lower middle class, including many recent migrants to the West Coast. As Sister Aimee herself put it, perhaps slightly tongue in cheek, "I bring spiritual consolation to the middle class, leaving those above to themselves and those below to the Salvation Army." Fundamentalist churches in the area drew close to 80 percent of their membership from people who had lived in Los Angeles for less than ten years. Eager for the familiar and positive message Sister Aimee radiated, these recent arrivals were nonetheless embedded in the emerging consumer and entertainment culture of the time, and radio was a natural way for her growing denomination to tap a huge potential audience.

The latter half of her ministry was dogged by controversy, although McPherson's media outlets and her rigorous schedule of services and appearances did not falter. During the lean Depression years, when many smaller religious radio stations and programs went off the air for lack of funds, KFSG continued to broadcast (although with a shared-time arrangement

with KRKD Los Angeles), and McPherson opened additional branches of her church in dozens of cities. She died in Oakland, California, just before her 54th birthday. Her son Rolf continued the ministry until 1988. After her death, the Church operated one of Los Angeles' early FM stations, KKLA FM (97.1) until the early 1950s and later assumed control of KRKD's AM and FM outlets.

McPherson's radio career permanently linked religious broadcasting with show business and successfully bridged old-time revivalism and modern mass communication. Her imprint remains not just on Pentecostalism itself, but on the exuberant, colorful, and sometimes all-too-human face of media evangelism throughout the century.

Media Rating Council

Industry Self-Regulatory Group

Originally known as the Broadcast Rating Council (BRC) and then as the Electronic Media Rating Council (EMRC), the official sanctioning body for ratings services now goes by the name Media Rating Council (MRC). The MRC works to maintain confidence and credibility in ratings through its self-stated goal of setting standards that ensure that surveys of media audiences are conducted in a manner that encourages quality, integrity, and accurate disclosure of the research process. A nonprofit agency sanctioned by the U.S. Justice Department, the MRC consists of 70 members from broadcast and cable trade associations, media owners, advertising agencies, cable networks, print and internet companies, and national networks.

The MRC is a nonprofit industry organization that is run on its membership fees. Each member organization provides one person to serve on the MRC board of directors, which makes the final decision as to whether reports that have been audited will receive accreditation from the council. Among the members of the New York-based MRC are the National Association of Broadcasters, the Television Bureau of Advertising, the Radio Advertising Bureau, and the Cable Advertising Bureau.

The MRC was established in 1964, when it was known as the BRC. A self-regulatory agency, the BRC was formed in response to an investigation by the House Subcommittee on Communications of the Interstate and Foreign Commerce Committee, under the chairmanship of Oren Harris. The Harris Committee, as it was known, held hearings in 1963 to investigate ratings and audience research. The hearings arose both from an increased focus on television ratings after the quiz show scandals of 1961 and from complaints by advertisers that they couldn't obtain upfront information about research methodology from the Nielsen Company. Essentially, the Harris Committee was concerned that if ratings were defective or deceptive, they would affect programming selections by stations and work in a manner that was not in the public interest.

The credibility and validity of ratings became a growing industry concern as U.S. representatives questioned executives from broadcast-measurement companies about the quality of their research. Faced with the possibility of government interference in the ratings business, broadcast industry leaders obtained permission from the U.S. Justice Department (to avoid any perception of antitrust violations) to set up the BRC, thereby ensuring a means of self-regulation.

The BRC changed its name to the Electronic Media Rating Council in 1982 to include all electronic media, such as

radio, television, and cable. The "Electronic" in the council's name was dropped in 1997 when the council started performing audits on print services as well as broadcast services. On 4 September 1996 the *Study of Media and Markets* (a national survey of over 20,000 adults performed by Simmons Market Research Bureau) became the first multimedia research study with a primary focus on print media to receive accreditation from the council. Today the MRC audits organizations such as Mediamark Research (which provides research to all forms of advertising media collected from a single sample) and J.D. Power and Associates (which publishes the annual *Car and Truck Media Studies* to assist with marketing and media strategies).

Audience measurement services voluntarily submit their studies to the MRC for review and possible accreditation. The MRC then commissions audits by an independent accounting firm (currently the Ernst and Young Corporation) to review the data. The ratings services pay the cost of the audit to the MRC, which in turn pays the auditors. This system allows for some separation between the parties and establishes that the MRC, not the ratings service, is supervising the audit.

Even though the auditing process is voluntary, many organizations still seek accreditation so that they will be considered legitimate in the industry and will therefore be better able to sell their ratings. Organizations seeking accreditation must agree to conduct their service as represented to users and subscribers, undergo MRC audits, and pay for the costs of the audits. The results of the audits are reviewed by the council's board of directors to determine if the ratings service will receive accreditation. Should a report receive accreditation, the organization submitting the report still must re-apply the following year and have the report reviewed on an annual basis. The MRC accredits syndicated services and individual reports, not entire companies. Accredited services and reports carry the MRC double-check logo.

In 1993 the council made an unprecedented move when it voted to suspend its accreditation of the spring Atlanta Arbitron survey, citing an on-air promotional campaign by Atlanta broadcasters that "hyped" (aimed to increase response rates) the survey by urging listeners to cooperate with Arbitron's diary-based system. The council decided that the effort could have an adverse effect on methodology and thus distort the survey results. The move to suspend accreditation met with sharp criticism from the Radio Advertising Bureau (RAB), which was upset with what it believed was an unfair bias toward television. Despite the controversy, the RAB currently holds membership in the MRC.

The MRC has expanded its role over the years but still functions primarily in an effort to maintain rating confidence and credibility. Melvin A. Goldberg, then EMRC executive director, explained in 1989 that obtaining accreditation required adherence to specific minimum standards that outlined basic objectives of reliable and useful electronic media audience measurement research. Acceptance of those standards was voluntary and was one of the conditions of EMRC membership.

According to Goldberg, the minimum standards fell into two groupings: (1) "Ethical and Operations Standards," and (2) "Disclosure Standards." The Ethical and Operations Standards governed the quality and integrity of the overall process of producing ratings. Meanwhile, the Disclosure Standards specified which information a ratings service had to make available to users, to the EMRC, and to its auditing agent. The overall effect of the standards was to assure anyone using EMRC-accredited ratings that the ratings actually measured what they said they did.

Thus, the minimum standards established professional codes of conduct that ratings services had to agree to in order

to gain accreditation. For example, a ratings service was required to submit complete information on its survey methodology, including sampling techniques, recruiting procedures, weighing, tabulations, coding and computer software, and the eventual ratings. The standards that Goldberg referred to are still in effect today. However, the MRC has also added electronic delivery requirements that govern the proper way for ratings services to deliver data to a third party electronically. The MRC has also incorporated internet ratings reports into its auditing processes.

Mercury Theater of the Air

Anthology Radio Drama Series

Mercury Theater of the Air was an offshoot of Orson Welles' successful theater company that had catapulted him to Broadway fame. Using many of the same actors, he put on a series of radio plays in 1938 under the title *First Person Singular*, although the *Mercury Theater* name was better known. At first the show had no sponsor and few listeners, but the success of the legendary "War of the Worlds" episode in 1938 persuaded Campbell's Soup to back it. The radio plays gave Welles national fame and allowed him to branch into films with his seminal *Citizen Kane* in 1941. The originality and technical flair that marked that film applied equally to Welles' radio productions.

By 1938 Welles, an accomplished Shakespearean actor, was becoming a noted radio performer, having worked on *March*

of Time; adapted, directed, and starred in the seven-part *Les misérables*; and, most notably, by becoming the voice of *The Shadow*. He was approached by William Lewis, head of programming at Columbia Broadcasting System (CBS), to make nine one-hour adaptations of famous books. Welles' budget of \$50,000 for the nine shows was not much, given that he had been earning \$1,000 per week, and the shows were slated for an unpromising timeslot against the popular *Edgar Bergen and Charlie McCarthy*. However, the deal did offer Welles creative carte blanche; he did not need to worry about pleasing a sponsor or appealing to any target audience. (CBS made the offer at a time when Congress was threatening legislation aimed at raising radio standards, so owner William S. Paley wanted programs that could turn CBS into a veritable patron of the arts.)

Broadcasts began on 11 July 1938 on the WABC network with "Dracula." Like subsequent performances, it followed Welles' view that "the less a radio drama resembles a play the better it is likely to be." This represented a major departure from many previous programs that had tried to recreate live theater down to the last detail, even including intermissions and chatting patrons. Instead, Welles introduced an omnipresent narrator, himself, who played several roles. This not only allowed Welles to take center stage but also changed the narrator into a storyteller, all the other characters effectively becoming projections of himself. Welles was equally innovative in his use of music. He asked Bernard Herrmann (head of music for CBS) for an unprecedented amount of musical scoring for each drama: up to 40 minutes in 57-minute-long performances. Similar demands were made with regard to sound effects, which overlapped the dialogue instead of occurring at the end of a speech as had been the practice. Welles demanded that even the faintest rustle of leaves be reproduced, despite the fact that very few listeners would have been able to hear these effects on their crackling AM radios. (They can now be appreciated on compact disc recordings, however.)

Nearly all of the dramas performed by the Mercury Players, which included "Treasure Island," "The Thirty-Nine Steps," and "The Count of Monte Cristo," were classics with family appeal. Their tone was not patronizing, but neither were they too advanced for children to appreciate. Welles decided which story to perform each week, but despite opening credits saying that each play was "produced, directed, and performed by Orson Welles," his participation was strictly limited to reviewing the script, making last minute changes, and performing. His long-time collaborator John Houseman and experienced radio man Paul Stewart oversaw the script writing and rehearsals. For the cast, Welles was able to call upon members of the Mercury stage theater such as George Coulouris, as well as other experienced radio actors including Ray Collins, Agnes Moorehead, and Martin Gabel.

Despite this range of talents, the programs rarely attracted more than four percent of the national radio audience until "War of the Worlds" greatly increased Welles' fame. The resulting sponsorship by Campbell's Soup caused the title of the series to be changed to *The Campbell Playhouse Series* in midseason 1939. This new name also reflected the demise of the Mercury Theater, which had fallen apart following a number of unsuccessful theater productions.

Ostensibly, *The Campbell Playhouse Series* was the same program as the *Mercury Theater of the Air*, and the dramas continued to be hour-long adaptations. However, the new and bigger budget allowed Welles to cast star names, including Katharine Hepburn ("A Farewell to Arms"), Laurence Olivier ("Beau Geste"), Gertrude Lawrence ("Private Lives"), and Walter Huston ("Les misérables"), as his co-stars. Former members of the Mercury stage theater continued to work on

the show, but they were now reduced to supporting roles. The presence of a star also affected the show's format, as the play would now be sandwiched between segments of talk show style patter as Welles chatted with his guest star. This would invariably include some banal reference to the joys of Campbell's soup. Campbell's also inserted commercial breaks for soup ads into the plays themselves. The *Mercury* broadcasts had been uninterrupted, but now cliff-hangers had to be created to insure that listeners did not tune in a different program during the commercials.

The *Campbell's* plays were also based upon noticeably different books. The *Mercury's* eclectic mix of classics was forsaken in favor of more populist and more modern works, primarily best-sellers from the previous decade. There were also reworkings of previous Welles productions, which were an indicator of the extent to which the program lost much of the *Mercury's* originality and innovation. Welles' contribution also dropped off considerably as he began to concentrate more on theater before relocating to Hollywood. During this period, he would fly to New York on the day of the performance, make the broadcast, and then fly back to Hollywood. The production of the plays was thus left to Houseman and Stewart, with almost no input from Welles at all. However, *Campbell Playhouse* was one of the most popular shows on radio until Welles finally pulled the plug in March 1940 to fully concentrate on cinema. He had considered moving the show to Los Angeles so that his actors could be employed while he worked in films, but Campbell's refused to give up the Broadway panache that the show's New York connection provided. The *Mercury* name did make some sporadic returns to radio whenever Welles needed to raise some quick cash, but these later programs were mainly rehashes of previous performances that added little to the originals.

Metromedia

Group Owner of Radio Stations

Corporate executive John Kluge made his mark as the founder of Metromedia, a media conglomerate that operated through the 1960s and 1970s both with independent television stations in major U.S. cities and with owned and operated major-market radio stations as well. Although not well known to the general public, Kluge emerged in this period as one of the most powerful media moguls. Kluge proved that independent television stations and big-city radio stations could make millions of dollars in profits by counterprogramming. In 1985, when Australian Rupert Murdoch offered Kluge nearly \$2 billion for Metromedia's seven television stations, he sold out and began to reinvent Metromedia. He was out of big-city radio during the late 1980s.

John Werner Kluge surely represents the American success story. Kluge grew up poor in Detroit, but in 1933 he won a scholarship to Columbia University, where he earned a degree in economics. Serving U.S. Army Intelligence during World War II, he returned with little taste for resuming a career in the employ of others. He looked for ways to make money, including buying and selling radio stations.

After World War II, Kluge came to radio (and television) for its advertising power in the growing market of Washington, D.C., where he had served in World War II. Kluge bought and sold radio stations; his first was WGAY-FM in Silver Spring, Maryland, a Washington, D.C., suburb. As radio reinvented itself as a format medium, Kluge bought and sold stations across the United States, with early investments in radio groups including the St. Louis Broadcasting Corporation, Pittsburgh Broadcasting Company, Capitol Broadcasting Company (Nashville), Associated Broadcasters (Fort Worth–Dallas), Western New York Broadcasting Company (Buffalo), and the Mid-Florida Radio Corporation (Orlando).

Kluge became aware of television as an investment possibility when he ran into an acquaintance on a street in Washington, D.C.; the acquaintance casually mentioned that the failed Dumont television network was going up for sale. In January 1959 Kluge acquired Paramount Pictures' share of what remained of DuMont, the television stations of Metropolitan Broadcasting, for \$4 million. He then consolidated his radio and television holdings and later bought and sold interests in restaurants, outdoor and direct-mail advertising, and magazines.

Indeed, Kluge never stopped trading radio—if he figured he could make a profit. So in 1982, for example, he sold WMET-FM (Chicago) and KSAN-FM (San Francisco) and acquired KHOW-AM and WWBA-FM in Tampa, Florida. Yet with Federal Communications Commission rules permitting Metromedia to own only seven AM and seven FM radio stations, Kluge held on to stations in top markets because they made the most money. Metromedia held WNEW-AM and -FM in New York City, KLAC-AM in Los Angeles (acquired in 1963), and WIP-AM in Philadelphia (acquired in 1960) for the longest amount of time. Once a station was acquired, Kluge assigned managers to squeeze maximum profits, not caring what format was used. His stations employed all formats: adult contemporary, beautiful music, all-news—any format that worked in that particular major market.

In his heyday, Kluge grew famous for cutting costs and maximizing revenues; indeed, once he had assembled Metromedia, he moved the operation's headquarters out of expensive Manhattan across the Hudson River to Secaucus, New Jersey, where rents were lower. He secured the cheapest possible programming, and then, even with small audience shares, Metromedia could, with bare-bones costs, make a profit. But not

every well struck oil. One disastrous misstep was Kluge's purchase of the niche magazine *Diplomat*. Another was his vision of forming a fourth television network, a venture in which Kluge only lost millions of dollars.

In April 1984 Kluge took Metromedia private, and so he possessed three-quarters of Metromedia stock when he sold the seven television stations to Rupert Murdoch a year later. The eventual sale of the radio stations in the late 1980s would make Kluge more than \$100 million, a great deal of money, but little compared to the billions made from the sale of the television stations.

But by the 1990s Kluge was again at work building a new corporate empire. He again took a qualified risk by sinking his fortune into paging devices such as beepers and mobile telephones. He bought licenses for operation in major markets, waited as the market evolved, and then sold out at a profit. He also went global, forming Metromedia International Telecommunications to bring wireless cable and communications businesses to the emerging markets of Eastern Europe and the

former Soviet republics. In 1994 Kluge began to break into the radio broadcasting business once again by acquiring Radio Juventus in Hungary. By 1999 Metromedia International was a leading operator of radio stations in Eastern Europe and the former Soviet Union, with 15 stations in ten markets.

Metropolitan Opera Broadcasts

Bringing Opera into the Home

Performances of New York's Metropolitan Opera have been broadcast regularly on radio since 1931 and occasionally on television since 1977. Milton Cross was the voice of these broadcasts for more than four decades. The continuous support of Texaco (ChevronTexaco after 2000) from 1940 to 2004 formed what was probably the world's longest-running commercial broadcast sponsorship.

Origins

New York's Metropolitan Opera Association was formed in October 1883, and soon the city was presented with an annual season of fine opera performances by top-drawer orchestras and singers. But for decades the only way to hear and see a "Met" performance was to purchase an expensive ticket and attend a program in New York.

The first hint of an alternative means of delivering opera came on 13 January 1910. With the permission of the Opera's assistant director, wireless inventor (and opera lover) Lee de Forest set up one of his transmitters high in the attic above the stage with a temporary bamboo antenna on the roof. Several microphones were placed on the stage. That first transmission

included scenes from *Cavalleria Rusticana* and Enrico Caruso singing in *Pagliacci* and was heard primarily by other radio operators and some reporters. And what they heard was anything but a clear signal, given the crude equipment of the time. The poor results did not endear the company's management to the rising medium of radio.

Despite radio's later development, opera director Giulio Gatti-Casazza resisted further experimentation with radio microphones for two decades out of a fear of lost ticket sales. He also felt mere *listeners* would lose the visual aspect of opera. Public reasons given for the lack of radio coverage included technical problems with placement of microphones and contracts with lead singers that forbade such transmission. Yet the Met was being bypassed by others.

The Chicago Civic Opera went on the air in 1922 when station KYW debuted with a focus on opera broadcasts. And other performing companies were heard in other cities. So were some performances by the Manhattan Opera Company that then competed with the Metropolitan Opera. The fan magazine *Radio Digest* began an editorial campaign to get the Met to change its mind that same year. Station WEAJ wasn't waiting—they formed their own in-studio opera companies,

one for grand and one for light opera—and broadcast their performances for several years. The original language of the composer was used, but performances were cut to fit one-hour time slots. And they took place in a studio, not on an opera stage, limiting what could be accomplished. Broadcasts of opera from Europe could occasionally be picked up by U.S. listeners tuning shortwave. The broadcast sound quality left much to be desired, but at least the operas were being heard.

What finally turned the tide was the Met's need for new sources of operating funds during the depression. NBC secured the broadcast rights for \$120,000 for the first season, outbidding rival CBS. Broadcasts began with *Hansel and Gretel* on Christmas Day of 1931 with Deems Taylor providing the initial commentary. He received howls of protest when he timed his comments to appear over the music and soon changed his approach. The first broadcasts also featured announcer Milton Cross, who would remain as host until 1975, doing more than 800 broadcasts and missing only two in all those years.

Metropolitan Opera Auditions of the Air was developed as a separate program (1935–58; on NBC until 1937, then Blue/ABC) and also featured commentary by Milton Cross with Edward Johnson, managing director of the Met, as host. Each week aspiring operatic performers would do their best to earn audience support and a contract from the Met.

Despite the interest of a small but vocal audience, sponsorship for the broadcasts was difficult to arrange and harder to perpetuate. Several backers (American Tobacco, RCA, and Lambert drugs) came and went, and by the late 1930s, opera broadcasts from New York were threatened by a lack of continuing advertiser support.

Texaco Sponsorship

Beginning on 7 December 1940, the Texaco oil company took up sponsorship of the weekly broadcasts. Though at first this seemed merely the latest in a changing parade of financial backers, Texaco stuck with the program, pleased with the highbrow audience it attracted. More than six decades later, ChevronTexaco continued to support the Metropolitan Opera broadcasts, forming what was probably the longest continuing relationship of an advertiser and a program in radio history. The broadcasts under Texaco at first continued on NBC, then moved to Blue (which became ABC) until 1958, at which point CBS carried on the series for two years. But Texaco became unhappy with declining network interest and decided to create its own specialized network of stations to carry the Saturday matinees. So in 1960 the Texaco-Metropolitan Opera Radio Network was created, with Texaco arranging for the AT&T connecting lines to link the slowly growing number of stations carrying the broadcasts.

As microphone and other radio technologies improved, so did the sound of the opera on the air. By the late 1940s a more

complex multiple microphone technique was being used. The opera company understandably insisted that no microphone be placed where it could be seen, so broadcasts utilized four microphones placed near the stage footlights. These were aimed at the floor to receive a more equal (reflected) sound of the varied singing voices and spoken lines and were supplemented by two more microphones suspended above the orchestra. Stereo transmissions were added in the 1960s. The entire radio operation was upgraded with the move of the Met into its new opera house in New York's Lincoln Center in 1966. The opera network was connected by satellite in the 1980s.

Over the years the opera broadcasts were supplemented with the "Texaco Opera Quiz" and "Opera News on the Air," features that became very popular. On Milton Cross' death in 1975, Peter Allen took over the host role and continued it into the 21st century. In 1977 several operas were televised on the Public Broadcasting Service, which still does three or four such performances each season (with English subtitles). Texaco also supported formation of a Media Center to archive past broadcasts.

Over the years the audience for the programs grew, first in the United States and then beyond. The 20-week (November–April) season of Saturday matinees has long been transmitted throughout the United States and Canada (more than 325 stations across North America), and beginning in 1990, to 27 European countries. Australia and New Zealand joined the network in 1997, and in 2000 the Texaco network welcomed Brazil and Mexico. By the end of the 2000–2001 season, Texaco had sponsored 1,212 Metropolitan Opera broadcasts of 144 different operas.

In May 2003 ChevronTexaco (as the sponsor had become after a 2000 merger) announced that the 2003–04 season of matinee broadcasts would be the last they would sponsor, ending a nearly 65-year run, the longest continuous sponsorship in radio history. The Metropolitan Opera said it would continue the broadcasts and seek new sponsors. ChevronTexaco said the series had been costing about \$7 million a year, reaching some 10 million listeners in 42 countries. Their announcement to terminate sponsorship came after the oil company saw a drop in both profits and stock price.

Mexico

Radio reaches more people in Mexico than any other electronic medium of communication. Despite the broad reach of television and the growing role of cable and the internet, radio broadcasting continues to be a central arena of commerce, culture, education, and politics. Beginning in the 1920s and 1930s, radio's dynamic sound format made it an ideal medium for Mexico's orally based popular cultures, including music, verbal humor, and melodrama. Despite the strong influence of the U.S. commercial broadcasting model, radio practices in Mexico reflect the interaction of a variety of social forces: local popular cultures, the national state, transnational commercial interests, and civic groups.

Broadcasting Begins: The 1920s and 1930s

Beginning with Mexico's first radio transmission in 1908, radio was the domain of amateur operators who used the medium primarily for point-to-point communication. With the authorization of the first non-experimental broadcasting stations in 1923, however, state and commercial interests began to develop radio as a broadcast medium. State-sponsored stations were operated by specific branches of government (e.g., the Navy, the Ministry of Education) with limited public funding. Commercial stations were financed by entrepreneurs who drew on both transnational capital and domestic capital accumulated in ancillary fields (e.g., newspaper publishing, electronics, retail sales). The first commercial station, CYL, was launched by Luis and Raul Azcárraga, distributors of U.S. radio parts and receivers, in partnership with the Mexico City newspaper *El Universal*. Another early station, CYB (later XEB), was started by a cigarette company, El Buen Tono, with

French financial backing. Sixteen stations were broadcasting by 1926, and nineteen by 1929, the year Mexican stations received the "XE" and "XH" call letter designations.

Beginning in the early 1920s, the U.S. government and U.S. media interests made a concerted effort to open broadcasting markets in Mexico and Latin America to U.S. commercial interests. At the 1924 Inter-American Conference on Electrical Communications held in Mexico City, however, Latin American delegates resisted this offensive and argued that a strong governmental role in radio was essential to economic self-determination. Although they conceded to the principle of commercial competition where feasible, Latin American delegates resolved that electronic communication media were public services over which national governments held direct control. These resolutions became the basis for Mexico's first radio law of 1926, the Law of Electrical Communications (LCE) and the subsequent Law of General Means of Communication (LVGC).

Despite considerable U.S. pressure, Mexico's radio regulations were strongly influenced by state activism and economic nationalism. The 1926 LCE declared the airwaves to be a national resource, allowed only Mexican citizens to own or operate radio stations, and prohibited any transmissions that attacked state security, public order, or the established government. The LVGC established a system of 50-year concessions for commercial broadcasters. Concessionaires were prohibited from making political or religious broadcasts and were required to carry government transmissions free of charge. Further regulations prohibited radio studios from being located on foreign soil and required broadcasting in Spanish. In practice, this regulatory framework ensured the rapid devel-

opment of commercial broadcasting while giving the state a privileged position of access and control within a highly nationalistic broadcasting system.

Commercial broadcasting grew enormously during the 1930s with an infusion of advertising revenue from transnational companies like Colgate-Palmolive and Proctor and Gamble. Although many prominent regional stations started in the early 1930s, Mexico City became the undisputed power center of commercial broadcasting. The centerpiece of Mexico City broadcasting was XEW, "La Voz de América Latina desde México" ("The Voice of Latin America from Mexico"), founded by Emilio Azcárraga in 1930. XEW soon became the most powerful and most popular radio station in the country. By the late 1930s Azcárraga had organized two national radio networks anchored at stations XEW and XEQ in Mexico City. Along with the rise of the Azcárraga group, the late 1930s witnessed the consolidation of the commercial broadcasting industry and the formation of a powerful industry group that became the Radio Industry Chamber (the CIR, later CIRT) in 1942.

As commercial broadcasting advanced, the central state also expanded its efforts to harness the new medium. The number of government-operated radio stations reached a peak of 14 during these years. Important stations were operated by the National Revolutionary Party (PNR, later the PRI), the Ministry of Public Education, and the Autonomous Department of Press and Publicity. Beginning in 1937 the government produced a "National Hour" program of official information and national culture that all stations were required to broadcast weekly. At the same time, radio regulations promoted national culture by requiring all broadcasters to include 25 percent "typical" Mexican music in their broadcasts. The 1930s also saw the beginning of state-sponsored radio education projects, which included the distribution of radio sets to rural schools and working class neighborhoods.

Whereas comedies and drama serials dominated U.S. broadcasting during the 1930s, music was the mainstay of Mexican radio. This was due, in part, to an explosion in the production and circulation of popular music in Mexico and Latin America beginning in the 1920s. Musical programs included boleros, mambos, and rancheras performed by orchestras, bands, and soloists, often interspersed with comedy interludes in a "musical variety" format. In addition, radio regulations created a climate that promoted national musical forms over the radio medium. Commercial broadcasters found that Mexican singers and musicians performing popular Mexican tunes provided the ideal radio content to satisfy state nationalism and capture the national broadcasting market. Mexican orchestras featuring performers like Agustín Lara and Toña la Negra dominated the XEW network schedule.

Although dramatic series were less prominent than music during the 1930s, broadcasters developed a number of dra-

matic and nonfiction program formats by modifying and adapting U.S. soap operas, game shows, and news and sports programs. Radionovelas, for example, combined the techniques and formats of U.S. soap opera production with the melodrama of Latin American music, film, and theater.

Radio listening grew considerably over this period as the number of stations grew, the quality and consistency of programming improved, and the price of radio sets dropped. Listeners had been scarce in the 1920s, but between 1930 and 1935 the number of radio receivers grew to an estimated 200,000 sets and reached an estimated 600,000 sets by the end of the decade. Surveys from Mexico City indicate that well over half of the urban population had regular access to the medium by the late 1930s, although radios were still rare in rural areas and smaller regional cities.

A Golden Age: The 1940s and 1950s

The 1940s and 1950s were characterized by steady growth and consolidation in the radio industry and the increasing popularity of the radio medium. Between 1941 and 1950 the number of radio sets grew from more than 600,000 to almost 2 million. Assuming approximately six listeners for every radio receiver, a 1943 survey indicates that over 90 percent of the populations of Monterrey and Torreón had regular access to radios, compared to 79 percent in Guadalajara, 68 percent in Mexico City, and only 33 percent in Puebla and Morelia. In 1941 Azcárraga and his partner Clemente Serna Martínez consolidated their radio holdings into a single company, Radio Programs of Mexico (RPM). By the mid-1940s RPM networks encompassed nearly half the stations in Mexico and included more than 30 affiliates in Central America, the Caribbean, and the northern rim of South America. Several other national networks emerged in the 1940s, including networks anchored by stations XEB and XEOY-Radio Mil.

Mexican broadcasters' regional power became evident in 1946 when the chief organ of the radio industry, the CIR, organized the Inter-American Association of Radiobroadcasters (AIR) to promote commercial broadcasting throughout Latin America. In 1948 AIR delegates drew up the *Bases of the AIR*—a set of principles to guide broadcasting legislation in the region. These principles declared broadcasting to be a fundamentally private activity undertaken in the public interest. The document argued that government regulations should be limited to the technical aspects of broadcasting and that the state should be prohibited from competing with private broadcasters for advertising dollars. The unstated goal of the AIR was to ensure that the commercial model of broadcasting would guide television development in the region.

World War II had a significant impact on the consolidation and expansion of the Mexican radio industry. During the war the U.S. government sponsored a massive propaganda

campaign through the Office of the Coordinator of Inter-American Affairs (CIAA). Headed by Nelson Rockefeller, the CIAA aimed to counter Nazi propaganda in Latin America by increasing the dependency of Latin American broadcasters on U.S. corporate advertising, strengthening oligopolies (especially Azcárraga's), and blacklisting uncooperative broadcasters. The CIAA ultimately discovered that the best way to convey its propaganda was to incorporate it into Azcárraga's popular Mexican commercial content. As a result, the Azcárraga group benefited from CIAA funding without losing significant control over radio content.

Indeed, the era of the CIAA has been described as a "golden age" of radio in Mexico and Latin America as a whole. Mexican performers such as Jorge Negrete and Agustín Lara became international stars through the synergy of radio, records, and cinema. Musical variety programs and radionovelas of a distinctly Mexican pitch became the institutional and economic mainstay of commercial radio. Of the most popular radionovelas first produced during this period, *El derecho de nacer* (The Right to be Born) and *Simplemente María* (Simply Maria) later became classics of the telenovela genre.

While television entered the majority of U.S. homes by the late 1950s, it was adopted much more slowly in Mexico. Although a small number of television and FM stations were launched at this time, their audiences remained extremely limited due to the expense of television sets and FM-compatible receivers. Instead, AM radio continued to grow and expand during the 1950s and remained the primary broadcasting medium until well into the 1960s and 1970s. Radio Cadena Nacional was one of several new networks that emerged in the 1950s. Azcárraga's RPM organization, however, remained dominant and increased its national broadcasting coverage by buying two independent networks. Expansion abroad also increased during this period as Azcárraga's Latin American network grew to 80 affiliates and RPM began exporting programs to Spain. At the same time, the AIR expanded its international activities and opposed government broadcasting initiatives in several countries. The postwar period also witnessed the formation of labor and professional organizations in Mexican broadcasting, including the Union of Radio and Television Industry Workers (STIRT) and the National Association of Mexican Announcers (ANLM).

Growth and Competition: The 1960s and 1970s

The 1960s and 1970s were decades of tremendous growth for the radio industry. The radio audience exploded from almost 3 million to more than 14 million between 1960 and 1970 and reached 20 million by the end of the 1970s. The structure of the industry remained highly centralized despite the Azcárraga group's increasing shift to television. Important new radio

chains developed during this period, including Sociedad Mexicana de Radio, S.A., Asociación de Concesionarios Independientes de Radio, Organización Impulsadora de Radio, and Organización Estrellas de Oro. In the early 1970s Clemente Serna Alvear (son of Serna Martínez) purchased Radio Cadena Nacional and formed Radio Red, a network devoted to talk and news programming.

Despite robust growth in radio, however, television began to siphon off both talent and advertising revenue. Although radionovelas continued to draw vast audiences during the early 1960s, by the end of the decade live radio production was increasingly replaced by less expensive recorded programs (mostly music). Polls indicate that the percent of stations airing radionovelas declined to 27 percent in 1977 and less than 7 percent by 1981. Television competition also led radio broadcasters to explore new technologies as a means of increasing their markets. Beginning in 1970 the Mexican Association of FM Broadcasters began to promote commercial FM broadcasting and encourage the manufacture of FM radios. By 1980, the number of FM stations had more than doubled (from 65 to 174) and the commercial model of FM radio was firmly in place.

The 1960s and 1970s also witnessed important developments in broadcast regulation. The 1960 Federal Law of Radio and Television (LFRT) established a regulatory structure that would remain in place through the year 2000. The LFRT followed many of the recommendations made by the AIR and CIRT and declared broadcasting to be an activity undertaken "in the public interest," rather than a "public service." At the same time, the LFRT continued to assert a national interest in broadcasting with regulations that promoted national morality and culture.

Social change and state activism in broadcasting during the late 1960s and early 1970s also led to significant regulatory revisions. Renewed government interest in broadcasting was signaled by the reopening of the Education Ministry's radio education project in 1967 with station XEEP. After much wrangling between the government and the industry, a 1969 agreement gave 12.5 percent of the broadcasting day to the state, but did not allow that time to accrue. Regulatory adjustments continued over the course of the 1970s as both the state and commercial interests jockeyed for privileged access to the broadcast media. By the late 1970s, "right to information" debates succeeded in breaking the state's moratorium against political broadcasting: for the first time all political parties were guaranteed access to the mass media.

Crisis and Consolidation: The 1980s and 1990s

The last two decades of the 20th century were characterized by technological innovation, new program formats, and the

rise of a significant non-commercial radio sector. Many changes during this period were motivated by crisis conditions in the Mexican economy in the 1980s and early 1990s. Economic pressures forced broadcasters to seek new means of competing with television, which gobbled up almost 75 percent of the media advertising pie by the early 1990s. Beginning in 1986, radio chains began to use satellite technology as a means of increasing market share and reducing costs. Satellites not only improved networks' abilities to reach targeted markets nationwide, they also helped Mexican broadcasters reach international markets, including the lucrative U.S. Latino market. Centralization and consolidation continued to characterize the radio industry during the 1980s and 1990s, as fewer than a dozen groups controlled the majority of radio stations.

Political and social upheaval stimulated significant changes in radio program forms and content. As a range of political and civic voices began to call for democratic change in Mexico, radio became a ready outlet for political dissent. For commercial broadcasters, the decision to give voice to political opposition was, in part, a strategic decision. By airing oppositional voices, radio was able to provide a competitive information product that television broadcasters would be unable to offer until the mid-1990s. Radio's currency was also increased by the 1985 Mexico City earthquake. During the disaster, radio became a central means of coordinating relief efforts, disseminating information, and bringing the concerns of community and civic groups to the attention of government officials. All of these events contributed to the rise of news and talk-radio formats in the late 1980s and early 1990s and promoted social, cultural, and political openness on the air. Radio Red's *Monitor*, for example, became a prominent national news program. Overall, commercial radio news and information shows continued to reflect the centralized nature of the radio industry by focusing on Mexico City-based politics and culture.

Mexico experienced considerable growth in noncommercial broadcasting during this period. The number of noncommercial, "permissioned" stations doubled between 1981 and 1991 (from 47 to 100) and doubled again by 1999 (reaching 223). Growth in noncommercial broadcasting included two state-sponsored networks, Grupo IMER and Indigenous Cultural Radio (RCI), independent community radio, and university radio. Grupo IMER constitutes a unique hybrid in Mexican broadcasting, combining both state and nongovernmental funding and receiving special permission to supplement its budget with advertising. Unable to sell advertising, independents and university stations were hard hit by economic crises during this period. Despite calls for a new category of "social enterprise" radio that would allow nonprofit stations to sell advertising, community broadcasters remained "weak voices" on the Mexican airwaves.

The Future of Radio in Mexico

Mexican radio in the 21st century has entered a period of transition. Calls for the revision of the Federal Law of Radio and Television can be heard in a variety of circles, from civic and nongovernmental groups that would like to see new opportunities for community radio and low-power FM, to commercial broadcasters with interest in convergence and cross-media acquisitions. While the oligopolistic structure of commercial radio remains firmly in place, the government's anti-monopoly commission has so far prohibited the massive media mergers that have characterized U.S. radio. In sum, radio remains a lively medium of social communication that promises to play a central role in Mexico's changing economic, political, and cultural landscape.

Middle of the Road Format

Middle of the road (MOR) refers to a form of radio music programming that features popular standards and current hits, mainly adult contemporary in nature. MOR relies on broad-based music that appeals to adults 45 and older, and it serves as a "bridge" between the adult contemporary and easy listening formats. Other industry terms that describe the MOR approach include *full-service*, *variety*, *general appeal*, and *diversified* (Keith, 1997).

MOR serves as "one of the oldest and most durable types of programming within format radio" (Howard, Kievman, and Moore, 1994). It finds its origins in the 1940s, when radio offered a variety of program material and before rock and roll as a musical genre spurred the creation of specialized formats. Traditional MOR stations of this radio era appealed to adults by giving them "lots of news, sports, and safe, comfortable music" (Halper, 1991). As more and more stations sought to attract teen audiences, whom they saw as becoming more important as a demographic group, they began to air countdown shows of popular hits during nights and weekends. In this capacity, MOR serves as the predecessor of Top 40 radio.

During the 1950s, television began to displace radio as a source of entertainment programming, as embodied in serialized dramas and the like. Keith (1987) notes that as the networks left radio, stations found themselves having to fill their schedules with recorded music, news, and sports. When rock and roll arrived on the radio scene, marking the start of format specialization, MOR stations modified their playlists to secure the older adult audience. Thus, MOR established itself as a true radio format, characterized by broad-appeal music and a "full-service" function of providing music, news, and sports. By the mid-1950s, "MOR dominated the radio programming scene" (Keith, 1987).

Between the 1950s and 1970s, MOR enjoyed high popularity. But MOR as a programming powerhouse began to lose strength as the radio industry evolved during those decades. As radio became further fragmented, MOR had to contend with competition from new programming styles, such as beautiful music in the late 1950s and soft rock and oldies in the 1960s. Keith (1987) points out that these formats, plus the updating of easy listening station playlists and the rise of adult contem-

porary, took away some of MOR's audience. Because MOR was a mainstay of AM, its numbers fell further as FM grew in popularity in the 1970s, with mellow rock taking away the younger side of its demographic, 25- to 40-year-olds.

By the 1980s, the MOR audience consisted mainly of the 45 and older crowd, with a number-2 Arbitron rating in AM listenership and a number-11 ranking among the 12 formats listed for FM (Keith, 1987). Indeed, some believed that by the mid-1980s, MOR ceased to exist altogether, as other programming formats, especially adult contemporary, took its place. Fewer than 100 stations holding the label MOR remained by the mid-1990s (Keith, 1997).

Music-wise, the traditional MOR format through the years consistently centered on popular standards that emphasized melody more than a beat (Howard, Kievman, and Moore, 1994). Indeed, Hyatt (1999) considers the term *middle of the road* as synonymous to *adult contemporary* and *easy listening*. The term *middle of the road* accurately describes this type of music, which is similar to the more modern adult contemporary genre—neither too soft nor too raucous, music that walks the line musically, “avoiding anything too old, too new, too upbeat, or too solemn,” as Keith (1987) describes it. Asserts Gregory (1998), “MOR was coined by broadcasters to describe a style of popular music that is high on melody, but short on substance.”

Traditional MOR station playlists might include “traditional” pop vocalists such as Frank Sinatra, Tony Bennett, Rosemary Clooney, Ella Fitzgerald, Perry Como, and Peggy Lee; big band acts such as Benny Goodman and Glenn Miller; and relatively “contemporary” acts such as Helen Reddy, Olivia Newton-John, Barbra Streisand, Roger Whittaker, Ray Conniff, and Sergio Mendez (Howard, Kievman, and Moore, 1994; Keith, 1987, 1984). Crossover artists who found success in the MOR format during the 1970s included the Carpenters, Glen Campbell, and Anne Murray (Keith, 1984).

During the 1980s and 1990s, notes Gregory (1998), further updating of the MOR style came with the crossover success of artists with soul and rhythm and blues backgrounds, such as Whitney Houston, Toni Braxton, and Luther Vandross. The demarcation between MOR and adult contemporary formats eroded even further during this time, if one believes Gregory (1998) when he asserts that “the whole concept of what MOR actually represented was embodied by Canadian Celine Dion, Elton John and the modern musicals of Andrew Lloyd Webber and Tim Rice.” In short, when considering the range of artists found on station playlists, MOR and adult contemporary mirror each other in terms of melodic style, but the MOR playlist includes older standards.

In addition to the inclusion of older tunes, MOR differentiates itself from other similar formats in its use of on-air personalities and its added emphasis on news. For example, whereas adult contemporary stresses music, MOR “has always been the home of the radio personality” (Keith, 1984). On-air announcers and disc jockeys enjoy considerably more freedom on MOR than on other music-based formats; they often choose individual selections to play and may have extensive programming experience (Howard, Kievman, and Moore, 1994). Indeed, “MOR personalities often serve as the cornerstone of their station’s air product” (Keith, 1997).

Though fewer traditional MOR stations existed in the late 1990s, the format, encompassing heavy news and informational programming, still found success in the larger metropolitan markets. Just as the radio industry as a whole had experienced “frag-out” during the 1970s, the MOR label became delineated at the end of the 20th century with descriptors such as “nostalgia,” “golden oldies,” and “adult standard.” Stations employing the MOR genre in the late 1990s reflected this emphasis on music favored by its older-adult audience through slogans such as “Unforgettable Favorites,” “The Original Hits Station,” “Station of the Stars,” “The Greatest Music of All Time,” “The Memory Station,” and “Great Songs, Great Memories.”

Milam, Lorenzo 1933–

U.S. Community Radio Activist

Lorenzo Wilson Milam is a broadcast activist, teacher, and writer who founded or helped to get licensed more than 40 community-based FM radio stations between 1962 and 1976. Originally published in 1975, his book *Sex and Broadcasting: A Handbook on Starting a Radio Station for the Community* showed nonprofit groups how to get on the air, legally licensed by the Federal Communications Commission (FCC). Typically underfunded, most of these stations used donated and home-built equipment, all were programmed by volunteers, and most have not survived in their original forms. What Milam accomplished in the 1970s is similar to what the microradio proponents achieved for community groups in the late 1990s, but with one major difference: Milam's stations had government licenses, and microradio did not.

Many of Lorenzo Milam's social and political goals for radio were repeated 30 years later by Stephen Dunifer of Radio Free Berkeley. Dunifer believed, as Milam did, that radio was in the firm control of corporate entities and that community groups such as antiwar activists, tenants' rights groups, homeless advocates, the disabled, and all others denied a voice by the mainstream media were entitled to broadcast. Unlike Dunifer, Lorenzo Milam's 1970s timing allowed him access to open FM channels now no longer available. During the time that Milam was helping community groups get licensed, the dominant medium was AM radio. Most commercial FM stations were not profitable, and there were few educational licensees on the air, so a lack of interest in FM made it easier for Milam to obtain licenses.

The 1945 allocation of VHF channels set aside a portion of the then underused FM band for a license category called "educational, non-commercial." Channels between 88.1 and 91.9 megahertz were reserved for colleges, high schools, community nonprofit foundations, churches, and other institutions without a commercial purpose. A category known as 10-watt Class D allowed entry-level broadcasters, such as high schools, to purchase inexpensive transmitters. In 1978 Class D was eliminated, but in January 2000 the FCC created a special class of licenses called Low Power FM Radio (LPFM). The LPFM service is designed to create opportunities for new voices to be heard on the radio.

The LPFM service consists of two types of radio station: 100-watt stations that reach an area with a radius of approximately three and one-half miles; and 10-watt stations that generally reach an area with a radius of between one and two miles. By contrast, full-power FM radio stations generally operate at between 6,000 and 100,000 watts.

LPFM stations are available only to noncommercial educational entities and to non-profit public safety or transportation organizations. Licenses are not available to individuals or to commercial operations. In order to assure the greatest diversity of ownership, existing broadcasters and other media entities are prohibited from owning LPFM stations, and an entity may own only one LPFM station in the same area.

There are several informal categories of noncommercial FM stations. Most successful, as defined by funding success and audience numbers, are those affiliated with National Public Radio (NPR). A second category, college radio, is typically programmed by students, often as part of a radio-TV-film degree. Third, the religious category includes Christian music and talk. A fourth category, defined by the 1946 founding of the Pacifica Foundation, is community radio, featuring alternative forms of music and talk and commentary by and for communities of minorities, women, gays and lesbians, poor people, and others. If the microradio movement in the late 1990s can be traced back to Lorenzo Milam's work in the 1970s, Milam's work had as its basis Pacifica and KPFK-FM, Berkeley, California.

In 1958 Milam, then a graduate student at the University of California, Berkeley, began to volunteer at KPFA, where he studied the community programming philosophy of Lewis Hill. This philosophy encouraged Milam to introduce this unique concept to other cities. After his first station, KRAB in Seattle, was licensed in 1962, he traveled the country, writing and lecturing about community radio and helping at least 40 stations get on the air. He revealed his sense of humor in the call letters of some of these: KBOO, KPOO, WAIF, KCHU, KDNA, and KUSP. The stations typically suffered from organizational problems, philosophical conflicts, and lack of funding; because they were run by volunteers, the sound was uneven and the equipment insufficiently maintained. Many of these stations failed, or else the licenses were transferred to other nonprofit groups, which then reorganized, adequately funded, and upgraded them.

Milam's advice about dealing with the FCC can be found in *Sex and Broadcasting*:

Remember this about them: 1. They don't care about you; 2. They have heard your story before; 3. They don't care about you; 4. Influence means little to them; 5. You mean more work for them; 6. They don't care about you, at all. However, if you submit a clean, respectable application, and pray fervently to The Great Aether

God—you may well get a permit to go on the air. They aren't out to help you until you have a construction permit, but they do recognize that they have a job to do. And if you are right, and honorable, and persistent, then they'll get tired of saying can't-have-it can't-have-it can't-have-it like some miserable child and will grant you permission to do the thing that you wanted to do all along; that is, to broadcast, to transmit the sounds of generations across the halls of our ages.

Lorenzo Milam was an idealist at a time when using radio as a force for change seemed possible. He became proficient at FCC license applications, and he had enough technical expertise to find and install broadcast equipment. Originally influenced by Lewis Hill, he wanted his stations to be less encumbered by political infighting and to have less of a left-wing litmus test for programming. But after 15 years of station building, Milam and his allies fell prey to the major reality of broadcasting: one needed a great deal of money to continue operating.

In a 1996 email message in response to an invitation to speak at a radio conference, Milam wrote: "I'm totally out of radio. It's something I did, and I did well, for 20 years, and that was plenty. I did yeoman service to The Cause, and thank God I'm done with it. Which is not unlike entropy: we either grow, or we rot. I have several other reasons for being out of the picture now, more than being 63, and being mostly unwilling to travel in the U.S. The most compelling reason for me to be done with it is the things I have gone on to in the last 15 years." Those activities include editing an on-line publication called RALPH. Milam currently lives in Mexico, about which he says, "It's a wonderful new life, as compelling as radio was."

Minnesota Public Radio

One of the major trends in public radio during the 1990s has been the growth of "superstations," whose signals, relayed by repeater antennae and satellites, may blanket an entire region or reach halfway across the United States. The first, and leading, public radio superstation is Minnesota Public Radio (MPR), which extended into seven states and Canada by the late 1990s.

MPR originated with KSJR-FM, a classical music station licensed to St. Johns University, which went on the air in Colleville, Minnesota—approximately 75 miles northwest of Minneapolis—on 22 January 1967. William Kling, a St. Johns graduate, served as the station's program director. In the fall of 1969, a student announcer from the University of Minnesota named Garrison Keillor took over hosting duties of KSJR's

Morning Program and began telling stories in addition to spinning records. By 1971 Keillor had changed the program's name to *A Prairie Home Morning Show* and enjoyed a wide following, ultimately leading to the wildly successful *A Prairie Home Companion*. Kling had left the station for a job at the Corporation for Public Broadcasting in 1969, but he returned two years later when St. Johns turned control of KSJR over to a nonprofit concern, Minnesota Educational Radio. Kling obtained federal funding and foundation grants to develop a St. Paul-based regional news service, and the group changed its name to Minnesota Public Radio in 1974. In addition to completing a network of its six licensees in 1975, Minnesota Public Radio also pioneered radio reading services for the blind through the use of FM subcarriers.

Under Kling's leadership, Minnesota Public Radio grew at a phenomenal pace in the 1980s. To capitalize on the success of *A Prairie Home Companion*, MPR founded the Rivertown Trading Company in 1981 to sell merchandise connected to the program. In April 1983 MPR launched American Public Radio (APR) as an independent corporation and rival to National Public Radio (NPR); MPR also initially provided the bulk of APR's programming. The statewide MPR network grew to include 12 stations by 1985. Two years later the Rivertown operation was reorganized as the Greenspring Company, a for-profit subsidiary of MPR. Kling's fund-raising and entrepreneurial skills were reflected in the fact that by 1988 MPR received nearly \$5 million from listeners, more than \$3 million in government funding, and close to \$8 million in revenues from broadcasting and other activities, including *Minnesota Monthly* magazine and catalog sales. By the end of the 1980s, MPR was operating 17 licensees, with another station under construction and applications for four more stations on file with the FCC.

MPR President Kling claimed that MPR moved into an area only after a community requested that it do so, and he insisted that the community finance station construction and the first year of operation. In late 1989 residents of Sun Valley, Idaho, applied to the FCC for a permit to install a translator and a 100-watt station with MPR's assistance; soon, MPR's signal was bouncing off the mountains of Idaho. Not surprisingly, these expansionist policies led to direct conflicts with local stations. MPR established a transmitter near Grand Forks, North Dakota, in 1990, although the area already was served by AM and FM public stations licensed to the nearby University of North Dakota. Much of MPR's programming was the same as that of the local stations, who could not hope to match MPR's marketing and production resources and who watched helplessly as MPR skimmed off the cream of their subscriber base.

MPR's profits from Greenspring (which Kling termed an "experiment in 'social purpose' capitalism") also began to

attract considerable attention from those outside the organization. Although MPR was ostensibly a separate entity, its ties to Greenspring represented a potential conflict of interest and led to an inquiry by the Minnesota attorney general's office. MPR ultimately was cleared of wrongdoing and sold its catalog business to Minneapolis retailer Dayton Hudson for \$120 million in March 1998. Kling personally received \$2.6 million from the deal. Minnesota Public Radio also began operating the Public Radio Music Source (PRMS) in conjunction with 66 other public radio stations in January 1993. Participating stations advertise a toll-free number for listeners to purchase the CDs on their station's playlist. In return, the station earns up to 10 percent of the gross from sales. However, critics argue that PRMS encourages stations to narrow their programming and aggressively promote particular releases, with the result that public radio increasingly resembles its commercial counterparts.

MPR spent much of the 1990s consolidating its sprawling operations, and it expanded into southern California in 1999 when it took over Pasadena's financially beleaguered KPCC. Its defenders (and many listeners) argue that Minnesota Public Radio is a paragon of professionalism and vision that will serve as a model for public radio in the 21st century, but its detractors claim that MPR is driven by little more than cut-throat competitive imperatives. Both would agree that MPR rejects the traditional model of public radio, in which stations serve small geographic areas with programming that is not considered commercially viable. In its embrace of professionalism, expansion, and entrepreneurship, Minnesota Public Radio has in many ways set the agenda for public radio in the United States.

Monitor

News and Features Program

A breakthrough in radio journalism formats, *Monitor* premiered on the NBC network in 1955. It was the first regular radio broadcast to employ the magazine format, offering a mix of late-breaking news, interviews, features, humor, and music. The weekend broadcasts continued for nearly 20 years.

The arrival of television in the United States after World War II prompted a dramatic shift in the habits of radio listeners. By the mid-1950s Americans owned more radios and chose from more radio stations than ever, but instead of being the center of attention in the living room, radios had been moved into the kitchen, the bedroom, and the automobile. Surveys suggested that listeners were tuning in more frequently and for shorter periods of time while performing other tasks around the home, at work, or while driving. This high rate of listener turnover made it difficult for soap operas, variety shows, and concert performances to maintain their audiences, and such shows began disappearing from network schedules. Programming began to emphasize news, music, and local personalities, or disc jockeys, reflecting radio's new role inside—and outside—the typical American home.

Symbolizing this trend was *Monitor*, which premiered on NBC radio on 12 June 1955 as a weekend feature for local affiliates to carry at their discretion, either in its full, 40-hour Friday night-through-Sunday package, or as selected portions to complement local schedules. Since *Monitor* did not employ actors or use complex production techniques, its budget was relatively modest. Its electronic theme, nicknamed the “*Monitor* beacon,” became a familiar sound to millions of listeners over the next 20 years. A multiple series of variably pitched and paced beeps, the theme allowed affiliates to leave or join the network at scheduled times and also identified the program to its audience.

With its novel potpourri of segments entailing sports, news, interviews, comedy, music, and commentary, *Monitor* became a commercial success. In 1956, Patrick D. Hazard described *Monitor*'s unique format:

First of all, in a magazine-type broadcast, it is possible to mix levels of taste in the material presented—something for everyone, in the *Life* [magazine] tradition of photo-journalism. And just as in one issue of that magazine, one may see “horror” photos as well as a brilliant color essay on a phase of American art history . . . so a listener dialed to *Monitor* [may] psychologically tune out, by degrees, program material not compelling to him. . . . There is flexibility of appeal (see Hazard, 1956).

This same flexibility in programming permitted greater numbers of advertisers to sponsor smaller blocks of time, a reflection of the new economic order of radio in the 1950s.

Broadcasting magazine had given a sense of *Monitor*'s flavor at the time the program was debuting:

NBC said a typical hour on the weekend service might include the following: the first segment of a trip through Paris with *Monitor*'s roving European correspondent (succeeding segments would be positioned throughout the rest of the day); a dramatic highlight from a current hit Broadway play or movie; live or taped appearances by people at the top of the news that weekend; comedy of all types, including live and recorded routines by stars from all fields of show business, both jokes and stories; a *Monitor* exclusive—which might be a dive with the atomic-powered submarine, the *Nautilus*, firing a rocket at White Sands or visiting Birdland, New York's mecca of jazz; a behind-the-scenes visit with a top star of Broadway or Hollywood; plus, of course, *Monitor*'s basic news, time, weather, sports and local features (*Broadcasting*, 11 April 1955).

Monitor was the brainchild of Sylvester L. (Pat) Weaver, a former Young and Rubicam advertising executive who had joined NBC in 1949 as its vice president in charge of television. By the end of 1953, in a climate of tension and uncertainty, he was promoted to president of NBC. In its radio and television audience ratings, NBC was trailing rival CBS, and Weaver vowed to radically change his network's fortunes with new directions in programming. The networks, he said, “must gamble on shows, on talent, on projects; and we will lose in doing this all too often. But only a great network can afford the risk, and that is essentially why the great network service is so important to this country.” In addition to *Monitor*, Weaver created *Today* and *The Tonight Show* for NBC television, and he also is credited with the programming strategy of offering occasional specials in lieu of regular shows.

Because of its success, *Monitor* was later imitated on CBS and ABC radio and is arguably a model for the style employed by National Public Radio's *All Things Considered*, beginning in 1971, and *Morning Edition* in 1979. The *Monitor* style also inspired the creation of television magazines, beginning in 1968 with CBS's *Sixty Minutes*, and later with NBC's *Dateline*, ABC's *20/20*, and many others.

Scores of well-known radio personalities hosted *Monitor* segments during its 20-year run, including Ben Grauer, Hugh

Downs, Gene Rayburn, Bert Parks, Hal March, Jim Backus, Ed McMahon, Henry Morgan, Joe Garagiola, Garry Moore, Bill Cullen, Cindy Adams, Wolfman Jack, Don Imus, and Robert W. Morgan. It began as a 40-hour weekend broadcast, airing almost continuously from Friday night to midnight Sunday, but was later shortened to 16 hours, from 1961 until 1974. In its final months of production, *Monitor* was offered for 12 live hours each weekend, with nine repeat hours. Its final broadcast was Sunday, 26 January 1975, hosted by John Bartholomew Tucker.

Morgan, Henry 1915–1994

U.S. Radio Humorist

Although Henry Morgan is chiefly remembered as radio's "bad boy"—because he openly criticized the products offered by his sponsors—this reputation has tended to divert attention from his considerable skills as a satirist and writer. At times in the post–World War II years, Morgan's barbs were as sharp as those delivered by his idol, Fred Allen, although Allen seemed more in control of both his gifts and his material.

Morgan's first job in radio as a page boy at WMCA in New York in 1931 did not last long because he had the congenital habit of saying what he felt, but his loud and clear delivery soon earned him a position at the station as announcer. In 1933, at Philadelphia's WCAU, Morgan could claim to be the youngest announcer in radio. His tenure there, however, did not last long. One evening, out of boredom or giving in to his love of mischief, he included the name of the man who owned the station in the missing person's report, and soon Morgan himself was missing from WCAU's payroll. After working for a year at WEBC in Duluth, Morgan joined WNAC in Boston as night-shift announcer, a job that lasted until he was dismissed for assigning other announcers to do his shift while he attended classes at Suffolk Law School.

Morgan finally found his niche in 1940, at WOR in New York, when he was given first a Saturday morning show and then a 15-minute evening show six times a week that was intended to get the devilishness out of his system. Instead,

Meet Mr. Morgan and *Here's Morgan* found a willing audience eager to hear Morgan's odd mixture of novelty songs, ad-libs, invitations to tune in to other stations, and peculiar weather reports such as "falling barometer, followed by loud crash." But it was the baiting of sponsors that made *Here's Morgan* so refreshingly appealing to listeners, because here was Morgan saying exactly what they wanted to say, for example, that he wouldn't wear Adler's Elevator Shoes to a dog fight and that Life Savers were a gyp because the centers were missing. The outraged sponsors departed, but the delighted fans stayed.

After serving in the army, Morgan continued the 15-minute format on WJZ until September 1946, when *The Henry Morgan Show* debuted on the American Broadcasting Companies (ABC). The program began unconventionally, with the announcer asking instead of declaring the title of the program, a peculiar version of "For He's a Jolly Good Fellow," and Morgan casually mocking Kate Smith's sunny greeting by muttering, "Hello, anybody. Here's Morgan." What followed might be a parody of a soap opera or quiz show; an interview with Dr. Heinrich Von Morgan; a visit to an old jokes' home; or a strange commingling of odd pairs, such as baseball and opera or *Hamlet* and a detective show. Unlike many other comedians of the time, Morgan did not build his shows around a theme. It was the unpredictable nature of *The Henry*

Morgan Show that kept listeners wondering, "What's going to happen next?"

What they could expect, however, was Morgan's unmerciful ribbing of his sponsors. He introduced a spot for Schick by calling it "the world's worst commercial" and implied that the victor in an on-stage "shaveathon" won not because of a Schick razor but because he was only eight years old. He even carried his weekly lashing of Rayve Cream Shampoo over to Fred Allen's show, where he told Allen that his contract required him to throw dirt in men's hair to boost sales and to offer users "24 tubes of the same stuff to teach you a lesson." Both sponsors were unusually patient, with Eversharp Schick taking it on the chin from 1946 through 1947 and Rayve sticking with Morgan to the end of the 1948 run.

Chief among Morgan's supporting cast was Arnold Stang, who played recurring character Gerard opposite girlfriend Hortense and Morgan's "Hank." Stang, assuming less obnoxious roles than he did on *The Milton Berle Show*, ably assisted Morgan in skits with help from regulars Art Carney, Betty Garde, and Minerva Pious.

Morgan's desire to keep audiences off-balance with audacity made him the darling of the cognoscenti, but his scattershot approach of taking aim at every target in sight did not appeal to the masses, who preferred the gentler humor coming from the residents of Allen's Alley, Wistful Vista, and Pine Ridge. Morgan sometimes let his personal peeves supercede his function as entertainer, as occurred in his rebuttal to a U.S. senator who had criticized the way New Yorkers talk or in his defenses of jokes that laid eggs. On the radio, Morgan was always playing more to his iconoclastic soul than to any audience, and that independent streak contributed to his cancellations as much as his ambushing of sponsors did.

Although Morgan freely bashed people of all political stripes, his anarchic attitude and association with organizations allegedly tied to communism led to his name's appearance in *Red Channels* (1950) and his subsequent blacklisting. After a period of being considered unemployable, he landed a late-evening show on WMGM on which he interviewed diners at a Manhattan restaurant. One of those customers happened to be Mark Goodson, who hired Morgan to be a panelist on television's *I've Got a Secret*. After the popular game show ended its long run, Morgan had flings at delivering brief commentaries on WNEW and longer discourses on a talk show for WOR before entering a phase of what he called "full-time

shabby employment" providing voice-overs for television commercials, which he continued to do until shortly before he died of lung cancer in 1994.

CLAIR SCHULZ

Henry Morgan. Born Henry Lerner von Ost, Jr., in New York City, 31 March 1915. Page boy, WMCA, 1931; changed name to Henry Morgan, 1932; announcer, WABC, WCAU, WNAC, WOR, 1933-40; host, *Here's Morgan*, 1940-43; served in U.S. Army, 1943-45; starred on *The Henry Morgan Show*, 1946-48 (ABC), 1949-50 (NBC); appeared on television game show *I've Got a Secret*, CBS, 1952-67, 1976. Died in New York City, 19 May 1994.

Morgan, Robert W. 1937–1998

U.S. Disc Jockey

Robert W. Morgan became one of the most influential disc jockeys of the rock era when he took a job in 1965 as one of the “Boss Jocks” at Los Angeles “Boss Radio,” 93-KHJ. The station’s format consisted of playing selected hits and placing strong emphasis on its disc jockeys. The format changed radio programming and made Morgan’s style one of the most copied in U.S. radio.

Origins

Morgan was born in Mansfield, Ohio, in 1937 and was raised in the small town of Galion, Ohio. He attended Wooster College, where in 1955 he got his first job in broadcasting (earning a dollar an hour) working at stations WWST and WWST-FM. There, he became known as the “Rooster of Wooster.”

Morgan left Wooster College to pursue a career in broadcasting, moving to Oxnard, California, where he took a job doing an all-night show called “Kegler’s Spare Time with Bob Morgan,” which he broadcast live from the Wagon Wheel Bowling Alley.

In 1959 Morgan entered the army and was stationed at Fort Ord, in Monterey, California. After completing his tour of duty, he moved down to Carmel, where he got a job working for the small 500-watt station KTEE-AM. There he was teamed with Marine Corps Heavyweight Boxing Champion Bob “K.O. Bailey” Elliott for a classical music program.

Morgan remained at KTEE for only six months, because he grew tired of working within the classical genre. He took a job working as the morning drive disc jockey for the larger KMBY-AM in Monterey. While there he also operated and ran the control board for the *Arthur Godfrey Time* program. In 1961, once again feeling dissatisfied, he moved to a job at KOMY-AM in nearby Watsonville. However, he was there for only one day, because instead of giving out the request number for KOMY, he gave out the number for his former station, KMBY. Soon, KMBY found itself flooded with phone calls from listeners asking for him. He was offered five times his salary to take his former job back, and he immediately went back to work at KMBY.

In 1962 Morgan moved to Fresno, California, where he took a job with KMAK-AM working with Ron Jacobs, a Top 40 format pioneer who was to become one of radio’s most influential program directors. Morgan took over the afternoon drive time, and he and Jacobs began working on a series of jingles and promotions for his show. The professional quality of these promotions became the groundwork for the eventual design of “Boss Radio.” It was also during his stint at KMAK

that he began occasionally using the name “Robert W” for his promotions. However, he still referred to himself as Bob on the air.

Morgan left KMAK after only one year and spent the next couple of years moving around northern California from station to station. In 1963 he took a job at KROY-AM in Sacramento, where he spent eight months. Then, in 1964, he took a job at San Francisco’s KEWB-AM, a Top 40 station where he first met “The Real Don Steele,” a fellow disc jockey who became one of his closest friends.

Boss Radio

In 1965, after a successful Top 40 show at KEWB, Morgan was offered a job on a new radio station in Los Angeles. The station was being developed by RKO consultants Bill Drake and Gene Chenault (a team later known simply as Drake-Chenault). They had the goal of simultaneously programming a chain of stations throughout the United States and were seeking a way to improve upon the Top 40 radio format to keep it fresh and exciting.

After developing stations in Fresno and San Diego, Drake-Chenault went to work on RKO’s Los Angeles flagship station, 93 KHJ-AM. They hired Ron Jacobs, Morgan’s former program director from Fresno, to be the program director for KHJ, and Jacobs immediately hired Morgan to be the morning man, working 6:00 A.M. to 9:00 A.M.

The new station’s slogan was to be “Boss Radio.” The Boss Radio format was simple: the station only broadcast selected hit records to make sure they maintained a loyal following, and they also created vivid imagery with their jingles and on-air promotions. Rather than using traditional jingles, the station shortened them, using brief phrases and slogans that were constantly repeated.

The most important component of the format, however, was the strong emphasis on the on-air personalities, who were called “The Boss Jocks.” Morgan was one of seven original Boss Jocks, which included his coworker from San Francisco, The Real Don Steele.

Morgan went to work on the new Boss Radio in May 1965, and from that time on, he dominated Los Angeles radio. He developed his own signature statement for his daily sign-on—“Good Morgan!”—which he used for the rest of his broadcasting career. He and the other Boss Jocks were responsible for turning the Boss Radio format into a major success. Not only did Boss Radio become the number one radio station in Los Angeles within six months, but the format achieved national

recognition and spread to stations throughout the United States and Canada.

Over the next five years on KHJ, Morgan earned unparalleled shares in the Arbitron radio ratings, with over 20 percent of Los Angeles listeners tuned to him each morning. He became the voice of Boss Radio and introduced a cast of characters, slogans, and routines that made him even more popular. His "Getting Morganized," a machine he created to give his listeners a zap of extra luck or energy, became so popular that he took it with him when he left KHJ.

During these years, Morgan did all of KHJ's promotions and images, and he began to take on work outside of Los Angeles. He became known as the quintessential boss jock, and his style was frequently copied by morning disc jockeys throughout the country. He was one of the best-known broadcasters in the country, and in 1967 he received *Billboard* magazine's "Air Personality of the Year Award."

In 1969 Morgan narrated and coproduced (with Ron Jacobs) the first ever "rockumentary," the 48-hour *KHJ History of Rock and Roll*. It aired worldwide, and when it was broadcast in the Los Angeles market, it received a 60 share in the ratings.

During this time, Morgan also began appearing on television, hosting and narrating for several shows, including *Boss City*, *Morgan's Alley*, the American Broadcasting Companies' (ABC) *In Concert*, the National Broadcasting Company's (NBC) *The Helen Reddy Show*, and the local KHJ-TV channel 9's *Groovy Show*.

Morgan left KHJ in 1970 to move to Chicago to work at WIND, but, not liking the cold climate, he returned to Los Angeles in 1972 to his morning drive slot at KHJ. He remained there until 1974, when he took a job at FM station K-100 (KIQQ) another Drake-Chenault programmed station. The team re-created their AM radio success on the FM dial, and soon it became the number-one morning program in Los Angeles.

In 1975, Morgan took a job at KMPC-AM as a staff announcer, working a split shift on the weekends and filling in for the weekday staff, including legendary Dick Whittinghill. In 1979 Morgan took over for Whittinghill when he retired. At KMPC Morgan formed his "Good Morgan Team," a group of radio professionals that specialized not only in music, but also in news, weather, sports, and traffic. He stayed at KMPC through the early 1980s despite several format changes and finally a transition to talk radio. Even this did not hurt his popularity: he had the best ratings on the station and became highly successful at the talk format as well.

During this time, Morgan also cohosted a local television show on KNBC-TV called *The Everywhere Show* and became the announcer on the nationally syndicated musical series *Solid Gold*. He also hosted several nationally syndicated radio shows, including *Record Report* and the ABC/Watermarks

The Robert W. Morgan Special of the Week, on which Morgan interviewed the most popular music personalities in the world. He even recorded a program for TWA's in-flight radio called *Morgan's Manor*. During this period, he also recorded thousands of radio and TV commercials, movie trailers, and documentaries.

In 1982 Morgan left KMPC to return to a music show and took a job at Emmis Broadcasting's KMGG Magic 106 FM. In 1985 he returned to KMPC when they returned to a music format, and in 1986 he gave the last broadcast of 93 KHJ when it signed off the air (the station was sold and subsequently became a Spanish format).

In August 1992 Morgan took over as the morning disc jockey at KRTH (K-Earth) 101-FM, oldies radio, and was reunited with The Real Don Steele. He remained there until 1998, when lung cancer forced him to retire. When K-Earth 101 held a retirement tribute for him at the Museum of Television and Radio in Beverly Hills, it was hosted by Dick Clark, who spoke at great length of Morgan's influence on Top 40 radio. In 1993 Morgan received a star on the Hollywood Walk of Fame, and he was inducted into the National Broadcasters Hall of Fame in 1994. He was also inducted into the Ohio Broadcaster's Hall of Fame. He died of lung cancer in 1998 and was posthumously inducted into the Radio Hall of Fame at Chicago's Museum of Broadcast Communications. Samples of his work are on permanent display at the Museums of Television and Radio in Beverly Hills and New York and at the International Broadcasting Congress Archives in Brussels.

Mormon Tabernacle Choir

U.S. Choral Group Featured in Radio Broadcasts

The Mormon Tabernacle Choir's broadcast program, *Music and the Spoken Word*, began soon after The Church of Jesus Christ of Latter-day Saints began broadcasting in 1922 on KZN (today's KSL) radio in Salt Lake City. Only rehearsals were broadcast occasionally at first, in part because the musicians were skeptical of the fidelity of radio. The first formal broadcast came on 26 June 1923, when President Warren G. Harding also spoke. The choir began its regular live performance schedule when KSL became an NBC affiliate, and on 15 July 1929 the first regular network Tabernacle Choir program was aired nationally. Today, it claims the title, "longest running continuous network radio program in America" with more than 3,600 broadcasts to its credit. The performance is delivered live when every Sunday morning more than 2,000 radio, television, and cable operations broadcast the program worldwide.

Choir History

The Mormon Choir first sang in Utah's Salt Lake Valley more than 150 years ago, coming into existence in 1847. There was no "Tabernacle" or organ at that time so the group sang in an improvised bower of trees where adobe blocks and poles supported the roof of leaves and branches. From this beginning it played a central part in the early church's commitment to celebrate culture—both sacred and secular events. The historic auditorium, the Tabernacle, is a dome-shaped building in Salt Lake's Temple Square, first used in 1867. The Tabernacle organ was installed that same year and it has become the most recognized symbol of the choir.

In 1849 John Perry, a Welshman, became the choir's first regular director. Perry was followed by others who brought formality and discipline to the choir organization. Evan Stephens, also from Wales, conducted the choir for 27 years. Under his leadership, the choir grew from 125 singers to over

300. Stephens directed the choir on its first major concert tour in 1893 and is credited with laying the foundation for the choir's growing international acclaim.

The choir program tradition consists of song, organ recitals, and a short non-denominational sermon dubbed the "Spoken Word." For more than 40 years, Richard L. Evans provided the latter—thought-provoking, inspirational messages usually two to three minutes in length, all eventually published in a series of books. Upon his death, Evans was replaced by J. Spencer Kinard, who worked for 19 years. He was replaced by the current voice, Lloyd Newell.

The Choir on the Air

The choir began its national broadcast history with the NBC network in 1929, when KSL became an affiliate. When KSL switched to the CBS network in 1933, the choir followed. The "Spoken Word" unit of the program was added in 1936.

It is no wonder that the fidelity of these first programs was questioned by the musicians. As the story goes, KZN/KSL apparently owned only one microphone in those early days. Thus, according to a prearranged plan, the station briefly went off the air as a courier dashed across the street from the station to the Tabernacle carrying that one microphone. There, a tall stepladder was installed near the organ console, and the announcer climbed to his precarious perch atop that ladder holding the microphone that was to pick up both the music and the announcer's words.

Coverage of the choir has grown with technology. In 1948, television broadcasts began in Salt Lake and the choir was among the station program lineup. In 1961, it became a part of the church's launch into international shortwave radio. In the 1970s, the choir took part in the first satellite broadcasts. Today, choir presentations use radio, television, cable, satellite, motion picture recording technology, and the internet in its

world-wide distribution. The choir has made more than 150 recordings (some of them CDs), five of which have attained gold status with sales of over 500,000, and two have received platinum awards for sales of more than 1 million. Perhaps best known is their classic recording of "Battle Hymn of the Republic," recorded with the Philadelphia Orchestra, for which the choir was awarded a Grammy in 1959.

Morning Edition

U.S. Newsmagazine Program

For millions of Americans, weekday consciousness begins with *Morning Edition*: the clock radio turns itself on to the razzle of B.J. Liederman's theme music or the resonant calm of host Bob Edwards.

The program began on 5 November 1979. After National Public Radio (NPR) scored a success with its afternoon newsmagazine, *All Things Considered*, the network's member stations wanted a morning service. They were not necessarily looking for a program. Most member stations at the time ran classical music in the morning, but they wanted news and feature elements they could drop into those programs. Unlike *All Things Considered*, which had evolved on the air, *Morning Edition* was to be a planned creation, conceived by a committee with input from stations and guidance from audience researchers. The format was to be a two-hour series of segments, with a mix of news, sports, arts, and features. None of the segments was to be longer than nine minutes, with fixed times so that stations could take what they wished and cover the rest with local news, weather, and traffic. But production of the pilot was handed over to two morning newsmen from the immensely popular Washington commercial station WMAL. As former producer Jay Kernis recalls, "they knew how to do AM drive-time radio, but they broke the promise of public radio. They ignored the audience we'd been building." The pilot failed. Host Bob Edwards remembers them as sounding "like a bad talk show in a small market."

NPR's news director, Barbara Cohen, fired the producers and the first two hosts. Kernis, the arts producer, was promoted to senior producer and "given ten days to re-invent the show and teach the staff how to produce it." Frank Fitzmaurice came in as executive producer to oversee the program's news content. Bob Edwards, who had spent five years as cohost of *All Things Considered* with Susan Stamberg, was recruited to fill in as host for 30 days, until the network could find someone to take over.

Jay Kernis recalls how he and Edwards thought through the role that began Edwards' more than two decades as the solo host of the program. "A host is not an announcer," Kernis says. "A host is the glue that holds the show together. There should be this vortex of information, and in the calm center, there should be the host, Bob, steady Bob, carrying it all back to you."

Kernis also preached to his staff that the show's strict format should be liberating rather than restricting, a concept he says he got from the late arts producer Fred Calland, who pointed out that *All Things Considered* had to create a new architecture in its relatively free-form 90 minutes every day. The program could succeed or fail, depending on whether that structure was successful. With *Morning Edition*, the architecture was a given. As Calland put it, "you know the perimeters of the canvas, now you can paint."

One example of working within the structure came when Kernis had to write a short piece of advance copy for Bob's

interview with American haiku poet Nick Virgilio, to be read just before newscaster Jean Cochran delivered the top stories. He did it in classic, 17-syllable form:

Some words hit; some hurt.
Jersey poet writes *haiku*.
News from Jean Cochran:

Resources were stretched thin in the early days of the program. *All Things Considered* was not anxious to share its small pool of reporters, and some reporters preferred being heard on the established afternoon flagship. That meant that Edwards had to get at the news through live interviews, often a dozen or more in a day. Kernis credits three of NPR's most successful female reporters, Cokie Roberts, Nina Totenberg, and Linda Wertheimer, with seeing the audience potential in *Morning Edition* and doing extra work to make sure their reports got on its air.

Morning Edition's voracious format made more room for commentators, too, such as retired sportscaster Red Barber, whose weekly chats with Edwards were one of the program's most popular features for a dozen years.

Morning Edition's producers say the feel of the program is governed by two factors: it is the first thing many people hear each day, and the format is designed to be shared with local stations.

Executive producer Ellen McDonnell says that listeners need to be nudged into their day: "I tell our substitute hosts 'you're up; we're not. People don't want to be blown out of bed.'" Though the show has aired vivid personalities, including Susan Stamberg, Alex Chadwick, and Renee Montaigne as substitute hosts, senior producer Greg Allen says that focus groups consistently favor Bob Edwards' reassuring, understated style. "When Bob's on vacation, we get letters from listeners urging us to bring him back."

The fact that *Morning Edition* begins the day means that its news content is more anticipatory than that of *All Things Considered*. Producers look for items about what's coming up in the day, and what those events are likely to mean for the listener.

Producer Jay Kernis says he decided early on that if he could not know which 20 minutes of the show listeners were going to hear, he would try to make sure that any 20 minutes contained some news, some arts, and some feature. Although

the program no longer has specific times dedicated to arts or sports, producers still try to maintain a mix that balances hard news with human emotion. Ellen McDonnell says, "you need a smile, music, a commentary. When the news is grim, we try to be cognizant of the time of day. We don't sugar-coat the news, but we don't have to report every graphic detail." Edwards and McDonnell say that *Morning Edition* aims for a certain civility. McDonnell keeps in mind that "we're a guest who's been invited into your home or your car." Edwards points out that, in the morning at least, "people want that familiar voice, the radio friend."

Morning Programs

Morning programming developed slowly in radio, an ironic fact given that morning or “drive time” would by the 1960s become the most valuable radio broadcast time to advertisers seeking the largest audiences available.

Origins

Radio stations were slow to program morning hours as there was seemingly little audience interest in listening so early. Radio began as an evening service, only gradually moving into daytime hours. Beginning in larger cities, however, by the mid-1920s many stations had expanded their schedules to program the entire day. Their schedules included early morning hours, sometimes beginning at 7 or 8 A.M., and usually offered some type of uplifting talk and/or music. Among the best known of the pioneers was Charles K. Field, who created the “Cheerio” personality for early morning KGO listeners in San Francisco starting in 1927. At the same time Anthony Snow was broadcasting homespun philosophy as “Tony Wons” to Chicago listeners over WLS. Both soon moved to the national scene for lengthy network runs into the 1930s. A few other stations offered a variety of music and talk. Baltimore’s WCAU began its *Morning Musical Clock* in 1927 or perhaps earlier (station records are unclear), built around a theme of the passing early morning time. It was still on the air two decades later. The program title would in future years come to label a format on many radio stations.

With a growing audience of radio set owners by the late 1920s and slowly awakening advertiser interest in reaching those listeners, the new national networks began to expand their program offerings into earlier daytime hours as well. Programs took many forms, from informal talks and music to those aimed at children. Virtually all were upbeat in tone as befitted the start of the day. Among the first was Field’s organ music and talk-filled *Cheerio*, moved from San Francisco and heard for a half hour daily on NBC at 8:30 A.M. beginning in 1927 and continuing for a decade. *Jolly Bill and Jane*, with music and chatter aimed at children, was also heard daily on NBC at various early morning hours and ran for a decade beginning in 1928. *Gene and Glen* provided early morning comedy (and a multitude of voices) for many years on NBC starting in 1930. *Tony Wons’ Scrapbook* moved from Chicago to New York and was heard daily on CBS (and later NBC) during the 1930s. The host would begin each program asking “are yuh listenin’?” and millions of women were. Wons edited nearly a dozen published collections of the poetry and prose he had used on the air.

Golden Years

Network offerings broadened in the 1930s to include drama (*Vic and Sade* began in 1932 on NBC Blue and was first heard at 9:30 A.M.), comedy (*Laugh Club* on NBC-Blue), comedy household hints (*The Wife Saver*, on various morning slots on NBC and NBC-Blue from 1932 until 1943), news commentary (Ann Hard on weekday mornings on NBC), and health (*Health Talk* daily on CBS). In 1940 CBS offered early morning classes from the *American School of the Air*.

As happened with other radio programming, the developing world crisis and eventual outbreak of war in 1941 was reflected in morning programs. Many stations, especially those near military bases, offered morning “Reville” shows, a variation of the “musical clock” format already present in many markets. Early morning network newscasts became a staple on all the networks beginning in 1940. They were heard daily, typically for 15 minutes, and were soon filled with wartime news and information.

As soap operas filled most network daytime hours in the early 1940s, some of the series, such as the CBS drama *Woman of Courage* (1939–42), began as early as 9 A.M. Local stations (and sometimes the networks) took a different tack and offered many homemaking programs at various daytime hours. *Adelaide Hawley Homemaking* was heard most weekday mornings on CBS in 1940.

Networks increasingly focused on talk variety programs for morning hours. Arthur Godfrey’s CBS show (so popular he had to give up his local morning program on Washington, D.C.’s WMAL in 1948) and Don McNeill’s *Breakfast Club* on ABC had strong audience appeal during the 1940s and 1950s. Such network morning shows became a popular way to start the day along with regular newscasts, a pattern that had developed first during the war.

Postwar “Musical Clocks”

Music-based programming by local stations dramatically expanded daytime program offerings. These “musical clock” or “early bird” or “wake-up” programs had developed in some markets in the 1930s, grew during the war, and expanded greatly in the postwar years. Virtually all of them were based on a combination of music, news, weather, and talk items with constant references to the time and, in larger cities, to traffic conditions. As radio prime time remained the most important listening period (and thus expensive for advertisers), advertising in morning programs could be purchased

for one-third to one-half the cost of advertising in the evening hours, and advertisers flocked to the proven ability of early morning radio to sell listeners.

By mid-decade, local station morning broadcast hours were rapidly becoming radio's prime time as network offerings faded away in the face of television competition. Costs to advertisers rose and morning hosts became the new stars of radio. One, Tom Joyner, was in such demand that for many years he hosted a morning show in Dallas and then flew to Chicago for an afternoon drive-time program. He stuck to this grueling schedule for years. The parallel rise of rock and roll music in the 1950s helped fuel a faster-paced morning show still based on a mixture of recorded music and live news, weather, and sports reports. Radio listening became a popular way to make increasingly congested traffic and long commutes more tolerable. In major markets regular traffic reports became an important part of the morning show format.

In the 1970s the morning period spawned the so-called "morning zoo" format, a fast-paced, high-energy approach that is known to disregard traditional programming rules. The concept behind this morning programming approach is to create a zany, often irreverent atmosphere designed to keep listeners fully engaged, awake, and on the edge of their car seats during the commute to work and school. Employing an ensemble cast of characters, its prevailing programming ingredient is comedy and pop-culture chatter usually revolving around hit movies and TV shows, celebrities, and sports. This morning daypart schematic has been refined (toned down in some cases) over the years and has become a mainstay at most larger market contemporary music outlets.

Non-commercial stations also got into the act. Local university and community stations had long provided a mixture of news, features, and, often, classical music. In 1981 National Public Radio developed *Morning Edition* as an expanded long-form news program designed to compete with the more concise commercial radio news programs.

Modern Mornings

Local radio stations seek to provide audiences with personalities who would build a "listener habit" and amass large and loyal followings. In most markets morning radio hosts became celebrities attracting huge rating numbers that advertisers found compelling and appealing. Among the myriad stars of the sunrise hours was WTIC-AM's Bob Steele, who began entertaining Hartford, Connecticut area listeners in the late 1930s and continued doing so into the 1990s. Steele's tenure on the air, while exceptional, was not atypical, as morning radio hosts around the country often enjoyed greater longevity than other on-air personnel. One indication of the enormous status of certain popular morning hosts is that on occasion radio facilities have actually been named or renamed in their

honor. One such example is WPRO's Brine Broadcast Center in Providence, Rhode Island, whose moniker pays tribute to morning radio giant Salty Brine for his nearly half century of service.

Modern morning disk jockeys tend to talk more than they do in other dayparts. They continue to provide a generally upbeat tone just as their forbears did eight decades ago. News and traffic reporters often are part of a "morning team" as a star disk jockey often has a regular sidekick, or co-anchor.

Morning or drive-time radio continues to be a radio staple. Increasingly dominated by the personalities heard daily, such programs have thus far thrived despite increased competition from local and national morning television shows. Fragmentation of audiences because of cable and the internet mean that morning programming is under intense competition. New York's Don Imus had his morning radio show rebroadcast on MSNBC, and Howard Stern's morning program, also from New York, is widely rebroadcast across the country. Syndication of popular national figures has surged as cost-cutting has diminished the quality of morning radio, particularly in small and medium markets.

Morrow, Bruce “Cousin Brucie” 1937–

U.S. Radio Personality

From early on, radio called to Bruce Meyerowitz. Radio was very real to him, whether it broadcast World War II, the death of President Franklin D. Roosevelt, Superman, the Bickersons, or the Shadow. Meyerowitz was so hooked by the time he was 16 that he and a friend created his first radio name of Bruce Morrow even before he landed a job.

After high school, Meyerowitz enrolled at Brooklyn College. Having no interest in a liberal education, he transferred to New York University’s Communication Arts program in 1953. The better fit was immediately apparent to Meyerowitz, who was extremely interested in broadcast technology. Interestingly, television was the major catalyst for initiating Meyerowitz’s broadcasting career. The Columbia Broadcasting System (CBS) was demonstrating its color TV system on campus, so he successfully convinced the National Broadcasting Company (NBC) to let him cover it as a stringer. Amazed by color TV, he saw the future and wanted to be a part of it.

Meyerowitz was tired of pretending to do radio in labs, so he single-handedly founded New York University’s station. WCAG, for Communication Arts Group, was a primitive setup that sent its signal via wire from the lab to a lounge area. It became a carrier-current station serving the campus during the 1950s, an exciting time in the history of music. Meyerowitz programmed a classical format with some news, but rock and roll was garnering tremendous attention nationwide.

In 1957 Meyerowitz became a radio professional. A Hamilton, Bermuda, station manager wanted to develop a big-city sound and was seeking the next Alan “Moondog” Freed. Meyerowitz was offered a job, and, as “Bruce Morrow,” he made his professional debut on ZBM. In Bermuda, Morrow encountered anti-Semitism and racism, so he did not stay long.

Morrow idolized Freed on New York’s WINS and realized his dream in 1958 by taking a producer job there. Morrow recalled: “They wanted somebody young and eager (and cheap). I was all that, and I was one thing more. I was a WINS freak.” WINS built its popularity on Top 40 music and on Freed, who left for WABC. Although he would not be on the air, Morrow was overjoyed to work for WINS. He said, “I was going to be a producer for the station that had brought Moon-dog to New York—Ten Ten WINS!”

Morrow got his big break when the American Federation of Television and Radio Artists (AFTRA) staged a strike. Morrow went on the air from 2 P.M. to 8 P.M., stumbling his way through news and record introductions. Although he later joined AFTRA, Morrow was maligned as a scab. He felt uncomfortable about crossing the picket line, but he landed a permanent 7 P.M. to 11 P.M. announcer position.

One evening in 1959, an elderly woman wandered into WINS and asked: “Well, cousin, can you give me fifty cents please? I want to get home to the Bronx.” The encounter inspired the evolution of his name to Cousin Brucie. That year, Murray the K (Murray Kaufman) took the WINS night shift as heir apparent to Freed. Although impressed by Murray on the air, Cousin Brucie did not see eye to eye with him. Murray wanted Cousin Brucie’s evening shift and convinced management to give it to him. Morrow would not switch and was out of a job. Cousin Brucie claimed that Murray bought the shift using payola money.

“Cousin Brucie” Morrow
Courtesy Radio Hall of Fame

In 1960 Miami's WINZ hired Cousin Brucie, who initiated the *Pepsi-Cola Cousin Brucie Saturday Night Party* from Kingston, Jamaica, every other Saturday. He also met and married Susan Stoloff in Miami. Cousin Brucie worked for WINZ less than a year before receiving a Christmastime telegram from WABC in New York inviting him to "come home." In 1961 he took the 10 P.M. to midnight shift at WABC before moving to the 7 P.M. to 11 P.M. evening time period, which he dominated in New York until 1974.

At WABC Cousin Brucie helped define a generation's music. For many summers his live music shows were fixtures at New Jersey's Palisades Amusement Park. In 1965 Cousin Brucie played a role in Beatlemania. Although Murray the K dubbed himself "the Fifth Beatle," Brucie was not impressed, calling the statement "a lapse of taste if not sense shared by many a jock in many a radio market." Brucie helped WABC become "W-A-Beatle-C," and he hosted the Beatles' legendary Shea Stadium performance in August 1965.

In 1973 WNBC hired Wolfman Jack to compete against Cousin Brucie. WNBC had already hired Don Imus to go against Dan Ingram. Both Cousin Brucie and Wolfman Jack claimed victory, but the truth seems to lie somewhere in between. When Wolfman Jack wanted his contract voided, he says he convinced WNBC to hire Cousin Brucie. Whether true or not, Cousin Brucie left WABC on 7 August 1974 to join WNBC-AM, which no longer had to worry about his competing against them.

Brucie resigned from WNBC in 1977 and became a partner in the Sillerman Morrow Broadcast Group. In 1979 the group launched WALL-AM-FM in Middletown, New York, and Cousin Brucie went back on the air. By 1981 he moved to another group station, WRAN-AM in Dover, New Jersey. Cousin Brucie joined WCBS-FM in New York in 1984, where he still hosts *Cousin Brucie's Yearbook* on Wednesdays from 7

P.M. to 10 P.M. and *Cousin Brucie's Saturday Night Oldies Party* from 7 P.M. to midnight.

Motorola

Radio Manufacturer

Motorola has been a leader in exploring and promoting new uses of radio technology. The Chicago-based company initially focused on radio receivers. Later, Motorola developed applications of the technology for government, military, and private use, helping radio to realize its potential as a two-way communication tool. In so doing, Motorola became a haven for engineering and high-quality technological innovation.

The Motorola story starts in the 1920s, with a business-savvy young man from north central Illinois. Paul Galvin quickly saw the potential of radio as the medium developed. Galvin and partners formed two companies to produce storage batteries and power converters for radios. Both were closed by 1928, but Galvin continued to believe in the potential of the business. After borrowing \$1,000, Paul Galvin and his brother

Joseph formed the Galvin Manufacturing Corporation in September 1928.

Galvin Manufacturing quickly moved into the production of private label radios for wholesalers and retailers and experienced some moderate growth. But smaller firms like Galvin's were hit hard by the economic downturn that followed the stock market crash in late 1929. If Galvin Manufacturing was to remain in business, the company needed to develop a landmark product that would mark it as a vital player in radio. Paul Galvin found the cornerstone for his company with the automobile radio.

Although auto radios had been available in the 1920s, they were expensive, difficult to install, and sounded terrible because of static interference from electric devices within the car. Galvin and his associates developed a prototype that solved these problems and installed it in his car in time for the 1930 Radio Manufacturer's Association convention. Galvin drove to Atlantic City for the show and demonstrated his new product to conventioners who marveled at the innovation.

Galvin Manufacturing's 5T71 was the first commercial radio designed to fit most automobiles and sold for about \$120 including installation. In order to create a name that would associate sound with motion, Galvin coined the name Motorola for his radio by combining the word *motor* with *ola* from *Victrola*. Though Galvin Manufacturing retained its original moniker for years, it was the trademarked Motorola name that became famous. By 1936 Motorola was an industry leader and was among the first brands of car radio to include push buttons, fine tuning, and tone controls.

That same year, the Federal Communications Commission (FCC) took action that facilitated Galvin's move into other radio products. After the FCC allocated spectrum space for police communications, Galvin introduced its first AM mobile receiver, called the Police Cruiser, and the following year introduced accompanying transmission equipment. Soon, the need for two-way communications became apparent, so Galvin developed mobile AM transmitters for officers in the field. The cost of a complete system, including one base station and three mobile radios, was about \$4,000.

Motorola introduced the first line of improved two-way FM equipment in 1941. This innovation marked the start of a 30-year period in which Motorola engineer Daniel Noble and the company became internationally known for research and development. Motorola later adapted this same FM technology for use in larger commercial and industrial markets as two-way radio communication became commonplace in the 1950s.

During this same era, Motorola became an important supplier to the American military. When World War II broke out in Europe, Galvin assembled an engineering team to develop a lightweight, portable, two-way radio that could be used on the battlefield. Eventually, the U.S. Army awarded Galvin Manu-

facturing a contract for the Handie-Talkie, a five-pound AM radio with a range of about one mile. Galvin manufactured more than 100,000 of the radios before the end of the war. The company also developed a 35-pound FM two-way radio in a backpack with a range of ten miles. This device, the Galvin SCR-300, became better known as the Walkie-Talkie and was hailed by military leaders as a pivotal communication device. Galvin produced 45,000 of the Walkie-Talkies along with jeep and tank radios to aid the war effort.

Galvin Manufacturing became a publicly traded stock in 1943. In 1947 the company formally changed its name to Motorola and prepared to reap the dividends of a booming postwar economy. It did so by continuing to expand on its radio business but also by continued research and development efforts and what company officials call "continuous self-renewal" into other areas of electronics. In the 1950s, Motorola became an important supplier of automobile radios to Ford, General Motors, and Chrysler. Almost one-third of the car radios on American highways had been made by Motorola as the decade concluded. It was also during this period that Motorola started to manufacture television sets, developed some of the first radio paging systems, and became involved in the semiconductor business. Motorola initially used transistors to miniaturize its own products, leading to a line of pocket-sized radios. Transistors were also crucial in the development of its advanced, two-way Motrac system that ultimately boasted a 50 percent global market share for mobile radios.

Over the years Motorola maintained a partnership with the American government on various projects, including the space program. Motorola systems have played a vital role in tracking and communications between earth and outer space since the company developed a system for an early satellite mission in 1958. Motorola endures as an important, diversified, global corporation in electronic communications. Despite some serious business problems in the 1990s, Motorola remains involved in wireless telephone and messaging, two-way radio communications, semiconductors, networking, and more. The Galvin legacy at Motorola also continues; a third generation of the family is now running the company.

Murray, Lyn 1909-1989

U.S. (British-Born) Radio Composer and Conductor

Lyn Murray began his career in radio in the early 1930s. His life work included composing and conducting music for radio, television, and film for more than half a century.

Murray was born Lionel Breese in London in 1909. His father emigrated to Philadelphia in 1923 and the family followed in 1925. Murray entered radio by working for the Columbia Broadcasting System (CBS) at their station WCAU in Philadelphia as a staff conductor and arranger from 1931 to 1934. He then moved to CBS in New York as a staff conductor, composer, and arranger, remaining in New York until 1947.

During Murray's years with CBS radio, he worked on a wide variety of programs. These included *The Adventures of Ellery Queen*, 1939 to 1942; *Radio Reader's Digest*, 1942 to 1944; *Columbia Presents Corwin*, 1944 to 1945; *The Ford Theater*, 1947 to 1949; and *The Hallmark Playhouse*, 1948 to 1953. He also worked for the National Broadcasting Company (NBC), composing and conducting the music for *The Adventures of Philip Marlowe*, 1947. Other programs for which Murray composed or conducted episodes include: *Chrysler Airshow*, 1937; *An American in England*, 1942; *The March of Time*, *Your All-Time Hit Parade*, *Sunday Night Party*, *Rippling Rhythm Revue*, *The Danny Kaye Show*, *Watch the Fords Go By*, *Lucky Strike Hit Parade*, *Heinz Magazine of the Air*, and *Music from the House of Squibb*. Murray also directed *The Lyn Murray Singers*, a choral group that appeared regularly on the *Texaco Star Theater* and *Hit Parade*. Murray's excellence as a conductor, as well as his extensive knowledge of popular and classical music, led many in the industry to consider him one of the best directors.

In the summer of 1946, Murray taught a course in radio choral techniques at the Julliard School. Murray offered students an opportunity to appear on network commercial shows. In his publicity for the course, Murray noted that he was organizing a concert tour that would include qualified students. Pete Seeger, folk singer and banjoist, and Norman Cordon of the Metropolitan Opera were expected to be part of the tour.

In 1947 Murray moved to Hollywood to find work in television and movies. In his diary, Murray makes occasional reference to being listed in *Red Channels*, a factor that he felt limited his employability in his early days in Hollywood. In 1952 Paramount Studios held up a contract with Murray, which he later wrote was probably related to his listing. Then, when negotiating a contract with the American Broadcasting Companies (ABC) in 1954, the issue of *Red Channels* came up but was dismissed.

Murray was instrumental in founding the Composers Guild of America in 1953 and 1954. He co-wrote the organization's constitution and by-laws with Sandy Courage. The name was changed to Composers and Lyricists Guild of America in 1956. (It is currently known as the Society of Composers and Lyricists.) Murray also served as a board member for the National Academy of Music.

Murray won two Emmy Awards for musical scores. The first, in 1986, was for *National Geographic's* television special "Miraculous Machines," and the second was in 1988 for *National Geographic's* special "Treasures of the Past."

Murray's diary of his career from 1947 through 1987, published as *Musician*, chronicles his ups and downs in the radio,

television, and film industries. Murray died at age 79 of cancer in Pacific Palisades, California.

Murray the K (Murray Kaufman) 1922-1982

U.S. Radio Personality

Murray the K was a popular New York City radio personality in the 1950s and 1960s who gained national fame through the promotion of popular music and culture. He produced many package shows that featured now legendary American recording artists. Even the Beatles, before they were known in the United States, were encouraged by other international performers to work with Murray the K when they came to the United States.

Origins

Murray the K's real name was Murray Kaufman. He was born in Virginia to a show business mother, Jean Greenblatt, and a leather merchant father named Max. He entered show business as a child by appearing as a dancer and extra in several Hollywood films. He later dropped out of high school in the late 1930s to become a catcher in the New York Yankees' minor league baseball organization. World War II disrupted Kaufman's dream of playing for the major leagues, however, and he changed direction by preparing for a career in show business. While serving in the U.S. Army during the war, he produced entertainment shows for American soldiers. In the late 1940s he found his way into New York's Catskill mountains, where he began producing nightclub shows and working as an emcee. In the off season (November through April), Kaufman returned to New York City and worked in promo-

tion. Most notably he helped push Patti Page's recording of "How Much Is that Doggie in the Window?" to number one on the music charts in the early 1950s.

Radio Career

In 1953 Kaufman got his first radio job producing a remote interview show that was broadcast from a New York nightclub and hosted by various movie stars such as Lorraine Day, Eva Gabor, and Virginia Graham. After two years Kaufman moved behind the microphone at New York's WMCA and co-hosted the talk show with his wife in addition to taking on some general announcing for the station. He began working as a late-night disc jockey at WMGM in 1957, just as radio was beginning to cater to younger audiences and to play more recorded music. Kaufman joined the National Conference of Disk Jockeys, as did Dick Clark and others, to help advance the image of radio broadcasting's new professional generation.

WINS New York hired Kaufman in 1958 to produce a late night show he called *Swingin' Soiree* on their 50,000-watt station. He followed Bruce "Cousin Brucie" Morrow in their lineup; Morrow had moved into the 7:00 P.M. to 11:00 P.M. time period that had been occupied previously by Alan Freed, a casualty of the payola scandal. Murray the K developed a large, loyal audience at WINS, and in 1959 he succeeded Morrow, who moved to another station.

Kaufman parlayed his radio success into other successful business ventures. From his *Swingin' Soiree* popularity and visibility he was able to generate huge audience attendance for four annual live music shows that he produced at the Brooklyn Fox Theater. His pioneering lineups of recording artists were racially integrated and drew multi-racial audiences.

Kaufman worked obsessively and seemed to be omnipresent as he promoted or produced shows at venues throughout the city. He also floated among shows, acting as host or emcee, and took his disc jockey radio program to numerous remote sites at theaters, on the streets, in the subway, or in air force jets. He also produced a series of oldies albums, placed his picture on their covers, and sold Murray the K T-shirts. In 1965, Kaufman's estimated combined income was \$150,000.

Murray the K's radio style has been called "hip." Some historians refer to him as "the king of hysterical disc jockeys." He used his vibrant vocal chords, accented with nasal tone, to voice plays on words, pig Latin expressions, and sound effects. Each of his sound effects was prerecorded and placed on a separately labeled cart. They were aired at strategic spots in his show and ranged from roaring freight trains, cavalry

bugle charges, and nutty macaw laughter to screaming men plunging down an abyss. He took great pride in studying popular culture and recognizing new trends. Some teens from his era, now older adults, can still repeat portions of his zany nonstop patter and retain a deep respect for his cleverly humorous style.

During one rating period, Murray the K was 20 points ahead of his nearest competitor. Subsequently it took two years of competition, from two rival New York radio stations (WABC and WMCA) that converted Kaufman's program style into full-time formats, to dethrone his show. Kaufman maintained that this was only possible because his show on WINS was preceded by a two-hour newscast and followed with talk and interview programming.

The Beatles already knew about Murray the K's reputation when they were welcomed to America in early 1964 by a huge media contingent and 4,000 screaming teens at New York's Kennedy Airport. Kaufman represented WINS radio at the news conference. To conduct a live remote, he drew upon his veteran radio interviewing experience and strategically positioned himself and his microphone in front of the Beatles' makeshift platform. Then, using his hip radio styled language ("Hey, George, baby!" "Ringo, over here, baby!"), Murray the K smoothly dominated the entire affair. The knowledge that he displayed about the Beatles' career, as well as his quick wit, convinced the singers that Kaufman held the key to their conquest of New York. So the Beatles made Murray the K a part of their entourage. He traveled with them in the United States and Europe, and served as master of ceremonies at their second Carnegie Hall performance. He also visited with them on their movie set, appeared in their film *Help!* and roomed with George Harrison. Harrison, in an effort to protect Kaufman from other reporters' jealousy, referred to him as "the fifth Beatle." Murray the K was catapulted to national and international fame.

Early in 1965 Murray the K came to the attention of some U.S. government officials who were endeavoring to locate the most appropriate national spokesperson for a youth program. The Office of Economic Opportunity, headed by Sargent Shriver, hired Kaufman to lead a national communication effort about a summer jobs initiative called "New Chance," which would be aimed primarily at urban youth. Kaufman, with typical high energy and vision, traveled throughout America to shoot a series of musical performances on location by leading black and white recording artists. He interspersed the music videos with informational announcements about New Chance and called the show *It's What's Happening, Baby*. The Columbia Broadcasting System (CBS) agreed to donate 90 minutes of national prime time to air the program in late June 1965, and it received high ratings. The recording artists accepted scale pay and CBS paid the bill. Kaufman, far from being commended for his brilliant work, was censured by some

U.S. Congressmen who criticized rock and roll as being repulsive African jungle music. Later in the year, WINS-AM, perhaps unable to compete with Murray the K's institutional imitators WABC and WMCA, was sold to Westinghouse, Inc., and its format was switched to all news. After eight years, Murray the K left WINS radio.

By early 1966 Kaufman had established "Murray the K's World" in Garden City on Long Island, New York—a multi-level and multimedia entertainment complex converted from an abandoned airplane hangar. Although short-lived, the nightspot is said to have influenced music venues such as the Plastic Inevitable, Manhattan's Cheetah, and the Fillmore Auditorium in San Francisco. Unfortunately, Kaufman suffered huge financial losses from his intended month-long run of rock shows, due to a subway workers strike. According to his lawyer, the strike prevented performers and audiences from coming to the theater after the first few performances. He sought \$25 million in damages.

The determined Murray Kaufman then turned his efforts to another television concept for the Office of Economic Opportunity, this time at the local level, producing at least two highly rated television programs for New York's Channel 5. His first was a 90-minute combination of in-concert and on-location clips of popular recording artists, with drop-in talk segments by other noted celebrities. The first show drew an estimated 3 million viewers to two broadcasts. The second show was entitled *Murray the K's Special for the Year 2000*. It aired in May 1966 and sought to explain the vast differences in language, music tastes, and dress that would exist between youth and adults at the turn of the century.

Early in 1966 WOR Radio hired Kaufman as its program director. However, in July 1966 management shifted Kaufman and three other disc jockeys from WOR-AM to WOR-FM and cut their wages by 50 percent. FM radio was still developing its economic base, but the American Federation of Television and Radio Artists represented the four disc jockeys in their efforts to retain their AM salaries. Kaufman and the others went on strike until October 1966 when the matter was resolved, although they remained at lower salaries.

The low frequency of commercials on FM radio allowed Kaufman to initiate an indelible radio programming innovation by pioneering progressive radio. He emphasized the perspective that albums contained many good songs that were appropriate for airplay. He also encouraged exposing the full artistic expressions of recording artists by playing their extended-time productions. Nonetheless, a very proud Murray

the K cut short his tenure at WOR-FM in 1967 when program consultant Bill Drake was brought in by management to institute programming guidelines and policies. Before departing, Kaufman went on the air and blasted WOR's decision, just as he had done previously at WINS.

From 1967 to 1976 Kaufman worked short stints at various radio stations but never achieved the high points of his earlier career. He began with CHUM (Canada) from 1967 to 1968. Later in 1968 he took a weekend slot on his old WMCA station from 2:00 to 7:00 P.M. on Sundays. After several other brief stints, in the late 1970s he moved to California with his sixth wife, soap opera actress Jacklyn Zeeman. He had three sons from previous marriages. His last job in radio was hosting a syndicated radio program for Watermark.

Kaufman, a smoker, had battled cancer since 1973 and was finally forced to relinquish the job with Watermark in 1981 due to his failing health. After retirement he was financially strained but lived in comfortable surroundings. (Tony Orlando provided him with a 24-hour nurse and housekeeper.) Murray Kaufman died of cancer in Los Angeles on 21 February 1982.

LAWRENCE N. REDD

Murray the K. Born Murray Kaufman in New York City, 14 February 1922. Song plugger for Bob Merrill, 1950s; popularized Merrill's "How Much Is That Doggie in the Window," 1950s; president, National Council of Disc Jockeys, 1950s; spearheaded council's relief effort during Hungarian Revolution, 1956; late-night radio disc jockey, WMGM, 1957; hosted *Swingin' Soiree* for WINS, 1958; spokesperson for government youth program "New Chance," 1965; hosted "Murray the K's Special for the Year 2000" for television, 1966; worked short stints at various radio stations, 1967–76. Died in Los Angeles, California, 21 February 1982.

Murrow, Edward R. 1908–1965

U.S. Radio Journalist

Journalists from broadcast and print media alike consider Edward R. Murrow one of the greats of his time. His legacy was to be among the first to put radio news into a league of respectable journalism. He later helped to launch serious television journalism and started the first TV newsmagazine program. Most important, he established traditions of courage and integrity in the profession of broadcast journalism at a time when radio was still developing the tone of its news function.

Murrow's work spanned from the onset of World War II until the Kennedy administration, from his radio reporter years to president of Columbia Broadcasting System (CBS) News, to director of the U.S. Information Agency. His on-air radio reports of events helped shaped the nation's ideas of what was occurring in the world. His dramatic language in radio formed aural word pictures that were rare and striking to his listeners, and he carried his style into the new medium of television. Murrow became a mentor to many in broadcast news, who carry his ethics and style into today's news efforts. His legacy can be found in the most prestigious journalism awards, in schools named after him, and in historical accounts of corporate and government integrity.

Origins

Murrow was born on 25 April 1908 in Polecat Creek, North Carolina, as Egbert Roscoe Murrow, the son of a farmer. He had two older brothers, Lacey and Dewey. When Egbert was six years old, the family migrated by train to the Northwest. They ended up near Blanchard, in the northwest corner of Washington State, where the family struggled to make ends meet.

As a teen, Egbert changed his name to Edward. He became active in sports, debate, and drama, and he even served as a bus driver for the scattered students of his small school. After his graduation from high school, he worked as a logger in the virgin woods of the Olympic Peninsula. It was in this setting that he learned both virtues and vices, appreciation for the rugged beauty of the Olympic Mountains, and the language and smoking habits of the rough brotherhood of lumberjacks, which tempered the Quaker traditions of his family.

After a year and two summers of working in the woods, Murrow enrolled in 1926 at Washington State College (WSC; now Washington State University) in Pullman, on the east side of the state. His intentions were to pursue a curriculum in prelaw and then go to law school. But circumstances led him to a public-speaking course taught by a dedicated and inspiring teacher, Ida Lou Anderson. She was demanding, but she recog-

nized a talent in Murrow and helped him to develop his potential. Eventually she became his mentor and instilled in him a love of the use of language, a somber introspection regarding his own values, a love of philosophy, and a flare for the dramatic. He went on to enroll in the first broadcasting course, "Radio Speaking."

After his first year of working for his room and board, he became involved in the Greek fraternity system at WSC. Through the political influence of his peers, Murrow was elected student body president for his senior year. He graduated in 1930. He then became an officer for the National Student Federation of America in 1932, traveling to New York City with a meager living expense to run the national office. Soon, Murrow became active in encouraging student exchange among various countries, working for the International Institute of Education.

Honing Radio Journalism

In 1935, Murrow was hired as director of talks at CBS. In this position, he traveled to Europe to line up speakers, and he was there in 1938 at the time of Hitler's invasion and annexation of Austria. The event was described by Murrow in a radio report from Vienna (the beginning of his journalistic career), in which he described the mood of the people, the political setting, and the street scenes in vivid details that made his verbal descriptions come to life. This was to be the first of many descriptions he would later give of the effects of World War II.

Murrow's observations from the European front often came from mere notes used when he dictated his descriptions from his mind's eye. His descriptions and dramatic use of language captured the ear of American listeners, who were compelled not only by the events but by Murrow's style as well.

As the war intensified, Murrow began to broadcast about war events from the basement of the British Broadcasting Corporation (BBC)'s Broadcast House. Murrow turned to short-wave radio for his 1940–41 London "Blitz" broadcasts. The broadcast quality was questionable, with fading and fidelity dependent on the earth's atmosphere. Yet it was those broadcasts, often sent late at night London time for the convenience of listeners on the U.S. East Coast, that led to his first real fame. They were timely, compelling, and immediate for a world breathlessly awaiting word about the quickly growing war. And each one began with his standard and quite dramatic signature opening: "This . . . is London." (In later years he said that Ida Anderson had suggested to him that he insert the pause after the first word.)

Edward R. Murrow
Courtesy CBS Photo Archive

His descriptions of the English people under siege carried the insights of a sociologist:

This is a class conscious country. People live in the same small street or apartment building for years and never talk to each other. The man with a fine car, good clothes and perhaps an unearned income doesn't generally fraternize with the tradesmen, day laborers and truck drivers. His fences are always up. He doesn't meet them as equals. He's surrounded with certain evidences of worldly wealth calculated to keep others at a distance. But if he's caught in Piccadilly Circus when the sirens sound, he may have a waitress stepping on his heels and see before him the broad back of a day laborer as he goes underground. If the alarm sounds about four in the morning, as it did this morning, his dignity, reserve and authority may suffer when he arrives half-dressed and sleepy, minus his usual defenses and possessed of no more courage than those other who have arrived in similar state. . . . Maybe I'm wrong . . . but I can tell you this from personal experience, that sirens would improve your knowledge of even your most intimate friend (Broadcast, 4 September 1939).

Murrow reported not only on the war situation, but on the people. He spoke of girls in light dresses, boys sobbing, old toothless men, and women clutching their belongings as they left their bombed-out homes. His characterizations were vivid and insightful:

I'm standing tonight on a rooftop looking out over London. . . . Out of one window there waves something that looks like a white bed sheet, a window curtain swinging free in this night breeze. It looks as though it were being shaken by a ghost. There are a great many ghosts around these buildings in London. . . . Down below in the streets I can see just that red and green wink of the traffic lights; one lone taxicab moving slowly down the street. Not a sound to be heard. As I look out across the miles and miles of rooftops and chimney pots, some of those dirty-gray fronts of the buildings look almost snow-white in this moonlight here tonight (Broadcast, 22 September 1940).

Sometimes Murrow's courage bordered on foolhardiness. On one notable occasion, and ignoring direct network orders that he not place himself in harms way, he accompanied a B-17 bomber crew on a bombing mission over Berlin. His descriptions became some of his most memorable writing:

The clouds below us were white, and we were black. D-Dog [the plane] seemed like a black bug on a white

sheet. The flack began coming up. . . . The small incendiaries [we dropped were] going down like a fistful of white rice thrown on a piece of black velvet. As Jock hauled the Dog up again, I was thrown to the other side of the cockpit, and there below were more incendiaries, glowing white and then turning red. The cookies—the four-thousand-pound high explosives—were bursting below like great sunflowers gone mad. And then, as we started down again, still held in the lights, I remembered that the Dog still had one of those cookies and a whole basket of incendiaries in his belly, and the lights still held us. And I was very frightened (Broadcast, 3 December 1943).

As the war ended, Murrow accompanied the troops into the concentration camps of Germany. He told his listeners:

If you are at lunch, or if you have no appetite to hear what Germans have done, now is a good time to switch off the radio, for I propose to tell you of Buchenwald. . . . The prisoners crowded up behind the wire. We entered. . . . There surged around me an evil-smelling horde. Men and boys reached out to touch me; they were in rags and the remnants of uniform. Death had already marked many of them, but they were smiling with their eyes. . . . When I entered [one of the barracks] men crowded around, tried to lift me to their shoulders. They were too weak. Many of them could not get out of bed. I was told that this building had once stabled eighty horses. There were twelve hundred men in it, five to a bunk. The stink was beyond all description (Broadcast, 15 April 1945).

Postwar Broadcast Journalism

After the war, Murrow returned to the states and to CBS, which was now a much different organization than the one he had left in 1937. William Paley, head of CBS, persuaded Murrow to take over the network's news organization. His radio war broadcasts had become famous, and his fame would certainly help enhance the network's programs. In his new position, Murrow tried to reflect American life, with both its shortcomings and strengths. He created the radio programs *As Others See Us*, a report on how the foreign press viewed the United States, and *You Are There*, a recreation of historical events. And, since radio had been looked down upon by the print media, Murrow produced the program *CBS Reviews the Press*, in which he ensured that the criticism of radio would become a two-way street, and that "mutual criticism will benefit both."

Eventually Murrow was joined by a young producer, Fred Friendly, and together they produced *I Can Hear It Now*, a 45-minute record that was soon followed by others. The 1950-51

network program *Hear It Now* evolved from that project. It was a sound documentary, a kind of magazine on the air, covering several subjects each week in its hourly network format.

Murrow reluctantly entered into television with Friendly. They produced a 1952 TV counterpart to their radio series entitled *See It Now*. Early programs appear rough and unpolished compared to today's network magazine shows, but the focus was not on appearance but on substance.

Not all of Murrow's work was flattering to the news efforts of his day. In 1958, in an address to his colleagues at the meeting of Radio and Television News Directors Association, he told a startled audience:

So far as radio—that most satisfying and rewarding instrument—is concerned, the diagnosis of its difficulties is rather easy. . . . In order to progress, it need only go backward. To the time when singing commercials were not allowed on news reports, when there was no middle commercial in a 15-minute news report, when radio was rather proud, alert and fast. . . . If radio news is to be regarded as a commodity, only acceptable when saleable, then I don't care what you call it—I say it isn't news.

The same speech was highly critical of television, which helped to further sour Murrow's already poor relations with CBS.

After the election of John F. Kennedy as president in 1960, Murrow was chosen to head the U.S. Information Agency. Once critical of government positions, he now found himself spokesperson for the Kennedy administration and its relay of news throughout the world.

In the fading days of his career, Murrow's contributions were recognized with the Medal of Freedom, the country's highest civilian honor. He was also knighted by Queen Elizabeth for his vital role to England during World War II. Ill health, likely brought on by his chain smoking, forced Murrow into early retirement. He died of cancer in 1965 at the age of 57, leaving his wife, Janet, and one son, Casey.

Edward R. Murrow. Born Egbert Roscoe Murrow in Polecat Creek, North Carolina, 25 April 1908. Attended Stanford University and the University of Washington; graduated from Washington State College (now Washington State University),

1930. Served as assistant director of the Institute of International Education, 1932–35; began career with CBS as director of talks and education, 1935; became director of CBS' European Bureau in London, 1937; during World War II, hired and trained distinguished corps of war correspondents, including Eric Sevareid, Howard K. Smith, Charles Collingwood, and Richard C. Hottelet; returned to U.S. as CBS vice-president and director of public affairs, 1946; resigned to return to radio broadcasting, 1947; narrated and produced *Hear It Now* radio series, 1950–51; brought series to television as *See It Now*, 1952–58; began *Person to Person* television program in 1953; moderated and produced *Small World*, television series featuring discussions among world figures, 1958–60; appointed by President John F. Kennedy to head U.S. Information Agency (USIA) in 1961, and remained in post until 1964. Recipient: nine Emmy Awards. Died in New York, 27 April 1965.

Museums and Archives of Radio

Repositories of Radio History

There are many public, private, and academic archives and museums whose sole purpose is to preserve radio broadcast documents and programs. Most of them have audio and visual recordings, books, periodicals, pamphlets, oral histories, interviews, and other documents that trace the history of radio programming and radio broadcasting. In addition, several archives and museums are devoted to the history of radio technology itself and the development and advancement of this technology. Still others trace the important figures and individuals in radio broadcasting, radio technology, and radio history. There are also dozens of old-time-radio collector's clubs with less extensive collections of radio broadcasts.

Origins of Museums and Archives of Radio

The idea of establishing formal radio museums and archives began in the 1940s, and such institutions were actually developed in the 1970s. The Broadcast Pioneers Library was the first organized library of radio history; it was begun in the 1960s and formally opened in 1972. However, some less formal collections began much earlier. For example, in 1949 the Library of Congress began to collect and preserve some radio programming. At the same time, the National Archives started collecting and preserving programming from governmental sources and began receiving donated new programs and material from radio stations and networks throughout the U.S.

During World War II, the Armed Forces Radio Services began to produce discs in order to bring radio programs to U.S. troops during the war. These discs would later become the basis of privately traded material. During the same period, a few network and syndicated programs were distributed on discs as well.

In the 1950s the Broadcast Pioneers organization unsuccessfully attempted to establish a museum of broadcast history. During the same decade, individuals began seriously recording and collecting radio programs with the introduction of home-recording equipment and the demise of network radio. Reliable and affordable reel-to-reel recorders were first introduced into the consumer market during this time.

However, radio program collecting did not become truly popular until the 1960s, when classic radio programming began to change dramatically and, many felt, to disappear. As a result, many individuals began to realize that preserving such programs was essential for documenting the history of radio. Individuals began to organize for the purpose of exchanging radio programs, information, and resources. As expected, as radio formats rapidly changed, radio stations began to discard

their old stored material and programs. These informal groups began collecting such materials, and a collectors movement started to grow. These groups also created newsletters on radio program collecting.

One of the earliest and most influential of the collectors groups was the Radio Historical Society of America, founded by Charles Ingersoll in the 1960s. Ingersoll also started one of the first newsletters for collectors of old-time radio programs, and *Radio Dial* set the standard for those to follow. One of these was *Hello Again*, started in 1970 by Jay Hickerson. It remains the most popular of old-time-radio collector group newsletters. This newsletter was also part of the formation of the Friends of Old Time Radio. *Hello Again* was successful because it brought together more than 100 of the most active program collectors. According to Professor Marvin R. Bensman of the University of Memphis Radio Archives, "Today, approximately 160-plus active collectors comprise the mass of privately collected broadcast material available."

Another factor that helped spawn the radio collector movement was the sale of radio programs to private individuals. J. David Goldin, a former Columbia Broadcasting System (CBS), National Broadcasting Company (NBC), and Mutual engineer, first mass-marketed and sold radio programs. In the late 1960s, Goldin formed Radio Yesteryear, a company that sells audio recordings of classic radio programs. He also started an album subsidiary of the company called Radiola.

A big boost came for the establishment of the first broadcast history library when William S. Hedges, a former NBC executive, began collecting items for the Broadcast Pioneers History Project between 1964 and 1971. This collection, which consists of nearly 13,000 items, including correspondence, articles, and speeches in 540 different subject categories, formed the core collection of the Broadcast Pioneers Library, which opened in 1972 and led to the establishment of the Library of American Broadcasting.

Public and Academic Museum and Archive Collections

Library of American Broadcasting (University of Maryland)

The first formally established institutional radio archive was the Broadcast Pioneers Library, begun in the 1960s and formally opened in 1972. It was housed in the headquarters of the National Association of Broadcasters (NAB) in Washington, D.C., until 1994. It then became part of the library system at the University of Maryland, College Park, and became known

as the Library of American Broadcasting, one of the most extensive collections of the history of broadcasting. The collection consists of audio and video recordings, books, periodicals, pamphlets, oral histories, photographs, personal collections, and scripts that pertain to the history of broadcasting. The library features more than 8,000 volumes ranging from engineering manuals to programming histories. It is particularly strong in its book collection from the early part of the 1920s and 1930s, tracing the evolution of broadcasting.

The library's audio holdings include 1,000 interviews, speeches, news broadcasts, special events, and oral histories (with many accompanied by transcripts) of such important radio figures as Edgar Bergen, Norman Corwin, Leonard Goldenson, Lowell Thomas, and William Paley. There are also thousands of recordings in many formats, including more than 8,300 recorded disks, 25,000 photographs, and 10,000 CDs of commercials in its Radio Advertising Bureau Collection. Also housed here are many specialized collections from radio performers, executives, broadcast engineers, writers, producers, and magazine publishers. Highlights include political speeches from Franklin D. Roosevelt, Winston Churchill, and Harry S. Truman in the Donald H. Kirkley collection; more than 160 recordings of congressional hearings, political speeches, and other media events of the 1960s and 1970s in the Daniel Brechner Collection; and The Center for Media and Public Affairs Collection, which contains talk radio programs.

Some of its other holdings include some 7,000 pamphlets, ranging from 1920s Bell Laboratories radio engineering bulletins to promotional materials from broadcast networks; the Westinghouse News Collection (1958–82), which consists mainly of raw feeds from the Washington bureau; the Associated Press Radio Competition Collection (1967–68), which contains samples of radio journalism, almost exclusively from California.

There is also a collection of government documents that includes the Navigation Bureau List of Radio Stations (1913–27), Federal Radio Commission (FRC) and Federal Communications Commission (FCC) decisions, and congressional reports and hearings.

The museum acquired the Chester Coleman Collection of the NAB Library and Historical Archive in June 1998. This collection includes more than 4,000 books and periodicals. The NAB collection also includes historical meeting and convention minutes, newsletters, promotional materials, and scrapbooks.

National Public Broadcasting Archives (University of Maryland)

An additional archive housed at the University of Maryland is the National Public Broadcasting Archives (NPBA). The

archives originated as a cooperative effort between both educational institutions and broadcasting organizations, including the Corporation for Public Broadcasting (CPB), Public Broadcasting Service (PBS), National Public Radio (NPR), the Academy for Educational Development, and the University of Maryland. The idea was spearheaded by Donald R. McNeil, a former PBS board member who was concerned that the history of public broadcasting was at risk.

The archives, which opened 1 June 1990, form part of the Archives and Manuscripts Department of the University of Maryland Libraries. They consist of historical materials from the major organizations of U.S. noncommercial broadcasting. These include PBS, Children's Television Workshop, CPB, NPR, Agency for Instructional Technology, America's Public Television Stations, Association for Educational Telecommunications and Technology, Public Service Satellite Consortium, and the Joint Council for Educational Telecommunications.

The NPBA also has personal papers from many influential public broadcasting figures and a reference library containing basic studies of the broadcasting industry, rare pamphlets, and journals on relevant topics. The archives also house a collection of audio and video programs from public broadcasting's national production and support centers and from local stations. There is also a collection of oral history tapes and transcripts from the NPR Oral History Project.

Museum of Broadcast Communications (Chicago)

The Museum of Broadcast Communications is devoted solely to radio and television broadcasting and is housed on two floors of the Chicago Cultural Center. (The Museum was scheduled to relocate to new premises in Chicago's River North area as of Spring 2004.) The museum's purpose is to educate the "public, teachers, and students about the profound influence of radio, television, and advertising in our world." It does this via hands-on exhibits, broadcasting memorabilia, a public archives collection, and educational outreach programs.

The Museum was founded in 1987 by Bruce DuMont, the nephew of television pioneer Allen B. DuMont, using private contributions. It consists of changing exhibits, radio and television archives, a Radio Hall of Fame, an Advertising Hall of Fame, the Lynne Harvey Radio Center, and a gift shop. The museum's public archive, the Arthur C. Nielsen Jr. Research Center, contains over 85,000 hours of television and radio broadcasts, commercials, and newscasts, with 13,000 television programs, 4,000 radio broadcasts, and 11,000 television commercials, all of which can be screened on site in one of 26 study suites. All programs in the archive's collection are cross-referenced and cataloged in a fully computerized retrieval system. The collection focuses on Chicago television news, talk/interview programs, documentaries, political broadcasts, programs

of its Radio Hall of Fame inductees, sports programming, and "Golden Era" television dramas.

Included in its archives is an extensive historic radio program collection, the Chuck Schaden Radio Collection, which contains more than 50,000 programs and is considered to be the largest of its kind in the United States. The Lynne Harvey Radio Center features a live, weekly broadcast of *Those Were the Days*, by radio historian Chuck Schaden, complete with a live studio audience, as well as other live broadcasts. The museum also hosts many special events, including an annual induction ceremony into its Radio Hall of Fame, which pays tribute to the legends of radio. The Hall of Fame was founded by the Emerson Radio Corporation in 1988 and was taken over by the Museum of Broadcast Communication in 1991. There is also a collection of vintage radio and television sets from local donors.

Museum of Television and Radio (New York and Los Angeles)

The bicoastal Museum of Television and Radio (New York and Los Angeles) is devoted to radio and television broadcast history, particularly focusing on the individuals and programs that make up that history. The museum was founded in New York in 1975 by William S. Paley, chairman of CBS, as the Museum of Broadcasting. The museum changed its name and moved to a larger headquarters in September 1991. The New York museum's holdings include some 100,000 radio and television programs, as well as 10,000 commercials. It also includes two screening rooms, two theaters, a group listening room, 96 individual booths equipped with television and radio consoles, a research library, and a gift shop. In addition, there are three public galleries that display broadcast industry artifacts.

In March 1996 the Los Angeles branch of the museum opened in Beverly Hills. It has the same features as its East Coast predecessor. Because Los Angeles is the number-one radio market in the United States, the Los Angeles museum offers more of an emphasis on radio than the New York branch (which focuses more on television). In addition, when radio was in its heyday during the 1930s and 1940s, many shows were made in Los Angeles. According to Norm Pattiz, a trustee of the museum and chairman of Westwood One, "We're now in the No. 1 and No. 2 radio markets, with exactly the same material available at both museums."

Both locations offer seminars by critics, directors, producers, performers, journalists, and writers, including University Satellite Seminars, and both offer a wide variety of programs from the collection in two screening rooms and two main theaters, as well as constantly changing special exhibits. Programming from current series and exhibitions is shown throughout the day.

American Library of Radio and Television (Thousand Oaks, California)

The American Library of Radio and Television is part of the Special Collections Department of the Thousand Oaks Library System. Its holdings focus specifically on the history of radio rather than on the individuals in the profession. The library was founded in 1984 after the Thousand Oaks Library System broke away from the Ventura County System. The newly formed Library Foundation and the Friends of the Library decided that they wanted the library to focus on larger programs and a research collection. Specifically, they were anxious to fill a niche in the Los Angeles area by focusing on a special historical collection. They chose broadcasting because several of the library organizers had extensive contacts in the radio broadcasting industry.

Along with Maryland's Library of Broadcasting, the American Library of Radio and Television offers one of the largest collections of broadcasting documents in the United States, and it has an extensive reference collection of radio materials including 23,000 radio and television scripts, 10,000 photographs, 10,000 books on the history of radio and television broadcasting, pamphlets, sound recordings, periodicals, 200 maps and charts, manuscripts and personal papers, 5,000 audio recordings, and 50 oral history tapes.

In addition, the library contains archives of such notable individuals and stations as Norman Corwin, Bob Crosby, Monty Masters, Carlton E. Morse, Rudy Vallee, and KNX AM. Their Radio Series Scripts Collection contains scripts from 1930 through 1990, and their Radio Sound Recordings Collection contains recordings from 1932 to 1994.

The George Clark Radioana Collection at the Smithsonian Institution

The George H. Clark Radioana Collection is a part of the National Museum of American History of the Smithsonian Institution. The collection was assembled by George Clark of the Radio Corporation of America (RCA) and is one of the most extensive collections of documents and publications on the history of wireless and radio in the United States. It was transferred from the Massachusetts Institute of Technology to the National Museum of American History in 1959. The collection occupies more than 276 linear feet of shelf space, but it has not been fully indexed.

The collection is particularly strong from 1900 through 1935. There is extensive biographical information on the men who developed the technical aspects of radio and the industry; information on the inception, growth, and activities of radio companies, most notably the National Electric Signaling Company and RCA; and photographs of all aspects of radio.

The United States Library of Congress and the National Archives

Both the United States Library of Congress and the National Archives in Washington, D.C., have collections of voice recordings and radio programs. The Library of Congress has received donations of transcriptions of old radio shows. There are over 500,000 programs in their collection, including a large number of British Broadcasting Corporation (BBC) and Armed Forces Radio and Television Service (AFRTS) recordings. The library also has a large collection of radio-related items, such as early folk and regional programs, as well as a large selection of NBC Radio's broadcast discs from 1935 to 1970, which cover the Depression, World War II, postwar recovery, and radio comedy and drama programs. Other radio collections include the WOR-AM collection, United Nations recordings, Library of Congress concerts and literary recordings, and the Armed Forces Radio Collection. There is also an extensive collection from the U.S. Office of War Information (OWI), which, between 1944 and 1947, transferred thousands of items used to support the war effort to the Library of Congress. These items include OWI sound recordings, photographs, and a small number of research papers. In addition, the Motion Picture, Broadcasting, and Recorded Sound Division holds nearly 50,000 acetate disc recordings of foreign and domestic radio broadcasts.

The National Archives of the United States also features a broad collection of radio-related material. Most of these are housed at the Special Media Archives Services Division's Motion Picture, Sound, and Video unit at Archives II in College Park, Maryland. The holdings include 150,000 reels of film, 160,000 sound recordings, and 20,000 videotapes. These materials were obtained from both public and private sources. The sound recordings catalog includes radio broadcasts, speeches, interviews, documentaries, oral histories, and public information programs. The library indicates that the earliest recording they have dates from 1896, with the bulk of their recordings coming from between 1935 and the present.

Some of the specialized catalogs in the holdings include the NPR catalog, which contains NPR news and public-affairs broadcasts from 1971 to 1978, and the Milo Ryan Photoarchive Collection, which includes 5,000 recordings, primarily of CBS-KIRO radio broadcasts from 1931 to 1977. These materials were originally kept at the University of Washington and contain news and public-affairs programs, speeches, interviews, wartime dramas, and daily World War II news programs. The library also features the American Broadcasting Companies (ABC) radio collection, which consists of 27,000 radio broadcasts of news and public-affairs programs from 1943 to 1971.

Duke University Library Advertising History Archive

Duke University Library has a special Advertising History Archive that is part of the John W. Hartman Center for Sales, Advertising, and Marketing History. The advertising history collection located in the Hartman Center is the J. Walter Thompson Company Archives. The J. Walter Thompson Company is one of the world's oldest, largest, and most innovative advertising firms. The collection documents the history of the company and, as part of this, its role in radio broadcasting. The J. Walter Thompson Company's Radio Department produced some of the most popular radio shows on the air during the 1930s and 1940s. These include *Kraft Music Hall*, *Lux Radio Theater*, and *The Chase and Sanborn Hour*. These and other Thompson programs are housed in the collection.

In 1979 the J. Walter Thompson Company Archives were formally established in the company's New York Office. In 1987 Chief Executive Officer Burt Manning authorized the gift of the entire collection to Duke University. The archives contain over 2,000 linear feet of printed and manuscript materials, nearly 2 million items in all, half of which are advertisements. The archives house the Radio-Television Department files, which include microfilm of scripts of most of the agency-produced radio and television shows from 1930 to 1960, including *Kraft Music Hall*, *Lux Radio Theatre*, and *Lux Video Theatre*. Most of the holdings in the archives are open to researchers except for recent and unprocessed materials.

The Pavek Museum of Broadcasting (St. Louis Park, Minnesota)

The Pavek Museum of Broadcasting, located in St. Louis Park, Minnesota, a suburb of Minneapolis, houses a large collection of antique radios, televisions, and other broadcasting memorabilia and equipment, including an actual old-time radio studio. The mission of the museum is to provide a broader knowledge of how pioneers in electronic communications affected the evolution of society, to stimulate a new recognition of the practical and real contributions that exploring science and the communication arts can bring, and to provide a permanent and living repository for the preservation of these historic items.

The museum opened in 1988, and most of its collection comes from the original Joseph R. Pavek Collection. Pavek, an electronics instructor for Dunwoody Institute, started his collection in 1946. He also had his own electronics business, and he began storing his collection at his business. By the 1970s he began to look for someone to take over the collection, house it, staff it, and make it available to the public. In 1984, unable to find such a person, he was set to sell the collection, but Earl Bakken, the inventor of the pacemaker, stepped in and, with Paul Hedberg of the Minnesota Broadcasters Association,

formed the nonprofit organization that became the umbrella for the museum.

The Pavek collection consists of over 1,000 radio receivers, transmitters, and televisions from the first half of the 20th century. Highlights of the collection include a working 1912 rotary spark-gap transmitter, crystal radios of the early 1920s, a collection of vacuum tubes (including several original de Forest Audions), and a large collection of radio literature. Additional donations from radio and television stations and from other collectors have greatly increased the size of the original collection.

Included at the museum is the Charles Bradley Collection, which has examples from over 60 Minnesota radio and television manufacturers from the 1920s and 1930s. There are also many examples of historic broadcast equipment on display, such as cameras, consoles, and microphones. The museum also houses the Jack Mullin Collection, which documents the history of recorded sound, with over 125 years of audio recording technology, starting with the earliest days of the phonograph. Mullin is credited as being the person who brought back two tape recorders from a German radio station while serving in the Signal Corps at the end of World War II. At the time, tape recording was an unknown technology in the United States, and Mullin was immediately hired by Bing Crosby to tape-record his popular radio program for broadcast, the first use of tape recording in American broadcasting.

Also featured in the archives is the Pioneer Broadcaster Series, which preserves videotaped interviews with radio pioneers. The museum also has an educational program with classes, workshops, and exhibits for both children and adults. There is also a library of technical and service information on electronics and electronic communication. Besides the permanent collection, the Pavek also displays items on loan from other private collections.

University of Memphis Radio Archive

The University of Memphis Radio Archive is a collection of broadcast programs that was started over 30 years ago by Dr. Marvin R. Bensman of the Department of Communication. Bensman began his radio collection from original transcriptions, private collectors, and other institutional collections. The collection is intended to be a representative sampling of most series and shows.

The collection is housed in the Microforms Department of the McWherter Library at the University of Memphis. Individuals may request audiocassettes of these radio programs. Programs have been selected because they give a sense of the history and development of broadcasting. They feature the key events that influenced the regulation of broadcasting and of broadcasting programming. Some highlights of the archive include Westinghouse's 50th Anniversary program; the history of broadcasting from the 1920s to the 1970s; 50th anniversary

shows about the development of the BBC, NBC, and CBS; early pioneer broadcasters and/or inventors; Aimee Semple McPherson's broadcasts; the American Society of Composers, Authors, and Publishers' (ASCAP) Cavalcade of Music concert in 1940 consisting of live performances by musical stars including Berlin, Handy, and others; *Year-end Reviews*; CBS Radio Workshops; World War II broadcasts; numerous movie dramatizations; and classic comedies.

Private/Personal Museum and Archive Collections

American Museum of Radio

The Bellingham Antique Radio Museum is a nonprofit museum located in Bellingham, Washington. It is a private collection gathered over the past 25 years by Jonathan Winter, who started collecting radios when he was a child. The collection spans the history of radio from the time it began through the early 1940s and features over 1,000 antique radios on display. The Bellingham Antique Radio Museum, as it was originally called, opened in 1988 in a small room and moved to larger quarters in downtown Bellingham in 1990. In 2001 the museum moved to a new, larger facility.

In addition to its collection of antique radios, there is other material on display highlighting the history of radio technology, including historical photographs; books and magazines from radio's early days; microphones, coils, tubes, speakers, and other parts; biographies of people involved in radio history; audio clips of some of the more historic broadcasts; and clips of radio entertainment shows from the early days of broadcasting.

U.S. National Marconi Museum (Bedford, New Hampshire)

The U.S. National Marconi Museum was created by the Guglielmo Marconi Foundation in 1995 to help publicize the name of Marconi, the "Father of Wireless." The museum is located in Bedford, New Hampshire, and the collection features equipment, historical literature, and audiovisual presentations on the development of radio communications. It features displays of early Marconi wireless equipment, along with the progression of radios up to a current cellular telephone exhibit. The museum also features a restoration room for repairing vintage radios, a machine shop, and a facility room for educational lectures to school groups and for meetings of electronic-oriented organizations.

The John Frey Technical Library contains thousands of radio communication periodicals, some in a series dating from 1920. All the publications are indexed and cataloged on CD-ROM and can be accessed by internet on the library computer. The library also features hundreds of engineering, text, and reference books.

Museum of Radio and Technology (Huntington, West Virginia)

The Museum of Radio and Technology is a small, private collection consisting of old radio and television sets, and it is staffed exclusively by volunteer museum members. It features several displays, including a radio shop of the 1920s and 1930s that has a variety of radios from that era, including battery radios; horn speakers; a wind-powered generator; a radio-television sale room featuring radios, television sets, and wire recorders; a Gilbert toy display; a vintage hi-fi room with tube-type audio equipment and related components such as amplifiers, tuners, tape recorders, receivers, microphones, and turntables. The highlight of the display is the Western Electric transmitter, a 1930s 5,000-watt AM transmitter complete with power supply components and studio equipment.

The Radio History Society's Radio-Television Museum (Bowie, Maryland)

The Radio History Society is a nonprofit organization dedicated to the preservation of radio and television history. In June 1999 the society opened its new Radio-Television Museum in Bowie, Maryland, housed in a fully restored turn-of-the-century building.

The Radio Historical Society owns a large collection of old literature and radio artifacts relating to the history of radio and television broadcasting. Some of their collection includes radio sets from the 1920s through the 1960s plus local broadcast memorabilia. Their permanent and changing exhibits include home receivers, novelty radios, broadcast microphones, and communication and ham radio equipment. They also maintain a display area at George Washington University's Media and Public Affairs Building in downtown Washington, D.C., with changing displays.

Society to Preserve and Encourage Radio Drama, Variety, and Comedy

The Society to Preserve and Encourage Radio Drama, Variety, and Comedy (SPERDVAC) is an organization of old-time

radio enthusiasts that has assembled one of the most important and well-maintained radio program archives in the world. There are over 20,000 original transcription discs, as well as a large library of printed materials and scripts. In addition, there are over 2,000 reels of old-time radio available only to its members. SPERDVAC also produces a monthly newsletter and a catalog listing the thousands of shows in its collection, and it hosts monthly meetings and annual conventions in the Los Angeles area.

Music on Radio

Music has been a staple of radio programming since the medium's creation in the early 1920s. Indeed, David Sarnoff's historically fabled memo—real or not—foresaw radio's potential future as a “music box.” Before radio, to be able to listen to music one had to play an instrument (most often a piano), purchase a poorly recorded disc, or pay to attend a live performance. Radio broadcasting changed that by offering frequent free musical performances for the simple purchase of a radio receiver.

Radio music history can be divided into two eras, divided by a short but confusing transition period. During the first (to 1950), most music was broadcast live as a part of a variety of radio formats, both network and local. The second era (since 1955) followed a brief and difficult transition but soon saw station programmers regularly playing music using specific short lists of recordings. This focus on specific formats has defined radio music, with only the conversion from various disc formats to audiotape and then back to digital discs and tapes changing the means of recording and playback. Indeed, technical change underlies any historical analysis of music on radio. The phonograph record as a means of listening to music preceded radio, but it was radio broadcasting that vastly expanded the musical recording industry—first on 78-rpm records, then, after the war, on 33 1/3-rpm long-playing records and 45-rpm records into the 1960s. Thereafter came a decade or so of analog audiocassettes, and finally, at the end of the 20th century, compact discs and other digital formats.

Network Tin Pan Alley Era (to 1950)

Music as a popular radio program genre started when many advocated the new medium as a means to bring high-art music such as opera and orchestral recitals to the mass public. But although European classical music never disappeared from radio's schedule as radio entered the network era during the late 1920s, its presence quickly gave way to popular music and in particular to variety shows starring musical talents such as Rudy Vallee and Al Jolson. New York City's Tin Pan Alley created the music that big bands and their singers offered radio listeners.

By the early 1930s, both the National Broadcasting Company (NBC) and the Columbia Broadcasting System (CBS) had discovered genres of musical programs that the public preferred. The networks tried classical music; varieties of popular music; and what might be called light or background music, which was designed for listeners involved in activities other than dedicated listening. But although broadcasting classical concert music suggested that radio was providing a “good” to the masses, comedy and variety shows created the mass audiences advertisers sought. Broadcasts of the Chicago Civic

Opera on NBC Blue (Saturday), the Cities Service Orchestra on NBC Red (Friday), the Edison Electric Orchestra on NBC Blue (Monday), and the Paramount Symphony Orchestra on CBS (Saturday) maximized prestige but drew small audiences.

Variety shows proved to be the most successful means of creating a profit with music programming. These shows varied depending on how pop music was emphasized—from a comic host with a musical guest to a musical host with a comic as guest. The latter—the musical variety program—became the most popular network radio genre during the 1930s. Top attractions centered more and more on name bands, including Guy Lombardo's Orchestra on CBS or the Paul Whiteman Orchestra on NBC, both broadcast on Monday nights.

Through the 1930s, so-called light music offered the second-largest musical category of radio shows; for example, Jesse Crawford played the pipe organ on CBS on Sunday nights, Lanny Ross (later of *Your Hit Parade* fame) soothed his audiences on NBC on Saturday nights, and—in a rare case of sponsor naming—The Wheaties Quartet performed as intended background music on CBS on Wednesday nights.

By the mid-1930s, NBC and CBS were offering some of the most popular free musical entertainment during those hard times. Indeed, sales of phonograph records plunged during the Great Depression as fans substituted listening to music on the radio for the relatively expensive purchasing of individual phonograph records. Radio became the place where new popular tunes were introduced, and their creators and players became musical stars.

Although during the day local stations still offered non-network live music from the community, prime time had become big time for radio listeners and programmers. Yet stations in large cities did maintain orchestras to play for the local programming. In reality the music that most fans sought came primarily from New York City and then in small doses from Los Angeles-based studios that used musical talent associated with movie making.

By 1940 classical concert music still offered prestige, but on fewer and fewer programs. A star system developed as NBC put together its own classical orchestra, led by Arturo Toscanini. At CBS, William S. Paley signaled that his star was Andre Kostelanetz, who by 1940 was on the air not one night, but two. NBC continued to hire a classical orchestra in order to identify itself as the higher-class network, and by the early 1940s they had scheduled the Boston Symphony, the Firestone Concert, the Minneapolis Symphony, and the Rochester Philharmonic Orchestra.

Judging by the number of shows offered in 1935, radio listeners seemed to prefer a named band with an identifiable sound to a group with the name of its sponsor—even if that

was a full classical orchestra. Yet some names in the light music category could and did become pop music stars, such as Kate Smith, who had high ratings in 1935 despite being on the air for only 15 minutes on CBS on Saturday nights.

By 1935 variety shows—which had always had a popular music component—reigned as the most popular of radio's genres. No list can be complete, but the big bands of the day could be found throughout the schedules of NBC and CBS—including the Bob Crosby orchestra, Fred Waring, Horace Heidt, Paul Whiteman, and the “waltz king” Wayne King. Guy Lombardo's orchestra remained a fixture on CBS on Monday nights, symbolizing more and more that the name was in the band and its singers, not in some amalgamation fashioned directly by the sponsor.

In short, the popular mainstream music of the 1930s and 1940s was found primarily on network radio. Orchestras were hired to perform live to generate a studio-made “high-fidelity” sound before the innovation in the late 1940s of 33 1/3-rpm and 45-rpm records. In-house studio orchestras were formed to provide background music for dramatic shows as well.

Big bands played remotes for dances in such ballrooms as the Aragon in Chicago and the Pacific Square in San Diego, at beach or other waterside attractions (the Steel Pier in Atlantic City and the Glen Island Casino in New Rochelle, New York), at restaurants (the Blackhawk in Chicago, the Copacabana in New York City), and at major hotels in most big cities. Such remotes offered popular venues for radio broadcasting through the 1940s and symbolized the hot new sounds for dancers of the era.

The rise of “name” singers was another emerging trend. Through the 1930s singers, led by Bing Crosby, learned to use the microphone for effect, not simply as a means of broadcasting. Ratings spiked when Crosby and Frank Sinatra—as well as Rosemary Clooney, Ruth Etting, Helen Kane, Peggy Lee, and Doris Day—were scheduled. Soloists hardly represented the lone form of popular radio singing. There were duos, trios, and quartets—from the Ink Spots to the Mills Brothers, from the Andrews Sisters to the Boswell Sisters. Singing intimately and in a number of styles, all based on Tin Pan Alley arrangements, became a true art form through radio broadcasting.

The war years proved to be the final hurrah for the musical variety show. National defense bond rallies often functioned as all-star radio variety shows, meant to outdo all other radio extravaganzas. Programs such as *Music for Millions*, *Treasury Star Parade*, and *Millions for Defense* not only drew needed bond sales but also were beamed overseas or recorded for later playback for the troops fighting in Europe and the Pacific. The top stars of network radio toured for the United Service Organizations (USO) and went abroad to entertain soldiers near the fronts. Indeed, radio star and big band leader Glenn Miller was killed while traveling from one such show to another. The war years also proved the crest for big band singers on net-

work radio. Kate Smith and Dinah Shore, for example, starred in some of the most popular shows on radio.

This system of making live music came apart, however, because of the demands of its most famous star, Bing Crosby. Crosby hated the necessities of live broadcasting, which demanded a rigid schedule that included doing shows twice (once for the Eastern and Central time zones and then a second time for Mountain and Pacific time zones). In 1946 Crosby moved his top-rated show from NBC to ABC to obtain relief. ABC, desperate for ratings, allowed Crosby to prerecord his *Philco Radio Time* using newly developed audiotape technology. He did not have to be in the studio when his show debuted (on 16 October 1946), nor weekly as it ran on ABC until June 1949. At that point William S. Paley, head of CBS, also gave into recorded music programs and as a part of his famous “talent raids,” offered Crosby more money than ABC could afford.

Even though Tin Pan Alley and its allies in Hollywood largely dominated music played on the radio through the 1940s, there were alternatives. In particular, hillbilly music shows were becoming hits on the networks and on many local stations, particularly on small-town outlets in the South and West.

NBC led the way on the network level with *The National Barn Dance* and *The Grand Ole Opry*, both on Saturday nights. Numerous Southern stations offered live music, particularly during early morning hours. The demand for hillbilly music exceeded the supply, and so border stations based in Mexico blasted at 1 million watts music by hillbilly favorites such as the Carter Family, Jimmie Rodgers, Cowboy Slim Rinehart, and Patsy Montana.

The Carter Family—a trio composed of A.P. Carter, Sara Carter, and Maybelle Carter—was the first family of country music, and their famed 1928 Bristol, Tennessee, recording sessions kicked off a new genre of popular music. Jimmie Rodgers was also at those Bristol sessions and should be counted among the creators of hillbilly music. Nolan “Cowboy Slim” Rinehart, “the king of border radio,” was a singing cowboy who, because of border stations' power, was heard across the nation as much as his more popular rival, singing cowboy Gene Autry. Cowgirl Patsy Montana teamed up with Rinehart for a series of transcribed duets during the 1930s and became so popular that her 1935 recording “I Wanna Be a Cowboy's Sweetheart” became the first million-selling record by a female hillbilly artist.

Ethnic artists found it more difficult to gain access to even local radio. In particular, although African-Americans were developing rhythm and blues music, the genre could rarely be heard on the radio during the 1930s and 1940s. Race records and juke joints offered the sole outlets, but the music was there and rich in form and style for the great change that was about to happen to radio music broadcasting.

Transition (1948–55)

Beginning in the late 1940s, NBC and CBS committed themselves to network television. They transferred their big bands and pop singers—plus some symphonic music—to TV and used profits from network radio to fund their new, and in the future far more profitable, medium. This worked well for the networks, and Bing Crosby, Kate Smith, Tommy Dorsey, and particularly Dinah Shore became mainstays of network television programming of the 1950s.

Their departure—and that of most other network programming—left radio stations looking for something new. Stations would find their salvation and reinvention in rock, an amalgamation of country and race forms. As rock was developing through the early and middle 1950s, Todd Stortz and Gordon McLendon pioneered Top 40 radio. They developed a short list of top tunes and played them over and over again. Teenagers of the 1950s—not interested in the big band, Tin Pan Alley music of their parents—embraced Top 40 radio. AM radio stations—looking for something to fill their time as network programs migrated to television—looked to Top 40 as their salvation.

There were sizable vested interests in keeping the live musical variety show going. These included the performing music societies, the American Society of Composers, Authors, and Publishers (ASCAP) and Broadcast Music Incorporated (BMI). Even more concerned was the American Federation of Musicians, the performer's union which tried to slow adoption of the innovative recording techniques—tape and discs—which union leaders and members feared (correctly) would lessen the demand for their live services. These parties, in addition to many parents and religious leaders, found rock music subversive and threatening. Even NBC tried to keep the variety musical show alive on radio with *The Big Show* on Sunday nights in 1951, but with no success.

Format Radio (Since 1955)

The symbol of the Top 40 revolution in radio was singer Elvis Presley. Gone were the big bands, dominated by brass and woodwinds, with dozens of players; these had been replaced by combos of a drummer and a couple of guitars. The electric guitar gave the necessary amplified sound and beat. The singer, who had been just one part of the big band, was now moved to the forefront, and with Chuck Berry, the singer sang his or her own compositions (so the songwriters of Tin Pan Alley were no longer needed). And, most important, the music of the margins—hillbilly and race—moved to the forefront as the amalgam labeled rock and roll. Elvis was the “hillbilly cat.” Chuck Berry grew up in St. Louis listening to both *The National Barn Dance* and *The Grand Ole Opry*. After more of a struggle, blues music, later dubbed rhythm and blues in its urban form,

came to mainstream rock in the form of Detroit's “Motown Sound.”

Rock, country, and rhythm and blues formats spawned a myriad of newer sub-formats for radio stations that wanted to be more than just “the other” Top 40 station in town. Taking but a single example, the history of country symbolizes how one marginal form became mainstream in the last half of the 20th century—indeed the top format in all radio by century's turn.

As rock splintered into many subtypes, each with devoted audiences, country rose to become the music that many white Americans listened to, in part because during an era of civil rights unrest, country recognized and appreciated that its roots were not tinged by music with more direct African-American roots. Country had its origins in the folk and hillbilly music that was so marginal during the network radio era—save for the popular “barn dance” programs. For advertisers, country attracted white, middle-class, suburban America—the audience they most wanted to reach.

Entrepreneurs provided a new name, and “country and western” was used into the 1960s. With the rise of Nashville (Tennessee) as an important recording center, however, the “western” was dropped, and by the time country format radio took off, the name was simply “country.” What would become known as the “Nashville sound” worked as Hank Williams made country songs popular as pop music—an approach also heralded by Jim Reeves and Patsy Cline. By the 1960s, country emerged as an alternative genre, with stars such as Johnny Cash, Jimmy Dean, Loretta Lynn, and Dolly Parton. As rock seemed to lose its roots in the 1970s, country became an even more popular radio format. By the 1980s many surveys found country to be the most popular format on radio. A once marginal music style had become a dominant form of pop music, all made from a central location in Nashville.

With the innovation of portable and automobile radios, radio listening moved out of the home and became ubiquitous, particularly with the advent of the Walkman. The average person listened more than three hours per week. Advertisers targeted ethnic groups (principally African-Americans and Latinos), different age groups, income classes, and genders with different types of music. Adult contemporary music worked best for those 25–34 years old, whereas album-oriented rock was aimed at teenagers; their college-aged cousins seemed to prefer classic rock and contemporary hits radio. Country generally appealed to an older audience.

By the middle 1990s, many argued that radio had become too formulaic. Virtually all radio sought female suburban adults 18–34 who listened to radio on their way to and from work. Artists (in any format) who did not fit that pattern of attraction were simply not played. In the 1990s, for example, Top 40 morphed into “contemporary hits radio” and largely abandoned those who had once helped to create it: teenagers.

Creating a complete listing of these format formulas is almost fruitless—the annual *Broadcasting and Cable Yearbook* by the late 1990s listed more than 75 formats—starting with adult album alternative or AAA, moving on to urban contemporary, variety (four or more formats), Vietnamese, and finally women.

In the 1990s country music was among the most popular formats on U.S. radio. In turn, country spun off the gospel music format, and later the Christian contemporary music format. Its composers and stars were influenced by rock stylings they grew up with; superstar Garth Brooks recalled the group Kiss as his key influence. Indeed, during the 1990s one could more easily find a Willie Nelson or Loretta Lynn “classic” tune covered and then played on an adult contemporary format, a beautiful music format, or an easy listening format station than on a country station.

Other formats enjoyed great popularity during this turn of the century period as well, among them what was termed Contemporary Rock, Rhythmic Oldies, Urban, and Hot AC. Perhaps the most tuned by young listeners was Hip Hop. It inspired the newest incarnation of the Top 40/CHR format because the Hip Hop sound dominated the best selling music charts nationally, if not globally.

Music Testing

Determining Radio Audience Preferences

There has never been as great a need for accurate music research data in the radio industry as there is today. Not only are many more entertainment options available to potential listeners, but the expectations for ratings and profit performance continue to increase. As a result, programmers of music-oriented stations have adopted a variety of research methods to better understand their listeners' attitudes toward particular songs.

Requests

Perhaps the most easily overlooked source of music data is a station's request line. Many programmers recognize requests as an inexpensive and simple way to collect music information. Instructing disc jockeys to tally songs that people care enough about to request is an easy and cheap way to obtain a daily glimpse of titles that excite listeners. However, programmers

should be careful not to place too much confidence in request data. Listeners with enough spare time to place requests may not best represent a station's audience. To better ensure that a station's entire audience range is represented, programmers rely on more scientific methods.

Callout

The primary method of music testing is callout research. Callout consists of trained interviewers telephoning randomly selected listeners of a particular station and having them use a pre-established scale to rate 15 or 20 "hooks" from songs the station plays. A hook is a brief lyrical segment, often the title or chorus, that captures the essential quality of the song.

According to Tony Novia of *Radio and Records* magazine, callout began in the 1970s when broadcasters believed they could predict which new songs would become popular by having listeners rate hooks from the very latest releases. Unfortunately, because the songs were so new and had not received any airplay, respondent unfamiliarity resulted in unreliable data. Beginning in the 1980s, programmers realized that callout was an effective tool for obtaining data about familiar music. The hook, in effect, was just long enough to "jog the memory about a song in question" (Novia, 2000). Today, most users of callout recommend that songs not be included in research until they reach a high level of familiarity through airplay. For example, radio consultant Guy Zapoleon reports that a general rule is to have a song play at least 100 times on a station before placing it into callout.

During callout, respondents provide data after each hook is heard over the phone line. First, they are asked if they recognize the song. If they do, a favorability-scale question is generally asked next. For example, listeners may rate the song on a scale of 1 to 10, where 1 means they dislike the song very much and 10 means they like the song very much. Another type of data often obtained during callout is a fatigue or burn-out measurement. Listeners are asked, "Are you tired of hearing this song on the radio?" Especially in contemporary music formats, fatigue data is important for determining when to decrease airplay of a popular song title.

Perhaps the biggest benefit of callout research is the ability to gather music data quickly, easily, and inexpensively. These benefits result in the ability to generate weekly reports on current music. Drawbacks to callout include the reliance on hooks, the brevity of which sometimes fail to capture the essence of a song; the comparative low fidelity of telephone lines, which may negatively bias results; and the high refusal rates of respondents, which can be expected any time researchers make unscheduled telephone calls. Two newer and less prevalent music testing techniques, the personal music test and call-in research, have been developed to address these shortcomings.

Call-in and Personal Music Tests

As is implied by its name, call-in research consists of listeners telephoning a station's research department to complete music tests. This method allows listeners to provide information at their convenience. A similar method involves invitations to visit the station's website, where listeners can participate in a music test in which audio of hooks (or even of entire songs) is streamed. There are several drawbacks to these two methods that must be kept in mind. First, just as with those who request songs, listeners who have the time or interest to phone a station or visit its website to participate in a music survey may not be representative of listeners in general. Second, there is no way to adequately prevent one listener from providing opinions more than once, thereby biasing the results.

A personal music test attempts to combine the scheduling convenience of call-in with the representativeness and quality control of callout. Using this music testing method, telephone interviewers call a random selection of station listeners and schedule an appointment for them to visit a research facility at a convenient time. Upon their arrival, listeners are given a hook tape of current music and a personal cassette player with headphones. Listeners work through the hooks, providing ratings for each hook at their own pace. The personal music test ensures that respondents devote the undistracted time required to provide valid data. Furthermore, because telephone lines are not involved, the fidelity of the music being tested is much closer to what is actually heard over the air. A major drawback to the personal music test, however, is cost, because most stations employing the method have found that a financial incentive is necessary to increase participation.

Auditorium Music Tests

Although the methods mentioned above tend to be used to collect opinions of fewer than 30 current songs, auditorium music tests (AMTs) are generally employed to test between 350 and 700 older songs. Familiarity with the titles is assumed; the goal here is to determine the best-liked "gold" music among the station's target audience. For oldies formats, the method is often used to determine the entire playlist; therefore, oldies programmers conduct AMTs each quarter, whereas more contemporary music stations can afford to do them only once or twice a year. AMTs consist of inviting between 75 and 150 randomly selected listeners to an auditorium and playing a hook tape for them. The shared sense of purpose and controlled environment are key benefits to this method. One drawback is the cost of auditorium rental and respondent incentives. Another is the possibility of respondent fatigue, which can be lessened by scheduling breaks periodically during hook presentation.

Mutual Broadcasting System

U.S. National Radio Network

The Mutual Broadcasting System was unique among the four national radio networks. Whereas the other networks originated most of their programming from studios in New York City and Hollywood, Mutual was a cooperative program-sharing venture whose member stations around the country provided most of the programming. As the last major network to be established, Mutual's stations tended to be the ones the other networks did not want: low-powered rural stations with limited listening areas. Thus, although Mutual was eventually to proclaim itself the nation's largest radio network based on the number of affiliates it served, it was continually mired in last place in a four-way race.

Mutual and its affiliates created many memorable programs, such as *The Adventures of Bulldog Drummond*, *Buck Rogers*, *Double or Nothing*, *20 Questions*, *The Falcon*, *The Green Hornet*, *The Shadow*, *Sherlock Holmes*, *The Lone Ranger*, *Dick Tracy*, *Queen for a Day*, and *Captain Midnight*, and featured personalities such as the controversial Father Charles E. Coughlin, Dick Clark, Merv Griffin, Mike Wallace, and, in later days, Larry King. But the network's fourth-place status and chronically weak financial position often resulted in its best programs being lured away to the deeper-pocketed competing networks.

Creating a Fourth Network

Because local radio listening areas, or markets, varied widely in both population and number of stations locally available,

the three-network system (National Broadcasting Company [NBC] Red, NBC Blue, and the Columbia Broadcasting System [CBS]) worked well in some places and not as well in others. Markets with three local stations willing to affiliate with a network (despite the advantages, not all stations desired affiliation) were ideally suited to the status quo. Markets with fewer than three stations frequently saw a station affiliated with more than one network, with one network considered the station's primary affiliation and another network constituting a "secondary" affiliation. In markets with four or more stations desiring network affiliation, somebody, obviously, was going to be disappointed. In a competitive environment with four or more stations, the affiliation contracts usually went to the more powerful stations.

The early 1930s saw several attempts to start a fourth radio network, from the Amalgamated Broadcasting System (headed by popular radio comedian Ed Wynn, often billed as "the perfect fool": the network folded in five weeks) to an American Broadcasting Company (no relation to today's ABC) that lasted a few months. Among the many reasons for the high failure rate, two deserve special consideration, because they were to resurface continually as formidable challenges to anyone trying to compete with NBC or CBS. The first was the fact that the three major networks already had solid relationships with the best advertisers, and they still had much airtime to sell. In many ways, a sustaining program represented an unsold commercial slot. Ideally (for the network), the entire schedule would be commercial. Thus, the sales representatives

at NBC and CBS aggressively went after advertisers to buy more time, often offering discounted rates to large advertising accounts. Any start-up radio network was going to have a tough time convincing advertisers to stray from the majors. A second problem was the ragtag nature of most of the stations not already signed with NBC or CBS. As much as these stations wanted network affiliation, this accumulation of largely low-powered and/or rural stations would not be very attractive to national advertisers.

Ironically, the company that was finally to establish a fourth network started life with no national network intentions. In 1934 four powerful independent (non-network) stations banded together to form the Quality Group. The purpose of the group, which consisted of WOR (New York), WGN (Chicago), WLW (Cincinnati), and WXYZ (Detroit), was twofold. First, they would share their better sustaining programs among themselves. Second, they would offer an alternative to the producers of commercial programs who wanted access to four major metropolitan markets without going through one of the established networks. As a Quality Group spokesman stated, "We will endeavor to make suitable time arrangements for advertisers seeking to broadcast in important markets through the use of a few stations having high power and a vast listening audience. . . . Each station will remain independent and make its own decision in accepting programs. . . . Several programs are now broadcast over this group of stations by mutual agreement." The "mutual" nature of the cooperative venture apparently struck a chord, because the organization was almost immediately renamed the Mutual Broadcasting System (MBS). By the time it celebrated its first anniversary in 1935, Mutual carried 20 hours of commercial broadcasts and 40 hours of sustaining broadcasts per week. The anniversary was bitter-sweet, however. The one non-stockholding partner in the venture, WXYZ, had just jumped ship to NBC Blue. Mutual was able to replace WXYZ in the Detroit market by signing CKLW, an across-the-border Canadian station that had served as the area's CBS affiliate. CBS had dumped CKLW in favor of yet another Detroit station, WJR, when it increased its power to 50,000 watts.

More significantly, a major schism regarding the future of the company was developing among the three owner stations. Desiring to increase the operation's revenue, WGN and WOR wanted to open Mutual up into a broader network serving more stations. WLW was opposed to this plan. Whereas the metropolitan locations of WGN and WOR (Chicago and New York City) gave them local access to millions of listeners, WLW got most of its audience through the far-flung reach of its nighttime 500,000-watt signal. If Mutual began to sign affiliates in the cities reached by WLW's signal, the station reasoned, WLW would lose much of its audience to these local stations. WLW wanted MBS programming to remain exclu-

sively available to the original four markets to preserve its own unique appeal to its geographically widespread audience.

WLW was outvoted. By early 1936 some individual Mutual programs (but not the complete network schedule) were being carried on a network of nine stations. By the fall of 1936, Mutual announced expansion to the West, signing affiliation agreements with the Don Lee regional network in California and with several Midwest stations along the American Telephone and Telegraph (AT&T) line, which was leased to carry the network's signal to the West Coast. At the same time, WLW announced that it was turning in its MBS stock. It remained an MBS affiliate for many years, even continuing to supply Mutual with some original programming. Its own schedule, however, became increasingly a mix of MBS and NBC. The Federal Communications Commission (FCC) eventually decided that the "superstation" experiment was a failure, placing WLW at too much of a competitive advantage over other stations, and WLW became a regular 50,000-watt clear channel station. The Don Lee network picked up WLW's stock, as well as one-third of the cost of the expanded network operations. Before the network hookup to California was in operation, Mutual signed a Washington, D.C., station and another regional network, Colonial, as a New England affiliate. Thus by the end of 1936, Mutual was a true trans-continental network, albeit one with huge gaps (most significantly, the southern half of the United States). Despite this expansion, MBS executives remained committed to the network's unique vision. Company President W.E. Macfarlane emphasized the independent nature of Mutual's affiliates by noting, "The Mutual Broadcasting System was organized with the purpose of presenting better programs, allowing stations to maintain their independence, and creating a network of stations which would serve the country's listening audience and still allow stations to fulfill obligations to their various local communities."

By 1937 Mutual was serving 51 affiliates. The complete network schedule consisted of 30-3/4 hours of commercial programs and 93-1/4 hours of sustaining programs per week. Within a year, the total number of affiliates was up to 51. Yet increasingly, Mutual was finding itself frustrated by the major networks. Many of its new affiliates were only secondary Mutual stations. These stations owed their primary allegiance (and best broadcasting hours) to one of the major networks. On these stations, Mutual only got the broadcast times the major networks did not want: the hours with the fewest listeners that were the most difficult to sell to national advertisers. Because of its weak position relative to the other networks, Mutual became an early practitioner of "counter-programming." If the most popular program on radio in a given time slot was a drama, Mutual would schedule a musical show opposite it.

The FCC Network Probe

Early in 1938, in part responding to growing complaints from Mutual about its difficulty in competing with the entrenched New York-based networks, the FCC initiated a probe of possible network monopolistic practices. Data soon confirmed some of Mutual's complaints—CBS and NBC, with three networks between them, dominated the strongest stations across the country. Mutual was having trouble getting a competitive foothold in the business.

Mutual's winning of the rights to provide the baseball World Series broadcasts in 1938 and 1939 brought other network practices into sharp contrast. CBS and NBC ordered their affiliates to stick with their own network programs, even when those stations wanted to carry the highly popular games (and Mutual was willing to provide them). The closed-door approach of the New York networks certainly helped to underline Mutual's anti-competitive arguments.

Based in part on information provided by Mutual, the FCC issued its final report on chain broadcasting in May 1941, calling for a host of changes in the relationship between networks and their affiliates. After a fierce legal battle, and several long congressional hearings, the rules were upheld in a landmark Supreme Court decision in 1943. NBC and CBS were forced to modify many of their affiliation contracts, somewhat evening the playing field for Mutual.

The Decline of Mutual and Network Radio

The MBS continued to expand through the 1940s, reaching 400 affiliates in 1947. It became the first network to include FM stations in its lineup, although these affiliations were plagued in the beginning by a dispute with the American Federation of Musicians that prohibited any musical programs from being carried over FM stations without an additional fee. The expanded Mutual network now reached 84 percent of the nation's radio homes, although only 60 percent of the network's programming was actually carried over the entire system.

Although the post-World War II structure of Mutual was basically the same as it had always been—a program-sharing cooperative owned by three major stockholders (WGN, WOR, Don Lee) and a few minor stockholders (including the New England-based Colonial regional network)—major changes in the broadcasting landscape and in Mutual's corporate structure loomed on the horizon.

After decades of development, television was finally ready for its commercial launch immediately following World War II. Although CBS, NBC, ABC, and an electronics firm named DuMont all announced plans for television networks, Mutual's stand on the matter was ambivalent. Although WGN, WOR,

Don Lee, and some Mutual affiliates were getting into television, MBS announced in 1948 that it would "leave actual video operations to its stockholder stations." The decision was made that these stockholder stations might provide programming to MBS affiliates, but that such programming, for the time being, would be outside of Mutual. Although he assumed that MBS would eventually become the fourth television network, MBS president Edgar Kobak stated, "I have a hunch that a few years from now survival may be difficult and one way to survive is to be careful now. That's what we at Mutual are doing." Survival for Mutual would indeed soon become difficult, and the decision not to actively develop a television arm would be one of the major contributing factors.

In 1943 General Tire and Rubber bought the Colonial network, giving it a small stake in MBS. In 1950 it expanded its broadcast holdings with the acquisition of the Don Lee network (giving the company 38 percent ownership of MBS), and its purchase of WOR the following year made it the controlling partner in Mutual, with 58 percent of the stock. Under the new corporate name of General Teleradio, the company acquired the remainder of Mutual's outstanding stock to become the sole owner of MBS. General Teleradio bought RKO-Radio Pictures in the mid-1950s. General's interest in the studio was solely to obtain its backlog of old theatrical movies as programming for General's growing roster of independent television stations. General had no intention of getting into the theatrical film business or of using RKO's studios as a production center for a possible MBS television network. Content to run its television outlets as independent stations, the newly renamed RKO-General immediately liquidated the film studio and, in 1957, sold MBS to oil tycoon Armand Hammer. The company would pass through the hands of five more owners in the next three years.

In the fall of 1958, Mutual was sold again, this time to Hal Roach Studios. A venerable producer of theatrical short comedies in the 1920s and 1930s, Roach had become a major television producer in the 1950s. By the late 1950s, however, the company was in the throes of serious financial reversals, compelling it to accept a buyout offer from a businessman named Alexander Guterma. Guterma immediately announced plans to combine the Roach operation and MBS into a broadcasting powerhouse of both radio and television networks, the latter of which would be supplied with programming from the Roach Studios. Within months, however, the Guterma empire collapsed under allegations of stock fraud.

In February 1959, MBS was sold by the Hal Roach Studios to recording executive Malcolm Smith. Smith sold MBS within months to a new set of owners, the McCarthy-Ferguson Group, who entered the network into bankruptcy reorganization.

During the transition from Smith to McCarthy-Ferguson, a final peculiar twist to the Roach-Guterma era emerged. In an

effort to save his flagging business empire, Alexander Guterma had accepted \$750,000 in January 1959 from the dictator of the Dominican Republic, Generalissimo Rafael Trujillo, in exchange for up to 425 minutes per month of favorable coverage of the Dominican Republic on Mutual radio news broadcasts. Negative reports on the Dominican Republic would not appear on MBS. The arrangement was reported to federal authorities by the new MBS management, who had found themselves accosted by agents of the Dominican Republic demanding performance on the deal or return of the money. In addition to his problems with the Securities and Exchange Commission, Guterma found himself tried and convicted of failing to register himself as an agent of a foreign principal.

In April 1960, McCarthy-Ferguson sold the network to the giant manufacturing company 3M, which was seeking to diversify into new fields. By the 1960s, however, network radio had become little more than a news-delivery service. As a corollary enterprise to the news division of a television network, a radio news service could return a profit. Despite the fact that it could boast the largest number of affiliates of any radio network, over 500 in 1967, with no television operation to share the costs of news gathering Mutual was locked in a terminal slide toward oblivion.

Despite the inevitability of its demise, MBS lasted considerably longer than most industry analysts expected (and longer than the pioneering NBC Radio Network). The end for Mutual came on 18 April 1999. Its final owner was the Westwood One radio group, which had bought Mutual from Amway in 1985. Shortly before Mutual's demise, Westwood One had turned most management decisions over to CBS Radio, which saw Mutual as redundant to other services offered by both Westwood One and CBS. The last Mutual sta-

tions were offered affiliation with Westwood One's CNN Radio operation to replace the departed 65-year-old Mutual network.

N

Narrowcasting

Narrowcasting is the process of identifying or selecting a specific portion of the overall radio audience and designing a station's programming to attract and retain that audience. Other related terms include *audience fragmentation*, *target audience*, *listener segmentation*, *niche audience*, and *format-specific, cultural-specific, or audience-specific programming*.

Narrowcasting stands in contrast to the older word *broadcasting*, which was borrowed from the agricultural industry. To a farmer, broadcasting means to sow seeds as widely as possible throughout a field; in radio, stations transmit their signal widely throughout their coverage area. In the early decades of radio, stations designed their programming to meet the needs of the largest, widest possible audience. However, stations could not always meet everyone's needs adequately, and portions of the population were left underserved or neglected by programming intended for an aggregate audience.

During the 1930s and 1940s, some independent, non-network stations in larger U.S. markets sold air time to African-American or non English-language programmers. In addition, some country and folk listeners could find programs to meet their needs in the various barn dance and jamboree shows around the country, although few stations featured around-the-clock music for rural listeners.

After World War II, the number of radio stations on the air increased dramatically, increasing the pressure on each outlet to find programs that would appeal to at least some listeners. Managers of newer stations who were willing to forgo the "golden age" approach to programming focused their programs to attract specific audiences; as a result, African-American and country stations first appeared in the late 1940s and early 1950s. During the same period, Top 40 programmers reached out to teens, and Middle-of-the-Road stations attracted older audiences: thus the first true formats were born.

The practice of narrowcasting is of particular interest to advertisers, because even though audiences are typically divided by listening characteristics, listener segmentation also

results in buyer segmentation. When special audiences are targeted for specific products, the result is a more efficient use of advertising dollars. Teens are more likely to buy acne medicine and soft drinks. Mature audiences are more prone to invest in luxury cars, health care products, or mutual funds. This improved efficiency can be illustrated by the question, "Would you rather stand on the street and try to sell hot dogs to all the people passing by or would you rather talk to ten hungry people?" On the street, a salesperson will meet many people, but not all will be prepared to purchase. On the other hand, ten hungry people may find themselves quite interested in the prospect of a hot dog, if the salesperson can only locate them.

Over time, the practice of narrowcasting has enhanced the partnership between stations and advertisers. *Broadcasting and Cable Yearbook* in 2000 recognized 70 different radio formats in use. These various narrowcast formats divide the total audience into listener groups according to the demographic characteristics of age, gender, culture, or income. The station programmer's job is to design a total package of program elements, including music, news, IDs, liners, and public service announcements, to attract and retain their specific audience. The advertiser's task is to match audiences with products. A successful link of programs, audiences, and advertisers results in a more efficient and, in the long run, more economical effort enabling stations to deliver audiences to advertisers.

National Association of Broadcasters

U.S. Broadcast Trade Organization

The National Association of Broadcasters (NAB) is the primary trade association of the American broadcasting industry. The NAB represents the industry before the Federal Communications Commission (FCC), Congress, and other government entities and takes a proactive role in acquainting the public with the importance of radio and television communications.

Members of the association set policies and make decisions on industry-wide matters through a board of directors composed of radio and television broadcasters elected by fellow members. This joint board is subdivided into a radio and a television board, each with its own chair. The joint board also has a chairman. NAB is overseen by a full-time president.

NAB has an extensive committee structure that enables it to draw on the specialized knowledge of its members in dealing with industry causes and in making recommendations to the board of directors. These committees are composed of representatives of individual stations, broadcast groups, and the networks. Active member support and participation are the basis for NAB decisions and activities.

According to its charter, NAB operates "to foster and promote the development of the arts of aural and visual broadcasting in all forms; to protect its members in every lawful and proper manner from injustices and unjust exactions; to do all things necessary and proper to encourage and promote customs and practices which will strengthen and maintain the broadcasting industry to the end that it may best serve the people."

Origins

The early history of NAB is closely tied to the issue of using recorded music in early radio broadcasts of the 1920s. At that time, broadcasters freely used phonograph records without compensating the artists involved, in spite of a 1917 court decision that upheld the right of creative artists to license their products under provisions of the 1909 copyright act. By early 1922, the declining sale of phonograph records in the face of

radio broadcasting caused the American Society of Composers, Authors, and Publishers (ASCAP) to look for ways to recover lost royalties directly from broadcasters. ASCAP, founded in 1914, provided the means for artists to license and copyright their creative efforts.

In April 1922 ASCAP determined that the radio reproduction of copyrighted songs fell under the "public performance for profit" portion of the copyright law and that the copyright owners were entitled to compensation from the broadcasters. ASCAP notified all broadcast stations of their intention to collect royalties for their members, but the announcement was largely ignored by the fledgling industry.

After finding little success pursuing its aims within the broadcast industry as a whole, ASCAP decided specifically to move against Westinghouse, General Electric (GE), the Radio Corporation of America (RCA), and a few other giants of the new industry. ASCAP called for a conference to discuss the issue, but it was once again ignored. The broadcasters agreed to a meeting only after ASCAP threatened to sue them for copyright infringements if they did not meet.

At the meeting on 20 September 1922, ASCAP presented as its major concern artists' rights to royalty payments, while broadcasters expressed their desire not to pay royalties. Of major importance to the broadcasters was the payment of performers; at that time, many musicians performed on radio free for the exposure, and broadcasters felt that if they paid some, they would have to pay them all. The broadcasters told ASCAP that they would go on the air with "The Old Gray Mare, She Ain't What She Used to Be" rather than pay ASCAP for the privilege of broadcasting the latest ASCAP licensed hit, "My Bromo-Seltzer Bride." The meeting ended without resolution.

Organization by Zenith's McDonald

The second ASCAP-broadcaster conference occurred one month later, on 25 October 1922. At this meeting, broadcast-

ers expressed sympathy for the artists' position but stated that they could not afford to pay for the music if it would lead to paying all composers, individual performers, and orchestras. ASCAP responded by filing a suit and notifying all broadcasters that it was revoking all temporary licenses for broadcast of ASCAP members' music. Additionally, ASCAP established a rate schedule that fixed fees for the use of music at \$250 to \$5,000 per year per station depending on the size of the station's audience (determined by location, wattage, and profits). The arbitrary nature of the ASCAP action caused a small group of broadcasters, organized by "Commander" Eugene F. McDonald, Jr., founder-president of Zenith Radio Corporation (and station WJAZ), to meet in Chicago in early 1923 to form an organization to oppose ASCAP; this organization would become the National Association of Broadcasters.

The group, all pioneer broadcasters, moved quickly from a discussion of ASCAP to the need for a regulatory body for radio similar to the Interstate Commerce Commission. At this initial meeting of concerned broadcasters, McDonald first used the name "Federal Communications Commission" for such a group. They also considered rules and regulations that they felt should apply to a free enterprise system for radio.

Shortly after this meeting, McDonald, who knew little of the music business, called on his friend and business colleague Thomas Pletcher, president of the QRS Music Company, for advice. He told Pletcher that his group of broadcasters believed that authors and composers should be paid directly for their contributions, rather than through ASCAP, but that they did not know how to proceed with the organization. Pletcher suggested that the group hire Paul B. Klugh (a knowledgeable, recently retired music roll manufacturer) as secretary of the new organization. McDonald successfully recruited Klugh, who assumed the position of executive chairman. McDonald embarked on a campaign to persuade RCA, GE, Westinghouse, and American Telephone and Telegraph (ATT) to join the fledgling group, but he was initially unsuccessful.

The actual organizational meeting for the NAB was held in the studios of WDAP (Chicago) on 25 and 26 April 1923, with 54 representatives of various radio constituencies. Representatives of ASCAP presented their positions and, after discussion, left the meeting. A committee was then formed to propose the structure for an organization that would carry out the aims of the broadcasters. The committee consisted of McDonald (WJAZ), T. Donnelley (WDAP), J.E. Jenkins (WDAP), W.S. Hedges (WMAQ), P.B. Klugh, R.M. Johnson (Alabama Power and Light Company), and George Lewis (Crosley Manufacturing Company). The group, known as "the Committee of Seven," reported on 26 April 1923, and their recommendations were accepted: the association was to be known as The National Association of Broadcasters, NAB's offices would be established in New York City, and they would employ a managing director. Paul Klugh was selected as the managing direc-

tor by a unanimous vote. Two other meetings were held in 1923 with the main subject of discussion being the development of an NAB "music bureau" of copyright-free music.

The first annual meeting of the National Association of Broadcasters was held in conjunction with the annual National Radio Show held in New York on 11 October 1923. This meeting, called to order by Chairman Klugh in the Commodore Hotel in New York City, resulted in the election of the first real officers of the NAB. McDonald was elected president. A number of addresses were presented, and the group received a list of holdings in the NAB Music Bureau. A discussion of legislation plans was also undertaken. The group wanted to accomplish two goals with their legislation: (1) music copyright revision and (2) modernization of the 1912 Radio Act. During the meeting, McDonald conducted a test of the size of the audience at WJAZ by asking listeners to send in paid telegrams acknowledging their reception. The audience was estimated to be 400,000, based on receiving 4,284 telegrams in four hours. The public relations coup resulted in considerable publicity for the young broadcasters group.

In conjunction with the 1923 Chicago Radio Show in November, McDonald and his good friend Thorne Donnelley of WDAP, both officers of the NAB, along with Chicago station KYW, conducted an audience census to determine music preference in the Chicago listening area. For 12 days the stations requested listeners to write in telling what they most desired to hear. The three stations received a total of 263,410 pieces of mail, with WJAZ receiving 170,699; WDAP, 54,811; and KYW, 37,900. It was estimated that not more than 1 in 50 listeners would respond, which suggested that the three stations were being heard by an audience of more than 13 million.

In 1924 ASCAP attempted to flex its muscle and thus created a situation that brought the music copyright problem before Congress. The Edgewater Beach Hotel (home of WJAZ) had always paid a fee to ASCAP for the music used in its dining room. Because at times this music had also been broadcast live over WJAZ, ASCAP refused to renew the performance license for the music unless a broadcast license was also secured, even though the hotel no longer allowed WJAZ to broadcast the music. The broadcasters determined that this situation was a good legal test case. The fact that McDonald's WJAZ was involved and that he was also president of the NAB undoubtedly was an important factor in choosing this incident for the test case.

On 22 February 1924, Senator C.C. Dill, at the urging of the NAB, introduced a bill to the Senate that amended the Copyright Act of 1909 to make radio performances of copyrighted material essentially legal and royalty-free. A nasty battle ensued, with ASCAP waging a publicity campaign encouraging all musicians to join the fight. NAB, small and new, had little money to fight back, and a plea to broadcasters for financial help brought nothing.

The NAB cause was represented by NAB President McDonald, Executive Secretary Klugh, and Counsel Charles Tuttle. In January 1925, the ASCAP-supported Perkins Bill (H.R. 11258) was introduced in the House. This bill called for massive changes in the copyright law in general and particularly in those portions concerned with radio broadcasting.

Years of debate followed. The NAB endorsed its stand at each succeeding annual conference. McDonald's involvement also continued. As NAB president, he was appointed one of ten members of the Copyright Committee of the Fourth National Radio Conference called by then Commerce Secretary Herbert Hoover in Washington on 9 November 1925. The fight to avoid paying royalties, however, was rapidly being lost, and the NAB and ASCAP entered secret negotiations. McDonald stepped down as president of the NAB in 1926 as he began a battle with Secretary Hoover over frequency allocations, but he continued his strong involvement with NAB for many years, holding a variety of offices.

NAB Radio and Television Codes

The NAB has been involved in voluntary compliance broadcast codes since 1929, when it produced its first "Code of Ethics" in an attempt to preempt the Federal Radio Commission from imposing such a code. In 1939, attempting to avoid FCC action regarding children's programs, the NAB issued a "Radio Code" dealing with profanity and limits on commercial time in children's programming. NAB issued a guide for broadcasters in 1942 covering security in wartime broadcasting. Although compliance with these codes was voluntary, many NAB members subscribed to them, and the various NAB radio and television codes existed until they were dropped in 1982 after a court case found a portion of the code unconstitutional. Today the NAB operates under a "Statement of Principles" dealing with program content.

The NAB expanded greatly in 1938 and has grown with the broadcasting industry, incorporating other groups in the industry. The FM Broadcaster Association became a department of NAB in 1945, and in 1951 the Television Broadcasters Association also merged with NAB. Springing from NAB membership in 1959, a new and independent National Association of FM Broadcasters met for the first time; by 1984, the 2000-member group, then named the National Radio Broadcasters Association, merged with NAB. NAB also accepts associate members in fields allied to broadcasting.

The Modern NAB

Although much of the association's focus since the 1950s has been on television, cable, and newer media, radio continues to occupy NAB lobbying and developmental efforts. NAB championed FM in the 1960s and 1970s, publishing a monthly

newsletter tracing industry developments. In the early 1980s, NAB fought strenuously and eventually successfully to beat back an FCC proposal to reduce AM channels from 10 kilohertz to 9 kilohertz, parallel to much of the rest of the world. The association argued that such a move would increase interference and make many push-button radios obsolete. At the same time, NAB supported efforts to create AM stereo and to select a technical standard for the service.

In the late 1990s, NAB radio interests focused on digital radio and on developing a successful technical standard to allow digital audio broadcasting (DAB) service to begin. At the same time, NAB fought hard against allowing satellite digital services to develop, because they would threaten the local stations represented by the association. And NAB fought against the highly popular introduction of low-power FM stations (LPFM) in 2000, arguing that the potential for hundreds of new stations would greatly increase interference problems. NAB maintains an ongoing educational program on its agenda.

The huge annual four-day NAB conventions, which now attract more than 115,000 attendees, are held every spring (in Las Vegas since the early 1970s) and devote considerable conference time and exhibition space to radio and audio topics. A fall conference focused entirely on radio programming and operations is also held, and radio-related publications are issued regularly. With more than 100 full-time employees housed in its own modern building in Washington, D.C., the NAB has gained a reputation as one of the strongest and most effective lobbies in the nation's capital. Part of this strength comes from the clout inherent in member stations, which provide airtime for political candidates and which will readily call congresspersons to press their views.

National Association of Educational Broadcasters

The National Association of Educational Broadcasters (NAEB) was the oldest professional educational broadcasting organization in the United States, founded as the Association of College and University Stations in 1925. Until its demise in 1981, the NAEB served as the nation's most influential force in the establishment and preservation of an alternative system of noncommercial educational (public) radio stations.

Origins

The historical roots of American public radio extend back at least as far as those of commercial radio broadcasters. Early in the 1900s experimental stations began appearing in electrical engineering departments of universities and colleges across the country, the first being station 9XM (now WHA) at the University of Wisconsin in Madison. Unfortunately, the primary motivation for building many of these stations was limited to the study of technical considerations, without much concern about the programming and service potential of this new electronic medium. By 1926, roughly half of these early stations had gone off the air, but among those remaining, there was a growing interest in exploring educational uses for radio.

Secretary of Commerce Herbert Hoover had already begun a series of annual National Radio Conferences in Washington, D.C., and it was at the fourth of these gatherings, on 12 November 1925, that a group of educational broadcasters created a new organization, the Association of College and University Broadcasting Stations. At first, this fledgling collective of broadcast pioneers was loosely knit and had no specific purpose other than to support and promote radio for educational use. Membership was open to all educational institutions that operated radio stations, but even with annual dues set at only \$3.00, less than half of the qualified institutions joined the association during its first few years of existence. Documentation for this period is extremely limited, but it is clear that the members struggled against enormous odds to hold the organization together, as the Great Depression began to bring financial hardships to institutions of higher learning.

The first formal convention of the 25-member association was held on the Ohio State University campus in Columbus in July of 1930, convened in conjunction with the Institute for Education by Radio. Recent licensing actions by the Federal Radio Commission were seen as clearly favoring the commercial use of radio at the expense of educational development. Hence, there was a growing sense of urgency that something needed to be done to stem the tide of lost licenses for educational institutions. Association president Robert Higgy, Director of Ohio State's WOSU, launched a campaign to seek legislation that would reserve a portion of the radio spectrum exclusively for noncommercial educational use. Association members joined with other educational radio advocates, including the National Advisory Council on Radio in Education and the National Committee on Education by Radio, in that pursuit over the next several years. However, when the Communications Act was signed into law on 19 June 1934, the provision for which they had fought so hard had been deleted. Instead, Congress specified that the newly created Federal Communications Commission would study the matter of nonprofit allocations to educational institutions and report back on their findings.

Reorganization and Name Change

When the association members gathered on 10 September 1934, in Kansas City, Missouri, for their annual meeting, there was a renewed determination to influence the work of the FCC. A new constitution was adopted and the organization's name was changed to the National Association of Educational Broadcasters. This new label better reflected the interests of existing members, particularly those that were producing educational programs that were being broadcast over commercial radio stations. The NAEB members rededicated themselves to three goals: reserving channels for educational use, establishing a national headquarters, and creating a mechanism for program exchange. Toward this third goal, three committees were established, each to study a specific means of program

exchange: shortwave transmission between stations, the establishment of a chain network, and the recording of programs.

The FCC hearings that stemmed from the congressional statute to study the matter failed to result in the desired educational reservations, though the NAEB continued to lobby both the FCC and members of Congress in the years to follow. When the NAEB assembled in Iowa City on 9 September 1935, each of the program exchange committees made their reports. The use of shortwave interconnection was judged impractical, but there was some optimism expressed that federal and state appropriations might enable the creation of a chain network at some future date. However, the only short-term means of program exchange seemed to be to record programs and exchange them among stations through the U.S. mail service. The goal of establishing a national office was still well beyond the members' reach.

The NAEB continued to meet annually through 1938 but suspended its regular meeting schedule during the years 1939–41. Throughout this period the association achieved modest accomplishments, including purchasing of sound transcription equipment, beginning the publication of a regular newsletter, creating of a radio script exchange, and successfully lobbying the FCC to reserve designated "curricular channels" in 1938, though the authorization of FM broadcasting would render this initial lobbying victory moot. The continued efforts by the NAEB culminated in the FCC's acceptance of the reservation principle when the Commission first authorized FM service in 1941, reserving the five lowest channels for noncommercial educational use. Four years later, the FCC shifted the placement of FM broadcasting to its present location, and set aside the lowest 20 channels (88–92 MHz) for educational use.

Although membership in the association during the early 1940s did not increase significantly, the organization gained greater cohesion and confidence as representatives from member stations worked cooperatively on a variety of association initiatives, including FM channel reservations. Efforts were stepped up to get educational institutions to apply for construction permits for FM stations, and discussions about establishing a national headquarters with paid personnel continued to gain momentum. In an attempt to encourage more stations into operation, the NAEB convinced the FCC to liberalize its FM rules by creating a new Class D license in 1948 that allowed stations to broadcast with as little power as 10 watts, thus greatly reducing the costs of transmitter equipment and ongoing operations for the many colleges and universities that wanted to mount student-operated radio stations.

In 1949, the long-envisioned program exchange was formally begun when station WNYC in New York City made five sets of recordings of the *Herald Tribune Forum* series that were mailed among 22 NAEB member stations in a distribution system that came to be known as the bicycle network. Prompted by the success of this bicycle tape network, Univer-

sity of Illinois Dean Wilbur Schramm offered a plan at the 1950 NAEB convention in Lexington, Kentucky, to house the network headquarters on his Urbana, Illinois, campus, with funding generated by a series of grants. The following year the NAEB received a major grant from the W.K. Kellogg Foundation to fund a permanent national headquarters and distribution center at the University of Illinois. A series of other major grants were soon forthcoming, and both the financial posture and the services provided by the NAEB improved significantly. Increases in NAEB membership quickly followed, and by January of 1954 there were 218 members and 78 stations participating in the tape network. The national headquarters staff had expanded to seven full-time employees. After nearly 30 years of struggling for its own survival, the NAEB had become the dominant force in U.S. educational broadcasting.

Organizational Transitions

During the 1950s, the NAEB greatly improved its stature within the educational community, both nationally and internationally. Increased human and financial resources enabled the association to exhibit expanded leadership and professional development for the educational broadcasting establishment. Workshops, seminars, and regional conferences soon complemented the annual convention. In 1956, a sister organization of individual members from a wide range of educational professions—the Association for Education by Radio-Television (AERT)—merged with the NAEB and brought with it a scholarly publication, the *AERT Journal*. The following year, the association began publication of the *NAEB Journal*, in addition to the monthly *NAEB Newsletter* and other occasional reports and monographs. By the 1959 convention in Detroit, Michigan, it was evident that the NAEB's ever-widening vision had outgrown its home in Urbana, Illinois.

From the inception of the national headquarters at the University of Illinois, the NAEB had operated with an elected president from one of the member stations and a full-time executive director located at the national office. It was time to move the national headquarters to Washington, D.C., and to hire a full-time president. On 1 September 1960, the NAEB's new offices opened in the DuPont Circle Office Building at 1346 Connecticut Avenue, NW. The new president who would lead the organization into a new era of educational broadcasting was William G. Harley, a former elected NAEB president and chairman of the board of directors who had gained national prominence as manager for the highly successful WHA-AM-FM-TV stations at the University of Wisconsin.

Harley moved quickly to establish the NAEB as a lobbying force on Capitol Hill while expanding the number of grants that enabled the NAEB to enhance its intellectual position. A new publication, the *Washington Report*, was created to help keep members posted of important developments in the capital

city. The NAEB Radio Network took full advantage of the Washington connection by producing a new public affairs show, *Report from Washington*, that was sent by air mail to the Center in Urbana for distribution to member stations. Harley also secured letters pledging support from both presidential hopefuls, Richard M. Nixon and John F. Kennedy, as a way of building bridges with the new administration. And among the first academic projects to come out of this period was the commissioning of Marshall McLuhan to prepare a report on the new media's role in the future of education. The book resulting from that project, *Understanding Media*, remains one of the most influential mass communication publications of the 20th century.

NAEB leaders had long advocated that the association should be more of a professional organization than a trade association in the traditional sense. The influx of individual members brought about by the merger with AERT in 1956 and the growing ranks of members from closed-circuit instructional television facilities were causing growing dissatisfaction with the existing governance structure, which was controlled by radio and television station representatives. At the 1963 NAEB convention in Milwaukee, Wisconsin, the members voted unanimously to reorganize the association into four divisions: Radio Station Division, Television Station Division, Instruction Division, and Individual Member Division. Each was to elect its own board, with the four boards comprising the NAEB Board of Directors. Offices and support staff for each of the units would be established within the national headquarters.

For radio interests, the reorganization was a major step forward. Television representatives had been exercising more and more control over the NAEB since the mid-1950s. Growing numbers of radio representatives wanted a separate organization of their own but knew full well that they did not have the resources to go it alone. The reorganization gave radio the independence it needed to chart a new course, while allowing it to benefit from the largesse of the higher television station dues. The new configuration also afforded the opportunity for a new name—National Educational Radio (NER)—while remaining under the NAEB umbrella. In the spring of 1964, the radio board appointed WUOM (University of Michigan) production manager Jerrold Sandler to be NER's first executive director. The tape exchange network—now officially named the National Educational Radio Network—remained in Urbana.

Under Sandler's guidance, NER acquired the kind of representational and leadership presence in Washington, D.C., that the radio representatives had envisioned. In addition to continuing the program exchange system, the new division became far more active on Capitol Hill, raised major grants for program and research projects, built relationships in the international community, provided a unified voice in professional circles, offered consulting advice to member stations, and distributed grants-in-aid to support special projects. During

1966–67, Sandler contracted with Herbert W. Land Associates to conduct a national study of the status of educational radio in the United States. The resulting report, *The Hidden Medium: Educational Radio*, offered the documentation needed for Sandler to lobby Congress on behalf of radio during the drafting of what had been the Public Television Act of 1967. As a direct result of Sandler's efforts, radio was written into the language during the eleventh hour, and the final legislation was called the Public Broadcasting Act of 1967.

A Forecast of Demise

While passage of this historic legislation dramatically changed educational radio and television for the better, it signaled the beginning of a transformation that would eventually mean an end to the NAEB. The Act created the Corporation for Public Broadcasting (CPB), which was charged with strengthening the newly relabeled *public* radio and television stations in the United States. This mandate led to the creation of the Public Broadcasting Service (PBS) and National Public Radio (NPR). In 1971, NPR began live national network interconnection of member stations, and the National Educational Radio Network soon merged with NPR. For a number of months, NAEB continued to represent radio stations before Congress, but by 1973, the stations had created a new lobbying and public relations organization—the Association of Public Radio Stations (APRS)—and so NAEB ceased its radio representation function. (APRS would later merge with NPR in 1977.)

Just as NPR and APRS took over the functions of NAEB's Radio Division, PBS soon acquired the functions of the Television Division. By the mid-1970s, the NAEB was again forced to undergo a major reorganization and a redirection of its mission solely as a professional organization. When Harley retired in 1975, James A. Fellows became NAEB's last president. Fellows worked tirelessly to revitalize the association and to generate a solid funding base through individual member services. A variety of public telecommunication institutes on such topics as management skills, graphic arts, instructional design, and audience research methods were scheduled throughout the country. The publications program was expanded with the creation of *Public Telecommunications Review*, a research index and reprint series, and later with the *Current* newspaper. Members were served by various professional councils, ranging from broadcast education and research to engineering and management. The annual convention afforded additional professional training opportunities and a career placement center. In short, the NAEB attempted to become the professional standard bearer for the public broadcasting industry.

Despite a herculean effort by Fellows and his ever-shrinking staff, the NAEB could not sustain itself as an organization supported solely by individual members. At its final convention at the Hyatt Regency Hotel in New Orleans on 3 November

1981, NAEB board chairman Robert K. Avery recalled the association's important accomplishments over the preceding 56 years. With the vote taken to declare bankruptcy, he brought down the final gavel and dissolved the organization.

National Association of Educational Broadcasters Tape Network

Early Program Exchange for Educational Broadcasters

The National Association of Educational Broadcasters (NAEB) Tape Network was the first formal agreement among educational broadcasters to allow for the exchange of programs for rebroadcast. This system was important because it provided for the sharing of much-needed program materials between financially strapped broadcast stations across the United States.

Origins

In the 1930s a growing concept of educational broadcasting was developing at a few scattered stations, most of which were loosely affiliated with colleges and universities. Representatives held annual conventions, which led to formation of the Association of College and University Broadcasting Stations, predecessor to what became the NAEB. The group's primary purpose was to persuade the government to set aside radio channels for state, college, and university operated stations. Another goal was to develop a mechanism for program exchange.

These broadcasters watched the successful sharing of programming taking place in commercial radio through the National Broadcasting Company (NBC) Red and Blue networks and the Columbia Broadcasting System (CBS). A network for educational radio was discussed but was dismissed as too costly; an idea for a script exchange met with little enthusiasm. A few stations did exchange scripts, but few of these exchanges resulted in produced programs.

In 1932 NAEB secured a \$500 grant from the National Advisory Council on Radio Education and purchased a wire recorder. The device was to be circulated among stations for recording programs for air. In 1949 the director of New York's municipal station WNYC, Seymour Siegel, made five sets of recordings of the *Herald Tribune Forum* and distributed them to 22 NAEB member stations throughout the year. This event marks the start of what was labeled a "bicycle" (mailed tape exchange) network.

Postwar Developments

In 1950 NAEB was able to secure more funding, this time from the Kellogg Foundation. The purpose of the grant was to support a systemized national noncommercial education and culture tape network to serve the growing demand for educational radio programming. The exchange system delivered programming from the British Broadcasting Corporation (BBC), the Canadian Broadcasting Corporation (CBC), and domestic stations and production centers. In its first year, what became the National Educational Radio (NER) network mailed over 500 hours of programming to 52 NAEB member stations coast to coast.

A network headquarters was established in Urbana, Illinois. Programs were duplicated on high-speed equipment. A fee was established for member stations, and within five years, the organization was modestly financed but self-sustaining. By 1967 it was estimated that the network distributed some

35,400 hours (more than 80 million feet of tape) of educational radio programming in the United States on a budget of less than \$60,000.

Sample bulletins from the early years of the tape exchange demonstrate diverse program offerings. Program topics included physical sciences ("The Impact of Atomic Energy"), social sciences ("Woman's Role in Society"), mental and physical health ("The Effects of Smoking"), and arts and literature ("The Alabama String Quartet"). Children's programming was a category listed in early bulletins, but specific examples are difficult to find. Networks supplied their affiliates with tapes to be used in local schools as well. Subject matter for kindergarten through 12th grade included science, foreign languages, guidance, language arts, music and art, safety and health, and social studies.

Most of the programs distributed by the tape network in return for the regular affiliation fee consisted of offerings from individual affiliates. Production costs for these programs were generally covered by the local stations. Some stations enhanced programs with modest grants from organizations such as the National Home Library Foundation and the Johnson Foundation.

The network also delivered some special programming to affiliates at no additional cost. For instance, a 30-minute *Special of the Week* produced out of the University of Michigan featured addresses by national and world leaders on public affairs. In addition, an 11-program series by WGBH Boston (*A Chance to Grow*) examined how families dealt with critical changes in their lives. The series featured interviews with families and was produced with the aid of grants and contributions. The government also provided some "no-charge" programs, such as a panel discussion from a conference held by the Selective Service System at the University of Chicago. And finally, the Library of Congress had a special arrangement with the tape network to allow the network to distribute certain readings and lectures given by the library.

Programs were also provided to affiliates from a wide variety of international sources. Regular contributors to the network included the BBC (*Transatlantic Forum*, *The World Report*, and *Science Magazine*), Radio Netherlands, Berne, Italian Radio, UNESCO, and the CBC, among others.

While the tape exchange network was still in a growth mode, educational broadcasters were still pushing for a more permanent way to exchange programming—a real network. In September 1965 some 70 NER stations linked together for a historic live interconnection to broadcast three hours of German national election results coverage.

In 1966 at a NER conference (The Wingspread Conference), 70 leaders from the industry, government, the academic community, philanthropy, and the arts came up with a seven-point plan for developing educational radio that included a national production center and the use of communications satellites for transmitting noncommercial programming. A concrete step toward centralized programming was made in March 1967 when NER set up a Public Affairs Bureau in Washington. However, a centralized network was yet to come. During the Carnegie Commission's study of 1965–67, the need for an interconnected educational radio system was again stressed. The Public Broadcasting Act (1967) that followed set the stage for the development of that network. In the years following the passage of the act, educational broadcasters met to plan the network. Finally, on 3 May 1971, the goal of national programming distribution sources for noncommercial radio broadcasters was realized, when National Public Radio premiered its first live show—*All Things Considered*. Other programs and a satellite interconnect to allow members to share programming would follow. Educational broadcasters no longer had to duplicate and mail tapes to deliver shared programs to the public.

National Barn Dance

Country Music Variety Program

Although the *Grand Ole Opry* is best remembered because it survived far longer, the WLS *National Barn Dance* before World War II ranked as America's most popular country music program. After being picked up by the National Broadcasting Company (NBC) network in 1933, and sponsored and supported by Miles Laboratories' Alka-Selzer, the WLS *National Barn Dance* became a Saturday night radio network fixture.

The show's long time home was WLS-AM, a pioneering and important station in Chicago, named by owner Sears-Roe-

buck to herald itself as the "World's Largest Store." First under Sears, and then after 1928 with new owner *Prairie Farmer* magazine, the focus of this clear channel station was always the rural American. Clear channel status made WLS-AM a fixture in homes throughout the Midwestern farm belt.

Originally called the *WLS Barn Dance*, by 1930 the program had expanded to fill WLS's Saturday nights. When the NBC Blue network began on 30 September 1933 to run a portion, sponsored by Miles Laboratories' Alka-Seltzer, the pro-

WLS National Barn Dance Cast, 1944

gram was renamed the *National Barn Dance*. Though NBC varied the program's length (from 30 to 60 minutes and back, again and again), from 1936 to 1946, the network always penciled the *National Barn Dance* on the schedule starting at 9 P.M. on Saturday nights. Indeed, in 1940 when NBC picked up the *Grand Ole Opry*, the *National Barn Dance* was already a network fixture, signaling to all who paid attention to radio industry trends a growing interest in the "hillbilly" musical form.

The statistics were impressive. For example, on 25 October 1930 nearly 20,000 fans poured into Chicago's massive International Amphitheater for a special performance, and an estimated 10,000 had to be turned away. The popularity peak of the *National Barn Dance* came during World War II, but after the war the *Opry* surpassed its predecessor in ratings, and the shift to Nashville was underway. NBC dropped the *National Barn Dance* in 1946.

But in its heyday, beginning with a move in 1932 to the Loop's Eighth Street Theater, the success of the *National Barn Dance* could literally be seen as crowds lined up for precious Saturday night tickets and regularly filled the theater's 1,200 seats for two shows. Stars included those remembered by country music historians (Bradley Kincaid, Arkie the Arkansas Woodchopper, and Lulu Belle and Scotty) and those who would help define popular culture of the 20th century (Gene Autry).

Bradley Kincaid was one of country music's first popular sellers. He was a student in Chicago in 1926, having moved there from his native Kentucky, when a friend suggested he try out for the hillbilly show on the radio. Kincaid borrowed a guitar, practiced a few ballads he had learned from his family, and soon was a star. His name is usually lost in country music history, but Kincaid helped define the genre as it emerged during the 1920s and 1930s.

Missourian Luther Ossenbrink renamed himself "Arkie, the Arkansas Woodchopper" when he arrived at WLS in the middle of 1929 after some experience on the radio in Kansas City. While playing the fiddle, guitar, or banjo, he sang and told cornball jokes. Sears executives must have loved his favorite song, "A Dollar Down and a Dollar a Week."

Although the husband-and-wife singing duo, Lulu Belle and Scotty (Wiseman), who appeared from 1935 through 1958, may have been the *Barn Dance's* most enduring act, to the world Gene Autry symbolized the star-making power of the *National Barn Dance*. Autry appeared during the early 1930s as the "Oklahoma Yodeling Cowboy," but when his "Silver Haired Daddy of Mine" became a hit, he was off to Hollywood and became part of radio legend.

Following NBC's dropping of the *National Barn Dance*, the program reverted to again being a local show until 1949, when the American Broadcasting Companies (ABC) radio network, sponsored by the Phillips Petroleum Company, picked up the

show. The ratings on ABC were anemic, and so by the mid-1950s the *National Barn Dance* was a faded memory for everyone except the aging Chicagoans who continued to embrace its radio and television versions. The Eighth Street Theater closed on 31 August 1957, and WLS abandoned it.

In 1960, many of the former *National Barn Dance* regulars appeared on Chicago's WGN-AM under the name *WGN Barn Dance*. But after the Tribune Company, the owner of WGN, syndicated the show for television in the 1960s with limited success, Tribune executives closed the show for good in 1971.

National Broadcasting Company

While now focused on television, the National Broadcasting Company (NBC) was the first purpose-built national radio network, although it continues as such today in name only. Begun with an emphasis on public service program orientation, NBC became a very profitable commercial venture that helped to dominate—and define—radio's golden age.

Origins

The origins of NBC lie in the extensive political and legal maneuvering of its parent company, the Radio Corporation of America (RCA), in the 1920s. One member of the RCA group, AT&T, found its phone lines could be used not only for remote broadcasts but could also connect stations together in a "chain" or network. AT&T announced the formation of 38 "radio telephone" stations linked by telephone lines, the purpose of which was not to provide programming but rather to "provide the channels through which anyone with whom it makes a contract can send out their own programs," an arrangement that soon became known as "toll broadcasting."

But RCA was operating its own New York City station as well. WJZ began operations as a Westinghouse outlet in 1921 but was purchased by RCA two years later. Unlike AT&T, RCA's interest in the medium was based on its desire to sell more receivers, the assumption being that entertaining programs would result in the sale of more sets. Thus, by 1923 there were two factions battling for control of radio: the "Telephone Group" led by AT&T and Western Electric, and the "Radio Group" consisting of RCA, General Electric (GE), and Westinghouse. AT&T sold its interest in RCA when conflict became inevitable and refused to allow any station aligned with the Radio Group to use its telephone lines to establish a network.

With the threat of government intervention looming, it was left to RCA General Manager David Sarnoff to broker a compromise. He proposed that "all stations of all parties [be put] into a broadcasting company which can be made self-supporting and probably revenue-producing, the telephone company to furnish the wires as needed." This marked the creation of NBC, which began operation in November 1926 with Merlin H. Aylesworth, former managing director of the National Electric Light Association, as president. Although ownership of NBC was originally divided among RCA, GE, and Westinghouse, AT&T profited the most, since it controlled the wires that would eventually connect thousands of stations nationwide (a franchise that would be extended even further with the introduction of television). In short, AT&T got to keep the toll without having to worry about the broadcasting.

Consolidation and Growth

NBC immediately adopted the practice of toll broadcasting by selling studio space and a time slot—"four walls and air" in trade lingo—to interested advertising agencies and their sponsor-clients. RCA also decided to operate two NBC networks, with WEAJ as the flagship station of NBC-Red and WJZ anchoring NBC-Blue (the colors apparently derived from either the company's color-coded program charts or the pencil lines AT&T engineers drew to map the wire paths for the two networks).

NBC grew rapidly in size and profitability. In 1927 the network had 48 affiliates, including both the Red and Blue networks, and lost almost \$500,000 in net income; by 1932—when RCA assumed complete ownership of the network—it had 85 affiliates and pretax profits of \$1.2 million.

As both networks grew, so did the interest of advertising agencies and sponsors, who saw network radio as an increasingly effective way to reach a national audience of consumers. Fortunately for advertisers, the ability to reach a mass audience with radio intersected with an expansion of the American economy in the 1920s. In 1929 Merlin Aylesworth proclaimed that radio was "an open gateway to national markets, to millions of consumers, and to thousands upon thousands of retailers."

Soon, major advertising agencies were enthusiastically embracing the new medium, a revolution that was not dampened by the Great Depression. The NBC schedule in the 1930s was dominated by shows named for their sponsors, such as *The Chase and Sanborn Hour*, *Cliquot Club Eskimos*, and *Maxwell House Showboat*. By the early 1930s, the economic structure that would dominate radio for the next 20 years had emerged. The networks learned to be the middleman, selling time to advertising agencies that produced the commercial shows on behalf of paying sponsors, while their affiliates were responsible for developing a rapport with local audiences.

Throughout the decade, NBC continued to flourish. A sharper distinction between the Red and Blue networks came into focus. NBC-Red was home to the most popular programs, including *Fibber McGee and Molly*, *One Man's Family*, and *Amos 'n' Andy*, as well as such stars as Bob Hope, Jack Benny, and Fred Allen. Not surprisingly, it accounted for most of NBC's profits. NBC-Blue, on the other hand, was somewhat schizophrenic in character, as it was the home of cultural programming of the highest quality—the *NBC Symphony* led by Arturo Toscanini chief among them—but also was the dumping ground of sustained (unsponsored) programming that as often as not placed fourth in the ratings behind NBC-Red, CBS, and the less successful (after 1934) Mutual Broadcasting System. Still, Blue served as something of a loss leader for

RCA, as it was frequently touted by the company as a prestigious public service. Blue also allowed NBC to cultivate a reputation superior to that of CBS, which was always a special consideration for David Sarnoff.

NBC's economic strength derived almost wholly from its affiliate relationships. In 1932 the network initiated a plan to pay its affiliates a fee for every network-originated, sponsored program that the affiliate carried on its schedule. In return, the affiliate agreed to purchase NBC's sustained programs at a rate lower than what the station might typically produce in-house. This a la carte system still allowed the affiliates some freedom to pick and choose among the various network offerings, and although many of the larger stations objected to what they considered an inadequate reimbursement for their time costs, the arrangement allowed NBC to provide nationwide coverage to paying advertisers. However, both NBC and CBS continued to extract more concessions from their affiliates throughout the 1930s, knowing there was no shortage of local stations eager to accept whatever demands the networks might place upon them. As a result, government intervention became almost inevitable.

Report on Chain Broadcasting: 1941

Although the economic structure of commercial broadcasting was consolidated in the early 1930s, its regulatory parameters were slightly more fluid. In March 1938 the Federal Communications Commission (FCC) initiated an investigation into all phases of the broadcast industry, primarily at the instigation of the Mutual Broadcasting System. Mutual complained to the FCC that it was unable to expand into a national operation because NBC and CBS had affiliation agreements with more than 80 percent of the largest radio stations in the country.

The result of that inquiry, the 1941 *Report on Chain Broadcasting*, was highly critical of the network-affiliate relationship, and the regulations derived therein signaled the beginning of an on-going battle between broadcasters and the government over monopoly practices. To NBC and CBS, the rules set by the *Report* threatened to undermine the very structure of the broadcasting industry.

Most crucial among these were the establishment of strict limits on the length of affiliation contracts; the loosening of affiliation ties by allowing stations to broadcast programs from other networks or sources; the power of affiliates to reject network programs if the stations felt the offering was not in the public interest; and, most dramatically, the abolition of the practice of "option time."

This provision struck directly at the heart of network operations, and NBC, CBS, and Madison Avenue howled in protest. Option time was a standard feature of every affiliation contract, giving the network the legal right to preempt a station's schedule for network programming. CBS affiliates

agreed to give up their entire broadcast day if the network demanded it; NBC was slightly less stringent, asking for options on eight and a half hours a day, including the profitable 8 to 11 P.M. evening block. The stations were compensated for all hours claimed by the networks at a rate adequate to cover the loss of potential sales to local advertisers (these local rates were set by the network as well, a procedure also abolished by the 1941 regulations). It was a profitable arrangement. The affiliates received popular national programming, relieving them of the chore of local production, and were compensated for their airtime—NBC took in three times more money from time sales than it dispensed in compensation and could guarantee advertisers a national audience.

The networks bitterly denounced the new regulations and brought suit in federal court to stop their implementation, but it was pressure from the business and advertising communities that caused the FCC to revise the chain broadcasting rules in an October 1941 supplemental report. The commission reasoned that while it remained unconvinced by the NBC and CBS contention that option time was indispensable to network operations, "it is clear that some optioning of time by networks in order to clear the same period of time over a number of stations for network programs will operate as a business convenience." As a result, the networks were permitted to maintain control over the 8 to 11 P.M. slot, the most heavily attended and profitable portion of the broadcast day. Thus, the prime-time schedule remained closed to independent and local producers on affiliate schedules.

Of more direct impact to NBC was the regulation that "no license shall be issued to a standard broadcasting station affiliated with a network organization which maintains more than one network." In other words, either Red or Blue had to go. Despite some public grumbling, RCA was not entirely unhappy with this ruling, having long considered the sale of Blue as a possible source of financing for television activities. Still, NBC filed suit in federal court challenging the Chain Broadcasting rules, but in May 1943, the Supreme Court ruled for the FCC in *NBC v the United States*. Five months later, RCA sold the Blue Network to Life Savers magnate Edward J. Noble for \$8 million. The sale provided RCA with a cash infusion with which to prepare NBC-TV for an anticipated boom following World War II and led to the formation of the American Broadcasting Company (ABC) in 1945.

NBC Radio and the Emergence of Television

The immediate postwar era was enormously profitable for radio as pent-up consumer demand, combined with a shift from military to domestic manufacturing, unleashed a spectacular buying binge. However, television loomed on the horizon, and the new medium promised to have a dramatic impact on network radio. In 1945, 95 percent of all radio stations were

network affiliates; in 1948—the year NBC, CBS, and ABC began seven-day-a-week television broadcasting—the figure was 68 percent and dropping fast.

Ironically, the end of network radio as a source of major entertainment was hastened by the CBS “talent raids” of 1948–49. In order to attract NBC’s biggest radio stars, CBS designed a clever finance mechanism that had the practical effect of placing performers under long-term contract to the network. It was an elegant scheme: radio stars (who were otherwise taxed at personal income rates of up to 75 percent) would incorporate themselves and, in turn, license their company to CBS. The amount paid by CBS would be considered a capital gain and taxed at 25 percent. As a result, NBC performers left the network in droves for CBS, starting with Amos ‘n’ Andy creators Freeman Gosden and Charles Correll in September 1948, soon followed by Jack Benny, George Burns and Gracie Allen, Red Skelton, Bing Crosby, and Edgar Bergen.

The talent raids certainly paid off for CBS in terms of income (a profit increase of almost \$7 million), more successful programming (12 of the top 15 radio shows in 1949), and tangential publicity. Most important, radio provided both the financial and programming foundation for the network’s television operation. Every star brought over in the talent raids eventually appeared on CBS-TV, draining resources away from NBC.

As television continued to attract an increasingly larger audience, major advertisers rapidly left radio and moved their dollars into the new medium. By the early 1950s, the trend toward television was readily apparent. Fewer and fewer network-originated radio shows were made available to affiliates, while the number of programs that were simulcast (broadcast simultaneously on both radio and TV) increased. By the end of the decade, stations across the country began severing their network affiliations to produce their own programming, an action unthinkable during radio’s heyday.

In 1960 NBC stopped production on its last remaining daytime radio serial, *True Story*, and thereafter existed almost solely as a news feed to subscribing stations. In 1986 RCA (including NBC) was purchased by GE (in a sense returning to its original owner), and that same year the network formally split its broadcasting divisions. NBC Radio was then sold to radio conglomerate Westwood One, which continues to maintain “NBC Radio Networks” as a separate brand, although in reality the network has no journalistic responsibility for newscasts labeled as “NBC.”

National Federation of Community Broadcasters

Member Organization of Community Radio Stations and Producers

The National Federation of Community Broadcasters (NFCB) is a membership organization representing more than 200 radio stations in the United States; it provides legal, technical, and logistical support for community-oriented, educational, and noncommercial broadcasters. Under its leadership, the community radio sector of U.S. broadcasting has emerged as a viable service in major urban centers and rural communities across the country.

In 1973 a group of dedicated community broadcasters met in Seattle to consider the possibilities of coordinating their efforts and promoting community radio throughout the United States. Two years later, in the summer of 1975, the National Alternative Radio Conference (NARK) convened in Madison, Wisconsin. The conference participants—an assortment of radio enthusiasts, artists, musicians, and community activists from across the country—resolved to form a national organization that would represent the interests of community broadcasters before the U.S. Congress and federal regulators. Within a matter of months, the newly formed NFCB located its headquarters in the Washington, D.C. apartment of two of the conference organizers, Tom Thomas and Terry Clifford. From these humble beginnings, the NFCB began its lobbying efforts in support of community-oriented radio. From the outset, the NFCB had two goals: to influence national broadcast policy-making and to secure federal grant money to support this new, locally oriented radio service.

Central to the NFCB's mission is enhancing and increasing diversity in radio broadcasting. Throughout its history, the NFCB has placed special emphasis on opening up the airwaves to women, people of color, and other cultural minorities whose voices are largely absent from mainstream media. In this way, the NFCB promotes volunteerism, supports localism, and encourages the development of programs and services specifically designed to address the needs and interests of underserved audiences. For example, community volunteers program music and public-affairs programming on WFHB in Bloomington, Indiana; WVMR is the only broadcast service for people living in the isolated region of Pocahontas County, West Virginia; and member station KBRW provides multilingual programming for native peoples in Alaska's North Slope region.

In addition, the NFCB provides all manner of technical and logistical support for community broadcasters. To that end, the NFCB has developed training materials that outline the procedures for license applications, describe the use of broadcasting equipment, and offer practical suggestions for enlisting local community support. Some of these publications

include *The Public Radio Legal Handbook*, a reference guide to broadcast regulations; *Audiocraft*, a textbook on audio production techniques; and the *Volunteer Management Handbook*, which provides useful strategies for securing and maintaining an enthusiastic volunteer base. Crucially, the NFCB also provides the legal and engineering expertise necessary to successfully secure a broadcasting license from the Federal Communications Commission (FCC). Moreover, through its monthly newsletter, *Community Radio News*, and its annual conventions, the NFCB continues to keep its member stations abreast of ongoing policy debates, new funding initiatives, and the latest technological innovations. Finally, the NFCB established the Program Exchange service in recognition of the need for new and existing stations to round out their broadcast schedules. This scheme encouraged community broadcasters across the country to trade tapes produced by member stations as well as programming developed by independent producers. Not only did this service help offset the costs associated with program production, it had the added benefits of creating an informal network between community stations and helping to define community radio's national identity.

Under the auspices of the NFCB, the community radio movement of the late 1970s challenged the conventions of commercial radio, forever changing the landscape of U.S. broadcasting. The NFCB successfully lobbied the U.S. Congress, regulatory bodies, and government funding agencies to support noncommercial broadcasting in general and community broadcasting in particular. Most important, perhaps, in its commitment to community access, control, and participation, the NFCB popularized listener-supported radio. This model, first championed by Lewis Hill and the Pacifica stations, encourages community residents to become involved in every aspect of the local radio station: management, governance, finance, promotion, and production. Like the Pacifica stations and those associated with Lorenzo Milam's KRAB nebula, NFCB member stations seek to enhance radio's role in the civic, cultural, and social life of the community. Unlike commercial radio, which shies away from innovative and controversial programming, NFCB member stations encourage local cultural expression and support community activism.

Over time, as the organization's influence with industry leaders and policy makers grew, the NFCB became firmly entrenched in the Washington establishment. As a result, the NFCB's fortunes became linked to those of National Public Radio (NPR) and the Corporation for Public Broadcasting (CPB). For a time, this relationship proved beneficial to both

parties. For example, in 1982 the NFCB organized the first Minority Producers Conference, which was instrumental in diversifying the staff at public and community radio stations across the country. However, the NFCB's relationship with the CPB has been a source of controversy among some community radio advocates. For instance, the NFCB and NPR supported the FCC's 1978 termination of 10-watt Class D stations, a prohibition that has fundamentally altered the character of community radio in the United States and that has, more recently, prompted the rise of the so-called microradio movement.

Over the past decade, community radio stations have grown increasingly dependent upon CPB funds, such as the Community Service Grant, to support their efforts and improve their services. However, the eligibility requirements for these funds were far beyond the means of small stations with modest resources. As a result, these stations were confronted with the unpleasant choice between shutting down or hiring professional staff to generate income, produce or acquire more "polished" programming, and oversee the station's daily operation. This condition seriously undermines community participation and has led to the "professionalization" of community radio. In recent years, some community stations have become little more than supplemental outlets for the nationally produced programming of NPR, effectively consolidating the public radio sector and eliminating community radio's greatest strength: its localism. Furthermore, the NFCB's Healthy Station Project, with its emphasis on attracting upscale demographics to community stations, has been sharply criticized for its chilling effect on community radio's news and public-affairs programming and the attendant homogenization of music and cultural fare.

Following a period of considerable internal unrest and organizational restructuring, the NFCB moved its headquar-

ters to San Francisco in 1995 and began sharing its operation with Western Public Radio, a not-for-profit radio training and production center. In 2002, NFCB relocated again, this time across the bay to Oakland. With new offices, facilities, and staff, NFCB launched exciting new initiatives, most notably the National Youth in Radio Training Project.

National Public Radio

U.S. Noncommercial Radio Network

National Public Radio (NPR) is the U.S.'s largest public radio producer and distributor, providing more than 100 hours of news and cultural programming each week to more than 600 member stations. The network is probably best known for its drive-time newsmagazines, *Morning Edition* and *All Things Considered*, but it produces a wide range of radio fare, including music and cultural programs, such as *Performance Today* and *Jazz Profiles*, and the nationwide call-in program *Talk of*

the Nation. In the course of its 30-year history, the network has won virtually every major broadcast award and has figured prominently in the nation's political and artistic life.

Origins

Public radio in the United States had its origins in the 1920s, when low-budget community and college stations sprang up

around the country. Hundreds of such stations took hold in the early, unregulated days of radio, but not many of these “educational stations” survived the Depression, especially as commercial broadcasters saw radio’s potential as a vehicle for mass-market entertainment and lucrative advertising.

The National Association of Educational Broadcasters (NAEB) argued that educational stations could not compete for spectrum space with commercial giants such as the National Broadcasting Company (NBC) and the Columbia Broadcasting System (CBS). In 1945 the NAEB convinced the Federal Communications Commission (FCC) to allot the low end of the radio dial to educational broadcasters, winning 20 FM channels, from 88 to 92 megahertz. The allotment gave educational radio the stability to build up a small but hardy core of stations.

The Public Broadcasting Act

By the early 1960s, educational broadcasters were exploring the possibility of networking to help fill their program days. Don Quayle, the first president of NPR, recalls “there was a general feeling, both in television and in radio, that no single station had the resources to do the quality of programming we wanted.” Quayle helped link up educational radio and television networks in the northeastern United States that were among the precursors of NPR.

Those networks lacked the resources to do much more than instructional broadcasting until the mid-1960s, when President Lyndon Johnson called on the Carnegie Foundation to look into the possibility of a federally funded broadcasting system. After a two-year study, the Carnegie Commission firmly backed the idea of federal funding, but it envisioned a far wider focus, distinguishing between educational and *public* broadcasting.

The commission offered 12 recommendations for the new service, including public-affairs programming that sought insights into controversial issues, diversified programming in which minorities were represented, and coverage of contemporary arts and culture. The commission’s recommendations dealt only with television, but President Johnson, a successful radio station owner himself, was sympathetic to radio advocates who fought to be included. Critics argued that adding hundreds of weak and needy radio stations to the measure would dilute the federal funding and drag the whole project down. Supporters pointed out that radio could offer more services than television at a far cheaper cost.

Congress passed the Public Broadcasting Act in October 1967 and included radio, but the funding available to the newly formed Corporation for Public Broadcasting (CPB) quickly dwindled from a proposed \$20 million to \$5 million. Without financial support from the Carnegie Commission, CBS, the Communications Workers of America, and the Ford

Foundation, CPB would not have been able to fund much programming.

In 1969 CPB sponsored a conference in San Diego that laid the foundation for National Public Radio, an entity that, unlike its television counterpart, the Public Broadcasting Service, would produce as well as distribute programs. The corporation invited Bill Siemering, then the station manager of WBFO in Buffalo, New York, to help conduct the discussion. Siemering had already articulated a vision for the service in an essay called “Public Radio: Some Essential Ingredients,” in which he argued that public radio should be “on the frontier of the contemporary and help create new tastes,” but that it also had to meet the information needs of the public.

Don Quayle was chosen as the organization’s first president, not long after he had made a presentation to the Ford Foundation showing that he could interconnect all the qualified public radio stations “for less than [New York public station] WNET spent on television.” Quayle hired Bill Siemering as the network’s first program director and set him to work on what was to be its first regular program, *All Things Considered*.

National Public Radio Goes On the Air

National Public Radio was incorporated on 26 February 1970 with 90 charter stations. The network set up offices and studios in Washington, D.C., closer to the heart of the nation’s politics than the big commercial networks, which had long been based in New York. NPR officially went on the air in April 1971, offering live coverage of the Senate hearings on Vietnam. Less than a month later, on 3 May 1971, the network aired its first edition of *All Things Considered*. Siemering, who directed the first program himself, recalls that it got off to a “rocky and exhilarating” start, with host Robert Conley unable to hear the cues in his headphones. But as to content, it fulfilled practically all the elements that Siemering had outlined. The program went on the air as thousands of antiwar demonstrators filled the streets of Washington in what was to be the last major protest of the Vietnam War. Reporter Jeff Kamin brought back tape of the chanting and the sirens as police waded into the crowds of demonstrators and made more than 7,000 arrests. The same program featured a young black woman speaking dreamily about her heroin addiction. As Siemering had promised, the program transmitted “the experience of people and institutions from as widely varying backgrounds and areas as are feasible.” It spoke “with many voices and dialects.” Siemering says that it also illustrated many of the network’s goals: “using sound to tell the story; and presentation of multiple perspectives rather than a single truth.”

Over the next few months, the program took shape. Siemering found a distinctive voice and sensibility for the program and the network in Susan Stamberg, who became the

first woman to host a daily national newsmagazine. Stamberg was paired with Mike Waters and later with Bob Edwards. The network offset its limited resources and relatively inexperienced staff with a creative, conversational approach that began to gather fans. Producers at the network tried to explore the possibilities of the medium, emulating the sound-rich work of the Canadian Broadcasting Corporation (CBC) in Canada and the German producer Peter Leonhard Braun at *Sender Freies Berlin*.

During the first decade, cultural programming was a strong component of the network's output. Bob Malesky, now the executive producer of NPR's weekend programming, puts it this way: "*All Things Considered* was experimental, while concert programs gave stations the solid base to build a day's programming around, for what was still a largely conservative audience. NPR's first arts program was *Voices in the Wind*, and during its five-year life span (1974–1979), it was second only to *All Things Considered* in station usage." NPR also provided stations with *Folk Festival USA* (1974–79) and *Jazz Alive* (1977–83), both the work of producer Steve Rathe. In 1982 the network launched the *Sunday Show*, a five-hour cultural newsmagazine that won a Peabody Award for its first year but, like *Jazz Alive*, fell victim to the NPR financial crisis in 1983.

Expanding Role

For its first five years, NPR functioned primarily as a production and distribution center for its member stations, which had grown over the years to 190. The network took on a bigger role in 1977, after a merger with the stations' lobbying organization, the Association of Public Radio Stations. Don Quayle had left the network in 1973 to become a senior vice president at CPB, and the merger took place under President Lee Frischnecht. NPR offered member services, including training, management assistance, and help with program promotion. The network also began representing the member stations' interests before Congress and the FCC.

The network gained a great deal more national visibility under its third president, Frank Mankiewicz, who was hired in 1977. Mankiewicz came to the job from a background in freelance journalism and politics. He had been Robert Kennedy's press secretary during the presidential campaign that ended with the senator's assassination in Los Angeles, and he had managed the presidential campaign of Senator George McGovern. He had barely heard of NPR. He recalls that he got the job after promising the board that he "would do whatever was necessary so that people like me will know what NPR is."

Mankiewicz's first coup was getting permission for NPR to do live coverage of the Panama Canal debate in the Senate in 1978. It was the first live broadcast ever from the Senate floor.

He chose NPR's Senate reporter, Linda Wertheimer, to anchor the coverage, despite complaints from station managers who worried that a woman would sound "too shrill."

Mankiewicz also fostered the network's longtime goal of offering a morning program service. When *All Things Considered* was first conceived, many public radio stations were not even on the air in the mornings. Bill Siemering says he felt that a new staff creating a new kind of program needed to work together on the day's news, without having to contend with the problems of preparing a program overnight, so the network's flagship program was designed for afternoon drive time. But the network was well aware that radio's biggest audience was in the morning, and NPR was eager to reach it. Mankiewicz also believed that if listeners tuned to an NPR program in the morning, there was a good chance the dial would remain there the rest of the day.

Mankiewicz says he saw his chance to start a morning program when CPB President Henry Loomis offered him a big chunk of money. Loomis pointed out one day that CPB, unlike most federally funded agencies, received its appropriation in a lump sum at the beginning of the fiscal year. That meant that the money accrued a lot of interest in the course of the year, about \$4 million. Loomis, a radio fan, asked Mankiewicz what he would do with that money if he got it. "I'd use it to start a morning radio program." Loomis liked the idea and put up the money to start *Morning Edition*, which went on the air in November 1979. After the member stations roundly rejected a pilot version of the program, Bob Edwards was lured from his position as *All Things Considered* cohost with Susan Stamberg to take over *Morning Edition* on a temporary basis. Edwards stayed on, and the program became a hit.

Morning Edition marked an important departure in program style for the network. Whereas *All Things Considered* flowed relatively freely through its 90 minutes, from beginning to middle to end, *Morning Edition* was conceived as a *program service*, structured into rigid segments that member stations could either use or replace with their own local news, weather, and traffic reporting. The success of the *Morning Edition* format led many station managers to lobby for similar changes in the afternoon program, changes that the producers resisted until the mid-1990s.

The demands of providing material for two major programs each day also forced a significant change in the structure of the organization. In the early years, all reporters and producers worked directly for *All Things Considered*, tailoring their work to the eclectic and free-flowing style of that program. The advent of *Morning Edition* meant that the same reporters had to write and produce for the more rigid time constraints of the program service as well. To avoid having reporters pulled by the conflicting demands of the two shows, the news department adopted a "desk" system like those at major newspapers. Editors with specific expertise and experi-

ence set up a national desk, a foreign desk, a science desk, and so on. Reporters now worked for NPR news, rather than for a particular show.

In 1980 the network made a striking improvement in its sound quality with the launch of the nation's first satellite-delivered radio distribution system. Overnight, the programs went from the tinny, telephone quality of a 5 kilohertz phone line to the clarity and intimacy of the studio. Mankiewicz likes to joke that he told the technicians to add a bit of static to the broadcast for the first few days, "to lend an air of verisimilitude" to the otherwise too-perfect sound. The satellite also expanded the network's delivery capacity from a single channel to four, allowing stations to choose alternative programs without having to wait for the tapes to arrive in the mail.

The satellite meant that listeners could hear complex, skillfully layered sound without the degradation of telephone lines, and it cleared the way for the golden period of NPR documentaries. In 1980 the network broadcast a 13-part series by former *Voices in the Wind* producer Robert Montiegal called *A Question of Place*. The series used sound to bring to life the work of writers and thinkers such as James Joyce, Michel Foucault, Simone de Beauvoir, and Bertrand Russell. The following year, writer James Reston, Jr., producer Deborah Amos, and host Noah Adams used tape from the last days of the Jonestown religious cult to show how a leader's egomania led to the mass suicides of more than 900 people in Guyana. The network even branched into radio theater, with the series *Earplay*, *Masterpiece Radio Theater*, and a radio version of the George Lucas hit film *Star Wars*.

Financial Crisis

NPR was riding high and spending freely in 1983. Under Frank Mankiewicz, the network's membership had grown to more than 250 stations, and as he had promised, it was familiar to people like him, people in politics, the arts, and business. When Mankiewicz took over in 1977, the network was dependent on the federal government for 90 percent of its funding. By 1983 corporate underwriting, foundation grants, and other income had brought that figure down to around 50 percent. But the network was not in good financial shape. The network's chief operating officer, Tom Warnock, came to Mankiewicz with the news that NPR might be as much as \$2 million in debt. As Warnock delved deeper, the estimate of the debt grew, finally reaching \$9 million, a third of the network's budget. Subsequent audits revealed that NPR's accounting was so sloppy that some of the spending could not be tracked. As an example, the network had issued more than 100 American Express cards to its administrators, who ran up hundreds of thousands of dollars in bills for entertainment and travel. Teetering on the edge of bankruptcy, the network slashed department budgets and ultimately had to lay off about 100 people.

The staff of the cultural programs department shrank from 33 to 8. Mankiewicz says he could have saved the situation with an ordinary bank loan, but political differences with the CPB's leadership made that impossible. In the end, Mankiewicz resigned.

Ronald Bornstein, the director of telecommunications at the University of Wisconsin, took over as acting president, leading a rescue team of lawyers and accountants from some of the top firms in Washington. For the first and only time in its history, the network went directly to its listeners to help pay off the debt, by including a fund-raising segment in *All Things Considered*. The member stations were wary of allowing the network to raise money from among their contributors, and only about a third of them chose to carry the segments. Even so, the "Drive to Survive" brought in \$2.25 million in just three days. The balance of NPR's debt was to be paid off over a three-year period, under the terms of a loan agreement that was hammered out in often-rancorous negotiations with the CPB.

Messy and embarrassing as it was, NPR reported the story of its near-disaster as it happened. That, too, was part of Mankiewicz's legacy. "By that time, NPR had cast itself unambiguously as a news organization, so the standards of news applied to it," recalls Doug Bennet, who took over as president in 1983. Bennet says that what Mankiewicz "really did was to establish NPR in the news niche, and that was genius. Before, there was some news, but nowhere near the scale of investment or the staff." Scott Simon, then the network's Chicago bureau chief, was brought in to report on the financial crisis, interviewing beleaguered staffers and disgusted members of Congress. Bennet found himself taking over at an organization that was tense and distrustful.

Return to Stability

Bennet recalls that during his first one and a half years, he had to cut the budget eight more times, as new deficits were discovered, but he says, "I never believed that NPR would disappear." Bennet's first task was to develop a plan that would reassure the stations and Congress that NPR could be turned around.

The feud with the CPB eventually led the CPB to open up its funding process so that NPR would not be the only recipient. CPB created a Radio Fund, permitting any radio organization to apply for the money. The new funding system was approved without NPR's knowledge, to the fury of station managers. NPR had lost its funding monopoly and faced the prospect of presiding over an ever-diminishing cut of the pie. Doug Bennet recalls sitting in a bar with then-Board Chairman Don Mullally, charting out a radical and risky new funding plan on a bar napkin. The business plan, announced in February 1985, proposed giving all the CPB money to the member stations and letting them use it to acquire programming

wherever they wished. "We were saying to the stations, you can take this money and run, if you want to," Bennet says, "and for about five years, it was a much more market-like relationship." NPR's biggest competitor in that market was American Public Radio (APR).

APR was formed by a group of stations led by William Kling, the president of Minnesota Public Radio. The group had long been critical of NPR's cultural offerings and established its own network to acquire and distribute programs. APR's strongest offering was Garrison Keillor's *Prairie Home Companion*, once rejected by NPR's Mankiewicz as elitist and patronizing to middle-American values. *Prairie Home Companion* quickly became the most popular program on public radio.

Bennet says that, despite the funding pinch, he felt NPR had to prove that it could go forward. "We had to show we weren't locked in a zero-sum game, that we could invent and invest." Bennet backed the development of new programs, such as *Weekend Sunday* and *Performance Today*. The new funding scheme meant that new programs "had to be viable from a market standpoint," Bennet says. "The concept behind *Performance Today* was to showcase contemporary American performances—last night's, if possible—and to give stations a show that funders would support." The network also picked up new programs for distribution, including *Car Talk*; *Fresh Air with Terry Gross*; and *Afropop*, a review of African popular music that Bennet says "was always my proof that the NPR audience was willing to consider all kinds of music, and not just Brahms."

The new programs exemplified the deep change in NPR's mission that took place in the aftermath of the funding crisis, a change from offering listeners an alternative to being a force in the marketplace. Bennet says that NPR formally established that building its audience was an important goal, something that had been debatable in the past. Along with the funding control, stations had assumed more power over programming by refusing to buy any program that seemed unlikely to draw a significant audience in their area. The result was a gradual strengthening of the hard-news content of the magazine programs, leaving much of the network's arts and cultural programming struggling.

News took an even stronger hold as NPR's foreign desk reached out to report more and more ambitious stories. In 1986 NPR's coverage of the overthrow of Philippine President Ferdinand Marcos was more comprehensive than any of its previous reports. Cadi Simon, then the foreign editor, described the change in Mary Collins' (1993) book *National Public Radio: The Cast of Characters*, saying NPR "treated the story like an ongoing news event rather than just coming back and gathering tape." The network applied the same technique to later stories, including the Tiananmen Square uprising in China and the fall of the Berlin Wall, preparing the ground for full-scale reporting on the Persian Gulf War. Simon told Col-

lins, "The coverage of the Gulf War did not happen in a void. It came out of a network that was established, a mind-set that we had come into."

The network fielded some of its top reporters during the 1991 war, including Deborah Amos, Deborah Wang, Scott Simon, John Hockenberry, John Ydstie, and Neal Conan. Conan was among a group of correspondents who were captured and held for several days by Iraqi forces. Their reporting on the war and its aftermath—the oil-field environmental disaster in Kuwait and the Kurdish refugee crisis in northern Iraq—showed that NPR could compete with the television networks and with 24-hour cable news. It was a pattern that would be repeated throughout the decade in places such as Ethiopia, Bosnia, and Kosovo. The network's round-the-clock coverage of the war strengthened NPR's weekend programs and led to the creation of a nationwide call-in show, *Talk of the Nation*.

NPR was also establishing itself as a strong source of political news, with coverage of the presidential campaigns and political conventions. The network's top political correspondents included Linda Wertheimer, Cokie Roberts, Mara Liasson, Brian Naylor, Elizabeth Arnold, and Peter Kenyon. NPR's legal affairs correspondent, Nina Totenberg, enhanced the network's reputation with her coverage of the Supreme Court. In 1987 Totenberg broke the story that Supreme Court nominee Douglas Ginsburg had smoked marijuana while he was a professor at Harvard Law School in the 1970s. The story led to Ginsburg's withdrawal. In 1991 Totenberg reported Anita Hill's allegations of sexual harassment against another Supreme Court nominee, Clarence Thomas. Both stories put NPR squarely in the media spotlight.

Expansion

By the time it celebrated its 20th anniversary in 1991, NPR had grown to nearly 400 member stations nationwide. When Doug Bennet stepped down as president in 1993, the network had begun extending its reach around the world, with the establishment of an international service, beamed by satellite to Europe through the World Radio network in London. Over the next five years, that network evolved into NPR Worldwide, reaching more than 50 countries and territories, from Antarctica to Finland.

NPR's new president, Delano Lewis, oversaw the establishment of the NPR Foundation, designed to help insulate the network against financial crises like the one that had nearly destroyed it ten years earlier. Lewis, the first African-American to head the network, was a former telephone company executive with broad connections to the business and political communities in Washington. He expanded the network's fundraising base and strengthened relations with the member stations. In 1994 the network moved into its own building, at 635

Massachusetts Avenue in Washington, D.C. The move allowed NPR to bring all its news, production, and administrative operations under one roof and provided state-of-the-art facilities for production.

The expansion of production facilities came as NPR was returning to the creation of sound-rich, highly textured documentaries. In 1992 the network had begun *Radio Expeditions* as a joint venture with the National Geographic Society. In 1994 it premiered the 26-part series *Wade in the Water: African-American Sacred Music Traditions*.

NPR also began exploring the possibilities of the internet. The network launched its website in 1994, and the following year it teamed with the Progressive network, using RealAudio technology that allows users to hear prerecorded audio files of the programs on-line.

After a long struggle, *All Things Considered* moved to capture a bigger segment of the national drive-time audience by advancing its East Coast start time to 4:00 P.M. and expanding from 90 minutes to two hours. Although not as rigidly segmented as *Morning Edition*, the new *All Things Considered* format provided more fixed points at which member stations could insert local programming. Two years later, in 1997, *Morning Edition* also stretched its airtime, moving to a 5:00 A.M. start.

The network expanded its own programming and its program distribution in the late 1990s. NPR's *Performance Today* grew from five to seven days a week in 1996. The following year, the network introduced *Sounds Like Science* and began distributing more programs produced by member stations, including the talk shows the *Diane Rehm Show* and *Public Interest* and the sports program *Only a Game*. In 1998 NPR premiered its cross-country news quiz *Wait, Wait . . . Don't Tell Me* and a short-lived music and popular culture program, *Anthem*.

The network expanded its presence on the worldwide web in 1998, making an agreement with Yahoo!, the internet media company, to provide selected audio content to *Yahoo! News*. When new president Kevin Klose took over in 1999, the company was entering an agreement with Minnesota Public Radio to create an on-line network supplying interactive news, information, arts, and entertainment.

Klose, a former head of the government's Radio Liberty and Radio Free Europe, says he wants to bring NPR to its fulfillment as a major player in the world of news and information. He is pressing to move the network into new technologies, including satellite radio, which would allow NPR to provide some programming directly to its listeners for the first time ever, without going through its member stations. Klose says a major challenge for NPR's future will be how to become a multimedia enterprise without compromising its values.

Former President Doug Bennet sees other challenges, including the danger of commercialization at NPR, in which

underwriting credits come to sound more and more like advertising. "I think it's a terrible mistake," he says, "to give up the niche of a non-advertising entity to compete ineffectively for advertising." Kevin Klose says he wants to make sure that NPR's "content is not penetrated by commerce."

Governance and Funding

Unlike most commercial networks, NPR does not own or operate any of its member stations. The private, nonprofit corporation is a membership organization, a structure that Klose says is "at the heart of its dynamism." It is governed by a 17-member board composed of the NPR president, ten station managers elected by the membership, and six public members chosen by the board and confirmed by the member stations. The member stations are autonomous entities, most often licensed to colleges and universities or community groups. In exchange for their dues and program-licensing fees, NPR stations receive programming, professional training for staff members, help in promoting programs, and representation in Washington on issues affecting public broadcasting.

On average, member stations take about 27 percent of their programming from NPR. Local staff members produce about 48 percent of the station's program content, and another 25 percent comes from other public radio producers and distributors, such as Public Radio International.

More than 92 percent of the U.S. population now lives within reach of an NPR member station. The stations have a combined audience of some 19 million people, of whom more than 13 million listen to programming provided by the network.

The typical member station gets about a quarter of its funding from its listeners, soliciting donations with on-air and direct-mail appeals. Stations that are licensed to educational institutions generally get around 19 percent of their revenues from their colleges or universities. Corporate donors provide around 17 percent of station support, and about 14 percent comes from CPB. The remainder comes from foundations and other sources.

Although it was created with an infusion of federal money, NPR no longer receives any direct federal funding for general support. Slightly more than half of its funding comes from dues and program fees paid by the member stations. Most of the rest of its \$80 million budget is contributed by private foundations and corporations.

National Radio Systems Committee

Recommending New Technical Standards for Radio

A cooperative entity of the broadcast and consumer electronics industry, the National Radio Systems Committee (NRSC) recommends technical standards relating to radio broadcasting in the United States. It is particularly concerned with development of standards for both digital audio broadcasting and the radio broadcast data system. The NRSC was originally established in 1985 and initially investigated aspects of AM radio transmission. It has since taken on several other projects.

NRSC members are generally engineers, scientists, or technicians with in-depth knowledge of the subject being studied. They may be from companies, nonprofit organizations, or government entities. Anyone who has a business interest in the technology being investigated by the NRSC is welcome to join and participate. Meetings are held on an as-needed basis. Member organizations fund the participation of NRSC committee participants.

The NRSC receives information from a variety of sources—the companies interested in manufacturing new devices, the International Telecommunication Union (ITU) and other bodies that deal with worldwide standards, and the Federal Communications Commission (FCC). In turn, it monitors and assists with technical testing of proposed new systems.

The NRSC accomplishes its work by establishing subcommittees to focus discussion and development efforts. Two were active as the new century began—one concerning digital audio broadcasting (DAB) and the other concerning radio

broadcast data systems (RBDS, or simply RDS). In April 1998 the NRSC suspended activities of a third subcommittee (concerned with high-speed FM subcarriers) because the group had reached an impasse in its deliberations to develop a voluntary standard.

As recommendations emerge from the subcommittees, they are considered and voted upon by the full NRSC membership. These final agreements are in the form of recommendations to both industries (electronic media and consumer electronics) and to the FCC, which must issue any formal standards decisions.

The DAB subcommittee worked for several years to agree upon a final technical standard for in-band, on-channel ("IBOC") digital radio for the United States. The subcommittee also established working groups to compare and contrast two potential DAB systems (one developed by USA Digital Radio and the other by Lucent Digital Radio). By late 2002, there were two operating satellite-delivered digital radio services in the U.S., and the FCC had issued an NRSC-recommended standard for terrestrial digital radio service.

The RBDS subcommittee originally approved RBDS standards in 1993 and last revised and updated them in 1998. Largely based on the European system, the RBDS signal is a low-bit rate data stream transmitted on the 57-kilohertz subcarrier of an FM radio signal. Radio listeners know RBDS mostly through its ability to permit RBDS-equipped radio

receivers to display station call letters and search for stations based on their program format. In addition, special traffic announcements can be transmitted to RBDS radios as well as weather or other emergency alerts.

National Religious Broadcasters

Trade Association

The National Religious Broadcasters (NRB) is a trade association of more than 1,200 Christian radio and television stations, most of which broadcast from an evangelical Protestant perspective. Full membership in the NRB is granted to those who meet financial accountability standards and sign a seven-point "Statement of Faith." The organization has grown from a small group of separatist broadcasters in the 1940s to a professionally staffed organization with both political and spiritual influence.

Origins

By the 1940s, radio airtime had become so valuable that commercial non-religious stations began placing preachers in Sunday morning time slots. Networks preferred to offer organized religious groups "sustaining," or free, airtime to meet government requirements for religious or public affairs programming. Time was offered to organizations representing Roman Catholics, Jews, and mainline Protestants through the Federal Council of Churches (later known as the National Council of Churches). However, evangelical churches, such as the Southern Baptists and the Assemblies of God, were not members of the mainline Protestant organization and were not allowed to share in the free air time.

Disgruntled evangelical broadcasters joined churches, parachurch ministries, and educators in the 1942 formation of the National Association of Evangelicals (NAE). Two years later the NAE chartered the formation of the National Religious Broadcasters to address more specifically the concerns of evangelical radio stations and programs. The NRB grew to become independent of the NAE, although the two groups remained affiliated until 2001, when the NRB voted to formally end the relationship after the NAE began accepting members who were part of the National Council of Churches. The National Association

of Evangelicals today represents over 50 denominations and 250 parachurch ministries.

The National Religious Broadcasters set up headquarters near Washington, D.C., since a major function of the organization was lobbying the Federal Communications Commission. The NRB also created a code of ethics for broadcast ministries and has provided legal advice to members. The group, however, was mostly unsuccessful in securing free broadcast time for evangelical ministries, so in the late 1940s members began to buy airtime and start their own Christian radio stations. The success of Billy Graham, Oral Roberts, Rex Humbard, and others led to an explosion of Christian programming in the 1960s and 1970s.

The NRB began holding its annual convention in Washington, D.C., in 1956, attempting to influence politicians and FCC commissioners. For more than 30 years, the annual D.C. meetings attracted thousands of increasingly vocal Christian communicators, who took credit for helping to elect born-again President Jimmy Carter and conservative Ronald Reagan (who addressed the NRB delegates). The NRB was also instrumental in influencing the government to redefine equal employment laws to allow Christian radio stations to use faith-based criteria when hiring new employees.

NRB Executive Director Ben Armstrong led the organization's growth from 1966 to 1989; over that period, the NRB quadrupled in size to include almost 100 syndicated television preachers and three major religious TV networks. The religious broadcasting audience grew from around 5 million in the mid-1960s to more than 25 million two decades later. The most successful radio member has been *Focus on the Family* with Dr. James Dobson, which started in 1977 and currently airs on more than 3,000 radio stations in 95 countries.

By the early 1980s, the NRB had become the spiritual and political voice for the estimated \$2 billion religious radio and

television industry, but the end of that decade saw a dramatic decline in the religious broadcasting industry. In 1987 former NRB member Jim Bakker, who hosted the daily *PTL Club*, resigned his radio and television ministry after it was revealed that his organization had been paying a woman to keep quiet about her sexual encounter with him. The following year brought more scandal and controversy: Oral Roberts was chastised by the media for stating that God would “call him home” if he did not raise \$8 million; Pat Robertson of the Christian Broadcasting Network briefly ran for president of the United States; and evangelist Jimmy Swaggart was accused of soliciting a prostitute. Nationally, Christian broadcasters experienced a dramatic decline in their audiences, and some lost up to three fourths of their contributions.

The NRB, accused of not properly monitoring the ethical standards of its members, responded to the crisis by strengthening financial accountability procedures and tightening membership requirements. By the 1990s, leader E. Brandt Gustavson moved the annual convention to other cities, trading the politically oriented meetings of Washington, D.C., for a more spiritual emphasis outside the beltway. By the end of the decade, religious broadcasters had stopped the decline in audience and contributions and saw a slow growth in the trust of those looking for spiritual programming. In 2002 the group ousted new president Wayne Pederson after only one month in office for his criticisms of members who were better known for their politics than their ministries. New leader Frank Wright attempted to keep NRB's spiritual focus while increasing its political influence, and President George W. Bush addressed the group's 2003 convention.

Today some major evangelical religious broadcasters are not members of the NRB because they wish to avoid the full financial disclosure required by the organization. Ministers who receive more than \$500,000 annually in donations must meet the strict standards of the Evangelical Council for Financial Accountability. Smaller ministries must still meet the NRB in-house standards, but denominational and church-sponsored broadcasters are exempt from the financial accountability requirements. Associate, non-voting memberships that do not require signing the NRB's “Statement of Faith” are available to secular organizations or mainline churches.

Religious Radio Today

“Sustaining” or free radio time is no longer given to the three major religious bodies, and mainline churches are generally unwilling to compete with the big dollars spent by evangelicals. But the current environment can be traced to the unwillingness of mainline churches to share their free time in the 1940s, forcing NRB members to buy airtime in order to get their gospel message over the airwaves. Some non-evangelical denominations are gradually budgeting for media time, and a network of Roman Catholic radio stations was started in the United States in 1999. Most Catholic broadcasters are not members of the NRB but are part of the Catholic Academy for Communication Arts Professionals.

With the fourth-largest format among commercial stations and a directory that lists over 1,600 radio stations playing religious programming at some point during the broadcast week, the National Religious Broadcasters has grown to become a significant political, economic, and spiritual organization for the evangelical Christians who use radio to spread their gospel.

National Telecommunications and Information Administration

U.S. Telecommunications Policy Agency

The National Telecommunications and Information Administration (NTIA) is a Department of Commerce agency responsible for advising the Executive Branch on matters of domestic and international telecommunications and information policy. This includes managing federal government uses of the radio spectrum, which is used for wireless microwave or satellite-based broadcasting and telecommunications.

Background

The NTIA's role today carries the legacy of the Commerce Department's radio activity, which began in the early 1900s. The cabinet-level Department of Commerce and Labor was established on 14 February 1903. Because the earliest uses of radio were both commerce and navigation based, the Department of Commerce and Labor was involved with establishing radio standards, procedures, and equipment requirements in conjunction with national navigation, ship outfitting, and lighthouse communications. The April 1912 *Titanic* disaster highlighted the need for greater commercial, government, and amateur radio standardization and regulation procedures. These were included in the Radio Act of 1912, which required radio apparatus on all passenger steamers and established a system of allocating and assigning both frequencies and licenses to commercial, government, and amateur radio operators. These administrative duties fell primarily to the Commerce Department's Bureau of Navigation.

On 4 March 1913, ten years after the creation of the Department of Commerce and Labor, President Taft signed legislation dividing the unit into separate Labor and Commerce Departments. Increasingly, the Commerce Department was called upon for research and development of radio's commercial and defense applications, including "the investigation and standardization of methods and instruments employed in radio communication," which fell primarily to the Bureau of Standards. In 1916 it developed a radio laboratory—the predecessor of the current Institute of Telecommunication Services (ITS). The Commerce Department's early radio development efforts also extended to the general public. For example, the Bureau of Standards determined standards for homemade crystal detector sets and distributed instructions for constructing them in 1922.

The second secretary of commerce, Herbert Hoover, served from 1921 to 1929. Intent on harnessing the commercial power of radio advances, Hoover convened four national radio conferences to discuss how new radio technologies and capabilities should be regulated in light of increasingly diverse

and complex demand. In 1927 a new Radio Act created a Radio Division in the Department of Commerce and an independent Federal Radio Commission (FRC). The FRC relieved the Bureau of Navigation's licensing, frequency allocation and assignment, and transmitter power output regulation duties. Enforcement oversight and technical research duties fell to the Department of Commerce's Radio Division. With creation of the Federal Communications Commission (FCC) in 1934, the Department of Commerce retained oversight of government radio spectrum allocation and technical research.

NTIA Origins

It was Executive Branch activity in the late 1960s and early 1970s, however—particularly in the Nixon administration—that resulted in the current configuration of the NTIA. An Office of Telecommunications Policy (OTP) was created within the Executive Office of the President in 1970. Under its first director, Dr. Clay Whitehead, OTP worked to coordinate federal agency concerns about telecommunication. (In one administrative response, the Federal Communications Commission formed its own Office of Plans and Policies to deal with longer-range studies, so as not to let OTP completely control that role.) OTP became involved in both electronic media questions as well as telephone industry concerns. After Nixon resigned from office in August 1974, OTP was guided by an acting director. When President Jimmy Carter took office in 1977, officials initiated a planning process to decide how to deal with OTP. Henry Geller, former FCC general counsel, headed up a team to assess what was needed and how best to accomplish that need. The result was to shift OTP out of the Executive Office of the President and to the Department of Commerce.

The NTIA was created in 1978 by merging the Executive Branch's Office of Technology Policy and the Department of Commerce's Office of Telecommunications. This merger was effected through Reorganization Plan No. 1 of 1977 and Executive Order 12046 of 27 March 1978.

Responsibilities

The NTIA's radio-related policy, technical, research, and spectrum-management functions are overseen through five offices and three staff groups.

Domestically, the Office of Policy Analysis and Development (OPAD) develops policy recommendations for the Executive Branch regarding common-carrier, broadcast, cable, digital, radio spectrum, wireless, and information technologies. It

focuses on promoting universal, affordable radio, television, and telecommunications in the public and commercial sectors and works alongside the FCC. OPAD was instrumental in developing legislation and a computerized system for auctioning excess government radio spectrum for nongovernmental use. It also gathers data and makes recommendations to encourage minority radio and television station ownership through its Minority Telecommunications Development Program. The Office of Telecommunication and Information Applications undertakes funding for new technology demonstration projects, with a specific focus on underserved public-sector areas.

The Office of Spectrum Management (OSM) oversees planning and policy strategy and implementation of federal government radio spectrum use in conjunction with its advisory Interdepartmental Radio Advisory Committee. This includes spectrum for federal government radio transmitters such as those used by the Department of Defense, the National Aeronautics and Space Administration (NASA), the National Park Service, airport communication, and public safety and emergency services. The OSM also offers technical and policy courses to interested international parties on spectrum makeup and management. The OSM deals specifically with federal government radio spectrum use, whereas the FCC deals with nongovernmental uses of spectrum; the two coordinate their activities closely.

Government spectrum applications overseen by the NTIA include defense; Voice of America facilities; radar and voice communications necessary for weather radio and flood warning services, commercial and pleasure aeronautical and maritime traffic, and weather satellite systems; and floodwater management systems and time signals. Government spectrum ranges throughout the 0- to 300-gigahertz range; at this writing, the government has more than a quarter million assignments: 43 percent for defense, 19 percent for resource management, 18 percent for public safety, 13 percent for transportation, and 8 percent for other purposes.

The Office of International Affairs provides policy and technical counsel regarding international radio frequency spectrum allocation, the Global Information Infrastructure initiative, and other issues of legal and technical standards to advance U.S. commercial interests. In this capacity, it works closely with the State Department and with such international bodies as the International Telecommunication Union, the Organization for Economic Cooperation and Development,

the World Trade Organization, the International Telecommunications Satellite Organization, the International Mobile Satellite Organization, the Organization of American States Inter-American Telecommunications Commission, the Asia Pacific Economic Cooperation Telecommunications Working Group, and the Southern African Regional Telecommunications Restructuring Program.

ITS undertakes engineering research for the NTIA. From its laboratory in Boulder, Colorado, ITS generates knowledge about domestic and international infrastructure development and enhancement, more effective use of radio spectrum, and resolving various technical concerns of federal, state, and local governments and of commercial and nonprofit industries and organizations. The Federal Technology Transfer Act of 1986 is the legal basis for any of these activities that require sharing government facilities or resources, including radio spectrum.

NTIA is a relatively small agency—about 300 people, compared to the FCC's 2,000 or more. The former concentrates on mid- and long-range policy, while the latter focuses on day-to-day licensing and related decisions. They must and do work closely together on spectrum matters. In its near quarter-century of operation, NTIA has waxed and waned in importance, often depending on the political trends and personalities of the times. Although Critics have claimed NTIA should stand for "not terribly important agency," the NTIA has performed significant duties related to radio and radio spectrum management.

Native American Radio

Native Owned and Operated Stations

Native American radio is perceived as a way to help retain the languages and traditions of the tribes as well as a method for communicating to Native Americans who speak a Native tongue exclusively. Many older Native Americans use English as a second language, if they use it at all, and are unserved by “Anglo” broadcasting stations. Native-operated stations are also seen as potential tools to help combat the negative images and false impressions of Native Americans often prevalent in mainstream society.

Origins

Hundreds of years of exploitation and oppression by non-Native Americans, mainly whites, served as the primary impetus behind the establishment of Native-controlled broadcast media. In the 1960s Native Americans resoundingly rejected the paternal rule of the “Great White Father” in Washington in favor of playing a greater role in their own affairs and destiny. In the eyes of many, an historic Native American action at Alcatraz in 1969 was another catalyst for the creation of Native-controlled radio outlets in the United States. Dozens of statements (by those occupying the island in San Francisco Bay) concerning the plight of Natives were broadcast via Pacifica’s KPFA-FM. The station loaned the Native Americans on the island a Marti transmitter to relay their messages to its studios in Berkeley, which it then broadcast live. Radio Free Alcatraz, as it was called, focused on the impoverished state of Native American affairs, demanding that attention be paid to Native American health, education, and cultural issues. From the perspective of those who occupied the tiny island, radio was the medium whereby the truth could be conveyed. It could leap barriers and roadblocks and reach the ears and hearts of the public.

The Red Power Movement was born against a backdrop of civil unrest stemming from a call by African-Americans and other minorities for equal rights. Out of this crusade came the American Indian Movement (AIM) in the late 1960s. Driving AIM was the restoration of Native pride and identity through the preservation of Native American culture and language. AIM’s primary function was to call attention to the human rights violations against Native Americans and to ensure that the Native American culture would not be exterminated. AIM’s seizure of Wounded Knee, South Dakota, in 1973, and its use of the media to dramatize the situation, raised Native awareness of the potency of electronic media, which were an integral part of the organization’s strategy to expose to the world what it perceived as gross injustices against its people.

This particular incident would be a key factor in the development of Native-controlled and operated broadcast stations.

Ray Cook, executive director of what was formerly the Indigenous Communications Association in the early 1990s, holds that AIM helped plant the seed that led to the creation of Native electronic media. In interviews with the author of this entry, he also cites the 1934 Native American Restoration Act as providing the initial interest among Native Americans in the potential use of radio to achieve a voice of their own. The Economic Opportunity Act of 1965 also helped set the stage for the creation of tribally licensed radio stations, since it permitted Native American organizations and tribes to work independent of the Bureau of Indian Affairs (BIA) while developing social, economic, and educational agendas.

The construction of the first Native-owned radio stations began in 1971 at the height of the Native American rights movement and today number over two dozen. With but one exception (CKON on the border of Canada and New York state) all Native American broadcast facilities operate under the auspices of the Federal Communications Commission. Tribal governments or local school boards typically are the principal licensees. KILI-FM in Porcupine, South Dakota, is, however, licensed to a corporation.

Patterns of Operation

Support for Native-operated stations comes from a variety of sources, chief among them the Corporation for Public Broadcasting and the National Telecommunications and Information Administration (NTIA). While the former was instrumental in launching the now defunct Indigenous Communications Association, NTIA breathed life into several Native broadcast projects through its Public Telecommunications Program. Of the 28 (figure varies due to frequent start-ups and occasional shut-downs) Native stations in the United States, only four are commercially licensed. As such they have little to do with the funding sources so vital to the existence of their broadcast brethren. The public broadcasting initiatives of the 1970s and 1980s (which made funds widely available for Native radio projects), coupled with the lack of a sufficient economic base for advertiser-supported stations in most Indigenous communities, has resulted in a predominantly noncommercial medium.

The majority of Native stations broadcast west of the Mississippi, while Alaska and New Mexico boast the largest number of Indigenous outlets. All but three Native stations have ethnically diverse or mixed staffs, while KDLG, KABR, and KCIE limit their hiring to Native Americans exclusively. However, at

this writing, only four have staffs that are less than 50 percent Native American. Most Native stations serve rural audiences with a mixture of diverse and often eclectic programming. Music is the primary programming ingredient with a host of genres, among them country, rock, jazz, and rap. Most Native stations air traditional tribal music and language programs and receive additional programming in English and Native American from American Indian Radio on Satellite (AIROS).

The future of Native American radio appears at once both bright and uncertain at the start of the new millennium. Although the continuation of government funding remains in question, the Indigenous broadcasting community is building (and plans to build) dozens of additional radio stations on reservations throughout the country, especially in the midwest and Alaska.

Netherlands

Birthplace of Broadcasting in Europe

Radio in the Netherlands began in November 1919 when an engineer named Idzerda broadcast from the Hague laboratory of his company, the Netherlands Radio Industry. He paid for the broadcast himself and with funds he raised through on-air appeals to listeners throughout Western Europe. For several years thereafter, new broadcast services proliferated, causing the minister of public works to require joint franchise applications from current and would-be broadcasters. Idzerda was almost bankrupt, and the only company to obtain government permission to lease airtime to organizations was the Netherlands Transmitter Industry. The first to do so was the Netherlands Christian Radio Association in 1924. By 1928 there were four others: Workers Radio Amateurs Association (1925), Catholic Radio Broadcasting Foundation (1925), Liberal Protestant Radio Broadcasting Association (1926), and General Radio Broadcasting Association (1928). These five services (networks) had to share time on two transmitters.

The government's position was not to operate broadcast services but to require the diverse organizations that did operate such services to air a broad range of programming for all Dutch citizens. Given the biases of the five organizations, as indicated by their names, it is understandable that a great deal of bickering and politicking went on about how each should meet its government mandate. Each organization was responsible for funding its own operations. Most did this with listener

donations and funding from parent organizations (e.g., the Catholic Radio Broadcasting Foundation received support from the Catholic Church). There were no license fees, a common funding practice in other European countries. Although there was a small amount of advertising early on, all on-air advertising ceased by 1935.

The influence of religion on Dutch society is significant, even though almost half of the Dutch population is not affiliated with any organized religion. The principal religions are Roman Catholicism, Liberal Protestantism, and Calvinism, although there are many others. The central role of these three dominant religions, along with the influence of political parties, is referred to as the "pillar" concept, with each organization serving as a pillar that supports the nation's structure.

Nazi Germany occupied the Netherlands from 1940 to 1945, during which time it controlled all broadcasting facilities and instituted a license fee, which the postwar government retained. In 1947 the five prewar organizations agreed to pool resources and form the Netherlands Radio Union (NRU). Each organization retained its autonomy but worked cooperatively with the others under the jurisdiction of the minister of education, arts, and sciences.

Experiments with television in the Netherlands began prior to World War II, ceased during the Nazi occupation, and began again in 1948. The NRU organizations agreed to finance tele-

vision from their radio revenues and from regular television service in 1951. License fees for television-set ownership were established, and television grew, creating changes in radio similar to those occurring in the United States.

Dutch society became very liberal in the 1960s, and popular music (e.g., the Beatles, the Who) spawned a proliferation of illegal (unlicensed) pirate radio stations that aired primarily rock and roll music. These stations became so rampant that the Dutch military was called in to take them off the air. All this illegal broadcasting resulted in the Dutch Parliament's giving consideration to a new form of broadcasting system that might eliminate the pillar organizations. The Broadcasting Act of 1967 retained the pillars but allowed additional groups to apply for airtime. It also created the Netherlands Broadcasting Foundation, which combined the functions of the old NRU and the Netherlands Television Foundation, the overseer for Dutch television.

Two more broadcasting organizations were created in the early 1970s: the Evangelical Organization (EO) and the Veronica Omroep Organisatie (VOO). The EO was similar to the traditional pillars, whereas VOO grew out of an outlawed pirate radio station.

Another law, the Media Act of 1987, provided for independent local radio stations to transmit at low power via cable systems and set up a regional radio system. The government maintained its involvement in regulating broadcasting. Since then, however, it has been reluctant to get involved in program matters, beyond occasional warnings.

Today, radio at the national level is facing a loss of listeners to the popular formats of local, regional, and some foreign stations delivered via satellite such as U.K.-based Sky Radio. At the national level, there are now 5 public service radio channels (Hilversum 1-5), 10 domestic commercial channels that play mostly music, and 6 commercial imported services. The regional stations include 13 public and 6 commercial radio services. There are also 356 local radio stations.

Programming on the national public service radio channels includes news and music, but each channel has a particular focus. Hilversum 1 is family oriented in addition to carrying a lot of sports. Hilversum 2 provides light entertainment and discussion shows. Hilversum 3 airs primarily popular music and commands the largest audience share (up to 15 percent). Hilversum 4 broadcasts primarily classical music and is similar to the Third Programme services in England and Germany. Hilversum 5 provides programming in several languages for cul-

tural and ethnic minorities (e.g., Turkish, Arabic, Chinese, etc.). All five are disparaged for their formality by younger listeners, most of whom prefer the commercial channels.

Most commercial competition at the national level comes from foreign pop music satellite channels (e.g., Sky Radio, Kink-FM, Radio 10 Gold) and domestic music satellite channels (e.g., Jazzradio, Radio 21, Concertradio). Similar competition occurs between public service and commercial stations at the regional level. Most local stations operate at low power with volunteer staffs and limited revenue. Many provide information and music programming for narrowly targeted local audiences.

New developments in technology and politics, including the European Union, have steered the Dutch toward a dual system combining its well-established public service radio system with a more recent but growing commercial business. The public service has a bright future, because both politicians and pillars are cooperating in cautiously adopting new technology. Thus, radio in the Netherlands, which has provided an unusual diversity of original programming for such a small country, is likely to continue to do so.

Network Monopoly Probe

Landmark Policy Decision

Under pressure from many political figures and a fledgling network having trouble competing, the Federal Communications Commission (FCC) launched an investigation of potential radio network monopoly practices early in 1938. The probe lasted until 1941 and became the subject of a landmark Supreme Court case.

Origins

The radio industry had already been the subject of one investigation into possible monopoly practices. On the order of the House of Representatives, in 1923 the Federal Trade Commission (FTC) had examined the radio manufacturing industry's patent sharing and marketing agreements and determined they amounted to an illegal cartel.

The national radio broadcasting networks began operation as the National Broadcasting Company (NBC) in 1926 and the Columbia Broadcasting System (CBS) in 1927; the Mutual Broadcasting System (MBS) had initiated its very different approach in 1934. But very quickly it became apparent the newest network was having a hard time breaking into major radio markets already served by affiliates of the existing networks. Making competition harder, NBC in the 1930s operated a "Red" and "Blue" network that gave it two affiliate stations in larger markets. Between the two of them, sometimes in "competitive cooperation" with a CBS affiliate, these powerful network-affiliated stations could lower prices to the point that a potential newcomer could not break even. By the late 1930s the pattern of network dominance was hard to miss.

Of the 49 most powerful stations (the 50,000-watt clear channel outlets) in the United States, 21 were affiliated with NBC Red, 20 were affiliated with CBS, 6 were affiliated with NBC Blue, and only 2 had signed with Mutual. On the other hand, of the least desirable (lowest-powered) stations, Mutual led the pack with 111 affiliates, followed by 44 on NBC Blue, 34 connected to NBC Red, and only 18 affiliated with CBS. Of the nearly 200 Mutual stations in 1942, 26 in important cities had contracts with another network which had first call on their best hours. Examined another way, NBC and CBS controlled more than 85 percent of total broadcasting nighttime wattage.

To network critics the problem went even deeper. Networks totally dominated their affiliates. Contracts favored the networks at every turn because it was obvious that network affiliation was vital to true financial success in the radio business. Networks were tied to their stations for only a year while stations were often contracted for three to five years. Networks

could "option" chunks of affiliate time for network programs. Networks dictated many operational aspects of their supposedly independently owned affiliate stations.

CBS and NBC made a major blunder as the FCC proceedings got under way. The baseball World Series had been carried on all four networks from 1935 to 1938. In 1939 a new sponsor (Gillette) paid the baseball leagues for the rights to broadcast the series exclusively over Mutual. To better distribute the series nationwide, Mutual entered into temporary affiliation agreements with several NBC and CBS affiliates in communities with no regular MBS affiliate in order to permit the stations to broadcast the games. NBC and CBS informed their wayward affiliates that they would not be released from their contractual obligation to run their regular network programming while the games were being played even though in some cases the requested program preemptions amounted to little more than an hour of the daytime schedule. Although a few stations defied their networks and carried the series games anyway, most capitulated. The same drama played out the following year, when Mutual again got exclusive rights to broadcast the series and signed up a large temporary network, only to lose much of it under threats from NBC and CBS.

FCC Decision

After extensive 1938–39 hearings and an initial staff report in 1940, the FCC issued its final chain (network) broadcasting report in May 1941, a 153-page analysis that reviewed past network development and practices. The commission found that NBC and CBS were engaged in a number of anti-competitive practices, and it issued new rules to curtail these practices. The report was one thing; its conclusions and proposed order for rule changes was quite another.

In its most controversial finding, the commission concluded (in the seventh of its eight rule changes) that NBC would have to sell one of its two networks. As the FCC had no direct regulatory role over networks, the wording of the proposed rule was clever: "No license shall be granted to a standard broadcast [AM] station affiliated with a network organization which maintains more than one network." As the FCC licensed all broadcast stations, network structure could be controlled in this indirect fashion. The order made clear the rule would not be applied if the networks were not operated simultaneously or if there was no overlap in the areas served by the network (such as the many operating regional networks).

Using the same approach, the commission further decreed that stations could not be forced to sign exclusive network

contracts that forbade them from preempting network programming. Licensees, the commission continued, had the absolute right to accept or reject network programs on a show-by-show basis. Contracts could only bind networks and stations for the same period of time. The effect of the rule changes was to increase the power of the licensee over what it broadcast. Given that the FCC held licensees responsible for what they put over the air, this made eminent sense to the commissioners.

Aftermath

Infuriated and concerned, however, both NBC and CBS mounted a strong attack on the chain broadcasting order. Amidst considerable publicity and press releases, they sued the FCC while also persuading sympathetic members of Congress to investigate the agency. In the end both the commission and its new network regulations emerged largely intact.

The networks' lawsuit was eventually (January 1942) dismissed by the Federal District Court for the Southern District of New York, the judge arguing that the court had no jurisdiction. At nearly the same time, however, the U.S. Justice Department brought an antitrust suit against the networks, using the FCC report and data as support. In June 1942 the Supreme Court agreed to review the FCC rules. On 10 May 1943, by a vote of 5 to 2, the court held in favor of the commission, concluding that the rules in no way violated the First Amendment rights of the networks. The court noted the World Series fiasco, commenting that "restraints having this effect are to be condemned as contrary to the public interest irrespective of whether it be assumed that Mutual programs are of equal, superior, or inferior quality." Following the decision, NBC sold its Blue network in 1943, which in 1945 was renamed the American Broadcasting Company (ABC).

The FCC did have to suffer through months of intense congressional scrutiny, in part for the network rules, but also for congressional dislike of activist FCC chairman James Lawrence Fly. The U.S. Senate held hearings on the network rules before which both the CBS and NBC leadership testified. A bit later Representative Eugene E. Cox (Democrat-Georgia) undertook an 18-month investigation of all aspects of the FCC that led to a number of published hearings but little real change. The pressure of all these investigations on the commission, however, clearly took its toll on the personnel and on other regulatory activities.

The chain broadcasting proceeding was only the first of three FCC probes of the networks, although the later investigations (1955-57 and 1978-81) focused almost entirely on television. The 1957 report did include one chapter reviewing radio networks, but noted their decline in the face of television expansion, and thus proposed no further action. Some FCC rules limiting television networks continued for decades, but most were abandoned by the 1990s. The commission had qui-

etly dropped virtually all of its radio chain broadcasting rules decades earlier. The decline of radio networks had made them unnecessary.

New Zealand

An early adopter of radio technology, New Zealand saw considerable variation in its radio system over the years, thanks to both political changes and social pressure. For decades the system was dominated by a state-controlled network of stations.

Origins

New Zealand stations began transmitting in the early 1920s, and by 1925 there was at least one service in all the major population centers. In 1926 the state began a process that would lead to politics and politicians dominating radio for more than 60 years. That year, the government established the Radio Broadcasting Company (RBC) to provide a national broadcasting service. Its revenue came from a licensing fee paid annually by every owner of a radio receiver. Existing stations not absorbed by the new company were permitted to continue broadcasting, but with heavy restrictions. They became known as "B" stations, in contrast to the RBC's "A" stations.

During these early years, in deference to newspaper proprietors, advertising was prohibited on radio. The state not only controlled the allocation of transmission frequencies but also licensed the right to receive. There was also an informal set of conditions in place based on broadcasters' knowledge that the government frowned upon any form of vulgarity, controversial political or social topics, and direct or indirect criticism of the state. Significant visitors to New Zealand in the early days of broadcasting, including philosopher Krishnamurti and the Canadian politician Major Douglas, were prohibited from broadcasting.

However, the peculiar shape of radio broadcasting in New Zealand was forged in the 1930s. In 1932 the RBC was replaced by a direct government agency, the New Zealand Broadcasting Board. The board's stations were conservative, and many listeners preferred the more lively and still independent B stations, although these stations were subject to strict government inspection and had no rights to generate revenue from commercial activities. Many of them were able to stay on the air only because they were subsidiary activities of radio and record retailers or were sustained by voluntary work and donations.

The first "personalities" in New Zealand radio were on the B stations. One, a Methodist minister, Colin Scrimgeour, used his religious program to attack the Depression policies of the government, which, in turn, tried to prevent his broadcasting by jamming the station's frequency.

State Control

Ironically, the election in 1935 of the socialist Labour Party to government saw the end of the B stations that had helped Labour to victory. The New Zealand Broadcasting Service (NZBS) was established as a department of state, and it immediately absorbed or closed down all remaining independent radio stations, establishing direct state control of all broadcasting.

Negative experiences with the nation's overwhelmingly conservative newspapers encouraged the government to create something unique in the world of broadcasting: a state-owned commercial radio organization. In 1937 the NZBS was split into two divisions, with the A stations remaining noncommercial and somewhat elitist and the B stations forming a popular state-run commercial radio division. The combination of advertising revenue and annual receiver license fees made broadcasting a significant income generator for the government. Broadcasting also became the country's most significant patron of the arts, publishing the country's leading journal of culture, operating the only symphony orchestra, and providing valuable employment for New Zealanders with creative ability.

Postwar Change

A change of government in 1960 saw the first of many attempts to reduce the role of government in broadcasting. Given responsibility for the development of a television service, the NZBS was changed from a state department to a public corporation, although radio remained much as it had been, with bureaucrats remaining in control. The only significant change was the development of a local radio news service, some 40 years after radio began!

However, changes in social taste were not being reflected in radio, and there was strong resistance to the popular music of the 1960s and to other "foreign" influences. This led to the launch in 1967 of a "pirate" radio ship broadcasting from international waters. The success of the pirate Radio Hauraki in capturing the younger radio audience began a process of change that eventually led to the licensing of private radio stations and a reduction of state influence and control.

These changes were not without resistance. During the 1970s there was a rash of legislative changes to broadcasting structures, as first one government and then another tried to maintain control of the airwaves. It was a period of change and tension between broadcasters and politicians. New broadcasting legislation appeared almost annually. Gradually, however, the influence of state broadcasting waned.

Over these years, the number of private radio broadcasters rose steadily, from three in 1972, to nine by 1976, and 22 by 1984.

Modern Radio

Then a new government ushered in a period of radical change. In 1988 New Zealand radio broadcasting was completely deregulated. Frequencies were auctioned, and frequency owners were given trading rights. Deregulation led to a dramatic increase in the number of radio stations, up from 69 in 1988 to 164 in 1993, to nearly 300 in 1999, serving a population of less than 3.5 million.

The government sold its commercial radio stations to a consortium of overseas broadcasters in 1994. In 2000 commercial radio in New Zealand consisted of three major ownership groups and a large number of small private operators. However, by 2002 consolidation had reduced the major groups to just two, both controlled by overseas interests. Other radio included two public radio networks, 25 stations dedicated to the indigenous Maori language, and 11 community-access radio stations wholly or partially funded by the state.

At the beginning of the century New Zealand's unique and intense relationship with radio is reflected in a number of facts, not the least of which are the large number of radio stations servicing a relatively small population (arguably the greatest number of stations per capita in the world), the time spent listening to radio (with youth time-spent-listening bucking the worldwide trend and actually increasing), and the consequent

amount of revenue generated (at times rising close to 14 per cent of the total national advertising expenditure).

News

News did not become a regular feature of radio programming until the early 1930s, although some stations offered occasional news programs as early as the late 1920s. Radio news remains a fundamental albeit reduced segment in the program schedule of most radio stations today. For many stations, the genre of "news" has been redefined to include entertainment information as well as hard news. The style of writing and announcing radio news in its early years differs significantly from the writing and announcing style that is now known as broadcast journalism.

Origins (1920-35)

Radio news in the early 1920s was essentially an oral version of national newspaper news. Radio broadcasters took to reading newspaper stories on the air because newspapers were the main source of news and because many radio stations were owned by newspaper companies. In addition, some big-city stations initiated the practice of interrupting regular programming to carry election results or other breaking news events. Radio news reports were a relatively small part of the overall program

content for most stations, which followed an “all things to all people” programming strategy by broadcasting a variety of programs, primarily music and variety and various forms of talk, only slowly including regularly-scheduled newscasts.

At first, there were no daily newscasts. Newspaper-owned stations provided sporadic news bulletins as teasers to increase newspaper sales. At other stations, hosts read news as a filler, often without identifying the source of information. A few major-market stations broadcast once-a-week commentaries on current news events, such as those aired in New York by H.V. Kaltenborn, an assistant editor of the *Brooklyn Eagle* newspaper. A few stations carried news of shipwrecks (early operators were required to tune marine emergency bands) or special news events. For example, in 1925 the infamous Scopes “monkey” trial in Tennessee was covered using long-distance telephone lines by WGN radio in Chicago.

With the advent of national network programming, radio newscasts slowly became a feature of the evening schedule. Gathering information primarily from press association newswires, radio networks distributed national news to their affiliate stations through phone lines. However, regular network news did not begin until a 15-minute newscast was inaugurated by NBC’s Lowell Thomas in 1930. Two years later, the Lindbergh baby kidnapping became a major network news event, for which networks often preempted their regular schedules.

By this time, however, a number of newspapers, fearing radio’s growing competition, began to impose limits on radio use of their stories, as well as those supplied by the newspaper-controlled wire services, the Associated Press (AP) United Press (UP), and the International News Service (INS). In response, CBS formed its own newsgathering organization in 1933 by putting together a nationwide corps of correspondents made up primarily of freelance “stringers.” Both NBC and CBS used newly founded independent news services such as Transradio to assist in gathering news during the press embargo.

Eventually realizing that radio stations would continue to find a way to gather and deliver news, newspaper owners proposed a compromise in 1933 called the Biltmore Agreement, after the New York City hotel where it was hammered out. According to the terms of the agreement, CBS was to halt its own newsgathering and both CBS and NBC were to restrict their newscasts to two 5-minute news summaries obtained from a newly created Press-Radio bureau. The news summaries were to be aired only after morning or evening newspapers had been published. And radio reporters were limited to providing background information as opposed to detailed news.

However, the Biltmore Agreement was hardly effective. Only a third of radio stations—the network affiliate stations—were bound by it. In addition, the agreement had loopholes that radio stations took advantage of by offering news “commentaries,” which the agreement allowed.

Realizing the ineffectiveness of the Biltmore Agreement, two newswire services—UP and INS—broke the news embargo in 1935. Finally, in 1940, AP agreed once again to sell its news services to radio, thus effectively ending the black-out. Re-establishment of radio news wire services coupled with network and local stations’ own newsgathering resources provided the necessary preconditions for placing news firmly in the broadcast program schedule.

Golden Age (1935–50)

By the late 1930s, news had become an expected function of radio and it constituted an average of more than ten percent of the radio programming. Individual stations broadcast news that varied in length and depth. Local news gained greater prominence in the average station’s program schedule, though it often amounted to just the headlines. By 1938 many radio stations were subscribing to more than one news wire service, and the services were carrying information written especially for radio delivery as opposed to newspaper publication. Several news wire services allowed their news to be sponsored during radio newscasts. Network news reporting was expanded as political crises in Europe and the Pacific deepened. Yet both NBC and CBS also covered many world-wide sporting events and human interest stories in addition to the often grim news of the day.

In 1937 one of the most dramatic news reports ever broadcast was on WLS in Chicago the morning after the German airship *Hindenburg* burned at Lakehurst, New Jersey. Reporter Herb Morrison had intended to record his report on the flight of this airship for archival purposes, but the networks viewed the disaster and Morrison’s memorable eyewitness account as so significant that they aired portions of it despite policies allowing only live broadcasts.

Events leading to World War II proved a catalyst for radio news because of a growing public desire for the latest information. To meet the increasing demand for news from abroad, NBC developed a European news operation in 1937, which ushered in a new kind of news reporting that included on-the-spot reports and interviews, commentaries, and actual sounds of people and events being covered “in the field.” Both NBC and CBS established foreign news bureaus and developed their first live overseas news reports, which were relayed by short-wave radio to New York City and then by telephone lines to affiliate stations.

CBS expanded news coverage to a half-hour segment for the first time with its *Foreign News Roundup*, which focused on the 1938 German occupation of Austria. *Roundup* originated from key European cities including London, Paris, Rome, Berlin, and Vienna. Reporters in these cities would stand by microphones recounting and assessing events of the day. They could also hear and react to their colleagues’ reports.

Roundup was anchored by Edward R. Murrow in London. Murrow and CBS are largely credited with helping radio to mature into a full-fledged news medium. One notable legacy of Murrow and his team would prove to be the development of “broadcast journalism” as a distinctive syntax of writing and reporting news—conversational and brief writing that incorporates sound from the field, or *actualities*, into the news story. Murrow’s actualities often included exploding bombs and screaming sirens.

Some war correspondents were limited to recording their reports before airtime because of government restrictions. But most reporters managed to broadcast their reports live, proving over time that they could do so without breaching military secrets. CBS introduced the term “news analyst” as a replacement for the term “commentator” specifically to avoid the impression that its radio news improperly shaped public opinion.

While the BBC and other European services widely reported the expanding war after 1939, entry of the United States into the war in late 1941 dramatically increased American radio news reporting. From 1940 to 1944, scheduled network news increased by more than 50 percent. By 1944, NBC-Red was offering 1,726 hours of news annually, while CBS was a close second with 1,497 hours. Despite a postwar decline in overall news hours, news still occupied more than 12 percent of network evening airtime.

Improving technology, such as portable recorders and smaller transmitters, provided the means for such dramatic broadcasts as Edward R. Murrow’s recording of a bomber’s run over Germany, George Hicks’ live coverage of the June 1944 D-Day landings in Normandy, and pick-ups of news from distant Pacific island battlefields. Listeners heard the war begin by radio in 1939 (or in the U.S. on an otherwise quiet Sunday in December 1941)—and heard world leaders announce the end of the war in Europe in May 1945 and in the Pacific just three months later. Millions tuned to the Japanese surrender as it was broadcast from the deck of the battleship *Missouri* in Tokyo Bay in September 1945. And radio carried the resulting celebrations in cities around the world.

Adjustment (1950–70)

Despite the growing diffusion of television into American households in the late 1940s and into the 1950s, radio networks continued providing an extensive schedule of news and commentary for years after World War II. Only after the mid-1950s did network news schedules begin to dip sharply, soon to decline to hourly summaries of top stories. News continued to be an important element of most local station schedules.

Networks attempted to redesign their radio news. Network executives decided that the five-minute news summaries supplied on the hour should now be delivered by experienced

reporters with recognizable names, rather than by staff announcers. In addition, the networks tried rolling out “variety news programs” that offered a greater emphasis on feature stories. In 1955, NBC began airing *Monitor*, a mixture of news, music, interviews, dramatic sketches, and sports. *Monitor* was hosted by Frank Blair and Hugh Downs; Gene Shalit did occasional film reviews. ABC began *New Sounds*, a week-day evening series patterned after *Monitor*. In 1960, CBS began *Dimension*, a series consisting of five-minute informational inserts on the half hour. For all the network’s efforts, however, their audience and network radio news continued to decline in the face of television’s increasing viewership.

As radio stations increasingly programmed according to some music format by the mid-1950s, news was made a part of the schedule. Only major-market stations provided more than a news headline service.

In the 1960s, news finally became its own radio format. KFAX in San Francisco adopted the first “All News” format in 1960 with each hour containing 25 minutes of hard news, updated throughout the day. The remaining minutes were filled with sports, business news, and feature stories. But KFAX failed after four months because of a lack of advertising support. The first commercially successful all-news radio station was founded by Gordon McLendon in 1961. McLendon took a rock-and-roll radio station in Tijuana, Mexico, changed its format to hard news, and targeted it at listeners in Los Angeles. News was recycled every half hour to coincide with the commuting times of drivers going into and out of Los Angeles. No reporters were used—just hard news from the newswires AP, UPI and the Los Angeles City News Service. In 1965, WINS in New York City became an all-news station and began airing the promotional advertisement that has now become standard to Westinghouse (Group W) news stations: “All news, all the time.” WINS used its own reporters and focused heavily on local news, as did KYW in Philadelphia, Pennsylvania, and other stations in cities large enough to support the expensive format.

Radio News Formats

Most aspects of modern radio news vary widely among stations, including the number, scheduling, and length of newscasts, the content of stories broadcast, and their order of presentation. Each of these, in turn, may depend on market size, station format, and any news policy of the owners, especially of multiple outlets. Overall, less news is offered on radio today than was the case a decade or two ago.

While some stations still retain regular newscasts, many music and all-talk outlets focus on feature material. Contemporary Hit Radio (CHR) and Adult Contemporary (AC) stations often still provide brief newscasts, for example; others, such as Country, Easy Listening, and Album-Oriented Rock (AOR),

more often run features or have eliminated news, reasoning that not every station in a multi-station market has to provide it. If stations affiliate with a network at all, it is most often to carry their brief national newscasts. Some networks are designed to serve up news to fit within specific radio formats.

Through the 1980s the typical pattern for small- and medium-market music stations was to offer five minutes of news on the hour, usually combining world, national, and local stories with a growing emphasis on the latter. World and national news is most often received as an audio feed from a network or syndicated satellite service or as text from the Associated Press, and may be recast to include a local angle.

On stations still offering news, newscasts range from a minute of headlines to three or four minutes long. Most “stories” are now limited to a sentence or two totaling 10 to 20 seconds—a 60 second story would be very unusual. Stories may contain a sound bite or sound actuality, perhaps bits of an interview. Short newscasts are often devoted to but one or two stories, especially with breaking news. While major-market AM radio stations once offered up to a half hour of news in morning or afternoon drive time, that model has all but disappeared as most stations trim or even eliminate news staffs.

The largest markets typically include an all-news AM station. These often utilize a “news wheel” to format their newscasts. This displays the length, order, and content-type of stories to be broadcast over a half hour or hour cycle, after which the wheel repeats itself. Ideally, each time the news wheel begins again, stories have been refreshed with new information or have been replaced with new stories. The news wheel is especially convenient for listeners who like to know that they can hear a specific type of information (e.g. the weather forecast) by tuning in at exactly :20 and :50 minutes past the hour. As radio news is easier to prepare than reports for TV or newspapers, radio is often quicker at getting breaking news on the air, though internet-based services can be the fastest of all.

Information Sources

Radio stations gather news from a number of sources, including the local newspaper, the telephone, and the field interview. The local newspaper is especially important to smaller stations with a limited budget and news staff. Reporters will rarely admit to using the local newspaper as a primary source of news, instead describing the newspaper as source for obtaining leads to develop news stories. However, reporters at smaller radio stations often do not have the time to gather their own news, so they end up rewriting newspaper stories for their own newscasts.

The telephone is used for conducting interviews with officials and experts—such as politicians, police officers, and cor-

oners—to acquire actualities to be edited later into sound bites. The radio reporter often initiates a phone call from the studio and then records the conversation on tape or computer. FCC regulations specify that reporters must identify themselves as such and name the station they work for and that they must indicate that the station plans to broadcast portions of the interview. All of this has to be done before the reporter begins recording the interview. The telephone is also used to receive live or pre-recorded traffic and weather reports from companies that sell these services to radio stations. *Accu-weather* is widely subscribed to for weather information, while *Cellular 1* and *Shadow Traffic* are widely subscribed to for traffic information.

Hand-held cassette and minidisk recorders are used by radio reporters to gather actualities from the field. Hand-held recorders are used to record actualities and then to play them back over a telephone line to the studio.

To gather national news, radio stations use newswires, satellite feeds, and the internet. The main newswire subscribed to by both small-market and major-market radio stations is AP; what is left of the UPI agency is used by a small and dwindling number of stations. Typically only the very largest stations in the U.S. subscribe to the other three big international newswire services—Reuters from England, the French Agency Press (AFP) from France, and ITAR-Tass from Russia. Major-market radio stations normally subscribe to regional and city newswire services as well. Newswire services deliver information mainly through satellite downlinks or conventional phone lines connected to a radio station’s computer.

Radio stations also use satellite dishes to receive audio news from satellite news feeds. These feeds can be re-broadcast as self-contained newscasts, or they can be used as actualities to be edited into sound bites. Satellite feeds come down at specific times determined by the satellite service. Satellite feeds are provided by the networks CBS, NPR, and CNN, as well as the news wire service AP. They are normally provided free of charge to radio stations in exchange for pre-selected advertising spots in the radio station’s program schedule, which will generate revenue for the satellite service. The remaining available spots will be made available for the local stations to fill with news sponsorships. Television is also used to gather information for radio newscasts. The advent of all-news channels and mostly news channels (e.g., CNN, Fox, MSNBC, ESPN, Weather Channel) has allowed radio reporters to monitor nationally developing news stories constantly.

Increasingly, radio stations are relying on the internet to gather national and international news. Many traditional media organizations such as CNN and NBC as well as non-traditional news organizations provide websites with news and information that can be downloaded as text or audio. The internet provides a cheaper alternative to subscribing to a newswire or satellite, but the boundaries for copyright

infringement and source credibility are less clear than for newswire or satellite news information.

Regulation and Deregulation of News

For many years, the FCC's licensing renewal guidelines strongly encouraged stations to provide from 6 to 8 percent of total airtime to news and public affairs. Those rules disappeared in the early 1980s, leaving stations to determine their own journalistic role—if any. As a result, in the past two decades many stations have opted out of any news programming at all. However, most small-market Top 40/Contemporary Hit Radio stations have retained news programming because of a traditional listener base that has expectations for local, community-oriented news with a practical quality, such as local events, traffic reports, and high school and college sports.

Industry consolidation in the 1990s has led to further reductions in radio news programming as part of corporate cost-cutting strategies. Multiple stations with common corporate ownership now routinely obtain news by purchasing national news feeds from independent “outsourcing” companies, such as Metro Network's *MetroSource*.

Significantly, the marketplace guideline of deregulation has led many radio stations to air a new kind of news in their program schedules. Today news has come to be defined not strictly as hard news but also as entertainment-oriented information. Medium-market and major-market radio stations have reinforced this redefinition through the news covered in syndicated talk shows they program. National hosts such as Rush Limbaugh, Don Imus, G. Gordon Liddy, Laura Schlessinger, Howard Stern, as well as many local talk-show hosts now feature political, sexual, or celebrity news in their shows. These and other talk-show hosts routinely deliver news stories and

then offer their own opinionated comments, after which listeners are invited to engage in the discussion by calling, faxing, or emailing the program.

News Agencies

For most of their history, radio stations have relied on national sources for much of their news. Other than the radio network news divisions, the prime source for national and international news has usually been one or more of the news agencies (also called news or wire services or press associations) such as the Associated Press (AP), United Press International (UPI), or Reuters. In recent years, the news agencies have provided considerable regional and local news as well. As more radio stations reduce their news staffs (or eliminate them

entirely), “rip ’n’ read” newscasts based entirely on news agency copy have once again become common.

Cooperative news gathering began in the United States with the formation of the Associated Press by a number of New York daily newspapers in 1848. Although reorganized several times, the AP has always been a cooperative rather than a profit-seeking venture. The United Press (UP) was begun as a profit-seeking affiliate of the Scripps newspaper chain in 1907, and the International News Service (INS) appeared as another

commercial venture in 1909, controlled by the Hearst newspapers. Each of the three was based on service to newspapers, and newspaper-based board members controlled their operation. Radio's arrival and demand for service created big questions for the agencies.

Associated Press

The oldest and largest news agency had the most trouble deciding how to handle the new medium. As early as 1922, when few stations offered news, the AP warned its member newspapers not to allow use of AP news reports on their own radio stations. But in 1924 and 1928, AP did allow election returns to be broadcast. Starting in 1933, AP adopted a policy of allowing radio use of AP news stories only for events of "transcendent importance," and this continued until 1941, long after its competitors were serving broadcasters.

In 1941 AP initiated a radio wire—a news service written for use on the air, as opposed to the traditional service for newspapers designed to be read. Dubbed "Circuit 7760," it operated 24 hours a day under the direction of Oliver Gramling. Within a year AP was serving 200 (of about 750 total) stations in 120 cities, with 110 stations on its broadcast wire payroll. After the war, some 450 stations were elected to associate membership (an important status within the AP cooperative organization, as radio now had more of a voice in management decisions). By the early 1950s, AP was providing some 75,000 words every 24 hours, written for audio reading, and usually condensed and rephrased from the main newspaper service.

AP news for radio was usually provided in the shape of ready-to-use newscasts of different lengths. This led many smaller stations, lacking their own news staffs, to simply have an announcer assemble a news program from the news agency wire stories ("rip 'n' read"). As more stations developed popular music formats, many relied on this practice for their entire news operation. Now dubbed the AP Radio Network, the agency launched an audio service with actualities (sound recordings from the field) for stations to use in their own newscasts in 1974. Just five years later, the AP Broadcast Wire was said to be the longest leased telecommunication circuit in the world.

In 1980 the AP broadcast service became the first radio network in the world to use a communications satellite. Just four years later, AP owned its own satellite transponder, making it the first news organization to do so. In the meantime, AP had shifted its broadcast operations from New York to Washington, D.C. A decade later, AP was serving just over half the commercial radio stations in the nation with four focused services designed to better serve varied radio formats: AP NewsPower, AP DriveTime, AP NewsTalk, and AP Specialty Wires. To these was added AP All-News Radio in 1994, a 24-hour

service of "full packed" radio newscasts that served more than 70 stations by 2000, with another 750 taking news feeds.

United Press and International News Service

The story of UPI and radio is more complex and begins with its two commercial predecessors: the United Press and the International News Service.

The United Press provided a 1924 general election hook-up using WEAJ in New York as the base station. UP's president Karl Bickel argued strongly in favor of serving radio in the 1920s and saw the new medium as an exciting development. But his newspaper-dominated board of directors prevented such a service until 1935 when he resigned owing to ill-health at age 53, leaving his successor Hugh Baillie to bring UP service to radio station subscribers. In the meantime, a number of radio stations owned by UP client newspapers had been using UP reports on the air, despite news agency policy banning such practices. In 1943, UP published a *United Press Radio News Style Book*, an indicator of the growing importance of radio to the commercial news agency. By the early 1950s, UP was providing about 70,000 words per day to its radio subscribers.

The smaller and weaker International News Service began a "radio-script" service providing radio material 40 times a week in addition to its regular print service. In the face of AP expansion and success in luring away newspaper clients, however, the weaker INS and UP agreed to merge to form UPI in 1958.

United Press International

With the merger, UPI, under Scripps control, began to provide its client radio stations with audio reports to use in their own news programs. By 1965 clients were receiving about 65 voice stories a day from the UPI radio center in Chicago. Nine years later they were also receiving 20 full newscasts a day with inputs from London and Hong Kong. In 1977 UPI was serving about 900 client stations (almost twice the number reached by the AP). UPI also moved to distribute its radio news service by satellite in the early 1980s.

But UPI was in deep financial trouble. Although intended from the start as a commercial affiliate of a for-profit newspaper company, the agency had fairly consistently lost money. By the 1970s it was rapidly losing newspaper clients to the larger and better-financed AP and began to focus more on its radio station business.

In 1982, after a two year effort, Scripps sold the company it had founded nearly three-quarters of a century earlier. The sale led to two decades of drastic decline under several successive owners and two separate declarations of bankruptcy. UPI declined from about 1,800 employees at the time of the Scripps sale to less than 200 in mid-2000 when a Unification Church

affiliate took control of the remains of the Washington-based news agency.

The UPI radio network was now the central part of the now much smaller news service. It offered 24 hours of fully produced programs for use at the top of each hour plus an actuality service for stations to use in their own newscasts (called "Selectnews," it began in 1992). While UPI reached some 2,000 stations in 1994 and radio accounted for half of the agency's income three years later, UPI had to end its radio service on 19 August 1999 for lack of funds, competition from newer news sources, and a drastic drop-off in the number of client stations (to just 400). Its final words:

This is the final broadcast from UPI Radio. United Press International is getting out of the broadcast news business and has sold its contracts to Associated Press Radio. For those of us suddenly out of work, it's been fun. We feel UPI Radio has done its job well overall, even as we struggled with fewer and fewer resources. So we sign off now with smiles, memories, a few tears . . . but no regrets.

Other Services

Although most stations relied upon their network affiliation (if any), a specialized news service, or AP for world and national news, competing news sources had existed even in the early years of radio. Several entities, for example, had developed to serve radio in the wake of the brief 1930s "war" that limited availability of AP, UP, and INS news feeds. The agencies created the Press-Radio Bureau to combine service from the three in special radio reports, and it lasted until 1938. The Yankee News Service served the New England regional network's affiliates, the Continental Radio News Service based in Washington, and the Radio News Association from Los Angeles also began operation in 1934. Transradio Press Service began at the same time, largely built with former Columbia Broadcasting System (CBS) news people, aimed at serving non-network radio stations. Transradio survived beyond the 1930s (to December 1951, when it closed for lack of sufficient station clients) because stations could again obtain their news from the traditional news agencies.

London-based Reuters made its first radio agreement with the then-commercial BBC in 1922, although with provisions that no news would be broadcast before 7 P.M. in the evening, thus protecting the circulation of evening London dailies. Continuing negotiations in the mid-1920s allowed the BBC to cover current events as they were happening, and by 1929 the now government-chartered BBC received the full Reuters news wire for use in its news programs. Only in 1972 did Reuters begin its first voice news service for local stations in Britain and the United States. By the 1990s the firm had refocused on financial reporting and information and no longer served radio stations.

The expansion (and by the late 1990s, the consolidation) of the radio business contributed to a variety of other radio news services including Unistar (which carried CNN Radio), Capnews, the Business Radio Network, and the USA Radio Network. This expansion of syndicated news sources paralleled the decline of individual local station news efforts; instead of supporting local station news, these services were increasingly replacing local efforts.

Nightingale, Earl 1921–1989

U.S. Radio Commentator and Actor

With a sonorous voice characteristic of his English surname, combined with his writing and verbal styling, Earl Nightingale led a distinguished career as a radio inspirational speaker and actor. He was the voice of radio serial hero *Sky King*, and with his five-minute daily program *Our Changing World* lasting for almost 30 years, Nightingale created one of the longest-running syndicated programs in the history of radio. The innovative talk show he wrote and hosted for WGN was one of the most heavily sponsored shows in radio. Venturing beyond traditional broadcasting, Nightingale took his radio writing and speaking skills into new media, producing history's best-selling non-entertainment recording, *The Strangest Secret*. In addition, the Nightingale-Conant audio publishing and syndication corporation he co-founded pioneered motivational recordings.

Origins

Nightingale was born in March 1921 in Los Angeles, California. Encouraged by his mother, he became a good reader by the time he entered kindergarten. His passion for reading became the foundation of his writing and gave him the ideas he was later to broadcast. Seeing his family in the depth of the Depression in 1933, 12-year-old Nightingale became intensely curious about what separated the “haves” from the “have-nots.” He began looking for answers in his local library. Vowing to find a way to become financially independent by the age of 35, his search for answers became the defining quest of his life and career. It also contributed to his personal library of over 6,000 books.

Nightingale joined the U.S. Marines in 1938 and was one of only 12 Marines to survive the Japanese bombing of the battleship U.S.S. *Arizona* at Pearl Harbor in 1941. While he was a Marine instructor at Jacksonville, North Carolina, in 1945, Nightingale worked part-time at a local radio station and quickly discovered his gift for broadcasting. After leaving the service, he became a broadcaster for KTAR in Phoenix, Arizona. Three years later, he was an announcer and news commentator with the Columbia Broadcasting System (CBS) in Chicago. Having been with CBS for only a year, Nightingale joined the staff of WGN in Chicago as a writer-producer in 1950. From 1950 until 1954, his radio role as the dashing radio adventurer *Sky King* was broadcast nationally.

Inspirational Radio

While portraying *Sky King*, Nightingale created and hosted a 90-minute daily talk show at WGN that soon became, in his words, “one of the most heavily-sponsored programs in the

industry”—due in large measure to Nightingale’s remarkable ability to sell advertisers. His guest-interview “talk” format, according to some, served as a prototype for talk show formats popular today. The success of the radio talk show that Nightingale wrote, hosted, and sold led to a television version on WGN-TV.

In 1956 the *Chicago Daily Tribune* reported that Nightingale’s childhood dream had been realized:

An intense young radio commentator will retire tomorrow at the age of 35, on a life income he estimates will be from \$30,000 to \$50,000 a year. He is Earl Nightingale, who heads three corporations built up out of his radio work, and who will say farewell tomorrow night to his WGN listeners who have heard him ten times a week since 1950 (Hughes, 1956).

While meeting the demands of his daily radio and television programs at WGN, Nightingale’s entrepreneurial drive had enabled him to develop several sales firms, one of which was a nationally ranked life insurance agency. He also had formed his own firm, Earl Nightingale, Incorporated, through which he bought radio time from WGN. He once estimated that he had worked 12 to 14 hours a day from 1944 until 1956 to achieve his determined childhood goal of early retirement.

Nightingale had also been in demand as a public speaker while he was at WGN. One of his platform messages, “The Strangest Secret,” was a compilation of key ideas from his reading about success, wealth, and achievement. On hearing Nightingale’s talk, the president of the Pure Oil Company urged him to record it; during the same month he retired from WGN, Nightingale made the recording.

In 1959, Nightingale returned to work to write and record his own daily syndicated radio program, *Our Changing World*. In five years the program was syndicated to the largest number of stations in the history of broadcasting to that time. As Nightingale described his approach, “[W]e take the refined knowledge that has been promulgated by the great thinkers of our time . . . and winnow from it that which we feel is vital to the average person and then put it into language that he can easily understand.” With 7,000 radio commentaries recorded, *Our Changing World* lasted for almost 30 years, making it one of the longest-running syndicated radio programs in history.

In 1960, Nightingale and Lloyd Conant formed the Nightingale-Conant Corporation around the success of *The Strangest Secret* and the syndicated *Our Changing World*. *Standard and Poor’s Register of Corporations, Directors, and Execu-*

Earl Nightingale
 Courtesy Nightingale-Conant Corporation

tives described the Nightingale-Conant Corporation in January 2000 as having 250 employees, having annual sales of over \$30 million, and producing “motivational, educational and communication programs, cassette tapes, recordings and films, radio and television programs, graphic arts.” Fellow radio commentator Paul Harvey described Nightingale as “the dean of self-development.”

In 1986 Earl Nightingale was inducted into the National Association of Broadcasting Hall of Fame. This radio personality, with an extraordinary genius for touching an audience through a microphone, died in early 1989.

Non-English-Language Radio in the United States

In the United States, the radio boom of 1923 coincided roughly with the legislated end of the largest wave of international immigration in modern history. Some 20 million immigrants arrived on the shores of the United States between 1871 and 1920, some settling permanently, some returning home, and others traveling that route a number of times. The result was a proliferation of people and communities who spoke German, Polish, Spanish, Yiddish, Italian, and other languages. At the end of the 19th century, newspapers were the primary vehicle for the dissemination of information, with countless daily papers from every ethnic and political angle being published every day. As cities grew and the networks of newspaper distribution had not yet expanded, radio became a vital alternative to the printed word.

As early as 1926, foreign-language markets were being identified as potential profit centers. Despite indications by the advertising industry, major networks such as the National Broadcasting Company (NBC) and soon the Columbia Broadcasting System (CBS) were loath to incorporate foreign-language programming into their schedules. (However, for two years beginning in 1928, NBC briefly broadcast *Der Tog*, a Yiddish-language program.) Yet by 1964 more than 340 radio and television stations broadcast non-English-language programs in everything from Italian to Navajo. The majority of these stations were local, low-wattage stations without access to national networks. More recently the number of non-English broadcasts has increased exponentially with the popularization of web-based broadcasting. The development of non-English programming through alternative formats (local versus network and web versus traditional radio) is not coincidental but speaks of a particular power relationship between language and radio.

Throughout radio's history, the number of non-English stations in the United States has been quite significant, which suggests a considerable listening audience despite its traditional exclusion from market studies. As NBC and CBS rapidly grew to dominate the national networked radio dial, numerous local radio stations, generally with a broadcast power between 100 and 500 watts, began to spring up in urban areas. Almost always, these stations rented portions of their broadcast day to different community groups who wished to broadcast. Two of the most prominent examples are New York's WEVD and Chicago's WCFL. Founded in 1927, WEVD was owned by the Debs Radio Trust and broadcast programs in at least four languages, while WCFL hosted broadcasting in no fewer than 11. In 1924 WOAI in San Antonio, Texas, aired its first Spanish language broadcast, and Cleveland's WJAY initiated a weekly Polish-language program beginning in 1926.

Following the Federal Radio Commission's reorganization of the radio dial in November 1928, the majority of the stations that carried non-English-language programming found themselves relegated to the low and high frequency margins of the broadcast spectrum. Additionally, the FRC forced many of these stations to share frequencies and therefore also divide up the broadcast day. Broadcasting from the margin and on power that typically ranged from 250 to 1,000 watts, these stations cobbled together whatever broadcasting they could, usually comprised of a loose coalition of multi-lingual programs, performers, advertising agents, and sponsors. Few if any of these stations could choose to broadcast in only one language. The only significant exception to this rule was organized during the late 1930s, when New York-based station WOV organized 15 east-coast stations into the International Broadcasting Corporation which served as an Italian-only network, serving an audience of nearly 3 million listeners.

With the organization of the Federal Radio Commission in 1927 and amid the growing concern about the "decency" of radio programs, Section 29 of the Radio Act of 1927 sought to regulate U.S. airwaves by providing that "whoever utters any obscene, indecent, or profane language by means of radio communication shall be fined not more than \$10,000 or imprisoned not more than two years." As it was impossible to listen to every broadcast nationwide, the FRC mandated that broadcasts be recorded if a listener had filed a complaint against that program. In the beginning, these recordings were made on glass plates (78-rpm records could not hold long enough segments, and magnetic recording tape had not yet been invented). This concern about the "decency" of language contributed to a general suspicion about non-English broadcasts and led to additional federal policing and harassment of such programs. Of course, it was also true that non-English broadcasts could elude the surveying ear of the FRC because often FRC monitors could not understand their content.

If non-English-language programs were considered a marginal segment of radio broadcasting in the United States, the incorporation of non-standard English speakers into English-language programs fueled the popular imagination. During the Depression years, the networks established themselves nationally via the appeal of ethno-comedies such as *The Goldbergs* and *Amos 'n' Andy*. These two programs, as some of the first to reach national audiences, drew significantly on cultural, linguistic, and dialectical differences for their humor. In the case of *The Goldbergs*, the common problems of language acquisition (mispronunciation, spoonerisms, malapropisms, etc.) and accent were the source of a great deal of the humor that Molly Berg wrote into the program. *Amos 'n' Andy* drew on a much older tradition of minstrelsy (and played on its racial stereo-

types), but the particular challenge of putting blackface on radio turned the emphasis from appearance to dialect as the primary signifier of difference. Even though the Goldbergs were clearly on the path toward becoming ordinary Americans, whereas Amos and Andy were depicted as unassimilable, in both cases mastery of English was highlighted as the key determinant of mainstream acceptance. These programs clearly appealed to English-speaking audiences as they poked fun at members of non-traditional-English-speaking population groups.

Although culturally and linguistically marginal, non-English-language programs occupied a substantial amount of the radio dial. Statistics for non-English broadcasts during the Depression era are scant, but one source reports that nearly 200 stations out of a total of 850 broadcast non-English-language programs for some part of the day.

In a 1941 anthology entitled *Radio Research* (edited by Paul Lazarsfeld and Frank Stanton), sociologists Arnheim and Bayne published a survey of non-English-language broadcasts. They reported the presence of German, Italian, Yiddish, Polish, Lithuanian, and Spanish broadcasts. However, there were almost certainly Greek, Croatian, Russian, Hungarian, Bulgarian, Romanian, Chinese, Japanese, and Gaelic broadcasts at the time, as well. Although Arnheim and Bayne were primarily interested in the content of a typical broadcast day, their study is the first organized examination of ethnic radio in the United States, representing an early effort to include non-English-speaking audiences in radio market research.

Limitations

As soon as the United States entered World War II, the Federal Communications Commission (FCC) and the Foreign Language Division of the Office of Facts and Figures began investigations of all major East Coast stations (as well as others farther west) that broadcast foreign-language programs. Stations in New York, Philadelphia, Boston, and Chicago were targeted, and Alan Cranston, then chief of the foreign language division, recommended that certain broadcasters be "barred from the air immediately." Following the removal of a handful of German and Italian broadcasters and a general decline of foreign-language broadcasts, in March 1942 Cranston initiated new programs in German and Italian. The programs, entitled *Uncle Sam Speaks*, were designed to encourage ethnic listeners to join the war effort through volunteering or taking jobs in the defense industry.

Despite this overall reduction in U.S. foreign-language broadcasting, the World War II era also marked the emergence of substantial Spanish-language broadcasting, which has grown exponentially since that time, with about 500 stations including Spanish-language programming by 1980. In the

postwar years, broadcasters in Yiddish actively involved themselves in reuniting Jewish refugees with their families by broadcasting names of people who were looking for family members. Despite these brief highlights, the 1940s were devastating to non-English-language broadcasting, with the exception of Spanish broadcasts, which managed steady growth. Not coincidentally, the postwar years also witnessed the near-total domination of radio by the networks.

With the rise of McCarthyism in the 1950s, radio stations that previously housed foreign-language programs began dropping them from their rosters, fearing that broadcasters from Eastern Europe might use their airtime to spread communist propaganda. These station owners were responding to demographic changes, as well; first-generation groups began to give way to their English-speaking children. As language and residence patterns changed, so did cultural tastes, and programming once valued for its cultural specificity began to sound old-fashioned. However, this era should not be seen as the end of foreign-language radio, but rather as a reflection of changing immigration and settlement patterns and changes in the cultural preferences of many European immigrants. Thus, as European-language broadcasts decreased, a sizable immigration from Asia (most significantly from the Philippines, India, and Korea) gave birth to new broadcast options. And Spanish-language broadcasting continued its growth.

Since the late 1960s, non-English-language radio in the United States has seen a massive growth in both the overall number of stations, as well as the size and impact of audiences. Stations broadcasting primarily in Spanish, Korean, and Chinese have multiplied in conjunction with the growth of immigrant populations in primarily urban areas. What distinguishes the growth of non-English-language radio programming in the second half of the century from that of the first half is the development of single-language stations that are able to compete in larger metropolitan markets. Whereas network interests choked off the development of single-language radio stations during radio's golden age, the virtual dominance of radio by local interests has opened the door for radio stations that target a particular ethno-linguistic population in a particular area.

Online Radio

Recently, with the popularity of the internet and the increasing availability of web-based broadcasts, non-English "radio" broadcasts are flourishing. For example, www.live-radio.net contains a listing of online broadcasts from radio stations all over the globe in virtually every language imaginable. The two primary interfaces from accessing online media also include simple ways of locating and accessing online broadcasts of all kinds. No longer restricted by the narrow spectrum of radio

frequencies, broadcasters can reach audiences of size and scope never before imaginable. At the same time, audiences can tune in to a wider variety of programs originating from more locations, and broadcasting in more languages than has ever before been possible.

With the spread of online broadcast technology and an FCC ruling in 2000 to create a class of low-wattage stations, the future of non-English-language broadcasting is bright, if not in traditional broadcasting. Insofar as non-English-language programs have long been on the margin of mainstream broadcasting, they have also often been in the vanguard of broadcast practices, conventions, and styles. Thus the sheer number of non-English web-based broadcasts should come as no surprise. Their proliferation indicates that the future of radio is wide open, a form of expression that cannot be limited by traditional broadcast practices or geographical location. It also heralds a return to the origins of non-English-language broadcasting in the United States, which were rooted in the needs and preferences of immigrants from other countries.

North American Regional Broadcasting Agreement

Sharing Frequencies among the U.S., Canada, Mexico, and the Caribbean

First placed into effect early in 1941, the North American Regional Broadcasting Agreement (NARBA) treaty doled out radio channels to Canada, Cuba, Mexico, and the United States. Renewed after extensive negotiations in 1960, it remained for years the basis for cooperative regulation and interference reduction among these countries until it was replaced by bilateral agreements and treaties affecting all of the Western Hemisphere.

As the number of radio stations in North America grew, countries neighboring the United States felt increasingly squeezed out of valuable medium wave frequencies used for AM radio broadcasting. Naturally the potential for trouble was greatest along the northern and southern borders of the United States, where American stations could—and did—cause interference to outlets in other countries, and vice versa. Given the

larger U.S. population and expanding radio industry, American broadcasters sought the lion's share of available frequencies, leaving little to be shared by Canada, Mexico, and Cuba.

In 1937 representatives of the four nations met in Havana and hammered out the gist of a proposed frequency-sharing treaty. The task was not easy: given the great distances covered by AM signals, the work was complex and occasionally contentious. Nevertheless, the treaty was ratified by each nation and entered force on 29 March 1941. At the time, there were about 750 broadcast stations on the air in the United States, most of which had to shift their frequency (some only slightly), primarily to clear some radio channels for expanded use in Mexico. But for the remainder of the decade, the four nations were able to license stations in accordance with NARBA, thus greatly reducing potential interference problems.

The treaty expired in March 1949 after initial attempts to renew it failed. The demise of NARBA occurred despite considerable effort and controversy. The key problem was the dramatic expansion of American broadcasting—to 2,127 stations when NARBA expired—and thus the greater (and steadily expanding) use of spectrum by the U.S. radio industry. At the same time, driven in part by understandable nationalism, governments in the neighboring countries felt they were (again) getting the short end of the frequency stick, because the number of their stations had increased as well.

Cuba was the loudest complainer, even in the late 1940s. It demanded use of more frequencies and threatened to not ratify a NARBA renewal if it did not get them. Likewise, Mexico moved to protect some of the border stations serving American audiences. Complicating matters was the addition of new negotiating players: Haiti, the Dominican Republic, and Britain (on behalf of the Bahamas and Jamaica). Still, after several rounds of engineering work and diplomatic negotiation, a draft of a second NARBA treaty was initialed in 1950. But because of continuing negotiation problems—and rising pressure from big clear channel broadcasters fearful of losing some of their coverage as well as from small daytime-only stations hoping for longer broadcast hours (both groups felt they had given up enough already)—American ratification was delayed.

Between 1953 and 1962, a second NARBA was ratified by Cuba, Canada, the Dominican Republic, and the Bahamas. In 1960 the U.S. Congress ratified it as well, placing the treaty into force despite the lack of agreement from Mexico, Jamaica, and Haiti. Bilateral agreements with Mexico in 1969–70 and again in 1986 (as well as with Canada in 1984), served to keep the lid on potential interference problems and allowed many American daytime-only stations operating on Mexican or Canadian clear channels to begin operations before local sunrise and sometimes to extend operating hours into the evening with greater power. These agreements remain in force as long as the three nations agree.

Politics, always potent in international agreements, became central in dealing with the island nation of Cuba. By the late 1960s, the Castro regime in Cuba was informally ignoring the 1960 NARBA treaty. In 1981 Cuba formally abrogated the agreement and began to build stations that went well beyond the agreement in terms of power and frequencies used. When the United States began propaganda broadcasts into Cuba over Radio Martí, the Castro government retaliated by building high-power transmitters that caused considerable interference, especially with stations in the American South and Midwest. The Federal Communications Commission began to make case-by-case decisions allowing the affected stations to increase their own power—in essence recognizing exactly the kind of “radio war” the original NARBA treaty was designed to prevent.

As for the other nations in the region, the second NARBA treaty was eventually superseded by various Region II (Western Hemisphere) radio broadcasting agreements established under the auspices of the International Telecommunication Union in a series of regional radio conferences.

Nostalgia Radio

Broadcast audio programming has been collected by both institutions and interested individuals and most recently has become a battleground of interests. Central to the ability to collect such programs, of course, was the development of a means to make permanent recordings. Broadcasters from the beginning of radio needed some way to record. Initially the

only means for recording was cutting a disc. Western Electric had developed the 16-inch, 33 1/3-rpm recording disc for use as the sound tracks for early 1920 “talkies.” Sound-on-Film (SOF) optical tracks did not follow until later. The same medium was used in radio to record programs, usually for archiving, but sometimes for program syndication to multiple

markets. Those Electrical Transcriptions (ETs) that survived were preserved by sponsors, their advertising agencies, the talent on the shows, and some broadcast engineers.

Beginnings of Programming Collecting

The Library of Congress began to collect and preserve some programming in 1949 in its role as the U.S. copyright depository. The National Archives also collected and preserved programming from governmental sources and increasingly received donated event and news materials from stations and networks. Institutional archives are as variable as the institutions preserving the available material. Funding difficulties led the UCLA Film and Television Archive to concentrate on their film collection and discontinue the development of its radio archive, which consisted of 50,000 ETs and 10,000 tapes of radio dating from 1933 to 1983 (which the Archive still retains). The Milo Ryan Phonoarchive at the University of Washington, obtained from radio station KIRO, consisted of CBS programming from 1938 to 1962. These ETs were subsequently transferred to the National Archives. Material became available as people gained access to more ETs as radio stations began disposing of their stored material and donations were made to institutions. A large source of material was recordings that had been made for Armed Forces Radio to bring radio programs to U.S. troops during World War II. Those ETs that survived and a few network and syndicated discs comprised the basis for collectors in the sixties, when radio as it had been was almost gone. From these and other sources ETs were transferred to audiotape.

Serious collecting of radio programs by individuals was the result of the introduction of home reel-to-reel tape recording decks to the consumer market around 1950. Small groups formed to exchange material, information, and sources on both the East and West coasts. A number of clubs began to trade tapes, the earliest being the Radio Collectors of America. Some of these grew into large organizations of members who gathered and traded from their shared collections, such as the North American Radio Archive (NARA) and the Society to Preserve and Encourage Radio Drama, Variety and Comedy (SPERDVAC).

In 1954 Charles Michelson developed a rebroadcast market by obtaining an umbrella agreement to license *The Shadow* to individual radio stations, long-playing record manufacturers, and producers of home-enjoyment tapes. The first aggressively marketed private dealer was J. David Goldin, a former engineer at CBS, NBC, and Mutual, who formed "Radio Yesterday" and an album subsidiary, "Radiola," in the late 1960s. Michelson began to send "cease and desist" letters to collectors selling any of the series he had licensed.

Newsletters about radio program collecting began to circulate in the late 1960s. The most influential, which set the stan-

dard, was "Radio Dial" by the *Radio Historical Society of America* founded by Charles Ingersoll. Carrying on the tradition, the leading newsletter today is "Hello Again" by Jay Hickerson, which began publication in 1970 and tied together more than 100 of the most active collectors at that time. Today, more than 160 active collectors comprise the mass of privately collected broadcast material available, but thousands of other collectors maintain some program recordings. No one knows how many shows survive, but 150,000 or more are documented as existing in Jay Hickerson's *Ultimate History of Network Radio Programming*, which is an attempt to catalog every radio program currently circulating. The publications of *Radio's Golden Age* in 1966 and its updated revision as *The Big Broadcast 1920-1950* in 1973 by Frank Buxton and Gary Owen also increased interest in old radio programs.

Despite the interest of individual private collectors and the growth of institutional archives, the preservation of radio programming faces a crisis stemming from a combination of concerns. The most basic problem is the increasing rate of disposal and destruction of material. The way programs have been recorded—electrical transcription to tape formats—poses problems for preservationists. As transcription turntables disappear and reel-to-reel tape recorders are replaced with cassette recorders (and cassette recorders replaced with CD players), the means for playing the available material is lost or exists only in museums. The need to transfer the older formats into new formats is a time consuming and costly process. Many radio programs have been made available over the worldwide web in the downloadable MP3 format, free to anyone with a computer and an internet connection. Some collectors sell home-recorded CDs on their own websites, with as many as 50 or more shows on a single disk. There are numerous sites on the internet dealing with Old Time Radio (OTR).

Copyrighting and Collecting

Another problem is one of copyright ownership and control. As the nostalgia market for old radio programming has developed, copyright owners became more interested in protecting their copyrights. Ownership of many programs is very complex and depends upon contracts with directors, writers, performers, and rights holders of music and other materials used in the broadcasts. Private collectors who charge for duplication or sell programs are more susceptible to copyright problems than are institutions. Under certain conditions specified in the copyright law, libraries and other archives are authorized to photocopy or make other reproductions for research and teaching. However, Congress, through changes in the current copyright law, has placed most old radio programs under copyright even though they aired 75 years ago. Although sound recordings could not be copyrighted until 1972, the underlying script could be copyrighted as an "unpublished

work." If producers registered copyrights and then failed to renew them, the script and the show are in the public domain.

Marketing Old Radio Programs

There are a number of people who broadcast OTR, such as Chuck Shaden in Chicago and the country's biggest seller of old-time radio programs, Carl Amari, founder of "Radio Spirits." In 1990 Amari began syndicating his own old-time radio compilation program, "When Radio Was," hosted by Stan Freberg and heard nationwide in some 300 markets. Another program is "Radio Hall of Fame," licensed through "Radio Spirits." "Radio Spirits" has been estimated to be a \$14-million-a-year business, selling lavishly packaged tapes and CDs through its own catalog, bookstores, and discount outlets such as Costco. Amari purchased "Radio Yesteryear" and another rival "Adventures in Cassettes." He then sold "Radio Spirits" to Media Bay. "Radio Spirits" has threatened litigation against website operators, tape dealers, and CD distributors. It claims to have exclusive agreements with radio-show creators and their heirs. The threat of litigation has done little to slow the internet activity but website owners face the prospect of having to pay a fee for each download. A major difficulty is that Amari will not reveal the full list of programs he claims to control, calling it proprietary information.

O

Oboler, Arch 1909–1987

U.S. Writer, Producer, Director

Arch Oboler was one of the great auteurs in radio history, using the medium as his personal means of expression. During his career as one of radio's premier and prodigious dramatists, Oboler estimated that he wrote more than 850 plays, many of which represent the highest achievement of aural composition.

Early Years

Born in one of the nation's most creative broadcasting centers, Chicago, on 7 December 1909, Oboler became obsessed with the medium after building his first crystal set. After graduating from the University of Chicago, he wrote more than 50 plays before any station showed an interest in his fledgling ability. During the early 1930s radio was, according to Oboler, "an imitation of motion pictures and an echo of the stage." Oboler was searching for a new way to realize the potential of the medium. In 1933 he sold his first script, *Futuristics*, to the National Broadcasting Company (NBC) for national broadcast to inaugurate the new Radio City facility in New York.

In 1934 Oboler established a name for himself as a contributor of original playlets for Don Ameche in the anthology series *Grand Hotel*. A year later, Rudy Vallee was so impressed with Oboler's work for his radio series that he repeated several scripts. Oboler continued his association with Ameche on the *Chase and Sanborn Hour*, which also starred Edgar Bergen and Charlie McCarthy. His satirical takeoff on the Adam and Eve myth, written for Ameche and guest star Mae West, created a national uproar because of the Hollywood siren's salacious reading of Oboler's suggestive lines. Oboler's career continued to soar.

Network Success

In May 1936 NBC gave creative control of the popular series *Lights Out* to Oboler. The original creator and producer of

this "ultimate in horror," Wyllis Cooper, had left to become a Los Angeles screenwriter, and Oboler seized the opportunity to formulate *Lights Out* as a "theater of the mind." He experimented with narrative techniques, developing his patented stream-of-consciousness mode to delve into the minds of his characters. Oboler also used sound effects to construct bizarre worlds that were often analyses of contemporary social situations.

Oboler's own macabre voice was heard opening each episode of *Lights Out* with the signature warning, "It . . . is . . . later . . . than . . . you . . . think." What usually followed was an examination of the dark side of Oboler's own imagination. In "Chicken Heart," a scientific experiment goes awry, until the expanding organ overwhelms the world with an incessant thumping. (The program inspired one of Bill Cosby's classic routines about his childhood, heard on his *Wonderfulness* album.) In another critique on science, "Revolt of the Worms," the modest earthworm grows to absurd proportions and suffocates the lead characters. The tense situations were abetted by inventive sound effects—bacon frying signified the body being electrocuted; the chewing of Lifesavers candy simulated the crushing of bones; and the manipulation of warm spaghetti meant that something ungodly was happening to human flesh. Hollywood stars, such as Boris Karloff, were intrigued by Oboler's fantasies and journeyed to Chicago to contribute their services. By 1938 Oboler felt confined by the horror genre and wanted instead to take on the evils of the times, Hitler and the rise of Nazism.

A progressive NBC executive, Lewis Titterton, suggested the title for Oboler's new series upon hearing a recording of the pilot, "The Ugliest Man in the World." Titterton thought the future of radio depended on the vision of the writer, and the new series was crowned *Arch Oboler's Plays*, debuting in March 1939. Oboler was now among radio's elite, the first writer accorded name-in-the-title status. The new program was

sustained by NBC, presented without advertising, and Oboler's imagination was now unfettered.

Oboler, writing about "the terrors and monsters within each of us," used his stream-of-consciousness technique to shattering effect and made radio a viable new art form. He revealed the inner psyche of a soldier who returned home a vegetable, played by the tenacious James Cagney, in his controversial adaptation of Dalton Trumbo's antiwar novel, *Johnny Got His Gun*. Joan Crawford joined forces with Oboler and played an anxious mother awaiting birth in *Baby*. The acclaimed Russian actress Alla Nazimova offered her services, and Oboler wrote the antifascist drama *Ivory Tower* for her. He also pushed radio drama into new directions: he was the first to integrate a full orchestra into a radio play, his dramatization of the life of Russian composer Piotr Ilich Tchaikovsky.

After his series left the air in March 1940, Oboler lent his talents to the propaganda effort to rally American morale during World War II. Oboler's plays explicitly warned about the atrocities of "the Jap-Nazi world." In "Chicago, Germany," which was presented on the *Treasury Star Parade*, he imagined what would happen if Hitler conquered the United States. Urging that radio needed "an injection of hatred and passionate feeling," Oboler created several patriotic series for NBC: *Everyman's Theatre*, which he directed and wrote, using previous scripts from *Lights Out* and *Arch Oboler's Plays*; *Plays for Americans*, which featured such Hollywood stars as Bette Davis, James Stewart, and Dick Powell; and *Everything for the Boys*, a unique collaboration with actor Ronald Colman to provide entertainment for servicemen.

By the end of the war, Oboler was exhausted by the nerve-racking demands of his chosen medium. In the mid-1940s he brought back *Lights Out* for the Columbia Broadcasting System (CBS) and *Arch Oboler's Plays* for Mutual. He lamented that "radio, for the dramatist, is a huge, insatiable sausage grinder into which he feeds his creative life to be converted into neatly packaged detergents."

Other Media

He took his dark vision almost exclusively to the motion pictures, wanting to control as much of the production as possible. His first directorial effort, *Bewitched*, was based on an award-winning radio script he had written for Bette Davis. Other films he wrote and produced had overtly political themes: *Strange Holiday*, about a fascist invasion of America; and *Five*, the story of survivors of a nuclear holocaust. Always fascinated by technology, he wrote, directed, and produced the first commercially successful film in 3-D, *Bwana Devil*. He spent millions of his own money to gain further credibility for 3-D movies, but to little avail. His only foray into television was, of all things, a comedy anthology series,

Arch Oboler
Courtesy Library of American Broadcasting

which critics acclaimed for its imagination and craftsmanship. Oboler's experimental *Comedy Theatre* was discontinued by the American Broadcasting Companies (ABC) after only six episodes.

When Oboler died in 1987, a syndication firm was releasing much of his radio work that had not been heard for more than 40 years. Throughout his career, Oboler gave the horror genre legitimacy and seriousness, leading author Stephen King to call Oboler "the genre's prime auteur." Inheritor of Edgar Allan Poe's dark, fantastical vision, Oboler paved the way for such future masters of the grotesque as Rod Serling and Ray Bradbury.

Obscenity and Indecency on Radio

Radio has long been considered a guest in the home or car, and so the medium has been constrained in the kinds of language broadcast. The original language of the Radio Act of 1927 (Sec. 29) indicated that “No person within the jurisdiction of the United States shall utter any obscene, indecent, or profane language by means of radio transmission.” However, it was not until 1948 that Congress put teeth into this provision by incorporating this prohibition into the criminal code (18 U.S.C.A. 1464). But does such a constraint violate First Amendment rights of free expression? And has the cultural climate of language usage changed since 1948? Do we know what constitutes *obscene* or *indecent* for everyone, or do these meanings differ from one person to another? Is there any good way for the Federal Communications Commission (FCC) or the courts to enforce this measure without violating a provision in the Communication Act (Section 326), let alone the First Amendment, that prohibits the censorship of broadcast communication? These questions complicate any clear answer to or brief discussion of this issue. However, some court decisions and activities of the FCC give us a history upon which we can base an informed discussion.

Developing Concern

Early in the history of broadcasting, those who announced or otherwise spoke on radio did so with a great deal of decorum and civility. Often they would wear formal attire, even though no one could see them. The language was precise, enunciation was as perfect as possible, and certainly there was neither slang nor profanity. “Radio speakers” were guests in listeners’ homes, and they spoke with careful politeness.

The FCC recognized in 1975 that

broadcasting requires special treatment because of four important considerations: (1) children have access to radios and in many cases are unsupervised by parents; (2) radio receivers are in the home, a place where people’s privacy interest is entitled to extra deference; (3) non-consenting adults may tune in a station without any warning that offensive language is being or will be broadcast; and (4) there is a scarcity of spectrum space, the use of which the government must therefore license in the public interest. (56 FCC 2nd 97)

However, radio evolved to the point that speakers became less formal and more conversational in their radio dialogues with the listener. American culture was changing. Nudity in over-the-counter magazines such as *Playboy* appeared. Frank discussions about sex were no longer as taboo as they had been previously. It was during this time, in the late 1950s and 1960s, that the U.S. Supreme Court tried yet again to define obscenity issues in the media.

In *Roth v United States* (1957), the U.S. Supreme Court tried for the first time to establish some definite measure to define obscenity, after noting that it was not protected by the First Amendment. It was a matter of “whether to the average person, applying contemporary community standards, the dominant theme of the material, taken as a whole, appeals to prurient interest.” There was still no certainty as to what *prurient* meant. A definition was left unarticulated in the case of *Jacobellis v Ohio* (1964): Justice Stewart stated that although he had a hard time defining pornography, “I know it when I see it.”

In *Memoirs v Massachusetts* (1966), the new element added to the definition was that material is patently offensive when it affronts contemporary community standards relating to the description or representation of sexual matters. “Pandering material,” that which openly advertises and appeals to erotic interests, was yet another element added to the definition in 1966 (*Ginzburg v United States*).

But by 1967, the courts had become flooded with obscenity cases, resulting in confusion. In *Redrup v New York*, the court articulated a kind of reverse definition: nothing was obscene except when it fell under the specific circumstances of (1) “pandering,” (2) failure to uphold specific statutes designed to protect juveniles, or (3) an assault upon individual privacy by publication in a manner so obtrusive as to make it impossible for the unwilling individual to avoid exposure to it. It is perhaps this third provision that prevented obscene language in broadcasting in an era in which such language was becoming common in other media.

By 1973, in one of the last attempts by the U.S. Supreme Court to define obscenity, in *Miller v California*, the Court fell back to the elements of the “Roth rule” from the 1957 case. It also added the notion of the “SLAPS rule,” which takes into consideration whether the work in question lacks “Serious Literary, Artistic, Political or Scientific value”; the Court thereby rejected the previous obscenity standard of being “utterly without redeeming social value.”

It was during this era that American mass culture continually presented the courts (and, where broadcasting was concerned, the FCC) with dilemmas of staying with the traditional or liberalizing policies to accommodate new language and attitudes about sex.

As American culture changed, how was radio to reflect this shift? Slang expressions, double entendres, dirty jokes, and

derogatory terms became popular. Indeed, during that era, some talk radio programs, known as “topless radio,” discussed matters of sex in a frank manner. Here, talk show hosts, disc jockeys, and phone-in callers engaged in sexually explicit dialogue, apparently for the express purpose of titillating listeners. Some stations were found to be broadcasting indecent material, however, and fined by the FCC in 1973.

But the pivotal case as it relates to obscenity or indecency on radio came in the case of comedian George Carlin. In his comedy routine “Seven Dirty Words You Can’t Say on Radio or Television,” Carlin expressed thoughts about the nature of some taboo words and how nonsensical their expressions were in many colloquialisms. His descriptions poked fun at society’s view of such words. His humorous satire examined the “language of ordinary people . . . and our silly attitudes toward those words.” Carlin’s routine on the subject was recorded and released with the provision “not for broadcast.” However, a New York City radio station owned by the Pacifica Foundation aired the dialogue one afternoon. A man heard the broadcast of the dialogue while driving with his young son and wrote a letter of complaint to the FCC. He stated that he could not understand why the recording had been broadcast over the air that the FCC was supposed to control (*FCC v Pacifica*, 1978).

The challenge worked its way through the courts for nearly five years, from 1973, when it was first aired, until 1978, when the U.S. Supreme Court decided on it. Because of the dilemma between the FCC’s need to prohibit indecent broadcasts and the constitutional rights guaranteed by the First Amendment, the U.S. Supreme Court agreed to hear the case. The Court in considering this dilemma had to take into consideration both the changing social climate of increasing latitude and also the fact that the sketch had been broadcast in mid-afternoon, at a time when any child might have been listening. The Court looked at the FCC’s enforcement role and its mandate for enforcement from the U.S. Code on indecency and reflected on the cases over the previous decade, which had maintained no First Amendment protection for obscene material. The Court also looked at the careful definitions of *obscenity* and *indecency*.

However, the need for more stringent definitions seemed necessary for broadcasting. One distinction was that *indecency*, unlike *obscenity*, may have First Amendment protection. The concept of *obscenity* uses a more serious standard than does *indecency*, which was defined by the court in the *Pacifica* (1978) case as “intimately connected with the exposure of children to language that describes, in terms patently offensive as measured by contemporary community standards for the broadcast medium, sexual or excretory activities and organs, at times of the day when there is a reasonable risk that children may be in the audience.”

The Court went on to suggest that the material might not have been indecent under some circumstances, such as when

children would not be present. This notion led to the concept of *safe harbor*, a time, for example late at night, when the number of children listening is minimal and when it might be safe to consider a different standard.

For many succeeding years, the FCC applied this ruling to indecent programming airing before 10:00 P.M. By 1987 the FCC changed its definition of *safe harbor* and came to consider a more general definition of indecency. Time of day became less of a factor, because children or youth could often be found listening at all hours. Context became the important factor in determining indecency. Later, the Commission returned to the safe harbor idea, changing the start of the harbor to midnight, provided that the questionable materials began with appropriate warnings. It was assumed by the Commission that parents would maintain some control over their children's listening after midnight. Thus, the focus shifted from the FCC's policing to setting up zones in which parents were responsible.

Broadcasters, together with other interested parties, challenged this new post-midnight safe harbor, because there didn't seem to be any data on such a safe zone. However, Congress intervened, and in the 1989 appropriations bill signed by President Reagan, the FCC was required to enforce a ban on indecent and obscene speech 24 hours a day. This was Congressional grandstanding—they knew such a full-time ban would never survive Court review, but they could look virtuous. Courts eventually did overturn the ban.

Further litigation continued well into the next decade with continually varying definitions of *safe harbor*. The FCC decided in 1993 to look at indecency from the other side; rather than addressing the issue of a safe harbor for questionable language, the FCC declared that it would enforce a safe harbor from 6:00 A.M. to 8:00 P.M., during which time indecency would not be aired. This left the later evening hours up for grabs, but the Commission still maintained a watch on complaints about indecency.

Elements of indecency evolved from topless radio to "shock jocks," disc jockeys and hosts who used shocking and titillating language to enhance their popularity, language and descriptions to which listeners had become more accustomed. Don Imus and Howard Stern were examples of this type of rawness, and unpredictability became popular. Stern, who proclaimed himself "King of all Media," often asked his guests about their sexual habits. References to women were generally about their sexual attributes. His female co-host was the object of frank discussions about sexual habits, and sometimes he would spank bikini-clad females. Radio leaves everything to the imagination, so it was difficult to determine whether it was the act on radio or the imagination of the listener that made things unacceptable.

Stern, who wrote books about his misadventures, and about whom a movie was made, remained unabashed about his boldness. It was this brash style that took him from one

market to the many markets that carried him. As long as there was an audience to listen to his material, it appeared to be socially acceptable, even though most of his audience members were adolescent white males who chuckled at the suggestive material. He spoke of masturbation, incest, and the breast size of famous women, and he included segments on "bestiality dial-a-date." His antics caused him to be fined by the FCC on the basis of violating the federal statute prohibiting the use of obscene, indecent, or profane language on the air. His parent company, Infinity Broadcasting, fought the fines, and they remained in litigation for several years until Infinity moved for a deal to acquire other broadcast stations, a proposal that had to have FCC approval. An agreement was struck, and Infinity paid some of the fines incurred by Stern.

But the shock jock's language and antics continued to trouble some segments of listeners. One church group called for a widespread boycott of products advertised on Stern's shows. The advertisers found that their sales dropped; in turn, they dropped their advertising support of the radio personality. Occasionally, this infuriated Stern, who lashed out against such groups. His infamy was noted in the national press in the spring of 1999, when, while speaking of the shooting tragedy at Columbine High School, he indicated that the shooters were kind of stupid—they should have had sex with those girls before they took them out. This statement put Stern in a questionable light in the minds of many, but his program continued.

Specific challenges regarding the definition of indecency remained problematic. In the early 1990s, an album by the rap group 2 Live Crew, *As Nasty as They Wanna Be*, proved to be troublesome for many. It contained hundreds of sexual references and obscenities. Live performances of material from the album caused arrests of the group members. There was word that some stations tried to air the work, but no complaints ever reached the FCC, and no action was taken against 2 Live Crew by the FCC.

In Santa Barbara, a station licensed to the Regents of the University of California played sexually explicit lyrics in the recorded music "Making Bacon" by the Pork Dudes. A Pacifica station in Los Angeles played excerpts of the play *The Jerker*, about a homosexual dying of AIDS. Although the story and theme were not found to be objectionable by the FCC, the extensive use of patently offensive language referring to sexual and excretory organs and functions caused the FCC to rule that the broadcast was indecent.

There is an ever-growing list of broadcasts that either have been or could be cited for the use of indecent language. The examples given previously illustrate the problems with definition and enforcement by the FCC.

Profanity can be equally offensive for some listeners, but judgments regarding profanity are highly subjective, and profanity is considered to have different levels of offensiveness as part of the artistic expression. Such complications make it

difficult for the FCC to enforce the prohibition of “profane language.” *Profanity* is “the use of irreverent or irreligious words, including cursing by invoking deity.” In earlier generations, profanity was common but was usually confined to specific groups that would be tolerant of such words—not in “polite, mixed company” and certainly not in broadcasting.

Recently, profanity has become more common, perhaps because of its widespread use in movies. The FCC has viewed profanity as being judged from the perspective of the listener or viewer. Generally, the Commission will not bring action unless a speaker uses profanity so repeatedly in invoking a curse as to cause a public nuisance. So radio announcers and talk show hosts who occasionally invoke deity in a profane manner would not likely incur any action from the FCC. More recently, the use of profanity in everything from the language of some musical artists to prime-time television shows would make any enforcement of the profanity prohibition difficult. Indeed, one letter from a conservative watchdog group in the fall of 1999 about indecent language on network television received the reply from the FCC that as long as language was used “in context,” there were no words that could be forbidden. It was a trend that concerned the more conservative observers.

A newer problem is the wide diversity of the media and the invisible nature of those media that are not really “broadcast” and are therefore not punishable under the indecency rule that applies only to “broadcast” language. For example, when one watches premium cable channels and sees R-rated movies with a plethora of obscene, indecent, and profane language, it is easy to get the idea that such language has become acceptable in broadcasting on radio and television. However, cable dissemination is another medium, not a broadcast entity. Although the distinction remains clear in the minds of regulators and enforcers, it may be less clear in the minds of consumers—listeners and viewers. Such popularizing of language once found taboo makes for mixed signals about the implementation of unlawful language in broadcasting.

Was there a legislative cure? In 1996 Congress passed the Communications Decency Act, seeking to protect minors from harmful material, specifically on the internet, but the Act included the term *transmission*, which could be construed to include broadcasting. The American Civil Liberties Union challenged the law on the basis that it violated First Amendment rights. The U.S. Supreme Court in 1997 ruled that the Act’s provisions of “indecent transmission” and “patently offensive display” abridged the freedom of speech protected by the First Amendment; the ruling thus struck down the Communications Decency Act.

The convergence of broadcast, cable, and the internet has further confused the picture of exactly what constitutes “indecent, profane or obscene” language and when and under what circumstances such language may be broadcast or prohibited.

As social mores change, so too will the laws and policies affecting materials seen in the media or heard on radio.

Office of Radio Research

Applied Studies of Audiences

The Office of Radio Research was established in 1937 after the Rockefeller Foundation extended a two-year grant to Hadley Cantril, a psychologist at Princeton University (best remembered for his studies about the effects of Orson Welles' radio broadcast *Invasion from Mars*), and Frank Stanton, a recent psychology Ph.D. from Ohio State University who headed up research for the Columbia Broadcasting System (CBS) and ultimately directed the network as president from 1948 to 1971. The two researchers had proposed a series of studies to broaden the methods for assessing the impact of radio on the public, including the motivations for listening, radio's psychological value to the audience, and the role it played in their lives. Although they had envisioned extensive use of experimental methods, they chose as their research director an Austrian-trained psychologist, Paul Lazarsfeld, who proved to have a deep interest in applied research and methodological innovation. Lazarsfeld had come to the United States on a Rockefeller fellowship in 1933 and remained there after a protofascist government took power in Austria in 1934.

As associate directors, Cantril and Stanton oversaw the work of the office, but Lazarsfeld was in charge of its day-to-day operations, which were initially handled at an office in Newark where Lazarsfeld had already set up an applied social research center in conjunction with the University of Newark. As an intellectual alliance became firmly established between Stanton and Lazarsfeld, Cantril began to withdraw from the project, and the offices, still officially known as the Princeton Office of Radio Research, migrated in 1938 to New York City's Union Square. In 1939, Princeton severed its ties and the project was moved to Columbia University. Given the relatively limited amount of funding available, Lazarsfeld was forced to pursue a wide variety of audience studies, depending often on archival data previously gathered for Gallup polls and radio program audits as well as soliciting applied research projects from commercial organizations. Lazarsfeld was espe-

cially adept at secondary analysis of program ratings, with a particular focus on the social differences between the audiences of various programs, an approach that was nurtured by his European concern for social stratification.

In a successful attempt to win additional Rockefeller Foundation support, Lazarsfeld initiated plans to publish the research studies generated by his small staff. Twice, in 1939 and in 1940, he arranged for an entire issue of the *Journal of Applied Psychology* to be wholly devoted to radio research completed by the office; he was also responsible for a thematic compilation of studies in book form, titled *Radio and the Printed Page*, published in 1940. This tradition continued with three volumes of essays titled *Radio Research* that Lazarsfeld and Stanton jointly published in 1941, 1944, and 1949. The major proposal that Lazarsfeld put forth to ensure a three-year renewal of Rockefeller funding to begin in March 1940 was the idea of creating a study involving two large panels of radio listeners to be interviewed at intervals to assess their response to a sequence of radio broadcasts.

Initially, the research was to be centered on a radio program sponsored by the Department of Agriculture, but ultimately the panel design was implemented for a study of the impact of mass media on voting during the 1940 presidential campaign between Democrat Franklin Roosevelt, running for an unprecedented third term, and Wendell Willkie, a Republican utility executive. The unexpected results—only 54 out of 600 panel members shifted from their initial voting preferences between May and November—led Lazarsfeld and his colleagues, Bernard Berelson and Hazel Gaudet, to devise their theory of the two-step flow of communication effects, in which opinion leaders provide a critical interpersonal link between mass media messages and their intended audiences (*The People's Choice*, 1944, 1948).

In the decade of the 1940s, the office supported a number of studies that marked their authors as prominent innovators

in communication research, including sociologist Robert Merton's study of Kate Smith's radio war bond campaign; Bernard Berelson's study of the effects of the 1945 New York City newspaper strike; and Herta Herzog's study of the motivations of women soap opera listeners using in-depth interviews, a precursor of focus group methodology. Joseph Klapper, who later headed audience research at CBS, completed his dissertation under Lazarsfeld's direction in 1949. A revised version published in 1960, *The Effects of Mass Communication*, forcefully argued against the notion of powerful mass media. Lazarsfeld also invited fellow European émigrés to the office. Film theorist Rudolf Arnheim analyzed the dramatic content of soap operas, and critical theorist Theodor Adorno studied the role of popular and classical music, although Adorno was uncomfortable with Lazarsfeld's quantitative techniques.

Key to the success of the office may have been the relationship between Lazarsfeld and Stanton. Lazarsfeld was ever mindful that he needed the confidence of the broadcast industry to acquire access to the data it gathered as well as political support, but he also realized that he had to persuade executives that studies with negative or unorthodox findings might nevertheless help them better understand and run their industry. Stanton not only had financial resources at CBS to fill in funding gaps at the office, but he was an ally who shared Lazarsfeld's commitment to innovative research techniques. Their joint development of what was called the Lazarsfeld-Stanton Program Analyzer reflected their shared zeal. This device, used both at the office and at CBS studios, allowed the simultaneous recording of the individual opinions of a test audience. Ten listeners at a time could indicate when they liked or disliked the program they were hearing. Such an instant audience analysis machine would be replicated 40 years later using networked personal computers.

Curiously, the Office of Radio Research benefited as well from the social and technological disruptions occasioned by the outbreak of World War II in Europe and by the United States' eventual entry into the conflict. The Rockefeller Foundation's support of radio research was motivated in no small part by a concern about the uses of radio programming for propaganda in wartime. And when America found itself at war, social psychologist Samuel Stouffer, who headed research for the U.S. Army, pursued some of his projects using Lazarsfeld's personnel and even the office's program analyzer. Finally, the exigencies of the wartime economy interrupted the development of commercial television in the United States, artificially extending radio's dominant role in American life.

The vitality of broadcast radio and the importance of this wartime research no doubt aided Lazarsfeld in his quest to fully integrate the office into the structure of Columbia University as a research unit in the graduate school. This he

achieved in 1945, shortly after renaming his hybrid organization for academic, governmental, and commercial research the Bureau of Applied Social Research. It is unclear whether the name change was an attempt to achieve academic legitimacy, to broaden its research mission, or both, but by the time the bureau celebrated its 20th anniversary in 1957, it had effectively abandoned commercial broadcasting as a focus of study.

Office of War Information

World War II U.S. Government Agency

The Office of War Information (OWI) was intended to be the primary voice of the United States government during World War II. It cleared government radio programs and provided background information on the war for use by broadcasters and periodical publishers.

Origins

The Office of War Information began its life as a response by President Franklin D. Roosevelt to the petty sniping and conflicting reports released by rival government information agencies. Established on 13 June 1942, the mission of the Office of War Information was described in Executive Order 9182 as “the facilitation of the development of an informed and intelligent understanding, at home and abroad, of the status and progress of the war effort, and of the war policies, activities, and aims of the Government.” The OWI’s domestic branch was formed by combining all or parts of three existing entities: the Office of Facts and Figures, the Office of Government Reports, and the Information Division of the Office of Economic Stabilization, while its foreign or overseas branch was created from the existing Foreign Information Service of the Office of the Coordinator of Information. The OWI soon expanded its scope beyond the duties of the agencies it replaced, moving into production and policy along with information dissemination.

Although similar to its predecessors in function, the OWI was envisioned initially as having greater authority than the agencies it replaced. But Roosevelt refrained from giving the OWI the necessary teeth to accomplish the task at hand. Many federal departments still had their own information units, and the OWI’s authority allowed it only to coordinate their various activities. It could suggest whether a given piece of information should be released or withheld, but it had no recourse if other agencies ignored their advice. Thus in practice the OWI had no more real authority than the agencies it replaced had exercised.

Structure of the OWI

Appointed to head the OWI was journalist and former CBS radio commentator Elmer Davis, who as director was to be involved in larger policy issues both at home and abroad. The choice was hailed almost universally in all quarters, for his radio work had given Davis a reputation for honesty and common sense. His associate director was Milton Eisenhower, a former official of the Department of Agriculture. Eisenhower

was appointed specifically to handle administrative matters, as Davis had no experience in that area.

Former Office of Facts and Figures head Archibald MacLeish assumed the post of Assistant Director for Policy Development and reported directly to Davis’ office. MacLeish’s office served as a think tank of sorts for policy questions, which were then referred (with recommendations) to Davis for final action.

The two branch heads for domestic and foreign operations were next in the hierarchy. Robert Sherwood, noted playwright (*Abe Lincoln in Illinois*) and one-time Republican who became speechwriter and advisor for Franklin Roosevelt, was chosen as Administrative Director for Overseas Operations. Moderate Midwestern publisher and radio station owner Gardner “Mike” Cowles, Jr., was appointed Assistant Director for Domestic Operations.

Foreign Branch Activities: The Voice of America

The difference in the titles of Sherwood and Cowles was no accident. Sherwood, the former head of the Foreign Information Service of the Office of the Coordinator of Information, had centered his burgeoning operation in New York, not Washington, and much of its later work was actually based in England. Davis and Eisenhower had no experience in international affairs, and much of their time would later be spent trying to smooth the ruffled feathers of “a new and often cantankerous staff on the one hand, and dissatisfied executive departments on the other.” From the outset Sherwood and the overseas branch maintained a level of autonomy and distance from its superiors (and from congressional criticism) that the domestic branch could not duplicate.

The Voice of America (VOA), the radio service of the overseas branch, was created in the belief that the U.S. was lagging behind both the Germans and the British in the use of radio as a tool of war. Originally part of the Foreign Information Service, its formation predates that of the OWI by several months. John Houseman, a theatrical and radio producer best known for his collaboration with Orson Welles, was appointed by Sherwood to head the Voice of America. Under his leadership, the Voice, as it was known, was a bastion of liberalism. Its sound was unique, making use of agit-prop and experimental radio and theater techniques to communicate its views. Organized on the principal of language desks (much like the short-wave operations of the BBC), the VOA became a haven for expatriates from every nation under Nazi occupation. As a part of the foreign branch, the VOA exercised direct control

not only over its programming but eventually over its broadcast facilities, acquiring the use of all 14 of the existing short-wave outlets in the U.S. by early 1943.

Under Houseman, the VOA played an important role in defending America against criticism for the lack of a second front during the dark days before the tide of war had turned. By the summer of 1943, however, as victory began to appear likely for the Allies, the liberal propaganda style of Houseman and his staff gave way to a less dramatic, more journalistic approach, one meant not to rouse people to action but to inform. This trend accelerated after Houseman and many of his adherents left the VOA. Military news took precedence over the political, and anything smacking overtly of propaganda was dropped (on the principle that those living under Nazi occupation had heard enough of it already). This approach continues to be effective for the VOA to this day.

Domestic Branch Activities

At its peak, the OWI's domestic branch had its finger in nearly every aspect of the war effort, to the dismay of its critics, and scores of federal agencies cleared information through it daily. This broad reach was not to last, however.

In a democracy, a domestic government propaganda operation cannot help but be slightly suspect, even in wartime, so it is surprising that OWI homefront activities went unchallenged as long as they did. Elmer Davis had been on the job a little more than a year before the dam broke. During the spring and summer of 1943 a congressional coalition of Republicans and conservative Democrats attacked the agency, accusing it and its director of using its resources to work for the re-election of Roosevelt in 1944. The fact that its director had been a frequent critic of congressional Republicans before leaving CBS for the OWI made the situation even worse. Davis fought a losing battle with Congress over the organization's domestic activities and budget, even threatening to resign. By the time the situation had eased somewhat in late June, domestic operating expenditures had been trimmed to \$2.75 million, a meager amount compared to the \$24-million budget approved for the overseas branch. The appropriation was just enough, Davis mused, to avoid "the odium of having put us out of business, and carefully not enough to let us accomplish much." As it was, the cuts forced closings of regional offices around the country. The motion picture production and publishing arms ceased to exist, and much of the responsibility formerly held by the OWI was lost to other government agencies or returned to private-sector entities such as the Advertising Council. As a result, the OWI's domestic operations became precisely those of the "coordinating super-agency" that had been decried.

One of the few domestic activities not drastically reduced in scope was OWI placement of government messages on radio programs and stations, both national and local. As all time

was "donated" (participation was mandatory), expenses were minimal. The system put in place to organize this effort was devised and managed by the staff of the OWI Radio Bureau.

The Radio Bureau

According to a preliminary inventory of the files of the OWI, published by the U.S. Government Printing Office in 1952, the Radio Bureau "reviewed, cleared and approved all proposed radio programs sponsored by Government agencies and served as a central point of contact and clearance for other agencies in other relationships with the radio broadcasting and advertising industries." It also "obtained the use of radio programs with a known audience," and "kept the radio industry informed of the relative importance of the many requests for contribution of free time for Government programs.

Within the bureau were various divisions, each with its own specific area of concentration. These included the Government Liaison Division, the Program Services Division, and the Industry Relations Division. The most important, however, was the Allocation Division. Its primary function was the management of the seven "facilities plans," four providing for the orderly inclusion of "action"-oriented messages (those requiring activity on the part of the listening audience, such as "Don't Buy Black Market Meat") and three plans devoted to communicating war-related "background" information (messages which were meant to educate the American people about why they were fighting and what they were fighting for). The seven facilities plans administered by the Allocation Division were developed to "better insure effective, well planned dissemination of all war information (exclusive of war news) via radio."

First and most extensive among the more specific "action" plans was the Network Allocation Plan. The primary goals of this plan included a "determination as to what needs were paramount and deserved priority," an "orderly allocation and distribution of needs over the radio network structure," and a "wise distribution of war messages which would not surfeit audience and harm established listening habits." To accomplish these tasks, an elaborate bureaucracy was developed linking the four national networks, the various national sponsors, and the program-producing advertising agencies to the OWI Radio Bureau's Allocation Division in Washington, D.C. Under this plan every network program classified as entertainment would carry such information as the Allocation Division provided. Shows broadcasting weekly were required to include a message once every month, while those airing more frequently, such as the many soap operas of the day, were expected to air two such messages in the same period. Schedules were designed to prevent audience overexposure to any one campaign, and many radio campaigns could be run simultaneously owing to the large number of programs available for use.

Copies of all OWI allocation directives concerning a specific program were sent to each of the parties involved. The networks appointed OWI liaisons for both sponsored and sustaining programming, while sponsors usually delegated the job to someone in their advertising department (often the manager himself). These communications to sponsor and the network sponsored program liaison were just courtesies, however, as the bulk of radio's creative work at this time was carried on in the radio departments of advertising agencies around the country (though mostly in New York, Chicago, and Hollywood). These agencies were hired by the sponsor to handle every facet of a show, from conception to production. It was through the like of Kenyon & Eckhardt, Lord & Thomas, BBD&O, and J. Walter Thompson that the government's information truly flowed to the ears of the American people.

OWI information was distributed in the form of a fact sheet that contained the information to be stressed in a program's scheduled allocation. This, along with a cover letter listing the name of the program it was for and the projected date of broadcast, was sent to the ad agency's OWI liaison, usually a staffer in the agency's radio division. Once the information reached the hands of the program's writers, its treatment was completely up to them. Participation was viewed as mandatory, and Radio Bureau staffers monitored broadcasts to verify that assigned allocations had been carried, judging them according to perceived effectiveness at the same time.

The Station Announcement Plan and National Spot Plan were similar in form and function to the Network Allocation Plan but targeted independent stations, syndicated and local sports programming, and other non-network fare.

The final plan in the action group was the Station Live Program Plan, which was under the control of the various OWI Regional Radio Directors who, working with local stations, would try to produce one-shot war programs with more of a hometown flavor. The OWI promoted the importance of a local character coming through over the air so that people would feel more connected to the war effort.

The first of the background information plans was the Feature Series plan. This plan, proposed jointly by the four national networks, called for a "series of network programs embracing background issues of the war which cannot be fully delineated by radio in any other way." The focus was "not on the progress of the war, and not on the things the citizen must do to help win the war, but on the things the citizen must know and understand about the war effort in order wholeheartedly to play his part during the war and in the establishment of a just and lasting peace."

The next background plan made use of existing network programming in much the same way as the Network Allocation Plan did, but shows on the Special Assignment Plan were those that volunteered their time and talent "over and above" the requirements already set by the Network Allocation Plan. These

programs developed a stronger relationship with OWI and were given more personal treatment by the Radio Bureau, along with tremendous access to government facilities and resources.

The final background plan was the Station Transcription Plan, which consisted of "transcribed war programs produced for station use by government agencies." Stations could receive programs upon request. The two main programs offered were *The Treasury Star Parade* (in cooperation with the Treasury Department), which was a three-a-week series, and the OWI's own show, *Uncle Sam*, a five-a-week "strip."

It is not possible to truly gauge the overall importance of radio as a tool of government information dissemination during World War II, even from the vantage point of more than a half-century later. Still, despite the difficulties inherent in its task, the OWI was correct to let radio do the job at home with a minimum of government interference, and in many ways it was a success story of amazing proportions. Some expressed alarm at the use of advertising techniques in the service of the war effort, but a great deal of important government information was communicated effectively to the nation's civilian population using the familiar forms of radio advertising. Though it is hard to isolate radio's impact from other media, its role as a common focal point of American life undeniably helped foster a unity of purpose among those on the home front that may not otherwise have existed. That the work of the former radio arm of the overseas branch, the Voice of America, goes on to this day is an indication of its perceived effectiveness. Though World War II and the Cold War have ended, the VOA continues to serve the foreign policy goals of the United States, broadcasting 900 hours of programming each week in 53 languages.

Oldies Format

The Oldies radio format features the greatest pop music hits of the 1950s and 1960s. The format was created in the early 1970s and initially targeted the musical tastes of the 18- to 34-year-old "baby boomers." The format still targets baby boomers today, although they are now predominantly 35 to 54. This audience was the first generation to grow up with rock and roll. The format's core artists include such 1950s standouts as Elvis Presley, Chuck Berry, Buddy Holly, and the Everly Brothers and 1960s superstars such as the Beatles, Supremes, Beach Boys, and Four Seasons.

The Oldies format was based on a segmentation strategy that targeted older Top 40 listeners. Top 40 was the first radio format to target a young audience, and from its inception in the late 1950s through the late 1960s, it was virtually the only younger-appeal format. When musical styles changed in the late 1960s and early 1970s, a certain portion of the Top 40 audience ceased to relate to the current style of popular music. This disenfranchisement created a format void that was ultimately filled by the creation of the Oldies format.

Top 40 stations play mostly current hits, with a few oldies thrown in each hour. For Oldies stations, the entire focus is on 1950s and 1960s oldies, although some first-generation Oldies stations occasionally played current hits, calling them "Future Gold." This practice was dropped when Oldies stations discovered that their audience didn't want to hear current music, not even one song an hour. Research showed the audience wanted Oldies music exclusively, and this exclusivity became the format's most powerful listener benefit. The success of this appeal was the genesis for the format's most popular positioning statement, "All Oldies. All The Time."

The Oldies format was a natural, evolutionary outgrowth of Top 40 radio. Consequently, it was shaped by the same cultural factors that affected our society at that time. In the 1950s and 1960s America was a "mass market" society. There were few media choices. Most markets had one or two daily newspapers; three network TV stations (American Broadcasting Company [ABC], Columbia Broadcasting System [CBS], and

National Broadcasting Company [NBC]); and a handful of AM radio stations. (FM stations didn't gain significant listening levels until the mid-1970s.)

Because of the limited media choices, media (and virtually all other consumer offerings) were targeted to the mass audience. Most radio stations were programmed to appeal to a broad, adult audience. When the Top 40 format was created, it too was programmed to a wide demographic target audience that ranged in age from subteens to people in their 30s and 40s. Therefore, Top 40 music of the day was an amalgam of many tastes and styles and represented a variety of music, including such divergent artists as Fats Domino; Percy Faith; Peter, Paul, and Mary; The Singing Nun; Roger Miller; Herman's Hermits; Dean Martin; James Brown; Cream; and others. This diversity of musical styles is reflected in the playlists of today's Oldies stations.

The first stations involved in the development of the Oldies format included Westinghouse's WIND-AM in Chicago; CBS FM's WCAU-FM in Philadelphia; and the station that became the format's standard bearer, CBS FM's flagship station, WCBS-FM in New York City. Other early Oldies stations included KRTH-FM in Los Angeles, WFYR-FM in Chicago, and KOOL-FM in Phoenix.

The early success of WCBS-FM was notable for two reasons. First, the station operated in the spotlight of the nation's largest market, and anything of consequence that happened in the number-one market made news. Second, it was an FM station that was beginning to get noticeable ratings at a time when the overwhelming majority of all listening still occurred on the AM band.

WCBS-FM's success had a major impact on the format. Radio operators surmised, "If WCBS-FM can pull a three-share in New York City, with all of the stations in that market, imagine what we can pull in ours." What they discovered, in most cases, was that their Oldies station also was able to pull a three-share, which was indicative of the format's appeal at that time.

Oldies was viewed as a niche format. It had a small, loyal audience but was not considered a format that would make a station a market leader. Most Oldies stations were operated on that premise. Generally, they tended to be on the AM dial with inferior signals (at a time when radio listening was increasingly focused on the FM dial). Most ran network or syndicated programming that was not local, they weren't promoted or marketed, and they were low-cost operations with modest profit goals. There were some notable exceptions, but for the most part the radio industry perceived Oldies to be a second-tier format. Like many beliefs, this had the possibility of becoming a self-fulfilling prophecy. Since the radio industry did not believe Oldies could deliver big ratings, it did not invest resources in the format, and thus the format did not grow.

This perception lasted until the mid-1980s, when two major broadcasting companies began achieving big ratings with their Oldies properties. Shamrock Broadcasting's WWSW-AM-FM in Pittsburgh, KXKL-FM in Denver, and WFOX-FM in Atlanta and Sconnix Broadcasting's WQSR-FM in Baltimore and WMXJ-FM in Miami served as pivotal success stories that forced the industry to reevaluate Oldies as a

format. These two companies asked the question, "What would happen if you treated an Oldies station like you would any other station? What would happen if you offered local programming, hired programming consultants, did local research, invested heavily in programming and marketing, and—most important—offered the format on FM?" From the late 1980s to the mid-1990s, market after market saw the emergence of a new FM Oldies competitor. Today, Oldies is considered a major radio format, and in virtually every large and medium market, and in most smaller markets, listeners can find at least one station that specializes in it.

Old-Time Radio. *See* Nostalgia Radio

One Man's Family

Serial Drama

Created by one of broadcasting's neglected auteurs, Carlton E. Morse, *One Man's Family* was radio's most acclaimed and popular primetime serial drama. Relating the multi-generational saga of the Barbours, an upper middle class family in San Francisco, *One Man's Family* aired 3,256 episodes from 1932 to 1959, making it the longest uninterrupted narrative in the history of American radio. With an opening dedication to "the mothers and fathers of the younger generation and to their bewildering offspring," *One Man's Family* reflected the aspirations and tensions of the American family over three decades.

Morse imbued *One Man's Family* with a novelistic aura. He modeled his series on *The Forsyte Saga*, John Galsworthy's sprawling study of an aristocratic family in late Victorian and Edwardian England. To underscore the literary parallel, Morse

divided his series into "books" and "chapters," which were announced at the beginning of each show. The final program closed the run at Chapter 30 of Book 134. The artistic trappings help give *One's Man's Family* a critical legitimacy, making it seem more than soap opera, closer to literature. Much of the critical discourse about the program echoed Gerald Nachman's assessment that the serial "was emblematic of America's ongoing faith in the home as the savoir of the nation and the wellspring of its spiritual strength."

A Morse Creation

Louisiana-born Carlton Morse studied drama at the University of California at San Francisco, where he first became intrigued

with the city that would take hold of his imagination. After struggling as a journalist, he joined the staff of KGO, the San Francisco radio affiliate of NBC two weeks before the stock market crash of 1929. He began writing scripts for the series *House of Myths* and later wrote for such mystery programs as *Chinatown Tales* and *Split-Second Tales*. He gained a reputation for his "blood and thunder" scripts, including "Dead Man Prowl" and "City of Dead," first heard on NBC *Mystery Serial* and later revived for the syndication series *Adventures* by Morse in the 1940s. Morse also crafted plays based on the files of the San Francisco Police Department for *Barbary Coasts Nights*.

Concerned about increasing juvenile delinquency after World War I, Morse turned his back on the action genre and developed a series that would affirm family bonds. Serving as both producer and director, he chose many young actors with whom he worked at the university and at *Mystery Serial* for a new program that would emphasize relationships over plot. *One Man's Family* debuted on 29 April 1932 as a 13-week trial on NBC's San Francisco, Los Angeles, and Seattle stations. Broadcast weekly from the NBC radio studios at 111 Sutter Street in San Francisco, the program was aired in May to the full West Coast lineup of stations and one year later was carried nationwide, becoming the first program based in the West to be heard regularly in the East.

One Man's Family quickly attained commercial viability. In 1934 Penn Tobacco became a regular sponsor for a year, soon replaced by Standard Brands for the next 14 years. With a half-hour Wednesday evening slot and an increasingly devoted audience, the production moved to Hollywood in 1937. *One Man's Family* achieved its highest rating during the 1939–40 season when it was on Sunday evenings following the Jack Benny and Edgar Bergen/Charlie McCarthy comedy programs, and ranked among the top five programs in the nation. In September 1949 there was such a public outcry when Standard Brands dropped the series that NBC sustained it until another advertiser could be found. Miles Laboratories became the sponsor in June 1950 and reorganized *One Man's Family* as a daily quarter-hour program. When the series ended on 8 May 1959, Morse mourned its passing with a note to the *Los Angeles Times*: "The signposts for sound family life are now few, and I feel the loss of *One Man's Family* is just another abandoned lighthouse."

The Ensemble

One Man's Family was immediately recognized for its unprecedented realism. Morse's relationship with his cast was partly responsible for the program's authenticity. Morse wrote the scripts with the personal quirks of each actor in mind, and the ensemble responded by sticking with the program for years. When it ended in 1959, many actors were still playing roles

that they had originated decades before. J. Anthony Smythe starred as the patriarch Henry Barbour, the crusty, conservative stockbroker, for the entire run of the series. Minetta Lane continued as Fanny Barbour, the patient mother of five children, until 1955 as did Michael Raffetto who held forth as the eldest son Paul, a battle scarred veteran who became the trusted moral center of the family. Page Gilman, the son of NBC vice president Don Gilman, joined the cast as a 15-year old playing the youngest son Jack and stayed to the cancellation. When Barton Yarborough, who played the mercurial son Clifford, died suddenly in 1951, his character was written out of the script.

The inaugural episode began with a household of seven; by the end of the run the extended family totaled more than 90. The story lines unfolded slowly and realistically, dealing with such traditional serial subjects as romance, marriage, children, and divorce. Morse tried to capture the rhythms of daily life by listening to his actors and the audience. When the actress Bernice Berwin, who played the eldest daughter Hazel, was pregnant, so was her character. Although much of the domestic action centered on the large family home in the wealthy community of Sea Cliff near the Golden State Bridge and their weekend retreat at Sky Ranch, the well-off Barbours were also affected by national events, especially World War II, which threatened the lives of several leading characters. The tragic heroine of the program, Claudia, was lost at sea when Germans torpedoed her ship, a situation constructed by Morse to allow actress Kathleen Wilson to leave the series and raise her own family. Listeners became so upset that their impetuous and star-crossed Claudia was presumably dead, that Morse revived the role with another actress, Barbara Fuller, who stayed until the end of the series.

Impact

One Man's Family became a national ritual as millions of Americans embraced the Barbour family as their own. Many collectibles were marketed to the ardent fans, including cookbooks, diaries, and family albums. Radio satirists Bob and Ray parodied this sentimental side of the series with their look at the "Butcher family" in *One Feller's Family*. Standard Brands and its advertising company J. Walter Thompson were so pleased with the success of *One Man's Family* that they asked Morse to create another radio series. Morse returned to his action roots and conceived *I Love a Mystery*, which employed many of *One Man's Family* regulars. Morse adapted his family serial to television several times. *One Man's Family* was presented first in 1949 as a weekly prime-time series on NBC. Lasting three years, the live, half-hour television version started the Barbour story practically from the beginning, almost where it began decades before on radio. Consequently, none of the radio stars were asked to participate. This first

video adaptation is notable because it featured a young Eva Marie Saint as the adventurous Claudia with Tony Randall and Mercedes McCambridge in lesser roles. Again starting at the beginning, *One's Man Family* was brought to television as an afternoon quarter-hour soap opera in 1954 but lasted only a year. This time Anne Whitfield played Claudia, while she was also playing Claudia's daughter Penelope on radio. Finally in 1958 Morse tried again with a pilot produced for *The Loretta Young Show*, focusing on the relationship between Claudia (Jean Allison) and Johnny Roberts (Keefe Brasselle), an early radio story line.

Carlton Morse estimated that he wrote more than 10 million words to bring to life his vision of an American dynasty. Like the rest of America, his radio family, although prosperous WASPs, persevered through the Great Depression, World War II, and the beginnings of the atomic age. Morse truly believed that if the integrity and moral strength of the family could stay intact, then no great harm could come to the nation. *One Man's Family* was the embodiment of his patriotic and patriarchal philosophy. If *One Man's Family* is still warmly remembered by radio partisans, Morse's immense talents as a producer/writer/director have largely been forgotten, and references to his creative contribution are missing from several radio histories. *Variety* even misspelled his first name when he died on 24 May 1993 in Sacramento, California. But Morse was diligent to save and copyright his scripts, donating them to Stanford University for serious scholarship.

For those critics who fell under the sway of *One Man's Family*, the collection at Stanford will prove that Morse was not only a pioneer of the serial narrative, but also one of broadcasting's most gifted and compelling storytellers. The program series is one of those honored by the Radio Hall of Fame.

Osgood, Charles 1933–

U.S. News Reporter

Radio news personality Charles Osgood has received many accolades for his unique style. One of his colleagues, Charles Kuralt, referred to him as “one of the last great broadcast writers.”

His ability to take a simple off-beat news story or little-known fact and develop a commentary attracts many radio listeners to his daily morning Columbia Broadcasting System (CBS) Radio News program, *The Osgood Files*, which runs in four installments. CBS News reports that his program is noted for its large audience.

Osgood worked as general manager of WHCT (the first pay television station in the United States) in Hartford, Connecticut, and as program director and manager for WGMS in Washington, D.C. Before going to WCBS, Osgood spent almost four years on general assignment for American Broadcasting Companies (ABC) Radio News, where he did a show called *The Flair Reports*, a radio program similar to *The Osgood Files*.

Prior to joining CBS News, Osgood was a morning anchor and reporter for WCBS Newsradio 88, the CBS flagship AM station in New York City, from 1967–91. On 28 August 1997, WCBS Newsradio 88 celebrated 30 years of all-news format by highlighting Charles Osgood as one of the legends of radio in a program called “Let’s Find Out.”

In addition to his work on CBS Radio Network, Osgood is also a correspondent for CBS Television Network. On 1 April 1994, he was named anchor of CBS News *Sunday Morning*. Before being named to this post, he had provided commentary for *CBS This Morning* and had been a regular contributor to *Up to the Minute* and *Sunday Morning*. Until June of 1992, he was co-anchor of the *CBS Morning News* and a contributor to the *CBS Evening News with Dan Rather*. From 1981–87, Osgood anchored the *CBS Sunday Night News*.

His features for *The Osgood Files*, which he writes and delivers, often display a wit that is blended with a childlike sense of wonder, as exemplified in his frequent sign-off, “I’ll see you on the radio.” To Osgood, radio permits the listener to build his or her own pictures, which are not confined by the “limits of a television screen” but are constructed by limitless imagination.

Early-morning commuters appreciate Osgood’s keen perspective on life, which sheds new light on a fast-paced society. In fact, the Society of Silurians, a distinguished group of New York journalists, have honored him for his “fresh approach to news and its background.”

Often called CBS News’ “poet in residence,” Osgood uses the Dr. Seuss approach to poetry to deliver some of his com-

mentaries in verse. As he says, “The news of the day is so goofy at times/It just seems to fit into couplets and rhymes.” Consequently, it seemed only fitting for President Richard Knedler of Franklin and Marshall College to present Osgood with an honorary Doctor of Human Letters Citation (1998) that was written in verse. Osgood acknowledged the honor by quoting from Theodore Geisel (a.k.a. Dr. Seuss).

Osgood’s commentaries have earned him some of the most prestigious awards ever given to a broadcast journalist. For five consecutive years, he received the *Washington Journalism Review*’s “Best in the Business” Award as “Best Radio Reporter” (1988–92). He also won two George Foster Peabody awards (1985–86) for *Newsmark*, a weekly CBS Radio public-affairs broadcast.

In 1990 Osgood was inducted into the National Association of Broadcasters Hall of Fame. In 1993 he was presented with the Marconi Radio Award for Syndicated Network Personality of the Year. In 1995 he received the Lowell Thomas

Charles Osgood

Electronic Journalism Award from the International Platform Association and the John Connor Humanitarian Service Award from Operation Smile.

Osgood, a native New Yorker, received a B.S. in economics from Fordham University. He also holds an honorary doctorate from Fordham, an honorary law degree from St. John's University School of Law, and honorary degrees from St. Bonaventure University, Stonehill College, College of St. Rose, LeMoyne College, St. Peter's College, and the College of Mount St. Vincent.

Our Miss Brooks

Situation Comedy

One of the most beloved female characters in radio comedy was Eve Arden's Connie Brooks, an English teacher at a Midwestern high school. Miss Brooks was good-humored, witty, and sardonic, a change from the scatterbrained or merely sarcastic female characters who had been plentiful in supporting or co-starring roles in radio comedy up to that time. Miss Brooks was radio's first single woman as lead character in prime time, and Eve Arden brought to the role the character and intelligence that she had become famous for in films such as *Mildred Pierce*. In films, however, Arden had usually played supporting roles, such as the heroine's best friend. *Our Miss Brooks* allowed Arden to shine on her own, and her series became one of the most popular of the postwar period.

Arden was not the first choice for the role of Connie Brooks. Producer Harry Ackerman had originally wanted Lucille Ball, who turned it down, and he had then asked Shirley Booth. Booth refused the series because, Ackerman recalled, "all she could see was the downside of being an underpaid teacher. She couldn't make any fun of it" (quoted in

Nachman, 1998). Meanwhile, Columbia Broadcasting System (CBS) President William Paley had become acquainted with Arden and proposed that she do the series. She passed on the original script, but a rewrite by Joe Quillan and Al Lewis proved more to her taste (Lewis would serve throughout the show's run as writer-director). There was still the matter of the broadcast schedule to negotiate, however. The program was scheduled to premiere at the beginning of the summer, which Arden had planned to spend with her children in Connecticut. She asked if the programs could be transcribed, allowing her to do all 15 in a short time and then depart. The network agreed, and *Our Miss Brooks* became one of the first radio programs to be broadcast by transcription. It quickly became the number-one program of the 1948 summer season.

Arden's warm and witty delivery anchored the program, but she was surrounded by an equally talented supporting cast, many of whom went on to fame in film and television. Gale Gordon, famous for his portrayal of Mayor La Trivia on *Fibber McGee and Molly* (and later as Lucille Ball's television

Eve Arden, *Our Miss Brooks*
Courtesy Radio Hall of Fame

nemesis), played Madison High's blustering Principal Conklin. Future film stars Jeff Chandler and Richard Crenna both had prominent roles—Chandler as Miss Brooks' love interest, biology teacher Mr. Boynton, and Crenna as her adoring, mischief-making student Walter Denton. The other women in the cast were Jane Morgan as Brooks' addled landlady Mrs. Davis; Gloria McMillan as the principal's daughter Harriet; and Mary Jane Croft as Miss Enright, a possible competitor for Mr. Boynton's affections.

Stories often revolve around some scheme of Denton's going comically awry (such as his plan to make Miss Brooks teacher of the year); he inevitably involves Miss Brooks in some way, which ends up getting her into hot water with Mr. Conklin. Conklin constantly suspects Brooks of being at the root of whatever problem is at hand (with some justification), but she is also adept at mollifying him and helps to protect him from the dreaded school board. As Gerald Nachman (1998) has noted, part of the uniqueness of Brooks' character is that "she treated men with refreshing suspicion—but as undeserving equals." Miss Brooks is always the smartest, most rational, most sophisticated person in any room. In her romance with Mr. Boynton, she is clearly the aggressor in the relationship, trying to figure out ways to manipulate Boynton into asking her out on dates. As she explains to Mrs. Conklin in one episode, "In a moment of weakness, I promised Mr. Boynton the entire weekend." Mrs. Conklin asks, "When did you do that, Miss Brooks?" and she replies, "At lunch in about an hour from now. That is, I'm sure he'll accept—er—invite me." Although Mr. Boynton remains friendly and admiring throughout the series, he is perpetually dim with regard to romance and often seems more enamored of his frog, McDougall, than of Miss Brooks.

Connie Brooks' spirit, however, remains undaunted by the lack of progress in her romance or the shortcomings of her profession. Although the program addressed some of the problems of being a schoolteacher—especially low wages and lack of appreciation—Brooks' obvious sense of her own worth helped her rise above her circumstances and served as an inspiration to teachers around the country. Eve Arden received thousands of approving letters from teachers, was often asked to address Parent-Teacher Association (PTA) meetings, and was even offered jobs teaching English at various high schools. Most important, perhaps, Brooks suggested that marriage and children were not the only road to fulfillment for young women in the 1950s. The popularity of the program attests to

the audience's desire for more alternatives than those that the narrowly defined culture of the postwar period offered them, and Miss Brooks made such an alternative seem not only possible, but thoroughly enjoyable as well.

In 1952 *Our Miss Brooks* moved to television, where it ran successfully until 1956, earning Eve Arden an Emmy as Best Actress. Although she continued to appear on stage and in films, Arden's low, throaty voice was instantly recognizable to fans of the show, and she always remained best known as Miss Brooks. Fortunately, most of the program's eight-year radio run is available in recordings, providing a remarkable testament to one of radio's comedy heroines.

Owens, Gary 1936–

U.S. Radio Personality

In his more than 40-year career, Gary Owens has hosted more than 12,000 radio shows. Owens began working in radio in the 1950s, paying his way through college by working at KORN, in Mitchell, South Dakota. As a boy, Owens listened to such radio programs and personalities as *Superman*, *The Shadow*, Jack Benny, and Fred Allen. From KORN, Owens went on to KMA in Shenandoah, Iowa; to KOIL in Omaha, Nebraska; and to KIMN in Denver, Colorado. Gordon McLendon hired him to increase ratings at KILT in Houston, KTSA in San Antonio, WNOE in New Orleans, and WIL in St. Louis. Owens said in a *Billboard* interview: “I was a troubleshooter for McLendon, doing unusual things to gain ratings. I worked in three markets in one year” (Rusk, 1996). In 1959

McLendon moved Owens to the morning drive slot at KEWB in San Francisco, which was within arm’s length of Owens’ ultimate goal of Hollywood.

Owens moved to Hollywood’s KFVB in 1961. In 1962 he began a 20-year stint at KMPC in Hollywood. TV producers and directors hired him for countless parts and voiceovers in movies, TV shows, cartoons, and commercials. Owens, broadcasting direct “from beautiful downtown Burbank,” became one of the more recognizable voices in entertainment. Owens is most famous for his trademark hand-over-the-ear delivery on NBC-TV’s *Rowan and Martin’s Laugh-In* from 1968 to 1973. He was one of many regulars on the one-hour television show. Endless gags were crammed into the hour-long program,

Gary Owens
 Courtesy Radio Hall of Fame

because the producers believed the fast pace would not require all attempts at humor to work so long as the audience was not given time to be bored. From 29 September to 26 December 1969, Owens hosted the daytime game show *Letters to Laugh-In*, a spin-off of the regular show in which four guest celebrity panelists read jokes sent in by *Laugh-In*'s viewers. The studio audience chose jokes to be used on the prime-time program.

In 1982 Owens left KMPC for several other Los Angeles stations. He first went to KPRZ, then to KKGQ-FM in 1985, KFI in 1987, KLAC in 1992, and KJQI in 1993. Since 15 June 1996, Owens has hosted *Music of Your Life*, a radio program syndicated by Jones Satellite Networks. While being seen or heard on TV, Owens has also worked regularly in radio. He told *Billboard* magazine: "I occasionally will get off the air and strictly do television, cartoons, and commercials, but I eat, drink, and sleep radio. I love radio. I always have" (Rusk, 1996). Owens has won 50 Clio Awards and earned a star in the Hollywood Walk of Fame. He has been hailed as a "Legend" by *Billboard* magazine and (along with Gordon McLendon) was named to the Museum of Broadcast Communications Radio Hall of Fame in 1994.

Ownership, Mergers, and Acquisitions

During radio's first seven decades, through the mid-1990s, ownership of radio stations was limited by Federal Communications Commission (FCC) rules. Since the passage of the 1996 Telecommunications Act, owners have been allowed to own not just a few stations, but hundreds. Through multiple mergers and acquisitions, a handful of new radio owners—led by Clear Channel and Infinity/Columbia Broadcasting System (CBS)—have consolidated hundreds of stations under a single corporate umbrella.

The First 70 Years

During radio's development stage in the 1920s, stations were most often owned and operated as secondary sidelines to other businesses, such as hotels, retail stores, or radio-related businesses such as receiver manufacturing or sales. Newspapers acquired stations out of fear of a new competitor for local advertising dollars. Department stores and hotels bought stations to promote their sales. But with the development of the

national networks, the National Broadcasting Company (NBC, owned by radio manufacturer Radio Corporation of America) and then CBS, ownership began to consolidate.

By 1936 about half of all stations were affiliated with a network, but the FCC frowned on networks' directly owning too many outlets. NBC and CBS acquired stations in major cities, reaching most of the population, and these owned and operated units accounted for a quarter of the networks' income. In 1943 the FCC issued a rule limiting owners to no more than one AM and one FM station per market. Thus groups of stations were developed across multiple markets by both networks and by other firms. Later in the 1940s, the Commission set as seven the number of AM stations that could be owned in common. In 1953 the FCC raised the FM limit to seven and formalized the limit of seven AM and seven FM stations that would define radio ownership for three decades.

The New World of Radio Ownership

The dramatic growth in the number of radio stations led the FCC (under pressure from the broadcast industry) to allow several increases in ownership limits after 1980—to 20 AM and 20 FM stations, for a potential national total of 40 outlets—by the early 1990s. Also gone, as of 1992, was the “duopoly rule” that had limited a single group or individual to no more than a single AM and FM outlet in a single market. On 8 February 1996, President Clinton signed into law the Telecommunications Act of 1996, which, among its many provisions, directed the FCC to eliminate the national multiple radio ownership rule and to relax the local ownership rule. In an Order adopted 7 March 1996, the FCC implemented these provisions, and soon the former ownership limits of seven AM and seven FM stations seemed quaint.

The Telecommunications Act of 1996 loosened but did not eliminate ownership restrictions. For example, in markets with 45 or more commercial stations, a single company may own up to 8 stations with no more than 5 as either AM or FM. If the market has 30–44 commercial radio stations, the total number one owner can acquire drops to 7, with a maximum of 4 in the same class (AM or FM). For smaller markets, those with 15–29 radio stations, the total “cap” (permitted absolute amount) drops to 6, with 4 of any one modulation. Finally, in markets with fewer than 14 commercial radio stations, the total that any one company can own is 5, with no more than 3 as AM or FM (in each case, up to half the stations in the market).

Passage of the 1996 Act set off the greatest merger wave in radio history. CBS merged with Infinity Broadcasting, and in a telling metaphor Infinity's founder, Mel Karmazin, noted, “it's like combining two ocean front properties.” He meant that the new empire would not be some “mom and pop” collection of stations, as had often been the case in the past, but would own

seven outlets in New York City, six in Los Angeles, ten in Chicago, eight in San Francisco, and four in Washington, D.C. By 2000, the new CBS/Infinity combination commanded nearly a third of all radio advertising revenues in the top ten markets.

During just the first year after passage of the 1996 law, the FCC calculated that some 2,066 radio stations (about 20 percent of the total) changed owners. As a result of this trading activity, the Commission observed that there were a score of new owners and a significant increase in the number of large group owners—and therefore of concentration of station ownership overall. There were also considerable changes in the composition of the top 50 radio group owners, reflecting mergers between companies on that list as radio groups began to develop into vast empires. And the top media companies continued consolidating: the top ten of 1996 shrank to six by the end of 1997, to a top three by the fall of 1998, and to a Big Two by 2000—Clear Channel and CBS/Infinity after its merger with Viacom. Disney's American Broadcasting Companies (ABC) and Cox's radio division followed as part of major media conglomerates and were the only powers that could offer Clear Channel or Viacom's CBS/Infinity a true challenge.

Clear Channel

Clear Channel Communications, based in San Antonio, Texas, owned more than 900 radio stations by early 2000, the largest radio group in history. It remained the largest in mid-2003, with more than 1,200 stations nationwide. Clear Channel owned stations in the top markets of the United States, yet it was still best thought of as a force in small and medium markets in communities such as Grand Rapids, Michigan (media market 66), and El Paso, Texas (media market 69). Clear Channel had also expanded abroad, acquiring radio stations in Australia, New Zealand, and the Czech Republic.

But Clear Channel's October 1999 purchase of Hicks Muse's collection of radio stations pushed it into an ownership category never fathomed by the creators of the Communications Act of 1934. Hicks Muse, an investment company unknown to the radio business before 1995, owned in excess of 400 stations when it sold to Clear Channel. The deals had come rapidly. In February 1997, in two deals worth more than \$1.6 billion, the largest radio group was formed. The combined company, to be called Chancellor Media Corporation, was put together by Hicks Muse; later that month, Hicks Muse took over Evergreen, and the rush was on. Next came the takeover of ten radio properties owned by Viacom for \$1.075 billion, bringing Hicks Muse to widespread notice with a then combined enterprise of 103 radio stations in 21 markets, aggregate net revenues of more than \$700 million, and an enterprise value of about \$5 billion. With its late 1999 takeover of Hicks Muse, Clear Channel had acquired stations in nearly every radio market in the United States—certainly in

every major one. Clear Channel had become the greatest owner of radio in the medium's 80-year history.

CBS/Infinity

CBS/Infinity owned far fewer radio stations than Clear Channel, but its 161 stations by early 2000 placed it in a strong second place. Despite growing to 185 stations by mid-2003, CBS/Infinity had slipped to fourth place in number of stations but remained second in terms of revenue and audience size because the outlets were all located in major markets. With stations in the top ten markets, CBS/Infinity was a media conglomerate, with a very profitable radio division functioning at the heart of the corporation's strategy for the future. Karmazin argued that radio offered an advertising vehicle that even television could not match, because radio could target listeners far more efficiently.

Under Mel Karmazin, founder and head of Infinity Broadcasting (which Westinghouse CBS acquired in July 1996 for \$4.9 billion in the costliest merger to that date in radio history), CBS/Infinity radio ownership in the top ten markets had become impressive by 2000. In the next ten markets, CBS/Infinity owned strong radio positions in Atlanta, Minneapolis, St. Louis, Baltimore, and Pittsburgh. All this added up to equal status with Clear Channel, but one that was accomplished in a far different manner.

Disney/ABC

Disney—although far more famous for its other media operations—took sizable revenues from its radio division, although its radio holdings paled in comparison to CBS, let alone Clear Channel. Yet Disney offered a significant presence because overall it ranked as the largest media conglomerate in the world before the America Online/Time Warner merger early in 2000. Chief Executive Officer Michael Eisner and his management team kept a significant position in radio; Disney did not sell off these assets as it did with the newspapers it acquired from ABC/Capital Cities, but it also chose not to try to match the merger frenzy of its larger radio rivals. Disney surely had the resources to grow into a larger radio power, but as the 1990s ended the company had chosen not to expand. It rested on its ownership of stations in the top media markets and so should best be thought of as a smaller version of CBS/Infinity. Yet radio did not rank high on Michael Eisner's radar, because Disney management looked to expand the television side of ABC with the potential of more sizable synergies. Disney expanded only the AM penetration of ABC radio to provide outlets for its Radio Disney children's network. By mid-2003, Disney/ABC had slipped to ninth place, with 74 stations, though still ranking third in total audience, and fifth in revenue.

Radio Station Ownership in Top 10 Markets, by Major Groups: 2000

Market	Number of Stations Owned by:		
	Clear Channel	Infinity/ CBS	ABC/ Disney
1. New York	5	6	3
2. Los Angeles	15*	8	3
3. Chicago	6	8	5
4. San Francisco	9	7	3
5. Philadelphia	6	5	1
6. Detroit	7	6	4
7. Dallas/Ft. Worth	8	8	4
8. Boston	0	5	0
9. Washington	8	5	3
10. Houston	16*	4	10
Top-10 Market Stations Owned	80	62	36
Total Stations Owned	959	161	43
Stations Rank	1	4	11
Revenue Rank	1	2	3
Audience Reach Rank	1	2	3

*Some of these will be spun off to meet FCC ownership limits—this process in a number of markets will bring Clear Channel to just under 900 stations.

Source: *Who Owns What* (10 January 2000)

Cox and Cumulus

Like Disney/ABC, Cox by 2000 represented a diverse media corporation far more famous for other operations. Its radio division was sizable, but the public focused on its newspaper operations, and the company was best known for its newspaper, the *Atlanta Constitution*, and for its move into new media. Although this Sunbelt company had substantial interests in broadcast and cable television, Cox also had a large number of radio stations, with four in Los Angeles, and clusters in Houston, Atlanta, Tampa, and Orlando. Cox merged with New City Communications to add markets such as Tulsa, Oklahoma, and New Haven, Bridgeport, and Norwalk-Stamford, Connecticut. Then the company traded its Los Angeles cluster of outlets to Clear Channel to acquire Houston properties as well as to add stations to their existing clusters. By mid-2003, Cox had more than 75 stations—third in revenue, fourth in audience, but seventh in number of outlets.

Cumulus Media aggregated more than 260 stations by 2003 (second only to Infinity in number of outlets, though ninth or tenth in terms of audience or revenues), buying and

consolidating in markets smaller than the top 100. The company's strategy paralleled in the smallest audience-rated markets what Clear Channel had accomplished in markets of all sizes, and what CBS/Infinity achieved in the largest cities.

Minor Mergers and Public Policy

There were holdouts to the radio merger frenzy of the late 1990s. Stubborn single station owners did hang on. WRNR-FM in the metro Washington, D.C., market illustrates the frustrations of operating as a single independent company in a world of radio consolidation. Jack Einstein is a throwback to the days when the FCC restricted ownership of radio. His Annapolis, Maryland-based WRNR-FM sought simply to survive as the bigger consolidated companies took over the Washington, D.C., market. He had no advantages of scale economies to reduce costs, nor could he sell a whole set of stations and formats to big advertisers. The temptation was to cash out, but Einstein—as of early 2000—could not resist the lure of running a radio station programming vintage and progressive rock, and so with a “group” of three stations all in the Washington, D.C., market, the eighth largest U.S. radio market, he sought narrow formats and held on with his son as featured disc jockey.

The U.S. Department of Justice remains an important player as well. Since the FCC has lifted its ownership limits, it has been up to the antitrust division to determine if a merger violates antitrust laws. During the late 1990s, the Department of Justice negotiated a number of consent decrees, such as one in Cincinnati in which Jacor agreed to reduce its share of the advertising dollars from 53 percent to 46 percent, and another whereby CBS (as a result of its Infinity takeover) had to divest itself of stations in nine separate markets.

Faced with growing complaints about radio's continuing consolidation, however, in mid-2003 the FCC adjusted its radio market rules. The commission replaced its “signal contour” method of defining local radio markets with a geographic market approach used by the Arbitron rating service. The commission concluded that its signal contour method created anomalies in radio ownership that congress could not have intended in the 1996 act. The FCC's 2003 decision closed a seeming loophole by applying Arbitron's definitions of geographic radio markets to better reflect radio industry practice.

Radio Ownership Outlook

The aforementioned top radio groups are among the biggest companies in an ever-consolidating radio industry. There are many others, but they are all far smaller than the dominant companies. Clear Channel, Infinity, Cox, and Cumulus point to a continuing trend toward greater consolidation during the

first years of the 21st century as the radio industry continues to adapt to the far looser FCC caps on ownership set in 1996 and modified in 2003.

Although no one knows how far this consolidation will go—it was considerably slowed by the poor economic conditions of the early 2000s—media conglomerates such as McGraw Hill Companies, the New York Times Company, and the Tribune Company continued to own and operate radio station groups awaiting the radio industry's shakeout from mergers and acquisitions. All had acquired radio years earlier, and by the early 2000s they chose simply to sit on their relatively small holdings as management determined how far a Clear Channel or Cumulus would grow and what effects of that consolidation would spill over to the relatively small holders of radio stations. Most observers agreed, however, that the first decade of the new century would likely see radio consolidate even further.

P

Pacifica Foundation

U.S. Noncommercial Radio Network

The Pacifica Foundation inaugurated the first listener-supported, noncommercial radio network in the United States in the two decades after World War II. By the 1990s it owned five noncommercial FM stations throughout the country: KPFA-FM in Berkeley, California (acquired in 1949); KPFK-FM in Los Angeles (1959); WBAI-FM in New York City (1960); KPFT-FM in Houston (1970); and WPFW-FM in Washington, D.C. (1977). Characterized by unconventional and dissent-oriented programming, Pacifica also provides news and public-affairs material for about 60 affiliated community radio stations.

Pacifist Origins

The Pacifica Foundation was created in 1946 by a small group of World War II-era conscientious objectors (COs) who had participated in the pacifist student club movement of the 1930s. Most of them belonged to the War Resister's League or the American Friends Service Committee. Lewis Hill is generally credited as the guiding force behind the creation of Pacifica. A CO himself, Hill sought the development of institutions that would foster what he called a "pacific world in our time" through the encouragement of public dialogue. In pursuit of nonprofit status, Hill filed Articles of Incorporation with the state of California in the summer of 1946.

The Pacifica Foundation's first project—listener-supported KPFA-FM in Berkeley—received a license in 1948 and went on the air on 15 April 1949. KPFA is recognized as the world's oldest listener-supported noncommercial FM station, but it barely made it through its first five years. Equipped with a 250-watt transmitter during a period when hardly anyone owned FM receivers, KPFA was saved by the Ford Foundation from an early death with a \$150,000 grant in 1951. This windfall allowed Hill to test his "2 percent theory," first artic-

ulated in that year. His theory stated that any listener-sponsored radio station could function effectively with the regular monetary support of 2 percent of a given metropolitan area's radio listeners.

Having obtained a larger transmitter by the mid-1950s, KPFA's early programs reached an audience of approximately 4,000 subscribers, about one-quarter of whom held advanced degrees. The audience regularly tuned in for the commentaries of movie critic Pauline Kael, poet Kenneth Rexroth, and Zen scholar Alan Watts. The station became a mecca for the leading lights of what scholars generally call the San Francisco Literary Renaissance, especially Jack Spicer, Robert Duncan, and Lawrence Ferlinghetti. In 1957 KPFA broadcast the first radio airing of Allen Ginsberg's poem *Howl*, copies of which were subsequently seized at Ferlinghetti's City Lights Books by the San Francisco police department on charges of obscenity.

Transition to Dissent Radio

By 1959 the Pacifica Foundation had inaugurated its second radio station, KPFK-FM in Los Angeles; this acquisition was followed in 1960 by WBAI-FM in New York City, a gift to Pacifica by a philanthropist.

Although Pacifica came into existence during the early years of the Cold War, it had its ideological roots in 1930s pacifism. In its public-affairs programs Pacifica encouraged town-hall style discussions revolving around pacifist/anarchist questions. A KPFA panel entitled "Does atomic power threaten our civil liberties?" included participants on the political left, center, and right. On its three stations, the organization endeavored to include the commentaries of conservatives such as William Rusher, Russell Kirk, and Caspar Weinberger.

But the government took far more interest in the handful of communists and communist sympathizers who regularly

appeared on Pacifica's three frequencies, such as historian Herbert Aptheker and Sovietologist William Mandel. In 1960 KPFA broadcast Mandel excoriating the House Un-American Activities Committee (HUAC) during his subpoenaed appearance in San Francisco. When, in October 1962, WBAI in New York broadcast the comments of a disgruntled former Federal Bureau of Investigation (FBI) agent, it triggered a complete bureau investigation of the entire Pacifica network, personally ordered by an irritated J. Edgar Hoover. In early 1963 the principals of Pacifica's national board were subpoenaed to appear before the Senate Internal Security Subcommittee, dominated by Senator James Eastland, a personal friend of Hoover.

Seeking public sympathy for the network, Pacifica's leaders gradually revised their ideology, adapting the Federal Communications Commission's (FCC) fairness doctrine to the organization's mission. Rather than attempting to encourage left/right dialogue, the network would serve the dissenter and his or her audience. "Just as I feel little obligation to spend time on my broadcasts saying what is wrong with communist governments," declared Pacifica president Hallock Hoffman in 1963, "since everyone hears what is wrong with communist governments from every side, I think Pacifica serves the ideal of balance if it spends little time reinforcing popular beliefs." KPFA public-affairs director Elsa Knight Thompson made a similar appeal in 1970: "Pacifica Foundation was created to implement the 'Fairness' doctrine on the air rather than on paper, but implementing this policy of balanced programming is not achieved by having someone say yes for five minutes and then finding someone to say no for five minutes." "Pacifica is high-risk radio," concluded a 1975 brochure. "When the theater is burning, our microphones are available to shout fire."

Pacifica's tactical response to McCarthyism gave birth to what a later generation would describe as "alternative media." By the early 1960s the growing availability of FM receivers enabled Pacifica to broaden its audience. More than 27,000 people subscribed to a Pacifica station by 1964. By the late 1960s WBAI staff estimated that approximately 600,000 people tuned in to the station for its *mélange* of music, commentary, and live coverage of the Vietnam antiwar movement, an audience level probably never matched by any Pacifica station since. The network became "free speech, First Amendment" radio, famous for its broadcasts of the remarks of Ernesto "Che" Guevara and for its news dispatches directly from Hanoi.

By 1970 the network's reputation had spread to the point that it caused a backlash. Pacifica station KPFT-FM in Houston went on the air that year, only to have its transmitter bombed twice by the Ku Klux Klan. Ultimately a Klansman was apprehended while en route to California to continue his sabotage at the Los Angeles and Berkeley stations. In 1971 a WBAI manager spent time in prison for refusing to turn over to the police taped statements of men incarcerated in New

York's notorious "Tombs" city jail. Three years later KPFA's manager was incarcerated for refusing to surrender to the FBI taped statements of the Symbionese Liberation Army. So far did Pacifica push the envelope of free speech that the Supreme Court in 1978 ultimately ruled as indecent a 1973 WBAI broadcast of comedian George Carlin's "Seven Words You Can't Say on Television" routine.

Community Radio

As the Pacifica network grew, its public statements became increasingly populist. After the Berkeley Free Speech movement of 1964 and the Columbia student uprising of 1968, the organization's principals spoke in the language of grassroots democracy. "We have been too academic in the past," declared a KPFA news director in 1975, "and now we want to go to the people and get their feelings." Such rhetoric drew to the organization an unprecedented wave of feminists and minority activists who sought the chance to express their feelings without the assistance of white middle-class mediators. These programmers, often adherents of "Third World" ideologies such as Maoism, coexisted uneasily with an earlier generation of Pacifica activists. Ultimately this generational tension resulted in difficult and lengthy staff strikes at KPFA in 1974 and at WBAI in 1977.

Out of these conflicts came the basic precepts of "community radio": first, that decisions at a Pacifica station ought to be made collectively, and second, that the network should dedicate its efforts to giving the "voiceless" a forum. The principles of Pacifica's fifth acquisition, WPFW-FM in Washington, D.C., most clearly articulated this philosophy. When WPFW was inaugurated in 1977 after seven years of bureaucratic wrangling with the FCC, the station's news director issued a directive to WPFW's news staff that exemplified the idea of community broadcasting: "We are here to tell people what PARTICIPANTS (the perpetrators and those affected) are saying, doing, planning and thinking—NOT what WE THINK they stand for or really mean. Their actions speak louder than your adjectives." Many noncommercial radio stations across the United States adopted this stance and created the National Federation of Community Broadcasters in 1975.

The community radio philosophy allowed the Pacifica network to accommodate an unprecedented new wave of staff who provided distinct programming. At KPFT came a bevy of programs that served the Gulf Coast in no less than 11 different languages. From WPFW in Washington, D.C., a disk jockey broke the news of the 1983 U.S. invasion of Grenada through live telephone interviews with musicians in Jamaica. At all the Pacifica stations, women's and Third World departments sprang up, with refurbished broom closets often functioning as their offices. The organization's self-conscious

decision to operate on the ground floor of American life allowed it to billboard the talents of artists such as Whoopi Goldberg, Alice Walker, and Bobby McFerrin long before they became enshrined in American culture. It also enabled Pacifica stations to provide unique coverage of ongoing stories, such as the 1970s campaign to stop the closing of the International Hotel in San Francisco, a refuge for Filipino workers, and the efforts of solidarity groups to challenge U.S. policies in Central America.

Toward a Centralized Network

Although the Pacifica Foundation has crossed swords with the FBI, local police departments, and Senate investigation committees, its most turbulent battles have usually been with itself. After 1980, the most difficult question the organization faced was the extent to which it should centralize its operations and programming schedule. Pacifica began its first experiments with national programming in the late 1970s with the creation of a national news program. These efforts were followed by live “gavel-to-gavel” coverage of the 1986 Senate Iran-Contra hearings and subsequent confirmation hearings on the candidacy of Robert Bork for the Supreme Court. Emboldened by these successful ventures, the network inaugurated “Democracy Now” in 1996, a one-hour public-affairs program taken by all the Pacifica stations and 65 affiliated community radio stations. By 1997 Pacifica estimated that 700,000 people a week listened to its programming either direct via a Pacifica station or through an affiliate.

But in the 1990s these gains were accompanied by painful purges of volunteers, especially at KPFA and KPFT. Managers who had lost patience with the democratic process initiated these staff reorganizations. They perceived station program schedules as fragmented, broken down into too many individually controlled shows of poor quality. The problem of managing Pacifica frequencies was exacerbated by government policies that, beginning in the late 1970s, limited the amount of local-access, noncommercial airtime available in most metropolitan regions by eliminating most of the educational low-power FM outlets still on the air. Faced with scores of programmers who had hardly anywhere else to go, Pacifica stations found that personnel and programming decisions had become perilous—guaranteed to provoke trouble. In addition, the emergence of the internet in the early 1990s enabled dismissed programmers throughout the network to create effective dissident organizations, complete with discussion lists and websites.

In February 1999, under pressure from the Corporation for Public Broadcasting to increase audience share, the national board of the Pacifica Foundation voted to centralize its operations, removing all station Local Advisory Board (LAB) mem-

bers from its body. LAB members had sat on the national board since the late 1970s. This reform was followed by the dismissal of KPFA’s general manager two weeks before that radio station’s 50th anniversary celebration and by the cancellation of programs whose hosts discussed the controversy surrounding that dismissal over the airwaves. These actions exacerbated long-standing frustrations at KPFA and throughout the Pacifica network. On 13 July 1999, after media activists discovered a memorandum from a member of the national board proposing the sale of KPFA or WBAI, the Pacifica Foundation hired a security firm to expel KPFA’s staff from the building. More than 50 programmers were arrested. In response, some 10,000 Bay Area residents staged a demonstration demanding the restoration of the station and the resignation of the national board. The crisis became an international cause, receiving press coverage throughout the United States and Europe. KPFA drew expressions of support from as far away as the staff of Serbia’s banned Radio B92. KPFA’s staff returned to work on 5 August and the board, at a meeting in Houston in late October, pledged not to sell or transfer the license of any Pacifica station.

Unfortunately, the network’s leadership continued to try to solve its problems via personnel purges. Later in 1999 Pacifica’s executive director removed the news bureau’s program director from his position shortly after the Pacifica Network News broadcast a brief story about community radio affiliate dissatisfaction with the service. Then in November of 2000 the general manager of WBAI was removed. Pacifica once again fired staff who protested the dismissal over the station’s airwaves. These actions sparked a nationwide listener-subscriber boycott of the network, which, in tandem with three lawsuits filed against the board and a public pressure campaign, forced Pacifica’s leadership to sue for peace in the winter of 2001. A settlement resulted in an interim governing board, which set itself the task of creating a more democratic structure for the organization.

Paley, William S. 1901–1990

U.S. Broadcast Executive

William S. Paley developed and long exercised control over the Columbia Broadcasting System (CBS), one of the most successful networks in broadcasting. His contributions and influence make him one of the giants of radio and television history.

The son of Jewish Russian immigrants who prospered with a cigar manufacturing business, first in Chicago, and later in Philadelphia, Paley became involved with radio when his sister married into the Levy family, part owners of the fledgling Columbia radio network. His father, Sam Paley, agreed to invest in the network, partly to help rescue Columbia from financial instability and also because of the success he had advertising his La Palina cigars on WCAU, the Philadelphia affiliate. After his first exposure to radio, supervising *The La Palina Smoker*, a program sponsored by the family cigar company, young William Paley became enthralled with the medium.

In 1928 Paley and members of his family purchased controlling interest in the struggling radio network that Paley would continue to nurture and oversee for more than 60 years. Although his number of shares and percentage of ownership dwindled over time, Paley ruled the network as if it were his alone. Serving as chairman of CBS, Paley developed the network by buying additional stations, adding to the number of affiliated stations carrying CBS programming, and conducting a number of savvy business negotiations to enhance the network's competitive position. Under Paley's aggressive leadership, CBS rapidly advanced to challenge its older and larger rival, the National Broadcasting Company (NBC), in audience size and profitability.

One of the strategies Paley used to entice new stations to carry CBS programming was to increase the number of hours of sustaining programming (programming without advertising) provided at no cost to the affiliates, but with the proviso that

CBS would have exclusive rights to furnish programs to the stations. Along with his business acumen, Paley was especially adept at gauging public taste and programmed his network to appeal to large audiences while at the same time providing news, cultural, and public-affairs programming widely acknowledged to represent outstanding quality. CBS was a leader, especially in the area of news programming, where the broadcasts of Edward R. Murrow and the staff of correspondents assembled during World War II became legendary. By providing quality programming and also carrying popular and entertaining shows for the mass audience, Paley was able to maximize both prestige and profits for CBS.

Paley's extravagant personal lifestyle and involvement in high New York social circles were also demanding of his time. A man of considerable personal charm, he thoroughly enjoyed the company of well-known and important people, including royalty, entertainers, and other socialites. He was married twice, and both women, Dorothy and Barbara (Babe), were symbols of beauty, style, and elegance. Frequently an absentee administrator, Paley leaned heavily on such notable CBS executives as Edward Klauber, Paul Kesten, and Frank Stanton. During World War II, Paley served as a consultant to the Psychological Warfare Branch of the Office of War Information, spending time in Africa and Europe attending to organizational matters and supervising broadcasts. CBS was run in his absence by Paul Kesten, who resigned in 1946. Following the war, Frank Stanton became president of CBS, supervising its daily operation. Stanton became a leading spokesman for the entire broadcasting industry and an articulate defender of the First Amendment. Stanton served as president of CBS for many years under Paley's chairmanship and played an especially crucial role in guiding the network, but it was Paley who held and exercised final authority.

George Burns, William Paley, Gracie Allen, Mary Livingstone, and Jack Benny
 Courtesy CBS Photo Archive

Unlike NBC's David Sarnoff, Paley frequently involved himself directly in programming matters, personally courting and encouraging well-known personalities to work for CBS. In the late 1940s, in what became known as "talent raids," Paley successfully lured several popular NBC stars to work for CBS, including Jack Benny, Bing Crosby, George Burns and Gracie Allen, Edgar Bergen, Red Skelton and the program *Amos 'n' Andy*. These big names drew large audiences and boosted the ratings for CBS, allowing the network to charge higher rates for advertising time and resulting in greater profits, some of which were invested in television, making CBS more competitive with RCA and NBC.

By the 1950s, networks were concentrating far more on television than on radio. Many of the stars and some entire programs were moved from one medium to the other. Edward R. Murrow's *Hear It Now* became *See It Now* on television. Programming on network radio became little more than news summaries, sports, and coverage of special events.

Along with Frank Stanton, Paley continued to guide CBS through the development of its television network and the

building of new headquarters, known as "Black Rock," completed in 1964. In 1976, Paley was instrumental in creating the Museum of Broadcasting in New York City. After Stanton retired, a number of executives were brought in, each dismissed in turn until 1983, when Paley was succeeded as CBS chairman by Thomas Wyman. After an unsuccessful hostile attempt by Ted Turner to buy CBS, Lawrence Tisch gained control in 1987 and reinstated Paley, although by that time his influence had been greatly reduced. Paley continued as a figure-head chairman until his death in 1990 at age 89.

Payola

Illegal Payments to Disc Jockeys

Payola is an undisclosed payment by a music promoter to a broadcaster for the purpose of influencing the airplay of a particular song. This business practice of paying to play has been known to be associated with radio broadcasting since a national scandal rocked the radio industry in the late 1950s, but sheet music publishers were paying popular artists to perform specific songs even before the start of radio broadcasting.

The term *payola* was coined by *Variety* in 1938 in the wake of numerous stories covering music “pluggers” who promoted their songs to big-name orchestra leaders with network radio shows. It was common for as many as a dozen pluggers to attend a remote broadcast begging a popular bandleader to perform their music. In 1935, the National Broadcasting Company (NBC) barred pluggers from entering the Radio Corporation of America (RCA) building in an attempt to insulate directors from the relentless promotion men.

As postwar television viewing grew, many network radio programs disappeared. Local radio stations, forced to develop low-cost local programming, embraced recorded music formats. Local disc jockeys were soon selecting the music of a new generation—rock and roll.

From 1945 until 1959, the number of recording companies grew from about a half dozen to nearly 2,000. By the end of the 1950s, large-market radio stations were receiving as many

as 250 new record releases each week. With many more records being produced than could be broadcast, record companies followed the industry formula of compensating the most popular platter spinners. Disc jockeys justified payola as “consulting fees” to “audition” new releases. In most cases, payment was legal as long as it was reported on income tax forms.

In addition to cash, disc jockeys were offered gifts, such as liquor, TV sets, clothes, and sometimes prostitutes. In a 1959 *Life* magazine expose, former WXYZ Detroit disc jockey Ed McKenzie remembered that a “record plugger once offered to install a bar in my basement” (“A Deejay’s Expose—and Views,” 23 November 1959). That same year, covering the Second International Radio Programming Seminar and Pop Music Disk Jockey Convention in Miami Beach, *Time* magazine described the 2,500 attendees as members of “one of the most pampered trades in the U.S.” (“Disk Jockeys: The Big Payola,” 8 June 1959). Record companies flocked to Florida to backslap the jocks. *Variety* described the convention as a drunken orgy. A headline in the *Miami Herald* exclaimed, “Booze, Broads, and Bribes.”

Elected officials noticed the attention payola was receiving in the popular press. It was also a wake-up call for naive station owners and managers who were unaware of payola or

who did not mind their popular personalities earning a little extra on the side. When several government investigations were announced, many paranoid station executives conducted their own internal investigations. Fearing eventual action by the Federal Communications Commission (FCC), owners suspended or in some cases fired disc jockeys suspected of accepting payola. Many disc jockeys resigned before they were asked questions. Detroit WJBK-TV news director Jack LeGoff was let go after he defended payola on the air as “a part of American business.” His fellow employee, disc jockey Tom Clay, was fired for taking payola, and two other WJBK-AM staffers resigned. The Federal Trade Commission (FTC) began issuing complaints against record labels, and record giant RCA Victor later agreed to a consent judgment to end payola practices. The New York district attorney’s office began a payola inquiry and subpoenaed the financial records of a dozen record companies.

The House Legislative Oversight Subcommittee conducted the most highly publicized investigation. In late 1959 it sent investigators to Boston, Chicago, Los Angeles, Milwaukee, New York, and Detroit to examine the payola racket. An aide said the subcommittee “had been receiving complaints from all parts of the country about disk jockeys and music programs.” The subcommittee claimed it had received many letters “from irate parents complaining about particular types of music—specifically certain types of rock and roll and the music aimed at the teenage market” (“Hogan Starting ‘Payola’ Inquiry in Radio and TV,” *New York Times*, 20 November 1959). Claiming the moral high ground, the American Society of Composers, Authors, and Publishers (ASCAP) and other publishing interests lobbied Capitol Hill, asserting that payola was the reason rock and roll music existed. The subcommittee began hearings on “Payola and Other Deceptive Practices in the Broadcasting Field” in February 1960. However, the focus was clearly on rock and roll. Critics argued that the hearings were merely a witch hunt. Broadcasting trade papers believed it was election-year grandstanding by the same politicians who had produced the recent quiz shows scandal. Nevertheless, more than 50 witnesses testified before the committee, including disc jockeys, program managers, radio station owners, record distributors, music surveyors, and FCC officials.

The consequences of the payola hearings and scandal varied. Several popular East Coast disc jockeys who lost their jobs found employment in West Coast markets, including former New York rock and roll pioneer Alan Freed. Freed was later indicted by a Manhattan grand jury on charges of commercial bribery and was penalized by the Internal Revenue Service. In 1960 the Communications Act of 1934 was amended to discourage payola. Stations were required to announce on the air any “promotional considerations” they accepted to broadcast specific programming. This made the licensee responsible for disclosing gifts accepted by its employees. Violators faced fines

of up to \$10,000 and jail terms of up to one year. As a result of new anti-payola regulations and the growing popularity of the Top 40 format, most disc jockeys no longer wielded the power to pick the hits. Managers (program directors) made the final decisions.

Payola did not end with new regulations. After 1960 it simply became more sophisticated. A 1977 FCC investigator explained, “It’s not simply a matter of someone handing a disk jockey a \$100 bill and a record he is expected to play” (“Say It Again Sam, But You’ll Have to Tell the FCC Why,” 14 February 1977). Trade lists compiled from the reports of a few select radio stations determined hit songs. Manipulating radio playlists was more important than frequent airplay. Labels hired independent promoters to do the dirty work of bribery, making it more difficult to trace payola back to record companies. This introduced underground connections to organized crime. Marijuana and cocaine became payoffs in some markets (“drugola”). Rumors and occasional investigations continued to surface as the 20th century ended. However, the actual extent of present-day payola is difficult to determine.

Another industry-coined term for a different behind-the-scenes scheme in broadcasting is *plugola*. Plugola involves a payoff in exchange for hiding a “plug”—in essence, an advertisement within a radio program. These disguised commercials have their roots in the film industry, in which advertisers paid to have brand names strategically placed in film scenes. The practice eventually infested the golden era of radio as promoters provided under-the-table incentives to program producers and writers willing to plant plugs in radio scripts. For the right price, big-name talent would even adlib a subtle plug during a coast-to-coast show. By the 1950s a “complimentary” plug for a product or service planted on a top television or radio show cost \$250 with neither the network nor program sponsor receiving compensation. Plugola was not examined as closely as payola during the 1959–60 Congressional probe. By that time plug planting was disappearing as network radio eroded and television networks began clamping down on the practice.

Pay Radio

Although at first an odd proposition to American radio listeners, the notion of pay radio—paying to listen to one or more radio program services—is neither new nor rare. And with developing digital services, pay radio is rapidly becoming an accepted part of radio's landscape.

Early Notions

As radio struggled to find a means of financial support in the early 1920s, several suggested options included some means of direct payment by listeners. Station WHB in Kansas City, Missouri, for example, sold tickets in 1924 to an "invisible theater of the air." For a set price, listeners would obtain a literal ticket—but then, of course, those who did not pay could also "attend" the broadcasts, so the idea rapidly died. This was an early example of listener "donations" to help cover the cost of radio broadcasting—an idea still common in public radio and television today.

Outside the U.S., many other nations adopted a system of radio licensing wherein for each radio or household, an annual fee (effectively a service tax) was set by the government to be paid (usually to the postal authorities), with the proceeds being turned over to the national broadcasting service to meet its operational expenses. The British Broadcasting Corporation (BBC) was perhaps the prime example of this type of funding, which continued into the 21st century despite advertising's inroads in commercial systems in most other countries.

Although advertising was widely adopted in the United States by the late 1920s as radio's chief means of support, the beginning of the Depression placed heavy financial pressure on emerging stations and networks. Therefore, additional

means of seeking radio revenue were occasionally offered. For example, in 1930, at the tenth anniversary dinner celebration of KDKA's (Pittsburgh, Pennsylvania) first broadcast, one politician suggested developing a radio with a key device, with said key to be sold for a set price (he suggested a dollar) each year.

With the competition of television looming after World War II, the pay radio idea was again briefly touted. Before becoming a U.S. senator, William Benton backed the idea of subscription or pay radio. Listeners would pay \$18 for a year (essentially a nickel a day) to receive radio programs without advertising. At about the same time, in 1947–48, several stations expressed interest in a home music service based on patents of the Muzak corporation.

Neither idea came to fruition—in part because of controversy over even introducing the notion of paying for something that was then free to the audience. And with that, any discussion about pay radio disappeared for several decades. Indeed, the heated debate over possible introduction of a pay television service, which raged from 1948 to 1968, made any consideration of pay systems for radio even more remote.

Modern Pay Radio

By the 1990s, however, some radio listeners were paying to receive programs. Many of the nation's cable television systems offered audio channels, usually for an additional monthly subscription fee.

The 1990s also saw development of two new radio technologies, both of which revived notions of pay radio. The first was satellite delivery of many radio channels, some without advertising, in return for an annual subscription fee by listeners—

essentially the same idea that Benton had proposed a half-century earlier, updated with a new means of transmission.

Satellite pay radio got a boost when, in early March 1997, the Federal Communications Commission (FCC) approved frequencies for digital satellite radio transmissions to be made available for payment of a monthly subscription fee. Four companies sought to provide the new service—American Mobile Satellite Corporation (Reston, Virginia), CD Radio of Washington, D.C., Digital Satellite Broadcasting (Seattle, Washington), and Primosphere (New York), though in the end only two (operating as XM Radio and Sirius) actually took to the air. The broadcast industry fought satellite radio in a doomed effort to forestall the competition.

Subscription fees for the compact disc (CD) quality digital satellite service ranged from \$10 to \$13 per month when they were introduced in 2001–02. Available channels—some carrying advertising—included weather, sports, opera, talk, and a variety of musical formats. Service providers focused market-

ing of the service especially to those spending large amounts of time in their cars, such as urban commuters.

The second technological innovation, finally approved by the FCC in late 2002, was terrestrial CD-quality digital transmission, or digital audio radio (DAR) or broadcasting (DAB). This technology was already available in Japan and parts of Europe, and some American industry figures suggested that listeners might pay a subscription fee for the service, which would mark a vast improvement over AM and FM analog transmissions.

In neither the satellite nor the terrestrial radio systems, however, is the term *pay radio* very widely used, for it carries negative connotations in an advertiser-supported business.

Peabody Awards and Archive

Now one of the more prestigious prizes granted in broadcasting, the Peabody Awards have since 1941 recognized the best people and programs in both radio and (since 1948) television. From 1,200 entries annually, only about 25 to 35 programs are selected, making these among the most competitive of broadcast awards.

Origins

In 1938 the National Association of Broadcasters (NAB) formed a committee to establish a prize to recognize distinguished achievement and meritorious service in radio programming. One of the committee members was Lambdin Kay, longtime manager of WSB Radio in Atlanta. Kay became a champion of the awards program and made it his special project. One day, WSB's continuity editor, Mrs. Lessie Smithgall, overheard Kay talking about setting up a fair and impartial system for administering the awards. She suggested that he contact her former professor, John E. Drewry, then dean of the Henry Grady School of Journalism at the University of Georgia, about university sponsorship of the award.

Basing his concept on the Pulitzer program administered at Columbia University, Kay approached Dean Drewry and received his enthusiastic support. Drewry contacted the univer-

sity's president, Eugene Sanford—who had initiated the first journalism classes at the university in 1913—for his endorsement. Sanford approved the plan to house the broadcasting award at the University of Georgia, and during 1939, the board of regents of the University of Georgia authorized the award to be named in honor of George Foster Peabody, a native Georgian and major benefactor of the university. At the 1939 meeting of the NAB in San Francisco, Kay and Drewry presented the plan to the association and received unanimous support for establishing the Peabody Award.

Peabody, born in 1852 in Columbus, Georgia, moved to New York with his family after the Civil War. Largely self-educated, Peabody became a successful industrialist and financier. He supported humanitarian causes, especially education, and helped finance a library, a forestry school, and a classroom building at the University of Georgia. He was also the university's first nonresident trustee. In appreciation, the university awarded him an honorary degree. After his death in 1938, the university named the broadcasting award for him. Today, the name George Foster Peabody has become synonymous with excellence in electronic media.

The first awards were presented at a banquet at the Commodore Hotel in New York on 31 March 1941 for programs broadcast in 1940 and were jointly sponsored by NAB and the

University of Georgia's School of Journalism. The Columbia Broadcasting System (CBS) carried the ceremony live, and the broadcast carried addresses by CBS Chairman William S. Paley and noted reporter Elmer Davis, the recipient of the first personal Peabody Award. After the program, the NAB bowed out of future sponsorship of the awards to avoid any conflict of interest. In 1990, at the 50th anniversary ceremony, the NAB once again sponsored the event.

The Peabody Awards recognized television programs for the first time in 1948. Among early television winners were *Disneyland*, Ed Sullivan, and Edward R. Murrow for his *See It Now* series. Cable television was first recognized in 1981 when Home Box Office (HBO) and *Ms. Magazine* won for "She's Nobody's Baby: A History of American Women in the 20th Century." Over the years, Peabody Award winners for meritorious programming read like a "Who's Who" in broadcasting and cable. A complete list of winners is available on the Peabody website (address listed below).

The Peabody Awards are the most competitive of the many broadcasting honors. The awards are given without regard for program genre, and recipients represent programs in news, documentaries, education, entertainment, public service, and children's shows. Personal and organizational awards are also presented for outstanding achievement in broadcasting and cable. A national advisory board selects the Peabody Award recipients, and its members are practitioners, educators, critics, and other leaders in the broadcast and cable industries.

One by-product of the awards is the formation of one of the country's richest broadcast archives. Housed at the University of Georgia Library, the Peabody Collection dates to 1940 and preserves the best of 20th-century radio and television for today's students and scholars and for future generations. The collection has grown to over 40,000 radio and television programs and related print materials. In breadth and program diversity, the collection contains significant news, documentary, educational, and entertainment programming from radio, broadcast television, and cable.

The collection also reflects the full range of independent, local, and network programming and contains many of the finest, most significant moments in broadcast and cable history.

Virtually all major news events, from World War II to today, may be found. In addition to spot news, documentary, and public-affairs programs, the Peabody Award also recognizes excellence in entertainment, educational, children's, and sports programming. One definite advantage of the collection is its accumulation of local programming.

The collection's entry books list submissions and provide information on programs submitted in a given year, with radio and television entries inventoried separately. Entries are listed alphabetically by state and are grouped according to submission categories: news, entertainment, documentary, education, youth/children, public service, and individual/institutional. Each volume has a table of contents, and entries are described in brief paragraphs provided by the submitters.

Because copyright is retained by copyright holders, not the Peabody Collection, no programs are loaned, but researchers may use the collection on site. Generally, shows from 1976 onward may be found in the card catalog of the Media Center of the University of Georgia's Main Library. These programs are listed alphabetically by title within categories. In most cases, screening copies exist for on-site viewing. Many older programs are not readily accessible because screening copies have not been dubbed owing to lack of funding.

Perryman, Tom 1927–

U.S. Country Music Promoter and Disc Jockey

As a disc jockey, promoter, and radio station owner, Tom Perryman played an important role in the dissemination of country music from the 1940s into the 1970s. From radio stations in Gladewater, Texas, and later Nashville, Tennessee, Perryman enthusiastically introduced new country music artists and their records to a wide audience. In addition, acting as a sort of southern Alan Freed, he booked and promoted concerts for aspiring artists, most notably Elvis Presley, whose career was in its infancy when Perryman worked with him. He belongs to a fraternity of influential country music disc jockeys who exemplified the widening role of DJs in the commercialization of country music during the post–World War II era. Perryman’s handprints on the commercialization of country music are as plain as those of DJs Nelson King (WCKY, Cincinnati, Ohio), Hugh Cherry (WKDA, Nashville, Tennessee), Squeakin’ Deacon Moore (KXLA, Pasadena, California), and Biff Collie (KLEE, Houston, Texas).

Before Perryman joined radio station WSM in Nashville, Tennessee (where he rose to the apex of his power as a disc jockey), he was active in booking and promoting country artists in the music-mad northeast Texas area. He performed these tasks in addition to his disc jockeying at radio station KSIJ in Gladewater, Texas. It was common for disc jockeys to book artists during Perryman’s record-spinning stint in Texas during the late 1940s and early 1950s, but Perryman is distinguished for giving soon-to-be popular musical acts some of their earliest breaks. When a 19-year-old Elvis Presley was stuck in Shreveport, Louisiana, without money or bookings, after playing KWKH’s *Louisiana Hayride* in the fall of 1954, Perryman put Presley and his band to work in a Gladewater club. It was one of Presley’s first non-radio gigs outside his home turf of Memphis, Tennessee; Perryman would continue to book Presley in Texas over the next year, until the rocker rose to national prominence in 1956.

Perryman’s efforts as a disc jockey and concert promoter also helped to generate a Texas following for developing country music acts such as Johnny Cash, Johnny Horton, and Jim Reeves, artists who appeared weekly on KWKH’s *Louisiana Hayride*. These artists relied on regional bookers and promoters to get work for them between their weekly *Hayride* appearances, and Tom Perryman worked tirelessly for them in the nearby northeast Texas region. Perryman formed a particularly close bond with Jim Reeves, allying with him in numerous ventures including the purchase of KGRI radio in Henderson, Texas.

As Perryman consolidated his influence in Texas, his profile on the national country music scene grew with his frequent let-

ters to the music trade magazine *Billboard*, which recorded his impressions of country music artists and songs. His published plugs often helped to sustain an artist’s or song’s momentum. “Tom Perryman, KSIJ, Gladewater, Texas,” one *Billboard* item read in 1952, “reports that Slim Whitman, who has ‘Indian Love Call’ coming up on Imperial, is running neck and neck with Hank Williams for top station popularity.” Record company representatives realized that Perryman was an important figure on the Texas music scene partly because they saw his name in *Billboard* virtually every week during the early 1950s; as a result, recording executives often consulted him as they searched for new artists.

In 1953 Perryman’s work on behalf of the country music industry broadened when he joined the first board of the Country Music Disc Jockey Association (CMDJA), which would evolve into the Country Music Association (CMA), country music’s most influential trade group. Perryman’s impact on the distribution of country music increased dramatically with his move in 1956 to radio station WSM in Nashville. He became the first host of the station’s influential all-night country music disc jockey show *Opry Star Spotlight*. (Others such as Eddie Hill and T. Tommy Cutrer had hosted WSM’s overnight country programming before him, but Perryman was the first to handle the show after it was named *Opry Star Spotlight*.) Over the 50,000-watt clear channel station, Perryman brought country music to the station’s vast overnight audience that was spread over most of the contiguous United States. During his two years at WSM (1956–1958), he also served as the talent coordinator of the station’s powerful talent agency and the assistant manager of WSM’s hallmark country music show, the *Grand Ole Opry*.

Perryman continued to help open markets for country music after leaving WSM. In 1959, after a brief return to KSIJ in Texas, he became general manager and co-owner (with country music star Jim Reeves) of radio station KGRI in Henderson, Texas. Under Perryman and Reeves, KGRI became one of the nation’s first all-country-music stations. In 1967, three years after the death of Jim Reeves in an airplane crash, Perryman and Reeves’ widow, Mary, became co-owners of WMTS-AM and FM in Murfreesboro, Tennessee, another all-country station. He served as general manager of KGRI and WMTS concurrently. In 1969, the Country Music Association named WMTS “Station of the Year.”

Perryman retired from regular radio work in 1978 upon the sale of WMTS. At the beginning of the 21st century he served as president of the Reunion of Professional Entertainers of Country Music, a group that acts as an advocate for veteran

country music performers. He was inducted into the Country Music Disc Jockey Hall of Fame in 1988 and the Texas Country Music Hall of Fame in 1999.

Philco Radio

Radio Receiver Manufacturer

Philco radios were first introduced by a small Philadelphia electrical manufacturer in 1928. Within two years, they became the top-selling radios in the United States, and they continued to lead the market for more than a decade.

Early Years

In the initial years of radio development, radios operated from electricity provided by batteries. The Philadelphia Battery Storage Company (the Philco trademark was registered in 1919) began producing batteries for radios in the early 1920s, an offshoot of its earlier production of automobile and truck batteries. In 1925 Philco produced an innovation that eliminated the need for batteries and allowed radio owners to operate the set with electricity from a light socket—the “Socket-Power” unit. The company grew quickly with its two radio-related products and soon began sponsoring a national radio broadcast known as the *Philco Hour*, which appeared on National Broadcasting Company (NBC) Blue from 1927 to 1929 and on the Columbia Broadcasting System (CBS) from 1929 to 1931.

The Radio Corporation of America (RCA) introduced a set powered by alternating current (AC) in 1927. Not long after, RCA announced that it would license other manufacturers to use the new AC technology, effectively wiping out the market for radio batteries.

Philco management recognized the challenge to its survival and completely changed the focus of its business. The company chose to design and build its own radios and set mid-1928 as a target date to introduce the new product. Most manufacturers were producing radios that all looked very much alike. Philco chose to change that look. Instead of the sturdy, sensible wooden box that most table-model radios resembled, the company produced a metal case radio in five bright colors. To attract female consumers, Philco offered four of the models decorated with hand-painted floral designs. Each had color-coordinated matching speakers (early radios did not contain internal speakers).

Recognizing the importance of a strong advertising campaign, Philco introduced its radios in expensive double-page color ads exclaiming, “COLOR! VIVID COLOR!” The copy described them as “enhanced with color effects by Mlle. Mes-

saros, one of the foremost colorists in the decorative arts. The colors are applied *by hand* under her personal direction.”

In addition to the unusual color sets, Philco also offered three console models, radios that were cabinet-style pieces of furniture based on the Louis XVI period; these were created by an internationally known furniture designer. The striking line of radios would be the first in a long line of innovations from the company. Philco introduced its first eight models at an industry trade show in June 1928.

It was a stunning accomplishment. Many had thought that RCA's new AC-powered radios spelled the end for Philadelphia Battery Storage. Philco's response was an indication of an innovative ability that would stand it in good stead for the next 30 years and help maintain its reputation for superior-quality products.

At the end of 1928, Philco was in 26th place among radio manufacturers. The company's management believed the best way to compete in 1929 was to improve quality and lower prices. At a time when most manufacturers used the labor-intensive method of assembling each radio individually by hand, Philco borrowed \$7 million to convert and expand its facilities for mass production.

Philco advanced to third place in the industry by selling 408,000 radios in 1929. Despite the October 1929 stock market crash, Philco continued to thrive. The \$7 million debt was paid off early in 1930. Later that year, Philco increased its employee base from 1,500 in May to 4,000 by September. Orders for radios continued to increase, and the company announced it was hiring 75 men a day. Soon Philco announced the formation of a subsidiary to manufacture Philco-Transitone automobile radios.

The radio manufacturer continued to recognize the value of advertising, and, in an early version of a common promotional technique today, a Philco radio was prominently featured in the hotel room of movie star Bing Crosby in Paramount's 1932 film *The Big Broadcast*. At the same time that the company was proving such a success in radio manufacturing, it was also looking toward the future and diversifying. Noted inventor Philo T. Farnsworth came to Philco in 1931 to join a research team devoted to television development. In 1932 the Federal Radio Commission licensed Philco's experimental television station W3XE. The company also began to produce home appliances. During the 1930s Philco offered a variety of products, including automobile radios, phonographs, radio-phonograph combinations, air conditioners, and refrigerators.

Near the end of the decade, Philco began a shift from the large tabletop “tombstone” and “cathedral” radios (so called because of their shape) and produced smaller and less experience radios. Industry leaders Atwater Kent, Crosley, Majestic, and Zenith initially ignored the shift to undersized table models. Consumers, however, responded quickly to the new, space-

saving radios. In 1938 Philco's 10 millionth radio came off the assembly line.

World War II and After

With the United States' entry into World War II, Philco shifted to production of military items, including radios for tanks and planes. The company also trained military personnel in the installation, operation, and maintenance of electronic aircraft equipment. Only after the war's end in 1945 were new radios, phonographs, refrigerators, and air conditioners produced again by Philco.

Philco sponsored two national network programs: *Philco Radio Time*, starring Bing Crosby, and a radio anthology of plays adapted for radio, the *Philco Radio Playhouse*, hosted by actor Joseph Cotten. *Philco Radio Time* was the first prerecorded program. Prior to its introduction in 1946, all radio programs were broadcast live.

Philco was active in transistor research in the 1950s, producing a number of transistor radio models. The 1960s began a troublesome time for Philco. The company was losing money—more than \$4 million in 1961. Ford Motor Company purchased Philco late in 1961. The Philco-Ford division, producing television sets, computers, and satellite communication equipment, once again became profitable.

During the 1970s Americans became more interested in antiques and collectibles, and among the items drawing their interest were cathedral radios from 40 years earlier. Philco-Ford introduced a miniature, transistorized AM-FM replica of its model 90 Baby Grand (originally produced in 1931).

General Telephone and Electronics purchased the Philco division from Ford in 1974 and then sold Philco to North American Philips Corporation, where the division now produces televisions.

Phillips, Irna 1901–1973

U.S. Creator of Radio Serial Dramas

Every woman's life is a soap opera.

—Irna Phillips

Irna Phillips, one of the most prolific and successful creators of daytime serials, has long been regarded by contemporaries and historians as the "Queen of Soap Opera." Indeed, Dan Wakefield (1976), in his study of soap operas, concluded that Irna Phillips "is to soap opera what Edison is to the light bulb and Fulton to the steamboat." Although competitors such as Frank and Anne Hummert oversaw the development of dozens of serials, Phillips was the individual creator, writer, and producer of the largest number of serials on daytime radio (9) and television (8). Not only was Phillips responsible for inventing the first daytime serial in 1930, she influenced the rise of daytime dramas in radio and developed the programming form over more than 40 years. In her radio career, Irna Phillips helped to establish many of the distinguishing characteristics of the soap opera genre: a continuous and never-ending narrative, multiple plot lines, dialogue-based drama, complex characterization, slow-paced story lines, a focus on female characters and emotional intimacy, suspenseful cliff-hangers, and the use of dramatic organ music to bridge scenes. However, her most notable programming achievement may be the creation of the *Guiding Light*. Broadcast—first on radio and then on television—for more than six decades, Irna Phillips' *Guiding Light* is the longest continuous story ever told in American broadcasting.

Irna Phillips was born 1 July 1901 in Chicago, Illinois, the youngest of ten children of a German-Jewish family. After her father died when Irna was only eight, she maintained a close relationship with her mother. After attending Northwestern University for one year (1918–19), Phillips transferred to the University of Illinois, became a drama student, and graduated with a degree in education in 1922. After a brief stint teaching at a junior college in Fulton, Missouri, Phillips earned a master's degree at the University of Wisconsin in 1924. After her graduate work, Phillips spent four years teaching speech and drama at Dayton's Teacher College in Dayton, Ohio. On a visit

to her hometown at the age of 28, Irna Phillips toured the radio station WGN. According to legend, while she toured the facility, Irna was mistaken for an actress looking for an audition. After reading Eugene Field's poem, "The Bowleg Boy," Phillips was offered a job as an intern. Phillips initially turned down the offer, but the visit rekindled her interest in drama. By May 1930 Phillips was a paid employee of WGN, acting in small roles and reading inspirational verse on a program entitled *Thought for a Day*.

Accounts differ as to how Phillips began writing for radio. Her work starring in and writing for a 15-minute drama, *Sue and Irene*, and designing a Memorial Day program, among other projects, apparently caught the attention of WGN station manager Henry Selinger. Selinger, aware of the untapped selling potential of daytime radio, had approached the Lord and Thomas advertising agency to develop programming for female audiences. Selinger offered Phillips \$50 per week to write a daily drama about the "Sudds" family, which could be sponsored by a soap company. Although various sponsors remained unconvinced of the potential of a daytime serial, the program, renamed *Painted Dreams*, aired on WGN as a sustaining local program on 20 October 1930. *Painted Dreams*, broadcast six days a week, was radio's first soap opera, the first daytime serial narrative aimed at a female audience. The drama about an Irish-American household centered upon three characters: Mother Moynihan (voiced by Phillips); her daughter Irene; and a boarder, Sue Morton; the show dealt with the conflict between the traditional Mother Moynihan and her modern, career-minded daughter.

After two years and 520 scripts, Phillips wanted to sell her successful serial to a network. WGN, claiming ownership of the program, refused to allow Phillips to take *Painted Dreams* national. In protest, Irna Phillips quit her job and filed suit against the company. After an eight-year court battle over the program's copyright, Phillips lost the case. After leaving WGN, Phillips was determined to establish the rights to her own material. For the rest of her career, Phillips acted as an independent producer, creating programs and subsidizing all their

Irna Phillips

production costs before selling the package to a network. In 1932 Phillips moved to WGN's rival in Chicago, WMAQ. Collaborating with Walter Wicker, she developed another serial, a virtual replica of *Painted Dreams*. *Today's Children* (1932–37; 1943–50) featured a widowed Irish-American mother, Mother Moran; her daughters, Eileen and Frances; and a boarder, Kay Norton, living on Chicago's Hester Street.

Phillips developed seven other original serial dramas for daytime radio. After the birth of *Today's Children*, Phillips developed a short-lived drama about a painter involved with many glamorous women, entitled *Masquerade* (1934–35; 1946–47). This serial, designed to sell cosmetics, lasted only a few months, although it would be revived and redesigned nearly a decade later. Phillips' next and more successful creation was *Road of Life* (1937–59). This serial was the first major soap opera about doctors and nurses. Jim Brent, a young intern at City Hospital, was the serial's hero, equally adept at mending the "broken legs and broken hearts" of his patients (cited in "Queen of Soaps," 1964). That same year, Phillips' seminal daytime drama, *Guiding Light* (1937–56 on radio; 1952–present on television) was first broadcast. Dr. Preston Bradley, a Chicago clergyman admired by Phillips, was the inspiration for the serial's central character, Dr. John Ruthledge. The assimilationist drama centered upon Dr. Ruthledge and his attempts to minister to the Italian, Irish, and Polish families in the slums of Five Points. After the death of Phillips' mother (who was the model for the mothers in *Painted Dreams* and *Today's Children*) in 1937, Phillips replaced her popular and highly-rated serial *Today's Children* with the drama *The Woman in White*. In tribute to the nurses who cared for her ailing mother, Phillips developed a daytime drama about a young nurse named Karen Adams and her struggle to save the souls of her patients.

Phillips' next two contributions were more focused on the personal lives of their heroines. *The Right to Happiness* (1939–60), initially a spin-off of *Guiding Light*, became the story of an oft-married heroine, Carolyn Allen, and her fight for personal happiness. Influenced by Irna Phillips' experience as a single career woman in 1940s New York City, *Lonely Women* (1942–46) detailed the life of a group of women, separated from husbands and boyfriends during World War II, living at the Towers, an all-female hotel. In 1944 Phillips played with the traditional 15-minute format of the genre. She combined three of her serials in an hour-long block entitled the *General Mills Hour* and experimented with different program lengths, integrated story lines, and characters that traveled from serial to serial. Her final contribution to daytime radio was *Brighter Day* (1948–56), a drama about a widowed clergyman and his children in the town of Three Rivers.

Not only was Phillips prolific, her dramas were incredibly popular. Phillips and her sponsors regularly received over a quarter of a million requests for each promotion advertised on

her serials. By 1940 Phillips' most enduring product, *Guiding Light*, was broadcast to 12 million listeners over 300 stations, and Phillips' salary was estimated at over \$200,000 a year.

Irna Phillips believed there were three main objectives of a successful daytime radio drama: to entertain, to teach, and to sell. Although Phillips, a never-married career woman, had little in common with the 37 million homemakers targeted by daytime radio serials, she knew this audience would connect with complex female characters and domestic story lines. In her serials, Phillips threatened the security of her main female characters with illnesses, problem children, other women, and any other obstacles that might destroy their domestic bliss. Her tension-filled formula—"small-town-woman-with-an-emotional-problem-in-physical-danger"—shaped the development of many of her dramas. Irna Phillips was also a staunch advocate of the educational potential of her daytime dramas. Serials, she believed, taught women valuable lessons about how to address "real-life" problems. Phillips was quite progressive in integrating social issues into her plot lines, a practice that would become a hallmark of the genre.

To make her serials as realistic as possible, Phillips consulted physicians, lawyers, and government experts on how to incorporate social issues in her serials and how to advise her audience to respond to these matters. For example, in 1945 Phillips worked with the Office of War Information to produce a story line to instruct women on how to rehabilitate disabled war veterans. Phillips—often the target of critics such as James Thurber and Dr. Louis Berg, who feared the dangerous influence of these programs on American women—was so convinced of the public service her serials offered that she spent \$45,000 of her own money to combat these critical perceptions in the press. But despite her lofty ideals, Irna Phillips also understood the commercial realities of daytime programming. From her earliest days in radio, Phillips realized that the daytime serial was a "selling drama," a program intended to attract a lucrative female audience and to sell goods to that audience. Phillips was quite careful throughout her career to cultivate a reputation as a producer dedicated to her sponsors and responsible for making her serials effective advertising vehicles. For example, to charm a potential sponsor, Montgomery Ward, Phillips planned an engagement story line for one of her main characters to sell the home goods carried by that department store. Her success entertaining, teaching, and selling goods to female audiences made Phillips (with her longtime sponsor and business partner, Procter and Gamble) one of the most powerful women in soap opera production.

Phillips' unusual writing technique was strained as her serials became more successful. Phillips dictated up to six scripts per day to her longtime secretary, acting out each line of dialogue and changing her voice to indicate different characters. By the early 1940s, Phillips had five daytime serials on network radio and over 60 characters to write for. In her most

prolific period, Phillips wrote between 2 and 3 million words a year for radio, the equivalent of 27 novels each year. To manage the workload, she eventually developed a system similar to that of the Hummerts, plotting story lines and delegating the work of writing dialogue to a stable of writers.

Irna Phillips' success in developing and producing daytime serials continued even after network radio began to decline. Two of her serials, *Guiding Light* and *Road of Life*, were among the few programs to survive the transition to television. She also produced the first television soap opera in 1949, the short-lived *These Are My Children*. Just as she was influential in developing the soap opera genre on radio, Phillips pioneered the adaptation of radio serials to television, inventing an intimate visual style for the genre. She also created enduring television soap operas such as *Another World* (1964–99), *As the World Turns* (1956–present), and *Days of Our Lives* (1965–present). Not only did Phillips develop a record number of radio and television soap operas, she also trained the next generation of soap opera creators on television. Agnes Nixon (creator of *All My Children*, *Loving*, *The City*, and *One Life to Live*); William J. Bell (creator of *The Young and the Restless* and *The Bold and the Beautiful*); and Ted Corday (co-creator of *Days of Our Lives*) were all protégés of Irna Phillips in radio and early television. In all, seven of the ten soap operas on daytime television in 2003 can be traced to Irna Phillips. Although traditional broadcast histories have failed to acknowledge the extent of her contribution to the development of radio and television, recent historians, her sponsor, Procter and Gamble, and the daytime community have publicly recognized Phillips as perhaps the most important force in the creation and development of the soap opera.

JENNIFER HYLAND WANG

Playwrights on Radio

Writing drama for radio was a challenging task, for, unlike on the stage or screen, a radio playwright had to depend solely on sound, dialogue, and description to tell a story. The inability to use any visual devices derailed more than a few early would-be radio authors. Those who succeeded, however, created a wonderful art form that flourished for nearly two decades of radio's golden age. A half century later it is understandable that few people under the age of 60 remember the names of Norman Corwin or any of the other major radio dramatists. Corwin was the dean of America's radio playwrights during the golden age that began in 1935 and lasted until the late 1940s. Poets, novelists, and mystery writers joined Corwin and others who wrote mainly for radio in having their works aired to a vast listening public. A number of writers for the stage also sought out the broadcasting studios. A 1945 anthology of radio plays featured works by a priest, two army sergeants, a Noble prize-winning novelist, a musicologist, and even a blind man. Novelist John Steinbeck, TV personality Steve Allen, and TV newscaster Chet Huntley took brief stabs at radio play writing.

Golden Age Radio Drama

The first golden age radio playwrights were heard on two dramatic anthologies, the *Cavalcade of America* and the *Columbia Workshop*. The former was a showcase for largely patriotic shows; the latter, an experimental dramatic anthology, offered more artistic productions. Soon after the *Columbia Workshop* was launched in 1936, the show received a manuscript for *The Fall of the City*, a play in verse, from Pulitzer prize winner Archibald MacLeish. It dealt allegorically with the growth of fascist dictatorships in Europe. Its broadcast struck a chord and inspired a number of other talented and experienced writers. Because poetry lends itself particularly to aural expression, Stephen Vincent Benét, Edna St. Vincent Millay, and other poets joined MacLeish's ranks on radio. So did William Saroyan, Pare Lorentz, Dorothy Parker, and a number of other prose writers.

Howard Koch and John Houseman

On the eve of Halloween 1938, CBS broadcast what is probably the medium's best-remembered show, an adaptation of H.G. Wells' novel *The War Of the Worlds*. Orson Welles produced and acted in the program. However, despite the popular notion that Orson Welles also wrote the radio script, the primary authors were his two collaborators, John Houseman and Howard Koch.

John Houseman, a Romanian born Jew, was originally a grain dealer until the Depression put him out of business. By 1938, he was a stage producer, director, and writer, working in two undertakings with Welles, the Mercury Theatre (a stage troupe) and the *Mercury Theatre of the Air*. For the latter, a show on CBS, Houseman initially did the writing until he and Welles took on Howard Koch, a tall, shy Columbia Law School graduate, to relieve Houseman. It was Koch who wrote the original script for *War of the Worlds*. Houseman collaborated on two rewrites and Welles applied the finishing touches.

Even after the show created panic nationwide, Koch, its principal author, still remained unknown to the public, for Welles never attempted to set the record straight. After a shift in the Welles-Houseman relationship, Houseman left. Subsequently, Campbell's Soup offered Welles sponsorship of another radio series, and Koch continued as writer. Not long afterwards, Koch became a film writer, most notably co-author of the famed *Casablanca*.

Among the many talented writers who took to radio was Brooklyn born Lucille Fletcher. After receiving her degree from Vassar College in 1933, Fletcher took a job as a typist in CBS's publicity department. After Norman Corwin produced a play based on a story that she wrote, Fletcher decided to try radio writing herself. One of her first plays was performed on *Mercury Theatre of the Air*. Her most successful one, *Sorry, Wrong Number*, first broadcast in 1943, was translated into 15 languages, made into two films, and served as the basis for two operas. Other radio plays by Fletcher were produced on the *Columbia Workshop* and the *Suspense* series.

In the four or five years before Pearl Harbor, in response to the threat of fascism that had materialized in Europe, a group of writers began to produce a "social consciousness" body of radio drama that displayed a strong concern for human freedom. Thus Arch Oboler inserted political themes into about a third of the shows he wrote for the horror series *Lights Out*. Like virtually all of these writers in the pre-Pearl Harbor days, however, he did so in an allegorical manner. Also, a year before the Japanese attack, a government official had taken an initiative that led to the creation of *The Free Company*, an allegorical, antifascist series that featured plays by Stephen Vincent Benét, MacLeish, Maxwell Anderson, Robert Sherwood, Marc Connelly, and Sherwood Anderson.

World War II

After Pearl Harbor, both the networks and the government promoted programs intended to boost morale and otherwise assist in the pursuit of victory. Norman Corwin directed two four-network efforts at the request of the government. The first, only a week after Pearl Harbor, celebrated the Bill of Rights. The second, which began two months later, was a 13-part series about the war, for which he wrote about half of the shows. Its broadcast roughly coincided with production of Arch Oboler's first post-Pearl Harbor series, *Plays for Americans* on NBC. Oboler produced at least 70 "beat the Axis" radio plays in 1942. He played a particularly prominent role in the propaganda campaign against Germany, arguing forcefully that Americans needed to hate the enemy in order to conduct a successful war effort.

Twenty-seven year old Randal MacDougall was one of the writers for the Corwin series. Like many others of his generation, as a boy he had been fascinated by the technology of radio and had wound copper wire around an oatmeal box to make his first set. MacDougall began to write seriously at the age of 12. In his late teens he was working as an usher at New York City's Radio City Music Hall when a conversation with an NBC executive landed him an office job with the network. Eventually MacDougall worked his way onto the script staff. In 1942 he began working for a new war series, *The Man Behind the Gun*, one of the best dramas depicting the war era. Other notable and prolific writers of wartime radio drama included Allan Sloane, Peter Lyon, and poets Stephen Vincent Benét, Langston Hughes, and Norman Rosten. New Jersey-born Millard Lampell and playwright Arthur Miller, both close friends of Rosten, wrote for radio as well.

Allan Sloane, originally a newspaper journalist, broke into radio in 1943 when, temporarily jobless, he walked unannounced into the office of the producer of *The Man Behind the Gun* and handed in a script he had written at home. He was hired within a few days. Peter Lyon, another journalist, got started writing for *The March of Time*, a dramatized news

documentary. Later, he also wrote for the *Cavalcade of America*. Like many of his radio colleagues, Lyon was a progressive. Among other interests, he was a strong trade unionist. He and Millard Lampell both wrote for a wartime series entitled *Labor for Victory*. Lyon also served in 1944 as president of the Radio Writers Guild.

In his earlier years Pulitzer prize winner Stephen Vincent Benét was rather indifferent to politics. But during the 1930s, he grew increasingly interested in national and international events and developed wide friendships among European refugees. By the time of Pearl Harbor, he was driven to assist the war effort, attending meetings and giving radio readings of his poetry. His best-known contribution to the war effort was a radio drama in verse, "They Burned the Books."

Langston Hughes had many fewer opportunities with radio than did his white peers. He first wrote for radio in 1940 when CBS asked him to prepare some scripts for a Norman Corwin series. Soon, Hughes was lending his talent to the war effort even though he found that he was radio's "token" black writer, defending a democracy whose fruits he could not fully share.

Norman Rosten, a protégé of Stephen Vincent Benét, was one of the most prolific writers of radio plays of the 1930s and 1940s. Rosten received part of his preparation for writing radio drama on a playwriting fellowship at the University of Michigan. The broadcast of MacLeish's *The Fall of the City* made him realize radio's potential as a vehicle for poetry. After completing his studies, Rosten returned to New York where, with an introduction from Benét, he began to write patriotic radio plays for the *Cavalcade of America*.

Millard Lampell grew up in the same New Jersey hometown as Allan Sloane. Son of an immigrant garment worker, Lampell, a short, athletic, ebullient, man, worked in his youth as a fruit picker and coal miner. He sold his first piece of writing, an article about fascist groups on campus, while he was in college in West Virginia. After college, Lampell moved to New York City and sang for a while with folk singers Woody Guthrie and Pete Seeger. One Sunday, after they finished a gig, a radio producer who had been in the audience approached Lampell and asked him if he would be interested in writing for radio. Lampell's writing career was off and running.

In 1942 and 1943 Lampell wrote scripts for *It's the Navy* and several other war-related radio programs. In 1943, he was drafted. After training, he was assigned to the Air Force radio section in New Haven, Connecticut. There he wrote, produced, and directed programs. In 1944, Lampell was released from the service to visit veterans hospitals around the U.S. and gather material for radio scripts about returning soldiers. Afterwards, he produced *First in the Air*, a series for the Army Air Forces program. Subsequently he lectured on radio writing at several New York area colleges. In 1946, Lampell went to Hollywood as a contract writer at Warner Brothers.

The fact that Arthur Miller wrote most of his early plays for radio has not been well known. But he wrote perhaps 25 radio plays between 1939 and 1946, most of them war related. New York-born Miller attended the University of Michigan, where he befriended Norman Rosten and began writing plays. After graduation, Miller also moved back East. Within a few months, a film studio offered him \$250 a week to work in Hollywood. Miller rejected the offer, opting instead for a job at \$22.77 per week with the Federal Theatre, a government work program for writers. At around the same time, the *Columbia Workshop* accepted his first play for radio. Miller also wrote for a series entitled *The Doctor Fights* and, after Rosten recommended him, for the *Cavalcade of America*.

During the war, Miller was rejected twice for military service because of a knee injury. As a substitute, he took a job in the Brooklyn Navy Yard where he helped recondition ships for service. He also threw himself into writing patriotic shows for radio. He worked quickly, completing a half-hour play in less than a day and spending only three months per year writing for radio. During the other nine he wrote for the stage.

Arthur Laurents graduated from Cornell University in 1940. At the urging of a friend, he enrolled in a radio writing course at New York University. His teacher, a CBS director, was so impressed with a play that Laurents wrote for the course that he sold it to the *Columbia Workshop*. After that Laurents wrote for numerous commercial shows before moving away from radio in favor of musicals and films.

Morton Wishengrad was born in New York's Lower East Side in 1913 to Russian-Jewish immigrant parents. A tall, thin, and reserved man, he shared many of the concerns of the progressive-minded writers of his generation. Wishengrad's first job was as the educational director, editor, and researcher for the International Ladies Garment Workers Union. During the war he worked for the American Federation of Labor as director of a joint Labor Short Wave Bureau that broadcast to organized labor in Europe. He also wrote scripts for NBC's *Labor for Victory*, the *Cavalcade of America*, and several other shows.

Writing for Minorities

Wishengrad stands out among a number of Jewish radio writers as perhaps the only one to clearly bring his Jewish consciousness to radio. Although he wrote for mainstream shows, Wishengrad is best remembered for his writing for programs that primarily addressed a Jewish audience. In 1943, he produced a script about the battle of the Warsaw Ghetto for the American Jewish Committee. It was one of a very few wartime shows that touched on the Nazis' genocide policy. The following year, Wishengrad began to write for *The Eternal Light*, a new Jewish religious drama series, sponsored by the Jewish Theological Seminary.

Mitchell Grayson and Richard Durham, two African American radio dramatists, also appealed to special audiences. Grayson, a New York writer, wrote and directed *New World A'Coming*. Durham wrote *Destination Freedom* in Chicago. Both were provocative collections of half-hour black history dramas about prominent African Americans that helped pave the way for the civil rights movement.

Postwar Era

Despite radio drama's great success from the mid 1930s, by the 1950s the genre was in decline, a consequence of the ascent of television and the postwar increase in commercialization in broadcasting. The latter helped make radio vulnerable to a destructive broadcasting industry blacklist carried out by anti-communist vigilantes. Corwin, Grayson, Hughes, Lampell, Rosten, and virtually all of the other writers discussed here were its targets. By 1957, most radio dramatists also had to write for television and film to make a living.

With the departure of many of the war-era radio dramatists, the American radio audience lost a steady source of progressive ideas. The public also lost some fine entertainment. For a short time, during television's Golden Age, the new medium filled the gap. But then it too faded from its glory days.

Poetry on Radio

Poetry has played many roles on radio, from filling dead air-time to giving voice to the grief of mourning, as well as many of the places in between.

Introduction and Themes

Poetry on radio was initially occasional and spontaneous, with an announcer reading a poem before or after a music segment or the farm reports. Ted Malone, who was later to be one of the best-known hosts of poetry on radio, began his career this way. In the late 1920s, quickly substituting for an act that failed to show, the program director thrust an anthology of poetry and a mike at Malone and left him to his fate. His reading was a success, and Malone went on to a radio career of more than 25 years with *Between the Bookends*. Because of the ease of production and minimal expense involved, this tradition expanded in the 1930s and 1940s and continues to this day.

The poetry heard on radio has tended to fall into several categories. Early on and into the golden days of radio it has mostly been of the sentimental or "light" variety, especially on shows that were commercially sponsored. Poetry was often taken from popular magazines, such as *Good Housekeeping* or *Redbook*. Many times it was read over music, sometimes accompanied by philosophizing or "gentle wisdom." When more serious or "highbrow" poetry found its way onto the airwaves, it was usually in a sustaining program, and later in non-commercial radio. Some shows included music underneath, or before or after the poetry, while others were straight readings of poems.

By the late 1930s poetry found a new form with the appearance of radio verse plays. The originators of radio verse plays in the U.S. were Archibald MacLeish and Norman Corwin. It was here that poetry reached its greatest number of listeners, as illustrated by the estimated audience of 60 million for Corwin's "We Hold These Truths" in 1941. The paragraphs that follow, by no means inclusive, highlight selected examples and events throughout the nearly 100 years of radio.

Origins

In the early part of the 20th century, radio was primarily a medium of individuals and amateurs some of whom would occasionally read poems, sometimes just to fill dead air, or sometimes in loosely organized "shows." Unfortunately, because the technology was not easily available to record these "programs," and scripts were rarely kept, few names or titles have survived.

In the early 1920s poetry was often read within other programs, such as variety shows hosted by people such as Major Bowes, Rudy Vallee, and Fred Allen. The earliest poetry appeared on local radio shows, such as a program in Yankton, South Dakota, broadcast in 1921 on WNAX and supported by the Guerne Seed and Nursery Company. One listener won a "poetry" contest with, "the Guerne's are the farmer's friend / They always will be to the end."

Later, when radio became more structured, stations broadcast identifiable announcers, and programs with titles appeared, such as *Cheerio*, *Tony's Scrapbook*, *Between the Bookends*, and *Poet's Gold*. One of the earliest shows featured Edward Godfrey reading poetry on a children's program titled *Stories and Poems Read by Uncle Ed over KDKA* (Pittsburgh, Pennsylvania). Beginning 26 October 1923, it was a variety program, usually lasting 15 minutes, that ranged from imitations of birds and animals to music on the mouth organ and guitar to the reading of poems, some original.

One of the first shows to feature poetry was *Poems*, with Beatrice Meisler reciting poetry each week on WGBS in New York City in 1925. Another was *Poet's Corner*, sponsored by Hewitt's Bookstore, with an unidentified performer reading poetry on KFON in Long Beach, California, in 1926. A third was *Poetry Club*, in which Mrs. David Hugh read and discussed poetry on KHJ, Los Angeles, California, in 1929.

While most of this early poetry on the radio was of the sentimental type, more serious poetry did appear. As radio became more regulated in the 1920s, one of its roles was to provide a

public service, as defined in the Radio Act of 1927. With this in mind, "highbrow" material, including some poetry, also appeared in sustaining programs (programs funded by the station or network without commercial advertising). David Sarnoff, vice president and general manager of RCA, suggested that the masses needed to be uplifted by culture, including poetry. While these early poetry broadcasts sometimes were on commercial radio, they were not necessarily commercially sponsored and often served as filler between commercially sponsored programs.

Network Radio

Poetry began on the networks in 1929 when CBS asked David Ross, with his fine voice, to read poetry in a half-hour Sunday afternoon sustaining show titled *Poet's Gold*. However, like many radio shows and personalities, Ross began locally, first airing in 1926 on WMAQ, Chicago. *Poet's Gold* continued on CBS into the late 1930s, mostly on Sunday afternoons. Ross read classic and contemporary verse by poets such as Ben Jonson, Samuel Taylor Coleridge, Percy Shelley, Robert Frost, Edna St. Vincent Millay, and Stephen Vincent Benet, usually over music. *Variety* commented that it was one of the best of the many programs of the 1930s featuring poetry and quiet music. Ross participated in another trend of poetry on radio programs by publishing a related book named after the show, *Poet's Gold*.

Ted Malone (Frank Alden Russell) and Tony Wons (Anthony Snow) were the two major personalities of poetry shows on network radio. On *Tony's Scrapbook* Wons gave down-home wisdom and commentary mixed with sentimental verse from sources such as *Good Housekeeping* and *Redbook*, as well as drawing occasionally from literary giants. Wons' gentle, intimate sounding delivery made him a favorite with female listeners. Popular or "light" poetry was more likely to be commercially sponsored, and Wons was able to find companies to foot the bill, including International Silver and Johnson Wax in the 1930s and Hallmark Cards in the early 1940s. Before that he had supported his program by selling yearly collections of poems read on the air, thus the show's name. CBS participated in the publishing of the scrapbooks and later had a deal whereby the network got a cut of sales from the books in exchange for air time.

Wons also appeared on other shows. In 1931 he contributed to the *Camel Quarter Hour*, a variety program directed by Erik Barnouw and sponsored by R.J. Reynolds, where he read a poem on each show. In the commercial spirit, he also read two poetically phrased messages about Camel cigarettes, as part of an attempt to market cigarettes to women. From September 1934 to August 1935, Wons appeared on *The House by the Side of the Road*, a half-hour Sunday afternoon

dramatic program, sponsored by Johnson's Wax and Allied Products and broadcast on NBC.

Ted Malone hosted *Between the Bookends*, a book review program that also featured conversation and poetry, for more than 25 years. It included Malone's poetry as well as that of others and was usually amusing and almost always uplifting. Malone sat in a studio with the lights dimmed and read poetry to organ accompaniment played by Rosa Rio. To Malone, radio was an intimate medium that fit the simple and sentimental poetry he read. Malone was poetry editor at *Good Housekeeping*, and the poems he read were mostly taken from it and similar magazines. He published several *Between the Bookends* anthologies, which were widely available.

Malone also hosted a 30-minute *Pilgrimage of Poetry* program for one season on NBC Blue that featured 32 of the most famous poets in America. Malone traveled to the homes of writers such as Henry Wadsworth Longfellow, Stephen Crane, Edgar Allan Poe, and Walt Whitman, among others, as a way of sharing their lives with his radio audience. He followed this with a season of *American Pilgrimage*, broadcast from 1940 to 1941, where he visited the homes of such literary stalwarts as Mark Twain and Herman Melville.

Sentimental/Cheerful Poetry

Readings of sentimental/cheerful poetry over a background of organ music or in between announcers' talking and philosophizing had the widest audience for poetry on the radio. *Cheerio*, a program of good cheer that included poetry, was also the broadcast name used by the popular broadcaster and host of the show, Charles K. Field. He read poetry and gave inspirational talks starting in 1925 on local radio in the San Francisco Bay area. He moved to the networks in March of 1927 until he was off the air in April of 1940. Field claimed never to have received a penny from his broadcasting, but he wrote many best-selling books. They contained the poetry and wisdom used on his shows and provided his income. In a program called *Cheerio Exchange*, Field's staff maintained a fund to purchase radios at a discount to be lent to shut-ins.

Moon River was broadcast on WLW (Cincinnati, Ohio) in the 1930s and 1940s. It was one of the best-known and best-loved local shows of the network radio era. It began when WLW's owner, Powel Crosley, Jr., told Ed Bryan to create a poetry show to make use of the organ he had just purchased. Narrated by Bob Brown among others, *Moon River* occasionally found its way to the networks. One reference mentions it being broadcast on NBC Red at 12:30 A.M. on 15 March 1942.

George Work hosted *Melody and Rhyme* from 1927 until his death in 1947. It was broadcast on WNYC on Sunday mornings from 8:00 to 8:45 A.M. During those 45 minutes, he

read four to six sentimental poems over music, or between musical selections.

Edgar Guest's poems were a regular feature of many music-poetry programs. He also had his own radio career as a poet/host. It began in Boston in the 1920s, although Guest was most well known in the Midwest. He hosted his own show in the 1930s on WASH (Grand Rapids, Michigan) and later on a show in which he read poems between selections by the Detroit Symphony on CBS. Guest's career with poetry on radio continued into the 1940s as he provided poetry for an NBC radio show in 1941 along with Eddie Howard.

Highbrow/Serious Poetry

Although most of the poetry on the radio was of the sentimental variety, there has long been a presence of "highbrow" or serious poetry allied with the more elite poets, poetry establishments, and the academy. One show that included more serious poetry was the previously mentioned *Poet's Gold*. Another was *Poetry Hour* hosted by A.M. (Aloysius Michael) Sullivan, an officer of the Poetry Society of America. Sullivan began broadcasting *Poetry Hour* on WOR/Mutual Network in 1930 and was still on the air into the 1940s. *Poetry Hour* presented the poets reading their own work and discussing techniques and trends in poetry. He presented more than 300 poets on the air including Stephen Vincent Benet, Edgar Lee Masters, Padraic Colum, Sara Teasdale, Mark Van Doren, and Kimball Flaccus. In 1937 this program helped provide an entrée onto the radio airwaves for Norman Corwin, who filled in for Sullivan on several occasions. In 1948 Sullivan created *The Poet Speaks*, which combined the reading of poetry with discussion about it.

Among the highest of the highbrows, Harriet Monroe, the founding editor of *Poetry: A Magazine of Verse*, appeared on *Here, There and Everywhere*, a 15-minute Chicago area program between 1930 and 1936. She also was on CBS's *American School of the Air* in a 10-minute segment on modern poetry.

Radio Verse Plays

The late 1930s brought a new development to the history of poetry on radio with the beginning of radio verse plays. The legendary first broadcast was Archibald MacLeish's verse play for radio *The Fall of the City*, which was broadcast 11 April 1937 from 7:00 to 7:30 P.M. on CBS. *The Fall of the City*, said critics, represented the American broadcasting industry's discovery of great radio in poetry and at the same time an American poet's discovery of great poetry in radio. In MacLeish's own words, "I realized at the time how much 'The Fall of the City' owed to not being seen, how much it owed to the fact that the imagination conceives it."

The Fall of the City raised the bar for the level of poetry on radio. First, its author was a writer of high repute—MacLeish won the Pulitzer Prize for Poetry in 1933 and later became the Librarian of Congress. Second, the play recognized radio as a literary medium, well suited to verse and poetry. This furthered the view that radio was highbrow and artistic. *Fall of the City* was referred to frequently by critics in later years as an eminent first in literary broadcasting.

It was, however, Norman Corwin who was to become known as "radio's poet laureate." The *New York Times* said that "Corwin writes with a poet's vision, a good reporter's clarity and a technician's precise knowledge of his craft—three attributes that have made him preeminent in radio literature." While Norman Corwin's name eventually overshadowed all others in the world of radio verse plays, he went on to become much more as he made his reputation as a writer, producer, and director.

Corwin began his radio career at WBZA (Springfield, Massachusetts) reading the news and then later hosting a show called *Rhymes and Cadences* in which he read poems aloud. He moved to New York in 1936, where he hosted *Poetic License* beginning in late 1937. It was broadcast from 9:45 to 10:00 P.M. on WQXR, a New York station then known for its high-quality ("for the discriminating listener") innovative programming. *Poetic License* featured some of the leading poets of the day in conversational poetry, or what was to become known as "talking verse." On one show Corwin presented an adaptation of *Spoon River Anthology* that caught the attention of W.B. Lewis, a CBS vice-president, and led to his becoming a major fixture there.

Soon after moving to CBS, Corwin started *Words without Music*, a sustaining show broadcast on Sundays from late 1938 to June 1939. Here Corwin appealed to a variety of listeners by reading poetry from Mother Goose to Walt Whitman, Carl Sandburg, Robert Frost, and occasionally African-American poets such as James Weldon Johnson and Sterling Brown. *Words without Music* used a form called "vitalized" or "orchestrated" poetry that consisted of dramatizing a poem, giving its lines to several voices, and sometimes adding lines and repetition for dramatic effect. By dramatizing poems and/or adding a sense of humor, Corwin opened up the audience for "good" poetry beyond the highbrow, to include those who enjoyed drama and/or comedy.

Words without Music inspired an NBC poetry program *Fables without Music*, featuring Alfred Kreymborg. It was, however, much more serious in tone and subject. Broadcast in the spring of 1939, it consisted of 10 radio verse plays of 15 minutes each.

Among the hundreds of verse plays written for radio in the 1940s are Stephen Vincent Benet's *A Child is Born*, W.H. Auden's *The Dark Valley*, Pearl S. Buck's *Will This Earth*

Hold?, Norman Rosten's *Concerning the Red Army*, and Edna St. Vincent Millay's *The Murder of Lidice*.

Postwar Years

After World War II, poetry played a lesser role on network radio. Some earlier shows, such as *Between the Bookends*, survived into the 1950s. Others suffered as the networks became more commercialized and reduced the number of sustaining programs. Norman Corwin left CBS in 1948 because of a contract dispute and moved to Hollywood. In addition, the networks were less interested in promoting these shows. One example was their reduction in support for the publication of books to support and advertise their on-air poetry shows.

Shows containing poetry or of interest to poetry fans did, however, appear, some locally and some on the networks. One was hosted by Mary Margaret McBride, who broadcast from 1935 to 1955, first as Martha Deane, then under her own name. Her guests included Langston Hughes, Mark and Carl Van Doren, Carl Sandburg, and William Carlos Williams.

Like so many artists, poets of the 1950s suffered under the pressures of McCarthyism. Unofficial lists of "communists" included many prominent poets such as W.H. Auden, Archibald MacLeish, Carl and Mark Van Doren, and Stephen Vincent Benet.

New poetry shows that began in the 1950s included *Poetry of Our Time*, featuring author and poet Katherine Anne Porter reading her poetry. Another was *Anthology*, which mixed music, poetry, and other literature in a series presented in cooperation with the Poetry Center of the Young Men's-Young Women's Hebrew Association. It was produced by Steve White, directed by Draper Lewis, and hosted by Harry Fleetwood. Guests included W.H. Auden, Edna St. Vincent Millay, William Carlos Williams, and Wallace Stevens.

David Ross' long career of reading poetry on the air continued in the 1950s with *Words in the Night*. Here Ross read poetry with music provided by guitarist Tony Mattola and vocalist Sally Sweetland. *The Poet Speaks* was heard on WGBH (Boston) featuring Wallace Stevens, e.e. cummings, and Adrienne Rich, among many others.

Non-Commercial and Other Venues

With the decline in network support for poetry, non-commercial and educational radio filled some of the gap. University and other stations serving cultured and academic populations have supported numerous poetry programs that have lasted as long as their mostly unpaid hosts could manage. Broadcasting since the late 1920s, WOSO at Ohio State University did some of the most progressive work in poetry including *Lyric Ohio*, which presented the work of Ohio poets. On the air since

1930, *Invitation to Reading* on WHA at the University of Wisconsin included poetry programs for high school students.

In the late 1950s, music and literature shows made up 70 percent of the schedule for KPFA (Berkeley, California), flagship station of the Pacifica Foundation. In 1959 KPFA broadcast *The Poetry of Lawrence Ferlinghetti* as well as numerous other shows of beat poets from the thriving poetry scene in the San Francisco Bay Area at the time. Chicago's fine arts station, WFMT, has throughout its history featured live and recorded poetry readings. One notable example is Ken Nordine's *Word Jazz*, which was broadcast in the late 1950s and early 1960s.

The Library of Congress' presence on the radio began in the early 1940s with the Radio Research Project headed by Archibald MacLeish. Although poetry was not its main emphasis, the Research Project featured some of it in a series titled *Books and the News*. In 1950, consultant in poetry Conrad Aiken inaugurated the broadcasting of readings over a local radio station, WCFM, under the Library of Congress' sponsorship. These broadcasts continued in the 1950s and included Katherine Garrison Chapin reading the poems of Emily Dickinson as well as the works of other women poets. The programs were broadcast from the Coolidge Auditorium at the Library of Congress and were often aired only locally in Washington, D.C., although some reached a national audience as well.

Since the early 1950s the Library of Congress has continued to have an irregular but important presence on the airwaves. It has often featured the current consultant in poetry (now called Poet Laureate Consultant in Poetry) as well as a long list of distinguished poets of note. The Library of Congress continues to host poetry broadcasts to this day. Recently these have primarily been on WETA-FM in Washington with national distribution via satellite. One example is *The Poet and the Poem from the Library of Congress*, hosted by Grace Cavalieri, which began broadcasting in 1989 and has been annual since 1997. Robert Pinsky provided the first live poetry webcast on the internet from the Library of Congress on 8 October 1998.

The Library of Congress' Archive of Recorded Poetry and Literature contains many broadcasts by known and not-so-known poets. Many recordings were made at local stations and given to the Library for inclusion in the archive. The Archive of Hispanic Literature, also at the Library of Congress, contains the recordings of hundreds of poets, including six or more Nobel Prize winners from Latin America and Spain. It is difficult to know how many of these were broadcast.

The decade of the 1960s opened with a major American poet, Robert Frost, reading a poem he had written at the inauguration of John F. Kennedy. It was broadcast live on radio and began

*A Golden Age of poetry and power,
Of which the noonday's the beginning hour*

At that point he was blinded by the sun and snow and could hardly read his words. Quickly he moved into a poem he knew well, "The Gift Outright," holding his head high as the words reached out. Frost also read on WAMF (Amherst, Massachusetts) many times between 1948 and 1962. Most of those recordings are in the Archive of Recorded Poetry and Literature at the Library of Congress.

In the 1970s, poetry's access to the airwaves increased with the advent of National Public Radio (NPR). Since its beginning in 1971, NPR has broadcast a number of shows that have featured poets and poetry. *Voices in the Wind* broadcast beginning in 1974 with Oscar Brand as host and included Nikki Giovanni, Lucille Clifton, and Allen Ginsberg. *Poet Speaks*, a 30-minute show that originated at WGBH, broadcast with Herbert Kenny as host from April to June 1972. Guests included Richard Eberhart, John Updike, May Sarton, and Allen Tate. Some shows had very limited runs, perhaps one or only a few broadcasts. *Spoon River Anthology* was broadcast in March 1973 in four weekly installments, originating at WGBH. *The Archibald MacLeish Tribute* was broadcast 15 April 1981 with MacLeish and John Ciardi. MacLeish was also interviewed in *Book Beat* on 31 October 1971. *Voice of the Poet* was broadcast 15 January 1975 with Jerome Rothenberg and Marge Piercy among the guests. Some of the other shows that have featured or included poetry are *Talk of the Nation*, *Fresh Air*, and *Children's Radio Theatre*.

Poetry on Radio Today

At the beginning of the 21st century, Garrison Keillor hosted a daily five-minute radio program called *The Writer's Almanac*, in which he notes milestones of the day and closes with a poem or two. It is heard each day on public radio stations throughout the country. Occasionally Keillor also includes poetry in his weekly program *A Prairie Home Companion*. Other short shows similar to *The Writer's Almanac* include *The Osgood File* with Charles Osgood, heard daily on the CBS radio network, and *Bookbeat*, a daily report on new books and authors with Don Swain as host on WCBS in New York.

New Letters on the Air, the radio companion to the printed publication *New Letters*, was first broadcast locally in Kansas City, Missouri, beginning in 1977. *New Letters on the Air* is a half-hour weekly show designed primarily to introduce the author with a short interview and then a number of poems. Typically, the program has about 10 minutes of poetry, 15 minutes of interview, and 3 minutes of introductions, credits, and musical bridges. *New Letters on the Air* has featured four Nobel Prize Winners, as well as 50 winners of various other literary awards, including the Pulitzer Prize. Approximately one-third of the featured writers are members of ethnic minorities. It has been syndicated over the NPR satellite and broadcast in

more than 60 cities. From 1984 to 1995 it was hosted and produced by Rebekah (Presson) Mosby.

The Poet and the Poem is a one-hour show broadcast locally on WPFW in Washington, D.C., nationally by Pacifica Radio, and internationally by the Voice of America. From 1977 to 1997 it was broadcast weekly, first on Thursday, then on Sunday evenings. It has featured more than 2,000 poets ranging from United States Poet Laureates and Pulitzer Prize winners to unpublished and/or fledgling poets of consequence. In *The Poet and the Poem*, host Grace Cavalieri first provides biographical information about the poet who then reads several poems. A poet herself, Cavalieri asks probing and insightful questions that draw the poets out in revealing and informative ways. From 1978 to 1993, the program also hosted an all-day poetry broadcast once a year featuring 35 performers present. Titled *Ribbon of Song*, it featured Sterling Brown among others and the archival works of Paul Laurence Dunbar and Langston Hughes among others. In May (National Poetry Month) of 2000, in celebration of the bicentennial of the Library of Congress, *The Poet and the Poem from the Library of Congress* was a one-hour weekly show with W.S. Merwin, Louise Gluck, Robert Pinsky, and Rita Dove.

Other contemporary shows of note include *Poems to a Listener* with host Henry Lyman on WFCR-FM, Amherst, Massachusetts; *A Moveable Feast* with Tom Vitale and guests such as Allan Ginsberg, Charles Bukowski, and Joyce Carole Oates; *Soundings* with Wayne Pond; *Bookworm* with Michael Silverblatt from KCRW, Santa Monica, California; *Enjoyment of Poetry* with Florence Becker Lennon on WEVD, New York; *Booktalk* with Rus Morgan on WYPL, and *The Book Show* with Douglas Glover.

Poetry continues to be heard on radio in much the way it was in the early parts of the 20th century. It is heard on stations big and small, to inform and entertain, as filler, inspiration, and as something to soothe. As the internet becomes more of a force in radio, more programs will be available live over the web. Recorded poetry as well is becoming available on line, being broadcast, or "webcast."

Perhaps the close and continuing association of poetry and radio should come as no surprise. The development of the radio restored the power of the spoken word. Both are reflections of the original oral traditions that gave birth to our literary heritage. In the words of Archibald MacLeish, "The ear is the poet's perfect audience, his only true audience. And it is radio and only radio which can give him public access to this perfect friend."

Politics and Radio

The late 1920s witnessed the dramatic expansion of radio as it became a powerful new form of mass communication. The 1930 census reported that nearly 70 percent of all homes in the United States had at least one radio. As the 1930s came to a close, more families owned radios than owned telephones and automobiles or subscribed to newspapers. Nowhere was the impact of radio more widespread than in the political arena. Radio had several effects on political discourse and campaigns. It made campaigning more expensive, as the cost of radio air time added millions to campaign budgets, and it brought the advertising agency into politics. Perhaps even more important, radio was the first technological medium that allowed presidents to "go public"—that is, to go over the heads of Congress and directly to the people, thereby changing the method of governance. This essay, detailing radio's impact on the political process, chronicles the major eras of political radio in the U.S., which include 1) politics and radio in the early years—from Harding to Hoover; 2) Roosevelt and radio; 3) the postwar years and the rise of television; and 4) the rebirth of political radio.

Politics and Radio in the Early Years— From Harding to Hoover

The first president to speak on radio was President Woodrow Wilson in 1919. However, only a few people heard Wilson's address, and those listening could distinguish no more than a few clear words. Historians theorize that if radio had evolved ten years earlier and provided him the opportunity to speak directly to the people, Woodrow Wilson might have been more successful in his appeal for League of Nations membership.

It was not until after the landslide Harding election of 1920 that both the public and politicians realized that radio could be a pragmatic and efficient communication medium. After the election, Harding periodically spoke on the radio concerning national matters. His 1923 State of the Union speech was carried widely, and later that same year, while on a Western tour, Harding energized the populace's acceptance of political radio with a series of commentaries entitled "Stewardship of the Administration." The effects of these radio announcements were swiftly imprinted upon the American political landscape.

For example, development of radio during the Harding administration was evident in the broadcasting arrangements made for his Western tour. The railroad car in which he traveled was equipped with a radio transmitter in order to broadcast speeches to a large portion of the nation.

There is little doubt that the novelty of these presidential addresses made at least some impression on the populace. Nonetheless, Harding, it seems, was not altogether comfortable with the new medium. A *New York Times* observer reported, "He is dominated by the restraining influence of the radio-telephone amplifiers, into which he has talked while making these addresses. The mechanical contrivance worries him . . . and he is tempted at times to revert to the old style oratory" ("Cordial to Harding, Cold to Speeches," *New York Times*, 25 June 1923).

As troubling as the mechanics of the radio may have been to Harding, his successor, Calvin Coolidge, found the medium to be suitable to him rhetorically, even as he recognized radio's political possibilities. "Silent Cal" was anything but silent when it came to radio broadcasts. In 1924 it is estimated that Coolidge spoke more than 9,000 words per month over radio and that more than 50,000 people heard his voice during the first eight months of 1927, more than had heard any previous president. That radio broadcasts benefited Coolidge is rarely disputed. Both writers and politicians who assessed Coolidge's radio abilities gave him enthusiastic endorsements. Coolidge himself once made the observation, "I am very fortunate that I came with the radio. I can't make an engaging, rousing, or oratorical speech, but I have a good radio voice, and now I can get my message across to them without acquainting them with my lack of oratorical ability" (Chester, 1969). Coolidge tended, however, to refrain from utilizing radio as a tool for practical political or party gain. Even though radio played a large role in establishing Coolidge as president and in getting him re-elected, he did not feel the need to speak habitually to the nation.

Certainly presidential addresses made up the largest number of political programs on radio in these early years, but the public also seemed to pay attention to other political events carried on the airwaves. Starting in 1924, political party conventions were covered by radio and heard by a large audience, and that same election witnessed the beginning of paid broadcast advertising for political parties and candidates. The early years of radio also saw the beginning of radio's use as a medium for advocating political viewpoints. The most famous of these advocates was the "Radio Priest," Father Charles Coughlin, who used radio to promote his views on social and political issues of the day during the 1920s and 1930s.

If Coolidge was the harbinger of radio as beneficial to the democratic ideal, Hoover was the forerunner of radio as an integral part of a campaign. Hoover pushed the Republican

party toward spending the major portion of its publicity budget on radio. Indeed, in May 1928 Hoover indicated that he would engineer his campaign largely through radio and films. The use of radio in the 1928 campaign by both Hoover and his Democratic challenger, Alfred Smith, was remarkable on a number of levels. First, despite his interest in drama as a younger man, Smith did not use the radio airwaves well. Problematic was his East Side accent, which may have endeared him to the immigrant population in New York City but which hurt him in the South, where he desperately needed votes. Second, the spending for airtime in this campaign, by both parties, reached nearly \$2 million. This represented only about 15 percent of the total publicity budgets of both parties for a medium that was able to reach nearly 40 million voters.

Radio as a political medium was growing rapidly. For example, the League of Women Voters developed a bipartisan series of programs designed to inform voters, claiming to provide background information, differing points of view on issues, and information on the political and voting process. Campaigning notwithstanding, political scientists argue that radio may have had an even more powerful influence upon American presidential politics than simply the obvious effect of helping candidates attract votes. The power of the president rose with the ability to go "over the head of Congress" directly to the American public. The potential power of the presidency was strengthened during the Harding, Coolidge, and Hoover administrations, and radio played an important role in this development.

Roosevelt and Radio

The harshness of the Great Depression, which had shrouded the country since 1929, almost ensured a victory for the Democratic party in the 1932 election. One of the more notable aspects of his nomination was Franklin Delano Roosevelt's outstanding radio speaking ability. He began his campaign with a radio address at Albany, New York, and he accepted the nomination of his party at the convention over radio, breaking the precedent of waiting for a time lapse of one month. Long before his nomination, Roosevelt suspected that the power of radio would be important to his political livelihood. For instance, in an address to the Tammany Speaker's Bureau in 1929, Roosevelt argued that American politics "had passed from an era in which silver tongues had swayed many votes through a period of newspaper domination to the present age in which radio was king" (Chester, 1969).

The election of 1932 witnessed a remarkable juxtaposition of quality versus quantity. Herbert Hoover had, for example, launched his campaign for re-election over the largest political radio hookup in history, nearly 160 stations. The Republican party used 73 hours of network time to boost its candidate,

compared to 51 hours for the Democrats, and ultimately Republicans outspent Democrats on the radio. This did little to enhance the possibility of Hoover's being re-elected, however, as he was not a particularly effective performer on the radio.

The 1936 election was one of the more remarkable campaigns in the history of presidential politics. The Republicans chose a notoriously poor public speaker in Kansas governor Alfred Landon. Furthermore, 1936 witnessed the arrival of a third-party candidate, William Lemke of the Union party, whose candidacy was driven by Father Coughlin. Faced with a strong Democratic candidate as well as Father Coughlin's demagoguery, Republican strategists developed and employed several innovative radio strategies to assist their candidate. The innovations included spot radio advertisements for their candidate as well as the radio drama *Liberty at the Crossroads*, which played on WGN in Chicago. One of the more creative techniques was a one-sided "debate" in which Republican linchpin Arthur Vandenburg "debated" a phonographically recorded Franklin Roosevelt. The debate was designed to illustrate Roosevelt's failed campaign promises from 1932. The "debate" caused consternation among the 66 stations scheduled to carry it: 23 broadcast it, 21 cut it off, and the remainder vacillated back and forth. Also during 1936, both parties placed a great deal of emphasis on foreign language broadcasts, creating about 2,000 political broadcasts altogether. The Democrats had foreign-language transmissions in over a dozen cities, and the Republicans employed 29 languages in everything from 100-word spot advertisements to 30-minute talks.

Roosevelt's overwhelming victories in 1932 and 1936 were due, in part, to his use of radio. However, these victories were not so much caused by the use of radio in the campaign itself; instead, it was the cultivating of the electorate during his first term in office that ensured Roosevelt's success. Republican innovation aside, the introduction of Roosevelt's "fireside chats" was one of the most effective uses of mediated political communication in the 20th century.

The Postwar Years and the Rise of Television

With the advent of television, Harry Truman as well as other politicians had to adapt to a new broadcast medium. The future of politics in radio also evolved. Significant during the 1948 campaign was a debate that served as the antecedent to the famous televised Kennedy and Nixon debates 12 years later. The leading contender for the Republican nomination in 1948 was Thomas Dewey, but Minnesota Governor Harold Stassen was a strong challenger. The two men faced off at a Portland radio station in May 1948, and Dewey profited from the confrontation. A poll taken by the *Oregonian* showed that Stassen's popularity dropped following the debate, although by the eve of the election his numbers reflected his pre debate strength.

Harry Truman's most significant innovations in the political use of radio in 1948 were to record press conferences to assist the White House in checking sources and notes. The Truman White House then began to allow radio broadcasters to transmit portions of the recordings to the general public. Truman's administration will probably be best remembered in broadcast history for the ascent of television. Though radio continued to be used, television quickly became the medium that affected the electorate. Truman became the first president to participate in a television broadcast from the White House when on 5 October 1947 he asked people to cooperate in the President's Food Conservation Program.

Although radio would not again dominate the American political scene, radio remained an important medium for political progress in many less developed countries. The Voice of America continues to broadcast political and informational programming around the world, and many nations, divided by political subcultures and a myriad of differing languages, still find radio superior to television as a way of communicating political messages.

Rebirth of Political Radio

Television made a rather subdued entry into politics at the 1948 Democratic convention. Only a handful of cameras provided live coverage for people who owned sets between Boston and Washington. Even so, television was about to create dramatic changes in American politics. Radio had already laid the foundation for these changes. One of the changes that had developed with radio was that it was a more politically neutral medium than the print medium of the press. Barnard (1924) pointed out, "The listener can form his own opinion for the candidate's utterance before the press or the parties can instruct him." Television continued, to a degree, that aura of neutrality.

Although the days of radio *dominance* of presidential politics were over, radio continues to this day to play an important role in political campaigns for state and local elections. Thousands of elections take place in the United States below the presidential level, and in each election cycle radio serves not only to cover candidates and issues in these races, but also to provide the only affordable and viable broadcast medium for campaign advertising. Even in presidential campaigns and many statewide races, radio remains a viable advertising medium because it provides an avenue for targeting much more specific subgroups of the population than television's more generic audience.

The dichotomy between television and radio grew, and by 1956 television had become a more important source of information than radio. However, radio retained an important role in politics. For example, scholars still argue about the controversial finding from the 1960 Kennedy/Nixon debate that

Kennedy was judged the winner by those who watched the debate on television, whereas Nixon was thought to be the superior debater by those who heard the debate on the radio. This finding fueled a continuing debate of its own—why some candidates apparently are more successful on television while others excel on radio.

Radio also played a major role in several aspects of the 1968 presidential campaign. The candidacy of Senator Eugene McCarthy of Minnesota was strengthened when he devoted a large portion of his budget for the New Hampshire primary to radio (McCarthy's campaign team created some 7,200 spots for 23 New Hampshire radio stations to run within a three-week period). The impact of McCarthy on the 1968 primaries was due in large part to his use of radio in New Hampshire. Richard Nixon also relied on radio in his 1968 campaign: believing the studies that touted his superiority on radio in the 1960 debates, Nixon delivered radio addresses on 14 straight nights leading up to the general election. Not only did Nixon use radio extensively again in his 1972 re-election campaign, but he regularly devoted time to major radio addresses during his presidency.

Not until Ronald Reagan would a president give such attention to radio as a method of communicating with the American public. Unhappy with press representation of his policies, Ronald Reagan initiated regular Saturday afternoon radio broadcasts in order to talk directly with the people. George Bush occasionally delivered radio addresses as well, though less frequently than Reagan. President Bill Clinton returned to Reagan's routine of Saturday radio conferences. The general consensus has been that the effects of these messages are limited and may be of more importance in creating news for other media to disseminate. For instance, even though barely half of all radio stations broadcast Reagan's radio addresses, coverage of the talks by the television networks was extensive, and thus Reagan may have succeeded in putting many of his ideas on the table by using the media to emphasize his own agenda.

Another political radio phenomenon developed in the 1980s and 1990s. Political talk radio erupted in the 1980s with impressive audience demographics. For example, in 1995 Rush Limbaugh attracted nearly 20 million listeners, 92 percent of whom were registered voters, 39 percent of whom had college degrees, and 30 percent of whom had a family income of over \$60,000. Industry officials argue that talk radio affects politics and elections by reaching a small target group of active citizens. The decline in the popularity of political talk radio in the late 1990s, however, suggests that the dramatic impact attributed to political talk radio in the 1992 and 1996 elections may not be repeated in the next millennium.

The next development in radio's marriage with politics will undoubtedly evolve from its melding with yet another new medium, the internet. Increasingly, radio stations are finding

outlets for their programming through internet broadcast, and political talk radio as well as campaign advertising and airing of political issue positions are all sure to provide increased venues for political impact.

Finally, radio set the stage for a new type of political communication. Radio and television are more intimate in nature, bringing political leaders and candidates into the home, where families watch and listen to the candidate in informal settings. Roosevelt's fireside chats introduced a new model of communication, that is, one leader or candidate sitting in his or her living room speaking with millions of people also sitting in the privacy of their living rooms (Jamieson, 1988). These intimate settings allow a politician to educate, to remind, and in large part to garner support for his or her programs. Radio was the building block upon which politically intimate communication developed and the springboard for the success of television in the political arena.

Although radio may not have revolutionized politics, it did help to change the atmosphere in which the political system operated. Radio may have limited the old-style political oratory and led to the new genres of intimate political address represented well by Ronald Reagan and Bill Clinton. Radio also increased the president's ability to "go public" with issues, forever altering the political dynamics of interaction between the executive and legislative branches.

It is significant that only a few years after the advent of radio in the political arena, one of the greatest radio politicians, Roosevelt, came to the forefront. Very early in the Roosevelt years it was clear that he demonstrated in his low-key fireside chats a mastery of intimate personal delivery. But by 1932, this was altogether natural. Radio was, by then, clearly the way a president spoke to the nation's people.

Polk, George 1913-1948

U.S. Radio Correspondent

Columbia Broadcasting System (CBS) radio reporter George Polk was murdered in Greece in May 1948 at the age of 34, and the identity of his murderer was never discovered. It is a great irony that a prestigious award named for him is given annually to journalists whose tenacious investigative reporting demonstrates the importance of a free press, for Polk was discouraged—not only by the government, but by well-respected members of journalism's elite—from the type of in-depth digging that would later garner other reporters the coveted Polk Award. The evidence indicates that, in order to further U.S. Cold War policies, CBS and a committee of Washington journalists were willing to accept the unlikely conclusion that Communists were behind Polk's murder.

Shortly after Polk arrived in Europe in 1945 as a freelancer for the *Los Angeles Daily News* and United Daily Features Syndicate, he met CBS reporter Edward R. Murrow. Impressed by the former Navy pilot, who soon became a respected member of the Middle East press corps, Murrow urged Polk to consider reporting for CBS. Polk was writing for *Newsweek* when CBS hired him in 1946 to be their Cairo correspondent. Within months, the network promoted him to chief Middle East correspondent.

He was tireless in his efforts to report on the Greek civil war that was punishing a population that had already suffered under Nazi occupation during World War II. The United States government was backing the Royalist regime in power. In 1947 President Harry Truman convinced Congress to provide a controversial \$300 million aid package to Greece that included funding, military personnel, supplies, equipment, and civilian advisors. In its battle against Communism, America's Cold War policy of supporting the Greek government had come under fire from Polk, who wrote critical stories of "corruption and venality," charging that money was being siphoned from the millions of dollars in American funding. In the days prior to his death, Polk had received information confirming his suspicions of malfeasance and planned to report it on his return to the United States.

Polk's last broadcast report aired from Greece on 6 May 1948. He told a CBS colleague that he was taking a few days of vacation before heading home to the United States and a Nieman fellowship. Eight days later, his body washed ashore in Salonika Bay. He had been shot, execution style, in the back and his hands and feet were bound. Members of the American press were quick to respond, and when the *New York News*pa-

George Polk
 Courtesy CBS Photo Archive

per Guild set out to conduct an independent investigation of the correspondent's death, a group of nationally known media representatives stepped in.

Political columnist Walter Lippman headed the self-appointed committee looking into the murder. Included in the group were CBS head William Paley, James Reston of the *New York Times*, Ernest Lindley of *Newsweek*, and *Washington Post* publisher Eugene Meyer, among others. Lindley, an editor at *Newsweek*, in later years described the committee's purpose: to do "everything within their power to see that the murderers of George Polk were arrested, brought to trial, and convicted." Lippman chose attorney and former Office of Strategic Services

(OSS) head General William "Wild Bill" Donovan to represent the committee. But Donovan's investigator, Lieutenant Colonel James Killis, was recalled by the State Department after he discovered evidence pointing toward the Greek government and away from the Communists.

Who killed George Polk? A number of theories have been advanced in the intervening years. The one accepted without skepticism by the U. S. government and rubber-stamped by the Lippman Committee, despite weaknesses and inconsistencies in the evidence, blames Communist guerrillas who were supposedly hoping the right-wing Greek government would be blamed for Polk's death. Thus, the theory postulates,

the American support for the Greek government would diminish.

There is compelling evidence that upper-level Greek officials were trying to prevent Polk from reporting on government corruption. Shortly before his death, Polk met with Greek Foreign Minister Constantine Tsaldaris. Polk told the powerful politician that he knew about U.S. assistance money that had found its way into Tsaldaris' personal bank account. He threatened to "blow this story sky high." Polk had also been reporting on the brutality of the repressive Royalist regime. In his broadcast on the day he disappeared, Polk described the effects of martial law in Greece and reported the more than 200 executions recently conducted by military firing squads.

Another theory suggests that agents from Great Britain, the leading power in the Middle East before being replaced by the United States, murdered Polk to sabotage U.S.-Greek relations. In the mid-1990s, an alternative theory was suggested. In this scenario, Polk was tracking down information about drug smuggling and black marketeering. The criminals supposedly got rid of Polk before he could reveal what he knew about their activities.

During the summer of 1948, as the Greek authorities showed few results from their investigation, Donovan began to pressure for an arrest. In August police brought in journalist Gregory Staktopoulos and tortured him during the next six weeks. Eventually Staktopoulos "confessed" to assisting the Communists, who he said were directed by the Kremlin. He was convicted in a show trial the following April. There were two supposed conspirators who were tried in absentia. Later it was determined that one was dead at the time Polk was killed. Staktopoulos was sentenced to life in prison but the sentence was later reduced and he was released in 1961. He maintained his innocence until his death in 1998. Polk's Greek widow described pressure from officials to sign a document implying that her husband had been killed by a jealous lover. She left the country with a vow never to return.

Donovan's report, described by some as a whitewash, was three years in coming. It appears that his goal throughout the investigation was to deflect attention and embarrassment from the Greek government. Criticism of Lippman and the committee members focuses on their willingness to support the U.S. government's version of events rather than the truth. Iconoclast I.F. Stone appears to be the only media representative at the time to report on the conflict of interest evidenced by the

relationship between the committee and the U.S. government. Stone, who called Polk "the first casualty of the Cold War," published a 1952 series of articles challenging the Lippman Committee's report.

The George Polk Awards are presented annually by Long Island University for special journalistic achievement. They go to famous as well as small town reporters.

Popov, Alexander 1859–1906

Russian Wireless Pioneer

Although claimed by the Soviet Union for many decades as the inventor of radio, Alexander Popov was in reality one of several important early experimenters with wireless apparatus. Popov was an academic interested in research results more than commercial applications. A serious problem for modern researchers is that Popov left few laboratory notes; most of what is known of his work comes from his few published papers and the recollections of contemporaries.

Origins

Popov, born in a small town in a Ural Mountains mining region, grew up surrounded by various applications of technology. These fascinated him from a young age. After two years of elementary schooling, in 1873 he entered the seminary (secondary school) in the city of Perm and studied mathematics, natural science, and theology, and he began to develop his great interest in physics.

In 1877 he went on to university studies of mathematics and physics at St. Petersburg University, where he excelled at both experimental work and building the equipment necessary for such physics research. At the same time he worked with the local power company, which was developing an arc light system for the city. After his graduation in 1882, Popov stayed on as a laboratory assistant, but needing more support for his growing family, Popov accepted a teaching position at the Russian Torpedo School located at the naval base at Kronstadt, on the Gulf of Finland, beginning in 1883. The home of the country's Baltic Fleet, the base offered fine laboratory and library facilities, indeed some of the best in the country. Popov's teaching duties and original research work there focused on applications of electricity on board ships. Because of the pressure of work, however, he published few scientific papers.

In 1893 Popov represented the Torpedo School on a visit to the Chicago World's Fair and the Third International Electrical Congress, where he got a chance to interact with other electrical researchers on visits to companies and laboratories. Such exposure helped him refine his own work at home and sharpened his interest in the application of what were then called Hertzian waves.

Wireless Telegraphy

By 1894 Popov was increasingly focused on wireless transmission and reception. He read of Lodge's improvements in the

"coherer" device then used to detect wireless signals and worked to improve on them. His initial application of this technology concerned atmospheric electricity. This was a kind of crude electrical weather forecasting, specifically in the detection of nearby lightning flashes that could be picked up because of their electrical discharge. In a sense Popov found a use for signals that would later be scorned as static noise to be overcome.

On 7 May (April 25 on the old-style calendar then still in use in Russia) 1895, Popov's paper "On the Relation of Metal Powders to Electric Oscillations" provided a demonstration of his lightning detecting (and warning) wireless apparatus to members of the physics department of the Russian Physical and Chemical Society, noting he had achieved success at distances up to 600 yards. A continuing operation of lightning detection was established later that summer with the Institute of Forestry and was soon detecting lightning discharges up to 20 miles distant. A local newspaper report on Popov's demonstration and the potential it represented appeared a few days later. A published description of his apparatus first appeared in the initial 1896 issue of a respected Russian scientific quarterly. Beginning in the 1920s, May 7 was celebrated in the Soviet Union as "radio day."

In a December 1895 note Popov added that he entertained the hope "that when my apparatus is perfected it will be applicable to the transmission of signals to a distance by means of rapid electric vibrations—as soon as a sufficiently powerful generator of these vibrations is discovered." He was among the first to foresee the practical potential of experimental wireless work.

On 24 March 1896 Popov may have conducted a wireless demonstration before the same society, on the campus of St. Petersburg University, where he transmitted the name "Heinrich Hertz." Unfortunately no one present recorded their recollections until some three decades later, by which time the Soviet Union was already touting the inventor as *the* inventor of radio. This demonstration is potentially important, as Marconi only conducted his first public demonstration in Britain in July 1896, four months later. Both Marconi and Popov were among the first experimenters to achieve wireless transmission and detection over a distance of several miles.

Popov recognized the many limitations in his system and sought to improve it (amidst his many other duties and interests). He focused on increasing transmission power but paid little attention to improving his aerials (antennas) or the quality of the signal detectors (receivers) used and thus achieved only limited gains in coverage. Still, by 1897 he was installing

wireless apparatus on Russian naval vessels for short-range tests, and within two years he was conducting demonstrations 20 miles at sea. In 1899 Popov traveled to Germany and France to meet with other wireless pioneers, including Adolph Slaby, and compared notes on what each was accomplishing and how. At about the same time, Popov wireless devices were used in the complex rescue of a stranded Russian battleship and to save nearly 50 fishermen who had floated out to sea on an iceberg.

Final Years

While there will always be controversy over who accomplished what and when in early wireless, Popov remains an important pioneer. He helped to establish the first Russian manufacture of wireless equipment (at the Torpedo School), helped to train others, and worked closely with, among others, French engineer Eugene Ducretet, who manufactured equipment to Popov's specifications. Popov earned the Grand Gold Medal for his research at the Paris International Exposition (World's Fair) of 1900. In 1901 he was named professor and in 1905 director of the prestigious Electrotechnical Institute in St. Petersburg.

Popov's early death (he was 46) was due to his generally poor health brought on by a lifetime of overwork, but it was hastened by Czarist government pressures placed on him to discipline institute students with whose political protests he largely agreed. He thus died too soon to witness the growing exploitation of improved wireless systems in a host of different

ways. He never claimed to be the inventor of wireless—that came from others long after his death.

Portable Radio Stations

In the early 1920s, hundreds of entrepreneurs were bitten by the radio bug and decided to set up their own stations. In cities all over the United States, local businessmen (and several women) put radio studios in their stores, their houses, their garages, or their factories. But some station owners had a different plan: to put a radio station in a truck and drive it to cities that had no station of their own. Such mobile stations were called "portables," and from about 1923 to 1928, they were often invited to county fairs, expositions, and amusement parks. The owner would remove the equipment from the truck and set up an actual broadcasting station on the grounds. Most of the portables were not very powerful—between 10 and 50 watts—but their purpose was to introduce the new

technology to people who lived far from the big cities. Portables also served as a good gimmick to get more people to attend a local sales event: attendees could not only shop but also watch a live radio broadcast. One portable, WTAT (later renamed WATT), was owned by the Edison Electric Illuminating Company, which first put it on the air (and on the road) in the summer of 1923. WTAT was usually driven to the hall in which a home show or electronics exhibition was taking place; Edison personnel would first entertain and then demonstrate the wonders of the company's various products.

Another successful portable operated in Rhode Island and throughout New England. Owner Charles Messter was written up in the *Providence Journal* on 7 January 1925: the reporter

discussed some of the cities where the station had been and then explained how the portable worked.

[Mr. Messter's station, WCBR] consists of a 50-watt standard Western Electric transmitter using 600 volts on the plate. He carries storage batteries and a charger so that he will not be caught without power. His three-wire outside antenna is 200 feet long and is usually erected on top of the building in which the outfit is being used . . . The entire outfit can be easily set up and taken down, and this makes practicable its shipment from place to place on short notice.

Perhaps the best-known owner of a portable station operated in the Midwest throughout the mid-1920s. Charles L. Carrell, formerly a theater impresario, operated five portables based in Chicago, and he took them wherever he was hired to broadcast. One of Carrell's portables, WHBM, appeared in East St. Louis in December 1927, having been invited there by the Chamber of Commerce. The station remained for three months of broadcasts, giving many local performers an opportunity to be heard.

Of course, the novelty of portables wore off, but they might have continued their work were it not for the increasing number of stations on the AM band. In November 1925, at the Fourth National Radio Conference, Herbert Hoover, then Secretary of Commerce, stated that the airwaves had become too crowded. He warned that soon, not everyone who wanted to put a new station on the air would be able to do so. This and other problems (such as wave jumping—in which a station operated from a different frequency than the one it had been assigned) would lead to the creation of the Federal Radio Commission (FRC), an agency that had the authority to license and supervise radio broadcasting, in an attempt to bring order to a chaotic situation. The FRC regarded the portable transmitters as part of the chaos. Portables interfered with an already crowded radio spectrum, and the agency decided that eliminating them would be a positive step. It might not solve the problem of crowding—by 1927, there were not that many portables left—but it would at least keep the airwaves free of sudden interference that might be caused when a portable came to town.

The FRC General Order 6 of 26 April 1927 warned that portable broadcasting stations would only be relicensed for a limited period of time—120 days. (Originally, portables tended to operate mainly in the summer, when fairs and outdoor shows were taking place, but some portables had become nearly year-round operations.) It wasn't long before the FRC began to strongly suggest that any portable that wanted to select a specific city of license could become a permanent part of that city, but that licenses to operate portables as portables

would not be permitted for much longer. The end came in mid-1928, when the FRC issued General Order 30, officially terminating the portables. Some of the owners, anticipating this, had found homes for themselves and their stations—Charles Messter, for example, joined his friend Harold Dewing in Illinois, where they anchored a portable to the city of Springfield. By 1928 Edison Electric had long since put a full-time station on the air (WEEI) and no longer needed the promotional value of a station in a truck, so WATT was shut down, as were several portables in other cities.

But the person who owned the most portables was the one who didn't want to see them taken off the air. Charles Carrell demanded a hearing from the FRC, and several months later, he went to Washington to plead his case. Unfortunately for him, the FRC seemed to have its mind made up. After reading Carrell's materials and considering his argument, the Commission decided there was just no room for portables any longer. In fact, the commissioners did not mince words: they called the portables "a menace" and went on to say that permitting the portables would not be in the public interest, because the frequencies they chose were usually already occupied by permanent stations, and the closer together on the dial two stations were, the worse their signals would be received. Thus, the renewal of the portable station licenses could not be allowed.

Carrell took his case to the U.S. District Court on appeal, but the court would not overturn the FRC's ruling. Having lost most of his stations, he moved one of the Chicago portables (WBBZ) to Ponca City, Oklahoma, and made it a permanent station; he moved his family there, too. Only four years after losing his legal battle, he died in 1933 at the age of 58. The station in Ponca City still exists, but its early days as a portable are seldom if ever mentioned. In fact, few people realize how innovative portables were and how, for a brief period of time, they delighted radio fans who had never seen a live radio broadcast before.

A Prairie Home Companion

Public Radio Comedy Variety Program

A *Prairie Home Companion* (PHC) is one of the most successful programs produced on public radio in the United States. The show received the prestigious George Foster Peabody award in 1980 and its creator and host, Garrison Keillor, is considered an American cultural treasure. He was awarded a National Arts and Humanities medal by the Clinton White House in 1999. Nearly 4 million listeners tune in weekly to more than 500 public radio stations across the United States for the live two-hour broadcast. The show also airs abroad on America One and the Armed Forces Networks in Europe and the Far East.

Often compared to humorist Mark Twain, Keillor writes the script for each week's show. It includes comedy sketches with recurring characters ("The Lives of the Cowboys," "Guy Noir Private Eye"), mock commercials ("Ketchup Advisory Board," "Bebopareebop Rhubarb Pie," and "Café Boeuf" and the occasional competition ("Talent from Towns under 2,000" contest). Musicians from around the globe provide a diverse mix of live folk, jazz, rock and roll, classical, gospel, and ethnic tunes.

A program host on Minnesota Educational Radio in the early 1970s (it became Minnesota Public Radio in September 1974), Keillor was inspired to try an old-fashioned radio variety show back home in Minnesota after a leave of absence to research the *Grand Ole Opry* for a *New Yorker* magazine article. The show first played in a nearly empty auditorium at Macalester College in St. Paul on 6 July 1974. Twelve people (who paid one dollar for adult admission—50 cents for children) made up the audience. The show's popularity slowly grew, and national broadcasts began in 1980.

By 1987, 13 years after the initial performance, 4 million listeners were tuning in to hear Keillor open the show with its signature tune, Hank Snow's "Hello Love." In the same year, however, Keillor announced that PHC was coming to an end; he was heading off to Denmark to devote himself to writing. There was a farewell broadcast in June 1987 in St. Paul. One year later, there was a second farewell show from Radio City Music Hall in New York. Keillor told the crowd, "It was so much fun leaving that we're coming back to say goodbye again," to enthusiastic applause. The following year, the cast crisscrossed the United States, performing in 13 cities, for the "Third Annual Farewell Tour."

In 1989 Keillor started a new variety show, *The American Radio Company*, broadcast from the Brooklyn Academy of Music. Eventually more than 200 public radio stations carried the program. In 1993 the show moved to Minnesota and its name was changed back to *A Prairie Home Companion*.

The show was still being broadcast at the dawn of the 21st century.

About half the programs are produced in the Fitzgerald Theater in downtown St. Paul. The remainder are broadcast from a tour of cities scattered across the U.S., as well as Europe. In large civic centers and college auditoriums, fans of all ages gather to see the stage set with its worn Oriental rugs, musical instruments, and microphones. Behind it all there's a clapboard house-front with a light in the upstairs window and several lucky audience members sitting on the front porch.

Dressed in his signature black suit, white shirt, and red tie, Keillor sings tunes he has written during the previous week, accompanied by the house musicians, the Guys' All-Star Shoe Band led by pianist Rich Dworsky. Keillor plugs the fictitious sponsor of the show, Powdermilk Biscuits, "with that whole-wheat goodness that gives shy persons the strength to get up and do what needs to be done."

The audience waits in anticipation as the ensemble cast, actors Tim Russell and Sue Scott, and sound effects wizards Tom Keith and Fred Newman, step up to their microphones. Russell, a master of impersonation, brings roars of laughter as he converses with Keillor in the voices of Presidents Bill Clinton or George W. Bush, Julia Child, Bob Dylan, Ted Koppel, and many other celebrated personalities. Keith is famous for his ability to produce sound effects with his voice (the sounds of animals, automobiles, motorcycles, missiles, helicopters, and explosions) and a variety of props (including a box of gravel, cellophane, and a miniature door).

The musical segments are eclectic and could include a gospel group, a rhythm and blues singer, or a classical pianist. Rockabilly band Jack Knife and the Sharps, guitarist Leo Kottke, mandolin player Peter Ostroushko and singers Suzy Boguss and Iris DeMent have performed for PHC audiences. Special guests may include writers, actors, comedians, or poets (humorists Al Franken and Roy Blount, Jr., authors Studs Terkel and Frank McCourt, U.S. Poet Laureate Billy Collins, comedienne Paula Poundstone, and actress Sarah Jessica Parker have made appearances).

Halfway through the show Keillor reads messages scribbled by members of the audience on small pieces of paper. Birthday wishes, parental advice, and words of affection go out to friends and family across the country. Throughout the show the audience responds with delighted applause to the mix of songs, comedy routines, brief interviews with guests, and commercials for old familiar products and services.

Near the end of PHC, 15 to 25 minutes are reserved for Keillor's weekly monologue. His opening words, "It's been a

quiet week in Lake Wobegon,” are greeted with a surge of applause. In Keillor’s melodious baritone, the latest tales about the imaginary town’s residents (including the Tolleruds, Krebsbachs, and Pastor Ingqvist) lull the audience into a sense of community in the darkened theater. The words flow steadily until finally it all comes to a tidy close, “And that’s the news from Lake Wobegon, where all the women are strong, all the men are good-looking, and all the children are above average.”

A Prairie Home Companion stands at the end of a tradition that stretches back to the earliest days of radio. Its predecessors include such variety programs as *The Eveready Hour*, *The Rudy Vallee Show* (also called *The Fleischmann Hour*), *The Maxwell House Show Boat* and *The Collier Hour*. With the arrival of television in the 1940s, variety shows disappeared or shifted to the new medium. The old-fashioned variety owes its survival almost completely to the appearance in the 1970s of *A Prairie Home Companion*.

Premiums

Toys and Gifts Offered over the Air

The radio premium became a significant device for measuring listeners’ product and program loyalties, and it confirmed sponsors’ identifications with admired personalities and attractive fictional characters. Rushing strongly through the 1940s, the avalanche of radio premiums—recipe or inspirational booklets, club badges and membership manuals, costume jewelry, character rings and pins, whistles, and other paraphernalia—finally abated with the advent of television.

In radio’s early years, premiums were introduced obliquely in unsponsored “talks.” Initially forbidden to describe specific products on the air, many companies offered staff representatives to discuss consumer-interest subjects, and afterward the program host might suggest that the speaker’s employer had *permitted* him to offer a token of appreciation for the listener’s interest—a 1923 recipe booklet from a Chicago meat-

packer, for instance. Thus, through the Trojan horse of ostensibly objective information giving, companies could gain listeners’ gratitude by dropping logo-marked “gifts” into their mailboxes.

In the 1930s, the postman’s premium-bearing burden increased. Premiums were compellingly described in often-lengthy commercials, and they were sometimes integrated into program content. “Missing a commercial proved almost as much a disappointment as missing a moment of the action itself,” recalls a veteran children’s serial listener; “I enjoyed sending for the advertised products, especially those, like the decoder ring, which became part of the story.” To get the required labels or panels, children spooned through boxes of breakfast food, and their mothers baked and fried their way through packages of flour and shortening. Each week thousands

of labels, dimes, and postcards reached premium fulfillment addresses in Chicago and St. Louis, and the listener's eager wait began for the mail carrier to bring the Jack Armstrong Hike-o-Meter or the brooch "just like the one our heroine wears in today's episode."

The premium's role in building audience loyalty may be seen in a handwritten note reproduced inside the front cover of Standard Brands' 1938 souvenir script *One Man's Family Looks at Life*, where Paul Barbour, the radio clan's philosopher-son, says, "As you know, this book comes to you not only from *One Man's Family*, but also from the makers of Tender Leaf Tea. When you think of one, think of the other. For Tender Leaf Tea makes it possible for *One Man's Family* to meet your family over the radio." Five years earlier, the pioneering serial *Clara, Lu, and Em* had courted such consumer loyalty by offering a 1933 Chicago World's Fair spoon for a Super Suds box top. For a time *David Harum*, the story of a small-town banker and horse trader, gave away a horse each week; later, when the protagonist took up photography, the program promised a working camera for a quarter and a Bab-O cleanser label. Pepsodent toothpaste's sponsorship of *Amos 'n' Andy* produced such premiums as sheet music, scripts of key episodes, and maps of the characters' adopted hometown.

General interest programs of the 1930s also devised apt premiums. *Captain Tim Healy's Stamp Club of the Air* explored the historical or geographical backgrounds of postal designs and would send a starter stamp collection for an Ivory soap wrapper. In an age fascinated by aviation, a shoe store chain's program *Friendly Five Footnotes* encouraged listeners to pick up copies of the booklet *It's Easy to Learn to Fly* at the local outlet. *The Court of Missing Heirs*, dramatizing stories of unclaimed fortunes, published a bulletin listing such cases, and *The University of Chicago Round Table* furnished transcripts of its radio discussions.

Many children's adventure serial premiums were tied to annual memberships in clubs and secret societies, and announcers energetically persuaded the listener to be "the first on your block" to obtain "your very own" message decoder badge, club manual, glow-in-the-dark ring, or other "swell" object for play and display. Don Gordon tutored children to claim their free *Captain Midnight* Flight Patrol membership cards "on the spot" when their parents next filled the gas tank at the Skelly service station, and Ovaltine spokesman Pierre Andre elicited many a "thin dime" for send-away *Orphan Annie* and later *Captain Midnight* premiums. *Jack Armstrong*, Wheaties' serial of a high school athlete turned adventurer, fea-

tured devices useful in hiking and camping. In *Tom Mix*, the cowboy hero was able to escape being tied up by nudging a magnifying glass into position so that the sun would burn into the rope, and soon requests for the magnifying glass premium filled Ralston-Purina's redemption offices. Quaker Oats offered each *Sergeant Preston of the Yukon* listener a certificate representing "actual" ownership of a square inch of Klondike land; the property was later forfeited for nonpayment of taxes, but the deed certificate continues to rise in value as an artifact of 1940s childhood.

In the 1950s, radio premiums faded with the single-sponsor programs that had offered them. Some radio shows attempted TV adaptations or simulcasts and continued to feature premiums for a time, but the success of the radio premium, like that of the host program, had depended on the enlarging power of the imagination. The camera would show too clearly that the giveaway periscope was a flimsy thing of plastic or heavy paper and that the soap opera premium jewelry gave off a glassy glare in the black-and-white TV picture. Television would develop its own lures, and the radio premium was put away in closets and memories.

Press-Radio War

Newspapers' Attempt to Stifle Radio News

The Press-Radio War proved to be an early example of the new medium of radio broadcasting competing against established newspapers to define roles and control the flow of information to the public. The radio industry emerged from this so-called war as a formidable medium that could not be restrained by newspaper publishers.

Origins of the "War"

Radio stations broadcast virtually no news in the early days of the medium. Most of what could be considered news broadcasts were actually commentaries delivered perhaps no more than once a week by broadcast pioneers such as H.V. Kaltenborn and Frederic Wile. The Columbia Broadcasting System (CBS) radio network broadcast its first regular daily news summary beginning in early 1929. By that time, the nation's radio listeners had grown to appreciate this broadcast medium's ability to inform them in a timely manner. News broadcasts of election results and the sensational kidnapping of the Lindbergh baby in 1932 had whetted the public appetite for information delivered via radio. An estimated 63 million listeners tuned in to radio broadcasts the day Herbert Hoover was inaugurated in 1929.

The newspaper industry became alarmed at what was clearly becoming a threat to print. Radio threatened to take away the "breaking news" role of newspapers. The newspaper "extra" was becoming a thing of the past by the early 1930s. Perhaps more important, newspaper executives feared that the growth of radio news would continue an erosion of advertising revenue from print to broadcast. The newspaper industry was ready to wage "war" against radio.

A committee of the American Newspaper Publishers Association (ANPA) brought two key recommendations to the 1933 ANPA convention. One was for the wire services to stop supplying news material to radio. The other was for newspapers to publish radio program listings only if the radio stations paid for the space as advertising. The wire services (Associated Press [AP], United Press [UP], and International News Service [INS]) were largely controlled by newspaper publishers. Pressure from the publishers led the wire services to stop providing news to radio broadcasters. The newspaper industry mistakenly believed that the removal of wire service access from the radio industry would force broadcasters out of the news business.

The radio industry fought back, largely through the efforts of CBS. CBS president William Paley directed Paul White to establish the Columbia News Service, a news organization that could supply the news needs of CBS network without the help

of the wire services. White, a former UP executive, quickly established news bureaus for CBS in major U.S. cities and arranged for part-time stringers (temporary, on-call reporters) in other news centers. The Columbia News Service bought international news reports from foreign news agencies around the world. CBS network continued its broadcasting of news, further angering the newspaper industry. The National Broadcasting Company (NBC) also continued broadcasting the news, largely through the reporting efforts of Abe Schechter, but on a more limited scale than CBS. The newspaper industry retaliated by dropping CBS program listings from many newspapers around the nation.

It was clear that neither broadcasters nor newspaper publishers were happy with how this war was developing. Representatives of Publishers' National Radio Committee, the wire services, and CBS and NBC met in December 1933 in New York City to discuss ways in which they might work out their differences. The two-day meeting, held at the Hotel Biltmore, resulted in a list of understandings that became known as the Biltmore Agreement.

The agreement called for the establishment of a Press-Radio Bureau that would provide news from the wire services twice a day for unsponsored five-minute newscasts on the radio networks. The morning newscasts, however, could only be broadcast after 9:30 A.M. so as to protect sales of morning newspapers, and evening newscasts were to be broadcast after 9:00 P.M. to protect evening newspaper sales. CBS agreed to break up its own news service, and NBC agreed not to begin one. News bulletins of "transcendental" significance would be provided by the Press-Radio Bureau in a timely fashion between newscasts when circumstances dictated.

The terms of the agreement clearly favored the newspaper industry. The radio industry suffered little, however, because the agreement quickly began to unravel. Several factors led to the quick failure of the Biltmore Agreement. First, independent radio stations and even network affiliates not owned by the networks were not included and thus did not feel compelled to adhere to the terms of the agreement. They scheduled newscasts whenever they chose, with whatever information they could put together. Next, news material was provided to radio stations from several new news-gathering services, including the Transradio Press, which had jumped in to provide information to broadcasters at the time when wire services refused to provide news to radio. These new services were referred to in the newspaper industry as "outlaw" press associations, but there was clearly nothing in the Biltmore Agreement that could restrict them. The Press-Radio Bureau then began sending the

networks more and more news updates during the day under the agreement's provision that allowed for timely release of "bulletin" information. Finally, in early 1935, UP and INS announced that they would renew selling news service to radio broadcasters as a way to maintain a competitive position against Transradio and the other "outlaws." AP soon followed. In a little over one year's time, the agreement had fallen apart. The Press-Radio Bureau executive committee would not meet again after May 1935.

The Biltmore Agreement failed owing to both practical and philosophical weaknesses. Practically, the power of radio broadcasting was beyond the point at which arbitrary restrictions imposed by the newspaper industry could be effective. From a philosophic standpoint, the agreement was clearly a narrow-sighted effort to stifle information flow in a democracy. The effort to suppress news in a legitimate, although relatively new, channel of expression was a violation of the principles of press freedom in the United States. Had the effort to restrict news from the radio airwaves been more successful, the clear losers in the matter would have been America's consumers of radio broadcasting.

Production for Radio

Creating Radio Programs

Production is an important, if not the most important, function at a radio station. Without production there is no sound from the radio speaker. As used in radio, the term *production* refers to the assembly of various sources of sound to achieve a purpose related to radio programming. Production is the intermediate step that translates ideas into audible content. The preceding steps are planning and writing, and transmission is the last step to deliver the program to the listener.

The production process in radio has changed significantly since radio first became a broadcast medium. All program production was live in the early days: actors, musicians, and announcers gathered around the microphone at the scheduled

air time and created the radio show, commercials and all. However, turntables, records, and recorders soon gave producers the ability to reproduce and enhance production efforts. Today, computers and other digital equipment play major roles in the creation of production for radio.

Early Radio Production

Production for radio during the time of the experimental broadcasts before 1920 was rudimentary: the radio equipment operator spoke into the microphone himself. As the technology of radio improved during the 1920s, interest in radio grew. By

the late 1920s, as radio programming had become more complex, the production of those programs required more people and equipment.

At the National Broadcasting Company (NBC) Red network, the person responsible for the complete supervision of a program, including conducting rehearsals, was called the "production director." At NBC Blue, the Columbia Broadcasting System (CBS), and Mutual, he was called the "producer" or "production man." In a 1944 radio production text, Albert R. Crews defined the production director as "a painter who uses a loudspeaker for his canvas; actors, speakers, music, sound effects for his colors; and a mixing panel for his palette. He must consider himself a conductor as well as a partner-creator of a symphony in sound." From the time the completed script was delivered until the program aired, the production director was the final authority on all matters relating to the broadcast. The production director was responsible for devising the best arrangement of musicians, vocalists, speakers, actors, and sound effects technicians in order to create the program.

Radio programming of that era could be grouped into two major categories: spots and programs. Spots varied from ten seconds to five minutes and included commercial announcements, news broadcasts, and weather reports. Programs featuring speech (serials and dramas, speeches, instruction, news commentary, audience participation, sports, and religion), music/song, and novelty/variety ran up to one hour.

Most of these programs were created live in the studio. The typical studio was a large room, usually acoustically isolated in some way from the rest of the building, hung with heavy drapes or acoustical wall treatments. Here the actors, musicians, announcers, and sound effects people were arranged around one or more microphones.

Many programs were broadcast live from remote locations. Stations used what were called "pick-up locations" connected with telephone lines. Theaters, churches, baseball fields, hotels, and dance halls were some of the locations from which radio stations originated live productions of special events or regular programs.

Many of the programs heard on radio throughout these early decades of radio were uncomplicated from a production viewpoint, especially those created at smaller independent stations. One or two people were heard talking or reading, occasionally with musical accompaniment. More elaborate programs were produced by larger stations and the networks. Sponsor messages became elaborate mini-productions within a program. Humor, melodrama, and jingle singers helped create memorable messages. Musicians, singers, actors, and complex live sound effects all contributed to the production of these live commercials.

Drama programs made regular and frequent use of one of the most fascinating aspects of live radio production, the assembly of sound effects to create the illusions that were so

important in making radio theater of the mind. Often, a sound effect suggested time and location or created exposition in these dramas. Coconut shells "stomped" in a tray of sand and a few stones created the sound of horses. Crash boxes filled with broken glass were ready to create the sound of glass breaking. The manipulation of uncut broom corn created the sound illusion of walking through brush. Windows and doors mounted in portable frames, a splash tank, and a walking platform were just some of the various mechanical devices used to create realistic, and sometimes unrealistic, sound effects.

From Live to Recorded Production

As productions became more sophisticated, producers also began to use sound effects recorded on discs. These were ten-inch, double-sided discs revolving at 78 rpm and were used to produce effects that could not be created realistically in a studio, such as train and airplane sounds, machinery of various sorts, and sounds of warfare. Often, effects were used in combination, played at variable speeds on multiple turntables that were specifically designed for sound effect reproduction. Changing the speed on an effect often created a realistic sound of something other than the original. For many programs, the sound effects staff and their equipment were the most important part of the production team assembled for a broadcast.

Even before the introduction of the tape recorder, transcription discs were used to record programs for rebroadcast, archiving, or distribution to other stations, but they were also used to create libraries of music, sound effects, and commercials. Thanks to transcription discs, many popular radio programs and commercials from the 1920s through the 1940s have been preserved. A 16-inch transcription disc, revolving at 33 1/3 rpm, could hold 15 minutes of program material. By the late 1940s, CBS had introduced the vinyl long-playing record, the 33 1/3 LP. Although radio also adopted this format as a means of recording and distribution, nothing would match the tape recorder for production purposes.

The Germans developed the magnetic tape recorder during World War II. The "Magnetophon" design was brought back to the United States at the end of the war. In 1946 singer Bing Crosby's program *Philco Radio Time* was the first program to make use of the tape recorder to record and edit the program in advance of airing. The Ampex Corporation produced its first recorder in 1948, and broadcasters quickly began to use the stationary tape recorder in production. Now producers were released from the bonds of time and place. Networks used recorders to delay programs for the different time zones. Advertising agencies were able to put produced commercials on disc and tape, allowing for continuous re-airing by stations and networks. Audiotape also introduced the ability to edit program content, correcting mistakes or making changes by cutting out or inserting additional tape. In 1959 the endless-

loop tape cartridge recorder was introduced to radio. This led to a major improvement in the way commercials were aired on radio. A continuous loop of audio tape housed in a cartridge allowed an individual commercial to be selected by the engineer, inserted into the player, and played back immediately without cueing. Broadcast “carts,” reel-to-reel recorders, turntables, and microphones were the basic pieces of equipment used in almost every radio station through the early 1990s.

How Production Works: A Hypothetical Case Study

To illustrate the various components of modern radio production and how they interrelate, the first part of a typical broadcast morning at a hypothetical radio station using a digital recording and playback system is described. All of the activities in the following descriptions represent production tasks, either live or recorded.

The morning announcer turns on a computer monitor and loads a playlist containing most of the day’s commercials and messages into the computer-based digital audio delivery system, which was installed a year ago to replace the station’s aging cart machines and reel-to-reel recorders. The computer used by the announcer in the radio control room, along with those in the production studio, the newsroom, the music director’s office, and the traffic director’s office, are all connected to a fileserver, so that as soon as a recording is created at one location, it is available for playback anywhere on the network.

The announcer begins the broadcast day by playing a sign-on announcement (although increasingly, especially in larger markets, stations remain on the air at all times). This daily message was recorded in the station’s production studio a month ago by the production director after the new ownership of the station was approved. After sign-on, the announcer turns on the network feed potentiometer or “pot” in order to air a network newscast, which is coming to the station via satellite. After the newscast, a 60-second commercial for a local furniture store is aired from the digital audio system; this commercial was produced by the afternoon announcer last week. The commercial uses a track from the station’s music production library and the announcer’s voice, which has been run through a microphone patched through a microphone processor in order to make the voice sound more powerful.

Following this commercial, the announcer turns on the newsroom microphone, and the news director begins the first of several live morning newscasts. The first two stories each require the announcer to insert an actuality or sound bite at the appropriate place in the story, using the minidisc player mounted just above the compact disc (CD) players. These actualities were extracted from an interview the news director recorded over the telephone yesterday afternoon, edited on the newsroom computer, and transferred to minidisc. The newscast concludes with the weather, which the announcer plays

from a broadcast cart recorded over the telephone earlier this morning. After the weather, the announcer plays a station jingle, a short recorded musical promotion for the station. This jingle was recorded as part of an image campaign package recorded by a Dallas production company specifically for this station about three months ago. The announcer quickly looks at the computer monitor to make sure that the music playlist for the day is loaded on the other side of the screen and starts the first song of the morning. This selection, along with six other songs, was recorded into the digital audio delivery system yesterday by the music director.

After a second piece of music, the announcer finally opens her own microphone to say good morning. While talking, she adds the sound of a bugle to punctuate her remarks. The bugle, like many other standard sound effects, comes from a library of digitally recorded sounds licensed for broadcast use and is recorded, along with about 20 other sound effects, directly on a stand-alone hard disk recorder. Each sound effect has its own selector button. The first traffic report of the day is scheduled next. The announcer checks the console to make sure that the remote feed is in cue. Right on schedule, the line comes alive. Today the traffic reporter is downtown at the scene of an accident and is using a mobile transmitter. After a short traffic report, the announcer performs the well-practiced routine of reading advertising copy for the sponsor of the traffic report over the traffic music theme played back from the computer. At the end of the theme music, two more recorded commercials are triggered by the computer to start automatically. These came preproduced from the clients’ advertising agencies. The first spot was produced at a Los Angeles production house and features four different actor voices and customized music. The second spot was produced for the client through a Chicago advertising agency. The recording itself was made in Chicago, while the voice talent was in New York, connected to the Chicago recording studio by a digital telephone line. The first spot was mailed to the station, and the second was sent as a sound file over the internet. An intern dubbed the first spot using a reel-to-reel recorder in the production studio and placed the second spot in the playlist by using the cut/paste function of the computer.

After several more music cuts, the announcer plays the new morning show contest open. Over the past several days, she has worked in the production studio recording this rather complex opening for the contest using a multitrack digital editor. She used six different segments from previous contest winners, a music bed, sound effects, and several electronic production elements to create the background. Then she voiced her copy through the digital effects processor to completely change the sound of her voice. After the open plays, she reads the trivia question and asks for the sixth caller. As music plays, she answers the phone until she gets to the sixth caller. After receiving permission to record the call, she feeds the phone

input of the console into audition (so that it doesn't go out over the air) and records the contest winner onto the hard disk recorder. With just enough time to electronically edit out the beginning of the phone call, she adjusts the edit markers on the waveform editing screen, presses the cut button, and saves her work. The song ends, and she plays back the contest winner recording on the air, adjusting the output level on the audio console. On to the next commercial break.

This hypothetical excerpt of daily activity in a radio control room effectively illustrates the fact that production is a multi-level activity necessary to create a radio program. Segments of the assembled program might have been produced at different places, different times, and using different equipment. Or the production of a segment might be happening live, concurrent with the program's airing. In some respects, digital recording simplifies the production process. Digital recording into a networked system allows instantaneous delivery of the completed spot, program, or sound element throughout the system. However, there is always the potential for computer or other equipment failure. Radio stations that depend on computer-based audio systems usually implement a redundant backup approach as part of the system or retain some analog equipment for emergency use.

Production Personnel

Most stations have at least one person whose primary function is to record and manage the station's production of commercials, promotional announcements, public service messages, identifiers, and the many other sound elements used hourly and daily on the air. The person primarily responsible for this work is the production director. There are more people involved in a station's production than just the production director, however. As the previous illustration suggests, a large number of people, both outside and inside the station, have responsibilities that are related to production: a reporter editing an interview to create an excerpt to be used in an upcoming newscast; an on-air announcer reading the weather while mixing in a music bed underneath; an account executive dubbing some new spots supplied by a client's advertising agency; a station's disc jockeys on the air live; jingle singers in Dallas recording a new set of jingles for a station in Detroit; an engineer recording or feeding a live airing of an orchestra concert syndicated via satellite; and a sports producer mixing multiple announcer and field microphones with recorded features to create a live baseball broadcast—all are involved in production.

The Recording Process

Since the 1940s recording has become one of the most important parts of the production process. Radio today depends on quality recordings to create the bulk of the program schedule.

The recording and production process actually starts outside the radio station for much of the program content. The station modifies most of this material very little. Most music aired by stations today comes to the station already recorded in some format: CD, hard disk, or digitally via the internet. Some commercials come to the station prerecorded; these elements are simply dubbed or rerecorded to an appropriate format for use in the on-air playback equipment.

Much of the material heard on a radio station is, however, recorded in its own production studio. The recording process can be illustrated by following the recording of a typical commercial: (1) a copy writer at an agency or the station writes commercial copy; (2) the producer working for the agency or at the local station reviews the copy and selects appropriate music and sound effects for the spot if not already specified; (3a) the spot can be recorded in real time by mixing all three elements (voice, music bed, sound effects) at the console and routing it to a recorder (reel, cart, or computer); (3b) alternatively, the spot can be mixed as a multitrack production in three successive recordings, recording the music at full volume on track one, voice on track two, and sound effects on track three. The levels can be adjusted during final mixdown and recording to the format to be used for on-air playback. If the copy changes, the producer can go back to the master multitrack recording and either rerecord the entire voice track or edit, cutting and pasting the changes from another audio file.

As automation becomes more prevalent and refined in radio, the recording process becomes even more central to the production function. Precision recordings, timed perfectly and recorded digitally, allow customized voice tracking by announcers from remote locations. An announcer working virtually anywhere in the country can function as a shift announcer for multiple stations anywhere, providing individualized current information for each separate station, all during the same shift. Digital distribution, digital recording, and digital automation create the illusion that the announcer is physically present at the station. Radio has truly become a virtual medium.

The Editing Process

A big part of production for radio is the editing of radio program material. Editing of recorded audio material for radio is undertaken for one or more of the following three reasons: (1) to correct mistakes; (2) to shorten or lengthen the running time of an element; or (3) to creatively enhance or change the content. In the days of analog recording, the quickest way to add, delete, or reorder material in a recording was to splice the tape, physically cutting the tape with a razor blade or scissors; then removing, adding, or replacing tape; and finally rejoining the segments with splicing tape. Done well, a splice edit is imperceptible. The editor finds the beginning point of

the edit, marking the tape over the playback head on the recorder. The tape is then advanced until the end point is found and marked over the playback head. Using a splicing block, an angled cut is made over each mark, followed by the insertion of a similarly marked and cut audiotape segment or the joining of the two ends of tape. Assured that there is no gap or overlap between the two segments of tape, the editor places a piece of specially formulated splicing tape over the splice and then closely trims the excess splicing tape.

The splice block has been all but replaced by the digital editor. There are many brands, types, and approaches to digital editing. Some units are stand-alone units, a combination of hardware and software. Others are software packages for a computer with sound card. Some are basic two-channel editors; others are multitrack recorder/editors that allow almost unlimited additions of sound layers with no degradation of audio quality. What they all have in common is the ability to allow the editor to visually and audibly determine precise edit points, cut and paste audio from one file to another or to the same file, and perform non-destructive modification of the original audio. Much of the recording and editing work that takes place in radio production studios is focused on commercials.

Producing Creative Commercials

Producing the radio station's commercials is a creative challenge. The production for each spot has to accurately interpret the details of the written copy, capture the mood of the spot as intended by the writer, attract attention, sound different from all the other spots running on the station, and yet be consistent with the overall format and sound of the radio station.

There are many ways to meet the challenges of producing compelling commercials. Turning the process over to an advertising agency is one way. As reviewed earlier, ad agencies were once in almost total control of the radio networks' program and commercial production. Although agencies no longer exercise such a stranglehold on the programming decisions of local stations and networks, much of the advertising content heard on radio today is produced through the efforts of ad agencies representing clients, especially at the network and syndicated program level. These larger clients can afford to pay for the creative writing, production, and celebrity talent used to create memorable advertising. Stations merely schedule and dub or pass through these commercials from the network or syndicator.

Networks are not the only place to find creative spots. There are many techniques and resources available to producers at local stations as well. Radio stations still use music and sound effects production libraries to enhance production. First available on 78-rpm records, then on vinyl LPs, these libraries are now digitally recorded on CD. The production music libraries offer precisely timed versions of instrumental music

beds that can be licensed and used as the backgrounds for commercials and other announcements. These music tracks are usually recorded in 10-, 15-, 30-, and 60-second lengths of the same theme. These creatively titled compositions are available in a variety of music styles, tempos, and instrumentation. Most of the music production libraries are buyout libraries: the station pays a flat fee for the right to use the entire library indefinitely. Some libraries use "needle drop" fees (the term goes back to the days of turntables and discs): the station pays a fee for use of a specific music track for a specified length of time for a specific commercial. Some companies specialize in the composition and recording of customized, personalized jingles or music beds for station clients.

Sound effects are usually sold as buyout libraries containing a comprehensive array of digitally recorded sounds of every possible situation, activity, or device. Babies crying, rocket launches, train whistles, wind, rain, and a computer modem are examples of sounds that have been digitally recorded for inclusion in a sound effects library. Continuing a tradition from the early days of radio, the use of sound effects adds realism and interest to radio content.

The Role of Production in Creating a Station's "Sound"

Since the advent of television, radio has gone from being a general interest entertainment medium to programming using a specialized, formatted approach. Radio stations rely on a "format," or the creation of a consistent mix of programming elements, to attract and maintain a target audience. The station can then maximize its listenership within specific demographic characteristics, carving out a specific niche among all the stations in a competitive market. All the format elements are carefully selected and positioned in order to maximize and maintain listeners. Most formats are music based, but some formats are based on music alternatives, such as talk, sports, and all-news radio.

The basic components of format are often the same from station to station. Two competing stations could be programming exactly the same music lists. The differences listeners would hear in the stations would stem from the different approaches taken with production and related elements like promotion. Beyond format, production is the key element influencing the sound of a radio station. The music beds used in the commercials, the promotional announcements for the station itself, the station identifiers, the jingles, the voices on the air, and how they deliver content are just some of the many production elements that contribute to the overall sound of the station. Production is what ties the different programming elements together and makes the whole package seamless. Listeners are not necessarily aware of good production, but they certainly notice the lack of it.

Programming Research

Most programming research conducted today is done to measure motives and habits of a radio station's target audience. The programmer's goal is to deliver audience to advertisers to generate revenue from the sale of advertising time. By 1985 most programming decisions were based on attracting audiences rather than on providing "necessary" information to them. Advertisers tend to trust research conducted by parties outside the station, for example, by ratings companies such as Arbitron. Research data gathered by commercial research organizations and paid for by the radio station owner is considered less reliable, and research conducted in house is the least reliable, according to advertisers. Station programmers use all three types of research to learn listener motivations that will inspire loyalists to listen longer and that will attract new listeners to sample the station.

In-house research is usually more valid to the specific station; it is also much less expensive than vendor research. In-house research begins before the station goes on the air for the first time, with tests of signal strength within the broadcast reach. Dial testing of all signals within the Area of Dominant Influence (ADI) that will be competing for the same audience indicates missing formats that audiences might tune in to if they were available. Once a format is selected and the station is

on the air, station telephone call-outs to audience loyalists and potential listeners can help determine which tunes need to be dropped from the playlist because they are too familiar (boring), and which need to be added to make the sound more current. The station programmer uses ethnographic techniques to study lifestyles of the target audience—observing them in everyday settings, reading the magazines and newspapers they read, and noting when they are tuned in to radio.

Psychographic research also provides lifestyle and buying information about the station's audience. The research is survey based, and the populations are sampled by zip code. The assumption is that people who share a zip code also share values, lifestyles, and consumer motivation. Advertising time is sold based on a match in psychographics between the advertiser's target and the station's audience.

Outside research vendors are contracted to provide a more objective view of audience perceptions of the station's format, programming elements, promotions, and even the call letter colors. Auditorium testing is a quantitative method used to measure music perceptions. As many as 500 subjects, screened for age and other demographics and loyalty to the station or its closest competitor, are gathered in an auditorium (a hotel convention room, for example) to listen to "hooks" of 10 to 20

seconds of a tune, enough for audiences familiar with the tune to identify it. Between 200 and 500 tunes might be tested for responses of “like” to “dislike,” “tired of it,” or “unfamiliar.” If a tune is familiar and liked, but the audience is tired of it, it is played less frequently on the station despite its national popularity. In addition to music testing, auditorium testing is used to measure response to advertising and marketing campaigns, disc jockeys, talk show hosts, and other talent, including news, contests, and marketing. Focus groups are the most common qualitative method used to understand *why* audience members (about 12 are chosen to participate) respond as they do. The moderator assesses motivation by using psychological projective techniques, brainstorming, laddering, role playing, role reversal, and others. Information from focus groups is usually not generalizable unless a great number of groups are conducted with subjects chosen randomly from a population.

The task for the radio station program director in assessing the value of research data and findings is to ask a number of questions. First, is this a quantitative study? If so, how was the sample drawn? Were there enough subjects to analyze the data statistically? What is the margin of error? Can the findings be generalized to the station’s listening population? Second, were the questions asked unbiased? Were they valid? (i.e., did they test what the station programmer wanted to know?). Finally, are the findings reliable? If we did a similar study, with subjects drawn from the same population, would we get similar results?

Responsible researchers address these issues and explain their conclusions in language that is clear to the programmer. The goal is to provide information to enable the programmer to select programming that will “deliver” audiences profitably to advertisers but that will also respond to listeners’ “convenience, interest, or necessity.” Audience members are to be considered fellow community constituents, not just ears delivered to advertisers.

Programming Strategies and Processes

Programming was born of the combination of scheduling segments and tabulating appearances, yet it has an elusive definition. As Les Brown wrote in the foreword to *Broadcast Programming: Strategies for Winning Television and Radio Audiences* (Eastman), there is “a vast lore of programming wisdom, much of it self-contradictory because what works at one time or place may not work at all at another time or place.” In the same textbook, Sydney W. Head worked at a definition:

Programming is strategy. It deals with the advance planning of the program schedule as a whole. It involves searching out and acquiring program materials and planning a coherent sequence, a program service. Production is tactics. It deals with arranging and maneuvering the people and things needed to put programming

plans into action. It selects and deploys the means for achieving program plans on the air.

A program service is much more than the sum of its parts. Decisions about how to combine programs, or program elements, into an effective whole are just as important as decisions about which program items to accept or reject.

Head cautioned that a “seemingly obvious” distinction between programming and production is often overlooked.

This oversight arises for understandable reasons: in the first place, production is much easier to define, teach, and practice than is programming. The production end product is visible, audible, observable, assessable. Programming, however, is far more elusive. It cannot be

practiced unless one has on-air access to an actual station and perhaps a year to await results. Production, on the other hand, can be practiced with modest facilities, and the results can be recorded for instant analysis and evaluation.

Finally, the programming function varies so much in the scope and nature of its operations from one programming situation to another that it is difficult to discern what, if anything, all these situations have in common.

Radio's Golden Age

Radio's best-known programming strategies were introduced during the 1930s and early 1940s when network programs emerged featuring former vaudeville stars who, through radio, became a part of everyday life in America. That was a unique period. Radio was the only free entertainment medium (once you owned a receiver) for a nation emerging from a disastrous depression. Radio changed listeners' attitudes about themselves, about their world, and especially about their leisure time. The radio occupied the same central place in U.S. life that television would achieve in the latter half of the century.

The key strategy was to entertain with words and sounds that stimulated listener imagination. The Golden Age of radio has also been called the "theater of the mind" days when listeners turned words and sounds into mental pictures. A man named Raymond opened a squeaking door on *Inner Sanctum* and the stories told behind that door made spines tingle for half an hour. That age also brought *The Shadow*, a Gothic thriller whose main character was a mental projection against a foggy night full of smoke from coal-burning furnaces.

On the lighter side of that period was Fibber McGee's closet, a packed-to-the-gills jumble that fell with a crash to the floor once per episode in an avalanche that usually included samples of the sponsor's product. After the cacophony there was a pause. Finally, a dinner bell crash-tinkled to the floor as punctuation. Each member of the radio audience "saw" each scene exactly as he or she wanted to see it. Each listener "saw" a different show, yet each show was perfect because it was all a product of the mind, stimulated by the spoken word in conjunction with musical interludes and sound effects. (When attempting a television revival of radio's *Fibber McGee and Molly*, the National Broadcasting Company [NBC] left the famous closet out of sight—in the hands of sound-effects experts and the imagination of the viewer.)

Programming strategy quickly evolved. The orchestras, sopranos, and baritones who were radio's first performers were on the air to give receiver manufacturers live demonstrations of the new audio medium. Once radio took hold, the strategy was to amass large audiences for advertisers who longed to have their products associated with those performers who

became household names, such as Jack Benny, George Burns and Gracie Allen, Fred Allen, and W.C. Fields.

Surviving the Challenge of Television

The arrival of television abruptly changed radio strategy. As the 1950s began, the radio networks were collapsing under the impact of the new visual medium. Jack Benny's deadpan face could now be seen, not just imagined. Radio performers moved into brightly lit video studios and added scenery, building sets of the houses and neighborhoods that previously had been part of listener imagination.

To owners, radio stations became liabilities, not the assets they had been just a few years before. Many broadcasting companies sold their radio stations to invest in television. Radio entrepreneurs sifted through the wreckage of big-time radio and improvised new ideas to attract audiences. What saved radio during the encroachment of television was what appeared to be a new innovation in programming—the disc jockey.

Programmer Rick Sklar offered this scenario in *Rockin' America: How the All-Hit Radio Stations Took Over* (1984), his story of New York's legendary Top 40 station, WABC:

Imagine the dilemma of the first person who proposed playing records instead of broadcasting live bands over the radio. Records? Who will listen to records played over the radio? People play records on phonographs. They'll think we're putting one over on them if we play records on the radio. But as early as 1948 the first bands were being laid off.

Playing records wasn't actually new in the mid 1950s. In New York, WNEW's Martin Block had created his *Make Believe Ballroom* program 20 years earlier. Beginning in 1935, Block made music using turntables and "platters," as the 78-rpm records were called, not with a baton or a piano as his contemporaries did.

When radio was disrupted by the introduction of television, broadcasters stretched individual record programs into 24-hour formats. Thus were born Top 40, Middle of the Road, Beautiful Music, and other full-time formats. Each station became something distinct. The days of radio stations' attempts to be "all things to all people" virtually disappeared. Fortunately, however, disc jockeys such as Todd Storz and Gordon McLendon did not view the future of radio in terms of its past. The change to format radio stimulated another golden age as teenagers discovered Top 40.

The Top 40 format was an all-new strategy of playing the best-selling 45-rpm records over and over, so the listener was never more than a few minutes away from hearing a favorite song. On Top 40 radio, Elvis Presley was king and so was the

disc jockey, who spun the sound track to the lives of 1950s teenagers. The Top 40 format began the resurgence of public interest in radio. It also spawned other music-based program services based on the strategy of repetition of songs: the Adult Contemporary, Country, and Urban formats. The all-music strategy was to dominate radio for half a century.

Programming as Science

Michael C. Keith calls programming a radio station during this period “an increasingly complex task.” In his book *The Radio Station*, Keith writes “The basic idea, of course, is to air the type of format that will attract a sizeable enough piece of the audience demographic to satisfy the advertiser.” The ability to attract and hold an audience requires science as well as art in programming strategy. The science involves studying what motivates the audience to stay with long-form 24-hour music programs.

Examination of the audience was distilled into nine essential questions by Sydney Head in *Broadcast Programming: Strategies for Winning Television and Radio Audiences* (Eastman, Head, and Klein, 1981):

1. How much time does the average person listen to my station?
2. Am I doing a good job of reaching my target audience?
3. How many different groups of people contribute to my station’s average audience?
4. What percentage of the listeners in one of my time periods also listen to my station in another time period?
5. During which hours of the day does my station do the best job of reaching listeners?
6. How much of my audience listens only to me and to no other stations?
7. Is my station ahead of or behind the market average of away-from-home listening?
8. Which are the most available audiences during certain times of day?
9. How often do my listeners hear the same record?

The questions are best answered in ratings reports from Arbitron and similar companies. Ratings questions about size and quality of the audience often distract programmers from the issue of usefulness or innovation of the programming itself. Amassing an audience requires constant feedback on how well the audience is satisfied. Yet none of these questions concerns the quality or the content of programming.

Radio is measured not only in terms of cumulative audience (the number of people who tune into a given station in a week) but also by time spent listening (the number of quarter hour segments heard, or “average quarter hours”). The rat-

ings process influences programming strategy, and programmers find themselves aiming their efforts at the ratings methodology rather than the audience by attempting to extend time spent listening in order to increase average quarter hour shares.

A sure way to effect longer listening is to combine programming elements—hit records, for example—with positions on the clock. If a familiar and popular classic song is played at the top of the hour, then followed in the next music position with a current hit, then by an up-and-coming record, and so on around the hour, the station’s programmer sets up a sound that includes a constant change of era or year of origin for each song. The result is a “Hot Clock” or “Music Wheel” that when drawn resembles the face of a clock with lines extending from the center like bicycle spokes separating songs, commercials, and other programming elements. (Hot clocks are not exclusive to music stations. News and news-talk stations use them as well—often calling the visual version a “News Wheel”—to designate places on the hourly clock for certain types of news stories or talk show segments.)

The music programmer further attempts to mix upbeat songs with slow songs, male vocals with female vocals, large production sounds with solo instruments, etc., so that a sense of musical variety is achieved within the hour. This definition of category is from a client memo from the consulting firm Shane Media Services:

What is a category? It’s a group of songs organized by a primary characteristic. On the current/recurrent side of the library, categorization is determined by age and amount of play. For example, new songs are put in an “add” or “light” category; these titles receive the least amount of play and are protected by categories made of more familiar songs. This category’s function is to introduce new songs in a palatable manner. It’s placed on the clock so announcers can sell the songs it includes.

As songs build up play, they begin to be tested in audience research. Songs listeners show interest in are worthy of more play. They move up to medium current—enough rotation for average listeners to develop affection for the songs.

Medium songs that excel in research move to hot current. Hot current is a category determined by value—current songs listeners care about most. Recurrent categories are made of proven hits and age again becomes the primary organizational criterion: Hot recurrents are the strongest hits with high play. Medium and bulk recurrents are seven to fourteen months old and represent the best of the recent hits.

Gold categories are organized by value: the Power category is made up of the best testing titles, songs listeners want to hear every day. These songs have high “love”

scores, high “play more” scores and little “tired of” scores.

The medium or secondary gold category is made of songs listeners like but aren't involved with enough to want to hear daily. Sometimes records are put into secondary gold because high “love” scores are combined with high “tired of” scores. Resting songs by playing them every two to three days instead of daily usually results in higher scores the next time songs are tested.

If a station uses a third level of gold, it's usually made of songs that have sufficient “like” scores but no “love.” These are “okay” songs that won't make listeners tune out but also don't cause them to turn up the station or tell their friends to stop working and listen.

Music rotation software such as Selector, PowerGold, and MusicMaster helps stations achieve balance through elaborate sound codes and type codes. Use of the popular software also allows efficient management and diagnosis of play histories in a music library once criteria are established.

Formats

A brief overview of the major formats will shed some light on programming strategy.

Adult Contemporary (AC) The most familiar musical selections found on radio are from Adult Contemporary stations. In terms of the number of listeners, AC was the most popular format of the 1980s and 1990s. It has many permutations owing to the broad age range of listeners (25–54) and their diversity of tastes. AC's territory covers the softest jazz instrumental and light rock to modern hits. Collectively, the varieties of AC are radio's most listened-to formats.

Top 40 or Contemporary Hit Radio (CHR) “Contemporary Hit Radio” was the euphemism used by radio people who thought “Top 40” was a term used by kids. Listening to their public, they discovered that “Top 40” was what people called radio that played the hits. The strategy remains the same as it was during the earliest years of the format: play the best-selling songs and repeat them often.

Rock Rock music (formerly called “rock and roll”) takes many different forms, most of which have resulted in radio formats. For example, Classic Rock is an offshoot of Mainstream Rock. Offering the comfort of familiarity, the Classic Rock format presents a mix of well-known bands, primarily from the 1970s. Then there's the easy-to-identify rift between Mainstream and Modern (or Alternative) rock. Alternative rock music begins as a splinter of some other style. If it grows, it is embraced by the mainstream and is no longer “alternative,” thus losing its cachet.

Country Since the 1970s, Country has been adopted by more stations than any other format. In its earliest days, the

Country format was considered to be aimed at a blue-collar audience. As the audience grew and young artists revitalized the music in the early 1990s, the blue-collar image became mainstream. The format scores very well among adults aged 25 to 54 and is the least prone to audience fragmentation. Its strategy is rooted in the Top 40 tradition: play the most popular songs often. Country stations tend to offer a mix of songs from a broad spectrum of years.

News-Talk News-Talk radio could be called “personality radio,” even though the caller interaction and tendency toward political topics often obscures the impact of on-air personalities. Rush Limbaugh and Dr. Laura Schlessinger were the reigning superstars at the beginning of the 21st century, with hundreds of newcomers trying to establish themselves in second and third place. Programming News-Talk requires a talent-driven strategy. Talented program hosts who give the listeners access by telephone to highly interactive, relevant discussions are the big winners.

Marketing as Radio's Product

In the late 1970s and early 1980s, radio station operators changed their focus from product and programming to positioning and perception. The shift was in large part a result of the efforts of consultant George A. Burns, whose books postulated that the way a radio station sounded was secondary to what listeners imagined or perceived about the station. Burns urged his readers to leave “the product dimension” and to enter “the marketing dimension.”

Programming had long been radio's primary product concern. However, in the competitive environment after the rise of FM music formats, product alone was not enough to achieve differentiation and success. As Burns wrote in *Radio Imagery: Strategies in Station Positioning* (1980):

Standard wisdom originally held that fragmentation would provide a wider spectrum of listening opportunities for the public. Indeed, this seemed to be the case at first. Formats such as “classical” and “progressive rock” supplied fuel for the work of spreading FM. AM operators first became aware of FM in a serious way when they noticed “beautiful music” or “progressive rock” beginning to hurt them. Fragmentation began as alternative programming.

As audiences fragmented, more stations became viable listening options even though each station's audience was smaller. For instance, more than 70 stations could be heard in most parts of the Los Angeles metro area in 1999, according to the *M Street Radio Directory*. In smaller cities, too, the number of stations proliferated. Tulsa, Oklahoma, had more than 25 stations serving some segment of its population during that same

period. Large numbers of stations usually meant several stations in the same format with little differentiation. To program effectively against direct competition, stations enlisted research companies to test music libraries and to probe audience perceptions. The research allowed stations to play proven, safe songs that received the highest scores and to reduce the risk of unfamiliar or overplayed songs.

Research became part of the marketing loop. With so many stations vying for a diminishing segment of the audience, the paramount concern became keeping a station's name in the forefront of listeners' minds. Naming stations was as much an art as programming them. Mnemonics like Z-93, Star 104, K-FROG, and FROGGY 98 caught attention because they were memorable. Advertising campaigns urged listeners to remember one station for country music, another for news, and so on.

Station management concerned with marketing did not ignore programming, but they did take programming for granted. Effective programming was accepted as a given, and emphasis shifted to marketing, promotion, and advertising to influence audience recall.

Programming after Consolidation

The Telecommunications Act of 1996 eliminated many radio ownership limits and simultaneously shifted programming strategy. Consolidated ownership now makes it possible for one company to own a cluster of stations in the same market. An operator company that can do so chooses its cluster by format in order to control all or most stations in a format or to minimize competition. Thus a company may acquire several varieties of rock stations, or both of a city's country stations, or a combination that includes an all-news station, an all-talk station, and an all-sports station, just to cite three possibilities.

Consolidation offers opportunities for cost savings in programming by combining air talents to perform on several stations in a cluster and operating one news department to serve many stations. For instance, Capster Broadcasting Partners assembled a staff of air talents in Austin, Texas, to feed voice tracks to more than 100 stations in the Capstar and AM/FM groups via a wide area network of linked computers. Another approach to cost savings in programming is the "hub and

spoke" system employed by Clear Channel Communications, in which a centrally located station in a large or medium market feeds programming to be simulcast in nearby smaller cities.

Consolidation also has given rise to syndicated programs, both national and regional. Many morning shows are syndicated: for example, radio personalities Bob and Tom from Indianapolis, John Boy and Billy from Charlotte, Mark and Brian from Los Angeles, and Rick Dees also from Los Angeles. Such shows seem to be a return to the network style of early radio, but without the national attention that network programs received in the pre-television era. Syndicated programming allows local stations to air shows they could not (or would not) produce themselves.

Progressive Rock Format

Progressive rock is a radio format designed to appeal to rock music fans who were initially represented by the counterculture of the late 1960s. At times referred to as *progressive radio*, *underground*, *free-form*, *album-oriented rock* (AOR), *alternative*, and *classic rock*, the progressive rock format has its roots in the underground rock movement in the years leading up to the Woodstock Music Festival in 1969.

As an alternative to the repetitive hit music of Top 40, which was pervasive on AM radio at the time, progressive radio began on undeveloped FM stations as so-called free-form programming, an ephemeral concept that encouraged each disc jockey to program his or her own show with a newer and broader brand of rock and roll than merely its pop progeny, interspersing music with commentary that referenced an emerging cultural change in the United States. Progressive radio drew an audience previously unserved by radio, and it is credited with establishing FM as a dominant force in music radio.

By the mid-1970s, FM progressive rock in a variety of permutations spearheaded audience migration to the new frequency band. Although the radio industry paid little attention to FM, FM was handily supported by the recording industry and the electronics industry, both of which had high stakes in high-fidelity products. By the end of the decade “progressive” stations had seized a majority of the mainstream radio audience owing to the widespread popularity of progressive rock music and the ability of FM to broadcast high fidelity in stereo. As progressive music hit the top of the charts, Top 40 stations reacted by retooling their playlists and moving their operations to the FM band, forcing AM to all but abandon music as a viable format in most competitive markets. To distinguish themselves from Top 40’s encroachment, many progressive rock stations began adopting the AOR format designation. Although the progressive rock format has not disappeared, defining it has become contentious and subjective. Some prefer to tie the format to the music of its breakthrough, programmed as classic rock, whereas others consider it a timeless concept based on a musical alternative to mainstream pop, peppered with a left-of-center banter. In either case, progressive rock radio is connected to at least three distinct breeds of broadcaster: rock and roll radio pioneers such as Alan “Moondog” Freed, community or pirate radio operators, and shock jocks.

The rock and roll of Elvis Presley, Jackie Wilson, Buddy Holly, The Shirelles, Chuck Berry, and countless others successfully altered radio’s musical landscape in the 1950s as disc jockeys developed a relationship with their youthful audiences and an ear for an alternative sound. Similarly, early progressive rock disc jockeys such as Tom “Big Daddy” Donahue brought a new sensibility and attitude to the medium, playing a variety

of alternative music styles, including folk music; a more sophisticated brand of rock and roll; and cross-genre hybrids that combined blues, country, soul, funk, or jazz with increasingly amplified guitar rock, creating new subgenres such as folk-rock, progressive country, country rock, jazz fusion, latin rock, acid rock, hard rock, and heavy metal. Progressive stations did not play hit singles. They played albums, sometimes an entire LP at a time. The format was built around artists who broke new ground musically and lyrically. Artists such as The Doors, Jimi Hendrix, Joni Mitchell, Vanilla Fudge, Creedence Clearwater Revival, Crosby Stills and Nash, Led Zeppelin, Jefferson Airplane, Janis Joplin, Allman Brothers, Santana, Beatles, Rolling Stones, and others certainly had pop hits, but it was their other album tracks that made progressive playlists, songs often distinguished by lyrics that questioned authority, embraced social protest, and celebrated the sexual revolution.

This music did not fit neatly into the under-three-minute song length common for airplay on Top 40. There were also rare recordings, live performances, and rock star interviews, which added spontaneity and primed the syndication efforts of new radio networks such as Westwood One. And rather than announce the time and temperature, progressive disc jockeys slipped in pithy social commentary and politically charged comedy bits—often in the same breath. The unique combination of music, structure, and editorial point of view conspired to spawn an identity all its own. Not since the seminal rock and roll disc jockeys of the 1950s had radio responded so directly to popular culture. In both eras, too, popularity brought increased scrutiny, claims of amorality, and scandal. And both saw the execution of their respective preformats move from the individual programmer to station owners and consultants who went on to develop successfully marketable formats.

As playlists shrank and advertising increased, purist progressive announcers became disenchanted with an apparent squandering of the airwaves by strictly commercial interests. Some became radio pirates in the spirit of the underground movement, broadcasting without a license from hideout locations. Others joined or started licensed, noncommercial, low-power community radio. Still others abandoned the need to control the music by developing talk show personalities that led to the advent of FM talk and the so-called shock jock.

Early progressive stations were instrumental in introducing and “breaking” new artists and music. They also provided a voice for “lifestyle” news services such as Earth News, the National Broadcasting Company’s (NBC) The Source, and the American Broadcasting Companies’ ABC FM network, as well as forging opportunities for targeted advertising. Progressive

announcers would categorically reject ad copy with hype or that promoted products antithetical to the desires of their perceived audience. Traditionally, progressive stations did not yell at their audiences, sensationalize in the purely promotional sense, or hard sell, except in parody or satire. They adopted a reduced commercial load of 9 to 15 minutes of advertising per hour as opposed to the 18 to 30 minutes of Top 40, partly because of the fact that advertisers were not yet sold on the value of the progressive rock audience.

The format's original structural characteristics included commercials scheduled in "spot sets" and music programmed in "song sets," which established the music mix "segue" as an art form, setting a mood that organically led to increased time spent listening. Many progressive rock formatics were so successful in holding audience that they have long been incorporated into other music formats.

Early adapters of commercially successful progressive rock formats include San Francisco's KMPX and KSAN; Boston's WBCN; Los Angeles' KMET and KLOS; Chicago's WXRT; and New York's WOR-FM, WNEW-FM, and WABC-FM/

WPLJ. Perhaps the most consistent preservation of the original progressive rock spirit has been on student-run college radio, as well as on some of the Pacifica stations.

Promax

Industry Trade Association

The primary trade organization in electronic media focusing on promotion and marketing, Promax is a nonprofit, mutual-benefit association for promotion and marketing executives in the electronic media. It conducts annual trade conventions, distributes videotapes of award-winning on-air promotions and print materials, and serves as a clearinghouse for ideas and projects related to electronic media promotion via its resource center and weekly fax memos.

Although broadcast and cable television has been its most salient focus, Promax also serves the commercial and noncommercial radio industry. About 10 percent of its 2,000 member companies are in the radio business, mostly from major-market stations and large groups and from production companies offering creative concepts and marketing services to radio. Among the best known in the radio area have been such companies as Columbia Broadcasting System (CBS) Radio, American Broadcasting Companies (ABC) Radio Networks, and the Westwood One networks. Nearly all large and midsized market stations hold membership and send representatives to the annual Promax conventions.

The association's avowed goals are to share promotion and marketing strategies, to share research techniques and information, and to spread the word on new creative concepts and technologies. Like other trade associations, Promax provides the opportunity for the marketing executives of networks and program syndicators to meet with their counterparts at affiliated stations and for production companies and consultants to show off their wares and attract the attention of potential clients.

On a daily basis, a president/chief executive officer (CEO) and a staff of 20 full-time personnel run the association. The president is selected by an executive committee of the 27-person board of directors overseeing Promax. A portion of the board turns over annually, and new directors are elected by the entire association membership. Board members are nominated to represent a mix of networks, studios, stations, cable systems, production companies, distributors, agencies, and consulting companies.

Founded in 1956 as the Broadcasters Promotion Association (BPA) and operating in tandem with the Broadcast

Designers Association (BDA) since the late 1970s, the association grew from a few hundred company members to well over 1,000 by the mid-1980s and to nearly 2,000 companies by the year 2000. Administered in the 1970s and 1980s out of Lancaster, Pennsylvania, by Executive Director Lance Webster, the organization's growth in the late 1980s resulted in a move to Los Angeles. Webster is credited with increasing the association's national visibility, stabilizing its procedures and structures, and creating active ties with other trade and educational organizations.

In 1984 the association's name was changed to Broadcast Promotion and Marketing Executives to acknowledge participation by highest station and network management and to recognize two factors: the rising importance of promotional activities in an increasingly competitive situation and the industry's increased focus on marketing strategies—which involve a broader conception than sales promotion and audience program promotion. But by the early 1990s, the incongruity of a large cable membership had led to still another evolution in the association's name, this time to Promax in 1993. (Although the name is frequently spelled in all capitals, the word is not an acronym; it draws on the association's traditional connection with the field of promotion, adds an *x* for executives, and hints at “maximum something” to users, an acceptable bit of hyperbole suiting this profession.)

Another major change was the expansion of worldwide promotion conventions, such as the association's first international conference in Leeds, England, in 1990. This became the annual Promax–United Kingdom meeting, and it has been followed by Promax Asia, Promax Europe, Promax Latin America, and, in 1999, the first Promax Australia/New Zealand convention. As of 2000, the association had member companies in 35 different countries and was dealing with rapid membership growth outside the United States.

Two individuals clearly stand out as the biggest contributors to the evolution of the association: Lance Webster, publications coordinator in 1979 and executive director for much of the 1980s, and Jim Chabin, president and CEO during most of the 1990s (now president of the Academy of Television Arts and Sciences in Hollywood), who implemented the association's international vision. In 1999 Glynn Brailsford stepped into the joint position of president and CEO of both Promax and BDA and has continued building and consolidating the international partner associations and melding the administration of Promax and BDA.

Association board president in 1980, Tom Dawson, a CBS Radio vice president, was a key individual in building the radio membership in the organization from 1976 through 1988. Elected to the association's Hall of Fame in 1992, Dawson is building an archive and writing a history of the association. Erica Farber, executive vice president at Interep and president of the Board in 1991–92, took on the role of fostering the

growth of radio membership. Farber is now publisher and CEO of *Radio and Records*.

The annual North American convention, usually held in the United States, is the centerpiece of Promax's offerings. Called the Promax Conference and Exposition, by 1999 the association reported that nearly 7,000 industry executives attended. The convention offers about 65 sessions and workshops with some 200 expert speakers and presenters; about one-half of those panels directly or indirectly address radio interests. Topics have included branding and copyright and music, sports, and performance rights, in addition to radio-only panels about contesting and games, image marketing, segmentation research, audience measurement, and audio technologies. By the late 1990s, the internet had become the conference subject of the most riveting interest to radio executives.

At the annual convention, Promax makes the International Gold Medallion Awards for excellence in marketing and promotion, recognizing achievement in 280 categories for local television, networks, cable, radio, and program syndication with gold Muse statuettes or silver certificates. The categories recognize image and program promotion in on-air and print media as well as multimedia campaigns and contests. Special achievement awards have gone to such celebrities as Casey Kasem, Dick Clark, Stan Freberg, and Chuck Blore.

The BDA was formed in 1978 with the support of what was then BPA, and it has since met annually conjointly with Promax in North America, Europe, and Australia. It spotlights the needs and interests of the creative staffs of stations and advertising agencies and gives its own awards for outstanding artwork at a separate meeting held at the same time and in the same conference site as Promax. It also conducts panel sessions and workshops focusing on cutting-edge design concepts for program guides, magazines and newspapers, outdoor billboards, posters, and transit signs, as well as on-air spots for both television and radio. In recent years, considerable attention has gone to the implementation of creative ideas via digital technology.

In the 1980s, Promax began issuing weekly faxed communications (*PromofaX*), replete with practical ideas for station promotion, many of which are innovative ideas for radio contests or image promotion. Promax also publishes an annual *Image* magazine at the time of the North American convention, which incorporates examples of promotion and marketing in both television and radio from around the world. In addition, Promax conducts periodic surveys that track changes in salaries, status, and backgrounds of commercial promotion managers and changes in the technologies and methods used in daily promotion and image promotional campaigns. It summarizes these results in *PromofaX* and *Image*. Central to member relations, the Promax Resource Center is a repository for materials about promotion and marketing. It sells audio- and

videotapes of panels, workshops, and keynote speakers as well as copies of award-winning print materials.

Promenade Concerts

BBC Classical Music Series

They are a classic example of the old meeting the new, the young meeting the aged, and the traditional meeting the contemporary. They are at once casual and formal, simultaneously hip and sophisticated, sometimes playful and at other times serious. They are the Henry Wood Promenade Concerts, the summer music series of the British Broadcasting Corporation (BBC), known simply as “the Proms.”

Origins

Begun in 1895, the Proms were created in order to expose the widest possible audience to the classical music. To serve this purpose, the Proms were presented as less formal than traditional classical concerts, and with at least some very inexpensive ticket prices. Those strategies remain in place to this day. Young and old alike attend, some seated in luxury boxes and others lounging on the promenade floor. Some wear formal attire while others sport cutoffs and sandals. The result is that a very diverse audience continues to attend the annual series.

Although the name Henry Wood has long been associated with the Proms, the series was actually the brainchild of Robert Newman. In fact, the original name for the concert series was “Mr. Robert Newman’s Promenade Concerts.” Newman was perhaps more businessperson than musician, but during his tenure as the manager of the Queen’s Hall in London (the original home of the Proms), he made known his desire to reach a wider audience with finer music. He envisioned a type of educational environment in which audiences might be attracted by more popular music, and then—once attracted—exposed to the more serious higher forms of music. He envisioned a less formal environment in which audience members

could enjoy performances as they stood or sat in a more relaxed promenade arrangement. He also desired a more affordable environment that would allow everyone, even those of limited means, to enjoy fine music. Robert Newman had the vision; Henry Wood was the man he selected to give life to that vision as the first conductor of the Queen’s Hall Orchestra and the Promenade Concerts.

Henry Wood’s contributions to the Proms were legendary. He introduced audiences to new music, new performers, and new composers. Each season featured a certain amount of standard repertoire, but Wood insisted upon including new works—works that came to be known as the “novelties.” The Proms orchestra consisted of the finest established musicians available, but Wood was also known for being a champion of aspiring young players. Wood also introduced his audiences to many of the leading composers of the day, including Richard Strauss and Sergei Rachmaninoff.

The Proms on the Air

The BBC became involved with the Proms in 1927. Because of financial trouble, Newman had earlier relinquished the management of Queen’s Hall and its orchestra, as well as the concert series, to Chappell and Company, a publishing house. But the Proms continued to operate at a deficit, and in 1927 Chappell and Company’s management decided that the company could no longer sustain the concerts financially. As a result, the BBC took charge and a new era began. Not only did the BBC bring financial support, but now the Proms could reach an even wider audience than ever, as people throughout England could listen to every performance on their radios.

World War II brought about several changes in the Proms. Temporary withdrawal of the BBC's financial support (necessitated by the war) forced Wood to seek and secure private sponsorship for a few years. The BBC Orchestra, which had been formed in 1930 (three years after the BBC took over the Proms) was temporarily replaced by the London Symphony. Perhaps most significant, however, was a war-induced change in venue for the concert festival. In 1941, Queen's Hall was severely damaged by German bombing, forcing the Proms to be moved to the Royal Albert Hall. This historical and elegant auditorium, which has a capacity of 6,000, remains the home of the Proms to this day.

Henry Wood conducted 50 years of Promenade Concerts. He died in August 1944, only three weeks after his last Proms concert. In the years that followed his death, several conductors and music directors helped to define the future direction of the Proms. Two primary trends of the post-Wood era were an increase in the number of participating orchestras and an increase in the variety of musical styles represented. During the 1950s, orchestras from places other than London were included in the Proms lineup for the first time. As other orchestras participated, the Proms took on a more international flavor. Through the 1960s this international flavor began to be noticed more in the musical repertoire as well.

A very popular feature of the Proms is its "Last Night" celebration that closes the season each year. It combines a festive party atmosphere with the Proms tradition of great classical music and a sense of camaraderie on the part of "Prommers" who participate in a robust audience sing-along of traditional Proms favorites. The Last Night is so popular, and tickets are

so hard to come by, that London's Hyde Park now hosts the BBC Proms in the Park, an event that allows an additional 40,000 people to view the Last Night of the Proms telecast live on a giant video screen.

More than 100 years after their beginning, the BBC Henry Wood Promenade Concerts remain true to their original purpose: to be enjoyable and accessible to a wide audience. Their popularity continues to increase, and BBC Radio 3 still airs the entire 72-concert series each summer. Additionally, some performances are broadcast by BBC Television and the BBC World Service, further extending the Proms experience to audiences around the world. The concert series attracts some of the world's finest musicians, who perform some of the world's best music.

Promotion on Radio

During the early years of commercial radio in the United States, most stations had little reason to promote themselves to listeners because of the relative lack of competition in the local marketplace. Moreover, since the homogeneous programming provided by national networks resulted in every station's sounding basically alike, there was little to promote about a station's "distinctive" qualities. By the middle 1950s, however, local radio programmers began experimenting with new entertainment and musical formats in an attempt to regain audiences lost to the upstart medium of television.

Once stations began to differentiate their programming and audiences found a choice of offerings, the need to attract listeners to specific stations intensified. Since then, the variety of

station formats and programming has increased, and along with it the value of promotion in the eyes of radio professionals. One reason promotion is vital in today's radio marketplace is the current Arbitron ratings system, which depends on listeners' ability to recall a station's call letters or name when filling out the ratings diary. Arguably, this methodology means that the station with the highest top-of-mind awareness, not the greatest number of actual listeners, may win the ratings battle.

In an effort to increase this station awareness in the local community, stations depend on promotion to help accomplish four major goals: (1) to increase the number of people who sample the station; (2) to give the current audience a reason to

listen for a longer time; (3) to provide listeners who must tune out incentives to tune in later; and (4) to create and reinforce the station's image.

Audience acquisition promotions are designed to encourage station sampling by people who don't regularly listen. By necessity, this is accomplished through promotional campaigns designed for and delivered through other media. Television commercials on local stations and cable systems, direct mail pieces, roadside billboards, bumper stickers, T-shirts, key chains, refrigerator magnets, and a variety of other types of promotional merchandise are used to introduce the public to the station's call letters, frequency, format, personalities, and contests. The strategy behind audience acquisition promotions is to inform or remind potential audience members about the programming a station delivers, hoping to match the station's product with listener wants and needs.

Promotions designed to increase the amount of time current listeners spend tuned to the station are called audience maintenance promotions. Often, audience maintenance goals are accomplished through the design and implementation of on-air contests. For example, a music-oriented station might implement a contest in which listeners must hear a specific song, or any song by a specific artist, before phoning the station to try and win a prize. By strategically working with the programming or music departments to determine when the designated song or artist will play, stations can increase the time listeners spend tuned to the station waiting for a chance to win. Other popular variations on this audience maintenance contest include the scavenger hunt (in which listeners wait to hear different items they must collect in order to have a chance to win a prize) and the treasure hunt (in which clues are periodically given for the hidden location of a valuable gift certificate).

Contests may also be designed to provide audience members who must stop listening with incentives to tune back sometime later. These contests are referred to as recyclers, and they take one of two forms. Horizontal recyclers are designed to entice listeners to tune in again at the same time the following day. For example, a common horizontal promotion on music stations is to encourage listeners to fax the midday host a list of their favorite songs. The listener whose list is chosen wins prizes plus gets to hear his or her favorites played during the lunch hour. When stations promote this as a programming element done every weekday at the same time, it recycles listeners to the lunch hour of the following day to see if they have won. Vertical recyclers, on the other hand, are designed to entice listeners to tune in later during the same day. For example, having a morning announcer promote that the next chance to win concert tickets is during the afternoon show recycles those who may have to tune out during the workday to the station for their drive home.

Regardless of the strategic goals of a station contest, promotion directors must keep in mind applicable federal regula-

tions. For example, the FCC prohibits the broadcast of information about most lotteries other than those sponsored by nonprofit organizations and state governments. In order for a radio promotional contest to constitute a lottery, it must contain three components: a prize, chance, and consideration. Consideration is something of value paid by the contest participant, such as an entry fee. For example, if a station decided to give away a new car (a prize) to someone chosen at random (chance) from those who bought a ticket to the station's annual concert/birthday party (consideration), that station would violate lottery laws when promoting the contest on air. Stations often alleviate this problem by instructing listeners how to enter without consideration in the official contest rules—which the FCC requires be fully and accurately disclosed. Other laws that may impact radio promotions prohibit the broadcast of obscene content and limit the broadcast of indecent material to certain hours.

Another goal of radio promotion is to establish and reinforce the station's image in the minds of the audience. It is important that every contest, billboard, bumper sticker, and website associated with the station is consistent with the desired image. Often, program directors and promotion departments work together to establish the target image for their station. This way the program director's vision of the station image is known by the promotion department, and they can be sure that all aspects of the promotion mix are developed with the image in mind.

In order to identify a station's target image, a list is sometimes created of words or phrases that would be desirable for listeners to associate with the station. For example, a news station would want to have the image of being dependable, honest, timely, and involved with the community. A rock station, on the other hand, would be more interested in being known as the rock concert station, as being knowledgeable about entertainment news, and as the station that gives away music-related prizes. Creating lists such as these can help ensure that the content of radio promotion is consistent with the desired image.

When trying to reinforce station image, however, content may not be the only variable that promotion directors can use. Radio consultant Lee Abrams argues that the sound of on-air promotions can go a long way to improving a station's image. Abrams advises that when creating on-air promotion, stations should "hit the production room and come out with great stuff" (Lynch and Gillispie, 1998). Recent research suggests that Abrams may be correct. Potter and Callison (2000) have experimented with different types of production techniques in on-air promotions and found that promotions containing sound effects, music, and multiple announcers create more positive images in listeners than comparatively simple promotions do.

Promotional activities—from contests and giveaways to billboards and bumper stickers—cost money. Many stations

regularly budget for ongoing promotional campaigns, funding them through management's commitment to marketing the station. Sometimes operating capital for promotions at a current-based music station is enhanced by money from an independent music promoter who pays the station for the right to discuss music decisions with the program director on a weekly basis.

In all formats, however, there is increasing pressure to develop more sales promotions than ever before. Sales promotions are campaigns that accomplish marketing and image goals for the station while simultaneously providing the sales department with tie-ins that can be sold to advertisers. Sales promotions take many forms; for example, co-sponsorship of a contest or event by both the station and the client, remote broadcasts from a client's location where listeners enter to win prizes, coupons for the client's business as the "removable" backs of station bumper stickers, and advertiser logos screen printed on station t-shirts. Anything that the station's promotion can do to help generate advertising revenue can be viewed as a way to offset the cost of the promotion itself.

Propaganda by Radio

Propaganda has had many definitions. A basic definition is that it is selective and biased information aimed at indoctrinating, converting, and influencing people. From its source in Roman Catholicism, when in 1622 Pope Gregory XV created the *Sacra Congregatio de Propaganda Fide* (an agency charged with spreading the Christian faith in foreign missions), to efforts to use radio for propaganda, particularly by Nazi Germany in the 1930s and 1940s, *propaganda* has taken on increasingly negative connotations and is currently associated with lies, deception, and disinformation designed to control populations or dishearten adversaries.

Origins

It is difficult to say with any accuracy when radio was first used as a medium of propaganda. Several countries had radio services on the air prior to World War II, including Belgium (1934), France (1931), Japan (1935), the Netherlands (1929), the Soviet Union (1927), and the United Kingdom (1932). Arguably some of these broadcasts aimed to present these nations in the most positive light (especially those of Radio

Moscow in 1925 and 1927, celebrating the October Revolution and the Bolshevik victory). Some historians consider the Soviet broadcast in 1917 (featuring Vladimir Lenin and the announcement of the beginning of a "new age" on 30 October) to be the first recorded propaganda broadcast using radio. It was aimed at potential revolutionaries in Europe. However, Nazi Germany is often credited with initiating the earliest sustained effort to broadcast propaganda via radio, using radio as an instrument of conquest. There is some dispute on this score, as there was intermittent use of radio even during World War I, although this was more accurately wireless telephony and consisted mostly of news reports. One famous "broadcast" of this type carried Woodrow Wilson's "Fourteen Points" plan to end the war and to assure that it was the "war to end wars." During the Versailles peace conference in 1919, Germany was prohibited by the Allied powers from using its transmitting stations in Nauen, Hanover, or Berlin, and from constructing any new transmitting facilities for a period of three months after the signing of the peace treaty.

One reason for the rapid development of radio as an instrument of propaganda after World War I was that age-old

tensions continued to exist in Europe as radio developed there under state ownership or control. With nation-states having broadcast monopolies, it was a short step to considering the medium as a vehicle for pursuing national interests, for putting a national spin on events—in short, for propaganda. In 1925 the Soviet Union put the world's first shortwave station on the air, greatly extending the reach of the Bolshevik political agenda. The Soviet Union then used radio as a weapon in a dispute with Romania (provoking a Romanian radio response) over Bessarabia in 1926. Japan also used radio as a weapon in its invasion of Manchuria shortly after putting its first station on the air in 1931.

By the early 1930s international radio services distinguished programming in their native language from that in other languages, with the latter considered propaganda. By this definition the Third Reich's inaugural English-language broadcast to North America, on 1 April 1933, was propaganda regardless of its actual content. This also applied to its creation of radio services in several other foreign languages the following year. The earliest broadcasts were really aimed at Germans who had emigrated, providing them with a continuing link to the "Fatherland," but gradually the broadcasts became more overtly propagandistic, with the *Reichsender* encouraging listener parties to hear the latest speeches by Adolf Hitler and other Nazi Party leaders. Germany also used radio as a weapon to influence politics, to gain sympathy for the Austrian Nazi Party in 1933 and 1934, and prior to its intervention in Austrian politics in 1938. In the latter campaign, the Nazis distributed 100,000 radio sets in Austria to assure an audience for its broadcasts. (This tactic was also used by the Italians for broadcasts from Radio *Bari* to the Middle East and North Africa beginning in 1935. By 1937 the Italians were broadcasting in 16 languages to countries in the Mediterranean basin.) The Nazi goal was to create what was called a "fifth column," a group of convinced believers in the Nazi cause who would assist it by working within their own countries to promote it.

Some efforts were made to stem the use of radio for propaganda purposes. The League of Nations, which had been advocated by U.S. President Wilson as part of his "Fourteen Points," adopted a convention (agreement) in 1936 to outlaw aggressive radio propaganda and incitements to war or insurrection. This agreement also called upon its signatories to use radio to promote peace, better knowledge of other civilizations and conditions of life, and the true nature of international relations between neighbors. Although this convention was signed by 28 countries, it was eventually ratified by only 19 and had little effect on actual uses of radio in Europe. It did not come into effect until 1938 and by then it was too late to stem the tide of radio use to promote national aims. (Neither Germany nor Italy signed the convention.)

Fascist propaganda (especially from Italy to the Middle East, where the British had extensive colonial and commercial

interests) led the British Broadcasting Corporation (BBC) to initiate its first foreign-language broadcasts. Its request to Parliament to do so was premised on the need to respond to such propaganda, provoking a debate about whether the United Kingdom should engage in propaganda, defined as foreign-language broadcasting. Approval was secured, however, and on 3 January 1938 the BBC began broadcasting in Arabic to the Middle East and North Africa. Its first broadcast caused an immediate stir because it reported the execution of an Arab accused of carrying a concealed weapon. The British Foreign Office feared that the report would result in widespread unrest. This broadcast solidified the BBC's independence from government interference and became the foundation of its reputation for truthful reporting, however, as it demonstrated that the service would broadcast the truth even when the British government disapproved.

It was not merely the use of foreign languages that was considered propaganda, however. Prior to World War II, both Nazi Germany and Fascist Italy used propaganda as a vital part of their peacetime diplomacy. Some nations also used radio for domestic propaganda, seeking to enlist their citizens' support for proposed national efforts or to convince them of the correctness of government policies, even when individual citizens' fortunes didn't seem to be improving. Germany, Italy, and Japan all became masters of such strategies, employing not just radio but a variety of other media, including print and film, to engage their own citizens in preparation for conflict with other countries. In Japan, the emperor's enthronement was broadcast throughout the country in 1928, and in 1936 the Japanese government created an Information Committee under cabinet control to coordinate propaganda activities. All Japanese broadcasts (domestic and international) became subject to censorship. Transmissions that were prohibited included those that "impaired the dignity" of the imperial house (the emperor), those that impaired the honor of the government or of the military services, and those that were determined to be political speeches or discussions. Similar measures were taken in Germany through the *Propagandaministerium* under Joseph Goebbels, whose opinion was that all read broadcasting is true propaganda.

World War II

With the outbreak of World War II in 1939, radio became a full-fledged tool of war. Germany's government declared it illegal to listen to foreign broadcasts, even including broadcasts from Nazi-occupied areas in the ban. Radio sets were confiscated to prevent unauthorized listening and it became a capital offense to listen to certain broadcasts, particularly those from the BBC. It engaged non-German citizens to broadcast in foreign languages to its adversaries, with the most famous broadcaster being the Irishman William Joyce, the second

broadcaster dubbed “Lord Haw Haw” in Britain. He was executed by the British at the conclusion of the war for treason. The Italians likewise employed foreigners for its broadcasts, including the American poet Ezra Pound, who was also tried for treason after the war. (Pound was determined to be insane and committed to a mental institution.) Other infamous broadcasters who broadcast specifically to troops included those dubbed “Axis Sally” and “Tokyo Rose” by the Allied forces. Their broadcasts were designed to demoralize Allied troops by exaggerating both Allied losses and naval or battlefield successes of the Axis powers (Germany, Italy, and Japan). They also attempted to make the soldiers homesick by suggesting that their wives and girlfriends were lonely or being unfaithful to them or suggesting that Allied battlefield commanders had little or no concern for the welfare of their troops. Stations carrying such broadcasts also played music popular with the troops in an effort to attract them to listen, and they often were heard by the troops because of that music.

The British became adept at “black propaganda” or clandestine broadcasting, putting signals on the air that purported to be aired from German-occupied territory. The first such British broadcast occurred on 26 May 1940, when *Deutscher Freiheitssender* (German Freedom Station) went on the air, featuring Carl Speiker. The French, too, sponsored such broadcasts until the Nazi *Blitzkrieg* overran their forces, leading to German occupation of Northern France and the French collaborationist *Vichy* government in the south. The Soviet Union and the United States engaged in similar activities. For instance, Radio 1212 purported to be a German radio station broadcasting after D-day but was in fact operated by the U.S. military’s psychological warfare unit using the facilities of Radio Luxembourg, which were captured and put back on the air on 22 September 1944. Radio 1212 operated as a clandestine radio station between 2:00 and 6:00 A.M., calling attention to mistakes made by the German high command and other authorities. During the daytime and evening hours the station operated as Radio Free Luxembourg, broadcasting portions of letters captured by the Allies in a program called “Letters That Didn’t Reach Them” and greetings to those back home from a parade of carefully selected German prisoners of war, along with other programs. The U.S. serviceman’s magazine *Yank* eventually claimed that this station broadcast the first on-air execution, when two German soldiers were shot after being captured while engaged in espionage.

Another strategy employed during World War II was called “ghost-voicing.” This involved surreptitiously sliding a signal onto a broadcast from another station at a higher power so that the broadcast sounded as seamless as possible. The ghost signal would then be heard by the listener as if from the original station. Both the British and the Soviets became adept at interrupting Hitler’s radio speeches with broadcasts designed to make him appear mentally unbal-

anced or foolish, or to foment unrest by putting different words in his mouth that were designed to upset his listeners. A similar technique involved recording propaganda broadcasts and then waiting for the right time to replay them to discredit the original source. For instance, when the German army was pushing into the Soviet Union, Nazi broadcasts carried pronouncements from Adolf Hitler concerning the timing of the Soviet state’s total collapse. When the Soviet Red Army held Moscow and Stalingrad and began to push the German army back, the BBC rebroadcast Hitler’s original claims to demonstrate his fallibility.

The United States entered the “radio war” in February 1942, when the Voice of America (VOA) was first broadcast to Europe. In June the Office of War Information was created for the purpose of disseminating both information and propaganda. It contracted with privately owned U.S. shortwave stations to carry VOA programs. By November the federal government began supervising all privately owned international broadcasting stations. The VOA, like the BBC, saw its role as being that of telling the truth or spreading the gospel of democracy.

Cold War Radio

Propaganda by radio continued after the conclusion of World War II as a result of increasing tensions between the Soviet Union and its former Western wartime allies. The tensions created by this use of international radio made it difficult to resolve differences in various international assemblies, including the International Telecommunication Union and the United Nations, over regulation of the airwaves, issues of national sovereignty, freedom of information, and the right to communicate. Countries using radio for propaganda tended to demonize each other, with radio a major weapon in the Cold War that emerged in the aftermath of World War II. The two “superpowers”—the United States and the Soviet Union (so called due to their size, population, and early development of nuclear arsenals)—engaged in a titanic struggle to win the hearts and minds of the world’s peoples. As the old colonial empires began to be replaced by newly independent states, particularly after 1960, both of these countries pressed their propaganda war into new arenas in Africa and Asia. Of particular significance in this postwar propaganda world were the issues of arms control and disarmament, aggressive or military intent—especially in Europe where two military alliances, NATO and the Warsaw Pact, faced off across the Iron Curtain—and the extension or containment of world revolution in response to the ideological rhetorics of democracy versus dictatorship (the Western version) and equality versus hegemony (the Soviet version).

Even though the Voice of America had been dismantled by President Harry Truman in 1945, a new National Security Act

passed in 1947 re-established U.S. intelligence operations and created the Central Intelligence Agency (CIA). The CIA secretly funded the creation and maintenance of both Radio Liberty (RL) broadcasting into the Soviet Union itself and Radio Free Europe broadcasting to the Central and Eastern European countries that had fallen under Soviet hegemony at the end of the war. These stations, called "surrogate radio services," were designed to provide domestic news for each of the target countries in order to inform the occupied populations of the truth about what was happening in their own countries. Both Radio Free Europe and Radio Liberty depended on émigré staff from the countries to which they broadcast to lend an aura of authenticity to their broadcasts. All of the countries to which the two services broadcast were considered to be behind the Iron Curtain.

In 1948, after most U.S. information services abroad had been shut down, the U.S. Congress changed its opinion on the value of information and of international broadcasting and passed the Smith-Mundt Act, creating a permanent international information agency and providing operating funds for a revitalized Voice of America. In 1950, with the outbreak of the Korean conflict, President Truman declared a "campaign of truth" against Communist distortions of American actions, to be carried out by U.S. government-funded organizations, including the VOA.

On the Soviet side, Radio Moscow continued operations at the conclusion of World War II. The Soviet Union also saw to it that countries in the Warsaw Pact (a military alliance to offset the NATO alliance of the Western European powers) established radio services to supplement its own activities, which led to the creation of Radio Prague (Czechoslovakia), Radio Berlin (East Germany), Radio Budapest (Hungary), Radio Bucharest (Romania), and Radio Sofia (Bulgaria), among others. Although these stations put their own spin on broadcasts, they were also subject to strict control through national communist parties subject to Moscow. So there was little difference in their opinions on issues that were considered important by the Soviet Union's Communist Party.

The Soviet Union also funded the creation of radio stations by revolutionary movements that it supported throughout the world and engaged in clandestine radio broadcasts such as the Voice of the Turkish Communist Party and Our Radio into Turkey from Romania and East Germany, the National Voice of Iran from the Soviet Union itself, and the Voice of the Iranian Toilers from Afghanistan during the Soviet occupation and war in Afghanistan. In similar fashion, the CIA funded clandestine radio stations such as Radio Swan, directed to Cuba; Voice of Liberation, directed to Guatemala; and Radio *Quince de Septiembre*, directed to Nicaragua, as well as stations in southeast Asia (Voice of the National United Front of Kampuchea) and Iran (Free Voice of Iran). And in the Allied-occupied portion of Berlin, the military established Radio In

the American Sector (RIAS), ostensibly to broadcast to Allied troops stationed in the city but with the knowledge that most of the citizens of East Germany could easily tune it in as well.

The nature of the propaganda used by the Cold War powers shifted over the period from 1946 to 1985, too. In the early days, beginning with Truman's campaign of truth, the role of American propaganda radio was to respond to what were seen as Soviet lies and provocations by using radio to correct the record. It was radio of reaction. Gradually, however, the Voice of America began to concentrate instead on presenting the face of the United States to the world by providing more ongoing features about life there, including its culture and its economic and political systems. It became more pro-active, leaving some of the more onerous "corrective" work to be accomplished by Radio Free Europe and Radio Liberty, and later by Radio Martí (directed to Cuba) and Radio Free Asia.

To a degree the VOA followed the BBC's lead. The BBC had been freed from its reactive role to Nazi and Fascist radio by the victory of the Allied powers in World War II. On the Soviet side, too, the nature of the propaganda changed under Premiers Kosygin and Brezhnev, becoming less strident in its complaints about Western portrayals of its intentions and concentrating more on the achievements of Soviet science and technology. By 1981 a publication of Progress Publishers (the English-language press of the Soviet Union), written by Vladimir Artemov, recognized the shift, claiming that radio propaganda, although still providing what he called "ideological interference," had become more versatile and sophisticated.

These changes reduced the amount of explicit propaganda; that is, propaganda using restrictive themes and often demonizing other countries, their leaders, or activities, or relying on catch words, sloganeering, or stock ideological interpretations to focus listeners' attention on the particular aspect of a dispute or event that would provide the most positive spin for the broadcaster's government. The emotional temper of the competitive broadcasts also decreased, even though control of the information flow continued in an attempt to have a particular point of view accepted as the most accurate or legitimate one.

With the inauguration of *perestroika* (restructuring) and *glasnost* (openness) in the Soviet Union by Mikhail Gorbachev in the mid-1980s, the role of propaganda between the USSR and the U.S. (and their respective allies) began to shift again. Gorbachev began to adopt the public relations techniques of the West in an effort to achieve new respectability for the Soviet posture in international relations, again moving away from the most obvious forms of propaganda to those that were more subtle and harder to characterize. The United States, for its part, began to focus its attention even more on "civilized persuasion" conducted through the public vehicles of information distribution via radio and satellite television. It contrasted

this approach with what it considered the continuing propaganda of the Soviet state, regardless of the new media strategies that Gorbachev adopted.

With the "velvet revolution" (non-violent political change) that occurred in Central and Eastern Europe beginning in 1989, not only did the role of the former Eastern bloc radio services change but so did the role of Radio Free Europe and Radio Liberty. The most controversial broadcasts by either of these services occurred between 1953 and 1956, when Radio Free Europe was accused of encouraging the Polish and Hungarian uprisings that were put down by Soviet tanks. Apparently many central Europeans had interpreted Radio Free Europe broadcasts as promising U.S. intervention if they rose up against Soviet power. Ironically, the early broadcasts of 1953, based on the defection of a colonel in the Polish secret police, were considered the most effective U.S. political broadcasts since 1945. But when the uprisings occurred in 1956, based on extensive use of the Polish colonel's revelations about secret police files as well as reports on Khrushchev's attack on Stalin for excesses in February 1956 and adoption of an agreement between Khrushchev and Tito on different paths to socialism, they also became the most controversial. After the velvet revolution there was some talk in Washington circles of shutting these services down altogether. But when leaders such as Vaclav Havel of the Czech Republic indicated the need for the stations to continue broadcasting and to assist these countries in the transition to democracy, their broadcasts continued. They began to set up in-country bureaus to facilitate news flow and began to function as truly domestic radio stations, often finding local facilities from which to broadcast their programs. Radio Free Europe even moved most of its operational functions from Munich to Prague and took up residence in the former parliamentary building.

After the Cold War

When Soviet generals attempted a coup against Mikhail Gorbachev in 1991, locking him in his country house until they were stopped in Moscow by its mayor (Boris Yeltsin) and thousands of protesters, Gorbachev later credited international shortwave radio, and particularly the broadcasts of the BBC World Service, with keeping him apprised of unfolding events. Although the Soviet Union collapsed as a unitary state shortly thereafter, Gorbachev's dependence on Western broadcasts underscored the earlier comments of many Soviet dissidents, including Aleksandr Solzhenitsyn, regarding their value.

More old-style propaganda continued to thrive during this period of redefinition, however. A new surrogate station, Radio Free Afghanistan, operated during the Soviet occupation of that country, Radio Martí's operations were supplemented by a new Television Martí and a new Radio Free Asia, all with the operational principles that had guided Radio Free Europe

and Radio Liberty during the Cold War largely intact. During the Gulf War of 1991, American fighter-bombers attacked the transmitting complex and studios of Radio Baghdad on several occasions, and the Voice of America found itself subject to review over its suspected role as a propaganda agency.

In continuing regional conflicts, radio also continued to be used for propaganda purposes. In Rwanda, for instance, the Hutu government used radio to adroitly fan the flames of tribal rivalries, inspiring many Hutus to go on killing rampages, although they formerly lived at peace with their Tutsi neighbors. In the Balkans, too, the warring factions used radio to whip up ethnic hatred and to justify policies of genocide. During the Balkan air campaign, U.S. bombers targeted Yugoslavian radio and television operations with the justification that the Milosovic regime in Belgrade was using the media to spread disinformation and hatred toward Bosnians and Kosova Muslims among ethnic Serbs.

In 2000 several clandestine radio operations continued to function throughout the world, with stations operating in Afghanistan, Burma (Myanmar), Colombia, Congo, Eritrea, Ethiopia, Georgia, Iran, Iraq, Kurdistan, Somalia, Sri Lanka, Sudan, Tibet, Vietnam, and West Sahara. Virtually all of these countries either had active liberation movements operating (such as the Tamil Tigers in Sri Lanka and the Kurds in Iraq), had continuing tribal or ethnic rivalries (such as in Congo), or were engaged in cross-border warfare (such as Eritrea and Ethiopia). In other words, all types of military conflicts have included the use of radio as a vehicle of propaganda or psychological warfare.

The arrival of new technologies for international information distribution have meant some reduction in the significance of radio as a medium of propaganda. The Ayatollah Khomeini, for instance, smuggled audiotapes into Iran prior to the Iranian revolution that overthrew the Shah, and Chinese dissidents attempting to get their message to the West have used both facsimile machines and the internet. Even in the depths of the Cold War, Soviet dissidents distributed information clandestinely through printed publications and videotapes of surreptitiously performed dissident plays, distributed by hand from one person to another. But radio, as an inexpensive and widely available medium of communication, will probably remain the medium of choice for protest, propaganda, insurrection, and revolution for many years to come.

Psychographics

Grouping Radio Listeners by Psychological Characteristics

Ppsychographics is the term for a method of market segmentation that groups consumers on the basis of their psychological characteristics. Unlike demographics, which describes consumer or audience attributes such as sex, age, income, or occupation, psychographics is concerned with unobservable personality traits, such as confidence, aggressiveness, extroversion, curiosity, conscientiousness, agreeableness, and so forth. Psychographics draws inspiration from an array of conceptual perspectives, including theories such as trait-factor, motivation, self-concept, psychoanalytic, and social psychology. Lifestyle characteristics—activities, interests, and opinions—are generally considered a conceptual framework distinct from psychographics. In practice, however, blending personalities and lifestyles is key to producing useful marketing information, and lifestyle characteristics are routinely considered part of a psychographic profile.

Development of Psychographics

Although media and market research about consumer psychology was common as early as the 1920s, the term *psychographics* did not appear until the late 1960s and early 1970s, when target marketing emerged as a predominant business and com-

munication strategy. As more and more companies focused product development and communication efforts on narrowly defined consumer groups, advertisers and marketers called for more sophisticated market segmentation techniques. It had become clear that demographic classifications were insufficient because they lacked the detail necessary for crafting the style of persuasive messages advertisers now preferred. Also inadequate were the prevailing methods for collecting psychological data. Researchers often chose in-depth interviews to uncover psychological and lifestyle dimensions about their subjects. Although rich in detail, the qualitative data were unwieldy for marketers. Interviews were time consuming, which realistically limited the total number of conversations, and therefore, the sample sizes of studies. Interviewing also generated a vast amount of material that was slow to code and cumbersome to analyze.

The emergence of psychographic research paralleled the rapid increase of computer accessibility. Psychographics emphasized easily administered survey instruments with objective questions and precoded responses. Computer data analysis helped psychographic studies include large numbers of subjects, which in turn gave them more general results that could be processed in less time.

Psychographics and Radio

Advertisers' increased emphasis on psychographics also coincided with, and contributed to, the resurgence of radio as a marketing medium in the 1960s and 1970s. Radio was moving from a mass-appeal medium, the something-for-everyone sound and style, to a format-driven medium focused on listener niches and format specialization. At the same time, the proliferation of FM was increasing the number of radio stations and, consequently, competition for advertising dollars. Advertisers were looking beyond standard demographic groupings of target audience; they wanted more tightly focused audience profiles. Differentiating station formats and delivering the audiences for which advertisers were asking became an economic necessity. And it also became necessary to back up claims about number and types of listeners with acceptable cumulative (also known as "cume") audience figures and other ratings details. Not only did the fusion of these various factors stimulate format specialization in radio, it also spurred the creation of hyperspecializations—finely tuned variations on the already flourishing number of general format-types.

The division of the daily radio schedule into dayparts also enhanced radio's attractiveness to advertisers intent on applying psychographic research to their media buys. The accent on lifestyle characteristics in psychographics found a perfect complement in the radio programming day. Advertisers could not only narrow the type of listener to whom they were speaking but could also isolate message sending to the time of day most likely to match target consumers' listening habits.

Although some radio stations used psychographic research to profile their own audiences, most commercial stations continued to market their audiences using demographic descriptions. This practice continues today for several reasons, not the least of which is the prohibitive cost of psychographic research. The fact that radio stations do not typically provide psychographic data about their audiences is not, however, a significant barrier to advertiser purchases of radio spots. Advertisers buy airtime based on both demographic and psychographic data and generally have explicit knowledge of what type of listeners they want.

Public radio is an exception. Public stations regularly use audience personality and lifestyle profiles to entice program sponsors and fortify fund-raising efforts. Understanding listeners' motivations for donating to public broadcasting helps stations to construct persuasive messages and, as a result, to boost financial support from listeners.

Psychographic Measures

Many researchers customize their own segmentation studies as they attempt to predict consumer behavior based on psychographic profiles. Instruments designed to measure various constructs, such as learning style, locus of control, sensation seeking, or general personality traits, illustrate potential tools for gathering psychographic data.

A variety of research firms offer proprietary psychographic research models and syndicated research services. Among the best known are the *Yankelovich Monitor* and the Values and Lifestyles Systems (VALS) from SRI International (formerly the Stanford Research Institute). Since 1970 the *Yankelovich Monitor* has published an annual report on the changing attitudes of adults aged 16 and older based on 2,500 two-hour in-home interviews, combined with written questionnaires. The *Monitor* study is designed to identify broad consumer trends and to build in-depth profiles of target segments.

SRI International created the original VALS in 1978. It offered a psychographic typology that categorized American adults into nine mutually exclusive groups based on consumer responses to questions about lifestyles and social values. The VALS segments were revised and renamed in 1989 in an effort to make VALS more useful to SRI's business customers. Rather than classifying consumers by responses to topical, attitude-oriented issues, the new VALS₂ system uses eight profile groups that cluster consumers based on fixed psychological qualities.

Public Affairs Programming

From the earliest days of broadcasting, public affairs has been a vital part of the program service of most radio stations and networks. Although it has come in various forms through the years, and despite its decline in recent years in commercial radio, this type of programming has been a resilient, integral player in the public's efforts to understand the vital issues of the day.

"Public affairs" is a broadly construed program type in which current issues of public concern are discussed, analyzed, and debated. The issues may be of broad public interest (such as a presidential election) or designed to appeal to a more narrowly based set of interests (such as the building of an overpass by a public school). The "public" may be defined as the general population of listeners or a more narrowly defined segment (gay men, farmers, housewives, etc.). Yet despite the wide variety of approaches to this program type, there have been two basic approaches to its conceptualization: in the more common one, the public affairs program is designed to have an expert or group of experts discuss the matter at hand; in the other, a more widely drawn segment of opinion and analysis is tapped.

Origins

From the inception of regular broadcasting, radio stations (and later the networks) had an interest in maintaining a public affairs presence. Such programs were inexpensive and helped to build radio's public reputation. Among the earliest were speeches given by prominent people—local and national. In 1923 President Warren G. Harding spoke about the World Court in St. Louis. His speech was carried by local station KSD and by AT&T stations in New York and Washington, D.C., producing the largest audience ever to hear a presidential address at one time. Listeners took these programs quite seriously. Later that year, former President Woodrow Wilson's speech on Armistice Day was broadcast by radio stations in New York City and Schenectady, New York; Washington, D.C.; and Providence, Rhode Island, despite his having been in ill health and out of the public eye for some time. (More than 20,000 people showed up at his house the next day to wish him well.) The following summer, 18 stations linked to WEA, New York, carried coverage and commentary of the 1924 Democratic National Convention. Listeners heard arguments and violent debates between members of the Ku Klux Klan, and also between New York Governor Alfred E. Smith, former Treasury Secretary William Gibbs MacAdoo, and William Jennings Bryan. Heated arguments went on for hours, complete with cheering and booing from the assembled galleries. Fist-fights broke out on the air; they were so tumultuous that the

Democratic Party stationed an official censor to stand on the platform in order to shut off the microphone when speeches became too heated.

Despite the popularity of the format, broadcasters found early on that any serious discussion of public affairs was bound to be contentious. Because the espousal of any particular position on a disputed issue was bound to receive favorable comments from those who agreed with it and criticism from those who did not, broadcasters feared alienating any part of their audience, or the current political powers, or (worst of all, from their perspective) existing or potential advertisers. From this concern would come a firm broadcast business stand against allowing purchase of advertising time for expression of views on controversial issues—a ban that lasted well into the 1980s. On 4 April 1922, Hans von (later H.V.) Kaltenborn, then associate editor of the *Brooklyn Eagle*, began a series of half-hour reviews of current world affairs on station WEA, New York, the radio station of AT&T. These talks were something new for broadcasting, especially his editorial commentary on the affairs of the day. As Kaltenborn notes in his autobiography, *Fifty Fabulous Years* (1950), radio management was reluctant to air such discussions because they feared "the expression of opinion on the air might have dangerous repercussions and might even jeopardize the future of broadcasting." From its beginnings, public affairs programming demonstrated the conflicting pressures on broadcasters of informing the public and protecting the bottom line. Program producers often were caught in a struggle between the public and the commercial interests of station management.

One way to mitigate this "problem" was to air public affairs program series that offered a variety of viewpoints. Among the first public affairs program series were regular broadcasts of *Meetings of the Foreign Policy Association*, which ran on National Broadcasting Company (NBC) Blue from November 1926 to 1940, *Meetings of the Government Club* (NBC, 1926 to 1930), and *Our Government*, a series hosted by journalist David Lawrence discussing the relationships between the federal government, business, and various professions (NBC, 1927 to 1933). In 1929, 227 officials of the U.S. Department of Agriculture gave more than 500 addresses on various issues concerning agricultural issues and policies on NBC stations.

Major Network Series

In the tightening grip of the Depression and the coming of the Roosevelt years, NBC broadcast two public affairs series focusing on economics: *The Economic World Today* (November 1932 to June 1933) and *Economics in a Changing World*

(October 1934 to March 1935). During the mid- to late 1930s, NBC broadcast a number of public affairs series explaining the roles of various New Deal programs such as the National Recovery Administration (1933), Federal Housing Administration (three series from 1934 to 1939), and the Social Security Act (1936 to 1940).

By the mid 1930s public affairs programs had become a regular part of network program schedules. Their primary format was either to present debates or discussions between experts on particular issues or to broadcast interviews of prominent individuals by journalists. While none expected nor achieved large audiences, the relatively small number of listeners were generally those with strong social and political ties, and thus of importance greater than their number. Among the most well known were the *University of Chicago Round Table*, broadcast on WMAQ, Chicago (1931 to 1933), and then on the NBC Red Network (1933 to 1955); *American Forum of the Air*, hosted by Theodore Granik on the Mutual and later NBC networks (1937 to 1956); and *America's Town Meeting of the Air*, hosted by George V. Denny on the NBC Blue/American Broadcasting Companies (ABC) network (1935 to 1956). All shared the format of a panel presenting various viewpoints on issues of the day to the audience. Based on the notion that somehow "scholarly objectivity" would remove any fear that the program could be controversial, *The University of Chicago Round Table* was aimed at an elite, educated audience (panelists were intellectuals, primarily college professors).

The real breakthrough program was *American Forum of the Air*. Sponsored by Gimbel's Department Store in New York, *American Forum* was initially hosted by store employee and law student Theodore Granik. His idea was to provide legal advice and a weekly discussion of legal issues over the air in a panel discussion format. When the program moved to WOR (Newark, New Jersey), Granik started to move the panel toward more controversial questions in a more adversarial format. Guests included members of Congress, Cabinet secretaries, journalists, and other prominent citizens. The topics discussed included the New Deal, labor unrest, civil rights isolationism, fascism and Communism. (It should be noted that no communists were ever allowed to speak on the program even when the subject was the nature of Communism itself.) The program was considered important enough to be printed verbatim in the Congressional Record, resulting in many floor debates initiated by the program. Fireworks erupted when a heated debate (virtually unknown in radio up to that point) broke out on the subject of prohibition, between New York Congressman Emmanuel Celler and Emma Boole of the Women's Christian Temperance Union. Boole charged members of Congress with being illegal drunkards, arguing that there were "underground passages" running directly from Washington speakeasies to congressional offices. The charges

caused a national uproar drawing widespread attention, and a large audience, to the program.

The best-remembered series of public affairs speeches were the Fireside Chats of President Franklin D. Roosevelt. The first of these, on the banking crisis, was broadcast 12 March 1933, just a few days after his inauguration. Speaking to an audience estimated at more than 60 million radio listeners, President Roosevelt explained banking practices, his reasons for instituting a "bank holiday," and a call for people to have confidence in the government's ability to carry out his plans. In 104 radio addresses between 1933 and 1936, Roosevelt drew large audiences and an array of support for his New Deal policies. The series lasted until 1944.

But it was in reaction to a neighbor who refused to listen to anything Roosevelt had to say that George V. Denny, Jr. created the best-known public affairs debate program: *America's Town Meeting of the Air*. For more than two decades, *Town Meeting* was the public affairs program of choice for millions of listeners. The program received more than 4,000 pieces of fan mail per week. More than 1,000 *Town Meeting* debate and discussion clubs were formed in libraries, churches, schools, community organizations, and local homes for people to gather, listen, and then continue the debate long into the night after a program was over. The National Women's Radio Committee named *Town Meeting* the best educational program in the country in 1936. High school students in New York City listened to the programs and then participated in similar classroom discussion the next day. In 1938 and 1939, listeners purchased more than 250,000 copies of program transcripts so that they could have a permanent record of what had been said.

Town Meeting's popularity stemmed largely from the range of program debate and the volatility of its format. From the beginning it hosted debates that easily led to heated argument. The initial broadcast on 30 May 1935 was "Which Way America—Communism, Fascism, Socialism or Democracy?" In other broadcasts, Eleanor Roosevelt debated Mrs. Eugene Meyer on the benefits of the New Deal, and Langston Hughes discussed "Let's Face the Race Question" (at a time when the voices of African-Americans were seldom heard). Other speakers included justices of the Supreme Court, Norman Thomas, William Randolph Hearst, Jr., Cabinet secretaries, members of Congress, leading educators, and noted authors. Whereas other programs eschewed contentious feedback from the audience, *Town Meeting* promoted it; audience condemnation and heckling of speakers was expected. In some programs, speakers came close to physical violence on the air.

An October 1931 talk by British playwright George Bernard Shaw on the Columbia Broadcasting System (CBS) created a major stir. The network had wanted Shaw to come to its London studios to give a talk on the current situation in Europe. Network management's elation at his appearance was

deflated when he focused the majority of his remarks on praising the Communist system in the Soviet Union: "Hello, all my friends in America! How are all you dear old boobs who have been telling one another for a month that I have gone dotty about Russia? . . . Russia has a laugh on us. She has us fooled, beaten, shamed, shown up, outpointed, and all but knocked out." A resulting widespread public outcry led CBS executives quickly to broadcast a rebuttal from a clergyman in order to counteract what they feared was Shaw's inference that the communist system was divinely favored.

Among the more notable public affairs programs of the 1940s were *Life Begins at 80* (on Mutual and ABC from 1948 to 1953), a discussion of world affairs by a group of senior citizens that was reportedly so frank in its discussions that programs had to be taped and edited before broadcast; *Juvenile Jury* (carried by Mutual and NBC from 1946 to 1953), a program featuring young people giving their perspectives on current issues of the day; and *Leave It to the Girls* (on Mutual, 1945 to 1949), which started as a discussion program featuring career women talking about problems submitted by their listeners, before becoming more comedic.

By the 1950s much of radio's major programming was migrating to television; public affairs programs either followed this trend or met their demise with the growing popularity of the new medium. In December 1950, CBS began a weekly series, *Hear It Now*, hosted by highly regarded correspondent Edward R. Murrow. The program was short-lived, moving to television in September 1951 as *See It Now*. Another radio program, *Meet the Press*, began in the late 1940s on NBC Radio and also moved to television in the 1950s. (It remains a Sunday morning fixture to this day.) The long-running *America's Town Meeting of the Air* left the air in 1956.

Many local stations continued to produce public affairs programs targeted at specific immigrant groups such as Poles, Basques, Japanese, Haitians, and Mexicans. Typical was the *Hellenic Radio Hour* hosted by Penelope Apostolides at stations around Washington, D.C., between 1950 and 1995. The program was a one-hour broadcast featuring news and discussion by and for the Greek community, as well as aspects of Greek culture.

Non-Commercial Programs

While public affairs radio was declining on commercial radio in the 1950s, a newer, more robust format was taking its place: listener-sponsored radio typified by the broadcasts from stations of the Pacifica Foundation, originally of Berkeley, California. Public affairs was one of the four primary areas of station programming. As Eleanor McKinney notes in *The Exacting Ear* (1966), Pacifica Radio's intention was to provide a program service different from that provided by commercial broadcasters, because "(w)e were all convinced that

the commercial notion of 'all us bright people in here broadcasting to all you sheep-like masses out there' was completely false."

McKinney cites Lewis Hill, Pacifica's founder, who held that the problem was how to provide listeners with truly provocative programming that addressed significant alternative viewpoints, analyses, and proposals for fixing the major problems of the day. "Radio which aims to do that," Hill argues, "must express what its practitioners believe to be real, good, beautiful and so forth, and what they believe is truly at stake in the assertion of such values." Hill went on to claim that "either some particular person makes up his mind about these things and learns to express them for himself, or we have no values or no significant expression of them."

A cross-section of Pacifica's programs published in 1966 shows that the public affairs commitment of the three stations in Berkeley, Los Angeles, and New York spanned a wide range: a 1953 broadcast of a talk on the "First Amendment: Core of Constitution" delivered before a congressional committee by legal scholar Alexander Meiklejohn; a 1958 hour-long interview with Ammon Hennacy, editor of the *Catholic Worker*, in which he discussed conscientious objection to war and the benefits of a decentralized state; the 1960 broadcast and subsequent documentary productions reporting on House Un-American Activities Committee hearings in San Francisco; a much requested interview by Irish poet and author Ella Young, discussing environmental issues; Supreme Court Justice William O. Douglas discussing racial discrimination, on Independence Day 1962; a documentary, "Freedom Now!" produced from field recordings of blacks and whites during the racial struggles of Birmingham, Alabama, in 1963; and regularly scheduled series of commentaries by William Rusher, editor of the *National Review*, and noted author Ayn Rand. These outlets for a wide range of public affairs remain on the air to this day.

In the 1970s, several former staff and volunteers at the five Pacifica stations (Pacifica had added stations in Houston and Washington, D.C.) were among the first reporters and producers at National Public Radio (NPR). This non-commercial network has been producing two daily news programs (*Morning Edition* and *All Things Considered*) that regularly feature documentaries on a wide range of subjects, such as health care, poverty, environmental concerns, electoral campaign financing, war and peace, famine, and many other subjects.

While commercial radio largely abandoned its public affairs commitment in the wake of Reagan era deregulation, it remains a vital component of non-commercial and community stations around the country. Public affairs programming is one of the hallmarks of NPR. It provides three daily public affairs talk programs: *Talk of the Nation*, a national call-in program that runs for two hours Monday through Thursday afternoons; *Fresh Air*, a daily hour-long interview program that

focuses on the arts and culture, and the ways they are imbedded within current events; and *The Dianne Rehm Show*, a daily two-hour call-in program with many distinguished guests, offering listeners opportunities to hear and participate in lively, thoughtful dialogues on a variety of topics.

NPR also provides stations with three weekly public affairs programs. *Latino USA* and host Maria Hinojosa provide public radio audiences with information about the issues and events affecting the lives of the nation's growing and increasingly diverse Latino communities. News round-ups and acclaimed cultural segments promote cross-cultural understanding and develop a forum for Latino cultural and artistic expression. *Living on Earth*, which has won a number of awards, is hosted by Steve Curwood. The program explores the environment—what people are doing to it and what it's doing to us. In-depth coverage, features, interviews, and commentary examine how the environment affects medicine, politics, technology, economics, transportation, agriculture, and more. The third series, *The Merrow Report*, focuses on education, youth, and learning, hosted by John Merrow.

In 1983 a second public radio programming source, American Public Radio (since renamed Public Radio International or PRI), began operations from the Twin Cities of Minnesota. Its stated mission was "to develop distinctive radio programs and to diversify the public radio offerings available to American listeners. Among APR's first program offerings was a two-hour weekly talk, essay, interview, and listener call-in program, *Modern Times with Larry Josephson*. The program (first aired by local station KCRW in Santa Monica, California) was about the basic moral and philosophical questions posed by current issues such as abortion; Supreme Court decisions; the Joel Steinberg/Hedda Nussbaum tragedy (hosted by Susan Brownmiller); the atomic age (hosted by McGeorge Bundy); and the end of the Cold War (hosted by Arthur Schlesinger, Jr.).

During the Persian Gulf War in 1990, APR carried a half-hour nightly program, *Gulf War: Special Edition*, consisting of reports from more than 20 BBC reporters in the Middle East, combined with CBC coverage. The series, modeled after the *Nightly Vietnam Report* of Pacifica's WBAI (New York), provided international perspectives on the war that were unavailable from any single producer or network.

In 1994 APR changed its name to Public Radio International to focus more of its efforts, in part, on globally relevant programming. *The World*, public radio's first global news program, was begun in 1996.

More recently PRI has provided public radio stations with daily public affairs programming from the British Broadcasting Corporation (BBC) and the Canadian Broadcasting Corporation (CBC). Among the BBC offerings are *Newshour*, a 60-minute thrice daily program of news reporting, commentary, and analysis; *The World Today*, a 15-minute program that

looks into one international issue each day; and *Outlook*, a 25-minute magazine-style program on international issues. The weekly program *Dialogue* is produced by the Woodrow Wilson International Center for Scholars in association with Radio Smithsonian. This program focuses on topics of national, international, historical and cultural affairs.

Alternative Public Affairs Formats

There have also been efforts to broaden the ways in which stations reach out to their audiences to engage them in discussions and actions concerning issues of current interest. A brief experiment in an alternative form of public affairs radio was *America's Hour*, which ran on CBS from July to September 1935. Its aim was to "boost America" while decrying public dissatisfaction at the height of the Depression. The format was an hour-long melodrama on such issues as railroads, hospitals, mining, and aviation; the intent was to praise mutual management/worker relationships, denouncing "radicals who breed discontent." This program was also noteworthy as being the early breeding ground for radio dramatic actors of later prominence: Orson Welles, Joseph Cotten, Ray Collins, Betty Garde, and Agnes Moorehead.

Some of the more interesting public affairs programs were experiments in using the station to initiate dialogue within the community, with the station seen as a forum for the active engagement of various segments of the local community. Two of the earliest such efforts were produced at commercial FM stations. One of these was the work of Danny Schechter at WBCN-FM, Boston, between 1970 and 1977. WBCN was a major pioneer underground or progressive commercial music station in the country. Calling himself "The News Dissector," Schechter created a public affairs format to match the diverse interests of the station's listeners who, he believed, were interested in public affairs not slanted in the traditional way. Writing in *The More You Watch the Less You Know* (1997), Schechter says his approach was to dissect the news; that is, to

break it down into elements that explained what was going on, rather than just report the familiar surfaces. . . . [He] wanted to present news that looked at the world from the point of views of people who were trying to change it, rather than those who would keep it the way it was.

Schechter provided in-depth analyses and discussions of such issues as the anti-Vietnam movements, racism and apartheid in South Africa, and the needs and interests of workers in Boston-area manufacturing industries. He sought to bring a more inclusive format to public affairs programs by inviting community activists to participate in discussions of major issues of the day.

Wes "Scoop" Nisker produced public affairs programs in the same vein at KSAN, San Francisco, in the mid 1960s to mid 1970s. Nisker created person-on-the-street packages in which he incorporated a variety of voices, music, and sounds to create programs on subjects such as the annual Gay Pride Day parade, political campaigns, and sex and violence on television. Nisker concluded each broadcast by urging his listeners to become involved directly in the issues of the day, saying, "If you don't like the news you hear on the radio, go out and create some of your own."

Another experiment in engaging the community actively in public affairs was *The Drum* on WBUR, Boston. Begun in 1968 by a consortium composed of staff from WBUR, the Boston mayor's office, Action for Boston Community Development, and local commercial radio and television stations, *The Drum* was an effort to provide both a radio forum for public affairs discussions and a job training site for young adult members of Boston's minority communities. At the time, the only station that had programming targeted at minority communities in Boston signed off at sundown each day. To reach out to these segments of the population, *The Drum* provided a nightly program of news, music, and public affairs features (on issues such as health care, housing, employment, violence, drug abuse, and education) aimed at those communities. Program staff was composed primarily of young men and women recruited from the communities covered. The recruits were contracted to work for the program for a year, during which they were given rigorous training in news and public affairs reporting, writing and program production, announcing, publicity, and community outreach. At the completion of the training year, commercial radio and television stations provided them with jobs as a means of increasing minority staff presence and, for the stations, as a way to gain larger audiences in inner city communities.

Thus *The Drum* provided a model, demonstrating ways that local broadcasters could more closely cater to the needs and interests of under-represented communities in their areas while also expanding their audience base. *The Drum* project was terminated in August 1971. However, many former *Drum* trainees are still working in the broadcasting industries as on-air talent and station management.

The 1970s also saw the founding of radio stations produced by and for Native American communities. More than two dozen Native American stations now have their own national satellite network and have garnered a large audience in indigenous communities. On the reservations the stations produce public affairs news and cultural features of interest to the communities. The sole source of Indian news, these stations act as preservers of Native American languages and culture. They have become the new *eyapaha* (a Lakota word for "town crier"). Typical is station KBRW in Barrow, Alaska. The station's management considers its most important product to be

programs about Native American issues and interests, local and state news and discussions, broadcasts of local governmental meetings, personal messages, and public service announcements.

Among the longest running of public affairs commentary programs was *Uncommon Sense: The Radio News Essays of Charles Morgan*, which ran on KPFK, Los Angeles, from 1974 to 1991. This was a series of twice-weekly 15-minute essays on current events covering such topics as the power of the multinational oil companies (which Morgan decried as "The Dictatorship of the Petroletariat"), the Rockefeller-sponsored Trilateral Commission, political extremism, and the increasing disconnection between official news and politics and the growing underclass of people of color in south central and east Los Angeles. From the mid 1980s, Morgan added a listener call-in program, *Talk to Me*, that allowed listeners to respond to what he was saying on the air. *Talk to Me's* significance was that Morgan encouraged listeners to debate him and each other in a lively exchange of ideas. This was very different from the "question-the-expert/hang-up-for-the-answer" format that dominated talk radio.

Alternative Radio is a public affairs program service in Boulder, Colorado, that attempts to breach the near-monopoly of corporate control over commercial radio outlets. Founded in 1986 by producer David Barsamian, *Alternative Radio* provides lectures by and interviews with outstanding analysts (and individuals usually shunned by mainstream media sources) on a variety of topics. Barsamian offers the hour-long program free to stations and then sells copies of the programs to listeners. Among recent national program bestsellers are historian Howard Zinn on "The Use and Abuse of History," Vermont independent congressman Bernie Sanders on "Single Payer Health Care," and journalists Molly Ivins on "American Political Culture and Other Jokes" and Barbara Ehrenreich on "Trash Media: The Tabloidization of the News." Other regular speakers are Michael Parenti, Noam Chomsky, Ralph Nader, and Dr. Helen Caldicott.

The Women's International News Gathering Service (WINGS) is an all-woman independent radio production company that produces and distributes news and current affairs programs by and about women around the world. WINGS programs are used by non-commercial radio stations, women's studies, and individuals. Programs can be heard on local radio stations, on shortwave, on the internet, and on cassettes. The WINGS mailing list provides updates on stories and new information about women's media. Headquartered in Austin, Texas, WINGS collects programs and news stories to distribute to public radio stations around the country.

A more recent radio public affairs program with an alternative format is the daily *Democracy Now!* This is a national, listener-sponsored public radio and TV show, pioneering the largest community media collaboration in the country. The

program started in 1997 as the only daily election show in public broadcasting, and has since broadened its focus to national and international public issues. In 1998, *Democracy Now!* went to Nigeria, Africa's most populous country, to document the activities of U.S. oil companies in the Niger Delta. The program won the 1998 George Polk Award for the radio documentary "Drilling and Killing: Chevron and Nigeria's Military Dictatorship." In November 1999 *Democracy Now!* produced an eight-day series of special reports on the demonstrations against the World Trade Organization meetings in Seattle, Washington. Following these programs, in 2000 *Democracy Now!* pioneered a unique multi-media collaboration involving non-profit community radio, the internet, and satellite and cable television through the Free Speech TV satellite channel. This is the first radio public affairs program to utilize, and to engage, voices from around the world via converging communications technologies.

Public Broadcasting Act of 1967

U.S. Legislation Creating a Support Mechanism for Public Broadcasting

The Public Broadcasting Act of 1967 was the first federal legislation that enabled Congressional support for a national public radio and television system for the American people. As a direct result of the Act signed into Law on 7 November, the Corporation for Public Broadcasting was created, and subsequently National Public Radio (NPR) and the Public Broadcasting Service (PBS) were established as radio and television distribution networks, respectively.

Origins

Historians are fond of recalling that federal support of public radio in the United States was largely an afterthought. The impetus that led to the creation of the Public Broadcasting Act of 1967 is rooted in efforts to gain public awareness and funding for what was then known as educational television. That

the Act was rewritten to explicitly include the medium of radio is a testament to the enormous commitment of a handful of radio enthusiasts.

Noncommercial educational radio frequencies were first set aside by the Federal Communications Commission (FCC) in 1938 (for special high-frequency AM stations to broadcast to school classes) and in 1941 for the new FM service. When FM's frequency band shifted in 1945, the educational reservation was shifted as well. In each case, however, the building of stations to use the allocated frequencies was slow in coming. Educational institutions found it difficult to gather funds to put stations on the air and then sustain their on-going operation. Many of the educational radio stations that were built during the 1950s and 1960s failed to achieve the professional standards of their commercial counterparts, and hence the audiences for such outlets were relatively small. So little attention was being given to this "hidden medium" that radio

representatives had little influence in the power circles of Washington, D.C.

By contrast, the FCC had created noncommercial educational television channels in April of 1952. The medium of television had caught the public's imagination as an educational resource, although except for Ford Foundation grants its early funding picture was comparable to that of educational radio. Concerns about American education during the late 1950s led to the availability of limited monies to support educational television via the National Defense Education Act of 1958, but educational television advocates saw this modest infusion merely as an important first step. A major political offensive was launched by groups such as the National Association of Educational Broadcasters (NAEB) to take advantage of the pro-educational television campaign rhetoric of President John F. Kennedy. This effort reached fruition on 1 May 1962 when President Kennedy signed into law the Educational Television Facilities Act of 1962. The legislation authorized \$32 million over a five-year period to construct new stations or improve the coverage of existing stations. During this period the number of educational television stations nearly doubled.

A New Legislative Initiative

The passage of the Educational Television Act of 1962 not only generated new funding for the construction of educational television stations but also created a new awareness and support base in both houses of Congress. Representatives and senators alike who had been actively involved in the passage of the facilities legislation remained openly impressed with the promise of this new educational medium. One of the senators who had helped mount the charge for educational television funding in the 1950s was Lyndon B. Johnson. When Johnson became president of the United States after the Kennedy assassination, educational television appeared to fit well with his Great Society programs.

The Educational Television Stations (ETS) division of the NAEB held a conference on the long-range financing of educational television in December of 1964. That gathering, and the national survey of station needs associated with it, served as the launching pad for creating a blue ribbon commission to study the future of this important educational resource and to make recommendations to the president. Days after the conference concluded, C. Scott Fletcher of ETS had secured funding from the Carnegie Foundation to form the Carnegie Commission on Educational Television, to be chaired by Ralph Lowell. After a year of study, the Commission issued its report—*Public Television: A Program for Action*. President Johnson received and endorsed the recommendations and then called for legislation that would give life to the vision outlined. Educational broadcasters also applauded the report at a second funding conference held in March 1967 that was designed to encourage prompt

congressional action. That action came quickly, as Senate hearings on S. 1160 began 11 April 1967. But for advocates of educational radio, or public radio as it was now being called, the legislation had a definite weakness: there was no explicit provision for the radio medium. The proposed law circulating in both houses of Congress (S. 1160) was for a Public Television Act.

If there is a single individual who deserves credit for changing the course of this legislation it is Jerrold Sandler, executive director of NAEB's National Educational Radio (NER) division. Sandler was well aware of the ETS division's intention to play down the role of educational radio because of its uneven track record. Without fanfare, Sandler began a campaign to have public radio included in the language of the Act. Among his initiatives were a conference at the Johnson Foundation's Wingspread Center in Racine, Wisconsin, and the commissioning of a national fact-finding study to demonstrate that public radio was indeed alive and well. The resulting report, *The Hidden Medium: A Status Report on Educational Radio in the United States*, was distributed to Washington policy makers after the Senate and House bills had already been scheduled for hearings. But even at this late date, the report had a significant impact. Jerrold Sandler's impassioned testimony during the Senate hearings prompted Senator Griffin of Michigan to propose that the bill be broadened to include radio and the name of the forthcoming legislation be retitled the Public Broadcasting Act of 1967. In addition, the name of the oversight agency to be created by the Act was changed from the Corporation of Public Television to the Corporation for Public Broadcasting. Public radio had scored a major policy victory.

This landmark legislation became Section 396 of the Communications Act of 1934. Congress mandated the FCC to uphold the law that was designed to "encourage the growth and development of public radio and television broadcasting" in the United States. Yet with all its public-interest language and the creation of a new nonprofit organization to ensure that public radio and television would develop and prosper, the Act failed to provide the insulated long-range funding mechanism recommended in the Carnegie Commission report. That failure would consume the energies of the public broadcasting community for decades to come.

“Public Interest, Convenience or Necessity”

“Public interest, convenience or necessity” is perhaps the most significant phrase in the Communications Act of 1934. Through this durable but flexible set of words, first employed in the Radio Act of 1927, Congress guides (but also allows vital discretion to) the Federal Communications Commission (FCC), radio’s most important federal regulator. The agency must act in the public interest. In turn, the rules and policies it creates exist, in part, to prod radio licensees to serve the public interest.

Statutory Origins

The earliest federal radio statutes (the Wireless Ship Acts of 1910 and 1912) were short-lived, although the subsequent Radio Act of 1912 lasted for 15 years. Initially written primarily for maritime wireless telephony, these laws proved inadequate when radio expanded to include broadcasting. Courts ruled that the secretary of commerce (the major regulator under the early acts) lacked the discretion or flexibility to adopt new rules or regulations as radio changed. The secretary’s actions, courts said, were limited to the specifics of the Act. Broadcasting required new legislation.

After ignoring this problem for several years, Congress finally adopted the Radio Act of 1927. The new statute created a Federal Radio Commission (FRC) and charged it with keeping up with the rapidly changing field of radio. Unlike the secretary of commerce, the FRC could adopt rules and regulations with the force of law. Such discretion, however, required the statutory limitation that Congress provided by mandating that the FRC regulate radio in the “public interest, convenience or necessity.” When the Radio Act of 1927 was replaced by the Communications Act of 1934, Congress re-enacted the public interest standard.

The phrase was derived in part from earlier statutes regulating usage of scarce public resources such as public lands and establishing federal agencies to manage natural monopolies such as railways. By creating the FRC and the FCC and giving

them this general statutory charge, Congress could step back from the day-to-day details of regulating rapidly changing radio, but it could also always rein in those agencies by saying, formally and informally, that they had not acted in the public interest. In theory, courts could do the same, if it can be argued that an FCC action is not in the public interest. In practice, however, the Communications Act has granted the FCC wide and rarely challenged discretion. For seven decades, the FCC has justified various rules, regulations, and policies under the standard. As radio (and its social and business contexts) has changed, the FCC has repeatedly altered its understanding of what the public interest requires.

Who Determines the Public Interest?

It is not flippant to say that the public interest in radio is whatever a majority of FCC commissioners believe it to be at any given time. There are two limits to this statement, however. First, the FCC runs the risk of being overturned in court if it cannot justify a rule, regulation, or action as being in the public interest. Courts have historically been reluctant to make this finding, however. More often, they either rule that the FCC has not compiled an adequate record to support its decision—and give the FCC a second chance on remand—or conclude that the commission simply lacked statutory authority to act in the area. FCC actions, of course, must also comply with the Constitution, especially the First Amendment. On rare occasions, courts have ruled that an FCC policy thought to promote the public interest cannot stand because it violates the First Amendment.

Second, the FCC’s opinions on the public interest can be undone by Congress, the commission’s ultimate source of both budget and policy authority. If FCC rules, policies, or actions substantially distress Congress, legislators can seek to substitute their view of the public interest for the commission’s by simply overriding an FCC decision or amending the Communications Act. Such steps are rarely taken, however. It is more

common for Congress, through budgetary and oversight hearings, to telegraph warnings to the FCC about its expectations. The FCC usually heeds these warnings and rarely offends Congress even if commissioners believe an offending action to be in the public interest. A mid-2003 package of FCC decisions concerning media ownership sparked considerable congressional concern and disagreement, and an attempt in the Senate to roll back the rules to those existing before the FCC change. But House (and White House) support for the FCC action doomed the Senate initiative.

The FCC is typically a light-handed regulator of broadcasters. In many areas, the FCC leaves them great discretion as to how to fulfill general FCC mandates. Radio broadcasters, for example, must make “reasonable efforts” to provide “reasonable access” to their stations to candidates for federal elective office. In determining what is reasonable, the FCC expects radio broadcasters to consider what would best serve the public interest.

Public Interest Standard and Radio

In the early 1920s, attempts to regulate radio by the secretary of commerce collapsed as courts ruled that the secretary had limited authority to deal with broadcasting. When the Federal Radio Commission was formed in 1927, it had to deal with the consequences of this breakdown. There were more radio stations on the air than the technology of the day could handle, with resulting interference reducing service quality for all. The FRC had to clear the air and reduce the number of licensees.

Some urged that this be done on technical grounds alone, removing from the air stations that caused interference or could not maintain a reliable transmission schedule. Advocates of this approach often pointed to Section 29 of the Radio Act of 1927 prohibiting the FRC from censoring the uses of radio. This limitation, they argued, meant the FRC could not consider the content of the service a broadcaster was providing.

Others concluded, however, that the public interest standard compelled the FRC to consider content, despite the no-censorship clause. The FRC adopted this position and denied licenses and license renewal to radio broadcasters whose content was not at least generally in the public interest. The FRC ruled that the interests of the public, in good service as the commission defined it, were superior to the interests of broadcasters or advertisers. The public interest mandate led the FCC to regard broadcasters as “proxies” or “trustees” for the public. Reasoning that broadcasting was a scarce public resource and that there were more who wanted to broadcast than frequencies to accommodate them, the FCC developed the trusteeship model and assumed the ability to oversee and define the duties of the trustees—radio broadcasters.

The criteria for being a good trustee were not especially burdensome. Licensees were not to run stations solely to serve

their own interests or the interests of advertisers. They were not to air programs or hoaxes (such as Orson Welles’ 1938 *War of the Worlds* broadcast) that would scare or disrupt the community. They were not to carry programming, such as on-air diagnoses of disease and prescription of remedies, that might cause harm to others. In the very earliest days of the FRC, being a good trustee meant not playing recorded music, on the assumption that people who wanted to hear records could buy them—a public interest perspective the FRC quickly abandoned.

These programming policies eventually evolved into a general FCC expectation that every radio broadcaster would offer a “balanced” or “well-rounded” program service—a something-for-everyone-at-some-time approach that required every radio broadcaster to offer both paid and sustaining (unpaid) programs during the broadcast day that would be of some interest to everyone. These general expectations persisted until the 1960s when radio, as a result of the ascendance of TV, began to develop specialized formats serving narrowly targeted audiences. The FCC acquiesced in this specialization.

Overall FCC regulation of radio content switched from expecting balanced or well-rounded programming to anticipating that broadcasters would offer minimum amounts of non-commercial, non-entertainment programming and refrain from over-commercialization. Although there were never any specific FCC rules setting quantitative news and public affairs expectations, until the early 1980s radio broadcasters ran the risk of having license renewals designated for review by the full FCC if they failed to offer minimum amounts of news or public affairs shows (8 percent for AM, 6 percent for FM), or if they ran too many commercials. Under the public interest standard, the FCC also expected that radio broadcasters would regularly and formally, through surveys of community leaders and the general public, ascertain the problems, needs, and interests of their communities and use their findings to formulate non-commercial, non-entertainment programming.

For many years radio broadcasters were also required to comply with the Fairness Doctrine, another policy the FCC promulgated under the public interest standard. This doctrine imposed two obligations on broadcasters: to devote “reasonable” attention to the coverage of controversial issues of public importance in their community, and to provide a “reasonable opportunity” for opposing views on those issues to be heard. The doctrine was never codified in the Communications Act of 1934; rather, it was another example of a policy created by the FCC under the public interest standard.

Public Interest and the Marketplace

During the 1970s, winds of deregulation swept through the regulatory world, including the FCC. Under both Democratic (Carter) and Republican (Reagan) administrations, and in

many areas beyond communications (banking, transportation, etc.), the theory was advanced that marketplace forces, rather than regulation, should be relied upon whenever possible. Regulation, including regulation of radio, should be a last resort, used only when the marketplace produced clearly dysfunctional results. Public interest regulation traced its origins to New Deal responses to the Depression, the greatest marketplace collapse in U.S. history. Fifty years later, with a more robust, capitalistic economy in place, economists, industry leaders, and regulators argued that FCC behavioral regulations, such as the Fairness Doctrine and news programming guidelines, were no longer appropriate. The commission, it was argued, should only rarely substitute its assessment of the public interest for what consumers and the radio industry, responding to marketplace forces, wanted and chose to do.

By the 1980s the number of radio stations was also much greater than in the 1930s and 1940s when many FCC public interest regulations began. The few hundred AM stations of 1934 had grown into thousands of AM and FM stations. With so many more stations on the air, it was argued, members of the public could choose those fitting their own standards or preferences. Radio deregulation orders in 1981 and 1984 eliminated the FCC's expectations about minimal amounts of news and public affairs programs. The commission reasoned that stations should not be compelled to provide specific amounts of such content in the public interest if they did not want to do so and if consumers were uninterested in such content. Other radio stations or perhaps other media would step in and fulfill any need for news if stations decided to cut back. Similarly, the FCC dropped its limits on the amount of time stations could devote to airing commercials. A station running too many commercials would presumably suffer in the marketplace. That marketplace, rather than the FCC, would henceforth protect the public interest from over-commercialization. Finally, the FCC decided that the public interest no longer required broadcasters to formally ascertain the problems, needs, and interests of their communities on a regular basis. Broadcasters out of touch with their communities, it reasoned, would be held in check by marketplace forces, so the rules mandating ascertainment were dropped.

Three years later, again responding to marketplace-based theories of deregulation, the FCC dropped the Fairness Doctrine. It concluded that the doctrine might be counter-productive, as it could push broadcasters to play it safe in order to avoid Fairness Doctrine complaints. But more significantly, the commission believed that a multiplicity of voices in the electronic media marketplace of the late 1980s would, if deregulated, better serve the public's interest in receiving diverse and antagonistic information than regulation by the FCC. Some scholars and many radio industry leaders trace the

growth of highly opinionated talk radio in the 1990s to the elimination of the Fairness Doctrine, as the FCC no longer believed that it was contrary to the public interest for a broadcaster to be unfair or unbalanced in the treatment of public issues.

Regulation under the Public Interest Standard Today

At the start of the 21st century, little remains of the public interest regulation of radio as practiced during most of the 20th century. All radio broadcasters are expected by the FCC to offer some “issue responsive” programming, but the commission has almost never questioned broadcasters' interpretations of this vague standard. If licensees prepare and properly place in local public files quarterly “issues/programs” lists identifying at least five issues that have received treatment on the station during the previous quarter, the FCC assumes that the issue-responsive programming obligation has been met. It is considered contrary to the public interest to broadcast false information concerning a crime or catastrophe if it is foreseeable that the broadcast will cause “substantial public harm”—a prohibition aimed mostly at shock-jock hoaxes. The terms and conditions of station contests and promotions must be fully disclosed and, except in extraordinary circumstances, adhered to. Misleading the public about such contests is considered contrary to the public interest.

As the FCC reduced or eliminated its content- and/or conduct-related public interest rules, it sharpened some structural regulations rooted in the public interest standard. The goal has been to promote diversity of station ownership and employment, as a complement to marketplace based deregulation. If the commission is to rely on the marketplace, then that marketplace must be diverse and competitive. Although Congress, through the Telecommunications Act of 1996, eliminated a decades-old FCC public-interest-based cap on the number of radio stations a single owner could own and set off massive consolidation of radio ownership, the FCC adopted limits on the number of stations that could be owned by a single owner within markets. The commission rooted its limits in the theory that dominance of a market by a single voice was contrary to the public interest.

And, since the late 1960s, the FCC has attempted to promote diversity in the broadcast employment marketplace by adopting policies attempting to enhance the employment of minorities and women by broadcasters and the ownership of stations by members of ethnic groups. In the late 1990s, with national standards on equal employment opportunity, affirmative action, and “minority set-asides” shifting, courts questioned and in some instances overturned these FCC policies. Believing that ethnic and gender diversity in employment and station ownership was in the public interest, however, the

FCC adopted revised policies that it hoped would survive judicial scrutiny.

At the start of the 21st century, radio and TV broadcasting are in the process of converting from analog to digital transmission. Digital transmission may dramatically alter the services broadcasters can deliver. Digital radio broadcasting will surely continue to provide listeners with entertainment, information, and advertising. It may also permit additional services to piggyback onto the aural services broadcasters have provided since the 1920s. Digital radio, for example, may have a greater capacity to transmit emergency information than analog broadcasting. Public policy debates are likely to emerge about whether digital radio should have new and different public interest obligations beyond the minimal obligations currently imposed on analog radio. Public interest advocates are likely to argue for such regulations, whereas the radio industry will surely argue that continued reliance on competition and the marketplace is the course of action most in the public interest.

Public Radio International

Although many people view National Public Radio (NPR) as synonymous with public radio broadcasting in the United States, its rival network, Public Radio International (PRI), actually distributes more programs to public radio stations.

PRI originated as American Public Radio Associates (APR), which grew out of concerns by large-market stations that NPR's control over programming distribution led it to favor its own programs over those produced by member stations. Several of these stations, including Minnesota Public Radio, New York's WNYC, Cincinnati's WGUC, San Francisco's KQED, and KUSC in Los Angeles, founded APR in January 1982. Minnesota Public Radio president William Kling chaired the new organization. From the outset, APR followed an explicitly entrepreneurial model of organization that was frequently at odds with NPR's slow-moving membership model. Whereas

NPR was governed by an elected board of station managers, APR operated under an independent board of directors. Whereas NPR developed and produced the majority of its programs, using staff and facilities subsidized by member stations, APR distributed already completed shows from stations and independent producers. Finally, NPR offered an entire program service for a single price to member stations, whereas APR provided individual programs to stations on an exclusive basis.

APR's initial program offering was *A Prairie Home Companion*, which Minnesota Public Radio had syndicated since 1980, after NPR president Frank Mankiewicz had rejected the program as "too parochial." *A Prairie Home Companion* skyrocketed in popularity, ranking second to NPR's *All Things Considered* as an audience (and station fundraising) draw. In

1983 APR incorporated itself as a fully independent organization. The following year, APR began to distribute *Monitorradio*, a news and public-affairs program produced by the *Christian Science Monitor*. In 1985 APR surpassed NPR as the largest supplier of cultural programs in public radio.

APR also benefited from changes in public radio funding in the mid-1980s. Beginning with fiscal year 1987, nearly all federal dollars went directly to stations. Public radio stations could then purchase programs from NPR or from other organizations and stations. By directing federal funds to stations instead of sending money to stations through NPR, local stations gained more control over programming and NPR was buffered from unstable federal funding.

Emboldened by the increase in direct funding, and claiming that NPR's distribution policies (which required member stations to purchase a full schedule rather than individual programs) posed a significant barrier to entry, APR threatened to bring an antitrust suit against NPR. In late 1987 NPR responded by "unbundling" its program service by offering groups of programs, rather than an entire schedule, to stations. However, APR offered producers higher fees, and popular programs such as *Fresh Air*, *Mountain Stage*, and *Whad'ya Know* began to jump from NPR to APR. NPR responded by further paring back its cultural programming in favor of news and public affairs.

Reflecting its global designs on public broadcasting, American Public Radio changed its name to Public Radio International (PRI) in July 1994. Two years later, PRI made its first venture into program production with *The World*, an ambitious news and public-affairs program designed to compete directly with *All Things Considered*. PRI also distributes the highly popular *Marketplace* financial program, a show that appeals to corporations as well as listeners: by the mid-1990s, *Marketplace* drew 4 percent of all corporate sponsorship money for public radio and brought in the highest sponsor income of any public radio program.

In 1997 PRI counted 591 affiliates; NPR had 635 member stations. The two networks had long been considered bitter rivals; therefore, many observers were stunned in late 1997 when NPR President Delano Lewis approached PRI president Steven Salyer to discuss the possibilities of merging the organizations, believing that a merger would attract more corporate sponsors to public radio, help position public radio against commercial competitors, and also allow public radio to act quickly on entrepreneurial ventures. The plan died quickly, however. Whereas NPR was controlled by stations, PRI was not interested in station representation. An NPR/PRI merger

also would have limited the number of opportunities for program distribution and would have reduced diversity. Yet given potential economies of scale and declining federal funding for public radio, such a union may someday prove irresistible. In the meantime, many public radio listeners remain understandably confused about the two services, and their relationship. At the time of writing, the two are totally separate program services for noncommercial radio stations, competing for corporate underwriting dollars.

PRI's leaders have stated that their service offers a competitive alternative to NPR, creating more diversity for the public radio system. Indeed, PRI has distributed many of public radio's outstanding programs throughout its history. Yet much of PRI's success stems from the fact that (unlike NPR) it primarily distributes completed programs, therefore avoiding the costs incurred through production. PRI's attempts at producing programs, such as *The World*, have proved to be highly problematic. Competition may lead to more pluralistic programming, yet competition has its pitfalls when applied to public goods and services. Critics have charged that PRI has focused on reaching upscale audiences from the outset, emphasizing classical music and business-oriented news and public affairs programming while relegating the less popular "conscience" items to NPR. More than any other organization, PRI has played an instrumental role in introducing marketplace economics into the public radio system. Although PRI's financial success is incontestable, its overall contribution to public radio remains subject to debate.

Public Radio Since 1967

Although educational radio had existed for 50 years—longer than commercial radio—a study published in 1967 aptly described it as “the hidden medium.” Commercial radio overwhelmed its noncommercial alternative on the AM band through the 1940s. Then, just when the reservation of 20 channels for noncommercial use on the new FM band gave educational radio a new start after World War II, the attention of educational broadcasters switched to television. Radio continued to languish.

The Beginning

A handful of professionally staffed educational stations served mostly rural areas of the country from state universities in 1967. New York City’s WNYC and Boston’s WGBH were urban exceptions and accounted for much of educational radio’s very limited total national listenership. The Pacifica Foundation radio stations in Berkeley, Los Angeles, and New York attracted more notoriety and more listeners than did most educational stations. Voices of political and social dissent, these stations stood somewhat apart from mainstream educational radio stations. They would continue that independent course as leaders of the “community” radio movement separate from, and sometimes in conflict with, the “public” radio discussed in this article.

When educational broadcasters organized to seek federal funding in the mid-1960s, they sought support only for television. Radio, they believed, had no future. Funding educational radio would divert precious resources from television. The clandestine efforts of a small band of maverick educational radio managers, however, quietly slipped the words “and radio” into President Johnson’s Public Television Act of 1967. Deputy Undersecretary of Health, Education, and Welfare Dean Costen added those crucial words as he drafted the legislation for the administration. Costen was an old friend and former employee of Ed Burrows, manager of the University of Michigan radio station, WUOM, and a friend of another former WUOM employee, Jerrold Sandler, the Washington lobbyist for educational radio. At the behest of Burrows, Michigan’s Senator Robert Griffin sealed radio’s victory by amending the name of the 1967 Public Television Act to “Public Broadcasting” and creating a Corporation for Public Broadcasting rather than a Corporation for Public Television. Thus began the modern history of educational—now called public—radio.

Required by law to create a national public radio system out of virtually nothing, the new Corporation for Public Broadcasting (CPB) appointed as director of radio activities Al Hulsen, the manager of the university station at Amherst, Mas-

sachusetts, whose soft-spoken style belied a ferocious determination. Hulsen pursued a two-pronged strategy. He offered financial aid to noncommercial stations that reached minimal professional standards: maintaining a staff of at least three full-time members, broadcasting six days per week for 48 weeks a year, and providing a program service of cultural and informational programming aimed at the general public rather than student training, instructional, or religious programming. The minimum requirements were to increase gradually to five full-time staff and 18 hours a day operations for 365 days a year. Though hardly rigorous, these standards excluded all but 72 of the 400 noncommercial radio stations operating in 1969.

The second part of Hulsen’s strategy would create a national entity to produce, acquire, and distribute quality programming to those stations. For this part of the strategy, the weakness of the public radio stations proved advantageous. Whereas public television boasted a handful of relatively strong local stations with national programming ambitions that might be thwarted by a single strong national production center, no public radio station felt capable of producing a significant amount of national-quality programming. Moreover, its weakness and obscurity allowed public radio to avoid the scrutiny of the Nixon administration when it put an end to any dreams of a strong “fourth network” for public television. No one objected if the anemic public radio system created a single independent production and distribution entity that could give strong direction and a clear identity.

The argument for a national radio production center went beyond politics, however. Radio programming differed from television programming. Whether commercial or public, television built schedules of unrelated programs from a variety of producers. Contemporary radio stations, commercial or public, built their services around integrated *formats* rather than a series of programs, and such coherence would best be provided by a single production center. An initial planning board incorporated that production center in Washington, D.C. on 3 March 1970 as National Public Radio (NPR).

National Public Radio defined the national identity for public radio. Its initial board of directors, elected by and largely composed of station managers, in turn articulated that identity. Board member William Siemering of WBFO in Buffalo, New York, captured the spirit of the board deliberations and the anti-authoritarian political climate on college campuses in the late 1960s. His “National Public Radio Purposes” set out a series of expectations that significantly modified the formal, elitist quality of traditional educational radio and its model, Britain’s British Broadcasting Corporation (BBC). To Siemering and his fellow board members, public radio should be an instrument of direct democracy. It would listen to the nation as

much as it would talk to it. Yes, public radio would pursue the highest standards of journalism. Yes, public radio would tap the academic resources of the nation as never before. Yes, public radio would preserve and foster the cultural life of the nation. All of this might have been expected of traditional educational broadcasting. *Public* radio, however, would also reflect the diversity of the nation, giving voice to the unheard, establishing dialogue among those who seldom speak with one another, and seeking wisdom in ordinary people as well as those with credentials. In Siemering's memorable phrase, public radio would "celebrate the human experience."

The chief celebrant would be Siemering himself. NPR's first president, Donald Quayle, hired Siemering as his program director and told him to bring into reality the ideals he had so eloquently enunciated. The implementation proved to be more difficult than the promises, all of which were expected to be realized in NPR's first program offering, *All Things Considered*, a 90-minute daily magazine that debuted at 5:00 P.M., Monday, 3 May 1971. As its title suggested, *All Things Considered* was intended to be something more than a "news" program. It would "contain some news," Siemering said, but *All Things Considered* would also reflect public radio's egalitarian values and a commitment to "quality" in a whole range of topics. Any subject might be considered, as long as it was approached in a considered manner. Quayle and the board intended *All Things Considered* to be public radio's *Sesame Street*, a defining program that would break into the public's consciousness and call attention to this newly defined medium of public radio. The program did indeed come to define public radio, but only slowly and incrementally over the course of the next decade. *All Things Considered* won its first Peabody Award in 1973 and its first Dupont Award in 1976.

All Things Considered contributed to the gradual growth in listenership for and awareness of public radio. The other strand of Hulsen's strategy, building and strengthening local stations, proved to be even more important. The incentive of federal money and the opportunity to bolster their image in their local communities by carrying *All Things Considered* caused universities and other local licensees throughout the country to upgrade their small stations to meet Hulsen's standards or, in many cases, to start new stations from scratch. Hulsen put particular emphasis and resources into upgrading several small college stations with virtually no listenership in the Los Angeles basin into significant enterprises. He focused on turning the Chicago Board of Education's instructional station into a large, powerful public station covering all of "Chicagoland" from the top of the John Hancock Building. He invested significant federal funds in several production centers, most notably Minnesota Public Radio (MPR), which burgeoned from a student radio station at St. John's College to two statewide networks and the largest locally based operation in public radio.

Listenership doubled in the five years after public radio audiences were first measured in 1973, from roughly 2 million listeners a week to a little more than 4 million in 1978. The largest part of that growth came from new and upgraded stations added to the system, and a smaller part came from increased listening to the initial core stations. Federal, state, and local taxes, primarily through state universities, provided more than 80 percent of the funding for these stations. Listeners provided only about 10 percent.

Public radio grew from almost nothing to something real in the 1970s. Nonetheless, it remained in the shadow of public television and found itself responding to the often troubling developments in the visual medium. Although hostile to all media, the administration of Richard Nixon was particularly unhappy about a television system created by Lyndon Johnson's Great Society, supported by tax money, and presumed to be liberal and hostile to Nixon and his policies. The administration was able to express its displeasure through its control of federal appropriations for public media, which the president vetoed in 1972. To strengthen itself politically, public television folded its lobbying activities into its programming organization, the Public Broadcasting Service (PBS), and recruited a politically influential board and board chairman to provide effective leadership.

Public radio might have responded with a parallel structure at NPR. Quayle objected, however, that political activities should be kept separate from an organization like NPR that produced programming, particularly news programming. As a result, public radio established a separate organization in 1973 to handle its lobbying activities, the Association of Public Radio Stations (APRS), with its own board of directors that consisted, as did the NPR board, primarily of elected station managers. The heads of the two largest local public radio organizations, Minnesota Public Radio and Wisconsin Public Radio, assumed the leadership of APRS, and NPR found itself facing a strong rival. William Kling of Minnesota and Ronald Bornstein of Wisconsin criticized the leadership of NPR. More fundamentally, they rejected the concept of a single national production center. They preferred the television model of program production by the larger stations in the system, the largest of which they happened to manage.

The rivalries within public radio weakened further its already weak position relative to public television, particularly when the two media fought one another over the division of CPB funds between radio and television. Television's victory in formulating CPB's 1975 budget forced the radio system to conclude that the division between NPR and APRS needed to end, and the two organizations merged. In reality, the merger in 1977 constituted a takeover of NPR by the APRS leadership, which vowed to give public radio the dynamism they felt it had heretofore lacked.

The Second Beginning

To provide that dynamism, the board of the “new” National Public Radio chose as president Frank Mankiewicz, son and nephew of Hollywood producers and writers Herman and Joseph. Mankiewicz was a lawyer and a reporter, and he had been press secretary to the late Senator Robert Kennedy and manager of George McGovern’s 1972 campaign for president. A showman, a journalist, a politician, and a natural promoter, Mankiewicz had all the qualities that might put public radio on the map. He would provide public radio with a second beginning.

Public radio made important strides in four areas during the Mankiewicz years, 1977–83.

Politics. Mankiewicz resolved the continuing conflict with public television over the division of CPB money by convincing Congress to earmark 25 percent of CPB funding for radio, leaving 75 percent for television, a more favorable division for radio than it had ever had—or even hoped for—in the past.

Visibility. Mankiewicz was everywhere. Suddenly national media paid attention to the hidden medium, in part because of Mankiewicz’s perseverance and in part because he gave them programs they could write about. NPR gained particular notoriety with its live broadcast of the Senate debate over the Panama Canal treaty and an exclusive call-in program from the White House with President Jimmy Carter. Public radio gained similar publicity for a radio adaptation of the movie hit *Star Wars*.

Programs. Less important in attracting attention, but ultimately far more important in attracting listeners, NPR in 1981 added a two-hour *Morning Edition* complement to its showcase afternoon program, *All Things Considered*. Morning, of course, is radio prime time, and Mankiewicz made public radio competitive where it mattered most, lifting listenership not only in the morning but throughout the day. The birth of *Morning Edition* brought with it a more basic change. With newsmagazines in the morning and the late afternoon, NPR became an around-the-clock news organization and moved firmly into coverage of breaking news. What had been perceived as an “alternative” medium focusing on the offbeat, the whimsical, the arts, ideas, and the lives and opinions of ordinary people in addition to carrying “some news,” *All Things Considered* joined *Morning Edition* in focusing more heavily on the news of the day as reported by a greatly expanded system of reporters, most notably the female trio of Nina Totenberg, Linda Wertheimer, and Cokie Roberts. Mankiewicz redefined “alternative” as doing what they other guy does but doing it better. “In depth” replaced “alternative” as public radio’s *raison d’être*.

Satellite Distribution. Congress agreed to fund satellite distribution systems for public radio and television in 1979. The radio satellite dramatically improved the technical quality

of public radio’s national programming. More important, it allowed multiple programs to be distributed at the same time and allowed live program origination from various places in the country other than Washington, D.C. Multiple origination points gave individual public radio stations the ability to send programming to the system without going through NPR in Washington. It made feasible a television model of multiple program producers, long advocated by Minnesota’s Kling, the principle architect of the new satellite system.

Though Bornstein and Kling had been largely responsible for his elevation to the NPR presidency, Frank Mankiewicz could not bring himself to accept a diluted role for NPR as leader and sole programmer for public radio nationally. He would not agree to Kling’s proposal that NPR fund, distribute, and promote a live weekly variety show that Minnesota Public Radio produced in St. Paul. Perhaps Kling never really expected—or even wanted—Mankiewicz to accept his proposal, for he used the rejection as a rationale to establish a second network in competition with NPR. American Public Radio (APR) would resemble PBS more than NPR. Like PBS, American Public Radio would not produce its own programs. Rather, it would schedule and promote national programs produced by individual stations, particularly those of Minnesota and four other founding stations that Kling brought into his enterprise: WNYC, New York; WGBH, Boston; KUSC, Los Angeles; and WGUC, Cincinnati. Bill Kling served as president of both American Public Radio and Minnesota Public Radio. Headquarters of the new network started in the MPR building before moving to an office building a few blocks away in downtown St. Paul. Ultimately, American Public Radio signaled its independence from its parent by moving out of St. Paul—all the way to Minneapolis. In 1995 APR changed its name to Public Radio International.

APR burst on the public radio scene in 1980 with the St. Paul-based variety show *A Prairie Home Companion*. Veteran MPR announcer and freelance writer Garrison Keillor hosted the show in an intimate style that conveyed listeners to the mythical town of Lake Wobegon, Minnesota, “where all the women are strong, all the men are good looking, and all the children above average.” In addition to the News from Lake Wobegon, *A Prairie Home Companion* included a wide range of musical styles, skits, and commercial parodies. When it declined to fund and distribute the program, NPR had claimed that *A Prairie Home Companion* was too regional, but listeners across the country proved otherwise as they turned on their radios Saturday evenings to enjoy the latest from Lake Wobegon.

Beginning national distribution less than a year after the launch of *Morning Edition* by NPR, *A Prairie Home Companion* joined it and *All Things Considered* as the three programs that defined public radio and drew listeners to it. Garrison Keillor became public radio’s most recognized personality, his

face reaching the cover of *Time* magazine in 1985. *Morning Edition* and *A Prairie Home Companion*, plus continued growth in the number of public radio stations, caused public radio's audience to double again, to over 8 million by 1983.

The best of times turned into the worst of times in 1983. The 25 percent budget cuts imposed on public broadcasting by Ronald Reagan launched the crisis, but Frank Mankiewicz's reaction to the cuts almost turned it fatal. In every crisis lies an opportunity, and Bill Kling saw the impending budget cuts at public radio stations as a chance for APR to sell those stations large quantities of low-cost, high-quality programming that would allow stations to reduce staffs and costs. Not willing to let Kling steal this market, Mankiewicz responded with an even better package at an even lower cost—so low, in fact, that it could not support itself. Kling wisely ended his project. Mankiewicz went full speed ahead with his, as part of a burgeoning concept of entrepreneurial activities that would allow NPR to “get off the federal fix by '86.” Whatever federal money Reagan continued to provide should go to support the stations, Mankiewicz said. NPR would support itself by selling programs to stations and selling a wide variety of services to business partners.

Whatever the merits of these projects in the long run, they required substantial cash investments in the short run, and the need for those investments came in the same year that NPR's federal support, which made up most of its budget, dropped by 25 percent. In March 1982 NPR staff realized they would run a \$3 million deficit in that fiscal year. Despite drastic cuts imposed by the NPR board, the deficit projection doubled to \$6 million a month later, and to \$9 million by June: NPR was insolvent. Mankiewicz, other senior officials, and about a quarter of NPR's 500 employees lost their jobs, and the same Ron Bornstein from Wisconsin who had been instrumental in placing Mankiewicz in the NPR presidency took over as interim president. Bornstein arranged a series of loans from the Corporation for Public Broadcasting. NPR's member stations guaranteed repayment of the loans, and NPR continued to operate.

The Third Beginning

The public radio system that emerged from the NPR crisis looked quite different from the system that went into it. Though NPR was still the most important single organization, individual stations asserted their independence and leadership. The stations, after all, had deposed Mankiewicz and guaranteed the loans that saved NPR. Their responsibility for NPR became permanent in 1985, when they and CPB agreed that federal money that had formerly gone directly to NPR would now go to the stations, who would purchase programs from NPR, APR, or other sources. The larger stations in the system banded together as the Station Resources Group (SRG),

expressly designed to exert leadership within the system in place of NPR. The SRG contended that the public radio system brought into existence by federal money through the Corporation for Public Broadcasting should no longer look to government as its primary source of funding. Public radio's future rested not with government support, but with the ability of public radio to raise private funds from corporations, foundations, and, above all, directly from listeners. Reagan's 25 percent cut in federal support, and the anti-government, free-market philosophy it represented, suggested to these stations that government funding was less certain than private money. Moreover, some of them, most particularly Bill Kling of Minnesota, concluded that private funding was preferable to government funding and set out aggressively to seek “underwriting,” the euphemism for soft advertising, listener memberships, and major gifts. Again led by Kling, the station managers of the SRG decided that the academic institutions and state and local governments that held the licenses to most public radio stations hampered the new entrepreneurial spirit. Some actually separated from their institutional licensees to become freestanding, not-for-profit corporations; others found ways to operate more independently within their institutional structures.

The results of these efforts were dramatic. By 1998, public radio was a half billion dollar-a-year industry, with the private sector providing more than half of its income. Listeners provided 30 percent of public radio's revenue; business 17 percent; and foundations 10 percent. Only 13 percent came from the federal government, and state and local governments generated 30 percent, primarily through the budgets of state universities. By 1998, public radio was reaching more than 20 million listeners each week, ten times its 1973 listenership.

The ability of public radio to raise money through memberships and underwriting depended directly on its ability to attract, hold, and satisfy listeners. Even those most committed to the more traditional mission of public radio recognized that they fulfilled their mission best when their programs reached the most people. Hence, public radio's priorities after 1983 emphasized audience growth through research. The strategy developed by a national Audience Building Task Force in 1986 set the tone for much of the subsequent development of public radio. Recognizing that most public radio listeners listened to commercial radio more than they listened to public radio, the task force determined that the most direct way to increase public radio listening was to get current listeners to spend more time with public radio and to attract more people like the current listeners. Rather than increasing the diversity of programs in order to appeal to more people, the most successful public radio stations focused on programs that appealed most to existing listeners.

Stations set out to eliminate those program elements that they believed caused listeners to tune away to other stations.

Out went some of the more esoteric and self-indulgent offerings. A similar fate awaited programs too blatantly academic in tone. The hour or two a week of programs aimed at targeted groups turned off those who were not members of those groups; these programs disappeared from most stations. Music in general assumed a reduced role, replaced by news and information, the primary appeal of public radio. The music that remained tended to be confined to classical and jazz, and particularly to the more mainstream selections within those genres. Any hopes for a revival of radio drama evaporated in the quest for consistent appeal.

To replace programming that no longer fit, NPR added programs with qualities that echoed the appeal of *Morning Edition* and *All Things Considered*—programs such as *Weekend Edition*, *Fresh Air*, and *Talk of the Nation*. Public Radio International offered *Marketplace*, a daily news program focused on economics that was created by two former producers of *All Things Considered* and that appealed to NPR news listeners. Nonetheless, the biggest public radio “hit” of the 1990s turned out to be a quirky program that followed no known formula. *Car Talk*, a less-than-serious advice program, became the most listened to hour on public radio. It was like no other public radio program, yet it appealed to most of the same people who liked *Morning Edition*, *All Things Considered*, and *A Prairie Home Companion*. It gave them yet another reason to spend more time with public radio.

Research in the late 1980s demonstrated the wisdom of such a strategy as public radio sought to raise money from listeners. The research found that the propensity to make donations related directly to the loyalty of listeners to the station. Those who spent the most time with public radio were the most likely to give. Those who tuned in only occasionally were less likely to give. Survival and growth, then, depended on each public radio station’s becoming extremely important in the lives of some people rather than marginally important to many people. Whereas Siemering’s philosophy urged public radio to bring together people of all backgrounds, races, regions, ages, and educational levels, the new imperative suggested focusing on a particular subset of the potential audience.

A subsequent study called *Audience 88* identified the people most attracted to public radio programming. It identified educational attainment as the primary predictor of an interest in public radio programming—not surprising, perhaps, for a medium that began in universities as “educational” radio. The more years of education an individual had, the more likely he or she would be to listen to public radio. A substantial part of the audience had earned advanced graduate and professional degrees. Since education correlates directly with income, well-educated public radio listeners tended to be very comfortable financially, but education level, not wealth or social class, predicted loyalty to public radio. Indeed, the most likely of all to love public radio was the individual with

a lot of education and a more modest income, the teacher rather than the doctor, the social worker rather than the investment banker. The ultimate public radio listener turned out to be the Ph.D. who drives a cab. In the values and lifestyle terminology of the time, public radio listeners came largely from the psychographic group called “Inner Directed and Societally Conscious.”

Public radio had by the end of the 1980s identified its audience and committed itself to serving that audience well, much as commercial media identify target audiences and attempt to give them what they want. Unlike commercial radio, however, public radio formulated its mission and values initially without consideration of an intended audience. It produced programs that reflected the democratic purposes enunciated by Bill Siemering in 1970. It produced programs that sought to be thoughtful, fair, open-minded, and in-depth; programs of substance, not hype; programs that represented the best traditions of the universities that gave birth to public radio, but in an accessible, non-academic style. It produced programs driven not by commercial values but by the desire to “celebrate the human experience.”

Listeners who heard this programming, and liked it, self-selected. They chose to listen to programs that resonated with them. This self-selection happened before public radio professionals learned—or cared—who these people were. When public radio decided its life depended on keeping, pleasing, and deepening the loyalty of those listeners, the most effective strategy was clear: public radio needed to commit itself ever more firmly to the original values that attracted those listeners in the first place. Public radio gives its target listeners what they want when it presents programs that reflect the initial academic values of universities, a commitment to depth and quality, and Bill Siemering’s faith in the intelligence and openness of ordinary people.

Public Service Radio

Public service radio has its roots in Great Britain and is based upon civic principles that envision radio broadcasting as contributing to the betterment of society and the promotion of democratic ideals. The concept of public service radio values public welfare and social good over competitive market forces.

Origins

Public service radio is based on the principles of universality of service, diversity of programming, provision for minority audiences and the disadvantaged, support of an informed electorate, and cultural and educational enrichment. The concept was conceived and fostered within an overarching ideal of cultural and intellectual enlightenment of society. The roots of public service radio are generally traced to documents prepared in support of the establishment of the British Broadcasting Corporation (BBC) by Royal Charter on 1 January 1927. As public trustee, the BBC was to emphasize serious, educational, and cultural programming that would elevate the level of intellectual and aesthetic tastes of its audience. In turn the BBC would be insulated from both political and commercial influence. Therefore, the corporation was a creation of the crown rather than parliament, and funding to support the venture was determined to be derived from license fees on radio (and later television) receivers rather than advertising. Under the skillful leadership of the BBC's first director general, John Reith, this

institution of public service radio embarked on an ethical mission of high moral responsibility to utilize the electromagnetic spectrum—a scarce public resource—to enhance the quality of life of all British citizens. Critical inspection of the performance record of public service radio in England since the 1930s would suggest that although there has been a consistent effort to adhere to this lofty idealism, actual practice has never been totally exempt from the political and economic imperatives of modern society. However, in contrast to the performance of the profit-driven commercial radio stations of the United States and elsewhere, the BBC has been repeatedly singled out as a standard bearer of some of the highest quality radio programming available anywhere in the world.

Development of Principles

The notions underlying public service radio undoubtedly grew out of the belief that since the airwaves are an invaluable public resource, the use of this resource must always be driven by a sense of ethical purpose. The medium of radio was seen as being especially well suited to the exploration of society's educational and cultural potential. Fundamental to John Reith's philosophy was a commitment to universality—the idea that services of radio should be made available to the greatest number of citizens possible, thereby elevating the quality of life of an entire society. In defiance of basic capitalistic principles,

Reith saw the radio audience as a set of people needing to be served and uplifted rather than exploited for financial gain. Instead of seeking the largest audiences possible in order to maximize profits, public service radio was supposed to awaken tastes in serious literature, challenge an awareness of the human condition, and stretch the minds of listeners to explore new cultural horizons.

Critics of the principle of universality as applied to public service radio argue that broadcasting the highest quality programming available is of little value if no one is listening. Advocates of public service radio maintain that quality programming is not necessarily dull or boring. Indeed, one of the principles of public service radio is that it offers a wide range of program fare, including entertainment. A commitment to being comprehensive in its approach to diverse service suggests that, within the range of programming offered listeners during a typical broadcast day, some segments do entertain as well as educate and inform. The original conception of multiple services (e.g., Radio 1, Radio 2, and Radio 3), was to offer a range of choices simultaneously that were, by design, distinctively different, as opposed to the virtually identical commercial programs that were all vying for the same mass audience.

Of concern to the original founders of public service radio was that news and public affairs programs would be free from any partisan influence, whether from government or the commercial marketplace. The insulation of revenue from the direct control of any agency that could bias the programming content was seen as a fundamental principle for assuring that the radio service would truly be in service to the entire citizenry. However, as suggested above, this ideal has always existed more in theory than practice.

Global Growth

Within the governance of national authorities, public service radio was recreated across Western European democracies and beyond in various forms. At the core of each was a commitment to operating radio services in the public good. The principal paradigm adopted to accomplish this mission was the establishment of a state-owned broadcasting system that either functioned as a monopoly or at least as the dominant broadcasting institution. Funding came in the form of license fees, taxes, or similar noncommercial options. Examples of these organizations include the Netherlands Broadcasting Foundation, Danish Broadcasting Corporation, Radiodiffusion Télévision Française, Swedish Television Company, Radiotelevisione Italiana, Canadian Broadcasting Corporation, and Australian Broadcasting Corporation. While the ideals on which these and other systems were based suggested services that were characterized by universality and diversity, there were notable violations to these ideals, especially in Germany, France, and Italy. In some cases the state-owned broadcasting

system became the political mouthpiece for whomever was in power. Such abuse of the broadcasting institutions' mandate made public service broadcasting the subject of frequent political debates.

Contemporary accounts of public service radio worldwide often include the United States' National Public Radio (NPR) and Public Radio International (PRI) as American examples. However, unlike the British model which was adopted across Europe, the U.S. system came into being as an alternative to the commercially financed and market driven system that has dominated U.S. broadcasting from its inception. Whereas 1927 marked the beginning of public service radio in Britain, the United States Radio Act of 1927 created the communication policy framework that enabled advertiser-supported radio to flourish. Language contained within this act explicitly mandated radio stations to operate "in the public interest, convenience, or necessity," but the public service ideals of raising the educational and cultural standards of the citizenry were marginalized in favor of capitalistic incentives. When the Radio Act was replaced by the Communications Act of 1934, the Federal Communications Commission (FCC) recommended to Congress that "no fixed percentages of radio broadcast facilities be allocated by statute to particular types or kinds of non-profit radio programs or to persons identified with particular types or kinds of non-profit activities." It was not until 1938 that the FCC created an experimental license for "noncommercial educational" radio stations. In 1941 the commission reserved some of the new FM channels for non-commercial licenses. But even though these stations were envisioned to be the United States' answer to the ideals of public service radio, the government's failure to provide any funding mechanism for noncommercial educational stations for decades resulted in a weak and undernourished broadcasting service. Educational radio in the United States was referred to as the "hidden medium." Until passage of the Public Broadcasting Act of 1967, there was no formal government-supported mechanism for ensuring that public (service) radio could develop into a viable national communications medium.

Growing Criticism

During the 1970s and 1980s, public service broadcasting worldwide came under attack, as the underlying principles on which it was based were called into question. Much of the dissatisfaction came as a response to public service radio's television counterpart. The arrival of new modes of television delivery (cable television, satellites, video cassettes) had created new means of access to broadcast services and thus changed the public's perception about the importance and even legitimacy of a broadcasting service founded on the principle of spectrum scarcity. From an ideological perspective, conservative critics were raising questions about the very notion of a

public culture and about public service broadcasting as a closed, elitist, inbred, white male institution. Movement toward a global economy was having an ever increasing impact on the way policy-makers saw the products of radio and television. The free market viability of some educational and cultural programming as successful commercial commodities seemed to support the arguments of critics that public service broadcasting on reserved channels was no longer justified.

Deregulation of communication industries was a necessary prerequisite to the breakdown of international trade barriers, and the shift toward increased privatization brought new players into what had been a closed system. The growing appeal of economic directives derived from consumer preferences favored the substitution of the U.S. market forces model for the long-standing public trustee model that had been the backbone of public service radio. Adding to this appeal was the growing realization that program production and distribution costs would continue to mount within an economic climate of flat or decreasing public funding.

By the early 1990s, the groundswell of political and public dissatisfaction with the privileged position of public service broadcasting entities worldwide had reached major proportions. Studies were revealing bureaucratic bungling, cost overruns, and the misuse of funds. One commission after another was recommending at least the partial dismantling or reorganization of existing institutions. New measures of accountability demanded more than idealistic rhetoric, and telecommunication policymakers were turning a deaf ear to public service broadcasting advocates.

Prospects for the Future

Communication scholars in the U.S. who had been reticent on these issues began to mount an intellectual counterattack based largely on the experiences of public broadcasting in the United States. Critiques of U.S. communications policy underscored concerns about the evils of commercialization and the open marketplace. Studies pointed to the loss of minority voices, a steady decline in programs for segmented populations, and a demystification of the illusion of unlimited program choices introduced by the new communications delivery systems. Content analyses revealed program duplication, not diversity, and the question of just how far commercial broadcasters would venture away from the well-proven formulas and formats was getting public attention.

A concerned electorate was beginning to ask whether the wide-scale transformation of telecommunications was not without considerable risk, and whether turning over the electronic sources of culture, education, and political discourse to the ever-shifting forces of the commercial marketplace might have profound negative consequences. Many of the studies that expressed concern about the ever-accelerating growth of

market forces pragmatism at the expense of public trust idealism were drawing their interpretive power from theoretical writings about the vital importance of the public sphere to the future of democracy worldwide. The central argument advanced was that within contemporary society individuals pursue their own private self-interests, whereas it is within the public sphere that individuals function in their role as citizens. Public service radio and television were characterized as being essential to the preservation of the public sphere.

By the end of the 20th century, the environment of electronic communications was in a state of flux as newer technologies vied for a piece of a quickly expanding and constantly evolving marketplace. Both commercial and public service radio stations were adding audio streaming on the worldwide web to their traditional modes of distribution. Public service radio institutions were reassessing their missions and were building new alliances with book publishers, computer software manufacturers, and commercial production houses. In the United States, public radio stations were experimenting with enhanced underwriting messages that were sounding more and more like conventional advertising. The relative success of these and other new ventures worldwide was still unknown. Whether public service radio would survive the enormous media transformation that was taking place around the globe had become a frequent topic of both academic and political debate.

Pulse, Inc., The Audience Research Firm

The Pulse, Inc., provided audience research reports for up to 250 markets from 1941 to 1976. Throughout its history, the company was associated with its founder, Dr. Sydney Roslow.

Origins

In 1940 and 1941 Roslow worked as a psychologist for the Psychological Corporation, a company composed of academic psychologists. In 1939 the corporation had experimented with a roster personal interview technique in an audience study commissioned by station WBEM (Buffalo, New York).

Encouraged by noted social scientist Paul Lazarsfeld, Roslow published the first official *New York Pulse* for October/November 1941. Stations WABC, WEAJ, WNEW, and WOR, as well as advertising agency N.W. Ayer, were subscribers to the report, which summarized interviews with 300 respondents per day (2,100 per week). Equal numbers of respondents were assigned to each of the three dayparts included in the report.

World War II slowed the young company. As Roslow went into government service during the war (in the Department of Agriculture in Washington, D.C.), his wife carried on the business. Two large studies were conducted for WCAU (Philadelphia) in 1944 and 1945. Shortly after the war, Pulse added surveys in Boston, Chicago, Cincinnati, Ohio, and Richmond, Virginia. Eventually Pulse became the dominant local radio audience research supplier. By early 1963 Roslow reported that Pulse was publishing reports on 250 markets. Its clients included 150 advertising agencies and 650 radio stations.

At the peak of its popularity, Pulse referred to its research method as "personal house-to-house interviews":

The emphasis in this survey is that the interview is made at the home. . . . The roster as used in PULSE surveys is a schedule of radio stations and programs by day-part

periods. . . . After the introduction the interviewer is instructed to elicit from the respondents an estimate of when they listened to the radio as the first step. To obtain this information, the interviewer tries to proceed hour by hour through the day, beginning with the time the respondent gets up. Then, the respondents are invited to look at the roster and report their listening.

Pulse respondents reported listening at home and away from home, a unique feature of its audience reports during the company's heyday. Listening preferences, demographics, and other measures were also collected.

The sampling procedure for the Pulse surveys was a sample of "sampling points" (geographical locations distributed at random through the survey areas of the market being studied). This process may be clearer by reviewing the particulars from the October–December 1973 Pulse survey of Atlanta, Georgia. According to the report, Metromail (a market research firm under contract to Pulse) selected at random the addresses of telephone households from the counties surveyed. Each of these addresses became the center of an interviewing "cluster" of approximately 15 interviews. In all, the data for Atlanta came from 146 sampling points, with 2,791 persons interviewed (19 persons per sampling point). As the survey period was 7 October through 28 December 1973 (82 days), it can be seen that the survey could have involved as few as two interviewers, each interviewing persons at one sampling point per day.

The counties surveyed were divided into two parts: the central zone, representing the counties where market radio stations delivered stronger signals; and a larger area, the radio station area, where Atlanta stations were not as dominant and listeners lived farther from the business areas of Atlanta.

In most other respects, the Pulse reports present data similar to that in contemporary radio market reports: listening esti-

mates, cumulative estimates, daypart estimates, in-home and out-of-home estimates, etc. Special sampling provisions were instituted for Hispanic and African-American listeners.

Decline

During the 1970s Pulse was gradually supplanted by Arbitron (formerly the American Research Bureau [ARB]) as the dominant radio audience research company. According to Beville (1988), Roslow attributed this trend to several factors. One was the acceptance by advertising agencies of the diary technique for the measurement of television audiences. It was only a small step further to consider personal diary technique (the Arbitron method) acceptable for measuring radio audiences.

A second factor in Roslow's view was that radio advertising was not profitable enough for agencies to buy more than one audience measurement service; that is, they could not afford to buy reports from both Arbitron and Pulse. A third factor was the technology of the Arbitron parent company at the time, Control Data Corporation (CDC). CDC's large computers could produce more elaborate reports in shorter periods of time and sooner after completion of data collection than the computers available to Pulse.

Another factor in Pulse's loss of business may have been the broadcast industry's All-Radio Methodology Study (ARMS) of 1965. This survey compared the various techniques for collecting radio listening data. ARMS gave the Pulse technique good marks but also provided validation of the personal diary method used by ARB (later Arbitron). In addition, the ARB methods included larger survey areas, making it possible for stations to justify advertising sales on the strength of larger areas included within the surveys of their markets.

During this downward trend in Pulse's business, a number of management changes were also taking place. In 1975, Roslow (who had remained the company's sole owner) retired and moved to Florida after appointing his son Richard president. The following year, two other long-time key officers of the company departed: Laurence Roslow, Sydney's nephew, who had directed all research operations; and sales manager

George Sternberg (Sydney's brother-in-law). Left to manage the company, Richard Roslow and his younger brother Peter failed to reverse its fortunes, and in April 1978, Pulse, Inc., closed its doors.

There will always be a lingering nostalgia for Pulse reports among radio managers who remember them, as no other radio audience research methods interviewed listeners face to face. Radio and sales managers had come to feel that this feature alone justified their confidence in the service, as they valued face to face contacts very highly. In addition, the disappearance of Pulse meant that future ratings services for radio had much higher overhead expenses, involving not only huge computers but centralized calling centers and large numbers of workers to collect the necessary data. Prices for rating services inevitably edged upward as well.

Pyne, Joe 1925–1970

U.S. Talk Show Host

In the 1960s, Joe Pyne pioneered the “controversial” talk show format, first on radio and then on television, in which political and economic discussion became a vehicle for entertainment. He was combative with guests, using sharp barbs to insult them and at the same time to please his audience.

Pyne was born in Chester, Pennsylvania, in 1925. A Marine during World War II, he won three battle stars while fighting in the Pacific, and he lost his left leg. After the war, Pyne’s broadcasting career began in Chester, at WVCH, in 1948. A year later he hosted a call-in radio talk show, “It’s Your Nickel,” at WILM in Wilmington, Delaware. He later worked at seven different radio stations in the United States and Canada, including WDEL-TV in Wilmington, before eventually moving to Los Angeles in 1957 to work in radio and television, including KLAC-TV.

As the public became increasingly concerned about the direction the country was headed, listeners wanted not only to hear those and other issues discussed, but also to express their own thoughts on them. Controversy surrounding the conclusions reached in the Warren Commission’s 1964 report on the assassination of President Kennedy, as well as the growth of three political movements—the Berkeley Free Speech Movement, opposition to the Vietnam War, and the American civil rights struggle—all provided issues of concern to radio listeners in the mid-1960s. With the telephone, two-way radio was possible, and listeners developed loyalties to radio talk show hosts who reflected their own opinions and viewpoints.

As political and economic issues increasingly seemed to divide Americans, Pyne’s style of confrontation with guests, in which he baited and insulted them rather than engaging in intellectual discussion, grew to be extremely popular with audiences. He routinely invited, and then lambasted, guests who held extreme positions, such as black Muslims, American Nazis, and Ku Klux Klansmen. Sometimes the guests self-destructed under intense questioning and ridicule by Pyne, as was the case on one program with a self-described religious bishop who admitted to having had sexual affairs, or on another show when the advocate of the free distribution of the drug LSD revealed he had once spent time confined in a mental institution.

Pyne seemed to relish shocking his guests with his rude behavior, and the more he displayed bad manners, the more his audience seemed to enjoy his performance. Pyne occasionally used airtime to advocate extreme political policies, including bombing Communist China and sentencing those who smoked marijuana to life in prison. Vietnam War protesters were called “peace creeps,” and liberals and homosexuals were told they

were “stupid” or “jerks.” Those Pyne did not agree with were told to go home and “gargle with razor blades.” Members of the studio audience were invited into the “Beef Box,” where they were permitted to sound off about issues until Pyne grew weary and dismissed them, often after first deriding them.

Metromedia placed Pyne’s program in syndication, and in 1966 it was heard over 250 radio stations. In 1966 Pyne expanded his radio show to television, airing first on Los Angeles station KTTV. Metromedia syndicated the program, and *The Joe Pyne Show* eventually was carried in over 80 cities throughout the United States and Canada. Pyne was also tapped to become the host of *Showdown*, a daytime TV quiz show on the National Broadcasting Company (NBC) network.

At its peak, Pyne’s morning radio show was ranked number one in its time slot in the Los Angeles market and was syndicated in more than 400 cities and towns throughout the country. His shows were on the air for a total of 27 hours every week.

Pyne’s critics called him “Killer Joe,” believing he displayed a lack of fair play with his guests. They chided him for behaving cruelly by inviting people onto the show in order to make fools of them, purely for the entertainment of his audience. Some critics regarded Pyne as the host of nothing more than a tasteless “electronic peepshow.” *New York Times* critic Jack Gould referred to Pyne as “the ranking nuisance of broadcasting,” but he added that if Pyne were to exercise self-restraint, he had the potential to air a show of “vigor and value.”

However, Pyne responded to his critics that he did not want to be known as a nice person, and that he required his programs to be “visceral” and not to involve intellectual discussions. He believed his role was to expose extremists, hucksters, and kooks. Pyne also believed his guests were masochistic, looking for him to punish them for their polemics or con games.

Pyne’s show was not the first of its kind. In 1958 David Suskind aired a late-night talk show, *Open End*, in which guests argued over political and economic issues, often raising their voices and interrupting each other. However, *The Joe Pyne Show* was one of the first to mold the program around the host’s ability to exploit the guests’ views for entertainment value. In 1966 Pyne’s show spawned similar syndicated programs, such as *The Alan Burke Show*, hosted by another abrasive radio talk announcer, and *Firing Line*, moderated by conservative political columnist and editor William F. Buckley.

Pyne, who chain-smoked on the air, contracted lung cancer and died on 23 March 1970. He was 44.

Q

Quaal, Ward L. 1919–

U.S. Broadcasting Executive and Consultant

Although most radio listeners would not recognize his name, Ward L. Quaall is probably one of the most influential figures in U.S. broadcasting. In a career spanning nearly six decades, Quaall has worked in numerous on-air, management, lobbying, and consulting positions.

Quaall began his career in broadcasting while a student at the University of Michigan, working as an announcer, writer, and producer at WBEO in Marquette, Michigan, and later at WJR in Detroit. In 1941, after earning a degree in speech and radio, he began working as an announcer and producer at WGN in Chicago, where he broke into a Chicago Bears football broadcast to announce the Japanese bombing of Pearl Harbor on 7 December 1941.

Quaall entered the service in 1942 and worked as a communications officer in the navy until 1945. After the war, he returned to WGN as special assistant to general manager Frank P. Schreiber. In this capacity, he oversaw the station's farm and public service programming; represented the station in Washington, D.C.; and helped plan the development of WGN-TV, which became Chicago's first full-time television station in April 1948. The contacts Quaall made in Washington, coupled with his effectiveness in communicating his station's interests in a variety of political arenas, would make him a valuable industry spokesperson in the ensuing decades.

In 1949 Quaall took a leave of absence from WGN to become executive director of the Clear Channel Broadcasting Service (CCBS), at the time perhaps the most influential trade group in broadcasting. The CCBS represented independent (non-network-owned) clear channel radio stations seeking to maintain and enhance their status as the only stations broadcasting on their respective frequencies at night. Clear channel stations, through the CCBS, also sought power increases of up to 750,000 watts. One of the clear channel stations' chief political opponents, Senator Edwin Johnson of Colorado, called the CCBS "a well-entrenched, well financed, well staffed

group who are determined to have radio control in the United States."

To bolster the argument for higher power, Quaall touted the clear channel stations' efforts to provide farm and rural service programming. He backed up the argument by encouraging member stations to improve such programming, simultaneously building close relationships with leading farm groups. Quaall, in fact, helped orchestrate support for clear channels from influential national farm lobbies such as the National Grange and American Farm Bureau Federation, both of which went on the record in support of clear channel broadcasting.

As the clear channel debate dragged on into the 1950s, Quaall left the CCBS to join Cincinnati's Crosley Broadcasting Corporation in 1952. He continued to be intimately involved with the clear channel debate, however, making frequent trips to Washington to lobby on behalf of the CCBS. After four years at Crosley, Quaall returned once again to WGN and WGN-TV as vice president and general manager in 1956. Following the death of founder Robert R. McCormick, the management at the Chicago *Tribune*, which owned WGN, neglected the radio property in favor of television. "Radio has had it," Quaall was told by one *Tribune* official before he took the job. Quaall proceeded to revamp the station's programming, pulling numerous paid religious programs off the air and concentrating on increased local programming; in fact, he was able to rebuild WGN radio to national prominence. During this time, Quaall also oversaw the expansion of the *Tribune's* radio and television holdings and developed WGN-TV as the model for the modern independent television station. He became president of WGN Continental Broadcasting Company (now Tribune Broadcasting Company) in 1963. In 1975 he retired from WGN and began his own consulting firm, The Ward L. Quaall Company, the following year.

His political clout reached its zenith during the 1980s, because Quaall had been close friends with Ronald Reagan

since the 1940s, when the two met at a Chicago radio concert Quaal was announcing. Reagan sought Quaal's input on Federal Communications Commission (FCC) appointments, and in many ways Quaal became *the* voice of the broadcasting industry, as far as the president was concerned. Quaal took the industry's case for blocking reinstatement of the fairness doctrine directly to Reagan, who in 1987 vetoed a government funding bill because it also included the fairness doctrine. Similarly, Quaal supported other measures designed to deregulate the broadcasting industry during the Reagan years. "I take special pride in my efforts to bring full First Amendment rights to broadcasting," Quaal said.

Ironically, by the 1990s Quaal's dissenting voice was drowned out by the industry's quest for raising limits on ownership of radio and television stations. Quaal opposed the provisions in the Telecommunications Act of 1996 that would soon allow companies to own hundreds of radio stations. Quaal maintained that such acquisitions have ruined radio's local service. "They've wrecked radio," Quaal said. "How can you own more than one hundred stations and keep track of their local programming?"

Quaal continues to run his company from offices in Chicago and Los Angeles. He works with clients on management and personnel issues, acquisitions, and lobbying activities. Quaal says that the main things he brings to his clients are experience and "a lot of contacts." Many in the industry agree. "In the trenches of Washington's regulatory battlefields," *Electronic Media* wrote in 1988, "few industry lobbyists can boast the accomplishments of broadcasting's Ward Quaal."

Quiz and Audience Participation Programs

Few genres used radio's strengths of live broadcasting, spontaneity, and listener involvement more effectively than audience participation programs and their most successful incarnation, the quiz show. Few genres created as much of a sensation as quiz shows at the height of their popularity, or as much of a backlash when condemned by the institutions of broadcasting. And few genres demonstrated the radical transformation of radio in the television era by so quickly abandon-

ing the very medium that gave birth to the quiz show itself. Although quiz shows are best remembered at the center of the infamous TV quiz show scandals of the late 1950s, the genre had a rich history in the early days of radio.

The quiz show is one of the only genres that could truly be called "native" to broadcasting, not stemming from the common sources of vaudeville, theater, film, or literature. Certainly the program format drew upon a number of important ante-

cedents, including newspaper puzzles, parlor games, spelling bees, gambling, carnival contests, and movie-house games such as “Screeno.” Despite these varied sources, the specific incarnation of the quiz show on radio was unique, combining the informational content of an educational program, the competitive thrill of sports spectatorship, the humorous patter of comedy and variety shows, and the musical performance featured on much radio programming. The quiz show was the most successful type of audience participation program, which was a general term for any program that incorporated the audience—whether in the studio or at home—into the program’s proceedings. Other forms of audience participation programs included “stunt” programs, amateur hours, and “sob shows.”

Origins

The radio quiz show had its roots in the earliest days of the medium’s commercialization in the mid-1920s, albeit in a form quite different from the way the genre would thrive in the 1940s. Question-and-answer quizzes were a common feature of local radio broadcasts on shows such as WJZ-New York’s *The Pop Question Game*. On this program and on other segments on local stations, announcers would ask questions and provide the correct answers after a pause; there were no contestants or prizes, and the audience was expected to try to guess the correct answer at home. These early question-and-answer shows were not terribly popular and were mostly used to fill time and provide an educational diversion within a fairly barren radio schedule. As radio programming became more sophisticated, these early local quizzes were relegated to the sidelines of the radio schedule.

The first major breakthrough of the audience participation genre occurred in the mid-1930s. As national networks came to dominate the airwaves with their high-priced stars, local unaffiliated stations such as New York’s WHN needed to devise innovative formats to compete. In 1934 WHN hired theatrical manager Major Edward Bowes to create an inexpensive program to boost their ratings; Bowes drew upon a vaudeville tradition in airing an amateur talent contest. The program was a huge hit—within a year, the National Broadcasting Company (NBC) had purchased the show, and Major Bowes’ *The Original Amateur Hour* was voted the most popular show of 1935. The formula was simple—parade a succession of unpolished performers in front of the microphone and reward talented individuals with prizes. An additional gimmick caught on, allowing audiences at home to vote for their favorite amateur via telephone, making the show a truly participatory endeavor. As with most successful radio innovations, a number of imitations followed, leading to an all-out amateur craze in the mid-1930s. Although the amateur hour itself faded in popularity by the end of the decade, its effects lasted far longer through its popularization of the audience participation format.

Although amateur hours showcased ordinary people as the “talent” featured on the radio, they presented traditional forms of entertainment, such as music, comedy, and dancing. It took another program to shift the focus of audience participation to everyday people doing everyday activities. *Vox Pop* emerged on NBC in 1935 with an unusual format—the hosts asked ordinary people questions, broadcasting the resulting dialogue as representative of everyday life. Additionally, the program pioneered the practice of giving prizes to its participants, offering both cash and merchandise from sponsors to interesting guests. Other programs followed in *Vox Pop*’s footsteps, most notably *We, the People* (1936), as the audience participation format developed into a successful alternative to comedies, musical programs, and dramas.

The quiz show itself developed out of these precedents, taking the contest form from amateur hours and the everyday guests from *Vox Pop*. In 1936 the show hailed as the first radio quiz debuted on Washington, D.C., station WJSV; *Professor Quiz* offered ten silver dollars to the contestant who answered the most questions during each program and invited listeners to send in questions for additional cash prizes if their questions were used on the air. The program was picked up by the Columbia Broadcasting System (CBS) in 1937 to great success, leading to numerous clones, including *Uncle Jim’s Question Bee*, *Dr. I.Q.*, *True or False*, and *Ask-It-Basket*. By the late 1930s, quiz shows were established as a popular genre for prime-time radio, with many programs among the top network offerings. The genre established its formula quickly—prizes were modest, questions were intellectual but not too difficult for average listeners, and audience members were invited to participate by sending in their own questions for additional prizes.

Golden Age

Though certainly a fad, quiz shows were able to survive far longer than other radio fads, such as the amateur hour. One reason for the genre’s continued success was the creativity of quiz producers in devising variations on the basic formula. One of the first and most successful innovations was NBC’s *Information Please*. Producer Dan Golenpaul thought that most quiz show listeners might want to turn the tables on the “know-it-alls” who ran quiz shows and try to “stump the experts.” His program, debuting in 1938, offered the chance to do just that—*Information Please* featured a panel of experts on a number of topics, including columnist Franklin Pierce Adams, sportswriter John Kiernan, pianist Oscar Levant, and one rotating guest panelist, all presided over by erudite host Clifton Fadiman. Listeners were invited to submit questions designed to stump the panel, and listeners were rewarded with \$10 and an encyclopedia set if they offered a question that could not be answered correctly. The program incorporated a

great deal of wit and sophisticated patter among the panel, gave audience members a chance to show up the alleged experts, and created the celebrity panel format that has since become a staple of game shows. The program was hailed not only as fine entertainment but as legitimate education as well, receiving awards from literary magazines and becoming a favorite on college campuses. *Information Please* demonstrated that the quiz show was not dependent on featuring everyday people but could also captivate audiences with celebrities participating in the quizzes.

Whereas *Information Please* succeeded on its intellect and wits, another innovation pushed the genre in the opposite direction. Since the emergence of broadcasting, music has been at the center of radio programming. Quiz shows were quick to incorporate this radio staple to appeal to listeners less interested in intellectual and informational questions. Struggling bandleader Kay Kyser teamed with up-and-coming quiz producer Louis Cowan to devise the *College of Musical Knowledge*, a quiz focused on musical questions interspersed with numbers played by Kyser's band. The program was a hit for Chicago's WGN in 1936 and transferred to NBC in 1938, where it would run for ten years. Similar programs followed *College's* mixing of quizzes and music in the late 1930s and early 1940s, including *Melody Puzzles*, *Beat the Band*, and *So You Think You Know Music*. But a more controversial example of the musical audience participation program debuted in 1939—NBC's *Pot o' Gold*.

It was not until *Pot o' Gold* that a radio program took full advantage of the widespread availability of the telephone to allow listeners to participate more fully in broadcasting. The program was not a quiz show by most definitions—most of each show consisted of typical band numbers from Horace Heidt and His Musical Knights. But *Pot o' Gold* had a gimmick that made it a national sensation for two years—during each episode, the hosts would spin a large wheel to randomly select a phone number from a collection of telephone books spanning the country. Heidt would then call the number and award \$1,000—then a vast sum for most families still suffering the effects of the Great Depression—to whomever answered the phone. The gimmick was a huge success, creating a new type of audience participation program termed the *giveaway*. For two years, the show was enormously popular, leading to reported drops in movie attendance and phone calling during its Tuesday night time slot, as all of America awaited Heidt's lucrative call. The show even spawned a 1941 movie musical (also entitled *Pot o' Gold*), starring Heidt and Jimmy Stewart, that fictionalized the show's origins. Despite the program's success, it was off the air after two years, because it generated as much controversy as popularity.

Some of the controversy surrounding *Pot o' Gold* stemmed from accusations that the mechanism for choosing telephone numbers was biased, not representing some locations and dis-

criminating against people who had moved since phone books had been issued. Other people objected to the telephone system's inability to guarantee that calls would be put through effectively, worrying that they would miss out on the jackpot. And in the 1940s, not everyone owned a telephone. But the biggest controversy involved the Federal Communications Commission's (FCC) accusation that the program was a lottery and thus violated a provision of the Communication Act of 1934. Although the FCC could not censor programming, it was empowered to prevent stations from broadcasting illegal material, including programs that were deemed to violate federal lottery laws. In 1940 the FCC decided that *Pot o' Gold*, along with a number of local programs, violated the lottery section of the Communication Act and recommended that the responsible broadcasters be prosecuted by the Department of Justice. NBC and other broadcasters denied that giveaway programs were lotteries, because no listener needed to provide any money or other "consideration" (except owning a telephone) to be eligible to win. The Department of Justice refused to prosecute, and the FCC dropped its case, yet broadcasters took the action as a warning; rather than risk being denied license renewal by the FCC, broadcasters canceled or retooled most giveaway programs to make sure they did not violate lottery laws. The link between quiz shows, the FCC, and lottery laws did not disappear, however, and the issue would become even more controversial in the late 1940s.

Although *Pot o' Gold* and other giveaways created a brief sensation, other innovations in the quiz show format proved to have more long-lasting success. Just as *College of Musical Knowledge* thrived by mixing quiz shows with music programs, another genre mixture provided a number of hits: blending children's programming with quiz shows. Cowan, again the crucial innovator, decided to combine the format of *Information Please's* panel of experts with the widespread appeal of precocious children. The resulting hybrid was *Quiz Kids*, which debuted on NBC in 1940 and lasted for 13 seasons. The program featured a panel of erudite children who amazed audiences both with the extent of their knowledge and their more typically childlike personalities. The program was a hit among both adult and child audiences, and many teachers praised the show's ability to make learning and education seem fun and entertaining. Again the quiz show was held up as both entertaining and educational, although that balance would start to shift throughout the 1940s.

Funny Stunts

As the quiz show entered the 1940s, most of the programs were viewed as respectable, entertaining, and even educational. But one innovation would drastically change the tone of the audience participation format, pushing the genre away from the intellectual pursuits of *Information Please* and toward

more outlandish and comic pleasures. Ralph Edwards, a radio announcer, decided to capitalize on the audience participation boom. He felt that many potential audience members would enjoy the participatory aspect of quiz shows but were put off by the intellectual nature of shows such as *Information Please* and *Professor Quiz*; thus he set out to devise a quiz show that focused more on humor and participation than on knowledge and education. His inspiration came from a parlor game he remembered playing as a youth—one person would ask another a question, and if the answer were wrong, the person who answered incorrectly would have to pay for his or her mistake by being forced to do some humiliating “consequence.” Edwards named his show after the game, and in 1940 *Truth or Consequences* debuted on CBS. The prizes were small—\$15 for a correct answer, \$5 for performing a consequence—but audiences were enthralled by the show for other reasons. The consequences became the centerpiece of the program, leading contestants purposely to answer questions wrong to perform comic stunts.

Initially the consequences were quick and modest—one contestant had to spell words while sucking on a lollipop, another had to be a one-man band with pots and pans, and a construction worker had to imitate a bawling baby. As the show grew in popularity, sponsor Ivory Soap upped the production budget to devise more elaborate stunts. The show added remote broadcasts, putting contestants out on the streets to interview strangers or to lie in bed with a seal on a New York street corner. The program also upped the ante for cash prizes, often offering large rewards for completing a stunt—one contestant was promised \$1,000 if he could fall asleep during the course of the program. In one of the more notorious stunts, Edwards told a contestant that a cash prize was buried on a street corner in Holyoke, Massachusetts; the man immediately boarded a train to dig up his loot, but he was beaten to the punch by hundreds of local residents who intercepted his \$1,000 bounty. Another famed stunt resulted after Edwards told audience members to send a contestant pennies to buy war bonds in 1943; the woman received over 300,000 coins as a result, requiring Edwards to provide helpers to open her mail. As a result of such excessive and outrageous participatory stunts, *Truth or Consequences* became a radio sensation in the 1940s, leading the way for other “stunt” shows to reach the air (and for a town in New Mexico to rename itself after the show).

The most notable clone was NBC's *People Are Funny*, starring Art Linkletter. The show took the basic format of *Truth or Consequences*, adding different stunts and Linkletter's comic personality to generate a large fan base beginning in 1942. One of Linkletter's stunts pitted two contestants against each other to see who could hitchhike across the country faster; the winner was given a new car. Another stunt gave a family their own airplane just for answering the question, “What is your

name?” The success of these shows proved the importance of humor to the audience participation format—producers saw that quiz shows did not need to rely on the question-and-answer format to entertain an audience and draw high ratings. *Can You Top This?* was one successful comic quiz (1940–54)—listeners sent in jokes, which were read on the air; then, a panel of comedians tried to “top” each joke with another on the same topic, and the studio audience judged the results. Another program was *It Pays to Be Ignorant* (1942–51), an outright satire of *Information Please* in which panelists humorously failed to answer questions such as “What animal do you get goat's milk from?” The program was fully scripted with no audience participation, but the parody mined the same terrain as quiz shows. By far the most successful comedy quiz was 1947's *You Bet Your Life*, starring the well-known comedian Groucho Marx; the format was that of a typical quiz show, made distinctive only by Marx's comic ad libs and friendly harassment of contestants. Soon the show became more focused on Groucho's quips, with the quiz providing only a basic structure for the comedy.

Besides leading to comedy quizzes, the stunt programs popularized another variation on the audience participation format—the ongoing telephone contest. Although *Pot o' Gold* had made the random telephone giveaway an important feature of audience participation programs, it took the well-established success of *Truth or Consequences* to bring the giveaway back after the FCC's concerns in the early 1940s. Edwards started a contest called “Mr. Hush” in 1946—each week a mystery voice read a riddle and a series of clues. Edwards would then call a random phone number, asking whomever answered to identify the mysterious Mr. Hush; after weeks of failed attempts by other listeners, eventually the listener who gave the correct answer of Jack Dempsey won an enormous jackpot of sponsor-provided merchandise. Subsequent contests, such as “Walking Man” and “Mrs. Hush,” were expanded to allow listeners to submit their phone numbers along with contributions for health-related charities; Edwards's contests raised millions of dollars for organizations such as the March of Dimes and the American Heart Association. These telephone contests became a national sensation, with winners making headlines and boosting ratings to record levels and inspiring another Jimmy Stewart film, *The Jackpot* (1950). Edwards's contests reinvigorated the giveaway format, which would reappear to greater controversy in the late 1940s.

Quiz shows saw little innovation beyond the stunt programs during the war years. Shows like *Information Please*, *Quiz Kids*, and *Dr. IQ* all continued their success, with few new programs competing against their formula. The new shows that did emerge followed the basic formulas set up by the genre's forerunners, with a few added twists. Two long-lasting programs added a gambling element to the quiz format—

both *Take It or Leave It* (1940–52) and *Double or Nothing* (1940–54) allowed contestants either to take their winnings or to risk them on another question for double the amount. The prizes were modest—*Take It or Leave It*'s grand prize was \$64, leading to a new catchphrase, “the \$64 question.” This basic format would be revisited on television in the late 1950s by the higher-priced quiz show *The \$64,000 Question* and in 1999 by *Who Wants to Be a Millionaire?* Although quizzes went mostly unchanged during World War II, there were concerns about the open microphone featured in all audience participation shows—the U.S. government worried about foreign agents using these programs to communicate coded messages. The U.S. Office of Censorship issued guidelines for programs to avoid “man-on-the-street” interviews like those on *Vox Pop* and to be careful in selecting audience members to participate. Quiz shows joined the war effort, donating prizes to war relief and encouraging listeners to participate in war bond drives.

Sob Shows

Another variant in the audience participation show emerged in the mid-1940s. Many daytime programs had established solid audiences, especially among women, by focusing on human-interest stories. The audience participation format was compatible with this type of program, and thus producers created what were often deemed “sob shows.” The most famous and long running of these programs was *Queen for a Day*, debuting in 1945. The program featured a panel of women who testified to the hardships of their lives and told listeners their greatest wish. The studio audience would then judge which woman was most “worthy” of rewards, naming her “Queen for a Day.” The Queen would be awarded her wish as well as a package of sponsor-provided merchandise. Although the program capitalized on women’s poverty and desperation to garner ratings, it also provided both material and emotional uplift for thousands of women over its 20-year run. Other programs succeeded in the daytime schedule, including both more traditional quizzes like *Double or Nothing* and *Give and Take* and other human-interest contests like *Bride and Groom* and *Second Honeymoon*. Audience participation shows had taken root in daytime schedules, a position they continue to inhabit on television to this day.

If *Queen for a Day* established the emotional potential of audience participation programs, it took *Strike It Rich* to fulfill that potential. CBS brought the show to the air in 1947, almost immediately creating controversy. The program featured down-and-out contestants who competed in a short quiz to win up to \$800; the real drama followed, as audience members called in on a “heartline” to offer help, in the form of money, jobs, goods, or services, to the needy contestants. People highlighted their hardships to capture the pity of the

enthralled home audience, who listened in high numbers, but controversy followed. Critics decried the program as exploiting human misery for profit. One contestant was successful in garnering pity from the audience and was given a good deal of charity, but it was soon discovered that he was an escaped convict from Texas. The New York Department of Welfare complained that people traveled to the city to appear on the program, only to be refused and end up on the welfare rolls; the Department of Welfare demanded that the program be required to get official licensure for providing public welfare aid to contestants. All of this negative publicity merely boosted the show’s ratings, and it transferred to television and ran for over a decade. But the quiz show was still in for its most dire round of negative publicity.

Before discussing the last wave of radio quizzes in the late 1940s, it is important to consider not only the programs that composed the genre on radio, but also the cultural values associated with the genre. Although certain formats were celebrated as “quality” radio (such as prime-time drama) and others were derided as inappropriate (such as soap operas), quiz shows and audience participation programs were seen as mostly harmless entertainment with little controversial content. Nevertheless, many critics felt that the genre promoted the “un-American” value of receiving “something for nothing,” because people could receive lavish prizes for answering simple questions (or sometimes just for answering the telephone). Fans of the genre, however, felt that the quiz show offered hope during tough times, giving people the promise that their dire straits might be turned around with a simple phone call. Most people thought the genre was “simple entertainment,” although some held up the educational possibilities of quizzes to provide knowledge to the masses and to popularize education among listeners. Some audience members became die-hard fans, looking to participate in the programs enough to call themselves “professional contestants” because they frequented the studio broadcasts in New York. Though audience participation shows ran the gamut of cultural legitimacy—from *Information Please*'s highbrow appeals to *Queen for a Day*'s often shameless exploitation of human misery—the quiz show was generally accepted as a valuable part of the radio schedule.

The radio industry saw the genre in more stark economic terms—quiz shows were an inexpensive programming form, simple to produce, with proven popularity. Sponsors liked the programs because they were a highly profitable format—they required little money for “talent” (only hosts and announcers), needed small writing staffs, and could be produced quickly without many rehearsals. Although prizes were often lavish, especially in the late 1940s, producers usually persuaded companies to contribute products to the prize packages in exchange for on-air mentions; this practice was eventually discontinued by the National Association of Broadcasters (NAB)

in 1948, because they felt that sponsors were “freeloading” on their programs. Network censors were a bit less enthusiastic about the genre because the ad-libbed format often led to comments that were viewed as inappropriate and hard to control. Despite general industrial support for the audience participation format, the late 1940s would see quiz shows gain a powerful enemy: the FCC.

Stop the Quiz Show!

Following the success of the phone contests on *Truth or Consequences*, a number of programs emerged to capitalize on the giveaway format in the late 1940s. Shows such as *Get Rich Quick* and *Everybody Wins* used the telephone call as a mechanism to draw in listeners by giving away large jackpots, but the most successful and notorious giveaway was ABC’s *Stop the Music!* Premiering in early 1948, the show had a simple premise—a band played songs until the announcer yelled, “Stop the Music!” Then host Bert Parks called a random phone number and asked the listener to identify the song. If the listener got the correct title, he or she would win a prize and a chance at the huge jackpot—usually over \$20,000 in merchandise—for identifying the “Mystery Melody.” The Cowan-produced show became a huge sensation, with high ratings and widespread press coverage. The program’s success sparked other giveaways, such as *Sing It Again*, creating the biggest boom in prime-time quiz shows in radio history. Yet the rise of the giveaways prompted numerous protests by various players within the broadcasting industry.

Fred Allen, whose program had been the perennial ratings champion on Sunday nights, found his show sliding when *Stop the Music!* aired in his time slot. He launched a high-profile anti-giveaway campaign in the press, even offering \$5,000 to any listener who, if called by *Stop the Music!*, would claim to be listening to Allen instead, an offer Allen never had the opportunity to fulfill. The NAB also felt that the giveaway trend was potentially a detriment to radio; in 1948 the NAB issued a policy statement positioning itself firmly against “buying an audience” instead of offering solid entertainment programs. But the biggest, and most powerful, enemy to the giveaways was the FCC. In the name of the public interest, the commission issued a policy in August 1948 claiming that giveaways violated lottery laws and threatening to revoke licenses of stations that continued to broadcast the programs. Although the order was immediately enjoined by the courts when ABC filed a lawsuit against the FCC’s orders, the policy became a lightning rod for the variety of opinions swirling around the genre in the late 1940s and helped put an end to the radio quiz show.

The FCC’s ban received overwhelming press coverage, with critics and commentators taking sides on the matter. Thousands of audience letters poured in to the FCC, expressing

divergent opinions on the value of both the programs and the FCC’s actions. Critics of the genre condemned it as gambling, pandering to base instincts, and not offering wholesome entertainment. Defenders of quiz shows claimed that they were real-life dramas, that they were more entertaining than scripted programs, and that people did not listen simply for a chance to win. The issue dragged on in the courts for years; it was finally resolved in 1954, when the U.S. Supreme Court ruled (*FCC v ABC*, 347 US 284 [1954]) that the FCC had misinterpreted the lottery laws—giveaways were legitimate because contestants were not required to provide “consideration” to be eligible to win. Although successful programs like *Stop the Music!* continued while the courts deliberated, new programs were careful to avoid the giveaway format so they would not suffer from negative publicity. By the time the format was cleared, the giveaway had mostly disappeared as a brief fad. Yet shows like *Stop the Music!* had upped the ante for quiz shows, leading to the huge jackpots that would become staples of the prime-time television quizzes of the late 1950s—and of early 2000.

Although the radio quiz show had moments of intense popularity and publicized controversy, its decline was quiet and swift. As television began to spread into more homes in the postwar era, quiz shows were quick to make the transition to the visual format. Unlike dramatic programs, quizzes did not have to create elaborate sets or visuals to appear on television—cameras could easily capture the inexpensive live proceedings that studio audiences had been witnessing for years. Thus programs like *Stop the Music!*, *You Bet Your Life*, *Quiz Kids*, and *Truth or Consequences* all made the transition to television in the early 1950s. Although the networks initially aired these shows on both television and radio, they soon realized that the audiences for radio were dwindling; by removing the shows from the radio, they encouraged fans to purchase televisions when the newer medium became the primary entertainment form of the 1950s. When the TV quiz shows of the late 1950s were exposed as being scripted and “fixed,” radio quizzes had long been off the air and thus remained immune from the scandals.

The quiz show was an important part of radio’s “golden age,” captivating audiences with high-minded questions and emotional appeals, precocious youth and outrageous stunts. Although the format did not last beyond this era of radio broadcasting, its impact is still seen today on television game shows—the inflating jackpots, engaging contestant personalities, amusing celebrity panels, and quick-witted hosts all were conventions established by radio quiz shows. Occasionally radio refers back to these traditions—public radio’s *Whad’ya Know* and local stations’ call-in giveaways are both updates of classic radio audience participation techniques. Yet these programs were once a broadcasting staple, equal in popularity to better-known genres such as suspense dramas, musical

performances, news reports, and celebrity comedy shows. The quiz show was an important, though often ignored, component of radio history, one that warrants a greater examination and appreciation by media historians.

R

RADAR

National Radio Ratings Service

Because radio is woven into the patterns of consumers' day-to-day lives, reaching them at home, in the office, and on the road, research is needed to understand how radio's role in today's media mix may be changing. As with the more commonly known television ratings conducted by Nielsen Media Research, Statistical Research Inc. (SRI) uses a sample of radio listeners to determine listener patterns and characteristics. Radio's All Dimension Audience Research (RADAR) was first produced in 1967 and has been produced by SRI since 1972. Using nearly 30 measured networks, RADAR can provide data on national and network radio audiences in a variety of formats to SRI clients.

For its RADAR product, SRI uses an 8-day telephone interview methodology, which it claims establishes a rapport with respondents that allows them to create an accurate and complete picture of radio exposure over the course of one week. SRI also has the ability to merge its respondent data with some 3 million "clearances" (records of carriage), thus allowing RADAR to provide ratings for specific programs and commercials. Since 1972, SRI has increased the RADAR sample size (from 4,000 to 12,000 respondents annually), the number of measurement weeks (from two to 48 annually), and the frequency of reporting (from annually to quarterly).

One component of the RADAR product allows users to process data and conduct analyses, including profiles of national radio audiences, profiles of network radio audiences, custom electronic ratings books, estimates of the reach and frequency for rotation plans, estimates of the reach and frequency for broadcast schedules, and optimal network radio advertising plans. Another component allows users to combine RADAR data with information from other sources and generate overall reach-and-frequency estimates.

Data from RADAR reach and frequency applications can be used as a base for combinations with other information—about radio, the internet, print, or any medium—that the user

has obtained and entered. Up to 12 different other-media properties or sources can be included and collectively weighed at the user's discretion.

There are also two RADAR software applications that enable users to estimate audiences for local markets and programs not measured directly by RADAR. With these tools, users can approximate how much a plan's reach may be increased by scheduling units on non-RADAR programming. In addition, users with access to local data can distribute RADAR's national audience data for a particular schedule to individual markets.

The founders and principals of SRI are Gale Metzger, president (formerly with A.C. Nielson, and the first research supplier to be elected chair of the Advertising Research Foundation's Board of Directors), and Gerald J. Glasser, a former professor of business statistics at New York University. In 1990 Metzger and Glasser were joint recipients of the Hugh Malcolm Beville, Jr., Award of the National Association of Broadcasters and the Broadcast Education Association. The SRI founders were cited for "integrating audience research into the broadcast managerial process" and for "superior leadership in the development of the audience measurement field," among other contributions. The SRI staff includes more than 70 full-time employees. The company is based in Westfield, New Jersey.

RADAR studies are based on probability sampling, high response rates, in-depth interviewing by trained personnel, and multiple checks to ensure accuracy. The key component is the sampling process.

Representative Samples

If every member of the population has an equally good chance of being in the sample, it is a representative sample. Through statistical theory, we know that fairly drawn (or random)

samples usually vary in small ways from the population. Over time, these small differences tend to average out. A representative sample does not have to be very large to represent the population from which it is drawn, but it does need to be selected in a way that gives all members of the population the same chance of being chosen. Although it is impossible to determine the exact number of listeners spread over a particular area, well-conducted samples generally provide a good estimate.

In sampling, it is common to select a small portion of the entire population to test. If a more accurate estimate is desired, a larger sample is taken. For example, suppose we select 10,000 people to question regarding their radio listening habits. It would be very unlikely that we would get exactly 5,000 that listened to a particular radio station. Likewise, it would be very unlikely to get 0 or 10,000. However, the percent of the listeners we did find in our sample group would be close to the percent that existed in the entire population. In fact, according to sampling theory, the larger the sample we used, the more confidence we would have in our estimated answer. With a sample of 10,000 we might reasonably conclude that the actual percentage would be between 48 and 52 percent of the listeners. This would suggest that possibly one out of every twenty times we would estimate an answer outside this range. With a larger sample, this range might decrease to 49 to 51 percent, and thus decrease this error probability to more than one out of thirty times.

The RADAR product uses a structured respondent recruiting process. This process includes incentives, advance contacts with potential respondents, and flexibility in the week for which the radio listening data are compiled. This process results in a tabulated sample of about 50 percent.

In addition to the RADAR product, SRI has conducted numerous proprietary studies on radio for the major broadcast networks and programming suppliers. Studies resulting from this work include: the ability of radio commercials to evoke images from familiar TV ads; the way people relate to radio, including the role it plays in their daily lives; awareness of and attention to public radio, as well as reactions of public radio

audiences to programming and on-air fund raising; perceptions of local radio stations—reasons for listening and non-listening, station image, and evaluations of station personalities; and the accuracy ascribed to radio news broadcasts by listeners.

Tracking Trends

Because the methodology of RADAR research has remained consistent, there exists a capability to track trends across more than 25 years of data. For example, trend comparisons have shown that as women have moved increasingly into the labor market, their radio usage has become more similar to men's. In addition, listening itself has also moved outside the home. In 1998, 38 percent of radio usage occurred in homes, as opposed to 61 percent in 1980, and car radio listening has nearly doubled over the same time, from 17 percent to 33 percent. Finally, the FM and AM bands have essentially switched places in terms of listenership during the past 25 years; AM's audience share has dropped from 75 percent to 18 percent, and FM's share has risen from 25 percent to 82 percent.

A significant share of SRI's work has been in media audience measurement. SRI's clients have included all major television and radio networks, professional sports leagues, Fortune 500 manufacturers, and foundations.

Radio Academy

Promoting and Celebrating British Radio

The Radio Academy in the United Kingdom was established in 1983 "to encourage the pursuit of excellence in all aspects of the radio broadcasting industry, and to foster a greater

understanding of the medium" (from the mission statement). It includes members from the British Broadcasting Corporation (BBC) and British commercial radio spheres.

Origins

In 1980, the idea of a professional body offering neutral ground for all of those interested in the development of radio broadcasting in the U.K. was proposed at the Radio Festival in Edinburgh by Dick (later Lord Richard) Francis, the BBC's managing director of radio. His companion on the platform at the time was the chairman of public affairs for the commercial radio companies, John Bradford, who endorsed the idea on behalf of the commercial sector.

Francis acknowledged in his initial remarks that many people believed that a radio academy had existed for over 50 years and that it was known as the BBC. He now acknowledged, some six years after the launch of independent (i.e., commercial) radio in Britain, that there was indeed an alternative source of radio production with demonstrated merit.

A working committee was formed under the chairmanship of Caroline Millington from the BBC. It included representatives of the BBC, commercial radio, and those with unaligned interests. Their first task was to assume responsibility for the organization and administration of an annual celebration of radio, a Radio Festival.

Operations

From extremely small beginnings with a handful of members and an occasional public event such as the yearly festival, the Radio Academy has grown to become the most important voice for individual practitioners of the craft and business of radio in the U.K. Since 1980, the Academy has been a registered nonprofit organization operating under the direction of a council elected by its membership. Although it offers members a wide range of services, its central purpose remains as clear in the 21st century as it was in the original concept Francis proposed: the provision of neutral ground on which all of those who care about radio can debate and celebrate the power of the medium.

The key event in the Academy's calendar continues to be the Radio Festival. This has now been supplemented with an event for the music industry, Music Radio, as well as events for radio technicians, promotions departments, news staffs, and the web community. The Council of the Radio Academy also confers an annual Fellowship of the Radio Academy, the highest honor given in recognition of service to the U.K. radio industry, to an individual who has made an outstanding and sustained contribution to the industry. In addition, since 1998 the Academy has hosted the annual Sony Radio Awards ceremony. Its mem-

bers nominate candidates to be considered for the Sony Gold Award.

The Radio Academy fosters close working relationships with student broadcasters under the aegis of the Student Radio Association and also with the academic community and its association, the Radio Studies Network. The Academy also provides administrative support to both of these organizations.

The Sony Radio Awards

The Sony Radio Awards are the Oscars of British radio, an annual award program that recognizes excellence in all aspects of radio. Established under the auspices of the Japanese electronics company Sony in the early 1980s, the Sony Awards evolved from a similar program supported by the U.K.-based Pye electronics company. The Radio Academy now administers the program and hosts the awards ceremony, although Sony continues to support the awards program financially.

The governance of the awards scheme is entrusted to an invited committee who report through their chairman to the Council of the Radio Academy. It is the responsibility of this group to determine individual categories and criteria to be applied by the judges, a small team of professionals in or closely allied to the radio industry.

For the Silver and Bronze awards, nominations are open to programs and broadcasters from any station that has operated continuously through the preceding 12 months. Submissions usually consist of unedited recordings of the programs and individuals being nominated. Only members of the Radio Academy may submit nominations for the Gold Award, which recognizes either an individual or program judged to have made the greatest contribution to the industry during the previous year. Nominees submitted by the members are considered by the awards committee, which makes the final decision on a yearly recipient. A short list of five nominations for each award is published about six weeks before the awards ceremony, and the final results remain confidential until their announcement at the ceremony. In exceptional circumstances, the committee may also give a special award for outstanding service over an extended period of time.

Radio Advertising Bureau

U.S. Radio Trade Association

The Radio Advertising Bureau (RAB) is the sales and marketing arm of the U.S. radio industry. The RAB promotes the effectiveness of radio advertising to potential national advertisers, helps its members effectively market radio advertising to station clients, provides sales training for station employees, and serves as an information resource for station members.

Origins

A Broadcast Advertising Bureau (BAB) was established by the National Association of Broadcasters in 1950, but it quickly failed for lack of support. A second attempt a year later was more successful, and by 1954 the bureau had all four U.S. networks, more than 835 stations, and 11 station representatives as dues-paying members. At the beginning of 1955, BAB became the Radio Advertising Bureau with a continued aim to provide sales information, especially radio advertising success stories, to prospective advertisers and their agencies. RAB had more than 1,000 station members and a million dollar annual budget by 1959.

The RAB had arrived at a crucial time in radio history. Audiences and advertisers were concentrating on television, and radio was in the midst of its transition from traditional or middle-of-the-road programming aimed at a broad audience to increasing specialization based on various popular music formats, especially variations on Top 40. RAB opened branch offices in Chicago, Los Angeles, and Detroit in the early 1960s. In 1964, RAB initiated the All-Radio Methodology Study (ARMS) audience research program to determine the best ways to measure and describe radio's listeners. On a lighter note, RAB retained comic Stan Freberg to develop a series of commercials touting radio's benefits over television. One of them applied sound effects to create the image of turning Lake Michigan into a huge cherry sundae. It was effectively used for many years.

RAB expanded its efforts and output in the 1970s and 1980s, catering to both large and small radio outlets. Monthly publications, sales meetings, and demonstrations spread the word on how best to utilize radio for advertising. RAB also

targeted such large advertisers as Sears and Procter and Gamble—neither of which then advertised on radio—and turned both companies into major users of the medium. A 1989 campaign used brief moments of silence to explore what the world would be like without radio. RAB began to service FM outlets and soon moved to a “radio is radio” campaign, arguing that both AM and FM provided valuable services to advertisers. In 1994 much of the RAB moved to Dallas in a cost-cutting move, though headquarters remained in New York.

RAB Objective

The RAB promotes the effectiveness of radio advertising, helps its members effectively market radio advertising to station clients, provides sales training for station employees, and serves as an information resource for station members. The annual *Radio Marketing Guide and Factbook for Advertisers*, published by RAB, compiles the most recent data on radio audiences, provides information on the top radio advertisers, and includes comparative media information and radio listener facts.

As the primary sales association for the industry, the RAB also tracks the performance and financial health of the radio industry. As many large radio group owners have begun to sell stock through initial public offerings, the RAB has become an important spokesperson for the health and prosperity of the radio industry. More than 5,000 stations, networks, and sales organizations in the United States and abroad are members of RAB.

Member Services

The RAB's Member Services Helpline provides members with access to the radio industry's largest database of marketing, media, and consumer behavior information. The database includes more than a half-million individual reports on some 3,000 different marketing, media, and consumer topics. RAB uses the internet to supply station members with information (its website is www.rab.com). Available on the site is informa-

tion to help radio account executives prospect for clients, prepare client proposals, make client presentations, and become a marketing resource for advertising clients.

RAB members can find RAB Instant Backgrounds on 160 distinct business categories, products, or services. A radio account executive needing information to prepare presentations for clients as diverse as accountants, a women's clothing retailer, an air conditioning repair service, or warehouse shopping service could obtain specific information about the customers who typically use these services, including competitive characteristics of each business category and the times customers prefer to shop. RAB Research also provides seasonal promotional and sales ideas, consumer information, and media information—including not only facts on radio usage but information to help account executives sell against other media such as newspapers, television, yellow pages, and the internet. An audio library of 1,000 MP3 format commercials, a database of commercial scripts, and a co-op advertising directory are also available online. RAB PROposal Wizard can be downloaded to assist account executives in creating attractive, organized, and problem-solving sales proposals.

Sales Training

A continuing theme for the RAB has been to promote the effectiveness of the radio industry as an advertising medium against other competing media. Although radio broadcasts have entertained and informed listeners since the 1920s, the radio industry receives less than ten cents of every dollar spent on advertising. Newspapers and television receive the greatest percentages of revenue. RAB's efforts are intended to assist local stations in getting a larger share of the local advertising revenue and to see that advertisers nationwide are aware of radio's effectiveness. RAB's awareness campaign, entitled "Radio Gets Results," focuses on how local stations have provided marketing solutions for their clients. Gary Fries, president and chief executive officer of the RAB, described the "Radio Gets Results" campaign as a way to provide the radio industry with documented proof of radio's unique ability to deliver outstanding results for its advertisers.

Professional development of station account executives is another role of the RAB. Radio consolidation, one result of the passage of the Telecommunications Act of 1996, has decreased the number of radio station owners. Large radio groups of several hundred radio stations are now possible. The larger radio ownership groups have done two things to the industry. First, they have put increased pressure on station

managers and sales managers to increase revenue. Second, stations are increasingly aware of the need to invest in sales training for their employees.

RAB station members receive daily sales and marketing emails to help sales managers conduct successful sales meetings and to highlight new sales opportunities for account executives. The RAB offers sales training and accreditation through the Academy Certified Radio Marketing Professional. RAB began offering sales training courses in 1973; they estimate that only 5 percent of all radio salespeople have ever qualified for accreditation. Once the Radio Marketing Professional status is reached, persons wishing to receive advanced designations must combine knowledge gained from studying RAB materials with what they know from their day-to-day experience as radio account executives.

Because the Radio Advertising Bureau is a member-supported trade group, much of RAB's information is available only to members. The RAB's website includes free information, including the "Radio Gets Results" station testimonials, media statistics, links to other sites, and the latest press releases from RAB, which often highlight industry trends. Instant Backgrounds, audio files, the co-op database, and other features are available to members only.

Radio in the American Sector (Berlin)

U.S. International Radio Station

Radio in the American Sector (RIAS) of Berlin was one of the longer-lasting international broadcasting services in the U.S. “arsenal” of Cold War propaganda weaponry. Aside from its longevity, it is also significant as the earliest example of a “surrogate” (what audiences presumably want but do not get from their own domestic stations) international radio service for an entire nation. The founders of Radio Free Europe and Radio Liberty modeled their services on RIAS.

Origins

The U.S. military occupation force founded RIAS in 1946 to reach Germans living in the American-occupied sector of Berlin with a few hours per day of German-language material. The schedule included news programs and some entertainment, but there were also programs about the evils of the former Nazi regime and the steps being taken to make Berlin and Germany into democratic entities. At first it operated as a wired radio service through what remained of the city’s telephone system. Soon, however, tensions between the Western Allies (comprised of the United States, Great Britain, and France) and the Soviet Union increased, and the station acquired a low-power AM transmitter. It also began to employ more and more refugees from the Soviet-occupied zone of Berlin and East Germany.

The new transmitter enabled RIAS to reach the entire Berlin area, which was a decided advantage when in 1948 the Soviet Union imposed a blockade of all roads, rails, and canals leading into the Allied-occupied western half of the city. The Berlin Airlift mounted by the Allies brought coal, medicine, potatoes, and other vital supplies; RIAS brought messages of support for the West Berliners and continuing news of the successful defiance of the blockade for the Soviets and East Berliners. The station also seemed by its very presence to symbolize Western determination to remain in West Berlin.

By the time the blockade ended in 1949, it was clear that the division between East and West Germany was hardening into something more permanent and that RIAS should be employed to reach *all* of Soviet-occupied East Germany. At that time, it was placed under the control of the U.S. High Commission for Germany. The station already had developed a well-rounded program service, with a wide range of information and entertainment that included full coverage of activities in East and West Berlin as well as radio dramas, quiz shows, jazz, pop, classical music (RIAS had its own band, orchestra, and chorus), cabaret, and satire. Much of what it

broadcast was most unwelcome to Soviet and East German authorities, who did not want East German listeners to hear of the growing economic strength of West Germany or to be exposed to such “decadent” Western material as jazz, church services, or music by avant-garde composers such as Stravinsky and Schoenberg.

Cold War Operations

Most of all, those authorities deeply resented and feared RIAS’s daily coverage of events that showed Soviet and East German administrators in a bad light. They jammed (electronically blocked) the incoming broadcasts, but RIAS employed an increasing number of frequencies and more powerful transmitters in the AM, FM, longwave and shortwave bands and added a second 24-hour-a-day program service. Although some of the jamming was successful, much was not—and even the successes may simply have aroused the curiosity of listeners to learn what it was that the government wanted to keep them from hearing.

Intensification of the Cold War during the 1950s drove RIAS to try even harder to gather every bit of information possible on life in what now bore the title of German Democratic Republic (GDR). National and (brief) local newscasts were intensely monitored and transcribed; national and local newspapers were examined minutely; and intelligence reports were studied from every angle. All of that information was filed on cards, which were cross-cataloged under numerous headings. This system enabled RIAS to link many developments, no matter how small, with past developments. In many instances, East Germans would learn that life actually was getting worse for them—or it would be if they didn’t use every legal resource at their disposal to block or modify deleterious changes to labor contracts, educational content, and the like. Yet the station was most careful to refrain from anything that might encourage its East German listeners to openly rebel against their communist rulers—a step that would almost certainly bring the large and well-armed Soviet military forces stationed throughout the country into what would be a very uneven battle.

When East German factory workers, distressed over contractual changes that forced them to work even harder for no increase in already low wages, took to the streets of Berlin and several other cities in March 1953, RIAS knew that it had to cover the demonstrations. As it did so, the station also reminded the workers and their supporters time and again to refrain from destroying property or openly calling for removal

of the communist government. When the demonstrations dispersed, there was no retaliation by the government, which quietly improved the contract. It also was in 1953 that RIAS was brought under the newly created United States Information Agency (USIA).

The Hungarian Uprising of 1956 had a very different outcome, with workers and supporters—including the U.S. government-supported Radio Free Europe—at first seeming to win a change in government, but soon facing Soviet tanks and brutal repression from a new communist administration. This event may have underscored the wisdom of RIAS's decision to caution East Germans against rash actions, but it also underscored the limits to which the Western Allies would go in supporting such insurrections. RIAS now had to reappraise its overall policy of encouraging its East German audience to think of the communist government as temporary. That policy was replaced by the concept of gradual evolution, through which the communist government would be encouraged to move away from doctrinaire Marxism and toward a more citizen-friendly form of socialism, or at least "communism with a human face."

Gradual evolution was based on an interesting assumption: if the people *and* their rulers were aware of the ever-growing prosperity, political stability, and military strength of Western Europe and North America, there would be great pressure on communist governments to change or be left hopelessly behind. It was particularly easy for RIAS to contrast the West with the East because the Federal Republic of Germany (more widely known as West Germany) clearly represented the former, and the German Democratic Republic the latter. The two nations shared a common history and language but were worlds apart in their present economic strength and degree of personal freedom (to travel, to change jobs, or to vote in open elections). Since RIAS had access to a large amount of information about East Germany that its rulers would not share with their people, it could present detailed and generally accurate comparisons on a daily basis.

Much of that advantage disappeared overnight on 13 August 1961, when the East German government erected a wall that literally divided Berlin in two. It became much more difficult to obtain daily newspapers from around the GDR; the heavy flow through West Berlin of East German refugees, who often had provided valuable and detailed information on life in their former homeland, ground to a virtual halt. Nevertheless, RIAS persevered, now emphasizing Western progress and changes taking place in other communist nations in Eastern Europe. The hope in the latter case was that East Germans might be able to persuade their government to at least follow the example of other "fraternal" communist partners. The station also developed special programs such as a 5-minute daily broadcast for East German military personnel stationed along

the Berlin Wall and along the heavily guarded border with West Germany, in which those on duty were reminded that would-be escapees were Germans, too, and certainly not criminals in any of the usual senses; therefore, the program urged guards to consider shooting to miss, and not to kill.

It was more difficult than ever to measure the effectiveness of any RIAS broadcasts to East Germany, since refugees had been far and away the most important source of survey-gathered data in pre-Wall days, and now very few escaped. In 1972 the two Germanys signed an interstate treaty permitting a limited number of personal visits in both directions. That seemed to signal the possibility that there might someday be some form of confederation. West German politicians and media, RIAS among them, referred less and less often to "the so-called German Democratic Republic." The West German government was now covering most of RIAS's annual budget, although a few U.S. administrators remained nominally in charge and the station remained within USIA. Yet jamming of the station continued, even as it was becoming easier for East Germans to watch West German television without interference from the East German authorities. (RIAS itself began a regularly scheduled TV service, but not until August 1998.)

Demise

By the 1980s, there were further signs of relaxation, accommodation, and even cooperation by both Germanies, and RIAS broadcasts were careful to take note of the changing climate. However, jazz and rock music more or less indigenous to East Germany (but often sounding suspiciously like current Western jazz and rock stars) began to appear on East German radio and TV. Mild forms of criticism of the government (but not of communism itself) appeared in East German cabarets and novels. Such moves made RIAS less unique, but since the GDR remained one of the most rigid communist-governed nations in Eastern Europe, RIAS broadcasts about the greater freedoms developing in some of the GDR's neighbors continued to find ready ears. Still, very few Germans on either side of the Berlin Wall were prepared for its entry points to open freely on 9 November 1989, and even fewer to see large numbers of East Germans walking through to mingle with West Berliners. Within a year, the two German governments had signed a treaty of unification and become a single nation, but hardly as equal partners: the "new" Federal Republic was a larger version of the old one, and very much a part of the West.

The unification ended RIAS's *raison d'être*. In 1992 RIAS TV was incorporated with West Germany's international radio service, Deutsche Welle, and became DW Auslandfernsehen ("international TV"). In that same year, the station's second radio service, RIAS 2, became a commercial radio station ("r.s.2") operating on the same frequency. In 1994 the West

German longwave radio service Deutschlandfunk incorporated parts of the East German radio services and parts of RIAS 1 as a new Deutschlandfunk "Berlin-programm." Thus, two erst-while Cold War enemy services now found themselves partners, even as the release of hitherto secret data from East Germany showed that RIAS Berlin indeed had been a major thorn in the side of the East German government and an important factor in bringing about its demise.

Radio Authority

Regulating British Commercial Radio

The Radio Authority is at the center of the United Kingdom's regulatory system for radio. The Broadcasting Acts of 1990 and 1996 gave it responsibility for advertising and awarding licences and subsequently for overseeing the performance of all commercial, community, and other radio services in the U.K., whether they be national, local, cable, satellite, or other broadcast services. Its reach covers everything in the British radio business in the country with the exception of the publicly owned and non-commercial British Broadcasting Corporation (BBC). The radio services for which it is responsible range from national radio networks such as Classic FM and Talk Sport to hospital and student radio stations and special short-term radio services covering, for example, special events and trial services.

The Radio Authority also launched a project known as Access Radio, a not-for-profit pilot scheme, in 2002. This may lead to a series of small-scale local community radio services licensed on a permanent basis in the future. The Access Radio stations under the pilot scheme are intended to serve a particular neighborhood, or community of interest, and to have clear social gain aims. The Radio Authority took over the responsibility for all non-BBC radio from the Independent Broadcasting Authority (IBA) in 1991. That body had been responsible for licensing and supervising British commercial television until the first commercial radio license in Britain in 1973, when it added radio to its responsibilities. The 1990 Broadcasting Act separated the functions of commercial radio and television, giving the former to the Radio Authority.

The Authority carries out three main tasks and responsibilities: it plans the use of frequencies allocated to radio broadcasting, awards licences to bidders with a view to broadening listener choice, and regulates content, in both advertising and programming. It publishes codes that broadcasters must adhere to, covering the use of frequencies, the content of programs, and advertising and sponsorship. It also supervises the radio station ownership landscape.

Although it may appear that Britain's radio industry remains highly regulated, in general regulations are designed to ensure that those who are awarded licenses abide by the undertakings that they have made in their applications. If, for example, a station bids for a license to program talk radio, it cannot then play a lot of adult contemporary rock music. If one bids for a license to be a local mixed-programming station, it cannot then broadcast only religious evangelism.

The Authority has the power to demand that stations make apologies for breaches in Authority codes. Offending stations may be asked to make corrections, may be fined, or may, in extreme cases, have their licenses shortened or revoked entirely.

Concerning advertising, the Authority code sets out standards to ensure that advertising is legal, decent, honest, and truthful. The Authority code on news and current affairs requires all coverage of these to be both accurate and impartial. Unbalanced politically partisan broadcasting is not permitted. The code covers discussion and phone-in programs, personal view programs, documentaries and features, and pro-

grams at election times. There are also codes on general programs and on engineering and the way in which allocated frequencies are used.

The Radio Authority advertises when new radio licenses become available and is open to anyone to apply. There are several levels at which licenses are advertised and awarded. National licenses are for services covering the entire country on AM or FM, of which there are three. They are advertised nationally and in open competition. Applicants have to make a cash bid; provided that they meet the requirements laid down in the Broadcasting Acts, licenses are awarded for eight years' duration to the highest bidder.

Local licenses are available for both AM and FM services and are advertised in the respective locality. The Authority has to decide whether a suitable frequency is available and whether the local market has the commercial resources to support another service. When deciding on the applications, it has to consider whether the proposed service will cater to local interests and tastes and broaden listener choice. There is public consultation during the decision making process. The Authority also has to decide whether the applicant has the financial resources to sustain the service for the license period. As with the national licenses, local licenses are awarded for eight years.

Cable and satellite licenses are subject to fewer requirements and obligations. All services intended for general reception (i.e., those without any coding or restricted access provision) need to be licensed by the Authority. Such licences

are awarded for five years. Like many other European countries, Britain now has digital radio using the Eureka DAB system. The Radio Authority is required to license all commercial services using the platform. The Radio Authority had awarded 42 digital licences by mid-2003, and together these provide more than 250 program services.

The Authority is funded by the license fees paid to it by each of the licensees and by the fees payable by all applicants. The chair, deputy chair, and all other members are appointed by the government's secretary of state for Culture, Media, and Sport; the organization consists of 47 full time and part time staff.

A new communications regulator, Ofcom, was to be established by the end of 2003. The new Communications Bill that went through Parliament in 2003 is expected to bring about the transfer of the functions of the five existing regulatory bodies, the Radio Authority, Independent Television Commission, Broadcasting Standards Commission, Oftel, and the Radio-communications Agency, to Ofcom. The existing bodies will be disbanded as a result.

Radio City

New York City Headquarters of NBC

Few station or network headquarters are well known as tourist spots. However, Radio City, a central part of Rockefeller Center in midtown Manhattan, has been an exception virtually since it opened in 1933 as the operational headquarters of the National Broadcasting Company (NBC). Public tours are offered, and Radio City has even been the subject of at least three novels.

Origins

In 1928, John D. Rockefeller, Jr., leased 12 acres in midtown Manhattan from Columbia University. Called the "Upper Estate" by the landowner, the plot was bounded by Fifth and

Sixth Avenues and 49th Street to 52nd Street, and was then occupied by low-rise brownstones, tenements, and theaters. Rockefeller planned to revitalize the area with three large office buildings and a new Metropolitan Opera House, but the stock market crash of 1929 forced him to scrap the original plans. Still wanting to develop a commercial district on the property, however, Rockefeller hired three architectural firms and a consultant to refine his plans.

In 1930, a \$250-million, 11-building project for the area was announced. Raymond Hood had overall architectural control of what would become the largest privately owned prewar business and amusement complex in the world. The first art-deco-style building to open was the Radio-Keith-Orpheum

(RKO) Theater, which seated about 3,500 moviegoers (it was torn down in 1954 to make room for an office building). Delayed somewhat by the Depression, the last of the original buildings was not completed until 1940.

In the 1950s what had become known as Rockefeller Center was extended west of Sixth Avenue to incorporate several high-rise office buildings; the Center now comprises 18 buildings. Control of the Rockefeller Center was sold by the family in 1985 in a complex deal. By 1989 the Japanese Mitsubishi company had become the majority owner, but after a real estate turndown, ownership went to Tishman Speyer Properties in 1997.

The centerpiece of Rockefeller Center, however, was the 70-story building at 30 Rockefeller Plaza, soon known for its chief occupant as the "RCA Building" ("GE Building" after 1986), but often referred to simply as "30 Rock." It opened in 1933.

NBC Headquarters

The Radio Corporation of America (RCA) moved its headquarters into many floors of the skyscraper in late 1933, bringing the NBC network along with it. NBC occupied its new studios early in November and dedicated them on 18 November 1933.

Studios for the network and its New York flagship station, then WEAf (later WNBC), would eventually occupy 11 floors, of which only the second and fifth had windows. This was part of an unprecedented effort to keep outside sounds isolated. Extensive sound filtration and insulation systems made the many studios among the finest anywhere. Their entire space (4.5 million square feet) was air conditioned, a rarity in that early period. The studios ranged in size from 14 feet by 23 feet to the world's largest studio—78 feet by 135 feet with ceilings 30 feet high. This huge room, Studio 8-H, could accommodate an audience of 1,300 persons.

Not all of the NBC space was immediately used; postwar auditorium studios (Studios 6, 7, and 8) were developed on the sixth and seventh floors as needed. Most studio equipment—master control and the like—was on the fifth floor with 50 tons of backup batteries in case of a power loss. No fewer than 275 synchronized clocks appeared throughout the NBC and WEAf floors.

The new NBC space had also been designed for eventual television operations, although that medium was technically very crude in the early 1930s. Later in the decade, however, NBC began studio television experiments with a much improved all-electronic system that soon extended to two large mobile vehicles, often seen parked outside 30 Rockefeller Center. Right from the start, NBC provided studio tours to the general public, which proved to be highly popular and grew even more so when extended to the new television spaces. By

the end of World War II, more than half a million people took either the basic or extended studio tour of NBC every year.

The Radio City Music Hall

Perhaps the most famous single part of the Rockefeller Center complex is the Radio City Music Hall on Sixth Avenue. Built at a cost of about \$8 million, it was the largest theater in the world with almost 6,000 seats under a huge arching ceiling. Its handsome art deco interiors were designed by Donald Deskey. It opened on 27 December 1932, and the first of its now-famous Christmas stage shows was offered a year later.

For decades the Music Hall offered movie and stage show combinations that were hugely successful. But as television developed and films began to draw smaller audiences, so did the Music Hall. In 1978 some discussions were held with regard to tearing the place down and erecting another office building; however, the building was granted city landmark status and saved. Its presentations after 1979 focused on what people could not see in their home towns or on television—spectacular stage shows.

In the late 1990s, the Hall underwent a massive \$77 million renovation paid for by Cablevision, which currently operates the facility. The complete renovation even included changing each of the nearly 6,000 seats by the company that had made the originals. Much of the original lighting was repaired and rejuvenated, as were all wall surfaces. Computers now control lighting and sound effects, yet much of the Music Hall's original stage equipment remains in place and in use.

Radio Corporation of America

No single U.S. communications company has had a more fundamental and important association with the worldwide development of radio broadcasting than the Radio Corporation of America (RCA). Although RCA no longer exists as a separate corporate entity today, having been acquired by General Electric (GE) in 1986, its brand-name products continue to be marketed by Thomson S.A. of France.

Origins

In the early 20th century, the American Marconi Company was a wholly owned subsidiary of Marconi Company, a British corporation. Marconi had a virtual monopoly on maritime ship-to-shore wireless communication when England entered World War I against Germany in 1914. Because of the important role of wireless in maritime operations, President Woodrow Wilson directed the U.S. Navy to assume control of the American Marconi stations and all German-owned stations in 1917 when the United States entered the war. The Navy operated these until the end of the war in 1918, when the U.S. government was reluctant to return control of the American Marconi stations to the British parent company.

Franklin D. Roosevelt was then Assistant Secretary of the Navy, and the experience gained from overseeing operation of these wireless stations during the war convinced him that all radio patents and operations in the United States should be kept under U.S. control. After World War I, British Marconi and General Electric began negotiations for the GE Alexander-son Alternator, which was the state-of-the-art hardware for long-distance wireless transmission. The U.S. Congress expressed concern that Marconi's acquisition of this equipment would result in a foreign company (and, by implication, a foreign country, albeit a friendly one) gaining complete control over maritime communication, which would not be in the national interest. Congress and the Navy pressured General Electric to buy American Marconi, which it did in October 1919. RCA was established to operate all the American Marconi wireless stations that General Electric had acquired. RCA's charter mandated that all board members were to be

U.S. citizens and that stock interest by foreign companies or individuals could not exceed 20 percent. The chief of GE's legal department, Owen Young, was appointed RCA board chairman, and two former American Marconi executives, Edward McNally and David Sarnoff, were appointed its president and commercial manager respectively.

GE and RCA developed cross-licensing agreements that permitted each firm to use the other's radio patents. Over the next three years (through 1922), cross-licensing agreements and RCA stock purchases were made by Westinghouse, American Telephone and Telegraph (AT&T), and United Fruit Company, which had patents on crystal radio, as radio was United Fruit's primary means of communication with its Central and South American plantations. The radio business at that time consisted primarily of international, maritime, and amateur radio services, and just a handful of radio broadcasting stations.

Radio broadcasting grew rapidly during the early 1920s and fostered corporate competition, much of it bitter, over whether the Federal Government or private corporations should control radio broadcasting and how. The corporations, for that matter, were engaged in vicious competition for control and experimented with various ways to shoulder the costs of radio broadcasting and the need for its further development. During this fractious period, AT&T and its manufacturing subsidiary Western Electric were referred to as the "telephone group." WEAf in New York was its first AM station and was in the vanguard for many experiments and innovations during the 1920s. An important experiment was known as "toll broadcasting." The telephone group introduced the first commercial announcements on radio (WEAF) in 1922. RCA, GE, and Westinghouse were referred to as the "radio group" and pooled their development efforts, including operation of the GE and Westinghouse stations. The two groups had very different ideas about how radio and broadcasting should develop.

The Federal Trade Commission, following a congressional mandate, began an investigation into alleged monopolistic practices brought about as a result of the more than 2,000 pooled patents and cross-licensing agreements. The results of this 1923 investigation led to a binding arbitration agreement

between the telephone and broadcasting groups to resolve their differences. Eventually, in 1926 they resolved the disputes when AT&T agreed to leave the broadcasting field, selling the popular WEAF station to RCA. RCA then created the National Broadcasting Company (NBC) as a wholly owned subsidiary of RCA. NBC began a regular network service using WEAF as its flagship program source. In time, 25 stations in different markets were affiliated with the NBC network. Shortly thereafter NBC established a second radio network using Westinghouse's WJZ, also in New York, as its anchor for programming. The WEAF operation was to be known as the Red Network and the WJZ operation was known as the Blue Network, ostensibly because an RCA engineer drew connecting lines in red and blue on a map showing the locations of the stations served by each. NBC became the base for RCA's expansion into commercial radio broadcasting on a national scale.

RCA became a giant in the radio set manufacturing business initially by marketing GE and Westinghouse radios. In 1929 the three companies consolidated their research, manufacturing, and marketing operations. RCA then bought the Victor Talking Machine Company and its famous logo and slogan "His Master's Voice"—the Francis Barraud painting of "Nipper" the Fox Terrier looking into the bell of a Victrola. The \$154 million paid for Victor enabled RCA Victor to manufacture its own radios and phonographs at a new plant in Camden, New Jersey. The new RCA Victor then established the RCA Radiotron Company to manufacture radio tubes, and by 1930 RCA controlled a substantial portion of the several markets in which it was active. This raised eyebrows in Washington, and investigations soon followed.

The Justice Department instituted antitrust proceedings that lasted almost three years. Finally, in 1932 the companies signed a compromise consent decree that resulted in GE and Westinghouse divesting themselves of RCA stock, relinquishing their positions on the RCA board of directors, and making their license agreements (dating back to the early 1920s) non-exclusive. RCA was now an autonomous and independent corporation. Its new president, David Sarnoff, introduced the RCA Photophone in 1932, a device that allowed moviegoers to hear Al Jolson on screen in the first "talkie."

Expansion

The newly independent Radio Corporation of America grew rapidly, expanding some operations to Hollywood, and growing both its manufacturing base and NBC networks. A research and development center opened near Princeton, New Jersey. Research on television focused at RCA's plant in Camden, New Jersey. RCA joined with a chain of vaudeville theaters to start Radio-Keith-Orpheum (RKO) Movie Studios and produced many successful feature films. The NBC radio net-

works flourished in the 1930s. Rockefeller Center was built in New York City during the early 1930s, and the high-rise building in that complex was named the RCA Building as part of the agreement by RCA to occupy multiple floors, including the first eight (which housed both WEAF and the NBC network facilities), and the top floors (which housed RCA's corporate offices).

RCA's involvement in television began in 1930. Sarnoff hired Vladimir Zworykin, the inventor of the "Iconoscope" (forerunner of today's camera tube) and "kinescope" (forerunner of today's picture tube) away from Westinghouse at the end of the 1920s to establish a laboratory in Camden to develop television. Ten years and \$50 million later, Sarnoff introduced RCA's electronic television at the 1939 World's Fair in New York City. Commercial television, using largely RCA technology, began operation in mid 1941.

When the United States entered the war in 1941, RCA plants were converted to war production, making tubes, sound equipment, sonar bomb fuses, mine detectors, and ultimately radar, which was introduced later in the war by the British. Commercial radio and television production resumed less than two months following the end of World War II in 1945. Many new television stations sprang up, resulting in a freeze on authorizations (licensing) by the Federal Communications Commission (FCC) for almost four years, in order to assure equitable allocation of stations and non-interference of signals throughout the country.

Following a round of controversial Congressional hearings, RCA's all-electronic color TV system was adopted as the national standard in 1953. RCA held the patents on that technology at the time, so virtually every color television set produced until the mid 1960s contained RCA parts. All color kinescopes were manufactured by RCA. When a finished tube came off the assembly line it was given one of several different brand labels, packed into a matching brand-labeled box, and forwarded to an RCA competitor such as General Electric, Sylvania, Philco, or Motorola, if not labeled for sale as an RCA set.

Decline

The 1950s and early 1960s marked the peak of RCA's role in the broadcast and electronics industry. Sarnoff had actively supported the research underlying the company's success in black-and-white and later color television. The firm had developed a huge collection of patents, further strengthening its position. RCA was active in virtually all parts of the electronics field, including military and space communications, and it held major market positions in all those industry segments. At the same time RCA had become a major military equipment manufacturer and had entered the computer business, among others, spreading its resources across new fields.

Sarnoff remained in charge until his 1969 retirement, but other firms made the breakthroughs that would dominate the business in years to come. After Sarnoff's retirement, massive investments in technology that rapidly became obsolete (such as a type of video disc recording and mainframe computers) led to huge losses, weakening RCA in the 1970s (then under the leadership of Sarnoff's son Robert). As manufacturing lagged, soon the NBC television network subsidiary was providing RCA's margin of profit. The younger Sarnoff was soon replaced by a quick succession of other presidents and chairmen as RCA sought to regain its former electronics preeminence within a far more competitive and deregulated marketplace. Much of its consumer electronics business (as with other U.S. firms), including radio and television manufacturing, faded in the face of new competition from abroad. The company's attempt to break into the computer manufacturing business resulted in a huge loss—more than \$500 million when RCA finally pulled out. When a strong hand was most needed, severe management infighting broke out that would prove fatal to the company's survival as an independent entity.

Finally secret negotiations (initially RCA's board and other leaders were not included) were begun between RCA chairman Thornton Bradshaw and General Electric, which was now rich with profits from manufacturing and takeovers of other companies. The situation was ironic, as GE had created RCA so many years before. Bradshaw said later that some kind of takeover was the only way RCA's many parts might be kept together. But this was not to be.

In 1986 GE took over all of RCA for \$6 billion (a huge deal at the time) and shortly thereafter began to dismantle the empire David Sarnoff and others had created. Some parts were incorporated into GE's operations. The research labs that had helped to create television and other products were sold because GE had its own research labs. In 1987 the RCA trade name was also sold for use on consumer products that would now be sold by the French company, Thomson S.A. The NBC radio network that had pioneered national radio programming in the 1920s was sold, as were all of the NBC-owned radio stations.

RCA exists today merely as a product trade name, the giant company that once dominated U.S. radio having disappeared less than two decades after the retirement of its longtime leader.

Radio Data System

Transmitting Additional Information

Radio Data System (RDS), or Radio Broadcast Data System (RBDS) as it is called in the United States, is a transitional technology for FM radio, important parts of which will be incorporated into the developing digital radio systems. RDS technology allows a station to transmit an eight character digital message (e.g., station call letters, identification of music being played) to suitably equipped receivers. A small digital readout tells a listener what station is tuned, what music or talk is being provided at the time, as well as other types of information.

Development

Because of the line-of-sight limit to analog FM radio transmission, many transmitters are required to cover a large geographical area. Adjacent transmitters cannot broadcast on the same frequency because they would interfere with each other. In order to stay tuned to the same radio network or program service, a listener driving long distances would have to constantly seek out a new signal as he moved. Unless the listener knew which transmitter served which area, he would not know the optimal frequency for his favorite network or music or talk program service. This was the problem that engineers sought to solve with the development of RDS beginning in the late 1960s.

Swedish engineers began development of what became RDS in 1976. They sought a means of sending data to radio pagers. Soon a group of broadcast engineers working under the auspices of the European Broadcasting Union (EBU) developed the RDS through the 1970s to meet the requirements of European countries, and subsequently it became a European standard under the umbrella of the Comité Européen de Normalisation Electronique. Initial field tests began in 1980. A large-scale operational trial took place in Germany five years later. Regular service began in Ireland, France, and Sweden, in addition to Germany, in 1987, the same year that Volvo made available the first car radio featuring RDS capability. More European countries—and radio manufacturers—followed over the next two years. By the early 2000s, the number of RDS sets in use totaled over 60 million, most of them in Europe.

Radio Data System Features

RDS technology uses a separate and inaudible digital signal that is a subcarrier (an additional signal) of an FM transmission. An RDS receiver can decode this information to enable

digital display of station or program information including the following features.

RDS allows automatic retuning to alternative frequencies. When the radio detects that the signal for a particular program service is becoming poor and hard to hear (due to distance from the transmitter), it seeks another one with the same program identification, and if that station provides better quality, the radio switches over so quickly that the listener is not aware of it. More expensive and sophisticated radios have two tuners at the front of the set, and these are constantly searching for a better service, making for even more efficient switching. Not having to look at the radio to retune while driving has obvious implications for safety on congested roads.

Indicating the type of program provided by the station is one popular RDS feature, while providing additional information such as useful telephone numbers, record titles, and so on via the display is another. This information can be up to 64 characters long and is displayed by scrolling through successive eight character screens. This feature is obviously of more use in home tuners than in moving cars.

On an RDS-equipped radio, the listener is offered an 8-character alphanumeric display of the call letters of the station. With the use of abbreviated indicators, this display can also inform the listener whether that station will provide any sort of traffic or travel program. The radio can interrupt listening when these traffic announcements are being broadcast.

A feature that has made the traffic and travel service work efficiently is the enhanced other networks (EON) feature. This is used to update information stored in a receiver about other program services than the one currently tuned. In other words, a listener can be listening to one radio station or even to a cassette or CD, and if a different local news station is about to broadcast travel information, the receiver can switch away from the primary source of entertainment to that travel information and back at the end of it. If manufacturers were convinced of a demand, they could build sets that would be able to vector onto any particular program type. EON availability is demonstrated by the logo "RDS-EON" which is normally displayed on a radio's front panel or on receiver packing.

In Europe, many broadcasters are currently implementing another feature using the RDS traffic message channel (TMC). Through this, it is possible to broadcast encoded travel announcements, and by means of a voice synthesizer, these can be heard or printed out by the listener in his or her own language regardless of the country through which he or she is driving. Because of the complexity of the process, in order to make the best use of the service, receivers should have two tun-

ers at the front, one listening for conventional RDS services and one tuned to the service carrying the TMC information. To date, probably because of cost, the manufacturing industry is dragging its feet over the development of these more sophisticated radios, though there are several simple TMC-capable sets on the market.

RDS can also supply the smart radio with the current date and time, which adjusts automatically for time zone changes. Among the more subtle features especially useful in Europe is the extended country code, which provides supplementary information to tell the radio in which country (and thus language) it is operating. To keep the RDS system flexible and to adapt to new developments, an “open data application” retains unallocated data groups for control of potential new tasks.

The system can also control the relative volumes of speech and music via a music-speech switch. One feature extensively used in some European countries (and indeed, the feature that began RDS development), is radio paging, which enables broadcasters to use existing networks in a cost-effective way to deliver messages to personal receivers. Up to 40,000 subscribers can take advantage of the service on one program service. There is a related emergency warning system so that those broadcasters who wish to do so can transmit confidential warning messages in the event of a national emergency.

Radio Data System in the United States

Initial RDS demonstrations took place in the United States in 1984 in Detroit. Ford began development work on an RDS-equipped automobile radio. Research and further demonstrations continued in various locations for several years. RDS was demonstrated at the 1986 NAB convention. The National Association of Broadcasters and the National Radio Standards

Committee (NRSC) formed a subcommittee to develop an American technical standard recommendation for the Federal Communications Commission. The United States adopted a Radio Broadcast Data System (RBDS) standard in 1993 that added functionality to the basic RDS offering. Further developments in the 1990s sought to retain basic RDS and RBDS compatibility.

As stations are all identified by call letters, a unique set of program identification codes was devised for the transmitter RDS encoders in North America, and a new set of program types was needed to meet the specific needs of the American market. The 31 numerical program type (PTY) codes thus vary in the European RDS and American RBDS systems.

Future

RDS was designed for use with analog FM broadcasting. As such, it achieved some success in several European broadcasting systems and in a few other countries. But as RBDS, it never took off in the U.S. American station managers saw little value in the system, deciding not to invest in a technical patch for a medium—FM—threatened with obsolescence. They foresaw that most of the RDS/RBDS features would be provided in the more revolutionary digital services coming on line in the new century.

Radio Disney

Radio Network for Children

Radio Disney is a radio network for children and a marketing unit of The Walt Disney Company. The network is distributed nationally by Disney's American Broadcasting Companies (ABC) Radio Networks to an affiliate base of AM radio stations and is also streamed on the internet.

Radio Disney is a 24-hour synthesis of contemporary hit music, oldies, radio theater, and game shows, all programmed

for “kids and moms.” Its live feed originates from an ABC production facility in Dallas, and some programming occurs remotely from locations such as Disneyland in Anaheim, California. Disc jockeys play music, talk to children on the telephone, and interview celebrities. Signature Disney cartoon characters (Goofy, Donald Duck, Minnie and Mickey Mouse) pop in regularly to keep the broadcast environment “fun.”

Commercial breaks include avails (available commercial spot positions in a program) for local affiliate sponsors, although advertising and promotion for other Disney businesses (theme parks, live events, websites, movies, television, and retail) is an inherent aspect of program content and contest prizing.

Radio had scores of shows for children in the pre-television age, but as those comedies, adventure series, and westerns migrated to the tube, so did their audiences. In fact, Disney's *Mickey Mouse Club* was long responsible for television's ability to keep kids entertained. Consequently, radio essentially abandoned children, reacting to the onslaught of TV with increasingly sophisticated strategies to identify and sell its listeners to advertisers, supported by ratings methodologies that were unable to effectively quantify the under-12 demographic. Although pop music radio has attracted kids since the early days of rock and roll, children had not been directly targeted, nor could they be accurately counted.

Nonetheless, experiments in format radio for children began in earnest in the early 1980s on both commercial and public stations, laying the groundwork for an ongoing children's radio network, which led to Disney's entering the field. A number of concepts for children's radio were tested by the *Children's Radio Network*, established in 1982 by William C. Osewalt; these were broadcast on a handful of underutilized commercial AM stations from Florida to Oregon and eventually found a full-time home at WWTC in Minneapolis. The station's owner, Christopher Dahl, designated WWTC the flagship station for the first full-time kids' radio network, adopting the moniker "Radio Aahs." The network was programmed with specific segments for younger and older children; featured music, contests, and stories; and encouraged audience participation. Because its survival depended on increased distribution and advertising revenues, Radio Aahs entered a marketing relationship with ABC Radio.

It seemed that radio for children would flourish in the 1980s, as others, too, explored opportunities, some supported by Peter Yarrow of the singing group Peter Paul and Mary and

by Peggy Charren of Action for Children's Television. KPAL in Little Rock, Arkansas, had a full-time children's format, and WGN in Chicago was among the affiliates of the short-lived weekly music and news series for children, *New Waves*, which was cohosted by Fred Newman of Nickelodeon and funded by the Markle Foundation.

Public radio's significant children's radio venture, *Kids America* (which started locally in 1984 on New York's WNYC as *Small Things Considered*), was a live, 90-minute daily program distributed by American Public Radio that featured music, wordplay, call-ins, jokes, celebrity interviews, and problem-solving advice for a national audience until 1988.

Discussions at ABC about a children's network began as early as 1989, but it was not until 1996 that Radio Disney began broadcasting. Although Radio Disney's format is derivative of its predecessors (ABC Radio's marketing relationship with Radio Aahs resulted in a \$30 million judgment against Disney in 1998), its uniqueness resides in the use of Disney characters—the first time Disney cartoon stars have had a regular radio presence—and in Radio Disney's internet site (www.pcs.disney.go.com/disneyradio/), which promotes the music it plays on the air, conducts listener polls, and attempts to engage kids in an array of participatory content. Disney's relationship with Infoseek, which established go.com, and distribution via satellite (both XM and Sirius Satellite Radio offer the channel to subscribers), has propelled Radio Disney beyond its progenitors and the limitations of AM. Because Arbitron (the radio ratings company) does not provide listening statistics on children, Radio Disney relies on a marketing model to determine its media value rather than the more typical advertising model based on cume audience (or CPM, cost per thousand), common with other radio networks. Radio Disney uses the might of its brand to cross-promote, creating a children's media environment that is as much aural amusement park as it is radio network.

Radio Free Asia

U.S. International Radio Service

The collapse of the Soviet empire in the so-called velvet revolution that began in 1989 led many to credit the work of international radio services, particularly Radio Free Europe (RFE) and Radio Liberty (RL), for breaking the information

monopoly in Eastern and Central Europe. Because of the Tiananmen Square massacre of June 1989, opinions developed that perhaps a similar broadcasting effort might be attempted in Asia. Yet there was also a feeling that the work

of the surrogate stations was over and that they should be phased out.

During the administration of President George H.W. Bush (1989–93), two ad hoc committees were established to examine this issue. In 1991—the year of the Soviet Union’s own collapse—one of these groups, the President’s Task Force on U.S. Broadcasting, recommended that the United States increase its efforts to broadcast into China and other communist states in Asia. The following year, the second group mandated by the U.S. Congress, the Commission on Broadcasting to the People’s Republic of China, made a similar recommendation. Both groups suggested that the United States follow the RFE/RL model of setting up a surrogate radio service, although a long-standing group, the U.S. Advisory Commission on Public Diplomacy, disagreed with these recommendations in 1992, endorsing a minority opinion that the United States should augment its current broadcasting activities through the Voice of America (VOA). No action was taken, however, during the remaining years of the Bush administration.

In 1993 the new Clinton administration proposed shutting down the RFE/RL operation to save \$210 million per year. A fight to save the services was mounted in Congress, led by Senator Joseph Biden, and the Clinton administration gave way. Daniel A. Mica, Chairman of the Board for International Broadcasting, parent organization of RFE/RL, despite the U.S. Advisory Commission’s reservations, argued that surrogate radio stations had been effective in the past. As he put it, “I have talked with Yeltsin, Havel, Walesa, people in the streets who would come up and tell me that they huddled in closets for 40 years to listen to our broadcasts. It helped make possible, I think, what we see today . . . the fall of the Berlin Wall, the new and emerging democracies. Is surrogate radio, VOA, necessary any longer? Do you believe that everything is going to be fine in Russia, in some of the bloc countries that are going through elections, that are electing some of the very people who were just toppled a few years ago? Any knowledgeable person knows that is not the case. As a baby being born, you cannot abandon it. As a new nation being structured, we cannot abandon it.”

In 1994 Congress passed the Radio Free Asia Act to establish a new surrogate radio service for Asia. It was to be housed, along with RFE/RL, under the Board for International Broadcasting. Although funded by Congress, it was to have—like its predecessor services—a quasi-independent status. Radio Free Asia began broadcasts in March 1996. It uses 12 leased transmitters in Asia, the Pacific, Europe, and the United States to broadcast into China, Laos, North Korea, Burma, Vietnam, Tibet, and Cambodia. The service functions as a “home” or surrogate radio station, with its programming aimed at providing internal news to populations living within its target areas. It also promotes democratization and the

establishment of a market economy in its broadcasts. Its stated mission is

[t]o broadcast domestic news and information in nine languages to listeners in Asia who do not have access to full and free news media. The purpose of RFA [Radio Free Asia] is to deliver accurate and timely news, information and commentary and to provide a forum for a variety of opinions and voices from within Asian countries. RFA seeks to promote the rights of freedom of opinion and expression—including the freedom to seek, receive and impart information and ideas through any medium regardless of frontiers.

In 1997 the Radio Free Asia Act passed by Congress declared that the government of the People’s Republic of China was systematically controlling the flow of information to the Chinese people and that the Chinese government was more interested in maintaining its political monopoly than in economic development. The act called for increasing the hours of broadcasting in Mandarin, Cantonese, and Tibetan to 24 hours a day and for increasing efforts to add other dialects to Radio Free Asia broadcasts; the act also endorsed the idea of adding Mandarin television broadcasts through Worldnet seven days a week.

Like the VOA, Radio Free Asia broadcasts in Mandarin have been jammed with limited success. There have also been reports that its programs in Korean and Vietnamese have been jammed from time to time.

In March 2000 Radio Free Asia, with a staff of 248 people in eight locations (Washington, D.C.; Hong Kong; Tokyo; Taipei; Phnom Penh; Dharamsala; Bangkok; and Seoul), was broadcasting 12 hours of Mandarin per day, 8 hours of Tibetan, 2 hours of Burmese, 2 hours of Vietnamese, 2 hours of Korean, 2 hours of Lao, 2 hours of Khmer, 3 hours of Cantonese, and 1 hour of Uygher. All services were aired seven days a week.

Radio Free Europe/Radio Liberty

U.S. International Radio Services

Radio Free Europe (RFE) and Radio Liberty (RL) represent the most ambitious of all Western international broadcast operations developed especially for the Cold War. Directed at the Soviet Union and the communist-governed nations of Eastern and Central Europe, by the 1980s they broadcast over 1,000 hours per week in 21 languages. As the century closed, those figures stood at over 800 and 22, respectively. RFE and RL have proven to be remarkably adaptable and resilient over time, escaping extinction on more than one occasion, and both continue to operate years after the end of the Cold War.

Origins

A clear majority of international radio services are financed openly by national governments, but several governments also covertly finance clandestine (concealed identity, often unlicensed) radio stations, most of them small-scale operations using one or two languages and with active lives of weeks or months. From their origins in the early 1950s until the early 1970s, RFE/RL functioned as very large-scale operations using many languages, and with a highly unusual form of concealed identity: they masqueraded as nongovernmental services financed by contributions from citizens and private corporations throughout the United States. Even after the U.S. journal of opinion *Ramparts* published an article in March 1967 that provided a detailed account of the U.S. Central Intelligence Agency's (CIA) many financial conduits used to support such operations as RFE/RL, the now not-so-covert system of financing continued.

That the stations were provided with such an elaborate disguise in the first place has much to do with a *modus operandi* that the U.S. government first established during World War II. The Voice of America (VOA) began operation in February 1942 as the official international radio "voice" of the government. Very soon, however, the predecessor to the CIA—the Office of Strategic Services (OSS)—began to create clandestine stations to broadcast to Germany, Italy, Japan, and the territories they occupied. Since there were no official links between the government and those stations, government officials could deny knowledge of them and of anything they broadcast, which they clearly could not do in the case of VOA. The CIA was created in 1947, and within two years it had established the National Committee for a Free Europe (NCFE) as a private corporation. The NCFE supported unofficial (i.e., nongovernmental) services that would follow an independent policy line where Eastern Europe was concerned. Diplomatic custom pre-

vented the U.S. government from calling for the liberation of Eastern European nations from communist rule, because they were sovereign states; NCFE, as an independent body, could and did advocate such a position.

RFE came on air in 1950 with a service to Czechoslovakia. It was staffed mainly with Eastern Europeans who had fled to the West when the communist governments came to power, and it was administered by some of the same individuals who had worked for the OSS during World War II. It identified itself as "the sort of station that Czechoslovaks [then, in turn, Romanians, Hungarians, Poles, Bulgarians, and from 1951 to 1953, Albanians] would want if they had a real choice." In other words, the various RFE language services, following the lead of Radio in the American Sector (RIAS) Berlin, functioned as surrogate domestic stations. Radio Liberation from Bolshevism, as the eventual Radio Liberty was called at its inception in 1953, served the entire Soviet Union in much the same manner, except that its surrogate services were often vehicles for encouraging separatist sentiments in Soviet republics such as Georgia, Ukraine, and Uzbek, using the languages of those republics as well as Russian to do so.

Strategies and Cooperation

Although RFE and RL were separate organizations until 1976, they did cooperate in a number of ways, particularly in sharing audience research findings. Each had its own office of research and relied heavily on data gathered from refugee centers, as well as from visitors to Western nations. (When the Cold War ended, unpublished research studies that had been conducted by the communist governments revealed that the RFE/RL data were remarkably accurate.) Also, both were administered by U.S. citizens covertly appointed and paid by the CIA, and both received CIA intelligence reports concerning RFE/RL target nations.

The stations did follow somewhat different pathways where the theme of "liberation" was concerned: The Radio Free Europe appeal was more likely to urge individuals to take small-scale actions, such as work slowdowns or minor acts of sabotage, that would weaken the communist governments to the point where large numbers of citizens might rise up and force them out of power, perhaps with the military support of the Western democracies. The Radio Liberty appeal regarded the liberation of the Soviet Union as much more of a long-term undertaking, and exposure of governmental corruption, inefficiency, brutality, and unequal treatment of many of the republics was seen as an important contribution to the eventual

downfall of communism. However, hints at overt Western military intervention were exceedingly rare. To the communist governments of the target nations, distinctions between the stations did not matter: both were jammed (their transmissions blocked by electronic interference) from the time they first came on air.

When the Hungarian Revolution of October 1956 failed to draw Western intervention and brought an even tougher communist government into power, both RFE and RL were forced to reappraise their strategies. Anything suggesting such intervention now was forbidden. One overt symbol of that change was the renaming of Radio Liberation, which became Radio Liberty in 1958. The stations now began to emphasize the growing economic strength of the West, particularly Europe. The hope was that listeners in the Eastern European nations and the Soviet Union would compare their own circumstances with those of their Western counterparts, eventually conclude that they were falling farther and farther behind, and then put increasing pressure on their own governments to liberalize economic policies (with possible effects on political policies) so that they would more closely resemble the obviously successful Western policies. The message now was one of evolution, not revolution. This message was often supported by news reports and other current events programs that informed all of the target nations about reforms undertaken in any one of them—in RFE parlance, “cross-reporting.”

Whether that policy shift impressed RFE/RL audiences is difficult to say. The communist media publicized allegations that RFE’s Hungarian service had in effect caused the deaths of thousands of Hungarians in the 1956 revolution by leading them on with false promises of Western intervention. Research conducted in the years immediately following the revolution revealed that, although there were no unequivocal promises, there were strong suggestions of intervention in several broadcasts, usually added spontaneously by RFE announcers to reports from Western sources. That caused both RFE and RL to tighten their systems of internal supervision, which until then had given the heads of the various language services (many of them not U.S. citizens and usually driven by strong personal hatred of communist rule in their old homelands) great freedom to interpret and apply overall policy directives as they wished. Stricter supervision proved easier to manage with RFE than with RL, in part because of the scarcity of individuals with sufficient fluency in the many non-European languages, such as Uzbek, in which RL broadcast. What is more, any supervisor would have to be sensitive to the emotional nuances of those languages yet possess sufficient emotional detachment from the Soviet political culture that affected life in the Uzbek Republic to be able to render valid independent judgment on the style and content of RL’s Uzbek Service broadcasts—no easy task.

Challenges in the 1960s

In the 1960s, RFE/RL faced three major challenges. The first was the Cuban Missile Crisis of 1962, in which nuclear war at times appeared imminent. RL increased the broadcast time of its Russian-language service and added a special Russian-language service for Soviet military personnel stationed in Cuba. Its message was one of restraint, although it underlined in the clearest possible terms the determination of the U.S. government to keep Soviet nuclear missiles out of Cuba. Within days, the Soviet ships carrying the missiles turned around in mid-ocean and headed back home. The second crisis—the move by Czechoslovakia in 1968 to become more independent of Soviet influence—was in certain ways more difficult for RFE/RL. The stations were aware that what they broadcast to Czechoslovakia itself and what they broadcast about the Czech situation to the other Eastern European countries and the Soviet Union would be compared with RFE’s performance during the Hungarian Revolution in 1956. Supervision of broadcast content was tight enough this time that the basic message of U.S. and overall Western support for Czechoslovakia’s seeming shift toward democracy was accompanied by messages urging Czech listeners to proceed with caution. There were no messages even suggesting the possibility of Western military intervention. The Soviet military already stationed in Czechoslovakia did intervene and in effect installed a more loyal communist government, but bloodshed was minimal.

The third crisis—disclosure of CIA funding for RFE/RL in 1967—sent many station staff members into shock. There were already rumors that the CIA was losing interest in the stations, chiefly because the Cold War seemed to be easing off, but also because the stations were costly and difficult to administer. (Power struggles among and within the various RL language services over “correct” policies for “their” republics, religious denominations, and so forth were legendary and sometimes vicious.) The stations’ handling of the Czech situation during the following year earned them some praise, but the seeming shift in U.S. policy toward greater accommodation of the Soviet Union and the People’s Republic of China at the end of the decade and on into the early 1970s gave the anti-RFE/RL forces within the CIA fresh hope and encouraged some members of Congress (including the highly influential Democratic senator from Arkansas, J. William Fulbright) to argue that what Fulbright labeled “this relic of the Cold War” should be put to rest.

The stations lobbied Congress on their own behalf and, with the support of Eastern European and Soviet Republic exile groups around the United States—many of them well connected with U.S. senators and representatives—managed to avoid extinction, albeit under a new administrative structure that was far more open to public scrutiny than that

under the CIA had ever been. Congress was also anxious to see some visible signs of increased efficiency in the stations and pushed for a merger of their respective staffs into one building, with one administrative board, a consolidated management, and joint policy guidance. All of these changes took place in 1976.

The Era of Détente

The spirit of détente (relaxation of Cold War tensions) introduced by President Richard Nixon as he visited China and the Soviet Union in the early 1970s held up reasonably well in succeeding years, and by the early 1980s there were signs of relaxation in some of the more doctrinaire Marxist economic and cultural policies. Those signs became far more evident after Mikhail Gorbachev became president of the Soviet Union in 1985. Artistic and economic freedoms multiplied and were joined by a degree of political freedom, particularly in the form of the increasing freedom accorded to the Soviet media to criticize graft and corruption even when committed by high-ranking officials. The government's failure to promptly disclose the magnitude of the Chernobyl nuclear plant disaster in 1986 infuriated Gorbachev, who urged the media to redouble their investigative efforts while virtually ordering Soviet officials to cooperate with the media in those efforts. By the end of the 1980s, the Soviet Union and most of the Eastern European countries had shut down their jamming transmitters, and RFE/RL broadcasts could be received clearly, but there was less reason to listen to them now that the communist media were able to report more fully, frankly, and immediately. It looked very much as if the old RFE/RL mantra—"We're in this business to work ourselves out of a job"—might finally be coming true.

Finding a New Mission

But if the RFE/RL cat had already used up some of its nine lives, it had others in reserve. There were numerous calls in Congress during the early 1990s for abolition. What purpose could those services have, opponents argued, now that the Cold War was over and the former communist nations were establishing media systems that operated along democratic and even free enterprise lines? RFE/RL and its supporters argued that it was premature to assume an immediate, or even swift, conversion to democracy and free enterprise on the part of radio and television in Eastern Europe and the former Soviet Union. Furthermore, RFE/RL could be a key player in effecting such a conversion, both by the example of its own programming and by consultation services that it was well suited to provide, since its staff spoke the languages of those countries and understood democratic broadcasting. The service also agreed to shift its operational base from Munich to Prague—a

move that would save a great deal of money because of the lower cost of living in Prague and freedom from high German labor contract costs.

The stations also could point out the support they continued to receive from prominent political figures in their target regions. Russian President Boris Yeltsin helped RFE/RL establish a bureau in Moscow following the unsuccessful coup attempt of August 1991, during which RL had played an important role in keeping Russian listeners informed of developments. Czech President Vaclav Havel told station staff that Czech Republic stations needed the professional example of RFE's Czech service as a reference point and that Czech listeners could profit from the broad perspective on regional and world events that it supplied. Even so, RFE's Czech service was cut back, and it entered into a cooperative relationship with Czech public radio to set up a new public-affairs program. The RFE Polish and Hungarian services ceased. But both RFE and RL found new outlets by making arrangements with more than 100 radio stations throughout Eastern Europe and the former Soviet Union to rebroadcast RFE/RL programs.

As Yugoslavia began to break apart in the early 1990s, RFE and its supporters raised the possibility of a Yugoslav service, and in 1994 RFE began broadcasting in Serbian, Croatian, and Bosnian. Disorder in Albania in the mid-1990s brought a resurrection of RFE's former Albanian service. Continuing crises in the Balkans during the late 1990s, the war in Kosovo in particular, served as fresh reminders of the fragility of that part of the world and provided one more reason for maintaining the services. RL acquired responsibility for two tactical radio operations originally established by the CIA. Radio Free Afghanistan and Radio Free Iraq both came under RL in the 1990s; the former has survived the disappearance of a harsh Islamic government in Afghanistan in 2002, while instability in Iraq virtually guarantees continuation of the latter. RL also added a Persian (Farsi) service, Radio Azad, in 1998, then renamed and reoriented it in December 2002 as Radio Farda, for Iranians under 30. (Farda is a joint venture between RFE/RL and VOA.) Finally, RL initiated a web-based Tajik service in 2001.

Thus, RFE/RL has been able to establish for itself what appears to be a permanent place in the overall structure of international broadcasting activity financed by the U.S. government. The International Broadcasting Act of 1994 (Public Law 103-236) brought together all U.S. government nonmilitary international services under a Broadcasting Board of Governors. The nine presidential appointees who serve on the board also function as the RFE/RL board of directors. They also provide oversight for the International Broadcasting Bureau (IBB), which includes the VOA, Radio-TV Martí (to Cuba), Radio Free Asia (RFA), and the WORLDNET Television and Film Service. As of 1 October 1999, the IBB became independent from the U.S. Information Agency and is now

financed through a separate annual appropriation by Congress. RFE/RL also receives such an appropriation. So does the new (broadcasts began in 1996) RFA, which serves listeners mainly in the People's Republic of China, Laos, Cambodia, and North Korea.

This situation throws into sharper relief than ever one of the longer-running questions about RFE/RL and RFA vis-à-vis VOA: why does the U.S. government need two broadcast services to reach the same parts of the world in the same languages? There is little evidence to suggest that listeners see RFE/RL or RFA as anything other than voices of the U.S. government, even though official publicity from them stresses their "private" identities. There is one notable difference in program strategies: RFE/RL and RFA both place far more emphasis on coverage of events taking place within the nations they serve, whereas VOA stresses political, economic, and cultural life in the United States. But all of them provide coverage of international events, and there is duplication in that coverage. It seems likely that there will be increased pressure by Congress on all of the services to coordinate that and possibly other aspects of their programming, with a full merger into a single service as a not-unlikely prospect at some future date.

Radio Hall of Fame

Recognizing Important Contributions to American Radio

Operated by the Museum of Broadcast Communications (MBC), the Radio Hall of Fame honors those who have done the finest work in U.S. radio broadcasting, past or present. Each year several new winners are added to the growing list of honorees.

How It Operates

The idea of creating a hall of fame for radio broadcasting originated with the Emerson Radio Corporation in New York. The first awards were given in 1988. The MBC in Chicago took over administration of the awards in 1991.

Each year the Radio Hall of Fame steering committee (a group of about 30 radio professionals and others named by the president of the MBC) nominates worthy individuals in each of four categories: pioneer network or syndicated; pioneer local or regional ("pioneer" meaning at least 20 years of service); active network or syndicated; and active local or regional ("active" meaning at least 10 years of service). Up to four nominations may be made in each category.

Nominations are sent to members of the Radio Hall of Fame and the MBC in May and (to new members) July of each year. Ballots are tabulated by a Chicago accounting firm. Nominees who receive at least 50 votes are eligible for consideration for

induction for up to five subsequent years. New winners are announced in August and presented at an annual Chicago dinner/broadcast in November.

Inductees: 1988–2001

Each of the inductees (person or program) is listed below alphabetically by program category.

Radio Luxembourg

English Language Service, 1933–1992

Radio Luxembourg has a unique place in radio history. It broadcast to three generations of United Kingdom listeners, and it is the best-remembered—though not the first—station broadcasting from Europe. Some of the most famous personalities in broadcasting and light entertainment were heard on the station.

Origins

Before World War II, the British Broadcasting Corporation (BBC), which had an official monopoly on U.K. radio services until 1973, broadcast mainly serious and high cultural programming, especially on Sundays—often the only rest day for working people. This left a clear gap in demand for lighter, entertainment-led fare.

The tiny country of Luxembourg had been allocated only a single low-power, medium wave transmitter by the International Broadcasting Union, but in order to gain lucrative

advertising from much bigger audiences elsewhere in Europe, the Compagnie Luxembourgeoise de Radiodiffusion (CLR), which had been incorporated in 1931, appropriated a long wave frequency. It began broadcasting services in several languages over the most powerful transmitter in Europe from studios at the Villa Louvigny in the city of Luxembourg. The English service, initially broadcast only on Sundays to counter the limited BBC programming, began on 4 June 1933. Most of the programs were produced by London advertising agencies, principally J. Walter Thompson and the London Press Exchange; most programs were variety shows, dance-band half hours, and personality showcases, with the artists closely associated with the products they advertised. The most fondly remembered show of this period was a children’s program, *The Ovaltine’s Concert Party*, sponsored by the makers of the malted drink Ovaltine. In an inspired marketing ploy, a club called the League of Ovaltineys was formed in 1935; by 1939 the club claimed some 5 million members.

In 1936 the BBC's audience research indicated that most listening in the United Kingdom on Sundays was to continent-based stations, with Luxembourg being the most successful. The post office in the United Kingdom, under pressure from the BBC, refused to carry programs from England by landline to the Luxembourg transmitter, so most were recorded in London on either 78 rpm discs or film celluloid and shipped to the Grand Duchy.

Indeed, the BBC, the U.K. government, and other national and international bodies made strenuous and persistent efforts to thwart the Luxembourg broadcasts, but the broadcasts continued until World War II and Luxembourg's 1940 occupation by Germany. Even then, the station continued broadcasts in English to the United Kingdom—this time for Nazi propaganda. The most notorious broadcaster on this "service" was William Joyce, whose outrageous claims about the progress of the war and the Allied leaders—all delivered in an exaggerated upper-class accent—led the British public to mock him as "Lord Haw Haw." Joyce was executed for treason in 1946.

Postwar Operations

Toward the end of 1944, U.S. forces took over the station, initially to broadcast morale-boosting programs for Allied prisoners of war and, after peace in 1945, as an entertainment station for troops remaining in Europe. The U.S., French, and British governments were all involved in negotiations to take over the transmitters, but in September 1946, Radio Luxembourg announced that sponsored programs in English would begin again at the end of the year. The U.K. audience quickly returned, along with the Ovaltineys, and in 1948 British listeners heard their first record chart show. However, the range of programs also included comedy shows and quiz and talent shows; several of the latter, including *Take Your Pick* and *Opportunity Knocks*, made a successful transition to the new commercial television service in the United Kingdom.

The rapid success of television's claim on U.K. audiences led CLR to believe they could make more money by using the long wave frequency for their French programs. So in 1951 the English language service was moved to medium wave—the soon-to-be-famous 208 (meters) frequency—and confined to evening broadcasts. In 1954 CLR began a television service and became CLT—the Compagnie Luxembourgeoise de Télédiffusion. In the mid- to late-1950s Radio Luxembourg's content became more concentrated on record programs, sponsored by the major record companies, which, naturally, insisted that only their own releases be played in their slots. Nevertheless, this was the first time U.K. listeners had the opportunity to hear rock and roll records—the BBC broadcast only a couple of hours of "pop" music every week and for several years frowned on the new music genre, as did many parents. This, of course, only added to the illicit thrill for the

young generation of listening to Luxembourg—especially with a "secret" transistor radio under the bedclothes.

The limitations of the content and presentation of the sponsored record programs became increasingly unsatisfactory after "pirate" radio stations began operations in 1964 off the coast of Britain, mainly broadcasting "live" programs and based on a much wider mix of popular music. Crucially, in this era Luxembourg lost its place as the buccaneer of broadcasting: the offshore stations were now the ones pushing the legal and musical boundaries and defying authority—Luxembourg now almost sounded like the establishment.

Demise

In 1968, after a new law had forced most of the pirate stations off the air, Luxembourg introduced a "live" disc jockey-presented Top 40 format, broadcast directly from the Grand Duchy. The BBC had introduced the officially sanctioned replacement for the pirates, Radio 1, in September 1967. Broadcasting on this station was mostly restricted to daytime, so for the pop-hungry audience, Luxembourg had evening hours virtually to itself until the start of authorized local commercial radio services in October 1973.

In the 1970s and 1980s, in order to stave off increasing competition from BBC and newer commercial stations, Radio Luxembourg made several further attempts to redefine itself and appeal to a more tightly defined niche audience; formats included disco and album rock. However, U.K. listeners had an increasingly sophisticated range and quality of media on which to listen to music, and the famous "Luxembourg fade"—the signal struggling against nighttime AM interference—lost much of its charm. All of this led to a dramatic loss of audiences and, with them, advertising revenues.

The decision was made to reallocate the transmitter and frequency used for the English language service: programs on 1440 kilohertz ended on 30 December 1991. An English service continued on the ASTRA satellite—using an audio channel on SKY TV—and on shortwave, but even this restricted service was deemed not to be viable and was closed just 12 months later. In 1997 CLT merged with the Hamburg-based Film-und-Fernseh-GmbH (UFA) to form CLT-UFA.

Radio Martí

U.S. Service Directed at Cuba

Radio Martí is a U.S. government operated news, public affairs, and music radio service designed for listeners in Cuba. Named after an early 20th century Cuban independence hero José Martí (who, ironically, often fought against the U.S.), Radio Martí was modeled after other government-sponsored propaganda radio services such as Radio Free Europe, Radio Liberty, and the Voice of America (VOA). Radio Martí began operating in 1985 and generated considerable controversy, much of which continues today.

Origins

The U.S. government began to oppose Fidel Castro's regime shortly after it came to power at the beginning of 1959. Opposition escalated in the early 1980s with Cuba's support of rebellions in El Salvador and Guatemala, and Cuba's influence on Nicaragua's Sandinista regime. A 1981 Reagan Administration initiative, "Radio Broadcasting to Cuba" became the seed for what would become Radio Martí, and was a revision of a proposal by Senator Jesse Helms (R-NC). In June 1981 he asked that existing Cuban broadcasts by VOA be designated "Radio Free Cuba" and be transmitted over an AM frequency as there were few shortwave receivers available in Cuba.

American AM broadcasters were alarmed as they were already experiencing escalating radio interference from domestic Cuban transmitters. Noted first by stations in southern Florida, AM stations across the Southeast were suffering growing interference from often high-powered (50 kilowatts and more) Cuban transmitters. U.S. radio broadcasters charged Cuba with violating the North American Broadcast Agreement, which both nations had signed in 1950 (and from which Cuba withdrew in 1981). In response to station pleas for action, the Federal Communications Commission began granting "temporary" power increases to the U.S. outlets most strongly affected.

After Cuba announced plans to launch almost 200 new radio stations, many of them also using high power, a Western hemisphere AM broadcasting conference was convened in late 1981 in Rio de Janeiro. The American proposal to develop a Cuban-focused radio service angered Cuban representatives who walked out in the middle of the six-week conference. Despite this growing domestic and international tension, however, the Reagan Administration continued to push for establishment of the service.

A Presidential Commission on Broadcasting to Cuba was established in September 1981 to recommend the operating principles and details of the new station. Its report a year later suggested what became Radio Martí's charter, stating that the purpose of the station was to "tell the truth to the Cuban people about their government's domestic mismanagement and promotion of subversion and international terrorism in this hemisphere and elsewhere." In the meantime, congressional funding to initiate Radio Martí development was delayed for two years as debate dragged on.

Use of AM Frequencies

At the heart of the debate was the proposal to use an AM frequency for the Cuban service due to the dearth of shortwave receivers on the island. This provoked a conflict between American broadcasters fearing greater interference and the government's anti-Castro policies. U.S. AM stations also feared Cuban retaliation in the form of high-powered signal jamming that could wreak havoc with American stations and not just Radio Martí. The National Association of Broadcasters promoted several alternatives for Radio Martí, including use of a shortwave frequency and making the service a function of VOA rather than a free-standing service. Radio Martí supporters argued that VOA was prohibited by its charter from performing this function.

In its final report, the presidential commission acknowledged that government use of a civilian AM frequency was a violation of principle, but was not without precedent. VOA already used 1580 kHz for Caribbean broadcasts from the island of Antigua. Radio Free Europe also used an AM transmitter to broadcast to Eastern Europe from Germany. In the late 1960s, a government-sponsored anti-Cuban AM station was established on Swan Island, about 400 miles southwest of Cuba. Named Radio Americas, the clandestine station (supported by the Central Intelligence Agency) was successfully jammed by Cuba and operations were quickly terminated. Since none of these stations were located in the U.S., they posed little threat to American broadcasters.

The most important precedent invoked by the commission, however, was an AM frequency VOA had been using since the Cuban missile crisis in October 1962. Located in Marathon Key, Florida, it broadcast to Cuba on 1180 kHz for three decades even though the military crisis originally used to justify the operation had quickly faded away. Radio Marathon, the first government operated station within the continental United States to use an AM frequency, shares the AM channel used by radio station WHAM (Rochester, New York) and other outlets.

In 1982 lawyers for station WHO submitted testimony showing that it would not be a violation of the VOA charter for it to assume responsibility for Radio Martí. This new evidence allowed the existing Radio Marathon operation to evolve into a new Radio Martí. Senate Bill 602 was signed into law by President Reagan in September 1983, formally creating Radio Martí as a part of VOA. Controversies continued over who would actually control station content—professional VOA administrators and broadcasters, or the anti-Castro Cubans based in Miami. The latter wanted a far stronger political tone to the operation and sought to make it a voice for the Miami-based opposition movement. This battle would extend over the next two decades.

Operations and Controversy

Radio Martí signed on the air on 20 May 1985 from Marathon in the Florida Keys, transmitting on 1180 kHz. Initial reports from listeners suggested that while the station was less strident in its message than many had feared, it was also dull. Music programming was popular, but provided little that was not already available on Cuban stations (or those in Miami often picked up in Cuba). One Radio Martí soap opera had been produced a decade earlier (and sounded that way) while a Spanish-language comedy show was older still. Lack of personnel was cited by station programmers as the reason for what was planned as temporary use of the old material.

Initially programming 14 hours per day, Radio Martí expanded to 17 hours in 1986, and eventually into a 24-hour

service. Audience research was difficult given the understandable refusal of Cuban authorities to allow on-site surveys. Instead, Radio Martí officials relied largely upon interviews with recent Cuban emigrants for a sense of what was being listened to and listener reactions.

Radio Martí operation and an appreciation of its growing audience led to the creation of a television counterpart, TV Martí, and an Office of Cuba Broadcasting (OCB) to supervise both radio and television stations, in March 1990. Thanks to consistent jamming of its signal, however, the late afternoon telecasts were seen by few on the island. Its relative lack of success prompted calls for a cut in funding to both services, though political support assured that funding continued into the 21st century, with most of the money going into the radio service. The U.S. government experimented in May 2002 with delivery of both radio and television signals using transmitters in circling airplanes as well as direct broadcast satellite links in an attempt to overcome Cuba's jamming efforts. By early 2003, broadcasts also encouraged tuning the services over the internet, though internet access is limited (and tightly controlled) within Cuba.

In 1994 the International Broadcasting Act required that all American international broadcasts, including Radio Martí, be consistent with broad American foreign policy objectives. It also reorganized all U.S. international radio services and later made them part of the Department of State. New management for Radio and Television Martí was installed in 1997 and fairly regularly thereafter. By late 1998, 80 percent of Radio Martí programs were live, replacing pre-recorded material and making the service more appealing to younger listeners. Five years later, the service was operating on a budget of about \$15 million annually, employed just over 100 people full-time (both in Miami and at the transmitter site in Marathon Key) and made use of many part-time broadcasters. Its two AM transmitters (upgraded to 100 kilowatts in 1999) utilize four antenna towers that focus signals toward Cuba. Cuban jamming efforts varied depending on relations between the two countries.

Despite strong congressional and administration political support, problems persisted with station administration and internal controls of Radio Martí program balance and objectivity. News commentary and public affairs programs were often found to be too shrill and more reflective of Miami Cuban exile thinking than broader American foreign policy as was required by law. A State Department study in mid-1999 confirmed these concerns and recommended more internal program reviews and effective logging of what exactly was being broadcast as well as external oversight. As just one high-profile example, debate erupted over Radio Martí coverage of the Elián Gonzalez controversy in early 2000. A six year-old boy had escaped the island with others, and was living in Miami with a relative. After much political wrangling over several months, he was taken by U.S. police (resulting in some

inflammatory news coverage and photos) and returned to Cuba and his father. Raging controversy over this "surrender" pitted the Miami exile community against the federal government and the radio service was caught in the middle. Radio Martí delayed the news of what many Cuban exiles perceived as a political abduction for four hours. The station director was soon replaced.

Well into the early 2000s, continuing controversy enveloped direction of both the OCB and Radio Martí, and a succession of directors of both operations came and went, reflecting continued infighting over the content and tone of the service.

Radio Monte Carlo

Commercial Radio in France

Nominally the radio service of the principality of Monaco, Radio Monte Carlo was in fact controlled by France until 1998, providing news and entertainment programs in a commercial format for both French and European audiences. A later Middle East service had more of an international flavor.

Origins

Prior to World War II, France experimented with both commercial and state-operated radio, with some of the most popular radio heard in Britain coming from French-established radio stations such as Radio Luxembourg, Radio Normandie, and Radio Paris. During the war, Vichy Prime Minister Pierre Laval created an organization to operate what were eventually known as *radios périphériques*, commercial stations that could broadcast into France from the fringe. Radio Monte Carlo was

the first of these, established in 1942. The Vichy (collaborationist) government in the southern part of France purchased the property in 1943. The German government began to install high-powered transmitters in an underground bunker located in the principality of Monaco, for propaganda purposes. Allied forces captured the station before it could be put on the air by the Nazis, however, and in 1945 at the conclusion of the war, all radio stations in France itself were nationalized through the organization Société Financière de Radiodiffusion (SOFIRAD).

Between 1945 and 1958, SOFIRAD controlled more than 80 percent of the interest in Radio Monte Carlo. In 1964 the French state took over indirect control of the *radios périphériques*, creating a quasi-state corporation. This was part of what was called France's "audiovisual foreign policy," coordinating all schools, technical and scientific cooperation, and cultural activities (including radio, television, and film) as

part of the state's cultural diplomacy. Through this activity it subsidized the operations of public broadcasting in France; the operations of TV5; Canal France International; Radio-France Internationale; the *périphériques*; Radio Monte Carlo Moyen-Orient (Middle East), an AM (medium waveband) station broadcasting in Arabic and French from Cyprus; and Médi 1, broadcasting to the Maghreb countries from Morocco.

Radio Monte Carlo's programs were generally livelier, more informal, and more commercial than those of the state monopoly radio stations. In 1964 it began FM broadcasting and in 1965 it started experimental broadcasts using long waves at 1,250,000 watts, making it the most powerful long wave radio station in the world. It also developed a reputation as a more reliable source of news in France than the state monopoly broadcasters, even though the French government itself had such a large (over 80 percent) interest in it and appointed ten of the 12 members of its board of governors. This reputation for news coverage became especially noteworthy in its reporting of the student riots in Paris in 1968.

Transition to Private Ownership

Although it was originally a profitable venture, as it and the other *radios périphériques* attracted more than half the French radio audience, by the end of the 1980s Radio Monte Carlo's audience had dropped significantly, partly due to the rise of pirate radio stations in 1977 and 1978. These pirate stations were operated not only by individual entrepreneurs but also by French opposition political parties themselves so that by 1981 the French state radio monopoly was effectively broken. Radio Monte Carlo attempted to attract people back by initiating talk radio and purchasing the Radio-Montmartre.

In 1986 the government granted domestic FM licenses to the *radios périphériques* and in 1989 Radio Monte Carlo purchased the Nostalgie FM network. By 1992 there were 1,700 radio stations operating in France, 1,200 of which were commercial. Radio Monte Carlo operated on a variety of wavelengths including AM or medium wave frequencies and shortwave, from both Monaco and Paris. This prompted questions about the long-term viability of the *radios périphériques* in the newly competitive and privatized environment of French media, as well as question about the French government's par-

ticipation in them. In 1994 an agreement was reached whereby Radio Monte Carlo would be privatized, thus ending the participation of the French state in its finances and operations. This occurred by mutual agreement in 1998.

Middle East Service

When Radio Monte Carlo Middle East was first created, it relayed its programs from the studios of Radio Monte Carlo in Monaco, but in the mid 1970s the production headquarters was shifted to Paris. (Although it broadcast on medium wave, it also began a short-lived experiment in shortwave delivery after 1985.) Increasing in popularity in the Middle East, particularly for its pro-Arab reporting during the 1973 Middle East war, Radio Monte Carlo played a prominent role in reporting the 1970 Mecca Mosque incident, the 1981 assassination of Egyptian President Anwar Sadat, Lebanon hostage-takings, and the 1981 *Achille Lauro* cruise liner hijacking. It broadcast a mix of French, American, and Arabic music, in addition to news and commentary. As Boyd puts it, Radio Monte Carlo Middle East was an especially profitable station from the mid 1970s until the early 1980s, when the oil slowdown occurred in the region. Its profits were further reduced in 1986 when Saudi television began accepting advertisements.

Radio Moscow

International Radio Service of the Soviet Union

The Soviet Union was one of the first countries in the world to engage in international broadcasting. Its first official international broadcasts aired in 1927 during the tenth-anniversary celebration of the Bolshevik Revolution. Listeners outside the Soviet Union had been able to hear Soviet shortwave broadcasts as early as 1922 from Radio Comintern, although these broadcasts were officially designated as domestic. In 1925 broadcasts about the anniversary of the October Revolution were broadcast in English, French, and German (although also ostensibly to internal audiences), and the 1927 broadcasts from Moscow were also aired in foreign languages. All these efforts, however, were sporadic, ending as quickly as they had begun when their official purpose concluded. Radio Moscow was officially inaugurated as a continuous service in 1929, with broadcasts in Chinese, Korean, and English from Khabarovsk, Siberia, near Manchuria, and in German, French, and English from Moscow itself.

Radio Moscow was the Soviet Union's entry into the radio war waged against Nazi Germany by the Allied powers in World War II. Although the Germans had used radio against the Soviet state in the mid-1930s, the battle between these two powers ceased once the Russo-German non-aggression pact was signed in 1939, a situation that continued until Hitler attacked the eastern front in June 1941, at which time Radio Moscow resumed its anti-Nazi broadcasts. Radio Moscow continued to be heard throughout Europe during the war, including in Nazi Germany, and it was a prime target for Luftwaffe bombing runs over the Soviet Union.

Cold War Transmissions

Following the end of the war in 1945, Radio Moscow became the principal adversary of the radio services emanating from North Atlantic Treaty Organization (NATO) countries in the Cold War that began in 1946. It broadcast about 48 hours a day (or about 335 hours per week) in various languages. Like the Western international radio stations, it broadcast a mix of news, features, music, commentaries, mailbag (comments from listeners or answers to their questions), and interview programs. By 1950 Radio Moscow was broadcasting 533 hours a week, by 1960 1,015 hours, by 1970 1,908 hours, and by 1980 2,094 hours. In 1986 Radio Moscow, Radio Peace and Progress, and other Soviet regional stations were broadcasting 2,229 hours per week (second only to the American stations, Voice of America, Radio Free Europe, Radio

Liberty, and Radio Martí, in total hours per week). In 1985 Radio Moscow was broadcasting in 82 languages to Europe, Asia, Africa, the Americas, and the Pacific Island nations (including Australia).

From its earliest years, Radio Moscow was under the control of various state ministries and committees, with the State Committee for Radio and Television in charge from 1957 until the demise of the Soviet Union. Radio Moscow was thus subject to the same ideological expectations as those that applied to the Soviet Union's domestic services. These expectations were enforced by the Communist Party itself, exercised through the Council of Ministers. The principal divisions of the State Committee—mirrored in the organization of each of the broadcasting services—were information, propaganda, children's programs, youth programs, literary programs, music, audience research, and program exchange.

Voice of Russia

A new policy of *glasnost* (openness) began to filter into the broadcasts of Radio Moscow in 1987, based in the avowed commitments of the Soviet leader Mikhail Gorbachev. Radio Moscow became less adversarial toward the West, and its broadcasts began to take on more of the tone of the Western stations, particularly the British Broadcasting Corporation (BBC) World Service. But with the fall of the Soviet Union and the financial difficulties of the new Russian state, Radio Moscow also fell on hard times. It began to cut back its broadcast hours and to reduce its programming languages. In 1995 it laid off 30 percent of its staff. By 1999 the "Voice of Russia," Radio Moscow's new name, was down to 31 languages, and its weekly airtime was down to 504 hours. The Voice of Russia claims to broadcast 340 feature programs, providing its listeners with insights into the various "fields of life" in Russia, and to have listeners in 160 countries. It uses 50 transmitters in Russia, 30 in former states of the Soviet Union, one in Germany, and two in China to reach its audiences.

The change in Radio Moscow's programming philosophy could be seen between 1987 and 1990 in its coverage of international news, particularly in events that included the two superpowers. Its ideological edge was softened over this period, and it began to grope for ways to report the news using different linguistic frames than those that had influenced its broadcasts from early in its history. It shifted away from a perspective grounded in rivalry or enmity between the Soviet

Union and the West, to different linguistic categories that were more dynamic and neutral in their treatment of the American president and life in the United States.

Despite the changes in Russia, the Voice of Russia continues to be a state broadcasting company. It is financed by the Russian government and is governed by a chairman and a board of directors. It is also a member of the Federal Teleradio/Broadcasting Service of Russia, which also includes the state-financed domestic radio and television services in Russia. Although it is expected to provide multiple views in its programming, it continues to give priority to views of the state in its broadcasts. Its mission continues to be that of telling the world about Russia, portraying the country realistically, and explaining it to its international audiences.

Radio Sawa/Middle East Radio Network

U.S. International Radio Service

Early in 2002 the United States initiated a new 24-hour Arabic language radio broadcasting service in the Middle East. The service was a product of Voice of America (VOA) rethinking about the United States' image in the region. Implementation was speeded up after the 11 September 2001 terrorist attacks on New York and Washington, D.C., and Radio Sawa ("together" in Arabic) began service in March of 2002.

Origins and Mission

For several decades the Voice of America provided an Arab-language service by shortwave and medium wave. These broadcasts were usually for only a few hours a day, and there was often considerable criticism of this single service for such a varied area. More specifically, the service was often criticized for what was or was not broadcast. With the expansion of FM service throughout the Middle East, shortwave listening dropped off. United States radio "presence" across the region was thus increasingly left behind by the domestic and international radio efforts of other countries. Consideration of a dedicated Arabic service was initiated at the end of the 20th century.

The idea for what would become Radio Sawa originated with the U.S. Broadcasting Board of Governors (BBG), which supervises all U.S. international radio services. Norman J. Pattiz, chairman of Westwood One, and a Clinton administration appointee to the BBG (and the only radio professional member), spearheaded the process to get the new service on the air. He led a study mission to the Middle East in early 2001, becoming even more convinced of the need for a full-time Arab-language service to counteract the many area government-supported media services that provide less-than-positive views of the United States. Pattiz's idea took on more urgency in the aftermath of the September 2001 terrorist attacks on the United States and soon became a "pilot project" of the Voice of America. Congress provided \$35 million to launch the project in fiscal year 2002, half of which was to be used for one-time investments in transmitters. The second year (fiscal year 2003) financial request to Congress was for nearly \$22 million.

The intent of the Middle East Radio Network (MERN), as it was originally dubbed, was expressed in an early press release: "to broadcast accurate, timely and relevant news and information about the region, the world and the United States, and,

thereby, to advance long-term U.S. national interests.” MERN’s primary audience was defined as those in the Middle East under the age of 30—roughly 60 percent of the population. A secondary audience was defined as anyone seeking news.

United States delegations visited various Arab nations in late 2001 and early 2002, seeking agreements to establish both medium wave (AM) and FM transmitter locations for the new service. Operations were established in Washington and in Dubai, and Arab-speaking staff was hired in both locations. Broadcasts would be provided in five regional Arabic dialects aimed primarily at listeners in Jordan and the Palestinian areas, Egypt, Iraq, Sudan, and the Gulf States.

Initiation

MERN first went on the air as Radio Sawa on Friday, 22 March 2002, with popular Western and Arabic musical programming and promotions for news broadcasts that began in early April. Initial broadcasts came from FM transmitters based in Amman, Jordan, and in Kuwait City. The service was also carried on the digital audio channels of the satellite services Nilesat, Arabsat, and Eutelsat’s “Hotbird.” Termed “phase one” of the service’s rollout, these first transmitters were joined in mid-April with two more from both Abu Dhabi and Dubai in the United Arab Emirates. Medium wave or AM transmissions were provided from both the Eastern Mediterranean and the Gulf. (The VOA’s Arabic language service was terminated in favor of Radio Sawa shortly after the latter went on the air.)

Programming was planned to expand to include news analysis, interviews, opinion pieces, sports, weather, and features on a variety of political and social issues. Various regional programs were also projected. By early 2003, FM transmitters were operating 24 hours a day from Amman (Jordan); Kuwait; Dubai; Abu Dhabi; Doha; Djibouti; and Manama (Bahrein), along with the two medium-wave (AM) transmissions—and the service could also be tuned in numerous short-wave frequencies. Plans included six different program streams for different parts of the Middle East. Initial Radio Sawa audiences were difficult to ascertain, although by mid-2002 audiences seemed to be growing, especially in Jordan. Original expectations were that 4 million would listen during the service’s first year, with closer to 7 million a year later.

Receivers

Over the course of some eight decades of radio broadcasting, receivers for tuning into broadcasts have evolved and become generally lighter, more efficient, and less expensive. They have changed radically in both design and internal features. While radio receivers are now virtually ubiquitous in homes, cars, and offices, such was not always the case. This entry focuses primarily on U.S. commercial development of consumer radios, with some discussion of developments outside the U.S. as well.

Early Receivers

The earliest consumer radio receivers were relatively crude handmade devices created by amateurs. Throughout the

1920s radio enthusiasts built a variety of sets: sometimes simple crystal tuners, often more complex sets featuring several vacuum tubes (these were sometimes sold as ready-to-make kits). Except for the crystal sets, early radios required power provided by bulky wet-cell batteries and later by rechargeable storage batteries. Users listened using earphones or, by mid-decade, separate horn-shaped acoustic speakers. These early sets were limited in sensitivity (ability to pick up weaker signals) and selectivity (ability to distinguish between signals and to tune sharply) and were not very handsome to look at, consisting of a mass of wires, tubes, batteries (often leaking), and controls. They required careful tuning with several dials, and delivered (by present day standards) poor audio quality.

The first commercial receivers became available in 1920–21, but initial store-purchased sets were expensive and thus limited in appeal. Manufactured initially by Westinghouse and General Electric (for sale under the RCA “Radiola” label) and soon thereafter by other manufacturers, they came with key components simply mounted on boards (termed *breadboards* in the trade) or built into wooden cases (sometimes referred to as *breadboxes*), and they required the same complex battery and antenna rigs used by the home-built sets. As the radio craze peaked in 1922, hundreds of other manufacturers—including Atwater Kent, Crosley, Grebe, and many smaller firms—offered receivers from inexpensive single-tube sets (selling for up to \$10) to far more sophisticated multi-tube receivers selling for well over \$100. By 1924 more than a million commercial sets a year were being sold to consumers. Most were hand-wired, thanks to relatively cheap labor (this industry was one of the first modern manufacturing businesses to employ women) and the complexity of their designs.

The first receivers able to operate on AC power, thus eliminating the need for messy batteries, appeared from Atwater Kent, Grigsby-Grunow (“Majestic” radios), and then RCA in 1927–28. From 1924 until 1931, only RCA offered the superior superheterodyne circuit, for the company had purchased Edwin Armstrong’s patent. The “superhet” provided far better selectivity and sensitivity than did radios made by other firms. As part of the settlement of an antitrust proceeding, RCA had to make the circuit available to other manufacturers. Superheterodyne circuits dominated radio receivers for decades.

By the late 1920s receiver design was becoming more sophisticated, and the first console (free-standing) “hi-boy” floor models became available as radios became an item of furniture for the home. Indeed, the design of the wooden cabinetry became an important radio selling point, as did annual model changes (sometimes models changed more frequently than annually), somewhat paralleling automobile sales techniques. Radios were widely sold in various historical “period” styles as well as utilitarian furniture—desks and end tables, for example—all intended to fit with varied home decor. Some table models appeared in all-metal cases, which added to their weight but protected the delicate tubes and circuits. Again attesting to inexpensive labor costs, some were even offered with hand-painted floral designs in multiple colors, made to order. Most radios offered circular dials for selecting stations, leading to users referring to a given frequency “on the dial.”

On the eve of the Great Depression, some 60 manufacturers of radios were operating, although four of them held two-thirds of the market and two controlled a third. Fancy console models dominated the radio market. Overproduction, however, helped to force prices down (from an average of \$136 in 1929 to about \$90 in 1930 and down to \$47 by 1932). A host of manufacturers were forced out of the market and then out

of business. Depression realities forced a return to cheaper small table model radio receivers, and by the mid-1930s Philco was making a third of them. Crosley and Emerson also specialized in small and inexpensive radios (around \$15).

Mass Market Receivers

In part as a move toward greater efficiency, radio circuits, vacuum tubes, and designs all became more standardized. Most table radios (by the mid-1930s, these combined the receiver and loudspeaker in a single enclosure and made up 75 percent of the market) were of the “cathedral,” “gothic” (with a rounded or pointed top), or later “tombstone” (with a flat top) design. As economic conditions improved, console radios resumed their former popularity, and better models featuring shortwave as well as medium wave (AM) bands, pushbutton station selection, better speakers, and larger lighted radio dials for easier tuning became available. The first car radios appeared around 1930, although only the more expensive models included radios as factory-installed equipment. By 1938 more than half of the world’s radio receivers were in the United States. That radio had become central to daily life is clear as more homes owned radios than owned telephones, vacuum cleaners, or electric irons.

Radios came in an increasing variety of shapes and sizes. Smaller shelf or “mantle” radios became popular because they were easy to move from one room to another. Compact or “midget” radios by Emerson and other firms were made possible by smaller vacuum tubes. Some were manufactured in novelty designs tied to popular radio shows (e.g., Charlie McCarthy or Hopalong Cassidy) or reflecting popular culture (e.g., the Dione Sextuplets) themes. Prices dropped below \$10 for some models. In the late 1930s and early 1940s, tabletop sets manufactured from special Bakelite and Catalin plastic resins became popular owing to their reasonable prices and huge decorative appeal. Most sets featured two to three colors and fit in well as bright additions to kitchens and family rooms. Some models were purchased because of their value as both colorful and practical accessories in bedrooms and even bathrooms. (Today many of these same sets are expensive collector’s items, costing thousands of dollars.)

In April 1942 manufacture of all civilian radios was halted as part of the U.S. war effort. Finding spare parts grew harder, and thus radio repairs became increasingly difficult as the war continued. Pent up demand led to massive numbers of AM radios being made again starting in late 1945. More than 50 million were sold from 1946 to 1948 alone. The availability of more receivers meant more multi-receiver households, a phenomenon that had first appeared in the 1930s. Plastic was now the radio cabinet material of choice, available in many different colors and shapes and less expensive to manufacture than the former wooden casings.

Radios in the 1950s continued the trend to smaller and lighter formats. Few consoles were sold (households devoted available console space to television) as sales concentrated on table radios, most of which were AM only despite the appearance of FM stations. Clock radios with “wake-up” features became popular. Radio technology had changed very little over two decades because designs were still based on the use of vacuum tubes. Only in 1954 did the first tiny transistor models become available, their ready portability a trade-off for very poor sound quality. Only in the 1960s did transistor radio prices drop sufficiently to drive tube models off the market.

FM Receivers

The first FM radio receivers became available in 1941 just as the first FM stations took to the air. Perhaps 400,000 were manufactured before wartime consumer product restrictions came into force. All of the pre-war sets were designed for the 42–50 megahertz FM band, so when the Federal Communications Commission (FCC) shifted the service up to 88–108 megahertz in 1945, the older sets were made obsolete. A few receivers were sold with both old and new FM bands in the 1945–48 period, when dual station operation was allowed. Only very slowly did sets on the new band become available, and then only at prices far higher than comparable AM models. Sales were slow—a tiny fraction of AM levels—and declined into the 1950s.

As FM service began slowly to expand in the late 1950s, however, so did the manufacture and sale of FM receivers. The addition of stereo service in 1961 was a major factor in rising FM receiver sales, as was the growing high fidelity movement (which originated in Britain) among audiophiles. FM reception was a core feature of component stereo systems. Companies such as Fisher, Marantz, and Scott built high-quality tuners that required separate amplifiers and speakers but delivered superb sound.

By the mid-1960s FM radios were found in more than half of the nation’s households, but FM radios remained rare in automobiles into the 1970s. FM proponents sought to persuade Congress to require that all radios receive both AM and FM bands (parallel to television legislation that mandated UHF as well as VHF reception capability), but slowly rising FM sales made the attempt unnecessary. As prices came down and more FM stations took to the air, more radios featured both AM and FM tuning capability.

Portable Receivers

Initial portable radios were portable in name only. Handmade “portables” were fragile, bulky, and heavy, even without the required horn speaker and batteries. Yet the ability to take a

radio with you was a strong lure, as is evident even in radio advertising of the early 1920s. Some homemade models were tiny and featured earphones. Still, the first commercial portables resembled midsize suitcases, and not light ones at that. One knew they were intended to be portables simply because they had handles. All these difficulties drove the portable radio off the market by 1926–27 while consumers focused on the new plug-in home receivers.

While many small radios were sold with handles, they still had to be plugged in (they did not operate with batteries), making them what Schiffer (1991) terms *pseudo-portables*. They looked the part, but they were not. Almost no true U.S. portable radios were manufactured in the 1930s save by some smaller companies operating on the fringe of the business. The market was simply too small.

The availability of smaller and more efficient tubes that drew battery power more sparingly helped spark a revival in manufacturer interest in portable radios in 1938–39. Led by Philco and other firms, battery-powered portables began to flood the U.S. market: more than 150 models were available by the end of 1939. Many still looked like cloth-covered suitcases, but now they were small, light, and clearly intended to be carried about. Others made use of the then-new plastic cases and weighed only five or six pounds even with their batteries. Some were even touted as being pocket sized. Most could also double as plug-in table radios. One of the best was Zenith’s Trans-Oceanic, which went on sale early in 1942 featuring several shortwave bands with AM reception, a radio log, special antenna, and a large battery pack. Despite its high price (\$100), it was hugely popular in the few months it was available, and it resumed production after the war, lasting in improved models well into the 1960s.

Postwar portables were central to the AM radio boom. Although based on prewar technology, they appeared in bright plastic cases that emphasized modern styling, many of them dubbed “lunchbox” radios because of their size. Manufactured by many companies, these were hugely popular in the late 1940s and into the 1950s, selling more than a million units a year. Smaller “miniature” or “shirt-pocket” models appeared in the early 1950s. No portables included FM tuning, in part because of the limited distance FM stations could transmit.

Announcement of the transistor in 1948 and its first appearance in a small radio (the Regency TR-1 in 1954) sparked a new generation of portables in the late 1950s that emphasized their tiny size, light weight (11 ounces in the Regency’s case), long-lasting batteries, and portability. Combined with radio’s development of Top 40, the transistor portable helped to transform radio’s audience from an at-home family image to an on-the-road active youth image. Yet tube-based (or tube-transistor combination) portables lasted into the early 1960s, in part because of the initial high cost of transistors.

Receivers Outside the U.S.

Radio receivers in other countries generally followed the same trends as in the United States. Tight patent control encouraged domestic manufacturing in most industrial nations before World War II, limiting imports from the United States or elsewhere. What most set different nations apart was the design of the radios in each era.

Early British wireless sets were battery powered; sets designed for “mains” (AC) power appeared in 1926 but took longer to catch on as electrical service was spotty. Annual (1926–49) 8- to 10-day “Radiolympia” shows near London highlighted the annual model changes of the dozens of receiver and radio equipment manufacturers. There was little standardization of components or design, although regulations required the use of largely British materials and vacuum tubes. Receiver cabinets were made largely of wood until the inception of Bakelite products in the mid-1930s. Many receivers were rented rather than sold. Thanks to the lingering lack of rural electricity, the battery-powered portable radio was very popular in the 1930s, well before that occurred in the United States. Although civil production continued well into 1940, the war’s demand for rapid construction of military equipment brought about far more standardization of parts and processes with a dramatic reduction in the different numbers of devices manufactured. Postwar radios were made under conditions of rationing yet achieved prewar levels very quickly. Promotion centered on homes purchasing a “second set” to expand radio listening. Radios appeared in more modern designs. Although BBC broadcasting in FM began in 1955, few FM radios were sold until the 1960s. The inception of FM and availability of improved recordings sparked the high-fidelity movement that began in Britain. High quality audio products became a chief British export. At the other end of the radio scale, the first British transistor radio was sold in 1956 but by 1964 (as in the United States), the market was dominated by Asian imports.

In Europe, Germany had scores of radio manufacturing firms before World War II. Cheap labor and solid patent control (especially by Telefunken) allowed manufacture of good radios at low cost, resulting in few imports. During the war, many receivers were made to receive only local German stations in an attempt to reduce foreign listening. Saba made some of the best German radios from the mid-1920s into the 1960s. They offered advanced features such as motor drives for more rapid tuning, multiple bands, and remote controls. Many German table radios of the 1950s, such as those by Grundig, Telefunken, and Blaupunkt, became high-end imports to the U.S. market. They featured multiple bands (including FM well before most American sets), good speakers, push-button tuning, and often had rounded and polished

wooden cabinetry. The German industry finally succumbed to Far Eastern imports, as had U.S. firms.

In France, prewar radios were nearly all of domestic manufacture, with a fair number being exported to European and South American markets. As in many nations receivers were expensive at first, leading to considerable community listening to radios in centrally located public places. French postwar radios featured some of the most dramatic styling of receivers anywhere. A combination of art deco and moderne, their cabinets combined wood with metal and plastic highlights.

A few nations emphasized the manufacture of receivers for wired radio systems. Designed to keep receiver costs down while preventing listening to foreign stations, receivers could be very cheaply designed (essentially they were loudspeakers) as they were connected by wire to only one or two nearby transmitters. Some 12 million of these existed in 1950 and 40 million by 1960, nearly all in Russia (70 percent of all sets) and Eastern Europe (25 to 40 percent depending on the country). China made considerable use of wired radio systems as well.

In Japan most receivers into the late 1920s were of the crystal type. Battery-powered tube receivers (with from one to three vacuum tubes) cost ten times as much, and the best models were imported from the U.S. Set makers were usually small companies with limited output, which partially explains why early Japanese radios did not achieve the technical prowess of those in other nations. AC-powered receivers appeared in 1926 and by late in the decade were becoming more affordable and thus common. By 1930 loudspeakers were built into radio sets and were soon of the vastly improved dynamic type providing better quality sound.

Superheterodyne receivers were on the market by 1933 but did not become commonly available until after World War II due to cost. By 1938 the NHK network developed a “standard receiver” type with three or four tubes and magnetic speakers, and it “approved” though did not license the 15 companies chosen of the more than 60 operating set makers. During the war, government-encouraged consolidation resulted in about 30 firms being allowed to manufacture approved types of receivers, none of which included shortwave bands in order to better control listener choices. Price controls were imposed that continued under the occupation. By the late 1940s rationing and price controls were lifted, and Japanese radios began to match the best of those made abroad, often sold on the installment plan to spread out their high prices. The number and quality of receivers both expanded dramatically in the 1950s. All-wave receivers became standard, high-fidelity sound was available by 1955, FM reception in 1957, and stereo receivers after 1960. Transistor radios, manufactured in small numbers in the 1950s, dominated the industry by the 1960s, when many were exported to the United States.

Modern Receivers

The primary change in the U.S. radio market after 1960 (other than the addition of FM stereo) was less in their technology than their source. Japan began producing small tube portable radios for sale in the United States in the 1950s and sold its first transistor radio (a Sony TR-63) in 1957. Soon thousands of radios were being imported, combining solid (and often better) engineering with low prices. Some U.S. manufacturers shifted set making (or licensed their designs) to companies in the Far East. The revolution happened quickly; by 1963 there was no U.S. small transistor radio, for they all came from Japan. Cheaper foreign labor soon wiped out U.S. radio (and later television) manufacturing of all types; the final Zenith Trans-Oceanic model of 1973 was made in Taiwan.

In the 1990s some sets (called "smart receivers") featured RDS (Radio Data Systems) technology that enabled AM and FM stations to transmit data to receivers, thus allowing them to perform several automatic functions. Users of such sets could interface with stations and access programming information from them via a built-in light-emitting diode (LED) screen. Radio thus became a visual medium. At the turn of the 21st century, the first digital radio receivers were becoming available in the United States, having already appeared in Britain and several European countries. These were high-end products designed for use with satellite radio services.

Recording and Studio Equipment

From the carbon microphones used by the early radio experimenters to the virtual studio of today, radio equipment has evolved to meet the demands of changing programming strategies. In the earliest days of radio, the equipment used to create programs was very basic. The radio operator spoke into a microphone connected to a transmitter. Soon, radio control rooms were equipped with mixing consoles to mix and route

microphones, remote lines, network feeds, and transcription players. In the 1950s, tape recorders were added to the equipment inventory of the best-equipped radio studios. In the 1960s, broadcast cartridge recorders and players were adopted by broadcasters as the industry standard for recording and playback of commercials and other short-form production.

In the 21st century, the basic functions of recording, editing, and playback are still central to the production process at all radio stations, but the choice of type and brand of equipment is extensive. At many radio stations, most of the recording and studio equipment is now digital, and the computer hard disk and other digital alternatives are the storage media of choice. The typical production and on-air studios of today are equipped with a variety of microphones, mixers, and consoles, analog and/or digital recording and playback equipment, audio processing equipment, and monitors. This essay describes the typical recording and audio equipment that either has been used or is being used in radio studios to meet production needs.

Microphones

The microphone is the most fundamental of all the recording and studio equipment in use today. Most radio production usually starts with a microphone. A microphone is a transducer: it changes the sound energy of an announcer's voice, musical instrument, or other sound into an electrical signal that can then be mixed with other microphones and audio sources to create the radio program. Depending on production requirements and budget, a number of different types of microphones have been used in radio broadcasting.

Microphones can be classified by the method of creating the electrical signal, or the means of transducing the sound. Adapted from their applications in telephones, carbon microphones were the first microphones used in radio. As the carbon microphone was prone to distortion and easily damaged, it was soon replaced by more durable and accurate microphones. Dynamic, or moving-coil, microphones use a diaphragm attached to a moving coil in a magnetic field to generate electrical energy. The dynamic microphone is accurate and fairly inexpensive, making it popular for both studio and remote situations. The Electro-Voice RE-20 and Shure SM-7 are two of the most commonly used dynamic microphones in radio studios today.

Condenser (or more accurately, capacitor) microphones use a built-in battery or phantom power supply from a console or mixer to charge a conductive diaphragm and backplate, creating a changing capacitance that generates the electrical signal. Condenser microphones, because of their wide frequency response, are the microphones of choice in many radio studios.

A third type, the velocity (also known as ribbon) microphone, suspends a strip of corrugated aluminum ribbon in a magnetic field. When the ribbon is vibrated by the sound pressure, an electric current is generated. While this type of microphone may still be found in some radio studios, the dynamic and condenser microphones are the microphones typically used in today's radio operations.

Microphones can also be classified by pickup patterns. A microphone's pickup pattern describes how the microphone responds to sound coming from different directions. There are three major types of pickup patterns: omnidirectional, bidirectional, and unidirectional. All three types have been or are being used extensively in radio production. An omnidirectional microphone picks up sound uniformly from all directions. The bidirectional pattern picks up sound best from the front and rear, rejecting sound from the sides. A unidirectional pattern picks up sound from the front.

A specific type of unidirectional pattern is the cardioid. Its heart-shaped pattern picks up sound best from the front, with more rejection as the sound source moves to the back. Subcategories of the cardioid pattern are the supercardioid, hypercardioid, and ultracardioid. Each of these successively rejects more sound from the sides, focusing more narrowly on the area in front of the microphone pattern. The pickup pattern of a microphone is determined by the type of pickup element it uses together with the number, size, and positioning of ports in the microphone housing used to direct the pickup of sound. Specific production situations dictate the type of pattern to be used. An omnidirectional microphone works well to pick up a group of people gathered around a microphone. Bidirectional microphones were useful in producing radio dramas because the actors could face each other. Cardioid microphones are especially popular in modern radio production because of their ability to reject unwanted studio noises behind the microphone.

Audio Mixers and Consoles

The audio mixer or console is the focal point of operations in a radio or recording studio. A mixer or console is a device that selects, amplifies, routes, mixes, processes, and monitors input signals, sending the resulting output(s) to the transmitter, recorder, or other destination. A mixer is distinguished from a console in that the mixer is smaller and sometimes portable, and is used for basic production such as mixing the three or four audio sources typically used in a newscast or sportscast. An audio console or audio board is larger and more complex, sometimes with 20 or more channels providing space for the numerous audio selection and processing options needed regularly in on-air and production situations. The console used for on-air operations is designed to be easy to use and efficient in selecting, controlling, and mixing the sources typically needed during a live radio program. The production console, because it is used in recording situations, often has a completely different design and layout from an on-air console. Flexibility, in terms of assigning and processing inputs and outputs, is the key to production console design.

On-Air Console

The electronics and design of on-air consoles have changed significantly from the early days when consoles were large, custom-designed, vacuum-tube units with large rotary controls that dominated the studio. Today's solid state, often digital, fader-control consoles meet the same needs as those first audio consoles. The on-air console is used to select, mix, and control the audio signals used to create the on-air programming of the station. This console's main purpose is to facilitate the simultaneous playback of several microphones, compact disc (CD) players, broadcast cartridge players, and other audio playback equipment. The primary output of this console is typically fed to the final audio processing and on to the transmitter.

Most on-air consoles have similar standard features and layouts. Variation comes from the number of channels and sources that can be connected to the console and special features in processing and monitoring the inputs and outputs. The number of channels on the on-air consoles varies greatly. In small or mostly automated stations, a console with six channels may handle all required operations; stations with complex live programming may have an on-air console with 20 or more channels. Each of these channels has a linear fader control that increases the output of the channel as it is pushed up, allowing the operator to visually monitor the settings of the channels. Each channel usually has two, three, or more selectable inputs to allow alternative sources to be selected depending on specific requirements. For example, channel five on a console may have CD player one as the A input, mini-disc player one as the B input, and reel one as the C input. Most on-air consoles have two or three outputs, often labeled program, audition, and utility. Each channel can be assigned individually to program, audition, or utility. The program output is often fed directly to the on-air audio processing equipment and then on to the transmitter. The audition output is often fed to recording equipment, to record telephone calls off-air, for example. Some facilities use the audition and utility feeds to send program material to a second radio station or other location. These outputs usually have corresponding VU (Volume Unit) or LED (Light Emitting Diode) meters to allow for visual monitoring of the audio outputs. The console will also have switchable monitoring of these outputs using loudspeakers and/or headphones. On-air consoles also have a completely separate monitoring circuit called "cue" to allow the operator to preview or cue the audio before it is added to the mix. Each channel, where appropriate, has remote start/stop capability to control an audio source such as a tape recorder or CD player. Other standard console features typically include a digital clock/timer, built-in connection circuits for adding telephones as audio sources, and intercom circuits to facilitate communication with announcers in other studios.

Production Console

Until the 1970s, equipment in most radio production studios was not significantly different from equipment in on-air studios. Each studio was equipped with a console, microphone(s), open-reel audiotape recorder, broadcast cartridge (cart) player, and turntables. A broadcast cart recorder and perhaps additional open-reel audio recorders and audio processing distinguished the studio used for production from the on-air studio. As the popularity of stereo FM radio increased after 1961 and affordable multitrack tape recorders were introduced, the motivation and the means existed to create more elaborate commercial and program productions. The contemporary radio production console reflects this more complex approach. The console is designed to facilitate concurrent selection of more audio sources, compound audio processing of the various signals, and provide flexibility in routing inputs and outputs depending on the specific needs of the production project.

Much of contemporary radio production, especially in larger markets, begins as a multitrack recording project. Generally, multitrack recording involves a two-stage process. In the first stage, the different elements of the production are each recorded individually, at full volume, on separate tracks. The second stage involves playing back all of the separate tracks concurrently, adjusting the relative outputs to their appropriate levels, and mixing down to two-track stereo. This procedure provides a more efficient method of changing one or any combination of elements without re-recording all the elements. Experiments with the mix can be conducted without affecting the final recording. The production console needed to support this method provides the ability to route each of the tracks from a multitrack recorder to a separate fader for adjustment and processing during mixdown.

Digital Console

One of the most recent innovations in recording and studio equipment is the digital console. Digital consoles accept the digital output of CD players, hard disk recorders, and other digital sources without conversion to analog for the purpose of routing and mixing. Maintaining the signal in digital form minimizes the possibility of noise and other artifacts introduced during conversion to analog and reversion back to digital. The continuity of the digital signal can be maintained throughout the audio chain. A digital console is different from an analog console in that the audio controls on the surface of the digital console are not physically connected to the audio circuitry. The controls are actuators that send digital control signals to the circuitry to carry out the console functions. These digital signals are commands that can be stored, grouped, recalled, and assigned as needed to various channels.

This process creates simplicity and flexibility, allowing console size to remain compact and efficient to operate.

The digital console also provides sample-rate standards conversion and synchronization, converting differing standards from different equipment to one station standard. The CD uses a sampling rate of 44.1 kilohertz, or 44.1 thousand times per second, to measure the height of the analog signal. Hard disk audio systems usually sample at 32 kilohertz while digital audiotape uses a 48 kilohertz rate. The console can generate one standard and all devices can be converted to it, along with providing a reference signal for synchronization.

Most digital consoles also accept analog inputs (open-reel audiotape recorder, microphones, etc.) and provide analog to digital conversion for insertion of these sources into the digital air chain. The console has been the last piece of major radio production equipment to complete its evolution to digital. At the same time, digital developments have, in some respects, eliminated the need for the hard-wired console.

Virtual Console

As more production is created in the digital domain, there becomes less need for an audio console to be a separate piece of hardware, manipulated by an operator. Audio sources can be connected directly to a computer and the functions previously controlled by an operator working a console (such as source selection, routing, mixing, and processing) can be programmed on the computer screen as a software function. In essence, the same process described above for digital console operation can take place entirely within the computer. The virtual console is usually a component of many hard disk recording systems. The console may simply be used to select and route audio sources for two track recording and editing or the console may be the starting point for a complex multitrack recording and editing session. Radio has come a long way from the early days of recording programs on transcription disks.

Transcription Disk Recorder

The earliest recording method used in radio was the transcription disk recorder. Modified from the early phonograph technologies, radio stations began using the transcription recorders and players in the 1920s. By the 1930s, most of the larger radio stations had transcription disk recorders. The recording process used a 16-inch flat disk of aluminum or glass covered with cellulose nitrate in which a lateral or vertical groove was cut. The transcription was cut at a speed of 33 1/3-rpm and provided a transcription time of 15 minutes. These disks were used by affiliate stations to record network programs and play them back at a later time, by program producers to distribute non-network programs to stations, and by local stations to

record their own programs for rebroadcast or air check purposes. Even after the introduction of the magnetic tape recorder, the use of transcription recordings continued into the late 1950s.

Open-Reel Audiotape Recorder

The analog open-reel audiotape recorder was introduced to radio in the United States after World War II. Both Rangertone and Ampex Corporation manufactured professional open-reel audiotape recorders based on the designs brought back from Germany. The analog open-reel audiotape recorder has been an integral part of every radio studio since then. At first, recorders were monaural, recording and playing one track. The two track recorder was then introduced and, as FM radio and stereo transmission developed, soon became the recording standard.

The fundamentals of tape recorder technology have changed very little since the tape recorder's introduction. The audiotape used today is of better quality, resulting in better fidelity and lower noise, but the electronic principles and mechanics of operation are largely unchanged.

The main components of the open-reel audio tape recorder are the magnetic heads, the tape transport mechanics, the recording and playback electronics, and the tape itself. The magnetic heads of the recorder are the focal point in the process of recording audio on a tape and reading audio from a tape in order to recreate it. There are three heads in a professional recorder, mounted left to right in the following order: erase, record, playback. The tape goes past the erase head first, where any previous signal recorded on the tape is removed during the record function. At the record head, if the tape recorder has been placed in the record mode and a signal is being sent to input of the recorder, this signal will be deposited on the tape, magnetizing the metal particles present on the tape to create an analog of the original sound waves. This signal is now stored on the tape, and as the tape passes the playback head, the arranged magnetized particles create an electrical signal representing the original sound, which is then sent to the output section of the tape recorder electronics.

A tape recorder can be described by the number of tracks it can record or play. A recorder with one head each for erase, record, and play is a one (full) track monaural recorder. Its record and playback electronics are configured using one channel. A recorder with two heads is a two channel, two (or half) track stereo recorder. A recorder with four heads is a four channel, four track recorder. Larger radio production facilities will often have four or eight track recorders available for multitrack radio production. Because multitrack recordings are typically mixed down to two track stereo for on-air playback, the most common audiotape recorder used in radio is the two track stereo recorder.

The open-reel tape transport mechanism is designed primarily to move the tape past the heads at a consistent, exact speed. Tape speeds used in radio are seven and a half inches per second (ips) and 15 ips. Tape reels of seven inches, holding 1200 feet of one and a half mil (thousandths of an inch) tape will record and play for 30 minutes at seven and a half ips. Tape reels measuring 10.5 inches will hold 2400 feet of one and a half mil tape for 60 minutes at seven and a half ips. The tape transport system consists of the motors and tensioning systems to move the tape efficiently from supply side to take-up side. The key component in this process is the capstan and pinch roller. The capstan turns at a precise speed while the pinch roller holds the tape against the capstan, pulling the tape past the heads at the selected speed. Any variation in speed or interference in the transport process will result in inaccurate recording or reproduction. Most recorders also have some type of tape counter to display elapsed time or the amount of tape used.

The open-reel audiotape recorder also has electronic circuitry to support the recording and playback processes. Professional recorders typically have both microphone and line level inputs with individual level adjustments for each channel. The line level input accepts outputs from the console or other equipment, including other recorders. The record mode can be engaged separately for each channel as well. This feature, combined with a feature often called Sel Sync (Selective Synchronization) or Sel Rep (Selective Reproduction) allows the user to listen to material recorded on one channel while recording on the other channel in synchronization with the playback channel. Professional recorders also have monitor selector switches, one for each channel, that allow listening to the source audio at the input or the audio coming from the playback head. These monitor select switches also control the signal sent to the VU meter for visual monitoring of the audio. Output level controls for each channel are also part of the electronics of a professional recorder.

The audiotape itself is an important component of the recording process. Better quality tape costs more but provides better reproduction and long-term storage. Inexpensive tapes will deteriorate faster, causing audio dropouts and flaking of the magnetic oxide coating. Tape thickness is either one or one and a half mils (thousandths of an inch). Open-reel audiotape is available in quarter-, half-, one-, or two-inch widths. The quarter-inch tape is used with full track, two track, and some four track recorders. Multitrack recorders of four or more tracks use half-inch or wider tape. The two inch tape is used on recorders that record and play 16 or 24 tracks used in professional recording applications.

Broadcast Cartridge Recorder/Player

Shortly after the open-reel audiotape recorder became a mainstay of the radio production process, the development of the

broadcast tape cartridge and recorder/player created another major refinement in the ability of radio to efficiently record and reproduce content. The cartridge recorder and player were introduced to radio in the late 1950s. Using a quarter-inch tape traveling at seven and a half ips, the tape is spliced into an endless loop wound on a single hub so that it comes out from the center of the reel, travels past the record/playback heads, and is rewound on the outside of the hub. A cue tone recorded on the tape when the start button is pressed in the record mode is sensed by the player during playback mode, stopping the tape at exactly the start of the message. A standard sized cartridge allows recording times of five seconds to ten minutes. Multiple messages can be recorded on one cart; each has its own cue (stop) tone. At one time, recording and dubbing carts was the primary activity in any radio production facility. Commercials, jingles, music, news actualities, and any program or message shorter than ten minutes was recorded on a cart. Almost every radio station used carts until the late 1990s, when digital media rapidly began to replace them.

Digital Recording, Playback, and Editing Equipment

The development of digital audio recording and playback equipment has introduced major changes in radio recording and production. The changeover from analog to digital started with the compact disc player. The once ubiquitous turntable is now almost nonexistent in radio studios. Radio quickly adopted the CD as a playback medium for music and other programs. A read-only medium until recently, CD recorders and re-writeable CDs are now being used in radio for a variety of purposes, including program production and archival storage.

Digital versions of the audiotape recorder are also being used in radio production. The rotary-head digital audiotape recorder (R-DAT) uses a helical scanning process very similar to that used in a video cassette recorder to record the digital information necessary to encode CD-quality two-channel stereo audio on a small cassette tape. The open-reel stationary head digital tape recorder manufactured today is a multitrack recorder with 24 or 48 tracks, and because of its complexity it is generally found in professional recording studios rather than in radio production studios.

Introduced as a consumer application, the digital minidisc combines the laser optical technology of the CD with the magnetic recording process of tape. The minidisc format has been adopted by many radio stations because it provides digital-quality recording, random access, and portability for field recording, all at a more modest cost than many other digital recording and playback systems. In these facilities, the minidisc recorder/player has replaced the cart recorder/player for recording and playing back short-form programs, announcements, and messages.

Digital options for recording, storing, and playing back radio programming have increased dramatically in recent years. Another option is now the hard disk of a computer. When a sound card is added to a computer with sufficient speed and a large enough hard drive, the computer can effectively replace a tape recorder. As the cost of hard drives has decreased and disk storage space has increased, recording audio on hard drives has rapidly become a viable alternative to tape and disk-based audio recording systems in radio stations. The tapeless digital radio studio exists in many different configurations and formats.

Hard disk recording systems used in radio include self-contained units such as the 360 Systems Shortcut, a hard disk two track recorder/editor, and the 360 Systems Instant Replay, a hard disk audio player, capable of playing back up to 1,000 different audio cuts when a button is pushed. Another approach to the hard disk system is the software-based integrated system installed on a personal computer. The Enco Digital Audio Delivery system and Arrakis Digilink are two of the many examples of this approach to digital audio. These systems integrate, in varying combinations, the mixing and routing functions of a console, audio editing and processing, playback, and automation functions into a single unit. While hard disk recording allows efficiency, quality, and creativity not possible with tape-based systems, broadcasters must contend with a new set of interface and technical support issues as they adopt these technologies. Hard disks can fail without warning. Where these systems completely replace tape and cartridge-based playback systems, some type of drive redundancy or removable tape or disk-based back-up is a necessary component of the system.

Once cost-prohibitive for many radio stations, digital multi-track recording and editing is now a key feature of much of the digital recording software and equipment. Many of the products are software-based so that any computer with a sound card and a large hard drive can become a digital recorder/editor. Many are self-contained units capable of recording eight, sixteen, or more tracks onto a built-in hard disk, Hi-8 videotape, or removable disk or tape system. Many of these devices are capable of being synchronized together using MIDI (Musical Instrument Digital Interface) or SMPTE (Society for Motion Picture and Television Engineers) time code so that the number of recording tracks can be expanded.

Digital recording has also changed the methods of editing audio. The process of recording over material to be replaced, dubbing to a new tape, or physically marking, cutting, and splicing the audio tape to remove or insert material has largely been replaced by a virtual editing process that takes place on the computer screen. A visual representation of the waveform of the audio to be edited is displayed on the computer screen or LCD (Liquid Crystal Diode) panel of the hard disk editor. Various editing functions can be carried out by marking and

highlighting segments of the waveform. Material can be cut from one file and pasted into another. Adjustments can be made to the beginning and ending points of the audio file. The whole file or just a portion can be programmed to loop continuously. Files can be combined in a virtual over-dubbing mode.

Audio Processing

In addition to the audio sources, console, and recording devices, most radio recording studios have additional equipment to process the audio for creative and technical reasons. There are four general categories of audio processing: frequency, amplitude, time, and noise. An equalizer is a type of frequency processor, increasing or decreasing selected parts of a sound's frequency response. Equalizer controls are included on many production consoles and in digital audio software programs and are used to refine and enhance the sounds during the recording or production. An amplitude processor is used to control the volume of the audio. Compressors and limiters are commonly used to even out the level of audio. Reverberation and echo units are time processing units that give a sound a distinctive characteristic. Noise reduction processors such as Dolby and DBX units help lower noise caused by analog recording and electronics. Audio processing today is often created digitally, allowing multiple functions to be manipulated. Some processing and effects equipment uses MIDI as an interface system to connect to synthesizers, keyboards, samplers, and other electronic equipment for creative control purposes in radio production.

Monitors

Every studio needs at least one pair of monitor speakers in order to hear the production being created. A speaker performs the exact opposite function from a dynamic microphone; electrical energy is transduced into sound energy when the electrical energy representing the sound is sent through two wires into a magnetic field at the back of the speaker. A moving coil and speaker cone suspended in this field are induced to vibrate by this electrical energy, causing surrounding air molecules to vibrate, creating sound analogous to the original sound. In critical production and recording situations, the monitors must be capable of accurately reproducing the sound from the audio that has been mixed and recorded. Most speakers used as radio studio monitors are dynamic speakers. A separate woofer is used to reproduce the lower frequencies and a tweeter reproduces the higher frequencies. A crossover is an electronic circuit that sends lower frequencies to the woofer and higher frequencies to the tweeter. An acoustic suspension

design has speakers and crossover mounted in a sealed box enclosure. The bass reflex design uses a tuned port to release some of the lower frequency sound from the rear of the speaker to combine with the main sound of the speakers, resulting in stronger bass sound. Typically, radio studio speakers are hung from the ceiling or mounted on the walls behind the audio console. This placement, with the speakers slightly angled in toward the operating position, enables the operator to accurately hear the stereo imaging in the mixed sound. Since an open microphone near a monitor speaker will cause feedback, in radio studios a mute circuit is usually used so that when a microphone is turned on, the monitor speaker will be muted. Headphones are worn so that the operator or other personnel may continue to hear the mixed audio while the microphone is on.

Studios

At the beginning of radio broadcasting, studios did not exist; the announcer used a microphone connected directly to the transmitter, housed in whatever space was available, often in a garage or shack. As the process of creating live radio programs grew more sophisticated, so did the studios. Soon the engineers and equipment were housed in a control room, separated from the performers (and often studio audiences) in the studio. A variety of materials including burlap, plush velour curtains, and solid surface baffles were used to control the acoustics of the studios. Larger stations and networks constructed very elaborate and large studio complexes, rich in architectural design and isolated from the rest of the building through special suspensions. Some studios were large enough to seat full orchestras and large studio audiences.

As radio began to rely on local programs featuring recorded music, radio stations began to build smaller, more specialized studios. Initially, most stations relied on an engineer to operate the audio console and adjust the transmitter from the control room while the announcer or program host remained in the announcer booth, receiving cues through the glass separating the two rooms. As transmitters became more stable and stations looked for ways to cut costs, it soon became common for the announcer to also engineer his or her own program. This operational change resulted in a smaller radio studio where the announcer stands or sits at a microphone and console, surrounded by other necessary equipment within easy reach. While proper acoustic design and isolation is still important in these contemporary studios, audio processing helps overcome acoustical problems. Digital remote equipment also minimizes the need for radio studios. A telephone line and a digital

encoder/decoder set make it possible for a radio station to be able to have a studio virtually anywhere.

Recordings and the Radio Industry

The radio business and music recording industry have been symbiotically related from the inception of broadcasting in the 1920s. While live music performed on radio initially devastated the record business, radio's improved technology later helped to revitalize the manufacture of recordings. As radio shifted in the 1950s from programs to formats, popular recorded rock music became a staple on the air. Music played on radio promoted record sales—indeed, radio and records (the title of one trade periodical) became virtually inseparable.

Origins

However, radio's relationship with recordings was not so close at first; the two were separated by their differing technologies. While records were played on some early experimental broadcasts, and on smaller market stations in the 1920s, generally radio avoided the use of recorded music. This was due in part to the poor quality of the largely mechanical recordings of the time, and in part to a widely held feeling that radio should not merely play recordings people could easily buy on their own. This tradition of live radio carried over to the networks as they began forming in the late 1920s. Stations and networks provided hours of live music programming of all types, popular to classical, and the best techniques of studio design and microphone placement became issues of scientific analysis.

Live music on radio nearly doomed the record industry. The poor quality of mechanically recorded records could not hold up to the higher quality of live singing and orchestral music on the air. As record sales declined sharply, many firms left the business. Radio's technology came to the rescue in the form of the electrical transcription (ET). Developed in the late 1920s to allow longer recording times (up to 15 minutes on a side), the 33 1/3 rpm discs featured better frequency response through all-electronic means of recording. They were typically used by stations (WOR in New York was one of the first) to record and sometimes to archive programs. ETs encouraged the development of program syndication as well. Initial attempts failed to sell the better quality 33 1/3 format as commercial records, probably because requiring consumers to buy a new record player in the depths of the Depression was doomed from the start.

The big band music of the 1930s and 1940s was programmed widely on radio and helped to revive record sales. Many programs featured top singers and orchestras whose records were often promoted on the shows. Musicians had plenty of live venues at which to play, and radio carried many of them. At the same time, however, worries about recordings concerned the American Federation of Musicians, which insti-

tuted two strikes in the 1940s to preserve live radio in the face of some pressure to allow greater use of recordings.

Even as recording methods improved, the standard commercial recording, a 78-rpm disc, could still play only a few minutes on a side. World War II delayed further progress on all consumer products, but wartime research would contribute to a post-war revolution.

Postwar Revolution

When popular singer Bing Crosby heard about audio tape recording, he offered his top-rated program to a new network (ABC) on the condition that they allow him to record the show to avoid having to perform it twice each time for the East and West Coast time zones. Although networks had stoutly resisted the use of recordings on the air save in emergency situations, ABC was desperate for a popular star to build its competitive position. Crosby got his wish, and the ban on use of recordings began to waste away in the face of this new means of making high quality recordings that sounded almost live.

In 1947–48, engineers at CBS Laboratories, working under Peter C. Goldmark, developed a considerably enhanced 33 1/3 rpm record that squeezed in more grooves on each side of a 12-inch disc. Other parts of the system were also upgraded, including the vinyl from which the record was made, the stylus, microphones, amplifiers, and record players themselves. The "microgroove" long-playing (LP) records, with 20 to 25 minutes of music on each side, were a sensation when introduced on the market. Now consumers could hear opera or symphony concerts without annoying record changes every few minutes. Shortly thereafter, RCA introduced its own version of the improved records, a 45-rpm 7-inch disc, called "extended play" (EP) designed particularly for popular songs. Soon "the 45" became the standard form for selling popular music, while "the 33" was the standard album for longer-form music. Record players were designed to switch among the three speeds, although the 78 quickly disappeared. The most expensive console models combined radios (and soon televisions) with the record player.

As new radio stations flooded onto the air in the late 1940s and the 1950s, they sought programs to attract listeners and advertisers. Live programming was expensive while the use of records was cheaper and thus far more profitable. The result was more playing of recordings on the air—unheard of a mere few years earlier. At the same time a quest for high-fidelity (hi-fi) began to spread from Britain, encouraging an interest in better sound. The new FM stations catered to this interest as did a market for often expensive sound systems. But more atten-

tion—and far more money—was focused on the mid-1950s rise of rock-and-roll music.

Rock music saved radio as the networks gave way to television competition. As the top-40 music system developed in the mid-1950s, record sales grew modestly. After the rise of Elvis Presley in 1956, the growth in sales of 45 and 33 rpm records through the end of the decade was more than 125 percent over previous years. The payola scandal late in the decade served to underline what everyone in the business now understood—that radio's on-air "plays" were essential to popular record sales just as the existence of those records was vital to radio's success. Though more closely controlled after 1960, music companies continued to provide free or heavily discounted records to radio stations to encourage their inclusion on program playlists, and thus to promote record sales.

Record sales continued to skyrocket into the 1960s. Capitalizing on the popularity of rock, radio programmed more of it—and record companies produced more recordings. Radio and records were both aimed at a youthful audience with expendable income, listeners of increasing interest to advertisers. By the 1970s the splintering of music formats as well as the increasing separation of programs between AM and FM stations provided more outlets for recorded music of all types.

Radio's continuing popularity clearly affected music types and formats. "Crossover" music became more common: a specialized recording (say, a country song) might begin to sell well more broadly in the pop music market. Or a specialized song might sell well in another niche market. A crossover can be accidental, but most often it is the result of a deliberate attempt by a music company to bring a song or performer to the attention of more buyers to increase sales. Crossovers have become more common since the 1950s. The constant changing of their music formats by many radio stations has encouraged this constant mixing and changing of musical types.

Modern Era

The arrival of both television and especially cable TV channels changed radio's role. By the late 1980s, radio was no longer the sole broadcast outlet for recorded music as listeners flocked to music concerts and channels offering video with sound. Radio remained the most mobile means of listening to music.

Development of the relatively short-lived cartridge and then cassette audio recording devices aided not only radio stations, but also consumers who could now more readily travel with their recordings. The appearance of compact disc (CD) recordings in 1984 soon displaced the LP as the standard consumer recording format, and the even higher capacity of DVDs may do the same to CDs in the early 21st century. Through all these recording format changes, however, radio (along with some cable music channels) continued largely to define what music America liked.

In the late 1990s, internet streaming of music added yet another channel of music delivery to consumers. While the internet offered radio stations far greater reach, this development directly threatened music companies as listeners could download digital copies of desired music without buying it. A host of legal cases, especially involving an internet service called Napster, tested what could and could not be offered online, generally having the effect of limiting downloads only to music that customers paid for. Even here, however, the relationship of music delivery and sales was somewhat symbiotic as recordings (CDs or tapes) were increasingly being sold online as well as through retail outlets.

Re-Creations of Events

Creative Use of Sound Effects

The term *re-creations* refers to the creative use of sound effects and other inputs to provide a program that is not what it appears to be. To an extent, any radio drama that uses sound effects to create in listeners a mental image involves re-creations. But the most famous examples in radio history involved the use of wire service reports (for the facts) and recorded sound effects (for the color, especially crowd noises such as applause and shouts) to encourage listeners to think they were listening to sports play-by-plays from an observer right on the field rather than, in fact, as visualized by an announcer often hundreds of miles from the scene.

In the early days of radio, news played a relatively small role in radio broadcasting. With entertainment programming serving as the main precedent for new programs, some early radio newscasters re-created events in the news. Given the available technology at the time, radio broadcasters found it difficult to easily produce actualities of people in the news, so the dramatizations of events in the news became a well-accepted substitute.

The best-known example of a news re-creation was *The March of Time*, a program produced by *Time* magazine. *Time* general manager Rob Edward Larsen and Fred Smith of WLW in Cincinnati originally produced a program in 1928 called *NewsCasting*, a summary of the news syndicated to about 60 stations. (Larsen receives credit in some sources for coining the term “newscasting.”) In late 1929, Smith hit upon the idea of dramatizing the news, and the Larsen-Smith team began producing a program called *NewsActing*.

On 6 March 1931, *The March of Time* debuted on CBS, produced by Larsen and Smith and using actors, sound effects and music. The program took its name from its theme song *The March of Time*, composed by Ted Koehler and Harold Arlen. The script of the first program began: “Tonight, the editors of *Time*, the weekly newsmagazine, attempt a new kind of reporting of the news, the re-enacting as clearly and dramatically as the medium of radio will permit, some themes from the news of the week.”

Many of the “historical” recordings of early radio broadcasting are, in fact, re-creations. Especially in the 1920s, most radio stations generally did not have the capability to record their programs. The legacy of *The March of Time* made such re-creations acceptable in the late 1940s and early 1950s when a number of records celebrating radio-station anniversaries were released. For example, the recording of “the first broadcast” of KDKA in Pittsburgh on election night, 1920, is actually a re-creation made in the mid-1930s.

Sports, especially baseball games, became popular occasions for radio re-creations. Until the late 1950s, major league

baseball franchises were concentrated in the Northeast. No team was located farther west than St. Louis or farther south than Cincinnati. As a way of bringing major league games to vast areas of the nation without big-league teams of their own, radio stations began to re-create games that were taking place in ballparks around the country.

“Dutch” Reagan

Certainly the most famous of the re-creators, now if not then, is Ronald Reagan. “Dutch” Reagan, as he was then known, broadcast more than 600 re-creations of Chicago Cubs games on WOC in Davenport, Iowa, and WHO in Des Moines, Iowa, between 1933 and 1936. The future president’s system was typical of the play-by-play re-creators. Reagan sat in a radio studio in Des Moines, 300 miles away from Wrigley Field, and received a pitch-by-pitch description of the game in progress via telegraph. As Reagan described it many years later:

Looking through the window I could see [the producer] “Curly” (complete with headphones) start typing. This was my cue to start talking. It would go something like this: “The pitcher (whatever his name happened to be) has the sign, he’s coming out of the windup, there’s the pitch,” and at that moment Curly would slip me the blank. It might contain the information “S2C,” and without a pause I would translate this into “It’s a called strike breaking over the inside corner, making it two strikes on the batter.”

Occasionally the telegraph line would fail and the announcer would have to improvise until it was restored. In those situations, the announcer had to use his wits, as Reagan once was forced to do in a game tied in the ninth inning:

I knew of only one thing that wouldn’t get in the score column and betray me—a foul ball. So I had Augie [Galan] foul this pitch down the left field foul line. I looked expectantly at Curly. He just shrugged helplessly, so I had Augie foul another one and still another. . . . I described in detail the red-headed kid who had scrambled and gotten the souvenir ball. . . . He fouled for six minutes and forty-five seconds until I lost count.

Gordon McLendon

Whereas Reagan’s colorful exploits as a play-by-play re-creation announcer are well known because of his later fame as

an actor and political figure, the person best known as a practitioner of the skill was Gordon McLendon, "the old Scotchman, 83-years-old this very day" (quoted in Garay, 1992). Recreations had been around since the earliest days of radio and were considered an "honorable practice of the time," according to famed sports broadcaster Lindsey Nelson. But McLendon elevated re-creation to an art with his productions of baseball on the Liberty Broadcasting System (LBS) in the late 1940s and early 1950s.

McLendon was the young owner of fledgling radio station KLIF in Dallas, Texas. One of his early programming ideas at KLIF was to re-create sporting events. In fact, his first re-creation was of a professional football game between the Detroit Lions and the Chicago Cardinals on the day that KLIF took the air, 7 November 1947. But baseball was McLendon's true love.

The leisurely pace of baseball has always allowed play-by-play announcers great freedom, and it was said that in re-creating baseball games, there were no limitations—the broadcaster's imagination could run wild. McLendon started re-creating major league baseball games on KLIF in 1948. This soon led to the establishment of LBS. By 1951, 458 affiliates had joined LBS, and the network was second in size only to the Mutual Broadcasting System.

An important aspect of re-creations was the use of sound effects. Author Ronald Garay described McLendon's technique:

Three or four turntables were kept spinning throughout the re-created games with disks containing the various crowd noises always cued on one or more of the turntables. . . . What would be distinguishable above the crowd noise every so often would be a vendor hollering out the name of a sponsor's product. . . . Gordon's passion for realism and accuracy led him to send an engineer to record every ballpark sound that a radio listener might expect to hear. [Engineer] Glenn Callison recorded many of the sounds at Burnett Field in Dallas. . . . Gordon sent [technician] Craig La Taste to every major league baseball stadium in the country to record sounds identified with each particular stadium.

The success of a re-creation also depended, of course, on the skill of the individual announcer. Author Willie Morris, in his autobiography *North Toward Home* (1967), wrote of McLendon:

His games were rare and remarkable entities; casual pop flies had the flow of history behind them, double plays resembled the stark clashes of old armies, and home runs deserved acknowledgement on earthen urns. Later, when I came across Thomas Wolfe, I felt I had heard him before, from Shibe Park, Crosley Field, or the Yankee Stadium.

McLendon himself described his approach this way:

No picture that is shown on television could be possibly as vivid as the picture I painted in my own mind of a baseball game. To me . . . those players were far bigger than life, and Ebbetts Field, even though there were 3,000 people there if you actually were broadcasting from the field, was always in my mind's eye crowded with 35,000 people. The walls were a thousand feet tall that those home runs were hit [over]. . . . I could come out with a far more vivid picture than any that I could have ever painted from the baseball park itself.

The end of this creative but somewhat misleading use of the airwaves came in the early 1950s as both major- and minor-league audience attendance began to decline, in part owing to growing television coverage of the majors. A glimmer of the potential profits from controlling television and radio rights to their franchises pushed baseball owners to forbid unauthorized use of the activities in their ballparks. They sharply increased the fees charged to LBS for game rights (from \$1,000 for a whole season in 1949 to \$225,000 just two years later) and then turned the matter over to individual baseball clubs for renegotiation and higher fees. Thirteen of the teams refused to grant LBS rights at all. This fee increase, in conjunction with the departure of key advertisers, spelled the end of re-created baseball games.

Red Channels

1950 Blacklist

In 1950, as Julius and Ethel Rosenberg were being arrested for atomic spying and the Korean War was commencing, the American Business Consultants published *Red Channels, The Report of Communist Influence in Radio and Television*, which formalized the practice of blacklisting in the broadcasting industry. The publication listed 151 performers and artists who were deemed to be communist sympathizers (“fellow travelers” in 1950s parlance). Many of the personalities who were charged and others who were whispered about were denied employment in show business.

The publication of *Red Channels* was an outgrowth of the investigation of communist infiltration of the motion pictures by the House on Un-American Activities (HUAC), chaired by Parnell Thomas in 1947. After World War II, as the Cold War developed between the United States and the Soviet Union, someone suspected of being a supporter of communist and, in many instances, liberal causes could be branded a traitor and forced to reveal his or her political ideology. There was a great concern among certain members of Congress and other patriotic organizations that writers, directors, and actors were using popular culture to spread their nefarious beliefs. Many studio and broadcasting executives, under pressure by the HUAC hearings and by advertiser concerns, agreed never to hire a known communist on staff.

Founded in 1947, the American Business Consultants was a private organization headed by three former Federal Bureau of Investigation agents: John G. Keenan, Kenneth Bierly, and Theodore Kirkpatrick. Proclaiming that the government’s efforts had failed to combat the communist message, the group published a newsletter, *Counterattack: The Newsletter of Facts on Communism*, to “obtain, file, and index factual information on communists, communists fronts and other subversive organizations.” The group canvassed volumes of the *Daily Worker*, pamphlets of leftist rallies, and unpublished findings of the HUAC committee to uncover names of potential traitors. In June 1950 they published their special report, *Red Channels*, a formal list of 151 people whom the Communist Party used as “belts” to transmit pro-Sovietism to the American public.” The

report claimed that the Russians were using radio and television as a means of indoctrinating U.S. citizens even more than press or film. Many of radio’s most influential and talented artists were cited, including producers/directors Himan Brown, Norman Corwin, and William Robson; personalities Ben Grauer, Henry Morgan, and Irene Wicker; and commentators Robert St. John, William L. Shirer, and Howard K. Smith. Some retribution was immediate: Wicker, the “Singing Lady” who had entertained children for years on radio, was dropped by her sponsor Kellogg, and Robson, who had directed many of *Columbia Workshop*’s innovative dramas, was mysteriously dismissed from his Columbia Broadcasting System (CBS) assignments, receiving payments until his contract expired.

Many of the 151 industry members were listed because they were social activists, from New Deal supporters to civil rights demonstrators. The writers of *Red Channels* (who were not credited by name) admitted that not all those named were political radicals; in fact, some “dupes” advanced “communist objectives with complete unconsciousness.” Nevertheless, everyone was under suspicion, and *Red Channels* became one of several blacklists circulating on Madison Avenue (though one of the only ones formally published), consulted by broadcasting executives, advertising agencies, and sponsors. Some performers were given the opportunity to recant their previous beliefs or risk being barred from the industry. For a fee, the American Business Consultants also advised radio and television producers as they were casting on which performers had problematic backgrounds.

With the publication of the 215-page *Red Channels*, many companies began to institutionalize blacklisting. CBS, considered the most progressive of the networks, demanded loyalty oaths from its employees and hired a vice president in charge of “security.” The other networks quickly followed suit. Batten, Barton, Durstine, and Osborn legitimized the hiring of “security officers” to clear names for the advertising agencies. Both networks and agencies, working as quietly as possible behind the scenes, abided by one principle: don’t hire controversial personnel, so that you won’t have to fire them.

For many, the *Red Channels* list was the culmination of many years' worth of whispered accusations. Radio director William Sweets had been under investigation since the late 1940s. Sweets directed two hit series, *Gangbusters* and *Counterspy*, for the radio production company Phillips H. Lord, Inc. A charge had been made to the series' sponsors that Sweets, also national president of the Radio Directors Guild, had mandated that only communists could work for him. He was forced to resign and, following the distribution of *Red Channels*, had difficulty finding any employment. Sweets' difficulties were later attributed to Vince Harnett, who had worked in the Lord office and who became a specialist in communist infiltration. As a freelancer, he wrote the introduction to *Red Channels* and worked with Lawrence Johnson's supermarket chain

in Syracuse, New York, to boycott products of sponsors that allegedly advertised on shows employing subversives.

The institutional pressure also affected radio news departments. William Shirer had been a member of "Murrow's boys" and was one of radio's most respected commentators. In 1947 he resigned from CBS when his news program lost its sponsor. The *New Republic* (13 January 1947, cited in Cloud and Olson, 1996) charged that after World War II, 24 liberal analysts, such as Shirer, were dropped by the radio networks because of objections from sponsors. Shirer did work for other stations, but after his name appeared in *Red Channels*, no major network regularly employed him again. Considering himself a victim of the blacklist paranoia, Shirer contended "that if the major networks had taken a firm stand in the beginning . . . [by] making a fair determination of individual cases, this thing would never have gotten off the ground."

Before the dissemination of *Red Channels*, discrimination based on political reasons was informal and subjective. The publications of the American Business Consultants commenced systematic ideological screenings, although always behind closed doors. Such blacklisting also coincided with corporate pressures in broadcasting to make a profit in postwar America by pleasing the largest audience possible. Any controversy was strictly to be avoided. Even after the 1954 downfall of one of *Red Channels*' most ardent supporters, Senator Joseph McCarthy, the purging of subversive elements in the entertainment industry persisted quietly into the 1960s. In 1962, when a radio raconteur, John Henry Faulk, won a libel suit against *Counterattack* and other accusers, the mechanics of blacklisting finally became part of the public record just as the process died out.

Red Lion Case

Landmark Supreme Court Decision

In this 1969 decision, the U.S. Supreme Court upheld the constitutionality of the Federal Communications Commission's (FCC) fairness doctrine and of related personal attack rules. These FCC regulations in some instances required broadcasters to air viewpoints with which they disagreed or to provide airtime to persons criticized by or on the stations. The case is important because it reaffirmed the notion that radio stations' use of a scarce public resource—the electromagnetic spectrum—justified a different First Amendment standard for broadcasting than for print media.

Although the case is commonly referred to as simply *Red Lion*, the court's decision involved a second lower court case as well, *United States v Radio Television News Directors Association*. Because the two cases involved similar issues, the Supreme Court consolidated them and issued one opinion. The cases involved the FCC's fairness doctrine and a specific application of the doctrine known as the personal attack rules. Under the general fairness doctrine, all radio broadcasters had an affirmative duty to cover controversial issues of public importance in their programming and to provide a reasonable opportunity for all sides of the controversy to be aired. The personal attack rule stated that if a person's character, integrity, or honesty was attacked during the discussion of a controversial issue of public importance, the station airing the attack had to notify the person of the attack; provide a tape, transcript, or summary of the program; and afford the attacked person an opportunity to reply to the attack on the air.

The *Red Lion* litigation arose when WGCB, a radio station licensed to the Red Lion Broadcasting Company in southeastern Pennsylvania, aired a 15-minute syndicated program by the Reverend Billy James Hargis. During the program Hargis discussed a book, *Goldwater—Extremist on the Right*, written by Fred J. Cook. Hargis attacked Cook as being a communist sympathizer, a newspaper reporter who was fired for writing false charges against public officials, and a critic of J. Edgar Hoover and the FBI and of the Central Intelligence Agency. When Cook heard of the broadcast he demanded time to reply on the station pursuant to FCC policy. Red Lion refused, and the FCC ordered the company to afford Cook an opportunity to reply. Red Lion appealed the order, and the U.S. Court of Appeals for the District of Columbia Circuit upheld the FCC's decision. (Years later, respected journalist Fred Friendly alleged that Cook may have been working with the Democratic National Committee, using the fairness doctrine and the personal attack rule to harass stations that carried ultraconservative programming. In response, both Cook and the Committee insisted that Cook had acted alone.)

After the *Red Lion* litigation had begun, the FCC adopted specific regulations clarifying its personal attack rules. The Radio Television News Directors Association challenged the FCC's action in court, and the U.S. Court of Appeals for the Seventh Circuit ruled that the FCC's regulations violated the First Amendment free speech and free press rights of broadcast stations.

In its ruling on the consolidated cases, the Supreme Court confronted two primary legal issues: whether the FCC had jurisdiction under the Communications Act to adopt the fairness doctrine and its related rules, and whether the policies abridged the free speech and free press rights of broadcasters. Justice Byron White wrote for a unanimous court. (Eight justices voted in the case. Because he had not participated in the oral arguments, Justice Douglas took no part in the Court's decision.)

With respect to the jurisdictional issue, the Court noted that the FCC had been given extensive powers to regulate in the public interest, convenience, and necessity. In previous cases, the power to regulate had been described by the Court as "not niggardly but expansive." The Court also cited various congressional actions that seemingly approved of the FCC's actions in adopting and enforcing the fairness doctrine. Given the Court's own precedents and the implied congressional approval of the FCC's actions, the Court determined that the FCC did in fact have the necessary authority under the act to establish the fairness doctrine and personal attack rules.

Regarding the constitutional issue, the Court first stated that broadcasting was clearly a medium protected by the First Amendment, but that differences in the characteristics of various media justified different treatment under the First Amendment. The Court then addressed the issue of spectrum scarcity. Because of the interference that would result, not everyone who wants to broadcast can do so; there is simply not enough spectrum for all would-be broadcasters. For this reason, Congress enacted legislation giving the FCC the authority to license and regulate broadcasting to serve the public interest. Justice White wrote that, given this scarcity of frequencies, "it is idle to posit an unbridgeable First Amendment right to broadcast comparable to the right of every individual to speak, write, or publish."

The Court determined the public has a right to hear the voices of those who, because of spectrum scarcity, cannot speak through their own broadcast station. According to Justice White,

Because of the scarcity of radio frequencies, the government is permitted to put restraints on licensees in favor of

others whose views should be expressed on this unique medium. But the people as a whole retain their interest in free speech by radio and their collective right to have the medium function consistently with the ends and purposes of the First Amendment. It is the right of the viewers and listeners, not the right of the broadcasters, which is paramount. It is the purpose of the First Amendment to preserve an uninhibited marketplace of ideas in which truth will ultimately prevail, rather than to countenance monopolization of that market, whether it be by the government itself or a private licensee. . . . It is the right of the public to receive suitable access to social, political, esthetic, moral, and other ideas and experiences which is crucial here. That right may not constitutionally be abridged either by Congress or the FCC.

Having found that the First Amendment rights of viewers and listeners to receive diverse viewpoints were paramount over the First Amendment rights of broadcasters to control the speech over their stations, the Court concluded that the fairness doctrine and its related regulations passed constitutional muster.

The *Red Lion* case is important not so much because of the individual disputes it settled but because of its lasting contribution to our understanding of the First Amendment rights of broadcasters. Even though the FCC stopped enforcing the fairness doctrine in 1987 and the personal attack rule in 2001, the case still stands for the proposition that, because of spectrum scarcity, the government can apply different First Amendment standards to broadcasting than it does to other media.

Regulation

Regulation of radio in the United States began in 1910 when Congress passed modest legislation to control the use of wireless at sea, a law updated in 1912. A separate and more substantial Radio Act of 1912 could not foresee broadcasting. Following the beginning and surge of radio broadcasting in the early 1920s, pressure rose for a new law. The Radio Act of 1927 created an independent commission to determine regulatory policy for radio and broadcasting in the United States. The venerable Communications Act of 1934 expanded the powers of what became the Federal Communications Commission (FCC) to determine regulatory policy, subject to congressional oversight.

Over the past eight decades, government regulation of American radio has varied from minimal oversight, to pervasive control, and more recently to substantial deregulation. Beginning in the late 1970s the commission began adopting less stringent regulatory policies for broadcasters, replacing specific requirements with market-based competition. The Telecommunications Act of 1996 introduced significant relaxation in broadcasting ownership requirements. The 1934 Act, though amended many times, still provides the overarching schema for American radio regulatory policy.

Early Radio Regulation

The “commerce” clause of the U.S. Constitution (art. 1, sec. 8) assigns to Congress the option of regulating interstate and foreign commerce. Early radio stations served as basic communication systems, transmitters of messages that were meant to facilitate commerce and to protect the health and well-being of U.S. citizens. The Wireless Ship Act of 1910 (PL 262, 61st Cong.) reflected congressional intent to institute modest regulatory requirements on the nascent wireless communications industry. Oceangoing ships traveling to or from the United States were required to have transmitting equipment if carrying more than 60 passengers. The secretary of the Department of Commerce and Labor was given the authority to make additional regulations to secure the execution of the 1910 Act.

The 1912 sinking of the *Titanic*, with the tragic loss of 1,500 lives, forced congressional action to meet American international treaty obligations in wireless communication. The 1910 law was expanded, and was followed a few months later by the more comprehensive Radio Act of 1912. The law provided for licensing all transmitting apparatus for interstate or foreign commerce by the secretary of commerce and

required that each station operator be licensed and that the government prescribe regulations to minimize interference. Other sections of the act provided for the licensing of experimental stations, regulation over the type of modulation, prohibition against divulging the content of private messages, and a requirement to give preference to distress signals.

The Radio Act of 1912 did not foresee and thus did not mention radio broadcasting. Public interest and service obligations were not discussed except as they pertained to point-to-point communication. However, the emergence of broadcasting after 1920, with the rapid proliferation of new stations seeking licenses and vying for airtime on an extremely limited allocation of frequencies, created administrative problems for Secretary of Commerce Herbert Hoover. The 1912 act allowed the secretary no discretion to develop and modify administrative regulation as needed, depending on changes in the radio business.

In 1922 Hoover convened the first of what became four annual National Radio Conferences designed to elicit voluntary self-regulation by broadcasters and other interested parties. Attendees realized the inadequacy of the 1912 Act and many called for better government oversight through more comprehensive legislation. But interference among broadcasting channels dramatically increased as the number of stations proliferated and as operations increased power and moved transmitters; early broadcasting entered a period of chaos without any significant government oversight.

Between 1922 and 1923, Hoover expanded the number of frequencies assigned to radio broadcasting in an attempt to relieve interference conditions. The secretary, who strongly endorsed the notion of self-regulation, had some success persuading stations to share frequencies, limit power, and split up the broadcast day. However, despite his attempt to facilitate solutions, a growing dissatisfaction with time allotments and frequency sharing created problems for Hoover's policy of "associationalism." It was becoming apparent to Hoover and the industry that self-regulation could not solve increasing interference and allocation problems. At the fourth and final radio conference in November 1925, all agreed that "public interest" should be the basis for broadcasting policy. Attendees also convinced the secretary to stop issuing new radio licenses. Thus, the licensing provisions of the 1912 Act were suspended under an ad hoc regulatory policy that was agreed to by government and by the large radio manufacturing and broadcasting interests.

On 16 April 1926, however, a federal appeals court dealt the final blow to the 1912 Act when it ruled that the secretary had overstepped his authority. As a result, Hoover was powerless to enforce any operating requirements on licensees (*United States v Zenith Radio Corp. et al.*, 12 F. 2nd 614 [N. D. Ill. 1926]). Immediately after the *Zenith* decision, stations began switching frequencies, increasing power, and ignoring previ-

ously agreed-upon time-sharing arrangements. Interference levels grew dramatically, particularly at night, when signals were prone to long-distance skipping.

Under growing pressure that was fueled by dissatisfaction among broadcasters and the listening public, Congress passed the Radio Act of 1927. The legislation specifically regulated broadcasting for the first time by establishing a framework to regulate the industry and investing decision-making powers in an independent agency. Seven years later, with the passage of the Communications Act of 1934, Congress merged oversight of wired and wireless communication under the new FCC.

The Radio Act of 1927—Real Beginning of Broadcast Regulation

The Radio Act of 1927 (PL 632, 69th Cong.) conceived that a newly constituted Federal Radio Commission (FRC) would be able to resolve numerous interference problems that had emerged during radio's development. Drawing on a combination of earlier legislative efforts introduced by Representative Wallace White of Maine and Senator Clarence C. Dill of Montana, the 1927 legislation provided for continued but more effective licensing and for the assigning of station frequencies, power, and fixed terms for all radio licenses. The legislation also provided for the creation of a temporary commission with authority to designate licensees and to regulate stations' operating conditions. The act asserted a public interest in broadcasting and public ownership of the airwaves, extended considerable rulemaking discretion to the commission, and provided commissioners with considerable discretion to decide questions of law and policy.

One of the significant outcomes of the 1927 Act, still debated today, was that broadcasters were accorded more limited rights under the First Amendment than was traditional for the press. The legislation clearly designated the electromagnetic spectrum as part of the public domain, allowing the commission the power to grant rights to users of the spectrum but forbidding private ownership over communication channels. In addition, extreme interference problems encountered with the breakdown of the 1912 Act suggested that a real scarcity of available channels existed. This complicated the task of the commission to devise a permanent allocation scheme that would suit all political and business constituents. Because the known radio spectrum and limited engineering capabilities could not afford all who wanted to speak an opportunity to do so, the FRC was empowered to impose rules and regulations limiting the number of entities actually using the airwaves. Legislators provided the commission with broad discretionary powers, subject to adjudication by the federal courts.

Many of today's expectations for regulatory policy emanate from the 1927 legislation. The Radio Act called for a commission comprising five members, each appointed from and

responsible for representing a specific geographical zone of the United States. Congress initially conceived that the agency would dispense with the interference problems within the first year, after which the commission would become a consultative, quasi-judicial body meeting only when necessary. Sections 4 and 9 of the act invoked an undefined public-interest standard and gave commissioners the power to license and regulate wireless stations; federal radio stations were exempt from regulatory oversight. Licensing decisions made by the commission were subject to adjudication by the court of appeals, essentially as a *de novo* review. Legal scholars point to the fact that oversight was essentially a limited review of specific issues within a narrow class of petitioners.

Although the act did not contain specific language to regulate broadcasting "chains" or networks, legislators gave commissioners the ability to "make special regulations applicable to radio stations engaged in chain broadcasting" (sec. 4 [h]). Therefore, whatever control the commission could impose over radio networks had to be accomplished at the station level. Similarly, the act dealt with advertising in a minimal fashion. Some historians point to the fact that advertising was not widely accepted in 1926, when the bill was written, as one possible reason to explain the apparent oversight in the legislation.

Scholars are divided over the effectiveness of the FRC, but they generally give the organization little credit for effecting consistent and strong regulatory policy. During its six-year tenure, relations with Congress were stormy, sometimes to the point of hostility. By the end of its first year, congressional members who wrote provisions of the act called FRC commissioners "cowards" for their lack of regulatory action. Other critics pointed to flawed decision making based on poor information collection. The FRC's inability to resolve interference problems and redistribute licenses caused Congress to impose the Davis Amendment, which called for equality of service standards, in the 1928 reauthorization bill.

The broadcasting industry, led by the Radio Corporation of America (RCA), Westinghouse, and General Electric, succeeded in convincing the FRC that the general framework of broadcasting developed under the secretary of commerce should be retained. Robert McChesney (1993) points out that reauthorizing the existing commercial stations without redistributing licenses caused many noncommercial licensees to have their allocations and times of operation reduced. At the end of the FRC's tenure in 1934, commercial broadcasting was well established in the United States.

Passage of radio legislation clearly reflected the congressional view that the electromagnetic spectrum represented a valuable natural resource that was to be carefully cultivated and conserved for the general population. *United States v Zenith* had opened the floodgates to far too many licenses, creating substantial interference and chaos for listeners and broadcasters alike. It is not surprising, therefore, that resolu-

tion of licensing-related controversies became the first priority of the FRC. Regulatory decisions of the early commission were frequently politically motivated. Client politics stifled regulatory efforts by pitting interests that favored policies to support the growth of a nascent broadcasting industry on one hand against the desires of congressional members who wanted a solution that redistributed licenses along geographical regions on the other. Thus, partisan politics made the FRC sensitive to criticism from both large industry players and the regional constituents of various members of Congress. Furthermore, because only two of the FRC commissioners were actually confirmed by the Senate during the FRC's first term, the initial action of the agency was tentative, depriving the commission of an opportunity to regulate boldly. With passage of the Davis Amendment in 1928, Congress specifically directed the FRC to solve interference problems that plagued the AM band and to provide equalization of services to the different geographical regions of the country. With newly confirmed commissioners and a better sense of purpose, the FRC redistributed the broadcast band in the fall of that year. General Order 40 put into place a structure that allocated certain broadcast frequencies for long-distance, regional, and local services. The outcome of this new engineering calculation was the development of clear channel stations, which came to dominate radio during the 1930s, 1940s and 1950s.

The basic regulatory structure embodied in the Radio Act of 1927 became the basis for the permanent body designated under the Communications Act of 1934. By 1934 broadcasting had evolved into a highly profitable business. The structural components of the network radio system, almost wholly outside the purview of the FRC, had developed into a series of highly successful operations. The breakup of the RCA trust had created powerful forces within the communications industry vying for different segments of the industry. Many of the most powerful broadcasting stations, designated as "clear channels," were licensed to the large broadcasting or radio manufacturing companies, and the FRC's adoption of a system of clear (national), regional, and local AM channels (General Order 40) solidified the interest of stations already on the air, but has lasted in large part to the present as the chief means of allocating channels and reducing interference.

The Federal Communications Commission

The passage of the Communications Act of 1934 (PL 416, 73rd Cong.) established a permanent commission to oversee and regulate the broadcasting and telecommunications industries. In creating the FCC, Congress invested the permanent agency with the same broad regulatory powers that had been given to the FRC. These powers were extended to include wired telecommunications services, which had previously been under the jurisdiction of the Interstate Commerce Commission. Most

provisions of the 1927 Act were incorporated word for word into Title III of the more comprehensive Communications Act. The language of both the 1927 and 1934 acts allowed the agency to employ a wide variety of sanctions, incentives, and other tools to fulfill regulatory or policy mandates. Over the years, court rulings concerning the Act and appealed FCC decisions have helped to delineate the boundaries of permissible government action.

The new agency did not intend to upset the broadcasting systems that had developed under the Secretary of Commerce and the FRC. However, Congress provided the new agency with some regulatory flexibility by repealing the specific requirements of the Davis Amendment. The general themes of the 1934 Act exemplified the principles of the New Deal by consolidating federal powers under one agency and centralizing the decision-making power for all communications industries. Both the 1927 and 1934 acts are significant because they invested regulatory powers in an independent “expert” agency. The realization that broadcast regulation should not be limited to supervision of interference and other technical aspects was fully apparent to legislators.

The newly formed FCC was confronted with the need to develop both an immediate and a long-term agenda. Immediate tasks included identifying and defining what constituted service in the “public interest, convenience, and necessity.” The FRC had developed some regulatory policies, but clarification would be needed for long-term administrative policy development. As a corollary to this process, the FCC would have to develop reflective criteria to determine whether stations were doing an acceptable job of meeting their public service obligations. Consistent with this goal, the agency would be required to articulate and give meaning to broad phrases such as *public interest*.

Secondly, the FCC was now charged with developing a plan for utilizing the expanding electromagnetic spectrum. The years between creation of the FRC and creation of the FCC yielded important discoveries regarding the extent and usage of the spectrum. The commission, charged with “the larger, more effective use of radio” (sec. 303 [g]), needed to develop a more complex mechanism for determining which users should be allowed to use what radio band and for what purposes. Different uses would require differing amounts of spectrum space, and conflicting requests for spectrum utilization would require the FCC to make determinations for which services and how many users the spectrum could provide for.

FCC *Annual Reports* through 1939 illustrate that the commission undertook much more sophisticated record collection than the FRC. Between 1936 and 1937, the commission required all broadcasters to file comprehensive information regarding income, property investment, number of employees, and nature and types of programs. The FCC reported much of the statistical data to Congress during 1938. In that same year,

the Commission began the first full-fledged review of the practices of chain (network) broadcasting. The initial years of the FCC reflected the need to collect and collate sufficient data to implement a long-term broadcast regulatory policy.

Localism and Trusteeship—A Framework for Broadcast Agenda Setting

The broad nature of the language used in the 1927 and 1934 acts did not prescribe specific tests or mandates for users of the radio spectrum. Consequently, it became necessary for the FRC and FCC to articulate policies that it could use as touchstones for measuring the service of the licensee. Over time, these pronouncements, coupled with rules and regulations, allowed the commission to establish a baseline regulatory policy.

Early decisions of the FRC and the FCC generally illustrate the importance placed on local operation and on a “trusteeship” model in broadcasting. Local outlets were seen as “trustees” of the public interest, despite the growing power and programming of the radio networks throughout the 1930s and 1940s. These two principles became the bedrock of federal radio policy making for decades.

The commission realized that defining what constituted acceptable service for a licensee required developing a set of standards that a broadcast licensee could aspire to or be measured against. In *Great Lakes Broadcasting Company et al v FRC* (37 F. 2nd 993 [D.C. Cir.]), the FRC devised an important set of principles to delineate what constituted public service and to inform licensees as to what their obligations would be as trustees using a natural public resource. The principle of trusteeship was based on a rationale of spectrum scarcity and required broadcasters to provide that

the tastes, needs, and desires of all substantial groups among the listening public should be met, in some fair proportion, by a well-rounded program, in which entertainment, consisting of music both classical and lighter grades, religion, education, and instruction, important public events, discussion of public questions, weather, market reports, and news, and matters of interest to all members of the family find a place.

In asserting that stations were trustees, the FCC attempted to develop a policy that scrutinized the economic impact that proposed stations would have on current station trustees. Thus, the FCC denied some licenses when it feared that an applicant had inadequate resources. At other times, the FCC refused to issue a license when an applicant was financially secure but would provide harmful competition to an existing licensee. Taken as a whole, FCC decisions published between 1934 and 1940 do not illustrate how the agency evaluated the merits of potential economic injury, nor do they demonstrate a uniform

record of policy making. Robert Horwitz notes that the FCC's decision to protect the broadcast system resulted in de facto protection of existing broadcasting facilities. In apparent ad hoc fashion, the FCC sometimes approved license applications where there were existing stations, and other times it refused to grant construction permits in cities that had no primary radio service at all. Engineering factors were not critical in many decisions.

Encouraging localism (the idea that stations should reflect their own communities) became the second fundamental principle and proved useful for several reasons. Both network and local programs were being provided to listeners via a local licensee assigned to serve a particular community or via a clear channel station meant to serve a wide geographical area. Although the FCC had very limited control over national networks, it discerned that its power to regulate was essentially the power to control local stations, the stations' relationships with network program suppliers, and the stations' relationship with the community of license. Thus, policy evaluation based on serving the interests of the city of license provided the FCC with sufficient leverage over the whole of the broadcast industry through station regulation.

Regulatory Policies in the 1940s

As the 1930s ended, the FCC expressed concern that radio networks held too much power over licensees through affiliation agreements that prevented stations from programming more independently. The commission's actions during this period illustrate a desire to increase the responsiveness of local licensees to their listening public, reduce the anticompetitive behavior of the powerful radio networks, and effectively increase competition in local broadcasting. In addition, the commission wanted to end the competitive advantage the National Broadcasting Company (NBC) held over the Columbia Broadcasting System (CBS) and the smaller Mutual network as a result of its ability to program both the NBC Red and Blue networks. The Chain Broadcasting Regulations issued in early 1941 were challenged by NBC in *National Broadcasting Company et al v United States* (319 U.S. 190 [1943]). The Supreme Court decision, written by Justice Frankfurter, upheld the FCC's authority to regulate the business arrangements between networks and licensees. More important, the decision upheld the constitutionality of the Communications Act and reaffirmed the commission's presumption that it had substantive discretionary power to regulate broadcasting.

But hoped-for changes in the relationship between networks and affiliates failed to emerge. Even though the commission faced increased criticism and oversight hearings between 1942 and 1944 (resulting in the resignation or non-reappointment of several commissioners), FCC staff investigated what licensees proposed to program when they filed applications

compared to what they actually programmed. The results of the investigation were summarized in the 1946 "Blue Book." The Blue Book restated the commission's interpretation of what constituted public-interest obligations and articulated four primary concerns: the quantity of sustaining programming aired by the licensee, the broadcast of live local programs, the creation of programming devoted to the discussion of public issues, and elimination of advertising abuse.

Although the Blue Book reflected the first attempt by the FCC to articulate a fully developed policy statement regarding what constituted good service, the FCC never fully enforced application of the service statements it advocated. Still, the Blue Book was an attempt to make broadcasters more responsive to their listeners. First, it articulated the commission's view as to what constituted good service. Second, it started a debate within the industry as broadcasters objected to a perceived governmental attack on their ability to program without censorship or government interference. Third, in an attempt to forestall the promulgation of formal content-based rules, the National Association of Broadcasters strengthened its own self-regulatory radio code. Finally, though perhaps unintentionally, the commission increased record-keeping requirements for broadcasters.

Following the end of World War II (a period of unparalleled prosperity in broadcasting), the commission encouraged local competition by allowing a rapid and dramatic increase in the number of licenses in the standard (AM) broadcast band. Some experts note that the pressure to expand broadcasting may be seen less as a regulatory initiative and more as a result of renewed interest in entertainment due to the end of the Depression of the 1930s and the repeal of war priority restrictions. The expansion of radio broadcasting was further enhanced with the FCC's creation of a new expanded FM band after 1945. As the decade drew to a close, the FCC revoked its former prohibition on station editorializing, thus laying the groundwork for what would become known as the fairness doctrine.

Postwar Radio Policy

The shift in revenue from network to local radio and the increased competition in the AM band forced significant changes in radio programming. Morning and afternoon "drive" times became major sources of revenue. Stations abandoned the block programming structure typical of network affiliation in favor of generic formats that were stripped across the broadcast week. Because concepts developed in the Blue Book held little significance in the context of this new local competition, the FCC issued a *Programming Policy Statement* in 1960 (25 Fed. Reg. 7291; 44 FCC 2303) to restate a licensee's broadcast obligations. Reflecting the changes in radio with the rise of television, requirements for

sustaining programs (those without advertising support) were dropped and other program guidelines were updated.

The 1960 *Programming Policy Statement* required broadcasters to discover the “tastes, needs, and desires” of the people through local area surveys known as “community ascertainment.” With the 1960 Policy Statement, the commission delineated a 14-point list of major program elements that broadcasters were supposed to provide for the service area. Broadcasters criticized the laundry-list approach to programming requirements and the agency itself for using specific “quotas” of programs enumerated in guidelines as a litmus test for automatic license renewal.

A decade later, the FCC issued a “primer” that placed significance on programs that were responsive to community problems rather than serving the “tastes, needs, and desires” of the community. In 1976 the commission reaffirmed a commitment to the ascertainment process by making it a continuous requirement. Many felt that with this requirement, combined with other filing requirements, the FCC was imposing a significant record-keeping and filing burden on licensees.

Between 1964 and 1980, the fairness doctrine was fairly rigorously enforced by the FCC, and critics of the doctrine claimed that the specter of a fairness complaint, with its potential for legal entanglements, frequently prevented (“chilled”) broadcasters from airing more discussion of public controversies. Supporters of the doctrine claimed that broadcasters merely used the threat of a fairness complaint as an excuse for not airing more controversial material. The fairness doctrine was a source of discomfort for broadcasters and First Amendment advocates alike. By the 1980s, because of the increasing competition among stations and with radio deregulation under way, the commission began looking for a way to eliminate its own doctrine.

Until 1980 the FCC set policy through implementation of a series of behavioral rules meant to provide guidelines for broadcasters as to what was or was not acceptable. For example, the ban on indecent language was proscriptive, telling stations what was the boundary of acceptable speech. Rules banning some types of cross-media ownership and simulcasting of AM and FM programs were examples of agency rule-making designed to *structurally* organize the industry. Taken as a whole, the accretion of rules and record keeping led broadcasters and policy makers alike to question whether the time was ripe for regulatory reform.

Radio Deregulation

Serious thinking about deregulation began at the FCC in the mid-1970s, and a move to lift some rules on radio had been outlined in 1979. The 1980 election of Ronald Reagan increased the pace of thinking about radio deregulation. Radio had grown from a few hundred stations in the 1920s to thou-

sands of outlets. Under the lead of FCC Chairman Mark Fowler, the agency pushed to deregulate four required station activities, leaving more up to licensees. The eventual report and order (84 FCC2d 968) eliminated minimal advertising and non-entertainment program guidelines, program log requirements, and rigid approaches to ascertaining community needs. Instead, the commission planned to rely more on “marketplace forces” to provide checks against program or advertising abuses. Many filing requirements were abolished. In the deregulatory process, radio license renewal literally became a pro forma postcard process, increasing most licensees’ expectations of renewal. Deregulation, combined with an easing of ownership restrictions in the early 1990s, reflected the agency’s attempt to make market economies define broadcasters, who now faced increasing operating costs and stagnant advertising revenues.

Commission Regulation as Ad Hoc Policy Making and a Diminishing Public Trustee Model

Robert Horwitz notes that FCC deregulatory policies championed under Mark Fowler (1981–87) mirrored the 50-year-old demands of the broadcasting industry to make the commission a neutral technical oversight agency. The liberal interpretation of the First Amendment, characterized by the equal-time requirements of the FCC’s political broadcast rules, faded with the commission’s deregulatory efforts. With fewer content and structural controls left in place, radio broadcasting illustrated erosion of the public trusteeship model that had characterized radio since 1927. The dismantling of the trustee concept, combined with the reduction in structural requirements in regulation, left radio open to freer market competition. Passage of the Telecommunications Act of 1996 eased radio station ownership limitations, although the maximum number of stations allowed in any specific market is still restricted.

Even though deregulation and ownership consolidation have increased competition among the top radio stations in most radio markets, critics of deregulation note that the FCC has failed to create a diversity of ownership to mirror the demographic characteristics of America itself. Despite agency attempts to encourage diversity, the number of minority-held licenses has actually decreased, whereas the overall number of station licenses has increased. Other critics point to the failure of AM stereo and the delayed introduction of a digital radio broadcasting standard as indications that the FCC has rarely been successful in inducing the industry to embrace technological innovations. Pirate radio broadcasters and growing disenchantment with increasingly stratified radio programming led the FCC to create a new low-powered FM broadcasting service, which faced strongly negative reactions from the industry and Congress.

The commission's decision making can be viewed from a number of useful perspectives. Commission policy can usually be traced on a track parallel to congressional initiatives. For example, with the growth of radio into a large, mature industry, constituent pressure on the agency from members of Congress became less significant, and as a result social regulatory or structural policies were relaxed. Congressional intent, as manifested in legislative efforts such as the Telecommunications Act of 1996, illustrates Congress' desire to treat radio broadcasters less like public trustees and more like a price- and entry-controlled industry segment.

Early critics of the FRC and later the FCC complained that forced social regulation created artificially close ties between the regulatory agency and the broadcasting industry. Under "capture theory" analysis, such a regulatory agency becomes overly concerned with maintaining the economic well-being of the public trustees it licenses. The result is the creation of an oligopoly with limited, managed competition. During the 1980s, both conservatives and liberals promoted broadcast deregulation as a way to deconstruct the relationship that had developed between the regulators and the maturing broadcasting industry. Because competition creates long-term economic uncertainty, deregulation undermines the agency-client relationship.

The success of U.S. radio regulation can be measured in a number of ways. Radio is a vibrant industry with several large competitive players owning hundreds of radio stations each. Competition for listeners within specific demographic segments in most medium and large radio markets is fierce. Large radio markets support many different formats. Critics of the FCC liberalization policies complain that such policies may serve large listening segments but tend to marginalize smaller populations that seek more diversity in programming or increased access to the media to express divergent viewpoints. Whether one believes that the government should be worried about First Amendment issues largely depends on one's view of whether social regulation should mandate public access to the airwaves. However, a consequence of the expansion of the number of radio outlets and deregulation as a governmental policy is that both factors undermine the public trustee argument. In the long term, radio broadcasting will continue to be more concerned with economics and less concerned with the tastes, needs, and desires of the community of license.

Reith, John C.W. 1889–1971

First Director-General of the British Broadcasting Corporation

In its 75-year history, only two directors-general of the British Broadcasting Corporation (BBC) have seen their names used as descriptions for a style and philosophy of management. One was the most recent, John Birt, and the other was the first man to hold the post, indeed, the man credited with giving the BBC its unique character among broadcasting organizations, John Reith.

Reith was a unique character, a towering presence both physically (he stood 6 feet, 6 inches tall) and in the force of his personality. He was a man driven by the belief that it was his destiny to perform a great service for his country and constantly tortured by the fear that he was failing to fulfill that destiny. He was capable of the breadth of vision required to see the potential for the infant broadcasting industry, but at the same time he harbored petty grudges and resentments against those he felt were hindering him in his task. And just as his personality was complex, so was the institution he fashioned in his own image. The term *Reithian* has come to embody the first principles of British public service broadcasting: to provide the best in order to enlighten and educate. The term also carries overtones of paternalism and elitism.

Early Years

Reith was born in 1889, the seventh child after a gap of ten years, to the Reverend Doctor George Reith and his wife Mary. Dr. Reith was a minister of the Presbyterian Church in the fashionable part of Glasgow. He ran an austere and joyless home based on strict Christian principles. The influence of his father's puritanism ran through the whole of John Reith's life and work.

The fact that his father refused to send him to university after leaving school and instead apprenticed him to an engineering firm was a perpetual source of resentment. Although Reith never felt satisfied with engineering, he discovered a talent for organization and found a good job with another engineering firm in London.

After being invalided out of the army in 1915 with a World War I injury that left him with a huge scar down his left cheek, Reith again turned to engineering. But, in common with many after the war, he had a period out of work until he was given a temporary post in London as the personal assistant to a Conservative politician, Sir William Bull.

A few months later, he answered an advertisement for the general manager of the BBC. Reith applied although, as he wrote in his diary, he knew next to nothing about broadcasting. Probably in part because of the influence of Sir William

Bull, Reith was appointed, and in December 1922 he began to organize British broadcasting.

The BBC began as a private company formed from a group of the most successful wireless set manufacturers. It was answerable to the postmaster general, who issued broadcasting licenses to the BBC to be distributed regionally. The conditions of the licenses were that the service should not carry advertising and that it should not broadcast news that had not previously been published. This last restriction was a sop to the newspaper industry, which feared the BBC would put newspapers out of business.

It did not take Reith long to find out what broadcasting was about. Along with the small group of talented and enthusiastic men who had been recruited to help launch the BBC, he quickly saw its potential. He also decided from the very early days that the BBC should perform a public service regardless of the effect on the company's profits.

Regional stations were quickly established in the North in Manchester and in the Midlands in Birmingham. But Reith strongly believed that a national broadcaster operating in the public interest should be able to serve everyone. A number of smaller relay stations were quickly opened, and by 1925, 80 percent of the population could receive the BBC. Reith quickly introduced a networking system that would allow the regional stations to broadcast simultaneously important programs from London and that would also allow the regional stations to supply the network. By 1930 the BBC was transmitting two services, the National Programme, from London, and the Regional Programme, which offered a more local schedule.

Reith's declared aim was to bring the best of Britain to all the British. To this end he set up advisory committees to guide the content of the broadcasts. The first of these was the Religious Advisory Committee, which was formed in March 1923. It was the prototype of others set up not only in London but also in the regional centers. The Spoken English Advisory Committee had as members George Bernard Shaw, Rudyard Kipling, and the Poet Laureate Robert Bridges, among others. He wanted the committees to bring the best minds to consider the quality of the programs, but his was a very highbrow view of quality. The Music Committee, for example, set up in 1925, comprised only classical musicians.

In 1925 the government appointed Lord Crawford to head an enquiry into the future of the BBC. Reith took it upon himself to deliver a memorandum to the committee, not on behalf of his board but in a personal capacity. In it he urged the committee to turn the BBC into a public corporation along the

lines of the utilities. In March 1926 the committee agreed, and the BBC ceased to be a private company on 1 January 1927 and became the British Broadcasting Corporation.

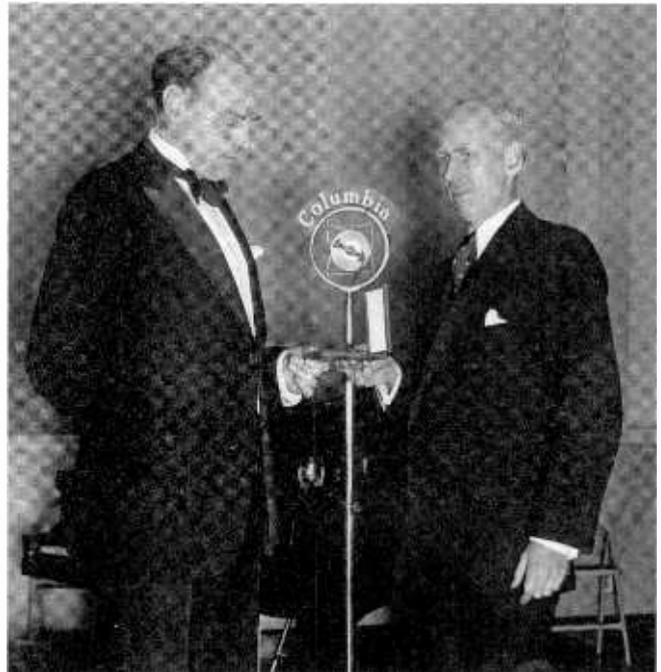

BBC and the General Strike

Reith had once again gotten his own way, but he was soon plunged into one of the most serious crises of the BBC's history, one that would establish the character of the BBC forever. Britain's coal miners had been protesting about their working conditions and pay for many months, and the Conservative government, under Prime Minister Stanley Baldwin, had been stalling. The storm finally broke in May 1926, when the Trades Union Congress called for a general strike. The broadcast of dance music was interrupted so that Reith himself could broadcast the news of the start of the strike. Because the newspapers were not being printed, restrictions on the broadcasting of news were relaxed, and the BBC put out five bulletins a day. Reith insisted that only announcers who spoke English with an Oxford accent should be allowed to read the news, so as to "build up in the public mind a sense of the BBC's collective personality" (Briggs, 1965).

Immediately the BBC clashed with the government. Chancellor of the Exchequer Winston Churchill, who was putting out a government propaganda sheet, saw the potential of the BBC and wanted to commandeer it. Reith got wind of this and was determined to stop him. He persuaded Baldwin that if the BBC were to retain any credibility with the public, it must be seen as impartial. At the same time, in the national interest, he promised that the BBC would not do anything that might prolong or be seen as justifying the strike.

To this end, the BBC broadcast news of demonstrations and read out statements from the Labour Party leader, Ramsay MacDonald, and various prominent Trades Unionists. But neither the representatives of the strikers nor the parliamentary opposition were allowed to appear in front of the microphone in person. Eight days after the strike began, Baldwin went on air to tell the British people that the strike was over and that they should forgive and forget. When Baldwin finished speaking, Reith the showman paused and then started to declaim the words of the hymn "Jerusalem," which begins, "And did those feet in ancient times, / Walk upon England's mountains green?" A massed choir and orchestra he had set up in the studio picked up the hymn, and it ended in a great climax.

This event marked the future of relations between the BBC and successive governments. The BBC has remained impartial and often a thorn in the flesh of government, but it has always supported the concept of parliamentary democracy and has always been vulnerable to government pressure on such things as the renewal of its charter or the amount of the license fee. Reith defined the BBC as "an institution within a constitution."

The events surrounding the strike have led some commentators to conclude that Reith failed the BBC at this crucial time, that because of his desire to be in with the people at the center of power and his desire for a knighthood, he allowed the BBC to be used by the government. Others say that he could have done no more. With Churchill breathing down his neck, the indecisive Baldwin could easily have allowed the BBC to be taken over if Reith had not fought so hard to keep the company unaligned.

Reith's whole vision for the BBC was as a force for social cohesion. One of the ways he sought to achieve this was through the live broadcasting of national events. The first of these was the speech by George V to open the British Empire Exhibition on 23 April 1924, heard by an audience of 10 million people. From 1927 onward, many more public events were covered on a regular basis, such as The Trooping the Colour ceremony, and also major sporting events, such as the Oxford and Cambridge boat race, international rugby matches, the Grand National horse race, and the Wimbledon tennis tournament.

Final BBC Years

Directors-general of the BBC have to report to the board of governors. Reith's first four years after incorporation were a time of great tension between himself and the board. The

chairman was Lord Clarendon, who was ineffectual in the role and easily bullied by more assertive board members, among them Mrs. Philip Snowden, the wife of the former chancellor in the Labour government. She took issue with almost everything Reith did. She felt he was an overbearing autocrat and spoke in letters of his "overwhelming egoism." Although Mrs. Snowden, or "the Scarlet Woman," as Reith called her in his diaries, was undoubtedly out of line with her approach to her work on the board, she made some telling points. Reith certainly was an autocrat. He wrote in his diary about his frustration at having to refer to committees and work with others when he could do the job so much more quickly if he were left to do it alone. His conviction that he alone could run the BBC properly was mirrored by his conviction that the BBC alone could provide the best service to the British people. He was adamant that the BBC should remain a monopoly, but he believed equally that it must remain in the hands of the state and not become a commercial operation.

Mrs. Snowden was particularly bothered by the lack of any staff associations at the BBC (all staff complaints went directly to the director-general) and by Reith's unorthodox recruitment procedures. Very few senior jobs were advertised; they mostly went to friends of friends. All senior appointments were made by the director-general himself, and every new person taken on by the BBC had an interview with him soon after starting. Reith also sacked people himself. One of the more controversial firings was of the chief engineer, Peter Eckersley, who was reputed to know more about broadcasting than anyone else in the country. Reith fired him in 1929 for being involved with a woman before her divorce had come through. Reith later explained that it was not a simple moral case. He would not fire everyone who had an extramarital affair. A conductor or a variety show producer could behave differently from a manager, an announcer, or a senior talks producer. But he did believe the BBC was the keeper of the nation's conscience, and as such, those who worked for it had to be seen as above reproach themselves.

But Reith started to get bored. He announced loudly that there was not enough to do at the BBC now he had gotten it running and that he was ready to take on a really big job and so be of more service to his country. Unfortunately, his character and his oft-professed contempt for politics if not politicians told against him. Nothing was forthcoming. He set about restructuring the BBC, but his style of management was becoming rather outdated and very cumbersome. He created far too many committees, which acted as a dead weight on the program makers, who, in the national center at least, became dutifully conformist.

In the regions, however, where Reith was less able to interfere, there was room for more creativity. The northern region in particular saw a burgeoning of innovative programs, using

regional accents, live broadcasts, and the voices of ordinary people talking about their work.

By the late 1930s it was clear that Reith had to go. What is not clear is how his departure was engineered. One theory is that the chairman and various board members plotted to oust him, but there is little concrete evidence to support this. In 1938 Reith was summoned by the prime minister's office to be told that he was to leave the BBC forthwith and take over Imperial Airways.

After his last day at Broadcasting House, he was driven, with his wife, to the Droitwich transmitter, and at the stroke of midnight he closed down all the engines and switched it off, without, he was pleased to be able to tell anyone who would listen, any engineer telling him what to do. As he left he signed the visitors' book: "JCW Reith, late BBC."

For a while he lobbied to be allowed to become chairman of the board or to be otherwise involved, *ex officio*. When these pleas fell on deaf ears (he would undoubtedly have made his successor's life very difficult), he sent back all his radio sets and turned his back on the organization to which he had devoted the previous 16 years.

Although he had another 33 years in public life, and although his subsequent posts were in prestigious government departments and public companies, Reith frequently succumbed to bouts of depression over his own failure to achieve anything of what he deemed real greatness. To others, however, his legacy is still in evidence whenever anybody turns on a radio to listen to the BBC.

John C.W. Reith. Born in Stonehaven, Scotland, 20 July 1889. Educated at Glasgow Technical College; served in Scottish Rifles in World War I; served in Officers' Training Corps, 1911-14; lieutenant, Royal Navy, 1942-44; engineering apprenticeship, Hydepark Engineering Works, Glasgow, 1906-14; junior engineer, Pearsons, London, 1914; general manager, Beardmore's engineering works, Coatbridge, 1920-22; general manager, British Broadcasting Company (BBC), 1922-26; first director general, BBC, 1927-38; started first regular schedule of public television broadcasts in the world, 1936; chairman, Imperial Airways, 1938; Minister of Information, 1940; member of Parliament for Southampton, 1940-41; Minister of Transport, 1940; Minister of Works, 1940-42; director, Cable and Wireless, 1944; chairman, Commonwealth Communications Council (later the Commonwealth Telecommunications Board), 1944-50; chairman, National Film Finance Board, 1949; director, Tube Investments, 1953. Received GBE, 1934; knighted, 1927; GCVO Doctor of Laws, Manchester University, 1933; honorary doctorate, Oxford

University, 1935; member of Royal Company of Archers, 1937; GCVO, 1939; titled Baron Reith of Stonehaven, 1940; Commander of the Bath, 1944; Lord High Commissioner of Church of Scotland, 1967–69; Lord Rector, Glasgow University, 1966; Knight of the Thistle, 1969. Died in Edinburgh, Scotland, 16 June 1971.

Religion on Radio

The message, “What hath God wrought?” sent over Morse’s telegraph in 1837 indicated that religious topics might well be prominent in electronic communications. This proved to be the case when, shortly after Marconi succeeded in transmitting messages by wireless telegraphy in 1895, hymns and prayers were included in the earliest test broadcasts. As stations were granted licenses, religious programming instituted itself as a vibrant and often controversial element in radio.

Beginnings

One of the country’s first radio broadcast stations, Westinghouse’s KDKA in Pittsburgh, aired *Sunday Vespers* from the nearby Calvary Episcopal Church on 2 January 1921. The pastor was not very interested in the event and so asked his junior associate, Rev. Lewis Whittemore, to conduct the service. In order not to distract those attending, the two KDKA engineers (one Jewish, the other Roman Catholic) donned choir robes. This broadcast was so well received by the listening audience that it soon became a recurring feature of KDKA’s Sunday schedule and was presided over by the senior pastor.

In November 1921 the first continuous religious program was broadcast as the *Radio Church of the Air*, and in the following month the Church of the Covenant in Washington,

D.C., obtained a broadcast license in order to set up WDM, the nation’s first religious radio station. In 1922 Chicago mayor William Hale Thompson invited Paul Rader, who had recently founded the Gospel Tabernacle, to broadcast from a radio station set up in City Hall. Rader quickly grasped the potential reach of radio and negotiated the use of WBBM’s studios and airtime on Sundays to run his own once-a-week station, WJBT (“Where Jesus Blesses Thousands”). Besides broadcasting services, Rader presented talks and aired performances by his Gospel Tabernacle Musicians.

Rush to Radio

By 1923 religious organizations held 12 broadcasting licenses and other church groups offered programs to nonreligious channels. That year, fundamentalist preacher R.R. Brown launched the first weekly non-denominational program over Omaha’s WOW. Later known as the *Radio Chapel Service*, the program continued until Brown’s death in 1964. In 1924 Walter Maier, an Old Testament professor at Concordia Seminary, was the force behind the establishment of KFJO, which still broadcasts from St. Louis under the auspices of the Lutheran Church, Missouri Synod. Also in 1924, Aimee Semple McPherson’s International Church of the Foursquare Gospel

in Los Angeles set up KFSG. By 1925 the number of religious organizations holding broadcasting licenses had increased to 63. Faced with the explosion of interest in all types of radio, the Department of Commerce passed a rule limiting any new religious or public service stations to broadcasting at 83.3 kilocycles, forcing the sharing of this one frequency by several stations.

Controlling the Flow

On the East Coast in 1923, S. Parkes Cadman started broadcasting services from the Brooklyn YMCA over WEAJ and, through a telephone hookup, to a few New England stations. WEAJ liked his interdenominational and low-key approach, but other religious groups quickly began pressing for access to the airwaves, so WEAJ approached the Greater New York Federation of Churches (GNYFC) for help. It agreed to provide the station with three program streams: Protestantism was represented by the *National Radio Pulpit* (which remained on the air until the early 1970s), while Roman Catholics and Jews were given their own airtime. When WEAJ became part of NBC, its religious programs became available coast-to-coast.

Sustaining Time

Looking at the varieties of religious broadcasting available and conscious of the diversity of their vast audiences, the networks were eager to keep radical and controversial religious broadcasts off their airwaves. The Federal Council of Churches (which, paradoxically, was subservient to the GNYFC) was consulted by NBC's Religious Advisory Council, which subsequently decided that mainline religious groups would receive sustaining (free) time on the network provided the groups paid their own production costs and avoided proselytizing. All programs would be non-denominational in nature and would be presented by a single speaker so that a preaching format could be maintained.

Under the system of sustaining time, not only were minority groups such as Muslims and Buddhists excluded, but so were Christian Fundamentalists, Evangelicals, Pentecostals and, for many years, Southern Baptists, Lutherans, and other sizable denominations. Mormonism was represented (on CBS) by *Music and the Spoken Word*, featuring the Mormon Tabernacle Choir. In effect, religious broadcasting became segregated—mainline Protestantism, Catholicism, and Judaism were welcomed by the networks at both the local and national levels, while Fundamentalists, Evangelicals, and other independent groups were forced to rely on paid broadcasting. Furthermore, NBC refused to sell them any network airtime.

The Federal Radio Commission's (FRC) attempt in 1927 to end the chaos caused by too many stations trying to broadcast on too few available frequencies made matters even more diffi-

cult for non-mainstream religious groups. In tightening up its regulations, within six years the FRC had forced about half of the religious radio stations to close because they could not provide the required equipment and personnel.

In 1934 the GNYFC ceded responsibility for religious programming on NBC and CBS to a new committee of the Federal Council of Churches. The mainstream groups accepted the idea of sustaining-time religious broadcasting because it guaranteed them access to large audiences through programs such as *National Radio Pulpit*, *Catholic Hour*, and *Message of Israel*. Cooperation with the networks lessened any threat that they would seek to ban all religious broadcasting because of the often provocative views of conservative groups. Protestant conservatives, however, believed that their voice was being silenced by federal intervention and collusion between mainline religions and liberal network bosses.

Paid-Time Programs

Despite their inability to purchase airtime on the networks and the increased technical regulations on their facilities, many Protestant conservative broadcasters prospered. In 1926, for instance, WMBI, a station sponsored (then and now—it is the nation's oldest audience supported station) by the Moody Bible Institute, went on the air with up-to-date equipment and a professional staff who avoided both direct financial appeals and demagogic attacks on other religious viewpoints.

Charles E. Fuller was perhaps the quintessential fundamentalist preacher of the 1930s and 1940s. He made his first radio broadcast in 1923, but did not begin a full-time career in religious broadcasting until 1933. The Mutual Broadcasting System (MBS) was happy to sell airtime to Fuller and to other non-mainline religious broadcasters in order to get enough revenue to establish itself in the marketplace. The success of Fuller's *Old Fashioned Revival Hour (OFRH)* may be tracked by the number of Mutual stations that carried the program: 66 in 1937, 117 in 1938, and 550 by 1942.

As its name indicates, Fuller's *OFRH* largely followed the format of a revival meeting; its message was simple and represented an amalgamation of conservative religious and cultural values, such as a certain anti-intellectualism and concern with apocalyptic themes. Fuller was given to addressing the audience as his "friends in radioland" and would encourage them to take out their Bibles and gather round the radio set. The *OFRH* was in many ways a model for later broadcasts of a similar nature: its charismatic presenter was at the center of the show, the program was positioned within larger church activities, fundraising activities were emphasized, and production values were kept extremely high.

Walter Maier, who had been instrumental in the founding of KFUV, started *The Lutheran Hour* in 1930. It aired on CBS until the network changed its policy on paid time broadcasting

Billy Graham
Courtesy Billy Graham Evangelistic Association

in 1935 and so had to move to the Mutual network. Underwritten by General Motors, *The Lutheran Hour* became the most popular religious program of its day, broadcast in 36 languages over 1200 stations worldwide, and receiving more mail from listeners than *Amos 'n' Andy*. Unlike many other radio preachers, Maier avoided any sort of star status, insisting that the message rather than the messenger was the only thing that mattered.

Other significant programming was supplied by Paul Rader, the founder of WJBT in Chicago, who by 1930 had an hour-long network show on CBS, the *Breakfast Brigade*, which featured his Tabernacle musicians. J. Harold Smith's *Radio Bible Hour* and Theodore Epp's *Back to the Bible Hour* also had many devoted listeners.

Anti-Bias Stance Strengthened

In 1939 issues concerning sustaining time versus paid time once more came into sharp relief with the decision by the National Association of Broadcasters (NAB) to restrict its member stations from editorializing about "controversial" matters, such as anti-Nazi or anti-communist statements. The NAB was responding, at least in part, to the mounting anti-Semitic and anti-Roosevelt rhetoric in broadcasts on CBS by Father Charles Coughlin, a Roman Catholic priest.

One result of the NAB's actions was that the Federal Communications Commission (FCC) began to deny license renewals to stations judged to have neglected warnings against bias and controversial themes. Further, the FCC insisted that religious broadcasters and other such groups could no longer seek new members or beg for financial contributions over the air. In reaction to the latter ruling, religious broadcasters devised the "free will offering" pitch which is still used today.

Although by 1941 Coughlin had been removed from the airwaves, the FCC took its anti-bias stance even further with the "Mayflower Decision" which, in commenting upon a Boston radio station, held that "the broadcaster cannot be an advocate." This ruling was relaxed somewhat during World War II when paid time religious programming was allowed to return to evangelization activities as long as national politics were not commented upon.

Mutual Changes Its Course

By 1940 about a quarter of the Mutual network's revenues came from Fuller's *OFRH* and other paid-time religious broadcasting. Two things, however, caused it to change its position: it was becoming more financially stable and was looking to further diversify its revenue stream, and in 1942 it was attacked by a liberal interest group, the Institute of Education by Radio, which was opposed to all forms of paid religious broadcasting.

Responding to this onslaught, conservative broadcasters met in St. Louis and set up the National Association of Evangelicals in an attempt to prevent further restrictions on paid religious broadcasts. Despite this move, Mutual announced in 1943 that it intended to make deep cuts in the time it made available for such programs in its 1944 season. The NAE reacted with consternation and worried that individual stations might also try to limit the time sold to religious broadcasters. In 1944, therefore, the members of the NAE decided that they needed to organize an effective pressure group and so set up the National Religious Broadcasters (NRB).

Fuller, forced by Mutual to accept only one half-hour program a week, chose to put a shortened version of *Pilgrim's Hour* in that slot and moved the *OFRH* to a hastily assembled group of independent radio stations, which gave him most of the coverage of the Mutual network. Fuller's solution of non-network syndication through independent stations soon became, and remains, a favorite method for distributing paid religious programming. Mainline religious groups, in fact, also decided in 1944 to start their own syndication campaign through the Joint Religious Radio Committee of the Congregational Christian Church, the Presbyterian Church USA, and the United Church of Canada. Today, in the same way that the NRB supports the conservative or independent wing of Protestantism, mainline Protestantism is represented by the Communications Commission of the National Council of Churches.

After World War II

During World War II, the government froze construction of new stations and the FCC granted few new licenses. By the end of 1945, however, the FCC had already issued more than a thousand licenses for stations and, for the first time since the 1920s, new noncommercial stations began to appear. This provided new outlets for religious programming. Choices also expanded in commercial operations. In 1946, for instance, KDRU in Dinuba, California, began as the first ever Christian radio station run as a commercial enterprise.

In the 1940s and 1950s new voices and new programs found their way onto the airwaves. ABC, the new network founded after the split-up of NBC's Red and Blue networks, aired *The Greatest Story Ever Told* between 1947 and 1956. The Southern Baptists finally got sporadic access to sustaining time for *The Southern Baptist Hour*, and the Christian Reformed Church's *Back to God Hour* started in 1947. The Church of the Nazarene was represented by *Showers of Blessings*, the Seventh Day Adventists had the *Voice of Prophecy*, the Free Methodists produced the *Light and Life Hour*, the Mennonites had their *Mennonite Hour*, and the Assemblies of God sponsored *Sermons in Song*.

Under the direction of the National Council of Catholic Men, the Catholic Church produced four programs: a drama,

The Ave Maria Hour, *The Catholic Hour* with Fulton Sheen (who presented the program from 1930 until he transferred to television in 1952), *Faith in Our Times*, which was broadcast on the Mutual network, and *The Hour of Faith*. Judaism was represented by one new program, *The Eternal Light*, which ran on NBC from 1946 until 1955. Noted for its excellence, it was funded by NBC and produced in conjunction with Moishe Davis, director of the Jewish Theological Seminary.

Just as many secular shows moved from radio to television, so also did several well-known religious programs. Nevertheless, radio continued to host a wide variety of religious shows. In 1950 *The Hour of Decision* carried Billy Graham's Atlanta Crusade over more than 150 ABC affiliates, and the next year Norman Vincent Peale and his wife Ruth became the first husband-and-wife team to host a religious program on radio.

Decline of Radio Networks

The rise of television caused a huge shakeout in the radio industry. At the same time that conservative and independent religious broadcasters seemed to find new confidence and dynamism, some mainline churches (including some that were having major financial upheavals) appeared to be losing interest in maintaining a vital presence on the radio.

The mainline churches had bought into the notion of sustaining time. As network revenues fell, however, and many local stations wished to maximize their profitability, there was a marked decrease in the amount of time given to sustaining programs and a trend to place these programs into fringe timeslots, either very late at night or early in the morning. The NCC, noting that sustaining time had declined from 47 to 8 percent of religious broadcasting, charged that this trend moved against the public interest, but it did not get very far with its complaints.

In 1960 the NRB and the NCC reached a compromise between their two positions, declaring that broadcasters' public service obligations could be fulfilled by either sustaining or paid time. Their announcement banned program-length fundraising, declaring it unconstitutional, and further stated that religious programs were exempt from the FCC's Fairness Doctrine. The FCC's "hands off" stance facilitated this posture, but it was challenged in 1964 when an author claimed that he had been slandered by a conservative preacher and demanded equal time to reply on WCCB, a Pennsylvania Station of the Red Lion Broadcast Group. This demand was upheld by the FCC and, ultimately, by the U.S. Supreme Court.

Toward the Current Era

In the mid-1970s, word started to spread that Madelyn Murray O'Hair, a leading atheist, was asking the FCC to put an end to all religious broadcasting. Although a total fabrication,

it was taken very seriously by conservatives and independents who had already been riled at an unsuccessful attempt by Jeremy Lanzman and Lorenzo Milam to limit the number of licenses given to religious broadcasters. A result of this was a significant increase in donations to conservative and independent religious broadcasters.

In 1977 James Dobson, a lay psychologist whose "traditionalist parenting" ideas pitted him against the likes of Benjamin Spock, began broadcasting *Focus on the Family* on local radio. Within 15 years his show had grown into the most popular Christian program ever, being broadcast on nearly 1,500 radio stations in the United States and abroad. Unlike many others who started in radio, Dobson insists that he remains happy working in radio and has no desire to move into television.

The NRB became explicitly involved in the political process during the late 1970s. Alarmed at what it considered the "liberal drift" of the Carter Administration, the NRB convened a meeting of religious broadcasters to urge them to become more involved in "educating" Christians about the political process. As a result of this gathering, Jerry Falwell formed the Moral Majority and Pat Robertson not only organized the Freedom Council, but seven years later launched an unsuccessful campaign to win the Republican presidential nomination. Since the early 1980s, Christian fundamentalists have been active and loyal supporters of Republican candidates for political office.

In 1978 WYIS in Philadelphia, the first religious station owned by African-Americans, went on the air. Although it is conservative in nature, there are other preachers of the "Black Gospel" who are not quite as traditional. Frederick J. Eikerenkoetter II, known to his followers as the "Reverend Ike," began to make a name for himself by preaching a "gospel of prosperity," mailing out "miracle prayer cloths" and pamphlets about how to become rich and stay that way. At one point in the late 1970s, the Reverend Ike had a program in 56 radio markets, but he has since faded into obscurity. The American Muslim community has been served by programs featuring the Honorable Elijah, Malcolm X and, more recently, Minister Louis Farrakhan. Mainstream Muslim radio is now available via the internet.

Jewish radio is largely served by syndicated programs such as *Israel Today Radio* and programs made by the Jewish Federation and the Union of American Hebrew Congregations. There are a few Jewish radio stations, notably in Florida and Boston, but as with the Muslim community, the biggest source of Jewish religious programming can be found through streaming audio on the internet.

Catholic radio appears to have fallen on hard times since the days when it was the responsibility of the National Council of Catholic Men. Certain dioceses, mostly in the Northeast, the states bordering Mexico, and on the West coast, have their own radio stations, and some syndicated programs are produced by groups such as Franciscan Communications, the

Christophers, and the Paulists. But given the hierarchical structure of the Roman Catholic church, the lack of a consistent radio strategy is puzzling. In 1999 a group of Roman Catholic entrepreneurs funded Catholic Family Radio, a network with an avowedly conservative viewpoint, but it almost immediately fell into financial difficulties and faced bankruptcy within a year. Mother Angelica's EWTN network, although principally a television operation, also broadcasts on shortwave radio, provides syndicated programming to local stations, and can also be heard over the internet.

Entering the 21st Century

In 2003, www.radio-locator.com listed 1184 religious radio stations in the United States and Canada, about equally divided between AM and FM. Most carry inspirational and spiritual talk and music, and many of them continued to air sermons. Another 411 stations were listed as "Christian Contemporary" and there were 495 "Gospel" stations, most of these in the South.

Clearly, religious broadcasting by radio continues to flourish, although media consolidation and population shifts have meant that some forms of Christian radio (local stations in Appalachia, for example), are in decline. Conversely, the continuing influx of Hispanics into the United States has meant that considerably more resources are being dedicated to the religious needs of Spanish-speaking peoples.

The excitement that greeted the first religious broadcasts 80 or more years ago has, of course, been considerably tempered. Radio was the first medium that could communicate the sense of a speaker's presence to a mass audience in distant locations. Christians especially hoped that radio broadcasting would allow them to obey the command of Jesus to "Go ye therefore and teach all nations." Experience has shown that radio is not a very efficient tool for gaining converts, but that it can be very useful in providing comfort and support to those already committed to the broadcaster's viewpoint.

Future developments in religious broadcasting by radio will depend on at least three major factors: the creedal and liturgical orientations of the people who will want to listen to the programming, the structures of ownership and control of the media, and ongoing technological developments.

Renfro Valley Barn Dance

Country Music Program

One of country music's important radio stage shows, the *Renfro Valley Barn Dance* could be heard in the U.S. South and Midwest from the late 1930s until the late 1950s. Along with the *Grand Ole Opry* on WSM (Nashville, Tennessee), the *Jamboree* on WWVA (Wheeling, West Virginia), the *National Barn Dance* on WLS (Chicago, Illinois), and other similar country music shows, the *Renfro Valley Barn Dance* provided a widely heard forum for country music as it grew commercially in the 1940s and 1950s.

The Saturday night showcase for country music talent debuted on 9 October 1937 over the 500,000-watt radio station WLW in Cincinnati, Ohio. Initially, *Renfro Valley Barn Dance* broadcast from the Cincinnati Music Hall and then from the Memorial Auditorium in Dayton, Ohio, but in 1939 John Lair, the program's originator, moved operations to Renfro Valley, Kentucky, some 60 miles from Lexington and not far from Lair's birthplace in Rockcastle County. In Renfro Valley, Lair stationed his show in a converted barn and built around it a rustic pioneer village for tourists to visit. This idea of building a tourist destination around the Renfro Valley stage show predated the *Grand Ole Opry's* Opryland megaplex by some 30 years.

With the show's physical move to Kentucky came also a move to a new radio station home. In 1941 the 50,000-watt WHAS in Louisville began airing the *Renfro Valley Barn Dance*, propelling to the South and Midwest the sounds of the show's country singers and comedians. Over the span of the show's run on radio, it would also be carried by the National Broadcasting Company (NBC), the Columbia Broadcasting System (CBS), and the Mutual Broadcasting System.

Many of the early performers on the *Renfro Valley Barn Dance* had come to the show from WLS radio in Chicago, where John Lair had organized the popular Cumberland Ridge Runners—a musical act on the *National Barn Dance*—and had worked as a music librarian in the 1930s. Former *National Barn Dance* acts on WLS who followed Lair when he headed South were the musical acts Red Foley, Lily May Ledford's Coon Creek Girls, and Karl and Harty. Foley, who was an original investor in the Renfro Valley complex, would go on to be the best-known graduate of the *Renfro Valley Barn Dance*, garnering many hit country songs on the Decca recording label and a prominent spot on the nation's most popular barn dance, the *Grand Ole Opry*. Other nationally known talent who appeared regularly on the *Barn Dance* included comedian Whitey "The Duke of Paducah" Ford (another original investor in the Renfro Valley complex), comedians and song parodists Homer and Jethro, and steel guitar legend Jerry Byrd.

Although the *Barn Dance* gave valuable exposure to country musicians and comics and, in general, helped to establish country music as a commercial force, the show was also important in preserving many of the pre-World War II elements of country music. Founder John Lair was an avid collector of folk songs and ensured that those songs continued to be performed by *Renfro Valley Barn Dance* performers, even as other country music radio shows and performers were forgetting such songs. In addition, as electric instruments and drums became increasingly common in country music during the 1940s, Lair maintained an emphasis on traditional acoustic music, such as that performed by Renfro Valley acts Manuel "Old Joe" Clark, the Callaway Sisters, the Mountain Rangers, and the Laurel County Boys.

As the popularity of the *Renfro Valley Barn Dance* grew in the 1940s, it spun off other musical showcases that brought country music to various audiences. Tent shows featuring *Renfro Valley* talent played one-nighters throughout the East, Northeast, and South. In addition, the Renfro Valley troupe performed on daily shows broadcast over WHAS. For fans of gospel music, Lair and his "Renfro Valley folks" produced the *Renfro Valley Gatherin'*, a program that aired on the CBS network in the 1950s and that still airs today in syndication over more than 150 radio stations in the United States and Canada.

In 1958 WHAS and CBS dropped the *Renfro Valley Barn Dance* from their schedules, marking the end of the show's wide distribution. The program was a victim of the rise of rock and roll music and the decline of network radio. Virtually the only broadcast outlet for Renfro Valley talent would be the tiny radio station WRVK, which Lair established in 1957. As a live performance, however, the *Renfro Valley Barn Dance* continues to be staged every Saturday night, drawing tourists to Lair's pioneer village and often featuring major country music artists. Lair died in 1985 at the age of 91, but his mission to bring country music to the people continues to be fulfilled.

Retro Formats

Oldies/Nostalgia/Classic

Although these programming formats are not identical, they all derive the music they air from years gone by. Whereas the nostalgia station, sometimes referred to as *Big Band*, builds its playlist around tunes popular as far back as the 1940s and 1950s, the oldies outlet focuses its attention on the pop tunes of the 1950s and 1960s. A typical oldies quarter hour might consist of songs by Elvis Presley, the Beatles, Brian Hyland, Three Dog Night, and the Ronettes. In contrast, a nostalgia quarter hour might consist of tunes from the pre-rock era performed by Duke Ellington, Benny Goodman, Frank Sinatra, the Mills Brothers, Tommy Dorsey, and popular ballad singers of the past few decades.

Nostalgia radio caught on in the late 1970s, the concept of programmer Al Ham. Nostalgia is a highly syndicated format, and most stations go out of house for program material. Because much of the music predates stereo processing (1958), AM outlets are frequently the purveyors of this brand of radio, although in recent years more and more nostalgia programming has appeared on FM because recordings have been remixed in stereo. Music is invariably presented in sweeps, and for the most part disc jockeys maintain a low profile. Similar to easy listening, nostalgia emphasizes its music and keeps other program elements at an unobtrusive distance. In the 1980s, easy listening stations lost some listeners to this format, which claimed a viable share of the radio audience.

The oldies format was first introduced in the 1960s by programmers Bill Drake and Chuck Blore. Whereas nostalgia's audience tends to be over the age of 55, most oldies listeners are somewhat younger. Unlike nostalgia, many oldies outlets originate their own programming, and very few employ syndicator services. In contrast with its vintage music cousin, the

oldies format allows greater disc jockey presence. At many oldies stations, air personalities play a key role. Music is rarely broadcast in sweeps, and commercials, rather than being clustered, are inserted in a random fashion between songs.

In the 1990s, oldies stations attracted a broader age demographic than they had in previous years because of a continuing resurgence in the popularity of early rock music. At the same time, nostalgia listener numbers remained fairly static but substantial enough to keep the format on the air in several markets. As of 2002, some 700 radio stations featured one or the other retro sound. A more dance/contemporary approach, called "jammin' oldies," has attracted additional listeners in recent years.

Another variety of vintage radio, classic rock/classic hit (also called boomer rock and adult hits), rose to prominence in the late 1980s. Stations employing this music schematic draw their playlists from the chart toppers (primarily in the rock area) of the 1970s through the early 1990s and often appear among the top-ranked stations in their respective markets.

Whereas classic rock concentrates on tunes essentially featured by album-oriented rock stations over the past quarter century, classic hit stations fill the gap between oldies and Contemporary Hit Radio (CHR) outlets with playlists that draw from Top 40 charts of the same period, although there may be an emphasis on more recent tunes at some classic hit stations.

Rock and Roll Format

Radio's 1950s Transition

Rock and roll was a hybrid musical form that grew out of rhythm and blues and country boogie, adapting the adult themes of the lyrics found there to the concerns of teenagers. Electric guitars and saxophones were predominant. The rhythm was usually marked by a strong backbeat, though shuffle, swing, straight-eight, rumba, and other rhythms were used. Harmonically, rock and roll adopted the blues chord changes and the standard song structures of the music that preceded it.

Background

Rock and roll radio in the United States was part of a massive set of changes in the industry beginning in the late 1940s and leading to modern formatted radio. After World War II and through the 1950s, the radio industry in the United States underwent fundamental changes, including an increase in the number of AM stations from less than 1,000 in 1945 to about 3,600 in 1960. This radically increased the competition for advertising income, on-air talent, programming materials, and audiences. At the same time, broadcasting networks were shifting their advertising finances, talent, and programming to television, leaving many of the older, established stations in need of programming, income, and management ideas. As television began to dominate the prime-time evening audience, radio increasingly depended on daytime audiences and on audience segments outside the urban, middle- and upper-class living rooms where television was adopted early, audiences such as African-Americans, teenagers, rural dwellers, and the less affluent. The displacement of the living room radio by the television, the postwar increase in the prevalence of car radios, and the later transistor revolution led to a dispersion and segmentation of the audience. People listened outside the family group, as individuals in different rooms of the home and outside the home.

Record shows served the need for cheap programming that appealed to audiences who tended to be listening second-

ary to other activities. The shows were usually built around a disk jockey personality, who often chose the music and might also work with local record stores and other sponsors. The personality and the music became a programming package with special appeal to targeted audience segments—as opposed to the old network model of wholesome entertainment for the whole family. Rock and roll reflected the shift from mainstream homogeneity to diversity and special-appeal programming.

Origins

In the late 1940s, commercial necessity began to overcome racist habits among radio station owners, managers, and advertisers, who began to program and advertise for African-American audiences and to hire African-Americans as on-air talent and program advisers. The first experiments were so successful that they led to a revolution in what was called “Negro appeal radio,” featuring rhythm and blues music and disc jockeys who used the argot of working-class black folks. Disc jockeys in this format quickly became local celebrities, with their personal styles growing correspondingly more flamboyant. Attention-getting nicknames, rapping, rhyming, signifying, and characteristics of older verbal insult games and of the later rap and hip-hop were present in the style of African-American personality disc jockeys. As this became the hot new trend in radio, white disc jockeys learned to talk like hep cats too, and sometimes African-American voice coaches and programming consultants were hired at otherwise segregated radio stations. Later white proponents of the style, such as Dewey Phillips and Alan Freed, dropped the rhyming and much of the stylized wit, replacing them with a kind of wildness that may have reflected the liberty of white release into black style—as well as the booze and pills they were famous for consuming.

Negro appeal radio was not only a boon to the African-American community but also led to the discovery and development of white audiences for what had been conceived of as

race music. Two important contingents were white entrepreneurs, often with working-class roots and rebellious attitudes, and white teenagers with spare time and disposable income. Disc jockeys such as John Richbourg (WLAC, Nashville), Dewey Phillips (WHBQ, Memphis), and Alan Freed (WJW, Cleveland); record producers such as Leonard Chess (Chess Records, Chicago), Sam Phillips (Sun Records, Memphis), and Randy Woods (Dot Records, Nashville); and record store owners and mail-order entrepreneurs such as Randy Woods (who turned mail-order business for Randy's Record Shop in Gallatin, Tennessee, into financing for Dot Records) and Leo Mintz in Cleveland were key players. They were white people with more than casual contact with African-American culture and with their own complicated mix of motives. Although some were primarily exploiting business opportunities, others were responding to a genuine affinity for African-American people and culture, and for others rebelliousness appears to have been the primary motive. The disc jockeys became the spoken voice bringing rhythm and blues music to white teenagers, and thus their rebellion—explicit in their loud, rude, on-air style and implicit in their love for forbidden black culture—became an essential component of rock and roll.

Heyday and Controversy

Beginning in 1955, rock and roll records became an ever-larger presence on music sales charts. These were songs by both white and black artists, mostly produced by independent record companies, bought by both white and black audiences. Eventually these songs dominated both the pop and the rhythm and blues charts, with notable presence on the country chart as well. In 1956 Elvis Presley made his first release after his contract was bought from Sun records by the major Radio Corporation of America (RCA); "Heartbreak Hotel"/"I Was the One" was in the top 10 of all three charts simultaneously. In the following years, the pop charts became completely dominated by rock and roll and soul, and so many songs crossed over from the rhythm and blues chart to the pop chart that *Billboard* actually suspended a separate listing for a short period in the early 1960s.

Across the same years that rock and roll came to dominate the pop charts, Top 40 radio became the new standard model for popular music radio programming. In this model, the popularity charts were used as a guide to radio programming, with the most popular songs played the most often. Complications about the validity of the charts or about the necessity that radio stations chose songs to play before they could appear on the charts, were ignored. The programming logic was hailed as a dispassionate, even scientific advance. Questions of taste were irrelevant, it was said; the new Top 40 programmers gave the public what it wanted. The result was that the charts and the radio were locked into a positive feedback system, so that

some popularity led to more popularity—and rock and roll took over.

Rock and roll was controversial, and not only because of its associations with rebellion and forbidden fun. Though it took a while to catch on in the white middle class, by the late 1950s it swept up teenage interest in a manner that disconcerted adults. Reports of conflict between police and crowds at a few concerts were widely publicized. Exploitation movies capitalized on the association of rock and roll and delinquency. Racists objected to the mixing of black and white musicians and audience members. Rock and roll was predominantly produced by small, independent record companies that quickly came to dominate the older major companies in the popular music market. It was pioneered on independent radio stations, and when it crossed to more established stations, the flamboyant, independent character of the personality disc jockeys came with it. More established interests in the music industry, white backlash groups in the South, conservative ministers, parent-teacher associations, and politicians found a convergence of interests in their suspicion that rock and roll was a conspiracy led by the disc jockeys and damaging to (white) youth.

The payola scandals of 1959–60 were the most prominent component of the anti-rock and roll backlash. The practice of record companies' plying radio and other industry personnel with money and favors was decades old and not illegal; as early as the 1890s, song publishers had aided sheet music sales by paying prominent band leaders to perform their songs. What was new was the power of individual disc jockeys and the success of new, small record companies outside the New York music industry establishment. The disc jockeys were the primary target of the scandal, and station owners used the opportunity to wrest control of programming away from them. The model of management-controlled Top 40 programming spread throughout the industry, and by the early 1960s few disc jockeys anywhere selected their own music to play. The free-spirited and entrepreneurial era of rock and roll radio in the United States was over.

Rogers, Will 1879–1935

U.S. Radio Humorist

Will Rogers became one of the United States' most popular entertainers of the 1920s and early 1930s. His appeal was enormous through his newspaper columns, movies, lectures, books, and radio shows.

A photo at the Will Rogers Memorial Museum in Claremore, Oklahoma, shows him making his first radio appearance in 1922 over pioneer station KDKA in Pittsburgh. A 1924 photo shows him with members of the Eveready Orchestra at WEAf in New York City on election day. He did a series titled "Fifteen Minutes with a Diplomat" on the *Eveready Hour*, the first commercially sponsored pre-network hookup.

Rogers was initially uncomfortable with radio. He had difficulty with time restrictions and performing in studios without audience laughter to give him clues as to whether his remarks were funny. He wrote after an early broadcast, "Well that little microphone that you are talking into, it's not going to laugh, so you don't know when you tell anything whether to wait for the laugh, or just go right on." As radio studios became more elaborate, producers included live audiences as part of his programs.

Departing from his wealthy upbringing, Will Rogers approached his radio audiences in the guise of a simple cowboy from the plains of Oklahoma. Always an enthusiastic reader of newspapers, Rogers delivered a style of humor encompassing current social and political issues while gently roasting the key personalities or offering advice on various matters.

During the 1920s his numerous professional endeavors included radio appearances and participation in various national radio hookups. He also wrote humorous radio ads for Bull Durham tobacco. On 17 August 1926, while in Europe, Rogers did a broadcast in London for the largest fee ever paid a radio personality in Great Britain. Known for his

support of relief organizations, his fee went to a hospital charity.

On 4 January 1928 Rogers hosted an ambitious nationwide show connecting 45 stations. Sponsored by Dodge, it was the first broadcast featuring performances in four different locations. After introducing the main guests, Fred and Dorothy Stone, Al Jolson, and Paul Whiteman's orchestra, Rogers announced that he had a surprise. Then imitating the high-pitched voice of Calvin Coolidge, he delivered his own version of the president's state of the union message. Listeners actually believed that Coolidge was talking. Although Rogers sent an apologetic telegram to the White House, biographer Ben Yagoda claims that Rogers never got back into the president's good graces.

By the early 1930s Rogers' broadcasts and daily newspaper pieces reached 40 million people. His income from his various ventures amounted to \$600,000 annually. Beginning in 1930 he had his own regular program, sponsored by E.R. Squibb and Sons, a drug company. From that date until his death, he made regular appearances over radio. He did 12 radio broadcasts for Squibb in 1930 and 53 programs called *The Good Gulf Show* for the Gulf Oil Company between 1933 and 1935. According to the *New York Times*, Squibb paid Rogers \$77,000, almost as much as Babe Ruth's annual salary. The Squibb shows were monologues on Charles Lindbergh, President Hoover, Alfred E. Smith, the Prince of Wales, Henry Ford, and other popular persons and topics.

In 1932 Rogers agreed to be a regular on *Ziegfeld's Follies of the Air*. The show's tight format allotted just four minutes for Rogers' monologue. Rogers' segment, done from Los Angeles, was hooked into the rest of the program originating in New York. When cued to close his segment, Rogers went on talking. After finding out that he was cut off, Rogers sent

the sponsor, Chrysler, a three-word telegram: "Get Another Boy."

Rogers' difficulty with time constrictions can be attributed to the freewheeling style that he had perfected over years of ad-libbing on the Ziegfeld Follies and as a vaudeville entertainer. He said whatever came into his head while rambling from one anecdote to another without any concern for time. He took advantage of the situation to get laughs by bringing an alarm clock to the studio during a *Good Gulf Show* on 7 May 1933. "When the clock's alarm sounds," he promised, "I don't care whether I am in the middle of reciting Gunga Din or the Declaration of Independence, I am going to stop." Each Sunday thereafter the announcer opened the program with, "Here is Will Rogers and his famous alarm clock." The alarm became the signature for his time to sign off.

Rogers appeared weekly on *The Good Gulf Show* beginning on 30 April 1933. He was paid \$50,000 for the series and donated all the money to unemployment relief. The broadcast normally originated from Los Angeles, but his commentaries were transmitted from wherever he was on tour. After the commercials and orchestral segments, Rogers' presentations lasted 15 minutes. The show aired on Sunday evenings at 9:00 P.M. and was followed by President Franklin D. Roosevelt's "Fire-side Chats."

Rogers drew from the headlines and combined materials from his newspaper column with extemporaneous horseplay. The programs were live and unedited, offering a less mediated, rawer version of Rogers than do his writings.

On a Gulf program from Chicago, he employed his vocal version of the voices of *Amos 'n' Andy*. On another program, Rogers discussed radio's invisible audience while asking the listeners if his humor was too political. One Gulf program opens with a tribute to Will Rogers from the Senate read by Colonel Edwin A. Halsey describing Rogers as "the poet laureate of wisecracks." Another memorable Gulf broadcast features him talking about gold; however, he discusses it as a sportscaster announcing a football game between the United States and the rest of the world.

The *Good Gulf Show* lasted until June 1935. Rogers signed an agreement to continue the programs, but he and his friend Wiley Post died in a plane crash in Alaska on 15 August 1935. Both NBC and CBS went off the air for 30 minutes as a tribute to his life.

Few recordings of Rogers' air work have survived. Printed transcriptions of the Gulf programs are available at the Will Rogers Memorial. Unfortunately, only 16 sound recordings of the Gulf series exist. Verbatim transcripts of the 12 Squibb shows can be found in *Radio Broadcasts of Will Rogers* (1983) along with an important single broadcast made in 1931 for the Organization of Unemployment Relief. An audio cassette tape collection of his radio talks, mostly from the Gulf show, is available at the memorial.

FRANK J. CHORBA

William Adair Rogers. Born 4 November 1879, near Oologah, Indian Territory (later Oklahoma), one of eight children of a successful rancher and banker. After an extensive rodeo career, came to New York as vaudeville performer, eventually with Ziegfeld Follies, 1904-14; moved to Hollywood in 1918 and appearance in dozens of films, 1918-35; syndicated newspaper column, "Will Rogers Says," 1922-35. Killed in a plane crash with Wiley Post near Point Barrow, Alaska, 15 August 1935.

Rome, Jim

U.S. Sports Radio Personality

Jim Rome is one of the most popular and respected sports radio personalities of the day, with a following so rabid that it approaches cult status. Known for his aggressive, “in-your-face” style, Rome asks only one thing of the callers to his Los Angeles-based, nationally syndicated program: “Have a take and don’t suck.”

Rome’s radio career began while attending college at the University of California, Santa Barbara (UCSB) and working for campus station KCSB. After graduation in 1987 with a degree in Communications, he worked for a Santa Barbara radio station KTMS in a number of capacities, including sports director and play-by-play announcer for UCSB sports. The essence of his radio program today can be traced to its roots in that period, when he tried to make the program he hosted both different and appealing.

In late 1990 Rome received a big break when he began working for XTRA Sports 690 in San Diego, a 50,000-watt station whose signal could be heard up and down the Pacific coast. His show ran from 7:00 P.M. to midnight, and this was when the program really developed. Off-the-wall callers were commonplace, prompting Rome to characterize the climate as a jungle where only the strong survive. The label stuck. The phenomenon grew through mid-1995, when the Nobel Broadcast Group began syndicating Rome’s program, initially to four affiliates. The program is now syndicated by the Premiere Radio network and has more than 200 affiliates with 2.5 million listeners in the United States and Canada.

The Jim Rome Show is much more than telephone calls and interviews. When listeners tune in, they are transported into a unique radio environment—the Jungle. To survive in this jungle, the visitor is advised to understand its unique language—its “gloss” (short for glossary). A few examples include *crib* (a team’s home field or arena, or one’s home territory); *blowing up* (becoming popular, thriving); *props* (credit, praise); *fishwrap* (*newspaper*); and *monkeys* (program directors of stations that air *The Jim Rome Show*). That gloss, along with the overall texture of the program, can make it difficult to follow initially. Rome characterizes his program as an acquired taste and asks new listeners to give it a two-week trial before rendering a verdict. The three-hour program consists largely of running “smack”—the host and his callers lining up with highly critical takes on one or more topical issues or personalities. It is not for the faint of heart. Only the thick-skinned need apply—or call. Failure to have a take that does not “suck” will generally lead Rome to “running” the caller—sounding a buzzer and hanging up. Espe-

cially good takes, however, often punctuated with “Out!!!” by the caller, will be followed by the host’s exclaiming, “Rack him!” (or, on occasion, her). This means that the call is now eligible for the “Huge Call of the Day” and may be replayed at the end of the program. For those unwilling or unable to call, they may fax or e-mail their takes, and Rome (“Romey” to Jungle veterans—the “clones,” as they are called) will read them.

Although the Jungle can be a rough place, it is a principled place, where the host’s takes—though delivered with his typical edginess—are replete with moral integrity. Rome’s contributions to radio include bringing intelligence, knowledge, and insight to a genre—sports talk radio—that is often lacking in those attributes. An expert interviewer, Rome frequently elicits information that others would not. Moreover, because he is so widely respected, people who typically refuse interview requests often agree to talk with Romey.

Rome’s respect from the public and sports figures alike stems from his knowledge of his subjects plus a penchant for asking the tough questions. Although his style remains hard-hitting and no holds barred, Rome is highly respected by many people for the insight and preparedness he brings to his interviews. Much of his day, in fact, is devoted to preparation. He claims that for every hour he is on the air, he spends at least two doing his homework.

Linked to *The Jim Rome Show* is the phenomenon of the “Tour Stop.” Tour Stops began with Rome’s occasionally originating his radio program from a location in one of his affiliate cities. His clones attend en masse, some traveling long distances. In addition to listeners, several sports figures who live in the Tour Stop city also drop by. Like the program itself, the Tour Stop happening has grown exponentially since its inception. The first was in Omaha in 1996. Because of escalating crowd sizes and a sort of “Jungle fever” that ensued as Rome attempted to conduct his program, Tour Stops are now conducted off the air on Saturdays.

Although Rome’s résumé is dominated by his work in radio, he also has utilized his talents in television. This includes two years hosting *Talk2* on ESPN2 in the mid-1990s. In that venue, an incident occurred that continues to follow Rome. Then-Los Angeles Rams quarterback Jim Everett was a guest on the show, and Rome called him “Chris” three times, a reference to female tennis player Chris Evert, in questioning his toughness. Once Everett had enough, he flipped over the table and nearly did the same to Rome. Rome now acknowledges he mishandled the situation and calls it “regrettable.”

Rome's television programs also include *The Last Word* on Fox Sports Net, which he hosted for five years nightly. In May 2003, he began a weekly program on ESPN, *Rome is Burning*.

Rome was named California's sportscaster of the year in 2000. He lives in Los Angeles with wife Janet and son Jake.

Roosevelt, Eleanor 1884–1962

U.S. First Lady and Broadcaster

Among her many roles as first lady, Eleanor Roosevelt delivered commercially sponsored broadcasts. She was the first to do so. Eleanor Roosevelt was on the air more often than any other Roosevelt and for a greater variety of reasons. She used radio to sway public opinion on issues she was concerned about, to make money, and to help her friends and family. And like her husband, she had a personal, conversational approach to the medium that worked well for radio.

Roosevelt's radio career included a few political talks before 1927, a number of sponsored series from 1930 through the 1950s, and hundreds of speeches and interviews. From 1921 to 1924, while Franklin D. Roosevelt was struggling with his polio, Eleanor Roosevelt was reaching out into political activism and giving radio speeches to keep the Roosevelt name before the public. She gave a very well organized speech on WRNY about an upcoming referendum in New York. It was clearly a political speech supporting the Democratic platform, but it started off on a personal note—"On one of the registration days here in NYC a friend of mine tells me that she had the following experience . . ." Other speeches were on topics that reflected her own interests in helping others: charities such as Children's Aid Society, Salvation Army, Emergency Unemployment Relief Fund, and later the United Nations. She also gave messages that reflected her set of values; they could be about parenting, the duties of a wife, or the life of a first lady. She was aware of her prominence and desired to keep that stat-

ure to continue to be able to influence social change. She worked at maintaining a platform and a channel to her audience, one that she assumed to be mostly women.

Her first series of sponsored radio programs in 1932–33—*Pond's Radio Program Speeches*, for Pond's, a cold cream manufacturer—was clearly directed to women during the daytime. A sampling of her subjects included "Keeping Your Husband Happy" and "Official and Social Life in Washington." The very fact that Roosevelt, soon to be first lady, was being paid for her broadcasts made the news, but she replied that the monies were going to charity via a special fund set up with the American Friends Service Committee, and she reluctantly held off making more commitments for sponsored programming until 1934.

The sponsored series that aired from 9:30 to 10:00 P.M. in 1934 for the Simmons Mattress company was intended to be a blend of feature material and current events. Roosevelt actually referred to herself as a news commentator. She had other sponsored series, but the series that had the most controversial programming was her 25-program Sunday night series for the Pan American Coffee Association—an organization that represented eight coffee-exporting countries—while she was co-director of the Office of Civil Defense. Her topics included rumors of the president's dictatorial powers, torpedoing of ships, German propaganda, U.S. civilian defense, anti-Semitism, and others. The programs were remarkable for their

Eleanor Roosevelt at CBS's WABC Studios
Courtesy CBS Photo Archive

incorporation of propaganda for the president's policies, but research indicates that only the socialist Norman Thomas asked for reply time to give the isolationists' perspective—which he was denied.

After the war and out of the White House, Roosevelt's selection of broadcast topics continued to vary. Her daughter Anna produced a 15-minute weekday radio series with her from October 1948 to August 1949; Eleanor Roosevelt participated two or three times a week. Samples of Eleanor's topics for this included the value of Wiltwyck School, a small school for delinquent children across the Hudson River from Hyde Park that she had supported throughout its years; radio's responsibility, which was heavily drawn from Edward R. Morrow's acceptance speech for an award; and spring at Hyde Park. But apart from this series, Roosevelt also gave radio broadcasts on very serious issues such as communism and the value of freedom of expression, and the significance of the Declaration of Human Rights. She also gave partisan speeches for Democratic candidates, and she was always ready to be interviewed.

The lack of continuity of broadcast series and the variety of topics indicate to some that Roosevelt did not take radio especially seriously. She was not a broadcaster first and foremost, but she was clearly aware of the business aspects of broadcasting. Her correspondence with her agents, who demanded high fees for her, make apparent her awareness of the need for exclusivity with agents or with networks, and illustrates her desire to protect her output so that it was always valued. One agent, Myles Lasker, was adamant about trying to get high fees. He found a sponsor, the J. Walter Thompson advertising agents for The Johns-Manville Company, willing to pay a \$3,000 honorarium for a 5-minute talk on "The American Home—Its Traditions and Hopes." Another agent noted: "I've chased down several radio inquiries and find they're phony. I guess it's someone trying to pull some cheap stunt." Roosevelt was careful to protect any content that had been sponsored. She notified the National Broadcasting Company (NBC) that they could list her speeches in a catalog intended to sell their programming but that she would not allow for any of her commercially sponsored broadcasts to be listed. She was also economical in her use of content. Just as she had a selection of four or five topics for her lecture tours, she often repeated subjects over the years. There are countless programs whose topic is "A Day in the Life of the First Lady," "Role of the Wife," or the value of "Freedom of Expression."

She also used the medium as a means to work with and help friends. At the request of her friend Esther Lape, for example, Roosevelt broadcast a speech in January 1935 to counter the Hearst-Coughlin onslaught against the World Court. Then, in 1941, she was more than willing to speak on behalf of FDR's policies, and she was sure to have him, or his aides, go over the scripts. To help her children make money she worked with her

daughter Anna (1948–49) on a radio series, and then with son Elliott (1950–52) on a television series.

Roosevelt appreciated the power and influence the medium afforded her. In her later years she gave up her lecture circuit in favor of broadcasting, so that more people could hear her. In 1951 she was asked to be a charter member of the women's broadcasting organization, AWRT (American Women in Radio and Television).

Russia and Soviet Union

Prerevolutionary Russia, although in many ways technologically undeveloped, was a leader in the development of wireless. Despite the Russian Revolution and the civil wars that followed it, the country's deployment of radio in European (western) Russia in the earliest decades of the 20th century was comparable to that occurring in other industrialized nations. The Union of Soviet Socialist Republics (USSR) subsequently developed extensive wired and wireless radio systems that, in content and structure, were consistent with communist ideology and the aims of communist states. The collapse of the USSR in 1991 put radio, like many aspects of life in the Russian Federation, on a chaotic course. Commercialism came rapidly to some areas, but state-run systems struggle on. Despite exploiting some new technologies, such as the internet, for global as well as national distribution, the overall preparedness of Russian radio broadcasters for the radio technologies of the 21st century seems inadequate.

Prerevolutionary Russian Radio (to 1918)

The Soviet Union long hailed St. Petersburg academician Alexander Stepanovitch Popov as the "father of radio," and Russia continues to celebrate 7 May as "Radio Day" in recognition of his demonstration of the detection of electromagnetic discharges from lightning on that day in 1895. It is possible that Popov transmitted the Morse-coded words *Heinrich Hertz* at St. Petersburg University on 24 March 1896, but documentation of this achievement has always been hazy. If one counts the 7 May 1895 demonstration as a true demonstration of radio telegraphy, then Popov invented radio more than a year

before Marconi's 2 June 1896 patent application. However, Marconi's July 1896 demonstration of sending and receiving coded messages is better documented than Popov's alleged March transmission. Unlike Marconi, Popov did not capitalize on his invention. He seems to have had less interest in radio than Marconi did, and in any event, the czarist navy took over radio's development by 1899. Popov worked independently of Marconi, although they both built on the common work of scientists and inventors such as Maxwell, Hertz, and Lodge, and Popov certainly counts as an important inventor of early radio. Others were also at work on radio in St. Petersburg at the time, including Vladimir Zworykin, who immigrated to the United States just two years following the 1917 Russian Revolution, joined Westinghouse Electric Corporation, and later became known in the West as a father of electronic television. Although the West benefited from the flight from revolutionary Russia, many scientists and technicians remained in the country after 1917 and contributed to the development of radio in the Soviet Union.

Radio in the USSR (1918-90)

Vladimir Lenin appreciated the potential for radio to advance the causes of the Bolsheviks and to build support for the party. He considered radio sufficiently important as a potential means of overcoming the huge distances in the country to justify devoting a substantial portion of the country's scarce gold reserves to its development. Newspapers, Lenin's preferred means of communication, could not reach the masses of illiterate workers and peasants as radio might. Therefore, as early

as December 1918, Lenin set up an experimental radio laboratory in Nizhniy Novgorod (Gorki in the Soviet era). Activity at the lab was halted during the civil wars that followed the 1917 revolution, but it resumed in 1924. A 12-kilowatt station (among the most powerful in the world at the time) went on the air from Moscow beginning 17 September 1922, irregularly transmitting music and an occasional speech by Lenin. In October 1924 the Russian government's Council of People's Commissars established a Joint-Stock Company for Radio Broadcasting, *Radioperedacha*, with the stock held by trade unions and teachers. Control of the station by such a joint-stock company reflected a level of freedom from Communist Party control that would later disappear in the USSR. Under this company, the Moscow station on resumed systematic, regular broadcasts on 12 October 1924. Within a year Moscow also had the first Soviet wired radio system (*radiotranslyatsionni uzel*), an interconnection of 50 speakers. Although Russia may not have invented the radio, a good case can be made that it invented the wired nation, because up until the mid-1960s, the number of wired receivers—*radiotochki*—in the country generally exceeded the number of over-the-air receivers.

With Stalin's ascent to power, a movement began to increase central government and party control of wired and wireless radio. *Radioperedacha* was dissolved in July 1928, and the Commissariat of Posts and Telegraphs, which already regulated radiotelegraphs, unsuccessfully assumed control. On 31 January 1933 the Council of People's Commissars of the USSR established the All-Union Committee for Radiobroadcasting and Radiofication (Russian acronym, VRK) and put it broadly in charge of wired and wireless radio throughout the USSR. Ultimately, each USSR republic (except, notably, Russia) established its own radio committee to oversee services to the republics, but these committees worked under close supervision from Moscow, which continued to determine nationwide programming. There were local committees for cities and even for factories, collective farms, and the like.

Wired and wireless radio grew slowly prior to World War II. In 1928 there were about 20 over-the-air stations, and by the time Hitler invaded Russia in 1941, that number had grown to about 90 stations and an estimated 760,000 over-the-air receivers. But VRK estimated that in 1940 there were 11,000 "radio exchanges" powering about 5 million speakers.

The "Great Patriotic War," as Russians call World War II, devastated Soviet radio. Nearly all over-the-air sets were confiscated by Soviet authorities and, it is claimed, returned at the war's end. In European (western) Russia, German invaders either captured wired radio exchanges or destroyed them. When the war turned for the Soviet Union, it discovered that it was unable to broadcast pro-Soviet propaganda to the western part of the nation because very few individuals had wireless receivers. At the war's end, only 5,500 exchanges were opera-

ble, most of them east of Moscow. The wired systems, however, were quickly rebuilt, and it is estimated that by 1947 9,250 exchanges were operable.

Wired radio was attempted in other nations, both in the East and in the West, but no nation took the idea as far as the Soviet Union did. The addiction to wired radio is sometimes traced to the desires to limit information access of Soviet citizens, and that may have been part of the motive. But there were other reasons for the adoption and expansion of the system.

Until they grow to gargantuan size (which eventually they did), wired exchanges are cost efficient. Because the home or work receivers consist of little more than a case, a transformer, a switch, and a speaker, they are something that the chronically underdeveloped Soviet consumer electronics industry could produce in quantity. Over-the-air radios were more complex and expensive; in 1936, for example, there were just 650,000 such sets in the country. Around 200,000 of these were regarded as outmoded, and 270,000 were crystal sets.

Wired systems had some other advantages. They did not require batteries—chronically unreliable and in short supply—as inexpensive receivers often did. They could even operate in households without electricity. Through wind-powered exchanges, some Soviet villages got wired radio before they were electrified. During the Nazi siege of Leningrad (September 1941–January 1944), the wired radio system continued to function despite the collapse of the electrical system in the city. Throughout the 900-day siege, a metronome continued to beat as the heart of Leningrad, varying in pace, some said, with the level of threat to the city. Speeches, war information, and even live symphony concerts were transmitted to the beleaguered city.

Wired exchanges could also be operated to provide some time for "local" broadcasts. At the very least, services from Moscow could be interrupted for short periods of time to accommodate programming specific to a republic (including programming in languages other than Russian) or city, or, in some instances, programming intended for a specific factory, collective farm, or workplace. Given the low signal capacity of the systems, however, such programming displaced Moscow programming and therefore never amounted to a large percentage of transmission time.

Wired radio systems were repaired and expanded after the war. By 1946 Moscow (and later other parts of the country) had two-channel service. A third channel was added in 1947, when it was estimated that only 18 percent of radio listening came from over-the-air services. A fourth channel was added in 1965, and a five-channel system was the never-realized Soviet goal.

Slowly after the war, however, over-the-air stations were begun in earnest. Because AM had not become as entrenched in the USSR as in other countries (notably in the United States), FM was introduced relatively early. In 1963 the coun-

try was thought to have 170 long-, medium- (AM), and short-wave stations but also 86 FM stations. Whereas wired speakers accounted for 75 percent of receiving equipment in the 1950s, by about 1965 half of all receivers in the country were wireless. The country settled into a pattern, still true today, of hybridized wired and wireless transmission.

Following Stalin's death in March 1953, VRK evolved into the USSR State Committee for Television and Radio (*Gosteleradio*), which, until the collapse of the USSR in 1991, monopolized domestic radio and television as well as international broadcasting. Choices expanded somewhat as *Gosteleradio* added services. At the end of the Soviet era, the "First Program," a mixture of news, commentary, classical music, and folk music, used wired and wireless services to reach 97 percent of the population. The second program, *Mayak* (lighthouse or beacon), a highly popular, slightly less political or stuffy service, reached 85 percent of the country. In 1964 *Mayak* was the first service to go full-time in the USSR. Its lighter, sometimes even deliberately entertaining, service and round-the-clock schedule were intended to make it, in part, a competitor to Western shortwave international radio services, such as Radio Free Europe. The Western services attracted audiences through their brighter blend of music and talk, and, until *Mayak* was introduced, they exploited the fact that Soviet radio channels shut down at midnight. The third program service, emphasizing classical music and education, reached only 40 percent of the nation by the 1980s, and the fourth channel could be heard by only 7 percent of listeners, mostly in Moscow.

Although not as political as in Stalinist times, Soviet radio services remained generally faithful to the communist ideal of using the mass media primarily to raise the cultural level of the populace. Entertainment was secondary. There was some popular music and jazz by the 1960s but also, compared to Western standards, heavy doses of opera, drama, and literary programs. Many programs were specifically targeted at children. Sporting matches were also frequent fare. The national service emphasized Russian, but services in the republics produced programming in many of the Soviet Union's more than 80 major languages. About 65 percent of receivers were over-the-air, picking up predominantly shortwave and FM signals. Although the Soviet AM band was similar to the band used in Europe and in the United States (570–1479 kilohertz, but on 9-kilohertz spacing rather than the 10-kilohertz spacing used in the United States), the Soviet FM band used a different range than that used in Europe and the United States. In part to discourage reception of Western FM signals in border states, the Soviet Union and its Warsaw Pact allies used a lower (64–74 megahertz) FM band, commonly known as the UKW or ultrashortwave band, than was used in the West (88–108 megahertz). Unlike FM in the United States, Soviet FM stations transmitted on even as well as odd (e.g., 88.1 and also 88.2)

frequencies in the FM band. Soviet radio also used a longwave band of 150–350 kilohertz and a shortwave band of 5.9–17.6 megahertz. Wired systems, by then usually carrying three channels, except in one-channel rural areas, continued to serve both cities and the countryside. In rural areas, they were often the only services available. Some urban wired systems used stereo. The *Gosteleradio* empire, on the eve of the Soviet collapse, had grown colossal, employing an estimated 82,000 people, second in size only to the Ministry of Defense.

Radio in the Russian Federation (Since 1991)

Some liberalization of Soviet radio occurred early under General Secretary Mikhail Gorbachev's policies of *glasnost* (openness) and *perestroika* (restructuring) once he succeeded Konstantin Chernenko in March 1985. Reporting of the failings of Soviet government (obvious to many Soviet citizens anyway) was allowed, although reporting of disasters such as Chernobyl in 1986 still did not take place immediately. Although a reformer, Gorbachev sought to preserve the USSR and, at least initially, the Communist Party. But *glasnost* empowered critics of the Soviet system. Boris Yeltsin, a well-known political figure, resigned from the party in June 1990, only to become the first freely elected president of the Russian Republic in July 1991. Independence movements in the non-Slavic republics grew. Often, anti-Soviet forces seized radio and television facilities. On 13 January 1991, 13 Lithuanians were killed in battles over studio and transmission facilities in Vilnius. The shocking bloodshed, many believed, hastened the end of Soviet rule, already undercut by dissent and rot at its heart. Significant squabbling began between Yeltsin—advocate of an independent Russia—and Gorbachev, defender of the Union.

The end really began on 19 August 1991 when, with Gorbachev out of Moscow, hardliners led a short-lived putsch aimed at removing him. After heroic defense at the Russian White House—headquarters for Yeltsin's Parliament of the Russian Republic—the ill-planned coup collapsed and Gorbachev returned to Moscow, weakened and disgraced. In short order, the USSR had to accept the independence of the Baltic and, later, other republics. On 25 December 1991—after a 74-year run—the curtain fell on the USSR. Gorbachev's goal of an open, but still communist, society had proved unsustainable.

Yeltsin realized that Gorbachev and *Gosteleradio* directly controlled electronic mass media in Russia. As noted earlier, under the USSR Russia had been the only republic without its own radio and television committee: the interests of Russia in electronic media were supposedly represented by *Gosteleradio*, but this situation was unacceptable to Yeltsin. In August 1990 the Russian Parliament created the All-Russian State Radio and Television Company (*Vserossiyskaya Gosudarstvennaya Teleradiokompaniya* [VGTRK, also known as RTR]), which

launched Radio Russia (*Radio Rossii*) on 6 December 1990. During the Lithuanian revolt in January 1991, Radio Russia supported the rebels. Gorbachev officially acknowledged RTR on 13 May 1991, and it assumed control of the national radio channel 2. When, in August 1991, coup leaders gained control of the main transmitter in northeast Moscow, RTR continued to transmit from the White House via shortwave and, in effect, through CNN.

As Yeltsin consolidated power following the coup, Radio Russia became the "first button" on wired radios throughout the Russian Federation, although the by then withering *Gosteleradio* held on to other national radio services. During an attempted coup against Yeltsin in fall 1993—following the collapse of the Soviet Union—anti-Yeltsin forces attempted to seize the shared RTR/Ostankino production facilities, but RTR had downtown studios and somehow maintained its link to the transmitter.

Today, Russia is served by four interregional, theoretically state-funded, radio services. Radio Russia, run by RTR, is the second most widely attended to service and is generally regarded as the official voice of the Putin government that succeeded Yeltsin in 1999. It broadcasts 18 hours per day on channel 1. Radio *Mayak*, a subsidiary of VGTRK, is still the most popular single service in the nation. Radio *Yunost* (youth), now associated with *Mayak*, broadcasts programs for audiences from 14 to 25 years old. Together, they now share channel 2. Radio *Orfey* (Orpheus) broadcasts 18 hours daily of classical music, educational programs, and newscasts about cultural events as a noncommercial state institution, typically on channel 3. Regional governments continue to run regional services, sometimes in languages other than Russian. There is also a state-run international service, the radio broadcasting company *Golor Rossii* (Voice of Russia), formerly *Radio Moscow*, which transmits programs in Russian and 31 foreign languages. As with many Russian state institutions, however, the economics of all state-run services are unsettled. Salaries are low and irregular. The state often fails to pay agreed-upon sums, and as a result, state-run services accept some advertising and are often behind in payments to other state-run agencies that still control towers and transmitters.

Given the continuing dependence on state-controlled over-the-air radio transmitters and wired radio systems, it should not be surprising that "independent" (nonstate) radio had a difficult birth. The first nonstate radio broadcast station (since Lenin's experiments just after the revolution) began in August 1990, when radio journalists at the faculty of journalism at Moscow State University founded *Echo Moskvy* (Moscow's Echo). It stayed on the air even when, during the 19 August 1991 putsch, KGB officials attempted to close it. Today it is one of about 20 nonstate FM stations available in Moscow. Nonstate over-the-air radio broadcasting has blossomed in many other larger Russian cities, but in nonurban areas, state

broadcasting (by wire and over the air) is often all that is available. Regional governors often have fairly tight control over state, and even nonstate, radio in their regions.

Many independent over-the-air radio stations operate in multiple cities. In U.S. terms, they might be described as par networks or certainly as closely controlled by a group owner. Many independent radio stations function as Russian-Western joint ventures of some sort. *Europa plus*, for example, is a joint French-Russian company that operates through about 60 "partner stations." American media entrepreneur John Kluge (after selling Metromedia's television properties to Rupert Murdoch to form the heart of Fox broadcasting) turned Metromedia International Group into a major player in Eastern Europe. It broadcasts on two frequencies in Moscow and on one in St. Petersburg and has other properties in Hungary, Estonia, Georgia, Latvia, and the Czech Republic.

According to the Licensing Administration of the Ministry for Press, Television and Radio Broadcasting, and Mass Communications of Russia, 946 licenses for the operation of radio transmitters were in use in Russia as of 1 September 2000. These include 671 licenses for over-the-air radio broadcasting, 216 for wired transmission, 10 for satellite radio, 7 for over-the-air and wired broadcasting, and 2 for multiprogram broadcasting.

Programming of independent radio generally does not stress politics. Rather, the stations often target the small and continually endangered Russian middle class, especially its youth. Programming is often an eclectic mix of Russian and Western rock and pop and can include weather and helicopter traffic reports and disc jockey patter that would be familiar to Western ears, although Russia has yet to develop an indigenous Howard Stern. Hard hit by the Russian economic collapse of 1998, which wiped out much of the advertising marketplace, the economics of independent stations are often problematic, although Western investors seem committed for the long haul. Independent stations are often in arrears to state-run transmission facilities, and continual government threats to collect the debt compromise their independence. Some often generate revenue by accepting payment for retransmitting the British Broadcasting Corporation (BBC), Deutsche Welle, or Radio Liberty. Others retransmit paid religious programming from Western (often fundamentalist Christian) sources. Weak economics tempt playola on a scale considered unlawful in the West, and because of lax copyright law enforcement (and no effective organization such as the American Society of Composers, Authors, and Publishers [ASCAP] or Broadcast Music Incorporated [BMI]), Russian popular musicians are eternally complaining that they are undercompensated for their music. One response is frequent co-promotion of raves and concerts between artists and radio stations.

Many of the independent stations found frequency space in the upper (Western) FM band (88–108 megahertz), which was

not used in Soviet times. Since 1991, the Russian consumer electronics industry has largely collapsed. Today, radios in Russia are often imported from Europe or Asia and (at least in the early to mid-1990s) often did not even receive the "Russian" (64–74 megahertz) band. Wideband FM radios are now available but are more expensive than sets without the old Soviet frequencies. The result is that those who can afford new radios sometimes cannot receive the Soviet frequencies at all but have easy access to the Western band, which may not be heard by Russians who have not replaced their radio sets. Car radio listening (almost insignificant in Soviet times because of the lack of private cars) is important in major cities. Despite tough times, urban Russians increasingly own cars. Imported used and new vehicles inevitably come with Western FM radios, and whenever they can, Russian youth mount Japanese radios in even the most decrepit of Russian cars. A response to this frequency chaos, by both independent and state-run over-the-air broadcasters, has been, in effect, cluster broadcasting. The same "station" may transmit on a variety of frequencies—from shortwave to Soviet FM to Western FM.

The Future of Russian Radio

It is as risky to predict the future of Russian radio as it is to predict the future of the Russian Federation itself. Political pressures continue on independent Russian television, and although less on radio, they are still present there. The economics of independent broadcasting, given the sad state of the Russian economy, remain less than promising. Transmission towers and transmitters themselves, still overwhelmingly state owned (and leased by independent radio), have received few technical upgrades and often not even basic maintenance for almost 20 years. A fire, allegedly started by a short circuit, at the Ostankino television tower in August 2000 knocked out most radio and television broadcasts in Moscow for several days. Other transmission facilities are likely to be in even more decayed condition. Russia lags behind Europe (and even the United States) in making a transition to digital radio.

Compared to Soviet times, however, some things are brighter. There are more radio services and more diverse content. There is political debate. There is more popular entertain-

ment, and somehow, high culture hangs on. Perhaps because of their familiarity with wired radio (or conceivably out of fear of the state of their transmitters), Russian radio has embraced the internet, and those of the international Russian-speaking diaspora, at least, can access a wide range of state and nonstate audio services. Indeed, if the money could be found for nationwide wireless broadband services (a not entirely fanciful idea in a country with decaying traditional broadcasting and wired telephone systems), "radio" in Russia's future might someday be widely delivered by the internet.

S

Sarnoff, David 1891-1971

U.S. Broadcast Executive

Though not an engineer and lacking much formal education, David Sarnoff played an important role supporting the technical development of American radio and television through his leadership of the Radio Corporation of America (RCA), a key manufacturer of receivers and broadcast equipment. He was also instrumental in the formation of the first permanent radio network, the National Broadcasting Company (NBC). The originator of many myths about his own background, Sarnoff's actual accomplishments needed little embellishment.

Early Years

Sarnoff's father, Abraham, left Russia for America when David was four, leaving behind his pregnant wife, David, and a younger son. When David was five, his mother sent him to Korme to begin training as a rabbi with his granduncle. He remained there until he was nine, when his father sent for the family to move to America. They left Russia in 1900 in the midst of considerable political confusion, traveling by ship to their new country. Soon after their arrival in New York City, David's father became an invalid. The boy took jobs delivering meat and newspapers, and he entered school to learn English. Within two years 11-year-old David bought a newsstand for \$200, and he took a job singing soprano in a synagogue choir at \$1.50 per week. Sarnoff's voice changed when he was 15, so he lost the choir job, and in that same year his father died. Sarnoff decided to pursue a career in newspapers and set his sights on the *New York Herald*. The first of many legends sprang from his visit to the paper. It has been said fate took Sarnoff the wrong way in the *Herald* building, causing him to end up at a Commercial Cable Company branch office. In reality, Sarnoff merely stopped at the first desk he saw and he became an office boy for \$5 a week. He discovered operators made more

money, so he studied on his own to learn telegraphy and Morse code.

Sarnoff moved to a job with the Marconi Wireless and Telegraph Company, where he first worked as office boy and then served as wireless telegraph operator wherever needed, be it on land or sea. At 17 he was assigned to Marconi's Siasconset station on Nantucket Island, where he read every technical book in the small station library and in Nantucket. In 1911 he volunteered for an Arctic sealing expedition that some considered to be so dangerous that the crews might not make it back alive. Sarnoff installed and operated the Marconi Company's wireless equipment onboard the *Beothic*. After the journey, the Marconi Company wanted him to continue at Nantucket, but he wanted to transfer to Sea Gate station in Brooklyn. Sarnoff took a pay cut to work at the busiest American wireless station, and within months, before he turned 20, he became manager.

Sarnoff parlayed the Sea Gate position into a better one at the Marconi facility located in the Wanamaker department store in New York City. Now on duty only during store hours, Sarnoff had time to pursue technical training at the Pratt Institute in Brooklyn. Although the story was widely repeated in later years, Sarnoff was not directly involved in the wireless reporting of the 1912 Titanic disaster. By that time he had moved into the lower rungs of Marconi management and was no longer a regular operator.

Sarnoff's rise was rapid. He was appointed as an operator instructor, then inspector of wireless equipment installed onboard ships, and then inspector of wireless stations. Soon he was appointed assistant traffic manager, assistant chief engineer (1913), and commercial manager (1917). At some point during this period, he may have composed a memo proposing the American Marconi manufacture of a "radio music box"—what today we would call a radio receiver—as a consumer device. The idea was initially ignored.

Radio Corporation of America (RCA)

Sarnoff's future shifted immediately after World War I when the U.S. Navy became concerned about British control of American Marconi. Given how central the company's stations were to government and commercial wireless operations, the navy pressed for elimination of the foreign (albeit Allied) control of its facilities. General Electric was prevailed upon to buy American Marconi and spin it off into a subsidiary to be named the Radio Corporation of America (RCA). Sarnoff continued in his role as commercial manager with the new firm and reframed his "radio music box" memo in 1920 or 1921, this time to broader acceptance given the initial appearance of radio broadcast stations.

RCA played a central role in the development of radio in the 1920s, with Sarnoff often directly involved in important innovations. He was a key figure in the formation of radio's

first permanent network, the National Broadcasting Company, in 1926. He was named to RCA's board of directors in 1927, and he became acting president of the company and president in his own right on 3 January 1930. A government anti-trust suit forced General Electric and Westinghouse to give up their stock in RCA by 1932, and the corporation emerged for the first time as a fully independent entity.

In the early 1930s, Sarnoff pushed RCA into the front line of radio research. The company began active television research in 1929. Sarnoff was intrigued when his old friend Edwin Armstrong proposed a wholly new system of radio that could successfully eliminate the static. After receiving his initial patents on FM in 1933, Armstrong was invited by Sarnoff to test the system in RCA facilities on top of the Empire State Building. However, Armstrong's claim that his new FM would make AM obsolete and eventually replace it—despite the fact that RCA and NBC were based on the existing AM technology—soured Sarnoff on the FM idea, and RCA turned to a major research push for television. Armstrong was asked to remove his apparatus, and he soon went his own way. The former friends soon became enemies as Armstrong pushed for FM development while RCA concentrated on television, which it introduced to American audiences at the 1939 World's Fair. RCA research was central to the system of black-and-white television that began regular operation in mid-1941.

In 1942 Sarnoff consolidated RCA's many research efforts in a new laboratory facility in Princeton, New Jersey (in 1951 it took his name). For much of 1944, Sarnoff was on active duty with the U.S. Army, assisting in development of communication systems for the invasion of Europe. He returned to RCA at the beginning of 1945 as a brigadier general (and was known as General Sarnoff for the remainder of his life).

Sarnoff's final 25 years (until his 1969 retirement) at RCA were increasingly dominated by two circumstances: competition with CBS and William S. Paley (a very different kind of industry leader), and the development of color television. Paley's network lacked a manufacturing arm and so concentrated more fully on programming, leading to his "raid" on NBC's chief stars and programs in 1948–49, just as network television was taking hold (and a year after Sarnoff moved up to become RCA's chairman). CBS led in the ratings war for the next two decades, but the rivalry extended to technology as the two firms fought over improved records (CBS developed the 33 1/3-rpm LP, while RCA played catch-up with the 45 rpm disc) and development of a system of color television. RCA worked feverishly on an all-electronic system compatible with existing black-and-white receivers. CBS pursued a different route with a partially mechanical system that was not compatible with existing sets and won initial approval from the Federal Communications Commission (FCC) in 1950. RCA research to improve their system continued during the Korean War (1950–53) when manufacture of color sets was suspended because of

wartime needs. Late in 1953 RCA persuaded the FCC to reverse its decision and accept the RCA all-electronic system as the basis for American color television. NBC began color telecasts early in 1954.

After a series of RCA presidents passed through the executive suite, Sarnoff turned to his son Robert, naming him president of NBC in 1956 and of RCA itself in 1965. Sarnoff remained CEO and fully in charge through the 1960s, years that were filled with public homage and honors to his long career. He retired in 1970 and died in 1971.

David Sarnoff. Born in Uzlian, Russia, 27 February 1891; immigrated to United States, 1900. Attended Pratt Institute, New York City; Army War College, 1926. Took delivery jobs and at age 11 bought newsstand; office boy for Commercial Cable Company; taught himself telegraphy and Morse code; office boy and then wireless operator with American Marconi Wireless and Telegraph Company; manager, Sea Gate Station, Brooklyn, 1909; installed and operated Marconi wireless equipment on *Beothic* for Arctic exposition, 1911; employed by Marconi, 1912–19; allegedly first to propose “Radio Music Box,” 1915 or 1916; married Lizette Hermant, 1917; RCA commercial manager, 1919–21; RCA general manager, 1921–22; proposed network radio, 1922; RCA vice president and general manager, 1922; wrote memo to RCA board predicting television, 1923; helped form NBC, 1926; elected to RCA’s board, 1927; acting RCA president, 1928; created Radio-Keith Orpheum (RKO) motion pictures company with Joseph P. Kennedy, 1928; became chairman of board, RKO, 1928; RCA executive vice president, 1929; served as chairman of board, RCA, 1947–70; forged RCA purchase of Victor Talking Machine Company, 1929; RCA president, 1930–65; gained

FCC approval of RCA’s color TV system, 1953. Died in New York City, 12 December 1971.

Scandinavia

Broadcasting in the Nordic Countries

Radio in the five Scandinavian countries typifies the public service tradition in Europe, as private commercial stations appeared only in the mid 1980s. Although now competing with commercial ventures for listeners, the public service systems remain the foundation of radio in this region.

Scandinavian radio is heavily influenced by the geography of the region and by language traits. Variations in geographic size and population density explain comparative distinctions, but there is also a shared cultural and social heritage (broadly construed) that is responsible for its similarities. Thus geographic and linguistic traits influence how radio is organized as well as explain its comparative importance.

It costs a great deal to broadcast in Norway due to its mountainous terrain, which requires a large number of transmitters and relay stations. In Finland the per capita costs for serving the Swedish-language and Laplander minorities are high. Iceland has a small and comparatively isolated population, and not surprisingly the fewest number of radio channels. Denmark is densely populated and has the highest number of channels per capita, although Norway actually has more total channels.

None of these countries speak a language that is widely spoken elsewhere, although Swedish is the best known due to Sweden's legacy as a former colonial power. Linguistic distinctiveness supports the popularity and importance of radio broadcasting in Scandinavia, whereas shared cultural and historical experience explains the cooperative framework between regional public service broadcasters.

Radio's Potential

History explains much about the organization and importance of Scandinavian radio. Radio was used as a propaganda tool by neighboring countries during World War II and the Cold War, and more generally as a way of strengthening national resolve and consciousness throughout Europe. The potential for abusing its capabilities for social influence combined with a desire to strengthen democracy and facilitate postwar reconstruction proved decisive in confirming the public service monopoly approach in the mid 1900s.

With the collapse of the Soviet Union and growing American influence, Scandinavia adopted processes and practices characterizing the European Union (EU) and Common Market in the 1990s. Deregulation targeted a range of monopolies in the early 1980s, especially electronic media. As a result, contemporary Scandinavian radio is characterized by dual systems, with private commercial and public service channels

competing in an increasingly open and international media marketplace.

Early History of Scandinavian Radio

There are broad similarities in the early history of radio broadcasting in the Nordic region. Wireless transmission was initially restricted to the military. Transmission typically depended on connections provided by a public trust telegraph company, and radio amateurs helped to develop and popularize radio. The economic depression of the late 1920s and early 1930s contributed to the establishment of the public service approach and monopoly organization, coinciding with concerns about the growth of fascism and communism in mainland Europe. The early history of radio was characterized by rivalry with newspaper companies and, paradoxically, benefited from newspaper innovations in developing program services.

Denmark

In the early 1920s radio amateurs (army engineers, etc.) were illegally experimenting with radio transmission, which was restricted to military control. Public interest grew when Svend Carstensen from the Copenhagen daily *Politiken* began broadcasting news bulletins in 1923 (via *Radioavis*). There were three transmitters in Denmark from 1923 to 1925. Radio manufacturers were also involved, holding seats in the first radio council of the Danish State Broadcasting Company (Statsradiofonien). Neither manufacturers nor amateurs had strong preferences about funding. Early Danish radio did not have advertising or sponsorship, although newspapers did produce radio shows during the experimental period between 1922 and 1925.

Radio became an issue of public debate in the mid 1920s. Engineers, industrialists, and the political right were in favor of organizing radio as a private industry. Union representatives, educators, and the political left favored public ownership, voicing concerns about the cultural impact of radio. The business interests were weak and disorganized, and in 1925 a one-year experiment for nationwide broadcasting by the Statsradiofonien was legislated.

Statsradiofonien became a permanent institution in 1926, and the name was changed to Danmarks Radio (DR) in 1959. DR is regarded as an independent institution of the state: it is financed totally by license fees, regulated by public service obligations, and administered by the radio council (*Radioraadet*).

Iceland

The Icelandic Parliament (Althingi) passed the first radio law in 1925, which authorized a private company for a seven-year period. That company, Utvarp HF, only lasted two years because its listeners never exceeded 500 and the company was denied government financial support. In 1927 a government committee investigated possibilities for creating a public broadcasting company. Icelandic Radio or Útvarpsstöð Íslands í Reykjavík (later known as RUV) was established in 1928 in the capital city of Reykjavík. The broadcasting board had its first meeting in late 1929, and broadcasting began in December 1930 with a 16-kilowatt station at Vatnesendi, five miles from the capital city. (The studio was located in Reykjavík.) Early broadcasting was restricted to a couple of hours each evening.

RUV was financed with a license fee and with supplemental advertising. The birth of radio broadcasting was not a conflicted event in Iceland because it began later here than elsewhere in Scandinavia, and also because characteristic problems had already been addressed in the 1920s when telephony was an issue.

Norway

Early Norwegian broadcasting was technically illegal because the Telegraph Law of 1914 prohibited radio listening. Wireless announcements were restricted to military and commercial correspondence under telegraph monopoly. Legal broadcasting began in October 1924 when the radio ban ended and license fee funding was established. Some advertising was also allowed. Advertising revenue peaked in 1929 at a bit less than 5 percent of total income. There was also a 10 percent "turn-over tax" levied on all broadcasting equipment.

Experimental transmissions actually began in 1923 with Norway's first radio station, Kristiania Broadcasting, which broadcast using a 500-watt transmitter located at Tryvannshoegda, near Oslo. The station was moved to the center of Oslo when radio made its official broadcasting debut in 1925. The Norwegian Broadcasting Company (Kringkastingsselskapet AS) was operated as a private company from 1925 to 1933. Other private broadcasting companies were established in Bergen (1925), Aalesund (1926) and Tromsø (1927). In 1933 the Norwegian government acquired the stock and created The Norwegian Broadcasting Corporation (NRK) that exists today. Despite opposition, advertising continued until 1939 (all NRK today are completely without advertising). The turnover tax ended in 1988.

Sweden

In the 1920s most Swedes supported a public monopoly because of concerns about radio's propaganda potential and

out of a desire for "order." Broadcasting was, however, first organized as a private company under strict government control. News content was prohibited until 1956 because of pressure from newspaper companies; this was supported by political parties. Radiotjänst AB (Svergies Radio) was then established in 1925 by a group of publishers and businesses. Manufacturers also applied for licensing. License fee funding was the preferred model; advertising was legally possible, but never accepted in practice. Radiotjänst AB was dependent on Televerket (the Telecommunications Administration). Televerket collected the license fees and distributed the monies. Until 1951 the state received about 30 percent of the annual levy. Televerket was responsible for the terrestrial infrastructure and also signed the annual operating agreement with the government.

As was typical in the Nordic region, most Swedes of the day lived in the countryside. (Heavy urbanization occurred in the postwar era.) Radio was assigned obligations to provide distance education and cultural services, and was mandated with an "enlightenment mission." The license fee was inexpensive to encourage rapid diffusion and to avoid discrimination against lower-income families, and a broadcasting commission was set up in 1927 to insure that Radiotjänst fulfilled its legal obligations. Since 1935 the commission has focused on reviewing programs.

Finland

Early Finnish radio is linked with the first decade of Finland's independence in the 1920s (it had been a Russian Grand Duchy until 1918). Clandestine radio had begun in 1917 under Czarist rule. The Radio Act was first enacted by the new Finnish government in 1919, specifying that equipment use be an exclusive right of the state.

The Finnish Radio Amateur League (Nuoren voiman liito) was formed in 1921 by young officers in the army's Signals Battalion. The Finnish government granted them a license to transmit radio signals and within a few years they had established 75 radio stations in Finland. The Finnish Radio Association (Suomen radioyhdistys r.y.) was independently formed in 1923 to represent the "interests of listeners." The association began offering evening programs on radio stations in 1924.

Most activity in early Finnish radio was situated in and around Helsinki and Tampere, the two biggest cities. The league and the association agreed on a public service approach. The Finnish government supported this as well because of a shared understanding that radio was a useful educational tool for people in remote regions. Most Finns lived in rural locations, and radio was also perceived as an appropriate tool for "sharing the cultural wealth." Early independence was marked by social turmoil between Finnish Finns and Swedish Finns, so radio was given a national unity mandate. In 1926 the Finnish

government approved a private corporation financed by stockholders involved with radio in the period, as well as the Finnish State, and called Oy Ylesiradio—AB Finlands Rundradio (YLE), the first part of the name in Finnish and the second in Swedish. An administrative council represented stockholder interests. After 1927, however, only members of Parliament were nominated to the council.

In the early years YLE was situated as a production company that could lend programs to local private stations. The transmission network was owned by the Finnish military. Programming requirements specified non-political content, no advertising, license fee revenue, bilingual services (Finnish and Swedish), and an emphasis on rural populations in need of distance education and cultural literacy services. In 1934 YLE became a complete public service radio company. Thereafter the state owned 90 percent of all stock, private sector involvement ended, and program content as well as organizational management became increasingly linked with the Finnish State via Parliament. This coincided with the depression era when money was tight and there was increasing apprehension over the rise of fascism and communism in other parts of Europe.

Broadcasting Principles

Unlike the situation in the United States, where public broadcasting operates at the fringes of a dominant commercial media market, in Scandinavia public broadcasting has been the foundation of the broadcast media. That foundation rests on five principles that position broadcasting as a service for citizens: (1) public broadcasters are required to provide a comprehensive range of program services for everyone who pays an annual license fee, typically referred to as “universal service”; (2) public broadcasting is a non-commercial venture. Annual license fees are collected as a form of taxation, the payment of which confers rights on the receiver and obligations on the source; (3) public broadcasting is accountable to parliamentary oversight; (4) broadcasting must serve cultural and educational intentions (frequently summarized as an “enlightenment mission,” this principle gives entertainment a lower priority); and (5) radio should have a tight domestic focus premised on language, culture, and unity.

The public service approach to broadcasting was created, in part at least, as a reaction against U.S. commercialism. Analyses of U.S. radio convinced many in Scandinavia that the commercial approach did not provide sufficient minority services and placed educational radio in a marginal context. Because U.S. radio focused on popular culture programs, to some observers it appeared that network and station owners demonstrated little interest in or potential for developing “high culture” services. Finally, although the commercial approach can address audiences as citizens, marketplace imperatives tend to favor a consumer-oriented emphasis. These value judgments,

in turn, were used to legitimate the public service ethic, and by extension a monopoly organization. The monopoly preference was also linked to limitations in available frequencies before FM radio was developed as well as the large investment required to create nationwide broadcasting systems for such small populations.

Competition and Deregulation

The pirate radio phenomenon of the 1960s and 1970s directly challenged the public monopoly in radio. These unlicensed and unregulated private channels broadcasting from offshore locations in international waters successfully targeted teenagers and young adults in the largest metropolitan areas, particularly Stockholm and Copenhagen. They took advantage of the underutilized VHF bandwidths in this part of the world. Although clandestine political activists were involved, most pirate stations were advertising-supported ventures. They capitalized on the lack of popular culture programs that were preferred by young people. Radio Luxembourg also filled this need, although it was a licensed commercial channel.

Public broadcasting monopolies fought back by launching regional channels in the 1970s and by offering limited and select popular music targeting young people. Although the regional channels were popular with adult and elderly listeners, youngsters were not satisfied. The popular success of the pirate radio channels strengthened the move to liberalize broadcasting policies.

With the exception of Sweden, private local radio was introduced in the Scandinavian countries in the mid to late 1980s. In light of the pirate channels, it was clear that there were sufficient frequencies available for new commercial stations. The public monopolies were now challenged as being contrary to democratic virtues. The 1990s saw growing competition between public and private channels, the latter becoming increasingly nationwide and network-oriented by the end of the decade.

In Finland, for example, the government approved legislation in 1993 called the Act on YLE that provides increased security for that company and its public service character but in exchange requires much higher productivity, efficiency, and openness to public scrutiny. This followed a major internal restructuring initiative launched in 1990 when Yleisradio reformed its radio channels. Radiomafia was launched to compete directly with the private commercial channels for the ears and hearts of young Finns, whereas Radio Suomi was structured as a network of regional channels featuring news and current affairs programming. In 2003 YLE launched a second radio reform in response to increasing competition, especially for young adults. Radiomafia was replaced with YLEX, for example. The situation in Finland is paralleled elsewhere in the Nordic region. In Norway, the combined private channels

account for about 10 percent of gross advertising, and P4 is a commercially financed national channel that recently purchased a substantial share of the company that owns Radio Nova, Finland's first nationwide commercial channel. The Disney corporation is also involved in Finnish radio, sharing ownership in Kiss FM.

Increases in competition coincide with and are increasingly fueled by European Union initiatives that decry protectionist policies and pursue European integration on the basis of commerce and competitive open markets in the European Economic Community (EEC). Member states find it increasingly difficult to regulate and control broadcasting as a purely domestic matter.

Even more pervasive is the increasing influence of concepts and tools developed in U.S. commercial radio. Today's public radio broadcasters are increasingly aware of rotation clocks, target audiences, formats, and profiling. Such concepts and tools were anathema a dozen years ago, but today one commonly hears programs referred to as products, audiences as customers, and listeners as markets. Media consultants, researchers, and scholars from the U.S. are no longer rare, but quite commonplace. For example, the European Broadcasting Union offered a 1999 seminar for public broadcasters on "Marketing Public Service Values." A radio training curriculum developed at Yleisradio in Finland features such coursework as "Competition Analysis" and "Program Soundscape." Broadcasters in the private sector are similarly inclined to learn about and rely on U.S. concepts and tools, partly because those channels are also commercial and thus fully compatible with the approach, and partly because U.S. media companies are investors and partners with various private channels and media concerns in Europe today.

The Future

The future of Nordic radio broadcasting depends on at least four factors. The first is the extent to which public broadcasting companies will be able to maintain the public service ethic, which will be increasingly difficult in light of growing competition with the private sector. Private competition is the second factor—the intensity and amount of private competition that will be permitted by the respective governments.

Third is technology, specifically digital audio broadcasting (DAB). In the late 1990s public broadcasting companies and governments in Scandinavia have pursued DAB as a priority, although the relative ranking of that priority varies from country to country (e.g., high in Finland but subject to recent setbacks in Sweden). DAB provides the only viable option for expanding the range of services radio can provide because the bandwidth required for one VHF/FM channel is sufficient for six DAB channels (and possibly more, depending on the type of content). To date sales of DAB receivers have been sluggish

because costs are comparatively high. Public broadcasters are carrying much of the responsibility for DAB development; the private sector has limited investment risks until a market develops.

A fourth and final factor is ultimately catalytic in determining how all of the others unfold in practice. The dynamics of radio broadcasting in the Nordic region depend on the balance between European Union policies emphasizing a business-oriented approach to just about everything, and a popular backlash that appeared in the late 1990s against such a strong economic orientation. EU policy is increasingly castigated for lacking sensitivity and balance with regard to regional concerns and cultural distinctions.

There are at least two major challenges facing radio broadcasting in the Nordic region. First, as public broadcasting has formed radio's foundation, the commercial sector has been supplemental. If this changes under increasing economic pressure, Nordic countries might create a public service ghetto wherein only the commercially unattractive programs and audiences are left to public service entities. That would mark the end of universal service and weaken the democratic orientation in Nordic radio. Second, there is the danger of an ethical dilution of the public service approach caused by the necessity of mastering commercial logic, concepts, and tools in order to cope with increasing competition. Ironically, the competitive dynamic that has fueled development could be weakened.

Schechter, A.A. 1907–1989

U.S. Reporter, Broadcast Executive, Creator of NBC News

With ingenuity but few resources, Abe Schechter built a news operation at the National Broadcasting Company (NBC) in the 1930s that could compete with print journalists.

He was born in Central Falls, Rhode Island, in 1907, the son of George Schechter and Celia Riven. In high school, he began as a reporter for the *Providence Journal* and continued there until he received a bachelor's degree from Boston University with a major in journalism. Then he worked at the *Newark Star-Eagle* and moved onto the *New York World*. He went to work for the wire services, first the Associated Press (AP) and then International News Service, where he became the youngest city editor in New York City.

In 1932, he joined NBC in the publicity department and then in the news and special events department. When he took the job, the network did little to cover news on a daily basis with the exception of a 15-minute, five-day-a-week newscast that had been launched in 1930 by Lowell Thomas. There were also a few commentaries, some with objective content and some with predictable political bias. But neither NBC nor the Columbia Broadcasting System (CBS) had a team of reporters and editors to collect, write, and present the news. Instead, the networks relied on the wire services for their information.

As the Depression deepened during the 1930s, the newspaper industry began to feel that broadcasters were becoming too competitive in the fight for the advertising dollar. To solve the problem, wire services were told to stop providing material to broadcasters, and because the print industry controlled AP and was the dominant client of the other services, the wire services agreed.

Schechter was forced to find his own news. Story ideas came from affiliates and, of course, from newspapers. To gather information for the Lowell Thomas newscast, Schechter relied on telephone interviews, because he had no staff and worked out of a storage room. He found that the words *NBC* and *Lowell Thomas* were effective tools for getting his calls through to important people, and the promise of tickets to live broadcasts of their programs was helpful, too. Sometimes, he

even managed to scoop the print reporters. But for the most part, he had to settle for broadcasting features, rather than news.

Schechter headed NBC's news and special events department from 1938 to 1941. He described the early years of NBC news in his autobiography, *I Live on Air*, published in 1941. Despite the success in gathering news during the press-radio war, NBC returned to using Schechter's department primarily for features, such as a singing mouse contest or the voice of a deep sea diver fathoms under the ocean.

Then, as the tensions in Europe tightened, NBC hired more correspondents and allowed more news on the air. Perhaps the network's motivation was to promote itself in the competition with CBS for listeners, but the result was more and better coverage of international events and an increase in advertising revenues as the audience for news grew. Schechter hired a news team in Europe to cover the coming war (although some criticized his choice of reporter for Munich, Max Jordan, who seemed to favor the Germans and was often able to get information out first).

Schechter's most famous scoop occurred in 1939. The German battleship *Graf Spee* was attacked by British cruisers and sought refuge in Montevideo, Uruguay. When the South American country asked her to leave, the captain decided to scuttle his ship rather than surrender her to the British. An NBC reporter described live on air the explosions and the sinking as millions listened. In 1940 Schechter scored another coup when he got a statement from the minister of The Netherlands as his homeland was being invaded by the Germans; Schechter followed this up with an on-the-scene report of Nazi paratroopers landing on Dutch soil.

When the United States joined World War II, Schechter left NBC to work with the Office of War Information but then moved to the War Department's Bureau of Public Relations as a civilian adviser; there he oversaw radio communications for journalists covering the war in the Pacific Islands. He received the Legion of Merit for his work during the Philippine campaign.

After the war, he became vice president in charge of news at the Mutual network, and then for a short time he was an executive with Crowell Collier Publishing Company. He returned to NBC in 1950 and became executive producer for a new television program, a morning news and talk show called *The Today Show*, but he left soon after the program went on the air to start up his own public relations firm, A.A. Schechter Associates, in 1952. The company was purchased by Hill and Knowlton in 1973. Schechter and his wife were killed in an automobile accident on Long Island in 1989.

Schulke, James 1922–1999

U.S. FM Radio Pioneer

James A. Schulke is recognized by many as the father of FM musical programming. Schulke's uniqueness in radio broadcasting is directly related to the legendary discipline that he instilled in radio management, programming, engineering, talent, and marketing. At the time Schulke embarked on a career in radio, less than 5 percent of U.S. radio listening was to the FM band.

An Ohio native, Schulke received his B.A. from Denison University and his M.B.A. from Harvard. He served in the U.S. Marine Corps during World War II.

Schulke began his career far from the established radio industry. Following an early New York City career with talent agent J.L. Saphier and advertising agency Young and Rubicam, Schulke was hired as vice president of the Paramount Sunset Corporation in Hollywood. He was charged with the responsibility of revitalizing the Paramount Lot and brought the production of such popular television shows as *Gunsmoke*, *Have Gun Will Travel*, and *Bonanza* to the facility. Having built a reputation as a turn-around specialist, Schulke was transferred by Paramount to become general manager of KTLA-TV, Los

Angeles, one of three independent TV stations operating in the competitive Los Angeles market.

Schulke's television career flourished with creativity. He established the first dual-anchor newscast in the market, was first to use a helicopter for covering television news, and built the first videotape newsroom. Under his leadership, KTLA became the first independent television station to rank number one in late news.

Schulke's career in radio began in 1962 when he joined the Magnavox Company, which was searching for methods to promote the sale of FM radio receivers. Schulke helped convince Magnavox to underwrite the creation of the National Association of FM Broadcasters (NAFMB). Schulke was the organization's first president. Under his leadership, the NAFMB lobbied the media research firm Arbitron to begin measuring FM listening separate from AM. The organization was also instrumental in pushing the Federal Communications Commission (FCC) in the mid-1960s into establishing a rule requiring separate programming for AM and FM stations. The original rule required 50 percent separation. Up until that

time nearly all FM stations had been simulcast with an AM station.

Upon leaving Magnavox, Schulke teamed with Robert Richer and Marlin Taylor in 1965 to form Quality Media Incorporated (QMI), an organization designed exclusively to market FM radio to advertisers. QMI's specialty was selling "good music" radio stations, including those with classical music formats. It was at QMI that Schulke first examined the potential of a tightly controlled "beautiful music" format. He saw the potential of matched-flow music and the need to appeal to the female listeners who controlled at-home listening. Schulke left QMI in 1970 to form Schulke Radio Productions (SRP). Marlin Taylor later left QMI to form a competitive beautiful music programming company for the Bonneville Corporation.

SRP's original operation was located in a brownstone apartment on New York's upper east side, where Schulke resided. Schulke recruited Phil Stout as his music director, and together they developed a matched-flow all-instrumental beautiful music format. The programming was based on long-term quarter-hour audience maintenance to drive average quarter-hour audience ratings. Schulke's control was so complete that he personally approved every music selection and every matched-flow quarter hour syndicated by SRP. When the supply of original instrumental and cover recordings recorded in the United States was exhausted, he was the first U.S. radio programmer to enter into an exclusive agreement with the British Broadcasting Corporation (BBC) in London for original arrangements.

SRP was very selective in choosing its clients because of Schulke's extremely rigid contract requirements. He insisted upon maintaining what was tantamount to total creative control. Commercial load was limited to no more than six minutes of advertising per hour, and the commercial acceptance policy rigidly forbade personal hygiene products or any loud multiple-voice pitches. News was kept to the bare minimum, so as not to distract the listener from the music flow. Schulke's contracts forbade subsidiary use of a station's subcarrier and demanded circularly polarized antennae, which would improve FM reception in the home and in the automobile. He even retained the right to veto the selection of any announcer.

Among the early Schulke believers was Woody Sudbrink, the founder of Sudbrink Broadcasting and the owner of the greatest number of independent FM stations in America from

1970 to 1978. Other original clients were Mike Lareux of WOOD-FM, Grand Rapids, Michigan, and J.D. McArthur, owner of WEAT-FM, Palm Beach, Florida. Each was the first top-rated FM station in its market.

Innovative marketing was also a Schulke signature. He is credited with creating phonetic call letters such as WLIF, "Life in Baltimore"; WLAK, "Lake in Chicago"; and WPCH, "Peach in Atlanta." He was also an early believer in using television to promote FM listening, with on-air ads noted for serene scenes and beautiful music that always culminated with an exact focus on the station's numeric dial position and phonetic call letter reference.

When the business grew, Schulke moved the operation to a self-contained facility in New Jersey where a state-of-the-art stereo duplication facility was constructed and the famous "black box" was located. The "black box" was developed there and was later installed in the audio-processing chain at every SRP station. The technical details of this engineering development were never disclosed (legend has it that the box was empty), leading some to regard it as a marketing ploy. It is factual that Schulke would not allow stereo commercials on any of his stations because SRP was not in a position to control the quality of the stereo duplication of commercials.

By 1974, two years after forming SRP, Schulke stations ranked either number one or two in the top 20 U.S. radio markets. SRP, which had been renamed Stereo Radio Productions, was sold to Cox Radio in 1979. At that time, SRP stations held major audience positions in the top 150 U.S. radio markets. James A. Schulke died on 6 August 1999 in Fort Lauderdale, Florida, at the age of 77. His papers are archived at the Library of American Broadcasting at the University of Maryland, College Park, Maryland.

James Schulke. Born in 1922. Received B.A. from Denison University and M.B.A. from Harvard; served in United States Marine Corps in World War II; worked at Magnavox Company, 1962-65; first president of National Association of FM Broadcasters; formed Quality Media Inc., 1965; formed Schulke Radio Productions, 1970; sold operation to Cox Radio, 1979. Died in Fort Lauderdale, Florida, 6 August 1999.

Science Fiction Programs

Science fiction programming takes full advantage of radio's ability to transport us through time and space—at a fraction of the cost of a bus ticket. With a well-written story, good voice actors, a few inexpensive sound effects devices, and a willingness to suspend disbelief, we can easily find ourselves lost in *Dimension X*, refugees in a *War of the Worlds*, or leaping tall buildings with our pal *Superman*.

The genre, which traces its roots to the pulp magazines and comic strips of the 1920s, has most often been labeled “thriller drama,” but it has actually infused almost every type of fiction, from action-adventure to comedy. There have been sci-fi detective programs, sci-fi adventure shows, sci-fi comedies, sci-fi kids' shows, even sci-fi soap operas. Many programs such as *The Shadow* dealt, at least periodically, with science fiction themes. Regardless of the other elements of a program (or episode), to be science fiction, a work should integrate the relationship between humans and “futuristic themes” such as new technology or alien races.

Science fiction radio dates back to the earliest days of commercial radio. *Ultra Violet*, a program few people remember, was first syndicated as early as 1930. More famous, however, were programs such as *Buck Rogers in the 25th Century*, which was first broadcast in 1932 and is commonly credited as being the first science fiction radio program.

Based on a popular comic strip, *Buck Rogers* was a 15-minute serial that aired five times a week at 7:15 P.M. on the Columbia Broadcasting System (CBS). Aimed predominantly at children, the series focused on Buck, a man from the present (the 1930s) who finds himself transported to the 25th century. The cast of characters included a very strong female character, Wilma Dearing, and the amazing scientist Dr. Huer. Interestingly, many of the fanciful technological devices invented by Dr. Huer in the show became commonplace technologies in the late 20th century. Good and evil were very clearly defined in *Buck Rogers*, and good always prevailed, but there were no truly memorable villains such as *Flash Gordon's* Ming the Merciless. Like all good serials, most episodes of *Buck Rogers* closed with a “cliff-hanger” ending that left many questions unanswered. Listeners had to “tune in tomorrow” for the next exciting installment. The series and sponsor also held the attention of their audience by allowing them to become “Solar Scouts” and to receive items such as “planetary maps” by responding to Kellogg's premiums.

Superman first arrived from Krypton on the Mutual Broadcasting System in 1940 and is a good example of how science fiction merged with other genres. In this show, also aimed predominantly at children, our superhero fought crime both as Superman and as his alter ego, mild-mannered reporter Clark Kent. “Girl reporter” Lois Lane and “kid photographer”

Jimmy Olsen, along with gruff editor Perry White, made up the rest of the regular cast. Often categorized as an action-adventure, crime, or thriller-drama program, the show's central character was an alien with superhuman powers.

Although most 1930s sci-fi radio programming was aimed at children, a few shows were designed for adults. Most of these were episodes of anthology programs such as *Mercury Theater of the Air*, which premiered on CBS in the fall of 1938. On 30 October, just a few short weeks after the premiere, this prestigious drama program, hosted by Orson Welles, pulled off the greatest hoax in radio history—the radio adaptation of H.G. Wells' “War of the Worlds.” The pre-Halloween dramatization of Martians landing in Grover's Mill, New Jersey, led some listeners to panic—and many to leave their homes.

Orson Welles' program played on the fears of an audience worried about war in Europe. When actual fighting broke out in 1939, more adult science fiction programs were broadcast as episodes of anthology shows. Series such as *Lights Out*, *Radio City Playhouse*, and *Escape* featured science fiction entries concerning time travel, alien invasion, and world conquest. America, including its radio audience, was becoming more technologically savvy, and more world-weary. Consequently, adult science fiction programs were becoming less reliant on horror and fantasy and more focused on actual science and technology.

By the 1950s, television was pulling a significant number of listeners away from radio. In order to hang on to adult audiences, the radio networks experimented with science fiction series aimed at adult audiences. Several adult anthology series devoted exclusively to science fiction premiered in the early 1950s, including *Year 2000 Plus* on Mutual and *Dimension X* on the National Broadcasting Company (NBC). Later known as *X Minus One*, *Dimension X* was one of the first radio drama series to be recorded on tape rather than broadcast live. As a result, programs could be more involved and could be post-produced to clean up mistakes. As an anthology, stories changed from week to week. Some shows were quite serious, but one of the most famous is an ironic comedy titled “A Logic Named Joe.” Originally broadcast on 1 July 1950, this humorous tale is about a world where futuristic computers, or “logics,” can do “everything for you.” The logics are interconnected in a worldwide web of computers that exchange information. “A Logic Named Joe” takes a comic look at a common theme in science fiction: humanity's fear that technology will take over and corrupt society. Unlike the adult-oriented anthology programs, most series science fiction of the era was limited to such children's shows as *Tom Corbett*, *Space Cadet*, and *Space Patrol*.

As U.S. radio comedy and drama moved to television, science fiction on the radio declined but did not disappear. Later series such as *CBS Radio Mystery Theater* often included science fiction, as well as fantasy and horror themes. National Public Radio stations also imported programs from the British Broadcasting Corporation (BBC) and the Canadian Broadcasting Corporation (CBC). One of the more famous imports, originally aired in England in 1978, was *The Hitchhiker's Guide to the Galaxy* series, which later spawned a BBC television series, several novels, and an interactive computer game.

Radio science fiction programs are actually more plentiful today than they have ever been, thanks to cassette sales, the internet, and a variety of interest groups. Not only are episodes of many classic programs such as "A Logic Named Joe" available for audio streaming, but original programming is being produced, such as the Sci-Fi Channel's web "radio" program, *Seeing Ear Theater*. Thanks to continued interest in the

form and some very fantastical technological advances, science fiction radio is not only alive and well, but its future is very exciting.

Sevareid, Eric 1912-1992

U.S. Journalist and Radio Commentator

One of the first "Murrow Boys" at Columbia Broadcasting System (CBS) news, Arnold Eric Sevareid reported many aspects of World War II and then became well known for his radio and television commentaries that surveyed the several sides of various controversies, often leaving the final conclusion up to the listener. He spent his entire broadcast career of 38 years with CBS.

Origins

Sevareid grew up first in North Dakota and then in Minnesota, graduating from high school in 1930. That same year he undertook an arduous 2,200 mile canoe trip with a friend, Walter Port, traveling from Manitoba all the way to the Atlantic Coast. Five years later he wrote his first book, a children's tale about the trip called *Canoeing with the Cree*. He spent a few months in the summer of 1931 out in the California gold fields, gaining useful experience, though little gold.

While in college at the University of Minnesota, he first entered journalism, working as a reporter on the student paper, the *Minnesota Daily*. He was active in and reported on the university's move to drop compulsory military training. But his radical views and activities probably cost him a chance for the

paper's editorship. Before graduating in 1935, he had begun working as a reporter at the downtown *Minneapolis Journal*. After graduation he helped organize the local chapter of the Newspaper Guild at the paper, which led to his being fired soon thereafter, supposedly for a minor error in a story.

In 1937 Sevareid and his wife sailed to Europe on a freighter, seeking a change of scene and new challenges. He studied for a time at the London School of Economics and at the Alliance Française in Paris. At this point he began using his middle rather than his first name and again became a reporter (and eventually night city editor) for the *Paris Herald*. He also worked part time for United Press in Paris. His writing soon attracted attention.

Radio Years

Sevareid's broadcast career began with a telephone call from London. Edward R. Murrow called him in mid-1939 to offer him a CBS radio job. Murrow noted that while he knew little of Sevareid's background, he liked his writing and ideas. The radio career nearly ended at its beginning when, nervous and with a halting delivery, Sevareid underwhelmed CBS officials in New York on his first broadcast in August 1939 just before

Eric Sevareid
 Courtesy CBS Photo Archive

World War II. A subsequent broadcast was only marginally better, but Murrow stuck by his new discovery and urged CBS to do the same.

As with other members of the “Murrow Boys” band, Sevareid covered many different aspects of the war. Based in Paris, he covered the fall of the city (getting his wife and new-born twin sons out just in time) in one of the last broadcasts before German troops entered. He was the first to report the surrender of the country a few weeks later. He reported from London with Murrow during the Blitz in 1940 and was then called back to the United States to report the war from New York and Washington. In 1943 he moved to the complex and remote China-Burma-India theater, where he at one point was lost for several weeks in the Burmese jungle after having to bail out of an airplane. By 1944–45, Sevareid was covering Allied advances in the Mediterranean theater and into Germany itself.

After the war he returned to the United States and headed the CBS news bureau in Washington, D.C., from 1946 to

1959. He published *Not So Wild a Dream*, a memoir of the Great Depression and the war years that was widely praised and long remained in print. CBS moved him to London for two years (1959–61) as a roving correspondent for the network. The new decade saw him briefly back in New York (until 1964) before a permanent return to Washington, where he remained for the remainder of his career. Not initially fond of the nation’s capital (he felt it was too provincial), he soon found it an exciting place to work, later terming it the news center of the world.

Later Career

Never entirely comfortable on the air even after years of radio experience, Sevareid was even less comfortable on television. As with Murrow and his other contemporaries, he thought little of television at first, considering video merely a means of entertainment and not a means of covering serious news.

Nevertheless he undertook CBS assignments on such early Sunday "news ghetto" programs as *Capitol Cloakroom* and *The American Week* and was both host and science reporter on the CBS series *Conquest* in the mid-1950s. Severeid reported eight presidential elections from 1948 to 1976, fulfilling different roles in CBS coverage of those campaigns. His important 1965 interview with former candidate Adlai Stevenson (for which he won a New York Newspaper Guild "Page One" award), however, was not broadcast over CBS but instead appeared as an article in *Look* magazine.

Severeid became best known to millions of Americans as the avuncular senior commentator on *The CBS Evening News with Walter Cronkite* from 1963 to his retirement in late 1977. His two-minute commentaries ranged over many subjects and were criticized by some observers as covering many sides of a controversy without clearly coming to any firm conclusions. In return Severeid argued that his role was to enlighten, not to lead. Indeed, he would often readily admit he did not know the answer to some controversial issue. His last CBS television commentary appeared on the Cronkite program 30 November 1977, just four days after his 65th birthday, then the mandatory retirement age at the network.

Severeid defined himself as a cultural conservative and political liberal, later refining the latter to conservative on foreign affairs and liberal on domestic matters. He would always consider himself first a writer, even during his decades with CBS. For many years (until 1966) he wrote a widely syndicated weekly newspaper column and also produced many magazine pieces and several books, the latter usually based on his radio or television commentaries. He also lectured widely.

Severeid's radio and television journalism won prestigious Peabody awards in 1950 (for his radio work), 1964, and 1967, and television Emmys, two in 1973 and one each in 1974 and 1977.

"Seven Dirty Words" Case

Supreme Court Decision on Broadcast Obscenity

For five years in the 1970s, the case of the "seven dirty words," in which a complaint by one listener brought the issue of electronic free speech all the way to the Supreme Court, was a direct challenge to the whole underpinning of Federal Communica-

tions Commission (FCC) regulation of the airwaves. The "seven dirty words" trial originated when a George Carlin record was played on a New York City radio station and became one of the landmark cases concerning indecency on the public airwaves.

Following in the tradition of his mentor Lenny Bruce, stand-up comedian George Carlin revolutionized comedy with a hip, irreverent attitude and an uninhibited social commentary. By the early 1970s Carlin turned his back on an established, middle-class audience and played almost exclusively to the counterculture. In 1972 he was arrested at the Milwaukee Summerfest while performing one of his satirical routines on language, entitled “Filthy Words” (sometimes called the “Seven Dirty Words You Can Never Use on Television” because of the monologue’s central joke). A local judge threw out the charges, but the same routine became the linchpin of a Supreme Court case involving the FCC.

In 1973 Carlin recorded “Filthy Words” for his album *Occupation: Foole*, which was distributed by Little David Records. *New York Times* critic Peter Schjeldahl noted that “Carlin’s playing with words, through meaning and emotive permutations, is so mild and earnest it’s almost wholesome” and that his “subliminal puerilities are often dissipated by lovely flashes of pure sensitivity.” In the earthy monologue, Carlin claims that there are 400,000 words and only seven you can’t say on television. On 30 October 1973 a recording of “Filthy Words” was played on the Pacifica Foundation’s New York FM station, WBAI. An announcer for the early afternoon program, *Lunchpail*, preceded the album cut with a warning that some listeners might deem Carlin’s language offensive.

One month later, the FCC received a complaint from a man who was listening to the station while driving into the city with his 15-year-old son. This was the only objection about the Carlin broadcast that was forwarded to either the commission or WBAI, a listener-supported public radio station.

After writing to WBAI to confirm the broadcast, the FCC used the outraged letter to define the nature of indecency. Ruling that Carlin’s recording was not obscene, the commissioners argued that the language was indeed indecent, depicting “sexual or excretory activity and organs, at a time of day when there is a reasonable risk that children may be in the audience.” The FCC did not want to censor this material, which it cited as “patently offensive as measured by contemporary community standards for media broadcast,” but wished to develop a principle of “channeling,” or finding a time of day when the fewest children would be in the audience. Several commissioners thought their statement did not go far enough and wanted indecent language prohibited from the airwaves at any time, but the majority felt that Carlin’s material would be appropriate sometime after midnight. The Pacifica Foundation appealed the decision, contending that the definition of indecent did not take into account any serious literary, artistic, political, or scientific value.

In March 1977 the U.S. Court of Appeals of the District of Columbia overturned the FCC ruling in a two-to-one vote because it violated Section 326 of the Communications Act, which forbids the FCC from censoring any work. Calling the

FCC’s position “overbroad and vague,” Judge Edward A. Tamm of the Appeals Court also deemed the attempt to channel offensive material into the late hours a form of censorship. The FCC appealed.

In July 1978 the U.S. Supreme Court, in a five-to-four split decision, reversed the appeals court and affirmed the FCC’s right to limit the use of profane language. In the majority opinion Justice John Paul Stevens wrote that “of all forms of communication, it is broadcasting that has received the most limited First Amendment protection” (*Federal Communications Commission v Pacifica Foundation* [438 US 726]). No distinction was made between radio and television or between AM and FM radio. Stevens concluded that offensive satire is available elsewhere but should not be broadcast in the afternoon when it is accessible to children. The Carlin broadcast was not labeled obscene, but it was considered by Justice Lewis Powell as “a sort of verbal shock treatment.” Justice William Brennan dissented, finding that by its definition of indecency the FCC would deem works by Shakespeare, Joyce, Hemingway, and Chaucer to be inappropriate. He concluded that it is “only an acute ethnocentric myopia that enables the Court to approve censorship of communications solely because of the words they contain.”

The Supreme Court’s decision did not fully settle the question of what is free expression on the public airwaves. Many writers and producers considered the ruling a major setback to the First Amendment rights of broadcasters. Some newspapers, including the *Washington Post* and the *New York Times*, included editorials in favor of the limited ruling but nevertheless did not print the notorious seven words. FCC chairman Charles Ferris worried that broadcasters would not tackle controversial subjects for fear of the ruling and reassured the industry that so-called indecent language would not be barred in news programs.

But by the end of the 1970s, the growth of cable television transformed the entire world of communications. Home Box Office (HBO) presented the entire “Filthy Words” routine in the special *George Carlin Again* in 1978. This time, Carlin was seen on premium cable, airing in the evening; there were no complaints to the FCC. Given that one has to pay a separate fee to receive HBO programs, the FCC or the courts would likely see such a presentation in a different light than the Carlin broadcast over WBAI. Over the next two decades, competition from cable would largely obliterate the definition of indecency for broadcasters and the FCC. But Carlin’s seven words would still rarely be heard on over-the-air radio or television. A clear legal distinction remained between cable service, to which one subscribes, and free over-the-air broadcasting. And the FCC maintained a partial ban on such material, channeling it to the 10 P.M. to 6 A.M. period.

In 2001 the FCC announced new decency guidelines for radio and television broadcasters, making it simpler for stations

to determine unacceptable material. The guidelines include instructions about intent and context as well as warnings against repeated swearing and explicit language. Under the new ruling, Carlin's routine would still be problematic if played during morning, afternoon, or evening hours.

The Shadow

Crime Drama

In radio drama's heyday, from the 1930s to the mid-1950s, few program openings matched—and perhaps none surpassed—the recognizability of *The Shadow's* aural calling card. The first straining phrases of Camille Saint-Saëns' tone poem *Le Rouet d'Omphale* (Omphale's Spinning Wheel) are established and begin to fade as the filtered voice cuts through in measured intensity: "Who knows what e-vil lurks in the hearts of men? The Shad-ow knows." A decidedly unfunny laugh follows, and the rushing music swells again. Here the listener can imagine the unblinking stare of the mysterious figure who has gazed into the dark side of human nature. Thus begun, the late Sunday afternoon broadcasts of *The Shadow* prompted many a schoolchild's nightmares and not a few adults' nervous glances into the evening darkness.

Origins

Although The Shadow became one of the best-known characters in radio drama, he first held the more modest role of introducer of stories about other protagonists, dramatized from pulp magazines published by Street and Smith, whose fiction factory had been churning out nickel and dime novels well before the end of the 19th century. Street and Smith's *Detective Story Magazine* and *Western Story Magazine*, both begun during World War I, were well established by the end of the 1920s, but competition tightened as rival mystery and Western publications as well as new aviation, sports, college humor, and romance titles crowded the market. Street and Smith

decided to seek new readers through the rapidly evolving rival popular medium, radio.

For *The Detective Story Hour*, first heard on CBS at 9:30 P.M. on 31 July 1930, Harry Engman Charlot wrote scripts based on stories soon to be published in *Detective Story Magazine*. Charlot (whose poisoning death in a seedy Bowery hotel five years later was never solved) also suggested that the host-narrator might be a mysterious figure who told the story from the shadows, his identity disguised. James La Curto was the first to impersonate The Shadow, but after several weeks he accepted a Broadway role and was replaced by Frank Readick, Jr., whose sidelit publicity photographs shielded his face behind a visor mask worn under a broad-brimmed fedora. Stimulated as much by the novelty of the program's mysterious host as by interest in the dramatized samples of Street and Smith fictional wares, listeners rushed to newsstands asking for "The Shadow's magazine." In April 1931 the publisher obliged with the first issue of *The Shadow, A Detective Magazine*, announced as a quarterly publication. Increased demand quickly turned it into *The Shadow Monthly* and then into simply *The Shadow*, published twice a month.

The Detective Story Hour was discontinued after a year, but audience interest led to the revival of The Shadow character as a part of *The Blue Coal Review*, a 40-week Sunday variety series that debuted on 6 September 1931 at 5:30 P.M. on CBS. Half of the hour was devoted to Street and Smith story dramatizations introduced by Readick in The Shadow persona. A few weeks later, Street and Smith reclaimed its Thursday evening

9:30 CBS spot with *Love Story Drama* (retitled *Love Story Hour* later in the season), in which The Shadow recounted tales from *Love Story Magazine*. These hosting duties kept The Shadow at work for a year.

In January 1932 Frank Readick was also heard in a Tuesday evening CBS series that used *The Shadow* as the program title for the first time. Other runs featuring Readick and the briefly returning James La Curto were aired in various time slots on NBC and CBS until 27 March 1935. During this period Street and Smith wanted the broadcast tales to reflect the magazine Shadow's protagonist role, while Blue Coal, by then a well-entrenched sponsor, did not want to alter the successful format that restricted the on-air Shadow to host-narrator duties. In 1937 the impasse was broken when Blue Coal agreed to a trial run in which The Shadow would serve as the main character, on the understanding that the program would return to its Shadow-as-host-only format if the public did not welcome the change.

Star Series

With Orson Welles newly cast as The Shadow, the program had a sensational re-opening on the Mutual network at 5:30 P.M. on Sunday, 26 September 1937, and it would remain a late Sunday afternoon fixture for many years. Ironically, just as Street and Smith had achieved a radio Shadow mirroring the print character's function as an active avenger against lawbreakers, the freshened broadcast figure pursued a new direction different from that which the magazine hero had taken from the beginning of the decade.

Having seen a market for The Shadow's own magazine in early 1931, Street and Smith offered the writing task to Walter B. Gibson, an experienced hand at turning out detective stories and a magician skilled enough to be the ghost writer of "how to" manuals published under the names of Harry Houdini, Harry Blackstone, Howard Thurston, and others. Gibson's interest in the occult would help in defining The Shadow's extraordinary powers. Borrowing names from two literary agents, Gibson began producing The Shadow novels under the pseudonym Maxwell Grant, and when the publisher increased and then redoubled the magazine's frequency, he found himself typing 5,000 to 10,000 words a day while his cabin in rural Maine was literally being built around him. The publisher arranged one meeting between Gibson and an early scripter of the radio series, Edward Hale Bierstadt, but otherwise the handling of the broadcast *Shadow* was left to Street and Smith and to the Ruthrauff and Ryan Advertising Agency. Turning out 28 novels of approximately 60,000 words per issue in the first year and 24 novels in each of the next six years, Gibson wrote of an international network of agents, lookouts, and operatives who reported to The Shadow, who himself took a number of guises, aviator Kent Allard being the chief of these. The

well-heeled and well-traveled Lamont Cranston, employer of a chauffeur named Stanley, was simply one identity that The Shadow assumed as needed when the "real" Cranston was abroad. The Shadow's print tales took him to the Caribbean, Asia, the Pacific islands, and other places where strange religions, philosophies, and practices abounded.

When Ruthrauff and Ryan, the program's packager, planned *The Shadow's* return to the airwaves in 1937, the agency decided that Lamont Cranston would be the sole alter ego of the crimefighter. Although the pulp Shadow had been a loner, Orson Welles' Shadow gained the companionship of "the lovely Margo Lane," first played by Agnes Moorehead, who shared Welles' background in the Mercury Theater and in *The March of Time* dramatizations of news events. According to the announcer's weekly spiel, Miss Lane (named after Margot Stevenson, whom producer Clark Andrews had been dating) was "the only person who knows to whom the voice of the invisible Shadow belongs." While the pulp Shadow had merely concealed himself in the shadows, the radio Shadow had learned "the power to cloud men's minds so they cannot see him." In the fifth episode of the revived series ("The Temple Bells of Neban," broadcast 24 October 1937), Cranston explained to Margo Lane how an Indian yogi had tutored him in "the mesmeric trick that the underworld calls invisibility."

The scripts gave Lamont and Margo a breezy sophistication reminiscent of the marital chat of Nick and Nora Charles in Dashiell Hammett's *The Thin Man* (novel, 1934; film, 1934; radio series, 1941-50) and anticipated the "darling" this and "darling" that conversations of amateur sleuths Pam and Jerry North in CBS's 1942-54 series *Mr. and Mrs. North*. Always on the go, Lamont and Margo might find danger in Haiti, at the opera, on the road to a ski resort, or in a carnival fun house. While Margo sometimes saved Lamont from danger or stumbled onto a key clue, she gradually became a convenient bait for psychopaths and a vulnerable "lady in distress" on whom to hang ten minutes' worth of plot tension. The pulp novels' supporting network of crimefighting agents was gone, and Lamont and Margo were generally left to their own resources. Crusty, snapping, and demanding Police Commissioner Weston, representing the civic establishment in contrast to The Shadow's benevolent vigilantism, dealt testily with Cranston on many occasions, and the taxi driver Shrevvy provided comic relief with his self-mocking repetitions of phrase. Even these secondary characters gradually disappeared.

When Orson Welles took the radio lead in *The Shadow*, he was promised that he would not have to attend rehearsals; he arrived at the WOR studios by taxi just before airtime, and the on-air performance was his *only* read-through of each script. His Mercury Theater and other commitments became so demanding, however, that he relinquished The Shadow's role after the regular 1937-38 Blue Coal season and a 1938 transcribed summer season (repeated in 1939) for B.F. Goodrich.

The Shadow played by Jimmy La Curto
Courtesy CBS Photo Archive

(The Shadow participated in the tiremaker's commercials, delivering a stern warning about worn tires on slick roads.) Ironically, although Welles was the best-known actor to portray The Shadow on radio, his sardonic laugh did not match the scariness of Frank Readick's, whose recorded "Crime does not pay" warning continued to be used at the end of each episode during Welles' tenure.

Bill Johnstone undertook the Cranston/Shadow role on 25 September 1938 and held it through five seasons, while Agnes Moorehead later yielded Margo Lane's part to Marjorie Anderson, and Ken Roberts became something of an institution as the announcer. Bret Morrison inherited the lead for the 1943-44 season but left over salary differences. John Archer and Steve Cortleigh had brief runs in playing The Shadow in the usual Sunday afternoon time slot as well as in occasional appearances on the mid-1940s quiz program *Quick as a Flash*, where a rotating series of radio detectives dramatized crimes for the panel to solve. Bret Morrison returned to the lead role in 1945, held it until the program ended in 1954, and later recorded a few new episodes for non-broadcast tape distribution. In those last years Margo Lane was played by Lesley Woods, Grace Matthews, and Gertrude Warner.

During the late 1930s and early 1940s, most episodes of *The Shadow* began *in medias res*, and the typical Sunday found Lamont, Margo, and their antagonists speeding from place to place by car, motorboat, or private airplane. To make an inquiring visit to a crime scene or to deliver a warning to a miscreant ("The Shadow already knows enough to hang you, Joseph Hart!"), Lamont Cranston often assumed The Shadow's identity shortly before the mid-program commercial break, and his second appearance, at the end of the episode, brought the crack of a handgun and the echoing cries of the guilty as they crumbled, sank, burned, or fell to their deaths. In later years the mad-scientist villains (often lisping and spitting in middle European accents) largely gave way to more commonplace thugs and hoodlums (grumbling in accents of Brooklyn and the Bronx). Early 1950s listeners often felt that they could predict, to the minute, the plot turn when a loudly protesting criminal's death would illustrate The Shadow's view that "*The weed of crime bears bitter fruit. Crime does not pay.*"

Neither Walter Gibson's pulp novels nor *The Shadow's* radio scripts gave much attention to subtleties of characterization or incident, and listeners have concluded that scarcely any story in all those broadcast years fully made sense. Villains, often nursing misconceptions of being wronged by society or stinging from previous encounters with The Shadow, were often megalomaniacs with ambitions for dominating large populations through the risky deployment of flimsy devices. One antagonist strove to block the sun's rays and leave the city in darkness, while in another tale a gang of robbers placed exploding light bulbs in fixtures throughout town so that peo-

ple would become fearful of using any lights, even car headlights or hospital operating room lamps. In "The Ghost of Captain Baylor" (15 January 1939), The Shadow freed 50 innocent sailors from the island dungeon of a group that was attempting to control naval traffic by rising in a submarine, popping open the hatch, and shooting a machine gun at passing vessels. The Shadow locked the thugs in their own dungeon and left them "to suffer, as long as their lives last, the terrible fate they designed for others," and while this typically articulated bit of poetic justice unfolded, Lamont Cranston's yacht proved capacious enough to return the victims to shore.

The Shadow's own powers and degree of vulnerability sometimes differed from one episode to the next. While he often seemed able to slip into any cell, cave, locked basement, vault, or ship's cabin, he was nearly burned alive in an ordinary room when its sole window was locked from the outside. In "Appointment with Death" (12 March 1939), a vengeful ex-con tricked The Shadow into swimming toward an island hideout so that the villain might shoot at the gap which the invisible Shadow's body would make in the rippling water. Other antagonists noticed the impressions of The Shadow's feet in deep-pile carpets or sought to trap his image in an early television receiver.

The last episode of *The Shadow* was broadcast on 26 December 1954, five years after Blue Coal had dropped its sponsorship and the same year that the Street and Smith *The Shadow* magazine had ceased publication. Communism and McCarthyism were the shadows then looming over the U.S. horizon, and television had begun to push drama programs from radio. In a 1960s reminiscence, Walter Gibson noted that The Shadow had become a creature of "camp," although he felt that those who derided the series also privately enjoyed it. In 1963 transcriptions of classic episodes were syndicated to WGN and other stations.

In the early 1940s *The Shadow* had been the highest-rated dramatic program on radio, and it prompted a 1940 movie serial starring Victor Jory, a short-lived comic strip drawn by Vernon Greene, a comic book series, three "Big Little Books," and a number of Blue Coal premiums, including ink blotters and glow-in-the-dark rings. The Shadow had been showcased in several "B" features in the 1930s and 1940s, and in 1994 Alec Baldwin starred in a large-budget film adaptation in which lavish costuming and set decoration adorned a typically loose-jointed plot.

The Shadow programs are reasonably well represented in the circulating libraries of radio clubs today, and many episodes starring Welles, Johnstone, and Morrison have been released on commercial records, cassettes, and CDs. Several internet sites offer easy access to program episodes, pulp novel texts, and splashy magazine covers. *The Shadow* persists, too, as a shuddering delight in the memories of those who knew radio before they knew television, when Sunday evening meant

sharing Lamont Cranston and Margo Lane's adventures among the obsessively evil and the picturesquely insane. With *The Lone Ranger*, *Amos 'n' Andy*, and a very few others, *The Shadow* remains an essential figure of golden age radio.

Shaw, Allen 1943–

U.S. Radio Programmer and Station Owner

Known first for the "Love" format on American Broadcasting Companies (ABC)-owned FM stations in the late 1960s and early 1970s, Allen Shaw was instrumental in the success of several major broadcast groups and became a station owner. During his career, Shaw was responsible for the operations of 43 radio stations in 31 markets for five different companies.

Origins

Radio attracted Shaw early. At age 11 he experimented with electronics, building transmitters and communicating via Morse code. A chance visit with his father to a local radio station turned young Shaw from aspiring engineer to aspiring air talent and programmer. The elder Shaw owned a building in

Haines City, Florida, where 50-kilowatt WGTO-AM located its studios in 1956, and one weekend he asked his son if he would like to see the facility. "It was the first time I had ever seen a disc jockey at work," Shaw remembered, "and it looked magical." He recalled his comments to his father about being able to hear the disc jockey in the car and in the kitchen. The performance side of radio hooked the 13-year-old.

WGTO was the first station licensed to Shaw's hometown, but it was not to be his first radio job. "They were a professional station; they hired good people," he said self-effacingly. In 1959 an "owner operating on a shoestring" established 500-watt WHAW-AM in Haines City, and, to use Shaw's words, "I was available for a buck an hour." An after-school job at WHAW launched Shaw's career at age 15.

In college he pursued radio, earning a degree in radio-television from Northwestern University in 1965. The proximity of Evanston to Chicago introduced Shaw to the legendary WCFL-AM, one of the two battling Top 40 stations in the Windy City at the time.

Radio Career

After college, Shaw moved to Albany, New York, for a brief stint as a disc jockey at WPTR, working the 7 to 11 P.M. shift. As Shaw told author Michael Keith in *Voices in the Purple Haze*, "I was supposed to be playing the top-selling hits of the day, such as 'Everybody Loves a Clown' by Gary Lewis and the Playboys and 'Lover's Concerto' by the Toys. I found myself slipping in unapproved cuts off the Rolling Stones, Beatles, and Bob Dylan albums. This was, of course, breaking the format rules of the station, a clear act of revolutionary protest." WPTR's program director told Shaw—"in no uncertain terms," as Shaw put it—that the public would decide through the purchase of 45-rpm singles what the station would play. Shaw, however, was hooked on the new music being released on long-playing albums.

A year later, in 1966, he was asked back to Chicago to become assistant program director of WCFL-AM. That station, like WPTR, was true to the top 40 singles. But Shaw listened at home to promotional copies of new rock albums by bands unfamiliar to him—Vanilla Fudge, Velvet Underground, and the Jimi Hendrix Experience.

"I found these sounds very interesting and exciting," he said, and he asked WCFL management if he could play some of them on the air. They agreed to one hour on Sunday nights. As Shaw described it, "Underground radio had come to Chicago, if only an hour a week and in monophonic sound."

During 1967 two events deepened Shaw's interest in the new music, called both "progressive rock" and "underground" at the time. The first was a radio conference featuring Tom Donahue, a former Top 40 disc jockey who became known as the "father of underground radio." Donahue's KMPX-FM, San Francisco, played an eclectic mix of blues, folk, and rock without structure or a playlist. The other event was a concert in Chicago where Lou Reed's band, Velvet Underground, opened for Jimi Hendrix. Shaw talked to Reed about the growing interest in the new music in New York and other cities. "[Reed] assured me that I'd be certain to succeed if I put this music on FM full-time," Shaw said.

That encouragement set Shaw working nights and weekends with WCFL colleague and former college friend George Yahraes on sample music tapes and graphics for what they decided to call the "Love" format. The two presented their ideas to owners of Chicago FM stations to no avail. Then they went to New York to meet with major radio networks. ABC Radio gave them not only a hearing, but also an invitation to

make their presentation at the annual ABC managers' meeting in February 1968. The new format was so well received by ABC managers that by June of that year Shaw was director of FM Special Projects at ABC.

On 28 February 1969, ABC launched the Love format on FM stations it owned in New York, Los Angeles, San Francisco, Detroit, Houston, and Pittsburgh. Tapes were produced in New York and shipped to the other stations for playback. Of the period, Shaw said, "We knew at ABC-FM that we were, as unlikely as it was, the largest corporate entity broadcasting the drumbeat of the flower-children tribe over powerful FM stations. . . . There was a certain amount of headiness in our attitude." The success of the Love format prompted ABC to name Shaw—at age 26—president of ABC-Owned FM Stations, a post he held from 1970 until 1980.

The executive experience he gained at ABC made Shaw valuable to other broadcast companies, too. In 1981 he was named executive vice president of radio for Summit Communications, based in Winston-Salem, North Carolina. His move to that city would turn out to be a long-term affair, as he remained in Winston-Salem when he was appointed executive vice president and chief operating officer of the North Carolina-based Beasley Broadcast Group.

Shaw moved into station ownership as president and chief executive officer (CEO) of Crescent Communications, which acquired KYLD-FM in San Francisco in November 1993. The company expanded with two additional stations in the San Francisco-San Jose market and acquisitions in Albuquerque, New Mexico and Las Vegas, Nevada. The aggregate purchase price for all the stations was \$63 million, and they were sold three years later to four separate buyers for a total of \$135 million.

The experience at Crescent allowed Shaw to build yet another company, Centennial Broadcasting, of which he was owner, president, and CEO. He understood the increasing value of scarce radio properties and in 1997 built clusters with three FM stations in Las Vegas and two FMs and an AM in New Orleans. A programmer at heart, Shaw developed yet another format by modernizing the adult standards format to make it attractive to the older baby boom audience. His standards format became the audience leader in Las Vegas on KJUL-FM. In early 2001 Centennial was sold to the Beasley Broadcast Group, and Shaw rejoined Beasley's corporate team.

Shepard, John 1886–1950

U.S. Radio Pioneer

John Shepard was an important New England radio broadcaster who helped pioneer many of the medium’s program and technology innovations. Little remembered today, his was a name to be reckoned with in the first three decades of radio broadcasting.

Origins

Born into a family of Boston merchants, Shepard did not set out to work in radio. His grandfather had founded a department store called Shepard, Norwell & Company in the 1860s; it later expanded and was re-named the Shepard Stores. John Shepard III followed in his grandfather’s and father’s footsteps by joining the business and soon became manager of the store in Boston while his brother Robert managed the Providence store.

Early Boston Radio

With his ability to spot a sales trend, Shepard noticed during the 1920s the growing popularity of amateur radio and the first broadcast stations, and made sure to carry equipment and receiving sets in his store. He became friendly with several of the amateurs, and when they began working with newly emerging broadcast operations, Shepard became even more intrigued with the medium’s potential. Convinced that radio was no passing fad, he planned a station in the Providence store—WEAN, which was licensed in June 1922; and by the end of July, a Boston station, WNAC, was up and running from the 4th floor of the Boston store. WNAC became so iden-

tified with the department store that in its first few months, virtually nobody knew its call letters; even local newspapers referred to it only as the “Shepard Stores station.” That was fine with John Shepard, who believed the novelty of a radio station would bring people into his store to watch a broadcast under way, and then, he hoped, do some shopping. In WNAC’s first few months, he even helped with some of the announcing, calling himself merely “J.S.” after the under-spoken fashion of the day.

All of the initial announcers were Shepard store employees, and the entertainment was derived mainly from music schools or local entertainers who wanted some radio exposure. But as the station continued to gain new fans, Shepard did something unusual for the time: he hired some well-known performers, and he paid them to be on the air. In the early 1920s, most stations had no budget for talent, so they depended on volunteers. Shepard was determined to run his station as a business, however, and that meant paying performers. While good for the performers, this move soon proved unfortunate for smaller stations like Boston competitor WGI, which, with few dollars for talent, soon lost many of its most popular musicians.

Shepard quickly became one of radio’s most passionate fans. When the National Association of Broadcasters was founded in 1923, he became the group’s first vice president and a member of their board of directors. Later that year, he was one of a small group of owners and executives who met with President Coolidge to discuss the future of radio, and in subsequent years, he was part of delegations that spoke with congressmen about up-coming legislation which might affect radio.

Shepard had great respect for radio's ability to spread ideas. He invited members of the clergy from all the major faiths to give inspirational talks at a time when diversity was not commonly accepted; his station was the first in Boston to air synagogue services. His interest in politics led to broadcasting some very contentious political debates, and also led to accusations that he was allowing the candidates he liked more air time than the ones he did not. Of course, Shepard was also devoted to radio because of its ability to sell products; his staff became known for creative copywriting and memorable commercials.

Innovations

Shepard's station was the first in Massachusetts to put an African-American musical, "Shuffle Along," on the air, in November 1922. WNAC was also the first to use "house names." When "Jean Sargent" or "Nancy Howe" left his station, her replacement took the same name as the woman she succeeded. There is also some evidence that he aired the first play-by-play broadcasts of Boston Red Sox baseball.

In early 1927 Shepard experimented with what today would be called a home shopping operation. His new station, WASN (All Shopping News), was run almost entirely by women, several of whom went on to long careers in broadcasting. Though it turned out that home shopping's time had not yet come, it was only one of many innovations that came from Shepard. Although he never built a receiver nor invented anything, he knew how to spot a trend and hire the right people.

Shepard was among the first broadcasters to link two stations (he undertook an early version of networking with WEAJ in New York City in January 1923). Periodically during the 1920s, he also linked WNAC with sister station WEAN to share programming. (In fact, a friendly rivalry ensued between the Boston and Providence stores, beginning with a road race between the two cities in the early 1930s, and culminating in the '40s with a weekly show called "Quiz of Two Cities.") From the successful linking of WNAC and WEAN, the Yankee Network was born; a local network that offered smaller New England stations the resources of both WNAC and WEAN, the Yankee Network first began signing up affiliates in the spring of 1930 and quickly became very popular.

Shepard helped to create a wider acceptance of broadcast journalism. He threw his support behind his own local news-gathering organization, in direct opposition to the Associated Press, which wanted to restrict radio news. Established in 1934, the Yankee Network News Service won the right for local radio journalists to obtain press credentials. It was soon in direct competition with the region's newspapers, using the slogan "News while it IS news," a direct slap at the inability of newspapers to react instantly as radio could.

Yankee Network technical director Paul DeMars had become an early supporter of Edwin Howard Armstrong's FM research. When in 1936 Shepard saw what FM could accomplish, he too was won over. He invested more than a quarter million dollars on his own experimental FM outlets, placing W1XOJ on the air in 1939 near Worcester as the first FM station in Massachusetts and one of the first half-dozen such experimental outlets anywhere. Its 50,000-watt signal nearly blanketed all of New England. Programs were transmitted to the site 42 miles west of Boston by another FM transmitter near the main Yankee Network studios in downtown Boston. This was followed in late 1940 by a second FM transmitter, W1XER atop Mt. Washington in New Hampshire, thereby creating the world's first (occasional) FM network by early in 1941.

The Yankee Network applied, unsuccessfully, for an FM license in New York City. But despite that setback, Shepard was the first broadcaster to create daily programming for FM, and in 1941 he was the first to get FM programs sponsored. He continued to promote the benefits of the new technology by sponsoring demonstrations, as well as selling FM receivers in his stores.

A landmark legal ruling came about because of a Shepard station practice. A disgruntled ex-employee, Lawrence Flynn, contested Shepard's Boston license by demonstrating how Shepard allowed politicians he favored to receive extra air time and favorable editorial mention. Shepard received a reprimand but retained his station when the Federal Communications Commission's *Mayflower* Decision of 1941 forbid radio stations from editorializing.

Nor did Shepard focus only on radio. When Charles Francis Jenkins' innovations in mechanical television in Washington, D.C., showed promise, Shepard supported development of a station for Boston. W1XAY, with studios in Lexington, Massachusetts, was on the air from the summer of 1928 until it ran out of money in early 1930.

Shepard served in numerous executive positions with the National Association of Broadcasters throughout the 1920s and 1930s, and he was actively involved in Broadcast Music Incorporated; he also chaired the first organization for FM owners (FM Broadcasters Inc.), and served on the board of the Mutual Broadcasting System. In the mid 1940s, in rapidly declining health, he sold controlling interest in the Yankee Network to General Tire Company, staying with the company for a while before retiring in 1949. He died in June 1950.

Shepherd, Jean 1921–1999

U.S. Radio Humorist and Monologist

His fans called him "Shep." Media guru Marshall McLuhan hailed him as the "first radio novelist." Like a modern-day Scheherazade, Jean Shepherd was a master storyteller who, with wit, tempered irreverence, and a gimlet eye for the minutiae of growing up, spun an inexhaustible supply of tales to a loyal following of late-night radio listeners.

He was born Jean Parker Shepherd 26 July 1921 in Hammond, Indiana, a steel-mill town just outside Chicago. During World War II, Shepherd served in the Army Signal Corps (an experience that provided fodder for a number of his stories) and briefly attended Indiana University. He began his career in entertainment as a performer at Chicago's Goodman Theatre.

Between 1950 and 1954, Shepherd was a disc jockey at WSAI in Cincinnati, doing live remotes from a restaurant called Shuller's Wigwam and hosting a nightly comedy show, *Rear Bumpers*, on WLW. In 1956 he moved to New York's WOR, where the *Jean Shepherd Show* broadcast for the next 21 years to an audience that swelled to as many as 100,000 listeners all along the eastern seaboard, courtesy of WOR's 50,000-watt clear channel signal.

The 45-minute show opened with the familiar racetrack bugle call that heralded his theme song (the "Bahn Frei Polka" by Edouard Strauss). Working without a script, Shepherd embellished tales of his boyhood years hanging out with pals "Flick,"

"Schwartz," and "Brunner" and of time spent in the army. Sometimes an entire show would be built around an absurd news story, and on occasion he read selections from favorite literary figures, such as poet Robert Service. No Shepherd tale ever proceeded in linear fashion: there were detours everywhere. He would go off on a tangent, digress, interrupt himself with an overlapping story, and then, even as his closing theme started to play, easily and logically tie all the loose ends together.

His narratives evoked nostalgia without cloying sentiment and were cynical without being destructive. Shepherd spoke of the ordinary, the remembered things—his mother standing at the kitchen sink in her stained chenille bathrobe making a meal that was always red cabbage, meatloaf, and Jell-O; the perpetual whining of a younger brother; his father's Blatz Beer burp. His delivery was conversational, punctuated by an occasional staccato burst of laughter; a chortle; a conspiratorial whisper; or a musical interlude, which could include anything from a kazoo solo to *kopfspielen* (musical sounds created by tapping on one's head) to recorded selections (most requested was "The Bear Missed the Train," a parody to the tune of "Bei Mir Bist Du Schön"). And as expression of the very apex of human triumph, he would utter the word "Excelsior!" ("Excellence!").

Shepherd's stories were richly detailed. Walking to school during an Indiana winter meant wearing "a 16-foot scarf

wound spirally from left to right until only the faint glint of two eyes peering out of a mound of moving clothing told you that a kid was in the neighborhood.” The exaggerated anticipation of waiting for the mailman to deliver a coveted radio premium (the *Little Orphan Annie* “Secret Decoder”) was described as, “At last, after at least 200 years of constant vigil, there was delivered to me a big fat lumpy letter. There are few things more thrilling in life than lumpy letters. . . . Even to this day I feel a wild surge of exultation when I run my hands over an envelope that is thick, fat and pregnant with mystery.” Many of the tales were written later as short stories for a variety of magazines, and several were collected into books.

Shepherd described himself as a humorist rather than a comic. “A humorist looks outward and sees the world,” he said, “a comic looks inward and sees himself.” His familiar manner combined with the intimacy of the medium encouraged almost cultlike devotion, prompting Shepherd to observe, “I had 5 million listeners and each thought he was the only one.” Fans felt like they had a secret pact with him, as if he and they were the only ones in on a big joke—and sometimes they were. More than once he would tell his audience to crank up the volume on the radio and shout along with him, “Drop the tools, we’ve got you covered!” One evening, Shepherd encouraged listeners to leave their radios, go to a street corner in Manhattan, and just mill around. Thousands showed up—and so did the police, who had gotten reports of a mob gathering. But the WOR listeners had been advised to simply and quietly mill—and then go home.

The greatest prank ever played by Shepherd and his devotees was the celebrated *I, Libertine* hoax, in which he told listeners to go to their bookstores and ask for a nonexistent book called *I, Libertine*. Prompted by the sudden demand, booksellers frantically tried to locate the book. Articles began appearing about the publishing sensation—the *New York Times Book Review* even included the book in its list of newly published works. “Friends would call to tell me that they’d met people at cocktail parties who claimed to have read it,” Shepherd recalled. When the hoax was finally revealed, one of the publishers who had been pursuing paperback rights to the “sensation” persuaded Theodore Sturgeon to actually write it (under the pseudonym of Frederick R. Ewing) based on Shepherd’s idea. It is now considered a collectible volume.

A WOR staffer once commented, “nobody at the station worked with Shepherd, instead they tried to work around him.” His working relationship with WOR tended to be scornful, even antagonistic, and Shepherd made little attempt to soften this contempt: when giving the station identification, he would say, “speaking of relics, this is WOR Radio.” He was annoyed by the necessary interruptions imposed by the commercial break and would instruct the engineer to “hit the money button.” His 21-year run on WOR Radio ended in April 1977.

Jean Shepherd
Courtesy AP/Wide World Photos

In the 1970s, the *Jean Shepherd Show* was syndicated nationwide to public radio and college campus stations, and for the next two decades Shepherd made a series of personal appearances, including Carnegie Hall and an annual Princeton University show. He also began a longtime collaboration with the Public Broadcasting Service and eventually became involved in feature films. The film *A Christmas Story*, which Shepherd cowrote and narrated, has become a holiday classic.

Shirer, William L. 1904–1993

U.S. Radio Journalist and Author

William L. Shirer was an accomplished newspaper foreign correspondent when in 1937 he became an important member of the Columbia Broadcasting System (CBS) radio news team assembled by Edward R. Murrow. From the late 1930s into the early years of World War II, his was the voice people often heard from Berlin, Vienna, and other European cities. Shirer continued his career as a radio commentator until 1949 and later published a number of influential books growing out of his reporting experience.

Early Years

Shirer was born in Chicago, son of a crusading U.S. attorney who died when the boy was only nine. His mother moved William and his brother and sister to Cedar Rapids, Iowa, where

in 1921 Shirer entered the denominational Coe College and graduated in 1925, having worked on the school paper. He worked his way to Europe on a cattle boat, arriving in Paris, which was then at its peak as an arts and literary hot spot.

Shirer's journalistic career began with a stint as reporter on the *Paris Tribune*, a European arm of the *Chicago Tribune*, from 1925 to 1927. His reporting of Lindbergh's flight to Paris in 1927 landed him a spot as a foreign correspondent for the parent *Chicago Tribune* that year but he was laid off in a 1932 downsizing. He was able to land a job, albeit one at a lower status, as a copy editor for the *New York Herald* Paris office that lasted for a couple of years. His next post was as the Berlin-based correspondent for Hearst's Universal News Service beginning in 1934. His bad luck continued, however, and in 1937 he was laid off from that post as well.

Radio Reporting

Now Shirer's luck turned around. On the very day he lost the Universal position, he received a cable from Edward R. Murrow, then CBS director of "talks" based in London. Murrow, seeking seasoned reportorial help as he developed a European news team, took Shirer to dinner at the fashionable Adlon Hotel in Berlin and asked him to join CBS at the same salary Shirer had been earning (Murrow did not know Shirer had lost his job). With few prospects and a pregnant wife, Shirer accepted.

While he had extensive journalism and European experience and was multi-lingual, Shirer did not have an obvious "radio voice," especially when compared with Murrow. Nonetheless, after a rather shaky initial few reports for CBS from Berlin (CBS news director Paul White was less than overwhelmed), Shirer became the first member of what years later would be known as "Murrow's Boys," a team of reporters that would all but dominate radio's coverage of rising European tensions and eventually war.

After several frustrating months of fairly minor reporting chores, Shirer hit his stride with an eyewitness account of Hitler's takeover of Austria in early 1938. Unable to broadcast from Vienna because of street barricades, Shirer flew to London (not an easy thing to do at the time) and broadcast to CBS in New York by means of shortwave. On 13 March 1938 Shirer led off the first multi-city CBS "World News Roundup" (although the program title was created later) with reporters in several European cities. Months later he reported on the growing Czech crisis from both Prague and Berlin, again using shortwave links. Throughout this period, Shirer and Murrow were close personal as well as professional colleagues, working virtually as equals.

Perhaps his finest radio news coup came in June 1940 when, by carefully reading what was going on and ignoring German news officials, he was on hand to report the French surrender at Compiègne, north of Paris. His report, carried on both CBS and the National Broadcasting Company (NBC), beat the official news release by some six hours. As censorship became tighter in Berlin, Shirer found himself unable to report the full story from the German capital city, and at the end of the year, he traveled home to New York to arrange for publication of his diary.

Shirer's *Berlin Diary* was a huge best-seller in 1941, eventually selling half a million copies. He went on the lecture circuit and did well. For the rest of the war, he reported from the United States, with two brief trips, one to London and one to Paris. He and Murrow, the latter angry that Shirer had never returned to his European news haunts, began to grow apart. Beginning in 1944 he had a regular, sponsored, Sunday evening news commentary program on CBS and developed a considerable following.

 Courtesy Library of American Broadcasting

Murrow became Shirer's boss when the former became a CBS vice president in charge of the network's news operations. The tension between the two men grew as Shirer often rejected or ignored Murrow's suggestions for reports or news approaches. In March 1947 Shirer lost his program's sponsorship, weakening his position within the CBS news hierarchy, and costing him about \$1,000 a week in lost sponsor fees. Although the reasons were never made clear, Shirer became convinced he was dropped for his liberal views in a time of increasing concern about communism in the United States. Others argued that he had become lazy and insufferable, making the rupture inevitable. The end of Shirer's program was widely reported and caused a storm of protest against (but not within) CBS, some of it aimed at Murrow. Shirer resigned from the network, well aware he no longer had a future there. Although he offered a weekly radio commentary on the Mutual network for two years, that stopped in 1949 and Shirer never worked full-time in broadcast news again.

Later Years

Shirer felt betrayed by Murrow and CBS and was bitter about it for the rest of his life. He wrote two nonfiction books on postwar Europe and two novels, neither especially successful, but one of them, *Stranger Come Home* (1954), was felt by many who knew both men to be starkly critical of Murrow.

The last period of Shirer's life began with the publication and huge success of his *Rise and Fall of the Third Reich* (1960), a history of the German Third Reich. Drawing on his direct experience (and personal acquaintance with many of the German leaders) and research, it became a Book of the Month selection, went through 20 reprintings in the first year alone, sold millions of copies, and has remained in print for decades. Once again Shirer was successful, respected, and financially well off.

For the last quarter century of his life, Shirer lived in the Berkshires of western Massachusetts and devoted himself to his writing, regularly turning out nonfiction books, several of which did quite well. Among them was a three-volume autobiography. His last book, a biography of Leo Tolstoy and his wife, appeared just a year before his death at age 89. Seven years later, transcripts of many of his Berlin broadcasts from 1934–1940 were published, allowing a new generation to appreciate his commentary and insight.

Shock Jocks

During a blizzard in January 1982, an Air Florida passenger jet lifted off from National Airport in Washington, D.C., and almost immediately crashed into the Fourteenth Street Bridge, close to the end of the runway. The resulting tragic loss of life led to a program segment by radio shock jock Howard Stern. Stern called Air Florida personnel and asked for the price of a ticket from National Airport to the bridge.

Radio shock jocks purvey a radio format known as "shock radio," "raunchy radio," or "topless radio." Shock jocks such as New York's Howard Stern and Chicago's Erich Mancow are aptly labeled, for the goal of their program content is to appeal to a predominantly male audience using a panoply of sexual and scatological references and stunts. Listeners are barraged by sexually explicit references, cultural and ethnic attacks, off-color listener telephone calls, and sexually based interviews and antics. It is not unusual for Howard Stern and his on-air staff to cajole a female guest into disrobing as Stern details her anatomy for his listening audience. Other radio jocks associated with this program style have included Steve Dahl, Gary Meier, Jonathon Brandmeier, Danny Bonaduce, and Don Imus.

Although it is difficult to specifically date the onset of the shock jock format, the trend can be traced to the early 1970s. Prior to that date, the Federal Communications Commission (FCC) heard very few cases dealing with obscenity and indecency, and most objectionable programs were isolated in nature; for example, a station in North Carolina lost its license in 1962 for broadcasting blue material by country and western singer Charlie Walker. In 1972 a Detroit radio station was fined \$2,000 for a sexual parody of a popular song.

The origin of the shock radio issue, however, might rest with WGLD-FM, Oak Park, Illinois, for airing a syndicated program entitled *Femme Forum*. This early morning broadcast contained an array of explicit sexual references, including a female listener's technique for oral sex. Popularly labeled "topless radio," the format subsequently led to the FCC's imposition of a \$2,000 fine in 1973 for obscene broadcasting. The issue of indecency arose again in 1975 with the airing of George Carlin's comedy album *Occupation: Foole*, from which WBAI-FM, New York, broadcast the "seven dirty words" segment at 2 P.M. The FCC fined the station only a small amount but issued a ruling on the scheduling of adult-oriented and indecent broadcast material. Shock jock Howard Stern created the benchmark for such fines in September 1995, when Infinity Broadcasting agreed to pay almost \$2 million to settle a number of FCC fines against Stern's programming.

Although *Newsweek* has termed New York's Don Imus a "former shock jock," many instead consider him to be the "father of shock jocks." The nature of his early broadcasting career confirms his iconoclastic approach. More recently, Imus

has assumed the position of watchdog over the political and social arena, and his barrages of criticism have an acerbic edge. Imus' attacks on President Clinton and his verbal caricatures of Dan Rather and CNN's Wolf Blitzer, among others, have been widely reported. This may be a new arena for shock jocks.

Today's shock jocks continue to sustain a large youthful listening audience with programming challenging the limits of taste and legal suitability. The most notable is New York's Howard Stern, self-appointed "King of All Media." His program is a pastiche of sexual patter and risqué material. Although Stern's syndicated program has been canceled in several markets, he continues to command a large listening audience. Fans of Stern will find a myriad of webpages discussing his programming and personal life. On one website, "Howard Stern News Desk," Stern is quoted as remarking, "I always resented the term 'shock jock' that the press came up with for me . . . because I never intentionally set out to shock anybody. What I intentionally set out to do was to talk as I talk off the air, to talk the way guys talk sitting around a bar." Stern's rise as a shock jock is detailed in both his book and film, both entitled *Private Parts*.

Another popular shock jock, Erich "Mancow" Muller, has been successful in Chicago. His irreverent barrage of ethnic and cultural slurs, coupled with references to bodily functions, has led to a wide following in his markets. His broadcast sidekick, "Turd," provides on-the-street antics and interviews.

The longevity of shock jocks will depend on many factors, including continued audience acceptance and advertising support; intervening variables may include the role of self-regulation and the FCC's interpretation of regulations and statutes relating to obscenity and indecency. Historically, radio programming formats and personalities have changed with the whims of the radio audience. For a period in the late 20th and early 21st centuries, shock jocks occupied a popular position on the radio dial.

Shortwave Radio

Most radio broadcasting takes place in the AM and FM bands (and, outside the United States, in the long wave band—148.5–283.5 kHz). However, the shortwave bands are home to domestic, regional, and international broadcasting as well.

Many different types of radio service use the shortwave frequencies, including maritime, aeronautical, data transmissions, and amateur radio. Within the shortwave spectrum of 1.7–30 MHz (often referred to as high frequency or "HF"), 14 bands have been allocated to shortwave broadcasting (ranges vary slightly in different parts of the world):

- 2.3–2.495 megahertz (120-meter band)
- 3.2–3.4 MHz (90-meter band)
- 3.9–4.0 MHz (75-meter band)
- 4.75–5.06 MHz (60-meter band)
- 5.9–6.2 MHz (49-meter band)
- 7.1–7.35 MHz (41-meter band)
- 9.4–9.9 MHz (31-meter band)
- 11.6–12.1 MHz (25-meter band)
- 13.57–13.87 MHz (22-meter band)
- 15.1–15.8 MHz (19-meter band)
- 17.48–17.9 MHz (16-meter band)
- 18.9–19.02 MHz (15-meter band)
- 21.45–21.85 MHz (13-meter band)
- 25.67–26.1 MHz (11-meter band)

The first three of these bands are referred to as the tropical bands and are generally reserved for broadcasting from countries in equatorial regions. The remaining "international" bands are open to everyone. A limited amount of shortwave broadcasting also takes place outside the designated bands.

Origins

The development of shortwave broadcasting traces its roots to early radio experimenters. Known as "hams," these amateur radio operators would utilize their radio equipment to communicate with each other, transmitting on any frequencies they chose.

Exploration of the shortwave bands began as a result of the Radio Act of 1912, which limited amateurs to operation above 1.5 MHz, bands then unexplored and thought to be of little value. All radio transmissions to that point (including those by the hams) had taken place *below* 1.5 MHz. What was widely thought to be ham radio's banishment to useless frequencies above 1.5 MHz proved to be its greatest asset, however, for the hams soon discovered that the reflective properties of the ionosphere made reliable radio transmission over great distances possible on the shortwave frequencies. Moreover, such transmissions could be accomplished with less power and smaller transmitting facilities than had theretofore been required for long-distance communication. (Ham radio operators continue to be an important element of the modern radio scene.)

Although Marconi had experimented with shortwave spark transmitters as early as 1901, the earliest shortwave broadcaster was Westinghouse engineer Frank Conrad, who experimented with the shortwave rebroadcast of Westinghouse station KDKA in 1921–22. These transmissions were heard in other countries, some of which rebroadcast the programs on their local standard broadcast stations. The long-distance capability of shortwave was a result of the reflective properties of a portion of the ionosphere known then as the Kennelly-Heaviside layer, so named after Britain's Sir Oliver Heaviside and Harvard professor Arthur Kennelly, who had independently suggested the existence of such a phenomenon.

By 1925 some large U.S. stations, including General Electric's WGY, Crosley's WLW, and RCA's WJZ, were simulcasting their regular AM programming on shortwave for experimental purposes. In the United States, it was hoped that shortwave could substitute for the long-distance cables needed to connect AM stations for network broadcasting. The cables were owned by the American Telephone and Telegraph Company (AT&T), which, as a competing broadcaster, was reluctant to lease the cables to others. When AT&T settled its disputes with the radio industry in 1926, ceased its own broadcasting, and agreed to lease its long-distance lines, a commercial rationale for reliance on shortwave as an adjunct to domestic broadcasting was lost.

Several objectives supported the use of shortwave for broadcasting purposes in radio's early days. Most important was basic technical experimentation: determining how far and how reliably signals could be transmitted, and at what times and frequencies. Another objective was to cover remote areas not easily reached by limited-range AM ("medium wave") signals, and thus provide news and entertainment to those not otherwise served by radio.

A third objective was to serve as a unifying national force. In the United States, broadcasting was essentially a private function. The government set technical standards and provided regulation on matters such as frequency, power, and hours of operation, but the broadcasters themselves were private enterprises. In most other countries, however, broadcasting was a government monopoly, and the government the principal broadcaster. (A modified American model was in force in Central and South America, where broadcasting was in mainly private hands, but with government broadcasting permitted as well.) Where the government controlled broadcasting, it was hoped that shortwave would be a useful tool for nation building. In some cases, geography dictated even loftier goals: Britain's "Empire Service," as its early international shortwave broadcasts were known, served as a means of communication with subjects in distant colonies.

The relaying of programs from one country to another by shortwave for rebroadcasting on local AM frequencies was another objective of early shortwave broadcasting. Although in theory such relays would provide a means of enriching local programming, the relays were usually small in scale until World War II, when rebroadcasting took on a propaganda objective. Both Germany and the United States entered into a large number of arrangements with South American stations for the rebroadcasting on local AM frequencies of programs delivered by shortwave.

The use of direct shortwave broadcasting—that is, shortwave programs intended for direct reception by listeners in another country, without local rebroadcasting—also proved a valuable propaganda technique for both sides during World War II. Although the reception of shortwave signals still required special equipment and some technical skill, it was not as complex as in the experimental days. In addition, the directional properties of shortwave—the ability to beam transmissions so as to maximize reception in specified geographic areas—lent itself to shortwave broadcasts specially targeted for particular parts of the globe. Thus Germany had its "U.S.A. Zone," and Italy and Britain had their North American services. The broadcasters made their programs more attractive by using the native language of the target audience.

After the war, the growth of shortwave broadcasting was largely a product of the propaganda needs of Cold War antagonists and the desire of many countries to have a place at the

international broadcasting table and a voice that served national pride. Shortwave broadcasting maintained its usual shape, however: international services presented by government broadcasters in the listener's own language, at convenient times, and on multiple frequencies so as to provide the best reception in the target zone.

Although never as prevalent on the shortwave bands as the government broadcasters, private stations use shortwave as well. In some cases these are private AM stations simulcasting on shortwave simply to increase their range. Private religious organizations have also used shortwave as a means of transmitting their message worldwide. This has been a growing phenomenon, with many religious organizations boasting modern, high-power transmitting plants. First in this category was HCJB in Quito, Ecuador, which has been broadcasting religious programs worldwide since 1931. Most private shortwave broadcasting in the United States is by religious stations.

Although its roots can be traced as far back as the 1936–39 Spanish Civil War, jamming became a serious problem in international shortwave broadcasting after World War II. The intentional transmission of noise on or near the frequency of an offending station by a transmitter located in the listener's area was routine in communist countries and was effective in preventing the reception of unwanted broadcasts. One response to jamming was to broadcast on multiple frequencies in hopes that one would get through. This led to more jamming and rendered significant parts of the shortwave broadcasting bands useless. Jamming largely ceased in 1988–89.

Modern Era

A number of modern trends have affected shortwave broadcasting both positively and negatively. The solid-state revolution greatly simplified the reception of shortwave signals. Frequency drift, a problem for many years in vacuum tube receivers, has disappeared; direct dial tuning has eliminated guesswork in finding the desired frequency; and synchronous detection has improved fidelity. In addition, miniaturization has made possible even portable shortwave receivers with sufficient sensitivity to give good reception. Higher transmitter power has meant stronger shortwave signals, the elimination of jamming has reopened previously unusable band space, and increased international coordination has led to better frequency allocation and less interference.

However, shortwave broadcasting is often underfunded by the parent authorities, and this, along with the absence of a marketplace ethic, has often resulted in unexceptional programming. And despite improvements in the quality of shortwave receivers, several factors, including the superior fidelity of local AM and FM reception, the "second nature" operation of regular radios, the absence of shortwave on car

radios, and the scarcity of widely available information on station schedules, have frustrated broad acceptance of shortwave. In addition, communication with faraway places is no longer a novelty. The ubiquity of information media such as cable TV and the internet makes shortwave broadcasting look quaint.

The number of shortwave broadcasters is on the decline. In addition to the loss of many local stations, some of the major broadcasters, including Radio Moscow, Radio Canada International, and the British Broadcasting Corporation (BBC), have reduced their output, sometimes drastically, and some countries have left shortwave broadcasting altogether. In some places, shortwave broadcast time has become a commodity, with high-power stations selling transmitter time to unrelated program producers (often in other nations). Although reliance on someone else's broadcasting facility is not without risk, purchase of airtime on a transmitter closer to the target zone can improve reception and eliminate the producer's need to maintain an expensive transmitting plant, while providing the transmitting station with additional revenue. With the demise of the Soviet Bloc and the introduction of market forces, Western stations have been able to purchase airtime in places that were previously off-limits. Thus, a religious station such as Trans World Radio can be heard broadcasting from Albania and the former Soviet Union. "Freedom" programs also rent time on transmitters in countries not directly related to the broadcaster's underlying message; for example, the Democratic Voice of Burma purchases time on transmitters in Norway and Germany, and the Voice of Tibet has broadcast from the Seychelles.

Notwithstanding the hurdles that shortwave broadcasting has faced, its oft-predicted demise does not appear imminent. Experiments in the use of the single-sideband transmitting mode and digital shortwave broadcasting continue the effort

to improve signal quality, lessen interference, and reduce the power necessary to push broadcast signals around the globe on shortwave.

Siemering, William 1934-

U.S. Public Radio Executive and Producer

Author of the Statement of Purpose of National Public Radio (NPR) and NPR's first program director, Bill Siemering is widely regarded as the philosopher and conscience of contemporary public radio in the United States. He defined a future for public radio in the late 1960s based on a firm foundation in educational radio's traditions.

Origins

Siemering's parents had toured on the Chautauqua circuit in the late 1920s until radio killed the movement in the early 1930s. The Chautauqua shows toured small towns in the United States, bringing entertainment, culture, inspiration, and

education to the largely isolated residents. When radio supplanted the touring shows, Siemering later believed, educational radio picked up their mission. When his parents settled in Wisconsin in 1934, rural Americans were receiving much the same sort of stimulation and diversion from the radio stations operated by state universities in the Midwest. Indeed, the family moved into a stone farmhouse literally in the shadow of the transmitting towers of the University of Wisconsin radio station, WHA, just south of Madison.

In his student days at the university, Siemering joined WHA's part-time staff and was immersed in the "Wisconsin Idea" of university outreach and public service. (He reminded public radio aficionados many years later that the first dictionary listing for "broadcast" refers to farmers throwing seeds in a wide circle, confident that some will take root but never certain about which ones or where.) This romantic rural vision of broadcasting met a gritty urban reality in 1962 when Siemering became manager of WBFO, the FM radio station of the State University of New York (SUNY) at Buffalo. He set out to do for a contemporary urban population what the traditional land-grant university stations had done for rural residents. Siemering saw the radio station as a potential link between the involved university and the community it served. "Public broadcasting can no longer be content as a refreshing cultural oasis," he said. "The emphasis must now be on solutions; how the individual can become politically involved to effect change."

To foster understanding between the races and to provide a voice for Buffalo's minority community, Siemering set up a storefront studio and provided airtime for volunteer broadcasters from poor neighborhoods. When the inevitable student strike to protest the Vietnam War hit the SUNY campus and 300 police moved in, he made the station a forum for discussion of the issues surrounding the strike. To the traditional authority of academics and journalists, Siemering added the unfiltered views of participants from all sides of the controversy. He saw a United States in which people were becoming compartmentalized, selecting those sources for their information that reinforced their existing beliefs. Public broadcasting, he said, should be an information source in which diverse groups could put their faith. He chastised both sides in the Vietnam War debate for avoiding meaningful discussion. Both sides, he wrote, feared that "discourse would modify, or in the eyes of some, weaken or compromise a position which has all the righteousness of a fundamentalist religion." The station's attitude was that all sides represented perspectives worth listening to: "We assumed they had a respectable point of view; our attitude was more like that of a counselor trying to have an individual share his perception of reality than an interrogating journalist."

Elected by fellow managers to the organizing board of National Public Radio in 1969, Siemering became the Thomas Jefferson of the new enterprise, capturing in eloquent words

the thoughts of his colleagues, which he had done much to shape by his example in Buffalo:

National Public Radio . . . will regard the individual differences among men with respect and joy rather than derision and hate; it will celebrate the human experience as infinitely varied rather than vacuous and banal; it will encourage a sense of active constructive participation, rather than apathetic helplessness. . . .

The programs will enable the individual to better understand himself, his government, his institutions, and his national and social environment so he can intelligently participate in effecting the process of change. . . .

The total service should be trustworthy, enhance intellectual development, expand knowledge, deepen aural aesthetic enjoyment, increase the pleasure of living in a pluralistic society and result in a service to listeners which makes them more responsive, informed human beings and intelligent, responsible citizens of their communities and the world.

Within a year, Siemering had moved to Washington as NPR's first program director, assigned the task of implementing his ideals, particularly in the form of NPR's initial offering, *All Things Considered*. Almost from the beginning, his philosophical approach clashed with bureaucratic necessities. Management seeking concrete plans were not reassured by phrases like, "Let's all hold hands and run a race." Yet it was exactly his humane philosophy that inspired much of the initial NPR staff and the emerging public radio family. He hired staff more on the basis of personal chemistry than professional experience, and his participatory management style relied on inspiration rather than direction. The results were both exciting and chaotic.

All Things Considered got off to a shaky start: occasionally brilliant, often less than competent. Ultimately the program found its stride, and it was at about that point when, to the shock of most staff and certainly Siemering himself, he was fired in December of 1972. The timing of the dismissal confounded him, although the underlying reason did not. From his first day on the job, his poetic operating style had bewildered and frustrated the NPR president and top management, who concluded after two years that his style would not change. Despite his rather brief tenure as head of programming, however, Siemering's influence on the institution endured. Many were inspired by his ideas and personality long after he departed. Even those who did not agree with his vision had to accept it as the point of departure from which NPR would evolve.

Siemering continued to work in public radio for 20 years after leaving NPR, holding leadership positions at Minnesota Public Radio and in Philadelphia, where he nurtured *Fresh Air* into a national program. Ultimately he was given what seemed

a perfect assignment for him when he was made executive producer of the documentary series *Soundprint*, which was designed to showcase the best work of the most creative producers in the public radio system. The father of *All Things Considered* and *Fresh Air* had a third child, one in which quality and creativity would prevail, where his ability to inspire would find an appreciative audience. Even *Soundprint* faced practical realities, however, and after five years more pragmatic leadership replaced him.

In 1993, the MacArthur Foundation selected Siemering as recipient of one of its coveted Genius fellowships, providing him with a stipend to pursue his interests. He used the opportunity to work with the emerging democratic radio systems in South Africa, Asia, Eastern Europe, and the former Soviet Union. He continued his international work after the MacArthur fellowship ended and well into his "retirement."

Siepmann, Charles A. 1899–1985

U.S. (British-Born) Radio Critic, Author, and Educator

Co-author of the Federal Communications Commission's (FCC) controversial "Blue Book" program policy statement and author of two important postwar books on American radio broadcasting, Siepmann was a strong advocate for exploiting the educational and public service potential in radio and later in television.

Charles A. Siepmann was born and educated in England and spent most of his first four decades in that country. After an education in the classics (interrupted by service with the British Army's Royal Field Artillery on the Italian front in 1917–1918), he graduated from Oxford's Keble College in 1922. While in college and soon thereafter, he worked with Brown Shipley near London. For three further years, he was a housemaster at a British Prisons reform school for delinquent boys.

The important turning point to the second phase in Siepmann's career—practical experience in radio broadcasting—came in the fall of 1927, when he joined the British Broadcasting Corporation (BBC), then just five years old and in only its second year of operating as a state-supported service. Under the firm direction of its director general, Sir John Reith, the BBC was already making an important impression in Britain and elsewhere in defining what public service radio could provide. Siepmann's next dozen years with the BBC, in a series of progressively more responsible roles, firmly defined his mindset concerning the positive benefits of public service radio broadcasting.

He began as a deputy to the director of the BBC's adult education section, rising to director in 1929. After the two sections were amalgamated, he became director of talks in 1932.

As Asa Briggs writes, "Under Siepmann's general direction, the reorganized Talks Branch settled down to plan some of the liveliest talks in the BBC's history" (see Briggs, vol. 2). After rising tensions on political and organizational matters in the Talks Branch, Siepmann was shifted to a newly created post, director of regional relations, in mid-1935. Six months later, after a careful study, he produced an important assessment of regional transmissions "in which for the first time an official of the BBC fully explored the social and cultural aspects of regional broadcasting" (Briggs, vol. 2). This marked the beginning of his own understanding of and appreciation for local, rather than only centralized, program planning. For his last three years at the BBC, until 1939, Siepmann was director of BBC program planning and a member of the BBC's Control Board. His final role was to assist the BBC in planning for its informational and related roles in the event of what seemed an increasingly likely European war.

The remainder of Siepmann's life was spent largely in the United States. He had first visited the U.S. in 1937 with the support of a Rockefeller Foundation grant to study how U.S. universities utilized radio. He returned two years later as a lecturer and assistant to President James Conant at Harvard University, serving from November 1939 until he entered government service in 1942, the same year he became a naturalized American citizen. Siepmann's wartime government work applied his knowledge of radio to special wartime needs. He worked first with the radio division of the short-lived Office of Facts and Figures and then in various posts with the Office of War Information (OWI), concluding the war as director of OWI's Oriental Broadcasting Section, based in San Francisco.

Siepmann is perhaps best remembered today for what came next—several months' work as a consultant for the FCC in 1945. Working closely with FCC staff members, he authored some of the text of a landmark FCC report issued in March 1946: *Public Service Responsibilities of Broadcast Licensees*, which was quickly dubbed the "Blue Book" after its cover color. The Blue Book was a scathing critique of the program and advertising practices of selected commercial radio stations in the 1939–44 period and became the center of a long-lasting controversy between the industry and its regulators.

He paralleled his government work with an extended and more personal argument in *Radio's Second Chance* (1946), his first full-length book. Siepmann concluded that although the American system of radio was "basically sound" and had much to offer, it could do much more by offering a broader spectrum of content in addition to music and entertainment. He suggested the developing FM service as one means of reinventing American radio to serve a wider public interest, an image drawn in considerable part from his public-affairs program experience with the prewar BBC. He called for more talks and discussions, more local programs, and a clearer separation of advertising from programming.

In 1946 Siepmann moved into the third, longest, and final phase of his career, this time as a university academic. Appointed a professor of education, he soon became chairman of New York University's department of communications, a post he held for more than two decades. In addition to teaching and other university duties, he published widely in both research journals and magazines of opinion, writing about public policy concerns in both radio and television. He also consulted briefly with the Canadian government's Massey Commission, undertaking a content analysis of the country's network radio programming in 1949 that appeared as an appendix in the commission's final report two years later.

Siepmann's *Radio, Television, and American Society* (1950) became an influential college textbook that remained in widespread use for many years. Perhaps his definitive statement of what broadcasting was and might be within the U.S. context, the book's chapters were divided into two parts. The first several chapters were devoted to a description of the United States and other systems of broadcasting, and those in the second part dealt at considerable length with the "social implications" of broadcasting. Writing at the dawn of commercial television, he emphasized the likely impact of video on radio and other media and argued again that although the U.S. system was good, it could be made still better by providing a broader choice of programs, especially more public service content.

In the early 1950s, Siepmann's attention turned almost totally to television's role in education, which Siepmann made the subject of several articles in *The Nation* and elsewhere; of a UNESCO-published study (1952) describing early American efforts to develop television's educational potential; and of his last book, *TV and Our School Crisis* (1958), on how television might help the educational crisis, which won a Stanton award. On his retirement from New York University, he taught for a few additional years at nearby Sarah Lawrence College before his final retirement in 1971.

Silent Nights

Enabling Distant Listening

The concept of *silent nights* is unique to American radio broadcasting in the early 1920s. Imagine a time when radio stations went off the air for two days because a president had died: it happened in August 1923, when, out of respect for the late President Harding, numerous stations voluntarily left the air until after his funeral. In the early 1920s, radio stations might also take a day off for a major holiday. A station could shut down because normal hours of operation were still very limited. No stations broadcast 24 hours a day yet—in fact, few were on for more than 4 hours, usually just in the evening. Even if a local station were broadcasting, static and interference from other stations might keep listeners from enjoying the entertainment.

In 1920, when regular broadcasting began in the United States, there were only a handful of stations on the air, and they shared a common frequency—360 meters (about 833 kilohertz). Sharing time was not yet an issue. By mid-1922, however, there were over 150 stations, and to have them all share one frequency was impossible. Trying to offer a solution, the government opened another frequency—400 meters (750 kilohertz). It was left to government radio inspectors to seek compromise with the stations to determine the times during which each would broadcast. Broadcast historian Erik Barnouw notes that in Los Angeles there were as many as 23 stations sharing one frequency at any given time.

And then came the idea of silent nights. It probably seemed like a good idea at the time. Stations in a city would voluntarily remain silent for several hours or for an entire evening, thus enabling radio fans to listen in to other cities and receive dis-

tant stations. Some cities also used the silent night concept to reduce interference, because with so many stations occupying only two frequencies, reception was getting worse and worse. From late 1922 to the mid-1925, stations grappled with the problem and tried various versions of silent nights. Some cities (such as Boston) couldn't seem to agree on it, so stations would suspend operation for each other if one station had a special broadcast planned; individual stations also agreed to stay silent one night a week to allow other stations more time on the air, but gradually this plan was abandoned. In Minneapolis, according to the *Morning Tribune* (6 October 1923), a "quiet hour" was chosen rather than an entire evening, but this idea also ran into trouble when a major event occurred during the time that was supposed to be the quiet hour.

Silent nights seem to have received the most support in Chicago. According to Barnouw, by 1923 Chicago stations voted to have Monday evenings after 7 P.M. as their silent night. In fact, Chicago was quite organized in its efforts. The Chicago Broadcasters Association sent out a very detailed press release to the major newspapers in early October of 1925 explaining why member stations had voted to continue with their silent night even though many other cities had tried it and given up. The Chicago Broadcasters Association believed that local listeners wanted to hear stations in other cities, and they felt they could bring about goodwill by continuing to make this possible. Atlanta, Kansas City, San Francisco, and Dallas were other cities that experimented with a silent night.

Unfortunately, silent nights didn't solve the problem. Although having stations voluntarily go off the air pleased

those people listening for distant stations (called “DXers”) the overall problems of crowding and interference were not alleviated by one city’s stations going silent for several hours once a week. Also, even in cities where one night was agreed upon, it didn’t take long for one or more stations to refuse to cooperate, and soon things were back to where they had begun. The Department of Commerce opened more of what became the AM band in 1923 and 1924, but the result was that even more stations came on the air, and radio columnists were once again noting complaints from listeners regarding poor reception.

By 1926–27 network broadcasting and paid advertising were becoming more common, and stations could no longer afford a night without revenue. The idea of silent nights, as noble as it may have been, became increasingly rare. In late 1927 even Chicago finally abandoned it, with station owners admitting that as much as they wanted to allow fans to hear

distant stations, they also wanted to make a living, and they couldn’t do that by staying silent. The days of shutting down for a holiday or going off the air to benefit the DXers were over, for radio had become a business and would be run like one.
