As Cooper's presence on Chicago radio expanded, so did the trails he was blazing for the black-appeal format. It was unheard of in the 1930s and 1940s for a black man to control any programming, but Cooper's production company (which was based in his home) at its peak produced some 50 programs primarily for black audiences and at the same time made a handsome profit. He would serve as a model for the white owners and program directors who would haltingly begin to woo the black audience in the 1940s. WDIA in Memphis, the first all-black-appeal station in America (1949)

would be the culmination of what Cooper had begun in the late 1920s.

Just as Cooper was making a way for the black format, he was also making a way for black employment in radio. The success of Cooper's programs hinged on the efforts of black employees: Cooper featured black actors and musicians and hired black writers and disc jockeys. In addition, blacks found employment on the operations side of his business. Barlow noted in 1999 that many of Cooper's "employee-trainees went on to successful careers in broadcasting; among the best known are Oliver Edwards, Eddie Plique, Manny Mauldin, William Kinnison, and Gertrude Roberts Cooper—the boss' third wife."

Among the other firsts in Jack L. Cooper's pioneering career was his status as America's first black disc jockey. One Sunday evening in 1932, *The All-Negro Hour's* pianist walked out on the show at the last minute to protest Cooper's refusal to give her a pay raise. In her absence, the boss improvised by putting a microphone by a small record player and spinning records. Over the years, Cooper would continue to rely on records for much of his musical programming, although, according to many of his contemporaries, he often eschewed the blues music so popular among blacks in favor of jazz and white dance music.

Jack L. Cooper built a small empire in black radio, controlling significant periods of airtime in one of America's largest markets and hiring many blacks to work in the industry during a time when virtually no other opportunities were available to blacks in radio. He demonstrated that blacks could succeed in radio and that black-appeal programming could be profitable. In the final analysis, Cooper's work proved to be an important factor leading to the substantial growth of black-appeal programming and black employment in radio during the late 1940s and 1950s.

Cooper continued to broadcast into the 1960s, when failing eyesight forced him to retire. He died in 1970.

Cooperative Analysis of Broadcasting

First U.S. Radio Ratings Service

The Cooperative Analysis of Broadcasting (CAB), a nonprofit organization, was the first company to provide regular studies of the radio audience on a continuing basis. From 1929 to 1933 the service belonged to Crossley, Inc., headed by

Archibald M. Crossley. With the emergence of the American Association of Advertising Agencies (AAAA) in 1934, Crossley turned over his service to a jointly financed cooperative venture consisting of national advertisers and agencies. By 1936

CAB was supported by the National Association of Broadcasters (NAB) and by 1945 the four major networks.

CAB was a marketing research organization. Its interest was not just in radio listening but in what advertisers in general got out of advertising. Radio program ratings were but one means of answering a number of questions and concerns that CAB addressed. Radio program ratings provided an answer to the question of how large an audience was. During this period, radio advertisers were also program producers, purchasing time periods from the radio networks and filling these periods with their own programs. Sponsors used CAB information about radio's listening audience to build programs that attracted the type of listeners most likely to buy their products. Because radio audiences were broadly based and were not already predetermined as magazines were by editorial policy, most advertisers concentrated merely on attracting large numbers of listeners.

Origins

Because national advertisers were some of the first companies to explore the use of radio as a means of advertising, it was perhaps not surprising that the Association of National Advertisers (ANA), through its radio commission (or committee), made the first attempt to answer basic questions regarding radio's anonymous audience and the national advertisers' possible customers. Because advertisers created programs and purchased time from networks, the first question that served as the focus for the first generation of audience research was that of network programs' relative popularity: what network programs were the most popular; that is, which programs drew the largest audiences relative to other programs? This question of program ratings served as the focus for CAB.

Crossley had started Crossley Inc. in 1918; it was one of three major organizations (the others being Roper and Gallup) that engaged in political polling. Political polling results were ranked by percentage points, much like ratings. When the ANA returned to Crossley to repeat an earlier audit, Crossley suggested that he should instead study radio's listening audience and listeners' program preferences. Although the radio committee of the ANA decided not to finance the study, the ANA did agree to endorse it if Crossley would underwrite it. By 1929 Crossley had gained endorsement from 30 sponsors, and by 1930 he began field work. Crossley's service functioned primarily as a network program rating service. Crossley, in fact, coined the term *rating*, although initially he used only the "identified listening audience," or what is now called the share, as the base for his ratings. Because national advertisers and agencies had developed Crossley's service, it initially served the 33 cities where the radio networks had outlets.

CAB's Method: The Telephone Recall

Although Crossley used a variety of techniques for different clients, including printed roster, mechanical recorder, personal interview, and coincidental, he selected a simple "next-day recall" telephone method to provide the first regular measure of network program audiences. The coincidental method employs an interview method in which the respondent is asked to state his or her listening to radio at the precise time ("coincidental" with) the interview. By comparison, next-day recall required respondents to recall behavior for the previous 24 hours. The recall method raised questions about respondent memory. Crossley's technique was to dial a telephone-based list and interview respondents about their previous day's listening.

Crossley chose the telephone recall method for four primary reasons. First, radio and telephone ownership had originally exhibited a high degree of congruence when he began his radio work in 1929—though radio homes would soon outstrip those with telephones. Second, telephones covered a wide area quickly. Third, recall meant that a great deal of information about listeners could be collected at little expense. Finally, sponsor identification was an important concern during the period. As Daniel Yankelovich noted in 1938, for many years advertisers held the belief that recall or registration was the most useful index of advertising effectiveness. Because most sponsors or agencies typically developed their own programs during this period or at least sponsored an entire program, advertisers sought to know the degree of registration between the programs and their product. Recall measured conscious impression. The chief drawback, of course, was that not all homes had telephones. By the late 1930s, twice as many homes had radios as owned telephones, meaning a large proportion of the radio audience was not reached by CAB researchers. Still, over the years Crossley's sample size grew four-fold from its starting point of about 100,000 households.

Enter Hooperatings

Crossley's service, under stiff competition after 1934 with the up-and-coming Hooperatings service, gradually lost ground. The foundation of Crossley's survey technique was originally quota sampling. This was a type of nonprobability sampling, meaning that the degree of sampling error could not be calculated (sampling error is the difference between the sample's results and the results that would be obtained if the whole population were surveyed). Quotas were set as to the number of respondents of varying demographics, such as geographical areas, age, gender, economic levels, and so forth that interviewers were to obtain. The goal in setting quotas was to ensure that the sample was distributed with respect to these characteristics in proportion to presumably known population totals. In

response to attacks from C.E. Hooper of Hooperatings, Crossley changed to random sampling, a type of probability sample in which sampling error could be calculated. A random sample ensured that each unit used in the sample had an equal chance or probability of being selected. He also shifted to the coincidental method, or having interviewers call while the program audience was still tuned to their radios. Hooper also questioned CAB's tabulation procedures, the phrasing of questions asked, and distribution methods.

As the authority of CAB was whittled away by the compiler of a more convincing set of statistics, backers of CAB became alarmed. By January 1946 Hooper had substantial subscribers, and industry backers saw CAB's switch from telephone recall to Hooper's method of telephone coincidental as rendering CAB superfluous. The final straw for CAB was the financial withdrawal of ABC, CBS, and NBC, which left MBS as the only radio network member. The four networks had provided 40 percent of CAB revenues. The three advertising association backers, ANA, AAAA, and NAB, were left holding the bag. An attempt was made to cover this large operating cost gap through increasing dues and assessment. However, CAB had gradually lost more and more ground to Hooper, and in June 1946 CAB suspended its 17-year-old service.

Run as a cooperative membership organization, CAB was operated by a board of governors consisting of advertisers, agencies, and broadcasters. This cooperative structure led to a crucial difficulty that impaired CAB. This structure had hindered its efficient operation, making it much less responsive to the marketplace than Hooper. The committee's divergent idea and politics led to a bureaucratic situation that Crossley called "too many chiefs." Its committee structure meant that decisions were long in the making; decisions were typically compromises and were tied to interest rather than economic

considerations; furthermore, results were not measured in terms of profits or loss in the marketplace. Hooper's private enterprise, on the other hand, was conscious of cost, was aware of the degree of acceptance from its clients, and was more responsive in general to the marketplace.

Both CAB's and Hooper's rating services were rating indices limited to a handful of urban cities. Neither provided national size estimates of the number of listeners to a given program, but rather were limited to comparative figures. Neither was designed to measure a true national program audience but was instead limited to urban telephone homes.

Copyright

Protecting Intellectual Property

Copyright is the legal principle that protects the intellectual property rights of the author of a work. Any original literary, audio, or video material can be copyrighted by the author. The author has the exclusive right to control the reproduction, distribution, performance, or adaptation of that work. In order for an author to claim copyright, the work must have been produced in a fixed medium (written on paper, tape-recorded,

or even typed onto a computer hard drive). Extemporaneous speeches or performances are not copyrighted.

There is a basic philosophy behind protecting copyright. Those who hope to make a profit from their creations are much more likely to be successful if others are prohibited from using the creations without paying for them. Copyright laws are created to encourage authors to write more with an assur-

ance that their material cannot be illegally reproduced or altered. The U.S. Constitution states that Congress has the authority to “promote the progress of science and useful arts, by securing for limited times to authors . . . the exclusive right to their respective writings.”

Most countries have some form of copyright law. In the United States, the 1976 Copyright Act is the law that provides much of the detail. There are a number of international copyright treaties and conventions, but there is not a single worldwide “copyright registration” that will protect an author’s work globally. The United States is a member of the Berne Convention and the Universal Copyright Convention, which recognize copyrights of residents of member nations. Some countries (most notably China) have been criticized for their unwillingness to enforce copyright claims in their country, allowing unlimited copying without compensating the author.

Copyright exists the moment an author creates a work in a tangible form, but without providing notice and registering the work, the author stands little chance of enforcing the copyright. Notice requires that the author provide the word *copyright* or the international symbol ©, the name of the copyright holder, and the date of the copyright. For audio recordings (whether CDs, cassettes, or vinyl), the © symbol is replaced with a ℗, for “phonorecord.” Without a notice, a copyright infringer may be able to claim an “innocent infringement.” The infringer may successfully claim to have been unaware that the work was copyrighted or may claim not to have known whom to approach to request copyright permission.

Registration with the Copyright Office is a relatively simple procedure. Although registration is not required to have copyright, trying to make a claim in court that copyright has been violated is impossible without registration. In order to register copyright, an author submits a form (available on-line), a \$30 registration fee, and two copies of the work. Although registration can be done months or years after a work is created, there are distinct legal advantages to registering the work within three months of its creation. Only those promptly registering copyright are entitled to recover attorney’s fees and statutory damages in a lawsuit.

Radio and Copyright

Radio stations use copyrighted material that they do not own every day. Almost all of the music they play was written by someone other than a station employee. Radio stations are required to pay royalties to the authors of the music they play. To simplify the process, performing rights organizations such as the American Society of Composers, Authors, and Publishers (ASCAP) and Broadcast Music Incorporated (BMI) were created to collect royalties from stations and to distribute the

royalties equitably among authors. Stations pay annual blanket licensing fees, which cover the cost of playing any songs from those libraries. The fees are based on the benefit each station derives from the copyrighted music. Highly profitable stations that play a lot of music in large markets are charged much more than are all-talk stations in small markets. Those fees are then equitably divided by the rights organizations based on their own determination of which authors’ works were most used.

Not everything a radio station does is covered by music licensing fees. The annual fees paid to performing rights organizations only cover *performances* of the music. Those organizations do not collect fees for other uses of copyrighted material, such as reproducing the work or creating some kind of adaptation. If a radio station uses music in producing a commercial, that is not a performance but is instead the creation of a new, derivative work. Using a piece of copyrighted music in this way without permission of the author is a copyright violation. In order to comply with copyright law, stations or advertisers that use copyrighted music in their commercials need to seek the permission of the copyright holder, usually the author. From that point, it is all a matter of contract negotiation. The author can allow the use for a limited time, charge any fee for the use, or prohibit the use altogether.

Just as a radio station has to pay copyright fees for the music it plays, others might be obligated to pay copyright fees for playing music, even if the music comes from a radio station that has already paid copyright fees. Because the premise of copyright is to reward authors when others benefit from their work, retail establishments, restaurants, and other venues must pay for the use of copyrighted music. If a restaurant plays music that enhances the atmosphere, thereby contributing to its profitability, the restaurant might be responsible for paying a fee for the use of the music. In 1998 the U.S. Congress amended the law to exempt smaller establishments. Retail establishments under 2,000 gross square feet and restaurants under 3,750 gross square feet are exempt from having to pay copyright fees. Larger establishments are expected to pay fees much as a radio station would.

Limitations on Copyright

Copyright does not last forever. Under earlier copyright laws, rights were protected for 28 years and could be renewed for an additional 28 years. In 1978 the law was modified to protect copyright for the life of the author plus 50 years. A more recent modification extended the protection. For works created since 1978, copyright lasts for the life of the author plus 70 years. Because the legislation had to account for changes in existing copyright, duration can be somewhat more complicated for pre-1978 works. Works created before 1978 are

generally protected for 95 years, with some rare exceptions (e.g., if a work was created in 1940 and not reregistered 28 years later). Because copyright endures beyond the life of the author, it can be willed just like any other piece of real property that the author owns. In fact, authors can sell or give away their copyrights before death, but the duration is still based on the author's life plus 70 years.

There are instances in which copyright is held not by an individual but rather by a corporation. It would be impossible to calculate the life of the author plus 70 years, because the corporation might go on indefinitely. For these *works for hire*, copyright lasts for 95 years from publication or 120 years from creation, whichever is greater.

There are times when copyright owners have no control over the works they've created. The doctrine of *fair use* allows for certain types of uses without permission or payment to the copyright holder. In determining whether a use is fair, four elements need to be considered: (1) the nature of the use, (2) the nature of the copyrighted work, (3) the amount and substantiality of the original that is used, and (4) the impact of the use on the potential market for the original.

Nature of the Use

Section 107 of the Copyright Act of 1976 states that the fair use of copyrighted works "for purposes such as criticism, comment, news reporting, teaching (including multiple copies for classroom use), scholarship, or research, is not an infringement of copyright." A 1994 U.S. Supreme Court decision determined that parody is also an acceptable purpose for a fair use. The nature of the use can be the sole factor distinguishing a fair use from a copyright infringement. For example, a radio station using a piece of music as the sound bed for a commercial would be infringing copyright. The same piece of music used by the same station as a sound bed for a news story would be a fair use, because news reporting is considered a fair use and so the use of the song as a news story element would be protected. Ironically, the same song used by the same station, if used as production music (e.g., as the theme song for the newscast) would be a copyright infringement. The nature of the use is an important consideration.

Nature of the Copyrighted Work

Authors who don't publish their works have a greater interest in keeping their works out of public sight. A poet or composer who creates work but prefers not to share it has greater protection from a claim of fair use than does a poet or composer who constantly tries to reach the largest possible audience. It would be difficult to claim a fair use of an unpublished work, even if the nature of the use were acceptable.

Amount and Substantiality Used

In order for use of copyrighted material to be considered fair, the amount of the original used should not be excessive. Unfortunately, no legally defined line separates the quantity considered fair from the amount that would not be considered fair. What we do know is that the judgment is made based both on qualitative and quantitative information. Although copying an entire work is not likely to be a fair use, use of just a small percentage of an original might be determined unfair if the use contains the essential part of the copyrighted work. The U.S. Supreme Court ruled that the *Nation* magazine infringed the copyright of Gerald Ford's memoirs when it published "only" a few hundred words from the original: the portion published was at the heart of what people most wanted to know (regarding Ford's dealings with Nixon) and was therefore significant.

Impact on the Potential Market

This is probably the most important consideration in determining whether a use is fair. Uses that harm authors by denying them profits are not likely to be considered fair. The issue is not whether the user profits, but rather whether the copyright owner's profit is reduced. Not-for-profit educational radio stations still must pay to use copyrighted music on the air, even though no one profits from airing the music. Musical parodies are protected in part because they do not harm the market for the original copyrighted work. The U.S. Supreme Court ruled that a 2 Live Crew parody of Roy Orbison's "Pretty Woman" was a fair use, stating in its reasoning that it could not imagine a potential purchaser trying to choose between the two versions.

An area of fair use where there is still some uncertainty is in home recording. A U.S. Supreme Court decision in 1984 held that video recording of television programs for noncommercial, in-home viewing was a fair use. That decision, however, essentially authorized "time shifting" of TV programs, that is, the taping of a program in order to watch it later. The Court never really addressed the issue of whether an individual would be allowed to amass a collection of videotaped programs as a fair use. The issue will undoubtedly be revisited as advancing digital technology makes high-quality reproductions easier to obtain. The recording industry already fears the possible explosion of MP3 digital audio recordings, many of which are made without compensation to the author. Their reproduction and distribution is made more rapid by the expansion of the internet and the increase of more advanced home computers. If in-home recording is a fair use, and individuals can access thousands of audio files, the recording industry could be severely affected.

Enforcement

In terms of enforcement, the government has no agency charged with seeking out copyright infringements. It is the responsibility of individual authors to protect their own copyrights, and for this reason many copyright infringements are never punished. In the case of music, performing rights organizations seek out copyright violators and take legal action through the courts, if necessary. Commercial studios, publishing houses, and other industries with a vested interest in protecting their copyrights are active in seeking out violators. Major violations are easily caught: ASCAP and BMI know which stations pay their fees and can monitor those that don't and charge them with a violation. Disney Studios is likely to find out if someone releases a film that is substantially similar to one of their own. But there are thousands of small venues where music is performed, hundreds of thousands of photocopiers, and millions of tape recorders. It is impossible for copyright owners to be able to enforce their rights in every possible arena. This does not mean, however, that the laws are any less real. Violations, no matter how small, can still be legally prosecuted. An appropriate analogy might be a traffic light in a small town at 3:00 A.M. If the light is red, it is still illegal to go. Anyone who does go through the red light is not likely to be caught. Nonetheless, the law still exists. The same

is true of copyright. A number of copyright violations are unlikely to be discovered, but they are still violations and can be punished if discovered.

Corporation for Public Broadcasting

The Corporation for Public Broadcasting (CPB) was created by the passage of the Public Broadcasting Act of 1967. Conceived as a nonpartisan entity established to promote and protect public radio and television, the Corporation has been embroiled in controversies and conflicts with the very public broadcasting organizations it brought into existence. Despite the best intentions of Congress, the CPB has not been able to sustain a nonpartisan posture through most of its existence.

Origins

When Lyndon B. Johnson signed the Public Broadcasting Act into law on 7 November 1967, the Corporation for Public Broadcasting was created. This landmark legislation became Section 396 of the Communication Act of 1934. In his public remarks at the signing ceremony, President Johnson stated that the Corporation "will get part of its support from our Government. But it will be carefully guarded from Government or

from party control. It will be free, and it will be independent—and it will belong to all our people."

Contained in the Corporation's charter is a Congressional declaration of policy that provides, in part, that it is in the public interest to encourage the growth and development of educational radio and television broadcasting; that freedom, imagination, and initiative at both the local and national levels are necessary for high-quality, diverse programming for public broadcasting; that federal support for public broadcasting is appropriate; and that a private corporation should facilitate system development and afford maximum protection from extraneous interference and control. The Corporation's board of directors consists of 15 members appointed by the U.S. President, with the advice and consent of the Senate. No more than eight members may be of the same political party, and all members must be United States citizens. Board members are appointed for a six-year term of office. All officers of the Corporation serve at the pleasure of the board of directors. Each

year the CPB must submit an annual report to the President for transmittal to Congress that contains a detailed statement regarding its operations, activities, accomplishments, and financial condition.

CPB and Public Radio

The Corporation for Public Broadcasting was incorporated in 1968 and began the task of staff appointments in 1969. Although the Office of Radio Activities was organized in June 1969 with Albert Hulsen as its first director, the top priority for CPB was television and the formation of a TV interconnection system, the Public Broadcasting Service (PBS). Hulsen, and his successor Thomas Warnock, used this early period to gather information about the performance of public radio in the United States and to begin planning for what would become radio's interconnection system, National Public Radio (NPR), launched in 1971.

CPB and PBS began feuding soon after PBS was created. Lyndon Johnson had since left the White House and President Richard M. Nixon did not like much of what he saw on public television. The Nixon White House started applying pressure on CPB, and the board in turn started applying pressure on PBS. The resulting conflicts between CPB and PBS nearly destroyed the very public broadcasting system that the Corporation had been created to protect. Eventually a reorganization at PBS and a partnership agreement between CPB and PBS stabilized the system and left television much stronger than its radio counterpart. Public radio would need to engage in major reorganization itself if it hoped to get its share of the funding pie during joint negotiations between CPB, PBS, and NPR. That reorganization came as NPR merged with the Association of Public Radio Stations (APRS) to form a new NPR in May of 1977. This created a new political equation in public broadcasting. No longer could CPB and PBS make unilateral decisions about public broadcasting—whether funding allocations or system development—without considering public radio.

The overall prominence of the Corporation for Public Broadcasting that was witnessed during the first decade following the passage of the Public Broadcasting Act had clearly declined by the beginning of the 21st century. Revisions in Congressional appropriation procedures had substituted funding formulas for board room negotiations. Repeated calls for CPB to be a pass-through agent for the distribution of public monies rather than a policy-making organization for public broadcasting had stripped the Corporation of much of its public stature, and with its loss of image came a drain in talent. Partisan politics had inadvertently been built into the fabric of CPB regardless of the safeguards that had been written into the articles of incorporation. When the Republicans rule, the

board is more likely to find liberal political bias in the system's public affairs programming. When the Democrats are in charge, the system's critics decry insufficient minority programming and barriers to access by independent producers.

CPB was created to help put into practice the visions of public service broadcasting that existed only in the form of idealistic rhetoric. Congress was willing to craft lofty language that gave the Corporation its mandate, but lawmakers were never willing to grant the system the kind of fiscal independence that the original system framers envisioned for the fulfillment of the dream for an alternative system of public radio and television stations that were above partisan politics and commercial marketplace imperatives. Given the political, social, and economic environment in which CPB has been forced to function, it is not surprising that its performance record as a catalyst for the development and preservation of public broadcasting has been no more impressive. Indeed, when all of the political and economic handicaps placed on CPB are factored into the performance equation, one might wonder how the Corporation has been able to sustain the level of effectiveness that it has achieved. Whether the Corporation for Public Broadcasting will be able to fulfill its true potential as a positive agent on behalf of public radio and television in the 21st century will largely depend on whether Congress will at long last create the insulated funding mechanism that was envisioned as vital to the Corporation's functioning some 35 years ago.

Corwin, Norman 1910–

U.S. Radio Playwright and Producer

Norman Corwin is widely considered radio's most revered and celebrated dramatist and poet. His career began during the medium's late infancy at the Columbia Broadcasting System (CBS) and extended into the 21st century with critically acclaimed work for public radio. Corwin wrote, directed, and produced more than 200 original radio plays that featured many of the most prominent actors of the day.

For his extraordinary output and talents, spirit and sensibilities, Corwin has been honored and admired by heads-of-state as well as by the literary and broadcast communities worldwide. Among his most noted radio works are *We Hold These Truths*, *On A Note of Triumph*, *14 August*, *The Undecided Molecule*, *The Plot to Overthrow Christmas*, and *The Odyssey of Runyon Jones*. Along with countless awards, Corwin has the distinction of being the first writer inducted into the Radio Hall of Fame. In his landmark history of American broadcasting published several decades ago, Erik Barnouw proclaimed Corwin the "unofficial" poet laureate of radio. Today this designation has rightfully attained "official" status.

Words in the Air

Corwin was born to emigrant parents in Boston in 1910. Unlike his siblings, who pursued college studies after graduating from high school, Corwin chose to go to work. Enamored of the power and beauty of words since early childhood, he first sought and gained employment as a writer and reporter for newspapers. He landed his first job in 1927 at *The Recorder* in Greenfield, Massachusetts, and not long after he was able to transfer his growing skills to the pages of Springfield's *The Daily Republican*.

While at *The Daily Republican*, Corwin edited the news and produced a popular poetry feature for a local radio station, but he had not seriously considered a career in radio. Following a dispute with the station's management concerning its unwillingness to cover strike-related stories, Corwin headed for New York. After a brief stint as a film publicist for 20th Century Fox, he convinced experimental station W2XR (later WQXR) to let him offer a show called "Poetic License." Not long after the show's debut, Corwin was doing clever and witty recitations on NBC, and in 1937 these would capture the attention of CBS's William Lewis, who would hire him to direct the network's just formed *Columbia Workshop*.

Between 1938 and 1949, Corwin wrote, directed, and produced dozens of highly acclaimed radio plays as the CBS network provided him uncommon freedom to innovate during sustained (unsponsored) segments of its broadcast schedule.

Later Corwin would attribute his great success to CBS's willingness to allow him to work without interference and strictures. Through evocative and imaginative scripts and technological mastery of the medium wherein the use of sound effects and music were redefined, Corwin took the radio drama in new and extraordinary directions. In his hands it became a legitimate and respected art form. Not only were his works rich in meaning and scale, but his output was amazing as well. In order to meet airtime demands, he often turned out a new play every week for months on end. His great energy and creativity brought added prestige to CBS.

Among Corwin's early network successes were *The Plot to Overthrow Christmas* (1938), which became a holiday standard in both broadcast and published form, and his dramatic disquisition against fascism, *They Fly Through the Air with the Greatest of Ease* (1939). Corwin's vast range became immediately apparent, and he soon was the driving force behind the medium's most auspicious series of programs offered under the rubric *The Columbia Workshop*. This distinguished effort provided a venue for the works of prominent literary figures of the day, such as Archibald MacLeish and Stephen Vincent Benet, as well as for Corwin himself. Many critics view CBS's *Workshop* as radio's high water mark.

Themes and Works

Corwin wrote programs that challenged the listener's emotions and intellect. His were dramas that dealt with the principle issues and concerns of the common man. Hatred, prejudice, deceit, and injustice were familiar themes in his plays. Given the era in which he worked, war became his foremost subject. For some critics, Corwin proved to be too much of a flag waver. The propagandistic and nationalistic nature and quality of many of his war-related scripts may have concerned some people but it won the praise and admiration of many more. Corwin was unabashedly patriotic, this stemming from his deep-seated passion for fairness and justice for all people. His dramas served to bookend the World War II era. Shortly after the bombing of Pearl Harbor and President Roosevelt's declaration of war, his play *We Hold These Truths*—celebrating the 150th anniversary of the Bill of Rights—was broadcast to the nation and commanded the largest audience for a play in the medium's history.

During this dark period in world affairs, Corwin contributed extensively to series like *This Is War* in 1942 and a host of other network programs that zealously promoted the Allied cause. To mark the war's end, Corwin penned and presented

Norman Corwin (center) directing
Courtesy of Norman Corwin

what many consider his masterwork, *On a Note of Triumph* in 1945. So poignant was its affect and impact that many who heard its broadcast were able to recite lines and even whole passages from it decades later. His war dramas had a galvanizing effect on the American public during a time when it was most needed.

Global conflict was not the only recurring or prominent theme in his protean repertoire during this period. Corwin excelled as much when writing about other aspects of the human condition. The more mundane experiences and actions of mankind intrigued him as did the curious machinations of the biological, mythical, and spiritual worlds.

His plays, although nearly always intended to convey a serious or thought-provoking message, were not unrelentingly

somber in nature. Corwin possessed a wonderful comedic sense and loved to offer up delicious satires, fantasies, and parodies on politics, business, and human behavior. On the lighter side of Corwin's canon are *My Client Curley*, *A Soliloquy to Balance the Budget*, *Good Heavens*, *The Plot to Overthrow Christmas*, *The Cliche Expert*, and *The Undecided Molecule*. His keen humor and playful imagination are evident in dozens of other radio plays as well. Corwin also applied his pen to the making of operas, documentaries, and essays for consumption by network audiences. Versatility became one of his legendary hallmarks.

Perhaps the only person to have entered big time national radio through the portal of poetry, Corwin enjoyed writing in verse more than prose, and because of this most of his plays

assume a distinct poetic life of their own. Among those who most greatly influenced him as a writer were poets like Walt Whitman and Carl Sandburg. The latter greatly admired Corwin's work and considered him one of the country's best practitioners of the rhyme form.

As the bard of radio's golden age, Corwin helped to lift the medium from its adolescence to its adulthood. His high ideals and moral vision demanded that radio become more socially and culturally astute. His symphonic (music was an integral ingredient of his plays) and altruistic inscriptions raised the stakes for practiced and aspiring radio dramatists alike and provoked and schooled its audience. The poet Carl Van Doren wrote that "Corwin was to radio what Marlowe was to the Elizabethan stage." Indeed, Corwin's work held its listeners in thrall as it conveyed the enduring truths—albeit both sad and delightful—about the human condition in unforgettable words and sounds.

Global Reach

Corwin's acclaim as a radio dramatist spread to the international arena and ultimately made him the most produced radio writer worldwide. Presaging this distinction, he set out on a global expedition to record the perspectives of people in many nations for use in a CBS documentary. Subsidized by the bestowal of the first ever Wendell Wilkie Memorial Award in 1946, this became a 13 part series called *One World Flight*, wherein many of the most compelling personalities of the time were interviewed on a host of propitious questions about the status of mankind. During Corwin's four month fact-finding journey he met and recorded the thoughts of people from all walks of life—heads-of-state, generals, waiters, actors, farmers, writers, composers, artists, orphans, and scientists. Corwin narrated the series, which particularly focused on the war's tragic aftermath and hopes for the future.

In one program he interviewed a widowed Italian woman and observed: "This voice and the echo of guns only lately stilled, and the silence of the cemeteries . . . the begging of alms, and the whimper of hungry children; this voice, and the mute rubble of wasted towns and cities—these were the sounds of need: need for the hope and for the reality of a united world."

Corwin has been cited as the first radioman to circle the globe as a journalist, and his passion for world justice and peace have informed his creative efforts throughout the last half of his exceptional career. Since the fade of radio's much heralded golden age following the arrival of television in the late 1940s, he has contributed to the efforts of the Voice of America, U.S. State Department, and several other world organizations by speaking on behalf of the poor and disenfranchised. In the early 1950s Corwin served as Chief of Special

Projects for United Nations Radio. Over the decades many of his radio plays have been rebroadcast to underprivileged areas of the world, and he has been invited to conduct seminars on the medium in Europe, Africa, and Asia.

Golden Age to Graylist

In the 1950s, Corwin's star faded as television took over the American living room. The market for radio drama all but vanished as the networks pursued television's more lucrative bottom line. Within a few short years, Corwin's name was no longer a household word. Forced to seek work elsewhere, he wrote scripts for television and movies, where recognition for his writing gifts was soon forthcoming. In 1956, Corwin penned the screenplay *Lust for Life* and received an Academy Award nomination. In the years to follow, despite his appearance on the McCarthy era graylist of those suspected of associating with communists, he would be honored with several prominent awards and citations.

Corwin continued to earn the public's affection and attention with five stage plays and over a dozen books. Yet despite his foray into other writing venues, radio would still command his greatest attention. There would be a steady but modest flow of writing assignments for the medium even as it became dominated by pop music and deejays.

In the late 1990s, public radio would prompt a rediscovery of Corwin's ethereal artistry by digitally remastering and airing *13 by Corwin* and commissioning him to undertake a series of original works, culminating in his rousing salvo for New Years Eve 2000, *Memos to a New Millennium*, narrated by Walter Cronkite. At 90 years of age, the medium's grand "radio-wright" (a term coined by Corwin) was still an undisputed master of the airwaves.

Coughlin, Father Charles 1891–1979**U.S. Roman Catholic Priest and Radio Commentator**

In the 1930s, Father Charles E. Coughlin, the “Radio Priest” from Royal Oak, Michigan, used radio broadcasts to assemble what was then the largest congregation in the history of Christianity. He also became the first Roman Catholic priest to make a serious impact on the U.S. political scene.

Early Years

Born of a Canadian mother and an Irish-American father in Ontario in 1891, Coughlin was ordained a Roman Catholic priest in 1916 as a member of the Basilian order. He assisted in several Michigan parishes, becoming a diocesan priest in Detroit in 1923. Already enjoying a reputation as a pulpit orator, his masses at the churches to which he was temporarily assigned regularly attracted overflow crowds.

In 1926 Coughlin became pastor of the just-dedicated Shrine of the Little Flower parish in Royal Oak, four miles up Woodward Avenue from Detroit's northern city limits. Although the parish had only 25 families at its inception, the enterprising young priest built a church to hold 600 people. The building process was anything but trouble-free. Raising funds for the new parish proved difficult, and the Ku Klux Klan, fearful of an increasing Roman Catholic populace in the area, burned a cross on the church lawn. Fortunately, Coughlin was introduced to Leo Fitzpatrick, station manager of powerful WJR radio, who was taken by the young pastor's plight. Fitzpatrick suggested that Coughlin employ his oratorical skills over WJR in order to create a more sympathetic climate for the Shrine parish and to appeal for financial support.

Persuasion by Radio

Originally entitled the *Golden Hour of the Little Flower*, Coughlin's first broadcast was relayed from the Shrine on 3 October 1926. Initially the program was intended for children but gradually shifted to adult topics on general economic and political perils facing the country. For Coughlin soon discovered that such subjects struck a responsive chord with listeners, resulting in correspondence that often contained financial contributions. He organized the Radio League of the Little Flower (annual membership fee: \$1) to stimulate donations that allowed him to purchase more radio exposure. In 1929 he bought time on Cincinnati's powerful clear-channel station WLW and began negotiations to add WMAQ (Chicago) as his enterprise's third station. Because WMAQ was a CBS-owned outlet, the matter was referred to network headquarters in New York. As a result, Coughlin was sold time on the CBS network. National visibility was at hand.

The cost of airtime soon was dwarfed by the rising tide of contributions that his widely distributed program elicited. As the Great Depression set in, Coughlin's offensive against the twin evils of communism and international banking resonated

with many and further increased the popularity of his broadcasts. But when his attacks became more specific and mentioned President Herbert Hoover by name, CBS became nervous. Edward Klauber, the network's executive vice president, requested that the priest submit scripts for advance clearance. Coughlin's response came in his 4 January 1931 broadcast when he asked his listeners whether or not CBS should be allowed to censor him. CBS was inundated with 1,250,000 letters of protest, and Coughlin's messages were never prescreened.

CBS still eased him off its network the following April and NBC was not interested in being Coughlin's replacement chain. So WJR's Fitzpatrick contacted Alfred McCosker, his counterpart at WOR, New York. Together they set up a telephone-linked group of 11 stations that expanded to 26 outlets from Maine to Colorado by the autumn of 1932. Weekly cost for the landlines and airtime was \$14,000.

Coughlin's program now openly laid blame for the Depression on President Hoover. Over a million letters of support poured in; Royal Oak's first post office was established to cope with his correspondence, and Father Coughlin became the subject of feature articles in radio fan magazines and newspapers across the country. His religious superior, Bishop Michael Gallagher, was a firm supporter of Coughlin's social justice agenda, so grumblings from prominent East Coast cardinals were of no concern. Thousands of visitors, Catholic and non-Catholic alike, made pilgrimages to the Shrine church, now graced by an imposing 150-foot stone tower upon which was carved a crucifix illuminated by floodlights. Coughlin's radio speeches, composed in a small study at the top of the tower, increased in both vehemence and popularity. A poll conducted by WOR named him the nation's most useful citizen of 1933, and when WCAU asked its Philadelphia listeners whether they wanted Father Coughlin or the New York Philharmonic on Sunday afternoon, there were 187,000 votes for the cleric and only 12,000 for the orchestra.

Controversy

Coughlin cheered the election of Franklin D. Roosevelt and remained a staunch New Deal supporter throughout 1933, FDR's first year in office. The priest's resonant brogue and passionate oratory advocated the nationalization of gold and revaluation of the dollar, policies that were originally favored by the Roosevelt administration as well. But Roosevelt never warmed to the "Radio Priest" and never extended to him the counselor status that Coughlin thought he deserved. So on 11 November 1934, Coughlin announced the formation of a National Union for Social Justice to lobby independently for his social and economic proposals. The break with Roosevelt became complete when the administration proposed joining the World Court, an entity Coughlin considered a tool of

international bankers. His 27 January 1935 broadcast was a blistering attack on the proposal, resulting in 200,000 protest letters to Congress, a key factor in the government's abandonment of the plan.

Coughlin's social justice movement now converged with the Share-Our-Wealth platform of Louisiana's bombastic Senator Huey Long. But in September 1935, Long was assassinated. The news reached President Roosevelt during a meeting with Coughlin and Joseph P. Kennedy (father of the future president), a conference Kennedy had arranged in an unsuccessful attempt to reconcile the priest and the president. The next year, Coughlin's National Union for Social Justice joined with Long's Share-Our-Wealth backers to create the Union Party and to endorse the presidential bid of North Dakota Congressman William Lemke. The priest also founded his own newspaper, *Social Justice Weekly*, which soon achieved a circulation of 1 million copies. Such success emboldened Coughlin to promise that he would leave radio if he could not deliver 9 million votes to Lemke. When Lemke garnered less than 1 million ballots, Coughlin honored his pledge and took leave of his broadcast audience on 7 November 1936.

Three months later, however, he was back on the air, rationalizing that this turnabout occurred because it was the dying wish of his supportive superior, Bishop Gallagher. For the next two years, Coughlin continued his broadcast attacks on Roosevelt's New Deal and its failure to adopt the monetary reforms that the priest advocated. Beginning in mid-1938, with European war clouds gathering, Coughlin began to focus more on international affairs. In his November 20th radio program, he excused German Nazism as a necessary defense mechanism against communism and supported the Nazi theory that Jewish bankers were behind the Russian Revolution. Over the next year his broadcasts took a more and more anti-Semitic tone.

In October 1939, fearing government retaliation for the strident broadcast oratory of Coughlin and other radical political voices, the National Association of Broadcasters' Code Committee placed strict limitations on the sale of radio time to "spokesmen of controversial public issues." As the priest's airtime was all purchased at commercial rates, this new self-policing edict gradually eroded his network as his contracts with stations expired. He canceled his 1940-41 season (the program had always taken a summer hiatus anyway) and never returned to the airwaves. On 1 May 1942, Coughlin's banishment from the public stage was complete when his new superior, Archbishop Francis Mooney, ordered him to cease all writings and nonreligious activities for the duration of the war. Acting upon a request relayed by Roosevelt emissary Leo Crowley and expressions of concern from the Vatican, Mooney threatened to revoke Father Coughlin's priestly authority if he did not comply.

Always the obedient priest, Coughlin immediately abandoned publication of *Social Justice*, allowed the government to

revoke its second-class mailing privilege, and retreated to the role of Shrine pastor. He served in that capacity until his retirement in 1966.

At the height of his prominence, Father Coughlin had a listenership of more than 30 million, received 400,000 letters per week, and was featured twice on the cover of *Newsweek*. In stark contrast, from 1966 until his death a decade later the "Radio Priest" lived unobtrusively, first in a small apartment behind his beloved Shrine of the Little Flower and then in a home he purchased in nearby Birmingham.

Country Music Format

At the beginning of the 20th century, “country music” was a version of folk music. With field recordings of the late 1920s, it became categorized as “hillbilly” music, and then after World War II, entrepreneurs renamed it “country and western,” a designation used throughout the 1950s and into the 1960s. With the rise of Nashville as the recording center, however, the “western” was dropped, and by the time it became an important radio format, the name “country” was widely accepted. Whatever the name, until the 1960s country music tended to be songs of poor white folk that were passed down generation to generation as the South and then the West were settled.

Early Country Radio

In 1927 Ralph Peer of Radio Corporation of America (RCA) Victor record company began to record country music performers, most notably Jimmie Rogers and the Carter family, and a commercial industry was born. The western side of country music was popularized in cowboy films of the 1930s and 1940s by such stars as Roy Rogers and Gene Autry. On the radio, western stars had regular programs: there were country music performances on live barn dances such as the *National Barn Dance* from Chicago; *Town and Country Time* from Washington, D.C.; and the *Grand Ole Opry* from Nashville.

During World War II, soldiers from the South and West took their music all around the world. In the postwar era, Hank Williams made country songs popular, and he was followed by Jim Reeves and Patsy Cline. As Top 40 took over radio airplay, country music—in the 1960s—emerged as an alternative genre centered in Nashville, with stars such as Johnny Cash, Jimmy Dean, Loretta Lynn, and Dolly Parton.

On radio, country music had long been confined to network programs (such as the *National Barn Dance* from Chicago and the *Grand Ole Opry* from Nashville), small-town stations, and the border radio stations in Mexico. With the decline of network programming and the rise of radio formats, non-network-affiliated stations were playing a substantial amount of country music as early as the late 1940s. Top 40 led the way in terms of playing a selected playlist from one genre of music. Country—from Nashville—did the same as it evolved during the 1960s.

The country music business realized the threat of rock and roll, and in the late 1950s the business reorganized what had been the annual country disc jockeys’ convention into the Country Music Association to promote more country music on radio. Although the identity of the first country-formatted station will forever be debated, stations converted from the programming techniques of the network era to those of the format era. Stations such as WARL-AM (Arlington, Virginia); KXLA-

AM (Pasadena, California); and KDAV-TV (Lubbock, Texas) played live and recorded country music almost all day by 1950.

A generation later, more than 300 radio stations broadcast recorded country music on a full-time basis, and over 2,000 more programmed country for part of the day. The Country Music Association deserves much of the credit for promoting country as an alternative format, but it was certainly helped by the fracturing of rock music during the 1960s and the alienation of its older audience. During the 1950s and 1960s, country format radio moved from its small-town base in the South (as well as in cities such as Los Angeles, where thousands of southerners had moved during the Great Depression) to cities all across the United States.

Country as a Format

By the mid-1960s, advertisers no longer thought of country radio stations as only being listened to by country folk. During the 1950s, it looked as though country would not survive the popularity of rock and Top 40 formatting, but the introduction of the “Nashville Sound”—typified by the now-classic recordings of Patsy Cline—proved that crossover hit making was possible. By the mid-1970s, country had its place in radio, with more than 1,000 stations playing country format. Country had become suburban—it had given a voice to adult problems, such as infidelity, boss hating, and the like, whereas pop music seemed stuck in teenaged concerns. Country radio listeners were therefore older and were nearly always white.

By the 1990s, one survey determined that country stations were number one in 57 of the top 100 radio markets in the United States. Many surveys found country the most popular format on radio, with such megastars as Garth Brooks, Reba McEntire, Alan Jackson, and Shania Twain. The country music format had surely reached a high point as the most popular radio music in the country.

Even in the mid-1990s, however, some argued that radio was becoming too formulaic. Country radio aimed programming at adults aged 18 to 34 who listened on their way to and from work, were made up of more women than men, and lived in the suburbs rather than the cities. Artists who did not appeal to these listeners, including Dolly Parton and Willie Nelson, were simply ignored. Pressed by advertisers seeking younger buyers, country radio ironically abandoned listeners over 49, the very fans who had helped build it into the nation’s most popular format.

During the 1990s, grown-up baby boomers embraced country, and so advertisers willingly anted up millions of dollars in advertising spending to reach them. Using Donnelley’s Cluster

The Grand Ole Opry celebrates its first new stage set in 22 years, 10 June 2000
 Courtesy AP/Wide World Photos

Plus system, in 1990 the Arbitron ratings service found that 40 percent of all country fans fit into the system's most affluent groupings, compared with fewer than one-quarter of all Americans aged 12 and older.

The boom in country radio (and television) is well reflected in the career of Garth Brooks, a star who did not sell his first compact disc until 1989 and who by the close of the century was the best-selling popular music artist in history. American music has never seen a phenomenon like Brooks, who in 1996 at age 34 had reached number two—in just seven years. In the process, he eclipsed Elvis Presley, Michael Jackson, and the Beatles. During the early 1990s he sold an average of 8 million “units” per year. Radio stations featured Brooks’ latest releases and captured millions of new listeners.

New ways of determining hits helped as well. In 1992 Brooks became the year's top-selling artist based on *Ropin' in the Wind*, released late in 1991, because computers were used to determine what was sold in stores rather than relying on telephone surveys. Brooks became, because of SoundScan computer counting, the first country artist to top *Billboard's*

charts. *Ropin' in the Wind* became the first country album ever to top *Billboard's* year-end pop album chart. Country radio programmers used SoundScan data (a music sales reporting service for subscribers that integrates weekly retail store reports on how many CDs have been sold, providing results for individual markets, regions, or the nation) to determine their playlists.

The 25 May 1991 *Billboard* chart was the first done on SoundScan, and suddenly 15 more country albums showed up in the Top 200 than had been there a week before. In 1984 the country category showed only 8 gold (500,000 sales), 4 platinum (1,000,000-plus sales), and 7 multiplatinum albums. By 1991 the numbers were 24 gold, 21 platinum, and 8 multiplatinum.

At the beginning of the 21st century, the future of the country music format looked bright. The number of young people listening to country music had increased almost 70 percent during the 1990s, and although its popularity was leveling off as the decade ended, no one predicted that country's core popularity would decline anytime soon. According to the *Simmons*

Study of Media and Markets, country music was the choice of one-fifth of the 18-to-24 population, with growth among those aged 25 to 34, 35 to 44, and 45 to 54, most of these being just the listeners most desired by radio advertisers.

Cowan, Louis 1909–1976

U.S. Radio Producer and Executive

Louis Cowan is associated mainly with the creation of various quiz shows, both for radio and later for television. However, Cowan himself was most interested in creating shows with an intellectual slant for popular audiences. Along those lines, Cowan was influential during World War II in helping to promote positive portrayals of African-Americans and military personnel on radio programs.

Louis Cowan was born Louis Cohen in Chicago in 1909. While a student at the University of Chicago, Cowan was influenced by the noted communications researcher Harold Lasswell and gained an interest in how communication could shape opinion. After graduating in 1931, he changed his name to Cowan and began his own public relations firm. One account he gained was publicity for the radio program *Kay Kyser's College of Musical Knowledge*. Cowan later formed his own independent production company, Louis G. Cowan Productions, and in 1940 he created his first radio hit, *The Quiz Kids*, which ran on the National Broadcasting Company (NBC) Blue network. Cowan's concept for this program was to feature a panel of bright children, none older than 16, fielding questions sent in by listeners. The program was an early exam-

ple of Cowan's attempt to blend his intellectual interests into a program aimed to appeal to a mass audience.

During World War II, Cowan moved to New York and volunteered his services to the Office of War Information (OWI). Cowan became a consultant and director of domestic affairs, working under Edward Kirby, who had transferred to the public relations division of the OWI from the National Association of Broadcasters. One assignment Kirby gave to Cowan was to encourage radio producers to develop positive portrayals of African-Americans; it was hoped that this would help decrease agitation and tension at a time when all branches of the U.S. armed forces were segregated. Cowan decided that the greatest prejudice and resistance to African-Americans was often found among lower-middle-class Americans, and he knew that these people could be reached effectively through daytime soap operas. Cowan therefore convinced Frank and Anne Hummert, the creators of many serials, to incorporate some African-American characters in their soap opera story lines—a very unusual occurrence at that point in radio history. In one case, the Hummerts introduced into *Our Gal Sunday* a young African-American in military training, Franklin Brown, who

appeared intermittently during furloughs. In an even more elaborate effort, the Hummerts had the heroine in *The Romance of Helen Trent* rescued by an African-American doctor after she fell into an abyss; afterwards, she found a job for this doctor as a staff physician in a wartime factory.

While working at the OWI, Cowan also sought to promote the general image of all military personnel. He convinced the Hummerts to create a new serial around a comforting and problem-solving army chaplain. This concept became *Chaplain Jim*, which started on the NBC Blue network in 1942. Cowan had one other interesting assignment relating to this serial. He was given the task of briefing the newly appointed psychological warfare officer, Columbia Broadcasting System (CBS) president William Paley, on the purpose of this program. This would not be the only time the two men's paths crossed.

After the war, Cowan went back to independent production of radio programs. Acting on his interest in intellectual and issue-oriented programming, Cowan in 1946 created *The Fighting Senator*, a show that featured a principled state senator battling corruption around him. Around the same time, Cowan's wife, Polly, was producing a talk show called *Conversation*, which brought together writers, college professors, and other celebrities to discuss various topics. Though winning accolades, neither program attracted large audiences. Cowan did have one more radio hit, again with the quiz show format. *Stop the Music!* premiered on the American Broadcasting Companies (ABC) network in 1948 and quickly attracted a large following. The premise of the show was simple: an orchestra played popular songs and was periodically interrupted by the program's host, Bert Parks, who shouted, "Stop The Music!" A phone call was then made randomly somewhere in the United States, and if the person who answered could identify the song that had just been interrupted, he or she would receive a number of expensive gifts. *Stop The Music!* was initially scheduled to air opposite Fred Allen's popular comedy show. Allen's program ratings fell so drastically as a result that his show was cancelled in 1950.

During the 1950s, Cowan turned his attention to television and created what became the first large-prize TV quiz show, *The \$64,000 Question*. This program was purchased by CBS in 1955. A few weeks after it premiered, Cowan sold his production company and accepted a job at CBS as vice president in charge of creative services. Two years later, in March 1958, he was promoted to president of CBS-TV. When it was discovered at the end of the decade that many of the big TV quiz shows, including *The \$64,000 Question*, had been rigged, Cowan was dismissed by CBS. This was done despite the fact that Cowan had no association with *The \$64,000 Question* after he sold his production company, and there was no evidence that Cowan ever knew about the rigging.

In his latter years, Cowan taught at Brandeis University and in Columbia University's Graduate School of Journalism. He also started his own publishing company and was cofounder of the American Jewish Committee's William E. Weiner Oral History Library. In 1976 Cowan and his wife died in an accidental fire in their apartment. Ironically, it was suspected that the fire was caused by faulty wiring in their television set.

Critics

Like critics of theater, music, and art, radio critics have reviewed as well as helped audiences to interpret a host of radio programs. Radio, however, presented unique challenges to the critic. Since radio was a new and strictly aural and fleeting medium, professional critics struggled to find an appropri-

ate way to critique the material presented. When radio first emerged as a mass communication tool, it and its content were dismissed as popular—even vulgar—"art." Intelligent writing about it was not taken as seriously as writing about theater, books, or film, thus making it difficult for radio critics to gain

credibility. There also did not seem to be a purpose to reviewing programs that were played only once. Such difficulties, among others, left a scarcity of radio criticism in the early years of the medium, and what criticism did exist failed to assume much importance. With the advent of television, radio became further buried in the press. However, the emergence of television criticism furthered the cause of radio criticism. Many critics were, as they are today, labeled by their publishers as radio/television critics.

Challenge of Criticism

Radio columnists did not face the same hurdles as critics because columnists served to inform readers about coming attractions and gossip, with perhaps some superficial appraisal. The critic—who, like the columnist, also amused and informed—did so in a broader, deeper context of constant evaluation. The critic judged the significance of a broadcasting event, considered its impact, or related it to past events in broadcasting or other areas. Critics added artistic, philosophical, and sociological dimensions to program reviews and commented on the industry and government or public actions.

Unlike theater, film, and music, which offered discrete presentation formats, radio was on the air continuously, and the quantity and variety of programs were a burden to critics, who often were called upon to treat programs ranging from education and politics to commerce and entertainment. A wide variety of assignments were therefore available, and those critics who had come from the world of newspaper reporting (as many of them did) often had an edge over other critics, as they were equipped with the reportorial skills of speed and judgment.

The difficulties of critiquing something heard and not seen played out most noticeably in drama criticism. Radio drama was given an ungenerous report overall by some because it lacked a visual element and therefore could not, many contended, hold the audience's attention. Many early critics insisted that all elements of a play be identifiable; a production was praised if it was clear who was speaking or if a synopsis of the story was given before the start of the action. Critics often treated radio dramas as adaptations instead of creating new ways to critique.

It was a common habit of newspaper critics to mention and discuss actors and their performances but not the programs themselves, as most program titles would require plugging the product or sponsor and therefore result in free advertising, which would compromise the critic's integrity. In addition, the lack of credence given to radio criticism meant that radio sponsors became protected and pampered, and they rarely heard criticism. In general, radio criticism was thought of as outside the industry's needs because station leaders and sponsors made a point of claiming to be businessmen, not show-

men; therefore, in the name of advertising, they were immune from theatrical standards.

Rise of Criticism

Many critics, most notably multimedia critic Gilbert Seldes, believed that the duty of broadcast critics was to propose change, but change that was workable within the advertising-supported commercial radio system. In this line of thinking, critics must understand and explain (perhaps today more than ever) the environmental constraints within which any electronic media organization must operate.

Several critics in the early days of radio issued calls for a responsible corps of radio critics, and many intellectuals acknowledged the importance of broadcast criticism in the name of preserving democracy.

Much early criticism was of a technical nature, wherein critics discussed such issues as transmission quality. Perce Col-lison, writing in the early 1920s, for example, critiqued sound quality as opposed to content. When critics wrote about broadcast news, which was a growing aspect of programming by the 1930s, they tended to comment on such aspects as sound effects and newscasters' voices.

Ralph Lewis Smith (1959), in his analysis of the U.S. broadcast system, lamented critics' coverage and opinions of the electronic functioning of a program, as if they were "scientific journalist[s]." This type of criticism only furthered the notion that broadcasting was not to be considered an art. The nuts and bolts discussion of radio subsided when people could buy ready-built radios as opposed to hobbyist-assembled kits. As radio's commercial potential became more obvious, "circuit talk" was replaced with gossip about radio stars. As an interest in radio personalities increased interest in radio overall, critical articles and commentary on individual shows and series as well as various personalities began to emerge.

Because there were no standards or precedents, broadcast critics experimented with column formats. In 1926 John Wallace presented his criticism in *Radio Broadcast* in the form of one long essay, two or three short reviews, and a few bright tidbits. In October 1942 in *Woman's Day*, Raymond Knight set up his material in newspaper form and called it "The Radioville Chronicle," which contained program reviews, a local gossip column, a classified section, and a notice of new shows.

Major Critics

During the 1920s and 1930s, most writing about programs was descriptive rather than critical, although there were exceptions. Volney Hurd and Leslie Allen, for instance, were among the earliest who produced insightful criticism in their 1930s columns in the *Christian Science Monitor*.

Radio producer Darwin Teilhet began writing a monthly broadcasting feature in *Forum* magazine from 1932–34 while he was in charge of radio production for the N.W. Ayer and Son advertising agency. When Teilhet began writing critical articles, his employer questioned their propriety; as a result Teilhet continued writing for several months under the name Cyrus Fisher—a prime example of the obstacles critics encountered within the radio industry.

A thoughtful critical approach to broadcasting was rare before World War II. Because radio proved to be an essential communication tool during the war, more attention was given to broadcast criticism after the war, not from scholars or journalists, but from the federal government. In 1946 the Federal Communications Commission (FCC) released its “Blue Book,” officially known as “The Report on Public Service Responsibility of Broadcast Licensees.” It examined overcommercialization and the lack of local and public affairs programming. One of its principal authors was Charles Siepmann, a former British Broadcasting Corporation (BBC) employee. The revelations in the Blue Book raised a storm of controversy about U.S. broadcasting that generated interest in more serious, professional critiquing of the medium.

Two months after the “Blue Book” was issued, critic John Crosby wrote his first daily radio column for the *New Herald Tribune*. Born in Milwaukee, Wisconsin in 1912, Crosby went to Yale for two years and then began a newspaper career, first on the *Milwaukee Sentinel* covering courts and police headquarters and then on the *New York Herald Tribune*. After serving in World War II for five years, Crosby returned to the *Tribune*. Reporters back from the war were so plentiful that the editors, unsure how to use Crosby, stuck him with writing a radio column. Having never owned a radio and barely having listened to one, he took the job expecting to wait for something better to materialize. Crosby eventually settled into his role and won fans with his wry, cynical wit. His column “Radio and Television” was syndicated from coast to coast to an audience of more than 18 million. Crosby’s columns were so influential that some thought they helped to raise radio into the realm of legitimacy with music and theater.

Despite the fact that radio criticism had to share page space with the gossip column, it was the data and conclusions in the “Blue Book,” Crosby’s column, and the burgeoning of television simultaneously that paved the way for more and better broadcast criticism in the 1950s and beyond. From the 1950s to the present, critics in both the media and academia have contributed, albeit in small volume, to radio criticism.

Producer-turned-critic Albert N. Williams was associated with the National Broadcasting Company (NBC) from 1937–41 and wrote occasional articles for the *Saturday Review of Literature*, which became a monthly series in 1946–47. A published collection of his columns entitled *Listening: A Collection of Critical Articles on Radio*, one of the first such books

on radio, appeared in 1948 with columns divided into categories of networks, programs, artisans, and advertising.

Lyman Bryson, a Columbia Broadcast System (CBS) consultant on public affairs, held a Sunday afternoon series on CBS radio, *Time for Reason—About Radio*, in 1946. One example of the type of program in the series was “Documentary and Actuality Programs.” Guests, including Charles Siepmann and John Crosby, were part of the program to provide a broader point of view. It was the first time a major network had used its own facilities to tell listeners, in an extended series of talks and discussions, about the problems and possibilities of radio in the United States from the broadcasters’ point of view. The idea was originally proposed by William S. Paley, CBS chairman of the board, in an address to the National Association of Broadcasters. Paley had asked for more intelligent criticism of the industry and for more activity by the industry in helping to provide background information for it. The idea was well received by critics, and the public and the series lasted until June 1947. A selection of the program material, “written from the broadcaster’s point of view,” was published a year later.

Previously a long-time drama critic, John Hutchens joined *The New York Times* in 1941 as a radio editor and columnist. When he left in 1944 for book reviewing, he was replaced by Jack Gould, who had been a *New York Herald Tribune* reporter in the mid-1930s and in the drama department of the *Times* from 1937–42. He was part of the *Times* radio department until 1944.

Robert Lewis Shayon was a producer-director for the Mutual Broadcasting System from 1938–42 and executive producer for CBS from 1942–49. Probably best known for the *You Are There* historical programs, he wrote for the *Saturday Review of Literature* and in 1950 became the *Christian Science Monitor*’s first television/radio critic.

Saul Carson was a critic for *The New Republic* from 1947–52. He started as an assistant radio editor under George Rosen at *Variety* in the early 1940s. He was a regular contributor to *Radio and TV Best* magazine, *The Nation*, and others.

Though not solely a radio critic, Ring Lardner, a comic *New Yorker* columnist, was a well-known sportswriter during World War I and also achieved literary success as a short story writer. When he was hospitalized with an illness in 1932, he spent a lot of time listening to the radio just as it was becoming a medium of mass entertainment, and he shared his observations in the *New Yorker*.

Other important critics and columnists from the 1920s through the 1950s included John Wallace, a prominent 1920s critic who wrote for *Radio Broadcast*; Ben Gross, broadcasting critic and columnist for the *New York Daily News*; George Rosen, radio and TV editor for *Variety*; Alton Cook and Harriet van Horne for the *New York World-Telegram*; Paul Cotton and Mary Little for the *Des Moines Register*; Stanley Anderson of the *Cleveland Plain Dealer*; Leonard Carlton of the *New*

York Post; and Edith Isaacs of *Theater Arts Monthly*. B.H. Haggin was a music critic who wrote for *The Nation*, *Hudson Review*, *The Dial*, and *Vanity Fair*.

Many cultural critics paid particular attention to radio, among them Bernard DeVoto, Frederick Lewis Allen, Harry Skornia, Wilbur Schramm, Paul Lazarsfeld, and Llewellyn White. These academic critics tended to critique the medium itself (as opposed to specific programs) and paved the way for radio studies by experts in communications, psychology, sociology, literature, and linguistics.

The best known of the cultural critics was Gilbert Seldes (1893–1969). Seldes did much for radio and television, increasing the interest in and serious attention paid to the popular arts. Seldes, unlike Shayon, Williams, and Teilhet (who were producers-turned-critics), started out as a critic then subsequently worked within the industry. He was perhaps the first American critic who devoted most of his career to examining popular as opposed to fine arts. Seldes was managing editor of one of the most famous “little magazines” of the 1920s, *The Dial*, which was modernist in its literary outlook but also enthusiastic about popular entertainment. His career also included stints as a theatrical producer, a radio writer and producer, the first director of programming for CBS television, and founding dean of the Annenberg School of Communications.

Seldes’ most famous work, *The Seven Lively Arts* (1924, which included essays on theater as well as film and comic strips) helped to establish his reputation as an important critic. Seldes became a regular film critic for *The New Republic* and a columnist for the *New York Evening Journal* and *The Saturday Evening Post*; he also wrote a monthly broadcast column for the *Saturday Review of Literature*, authored books of criticism on American history and current events, and contributed articles to nearly every high- and middle-brow magazine of the time. Seldes’ attention as a media critic eventually moved from film and radio to television, a shift exemplified in *The Public Arts*, his last major work, published in 1956.

Format and Content of Criticism

Radio program criticism, as differentiated from columns and general program information, was often found in such trade magazines as *Variety*, *Billboard*, and *Radio Daily*. Because the circulation of these publications was usually limited to show business professionals, the general listening audience did not benefit from such writing, to the chagrin of many critics. Leading critics also wrote for *Life*, *Collier’s*, *Atlantic*, *Harpers*, and *The Quarterly Review of Film, Radio and Television*. Today, however, readers are likely to be more familiar with their local newspaper critic.

In some ways, critical radio coverage finds itself at the beginning of the 21st century as it was in the 1920s and 1930s, with program listings and perhaps a review here and there.

Few, if any, professional critics now label themselves solely radio critics. Most cover television as well, along with a host of other electronic media. Television and radio columnist Robert Feder of the *Chicago Sun Times* and David Hinckley, critic-at-large for the (New York) *Daily News*, are two of the very few who semi-regularly still include radio criticism in their columns. Cultural criticism of radio in the late 20th century tends toward lamentations over the phenomenon of talk radio, including figures such as Howard Stern, Rush Limbaugh, and Dr. Laura Schlessinger.

Crosby, Bing 1903–1977

U.S. Radio Personality and Entertainer

Often referred to as “America’s Crooner,” Bing Crosby was the defining male singer of his time and one of the most popular and successful stars of the 20th century. He dominated the recording, film, and radio industries for 30 years. Crosby’s soft, conversational singing style, which critic Will Friedwald has described as a “warm B-flat baritone with a little hair on it” (1990), appealed to a broad audience of Americans and helped establish American popular song as both a legitimate art form and an extremely profitable mass media industry. Crosby’s relaxed, modest star persona, folksy charm, and quick wit also contributed greatly to his success. The informality of his radio variety show and his easy banter with guests made listeners feel especially comfortable with him and ensured Crosby a prominent place in the hearts of millions.

Harry Lillis Crosby was born in Tacoma, Washington. His birth date is a matter of dispute, but the most recent research puts it at 3 May 1903. His father worked as a bookkeeper, while his Irish-Catholic mother raised the brood of seven Crosby children. Strong-willed, practical, and religiously devout, his mother was the strongest influence on Crosby’s life, and he was her favorite child. Both parents were amateur musicians and encouraged a sense of popular music appreciation in their children. A bright but unmotivated student, young Bing was best known for his charm and his habit of whistling or humming while he walked. He earned his nickname because of his attachment to a humor feature called the “Bingville Bugle” in Spokane’s Sunday paper.

In 1920 Crosby entered Gonzaga College and joined an amateur band as a drummer and singer (using a megaphone). His life changed course in 1923 when he met Al Rinker, another amateur bandleader and the brother of blues singer Mildred Bailey. Al persuaded Bing to join his band; after the band dissolved in 1925, the two men left Spokane for Los Angeles to try to make it in the big time. Mildred provided them with connections, and their act, “Two Boys and a Piano,” proved so successful that they were hired by bandleader Paul Whiteman in late 1926. Whiteman paired the boys with Harry Barris, an up-and-coming musician and songwriter, and the trio became famous as the Rhythm Boys, recording and singing Barris songs such as “Mississippi Mud.” They sang in a modern, jazz-influenced, intimate style that was new to most audiences. In 1930 the trio left Whiteman and signed to play with Gus Arnheim’s Orchestra at the Coconut Grove in Los Angeles. Crosby frequently sang solos with the band, but he eventually left the trio and became well known as a solo performer to radio and nightclub audiences in the Los Angeles

area. In September 1930 he married Fox starlet Dixie Lee, who was a much bigger star at the time.

Crosby emerged as a star himself in 1931 with the release of the short film *I Surrender Dear* in the summer (made in part to promote his new hit single) and the debut of his nightly 15-minute radio program for the Columbia Broadcasting System (CBS) in the fall. CBS built him up as a crooner to rival the National Broadcasting Company’s (NBC) original crooner, Rudy Vallee, and by December, Crosby, Russ Columbo (also at NBC), and Vallee were the most popular singers in the nation.

Crosby’s public image, however, was more controversial. He had missed the debut of his New York radio show because of his drinking, and he was widely regarded in the industry as unstable. In response to criticism, Crosby worked hard to change his playboy image; fan magazines helped by promoting Crosby as a devoted husband and father (son Gary was born in 1933) whose wild days were behind him. This image better suited the more socially conservative Depression years and helped ensure Crosby a broad audience. In addition, Crosby enlarged his repertoire of songs beyond romantic crooning ballads. His music producer at Decca Records, Jack Kapp, believed that Crosby could become a type of “musical everyman” by singing a variety of songs, including cowboy songs, Hawaiian songs, hymns, and holiday songs. His film career for Paramount Studios, which signed him in 1932, followed a similar formula, presenting Crosby in a variety of roles that underlined his cool, relaxed persona and his comic as well as his singing talents.

In 1936 his radio career hit a new high when he took over as host of the popular NBC variety show *The Kraft Music Hall* and remained there for ten years. This hour-long program starred Crosby as the host and primary vocalist and featured a number of comic players and star musicians. Crosby’s comic sidekick, Bob Burns, known as the “Arkansas Traveler,” amused audiences with his rube humor and remained with the program until 1941. His bandleader, John Scott Trotter, replaced Jimmy Dorsey in 1937 and remained with Crosby until the end of his radio career. As John Dunning (1998) has noted, Burns’ humor helped balance the more serious musicians who appeared on the program, including a number of accomplished classical and jazz artists such as Jose Iturbi, Duke Ellington, and Jack Teagarden. Broadway star Mary Martin spent a year on the show in 1942, as did Victor Borge, a Danish concert pianist who served as an additional comic foil. The show also created new stars, such as Spike Jones and Jerry Colonna, both of whom were originally members of Trotter’s band.

Bing Crosby
Courtesy Radio Hall of Fame

Crosby's personality held the show together, and he shaped it to suit his easygoing personality. Unlike other variety shows of the time, for example, Crosby wanted no applause after numbers, because he thought it slowed the pace of his program. Guest stars were treated with an informality that belied their importance and made them seem like members of the gang, and Crosby's own self-deprecating humor underlined the "everyman" quality so essential to his image. His witty delivery seemed so natural and effortless that fans did not believe the program was scripted. At the same time, however, Crosby was clearly in charge of his program and would walk out of rehearsals if he became annoyed. In 1945 he left both NBC and his sponsor when they refused to consider the possibility of taping his programs rather than performing them live. The technology for taping had been developed during the war, and Crosby wanted the greater scheduling flexibility it could offer him. NBC thought audiences would not tune in to canned entertainment, so Crosby walked out and moved his variety program to the American Broadcasting Companies (ABC). His *Philco Radio Time* show ran for three years very successfully, and Crosby's program is credited as initiating the tape era in radio.

Crosby's radio career continued through the mid-1950s with various variety shows, although none was as successful as those of the 1930s and 1940s. He appeared on various television specials and occasionally in films until his death on a Spanish golf course in 1977. His reputation has taken a beating since then: biographers have portrayed Crosby as an emotionally distant man, cold to his first wife and children, inflexible, and miserly. For better or worse, however, Crosby remains what *Life* magazine called him in 1945: "an American institution."

Crosley, Powel 1886–1961

U.S. Radio Inventor, Manufacturer, and Broadcaster

Powel Crosley, Jr., the founder of a radio company that became the world's largest manufacturer of receivers within two years, was known as "the Henry Ford of Radio" for his pioneering work in the development and manufacture of inex-

pensive radio sets that made radio affordable to millions. Crosley's sets, some of which sold for under \$10, boosted radio's popularity, but because they were equipped with less sophisticated circuits, good reception necessitated stations of greater

power. Crosley, the owner of WLW, the most powerful AM radio station ever to operate in the United States, became a promoter of increased power for all stations.

Origins

Crosley was born in Cincinnati, Ohio, on 18 September 1886, and as a child he was fascinated by automobiles. While not yet in his teens, to win a bet offered by his father he built his own small vehicle powered by a washing machine motor and got it to run at least around the block. But he would be frustrated all of his life by his inability to build a commercially successful automobile.

After two years in law school in Cincinnati, he quit to become a chauffeur and work around cars. He later worked for a number of automobile firms in Ohio and Indiana, which, in the early years of the automobile industry, were competing with Michigan in motorcar production. Crosley found success in selling many auto accessories and gadgets. For example, Crosley made a radiator cap to hold an American flag that was a big seller during World War I and a device to keep the front tires of a Model T Ford headed straight before the development of rack-and-pinion steering. Crosley also owned a small manufacturing plant making a number of wood products, including cabinets for phonographs. When he noticed that one of his employees had made a small wooden three-wheeled riding bike for his son from scrap wood, Crosley began making and selling the "Taylor Tot," named for that employee. He pioneered maximizing advertising value by means of market research by carefully tracking response to magazine advertisements and then reducing the size of the display to get the biggest response from the smallest expenditure.

Receiver Manufacturer

In February 1921 Crosley's nine-year-old son asked for a "radio toy" as a birthday present. By then radio was the rage among boys who liked to build gadgets. Juvenile books and magazines often featured radio stories and radio heroes, along with instructions for making a simple set at home. The story goes that Crosley's son had listened to a radio at a friend's house and wanted one of his own. Crosley went to a store, discovered that the least expensive retail set cost about \$130, and instead bought a 25-cent instruction booklet and the parts.

Having learned that a homemade set could be assembled for about \$25, Crosley hired two engineering students from the University of Cincinnati (one of whom, Dorman Israel, was later chairman of Emerson Radio and Phonograph). Crosley and the students designed a set they could manufacture on an assembly line in his phonograph cabinet plant and called it the "Harko." The Harko was introduced at about \$20, but later the price was reduced to \$9, plus batteries.

Powel Crosley
Courtesy AP/Wide World Photos

Crosley liked to call this radio's successor, Harko, Jr., the "Model T of radio."

The first large sales campaign for the inexpensive sets was during the Christmas shopping season of December 1921: "It will tune from 200 to 600 meters, bringing in spark, voice and music, with an average amateur aerial." By July 1922, just a year after introducing the Harko, Crosley was producing 500 receivers a day and had become the world's largest manufacturer of radio sets and parts. During the 1930s the Crosley sets were extremely popular, especially the smaller kitchen models—many of which looked like the front grille of a car—made of a pre-plastic material called Bakelite in an art deco style. He purchased other, smaller radio companies, and the Crosley Radio Corporation (the word *Radio* was later dropped as other appliances were added) was a major business for 30 years.

Crosley remained interested in ideas for new products and improvements on existing appliances; his was the first company to make refrigerators with shelves in the doors—the Shelvador—controlling a patent that made millions. He purchased

the Cincinnati Reds baseball team in 1934 and installed them in the renamed Crosley Field, and founded a professional football team in Cincinnati in the 1930s.

Broadcaster and Manufacturer

As a radio hobbyist, and to provide programming for purchasers of his sets (and advertising to gain further customers), he started a radio station in his home. This station evolved into WLW, "the Nation's Station." In 1934 the Cincinnati Reds were the first major league team to play a night game under lights, arranged by Crosley from his newly-renamed Crosley Field, so the play-by-play reports could be carried on his station during more popular listening hours. WLW was also a founding station of the Mutual Broadcasting System (MBS), established in 1934. Crosley was also a co-founder of the National Association of Broadcasters (NAB), founded in 1923.

The Crosley Corporation was an early television manufacturer and owned TV stations in Cincinnati, Dayton, Columbus, Indianapolis, and Atlanta. In 1945 the company was purchased by the Aviation Corporation (later Avco), and in 1954 was still the fifth-largest manufacturer of radio and TV sets. The Crosley line of household appliances, including broadcast receivers, was discontinued in 1956. (While the name is still used by a manufacturing company of appliances, there is no connection to the original firm or family.)

Small Cars

Crosley had long been fascinated by automobiles, and yearned to produce a popular economy model. In 1939 he introduced a small car intended to sell for about \$300 and able to run 50 miles per gallon of gas. Opposition from the big car makers in Detroit, however, kept him from signing up dealers, so he tried to sell the car through department stores, such as Macy's in New York. World War II delayed manufacturing until 1946. In 1947 Crosley sold about 17,000 sedans, station wagons, delivery vans, and roadsters. The company's auto sales peaked the following year, at nearly 47,000. After years of "doing without" during the Depression and the war, Americans wanted bigger, roomier cars, and the appeal of smaller models

declined. Because many of the parts for his small cars came from other manufacturers, such as the Willys Jeep, and were produced for bigger vehicles, it was hard to make an inexpensive car with the power Americans wanted for the open road. The Crosley auto plant shut down in July 1952.

When Crosley died in 1961, he left an impressive legacy that included pioneering developments in popularizing radio and television, leadership in the fledgling broadcasting industry, efforts toward production of economy cars, and, not the least of his contributions, nighttime baseball.

Cross, Milton J. 1897–1975

U.S. Radio Announcer

Milton John Cross was a pioneer radio announcer who became famous as the voice of the Metropolitan Opera broadcasts and as a popular authority on serious music. Cross enjoyed a distinguished announcing career that lasted for five decades on the National Broadcasting Company (NBC) and on the American Broadcasting Companies (ABC), where his most prominent role was hosting the weekly nationwide broadcasts of the Metropolitan Opera. A one-time ballad singer on early wireless radio, Cross began his announcing career during broadcasting's pioneer days at WJZ in Newark, New Jersey. His tenure as a network announcer became one of the longest among all radio personalities. With his rare combination of announcing ability and knowledge of serious music, Cross occupies a unique place in radio history.

Born in New York City, Milton Cross grew up in the rough Hell's Kitchen section and dreamed of a career in music. After high school, he enrolled at the Institute of Musical Art (now part of the Juilliard School of Music) to study under the direction of Dr. Frank Damrosch. At the institute, he earned a certificate to serve as a music supervisor for public schools. Although he frequently sang as a tenor for several excellent church choirs in New York, he never applied for a school position. Instead, he became interested in radio shortly after the new medium began.

In 1921 Cross became aware of the new Westinghouse station, WJZ, in Newark and sought a position with the station as a singer. On 15 September of that year, while still attending the institute, he was given a chance to sing without pay on the station. The management liked his voice and quickly offered Cross its second announcing position, largely because of his excellent diction and his familiarity with foreign names and musical terms, and because he could fill in with a song whenever the need arose. Although he felt his future was in the music field, Cross accepted the position. His on-air duties included introducing speakers and performers, singing songs to fill time whenever speakers and other performers failed to show, delivering commercials for household supplies, reciting the Sunday funnies, reading children's stories, and other assorted announcing duties. He supplemented his small income from WJZ by singing in a Presbyterian church (his own faith), in Jewish synagogues, and in Catholic churches. Soon he was earning about \$40 a week for his singing and announcing.

Cross joined the NBC announcing staff when the network was formed in 1926. Station WJZ became the flagship for NBC's Blue network in New York, and many of NBC's programs originated at WJZ, where Cross had begun his professional career. As a staff announcer, Cross was called upon to

announce many different programs for the NBC network. However, his most notable career achievement came with his assignment to serve as announcer and host commentator for the radio broadcasts of the Metropolitan Opera.

In 1931 NBC decided to broadcast the Saturday afternoon performances of the Metropolitan Opera on a regular basis, and the network selected Milton Cross to serve as announcer-commentator. On Christmas Day 1931, Cross inaugurated NBC's Metropolitan Opera radio broadcasts with a performance of the opera *Hansel and Gretel*. From that initial network broadcast until his death in 1975, Cross missed only two Saturday afternoon Met broadcasts, and those were because of his wife's death. In his 43 years behind the microphone, Cross provided commentary on every opera in the Met's extensive repertoire. He often attended rehearsals and was noted for careful preparation of his opera commentaries, as well as his exquisite descriptions of the color, costumes, and scenery on the opera stage. In January 1975, at age 77, Cross was working on his material for an upcoming opera broadcast when he suffered a fatal heart attack, ending his remarkable 43-year career as the voice of the Metropolitan Opera. Cross has been credited with doing more than any other individual to make the Met a national institution. An estimated 12–15 million listeners tuned in from coast to coast each Saturday afternoon to hear the Metropolitan Opera's performances as explained by Milton Cross. To millions of opera fans, the resonant and cultured bass-viol voice of Milton Cross was said to have been more widely known than that of any other American, with the possible exceptions of President Franklin Roosevelt and Charlie McCarthy.

Through the opera broadcasts, Cross was instrumental in introducing opera to millions of Americans and in educating them about the operatic form of music. During the intermissions, he developed such popular features as "Opera Quiz," presented members of the cast, and tried to explain often convoluted opera plots. In addition, Cross contributed to the public's knowledge of opera through well-known books such as *Complete Stories of the Great Operas* and *Favorite Arias from the Great Operas*.

Cross received numerous honors for his excellence as a radio announcer. He was acclaimed for his pure diction, his mellifluous voice quality, and his fine delivery. In 1929 the American Academy of Arts and Letters conferred upon Cross a gold medal with the highest honors possible for a radio announcer. His distinctive voice brought instant recognition wherever he appeared, and his great ability to pronounce the foreign words so commonly associated with opera was frequently praised.

This ability resulted from four years of studying German in high school and years of study of Italian at the Institute of Musical Art. He also studied French with tutors at NBC and diction at Columbia University. At the time of his death at age 77, Cross left a legacy of having introduced millions of Americans to live opera through the radio medium.

Crutchfield, Charles H. 1912-1998

U.S. Radio Executive

Beginning in the 1930s, Charles H. Crutchfield initiated numerous radio programming improvements and became a pioneer in the U.S. system of commercial broadcasting.

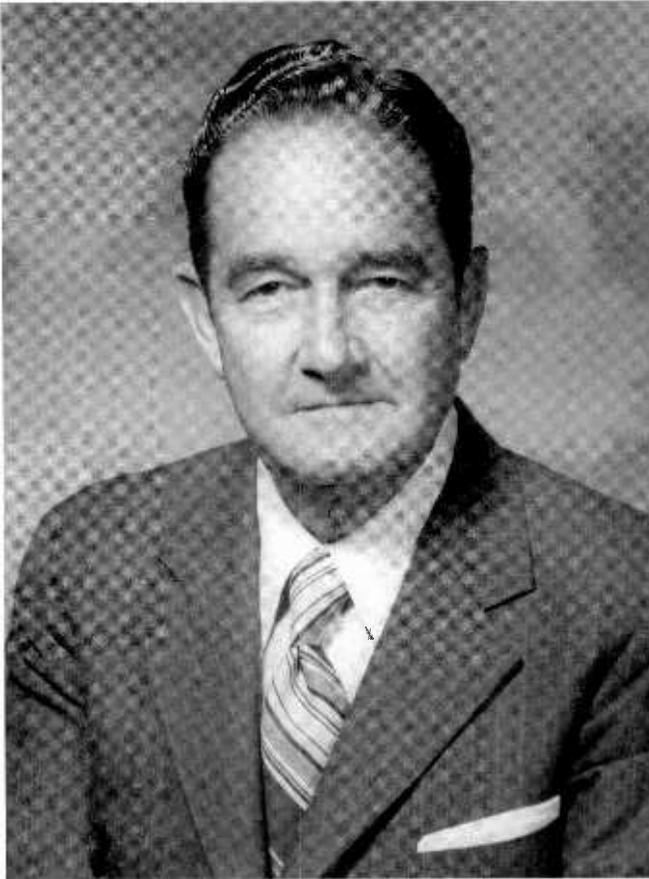

Crutchfield was born in 1912 in Hope, Arkansas. In 1920 the family moved to Spartanburg, South Carolina, where Crutchfield graduated from Spartanburg High School and enrolled in Wofford College. As he was walking home from classes one night in 1930, he decided to visit the studios of WSPA. When he got inside, the telephone rang. Since the announcer and the engineer were the only people in the studio, Crutchfield answered the phone and took a request from a woman who wanted a certain song played on the air. He wrote down the request and passed it on to the announcer. Immediately the station began getting more calls from listeners who wanted their requests and names on the air. Although Crutchfield did not realize it at the time, this was the first radio request program in the country.

It was not long before the owner of the station called, wanting to know what was going on at the station and if the young

man with the deep, rich voice who answered the phone would like a part-time announcing job at the station. Crutchfield accepted immediately and thus began his broadcasting career.

After working at five more stations in North and South Carolina, in 1933 Crutchfield was hired as a staff announcer at one of the oldest commercially licensed radio stations in the country, WBT in Charlotte, North Carolina. At the time, WBT was owned by the Columbia Broadcasting System (CBS) and was a non-directional, 50,000-watt, clear channel station that reached all of the United States except the West Coast.

Crutchfield is probably best known for his role in a program called *The Briarhoppers*. In 1934 a Chicago entrepreneur wanted to sell patent medicines, such as Peruna iron tonic, Kolor-Back hair dye, and Radio Girl perfume, on the radio. He called WBT's station manager to see if the products could be showcased on a hillbilly music program. The station manager asked Crutchfield if the station had such a band, and Crutchfield replied that they did, knowing full well that no such band existed at WBT. Seizing the opportunity, Crutchfield got some

Charles H. Crutchfield
Courtesy WBT/WBTV Archives

hillbilly musicians together, named the band “The Briarhoppers,” and went on the air with Crutchfield himself—as “Charlie Briarhopper”—acting as the emcee.

The Briarhoppers was immediately popular, garnering a huge and loyal audience. One reason for its success lay in its down-to-earth quality at a time when radio programs were decidedly highbrow and radio announcers spoke in a haltingly stilted and affected manner. But Crutchfield and the Briarhoppers would play upbeat music, tell corny jokes, and talk *with* the listeners rather than *at* them. Crutchfield’s ad-libbed commercials often poked fun at the products, and he used a just-plain-folks delivery. Former *New York Times* critic John Crosby recalls that Crutchfield was the first man he knew of “to sit a listener down with a microphone across from him in a studio and tell the man about the product.” The audience believed and bought, and thus was personal salesmanship born on radio. According to Crosby, it was Crutchfield and Arthur Godfrey who first did away with the stilted delivery of that era and popularized the one-to-one pitch so characteristic of the medium today.

The popularity of *The Briarhoppers* is difficult to imagine today. One of Crutchfield’s promotions promised listeners a black-and-white photograph of the Briarhoppers in return for a box top from Peruna, and the station consequently received more than 18,000 box tops each week. When requests slowed down, a color photo of the Briarhoppers was offered, and later a color picture of the Last Supper kept bringing in floods of responses. *The Briarhoppers* did as much as any program to convince newspaper advertisers and American businesses of the power of radio as a medium for advertising.

Crutchfield was named WBT’s program director in 1935, and he continued to introduce innovative programming. In 1936 he persuaded the Southern Conference to allow the first play-by-play radio coverage of its football games, and Crutchfield became the conference’s first play-by-play announcer. Other notable programs included reenactments of baseball games (including improvisation when the wire service went out), the broadcast of an egg frying on the sidewalk during the summer, Rebel yells by old Confederate soldiers, the broadcast of the wedding of two nonagenarian former slaves, and a program targeted specifically to a black audience. Crutchfield’s decision to air a local evangelist’s revival meeting led to the launching of Billy Graham’s broadcast career. Crutchfield was also responsible for the airing of station editorials long before it became a general practice among broadcasters.

Under Crutchfield’s direction from 1937 to 1945, WBT won seven coveted *Variety* awards. In 1942 the station became the first ever to garner two *Variety* awards in one year—one for its contributions to the war effort and another for fostering racial goodwill and understanding through a program series that broke precedent with Southern tradition. In 1945 Crutchfield was named general manager of WBT and became the youngest chief executive officer of a 50,000-watt radio station in the nation. He became a director of the broadcasting subsidiary the following year, vice president in 1947, executive vice president in 1952, and president in 1963.

Crutchfield’s influence in radio has been felt in other regions of the world. In 1951 the U.S. State Department sent him to Greece with the mission of setting up a nationwide radio network that would counter the barrage of communist propaganda flooding the country. Crutchfield represented the broadcasting industry when he and other American businessmen went to Russia in 1956 on a special mission. Upon his return he launched *Radio Moscow*. The program, designed to refute Soviet propaganda, won several awards and was syndicated nationally in 1960.

In 1949 Crutchfield signed North Carolina’s first television station on the air, WBTV. Eventually he was elected president of WBT’s and WBTV’s parent company, Jefferson-Pilot Broadcasting Company, which owned five other radio stations; two television stations; a company that provided computer services for broadcasters; and two companies engaged in audio, film,

and video commercial work. Although Crutchfield retired from Jefferson-Pilot in 1977, he was active in the media and public service until his death in 1998.

Crystal Receivers

Simple Early Radio Sets

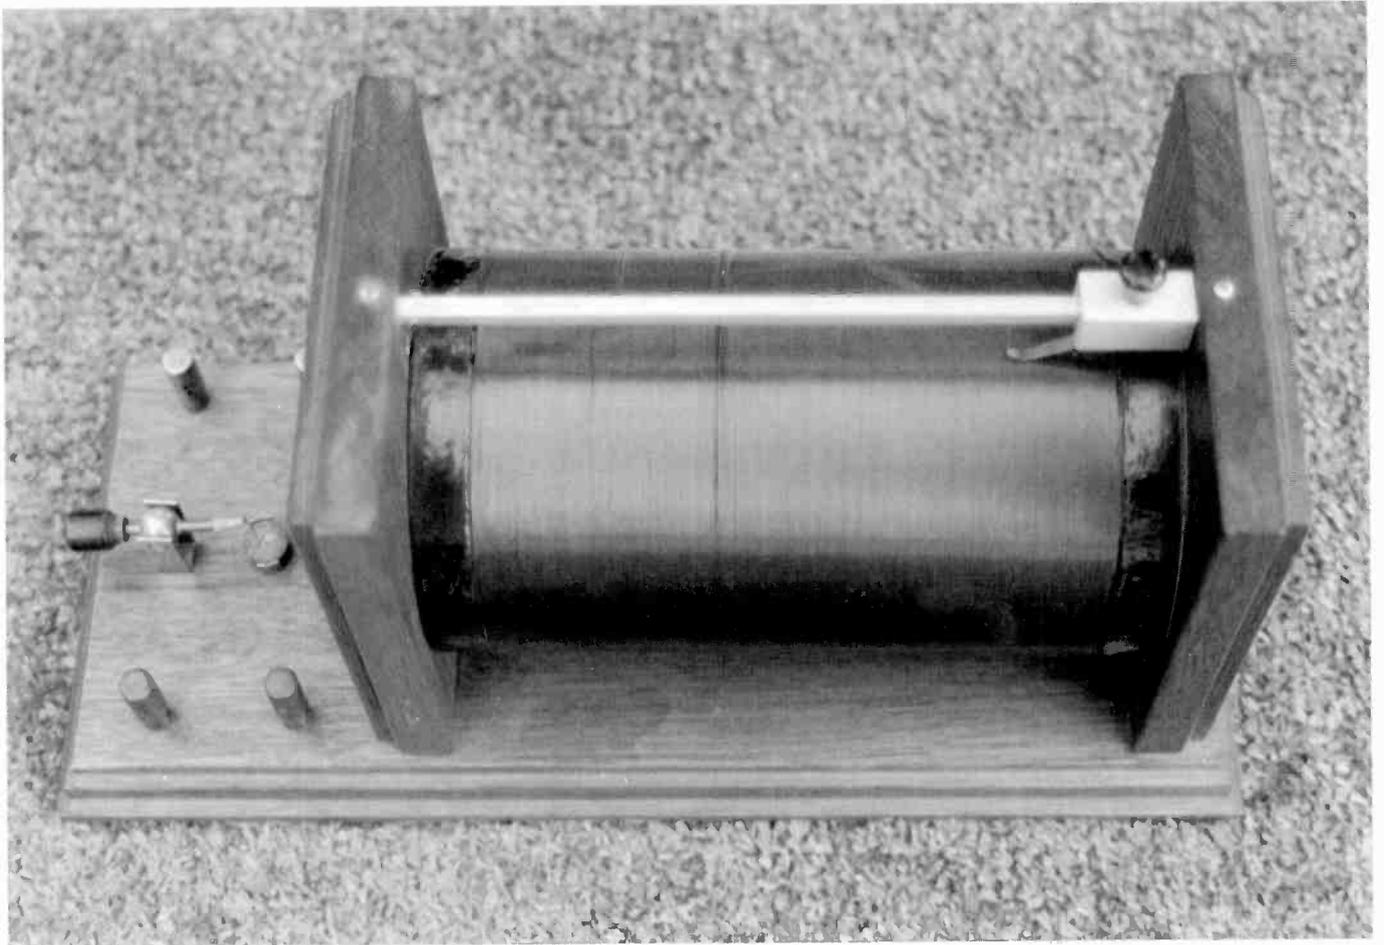

The crystal receiver, popularly known as the “crystal set,” was the device used by most people to listen to radio between 1906 and the early 1920s. The heart of the crystal receiver was the crystal itself, a small piece of silicon or galena, natural elements with the ability to detect radio frequency waves and to rectify or convert them into audio frequency signals. The crystal’s ability to detect radio signals was discovered in 1906 by General Henry H.C. Dunwoody and G.W. Pickard. The crystal receiver was inexpensive and easy to construct, making it possible for even a young child to build a radio. Even today, the construction of a crystal receiver from a kit is often a young person’s first introduction to radio technology.

As early as 1910, the three basic components and the instructions needed to construct a crystal receiver were available from mail-order electrical supply houses. All one needed was a spool of wire, a crystal detector, and earphones. The crystal detector consisted of a small piece of galena mounted in a lead base, approximately 1/4 inch in diameter, and electrically connected to a terminal. A tiny wire, called a “cat’s whisker,”

made contact with the exposed top of the galena, and its small moveable handle allowed the listener to find the spot on the galena where the radio signal was the loudest. The cat’s whisker was connected to a second terminal. One of these terminals was connected to the tuning coil.

A tuning coil was made by winding several hundred turns of thin, insulated wire around an empty oatmeal box or similar cylindrical object. A sliding piece of metal was positioned to move across the exposed coil windings for precise tuning. To the other terminal of the tuning coil a long wire, called the antenna, was connected and strung to a tree in the back yard, the goal being to get it as high as possible. The second terminal of the galena crystal/cat’s whisker combination was connected to one wire of a headset or single earphone. The other earphone wire was connected to a ground, usually a metal stake driven into the earth. Sometimes a fourth component, a fixed or variable capacitor, was added to the circuit.

To understand what the crystal receiver meant to the early science of radio, it is necessary to look at the available wire-

Crystal set

less detector technology in the early years of the 20th century. In Marconi's 1900 wireless, the receiving device used to translate the dots and dashes of his spark transmitter was a coherer, a small tube containing iron filings that closed like a switch when receiving the electromagnetic pulses of the Morse code. Each time the filings cohered, or caused the circuit to close, current from an in-series battery flowed; then, either a buzzer sounded, a telephone receiver clicked, or an inking device recorded a coded symbolic component of the message, a dot or dash. Then a small hammer would tap the filings apart, and the entire process began again to detect the next dot or dash. The coherer could only indicate to a radio operator if a spark signal was present. Such a system might receive five or ten words per minute and was unreliable. And although the coherer was a satisfactory receiver as long as the transmitter was of the spark-gap type, it would not work with the continuous-wave and voice-transmitting systems that quickly replaced the spark. The mechanical coherer did not

allow a receiver to "hear" audio, obviously a serious technical impediment to the development of wireless telephone and radio broadcasting.

Between the crude mechanical coherer and the discovery of the detecting properties of the crystal, several intermediate systems of detecting were invented and used by two of the leading early radiotelephone inventors. Between 1900 and 1905, Reginald Fessenden's Liquid Barretter and Lee de Forest's similar Electrolytic Detector were able to detect both continuous-wave code transmission and audio. These were less reliable than the crystal detector that followed, but they did allow radio operators to hear the human voice. By 1906 de Forest was advertising a radiotelephone system with his vacuum tube, the Audion, as the detector. Whether liquid, crystal, or vacuum tube, this new generation of non-mechanical detectors that converted or rectified radio frequency into audio frequency really opened the door for the development of the radiotelephone.

When licensed radio for the public was introduced in 1920, it was believed that the financial basis for the new commercial radio service would derive from sales of manufactured radio sets. Large companies such as Westinghouse and General Electric introduced home radios, the most popular of which was a crystal receiver in a wood box with earphones and instructions, called the Radiola 1 and the Aeriola Jr. The vacuum tube detector, as pioneered and used by de Forest 15 years earlier, was still too expensive for most families, but there were higher-priced radios available that used the crystal as a detector but added a vacuum tube as an amplifier to increase the volume. By the mid-1920s, better programming caused a demand for radios that would play loud enough to drive a horn speaker, and manufacturers introduced radios that used vacuum tubes for both detector and amplifier.

The vacuum tube remained the technology of choice for detecting radio signals until the transistor finally replaced it in the 1960s. And what happened to the crystal receiver? It is still the entry-level radio technology of choice. Its components, in the form of kits, are readily available today. It is almost a rite of passage for a young boy or girl to build a crystal set, and technical museums still offer Saturday morning classes where parents and their children can learn to construct a crystal receiver. There is still a thrill from building your own radio, one that seemingly works by magic, using no batteries, no elec-

tricity, one that pulls faint programs from a local AM station, experiencing what your great-grandparents did almost a century ago.

Cuba

Cuban radio has been linked to developments in the United States since its inception in 1922, mirroring Cuba's economic and political dependence on its northern neighbor. During its first four decades, Cuban radio followed the U.S. network system and broadcasting style. After the 1959 Cuban Revolution, the media was nationalized and relations with the United States were broken, but relations between the countries continued to frame Cuba's broadcasts, both domestic and international.

Pre-Revolutionary Radio: 1922 to 1958

On 10 October 1922 Cuba became the first country in Latin America to broadcast radio. Perhaps the 200 Cubans who owned radio sets (and until then had listened to U.S. stations) tuned in to that first broadcast—a speech in English by Cuban president Alfredo Zayas, made possible by the local phone company. Four days later, a second broadcast featured a speech

by the president of the American Club of Havana, encouraging U.S. citizens to visit Cuba. Through 1934 the phone company station (PWX) broadcast music, vignettes about Cuba's natural and historical attractions, and news in English and Spanish to the United States.

A regulatory radio commission was created in 1929, but the government's role was limited to establishing power standards, assigning frequencies, and awarding licenses—which it often did in exchange for fees or favors. By 1930 there were a half-million radios and 61 stations on the island. Radio was quickly popularized as an entertainment medium featuring talk shows and live popular music (orchestras would play free in exchange for promotion).

Stations were private and were financed mostly by advertisers. They initially leased airtime to private announcers, who in turn solicited advertisers to finance their programs. In the 1930s these freelance announcers were replaced by advertising agencies, and soon two large soap manufacturers were in fierce

competition for domination of the airwaves through their advertising departments.

In the 1940s, the two largest radio networks became associated with these manufacturers: Crusellas, with station CMQ, formerly PWX, became a subsidiary of Colgate-Palmolive; and Sabates, with Radio Habana Cuba—Cadena Azul, became a subsidiary of Procter & Gamble. It was not until the mid 1950s that the Cuban company Gravi shifted the balance by creating a third network.

In 1942 industrialists Abel and Goar Mestre bought 50 percent of station CMQ. After visiting the National Broadcasting Company (NBC) studios in New York, Goar Mestre decided to introduce rational planning in programs and schedules by organizing commercial spots into regular rotating blocks. Mestre also experimented with new formats such as specialized programming. Affiliate station CMBF played classical music only while Radio Reloj, founded in 1947, became the first 24-hour news station in the world. At this time, with a total audience of 85 percent of the population listening to radio daily, sophisticated survey research was introduced to serve commercial interests. By the end of the decade, CMQ was ahead of Radio Habana Cuba (RHC) in the ratings. Radio Progreso, with music and soap operas, rated third, and Mil Diez, an entertainment station run by the Popular Socialist Party, was fourth.

In 1947 CMQ's director of programming, Gaspar Pumarejo, started his own radio network, Union Radio, which became CMQ's main competitor. Two years later he inaugurated the first Cuban TV station. The introduction of the new medium caused a slight decline in radio's popularity. Resources were diverted to television, and with them went both advertisers and audiences, especially during the evening hours. Political battles, however, continued to be waged over the radio. As a result of frequent heated arguments, in 1950 the government passed a "right to reply" law that gave citizens the right to reply on the air to any accusations made against them. One very controversial program was that of Orthodox Party senator Eduardo Chibás on CMQ, which ended in 1951 when Chibás killed himself on the air. Radio Reloj, in turn, became the object of such battles in more dramatic ways—rebel forces occupied its facilities twice—once in 1952 by pro-Batista militias, and again in 1957 by revolutionaries.

At the end of the decade, the Batista government exerted tight control over broadcasts via financial subsidies as well as through direct censorship. In 1957, for example, rock and roll music was banned for allegedly promoting immorality. At the time there were 32 local commercial stations and five national networks—Union Radio, Radio Progreso, Circuito Nacional Cubano (founded in 1954 and using the former RHC infrastructure), Cadena Oriental de Radio, and CMQ. CMQ's signal was loud and clear thanks to high-power transmitters. However, the other stations' use of phone lines pro-

vided better coverage of the island at the expense of sound quality.

Radio and Revolution

On 1 January 1959, CMQ was taken over by employees involved in the underground struggle against the Batista regime; they announced the news of Fidel Castro's victory to the Cuban people. The new government immediately moved to control the media, which it had used for ideological purposes since Che Guevara founded Radio Rebelde in the Oriente Mountains in February 1958. The revolutionaries immediately eliminated all state subsidies, and over the course of two years, all stations were nationalized and placed under the administration of the Independent Federation of Free Radios (FIEL)—beginning with those such as Circuito Nacional Cubano that were associated with the former regime. As both foreign companies and advertising agencies were also nationalized, commercial advertising disappeared. By March 1961, public service announcements and political propaganda spots had replaced advertisements. Propaganda campaigns such as the 1962 Literacy Campaign and the 1970 Ten-Million-Ton Sugar Harvest Campaign were carried out to a great extent over radio.

To oversee operations and broadcasts, the Instituto Cubano de Radio (ICR; Cuban Institute of Radio) was founded on 24 May 1962. (It was renamed Cuban Institute of Radio and Television in 1976.) Revolutionary army commander and state prosecutor Jorge "Papito" Serguera was ICR's director between 1967 and 1974, when he was replaced by former urban guerrilla Nibaldo Herrera, a member of the council of ministers. A vice president for radio oversaw radio operations in coordination with the Partido Comunista de Cuba (PCC; Cuban Communist Party). The PCC Central Committee nominated all ICR officers, including the president, vice presidents, and station directors. The Communist Party Department of Revolutionary Orientation was in charge of media policies and exerted control over broadcast content.

Both the 1971 National Congress of Culture and Education and the 1975 First Cuban Communist Party Congress cemented radio's role in education and propaganda. The 1976 Communist Party Theses on Mass Media established policy guidelines in program design and production, which directed the media to "educate, inform, orient, organize and mobilize the population by appealing to reason and consciousness." The National Culture Council had an advisory role in educational programming. In addition, the armed forces and mass organizations (such as the Federation of Cuban Women and the Union of Communist Youth) used radio to disseminate their agendas and promote organizational membership.

Throughout the mid 1980s, Cuba's national stations were Radio Rebelde, based in Havana's former Circuito Nacional

Cubano studios and focusing on educational programming, including Russian lessons; Radio Liberación, formerly CMQ; CMBF, still an all-classical-music station; Radio Enciclopedia, dedicated to culture and the arts; and Radio Progreso, which featured variety programming. Because all stations shared the goal of ideological education, there was collaboration rather than competition between them. Most programming was locally produced, except for shows acquired by ICR through international exchanges, usually with other communist countries. Government control over content was absolute and extended to music programming, which had to be more than two-thirds Cuban, with all music by exiled artists excluded. Between 1973 and 1975, there was a ban on British and U.S. pop music that paralleled the repression of hippie aesthetics during that period.

Ideological Confrontation and International Broadcasts

The use of radio to disseminate ideology was not unique to the Cuban government. Since World War II, the United States used radio to combat communist ideology in Eastern Europe and, after Castro's victory, in Cuba as well. The United States and Cuba have a long history of disputes over frequencies and broadcasting power. In 1937, Cuba caused interference on 60 U.S. stations in retaliation for U.S. stations' intrusion into Cuban AM frequencies. In February 1960 both Cuba and the United States signed the updated North American Regional Broadcasting Agreement (NARBA). One month later the Eisenhower administration approved anti-communist broadcasts to Cuba, thereby subverting the agreement. Between 1960 and 1969, Radio Swan (later known as Radio Américas) broadcast to Cuba from Honduras. Swan featured old CMQ shows and exiled announcers whose voices were familiar to the Cuban public. As the U.S. administration initiated plans for the 1961 Bay of Pigs invasion, Swan's programming extended to 24 hours per day. At the same time, the U.S. Central Intelligence Agency (CIA) initiated clandestine broadcasts, and the Voice of America increased its Spanish programming from 30 minutes to 22 hours daily in both shortwave and AM (on Radio Marathon). Cuba jammed Radio Swan with CMBN's La Voz del INRA ("The Voice of the National Institute for Agrarian Reform") on the same frequency and with higher power. CMBN had a commercial format and broadcast mostly music and entertainment shows interspersed with propaganda messages and Castro's speeches. Russian transmitters and jamming devices allowed Cuban stations to broadcast at high power over several frequencies, to avoid U.S. penetration.

In May 1961 Radio Habana Cuba began shortwave broadcasts to disseminate the official views of the Cuban government and provide an alternative to the Voice of America, which was becoming its biggest competition. Throughout the 1960s and 1970s, RHC also offered a voice to representatives

of leftist movements, from Colombian guerrillas to U.S. black nationalists such as Bobby Seale and Stokely Carmichael. Also in 1961, Cuba launched CMCA, "the friendly voice of Cuba," to the United States. CMCA was on the AM band 17 hours per day through 1967, with mostly Cuban music and cultural programming in English. Mainly staffed with North Americans, one of its typical features was a biweekly program about the plight of African-Americans, entitled *Negroes in Today's World*. During the same years (1962–67), Radio Free Dixie was recorded at Radio Progreso studios and broadcast in English three times per week to the southern United States, where it was widely heard. The brainchild of black nationalist Robert F. Williams Jr. (who lived in Havana at the time), the show featured African-American music and news about the Civil Rights struggle. In the 1970s, Cuban broadcasts to the United States became more sporadic, except for rebroadcasts of the Voice of Vietnam from RHC (in English) until 1976.

Responding to Radio Martí

Improved U.S./Cuban relations during the Carter administration (1976–1980) brought about a radio truce, but Ronald Reagan's election as U.S. president in 1980 refueled the confrontation. In 1980, Cuba resumed English-language international broadcasts that interfered with U.S. stations, and often rebroadcast Moscow Radio in English to the United States on several frequencies. On 27 August 1982, Reagan announced plans to launch Radio Free Cuba (later known as Radio Martí for Cuba's independence hero, José Martí). Although the bill would not be passed until more than two years later, Cuba immediately suspended a bilateral migration agreement and announced plans to upgrade its transmitting equipment and increase broadcasting power. In 1982 it backed out of the NARBA agreement, and on the night of 30 August 1982, it broadcast English-language programming for four hours, blacking out stations on five frequencies across much of the United States. North American newspapers reported a Cuban radio announcer saying in English, "We are bringing you the world news and some good Cuban music for your enjoyment." This was the strongest signal ever broadcast from Cuba, according to the Federal Communications Commission, and it moved the National Association of Broadcasters to oppose passage of the Radio Martí bill in order to avoid further Cuban interference. Cuban plans to launch the Voice of Cuba and Radio Lincoln in English to the United States were not carried out for financial reasons. Instead, the Cuban Institute of Radio and Television assessed Radio Martí's possible level of intrusion throughout the island and measured the power increases necessary for local stations to neutralize Martí's signal. Cuba also filled most available frequencies with domestic broadcasts.

United States Public Law 98-111 was passed on 4 October 1983, approving Radio Martí as a division of the Voice of America. Broadcasts began on 20 May 1985, Cuba's independence day. Cuba protested before the United Nations and responded by jamming Martí with noise. A center was established in Havana for the purpose of monitoring and transcribing Radio Martí's broadcasts, but no direct response was broadcast. However, when Cuban exile station Radio Mambí reached the Havana airwaves five months later, the Cuban government retaliated and immediately launched Radio Taíno toward Florida. Taíno began broadcasting in November 1985 on the same frequency as Radio Martí, in both English and Spanish. Like PWX in the 1920s and CMCA in the 1950s, Radio Taíno was a friendly voice, featuring cultural programming that included vignettes about Cuba's natural wonders and tourist attractions. Radio Taíno appealed to the nostalgia of older Cuban expatriates. The station's identification announcement was identical to that of 1950s CMQ, and popular announcers from pre-revolutionary radio days presented Cuban music from the 1940s and 1950s.

The "Rectification" Process

By 1983 there were 54 radio stations in Cuba—five national, 14 provincial, and 35 local, covering 99 percent of the island. At that time, an administrative redesign of the provinces required an accompanying readjustment of the network system in terms of frequencies, power, and schedules. As a result, Radio Liberación was merged with Rebelde in 1984, and all national stations improved their coverage. Both national and provincial stations extended their broadcasting day to 24 hours. Stereo was introduced in 1984 and FM in 1986.

During Radio Martí's first two years (1985–87), audience ratings for all Cuban stations declined. The ICRT decided to face up to the competition by improving the quality of programming and by appealing to young people, who preferred foreign stations' music and entertainment news. At the same time, Russian premier Gorbachev's *perestroika* translated in Cuba into a "Process of Rectification of Errors" that called for journalistic "transparency" and attention to young people's needs. To lead this renovation, Carlos Aldana was nominated head of the Communist Party's Department of Revolutionary Orientation, and Ismael González, a social psychologist, became head of the ICRT. Both men had a history as youth leaders in communist mass organizations. Following guidelines issued at the 1986 Third Communist Party Congress, González promoted audience research and led a generational renewal, at a time when the average age of media producers was 59 years.

Radio Rebelde became a symbol of this renovation. In May 1984 it appeared on the air with a completely new sound. Live news and sports broadcasts were interspersed with commercial-sounding propaganda spots that used catchy slogans and

jingles. Announcers followed no written scripts, addressed the audience informally, and took live phone calls for the very first time. Also for the first time, drama shows presented the hardships of every day life. Beginning in 1987, Rebelde's top show was *Haciendo Radio* (Doing Radio), whose title recalled the new transparency line. It was a news program featuring live news broadcasts and investigative reporting of controversial issues.

More controversial was a local Havana station, Radio Ciudad de La Habana (Havana City Radio), that garnered top ratings with political humor and rock music shows. With a young and talented staff, Radio Ciudad emerged as the voice of Havana's youth. From 1986 to 1991, *El Programa de Ramón* (Ramon's Show) was its number one program. The first radio show named for an individual, it included biting political humor and featured the music of local underground rock bands. It was broadcast live every evening, reaching an audience of 300,000 in the city of Havana alone, with pirate tapes of the show circulating throughout the island. Next in popularity among young people was the classic rock show *Melomanía*, featuring the best of North American and British rock. But in 1990 Ismael González was deposed, and shortly thereafter these two shows were eliminated. The Rectification Period ended. Enrique Román, a former vice director of the Communist Party's Department of Revolutionary Orientation and director of the Communist Party's daily newspaper *Granma*, became the new ICRT president. A few months later, Carlos Aldana was also deposed on corruption charges and replaced as head of the Department of Revolutionary Orientation by former ambassador to Moscow and army colonel Ramón Balaguer.

Crisis and Reform

In the 1990s, following the collapse of the Soviet bloc, Cuba suffered a severe economic crisis. The ICRT was in desperate need of financial support—radio equipment was of Eastern European manufacture and fell into disrepair due to lack of spare parts. Advertising was now considered a viable solution to the problem, and incoming foreign investors were eager to promote their products in the emerging Cuban market. In 1994, Radio Taíno, a station born out of ideological confrontation with the United States (but with poor audience ratings), was revamped and became the first advertising broadcast outlet on the island since 1961. It was assigned an FM frequency for better sound quality, and new transmitters soon sent its signal to the island's urban centers and tourist resorts. While other stations curtailed their airtime in the face of crisis, Taíno expanded to 18 hours a day. Its new commercial format included dance music and entertainment news in both Spanish and English. Former Radio Ciudad de La Habana producers were hired by Taíno to appeal to urban youth. In its first year

alone, Radio Taíno's hard currency revenues amounted to \$250,000.

Due to pressures by new stakeholders such as advertisers and leaders in the music industry, the nature of radio production and broadcasting changed. Radio Taíno's premier program was *De 5 a 7*—the most popular music radio show during its six-year run. Although overt social critique was absent from *De 5 a 7*, stylistically it represented a revolution in Cuban radio broadcasting with its use of audio effects such as record scratching and a variety of special sound effects. The music played included the latest U.S. salsa hits, peppered with light show business news and cheerful concert announcements. The role of mass media was transformed. Rather than serving primarily as an instrument for ideological education, it became a tool for marketing products, services, and popular culture.

The need for economic recovery made Cuba's radio war with the United States a secondary concern. Cuba jammed U.S. stations with special programming only occasionally, as in retaliation for TV- Martí broadcasts (1989–90), to protest U.S. military intervention in Iraq and the former Yugoslavia, and during the custody battle over six-year-old Elián González (1999–2000). In 1999 ICRT vice president Ernesto López replaced Enrique Román to preside over the new commercial era and manage a \$6 million budget for the years from 2000 to 2002, the highest ever.

In 2000 there were 55 radio stations in Cuba, all controlled by the state: six were national (Reloj, Rebelde, Progreso,

CMBF, Taíno, and Enciclopedia), 16 provincial, 32 local, and one in shortwave (Radio Habana Cuba). There were 2.12 million radio sets, according to CIA estimates. The shows with highest audience ratings were Radio Reloj's morning news, Radio Progreso's late morning soap opera, and Radio Taíno's Latin dance music shows.

Cuba is a member of the International Telecommunication Union and is therefore bound by the Administrative Radio Regulations adopted by the 1979 World Administrative Radio Conference. Cuban stations are members of the Latin American and Caribbean Union of Radio Broadcasters, an association of public radio stations founded in 1985.

D

Daly, John Charles 1914–1991

U.S. Radio Journalist and Program Moderator

On 7 December 1941 John Charles Daly, Jr., made an indelible mark upon U.S. radio audiences with the first bulletin of the bombing of Pearl Harbor. Working for the Columbia Broadcasting System (CBS), Daly broke into the network at 2:25 P.M. Eastern time: “The Japanese have attacked Pearl Harbor, Hawaii, by air, President Roosevelt has just announced.”

Although he was ridiculed for his English accent in prep school, Daly possessed one of the richest speaking voices on the air. He was born in Johannesburg, South Africa on 20 February 1914. He was the youngest son of John Charles Daly, Sr., a Boston geologist, and Helene Grant Tennant, an Englishwoman.

After his father died of complications from yellow fever in the Belgian Congo, young John Charles, his older brother John Grant, and their mother moved to Boston in 1923. Daly graduated from the Tilton School in New Hampshire and was offered a scholarship to attend Boston College in 1930. He worked as a telephone switchboard operator to make ends meet during the Depression, but his salary was later reduced because of the worsening economic times. Two years later, when the financial burden of supporting his ailing mother became too great, Daly was forced to drop out of college. He first took a job at a wool factory in New England and later moved to Washington, D.C., where he worked for a transit company.

Seeking to join the new and exciting mass medium of radio, Daly was hired as a Washington reporter with the National Broadcasting Company (NBC). He became known for his ability to speak extemporaneously with great ease under the time constraints of broadcast airtime. However, his trademark diction and eloquence on the air sometimes upset NBC's listeners; a few wrote letters to complain that Daly's English accent sounded too foreign and pretentious.

In 1936, at the age of 22, Daly jumped from NBC to CBS just as the latter network was expanding its news service. Daly

soon became an original member of the legendary CBS News broadcasting team that worked under Edward R. Murrow.

Daly succeeded Robert Trout as the CBS White House correspondent. He had traveled more than 150,000 miles with Roosevelt throughout the United States, Europe, and South America by 1941. After the United States' entry into the war, he broadcast accounts of military operations in North Africa and Italy. Daly broadcast the first bulletins of Roosevelt's death from Warm Springs, Georgia on 12 April 1945.

As the new medium of television loomed, Daly was persuaded to host *What's My Line?* in 1950, in which a celebrity panel would guess the occupation of invited guests. The CBS network program eventually brought Daly the most fame and fortune of his broadcasting career.

In 1953 Daly was offered an unprecedented opportunity to become the vice president of news, special events, public affairs, religious programs, and sports with the rival American Broadcasting Company (ABC) network while continuing to host *What's My Line?* During the period 1953–60, Daly was ABC's only on-air news anchor on television. He was reported to have a quick temper and often clashed with management over news policy matters. Although Daly broke new ground by hiring a then largely unknown Howard Cosell to broadcast the first nightly sports report on national television, ABC executives said that Daly was a weak administrator who failed to hire other on-air talent to build the news division. In 1957 Daly publicly objected to the management hire of Mike Wallace to host a weekly personality interview program, *Night Beat*, saying that Wallace lacked hard news credentials. A decade later, Wallace would become the leading correspondent for the CBS newsmagazine, *60 Minutes*.

Daly resigned from ABC in November 1960 over a much-publicized dispute about the network's purchase of outside news programming. He was appointed director of the Voice of America (VOA) in 1967. Succeeding NBC journalist John

John Daly

Chancellor, Daly was expected to enhance the agency's image in its broadcasts around the world. He resigned the following year, complaining about a lack of management autonomy from VOA's parent agency, the United States Information Agency. Leaving VOA a year later, Daly said he was entering a "state of semi-retirement."

Davis, Elmer 1890–1958

U.S. Radio Commentator

From 1939 to 1941, Americans listened to Elmer Davis describe the war in Europe and analyze its impact on their lives. When the United States entered World War II, Davis became head of the government agency charged with coordinating the release of all information about the war effort.

Davis was born in Aurora, Indiana. His father was a bank clerk and his mother a school teacher, later a principal. He attended Franklin College, near Indianapolis, and graduated in 1910 with a B.A. He taught Latin for a year in a high school, then, as a Rhodes Scholar, he studied classics at Oxford University. When he graduated, he traveled across Europe and met the woman who later became his wife, Florence MacMillan of Boston. He settled in London to do postgraduate work and hoped for a career as a teacher of ancient history.

But upon his father's death in 1913, Davis returned to the United States to take care of his mother. The two settled in New York City, and he began a career as a writer by working for *Adventure Magazine*. A year later, he became a reporter for the *New York Times*, where he worked his way up to foreign correspondent and later to editorial writer. He also wrote light fiction, including novels and short stories. In 1924 he became a full-time freelancer, writing both fiction and nonfiction. His journalistic articles appeared in many of the major magazines.

War in Europe seemed inevitable by 1939. Davis, who had previously substituted briefly for the Columbia Broadcasting System's (CBS) top commentator, H.V. Kaltenborn, was asked to become a full-time news analyst for CBS. Two weeks later, World War II broke out. Soon, Davis was the third most

Elmer Davis
Courtesy CBS Photo Archive

popular commentator in the country, following Kaltenborn and Lowell Thomas. At the height of his popularity, his listeners numbered 12.5 million.

When preparing his commentaries, Davis would look at the teletype and read the wire service news, but only take notes. He would then rewrite the material in his own style—concise and easy to understand. And he did some of his own reporting, interviewing political leaders and traveling to the scene. For example, he joined Edward R. Murrow, the CBS newsman, in England in 1941 for a month.

Davis liked to think of his audience as being rational and gave them the relevant facts behind the story. His analysis was insightful and frequently sounded like plain old common sense, although he did have a tendency to refer to the ancient Greeks and Romans that he had studied in his youth. His most memorable characteristic was to ask a question, followed by a pause, then “Well—” and the answer. His Midwestern twang, dry sense of humor, and flat delivery seemed to reflect the average American voice and was reassuring to many.

An admitted liberal, Davis was nevertheless not reluctant to criticize President Franklin Roosevelt. Davis favored the United States’ remaining neutral during the war, but he had strong sympathies for the British. When Pearl Harbor brought America into the war in 1941, Davis became an ardent supporter of the war effort.

In one of his commentaries, he complained that too many government agencies were turning out information about the war. Reporters didn’t know where to go for facts; important information was withheld from the public; and confusing, conflicting stories were the result. Davis recommended that the president create an office to oversee all of these efforts. In 1942 Roosevelt offered him the job, and Davis accepted.

The Office of War Information had the task of coordinating all national and international propaganda and the release of all news about the war to journalists. Davis favored getting as much information—including the negative—to the public as possible without violating security. When the military was reluctant to cooperate, President Roosevelt backed Davis up. Davis’ lack of administrative experience led to some problems, but most journalists respected the efforts of one of their own to keep the news flowing during a difficult time.

His approach to drumming up domestic support for the war was to ask the networks for voluntary cooperation. He preferred that propaganda be integrated into regular programming, rather than being broadcast through special programming or didactic speeches. And broadcasters agreed.

When the war ended in 1945, Davis went to work for the new radio network, the American Broadcasting Companies (ABC), where he had a 15-minute program three times a week. He may have been motivated to move to ABC by a higher salary, but he also disliked CBS’s policy that news analysts had to stick to the facts and not air their own opinions.

Davis was one of the first people in the industry to attack Senator Joseph McCarthy, the powerful Republican from Wisconsin who had little tolerance for criticism. McCarthy believed that the country was threatened by communism, but Davis felt the dangers of McCarthyism to freedom of speech and freedom of thought were even greater. He wrote a best-selling book of essays on the topic, *But We Were Born Free*. During the 1952 elections, some stations dropped Davis’ program, but at his peak he had 150 stations carrying his commentaries.

In 1953 Davis had to retire from ABC because of his declining health. A year later, he tried a weekly commentary for ABC TV but again had to stop because of poor health. He suffered a stroke and died in 1958.

Dees, Rick 1951-

U.S. Radio Personality

Rigdon Osmond Dees III (Rick Dees) grew up in Greensboro, North Carolina, where he began his radio career at age 17 upon being dared by another student to audition for a local radio station. Dees took the challenge, landed the job at WGBG, and has worked in radio ever since. He was known first as Rig Dees and then adopted the name Rick. Dees has combined his love for comedy and the absurd to create his own wacky style, which is performed for listeners by his "Cast of Idiots," a myriad of voices both self-created and done by his wife, Julie. Dees' unique radio style has inspired audiences to tune in and to make him number one in the ratings in every market in which he has worked. From WGBG he moved to WCOG in Greensboro in 1969. In 1971 Dees split time between WKIX in Raleigh and WTOB in Winston-Salem while working on his degree at the University of North Carolina.

Dees left North Carolina in 1973 to join WSGN in Birmingham, Alabama. He moved to Memphis, Tennessee, in 1976, where he worked for a short time at WMPS before moving over to WHBQ that same year. As an air personality in Memphis, Dees became known nationally in 1976 with his disco music parody "Disco Duck," which reached multi-platinum status by selling more than 4 million copies. The song made it to number one on the charts and landed Dees a People's Choice Award. In addition to "Disco Duck," Dees produced and wrote several comedy albums, including *I'm Not Crazy*, *Rick Dees' Greatest Hit (The White Album)*, and *Put it Where the Moon Don't Shine*. His album *Hurt Me Baby, Make Me Write Bad Checks* was nominated for a Grammy Award.

In 1979 Dees moved to Los Angeles station KHJ-AM, where he was not particularly successful. But upon moving to Los Angeles' KIIS-FM in 1981, where he remained as of early 2003, Dees began a streak of winning *Billboard's* Radio Personality of the Year award 15 consecutive times. Since 1982,

he has hosted American Broadcasting Companies (ABC) Radio's internationally syndicated *The Rick Dees Weekly Top 40*, which airs to 30 million people via more than 400 stations in the United States and 70 other countries.

Dees was part of a 1984 Top 40 revival radio now known as "contemporary hit radio." The format relies on personalities or "superjocks" who are as important to the format as the music is. The format has been likened to that employed by 1960s air personalities such as Cousin Bruce Morrow, Murray the K, Alan Freed, Wolfman Jack, and others. Dees' fans are attracted by loony gags and bits. One of his staples is "Spousal Arousal," in which a spouse offers his or her partner romantic enticements. Another is "Battle of the Sexes," where men and women compete in trivia contests. Dees attributes his longevity in radio to his ability to stand for things that are different from the Howard Sterns of the world. On his own show, Stern frequently insults Dees.

Dees hosted the syndicated TV show *Solid Gold* (1983-84) and ABC-TV's largely unsuccessful late-night program *Into the Night Starring Rick Dees* (1990-91), a midnight talk show targeted at a younger viewing audience. His house band was Billy Vera and the Beaters, and the announcer was Lisa Canning. Greg Binkley and Bob Perlow provided comedy bits, along with "The Committee," four female senior citizens interacting with the host about a variety of topics. Dees said the show did not work because he was up against Johnny Carson's last year on the National Broadcasting Company's (NBC) *The Tonight Show*. Also, it was on during the Gulf War and was frequently delayed when Ted Koppel's ABC *Nightline* went overtime.

Other Dees television credits include appearances on *Roseanne*, *Married with Children*, and *Burke's Law* and voiceovers for animated children's programs such as *The Flintstones*, in which he was "Rock Dees." In the film *La Bamba*, the story of

Rick Dees
 Courtesy CBS Photo Archive

rock and roll artist Richie Valens, Dees played Ted Quillen, the person who helped start Valens' career. In the animated full-length motion picture *The Jetsons: The Movie*, he played Rocket Rick. Dees has received numerous honors and awards for his accomplishments, including placement of his own star on the prestigious Hollywood Walk of Fame.

De Forest, Lee 1873–1961

U.S. Radio Inventor

A formally educated scientist whose inventions in some way have affected nearly every human life, Lee de Forest was one of the most important of the early inventors of radio and electronic technology. He is most known for his pioneering work with the vacuum tube—first as a detector of radio waves, then as an amplifier for long-distance telephone calls, and finally as the major technology of the radio transmitter, one still in use today. Although de Forest was responsible for some of the more significant radio technical accomplishments of the early 20th century, his career was one of continuing controversy: he was accused of stealing inventions from Reginald Fessenden and Edwin Howard Armstrong, he was accused but not convicted of business fraud, and his continual exaggeration of the facts surrounding his life and career caused him to become estranged from the radio engineering establishment. Even though he wrote an autobiography proclaiming himself “the Father of Radio,” he never received the respect he actively sought his entire life.

Origins and Early Work

Lee de Forest was born in the Midwest but grew up in the Old South. Shortly after his birth in Council Bluffs, Iowa, in 1873, his father accepted a position as the president of Talledega College, a small, historically black school in Alabama. But although de Forest grew up in a rural environment, his education was formal, upper class, and thorough. He attended a private boys' school in Massachusetts, preparatory to his entrance into Yale University's Sheffield Scientific School, where he received the degree of Doctor of Philosophy, with an 1899 dissertation entitled “The Reflection of Hertzian Waves at the End of Parallel Wires.” After graduation, he worked briefly for several Chicago companies, Western Electric among them.

But young de Forest wanted to start his own wireless business. In the beginning, he followed the work of Marconi, attempting to develop better communication between ships and shore stations. After several attempts to demonstrate that his version of spark transmitter and coherer receiver technology was superior to that of Marconi and others, de Forest finally received the noticed of a Wall Street promoter named Abraham White. In 1902 de Forest joined White in forming the De Forest Wireless Telegraph Company. Among their early customers were the War Department and the U.S. Navy. Under the guidance of White, a public offering of stock was made, public demonstrations were held, and radio equipment was sold. But characteristic of de Forest's entire career, the hyper-

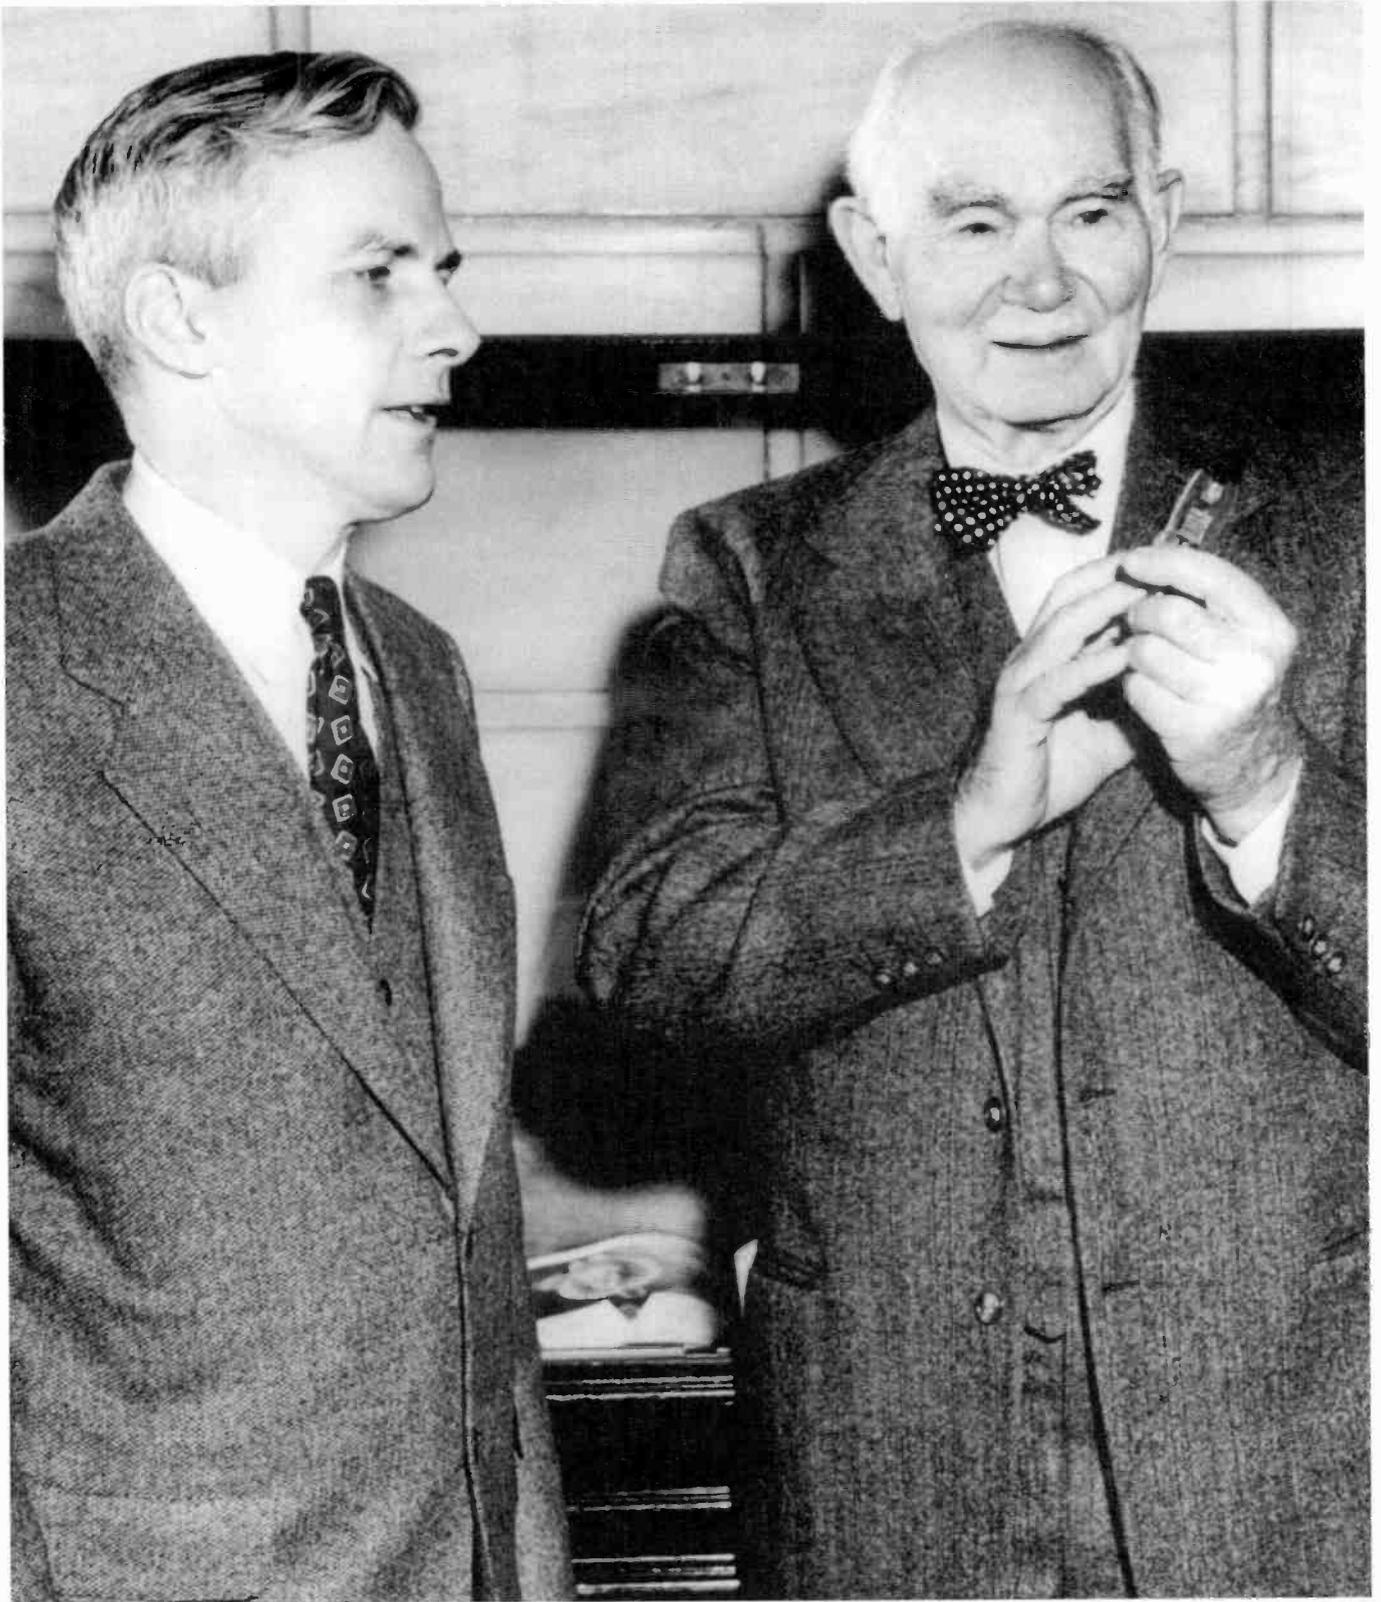

bole surrounding the company was greater than its actual value, and although de Forest continued to invent, he was apparently unaware that White may have been engaging in less than ethical business practices.

Apparently, de Forest tired of telegraph-based wireless. A person of culture and lover of the opera, de Forest believed early on that the radiotelephone, or talking wireless, was going to be a way to send highbrow musical entertainment into homes. It was one thing to have to earn a living selling communications equipment to the navy, but his real passion was voice and music by wireless. In 1907 he formed the De Forest Radio Telephone Company—merely one of what would become a steady stream of companies with various backers. For the transmitting part of his radiotelephone, de Forest used a version of a Poulsen direct current arc, and the historical record shows that de Forest did attempt on several occasions to use this device to send the voices of opera singers to members of the press stationed at receiving sets. Even when testing the radiotelephone for the navy, he usually played some sort of phonograph music as the ships entered the harbor. De Forest was a showman, and he was one of the early pioneers in what would become radio broadcasting to an audience.

Audion and Later Inventions

Lee de Forest is best known for his improvements to the basic invention behind all radio and television, the vacuum tube. Earlier, Thomas Edison's electric lamp had been modified by the Englishman Ambrose Fleming, who added a second element, called a plate, and named the new invention the Fleming Valve. By 1906 de Forest had modified Fleming's valve by adding a grid to control and amplify signals; he called his device the Audion. As became apparent over the next few years, the inventor did not fully understand his own creation. Little did he realize then that the simple Audion was going to bring him fame, fortune, heartbreak, and high legal bills for most of his life.

One of de Forest's first major brushes with the legal system did not concern the Audion but happened as a result of fraud in his radiotelephone company, and in 1913 he and business partners James Smith and Elmer Burlingame went to trial for misleading stock offerings. Smith and Burlingame were found by a jury to be guilty, but de Forest was declared innocent. Shortly thereafter, he began a decades-long court battle with Edwin Armstrong over the invention of the regenerative circuit based on the Audion tube. Regeneration is like feedback: a

small signal from the output of a vacuum tube is fed back into the input, thus making weak signals very strong. Both de Forest and Armstrong claimed discovery of this principle; the litigation lasted from 1914 to 1934, and although the courts would finally side with de Forest, the technical community did not. It was a hollow victory, which nearly destroyed both claimants.

Personally, de Forest suffered a series of failed marriages. The first of these, in 1906, was to a Lucille Sheardown, a marriage that ended in divorce the same year. The second, in 1907, was to Nora Blatch, who bore him a child, but Nora, a liberated woman with an engineering background, soon realized that she did not want to live under the shadow of de Forest. By 1911 the marriage had ended in divorce. By 1912 de Forest had remarried, this time singer Mary Mayo. Several children resulted, but by 1926, while in Europe, de Forest had married his fourth wife, the actress Marie Mosquini. Even though he had failed to divorce Mary Mayo, de Forest managed with legal help to marry Mosquini and remained married to her, apparently happily, for the rest of his life.

The Audion would continue to dominate de Forest's life. Moving to California in 1910, he worked for the Federal Telegraph Company at Palo Alto. While there, de Forest finally made his Audion tube perform as an amplifier and sold partial rights to American Telephone and Telegraph (ATT) as an amplifier for transcontinental wired phone calls. For this innovation he received \$50,000, whereupon he returned to New York and started the Radio, Telegraph and Telephone Company. By the beginning of 1916, he had finally perfected his Audion for its most important task, that of an oscillator for the radiotelephone transmitter. By late 1916 de Forest had begun a series of experimental broadcasts from the Columbia Phonograph Laboratories on 38th Street, using his Audion as a transmitter of radio for one of the very first times. According to de Forest in a newspaper article published in late 1916, "The radio telephone equipment consists of two large Oscillation tubes, used as generators of the high frequency current" ("Air Will Be Full of Music Tonight," *New York Sun*, 6 November 1916).

Early Broadcasts

A few months later, de Forest moved his tube transmitter to High Bridge, New York, where one of the most publicized pre-World War I broadcasting events took place. Just as Pittsburgh's KDKA would attempt to broadcast an election exactly four years later, in 1920, de Forest used the most public of events, the Hughes-Wilson presidential election of November 1916, for his broadcast. The *New York American* installed a private wire, and bulletins were sent out every hour. The listener reports in the press were positive: "Seven thousand wireless telephone operators within a radius of 200 miles of New

York City received election returns from the *New York American*. They heard not only election returns, but music as well." Because it happened in New York, was heard by a large audience, and received so much press attention, it was one of the single most important pre-World War I events in radio broadcasting. Beginning with his arc telephone experiments for the navy and his transmissions of opera music, and ending with his radio station at High Bridge in 1916, the evidence strongly suggests that Lee de Forest, more than any other individual, saw a potential for voice transmission beyond just a wireless replacement for two-way communication.

Lee de Forest's accomplishments in radio technology were both huge and unrewarded. His vacuum tube innovations between 1906 and 1916, although clouded by court battles, were nevertheless significant and long-lasting. In his later years he lived in Hollywood and worked on a variety of non-radio technical devices such as guidance systems for bombs. Most notable was his Phonofilm process, a way to make the movies talk by adding a synchronized optical soundtrack to the film. For that invention, he received an Oscar in 1959 from the Academy of Motion Picture Arts and Sciences. He continued to promote his legacy as the "Father of Radio," but his most important non-technical contributions to radio, his publicized pre-1920 broadcasts, were far in the past. He became increasingly paranoid, believing that his failure to achieve recognition was because of his "enemies." Following a long illness, he died in Los Angeles in 1961.

Delmar, Kenneth 1910-1984

U.S. Radio Actor and Announcer

Kenneth (Kenny) Delmar's career spanned the history of 20th-century media and popular entertainment. A versatile character actor, Delmar appeared in vaudeville, television, and motion picture productions, but he is most remembered for his work in radio. As Senator Beauregard Claghorn on *The Fred Allen Show* in the late 1940s, Delmar entertained millions each Sunday with his blustery rhetoric, his puns and malapropisms satirizing Southern culture, and his oft-imitated tag line, "that's a joke, son."

Kenny Delmar was born in Boston, Massachusetts, on 5 September 1910. His parents separated when he was a young boy, and he was raised in New York by his mother. A child of show business, he toured the country as early as 1918 with his mother and aunt, a vaudeville duo booked as the Delmar Sisters.

Early Radio Work

Delmar broke into radio in the 1930s as an announcer, working on such major network programs as the musical countdown show *Your Hit Parade*. He began doing more acting work throughout the decade, appearing as the vain Police Commissioner Weston on *The Shadow*, and in various roles on the newsreel dramatization program *The March of Time* and on Orson Welles' dramatic series *The Mercury Theater of the Air*. By the end of the decade he had established himself as one of radio's elite character actors.

Delmar's biggest role during this period was on the "War of the Worlds" broadcast of 30 October 1938. Before the broadcast, CBS censors had demanded that Orson Welles fictionalize the names of some real places and characters in the script, including changing Delmar's President Franklin Roosevelt character to the nameless "Secretary of the Interior." Delmar's impression of Roosevelt—a voice that by the late 1930s was intimately familiar to American radio listeners—was so realistic that it was a major inspiration for the panic felt by millions of listeners, despite the fact that the character was clearly identified as the "Secretary of the Interior" and not the actual President.

Senator Claghorn

Delmar's big career break came in 1946 with his acting work on *The Fred Allen Show* as Senator Beauregard Claghorn, the loudmouthed Southern politician who showed his sectional loyalty by drinking only from Dixie Cups, refusing to drive through the Lincoln Tunnel, and claiming that he was so Southern, "where I live we call the people from Alabama Yankees." Senator Claghorn was one of the residents of *Allen's Alley*, the imaginary street Fred Allen strolled down each week on his program beginning in the early 1940s, talking current events and sharing jokes with a geographically and culturally disparate quartet of recurring characters who occupied this same fantastical radio space. As the five-minute sketch developed over

time and the Alley's characters solidified, Senator Claghorn shared the street with the Jewish housewife Mrs. Nussbaum, the feisty Irishman Ajax Cassidy, and the farmer Titus Moody. Delmar landed the Claghorn role after Minerva Pious, the actress who played Mrs. Nussbaum, heard Kenny Delmar do a hilarious southern impression and recommended him to Allen. Though Fred Allen wrote most of the "Allen's Alley" dialogue himself, Delmar contributed a great deal to Claghorn's character, claiming that he modeled Claghorn after a Texas rancher who picked him up while hitchhiking in the late 1920s and barely stopped talking.

Delmar's Senator Claghorn first appeared on 5 October 1945 and became an overnight sensation, the subject of millions of amateur impersonations throughout America. Claghorn offered hilarious tidbits on Southern life, such as his statement that his Thanksgiving feast always began with a "Memphis Martini . . . a tall glass of pure corn likker with a wad of cotton in it." Senator Claghorn's "that's a joke, son" became a national catchphrase. The new Allen's Alley quartet was a certifiable hit, and *The Fred Allen Show* became one of the most popular shows on radio, drawing some 20 million listeners on Sunday evenings. Consumers ate up Claghorn memorabilia in the form of shirts and compasses that only pointed south, and the character became so popular that Delmar parlayed the role into two comedy records, a feature film entitled *It's a Joke, Son*, and radio and television commercial work well into the 1960s.

Allen's Alley became popular to an American population emerging from the Depression and World War II, moving to the suburbs, and coming to grips with the tumultuous decades of the 1930s and '40s. The very idea of the nation was under intense revision by many Americans, especially as older conceptions of ethnicity and regionalism had been subjected to the crucible of war. As the most popular character on the most popular radio program of the immediate postwar years, Kenny Delmar's Senator Claghorn character played a considerable role in the shaping of national ideas about the South during the postwar period. Allen's Alley provided for a suburbanizing population a reminder of the old urban ethnic neighborhoods and people, and may have served for its millions of listeners as a sounding board for their own new postwar Americanness, as this anonymous "white" population increasingly left behind its older urban ethnic ways and mores for the mass media society of the suburbs. Kenny Delmar's character had an ambiguous role in this process, but the degree to which Senator Claghorn shaped national ideas about Southerners should not be overlooked. Some Southern newspapers printed anti-Claghorn edi-

torials, and the real Senator Theodore Bilbo of Mississippi was an outspoken critic of what he saw as Delmar's insulting caricature of Southern politicians. Senator Claghorn was invoked on the Senate floor several times in the 1950s, both as an example and counterexample of the nature of Southern politics and politicians, and he was for many regular Americans of the World War II generation a national reference point on Southern culture.

Kenny Delmar as an actor never achieved the notoriety of his Senator Claghorn character, and he had wisely continued his character and journeyman work in radio throughout Claghorn's popularity. NBC considered giving Senator Claghorn his own show in 1949, but the plans never came to fruition. Delmar continued to work in radio after *The Fred Allen Show* went off the air in 1949, and he branched out into theater and television work as well. He also provided vocal work on cartoon shows into the 1970s, including work on *The Adventures of Hoppity Hooper* and *Underdog*. The cartoon character Foghorn Leghorn was lifted almost directly from Delmar's Claghorn character, though he received no royalties or official credit. He died on 14 July 1984 in Stamford, Connecticut.

Demographics

Defining the Radio Audience

Broadcast Research Definitions describes demographics as a system of categories by which a population is subdivided according to characteristics of the people who comprise it. The same term also describes audience reports which present audiences according to this system of categories. In broadcast ratings demographics most often refer to age and sex categories such as “Men 18–34” or “Women 25–49.” The terms may also be used to describe categories based on marital status, education, etc. (Fletcher, 1988).

Demographics are important in the radio industry in two ways. First, advertisers use demographics to describe their customers and to buy audiences for commercials. This practice is the basic revenue transaction supporting commercial radio. Second, radio stations are programmed to produce audiences with the demographics their advertisers seek.

Core consumers of any product or service account for the day-to-day, year-to-year success of a consumer company. The core consumer spends more or purchases more units in the product/service category in question and is particularly important to the survival of companies providing such goods/services. For instance, Campbell’s Soup identifies its bedrock offering as its condensed soups sold in red-and-white cans. The core consumer of this product purchases a case or more of these soups every month. The demographics of Campbell’s core consumers are important to the company, and its advertising must reach them as well as additional consumers who use their condensed soup less often or seasonally.

These additional consumers are an example of special advertising opportunities for radio. For many years Campbell’s has observed that more soup is purchased during the cold seasons and in areas most affected by cold weather. They also know that the typical seasonal purchaser of their soups is a mother with children at home who feels that adding soup to a child’s diet in cold weather will improve resistance to colds. As a consequence, Campbell’s regularly purchases additional advertising time on radio stations in geographical areas most affected by cold weather and on stations high in the demo-

graphic group comprised of women aged 30 and over, which presumably includes mothers with children at home.

Origins

In the 1930s, the early years of radio audience reports, the principal demographic of interest to advertisers was the number of households in the audience of particular programs. It was assumed that each household would own one radio receiver and that every member of the household would hear the programs broadcast through the household receiver. The result was that information about the programs tuned in by the household set was the prime information sought by researchers, and advertisers based their strategies on appealing to the product-purchasing decision makers in the household.

Demographics were so unimportant during radio’s Golden Age that the Nielsen Radio Index (NRI) became the principal national radio ratings service in 1950 (right at the end of the period) without having the capability of reporting demographics. The NRI used audimeters attached to respondent receivers at home (and eventually in cars). These devices could only report which programs were accessed by which radios; they could not determine who was listening or whether anyone at all was listening.

The rise of television in the late 1940s marked the rise of demographic information’s importance in selling radio time. By 1975—the year before its demise—The Pulse included these demographic categories in its reports: (1) Gender: male, female, total; (2) Age: teens, 18–24, 25–34, 35–49, 50–64, 65 and over, total; and (3) Ethnicity: Black, Hispanic, other, total. In the same year, Arbitron Radio reports included these demographics: (1) Gender: male, female, adults (male and female) and (2) Age: teens, 18–24, 25–34, 35–49, 50–64, 65+. Special weighting and interviewing procedures were in place for African-American and Latino listeners.

In the mid-1980s Tapscan had become an important selling tool for radio. Tapscan of Birmingham, Alabama, was a provider of radio sales software. The service was available only to full-service clients (stations that purchased all of the regularly scheduled Arbitron surveys of the market in question) of a

radio rating service. One of the displays produced by Tapscan analysis was a ranking report that showed which stations in a market had the highest numbers of listeners in each of the demographic categories included in the rating report. If an advertiser wished to sell jeans in a given market, in-house research would reveal that the core jeans consumer was a person in the 18–24 age group, that males were more brand loyal, and that females made more purchases and were more sensitive to price. A Tapscan analysis of the stations in each market would reveal which stations could provide the most young male and female listeners and thus should be included in the campaign buy for a jeans campaign.

The greater availability of radio listener demographics and increased use of sales analysis software made possible an important media buying strategy—Optimum Effective Scheduling (OES) or “optimizers.” The idea behind OES is that advertisers are best advised to purchase a combination of advertising opportunities from whatever stations in the market are necessary to deliver every listener in the demographic category sought by the advertiser. The software’s calculations during data analysis take into account two factors called *recycling* and *sharing*.

Recycling refers to the tendency of some proportion of an audience to listen during more than one daypart or to more than one program on a given station or network. For example, 25 percent of a radio station’s morning drive time audience is recycled to evening drive time. This means that only one out of four listeners in the morning will be present in the evening; hence, an advertiser determined to reach the optimum number of target listeners should buy commercials in both morning and evening drive time.

Sharing refers to listeners of more than one station, which may also be referred to as their having a “duplicated audience.” Sharing also implies that there will be some members of the advertising target demographic groups who listen to one station only, so those members’ favorite stations must be included in the OES calculation for advertisers who wish to reach them. OES software routines determine how many spots on which stations must be purchased to reach a designated percent of all radio listeners in a particular demographic group.

Optimum effective scheduling has become very important in national and regional media buying. It is also important in planning programming for a radio station. If an important audience listens exclusively to a particular radio station, then advertising from that station must be included in the advertising media plans of any business aiming for the demographic audience delivered by that station.

The need for OES presents some dilemmas to radio programmers. Should a station design its programs for homogeneous audiences from a relatively narrow set of demographic groups, increasing the likelihood that exclusive audiences will be included in buys made using the OES rationale? Or should

the station attempt to appeal to a wider range of demographic groups, hoping that each group delivered will be useful to the campaigns of different advertisers? Contemporary radio stations programmed under either of these philosophies are usually prosperous.

One of the most important radio program consultants since the 1980s, Ed Shane, wrote the following while discussing station audiences that are not core to the station:

An essential, of course, is to be able to judge whether there are others in the general audience. A jazz or new age station, for example, may have not only a loyal core, but also may have all the jazz or new age devotees in the market. More than one station has been bitterly disappointed to discover that there was no growth beyond their initial impact (Shane, 1991).

The situation is even more complicated for station clusters, which are now the norm in the major markets of the United States. Large radio groups today may own stations providing every major radio format, perhaps with five or six or more formats in the same market. The issue of which demographic groups a particular station should target with its programming must be answered by program executives and consultants who are responsible for stations with the same format in many cities, even when that format is failing to deliver its assigned demographics in one market served by the group. At the same time, a cluster of stations in any market attempts to use OES strategies to sell combinations of its stations whenever possible. Sales are often the responsibility of an integrated sales management team charged with selling all of the stations in the cluster.

Demographic Factors

Programmers must look at the demographic characteristics of the market as a whole in light of station formats and audiences already present in the market. The economy of the market is another important consideration. For instance, if the market is characterized by rapid home construction and high levels of home buying, the program planner will recognize that sales of products related to home improvement, major appliances, lawn and garden items, furniture, and interior design are likely to be important sources of revenue in the market. If the community hosts a rapidly growing number of small businesses, business-to-business advertising and ads that direct the attention of business managers to office supply websites will be potentially rewarding.

Various radio program materials produce different demographic patterns among listeners. Most music listeners, for example, gain their music listening preferences during the years in which they are becoming aware of popular music,

their teens and young adult years. Although their tolerance for other music may increase over the years, they tend to retain favorites acquired in those formative years. As a consequence, oldies (music no longer in current release but popular with demographic groups socialized to it at a young age) are a major component of popular radio programming. The latest hits tend to be preferred by young audiences, other types of music appeal more consistently to women, and still others are the choice of blue-collar workers.

A programmer's experience will suggest one or more formats that will attract the desired demographic groups in the market. The station will then conduct studies, perhaps by focus group, to determine listener attitudes about these formats and about the lack of certain music or other radio programming in the market. The focus group discussion may explore the preferences of potential demographics for different parts of the day. Listeners to some formats, although enthusiastic about hearing more of their favorite music, may also wish to hear traffic and weather reports at some time of the day. If talk formats are being studied, popular topics for discussion and the behavior of talk show hosts may be explored in focus groups. Increasingly there will also be discussions about the role of commercials in these formats. Should the commercials be concentrated in a small number of breaks in programming? How many commercials in a row are tolerable?

Format Approaches

The radio station program format will consist of a set of principles or rules for assembling programming. Sometimes these rules are relatively simple: (1) three musical selections should be played in uninterrupted succession; (2) a hit should be heard in this musical style four times per hour; (3) an oldie harking back to the birth of this style should be played at least once per hour; (4) titles and performers should be announced both before and after clusters of musical selections; (5) during early morning hours the time should be announced four times per hour; (6) during commuting hours traffic highlights should be presented twice per hour; and so on.

When the programmer has defined the format, a model tape of the format will be produced in which the music to be played is represented by brief excerpts. This makes it possible for potential listeners to hear all elements of a format in a short space of time (perhaps five minutes) while getting a feel for the music to be included. These model tapes are then played to potential listeners in focus group or auditorium settings. The researcher will also play excerpts of programming from competing stations to measure the competitive appeal of the proposed radio format. The same session may also include examples of promotional materials for the station so that those attractive to the station's target demographic groups can be identified.

When a new station format is broadcast, station management will pay close attention to the demographic groups delivered by the station. An important analysis from audience research reports will be the number of minutes an average listener in a target group listens to the station. This statistic is called "time spent listening" (TSL). The programmer hopes that the station's target demographic groups' TSLs are relatively large and that they will grow after a change in format. It is also significant that exclusive audiences (audiences that tune to only one station) will be apparent in the station's target demographic groups. The exclusive audiences will guarantee the station a place in OES advertising plans. Station promotion will be designed to increase the number of listeners in the target groups, and improvements in programming will be intended to increase time spent listening for these demographics.

Many stations use satellite or other syndicated sources for their programming. There is some cost associated with acquiring programming in this way. For a syndicator or satellite music service to remain profitable, a similar sort of demographic research is essential.

Although demographic research was not important in the early days of radio, the role of demographics in both contemporary radio programming and advertising sales has become crucial. Commercial radio stations must command audiences in the demographic groups important to their advertisers in order to ensure their own survival.

Deregulation of Radio

Eliminating Old Rules

Radio deregulation refers both to a specific Federal Communications Commission (FCC) proceeding (1978–81) and to a more general—and continuing—trend of dropping or modifying existing laws, rules, and regulations. Briefly, *deregulation* means to remove or significantly modify existing regulation, either through FCC administrative action or by congressional legislation.

Origins

Contrary to popular opinion, deregulation is not new. Indeed, the basic concept that less government is best is an old shibboleth evident in most aspects of American life. There is a deep-seated feeling that cuts across political lines (or most of them) that competition, rather than regulation, will lead to lower prices and higher-quality products or services. Nowhere is this truer than in an expanding industry with new players clamoring to enter the marketplace.

Combining this background with the economics of government in the late 20th century created the seedbed for radio deregulation. On all levels, government was operating at a deficit for much of the period after World War II. Federal deficits mounted annually, forcing Congress and the executive branch to consider ways of cutting costs—or at least of carefully assessing the benefits of new, let alone existing, rules and regulations. Paperwork reduction became a byword after the 1970s as government sought to root out rules that were no longer needed but expensive to maintain.

When deregulatory consideration was applied to broadcasting, it involved a basic review of the practical meaning of the Communication Act's concept of "public interest, convenience or necessity," which had guided FCC decisions since 1934. As society changed, so did at least some views of what government could or should accomplish. To varying degrees an ideological battle, there was at least broad agreement that government could no longer do everything.

In 1972 FCC Chairman Richard Wiley initiated a search for "regulatory underbrush" that could safely be eliminated without harm to broadcasters or their audiences—and within six years the commission had dropped or modified some 800 mostly minor rules. Many concerned small technical changes, and others reduced reporting requirements. This exercise set a larger process in motion.

Radio Deregulation Proceeding: 1978–81

In 1978 the National Association of Broadcasters (NAB), always seeking ways of reducing the burden of government on

its member stations, petitioned the FCC to consider dropping four requirements that affected radio. These included processing guidelines (used by the commission staff to decide on the granting of new and renewal license applications) that were designed to limit on-air advertising and promote non-entertainment programming. In addition, the NAB wanted the FCC to drop formal program log requirements as well as the complex process known as "ascertainment," which required licensees to learn more about their community of operation (and reflect that knowledge in their programming).

The petition was a good example of perfect timing, for it paralleled the thinking of many staffers in the FCC's Broadcast Bureau. Prompted in part by the NAB petition for rulemaking, the staff undertook its own studies of the radio business, noting especially how many stations had taken to the air since many of the rules had been established. They also developed a somewhat complex economic policy model that served to question the continuation of the rules the NAB targeted.

In September 1979 the commission issued a *Notice of Inquiry and Proposed Rulemaking* concerning the deregulation of radio. Pragmatic in tone, the long notice (80 pages in tiny *Federal Register* type) conceded that with the removal of the processing guidelines on programming there "will be a tendency toward program duplication and imitation" (Paragraph 144). But it also asked whether this would matter, given how many stations were now on the air, including multiple signals in all but the tiniest towns.

Release of the notice brought forth a torrent of public reaction. In the several months allowed for public comments, some 20,000 were filed, filling shelves of notebooks in the Broadcast Bureau's public file room. They were often emotional—arguing that dropping program guidelines would lead to the elimination of religious or some other kind of minority-interest programming or that letting go of the advertising guideline would lead to a flood of commercials on the air. Some claimed that elimination of the logging requirement would remove a useful tool for those who watched closely how well stations performed. In addition, critics held that elimination of the ascertainment rules would lead to even more "plain vanilla" radio, which would sound the same no matter where a facility was located.

The sheer amount of filed comments took the staff nearly a year to process and consider. Early in 1981, after concerted internal debate, the FCC released a *Report and Order* dropping the four radio rules that the NAB had originally proposed be dropped. On the very day of the order's release, the activist office of communications of the United Church of Christ filed

a court appeal and requested that the rule change be stayed pending a final decision. Not surprisingly, the broadcasting industry cheered the FCC decision, restating that the rules being dropped had little to do with program quality or service to listeners.

The U.S. Court of Appeals largely upheld the FCC rulemaking. It remanded for further action one piece of the decision—that concerning the dropping of program logs. The FCC had replaced the logging rule with a requirement that stations develop a list of community problems and programs aired that addressed those problems. The original order called for this to be done annually, and with the court's remand, the FCC made this a quarterly process, with station reports going into each station's own public files rather than being sent to Washington. The change passed muster with the appeals court.

Looking back two decades later, it is difficult to understand the emotions this proceeding created at the time. The issues now seem small and marginal, though at the time many critics saw the FCC decision as a watershed. For if the commission no longer concerned itself with the content that radio stations provided, what was the point of regulation, and what would happen to the industry? How could licenses be issued in the public interest if there was no longer any effective measure of what the public interest was? How could people complain about and seek to improve local station practices if the prime tools they had used previously (the station's local market ascertainment study or composite logs showing a typical week's programming and advertising) were eliminated? These critics argued that the new "problems and programs" listing would not be much use, certainly not in the way the old rules had.

Continuing Deregulation: 1980–2000

The 1981 rulemaking applied only to commercial radio. However, in parallel rulemakings commenced in 1981, the FCC eventually dropped the same four rules for noncommercial radio in 1984, and for television stations a year later. As many had predicted and others had feared, the radio deregulation proceeding paved the way for more substantial actions in the years that followed.

At virtually the same time, the FCC dropped its long and often complex license renewal form, replacing it with a mere postcard with a handful of easy-to-answer questions. Where stations had previously often filed a box of material, the simple postcard itself would often suffice now. Congress joined in the process, lengthening radio station licenses from three years to seven in 1981, and to eight in the 1996 Telecommunications Act. And beginning in 1982, licensees could buy and sell stations like any other property when the FCC dropped its "anti-trafficking" rule, which had required that licenses be held for at least three years before they could be sold.

Many rules were not as emotionally charged. Beginning in 1981 the FCC steadily reduced its former requirements on how much engineering expertise a station needed to maintain. Reversing its traditional approach, the commission argued that as long as a station was not creating interference to others, how good or how poor its own signal was would be better regulated by marketplace competition than by stiff rules. A station with poor-quality signals would rapidly lose audience and advertisers. A boon especially to smaller stations, the relaxed rules allowed them to share engineers or merely to have one on call rather than on the premises.

Higher on the emotional scale was the 1987 elimination of the FCC fairness doctrine. The decision made clear that licensees were the absolute authority on what issues and points of view they aired. Another shibboleth collapsed in 1992 when the FCC first allowed an owner to control more than a single station of each type (AM and FM) in a given market. This spelled the end of the long-established "duopoly" rule, created in the 1940s when there were fewer than 1,000 stations on the air.

The 1996 Telecommunications Act included provisions making it very difficult to challenge a broadcast license (such a process had briefly become a sport in the late 1960s and early 1970s, though few stations actually lost their licenses). The FCC would now have to find the incumbent licensee undeserving of a continued license before it could even consider a possible challenger.

The same act greatly expanded the number of stations anyone could own. In the 1940s the FCC had created de facto rules allowing ownership of no more than seven AM and seven FM stations nationally. As the industry expanded, so did pressure to raise those admittedly arbitrary limits. Finally, in 1985, the FCC increased them by five stations each—to 12 and 12. The limits rose again in 1992, to 18 and 18, and to 20 and 20 by 1994. With the 1996 Telecommunications Act, Congress eliminated any national cap on radio station ownership. By the turn of the century, the largest radio owners controlled nearly 1,200 stations.

Did all of this deregulation change the face of radio broadcasting? Certainly the economic and structural changes concerning ownership have considerably modified what was once a business of many small groups or individual owners. But the evidence remains inconclusive that elimination of the FCC's radio license processing and content rules two decades ago made any difference that competitive pressures would not have brought about anyway.

Desert Island Discs

BBC Music Program

The *Guinness Book of Records* states that *Desert Island Discs* is the longest-running music program in the history of radio. The BBC Radio 4 program is the third longest-running radio program in the world, after *The Daily Service* (1928) and *A Week in Westminster* (1929). The program was devised and copyrighted by Roy Plomley, who began his broadcasting career in 1930s commercial radio on the station Radio Normandie. The original program was expected to be a series of six episodes with the first being transmitted on 29th January 1942. Since that first episode, thousands of celebrities—from members of the British royal family to prime ministers and stars of stage, screen, and television—have taken part in this long-running hit program that takes the form of a sort of parlor game. In the game, guests must talk about themselves, select eight pieces of music, and imagine that they are to be stranded on a desert island Robinson-Crusoe style, taking with them only a book, a record, and some luxurious inanimate object.

Culturally, *Desert Island Discs* represents a history of British social convention and the British perception of "celebrity." It is also a symbol of British public radio's function throughout the second half of the 20th century and continuing into the 21st. Certainly its longevity has been used by the British Broadcasting Corporation (BBC) to symbolize the BBC's role in British popular culture and social life. A BBC Television 2 program produced by Alan Yentob in 1984 marked the *Desert Island Discs*' 40-year anniversary, and Monica Sims, then BBC Radio 4 Controller, was filmed at a reception for members of the U.K. arts community proclaiming: "All of us, whether we are eminent or not, all feel we are potential castaways. We all have eight favorite records. . . Roy had always tried to get the best out of people." Ten years later the same television program was repackaged with film of the third host of the radio

show Sue Lawley with the then Prime Minister John Major as castaway. This served to symbolize the BBC's importance in public life as well as ingratiate the Prime Minister by offering a soft and personal side to his character. As his castaway luxury he selected the Oval Cricket ground with a bowling machine. From 1988 Sue Lawley and her producer Olivia Seligman introduced a political and current affairs dimension to the program's content. During Roy Plomley's direction politicians were a rarity largely because "There is a drawback in inviting politicians to broadcast. . . Unless it is in a news or political program, one is not allowed to discuss politics, and there doesn't seem much point in interviewing a politician if you can't discuss the subject dearest to his heart."

The change in political edge after Plomley's death was also reflected in the program's editorial migration from light entertainment to news and current affairs. The emphasis on news-related interviews served the BBC's objectives at that time to achieve greater public relations with its broadcasts and to increase audiences. It could also be argued that this trend reflected the developing notion of politician as celebrity. Politicians or individuals with controversial political views would inevitably prefer the *Desert Island Discs*' format because its structure of music selection was more entertainment orientated than politically focused.

In his book on the program, Roy Plomley theorized about the reasons for the program's success: "I believe *Desert Island Discs* adds a dimension to a listener's mental picture of a well-known person, giving the same insight he would receive from visiting the celebrity's home and seeing the books, pictures and furniture with which he surrounds himself." Sir Paul McCartney said the program "conjures up traditional British pleasures like the Great British Breakfast, Billy Cotton's Band Show—

very downbeat, very relaxed. I love its homeliness." The program's first producer Lesley Perowne said, "The reason people liked it so much is curiosity. I think everybody wants to know the private tastes of public people and this was a very good way of doing it." The host since 1988, Sue Lawley, believes the program's success is based on "marrying music with conversation and thereby creating life." A cost-conscious BBC executive who had to concede the copyrighting of the format to Roy Plomley asked "Why didn't we think of it before?" Comedian Arthur Askey, who holds the record for being the only four-time castaway, stated, "It's such a simple idea. That's part of its success. It's a wonder that somebody hadn't beaten Roy to it." Conceptually, radio throughout the world has established similar programs because of the popular appeal of the structure and the method of satisfying listener curiosity. But the endurance of the program on the BBC Home Service and then BBC 4 is attributable to the social stability of the audience, the continuity of license fee funding, and the need to maintain the audience-drawing component in cultural speech programming. The program is aired in the U.S. on some public radio stations. The BBC has a longstanding policy of syndicating its programming in partnership relays with public networks such as PRI and NPR.

Despite its light atmosphere, which was always encouraged by Roy Plomley's ritual of lunching guests at the Garrick Club before their interviews, there have been moments of poignancy and profound revelation of character. The concert pianist Artur Schnabel said that despite playing in practically all the countries of the world, he refused to play in Germany: "I don't go to Germany out of respect for the dead. Unfortunately among the dead is my whole family." This contrasts with the bitter controversy of Sue Lawley interviewing the widow of British anti-Semite and Fascist leader Oswald Mosley in 1989; Diana Mosley used the program to express disbelief that the Nazis had murdered 6 million people.

The program has also produced unforgettable moments of drama and wit. When Tallulah Bankhead was asked how good a Robinson Crusoe she would be, she replied, "I can't even put a key in the door darling. I can't do a thing for myself. I never stand up if I can sit down and I never sit down if I can lie down." When British comedian Frankie Howard was asked how he would endure loneliness he replied, "It's better than the alternative"; when Plomley asked, "What's that?" Howard replied, "Dead."

John Kenneth Galbraith responded to the same question with "The whole idea doesn't appeal to me at all. I'm not especially gregarious. I can get along with my own dismal personality for a little while. I would hate to endure it for any length of time."

Other castaways had a pessimistic view of the isolated life on a desert island. Artur Schnabel selected as his inanimate luxurious object a loaded revolver, Maureen O'Sullivan asked for tranquillizers, and Jonathan Miller wanted to take with him a cutthroat razor.

In March 2002 the BBC sought to celebrate 60 years of the program with an anniversary celebration gala of music at the Royal Festival Hall in London. The event was recorded for radio and television transmission. Presenter Sue Lawley introduced a selection of music chosen by castaways down the years before an audience of 2,500 people. However, the event did not turn out to be a public relations success. *The Sunday Telegraph* called it "The Gala from Hell" and the reviewer for the *London Times* pointed out that the complex pageant defied the secret of the program's success, which was simplicity. Despite these negative reviews, the BBC could argue that celebrating 60 years of *Desert Island Discs* in this way generated media coverage that has helped embed the program into popular cultural folklore.

Developing Nations

Radio's Role in the World's Poorer Regions

Even in these days of instantaneous satellite communications and expanding cyberspace connections within and outside of the world's poor and industrializing nations, radio remains the medium with the largest global audience because of its ability to reach diverse and remote rural populations, the illiterate, those with little access to education, and those who have no electricity. Cheap radio sets are within the reach of even the poorest communities, if only at a local gathering place. As a result, radio has been and continues to be used extensively for development purposes, clandestinely by dissidents seeking to circumvent or overthrow governments, and more popularly as a vehicle for the dissemination of cultural and informational programming.

Historical Underpinnings

Development Radio began in most Third World countries while they were still colonies of one of the European powers. Colonial systems were operated largely for colonists, and closely followed the pattern and programs of radio "at home." Such facilities became the initial basis of national radio systems as colonies became independent nations.

In the decades following World War II, the major industrial powers divested themselves of most of their colonies. Radio has been used in these new nations in both crude and sophisticated ways to educate people, to propagandize them, and/or to involve them in grassroots development projects. In the 1960s the traditional practices of peasants in the developing world were targeted for change by Western development experts interested in the diffusion of innovations in agriculture, in education, and in industrialization. Their assumption was that use of radio and other media would assist and speed up the broader development process.

Persuasive communications were seen as key to the adoption of technological innovations, which were to lead directly to individual and national development. The introduction in the late 1950s of transistorized radio—cheap, portable, and not requiring electricity—made it possible to broadcast programs about what were seen as modern practices that would help the masses break free of stagnant traditionalism.

Since then, however, much research has refined and changed this simplistic and value-biased dominant paradigm of what development is and how it is to be achieved; research has also indicated the limitations to what were previously seen as direct, powerful, and uniform media effects on individuals. In the 1970s, for example, Third World scholars,

with what was to be termed a "dependency" view, took issue with the style and manner of Western-dominated development programming. External variables such as neocolonialism, top-down decision making, and lack of basic needs were taken into account, as were internal structural and political constraints such as land tenure systems and inefficient or corrupt government bureaucracies. Consequently, by the 1980s much radio programming addressed basic development projects designed to extend scarce resources and educational opportunities to remote and rural areas. Other factors in this change included the active participation of people at the grass roots; attempts at equity in the distribution of information; and the meeting of basic needs such as food, clean water, and education.

At the root of these newer perspectives was the recognition that the mass media in general, though still an important component in development, was not a magic means for implementing change. In addition, with illiteracy still rampant, print media were limited in their usefulness. Television was expensive to produce and disseminate. Computers with internet connection are for the privileged few. So radio, with its portability, low cost, and its accessibility for the illiterate and uneducated, remains the medium of choice for developing countries. Although much work has gone into using television, traditional media, and newspapers, development programming has focused on radio. This inexpensive and flexible medium continues to be the most frequently used of all the mass media in development projects. Radio is by far the most diversified and dispersed of the media, and its programming is the least expensive to produce.

Government Initiatives

The first act of government in new nations liberated from colonialism often was to set up national radio stations, which were seen as an integral part of propaganda and education efforts. These stations, typically in the national capital, are still seen as so important that they are often the first facilities to be occupied by rebels in any attempts to overthrow governments.

In addition to exploiting radio's potential as a conduit for propaganda, Third World governments have used radio to stimulate national integration in former colonies that have artificial borders encompassing many ethnic and language groups. National networks can simultaneously relay national news and programming in different languages across vast distances. Programming of national sporting events, or of tradi-

tional and indigenous music, is seen as a powerful integrator and reinforcer of national identity.

Radio broadcasting also has been used at both national and regional levels to disseminate information about government development projects. Official messages are transmitted countrywide in many local languages. Programming can run the gamut from official news and policies, to information about agricultural innovations, to music programs.

Often, educational programming on radio is supplemented by other media; for example, a program about family planning can be followed up with printed matter and audiocassettes and with visits by government workers to reinforce the initial message and to organize community discussions to build consensus. In addition, social marketing organizations can broadcast entertaining forms of programming. Mini soap operas, for example, have been used to promote nutritional beverages that counter dehydration in infants with diarrhea.

Considerable programming has been produced for rural farmers in an effort to motivate them to adopt specific agricultural innovations, such as the use of improved corn seed and fertilizers.

In recent years, however, as world lending institutions have insisted on open markets and democratization, many of these Third World government radio systems have been opened to commercial interests, which has resulted in less programming for development purposes.

Private Initiatives

Although governments have generally used radio to inform their populations about development projects, by contrast, development media planners in recent years have turned to community media rather than national systems. Programs are designed and carried out by members of the community. In the late 1970s, for example, project planners turned to farmers to produce programs for other farmers. In one such project, tape recorders and blank tapes were provided to volunteer workers, who in turn helped local people produce items for weekly broadcast. Some of these initiatives, however, had political ramifications in authoritarian countries and were therefore short-lived or heavily censored.

At the turn of the millennium, radio initiatives funded by international aid organizations such as UNESCO predominate. The creation of local rural radio stations coincided with the deregulation of national telecommunication monopolies, especially in Africa. Some current examples include the following. In Kenya, an "English in Action" program provides quality programming for secondary schools with few resources. In Papua New Guinea, a radio science project helps teachers improve basic education. In Mongolia, an informal distance education system provides learning opportunities to the

nomadic women of the Gobi desert. In Suriname, community stations encourage dialogue among women and link communities in the interior through a network of interactive telecenters. In the Philippines, local radio allows people to express themselves on political, economic, and cultural subjects. In El Salvador, women tune in for a broadcast that informs them about their rights and encourages their involvement in the community. And in Somalia, where most media operations were destroyed during the civil war and those that remained were clan owned, a nonpartisan media organization produces programming on peace issues.

Radio as Popular or Dissident Medium

Audiences living under authoritarian rule continue to tune in to clandestine radio broadcasts by dissident or revolutionary groups seeking to overthrow a government. The aim is to persuade citizens and elicit their participation in the cause, as well as to damage the legitimacy of a regime. However, pirate stations usually have very little reach and must constantly move operations to avoid imprisonment or even execution.

Listeners who live in countries without a free press depend on external broadcasting to get their news. In authoritarian regimes in Africa, for example, listeners with shortwave radios still turn to the British Broadcasting Corporation (BBC) for reliable and accurate news about internal unrest. Before the end of apartheid in South Africa, broadcasts from the bordering nations of Zimbabwe, Namibia, and Botswana kept the oppressed South African majority informed of world condemnation of apartheid and of dissident activities.

Those Third World countries with a free press often also have lively programming on both national and private radio stations. Call-in shows are a particular favorite, although participants are limited to those living in or near cities. Jamaica's talk shows are one lively example.

Finally, as new computer technologies allow radio broadcasting over the internet, new concepts of radio programming are being formulated. For example, the Feminist International Radio Endeavour, based in Costa Rica, has for the past decade produced daily live shortwave broadcasts for and about women in the developing world. In 1999 Realaudio programs in English, French, and Spanish were made available on the internet. In addition to these non-profit programs, private commercial initiatives such as WorldSpace are sending digital audio programs via satellite.

Diary

Method of Audience Research

As the name suggests, a diary is a paper booklet in which a person is asked to record his or her listening to radio or television programs, noting when listening started and stopped, which station the set was tuned to, and other comments. A diary is typically used to record one week of listening, then returned for tabulation. Radio audience estimates, usually called ratings, are based on the tabulation of information obtained from these diaries.

Origins

In the medium's early days, many radio set builders and listeners were not interested in hearing specific programs so much as listening to as many different stations as possible. This "channel-surfing" was called DXing—an abbreviation for distance. DXers kept track of the stations they heard in log books that recorded when they heard a station, the frequency and/or call sign, slogans, programs, and the city of origin. Some computed the distance to the stations they heard, and there were contests sponsored by radio clubs and radio magazines with prizes given to those who compiled the most stations and greatest total distance. Although the diary method existed in the early days of radio, until the rise of television diary-keeping was not the mainstay of radio audience measurement.

The first systematic audience research using diaries was done by Professor Garnet Garrison at Wayne (later Wayne State) University in 1937, though he called it a "listening table." Garrison, who later taught for many years at the University of Michigan, was working on an "experiment developing a radio research technique for measurement of listening habits which would be inexpensive and yet fairly reliable." He noted that other methods most widely used at the time were

the telephone survey, either coincidental or unaided recall, personal interviews, mail—sometimes called fan mail—analysis, surveys, and "the youngster automatic recording." He said that he had borrowed something from each method; since the listening table could be sent and retrieved by mail, it included a program roster, and was thought to be objective. The form he used was a grid from 6 A.M. to midnight, divided into 15-minute segments, that asked respondents to list stations, programs, and the number of listeners. Garrison concluded that "With careful attention to correct sampling, distribution of listening tables, and tabulation of the raw data, the technique . . . should assist materially in obtaining at small cost quite detailed information about radio listening." While his methodology was not adopted for about a decade, Garrison's "listening table" is essentially the way radio audience estimates are obtained to this day.

The Columbia Broadcasting System experimented with diaries in the 1940s but apparently thought the data was most applicable for programming research, for which it also used the program (or Lazarsfeld-Stanton) analyzer. CBS used information from diaries primarily to track such things as audience composition, listening to lead-in and lead-out programs, and charting audience flow and turnover. In the late 1940s, C.E. Hooper also added diaries to his telephone sample in areas that could not easily be reached by telephone. But this mixture of diary and coincidental data was never completely satisfactory. Indeed, one of the reasons for Nielsen's Audimeter winning out over Hooperatings was that the telephone method was confined to larger metropolitan areas, where TV first began to erode the radio audience. Hence, Hooper (unlike Nielsen) tended to understate the radio audience and therefore quickly lost the support of radio stations.

Arbitron Diaries

It was not until the end of the 1940s that diaries were introduced on a large-scale basis for providing syndicated audience research. James Seiler, director of research for the National Broadcasting Company's station in Washington, D.C., had for several years proposed using diaries to measure radio. NBC finally agreed to try a survey, not for radio, but for its new TV station in the market, agreeing to help pay for several tests. Seiler set up his own ratings service company in Washington and called it the American Research Bureau. He thought the name sounded very official, even patriotic. Later the name was shortened to ARB, and then to Arbitron when instant television ratings in larger cities were gathered electronically.

The American Research Bureau's first report was based on a week-long diary that covered 11–18 May 1949. By that fall, the company was also measuring TV viewing in Baltimore, Philadelphia, and New York. Chicago and Cleveland were added the next year. In spite of covering more markets the company grew slowly as both TV and the new diary method gained acceptance. Diaries were placed with TV viewers identified by random phone calls. From the beginning, Seiler was careful to list the number of diaries placed and those "recovered and usable." Also, "breakdowns of numbers of men, women, and children per set for specific programs [could] be furnished by extra tabulation."

Tele-Que, another research company, began diary-based television ratings in Los Angeles in 1947. In 1951 Tele-Que merged with ARB, thus adding reports for Los Angeles, San Francisco, and San Diego. During the 1950s ARB emerged as the prime rival to Nielsen's local TV audience measurement, especially after 1955 when it took over the local Hooper TV rating business. By 1961, ARB was measuring virtually every TV market twice a year and larger markets more often.

Local radio reports using the diary method were begun by Arbitron in 1965, nearly a quarter of a century after Garnet Garrison had recommended the method for the audio medium. Arbitron quit the TV measurement business in 1993 and now confines itself to radio.

The diary used by Arbitron today is not much different from the one used more than 50 years ago for television stations. Arbitron now measures more than 100 radio markets continuously and provides monthly ratings for about 150 areas for eight or more weeks each year. Diaries are still placed by phone call, then sent and retrieved by mail. A diary is sent to each member in the household who is 12 or older. The diary format asks the respondent to indicate each time she starts and stops listening to the radio, the call letters or station name, and suggests that if she is not sure of the call letters or station name, she should write in program name or dial setting. Respondents must also indicate whether the station is AM or FM and whether they are listening at home, in a car, or some

other place. At the back of the diary are questions about age and gender for audience composition tabulations and other questions, typically on product usage.

While most diaries are still placed by telephone calls, special care is taken to place diaries personally in Spanish-speaking homes and residences in high-density ethnic areas. After careful editing of the diaries' listening reports, audience estimates are published for each market in a "ratings book" and are available online to subscribers for other detailed analysis. In transferring diary entries into computer data, the operators have a number of aids and checks in the computer program that allow them to check the accuracy of call letters in each market and other information. Some radio programmers like to go to Arbitron offices near Washington, D.C., to study the diaries. Images of all entries are available and can be sorted to observe them in many different categories. By examining actual diaries, programmers or a consultant hired by a station can determine whether people remember call letters or station slogans correctly. Often diary keepers write other comments that might be helpful. More detailed statistical analysis is possible by consulting the ratings book online, which allows subscribers to tabulate persons in the sample by any or all demographic categories. Such manipulations of data allow computation showing favorite station, sharing listeners with other stations, audience in zip code areas, the time spent listening to one station, and other categories, to name just a few.

Advantages

As envisioned by Garnet Garrison, diaries offer some significant advantages that account for their popularity. They offer a relatively inexpensive method for gathering a lot of information over the weekly period. But there are problems associated with the method. Responses—the rate is reported in each rating book—are often from only half of the sample. Younger males, for example, have a low return rate. Since the listeners who are more likely to keep a diary and provide accurate information are also likely to listen to some formats more than others, there is continuing controversy about rating results. Recently the growing use of telephone answering machines, cell phones used out of the home, and other factors make it harder to obtain diary keepers. Nonetheless, millions of diaries recording radio listening and TV watching are processed each year, and the broadcasting industry, advertisers, and advertising agencies depend on (and pay a high price for) the information obtained from a very simple little book that has been around for quite a long time.

How much longer the diary method will be used is not clear. Arbitron, in cooperation with Nielsen Media Research, is testing a small personal recorder that people might carry to keep tabs on all the wearer's electronic media use.

Digital Audio Broadcasting

Replacing Analog Radio Stations

Several different digital radio standards or systems are being operated in different parts of the world. The system that has been in development the longest and that is in full-time operation in the most countries is called EUREKA 147. In the United States, which only selected a national digital standard in 2002, the phrase “high-definition radio” was coming into use by 2003 to suggest a parallel with developments in digital television. This entry surveys digital audio broadcasting (DAB) developments in Britain, Scandinavia, and the United States, with reference to other regions of the world as well.

DAB Basics

Digital audio broadcasting may be seen as the third stage in the use of the electromagnetic spectrum to transmit radio broadcasting services after analog AM and FM, both of which are prone to interference. In AM’s case this is caused by static and other unwanted signals, by sky waves reflected from the ionosphere, and by other stations on the same or nearby frequencies. FM’s main problems stem from unwanted reflections from high-rise buildings and other objects that cause what engineers term multipath distortion.

There are probably about 2.5 billion receivers with AM or medium wave reception capability in the world. Despite the expansion of FM, AM remains the most widely available means of reception. Both national and international radio broadcasters continue to rely on AM for much of their transmission requirements. The capacity of AM’s medium waves to reach beyond horizons and thus much further than FM transmitters makes it essential and irreplaceable. For many countries, DAB is too expensive because a complex and extensive transmitter network is required.

DAB represents a major break with this analog technology. Like all digital systems, it converts the original material into streams of “zeroes” and “ones”, which are then reconverted to recreate the original information. DAB, and specifically the EUREKA 147 system, differs from earlier digital systems in being capable of transmitting over a number of different “platforms,” including both terrestrial (land) and satellite (delivering services either separately or jointly) and over a large section of the electromagnetic spectrum: from 30 MHz to 3 GHz for mobile reception, and higher for fixed reception.

DAB can be accomplished in any of three ways: (1) in-band, on-channel (IBOC) or in band, adjacent channel (IBAC) using existing AM and FM terrestrial frequencies (actually blank spaces between frequencies); (2) terrestrially over another broadcast band (S-band in the United States and L-band elsewhere); and (3) by satellite digital audio radio services (SDARS), which bypasses terrestrial broadcasters by sending signals directly to consumers. (*See separate entry*, Digital Satellite Radio.)

The main advantages of DAB, compared with analog radio broadcasting, are many. First, DAB produces a much closer (technically accurate) replication of the original sound reproduced by the receiver, together with easier/automatic tuning than analog techniques.

Second, DAB is more efficient in its use of the radio spectrum and has a lower power requirement. Using the “multiplex” system, a number of radio transmitters carrying multiple signals can “overlap” on the same frequency—if broadcasting the same material. A “single frequency network” means that only one frequency needs to be used to cover a wide area—including a whole country. This compares well with the amount of spectrum needed for analog services. The overall digital sig-

nal is produced by 1,536 “carrier frequencies” that are distributed over a 1.5-megahertz band. The majority of these carriers are noise-free, and this, coupled with error-correction techniques, means there is no interference to any of the services.

Third, there is at least the potential for many more services in the same spectrum, compared with analog transmissions. This is because the total digital “bit rate” available on the single frequency—1.2 megabits—can be “sliced” in an almost limitless number of configurations, so more services can be “squeezed” into the same part of the spectrum. However, there is a widely accepted minimum bit rate per second (bp/s) thought to be necessary to provide acceptable quality of either mono or stereo transmissions, and a lower rate to be used for text, graphics, and pictures without causing distortion or interference.

Finally, material other than sound can also be transmitted with the “radio” signal, because many other types of media can also be converted and then reconverted in roughly the same way. Thus digital methods can transform sound broadcasting into a multimedia system.

The main *disadvantages* of digital radio broadcasting are the following: first, a variety of different systems are being developed (unlike AM or FM, there is as yet no agreement on a worldwide standard); second, one transmitter serving a number of different radio services on one multiplex means that less well established, independent organizations are likely to be excluded; finally, listeners will have to buy new radio receivers that are at least initially significantly more expensive than those for analog systems. Indeed, the total consumer expense for this technology will be vastly larger than what stations have to pay out.

EUREKA 147

The earliest digital radio system to reach adoption was the European EUREKA standard. The main reason for its development was to provide a new, distinct outlet for the European consumer electronics industry, which had been overshadowed by those in Japan and other “tiger” economies of the Far East. The name “EUREKA 147” derives simply from the prosaic fact that it was the 147th system to be developed under the umbrella of the EUREKA project, which was launched by 17 countries and the European Commission in 1985.

Work on a possible DAB system began in 1981 at a research institute, the Institut für Rundfunktechnik. The original base of the EUREKA 147 project and its main participant was a (West) German research institute—the DLR Projektträger Informationstechnik in Cologne. Both Germany and France contributed 36 percent of the costs of the project, the United Kingdom just 6 percent.

By 2003 the World DAB Forum indicated that some countries around the world were operating a DAB system using the

EUREKA standard. Outside Europe, the system is particularly well developed in former British colonies, notably Singapore, Hong Kong, Australia, Canada, and India. China is also operating the system, and thus the two most populous countries in the world have committed themselves to the “European” standard. One of the main advantages claimed for EUREKA is that it can be transmitted on all the main broadcasting platforms, terrestrial and satellite—the latter clearly important for covering large and sparsely populated areas, such as Canada and Australia, and over a large number of frequency bands.

Digital Radio Mondiale

Although EUREKA is undoubtedly the most developed and operationally established DAB system, several others are either in operation or are close to being so. A system developed by a private United States-based company, WorldSpace, designed for international broadcasting to developing countries by satellites, became fully operational in 1999, but the system requires new transmitters and, most significantly, new and completely different radio receivers. There is also a system for transmitting shortwave in digital form, called Telekom-TELEFUNKEN-Multicast, which was developed in Germany. These systems can be transmitted alongside current analog services on the same parts of the radio spectrum and may be converted by receivers requiring relatively little modification.

Another system comes from a consortium called Digital Radio Mondiale (DRM) and is designed primarily to complement AM broadcasting; this system was originally also developed as part of the EUREKA projects. DRM is a worldwide consortium of broadcasters, receiver and transmitter manufacturers, transmission companies, regional broadcasting unions, and research institutes. It is coordinating the development, standardization, and market roll-out of the system from 2003 onward. While the original drive came mainly from international shortwave broadcasters, the consortium now involves both domestic and international radio companies. Beginning in 1998, work proceeded very quickly and system development was completed during early 2001. In April 2001 the International Telecommunication Union (ITU) approved the DRM system for analog AM broadcasting. The DRM system overcomes the many defects of analog broadcasting—especially its often poor sound quality, fading, and interference. It is capable of greatly increasing the audio and reception quality, making it similar to good FM.

As with other digital technologies like DAB and the WorldSpace system, provision of supplemental program information or other information independent from the program is possible. It will also be possible to manufacture receivers in such a way that there will be no more need to search for alternative frequencies. The name of a station would be sufficient to receive the wanted program. The receiver will automatically

retune and change the frequency to the best one for the respective station chosen. This will be especially important for the many stations in Africa, Europe, and Asia that operate on several different AM frequencies.

DRM was established as a worldwide consortium to develop a single system for digital broadcasting in the frequency bands below 30 MHz. The formal inauguration of the group took place in Guangzhou, China, in March 1998. It is a not-for-profit organization registered in Switzerland with a single goal: to bring affordable, digital sound and services to the world radio market. By mid-2001, DRM had 69 members from 27 different countries. A project office is located in Geneva.

A second proposal, from the United States, was also designed specifically for medium wave broadcasting. Developed by USA Digital Radio (which later merged with Lucent to form iBiquity), it takes a different approach from DRM, requiring 30 kHz high frequency channels. DRM and USA Digital Radio were cooperating so that listeners could receive both systems with the same receiver. However, since the merger with Lucent this cooperation has come to a halt, and it will be up to the receiver manufacturers to decide which system will be implemented. Only the DRM system fulfils all the ITU requirements for long-, medium- and shortwave, and will therefore be the replacement of the analog broadcasting system below 30 MHz in the future.

DAB in the United Kingdom

In the United Kingdom, the development of DAB using the EUREKA 147 standard has been slow—certainly in the commercial sector. The BBC began full test transmissions in September 1995. Within the frequency spectrum allocated by the U.K. government to DAB (217.5–230 MHz), there is room for seven frequency blocks; two of these have been allocated for national radio coverage, one for Independent National Radio services and one for BBC national services. The remaining five multiplexes have been allocated for local/regional radio services, to be awarded by the Radio Authority (which regulates and licenses U.K. commercial radio).

The national commercial multiplex, run by a consortium called Digital One, carried up to ten services—simulcasts of the three national commercial stations, plus a classic rock station, a spoken word service featuring readings of books and plays, and a middle-of-the-road music station. The roll-out of Digital One's network of transmitters happened faster than those for the BBC's national DAB multiplex—quickly reaching 85% of the U.K. population. However, there were setbacks, as the suppliers of a radio version of the Independent Television News (ITN) rolling news service, and of finance and business channel Bloomberg, pulled out of the multiplex, which meant that by the end of 2002 two channels were

broadcasting nothing more interesting than “tone.” In addition to the national multiplexes, over 45 licences for local and regional services were expected to be issued by the beginning of 2004—each offering a “bouquet” of services, including simulcasts of FM and AM services. Of the “digital only” services, typically about three of these would be stations broadcasting in other parts of the country as well as, usually, two or three which have been created specifically for the DAB system in that area. In all, over 300 digital services were being offered on U.K. DAB transmitters.

There was a huge incentive for the commercial services to pay for their analogue services to be available on the DAB “platform”: if they did so, the 1996 Broadcasting Act compelled the sector's licensing body and regulator, the Radio Authority, to automatically renew their analogue licenses, which would otherwise be re-advertised every eight years. A Communications Bill—scheduled to become law by fall 2003—extended a further renewal period to 12 years, meaning that those investing in DAB transmission would have their analogue licenses on a 20 year lease. With FM licenses at a premium and otherwise liable to intense competition, the cost of simulcasting on DAB seemed a relatively small price to pay for the knowledge that their main services were secure.

An amendment to the 1996 Act of Parliament allowed the commercial operators to double the percentage of the multiplex “cake” used for non-audio services. This opened up increased possibilities for the development of commercial text-based services. Unlike the internet, the number of consumers downloading such services on DAB receivers is unlimited and does not increase the cost to the supplier, so this seemed likely to be an attractive additional source of revenue for the commercial operators.

Although no such financial incentive was on offer to the BBC, the Corporation's enthusiasm and commitment to DAB remained undimmed—although some senior managers were on record stating that, with hindsight, they had probably invested in it too quickly and too heavily. By the end of 2002 the BBC's national multiplex was offering simulcasts of its five national networks; plus the BBC World Service; an extra sports channel; a new music channel—6 Music—featuring rock sessions from the BBC's archives and pitched at the “young middle aged” audience; BBC 7 playing archive comedy and drama programs plus original, new programming, for children; and the BBC Asian Network. All of these include scrolling text showing program information and news and sports headlines as appropriate.

Despite the proliferation of program services, however, the take-up of digital radio receivers was slow and patchy, with industry estimates that only about 60,000 DAB sets had been sold by the summer of 2002. The main reason for the apparently unenthusiastic response from the listening public was price—manufacturers and campaigners for DAB were caught

in a classic economic dilemma: where only a relatively few consumers were prepared to pay several hundred pounds for a DAB receiver, large-scale, and therefore cheaper, production of the electronic chips and sets required mass sales. The early models for home use were designed for the high end of the consumer hi-fi market and therefore appealed to a relatively small number of enthusiasts with high disposable incomes.

The introduction of the first sub-£100 portable (designed only for plug-in use) receiver in the middle of that year led to a more than doubling of DAB radio purchases in the crucial run-up to Christmas. Indeed, consumer demand far outstripped supply with customers being put on waiting lists. At least one manufacturer brought out a portable combined DAB radio and CD player, and DAB radios available for automobiles expanded and became cheaper, lighter, and easier to fit.

By the spring of 2003 at least two small, battery-powered sets using third generation DAB chips were on the market. The integration of DAB receivers into cell-phones seemed imminent (several models already incorporated an FM receiver, with 2 percent of adults listening to radio via their cell-phone) and key manufacturers were promoting DAB receivers. Crucially, the BBC began to heavily promote its DAB (only) services, with program listings included in the best-selling magazine the *Radio Times*—published by the Corporation's commercial arm—and a major on-air promotion on both radio and TV in the summer of 2003. Continued support for DAB from national government was made explicit when the Secretary of State for Culture, Media and Sport (at a meeting of the Social Market Foundation in March 2003) praised the BBC and commercial sectors for putting aside their normal rivalries for a common development and promotion of DAB and said this had helped ensure that digital radio was not only “a great British success story” but that the U.K. was the most advanced country in Europe in its development. (In fact, Sweden could probably claim that title, certainly in terms of population coverage.) The Minister also opened the possibility of a date for switching off analogue radio transmitters.

One rather unexpected phenomenon was a considerable increase in radio being consumed through television. All the digital TV platforms—terrestrial, satellite, and (most) cable—allowed a range of radio services, usually including all the national DAB services. Most significant of these was probably the re-launched national TV digital terrestrial service—with financial backing by the BBC—which allowed consumers to watch and listen to a range of free-to-air services received through the “normal” TV aerial. This meant that hundreds of thousands of consumers, who were reluctant to pay for satellite dishes and subscription fees and were certainly unlikely to be “early adopters” of DAB radio sets, were now exposed to the DAB stations. By the end of 2002, 16 percent of U.K. adults—nearly 8 million—were listening to radio services via their TV.

All the national DAB services—BBC and commercial—were “live streamed” on the internet. Although reliable figures for individual services were hard to come by, it was estimated that around 12 percent of adults listened to “streaming” radio via the internet in a typical week, although much of this was to services originally created for analogue radio. Several DAB receivers were developed for plugging into computers. Indeed, some of the DAB non-audio services were developed specifically for this sort of integrated use. As well as seeing the scrolling text and program information available on “normal” DAB radios, a range of other information and web links were also presented on screen.

The link with the internet and the increased possibilities of interactivity between broadcaster and listener, as well as the integration between the different media, seemed likely to be a trend that was both increasing and intriguing. In early 2003 the MXR consortia—a joint venture between Chrysalis Radio, Capital Radio, Jazz FM, and the Guardian Media Group—announced an agreement with U.S.-based technology firm Command Audio to launch “on-demand audio.” The facility will allow listeners to their DAB multiplexes to listen to local news, sports, travel, and business bulletins whenever they want. The ability for individual DAB listeners to “rewind,” to “time-shift” programming elements, had for some time been one of the promised benefits of the technology.

All of this raised fascinating questions about the nature of radio as a medium and its relationship to the audience. Broadcasters had to consider the different ways that DAB was being consumed (through DAB radio receivers, TV sets, online, and over cell-phones), as well as the implications for this in their programming and marketing.

The United Kingdom's 1996 Broadcasting Act and the Radio Authority's interpretation of it has resulted in the geographical and population areas of local digital licences broadly matching the existing coverage areas of analog broadcasters. The effect of this is to greatly restrict the flexibility of the system: as with analog broadcasts, separate services cannot be broadcast on the same frequency, and there has to be sufficient distance between transmitters broadcasting different material on the same frequency to avoid mutual interference. At the local level, DAB is no more efficient than analog in the use of the frequency spectrum. This inefficiency and the fact that having at least two frequencies to carry national networks means that most areas will (at least until 2007, when other frequencies may be available) have a maximum of two “local” multiplexes.

A unique feature of the transmission arrangements of DAB in the United Kingdom is that BBC local/regional analog services have a “must carry” requirement on commercial multiplexes, but there is no automatic right of access for local/regional analog commercial stations, nor is there any limit to the number of services also broadcast—simulcasted—on analog.

A study of the license applications for commercial multiplexes reveals how the perceived “early adopters” market—the people who are most likely to be the first to invest in digital radio receivers—is linked with particular types of programming designed to appeal to them. One of the key demographic groups is clearly affluent males aged 25 to 45.

It also seems clear that EUREKA 147 is, to some extent, “technologically deterministic” in that it “naturally” favors large rather than small geographic areas of broadcasting, even though there is no overriding technical reason why national, and especially regional, services should be favored over local. The pattern adopted in the United Kingdom greatly favors large area services and, almost inevitably, large commercial interests.

DAB in Scandinavia

The development of EUREKA 147 DAB is on a fast track in the Nordic countries. Leaping into DAB before there is a robust popular market eager to receive digital signals is an unattractive commercial proposition. Thus, government initiatives are driving the transformation process, and Nordic public broadcasting companies bear much of the responsibility for building the DAB infrastructure necessary to expand this market.

Three factors underlie rapid Scandinavian DAB development. First, DAB significantly increases the possibilities for transmitting radio signals. There is no longer room for any development of AM or FM analog signals given the rapid growth of private and public channels since the mid-1980s (the bandwidth required for one FM channel is sufficient for six DAB channels). Second, DAB significantly increases production efficiency in radio programming. Public service companies in northern Europe are adding new radio channels to compete more effectively with the private sector via audience segmentation. The digital platform offers synergistic possibilities at a higher speed and efficiency. “Versioning” content, a process whereby the same “raw content” can be reconfigured in a variety of ways appropriate to the program format and audience interests of respective channels, is increasingly important in this context. Finally, DAB significantly increases integration possibilities across and within media industries. DAB is the only viable opportunity for radio broadcasting to maintain and advance its position in an increasingly competitive market place.

Although private broadcasting companies in Scandinavia have not yet been deeply involved with DAB development, that will soon change. The cost for a car DAB receiver was nearly \$1,000 at the turn of the century. Seven manufacturers are competing in the DAB receiver retail market, and prices are dropping. Four of the best-known companies are Clarion, Sony, Pioneer, and Grundig. It is expected that the cost of a

combined receiver and boot box will decline by half in the early 2000s. As signal coverage increases and receiver purchase prices decrease, the open market for DAB broadcasting will surge.

The transition to digital systems challenges the culture of public service radio. As the number of channels multiply and the scope of the private sector involvement increases, it is increasingly difficult for any public service company to provide a comprehensive and competitive range of radio program services. Achieving that nonetheless remains the heart of democratic principles that characterize and legitimate the approach.

Despite the certainty of DAB development in the Nordic countries, the digital future is laden with risks. A key factor hinges on when FM signals will be eliminated. That is at least a decade away from happening, although the pace will ultimately depend on consumer receiver purchasing decisions. Still, DAB developments are taking place more rapidly in the Nordic region than in the United States because there are fewer vested interests fighting the transition, stronger government involvement, and a common EUREKA 147 standard. Further, there are experienced and capable public broadcasting companies managing much of the risk as a tax-supported initiative.

DAB in the United States: IBOC

The United States has taken a different approach to digital radio. On 1 August 1990, the Federal Communications Commission (FCC) initiated a *Notice of Inquiry* into DAB development and implementation. The FCC and broadcasting business became interested in DAB after learning that Europe was developing its EUREKA 147 system. By 1991 the American radio industry responded with USA Digital Radio (USADR), a partnership of CBS, Westinghouse Electric Corporation, and Gannett to develop an in-band, on-channel (IBOC) system of DAB to eventually replace AM and FM. USADR preferred IBOC over other methods because it allowed stations to continue existing analog AM and FM service as they developed new digital signals that eliminate multipath and noise and reduce interference.

IBOC DAB has been called the “Holy Grail solution” because broadcasters can convert from analog to digital without service disruption and with low start-up costs while maintaining their heavily promoted dial positions. Initially the National Association of Broadcasters (NAB) supported DAB implementation using the EUREKA 147 system on L-band (500 to 1500 MHz), which it believed would give AM and FM equal footing. Incensed broadcasters caused NAB to change their position and support IBOC.

On 26 August 1992, USADR successfully delivered IBOC DAB on the expanded AM band at 1660 kHz in Cincinnati. At the September NAB radio show in New Orleans, USADR demonstrated its system using WNOE-AM and NPR affiliate

WWNO-FM. In 1993 NAB's DAB task force officially endorsed IBOC because it believed the FCC would never allocate alternative additional spectrum for DAB. The Electronic Industries Association (EIA), which had held that no system should be selected until all types were tested, struck a compromise with the NAB, agreeing that other systems would not be considered unless IBOC systems were shown not to meet terrestrial DAB requirements.

While much of the world appears convinced L-band is the best DAB spectrum, the FCC supported use of the S-band (2310 to 2360 MHz), in part because of the difficulty in shifting existing L-band spectrum users in the United States. Most non-FCC experts agreed S-band will be more expensive and less effective than L-band. As a result of the S-band decision, U.S. DAB will be IBOC, causing global incompatibility. At NAB's 1993 Las Vegas convention, USADR introduced broadcasters to its IBOC system, demonstrating that its IBOC system was more fully developed than any system other than EUREKA 147.

USADR and Lucent Digital Radio (LDR) agreed to work together on IBOC in May 1997, making broadcasters more optimistic about DAB's future. USADR and LDR worked jointly for about 10 months but ended their alliance early in 1998. Digital Radio Express (DRE), another IBOC developer, allied with USADR in late 1999. In October 1998 USADR petitioned the FCC to open a rulemaking proceeding to make its system the DAB standard. In 1999 a number of the larger U.S. radio groups invested in USADR. USADR's new corporate status was important because it demonstrated that much of the radio business believed in IBOC. Other broadcasters and electronics manufacturers, including receiver makers, soon fell into line. At NAB's 1999 meeting in Las Vegas, some broadcasters and manufacturers called for a "Grand Alliance" like the one struck with digital television (DTV). Robert Struble, USADR president, accurately stated that as a coalition from the beginning, USADR already was the Grand Alliance.

The FCC issued a DAB *Notice of Proposed Rulemaking* on 1 November 1999, more than nine years after its first *Notice of Inquiry*. The commission believed it was time

to determine whether an IBOC model and/or a model utilizing new radio spectrum would be the best means of promptly introducing DAB service in the United States. By initiating this proceeding now, we can foster the further development of IBOC systems, as well as new-spectrum DAB alternatives, help DAB system proponents identify design issues of public interest dimension and, where possible, encourage modifications that advance these policy objectives.

In October 2002, the FCC provisionally approved the technical standard offered by iBiquity digital, the company con-

trolled by the 15 largest radio broadcasters. The system allows AM and FM broadcasters to begin transmitting digital signals while continuing to offer their analog service. Initial broadcast equipment began to reach the market in late 2002 while the first consumer receivers became available early in 2003.

Fears remained, however, that using more of a station's frequency assignment (as the digitized signal does) might threaten some sub-carrier services such as reading for the blind, carried by many noncommercial stations. The FCC order allowed temporary authority for digital operation until such problems could be resolved. FM stations may offer digital signals at all hours, but AM stations are at least temporarily limited to daytime hours only because of their more complex evening signal propagation.

DAB's Future

Despite the impressive development of DAB in many parts of the world, its detractors had not been fully disarmed by the early 2000s. Many smaller and community radio operators had not been able to afford to pay for the still scarce capacity on multiplexes. The U.K.'s Community Media Association (CMA) which, in the early days of the development of DAB, had been led to believe that the new system would allow small-scale not-for-profit stations to (at last) find a secure and widespread outlet on a mass media, was bitterly disappointed when it became clear that both the transmission pattern and licensing structure would largely exclude their model of radio stations. The Association tended to view the licensing and regulatory structure of DAB in the U.K. as re-enforcing the dominance of a few major institutional operators—the larger commercial radio groups and the BBC—whereas the CMA favored a greater plurality of ownership and control, as well as of the "voices" and perspectives able to gain access to the public airwaves. The increase in frequency allocation in DAB may help to increase the range and type of operators using DAB, but these arguments highlight tensions on the more fundamental political and economic questions of access and regulation of broadcasting.

Other DAB detractors continued to question whether the public would embrace the new system *en masse*, in particular whether DAB receivers would ever fall in cost to the level where most listeners would be prepared to replace their many analogue radios and even whether there was sufficient interest in the increased choice of services to motivate listeners to make the digital switch. Many asked whether the text and other non-audio services were merely gimmicks, leading such critics to dub the new system "TV without the pictures." Whereas multi-channel digital TV had been embraced by the British consumer, it was often argued that radio was not perceived as providing the same level of sophisticated entertainment, information, and

education, with a consequence that many citizens were reluctant to pay a premium for increased radio services or the claimed increase in audio quality. Certainly, the early and sometimes persisting claims that DAB provided CD-quality sound had rebounded, amid complaints that the sound quality on many of the individual stations on the multiplexes had been degraded in order to accommodate more services. Broadcasters admitted they had to make compromises between program choice and sound quality.

There was also the continuing, nagging question as to whether the U.K. had backed the wrong system. Putting aside the argument as to whether radio needed to go digital at all, were the alternative and fast-developing standards such as IBOC likely, in the long term at least, to provide a more cost-effective, easily received, radio system? Furthermore, the integration and fast development of mobile (cell) phone technology and the internet, especially with broadband access, confuses and even threatens the concept of "radio" as a separate and distinct medium.

It may well be that the EUREKA 147 system, although undoubtedly a proven, sophisticated, and robust transmission standard, will prove too complex for sufficiently cheap receivers to be produced for the mass market, thus making the system commercially viable. The refusal of governments and broadcasters in the United States and Japan—the world's two largest economies—to adopt the EUREKA system, and the subsequent reluctance of some of the major manufacturers to develop inexpensive receivers, has prevented EUREKA from becoming the world standard. In the long term, the answer may be for receivers and transmitters to operate a "pick and mix" system: terrestrial IBOC for existing broadcasters and EUREKA for new ones. The development of the WorldSpace, Sirius, and XM Radio satellite-transmitted systems will also be followed with great interest to see if they are successful in developing their respective markets.

Digital Recording

Radio's transition from an analog to a digital medium began with the arrival of the compact disc (CD) in the early 1980s. Since then, radio has embraced digital audio technologies ranging from the first CD players, digital tape recorders, digital effects processors, and digital audio workstations to the more recent introduction of hard disk recorders, digital exciters for transmitters, digital audio consoles, and digital audio file transfer and streaming on the internet.

Digital audio provides superior reproduction of sound and additional benefits useful in a radio station's operation. Except for a station's microphones (which may become the sole analog source at a radio station), it is possible for a radio station's audio chain to be completely digital, from production and storage to playback and processing, before being sent to a digital exciter and on to the transmitter. In the many countries where digital audio broadcasting standards are now in place, transmitters and receivers are now also digital, completing the final links to make radio a totally digital medium. Many radio stations also distribute digital transmissions of their programming on the internet, making a digital version of radio's signal available to listeners with a computer, audio card, and internet connection.

Digital audio has dramatically improved the quality of radio's on-air sound and has also brought many operational enhancements to the production process used to create radio programs. The clear benefits of digital audio have motivated nearly universal adoption among radio stations of some type of digital audio recording and playback equipment. A list of digital audio equipment found in radio stations today includes CD players, CD recorders, open-reel stationary-head digital recorders, rotating-head digital audio tape recorders, mini disc recorders, and hard-disk recording systems. Computers with specialized software and audio cards with inputs and outputs to interface with the other audio equipment in the station provide digital audio replacements for tape recorders, the splicing block, and other production and processing equipment. Digital versions of other equipment, such as audio consoles, telephone hybrids, effects processors, compressors, limiters, microphone processors, studio-transmitter links, on-air audio processing equipment, exciters, and transmitters, are rapidly becoming the standards as aging analog audio equipment is replaced.

Digital Audio Basics

A sound itself is not digital. Sound is created when an object vibrates and causes the molecules of the medium surrounding it (usually air) to vibrate. These vibrations or sound waves are transferred through the air until they reach someone's ear or a microphone. At the microphone, sound is transduced (con-

verted) into electrical energy and becomes analog audio. The characteristics of this electrical energy are analogous to the original sound energy. This electrical energy can be amplified, manipulated, stored, or transmitted as analog audio; however, it can also be digitized and then amplified, manipulated, stored, or transmitted as digital audio.

Digital audio is created by converting analog audio into a stream of binary code, a series of ones and zeroes, representing the measurements of the characteristics of the original sound. This binary code represents measurements made of samples of the original audio representing the sound energy. The binary code can be recorded and stored on any device capable of reading and storing digital data. Magnetic tape, computer floppy disks, hard disks, and optical disks can store the digital information. These data can also be transmitted as pulses through copper wire, fiber-optic cable, or as radio frequency energy through the air. An exact, full-fidelity reproduction of the original audio can be created from the stored or transmitted digital code, copied without generation loss, and easily processed for creative and technical purposes. Unlike analog audio, the digital signal is not as subject to the limitations imposed by the storage medium or the electronics of the equipment. In the analog world, the tape itself adds noise, copying adds more noise, the amplifier adds noise, and so on. The dynamic range and frequency response of the original sound are also reduced as analog audio, because the analog system has inherent limitations in reproducing sound faithful to the original. The methods used to record and process digital audio minimize these limitations.

The digitization of analog audio involves four stages: filtering, sampling, quantizing, and coding. First, the audio is sent through a low-pass filter to prevent unwanted higher frequencies from becoming audible. This process is called anti-aliasing. Then the analog signal is divided, which determines the sampling rate. The more often the signal is sampled and measured, the more accurate the recreation of sound will be. Sampling rates are typically 32 kHz, 44.1 kHz, or 48 kHz. This means the signal is sampled either 32,000, 44,100, or 48,000 times every second. A measurement is made during every sampling period using a multidigit binary number. This binary number is called a word. The number of bits in a word is word length. A 1-bit measurement, for example, would only be able to discriminate between presence and absence of voltage. If n is the number of bits in the word length, the number of levels of measurement is 2^n . An 8-bit system provides 256 levels of voltage measurement. A 16-bit system has 65,536 possible levels, and a 20-bit system provides 1,048,576 levels. Systems with more quantizing levels have more accuracy and wider signal-to-noise ratios. The last stage of the digitizing process is the

coding stage, in which the bits are placed in a precise order for recording or output to another digital device. During this coding stage, each word is identified in the bit stream. Error correction minimizes the impact of storage defects. The binary code is then distributed or recorded as pulses of magnetic energy.

Moving audio to the digital domain for recording and reproduction purposes provides a number of advantages. Compared to analog audio, digital audio has an improved frequency response, wider dynamic range, immeasurable noise and distortion, and no degradation or generation loss in multiple digital recordings. Some audiophiles have been critical of the digital audio recording process, suggesting that when sound is digitized, it loses its warmth and can sound too sterile and even harsh. Radio has generally rejected those concerns and has continued to replace analog audio equipment with digital equivalents.

The Compact Disc

In 1980 the Philips and Sony corporations joined forces to create an optical disc for digital audio. The two companies agreed on a CD standard, a 12-cm optical disc using 16-bit/44.1-kHz sampling. The CD player and disc were introduced in Europe in the fall of 1982 and in the United States in the spring of 1983. As record and production library companies began to release their catalogs on CD, radio began using CD players in their production and air studios. Manufacturers developed CD players with features such as a shuttle control as well as a model that played CDs inserted in a special protective case, creating a process similar to the use of a broadcast cartridge machine. The CD changer, capable of handling multiple CDs, was also found useful at many radio stations. Many broadcasters used consumer models because the audio quality was the same for both. Not only did the CDs sound better than the vinyl long-playing and 45-rpm records, but the CD format was also much more efficient to use. CDs could be cued and started faster and, with care to protect the disc from scratches, would allow endless replays without degradation of sound quality. Additional data encoded in the compact disc provided precise track timings, indexing, and continuous monitoring of playing time of tracks and programs.

The CD player uses a laser to read the data encoded in the microscopic circular pits on the disc. The binary code is stored in a series of pits and lands in the disc. A pit is an indentation in the groove; a land is a flat area with no indentation. A photoelectric cell reads the amount of light reflected from the pits and lands and emits voltage to recreate the digital code representing the audio waves. As needed, the digital output of the CD can be converted back to analog audio or sent as digital output to a digital recorder or console. The only problem with the CD was that its content was limited to prepackaged mate-

rial offered by the manufacturer. However, the recordable CD was soon on the way.

The recordable CD (CD-R) was launched in 1988 but initially was not widely adopted as a production tool by radio. The first CD recorders were relatively expensive, and the disc recording was permanent: the disc could not be erased and recorded on again. Recently, with the introduction of the rewritable CD (CD-RW), lower-cost CD-R recorders, and CD-R drives installed in computers, the recordable CD has attracted more attention from broadcasters, for use as an archival and production tool and as a component in digital automation systems.

The digital versatile disc (DVD) is not yet a factor in the radio environment, but it most likely will be. The DVD is the same diameter and thickness as a CD, but a difference in design and manufacturing provides eight times the capacity of a CD by creating a dual layer. There are currently five recordable DVD formats. DVD-R and DVD+R discs can be recorded only once. DVD-RW and DVD+RW can be rewritten. The DVD-RAM is used for recording computer data only.

Digital Audio Tape and Mini Disc Recording

Although the CD was quickly adopted by most radio stations shortly after its introduction, digital audio recording had a more difficult time gaining a foothold in radio. Commercial digital audio recorders have been available since the 1970s and early 1980s. Sony and Denon introduced adapters that made it possible to record digital audio on videotape recorders. Open-reel two-track and multitrack digital recorders (Digital Audio Stationary Head) were employed in recording studios but were not widely used in radio. By the early 1990s, however, the rotary-head digital audio tape recorder (R-DAT) was finding a place in radio production.

R-DAT machines use essentially the same digitizing scheme as the CD, but they use a rotating helical-scan tape head to record and read the large quantity of information representing the audio signal on the small cassette tape. The result is audio recordings with characteristics similar to the CD with the additional flexibility of being able to record and rerecord. R-DAT recorders were adopted as a cost-effective, high-quality production and on-air playback tool, especially in automation systems. The use of R-DAT has been supplanted somewhat in recent years by other digital formats, including the mini disc.

Although originally intended as a consumer product, the mini disc recorder is finding a niche in broadcasting. The mini disc offers a more portable, less expensive alternative to hard disk recording, and the portable mini disc units provide a digital alternative for field recording. The mini disc offers nonlinear access, track identification, and a recording time of 74 minutes. It has low noise, low distortion, and a wide dynamic

range, but its use of data compression limits its use in critical recording.

Computer-Based Recording, Editing, and Digital Distribution

Open-reel analog recordings have at least one advantage over open-reel digital tapes: analog recordings are easier to edit than a digital tape. Because a digital tape has to be running at speed in order to decode the data to recreate the digital audio, digital open-reel recorders record and play on an analog head for editing and cueing purposes. The digital tape can then be marked, cut, and spliced like an analog tape. Physical editing is not possible with the DAT cassette tape, and electronic editing on a DAT recorder requires some finesse. Moving the recorded digital information to a computer hard disk opened the way for the rapid deployment of computer-based digital audio recording and editing systems, which have revolutionized audio production for radio.

By the early 1990s, audio could be recorded to media other than tape. Increased hard disk capacity, faster computer processing speeds, and new compression methods combined to make recording directly to a computer's hard disk a viable alternative to recording on analog tape. Software programs and audio input/output cards were developed to be used on inexpensive personal computers to create digital audio recordings that sounded better than the recordings created on professional analog equipment. Even consumer products could create professional-sounding results in radio production studios. Editing software was introduced that would allow nondestructive editing of the audio material. These programs typically provide a visual representation of the audio waveform, which can be marked, highlighted, cut, copied, pasted, and moved within and between sound files. Precise, noise-free edits are performed that can be readjusted and fine-tuned as needed without destruction of the original sound file.

There are numerous multitrack recording and editing programs used by radio stations, which, when combined with compatible high-quality computer audio cards, allow desktop computers to perform the same functions as multichannel recorders, production consoles, and effects processors—which cost thousands of dollars more—all in one computer.

Once the digital audio exists as a file in a networked computer, local area networks, wide area networks, and the internet allow these sound files to be distributed and shared internally or externally. An increasingly common distribution approach is the use of MP-3 files. The MPEG-1 layer 3 recording technology (commonly known as MP-3) is a digital audio file compression method increasingly used by radio stations to send and receive programs and programming elements through the internet. This form of distribution becomes cost-effective and important as advertising agencies and production compa-

nies start to distribute commercials, programming, and other information digitally. As radio groups consolidate and combine station operations and look for economies of scale, digital distribution of content will become even more important. After a commercial is created in the production studio of one of the stations in the group, it can be distributed instantly to all the other stations on the computer network.

Digital Audio Processing

After audio has been converted to digital form, it can be manipulated or processed for creative and technical reasons. Modern radio production studios often have at least one digital effects processor, which efficiently creates various combinations of digital effects, such as echo, reverb, pitch changing, phasing, flanging, and many others. Computer software-based recording and editing programs also have digital audio processing and effects as part of the package. Digital audio processing is also used in the station's air chain, running microphones through processors that convert the signal to digital before processing to strengthen and improve the sound quality of the announcer's voice. Digital processing of the audio signal before it is sent to the transmitter provides one last measure of limiting, compression, and other subtle adjustments to give the station's audio a distinctive, full sound.

Digital Satellite Radio

For more than 100 years, radio has been transmitted by electronic analog waves modulated by voice or frequency variance. At the beginning of the 21st century, digital signals beamed from communications satellites could change American radio from a medium with thousands of local stations into a national radio service with only a few content providers. In the new system, a listener could drive from coast to coast and remain tuned to the same CD-quality signal all the way. In the United States, two corporations and hundreds of investors are betting billions of dollars that Americans will embrace the new digital system of satellite radio.

Sirius Corporation vs. XM Corporation

Two corporations are at the front of the race to bring satellite radio to the American consumer: Sirius, headquartered at the Rockefeller Center in New York City, and XM, which has its offices on New York Avenue in Washington, D.C. Both companies take a similar approach to satellite broadcasting. Each is beaming a digital signal from a satellite to antennas the size of a playing card. The antennas, mounted in the consumers' cars or homes by suction cups, feed the signal into digital radio receivers that produce CD-quality audio with at least 100 different format selections. As of early 2003, XM offered 70 music channels and 31 talk channels while Sirius advertised 60 music channels and 40 talk channels. Both companies have signed well-known stars to provide special programming for subscribers. Both companies—and here is the big gamble—are charging for their audio services: initially \$9.95 (XM) and \$13.95 (Sirius, which offers more channels without advertising).

Investors at XM and Sirius are gambling that enough listeners are dissatisfied with the current fare on AM and FM radio stations that they will be willing to pay a small monthly fee to receive programming unavailable on analog terrestrial stations. Executives at both corporations note that almost 30 percent of all recordings sold at music stores come from artists receiving little or no radio airplay. The reasoning goes like this:

There may not be enough fans for alternative country acts such as Lyle Lovett or Steve Earl or for new-age performers such as Yanni to support a local radio station format. There are, however, enough of them scattered across the country to make a nationwide satellite feed economically feasible.

Given the sheer cost of both projects, niche programming alone will not offer the kind of return on investment stockholders of either company are looking for. Thus, the need for big-name performers. XM gave a channel to Grammy-winning producer and composer Quincy Jones. Former Yes member Jon Anderson is using the same approach, while Ted Nugent gets his own talk show.

Lee Abrams, creator of the album-oriented rock (AOR) sound of the 1970s, provides the consulting for all 50 music formats for XM. Abrams claims that XM will not emulate traditional radio. He understands subscribers are paying for the audio services and expect something different for their money. Abrams delivers expanded selections of classic rock artists such as Bob Dylan, The Beatles, or Led Zeppelin to counter complaints from traditional radio listeners that playlists have become repetitive. Abrams also delivers channels for contemporary alternative rockers as well as multiple jazz, country, and blues formats.

Sirius has given a channel to rock superstar Sting, who produces a daily live show with original and recorded music. With the main studios in New York City, Sirius plans to offer a number of live, in-studio concerts from artists who pass through the city while on tour. National Public Radio (NPR) provides two channels of talk and information, including an original morning program for satellite listeners only. Programmers point out that Sirius, with multiple rock, jazz, country, blues, and talk formats, plans no commercial advertising at this time, while some of XM's channels have up to six minutes of commercials per hour.

Sirius Corporation used to be known as CD Satellite Radio Service. Focus groups and marketing studies found consumers were confusing the name with the audio CDs available in

music stores. Furthermore, company executives felt the name CD no longer implied cutting edge technology. So, a name change to Sirius was ordered early in 2000.

Making Satellite Technology Pay Off

Several companies launch commercial communication satellites. XM hired Sea Launch to place its two Hughes Corporation satellites (named *Rock* and *Roll*) into orbit from an ocean platform located 4,600 miles west of South America. Sirius hired Space System/Loral to build and launch three satellites into orbit from the former Soviet republic of Kazakhstan. The enormous cost of the high orbit satellites for both corporations may be partially offset by leasing unused space on the various transponders to other companies with communications needs.

In order to maintain a constant signal, or footprint, over a specific region of the planet, satellites must remain in roughly the same position relative to the earth. Sirius and XM are using two different systems to meet that goal. XM uses two geostationary satellites positioned at 22,300 miles above the Earth. At that height, the speed of the satellite's orbit matches the speed of the rotation of the earth. Therefore, the satellites appear to be stationary in the sky.

Sirius uses three satellites in an inclined elliptical constellation. Elliptical orbit means the satellites are in a lower orbit moving across the sky. Each satellite spends at least 16 hours a day over the United States and at least one satellite is placing a footprint over the continental U.S. at all times. Both companies have a spare satellite on the ground in case of a catastrophic failure.

What kind of return will the two American corporations need to stay afloat? Wall Street analysts predict that each company will have to attract a minimum of 4 million subscribers within five years to break even. Such numbers are possible, as has been proven by successful satellite radio ventures in other countries.

Satellite Radio Worldwide

A privately owned American corporation with immense international ties, WorldSpace is the current leader in digital satellite technology. WorldSpace claims a potential audience of 4.6 billion people on five continents. Launched in October of 1998, the geostationary satellite Afri-Star offers three overlapping signals to the continent of Africa with 50 audio channels and multi-media programming available on each signal beam. Asia-Star was successfully placed into orbit with a similar programming array over the Asian continent in March of 2000.

A third satellite, Ameri-Star, will service South and Central America as well as Mexico. This satellite has no current plans to broadcast to the United States or Canada. However, World-

star has signed a cooperative agreement with XM to share technological innovations.

Delivering 24 digital radio signals, Orbit Satellite TV and Radio Network serves the Middle East, North Africa, and parts of Asia with "socially responsible" broadcasts in Arabic and other languages. Originally chartered with the Italian Ministry of Post and Telecommunications, Orbit signed with Telespazio to provide space segment services and launched programming in 1994 with 16 TV and four radio channels. Orbit now boasts business offices and uplink centers throughout the Mediterranean, Middle East, and the Indian Subcontinent.

Orbit first used transponder space on InTelSat satellites, the international telecommunications satellite consortium established by the United Nations. In 1999, Orbit expanded its coverage area by 22 million households when it began to also broadcast on Arabsat, a satellite placed into space by a cooperative of Middle Eastern nations. Orbit contracts with numerous international providers for programming content including CNN and ESPN Radio.

Several other satellites carry digital audio and analog radio programming. The Eutelsat array and the Astra satellites provide a radio footprint over Europe. Panamsat and Brasilsat provide programming for Central and South America. Other countries may well adapt to satellite radio faster than America does. Much of Europe and Asia are already used to the concept of a national radio service. Britain's BBC or Germany's Deutsche Welle have for years broadcast a national signal through the use of relay transmitters. A satellite service is simply a logical extension of that system.

Broadcast Opposition

As early as 1982, the Federal Communications Commission (FCC) began to develop regulations for direct broadcast satellites, or DBS. Signals would be provided to consumers via a three-meter dish antenna. Local broadcasters immediately attacked the proposed service with charges that a national TV service would undermine the localism provided by traditional television broadcasting.

In October 1992, the FCC again acted on an industry DBS proposal, this time for radio. The original proposal called for a Satellite Digital Audio Broadcasting System or DAB to be located in 50 MHz of the S band (2310–2360 MHz) with the intent to create a system that would provide a national service.

Again, local broadcasters rolled out the same arguments used against the DBS system: "The current number of FM and AM stations serving the United States represents the highest level of audio diversity available in the world." In comments submitted to the FCC the association added, "A competing satellite service presents a potential danger to the United States' universal, free, local radio service and, thus, to the public interest it serves."

A consortium of radio group owners also weighed in with the following comments to the FCC: "National radio stations raise a troubling question of undue concentration of control of the media, an issue that has been consistently a concern to the commission." The joint comments added, "erosion of audiences and advertising revenues caused by satellite radio would inevitably destroy the ability of many [existing] stations to offer these services."

Broadcasters opposed only the national delivery of a digital satellite signal and not the use of digital technology. In fact, the National Association of Broadcasters (NAB) began proposing a system referred to as in-band, on channel (IBOC). This system would replace terrestrial analog transmitters with digital transmitters for better signal quality and reception. Local broadcasters would then repeat satellite feeds of the various program services with inserts for local advertising and announcements.

However, satellite programmers counter that the broadcasters are overemphasizing the continued importance of localism. Listeners, they say, do not tune exclusively to one station. While local news, weather, and information are important, research shows many listeners will tune to a station specifically for music or entertainment programming. Satellite programmers believe listeners will tune to their service for specific formats and return to local stations when they need local information. As one programmer stated, "Program directors who think localism is fundamental to successful radio should look at the success of *USA Today*."

The Box in the Car or Home

Ultimately, the success of satellite radio in the United States depends upon whether consumers will buy the new digital receiver necessary to pick up the satellite signal. Sirius and XM settled a patent lawsuit in March of 2000 by agreeing that all digital radios will eventually have the capacity to receive both audio feeds. Deals have now been made with Sony, Alpine, Pioneer, Clarion, and other audio manufacturers to produce the receivers. Major retailers have agreed to market and sell the receivers for \$200.00 and up, depending on features and installation.

Some of the retailers, including consumer electronic shops, car sound shops, and automobile dealers, are offering installation for car receivers. Distributors are also marketing a portable device designed to translate a digital satellite signal for existing radios. In January of 2003, Delphi introduced the SkyFi radio, advertised as the first plug and play portable digital satellite radio.

However, the real key to success is cooperation by major automobile manufacturers in offering digital radios as available equipment in new cars. XM has agreements with General Motors (GM) and Honda. Sirius has a deal with Ford and ten-

tative agreements with Chrysler and five other automakers. The deal with Ford is particularly beneficial because the buyer gets a satellite radio and a two-year subscription to Sirius audio services.

The drawback, if the current marketing arrangement stays in place, is that owners of GM cars will have to take XM audio services while Ford owners will receive Sirius. Will listeners continue to pay for audio services when the initial deals run out with the car companies? As one industry observer put it, "Twenty-five years ago, TV viewers would have thought it odd to pay for watching television." Today, a majority of American homes have cable television and pay a monthly fee for expanded video service.

The Impact on Local Radio

If satellite radio succeeds, there will be some impact on local radio stations.

First, three critical audience-rating categories could be affected: time spent listening, or TSL; average quarter hour listening, or AVQ; and cumulative audience numbers, or cume. If enough listeners tune out local stations to listen to satellite radio, the local stations will report reduced numbers in those categories and will have to lower the rates charged for advertising.

Second, the concept of localism in radio in recent years has really come to mean the ability to generate local ad revenue, rather than the desire to program for regional interests of the community of license. Radio stations are no longer compelled by the FCC to provide specific programming to meet the needs of the local community. Music playlists are almost identical by format in every market. A listener can drive across the country today and find virtually the same 30 or 40 songs being rotated in each format by stations across the dial. If the majority of stations are playing similar music and running many of the same syndicated programs, then the broadcasters' "localism" argument is greatly diminished.

Despite their more than 100 channels of specialized programming, both Sirius and XM radio added subscribers more slowly than expected. Toward the end of 2002, Sirius was reaching only about 30,000 paying customers while XM (which had aired earlier) was reaching better than ten times as many. But each needed more than a million subscribers in order to survive, and in 2002 it appeared such levels would take at least a couple more years to achieve. One result of the slow growth was that their stock prices declined to record low levels as many observers concluded there was room for only one such service, not two. Both continued to seek additional investors and claimed they were in the competition for the long haul. At the same time, both trimmed their expenses, closing down unused studios and cutting back staff. Talk of consolidation lingered in the air.

Nonetheless, the investors for both XM and Sirius believe that the public will eventually buy into the idea of satellite radio. They believe enough of the public has grown tired of traditional radio's repetitive playlists and commercial saturation to give satellite radio a try at \$10.00 per month. Even radio giant Clear Channel Communications hedged its bet by becoming a major investor in XM. It is not clear that satellite radio will succeed as numerous challenges remain. However, executives at XM and Sirius are literally betting millions of dollars that the time is right for a new national radio service.

Dill, Clarence Cleveland 1884–1978

U.S. Communications Policy Maker

Clarence C. Dill was one of the key co-authors of the 1927 Radio Act and the 1934 Communications Act. In the formulation of the law, Dill helped set the traditional concepts that still govern electronic media. It was Dill who proposed a commission for the regulation of radio. The concept passed in 1927, was reinstated in 1934, and continues today as the regulatory authority. Believing the commission would control and regulate the continuing issues of monopoly, censorship, and spectrum utilization, Dill took those issues into the Senate and provided leadership for passage of the law.

Dill's role in the earliest legislative history of broadcasting was limited only by his late entry into the congressional arena. Secretary of Commerce Herbert Hoover and Representative Wallace H. White, Jr. had worked to develop radio law since the early 1920s, but they were unable to interest the Senate in their proposals. Dill provided that Senate leadership. His first bills mirrored the work of Representative White. However, as Dill educated the Senate, radio entered a critical period in its history, often called the period of chaos. Following the first session of the 69th Congress, the Zenith case (*United State v Zenith Radio Corporation*, 16 April 1926) and the Attorney General's Opinion (*Opinions of the Attorney General*, 8 July 1926) left the Secretary of Commerce with no regulatory authority, and Dill emerged as a significant leader.

During the conference committee negotiations between the Senate and the House over the pending radio bills, White was

deeply involved in his own reelection campaign, which left Dill as the primary author in charge of bringing the House and Senate versions of the bill together. Dill convinced Representative White that a commission should be established to function for one year. This would theoretically provide Congress with enough time to review the law before regulatory authority reverted back to the Secretary of Commerce. White accepted this as a temporary solution, but Dill openly declared that this commission was merely the beginning of a lasting communications commission. In this Conference Committee, Dill not only achieved this important directional victory, but out of the committee came a unified proposal with emphasis on the phrase "public interest, convenience or necessity." These key words provided the overall regulatory authority and were used rhetorically by both Dill and White to answer all major objections to the passage of the bill. By the time the bill came out of conference committee, the public pressure for passage was intense. Dill obtained quick passage of the bill that he felt protected the public interest. Dill's comments before the Senate during its deliberations on radio law reflect his attitude, the political atmosphere, and his own feelings toward the radio industry: "large corporations have invested large sums of money with little return on their investments. They hope for bigger returns in the future. I am not sure that it would be wise . . . to put too many legislative shackles around the industry at this state of its development" (*Congressional Record*, 69th Cong., 1927, 68, pt. 3:3027). Shifting with the political current of a demanding

electorate, Dill achieved passage for the bill that set the foundation for electronic media legislation.

Representative White wanted control of radio in the hands of the Secretary of Commerce. However, by 1934 he was supportive of the commission, and the Democrats were in charge. Dill was now the chair of the Senate Commerce Committee, and he chaired the subcommittee that was holding hearings on the proposed 1934 legislation. The key issue was placing the telephone and telegraph under control of the commission, a provision suggested by both Presidents Hoover and Roosevelt. The 1934 Communications Act passed with the basic provisions of the Radio Act still intact. It added only commission jurisdiction over telephone and telegraph, changed the name of the commission from the Federal Radio Commission to the Federal Communications Commission, and added commissioners to help with the increased workload.

Dill was a product of the 1920s era, when business and businessmen were held in high esteem by society. The business ethic permeated all areas of American life. According to Frederick Lewis Allen (1931) radio was the “youngest rider” on this “prosperity bandwagon.” Dill fought in the Senate for financial assistance for the fledgling radio industry. Besides being an advocate of business interests, Dill was a conservationist. The Teapot Dome and Elk Hills oil scandals had left the United States outraged by the exploitation of public resources. Senator Dill had been a principal in the Teapot Dome investigations as a member of the Public Lands Committee. The scandals and resulting investigations left a strong impression on Dill, and as a result he became an ardent supporter of the public ownership of the airwaves and an antagonist of radio monopolies.

Dill was first elected to the House of Representatives in 1915, but his career was cut short because of his vote against the United States’ entry into World War I. After the war, he was reelected, this time to the Senate. Tucker and Barkley, describing Dill’s ability as an astute politician, wrote, “he can smell the change of public opinion . . . a month or six weeks before anyone else in the chamber” (1932). Dill was a progressive politician, proudly associating himself with William E. Borah (R-Idaho), Robert La Follette (R-Wisconsin), Thomas Walsh (D-Montana), Burton K. Wheeler (D-Montana), and James E. Watson (R-Indiana). Dill described his own role as a leader of the Senate debate over radio legislation as “a one-eyed man among the blind.”

Dill served in the House of Representatives from 1915 to 1919, and he served as the Senator from Washington State from 1923 to 1935. On 12 July 1934, after 12 years in the Senate, he announced his resignation, stating, “The most common fault of public men is that they do not know when to quit . . . I do not want to make that same mistake” (*Tacoma Tribune*, 12 July 1934). Upon leaving the Senate, he returned to Spokane, Washington, where he had a successful law practice. He ran

for governor in 1940 and made an unsuccessful second run for the House in 1942. During his tenure in Congress, he worked primarily on radio, the Grand Coulee Dam, and hydropower legislation. This work set the foundation for a legal practice that he continued until his death. He died in Spokane, Washington, in 1978.

Disc Jockeys (DJs or Deejays)

What announcers were to listeners during the golden age of network radio—the voice or image of a program, network, or individual station—so disc jockeys (or deejays or simply DJs) became beginning in the mid-1950s. The style of the person playing records on the air determined, to a considerable extent, the identity of that radio station. Many DJs became regional stars, and a few became nationally known. By the early 21st century, however, the heyday of radio's popular DJ was long over.

Origins

A number of radio pioneers played records over the air in the medium's experimental days—Lee de Forest on several occasions, Reginald Fessenden, “Doc” Herrold in San Jose, and Westinghouse engineer Frank Conrad—in the years before World War I. So did many other known or nameless announcers (at the medium's inception, announcers were allowed to use only their initials on the air) at numerous stations during the 1920s and 1930s, though playing records over the air was frowned upon as a poor use of a scarce medium. Musicians' unions and record manufacturers also encouraged the use of live rather than “canned” music. Years later, stations located along the Mexican border aimed their formats of country music and conservative Christian programs toward American listeners; these programs were hosted by people with warm voices who seemed like comfortable neighbors and were soon widely popular.

The decline of network radio, beginning in the late 1940s, paved the way for the rise of the DJ. For now stations were forced to be free agents, not mere local conduits of national programs. Having to fend for themselves, stations turned to the easiest and least expensive way of filling time—playing recorded music.

1930 saw the introduction of one of the first “musical clock” programs (playing a set format of musical types, time notices, advertisements and news within a one-hour period), on KYW in Chicago, hosted by Ms. Halloween Martin. Certainly one of the earliest DJs and one of the first women in such a role, Martin intermixed recorded music with regular time cues and other chatter. The two-hour program moved to WBBM in 1934 when KYW relocated to Philadelphia. There it lasted for a decade, then enjoyed two more years on WCFL. The “musical clock” format remained a radio mainstay well into the 1950s.

Often cited as the first real “disc jockey,” Martin Block first hosted New York station WNEW's *Make-Believe Ballroom* in 1935. Using a format borrowed from stations on the Pacific Coast, the program was hugely successful, entering syndication

in 1940 (by 1946 it was carried on some 30 stations, making Block the most highly paid radio performer for a brief time). Another New York innovation, WNEW's listener-request-based *Milkman's Matinee* gained success as an overnight/early morning program hosted by Stan Shaw.

The term “disc jockey” seems to have come into use about 1940; it had its basis in such earlier terms as music jockey or record jockey. The “jockey” part may have been based on “riding” a record to fame (or riding gain on an individual record).

Several historians point to March 1946 and Al Jarvis at Los Angeles station KLAC as being “the first all disc-jockey station with identifiable personalities” (see Passman, 1971). Gene Norman, Dick Haynes, Alex Cooper, and Bob McLaughlin led the Los Angeles market's radio ratings into the 1950s. One popular feature was a daily evening “top 10” countdown program. With the KLAC model, the role of the DJ, as opposed to the earlier announcer, became clearer. The DJ combined the playing of music with chatter and intense station and record promotion. The DJ was also pushing his personality, not merely announcing what was being aired.

As other stations added DJs to their rosters, a National Association of Disc Jockeys, based in New York, was formed in the late 1940s. The need to cut back on station costs helped promote still wider use of DJs to perform some of their own technical work (some had broadcast engineer licenses) as well as to talk around the music, thus creating the “combo” role.

But external factors were also increasing the DJ's importance. The development of the 45 rpm record, soon used for pop singles, and the expansion of the market for portable radios, sharply increased the number of young people who listened to radio. This audience grew even faster after 1954 with the introduction of the first transistor radios and the proliferation of car radios. Thanks to these trends, by the 1950s DJs had become central to the popular music record industry—with both good (increased record sales) and bad (a bribery scandal in the late 1950s) results.

Rise of Top-40 DJ

The “golden age” of radio DJs came with the inception of Top-40 radio in the mid-1950s. Todd Storz (at KOWH in Omaha and WTIX in New Orleans) in 1953, and Gordon McLendon (at KLIF in Dallas) paved the way for countless others. They created a formula of tight formats, constant repeating of top popular songs, and flamboyant DJs. The DJs generated listener interest through promotional stunts (flag-pole sitting, treasure hunts) local events (record hops, remote broadcasts), extensive advertising, and other audience-building events. DJs also

played an increasingly central role in the marketing of popular records. The record industry and radio had forged one of the most profitable alliances in the history of electronic media—a relationship that survives into the 21st century.

Two examples of the rising DJ illustrate the trend. Alan Freed became one of the first nationally known radio DJs, first at WJW in Cleveland and by 1955 on WINS in New York. He played what was then called rhythm-and-blues or “race music”—an important forerunner to rock ‘n’ roll. Tensions existed between largely black rhythm-and-blues musicians (and the “cover music” recorded by white groups to make it acceptably “white” in sound) and rising rock ‘n’ roll, and Freed was one of the first to bridge the gap. Freed became the most important victim of the late 1950s payola scandal. On the other hand, Dick Clark’s *Bandstand* on Philadelphia’s WFIL beginning in 1952 (it became an afternoon television staple in 1957) gave strong impetus to the Top-40 approach and served as a template for radio DJs working in this format. But Clark also pushed a squeaky clean image for rock with dress codes for the dancers, as well as hosts, although he, too, would be implicated in the payola scandal in 1959.

Yet the trend toward Top-40 DJs was anything but smooth. Even KLAC in Los Angeles, the first all-DJ station, announced as early as 1958 that it would revert to mere announcers’ voices in pre-produced music formatting, arguing it would gain 13 percent more music by not using DJs. More music (and commercials) would result, with less focus on personality. The change would also provide for greater management control over the music played. A few years later, programmer Bill Drake would all but remove the DJ from the on-air mix at KHJ by imposing major strictures on non-music elements. DJs quickly dropped from high profile personalities to little more than record “liner note” readers at many stations. In the industry parlance of the time, they had been “Draked.”

Perhaps the highlight of DJ excess—at least in the public eye—were two national DJ conventions hosted by Todd Stortz. The first, in Kansas City in 1958, was a relatively staid affair. Not so the second and much bigger one (with about 2,500 attendees) in Miami Beach in 1959 that brought considerable bad press—“booze, broads, and bribes” read the newspaper headlines. The seamy underside of popular music radio was out there for all to see. What was happening, of course, was the public revelation of “payola” (record makers or producers paying DJs to play specific records), which had long been a part of the music industry. In part created by independent record makers trying to break into markets largely controlled by major distributors, the payola scandal became headline news at the end of the 1950s. Nor was the scandal limited to big cities: to the record makers, “every DJ was important in his own town.” The DJs tried to respond with the formation of a National Disc Jockey Association in Milwaukee in mid-1959. At its first convention in Minneapolis the NDJA developed a

code of ethics to show listeners that the business was trying to regulate itself.

In 1965 “Boss Radio” was introduced on KHJ in Los Angeles by Bill Drake and Gene Chenault. This newest twist to Top 40 involved “bigger” everything: huge contests and promotions, greatest events, hottest play lists (super-targeted and narrowed), and the coolest DJs (Ron Jacobs, Robert W. Morgan, The Real Don Steele), who always said just the “right” thing to enhance their larger-than-life images. After its success in Los Angeles, Drake and Chenault implemented the “Boss” approach at other RKO General stations around the country and influenced the sound of Top-40 radio personalities from then on.

Format and DJ Variety

A major change in the presentation style of contemporary music radio DJs occurred in 1966 with the introduction at KMPX-FM in San Francisco of commercial Underground Radio. A year later, Tom (“Big Daddy”) Donahue, after tuning in the eclectic programming of all night radio deejay Larry Miller on the little known KMPX, decided to execute his plan for commercial underground radio at that same station. He is regarded by many as the father of that format. Deejays at FM stations employing this sound (characterized by long album cuts and counterculture ruminations) assumed personas that were in stark contrast to their rock ‘n’ roll AM radio counterparts. Underground DJs did not scream and shout at their listeners; rather, they spoke softly and conveyed a “naturalness” uncommon for programming targeted at the under thirty-year-old listeners. Furthermore, the format made room for more female DJs, something in rare supply on the airwaves up to this time. Underground radio was ultimately co-opted in the early 1970s by the corporations that owned them. Management imposed tighter format criteria and sought to eliminate the rambling, sometimes incoherent, monologues and diatribes for which DJs using this format were famous.

Meanwhile, Beautiful Music stations—initially AM and ultimately FM stereo (mostly automated) outlets—fostered the “deep” voice announcer style that was felt to resonate with their mostly lush instrumental music playlists and mature and temperate image. As with other formats of the period, but especially this format, women announcers were unwelcome as their voices were perceived as too high. In the 1970s and later, when the format adjusted its image (renaming itself Easy Listening) to appeal to a more youthful audience, styles of announcing became less voice-centric and stilted and somewhat more natural and conversational.

At the same time, the hyper-specialization that occurred in radio programming in the 1970s and 1980s inspired a number of variations in DJ styles. Foremost among them was the brazen, the bold, and the brash as exemplified by the on-air per-

performances of morning DJs throughout the country who emulated the scatological rants of Don Imus and Howard Stern and who worked to create zany “zoo”-like atmospheres, high on talk and offering less music—a format highly popular with some audiences.

Decline

Many once-popular DJs, such as Dick Biondi, are now heard on “golden oldie” stations playing the same music for the same listeners—both now decades older. Because of the migration of music programming to the FM band in the 1980s, talk became the standard fare at most AM stations and in many ways its savior. Despite the harsh criticism leveled against right-wing broadcasters such as Rush Limbaugh and G. Gordon Liddy, such figures are in great part responsible for AM’s continued survival. But these are, of course, political commentators rather than true DJs.

By 2000 many industry observers sensed a growing dearth of future opportunities for DJs in radio. This was the result of many factors, chief among them being the greater use of satellite syndication (and thus a need to separately program each local market), ever-tighter playlist standardization, music format fragmentation, and ownership consolidation with its usual resulting lay-offs of personnel. The increasing presence of “voice tracking” and “cyber jocking” (the use of a few DJs in many different markets thanks to pre-recording and re-use) is, among other things, killing off the role of smaller markets as radio training grounds for a new generation of DJs.

All of this has led to more of a coast-to-coast sameness in what remains of radio’s DJ sound—what might be termed the “malling” (or mauling) of assembly-line radio. Indeed for many formats, including those of classical or jazz music, people can more readily listen to CDs or tapes (or, increasingly, the internet) for all the luck they are likely to have in finding their favorite music on the air. And this lack of offering special and interesting radio personalities, combined with insufficient musical variety, may prove fatal determinants of radio’s future as a venue for music.

So the story of the radio DJ may have come full circle—from invention in the late 1930s and early 1940s, to the glory days of the 1950s and 1960s high personality DJ, to a slow decline in the decades since then, to the “plain vanilla” sound

of much of music radio today. Radio is once again the home for a more amorphous radio voice, not unlike those early (and unknown) announcers.

Documentary Programs on U.S. Radio

Documentary programs did not play a large role in the history of American radio broadcasting. For three decades from the late 1920s, typically only one or two hours of documentary programs were presented on the national networks during the evening hours. In the 1930s and 1940s there were two to three hours of documentaries each week during the daytime as well, most of them produced and/or presented in association with educational institutions and intended for students listening in schools. By the late 1940s there were also several hours of documentary and other factual dramas on weekends, especially on Sunday afternoons (a time period that later would become the “intellectual ghetto” for television).

The documentary programs that were presented, although small in number, often were inventive in their use of voices, music, and sound effects: they created great prestige for the networks and helped stations satisfy requirements for public service programming. Some received much critical acclaim and are still remembered as the pinnacle of radio writing and production.

“Drama documentaries” broadcast during World War II were among the most exciting and accomplished examples of the art of radio and are still studied and enjoyed by students of radio history. Many American documentaries were produced at this time dealing with U.S. history and patriotism. These programs told war stories about America’s fighting men and about its allies—especially the British—or encouraged civilians to conserve resources and support the war effort (and reduce inflation), especially by buying savings bonds. The forms and techniques of such documentaries, combined with the traditions of the film documentary, were precursors to the television documentaries that began in the 1950s.

Origins

The earliest American radio dramas included documentary-type programs such as *Biblical Dramas* and *Great Moments in History*, both on NBC during the season of 1927–28. For several seasons following, at least one radio series presented historical stories or biographies in a dramatic form.

In 1931 the Columbia Broadcasting System (CBS) began *American School of the Air*, which was intended for students. Although this was more specifically an “educational program,” it did have documentary elements—and an eavesdropping audience of adults listening at home. The landmark program ran for nearly two decades.

On 6 March 1931, *The March of Time* began airing on CBS and was carried by 20 of the approximately 80 CBS affiliates. Each program dramatized several important news stories. Initially sponsored *Time* magazine, *The March of Time* had been

developed by Fred Smith, who earlier had dramatized news at WLW-Cincinnati and for syndication. Although the news stories were “re-created”—actors portrayed the characters of important events—this was the first important documentary program on radio. Under various sponsors, *The March of Time* was broadcast for 13 seasons and was partly responsible for Time, Inc. developing a monthly newsreel. By the late 1930s *The March of Time* on film had evolved from a collection of several short reports—the format of the typical newsreel at the time—to a documentary on a single topic. At the end of the 1930s the radio program was off the air for two seasons, but it returned during World War II, and increasingly it made use of the actual persons featured in the news stories.

During the 1930s and World War II, the high cost of using telephone lines for the transmission of remote stories and the lack of portable, high-quality recording equipment that allowed for easy editing made studio re-creation of events easier and less expensive than coverage of the actual event.

In 1936, to create a better image for itself, the DuPont chemical company began sponsorship of *Cavalcade of America*. A broadcast of 2 September 1936 told “the story of rayon,” which was said to “rank with the automobile and radio in its speed of development and in the way it has opened a wide new field of employment.” The program dramatized events in American history, although it carefully avoided any mention of gunpowder or dynamite, which were also manufactured by the company. Commercials always spoke of the progress and benefits of chemistry. This program introduced many young listeners to American history; it continued for nearly two decades until the end of most network dramatic programs.

Also in 1936, CBS introduced *We The People*. This program dramatized stories of generally well-known people, using music and a narrator, and was said to be based on actual documents.

In the late 1930s some factual programs were produced with or by the U.S. Office of Education, the Smithsonian Institution, the Library of Congress, the Rockefeller Foundation, and a number of universities. Some, such as *The Ballad Hunter*, produced by John Lomax, about folklore and folk songs, used recordings made on location. Alan Lomax, John’s son, also produced a 1941 program with the Library of Congress about people displaced by the Tennessee Valley Authority. Alan Lomax would eventually collect thousands of hours of sound and film recordings, and later develop television documentary series, about folklore.

William Lewis, as CBS vice president of programming, had been given carte blanche by the network for experimental dramas; he assembled the group that created Columbia

Workshop. From 1936 until 1941, Columbia Workshop produced experimental dramas and labeled some of these programs “documentaries,” especially when they dealt with social problems and issues. In February 1939, *Words Without Music* presented “They Fly Through the Air with the Greatest of Ease,” written and directed by Norman Corwin: the program described airmen bombing homes and then strafing the people who fled them. Accompanied by narration, dialogue, and sound effects, the story of the pilots involved their completing their missions of destruction but then being themselves shot down. A pilot describes the sight as one of the bombs hits its target: “Gee, that’s fascinating! What a spread! Looks just like a budding rose unfolding!” Although it was not noted during the radio program, the speaker was Vittorio Mussolini, a pilot and the son of Il Duce, the Italian dictator. But Corwin did make this clear in his introduction to the published version of the radio play: “One group of horsemen gave the impression of a budding rose unfolding, as the bombs fell in their midst and blew them up. It was exceptionally good fun.” —Vittorio Mussolini. (The younger Mussolini had written his impressions of dropping bombs on Ethiopian cavalry and watching the horses and riders as they were blown to bits.)

The program excoriated “all aviators who have bombed civilian populations and machine-gunned refugees.” While the U.S. was still neutral, and public opinion was evenly divided on the coming war in Europe, CBS was brave not to censor this program or other similar dramas that were based on fact. “They Fly Through the Air with the Greatest of Ease” received an Ohio State Institute for Education by Radio award in May 1939, as the program “best demonstrating the cultural, artistic, and social uses of radio.” It was a great boost for Corwin’s career, and it was the first of his many dramatized documentaries about the events leading up to World War II and the war itself.

Lewis now told Corwin that he wanted a new series that would build pride among Americans and promote self-awareness of the American heritage. The result was the series *Pursuit of Happiness*, which CBS publicity described as “dedicated to the brighter side of the American scene,” bringing us “reminders that today, with thankfulness and humility, we Americans still enjoy our constitutional rights to life, liberty, and the pursuit of happiness.” Begun in October 1939, the program presented a spectrum of Americana. It was not an immediate success. But the third program, “Ballad for Americans,” a musical written by Earl Robinson and John Latouche and sung by Paul Robeson, received much critical praise. By the time the series ended in May 1940—although there had been many arguments along the way—Corwin had successfully explored his idea of presenting “American sound patterns and phenomena.” This series would set the pattern for Corwin’s and many other CBS programs throughout the coming time of war.

World War II

On 15 December 1941, all four networks presented the Corwin production “We Hold These Truths,” honoring the 150th anniversary of the Bill of Rights: it presented short dramatized stories illustrating the importance of, and conflicts inherent in, each of the rights. Although the program had been in preparation for several months, its broadcast just one week after the attack on Pearl Harbor gave it special emotional appeal. In 1942 Corwin produced a series called *An American in England*, which sought to show how our allies lived, worked, and fought. As previous documentaries had been, these programs were mostly studio-produced dramatizations, but this series distilled research on actual people.

During World War II, the major emphasis of the networks was on reporting the news of the war. Most of that reporting was by newscasters in studios, mainly in New York. There was, of course, much news from London, and some from Asia, transmitted via shortwave—especially at the time of very big stories such as the June 1944 D-Day invasion. The vast majority of such reporting was broadcast live. Recordings were used only sparingly because available equipment was heavy, fragile, unreliable, and required too much battery power for use over long periods.

During the seasons of 1942–43 to 1944–45, radio saw a three-fold increase in the amount of documentary programming. Virtually all of the new programs were war related, often produced with the Office of War Information, and included salutes of each branch of the armed services. Because of a special wartime excess profits tax, many companies preferred to buy sponsorship of programs with money that would otherwise go for taxes, and some companies were willing to pay for documentary and information programs that in the past would have had to be self-sustaining. This additional funding meant that broadcasters could produce more elaborate and expensive documentaries.

At the end of the war in Europe, all networks again carried a Corwin-produced dramatized documentary called “On A Note of Triumph.” The program was well received and was subsequently released as a phonograph album. On that same night of 8 May 1945, however, the real future of documentary was revealed—although there seems to be no evidence that this change was understood at the time. An NBC program, arranged primarily by Prof. Garnet Garrison of Wayne State University in Detroit, presented a history of the war through phonograph recordings of the most important speeches and events of the war. There was a narrator as well as musical bridges, and some speeches had to be re-created because recordings were not available. This was the first use (on such a scale and for such an important occasion) of a substantial compilation of the actual voices and sounds recorded over a period of years.

Postwar Developments

In June 1946, Norman Corwin left New York for a four-month trip around the world “in a search for common ties and yearnings for world unity.” He returned with hundreds of hours of interviews recorded on magnetic wire and acetate discs. By this time plastic magnetic audio tape, to which all of the material was transferred, made editing much easier. The twelve programs produced from this material aired on CBS from 14 January to 1 April 1947 under the series title *One World Flight*.

Although the word “documentary” was now regularly used to describe programs (CBS had formed a documentary unit in 1946), studio re-creation was still the preferred means of presenting non-fiction material. Robert Lewis Shayon created *CBS Is There*, which began 7 July 1947: it dramatized historical events as if they had been covered by CBS correspondents at the time that they happened. For example, on 7 December of that first season, the program was “The Exile of Napoleon,” with CBS reporters “covering” the events that marked “the end of the Napoleonic era.” The next season the title was changed to *You Are There*, and the program continued on radio until 1950. It later had two runs on CBS television narrated by Walter Cronkite.

Many stations began using audio tape as an aid in gathering news and covering actualities. Yet it was another medium, the phonograph record, that helped show the way to documentary based on audio compilation of bits of recorded sound. In 1948 Fred W. Friendly and Edward R. Murrow compiled a history of the 20th century to that time; marketed as “I Can Hear It Now”, it was based on fragments from newsreel sound tracks and on radio recordings. But many items were also re-created, or edited drastically for a more dramatic effect. The success of the record (first released on 78 rpm records, and then re-released in the new LP format), and the several that followed, showed that there was a viable market for audio compilation history.

Working again with Friendly as producer, Murrow made the next significant breakthrough in documentary with his reporting of the 1950 election. “A Report to the Nation” was broadcast just 48 hours after election day; it was a compilation of the voices and sounds of the campaign—speeches, commercials, song, rallies, winners’ declarations, and losers’ laments. Within a few weeks this new format became the basis of a weekly program called *Hear It Now*, which the announcer introduced “as a document for ear.” A segment on 9 February 1951 called “Biography of a Pint of Blood” was not only one of the most dramatic of the series but also showed how audiotape recording would be used in future documentaries. With Murrow narrating, the program offered listeners the story (in interviews, reportage, and the sounds of the events) of one pint of blood—its being donated in the U.S., its transportation to the war front in Korea, and its use in saving a wounded soldier.

The Murrow commentary is spare, limited mostly to essentials needed for transition. Now the real reporter was the tape recorder gathering reality sound, to which narration as needed could be added. But with the decline of radio network audiences because of television competition, in April 1951 CBS cut radio advertising rates for the first time ever. The future of broadcast documentary programming, combining with the traditions of the film documentary, was now on television. *Hear It Now* lasted only that first season; it returned to television in the fall as *See It Now*.

Documentary After 1950

During the next half century there were many fine radio and audio documentary programs and series. But none would attract the audience, achieve the critical praise, or reach such large audiences as their counterparts on television.

For four seasons beginning in 1956, NBC Radio presented *Biography in Sound*; often it was the story of a performer and was based on radio, phonograph record, and movie sound clips, as well as recorded interviews with colleagues and historians. Also in 1956 NBC produced 33 half-hour summaries of the history of radio called *Recollections at 30*. Often the phonograph records of radio performers had to be substituted for actual recordings of the radio programs because none could be found—an unfortunate result of the networks’ earlier ban on using recordings of programs or of their carelessness: many of the recordings that were made were either lost or destroyed.

From the middle 1950s, most radio stations developed new music formats; there was little radio documentary. Sometimes audio-only reporting was used, especially if it was much less expensive and more convenient than bulky and expensive film equipment. In 1965 there were two notable series about poverty in America. *This Little Light* was a 10-program series produced in Mississippi by Chris Koch and Dale Minor for Pacifica Radio. Westinghouse Broadcasting also produced for the stations it owned a series on poverty called *Outskirts of Hope*.

CBS radio sent its own reporters to cover the Vietnam war, but from the beginning news president Fred Friendly insisted that they also provide TV coverage. ABC produced a weekly radio documentary about the Vietnam War for several years. NBC and CBS produced a very few radio documentaries each year, usually including one that was a summary of news for that year. These documentaries, as well as similar collections from Associate Press Radio, were often also made available as phonograph albums.

Since the 1970s, even smaller and more portable audio-recording equipment has made advances in the documentary art possible, but there are now few stations where radio documentaries can still be heard. Currently, National Public Radio in the U.S., the CBC in Canada and the BBC in Britain each typically broadcast several hours of documentaries each week. Producer

David Isay has won numerous awards for his sound documentaries, many of which have aired on National Public Radio.

In December 2000 ABC News produced what it called the first "Webumentary," a biography and recollection of John Lennon on the 20th anniversary of his death.

Dolby Noise Reduction

Reducing Unwanted Noise in Broadcasts and Recording

Dolby Noise Reduction (NR) makes audio signals clearer by reducing noise in the signal. There are a number of forms of Dolby NR, but in its simplest form, as applied in Dolby B NR, high-frequency hiss is reduced by about 10 dB using a process called *companding*: on low-level signals, the high frequencies are boosted during recording (or transmission) and then cut by a correspondingly appropriate amount during playback (or reception). Other noise reduction techniques have been applied with Dolby A, C, SR, and S.

Origins

Ray Dolby founded Dolby Laboratories in London in 1965. Dolby's career began in high school when he worked for Ampex Corporation in Redwood City, California. While still in college he worked with a team of Ampex engineers to invent the first practical video tape recorder, which was introduced to the broadcast industry in 1956 (Dolby was largely responsible for the machine's electronics). Dolby graduated from Stanford University in 1957 and received his Ph.D. in physics from Cambridge University in 1961. Dolby Laboratories moved its headquarters to San Francisco in 1976.

The first commercial product from the company was Dolby A, a noise reduction system using audio compression and expansion to reduce background hiss without the discernible

side effects of conventional wide-band compressors. More than any other feature, the system's freedom from side effects is what differentiated Dolby NR from previous attempts at audio noise reduction and ultimately helped earn its reputation. Also incorporated in this new noise reduction system was the ability to treat only soft signals, leaving unprocessed the loud signals that naturally mask noise.

A consumer version of the noise reduction system, called Dolby B, was released in 1968. Instead of dividing the signal into fixed multiple bands (as did Dolby A), Dolby B NR used a single, less-costly sliding band of compression that reduced noise in the higher frequency hiss region where most of the noise of consumer tape recording occurs. But the system needs the reference levels to be precisely set. Dolby NR is perhaps best known for its use with magnetic tape. The first product to use Dolby B was an open reel tape recorder made by KLH in 1968, but it made its biggest impact in the compact cassette format; with its inherent tape hiss problem and slow speed, cassette tape was a natural for Dolby B noise reduction.

Applications to Radio

The first experimental FM broadcasts using Dolby NR were made by WFMT in Chicago in June 1971 using the model 320

B noise reduction system. In March 1972 WQXR in New York City began full-time FM broadcasting using Dolby B.

In June 1973 it was proposed that Dolby B be joined with 25 microseconds pre-emphasis for FM broadcasting. In February 1974 this became the Dolby FM system demonstrated to the Federal Communications Commission (FCC). In June the FCC approved Dolby FM broadcasts. By August 1975 about 100 U.S. stations were broadcasting in Dolby FM. The use of Dolby FM moved outside the United States in October when the Canadian Department of Communications approved its use for broadcast.

Reducing Noise in Digital Signals

Concurrent with the development of these analog systems, Dolby Labs began research into digital audio in 1982. The primary goal was to find ways to reduce the amount of data required to transmit and store high-quality digital audio. Dolby Labs moved into the world of digital encoding schemes with AC-1, a refined form of Adaptive Delta Modulation (ADM). AC-1 was introduced in 1984, when bit rate reduction was in its infancy, and adopted the next year for use in a number of direct satellite broadcast and cable distribution systems. The Australian Broadcasting Corporation adopted it for direct broadcast satellite in its AUSSAT 1 in October 1985.

Dolby began its work in digital radio with the Digital Studio to Transmitter Line (DSTL) system, which was demonstrated for the first time in September 1991 in San Francisco at the National Association of Broadcasting's "Radio '91" conference. DSTL is a design featuring low time-delay implementation of Dolby AC-2, its second-generation digital encoding scheme using ADM. It features two high-quality channels and two auxiliary channels in the same spectrum space used for narrowband FM composite signals. Dolby DSTL was first installed in May 1992 at WWKX FM in Providence, Rhode Island.

Dolby Fax, for linking worldwide facilities with digital audio, began U.S. sales in March 1994. Dolby Fax uses Dolby AC-2 digital audio coding over two ISDN lines for high-quality transmission worldwide. In May 1994 DMX for Business began as the first direct broadcast satellite service, with Dolby AC-3 digital audio.

Dolby Surround is a matrix process that enables any stereo (two channel) medium, analog or digital, to carry four-channel audio. Encoded program material is fully compatible with mono and stereo playback, and listeners with playback systems incorporating Dolby Surround Pro Logic decoding receive four-channel surround sound. In February 1995 the BBC broadcast the first radio production in Dolby surround, "Bomber," on BBC Radio 4, and "Batman," "The Adventures of Superman," and "The Amazing Spiderman" on BBC Radio 1. Italy's Radio 101 has used Dolby Surround for all its

evening entertainment programming. In March 1995 "West Coast Live" became the first U.S. radio show to be regularly broadcast in Dolby surround. In January 1997 the first Dolby Surround Pro Logic system for in-car use was launched at the Detroit Motor Show.

Dolby moved into the world of personal computer (PC) Surround Sound in April 1996 when Dolby and Microsoft signed a letter of intent to jointly develop PC surround technologies and specifications supporting the use of Dolby Digital AC-3 and Dolby Surround Pro Logic. Dolby Digital (sometimes known as AC-3 for the technology on which it is based) is a perceptual coding for consumer applications that enables storing and transmitting between one and 5.1 audio channels at a low data rate. Dolby Digital makes it possible to store five audio channels using less data than is needed to store just one channel on a compact disc. This was followed by Dolby Net, a low-bit-rate version of Dolby Digital introduced for low-bandwidth applications such as real time streaming internet audio, in November 1996.

In January 1997 Virtual Dolby Surround and Virtual Dolby Digital were introduced at the huge Consumer Electronics Show in Las Vegas. They enable surround sound effects from desktop computers with just two speakers. In October 1999 real time multichannel audio was streamed successfully over the internet using 5.1-channel Dolby Digital.

In 1999 Dolby Laboratories introduced Dolby E, a professional multichannel audio coding technology that allows a single AES/EBU (digital audio) pair to carry up to eight channels of audio, as well as digital metadata, through broadcast facilities. It is a convenient, simple, cost-effective conversion of two-channel broadcast facilities to multichannel audio.

In the world of radio, Dolby Lab's impact has been most felt with Dolby NR, as well as several other programs such as Dolby Surround, DSTL, Dolby Digital, Dolby Fax, and Dolby E. Although no one can predict the future of radio and the interaction with new technologies, given its track record, Dolby Labs will likely play a role in radio's future—on the airwaves, on the internet, or wherever it goes in the new millennium.

Donahue, Tom 1928–1975

U.S. Disc Jockey and Radio Station Executive

In the late 1960s and early 1970s, Tom Donahue helped to revolutionize radio broadcasting in the United States. He is regarded as the “Godfather,” if not the “father,” of “free-form” rock and roll radio. In 1967 at KMPX-FM in San Francisco, he introduced the commercial underground radio format, which eventually became Progressive and later Album-Oriented Rock radio. Known as “Big Daddy,” Donahue was an imposing figure. He weighed over 350 pounds; sported a thick, dark beard; and spoke with a deep bass voice. He began his radio programs with the line, “I’m here to clean up your face and mess up your mind.”

Donahue got his first disc jockey job in 1949, at age 21, at WTIP in Charleston, West Virginia. He moved to radio stations in Maryland and Pennsylvania and eventually was hired in 1951 at WIBG in Philadelphia, where, in addition to the early 1950s popular tunes commonly heard on the air, he played rhythm and blues and rock and roll music.

In 1961 he moved to San Francisco, becoming a disc jockey at KYA, which had a Top 40 musical format. Working with music programmer Bill Drake, Donahue became a “kingpin” disc jockey at the station after helping to make it one of the top-rated operations in its market. The success of Donahue and the station was attributed in part to the fact that he and other disc jockeys heavily involved themselves with the music they played, often holding meetings to discuss the merits of records heard on the air. This distinguished the KYA disc jockeys from others in the business, who saw their jobs as simply springboards to careers in television or movies and who cared little about Top 40 music.

Donahue’s interests grew beyond his air shift and music programming jobs. Together with his partner, fellow KYA radio disc jockey Bobby Mitchell, he operated a small record label, Autumn Records. He employed a 19-year-old disc jockey, Sylvester Stewart (Sly Stone), at soul music station

KDIA to supervise the production of records by artists Bobby Freeman, the Beau Brummels, and The Great Society, with lead singer Grace Slick.

In the spring of 1965 Donahue left KYA to devote more time to his entrepreneurial interests. He operated a radio consultant service and published a music tipsheet, *Tempo*, which kept track of record sales. He also owned racehorses and produced music concerts, including a 1966 performance by the Beatles at Candlestick Park.

By the mid 1960s the Vietnam War and the civil rights movement began to dominate the news, and attitudes of young people on those issues, as well as on sex, drugs, and fashion, began to change. In response, Donahue and Mitchell opened Mother’s, San Francisco’s first psychedelic nightclub, which featured bands such as The Byrds and Lovin’ Spoonful.

Although Donahue recognized that Top 40 music had been dominated by rock and roll in the 1950s and had developed into a formidable economic industry, he believed it had now stagnated, failing to keep pace with changing tastes in American popular culture. For example, in order to play music by an emerging popular group, The Doors, stations often shortened the 6:50 “Light My Fire” to three minutes, and they virtually ignored “The End,” which ran 11:35. To be sure, there were in the mid- to late-1960s stations that experimented by playing longer musical pieces; the Pacifica Foundation’s WBAI-FM in New York City and Massachusetts Institute of Technology’s WTBS in Cambridge were two such stations. In 1966 an alternative format was presented on commercial station WOR-FM in New York City. However, the “underground” radio format was extremely rare.

Donahue longed to return to radio to program a station reflecting America’s burgeoning new musical and artistic landscape. He envisioned a “free-form” format, where disc jockeys were not constrained to be “boss jocks,” constantly upbeat

and energetic as they chatted in between two-minute pop songs with silly lyrics and commercials for products promising to control dandruff and acne.

In the spring of 1967, Donahue began contacting FM stations, hoping he could convince one to try the proposed format. He felt it was possible, because in the 1960s FM radio still had small audiences and formats mostly of classical or beautiful music, or else they were simulcasts of an AM station's signal. He discovered KMPX in San Francisco, a poor station that made ends meet by selling airtime to anyone who had money to pay for it. Most of the time the station provided foreign language programming.

Donahue convinced the station's owners to let him on the air as a disc jockey and music programmer, and on 7 April 1967 he went to work with the format he would later call "freak freely" radio. There would be no playing of pop singles. Instead, he encouraged the station's disk jockeys to play music from a variety of formats, ranging from rock to blues, to folk, to folk rock. Cuts could be as long as the disc jockey desired, and talk by the announcers was conversational and unhurried. There would be no announcing of the current time and temperature. And there would be no musical jingles heard, as was the case on Top 40 stations.

KMPX's commercial "underground rock" became an instant success in the San Francisco area. In June of 1967 Chinese language programming was dropped completely, and the "underground radio" format was extended to 24 hours a day. Donahue was soon invited to employ the same format at Los Angeles FM station KPPC.

In November of 1967 Donahue was interviewed in the second issue of the magazine *Rolling Stone*, where he touted the free-form format and derided Top 40 music as "dead, and its rotting corpse is stinking up the airways." Though Donahue overstated his case against AM radio, the changes he brought to the radio music business did force Top 40 stations to rethink their programming, and in time they added album-oriented groups to their programming lists.

In March of 1968 Donahue and his air staff had a falling out with KMPX management, and they went on strike. They moved to San Francisco station KSAN, where Donahue was hired as program director and later became vice president and

general manager. In May of 1972 he participated in a radio special honoring the fifth anniversary of free-form music radio. He began the program with Chinese music, to represent the foreign language show his disc jockeys replaced.

In the early 1970s the popularity of the free-form radio approach waned at commercial stations as managers began to reestablish stricter control over disc jockeys and their playlists.

Donahue was still working as KSAN general manager when he died of a heart attack on 28 April 1975. He was inducted posthumously into the Rock and Roll Hall of Fame in Cleveland, Ohio, in 1996.

Don Lee Broadcasting System

The California-based Don Lee network was one of the longer lasting and more influential of the regional radio networks that first appeared in the 1930s. Before its demise in 1950, the network also pioneered local television broadcasting.

Origins

In 1926 Don Lee (a Los Angeles resident whose wealth had been built on his exclusive distribution rights for Cadillac automobiles in California) purchased KFRC in San Francisco. In 1927 he acquired KHJ in Los Angeles to promote auto sales. He then joined the McClatchy radio stations in 1928 and formed a western network that became affiliated with the Columbia Broadcasting System (CBS).

Don Lee died in 1934, and his son Thomas took over what continued to be known as the Don Lee Broadcasting System. Thomas Lee broke with McClatchy, and in 1936 signed with the Mutual network. Through the remainder of the 1930s and during the 1940s, the Don Lee Broadcasting System served as Mutual's West Coast nerve center. Operations were centered at KHJ in Los Angeles, with KFRC in San Francisco and KGB in San Diego. By the late 1940s the Don Lee Broadcasting System also controlled 17 other stations in smaller California towns. KALE in Portland, Oregon, anchored that state's ten owned-and-operated stations located in smaller Oregon towns. KVI in Seattle and KNEW in Spokane led Washington's nine stations. The properties of the Don Lee Broadcasting System also included three stations in Idaho; KATO in Reno, Nevada; KOOL in Phoenix, Arizona; KCNA in Tucson, Arizona; and KHON in Honolulu, Hawaii.

Pioneering TV

For all its regional radio success, the Don Lee Broadcasting System's truly pioneering work was in television broadcasting. Although RCA is usually given most of the credit for pioneering American television, the Don Lee Broadcasting System deserves at least equal billing. Its radio profits funded television experiments that began as a simple television laboratory in 1930. On 14 November 1930, auto-dealer-turned-broadcaster Don Lee hired Philo Farnsworth protégé Harry Lubcke as his director of television. By 10 May 1931 Lubcke and his staff had built television equipment of sufficient quality to convince the Federal Radio Commission to give the Don Lee Broadcasting System permission to go on the air experimentally. On the last day of 1931, its experimental TV station W6XAO went on the air on a UHF frequency for one hour per day, a schedule maintained through the 1930s.

With a transmitter and studios located in the Lee building's second floor in downtown Los Angeles, TV broadcasting experiments commenced on a slow, steady basis through the 1930s. Highlights included 1933 news footage of a Southern California earthquake as well as USC football games. In October 1937 the Don Lee Broadcasting System presented a gala high-profile premiere, broadcasting both on radio and television the opening of the 27th annual Los Angeles Motor Car Dealers' Automobile Show from the Pan Pacific Auditorium. (This event represented for Don Lee Broadcasting System the equivalent of the more fabled 1939 RCA demonstration at the World's Fair.) Every year the Don Lee Broadcasting System television station broadcast the Pasadena Tournament of Roses Parade, and in 1940 moved its transmitter to the top of Mount Lee, above the fabled "Hollywood" sign. The Don Lee company was apparently on the verge of initiating mass market TV broadcasting—in Hollywood's back yard—but the bombing of Pearl Harbor on 7 December 1941 put further experimentation on hold. Throughout World War II, the Don Lee Broadcasting System concentrated on radio.

Decline

After the war, Thomas Lee continued to concentrate on his highly profitable radio business and thus did not push to convert experimental W6XAO into formally licensed KTSL-TV (KTSL stood for "Thomas S. Lee") until May 1948. This came after Lee opened a \$2.5 million radio and television complex at Hollywood and Vine with 18 studios covering 112,000 square feet, for television, AM, and FM broadcasting. Within the studio, Lee management sought to link radio with TV programming, not convinced that television would prove to be a stand-alone medium. Thomas Lee reasoned that simulcasting radio and TV programs would be the wave of the future. The Don Lee Broadcasting System's most famous show, *Queen for a Day*, was an example of this thinking.

Although radio broadcasts of *Queen for a Day* began on 29 April 1945, it would be two years before Lee gave the go-ahead to simulcast the program on the still-experimental TV station W6XAO. But when the simulcast finally occurred, its success led Lee to commit to television. Broadcasting live from a Hollywood theater-restaurant called the Moulin Rouge, host Jack Bailey interviewed four or five women who poured out tales of woe. The one receiving the most audience applause became "Queen for a Day" and was showered with gifts, her problems momentarily solved, at least in a material sense. James Cagney's sister Jeanne offered fashion shows in breaks between sob stories. *Queen for a Day* became a Los Angeles sensation through the early 1950s, and later ran on the

National Broadcasting Company (NBC) and American Broadcasting Company (ABC) networks.

Thomas Lee's death on 13 January 1950 was the beginning of the end of the Don Lee Broadcasting System. (He had been in poor health for years and either fell or jumped from the 12th floor of his broadcasting center.) Operations continued under long-time Vice President Lewis Allen Weiss until May, when, under the terms of Lee's will, the broadcast properties were put up for sale. In November, General Tire and Rubber Company's bid of \$12.3 million was accepted. General Tire folded the Don Lee Broadcasting System into its broadcast empire, which then included the Mutual radio network, the Yankee radio network, and TV/radio station WOR of New York. By the end of the 1950s, nothing remained of the previ-

ous Don Lee Broadcasting System as a regional network or a group of influential radio stations.

Dr. Demento 1941–

U.S. Radio Show Host

Since 1971 Dr. Demento has been the host of a weekly program of novelty songs and comedy skits, syndicated to more than 100 stations across the United States. Mixing the works of such legends as Spike Jones, Tom Lehrer, Monty Python, Stan Freberg, and Frank Zappa with contemporary comedians, comedy troupes, and musicians, the show has filled a unique niche in contemporary radio programming.

Barret Hansen, the future Dr. Demento, was born in Minneapolis in 1941. From his early years, it was clear that music would be a focus in his life. Prompted by his father, an amateur pianist, Hansen began taking piano lessons at the age of six. He also started a record collection, purchased mostly from a local thrift shop offering thousands of old 78-rpm disks.

The spread of rock and roll in the 1950s captivated Hansen, and he was particularly interested in rock's roots in rhythm and blues and country. After dabbling in disc jockey work in high school, Hansen attended Reed College in Portland, Oregon, where he worked as student manager of the campus FM station and graduated in 1963 with a degree in classical music. He then moved on to UCLA, where he wrote a master's thesis in 1967 on the evolution of rhythm and blues in the 1940s and early 1950s.

After graduate school in 1968, Hansen worked in Los Angeles for Specialty Records, a rhythm and blues label, and helped release a series of classic reissues. He also began hosting radio programs. This was during the famed era (late 1960s and early 1970s) of free-form FM radio, also frequently referred to

as "progressive" or "underground" FM radio. Emerging from both coasts and a number of college radio stations, the relatively short-lived free-form era was a period of personal rather than corporate radio. Stations professed a concern with playing good music rather than salable product, and they allowed disc jockeys the freedom to construct their own playlists rather than follow a preconceived format. In 1970 Hansen made a series of guest appearances on KPPC, the legendary free-form radio station, joining a show hosted by Steven Siegal, who was later known as "The Obscene Steven Clean." Siegal coined the name "Dr. Demento" for Hansen, and the guest spots were such a success that in 1971 Los Angeles station KPPC gave Hansen his own weekly program of rock rarities. Dr. Demento expanded the playlist to include such classics as "The Purple People Eater," "Transfusion," and "The Monster Mash," and listeners quickly demanded more of such fare.

In 1972 KMET-FM in Los Angeles became the new home of *The Dr. Demento Show*. The show first captivated the local arena, becoming the most listened-to Sunday evening radio program in Los Angeles, then the nation, when it went into syndication in 1974. At this point, Dr. Demento became a well-known figure with his own unique look, including a top hat he first wore on an album cover in 1975, and a "Rare Records" t-shirt from a local collectors record store.

The Dr. Demento Show's success has been built on a foundation of both classic novelty hits and submissions from amateur artists. Of the former, Demento's resurrection of Spike

Barry Hansen, aka Dr. Demento, 24 February 2000

Jones is a good example. Jones and his band, The City Slickers, specialized in zany melodies and lyrics, with a wide variety of unusual noises and sound effects thrown in to produce a uniquely whimsical sound. Jones met with great success on radio and in records beginning in the World War II era, producing such hits as “Der Fuehrer’s Face” and “You Always Hurt the One You Love.” However, his popularity faded by the mid-1950s, and he died in 1965. His recorded works became a cornerstone of *The Dr. Demento Show*’s playlist, and Dr. Demento referred to Jones as “the King of Dementia.” This exposure, plus the addition of a number of Jones’ classics to Dr. Demento’s various novelty collection vinyl (now CD) releases, introduced a new generation to the mad music of Spike Jones.

Although such classic recordings have continued to be a key part of the show, Dr. Demento has also received submissions of amateur works. Perhaps his most significant find through this process was famed parodist “Weird Al” Yankovic. When only in his teens and a fan of *The Dr. Demento Show*, Yankovic

mailed in a home-recorded parody. After a number of years of such submissions, Yankovic finally reached a more mainstream audience with the single “Another One Rides the Bus,” which he performed live on *The Dr. Demento Show* in 1980. Thus, *The Dr. Demento Show* helped spawn Yankovic’s enormous popularity as rock music’s best-known parodist.

Such songs as Yankovic’s parodies are the backbone of Demento’s weekly show. A typical broadcast opens with an hour of a general playlist: skits and songs from the Kids in the Hall, Tom Lehrer, Monty Python, Allan Sherman, Julie Brown, and Cheech and Chong; songs such as “They’re Coming to Take Me Away,” “Fish Heads,” and “Dead Puppies”; novelty cuts from otherwise straight rock acts such as The Police and AC/DC; and outright strange experiments, such as songs sung by Leonard Nimoy and William Shatner. The subsequent half hour is oriented around a single theme, such as songs about streaking, baseball, the internet, and so on. The remaining airtime consists of the “Funny Five,” the top five most requested songs of the week. Notably, virtually all of the

two-hour playlist comes from Dr. Demento's own record collection, built up since his days of buying records at the thrift shop.

Outside of his radio work, Dr. Demento also works on research projects, helps to compile various comedy collections, and continues to build his archival collection. He also writes on music history, penning numerous magazine articles, liner notes, and encyclopedia entries.

Dr. Demento emerged during a unique period in FM radio history, and his subsequent success owes a great deal to his love for and knowledge of all kinds of music and his ability to convey his enthusiasm to listeners. When asked what he saw as his place in radio history, Dr. Demento replied: "I try to open people's ears to lots of different kinds of music, old and new, that they might not otherwise be exposed to. I've entertained some people and opened their ears to musical discoveries, and helped the careers of some great artists."

Drake, Bill 1938–

U.S. Radio Station Consultant

Bill Drake changed the landscape of Top 40 radio in the 1960s and 1970s. His fast-paced, forward-moving "more hits/less talk" approach to contemporary music formatting generated attractive ratings, but by 1970 had diminished the traditional influence of loquacious disc jockeys and left dozens of cookie-cutter stations that sounded alike. Drake accomplished this synthesis by compacting hit-music radio into a precise system that could be easily staffed and centrally controlled.

Disc Jockey Years

It is said that a knee injury nudged Bill Drake into radio programming. The Georgia Teacher's College student had originally

hoped that his basketball scholarship would someday net him a contract with a professional team. When that was no longer possible, Drake (who was then known by his given name, Philip Yarbrough) decided to pursue a broadcasting career. The Donaldsonville, Georgia native had started announcing while a teenager at WMGR in nearby Bainbridge. By 1957 he carried that experience to college and was hired by WWNS in Statesboro, Georgia. Four years later, Drake took to the microphone on Atlanta's WAKE. Pronounced "wake," the pioneer Top 40 music station had a manager with a penchant for rhyme; he suggested that Yarbrough go on the air as "Bill Blake on WAKE." Yarbrough countered with "Drake" (his mother's maiden name). That day, listeners to the pint-sized station (1,000 watts

during the day and 250 watts at night) heard the name that would eventually be on the lips of radio people worldwide.

Bartell Broadcasting sold WAKE in 1961. As Drake was showing promise as program director in addition to performing as a disc jockey, Bartell moved him to their San Francisco outlet, KYA. This was another traditional Top 40 music station; programming focused on disc jockeys spinning records between frequent barrages of half-minute weather jingles, chatter, commercials of sundry lengths and tempo, sound effects, and time tones. Drake quickly concluded that listeners considered most of this as noise in the way of hearing more songs. Eliminating unwanted talk could convert the station into a real people-pleaser.

Armed with notebooks containing short station promotion announcements, as well as a plotted format clock showing precisely where these (and the music) should run, Drake started streamlining KYA. All rearranging was designed to keep listeners from tuning elsewhere. He concluded that few disc jockeys conveyed sufficient personality and charisma to be preferred over music. Although endowed with a resonant "radio voice" himself, Drake used the microphone only long enough to say the minimum about a song or station promotion, being very careful never to give the music short shrift. From his example, his on-air staff got the message not to ad-lib. Contrary to his critics, however, Drake welcomed a DJ air style where a personality could be perceived, as long as it did not noticeably impede the music flow. He found few who could master his ideal combination of great voice, impeccable pacing, friendly and enthusiastic tone, and compact presence.

The Fresno Fight

KYNO owner Gene Chenault needed programming advice for his Fresno, California station. His spunky Top 40 outlet practically owned the audience, but had started getting heavy local competition during 1962. Chenault's competition was KMAK, which was tightly formatted by Ron Jacobs. By the summer of 1963, Jacobs had conquered San Bernardino with KPEN and was busy toppling Chenault's Fresno station when Drake arrived.

The resulting radio war was fought with constant format tightening, increasing amounts of hit music, exciting station promotional stunts, and continual "ante upping." Each station monitored the other and had staff enthusiastically dabbling in a fraternal radio version of industrial espionage. When KMAK, for example, offered listeners a \$1,000 prize, KYNO people would quickly counter with a \$2,000 jackpot. Marathon remote broadcasts, where fans could see their favorite radio personality attempt to transmit solo all weekend, or sweepstakes in which listeners were invited to search for a single (cleverly hidden) "lucky key" to some station treasure, were thwarted by sleeping pills mysteriously ending up in a

tired marathon disc jockey's coffee and by the strange appearance of decoy keys throughout Fresno.

Throughout the intrigue, Drake crystallized his belief that a music station should sound like it is always in motion. Every bit of announcing was positioned to scream, "This station has everything you like, and our supply is endless!" By simply blasting a short station identification jingle immediately prior to a hit song, he gave KYNO a bit more edge (by implying, "even our jingles move quickly out of the way to keep your favorite hits coming") than the competition. When the smoke cleared, Chenault's better-funded KYNO nosed past its rival. Drake had defeated Jacobs, but their Fresno clash set the stage for the rise of new radio formatting.

Formation of Drake-Chenault

KYNO's recaptured dominance gave Chenault the idea of exploring possibilities beyond Fresno. He envisioned a firm from which he could market radio-program doctoring to numerous ailing stations with Drake as the surgeon. The two associates had already achieved victories at KYNO and at the Stockton facility owned by Chenault's acquaintances. By 1964 the partners were ready for their Drake-Chenault Enterprises (also known as American Independent Radio and Drake-Chenault Productions) to spread the small-city successes into larger media markets. San Diego would serve as their first proving ground.

Station KGB offered the new consulting firm an opportunity to establish a miracle-worker reputation. The San Diego AM station would have to fight its way past two relatively sophisticated Top 40 adversaries. Drake's installation of his tight, uncluttered, more-music format soon made the competition sound outdated. The tremendous resulting KGB audience jump proved to be Drake-Chenault's ticket to what would be its most memorable radio foray.

For group-owner RKO-General was searching for ways to shore up its radio division. Although WOR (New York) stayed nicely afloat, other RKO outlets required continuous bailing out. Chief among the problems was KHJ (Los Angeles), a 5,000-watt AM station that seemed hopelessly bypassed in the ratings. Drake-Chenault signed a consulting agreement in 1965 for what they saw as a make-or-break debut. Radio managers would be monitoring their Los Angeles efforts closely as few felt the market needed another rock and roll station. Competitors included KFWB "Color Radio Channel 98," and the 50-kilowatt KRLA. Both used talkative air personalities known by most southern California listeners.

Drake hoped to use a KHJ win as a door into dozens of wounded stations, but he felt that three active assignments (Fresno, San Diego, and Los Angeles) was, for the time being, a prudent cap. He wanted unfettered time (away from corporate distractions) to ponder how best to keep his format concepts

fresh, so he only promised RKO that he would be present in the KHJ offices about one day per week. That necessitated the hiring of a KHJ-based program director who clearly understood how best to achieve Drake-Chenault goals.

“Boss Radio”

Ron Jacobs, onetime Fresno competitor, filled the bill as program director of the anticipated Los Angeles operation. Chenault was especially pleased to have Jacobs and Drake on the same programming team and was said to have compared the amalgamation to going into battle (against the other area stations) with both Generals Grant and Lee on one side. A “more hit music” format, very similar to Drake’s Fresno and San Diego output, was readied for KHJ’s conversion. RKO’s promotion director, Clancy Imislund, suggested to Drake and Jacobs that KHJ be dubbed “Boss Radio.” The programmers judged “boss” (teenage slang for “cool”) to be old hat, but reluctantly agreed to adopt it.

Boss Radio KHJ hit the airwaves early in May 1965. By fall the once-comatose station had rocketed to the top of Los Angeles’ radio ratings and was the talk of the business. Its tight playlist (*never* any dead air), with 30 current hit songs (and with older favorites mixed in) sounded sleeker than rivals still working at getting through their top 40 or more records. Drake reasoned that he would rather have his outlets airing, for example, the 29th most popular tune, as opposed to the 40th or 58th. Also different from the competition was Drake’s strictly mandated 12-minutes-per-hour commercial maximum (a third less than the industry standard). This gave KHJ time to air at least two more songs each hour than KFWB or KRLA.

Formats were typically devised on paper by Drake, then implemented by Jacobs. Though Drake-Chenault was clearly responsible for putting the KHJ conversion in motion, insiders (such as music radio pundit Bill Gavin) credit Jacobs with the milestone contemporary music station’s day-to-day success. His connection to what flowed from KHJ kept the talented air staff, cache of station promotions, and every detail of the Boss Radio image highly polished. Not long after the format rollout, Jacobs heard a brief jingle burst, “KHJ-Los Angeles,” immediately followed by the disc jockey exclaiming, “It’s three o’clock in Los Angeles.” Instantly hit with the redundancy (and possible negative effects on listeners), he commanded the air staff to announce Los Angeles as Boss Angeles. The memorable, “classic Drake” nuance serves as one example of how Jacobs constantly honed the programming concepts typically associated with Drake-Chenault. He stayed with KHJ until spring 1969.

National Expansion

RKO officials now wanted Drake to duplicate the KHJ success elsewhere in their chain. Consequently, in 1966 Boss Radio

cloning took place at KFRC (San Francisco), WRKO (Boston, as “Now Radio”), CKLW (Windsor, Ontario/Detroit, Michigan), and WHBQ (Memphis). Each installation worked wonders, solidifying Drake’s miracle-worker reputation. His modification of WOR-FM New York (which received a hybrid of oldies, album cuts, and touches of the Top 30) didn’t match KHJ’s impact. In terms of FM receiver penetration of well under 50 percent in 1968–69, however, it generated respectable listenership.

The Drake-Chenault agreement with RKO allowed the programmers to work with stations in media markets not served by RKO. During the early days of the pact, critics predicted that the Drake format’s tightly controlled, high-energy sound was purely a province of the trendy West Coast and would never be accepted outside California. Prior to the Boston assignment, Drake-Chenault had been hired to try out Boss Radio in Oklahoma. Tulsa’s mid-American KAKC listeners embraced what was by then (1966) dubbed “The Drake Sound,” though it was also the brainchild of others—such as Jacobs.

Brainstorming kept the format fresh as Drake understood the value of being linked with associates able to translate ideas about mainstream radio listeners into concrete programming policy. In the days before digital satellite transmission or web streaming, Drake monitored client stations via telephone. Any disc jockey not conforming to the spirit of Boss Radio might receive a corrective call from THE boss. Except for fielding those dreaded calls, few directly heard from (or saw) Drake. He seemed to be both everywhere and nowhere. A chain of command—from him to the national program director to the local program director then down to the announcer—seemed to make edicts more powerful and enhanced the Drake mystique.

In 1970 *Newsweek* called Drake “the most powerful force in broadcast rock . . . with complete control of programming, commercial time, and even the hiring and firing of local disc jockeys.” Technically, such a stranglehold was against Federal Communications Commission (FCC) rules requiring station licensees to be in total control of their stations, but the magazine had a point to make on behalf of recording companies. They complained that, unless Drake put a particular record on his well-researched 30-song playlist, it had little chance of being spun by other hit music broadcasters. Songs over three minutes (eating up precious airtime in which another tune could be started) had difficulty making the “Boss 30” grade. A promising four-minute song was often abridged in a Drake-Chenault-sanctioned production room.

By 1970 the firm had 40 client stations paying upwards of \$10,000 monthly for its services. Reportedly, some felt cornered into such an association. Outwardly secure broadcasters, hearing rumors that the station across town was talking to Drake-Chenault, were known to panic, then hire the consult-

ants first as an insurance measure. The term *Fake Drake* surfaced as a euphemism for outlets, often in smaller markets, choosing to save the consulting fee by imitating the “factory-authorized” format. The imitation typically involved a set of short Drake-like jingles; a copy of the weekly KHJ, CKLW, or WRKO music survey; cassette aircheck tapes of those stations; and an erstwhile Drake client station’s disc jockey bent on becoming a noted programmer.

Changing Opportunities

The FCC’s mid-1960s directive that most FM stations could no longer simulcast programming of their commonly owned AM sisters provided a new marketplace for Drake’s output. RKO asked him to develop a format that could be inexpensively executed via automation on its FM properties. In late 1968 a middle-of-the-road (softer rock hits) offering, called “Hit Parade,” was installed in Boston, Los Angeles, and San Francisco. Its tempo soon increased, as did interest in the canned fare on the part of other budget-minded FM operators. By the mid-1970s, “Hit Parade” and several other ready-to-run formats (such as “Solid Gold,” “Classic Gold,” “XT-40,” “Super Soul,” and “Great American Country”) brought the taped Drake repertoire to about 200 stations in markets of various sizes. Associates tested a progressive rock offering but indicated that Drake never related to (for example) Grateful Dead or Janis Joplin album cuts, and they backed away from the genre.

The advent of increasing competition through separate FM formats, plus 18- to 34-year-olds’ changing taste in music, rendered the original Drake sound somewhat shopworn by 1973. Consequently, the RKO AM stations showed signs of ratings erosion. The hit single, pop music radio’s 45-rpm traditional stock in trade, was exhibiting a sales slide. Instead, young people started directing their attention toward the long-playing 33 1/3-rpm albums, which were primarily heard (without frequent jingles, promotion, commercialization, or staged forward momentum) on the emerging FM rock outlets. The 1960s generation, which Drake had cleverly schooled to demand a “more music/less talk” approach, discovered that even the most unsophisticated FM rock station (typically staffed by taciturn announcers who just wanted to let the latest album track all the way through) delivered more music than Boss Radio ever did. RKO officials insisted that Drake personally spend more time immersed in solving its stations’ audience exodus. Agreement, however, could not be reached, and RKO ended the relationship in 1973.

Following the RKO termination, Drake-Chenault sought another Los Angeles programming platform. It came in the form of struggling KIQQ (FM), dubbed K-100 to denote a 100.3-megahertz dial position. The duo was granted stock ownership in the venture and five years to make K-100 a profit center. Also at stake was a chance to sink KHJ and embarrass

RKO. Although much effort went into making K-100 into a ratings giant, the operation was filled with tension (compared to the sense of collegial fun that had driven the 1965 KHJ debut), and it never made a similarly significant impact on southern Californians. K-100 was sold in 1978.

By the late 1970s, the 24-hour syndicated format genre that Drake’s firm had helped pioneer found itself swimming in a sea of competitors. Improved automation gear and, eventually, satellite delivery made the program distribution process easier for newcomers to enter. Even though from about 1980 Drake’s programming had largely disappeared from major-market stations, his name still commanded respect in broadcasting circles. He and Chenault continued syndicating their turnkey formats through about 1980, when Drake-Chenault Enterprises was quietly sold (and eventually folded into Jones Satellite Radio).

In 1990 Drake actively reentered programming to help fine-tune KRTH (FM), KHJ’s former sister. To his credit, Bill Drake found contemporary music radio mired in discordant presentation and intuitively built it a concise programming formula followed in principle by scores of broadcasters today.

Drake, Galen 1907-1989

U.S. Radio Announcer and Program Host

Known for his homespun advice and storytelling, radio host Galen Drake was a consistent audience draw on local and national airwaves during the 1940s and 1950s. Once dubbed "The Most Convincing Microphone Voice" by *Radio Life* magazine, Drake pitched thousands of products over radio during the course of his career and hosted various programs, all of which revolved around his just-plain-folks commentary and philosophy. Drake reached the pinnacle of his radio career during the 1950s, when he simultaneously hosted a weekly variety show from New York City over the Columbia Broadcasting System (CBS) and two daily programs over radio station WCBS in New York.

Although Drake never acquired the popularity of fellow CBS star Arthur Godfrey, the two shared a somewhat similar style. Many listeners appreciated their advertisements because they seemed genuine, not overly fawning toward the products. Drake, like Godfrey, delivered his product appeals in a conversational, spontaneous manner, which he altered depending on his mood and experiences with the products; he rarely scripted his pitches, using only a few hastily sketched notes.

When Drake wasn't selling products, he hosted radio shows that were essentially forums for his advice, statements of philosophy, and stories; the conversational style that made his product pitches so convincing also characterized his performance on radio shows. Drake liked to sound spontaneous, a quality he achieved by striding into the radio studio less than five minutes before airtime, clutching only the sparsest of notes. Although he planned topics for discussion, he claimed to have no set outline to address them. "How am I going to know what I'll say until I start talking?" he once exclaimed. "Do you draw up diagrams of your conversation when you go visiting friends?"

The raconteur's "conversations" with his radio audience could cover multiple subjects in the course of one 45-minute program. For example, on one broadcast in 1947 he dealt with night vision, the effect of emotions on driving, mountain

climbing, inventors, and juvenile delinquency. He constantly peppered his shows with commonsense observations: "There are two times to keep your mouth shut: when you're swimmin' and when you're angry" or "What a man must do he can do. When he says he cannot, he means he will not."

Drake told interviewers that he based his advice and truisms on the words of philosophers and psychiatrists he studied as well as on the homegrown ideals that his father (who was in the furniture business) articulated. Drake's knack for delivering his advice and truisms grew from conversing, while still young, with many adults (three half siblings were grown at the time of Drake's birth) as well as from his acting, which began at Long Beach (California) Polytechnic High School during the 1920s.

Drake's high school acting coincided with his employment at radio station KFOX in Long Beach, where he sang and acted in radio plays. After graduating from high school in 1926, he remained at KFOX and also directed plays at the Long Beach Community Playhouse. In 1940 he debuted on the airwaves of CBS-affiliated KSFO in San Francisco, California, and two years later he landed at the CBS-owned KNX in Los Angeles, California. Drake's association with CBS radio would be his avenue to national fame.

Over KSFO and KNX, Drake hosted the *Sunrise Salute* and *Housewives Protective League* programs, which were created by Fletcher Wiley and produced locally at CBS radio stations around the country. The programs touted products approved by a panel of housewives and featured advice and stories for their female audience. Drake perfected his intimate radio delivery (which, however, some critics derided as smug and arrogant) as a voice of the Housewives Protective League (HPL). It was through his product marketing on the Fletcher Wiley programs that he came to define himself as a product pitchman rather than an entertainer. "I'm not a radio star," he once said. "I'm a partner in a client's business when I get his product to sell."

In 1944 the radio pundit moved to the East Coast to broadcast for the HPL over radio station WJZ in New York City. Three years later Drake went to WCBS in New York, which in 1954 would become the base of his first CBS network program, the *Galen Drake Show*. The show aired Saturday mornings at 10:15 EST and offered a mixture of music and Drake's wisdom and interviews. *Billboard* magazine reviewed the program in 1954 shortly after its debut: "Drake chats away, tells a few stories and interviews members of the studio audience who have the most unusual hobbies, are young grandmothers and are from out-of-town. There is no pretentiousness about the stanza or its entertainment, and yet it's most effective" (see Morse, 1954).

Drake's CBS program performed so well that in 1957 ABC-TV offered him a television show. However, Drake's appeal failed to translate to the new medium, leaving him to cling to

his radio base. He continued on WCBS until 1959, when he moved to radio station WOR in New York. His network program was picked up by the Mutual Broadcasting System, but Drake was nearing the end of his radio career. By 1963 he was off the air, a victim, perhaps, of diminishing radio audiences and the explosion of disc jockey programs. The personality's last notable show had been his nightly readings of the Bible over WOR, which began in 1960. In the mid-1960s, Drake returned to Long Beach, where he did occasional advertisements and acted in the Salvation Army's *Heartbeat Theater*, a syndicated radio drama. Drake died of lung cancer in 1989.

MICHAEL STREISSGUTH

Galen Drake. Born Foster Purcell Rucker in Kokomo, Indiana, 26 July 1907. Youngest of two children born to Theodore and

Flora Rucker; attended University of California, Los Angeles, 1926; wrote, directed, sang, and acted in radio plays, KFOX, Long Beach, California, 1926–40; host and announcer, KSFO, San Francisco, 1940–42; KNX, Los Angeles, 1942–44; WJZ, New York City, 1944–47; WCBS, New York City, 1947–59; WOR, New York City, 1959–early 1960s. Died in Long Beach, California, 30 June 1989.

Drama on U.S. Radio

The American radio industry is and has been the largest in the world. Before the rise of television, U.S. radio drama was creative as well as commercially popular. Radio also provided a marketing dimension for the Hollywood film industry. The political need to gain government support for the network monopoly was one factor behind the substantial network investment in quality sustaining (non-advertiser supported) programs.

As radio reinvented itself as a music medium in the 1950s, dramatic productions quickly fell out of favor. The competition from popular dramatic story telling on television was too intense. While the counter-culture movement of youth protest in the 1960s generated a demand for radio that offered a space for intelligent speech and alternative music, it did not support storytelling. Unlike the radio situation in Europe, Canada, and Australia, for example, American radio drama funding was not centralized into one service. Radio drama projects relied on entrepreneurial projects to raise funds from sponsors, private foundations, station budgets, and such public resources for cultural projects as the National Endowment for the Arts and the National Endowment for the Humanities. The developing publishing market for spoken-word cassettes and CDs in the 1980s and 1990s provided further commercial collateral for production budgets.

Origins

Early U.S. drama developed in individual stations across the country. Even before World War I, Charles "Doc" Herrold organized schedules for a station in San Jose, California, which in 1914 included transmitting a live play. A drama series was broadcast by station WGY in Schenectady, New York, in

1922. The WGY players began with a full-length production of Eugene Walter's *The Wolf* and soon established a regular Friday night schedule of two-and-a-half-hour performances of anything from *The Garden of Allah* to Ibsen's *The Wild Duck*. For three years not a single playwright asked for payment. An orchestra provided music in the silences between scenes and acts. By 1923 the WGY players had launched a \$500 radio drama prize competition to encourage scripts specifically tailored to the medium. The rules stipulated plays that were "clean," avoided "sex dramas," and employed small casts of five to six characters. One hundred scripts were submitted, but the play selected did not result in a successful broadcast.

As WGY productions began to be shared with other stations by early 1924, some of the actors were paid and other stations started radio drama centers of production. WLW in Cincinnati broadcast *A Fan and Two Candlesticks* by Mary MacMillan, which was followed a week later by the balcony scene from *Romeo and Juliet*. Drama became a weekly event. The transmission of *When Love Wakes*, an original play written by program manager Fred Smith, may have been the first play written especially for radio when it aired 3 April 1923, nine months before the transmission of Richard Hughes' *Danger* on the BBC in January 1924.

During these early years, radio stations realized that it was easier to control sound levels within a studio than to depend upon a theater stage as an arena for drama performance. In WGY's case, engineers designed microphones hidden in lampshades in case actors became nervous at the sight of a bare microphone. Chicago's KYW took to the air specializing in broadcasting operas. *Radio Digest* observed in October 1923 that the radio play was increasing rapidly in popularity and that many eastern stations had their own theatrical groups.

That same year, as a publicity device, WLW in Cincinnati provided airtime for the Shuster-Martin School to perform drama readings.

One of the first sponsored dramas was probably included in the *Eveready Hour*, which was launched in December 1923 on WEAf, New York City, to sell Eveready batteries. By 1927 the *Eveready House* program was producing a prestigious drama on a monthly basis, with each production auditioned before the sponsor three weeks before airing. Actors were now being paid \$75 to \$125 per performance. Rosaline Greene was praised for her portrayal of Joan of Arc.

Golden Age of Popular Radio Drama

The golden age of U.S. radio drama really began in the late 1920s when first the National Broadcasting Company (NBC) and later the Columbia Broadcasting System (CBS) began distributing networked programs. Drama was included along with dance and jazz concerts, because drama had “an aura of respectability.” The titles included *Great Moments in History*, *Biblical Dramas*, *Real Folks*, *Main Street*, and *True Story*. For the next three decades, virtually all American network drama and comedy programs were in the format of series in that they used a continuing cast of characters and provided programs on a regular (usually weekly) schedule. Individual episodes usually stood alone, each one a complete story, but such fare was built around continuing characters who would be around the following week. The growing number of network series were supplemented with anthology (sometimes dubbed “prestige”) drama programs, whose characters and stories both varied (such as the long-running *Lux Radio Theater*), with no continuing elements save perhaps for a host and regular scheduled air time (and probably a sponsor).

One kind of radio series—the daytime soap opera—offered something additional; their continuing plot lines further focused the series to become a serial that combined continuing characters with stories that often lasted for years, with subplots melding into one another in a never-ending fashion. Each episode depended on the episodes that had gone before and led directly to the following episodes, though stories moved very slowly. Serial announcers usually began each episode with a paragraph or two describing what was happening for listeners who had missed any segments. The plots were purposely designed to hook listeners into regular attendance.

African-Americans and Radio Drama

The cultural gulf separating the white majority from the African-American minority (until the civil rights movement of the 1960s) tended to distort and sometimes censor the presentation of the black identity and story-telling culture. African-American performers had negotiated roles in white-interpreted

and -mediated arenas for popular story telling. Although African-Americans performed some parts in *Amos 'n' Andy* (1928–60), “blacked up” whites Freeman Gosden and Charles Correll played the central characters; Madaline Lee played the duo’s secretary Miss Blue; and Eddie Green performed the role of Stonewall, the lawyer. To put it mildly, this was an unsatisfactory context for the expression of African-American identity. Eddie Anderson’s role as Rochester, Jack Benny’s black valet, represented mainstream participation in radio’s popular story-telling culture, but was also controversial in the perpetuation of the “Jim Crow” syndrome of racial stereotyping. Another distorting and comic exploitation of African-American women as maids was the character and series *Beulah* (1945–54). The first actor to play *Beulah* was William Hurt, a white man, who coined the character’s famous catchphrases “Love dat man!” and “Somebody bawl for Beulah?” The paradoxical ambiguity of radio’s representation of stereotypes became evident in 1947 after Hurt died from a heart attack and the Academy Award-winning African-American actress Hatie McDaniel took over the part.

World War II saw the introduction of positively drawn African-American soldier characters in daytime serials as the U.S. government sought to promote the contribution of black servicemen and reduce racial tension within the armed forces.

The problem of negative racial stereotypes and chronic discrimination against African-Americans’ participation was challenged by the work of Richard Durham at WMAQ in Chicago between 1948 and 1950. Durham originated, wrote, and directed a series called *Destination Freedom* that dramatized the stories of black achievers such as Benjamin Banneker, Sojourner Truth, Brooker T. Washington, Marian Anderson, and Joe Louis. Durham had been editor of the black newspaper the *Chicago Defender*. The scripting of 91 half hour episodes and their production remains a significant event in American radio drama history. The most notable and widely praised episode was the dramatization of the accomplishments of heart surgeons Dr. Daniel Hale Williams and Dr. Ulysses Grant Dailey in “The Heart of George Cotton,” originally aired in Chicago on 8 August 1948 and restaged in 1957 on the networked CBS Radio Workshop.

In 1944 Langston Hughes collaborated with the British radio drama producer D.G. Bridson to create a ballad-opera exploring the friendship between black Americans going to war with the people of Britain. The cast included Ethel Waters, Canada Lee, Josh White, and Paul Robeson; *The Man Who Went To War* was produced and performed in New York but only heard via shortwave by 10 million BBC listeners in Britain. Langston Hughes also wrote *Booker T. Washington In Atlanta*, commissioned by the Tuskegee Institute and CBS. Despite joining The Writers’ War Board after Pearl Harbor in December 1941, he faced blacklisting pressures from the House of Un-American Activities from October 1944. Erik

Barnouw wrote that even when American networks had commissioned and produced work by black writers, affiliate stations in the Southern states would often block the broadcast by substituting a local program of musical records.

Sustaining and Prestige Drama

Experimental radio drama of exceptional quality was produced in the United States during the golden age as a by-product of the commercial success of the networks. Advertising profits financed such programming in unsold time. A “marquee status” in radio culture sparked by competition between CBS and NBC helped to generate such programs. Even the poor relation of U.S. radio networks, Mutual (MBS), would commission 21-year-old Orson Welles and his Mercury Theatre to produce a six-part dramatization of Victor Hugo’s *Les Misérables* in 1937—ambitious storytelling and dramatic performance on a grand scale. Through a series called *Columbia Workshop* (1936–47), CBS was the first network to experiment with using sound effects for creative and cultural storytelling. Starting in July 1936 the programmers advanced radiophonic techniques for sparking the imagination. The discovery of sound filters that evoked ghostly phenomena gave birth to *The Ghost of Benjamin Street*.

The production of the script *The Fall of the City* by poet Archibald MacLeish presented a social and political attack on totalitarianism and ambition in production. The large “crowd” cast, the special location of performance at New York’s Seventh Regiment Armory, and the quality of the cast, which included Burgess Meredith and the young Orson Welles, combined to establish a radio drama broadcast on 4 March 1937 that defined the potential of the medium. *The Fall of the City* invested production confidence in the idea of a drama written in verse for radio. Barnouw (1945) described the resulting competition for prestigious drama projects between the networks. CBS contributed a series of Shakespeare productions featuring John Barrymore. NBC recruited Arch Oboler, who started with a production of his own play *Futuristics* and then persuaded the network to support a series of experimental horror stories, *Lights Out*. Oboler founded a tradition of science fiction horror and melodrama that continued in a series bearing his name.

CBS also signed up Orson Welles and the *Mercury Theatre of the Air* (1938). A formidable production, performance, writing, musical composition, sound design, and directing team of Orson Welles, John Houseman, Howard Koch, and Bernard Herrmann fashioned classic and contemporary novels and plays into highly charged hour-long sequences of live radio entertainment. The subtle sound-design creativity of Ora Nichols advanced the interface of sound and imagination for listeners. The adaptation of the H.G. Wells novelette *The War of the Worlds* at the end of October 1938 would write radio

drama into social and cultural history and send Orson Welles and his troubadours to Hollywood.

It was also in 1938 that CBS vice president William B. Lewis hired Norman Corwin to make a series of half-hour programs on Sundays to experiment with poetry. Corwin would become a tour de force in writing and radio drama. The series *Words without Music*, *Pursuit of Happiness*, and *Twenty-Six by Corwin* established his reputation. From his verse play for the festive season of that year, *The Plot to Overthrow Christmas*, to constitutional and historical pageants such as *We Hold These Truths*, Corwin contributed a body of literature and direction for radio that resonated in and had considerable influence on the English-speaking world. The poetics of his writing was also embedded with political poignancy; *They Fly through the Air* was an audio equivalent of Picasso’s famous painting on the bombing of Guernica, and his *Seems Radio Is Here to Stay* is a verse essay on the beauty and potentialities of the medium.

An analysis of Corwin’s verse play *The Undecided Molecule*, aired only weeks before the detonation of the atomic bombs in Japan in 1945, reveals writing, directing, and performance in advance of its time. Groucho Marks played the role of a judge metaphorically trying the idea of the atom bomb and mankind’s use of it in a surreal courtroom. It was a culturally and politically subversive weave of irony, spiced with post-modernist and existential wit and a tour de force of production and performance that served to define Corwin’s power and achievement in the history of world radio drama. It was also an elegant and powerful demonstration of radio drama’s literary credentials.

Detective Drama

The golden age produced a genre of audio-noir detectives both male and female. *The Adventures of Maisie*, featuring a character who globe-trotted the high seas from one exotic port to the next, began with a man being slapped when asking for a light and the catchphrase “Does that answer your question, Buddy?” *The Adventures of Nero Wolfe*, based on the popular novels by Rex Stout, proved that you could be a good private detective and so fat that your assistant Archie would have to do all your legwork for you. *The Fat Man* (1946–51) had the central character Brad Runyon starting each episode as the announcer spoke these words: “There he goes into the drugstore. He steps on the scale. Weight 237 pounds! Fortune: Danger!” *The Adventures of Philip Marlowe* (1947–51), *The Adventures of Sam Spade Detective* (1946–51), and *The Adventures of the Thin Man* (1941–50) arose out of the successful novels and films featuring the characters so named. The character Nora Charles, first played by Claudia Morgan in the radio series, amounted to a curious blend of femme fatale and positive gender representation. Nora, with a voice that purred

with sexuality, was a supersleuth. *Martin Kane, Private Eye* (1949–53) was an example of a radio detective series that made the successful transformation to television. The highly successful *Sherlock Holmes* (1930–36; 1939–46) culminated with British actors Basil Rathbone and Nigel Bruce in the roles of Holmes and Watson.

The invisibility of radio extended the boundaries of imaginative devices in story telling. *The Shadow* (1930–54) worked best on radio because the character had the power to be invisible. *The Shadow* and other series, such as *The Green Hornet* (1936–52) and *Nick Carter—Master Detective* (1943–55), transplanted the myth of the Western into the urban environment. The Western was also present in U.S. popular drama through, among others, the series *The Lone Ranger* (1934–56). *The Adventures of Dick Tracy* (1935–48) was based on the comic-strip detective created by Chester Gould and is another example of the radio detective genre that cross-pollinated newspaper/magazine comic strips and films.

The police radio series was a cultural mechanism for the mythologizing of Edgar Hoover's FBI or "G-men" and the large-city police departments. Notable series included *Dragnet*, *Call the Police*, *Calling All Cars*, *Crime Does Not Pay*, *Gangbusters*, *Famous Jury Trials*, *Official Detective*, *Renfrew of the Mounted Police*, *Silver Eagle Mountie*, *This Is Your FBI*, *The FBI in Peace and War*, *True Detective Mysteries*, and *Under Arrest*.

The detective genres generated controversy because of their stereotypically negative representations of Asian-Americans. *Charlie Chan* (1932–48) was built around an Asian-Hawaiian private eye who was always played by white American actors. The series *Fu Manchu* (1929–33), arising out of the Collier magazine stories, offered another example of the demonizing and typecasting of Chinese or Asians as "untrustworthy, inscrutable" villains.

"Soap Opera" Drama

Conditions for developing a thriving market of radio serials were ripe in 1930s America. National networks were expanding because they provided "free" entertainment once one owned a receiver. Further, and despite the Depression, there was a continuing market for products that could improve the quality of life in the home, including soap products and washing machines. Radio provided an excellent means of reaching out to the growing market of women concerned with such purchases, and seeking entertainment. Radio could meet the demand for entertainment about family and identity, about fantasy and the idea of home, about struggle against adversity and achievement, and about people who could be admired and respected. From these circumstances, the soap opera was born.

In Los Angeles Carlton Morse began writing episodes for the series *One Man's Family* in 1932; it would last for 28

years. The story of the Barbour family depended on its addictive narrative drive for its success. Radio had become the stage for its own popular American version of Galsworthy's *Forsyte Saga*. In 1939 Morse created *I Love a Mystery*, featuring the exotic adventures of three global adventurers from the A-1 Detective Agency. He wrote every word and directed every script; his craft had him up at 4 A.M. and kept him busy seven days a week. Barnouw (1945) wrote that radio was becoming a mecca for acting talent that could no longer find work in the theater. Radio was helping listeners—and more than a few creative people—buck the Depression.

Serials that charted social mobility and advancement secured lucrative sponsorship because the audience could identify with the reality and aspirations such programs embodied. *The Goldbergs* (1929–50) performed the ritual of a social journey from the Lower East Side of New York City into the middle-class suburbs; Pepsodent was a product that helped enhance the smile on their faces. Writer and actor Gertrude Berg created *The Goldbergs* in her quest to dramatize Jewish family life. Susan J. Douglas (1999) has observed the value of the research by Herta Herzog into the relationship between women listeners and soap operas: "The melodramatic narratives and strong female characters of daytime serials—coupled with the intimacy of the medium—provided powerful points of identification." Herzog's research in the 1930s showed that, to one woman listener, soap opera "teaches me as a parent how to bring up my child." Popular radio drama during the golden age was an opportunity for women's self-empowerment, and as Barnouw observes, "Almost one-third [of listeners] spoke of planning the day around serials." *Little Orphan Annie* (1930–42) could be comfortably associated with the coziness and nourishment of the Ovaltine bedtime drink. *Myrt and Marge* had the attitude that came with chewing gum made by Wrigley. *Buck Rogers 25th Century* (1932–36, 1939–40, 1946–47) was the kind of dream that listeners could think about when crunching on their breakfast cereals produced by Kellogg.

Many of the key producers and writers who controlled the form were highly educated and independent women. Irna Phillips probably wrote more words and made more money in the field of soap opera than anyone else. Her prodigious industry was founded in Chicago, and once she hit her stride no one could match her ability to invent story lines or dictate six scripts a day and write 3 million words a year. She was the creator of *Today's Children*, *Woman in White*, *Right to Happiness*, *The Guiding Light*, *Road of Life*, and *Lonely Women*. Her gift to the history of gender representation is that she invented and sustained women characters who were role models to American women listeners because they had strength and dignity and could hold their social position equally with men.

Another key center for popular series and serial production was founded and developed by advertising executive Frank Hummert and his assistant Anne S. Ashenurst, who later

became his wife. They established a team of writers distinguished by the talented *Chicago Daily News* reporter Robert D. Andrews, who probably generated more than 30 million words of storytelling for radio. Andrews' first serial story was *Three Days Lost*. Within a year of being hired by the Hummerts he was turning out five radio scripts a day. The author of a book on *How to Write for Radio* was convinced that Andrews was really three or four writers and that his name was the brand title of a writing syndicate. The Hummerts generated legends in the tradition of soap opera entertainment, some of which transferred to television.

In some respects the soap opera boom of the golden age could be described as the "Wild West of Writing." It was a Klondike for authors, advertisers, and networks because 80 percent of the programming of a network station in a big city market in 1939 was made up of wall-to-wall daytime soap episodes, most of them merely 15 minutes long. Elaine Carrington was an example of a short story writer who found that her ability to produce story outlines and scripts for daytime serials could make her a rich author. She conceived and wrote *Red Adams*, which became *Red Davis* and then *Pepper Young's Family* as the sponsors changed.

In the daytime soap by Jane Crusinberry, *The Story of Mary Marlin* (1935-45, 1951-52), Crusinberry dramatized a character who became a female U.S. senator. *Mary Marlin* was one of the highest-rated daytime serials after 1937, and because Crusinberry retained control of all the writing, the series was able to transcend the political and social compromises that arose from sponsor-controlled "factory writing." During World War II Crusinberry originated and wrote a series called *A Woman of America* (1943-46), which starred Anne Seymour and dramatized the history of achieving women in the United States.

The Legacy of World War II

The political struggle between communism and fascism through the 1930s and the years of World War II coincided with the most intense period of the "Golden Age" of radio. Howard Blue (2002) examines the work of 17 radio dramatists and writers who deployed the radio drama arts in their battle against fascism. Between 1941 and 1945 they were allied with commercial radio networks, private agencies, and U.S. government propaganda organizations that wished to rally the listening imagination in the fight against German Nazism and Japanese militarism.

Blue documents how the chill wind of the Cold War made casualties of left of center writers, directors, and actors who had been politically motivated in their creative engagement with radio drama during wartime. The personal memoir by the radio actor Joseph Julian, published in 1975 as *This Was Radio*, provides a compelling and agonizing account of how

Senator Joe McCarthy's witch-hunting could snuff out a career virtually overnight.

The compendium of 25 radio plays edited by Erik Barnouw and published in 1945 as *Radio Drama in Action* represents a significant body of literature from this period of broadcasting. Morton Wishengrad's *The Battle of the Warsaw Ghetto*, broadcast by NBC on the eve of the Day of Atonement in 1943, demonstrated how radio dramatization of actuality could succeed where radio journalism had failed. There was no effective contemporary reporting of the extraordinary rebellion by young Jewish fighters in the Warsaw Ghetto in April 1942. Wishengrad's research and literary imagination combined with the direction of Frank Papp, a music score by Morris Mamorsky, and acting performance by Arnold Moss to represent a vital moment in history.

Radio Drama in the Shadow of Television

With the development of U.S. network television beginning in 1948, radio drama's days were numbered. Within just a few years, audiences and advertisers had begun the rapid migration to the video medium, and network schedules grew sparse. The McCarthy witch hunts and Cold War paranoia also damaged American radio drama at the same time. Opportunities for significant network projects and corporate sponsorship were not coming to anyone who was perceived to be left of center. Orson Welles, Norman Corwin, and Paul Robeson had characteristics and track records that could be regarded as left wing. Along with thousands of talented writers, actors, and directors, they could be perceived as politically subversive. Black-listing generated self-censorship and drove a community of artists into exile. Others were silenced, their credentials ruined. Perhaps one of the more absurd manifestations of this cultural anomie was the 1952-54 syndicated series *I Was a Communist for the FBI*, in which film actor Dana Andrews infiltrated organizations as a double agent and week by week roamed episodes with titles such as *The Red Among Us*, *The Red Waves*, and *The Red Ladies*.

Money and talent became concentrated in television. There were courageous and worthy projects, such as *CBS Mystery Theater* between 1974 and 1977 produced by Himan Brown, which tried to turn back the clock. Such ambition and concentration of resources, however, was not sustained by audience figures and the interest of sponsors.

Drama on Public Radio

With the end of commercial radio's golden age in the early 1950s, radio drama was for many years an art hidden behind the cornucopia of television programming. Still, the mutually advantageous relationship between the Hollywood film industry and radio networks during the 1940s and 1950s exempli-

fied by *Lux Radio Theatre*, *Hollywood Hotel/Premiere*, and *Hollywood Star Preview/Star Playhouse*, *Star Theater* left seeds for future development and opportunity. In the 1970s Himan Brown produced original radio dramas for CBS radio. Still later, George Lukas donated the sound rights of his *Star Wars* stories to his former university radio station. National Public Radio (NPR) invested more than \$200,000 in a 13-part dramatization including members of the film's cast, music composer, and sound designer.

Satellite distribution generated a renaissance in interest in audio drama and created a new audience among young people. In some respects interest in the U.S. *Star Wars* project was similar to the interest shown by young audiences in Britain in the radio series *The Hitchhiker's Guide To the Galaxy*. Filmic music and multi-track sound design techniques combined with the cult of science fiction to produce success.

The period 1971 to 1981 witnessed the development of *Earplay*, a National Public Radio Drama Production Unit based in Madison, Wisconsin, under the artistic direction of Karl Schmidt. The project was substantially funded from federal sources and generated radio drama script competitions for new writers. It eventually developed large-scale collaborations with the BBC in England and commissioned well-known established writers such as Edward Albee, David Mamet, and Arthur Kopit.

National Public Radio's rival American Public Radio (APR, which later became Public Radio International) also generated interest in original spoken word story telling through the work of Garrison Keillor in Minnesota. NPR, in Washington, D.C., continued to courageously distribute *NPR Playhouse*, but, despite the enthusiasm of producer Andy Trudeau, radio drama became a cultural artifact in the tapestry of U.S. radio. Trudeau even commissioned an original series of new Sherlock Holmes dramatizations starring Edward Petherbridge, and NEH and NEA funding supported worthy cultural drama projects such as Samuel Beckett and German *Horspiel* seasons, which were the initiative of Everett Frost. Unfortunately, the poor take-up by NPR affiliate stations of *NPR Playhouse* programs resulted in its demise in September 2002.

Independent Producers and Radio Drama by Artisans

American radio drama has moved from a mass-appeal service based on daily or weekly series to a far narrower format aimed at small but elite audiences. There would appear to be no shortage of ambition and commitment from small independent producers all over the United States who use efficient modern digital technology to produce original plays and dramatizations that are crafted for a connoisseur audience mainly in public radio. New York-based independent producer Charles Potter and Random House have established a niche interest in the radio Western, with audiobooks that sell well in the retail

market and are also carried by some radio stations over the air. The internet, the audio drama cassette/CD/minidisc market, and digital radio offer accessible, low-cost networks of distribution. Furthermore, it is a low-risk genre for ideas and counter-culture. Companies such as Ziggurat, ZBS Foundation, Atlanta Radio Theatre, The Radio Repertory Company of America, Hollywood Theater of the Ear, The Radio Play—The Public Media Foundation, Midwest Radio Theatre Workshop, LA Theatre Works, Shoestring Radio Theatre, and many others have established significant output of original productions. Notable directors/dramatists include Yuri Rasovsky, Eric Bauersfeld, Joe Frank, and David Ossman.

During the 1980s and 1990s, WBAI, the Pacifica radio station in New York, was the arena for an interesting development in the art of the live community radio play. The station's arts director Anthony J. Sloan catalyzed much of this work. Sloan observed that "Most people did taped drama because it's safer. BBC does radio drama every day, but it's canned. I like live radio drama because the adrenaline flows for the actors. They know that not only is this live, but, guess what, it's only one-time. You get some incredible performances." Sloan orchestrated a series of media pageants that have occupied the streets of New York, the studios of WBAI, the satellite frequency of Pacifica Network programming, and the worldwide web with orchestras of musical, dramatic, and acoustic artistic expression fused by captivating, bold narratives. The productions were not short half-hour or one-hour sequences. They spanned five-and-a-half hours of airtime. Philosophically challenging, politically controversial, intellectually stimulating, emotionally invigorating dimensions of communication combined with complex sound production techniques and live performances on the sidewalks of the Lower East Side and various landmarks in the urban geography of New York City. The grassroots dimension of this work was an indicator of how radio drama could strengthen its identity and cultural value with its audiences. The *Leaving(s) Project*, transmitted on the night of 26 January 1996, comprised two live story-telling events over five-and-a-half hours. Larry Neal's play *The Glorious Monster in the Bell of the Horn* was presented before a live audience at the New Knitting Factory in the Tribeca section of Manhattan. The play was structured in the style of the epic opera based on the Brothers Grimm's *Peter and the Wolf*, wherein characters are identified by musical instruments. Then the multimedia event blossomed into "a journey piece" from different locations of the New York metropolitan area. There were six different groups of characters leaving New York for various reasons who were forced to deal with personal crises on their way to an Amtrak train at New York's Penn Station. Their interweaving storylines highlighted current social, political, spiritual, and artistic issues. All the disparate journeys were acted out live with moving microphones on location and culminated in a dramatic finale at Penn station. The realism of

the event is indicated by the fact that the fictional characters intended to board the 3:45 A.M. Amtrak red-eye service leaving New York, which was actually waiting to leave one of the platforms at the end of the broadcast. The event began at 10 P.M. on Friday night and continued until 3:45 the following morning. It could be heard in stereo on WBAI 99.5 FM, received by satellite on 360 community radio stations, and heard nationally and internationally on the worldwide web.

Early 21st century U.S. radio drama can be described as “the age of the artisan,” whereas the period before the 1950s could be described as “the age of the Network.” Audio dramatic techniques are also widely used in advertising and public information spots, so narrative creativity in radio is not a totally lost art.

Drama Worldwide

Varied Traditions of Radio Narrative

Radio has been and continues to be a substantial venue for serious and popular storytelling throughout the world. As English has become the global media language, it is possible to identify plays that have been the seed of stories in film, books, stage theater, television, and the internet. Arthur Miller and David Mamet are two leading U.S. playwrights who have

acknowledged the debt they owe to radio drama for influencing and developing their writing abilities. The politically controversial Italian playwright Dario Fo excelled in the radio medium. Wolfgang Borchert and Peter Handke are literary giants in post-war German culture, and their literary reputations stem from their radio output. The director and sound

play artist Klaus Schöning has articulated a distinct and original movement in the radio drama genre. The foundations of Orson Welles' film directing genius may well lie in his radio experience as much as in his theater work. His experience in writing, performing, and directing in radio is greater in volume and range than for any other medium in which he worked. Archibald MacLeish, one of the United States' leading 20th-century poets, wrote radio plays of exceptional literary quality. Norman Corwin developed a contemporary form for radio verse drama and fused it with the contemporary resonance of world events and U.S. history as it was happening. While the non-English speaking world has also created galaxies of storytelling cultures in radio drama, our knowledge of them has been compromised by the limited amount of translation and critical writing available.

Functions

Radio drama as storytelling tends to serve a number of purposes. It can define national cultural identity through original writing and performance. Dylan Thomas' *Under Milk Wood*, described as "a play for voices," is central to the consideration of Welsh literary achievement in the post-war period and is respected internationally as an example of radio drama literature par excellence.

Radio drama can be a location for the exploration of social, cultural, and sometimes political anxieties through popular soaps and long-running series. The popular soap has been a staple in the history of radio drama in many Latin American countries. Public and state radio in Poland has a long-standing tradition of supporting "high cultural" writing as well as the popular in plays and serials.

Through social action dramas, radio can warn, educate, and improve society through a blend of information, education, and entertainment. The British Broadcasting Corporation's (BBC) long-running radio soap opera *The Archers* was conceived as a method of improving the efficiency of farming techniques when there was still rationing in the aftermath of World War II. Social action dramas are prevalent in the developing world, and radio offers an opportunity to engage in the oral culture traditions of African and Asian countries.

Radio dramas also offer an arena for showcasing and adapting novels and short stories as well as stage literature from live theater. This has been the case in most Scandinavian and European countries. Hungary, France, Germany and Italy have extensive archives of scripts and recordings demonstrating radio drama's commitment to producing their countries' leading writers and dramatists.

Finally, radio drama has been used as propaganda and in support of war. Conventional plays and series are constructed to influence listeners ideologically, and the techniques of dramatization have been harnessed to fake enemy broadcasts, to

deceive military forces, and to weaken the morale of the enemy's home population. In the early 1950s the CIA used audio drama techniques to fake the sound of a non-existent army and airforce to overthrow a left wing government in Guatemala.

Political Economy of Radio Drama

The success of soap operas in the United States and Australia during the 1930s and 1940s represented mass communication and popular expression for new writing on an enormous scale. Dramatizations of literature and significant original plays had their place when the profit-led radio corporations saw an advantage in prestigious productions impressing commercial sponsors. Sometimes a minority cultural program such as Orson Welles' *Mercury Theatre on the Air* pulled off a publicity stunt, such as the 1938 *War of the Worlds*, and this popularized radio drama in terms of entertainment.

But spending profits for prestige was not a recipe for stability and growth in the arts. If the capitalist, corporate moguls of the 20th century became the equivalent of patron princes from the Renaissance, they were adept in applying the ruthlessness of those princes when cutbacks were needed. Publicly funded national radio networks have been the cultural umbrellas for most of the original radio drama produced in the world and the sound dramatization of prose and poetry. However, the financial relationship between radio drama production centers and their state-funded national radio networks is often clouded by the potential for political compromise and economic expediency. Radio drama has been at the mercy of economic instability and the political pressure to reduce public expenditure. The prerequisite for public funding is sometimes predicated on how well state-funded radio drama performs in comparison with the audience surveys of its commercial counterparts. As a result, radio drama in some countries such as Australia now concentrates on high culture and experimentation rather than the maintenance and production of popular series and serials. In France, radio drama has undergone a painful reappraisal through rationalization and cutbacks.

United Kingdom

Leading playwrights such as Samuel Beckett and Tom Stoppard have written extensively for the radio medium. Stoppard's stage play *Indian Ink* was conceived and first produced as the radio play *In the Native State*. Britain's playwright Caryl Churchill had nine of her radio plays produced by the BBC up until 1973, when her stage work began to be recognized at the Royal Court Theatre. Hanif Kureishi, regarded as one of Britain's leading Asian writers, famous for his film *My Beautiful Launderette* and his novel *The Buddha of Suburbia*, was first produced in radio. Sue Townsend, Harold Pinter,

Alan Ayckbourn, Alan Plater, Anthony Minghella, Angela Carter, Alan Bleasdale, Willy Russell, and Louis MacNeice are a few other literary luminaries whose writing roots were planted in radio drama.

One of the paradoxes of radio drama is that highly accomplished and revered writers who have chosen to specialize in this field remain locked in a cabinet of obscurity. Rhys Adrian, who died in 1990 after having written 32 plays broadcast by BBC radio, is an example of such a writer little known today.

Giles Cooper cultivated the art of dramatically counterpointing the exterior and the interior of characters who felt themselves “trapped in the contemporary machinery of modern life and who were unable to escape.” Cooper wrote over 60 scripts for BBC radio. His 1957 play *The Disagreeable Oyster*, along with the production of Samuel Beckett’s *All That Fall*, was fundamental in creating the need for a permanent sound workshop to create aural images based on effects and abstract musical rhythms.

In 1939/1940 BBC Radio Drama commissioned and produced *In the Shadow of the Swastika*, which offered a humanist challenge to the anti-Semitic prejudice engendered by Nazi ideology. The occasion of war stimulated a production that may have commanded the highest audience for any play broadcast in the history of radio. Norman Corwin’s *We Hold These Truths* was commissioned to commemorate the 150th anniversary of the United States Bill of Rights. This coincided with the Japanese attack at Pearl Harbor, and eight days after the attack, Corwin assembled a cast of the country’s leading actors including James Stewart and Orson Welles and broadcast to an audience of 60 million listeners across all the U.S. networks. Many of the dramas and drama-documentaries produced by Corwin throughout the war were preoccupied with themes that promoted the Allied cause and challenged the morality of the Axis powers.

Germany

Germany possesses a rich and diverse critical tradition of the radio drama form, but the language barrier means that its wealth of texts is inaccessible to the radio drama communities of the English-speaking world. It is also ironic that one of the most prolific, versatile, and widely published critical analysts of British radio drama is the German academic Horst Priessnitz. Radio drama has also been frequently used as propaganda. Nazi Germany used skilful mixtures of popular music and drama to psychologically intimidate Allied troops and civilian populations. They were sometimes aided by United States and British fascists. The U.S. academic Frederick Wilhelm Kaltenbach used dramatic scripts in overseas English broadcasts to attack the British position in the war. He translated a radio play by Erwin Barth von Wehrenalp called *Lightning Action* to celebrate the German victory in Norway.

Twelve scenes were recorded on 5 April 1941, and the cast included the British film actor Jack Trevor and other ex-patriots. He also satirized Roosevelt’s Lease-Lend Bill with a series of dramatic talks called *British Disregard for American Rights*. In May 1944 U.S.-German academic Otto Koischwitz wrote a doomsday radio play for the D-Day invasion forces and their families at home that was broadcast by shortwave to the United States. The actress Mildred Gillars (“Axis Sally”) played the part of a GI’s mother who in a tear-stained monologue predicted disaster and grief.

An argument could be made that German radio drama is distinctive for the greater importance it has had within the cultural traditions of German drama and literature. There is evidence that *Hörspiel* has generated a cornucopia of inspiration and originality in other storytelling media. The Weimar Republic era is distinguished by the work of playwright Bertolt Brecht, composer Paul Hindemith, critic Walter Benjamin, and composer Kurt Weill. They and many other pioneers understood the relationship between sound drama and radio reception and interrogated and explored modernist ideas of stream of consciousness found in symbolist novels and short stories, imagistic poetry, and developments in modern theater.

Whereas German Radio Drama has mirrored the BBC in generating a powerful canon of popular drama, dramatized literature, soap opera, light comedy, and detective and mystery series, German *Hörspiel* has become established as a literary art and drama form equal to stage theater, film, television, and literature. Alfred Döblin’s novel *Berlin Alexanderplatz* reached a popular audience through German radio in 1929 before it was produced for television by Rainer Werner Fassbinder. The nihilistic torpor of Nazi propaganda radio suffocated expression in the art form, and after the war the cultural role that radio played offered a rich arena for diversity and quality. The shortage of printing paper and the destruction of theater and cinema meant that radio drama contributed to the recovery and development of German storytelling. Decentralization of the structure of public stations meant that several centers of radio drama production flourished simultaneously.

The positive public response to the transmission of Wolfgang Borchert’s *The Outsider* in 1947 illustrated the centrality of *Hörspiel* in the country’s social, psychological, and cultural psyche. Bochert, Ingeborg Bachmann, and Gunter Eich illustrate the force of *literarische Hörspiel*, and Peter Handke, Jürgen Becker, and Reinhard Lettau are auteurs who represent that development of *Neue Hörspiel* that sought to explore new ideas and philosophies about the prosody of sound and thought in modern and postmodern society.

Canada

Original radio drama thrived in Canada because the government had decided to support public radio through the Cana-

dian Broadcasting Corporation (CBC). Canadian radio drama experienced a golden age of literary and dramatic expression from the 1940s to the 1960s. Canadian radio drama has been re-inventing itself in the public sector. CBC has maintained an imaginative and flexible approach to international co-production. Director James Roy helped originate the 1996 series *Searching Paradise*, co-produced between CBC in Toronto, ABC in Perth, and BBC Wales in Cardiff. He also pioneered the introduction of *The Diamond Lane*, a lively modern soap drama sitting comfortably with CBC's peak time morning format for 2 years during the late 1990s. The series featured live performances of actors as commuters traveling to work using a freeway lane reserved for vehicles containing three or more passengers and interacting with the on air presenters in the studio. The development of the English Speaking Radio Drama Association has facilitated the exchange of publicly funded radio plays such as CBC's *Mourning Dove* and work done in New Zealand, Hong Kong, Wales, Los Angeles, Australia, and South Africa.

Sweden

Swedish public radio has discovered new storytelling forms to find a new generation of radio drama listeners. The dramatists at Swedish Radio have cleverly propelled radio drama into the mainstream of artistic and cultural debate by creating a five minute soap opera that is broadcast within the peak listening morning slot between 7:50 and 8:00 A.M. Eva Stenman-Rotstein at the publicly funded Swedish Radio Broadcasting Corporation has steered a series of evolutionary changes to young people's radio drama that has captured a new generation of listeners. Storytelling for children and young people has also attracted sizable audiences.

Asia and Africa

The literary and dramatic traditions of African, Arabic, and Asian countries are virtually unknown in Europe and North America and other English-speaking countries. Many western societies are struggling to reconcile themselves to a past history of racist structure of education, imperialist history, and negative stereotyping of other countries' political, industrial, social, and cultural values. Furthermore, as these societies seek to realize their own multi-cultural status, interesting examples of creative reception in radio drama is emerging. British Asians and Afro-Caribbeans have found a confident voice in writing and production.

The satirical comedy drama series *Goodness Gracious Me* originated on BBC Radio 4 and has successfully transferred to television. Whereas the BBC of 1929 would produce *Shakuntala* or *The Lost Ring* by Kalidasa with a translation by a European academic, direction and performance by an all white

European cast, and orientalist attitudes to promotion and representation, the BBC of 2003 would mediate a classic work from an Asian by transferring the interpretation to Asian writers, directors, and performers. The Africa Service of the BBC has been a substantial patron of writers, dramatists, and poets from Africa, and producers have sought to create a co-production dynamic between London's Bush House and the writers, directors, actors, and audiences in African countries. An annual competition produces a series of radio plays called African Performance.

Japan

In the early 1990s the Television and Radio Writers' Association of Japan set up and ran an international award called the Morishige Audio Drama Contest. Over a period of four years, productions were entered from all parts of the world and were given equal treatment. The representation in this competition revealed a thriving and comprehensive infrastructure of radio drama practice and tradition from African and Asian countries that had not been as well represented in European dominated international competitions and festivals.

The Television and Radio Writers' Association had about 900 freelance writer/members and set up the award to stimulate the support of radio drama within the domestic and international radio industry. It also sought to make "a contribution to cultural exchange." The Morishige Award succeeded in its second objective. The first objective foundered on the lack of funds to continue the contest. The Asia-Pacific Broadcasting Union had also been seeking to encourage cultural celebration and exchange. In 1993 the Morishige selection committee were in the position to consider three plays entered by the state broadcasting system NHK, based in Tokyo and Nagoya, and further entries from Kyushi Asahi Broadcasting Company, Tokyo-FM Broadcasting Company, the Tokyo Broadcasting system, and Nippon Cultural Broadcasting. These plays demonstrated a fertile and competitive field of audio play production in both publicly funded and commercial sectors of the industry.

An entertaining representation of Japanese radio drama can be found in the film by Koki Mitani, *Welcome Back Mr. McDonald* (1998). This is a backstage farce that uses a live radio drama to send up Japanese society, American blockbuster mentality, and the prima donna values of show business.

Korea

The Korean Broadcasting System's (KBS) entry for the 1993 Morishige Prize was *The Angel's Curse* written by Choi Jaedo, directed by Cho Won-Suk—KBS's Chief Producer of radio drama. At this time Korea, like Japan, had a thriving broadcast dramatists' association with 500 members who were also

established poets, novelists, and stage playwrights. Korean radio drama could draw upon a profession of 400 actors. KBS was producing 200 or more single plays every year. New writers for radio were continually being brought on through special competitions, and the commercial broadcasting corporations produced 30 new radio dramatists every year in this way. There was also evidence of radio drama production and broadcasting in China, Mongolia, Uganda, Egypt, Hong Kong, Malawi, and South Africa.

India

In 1993 plays by the director Kamal Dutt had been entered in the Morishige award from All India Radio, which at the time of writing presented a considerable range of Indian radio drama on the internet. In 1991 P.C. Chatterji observed that the powerful theater movement in several parts of India had only "marginally affected the field of radio drama." He said that the ordinary run of radio play was "not of a high standard" because the rate of payment was poor and there was little hope of their utilization elsewhere. He cited *Tumhare Ghum Mere Hain* (Your Woes Are Mine) by Delhi playwright Reotic Sharan Sharma and *Harud* (Autumn) by Shankar Raina as examples of radio texts that had successfully transferred to theater and film and been recognized internationally.

Radio Drama Futures

From 1990 there has been a maturing of a global spoken word market so that the talking book, sound drama, or sound dramatization have been fighting for equal space on the shelves with traditional books. Radio drama's ephemeral status as an art form could be at an end. The performance of a dramatic script no longer exists just in the fleeting moment of a live stage event. It is being captured on cassette, compact disc, mini-disc, computer file, and other means of electronic storage for replay. Multimedia and the internet offer exciting dimensions to sound drama production and storytelling. The radio dramatist has been liberated from the dimension of short-lived terrestrial sound broadcasts.

Erik Ohls and the Swedish Radio Theatre in Finland have been pioneering the use of the internet for the promotion and more meaningful distribution of radio drama as an art form. Distribution of linear sound narrative can interact with lateral channels of sound, text, animation, and photographic and video images on the worldwide web. The web is also liberating from the point of view of control and means of production. The British website www.irdp.co.uk is an example of the internet being used as an independent space for new writing in radio outside the territories of state-funded broadcasting. Sound communication on the internet is not subject to government licensing and censorship. Transmission is

instantly stable in the international dimension and the technology is affordable.

In 2001 BBC radio commissioned a project called "the Lab" to explore the futures of audio drama in terms of interactive communication technology. The internet, with its hyper-textual lateral routes of structured narrative and digitalization, seemed able to expand the potentiality of sound storytelling. Similar experimentation has been undertaken by the drama department of Austria's public radio service.

The challenge facing radio drama producers of the 21st century seems to center on how the radio play can attract the younger generation when the form is not relevant or central to their media consumption. The BBC in Britain and public radio broadcasters in Europe and elsewhere have been trying without much success to establish thriving audio drama projects with young people and ethnic communities using new forms of interactivity via the internet. The fact remains that the most lucrative resources of radio drama funding in European public networks are controlled largely by middle-aged and middle-class people.

The development of digital radio in Britain has resulted in the establishment of two national radio channels dedicated to audio dramatic genres, *BBC 7* and *Oneword* (commercial). The BBC has the advantage of a huge back catalogue and the cushion of guaranteed funding from the license fee. Diversification of access to the broadcasting spectrum and an equality of opportunity in public funding may be a potential solution to continuing decline in radio drama activity in Britain and the rest of the world.

Drew, Paul 1935–

U.S. Radio Personality and Executive

There are four phases to the career of broadcaster and entrepreneur Paul Drew: early in his career, Drew influenced teenagers in Atlanta and the South as a disc jockey introducing the new sounds of Top 40 radio and traveling with the Beatles.

Later, his influence extended to the broadcast industry in the United States and Canada as a vice president of RKO General Radio. He formed several companies that linked the United States and Japan in entertainment ventures. And he was the

first director of Radio Martí, establishing Voice of America broadcasts to Cuba.

On the Air

As an Atlanta disc jockey, Drew avoided the “hyped” sound fashionable at Top 40 radio, opting instead for a soft, conversational approach that won him high ratings among teenagers on three stations. After stints at stations in his home state of Michigan, Drew moved to Atlanta in 1957 to join WGST, where he was advertised as “Atlanta’s most music-wise DJ.”

In 1961 Drew joined Atlanta’s WAKE at the invitation of his neighbor, WAKE Program Director Bill Drake. His show was a combination of tidbits about the artists whose records he played and descriptions of mythical “submarine races in Piedmont Park,” an excuse for teenage sweethearts to sit in their cars by the park’s lake.

It was his move to WQXI in 1964 that gave Drew his national reputation for picking hits. First as music director and later as program director, Drew attracted the attention of both the record industry and the radio industry. Because of that early visibility, he called his ten years in Atlanta radio his most important, because “I came in as nobody and left as somebody.”

During the 1960s, Drew was dubbed “the Fifth Beatle” (and occasionally “the bald-headed Beatle”) because he was the only broadcaster to travel with the Beatles on all their American tours. His daily reports from the tours were heard by millions of radio listeners. On Christmas Eve 1964, Drew produced a worldwide special with the Beatles from London.

Executive and Entrepreneur

For five years during the 1970s, Drew was vice president of programming for the radio division of RKO General Corporation, supervising formats as diverse as talk, Top 40, oldies, adult contemporary, and classical. At the time, RKO owned stations in Boston, New York, Memphis, Miami, Washington, San Francisco, Los Angeles, and Chicago.

The connections Drew made with recording artists throughout his years in radio resulted in a series of live concerts and artist specials produced for both radio and television. Featured were Neil Diamond, Chicago, Elton John, Olivia Newton-John, Cher, Frank Sinatra, and a long list of others.

He introduced the Japanese singing group Pink Lady to the United States and established them as the only Japanese artists to have both an American hit single and their own prime-time network TV show (on the National Broadcasting Company [NBC]).

His business interests expanded beyond broadcasting and music to specialize in Japan with a variety of companies, including Paul Drew Enterprises, The USA Japan Company,

the Mobotron Corporation, and the 2151 Corporation (the last two in partnership with Sony Corporation and the family of Sony founder Akio Morita).

Concurrently, Drew was commissioner to the California Motion Picture Council and served under two California governors. He was also a White House adviser for President Jimmy Carter’s energy program and served on the Commission of Ceremonies for the 1984 Olympic Games in Los Angeles.

In 1984 Drew received a nonpolitical appointment from President Ronald Reagan to be the first director of Radio Martí, which established broadcasts of the Voice of America aimed at Cuba. When he received the call from a friend of President Reagan, Drew had just returned from one of many trips to Japan, where he had accompanied California Governor Jerry Brown and introduced Brown to Japanese business opportunities for the state of California. Drew described himself as a “life-long Democrat” but accepted the appointment from a Republican administration because, as he stated, “I was doing something for my country.” After the Radio Martí experience, Drew confessed: “The radio part was easy. The political part was not.”

During his years in broadcasting, Drew guided and developed many well-known air talents and programmers. In *Network 40* magazine, Gerry Cagle noted, “Perhaps Paul’s greatest legacy lies in the success of those he hired.” The list of broadcasters who worked for Drew includes consultants Jerry Clifton, Don Kelly, and Guy Zapoleon; industry writers Gerry Cagle, Jerry Del Colliano, Walt “Baby” Love, and Dave Sholin; and air personalities Rick Dees, Charlie Van Dyke, Jay Thomas, and Dr. Don Rose.

In 1999 Drew and his wife Ann moved from their longtime home, Los Angeles, to Forsyth, Georgia, where he claimed he “was not officially retired.”

Duffy's Tavern

Comedy Program

—"Duffy's Tavern, where the elite meet to eat, Archie the manager speaking, Duffy ain't here. Oh, hello, Duffy . . ."

Every week, a ringing phone and Archie's nasal New York accent invited listeners into *Duffy's Tavern*, a weekly situation comedy set in a dilapidated pub in the heart of Manhattan's east side. Running the place on behalf of the ever-absent Duffy, Archie the manager and his cohorts—Eddie, Finnegan, Clancy the Cop, Miss Duffy (Duffy's daughter), and others—welcomed a new guest star or guest character every week into a defiantly low-class atmosphere of barbed but friendly give and take.

Duffy's was famous for its play with (and mistreatment of) language, especially Archie's constant malapropisms. "Leave me dub you welcome to this distinctured establishment," Archie said to guest star Vincent Price, "and leave me further say, Mr. Price, that seldom have we behooved such an august presentiment to these confines. . . . And feel assured, Mr. Price, that your visit is a bereavement from which we will not soon recover." As comedian Georgie Jessel once chided Fred Allen on *The Texaco Star Theatre*: "Fred! Two split infinitives and a dangling metaphor—people will think this is Duffy's Tavern!"

The pilot for *Duffy's Tavern* aired on 29 July 1940 on the Columbia Broadcasting System (CBS) radio program *Forecast*, which aired previews and pilots of proposed CBS shows in order to gauge audience reaction. The reaction in this case was enthusiastic, and CBS picked *Duffy's* up as a weekly half-hour program beginning in March 1941, running on Saturday nights at 8:30. It moved to two more time slots over the next year, until October 1942, when it switched to National Broadcasting Company's (NBC) Blue network, running at 8:30 on Tuesdays. When NBC Blue became the separate network American Broadcasting Companies (ABC), *Duffy's Tavern*

moved to the NBC network proper, where it ran for the next seven years.

Duffy's Tavern was largely the brainchild of its star, Ed Gardner (born Ed Poggenburg), who first created the character of Archie for the CBS program *This Is New York* in 1939. Archie's right-hand man was "Eddie the Waiter," played by Eddie Green, an African-American comedian with a dry wit, who often took the wind out of Archie's sails. Green's part was notable at the time for its lack of stereotype or inferiority: the writers for *Duffy's Tavern* received an award during "Negro History Week" in 1946 for providing Green with such positive, racially inoffensive material.

The most faithful patron of the tavern was the monumentally stupid "Clifton Finnegan," played by veteran radio comic Charlie Cantor (no relation to Eddie Cantor). Cantor had originated the slow-talking, even slower-witted stooge character Socrates Mulligan for the "Allen's Alley" segment on the *Fred Allen Show*, and he eventually transplanted a renamed Mulligan into *Duffy's Tavern*. Cantor was an enormously experienced radio talent, "the Great Mr. Anonymous of radio," appearing on programs such as *The Shadow*, *Abie's Irish Rose*, *Dick Tracy*, *The Life of Riley*, and *Baby Snooks*. At one point he was in such demand that he performed in 26 programs in one week, and for several months he appeared in the same time slot on three different networks in two recordings and one live show.

Ed Gardner's wife Shirley Booth originally played "Miss Duffy," a young woman on the lookout for marriageable men, pursuing them almost as energetically as they fled from her. After Gardner and Booth divorced in 1942, at least 12 different actresses essayed the role of Miss Duffy, most notably Florence Halop and Sandra Gould, whose combined tenure lasted approximately six years.

In 1944 production moved from Manhattan to Hollywood (though of course the tavern remained eternally in New York), and in 1945, Paramount released a *Duffy's Tavern* feature film, starring the central cast of the radio show as their tavern characters (Gardner, Green, and Cantor, with Ann Thomas as the Miss Duffy du jour), surrounded by literally dozens of Paramount contract players appearing as themselves (among them Bing Crosby, Dorothy Lamour, Alan Ladd, and Paulette Goddard). The film received tepid reviews—critics appreciated the star-studded stage show within the movie much more than the framing story featuring the radio characters—but the radio show itself kept going strong.

An NBC report in March 1949 identified *Duffy's Tavern* as one of the network's top four programs, "vital to the maintenance of a strong position in the industry," alongside Fred Allen, Fibber McGee, and Bob Hope. That year there were rumblings within NBC and rumors in the newspapers that Gardner planned to take the show to CBS; in fact, Gardner went so far as to obtain a release from the program's contract with longtime sponsor Bristol-Myers to free up his options to court another network. However, NBC found *Duffy's* important enough to renegotiate. During the 1949 summer hiatus, Gardner and NBC moved the program in its entirety—including equipment, staff, and performers—to Puerto Rico, to take advantage of a 12-year tax holiday intended to attract new industry.

When *Duffy's* returned to the airwaves in the fall of 1949 with recordings sent in from Puerto Rico, the show had a new sponsor, Blatz Brewing Company, which eventually caused some trouble for NBC. Some stations could not or would not allow beer advertising, and some that allowed beer would not accept the accompanying wine trailer ads, causing a number of stations to drop the program entirely. During its last year, *Duffy's Tavern* relied on multiple sponsors, including Radio Corporation of America (RCA) Victor and Anacin.

At the very end of 1951, despite a temporary rise in ratings after the Puerto Rico move, *Duffy's Tavern* was cancelled. In 1954, a syndicated *Duffy's Tavern* television show appeared, starring Gardner as Archie and Alan Reed (the radio show's Clancy the Cop) as Finnegan, but reviews were strongly negative, and the program did not last. By that time, the tavern's style of humor was considered old-fashioned and long past its prime. During the 1940s, however, *Duffy's Tavern* had been one of the mainstays of radio comedy, and long before television's *Cheers* came along, Duffy's embodied "the place where everybody knows your name."

Duhamel, Helen 1904–1991

U.S. Broadcaster and Executive

In the sparsely populated areas of the Midwest, some women were able to advance professionally in radio broadcasting as regional leaders in the industry. Such was the case with Helen S. Duhamel.

During the Depression of 1929, Helen Duhamel, at that time a mother of two small children, found herself in a unique position. Her father-in-law, Alex Duhamel, the owner of the Duhamel Trading Post in Rapid City, South Dakota, was facing near-bankruptcy and turned to her for advice. She encouraged her father-in-law to hold on to his business. During the next two years, Alex Duhamel managed to stay afloat, but he finally asked Helen Duhamel to take over. Using her background as a bookkeeper and seeking advice from the best businessmen in Minneapolis, she devised an innovative plan. By dividing the Trading Post building into smaller sections, she was able to sell some of the units and rent out others. By 1937 she had paid off the mortgage, and the Duhamel Company was out of debt in only five years. By 1940, Helen Duhamel had bought out all the other Duhamel heirs and owned the Duhamel Trading Post free and clear. Located near Ellsworth Air Force Base and Mount Rushmore, the Trading Post prospered during the war years of the 1940s.

From the inception of the first radio station in Rapid City in 1936, Duhamel recognized its potential as a profitable business. As a retail merchant, she had invested in radio advertising and found it an important factor in the success of her business enterprises. In 1943 she became a stockholder in Black Hills Broadcasting, which included KOBH Radio.

Observing the growing interest in radio, Duhamel began purchasing more and more stock in KOBH Radio, which became KOTA in 1945. By 1954 she had bought out all the other stockholders. When attending early broadcasting conferences, she was the only female owner of a radio station present.

Both KOTA and KOBH Radio had original offices in the Alex Johnson Hotel across the street from the Duhamel Trading Post in downtown Rapid City. The station was set up on the 10th floor, with its offices in the solarium on the 11th floor. After Duhamel's acquisition of the radio station, the operation was eventually moved to new headquarters above the Trading Post.

Near the end of World War II, the radio station applied to the Federal Communications Commission (FCC) for permission to expand from a tiny 150-watt station to 5,000 watts. U.S. Representative Francis Case of South Dakota assisted in getting the needed approval. He discovered that the military used the local radio station signals as a homing device for a

guidance system at night. By approaching the War Department, Case was able to ensure FCC acceptance of the KOTA application. On 1 January 1945, the application was accepted. The call letters were changed to KOTA, and the station logo was changed to "KOTA—Chief Signal Station in the Old Sioux Nation."

KOTA Radio became a Columbia Broadcasting System (CBS) affiliate, and the stockholders purchased a used transmitter and built three directional towers south of town on Highway 79.

Duhamel expanded her radio operations to include television. In order to bring live network TV to South Dakota, she installed the world's longest privately owned microwave system. In 1966, as an equal partner in South Dakota Cable, she brought cable television to rural South Dakota.

In 1976 Duhamel was elected to the South Dakota Broadcasters Association Hall of Fame. In 1991 she was also selected to be included in the Nebraska Broadcasters' Hall of Fame. Helen S. Duhamel died in 1991 at the age of 87. Bill Duhamel, her son, continues to head the highly successful, privately owned Duhamel Broadcasting Enterprises.

Dunbar, Jim 1932–

U.S. Talk-Show Host

Jim Dunbar was shot at five times by a disturbed listener. He may have been the only radio air personality to interview the “Zodiac” serial killer. As one of the pioneers of the news-talk radio format, Dunbar’s long broadcast career has been marked by peculiar fate and fortuitous innovation, culminating in his election to the Radio Hall of Fame in 1999. “I’m still a little flabbergasted being up there on a wall,” Dunbar said of his plaque in the Chicago-based Hall of Fame. “It’s still in a way kind of surreal, seeing your name up there between Tommy Dorsey and Don Dunphy, the old fight announcer” (all Dunbar quotations are from an interview with the author).

Dunbar’s career began in 1952 and included stints as a disc jockey and newscaster in Manhattan, Kansas, and Detroit, Michigan, before he became program director and morning disc jockey at WDSU in New Orleans in 1957. Four years later, he moved to WLS in Chicago as assistant program director and disc jockey.

WLS was “a very special station that owned the Midwest,” Dunbar said. “We had the Midwest by the ears.” He spent three years there but yearned to relinquish on-air duties and be a program director again. “I turned 30 and faced the fear that I might be playing Patti Page and Pat Boone the rest of my career,” Dunbar said. “I hated that music. I’m a jazz fan.”

Dunbar was hired in 1963 as program director for KGO in San Francisco, a station that consistently ranked last in a 12-station market despite adopting numerous formats. “They tried everything from German bund music to bird whistles, but nothing seemed to work,” Dunbar said. “Yellow-cab dispatchers had a bigger audience.”

As program director, Dunbar was charged with the responsibility of finding a format to pull KGO out of the ratings basement. He chose a new concept, news-talk, which he helped to shape. “I don’t want to take credit for being the inventor of news-talk radio,” Dunbar said. “A lot of people shared the credit. I just put together some things that had worked elsewhere, and that I thought would work here”—notably news, talk, and humor. “I had nothing to lose, so I thought, ‘Let’s give them something so compelling that they would hang on through the next commercial break,’” Dunbar recalled. “Radio had always been background. What we did was we made it foreground.”

As Dunbar defined it, the news-talk format is “fundamentally a bulletin service with a heavy emphasis on traffic, along with a series of talk-interview programs that would hold people,” Dunbar said. “It was bubble gum of the mind.”

Dunbar introduced a duo of consummate practical jokers to the KGO mix. Jim Coyle and Mal Sharpe were masters of

street pranks, devising an outlandish premise and then taping ad-lib interviews with unsuspecting passersby. They attempted to persuade people to graft chicken wings to their foreheads to enable them to fly, they tried to persuade a grocer to stock pre-bitten fruit, they sought recruits for a private army of San Franciscans to invade Los Angeles and endeavored to rent pigeons in Golden Gate Park for \$1.50 per hour. The well-dressed, straight-faced duo recorded these exchanges while “pushing our victims as far as they’ll go before they take a poke at us,” Coyle said (“Rent-A-Pigeon,” *Newsweek*, 13 January 1964). After they produced an album of their gags in 1963, Dunbar gave Coyle and Sharpe their own three-hour nightly show on KGO. “That’s what I feel proudest of,” Dunbar said of his career accomplishments. “They were so different from anything else on the air. They were funny and unusual. They helped establish the difference between us and other stations.”

Despite Dunbar’s innovations, the new format was not an immediate success. After one year, KGO’s station manager wanted to abolish the news-talk format and switch to rock and roll. “I told him, ‘We are about to turn the corner, and you are making a big mistake,’” Dunbar said. The station manager relented, and one year later KGO was one of the top-ranked stations in the market.

Shortly after taking the reins as program director, Dunbar reversed his decision to stay off the air and made himself an afternoon talk-show host. “Vietnam and conservation were pretty much all anyone wanted to talk about” during the 1960s and 1970s, Dunbar recalled. In September 1973 a psychologically disturbed listener, recent immigrant Lawrence Kwong, believed he heard Dunbar’s voice inside his head, threatening him. “He thought I was going to kill him, so he decided to kill me first,” Dunbar said. Kwong stood on the other side of the studio window during Dunbar’s show and fired five shots. The station had recently installed bulletproof glass, so Dunbar was spared. The enraged Kwong was undeterred, though, and headed for the studio door. When station advertising salesman Ben Munson tried to intervene, Kwong killed him and then committed suicide.

Another unbalanced listener called in to Dunbar’s show, claiming to be the notorious Zodiac killer who had committed a string of unsolved murders in California in the 1970s. He promised to give himself up if attorney Melvin Belli agreed on air to represent him. Dunbar invited Belli to the studio, where “Belli so dominated the conversation the guy hung up and called back 54 times in an hour and a half,” Dunbar said. The caller made arrangements to surrender to police with Dunbar

Jim Dunbar
Courtesy Radio Hall of Fame

and Belli present, but he never showed. Dunbar is confident that the caller was the real Zodiac killer because he knew details of murders that had not been publicly revealed. (The killer has never been caught.)

In 1975, Dunbar moved to the morning drive-time shift on KGO, a position he retained until his retirement in July 2000.

Dismayed by the plethora of shock-jocks and rude talk-show hosts on the airwaves today, Dunbar said he got out at the right time. "We are now imposing on the listener so much, and picking at scabs, that it has gone from intrusive to invasive," he said. Instead he wishes that other show hosts would emulate his approach. "You reveal what your heart is telling you and you let people respond to that, one way or another," Dunbar counseled. "That's how to do a talk show."

Dunlap, Orrin E. 1896–1970

U.S. Writer, Editor, and Radio Publicist

Orrin Dunlap was an important newspaper radio editor, a prolific author of books on radio and television, and an important corporate radio publicist working in and reporting about radio's first several decades.

Dunlap's radio experience began in 1912 with a home-built amateur radio transmitter in the attic of his Niagara Falls, New York, home. He gained commercial experience on the Great Lakes as a Marconi Wireless Telegraph operator. During World War I, he served as a U.S. Navy coast station radio operator in Maine. After receiving his B.S. from Colgate in 1920, Dunlap did some graduate coursework at the Harvard Business School before finding employment with the New York-based Hanff-Metzger advertising agency.

He became the *New York Times*' first radio editor in 1922, just as the national craze for the new medium was reaching its peak. Carr Van Anda, the *Times*' managing editor, asked Dunlap to develop a regular radio section for the paper. Dunlap would hold the post for 18 years, becoming a widely read critic and columnist and one of the most influential commentators about radio.

At the same time, Dunlap began writing books about radio; the first one, *The Radio Manual*, grew out of the many technical information requests from *Times* readers. Dunlap was able to write about technical matters in a clear fashion for those with little or no background. Eventually, he would publish 13 volumes on radio and related topics. Among them were two volumes on radio advertising (among the first on the subject to appear); a history of radio; a biography of Marconi in which the inventor cooperated; several books on television (the first being drawn from his columns in the *Times*, his only book so based); a reference book on radio inventors; a chronology of radio and television; and an overall history of telecommunications, the last edition of which appeared after his death. Though all long out of print, several of Dunlap's books remain standard reference works today.

In 1940 Dunlap joined the Radio Corporation of America (RCA) as manager of the company's information department, rising to become a vice president (in 1947) of advertising and

publicity before retiring. For most of this period he wrote RCA's annual report.

Durante, Jimmy 1893–1980

U.S. Radio, Film, and Stage Performer

When Jimmy Durante performed, he appeared to the world like a king penguin in basic black evening wear and a shapeless black fedora. Strong in his stride and tireless while performing, he was known for his rapid speech, gravelly voice, and cathedral nose. His legacy continues every Christmas season when he is heard as the narrator of *Frosty, the Snowman*.

Origins

Durante was born to Italian immigrant parents in New York City on the kitchen table in his parents' apartment. His parents gave him piano lessons as he grew up. From 1910 until 1914 Durante worked at Diamond Tony's on Coney Island. Billed as "Ragtime Jimmy," he became a talented piano player and learned the ins and outs of handling a crowd.

Durante worked his way up to the Alamo Club in Harlem, where he was bandleader and talent booker. He worked there until 1921 and moonlighted at other clubs. He also made a series of recordings with the Original New Orleans Jazz Band. During his time at the Alamo, Durante met his wife, Jeanne Olson. They were married in 1921.

During the 1920s, Durante gravitated toward vaudeville, where he became part of a comedy music team with Lou Clayton and Eddie Jackson, known as the "Three Sawdust Bums." He opened his own place, The Club Durant, which, although it did not last long, made Jimmy Durante a star. After the club closed in 1925, the three men continued performing music and comedy at various theaters and finally at the Palace Theater.

Durante developed much of his characteristic style during his vaudeville days. He purposefully misused the English language and enthusiastically delivered his signature "Hotcha-cha." He also became known for tunes such as "I Ups to Him," "I'm Jimmy, That Well-Dressed Man," and his theme song, "Inka-Dinka Doo."

Clayton, Jackson, and Durante made their Broadway debut in Ziegfeld's *Show Girl* in 1929. Durante had a chance to do a solo and let his personality shine through. The "Bums" also made their film appearance in *Roadhouse Nights*, filmed on Long Island in the Paramount studio. Durante played Helen Morgan's piano accompanist. He knew that he was not the matinee idol type, and he found his popularity increasing as he aged and became loved by another generation.

The next Broadway appearance for the trio was *The New Yorker* (1930–1931), playing speakeasy gangsters. At that time Durante was offered a five-year contract by Metro Goldwyn Mayer (MGM), breaking up the trio. Lou Clayton became Jimmy's manager and confidant until Clayton's death in 1950.

Durante appeared in 17 films over the next four years. In his first film he supported William Haines in *The New Adventures of Get-Rich-Quick Wallingford* (1931). During his early film career, there were few memorable moments. He took time off to reteam with Clayton and Jackson in the Broadway show *Strike Me Pink*. The play got modest reviews. Although his film career was not spectacular, Durante appeared in a number of films from 1936 to 1941. He also appeared on Broadway in the Cole Porter revue *Red, Hot & Blue* (1936–37, with Ethel Merman and Bob Hope) and then in *Stars in Your Eyes* (1939, again with Merman).

Radio

Durante was a guest on many radio shows in the 1930s and 1940s. He appeared with Eddie Cantor, Rudy Vallee, Fred Allen, and others, making appearances as well on such programs as *Fibber McGee and Molly* and *Duffy's Tavern*. In 1943 Durante began appearing on CBS's *Camel Comedy Caravan* with Garry Moore. In 1945 the program was renamed *The Jimmy Durante-Garry Moore Show*. Moore left in 1947, but Durante continued with the show through 1949. While appearing on radio, Durante also appeared in six films at MGM. He was a great comic foil for Van Johnson and June Allyson. In the 1950s he made only three films, starring with Donald O'Connor in *The Milkman*, *The Great Rupert*, and *Beau James*.

Film and Television

During the late 1940s and the 1950s, some of Durante's greatest success came from television. He co-hosted NBC's *Four Star Revue* in 1950, as well as the *All Star Revue* (1951–52) and the *Colgate Comedy Hour* (NBC, 1953–54). In 1954 he starred in his own show, which ran through 1956. Though his show went off the air, Durante continued to guest-star on television shows and in specials. Baby boomers knew him in the early 1960s from his various appearances on the *Ed Sullivan Show*. In 1969 he supplied the narration for the CBS cartoon *Frosty, the Snowman*, which still runs every year at Christmas. His last television appearance was on the *Sonny and Cher Comedy Hour* in 1971.

Unlike most of his contemporaries, Durante seemed ageless from the late 1940s throughout the early 1970s. In 1972, he suffered a stroke and his health declined. Wheelchair bound, he appeared on various award shows, making his last public appearance at his 83rd birthday bash in 1976. His fame was

Jimmy Durante

rekindled when his recordings of “As Time Goes By” and “Make Someone Happy” were used on the soundtrack of the movie *Sleepless in Seattle* (1993), putting Durante on the charts in the 1990s.

Durham, Richard 1917–1984

U.S. Writer and Radio Dramatist

From June 1948 to August 1950, Richard Durham was the force behind Chicago radio's *Destination Freedom*, a lyrical, politically outspoken weekly half-hour series of programs that dramatized the lives and accomplishments of various contemporary and historical black leaders. The series was an uncompromising, well-written presentation of dignified African-American images during a time when few such images existed in American media. Durham's scripts creatively and consistently rallied against racial, social, and economic injustice.

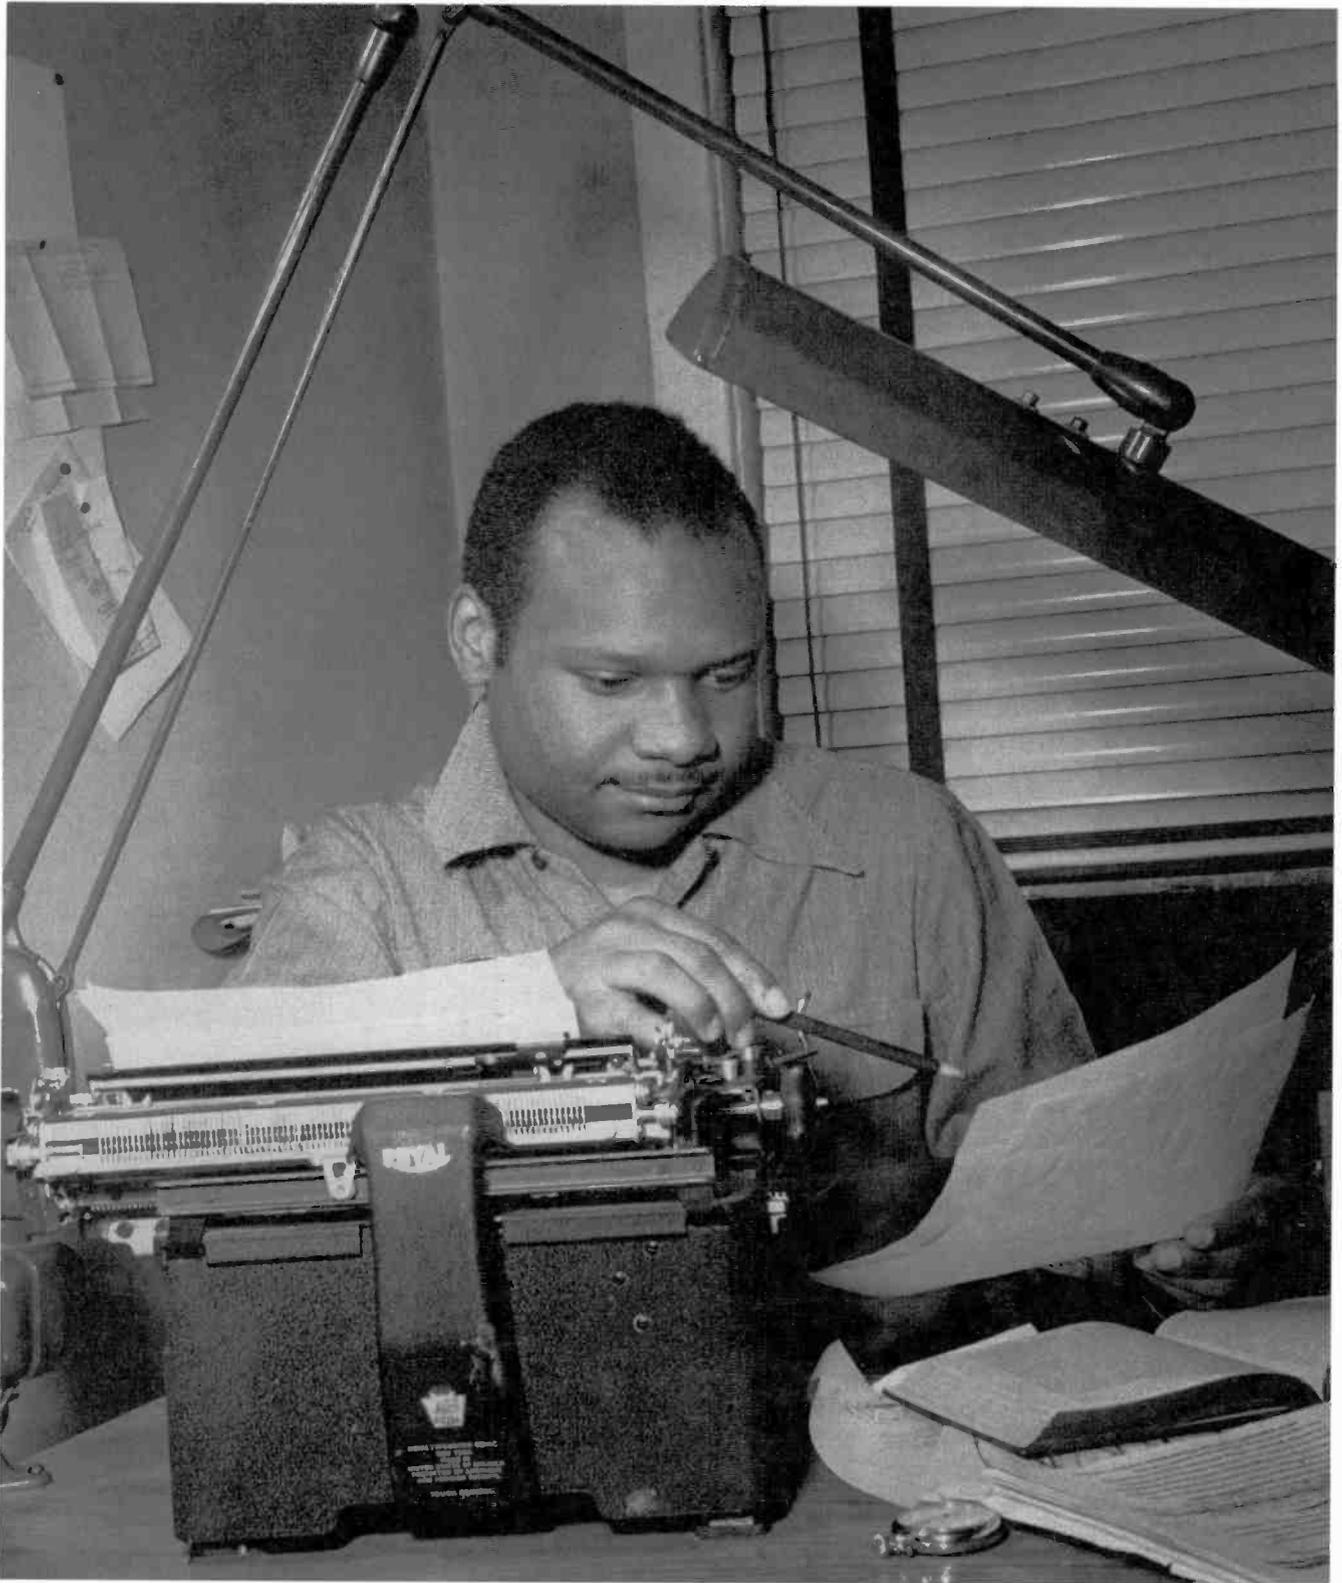

Early Years

Richard Durham was one of eight children born to a father who was a farmer and a mother who was a schoolteacher in rural Raymond, Mississippi. In 1923, when Durham was six years old, his family moved to Chicago, joining the large migration of African Americans from the agricultural South who sought better employment and education opportunities in the industrial North. Durham attended Chicago public

schools, became an avid reader, briefly enrolled in Northwestern University, and wrote poetry in his spare time.

During the Depression, Durham landed a job with the Illinois Writers Project, a state program that was an outgrowth of the federal government's Works Progress Administration. As a member of the project's radio division, he wrote for several shows that aired on Chicago stations during the early 1940s.

Ever the versatile writer, Durham also worked as an editor and print journalist for the Chicago-based and black owned *Chicago Defender* newspaper and *Ebony* magazine during World War II. After the war he was hired to write for a 15-minute weekly drama series entitled *Democracy USA*, which aired on WBBM, Chicago's Columbia Broadcasting System (CBS) affiliate station. Durham continued to hone his writing skills by creating a soap opera that dealt with the trials and triumphs of a fictitious black family. As one of the first soap operas of its day concentrating on African American characters, *Here Comes Tomorrow* aired on Chicago radio's WJJD from 1947 to 1948.

But Durham also longed to counter the stereotypical portrayal of African Americans on shows such as *Amos 'n' Andy* and *Beulah* by dramatically highlighting the accomplishments of black historical, cultural, educational, and political leaders—from figures such as slavery abolitionist Harriet Tubman and Haitian revolutionary Toussaint L'Ouverture, or cultural icons John Henry and Stackalee, to more contemporary movers and shakers such as poet Gwendolyn Brooks and statesman Ralph Bunche. *Destination Freedom* became Durham's brilliant means of expression.

Destination Freedom

Durham fortuitously approached Chicago's National Broadcasting Company (NBC) affiliate WMAQ with his series proposal during a time when there was a somewhat more liberal atmosphere in the post-World War II media. In fact, the director of WMAQ's public affairs and education division was Judith Waller, a woman who was passionate about and committed to public-service programming.

Durham was granted a weekly half-hour spot, and *Destination Freedom* debuted at 10 A.M. on Sunday morning, 27 June 1948. Each week, the series opened with an a cappella rendering of the African-American spiritual "Oh Freedom." An announcer briefly introduced the episode's specific focus, and then Durham began weaving his story—cleverly using actors, sound effects, and music to bring his scripts to life.

Durham was an inventive writer who used innovative storytelling methods. Often, objects or concepts became personalities. For example, in "Anatomy of an Ordinance," urban slums were personified by an arrogant character who was proud of his discriminatory origins, and Louis Armstrong's trumpet verbally guided listeners through the great musician's life in "The Trumpet Speaks." Additionally, in "The Rime of the Ancient Dodger," humorously rhymed verse helped to dramatize Jackie Robinson's integration of major-league baseball in 1947.

In one of the series' strongest productions, the award-winning "The Heart of George Cotton," Durham cast a human heart as a narrator. Accompanied by the sound of fluctuating heartbeats, Durham's heart character intimately involves the audience in an open-heart operation. This episode paid tribute to African-American surgeons Ulysses Grant Dailey and the legendary Daniel Hale Williams—the first doctor to successfully suture a human heart in 1893.

One of Durham's recurring themes maintained that until all people enjoyed social and economic freedom, the fight against oppression would continue. In fact, *Destination Freedom* characters such as slavery revolt leader Denmark Vesey and reconstruction senator Charles Caldwell actually verbalized this sentiment—one rarely heard on radio at that time. Also, Durham championed women's rights in his characterizations

of such African-American pioneers as abolitionist Sojourner Truth, educator Mary McLeod Bethune, choreographer Katherine Dunham, and journalist/activist Ida B. Wells.

Durham spent hours in the library poring over historical documents to find material for his scripts. He attempted to avoid overtly didactic scriptwriting approaches, opting to tell stories that might emotionally capture listeners and encourage them to draw their own conclusions.

Apparently, his approach worked. The show was enthusiastically received by many Chicago listeners—despite an airtime that Durham disliked because of its proximity to Sunday morning worship services. By the end of its first year, *Destination Freedom* had garnered several awards, along with praise from citizens' groups, the Chicago Board of Education, and Illinois Governor Adlai Stevenson. But there were also complaints. Some considered the series too radical, and groups such as the American Legion and the Knights of Columbus protested certain episodes. But because of the largely positive attention that *Destination Freedom* brought to the station, WMAQ continued the series. However, the station never sought to broadcast the series to a national audience, in part because it was believed that Southern stations would refuse to air it.

Inside WMAQ, which financially supported *Destination Freedom* (the *Chicago Defender* and the Urban League also briefly sponsored the series), Durham regularly fought with station censors. There were attempts to soften Durham's characterization of Revolutionary War hero Crispus Attucks, and proposed programs on such legendary figures as Paul Robeson and Nat Turner were rejected because they were considered too controversial. One show on abolitionist and statesman Frederick Douglass was so heavily edited that it would have been only 20 minutes long had it been produced with the proposed cuts. Durham and his predominantly African-American cast of socially conscious actors protested, and much of the edited material was restored.

WMAQ ended its support of Richard Durham's *Destination Freedom* during the summer of 1950, sparked by the rising conservatism of the budding anti-Communist period. After Durham's departure, the series lasted for a short period featuring traditional white heroes. But Durham sued WMAQ, preventing the station from continuing to use the *Destination Freedom* name.

Richard Durham sustained his politically astute creativity through work as a Chicago-based television scriptwriter, newspaper editor, author, and political speechwriter until his death in 1984. But he is perhaps best remembered for his brilliantly written and historically significant *Destination Freedom* radio series.

DXers/DXing

Tuning Distant Stations

DX is the telegrapher's abbreviation for "distance." It came into common use among early amateur radio operators to refer to those who concentrated on working with other operators at great distances. DXing continues as a focus of many modern-day amateurs.

The terms "DX" and "DXing" were also used among radio listeners. In broadcasting's earliest days, radio listeners were known as BCLs, for "broadcast listeners," and those BCLs who were interested in listening not for program content but for the thrill of hearing distant stations were called DXers. Their

hobby was (and still is) known as DXing, and their goal was to hear as many stations, from the farthest locations, as possible.

For a time in the early 1920s, long-distance broadcast listening was popular with a large portion of the population. Radio—especially radio from distant places—was a new experience, and everyone wanted to see how far they could "get" with their equipment. However, as the novelty of radio wore off and network broadcasting started, DXing became the preserve mainly of the technically inclined and of hard-core distance aficionados.

Shortwave broadcasting would not come to the attention of most listening hobbyists until around 1924, and so in the United States most DXing before then was done on the standard broadcast (medium wave) band, with domestic stations the targets. The relatively small number of stations and the resulting absence of the channel blocking that is common today, coupled with the prevalence of daytime-only operations, made it possible for a conscientious, well-equipped night hound to hear a large number of the stations that were operating.

DXing's attraction was captured by journalist Charlotte Geer in her 1927 poem "Another One":

You may pick out an average young man
Who has nothing especial "agin it,"
And draw up a comfortable chair
And settle him in it.

Then you mention the call of the West
Thus tempting his spirit to roam
That he early may tire of nooks by the fire
The tame little voices of home.

When the chimes of the clock tinkle ten
The rest of the folks go to bed,
You must then take the youngster in hand
And fasten the phones on his head.

You must lead him and prod him by turns
He'll yawn and seem bored and forlorn
Till he hears that first call from the coast—
And behold a DXer is born.

The "call from the coast" refers to the ability of east-coast listeners, late at night and under the right conditions, to hear stations in California as outlets farther east signed off at local sundown.

Although pioneer radio fans built their own sets, as the number of DXers increased a distinct market was recognized by equipment manufacturers, and soon radios with special features for long-distance reception were being produced. The most important elements to good reception were sensitivity (the ability to pick up weak signals), selectivity (the ability to separate adjacent signals), and frequency readout (the ability to know what frequency the equipment is tuned to). To meet these needs and the like needs of the amateur radio operators, the communications receiver was developed. These receivers, which appeared beginning in 1933 and continue on the market today, emphasize technical capabilities rather than appearance or simplicity of operation. Among the principal early manufacturers of such sets were Hallicrafters, Hammarlund, and National. Today the major producers of high-quality, semi-professional receivers include Drake, Icom, AOL, and Japan Radio Company.

With the discovery that shortwave signals could propagate around the globe, what had been, in the United States, largely a search for U.S., Canadian, and Caribbean stations on the standard broadcast band took on a worldwide flavor as DXers tried their hand at the shortwave frequencies. Many countries began international shortwave services, and domestic shortwave broadcasting became commonplace in many foreign countries as well, particularly those with large geographic areas to cover. These latter stations made particularly good DX targets. Some listeners also went outside the broadcasting frequencies, preferring to tune in to amateur radio operators; transmissions from ships, planes, and police; and other users of the shortwave spectrum.

The need for up-to-date station information led to the publication of magazines such as *Radio Index*, *All Wave Radio*, and *Official Short Wave Listener Magazine*. These publications were devoted either entirely or in part to DXing. Other magazines had special sections for long-distance radio enthusiasts. Clubs such as the Newark News Radio Club and the International DXers Alliance were formed, and periodic bulletins containing members' "loggings" and other DX information issued. Special broadcasts were scheduled over stations at times when they might not ordinarily be heard, and contests were held to compare DXing prowess.

Besides hearing the stations, many DXers collected QSLs. QSL is the telegraph abbreviation for the acknowledgment of receipt of a signal or a message. QSLs are cards or letters that stations issue to DXers, confirming that it was in fact their station that was heard, based on the listener's description of the programming. QSLs usually take the form of distinctive cards and letters containing information about the station and its location. Some DXers also make it a practice to make audio recordings of their DX catches and thus preserve their listening experiences.

Notwithstanding the common availability of local radio signals over even the simplest equipment, long-distance radio listening still has a devoted following. Although the pervasiveness of high-power, all-night broadcasting has made DXing on the broadcast band more difficult, on the shortwave bands the combination of improved receivers and higher-power transmitters has led to easier tuning and more reliable reception.

As a result, whereas DX was the main objective of long-distance radio enthusiasts during most of radio's developmental period, "shortwave listening"—listening for program content rather than distance—is often the purpose today. Some listeners follow particular specialties. On shortwave they may listen to clandestine radio stations; unlicensed pirate stations; or small stations from exotic parts of the world, such as Indonesia or the Andes. On the broadcast band, some listeners concentrate on domestic stations, while others focus on foreign broadcasters.

Although the number of DXers has declined over the years, there is still much truth in the observation made by radio pioneer Hugo Gernsback in 1926: "I can not imagine any greater thrill," he wrote, "than that which comes to me when I listen, as I often do, to a station thousands of miles away. It is the greatest triumph yet achieved by mind over matter."

Early Wireless

Induction and Conduction before 1900

Although Marconi, Lodge, Popov, and their contemporaries were the first electricians to make practical use of electromagnetic waves for communication, varied forms of wireless telegraphy had existed for 50 years before their work at the end of the 19th century. Most of the wireless inventors of this early era were Americans.

Henry and Morse

Joseph Henry, at Princeton University, conducted numerous experiments with induction, or the tendency of a primary electric current in a conductor to stimulate a secondary current in another conductor nearby. During one group of experiments in 1842, which Henry called "induction at a distance," he measured secondary current as far as 200 feet away from the primary circuit. Although the effects were more pronounced with the instantaneous discharge of a Leyden jar (electrostatic induction) at the primary circuit, they were also present when a continuous current passed through a coil (electromagnetic induction). Henry also noted that the wireless electricity seemed to oscillate, but he had no instruments sensitive enough to study this phenomenon. Neither Henry nor his students used induction for telegraphy, but his methods and results were well known to scientists on both sides of the Atlantic.

In the same year, Samuel F.B. Morse, using different technology, devised a working wireless telegraph. Having failed at submarine telegraphy when a ship's anchor hooked and cut the cable, Morse came up with a novel solution to the problem. By then, electricians knew how to use a natural conductor, like earth or water, as the return link to complete an electrical circuit. Morse reasoned that the same natural conductor could replace the wire in the link between transmitter and receiver as well. By attaching the ends of the wires leading from the battery and telegraph key to metal plates, doing the same with wires from a galvanometer, and then submerging the sets of

plates on opposite banks, Morse successfully sent a message across a canal some 80 feet wide. The next year, 1843, his assistants sent messages a mile across the mouth of the Susquehanna River.

Morse soon became preoccupied with building a wired telegraph system and never applied for a patent on the wireless scheme. About ten years later, however, James Bowman Lindsay, a Scottish schoolteacher, applied the same natural conduction technology to the task. Apparently Lindsay was unaware of Morse's prior work. By using larger metal plates spaced more widely apart, he increased transmission distance to two miles across the River Tay at Dundee. Lindsay received British patent 1,242 for this invention in 1854, but he failed to raise enough capital to build a prospective transatlantic installation.

Loomis and Ward

American dentist Mahlon Loomis, of Washington, D.C., devised a wireless telegraph system using the upper atmosphere as one conductor, the earth as the other, and the difference in electric potential between the two as the power supply. In 1866 he raised two kites, attached to grounded wires, from mountains in northern Virginia and transmitted a signal between them, a distance of 18 miles. Loomis later adapted this apparatus for telegraphy and, he claimed, telephony. The most interesting facet of this invention was that it worked best when the kites were at the same altitude, leading some historians to speculate that Loomis had hit upon the principle of syntony, or tuned resonance. Although he received U.S. patent 129,971 in 1872, Loomis failed to get a requested appropriation from Congress, and several potential groups of investors went broke in the numerous financial panics that followed the U.S. Civil War.

Another U.S. patent for wireless telegraphy, number 126,356, issued to William Henry Ward of Auburn, New

York, actually preceded the Loomis patent by three months. Ward was an author of religious tracts and a vigorous promoter of his own inventions, which included naval signal flags, bullet-making machines, bomb shell fuses, and pomade for the hair. Loomis had made Ward's acquaintance in the late 1850s when Ward agreed to take a set of Loomis-patented false teeth under consignment to a trade show in Europe. Because Loomis furnished no illustrations or model with his patent application, it is difficult to tell how much similarity existed between the two inventions. The Ward wireless telegraph, however, seems to be based on the absurd idea that convection currents in the atmosphere would carry the electric signal to the receiver. Neither system found a ready market.

The 1870s were a busy decade for electricians, whether they were scientists, engineers, or tinkering inventors. Laboratories large and small sprang up in the United States and Europe for both educational and commercial purposes. The new professional societies, as well as academic and trade publications, facilitated communication, so electricians knew what other electricians were doing. Although there was scant progress in wireless telegraphy, there were several interesting events.

Various experiments, including those by Elihu Thompson and Thomas Edison in the United States and by David Hughes in Great Britain, suggested the existence of electromagnetic waves, as predicted by James Clerk Maxwell. Edison called them the "etheric force." Hughes unwittingly built a complete radio system, with a sparking coil as a transmitter and a carbon microphone as a coherer, or receiver. He gave up these experiments, however, when directors of the Royal Society visited his lab to witness a demonstration and assured him that the effects were due to induction alone.

Wireless Telegraphy

In 1878 Alexander Graham Bell attempted to build a Morse-type wireless telephone using water as a natural conductor. He tested this device the next year with only limited success on the Potomac River near Washington, D.C. When he learned that John Trowbridge at Harvard was pursuing similar research, Bell dropped that idea in favor of one more promising—sending a voice signal on a beam of reflected light.

With a thin diaphragm of reflective mica at the mouthpiece, the device captured light waves from the sun, modulated the light as sound waves moved the diaphragm, and reflected the beam toward the receiver. The receiver was a parabolic reflector coated with silver and aimed at a piece of selenium, a natural photoelectric transducer. Once the selenium converted the light to electricity, the signal traveled to a regular telephone receiver. Bell called it the Photophone, received U.S. patent 235,199 in 1880, and exhibited the device widely in both the United States and Europe. Later

experiments proved that the device worked with less expensive lampblack substituting for the selenium and with any form of radiant energy. The Photophone then became known as the Radiophone, the first application of the term *radio* to wireless communication.

Although European electricians were captivated by the device, and Bell himself thought it a greater invention than the telephone, American Telephone and Telegraph (AT&T) saw no commercial possibility and soon ceased its development. The company continued to exhibit the Photophone as a novelty through the St. Louis World's Fair of 1904, but Bell was so disgusted that he gave his original model to the Smithsonian Institution and halted all active involvement with the company that had once borne his name and was based on his patents.

Amos Dolbear, another early telephone pioneer, became interested in wireless telephony by accident. While working in his lab at Tufts College in 1882, he noticed that he was still hearing sounds from a receiver, even though the wire to the transmitter on the other side of the room was disconnected. Upon examination, he determined that the signal was traveling by electrostatic induction. Through experimentation, Dolbear built a wireless telephone system that employed grounded aeri-als at both transmitter and receiver and worked well at distances of up to a mile. He demonstrated the invention by transmitting both voice and music at scientific conferences in the United States, Canada, and Europe, receiving U.S. patent 350,299 in 1886. Dolbear's transmitter was capable of generating electromagnetic waves and was in many respects similar to Marconi's of a decade later, but the receiver lacked any device to detect radio waves. Dolbear never attempted to sell his wireless telephone.

In Great Britain during the 1880s, both William Preece and Willoughby Smith developed functional wireless telegraphs to transmit across relatively short distances. They used both natural conduction and induction technologies to solve practical problems such as how to communicate with offshore islands and lighthouses and with workers in a coal mine. Preece, an engineer at the British Post Office, had been interested in wireless since he witnessed Lindsay's work in 1854. Later he became Marconi's chief advocate with the British government.

Moving Telegraphy

The possibility of communicating instantly by telegraph with moving trains generated substantial interest in the United States. William Wiley Smith, a telephone office manager, devised an electrostatic wireless telegraph that used existing lines running beside the tracks and received U.S. patent 247,127 in 1881. Although Smith's invention did not work very well, his partner, Ezra Gilliland, was a childhood friend of Thomas Edison. Three years later, Gilliland convinced Edison

to buy the patent, improve the technology, and promote it to the rapidly growing railroad industry as a safety and convenience appliance. Gilliland and Edison's interest in railroad telegraphy grew when they learned that another inventor, Lucius Phelps of New York, had just applied for a patent on a similar system. Phelps, moreover, was preparing to demonstrate a working model in New York City during February 1885. Edison quickly filed a new patent application based on improvements to the prior Smith patent. The Patent Office called the two applications into interference hearings. Meanwhile, Granville Woods, a black inventor from Cincinnati, filed still a third application for a railroad telegraph system. Once again, the Patent Office declared the Woods and Phelps applications to be in interference.

In a series of hearings that ended in 1887, Woods was the ultimate victor. He proved that as early as 1881 he had shown sketches and models of his invention to friends in his neighborhood. Shortly thereafter, he had lost his job and contracted smallpox, delaying his progress. After reading about the Phelps demonstration in *Scientific American*, he quickly gathered his old notes and models and went to his lawyer. In the meantime, the patent examiner determined that the Smith patent, controlled by Edison, had no priority because it used electrostatic induction, whereas the Phelps and Woods inventions used electromagnetic. After this ruling, Edison dropped out of the hearings and merged efforts with Phelps.

Woods received several U.S. patents for his invention, beginning with number 371,241, and Phelps did likewise, starting with number 334,186. But all of this activity was in vain, for the railroads had no interest in wireless telegraphy at that time. With no laws compelling safety or emergency communication improvements, they saw the technology as added expense without compensatory revenue. So none of the inventors profited. Eventually Edison modified his application and received U.S. patent 465,971 in 1891. He sold the patent to Marconi some years later for a nominal sum. After the failure to market the railroad telegraph, interest in wireless waned in the United States until after Marconi brought his system to the America's Cup races of 1899.

In a widely read article of 1891, John Trowbridge concluded that the technologies of Henry and Morse were inefficient for long-distance wireless communication and, with no tuning mechanism, were limited to a single message at a time. The last champion of natural conduction and induction wireless was probably Nathan Stubblefield, a farmer from Kentucky who learned about electricity by reading *Scientific American* and *Electrical World*. Stubblefield demonstrated an induction wireless telephone for neighbors as early as 1892. He generated considerable publicity in 1902 with a natural conduction wireless telephone that he displayed to enthusiastic crowds in Washington, D.C., and Philadelphia. One remarkable feature of this system was its ability to broadcast a signal

to multiple receivers simultaneously. Stubblefield intended to use it to disseminate news and weather information, but he was the victim of a stock fraud scheme that left him destitute. By the time he received U.S. patent 887,357 in 1908 for his induction system, superior technology existed. But he became very paranoid that others were seeking to profit from his work, and he eventually died of starvation in 1928.

Landell and Tesla

Two other inventors had the opportunity to develop wireless communication by electromagnetic waves prior to Marconi but failed to do so. Roberto Landell de Moura, a Catholic priest from Brazil, studied physics at the Gregorian University in Rome while he prepared for the priesthood. When he returned to Brazil in 1886, Landell set up a laboratory and began electrical experiments. His interest turned to wireless. He built acoustic telephones, a model of Bell's Photophone, and, soon after he learned of Hertz's and Branly's work, his own electromagnetic wave transmitter and receiver. Then he combined the three into one multifunction wireless telephone system. By 1893 Landell was sending messages over distance of five miles. Then, two years later, a powerful bishop witnessed a demonstration. He was so unnerved by the voices coming from nowhere that he declared the apparatus the work of the devil and ordered Landell to stop his work.

Shortly thereafter, fanatics broke into Landell's laboratory, destroyed the apparatus, and set fire to the building. It took Landell five years to regroup, but he eventually received Brazilian patent 3,279 in 1900 and traveled to the United States to pursue patents and development. Hampered by poor legal advice, illness, and inadequate knowledge of the U.S. patent system, Landell nevertheless persisted and received three U.S. patents, beginning with number 771,917 in 1904. By then Marconi and others controlled the market for radio.

Like Landell, Nikola Tesla was trained in physics at a European university. He came to the United States in 1884 to work first for Edison and then for Westinghouse. In his work with high-frequency alternating currents, Tesla discovered that the alternators also generated continuous electromagnetic waves that could be used to transmit signals. He demonstrated this phenomenon as early as 1891 but made no practical application of it until he built a radio-controlled toy boat, for which he received U.S. patent 613,809 in 1898. The next year, he established a laboratory in Colorado Springs, Colorado, from which he intended to send wireless messages to an international exposition in Paris in early 1900. But in the midst of his radio experiments, Tesla became fascinated with the possibility for wireless distribution of electric power through the earth itself and devoted most of the rest of his life to devising methods to accomplish that goal.

Earplay

Public Radio Drama Series

Earplay was an anthology series created in an effort to produce a variety of U.S. radio dramas in the late 1970s and early 1980s. Centered at radio station WHA in Madison, Wisconsin, it involved numerous prominent playwrights and scores of actors more than two decades after the last major commercial radio dramas had left the air. *Earplay* was a leading source of drama for member stations of the burgeoning National Public Radio (NPR) network.

The series began in 1971 as a grant proposal submitted to the Corporation for Public Broadcasting by project director Karl Schmidt, a University of Wisconsin professor and station manager of WHA. Schmidt had begun his radio career as a juvenile actor in 1941 and was involved as an actor and director in commercial, public, and armed forces radio. In the 1960s he produced a series of stereo dramas under the auspices of the National Center for Audio Experimentation. In many ways, station WHA, with a long history of producing radio drama, was an ideal place for the development of new forms of that genre. For 30 years the station's School of the Air applied the techniques and forms of drama for instructional purposes. In the early 1970s, WHA had particularly strong ties to Canadian actors and writers, BBC writers and directors, and producers from Radio Nederland.

Under the terms of its grant, the primary purpose of *Earplay* was "to develop drama in audio forms which are intelligible, enjoyable, and useful to more, rather than fewer, people."

A second purpose was "the establishment of a testing ground for playwrights and plays." (In the project's latter days, its producers would increasingly disagree as to whether intelligibility or experimentation should predominate.) The creators of *Earplay* proposed an emphasis on original dramas—works by new playwrights that did not demand long attention spans and had strong plot lines, a high degree of intelligibility, enjoyable listening potential, and relevance to life in the United States in the 1970s. There was a conscious effort to "compete with substantial ambient noise levels in the listening circumstance" by emphasizing short dramas (usually less than half an hour long) and avoiding reliance upon subtle sound effects.

Between 1975 and 1979 *Earplay* produced more than 150 radio dramas ranging in length from a few minutes to more than an hour. During those years the dramas were distributed to public radio stations on long-playing records. After 1981 the medium was reel-to-reel tape as part of *NPR Playhouse*. Later the plays were repackaged in half-hour installments under the title *Earplay Weekday Theatre*.

Earplay dramas sounded very different from radio plays of the 1930s, 1940s, and 1950s. Most of them were in stereo, and the acting had a closer, more intimate quality. In some cases the language also was very different and prompted advisories to subscribing stations. In the broadcasts of both Archibald MacLeish's *J.B.* and Edward Albee's *Listening*, for example, there were a half-dozen warnings about "sensitive material."

Another departure from U.S. radio tradition was the variable length of *Earplay* dramas, although they were often packaged in one- or two-hour blocks.

Like traditional radio dramas, *Earplay* productions typically involved six or fewer actors, and they often emphasized narration. In most cases the story line was straightforward, but occasionally the plays were more in the realm of the “sound collage.”

In their preface to the 1979 *Earplay* program information, the producers noted that the 1979 season reflected a commitment to “give the most promising American playwrights an opportunity to speak to a national audience through the unique medium of radio.” During that same year, *Earplay* received both the Peabody Award and the Armstrong Award. The dramas were produced in various locations, including New York, Los Angeles, and Chicago. Most of the postproduction work took place at WHA; the technical director was Marv Nonn.

Among the playwrights commissioned to create *Earplay* dramas were some of the most distinguished of the day: John Mortimer, Donald Barthelme, Larry Shue, Vincent Canby, Alan Ayckburn, Gamble Rogers, John Gardner, Anne Leaton, Athol Fugard, Tim O’Brien, and Archibald MacLeish. Robert Anderson’s play *I Never Sang for My Father* was later adapted into a major motion picture. Other plays went on to success on Broadway: *The Water Engine* by David Mamet, *Lightning* by Edward Albee, and *Wings* by Arthur Kopit, which won the Prix Italia. In order to defray the expense of involving major playwrights, *Earplay* initiated the International Commissioning Group with drama producers in England, Ireland, West Germany, Norway, Sweden, and Denmark, who added rights fees for their countries to *Earplay*’s U.S. fees to provide payments attractive to major playwrights.

Although *Earplay* was carried by a significant number of public radio stations, many years after the series ended Karl

Schmidt reflected that its demise came in part from its inclination to raise difficult issues without offering answers, so that the working person coming home after a tiring day would be inclined to pass over them in favor of more refreshing fare. During the late 1970s and early 1980s, Schmidt turned *Earplay* into a series, partly because series were more economical to produce than individual dramas, and partly because he found that many writers preferred structural guidelines to the indefinite length of the earlier format. In order to put *Earplay* resources to the most efficient use, Schmidt stipulated that the episodes in the series were to be approximately half narration and half dialogue. They were: *A Canticle for Leibowitz* (16 half-hours), based on the science fiction novel by Walter Miller, Jr.; *Happiness*, Anne Leaton’s multipart radio drama based on the musings of a middle-aged Texas woman; and *Something Singing*, Christian Hamilton’s play about abolitionist Amos Bronson Alcott—all of which were distributed through National Public Radio. Contracts allowed three years of use in any and all non-commercial stations in the U.S., with a three-year renewal option that was not exercised.

The Easy Aces

Comedy Program

The *Easy Aces* was a comedy written by Goodman Ace that first aired in 1930 and enjoyed a 15-year run on the Columbia Broadcasting System (CBS) and National Broadcasting Company (NBC) networks. The show was known for simple plot lines that allowed Jane Ace to contort the English language

inexhaustibly while her usually bemused but sometimes horrified husband supplied witty commentary. Like *The Burns and Allen Show*, *The Easy Aces* relied on the device of a scattered, illogical wife flummoxing the logic and control of her husband. Despite the current anachronistic, even sexist ring of the

stereotypical scatterbrained wife, the character had thrived in vaudeville and was still common in mainstream comedy programming well past the middle of the 20th century.

Born in Kansas City, Missouri on 15 January 1899, Goodman Ace's writing talents led him to the *Kansas City Journal-Post* after a stint at haberdashery and other odd jobs. Jane Epstein, also from Kansas City, was born to a local clothing merchant on 12 June 1905. By the time they married in 1922, Ace was regularly exercising his wit in his weekly column of drama and movie reviews for the *Journal-Post*. For instance, while reviewing a play billed as a scenic extravaganza, he offered the comment that the "sets were beautiful—both of them." Since 1922 the paper had sent news to local station KMBC via live feed from a cramped studio off the news room. By the late 1920s Ace's growing interest in radio caused him to approach KMBC's station manager Arthur Church with the proposal for a 15-minute program entitled *The Movie Man*. Church granted Ace the show at the rate of \$10 a week, money that supplemented his income from the *Journal-Post*. As a critic in the newspaper and on the air, Ace met many of the vaudevillians and celebrities who performed in Kansas City. He counted George Burns, Gracie Allen, Groucho Marx, Fred Allen, and Jack Benny among his friends, and even contributed jokes to some of Benny's early radio shows.

Ultimately, however, it was chance, not personal acquaintance, that led to the birth of *The Easy Aces* and Ace's initial success on radio. One Friday in late 1930 his broadcast ended, but the following program (which was to feature Heywood Broun) failed to come through on the network feed. A technician signaled Ace to ad-lib. Jane happened to have been watching from the lobby, so Ace motioned her in, introduced her as his roommate, and the couple bantered fluidly for 15 minutes. They spoke of a local man recently murdered while playing a game of bridge, and during a break Ace instructed Jane as follows: "You be dumb; I'll explain the finer points of bridge, and why murder is sometimes justified." Once on the air she fell effortlessly into character, asking "Would you care to shoot a game of bridge, dear?" and later wondering why "Whenever I lose, you're always my partner."

The audience responded favorably to the broadcast, prompting a local drugstore chain to offer the Aces an initial 13-week contract for two weekly shows. After this contract expired, the advertising firm Blackett-Sample-Humert (BSH) shopped the show around, quickly selling it to the advertisers for Lavoris mouthwash. During this period, the program was broadcast on CBS from Chicago, where Ace negotiated a weekly salary of \$500. Foreshadowing future clashes with sponsors, Ace made light of a Lavoris executive's contention that the program had aired five minutes late one evening. The sponsor responded by canceling the show. The Aces then moved to New York, where Frank Hummert of BSH secured the sponsorship that allowed the show to continue.

Easy Aces, Goodman and Jane Ace
Courtesy Radio Hall of Fame

The initial improvised broadcast established many of the enduring characteristics of *The Easy Aces*. While the bridge game was eventually abandoned, plots remained fairly uncomplicated. Largely character-driven, typical shows featured Jane visiting a psychiatrist, seeing an astrologer, or serving on a jury. She was the central character from the beginning and her relaxed delivery was the key to the program's continuing popularity. From the beginning, too, Ace's asides imbued the show with an air of sophistication and witty urbanity. The Aces' characters were clearly identified as upper-class and urban—he played a highly paid advertising executive. As Ace later phrased it, they lived "in the typical little eastern town, New York City: population eight million . . . give or take one."

Jane's misspoken words and phrases, referred to as "janeacisms," were responsible for most of the laughs on the program. Among her weekly linguistic slips were statements that she feared "casting asparagus" on a friend's character, had "worked her head to the bone," made "insufferable friends," and had relatives "too humorous to mention." More often than not, the malapropisms seemed to make a satiric point, such as: "Congress is still in season," or "I got up at the crank of dawn." The seeming deliberateness of her linguistic twists was enhanced by her sober, deadpan delivery. Context might also lead listeners to believe that her deranged phrasing was occasionally intentional. For instance, when Ace got her brother a menial job, she asked him if he would receive a "swindle chair" like the one Ace had. Sometimes the mood was darker, as in "We are all cremated equal."

Although the show appealed to radio insiders and sustained a loyal following, it did not receive high ratings. Ace was proud of the show's low ratings and even bragged about them in the print advertisements for the show. He was disturbed, however, by sponsor Anacin's attempt to encroach on the pro-

gram's autonomy. When the drug's parent company complained about a change in the music on the show, Ace fired off a letter criticizing Anacin's flimsy packaging. As he later put it, "They thought up a clever answer to that, which was 'You're fired.'"

After losing its sponsorship, *The Easy Aces* spent two years in syndicated reruns until it was revived as *Mr. Ace and Jane*, a 30-minute format with a live audience, a full orchestra, and a larger cast. The show also had a brief run on television in the 1949–50 season, but it did not translate well to that medium. By this time Goodman Ace had started writing for Danny Kaye's television program. In later years he would continue working in television, most notably for Perry Como and Milton Berle. Jane Ace's activities in broadcasting tapered off, and after a stint as *Jane Ace, Disc Jockey* in 1952, she became largely inactive in the field. Jane Ace died in New York on 11 November 1974. Goodman died on 18 March 1982.

Easy Listening/Beautiful Music Format

The term *easy listening* refers to a program format characterized by the presentation of orchestral and small-combo instrumental music intended to elicit moods of relaxation and tranquility among its target audience of older adult listeners. Vocal music is intermixed and may include solo artist and choral recordings made popular by recognized personalities as well as "cover" renditions of original performances. Easy listening achieved its greatest popularity in the 1970s and was broadcast predominantly by FM stations. It was common for listeners in major markets to have from three to five such stations from which to choose. In the early 1980s, stations began to defect from easy listening in favor of formats with the youthful orientation advertisers were seeking. The format's

popularity declined throughout the 1990s, to the point that easy listening stations by 2000 attracted less than 1 percent of the radio audience.

Origins

The origin of the phrase *easy listening* is undetermined. Its predecessors, "good music" and "beautiful music," were format descriptors popularized in the 1950s and 1960s by FM stations seeking differentiation from the Top 40 and middle of the road formats that dominated AM radio. Stations initially offered instrumental-laden good music programming to retail business operators on a subscription basis as a means of

inducing customer relaxation. Good music programming in the 1950s was transmitted via the FM subcarrier frequency, which precluded reception by the general public. Growing listener interest led broadcasters to shift the good music format to their FM main channels in the early 1960s. The good music format subsequently evolved into beautiful music.

Stations that pioneered the good music format in the late 1950s included several noted AM outlets. KIXL in Dallas; WOR in New York City; WPAT in Paterson, New Jersey; and KABL in Oakland-San Francisco, all defined the easy listening presentation and accelerated the format's popularity. KIXL programmer Lee Seagall emphasized the importance of matching music tempo with the hour of the day—upbeat during the morning but down-tempo, soft, and romantic in the evening. Gordon McLendon's KABL relied upon interstitial poetry selections to create distinction. Two evening specialty programs—WOR's *Music from Studio X* and the *Gaslight Revue* on WPAT—influenced WDVR Station Manager/Program Director Marlin Taylor in 1963 to extend the format on this stand-alone FM station to around-the-clock presentation for Philadelphia listeners.

Pairing good music with the FM medium was fortuitous for performers, broadcasters, and listeners. When the Federal Communications Commission directed FM broadcasters in the mid-1960s to curtail the practice of simulcasting the programming of their AM sister stations, this format emerged as the de facto FM format standard. FM broadcasting, in contrast with AM, exhibited the sonic advantages of high-fidelity reproduction and stereophonic sound. The subtle nuances of orchestral performances, diminished by the process of low-fidelity, monaural AM transmission, sprang from FM receivers with astonishing clarity and accuracy. After years of languishing in the shadow of AM radio, the FM medium began to assert its identity as a separate and technically superior mode of broadcasting.

What It Is

Industry followers generally regard the easy listening format as a beautiful music derivative. Beautiful music is a program format featuring soft instrumental and vocal recordings directed to a target audience of predominantly middle-aged female listeners. Lush, melodic, and subdued in its presentation, the format is carefully planned and executed to offer listeners a quiet musical refuge for escaping from everyday distractions. Programmers regard announcer chatter as intrusive and tend to limit the spoken word to brief news reports, time checks, and weather forecasts. Commercial interruptions are similarly minimized, and the construction of message content reflects the format's low-key delivery approach. The objective is to provide listeners with a background musical environment that complements their daily activities.

Beautiful music resides in the development of Muzak, a registered trademark denoting the mood-enhancing background music service pioneered in the 1920s by Brigadier General George Owen Squier. Muzak programming was piped via leased telephone circuits into America's factories to stimulate productivity and into retail stores and restaurants to elevate patrons' spirits.

Programmers for beautiful music and easy listening founded their presentations in the lush, layered string arrangements popularized by the Andre Kostelanetz, Percy Faith, and Mantovani orchestras. Trade publications began using the format labels interchangeably during the mid-1970s. But musicologists cite several distinguishing characteristics between the formats. Beautiful music delved more deeply into the repertoire of 20th-century popular music composers than did easy listening. Tunes by Cole Porter, Jerome Kern, and Hoagy Carmichael—pop music's "standards"—were common fixtures on beautiful music playlists. In contrast, easy listening stations adopted a more contemporary music viewpoint, favoring a greater infusion of fresher sounds. Tunes by Burt Bacharach, Henry Mancini, and John Lennon and Paul McCartney were commonly integrated into the presentation.

Greater distinction between the formats was evidenced by programmers' approaches to vocal music, in terms of both style and quantity. Performances by "traditional" vocalists, such as Perry Como, Andy Williams, and Frank Sinatra, as well as the cover arrangements produced by artists including the Ray Conniff and Anita Kerr choral ensembles, were sparingly interspersed into the presentation of beautiful music. Easy listening stations, which tended to blend instrumentals and vocals on a more proportionate basis, gravitated toward the pop sounds of AM Top 40. Some of the "softer"-sounding hits by Elton John, Billy Joel, the Carpenters, and others qualified for airplay. Up-tempo performances, particularly those punctuated by intrusive guitar licks or intensive percussion, were generally passed over by easy listening programmers.

Key Producers

James Schulke, a former advertising executive and FM radio proponent, established SRP in 1968 to syndicate an approach to the good music presentation that he termed *beautiful music*. Capitalizing on the good music format's mood-music heritage, SRP Vice President/Creative Director Phil Stout constructed each quarter-hour of programming on a foundation of lush orchestral and vocal arrangements of popular music standards. One nuance in execution—the segue—differentiated the beautiful music from the good music format. Stout insisted that transitions between recordings flow in such a manner as to preserve the emotions elicited in listeners by the tempo, rhythm, and sound texture of the performances.

Schulke marketed Stout's concept as the "matched flow" approach to format execution. It was not uncommon for Stout to expend up to two days' effort to assemble a single hour of SRP programming. Collectively, the SRP team's insistence on musical cohesiveness and technical integrity proved successful in attracting and holding listeners. SRP's beautiful music format typically surpassed other formats in Arbitron's "time-spent-listening" measurements, a desirable position for stations catering to advertisers who sought message frequency over reach.

Bonneville was founded in 1970 by Marlin R. Taylor, a veteran programmer who pioneered easy listening on Philadelphia's WDVR in 1963. Taylor meshed a keen music sensibility with an adroit understanding of listeners' tastes in transforming the low-rated WRFM into New York City's number-one FM outlet. Success with WRFM inspired Taylor to launch Bonneville as the vehicle for extending his programming expertise to a clientele that grew in the early 1980s to approximately 180 stations.

Beautiful music prospered in the politically conservative 1970s because its musical message resonated with a nation of silent-majority listeners who had outgrown Top 40 and had never connected with progressive rock, country and western, or ethnic formats. By the end of that decade, more than a dozen syndicators, including Peters Productions, Century 21, and KalaMusic, competed with Bonneville and SRP for affiliates and listeners. As a result, it was common for two or three stations in each of the top 25 markets to vie for a share of the audience.

Beautiful music stations were unable to sustain the momentum, however. "Light" and "soft" adult contemporary (AC) stations, which burgeoned in the latter half of the 1970s, steadily siphoned beautiful music's target listener, the middle-aged female, during the 1980s. In a sense, both beautiful music and light AC were easy listening formats (see Josephson, 1986). Unlike beautiful music, which cultivated reputations with listeners as a background music companion, light AC was vocal-intensive, personality driven, and foreground focused in its presentation.

Switching from beautiful music to light AC improved the revenues of many stations. Advertising revenue erosion for beautiful music stations was attributed to the fact that its aging audience was spending a disproportionately low percentage of its disposable income on consumer goods. Light AC stations, whose demographic profiles skewed toward younger female adults, delivered the audience that had become most desired by national advertisers.

During a 1980 industry conference, broadcasters reached general agreement about the perceptual distinctions listeners had drawn between stations that positioned themselves as either easy listening or beautiful music outlets. In an effort to shed negative images of beautiful music as passive, background radio, broadcasters confirmed easy listening as a more

appropriate positioning descriptor. The phrase *easy listening*, they agreed, evoked positive and active feelings of involvement by listeners with stations.

Decline

It was a calculated decision made by an industry about to confront a period of dramatic change in listener preferences. Easy listening/beautiful music, which Arbitron reported as radio's number-one format in 1979, slipped into second position behind adult contemporary the following year. The remainder of the 1980s proved to be a period of redefinition for easy listening.

Two distinct waves of defection by instrumental mood-music stations occurred, and each was precipitated by advertising industry pressures for stations to deliver younger, more upscale listeners. The first wave, in 1982-83, swept through the major markets. Where multiple easy listening outlets had once competed, now the lower-rated easy listening stations moved in other programming directions. Some of these stations subtly shifted toward soft AC, excising the instrumental music in favor of full-time vocals. Others pursued ratings success with entirely different formats. A second wave of abandonment occurred in 1988-89, when most of the remaining stations vacated easy listening. Traditional, "standards"-inspired instrumental music virtually disappeared from the airwaves.

The descriptive phrase *easy listening* became more indefinite in the radio lexicon of the 1990s, subsuming not only soft AC but the new age and smooth jazz genres as well. An emphasis on announcer personality and other formatics (sports play-by-play, traffic reports, and promotions) aligned easy listening with other mainstream music formats more closely than ever. As format fragmentation increased during this decade, the phrase *easy listening* generally gave way to variations on the soft AC theme.

The Edgar Bergen and Charlie McCarthy Show

Comedy Variety Program

Although few would have guessed it when the program first appeared on the air, a ventriloquist act became one of radio's longest-running comedy shows. The creation of Edgar Bergen, the smart aleck Charlie McCarthy character soon had the country in stitches.

The hour-long variety broadcast show was a highly popular format in the mid-1930s, and ventriloquist Edgar Bergen knew that his 17 December 1936 guest spot on Rudy Vallee's *The Royal Gelatin Hour* was a chance to break away from the uncertainties of nightclub engagements, party entertainment jobs, and a declining vaudeville circuit. Newspaper radio pages puzzled over Vallee's decision to "waste" airtime on an act that seemed to require being *seen*, and program insiders had even stronger doubts. However, Vallee asked his audience to give the newcomer a fair hearing, and top-hatted Edgar Bergen and his dummy, Charlie McCarthy, were so successful that they stayed for 13 weeks.

On 9 May 1937, the shy ventriloquist and his brash alter ego began hosting the National Broadcasting Company's (NBC) *The Chase and Sanborn Hour* on Sunday evenings at 8:00, one of radio's most desirable time slots. The Bergen-McCarthy program would see changes of title, length, personnel, sponsorship, and emphasis over the next two decades, but it would remain among the highest-rated of all programs until the summer of 1956, when network radio was rapidly yielding audiences to television.

Chase and Sanborn's program budget could afford a parade of Hollywood guest stars and the weekly services of singers

Dorothy Lamour and Nelson Eddy, conductor Werner Janssen, and emcee Don Ameche. In the second half of each program, mischief-making Charlie McCarthy mocked W.C. Fields for his drunkenness and crabbiness. Volleys from the McCarthy-Fields feud are among the best-remembered lines in radio comedy—for instance, Fields' threat to whittle Charlie into a set of venetian blinds and the dummy's punning response, "That makes me shutter." On 12 December 1937, Mae West sent a shiver through the sponsor and network ranks when her sultry reading of an Adam and Eve sketch on the show drew widespread protests. More happily, the program pioneered remote broadcasts from military installations, and in 1939 Bergen introduced his second radio dummy, cheerfully slow-witted Mortimer Snerd.

Becoming a briskly paced half-hour show in January 1940, the retitled *Chase and Sanborn Program* lost regulars Ameche and Lamour and placed renewed emphasis on Bergen's and his dummies' interplay with guests such as Charles Laughton, Carole Lombard, Clark Gable, and Errol Flynn. Ray Noble led the orchestra, and, in sketches exploiting the differences between British and American English, he often rivaled Mortimer Snerd in comic "dumbness"; Bud Abbott and Lou Costello offered variations on their "Who's on first?" routine. In 1944 Bergen added a third dummy, aging and man-hungry Effie Klinker, who, when asked if she had anything to say to the listeners, blurted out her telephone number to any interested male. The lineup of celebrity guests halted in 1948 when Chase and Sanborn prepared to drop its sponsorship. In a transitional phase,

Don Ameche returned with Marsha Hunt for a recurring segment as the eternally at-odds couple, the Bickersons.

Moving to the Columbia Broadcasting System (CBS) in 1949 as a result of William S. Paley's "talent raid" on NBC, *The Charlie McCarthy Show* continued to adjust to rapid changes in radio and in the sociopolitical climate. Called *The Edgar Bergen and Charlie McCarthy Show* in 1954 and *The New Edgar Bergen Hour* in 1955, Bergen's program now emphasized citizenship in a larger world by inviting scientists, professors, as well as military, political, and diplomatic figures to discuss their careers. Bergen and his friends vacated their regular time slot on 1 July 1956, and except for appearances on his first sponsor's 100th and 101st anniversary programs in 1964 and 1965, Edgar Bergen's radio career had ended. He went on to host a television quiz show in 1956 and 1957. Bergen died in his sleep in 1978 after the third Las Vegas performance of a planned farewell nightclub tour. Charlie McCarthy, who once had his own room in Bergen's Beverly Hills home, is now housed in a Smithsonian Institution display case.

In its early years, the Bergen-McCarthy program prompted an avalanche of Charlie McCarthy books, dolls, spoons, radios,

and other products. In most radio households, the show was the measure of Sunday evening family listening, yet Charlie McCarthy's leering attentions to female guests challenged propriety, and today the show's stereotypic treatment of W.C. Fields' drinking, Effie Klinker's "old maid" status, and Mortimer Snerd's good-natured rural stupidity would draw protests from many quarters. Still, the Bergen-McCarthy shows remain among the most popular in "old-time radio" circulation.

In retrospect, Bergen's success lay in his decision to build his act on a cluster of ironic impressions. Opposing the hard-times grain of the 1930s, Bergen and Charlie wore elegant evening clothes, and Charlie's monocle and upper-crust English accent gave an initial impression that was startlingly at odds with his earthy brashness. Charlie assumed the calculating speech rhythm of the schoolyard sharpie, and he wasted little respect on his elders, particularly the sometimes preachy Bergen: "I'll clip ya', Bergie, so help me, I'll mo-o-ow ya' down!" was Charlie's signature threat. Bergen sometimes flubbed his lines, but cocky Charlie rarely did. Charlie often ridiculed Bergen's lip movements and complained that his creator had grown wealthy by stinting on the boy's allowance. Thus Charlie

seemed to have the upper hand and the last word, but all the while Bergen's hand and mouth animated the creature of wood and cloth. The two were sharp opposites, yet one was entirely the creation of the other.

Editorializing

Expressing a Station's Point of View

The broadcast of editorials by radio stations has enjoyed an uneven history for both legal and economic reasons. Although legally allowed since 1949 and actively encouraged by the FCC in later years, most stations rarely editorialize on any issue.

An editorial is the expression of the point of view of the station (or network) owner or management. News commentary, in which a single newscaster expresses an opinion about one or more news events, is not an "editorial," because that individual is rarely understood to be speaking for management. The parallel to newspapers is apparent—the editorial page matches what is addressed here, whereas the "op ed" page offers other (and sometimes disagreeing) individual expressions of opinion.

Origins

Many stations took to the air in the 1920s and 1930s specifically so that their owners could express their points of view on one or more controversial issues. Indeed, some early stations that became subject to Federal Radio Commission (FRC) sanctions got into trouble because of their one-sided approach to religious or political issues. Early administrative FRC and court decisions made clear that stations—as part of their requirement to operate in "the public interest, convenience or necessity"—should provide a balanced program menu, allow-

ing a variety of points of view to be expressed. Nothing specific was said about whether or not stations could editorialize in the first place.

At the network level, editorializing was frowned upon in the 1930s. Although "comment" was fairly common among newscasters, and some programs of news "commentary" were common by the late 1930s—indeed, the role of news commentator became more widely recognized—such programs did not express the editorial opinion of network or station management and were thus not looked at in the same way by the regulators.

The *Mayflower* Case

Any question about the legality of station editorials was removed by the *Mayflower* case in 1941.

The Yankee Network's WAAB in Boston had presented editorials in 1937-38. This became a matter of legal concern in 1939, when the *Mayflower* Broadcasting Corporation (one of whose owners was a disgruntled former WAAB employee who felt stations should not editorialize) applied for the same frequency, throwing the stations into a comparative hearing before the FCC as required by provisions of the 1934 Communications Act. When the commission initially dismissed the *Mayflower* application for unrelated reasons, the company asked the FCC to reconsider based on the editorializing ques-

tion. Early in 1941 the FCC issued its final decision, which, while upholding the renewal of WAAB's license, made clear that "a truly free radio cannot be used to advocate the causes of the licensee. . . . the broadcaster cannot be an advocate." The commission argued that given the limited number of frequencies available (and thus the number of stations that could broadcast), each licensee had to remain impartial. In using a public resource (its frequency assignment), a station took on the responsibility of being open to expression of all points of view, not merely its own. Because WAAB had ceased editorializing in 1938 when the FCC questioned the practice, its license was renewed.

Perhaps surprisingly, given broadcasters' fierce defense of their First Amendment rights, there was little industry complaint about the decision. Indeed, many broadcasters were secretly relieved that the FCC had eliminated the editorial option, because they knew that no matter what was said, any editorial could make listeners and advertisers unhappy. As stations grew to depend more on commercial support, avoiding controversy became ever more important.

Encouraging Editorials

Only after World War II did the issue arise anew. Early in 1948 the FCC held eight days of hearings on the question of stations' editorializing and dealing with controversial issues. From those hearings came a mid-1949 decision allowing editorials, in effect reversing the *Mayflower* ban. As the commissioners put it, "We cannot see how the open espousal of one point of view by the licensee should necessarily prevent him from affording a fair opportunity for the presentation of contrary positions." Little did anyone see at the time how this decision—which allowed but did not actively encourage editorials—would lay the groundwork for the hugely controversial fairness doctrine in years to come.

Eleven years later, the commission became more positive, including "editorialization by licensees" as the 7th of 14 specific program types held to be in the public interest. More stations began to offer at least occasional editorials, with some larger outlets hiring dedicated staff for the purpose. But the majority of stations never editorialized, and many others did so only infrequently. For a number of years, *Broadcasting Yearbook* kept track of the number of stations providing editorials. Of AM stations reporting (including most but not all of those then on the air), 30 percent editorialized in 1959, and six years later, 61 percent did, though nearly half of those did so only occasionally.

One indicator of the (temporary, as it turned out) growth of station editorializing was the formation of the National Broadcast Editorial Association (NBEA) in the early 1970s. The association grew to more than 200 members (usually the edito-

rial director of a station); issued a quarterly publication, the *NBEA Editorialist*; and held annual conventions. One of the better-known station editorial directors was Don Gale, of the KSL stations in Salt Lake City, who over two decades broadcast some 5,000 editorials before his 1999 retirement. Each was broadcast three times a day on radio and twice on television. Ed Hinshaw at Milwaukee's WTMJ and Phil Johnson at WWL in New Orleans wrote or broadcast editorials for both radio and television for more than a quarter century.

By 1977 fewer stations reported editorializing activity, and most of those were only doing occasional editorials. A 1982 study identified more than 1,200 stations editorializing, many of them AM-FM-TV combinations. But later surveys suggested that the number was both much smaller and in decline. In September 1991 the NBEA was absorbed by the National Conference of Editorial Writers, most of whose members worked for newspapers.

The decline in station editorials after about 1980 was driven largely by economics. Increasing competition for advertising dollars and the need not to make potential clients irate certainly contributed. The demise of the fairness doctrine in 1987 probably contributed as well. So did the general demise of radio news and public-affairs programming on many stations. Because most focus on music, radio stations no longer compare themselves to newspapers in their community role. With that change in identification came the demise of editorializing.

Education about Radio

Developing University Curricula and Degrees

One measure of a topic's social importance or role is whether colleges and universities conduct research and offer courses (or even degrees) concerning that subject matter. Such academic recognition becomes a touchy question when the topic is largely commercial and enjoys a popular following—as did radio broadcasting by the mid-1920s. The study of mass communication was initially shaped with the first academic programs in newspaper journalism in the early 20th century. Radio broadcasting, however, presented something quite different with its emphasis on popular entertainment.

Origins

Perhaps ironically, the first Ph.D. dissertation on radio broadcasting was published as a book long before college or university organized studies of radio existed. Hiram Jome's *Economics of the Radio Industry* (1925) was based on the author's economics doctorate earned at the University of Wisconsin. Two years later, Stephen Davis' *The Law of Radio Communication* (1927) inaugurated yet another field of serious study, again long before most law schools offered courses on the subject. A series of lectures by radio leaders was delivered as part of a business policy course at the Harvard School of Business in 1927–28 (the lectures appeared as a book), and the first regular course about radio was organized in 1929 at the University of Southern California.

Soon additional scholarly apparatus became evident. The first scholarly journal article concerning radio appeared on the pages of the *Quarterly Journal of Speech* in 1930, when Sherman Lawton discussed principles of effective radio speaking. Two years later he expanded that article into the first college-level textbook on radio, *Radio Speech*. Initial courses began to appear elsewhere, usually within English or speech departments. By 1933 an early survey showed that 16 colleges and universities offered at least one radio course. In 1937 the first comprehensive radio textbook appeared, which would run through four editions over the next two decades—Waldo Abbot's *Handbook of Broadcasting*.

The pace of development speeded up in the final years before World War II. By 1938 another survey showed that more than 300 institutions offered at least one course in radio. Furthermore, eight now offered a bachelor's degree and two offered a master's degree; in 1939 the Universities of Iowa and Wisconsin began offering a Ph.D. with an emphasis in the study of radio broadcasting. By 1939–40 some 360 schools offered about 1,000 courses in 14 different subject categories (including electrical engineering, which was the majority), of

which the most common non-technical topics included radio speech, a survey course, scriptwriting, and program planning/production.

Postwar Expansion

Broadcast education entered a period of substantial growth, and there was a concerted movement to develop standards, if not actual accreditation, for degree programs in radio (and soon television). In 1945 one committee published a brief set of suggested standards for radio degree programs. By 1948 a government survey reported that more than 400 schools provided at least a single radio course, with 35 offering non-engineering degrees in radio broadcasting. However, not everything was in place as television began to make its appearance.

It is often said that a true academic field of study needs at least one national (or international) association of like-minded scholars and a research journal. In 1948 a step was taken toward the first of these with the creation of the University Association for Professional Radio Education (UAPRE), founded by about a dozen universities. The title reflected a tension evident in education for radio—were such courses and degrees designed primarily to turn out personnel for the industry, or was this media education to be more in the liberal arts tradition? UAPRE was set up specifically to accredit university and college degree programs, but it was unable to achieve that goal, though for reasons having nothing to do with radio but rather with the complex politics of establishing any national accrediting process.

By 1950 some 420 colleges and universities offered courses, and 54 provided non-engineering degrees: 30 bachelor's, 15 master's, and 3 Ph.D. Five years later, there were at least 81 course sequences leading to radio/broadcasting degrees. In 1955 the UAPRE gave way to the Association for Professional Broadcasting Education (APBE), which a year later began publishing *Journal of Broadcasting* as the first dedicated scholarly journal in the developing field. A year later a national survey reported 93 bachelor's degree programs (3,000 majors), 56 master's degree programs (over 400 students), and 15 Ph.D. programs of study (122 candidates). Broadcast educators now met annually with the National Association of Broadcasters, and many academics were becoming active in the more senior speech and journalism academic organizations. More scholarships, internships, and research opportunities were becoming available every year.

At that point, of course, all eyes were quite literally on television, and radio courses and research began to disappear. A

handful of announcing courses survived, but most other broadcast programs focused very strongly on television—and given the costs of such education and the lack of student interest in radio, radio studies were fairly quickly abandoned. However, the field was now sufficiently established to move away from a focus on professional education alone. APBE became the Broadcast Education Association (BEA) in 1973, thereby better recognizing the many liberal arts broadcast programs that had developed.

Radio's Revival

In the 1980s radio began to reappear in college and university curricula. This was due to a combination of factors, first in the industry and then in education.

Certainly the growing number of radio stations (with their entry-level positions for college and university graduates) was a factor. So was the revival of educational and public radio beginning in the 1970s and the reappearance of radio drama documentary broadcasts. The growing complexity of radio formats added a degree of depth to the medium that it had not previously possessed: there was more to study and understand than before. As audience and market research became more widespread and important in radio, people had to be educated in these areas. The explosive popularity of talk radio in the 1980s put radio in the political limelight. Radio was increasingly in the news: with controversial disc jockeys and talk show hosts having impact on elections, its appeal to young people as a possible career option increased exponentially. At the other end of the spectrum, growing interest in the “golden age” of radio increased interest in the history and sociology of radio. As in other parts of American life, more women and minorities were being employed by radio, opening further paths to success in the medium. Technology played a growing role as well, as the radio industry became increasingly computerized and automated, made plans to begin digital operations, and became more widely available on the internet.

Just as radio managers seemed to place more emphasis on the educational credentials of those trying to enter the field, colleges and universities seemed to rediscover radio as well. There were several indicators, including the reappearance of radio-only comprehensive and production-oriented textbooks, the new *Journal of Radio Studies* founded as an annual in 1992 and expanding to twice a year by 1998 (as the first academic journal focused on radio), and the (perhaps belated) formation of a broadcast and internet radio division within BEA

in 2000. Radio began reappearing in course titles in university programs across the country, coming full circle seven decades after the academic discovery of the medium.

Educational Radio to 1967

Well before radio broadcasting became an entertainment and sales medium, it was used for education. When Charles D. Herrold started the first radio broadcasting station in the United States in 1909, it was largely intended as a laboratory for students of the Herrold School of Radio in San Jose, California. When Lee de Forest, also in the first decade of the 20th century, tested his firm's radio apparatus using recordings of opera and other classical music, it was partly to introduce others to the music he loved.

There has been conflict from the early 1920s until the present between those who believe there is a need for nonprofit educational broadcasting and those who do not. For example, many commercial broadcasters believe that the frequencies occupied by noncommercial educational radio might be better employed for advertising. On the other hand, although its potential has never been fully realized, educational radio—like the internet—has such high potential that its use for education attracted many enthusiastic supporters.

This conflict is pervasive. In the late 1920s, the Federal Radio Commission (FRC) encouraged shared-time broadcasters to persuade educational institutions to give up their licenses. In the early 1930s, the Wagner-Hatfield Amendment was proposed to reserve channels for nonprofits. In 1941 channels were first set aside or reserved for education on the new FM band. In 1946, when the Federal Communications Commission (FCC) issued its "Blue Book" (*Public Service Responsibility of Broadcast Licensees*), it called upon commercial stations to cater to the needs of nonprofit organizations. However, the storm of protest from commercial stations about the "Blue Book" buried this idea at the time.

But although the record shows that educational radio has often been impressively effective in schools and adult education, it frequently was underappreciated. Educational broadcasting was cavalierly dismissed for decades, even though it was originally touted as a great advance. For decades, arguments in favor of a separate educational radio service relied on an analogy with the public service philosophy of agricultural extension intrinsic to the land grant colleges.

Origins: 1920–33

Indeed, one land grant institution, the University of Wisconsin, owns WHA, one of the oldest radio broadcasting stations in the United States. Land grant colleges were interested in outreach—the extension of their expertise to isolated regions. As a result, they first used radio both to provide lectures on topics of more or less general interest and to give specific information on topics intended to serve citizens of their state, such as agriculture and home economics. A few tried to use

radio for fund raising in the early 1920s, with very limited success.

A number of stations were merely the tangible results of experiments by engineering and physics faculty and students (such as Alfred Goldsmith, who operated 2XN at City College of New York, 1912–14) who wished to explore the phenomenon of wireless telephony. However, once they had tinkered to their heart's content, the daunting need to find content for their transmissions led, in many instances, to these stations' being turned over to departments of speech, English, music, and extension services. Another reason for this transfer was that the cost of programming, once the technical facilities met the FRC's standards, was a major expense.

Even before World War I, radio telegraph and some radio telephone experimentation had taken place at such colleges and universities as Arkansas, Cornell, Dartmouth, Iowa, Loyola, Nebraska, Ohio State, Penn State, Purdue, Tulane, and Villanova, in addition to Wisconsin. After stations were allowed back on the air in 1919 following the war, regular broadcasting service was started by many of these and others either for extension courses or strictly for publicity.

By 1 May 1922, when the number of radio stations was beginning a meteoric rise, the Department of Commerce's *Radio Service Bulletin* reported that more than 10 percent (23 of 218) of the broadcasting stations then on the air were licensed to colleges, universities, a few trade schools, high schools, religious organizations, and municipalities. This proportion soon climbed, with 72 stations (13 percent) licensed to educational institutions among the 556 on the air in 1923, and 128 (22 percent) of a similar total (571) in 1925.

Although early records are imprecise—noncommercial AM stations were issued the same type of license as commercial ones—many of these stations were short-lived. Not only did it appear that there was no pressing need for educational radio, but other factors pared the number on the air from 98 in 1927 (perhaps 13 percent of all stations) to half that (43, or 7 percent) in 1933. Although nearly 200 standard broadcast (AM) stations were licensed to educational institutions through 1929, almost three-quarters were gone as early as 1930. The 47 stations that remained, however, were tenacious—and roughly half of them continued to serve their audiences at the beginning of the 21st century.

The number of both commercial and noncommercial stations dropped in the late 1920s, largely because of the expensive technical requirements imposed by the FRC under the Radio Act of 1927. Additionally, the FRC's 1927–29 reallocations and elimination of marginal and portable stations often gave desirable channels to commercial operators at the expense of educational institutions. The costs of new interfer-

ence-reducing transmitters and other facilities were imposed just prior to the economic dislocations of the Great Depression—which dried up funds for colleges and commercial companies alike.

In addition, many university administrators saw no value in radio. At best, running a radio station, except where it also served curricular needs or could be used effectively by agricultural extension services, seemed to be a lot of work and expense for limited reward during tough times. Many institutions appeared glad that the FRC's new rules gave them an excuse to drop this expensive toy. This lack of interest closed many educational stations.

Into the 1930s, some educational stations found themselves pressured by local shared-time broadcasters to give up their frequencies for full-time use by commercial stations. To sweeten the deal, commercial broadcasters often offered to air some educational programming. Because commercial stations had more lobbying clout and deeper pockets and, in many cases, appeared to be more stable, closing down educational stations sounded very attractive to policy makers. It also sounded good to timid college administrators who didn't recognize the benefits of using radio for teaching, tended to allocate funding in other directions, and found commercial offers a "win-win" choice—until the promised educational programming was crowded out by advertising-supported programs.

A hard core of educational broadcasters successfully claimed that their stations were serving both the public interest and the interests of their parent institutions. But where there were not enough trained and interested personnel to argue for retention and financial support, many college and university stations no longer had an educational mission—nor, usually, a license.

Concern for their dwindling numbers and interest in ways of using radio effectively led radio educators to band together. In mid-1929, the Advisory Committee on Education by Radio was formed with backing from the Payne Fund, the Carnegie Endowment, and J.C. Penney, but it died before 1930 without having had much effect. In 1930 two rival organizations that would represent educational radio for a decade were organized: the National Advisory Council on Radio in Education and the National Committee on Education by Radio. The council worked with grants from the Rockefeller Foundation and the Carnegie Endowment and called on commercial stations to meet education's needs. The committee, with support from the Payne Fund, asked that nonprofit educational entities be given 15 percent of all station assignments—which would double the number of educational stations; the committee also attacked "commercial monopolies" and disagreed with what it called the "halfway" measures of the council.

One result of the proselytizing by both organizations was a Senate-mandated 1932 FRC survey of educational programs on both commercial and noncommercial stations. Having care-

fully timed their survey for National Education Week, when most stations scheduled some educational programs, the FRC concluded that commercial stations were adequately filling educational needs. Congress was not completely convinced, and Senators Wagner and Hatfield sponsored an unsuccessful amendment to the 1934 Communications Act allocating 25 percent of broadcast facilities to nonprofit organizations. After this failed, another dozen of the remaining educational stations began to take advertising in 1933 to meet operating costs and to cover American Society of Composers, Authors, and Publishers (ASCAP) music licensing fees.

The campaign for a set-aside of channels for education continued, resulting in Section 307 (c) of the Communications Act of 1934, which told the new Federal Communications Commission to "study the proposal that Congress by statute allocate fixed percentages of radio broadcasting facilities to particular types or kinds of non-profit radio programs or to persons identified with particular types or kinds of non-profit activities." The FCC held extensive hearings—100 witnesses, 13,000 pages of transcript—in the fall of 1934 and (as might have been anticipated) recommended against reservation of frequencies, for educator cooperation with commercial stations and networks, and for the establishment of another committee.

The resulting Federal Radio Education Committee (FREC) was originally composed of 15 broadcasters; 15 educators or members of groups such as the Parent-Teacher Association; and 10 government officials, newspaper publishers, and others, and it was headed by U.S. Commissioner of Education John Studebaker. "Broadcasters" ranged from network heads to the National Broadcasting Company's (NBC) music and education directors. The committee's purposes were to "eliminate controversy and misunderstanding between groups of educators and between the industry and educators" and to "promote actual cooperative arrangements between educators and broadcasters on national, regional, and local bases." A "subcommittee on conflicts and cooperation" was to try to deal with any friction between "the commercial and the social or educational broadcasters."

Holding On: The 1930s

FREC operated a script exchange (used by 108 stations and a large number of local groups in its first full year) and planned 18 major research projects so it could make valid recommendations. Funding—roughly two-thirds from educational foundations and one-third from the broadcasting industry (through the National Association of Broadcasters)—did not live up to expectations, and roughly half of the projects had to be dropped. Although some useful publications, a supply of standardized classroom receivers, and a great deal of script distribution resulted, the FREC actually held only one full meeting. It disbanded after World War II. Nevertheless, for more than

three decades, most educational broadcasters looked to the U.S. Office of Education, headed by Franklin Dunham and Gertrude Broderick, for coordination, sympathy, and low-cost practical assistance.

Because there were then no educational networks of any sort, the exchange of scripts was the best way to give educational stations and their audiences access to programming prepared by others. Beginning in early 1929, the Payne Fund supported daily *Ohio School of the Air* broadcasts on powerful commercial station WLW in Cincinnati. These programs, intended for in-school listening, were produced in the studios of WOSU, then and now licensed to the Ohio State University in Columbus. The Ohio state legislature appropriated money to partly cover production costs, teacher guides, and pupil materials. Later, WOSU, in the center of the state, became the primary transmitter of this program. Another early educational series for below-college-level classroom listening was the *Wisconsin School of the Air*, which began on university-owned WHA in the fall of 1931. WHA started a "College of the Air" two years later.

During radio's "golden age" from 1934 until the end of World War II, educational radio survived—but barely. The 43 educational AM stations on the air in 1933 dropped to no more than 35 by mid-1941. Roughly half had been on the air more than 15 years, 12 were commercially supported, and 7 of these were affiliated with a commercial network, airing educational programs only a few hours a day. One was operated by a high school, 2 were operated by church-affiliated educational groups, 9 by agricultural schools or state agricultural departments, and 11 by land grant universities, mostly in the Midwest. Only 11 stations were licensed for unlimited broadcast time, about half of them in the 250- to 5,000-watt category.

Commercial stations and national networks regularly scheduled some avowedly educational programming. In the 1920s, commercial broadcasters started "radio schools of the air," lectures, and even courses for credit. WJZ (New York) began such broadcasts in 1923, WEAJ (New York) followed, and WLS (Chicago) started its *Little Red Schoolhouse* series in 1924. Such programs, often in association with school boards, were long-lived and useful to the stations' images. For example, WFIL (Philadelphia) aired the *WFIL Studio Schoolhouse*, a series of daily radio programs, complete with teachers' manuals, in the mid-1950s. The *Standard School Broadcasts* (Standard Oil Company) were broadcast over a number of California stations into the 1960s.

A 1928 FRC study of 100 stations in the western United States had found that radio was supplying more features and more plays but fewer children's programs and less educational material than three years earlier. The study also found that, of the 54 hours that the average station was on the air each week, 5 were devoted to education and lectures other than on farm subjects, and 3 hours were on farm reports and talks. FCC hear-

ings in 1934 contained testimony that networks and larger stations were more cooperative with educators than were small and independent stations. Although the amount of such programming did not rise appreciably over the next two decades, neither did it fall until most commercial radio adopted all-music formats in reaction to the success of television in the 1950s.

Educational programming tended to be of three kinds: classroom instruction in English, history, social studies, and other disciplines, intended for classes from kindergarten to college; extension study, typically in fields that would be useful to the state or region being served, such as detailed agricultural practices and marketing news; and general cultural programs, such as classical music, which were inexpensive to produce.

Few stations of any sort produced dramatic programs, because the need for proven stories, talented performers, and special skills (such as sound effects) tended to require a major investment in time as well as money. College football and baseball games were often carried on college stations—at least until they became popular enough that more-powerful commercial stations offered to carry them. One potential audience given special attention by nonprofit stations was children, with programs of all types from stories and games to health instruction.

But the failure to provide an adequate number of channels on the AM band for education was not forgotten. National organizations continued to agitate for an adequate number of channels or to coordinate the efforts of existing stations. These groups included the FREC, the National Advisory Council on Radio in Education, the Institute for Education by Radio, the National Association of Educational Broadcasters (NAEB), and the National Committee on Education by Radio.

The Institute for Education by Radio was established at the Ohio State University in 1930 by I. Keith Tyler, and it hosted annual practitioner conferences on educational radio until 1960. Its published proceedings are a good source of contemporary thinking about what radio was doing for education—and might still do with sufficient support.

The NAEB was founded in 1934, but it traced its lineage to the Association of College and University Broadcasting Stations, established during the rush to get education on the air in 1925. NAEB was primarily a program idea exchange during the period up until World War II, but some of its 25 members also experimented with off-the-air rebroadcasting.

The National Committee on Education by Radio, mentioned earlier, worked hard for allocation of educational channels and sponsored annual conferences from 1931 to 1938, when its Rockefeller Foundation funding ended. One of the committee's more interesting initiatives was to help establish local listening councils—groups of critical listeners who would work with local broadcasters to improve existing programs and plan new ones.

In an attempt to secure educational channels without stepping on the toes of commercial broadcasters, the National

Committee on Education by Radio proposed that new educational stations be assigned to channels in the 1500–1600 kilohertz range, just above the standard (AM) broadcasting band of the time. These stations, however, typically would have had less range than those on lower frequencies and would have had to purchase new transmitters and antennas in many instances. Furthermore, there was no way of ensuring that receivers would be built that could pick up this band. As a result, most educators had little enthusiasm. (These frequencies eventually had limited use for high-fidelity AM experimental broadcasting, using 20-kilohertz-wide channels. In March 1941 they were added to the regular AM band.)

Early in 1938, the FCC reversed its earlier position and established the first specific spectrum reservations for noncommercial broadcast use, in the 41- to 42-megahertz band. After the FCC set aside 25 channels for in-school broadcasting, the Cleveland Board of Education was licensed (as WBOE) in November 1938. The next year, this allocation was moved to the 42- to 43-megahertz band, and the broadcasters using it were required to change from AM to the new frequency modulation (FM) mode of modulation. The first noncommercial educational FM stations were authorized in 1941. Because FM required a much wider bandwidth, this allocation provided only five channels, on which two fully licensed (and possibly five experimental) stations were transmitting to radio-equipped classrooms by late 1941. When commercial FM went into operation, education was assigned channels at the bottom of the overall band, which were fractionally easier for listeners to receive than higher ones. The interference-free reception and high audio fidelity of FM initially were very attractive, and half a million sets were sold before all civilian radio manufacturing was ended by the demands of World War II.

Postwar Rebirth: To 1967

This opportunity to establish new educational stations was welcomed. Although the wartime construction “freeze” of 1942 exempted educational broadcasting stations, scarcity of construction materials and broadcast equipment—together with the slow decision-making processes of educational institutions—meant that educational FM broadcasting at the end of the war in 1945 consisted of about 25 AM stations, plus 12 FM authorizations and 6 FM stations on the air. Nevertheless, many potential educational broadcasters used the war years for planning, realizing that finally, after more than a decade of talking about educational radio, they had the means to accomplish it.

But there were complications. In 1945 the FCC shifted the educational FM allotment to 88–92 megahertz, at the bottom of a new FM band. Because only a handful actually had to replace transmitters, this change was reluctantly accepted. The number of noncommercial educational FM stations grew sub-

stantially after World War II. Although these data are not completely reliable, it appears that there were 10 such stations on the air at the start of 1947 and 85 by 1952, 14 percent of all FM stations then on the air. The number kept rising and the proportion remained respectable: 98 in 1953, 141 in 1958, 209 in 1963, and 326 (16 percent) on 1 January 1968.

Perhaps chastened by earlier experiences with educational AM radio, institutions of higher education, school districts, and nonprofit community groups were initially hesitant to apply for FM licenses. Apart from past disappointments, high costs, and the need for colleges and universities to earmark resources to serve the millions of postwar students, potential operators were wary of the continuing paucity of homes with FM receivers and the possible effects of another new medium, television.

Late in 1948 the FCC, recognizing the burdens of high cost and the limited or campus-only uses planned by some colleges, approved a new class of 10-watt stations. These low-power FM stations were immediately popular and constituted more than one-third of the 92 educational FM stations on the air in 1952.

Audio tape recording’s potential was first realized by Seymour Siegel of WNYC in 1946. Recording also made it possible to reuse programs; for example, one station was still rebroadcasting some 1945 children’s programs in the 1990s—and they still were attracting youthful audiences. In 1951 the Kellogg Foundation provided funds to NAEB to establish a tape duplication operation at the University of Illinois, Urbana, to facilitate a non-interconnected “bicycle network” by which tape recordings of one station’s programs were mailed to other stations in succession. Soon, more than 40 stations were participating. The NAEB Tape Network was made possible by the postwar introduction of high-fidelity magnetic tape recorders, which replaced clumsy and fragile 15- or 16-inch transcription discs.

However, some postwar regional or statewide FM networks were established, as in Alabama and Wisconsin. In the latter, eight stations provided a full day’s programming to schools, colleges, and adults in most of the state. The National Educational and Radio Center, established in Ann Arbor, Michigan, in 1954 and later moved to New York, eventually started providing some taped radio programs through a subsidiary. At least one independent group of noncommercial stations, affiliated with the Pacifica Foundation, still operates stations across the country; another, the KRAB Nebula, organized by Lorenzo Milam, was more ephemeral.

Many educationally licensed stations programmed a great deal of classical or folk music and jazz, which were timeless and inexpensive. While education, music, and talk programs were generally inexpensive, news coverage was not, and educational radio therefore played a fairly minor role in the listening habits of most members of radio’s audience into the 1960s.

During the period up to 1967, educational radio remained an orphan in many ways. Although given general support in

regulatory matters by the FCC and Congress, funding was a perennial local problem. Studies of educational radio usually arrived at the obvious conclusions that money and a national rather than strictly local image were needed. On a local level, some educational radio stations served the public interest economically and well. Some acted both as training laboratories—for example, municipally owned WNYC trained interns from colleges across the country, and its sister station, WNYE, used high school students to create programs for schools throughout New York City—and as sources of a wider variety of programming for the many people who were not well served by the commercial radio broadcasting industry. Although not the first to lobby, the 1966 Wingspread Conference on Educational Radio as a National Resource came at the right time to argue for federal funding for radio, a proposal that succeeded in including radio in the 1967 Public Broadcasting Act. This provision of some facilities and program funding through the Corporation for Public Broadcasting and NPR after 1967 gave educational radio a very different look.

Edwards, Bob 1947–

U.S. Radio Host

As the solo host of *Morning Edition* since its first broadcast in 1979, Bob Edwards has shaped the sound of National Public Radio (NPR) in the morning. He has captured the morning news audience that was largely abandoned by commercial outlets and built a loyal weekly listenership of more than 12 million.

Edwards is a man of contradictions. He has won most of the major awards in broadcasting, but he likes to say that his job security lies in the fact that no one else wants to work his hours. He's an elected union official who insists on every nickel in a contract, yet he spends weeks each year on the road raising money for public radio stations.

Edwards came to NPR in 1974 as a newscaster. In a matter of months, he was chosen to cohost *All Things Considered* (ATC). Susan Stamberg, who shared the microphone with Edwards for five years, says he made up for his limited experience with clear writing and "that terrific voice."

Edwards actually came to the job with a background in commercial radio; he worked first at WHEL-AM in New Albany, Indiana, and then as an anchor and newscaster for Armed Forces Radio and Television when he was in the Army in Korea. After the army, Edwards moved to Washington, D.C., where he worked as a part-time anchor for WTOP-AM while earning a master's degree in communication from American University. At American University, he absorbed the gospel of Edward R. Murrow-style journalism from Ed Bliss, Jr., a former newswriter for Murrow at the Columbia Broadcasting System (CBS). Bliss passed on Murrow's insistence on active, uncluttered language and his love of sound in telling the story.

Susan Stamberg says that Edwards had a very old-fashioned news style when he came to NPR but that he made her "understand the greatness of Edward R. Murrow." She says Edwards' understated style provided a good balance for her exuberance: "His coolness permitted me to be hotter." Edwards says he learned to be like the straight man in a comedy team, a skill that served him well later in his 12-year broadcast relationship with Red Barber.

Edwards' tenure on ATC came during the years that Frank Mankiewicz ran NPR and began seriously marketing it. "There was a lot of buzz," Edwards says. "That was the point at which people started taking us seriously as a news source."

Edwards and Stamberg felt mildly threatened in 1978 when the network began planning for a morning program. NPR's news resources were stretched thin already, and the ATC hosts weren't anxious to share reporters and production help with a rival that got on the air before they did. They were relieved when, after a year of planning, the first *Morning Edition* pro-

duction team came up with a pilot that was laughably bad. It was chatty and sounded, says Edwards, like "a bad talk show in a small market." The network had already promoted the new show heavily to program directors at member stations, so it had to come up with something. Management fired most of the first *ME* team, recruited producers from other NPR shows, and then called on Bob Edwards to fill in as host for 30 days, until someone new could be hired. "Thirty days didn't sound so long," he says, "although it meant getting up each day at 1:00 A.M." By the time the 30 days had passed, it was apparent that Edwards' calm and reassuring presence was a perfect fit to the mood of a morning audience.

Edwards credits producer Jay Kernis with getting him through the early days of the program by crafting a system that could support a single anchor through two hours of news, interviews, and features each day. The system meant scripting as much of the anchor talk as possible and preparing thorough questions for every interview.

Edwards' own interests helped set the show's agenda. He was a sports fan, a relative rarity among NPR staffers, and he warmed to the show's daily sports segments. The need for daily sports features helped bring the show commentators such as Bill Littlefield and Frank DeFord. Most significantly, it brought Red Barber out of retirement to do a four-minute commentary every Friday at 7:35 EDT. As a veteran of more than 50 years in radio, the "Ol' Redhead" had no interest in cranking out a taped segment each week. He wanted a live conversation with the host, a prospect that Edwards found daunting, because the great sportscaster was as apt to talk about philosophy, religion, or raising camellias as about sports. Edwards eventually wrote a book about his on-air friendship with Barber, *Fridays with Red*, saying that the relationship helped him grow in confidence and maturity as a broadcaster.

Edwards' favorite awards show the range of concerns he brings to *Morning Edition*. He won his first Gabriel Award in 1987 from the National Catholic Association of Broadcasters for a story called "Bill of Sale: A Black Heritage," about a Maryland man who assembled a small museum of artifacts from his own family's enslavement, including the record of the transaction in which one of his ancestors was sold as chattel. Edwards won a second Gabriel in 1990 for "Born Drunk," a five-part series about fetal alcohol syndrome. In 1995 he won the Alfred I. duPont-Columbia University Award for "The Changing of the Guard: The Republican Revolution." A highlight of that series was Edwards' interview with Representative Dick Armey of Texas, in which the House majority leader averred that voters would be so happy with Republican leader-

Bob Edwards, host of *Morning Edition*
 Courtesy National Public Radio

ship that the GOP's promise to limit lawmakers' terms wouldn't mean much. The comment caused an uproar among Republicans, who insisted on the promises in the GOP's "Contract with America," and Arney was forced to backpedal. In 1999 *Morning Edition* received a George Foster Peabody award lauding Edwards as "a man who embodies the essence of excellence in radio."

Edwards was on the air the morning of 11 September 2001 when terrorists attacked New York and Washington, D.C. NPR's coverage of events that day earned a George Foster Peabody Award and a duPont-Columbia Award.

Edwards still gets up at one o'clock in the morning. He has to. As Susan Stamberg says, "He's hitched to the nation's alarm clock, and he's the first voice you hear. He's reassuring. I honestly believe that people's days are different when Bob's not there."

Edwards, Ralph 1913–

U.S. Radio Host and Producer

While Ralph Edwards is perhaps best known today for his work in television, his involvement with radio spanned several decades dating back to 1929. He is one of a handful of radio stars that caused a town to change its name.

Early Years

Edwards spent his formative years on the family farm in Colorado. The family moved to Oakland, California when he was 16 and he completed high school there in 1931. He began his broadcast career in 1929, while still in high school, at station KROW in Oakland. The station manager had been impressed with a high school play Edwards wrote and hired him to write scripts for radio—at the munificent pay of \$1.00 per script. He soon took on general announcing (and some acting) duties as well.

Edwards entered the University of California, Berkeley in 1931, and had earned a BA in English by 1935, intent on becoming an English teacher. While in school, however, he kept a hand in radio, working at KTAB in Oakland. Upon graduation, with few jobs available to him in education at that time, Edwards decided to work in radio.

Radio Years

Not finding much in the way of full-time employment in California, Edwards hitch-hiked to New York to try his luck there. He took on various part-time announcing duties in 1936 while living hand-to-mouth. Slowly things picked up. He was soon performing actor duties in several network plays, and in 1938 won a coveted full-time staff announcer's position at CBS, beating nearly 70 rivals. Within a year he was announcing some 45 network programs, mostly daytime offerings, every week, and was said to be one of the busiest announcers in the business.

Over the next several years Edwards would serve as host or announcer on dozens of programs, among them *Vic and Sade*, *The Phil Baker Show*, *Major Bowes' Original Amateur Hour*, *Life Can Be Beautiful*, *The Quiz Show*, and *The Horn and Hardart Children's Hour*. Despite his success as a network announcer and emcee, he was not content (the work was monotonous and boring) and sought greater opportunities.

This move involved his recollecting a childhood game, which in turn led to his creation in 1940 of what would become one of radio's pioneer game shows, *Truth or Consequences*. Edwards sold the idea to the Compton Agency and Procter & Gamble and that package was sold to CBS in

March, setting up his own production firm. Edwards was then 26. The program was the number one audience participation program for the next three years (though now on NBC). Prizes were minor (\$10 or \$15); everyone listened for the silly consequences of the (usually) wrong answers to the questions posed. *Truth or Consequences* was broadcast live until 1948, repeated twice on its Saturday schedule, at 8 P.M. for the Eastern and Central Time Zones, and three hours later for broadcast on the West Coast. Edwards later remembered they used the same scripts but new contestants for the rebroadcast. The program continued to enjoy enormous ratings success for years, becoming a network staple. As Dunning relates, many of the stunts (the "consequences") were highly elaborate, some stretching out for weeks at a time, often including audience participation.

In 1950 the New Mexico town of Hot Springs changed its name to Truth or Consequences in honor of the top-rated radio show. To mark the program's approaching tenth anniversary, Edwards had offered to host an annual celebration in and nationwide broadcast from any town willing to change its name to Truth or Consequences. The Hot Springs Chamber of Commerce spread the news of the offer to advertise the city free of charge. No longer would they be confused with other towns named Hot Springs across the country. A special city election voted by a margin of ten to one to change the name to Truth or Consequences. After a protest by nearly 300 area residents another election saw the votes in favor win by an even greater margin. Edwards kept his promise and aired the first live, coast-to-coast broadcast of *Truth or Consequences* from the newly named New Mexico town. Until the late 1990s, Edwards returned annually to the town of 7,000 people for the name-change celebration Fiesta. (In two later referenda, in January 1964, and again in August 1967, townspeople voted to retain the name. There is even a Ralph Edwards Park.)

In 1948, based on a minor "consequence" of his famous program, Edwards would create *This Is Your Life*, debuting first on radio and eventually enjoying a longer run (1952–61) on television, making Edwards a household name. During his long career, he also made a name for himself through his significant efforts for charity. During World War II, Edwards' formidable work for the War Bond drives won him wide praise, and his later involvement with the American Heart Association and the March of Dimes brought him further accolades.

Later Career

Edwards would enjoy considerable success in the television medium as both a producer and host. Ralph Edwards

Productions became part of Aquarius Productions in 1957 after 17 years as a sole proprietorship operation. After their long network runs, with several different hosts, both *This is Your Life* (1971–72, 1983) and *Truth or Consequences* (1966–74, 1977–78, 1987) were revived for first-run syndication. In 1978 all the Edwards companies (there were a number of them) and programs were merged into Aquarius and renamed Ralph Edwards Productions. That company began to syndicate *People's Court* in 1981.

Election Coverage

Radio Reports of National Campaigns

Elections provided some of the earliest content for the new medium of radio. In 1920, as Westinghouse prepared to issue KDKA's first radio broadcast, they chose to debut with reports of national election results. With a small audience, to whom "simple receiving sets" had been distributed, and advertising placed in the local papers to spark the interest of amateur radio enthusiasts, on the evening of 2 November 1920, the national election returns were broadcast to an audience of perhaps 500 to 1,000 listeners.

The early attraction of radio to politics was not immediately returned in kind by politics, as was evidenced in a comment regarding the 1924 election: "The effect of the election on radio was more important than the effect of radio on the election result" (Chester). However, a dependence on the new medium was soon to follow. Through a historical review of the election coverage on radio, this essay traces the role that radio played in the coverage of political campaigns and the early public dependence on the radio for election coverage.

Early Election Coverage

The first political campaign in which radio played a major role was the 1924 presidential contest. Strategists for President Calvin Coolidge's reelection effort saw the immediate advantages of the medium for "silent Cal," who found radio's requirement of short and simple language more compatible with his own style than the traditional round of presidential candidate stump speeches. One campaign advisor noted, "Speeches must be short. Ten minutes is a limit and five minutes is better" (Chester).

Campaign speeches and addresses by the candidates and other political advocates made up radio's major election coverage in these early days. The Republican Party even purchased their own radio station, on which they broadcast campaign addresses at all available hours in the day. This saturation sparked the Radio Corporation of America (RCA) to suggest that a limit of one hour per day be reserved for political address broadcasting and that such addresses be limited to 15

minutes each. The 1924 election coverage also included the first coverage on radio of the national party conventions. Both the Republican and Democratic conventions were carried to listeners across the nation. Although some political observers were sure that this marriage of radio and elections was a fad, those who predicted that political campaigns would never be the same were closer to the mark.

By the 1928 presidential campaign, 40 million people were able to follow the election campaigns via the radio, which had become an integral campaign tool, so much so that a candidate's "radio personality" was a part of the election dialogue. Republican Herbert Hoover was not an exciting radio personality, but he was credited for not offending his audiences. Democratic opponent Alfred Smith, however, had an accent that tended to alienate voters from the Southern states that he desperately needed to carry. The 1928 campaign also saw the rise in coverage of radio campaign addresses by people other than the presidential candidates themselves. Republicans continued to build on the perceived advantages of brevity in the new medium by creating 30 short speeches that covered the main points of Hoover's campaign. Lasting five minutes each, these were delivered by well-known local people over 174 local stations.

By 1932, with radios in more than 12 million homes, voters witnessed new radio strategies in the presidential campaigns. Franklin Roosevelt established a new precedent in radio address, flying to Chicago to accept his party's nomination prior to the adjournment of the national convention and thus broadcasting his acceptance address by radio from the convention. Other changes in radio coverage evolved during this campaign cycle, with the Columbia Broadcasting System (CBS) and the National Broadcasting Company (NBC) each allotting three periods a week for political addresses and refusing to sell airtime to either party before the parties had officially selected their presidential candidates. During the 1936 campaign, both candidates, Roosevelt and Kansas Governor Alfred Landon, toured the country with many of their speeches broadcast over radio. A unique variation of campaign speeches in the 1936 campaign focused on foreign language broadcasts. Both parties produced radio messages in a variety of languages, with the Republicans using as many as 29 languages in numerous messages varying in length from 100-word spots to 30-minute talks. Although Landon enjoyed many powerful newspaper endorsements, many believe that Roosevelt's victory can be at least partially credited to his effective use of radio during the campaign.

In Roosevelt's last campaign, in 1944, the press noted that Republican nominee Thomas Dewey, then-governor of New York, might be the first real competition Roosevelt had faced in radio performance. It was an unfulfilled prediction; a poll conducted by the American Institute of Public Opinion found

that the attitude Dewey conveyed while speaking on the radio hindered audience approval, further underscoring the need for candidates to understand and develop successful radio communication strategies.

During the 1948 election, Democratic incumbent Truman successfully developed his own approach to radio address. As opposed to Roosevelt's manuscript style of speech preparation, Truman found both success and effectiveness in extemporaneous speaking. Truman embarked on a successful "whistle-stop" tour during the campaign, and by simply and consistently repeating his message throughout the tour, he inadvertently capitalized on the fundamental nature of radio by reaching masses of voters with the same message.

Throughout the 1948 campaign, a larger percentage of President Truman's speeches were covered by local radio stations than were those of Dewey, again the Republican nominee. Whereas about 50 of the incumbent president's addresses were covered by radio, only about 34 of Dewey's were broadcast to voters. Also significant was the fact that most of Truman's speeches carried on radio were broadcast from his whistle-stop tour, giving them a background of excitement and timeliness. The coverage of Truman's speeches was particularly important for him, because the Democratic Party had limited funds to pay for broadcasts. In addition, many of the "whistle stops" where the actual speeches were given did not have local radio stations, and national coverage was essential for his message to reach large numbers of voters. Truman's upset victory was due in part to radio.

In the 1952 election, radio found a mass media partner as television made its first significant appearance in a political election. Although Eisenhower is credited for the first use of presidential televised spot advertising, surveys conducted after the election found that he made his greatest gains on radio (Chester). Nonetheless, the years when radio coverage would dominate elections were over.

Election Advertising

Early in radio coverage of elections, the blending of straightforward coverage and party and candidate advertising in election campaigns was established. By the time of the 1928 election, candidates and parties were routinely purchasing time for the airing of their speeches and messages. Advertising expenditures in 1928 reached \$650,000 for the Democrats and \$435,000 for the Republicans, as radio stations began charging presidential candidates for airtime after they had given their nomination acceptance speeches. However, during the 1936 campaign, Republicans began to run shorter spot advertisements on behalf of Landon, including language-specific spots directed to the minority and immigrant votes.

In the 1944 presidential election, both parties employed short, one-minute radio spots. The Democrats sought to remind voters that they should blame the Republicans for the Depression with quips such as “Hoover depression,” and the Republicans sought to tie the Democrats to the war with slogans such as “End the war quicker with Dewey and Bricker.” Testimonial five-minute spots were also employed by the Democrats, with speakers such as Vice President Henry A. Wallace and vice presidential candidate Truman.

During the 1948 presidential election, Dewey declined the use of five-minute spot announcements, feeling confident that he was ahead in the polls. The Republican national committee instead made use of 30- and 60-second spot ads to urge the people to vote Republican; the Democrats made very little use of spot announcements. Instead, Truman concentrated on reaching the voters through political speeches broadcast from his whistle-stop tour.

With Eisenhower’s introduction of televised political spot ads in 1952, radio advertising began to take a back seat to the advertising dollars spent on television. However, as radio stations grew in popularity and number, candidates began to use the target marketing of certain radio stations to reach particular types of voters. The increasing numbers of radio advertising dollars in presidential candidate budgets in the seven decades from 1928 to 2000 is noteworthy. Radio advertising expenditures topped \$650,000 in 1928, and by 2000 both parties were spending several million dollars each on radio advertising. A major reason for the resurgence of interest in radio advertising in the 1980s and 1990s has been the ability of radio to target increasingly diverse and segmented audiences.

Election Debates

An idea that was ahead of its time, a proposal for the first presidential debate to be broadcast on radio was actually put forth as early as the 1924 election campaign. Two decades later, radio hosted a 1948 Republican primary debate held in Portland, Oregon; the debate was a forerunner to the famous Nixon-Kennedy debates of 1960. The choice of the issue about which both the leading Republican candidates, Thomas Dewey, governor of New York, and Harold Stassen, former governor of Minnesota, were in complete disagreement set the stage for a traditional, non-moderated debate. The debate topic focused on whether the Communist Party should be outlawed in the United States. Stassen took the affirmative, and Dewey supported the negative. Although Stassen entered the debate with a slim lead in the state of Oregon, shortly thereafter (and strongly linked to his performance during the radio broadcast debate), he ultimately lost both his lead in Oregon and the Republican nomination.

The first Nixon-Kennedy debate in 1960 has been considered an important turning point in the presidential election.

The debate aired on both television and radio. Interestingly, although the television appearance both hindered Nixon and fundamentally affected his future campaign strategies, his radio ratings from the debate were notably positive. Not only did Nixon seem to come across far better than Kennedy, but those who *heard*, rather than viewed, the debate chose him as the winner by a substantial margin. Debates before and for many years after 1960 were scarce because of the FCC’s regulatory view that required *all* candidates to be included—or given equal time. This gradually changed in the 1970s and 1980s, leading to almost regular presidential candidate debates.

To this day debates make up a significant amount of the election coverage available to voters, and many debates are covered simultaneously by radio and television stations. However, so much more attention goes to the television medium that radio coverage of debates does not attract much attention in the modern political system.

Assessment of Modern Election Coverage on Radio and Its Impact

From its beginnings as the medium that brought election returns into the homes of Americans in 1920, radio coverage has evolved into a medium whose significance in American political coverage is quite limited. As television supplanted radio in the second half of the 20th century, radio’s role in election coverage maintained some significance only in lower-level elections, in state and local contests where candidates were unable to expend major resources on television coverage.

Exceptions to the general trend of reduced radio coverage of elections can be found at the national level in the aggressive coverage of the National Public Radio (NPR) system and state public radio outlets. The growth in the 1970s of all-news radio stations in some communities also brought a renewed interest in covering election matters in state and local communities. The all-talk radio formats of the 1980s and 1990s also heightened radio coverage of and concentration on political and election matters.

The impact of radio election coverage is not easy to measure. However, by 1944 a Roper survey reported that 56 percent of those interviewed felt they received the “most accurate news” about the presidential campaign from the radio. Although Roper surveys from 1959 to 1980 indicate that the American people’s reliance on radio as a news source decreased from 34 percent in 1959 to 18 percent in 1980, American radio listeners’ use of this medium to acquaint themselves with local candidates ranked even lower from 1971 to 1984. In 1971 6 percent of the respondents to a Roper survey indicated that they became acquainted with local candidates through the radio. Although the percentage rose to 10 percent in 1976, from 1980 to 1984 the percentage remained stable at

6 percent. During the presidential election years of 1973, 1976, and 1984, 6 percent, 4 percent, and 4 percent, respectively, indicated radio as a source through which listeners became acquainted with candidates for public office. However, in 1987 46 percent of the respondents to a Roper survey indicated that the radio was a "somewhat important" source of information for learning about presidential candidates, and 19 percent indicated radio as a "very important" source. This increase probably stemmed in part from the rise in popularity of political talk radio.

More recent polls from the 1990s have reflected the increased attention radio election coverage has received from voters. A Roper survey conducted from May to June 1992 suggested that 18 percent of respondents gathered information about the 1992 presidential election campaign from the radio, with a decrease to 12 percent by November 1992. However, a November 1996 Roper survey found that 19 percent of the respondents indicated that they gathered information about the 1996 presidential election campaign from the radio. Most recently, a November 1998 Roper survey reported that 23 percent of the respondents indicated that they gathered information about the 1998 off-year election campaigns in their state and district from the radio.

Although radio began its political coverage by broadcasting presidential election results, recognition of the potential impact of radio on the election process came quickly. Whether through radio coverage of candidate addresses, the development of political advertising, or the coverage of major campaign events such as conventions and debates, strategists and ultimately candidates recognized that radio could reach millions of voters. That accessibility thus influenced the need to effectively present the candidate and the candidate's message in this medium.

Undoubtedly, radio's election coverage brought the political process much closer to the American people. Not only could those with a radio in their living room suddenly sit in on their party's national convention, but they could also hear campaign addresses delivered by presidential candidates in distant states. Even more important, the American people could listen to a candidate deliver an address on specific issues in real time, and they could judge for themselves the information as well as the candidate's delivery style and personality. In

essence, radio, through its election coverage, handed the American people the opportunity to participate in and make decisions about candidates firsthand without relying solely on press interpretations.

Elliott, Bob. *See* Bob and Ray

Ellis, Elmo 1918–

U.S. Radio Executive

For more than 40 years, Elmo Ellis was a fixture in Atlanta radio. Dubbed “The Dean of WSB Radio,” Ellis served as a national radio guru in the 1950s at the time the medium was falling behind television. A prolific writer and producer, Ellis brought innovations to Atlanta radio that are still being applied by stations across the country.

Origins

Ellis was born in 1918, in Alabama. He attended West Blocton High School (where he played quarterback on his high school football team) and was a Phi Beta Kappa graduate of The University of Alabama in 1940. A cousin of radio great Mel Allen, Ellis studied journalism at Alabama, but he did not take radio courses until his senior year. He applied for a job at WSB in Atlanta after his graduation and was hired as the station’s promotions and publicity director. His first award came in 1940, from *Variety*, for best local station programming.

During World War II, Ellis joined the Army Air Corps and worked as a military broadcaster, writing and producing programs for every network. He also worked with Glenn Miller. Ellis told *The Atlanta Constitution* he was in Fort Worth, Texas, and had collaborated with Miller on a 1942 Army Air Corps radio show. Ellis said the bandleader had liked his work and wanted Ellis to join his radio production unit in New York, but the commanding officer rejected the transfer request. Ellis was still stateside when Major Miller, his band, and staff crashed into a foggy English Channel in December 1944.

In 1944, Ellis married his wife, Ruth, whom he had met in Texas. When he left the Army, Ellis worked in New York before returning to WSB and Atlanta in 1947. The station was about to launch its television efforts, and Ellis’ former bosses wanted him back for the transition.

Postwar Activities

WSB-TV went on the air 29 September 1948, with Ellis producing previews in Atlanta. Planning had been underway for

more than one year, and Ellis was at the heart of the operation. He introduced the station’s first game shows, do-it-yourself shows, and talk shows. Ellis and WSB-TV were a huge success in those early years.

In late 1951, WSB Radio and TV officials asked Ellis to return to the radio side as program director. Radio as an industry was dying, since most of the night-time stars and revenue had migrated to the younger medium. “I hadn’t thought much about radio in four years,” Ellis told *The Atlanta Constitution*. “But I have always been a loyal type person, and I felt my bosses really needed me over there.” He said in a 1994 interview that he did not want to return to radio, but as the radio side of WSB was languishing, Ellis obliged. WSB AM became known as “Atlanta’s Radio-Active Station,” and Ellis became its program director. He went on to write a list of 100 pointers that were published by Broadcast Music Incorporated, then he penned a groundbreaking article for *Broadcasting* magazine called “Removing the Rust from Radio.” In the article—and subsequent speaking engagements across the country—Ellis simply told station managers what had worked for him at WSB radio. According to *The Atlanta Constitution*, Ellis suggested radio “get off its podium, drop its pomposity and put on its roller skates. Mingle with the citizens, collecting and reflecting actions and opinions.” He suggested theme days (Old Timers Day, Sweet Music Day, etc.). Congratulate newly elected civic club leaders, he said. Promote radio’s flexibility with station breaks such as, “You can take a bath and still listen to WSB Radio.” Ellis wrote, “We must change from an entertainment-dominated medium to a locally oriented service. Remember, radio brings the event to the audience. This is different from television, which takes the audience to the event.”

During his tenure, Ellis contributed a number of well-respected programs to the station. The musical format was middle of the road, and the programming covered everything from news to sports to entertainment. One innovation, “sky-copter traffic,” is still being used today. The Shining Light award, which he introduced, is still being awarded on a regular basis after a hiatus.

Ellis also contributed to the scholarly world of radio, collaborating with Cox Broadcasting Corporation president J. Leonard Reinsch on the textbook *Radio Station Management* and writing *Opportunities in Broadcast Careers*. The latter is still in print, most recently updated in 1999.

In late 1981, after close to 30 years on the radio side of WSB, Ellis retired at age 63 as vice president and general manager of WSB AM-FM. He had held the general manager position for 17 years and had been a vice president of Cox Broadcasting for 12 years.

But Ellis did not leave the field of journalism. He began writing weekly opinion columns for the *Marietta Daily Journal* and *Neighbor* newspapers, and he continued to be on the air with "Life Management" spots aired weekly on smaller radio stations in Georgia. He is still an on-demand speaker and volunteer in his Sandy Springs community.

Ellis has won almost every award a Georgia broadcast journalist can win. In addition to the Peabody he won in 1966 for his "Viewpoint" editorials and "Pro and Con," Ellis is a Hall of Fame member of the University of Georgia's Di Gamma Kappa Broadcasting Honor society. In 1985, Ellis was the third person to be elected to the Georgia Association of Broadcasters' Hall of Fame. In September 1995, he won the Georgia Music Hall of Fame's Mary Tallent Pioneer Award. When he won the Ralph McGill Award from the Society of Professional Journalists at its annual Green Eyeshade banquet, he told *The Atlanta Constitution*, "Having been a member of the organization for more than 50 years, I am wondering if this award isn't just for longevity. I accept it as a tribute to the memory of Ralph McGill."

In 1995, Ellis was one of three Atlanta broadcasters named to *Radio Ink* magazine's list of 75 people who "made

a distinctive and major impact on the radio industry." He joined, among others, Ronald Reagan and Rush Limbaugh on that list.

GINGER RUDESEAL CARTER

Elmo Ellis. Born in Alabama, 11 November 1918. Graduated Phi Beta Kappa, University of Alabama, 1940. Joined the Army Air Corp and worked as a military broadcaster during World War II. Became promotions and publicity director, WSB, Atlanta, Georgia, 1940; wrote and produced network radio programs in New York; returned to WSB, Atlanta, Georgia, 1947; helped to develop WSB-TV, the first television station in the South, 1948-51; WBS officials requested his return to radio as program director, 1951; developed live coverage radio reporting, 24-hour news and weather format, and other innovative radio programming techniques; general manager, WSB radio, 1964-81; vice president, WSB radio, 1969-81. Recipient: George Foster Peabody Award, 1966; elected to Georgia Association of Broadcasters' Hall of Fame, 1985; Ralph McGill Award, Society of Professional Journalists, 1993; Outstanding Alumnus, University of Alabama, 1993; member, Hall of Fame, University of Georgia's Di Gamma Kappa Broadcasting Honor Society; Mary Tallent Pioneer Award, Georgia Music Hall of Fame, 1995; inducted into University of Alabama's Communication Hall of Fame, 1999; Hugo Black Award, University of Alabama, 2000.

Emergencies, Radio's Role in

Radio's news and entertainment roles have long been taken for granted. In times of emergency, however, the medium often rises to the occasion to play a unique public service role. In times of natural or man-made disasters, radio becomes a prime means of social surveillance, a link with the outside world, and a source of information. Radio can mitigate problems by promoting disaster preparedness, keeping people out of harm's way, assisting in rescue coordination and relief efforts, and facilitating rehabilitation and reconstruction efforts. Radio often has the first reports of impending natural disasters, be they tornadoes, hurricanes, or volcanic eruptions.

Radio's potential was demonstrated even before the inception of broadcasting. While wireless aided in rescuing people from several maritime disasters early in the 20th century, notably during the loss of the liner *Republic* in 1909 when more than 1500 people were saved thanks to a distress call, the 1912 *Titanic* disaster focused public attention on what the medium could do. On her maiden voyage in mid-April of 1912, the huge passenger liner struck an iceberg and began to sink. Her two wireless operators stayed at their posts almost to the end, sending both "CDQ" and the newer "SOS" emergency signals to both nearby ships and the distant shore. The sole operator

on the Cunard liner *Carpathia* heard the signals and the ship steamed 55 miles to rescue the 700 survivors in boats several hours after *Titanic* went down. For weeks thereafter, the wireless operators (one of whom perished) were newspaper heroes.

Early Emergency Broadcasting

The new role of radio became clear with two events in the spring of 1937. Massive snow melt flooding of the Ohio and Mississippi Rivers inundated towns and countryside alike, and local stations often were the only link with the outside world for days at a time. Stations that were themselves flooded out loaned their personnel to those still on the air. Regular program schedules were replaced with day and night reporting (sometimes around the clock) and radio broadcasters directed rescue teams where they were most needed. Some stations became arms of official state or federal agencies and provided a personal message service that might normally have been an illegal point-to-point use of radio stations. Radio's immediacy and portability were well demonstrated.

The most spectacular disaster covered on radio was the burning of the German passenger airship *Hindenburg* as it attempted to land in Lakehurst, New Jersey, near New York City on 6 May 1937. Although 36 people were killed in the fiery crash, 62 survived the disaster, which was hard to believe as the nation watched the subsequent newsreel coverage. But people first heard about the crash as Chicago station WLS reporter Herb Morrison reported what was presumed to be a routine landing. Morrison's gripping eye-witness account, in which he cried with a broken voice, "This is one of the worst catastrophes in the world," was aired on the networks the next day, all of them suspending their usual rule against use of recorded programs.

In all too many later natural disasters—floods, tornadoes, and hurricanes—radio stations provided the crucial warnings of impending trouble and then the critical links with rescue help and the outside world. People soon learned to turn to radio if concerned about the weather or some unusual event. Radio's growing transistor-driven portability in the 1950s continued the medium's unique role even in an age of television. Most radio stations have emergency generators and portable studio-transmitter links that allow reporters to get close to the scene of disasters or emergencies and provide on-the-spot reporting.

One sure indicator of radio's central role in emergencies was its use in government emergency communications schemes. Beginning with the CONELRAD system (1952–63), which can still be seen in old radios with tuners marked for the two frequencies (640 kilohertz and 1240 kilohertz) to be used in national or regional emergencies, and progressing to the

Emergency Broadcast System (1963–97), radio was to play a key role in Cold War civil defense planning and emergency warning schemes.

Radio's Role in More Recent Disasters

In the 1960s, radio's emergency role showed in two man-made emergencies. When President John F. Kennedy was shot in Dallas, Texas, on 22 November 1963, radio was often the first medium most people tuned to; television was far less common in schools and in the workplace then. As that Friday afternoon wore on, one could see people clustered around portable or car radios trying to learn the latest from Dallas, including the swearing in of a new president. During the massive overnight electric power failure in most of northeastern U.S. in late 1965, WBZ's Bob Kennedy became famous for his reassuring radio coverage during the many dark hours in the Boston area. New York DJs and news reporters filled much the same role there in the almost total absence of television reporting. Those who owned battery-powered transistor radios could tune in local radio personalities who did their best to communicate what was going on, how widespread it was, and when the lights began to come back on (the next morning). Many argued later that radio's collective voice helped to avert a widespread panic in the darkness.

In early 1989 stations in the San Francisco Bay area were on top of the Loma Prieta earthquake and provided the first reports of downed bridges and collapsed and burning buildings, and thus assisted in crowd control and channeled rescue workers to where they were most needed. Later that same year, stations in the Caribbean and along the U.S. coast warned of the looming hurricane Hugo, one of the most powerful storms in years. Station WSTA in the Virgin Islands assisted the Federal Emergency Management Agency (FEMA) and for several days was the only source of news and information for and about the people on the devastated island. The station served as a government communications center, emergency police dispatcher, and chief contact for emergency medical personnel. Stations in southern Florida played similar roles when hurricane Andrew struck in 1992 and wiped out many communities south of Miami.

In January 1998 a huge ice storm struck Maine and Eastern Canada, cutting electricity for at least hours, often days, and up to two weeks in some isolated communities. Thousands also lost their telephone connections, and the state's emergency broadcast system was knocked out as well. Hundreds had to move to central shelters. Throughout the storm, two radio stations managed to stay on the air and launched call-in shows. WWBX-FM in Bangor began "Storm Watch" around the clock, combining an aural bulletin board with message relay, town meetings, and a sharing and coordination center. The sta-

tion linked people with other people, announced the location of shelters, and passed on cold-weather survival tips. WVOM-FM, also in Bangor, stayed on the air thanks to propane gas carried up to its transmitter. It, too, provided a makeshift command center, often a voice in the dark for thousands with portable radios.

A year later, flooding from heavy rains ravaged eastern North Carolina. Stations again scrapped entertainment programming and went into a 24-hour emergency mode, reporting what was happening, linking people with safety spots on high ground, and helping to funnel rescue workers and food supplies where they were most needed.

When terrorists struck New York's World Trade Center (WTC) and Washington's Pentagon on 11 September 2001, radio again came to the fore as a primary means of media communication, especially to those in or near the attacked areas. With the loss of the multi-station antenna atop the WTC's North Tower, television reception was lost for much of the metropolitan New York region, save for cable subscribers. While across the nation many tuned to cable news services or the internet, thanks to battery-powered portables, radio was again the prime means of initial news reports and guidance for many listeners.

While television stations play similar roles, not everyone can receive signals if power is lost. Radio's portability and pervasiveness in cars, offices, schools, and homes makes it the medium of first resort in disasters and emergency conditions.

Emergency Broadcast System

Warning Listeners of Disaster

The Federal Communications Commission (FCC) established the Emergency Broadcast System (EBS) in 1963 to provide the government with a means of quickly contacting U.S. citizens in the event of an emergency. Originally conceived for national defense purposes, its mission was expanded to include natural as well as man-made disasters. The Emergency Alert System (EAS) replaced the EBS system in 1997. Although the technology and specific rules differ, the intent of the EAS remains the same as EBS.

Origins

In the 1950s the United States was increasingly concerned about the possibility of Soviet aggression. During the Cold War, the United States instituted a number of actions to protect itself from a Soviet attack. One fear expressed by the military was that the many American radio transmissions could serve as navigational aids for enemy aircraft (as they had for Japan's 1941 attack on Pearl Harbor). In 1951 the United States instituted a

program called Control of Electromagnetic Radiation (CONELRAD). Under this plan, all nonmilitary radio transmissions except for those on two frequencies—640 kilohertz and 1240 kilohertz—would cease. The military decided that limiting all transmissions to only those two frequencies would provide the best system for informing the public while limiting the usefulness of U.S. transmitters for locating military targets. Radio receivers sold after 1953 were required to mark the two designated frequencies with triangles to indicate their civil defense role. This requirement remained in effect until the EBS replaced CONELRAD in 1963.

The fear of Soviet aggression continued in the 1960s, but technology had advanced to the point that radio navigation for foreign bombers was no longer the anticipated threat. Instead, the United States feared a long-distance missile attack, which would not rely on radio navigation, so CONELRAD was replaced with the EBS in 1963. Although still serving the purpose of alerting the nation in the event of foreign aggression, there was no longer a need to order all transmitters off the air. Instead, only those lower-powered stations, usually without the staff or financing to keep a 24-hour emergency operation running, would be ordered off the air during an emergency.

EBS Operations

Unfortunately, the original system was susceptible to frequent false alarms. The early EBS warnings occurred when an EBS station stopped transmitting (known as dropping carrier). Other radio stations, required by law to monitor the EBS station, would then be alerted that the EBS had been activated. The problem was that EBS stations might stop transmitting as the result of a loss of power or because an electrical storm had caused a power surge. In 1973 the dual tone alert system was devised, which dramatically reduced the number of false alarms. EBS activation then required a purposeful triggering of the alert signal by a station employee rather than a station's passive dropping carrier. In the 1970s the EBS was seen as a valuable resource that could be used for more than just defense purposes. Added to the system's mission was notification of such natural disasters as earthquakes and tornadoes. Americans quickly became familiar with the EBS from the weekly tests that were required of all broadcast stations.

EBS was always taken seriously by the FCC, which has disciplined stations that failed to comply with the rules. Some stations ignored weekly tests. Others did not maintain the necessary equipment for monitoring and transmitting a signal. Although those transgressions occurred relatively frequently, it was the occasional willful violation of EBS rules that received the most attention and the most severe penalties. In 1991, during the Persian Gulf War, St. Louis disk jockey John Ulett announced that the United States was under nuclear attack and used the EBS tone to validate the hoax. Two hours later the

station apologized for the prank, which management claimed it was unaware of until it actually aired. The FCC was not persuaded by either the apology or the station's lack of complicity and fined KSHE-FM \$25,000 for the infraction.

Creating EAS

The need to revise the EBS became increasingly apparent. The two-toned signal was considered to be an annoyance by both broadcasters and listeners. The EBS's success depended on a "daisy chain" of alerts, requiring emergency personnel to contact a station, that station to broadcast a tone, and other stations to receive the tone and retransmit the information. Any breaks in the chain resulted in emergency information not being relayed. In 1989 one station did not rebroadcast an alert about the San Francisco earthquake because the operator on duty did not know how to use the equipment and all the station's engineering staff was attending the World Series baseball game. There have been numerous reports of stations that did not retransmit important weather information because of equipment or operator failure. The overall reliability of the system was called into question.

In 1994 the FCC acted to phase in a replacement of the EBS with the newer EAS by 1997. One change particularly appreciated by broadcasters was the shortening of the length of the alert signal. Instead of the two-tone transmission of nearly 30 seconds, the tone was reduced to only eight seconds. Although weekly testing continues, the alert tone is only required as part of monthly tests, thereby making the system much less intrusive. Weekly tests can actually be conducted that are nearly imperceptible to the audience.

For emergency personnel, EAS is an improvement over EBS because the digital signal can be triggered remotely without the involvement of station employees, thus decreasing the likelihood that messages will go unannounced. What's more, because EAS uses a digital signal, it is compatible with cellular phones, pagers, and other devices. The new law required cable systems to participate and made alerts available in Spanish and in visual forms for the deaf. If used at the national level, only the president or his representative can activate the EAS. Local activation can come from several sources, including National Weather Service and Federal Emergency Management Agency offices. In all the years of CONELRAD, EBS, and EAS, there has never been a national activation of an emergency alert.

Emerson Radio

Pioneer of Small Radio Receivers

From the early 1930s into the 1950s, Emerson Radio (not to be confused with the older and larger Emerson Electric Co.) was one of the larger manufacturers of radio receivers in the United States. The company's story parallels the decline of American manufacturing in the late 20th century.

Origins

Victor Hugo Emerson, a former Columbia Phonograph company manager, created the Emerson Phonograph Company in 1915–16. He was already well known in audio circles for his 14 patents in sound recording and reproduction granted from 1893 to 1905, and he continued to receive patents until 1922. His firm manufactured both phonographs and records (including a talking books line for children), riding the early mechanical era recording boom of the World War I years. When business fell off sharply after the war, the company found itself overextended and went into receivership in December 1920.

Benjamin Abrams (1893–1967), his younger brothers Max and Lewis, and Rudolph Kamarak purchased the remaining assets of Emerson Phonograph in 1922 and formed the Emerson Radio and Phonograph Corporation. The senior Abrams would run the operation for the next four decades. After selling off the record business, the new firm entered the radio receiver manufacturing business in 1924 as a small player among several giants and created and marketed some of the first radio-phonograph combination devices. With the advent of the Great Depression and the failure of many other radio manufacturing businesses, Emerson took a new direction.

Emerson and Small Radios

The Depression forced radio manufacturers to provide smaller and cheaper sets, a trend first pursued by several smaller California-based companies. But many of the initial "midget" sets were poorly made and unsuccessful. The image of small radios began to change with a 1932 Emerson product.

The "Model 25" was ten inches wide, six and a half inches high and four inches deep. It was a four-tube receiver with a six-inch speaker, weighing about six pounds. At a then low cost of \$25.00, the Model 25 sold about a quarter of a million units from late 1932 into the first half of 1933 and helped place Emerson on the map. Demand was so strong that for several months the manufacturing line had trouble keeping up.

Building on this breakthrough success, Emerson quickly focused its attention on other small radios. Some were novelty items built around popular movies (*Snow White and the Seven Dwarfs*), movie or radio stars (*Mickey Mouse*), and even people in the news (the Dionne quintuplets). All of them (as well as similar products from other firms) sold well, as did a \$9.95 compact radio of 1937. The "Little Miracle" set of 1938 was a five-tube superheterodyne receiver offered in a variety of styles and colors as combination and plastic cabinetry began to take over more expensive all-wood cabinets. The 1939 two-tube "Emersonette" took things further—a tiny six-by-five-inch receiver selling for \$6.95.

Emerson was now making more than 1 million sets a year. Perhaps the peak of Emerson's prewar success came with the 1940 "Patriot" model, with a design by Norman Bel Geddes based on the American flag (it came in red, white, or blue cabinets with the other two colors as trim).

By 1941, about 80 percent of all radio sales in the U.S. were of compact models, though Emerson was among the first to offer FM receivers when that service began commercial operation that year. But it was on the strength of its small radios that Emerson's portion of the total American radio market rose from a mere 1.5 percent to 17.5 percent between 1932 and 1942. Riding this success, in 1943 the company went public, selling 40 percent of its stock.

Expansion

Emerson produced its first television sets in 1947, although it continued to offer many radio models. In 1951–52 Emerson

first offered a new “pocket” portable radio with subminiature tubes designed by Raytheon. This led to the Model 747 in 1953, a tiny and eminently portable table radio that weighed only 22 ounces. One of the last miniature pretransistor radios, the Model 747 sold for \$40 even though it received poor review notices in *Consumer's Research Bulletin*.

But change was in the air. By 1954 radio made up only 15 percent of company revenues. Emerson offered its first audio tape recorders in 1955 and by the late 1950s was producing combination tiny tube and transistor radios and a growing variety of television models. In 1958, Emerson bought the DuMont consumer electronics manufacturing operation and began to use that brand name along with its own.

Later Developments

Emerson's last full year of independent operation was 1964. The company was sold to National Union Electric in 1965 and absorbed Pilot radio the same year. By the end of the year, the combined firm owned 20 subsidiaries that continued the sale of consumer electronics under both the Emerson and DuMont names. After several years in the red, owing in part to rising consumer electronic imports, the company began to shift away from this focus in 1972.

Major Electronics Corporation of Brooklyn bought the Emerson name in 1973 and four years later renamed itself after the earlier company. It dropped the last U.S. manufactured product (fittingly, a phonograph) in 1980. By 1983–84, imported televisions and videocassette recorders made up two

thirds of company sales. Most were manufactured in Korea but sold under the Emerson name. The once-revered H.H. Scott brand was taken over in 1985, and the company moved to New Jersey. The Scott line was discontinued in 1991.

In October the ever-smaller firm declared bankruptcy, and 60 percent of its stock was taken over by Fidenas Investments, a Swiss firm. Emerson began to retail car audio systems in 1995, licensing its name to several important Korean and Chinese consumer electronic products. But the turn of the 21st century, the company was down to about 100 employees dealing with product import and distribution. Emerson no longer manufactured anything. About half of its output was sold each year to Wal-Mart and a quarter to the Target discount chain.

“Equal Time” Rule

Political Broadcasting Regulations

Sections of the Communications Act of 1934 and related rules and regulations of the Federal Communications Commission (FCC) require that candidates for political office in the United States be treated equitably in their purchase or other use of broadcast time. These so-called equal time provisions are controversial and have been considerably modified over the years.

The Law

At first—in American elections between 1920 and 1926—there was no regulation of political broadcasting, and some stations did not allow candidates on the air with political

appeals. As Congress moved to pass the Radio Act of 1927, the initial bill contained no provisions concerning political candidates' use of radio. Only a Senate amendment that grew out of concern that radio might exert too much control over the political process led to the inclusion of Section 18, which required that

If any licensee shall permit any person who is a legally qualified candidate for any public office to use a broadcasting station, he shall afford equal opportunities to all other such candidates for that office in the use of such broadcasting station, and the [Federal Radio Commis-

sion] shall make rules and regulations to carry this provision into effect.

The provision did not *require* that political candidates be granted access to airtime, for the section continued, “No obligation is imposed upon any licensee to allow the use of its station by any such candidate.” Section 18, without change, became Section 315 of the Communications Act of 1934.

A remarkably small number of amendments have only slightly altered the meaning of these words in the intervening years. The first, in 1952, added a provision prohibiting broadcasters from charging political candidates higher rates than those charged other advertisers for “comparable use.” A more fundamental amendment added in 1959 exempted from Section 315 requirements any appearance by a candidate in a “bona fide” (meaning controlled by the broadcaster, not the candidate) newscast, news interview, news documentary, or on-the-spot news coverage if the appearance of the candidate was incidental to the program. Finally, in 1971 Congress narrowed the ability of broadcasters to avoid political advertisements or broadcasts when it modified another section of the act (Section 312[a][7]) to state that not allowing candidates for federal office (candidates for president, vice president, or for seats in the House and Senate) access to the air might be grounds for revocation of a station’s license. Stations could still avoid dealing with candidates for state and local offices.

For decades, broadcasters were caught in a legal bind—Section 315 specifically enjoined them from censoring any remarks made by political candidates, yet stations could still be held liable for any defamatory comments candidates might make. The Supreme Court finally removed this danger by holding in the 1959 *WDAY-TV* decision that, given the no-censorship requirement in the law, stations could not be held responsible for whatever candidates might say.

FCC Rules and Regulations

As required by changing circumstances, over the years the FCC has defined and refined what the relatively few words in Section 315 are to mean in practice. Such definition has focused on phrases such as “legally qualified candidate”; “equal opportunities”; “use” of a station; how to determine rates charged; and, after 1959, which programs were entirely exempt from the provisions. Indeed, the rules vary for primary and general elections as to who is covered and for what period of time (requiring, for example, an even more stringent “lowest unit charge” price requirement for candidates’ advertising 45 days before a primary and 60 days before a general election). Stations must maintain detailed and up-to-date records of all requests for political time and of all actual sales and/or uses of airtime for a period of two years.

These many complications grew steadily more involved after 1960 with an accumulation of numerous FCC decisions and court cases; the confusion finally led to publication by both the FCC and the National Association of Broadcasters of regularly revised booklet-length “primers” or “catechisms,” usually in question-and-answer format, of the latest rule interpretations. Despite their complexity—or perhaps because of it—broadcasters, candidates, and the public refer to these rules by the shorthand term of *equal time*, even though far more is involved than merely an equitable provision of time.

As but one example—prior to 1960, debates between or among candidates counted as a “use” requiring Section 315 treatment under FCC rules. For the 1960 election, Congress temporarily suspended Section 315 (leading to the so-called Great Debates between Kennedy and Nixon, which were carried on both radio and television). Effective in 1975, the FCC allowed debates to occur without triggering Section 315 requirements if the debates were sponsored by a disinterested third party—initially, the League of Women Voters. Only in 1983 were broadcasters themselves allowed to sponsor debates as one of the “bona fide” news exemptions in Section 315. National and local debates have increasingly become a staple of American elections since then.

The broadcast industry has attempted repeatedly to have the “equal time” requirements dropped—at least for radio (because of the large number of stations) if not for television as well. Indeed, in the 1980s, a deregulation-minded FCC made the same recommendation to Congress. But all such efforts have generally fallen on deaf ears, given that those who must act to make the change—representatives and senators—are the very people who depend on the access the law provides.

European Broadcasting Union

International Association of Public Service Broadcasters

The European Broadcasting Union (EBU) calls itself "the largest professional association of national broadcasters in the world." It is the umbrella organization of public service broadcasting organizations in Europe and beyond. The EBU is a nonprofit organization that is not affiliated with any national government or transnational political institution such as the European Union. Its headquarters are located in Geneva, Switzerland. The EBU's radio collaboration is called Euroradio. The organization facilitates program exchange, develops and provides technological support and legal advice, and lobbies for the continued existence of public broadcasting. In February 2000, the organization celebrated its 50th anniversary.

History

The EBU was founded in February 1950 during the European Broadcasting Conference in Torquay, England, as an international organization for public service broadcasting institutions. This was at a time when many Western European countries, still recovering from World War II, were rebuilding their radio networks and beginning to develop television facilities. Its early task was to help members exchange their programs, as well as to lend technological assistance when needed. Today, the EBU has moved far beyond its original scope of Western European countries, counting 69 active members in 50 countries and 49 associate members in 30 countries. Reflecting the end of the Cold War, in 1993 the EBU merged with the Organisation Internationale de Radiodiffusion et Télévision (OIRT), the former organization of Eastern European Broadcasters.

The EBU is a major international broadcasting institution that negotiates broadcasting rights for its members, coordinates co-productions, operates satellites, consults on legal issues, and stimulates European cultural life. Over the last decade, it has become more aggressively involved in media policy. The EBU is now a major player, lobbying European and international institutions defending and guaranteeing the survival of public broadcasting despite the growing commercial competition in this area. The EBU has a staff of more than

250 people, including a dozen in Moscow and another dozen in the U.S.

Members and Finances

The EBU allows as active members only radio and television broadcasters committed to the public service idea of broadcasting, highlighting information, education, and entertainment. Public service broadcasters tend to be financed mostly but not exclusively through viewers' fees, membership, or taxes on televisions or radios. The EBU statute officially asks for broadcasting organizations that fulfill a public service mission and achieve 98 percent national penetration. Its 69 active members are from 50 countries in Europe and adjacent areas in North Africa and the Middle East. Member organizations are in countries such as Austria, Bosnia, France, Hungary, Ireland, Israel, Portugal, Russia, Tunisia, and the United Kingdom. Some of the more influential organizations relating to radio are the financially strong British Broadcasting Corporation (BBC) and the Association of German Broadcasters (ARD). Moreover, the EBU also includes 49 associate members in 30 countries in the Americas, Africa, Asia, and Australia, utilizing and feeding into the EBU network.

The EBU is financed through annual membership fees, which are determined by the number of radio and television households each member reaches. In addition, members also must pay for the technical transmission costs of EBU news items and programs that they air. In the last decade, the EBU commercialized some of its services, offering them on a fee basis to nonmembers. It also sublicenses rights to broadcast sporting events. In 1999 the EBU's annual revenue was 407 million Swiss francs (about U.S.\$255 million), including 189 million Swiss francs for rights to broadcast sport events (about U.S.\$118 million) and 117 million Swiss francs (about U.S.\$75 million) for network transmission charges. Euroradio has a potential reach of 400 million listeners. It transmits approximately 2,000 concerts and operas, 400 sports events, and 120 major news events per year.

Organization

After the inauguration of the EBU in 1950, the first major event for the organization was the 1953 coronation of Queen Elizabeth II, which became the world's first live multinational television transmission. The Eurovision program exchange office was originally opened in Brussels in 1955, but a year later it moved most of its functions with the EBU to Geneva, where the operations were fully centralized by 1993. Since 1961 the EBU coordinates and transmits a daily television news feed (EVN) to all members. The late 1960s brought the change of international transmission to satellite. In 1970 the EBU opened a bureau in New York and another in Washington in 1987, followed by an office in Moscow.

The increasing deregulation of national media systems changed the media landscape in Europe tremendously. Facing increasing competition and membership interest from commercial broadcasters in most European countries, in 1990 the EBU underscored its status as an organization of public service broadcasters in its Marino Charter. Although its television transmission had formerly been based on free exchange systems between active members, the EBU commercialized its operations (Eurovision Network Services) and began selling transmission rights to non-members in 1994. In the last decade of the 20th century, the organization moved further away from its original mission by launching several television and radio outlets. Since 1998, for example, the EBU has offered its members a free classic radio program throughout the night (*Euro-classic-Notturmo*).

In the last few years, both television and radio operations have been shaped by the change from analog to digital technology. The EBU and its technical departments developed and facilitated for its members many new technological advancements into high definition television (HDTV), digital transmission, and digital audio broadcasting (DAB). Recently the EBU has ventured into collaborations and sub-licensing with commercial broadcasters, to avoid investigations by the EU commission for anticompetitive practices. (Several commercial broadcasters have challenged the EBU's exclusive agreements in court and in political committees.)

EBU Radio Department

Although the EBU radio department tends to be in the shadow of its more visible Eurovision branch, it is nevertheless an important international cooperation for radio program exchange and technology transfer. Radio has been part of the EBU since its launch in 1950. Over the years its expansion has reflected the major technical transformations in this field, with the EBU engineers often in the forefront of developing new technologies. In 1989 the EBU radio department launched Euroradio to provide "international exchange of high quality

digital sound programs," as its mission statement declares. It began digital transmission of its programs in 1994 via the Euroradio Control Centre (ERC) in Geneva. The Euroradio network is based on 40 satellite-to-earth stations utilizing a digital transmission system. The network currently operates on a digital system incorporating an audio base-band of 20 kilohertz and auxiliary data channels. It transmits its programs via two carriers on the Eutelsat II F4 satellite.

The EBU radio department serves under the direction of the EBU radio committee, an elected body of member representatives who provide guidelines for programming strategies. The radio department organizes radio program exchanges between all or several members. The programs are mostly music concerts, sports events, and news or current affairs. The department also arranges conferences and events for members and holds workshops for foreign journalists and radio producers. Members often contact the department when they need professional, technological, or legal advice. EBU also publishes the "EBU Radio News Fax Letter."

In addition, the EBU supports the development of specialized programming such as radio features and documentaries, radio dramas, educational and other programs for young people. With these niche and even experimental radio programs, the EBU supports the public service mission of its members, who often are required by law to inform, educate, and entertain a variety of societal groups, including minorities. For instance, EBU organizes the International Radio Feature Conference, in which feature producers can present and compare their work. Another example is the Radio Drama Project Group that organizes workshops, initiates radio dramas (often from smaller, less affluent members), and stimulates collaboration between radio drama producers in all member countries. The Project Group biennially commissions a major radio play. In the past, well-known writers such as Mario Vargas Llosa and Anthony Burgess have been among those whose work was aired.

To celebrate the new millennium, the EBU initiated a number of radio projects supplied by its members. These projects included, among others, an experimental audio art collage with sounds of the century, a collection of commissioned compositions, and a series of panels and lectures on human rights.

Music

The music department initiates new music projects, coordinates music transmission between member stations, and negotiates music broadcasting rights for its members. Annually it organizes and offers more than 2,000 live and deferred musical events such as operas, classical concerts, jazz, and rock via the Euroradio transmission system. One hundred of those are within regularly scheduled program slots; the others can be

ordered on demand. EBU members can select and request all events via the internet through EBU's MUS internet software. Members can download programs directly from the internet through SATMUSIC, "a program which synchronizes the automatic recording of high quality digital sound programme exchanges for EBU members," according to its web site. The Euroradio Control Centre also has a direct satellite connection to the Metropolitan Opera in New York to distribute performances to its members. The music department also coordinates the *Euroclassic-Notturmo* produced by the BBC. It provides an all-night program with light classical concerts by member stations; these include breaks to allow localized announcements by the members' hosts.

The music department has recently ventured into compact disc production by publishing a collection of traditional music on the Ocora label. It sponsors the Euroradio Big Band Concert and the international Forum of Young Performers. This music sponsorship becomes more important as national public service stations face political pressure to tighten their budgets. Euroradio's sponsored musical events may not be as well known as the European Song Contest organized by Eurovision, but they have become an important stimulus of music culture in Europe.

News

The news division offers local feed to other members, sets up broadcasting centers on location as important events occur, and supports foreign correspondents' efforts to broadcast radio reports to their listeners as fast as possible. The provision of timely radio news transmissions is very important in many European countries, where a majority of people turn to radio for breaking national and international news during the day. Supported by the EBU's foreign bureaus, the news division also coordinates coverage of international political events such as elections, conferences, and political conventions.

Other tasks of the news department include the negotiation of access rates to other transmission networks and development and implementation of new technology, such as digital satellite telephone stations and lightweight news-gathering equipment. The division also organizes a joint EBU-NABA (North America Broadcasters Association) conference on radio news and current affairs. In special meetings, division staff discuss issues such as international news flow and the ethics of international news reporting.

Sports

In its first years of existence, the EBU was typically guaranteed the broadcast rights to major sport events such as the Olympics and soccer championships, as there were no commercial counterparts with similar coverage that were able to bid for

the rights. In countries with more than one EBU member, these public stations would often share or take turns in covering major events. But the rise of commercial television and radio in the early 1980s changed the situation tremendously when new media moguls began to bid for rights to popular sports events. As a result the cost of broadcasting rights has skyrocketed.

The EBU captured the rights to broadcast the 2000 Olympic Games despite being outbid by Murdoch's FOX network. The International Olympic Committee decided on EBU because of its terrestrial penetration that no satellite provider could match at the time. Similarly, the EBU won the rights to air track-and-field competitions but lost the rights for the next two soccer World cups to the commercial Kirch Group from Germany. Now the EBU must sometimes rely on sublicense agreements and the support of national parliaments to keep such events on terrestrial channels.

The radio department typically negotiates jointly with the EBU television department. On location, it supports national broadcasters in their work. Besides top sports events, the EBU, following its public service mission, is also interested in broadcasting minor sports that commercial stations do not find appealing. In this role, the EBU radio covers and assists at about 150 sporting events each year.

Technology

The radio division is part of a broader EBU project that attempts to develop a more efficient and automated system of transmitting traffic and travel information to viewers, licensers, and agent systems. The goal is to keep public service stations updated with the latest technology, enabling them to counter commercial competition in this area. Moreover, the EBU has initiated joint experiments with web-radio and interactive internet radio. For more than a decade it has initiated the development of digital studio and transmission equipment.

Collaborations

The EBU works in partnership with all major international broadcasting organizations such as Asia Pacific Broadcasting Union (ABU), North American Broadcasters Association (NABA), the Union of National Radio and Television Organizations in Africa (URTNA), the Arab States Broadcasting Union (ASBU) and the Organizations de la Television Iberoamericana (OTI).

Future

As an increasing number of commercial stations build their market share by offering entertainment programs with mass appeal and outbidding public stations for rights to popular

sports events, national political bodies ask public broadcasters to be more fiscally responsible and approve increases in viewer fees or licenses very reluctantly. As a result European national and regional public service broadcasters face mounting pressure from both sides. The EBU is more important than ever in helping the public broadcasting concept to survive. Members can synchronize their efforts, more efficiently share their resources, and use the institution as a powerful lobbying organization on an international level. In addition, at a time when commercial format radio is gaining a strong hold in many European countries, the EBU radio department can help to maintain their members' mission of broadcasting programs with less mass appeal, such as minority programs, radio drama, or cultural events. The EBU's support for public service radio is a way of ensuring that radio remains an information and education medium in Europe and beyond.

Evangelists/Evangelical Radio

Conservative Protestant Religious Stations and Programs

Evangelical radio forms a distinct subgenre within religious radio, referring primarily to programs with a teaching/preaching format, often incorporating hymns or other kinds of sacred music. The intent of evangelical radio programming is to convert unbelievers or to reconvert lapsed Christians by stressing the Bible's call to repent and accept Christ as a personal savior.

It is difficult to be precise about what comprises "evangelical radio" as distinct from other forms of religious radio, because in some sense every effort at putting religion on the air constitutes an invitation to learn more about the principles being presented—and because radio itself, as an advertising-saturated medium, is built around an evangelistic pattern. Nearly everything on radio, from ubiquitous 60-second car sales spots to public radio fund drives, has something of an evangelical ring to it.

In addition, the term *evangelical religion* means different things to different groups of people, and the meaning has changed over the course of the 20th century. An *evangelist* can mean any person who seeks to convert another to his or her

own religious beliefs. In the popular mind, many tend to link the terms *evangelical* and *fundamentalist*, because both offer a Bible-centered worldview with an emphasis on personal conversion. However, the two are not coterminous. The modern evangelical movement had its roots in the fundamentalist movement of the 1910s and 1920s and maintained ties to fundamentalism through Bible colleges, summer camps, publishing, and radio, but a group of so-called neo-evangelicals decisively broke with fundamentalism by the late 1950s under the leadership of Billy Graham. Contemporary evangelicals occupy a middle ground between liberal religion and fundamentalism. Today, *evangelicalism* refers to a loose coalition of conservative Protestant groups in North America, including Baptists, Holiness-Pentecostals, nondenominational evangelists, and charismatic Protestants.

Although not all of these traditions have been equally involved in media evangelism, the media have been an important tool of American evangelicals in their quest to fulfill the so-called Great Commission, the instruction of Jesus Christ to his followers: "Go ye into all the world, and preach the gospel

to every creature” (Mark 16:15). The preaching of the Christian message in or to every country is considered by many evangelists to be a necessary precondition for the second coming of Christ (e.g., Matt. 24:14), and radio was touted as a providential means to accomplish this important end.

Origins

Revivalism—that is, religious meetings that work through music, word, and emotional appeal to encourage conversion in those attending—lent itself naturally to the new medium of radio in the 1920s. Revivalism grew out of the highly successful late 19th- and early 20th-century mass-audience revival campaigns of Dwight Moody and Billy Sunday and traveling revival movements such as Chautauqua. As promoters of radio evangelism were fond of reminding potential donors, a single broadcast could reach more people than even Dwight Moody had been able to reach in a lifetime. Because folk and camp-meeting revivalism was centrally an aural experience—the spoken and heard word being experientially more powerful than the written and read word—the format of revival sermons and meetings made it onto radio with little adaptation.

In fact, radio evangelism is one of the medium’s oldest program genres. In the largely unregulated early years of radio broadcasting in the United States, municipal and private stations alike were in search of material to fill time. Evangelists, ever on the lookout for ways to speak to larger and larger audiences, stepped in to fill the need and never left the airwaves, though their presence was not always so sought after by station owners and broadcasters. In addition, some evangelistic denominations and religious organizations developed their own stations to promote gospel on the air: WMBI Chicago (owned by the Moody Bible Institute), KFUE St. Louis (Lutheran Church, Missouri Synod), and KFSG Los Angeles (International Church of the Foursquare Gospel) were three of the earliest, all coming on the air within two years of each other in the mid-1920s; in 2003, all three were still broadcasting as Christian radio stations.

However, once network radio was firmly entrenched, evangelicals found it harder to access airtime, even with donations from loyal listeners and supporters. Their often strident “hell-fire and damnation” message worked against both networks’ desire for mass audiences and advertisers’ appeals for consumer spending, making evangelical radio a risk for network broadcasters. Additionally, airtime became more expensive, and evangelical radio was largely dependent on listener donations for the funds to purchase airtime. The National Broadcasting Company (NBC) and the Columbia Broadcasting System (CBS) early on developed a policy of donating a block of airtime for religious broadcasting to representatives of the major religious groups in America. As a fragmented and largely grassroots movement from the 1920s through the

1940s, American evangelicalism found itself unable to obtain this donated airtime from the networks.

Instead, evangelical radio focused on buying time on individual stations or developing its own small-scale independent networks. Although Christian benevolent organizations (e.g., the Gideons and the Christian Business Men’s Association) made regular and sometimes substantial donations to evangelical radio efforts, most broadcasters relied heavily on individual donations to pay for airtime. Listeners sometimes proved creative and resourceful in scraping together small amounts of money to send to support their favorite broadcasts.

Mutual Broadcasting System—the only national network that then sold time for religion—collected over \$2.1 million for its religious broadcasts in 1942. In 1944 this amount had jumped to \$3.5 million, a full quarter of the network’s income. By 1943, reported *Variety* magazine, an estimated \$200 million was “rolling into church coffers each year from radio listeners,” allowing racketeers and “religious pirates” to get rich quick without adhering to standards of accounting. Broadcasters’ appeals for funds proved increasingly controversial; Mutual eventually prohibited on-air appeals for funding. In the late 1940s, for example, the vigilant director of religious activities at Mutual Broadcasting, Elsie Dick, insisted that Walter Maier (speaker of the *Lutheran Hour* on her network) refrain from using even relatively vague statements, such as “if you want these broadcasts to continue, write to us to assure us of your interest.” Broadcasters on Mutual could not follow a request to “pray for the work of this broadcast” with the program’s mailing address, as this would violate Mutual’s policy against the solicitation of funds. Individual stations that accepted religious broadcasts sometimes also established similar policies. Broadcasters sometimes circumvented these restrictions by offering “free” merchandise such as Bibles, tracts, calendars, or commemorative pins. Through the written requests of listeners for promotional items, broadcasters could build a mailing list for direct-mail appeals instead of using airtime for financial appeals.

Examples of Evangelical Radio

Although it is impossible to be exhaustive in listing all evangelists and their programs throughout the years, a few examples illustrate the genre and its approach to missionizing America and the world: the *Back to the Bible Hour*, the *Radio Bible Hour*, the *Lutheran Hour*, and the *Old Fashioned Revival Hour*.

Started in 1939 by Theodore Epp, the *Back to the Bible Hour* was a daily gospel broadcast and Bible-study program originating from Lincoln, Nebraska. By the mid-1950s, Epp could claim that the “sun never set” on *Back to the Bible*, which was heard somewhere in the world at any given minute through AM, FM, or shortwave. The ministry had its own

large two-story building in downtown Lincoln, where half a million letters were received annually and where some 300,000 copies of the *Good News Broadcaster* and the *Young Ambassador* (the latter aimed at teenagers) were printed and mailed each month. A staff of over 150 workers and volunteers provided music and choir direction for the broadcast, sorted and answered mail, taped and shipped out recordings to stations, staffed a round-the-clock prayer room, and coordinated appearances of Epp and his field evangelists at rallies and meetings. Epp authored 70 books, started a Bible correspondence school, and founded a Back to the Bible Missionary Agency (now International Ministries). At his death in 1985, the program was continued with speakers Warren Wiersbe (1985–92) and Woodrow Kroll (1992–present); it is currently syndicated on over 385 stations and on-line.

More controversial and colorful was the stridently fundamentalist *Radio Bible Hour* of the Reverend J. Harold Smith, which began in 1935 in South Carolina but for some years was forced off American stations after its pugnacious attacks on the Federal Council of Churches. In 1953 Smith moved the *Radio Bible Hour* to a Mexican border station, XERF, in Ciudad Acuna, just south of the Texas border, where he continued to broadcast until Mexico banned English language religious broadcasts from superpower border stations. The program can still be heard over 50 stations and on-line.

The *Lutheran Hour*, sponsored by the International Lutheran Laymen's League of the conservative Lutheran Church, Missouri Synod, is the most widely syndicated evangelical radio program. Still heard on 1,200 stations worldwide and on-line, the *Lutheran Hour* was hosted from 1930 to 1950 by Dr. Walter A. Maier, a professor at Concordia Theological Seminary in St. Louis. His successors continued Maier's sermon-and-song format and its nondenominational approach to Christian outreach.

Finally, perhaps the best-known evangelical radio program was the *Old Fashioned Revival Hour*, the creation of southern California evangelist Charles Fuller in 1934. Recorded for many years in front of a live audience at the Long Beach Auditorium, Fuller's *Revival Hour* combined lively choral and barbershop-style revival hymns with energetic preaching; the program pulled audiences of 20 million listeners weekly by the mid-1940s. Fuller was also active behind the microphone in bringing together evangelical broadcasters in the 1940s and 1950s to advocate for paid-time programming through the National Association of Evangelicals and the National Religious Broadcasters.

One important thrust of radio evangelism—and a strategy employed by each of the media evangelists noted above—has been to extend religious broadcasting worldwide in the various languages of each nation. Clarence Jones, who worked in the late 1920s on broadcasts from the Chicago Gospel Tabernacle, was one of the pioneers of long-range overseas religious radio.

He founded radio station HCJB in Quito, Ecuador. Many North American evangelists, while securing time and broadcast airspace on the AM spectrum, also quietly used shortwave or mailed transcription discs to overseas stations in order to be heard by as wide as possible a swath of the globe. The *Lutheran Hour*, for example, broadcasts in over 130 countries in a multitude of languages, from French to Quechua to Zulu.

Although reaching the far corners of the globe was one goal of radio evangelists, reaching the hearts of listening individuals was the other and related goal. In other words, massive broadcast coverage mattered only as far as that coverage would convert people one at a time.

Trends since the 1960s

Billy Graham's evangelistic mass-media campaigns beginning in 1957 helped catapult evangelicalism back to a position of cultural influence. His *Hour of Decision* program was the first religious broadcast to be carried as a paid-time evangelistic broadcast on the American Broadcasting Company (ABC) radio network. And since the 1960s, the Christian media industry has literally exploded in growth, with television, publishing, music, and internet being added to radio. In 1971 there were 400 stations airing religious programming; in 1999 there were over 1,730 such stations, with 1,400 of those considered "full-time" religious stations airing 15 hours or more of religious programming per week.

Despite the dynamic growth, the format of evangelistic programs on radio has changed remarkably little. In stark contrast to the secular end of the contemporary radio industry, most evangelical radio programs are sponsored by a single organization or ministry. Although some are widely syndicated, nearly all evangelical programs are confined to Christian-format radio stations, in keeping with the radio industry's trend toward niche marketing. Gospel-oriented preaching programs continue to thrive within the world of Christian media, but since the 1960s, some religious broadcasters have expressed concern that evangelical radio is a religious ghetto, serving its own rather than reaching new converts.

As early as 1961, liberal Protestant Charles Brackbill, member of the Broadcasting and Film Commission of the National Council of Churches of Christ in America, criticized what he described as radio evangelism's tired format: "the loud and the sad and the intense voices pouring out on the faithful with their 'heartfelt' pleas for 'letters,' pictures, or books or blessed handkerchiefs." Evangelism, Brackbill argued, should seek to reach the unchurched through proven commercial broadcasting techniques: a quick first impression, a catchy "hook," and lots of repetition. In 1964 the Mennonites tried 30- and 60-second ad spots for the gospel message, criticizing traditional radio programming for attracting "an audience which already has some tendency toward spiritual orientation," in the words

of Dr. Henry Weaver, the developer of the series. HCJB founder and director Clarence Jones lamented in 1970 that missionary stations tended to drift in the direction of speaking to believers—who, after all, were the source of any station's continuing funds (incidentally, many of these same concerns would surface over televangelism, where the audience numbers, production costs, and cultural stakes were even higher).

Some scholars expressed concern that evangelism as a type of radio program would be replaced by magazine or talk-format programs or by Christian music programming. In the late 1980s, for example, one study suggested that only 37 percent of all programs on religious stations focused on preaching or teaching. However, according to the 2000 *Directory of Religious Media*, "teaching/preaching" is still the largest category among religious radio station formats, followed by "inspirational," "gospel," and "Southern gospel." This same directory lists hundreds of individual evangelistic programs, some syndicated or beamed by satellite to over 1,000 radio stations. Many of the radio programs are also broadcast on-line through the radio stations' websites, expanding the notion of "evangelical radio" far beyond the physical reaches of a radio signal. Perhaps internet broadcasting will prove another fruitful growth area for religious broadcasting. How successful evangelical radio is in reaching unchurched people, for whom the "good news" is "news" indeed, remains an open question. But there is no doubt that radio evangelism is, and has been throughout the century, a popular and profitable genre that is in no danger of vanishing from the American scene.

Everett, Kenny 1944–1995

British Disc Jockey

Kenny Everett (who changed his name from Maurice Cole in the mid-1960s) was fascinated by radio from childhood; with money gained from newspaper delivery rounds, he bought reel-to-reel tape recorders on which he recorded inventive mini-programs: music interspersed with comedy clips and speeches by politicians edited to humorous effect.

In 1964 he sent one of these programs, "The Maurice Cole Quarter of an Hour Show" (which, typically, actually ran for

some 20 minutes), to the British Broadcasting Corporation (BBC) in London. To his amazement and delight he was invited onto a morning magazine program on the Light Programme (the Corporation's light music and speech network), on which the tape was played in full and Everett was interviewed. Although he impressed the BBC producers sufficiently to be invited back for a formal audition, he was told there were no vacancies at the corporation. However, one of the producers

was covertly acting as a “talent spotter” for a new “pirate” radio station, the United States-backed Radio London, which was to become one of the most successful of the unauthorized stations broadcasting from outside the United Kingdom’s territorial limits. Soon after boarding the converted U.S. minesweeper that served as Radio London’s studios and transmitter, Everett met Canadian Dave Wish—who changed his name to Dave Cash. The two became firm friends and, after listening to tapes of a double-headed disc jockey show on KLIF in Texas, the *Charlie and Harrigan Show*, which featured comic characters wisecracking with a generally irreverent style, the pair began the *Kenny and Cash Show*, which became hugely popular. Everett would often stay up all night recording what were quickly to become his trademark comedy pieces for his own shows and “zany” promotions for other disc jockeys.

However, Everett’s unpredictable comments and outspoken views—especially on religion—led to his being dismissed by the station. He had taken exception to the pronouncements from U.S. evangelist Garner Ted Armstrong, who paid for a half-hour daily program that was scheduled in the middle of Everett’s. The disc jockey frequently edited Armstrong’s tapes to make it appear as if the evangelist were promoting violent crime, and Armstrong was generally lampooned by Everett, who had once been to a college for training Catholic priests. Armstrong happened to be visiting England during one of Everett’s outbursts, and the evangelist demanded Everett be removed from the station or he would remove his program—one of Radio London’s most lucrative contracts.

For a time Everett recorded a program for Radio Luxembourg, but he was again dismissed, this time for admitting in a newspaper interview that he had smoked cannabis. Forgiven by Radio London, he returned to the station in 1966—this time at ten times his original salary, a then enormous sum of £150 a week—in time to be chosen by the Beatles to accompany them to the United States to be the official disc jockey on what was to be their last tour. During this tour he forged a close relationship with his fellow Liverpudlians—then the biggest show business phenomenon in the world—and this was to pay off in subsequent exclusive interviews, previews of the group’s albums, and the Fab Four’s recording special jingles for Everett on both BBC and commercial radio.

When it became clear that the government was intent on forcing the pirates off the air, Everett jumped ship and this time was accepted by the BBC, which was about to launch the pop network Radio 1. At first, though, Everett was restricted to a weekly lunchtime show and recording jingles and promotions. His patience was rewarded with a weekly Sunday morning program and, eventually, a daily show. However, Everett’s outspokenness and refusal to obey instructions from the “suits” led to his being sacked by the BBC in April 1970. Officially this was because of a potentially libelous remark—although clearly intended humorously—about the wife of a government

minister. In reality, though, this incident provided the excuse the BBC mandarins had been looking for since Everett began attacking the Musicians’ Union, whose leaders were in delicate discussions with the corporation over the amount of airtime given to playing music off of records (the Union thought that unlimited use of such recordings would deprive its members of their livelihood).

Then began a fallow period for the disc jockey, who was by this time widely recognized as one of the greatest on-air talents in the United Kingdom. Everett recorded programs for a few BBC local radio stations and did some television work. Then in early 1973 the BBC relented, and he was allowed back on Radio 1, but only if he would record his shows to allow producers to “vet” them before broadcast. Their judicious editing left some programs running considerably shorter than their allotted transmission time. However, salvation from this unsatisfactory existence came with the start of legal commercial radio in October 1973. Everett became one of the first—and most important—hires of the greater London service, Capital Radio. By Christmas of that year, Everett had teamed up again with Dave Cash to revive the *Kenny and Cash Show* at the vital breakfast period—again this was a huge success. However, now Everett’s personal life was to have a dramatic impact on his career. Although he married in 1969, Everett had struggled throughout his adult life with latent homosexuality and had had a series of crushes on heterosexual men. When one of these—an engineer at Capital—rebuffed him in 1975, Everett made a serious attempt at suicide, leaving a note explaining his anguish at the unrequited love. However, much to Everett’s evident frustration, he was found just before the sleeping tablets had a lethal effect.

After a period of recuperation, Everett returned to a weekly program at Capital. This was one of the most creative periods of his career, during which he created a comic space serial, Captain Kremmen and the Krells. Kremmen—forever saving the world from the evil Krells—was Everett’s alter ego, inspired by 1950s BBC radio serials such as *Journey into Space*.

In 1978 Thames Television persuaded him to do a highly successful and inventive television show for the Independent Television (ITV) network. In 1982 the show switched to the BBC and was to run for five years at prime time on the mainstream BBC-1 channel. In October 1981 he also switched to BBC for his radio work—this time on the supposedly easy listening network, Radio 2. A risqué joke about Prime Minister Margaret Thatcher on the last program under his contract led to his final departure from BBC radio. In 1988 Everett returned to Capital Radio for a daily program on the golden oldies AM service, “Capital Gold,” which he continued until July 1994, when, increasingly ill from AIDS-related illnesses, he felt obliged to give up work. He died in April 1995. His funeral service a few days later was attended by many of the

biggest names in British show business. Everett's "Wireless Workshop" studio was donated by his sister Kate to the Paul McCartney-sponsored Liverpool Institute for the Performing Arts.

Fadiman, Clifton 1904–1999

U.S. Writer, Editor, and Radio Emcee

Clifton Fadiman came to radio not from newspapers, vaudeville, or Hollywood but from the outwardly quieter world of book and periodical writing, editing, and publishing. As the master of ceremonies of *Information, Please* and other programs between 1938 and the mid-1950s, he used his knowing tone, witty repartee, and fondness for punning to become an appealing advocate of culture, learning, and civilized conversation for the World War II and postwar generations.

Fadiman learned the pleasures of knowledge at an early age. His older brother Edwin taught him to read when he was four, and before his teen years he was absorbing Milton, Homer, Dante, and other classic writers. To support himself during high school and college, he pieced together many jobs, beginning with mixing sodas in his father's Brooklyn drug store and then simultaneously reporting, selling ads, distributing copies, and otherwise helping with his brother's Long Island newspaper. He became a book reviewer for *The Nation* at age 17, and during his Columbia University days he was a ship's chandler, a bookseller, and a paid breaker-in of wealthier students' smoking pipes. By the time he finished his A.B. degree in 1925, he had gained direct experience of popular taste in many fields.

After two years of high school teaching, Fadiman joined Simon and Schuster in 1927, and as general editor there from 1929 to 1935 he made a number of shrewd publication choices that produced best-sellers. At the same time, he lectured at the People's Institute of New York and participated in many public forums, one of which would have a direct bearing on his radio career several years later. In 1934, when he assumed the editorship of *The New Yorker's* book review page, he also had his first taste of sustained radio work as an on-air book reviewer for WJZ, but that stint lasted only six months. His best radio days were still to come.

In 1938 Dan Golenpaul, a creator of informational radio programs, was brooding over conventional quiz shows, which

regularly dragged audience members to the microphone and exposed the shallowness of their knowledge. Golenpaul outlined a fresh approach: invite the public to send in questions to test a panel of experts. In choosing a master of ceremonies, Golenpaul recalled Clifton Fadiman's crisp contribution to a New School for Social Research radio forum on modern literature a few years earlier. Invited to lead the new quiz, Fadiman teasingly framed the questions for a panel gathered to record an audition disc. After some network doubts about public interest, *Information, Please* (titled after telephone operators' then-customary greeting) was first heard on 17 May 1938 on National Broadcasting Company (NBC) Blue. An unexpected hit, it rose to an estimated peak listenership of more than 9 million during its decade on the air and made Clifton Fadiman a popular icon of the intellectual establishment.

While producer Golenpaul battled sponsors' intrusions and brushed aside network directives, Fadiman tweaked the chemistry of the panel, which included newspaper columnist Franklin P. Adams, sportswriter and naturalist John Kiernan, and pianist Oscar Levant. The fourth chair, like the third one when Levant was absent in alternate weeks, was reserved for guest panelists from a wide range of performers, authors, statesmen, and athletes. Fadiman introduced the questions in a tone of mock menace, offering (as a 1941 review put it) an "ingratiating personality, with its intriguing dash of affable arrogance." Seldom missing an opening for a pun, he called Othello's killing of Desdemona an instance of "smother love," and when correspondent John Gunther correctly identified Reza Pahlavi as Iran's head of state, Fadiman pressed the question with "Are you shah?" while Gunther counterpunned, "Sultanly." Years after the program left the air, Fadiman confided that the questions and answers were only "an armature on which to build a sculpture of genuine conversation."

Clifton Fadiman fronted other programs, too. He and composer-conductor Morton Gould led the win-the-war

Clifton Fadiman in 1938
 Courtesy AP/Wide World Photos

entertainment show *Keep 'Em Rolling* on Mutual in 1941–42, and from 1954 to 1956 he hosted NBC's sustaining *Conversation* with author-publisher Bennett Cerf and panel guests. In 1955 he was named a "communicator" for NBC's weekend program *Monitor*. His television contributions included *This Is Show Business* and a short-lived attempt to bring *Information, Please* to the newer medium.

After the mid-1950s, Fadiman largely focused on literary interests. He had been a board member and reviewer for the Book-of-the-Month Club since 1944, and he remained on its board of directors for more than 50 years. Begun in 1949, his "Party of One" column appeared in *Holiday* magazine for a decade. He especially valued his essay on children's literature for the *Encyclopaedia Britannica*, and he continued to assemble anthologies and to write books and essays urging the public to know the pleasures of books, wine, and mathematics.

This man of wit and prodigious memory was genially satirized as the *Duffy's Tavern* habitué Clifton Finnegan, who seemed almost too stupid to breathe. In the intellectually gritty 1950s, Dwight MacDonal more somberly dismissed Fadiman

as a "midcult" peddler of learning to unwashed masses, and more recently critic John Leonard bemoaned Fadiman's "philistine" failure to appreciate William Faulkner's novels. Several generations of readers have been grateful, however, for Fadiman's invitations to learning in *Reading I've Liked* and *The Lifetime Reading Plan*, and listeners to *Information, Please* and *Conversation* discovered that knowledge and wit could be both gratifying and greatly entertaining.

Although the arc of Fadiman's career began and ended in writing and publishing, the middle span made a notable contribution to radio's upward aspirations. In fact, he was most valuable to radio precisely because he was not *from* radio, and for those who wished to condemn broadcasting as merely a noisy, empty-minded enterprise, Clifton Fadiman remained a hard nut to crack.

RAY BARFIELD

Clifton Fadiman. Born in Brooklyn, New York, 15 May 1904. A.B. degree, Columbia University, 1925. Taught at Ethical Culture High School, 1925–27; editor at Simon and Schuster, 1927–35; book editor, *New Yorker* magazine, New York City, 1933–43; debuted on radio doing book reviews, 1934; noted as moderator of *Information, Please*, 1938–48; Book-of-the-Month co-founder and review panelist, 1944–99; member, Board of Editors, *Encyclopaedia Britannica*, Chicago, 1959–99; Regents Lecturer, University of California, Los Angeles, 1967. Recipient: Award for distinguished service to American literature for radio program, *Information, Please!*, 1940; Clarence Day Award, American Library Association, 1969; Dorothy C. McKenzie Award, Southern California Council on Literature for Children and Young People, 1986; National Book Award for distinguished contribution to American letters, 1993. Died on Sanibel Island, Florida, 20 June 1999.

Fairness Doctrine

Controversial Issue Broadcasting Policy

Until 1987 (with related parts lasting until 2000), the Federal Communications Commission (FCC) adhered to a series of policy guidelines collectively called the *fairness doctrine*. These guidelines encouraged stations to cover issues of public controversy, and to provide a variety of points of view on those issues. While they lasted, the policies were among the most controversial of all FCC program regulations.

Origin

A station licensee's duty to present diverse views on public issues was first declared by the Federal Radio Commission in 1928. A dozen years later, however, the FCC reversed direction when it strongly criticized a station for its practice of editorializing. In its 1941 *Mayflower* decision, the FCC concluded that with limited frequencies available for broadcasting, the public interest could not be well served by dedication of a broadcast facility to the support of its own partisan ends. In line with the *Mayflower* decision, broadcasters began to prohibit the sale of commercial time to deal with controversial issues—a policy that also helped them financially since such ads would only serve to anger some listeners and other advertisers.

In 1949 the FCC reversed itself, reconfirming that while stations have an obligation to cover controversial issues of public importance they now could (but did not have to) editorialize. When WHKC in Columbus, Ohio, refused to sell airtime to a labor union, the FCC stated that the station must be sensitive to the problems of public concern in the community and make sufficient time available on a nondiscriminatory basis. The commission concluded that radio stations have the “responsibility for determining the specific program material to be broadcast over their stations.” Therefore, they were required to devote broadcast time to “issues of interest in the community served by their stations and [ensure] that such programs be designed so that the public has a reasonable opportunity to

hear different opposing positions on the public issues of interest and importance in the community.”

To nail down the proposed new policy on editorializing, the FCC held hearings on the matter. From the hearings came a 1949 statement, *In the Matter of Editorializing by Broadcast Licensees*, which placed two primary obligations on the broadcasters. What would become known later as the “fairness doctrine” required broadcasters (1) to cover controversial issues of public importance, and (2) to provide a reasonable opportunity for the presentation of contrasting viewpoints on those issues.

Development

A decade later, in 1959, Congress entered the fray. Legislators amended Section 315 (the political “equal opportunity” section of the Communications Act) to limit the applicability of the requirement to four types of news programs. At the same time, they made more concrete the broadcaster's responsibility to afford reasonable opportunity for the discussion of conflicting views on issues of public importance. This added phrase would cause considerable legal confusion in the future.

By 1967 the FCC had extended what was now commonly referred to as “the fairness doctrine” to include broadcast advertising of cigarettes, reasoning that because smoking was a controversial health issue, broadcasters were therefore required to provide contrasting viewpoints (This provision lasted until cigarette advertising was removed from the air entirely in the early 1970s.)

Complaining about yet another extension of the fairness doctrine, broadcasters asked what other types of program or advertising might trigger fairness doctrine concerns. To clarify the scope of their doctrine, the FCC instituted a wide-ranging inquiry into the fairness doctrine and its efficacy. As one result, the commission created three “contingent rights of

access” policies similar to Section 315: the Zapple rule, the political editorializing rules, and the personal attack rules. The Zapple rule (named for a long-time Senate staff member, Nicholas Zapple, who had been involved with the issue) held that supporters of opposing political candidates must be given approximately the same amount of airtime during election campaigns. In its political editorial rule, the FCC required broadcasters to contact a legally qualified candidate within 24 hours of any station editorial opposing the candidate or endorsing an opponent and to provide a script or tape as well as free time to reply. The political editorial rule pertained only when a station editorial represented the views of the station licensee. Political commentators who were independent of management were subject only to the general fairness doctrine. Finally, the FCC’s personal attack rules specified that broadcasters must offer reply time if the honesty, character, or integrity of an identified person or group was attacked during the discussion of a controversial issue of public importance. A person attacked had to be notified within a week of the date, time, and identification of the broadcast. The licensee was required to provide a script, tape, or accurate summary of the attack and offer a reasonable opportunity for the attacked person to respond over the same station at no charge.

The Supreme Court firmly supported the fairness doctrine’s constitutionality in its 1969 landmark decision in *Red Lion Broadcasting Co. v FCC*. Broadcasters argued that the number of commercial radio and TV stations in the country was higher than that of newspapers (for which no such “fairness” policy existed because of the First Amendment)—and growing. Therefore, they argued that the fairness doctrine was unnecessary because the public suffered no shortage of opportunities to hear different stations and diverse viewpoints. Broadcasters also contended that the fairness doctrine actually “chilled” or curtailed First Amendment rights of broadcasters by encouraging self-censorship—in other words, that many controversial issues might not be covered at all. The Court rejected both of these contentions, asserting that as long as demand for stations exceeded supply (the high sales price of stations was one such indicator), scarcity of spectrum remained, and thus allowed such FCC policies. In addition, the Court ruled that the doctrine did not violate a broadcaster’s First Amendment rights since the right of the viewers and listeners to hear diverse viewpoints was paramount to the right of broadcasters to express their views.

Another Supreme Court case decided five years later, *Tornillo v Miami Herald* (1974), however, concluded that a fairness-type of requirement on newspapers in the state of Florida was clearly unconstitutional. Decided by the same court membership as had decided *Red Lion* five years earlier, the decision showed the stark difference in how the law viewed newspaper and broadcast journalists.

About the same time, the FCC adopted another Fairness Report, which reaffirmed the conclusions of its 1949 decision and upheld the application of a general fairness doctrine requirement for broadcast licensees on both statutory and constitutional grounds.

Demise

Despite the FCC’s continuing series of reports and codifications of the fairness doctrine requirements through the 1970s, broadcasters still had problems with the doctrine. They continued to argue that it was too difficult to determine what issues were controversial, which viewpoints should be represented, and suggested that the doctrine was having a “chilling” effect on the flow of ideas: broadcasters would be reluctant to cover controversial issues because according to the doctrine they would be required to report “fairly.” IN *FCC v League of Women Voters of California* (1984) the Supreme Court concluded that the scarcity rationale underlying the doctrine might be flawed and that the doctrine might be limiting the breadth of public debate. A footnote suggested that the Court awaited some kind of an indication from the FCC as to whether the conditions that had led to the fairness doctrine (and the *Red Lion* decision) had significantly changed. The doctrine was increasingly difficult to enforce and went against the grain of an increasingly deregulatory commission.

Responding to a complaint brought by a group called the Syracuse Peace Council, on 26 October 1984 the FCC concluded that WTVM-TV (a Syracuse, New York, television station owned by Meredith Corporation), had violated the fairness doctrine in its treatment of a controversy surrounding construction of a nuclear power plant, a conclusion that the Meredith Corporation vigorously contested. A few months later the FCC released another in its series of Fairness Reports to publicly reevaluate the need for the doctrine. The commission concluded that:

On the basis of voluminous factual record compiled in this proceeding, our experience in administering the doctrine and our general expertise in broadcast regulation, we no longer believe that the Fairness Doctrine, as a matter of policy, serves the public interests. In making this determination, we do not question the interest of the listening and viewing public in obtaining access to diverse and antagonistic sources of information. Rather, we conclude that the Fairness Doctrine is no longer a necessary or appropriate means by which to effectuate this interest. We believe that the interest of the public in viewpoint diversity is fully served by the multiplicity of voices in the marketplace today and that the intrusion by government into the content of programming occasioned by the enforcement of the doctrine unnecessarily

restricts the journalistic freedom of broadcasters. Furthermore, we find that the Fairness Doctrine, in operation actually inhibits the presentation of controversial issues of the public importance to the detriment of the public and in degradation of the editorial prerogative of broadcast journalists (FCC, *Inquiry into Fairness Doctrine Obligations of Broadcast Licensees*, 102 FCC 2d 145, 1985).

The report argued that (1) the doctrine was contrary to the public interest because it “chilled” expression, and, therefore, (2) the doctrine was probably unconstitutional. Despite these conclusions, the FCC retained the doctrine because it doubted that it had the power to abandon it. The FCC’s legal advisors concluded that with its 1959 amendments in the 1934 act, Congress had formally incorporated the doctrine into Section 315, and thus the FCC could not remove it. Therefore, the FCC asked Congress to abolish the doctrine; Congress did nothing. Meanwhile, in the *Meredith* case, the FCC was in the awkward position of enforcing a doctrine that it was fervently denouncing. On 19 September 1986 the U.S. Court of Appeals for the District of Columbia (D.C.) Circuit cleared up a legal ambiguity by ruling that the fairness doctrine had never been made a part of the 1934 law but was simply a regulation of the FCC. This meant that the FCC could drop its own regulation.

In the meantime the Meredith Corporation appealed the FCC fairness decision on constitutional grounds. In January 1987 the U.S. Court of Appeals for the D.C. Circuit instructed the FCC to address Meredith’s constitutional argument against the fairness doctrine. Faced with this opportunity, on 6 August 1987 the FCC formally announced it would abandon the fairness doctrine on the several bases already argued, chiefly that the doctrine was probably unconstitutional and that it certainly had a chilling effect, exactly opposite from what was intended. The FCC concluded that “the Constitution bars us from enforcing the fairness doctrine,” and argued that as the fairness doctrine chilled speech, it could not be construed to be sufficiently narrowly tailored to achieve a substantial government interest—the usual Supreme Court standard for content rules. Therefore, the FCC concluded that the fairness doctrine contravened the public interest.

Shortly after the FCC’s decision to drop the fairness doctrine, Congress tried several times to resurrect it by making the doctrine part of federal law. One of the proposed bills stated:

[The fairness doctrine] ha[s] enhanced free speech by securing the paramount right of the broadcast audience to robust debate on issues of public importance; and . . . [it] fairly reflects the statutory obligation of broadcasters under the [Communications] Act to operate in the public interest . . . [The fairness doctrine] strikes a reasonable

balance among the first amendment rights of the public, broadcast licensees, and speakers other than owners of broadcast facilities (H.R. Bill 1934, 100th Congress, 1st Session, proposing new Section 315(a) to the Communications Act, 3 June 1987).

President Reagan vetoed the bill, calling the fairness doctrine a “content-based” regulation and antagonistic to the freedom of expression. In a veto message drafted at least in part by former FCC Chairman Mark Fowler (who had long sought to end the doctrine), Reagan claimed that

S.742 simply cannot be reconciled with the freedom of speech and the press secured by our Constitution. It is, in my judgment, unconstitutional. Well-intentioned as S.742 may be, it would be inconsistent with the First Amendment and with the American tradition of independent journalism. Accordingly, I am compelled to disapprove of this measure (23 *Weekly Compilation of Presidential Documents*, 715–16, 1987).

Congress was unable to override the veto. Attempts to revive the bill in 1989, 1991, and 1993 failed of passage. Such attempts largely ended when Republicans took control of congress in 1994.

The Supreme Court effectively supported the FCC’s decision not to continue the doctrine when in 1990 it declined to review a lower court decision upholding the FCC action. Three years later, a federal appeals court decision reaffirmed that the fairness doctrine had been merely a commission policy and not a congressionally mandated law.

Aftermath

After the FCC abandoned the fairness doctrine, it announced it would no longer enforce fairness requirements for broadcast discussions of referenda, initiatives, recall efforts, and bond proposals. However, the commission made clear that its related personal attack, political editorializing, and Zapple rules remained in force. Broadcasters had first asked the FCC to abolish these rules in 1981, following up with at least four more formal requests over the next 16 years; all to no avail.

In December 1998, two leading broadcast trade organizations—the Radio-Television News Directors Association and the National Association of Broadcasters—challenged the constitutionality of the FCC’s personal attack and political editorial rules in the U.S. Court of Appeals for the D.C. Circuit. In a series of decisions over the next two years, the FCC was unable to sustain its rules against the Court’s firm finding that they appeared to be unconstitutional limits on broadcaster freedom. Angry at the slow moving commission, in October 2000 the court finally ordered that the rules be vacated (dropped)

immediately, and the FCC complied. The last vestiges of the long-lasting fairness doctrine were gone.

Family Theater

Radio Drama

Broadcasters have often been criticized for making program decisions based on monetary profit rather than a desire to provide educational and thought-provoking content. But throughout the history of radio broadcasting, some producers have used their talents to create programs designed to educate, enlighten, and assist listeners in coping with the difficult situations that arise in everyday life. *Family Theater*, which became one of the longest running weekly drama anthologies in radio history, was one such program.

On 13 May 1945, the Mutual Broadcasting System broadcast a Mother's Day special with an unusual premise—to unite the country in praying the Holy Rosary. The program featured the Sullivans, a family that had lost five sons in a single naval battle during World War II, and included a guest appearance by Bing Crosby and a message from President Truman. This event was the initiative of Father Patrick Peyton, C.S.C, a priest of the Congregation of the Holy Cross who had immigrated to the U.S. from Ireland in 1928. Inspired by the success of this Mother's Day program, Father Peyton, relying largely on private donations, founded Family Theater Productions in

1947. He enlisted the help of Hollywood stars and other media professionals to produce a weekly half-hour radio drama. The series, called *Family Theater*, premiered as a sustaining program on 13 February 1947 on Mutual. Programs emphasized moral problems, and each installment ended with an encouragement to prayer, using Tennyson's famous words, "More things are wrought by prayer than this world dreams of." Although Father Peyton was a Catholic priest, the dramas, by agreement with the network, were non-sectarian. They emphasized moral themes, but were designed as entertainment programming to appeal to a mass audience. The weekly dramas were supplemented by occasional holiday specials.

One of Mutual's contract provisions was that the series had to include at least one Hollywood star each week. The network's commitment to this series was in airtime alone—Father Peyton promised to pay all production costs. In an effort to help with these costs, stars frequently donated their payment back to the producer.

The first *Family Theater* drama, entitled "Flight From Home," starred Loretta Young, James Stewart, and Don

Ameche, and was written by True Boardman. Subsequent episodes featured Raymond Burr, Bing Crosby, Irene Dunn, Gary Cooper, Gregory Peck, and dozens of other major Hollywood stars. Although the final original production was completed in 1958, *Family Theater* dramas ran for 22 years. When original radio production was halted so that Family Theater Productions could direct its attention to the newer medium of television, the series continued running in repeats on various stations across the country. Many of the programs were rebroadcast as part of a new series called *Marian Theater*. In total, 482 original programs were produced, and, at the height of its popularity, the series ran on 429 stations nationwide. These radio programs were broadcast widely outside of the United States: in Canada, Latin America, Spain, Mozambique, Australia, and the Philippines. *Family Theater* won numerous awards for excellence, from trade associations and private organizations, and from non-Catholic as well as Catholic groups. Its motto became a well-known saying in popular culture, "the family that prays together stays together."

Father Peyton died in 1992, but his work continues in the United States and throughout the world. Family Theater Productions, which is now part of the Holy Cross Family Ministries (www.hcfm.org), has six international offices that produce television and radio programs. As of 2000, a dramatic radio series produced in the United States, called *La Historia*

de Quien Soy (The Story of Who I Am), continues the spirit of *Family Theater*. The Spanish-language drama focuses on the lives of a fictional U.S. Latino family, and explores issues of ethnicity, morality and faith.

Fan Magazines

Radio fan magazines serve two popular audiences whose memberships share an intense interest in either the programs and personalities or the technology of radio. The first audience consists of fans who listen to broadcasts, become curious, and seek additional information not provided over the radio. The other group is more concerned with radio's technology, such as amateur and ham radio operators, who are interested in developing and using the technology to both transmit and receive signals using shortwave radio. Both audiences continue to support a number of radio magazines.

Fan magazines enjoyed success because of the large and growing radio audience that was interested in the programs and personalities heard. The magazines were most successful from the mid-1920s through the early 1960s. Fan magazines published a variety of content, including program listings and descriptions. A substantial portion of their content was devoted to radio personalities and included picture stories,

hobbies, home life, and any relevant scandal or gossip. Most of the magazines included reader correspondence. Fan magazines helped audiences keep track of programming and stay interested, and they provided information for interaction among other fans.

The oldest group of radio fans are the amateur and ham radio operators. The American Radio Relay League's (ARRL) monthly magazine, *QST*, started publishing in 1916. *QST* was named for the international signal "QST," which means "attention all stations." Still published by the ARRL, *QST* has for years published product reviews and technical articles. Members share tips and tricks for operating and constructing radios. The difference between *QST* and popular fan magazines is the focus on radio technology rather than content. Because the magazine is published by an organized group, it reports news, legal and regulatory issues, and technical information and performs many of the functions of a trade journal.

Radio News

Cosmopolitan, *McClure's*, *Munsey's*, and other general interest magazines provided information about radio in the early 1900s, but it was not until the radio boom of the 1920s that exclusive mass-market radio magazines appeared. The need for a popular publication that served radio audiences was recognized immediately by early broadcasters. For example, KDKA distributed *Radio Broadcasting News* to about 2,000 newspapers. The magazine was developed shortly after the first broadcasts in order to provide background information and program listings that could be published in local newspapers. As radio's popularity increased during the first half of the 1920s, the number of radio magazines grew. By the mid-1920s, there were between 35 and 40 radio magazines serving an audience of nearly 1 million readers. *Radio News* claimed (May 1926) that the top five radio magazines, including *Radio News*, *Popular Radio*, *Radio in the Home*, *Radio Broadcast*, and *Radio Age*, had over half a million readers.

Radio News was one of the first magazines to capitalize on the radio boom and was founded by one of radio's greatest fans, Hugo Gernsback, who was familiar with both publishing and radio. He published a small radio magazine called *Modern Electrics* in New York in the early 1900s as a way to stimulate sales at his radio electronics store. In 1919 Gernsback started *Radio News* as a general interest radio magazine. Like many of the early radio magazines, the content of *Radio News* appealed to a broad audience of radio enthusiasts. Broadcasting was in its developmental stages, but the popular appeal of radio was already evident. *Radio News* was primarily a "booster" for radio, promoting radio to a developing audience of fans. *Radio News* called itself "Radio's Greatest Magazine," and its early content appealed to the amateur operators and listeners who fueled the early 1920s radio craze. Each issue had a Norman Rockwell-like cover with a scene that showed some aspect of radio in modern American life. The magazine was highly illustrated, and the content was diverse. Much of the content targeted amateur operators at a variety of skill levels by providing technical articles on home construction of radios and on the selection of components and equipment. There were regular features offering technical information and articles discussed receiving and transmitting radio signals. *Radio News* also held contests that challenged readers' technical skills with equipment construction and signal reception (DXing). The magazine even offered lessons in Esperanto, promoted as the international language of amateur radio operators.

Radio News promoted radio as a significant social force that served a variety of needs. There were articles about the people who had developed radio and were shaping its future and about the radio celebrities whose voices and sounds were

being recognized across the country. The magazine provided station listings and discussed some of the new successful radio stations, including WRNY in New York, where Gernsback delivered a weekly Tuesday night lecture. There were cartoons, poems, and fictional articles in which radio was a central theme. Readers were encouraged to become knowledgeable about radio in a number of ways. Crossword puzzles required readers to know terms and call letters. There were frequent contests, which included submitting drawings of an "ideal" receiving set, composing four-line verses using standard circuit symbols, or identifying errors in the drawings that appeared on the cover of the magazine. *Radio News* sponsored a "radio play" contest and published the works of the winners and finalists.

Radio News also featured a significant amount of advertising. For example, the index of advertisers for the January 1925 issue lists 381 advertisers and includes 180 pages with advertising (out of 240 total). Equipment and services offered by all segments of the emerging radio industry were advertised. There was also a classified advertising section. *Radio News* used product names in some of its construction articles, although it discontinued the practice after Gernsback was accused of selling out to advertisers. In 1926 *Radio News* claimed that it was second only to *Radio Broadcast* (a successful trade magazine) in its volume of advertising.

Radio News enjoyed its greatest success during the chaotic early 1920s. Advertising revenues dropped significantly as the distinction between professionals, amateurs, and listening audiences became more clearly defined. In the early 1930s, *Radio News* narrowed its appeal to the amateur technical audience and continued publishing technical information until in 1959 it became *Electronics World*.

Radio Guide

The successful popular mass-market fan magazines that emerged in the 1930s served the audiences created by broadcasting. There were more than a dozen popular fan magazines published during radio's golden age, including *Movie Radio*, *Radio Album*, *Radio Dial*, *Radio Digest*, *Radio Guide*, *Radio-land*, *Radio Mirror*, and *Radio Stars*. These magazines followed the example set by popular movie fan magazines, which focused on personalities, took readers behind the scenes, and always included pictures or portraits of stars on the cover.

Radio Guide is an example of this kind of fan magazine. *Radio Guide* was published weekly by M.L. Annenberg in Chicago beginning in 1932. By 1936 *Radio Guide* was printed in 17 regional editions and was selling 420,000 copies per week, and the content typified the radio fan magazine of the time. Part of the magazine offered stories and pictorials concerning radio personalities. One pictorial feature called the "Radio

Guide Album" included a full-page picture of the cast of a selected network program. There was information and gossip about radio stars and often a short story.

Radio Guide regularly provided short reports about current radio news, shortwave information, and upcoming musical events. Regular features that appeared in the magazine included "Coming Events," "Hits of the Week," "Contests on the Air," "X-word Puzzle," and "Radio Boners." Approximately half of the magazine's content featured a programming guide with day-by-day listings of programs and the stations that aired them. The magazine marked high-quality programs with a star symbol placed next to the listing. Religious programs were identified with a bell symbol. The program section included a log of numerous radio stations, including foreign outlets, and a modest listing of shortwave programs for the week. *Radio Guide* remained an important source of fan support through the early 1940s and laid the groundwork for the same publisher's 1953 creation of the hugely successful *TV Guide*.

Radio Mirror, which started publishing in 1933, changed its name to *TV Radio Mirror* in order to serve the popular interest in television. Fan magazines continued to provide information about radio into the 1960s, but their general content shifted substantially from radio to television. As radio became a medium of music that largely served local markets, the need for mass-market radio fan magazines disappeared.

Web Fan Magazines

The shift from national networks to local programming and the use of syndicated programming have resulted in smaller, more specialized groups of fans for radio programs and fewer opportunities for successful national mass-market fan magazines. A few traditional fan magazines are published in large regional markets, such as the *L.A. Radio Guide* in southern California, but generally the current market for radio fan magazines is limited.

The primary means of reaching fans today is with webpages and *e-zines* (electronic magazines). E-zines are delivered through the internet and presented in formats that resemble traditional fan magazines. Subscriptions are ordered through a webpage. An example is *Krud Radio*, a fan e-zine that offers a humorous look at radio and arrives by e-mail. About.com is accessed through a webpage and offers a "Guide to Radio" that discusses radio news, conducts polls about a variety of radio topics, provides links to internet audio sites, and includes a chat room for discussing radio topics.

Webpages offer fans the same content found in traditional fan magazines but provide a level of interaction not found in traditional magazines. Talk show host Art Bell's webpage logged more than 5.5 million visitors between January 1997

and January 2000, offering program summaries, archives, a chat room, feature articles, links, a studio camera, audio clips, and more.

Fans sometimes establish "unofficial" webpages that target other fans. Howard Stern's show has a number of unofficial webpages. For example, "Heynow's Webpage" offers a collection of Howard Stern RealAudio files. Stern's associate, Fred Norris, known as the King of Mars, has an unofficial fan site that was started because "everyone else on the show has at least one stupid fan page, so why not Fred."

Internet directories of stations and programs are replacing printed directories in fan magazines. Lists of stations and links to internet audio are provided by a number of websites, including RadioLinks.net, Broadcast.com, Macroradio.net, RadioStations.net, Netradio.net, Darnell's Black Radio Guide, and the Massachusetts Institute of Technology (MIT) List of Radio Stations.

Amateur and ham radio operators are experiencing a similar change in their fan magazines. There are still a number of specialized periodicals that target amateurs, but the internet is becoming an increasingly important source of information. Most organizations and publishers that produce magazines for this audience also have webpages, including the ARRL. *AntenneX*, a successful magazine that specializes in antennae for amateurs, is now promoting its website, which logged over 2 million visitors between 1997 and early 2003. *Ham Radio Online*, offered by the Virtual Publishing Company, provides technical information, news, opinions, cartoons, on-line discussions, feature stories, up-to-the-minute reports on world disasters, and an on-line newsletter delivered by e-mail.

The internet has revitalized fan interest by providing sites where smaller and more specialized groups of fans can find the content of traditional fan magazines. In addition, the community of fans using the electronic magazines and websites enjoys a level of interaction that traditional magazines could never offer.

Far East Broadcasting Company

U.S.-Based Religious Broadcaster

The Far East Broadcasting Company (FEBC) is an evangelical Christian international radio service that began in Asia and eventually developed stations in much of the world.

Origins

While attending a Bible college in Pasadena in 1934, Robert Bowman became the baritone in a men's quartet that was part of the Haven of Rest radio ministry on KMPC in Los Angeles. The quartet was headed by Paul Myers, known as "First Mate Bob" on the air, and Bowman would often host the program in Myers' absence, thus becoming known as "Second Mate Bobby." He remained with the program for 12 years.

Given his radio experience, Bowman became interested in the potential of radio use by those wishing to reach an international audience with a similar religious message. In 1938 he began initial planning for such an outreach program with John Broger, an actor and producer who was a former classmate of Myers at the Pasadena college. The war intervened and Broger became a communications expert in the Navy. On 20 December 1945, Bowman, Broger, and minister William J. Roberts founded the Far East Broadcasting Company to provide Christian programming in Asia.

After the incorporation of this new venture, Bowman left the Haven of Rest program to become FEBC vice president; Broger was president, Roberts executive secretary. The three agreed that, as Bowman was well known from his years with Haven of Rest, he should head the fund-raising process while Broger sought broadcasting licenses in Asia. As their original aim was to broadcast Christian programs in China, Bowman

and Broger worked with the Chicago-based Moody Bible Institute to produce a syndicated radio series, *The Call of the Orient*. Broger traveled to Shanghai to meet with Christian missionaries, and by June 1946 the China Christian Broadcasting System had been established with plans (never realized) to place stations on the air throughout China. In September Broger was granted a one-year franchise for stations in the Philippines, with the goal of establishing a base for shortwave broadcasting to the rest of Asia.

While Broger was involved in these negotiations, Bowman was raising funds through speaking and singing engagements in churches throughout southern California. He explained that funds were needed for the land, power generators and transmitters, antenna towers, and production equipment needed to put FEBC on the air. In November 1946, FEBC made the final payment for 12.5 acres in Karuhatan (north of Manila) in the Philippines. The next month, the first missionaries traveled to Manila. In April 1947 the first FEBC programs were carried (briefly as it turned out) on local stations in Shanghai, and on 4 July 1948 FEBC's own 1,000-watt station, KZAS (soon changed to DZAS) in Manila was dedicated in what was called Christian Radio City, putting out an AM signal to the metropolitan region. Shortwave capability was added later that year.

Until 1954, Bowman's and Broger's families took 18- to 24-month stints running the station. Bowman's first year was spent attempting to get the one-year franchise extended. With local legal assistance he was able to convince the Philippine Radio Board of Control to grant FEBC its first permanent license.

By July 1949 FEBC had initiated shortwave broadcasts to other parts of Asia from the Philippines, including China and

Russia. (The Shanghai operation had been closed down by the formation of the People's Republic, and listener mail from China disappeared for three decades.) By the end of the year, FEBC was broadcasting in 27 different languages, using station DZH-6 with 10,000 watts.

By the end of 1951, FEBC had five transmitters operating and began broadcasts to Japan that September. Bowman traveled to the U.S. to continue fund-raising efforts to expand the operation, but in 1953 returned to Manila to take over the administration of FEBC. By the end of that year, FEBC had three domestic stations and four more for overseas broadcasts. Broger became an information and education official with the Department of Defense beginning in 1954 and resigned his FEBC post three years later. Bowman became president, a position he held until his 1992 retirement when he became president emeritus.

In 1957 FEBC received licenses to broadcast in Okinawa using two AM stations (these were surrendered in 1972 when the island reverted to Japanese control). In September 1958, FEBC placed its first 50,000-watt transmitter into operation in the Philippines and opened recording studios in Hong Kong, then a British colony. A Tokyo studio followed in the next year. FEBC purchased KGEI in San Francisco in 1960 to initiate broadcasts to Latin America; the station had previously been used by the Office of War Information to broadcast news and information to the Pacific theater during World War II. Becoming known as "The Voice of Friendship," FEBC operated the station (soon placing a second shortwave transmitter on the air) until 1994.

FEBC efforts to broadcast to Asia were expanded in 1968 with the establishment of a British associate company, Far East Broadcasting Associates, to operate shortwave transmitters in the British-controlled (now Commonwealth) Seychelles islands, with the goal of reaching the Middle East, North Africa, and South Asia. Two stations in South Korea and another on the Pacific island of Saipan (1977) replaced the stations lost on Okinawa. Broadcasts to China were expanded

with huge transmitters (100 and 250 kilowatts) beaming signals to the mainland from several locations.

By 1979 FEBC was providing some 300 hours of programming per day, in 72 languages from 28 stations. Service was extended to areas of what had been the Soviet Union in the early 1990s. FEBC operated more than 30 transmitters by 1995, with a staff of more than 1,000 (90 percent of whom were non-U.S. citizens) and an annual operating budget of \$17 million. In 2000 the Far East Broadcasting Company broadcast its gospel message more than 400 hours a day in 154 languages.

Farm/Agricultural Radio

Radio has always had a special place in the lives of farmers and their families. Because of the isolation of rural life, the entertainment and information brought by radio are especially welcome, and up-to-the-minute weather forecasts and agricultural market reports are essential to every modern farmer's business. Even in today's age of television and the internet,

farmers still consider radio to be their most important source of agricultural information, and surveys indicate that most of them tune in to farm programs every day.

In 2002, about 75 radio stations, mostly in rural communities, provided what they consider to be a full-time agricultural format, and another 1,000 stations broadcast at least one hour

per week of special farm-related programming. In addition, a number of regional and national farm radio networks have evolved to provide stations with specialized programs and advertising.

Federal and state agencies, led by the United States Department of Agriculture (USDA), provide radio reports on topics ranging from the latest research on crop diseases to new agricultural marketing strategies. This information is provided to stations by the USDA in the form of scripts and press releases and as prerecorded audio and video reports that broadcasters can integrate into their own locally produced programs.

On commercial stations, farm programming is generally supported through the sale of advertising. Large corporate producers of agricultural products and services have found radio to be an ideal medium for reaching the widely dispersed farm audience, a group that includes the decision makers of U.S. agribusiness. Farmers who tune in for market reports on these stations are likely also to hear commercials for chemicals, fertilizer, seed, and other agricultural necessities.

Farm programming is also provided by many noncommercial radio stations, especially those associated with land grant colleges and universities with large agricultural research and teaching components. Many of these campuses have strong ties to federal and state farm service offices that provide regionalized agricultural information and programming.

Origins

Radio was just one of several technological innovations in the early part of the 20th century that revolutionized farm life. The telephone, phonograph, automobile, and rural mail delivery all served to greatly reduce the isolation of rural families. But the coming of radio in the 1920s meant that for the first time, farms were instantaneously connected to the outside world. Music, sports, politics, and religion were suddenly available with the twist of a dial. Once-isolated farm families were suddenly a part of the growing national radio audience. In most farm homes, a battery-operated radio became a fixture long before the house was wired for electricity. Perhaps most significant, the radio brought farmers information that had an immediate impact on their livelihoods. Accurate weather reports allowed farmers to time harvests and protect crops from storms, and immediate reports of commodity prices from big-city agricultural markets meant farmers could reap bigger profits and manage operations more efficiently.

In fact, government-produced weather forecasts and agricultural market reports were among radio's first regularly scheduled programs. Initially, these broadcasts were aired experimentally by college and university stations, which were among the first on the air with radio transmitters. As early as 1921 (some sources say earlier) the University of Wisconsin's 9XM (later, WHA) began transmitting agricultural informa-

tion on a regular schedule. Many other stations soon followed suit.

The USDA was especially quick to recognize radio's potential for reaching the far-flung farm audience. By the mid-1920s the agency had begun producing and distributing not only weather and market reports, but also informational programs on crop and livestock problems, agricultural marketing, and home economics. Scripts were distributed free of charge to radio stations through the USDA's vast network of county extension agents. The county agents themselves often worked closely with local radio stations to supplement programming with information on topics of local concern. At least some of the government-produced radio programs also had a distinctly political purpose: since farmers represented an important national voting bloc, the USDA interspersed the more mundane topics with features and talks that explained and promoted the administration's farm policy.

Early on, businesses that catered to rural customers also saw the potential of programming aimed specifically at the farm audience. Although overt radio advertising was still considered inappropriate in the early 1920s, these companies understood the promotional value of having their names on the air. Sears and Roebuck established the Chicago station WLS ("World's Largest Store") in part to promote its booming mail-order business with rural homes. The company was also instrumental in establishing other early stations in the Midwest and South. In Nashville, the National Life and Accident Insurance Company created the station WSM to help promote its products. In this case, "WSM" stood for the company's slogan, "We Shield Millions."

Stations across the country began to realize that the millions of U.S. farm homes constituted a special audience, and many began to produce and carry programs especially tailored for rural listeners, including those aimed at attracting farm women and children. Indeed, the Federal Radio Commission's radio frequency allocation scheme of 1928, with its high-powered clear channel stations designed to serve large rural areas, was very much driven by a concern (some of it admittedly political) for rural audiences. The National Broadcasting Company (NBC)'s *The National Farm and Home Hour*, begun in 1928, became one of the network's longest-running programs.

As radio developed, the government mounted a major campaign to get more farmers to buy receivers. USDA-authored articles in newspapers and farm periodicals told readers that the radio receiver had become an agricultural necessity. Countless anecdotes were reported of how farmers were able to save their crops by radio's advanced warning of bad weather or to increase their income by using radio reports of market price fluctuations.

But despite these efforts, bad economic times meant the adoption rate in rural areas lagged far behind that in cities. In the 1920s and 1930s many farmers barely eked out a subsis-

tence, and hard cash was always in short supply. In addition, farmers generally lived at great distances from stations and needed to buy more expensive receivers to get satisfactory reception. And despite New Deal rural electrification efforts, many regions still lacked electricity, forcing use of battery-powered radios. By the 1940 census, 92 percent of urban U.S. homes reported owning radios, but only 70 percent of rural farm homes did. The situation among rural nonwhites was far worse. The chronic poverty among minority farmers meant that as late as 1940, only 20 percent owned radios.

Farm Radio and Country Music

Early listener response convinced broadcasters that rural and urban audiences differed considerably in their musical tastes. Farmers, it was believed, much preferred what was then called “hillbilly” music. This style was based on the folk songs commonly performed in rural areas, usually by one or two musicians playing simple stringed instruments. As the need grew for more programming to attract and hold the farm audience, several large stations developed live musical variety shows with a distinctly rural flavor. *National Barn Dance*, from Chicago’s WLS, and *The Grand Ole Opry*, from WSM in Nashville, were two of the earliest and most successful.

By providing an audience for budding new performers and a ready market for their records, farm radio music shows played an essential role in the development of country music. Record companies began providing free or low-cost performers in exchange for the promotional value of having their stars heard on radio broadcasts. The fact that Nashville was the home of the powerful WSM and its immensely popular *Grand Ole Opry* was a decisive factor in that city’s becoming the country music capital of the world.

The National Association of Farm Broadcasters

Radio stations soon recognized the need for specialized broadcast personnel to produce agricultural news and information programming. The position of station “farm director” was generally filled by someone who knew farming well and who could dedicate full attention to researching and reporting on agricultural issues. Often, male farm directors were assisted by women who were delegated the duties of reporting on rural home economics and hosting homemaker-oriented programs of interviews, recipes, and household hints. Today, farm broadcasters are often graduates of specialized university programs in agricultural journalism, and, although men still dominate the field, the role of female broadcasters has broadened considerably.

In the 1940s farm directors from several stations met and formed what would eventually be known as the National Association of Farm Broadcasters (NAFB). Today, the NAFB is

farm broadcasting’s major trade organization, offering members a news service, sales and marketing assistance, and farm audience research.

Farm Radio in the Television Age

The coming of television meant changes throughout the radio industry. Many of the powerful big-city radio stations no longer found it profitable to target rural audiences, and farm radio programming increasingly became the province of the growing number of lower-powered regional or local stations serving rural areas. At the same time, agricultural news and information programs began to appear on many local television stations that served farm audiences.

Yet for a number of reasons, farm radio has remained a viable medium. The low cost and portability of modern radio receivers means today’s farm families can own several sets and listen wherever they happen to be. Radios installed in trucks, tractors, and other farm vehicles can accompany farmers throughout the workday. Timely weather forecasts and market reports remain just as important to farmers today as they were in the early days of radio. At the same time, the relatively low cost of operating a local radio station means that farm broadcasters can stay profitable even while appealing to a relatively narrow audience. In fact, it is just this characteristic that attracts agricultural advertisers, who can zero in on their target audience at a relatively low cost. These characteristics mean that farm radio will continue to flourish.

Faulk, John Henry 1913–1990

U.S. Radio Humorist

When his developing radio career was cut short in the mid-1950s because of political blacklisting, Texas-born humorist John Henry Faulk decided to fight back. He undertook a six-year legal battle and eventually beat the right-wing blacklisters who had controlled network assignments of radio and television creative personnel for years.

Early Years

John Henry Faulk (he always used his full name) was born in Austin, Texas, just before World War I. He grew up in a mixed-race neighborhood and was encouraged by his liberal parents to treat everyone alike. His own subsequent liberal politics were partially formed by his parents, both leftist political activists. Working and attending classes part-time, Faulk entered the University of Texas in 1929 but took a decade to earn his bachelor's degree in English. While in school he became fascinated with Texas and American folklore of all kinds. Just over a year later, with a Works Progress Administration research grant, he earned a master's degree with an emphasis in American folklore. He stayed on in Austin to teach English courses at the university for two more years. Despite the military build-up in the early 1940s, the army initially turned him down for health reasons, and Faulk served with the merchant marine and later the Red Cross. The army finally accepted him for stateside service as a medic in 1944.

All through this period, Faulk honed his already impressive storytelling abilities. Overhearing him at a New York party, a Columbia Broadcasting System (CBS) official offered him a program slot of his own. Faulk hosted *Johnny's Front Porch* on the CBS radio network in 1945–46. He moved on to various on-air positions with stations WOV and WPAT in New Jersey from 1946 to 1948. He returned to CBS to host the weekday hour-long daily *John Henry Faulk Show* on the network's flagship station, WCBS in New York, starting in 1951. His good-

natured Texas humor and characters gathered a growing listening audience and attracted appreciative advertisers.

Blacklisted and a Landmark Suit

By the mid-1950s, as his radio career developed, Faulk had become more concerned about the communist-baiting approach of the officers of the New York local chapter of the American Federation of Radio and Television Artists (AFTRA) performer's union, of which he was a member. For several years union officials had actively cooperated with (and some were officers in) AWARE, Inc., one of the blacklisting organizations that "investigated" the political backgrounds of performers and writers. Along with CBS journalist Charles Collingwood and comedian Orson Bean, Faulk ran for the AFTRA board and was one of 27 "middle of the road slate" members elected to the 35-member board. He was subsequently elected second vice president, taking office in January 1956. The new AFTRA officers promised to cut ties with the blacklisters.

Nursing their wounds, the former union officials used their newsletter to attack Faulk for his own political views and associations, including thinly veiled accusations that, based on his political activity (he had backed Henry Wallace in the 1948 presidential campaign, for example), he at least had strongly communist leanings. In the political climate of the times, with "McCarthyism" in full flower, this was a potentially damning indictment that often cost the accused his or her job. As the attackers expected and as Faulk feared, their classic tactic led to advertiser nervousness about Faulk, and he began to lose commercial advertisers for his program. Although the station initially stood by its employee, diminishing advertiser support and income raised concern, though his contract was renewed in December 1956.

Faced with the loss of his livelihood for a series of false accusations, Faulk decided to take on his tormenters, although

John Henry Faulk

he knew it would be a difficult and expensive process. With financial support from CBS newsman Edward R. Murrow, among others, Faulk filed a libel suit on 26 June 1956 against AWARE and its officers. But the overall situation turned bad—the “middle of the road slate” lost ground in AFTRA and became a minority again. Though his program continued for a few more months, Faulk was fired by registered letter from CBS while he was on vacation in July 1957.

AWARE managed to delay trial on the libel suit for some five years through a variety of legal maneuvers. In the meantime, Faulk could not obtain work in the broadcast or entertainment fields and had to rely on friends and supporters for the financial means to survive, let alone pay for the ongoing case. The trial of AWARE and its officers finally got under way in the spring of 1962 and lasted for 11 weeks. On 28 June 1962 the New York State jury awarded \$3.5 million in damages to Faulk (the largest libel judgment to that point), though this was later reduced to \$550,000 by an appeals court. Faulk eventually received about \$75,000 for his years of effort and deprivation. Through his lawsuit, he had made an important point about civil liberties that was widely reported, AWARE had declared bankruptcy, and the general public now knew about—and was increasingly appalled by—blacklisting.

Later Life

Faulk returned to Austin in 1968 and lived in Texas for the rest of his life. For a time he operated a small advertising agency. His blacklisting case became known to a new generation in October 1975 when CBS broadcast a two-hour made-for-television docudrama movie based on Faulk’s story. William Dev-

ane played Faulk, and George C. Scott played attorney Louis Nizer.

From 1975 to the early 1980s, Faulk played a homespun character on the nationally syndicated *Hee-Haw* television variety program. During the 1980s Faulk wrote and produced two one-man plays. In both *Deep in the Heart* and *Pear Orchard, Texas*, he portrayed characters with the best of human instincts but exhibiting the worst of cultural prejudices. He also lectured widely on college campuses, largely about civil liberties and freedom of expression, drawing on his own case. He died of cancer in Austin in 1990, aged 76.

The central branch of the public library in Austin is named after him, as are the John Henry Faulk Awards given out annually since 1986 by the Texas Storytelling Association for the state’s best storyteller. The Center for American History at the University of Texas at Austin (which holds Faulk’s professional and legal papers) sponsors an annual John Henry Faulk Conference on the First Amendment.

Federal Communications Commission

The Federal Communications Commission (FCC) is the federal agency charged with regulating broadcasting and other electronic communications media in the United States; it licenses stations to operate in the "public interest, convenience, and necessity." The FCC was created by Congress in 1934 to succeed the Federal Radio Commission. It is an independent federal agency established by the Communications Act of 1934 to regulate domestic interstate and international electronic communication, both wired and wireless.

Because the FCC was established as an independent federal agency, the "checks and balances" on it are not the same as they would be for administrative agencies (such as the Food and Drug Administration), which answer directly to the U.S. president. Although the president selects the chair and the commissioners (who must be approved by the Senate), the president does not have the authority to remove commissioners during their terms. The FCC is much more beholden to Congress, which controls not only appropriations but also the commission's very existence. Since 1981, the FCC is no longer a permanent agency but instead must be reauthorized by Congress every two years. Therefore, Congress' influence over the FCC has increased significantly during the 1980s and 1990s.

The FCC has a dual role: on the one hand, it makes rules and regulations to carry out the Communications Act, but it also serves as a judicial body, hearing appeals of its decisions. As a quasi-judicial agency, the FCC has the duty of both making rules and also serving as an adjudicator in cases dealing with rules violations and challenges. While the FCC has the

responsibility for making, policing, and judging the rules, its decisions are subject to court review. For example, the FCC created a rule requiring regular station identification. It also enforces the rule by asking stations whether they have adhered to it. In cases where stations have been found to violate the rule, the FCC must decide what punishment, if any, to apply. If the offending station challenges the decision, it appeals the judgment to the FCC. In this role, the FCC serves as the equivalent of a federal district court. FCC decisions that are upheld in appeal can then be challenged by appealing directly to the Federal Court of Appeals for the Washington, D.C. Circuit.

Commissioners

The FCC has five commissioners (reduced from seven in 1983), one of whom serves as the chair. Members are appointed by the U.S. president and approved by the Senate. The term of office for commissioners is five years, and they may serve multiple terms. No more than three commissioners from one political party may serve simultaneously.

Although the FCC chair has the same one vote as any of the other four commissioners, the chair has a greater ability to influence the direction of the FCC. The chair's role in selecting issues to pursue sets an agenda for the commission. During the 1970s and 1980s, for example, the FCC adopted a more deregulatory approach, eliminating a number of rules and streamlining the radio license renewal process. Under the leadership of chairmen Richard Wiley, Charles Ferris, and Mark Fowler, the

FCC revisited its responsibilities under the concept of the public interest, adopting the philosophy that the public interest is best served by allowing marketplace forces to function. In the 1990s Chairman Reed Hunt decided to investigate the possibilities of high-definition television and formed a task force to study it. Chairman William Kennard pursued the possibility of adding low-power FM stations to the radio band to provide increased opportunities for disenfranchised members of society to be heard. Although no chair has been successful in pursuing all of his interests, each has had the opportunity to set the commission's, and thus to a certain extent the nation's, communications policy agenda.

The majority of commissioners over the years have been lawyers (the last engineer commissioner retired in 1963). FCC commissioners are creatures of politics and as such are often more versed in politics than in technology. A number of commissioners have had no technological background prior to joining the commission. They count on their staff advisers and employees to provide them with the necessary background information. Fewer than half the commissioners have served their full five-year terms. When they leave the commission, they frequently join communications companies or legal firms providing consulting services. Commission staff members often find themselves dealing with former commissioners.

The personality of the FCC changes over time, based on the various personalities of the commissioners who serve and the political climate of the period. Space does not permit a listing of all former FCC commissioners and their contributions, but a few should be noted. Frieda B. Hennock, the first woman appointed to the commission in 1948, served during the critical period of the television "freeze" (1948-52). During those four years, the FCC stopped licensing new TV stations while it decided the issues of color TV, UHF versus VHF transmission, and channel allocation policies. Benjamin L. Hooks, the first African-American commissioner, was appointed in 1972 and worked diligently for the enforcement of equal employment opportunities. Henry Rivera was the first Hispanic commissioner, appointed in 1981. Robert E. Lee has the distinction of having served longer than any other commissioner to date, from 1953 until 1981. William Kennard was the first African American chairman when appointed in 1993.

FCC commissioners have been perceived alternately as pro- and anti-broadcasting. FCC chairmen James L. Fly (appointed 1939) and Newton N. Minow (appointed 1961) were public interest advocates who raised the ire of many broadcasters during their respective terms. Fly chaired the FCC during the forced sale of the NBC "Blue" Network. Minow is perhaps best remembered for referring to television as a "vast wasteland" in a speech to the National Association of Broadcasters.

On the other hand, James Quello joined the commission in 1974 after retiring from his position as vice president and general manager of station WJR in Detroit. Quello's Senate confir-

mation hearings lasted longer than any other commissioner's because a number of public interest groups, fearing that he would be too favorable to broadcast interests (Quello replaced public interest advocate Nicholas Johnson), opposed his nomination. In spite of the lengthy process, Quello was overwhelmingly approved by the Senate. While Quello served as interim FCC chair, *Broadcasting* magazine called him "the broadcasters' chairman." In spite of his strong support of broadcast interests, Quello was critical of indecency on radio.

Staff

Although the FCC has only five commissioners, there are nearly 2,000 staff members in dozens of different departments, including a dozen field offices across the U.S. The five FCC commissioners must officially hold a public meeting at least once a month. The business of the commission is largely conducted as items circulate among the commissioners in between meetings, and at the staff level in the operating bureaus. The FCC is divided administratively into a number of offices and bureaus, to which the bulk of the commission's work is delegated. The six major operating FCC bureaus are Consumer and Governmental Affairs, Enforcement, International, Media, Wireless Telecommunications, and Wireline Competition. Most licensing and regulatory activity undertaken in the name of the FCC occurs at this level.

Of greatest concern to broadcasters is the Media Bureau (previously called the Broadcast Bureau), which regulates AM, FM, and television broadcast stations and related facilities. It assigns frequencies and call letters to stations and designates operating power and sign-on and sign-off times. It also assigns stations in each service within the allocated frequency bands with specific locations, frequencies, and powers. It regulates existing stations, ensuring that stations operate in accordance with rules and in accordance with the technical provisions of their authorizations.

The Media Bureau has five divisions: Audio, Video, Policy, Industry Analysis, and Engineering. The Audio Division receives and evaluates approximately 5,500 applications per year for the nation's approximately 14,000 AM, FM commercial, FM noncommercial educational, and FM translator and booster stations. These applications include station modification applications, applications for new stations, assignment or transfer applications, license applications, and renewal applications.

Since the 1996 Telecommunications Act, radio and television stations are licensed for eight years (into the 1980s, the standard term was only three). Licensees are obligated to comply with statutes, rules, and policies relating to program content, such as identifying sponsors of material that is broadcast. The bureau ensures that licensees make available equal opportunities for use of broadcast facilities by political candidates or

opposing political candidates, station identification, and identification of recorded programs or program segments. Licensees who have violated FCC rules, and most especially licensees who have “misrepresented” themselves, are subject to such sanctions as forfeitures (fines), short-term renewals, or (rarely) license revocation.

Other FCC offices are established by the commission as organizational tools for handling the tremendous variety of commission tasks. The current FCC offices are Administrative Law Judges, Communication Business Opportunities, Engineering and Technology, General Counsel, Inspector General, Legislative Affairs, Managing Director, Media Relations, Plans and Policy, and Workplace Diversity.

In its attempt to carry out the wishes of Congress as expressed in the Communications Act, the FCC creates or deletes rules. Proposals for new rules come from a variety of sources both within and outside the commission. To begin assessing a new service or proposal on which it has little information, the commission may issue a Notice of Inquiry (NOI) seeking advice and answers to specific questions. If the FCC plans a new rule, it first issues a Notice of Proposed Rule Making (NPRM). The NPRM gives formal notice that the FCC is considering a rule and provides a required length of time during which the commission must allow public comments. After sufficient comment and discussion, new rules are adopted in FCC Reports and Orders and are published in its own official report series, the *FCC Record*, as well as in the government’s daily *Federal Register*. The rules are collected annually into Title 47 of the Code of Federal Regulations.

Licensing

Without a doubt, the greatest power of the FCC is its power to license or not license a station. Since its inception, the commission has modified its rules and procedures for determining the manner in which it grants licenses. In keeping with the directive of the Communications Act, the FCC has always licensed stations to operate “in the public interest, convenience, and necessity.” The specific manner in which it has made determinations about individual licensees, however, has undergone changes. For decades, the FCC would examine all applicants for a license to determine which would best serve the public interest, considering a range of characteristics, including preferences for local ownership, minority ownership, experienced ownership, and the character of the owners. Even a station that had been in operation for years faced the prospect of losing its license to a superior applicant in a renewal proceeding. The FCC had to conduct time-consuming and expensive comparative hearings whenever two or more applicants sought the same frequency.

The FCC and the broadcast industry have long been critical of the comparative process, which was largely eliminated by

the 1996 Telecommunications Act. Now, existing stations have an expectation of license renewal, provided they have not violated important commission rules. The FCC does not allow a new challenger to draw an existing station that has served the public interest into a comparative process. To avoid comparative hearings in the case of new stations, the FCC in 1999 adopted an auction process similar to what it had used earlier for other nonbroadcast frequencies. Rather than spend months (sometimes years) in comparative hearings, the FCC instead determines whether applicants meet minimum eligibility requirements. If they do, the applicants can then bid for new, available stations or purchase existing outlets.

The FCC does not monitor the broadcasts of radio and television stations. It relies on information provided to it by broadcasters, competitors, and audiences. Determinations about whether a station deserves to have its license renewed are based on documents filed by the station, any public comments the commission receives about that station, and challenges to the renewal by interested parties.

The commission is able to enforce regulations primarily through the *threat* of license action. The majority of license renewals are granted with no disciplinary action by the FCC. However, should the commission find rules violations by a licensee, its actions can range from a letter admonishing a station to fines of up to \$250,000 and a short-term renewal of the license, and even to the revocation of a license. It is the threat of this action that keeps broadcasters in compliance.

The FCC has the ultimate authority to revoke a station’s license or deny its renewal, although that action has rarely been taken. In more than 60 years, the FCC has taken this action only 147 times: an average of fewer than three per year out of thousands of license renewals. More than one-third of those revocations and nonrenewals were due to misrepresentations to the commission. Although such cases have been infrequent, the FCC has acted severely in cases where licensees have intentionally lied.

In 1998, the FCC revoked the license for Bay City, Texas, station KFCC because the owner “engaged in a pattern of outright falsehoods, evasiveness, and deception.” Chameleon Radio Corporation had been awarded a license to serve Bay City, but it attempted to move the transmitter closer to Houston, to the extent that Bay City would not even be served by the station. The FCC cited the station for repeated misrepresentations and lack of candor. Chameleon attempted to argue that the merit of its programming should protect it from revocation. The FCC responded that “meritorious programming does not mitigate serious deliberate misconduct such as misrepresentation.” Also that year, licenses were revoked for seven stations in Missouri and Indiana that were owned by Michael Rice through three different corporations. Rice was convicted of 12 felonies involving sexual assaults of children. The FCC was prepared to allow the corporations to continue

their ownership of the stations after their assertion that Rice would not be involved in station operation. The commission revoked the licenses on a finding that Rice was in fact involved in station operation and that “misrepresentations and lack of candor regarding his role at the stations” was cause for revocation.

Despite all the powers given to the FCC, the 1934 Communications Act specifically states that the commission may not censor the content of broadcasts. According to Section 326, “Nothing in this Act shall be understood or construed to give this Commission the power of censorship over the radio communications or signals transmitted by any radio station.” Nevertheless, the FCC’s reprimands and fines of stations for broadcasting indecent material at inappropriate times have been upheld by the Supreme Court. The FCC acknowledges its obligation to stay out of content decisions in most areas. The commission has declined to base license decisions on the proposed format of a radio station, and it no longer stipulates the amount of time stations should devote to public service announcements.

Spectrum Management

The FCC also has the important responsibility of managing all users (except the federal government) of the electromagnetic spectrum. This involves two processes. First, the FCC must allocate different uses for different parts of the spectrum in an efficient way that does not create interference. This is followed by the allotment of specific frequencies or channels to particular areas. Licensing of the allotments follows. (AM does not have allotments.) There have been two significant spectrum reallocations affecting radio. In 1945 the FCC moved FM’s allocation from 42 to 50 megahertz up to its current location at 88 to 108 megahertz, more than doubling the available channels but rendering the existing FM receivers and transmitters obsolete. In 1979 the upper end of the AM band moved from 1605 kilohertz to 1705 kilohertz to accommodate ten additional AM channels—a change that took years to implement (the first stations shifted to the new higher frequencies only moved in the 1990s).

A second part of maintaining spectrum efficiency is approving equipment that uses the electromagnetic spectrum. The FCC must be certain that all devices emitting electromagnetic signals do so within their prescribed limits. “Type acceptance” is the FCC process of approving equipment that emits electromagnetic radio waves. In most cases, the evidence for type acceptance is provided by the equipment’s manufacturer, who provides a written application with a complete technical

description of the product and a test report showing compliance with the technical requirements. An FCC identification number can be found on the backs of telephones, walkie-talkies, pagers, and even microwave ovens. The number does not imply that the FCC has inspected that particular unit but rather that the product meets certain FCC minimal standards designed to avoid interference.

Policy is sometimes the result of *inaction* by the FCC. For years, the commission was faced with what to do about AM stereo. Rather than choosing a standard from among competing applicants, the FCC adopted in 1982 a marketplace philosophy to allow a winner to emerge from marketplace decisions rather than their own. Many broadcasters believe the introduction of AM stereo was negatively affected by the commission’s “decision not to decide.” Some stations were reluctant to invest in AM stereo equipment, fearing they might select the losing standard and then lose thousands of dollars. Radio receiver manufacturers had the same concern. The FCC’s decision “not to decide” virtually killed any chance for AM stereo.

Federal Radio Commission

Predecessor to the Federal Communications Commission

The first agency created in the United States specifically to license and regulate radio, the Federal Radio Commission (FRC) existed from 1927 to 1934. During that time, the FRC was responsible not only for licensing radio stations in the United States, but also for laying the regulatory foundation that to some extent still exists today.

Origins

The United States passed the Radio Act in 1912, which provided authorization for licensing of radio stations. It was not until 1920, however, that the secretary of commerce began to exercise this authority. Congress had decided to empower the secretary of commerce because radio was seen as interstate commerce: thus, the Department of Commerce was the logical choice to handle the authorization of these new radio stations.

It did not take long to realize that radio licensing and regulation was a much larger task than could be handled by the secretary of commerce in addition to his regular duties. At the First National Radio Conference in Washington, D.C., in 1922, government officials and amateur and commercial radio operators met to discuss problems facing the infant industry. A technical committee's report resulted in the introduction of legislation in 1923, but it never got out of Senate committee.

At the Second National Radio Conference in 1923, many of the same problems were revisited, most notably concerns about interference. Because interference was greatest in places with the most transmitters (population centers) and less of a problem in remote areas, a recommendation emerged from the conference that the nation be divided into zones and that different rules be established for different zones based on their own specific needs. Again, legislation was introduced into Congress, but it never advanced beyond committee. A third national conference in 1924 produced no legislation either. Finally, the Fourth National Radio Conference in 1925 produced the proposals that would lead to the Radio Act of 1927.

During all this time, the secretary of commerce continued to license radio stations. The difficulty came when secretary Herbert Hoover attempted to *not* license a station. In 1923 Intercity Radio applied for a renewal of its license. The request was denied based on a determination that there was no longer spectrum space available. Intercity appealed the case, and the Federal Circuit Court of Appeals ruled in their favor. According to the court, the 1912 Act authorized the secretary of commerce to grant licenses: it did not grant the authority to deny them. In the court's judgment, the secretary of commerce had to accom-

modate applicants by finding them spectrum space that would cause the least amount of interference.

The secretary's authority was further undermined in a 1926 court decision. Zenith Radio had been operating a station in Denver with a prescribed allocation limiting it to two hours of broadcasts per week. The station challenged the authorization by using other frequencies not specifically allocated to it. When secretary of commerce Herbert Hoover filed suit against Zenith, the court ruled that Zenith was within its rights, citing a section of the Radio Act that allowed stations to use "other sending wave lengths." For all intents and purposes, such a decision authorized any licensed station to operate on virtually any frequency in addition to the one allocated.

The result of the two court cases was devastating to the secretary of commerce's assumed authority to regulate radio stations. Following the decision in the Zenith case, the secretary sent a letter to the U.S. Attorney General requesting an opinion on the authority vested in the secretary of commerce by the Radio Act. The attorney general's response only reinforced what the courts had already decided. The interpretation of the Radio Act of 1912 was that licensed stations could use virtually any frequency they wanted, at whatever times and using whatever transmitting power they wanted. With the secretary's authority eviscerated, President Calvin Coolidge asked Congress to create new legislation. With the president's endorsement, legislation that had been proposed as a result of the 1925 National Radio Conference moved swiftly through Congress, and the Radio Act of 1927 was signed into law by President Coolidge on 23 February 1927.

Initial Tasks

Central to the 1927 Act was the establishment of the FRC. Instead of having one person overseeing licensing and regulation of radio, a commission of five people appointed by the president and approved by the Senate would handle the duties. Perhaps influenced by the thinking that different geographic regions would have different needs, commissioners were to represent those different regions. When it passed the Radio Act of 1927, Congress naively believed that the FRC would need to act for only one year to straighten out all the confusion in radio regulation and licensing. After that, things would be well enough established that the agency could serve only as an appellate board for actions by the secretary of commerce. W. Jefferson Davis wrote in the *Virginia Law Review* that after the first year, "the Secretary of Commerce will handle most of the problems that arise, and the Commission will probably

function only occasionally.” Clearly, that was not to be the case. The FRC’s authority was made permanent in 1930 and was extended until 1934, when it was replaced by the Federal Communications Commission (FCC).

The FRC got off to what was at best a shaky start, as Congress had not financed it. The FRC came into existence without an appropriation from Congress. The original commissioners were required to do their own clerical work, and engineers had to be “borrowed” from other agencies for several years. Furthermore, Congress confirmed only three of the five nominees from President Coolidge in the first year. Two of the five appointees died during the Commission’s first year. Only one of the original FRC members, Judge Eugene O. Sykes, was still serving just two years later. In spite of these difficulties, the FRC was able to dramatically advance the nation’s radio regulatory policy in its eight years of existence, at a crucial time for the development of commercial radio. Even the publication *Radio News* recognized the enormity of the FRC’s task and the efficiency with which it worked. In November 1929, the publication stated,

Not in the history of federal bureaus has any commission ever been called upon to perform so great a task in so short a span of time. The already overloaded departments of the federal government could not have treated with radio problems on this scale without a great increase in personnel and what would have been tantamount to the setting up of a radio commission within the department to which it might have been assigned. By its segregation and absolute independence, radio has been regulated and its major problems have been solved without handicapping any other federal bureau (“Public Interest, Convenience and Necessity,” in *Radio News* [November 1929]).

The Radio Act of 1927 empowered the FRC with the authority and regulatory discretion that the secretary of commerce had lacked under the Radio Act of 1912. The new act specifically granted the FRC authority to license stations for a limited period of time; to designate specific frequencies, power, and times of operation of stations; to conduct hearings and serve as a quasi-judicial body; and to deny a license or to revoke an existing license. All of these powers had been denied the secretary of commerce.

Legal Challenges

It did not take long for the FRC’s enforcement authority to be legally challenged. Technical Radio Laboratory sought a license renewal for its station in Midland Park, New Jersey, and was denied by the FRC because there was not adequate spectrum available. Whereas Intercity had successfully chal-

lenged denial of its renewal request, Technical Radio Laboratory was not so fortunate, because the courts found that the FRC was within its authority. Dozens of other cases would follow, with similar results. Congress had taken the appropriate steps to provide the FRC with licensing authority.

According to the Radio Act, the FRC’s jurisdiction was based on Congress’ authority to regulate interstate commerce. Thus, radio stations that did not transmit across a state line might not have to be regulated by them. In theory, at least, radio stations involved only in intrastate commerce rather than interstate commerce were not subject to federal jurisdiction. Just such an assertion was made in the case of *United States v Gregg*. An unlicensed Houston station challenged the FRC’s authority, claiming that its signal was not interstate commerce. The court accepted the FRC’s argument that it had to have authority over all transmissions, even those that did not cross state lines, because otherwise it could not control the interference that might affect other, regulated stations. Leery of raising questions of states’ rights, Congress had avoided the issue in the Radio Act of 1927. In 1933 the court extended FRC authority to cover all radio transmissions.

For the most part, the FRC fared quite well in challenges to its regulatory authority. To be sure, there were cases that the FRC did not win, but it certainly won many more than it lost. The Commission’s ability to exercise regulatory authority over the broadcast spectrum became greater with each legal decision. In two highly visible cases, the FRC was able to deny license renewals for stations that had not acted in the public interest. In 1931 the court upheld the FRC in denying a renewal to Dr. John R. Brinkley’s station, KFKB (Brinkley had been using his station to prescribe medications). Brinkley claimed that the FRC had no authority to censor him. The court held that the FRC was not engaging in censorship by examining the record to determine if a licensee had acted in the public interest. The following year, Dr. Robert Schuler of Trinity Methodist Church appealed the denial of his station license, KGEF, claiming that his free speech rights had been violated. The court rejected that argument on the premise that the Commission was not preventing Schuler from making his vitriolic comments. As with Brinkley, the FRC could use his past record as an indication of how he would serve the public interest.

Defining the Public Interest

Included in the Radio Act of 1927 was the stipulation that the FRC would act “as public convenience, interest, or necessity requires.” Likewise, stations were to be licensed to serve the same public interest, convenience, and necessity. Congress borrowed the language from other legislation regulating public utilities. This vague directive from Congress served as the guiding philosophy for the FRC. In one action in 1928, the FRC

denied 62 license renewals and modified the operations of dozens more. A month later, the FRC issued a statement to explain its interpretation of the public interest standard and how it was to be applied. As the FRC pointed out in its statement, "no attempt is made anywhere in the act to define the term 'public interest, convenience, or necessity,' nor is any illustration given of its proper application" (FRC annual report, 166 [1928]). While asserting that a specific definition was neither possible nor desirable, the FRC set forth some general principles regarding the public interest. Perhaps most illustrative of all is the concluding sentence from the FRC's statement: "The emphasis must be first and foremost on the interest, the convenience, and the necessity of the listening public, and not on the interest, convenience, or necessity of the individual broadcaster or the advertiser." The language mirrors the sentiment of Rep. Wallace H. White, cosponsor of the bill that became the Radio Act of 1927, who said:

We have reached the definite conclusion that the right of our people to enjoy this means of communication can be preserved only by the repudiation of the idea underlying the 1912 law that anyone who will may transmit—and by the assertion in its stead of the doctrine that the right of the public to service is superior to the right of any individual to use the ether (67th Cong. Rec. 5479 [1926]).

The FRC determined that the public interest is served by having a "substantial band of frequencies set aside for the exclusive use of broadcasting stations and the radio listening public." It also adopted the general premise that the greatest good is served by minimizing interference. It follows from this that denying licenses in order to prevent interference, detrimental though it may be to some prospective broadcasters, serves the greatest good. The commission stated its intent to use the past record of a licensee to determine whether that station is deserving of a license. The reliability of a station's transmissions were also to be considered. Stations that could not be relied upon to transmit at regularly scheduled, announced times or whose transmission frequencies wandered around the spectrum did not serve the public interest. More than 70 years later, these interpretations of serving the public interest are still considered valid.

Also included in the 1928 statement on the public interest was the principle that stations should operate at different classes of service in order to ensure that there would be some stations serving larger geographic areas, while other stations served only small communities. This coincided with Congress' view, which had been stated earlier that same year when the Radio Act of 1927 was amended by the Davis Amendment in 1928. In addition to extending the FRC's authorization beyond its original year, the amendment directed the FRC to devise a

scheme for providing equitable radio services in all zones of the country. One week following the FRC's statement on the public interest, it issued a plan for providing different classes of radio service. Each of the nation's zones would have an equal number of channels assigned as clear channels, regional channels, and local channels. Clear channels were designated to be high-power stations audible at a distance, whereas regional and local channels had decreasing coverage areas. Eight clear channels, seven regional channels, and six local channels were assigned to each of the five zones. The FRC's basic concept of clear, regional, and local channels remained in force more than six decades later.

One of the public-interest principles established by the FRC that did not continue with the FCC was the concept that licenses should not be provided to stations that offer services that duplicate those already available. The FRC stated that simply playing phonograph records on the air does not provide the listening public with anything that it cannot otherwise obtain. The FRC would have maintained a licensing scheme that would compare the programming intentions of the applicants. It can also be inferred that the FRC did not favor licensing stations whose formats mirrored those of stations already in the community. Based on today's radio business, that policy clearly did not survive

Female Radio Personalities and Disk Jockeys

Radio's female pioneers, although limited by the social conventions of the times, were quite successful in the early days of radio. Since radio's inception, female personalities have sometimes been limited by legal, economic, and social constraints, as well as by their own perceptions of what is expected of them by listeners and the industry. As radio became more established, women had less formalized input into programming decisions, yet they have had a significant impact on the radio industry. Indeed, a congressional study in the early 1990s concluded that women-owned radio stations were 20 percent more likely to air women's programming than male-owned stations were and 30 percent more likely than non-minority-owned stations were (see Halonen, 1992).

Donna Halper (2001) is one of the few radio historians to track the lives of the early female pioneers: Eunice Randall, Emilie Sturtevant, Marie Zimmerman, Eleanor Poehler, and Halloween Martin. Randall made her radio debut in 1918 and became one of the nation's first female announcers. Sturtevant was one of Boston's first radio programmers in the 1920s. Zimmerman and Poehler were two of the first female radio station managers. The first woman to command Chicago morning radio in the 1920s was Halloween Martin, long before programmers realized the importance of that time slot.

Soap and Sisterhood

By the 1940s, female talk show hosts became popular role models for their female listeners, who sought advice on children, relationships, and detergents, as well as a bit of celebrity gossip and companionship. Television, ironically, seemed to supply an abundant pool of female hosts to the radio networks. While many female listeners tuned to Mary Margaret McBride and Kate Smith, others enjoyed the popular soap operas. The success of female radio personalities was often evaluated in terms of their ability to move merchandise.

By 1954, as the industry's reliance on the radio networks declined, female disc jockeys (although merely a handful

across the nation) began to redefine their role in radio. Martha Jean "The Queen" Steinberg was one of the first women in the nation to make the leap from being hostess of a homemaker show to being a rhythm-and-blues disc jockey on Memphis' legendary WDIA-AM. Also across Memphis airwaves, WHER-AM became the first all-girl radio station in the U.S. in 1955. Many of the disc jockeys remained at the station through 1972. WHER was the brainchild of station owner and record producer Sam Phillips. Apart from these exceptions, however, radio disc jockeys were predominantly white and male. With the emergence of rock and roll, these men attempted to out-shock their competitors in the quest for the most listeners, and in the process, they gained power and control over music selection and programming. Women faded behind the scenes for the next decade.

Sexpot Radio

In the mid-1960s, New York's WNEW-FM created "Sexpot Radio," an all-female lineup of disc jockeys. From this experiment, which lasted only 18 months, Alison Steele became known as the "Nightbird." Her legendary sultry voice captivated night audiences as she read poetic and Biblical verses in between music and interviews with rock stars. Steele, who died in 1995, was a member of the Rock and Roll Hall of Fame and the first woman to receive *Billboard Magazine's* FM Personality of the Year award in 1976. Unlike Steele, many women entered radio in the 1970s as part-time reporters and weekend announcers—after women's groups pressured the Federal Communications Commission (FCC) to revise its affirmative action policies. With free-form FM radio giving way to increasingly segmented formatting, women were often defined, not by their individuality, but within the context of a male-dominated morning show.

Before the turn of the decade, another radio station would once again provide new opportunities for women. Like WHER, it had a female staff and male owner. Connecticut's

WOMN-AM debuted in January 1979. It aired several news stories about women and played numerous female artists throughout the day. The short-lived effort paved the way for less stereotypical advertisements and created a demand for more female artists by radio stations across the nation.

Strong Talk in the 1980s

Music-oriented stations decreased their news and public service commitments and increased the number of songs played per hour. Still, there were signs that “chick” talk would become a valuable commodity in the industry in the years ahead. By the late 1970s, Sally Jessy Raphael had established herself as a popular radio talk show host, broadcasting her advice on love, family, and relationships to a late-night audience at a time when talk radio began to boom. Concurrently, television talk shows began to attract large female audiences away from radio. With every station playing the same songs, personality once again became an integral part of the programming mix.

Strong female personalities, such as Washington, D.C.’s Robin Breedon, soared in their ratings, past their white male competitors. With a decade of television broadcast experience and a degree from Howard University, Breedon became the number-one Arbitron-ranked morning personality in D.C. She proved that many listeners were seeking personalities with compassion and community commitment. *The Washington Post* referred to her as the “Queen of Radio.” During her ten-year radio stint, she won seven Emmy nominations and two American Women in Radio and Television National Awards; then-Mayor Sharon Pratt-Kelly even proclaimed a day named in her honor. Breedon left radio in 1998.

By 1988 Howard Stern was on his way to becoming a national icon. Robin Quivers, Stern’s articulate sidekick, became a dominant part of what was becoming known as “shock radio.” As early as the 1980s, many women entered radio as sidekicks who typically read the morning headlines and provided a laugh track for male-dominated morning shows. In some cases, these women also became the targets of sexist jokes told by male hosts.

The Rise of the Shockette Jock

The real revolution was happening in Rhode Island. Carolyn Fox, Providence’s number-one afternoon personality, spouted her liberal views on everything from sex to politics—before Howard Stern even gained national prominence. Fox paved the way for a number of women, such as San Francisco’s Darian O’Toole, Austin’s Sara Trexler, Denver’s Caroline Corley, and Detroit’s Kelly Walker, who became the new shock jocks of the 1990s. Many of these women began their careers as sidekicks or night personalities. Trexler, who began her career in 1986,

was selected as *Billboard Magazine’s* Small Market Local Air Personality of the Year in 1999. Emulating their male predecessors, many of these shock jockettes featured the same type of locker-room humor, but from a female perspective.

Karin Begin (a.k.a. Darian O’Toole) has been billed as America’s First Shockette. Although Carolyn Fox is her predecessor by more than a decade, the press and the radio industry has portrayed Begin as an American trailblazer for female radio broadcasters. Begin was born and raised in Nova Scotia and worked at a number of small Canadian markets before landing in the United States.

The turning point in her radio career came when she met Program Director Shawn Kelly, a big Howard Stern fan, who encouraged Begin to seek opportunities in the United States. Some of her early gigs included on-air stints in New Jersey, Philadelphia, Baltimore, and Sacramento. In San Francisco, she would become known as Darian O’Toole—the “Caustic Canadian Swamp Witch.” Her morning show skyrocketed to number one in San Francisco, climbing from 23rd to 1st place in the market in only three years. She left San Francisco’s KBIG in 1997 to take her show to New York. In September 1999 she returned to San Francisco to work at KSAN.

Alternate Models for Female Personalities

The ability to move merchandise, whether soap or soda, will always remain an essential part of commercial radio, for obvious reasons. With every product sold on radio, early female broadcasters knew that their bargaining power would increase tenfold. Some commercial gimmicks to market the female experience, such as the rise and fall of “Sexpot Radio” or the all-women radio station WOMN, have quickly failed within the past 40 years. On the other hand, the Seattle-based syndicated nighttime personality Delilah, a 25-year veteran, is taking a new spin on an old formula—a mix of advice and inspiration to a predominantly female audience, with listeners calling in to her show from more than 200 affiliates around the nation. Reminiscent of Casey Kasem’s long-distance dedications, but a bit more personal, she is very much like Mary Margaret McBride in her desire to chat about love, family, and relationships. In October 1998, she announced her pregnancy and promised to share her experience with her listeners. Many American listeners seem comforted by female radio personalities who symbolize traditional family values. Dr. Laura Schlessinger, a controversial conservative talk show host in the 1990s, starts her weekday show by saying “I’m my kid’s mom.” In the final analysis, there has never been one personality style that has worked for all female broadcasters; rather, the means of success has been their ability to connect to the listeners—both men and women—in some unique way.

Fessenden, Reginald 1866–1932

Canadian Electrical Engineer and Wireless Inventor

Reginald A. Fessenden was a seminal figure in the development of wireless telephony technology, the first important North American inventor to experiment with the wireless telephone, the immediate precursor of radio. Born in Canada, he undertook his most important inventive work in the United States, including the development of continuous-wave transmission and heterodyne principals (he was granted 229 U.S. patents from 1891 to 1936), and he conducted what was probably the world's first broadcast.

Origins

Fessenden was born in 1866 in what would become the Canadian province of Quebec, the first of four sons of an Episcopalian minister. His parents supported his drive for education, and he excelled in school, especially in math and science, earning an invitation from his father's alma mater, Bishop's College, to teach math and languages, although because of doing so, he never completed his own degree work. While teaching, he became increasingly fascinated with the scientific journals of the time, focusing especially on developments in electricity. He continued his teaching at a secondary education institute in Bermuda for another year or so.

There were several key turning points in Fessenden's professional life, and the first came in 1886 when he decided to leave secondary (high school) teaching and become involved more

directly in the field of electrical engineering, in which he was largely self-taught. He began as a field tester with Thomas Edison's company, which was then wiring the streets of New York City. Within a year he was working in power engineering at Edison's New Jersey laboratory, a post he held for nearly three years, from 1887 to 1890. Here he learned by observation the importance of patents and the scientific method—but apparently not the importance of the market or of the process of successful innovation. He was increasingly attracted to the study of Hertzian waves, reading laboratory journals in his spare time. Financial problems at the labs led to layoffs of many workers, including Fessenden. His practical experience in electricity continued as an electrical assistant at the Westinghouse subsidiary, the United States Company, in 1890. Just a year later, in 1891, he joined the Stanley Company of Pittsfield, Massachusetts.

Though he lacked academic credentials, Fessenden had by the early 1890s already published in respected journals. Based on his record, he was named a professor of electrical engineering at Purdue University in 1892, an institution then striving to develop a reputation in this field. After a year at Purdue, in 1893 Fessenden accepted an offer to move to the University of Western Pennsylvania (later the University of Pittsburgh) to occupy a new chair of electrical engineering. Half of his salary was paid by Westinghouse, which hoped to make use of Fessenden for its own research needs (he undertook incandescent

lamp work for the company). While at Western, Fessenden increasingly concentrated his own research on wireless telegraphy technology and applications.

Building on the work of Nikola Tesla and other pioneers, Fessenden by about 1900 had come to a fundamental conclusion: for effective wireless *voice* transmission, the generation of continuous wireless waves was required, not the dot-dash-friendly spark-gap technology that was then the Marconi standard for wireless telegraphy. This new system would require development of new means of both signal transmission and detection. Fessenden focused first on developing a new type of wireless detector to replace the crude Branly coherer (then widely used in wireless telegraphy, as it was a central piece of the Marconi system which dominated wireless).

Fessenden's second important career change came in 1900 when he was persuaded to resign the relative comfort and security of his tenured university post with the enticement of government support for his expanding research. He began what would be his most historically important decade (1900–11) with a contract to work as a special agent with the U.S. Weather Bureau, then a part of the U.S. Department of Agriculture. The bureau wanted him to develop wireless applications for weather forecasting and dissemination of weather reports. In April 1900 he began work for the Bureau at Cobb Island, Maryland, south of Washington, D.C.

By the middle of the year, he had sent the human voice by wireless to stations a mile apart at Rock Point, Maryland, though the signals were very noisy using the spark-gap technology of the period. For his bureau-supported work, he developed further transmitters at Cape Hatteras, Roanoke Island, and Cape Henry—and sent voice and music signals among those stations as well. For a while, the bureau's support of his experimentation seemed to be all that he expected, but arguments soon arose over rights to his prior patents as well as rights to patents growing out of bureau-supported work. Finally, in August 1902, Fessenden left the bureau's employ (before they let him go), the immediate cause being his interest in forming a commercial company to exploit his work in wireless telephony. The negative feelings that ended the Weather Bureau contract offered a bad omen for his future working relationships.

Improving Wireless Systems

An invaluable Fessenden contribution in this period was his discovery of the *heterodyne* principal (drawing on his Greek language training, the word refers to the mixing of two forces) in 1901. Not well understood at first—because the inventor was probably a decade ahead of what technology could accomplish—the principal would eventually lead to great improvements in both receiver sensitivity and static control. This allowed sending and receiving of signals from the same

antenna with no interference between the two functions. The heterodyne principal has remained central to radio ever since.

Seeking to develop the transmission side of his new wireless system, Fessenden conceived of the “alternator” to obtain the continuous alternating current waves he needed. After Westinghouse turned down his order, in 1901 Fessenden turned to General Electric (GE) to build his first alternator, a contract supervised by GE's brilliant Charles Steinmetz. Less capable than he sought, the resulting device was tested later that year, though it was only delivered to him in March 1903. The 10,000-cycle machine owed some of its design and principals to power-generation equipment. But Fessenden sought a 100,000-cycle machine that could serve as a transmitter on its own. With Fessenden's order to GE for such a device—which really pushed the margins of what could then be accomplished—a new player entered the story when engineer Ernst Alexanderson became involved. Though he and Fessenden would argue over a key aspect of the device (whether its core should be wooden or iron—Fessenden holding out for the former), they otherwise worked well together, and by 1906 an 80,000-cycle machine was delivered to the inventor's Brant Rock, Massachusetts, transmitter site, just south of Boston. It would soon be utilized in a pioneering experiment.

In an era when there was no means of amplifying often weak wireless signals, Fessenden by 1903 had developed a new means of detecting signals for his new system, a replacement for the then-standard iron-filing-based coherer. Fessenden's “liquid barretter” or electrolytic detector was a complex device that nonetheless proved faster and more reliable and used less energy than the coherer; in addition, operators could use headphones to hear the signals rather than reading them on a tape. The barretter was soon widely adopted (Fessenden's patent rights being largely ignored by both other inventors—chiefly Lee de Forest—and users, especially the U.S. Navy). It became something of a standard in the field until it was replaced by vacuum tubes just before World War I.

The National Electric Signaling Company

At this creative peak of his radio work, Fessenden entered into agreement with two Pittsburgh investors to financially support his continuing invention and testing process. In November 1902 bankers Hay Walker Jr. and Thomas H. Given agreed to fund the formation and operation of the National Electric Signaling Company (NESCO) in order to develop and market a wireless system that they then hoped to sell. Unlike many other fledgling wireless companies of the time, there was no public stock sale—Given and Walker provided all the financial support, a few thousand dollars at first and eventually a total of nearly \$2.5 million (nearly \$50 million at 2003 values). Fessenden was general manager. Almost immediately, tensions, and eventually out-and-out battles, developed

between the investors (who knew virtually nothing about radio technology but understandably sought a return on their funds) and the inventor (who held the technical knowledge but was becoming increasingly difficult to work with). From the beginning, NESCO focused on constantly changing short-term strategies as the partners bickered and fought. There was never an agreed-upon strategic plan for the firm, along the lines that Marconi was so successfully demonstrating at the same period. For example, Fessenden wanted to sell equipment, whereas his backers wanted to develop and market a complete wireless system.

NESCO transmitting stations were built in Washington, New York (Brooklyn), and Philadelphia (in nearby Collingswood, New Jersey) that were designed to provide overland communication in competition with existing wired systems. Despite considerable investment, wireless was still developing and often proved unworkable; not surprisingly, few customers materialized. Under a 1904 contract with GE, NESCO developed further transmitters in Lynn, Massachusetts, and Schenectady, New York, but the contract was cancelled in mid-1905 because of poor performance between transmitters. Faced with this failure, late in 1904, a shift in company priorities saw the partners seeking to develop a transatlantic radio service in competition with Marconi. At the same time, and against Fessenden's advice and pleas, NESCO stopped selling equipment. Transmitting stations were built in Scotland and in Brant Rock, Massachusetts, south of Boston. But they provided only sporadic communications—and almost none in the summer because of atmospheric static. By May 1906 Given and Walker had invested over half a million dollars, with precious little to show for it. That December a storm destroyed the Scottish station, effectively ending NESCO's transatlantic dreams. That, in turn, set the stage for one of Fessenden's most famous accomplishments.

With three days notice to shipowners using Fessenden equipment off the Massachusetts coast, on Christmas Eve of 1906 Fessenden offered what many consider the world's first true radio "broadcast"—a clear (not coded) voice and music transmission intended for widespread reception. Using his new and larger alternator, and with the inventor acting as "announcer," records were played, and Fessenden sang, played the violin, and even made a speech. All of this was repeated a week later on New Year's Eve. Fessenden was not seeking to *broadcast* as we think of the term today, but rather sought an improved means of competition with point-to-point wireline carriers. Unfortunately, his continuing pattern of claiming more for his system than it could in fact accomplish began to hurt. Further, because there was no press coverage (newspapers had not been invited to the experimental transmissions), few knew of the seeming wireless telephony breakthrough.

Radio telephony transmissions required more power and usually did not reach as far as radio telegraphy. But despite this

limitation, there seemed to be obvious applications of wireless to the telephone business. In early 1907 Given and Walker made a concerted effort to interest American Telephone and Telegraph (AT&T) in taking over NESCO, and initially their efforts seemed to bear fruit. Both AT&T engineers and top company management were favorably disposed to the idea. However, a financial panic in 1907 led to a change in AT&T management as the J.P. Morgan interests took over, and a major retrenchment took place. Any thoughts of investing in a still largely unproven technology were forgotten. This failure to sell NESCO to AT&T was a major setback and led to increased disagreements between Fessenden and his backers—he again wanted to sell equipment, and they wanted to sell the whole firm.

For a time things looked up with the hiring of Colonel John Firth as the accomplished sales manager NESCO desperately needed. The company resumed equipment sales, thanks to his good relations with navy officials and others, and he also helped to mediate between Fessenden and his two Pittsburgh financial backers. At the same time, however, NESCO scaled down with layoffs and reduced experimental work.

Frustrated with the constant bickering and continued lack of a focused company strategy, Fessenden revived plans to compete with Marconi in transatlantic communication, and toward that end he set up an independent company, Fessenden Wireless Company of Canada, without informing or involving Given and Walker. This led to a break between Fessenden and the backers late in 1910 (because Given and Walker felt they owned the patents in question). In January 1911 Given and Walker dismissed Fessenden from the company. He, in turn, sued for wrongful termination. Some 15 years of litigation followed.

Later Life

NESCO was placed in voluntary receivership to protect it from the inventors' suit (Fessenden eventually won a judgment of several thousand dollars), though research continued with about a dozen engineers. What was most ironic about Fessenden's departure and the demise of NESCO is that by 1911–12, the radio industry had begun to agree on the need to develop continuous-wave equipment for voice transmissions. No longer a part of NESCO, Fessenden was increasingly bypassed, due in no small part to his choleric temper, impatience, and maddening ego.

NESCO entered into a cross-licensing agreement with the Marconi interests after suits for patent violation had been brought. Finally, in 1917, after both Given and Walker had died, NESCO was sold to the International Radio Telegraph Company, which in 1920 fell to Westinghouse (and the patent rights of which were, in turn, transferred to the Radio Corporation of America [RCA] in 1921).

Fessenden's post-NESCO radio work was with the Submarine Signal Company of Boston. Beginning in 1912, he sought to improve underwater signal transmission and reception with what became known as the Fessenden Oscillator, a device also useful in detection of icebergs at sea; a wireless compass; and a fathometer or sonic depth finder. By the time he left Submarine Signal in 1921, however, Fessenden was largely through with radio innovation. In 1921 he received the gold medal of the Institute of Radio Engineers, and later he received the John Scott medal from Philadelphia for his development of continuous-wave wireless. In 1929 he received the Scientific American medal for his inventions concerning safety at sea.

Fessenden was clearly a visionary ("technically farsighted" says historian Susan Douglas, 1987) who sought to pioneer new approaches and systems, often at the margins of practicality of existing electrical capability. But unlike Marconi, Fessenden was totally unfit for marketing and presenting a public persona that would encourage investment. Frustration had helped to make him a very difficult man with whom to deal. He was variously reported as being short-tempered, impatient, intolerant, vain, and a man who rarely listened to others (for example, when he wrongly insisted on a wooden core for the alternator, relenting only when Alexanderson demonstrated the benefit of iron). He drove away many subordinates with his harsh treatment.

As with many radio pioneers, Fessenden proved to be important at pioneering (invention)—in particular at understanding the need for continuous-wave transmission, conceiving the alternator, and defining the heterodyne principal—but a relative failure at developing commercially successful innovations from any of these.

Reginald A. Fessenden. Born in East Bolton, Canada East (now Quebec), 6 October 1866. Oldest of four sons of Elisha Joseph Fessenden, an Episcopal minister, and Clementina Trenholme; moved to Niagara Falls, Ontario, 1875; attended De Veaux Military College, New York, 1875–77; attended Trinity College School, Port Hope, Ontario, 1877; worked for two years at Imperial Bank, Woodstock, New York; senior classical master, Bishop's College, Lennoxville, Quebec; principal, Whitney Institute, Bermuda, 1883–85; inspecting engineer, Edison Machine Works, New York, 1886; worked in industrial chemistry at Thomas Edison's lab in West Orange, New Jersey, 1887–89; electrical assistant at Westinghouse subsidiary,

United States Company, 1890; electrical assistant at Stanley Company of Pittsfield, Massachusetts, 1891; professor of electrical engineering, Purdue University, 1892; chair of electrical engineering, Western University of Pennsylvania (later University of Pittsburgh), 1893–1900; special agent, U.S. Weather Bureau, 1900–1902; transmitted first speech by wireless and developed high-frequency alternator for wireless transmission, 1900; discovered heterodyne principle, 1901; general manager, National Electric Signaling Company, 1902–11; introduced electrolytic or chemical wireless detector, 1902; established Brant Rock, Massachusetts wireless station, 1905; first broadcast, Christmas Eve 1906; researched submarine signaling systems, 1912–21. Died in Flatts Village, Hamilton, Bermuda, 23 July 1932.

Fibber McGee and Molly

Radio Comedy Series

For three decades, the consummate comedians Jim Jordan (1896–1988) and his wife Marian Driscoll (1898–1961) imitated and mocked the habits of middle-class American homeowners. They began as musicians and vaudevillians. These theatrical experiences, plus several radio series, prepared them for the initial broadcast of *Fibber McGee and Molly* on Tuesday, 16 April 1935. (The show lasted in various forms until 1959.) The Jordans and their writers, mainly Don Quinn and later Phil Leslie, wisely preserved what worked. During the 1940s, fans always voted it one of their favorite programs. Expressions like “Fibber McGee’s closet” percolated into popular speech. So did tag lines like Molly’s (Marian) “T’aint funny, McGee,” Throckmorton P. Gildersleeve’s (Hal Peary) “You’re a haard man, McGee,” and the Old Timer’s (Bill Thompson) “That’s pretty funny, Johnny, but that ain’t the way I heerd it.” (Fibber McGee’s overstuffed closet became an American icon, probably for two reasons: it symbolized the unpredictable fullness of the McGees’ world, and its sound of falling hip boots, mandolin, Aunt Sarah’s picture, and moose head—a triumph of sound effects—consoled listeners who had a similar storage problem. A replica may be seen at the Museum of Broadcasting in Chicago.)

Their modest home at 79 Wistful Vista attracted visitors from a wide variety of social, economic, and ethnic backgrounds. Such conviviality required explanation because McGee was often uncivil, arguing with bankers and bus drivers and department store managers, a dynamo of precarious amiability. Luckily, Molly moderated his bumptious unconviviality so that their many callers simultaneously experienced the contradictory ideals of defensive homeowner and welcoming hostess.

The perilous balance of discourtesy and diplomacy allowed McGee to insult guests and still retain their friendship. Doc Gamble (Arthur Q. Bryan) often received the master’s barbs. One time the doctor looked forward to a vacation he said would leave him “ship shape.” Ever the deflator of other people’s fantasies, McGee agreed that the doctor already looked like a great big “stern wheeler.” In keeping with the American spirit of fair play and the aesthetic rule that helplessness is not funny, Doc returned these insults with agility. Once he scolded McGee for being too cheap to buy a proper suit, dubbing Fibber a “rhinestone Jim Brady” and “our little Lucius Booby in that pin-stripe awning he uses for a sport coat.”

Similarly, other drop-ins to their parlor had positions that would ordinarily merit respect but instead received impertinence. Policemen were called “lugans” and “larrigans,” told to take off their hats, and given false information (asked his

name, Fibber replied, “Herman Gibletripe—and this is my wife Clara”). Mayor LaTrivia (Gale Gordon), outside the McGees’ home an effective orator, dissolved into babble at the McGees’. He boasted that the City Council had opposed him, but he had “stuck to [his] guns.” Both Fibber and Molly confounded him by asking why an elected official needed weapons, suggesting that he might have been more successful if he had not threatened them, and finally warning him that guns should not be tolerated.

Fibber reacted to aristocrats with a peculiar mixture of envy—which prompted get-rich projects to find a substitute for sugar or turn paper back into cloth—and disdain. Despite all the wealth of grand dames like Abigail Uppington (Isabel Randolph) and Millicent Carstairs (Bea Benedaret), Fibber commented that the latter “acts like a coquettish dray horse.” He admired clothing store dummies for their “nonchalant, supercilious, haughty” look: “It takes six generations of money in the family to achieve an expression like that.” Molly personalized his sociological dictum: “Yes, it’s strange how often a vacant face goes with a full pocketbook, which ought to give you a very expressive countenance.”

Because he never seemed to work and borrowed tools without returning them, McGee’s own income remained ambiguous. He yearned for money so much that he ripped apart their antique sofa to find \$20,000 hidden by an ancestor—\$20,000 Confederate, that is. The appearance of a maid on some shows, variously called Beulah (played by a man, Marlin Hurt) or Lena (Gene Carroll, also a man), hinted that he was prosperous; the appearance of a renter, Alice Darling (Shirley Mitchell), a gabby factory worker, on other episodes suggested that he needed spare cash. The general impression was of a household relatively secure in the economic parade.

Located in the middle of the middle class, McGee often was bested by those whom snobs would have considered beneath concern. When Ole Swenson (Dick LeGrand), the Swedish janitor at the Elks’ Club, said his boy in the submarine service was on a secret mission, McGee paraphrased loftily, “Sub rosa, eh?” Ole calmly torpedoed the hifalutin’ Latin with, “No, submarine.” Likewise, the recently immigrated Nick DePopoulous (Bill Thompson) steamrolled over “Fizzer,” telling his own tales with nonstop, heavily accented malapropisms.

Far from being disturbed by unpredictable standards for social deportment, people in McGee’s universe enjoyed the anarchy. Wallace Wimple (Bill Thompson), the hen-pecked victim of “Sweetie Face,” his “big, old wife,” just wanted to be alone with his bird book. To avoid her abuse, Wallace secretly rented a room under the name “Lancelot Eisenhower

Fibber McGee and Molly
Courtesy Radio Hall of Fame

Dempsey”—a name, he explained dreamily, that “just appealed to me somehow. It’s such a *brave* name.”

Two final visitors show how the give-and-take of their peculiar hosting rituals eliminated barriers. After Fibber read a bedtime story to Teeny (Marian), the precocious little neighbor girl, she asked, “What’s a ‘dell’?” Fibber: “Oh, it’s a kind of shady nook in the woods where green things grow.” Teeny: “You mean like dell pickles.” Announcer Harlow Wilcox, ever touting the benefits of Johnson’s Wax, delivered his pitches despite McGee’s interruptions.

Just as the program democratically blurred social distinctions, the language too evaded rules. McGee frequently delivered such tongue-tangling monologues as:

When I worked in the big mill there, I was quite the dude. ‘Mill Dude McGee’ I was known as. Mill Dude McGee, a magnificent mass of muscle and manly manners mesmerizing the maidens in the Midwest and mentioned most every month in many of the men’s magazines as the mirror and model for male millinery merchants, meticulous material manufacturers, and miscellaneous members of the metropolitan mob, mighty and magnetic from November through May.

Individual words, like manners, evolved into new forms. After getting Mayor LaTrivia’s goat, Fibber bragged to Molly, “He sure gets worked up, don’t he? He was just liver with rage.”

MOLLY: You mean livid, Dearie.

FIBBER: Go on, livid is a girl’s name, like Livid De Haviland.

MOLLY: That’s Olivia,

FIBBER: Oh, don’t kid me, Snookie. Olivia’s a country in South America.

During another episode, Fibber skipped from “subtle to subtle to scuttle to shuttle to chateau.” Such celebrations of social and linguistic independence during decades of Depression, war, and tumultuous recovery that required national conformity explain the enduring appeal of *Fibber McGee and Molly*.

Film Depictions of Radio

Radio's depiction in motion pictures initially stemmed from the concurrence of their golden ages, as radio stars were featured in movies, often playing their radio characters. Thereafter, films about radio focused more on radio's producers, dealing with the challenges and ethical issues they faced, or on listeners, depicting the impact radio had on their lives—particularly the medium's ability to unite communities. Mentioned here are many but by no means all of the motion pictures featuring radio-related subjects.

Radio Movies in the Golden Age

Major motion pictures focusing on radio first appeared during the height of Hollywood's studio system in the 1930s and gave fans their first chance to see moving pictures of radio celebrities. Virtually all were comedies or musicals, designed to get the audience's mind off Depression-era realities.

Foremost among these was the series of films beginning with *The Big Broadcast* (1932), which included George Burns, Gracie Allen, and Bing Crosby as employees of a struggling radio station whose survival depends on a group of radio celebrities, including Kate Smith, Cab Calloway, the Boswell Sisters, Arthur Tracy, and The Vincent Lopez Orchestra. This box office success led to a sequel, *The Big Broadcast of 1936* (1935), which finds Burns and Allen with a contraption known as a Radio Eye (what we now call television) on which various stars appear, including Ethel Merman. Still another sequel, *The Big Broadcast of 1937* (1936) followed, wherein Jack Benny is now the radio boss and Martha Raye his secretary; Burns and Allen returned, appearing once again with a host of stars, including Benny Goodman, Benny Fields, and Leopold Stokowski and his orchestra. The final installment, *The Big Broadcast of 1938* (1937), finds W.C. Fields playing twins who race ships that are powered by electricity supplied from radio broadcasts; it starred Raye, as well as Dorothy Lamour, Shirley Ross, and Bob Hope, who sang what became his signature "Thanks for the Memories" for the first time.

Another series of films that tried to mimic the success of the *Big Broadcast* began with *The Hit Parade* (1937), in which a talent search for radio stars turns up a series of celebrities, including Duke Ellington. Sequels included *Hit Parade of 1941* (1940), *Hit Parade of 1943* (1943), *Hit Parade of 1947* (1947), and *Hit Parade of 1951* (1950) and continued the trend of story lines designed to pack in as many acts as possible.

In the same genre of movies about radio stars was *The Great American Broadcast* (1941), which centers on a love triangle between a young woman and two World War I veterans who enter the radio business together, later to become rivals.

The finale hinges on a scheme by one of the men to reunite the woman and his wartime friend after they have parted ways, deciding to step aside and let the true lovers reconcile. His scheme involves organizing the first nationwide radio broadcast, an idea originally conceived by his war buddy, who he knows will surface to take credit and be reunited with his love. The broadcast itself features many top-name acts, including Kate Smith, Eddie Cantor, Rudy Vallee, and Jack Benny.

During this era a number of movies were also produced based upon radio programs themselves, giving audiences a chance to see their favorite radio characters in action. These include a movie version of Ed Wynn, *The Fire Chief* simply titled *The Chief* (1933) and starring Wynn. Several films featured characters of the radio comedy *Fibber McGee and Molly*, featuring the radio stars Jim and Marian Jordan. These films started with featured roles for the Jordans, playing their radio characters, in *This Way Please* (1937), followed by starring roles in *Look Who's Laughing* (1941), co-starring Edgar Bergen and Lucille Ball, *Here We Go Again* (1942), with Bergen, Gale Gordon and radio's *Great Gildersleeve* star Harold Peary, and *Heavenly Days* (1944). Peary enjoyed a string of films based upon *The Great Gildersleeve*, including *Gildersleeve on Broadway* (1943), *Gildersleeve's Bad Day* (1943), and *Gildersleeve's Ghost* (1944). Finally, there is *My Friend Irma* (1949), based on the radio sitcom of the same name and starring the radio show's lead actress Marie Wilson. The film featured the debut pairing of Dean Martin and Jerry Lewis, as did a sequel, *My Friend Irma Goes West* (1950). Band leader and radio star Kay Kyser also appeared in several motion pictures.

What *The Big Broadcast* and its progeny were to 1930s and 1940s radio stars, a series of rock-and-roll radio movies starring renowned disc jockey Alan Freed was to 1950s rock acts. These films included *Rock Around the Clock* (1956), *Don't Knock the Rock* (1956), *Rock, Rock, Rock* (1956), *Mister Rock and Roll* (1957), and *Go, Johnny, Go!* (1959). Showcasing the likes of Bill Haley and the Comets, The Platters, Little Richard, Chuck Berry, and The Moonglows, these movies featured plots that were mainly designed to pack in as many rock performances as possible. Freed's disc jockey career was itself the subject of a later film titled *American Hot Wax* (1978).

Radio Drama on Film

Foremost among films examining challenges facing radio's producers was *FM* (1978). The movie focuses on the successful program director of the number one rock-and-roll station in Los Angeles and his efforts to keep the station's sound from being too influenced by the commercial interests of its corpo-

rate owners. The overall theme of the movie is addressed in a pivotal scene, when the new sales manager toasts "to profit, and the quality it brings," to which the program director replies "to quality, and the profit it brings." Highlighting the extreme personalities of the station's air staff, the movie also foregrounds the influence radio has on its community, as the disc jockeys strike rather than give in to over-zealous commercial interests—a move that inspires hundreds of loyal fans to join the protest outside the station.

Director Oliver Stone critically examines the shock jock phenomenon in *Talk Radio* (1988), a film about a late-night talk show host based upon a play by Eric Bogosian. An intense, intelligent examination of hatred, violence, and loneliness in America, all of which are exhibited by callers to a radio program called *Night Talk*, the film is also a study of the host himself, who must suffer the consequences of provoking his late-night listeners to anger. The shock jock is ultimately killed by one of his violent listeners. The film critically examines the capacity of provocative radio talk show hosts to empower society's most troubled members, under the guise of providing entertainment and exploiting radio's First Amendment privileges.

Good Morning Vietnam (1987), perhaps the best known of all the films treated here, was directed by Barry Levinson and tells the partially true story of a wise-cracking, quick-witted disc jockey who joins the staff of Armed Forces Radio Saigon and uses his comic personality to entertain and unite the troops. From presidential impersonations to crass humor, the newcomer (played by Robin Williams) delivers a high-powered series of gags and thinly veiled criticisms of the war, in the process receiving bags-full of fan mail and the contempt of his humorless supervisors. The film also shows a more serious side, as the comic announcer confronts the ethics of army censorship of radio news.

Private Parts (1997) was shock jock Howard Stern's homage to his own rise to power. Based upon his book and starring Stern, the film recounts his career in the radio business, from his first problems with management at a local station, to meeting his long-time on-air companion Robin Quivers, to his network radio days and run-ins with the FCC. A somewhat one-sided retelling of the story, the film presents Stern as a working-class hero who does what he must to entertain the masses, much to the chagrin of his uppity and uptight management counterparts.

Foremost among films focusing on radio's listeners is Woody Allen's *Radio Days* (1987). A nostalgic look at World War II era radio, the film depicts Allen's childhood reminis-

cences of the role radio played in the lives of his Rockaway Beach family. A mock Martian invasion helps an Aunt see the cowardice of her date; the fantasy of a masked avenger allows a boy to imagine a life apart from suburban humdrum, much as exotic South American music allows his cousin to do the same; game shows or a ventriloquist's act provide occasions for family bonding or discussion; news bulletins following rescue efforts to save a young child who fell down a well help the family put their own petty squabbles in perspective; and war reports help a nation define an era. Throughout the film, Allen affords radio a ubiquitous presence, fondly recalling its role in every aspect of his childhood and lamenting that his memories of radio and its era fade more with every passing year.

Radio's influence in uniting communities is depicted even in films not principally focused upon radio. Hence, the cult classic *The Warriors* (1979) depicts a DJ, shown only as a pair of lips speaking into a microphone, as she helps gang members throughout New York City track and hunt members of the Warriors, who are falsely accused of murdering the charismatic leader of the city's most powerful gang; ultimately, she apologizes to the gang for the urbanite community's error. Another inner city set film that highlights radio's role in a community is Spike Lee's *Do the Right Thing* (1989), a drama about the eruption of racial tension on a city street in Brooklyn. The disc jockey of the street's storefront radio station serves as a source of news, reason, and inspiration for the community, helping to calm tension and keep the community apprised of neighborhood happenings. Finally there is George Lucas' classic *American Graffiti* (1973), wherein the omnipresent rock music and hip chatter of archetypal disc jockey Wolfman Jack set the mood of the time and binds together the community of young adults coming of age.

Fireside Chats

President Franklin D. Roosevelt's Use of Radio

The election of Franklin D. Roosevelt to the U.S. presidency in 1932 coincided with the development of radio networks and the growing popularity of radio. Radio was an ideal medium for Roosevelt, whose voice and style of delivery were well suited to the microphone.

Throughout his presidency (1933–45), Roosevelt used radio to talk to Americans about the problems they faced during the Depression and World War II. He inspired listeners to summon their confidence, determination, and courage to combat these threats to the nation's survival. Roosevelt's conversational, informal radio addresses quickly became known as "fireside chats."

As governor of New York, Roosevelt had used radio to appeal directly to the state's voters, and by the time he entered the White House, he was fully aware of the benefits of the medium. Because many newspaper owners were not supporters of his New Deal programs, Roosevelt found an advantage with radio, which allowed him to speak directly and personally with listeners in their own living rooms. Unable to walk without support after 1921 because of polio, Roosevelt found radio to be an ideal way to project an image of active and powerful leadership.

Roosevelt's press secretary, Steve Early, once noted that Roosevelt liked to picture his audience as a small group sitting around a fireside; this image led to a radio introduction that included the phrase "fireside chat." There are varying opinions as to which of Roosevelt's radio addresses should be classified as fireside chats, with the number placed at between 25 and 31 addresses he made during the 12 years of his presidency. Certainly not all of Roosevelt's radio speeches were in this category, as many of his other radio presentations were tied to ceremonial occasions or political events.

The fireside chats tended to be relatively brief, usually less than 30 minutes, and were structured so that the opening generally focused on a recent event. This was followed by a review of government actions and responses, along with an explanation of the likely impact on the country and the lives of listeners, including the roles they could play in helping to solve problems. Roosevelt's informal language included repetitive devices and simple, easily understood terms. He called for forward, progressive action and expressed optimism and faith in the American people and in divine providence.

Most of the fireside chats were scheduled between 9:00 P.M. and 11:00 P.M. and originated from the East Room or the Oval Office of the White House. Frequently, friends or members of the family were in attendance.

Although Roosevelt received assistance with research and preparation, including early drafts, his speeches reflect his own phrasing, personality, and style. Listeners noted that his pleasant and distinctive voice inspired hope and confidence. This played an important part in Roosevelt's ability to communicate ideas and emotions. His relatively slow delivery, clear articulation, and even his Eastern accent contributed to his memorable and successful use of radio.

Early fireside chats described New Deal measures to combat the Depression. Topics included the banking crisis, the National Recovery Administration, the Works Progress Administration, the gold standard, and unemployment. Roosevelt's goal was to assure listeners that his administration was doing everything possible to relieve hardships resulting from economic conditions.

By the late 1930s, although the official U.S. position relative to the war in Europe was one of neutrality, Roosevelt exhibited increasing sympathy for the Allies, and by 1940 the United States was providing nonmilitary support to Britain and France. In a fireside chat during May of that year, Roosevelt urged further American commitment to the Allied cause, and by 19 December, in another radio address, he called on the United States to become the "great arsenal of democracy." Following the Japanese attack on Pearl Harbor, Roosevelt used radio to call on the public for increased industrial production and for the acceptance of necessary restrictions at home during the war effort. During the war, Roosevelt used radio to inform the public, but he also realized that it was important to avoid providing information to the enemy, who could also listen to his broadcasts. Some of the comments in his radio addresses during the war were actually intended for Axis listeners and conveyed the message that the United States was determined and able to persevere to the war's end. The themes of Roosevelt's wartime radio speeches emphasized the nobility of the Allied cause, the inevitability of victory, and the necessity for individual sacrifice. He spoke of the need for more manpower, both military and civilian, and he expressed concern about complacency and overconfidence. Roosevelt used radio to encourage the purchase of war bonds and to describe how everyone could contribute to victory.

Toward the war's end, Roosevelt described the demand for unconditional surrender and plans for a postwar America. In his last fireside chat, delivered 6 January 1945, Roosevelt expressed hope for a United Nations organization, which he described as the best hope for a lasting peace. Franklin D. Roosevelt died 12 April 1945.

U.S. President Franklin D. Roosevelt moments before his fireside chat on 12 March 1933
Courtesy AP/Wide World Photos

Roosevelt was the first president to make extensive and continuous use of modern electronic means to speak directly to his constituents. This capability has contributed to the increased power of the executive branch of government. Roosevelt's use of radio allowed him to influence the national agenda and to counter opposing newspaper editorials. His radio addresses played a major role in his popular image, in his being elected four times to the presidency of the United States, and in the success of his efforts to lead the nation through the years of economic depression and world war.

First Amendment and Radio

The First Amendment (1791) to the U.S. Constitution provides, in part, that Congress shall make no law abridging the freedom of speech or of the press. Yet in spite of this proscription, there exist a number of regulations that limit free expression on radio. The very fact that stations must be licensed is a restriction that would be considered clearly unconstitutional if it were applied to print media. On the other hand, the courts have stated that radio broadcasting is entitled to First Amendment protection. The amount of protection is less than that enjoyed by print media, but it is still significant.

The fact that the First Amendment protections extend to radio as well as the press was made clear by a 1948 Supreme Court decision, *United States v Paramount Pictures*, which stated, "We have no doubt that moving pictures, like newspapers and radio, are included in the press whose freedom is guaranteed by the First Amendment." In order to best understand what free expression rights are due to radio, one needs to examine the rationale for regulating radio. Courts and legal scholars have provided a variety of arguments for regulation that fit into four general categories: scarcity of broadcast frequencies, the broadcast spectrum as a public resource, the need to alleviate interference, and the pervasiveness and power of the broadcast media.

Scarcity

In a 1984 decision, the Supreme Court stated, "The fundamental distinguishing characteristic of the new medium of broadcasting that, in our view, has required some adjustment in First Amendment analysis is that broadcast frequencies are a scarce resource that must be portioned out among applicants." This scarcity rationale has undergone a number of attacks in recent years with the proliferation of media, but in fact it is still considered a valid regulatory rationale. Although the number of radio stations (as well as the number of most other media outlets) has increased, courts continue to accept a scarcity ratio-

nale. The reason for this is that scarcity does not depend on the number of existing media outlets but rather on the determination of whether a new applicant stands a good chance of entry to the market. A vast number of existing media outlets implies that diversity exists, not that scarcity has been eliminated. If new applicants want to obtain station licenses and are unable to do so, that implies scarcity. Scarcity is a function of the number of people desiring a station to the number of stations available. As long as applicants exceed available frequencies, scarcity exists. As the Supreme Court noted in its *Red Lion* decision in 1969, "When there are substantially more individuals who want to broadcast than there are frequencies to allocate, it is idle to posit an unabridgeable First Amendment right to broadcast comparable to the right of every individual to speak, write, or publish." This is why there will never be scarcity for newspaper publishers, no matter how many newspapers are published in the United States. In theory, at least, any American can start a newspaper (at least there is no legal restriction). The same is not true for starting a radio station.

In 1943 the Supreme Court supported the notion that scarcity entitled the Federal Communications Commission (FCC) to make judgments about who would best serve the public interest. In *National Broadcasting Company v United States*, the Court rejected the argument that chain broadcasting rules were a violation of the First Amendment:

If that be so, it would follow that every person whose application for a license to operate a station is denied by the Commission is thereby denied his constitutional right of free speech. Freedom of utterance is abridged to many who wish to use the limited facilities of radio. Unlike other modes of expression, radio is not inherently available to all. That is its unique characteristic, and that is why, unlike other modes of expression, it is subject to governmental regulation. Because it cannot be used by all, some who wish to use it must be denied. But Con-

gress did not authorize the Commission to choose among applicants upon the basis of their political, economic or social views, or upon any other capricious basis. . . . The licensing system established by Congress in the Communications Act of 1934 was a proper exercise of its authority over commerce. The standard it provided for the licensing of stations was the “public interest, convenience, or necessity.” Denial of a station license on that ground, if valid under the Act, is not a denial of free speech.

Public Resource

In 1962 President John F. Kennedy referred to the broadcast spectrum as a “critical natural resource.” The federal government typically regulates the use of natural resources to ensure that they are not damaged and that their use is in the public interest. Viewing the spectrum as a public resource results in a philosophy that views users of the public resource as public trustees, who as such can be expected to act according to the dictates of those allowing them to use the resource. The government could have adopted other models for rationing spectrum, but it didn’t. The assumption is that those who use the public resource have some degree of public service obligation.

A good example of this requirement is the demand, found in Section 312 of the Communications Act, that broadcasters provide reasonable access to candidates for federal office. This affirmative obligation on broadcasters, which would be unconstitutional if applied to print media, can only be justified under a public-resource rationale. In the 1981 Supreme Court Decision *Columbia Broadcasting System v Federal Communications Commission*, the Court wrote that such a rule “represents an effort by Congress to assure that an important resource—the airwaves—will be used in the public interest. [The rule] properly balances the First Amendment rights of federal candidates, the public, and broadcasters.”

Interference

Undoubtedly the oldest of the regulatory rationales is the assertion that the government must regulate the broadcast spectrum in order to prevent interference. This was provided as rationale for the passage of the Radio Acts in 1912 and 1927. Failure to limit interference would result in a “cacophony” in which no one would be heard. Thus, the government exercises its authority to limit the free speech of some so that others might be heard. Some might contend that interference and scarcity are actually the same rationale, when in fact they are different. Their connection in broadcast contexts is understandable, because the spectrum is subject to both scarcity and interference. It is possible, however, to have interference when there is no physical scarcity. It is interesting to note that the

Supreme Court’s 1969 *Red Lion* decision quoted a 1945 print media case involving the Associated Press when it stated “the right of free speech . . . does not embrace a right to snuff out the free speech of others.” Clearly, there can be interference without scarcity. In *Red Lion*, the Court stated:

When two people converse face to face, both should not speak at once if either is to be clearly understood. But the range of the human voice is so limited that there could be meaningful communications if half the people in the United States were talking and the other half listening. Just as clearly, half the people might publish and the other half read. But the reach of radio signals is incomparably greater than the range of human voice and the problem of interference is a massive reality. The lack of know-how and equipment may keep many from the air, but only a tiny fraction of those with resources and intelligence can hope to communicate by radio at the same time if intelligible communication is to be had, even if the entire radio spectrum is utilized in the present state of commercially acceptable technology.

The Supreme Court justified broadcast regulation, in part at least, because of broadcasting’s unique physical characteristics.

Pervasiveness and Power

Perhaps most controversial of all the rationales, this claim asserts that broadcast media should be regulated because of the media’s unique role in the lives of Americans. In the famous *Pacifica* case (dealing with George Carlin’s “Seven Dirty Words” monologue), the Supreme Court stated that “the broadcast media have established a uniquely pervasive presence in the lives of all Americans.” Yet no one would attempt to assert that a small-town radio station has more pervasiveness and power than, say, *The New York Times*. Perhaps a more appropriate term for the Court to have used would have been *invasive* rather than *pervasive*. The Court seemed to be influenced by the fact that radio transmissions come into the privacy of one’s home and automobile and are instantly available to children, unlike newspapers, which wait outside our homes for us to collect them and are unreadable by children still too young to read. In *Columbia Broadcasting System v Democratic National Committee* in 1973, the Court stated a concern dating back to the 1920s that radio’s audience is in a sense “captive” because it cannot simply ignore the messages sent by broadcasters.

It is this rationale that supports limits on broadcast indecency. FCC rules that restrict the use of indecent language during certain hours of the broadcast day (6 A.M. to 10 P.M.) are based on the premise that the audience will consist of a number of minors who should not be subjected to indecent

language. Allowing the restriction of indecent material on the air is a recognition of broadcasting's pervasive nature.

First Amendment Protections

In spite of the regulations that do exist, radio is not without First Amendment rights. Section 326 of the Communications Act specifically states:

Nothing in this Act shall be understood or construed to give the Commission the power of censorship over the radio communications or signals transmitted by any radio station, and no regulation or condition shall be promulgated or fixed by the Commission which shall interfere with the right of free speech by means of radio communication.

Although some might contend that the Section 326 provision is rendered either superfluous by the First Amendment or invalid by rules such as those limiting indecency, the courts have continued to support the general principle that the FCC may not censor broadcasts.

Radio stations also have the right to decide who uses their facilities. The Supreme Court has unequivocally stated that the need to serve the public interest does not require that broadcasters provide access for individuals or organizations. Those who would like to present their positions on public issues have ample opportunity to do so without a government requirement that stations afford them airtime.

The Supreme Court has suggested that the balance between the First Amendment rights of broadcasters and the need for government regulation is not static and that changing conditions might warrant a change in the balance between the two. In the 1973 decision *Columbia Broadcasting System v Democratic National Committee*, the Court stated, "the history of the Communications Act and the activities of the Commission over a period of 40 years reflect a continuing search for means to achieve reasonable regulation compatible with the First Amendment rights of the public and the licensees." Eleven years later, in *Federal Communications Commission v League of Women Voters*, the Supreme Court made it even more clear that regulatory rationales were open to review and revision. In two rather significant footnotes, the Court signaled its willingness to accept a regulatory scheme that was less demanding of broadcasters. In addressing the scarcity rationale, the Court wrote, "We are not prepared, however, to reconsider our longstanding approach *without some signal from Congress or the FCC* that technological developments have advanced so far that some revision of the system of broadcast regulation may be required" (emphasis added). Although the Court was not prepared to lay the fairness doctrine or the scarcity rationale to rest, it opened the

door for others to do so. After a series of legal actions, the FCC did in fact eliminate the fairness doctrine.

The entire concept of treating broadcast differently from print media has been challenged for some time, but the practice continues. Modifications have been made, and radio has significantly fewer regulations today than it had prior to the deregulation movement that began in the 1970s. Nonetheless, some would assert that the changing nature of mass media will make it more difficult to have different regulatory schemes based on modes of transmission. With media converging as they are, will regulatory policies that treat media differently based on modes of transmission be able to survive? In an era in which both newspaper and radio messages can reach their audience via the internet, should one be regulated differently from the other? These are questions that have been posed for decades, yet our regulatory policy remains essentially unchanged. Broadcast media are subject to regulation based on the four regulatory rationales stated above, while the print media are largely unregulated. The amount of regulation that will be tolerated is subject to the balancing engaged in by the Supreme Court, but radio (along with television) continues to be subject to regulation.

Fleming, Sir John Ambrose 1849–1945

British Electrical Engineer; Inventor of the Vacuum Tube

Sir John Ambrose Fleming led an active scientific life. His career covered the time from James Clerk Maxwell to the advent of electronic television. Fleming has been described as the scientific and technical link between Maxwell and Guglielmo Marconi. He was an outstanding teacher and highly successful popular scientific lecturer. He published more than 100 important papers on his discoveries. Fleming is best known for the thermionic vacuum tube or valve, the first electron tube that could change alternating current, such as a radio wave, to pulsating, one-way flow direct current. Fleming's diode improved radio reception and was a forerunner of the triode tube developed by Lee de Forest. Although the transistor eventually replaced Fleming's valve, his valve remained an important component of radios for nearly three decades and was used in the early days of computers and television.

Fleming began his study of electricity and mathematics under James Clerk Maxwell in the new Cavendish Laboratory at St. John's College in Cambridge. During his studies there, Fleming worked on improving the Carey Foster Bridge, a method for measuring the difference between two nearly equal resistances in electrical conduction. Fleming's improvement made the measuring device faster and more accurate. Maxwell labeled the device "Fleming's banjo" because of the measuring wire's circular shape.

After receiving his doctor of science degree in 1880, Fleming worked as a consultant for private industry. His consulting work resulted in many new methods and instruments for measuring high-frequency currents and new transformer designs. Fleming was a primary contributor to the development of electrical generator stations and distribution networks for several companies, including the London National Company, the Edison Telephone and Electric Light Companies, and the Swan Lamp Factory. For both the Swan and Edison companies, Fleming lent his expertise to photometry and helped develop the large-bulb incandescent lamp that used an aged filament as the light source.

In 1899 the Marconi Wireless Telegraph Company hired Fleming as a scientific adviser to help design the Poldhu wireless station in Cornwall, England. This was the largest wireless station in England and the source of the first transatlantic wireless telegraph transmission in 1901.

Fleming's most important contribution to electrical engineering was his vacuum tube, widely used in both radiotelegraphy and radiotelephony. In 1888 Thomas Edison announced his "Edison effect," which described how electronic particles were emitted from a hot electric lamp filament. Fleming had repeated Edison's findings in 1899 but had found little practical use for Edison's discovery.

In 1904, however, while searching for a more efficient and reliable detector of weak electrical currents, Fleming was inspired to make a new lamp, or valve, that would have a hot filament and an insulated plate sealed inside a high vacuum tube. When a current was passed through the carbon or metal filament, the rarefied air between the hot filament and the cold plate filled with electrons and became a conductor of electricity. He found that the electrons would travel only when the plate was attached to the positive terminal of a generator and that the plate would attract the negatively charged electrons. Fleming also noticed that this flow of electrons was in only one direction, from the hot filament to the cold metal plate, and not in the reverse direction. Alternating current would enter the device, but direct current would leave. Fleming had converted alternating-current radio signals into weak direct-current signals that could be heard with a telephone receiver. This was a major advance in radio technology. Fleming called his discovery a thermionic valve or tube, because it acted much like a check valve, which allows fluids to flow in only one direction. Eventually, the device was labeled "Fleming's valve." It provided the first truly reliable method to measure high-frequency radio waves. Fleming patented his valve in 1904. This discovery revolutionized radio telegraphy

communication technology. The vacuum tube was the foundation of electronics until the 1960s, when solid-state technology was developed, replacing vacuum tubes in most electronic devices.

In 1906 Lee de Forest added a third element to Fleming's diode valve, thus effectively separating the high-frequency circuit from that of the filament, making amplification of radio signals possible. Litigation of the de Forest and Fleming patents continued for years. Court decisions in 1916 tied most companies into knots. As the United States entered World War I, the navy offered to indemnify all manufacturers of radio apparatus for the armed forces against any resulting patent infringement suits. This pooling of all patents enabled manufacturers to produce modern equipment without fear of lawsuits. Patent disputes between de Forest and Fleming were not fully resolved until after American Telephone and Telegraph (AT&T) bought de Forest's Audion patent, the Radio Corporation of America (RCA) acquired rights to the Fleming valve, and AT&T and RCA entered into a cross-licensing agreement in 1920.

Throughout his long career, Fleming lectured often at University College, the Royal Institution, and the Royal Society of Arts. He published extensively and presented several important research papers at learned societies' conferences. After Fleming read a paper on the need for an authoritative body for electrical standards for the burgeoning electric lighting industry, the Board of Trade Laboratory and eventually the National Physical Laboratory were established in Great Britain. Fleming is credited with developing a direct-reading potentiometer, set to read current and potential directly in amperes and volts, and with encouraging R.E.B. Crompton to put it on the market in a practical form.

Fleming placed his long scientific career into perspective when he wrote that in comparing the last half of the 19th century and the first third of the 20th century, there was an enormous increase in practical technical achievement, despite the diminished confidence we now have in the validity of our theoretical explanations of natural phenomena.

His peers regarded Fleming very highly because of his extraordinary devotion to his work. He never lost sight of the potential for wireless. He wrote that

radiotelegraphy has not only given to mankind a superlatively beneficial means of communication, but has also opened up for discussion physical and cosmical problems of profound interest. . . . We are only at the very beginning of this evolution, yet it has already completely revolutionised the practical side of wireless telegraphy, as well as telephony (Fleming, 1921).

Flywheel, Shyster, and Flywheel

Radio Comedy Program

Although much of their fame rests on the dozen films they made between 1929 and 1950, the Marx Brothers, working together and as solo performers, enjoyed a measure of success in radio and later television broadcasting. The National Broadcasting Company's (NBC) weekly comedy *Flywheel, Shyster, and Flywheel* was the first network radio program to feature the Marx Brothers. Or, more accurately, it featured two of the four-member comedy team: Groucho and Chico. The remaining brothers—Harpo's silent clown and Zeppo's straight man—were less suitable for radio. Despite the fact that only 26 episodes were produced between November 1932 and May 1933, *Flywheel, Shyster, and Flywheel* opened up new avenues for the Marx Brothers' comic genius.

Flywheel, Shyster, and Flywheel's origins are typical of many programs produced for American radio during the early 1930s. Following on the heels of its rival's success with the *Texaco Fire Chief Program*, the Standard Oil Company sought a vehicle to promote its new product line: Esso gasoline and Essolube motor oil. Working with its advertising agency, McCann-Erickson, Standard Oil agreed to sponsor a weekly variety program called *Five Star Theater*. Every night of the week featured a different program: detective stories, dramas, musicals, and comedies. As Michael Barson notes in the introduction to his edited collection of the program's scripts, "the jewel of the enterprise was Monday night's entry, *Beagle, Shyster, and Beagle, Attorneys at Law*," which featured Groucho as Waldorf T. Beagle, a wisecracking ambulance chaser, and Chico as his incompetent assistant, Emmanuel Ravelli. Indeed, with four successful feature films to their credit—*The Cocoanuts*, *Animal Crackers*, *Monkey Business*, and *Horsefeathers*—landing even half of the Marx Brothers was quite a coup for Standard Oil.

Beagle, Shyster, and Beagle debuted on 28 November 1932 over the NBC Blue network. Although audience reaction is difficult to gauge, at least one listener, a New York attorney named Beagle, was not amused. Anxious to avoid a lawsuit,

the network changed the name of Groucho's character to Flywheel and promptly altered the program's title accordingly. Not surprisingly, the scripts for *Flywheel, Shyster, and Flywheel* are characteristic of the Marx Brothers' penchant for rapid-fire one-liners, puns, putdowns, and malapropisms. And as in their movies, on radio the Marx Brothers had little regard for the rule of law or high society: few cherished American values or institutions were spared a "Marxist" skewering. For example, at the end of one episode, Flywheel (Groucho) advises a would-be philanthropist, "Instead of leaving half of your money to your children and the other half to the orphanage, why not leave your children to the orphanage . . . and the million to me?"

What is most significant about these scripts (the original programs were not recorded, but the majority of the show's transcripts survive in the Library of Congress) is their relationship to the Marx Brothers' film work. In some instances, entire routines from earlier films were reworked for *Flywheel, Shyster, and Flywheel*. For example, some episodes featured plot lines and dialogue taken from the Broadway hit and subsequent film *Animal Crackers*. Even the name of Chico's character, Emmanuel Ravelli, came directly from this film. Several scenes from *Monkey Business* found their way into episodes of the radio program as well. On the other hand, a number of *Flywheel, Shyster, and Flywheel* scripts foreshadowed the Marx Brothers' later film work. Of particular interest are early drafts of now archetypal routines and dialogue from the Marx Brothers' classic *Duck Soup*. The film's infamous trial sequence owes much of its funny business to a *Flywheel, Shyster, and Flywheel* script, as does Chico's hilarious recitation on his difficulties as a spy: "Monday I shadow your wife. Tuesday I go to the ball game—she don't show up. Wednesday she go to the ball game—I don't show up. Thursday was a doubleheader. We both no show up. Friday it rain all day—there's a no ball game, so I go fishing." The name of Groucho's character, Waldorf T. Flywheel, would be recycled some years later in the 1941 film *The Big Store*.

The need for this recycling of old gags and testing of new material is understandable. Along with their writers, Nat Perin and Alan Sheekman, Groucho and Chico soon grew tired of traveling cross-country from Hollywood to New York to do a weekly radio program. In fact, in January 1933, *Flywheel, Shyster, and Flywheel* took the then unprecedented step of relocating its broadcast from WJZ in New York to Hollywood for a time. Still, the time constraints facing both writers and performers undoubtedly contributed to their willingness to borrow from established routines while refining others. By the middle of 1933, however, it was a moot point. *Flywheel, Shyster, and Flywheel* was taken off the air. Although its ratings were quite respectable, considering the less-than-desirable airtime of 7:30 P.M., the sponsors were disappointed with the show's performance.

Throughout the 1930s and 1940s, Groucho and Chico returned to the airwaves in various guises. In 1934 they were hired by the Columbia Broadcasting System (CBS) to spoof the latest news in a short-lived program called *The Marx of Time*. Both Groucho and Chico struck out on their own as well. Chico made a number of radio appearances as a musical accompanist and band leader, and Groucho served as host for programs such as *Pabst Blue Ribbon Town*. During the war years, the Marx Brothers, including Harpo, made guest appearances on the Armed Forces Radio Service. Of special note, however, is Groucho's role as the judge in Norman Corwin's fanciful courtroom drama from 1945, *The Undecided Molecule*. Groucho's true calling on radio came in 1947 as a quiz show host on *You Bet Your Life*. Curiously, this popular program shuffled between the radio networks before finding a permanent home on NBC.

In an odd but telling postscript, the British Broadcasting Corporation (BBC) began airing recreations of *Flywheel, Shyster, and Flywheel* in 1990. The programs proved quite popu-

lar with British audiences and have subsequently been picked up for broadcast in the United States through National Public Radio (NPR).

FM Radio

Frequency modulation (FM) radio, more usually called VHF radio outside the United States, began with experiments in the 1920s and 1930s, expanded to commercial operation in the 1940s, declined to stagnation in the 1950s in the face of competition from television, resumed growth in the 1960s, and rose to dominance of American radio listening by the late 1970s. This entry focuses first on the basics of FM broadcasting and then explores the development of the service in the United States, where it was first invented and developed;

finally, this essay turns to selective brief coverage of FM outside the U.S.

FM Basics

FM transmitters modulate a carrier wave signal's frequency rather than its amplitude. That is, the power output remains the same at all times, but the carrier wave frequency changes in relation to the information (music or talk programs, e.g.)

transmitted. Electronic static (most of which is amplitude modulated) may flow with but cannot attach to FM waves, which allows the desired FM signal information to be separated from most interference by special circuits in the receiver.

Because U.S. FM channels are each 200 kilohertz wide (allowing a wide frequency swing), a high-quality sound image is transmitted (up to 15,000 cycles per second—almost three times the frequency response of AM signals and close to the 20,000-cycle limit of human hearing), usually in multiplexed stereo. The cost for this sound quality is paid for in spectrum—each FM station takes up 20 times the spectrum of a single AM station, although only a portion is used for actual signal transmission, with the remainder serving to protect signals of adjacent stations. FM radio in the United States is allocated to the very high frequencies (VHF), occupying 100 channels of 200 kilohertz each between 88 and 108 megahertz. Each FM channel accommodates hundreds of stations—there are more than 7,000 on the air at the beginning of the 21st century.

VHF transmissions follow line-of-sight paths from antenna to receiver, and thus FM transmitters (or television stations, which use neighboring frequencies) are limited in their coverage to usually not more than 40 to 60 miles, depending on terrain and antenna height. That limitation is balanced by the lack of the medium wave interference that AM radio has, which is caused by signals arriving from ground waves or sky waves at slightly different times because of the distances covered.

Experimental Development (to 1940)

No one person “invented” FM radio—indeed, the man most credited with developing the system, Edwin Howard Armstrong, readily conceded that point. The first patents concerning an FM transmission system were granted to Cornelius Ehret of Philadelphia in 1905, probably the first such patents in the world. Scattered mentions of FM in subsequent years focused on its negative aspects, suggesting that, based on what was then known, FM would not be a useful broadcast medium. Still, technical work continued, and more than two dozen patents had been granted to various inventors and companies by 1928. Much of the impetus behind research into FM work was the search for a solution to the frustrating interference problem with AM radio. By the late 1920s, it was clear that simply using more AM transmitter power would not overcome static, which made AM unlistenable in electrical storms. Something new was needed.

From 1928 to 1933, Edwin Armstrong, a wealthy radio inventor then on Columbia University’s physics faculty, focused on trying to utilize FM in a viable broadcast transmission system. Rather than working with narrow bands as had others before him, Armstrong’s key breakthrough was to use far wider channels, eventually 20 times wider than those used

by AM. The frequency could then modulate over about 150 kilohertz (though it normally used far less), leaving 25-kilohertz sidebands to prevent interference with adjacent channels. This allowed for greatly improved frequency response, or sound quality. Armstrong incorporated various circuits to allow precise tuning of the wide channels while at the same time eliminating most static and interference. Armstrong applied for the first of his four basic FM patents in 1930 and for the last in 1933; all four were granted late in 1933.

From 1934 to 1941, Armstrong further developed and demonstrated FM, working toward Federal Communications Commission (FCC) approval of a commercial system. After a number of long-distance tests (successfully sending signals up to 70 miles with only 2,000 watts of power) in cooperation with the Radio Corporation of America (RCA), Armstrong announced his system to the press early in 1935. A more formal demonstration to a meeting of the Institute of Radio Engineers later that year (and the published paper that resulted) marked the beginning of active FM innovation.

Resistance to the FM idea began to develop at about this time, usually growing out of the competing interests of two other broadcast services. Owners of AM stations, including the major networks, were concerned about the new technology that might totally replace their existing system. And companies already investing heavily in television research, especially RCA, thought that the new video service should receive priority in allocations and industry investment. FM was seen by some as merely a secondary audio service, albeit a far better one technically.

In July 1936 Armstrong obtained permission from the FCC to construct the world’s first full-scale FM station in Alpine, New Jersey, across the Hudson River from New York City. After a technical hearing, the FCC provided initial allocations for FM and television (among other services), granting the fledgling FM technology’s backers the right to experiment on 13 channels scattered across three widely separated parts of the spectrum—26, 43, and 117 megahertz. Early in 1939 the allocation was expanded to 75 channels located more conveniently between 41 and 44 megahertz. In the meantime, Armstrong’s experimental station—the world’s first FM transmitter—had gone on the air as W2XMN with low-power tests in April 1938.

Developing further experimentation but also looking toward commercial FM operations, the New England-based Yankee Network began to build two large transmitters in 1938–39. General Electric built two low-power FM transmitters at the same time, and the National Broadcasting Company’s (NBC) experimental station began operating in January 1940. The first FM station west of the Alleghenies began transmission tests in Milwaukee just a few days later. Transmitters for most of these operations came from Radio Engineering Laboratories. Receivers were first manufactured by General

Electric in 1939, with other companies joining in the next year; however, most FM sets cost a good deal more than their AM counterparts.

Early Operations (1940–45)

The FCC became the arena for a 1940 battle over whether or not to authorize commercial FM service, and if so, on how many channels and with what relationship to developing television. In March 1940, more than a week of hearings were held to air the industry's conflicting views over the merits of FM and television. On 20 May 1940, the commission released its decision allowing the inception of commercial FM operation as of 1 January 1941; the decision allocated 40 channels on the VHF band (42–50 megahertz), reserving the lowest five channels for noncommercial applicants. Final technical rules were issued a month later. The first 15 commercial station construction permits were issued on 31 October 1940.

As the new year dawned, 18 commercial and 2 educational stations aired (compared to more than 800 AM stations at the time). The first commercial license was granted to W47NV, affiliated with AM station WSM in Nashville. The first West Coast station, a Don Lee network outlet, went on the air in September 1941. FM outlets briefly used unique call signs that combined the letters used with AM stations with numbers indicating the channel used (e.g., W55M in Milwaukee broadcast on 45.5 megahertz). This system was replaced with normal four-letter call signs in mid-1943.

By the end of 1941, and after the United States had entered World War II, the FCC reported 67 commercial station authorizations, with another 43 applications pending. About 30 of the former were actually on the air. Wartime priorities forced the end of further license grants and limited construction material availability after March 1942. By the end of October 1942, 37 stations were in operation, plus an additional 8 outlets still devoted to experiments. But construction materials and replacement parts were increasingly difficult to find, and some owners turned back their authorizations or withdrew their applications pending the end of the war.

The first attempt at an FM network, the American network, never made it on the air, largely because of difficulties in constructing the needed affiliate stations in sufficient markets. Programs offered on FM were of two types—duplicated AM station signals (the most common type) or recorded music. Because of the duplicated content of existing stations, FM stations had little appeal for advertisers. Another problem was FM audiences. There were some 15,000 FM sets in use at the beginning of 1941 and perhaps 400,000 by the time manufacturing was stopped early in 1942, compared to 30 million AM-equipped households. Most observers expected FM to become an important part of the industry after the war.

Frequency Shift and Decline (1945–57)

The next dozen years—from 1945 through 1957—were both exciting and frustrating as the FM service struggled to become established and successful amidst a broadcasting industry increasingly infatuated with television and still investing considerable sums into the expansion of AM. Initial excitement over FM's potential gave way to a slow decline.

Toward the end of the war, potential operators were already concerned that FM's allocation of 40 channels was not sufficient for expected postwar expansion. To further complicate matters, wartime spectrum and related research suggested that the FM allocation of 42–50 megahertz might be subject to cycles of severe sun spot interference. Concerns about television expansion led to demands by some members of the industry for FM's spectrum space to be reallocated to television.

Extensive FCC hearings in mid-1944 aired some of the technical concerns about the FM band, though wartime security limited what could be discussed. Armstrong and his backers argued to retain (or, better yet, to expand) the existing allocation, in part because stations could easily network by picking up each other's signals and passing them on—something that would be impossible were FM to be moved higher in the spectrum (moving lower was out of the question because of existing services). In January 1945 the FCC proposed moving FM to the 84–102 megahertz band to avoid the expected atmospheric interference and to gain more channels, for a total of 90. Subsequent proceedings continued the industry split over what to do and how. Finally, in June 1945, the FCC made its decision, shifting FM “upstairs” to the 88–108 megahertz band with a total of 100 channels that the service occupies today. Continuing the precedent established in 1941, educational users were assigned to channels reserved for them at 88–92 megahertz. The former FM band would be turned over to television and other services after a three-year transition period.

At first it seemed the shift would only disadvantage those stations actually on the air (46 at the time) and those people with FM sets that could not also receive AM signals (perhaps 30,000 old-band FM-only sets in consumer hands). Generally FM's outlook was good. The FCC issued the first postwar grants for new stations in October 1945, and more applications were piling up. Through 1946 there were always at least 200 applications pending, and although the number of stations actually on the air grew fairly slowly, the number of authorized FM stations exceeded 1,000 by 1948—more than all the AM and FM stations on the air just three years earlier. Most applications were coming in from AM stations hedging their bets on the future. Several government agencies issued optimistic publications encouraging still more FM applicants. Two specialized FM trade magazines began to publish. A number of potential FM networks were in the planning stages, and the

first, called the Continental network, began operations with four stations early in 1947.

But all was not well. FM's frequency shift was more damaging in the short term than it had seemed. When stations began to transmit on FM's new frequencies, there were few receivers available to pick up the signals. Manufacturers were trying to meet pent-up wartime demand for new AM sets and had little capacity to devote to FM's needs. Thus FM suffered from the lack of a good-sized audience that might appeal to advertisers. Only token numbers of receivers were available until 1950, and by then demand for television sets was threatening capacity devoted to radio. FM's lack of separate programming (after considerable industry argument both ways, the FCC had allowed co-owned AM and FM stations to simulcast or carry the same material) offered little incentive for consumers to invest in one of the rare and expensive FM receivers. A cheap AM set could tune popular local and network radio programs just as well. FM's better sound quality was not enough of a draw. What independent programming did exist was largely classical music and arts material of interest to a relatively small elite. Advertisers saw no reason to invest in FM, especially when FM time was usually given away with AM advertising purchases. Indeed, AM was thriving—more than doubling the number of stations on the air from 1945 to 1950. And the growing concentration on television by broadcasters, advertisers, and the public made FM seem unnecessary.

As these factors combined and intensified, the results soon became apparent. The number of FM new station applications began to drop off, and then overall FM authorizations declined. By 1948 FM stations already on the air, among them some pioneering operations, began to shut down, returning their licenses to the FCC. FM outlets could not be given away, much less sold. The number of stations on the air declined each year. Faced with the seeming failure of his primary invention, Armstrong took his own life in 1954; with the loss of his financial backing, the Continental network had to close down as well.

Rebound (1958–70)

Then, and at first very slowly, FM began to turn around. Reports in several trade magazines late in 1957 picked up the fact that the number of FCC authorizations for FM stations had increased for the first time in nine years. Slowly the pace of new station construction picked up, first in major markets and then in suburban areas. Several factors underlay this dramatic shift.

First, AM had grown increasingly crowded—there were virtually no vacant channels available in the country's major markets. The number of AM stations had doubled from 1948 to 1958, and about 150 more were going on the air annually. However, an increasing proportion of the new outlets were

limited to daytime operation in an FCC attempt to reduce nighttime interference. FM, with no need for daytime-only limitations, was now the only means of entering major markets. In addition, the major spurt of television expansion was over, and this eased up pressure on time, money, and personnel, which could now be applied to FM.

But aside from overcrowding in AM and television, FM itself had more to offer. In 1955 the FCC had approved the use of Subsidiary Communications Authorizations, which allowed stations to multiplex (to send more than one signal from their transmitter) such non-broadcast content as background music for retail outlets ("storecasting"). This provided a needed revenue boost. So did the growing number of listeners interested in good music. These "hi-fi" addicts doted on FM operations, and this interest was evident in the increasing availability and sale of FM receivers. A developing high-end audience led advertisers to begin to pay serious attention to the medium.

Another technical innovation gave FM a further boost: the inception of stereo broadcasting. Beginning as early as 1952, some stations, such as New York's WQXR, offered AM/FM stereo using two stations—AM for one channel of sound and an FM outlet for the other. Occasional network two-station stereo broadcasts began in 1958—the same year commercial stereophonic records first went on sale. By 1960, more than 100 stations were providing the two-station system of stereo. But such simulcasting wasted spectrum (two stations with the same content), and the uneven quality of AM and FM provided poor stereo signals. What was needed was a system to provide stereo signals from a single station, and FM's wide channel seemed to offer the means.

In 1959 the National Stereophonic Radio Committee began industry experiments with several competing multiplexed single-station systems. By October 1960 the committee had recommended that the FCC establish FM stereo technical standards combining parts of systems developed by General Electric and Zenith. The FCC issued the standards in April 1961, and the first FM stereo stations began providing service in June. By 1965, a quarter of all commercial stations were offering stereo; by 1970, 38 percent of FM stations had the capability. Though few saw the future clearly, stereo would be a key factor in FM's ultimate success over long-dominant AM stations.

FM's continued expansion led the FCC to establish three classes of FM station in mid-1962. Lower-powered Class A (up to 3,000 watts of power and a service radius of 15 miles) and B stations (up to 50,000 watts of power and a service radius up to 40 miles) would be granted in the crowded northeastern section of the country as well as in southern California. Higher-powered C stations (up to 100,000 watts of power providing a service radius of 65 miles) could be granted elsewhere. A five-year FCC freeze on most new AM station grants beginning in 1968 helped funnel still more industry expansion into FM as

the FCC began to see AM and FM as parts of an integrated radio service.

Of even greater importance to FM's continued growth was a series of landmark FCC decisions from 1964 to 1966 requiring separate programming on co-owned AM and FM stations in the largest markets (those with populations over 100,000). Long concerned about the effect of wasting spectrum space by allowing the same programs to run on both AM and FM, the FCC had been persuaded by industry leaders to allow the practice when FM was weak. Indeed, many FM broadcasters expressed great concern about losing their ability to carry popular AM programming. But FM's growth in numbers and economic strength prompted the move—which further accelerated creation of new FM stations. In just a few years the importance of the FCC decisions (which by the late 1960s had been extended to smaller markets) became apparent as FM audiences increased sharply—bringing, in turn, greater advertiser interest and expenditure to make FM economically viable for the first time in its history. By the early 1980s, when the AM-FM non-duplication requirement was eliminated in a deregulatory move, FM stations were dominant in large part because of their unique programming.

That FM had achieved its own identity was exemplified when one of the big-three networks, the American Broadcasting Companies (ABC), initiated a network of FM stations in 1968. Although relatively short-lived, as the industry increasingly began to think of FM as radio rather than something different, the recognition that such a network gave to FM radio was a tremendous boost in the advertising community. Another indicator was Philadelphia's WDVR, which within four months of first airing in 1963 was the number-one FM station in the city, competing for top spot with long-established AM outlets, an inconceivable development just a few years earlier. Five years later, the same station became the first FM outlet to bill more than \$1 million in advertising time. The FM business as a whole reported positive operating income in 1968 for the first time (it happened for the second time in 1973, after which the industry as a whole remained profitable).

The key measure of FM's coming of age, of course, is actual audience use of the service. In 1958, for example, FM was available in about one-third of all homes in such major urban markets as Cleveland, Miami, Philadelphia, and Kansas City. By 1961 the receiver penetration figures for major cities were creeping up to about 40 percent, and national FM penetration was estimated at about 10 percent, showing how few FM listeners lived in smaller markets and rural areas, many of which still lacked FM stations. By the mid-1960s, FM household penetration in major markets was hovering at the two-thirds mark, and national FM penetration stood at about half that level. Although stereo and car FM radios were initially expensive, increasing production dropped prices and helped to further expand FM availability.

Dominance (The 1970s and Since)

After the many FM industry and policy changes of the 1960s, the 1970s saw FM becoming increasingly and rapidly important economically. Where FM attracted 25 percent of the national radio audience in 1972, just two years later survey data showed FM accounted for one-third of all national radio listening—although only 14 percent of all radio revenues. By 1979 FM achieved a long-sought goal when for the first time, total national FM listening surpassed that of AM stations. Every major market had at least four FM stations among the top 10 radio outlets. Indeed, FM would never lose that primacy, slowly expanding its role until by the turn of the century, FM listening accounted for nearly 80 percent of all radio listening.

Getting there had not been easy and had taken far longer than early proponents had expected. In part, FM's own success got in the way. After years of promoting FM's upper-scale (though small) audiences, often prejudicially dubbed eggheads and high-fidelity buffs, it was hard to shift gears and promote FM's large and growing audience as being tuned to simply "radio." (Indeed, the number of commercial FM classical music stations had actually declined by half since 1963, to only 30 by 1973.) At the same time, the number of educational FM stations expanded dramatically after 1965, greatly aided by the creation of National Public Radio and the appeal of its programs as well as by the availability of increased funding for station development and operation.

But with success came pressure to keep up. As news and talk formats increasingly defined AM (where the poorer sound quality did not matter), FM flowered with a full cornucopia of musical formats and styles. By the early 1970s, FM stations in the nation's largest markets were developing formats every bit as tight and narrow as those of their AM forebears. Each station and its advertisers were appealing to a specific segment of the once-mass radio audience in an attempt to build listener loyalty in a marketplace often defined by too many stations in most cities. By the late 1980s, FM's primary target market was that defined by its advertisers: listeners aged 26 to 34, followed by those 35 to 44 years of age. Only a relative handful of stations target teens, and fewer than 30 percent are interested in listeners aged 55 or older. As compared with its earlier days, FM has become positively mainstream.

FM's success is also seen in the usual marketplace measure—the price of FM stations being sold on the open market. Where top-market stations could literally not be given away in the early 1950s, by the late 1960s, the first million-dollar prices were being quoted. Three decades later, FM stand-alone stations in top markets sold for tens of millions of dollars, and some have sold for well over \$100 million. On the other hand, many miss the old days of FM programs aimed at a small, elitist, sometimes cranky but usually appreciative audience. A

1999 FCC proposal to create scores of low-power FM outlets was intended to bring back some of that spirit, but was severely curtailed by Congress in 2000.

FM Outside the U.S.

FM or VHF radio developed more slowly outside of the United States. In Europe, for example, postwar radio reconstruction in most countries focused first on established medium wave and long wave services and then on television; few countries had economies strong enough to develop FM services at the same time as these other initiatives. And politics played a part, because Europe hoped in the meantime to find a European technical solution to its substantial problems of interference and static.

Given the total destruction of its broadcasting system, Germany had to start over and thus led Europe in beginning FM broadcasting. The first transmitters were on the air by 1949, and most of West Germany was covered with FM signals by 1951. Sale of FM receivers was brisk (some were exported to the United States), partly because television was not a competitor until 1952. By 1955 there were 100 FM transmitters in operation. With a severe shortage of medium wave frequencies, Italy followed suit, providing its first VHF radio services in the early 1950s.

At about the same time, other European nations, working through the European Broadcasting Union (EBU), began to reconsider FM's potential, because they had largely completed the process of repairing or replacing wartime AM radio losses. FM was seen as the only means of reducing serious medium wave overcrowding and resulting interference problems as well as serving regions largely unreached by existing stations, and FM could do so less expensively than could medium wave facilities. Countries also sought additional program channels. Interestingly, the same debate over whether FM should carry the same or different programs (as existing medium wave services) divided industries and governments in Europe as it had in the United States. By the late 1950s, EBU member nations were working together to build a system integrating existing and new VHF radio stations. And, as in the United States, the new services were increasingly programmed independently.

After experimenting with FM in London as early as 1950, the British Broadcasting Company (BBC) began introducing a chain of VHF radio stations in 1955. By 1960, most of the country was reached with the new transmitters, which largely simulcasted the medium wave station signals, though receiver penetration hovered at only about 15 percent, rising to 30 percent five years later. The planned role of the VHF transmitters was to introduce local programming for specific audiences—something that had been lacking in Britain since the early 1920s. By the early 1960s, VHF radio transmitters outnumbered

medium wave facilities by 160 to 57. A decade later, there were 252 VHF transmitters in Britain. Lower FM receiver prices prompted rapid ownership growth.

Even by the mid-1980s, however, only about 20 countries (most of them in Europe) had extensively developed VHF radio. Despite its potential value to tropical countries, which are plagued by static on their AM or medium wave broadcast stations, few Third World nations had embarked on FM service. They lack the funds and even the need, because they have not fully utilized available medium wave channels. South Africa is an exception, having embarked in 1961 on development of VHF radio to cover the nation. Apartheid politics may have played a role here, because the VHF transmitters made it more difficult for Africans to hear foreign broadcasts, none of which were available on FM. Other African nations only experimented with FM in this period.

In the Far East, Japan experimented with FM for a decade before stations opened in major cities in 1969. The Ministry of Posts and Telecommunications sought to have an FM station in every prefecture and at least two in major cities. All of these are advertising-supported local stations. For a time in the 1970s and 1980s, a raft of mini-FM transmitters called "free radio," which covered a radius of only about 3,000 feet, were very popular, playing music and advertising. Few were licensed, however, and many were closed down in the late 1980s. The service came later to Australia, where what would become FM frequencies had been originally allocated to television. Reallocation of that service made initiation of FM service possible there in the 1980s.

Perhaps the most extreme examples of the FM-based "free radio" movement took place in the 1970s in both France and Italy. A number of unlicensed small local Italian FM stations went on the air in late 1974 and into 1975. When an Italian court held that the state broadcasting authority did not have a monopoly on local radio, hundreds more followed in 1976. By mid-1978, some 2,200 were on the air, providing Italians with the most radio per capita of any nation on earth. Stations programmed music and advertising and often expressed strong political viewpoints on both the right and left. France went through something similar in the late 1970s—by the early 1980s there were more than 100 such stations in Paris alone. Most gave way to a 1982 government decision to provide licenses to many of the stations as well as official permission to advertise.

FM Trade Associations

Promoting Radio's Second Service

From the inception of commercial FM radio in 1941, a series of five industry trade organizations appeared—and disappeared—in parallel with the medium's struggles and eventual success. Each was different in its outlook and focus.

The Early Struggle

The first FM group, the National Association of FM Broadcasters Incorporated (FMBI), was created in 1940 to promote the technology as much as the industry. Spearheaded by John Shepherd III of the New England–based Yankee Network and by Walter J. Damm of the *Milwaukee Journal* radio stations (one of which was the first FM station west of the Alleghenies), FMBI published thousands of copies of *Broadcasting's Better Mousetrap* to promote FM's better sound and other qualities. Before and during World War II, a mimeographed newsletter edited by Dick Dorrance appeared regularly to record the slow

initial development of the business. FMBI had 43 members by 1943—most of those either on the air or building new stations—and 137 by September 1944. Among its campaigns was a successful move to persuade the Federal Communications Commission (FCC) to modify FM station call letters from letter and number combinations denoting the channel of the station (e.g., W55M, which was on 45.5 megahertz) to the more familiar all-letter system used with AM stations. The FCC adopted the plan in 1943. Although FMBI fought the shift of FM frequencies that came in 1945, it worked to put the new spectrum into action.

With the end of the war, FMBI voted in 1946 to merge its activities into the FM Department (later Committee) of the National Association of Broadcasters (NAB), a pattern that would be repeated several times. Initially headed by Robert Bartley, later an FCC commissioner, this arm of the main industry trade association sought a place for FM within an

industry dominated by rapidly expanding AM stations and developing television.

Believing that the new medium needed the focused attention of a dedicated organization, broadcasters Roy Hofheintz of Houston and Everett Dillard of Washington, D.C., helped form the FM Association (FMA) in 1946. FMA's primary focus was to get AM broadcasters either to build the FM stations they had applied for or to return their construction permits to the FCC. FMA pressure on the FCC led the agency to terminate many "warehoused" but inactive permits, which were an indicator of FM's coming decline. The FMA ended its short existence with a two-year promotional campaign to brighten the medium's future.

All this activity was to no avail, and FM slipped into decline for most of the 1950s as industry attention turned to television.

FM's Revival

Formation of the FM Development Association (FMDA) in 1956 was one early indicator that FM's fortunes were about to take a turn for the better. Larry Gordon of WBUF (FM) in Buffalo, New York, was its president. Made up of about two dozen independent (without a matching AM station) FM station owners, FMDA sought to get broadcasters to place FM stations on the air. It also attempted to combat escalating music licensing fees being charged by the American Society of Composers, Authors, and Publishers (ASCAP).

In January 1959 a group of FMDA members formed the new National Association of FM Broadcasters (NAFMB). The organization decided to hold its first official meeting prior to the forthcoming annual convention of the NAB in Chicago. With the blessing of the NAB, the NAFMB was allowed to hold its first meeting on the Saturday just prior to the NAB FM Day program; at that time Fred Rabell, an independent FM broadcaster and background music franchisee in San Diego, was elected president. This was a nonpaying position, which he volunteered to accept with the help of his wife, and for nearly three years they operated the NAFMB from their FM radio station KITT.

Rabell was followed by another unpaid leader, T. Mitchell Hastings, Jr., owner of the Concert Network FM stations in New York City, Boston, Hartford, Connecticut, and Providence, Rhode Island, and the developer of the Hastings FM tuner, America's first FM car radio. Hastings led the NAFMB for three years. (Prior to his death in the mid-1990s, Hastings was chairman of the Armstrong Foundation, dedicated to the propagation of Edwin Armstrong's name as the father of FM radio through its Armstrong "Major Awards," first presented at the NAFMB conventions.)

Another person who played an important role in making the NAFMB successful was James Schulke, NAFMB's first full-

time paid president, who had offices in New York City. Schulke was hired in 1963 after an annual donation of commercial airtime by all National Radio Broadcasters Association member stations; this donated time was subsequently sold to the Magnavox Corporation for \$150,000. Special research, programming, and marketing studies were developed by the NAFMB in the 1960s as membership grew from its first 50 stations to nearly 500 by 1969. During those formative years, FM broadcasters volunteered their time and resources to advance public and advertiser awareness of FM radio. Dozens of these FM radio pioneers played major roles in the NAFMB, including Abe Voron of Philadelphia, Robert Herpe of Orlando, and James Gabbert of San Francisco.

The impact of NAFMB activities in the 1960s is reflected in the increase in the number of FM radio stations that went on the air. From just 578 commercial stations in 1959, with the majority duplicating the programming of a co-owned AM facility in the same city, the number of on-air FM stations had grown to more than 1,000 by 1963. The promotion of FM stereo multiplexing following the FCC's adoption of FM stereo radio standards in April 1961, as well as the one-year "Drive with FM" campaign in 1965 and 1966 to motivate consumers and the auto industry to have FM and FM stereo available on their auto and truck radios, also played a role in the accelerated growth of FM.

During the 17-year existence of the NAFMB as an organization that would accept only FM station members, the association was the driving force in promoting, researching, marketing, and expanding the visibility of both FM and FM stereo radio in the United States and Canada.

The NAFMB was both the longest-lived and the most successful of the five FM trade groups. It actively worked with the FCC to develop technical standards for FM stereo in 1960-61. A 1963 Harvard University Graduate School of Business study of FM's potential was sponsored by NAFMB and attracted widespread industry attention. The study's prediction of FM's eventual dominance of AM, seen as a pipe dream by many at the time, was borne out by events in the late 1970s. FM's eventual success was heavily aided by the separation of its programming from colocated AM stations in the late 1960s, something NAFMB lobbied the FCC heavily for. The association issued annual program surveys of FM stations in the late 1960s, which showed the growing variety of formats used by FM outlets. It conducted or supported a variety of other studies of the FM industry in response to growing advertiser interest in the medium. At the same time, the Radio Advertising Bureau focused more on FM's potential, and the NAB published its monthly *Emphasis* newsletter throughout the 1960s.

Because of pressure by AM and AM/FM station owners and operators who wanted to join the NAFMB, in September 1975, during its annual convention in Atlanta, the NAFMB

name and membership criteria were changed. The association became the National Radio Broadcasters Association (NRBA), and AM stations were to be admitted into membership. The new members pushed for the association's dedication to seeking regulatory relief from the FCC. Many stations active with NRBA were dissatisfied with the NAB's efforts for radio deregulation and believed that the older radio/TV association was devoting too much of its resources to television issues. Nine years later, in 1984, the NRBA merged with the NAB.

The success of FM radio in superseding AM radio as the dominant aural medium in America was consistently positioned by the NAFMB with the rationale that "in the long run, a quality product always succeeds with the American consumer." The NAFMB was the leading advocate of FM radio and played an important role in the medium's eventual success.

Foreign Broadcast Information Service

Monitoring International Radio Broadcasts

The Foreign Broadcast Information (originally Intelligence) Service (FBIS) was created in 1941 as part of the Federal Communications Commission. Operating as part of the Central Intelligence Agency since 1947, FBIS has provided a record of important international radio broadcasts for U.S. government decision makers. In the 1960s it expanded to record other types of foreign media output.

Origins

In 1938, John R. Whitton of Princeton University was heading the Geneva (Switzerland) Research Center, and in conversation with Edward R. Murrow of CBS Whitton became more aware of the growing impact of radio as a propaganda medium. Becoming both concerned about and impressed with the propaganda potential of radio, he hired researcher Thomas Grandin to study developing political uses of radio. In the course of his study, Grandin established a small receiving post in a Paris hotel to better follow selected broadcasts.

On his return to the U.S. in late 1938, Whitton sought funding to set up a continuing radio monitoring service. This led to creation of the Princeton (University) Listening Center in November 1939 with a Rockefeller Foundation grant designed to cover a period of experimentation. In June 1940, Rockefeller extended support for another year. The managing committee included Whitton, sociologist Hadley Cantril (who was co-director of the Office of Radio Research) and William S. Carpenter of Princeton, O.W. Riegel of Washington and Lee University (author of an early book on propaganda), B.R. McCutcheon (an engineer), and Harold N. Graves (as administrator). Graves recruited a staff of ten to record and transcribe the most important shortwave broadcasts.

From 3:00 P.M. until 11:00 P.M. six days a week, broadcasts were recorded on wax cylinders. Over the 20 months the Center operated, this process produced more than 100 volumes of exact transcripts totaling 8 million words. Broadcasts from Berlin, Rome, Moscow, Paris, and London were included. Some 20 booklets summarizing the detailed findings were

widely distributed to American media and researchers between December 1939 and mid-1941.

Early in 1941, the Defense Communications Board asked the Federal Communications Commission (FCC) to develop a more extensive government-supported foreign broadcast monitoring process (as a number of foreign governments had already done). President Roosevelt authorized the transfer of \$150,000 (nearly \$2 million in 2003 dollars) from war emergency funds for the purpose, and the Foreign Broadcast Monitoring Service (FBMS) was created in late February. Personnel from the Princeton operation were vital to this operation, with Graves acting as director until June 1941. Slowly an organizational structure was established.

Wartime Operation

During the first part of 1942, the FBMS established a number of listening posts to better monitor broadcasts. These were located in Portland, Oregon (the first site, it began operation in October 1941), San Francisco, Kingsville, Texas, Santurce, Puerto Rico, and in London. On 28 July 1942 the FBMS was renamed the Foreign Broadcast Intelligence Service (FBIS). The number of employees and operations reached a peak in March 1943. More listening posts (sometimes dubbed field offices) were established, in Silver Hill, Maryland (just outside of Washington, D.C.), and in Hawaii as well as several other foreign locations.

With teams operating around the clock, recordings were made at each field office. Transcripts and translations were then teletyped, cabled, or mailed to the Washington headquarters. Washington personnel summarized and analyzed the more important broadcasts and distributed them to government offices. The process of analysis soon attracted unwanted attention.

FBIS came under Congressional investigation in the spring of 1943, part of a long and highly critical political review of the FCC. Criticism centered on both FBIS personnel and operations. Partially as a result, most FBIS analysis functions were transferred to the Office of War Information. FBIS continued its basic monitoring and recording functions throughout the war.

In December 1945, the FCC announced plans to close down FBIS. Instead, the War Department took over the operation and in August 1946 it was transferred to the Central Intelligence Group of the National Intelligence Authority. It was renamed the Foreign Broadcast Information Service two months later. The FBIS became a part of the Central Intelligence Agency when the CIA was formed in September 1947.

Postwar Developments

As a "charter member" of the intelligence establishment, FBIS slowly expanded its operation to nearly 20 listening posts in

the U.S. and overseas. In 1967 the responsibilities of the FBIS were expanded to include keeping track of foreign newspaper and magazine (and news agency) output, in addition to broadcasts. In 1974 FBIS daily reports came available on a subscription basis to the general public, providing some of what the monitoring service was recording and translating. Some material was restricted for government-only use for six months. Attempts to close down some FBIS functions in the post-Cold War period have occurred at several points, usually in Congressional attempts to save funds.

Television and satellite transmissions were included in the FBIS operation by the 1970s and 1980s, respectively. In the 1990s, technological change had expanded FBIS even further to include commercial and government databases and so-called "gray literature" (where the source and veracity of the material is not always clear). Automatic (unmanned) monitoring by the 1990s expanded FBIS capabilities still further, while fax machines and computer data links allowed faster distribution of time-sensitive material. The agency was dealing with material in more than 60 languages; that number expanded with the end of the Cold War and initiation of media in local languages in many parts of the former USSR.

Because of the FBIS's language capability, its functions have often included translation services for different government needs. While much of what the FBIS records come from "open source" (public) entities such as radio and other media, it also collects information from other sources. The intelligence function of FBIS is best seen in two widely-reported events three decades apart (for which credit is usually shared with its British counterpart, the BBC Monitoring Service)—its recording of Radio Moscow broadcasts that the Soviets were withdrawing their missiles from Cuba in 1962, and the first word (monitored from the TASS news agency) of the short-lived August 1991 coup in Moscow against the government of Mikhail Gorbachev.

Formats

Defining Radio Programming

A format is the overall programming design of a station or specific program. It is essentially the arrangement of program elements—often musical recordings—into a sequence that will attract and hold the segment of the audience a station is seeking. There are as many as 100 known formats and variations.

Evolution of Formats

Radio formats developed in response to the competitive threat posed by television and the growing number of competing radio stations. For decades, radio stations had been a mass medium, with each outlet trying to be all things to all people. But as television grew in popularity and as more television and radio stations went on the air, audience fragmentation occurred, prompting radio programmers to seek ways to differentiate their programming and attract audiences. By the mid-1950s, radio programmers were willing to try almost anything to preserve the medium.

One lesson was learned from an independent (i.e., non-network-affiliated) radio station in New York, WNEW, which had successfully programmed a music and news format as early as 1935. While other radio network audiences defected to television, WNEW maintained its audience levels, presumably because its music and news format did not demand long-term or high-level attention from listeners, unlike the typical dramatic productions on the networks. The simpler, less demanding programming apparently allowed listeners to tune in for shorter periods of time and while doing other things, such as household chores.

Another lesson was learned from the success of "countdown" programs such as *Your Hit Parade*, a popular radio network program since the 1940s. Countdown programs tended to play the top 40 or so songs, and audience numbers were very strong. Not surprisingly, some programmers working for independent stations tried playing only the top 40 or so

most popular records and were successful. In this sense, they were simply attracting an audience by playing what the audience had already proven they wanted to hear. Station owners Todd Storz and Gordon McLendon were among those who turned the concept into a continuous format, creating the hit-oriented playlist.

Many stations quickly adopted the new approach. But as more stations played the same top 40 songs, a further need for differentiation and refinement arose. In 1957 Storz and programmer Bill Stewart are said to have noted the behavior of jukebox users who repeatedly selected their favorite tunes. Taking this observation back to their Omaha station, they refined the playlist to repeat the most popular hits more often than other songs. Other stations followed suit, positioning themselves as stations that guaranteed the top hits.

Eventually various formats evolved as stations sought to differentiate themselves from competing stations with similar formats. Rock, including soft rock and hard rock, was spun off. Adult contemporary (AC) developed as a way to appeal to an older audience demographic by playing current songs, minus the tunes that appealed mostly to teens. As album sales increased, many stations presumed that listeners wanted to hear certain artists, so they switched to playing primarily album cuts, eventually becoming known as album-oriented rock (AOR) stations. Formats were also distinguished simply by the creative names given them, such as "Hot Hits." The names would sometimes be intentionally vague in order to appear distinct to listeners while still seeming inclusive of all listeners to advertisers. AM stations also responded to the competition from FM and its superior frequency response and stereo capability by creating information formats such as news, talk, sports, agriculture, and education. Listener perceptions about AM sound quality became entrenched by the 1980s, forcing most AM stations to switch to non-music formats to survive.

New formats also emerged, partly because of the increasingly sophisticated ratings reports that provided more detailed demographic data. Stations pushed radio ratings companies to provide specific listener demographic data beyond an overall market headcount in order to justify themselves to advertisers. Once sub-audiences could be clearly identified, a symbiotic relationship emerged, with programmers developing formats that appealed to those audiences. Likewise, music trade magazines such as *Billboard* developed specialized charts that coincided with the formats of stations, and vice versa. Some format names, such as rhythm and blues, were in fact coined by *Billboard*.

Format Categories

The increase in artists, particularly crossover artists, has made it difficult for popular music stations to claim a “pure format,” that is, one based on agreement by stations nationwide as to what artists are included and excluded. However, today this definition primarily applies only to classical, big band, and similar formats consisting of older music. Many of the originally pure formats, such as AOR, country, and urban, have split into variations of their respective formats. From the standpoint of promotion, advertising, and ratings classification, it is best for a station to identify with a pure format, but the need to be competitive forces stations to adjust to the demands of the audience and industry. In the 1990s the concept of the “microformat” emerged, whereby syndicated and network music and information programming became fine-tuned to a specific audience and market, relying less on a cookie-cutter approach.

Today, each of the major music categories—country, AC, rock, and urban (black)—has several subdivisions. According to Eastman, et al (2002), the country format has three subcategories: traditional country, young (or hot) country, and country gold—each aimed at a specific demographic group. Adult contemporary offers hot AC, mainstream AC, soft AC, and a jazzier version called new adult contemporary/smooth jazz. Urban music is subdivided into urban contemporary, urban adult contemporary, and urban gold. Rock formats include adult album alternative (AAA); contemporary hit radio (CHR); churban (a blend of CHR and urban); active rock (hard/heavy metal); classic rock (popular rock music of the 1960s through the 1980s); and oldies, which is further divided into the decades of the 1960s, 1970s, and 1980s. In addition to these primary formats, there are many distinct formats, such as big band, alternative, contemporary Christian, classical, progressive, and beautiful music/easy listening.

Format Popularity

Country has overwhelmingly reigned in the U.S. as the most popular format among stations, followed by AC, although

both of these have slipped in recent years. One of the fastest-growing formats of the 1990s was modern rock, otherwise known as alternative, which capitalized on the mainstream popularization of many “alternative” bands. Because of AM stations and the interests of aging baby boomers, news and talk formats have increased in popularity. Sports and Spanish language formats, including Tejano, have also taken off in the last decade. A relatively new format called adult album alternative (AAA or Triple A) has also emerged, featuring an eclectic choice of music ranging from hard rock to folk music. Christian formats have increased dramatically in recent years.

Broadcasting and Cable Yearbook 2002–03 ranked the U.S. radio formats in terms of the number of stations identifying with each format. The top 20 formats were (in order): country (2,318), AC (1,863), oldies (1,208), news/talk (1,199), religious (889), Christian (869), sports (837), news (769), talk (726), gospel (652), CHR/Top 40 (646), classic rock (606), rock/AOR (601), Spanish (582), classical (529), jazz (426), urban contemporary (350), diversified (321), educational (264), and middle of the road (MOR; 261).

The next most popular formats among stations were (in order): alternative, variety/diverse, progressive, other, nostalgia, black, big band, blues, beautiful music, inspirational, full service, AAA, AOR, agriculture, foreign language/ethnic, public-affairs, Top 40, easy listening, children, new age (soft rock and jazz), Tejano (bicultural Spanish programming), light rock, bluegrass, golden oldies (hits of the 1950s), and folk.

A relative handful of stations identify their format as: polka, Korean, American Indian, reggae, Portuguese, French, Greek, Polish, disco, Chinese, new wave (rock from the United Kingdom, popular in the early 1980s), smooth jazz, comedy, sacred, Native American, Arabic, Russian, Eskimo, Japanese, Vietnamese, or Filipino.

Choosing and Creating a Format

Stations switch formats frequently to pursue more profitable demographic segments and in response to shifting audience tastes. According to Eastman, et al, the steps taken in choosing a format involve an evaluation of (1) the technical facilities of the station (i.e., AM, FM, range), (2) the character of the local market, (3) the delineation of the target audience, (4) the available budget, and (5) the potential revenue.

Stations assemble their formats in several ways. Some simply program recordings in a sequence throughout the schedule, whereas others carry different formats during different dayparts. Still others rely on “Format Syndicators,” which provide ready-made formats for a fee via satellite feed or music tapes. The formula for constructing a format goes beyond just music and includes a focus on production, personality, and programming.

Format Audience Characteristics

Certain audience demographics are predictors of format preference. For example, listeners to news are more likely to be married and to have lived in the area for at least two years, whereas AOR listeners are more likely to be single and on the move. Some studies also suggest that urban contemporary fans are the heaviest listeners, country listeners are the most loyal, and AC listeners are less involved in their station.

Formats can also be profiled on the basis of education, income, and age. For example, higher education levels are associated with beautiful music and news. In 1998 the highest household median income numbers were associated with AAA (\$62,954), news (\$62,722), alternative (\$55,298), classical (\$55,248), and modern rock (\$54,488). The two formats appealing most to older audiences are full-service (60.3 years) and nostalgia (59.3 years). Most formats, however, are showing an increase in the median age of listeners, with one exception: news/talk listeners are getting younger.

Finally, where a listener resides has some effect on format popularity. Country is more popular in the South and Midwest, and news and talk formats are listened to most in the West. Spanish has been the most popular format in Los Angeles.

France

French radio has passed through several different organizational schemes in its history, slowly expanding its domestic and international service. Radio has always been a primary means of spreading French culture around the world.

Origins

Before 1914, France participated in the development of wireless (telegraphy and telephony) with other industrial nations. World War I stimulated the use of large transmitters: after the one on the Eiffel Tower in Paris (1905) came another at La Doua in Lyon (1914), then one at La Croix d'Hins (1920, meant originally for the use of the U.S. expeditionary force) and one at Sainte-Assise (1922). The war also created thousands of radio specialists, trained in the armed forces, who returned to civilian life in 1919. Furthermore, the war accelerated the formation in 1918 of the Compagnie générale de TSF

(CSF), which was one of the four largest broadcast companies in the world (with Marconi in England, Telefunken in Germany, and Radio Corporation of America [RCA] in the United States).

The Mixed System (1922-40)

Considering French capabilities and interests, it is odd that France did not experience the same radio boom as Britain, Germany, or the U.S. However, the educational establishment, the Catholic Church, the press, and most intellectuals had trouble accepting the competition that "vulgar" radio entertainment might represent for other vehicles of culture and information. Successive governments and Parliament were incapable of giving radio a stable status. Left-wing political parties, with their minds on the traditional telegraph monopoly, wanted radio to be exclusively entrusted to the Ministry of

Post, Telephone, and Telegraph (PTT). Right-wing groups reacted rather favorably to the creation of private commercial stations.

After a few experiments in 1921, regular radio transmissions began in February 1922 from the Eiffel Tower station, which the army had handed over to the Post Office. In November 1922 the Radiola station was inaugurated by the CSE, and a third station was created in January 1923 by the École Supérieure (Graduate School) of the PTT. Beginning in 1924, stations appeared in the provinces. After much debate and incoherent legislation, the law of 19 March 1928 established a mixed, highly regionalized radio system.

By 1932 the 13 authorized commercial stations (financed by advertising) had a total transmitting power of 160 kilowatts, whereas the 11 government-operated transmitters had a combined power of 92 kilowatts. In 1938, after an important modernizing effort aided in 1934 by the establishment of an annual fee to be paid by owners of sets (compensated by the abandonment of advertising), the 16 public stations, of which 3 were in Paris (in 1939, the Poste National had its transmitter power raised to 900 kilowatts, making it the strongest in the world), competed against 11 commercial stations, 4 of them in Paris and each associated with a national daily newspaper.

The number of radio receivers increased comparatively slowly: from 600,000 in 1928 to 1.5 million in 1934, 4.7 million in 1938, and 5.2 million in 1940, for a population of 40 million inhabitants. Penetration was about a third less than in Germany or Great Britain. The audience for private stations, whose programs were more popular, was almost equal to that of the PTT network.

The growing European political crisis led the government to increase its control over radio news, and the same newscast was provided on all "public" stations and, from February 1939, on all private stations as well. Just two months before the declaration of war, the management of radio broadcasting was withdrawn from the Post Office and transferred to the office of the Prime Minister. Programs aimed at foreign audiences, especially German and Italian, were increased early in 1938, as were those aimed at French colonies in Africa and Asia.

The Era of Monopoly (1940–81)

From September 1939 to June 1940, radio was mobilized to support the French war effort and the country's morale.

German Occupation (1940–44)

After the armistice of June 1940, the north and west of France were occupied by the Germans, who unified the radio network around Radio Paris as a tool of propaganda in favor of total collaboration with Nazism. In the south, the Vichy regime

nationalized radio, and the Radiodiffusion Nationale served the conservative "national revolution" under Marshall Pétain. After the invasion of the southern zone (November 1942), the autonomy of the Vichy radio was gradually diminished. In spite of the prohibition on listening to foreign radios, many French could hear Radio Sottens in French-speaking Switzerland, the British Broadcasting Corporation's (BBC) French Service (Radio Londres), and later the Voice of America, Radio Moscow, or Radio Brazzaville (in the Congo, controlled by General de Gaulle's Free French), and after 1943 Radio Alger in French North Africa. This sad period was crucial for the prestige of radio in France—it continued speaking with different voices. The considerable importance nowadays of radio newscasts for the information of the French, as compared to the printed press or even television, is partly the result of habits formed in those days, when newspapers had lost all credibility.

The Fourth Republic (1944–58)

At the time of liberation, radio remained nationalized and, contrary to the situation between the two world wars, basically centralized. The Radiodiffusion Nationale (renamed Radiotélévision Nationale in 1949) was a public administration that produced three national services on short and medium waves and one service directed to French colonies. The few regional programs did not occupy much space in the schedule. Government control of news programs was very strong, but cultural programs and variety shows often attained remarkable quality. Commercial advertising was banned. Financing came from the annual receiver fee and government subsidies. The number of sets increased rapidly, from 5 million in 1945 to 10.7 million by 1958, by which time practically all households were equipped—even before transistor sets made it possible for a household to own several sets—and there were over 25 million by 1981.

The originality of the French radio landscape was largely due to competing "peripheral" stations, which aired programs made in France and aimed at a French audience but broadcast from transmitters located just beyond the national borders. Thus Radio Luxembourg (1933), Radio Monte-Carlo (1943), and in 1955 Europe 1 from the Saar in Germany all provided the popular sound of U.S. commercial radio, plus newscasts and political columns with content and tone that were far more free than those of the government-run Radio-Télévision Française (RTF). Europe 1 especially managed to innovate successfully by using a conversational and informal style quite different from the more formal and stuffy government radio speakers. The success of radio was also maintained by the late and slow development of television, which in 1958 still operated on only one channel to fewer than 1 million receivers.

The Fifth Republic (Until 1981)

During the administrations of General de Gaulle (1958–69), Georges Pompidou (1969–73), and Giscard d'Estaing (1973–81), the status of the RTF (the ORTF after 1964 with the addition of the word "Office") was modified several times, but the principle of a public monopoly was not questioned even as more management autonomy was granted. Television expanded to three channels and added color, and radio diversified its programs—without, on the whole, giving up their national character. The huge Maison de la Radio (House of Radio) in Paris, inaugurated in 1963, symbolized the centralization of the French broadcasting system, even though by 1980 there were also 34 provincial production centers. In 1959 the annual radio fee was combined with that of television, and it was terminated entirely in 1978, yet radio was not authorized to carry advertising, as television was from 1968.

Although French radio had programs for overseas territories and foreign audiences (which never had the appeal of those of the BBC or the Voice of America), the three national radio programs were dominant: France Inter, France Culture, and France Musique. In 1974 these were gathered under the name Radio France. FM, which made possible the multiplication of local stations, had already been used in Germany to counter the penury of long- and medium-wave frequencies. It could upset the French model of a few AM stations broadcasting at high power. The first French FM station, France Inter Paris (FIP), was created as a local outlet for the Paris region in 1971. Its music, news, and traffic advice format was directed heavily at car radio listeners. Over the next few years, that format spread to the whole country with regional programming.

But it became clear that FM could be used for "illegal" broadcasts: in Italy, beginning in 1973, "free radios," run by radical college students, environmentalists, and labor unions, flouted the broadcasting monopoly of the Radio Audizione Italiana; in 1978 the government had to increase the punishments for such pirates. Faced with the threat of "free radio," Radio France undertook to provide some of the desired programming when in 1980 it started several experimental FM stations, two national—aimed at youth (Radio 7) and older people (Radio Bleue)—and three decentralized outlets: one regional, one at the level of one of the 95 French "départements," and one truly local. They hoped that by applying a policy of multiplying stations, they could keep FM frequencies for the public service.

In spite of its efforts, however, Radio France was gradually losing market shares to the peripheral stations, whose entertainment programs were more popular and whose often caustic news programs sounded less conformist than those of the public service. The situation was all the more paradoxical because it demonstrated how ill-adapted the government "monopoly" was and, mainly, because the French government owned a

majority share in the capital of Radio Luxembourg and controlled Europe 1 and Radio Monte-Carlo via SOFIRAD, a company whose capital was owned by the government.

Return to a Mixed System (Since 1981)

The victory of both the Socialist Party and François Mitterrand in the 1981 elections caused a revolution in the radio world (and in television after 1984).

The Mitterrand Revolution

The promises of the social-democratic candidate to allow local "free" FM stations access to the airwaves generated hundreds of them over the next few months. Belatedly, the laws of 9 November 1981 and 29 July 1982 tried to introduce order into the mess. Licenses to broadcast would only be granted to independent stations linked to an association and with a range not greater than 50 kilometers; for their financing, they could only use volunteer work, subscriptions of association members, and government subsidies; and they could not be funded by any local government. In other words, there were to be no municipal radios and no profit-oriented radios. Licenses were delivered by the Haute Autorité de l'Audiovisuel (or HAA, which, after several transformations, became in 1989 the Conseil Supérieur de l'Audiovisuel [CSA]), which is in charge of seeing that laws are respected by all private and public broadcasting companies. That independent body, partly inspired by the American Federal Communications Commission (FCC), was at last to cut the cord that had since the origins of radio linked the French audiovisual system to the government.

The system of association radios was very soon to prove economically inapplicable. In 1985 the HAA had delivered some 1,800 licenses for the whole country. The law of 1 April 1984 authorized stations to set up as commercial companies and use advertising to finance themselves—and also to join into networks, provided that they kept part of their schedule devoted to local programs. The next year, a decree authorized peripheral radios to enter the FM band and thus to build national networks.

After 1985 the revolution in audiovisual communication was spreading to television, but it seemed to have ended for radio: no new institutional reform was going to wreak havoc on that scene. The regulatory body, by gradually settling the many conflicts, managed to more or less stabilize the movement and made it possible to prepare a relatively easy passage into the 21st century and the digital era. In 1995 the CSA set up 16 regional technical bureaus, the better to assume its functions in the provinces. A law (1 February 1994) raised from 25 to 49 percent the share that a given company could own of a station and allowed several networks to gather local station affiliates, provided their cumulative potential audience

did not exceed 150 million (the equivalent of three national networks).

To resist the invasion of the airwaves by U.S. audiovisual products, the French government and European Union authorities have promulgated regulations to guarantee a "cultural exception" to the principle of free circulation of goods. Laws of 18 January 1992 and 1 February 1994, applying the European guidelines on "Television without Borders" (30 October 1989 and 1 February 1994), have set a quota of 60 percent European products, including 40 percent French work on all radio and television stations. The CSA finds it very difficult to enforce the quotas, especially regarding pop music.

Modern French Radio

France now enjoys a radio system that is diverse, efficient, dynamic, and modern. It uses both microwave and satellite relays (which are increasing). It is initiating digital audio broadcasting. Most (85 percent) of the French regularly listen to radio; the morning audience for news is particularly high, whereas elsewhere in Europe people turn more often to home-delivered newspapers. The various services of Radio France generally attract a quarter of the French radio audience. Radio France owns two subsidiaries: Radio France Outre-mer, which serves some 2 million inhabitants scattered over the French territories of the Caribbean, the Indian Ocean, and the Pacific, and Radio France Internationale, which provides one service in French plus programs in 18 other languages using a variety of transmitters.

Radio France operates six national services: France-Inter (general interest), France Culture (considered too elitist by some), France Musique, Radio Bleue (for senior citizens), Le Mouv' (for youth), and France-Info (the first all-news station in Europe, begun in 1987 and attracting a large audience). Its 38 regional stations, which cover half the country, are now associated with the France Bleu network. The FIP services still operate in 76 cities. Radio France funds two orchestras and two choirs, produces some 500,000 hours of programming per year, and employs over 3,000 people, including 450 journalists.

Private-sector radio attracts about 70 percent of the audience. It is highly diversified, with some 1,600 stations that often serve several towns on different frequencies. Each of the old "peripheral" stations continues to supply a national general interest schedule, but each is now associated with two or three groups of local private radios and plays a role similar to that of U.S. networks. Radio Luxembourg (called RTL since 1954) is now linked to a vast pan-European holding com-

pany, RTL-UFA. Europe 1 is now associated with the Lagardère (aviation, armament, and publishing) conglomerate. Radio Monte-Carlo is associated with the NRJ network, which now enjoys third place in the French radio hierarchy, behind RTL and Radio France. These networks have extended abroad, where they cooperate with private commercial stations in Germany, Scandinavia, Spain, Eastern Europe, and Russia. The large national networks of local private radios, which have adopted the American music and news format, include 700 stations in all. Then there are some 300 commercial stations that are still independent, sometimes grouped into small regional networks, which thanks to more original programming intend to remain largely local and stay close to their listeners or to serve some religion. Lastly, some 500 fiercely independent "association stations" survive, partly thanks to government subsidies: their audience varies from one place to another and is rather small (2 to 3 percent) but is still a sign of militant protest. The audience of foreign stations is very small.

Freberg, Stan 1926–

U.S. Radio Satirist, Voice Actor, and Recording Artist

The man who rolled a 700-foot mountain of whipped cream into Lake Michigan and topped it with a 10-ton maraschino cherry didn't actually drain the lake and replace the water with hot chocolate. Rather, he did it the easy way by using radio's "theater of the mind."

Stan Freberg's stimulation of the imagination via radio is legendary among people in the radio industry. His series of commercials for radio called "Who Listens to Radio?" was a memorable treatment of situations that could only be achieved in language and sound and visualized in the mind of the listener—the whipped cream, the cherry (dropped by the Royal Canadian Air Force), and the addition of 25,000 cheering extras. In his most sardonic tones, Freberg would end each spot, saying, "Now, you wanna try that on television?" describing radio as a very special medium "because it stretches the imagination." The goal was simple: convince print and TV advertisers to reallocate their budgets to radio.

After the Lake Michigan spots came others: a skit about a perodactyl taking a bite out of the Superdome; another about a robber who stole nothing but radios. Each was tagged with a jingle called "Who Listens to Radio?" Freberg's lyrics demonstrated his unique brand of humor, including rhyming "in the morning with your toast and marmalade-e-o" with the word "radio." The song was sung by jazz stylist Sarah Vaughn and orchestrated by arranger Quincy Jones. More than 35 years after Freberg first produced "Who Listens to Radio?" the Radio Advertising Bureau received multiple requests each week for copies of the work.

Early Influence

Freberg grew up the son of a Baptist minister in Pasadena, California. His first experience in show business came at age 11 when he was an assistant to his uncle, a magician. In high school, he became enthralled with radio. He wrote, produced, and performed student radio shows and became his high school speech champion, winning a statewide competition. He was awarded a drama scholarship but turned it down to work with Mel Blanc, the actor who created the voices of Bugs Bunny, Porky Pig, and other Warner Brothers cartoon characters.

In the mid-1940s, Freberg became a regular on *The Jack Benny Show* and worked as a voice actor on *The Phil Harris/Alice Faye Show*, *The Man Called X*, and *Suspense*. He spent two years in the Army and then joined an orchestra, Red Fox and his Musical Hounds, as comedian and guitarist.

Freberg wrote and performed an early TV show for children called *Time for Beany*, which won an Emmy award. His

co-writer and performing partner on the show was Daws Butler, later the voice of TV's Yogi Bear and Huckleberry Hound and a voice actor on many of Freberg's popular skits.

In 1951, Freberg signed with Capitol Records for the release of "John and Marsha," a spoof of soap operas. The only "lyrics" to "John and Marsha" were the two names of the title, repeated throughout the record with a variety of dramatic intonations. "It was an exercise to see if I could run the gamut of emotions and not say anything except the names of the two leading characters," Freberg said.

A friend saw Freberg perform "John and Marsha" as part of a night-club routine and took a tape to Capitol. Freberg re-recorded "John and Marsha" in the Capitol studios with syrupy music in the background, and the single reached #21 on the Billboard chart. Some radio stations refused to play the record, fearing it was too suggestive. Theater of the mind had triumphed again, for the only suggestions were in the tone of Freberg's voice.

Success led to more spoofs on record. Freberg wrote and produced parodies of Cole Porter's "I've Got You Under My Skin" and Johnnie Ray's "Cry." In 1953, Freberg scored a number one single with "St. George and the Dragonet," a parody of the *Dragnet* television series.

The advent of rock and roll gave Freberg new fodder for parody. He satirized hit songs like "Heartbreak Hotel," "Sh-Boom," and "The Great Pretender." In liner notes to a collection of his skits on Capitol Records, Freberg pointed to "The Great Pretender" as one of his favorites because, "In addition to coming out fairly funny it lampoons a musical trend that I personally loathe."

In notes for *A Child's Garden of Freberg*, 1957, Freberg asserted himself as satirist:

In all my records I have tried to operate not as a record comic but as a satirist. There's a difference between pointless ridicule and earnest satire. A satirist is inherently a critic who seeks to improve society by pointing up its affectations and absurdities through the use of humor. His chief weapon is exaggeration. Satire is healthy.

Satire also creates controversy, as Freberg discovered more than once. His 1958 single "Green Chri\$tma\$" brilliantly attacked the commercialization of Christmas ("Deck the halls with advertising, what's the use of compromising?"). Many radio stations banned the seven-minute production. In 1960, Freberg irked radio again with his production of "The Old

Stan Freberg
 Courtesy CBS Photo Archive

Payola Roll Blues,” a satire on the pay-for-play scandals that rocked the industry at the time.

His most successful recording venture was the 1961 album *Stan Freberg Presents the United States of America*, in which Freberg lampooned people and events in American history. At the discovery of the new world, Christopher Columbus and Queen Isabella sang, “It’s a Round Round World.” George Washington hired an advertising agency to promote the newly formed United States, and Betsy Ross’ design for the American flag was celebrated Hollywood-style with “Everybody Wants to Be an Art Director.”

On the Air

During the 1950s, Freberg was heard on a variety of radio shows, including *That’s Rich* on CBS and a series of programs

on New York’s WCBS. In 1957, he was signed to *The Stan Freberg Show*, a live radio program on CBS, replacing *The Jack Benny Show*, which had moved to television. Critical response included raves from *Time* magazine about “a fresh, bright new sound that will wrench people away from the TV set.” *The New York Daily News* claimed, “Radio’s tired blood is being revitalized by Dr. Stan Freberg.”

In spite of positive reviews, the series lasted only 15 weeks. In addition to his frequent run-ins with CBS censors, Freberg wanted the show to run with a single, overall sponsor (like Benny’s show had), but he would not allow CBS to sell to a cigarette manufacturer. CBS preferred selling individual spot announcements, and Freberg felt that would mean “every three minutes I’d have to drop a commercial in.” The program ran without a sponsor. Freberg won no radio awards for the short-lived series, but the collected recordings won a Grammy Award.

Freberg's body of work grew with his Los Angeles-based advertising agency, called "Freberg, Limited" ("but not very" was added as a parenthetical on the letterhead). He produced memorable television commercials for Jenó's Pizza Rolls and Chun King Chinese foods. For radio, he developed more theater of the mind to sell Contadina tomato products ("Who puts eight great tomatoes in that little bitty can?"), tourism in the state of Oregon ("A territory's great, but you've gotta have a state!"), and the California Prune Advisory Board ("Today the pits; tomorrow the wrinkles!").

He took on commercial projects for two of America's biggest advertisers, General Motors and Mellon Bank. Freberg recalled one client, Dupont, asking him, "We know about the prunes and the pizza rolls, have you ever taken on a really serious client?" His answer: "Other than God?" referring to a series of commercials which needled Americans about not attending church regularly. They were used by the Southern Baptist Radio-Television Commission, the Detroit Council of Churches, the National Council of Churches, and the Presbyterian Church of the United States.

Latter Day Freberg

In the 1990s Freberg was heard on radio again with a daily commentary called *Stan Freberg Here*. His subject was anything topical, from learning to use a new computer to his take on the Gulf War. He was signed as host of the weekly radio series *When Radio Was*, a retrospective of old time radio shows.

In 1996, he continued the *United States of America* series by adding a long-awaited Volume 2, which took on subjects such as Morse's first telegram, Custer's Last Stand, and Edison's invention of the light bulb and the phonograph. Freberg coaxed bandleader Billy May out of retirement for orchestration and enlisted actors John Goodman, Tyne Daly, David Ogden Stiers, and Sherman Hemsley for spoken parts.

Freberg was writing Volume 3 of "United States" when, in 1999, Rhino Records asked him to assemble a retrospective box set titled "Tip of the Freberg: The Stan Freberg Collection, 1951-1998." The set includes remastered editions of his early Capitol recordings and a VHS tape of commercials Freberg produced for television.

Throughout the 1990s, Freberg was active as a voice actor, lending his talents to advertising and animation. He was regularly heard as the voice of Junyer Bear in "Bugs Bunny" cartoons and as Bertie in "Cheese Chasers" cartoons. In the feature animated film *Stuart Little*, Freberg was heard as the race announcer.

Freberg noted with pride in a 1999 interview that Paul and Linda McCartney mentioned him in a *Playboy* article when

they were asked where the Beatles got their sense of humor. Writer Stephen King said that Freberg's maraschino cherry commercial influenced his imagination, though King misremembered the scene as Puget Sound, not Lake Michigan. Playwright David Mamet referred to the same commercial and remembered the lake correctly, but magnified the cherry to 30 tons and added skyrockets along the shore. Freberg called the mistakes a tribute to the medium of radio that the scenes were remembered as even bigger than they were.

Underscoring his self-description as satirist, Freberg quotes Al Capp, the artist who drew the "Li'l Abner" comic strip: "The fifth freedom is the freedom to laugh at ourselves." To which Freberg adds: "Mr. Capp makes sense. When we stop laughing at ourselves, the decline and fall is not far off."

Frederick, Pauline 1908–1990

U.S. Radio Network Journalist

One of the first female network news correspondents, Pauline Frederick became best known for more than two decades of reporting from the United Nations for National Broadcasting Company (NBC) radio and television. For her first dozen years on network television—until 1960—she remained the only female reporter of lasting duration in the medium.

Frederick grew up in Harrisburg, Pennsylvania, and got her first journalistic experience covering social news for the local paper. She left to earn her bachelor's degree in political science (1929) and a master's degree in international law (1931), both from American University in Washington, D.C. She originally intended to be an attorney but grew more interested in journalism while in school. She worked as a freelance reporter for, among other media, the *Washington Star* on women's issues, and some of her interviews were syndicated by the North American Newspaper Alliance (NANA).

Her first broadcasting work was for NBC Blue, assisting commentator H.R. Baukage by conducting interviews with various newsmakers beginning in 1938 with the wife of the Czech ambassador as Germany occupied that country. She continued at NBC into the 1940s, undertaking scriptwriting and other assignments, few of them on air in an era when female broadcast journalists were almost unheard of. Unable to break that gender barrier, she left the network in 1945 to work full-time for NANA while freelancing occasional "women's news" and other reports for what had become American Broadcasting Company (ABC) radio. This period of intensive international experience included travel to 19 countries in 1945–46; she sent reports from several countries in the Far East, from the Nuremberg trials of Nazi war criminals in Germany, and from Poland.

Frederick returned to broadcasting when, despite being turned down by both the Columbia Broadcasting System (CBS) and NBC (who still felt women's voices were not authoritative enough for news), she obtained a part-time position with fledgling ABC News in 1946, initially focusing (again) on "women's news." Her impressive output—including an exclusive interview with General Eisenhower and later coverage of a foreign ministers' conference—raised her status to full-time employment in 1948. That year she helped anchor ABC's television coverage of the national political conventions, and from August 1948 to March 1949 she hosted the Saturday evening 15-minute *Pauline Frederick's Guest Books* of television news interviews. She was heard on several radio network newscasts, her radio focus becoming international affairs, including the then-new United Nations, on which she quickly became an authority.

In 1954 Frederick returned to NBC and continued covering the United Nations for 21 years until her mandatory retirement (because of her age—she was 65), about which she learned from a story in the *New York Times* in 1974. In this two-decade period she became the voice of the United Nations for many Americans. She was also heard covering political conventions, tensions and wars in the Middle East, the Cuban Missile Crisis and other parts of the Cold War, and the war in Vietnam. At the same time, she continued on NBC radio with *Pauline Frederick Reporting*, a 15-minute daily program.

After retiring from NBC radio and television news, Frederick commented on United Nations affairs for National Public Radio. She also became the first female journalist to moderate a presidential candidates' debate when she presided over one of the 1976 televised forums pitting President Gerald Ford against Governor Jimmy Carter. She retired in 1980.

Frederick received 23 honorary doctorates and was the first woman to win both the Alfred I. DuPont award (for commentary, in 1954 and 1956) and the George Foster Peabody award (1954). She was also the first woman to win the Paul White Award from the Radio-Television News Directors Association (1980). She was a model for many aspiring female journalists and was one of the first to succeed over a long career.

CHRISTOPHER H. STERLING

Pauline Frederick. Born in Gallitzen, Pennsylvania, 13 February 1908. B.A. in political science, 1929 and M.A. in international law, 1931, American University. Performed freelance journalism work, 1920s and 1930s; interviewer, NBC, Washington, D.C., 1938–45; war correspondent, North American Newspaper Alliance, 1945–46; joined ABC radio, 1946–53; returned to NBC, becoming first woman to report serious television news, 1954–74; first woman elected president of the UN Correspondents Association, 1959; international affairs analyst, NPR, 1974–80; first woman to moderate a presidential debate, Jimmy Carter and Gerald Ford, 1976. Recipient: Alfred DuPont Award for meritorious service to the American people, 1953; twenty-three honorary degrees; Headliner Award, Theta Sigma Phi; George Foster Peabody Award, School of Journalism, University of Georgia, 1954; First Pennsylvania Journalism Achievement Award; first woman recipient, Paul White Award, Radio-Television News Directors Association, 1980. Died in Lake Forest, Illinois, 9 May 1990.

Freed, Alan 1921–1965

U.S. Disc Jockey

In the 1950s, Alan Freed became the first nationally recognized disc jockey in the U.S. to feature the emerging rhythm and blues and rock musical forms. During a time when many white "platter pilots" were reluctant to play songs by African-American performers, Freed was not; as a result, he helped to advance the careers of a number of artists. He has also been credited with helping to popularize the term *rock and roll*.

Freed, who grew up in Salem, Ohio, began his career in radio as an announcer in New Castle, Pennsylvania, after World War II, and by 1949 he had a popular music request show over WAKR in Akron, Ohio. In 1950 he moved to Cleveland and landed a job at WXEL-TV; however, by June 1951 Freed had returned to radio, hosting a record show over Cleveland's WJMO from 6:00 to 7:00 in the evenings. Less than a month later, he moved over to WJW in Cleveland to host what became a very popular late-evening request show.

Although Freed had started playing rhythm and blues on the air while he was in Akron, the inspiration for his career in rhythm and blues came from Joe Mintz, the owner of a Cleveland record store called the Record Rendezvous. Mintz was convinced that a rhythm and blues show would be popular, because both blacks and whites were buying rhythm and blues records in his store. He convinced Freed to give the music a chance on the air, and the result was *The Moondog Show*, which proved to be a great success.

Freed received wide attention when, in 1952, he took his show on the road. He decided to host a live concert in the Cleveland/Akron area called the Moondog Ball. The show, which featured a variety of acts, drew a crowd of 25,000 people to a 10,000-seat arena, and it was heralded as a successful,

though raucous, event. The near riot created by the ticketless crowd outside the theater attracted press attention to the music Freed was playing.

By 1954 WNJR in New Jersey had begun to air taped copies of Freed's programs, and on 1 May he hosted an Eastern Moondog Coronation Ball at the Sussex Avenue Armory in Newark. Years later, the *New York Times* noted, "Going to one of Alan Freed's rock 'n' roll musicales has always been something like having an aisle seat for the San Francisco earthquake."

Freed moved from Cleveland to New York City in July 1954 after signing with WINS radio for the largest annual salary paid to an independent rhythm and blues jockey up to that point—\$75,000. However, blind street musician Louis "Moondog" Hardin objected to Freed's use of the Moondog moniker, and in December of 1954, Hardin won a court injunction against Freed's use of the term. Freed changed the name of his WINS program to *Alan Freed's Rock and Roll Party*, and the age of rock began.

Freed moved to WABC in 1958, but he lost both his prestigious radio program and a television show at WNEW-TV in 1959 as a result of the Congressional quiz-show investigations. The legal action was prompted by accusations that TV networks were rigging popular quiz shows of the day, but the inquiries shifted to radio after Burt Lane, a representative for the American Guild of Authors and Publishers, sent a letter to the Congressional Special Subcommittee on Legislative Oversight citing examples of commercial bribery. Freed and a number of popular disk jockeys were accused of accepting money from record companies in return for playing those companies'

Alan Freed at WABC, June 1958
Courtesy AP/Wide World Photos

songs on the air. Freed pleaded guilty to a charge of taking bribes in 1962 and subsequently left New York City. Freed died in 1965 at 43 years of age in Palm Springs, California.

CHARLES F. GANZERT

Alan Freed. Born Albert James Freed, near Johnstown, Pennsylvania, 21 December 1921. Attended Ohio State University, B.S. in mechanical engineering, 1943; served two years in U.S. Army; disc jockey, WKST, New Castle, Pennsylvania, 1945; radio host, WAKR, Akron, Ohio, 1947; hosted television dance show, WXEL, Cleveland, Ohio, 1950; disc jockey, WJW, Cleveland, Ohio, 1951–54; staged “Big Beat,” all-African-American-talent rock and roll shows, 1952–58; hosted *Rock 'n' Roll Party*, CBS-TV, 1957; disc jockey, WINS, New York City, 1954–58; disc jockey, WABC, New York City, 1958; hosted dance party, WNEW-TV, New York City, 1959; disc jockey, KDAY, Los Angeles, California, 1960; worked at WQAM, Miami, Florida, 1962; jazz disc jockey, KNOB, Los Angeles, California, 1964. Elected to the Rock and Roll Hall of Fame, 1986. Died in Palm Springs, California, 20 January 1965.

Freed, Paul 1918–1996

U.S. Religious Broadcaster

Paul E. Freed founded Trans World Radio in 1952 in Tangiers, Morocco. By 1999 Trans World Radio was broadcasting in 150 languages from 12 locations in the world. Its gospel message is broadcast more than 1,400 hours each week and reaches listeners on three continents.

Freed, the son of missionaries, was born in Detroit, Michigan, in 1918. As a young boy, his family moved to the Middle East, where his parents served with the Christian and Missionary Alliance Church. Freed's early education was sporadic; he attended English and German school in Jerusalem, was home schooled, and worked with tutors. When his parents were home on furlough, he attended Wheaton Academy in Illinois. From the Academy, he matriculated at Wheaton College, where he earned his bachelor's degree. After graduating from Wheaton College, Freed attended Nyack Bible College and graduated from its missions program. Shortly after his mar-

riage to Betty Jane Seawell in 1945, Freed left his employment as pastor of a small church in Greenville, South Carolina. Torrey Johnson, founder of the Youth for Christ movement, recruited Freed as the director of the Greensboro, North Carolina, program.

In 1948 Johnson sent Freed to the Youth for Christ conference in Switzerland. Despite protestations from Freed, Johnson insisted it was God's calling for him. While in Switzerland, Freed was convinced there was a need to transmit the message of God to the evangelical Protestant youth of Franco's Spain. Following a trip to Spain, Freed laid the foundation for a radio organization to bring the gospel message to the people of Spain. The Spanish government refused to sanction such work. Frustrated by his experience, Freed returned to the United States to find a way to fulfill his mission of evangelical radio for the people of Spain.

Origins of Trans World Radio

In February 1952 Freed founded International Evangelism (later to be known as Trans World Radio) in the international city of Tangiers, Morocco. Freed acquired a small piece of land directly across the narrow Strait of Gibraltar from Spain. By 1954, at 61 years of age, Freed's father, Ralph Freed, accepted a new ministry to become director of the radio station in Tangiers. Dr. Ralph Freed transmitted the first Christian message from Tangiers, Morocco, on a 2,500-watt transmitter. Working together, by 1956 the Freeds built the Voice of Tangiers into an organization that broadcast the gospel message to 40 countries in over 20 languages. In 1959, when Morocco became a politically independent nation, government officials for the new regime ordered all radio stations to become nationalized. Freed was forced to move his station. Freed was worried that the 80 million listeners of the Voice of Tangiers would be lost, because there were no other full-time gospel radio stations on the air. The tiny Riviera country of Monaco welcomed Trans World Radio and its gospel message.

Freed and Trans World Radio began broadcasting from a transmitter originally built during World War II by the Germans for propaganda purposes.

By 1960 Freed had completed a dissertation at the New York University School of Education. He combined international relations, mass communication, and religious education in preparation for his goal to expand Trans World Radio's broadcast of the gospel message to other areas of Europe. Freed believed that millions of people around the world would be receptive to the gospel message if they could hear it. European radio was not receptive to gospel programs or preachers. Most radio in Europe was controlled by the government, and the few countries that allowed preaching charged extremely high rates for even their lowest-rated times. Other countries that closed their borders to missionaries and the gospel message were also targeted by Freed for radio broadcasts.

The station in Monte Carlo broadcast with 100,000 watts. Freed targeted Spain, Portugal, the British Isles, Scandinavia, the then the Soviet Union, Central Europe, Southern Europe, the Middle East, and North Africa as the primary areas to be reached from Monte Carlo. The first programs aired by Trans World Radio were broadcast in 24 languages. The staff in Monte Carlo received 18,000 letters the first year offering support for their programming efforts. Trans World Radio continued to grow, setting up branch offices in different areas of Europe. Their ministry spread across Europe and into the Middle East.

In August 1964 Trans World Radio added a transmitting station in Bonaire Island, part of the Netherlands Antilles. Through this facility, Trans World Radio programmed 70 hours a week of gospel messages to the Caribbean and the northern part of South America. By 1980 Trans World Radio had established new transmitting stations in Swaziland to reach sub-Saharan Africa and Pakistan, in Cyprus to reach people in 21 countries in the Middle East and North Africa, and in Guam (broadcasting in 35 languages) to reach listeners in Central Asia, South Asia, Southeast Asia, and the Asian Pacific area. In the 1980s Trans World Radio established operations in Uruguay in partnership with "Radio Rural" to carry its gospel message to listeners in Uruguay and northern Argentina.

As Trans World Radio moved into the 1990s, Freed continued to work to expand listenership. Stations were added in Albania, Russia, Johannesburg, and Poland. By 2000 Trans World Radio broadcast 1,400 hours of gospel programs from 12 locations around the world. These programs were broadcast in 150 languages to an estimated 2 billion people. Each year, Trans World Radio receives over 1.4 million letters from listeners in 160 countries. Trans World Radio initially transmitted on AM at 800 kilohertz and has since added shortwave transmissions to reach more listeners. Shortly after Freed's

death on 1 December 1996, he was inducted into the National Religious Broadcaster's Hall of Fame.

Free Form Format

During the 1960s, FM was ripe for a new form of radio—radio that burst through established format boundaries, emphasizing wholeness over separation and communal action over atomistic listening. *Free form*—in which imaginative disc jockeys combined many types of recorded and live music, sound effects, poetry, interviews, and calls from listeners—was the aural representation of the counterculture movement. Eschewing the slick professionalism, high-pressure salesmanship, and tight formats of AM radio, free form was—and sometimes still is—distinctly spontaneous, experimental, and challenging. At its best, free form is an exhilarating art form in its own right—a synergistic combination of disparate musical forms and spoken words. At its worst, free form may be pandering and self-indulgent.

Origins

Free form's roots developed in both commercial and noncommercial settings. During the mid-1960s, noncommercial community stations were developing across the country, following the lead established by Pacifica stations in California, New York, and Texas. These stations depended heavily on low-paid (often volunteer) programmers whose anti-establishment agendas rejected the tight structure of most corporate, commercial media. At the same time, commercial FM was still in its infancy, and disc jockeys were encouraged to experiment with longer segments and album cuts. Free form developed amidst

these experimental venues, catching on quickly among community stations and some commercial FM stations—albeit late at night and on weekends.

Free form most likely originated at WBAI in New York City around 1963–64, with three different deejays: Bop Fass (Radio Unnameable), Larry Josephson (In the Beginning), and the following year with Steve Post's the Outside. Soon, it spread to other stations, notably Pacifica stations KPFA in Berkeley and KPFK in Los Angeles, and privately owned KMPX in San Francisco. KMPX's general manager, Tom Donahue, is often credited as being the driving force behind the "underground radio" movement. Although he did not invent free form, Donahue nurtured it and allowed it to grow from a program shift to an entire format (although *anti-format* might be a better term).

Style

Free-form programmers featured everything from cutting-edge musicians such as Bob Dylan and the Grateful Dead to comedy routines from W.C. Fields and Jonathan Winters. Indian ragas and classical music were heard back to back. Shows started late and ran overtime. Guests wandered in and out of control rooms, sometimes speaking on air, at other times just being part of the scene. Disc jockeys pontificated on the day's topics, their delivery styles ranging from chats with listeners and studio guests to rambling, witty monologues—often within the

same program. Interviews and announcements regarding the counterculture and antiwar protests peppered broadcasts increasingly as the 1960s wore on.

Free form's deliberately anarchistic and undisciplined sound was, in effect, a form of participatory theater and gained a considerable following within the counterculture. Listeners called in to programs and were often heard on the air, rallies were announced (and broadcast), and listeners met at live remotes and events sponsored by stations (such as WBAI's 1967 "fly in" at Kennedy Airport, organized by WBAI free-form host Bob Foss).

Challenges to Free Form

The popularity of free form reached its peak between 1965 and 1970 and ultimately waned for three primary reasons. Ironically, once established through the success of free form, commercial FM became bound by the same tight formats that defined AM. Also, leaders among free-form disc jockeys, notably WBAI's Larry Josephson, grew weary of underground radio and moved on to other pastures. And the counterculture movement that nurtured free form eventually evolved beyond its communal sentiments. As the movement splintered into subgroups focusing upon sexuality, gender, race, and ethnicity, free form gave way to specialty shows on community radio and to the newer, more professional "public" stations affiliated with National Public Radio (NPR).

The 1980s were particularly difficult for free form, as community stations and NPR affiliates began programming more syndicated programming and professionalizing their sound, especially following NPR's near bankruptcy in 1983. Severe internal battles over station control were sometimes waged, with the fate of free form hanging in the balance. Proponents argued that free form was a unique means of expression that the new professionals simply failed to understand. The latter charged that free form's time had passed and that free form appealed to only a tiny fraction of the potential market. Despite such challenges, free form continued to survive at some stations, albeit most often during the late-night hours where it had originally developed.

Contemporary Free Form

Among the community stations and a dwindling number of public stations that still program it, free form has taken on an air of sanctity, hearkening back to the good old days when community radio was central to the underground movement. Yet without a symbiotic cultural context to fuel and inform it, contemporary free form lacks the immediacy and connection with the public that it once held. As such, free form has

become a much more personal medium among disc jockeys, and a successful program is one that has smoothly combined a wide variation of sounds reflective of the programmer's moods and inclinations at the moment. Whereas 1960s free form was jarring and often disturbing in its quirky juxtapositions, contemporary free form is more often about flow and seamless segues.

Besides community and public radio stations, most college radio stations also program free-form music to some extent, although the preferred term is "alternative radio." College radio programmers, however, typically lack a historical awareness of free form and have little concept of its cultural implications. Also, college radio's alternative programming is rarely as diverse as free form heard on community and public stations.

Free form's most recent manifestation is on the internet. Community, public, and college stations increasingly broadcast via the web, and some internet-only stations—often the efforts of individuals working from home—advertise themselves as free-form radio. The internet is also an important meeting place for free form enthusiasts, whose web pages and chat groups provide means of sharing information and ideas.

Frequency Allocation

Providing Spectrum for Broadcasting

Governments allocate bands of frequencies, including radio frequencies, for specific uses. Frequency allocation meshes technical limits and options with political and economic realities to create the compromise solutions behind today's broadcast services.

Three definitions are useful. *Allocation* is the broadest division of the electromagnetic spectrum into designated bands for given services (such as AM radio in the medium waves or FM in the very-high-frequency [VHF] spectrum). *Allotments* fall within allocations—they are given channels that are designated for specific places (only FM and television broadcasting have allotments). Finally, *assignments* are allotments that have actual users operating on them (such as a given station using 98.1 megahertz, for example)—they are virtually the same as a license to operate.

Frequency allocation can be examined under three broad rubrics. First, frequencies are allocated to classes of service. All radio signals that travel through the air use frequencies that are part of the electromagnetic spectrum. By international agreement this natural resource is divided into bands in which certain kinds of broadcasting occur. Medium-wave (or AM) radio occurs in one part of the spectrum, VHF (or FM) radio in another, VHF and ultrahigh-frequency (UHF) television in others, cellular telephony in another, satellite communication in another, and so on.

The frequencies used by different services are a function of three circumstances. First is history. Early experimentation with certain kinds of broadcasting resulted in assumptions that final allocations for that service should occur in the bands, or at the frequencies, originally used. This is because radio and television sets are designed to detect and amplify certain frequencies. Therefore, once such devices begin to be sold, changing the frequency of the service they were designed to use would make them obsolete. This can happen—for instance, in the United States the frequencies used to broadcast VHF/FM were changed in 1945—but the presumption is against such changes if they can be avoided.

Second are the technical needs of a particular service compared to the characteristics of certain portions of the spectrum. For instance, lower frequencies, such as those used for medium-wave/AM radio or shortwave radio, travel farther and propagate in ways that make it possible for them to bypass barriers more effectively than higher frequencies, such as those used for VHF/FM. This makes shortwave an effective means to broadcast transcontinentally or across oceans, medium-wave an effective means to provide national radio services (or international services to contiguous countries), and VHF an effective

means to provide local radio services. Satellite television signals are at such high frequencies that they are effectively blocked by buildings, trees, or other obstacles. Such frequencies would be relatively useless if they were used by terrestrial (or land-based) transmitters, but because the satellite signals travel essentially vertically (from the sky to the earth), they can be used for this service as long as the dishes for receiving them are clear of obstacles. They can be affected by electrical storms or heavy thunderstorms, however, so some disruptions of service are inevitable.

Third are the political compromises made by the signatory administrations (or countries) that sign the allocation agreements under the auspices of the International Telecommunication Union (ITU). Such agreements, for instance, can result in an altered frequency band assignment for a particular service, despite uses of another portion of the spectrum in some countries. This is usually the result of a recognized need to rationalize frequency allocations so that transmission and reception devices can be designed using a worldwide standard. Otherwise the economies of scale may not achieve maximum impact, and the devices made may not be manufactured or sold as inexpensively as they would be otherwise. International broadcasting would be impossible if there were not an international allocation for such services, because the radio sets used to listen to them could not tune the same frequencies from country to country.

Frequencies are also allocated within classes of service to particular countries. Some frequencies assigned are exclusive, and others are shared. The less powerful a station is, the less distance its signals travel. Consequently, it can share its frequency with other stations located at a sufficient distance to avoid interference. This is easier with VHF/FM than with medium-wave/AM, because FM signals travel only by line of sight, whereas the propagation characteristics of amplitude-modulated (AM) signals change at dusk, traveling farther via night-time sky waves, which bounce off a layer of the ionosphere and return many hundreds of miles from their origin point. Countries contiguous to one another must share the total frequency allocation for a particular type of service within its region.

Frequencies are also assigned within particular allocations to particular users (or broadcasters). Different carrier frequencies (the center point of a channel—the frequency that appears on your receiver when you tune a specific station) are assigned to individual stations. In the United States, frequencies are assigned by the Federal Communications Commission (FCC) by means of broadcasting licenses. These licenses stipulate the

channel (or band of frequencies centered on the carrier) that a station is to use to broadcast, the power it can use (according to the class of service it is licensed to provide), and its hours of operation. AM stations, for instance, use the 535-to-1705-kilohertz band, and FM stations use the 88.1-to-107.9-megahertz band. There are 117 AM carrier frequencies that can be assigned and 100 FM frequencies. Because of the propagation characteristics of these two services and the differences in bandwidth (10-kilohertz bandwidths for AM stations and 200-kilohertz bandwidths for FM), there were in 2000 about 4,900 AM stations and more than 6,700 FM stations in the United States. In January 2000 the FCC also began a new class of FM service, allowing both 100-watt and 10-watt stations, which will add many new low-power FM stations to the American broadcast landscape.

The principal exception to these general rules for frequency allocation is the frequencies used for international broadcasting in the shortwave portion of the spectrum. Here, individual stations are not assigned particular frequencies or broadcast power to use. Because the amplitude-modulated carrier waves of shortwave stations have the same propagation characteristics as AM waves generally, shortwave stations must change their frequencies as the seasons change (because the sunspot cycle moves from inactive to active every 17 years) and often as the time of day changes. This is why such stations register their "demands" with the international Frequency Registration Board (FRB), part of the ITU. By registering, they can discover whether they are attempting to use the same frequency as another broadcaster in the same part of the world. Often stations will also collaborate to ensure that their broadcasts will not interfere with one another's.

When radio was just beginning to be used in the early part of the 20th century, scientists believed that there were a limited number of frequencies suitable for broadcasting. When the first stations began to go on the air in about 1919, they used the same few frequencies, and there was significant interference between stations. Shortwave was given its name because people believed that any wavelengths shorter than those first used for radio would be unusable. This was because the shorter the wavelength (and thus the greater the frequency per second with which a wave crosses a particular plane), the more power it takes to move a wave a given distance. In other words, the longer the wave, the farther it will travel with a given transmitter. People thought that if wavelengths became shorter than those used by shortwave, the power required to make them usable would be prohibitively high.

Transmitters have become more efficient, however, and new forms of broadcasting (such as frequency modulation and digital broadcasting) have developed that continue to open up new frequencies for use. At the 1992 World Administrative Radio Conference (WARC), the participants provided new allocations for broadcast satellite service. For audio (or sound)

broadcasting, the frequencies 1452-1492 megahertz, 2310-2360 megahertz, and 2535-2655 megahertz were agreed to, and the FCC subsequently allocated the spectrum 2310-2360 megahertz based on the international allocation adopted for the United States by the 1992 WARC for a Digital Audio Radio Service. The 1992 WARC also adopted an even higher set of frequencies for broadcast satellite service for high-definition television, with 17.3-17.8 gigahertz assigned to region 2 and 21.4-22.0 gigahertz for regions 1 and 3. All these new allocations will become effective 1 April 2007.

As seen in Table 1, the ITU has allocated the bands in the electromagnetic spectrum for various uses.

The pattern in these allocations is easy to see. It is useful to note that there are only 20,000 hertz in band 4, 299,970 hertz in band 5, and 2,999,700 hertz in band 6. As the frequencies used for broadcasting rise, the total amount of spectrum available increases not arithmetically (as, for instance, the band numbers do), but exponentially. What this means in practical terms is that the amount of spectrum now available for services has enabled enormously more service, more competition, and more exclusive service allocations at ever-higher frequencies. For broadcasting, this has also meant the opportunity to expand bandwidth as the frequency allocations have risen, thus allowing for higher-fidelity transmissions. Whereas in the AM band, bandwidths of 10 kilohertz only allow stations to broadcast about half of the frequency response that is within human hearing range, with VHF/FM broadcasting two signals (left and right) can be broadcast using the entire 20-kilohertz range and still leave room for sideband broadcasting, guard bands to prevent cross-channel interference, and a broadcasting envelope to prevent atmospheric or manmade interference. Use of even higher frequencies allows the broadcasting of multiple CD-quality digital signals in the same channel, which digital radio delivered by satellite will deliver.

All frequency allocations are based on the use of hertz (or cycles per second) generated by a broadcast transmitter (hertz are named for Heinrich Hertz, whose experiments led to recognition of cycles generated by sound). Human hearing, for instance, can decipher the frequencies from about 20 hertz to 20,000 hertz (or 20 kilohertz). Any vibrating object creates waves at a particular frequency. Large objects (such as kettle drums or tubas) generate mostly low frequencies, whereas smaller ones (such as flutes or piccolos) generate mostly high frequencies. Tuba sounds travel farther than piccolo sounds do. The same principle applies to broadcast transmitters that generate the carrier waves upon or within which sound is carried to radio or television receivers, with some reservations. Low-frequency signals tend to travel along the ground, and much of their power is absorbed by the earth. As the frequencies increase, more of the signal travels through the air than along the ground, and gradually more of it also becomes a sky wave, which travels up and bounces back to earth. These char-

Table 1. International Telecommunication Union Band Allocations

Band Number	Frequencies	Designation	Some Designated Uses
4	10–30 kHz	Very low frequency	Long distance point-to-point broadcasting
5	30–300 kHz	Low frequency	Medium distance point-to-point broadcasting, radio navigation, aeronautical mobile, low-frequency broadcasting
6	300–3000 kHz	Medium frequency	AM broadcasting, short-range communication, international distress
7	3–30 MHz	High frequency	International radio broadcasting; air-to-ground, ship-to-shore, and international point-to-point broadcasting
8	30–300 MHz	Very high frequency	Line-of-sight communication, VHF television broadcasting, FM broadcasting, aeronautical distress
9	300–3000 MHz	Ultrahigh frequency	UHF television broadcasting, space communication, radar, citizens band radio
10	3–30 GHz	Superhigh frequency	Microwave communication, space communication
11	30–300 GHz	Extremely high frequency	Microwave communication, space communication, radar, radio astronomy

acteristics mean that less power will actually move a wave at a higher frequency farther than a wave at very low frequencies, despite the fact that the wavelengths are lower at the higher frequency (wavelength and frequency are in inverse relationship). Therefore, when shortwave propagation was discovered in 1921, it was possible to reach as far with a 1-kilowatt transmitter as organizations had used 200 kilowatts to do before using the ground wave of low-frequency broadcasting.

Frequency allocations thus have to be made with several interrelated factors in mind: (1) the type of propagation that will occur at a given frequency (ground, direct, or sky); (2) the type of service that is to be accomplished with a particular allocation (local, national, or international, via terrestrial or satellite transmission); (3) the fidelity required for the service to be provided (for instance, voice, music, video, or CD quality) and the bandwidth necessary to provide that service; (4) whether the allocations must be exclusive or can be shared with other services; (5) existing experimental or other uses that a particular set of frequencies have been put to (thus providing what are called “squatter’s rights”); and (6) the political realities of allocation among the different administrations that seek to employ the frequencies for particular uses.

Fresh Air

Public Radio Arts and Issues Program

Fresh Air host Terry Gross refers to herself and her production team as “culture scouts,” seeking the latest in arts, ideas, and issues. The program is one of the most popular on public radio, drawing a weekly audience of more than 4 million listeners on some 435 stations. *Fresh Air*’s Peabody Award citation in 1994 noted that “unlike the cacophony of voices that sometimes obscure and polarize contemporary debate, Ms. Gross asks thoughtful, unexpected questions, and allows her subjects time to frame their answers.” *Fresh Air*’s guests have ranged from former First Lady Nancy Reagan to filmmaker Martin Scorsese, from hostage negotiator Terry Waite to novelist Joyce Carol Oates, singer Tony Bennett, playwright David Mamet, and thousands more.

Over the years, *Fresh Air* has evolved from a live, three-hour local program to a highly produced hour-long program that runs nationally. David Karpoff created the show in 1974 when he was program director at WHY Y (then WUHY) in Philadelphia; he modeled it on *This Is Radio*, a program he had worked on at WBFO in Buffalo. Karpoff was the first host, interspersing live interviews with classical music. He was followed as host by Judy Blank, and when she moved on, Karpoff in 1975 hired Terry Gross, who had been co-hosting and producing *This Is Radio* in Buffalo.

Gross drew complaints by changing *Fresh Air*’s music to jazz, blues, and rock and roll, but she won listeners over with an interview style that was thoughtful and direct. Gross, who was 24 at the time, had broken into radio just two years earlier when she helped produce and host a feminist program at WBFO.

By 1978, when Bill Siemering arrived as station manager at WHY Y, Gross was carrying on the entire three-hour program by herself, “playing records,” Siemering recalls, “that were just long enough to show one guest out and lead another one in.” As a former station manager at WBFO, Siemering had created *This Is Radio* out of the turmoil of campus protest and had then gone on to develop *All Things Considered* as a program director at National Public Radio (NPR). When he arrived at WHY Y (then WUHY), Siemering says the station was in a run-down building in West Philadelphia, where the ladies’ room plumbing leaked onto Gross’ desk. Siemering got a Corporation for Public Broadcasting grant to upgrade the station and was able to hire intern Danny Miller as an assistant producer for *Fresh Air*.

Miller, who eventually became the program’s co-executive producer, says the fact that *Fresh Air* began as a local show is an important source of its strength: “The show had years to mature before it went national.” Part of that maturation involved cutting back the amount of time on the air from three

hours to two in 1983, because, as Gross says, “Danny and I often felt that in order to fill the airtime, we were forced to focus more on the quantity than the quality of guests.” At the same time, Gross and Miller added a weekend “best of” edition of the show that became the seed for the weekly national edition that was to follow.

Gross sees the development of the show as a step-by-step evolution. The next step came in the spring of 1985, when WHY Y premiered a weekly 30-minute version of *Fresh Air*, distributed by NPR. It appeared at a time when public radio stations on the East Coast were pressing for an earlier start time for the popular newsmagazine *All Things Considered*, which would enable them to capture more of the drive-time audience. Robert Siegel, then the news director at NPR, resisted the idea, feeling that the show was already stretched to meet a 5 P.M. deadline. Siegel saw *Fresh Air* as an answer to the demand for a 4 P.M. start, because its sensibility matched that of *All Things Considered* without duplicating its news content. “It was a very good program,” he says, “and Terry is the best interviewer in public radio.”

Gross says the program was reconceived in 1987 as a daily arts-and-culture companion to *All Things Considered*. To integrate it further into the *All Things Considered* sound, the new format included a drop-in newscast. *Fresh Air*’s shorter interviews, reviews, and other features were put in the second half hour so that its pace would match that of the newsmagazine as listeners went from one program to the next. The new *Fresh Air* also featured a recorded interchange between Gross and the hosts of *All Things Considered* in which they discussed what was coming up.

The national version of *Fresh Air* was a hit, both with audiences and with program directors, who liked the show’s predictable format because it gave them the flexibility to drop in local material during drive time. However, Gross says she and co-producer Danny Miller grew to feel imprisoned by the rigidity of the format. They were glad, therefore, when the 1991 Gulf War brought new demands on everyone. Even though *Fresh Air* had concentrated on arts and culture, Gross says, “we had to address the war. Everybody was rightly obsessed with it.” The producers sought interviews that could supplement the news, looking for what Danny Miller calls “the great explainers,” experts on the culture and the history of the region. “Emergencies require change,” Gross says, “and emergencies justify change. If an interview ran more than a half hour, we let it.” The war coverage restored some of *Fresh Air*’s flexibility and expanded its portfolio to include a full range of contemporary issues.

Terry Gross, host of *Fresh Air*
 Courtesy National Public Radio

Regardless of the subject, Gross applies the same demanding preparation for each interview, reading each author's books, viewing the films, and listening to the CDs that she will discuss. Interviews typically last between 20 and 40 minutes, during which Gross gives her guests the opportunity to rethink and rephrase their answers if they feel they can express themselves better. She prides herself on treating guests with respect, but "that doesn't mean I won't challenge you." Gross' critics have complained that she does not ask confrontational questions, but Bill Siemering says her method is much more effective. "If you're on the attack, all you get is their defense. If you're respectful, you get a lot more."

After nearly three decades on the air, *Fresh Air's* archives are filled with the voices and thoughts of some of the era's most interesting people, what Gross calls "a scattershot history of American culture."

Friendly, Fred 1915–1998

U.S. Broadcast Journalist

Although best known for his work in television journalism and public-affairs programming at the Columbia Broadcasting System (CBS) and at the Public Broadcasting Service (PBS), Fred Friendly's broadcasting roots were in radio. His experience in radio and recording prior to 1950—in Providence, Rhode Island; in the China-Burma-India theater during World War II; and in New York City at the National Broadcasting Company (NBC) and CBS in the late 1940s—provided his entrée into network journalism and influenced his subsequent work in television.

In 1921, Friendly and his father, a jewelry maker, built a radio receiver and listened to the Jack Dempsey–Georges Carpentier championship boxing match broadcast by KDKA in Pittsburgh. Friendly first went on the air in the early 1930s as a high school student on WJAR in Providence, Rhode Island, to perform in a one-act play, *The Valiant*, written by H.E. Porter and R. Middlemass.

Friendly's broadcast career began in earnest in 1936 at WEAN, Rhode Island's first radio station, which was part of the Yankee network and affiliated with the NBC Blue network. At WEAN, Mowry Lowe, a Rhode Island broadcasting pioneer, served as Friendly's mentor. From 1937 to 1941, Friendly produced and broadcast *Footprints in the Sands of Time*, daily five-minute biographies of important historical figures, for which a sponsor paid Friendly \$5 per program, in addition to his \$35-a-week salary (see Bliss, 1991). Decca Records later purchased the series. Friendly also worked as an announcer at WEAN and appeared on Mowry Lowe's *Sidewalk Backtalk*, a man-in-the-street interview program. During the same period, he operated the Fred Friendly Company, characterized on its letterhead as "A Radio Production Service to Advertising Agencies."

At WEAN, Friendly made occasional news reports. For example, he helped cover the great hurricane of September 1938 in Rhode Island. In July 1941 the Mutual Broadcasting System carried his report on the opening of the naval marine air station in Quonset, Rhode Island. On 1 October 1999, National Public Radio rebroadcast the report on *All Things Considered* as "a piece of radio poetry." The broadcast evoked the verse of Walt Whitman and anticipated the themes of the army wartime film series *Why We Fight*. Friendly celebrated "\$30 million worth of cement and steel . . . and mortar and sweat to keep America strong," accomplished by "a melting pot of O'Neils, Murphys, Gustafsons, and Joneses, and Cohens and Marinos."

During World War II, as a result of his radio experience, Friendly served in the Signal Corps and in the Information and Education Section of the army as a master sergeant. In the

China-Burma-India theater, he lectured to troops and wrote for the army newspaper, *CBI Roundup*. In addition, Friendly made recordings of bomber runs for the historical archives of the army. He accomplished this by hooking up a wire recorder to a plane's intercom in order to capture the crew's communication, to which he would add his own running account of the mission. He also made recorded combat reports from the front lines of the Eastern Theater for the fledgling Armed Forces Radio Network. In addition, after visiting Europe to cover the Allied victory in the West and the liberation of the Mauthausen concentration camp in Austria, Friendly gave a radio report for Armed Forces Radio from New Delhi.

Following the war, Friendly had an idea for a record album made up of historical figures of the 1930s and 1940s, an extension of the idea behind *Footprints in the Sands of Time*, a project facilitated by the advent of magnetic tape. In 1947, the agent J.P. Gude introduced Friendly to Edward R. Murrow, who provided narration for the 46 voices—from Roosevelt and Churchill to Will Rogers and Lou Gehrig—heard on *I Can Hear It Now*, issued in December 1948 by Columbia Records. Friendly produced five additional records for the *I Can Hear It Now* series. The first album, a spectacular critical and commercial success, initiated the Friendly-Murrow collaboration, which has been called "the most productive, most influential partnership in the whole history of broadcast journalism" (Bliss, 1991).

On 2 July 1948 NBC first aired a radio show, conceived and produced by Friendly, called *Who Said That?* On the show, a panel of journalists and celebrities was given quotations reported during the previous week and tried to identify their sources. Robert Trout served as host, John Cameron Swayze as a regular panelist. In December 1948, Friendly launched a television version of *Who Said That?* on NBC that continued to be carried on radio, one of the first programs to be simulcast. The radio version remained on the air until 1950, the television program until 1955, by which time it had moved to ABC-TV.

In 1950, Friendly produced and directed for NBC *The Quick and the Dead*, a four-part radio dramatization and documentary on the history and future implications of atomic power. Friendly had witnessed the dawn of the nuclear age firsthand, flying in a reconnaissance plane over Hiroshima and Nagasaki several days after their destruction. In the radio documentary, Bob Hope played an average citizen posing questions that were answered by actors playing Albert Einstein and other figures instrumental in the development of the atomic bomb. Friendly collaborated with *New York Times* science

Fred Friendly
Courtesy of Ruth W. Friendly

reporter William Laurence on the program, which included interviews with actual scientists and statesmen as well as with crew members of the plane that dropped the first atomic bomb.

In 1950, as a result of critical acclaim for *The Quick and the Dead*, Sig Mickelson, director of public affairs at CBS, hired Friendly to join the network's radio documentary unit. Friendly immediately teamed up with Murrow to produce *Hear It Now*, a prime-time hour-long radio news magazine carried on 173 stations. The acclaimed program, which combined audiotaped actualities and interviews with newsmakers, prompted imitations at NBC (*Voices and Events*) and at ABC (*Week Around the World*).

Hear It Now lasted only one season before being transformed by the Murrow-Friendly team into the groundbreaking television program *See It Now* (1951-58), with Friendly as its executive producer. Friendly subsequently worked at CBS television as executive director of *CBS Reports* (1959-64) and as president of CBS News (1964-66). After leaving CBS, Friendly served as broadcasting advisor to the Ford Foundation (1966-80), as Edward R. Murrow Professor of Journalism at Columbia University (1968-79), and as originator and director of the Columbia University Seminars on Media and Society (1974-98), which have been broadcast since 1981 on PBS.

A radio sensibility persisted throughout Friendly's television career. Don Hewitt, executive producer of *60 Minutes* and a member of the original *See It Now* team, said that Fred Friendly taught him his most valuable lesson in television: "It is your ear more than your eye that keeps you at the television set. . . . The picture brings you there, and what you hear keeps you there."

Fritzsche, Hans 1900–1953

German Radio Official and Commentator

Hans Fritzsche is among the more controversial figures in radio history. As Nazi Germany's leading radio commentator, he gained notoriety during World War II. His rise to mass popularity was testimony to the successful efforts of Nazi propaganda to promote a softer, wittier, more popular, and entertaining side of the regime. In addition Fritzsche was a key radio executive within Nazi Germany. He was instrumental in reorganizing German radio to serve the propaganda purposes of Hitler and the Third Reich. During World War II he became the most senior German radio official.

Origins

August Franz Anton Hans Fritzsche was born in Bochum, Germany, on 21 April 1900, the son of a Prussian postal clerk. A volunteer for the Army, he served in Flanders during the final months of World War I. Receiving his high school diploma the following year, he went on to study German, history, and economics at the Universities of Greifswald and Berlin. Without graduating, Fritzsche embarked on a journalistic career in 1923–24, when Germany was just emerging from the dual crisis of inflation and secessionism that had paralyzed the country since the end of the war.

Fritzsche joined several right wing political parties and clubs that served as rallying places of the foes of the newly founded German democracy. In 1923 Fritzsche became first editor of a conservative business journal and later an editor at Telegraf-Union, a news service controlled by Alfred Hugenberg, a leading German industrialist and an important figure in right-wing and nationalist political circles.

Broadcasting Career

Fritzsche's broadcasting career began in 1932. At the age of 32, he was appointed head of the news section of the German Broadcasting Corporation (Reichsrundfunkgesellschaft or RRG) and was responsible for the coordination of news broadcasts throughout Germany. This astonishing career move to one of the most influential positions in German radio came as part of a right-wing effort to take over the RRG and centralize the loose network of the independently run regional public broadcasting companies. In November 1932 Fritzsche gained recognition beyond professional circles when he started a new program called *Politische Zeitungsschau* (*Political Newspaper Digest*), which was syndicated by several stations throughout Germany.

With his nationalist credentials, Fritzsche was welcomed into the ranks of the Nazi party, which had taken over the German

government in January 1933. After Joseph Goebbels had been appointed head of the newly created Reich Ministry of Popular Enlightenment and Propaganda (Reichsministerium für Volkserziehung und Propaganda, or RMVP), Fritzsche and other staff members of the RRG were incorporated into the press section of the RMVP. Fritzsche continued his work as chief news editor. He was responsible for three daily national news broadcasts in the mornings, afternoons, and evenings. He also organized broadcasts during special events such as the 1936 Berlin Olympics. Because Fritzsche was trusted by Goebbels and enjoyed a good relationship with the population, he was often asked to explain difficult political situations to the public.

In 1938 German propaganda was in disarray after the German occupation of the Czech Sudeten border region, and Fritzsche was appointed first as deputy and then as head of the German press section of the RMVP. In this capacity Fritzsche daily held so-called "press conferences" where journalists were told what to include and exclude in their reporting. Even though Fritzsche was one of Goebbels' close lieutenants, he managed to keep good relations with journalists. He was well liked by the German press corps and knew how to relate to his former colleagues.

Fritzsche's great moment came with the start of World War II. His regular radio broadcast had gained some popularity by that point, but he remained only one of several well-known radio commentators. After September 1939, however, Fritzsche became *the* German broadcaster, someone whose voice was instantly recognized by a majority of the population. To this day, older generations of Germans remember his name and that of his radio show *Es spricht Hans Fritzsche* (*This Is Hans Fritzsche*). Unlike many German military radio commentators, Fritzsche was a seasoned journalist, an intriguing speaker with a penchant for good formulas, and someone who knew his trade and had a clear grasp of the medium.

The airwave battles between Fritzsche and his British counterparts are legendary. From the Allied point of view, Fritzsche was the most conspicuous German radio commentator, especially during the first phase of the war when his *Politische Zeitungsschau* (*Political Newspaper and Radio Digest*) consisted almost exclusively of "replies" to Allied reporting on the war. Wrapped in anti-British propaganda, his broadcasts highlighted the achievements of the Third Reich. As long as Germany was winning, Fritzsche's skirmishes with the Allies were hugely popular among Germans. After the tide had turned, however, his effectiveness as a propaganda weapon diminished. His radio show was scaled back but did continue until the end of World War II.

Later Life

In 1942 Fritzsche was appointed head of the Radio Section of the RMVP, becoming Germany's highest ranking radio official. Loyal to the Nazi regime until the very end, Fritzsche was captured by Russian troops in May 1945 and held in the Lubjanca prison in Moscow. After Goebbels' suicide, Fritzsche, although a comparative junior, was prosecuted among the main war criminals at the Nuremberg International Military Tribunal (IMT) in 1945–46. Acquitted by the IMT, he was subsequently sentenced to nine years in a labor camp by a German denazification court.

Pardoned in 1950, Fritzsche married his second wife, the journalist Hildegard Springer, who published his prison letters and diaries. An unrepentant apologist of the Third Reich, Fritzsche unsuccessfully tried to return to politics. He died in Cologne of cancer in 1953 while working as an advertising executive.

G

Gabel, Martin 1911–1986

U.S. Radio Actor and Narrator

Martin Gabel appeared in some of the most popular American radio programs of the 1930s and 1940s, while also winning critical praise for his work with radio innovator Norman Corwin.

Gabel was born to Jewish immigrant parents in Philadelphia, Pennsylvania. His father supported the family by peddling watches and jewelry on the city's streets. Even as a boy, Gabel recited Shakespeare to himself, preparing for a career in the theater. In 1928, he entered Lehigh University in Bethlehem, Pennsylvania, where he studied English. He left Lehigh in 1931 without a degree and enrolled in the American Academy of Dramatic Arts in New York City, graduating from there in 1933.

Gabel followed a path that was typical for many successful New York actors, combining radio and stage work. In 1935, he starred in the Broadway hit *Dead End*. At the same time, his rich voice and suave, cosmopolitan diction began to win him parts on New York-based radio series. Over the years, he would appear on such programs as *The Columbia Workshop*, *Matinee Theater*, *The Casebook of Gregory Hood*, and *The March of Time*. However, the series that vaulted him to radio celebrity was *Big Sister*. The CBS soap opera, initially sponsored by Rinso Soap Powder, premiered in 1936. Gabel originated the role of Dr. John Wayne, the love interest, and then husband, of the title character. The popular series revolved around "Big Sister" Ruth Evans' selfless devotion to her orphaned brother and sister. John's crises and philandering inspired Ruth to further self-sacrifice. *Big Sister* brought Gabel more than fame among soap-opera fans; it provided him with a handsome income and steady work. In its first years, *Big Sister* aired weekdays from 11:30 to 11:45 A.M., a schedule that left Gabel time to appear in other radio and theater productions.

In 1936, Gabel performed alongside Orson Welles in the Broadway play *Ten Million Ghosts*. The play flopped, but the

association with Welles soon would bring Gabel prestigious radio and stage roles. On 23 July 1937, the Mutual network broadcast the first episode of Welles' seven-part radio adaptation of *Les Misérables*, featuring Welles as Jean Valjean and Gabel as his pursuer, Javert. Meanwhile, Welles and John Houseman were forming the Mercury Theater company, with Gabel as a key member. In his memoirs, Houseman describes the young Martin Gabel as an actor of deep sensitivity, insatiable ambition, and furious energy. Houseman also recalls that: "His gravid voice had made him, in his early 20s, one of the country's most successful and sexy radio actors." After creating a sensation with its stage productions, Welles and Houseman's innovative repertory group launched a weekly series on CBS radio. *The Mercury Theater of the Air* debuted on 11 July 1938 with "Dracula." Welles played the vampire and Gabel his nemesis, Van Helsing. Though Gabel appeared in other Mercury radio productions, he was not cast in the "War of the Worlds" broadcast that famously inspired a national panic.

As the 1930s ended, Gabel also began to work with CBS writer-producer-director Norman Corwin. Corwin was already attracting attention for the poetry and aural experimentation of his radio plays. In 1939, Gabel narrated a segment in Corwin's *So This Is Radio* series. A year later, he appeared as the devil in the rebroadcast of Corwin's radio play *The Plot to Overthrow Christmas*. Gabel spent some of the World War II years in the Army, but in 1944 he was again a civilian. That year he appeared in three plays in *Columbia Presents Corwin: "New York: A Tapestry for Radio"*; "A Pitch to Reluctant Buyers"; and "The Long Name None Could Spell," a program about the Nazi occupation of Czechoslovakia.

By the summer of 1944, the collapse of Nazi Germany appeared inevitable. CBS vice-president Douglas Coulter asked Corwin to prepare a special program for VE Day, the moment of Allied victory in Europe. With Corwin working on the West Coast, the program would be broadcast from the

CBS affiliate KNX in Los Angeles. Corwin had tried to use Gabel whenever his radio plays were produced in New York. For such an important project, however, Corwin insisted on flying Gabel to California to serve as narrator. Germany's surrender finally came on 8 May 1945 and *On a Note of Triumph* was broadcast live that evening, with Gabel and a large supporting cast. The program celebrating Allied victory was itself an artistic triumph. *Billboard* editorialized that *On a Note of Triumph* was "the single greatest—and we use greatest in its full meaning—radio program we ever heard." CBS asked Corwin and Gabel to broadcast a live encore performance five nights later.

Corwin thought that Gabel brought the ideal mix of authority, range, and discipline to the two broadcasts. *Triumph* concluded with a prayer to "Lord God of the topcoat and the living wage," a Corwin synthesis of biblical phraseology and American vernacular. According to broadcast historian Erik Barnouw, Gabel gave the prayer a quality that was both Old Testament and Broadway, bringing many to tears. *Variety* praised Gabel's vocal timbre and dramatic restraint and called *On a Note of Triumph* a milestone in radio.

In 1946, Gabel married radio and stage actress Arlene Francis, and the couple had one son. Gabel continued his stage work, as producer and director as well as actor. He also appeared in films and television programs, sometimes teaming with Ms. Francis. Gabel took more radio roles in the postwar years and appeared in two Corwin radio broadcasts for the United Nations. In the 1950s, his radio appearances became less frequent, coinciding with the general decline of radio drama.

Martin Gabel died of a heart attack in 1986. Obituaries stressed his stage and film achievements. However, Norman Corwin believed that Gabel was one of radio's most brilliant and underrated actors, the closest to Orson Welles in range, mellifluousness, and musical power. Upon Gabel's death, Corwin wrote his widow Arlene Francis that: "My work had first found its eloquent expression through Martin."

Gambling, John B. (1897–1974); John A. (1930–); and John R. (1950–)

U.S. Radio Show Hosts

The name John Gambling is synonymous with local New York morning radio. From broadcasting's infancy until the end of the 20th century, a dynasty of three John Gambblings greeted wake-up and commuter audiences via its *Rambling with Gambling* show on 50,000-watt WOR (AM).

This radio lineage was sparked by the 1912 *Titanic* sinking. British teenager John B. Gambling felt called to learn wireless telegraphy so that he might help save the lives of passengers aboard subsequent ill-fated vessels. After holding radio operator positions in the Royal Navy and with various commercial lines, John B. opted for the higher-paying American shipping firms. A U.S. citizen and chief wireless operator on a cruise ship by 1924, he fell in love with a young vacationer, proposed, then left the sea in favor of starting married life in New York City. His radio license landed him an engineering job at Newark, New Jersey based WOR, a fledgling 250-watt station that was about to double its power and open a studio in Manhattan.

First Generation

As the newest of the station's tiny technical staff, John B. Gambling was "stuck" with coaxing the transmitter to life for the gruff host of an early-morning New York based exercise show. Two days into this stint, he was told to do some announcing. Morse code had been his preferred stock in trade, but John B. dutifully approached the microphone and introduced the fitness guru. Letters swamped WOR's mailroom. "Who is that beautiful baritone voice?" the predominantly female writers wanted to know. They heard more of him when, a few months later, the calisthenics expert phoned an anxious Gambling to say he wasn't coming in that morning. By mid-1925, the original host (who was also the exercise program's sponsor) quit, leaving John B. Gambling to recite jumping-jack routines, read announcements, and banter with the show's modest musical group, all the while running around the studio and control room flipping switches and checking meters. It was supposed to be a temporary ordeal, but advertisers soon lined up to sponsor the friendly-sounding announcer/host of what was initially called *The Musical Clock*. WOR management lost little time in naming John B. Gambling as permanent host of what would later be affectionately dubbed *Rambling with Gambling*. Transmitter upgrades through the early 1930s eventually set the lighthearted proceedings on a firm 50-kilowatt footing.

The show was never an elaborate affair. Its 1940s incarnation, for example, included tunes from four erstwhile vaude-

ville musicians (branded "the world's greatest little orchestra"); 20 canaries (sponsored by a birdseed company) primed for song in front of their own WOR microphone; and Gambling, who did time checks every quarter hour between family-approved jokes that he collected, aired, and then promised not to repeat until the following year. And, not wanting to desert listeners while convalescing from hernia surgery, he went on the air from his hospital bed. Good old-fashioned folksy schlock, always under John B.'s avuncular direction, kept longtime listeners happy at the 710-kilohertz dial position.

Rival Columbia Broadcasting System (CBS) morning man Arthur Godfrey felt *Rambling with Gambling's* influence, often finding himself leapfrogged in the New York ratings by the WOR staple. Circa 1951, John B. Gambling was producing half of the station's gross advertising revenues. His reported \$500,000 annual salary and commissions came to more than the entire WOR operation netted after expenses. In 1955 some 27,000 fans filled Madison Square Garden to witness *Rambling with Gambling's* 30th anniversary broadcast. Even so, radio insiders studying the younger generation believed the nearly 60-year-old host would eventually have trouble attracting the new audiences needed to keep WOR fresh in big advertisers' minds. They were not alone. Not long after that milestone show, John B. Gambling resolved to find another host for his show. He hoped to turn over the *Rambling with Gambling* microphone to his son, John A. Gambling.

Old-time WOR listeners quipped that the John Gambling selected to succeed the venerable John B. should at least display the linear courtesy of having a C for middle initial, rather than an A. No matter, on 5 October 1959 John A. Gambling became host of *Rambling with Gambling*. Alongside his father, he had been cohosting the program for about a year, and on that fall morning, the elder broadcaster decided it was time to just stay home. WOR listeners heard no flashy torch-passing announcements.

Second Generation

It was not an automatic ascension for the 29-year-old "new-comer." Some station brass remembered John A. as a toddler warbling Christmas ditties during his Dad's holiday broadcasts and were disinclined to think of him as his own person. They also cited the matter of John A.'s voice. Compared to the original Gambling's more resonant tones, his was quieter, somewhat "barefoot."

New Hampshire stations had provided John A. Gambling with serious steps toward learning his trade. Besides spending free time between Dartmouth classes volunteering at the college's radio station, he paid dues with stints on the Granite State network's outlets in Manchester, Claremont, and Lebanon. Common to most disc jockey starts, Gambling experienced the humble glamour of radio broadcasting in makeshift facilities where one is required to wear many hats . . . and where the plumbing is still something in the station owner's future plans.

Graduation 1951 saw John A., wife Sally, and new son John R. ready for a return to the metropolitan New York area. His father invited him to assist with *Rambling with Gambling* and to participate in other WOR shows, including several aired over the Mutual Broadcasting System. Five years later, the station wanted a test program to determine whether John A. could make the grade as a big-city broadcaster. The station chose the nightly *Music from Studio X*, which was aimed at a sophisticated, young listenership. The show (first offered locally and subsequently via the Mutual network) quickly became a respectably rated easy listening show (on which, for high-fidelity clarity's sake, no record was exposed to the stylus more than once), granting John A. Gambling an outlet for honing the personable, "one-to-one" announcing style he continued to make famous on *Rambling with Gambling* following his father's retirement.

The new host gently massaged his inheritance into a modern 1960s presentation. Most noticeable was a swing away from Sousa marches and Strauss waltz numbers to Broadway show standards and instrumental cover versions of Top 40 hits. Musically, however, John A. drew boundaries around anything that sounded too much like rock and roll. Teens would write to say they "liked *Rambling with Gambling*, but couldn't Mr. Gambling please play a short Beatles single once in a while?"

Record selection became a bit more liberal during the 1970s. By then, though, there was hardly time to spin more than a few each hour. The broadcast's pace had accelerated in order to accommodate the ever-expanding rush-hour commuter crowd, and Gambling shared his show with a helicopter-borne traffic reporter, a weatherman, news commentators, sportscasters, and others. The team exuded a serendipitous brand of good-natured symbiosis not easily fabricated. Without trendy music or questionable humor, *Rambling with Gambling*'s ratings, circa 1975, topped 2 million people weekly, making its formula better received than any other single-station program in America.

As society, as well as morning radio, got edgier, many of Gambling's competitors were mystified at his ongoing success. Instead of sexual innuendo, *Rambling with Gambling* was (and is) sprinkled daily with local public service messages and occasional lost pet announcements. WNBC's Don Imus tried

poking fun at the clean-cut WOR host by speculating about the name of a hypothetical game in which housing project tenants wagered on whether or not their commodes ("johns") would function. John Gambling's non-confrontational style stayed the course while many other "gimmicky" New York air personalities, station formats, and call letters took turns in the broadcast business' great revolving door.

Meanwhile, John R., John B.'s grandson and John A.'s son, set his sights on a radio career, but he was unsure about someday hosting *Rambling with Gambling*. A late-1960s summer job at WOR prompted him to get involved in college radio (during the 1970s) at Boston University. After graduation, he served in managerial positions at a number of stations, including some then commonly owned with WOR. Tenure as morning host in the Poughkeepsie, New York, area followed.

During the 1980s, as talk radio spread to many of AM's strongest outlets, WOR was already specializing in the genre. By dropping any remaining music, *Rambling with Gambling*'s helpful informational routine fully qualified as state of the art, opening a spot on the show for a third generation of Gambling. In 1985 John R. began co-hosting with his father, John A. Five years later (just as his dad had done some three decades before), John A. turned over *Rambling with Gambling* to his son.

Third Generation

To stay contemporary without losing a focus on the show's wholesomeness, the youngest of the triumvirate has added more humor, and he feels freer than his predecessors did to express controversial points of view. Even so, the *Rambling with Gambling* audience continued graying without sufficient replacement numbers of younger consumers. Many had been enticed by self-centered talkers offering edgier, decidedly caustic fare.

Not long after Labor Day 2000, WOR's management admitted that its morning show was top-heavy with a largely retirement-age demographic many 21st century advertisers ignore. The station notified Gambling that his contract would be allowed to lapse at the end of the year. John R. responded that he didn't want his listeners to hear him "day after day, dying a slow pathetic [cancellation] death," and then he shocked WOR officials by simply signing off after his 11 September broadcast, some 75 years after his grandfather began the program. Countless calls of disappointment swamped the station's phone system. Among the sympathetic messages were those from New York City's mayor Rudolph Giuliani and the governor of New Jersey, Christine T. Whitman. Each expressed hope that another metropolitan outlet would pick up the long-lived program. These wishes came true shortly thereafter when this third John Gambling showed up on WOR's cross-town rival, WABC.

Gangbusters

Detective Drama Series

During the 1920s, the American public lost confidence in law enforcement officers as news of bribery and scandal involving real-life police officers became routine. The onset of the Great Depression in the early 1930s exacerbated this situation, and criminals such as Bonnie Parker and Clyde Barrow, Al Capone, and George “Baby Face” Nelson were often portrayed as folk heroes. Hollywood produced films (e.g., *Public Enemy* with James Cagney and *Little Caesar* starring Edward G. Robinson) that presented gangsters as tragic heroes. *Gangbusters*, the first successful regularly scheduled detective drama on network radio, played a major role in restoring America’s confidence in law enforcement officials.

Gangbusters was created by Phillips H. Lord, an actor and producer best known for his portrayal of the title character in

the radio series *Seth Parker*. Whereas the earlier series was known for its folksy warm feeling, Lord went in a different direction for his next project. *Gangbusters* was a blend of fact and fiction—dramatizations of actual crimes taken from the case files of local and federal law enforcement offices. The series premiered on the National Broadcasting Company (NBC) in 1935 under the title *G-Men*. After a brief run, the series moved to the Columbia Broadcasting System (CBS) in January 1936, and the title was changed to *Gangbusters*. The series also eventually appeared on the American Broadcasting Companies (ABC) and Mutual during its 22-year run.

The format of *Gangbusters* was simple. Each episode opened with a loud, identifiable opening of marching feet, sirens, and machine-gun fire. The series opening became so

Gangbusters
 Courtesy CBS Photo Archive

well known that it led to the phrase “coming on like gangbusters.” After the opening sound effects, the narrator would introduce the current episode, followed by an interview with a local law enforcement officer (usually from the locale of the current episode). At the end of each episode was a feature called “Gangbuster Clues,” which included information regarding a criminal currently at large. The audience was presented with a detailed description of the wanted person, along with information about how to contact law enforcement officials, and was asked to help bring the suspect to justice. These “clues” led to over 100 arrests during the series’ first three years. In subsequent years, many more were brought to justice through this forerunner to several successful television series (e.g., *Unsolved Mysteries* and *America’s Most Wanted*).

Lord employed actual law enforcement officials to comment throughout each episode. *Gangbusters*’ first narrator was Lewis Valentine, police commissioner of New York City. He was replaced after the first year by Col. Norman Schwartzkopf, former superintendent of the New Jersey State Police (Schwartzkopf’s son and namesake would later lead the U.S. troops during the 1991 Persian Gulf War). Schwartzkopf con-

tinued as narrator for most of the next ten years. In 1945, Valentine, now the retired police commissioner of New York City, replaced him.

The first episode was a dramatization of the Federal Bureau of Investigation’s (FBI) capture and shooting of John Dillinger. Lord had obtained the cooperation of FBI Director J. Edgar Hoover on the condition that only “closed” cases would be dramatized in the series. Subsequent episodes featured the stories of “Machine Gun” Kelley, “Baby Face” Nelson, “Pretty Boy” Floyd, and Bonnie and Clyde. When the series moved to CBS in 1936, it began to feature the stories of lesser-known criminals.

Gangbusters portrayed detectives as modern-day heroes who led glamorous lives and risked their lives in the service of others. The plots were very simplistic plays in terms of “good versus evil,” with good always winning. Rarely was any mention made of the causes of such criminal behavior.

Gangbusters had many imitators, most notably *Dragnet*, which began in 1949 and was arguably the prototype for all crime and detective dramas to follow. Unlike that show, however, *Gangbusters*’ television history was short. The format

was the same as its radio counterpart. Phillips H. Lord appeared in each episode as the narrator in addition to serving as series writer and creator. As in the radio version, clues regarding at-large criminals were presented, along with photographs. The television version premiered in 1952, alternating each week with *Dragnet*. *Gangbusters* was designed as a temporary series because Jack Webb had trouble producing weekly episodes of *Dragnet* on time. Both were very successful, with *Dragnet* ranking 20th among all network prime-time series and *Gangbusters* ranking 14th. However, as was the initial plan, *Dragnet* was continued the following season, and *Gangbusters*, the fill-in, was canceled.

Gay and Lesbian Radio

A number of attempts, often short-lived, at broadcasting gay and lesbian programs on radio have occurred since the late 1950s. As of 2002 the United States led the way, with more than 100 original gay and lesbian radio shows, which could be heard in large and small cities across the country; however, only a few of these shows are syndicated overseas. Other countries with such radio programs include Australia, Canada, the United Kingdom, Japan, and New Zealand. Gay radio, which targets a multibillion-dollar market, is not represented by a specific format type; rather, its music and talk programming reflects the socio-economic and cultural diversity within the gay and lesbian community. Personal expression through “queer radio” empowered gays, lesbians, bisexuals, and transgender communities to seek new ways to work collectively toward providing information, resources, and fellowship to others in the United States and internationally.

Origins

Five Pacifica radio stations—in Berkeley, California; Los Angeles; New York; Houston; and Washington, D.C.—

located in cities with the largest populations of lesbians and gays in the United States, aired the queer perspective in their news, public affairs, and literary discussions, even before the 1969 Stonewall Rebellion—the birth of the modern-day gay movement. Pacifica station KPFA-FM in Berkeley went on the air in 1949 and became the first listener-sponsored radio station in the world. Pacifica’s second station, KPFA-FM, began broadcasting in Los Angeles in 1959. The following year, philanthropist Louis Schweitzer donated WBAI-FM, New York, to Pacifica.

The poet Allen Ginsburg would propel gay radio into mainstream debate by challenging the boundaries of American radio in 1956, when he read his controversial poem “Howl” on KPFA. Ginsburg’s life of drugs, jazz, and a liberal attitude toward sexuality and morality epitomized the Beatnik rebellion against the status quo of the 1950s. In the late 1950s, San Francisco’s KPFA aired what is believed to be the first comprehensive gay-rights radio documentary in the United States. The two-hour documentary brought together a small group of physicians, lawyers, and criminologists with the mother of a gay man and Harold L. Call, an editor for the *Mattachine Review*

and a member of The Mattachine Society, America's first gay-rights organization, to discuss the rights of gay men.

Then, in 1962, WBAI aired "The Homosexual in America," a 60-minute program focused on the opinions of a panel of psychiatrists. Protests by Mattachine New York organizer Randolfe Wicker demanded equal time from WBAI management. On 16 July 1962, WBAI aired a radio forum with Wicker and six other gay men, which prompted some listeners to file a complaint with the Federal Communications Commission (FCC). The rejected complaint paved the way for future discussions on homosexuality in the electronic media. In essence, the FCC upheld Pacifica's contention that broadcasts addressing gay issues served the public interest, as long as the topics were handled in good taste.

Radio After the Stonewall Rebellion

Queer broadcasting may be traced back to the people who fought for free expression and civil rights. No event revolutionized and liberalized the gay and lesbian movement more than the Stonewall Rebellion. The decision on what needed to be done to achieve equality, tolerance, and ultimately acceptance by all Americans was made during one fateful Friday night on 27 June 1969 on the streets of New York City. A routine police raid on a Greenwich Village bar that served transvestites, lesbians, and gays turned violent after patrons decided not to run away from the police. What might be perceived as an isolated incident to most Americans sent shock waves throughout the queer community. The riots continued in New York City for three days, and The Gay Liberation Front was formed within weeks.

In 1971 Pacifica's KPFK debuted *imru* ("I am; Are you?"), the first weekly gay radio show in Los Angeles, and perhaps in the United States. Another program, *Amazon Country*, celebrated its 25th anniversary in 1999. That year the show was also the recipient of the 1999 Lambda Award for Outstanding Overall Performance by an Organization/Social-Cultural Group. *Amazon Country* airs on Sunday nights on the University of Pennsylvania's public radio station WXPB-FM, featuring a lesbian/feminist perspective in its music and interviews with artists, authors, and leaders throughout the nation. Since 1974 WXPB has also aired *Q'zine*, a radio magazine show that was originally called *Gaydreams*. It was named partly after a Grateful Dead song and first aired in 1974. Several other queer radio shows were heard mainly on noncommercial college and community radio stations. These programs were almost always volunteer produced, represented the efforts of only a handful of radio collectives, and were limited financially and regionally. The longevity of these shows often depended on the whim of the station manager and program director, and gay and lesbian producers on occasion were forced to compete among themselves for limited time slots.

Repression and Restraint

The 1980s saw a sexual revolution on radio and television—one that prompted public calls for censorship, music labeling, and stronger FCC policies and penalties, as well as for boycotts on stores and stations promoting explicit music. The public outcry against naughty lyrics on the radio seemed stronger than its reaction to Howard Stern's racial and ethnic epithets and verbal gay bashing.

As right-wing conservatism swept the nation during the Reagan era, gay-rights activists were under attack in the mainstream media. The previous victories in civil liberties and free expression were to be challenged once again by the FCC and the religious right. As early as the 1980s, the FCC warned Pacifica that any further broadcast of "Howl" could result in heavy fines or the forfeiture of its license. AIDS would provide the justification and rationale for what would become the widespread abuse of human rights and rise in hate propaganda in the years to follow. It was in this environment that queer broadcasting would push forward and feverishly combat the stereotypical attitudes and hate propaganda that continue to target gays and lesbians.

In 1986 the freedom of queer radio was challenged again by the FCC after Reverend Larry Poland accidentally tuned in to *imru* on KPFK and heard "Jerker," a radio drama about the impact of AIDS on two gay men. The FCC threatened to fine the station "for the patently offensive manner in which the sexual activity was described." The Justice Department declined to take action on the case. In 1991, Pacifica was one of several parties to lead a successful appeal to overturn the 24-hour indecency ban initiated by Congress and put into place by the FCC.

By 1987 the AIDS Coalition to Unleash Power (ACT UP) had attracted mainstream media attention to AIDS issues. "Outing" the famous became "in" among young queers who wanted to end hypocrisy in the media. The sexual revolution of the 1960s was being reinvented by George Michael and Madonna in the electronic media, as both challenged and toyed with gender boundaries in their music and videos. A number of radio stations aired promotional announcements that assured their audiences of "safe" lyrics, and the FCC began to wrestle with "safe harbor" policies designed to protect children from undesirable broadcast content.

The Rise of Queer Music

By the end of the 1980s, Melissa Etheridge and k.d. lang had expanded in popularity beyond college radio and were becoming household words on mainstream radio. The nation seemed ready for something different—and with the rise of alternative radio, a new breed of music was arriving on the scene; its new young audiences embraced the often mystical and mesmerizing

video clips of life and love projected across their television screen. For some musicians, it was time for the next step—queer music, in which gays and lesbians would share their experiences about lovers and life partners in their music.

The formation of the National Lesbian and Gay Country Music Association in 1998 was just one example of the trend toward acceptance of queer music in the United States. Other signs toward changing times include the acceptance of country musicians such as Mark Weigle, an independent singer/songwriter who has received regular airplay on Americana shows in Europe. He was nominated (along with Ani DiFranco, Rufus Wainwright, and the B-52's) for two 1999 Gay/Lesbian American Music Awards (GLAMA)—for both Debut Artist and Out Song “If It Wasn’t Love.” Weigle has been praised by music critics in gay and mainstream music publications such as *Genre*, *Billboard*, and *Performing Songwriter*. GLAMA is the first and only national music awards program to celebrate and honor the music of queer musicians and songwriters. Its first annual ceremony took place in New York’s Webster Hall in October 1996, with about 700 people in attendance. The judges comprised music reviewers from the gay and mainstream media; leaders in radio distribution; executives of major and independent record labels; and those working in performing rights, talent management, and retail. GLAMA’s final awards ceremony was held in April 2000; increasing administrative costs were cited as the reason for its demise.

Beyond the Gay Ghetto

In April 1988 Los Angeles radio producer Greg Gordon, a former *imru* producer and host (along with his volunteer staff), created the 30-minute newsmagazine program called *This Way Out*, which began with a weekly distribution to 26 public stations in the United States and Canada. It now airs on more than 125 radio stations—public and commercial—in six countries. The program contains news, author interviews, AIDS updates, humor, poetry, and music recordings by openly gay and lesbian performers rarely heard on commercial radio. The Gay and Lesbian Press Association honored *This Way Out* with its Outstanding Achievement Award in 1988, and the National Federation of Community Broadcasters presented the “Silver Reel” award to its producers in 1991 for their ongoing news and public-affairs commitment to cultural diversity. One affiliate station, Kansas City’s KKFI-FM, boasts that more than 500 individuals have presented a myriad of gay, lesbian, and transgender issues across its airwaves. In fact, KKFI is the first and thus far the only station in its market to air a local queer radio program. To some gay media activists, however, the failure to move beyond noncommercial radio and into the mainstream has been a form of “gay ghettoization,” or what some queer broadcasters have referred to as “preaching to the choir.” For years, noncommercial radio has been the primary

vehicle for communicating the queer perspective to the gay community, and increasingly to a straight audience. In 1992 WFNX-FM, a commercial Boston station, debuted *One in Ten*, a three-hour show with a mix of news, entertainment, music, and call-in discussions. In the early 1990s, several other commercial stations experimented, although unsuccessfully, with locally produced programs targeting gay and lesbian audiences.

In 1990 Thomas Davis became the president and general manager of two Amherst commercial stations located in a renowned gay and lesbian community in central Massachusetts. His company’s mission was to target listeners outside the gay community, in addition to gays and lesbians themselves. In doing so, the stations would attempt to convey the idea that gays and lesbians function much like any other members of society on a daily basis. As institutional members of the Gay and Lesbian Business Coalition, the stations have been supported on the air by many gay- or lesbian-owned businesses. Programming includes news stories relevant to gays and lesbians, as well as fund-raising efforts for a number of queer community concerns, such as AIDS research and hospice funding.

1992 was the year of the largest commercial venture for gay radio. The KGAY Radio network signed on the air on 28 November 1992 in Denver. KGAY, with its motto “All Gay, All Day,” was the inspiration of Clay Henderson and Will Gunthrie. Their previous efforts had included a short-lived 30-minute weekly gay commercial radio show and a weekly gay and lesbian news show called the *Lambda Report*, which first aired on public access cable television in 1989. KGAY Radio was the first attempt to market a 24-hour all gay and lesbian format in America. The KGAY founders planned to use a local Denver station as the headquarters for what they hoped would become a national cable FM operation. The decision to broadcast by satellite from Denver seemed easier and less expensive to the owners than purchasing a commercial radio station in a large or medium market. KGAY’s programming was uplinked to satellite dishes in North America, Canada, and the Caribbean. The music and news network was promoted as the first daily media vehicle for the gay and lesbian community in North America. Less than a year after it began, however, the KGAY network, with only a few sponsors and a mostly volunteer staff, failed.

In May 1994 another commercial radio venture was born on adult contemporary WCBR-FM in north Chicago. Les-BiGay Radio founder Alan Amberg conversed insightfully every weekday afternoon on America’s only drive-time gay radio show, as his signal reached into the Chicago neighborhoods where many gays and lesbians resided. By April 2001, his radio enterprise had logged more than 3,000 hours of programming and had a number of prominent national and local sponsors. Indeed, the show was hailed as the most successful

commercial queer radio venture of the 1990s in America, but Amberg was forced to end it in April 2001 because of financial difficulties. The internet is also home to a number of gay radio programs that can only be heard via the web, and this appears to be the trend among gay radio broadcasters who wish to seek a larger audience base to justify commercial sponsorship.

General Electric

Manufacturer of Consumer Electronics

General Electric (GE) was instrumental in the shaping of early American radio broadcasting through its creation of the Radio Corporation of America (RCA) in 1919 and its subsequent operation of several pioneering radio stations. GE is a diversified company with holdings in consumer services, technology, and manufacturing. GE operates in more than 100 countries and employs nearly 340,000 people worldwide, including 197,000 in the United States.

Origins

General Electric traces its history to the Edison Electric Light Company, established in 1878 by Thomas Edison, and to the Thomson-Houston Electric Company, established by Elihu Thomson and Edwin Houston in the early 1880s. Both companies grew by the 1890s into leaders in their field and battled over adoption of electrical current standards for the United States. Thomson-Houston promoted alternating current, whereas Edison championed use of direct current. Alternating current was adopted in the United States, and in 1892 the two merged to form GE. GE is the only company that has been listed continuously on the Dow Jones Industrial Index since its inception in 1896.

After the merger, the new company could boast of having some of the best minds in the country. Thomson's financial genius Charles Coffin became GE's first president, and Edison became a director. Thomson helped establish a program of scientific research that led to the creation of GE's Research Laboratory in 1900 under the direction of Dr. Willis R. Whitney. In a career spanning five decades, Thomson was awarded 696 U.S. patents for devices as varied as arc lights, generators, X-ray tubes, and electric welding machines. His successful "recording wattmeter" was a practical method of measuring the amount of electricity used by a home or business. In 1893 a young German, Charles Steinmetz, joined GE, and he designed new methods of designing machinery using alternating current. After the turn of the century, GE expanded its power-generation business by developing the first steam turbine-generator large enough to power cities. In 1903 GE purchased the Stanley Electrical Manufacturing Company of Pittsfield, Massachusetts. William Stanley, the head of that company, joined GE and pioneered electrical line transmission equipment. He is credited with inventing the transformer, which became the heart of the electrical distribution system. In 1910 GE developed ductile tungsten for light bulb filaments; ductile tungsten is still used in virtually every incandescent lamp.

GE and Radio

By the turn of the 20th century, GE began developmental work in wireless radio, and in 1906, E.F.W. Alexanderson developed a practical alternator to produce the high frequencies needed for reliable long-distance transmission. Later, Dr. Irving Langmuir of GE's Research Laboratory designed an amplifier for Alexanderson's alternator, completing the components of a transoceanic radio-transmitting system. This system was the most powerful generator of radio waves then known, and it became the pivotal point for negotiations with American Marconi, the U.S. subsidiary of British Marconi's worldwide wireless enterprise; these negotiations eventually led to the formation of RCA.

During World War I, the navy had operated most radio stations in the United States, including those using GE's Alexanderson alternator. Naval radio experts became convinced that this equipment was vital to U.S. interests, and after the war Admiral W.H.G. Bullard and Captain Stanford Hooper convinced GE executive Owen D. Young not to sell improved vacuum tubes and the exclusive rights to the Alexanderson alternator to the British subsidiary. In a meeting in May 1919, Young told E.J. Nally of American Marconi that GE would not sell the equipment because the U.S. government did not want control of this equipment to pass into foreign hands. Over the summer the two companies' officers negotiated the sale of American Marconi's assets to GE, and the deal they struck resulted in RCA's incorporation on 17 October 1919.

Shortly after its incorporation, RCA and GE entered into patent cross-licensing agreements with American Telephone and Telegraph (AT&T) and Westinghouse. Under these agreements, all signatories shared their patents. With this patent pooling, RCA quickly became one of the leading companies manufacturing and selling wireless radio equipment. By 1922 the company had moved into wireless' newest application—broadcasting. Radio station WGY began broadcasting from Schenectady, New York, with one of the first U.S. radio dramas, *The Wolf*. As this new phenomenon caught on with the American public, GE, with RCA and Westinghouse, became engaged in a series of intercompany battles with AT&T and its manufacturing arm, Western Electric, over who held what rights in broadcasting. To resolve this issue, AT&T sold its radio interests, and RCA created the National Broadcasting Corporation (NBC) in 1926 to oversee network endeavors in broadcasting.

In the early 1930s the Justice Department filed an antitrust suit against General Electric, Westinghouse, and RCA, alleging restraint of trade. In 1932 the companies signed a consent decree, and GE was forced to divest itself of any interest in RCA.

During the Depression years, GE made important improvements and contributions to X rays, electric ship turbines, and

the efficiency of electrical light and appliances. In 1940 GE expanded its business by relaying television broadcasts from New York City and by starting FM broadcasts. During World War II, these operations were suspended, as GE turned its efforts to helping win the war. The company supplied much help to the war effort, from aircraft gun turrets and jet engines, to radar and radio equipment, to electrically heated flying suits. GE made propulsion units for nearly 75 percent of the Navy's ships, and from GE laboratories came new systems for the detection of enemy aircraft and ships.

After the war, GE carried out an extensive program of expansion and decentralization. As a result, autonomous product departments developed. Over the years, GE also expanded its research and development divisions as well as its international efforts. Its many manufacturing lines ranged from consumer products such as light bulbs and consumer electronics, to major appliances such as refrigerators and television sets, to industrial and military equipment such as locomotives, aircraft engines, nuclear reactors, and ICBM guidance systems. In addition, GE moved into services such as insurance, consumer credit, and data processing. In 1957 GE opened the world's first licensed nuclear power plant and entered the mainframe computer business, which it sold in 1970 to Honeywell. Two years later GE developed the TIROS 1 weather satellite. During the 1960s and 1970s, the company continued expanding its lighting, aircraft engine, and electrical equipment businesses both domestically and abroad.

Modern GE

In late 1986 GE bought RCA (and NBC) in a \$6.28 billion deal that some say ironically came full circle to the 1930s divestiture. The following July, GE sold off the NBC Radio Network to Westwood One for \$50 million so that GE/RCA could concentrate on television and newer consumer media. At the same time, the company began selling the NBC-owned-and-operated radio stations. Over the next ten years, GE and RCA combined their consumer electronics businesses and subsequently sold them to Thomson in exchange for its medical equipment business and \$800 million in cash. The companies' combined defense business was also sold, to Martin Marietta for \$3 billion. GE/RCA retained ownership of the NBC television operations, and during the 1990s these NBC operations became exceedingly profitable for GE.

In 1989, NBC launched the business financial cable television network CNBC, and GE formed a mobile communications joint venture with Ericsson of Sweden. In 1991 NBC acquired the Financial News network (FNN) and sold its interest in the RCA Columbia Home Video joint venture. In 1994 GE created one of the first major industrial websites, www.ge.com, and two years later NBC and Microsoft joined forces to launch MSNBC, a 24-hour television and

internet service. In 1999 GE began e-Business as a key growth initiative. NBC launched NBC Internet (NBCi), a publicly traded internet company that merged the network's interactive properties with XOOM.com and the internet portal Snap.com to form the seventh-largest internet site and the first publicly traded internet company integrated with a major broadcaster. NBCi will use Snap.com as an umbrella consumer brand, integrating broadcast, portal, and e-commerce services. NBC also maintains equity interests in cable channels Arts and Entertainment (A&E) and the History Channel. NBC also has an equity stake in Rainbow Programming Holdings, a leading media company with a wide array of entertainment and sports cable channels. It also holds interests in CNET, Talk City, iVillage, Telescan, Hoover's, and 24/7Media. In partnership with National Geographic and Fox/BskyB, NBC owns and operates the National Geographic Channel in Europe and Asia.

The George Burns and Gracie Allen Show

Comedy Series

FOR 17 years, Burns and Allen provided one of radio's most enduring comedy series based on the vaudeville tradition.

Vaudeville Origins

George Burns, born Nathan Birnbaum in New York City on 20 January 1896, left school after fourth grade to sing professionally with the PeeWee Quartet. That move led to his career in vaudeville as a singer, dancer, and monologist (1910-31). Grace Ethel Cecile Rosalie Allen was born 26 July 1906 in San Francisco. She met George after a 1922 New Jersey vaudeville performance he had done with his partner, Billy Lorraine. Gracie, who began in vaudeville at 14 with her three sisters, wanted to work with Lorraine. She teamed with George instead, and they were married 7 January 1926. They per-

formed together in vaudeville, film, radio, and TV from 1922 until her retirement in 1958.

Gracie played "straight man" until George discovered she was funnier being nice yet dim-witted. George never considered changing Gracie, whom he loved because of her befuddlement and inverted logic. Gracie was a nervous performer, but audiences thought it was an act, part of her giddy, scatterbrained persona. She was uninterested in business, but George enjoyed other responsibilities as script supervisor and manager.

In 1929 Burns and Allen were invited to perform their Vaudeville act in London. After 21 weeks there performing to appreciative audiences at various nightclubs, the duo was asked to go on BBC radio—a successful stint that lasted 26 weeks. The team believed they could experience similar success on American radio.

Network Success

In 1930 the National Broadcasting Company (NBC) rejected them because of Gracie's squeaky, high-pitched voice, but she performed on Eddie Cantor's show in 1931 to rave reviews. A week later Burns and Allen played Rudy Vallee's show, which led to their 15 February 1932 debut on the Columbia Broadcasting System's (CBS) *The Robert Burns Panatella Program*. In 1933 their popularity earned them their own show, which lasted 17 years. *The George Burns and Gracie Allen Show*—also known as *Maxwell House Coffee Time, Burns and Allen*, and *The Adventures of Gracie*—presented sketches, music, and vaudeville routines. Among the show's characters was Mel Blanc's Happy Postman, who spoke pleasant and cheerful thoughts but always sounded depressed and near crying.

Originally based in New York, the show made road broadcasts from other cities and military installations throughout the United States. By 1934, the couple began work in film and relocated to Beverly Hills with two adopted children, Sandra Jean and Ronald John. In 1942 ratings dropped temporarily and the sponsor in turn dropped the program. The premise of Burns and Allen as boyfriend and girlfriend no longer worked. George explained: "Everybody knew we were married and had growing children . . . you have to have truth in a joke just the way you do in anything else to make it any good. If it's basically dishonest, it isn't funny." George finally realized the problem was that he and Gracie were too old to do the boyfriend/girlfriend premise. The jokes were stale, so the format was changed to reflect their status as a married couple and the program experienced a renewal of popularity, attracting 45 million listeners per week.

Many promotional strategies featuring Gracie were employed for the program throughout its run. She went on a show-to-show search for her mythical brother. She ran for president in 1940, receiving several hundred votes. In 1942 bandleader Paul Whiteman wrote *Gracie Allen's Concerto for Index Finger*, which Gracie mentioned constantly on the show. Ultimately, she performed the number at Carnegie Hall and with major orchestras, including the Boston Pops.

George and Gracie were not social commentators, prevailing instead with timeless humor and talented performances. In 1950 they successfully moved to TV, and their 239 episodes continue to air in reruns decades later. George explained: "We talked in vaudeville, we talked in radio, we talked in television. It wasn't hard to go from one medium to another." Gracie retired after the final TV episode on 4 June 1958, to be Mrs. George Burns, a mother and a grandmother. Only after her 27 August 1964 death did the public discover she had retired because of heart problems.

In his book *Gracie: A Love Story*, George's first line read: "For forty years my act consisted of one joke. And then she died." George continued in TV as an actor, developer, and pro-

ducer of *Wendy and Me, No Time for Sergeants, Mona McCluskey*, and *Mr. Ed*. In 1975 he returned to film, replacing his late friend Jack Benny in *The Sunshine Boys*. He also starred in the *Oh, God!* trilogy and a handful of other films. George continued TV guest appearances before being slowed by a 1994 fall. He performed in Las Vegas until his death on 9 March 1996.

German Wireless Pioneers

Arco, Braun, Slaby, and Telefunken

In addition to the seminal figure of Heinrich Hertz, the first experimenter to prove that James Clerk Maxwell's theories concerning the potential of electromagnetic radiation for communication were correct, several later German innovators helped to pioneer the practical introduction of wireless telegraphy at the turn of the 20th century. This entry briefly outlines the lives and contributions of three of them and the early development of the Telefunken company, which in 1903 merged their efforts.

Origins

Born early in 1849, Adolph Slaby spent much of his life as an academic researcher at a succession of prestigious German institutions. Into the early 1890s, he focused his efforts on motors and gas engines, thermodynamics, and some aspects of electricity, and in 1893 he had become the science and technology advisor to Kaiser Wilhelm II, a testimonial to his position in the German academic world. Drawing on the findings of Hertz, Slaby began working in wireless in the mid-1890s, but he was unable to transmit more than about 300 feet (in other words only within the technical high school building where he taught), no matter what changes in his apparatus he tried.

Born in 1850, Ferdinand Braun also became an academic. After earning his Ph.D. at the University of Berlin in 1872, he served as a faculty member at Marburg, the University of Strasbourg, Karlsruhe, and finally again at Strasbourg, becoming the director of the Physical Institute there. Braun applied for his first wireless patent in 1898, for a detector circuit to determine frequency. He would later become best known as the inventor of the cathode-ray oscilloscope, precursor of the modern television tube.

George von Arco, a member of the German nobility, was 20 years Slaby's junior. He would join Slaby as a research assistant and would become an important figure in the early development of Telefunken.

Early Wireless

Thanks to diplomatic channels through William Preece, chief electrician of the British Post Office, Slaby was invited to be present for the important May 1897 Marconi tests across the Bristol Channel from England to Wales that achieved transmission over eight miles. Marconi was unhappy over aiding a possible competitor (as turned out to be the case), but had no choice as the Post Office controlled the experiment.

Slaby returned home impressed with what he had witnessed and determined to improve on the system Marconi had demonstrated. Just two months later he conducted the first German wireless transmissions between suburbs of Berlin where, among others, the Kaiser was in attendance. With the Kaiser's full support in terms of funds and personnel, Slaby made rapid progress, and in the fall of 1897 he initiated wireless experiments up to a distance of about a dozen miles, using aerials held up by captive balloons.

Count von Arco joined Slaby as an assistant in 1898 in the Charlottenburg Technical High School's department of wireless telegraphy. The developing Slaby-Arco system made many improvements. One was to move the signal detector (a coherer) away from the base of the antenna, providing far better results. Soon Germany naval and merchant vessels were experimenting with Slaby-Arco devices. Transmitting stations were established in Austria, Sweden, Norway, Portugal, Russia, Denmark, and Chile in addition to Germany. In 1899, the German General Electric Company (AEG) purchased Slaby-Arco patent rights and provided funding for further experimentation.

By 1897-98, Ferdinand Braun was actively experimenting with wireless systems as well. He focused on four elements, including higher transmitter power and use of an oscillating circuit plus a crude early form of tuning to develop a system, for which he would share the 1909 Nobel Prize in Physics with Marconi. In 1898 he received his first wireless patent for his conduction system that worked for limited distances through

water or earth (and was thus sufficiently different from Marconi's work to survive any patent appeal). A short time later, Braun realized what was limiting the range of all wireless experimenters when he added two types of coil to the transmitting circuit and quickly began to achieve greater range, efficiency, and safety in operation.

By 1899 Braun's patents were supported by a commercial syndicate known as Telebraun, which was, in turn, taken over by the Siemens-Halske firm in 1901 with the intention of commercializing the system.

Despite all this innovation, all was not well. Early in 1902, when a brother of the German Kaiser returned from a visit to America, Marconi-equipped ships and shore stations refused to communicate with the Slaby-Arco equipped German passenger liner on which he sailed. Or at least that was the German position—Marconi interests claimed the problem was poor performance and lack of distance achieved by the German radio equipment. At the same time this international rivalry was sharpening, fierce patent litigation developed in German courts between Slaby-Arco (whose patents were held by AEG) and Braun (backed by the Siemens-Halske firm). Concerned that Germany might lose out in the world competition to develop viable wireless systems (and thus would have to rely on Marconi or American wireless equipment), Kaiser Wilhelm II stepped in.

Telefunken

At the Kaiser's insistence, on 27 May 1903 some 30 Slaby-Arco (AEG) and Braun (Siemens-Halske) patents (and as many personnel) were combined to create a new company, Gesellschaft für drahtlose Telegraphie, soon better known as Telefunken. Thanks to substantial government support, the new company soon operated more than 500 stations. Telefunken sold rather than leased (as Marconi did) equipment that initially used coherers as signal detectors but soon transferred to electrolytic detectors and headphones. The quality German equipment and growing number of transmission stations soon created strong competition with Marconi, aided by cooperation among German electrical corporations under the umbrella of government purchases and investment.

In part as a result of the 1902 incident of lack of maritime cooperation, the German government required that all German facilities make use of Slaby-Arco equipment. Imperial Germany also hosted the first international wireless conventions in Berlin in 1903 and 1906 to encourage inter-system communication. These meetings bore testament to the growing importance of German radio efforts in the face of Marconi's attempted maritime radio monopoly.

By 1906 von Arco had conducted wireless-telephony (voice) experiments over distances greater than 20 miles, and Telefunken had developed "singing spark" and "quenched spark"

transmitters, which use shorter aerials and were more efficient than earlier devices. The German army was setting up portable Slaby-Arco wireless telegraphy units for use in the field. The U.S. Navy had relied heavily on Slaby-Arco equipment beginning in 1903 for lack of a reliable American source of wireless equipment and dislike of Marconi policies. The Russian Navy did likewise, though its loss in the Russo-Japanese War of 1904–05 did not help the image of German wireless, especially as the winning Japanese fleet had made better use of its Marconi equipment.

Telefunken began to build a giant wireless transmission station at Nauen, outside of Berlin, to enable faster communication with distant German colonies. By 1910 it had developed into the largest transmitting station in the world, using a von Arco-developed alternator for transmission with antennas covering more than a square mile. By 1914, German wireless stations were communicating regularly with North America and Africa, and stations were being completed to allow regular communication to the Pacific as well. German wireless was certainly equal to anything created by Marconi in Britain or by various competing American companies.

Decline

Compared to the Marconi or American inventors' stories, however, there is comparatively little evident in English-language sources today about these early German innovators and companies.

Slaby died in 1913, and Braun, who had traveled to the U.S. to deal with patent infringement problems, died as an enemy alien in New York five years later. While von Arco continued with Telefunken and lived into the early part of World War II, outside of Germany only Braun is known today, primarily for his pre-television work.

But the end of Germany's growing radio success was due largely to the impact of World War I. Inception of the war in mid-1914 cut off Germany from her own colonies in Africa and elsewhere and isolated her business and industry. Most overseas German radio facilities were destroyed or captured by 1915. When the United States entered the war in April 1917, all German-owned wireless facilities there were taken over as enemy contraband. Losing the war in 1918 left Germany destitute and her industries, including wireless, in disarray. In just four years, Germany had lost her extensive network of international wireless stations and markets while many British and American concerns thrived as radio expanded into the 1920s.

George Wilhelm Alexander Hans (Count) von Arco. Born in Grossgorschuetz, Germany, 30 August 1869. Joined Slaby as a research assistant in 1898. Appointed manager of German telegraphs in 1903. Eventually chief engineer of Telefunken. Died in Berlin, 7 May 1940.

Karl Ferdinand Braun. Born in Fulda, Germany, 6 June 1850, sixth of seven children of Johann Conrad Braun, a government official, and Franziska Göhring. Ph.D., University of Berlin, 1872. Associate Professor, Marburg, 1877–79; Associate Professor, University of Strasbourg, 1880–82; Professor, Karlsruhe, 1883–85; Professor of physics, later Director of Physical Institute, Strasbourg, 1895–1918. First wireless patent applied for, 1898. Shared 1909 Nobel Prize in Physics with Marconi. Died in Brooklyn, New York, 20 April 1918.

Adolph Karl Heinrich Slaby. Born in Berlin, 18 April 1849. Studied mechanical engineering and mathematics, Royal Trade School, Potsdam. Appointed to Berlin Trade Academy in 1876. First chair of electrical engineering (1882) and director (1884), Electrotechnical Laboratory of Technical High School at Charlottenburg. Honorary Professor, University of Berlin, 1892. Technical advisor to the German Kaiser, 1893–1912. Died in Charlottenburg, Germany, 6 April 1913.

Germany

Despite increasing competition from other electronic media, radio continues to play an important role in Germany. The country's radio system is divided into the long-established network of public service stations—the Association of German Broadcasters (ARD)—and (since 1984) their commercial counterparts. Most stations are FM outlets and have regional or local reach. Although music and entertainment programs are important for German listeners, there are also many niche programs that offer anything from science magazines and minority programs to the renowned *Hörspiel* (radio drama) experiments. Moreover, radio still is an information medium; even music stations are expected to offer at least news on the hour and headlines in between.

Over the last two decades, the industry has experienced tremendous change stimulated by deregulation. This has led to an exponential increase of stations and intensified competition

resulting in many new radio formats and audience fragmentation. On average, Germans listen to radio for almost three hours per day, which is as much time as they spend watching television.

Origins

On 29 October 1923 the first German radio program was aired from Berlin. As was common in many European countries, the first German radio stations were not privately owned enterprises; instead, they were directly or indirectly controlled by national or regional governments. After World War I, when a nonmilitary radio network became a possibility, several wire services, newspaper publishers, the electrical industry, and other private investors tried to negotiate with the Weimar government to establish commercial radio stations. But ultimately the government prevailed, keeping broadcasts under their control.

A national broadcasting organization and nine regional publicly traded radio organizations were launched. These were controlled by the postal ministry but allowed limited private investments. Two programming organizations produced most of the content. Drahtloser Dienst AG (DRADAG; Wireless Service, Inc.) controlled by the department of internal affairs, produced political information (newscasts). *Deutsche Stunde* (German Hour), controlled by the postal and foreign ministries, was responsible for providing music and cultural programs. The system was financed through a license fee that was added to the price of new radio sets. In the last chaotic years of the Weimar Republic, broadcasting became progressively more centralized; by 1932, the national government took full power over the new medium.

Radio in the Third Reich

After the Nazis seized power in 1933, Joseph Goebbels quickly took control of all cultural and media institutions, restructuring them as part of his propaganda machine. As Minister for Public Enlightenment and Propaganda and head of the Chamber of Culture, he controlled all cultural productions including print, radio, film, theater, literature, and music.

An inexpensively produced radio set called *Volksempfänger* (people's receiver) became one of the Nazis' most successful propaganda instruments because it made tuning other non-German stations almost impossible. Because of these new sets, radio soon reached nearly 100 percent of the population and ensured the almost complete penetration of Third Reich propaganda. Both programming and staffing were monitored by the Chamber of Culture's department for broadcasting. From 1940 on, all German radio stations had to air the same government-created program.

As the war expanded, Allied countries made increasingly effective use of radio in their efforts to counter German propaganda broadcasts. The British Broadcasting Corporation (BBC) and others aired programs in German and other languages of occupied territories. Despite being threatened by a death penalty, an increasing number of listeners turned to these programs as the war continued and Goebbels' propaganda lies became more and more obvious. As the war drew to a close, German radio programs became more limited. Many stations were destroyed until in May 1945 the last intact Nazi-controlled radio station at Flensburg announced Germany's unconditional surrender.

A Divided Postwar System

West Germany

At the end of World War II, the occupying powers (the United States, Britain, and France) established a new broadcasting sys-

tem. In the beginning, all three Western allies tried to establish their respective media systems in their occupied zones. Yet a commercial system such as that in the United States was not viable because war-torn and destroyed Germany could not generate enough advertising support to finance it. On the other hand, the centralized French system resembled too closely the former Weimar system that had allowed an effortless takeover by the Nazis. Therefore, all Western allies at last accepted the British public service system as the basis for the new German radio operation.

It was important to all of the Allies to keep broadcasting away from the influence of the German national government and to decentralize the powerful medium. At first the Allied representatives were directly in charge of programming and station management, but they soon hired German nationals for increasingly responsible positions. The first regional broadcasting organizations were launched right after the war and by the mid-1950s, the now sovereign West Germany had nine regional public broadcasting corporations. They were organized into the Association of German Broadcasters (ARD). Each of the nine independent regional broadcasting corporations covered either one large or several smaller federal states, and each subsequently increased its stations to as many as five that aired different niche programs.

Reflecting Germany's decentralized political structure, each state organized its own media systems. The ARD broadcast corporations were monitored by boards composed of representatives of political parties, unions and industry, youth organizations, religious groups, and other groups that are considered relevant for society. These boards set general programming guidelines and voted on major administrative and editorial staff. Public stations were required to offer a variety of programs that catered to all groups of the public they served. There were also boards that controlled financial matters.

Critics of this system argue that the political parties have too much influence on broadcasting, denying the constitutional freedom of the media. The system is financed by a monthly broadcast fee levied on every household with a radio and by the sales of some limited commercial time. Most ARD organizations had one general station with a broad pop music selection, in addition to news and short features. The other stations were educational and youth talk-based stations, classical and jazz stations (many ARD stations own symphony orchestras and sometimes big band and jazz orchestras), and stations playing traditional music catering to older audiences. More recently, some have added stations with all-news formats. The indirect financing through listener fees allowed the stations to produce programs other than just those with mass appeal, which has made radio an important cultural form. From the 1950s through the 1970s, niche departments (not infrequently headed by Ph.D.s) flourished, producing genres such as *Hörspiel* (radio drama) and other experimental radio work.

Reacting to new technological developments that ended channel scarcity, in the mid-1980s the West German broadcasting system, including radio, was deregulated and allowed commercial competition.

East Germany

The East German media system was organized according to the Soviet-totalitarian model. Following the Marxist-Leninist-Stalinist concepts of media, broadcasting outlets were state-owned and centrally organized and their main purpose was to educate people about communism (usually and rather confusingly termed “socialism” in practice).

The Soviets developed stations in Berlin and other major East German cities—all under a central administration. But by 1952 Soviet forces relinquished control and censorship rights to a state broadcasting committee that was directly monitored by the East German government. East Germany abolished the states as political entities and centralized the media system. After 1955 there were the *Berliner Rundfunk* (Berlin Broadcasting) for East (and potentially West) Berlin; the *Radio DDR* for all East Germans; *Deutschlandsender* (Germany’s Station; later *Stimme der DDR* [Voice of German Democratic Republic]) broadcast for West German listeners; and *Radio Berlin International*, which produced programs in German and ten other foreign languages for international listeners. During the height of the Cold War, AM propaganda channels were added: *Freiheitssender 904* (Freedom Station 904) aimed at communists outside the country after 1956; and *Soldatensender 935* (Soldiers’ Station 935) geared toward Western soldiers after 1960. They were on the air until a phase of détente in the early 1970s eased the Cold War rhetoric.

A reform in 1987 resulted in a new channel for young people—the soon popular *Jugendradio DT64* (Youth Radio DT64). In addition, the established stations changed to more distinctive formats, under different names. *Radio DDR 1* aired information and music; *Radio DDR 2* aired regional programming in the morning and cultural or educational programming during the day. The *Berliner Rundfunk* focused on Berlin current events. The broadcasting system in East Germany was mainly financed by viewer’s fees and state subsidies. All radio and TV sets had to be officially registered.

A special problem for the East German government was that an estimated 80 percent of its people could tune to broadcast signals from the West. Besides the public TV stations, people especially listened to radio stations close to the German border. Although at first the political elite tried to enforce a strict ban on tuning in foreign broadcasts, it later gave in to their popularity. During the first few years of East Germany’s existence, members of the state-controlled youth organization were sent out to destroy antennae that were positioned to receive Western broadcasts. Sometimes the government tried to

jam (electronically interfere with) transmissions from the West, but that always led to protest from audiences. Under the rule of state council chairman Erich Honecker in the early 1970s, the East German government officially accepted West German broadcasting. Only the most rigid party members then refrained from listening and viewing.

In fact, West German broadcasting became a part of the political agenda. Often East German politicians countered Western news that had not been aired on eastern channels. It has been argued that these years of Western broadcasting had a major impact on destabilizing East Germany, which finally led to the fall of the Berlin Wall in 1989. The constant exposure to unreachable Western consumerism definitely led to a serious level of dissatisfaction among the population. After a phase of several short-lived media reorganizations during the upheaval, with the final German reunification in 1990, the East and West German systems were merged, following the Western model.

Today: A Dual System

In 1984 the West German media system changed to a so-called dual system allowing commercial as well as state governmental radio and television stations. After the reunification, the whole country adopted this system. The new political situation led to the launch of two new ARD organizations in former East Germany and the merger of two Western ones; thus there are now ten regional public service networks under the ARD umbrella. Further deregulation has led to a tremendous growth in the number of commercial radio stations in East and West. Reflecting the decentralized political system, each state has a different setup for commercial radio broadcasting, but most states permit a combination of local and statewide commercial radio stations. Some states only have five or six statewide private stations. Sometimes they are even guaranteed a commercial broadcasting monopoly in their area to guarantee enough advertising support; more competitive systems such as Bavaria have 50 or more private stations. There are some ownership regulations, but they have not stopped many newspaper, magazine, and book publishers from acquiring stations. A number of local newspaper publishers have taken advantage of their existing editorial base to launch radio stations.

The dual system has been redefined repeatedly based on several decisions by the highest constitutional court (*Bundesverfassungsgericht*), state legislation, and joint accords of all states. The latest legislation tries to guarantee survival of public as well as private broadcast entities. Although the German constitution guarantees freedom of the press and independence from government interference, there are several content regulations that apply to public as well as commercial stations. ARD stations are controlled by their boards, but even commercial

broadcasters must follow certain rules similar to the former U.S. Fairness Doctrine. These concern the protection of children and young people and balanced coverage of topics of public importance. Each state sets up differently structured boards that license the stations and monitor commercial stations' compliance with these requirements.

Two additional radio organizations do not fit into either the public or the commercial category. *Deutschlandradio* is another result of the reunification. It was launched in 1994 by combining the former national public service AM station *Deutschlandfunk* (Germany Radio) with RIAS (Radio in the American Sector, a station of the U.S. Information Service in Berlin) and a cultural station of former East Germany. Jointly operated by ARD and the German TV network ZDF, it airs two programs from Cologne and Berlin. It is commercial free and governed by its mission to support the reunification of the two Germanys. Its main focus is on political and cultural programs that are broadcast on FM, AM, and shortwave. The second organization, *Deutsche Welle* (*DW*; German Wave), broadcasts programs worldwide via satellite and shortwave radio in 34 languages. Based in Cologne and Berlin, it also broadcasts television programs via satellite. The reunification brought about a new legal situation for *DW*, which was formerly a West German government-controlled station. It is now legally monitored by the ministry of interior affairs and financed by the government, commercials, and sponsoring. In accordance with constitutional broadcasting freedom, however, no government department can directly control its programming.

As of early 2003, every household owning at least one radio paid Euro 5.32 (US\$5.60); households with both television and radio paid Euro 16.50 (US\$17.30). Twenty-eight percent of the overall collected fees were used to finance radio stations. A committee of representatives from all states decides on changes in fee structure or levels. With commercial competition it has become more difficult for public service broadcasters to defend fee increases. Public service radio stations also air commercials that are by law restricted to Monday-through-Saturday broadcasts at certain times of the day. But commercial local and regional radio broadcasters, which are fully supported by advertising, face almost no advertising regulations.

In 1987 there were only about 44 stations in West Germany, but the 1980s deregulation and German reunification increased that number to about 246 in 1999 in the united Germany. Of those, 59 are public service stations. This number has been fairly stable since the mid-1990s. After a strong growth phase in the first decade after deregulation, Germany seems to have reached a saturation point for its local/regional markets. Recently, new transmission technology has triggered some new national private stations and there are also several internet-only stations in Germany.

Audiences

According to media research in 1999, radio stations reach an average of 82 percent of the German people over age 14, on any given day some time between 5:00 A.M. and 12:00 A.M. Germans listen to the radio an average of 179 minutes a day. These numbers have slowly but steadily been increasing in recent years. Radio has remained popular despite increased competition from other traditional and new media. German listeners seem to be fairly loyal to their stations. When asked how many stations they heard the day before, they name only 1.4, on average, and they name only 2.8 stations heard when asked about their listening habits over the last two-week period. Overall, the public stations in the ARD network are losing listeners to commercial stations; the market share of ARD was 53 percent in 1999, compared to 45 percent for commercial radio. Only seven years earlier, in 1992, the ARD network had a market share of 70 percent, compared to 29 percent for commercial stations.

When asked what they consider to be the most important aspect of radio, 69 percent of women and 65 percent of men name news, 63 percent of women/60 percent of men name music, and 55 percent of women/54 percent of men name services such as weather and traffic reports and time announcements. Other popular genres are general background information on political events and political reporting, as well as regional programs and consumer news. As in the United States, radio listening peaks on Mondays through Fridays during the 7:00 A.M. to 8:00 A.M. "drive time" or commuting period, when almost 40 percent of women and 33 percent of men tune in. Listening slowly declines to another light peak around lunchtime with 22 percent of women and 16 percent of men listening. The afternoon sees another decline, but listening picks up again from 4:00 P.M. to 6:00 P.M., with 21 percent of men and 18 percent of women listening.

Many ARD and commercial stations stream their programs via the internet. There are currently pilot projects in several states testing new digital radio transmission technology (DAB). It is expected that new technology will lead to new stations and might shift radio from local and regional to more national format based stations. Other important factors in the future are the tough competition between public service and commercial broadcasters and the increasing audience fragmentation. German media researchers have discovered a distinctive audience split. Younger, less-educated, less-affluent audiences seem to favor commercial stations, whereas older, better-educated, more-affluent people tend to listen to public radio. The maturation of the "dual" system and new technology will provide more challenges for public and private stations in finding and keeping their audiences.

Gillard, Frank 1908–1998

British Correspondent and Executive

Frank Gillard's radio career may be divided into three important phases. He was described as "one of the BBC's most distinguished war correspondents" during World War II. Then during the 1950s and 1960s he was a key management executive determining reforms in British national and local radio. Finally, during his "retirement," he was responsible for acquiring archive interviews and writing the history of the British Broadcasting Corporation (BBC). He was also an adviser and consultant in North America and may have had some influence on the development of U.S. public radio. After his death on 20 October 1998, the then Director-General Sir John Birt described him as having made "an unrivalled contribution to the BBC."

War Correspondent

Following his death, a number of newspaper obituaries praised Gillard as a World War II war correspondent. For example, the London *Times* said, "Gillard's was one of the best known voices on British war time radio . . . his incisive reports kept listeners at home abreast of events from the raid on Dieppe to the Allied entry into Berlin and the final German surrender."

In fact, toward the end of his life Gillard had expressed "shame and disgrace" about the distorted and misleading nature of his BBC report on the ill-fated raid at Dieppe in 1942. This is hardly surprising given the fact that he had broadcast the extraordinary line: "As a combined operation this raid was an all-time model." It can be argued that no amount of censorship required him to express this degree of

enthusiasm for an event regarded as one of the greatest disasters of modern military history. He also regretted that he had followed the army's optimistic line too often in his reports and wished he had been more independent. (He was the only BBC correspondent with the Dieppe force because he had been the regional correspondent closest to Portsmouth.)

Throughout the war, Gillard had to be "on side" and operate in the context of a "white propaganda" role in war reporting. There was strict censorship, and journalistic presence depended on the approval and goodwill of commanding generals. Gillard had been a schoolteacher, not a journalist, before working as a part-time broadcaster and talks assistant for the BBC in western England. His war reports do not, therefore, indicate the instinct of the critical reporter seeking to "tell it as it is" but instead fall into the category of a performer operating as a public relations officer. He replaced Richard Dimpleby in North Africa because Dimpleby had been too closely associated with the failures of General Auchinleck's command. Gillard developed a rapport with Auchinleck's replacement General Bernard Montgomery. But after the Allied victory in North Africa, Gillard fell foul of Supreme Allied Commander General Alexander, who had mistakenly accused him of evading official censorship. But an examination of Gillard's war reports again reveals his role as a broadcast performer rather than a reporter detailing the truth of Allied slaughter in Bocage country between the invasion and break out.

An example of the wartime bias of his journalism is illustrated by this extract from a report broadcast 25 June 1944: "Almost the first words a German says when he is brought in

to a British or Canadian headquarters on this front are 'Please don't shoot.' Thousands have been amazed to find that we've no intention or thought of killing them." The fact was that there had been several occasions when Canadian troops did not take prisoners, and instances of prisoners on either side being shot dead or having their throats cut were being covered up by Allied reporting. Gillard and his colleagues failed to report, for example, that German tanks and anti-tank weapons were vastly superior to Allied equipment; that the Nazis had more automatic guns than the Allies; that British and Canadian army tactics in the Bocage were inadequate and contributed to an acceleration of casualties that eventually led to the British Army running out of reserves; that a number of Allied troops were killed by friendly fire; and that the bombing of Caen had been futile, resulting in the deaths of many more French civilians than German combatants. In fact, the Scottish playwright William Douglas-Home was court-martialed for refusing orders in relation to the Caen operation. An attempt to break out with British and Canadian armor in "Operation Goodwood" on 18 July 1944 was an unmitigated disaster and significant German military victory, but this was not even hinted at by any of Gillard's reports.

Management

The second phase of Gillard's career in broadcasting was much more significant. He demonstrated a cunning political ability to lobby for and to effect significant change in structures of BBC institutions and broadcasting. Beginning in 1956, he built up the resources, power, and importance of the BBC West Region and was appointed director of sound broadcasting in 1963.

Gillard went on a tour of the United States in 1954 and there realized that, despite the growing ascendancy of television, he did not meet a single person who thought that radio was dying. He noted that the changes were affecting "big battalion broadcasting" (networks) and "an increasing range of local stations." In particular, Gillard was impressed by the small station WVPO Stroudsburg in the Pocono mountains of Pennsylvania, which operated in daylight hours only and served a community of 15,000 people with a staff of 13. Gillard wrote a special report for the BBC, "Radio in the USA: A Visitor's View," which emphasized that WVPO "spoke to its listeners as a familiar friend and neighbor and the whole operation was conducted with the utmost informality."

His successes included the establishment of a network of BBC local radio stations; the redefining of BBC national networks to incorporate the popular musical format channel *Radio 1*; the introduction of more live, unscripted programming to reflect the changing nature of British popular culture; and the preservation of the BBC monopoly in radio broadcast-

ing long after it had been challenged in television. He could be criticized for axing the radio features department without establishing a context whereby its management could continue with the same force and creativity. He could also be condemned for canceling the *Children's Hour* without finding an alternative method of attracting and developing a new generation of young radio listeners. And his ruthless campaigning against a more democratic distribution of taxation for U.K. public radio and the suppression of commercial radio licensing may have had a negative impact on development and choice in British radio.

Historian

Gillard officially retired from the BBC in 1969, but he remained central to its establishment voice. In the 1970s he became the BBC's archival historian, and according to the *Guardian* journalist Maggie Brown, he was "the custodian of its inner secrets." He originated and managed a project of recording on audiocassette and film the memoirs of BBC personnel, which could only be used "on the BBC's centenary in 2022" when "everyone was safely dead or otherwise." As it has been argued that cultural memory and power are often determined by those who write history, Gillard's influence on historical portrayals/evaluations of the BBC is likely to endure. This is probably why the *Guardian* called him "a BBC Mandarin."

As Leonard Miall noted in his *Independent* newspaper obituary, Gillard, "would have been horrified that BBC News managed to get his age wrong in their announcement of his death." The BBC celebrated his memory by inaugurating awards for local radio broadcasting in his name.

Godfrey, Arthur 1903–1983

U.S. Radio Personality

During the years following World War II, Arthur Godfrey was one of the great stars of radio, keeping alive a tradition of variety programming through his simulcast *Talent Scouts* amateur program and also doing a popular morning talk and variety program with a stable of stars. These were Godfrey's radio venues, but he did do other radio programs—particularly during the early 1950s—as Columbia Broadcasting System (CBS) executives sought to take full advantage of his growing appeal. No one challenged the popularity of his other principle venue through the 1950s—a regular Wednesday night television variety program, *Arthur Godfrey and His Friends*.

Radio Origins

The red-haired ukulele player, whose gift for gab was a favorite of radio and television audiences through the post-World War II era, started his radio career in 1930 at WFBR-AM in Baltimore. Later, in the 1930s, he moved to Washington, D.C., first to WMAL-AM and then to CBS affiliate WJSV-AM (later WTOP-AM) for an early-morning program that would begin Godfrey's life-long association with the CBS network. Godfrey remained in Washington, D.C., until 1941, when he moved to New York and CBS's WABC-AM. During this decade and a half, Godfrey perfected what would be his fabled ability to communicate on an almost personal level with his listeners.

Based on his narration for the CBS broadcast of the funeral procession down Pennsylvania Avenue for Franklin Delano Roosevelt in April 1945, CBS executives moved Godfrey to

New York to begin a radio daytime series, *Arthur Godfrey Time*. This program would remain his staple for 27 years, frequently changing starting times but always running about an hour, and always ending before the noon CBS news.

In 1946 CBS added *Arthur Godfrey's Talent Scouts*, a copy of the long-running Major Bowes and later Ted Mack programs. *Talent Scouts* was Godfrey's first venture into prime time, and it became a big hit. Indeed, his move into television came in 1948 when he agreed to simulcast *Talent Scouts* on television. This would prove to be his launching pad to national fame.

Although others abandoned radio for television as soon as their popularity made it possible, Godfrey never gave up his morning radio chat fest. He did the morning program and then turned around on Monday nights—with the help of a capable production staff led by Janette Davis—and did *Talent Scouts*. Godfrey was smart enough to know where his comparative advantage lay, and he never gave up the morning radio show. (Indeed, once his popularity inevitably waned, he returned exclusively to radio, continuing his radio career until 1972.)

A Talent Scout

While his morning show touched an audience of housewives and baby boomer children, his fame, fortune, and pioneering activities in prime time brought him to the cover of *Time* magazine. Variety show *Arthur Godfrey's Talent Scouts* proved to be a far greater hit than Major Bowes' or Ted Mack's shows

ever were. *Arthur Godfrey's Talent Scouts* ran on both radio and television on Monday nights for a decade and was clearly Godfrey's best prime-time showcase. The show reached number one in the TV ratings in the 1951–52 season but fell behind *I Love Lucy* the next season and thereafter finished behind, but not too far behind, Hollywood-produced shows. It remained a radio staple even as other variety shows switched to TV and abandoned radio altogether.

The formula for *Arthur Godfrey's Talent Scouts* was simple enough, as old as the amateur hour idea from vaudeville, which had been popularized by Major Bowes on radio. For Godfrey's version, "scouts" brought on their "discoveries" to perform live before a national radio and television audience. Most of these "discoveries" were in fact struggling professionals looking for a break, and so the quality of the talent proved quite high, as thousands auditioned with the hope that exposure on Godfrey's show would provide that needed national boost. The winner, chosen by a fabled audience applause meter, often joined Godfrey during the following week on his morning radio show and less frequently as part of his televised *Arthur Godfrey and His Friends*. Some even joined his regular talent pool.

Godfrey and Janette Davis did well with pop and country singers. Through the late 1940s and 1950s, Godfrey significantly assisted the careers of Pat Boone, Tony Bennett, Eddie Fisher, Connie Francis, Leslie Uggams, Lenny Bruce, Steve Lawrence, Connie Francis, Roy Clark, George Hamilton IV, and Patsy Cline. But both Elvis Presley and Buddy Holly never made it past the audition. This Monday night 8:30 P.M. talent search was no place for early rockers, nor for African-Americans. That Godfrey lived in Leesburg, Virginia, and Janette Davis was from Arkansas seemed to enable them to find country talent on the fringes, but they always worked best when mining aspiring stars in the Tin Pan Alley tradition.

The "discovery" of Patsy Cline on 21 January 1957 was typical. Her scout (actually her mother), Hilda Hensley, presented Patsy, who sang a recent recording "Walkin' After Midnight." Though this was a country song, recorded in Nashville, and Cline wanted to wear one of her mother's hand-crafted cowgirl outfits that she wore while appearing on local television in Washington, D.C., Davis forced Cline to wear a cocktail dress. Still, the audience's ovations stopped the meter at its apex, and for a couple of months thereafter Cline appeared regularly on Godfrey's radio program. But despite the fact that Cline had been performing for nearly a decade, had been recording in Nashville since 1954, and had been a regular on local Washington, D.C., radio for more than a year, it is often stated that Godfrey, because of the great ratings and fame of his *Talent Scouts*, discovered Patsy Cline.

For *Arthur Godfrey Time*, Godfrey hosted a straight variety show, employing a resident cast of singers that at times included Julius La Rosa, Frank Parker, Lu Ann Simms, Pat Boone, and

the Cordettes. Tony Marvin was both the announcer and Godfrey's "second banana," as he was on *Arthur Godfrey's Talent Scouts*. Although the fame of *Arthur Godfrey Time* never matched that of *Talent Scouts*, the assembled company of singers, all clean-cut young people, remained a 1950s fixture in homes as Godfrey played host and impresario.

Fame and Fortune

By the early 1950s, Godfrey seemed unable to do anything wrong, despite a press that could find little reason for his popularity. During the summer of 1950, Godfrey even appeared twice a week on CBS, in addition to his television and daily radio shows, offering lessons on the ukulele to his television audience on Tuesday and Friday nights. This proved his peak of popularity.

His fall from grace began in October 1953 when he publicly fired the popular Julius La Rosa on the air. Through the mid- and late 1950s Godfrey feuded with newspaper critics who complained of his insensitivity to La Rosa and other employees. Although Godfrey's bout with cancer drew international sympathy, falling TV ratings led to his retreat back to radio.

But he did not give up on television. He flopped on *Candid Camera*. But CBS kept trying, and Godfrey continued to do specials: *Arthur Godfrey in Hollywood* on 11 October 1963, *Arthur Godfrey Loves Animals* on 18 March 1963, and so on once or twice a year. His final television special came on 28 March 1973: *Arthur Godfrey's Portable Electric Medicine Show*, filmed and shown on National Broadcasting Company (NBC) TV, was ironically his only major effort for that network. Radio was where Godfrey started and ended his career—and it was always his best medium.

Despite his critics, many of whom argued that Godfrey had no talent, he was one of the important on-air stars of radio and television for the 15 years after the end of World War II. Indeed, one can credibly argue that through the 1950s, there was no bigger star than this freckle-faced, ukulele-playing variety show host. Through most of the decade of the 1950s, Godfrey appeared in his two top ten prime-time television shows, as well as doing a daily radio program, all for CBS. Despite his fame as a discoverer of talent and as a host, in the end it was something about Godfrey's infectious chuckle, his offbeat sense of humor, and his ability to connect to middle-class Americans that made his fans tune in not one, but two, three, or four times per week, in the morning and during prime time.

To industry insiders, Godfrey's shows were simply vehicles for television's first great pitchman. Godfrey blended a Southern folksiness with enough sophistication to charm a national audience measured in the millions through the 1950s. For CBS in particular, Godfrey was one of the network's most valuable stars, generating millions of dollars in advertising billings each

Arthur Godfrey
Courtesy Radio Hall of Fame

year, with no real talent save being the most congenial of hosts.

On radio and television, Godfrey frequently kidded his sponsors, but he always “sold from the heart,” only hawking products he had actually tried or that he regularly used. No listener or viewer during the 1950s doubted that Godfrey really did love what he sold, for Godfrey’s rich, warm, resonant timbre made him sound like he was confiding to each audience member. Godfrey delighted in tossing aside prepared scripts and telling his audience: “Aw, who wrote this stuff? Everybody knows Lipton’s is the best tea you can buy. So why get fancy about it? Getcha some Lipton’s, hot the pot with plain hot water for a few minutes, then put fresh hot water on the tea and let it just sit there.” So, despite all his irreverent kidding and the uneven quality of his assembled talent, advertisers loved Godfrey and made him and his various shows a key part of broadcasting during the 1950s.

He did the same magic for Pillsbury, Frigidaire, and Toni (hair) products. Here was a friend recommending the prod-

uct, no snake-oil salesman hawking useless or overpriced merchandise. Godfrey drove CBS network efficiency experts crazy because he refused to simply read his advertising copy in the allocated 60 seconds. Instead, Godfrey talked for as long as he felt was necessary to convince his viewers, frequently running over. CBS chairman William S. Paley detested Godfrey but bowed to his incredible popularity. CBS president (and chief number cruncher) Frank Stanton loved Godfrey because his shows were so cheap to produce yet drew consistently high ratings.

By 1950 Godfrey was making well in excess of a million dollars per year and was among the highest-paid persons in the United States at the time. So popular was Godfrey in his heyday that in 1959, when he underwent one of the first successful operations for the removal of a cancerous lung, it was front-page news across the nation. At one point, in the mid-1950s, he had an estimated audience of 40 million and had more than 80 sponsors for his daily morning show. He received 60,000 letters a week. Because of his homey approach and sometimes

sly, off-color wit, radio great Fred Allen dubbed Godfrey “the Huck Finn of radio.”

The late 1950s and early 1960s were not kind to Godfrey. He battled cancer and saw his million-dollar yearly salary plunge. Godfrey finally retired from radio in 1972, by then a symbol of another era.

The Goldbergs

Comedy Serial Program

As early as 1937, just 8 years into its 16-year run on radio, *The Goldbergs* was selected by the industry magazine *Radio Daily* as one of the “Programs that Have Made History.” Indeed, *The Goldbergs* was a groundbreaking show that influenced both the form and content of later radio and television programming. Amid early radio fare, such as music variety shows and public talks, *The Goldbergs* (along with *Real Folks* and *Amos ’n’ Andy*) was one of the first dramatic serials on network radio and one of the first serials to concentrate on family life. *The Goldbergs* demonstrated the power of serials to attract a loyal audience. Its immediate success in 1929

prompted interest in radio programs that regularly featured familiar domestic situations, recurring characters, and continuing story lines.

The Goldbergs was a hybrid program, part comedy, part drama, and part serial; with its continuing story line and domestic focus, the program was the prototype for both later situation comedies and daytime soap operas. Yet *The Goldbergs* is most fondly remembered for its ethnic content. Among the first urban, ethnic comedies in broadcasting, the program spoke eloquently about the experience of immigrants during the Depression and their struggles to assimilate in their

adopted country. *The Goldbergs* remains one of the relatively few programs in the history of radio and television to offer a sustained ethnic perspective on American life.

The stories of the Goldberg family—at 1038 East Tremont Avenue, Apartment 3B, in the Bronx—emerged solely from the creator and writer of the series, Gertrude Berg. As Michele Hilmes (1997) writes, “no other daily serial drama reflected so explicitly its creator’s own ethnic background.” Gertrude Edelstein Berg (1899–1966) was born in Harlem to Russian Jewish parents. As a teenager at her father’s resort in the Poconos, Berg began writing plays to entertain the guests. This hobby continued even after Berg married and gave birth to two children. She soon developed a popular skit featuring a wife and mother named Maltke Talnitsky—modeled after her grandmother, her mother, and herself—her no-good husband, and her children. These characters were the earliest forms of the Goldberg family—Molly Goldberg, a Jewish immigrant mother; Jake Goldberg, a tailor and her sympathetic husband; and her two children, Sammy and Rosalie. Gertrude Berg sent a sample script through a family acquaintance to a New York radio station. Berg was offered jobs writing continuity and translating commercials and recipes into Yiddish on radio.

Although Berg’s first network offering, about two working-class salesgirls, *Effie and Laurie*, was picked up by the Columbia Broadcasting System (CBS) in 1929, it was canceled after just one broadcast. After this failure, Berg began to shop around her idea for a family comedy based on her earlier skits. Berg claimed that initially “radio studio big wigs” believed audiences would reject a program about Yiddish life. However, the National Broadcasting Company (NBC) saw the promise of radio’s first Jewish comedy and aired *The Rise of the Goldbergs* as a sustaining weekly evening series starting on 20 November 1929. Paid \$75 a week to write the series and produce the program, Berg controlled all aspects of the show’s development, from scripting the program in longhand to paying the performers. Berg, who voiced the character of Molly Goldberg, assembled a cast of New York stage actors to bring the rest of the Goldberg family to life: James Waters as Jake Goldberg, Alfred Ryder as Sammy, and Roslyn Silber as Rosalie. Berg’s importance to the series was recognized by fans; nearly 37,000 letters poured in when Berg became ill and was off the air for a week. NBC acknowledged Berg’s role, as well: Berg soon earned more than \$7,500 a week for the program. By fans and the industry, Berg was considered one of the most important personalities in broadcasting and one of the greatest women in radio.

By the 1931–32 season, the series, retitled *The Goldbergs*, aired six times a week and had become one of the highest-rated programs on radio. On 13 July 1931, the show was picked up by Pepsodent, who sponsored it for the next three years. Berg ended the serial briefly in 1934 to take the cast and the series on a nationwide promotional tour. When the networks cleared

Gertrude Berg of *The Goldbergs*
Courtesy CBS Photo Archive

serial dramas from the night-time air in 1936, *The Goldbergs* moved to daytime until 1945. In January 1938 Berg was signed to a five-year, million-dollar contract to write and star on *The Goldbergs*, making her one of the highest-paid writers on radio. Oxydol and Procter and Gamble picked up sponsorship of the show until the end of its run.

The Goldbergs was a serial that spoke about the economic and social tensions of the 1930s and 1940s, an assimilationist drama about an immigrant Jewish family living on New York’s Lower East Side. Many programs focused on typical domestic situations—report cards, dinner guests, schoolyard loves, and Molly’s worries about her family. In the early years of *The Goldbergs*, Berg described life in an urban tenement and the attempts of this immigrant family to achieve economic security during the Depression. But, most important, the serial vividly depicted the clash between old and new, yesterday’s traditions and today’s values, Old World parents and American-born children.

At the heart of this serial drama was the struggle of an immigrant family to assimilate culturally while still retaining their ethnic identity. Early episodes were marked by generational

conflict over how much the family should adapt to life in the United States. The parents, Molly and Jake Goldberg, were ethnic immigrants with “Old World” values. Molly’s voice revealed her immigrant background: she spoke with a heavy Yiddish accent and was famous for her “Mollyprops,” Yiddish malapropisms that twisted common phrases (“If it’s nobody, I’ll call back” or “I’m putting on my bathrobe and condescending the stairs”). Their American-born children, Sammy and Rosalie, spoke with relatively little accent and often challenged the traditions of their parents. However, by the end of the serial, the Americanization of Molly’s family was nearly complete; like so many other immigrants, the upwardly mobile Goldbergs eventually moved from their New York apartment to the suburbs.

The immigrant experience recounted in *The Goldbergs* clearly resonated in an era characterized by both massive immigration and calls for greater national unity. Although Gertrude Berg moved in more assimilated, upper-middle-class circles, she worked diligently to maintain the “realism” of the ethnic immigrant experience detailed in the series. In 1936, for example, Berg took Dan Wheeler, a writer from the *Radio Mirror*, to the Lower East Side to witness her research. In an article entitled “How the Ghetto Guides *The Goldbergs*,” Wheeler recounted Berg’s conversations with street vendors and immigrant women and her anonymous participation in a Lower East Side charitable club. Her efforts to represent the ethnic experience were appreciated by contemporary audiences. The program was cited at the time by groups such as the National Conference of Christians and Jews for promoting religious and ethnic tolerance.

The continued popularity of the radio program spawned the 1948 Broadway play *Molly and Me*, a comic strip, several vaudeville skits, and a 1950 film. After the program’s demise, *The Goldbergs* was briefly revived in 1949–50 for CBS as a 30-minute weekly radio series, but it endured in American culture as a television situation comedy from 1949 to 1955. *The Goldbergs* became one of the most popular comedies of early television, earning Berg the first Emmy Award for Best Actress in 1950. In 1961–62, Molly Goldberg inspired yet another television series, *Mrs. Goldberg Goes to College* (or *The Gertrude Berg Show*). Because of its acuity in representing a common immigrant experience, the magazine *TV Show* appropriately labeled *The Goldbergs* an “American institution” (Merritt, 1951).

Goldsmith, Alfred Norton 1888–1974

U.S. Radio Engineer and Inventor

Alfred Norton Goldsmith—teacher, engineer, and inventor—won the admiration of two generations of engineers for his contributions to the field of communication technology.

Goldsmith taught electrical engineering at City College of New York while working as director of research for the American Marconi Company. After World War I, he became the first director of research in the newly organized Radio Corporation of America (RCA), and he ultimately became vice president and general engineer of that company. Though RCA was organized to consolidate the patent rights held by different radio interests, under Goldsmith RCA also began to develop research interests in a number of key wireless technologies. His broad knowledge, both theoretical and practical, served RCA well as the company rapidly expanded.

Goldsmith was a prolific inventor with 134 American patents. He was a consulting engineer after 1930, and he served as editor (1912–54) of the highly influential *Proceedings of the IRE (Institute of Radio Engineers)*.

During a career that spanned more than 50 years, Goldsmith inspired those around him to apply rigorous and thoughtful science to the day-to-day engineering problems encountered by the infant broadcasting industry. The outgrowth of that research significantly influenced modern communications technology. He was responsible for patents related to many fields of communication technology, including radio, television, phonographs, aircraft guidance, and motion pictures. Included among Goldsmith's inventions were the shadow-mask cathode-ray tube used in modern color televisions; interlace scanning, which solved early television flicker problems; the radio diversity-reception system, which reduced signal fading; ultrasonic remote control systems; color facsimile transmission; an instrument landing system for aircraft; and the combination radio-phonograph.

Goldsmith was widely regarded as one of radio's outstanding early engineers. Friends, students, and colleagues described him as brilliant, citing his breadth of knowledge and quick insights, both of which won him the respect of those who worked with him and of the administrators who relied on his expertise. Archer (1939) claims that Goldsmith was responsible for christening RCA's early radios "Radiola," a trade name that became synonymous with RCA products. Later, Goldsmith became a freelance consultant and worked for RCA, Kodak, Radio-Keith-Orpheum (RKO), and other companies, but he remained a friend and trusted adviser to RCA's David Sarnoff.

Goldsmith was also an important voice in the formulation of broadcast policy, serving as a member of the Radio Advi-

sory Committee for the National Bureau of Standards at the four Radio Conferences held from 1922–1925. Later, he led the Board of Consulting Engineers, which helped the Federal Radio Commission develop a policy for international relay broadcasting and television. Goldsmith was able to popularize theoretical problems about early radio problems in language that was easily understood, and he published more than 100 papers and books. He edited several anthologies of technical papers by RCA engineers on facsimile, radio at ultrahigh frequencies, and electron tubes.

Although Goldsmith's engineering capabilities and inventions won him fame, perhaps his greatest contribution to the art of communication was his service to the engineering profession. He served as president of the Institute of Radio Engineers (IRE), an early professional society that he cofounded with Robert Marriot, and he edited the institute's journal, *Proceedings of the IRE*, for 42 years. Goldsmith also served as president of the Society of Motion Picture and Television Engineers. Throughout his career, he continued an active interest in these professional organizations, publishing dozens of technical papers on a remarkably wide range of different communication technologies.

FRITZ MESSERE

Alfred Norton Goldsmith. Born in New York City, 15 September 1888. Attended City College of New York, B.S. 1907; Columbia University, Ph.D., 1911; electrical engineering teacher, City College of New York, 1907–19; consultant, General Electric, 1915–17; Director of Research, American Marconi Wireless Telegraph Company, 1917–19; joined Radio Corporation of America (RCA) as Director of Research; promoted to Vice-President of Research and General Engineer, RCA, 1919–31; became independent consulting engineer for NBC, RCA, and Eastman Kodak, 1931; co-founded Institute of Radio Engineers (IRE; predecessor of IEEE), 1912; edited IRE journal *Proceedings*, 1912–54; served as president of the Society of Motion Picture and Television Engineers, 1932–34, and on Radio Advisory Committee for Bureau of Standards, National Television System Committee (NTSC); held 200 patents related to radio and television, 1919–72, as well as patents in motions pictures, communication technology, and air conditioning. Received Medal of Honor and the Founders Award of the IRE; Modern Pioneer Award, National Association of Manufacturers; Townsend Harris Medal, City College of New York; first recipient of the Haraden Pratt Award. Died in St. Petersburg, Florida, 2 July 1974.

The Goon Show

BBC Comedy Program

British radio comedy reached its peak in the 1950s, before television took over as the dominant medium around 1960. Of all the varied series, *The Goon Show* was the most outrageous, the most inventive, and the most demanding in its use of the medium. Rooted in off-the-wall humor such as Lewis Carroll, the Marx Brothers, and Hollywood cartoons, it became a cult item—loved by schoolboys and jazz musicians and hated by schoolmasters and the British Broadcasting Corporation (BBC) establishment.

It was the creation of four young performers, all of whom had been in the Armed Forces during World War II and had been involved with troop entertainments to some degree—Michael Bentine, Spike Milligan, Harry Secombe, and Peter Sellers. In the postwar period they performed in theatrical variety and made occasional radio appearances; Milligan made contributions to radio comedy scripts through his friendship with Jimmy Grafton, who ran a public house, Grafton's, in London's Victoria area and who wrote scripts for the conventional *Derek Roy Show*.

From meetings and experimental performances in Grafton's, the four put together a comedy show that they suggested to the BBC. After a pilot recording and some false starts, the first season began on 28 May 1951. The four had wanted to call it *The Goon Show*, borrowing from the Goons in the Popeye comic strip, but the BBC, not understanding the name (one official asked, "What is this *Go On Show*?") insisted that it be called *Crazy People*.

There were 17 shows in the first season and 25 in the second, which started on 22 January 1952. The format of the program included short sketches, very cartoonish in nature and

gradually building up the use of idiot logic and outlandish sound effects. After the second season, Michael Bentine left to follow his own slightly different comedy style, and the three others formed the basic cast for the rest of the show's life.

The third season, now at last called *The Goon Show*, offered 25 shows starting on 11 November 1952. It continued in the sketch format, with two straight musical items from mouth organist Max Geldray and Ray Ellington's jazz-style quartet. With the fourth season (30 shows from 2 October 1953), the shows took on the format that would become the standard, telling a single story that was interspersed with the two musical items. Plots included sending the Albert Memorial to the moon and chasing the Kipperd Herring Gang.

From the beginning of the fifth season (26 shows) on 28 September 1954, the series gained a worldwide audience through recordings sold to overseas radio stations by the BBC's Transcription Services; the show's overseas popularity outlasted the series itself by many years through repeats. The style had by now settled down, through the use not only of strong, daft plots but also of strongly drawn characters, created by scriptwriter Milligan both alone and in collaboration with Eric Sykes and Larry Stephens.

The main character, around whom all the plots revolved, was Neddie Seagoon (Secombe)—short, fat, stupid, noisy, patriotic, and well-meaning but gullible. In most cases, he was deceived into carrying out some ridiculous task—such as ferrying snow to the Sahara in cardboard boxes—for apparently patriotic reasons but in fact at the behest of the two master criminals, Hercules Grytpype-Thynne (Sellers), a smooth George Sanders type, and Count Jim Moriarty (Milligan), who

degenerated over the series into a cringing, starving wreck who dragged Grytpype-Thynne down with him (“Keep still, Moriarty—do you want us both out of this suit?”).

In the course of his adventures Seagoon would meet up with other eccentric couples. The senile Minnie Bannister (Milligan) (“We’ll all be murdered in our beds!”) and Henry Crun (Sellers) (“You can’t get the wood, you know”) were based, Milligan later claimed, on his parents: their dithering and bickering marked every appearance.

Another couple, usually cast as Seagoon’s helpers, were Eccles (Milligan) and Bluebottle (Sellers). Eccles was a combination of Walt Disney’s Goofy and the village idiot, and Bluebottle was the eternally hopeful Boy Scout, who almost always got blown up.

The main remaining character, Major Dennis Bloodok (Sellers), was a loose-boweled, lecherous, and greedy army officer of dubious morals. There were also many minor characters, including the baby Little Jim (Milligan), whose only line, whenever appropriate, was “He’s fallen in the water!” and the excitable Indians Lalkaka and Bannerjee.

In most radio series, the actors played characters who took part in the plot, but in *The Goon Show* it was the characters themselves who performed the plot, often making asides that showed they were indeed “only acting,” which gave an odd extra dimension to the comedy.

Apart from an occasional special show, the remaining seasons were the sixth (10 shows from 20 September 1955), the seventh (25 from 4 October 1956), the eighth (26 from 30 September 1957), a special season of reworked repeats for Transcription Services (14, recorded in 1957–58), the ninth (17 from 3 November 1958), and the final short season of 6 episodes beginning 24 December 1959. By this time the strain of writing and performing the shows had caused Milligan a nervous breakdown and a good deal of subsequent strain—which was showing in the writing—and the series came to an end on 28 January 1960.

Subsequently there were a few special appearances by the trio and a strange television series, *The Telegoons*, reworking old scripts with new recordings of the performers (without an audience) and puppets for the visuals: it was not successful.

The final appearance of the Goons was in the special show *The Last Goon Show of All*, recorded on 30 April 1972 for radio and also televised. The subsequent death of Sellers in 1980 made further reunions impossible.

The Goon Show had a lasting effect on British comedy. It took radio to the boundaries of what was possible through the use of detailed production and complex sound effects, and its irreverent and wildly illogical look at British life influenced many subsequent shows and performers—most famously television’s *Monty Python* team. The shows have continued to be extremely popular for many years through repeats and issues on records, tapes, and CDs.

Gordon, Gale 1905–1995

U.S. Radio, Film, and Television Actor

Gale Gordon, a hard-working radio (and, later, television) actor, may never have been a household name, but his voice and face were known to millions. Born into a theatrical family, he spent the first five years of his life in England. His father, Charles Aldrich, was a quick-change artist and his mother was actress Gloria Gordon, best known for her portrayal of Mrs. O'Reilly on radio's *My Friend Irma*.

Born with a cleft palate, Gordon endured two painful operations to correct the problem, and his parents pushed him into show business to help him perfect his speech. By the time he was 17, Gordon's voice was so richly developed that it became his trademark. "His voice was colorful and powerful so he could bend and shape the dialogue he was given," according to Lucie Arnaz. "He also used his whole body for effect, not just his voice," Arnaz added.

While still a teenager, Gordon made his Broadway debut with Richard Bennett in *The Dancers* in the 1920s. He then moved over to try the new medium of radio. Radio offered something new for actors: steady work. Gordon soon became one of the busiest actors in radio, sometimes appearing in 20 to 30 shows per week. In 1929, he moved to the West Coast for the role of Judas in *The Pilgrimage Play*. After a year of touring, he returned to Hollywood where he worked as a freelance actor and announcer. No role daunted him—he supplied the voices of villains, Tarzan, and Flash Gordon, in addition to playing straight dramatic roles in syndicated shows such as *The Adventures of Fu Manchu* and *English Coronets*.

Hy Averback, noted television and movie producer, described Gordon as a combination of Laurence Olivier and Charley Chaplin. Called the master of the slow burn and stack blowing, Gordon found his true forte in comedy. He became everyone's idea of the perfect stuffed shirt and comic foil. His bellowing voice proved to be indispensable and assured gainful employment in dozens of character roles on radio, including his well-known long-running radio roles as Mayor LaTrivia on *Fibber McGee and Molly*, the harried sponsor on *The Phil Harris and Alice Faye Show*, and the apoplectic banker Attenbury on Lucille Ball's *My Favorite Husband*.

Gordon was Lucille Ball's first choice for next-door neighbor and landlord Fred Mertz when *I Love Lucy* was brought to television in 1951. "My mother could always depend on Gale and trusted his acting choices on the radio show," Lucie Arnaz said. "And my mother wasn't fond of change; just for change's sake she would have gladly given Gale the part of Fred Mertz. But Gale was under exclusive contract with CBS Radio so William Frawley got the part."

Gordon worked with many notable actors in radio, including Jimmy Durante, Doris Singleton, Eve Arden, George Burns and Gracie Allen, Richard Crenna, Claire Trevor, Edward G. Robinson, Bea Benaderet, Jack Webb, Mary Pickford, Jack Haley, and Dennis Day. The only actor with whom he seemed to conflict was Mel Blanc, creator of the voice of Bugs Bunny and many other Warner Brothers cartoon characters; the two were constantly in competition for the same parts.

In October 1941, Gordon began playing the role of Mayor LaTrivia on *Fibber McGee and Molly*. (Mayor LaTrivia would arrive at the McGee house, start an argument, become tongue-tied, and blow his stack.) Gordon's only break from the show during 15 seasons was his service in the U.S. Coast Guard, where he served as chief gunner's mate during World War II.

In 1948 Gordon was given the role of Osgood Conklin in *Our Miss Brooks*, a situation comedy about a high-school English teacher forced to endure the supervision of this stuffy, by-the-rules, pain-in-the-rear school principal. Gordon's Conklin was dry, cynical, blustery, and explosive, all at once. It was to be his last role in radio; the show moved to television in 1952 and ran until 1956, with most of the original radio cast, including Gale Gordon, making a successful transition to the new visual medium.

Gordon met his wife, Virginia Curley, while working on the *Death Valley Days* radio program. They married in 1937 and later played together as Mr. and Mrs. Osgood Conklin in both the radio and television versions of *Our Miss Brooks*; they remained together until their deaths a few weeks apart in 1995.

Gospel Music Format

The gospel music format is a popular genre of radio programming that features generally upbeat music with a Christian message.

Gospel music has long been a staple of radio, particularly in the Bible Belt, and it was featured on several early radio stations, including WFOR in Hattiesburg, Mississippi; KWKH in Shreveport, Louisiana; WSM in Nashville, Tennessee; WVOK in Birmingham, Alabama; and WKOZ in Kosciusko, Mississippi.

Today's gospel music format originated with and grew out of special programming. As local radio stations began to dot the landscape of the United States, many of them featured gospel music on Sundays, or perhaps 30 minutes to an hour each day. Typically, this special programming featured either white Southern quartets, groups, and soloists (including the Statesmen Quartet, the Blackwood Brothers, the Chuck Wagon Gang, and Tennessee Ernie Ford), or black groups and soloists (such as the Jackson Southernaires, Edwin Hawkins Singers, or Mahalia Jackson).

During the 1980s, some radio stations began to program gospel music exclusively, billing themselves as “all gospel all the time.” With deregulation of the broadcasting industry in the 1980s, the number of radio stations significantly increased, and program directors created specialized music formats to target specific audiences. The gospel music format began to burgeon; a number of stations chose it as the only

type music they featured, complete with the “clock hour,” which delineates and specifies every element of programming during each hour. The clock hour, also known as the “format wheel” or “programming wheel,” could be compared to a pie cut into approximately 25 parts. For example, the top of the hour on the format wheel might include five minutes of national news from a network (not a few gospel stations are affiliated with the *USA Radio Network* because its content and style of reporting correlate with issues with which some Christians are concerned). At five minutes past the hour, a number-one song from yesteryear might be featured, followed by a top-ten gospel hit, followed by a totally new selection that might prompt the disc jockey to remark, “And you heard it first right here.” In this way, the gospel music format is similar to the structure of a Top-40 station, with on-air personalities using their names, throwing in some pleasanties, and striving to create an image appealing to the target audience—in the case of gospel, a bright, happy, encouraging sound.

Top radio groups such as Jacor, Clear Channel, and Infinity see gospel as a viable format. Capitalizing on audience loyalty to the music, a number of stations have improved their ratings after switching to the gospel format, increasing their average quarter hour listening shares and paving the way for advertising acceptance. The gospel music format is typically appealing to advertisers, although gospel music stations decline to

advertise certain products or services, such as alcoholic beverages or night clubs. If a gospel music station is airing a sporting event, typically the operator at the station has been instructed to block any network advertisements which pertain to alcohol or tobacco products.

Radio stations have increasingly subscribed to gospel music programming via satellite services. Listeners to such services may well feel that the syndicated announcers are actually present at the local station playing the music and making the comments, even though these DJs are merely part of the down-load. One of the most popular formats is called *The Light*, which features a mix of black urban gospel artists and includes cross-over collaborations by mainstream artists such as Cheryl "Salt" James of *Salt-n-Pepa* and Stevie Wonder.

Some stations have recently begun to feature specific gospel subgenres, such as southern, African American, country, jazz, contemporary, bluegrass, and even rap.

Grand Ole Opry

Country Music Variety Program

As the 20th century ended, the *Grand Ole Opry* was the most famous and longest-running live radio broadcast still on the air. A traditional radio barn dance, originating on WSM radio from Nashville, Tennessee, the *Opry* has reached homes across the eastern half of the United States. Although it started as a local show and later reverted to that status, through the 1940s and most of the 1950s the *Grand Ole Opry* was a staple on Saturday nights on the National Broadcasting Company (NBC). To most Americans, the *Opry* defined what a radio barn dance was and is. Because of its triumph over all major rivals, exemplified by the centralization of the country music industry in Nashville, the *Grand Ole Opry* occupies an important place in both radio and recording industry history.

The *Grand Ole Opry* made its debut on 28 November 1925 on WSM-AM's Studio B to an audience of 200 people. C.A. Craig, one of the founders of the National Accident Insurance Company of Nashville, Tennessee, owned a radio station during the early 1920s (later called WSM for "We Shield Millions"); in 1925 he hired George D. Hay away from WLS-AM in Chicago to develop a barn dance show for WSM, as Hay had done for WLS with the *National Barn Dance*. Hay

began in November 1925, and within a month the new show was a two-hour-long Saturday night staple.

By 1927, as an NBC affiliate, this two-hour local country hoedown followed the network broadcast of the National Symphony Orchestra, which aired Saturday nights from 8:00 to 9:00 P.M. One night, probably 8 December 1928, Hay reportedly stated, "For the past hour you have heard music largely taken from grand opera; now we will present the *Grand Ole Opry*." True or not, the title is now world famous.

Regional success can be measured by the show's need within a few years to move to a new studio, Studio C, which held 500 persons; later, after a series of temporary moves, the show made its permanent home in the 2,000-seat Ryman Auditorium at Fourth and Broadway in downtown Nashville in 1943. The show remained at that location throughout its network radio days and then, in 1974, moved to a new auditorium as part of the opening of the Opryland theme park in suburban Nashville.

The show had started informally as what scholar Charles Wolfe calls "a good natured riot." But although the program seems informal, getting on was always a struggle for the new

Marty Robbins on stage at the Grand Ole Opry at the Ryman Auditorium
 Courtesy Radio Hall of Fame

artist, and many argued that it became more and more commercialized. By the 1930s “hillbilly” stars had been developed, and some dead singers were immortalized. The music was spread thanks to the diffusion and growth of the population, and even greater stars emerged during the post–World War II era. The Opry management, particularly James Denny, took advantage of this interest, and the network (and many clear channel stations) carrying *Grand Ole Opry* enabled the broadcast to become one of the most popular radio programs in the country. Denny and his colleagues also worked with leading record labels to make Nashville the center of the “country and western” universe.

The *National Barn Dance*, from Chicago’s WLS, was already an NBC fixture when a half-hour segment of the *Grand Ole Opry* was added to a number of NBC’s regional broadcasts, including 26 stations in the Tennessee area. In 1939 NBC began to carry the *Opry* regularly on a regional

basis. Two years later the *Opry* went out all across the NBC network.

The coming of TV and format country radio signaled the end of the barn dance radio show. Yet WSM-AM stuck with the *Grand Ole Opry*, and Nashville became not just one center for the making of country music but the leading one. Indeed, many of the early Nashville recordings were done in WSM studios, until Owen Bradley and others began to fashion “Music Row” several miles west of the Ryman Auditorium. And by the time that Bradley at Decca and Chet Atkins at the Radio Corporation of America (RCA) began to remake “hillbilly” music into crossover country music with stars such as Hank Williams and Patsy Cline, the “Athens of the South” had become “Music City.”

The Great Gildersleeve

Situation Comedy

“Great” is the perfect epithet for the character Throckmorton P. Gildersleeve. First a foil on *Fibber McGee and Molly*, then star of his own program, he was a large man in the tradition of Shakespeare’s pleasure-loving Falstaff. Loud but never mean, he began sparring with Fibber, the archetypal windbag, in 1937. His character was honed as the bumptious, explosive Gildersleeve, who typically ended a duel with his exasperated phrase, “You’re a harrrrd man, McGee!” His very name, coined by script writer Don Quinn, combined dignity (Basil Gildersleeve was a famous Victorian classicist) and inside joke (the actor playing Gildersleeve lived on Throckmorton Place). The character left *McGee*, taking the train from the National Broadcasting Company’s (NBC) Wistful Vista to Summerfield on 31 August 1941, thus becoming radio’s first successful spin-off. The program would last 16 years, until March 1957. Gildersleeve, or “Gildy” to some, was played by actor Hal Peary to 1950 and by Willard Waterman from 1950 to 1957.

In his new town, Gildy’s abrasive personality mellowed as he embraced home, work, and social life. Each contact in Summerville deflated his grandiosity and humanized him. Once he planned to attend a costume ball dressed as an ancestor. He daydreamed about possible relatives—a romantic castaway on

a tropical island, a dashing pirate, a Gilded Age tycoon—only to learn that he was descended from Goldslob the Pennsylvania butcher (24 March 1948). His appetites kept housekeeper Birdie Lee Coggins busy. More feisty than most of radio’s black domestics, Birdie moderated his pomposity by repeating herself (“You know what I said? That’s right! That’s what I said”). Birdie often mirrored her employer. Both belonged to fraternal groups (she to “The Mysterious and Bewildering Order of the Daughters of Cleopatra,” he to “The Jolly Boys”); both sang well. Her talents and industriousness silently rebuked Gildy’s natural sloth. Her chocolate cake won a prize, and when she went on vacation, no one could prepare a suitable dinner. She also provided a mother surrogate for Gildy’s wards, niece Marjorie Forrester and nephew Leroy.

In an era when single-parent families usually implied a widow with children, Gildy was unusual. Like other unmarried guardians (Donald Duck, Sky King), he coped with the younger generation by combining bossiness, wheedling, and exasperation. Marjorie usually abided by his rules, but she began dating a series of boys who fell short of Gildy’s expectations. After wedding Bronco Thompson on 10 May 1950 and bearing twins (21 February 1951), she set up her own house-

hold next door. Although she dutifully catered to Gildy's whims, double dating with him before the marriage and asking him to babysit after the kids arrived, her in-laws tried his patience. Used to dominating her husband, Mrs. Thompson openly defied Gildy until they bonded on a picnic. But everyone else had become accustomed to their bickering, so they obligingly pretended to spat (22 March 1950).

Leroy gave little promise of accepting maturity: he reacted to his "Unk's" apparently foolish directions with an exasperated "Oh, for corn sakes." Gildy tried patience but often resorted to the ultimate threat, a menacingly drawn-out "Leeeroy." Certainly Leroy needed direction. His academic work would have embarrassed anyone, but it particularly discomfited Gildy, who courted the school principal, Eve Goodwin. Leroy's troubles with bullies, jobs, attractive girls, stolen lumber, and toothaches often defied logical advice, yet they somehow solved themselves.

Gildy seemed to be an unlikely source of practical wisdom. He loitered through his job as water commissioner, sometimes aided by his simple secretary Bessie. His campaign for mayor in 1944 floundered when he lost his temper on a political broadcast. When he discovered that no one in the city knew him or his job, he hatched a publicity stunt: to dive into the reservoir (23 April 1952). The bungled descent temporarily dampened his quest for recognition. Romance, at any rate, interested him more. Various women with descriptive names like Eve Goodwin and Adeline Fairchild prompted him to buy perfumes and candy from the crusty druggist, Peavey. Gildy should have imitated Peavey's famous tag line, "Well, now, I wouldn't say that," because his amorous crusades never led to the altar. His closest approach, with Leila Ransom, a flirtatious Southern widow, ended when her supposedly dead spouse Beauegard turned out to be alive (27 June 1948).

Gildy's male friends provided enough excitement to compensate for these losses. Judge Horace Hooker, the "old goat" who monitored Gildy's care of Marjorie and Leroy, diminished his ego by staying when Gildy wished to court a lady friend or by demanding vegetarian food when he came for dinner. So did Rumson Bullard, Gildy's wealthy and insulting neighbor, who drove a big car and disdained to invite him to a neighborhood party. The "Jolly Boys"—Peavey, Hooker, Floyd Munson the barber, and police chief Gates—met to gossip and sing. The bonding sometimes frayed, inspiring Chief Gates to plead, "Aw, fellows; let's be Jolly Boys!"

Network politics might have caused disaster, because the original Gildy, Hal Peary, launched his own short-lived Columbia Broadcasting System (CBS) show, *Honest Harold*, in 1950. Luckily, Willard Waterman, a friend of Peary's who often teamed with him on other shows, sounded like him and took over the lead until the show ended in 1957. Both men had fine singing voices and incorporated easy listening songs into the plot.

The two prolonged Gildy's life in movies and television. Peary appeared briefly in four amusing films (*Comin' Round the Mountain*, 1940; *Look Who's Laughing*, 1941; *Country Fair*, 1941; *Unusual Occupations*, 1944) and starred in four others (*The Great Gildersleeve*, 1942; *Gildersleeve's Bad Day*, 1943; *Gildersleeve on Broadway*, 1943; *Gildersleeve's Ghost*, 1944). Waterman was featured in 39 TV episodes (September 1955–September 1956). Radio writers Paul West, John Elliotte, and Andy White followed, sometimes recycling story lines (Gildy's aforementioned dive into the reservoir; his attraction to Bullard's sister from 19 September 1951). However, they overemphasized Gildy's womanizing tendencies for the first 26 programs. Other shows toned down Leroy's mischief, substituted new actors (only three originals remained), and lost a major sponsor. Still, both films and TV communicated some of the great man's foibles and successes familiar to radio fans.

Greece

Radio began in Greece later than in most other European nations, and the country was one of the last to develop an official government station. In a radio industry characterized by its state of constant flux, private stations and others controlled by the armed forces have existed alongside government outlets. Advertising has been accepted on some outlets, not on others.

Origins

Experimental radio stations were operated in Greece in the 1920s, but the first station offering a regular program schedule was established in Thessaloniki in 1928 as a private operation. Greek radio listeners relied primarily on stations in other nations, and considerable confusion and change was evident as the ministry in charge of radio kept switching. Despite several attempts, no other regularly operated stations existed in the country until the 1930s. In 1936 the government decided to develop a national broadcasting system that could educate Greek society. In 1938, Greece became one of the last European nations to develop a state-run radio station. The Ethnikon Idryma Radiophonias (EIR), or National Radio Foundation, provided programs consisting largely of music by the station's orchestra, choirs, and news.

At the beginning of World War II, the station helped boost the morale of the soldiers and the public. Eventually, the occupying German forces sealed radio receivers in Athens to receive only the national station, which they controlled. In the countryside people were ordered to turn in their radios or face severe punishment.

In 1945, EIR closed down the private station after an unsuccessful attempt to force it to broadcast the national signal. In the late 1940s, additional stations were built by EIR, as well as by private interests and the Armed Forces. Armed Forces stations were established to "enlighten" the people of Northern Greece about the dangers of communism. The United States,

which had taken a major role in the Greek Civil War, built two radio stations that transmitted Voice of America programs part of the day and state programming the rest of the day.

The Armed Forces stations were financed through army funds and advertising. In 1952, as Armed Forces stations gained popularity, EIR established a Second Program. This service carried commercials and more popular music, unlike the original station's (First Program) more serious orientation. That service carried news, information, and fine arts programming, but no commercials. In 1954, EIR established the Third Program that primarily provided classical music broadcasts. All stations from 1946 to 1953 were under strict government censorship, while some form of censorship continued until 1975.

A new Greek constitution drafted after the fall of the military junta (1967-1974) placed radio and television "under the immediate control of the state." A new state organization, Hellenic Radio-Television (ERT), heavily controlled by the government, was created to operate the public stations.

Structure

According to a 1975 law, and subsequent broadcast laws, the purpose of ERT is to provide "information, education, and recreation for the Greek people (through) the organization, operation and development of radio and television." In addition, the act states that "ERT programs must be imbued with democratic spirit, awareness of cultural responsibility, humanitarianism and objectivity, and must take into account the local situation." Finally, this law stated: "The transmission of sound or pictures of any kind by radio or television by any natural person or legal entity other than ERT and the Armed Forces Information Service (YENED) shall be prohibited" ("Greek Radio-TV Law," 1976). This brought an end to any legal private broadcasting in Greece.

In 1982, the socialist governing party, PASOK, placed all YENED stations under civilian government control. Nevertheless, there was a great reluctance to open the airwaves to private citizens. No political party was willing to part with control of broadcasting, which they could use for self-promotion when in power.

In 1987, a new legal structure for broadcasting created one company, Hellenic Radio-Television S.A. (ERT), now a corporation owned by the state, to control all public service broadcasting in Greece. One of its entities is Hellenic Radio (ERA), made up of the four domestic radio services (ERA-1, ERA-2, ERA-3, ERA-4) and the Voice of Greece shortwave radio service (ERA-5).

Nevertheless, the major importance of the 1987 law was that, despite initial opposition from the government, it provided for the establishment of private stations. The impetus for this change came from political pressure brought on by opposition political parties that wanted a piece of the airwaves. Candidates running for local elections pledged to build municipal radio stations. Eventually, opposition candidates won the mayoral races in Greece's three largest cities and the breakdown of the state broadcasting monopoly was imminent.

The new mayor of Athens insisted that if a legal structure for "free" radio was not created by the end of March 1987, he would build a municipal radio station anyway. On May 31, 1987, municipal station "Athens 98.4 FM" went on the air without a license.

A major problem with the 1987 law, and relevant decrees that followed, was that it did not deal with the issue of the number of frequencies available. Nevertheless, the first non-state radio station licenses were approved in May 1988, most going to municipalities and publishing companies (Roumeliotis, 1991). However, the Licensing Commission never announced the criteria used in allocating these licenses and did not tie them to specific frequencies.

Following the initial allocation of licenses, which had to be renewed in two years, the government failed to implement legislation regulating private broadcasting. Related laws and decrees were passed, but since no action ever took place, all radio station licenses expired at the end of the initial two-year period. Thus, technically some 1000 radio stations in Greece were operating illegally.

Current Scene

It was not until May 2001 that the first "permanent" radio station licenses were allocated for the Athens area. This license approval process is to continue for the rest of the country. However, given its history, Greek radio likely will not stabilize for some time to come. The radio environment in Greece, despite some maturation that forced many stations to go out of business, remains in a state of anarchy. In addition to hundreds

of illegal stations, there are stations that never even requested licenses and others that hold more than one frequency, while most do not pay the relevant taxes as required by the broadcast laws (Zaharopoulos, 1993).

State radio broadcasting has dramatically diminished in importance as its audiences have dwindled. Nevertheless, ERA still has 19 local and regional stations on AM, two AM relay stations, and 40 FM transmitters throughout the country. The ERA networks have also undergone certain changes. In 2002 the First Program was renamed NET Radio—NET (New Hellenic Television) being the name of Greek television's second channel, which has a serious orientation. The Second Program (ERA-2) carries more popular music and a few magazine and public affairs programs. One of the Second Program's frequencies in Athens was used to create ERA's fifth domestic service called "Kosmos" radio in 2002, carrying primarily world music. ERA-4 became ERA Sport, carrying mostly sports programming.

Municipal stations have also diminished in importance. Many have closed down, as their audiences were won over by commercial stations, and as cities could no longer afford to subsidize municipal radio.

Private stations built by former pirates have generally not succeeded either. Many of them either went out of business, were sold to larger corporations, or still broadcast as "mom and pop" operations. The real winners in the Greek radio scene have been the large media corporations or other industrial companies with their own stations. Most Greek industrialists who went into broadcasting did so in order to use their media voices to gain government contracts for their other businesses. Thus, even if most of these stations today lose money, their owners still view them as valuable sources of revenue.

Despite the trend toward program specialization resulting from a great number of stations, the two most popular stations in Athens (Sky, Antenna) feature variety formats with emphasis on news, political talk, and music entertainment. Another successful station is Flash, which is a news and information station. Generally, on the Greek airwaves today one can find any radio format imaginable. At the same time, public service broadcasting struggles to survive, while municipal public service broadcasting, with a few exceptions, is nearly dead. The next wave in Greek radio is expected to see foreign conglomerates entering the Greek market by buying existing stations.

The Green Hornet

Juvenile Drama Series

Joining a number of American fictional superheroes already entertaining the large radio audience from the late 1930s through the war and into the 1950s, *The Green Hornet* debuted over Detroit station WXYZ on 31 January 1936. The series began simply as *The Hornet* (the descriptive color was added later in order to copyright the title, according to radio historian Jim Harmon). Another brainchild of Detroit station operator George W. Trendle, who also created *The Lone Ranger*, the two half-hour action dramas shared more than classical music themes (for which no copyright fees needed to be paid) and the same creator. In this case, the famous sound of a buzzing hornet was made by a musical instrument called the theremin, while the music was Rimsky-Korsakov's "The Flight of the Bumblebee."

Russo (2001) reports that the first 260 episodes of the series lacked individual titles (they were simply numbered), but those broadcast after 9 August 1938 carried episode names as well. Most if not all of the early scripts (perhaps the first five years) were written by Fran Striker (who also authored *The Lone Ranger*), but they increasingly became a WXYZ team effort for the remainder of the 16-year run. At different times the half-hour drama appeared weekly or twice-weekly.

The protagonist was Britt Reid (also the Green Hornet), who served as a wealthy young newspaper publisher of *The Daily Sentinel* during the day and transformed into evil's arch enemy after sunset. The Green Hornet's mission, according to the opening narration, was to protect us (the law-abiding American citizen) from those "who sought to destroy our way of life." If one listened carefully, one of the series' conceits was made clear—the familial connection of the Green Hornet with his great uncle, the Lone Ranger. References to the earlier legendary figure were abundant. Young Reid was seen as carrying on the family tradition of fighting for justice and the American way. Against the backdrop of an uncertain world, the Green Hornet reassured listeners that the forces of good would always triumph over the forces of darkness. Only three charac-

ters knew that Reid was also the Hornet—his father (who appeared rarely), his secretary (who never lets on until late in the series), and Kato.

Kato served as the Green Hornet's faithful valet and partner in crime fighting. Kato also drove the Hornet's famous high-speed car, Black Beauty, during countless breathtaking chases in pursuit of the bad guys. A famous radio legend has it that Kato, who had been described for five years as Japanese, became a Filipino overnight after the 1941 Pearl Harbor attack. Harmon and other sources say, however, that Kato had been described as a Filipino of Japanese ancestry well before the war began. The role partially reflected a continuing American fascination with things oriental.

Unlike most crime fighters, the Green Hornet did not use lethal weaponry; his gun fired a knockout gas instead of bullets. And in contrast with most other radio superheroes, the Green Hornet often assumed a bad guy persona in order to capture criminals, and this frequently confused law enforcement officials, richly adding to the plot line. He and Kato would always escape the crime scene just before law enforcement officers (and reporters from Reid's own paper) arrived. The final scene would usually feature a newspaper boy hawking the latest headlines of the Hornet's ventures as featured in *The Daily Sentinel*, noting that the Hornet was "still at large" and being sought by police. They never did catch him.

Like other superhero programs of the day, *The Green Hornet* adventure series had its genesis in the pulp detective novels of the 1920s, and the characters also appeared in comic books during and well after the radio broadcasts. The series was resurrected for one season on ABC television in the mid-1960s, riding on the coattails of the tremendously popular *Batman* series.

Greenwald, James L. 1927–

U.S. Radio Marketing Executive

James L. Greenwald was one of the most important leaders of the station representative business. He was also an early proponent of the commercial value of FM radio.

Early Career

Greenwald began his career as a songwriter. In 1955 he determined that it might be more profitable to sell "air." Thus began a career in the national media sales business that spanned 41 years at the Katz Agency, Katz Communications, and Katz Media Corporation, where he served as chairman and chief executive officer until 1995. When Greenwald joined Katz Radio as a salesman, the firm represented only 25 stations. When he retired, the firm represented over 2,500 stations.

He was named assistant manager of the radio division in 1963 and president in 1970. With a company that by then had 65 clients, he began building an organization that launched

many innovative sales and marketing concepts. Greenwald was among the first national radio sales executives to foresee the emergence of FM radio. In a speech before the West Virginia Broadcasters Association, he said: "The days of FM stations being looked upon as supplements to AM stations are over. FM is radio."

In 1972 one of his first major steps as president of Katz Radio was to begin selling FM radio audience. Until then, most FM stations, if they were sold to national advertisers at all, were coupled with sister AM stations. Nearly all FM stations, except those that programmed classical music, simulcast programming with their AM counterparts, and Katz Radio was particularly steeped in the history of selling large AM stations only.

Greenwald visited with the owners of the major Katz AM stations that also had FM stations and first convinced them to sell their fledgling FM stations in combination with their AM stations. In many instances the additional audience, which was

essentially sold for the same price as the AM-only audience, resulted in higher rates and larger shares of budgets for the AM station. The Katz clients responded favorably. When the Federal Communications Commission (FCC) in 1965 passed the rule limiting simulcasting to 50 percent of the program day, Greenwald formed an in-house programming consulting unit within the Radio Division that urged the owners of FM stations to aggressively program their FM properties independently. Greenwald foresaw a national sales market rapidly developing that was willing to spend large sums to reach the emerging FM audience. By 1976, national sales on Katz-represented FM stations had grown to represent over 20 percent of the company's total volume. By 1980 it had eclipsed 35 percent, and by 1990, 70 percent.

Greenwald was an early believer in packaging audiences for advertisers. He recognized that with the represented FM stations emerging with strong audience, there was an opportunity to package stations for a larger share of market dollars. He created a concept called the Katz AID Plan, which provided an advertiser a substantial discount based on the share of budget placed exclusively on the Katz-represented stations.

During the early 1970s, the only network selling of national radio was being done by the traditional wired networks. Greenwald, having expanded the list of Katz Radio-represented stations to over 200, developed the non-wired radio network and formally organized the Katz Radio Network. This sales unit combined the Katz-represented stations on a customized basis to fit a particular advertiser's audience and demographic needs. Furthermore, the advertiser was offered the convenience of one invoice and could thus avoid dealing with hundreds of stations individually. It was part of Greenwald's marketing plan to make radio advertising easier to plan and buy.

Radio audience research was another Katz Radio innovation fostered by Greenwald. He strongly believed that radio should not sell against newspapers and other media but rather with them. Under his leadership, the Katz Radio Probe Research System was developed in 1975 using early computer technology; the system demonstrated how a radio schedule could enhance the reach of a newspaper buy by utilizing a relatively small portion of the newspaper budget. Later, the same concept was enhanced to include the combination of radio with television and outdoor, and the name Katz Probe Media Mix was created.

By the end of the 1970s, Greenwald had been promoted to executive vice president of the corporate entity, Katz Communications. His responsibilities were expanded to include the Katz Television representation. However, he never removed himself from close contact with and oversight of the radio division.

In 1976 Katz Radio, with Greenwald's support, took the bold step of representing more than one station in a single market when it simultaneously served WRNG and WGST in

Atlanta and later WAIT-AM and WLAK-FM in Chicago. Greenwald reasoned that two weak stations had a better chance of getting larger budgets if they combined their sales pitch. The concept of dual representation quickly spread within Katz markets, because even though exclusive representation was considered desirable by many owners, the huge advantages of the research, network sales operations, and the expansion of sales offices into regional territories was compelling to the stations. They understood that having a representative who could partner them with compatible stations would allow them to gain larger shares of budgets. This concept was the beginning of the consolidation of the representation industry and later of the radio industry in general.

Greenwald was instrumental in establishing an employee stock ownership plan at Katz that made the purchase of the firm from the Katz family possible, and Katz became the first employee-owned station representative firm in the industry.

The next giant step for Katz under Greenwald's leadership came in 1984, when Katz Communications purchased Christal Radio Sales from Robert Duffy. Katz-owned representation companies now competed directly against one another in nearly all of the top 100 radio markets. Katz also purchased the Jack Masla Company, Eastman Radio, Blair Radio, RKO Radio Sales, and Metro Radio Sales. These purchases set in motion the total consolidation of the radio representation industry. By 1992 there were only three major national representatives, Katz Radio Group, Interep, and Columbia Broadcasting System (CBS) Radio Spot Sales. CBS Radio Spot Sales was sold to Interep in 1995, leaving just two.

From his position as executive vice president of Katz Communications, Greenwald went on to become chairman, president, and chief executive officer of the newly named Katz Media Corporation. During Greenwald's tenure as the leader of the company, Katz entered broadcast ownership for the first time in its 100-year history when it purchased Park City Communications from Richard Ferguson in 1982. Katz sold the radio group in 1986. During his leadership of Katz Media Corporation, Greenwald expanded Katz Television into dual-ownership representation within a single market; purchased Seltel, a competing television representation firm; and instituted many of the innovative selling and research strategies created during his tenure at Katz Radio. Greenwald retired in 1995 and remains chairman emeritus of Katz Media Corporation.

Ground Wave

A ground wave is a radio signal that propagates along the surface of the earth. It is one of two basic types of AM signal propagation, the other being the sky wave, which travels skyward from the transmitting antenna and then may be refracted back toward earth by the atmosphere. The behavioral characteristics of both types of wave are important both to frequency allocation and to the nature of various radio services.

The term *ground wave* includes three different types of waves: surface waves, direct waves, and ground-reflected waves. Surface waves travel directly along the surface of the earth, following terrain features such as hills and valleys. Direct waves follow a “line-of-sight” path directly from the transmitting antenna to the receiving antenna, and ground-reflected waves actually bounce off the surface of the earth.

Both ground-wave and sky-wave signals can be used to provide radio communication. The distance each type of signal can travel is determined by a number of factors, among them frequency, power, atmospheric conditions, time, and—in the case of ground waves—terrain and soil conductivity.

The principal determinant of which type of signal provides the communication is transmitting frequency. At very low frequencies (below 300 kilohertz), signal propagation takes place mostly by surface ground waves, which at these frequencies may provide a reliable signal for several thousand miles. At medium frequencies (300 kilohertz to 3 megahertz), surface ground waves may propagate hundreds of miles, and sky waves may travel thousands of miles. At high frequencies (3 to 30 megahertz), sky waves provide the principal means of signal propagation, and they may provide usable signals for many thousands of miles. At very high frequencies (30 megahertz and above), propagation is largely by ground-reflected and direct ground waves, although at these frequencies the waves generally travel less than 100 miles.

The standard broadcast (AM) band (535–1705 kilohertz) is a medium-frequency band and is thus characterized by both ground-wave and sky-wave signals. During the day, AM propagation takes place mainly by ground-wave signals; sky-wave

signals generally travel through the atmosphere and into space. However, during night-time hours, changes in a portion of the ionosphere known as the Kennelly–Heavyside layer cause the sky waves to be reflected back toward the earth’s surface. These refracted sky waves can then provide usable service over many hundreds—or even thousands—of miles, although sky waves are generally more susceptible to interference and fading than are ground waves. A certain amount of AM sky-wave propagation also takes place in the hours immediately before sunset and immediately after sunrise. In contrast, propagation in the FM band (88–108 megahertz) takes place by line-of-sight or near-line-of-sight direct and ground-reflected ground waves only.

The complexities of signal propagation in the AM band have presented significant challenges for the allocation of frequencies since the inception of broadcasting in the 1920s. Primary among these, of course, is the presence of both ground-wave and sky-wave signals at various times of the day. The Federal Communications Commission (FCC) has established three service area categories for AM stations: (1) primary service area, in which the ground-wave signal is not subject to objectionable interference or fading; (2) intermittent service area, in which the ground-wave signal may be subject to some interference or fading; and (3) secondary service area, in which the sky-wave signal is not subject to objectionable interference.

Another significant factor is that AM signals—both ground-wave and sky-wave signals—can cause objectionable interference over a much wider area than that for which they can provide usable service. For example, although a given station may not be able to provide a listenable signal more than 50 miles from its transmitter, that station’s signal can still create objectionable interference to other stations on the same frequency over a much wider area. Signals in the FM band do not create this type of wide-area interference, and thus FM stations can be placed geographically closer together on the same frequency.

Perhaps the best illustration of the problems of allocation in the AM band is the dispute over clear channel stations, which began in the 1930s and was not completely resolved until 1980. Clear channel stations were originally created to provide wide-area service to rural audiences through their vast secondary service areas; other stations that were assigned to clear channel frequencies had to sign off at sunset in order to avoid interfering with the dominant stations' sky-wave signals. Clear channel stations sought to maintain and enhance their status by seeking power increases and the maintenance of their clear night-time frequencies. Other classes of stations called for the "breakdown" of clear channels by adding more stations to clear frequencies and by allowing daytime-only stations to broadcast full-time. At the heart of this dispute was an engineering argument over the best way to provide radio service to isolated areas: Clear channel stations maintained that the only way to provide effective rural service was by increasing the power of clear channel stations so that their secondary service areas would expand. On the other hand, other classes of stations called for more stations, located in close geographic proximity to the isolated rural areas, to provide ground-wave service to those areas.

Ultimately, the FCC decided to assign additional full-time stations to use clear channel frequencies, but the FCC protected a substantial portion of the clear channel stations' existing secondary service areas (a roughly 700- to 750-mile radius). Only clear channel stations (now called "Class A" stations) receive protection from interference in their secondary service areas.

The characteristics of ground waves and sky waves are in many cases the determining factors in the purposes for which radio services at various frequencies are used. AM broadcast service can provide reliable ground-wave communication at all times of the day and somewhat less reliable sky-wave communication at night. FM broadcast service can provide reliable line-of-sight service over shorter distances, with less blanketing of interference. Broadcasters in high-frequency bands (short-wave) can provide international sky-wave service.

Group W

Westinghouse Radio Stations

Westinghouse Broadcasting (Group W after 1963) remained active in radio broadcasting longer than any other company—beginning with the initial airing of Pittsburgh's KDKA in November 1920 and lasting into the late 1990s. Thanks to constant retelling of the KDKA story, the earliest years of Westinghouse Broadcasting are well known, but throughout the history of broadcasting the company was an important owner of both radio and later television stations, eventually merging into the once-independent Columbia Broadcasting System (CBS) network.

Getting into Radio (to 1931)

A Westinghouse engineer, Frank Conrad, had been experimenting with wireless for a number of years, and in 1919–20 he operated amateur station 8XK, playing recorded music one or two nights a week. A September 1920 newspaper advertisement by a local department store seeking to sell receivers to people who wanted to hear Conrad's broadcasts caught the eye of Harry Phillips Davis, a Westinghouse vice president in charge of radio work. Davis perceived that making receivers

for a possible new radio service could be the answer to Westinghouse's predicament. He urged Conrad to develop his hobby station into something bigger, and the inauguration of station KDKA on 2 November 1920 was the result.

The success of that initial operation led Davis to the development of a second station, WJZ, at the company meter plant in Newark, New Jersey, in September 1921 (the station was sold to the Radio Corporation of America [RCA] a year later). In the same month, station WBZ took to the air in Springfield, Massachusetts, followed by station KYW in Chicago in December and by WBZA in Boston in 1924. These pioneering outlets made Westinghouse an important early station operator that pioneered many types of program service.

Westinghouse stations were initially located at the factories, which meant that early performers had to learn to entertain in a room filled with electronic equipment, with only an engineer as their audience. Ultimately, the studios were moved to more aesthetically pleasing locations, such as hotels or office buildings.

Experimenting with the potential of shortwave technology, Westinghouse placed KFKX on the air in Hastings, Nebraska, in 1923 to make KDKA's signal more widely available. Another experimental shortwave station, W8XK, was established in Pittsburgh and was soon broadcasting 18 hours per day including a "far north" service to the Arctic. It was joined in 1930 by yet a third station, W1XAZ, in East Springfield, Massachusetts. By the late 1920s, Westinghouse was also pioneering in television research.

Evans Years (1931–55)

On Davis' death in 1931, Walter Evans became the next Westinghouse radio chief. He had joined the company as chief of operations in 1929 and would serve for more than two decades. Evans took a different approach to managing the company's stations and in 1933 signed a contract with the National Broadcasting Company (NBC) network to manage them all, including provision of all local and national programs selling advertising time. The agreement lasted until 1940, when it ended as part of the Federal Communications Commission's (FCC) investigation of national networks, and Westinghouse took over day-to-day operations itself.

Westinghouse operations expanded in the prewar years. Station KYW was moved from Chicago to Philadelphia in late 1934 as part of a deal with the FCC to provide service in underserved areas. Two years later, Westinghouse purchased its first station (it had built its previous operations), WOWO in Fort Wayne, Indiana, along with WGL in the same city, both of which were licensed to a new entity, Westinghouse Radio Stations (WRS). In 1940, WRS took control of all Westinghouse stations, separating the broadcast operations from other company functions.

Westinghouse shortwave (international) stations consolidated operations in Pittsburgh (8XS, which became WPIT in 1939 but closed a year later) and Boston (WIXT, which became WBOS). Westinghouse's international broadcasting was a multilingual operation that by late 1941 was providing 12 hours of programming a day: 5 hours to Europe and 7 to Latin America. Government programs expanded that total to 16 hours just a few months later. Early in 1942, the Boston station was taken over by the government's Office of War Information.

Westinghouse was an early player in FM radio: by 1943 the company owned five FM stations in cities where it also operated AM outlets. Original programming was provided on those FM facilities, but they had all reverted to simulcasting by the end of 1948. That same year, Westinghouse placed its first television station, WBZ-TV in Boston, on the air. As the operation continued to grow, the broadcast subsidiary's headquarters moved several times, finally ending up in New York in 1953, when it became known as Westinghouse Broadcasting Company (WBC), in part because of the addition of television.

McGannon Years (1955–81)

The man who served longest as head of the Westinghouse stations was Donald H. McGannon, who ran the operation from 1955 (after a few interim leaders) until 1981. McGannon soon earned a reputation as a man concerned about public service and program quality as well as profit. He brought Westinghouse back to Chicago with the 1956 purchase of WIND for \$5.3 million—at that point the highest price paid for a station. He also began a Washington news bureau to serve his stations in 1957. That same year WBC initiated an arts and classical music format from 4 P.M. to midnight on the four FM stations it still owned. But FM was then a weak service, and by 1970 Westinghouse was down to just two FM outlets, one in Boston and the other in Philadelphia, both programming classical music and suffering from a lack of promotion or advertising.

McGannon faced three serious policy crises early in his tenure. The first concerned Philadelphia's KYW AM and TV. Under at least an implied threat of losing NBC network affiliations for its Philadelphia and Boston television stations, Westinghouse agreed to "trade" its Philadelphia radio and television stations (KYW) for NBC outlets in smaller Cleveland in 1955. Over the next decade various business, FCC, and Congressional investigations brought to light the network threats that had created the deal, and it was undone in 1965, with the KYW stations returning to Philadelphia.

Two other problems briefly threatened Westinghouse licenses. Its Cleveland and Boston radio stations were implicated in the national payola scandal of the late 1950s, and several disc

jockeys were fired. Their activities figured in widely covered Congressional investigations. In 1961 antitrust price-fixing convictions against Westinghouse threatened the company's ownership of broadcast stations. Because of the independence of WBC from the parent manufacturing company, its licenses were renewed after several months of threatened FCC hearings. In mid-1963, WBC was renamed Group W.

Because the Westinghouse stations were situated in major cities, they produced sufficient revenue to allow for further acquisitions. In 1962, for example, Westinghouse shut down WBZA in Springfield (which had mainly been simulcasting the much more successful WBZ in Boston for years), making it possible to buy another station, KFWB in Los Angeles and by 1965 was offering an all-news format on WINS in New York. By the early 1960s, Westinghouse had begun using the term "Group W" to make its owned radio and TV stations more memorable.

A contemporary move was the successful implementation of all-news operations at three major-market radio stations. The conversion began with station WINS in New York, purchased in 1962, which suffered from a weak rock music format. Likewise, KYW had returned to Philadelphia to follow a weak decade of NBC station operation in its place. Westinghouse stations became known for a commitment to news and public affairs (Group W had operated its own news bureau in Washington, D.C., since 1957). All-news operations began KYW and WINS in 1965. KFWB in Los Angeles was purchased in 1966, and two years later it was also converted from rock music to an all-news format. Although not first with the format, Group W was the first to make it a lasting success in major markets.

Only toward the end of McGannon's tenure as Group W chief did the company begin to reconsider FM radio, which by 1980 was dominating national radio listening for the first time. That year Group W purchased two major-market Texas FM stations, KOAX (FM) in Dallas, which soon was renamed KQZY (FM), and KODA-FM in Houston. But although there were adjustments in station lineup, Group W's overall size and contribution to the Westinghouse bottom line (roughly 15 to 20 percent of annual revenues) remained remarkably stable.

Final Decades (1981–2000)

On McGannon's retirement, Daniel L. Ritchie became Group W's leader and served into the late 1980s, to be succeeded in turn by Burton B. Staniar. The expansion into FM continued with the purchase of KJQY (FM) in San Diego and KOSI (FM) in Denver in 1981. A San Antonio FM station, KQXT, was purchased in 1984; KMEO AM and FM in Phoenix were bought a year later; and WNEW-FM in New York was added to the Group W stable in 1989. Although some outlets were

spun off, the overall effect was to slowly grow the company—and to increase the proportion of FM to AM stations.

Group W switched AM outlets in Chicago as well. In the aftermath of Martin Luther King, Jr.'s 1968 assassination, WIND suspended popular on-air figure Howard Miller, whose statements about race and the police were becoming more strident. A breach of contract suit was settled out of court, but the station lost audience steadily for years thereafter and was sold in 1985 to a Spanish language broadcaster. Three years later, Group W purchased WMAQ, the one-time NBC outlet, thus resuming a role in Chicago radio.

In the late 1990s, Group W underwent a series of mergers and acquisitions that changed the face of the company and eventually caused it to disappear into other entities. The process began with the 1995 purchase by Westinghouse Electric of the weakened CBS network from Lawrence Tisch for \$5.4 billion dollars. The deal needed and received several cross-ownership waivers from the FCC, as the radio and television stations of Group W and the network were located in many of the same cities. The new entity controlled 39 radio stations, worth \$1.4–1.7 billion, and became the largest group owner in terms of revenues. In buying CBS, Westinghouse purchased a radio division that provided two services Westinghouse had been paying other companies to provide—network news and national sales representation.

In late 1996 CBS/Westinghouse merged with Infinity Broadcasting, combining under the CBS Radio Group name 83 stations, for a time the largest single ownership block in the industry. Over the next couple of years, Westinghouse sold off its traditional manufacturing base (power systems, which had been losing money, and electronic and environmental systems) and its original name to concentrate on the development of its radio and television holdings under the CBS name. The Group W trademark was briefly retained to identify technical support for television distribution and sports marketing, and as owner of record of six AM radio stations, the original KDKA (Pittsburgh), WBZ (Boston), and KYW (Philadelphia), as well as the later-acquired outlets WNEW (New York), WMAQ (Chicago), and KTWV (Houston).

By the turn of the 21st century, however, the radio group was operating under the Infinity name and the one-time Westinghouse (or Group W) stations were merely one integrated part of what had become the country's third largest group owner of radio stations.

Gunsmoke

Western Series

Gunsmoke, a western on the CBS Radio Network, was introduced at a time when most radio drama was disappearing. It not only lasted nearly a decade but also spawned television's longest-running drama series. *Gunsmoke's* devoted fans, who have praised its historical accuracy and realism, would likely attribute the program's longevity to its brilliant writing and acting. Others would say, "it's just a good story."

The stories on *Gunsmoke* provided the groundwork for the so-called adult western, a dominant TV genre for nearly 20 years. There were many radio westerns before *Gunsmoke*, particularly as daytime serials or evening programs, but most of them, such as the even longer-running *Lone Ranger*, were aimed primarily at a young audience.

Origins

Gunsmoke was the result of a collaboration between several writers and producers (all "urban oriented," according to William N. Robeson), including John Meston and producer Norman Macdonnell, who worked together at CBS from 1947 on *Escape* and other radio dramas. Robeson, who created *Escape*, admitted that that program was "pretty darned close to *Suspense*." Macdonnell was an assistant director with Robeson, and William Conrad was the announcer on *Escape*. With writer John Meston, several experimental western stories were tried between 1947 and 1950. In 1949 the team also produced two pilots of what they conceived of as an "adult western" with a hero named Mark Dillon.

The first *Gunsmoke* program came about when another program was abruptly canceled. Norman Macdonnell and writer Walter Brown Newman used elements from several of Macdonnell's earlier western stories to create "Billy the Kid," the first episode, which ran on 26 April 1952. Although unforeseen at the time, after "Billy the Kid" there would be 412 more episodes of *Gunsmoke*; the final show aired 18 June 1961.

Raymond Burr and Robert Stack (both of whom later became famous TV actors) were considered for the lead role, but at the last moment the job went to William Conrad. While he was the announcer on *Escape* and a veteran radio actor (he would also later star in several TV series), Conrad had just finished the movie *The Killers* and was considered a "heavy." In the pilot, the hero had to narrate much of the story in voice-over. Chester, his assistant, appeared in the first episode, but the part quickly grew larger, and the important characters of Doc and Miss Kitty evolved. From the first show to the last, *Gunsmoke* kept its cast of William Conrad as Marshal Matt Dillon, Georgia Ellis as Kitty Russell, Howard McNear as Doctor Charles Adams, and Parley Baer as Chester Wesley Proudfoot. While the relations between the four characters held the program together, it was the deep, booming voice of Conrad that provided the program's unmistakable signature. In addition to these regulars, veteran radio actors appeared in episode after episode.

Among fans of radio drama, *Gunsmoke* is considered the best western ever made. The series was marked by high-caliber writing and used only a score of authors during its entire run. Meston wrote 183 stories, and there were three years in which he wrote more than 45 episodes per year. His scripts often concerned the difficulties of frontier life, particularly for women.

After a light Christmastime show in 1952, Meston wrote "The Cabin," broadcast on 27 December, to assure the audience that *Gunsmoke* had not "gone soft." The episode concerned a young woman named Belle who had been raped. By the end of the program the marshal has killed the men who raped her (though this is not acted out explicitly) and is asked by the woman if he is married. "Too chancy," he replies. Matt tells Belle, "Don't let all this make you bitter, there are lot of good men in the world," and she replies, "So they say." As he heads back to Dodge, Matt ends by noting that the blizzard

Gunsmoke soundman Bill James beside William Conrad, who plays Marshall Dillon
Courtesy CBS Photo Archive

was gone but it was still bitter cold, "like riding through a vast tomb."

Most of the episodes end violently and tragically, usually with Matt being forced to kill someone. Meston said that violence was rampant in the Old West; there was no medicine, no sanitation, no heat, just sand, little water, and not much food. Meston's view may not be entirely accurate as history, but his shows appealed to an audience raised on the myths of the American West. Meston's scripts were also marked by their mostly factual treatment of Native Americans (called Indians in the shows). The stories often noted that Indians intermarried with whites, suffered as the buffalo were wiped out, were forced into virtual concentration camps, and that federal policy toward the Native Americans was to wipe them out. In "Sunday Supplement" (24 June 1956), a citizen of Dodge says to Matt, "Marshal, you're not standing up for a redskin are you?" Of course he was.

The 19 July 1954 episode, "The Queue," by Meston, is about a Chinese man who has come to Dodge. When others ridicule him and make nasty remarks about foreigners, Matt says, "Except for the Indians we're all foreigners here." Matt learns that the man speaks good English but feigns a Chinese accent because he knows it is expected of him. Kitty also talks of "darn few jobs that a woman couldn't do [she pauses] anywhere." Later the Chinese man is murdered (choked to death by his own pig tail, which is cut off) and robbed of a small box he always carries. Matt tracks down and kills the robbers. The box contains a faded paper indicating that the Chinese man had been honored for his service in the Army of the Potomac in the Civil War, and thus was awarded citizenship. Marshal Dillon suggests that the man be buried at a nearby army fort, whereas they just "plant" the two robbers he has just killed in "Boot Hill." The story was also produced as a first-season TV episode on 3 December 1955.

Although Meston was the principal writer, there were also many scripts by Les Crutchfield and Katherine Hite (Hite was one of the first women writers to work regularly on a western). The program frequently used three technicians creating sound effects. The sound patterns and music were often used to carry a program when the dialogue was sparse. Macdonnell noted that people who are working just don't talk all the time.

Within two years of its start, the program was a big hit for radio, which was losing programs, stars, and especially advertisers to television. *Gunsmoke* was sponsored by a cigarette company, and soon several other radio westerns appeared on the air. By 1957, however, most weeks' shows had no sponsor but only public service announcements and promotions for other CBS programs, and Meston was spending most of his time writing for the television version. A number of the early radio episodes were adapted for the TV program, which began on 10 September 1955. When it finished its run 20 years later, the TV series boasted 233 half-hour and 402 one-hour episodes. Later four made-for-TV movies were also produced. The final radio broadcast—a repeat—aired in June 1961 as the CBS announcer said matter-of-factly, "This concludes the series of *Gunsmoke*."

H

Ham Radio

Hobbyist or Amateur Radio Operators

The Federal Communications Commission (FCC) defines amateur radio operators as “qualified persons of any age who are interested in radio technique solely with a personal aim and without pecuniary interest.” Amateur operators are an international phenomenon. Since 1925, the International Amateur Radio Union (IARU) has championed their cause with governments around the world. In the United States, an early amateur radio pioneer named Hiram Percy Maxim organized the American Radio Relay League (ARRL) in 1914. The ARRL is a member of the IARU. There are currently more than 700,000 licensed amateur stations in the United States alone.

Since their beginnings in the early 1900s, amateur radio enthusiasts have also been known as “ham” radio operators. Historians are unsure of how the name came into common usage, but there is strong evidence that the term was bestowed by commercial telegraphers, who considered amateurs to be “ham-fisted”—that is, they sent Morse code very poorly. For many years, operators were also known in official circles as “Citizen Operators”—not to be confused with today’s Citizens Band (CB) radio operators.

Although he clearly had commercial interests in mind, the first amateur radio operator was arguably Guglielmo Marconi himself. Until about 1908, all radio experimenters hoped to capitalize on wireless communication. When Marconi successfully sent a wireless signal across the Atlantic in 1901, he used equipment of the same type used by radio hobbyists.

Origins

The history of amateur radio is in essence the history of all wireless communication. Amateurs developed many of the processes key to electronic communication and refined others. In 1909, when the first radio clubs were formed, radio frequency energy was generated by allowing a spark to jump across a wide gap. The frequencies used at the time were in the

range of today’s commercial AM broadcast band and below (300–6,000 meters).

With the onset of U.S. participation in World War I in early 1917, amateurs in the United States were ordered to dismantle their facilities for the duration of the conflict. Technical developments during the war included the replacement of spark-gap transmission with continuous-wave (vacuum-tube powered) transmission. The bandwidth of such emissions is much narrower, is not as prone to interference, and allows clear voice operation. The celebrated November 1920 broadcasts of pioneer station KDKA in Pittsburgh, Pennsylvania, began as experimental amateur programs under the call sign 8XK. The radio transmission of the Dempsey–Carpenter boxing match in 1921, another milestone in early radio, was organized by the National Amateur Wireless Association.

During this period, the issue of who controlled the airwaves was very unclear. In 1926 a federal court declared the only existing law, the Radio Act of 1912, to be essentially unenforceable. The Radio Act of 1927 created the Federal Radio Commission and federal statutes using the word *amateur* for the first time. The Communications Act of 1934 (which later created the Federal Communications Commission) continued many of the FRC’s policies and precedents, including licensing of amateurs.

All amateur activity was again suspended when the United States entered World War II in late 1941; amateurs were only allowed back on the air on 15 November 1945. Within those four years, wartime research opened up new communication options. Single sideband (SSB)—a mode of voice transmission in which the carrier and one of the duplicate sidebands are suppressed—was described in *QST* magazine in 1948. (*QST*, defined as a signal meaning “Calling All Radio Amateurs,” is the official house organ of the ARRL.) The popularity and advantages of SSB transmissions were well established by 1960. While most amateur equipment was still powered by

vacuum tubes, transistor technology was beginning to appear in both commercial and self-built equipment.

Amateur radio has always been attractive not only to the general citizenry, but also to the rich and famous. Howard Hughes was a licensed amateur radio operator. Senator Barry Goldwater (K7UGA/K3UIG) tried to become the first ham in the White House. Heads of state include the late King Hussein of Jordan (JY1), who encouraged amateur radio as a means of providing technical education for the citizens in his country. Noted radio broadcaster Jean Shepherd (K2ORS) was a very active amateur radio operator. The son of President Herbert Hoover was eventually elected as the president of the ARRL. Marlon Brando operated on the amateur bands from his South Sea compound for many years. Owen Garriott (W5LFL) became the first amateur to operate on board a space shuttle in 1983.

Licensing

With the pressure on the U.S. government to cut costs, in 1984 the FCC created the Volunteer Examiner Program. Tests for all classes of amateur licenses (which were once handled by the FCC) are now administered by approved volunteer examiner programs. In 1991 the privileged place of Morse code, long a tradition and requirement for an amateur license, finally yielded to the first code-free amateur radio license. The FCC administers six classes of operator license, each authorizing varying levels of privileges. The higher classes still require knowledge of Morse code.

In the United States, amateur call signs once consisted of the letter "W" and a numeral from 1 to 0, followed by two or three alphabetic characters. (The numerals 1 through 9 are used and roughly translate to geographical regions. For example, the ninth call area includes Illinois, Indiana, and Wisconsin. The numeral 0 [zero] is also used for the tenth call area.) These replaced the earliest call signs, which consisted of only the numeral and the following letters—often the operator's initials. Prior to World War II, the United States agreed to begin all call signs with prefix letters assigned by international agreement. By 1953, all possible W call signs had been issued, and the K prefix came into use. Today, prefixes include combinations of the letters W and K, followed by other letters in the alphabet as demand requires. The N prefix is also in use, as well as A.

New Directions

In 1961, through the efforts of a group of amateur operators collectively known as Project OSCAR (Orbiting Satellite Carrying Amateur Radio), thousands of amateur operators around the world listened in on the 50-milliwatt Morse code beacon of OSCAR I as it sent its "HI" message. The relative speed of the

code transmitted rudimentary telemetry and told of the condition of the satellite.

The OSCAR satellite rode into space in place of "ballast" on a regularly scheduled rocket launch. Current OSCAR satellites rival early commercial communication satellites (such as Telstar and others) in that they have the capability to relay both voice and data transmissions over half the planet simultaneously. OSCAR satellite experiments in the 1970s served as a prototype for the Global Positioning Satellite Service. Amateurs have also pioneered communication by bouncing signals off of the Earth's moon, off the tails of comets, and via reflection from the aurora borealis. Schoolchildren participate in direct communication with the space shuttle via amateur radio stations.

Morse code, the basis of all early wireless communication, is a very rudimentary form of digital communication. With an abundance of surplus equipment available after World War II, amateur operators adapted teleprinter systems to work via their stations. Later, radioteletype transmissions switched from the five-bit Baudot code to standard ASCII code.

By the early 1980s, with the interest in computers and the availability of components at hobbyist prices, a group of both Canadian and U.S. amateur operators began experimenting with advanced forms of digital communication. Their efforts would eventually lead to the creation of the AX.25 packet protocol—a wireless version of the X.25 protocol that underpinned much of the data communication through the end of the 20th century. Some OSCAR satellites (known as PACSATs or Packet Satellites) are even capable of relaying packet transmissions. Amateurs also experiment with spread-spectrum technologies. This system spreads the information in a transmitted signal over a wide frequency range. While it is not an efficient use of radio spectrum, its attraction is that it can coexist with narrowband signals using the same frequency range. To narrowband users, the spread spectrum signal appears only as a slight increase in noise level.

The Future

In spite of dire predictions during the 1980s that amateur radio was dying, the number of amateurs in the United States alone by the end of the 1990s stood at 710,000, nearly triple the number of amateurs in 1970. The code-free license, in combination with the popularity of low-cost very-high-frequency (VHF) and UHF portable transceivers and repeater stations, fueled much of the expansion. Growth of the internet, low-cost cellular phone communication, and other new technologies serve as a formidable detractor to future growth, but many amateurs have learned unique ways to marry the two forms of communication. Amateurs have developed shortwave radios and scanners that can be controlled remotely over the worldwide web. Another group provides a real-time experimental

navigational service that locates participating amateurs and displays the results on a graphical web interface. Messages move freely from the internet to amateur satellites to amateur packet repeaters. Amateur radio will likely continue to adapt and endure for many years to come.

Harvey, Paul 1918-

U.S. Radio Personality

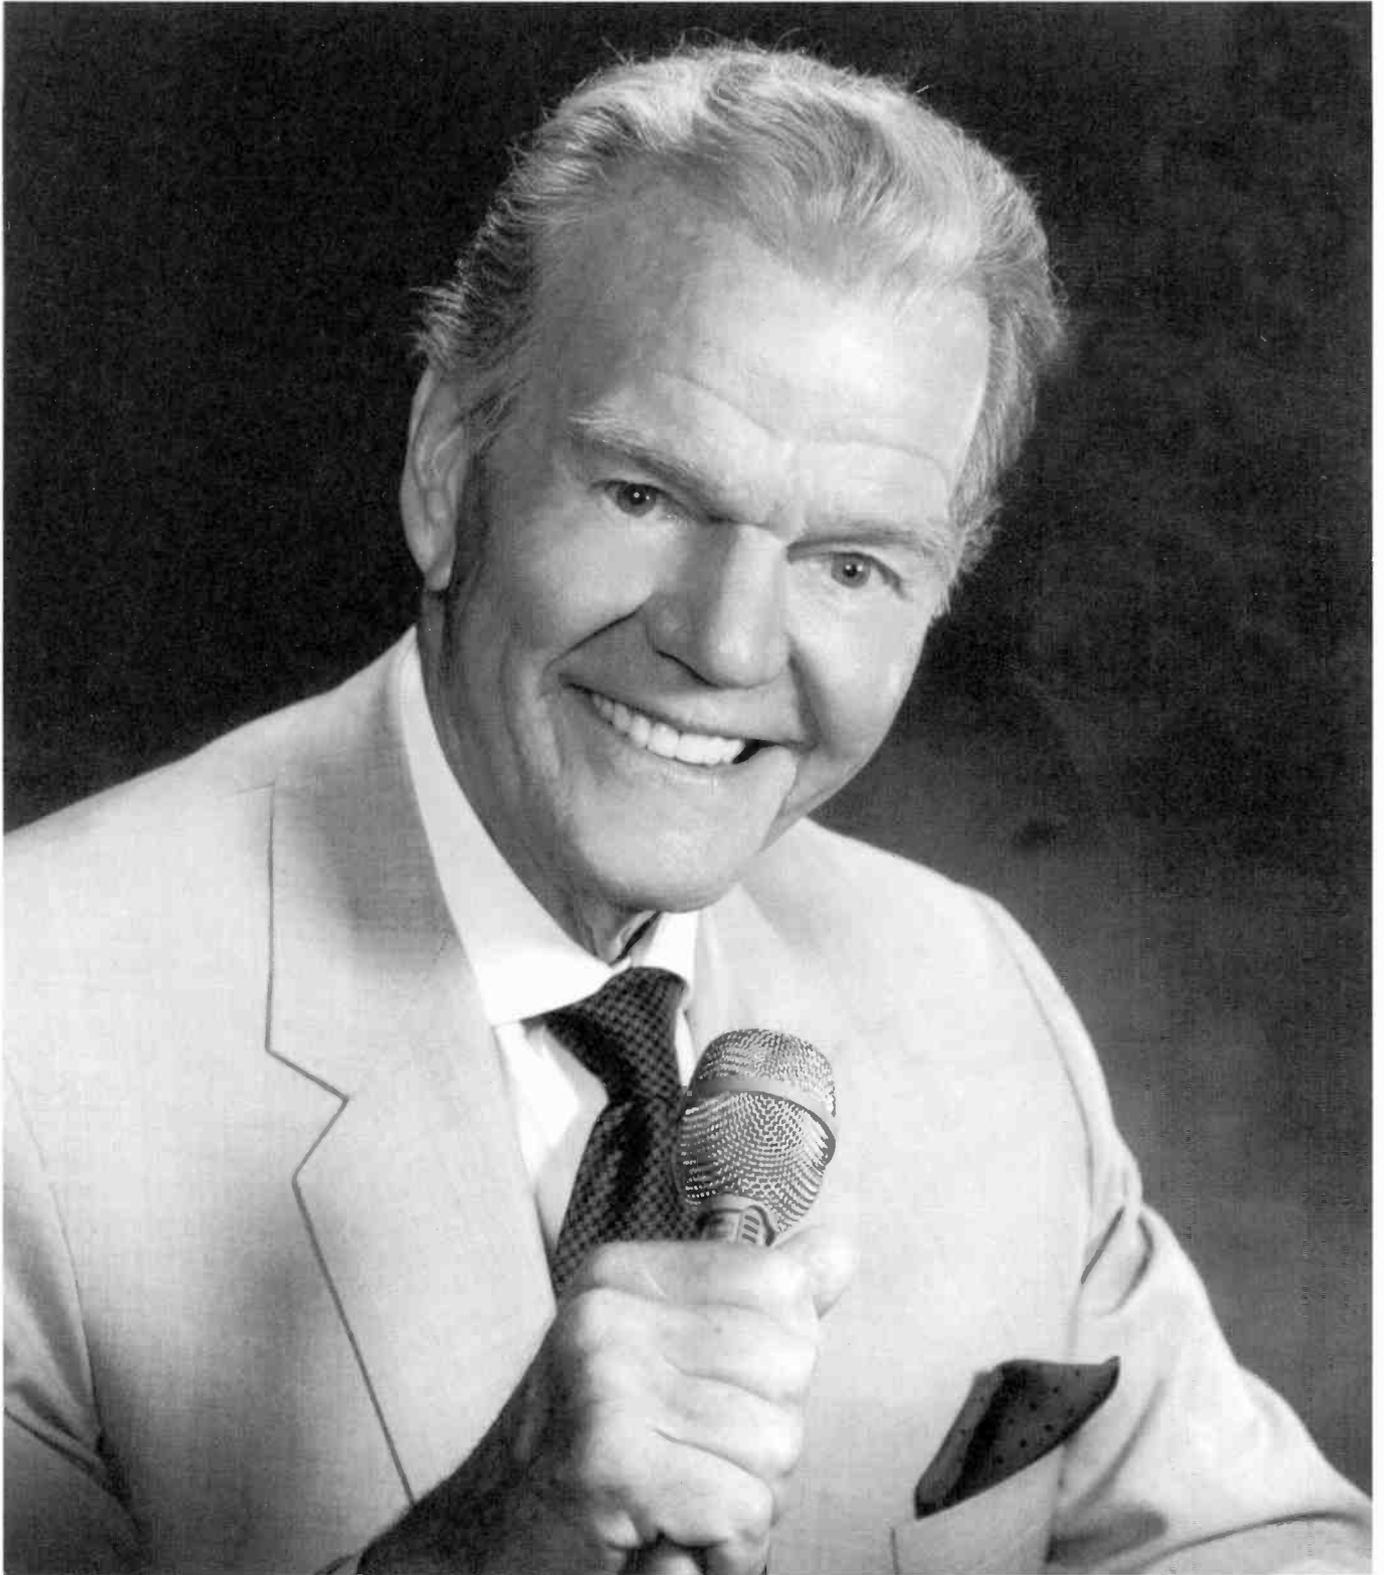

Six days a week, some 1,300 radio stations across the United States air Paul Harvey's *News and Comment* and *The Rest of the Story* radio programs. Twenty-four million listeners tune in to hear his combination of news and views.

Harvey was born Paul Harvey Aurandt in Tulsa, Oklahoma, in September 1918. Harvey and his sister were raised by his mother after his police officer father was killed in action when the boy was three years old. His interest in radio first emerged when he built his own crystal radio sets as a boy. Harvey was a high school student and champion orator when an English teacher encouraged him to go into broadcasting. Like others enamored of radio, he hung around and did odd jobs at a local station, KVOO-AM in Tulsa, until he was eventually hired. Harvey attended Tulsa University while still a staff announcer at KVOO, but a radio career proved more enticing than an academic degree.

In the mid-1930s and early 1940s Harvey worked at KFBI (Abilene, Kansas), KOMA (Oklahoma City), KXOK (St. Louis), and WKZO (Kalamazoo, Michigan), learning about

radio news, management, and programming. KXOK was the most memorable stop, as it was there that Harvey met his wife-to-be, a young student teacher named Lynne Cooper. He proposed to "Angel" (his pet name for Lynne) on their first date, and they married on 4 June 1940. Angel would become an energetic business partner as both producer of Paul Harvey's *News and Comment* and president of Paulyne Productions.

In late 1943 Harvey enlisted in the U.S. Army Air Corps, but he was given an honorable medical discharge just a few months later, after an obstacle course injury ended his military service. Heading back into broadcasting by 1944, Harvey was attracted to Chicago because it was home to several famous broadcasters and was the originating city for many national radio programs. Harvey hoped to move into "major market" broadcasting with his news reporting and radio drama skills. While he was in Chicago, two important events took place. First, he dropped his last name to become the more radio-friendly "Paul Harvey." Second, on the advice of his wife, he no longer did radio plays and concentrated on radio news. He

Paul Harvey
Courtesy of Paul Harvey News

was given a 10 P.M. news slot on WENR-AM and within a year was at the top of the ratings in Chicago.

Depending on which source is used, Harvey was propelled into network broadcasting either by Joseph P. Kennedy or by Harvey's wife, Lynne. One story suggests that the elder Kennedy befriended Harvey and urged the new ABC network to use him as a substitute broadcaster. His newscasts were so well liked by the affiliate stations that he was put on the network schedule by popular demand. The other story indicates that Harvey's wife persuaded an advertising agency to sponsor his broadcasts on the same network. In either case, 1951 marked the beginning of Paul Harvey's *News and Comment* on network radio.

Harvey's program is a blend of news of the day, trivia, amusing small-town yarns, and inspirational narratives. Some of the appeal of his program comes from the entertaining stories that Harvey composes. He has said that he applies the "Aunt Betty" test to his radio copy. Aunt Betty (based on Harvey's sister-in-law) is your typical old-fashioned, Middle American housewife, and if his story content is perplexing for Aunt Betty, then he rewrites it using simpler words or throws it out entirely.

Perhaps more than skillful writing, it is the unmistakable, resonant voice and inimitable delivery style that draw his huge radio audience. Harvey has a rhythmic reading style that features a mastery of changing inflection, pace, and use of the dramatic pause. Each news program begins with the familiar, "Hello, Americans. This is Paul Harvey. Stand by . . . [pause] . . . for news!" According to Harvey, that pause came about by accident when he allowed "dead air" while waiting for the clock to be where it should be before beginning his actual newscast. That dramatic halt often shows up during the news to deliver the punch line to a story, and Harvey uses it again at the end of the newscast in his stock close, "Paul Harvey . . . [pause] . . . Good Day!"

In 1976, with the help of his son, Paul Jr., Harvey expanded a segment from his news program into a new program, *The Rest of the Story*. In *The Rest of the Story*, Harvey uses the patented Harvey delivery style to spin a human-interest tale about the life of a famous person or little-known facts about a well-known event. Presented as a mini-mystery, amusing anecdotes and facts tell the story, with the identity of the individual or event revealed only at the end. Two collections of these stories have made their way into print: *Paul Harvey's The Rest of the Story* and *More of Paul Harvey's The Rest of the Story*.

Radio has always been Harvey's mainstay, but he has also had a syndicated TV series, a newspaper column syndicated by *The Los Angeles Times*, and a weekly commentary on *Good Morning America*. He also still maintains an extensive speaking schedule at conventions and college campuses across the country.

Over the years, Harvey has not only reached millions of listeners, but he has been frequently recognized by the radio industry. He has won the prestigious Marconi Award four times as "Network Personality of the Year." The National Association of Broadcasters and the Museum of Broadcasting have both inducted him into their Halls of Fame. The National Radio Broadcasters Association and the International Radio and Television Society gave him the Golden Radio Award and the Gold Medal Award, respectively. Paul Harvey earned a Peabody Award in 1993 and, in 1998, was included by *George* magazine as one of "The Twentieth Century's Most Significant Americans."

Hate Radio

Extremist Views on the Air

The messages of extremists are no strangers to radio. From the medium's inception there have been those who have exploited the airwaves to promote their agendas of prejudice and hatred. Despite the obligation of broadcasters to operate as public trustees, programs featuring blatant contempt and unvarnished loathing for different racial, ethnic, religious, political, and lifestyle groups have long been aired. Malevolent and inhumane attitudes and beliefs have unfortunately comprised the core of thousands of radio broadcasts.

Early Rancor on the Air

Beginning in the early 1920s, a number of radio programs were promoting ideological, philosophical, and political rancor. The first nationally successful (and what many consider one of the most influential) use of the airwaves to spread political and social invective were the broadcasts of a Catholic priest, Father Charles E. Coughlin. Coughlin began his radio career in Detroit in 1926 and moved to the Columbia Broadcasting System (CBS) in 1930, where he established the format and approach that right-wing media personalities over the decades have emulated.

Similar to some televangelists today, Coughlin's approach was to target certain groups in order to obtain the support of others and to garner, through his radio talks, millions of dollars in donations. He railed against Jews, labor unions, immigrants, and racial minorities, stirring and reinforcing resentment and hate against these competitors for jobs and social status in pre-World War II, Depression-ridden America. He called for a nation of Christians who would rule politics and the economy. This type of language anticipated the rhetoric that would be employed by far-right radio personalities of the 1990s. Indeed, Coughlin was the forerunner of the Holocaust-deniers and neo-Nazis of today.

Many people think of Walter Winchell, arguably the best-known radio commentator of the 1930s–1950s era, as a precursor to modern radio's Rush Limbaughs. His radio show, begun in 1932, was ostensibly a gossip program, but it expanded into right-wing political commentary. His shows had a huge, loyal audience, and he could affect national policy and make or break an individual's career with a few seconds of on-air commentary. He spread rumors, set styles, waged feuds, and excoriated some politicians while promoting the programs of others; he articulated the public's moods, fears, and prejudices.

The differences between the so-called left and right radio commentators became more pronounced in the late 1940s, when Senator Joseph R. McCarthy (R-Wisconsin) began to exploit Cold War fears and exercised great influence on American thought and action, throwing fear and obeisance not only into the media industries—principally film, radio, and television—but also into leaders and opinion makers of the country. Almost all commentators either supported McCarthyism or, out of fear of being blacklisted, were afraid to criticize him or his methods.

Most commentators in the pre- through postwar era were similar to Fulton Lewis, Jr., who is considered by some as the predominant right-wing commentator of that time and to whom Rush Limbaugh is often compared. Lewis supported McCarthy's contention that the U.S. government was infiltrated by communists and that secret plots were being hatched by communist secret agents throughout the country. This view helped fuel the later witch-hunts that often resulted in the professional, if not mental and physical, destruction of those accused—nearly always without foundation—of being communist sympathizers or fellow travelers.

After McCarthyistic suppression and punishment were no longer a concern to the media and the counterculture of the

1960s began to emerge, the media reinstated some elements of free speech, including several news and public-affairs shows that dealt with controversial issues, and more talk shows. It was not until after full-service radio networks disappeared in the early 1950s and specialized limited-time networks consisting mostly of music took their place—along with community-targeted narrowcasting, also mostly music, on local stations—that talk show hosts with set opinions emerged in force.

The far right seemed to understand more fully than the middle or the left the power of talk radio and quickly deluged stations with calls and opinions and stimulated a demand for, as some put it, loud-mouthed right-wing talk show hosts. One such host was Joe Pyne, who became one of the most popular talk personalities in the country with glib, biting, and unabashedly opinionated comments. A number of hosts, such as Bob Grant, later became famous for using Pyne's caustic approach. Grant often referred to African-Americans as "savages" and used expletives about other targets freely. Grant attributed his reputation to show business techniques, not bigotry. Ira Blue, who hosted a talk show in San Francisco in the 1960s, openly admitted during his on-air reign that the radio talker succeeds most when he is brazenly opinionated.

As the 1950s and 1960s progressed, many right-wing talk show programs and hosts became more subtle, using twisted logic rather than blatant vituperation to persuade their audiences. Meanwhile, right-wing rancor on talk shows went in two distinct directions during the decades that followed. As the number of stations increased, more on-air opportunities existed for fringe advocates. Ranters and ravers, some affiliated with organizations dedicated to violence, found microphones available to them. At the same time, soft-spoken intellectuals dispensing the same bottom line also had their access.

Late Millennium Waves of Rancor

The 1990s saw the greatest rise in the use of radio by far-right extremist groups, among them white supremacists, armed militias, survivalists, conspiracy theorists, and neo-Nazis. Many of these groups had effectively used the shortwave radio medium to promote their dark agendas in the 1980s, and they sought to go more mainstream with their messages by utilizing the AM and FM bands in the 1990s. Dozens of broadcast stations around the country gave airtime to organizations and individuals intent on denigrating people of color as well as those with non-Christian religious orientations. The bulk of these stations were smaller AM outlets, many of which were battling for their economic survival in the face of vastly declining audi-

ences and shrinking revenues. Far-right programs were a source of income.

Today, far-right hate groups still promote their ideologies over radio stations, but not to the degree that they did prior to the Oklahoma City federal building bombing in 1995. This tragic extremist deed prompted the president to issue an anti-terrorism bill making it clear that anyone employing the airwaves to promote violence and hatred would be hunted down and prosecuted. Technology, however, provided right-wing radicals with yet another way to propagate their racist and antigovernment views. The internet soon became the new home and the preferred medium for hate groups, which relished the freedom and lack of censorship that cyberspace afforded them.

In 1996 a white supremacist organization calling itself Stormfront launched what is considered the first extremist website. A former grand dragon of the Ku Klux Klan, Don Black, operates the internet site, which also features a link for children—"Stormfront for Kids"—run by his 11-year-old son. Within four years, a nearly incalculable number of radical-right websites, replete with sophisticated graphics and chat rooms, were in full operation, and many claimed thousands of hits each week. Several watchdog groups, among them the Simon Weisenthal Center, the Anti-Defamation League, Political Research Associates, and the Southern Poverty Law Center, reported that many of the same organizations and individuals, once so dependent on the airwaves to get their messages out to the public, now download their proclamations of hatred to thousands of websites, thus relegating radio to a secondary medium for their egregious purposes. One cannot help but note an ironic analogy in this migration of radio users to another medium. However, one suspects that the impact of this conversion will be far less traumatic for radio than the one brought on by the rise of television.

Hear It Now

CBS Documentary Program

Hosted by esteemed newsman Edward R. Murrow, *Hear It Now* was more important in broadcasting's history than its mere six-month run on the Columbia Broadcasting System (CBS) radio network would suggest. The program developed from a series of successful documentary record albums and helped to pave the way for the even more important television documentary series *See It Now*, which presented some of Murrow's finest work.

The Recordings

The idea of making record albums featuring the actual sounds of historical events originated with Fred Friendly, a World War II veteran working as a producer for the National Broadcasting Company (NBC). Friendly saw that the relatively new medium of magnetic tape would make editing sounds recorded during historical events far easier. When Friendly realized that he needed a narrator for his recordings, CBS producer Jap Gude introduced him to newsman Edward R. Murrow and a team was born. Sometime around 1947, Friendly and Murrow approached Decca Records, but that firm was not interested in "talking" records, which were usually money losers. On the other hand, Columbia Records (a subsidiary of CBS) had available capacity as well as interest: a "scrapbook for the ear" they called it.

The initial recording, *I Can Hear It Now, 1933-1945*, was released in the winter of 1948 as a boxed set of five 78-rpm records (10 sides, about 45 minutes total). Murrow provided the historical context and narrated the many sound bites. There was no music or sound other than those of the actual events. To the surprise of virtually everyone involved in the project, the set sold 250,000 copies in the first year, highly unusual for talking records. It was said to be the first financially successful non-musical album.

A second album covering the postwar years (1945-48), with sound bites drawn largely from the extensive archives of the British Broadcasting Corporation (BBC), came out a year later, and a third, *I Can Hear It Now: 1919-32* (which did use actors for some events when recordings were not available), appeared in 1950. Although the reasons are no longer clear, plans for a fourth album were abandoned. All were issued as 78-rpm albums originally, but some were later reissued in long-playing (LP) format. The title was resurrected in the 1990s for *I Can Hear It Now: The Sixties*, a two-compact-disc set narrated by Walter Cronkite.

The Broadcasts

The idea of broadcasting recorded sounds of historical or present-day events was anything but new. It had been done for *The March of Time* series beginning in 1931, and was often used during World War II. But there had been limited use of such material in part due to the networks' long-standing ban on use of recordings on the air. Something of a pilot program existed in CBS files—a 1948 proposed "Sunday with Murrow" documentary that had never aired for lack of advertiser support. Murrow and Gude now proposed a new program, called simply *Hear It Now* to stress its current-events emphasis, for a half-hour time slot. CBS Chairman William S. Paley so liked the idea, however, that he urged them to make it an hour-long program. Part of the difference in acceptance from the 1948 attempt to 1950 was a change in world events: the Korean War had begun and people once again were interested in world events.

When CBS began to look for a producer for the series, Gude suggested Friendly and CBS hired him away from NBC while the second *I Can Hear It Now* record album was being made. It was an easy choice, given Friendly's role as producer for the recordings and with several radio documentaries for the senior network. The series also provided a vehicle for Murrow upon his return from reporting from the Korean War battlefield.

As it aired, *Hear It Now* included "columnists" covering different subjects: CBS correspondent Don Hollenbeck discussed the media, Abe Burrows dealt with entertainment, and sportscaster Red Barber covered professional teams in several sports. The program had an original musical score by U.S. composer Virgil Thomson. Murrow decided which topics would be included and the order in which they were presented, but he and Friendly wrote the program together. Friendly was the key editor of essential sound bites. The result was a "magazine of sorts, covering the news events of the previous six days in the voices of the newsmakers themselves, by transcription and hot live microphones" in an era before recordings of actual events were common in radio news (quoted in Dunning, 1998). *Show Business Weekly* said the program, which won a Peabody Award, was "almost breath-taking in scope and concept." It was carried on 173 CBS affiliates. Other networks quickly caught on to the idea and imitated it. NBC's *Voices and Events* and ABC's *Week Around the World* provided essentially the same sort of content, but without Murrow and Friendly.

Fred Friendly (left) and Edward R. Murrow on *Hear It Now*, 1950
 Courtesy CBS Photo Archive

In many ways, the program was a radio vehicle for Murrow, who was then little interested in (and indeed, uneasy about) television. But as the realization became clear that pictures would add considerably to the *Hear It Now* idea, the audio version left the air while video preparations began. *See it Now* premiered on 18 November 1951 and ran until 1955.

Heavy Metal/Active Rock Format

The "Heavy Metal/Active Rock" format encompasses a musical genre that has played a marginal role in commercial radio programming, while the medium of radio has at times played crucial roles in the acceptance, rejection, and content of the music itself. The moniker is the radio industry's term for a category that has gone in and out of style while maintaining a core fan subculture since heavy metal's emergence in the early 1970s. The music in this format is characterized by a distorted guitar sound, a heavy bass-and-drums rhythm section, and a vocal approach that eschews traditional melodic conventions in favor of an aggressive, emotionally raw sound. The name "heavy metal" was at first uncomfortably accepted by first-generation rock bands such as Led Zeppelin, Deep Purple, and Black Sabbath and later happily adopted by second-generation acts such as AC/DC, Kiss, Blue Öyster Cult, Motörhead, and others.

Initially, few heavy metal bands found a place on commercial radio. Commercial rock radio itself was only then taking shape on the FM dial, as progressive/free-form stations (such as WOR in New York and KMPX in San Francisco) gave way to the new album-oriented rock (AOR) format, at stations such as WNEW in New York and WMMS in Cleveland, designed to reach a larger listening and buying public. Thus, heavy metal was not welcome in the earlier progressive rock format that grew out of the late-1960s counterculture, whose ideology did not complement the nihilism of groups like Black Sabbath. A few bands, however, did find their place on the FM dial in the early 1970s. One band, Led Zeppelin, in fact became central to AOR playlists through much of the decade.

If radio largely ignored heavy metal during the 1970s, in the 1980s the format would find new popularity. By the late 1970s, music on the radio was still functioning much as it had earlier in the decade, due to the continuing influence of AOR, which increasingly programmed the most benign rock music to appeal to the largest audience possible. The heavy metal music that did find its way onto the airwaves was limited to a few songs played endlessly in a station's rotation. The effect was that a few songs on AOR radio came to stand in for heavy metal as a musical genre and in the process became emblematic of the genre's perceived creative bankruptcy by the end of the decade.

In the late 1970s, competition from new genres such as disco and punk had some influence on American radio formats, but both musical styles returned to the level of subculture within a few years. Meanwhile, heavy metal was being reinvigorated, first by British bands such as Def Leppard, Iron Maiden, and Judas Priest, and then by U.S. bands such as Quiet Riot and Guns N' Roses. By the mid-1980s, heavy metal from bands like Scorpions and Mötley Crüe could regularly be

heard on American radio. Still, some saw a certain sacrifice in the newfound popularity of the genre on the airwaves. The anticommercial heavy metal of the 1970s gave way, slowly but surely, to a new style sometimes derisively called "lite metal," which meant less emphasis on long instrumental breaks featuring virtuosic guitar solos and greater emphasis on radio-friendly melodies and more traditional pop song structures.

In recent years, the heavy metal format has struggled amidst the relative fragmentation of radio into new formats that have eroded a once-loyal listenership. The format has become one choice in a sea of others, and stations carrying the format increasingly find themselves fighting for audiences in an ever-smaller market share. The emergence of the classic rock format in the mid-1980s and the alternative rock format in the 1990s has meant the loss of both older listeners alienated by newer bands and younger listeners with little allegiance to older heavy metal. Interestingly, the classic rock format has largely not designated earlier heavy metal music as classic. Heavy metal radio was slow to incorporate the music of alternative rock formats after the "grunge" explosion of the 1990s, headed by bands such as Nirvana, Pearl Jam, and Soundgarden. While grunge had stylistic links to the heavy metal bands of the 1970s, it also embraced the punk aesthetic.

The music played on heavy metal radio in the late 1980s and early 1990s, in comparison, largely catered to the mainstream music industry. Alternative rock formats encroached on both heavy metal and classic rock listeners with the success of stations such as KNDD in Seattle and WHTZ in New York, both of which made significant gains in their respective radio markets. Later in the decade, newer bands stylistically associated with heavy metal, such as Limp Bizkit and Rage against the Machine, developed. These groups owed much to the emergence of hip-hop music as a predominant popular style in the 1990s. The heavy metal/active rock format has embraced these groups in order to garner younger listeners, while the format expands and absorbs influences in a confusing radio market environment.

As the radio industry continues to change and programmers again return to once-outmoded formats, it will be interesting to see whether the heavy metal/active rock format will thrive in the new fragmented format environment. Other new venues for radio, including both internet and low-power radio initiatives, may serve heavy metal music fans in ways that commercial radio cannot.

Herrold, Charles D. 1875–1948

U.S. Broadcasting Pioneer

Charles Herrold is a relatively little-known broadcasting pioneer whose most significant work took place between 1912 and 1917. Although today most historians believe Herrold's claim that he was the first to broadcast radio entertainment and information for an audience on a regularly scheduled, pre-announced basis, he is dismissed as a minor figure because he failed to have a long-lasting impact on the radio industry. Nevertheless, his early broadcasts show innovation and originality and are of interest because Herrold is symbolic of many of the early broadcast pioneers: unknown, underfinanced, and overshadowed by the major corporations that would control broadcasting beginning in 1920.

Herrold was born in 1875 in the Midwest and grew up in San Jose, California. In high school he was recognized by his teachers and classmates for his superior grasp of mechanical and scientific subjects. After graduation, he attended Stanford University in nearby Palo Alto, but he dropped out for health reasons. In 1900 Herrold set up an electrical manufacturing company in San Francisco, but when the Great Earthquake of 1906 destroyed his residence, he moved to Stockton, California, to teach at a technical college. Building on his work as an inventor and his experience with students, Herrold returned in 1909 to San Jose and opened a vocational school. The Herrold College of Wireless was a way to provide an income and at the same time to allow him access to the laboratory environment necessary to continue his research.

Like Lee de Forest, Reginald Fessenden, and others, Herrold was most interested in inventing a radiotelephone system that would make him rich and famous. His contributions to the technology of the radiotelephone were lacking in scientific originality, although his device did allow him to broadcast. As the inventor of an arc transmitting system, he spent years attempting to differentiate his system from that of Danish

inventor Valdemar Poulsen. Herrold received six U.S. patents for his devices, patents that certainly would have been challenged by the Poulsen people were it not for the fact that by 1917 the perfection of the vacuum tube as the basis of all future radiotelephones made such arc-based devices obsolete.

Early notice of Herrold's use of the radiotelephone to "broadcast" to an audience is a notarized statement by Herrold, published in an ad for wireless equipment in the 1910 catalog of the Electro-Importing Company: "We have been giving wireless phonograph concerts to amateur men in the Santa Clara Valley," a statement prophetic of what broadcasting was to become. And although his 1910 listeners were amateurs and hobbyists, he did broadcast to public audiences daily during the 1915 San Francisco World's Fair. But Herrold's most significant contribution was that between 1912 and 1917 he operated a radio station providing programs of information and entertainment for an audience on a regular schedule, many of them announced previously in the newspapers. That he accidentally stumbled onto what was to become radio broadcasting may have been a function of his role as the headmaster of a wireless trade school. Because Herrold had the responsibility of providing daily technical activities for hundreds of eager young boys, it is likely that the broadcasting of the popular music of the day by his students to an audience of friends, families, and possible future students was the cauldron from which broadcasting emerged, Charles Herrold style.

Interviews with former students indicate that Herrold was broadcasting to a sizable audience: "It was a religion for 'Prof' Herrold to have his equipment ready every Wednesday night at nine o'clock. He would have his records ready, all laid out, and what he wanted to say. And the public or listeners, it became a habit for them to wait for it," according to Herrold's assistant, Ray Newby. Recalled Newby in an interview with Gordon

Greb, "We even had a San Jose music store that supplied us records, of course free of charge, and I think we played them all. We would take the *Mercury-Herald* in San Jose, and we would read headlines and discuss them a little bit, just something to yak about and make it interesting at the same time, to develop an audience, I would say." A local news story of a typical Herrold broadcast illustrates the method:

For more than two hours they conducted a concert in Mr. Herrold's office, which was heard for many miles around. The music was played on a phonograph furnished by the Wiley B. Allen Music company. Immediately after the first record was played numerous amateurs from various points in the valley notified (the announcer) that they had heard the music distinctly. He gave the names of the records he had on hand and asked those listening to signify their choice (San Jose *Mercury-Herald*, 22 July 1912).

The question remains: if Herrold's was the first broadcasting station, why do not more people know about it? Some of the misunderstanding surrounding the "who was first" broadcasting claims can be traced to an early historian, George Clark. In 1921 Clark, RCA's in-house historian, dismissed the claims of all who broadcast before KDKA, because, as he wrote, "ordinary citizens" could not buy radios until KDKA, and therefore men like Herrold and de Forest were not really broadcasters, because their audiences were engineers or amateurs, not "citizens." Still, Herrold was the first to use radio to broadcast entertainment programs to an audience on a regular basis. He was not the first to broadcast pre-announced to an audience—that was Fessenden in 1906; he was not the first to broadcast election returns—that was de Forest in 1916; he was not the first to get a broadcast license—that was Conrad in 1920. Herrold returned to the air in 1921 licensed as KQW, ran the station until 1925, and later specialized in radio adver-

tising. During World War II, he worked as a janitor at the Oakland shipyards. He died in 1948. Until 1958, when his story was uncovered by San Jose journalism professor Gordon Greb, almost no one outside of northern California had ever heard of Charles Herrold.

Hertz, Heinrich 1857–1894

German Physicist

In a series of laboratory experiments in 1887–88, Heinrich Hertz verified James Clerk Maxwell's theory that electromagnetic waves, or wireless transmissions, existed, and that these invisible forms of radiant energy traveled at the speed of light. Hertz paved the way for the development of wireless radio communications by notables such as Edouard Branly, Sir Oliver

Lodge, Guglielmo Marconi, Reginald Fessenden, Sir John Ambrose Fleming, E.F.W. Alexanderson, and Lee de Forest.

Hertz's research placed the field of electrodynamics on a firm footing, sparked enormous activity among scientists, and laid the foundations for the development of wireless telegraphy. He showed that electricity could be propagated or trans-

mitted as electromagnetic waves through space (without wire connections) and could be detected at a point distant from the transmitting source. The discoveries that he described in his May 1888 paper "Electromagnetic Waves in Air and Their Reflection" would later move the scientific community to call these waves "Hertzian" in his honor.

Hertz began wireless research in 1879 just as mathematical physics began to be recognized as a separate subdiscipline in Germany. Hermann von Helmholtz was a pre-eminent figure in the 19th-century scientific renaissance in Germany and was Hertz's lifelong mentor in Munich. Helmholtz encouraged Hertz to participate in a competition designed to solve a problem posed by James Clerk Maxwell's theories. Hertz's active wireless experimentation began in 1886 while he was a faculty member at the Technische Hochschule (Technical High School) in Karlsruhe. His discoveries began as he was conducting a class demonstration in electricity.

Hertz experimented with gaps in a wire coil connected to a Leyden jar to generate waves at various frequencies. The inner and outer foils of the Leyden jar became the two arms of a dipole or two-part transmitting antenna. Hertz tuned two flat coils of wire or metal strips to the same frequency so that the waves generated and received were identical. The Leyden jar stored the electrical charges while an induction coil magnified them as the spark gap and metal plate radiated the charges into the ether (or across the metal-laden laboratory). Thus, Hertz demonstrated the transfer of energy that Maxwell had predicted.

Hertz conducted his experiments in less-than-ideal laboratory conditions: steel and lead in the lab affected his measurements. His scientific apparatus (use of a spark gap) was crude. He used simple laboratory devices and often built his own devices to confirm Maxwell's prediction that electromagnetic waves existed, both as light and radio waves. The physically confined space Hertz used for his experiments required him to work with fast laboratory oscillations and short wavelengths. Eventually, Hertz showed that, like light waves, electromagnetic waves were reflected and refracted and, most important, that they traveled at the speed of light but had a much longer wavelength.

European scientists were reluctant to accept the results of Hertz's experiments. Researchers were slow to see the significance of Hertzian waves and to accept his conclusion that such waves traveled at the speed of light. They tended to cling to older, more familiar concepts, such as the corpuscular theory of light, which implied that light traveled in the form of material particles. However, Hertz's mentor, Helmholtz, never wavered in his support for his protégé.

Hertz did influence several scientific studies and research efforts around the world. He was generally regarded not as an innovator but as an uncommonly critical and lucid intelligence who addressed the conceptual problems of physics. Hertz

helped connect the traditional study of mechanics and the evolving study of electrodynamics.

Other scientists credited Hertz for their achievements. Albert Einstein, in an 1899 letter to his fiancée, indicated that Hertz's *Electric Waves* stimulated his interest in the electrodynamics of moving bodies; this interest would ultimately lead to his special theory of relativity. Hertz's work on the photoelectric effect (although the existence of electrons was unknown at the time) helped to verify Einstein's quantum equation for the photoelectric effect and identified certain phenomena as being clearly associated with the ultraviolet portion of the spectrum. Hertz also influenced Max Planck's development of quantum physics by providing equations for the emission and absorption of energy by oscillators. Wilhelm Conrad Roentgen credits his discovery of X rays in late 1895 to Hertz and Lenard's cathode-ray experiments.

Hertz did not extend his work to include potential applications of his discoveries. He was not interested in going beyond the theoretical stage of study. His experimental work on electromagnetic waves, however, led directly to radio telegraphy and to later innovations. The material he read about Hertzian waves influenced Guglielmo Marconi significantly. Marconi became the practical inventor and took Hertz's studies further.

Hertz helped move wireless theories and experiments to practical reality and refinement. He helped formulate suggestions on the proper approach theoretical physicists should take toward the physical universe. He suggested future research to build on his discoveries. His fusion of theory and experiment with a creative interest in philosophical and logical foundations is unique among scientists. Hertz succeeded in delineating central concepts and pointing the way to fruitful future research initiatives, and his achievements were lauded in science publications, the popular press, and in public speeches. He was a model for many future generations of physicists.

Leading physicists of the day had profound respect for Hertz both as a physicist and as a man. John Ambrose Fleming, who would use Hertz's discoveries for his own experiments, noted that Hertz's work marked a fresh epoch in electrical discovery. Hertz's name is used internationally to indicate a unit of frequency (what had been called a cycle, as in kilocycle, is now hertz or kilohertz) in his honor.

Hertz's final years were devoted almost entirely to exploring the theoretical implications of Maxwell's electrodynamics for the rest of physics. While at the peak of his productivity, Hertz died tragically at age 37 of chronic blood poisoning. At his funeral in Hamburg, Hertz was praised for his noble simplicity and genuine modesty.

Heinrich Hertz was one of the last classical physicists. Had he lived longer, he would doubtless have been a major participant in the development of modern physics.

Heinrich Rudolf Hertz. Born in Hamburg, Germany, 22 February 1857. Attended private school of Richard Lange, 1863 and 1872–74; admitted to upper class of *Johanneum Gymnasium*, Hamburg, 1874; began engineering studies at Dresden Polytechnic, 1876; switched from engineering to physics at University of Munich, 1877–78; attended Friedrich-Wilhelm University, Berlin, doctoral degree *magna cum laude*, 1880; Master builder intern, Frankfurt Public Works Department, 1875–76; military service with railway regiment, Berlin, 1876–77; assistantship with Hermann von Helmholtz, Berlin Physics Institute, 1880–83; lecturer, mathematical physics, Kiel, 1883; appointed professor of physics, Technische Hochschule in Karlsruhe, 1885; appointed professor of physics, Friedrich-Wilhelm University, Bonn, 1888. Received Philosophical Faculty prize, 1879 (leading to the discovery of electromagnetic waves); Matteucci Medal, Italian Scientific Society, 1888; Baumgartner Prize, Vienna Academy of Sciences, 1889; La Caze Prize, Paris Academy of Sciences, 1889; Rumford Medal, British Royal Society, 1890; Bressa Prize, Turin Royal Academy, 1891; elected corresponding member of several major scientific societies, including the Berlin Academy of Sciences, the Manchester Literary and Philosophical Society, the Cambridge Philosophical Society, and the Accademia dei Lincei; official adoption by the International Electrotechnical Commission of the name *hertz* as a unit of frequency, 1933. Died in Bonn, Germany, 1 January 1894.

Hicks, Tom 1946–

U.S. Broadcast Executive

Thomas O. "Tom" Hicks is the president and chief executive officer (CEO) of Hicks, Muse, Tate, and Furst, a Dallas-based leveraged-buyout firm. At one point during the late 1990s, Hicks and his investment firm held ownership interests in more radio stations in the United States than any other company or individual. Hicks, Muse, Tate, and Furst came into existence in 1989 when Hicks and three partners formed the private investment firm after several successful industry buyouts. Today, the portfolio of companies controlled by the firm includes real

estate, consumer products, movie theaters, sports franchises, and broadcast stations.

Hicks became a common name in the radio industry during the 1990s, when he served as CEO for AMFM Incorporated, formerly Chancellor Media Company. Under Hicks, Chancellor invested heavily in radio prior to the passage of the 1996 Telecommunications Act. With the elimination of ownership limits under the new legislation, Chancellor was well positioned to take advantage of further consolidation in radio.

Within a few months, Chancellor became one of the largest radio operators in the United States, at one point owning more than 400 radio stations.

Thomas O. Hicks was born in 1946 in Houston, Texas. One of four sons of a Dallas media representative, Hicks grew up with a strong understanding of and appreciation for the radio business. His father became an owner of a few radio stations in a number of small Texas markets, including Beaumont, Bryan, Port Arthur, Laredo, and Big Springs. As a teenager, Hicks worked as a radio announcer at his father's station in Port Arthur. Following high school, Hicks graduated from the University of Texas with a business degree in 1968. He then moved west, completing a master's of business administration degree at the University of Southern California.

Hicks and his partner, Bobby Haas, established a strong reputation for putting together profitable deals for investors, acquiring companies such as Dr. Pepper, Sybron Corporation, 7-Up, Thermadyne Industries, and Spectradyne. In 1989 Hicks formed Hicks, Muse, Tate, and Furst, as a venture capital firm with a buy-and-build philosophy.

Hicks began acquiring radio stations in earnest in 1993, with Chancellor Broadcasting and CapStar Broadcasting forming the cornerstones of the radio group as part of Hicks, Muse, Tate, and Furst's overall investment strategy. Acquisitions continued in 1996 and 1997 as Chancellor was renamed Chancellor Media. The company acquired several existing radio group holdings, including Evergreen, SFX, and Viacom.

The firm also ventured into television with the purchase of stations owned by LIN Television, as well as several outdoor advertising companies. In July 1999 shareholders approved the merger of the former Chancellor Media and CapStar into a new company known as AMFM Incorporated to reflect the emphasis on radio as well as to match the name of the company's national radio network. Early in 1999, AMFM owned 460 radio stations.

Aside from being one of the largest radio owners in the country, Hicks established a new type of entrepreneurial spirit in the radio industry. By clustering stations in geographical areas and appealing to different target audiences, Hicks capitalized on the changing economics of radio and the resultant cash flow that would come with streamlined operations. In an interview published in *Broadcasting and Cable* in 1997, Hicks called radio "one of the all-time great businesses for pre-cash flows." Hicks understood that by clustering operations, fixed costs could be lowered, while profit margins would increase.

Hicks' business philosophy toward radio spurred other groups to consolidation in order to maintain a national presence in the radio industry. Hicks demonstrated to other investors that radio was still a profitable investment. Although the consolidation movement in radio was not without controversy, there is no doubt that the radio industry experienced renewed

interest among the investment community and higher valuation as an industry group with Hicks as one of its leading advocates.

Throughout 1999, the stock value of AMFM remained flat amid investor concerns that the company was carrying too much debt. The company surprised the radio industry by disclosing in March 1999 that it would consider a possible sale or merger. In October 1999, a dramatic \$23.5 billion merger was announced between Clear Channel Communications and AMFM, creating the world's largest radio company. Once the merger was finalized in 2000, Clear Channel owned a total of 830 radio stations, capable of reaching an audience of more than 100 million listeners.

With the merger, Tom Hicks moved into a new role as the vice chairman of Clear Channel, working closely with Chairman L. Lowry Mays. Hicks remains one of the company's largest stockholders. Although he maintains less of a public role in his new position, he will continue to influence the radio industry with his presence on Clear Channel's board of directors.

High Fidelity

High fidelity is a term used to mean the highly accurate reproduction of sounds within the spectrum of human hearing, usually considered to be between 20 hertz and 20,000 hertz. English engineer Harold Hartley first applied the term in 1926. Much of today's understanding of what constitutes high fidelity reproduction stems from pioneering research into the way humans hear and interpret sound done by Harry Olsen for the Radio Corporation of America (RCA) and Harvey Fletcher at the American Telephone and Telegraph Company's (AT&T) Bell Laboratories.

Origins

Early sound reproduction devices such as Edison's cylindrical phonograph (1877) and Emile Berliner's Gramophone disk developed a decade later demonstrated the feasibility of recording, but they produced tinny sound with significant distortion and limited reproduction of voice and music. The near-simultaneous developments of radio broadcasting and sound motion pictures led engineers to search for ways to improve sound quality.

E.C. Wente's invention of the condenser microphone (1916) and improvements in loudspeaker technology by Rice and Kellogg at General Electric, Peter Jensen and others (1925) greatly improved the ability to record and reproduce audio. In the 1920s Edwin Armstrong's development of the heterodyne circuit improved the sensitivity and selectivity of radio receivers, and Harold Black's discovery of negative feedback provided improved audio reproduction, but several obstacles still prevented accurate reproduction of sound. The surface noise associated with records, coupled with their limited audio range and short playing time, sharply curtailed improvements in mechanical sound reproduction. AM radio transmissions were subject to significant noise and static interference. Engineers thought that reducing the audio bandwidth would reduce annoying whistles and associated distortions.

Simultaneous research into improved audio occurred in Britain, Germany, and the United States, but it was AT&T that spearheaded high-quality audio development. AT&T's Bell Laboratories undertook long-term development of sound reproduction in conjunction with high-quality long-distance telephone service. With the 1922 construction of WEA, AT&T's flagship New York City radio station, the telephone company carried out research to improve broadcasting microphones, consoles, and transmitters. Bell Labs also developed the transcription turntable using a slower speed (33 1/3 revolutions per minute) to increase playing time to 30 minutes to meet the needs of broadcasters and motion picture engineers.

By 1929 the introduction of the matched-impedance recorder, coupled with development of gold master records, increased the attainable frequency response to 10,000 Hz and greatly reduced surface noise for records.

By 1930 both RCA and Bell Labs were experimenting with various means of improving audio quality for records. One year later Leopold Stokowski, the famed conductor of the Philadelphia Orchestra, enlisted Bell Labs' help in setting up an audio test room at the Academy of Music. The first disk recordings capable of accurate sonic reproduction were cut with Stokowski's help, and Bell Labs made more than 125 high-quality recordings of the 1931-32 Philadelphia musical season. During this time Stokowski recorded the first binaural recording using AT&T's new two-styli cutter, developed by Arthur C. Keller, and in 1933 the first U.S. stereophonic transmission over telephone lines occurred when Bell Labs demonstrated a three-channel audio system in Constitution Hall in Washington, D.C. In 1938 Keller received a patent for a single-groove stereophonic disk record system.

Improving Radio

Although various advancements in the technology allowed AM radio to improve substantially, the narrow channel bandwidth adopted by the Federal Radio Commission and static interference problems created technical limitations to full high fidelity transmission. By 1935 radio stations that specialized in quality music were eager to adopt improved technology. The Federal Communications Commission (FCC) licensed four stations on three channels at the high end of the AM frequencies (in the 1500-1600 kHz region) to experiment with high fidelity broadcasting using a wider channel bandwidth. WHAM, a clear channel station that originated Rochester Philharmonic Orchestra broadcasts on the National Broadcasting Company's Blue Network, and WQXR in New York were among the early pioneers of high fidelity AM broadcasting. These stations used new Western Electric transmitters boasting better frequency response with a wider dynamic range. Improved radio receivers capable of better fidelity were manufactured by WHAM's parent company, Stromberg-Carlson, E.H. Scott, and others.

Regularly scheduled high fidelity FM broadcasts began on 18 July 1939 as Edwin Armstrong's station retransmitted classical music programs from New York's WQXR via special telephone lines. That same year, the Yankee radio network began high fidelity FM broadcasting, soon followed by General Electric and others. In 1944 Britain's Decca records introduced full fidelity recordings capable of reproducing most of the audio spectrum.

Hi-Fi Era

After World War II, rapid improvements in recording and playback technology accelerated the development of true high fidelity sound reproduction. Crosby Research and Ampex (1948) introduced high fidelity tape recorders. The broadcasting and recording industries quickly adopted these new machines. Columbia Records (1948) and RCA Victor (1949) revolutionized the record industry with their respective introduction of the 33 1/3 rpm long play album (LP) and the 45 rpm record. The new records used small microgrooves and a vinyl medium to reduce surface noise and improve fidelity. With the introduction of the LP, entire symphonic movements could be played at home without having to change records. Quality three-speed record changers developed by Webster-Chicago (Webcor), Voice of Music, and Garrard could play stacks of records without interruption. These innovations substantially improved the sound quality of recorded music, making affordable record players available to the general listening public. In 1950 Seeburg introduced its soon-legendary 100 series jukebox, boasting high fidelity amplifiers and large speakers and capable of playing 100 different 45 rpm selections. These jukeboxes were immediate hits with teens and helped usher in the era of the 45 hit single.

By the early 1950s all of the components necessary for accurate sound reproduction were available to consumers and the "high fidelity era" industry began. Fairchild and General Electric introduced magnetic phonograph cartridges, while Rek-O-Kut, Thorens, and Grado introduced specialized turntables and tone arms for audiophiles. Webcor's famous model 210 high fidelity tape recorder was introduced and specialized radio manufacturers such as Fisher, H.H. Scott, Macintosh, and Sherwood Labs began selling limited production high fidelity amplifiers and FM tuners. Speaker manufacturers improved the quality of home loudspeaker systems. Jensen's development of the SG-300 triaxial speaker (1949) and bass-reflex enclosure made it possible for enthusiasts to build their own high-quality systems, whereas AR introduced the acoustic suspension system (1954), capable of reproducing powerful bass with small bookshelf enclosures. Altec Lansing and JBL speakers became popular with audiophiles. Specialized magazines such as *High Fidelity* and *Audio* catered to the "hi-fi" enthusiast by reviewing the latest in audio equipment.

Commercial development of stereophonic sound continued throughout the 1950s, culminating with RCA Victor's intro-

duction of the stereophonic LP in 1958 and the FCC's approval of FM stereophonic broadcasting in early 1961. Combination AM/FM phonograph consoles gained popularity throughout the early 1960s, but with the introduction of transistorized equipment and new smaller sound formats such as the audio cassette (1963) and the 8-track (1966), compact stereophonic equipment eventually replaced larger console systems. Although four-channel record systems were introduced in the 1970s, they never received wide acceptance. By 1988 audio cassettes and compact discs were outselling LP records more than three to one.

The introduction of the compact disc player by Sony and Phillips ushered in the beginning of the digital audio era in 1982. Various digital recording formats, including digital audio tape systems (1986), recordable compact discs (1990), and minidisks (1992) currently provide the capability to make high fidelity recordings that are virtually indistinguishable from the original sound sources. Today, new broadcasting technologies such as satellite-based and in-band digital audio broadcasting and computer data compression advances suggest that even higher-quality broadcast distribution of music is on the horizon.

Hill, George Washington 1884–1946

U.S. Innovator in Radio Advertising

One of the key figures in the development of early radio advertising, George Washington Hill was a strong believer in using repetitive slogans to hammer home his products' benefits. His singular devotion to selling Lucky Strike cigarettes helped to underpin several popular network radio programs.

Hill was one of those larger than life figures who helped to shape both the tobacco industry and the advertising business. He grew up in the former as his father took on increasingly senior roles in the American Tobacco Company after it had been broken into 14 parts by a 1911 Supreme Court decision. In 1911, Hill became the vice president in charge of merchandising the company's products while his father served as president. On the senior Hill's death in 1925, G.W. Hill began two decades of company leadership.

He was singularly devoted to the company and its products. Concerned about the sales of the competing "Camels" brand of cigarettes, he initiated the "Lucky Strike" brand in 1917 and appeared to devote his every waking hour to its success. Working with such publicity experts as Edward Bernays and advertising genius Albert Lasker of the Lord and Thomas advertising agency, Hill sought out new and innovative ways to sell his brand of cigarettes, including widespread use of billboards and print advertising. He was also an early user of fledgling network radio.

From all reports, Hill was not an easy man to work for. His blustery personality and single-mindedness (other than fishing, he seemed to have few hobbies) gave him a focus few could—or wanted to—match. Hill was the model for the unlikable Even Llewelyn Evans, the protagonist in Federick Wakeman's 1946 (the year Hill died) best-selling novel *The Hucksters*, which was made into a successful 1947 motion picture. Wakeman was a former Lord and Thomas employee and wrote from his own experience as well as that of others.

Hill's Radio Role

Hill was an early if initially somewhat hesitant advertiser on network radio. Perhaps noting William Paley's success in selling La Palina cigars on the struggling Columbia Broadcasting System (CBS) network, Hill decided to see what the new medium could do for his Lucky Strike brand. He sponsored the *Lucky Strike Dance Hour* on the National Broadcasting Company (NBC; 1928–31). "Hill dictated the format, chose the announcer and orchestra, and approved all the tunes before broadcast" (Fox, 1984). He wanted loud, lively, and syncopated music that people would remember. To test the new medium's ability to attract buyers, in November and December

1928 he stopped all other Lucky Strike advertising, and sales rose 47 percent on the basis of radio advertising alone. With that, he was sold on radio. He went on selling cigarettes even when he got into trouble, as he did with the "Reach for a Lucky instead of a sweet" campaign, designed to get women to smoke. Candy manufacturers took him on, and he had to modify the sales approach. The program featured popular music, and Hill played a central role:

George Washington Hill—a churlish, canny fellow who even in his office wore a titled sombrero adorned with fishhooks, and who rode down Fifth Avenue in an open Cadillac manned by a bodyguard and decorated on the windshield with Lucky Strike packages—lived and breathed to increase Lucky Strike sales. All his waking hours were apparently spent in devising new schemes to that end. At Lord & Thomas, he found willing lieutenants. On Saturday mornings, Hill insisted that Lord & Thomas and NBC executives, male and female, join him at rehearsals of the Lucky Strike orchestra to foxtrot to music and test its danceability. America should defeat the Depression by dancing its way out, said Hill. Therefore such dignitaries as John Royal, NBC vice president in charge of programs, and Bertha Brainard, his stylish program manager, had to dance at the Saturday morning command performances. Meanwhile the commercials got longer and more strident. NBC acquiesced, dancing to Hill's tune (Barnouw, 1968).

Long-time New York radio critic Ben Gross repeated virtually the same story in his memoirs, as told to him by NBC President Deac Aylesworth, another occasional dancer.

On this and subsequent programs he sponsored, Hill sought a "loud, hard-hitting style of performance" (Barnouw, 1968), making use of repeated slogans and often inflated claims. Sometimes it was shock value—"There is no spit in Cremo," cried the announcer in some cigar advertising on the CBS network in 1930–31.

His focus remained on his beloved Lucky Strike brand, and Hill is credited with some of the best-known and most-remembered slogans of radio advertising, such as "Lucky Strike green has gone to war" (the material used in making the package color was needed in some wartime product); "LS/MFT," which was first heard in 1942 and stood for "Lucky Strike Means Fine Tobacco," a statement both spoken and sometimes tapped out with Morse code keys; and another claim for the cigarettes as being "so round, so firm, so fully packed." Hill

retained two auctioneers (L.A. "Speed" Riggs and F.E. Boone) at \$25,000 per year just to open and close programs he sponsored with rapid-fire tobacco auction sounds ending with a very clear "sold American."

Hill supported several later programs, including *Your Hit Parade*, which he "ran with an iron hand" (Dunning, 1998), meaning he controlled the songs played, the voices used, and, of course, the advertising that supported the program. One of the ad phrases promoting the show was "The best tunes of all go to Carnegie Hall," when the program moved to the New York concert hall normally known for classical music.

The *Information Please* quiz show cost American Tobacco some \$11,500 a week in production and advertising costs—not including the network time—in early 1946. The company spent even more for the top-rated *Jack Benny* program, which cost the company \$22,500 a week—the highest price of any show then on the air, again exclusive of airtime charges. American Tobacco remained a big radio sponsor for years after Hill's death.

CHRISTOPHER H. STERLING

George Washington Hill. Born in Philadelphia, Pennsylvania, 22 October 1884. Graduated from Horace Mann school, 1902; attended Williams College; entered tobacco business working for American Tobacco in North Carolina factories and leaf market operation, 1904; purchased tobacco company, Butler and Butler, with his father, Percival Hill, and headed merchandising, 1907; after American Tobacco trust was

reorganized, became vice president and sales manager of cigarette division, 1911–12; inaugurated Lucky Strike brand, 1917; president, American Tobacco, 1925. Died near Matapedia, Quebec, 13 September 1946.

Hill, Lewis 1919–1957

U.S. Founder of KPFA-FM and Pacifica Foundation

Lewis Hill was the founder of the world's longest-running listener-sponsored, noncommercial radio station, KPFA-FM in Berkeley, California, and its parent organization, the Pacifica Foundation. In his writings in the 1950s, Hill articulated the first general outline of listener-supported broadcasting.

Early Years

Hill was born in 1919 in Kansas City, Missouri. His father was an attorney and his mother an heir to the Phillips petroleum fortune. Hill's father, who also owned interests in oil, later became speaker of the Oklahoma state legislature. The Hills

sent Lewis to a military academy. As a teenager he rebelled against this decision by enrolling at Stanford University. There he majored in philosophy and poetry, studying with the noted poet and scholar Yvor Winters.

At Stanford, Hill fell in with the pacifist student movement and filed as a conscientious objector (CO) during World War II. After a short stay at a CO camp in Coleville, California, he served in Washington as the American Civil Liberties Union's advocate for pacifists in CO camps and prison. Possessing an excellent voice, he also worked as a radio news announcer for the National Broadcasting Company (NBC) Blue network. When asked in 1945 to read a newswire story about an incident at a Japanese internment camp in California that he

believed to be false, Hill refused to do so and quit his job. Shortly afterward, he relocated to San Francisco.

Hill came out of these experiences convinced that the pacifist movement, with its emphasis on dissent against an overwhelmingly popular war, had marginalized itself. He felt that pacifism's task should now be to build institutions that both demonstrated and advocated the possibility of what he called "a pacific world in our time." With his background in poetry, he convinced a number of people associated with San Francisco's literary scene, especially poet Kenneth Rexroth, to endorse his pilot project, the construction of a pacifist-controlled radio station supported by listeners. In 1946 he and a small group of pacifists filed articles of incorporation with the state of California for the Pacifica Foundation. The organization would "carry a radical war resistance program into a mass medium," explained a 1948 circular written by Hill, "to make possible a more and more intensive cultivation of the interests of common people in resisting war." Hill warned in an early fundraising prospectus against "ivory-towerism" in the Foundation's approach to broadcasting. The Foundation's first project, KPFA-FM in Berkeley, went on the air on 15 April 1949.

KPFA and Pacifica

Between Pacifica's incorporation and KPFA's inauguration, however, the overall goals of the organization underwent significant change. Although the Foundation had originally planned an AM station in the working-class city of Richmond, the Federal Communications Commission denied Hill's application for an AM license in 1947. The foundation was forced to file for an FM license in Berkeley at a time when FM service was marginal. This adjustment transformed the social character of KPFA from a venue designed to attract "common people" to a mecca for those few, primarily university-educated individuals who owned FM receivers in the late 1940s.

When KPFA temporarily went silent in 1950 because of a lack of subscriptions, Hill felt he had no choice but to return to the ivory tower strategy. Accordingly, he created a praxis for listener-sponsored broadcasting designed to attract support from the wealthy benefactors Pacifica was to rely on for its first two difficult decades. This philosophy first surfaced in a 1952 article on KPFA in the *Quarterly of Film, Radio and Television*. "The survival of this station is based upon the necessity of voluntary subscriptions from 2 percent of the total FM audience in the area in which it operates" (Hill, 1952). This percentage most likely had its origins in pacifist dogma rather than in statistics and math. Since the early 1930s, war resisters such as Albert Einstein had argued that if 2 percent of the populace of most nations would refuse to cooperate with the draft, wars would become extinct. Now Hill used such logic to appeal to a sense of noblesse oblige in potential benefactors. The 2 percent the-

ory, Hill wrote in *Voluntary Listener Sponsorship*, his final report to the Ford Foundation, represents "a way of extending the legitimate functions of social and cultural leadership. Obviously, to earn systematic support from the community's intellectual leadership, the listener-sponsored station must give the values and concerns of that leadership an accurate reflection at their highest level" (emphasis in original).

Hill's KPFA tended to reflect these values; for example, the station broadcast the sermons of Zen scholar Alan Watts, the film commentary of Pauline Kael, and the book reviews of Kenneth Rexroth. A "highbrow's delight," *Time* magazine called KPFA in the 1950s. In 1953 a small faction of ex-COs within KPFA, many of them resentful of Hill's leadership, staged a bureaucratic coup and expelled him from his position as general manager at KPFA. After a long and draining struggle, Hill used his leverage with the Ford Foundation to restore himself to even greater formal authority than he had enjoyed before the quarrel.

But, probably because of the bitterness of the conflict, by the mid-1950s Hill became increasingly distant from Pacifica's affairs. He spent more time on a Rockefeller grant that, with assistance from Rexroth, he had received to produce radio programs about poetry and the famous poets of his time. This project enabled Hill to travel about the United States and Europe, corresponding with Marianne Moore, T.S. Eliot, and Wallace Stevens, the last of whom was probably Hill's favorite writer. Hill himself was a published poet, his verse appearing in *Poetry* magazine in the early 1950s. One of Hill's last surviving programs on KPFA consists of a 1957 panel discussion on Allen Ginsberg's *Howl*, copies of which had just been confiscated by the San Francisco police department at the City Lights bookshop.

By that year, Hill's health had significantly deteriorated. He had long suffered from painful arthritis of the spine and had been taking harmful amounts of cortisone for the malady. In August of 1957 Hill took his own life, leaving a mysterious suicide note: "Not for anger or despair/but for peace and a kind of home." He was survived by his wife and three children. The Pacifica Foundation went on to acquire the licenses for four more radio stations, in Los Angeles, New York City, Houston, and Washington, D.C.

Hindenburg Disaster

The broadcast of a recording of the 1937 explosion, crash, and incineration of the German zeppelin *Hindenburg* marked the first time NBC played a recording of a news event over its networks. Because the original of that recording was slightly off speed, and because in subsequent years only short excerpts have been broadcast, many people have an incomplete understanding of the reporting of the event.

The Original Recording

On 6 May 1937, at about 6:30 P.M., Herbert Morrison, an announcer and program host from WLS, Chicago, began: “How do you do everyone. We’re greeting you now from the Naval Air Base at Lakehurst [New Jersey].” His words were preserved on an experimental portable Presto phonograph disc being made by WLS engineer Charles Nehlsen. Announcer Morrison and engineer Nehlsen had flown to New York on American Airlines, which had DC-3 airliners standing by for connecting flights for passengers bound to many American cities. The broadcast was intended to be good publicity for American Airlines.

Morrison told his listeners that the giant airship had been due that morning, but adverse winds over Newfoundland had slowed the trip. The *Hindenburg* had appeared over New York at noon but had to wait till dusk, when there was less wind, to dock. The ship had left Frankfurt, Germany, two and a half days earlier. This was the first crossing of the season, and also the first anniversary of this air service across the Atlantic.

For about eight minutes Morrison described the hovering *Hindenburg*, its crew, the trip, and carefully related the setting and the preparations for what everyone assumed would be a routine landing. He planned to interview several Chicago-bound passengers. Here is part of his description:

The ship is riding majestically toward us like some great feather, riding as though it was mighty, mighty proud of the place it’s playing in the world’s aviation. The ship is no doubt bustling with activities, as we can see, orders are shouted to the crew, the passengers probably lining the windows looking down [at] the field ahead of them, [voice in background over a loudspeaker: “. . . mooring now”] getting their glimpse of the mooring mast. And these giant flagships standing here, the American Airlines flagships waiting to rush them to all points in the United States when they get the ship moored. There are a number of important persons on board and no doubt new commander Captain Max Pruitt is thrilled too, for this is his great moment. The first time he commanded the *Hindenburg*, for on previous flights he acted as the chief officer under Captain Leyman. It’s practically standing still now, they lowered ropes out of the nose of the ship, and uh, it’s been taken ahold of down on the field by a number of men. It’s starting to rain again, the rain had slacked up a little bit. The back motors of the ship are just holding it uh, just enough to keep it from. [A shout is heard, from some one apparently standing nearby.]

It burst into flame! [There is a click, as the arm with the needle is knocked off the recording machine. It is replaced by the engineer and Morrison is heard again.]

Get out of the way. Get out of the way. Get this Charlie. Get this Charlie. And it’s crashing, it’s crashing terrible. Oh my, get out of the way please. It’s burning, bursting into flame and it’s falling on the mooring mast, and all the folks between it. This is terrible. This is one of the worst catastrophes in the world. Oh, it was four or five hundred feet in the sky. It’s a terrific crash ladies

and gentlemen, the smoke and the flames now. And the frame is crashing to the ground, not quite to the mooring mast. [His voice is cracking, and he almost seems to cry.] Oh, the humanity and all the passengers screaming around here.

Morrison tells Nehlsen to stop the recording so he can catch his breath. (The recording was stopped five or more times.) He reports that he has “raced down to the burning ship” and met a dazed man who was burned but had survived. Morrison says the man told him that a number of passengers had jumped clear of the ship and were safe.

Until approximately 8:30 P.M., over a span of about two hours, Morrison and Nehlsen recorded some 40 minutes on several discs, including Morrison’s accounts of helping with the wounded and his interviews with survivors. Although he first reported that it would not be possible for anyone to survive, he soon corrected himself. Amazingly, 61 people did survive, but 35 passengers, crewmen, and one ground handler were killed in the fire that lasted just over half a minute.

The first news bulletin describing the tragedy was reported on NBC’s Red and Blue networks at about 7:45 P.M. EST. There were later bulletins, and a live report from an NBC mobile unit at about 2:50 A.M.

Morrison hid the four 16-inch discs under his coat and said they had to avoid people—maybe American Airline officials and other reporters—in Newark, Buffalo, and Detroit on their trip back, fearing someone might try to confiscate the recordings. In Chicago they came into the WLS studios through a back freight elevator.

Impact of the Recordings

That next day NBC broke a long-standing rule prohibiting recordings on the networks and presented parts of Morrison’s recording and interviewed him live from a Chicago studio to which he and Nehlsen had returned. An announcer on NBC Blue said, “we present now one of the most unique broadcasts we have ever presented.” Morrison set the scene and a recording was played. WLS later made commemorative copies of the recordings. Most radio, television, and phonograph documentaries, however, use only the most sensational first few seconds, beginning with “It burst into flame.”

Broadcast historians long suspected that the original discs (or later copies) were recorded too slowly, so that when they were played back they pitched Morrison’s voice too high, making him sounding rushed and hysterical. Sixty years later another recording of Morrison at a band remote in May 1938

was found that could be used for reference. Chuck Schaden of the Museum of Broadcast Communication in Chicago produced a restored, speed-corrected version of the original *Hindenburg* broadcast and played it on his program on WNIB 3 May 1997.

Repeated presentations of the slightly off-speed version and the selective use of only a small part of the recordings have given an incorrect impression. While Morrison was naturally horrified by the explosion and erroneously assumed that all on board had died, he quickly corrected himself as new information became available. Listening to the entire set of recordings reveals that he was generally calm. Despite very difficult operating conditions, his reporting was mostly clear and accurate.

John Houseman, speaking of the Mercury Theater and Orson Welles’ production of “War of the Worlds,” has recalled that the actor portraying a radio news reporter at the Martian ship in a New Jersey field listened repeatedly to the disc of the *Hindenburg* report, and one of his lines is: “This is the most terrifying thing I’ve ever witnessed.” (Morrison at the *Hindenburg* had said: “Listen folks I’m going to have to stop for a few minutes because I’ve lost my voice, this is the worst thing I’ve ever witnessed.”)

Morrison, a native of Pennsylvania, had begun his radio career at WMMN in Fairmont, West Virginia. His stint at WLS in Chicago was followed by work at stations in New York, and for many years in Pittsburgh. In the 1960s he returned to West Virginia to help West Virginia University develop a radio-television program. After Morrison retired from the university, he lived in Morgantown until his death in 1989.

The crash of the *Hindenburg* was a tragic beginning for on-the-spot recording of broadcast news. The original recordings were presented by WLS to the National Archives in January 1938.

Hispanic Radio

U.S. Spanish-Language Broadcasting

Whether described as *Spanish language* or *bilingual*, programming that targets people of Latin American descent has been among the fastest-growing segments of the U.S. radio industry. From its inception in the 1920s to the present, its development has been closely tied to the character of Latin American immigration to the United States.

Early U.S. Spanish Language Radio

U.S. Spanish language radio differed significantly from the Spanish language press on the key question of ownership. Unlike newspapers, which were largely owned by members of the immigrant community, radio stations that broadcast Spanish language programming were almost never owned by Hispanics. There were no immigrant-oriented radio stations in the 1930s—only immigrant-brokered foreign language radio *programs*. The principal reason for this was cost. Compared to a small newspaper, the initial capital outlay for radio stations was seen as prohibitively high.

In the first decades of the broadcasting industry, radio station owners found that some hours of the day were less viable commercially. Owners sold these “off hours” for nominal fees to Spanish (and, in other parts of the country, to other minority) language radio programmers, who were responsible for acquiring their own sponsors. In this early period, radio station owners and advertisers did not think of the Spanish-speaking audience as consumers. This can be attributed to the relative isolation of Mexican and Mexican-American communities—the largest Latino immigrant group then and now—from the rest of society. Spanish speakers were occupationally and residentially segregated from the merchant and business classes, including radio station owners. Until Spanish speakers were conceptualized as a product that could be sold profitably to advertisers, the importance of Spanish language programming to station owners remained negligible.

However, for immigrant radio producers in the late 1920s and early 1930s, the audience was not in any sense an abstract one. Rather, programming was shaped within the immigrant enclave: face-to-face communication was key. For example, in Los Angeles, broker/programmer Rodolfo Hoyos spent much of his time walking through the commercial district of his southern California *barrio* (neighborhood) making personal calls on potential sponsors of his one-hour daily live music and talk program. During these sales calls on bakeries and *bodegas* (shops), that day’s musical selections, or a recent community event that might be mentioned on the air, would also be discussed.

Emblematic of these early Spanish language radio broadcasters was Mexican musician and radio producer Pedro González. His radio program, *Los Madrugadores*, (The Early Risers) began broadcasting from KELW, Burbank, California (just north of Los Angeles) in 1927. The program mixed live performances by Mexican musicians with information about jobs and community services and was extremely popular with the city’s Mexican immigrant community. González was, by training and predilection, a musician and performing artist. His response to social and political circumstances of the late 1920s and 1930s transformed him into one of the best-known Mexican-American political figures of his generation, a man *The New York Times* described in an obituary as a “folk hero and social advocate.”

Following on the heels of World War I and growing isolationist feelings, and again at the onset of the Great Depression in the late 1920s, the U.S. government deported tens of thousands of Mexican immigrants. González was arrested in 1934 and was subsequently convicted on trumped-up rape charges. He was sentenced to 50 years in prison, all the while protesting his innocence. After sustained protests from the Los Angeles Mexican community, he was released from jail and deported in 1940.

González translated and broadcast advertisements from general market advertisers, such as Folger’s Coffee, who were discovering the Spanish-speaking consumer market. Nonetheless, under political pressure after González’s arrest, the radio station discontinued all Spanish language programming. During the early 1930s, other broadcasters in Texas and throughout the Southwest also curtailed their foreign language programming in response to harassment directed at ethnic broadcasters and the imposition of more stringent radio licensing rules. These rules from the Federal Communications Commission closely examined ownership of stations (one had to be a U.S. citizen) and required that station management be fully aware of the English meaning of all material broadcast.

The reaction of American political and commercial sectors to the emerging Spanish-speaking audience was contradictory. On the one hand, advertisers had begun to recognize the potential profitability of this audience, and radio station owners discovered that by selling blocks of formerly “dead” airtime to immigrant brokers, they could generate increased revenue. At the same time businesses were courting this community, however, politicians, labor unions, and other community leaders were characterizing Mexican immigrants as a threat.

As a cultural complement to mass deportations, in the mid-1930s the Los Angeles district attorney and other government

authorities campaigned to ban Spanish from the airwaves. Although many stations continued to program Spanish language blocks, others wishing to reach Mexican-Americans moved their operations to the Mexican side of the border out of the reach of U.S. authorities. The tension created by the contradictory responses of the Anglo establishment to the Mexican community—commercially welcoming, but politically and culturally rejecting—would continue to shape the development of a Hispanic audience.

The Early Transnational Hispanic Audience

Emilio Azcárraga, patriarch of the Mexican entertainment conglomerate today known as *Televisa*, began his broadcasting empire with radio stations in the 1930s. Shortly thereafter, he began transmitting music from his Mexico City station XEW, *La Voz de América Latina* (The Voice of Latin America), to a radio station in Los Angeles, which then relayed it to other U.S. stations. In addition, Azcárraga owned five radio stations along the United States–Mexico border that transmitted directly into the United States. For Azcárraga and his fledgling broadcasting empire, the border that separates the United States from Mexico was little more than a bureaucratic nuisance. Mexicans who listened to radio lived on both sides of the official separation of the two countries.

By the 1940s U.S. broadcasters were discovering that the emotional impact of an advertising message delivered in a listener's first language and suggestively enfolded in a program of music or drama, evoking the most nostalgic memories of a listener's far-away birthplace, was infinitely greater than the same message in English. These Spanish language radio programs were broadcast weekly, not daily, in four states: New York, Arizona, Texas, and California, most of them in the off hours.

The early Spanish language radio audience in the United States was defined by its "otherness," particularly its continuing close ties to Mexico. When the commercial establishment began to imagine Spanish speakers as members of *their* marketplace, they began to mold Spanish language radio for an imagined audience more commensurate with that of the dominant, majority society. Immigrant program hosts were urged to shorten their commentary and pick up their pace, so as to better match the quick tempo of the new advertisements they were reading. The length of the music selections was also shortened to make room for more advertising breaks.

Changing the Immigrant Paradigm

In the postwar period outside the Southwest, Spanish language radio shared off-hour time slots with other foreign language radio. By the 1950s, German, Polish, Scandinavian, and other

foreign language radio broadcasting began a steady decline. This was largely attributable to the assimilation of European immigrants into the dominant culture. As these peoples were recognized as predominantly English monolingual, the commercial appeal of foreign language radio programs declined; these consumers could be reached with general radio programming and advertising. As such, foreign language broadcasting was not as attractive to advertisers and thus not as appealing to radio station owners.

During this period, the number of weekly hours of U.S. Spanish language radio doubled. Two-thirds originated in the Southwest, the region most heavily populated with Spanish speakers. By 1960 Spanish language radio accounted for more than 60 percent of all U.S. foreign language radio. Spanish was the only foreign language to command entire stations and entire broadcast days. Because of continuing immigration, U.S. Spanish language radio was growing at a time when other foreign language broadcasting was dying.

Radio station owners and their advertisers were among the first to notice (in commercial terms) that the European paradigm of immigration to the United States was not identical to that of Latin American immigration. Most European immigrants, within a generation or two of their arrival, were socially and economically integrated into the majority culture, losing their European "mother tongue" in favor of English monolingualism. In addition, European immigration to the United States was discontinuous, disrupted by two world wars and the vastness of the Atlantic Ocean. Once new German immigrants, for example, stopped arriving, a generation or so later all but a few reduced their use of German or stopped speaking German completely. Consequently, the market for German language radio dropped off precipitously.

In contrast, immigrants from Latin American countries, primarily Mexico, have arrived in a steady stream (of varying size) to the United States for most of this century. Monolingual Spanish speakers settling in the United States renew the life of the language and provide a core audience for Spanish language radio programming. Today, the Spanish-speaking audience is in many ways the ideal specialized audience. Language, race, and continued close association with Latin America made it an easily identifiable audience. Between 1960 and 1974, spurred by immigration from Cuba and Puerto Rico, the number of radio stations carrying Spanish language programming doubled.

In the next quarter century, that number doubled again as immigration from Mexico and Central America increased and, in equal measure, the United States born Latino population grew. At the same time, the Hispanic audience was "discovered" by Madison Avenue and the narrowcasting broadcasting industry to be "targetable," that is, definable in market terms, and therefore a potentially profitable "niche market."

Today there are more than 400 Spanish language radio stations in the United States. Like general market U.S. radio, it is shaped by ownership chains, with the Spanish Broadcasting System being the largest. Spanish language radio formats vary from news/talk to different kinds of music—*salsa*, *norteña*, and *rock en español*. In Los Angeles and Miami, the two U.S. cities with the highest concentrations of Latinos, Spanish language radio has been consistently rated first by audience measurement firms such as Arbitron throughout the 1990s.

Reflecting the permanence and diversity of Latino communities, radio programmers have begun experimenting with bilingual radio. Youth-oriented music dominates this format, with the disc jockeys' patter and the advertisements in Spanish and English, as well as in Spanglish.

Hoaxes

Pranks, Policies, and FCC Rulings

Until the early 1990s the Federal Communications Commission (FCC) had taken a relatively laissez-faire attitude toward radio hoaxes, admonishing offenders but avoiding several penalties. From 1975 to 1985 the Commission threw out a number of programming content policies initiated a decade earlier. In 1985 the FCC, under Chairman Mark Fowler's leadership, voted to eliminate its policy of restricting "scare" announcements as part of its deregulation initiatives during the Reagan administration. When the public became subject to a number of hoax abuses, however, in May 1992 the FCC issued a ruling prohibiting pranks that cause immediate public harm or divert resources from law enforcement.

War of the Worlds

Orson Welles perpetrated the first hoax in radio history in his 1938 radio play, "War of the Worlds." The national public panic over a well-crafted imaginary Martian invasion of the east coast of the United States was the ultimate demonstration of radio's impact on an audience. Subsequently, after the Welles broadcast, the FCC warned broadcasters not to use the words *bulletin* or news *flash* in entertainment programs and to provide adequate cautionary language in the airing of dramatizations.

Beginning in the 1950s legendary deejays such as Dick Biondi and Wolfman Jack attempted to shock their audiences with crazy stunts and wild antics. Radio stations across the nation undertook many pranks and trickery, such as turkeys thrown out of airplanes and a scavenger hunt for a \$1,000 bill hidden in a public library, in the name of fun and higher market ratings. In the 1960s the FCC began a new era of regulation, in part because of what it perceived to be the public's vulnerability to deceptive programming and promotions. In 1960 it issued a policy statement that addressed intentional distortion or falsification of programming (i.e., news staging). In 1966 the FCC issued a stronger policy, which warned against airing "scare" announcements. The 1966 policy was a reaction to specific complaints about radio contests that disrupted traffic, caused property damage, diverted law enforcement, alarmed listeners with imaginary dangers, and threatened life. The FCC stand slowed down the occurrence of hoaxes over the next several years.

Then, in 1974, Rhode Island's WPRO-FM recreated "War of the Worlds." The program had been promoted as a spoof throughout the day. During the actual broadcast, however, 45 minutes elapsed before the station aired a public disclaimer. One hundred and forty listeners called the radio station. While station personnel had warned the local police department of its

intent to air the program, the FCC admonished WPRO on the basis of its 1966 statement concerning broadcast of scare announcements.

In another instance, that same year a Tucson, Arizona radio personality, with the help of the news director, faked his own kidnapping. The commission failed to renew the license of KIKX-AM, specifically based on its violation of FCC policies related to the "fake kidnapping" (i.e., news staging, false newscasts, and licensee failure to exercise adequate control over station operations) and to a lesser extent on its technical violations on several station program logs and its Equal Employment Opportunity record. The commission affirmed its position in 1980, and two years later the District of Columbia Circuit Court upheld the decision.

Serious Radio Hoaxes

After the FCC eliminated its scare announcement policy, between 1989 and 1991 a number of serious radio hoaxes popped up across the United States; at least five are documented in the commission's ruling "Regarding Broadcast Hoaxes." Four of these incidents resulted in admonishment by the FCC, although only one resulted in a \$25,000 fine. On 2 October 1989 the FCC admonished KSLX-FM in Scottsdale, Arizona, for a stunt that faked the station being taken hostage by terrorist activity. In July 1990 the commission admonished WCCC-AM/FM in Hartford, Connecticut, for reporting a nearby volcanic eruption.

In 1991 three other serious hoaxes were perpetrated by St. Louis' KSHE, Los Angeles' KROQ, and Rhode Island's WALE. On 29 January 1991 KSHE morning personality John Ulett staged a mock nuclear alert during the morning drive time, complete with a simulated Emergency Broadcast System (EBS) tone and an authentic-sounding civil defense warning that announced that the nation was under nuclear attack. There was no disclaimer until two hours after the broadcast. Four hundred listeners called the station. The FCC fined KSHE \$25,000 based on the false use of EBS during the hoax. The KROQ morning team staged a false confession from an anonymous caller who claimed to have brutally murdered his girlfriend. Police spent nearly 150 hours investigating the case and the incident was featured twice on the syndicated TV program *Unsolved Mysteries*. On 9 July 1991 the WALE news director in Rhode Island announced that the overnight on-air personality had been shot in the head. Police and media rushed to investigate the incident. Upon hearing the broadcast, the program director called the station and told the producer to cease the hoax. When the producer failed to do so, the program director shut off the transmitter. The station went back on the air one minute later, with a disclaimer that aired every 30 minutes for the following 30 hours. Although the program director terminated the news director, the talk show host, and the pro-

ducer, the FCC admonished WALE for broadcasting false and misleading information and stated that the licensee was not excused by subsequent remedial action.

Anti-Hoax Ruling

The Commission's 1992 anti-hoax rule (Section 73.1217) did not discourage the morning crew at WNOR-FM in Norfolk, Virginia, from staging a series of news reports that the city park built over a landfill was about to explode. Local police, overwhelmed with concerned calls from listeners, filed complaints with the FCC. A month after the WNOR-FM incident, the FCC issued its anti-hoax ruling in an effort to target those incidents involving a false report of a crime or catastrophe. The FCC was eager to clear its docket of what appeared to be a stream of hoax violations and to enact a middle range of enforcement. The commission said that its ruling would provide enforcement flexibility by allowing fines that could range up to \$25,000 a day. In the ruling the commission states:

No licensee or permittee of any broadcast station shall broadcast false information concerning a crime or catastrophe if (a) the licensee knows this information is false, (b) it is foreseeable that broadcasting the information will cause substantial public harm. Any programming accompanied by a disclaimer will be presumed not to pose foreseeable harm if the disclaimer clearly characterizes the program as fiction and is presented in a way that is reasonable under the circumstances (amendment to Part 73 Regarding Broadcast Hoaxes, Communications Act, Report and Order, 7FCCRcd4106 [1992]).

This ruling clearly demonstrated the FCC's desire to manage promotional content abuses on the airwaves by assigning specific monetary punitive actions for serious hoaxes that posed a substantial threat to the public safety and welfare.

Hogan, John V.L. "Jack" 1890-1960

U.S. Radio Inventor and Engineer

Jack Hogan was a key figure in early American wireless and radio broadcast development, combining invention with practical innovation. He developed the single-dial radio tuner, the first high-fidelity radio station, and later turned to mechanical television and then facsimile.

Origins

Hogan was born in Bayonne, New Jersey, in 1890. He built his first amateur radio station in 1902 at age 12, using a coherer as a detector. (A coherer was a device in which iron filings cohered in the presence of an electrical signal, making it a useful "detector" of those signals.) Just four years later he was working as a laboratory assistant with Lee de Forest. Hogan attended the Sheffield Scientific School at Yale University, as had de Forest, specializing in physics, mathematics, and electric waves. In 1910 he went to work for Reginald Fessenden's National Electric Signaling Company (NESCO) at its Brant Rock, Massachusetts, station, as a telegraph operator. Fessenden was so impressed with Hogan that he assigned him to supervise erection of a terminal station in Brooklyn, New York. There he developed perhaps the first ink tape siphon (a method for permanently recording on a paper tape) for recording transatlantic radio signals, using an Audion amplifier. Hogan remained with Fessenden until 1914.

Radio

Hogan was a cofounder of the Institute of Radio Engineers in 1912 (he served as IRE president in 1920). In 1913 he directed acceptance tests of the U.S. Navy's first high-power station at Arlington and served as the Navy's chief research engineer until 1917, focusing on high-speed recorders for long-distance wireless. In 1917 he became commercial manager of the Inter-

national Radio Signal Company. He was placed in charge of operations and manufacturing with emphasis on radio for what were then called submarine chasers (destroyers) and aircraft. In 1918 he was made manager of the International Telegraph Company.

Hogan established his own consulting practice in 1921 (founding Radio Inventions, Inc. in 1929), where he specialized in broadcast apparatus and radio regulations. During this period he also wrote *The Outline of Radio* (1923), a guide for the general public about how radio worked; the book was so well received that several subsequent editions appeared. Always interested in tonal quality, Hogan built the first high-fidelity experimental radio station, licensed as W2XR, in 1929. Hogan and Elliott Sanger converted it to become commercial classical music station WQXR in New York City in 1936.

Graphic Communication

In the 1930s Hogan began to work on television technology, and then on facsimile systems. Since his television efforts had concentrated on what turned out to be outmoded mechanical scanning systems, Hogan soon dropped television to concentrate on the more promising field of facsimile transmission, which he worked on well into the 1940s. His system was said to be both faster and to provide more fidelity of reproduction than the crude systems that preceded his. He demonstrated his system to industry observers in New York and Milwaukee in the late 1930s, using experimental radio transmitters licensed by the Federal Communications Commission (FCC). The Radio Corporation of America (RCA) nearly adopted the Hogan system, but World War II intervened.

Hogan wrote a number of articles in the 1940s, for both specialist and lay readers, on what facsimile systems could do. During World War II, he acted as advisor to several govern-

ment agencies on radar, guidance systems, and missiles. He also chaired Panel 7 of the radio industry's Radio Technical Planning Board during World War II, which concerned itself with spectrum needs and technical standards for facsimile and made recommendations about these topics to the FCC.

After the war, Hogan returned to his facsimile work (resigning from WQXR in 1949 to focus his efforts further), but the systems then being touted did not develop commercially and are unrelated to facsimile as we use it today. Today Hogan is perhaps most remembered for his invention of single-dial tuning and as one of three cofounders of the Institute for Radio Engineers, the predecessor of today's Institute of Electrical and Electronic Engineers (IEEE).

Hollywood and Radio

In this era of studio-owned television networks, it is difficult to remember that only a few years ago, accounts of the history of television and broadcasting cast their relationship in terms of a bitter bicoastal rivalry. Hollywood hated and resisted television as it had radio, these historians said: they turned their back on it and refused to let their stars appear on it, and one studio even forbade television sets from appearing in its films.

If we take a closer look at history, however, nothing could be further from the truth. From the earliest years of radio, Hollywood studios regarded the upstart sound-only medium with a great deal of interest—despite the fact that in those days movies had no voice at all. After a period of experimentation with movie/radio cross-promotion, a few studios attempted to enter the network business. Thwarted by both economics and regulation, the film industry turned to steady and profitable production for radio, to the point that in the mid-1930s both major networks, the National Broadcasting Company (NBC) and the Columbia Broadcasting System (CBS), constructed major studios of their own in the heart of filmland. This pro-

ductive relationship continued through the early years of television, and although radio lost its importance in the Hollywood scheme of things as television quickly took over the production of dramatic programs, film companies still maintained a presence in radio station ownership and also in the production of recorded music, so vital to radio's new format mode. The merger mania of the 1980s and 1990s consolidated these cross-ownership positions, as radio, television, film, music, and new media became interlocking parts of the same communications conglomerates.

Origins

One of the earliest instances of film/radio cooperation took place not in Hollywood but on the stage of the Capitol Theater in New York City, part of the Loews/Metro Goldwyn Mayer (MGM) chain. In 1923 theater manager Samuel L. Rothafel entered into an agreement with American Telephone and Telegraph (AT&T) to broadcast his prefilm stage show over their

new station, WEAJ. The results were so positive that the show quickly became a regular feature, called *Roxy and His Gang*, one of the earliest hits of radio broadcasting. Soon other theaters jumped on the bandwagon.

Movies might not have been able to talk, but that didn't mean there wasn't a lot of musical entertainment in the theaters. Many big-city theaters featured elaborate stage shows and enormous theater organs, whose musical accompaniments animated their film showings. Concerts by theater organists were broadcast over WMAC, WGN, and KWY in Chicago and in many other cities starting in 1925. That year, Harry Warner of Warner Brothers Studios proposed that the film industry as a whole should start a radio network to publicize their pictures. He began by opening a Warner Brothers radio station, KFJB in Los Angeles, and in 1926 a second one, WBPI in New York City. Other studios took note. Pathe, producers of newsreels, announced that they would begin distributing a script version of their news films for delivery over local stations. By 1927 Universal chief Carl Laemmle inaugurated the *Carl Laemmle Hour* over WOR-New York, presenting vaudeville and film stars and giving previews of upcoming pictures. MGM experimented with the world's first "telemovie": a dramatic, blow-by-blow narration of MGM's new release, *Love*, starring Greta Garbo and John Gilbert, delivered on the air by WPAP's announcer Ted Husing (usually known for his sports coverage) as it unreeled before his eyes in the Embassy Theater in New York.

That same year, MGM announced an ambitious project with the Loews theater chain: a planned network based on movie materials and promotion that would link over 60 stations in more than 40 cities. This proposal followed a more detailed one announced the previous spring by Paramount Pictures Corporation. Paramount, in conjunction with the Postal Telegraph Company, planned to start up the Keystone network "for dramatizing and advertising first-run motion pictures." Because AT&T had a lock on the land lines vitally needed to link stations together into a network, and because AT&T had an exclusive contract with the existing radio networks, Paramount needed Postal Telegraph to provide its lines. Despite much excitement in the industry, neither the Keystone Chain nor the MGM/Loews network reached fruition. A combination of regulatory discouragement, exhibitor opposition, and competition from other sources diverted studios' radio ideas in other directions. Paramount shortly thereafter purchased a 49 percent interest in the CBS network, still struggling to compete with its deep-pocketed competitor. Meanwhile, NBC's parent company, the Radio Corporation of America (RCA), acquired its own film studio, Radio-Keith-Orpheum (RKO), in 1929. Though this was intended more as a way to capitalize on RCA's new sound-on-film system than as a radio venture, the era of "talking pictures" would facilitate a renewed interest in the potential of film/radio cooperation.

Depression Years

By 1932 America had been hard hit by the Depression. Film industry profits suffered, as theaters went out of business and box office receipts slowed to a trickle. Radio, however, continued to thrive. As advertising agencies began to take the broadcast medium seriously as an outlet for their customers' campaigns, a new and influential partnership was about to emerge. Dissatisfied with CBS's and NBC's staid approach to programming, several aggressive advertising firms turned their attention to Hollywood's untapped potential for radio-based product promotion. One of the most influential in this Hollywood/agency alliance was John U. Reber of the J. Walter Thompson Company (JWT), whose plan for radio advertising envisioned big-budget, star-studded productions sponsored by JWT clients over the major radio networks. He determined to form a working relationship with the proven entertainment producers in Hollywood, and by the mid-1930s JWT was producing at least five shows out of each year's top ten, most of them featuring Hollywood talent. Other major agencies included Young and Rubicam, Blackett-Sample-Hummert, and Dancer Fitzgerald. When in 1936 AT&T, as a result of an investigation by the Federal Communications Commission, reduced their land line rates to the West Coast, a "rush to Hollywood" resulted, and most major agencies, along with the two national networks, opened up studios in Los Angeles. Radio had gone Hollywood.

This productive and profitable association would have great impact on both the radio and film industries. A variety of radio programs developed that centered on movie industry stars, properties, and Hollywood celebrities. The most prestigious was the movie adaptation format pioneered by JWT's *Lux Radio Theater*. Hosted by celebrity director Cecil B. DeMille, *Lux* presented hour-long radio adaptations of recent Hollywood film releases, introduced and narrated by DeMille and featuring well-known film stars. It started on NBC in 1934 but jumped in 1935 to CBS, where it ran until 1954. From 1936 on, the program was produced in Hollywood. Others in this format, often referred to at the time as "prestige drama," included *Screen Guild Theater*, *Hollywood Premiere*, *Academy Award Theater*, *Dreft Star Playhouse*, *Hollywood Startime*, and *Screen Directors' Playhouse*. A popular feature of these programs was the intimate, casual interviews with famous stars; DeMille, for instance, would chat at the end of each show with that night's leading actors, often casually working in a mention of the sponsor's product.

The second major venue for Hollywood stars and film promotion was radio's leading genre, the big-name variety show. Starting with the *Rudy Vallee Show* in 1929, almost all of the top-rated programs on the major networks in the 1930s belonged to this genre: the *Kate Smith Hour*, *Maxwell House Showboat*, *Shell Chateau* (Al Jolson), the *Chase and Sanborn*

Hour (Bergen and McCarthy), the *Jack Benny Program*, *Kraft Music Hall* (Bing Crosby), *Texaco Star Theater*, the *Eddie Cantor Show*, *Burns and Allen*, *Town Hall Tonight* (Fred Allen), and many more. All featured regular guest appearances from Hollywood's best and brightest, often promoting their latest pictures or acting out skits related to film properties. Many stars eventually began hosting such programs themselves, especially in the late 1930s and early 1940s. Adolph Menjou and John Barrymore served as hosts for *Texaco Star Theater*; Al Jolson appeared on radio almost exclusively after 1935; and William Powell and Herbert Marshall hosted *Hollywood Hotel* at various times. Some directors also got into the act: Orson Welles was a frequent variety show guest and often guest-hosted for Fred Allen, and Alfred Hitchcock established a reputation on radio before becoming a television personality. Furthermore, a whole set of Hollywood's secondary ladies became more famous via radio performances than their film careers had permitted: Lucille Ball, Dinah Shore, Joan Davis, Hattie McDaniel, Ann Sothern, and many others began as frequent guest stars, then headlined their own continuing programs on radio and later television.

Dramatic series programs also featured Hollywood talent. Most were the anthology-style programs that would also become early television's most prestigious fare. *First Nighter*, *Cavalcade of America*, *Hollywood Playhouse*, *Grand Central Station*, *Four Star Playhouse*, *Ford Theater*, *Everyman's Theater*, and many others brought film stars to radio in a wide range of stand-alone drama and comedy pieces. During the war years, Hollywood generously donated its talent to morale-boosting programs, sometimes on the regular networks and sometimes for the Armed Forces Radio Service only, such as *Command Performance*, *Free World Theater*, *Everything for the Boys*, *The Doctor Fights*, and many more. Hollywood stars moved freely between film and radio, and they would host and perform just as frequently on television's early dramas. Only in the mid- to late 1940s, however, did film stars begin turning up as leading actors in series comedies and dramas. The situation comedy form, pioneered by radio programs such as *Amos 'n' Andy*, *The Goldbergs*, *Fibber McGee and Molly*, and *Vic and Sade*, would be given a new gloss and prestige as Hollywood luminaries, particularly the comediennes mentioned above, moved into regular series production in shows such as *Joan Davis Time*, *My Favorite Husband*, *My Friend Irma*, *Maisie*, *Our Miss Brooks*, and *Beulah*.

Finally, mention should be made of the ever-popular genre of Hollywood gossip and talk. Many leading figures built their reputations on film industry chitchat, including the print divas Louella Parsons and Hedda Hopper. Walter Winchell also started in print but achieved full status on radio, combining gossip with news-related material. Ed Sullivan, Earl Wilson, and Jimmy Fidler all trafficked in celebrity news and views. A late-developing genre, the so-called breakfast pro-

gram, presaged the television morning show *Today* with a combination of host chatter, celebrity guest interviews, and light news. Journalist Mary Margaret McBride pioneered the talk show format on radio in her long-running program of the same name. Another writer, Pegeen Fitzgerald, tried out McBride's formula in an early-morning show called *Pegeen Prefers*; she and her husband Ed would develop the first of the big-time breakfast shows, *The Fitzgeralds*. Others in this genre were *Tex and Jinx* (Tex McCrary and Jinx Falkeberg) and *Breakfast with Dorothy and Dick* (Dorothy Kilgallen and Richard Kollmar).

The film industry came increasingly to rely on the star-producing capabilities of radio as well. Radio personalities starred in many popular Hollywood films, from Freeman Gosden and Charles Correll ("Amos" and "Andy") in *Check and Double Check* in 1929, to special "radio" movies such as *The Big Broadcast of 1936* (and 1937 and 1938), to the Bing Crosby/Bob Hope/Dorothy Lamour "Road" movies in the 1940s (*Road to Morocco*, *Road to Zanzibar*, *Road to Rio*, etc.). Rudy Vallee, Eddie Cantor, and Jack Benny all met with box-office success. Orson Welles' flamboyant production of *War of the Worlds* for the CBS *Mercury Theater of the Air* won him the contract to make *Citizen Kane* in Hollywood.

Radio and Television

As television loomed on the horizon after World War II, movie studios stood in a strong position to move into television production. A combination of network economics, the emphasis on "live" programming during television's early days, and royalty disputes within the film industry would delay the Hollywood/television alliance until the late 1950s. Though the nature of radio changed dramatically once television came onto the scene, some studios did maintain a persistent presence in radio ownership and production. Warner Brothers, Paramount, RKO, and MGM all owned radio stations, and they were to get in on television station ownership early on as well. MGM went into syndicated radio program production and distribution in the late 1940s with such programs as *MGM Theater of the Air* and *Maisie*, starring Ann Sothern. As attention and dollars shifted to television in the late 1940s and early 1950s, and as radio became once again primarily a musical medium, Hollywood stars and on-air production would migrate to the newer medium as well. Soon film studios would dominate prime-time television programming, though this would not translate into network power until passage of the FCC's financial interest and syndication rules broke up the networks' tight vertical integration in the 1970s. However, just as film companies diversified into television, they also began to acquire interests in the music industry, the new backbone of radio, with frequent cross-promotion between music and film.

Merger Mania

As the 1980s wave of mergers and acquisitions continued into the 1990s, the film majors of yore became part of diversified media conglomerates. Warner became part of the Time/Warner/Turner empire, with more than 50 labels under its imprint, including Warner Music International, Atlantic, Elektra, Rhino, Sire, and Warner Brothers. The conglomerate also has interests in music publishing, record clubs, recording technology, and music distribution. Time Warner accounted for 21 percent of U.S. music sales in 1997. Columbia Pictures was acquired by the Sony Corporation, owner of Columbia Records (acquired from CBS) and associated labels, the Columbia House music club, and other manufacturing and distribution arms, all of which accounted for 15 percent of U.S. music revenues. Universal became a part of the Music Corporation of America (MCA), which was later acquired by Seagram. MCA has long been a major presence in the music industry, with 11 percent of the U.S. market. Its labels include A&M, Decca, Def Jam, Deutsche Grammophon, Interscope, Geffen, MCA, MCA Nashville, Motown, Island, Phillips, Polydor, Universal, and Verve.

In 1995 Paramount was acquired by Viacom, owner of MTV and related cable music channels (M2, VH1), a considerable power in the music business. MTV produces radio programming as well, including radio versions of *MTV Unplugged*, *MTV News*, and *Weekend Revolution*. In 1995 Viacom announced a partnership with radio's largest program syndicator and station groups, Westwood One, to launch a new MTV Radio network featuring music-related material. The Disney Corporation also holds extensive interests in music recording, and with its merger with American Broadcasting Company (ABC) in 1995, it now owns radio stations that reach 24 percent of U.S. households. Twentieth Century Fox was purchased by Rupert Murdoch's News Corporation in the 1980s and is now linked with satellite music channels worldwide. News Corporation also owns the Australian Mushroom and Festival record labels. And in this age of synergy, the tie between movies and music has become tighter than ever before, with movie sound tracks used to promote artists and recordings, and sound track releases often achieving billions of dollars in sales.

In the era of new media, where the lines between film, radio, television, music, recordings, and the internet seem to be growing more blurry every day, the integrated entertainment

corporations formerly designated by the term *Hollywood* have fingers in nearly every form of media that reaches into the home—or that reaches the viewer anywhere she or he might be. Now internet radio technology gives companies the ability to go on-line with their own “radio” services. DisneyRadio.com already provides a schedule of music and features from its films and artists, oriented toward children. Television shows on studio-owned networks promote recordings distributed by the company's record arm, which become hits on pop radio. Recording stars launch film careers; even radio personalities such as Howard Stern might receive a moment of celluloid fame. Though in the United States the days of radio drama and comedy faded, transferring their stars and audiences to television, the film industry continues to play a vital behind-the-scenes role linking radio to a host of other media. Without Hollywood, American radio could never have risen to the heights of creativity and popularity it achieved in its heyday. That the older medium bequeathed this tradition to a newer medium might be radio's loss, but it was television's gain.

Hooperatings

Radio Ratings Service

Hooperatings was radio's best known and most widely quoted rating service in radio broadcasting during its heyday from 1934 to 1950. C.E. Hooper (1898–1955) pioneered a technique, the coincidental telephone call, that became an industry standard. Hooper sold subscriptions to his ratings information, making his service the first commercial venture in the field of radio ratings. C.E. Hooper, known as “Hoop,” was imbued with a mission, and through his salesmanship he made his ratings service famous not just to the broadcasting industry but also to the public.

Origins

Hooper began his business career by selling aluminum utensils from door to door. He went on to earn an MBA (1923) from Harvard Graduate School of Business Administration. He took a job in Yakima, Washington, as assistant manager of the Liberty Savings and Loan Company. Between 1924 and 1926, he was advertising manager at the *Harvard Business Review*. He then took a similar job at *Scribner's Magazine*. He switched from selling space to buying space in 1929 as an account executive for Doremus and Company. After two years, at age 33, he entered the market research field as a member of the Daniel Starch organization.

Daniel Starch had taught business psychology at Harvard when Hooper was a student there. Starch conducted pioneering radio audience research for the new NBC network in 1928 and 1930, and in 1931 established the first continuous service for measuring the readerships of magazine and newspaper advertisements.

Since March 1930, Archibald Crossley had been “rating” broadcasts to estimate audience size for advertisers and for agencies that supported the Cooperative Analysis of Broadcasting (CAB). Crossley used a telephone recall method to ask listeners about their previous day's listening. He limited his surveys to areas of equal network opportunity, the 32 cities where all four networks (National Broadcasting Company [NBC] Red and Blue, Columbia Broadcasting System [CBS], and, after 1934, Mutual) could be heard with equal ease.

Hooperatings Begin

In 1934 Hooper left Starch to go into business as president of Clark–Hooper, a service that measured magazine and newspaper effectiveness. He also entered the field of radio audience measurement that same year using telephone *coincidental* calling when the audience was still listening, a method suggested

to him by George Gallup. The team of Clark–Hooper, Inc. was encouraged by a group of magazine publishers who wanted to set up a more valid measure of radio's advertising effectiveness. These publishers were convinced that Crossley's ratings overstated the actual number of radio homes. More popular programs under Crossley's rating system would achieve ratings as high as 40 to 60 percent of the radio audience. To make matters worse, despite the fact that Crossley merely provided a rating index, many broadcasters persisted in projecting CAB ratings to total radio homes, resulting in an astronomical number of radio homes. The reason for this rating inflation was that Crossley initially used only the “identified listening audience,” or what is now called the “share” (proportion of people tuned to a given channel based on all those using radio receivers at that time), as the base for his ratings. All of these factors hurt magazines and were factors that Clark–Hooper, Inc. undertook to correct.

Hooper's first important publicity came when, in collaboration with CBS, he estimated the number of adult listeners to President Roosevelt's fireside chat of 10 June 1936 in time for the next day's newspapers.

By 1938 the team of Clark–Hooper, Inc. had disbanded, and Hooper continued alone in the field of radio measurement. Although magazine publishers encouraged Hooper's service, they did not underwrite it. Hooper's method allowed him to innovate such features as the available audience base, resulting in ratings half the size of Crossley's. (The available audience included those not listening as well as those listening, whereas Crossley used only those listening.) Hooper also supplied an average audience rating, rather than give the total program listeners as CAB had done. An average audience rating was a program's total audience divided by the time intervals. Crossley's method, by comparison, presented only the total listeners to a given program in a sample or only the program's total audience. Furthermore, the coincidental technique eliminated what Hooper considered another major flaw with the recall method: the memory factor.

Hooper managed to make his name a household word. CAB reports had been primarily available to the buyers of advertising time, and consequently reports were guarded. Hooper, on the other hand, openly courted the press, making himself and his ratings newsworthy. His name began to appear in a vast assortment of trade magazines. In addition, he was written up in daily newspapers and even garnered a feature article in the *Saturday Evening Post* in 1947. Publicity surrounding Hooperatings rode such a crest during this period that Crossley was later to remark wryly that his defeat could

be traced to the fact that his name did not rhyme with anything. (A genius at promotion, Hooper had a field day attaching his name to such derivatives as Hooperuppers, Hooperdowners, Hoopermania, and Hooperhappy.)

Whereas Crossley's reports aided the advertising community, Hooper courted the other side of the street, the networks and the stations. In particular, he did this by introducing services specifically designed to aid stations and networks. Hooper's next move, in the early 1940s, was to introduce his "Stations Listening Area Reports" for local radio markets, quickly signing up 205 local markets to CAB's none. Stations were quick to assume 44.5 percent of the cost of Hooper's operation. Hooper was, of course, weakest in advertising clients, the community sponsoring CAB. This move to local market reports, together with Hooper's open press policy, made a major impact on CAB's clients—the advertising community.

By 1944 the CAB had lost ground to Hooper's coincidental method, and over time, Crossley also switched his service to the telephone coincidental method. With both services using the coincidental method, with growing costs, and with increasing numbers of interviews yet different results, industry executives began to argue that having two services was repetitive and wasteful. CAB was considered superfluous and was forced out of business in 1946.

In 1945 Hooper made his reports available to advertisers, agencies, and networks. This strategy, which included local stations as a vital part of his service, resulted in both economic and methodological advantages. The economic results were to increase the scope of Hooper's service without excessive financial burden to any one subscriber. In this sense, Hooper operated the first radio pool made up of the commercial interests in radio, a precedent that became an industry norm.

As Frank Nye points out in "*Hoop*" of *Hooperatings*, the odds had been against Hooper, an unknown selling a deflationary method to those who wanted optimal figures; furthermore, his service was based on a technique one-third more costly and was pitted against a service backed by three powerful associations. Whereas CAB had been developed to serve the advertising community, Hooper had worked the other side of the street, serving stations in 60 cities and their rep firms.

Through Hooper's showmanship, the Hooperatings became increasingly important. Although Hooper took great pains to emphasize in his writings that radio program ratings are measures of quantity, not quality, many critics complained that the ratings took on the sinister quality of being an absolute artistic standard for radio programming.

Although the industry had attacked CAB in particular, telephone-based methods were coming under closer scrutiny in general. In 1929 there were 10.25 million radio homes in the U.S. (approximately 35 percent of all homes), compared to 12.4 million telephone homes (42 percent of all homes). However, the situation changed rapidly when the number of radio

homes began to grow substantially faster than the number of telephone homes, raising the question of the representativeness of a telephone-based sample to measure radio. As radio went into World War II, radio homes were approaching saturation and were estimated to reach a national average of 85 percent of all homes, growing at twice the rate of telephone homes. The radio industry was beginning to grumble about the exclusion of listeners on farms, in small towns, and in areas remote from transmitters.

Coming Up on the Outside: Competition from A.C. Nielsen

Hooperatings did not survive the challenge of a new competitor, A.C. Nielsen. Its defeat lay, oddly enough, in the method it had championed, the telephone coincidental, as it attempted to measure the rise of a new advertising medium, television. The year was 1948, a year that brought attacks on two key fronts of the established Hooperatings by the up-and-coming A.C. Nielsen. These two fronts were projectable ratings (ratings projectable to a true national cross section) and TV ratings.

It became increasingly apparent that Hooper's telephone-based service was doomed if it could not develop a national sample. Hooper's Program Hooperatings measured only urban areas and were not projectable to a national audience. Because projectable ratings required a sample representative of national radio homes, Hooper's key challenge was to develop a representative sample. In April 1948 Hooper launched U.S. Hooperatings, his first projectable service of radio's listening audience. U.S. Hooperatings were an attempt to achieve this national cross section by adding a diary method to the coincidental method, in order to measure non-telephone homes. Hooper's projectable ratings were not an entity of their own but took the coincidental measurements as a base and projected them to a national total through information collected from diaries. Hooper planned to charge a separate fee to subsidize this new service, and he planned to operate it on a regular basis if enough subscriptions could be found. His primary client for such a service would be the networks.

However, Nielsen had begun integrating projectable ratings as a feature of his service with no extra charge. In addition, by March 1948 Nielsen had expanded his sample to a national basis. The bottom line was that, until ratings could be projected, they were merely indices of arbitrary value: the numbers were comparable one to another within urban areas but not representative of a national population. Nielsen thus offered a significant product innovation through the development of projectable ratings. Nielsen's projectable ratings offered both a pricing advantage and a superior method. Both strategies resulted in an eventual defeat of Hooperatings. U.S. Hooperatings failed to achieve enough subscriptions to launch the projectable rating service as a regular feature.

A second critical factor in Hooper's defeat by Nielsen was the rise of television. The Hooper network service covered only the larger urban areas with telephone homes. This coverage, however, represented only 20 percent of the population. Television had hit these urban areas the hardest and had made the most impact in cities where Hooper had based his radio rating service. In other words, although radio use was falling in the areas measured by Hooper's network service, it was not falling in 80 percent of the nation's homes. Thus, according to Nielsen, it was utterly unrealistic for Hooper to ignore TV's impact in his network radio cities.

Hooper had based his network program ratings wholly on telephone homes in the urban areas where television had made the greatest inroads. Thus, his sample was attacked for overweighing the influence of TV on radio listenership. To make matters worse, telephone subscribers were found to own a disproportionate number of TVs, when compared to nonsubscribers. Hooper consequently was accused of shortchanging and deflating radio.

In February 1950 Hooper sold his national ratings services (national radio and national TV ratings) to A.C. Nielsen, Inc. Hooper cited three factors in his decision. First, the number of sponsored network radio programs on the air had dropped 40 percent in three years. Thus, his radio network service had declined because of the flight of advertisers to network TV. Second, Hooper noted the increased competition from Nielsen. According to Hooper, without Nielsen competition, he would have continued his network Hooperatings, "riding the radio curve down and the television curve up." With the growing revenue split between Hooper and Nielsen, even the network TV rating business did not bring the total network ratings to a profitable level. Revenue had dropped from \$40,000 annually in January 1949 to \$25,000 by January 1950. Third, Hooper stated that television had so changed listening habits in cities with TV service that the averaging of listeners in cities with and without TV was no longer plausible.

The 36-city-based network Hooperatings assumed that "conditions" under which measurements were taken remained relatively constant and that consequently the change in the rating index or rank was a valid indication of change in popular-

ity. Because television came first to the big cities, where Hooper had based his samples, his reports indicated that radio audiences were moving in large numbers to TV. However, this was not true in most of the country. In not being representative, National Hooperatings indices had become essentially meaningless.

Although Hooper quit the national rating business, he planned to continue at the local level with city Hooperatings, city teleratings, area coverage indices, and sales impact ratings. These local markets were now where Hooper was getting two-thirds of his profits. In a prophetic statement, Hooper argued that the shift in their packaging was away from one average index to analytic reports of individual markets and of differences between markets. Hooper left the national rating field for TV and radio to A.C. Nielsen, Inc., and his Audimeter. Though he planned to continue his local market services, Hooper's untimely death in a boating accident prevented these plans from reaching fruition. The American Research Bureau (later Arbitron) purchased Hooper's remaining local service in 1955.

Hoover, Herbert 1874-1964

United States Secretary of Commerce (1921-1928) and President (1929-1933)

Although he later became President (1929-33), Herbert Hoover's importance to radio broadcasting lies in his service as the medium's first federal regulator. Hoover's cabinet department licensed and regulated radio stations while he served as Secretary of Commerce (1921-28). Managing the largest department of government at that time, Hoover attempted to influence the fledgling radio industry through speeches and called four national radio conferences in an effort to develop support for legislation that he eventually achieved with the Radio Act of 1927.

Among Hoover's vast array of concerns as Secretary of Commerce was the growth of radio broadcasting. When broadcasting burst onto the scene in the early 1920s, Hoover defined, explained, and advocated certain fundamental principles of public policy that today remain the accepted foundation upon which U.S. broadcasting rests.

Almost immediately after becoming Secretary of Commerce, Hoover was made aware of the challenges plaguing broadcasting. Because of the limited use of wireless prior to the advent of radio broadcasting, there had been no pressing need for spectrum planning, let alone further legislation. Hoover had to make policy decisions using the expertise of his staff, who supplied him with an array of recommendations on the direction radio regulation should take. The staff perceived the primary difficulties to be the determination of who was to broadcast, what was to be broadcast, and under what conditions.

From his experience in public life, Herbert Hoover had developed a strong philosophy of the proper relationship between government, business, and the individual. Facing a rising storm of listener protest over growing signal interference from the flood of stations taking to the air on a limited number of frequencies, Hoover undertook three approaches to resolving the policy impasse. From 1922 through 1925 he called four national radio conferences in Washington to poll industry figures for a consensus on what should be done. The first was attended by about 30 engineers and attorneys; the fourth attracted the attendance and participation of several hundred people from all parts of the growing industry. Department staff drafted agendas for the meetings, made recommendations, and supported conference results that paralleled their own thinking, often ignoring those that did not. Each conference concluded with ever stronger pleas to Congress to replace the obsolete and limited Radio Act of 1912 with something specifically designed for broadcasting.

At the same time, Hoover's department slowly expanded the number of frequencies available for broadcast station use—from only one in 1920 to three channels by August 1922

and the beginnings of a band of continuous frequencies in mid-1923. By April 1927, most of the present AM band had been so allocated. But Hoover and the department were doing this largely on their own initiative, as the Radio Act of 1912 provided little guidance and gave the secretary no discretion.

That lack of regulatory discretion eventually halted his activity, laudable though everyone agreed that it was. When Hoover sought to rein in what he saw as renegade stations that changed frequency, power, or location, thus adding to interference problems, he lost. A 1926 Chicago case held that he lacked the authority to issue such orders—the Radio Act merely allowed the department to issue licenses. Adding to the bleak picture, the U.S. Attorney General issued an advisory opinion that Hoover had largely exceeded his authority under the 1912 Act. It was clear that Congress would have to take action on new legislation.

Hoover often used the term "public interest" in reference to radio. He asserted that radio had become a "public concern impressed with the public trust" and that its use should be considered primarily "from the standpoint of the public interest to the same extent and on the same basis of the same general principles as our other public utilities." Use of this language by Hoover and his staff helped Congress to settle on the phrase "public interest, convenience, or necessity" in the 1927 Radio Act. Hoover stated often and consistently that broadcast regulation must: (1) establish service to the public as its paramount characteristic; (2) avoid monopoly in the control of facilities but not restrict necessary growth; (3) prohibit censorship by either private parties or groups or the government; (4) sustain broadcasting as an area for free and full development by private enterprise; and (5) be subject only to the degree of regulation necessary to protect the public against abuses.

Through trial and error, the essential ingredients of the regulatory scheme embodied in the Act of 1927 were refined during the daily operations of the Bureau of Navigation and Standards of the Department of Commerce. The new legislation that finally passed was greatly influenced by the philosophy expressed and promoted by Secretary Hoover and was a reflection of his general influence in government and of the respect with which he was viewed.

Hope, Bob 1903-2003

U.S. Comedian and Actor

Recognized for his versatility in vaudeville, on Broadway, in films, and on television, and for his USO performances for military troops around the world, Bob Hope is also remembered for his contributions to radio, where he starred in variety programs for a decade. In company with comedian Jack Benny and ventriloquist Edgar Bergen, Hope was consistently listed among the top ten network radio shows during World War II, perhaps because such programs helped audiences to forget the serious world outside.

Although Hope initially rejected radio because he thought it "would never amount to anything," Henderson (1988) remarks that Hope's "crackling, one-liner patter suited radio and he soon became one of the most popular performers on the air." His radio appearances on Columbia Broadcasting System (CBS) and National Broadcasting Company (NBC) radio were memorable because of his non-sequiturs and barbed monologues that he had honed in vaudeville and on Broadway.

In May 1937 Hope signed a 26-week contract for the *Woodbury Soap Show*, broadcast from New York. Later that same year, when he traveled to Hollywood to film *The Big Broadcast*, he continued the show on a transcontinental hookup. After the Woodbury program, he was signed to *Your Hollywood Parade*, which originated in California. By the time he signed to work with Paramount, the show blended with his plans, enabling him to fulfill the demands of both film and radio. It was during this period that he developed his trademark topical joke and monologue. Morella (1973) says the tone for the radio shows would be set by the breezy, irreverent monologue, heavily spiced with pointed allusions to current affairs. During the airing of one show, Hope was clocked at seven jokes per minute. To help maintain the frenetic radio

pace, he had as many as a dozen writers producing about 150 jokes a week just to fill his three-minute monologue and four-minute guest spot. *The Bob Hope Pepsodent Show* was the top-rated radio program of 1944.

Among the many techniques Hope used to become a major radio entertainer was his arranging for an ongoing feud with singer Bing Crosby. They pretended dislike for one another over Hope's envy of Crosby's wealth, singing ability, and status as leading man. Thompson (1981) says that the early radio broadcasts of the Pepsodent Show from 1938-1948 established a pattern to the Hope-Crosby relationship: Crosby was the archetypal city slicker and Hope the brash country bumpkin who was always being used but somehow managed to come out right in the end. Hope's efforts at ridicule sometimes backfired, however. For instance, in an episode in which Hope pretended to kill his sidekick Jerry Colonna (who was playing the part of Santa Claus), the level of negative reaction was so intense that for a short time the sponsoring Pepsodent company considered canceling the show. Colonna was an important part of Hope's radio broadcasts that audiences associated with the show, in addition to orchestra leader Skinnay Ennis and the vocal group Six Hits and a Miss.

When World War II began, Hope tried to enlist but was told he could better serve as an entertainer. With his USO troupe he made trips to Sicily, Britain, Alaska, North Africa, and the South Pacific. He was the mainstay of the Armed Forces Radio Service (AFRS), the network of stations the army and navy set up in the European and Pacific war theaters, and he performed regularly on such AFRS programs heard only by military personnel, such as *Command Performance*, *Mail Call*, and *GI Journal*.

Bob Hope
Courtesy of NBC

After the war, both the critics and the public began to desert Hope and his new sponsor, Lever Brothers. Some criticism was directed at the sameness of Hope's material; "the old zing was missing," writes Morella. In 1948 Hope dropped two of his best-known associates, Colonna and Vera Vague. However, in 1953 a move to morning radio and new sponsor General Foods landed Hope a \$2 million contract, the biggest single-season deal in radio history to that date. Morella explains that, although Hope's experiment with daytime radio was successful and his show lasted for five years, he eventually decided to stop bucking the tide. Radio listeners preferred music and talk shows; radio comedy had lost its appeal.

With the decline of network radio, Hope was one of a number of CBS stars (others included Groucho Marx, Kate Smith, and Ed Wynn) who were lured to NBC television in 1948–49. After doing stand-up humor and slapstick sketches on several programs, Hope was able to add a visual dimension to his established radio format and his own *Bob Hope Show* made its debut in 1952.

Unlike Hope's *Pepsodent Show*, his television work was confined mostly to monthly specials, particularly his Christmas shows for service personnel in remote areas. Schulman and Youman (1966) note that his popularity and acceptance were such that whoops of laughter greeted his barbed comments on social and political problems—comments that, from another comedian, might have been considered a breach of taste and manners.

The basic format of Hope's comedy shows—a monologue followed by sketches with other guest stars—remained unchanged since his radio days in the 1930s. The passing years diminished neither the polish nor the exuberance of his performance. When he was honored by the Kennedy Center in 1985 for his mastery of television, film, and radio, it was estimated that, during seven decades in show business, he had been seen and heard by more people than any other entertainer on earth. A resolution passed by the U.S. Congress in October 1997 declared Hope "a part of American folklore."

Horror Programs

Horror programs occasionally featured classic monsters like vampires and werewolves, but more often were home to the walking dead, disembodied spirits, or unique creations. In the 1940s, *Inner Sanctum's* no-holds-barred formula set the standard, and its “creaking door” is one of radio’s best-remembered icons. Listeners never knew what would happen on *Inner Sanctum* or who would be the next victim. In many cases, the episode’s narrator turned out to be the murderer! As John Dunning observes, “without benefit of the guilty knowledge, the listener was recruited as the killer’s sidekick.”

Origins

The real origins of radio horror can be found in the 1930s, but like all popular phenomena, the trend did not occur in isolation. Dime novels had been popular since before the turn of the century, and their direct descendants, the pulp magazines, had become increasingly lurid throughout the 1920s and early 1930s.

Pulps like *Weird Tales* displayed fantastic, horrific, and just plain odd cover images. The March 1923 *Weird Tales* cover, illustrating the story “Ooze,” depicts a tentacled, shadowy figure. Horned devils (October 1925), fiendish dwarves (March 1926), wolf-women (September 1927), treacherous druids (October 1930), and monstrous gorillas (September 1929) were common. Stories included Carl Jacobi’s “Mive” (January 1932), about carnivorous butterflies, and H.P. Lovecraft’s stories of unnamable, lurking monstrosities and rats inside walls. Horror was certainly in the air when Universal Studios inaugurated its series of “monster movies” with 1931’s *Dracula* and *Frankenstein*.

Radio’s *Collier Hour* serialized stories of Fu Manchu in 1929, complete with menacing fungus and poisonous green mist. “The Shadow” first appeared as a nameless narrator on the *Street & Smith Detective Story Magazine Hour* but would reincarnate in his own program, as an adventurer “with the power to cloud men’s minds.” Research is now uncovering isolated references to early 1930s horror programs, but the first significant horror program was *The Witch’s Tale*, which began on New York’s WOR on 28 May 1931.

Written by Alonzo Deen Cole, the series derived from the folk tale tradition. “Old Nancy, the witch of Salem,” began by gathering listeners around her fire. “A hunnert and fifteen year old” (her age changed frequently), she sat with “Satan, her wise black cat,” inviting listeners to “turn out them lights” and “gaze into the embers” as she wove her tales. Old Nancy’s dialect and stories are “straight from the Middle Ages,” as Dunning notes. The supernatural dominates, as ghosts seek vengeance, tombs are defiled, and curses are cast. Caucasians

laugh at “silly native superstitions” in “Spirits of the Lake” and “The Boa Goddess,” only to die horribly. Cole adapted legends like “The Flying Dutchman” and even tackled Mary Shelly’s *Frankenstein*. In “The Bronze Venus,” a man dies in the arms of a living bronze statue, and in “The Troth of Death,” a man betrays his lover, only to be doomed to spend eternity chained to a cemetery.

Nationally syndicated in 1934, the program survived at least half a dozen incarnations. (Ironically, one of the best and most popular surviving *Witch’s Tale* episodes, “Four Fingers and a Thumb,” originated in Australia.) Adelaide Fitz-Allen, Martha Wentworth, and 13-year-old Miriam Wolfe provided Old Nancy’s voice.

In 1934, Wyllis Cooper created *Lights Out* for Chicago’s WENR, drastically changing the tone of radio horror. Creative sound effects embellished imaginative nightmares, like people turned inside out, or the “Chicken Heart,” which grows to monstrous size. In “Murder Castle,” a killer suffocates. “Snake Woman” gains revenge with trained serpents. A chemist discovers “Oxychloride X,” a chemical that eats through anything. By 1939, writer Arch Oboler turned to more mainstream fare, claiming that he couldn’t keep on topping his own horror stories.

The Hermit’s Cave originated in 1935 on Detroit’s WJR. It was syndicated nationally by the 1940s, with a later West Coast version. The Hermit (played variously by John Kent, Klock Ryder, Toby Gremmer, and Charles Penman, who also directed) was a cackling counterpart to Old Nancy. He spoke over howling winds, promising “Ghost stories! Weirrrrrd stories! And murders, too! The hermit knows of them all!” Detroit acting troupe “The Mummies” produced ghost stories like “A Haunted House,” witchcraft tales like “The Red Mark,” and grisly fare like “The Vampire’s Desire.”

By the mid 1930s, local stations were anxious to cash in with programs like WKY’s *Dark Fantasy*, which broadcast from Oklahoma City. Network “Creepy hosts” like Ted Osborne can be heard on two surviving episodes of *The Black Chapel*, while Charles Penman hosted *The Devil’s Scrapbook* in 1938. Others like *The Devil’s Roost* and *The Witching Hour* no longer exist.

Inner Sanctum Mysteries began on 7 January 1941. “Raymond” was a new model for the “creepy host,” and *Inner Sanctum* incorporated both strands of previous horror programming—Old Nancy’s melodramatic supernatural tales and *Lights Out’s* explicit detail—and added its own unique flavor. Shamelessly theatrical, *Inner Sanctum* resorted to any melodramatic device to engage the listener. Background screams and sudden appearances of characters thought dead were common. Best of all, Raymond relished puns. He professed to keep

a "happy medium around to keep in the right . . . spirit." Raymond's moral of an ax murderer story was "Knife can be beautiful . . . if you look out for people with an ax to grind. They may be trying to get a HEAD of you."

Many non-horror series contained occasional genre trappings during their run. Orson Welles had famously adapted *Dracula* in 1938, and his *War of the Worlds* adaptation frightened thousands. The high profile *Suspense* adapted H.P. Lovecraft's *The Dunwich Horror*, and in "The Diary of Sophronia Winters," Agnes Moorehead's character wallops Ray Collins in the head with an axe. A werewolf stalks "The House in Cypress Canyon."

The Shadow fought monsters like "The Gibbering Things" and "The Weird Sisters" (both written by Alonzo Deen Cole), and *The Hound of the Baskervilles* was periodically reincarnated in *The New Adventures of Sherlock Holmes*. Beginning in 1939, the best-remembered serial adventure, *I Love a Mystery*, depicted gruesome murders and (apparently) supernatural menaces. Jack, Doc, and Reggie often encountered weird horrors like "Temple of the Vampires" or the "Monster in the Mansion," which involved an arm amputation and a headless black cat. A slasher roams the halls as a ghostly baby cries in "The Thing That Cries in the Night."

Still, *Inner Sanctum's* influence dominated, as new narrator/hosts appeared on other programs. *Suspense* was introduced by "The Man in Black," and by 1942 even a crime melodrama like *The Whistler* featured a nameless host. *The Mysterious Traveler* (Maurice Tarplin) rode a ghostly train, inviting listeners to join "another journey into the strange and terrifying." The Traveler told science fiction (insects seek revenge), ghost stories (haunted honeymoon cottage), and originals like "Behind the Locked Door." In this gem, trapped archaeologists discover sightless, horribly mutated descendants of a lost wagon train. *The Strange Dr. Weird*, who lived "on the other side of the cemetery," was a 15-minute version of *The Mysterious Traveler* and was also voiced by Maurice Tarplin.

A 1942 *Lights Out* revival had new narration, droned by Arch Oboler: "It-is-later-than-you-think." (The original *Lights Out* Chicago series began more effectively with "This is the witching hour. An hour when dogs howl, and evil is let loose on a sleeping world.") *The Haunting Hour's* opening was similar to the *Lights Out* original, with "Stay where you are! Do not break the stillness of this moment!" but the scripts were *Inner Sanctum* rewrites. *The Sealed Book* from 1945 sounded like *The Hermit's Cave*, as Philip Clarke, "The Keeper of the Book," unlocked "the great padlock," revealing "all the secrets and mysteries of mankind through the ages." Astonishingly, Don Douglas provided all the voices on *The Black Castle*.

Mystery in the Air, a 1947 summer replacement series with oily-voiced Peter Lorre, adapted classics like "The Tell-tale Heart," "The Black Cat," and "The Horla." Lorre's effective

performances usually ended with his screaming insanely. Willis Cooper returned with one of the finest horror/fantasy programs in 1947. *Quiet, Please* was surrealistic, lyrical and subdued. In "Let the Lillies Consider," Cooper asked, "What if plant life could think . . . and plot against us?" A resurrected god appears in "Whence Came You?" and something perches atop an oil rig in "The Thing on the Fourble Board." Each week, the *Quiet, Please* host signed off with, "I'm quietly yours, Ernest Chappell."

The Hall of Fantasy, originally broadcast from Salt Lake City's KALL, was revived by producer/director/writer Richard Thorne for Chicago's WGN in 1949. The show began with sounds of footsteps on wet concrete and featured unusually excellent production values, adapting Poe's "The Cask of Amontillado" and J. Sheridan LeFanu's "Green Tea." Thorne also contributed originals like "The Hand of Botar," in which a man develops intelligence in his right hand, and "The Jewels of Kali," in which a bizarre four-armed body searches the world for four mystical rubies.

Himan Brown's *CBS Radio Mystery Theater* adapted Poe and Shelly in the 1970s and 1980s, and similar radio programming continues today. Recreations are popular at conventions, and amateur groups often mix horror programs and science fiction productions. Still, as Hollywood movies feature increasingly realistic digital effects, it remains for new talents to harness the imagination with the aural medium and convincingly recreate the horror genre on radio.

Hottelet, Richard C. 1917–

U.S. News Correspondent

One of the legendary “Murrow boys,” Richard Curt Hottelet served as a radio correspondent for Columbia Broadcasting System (CBS) News during World War II. Edward R. Murrow hired the 26-year-old Hottelet in January 1944. He worked for CBS from 1944 until 1985, as both a radio and a television reporter.

Of German descent, Hottelet was born on 22 September 1917 in New York. During the Depression, his father lost his import-export business, and his family moved around frequently. After Hottelet graduated with a B.A. degree in philosophy from Brooklyn College in 1937, he had no clear-cut career ambitions, so his father suggested that he go to Berlin to study and live with a family relative. After he saw his philosophy professor at the University of Berlin greeting students with the Nazi salute, Hottelet tried out several other classes before dropping out altogether. Though he held no real interest in becoming a journalist, the United Press hired him as a stringer, and eventually he became a full-time correspondent. Along with another future “Murrow boy,” Howard K. Smith, Hottelet worked at the United Press’ Berlin bureau from the late 1930s until 1941.

Hottelet became a seasoned reporter in his early 20s. He covered Germany’s marches into the Sudetenland and later into Belgium and France by the time he was 22; he also witnessed the Dunkerque evacuation. His penchant for investigating the aftermaths of British bombing raids in Berlin and his “unconcealed abhorrence of Nazism” caught the attention and ire of the Gestapo (Bliss, 1991). He already had been taken into custody and questioned after phoning in a story on the deporting of Jews. Hottelet’s girlfriend, Ann Delafield (whom he later married), worked at the British passport control office in Spain, and she had formerly worked at the British embassy in Berlin. The Gestapo arrested Hottelet for espionage and charged him with sending German secrets to his girlfriend in Spain (Cloud and Olson, 1996).

The only American reporter arrested by the Gestapo, Hottelet spent four months in jail in 1941, in Alexanderplatz and

Moabit prisons, where he was threatened with execution. His arrest became a *cause célèbre* back in the United States. He was finally released in July 1941, along with another reporter, in exchange for the U.S. release of two German spies. After returning to the United States, Hottelet worked at the United Press’ Washington bureau and then for the Office of War Information (OWI) in London. Hottelet’s duties at the OWI included making broadcasts in German and writing propaganda leaflets that were dropped over Germany.

Hottelet resigned from the OWI in December 1943. He later described his decision: “I felt that government service was not for me and asked Ed Murrow for a job. He was thinking about building up the staff for the events of 1944, and in January I joined CBS” (quoted in Bliss, 1991). Murrow had already known him by that time. Hottelet was the youngest of the Murrow boys, and the most conservative in his personal views (Cloud and Olson, 1996).

As the newest of Murrow’s crack reporting team, Hottelet covered the D-Day landing from a B-26 Marauder bomber while reporting on the Ninth Air Force. His was the first news report made at the beginning of the Battle of the Bulge in December 1944; he covered the U.S. First Division, popularly known as the Big Red One. In March 1945, Hottelet covered Operation Varsity from an unarmed B-17 bomber with other reporters, photographers, and observers and had to bail out after the plane was hit.

As did other war correspondents, Hottelet saw firsthand the Nazi death camps in 1945. In April of that year, he was the first to report on the monumental meeting of the U.S. and Russian armies at the Elbe River. Among his other exploits, Hottelet went into Berlin on 4 May 1945, against military regulations; Russian soldiers detained him for a short time.

After the war’s end, Hottelet’s reporting assignments took him to Moscow, New York, and Philadelphia. In 1951, he went back to Europe, with an assignment in Bonn. When CBS decided to combine its radio and television divisions into one

Richard Hottelet

news department in 1954, Hottelet became a television correspondent. Starting in 1957, Hottelet anchored *The CBS Morning News*; his stint lasted four years before CBS changed the program's format. Hottelet became well known for his expertise in reporting international stories; he was assigned to the United Nations in 1960 and anchored a special report on the

1967 war in the Middle East. He served as editor of the volume on the United Nations in *The Dynamics of World Power* series.

Just as he was the last of the Murrow boys hired, Hottelet was also the last to leave CBS. He retired from the network in October 1985, around the time of the cutbacks that occurred at CBS in the mid-1980s. However, Hottelet has remained

active in the world of international affairs. In addition to having served as the spokesperson for the U.S. ambassador to the United Nations, he returned to radio in 1993 as moderator of *America and the World*, an interview show sponsored by the Council on Foreign Relations that aired on National Public Radio (NPR). In 1995 Hottetlet served as the NPR representative on a panel program concerning President Franklin D. Roosevelt and radio, which aired on C-SPAN. His expertise in analyzing foreign affairs found several media outlets well into the end of the century; during the 1990s he narrated a series of audiobooks on political hot spots around the world and continued to write on foreign affairs for the *Christian Science Monitor* into the early 2000s.

Howe, Quincy 1900–1977

U.S. Radio Commentator

In 1939 Quincy Howe began broadcasting news and commentary on radio station WQXR in New York. In 1942 he moved to the Columbia Broadcasting System (CBS), where he helped make analysis an accepted part of news reporting. He was one of the first radio journalists to bring the news of World War II into American homes.

Howe was born on 17 August 1900 in Boston, Massachusetts, to Fanny Howe and Mark Howe, who worked as an editor and a writer at the Atlantic Monthly Company. Howe attended St. George's School in Newport, Rhode Island, and then matriculated to Harvard University, from which he graduated *magna cum laude* in 1921. Howe then studied for a year at Christ's Church, Cambridge University, in England. When he returned to Boston in 1922, he became an editor for *Living Age*, a magazine published by the Atlantic Monthly Company. *Living Age* was sold in 1928, however, and Howe soon moved to New York. Archibald Watson, who had purchased the mag-

azine, hired Howe as editor in chief in 1929. Howe selected articles that were topical and also contributed a regular column about world affairs.

Howe, a Boston liberal, married Mary L. Post, with whom he had two children. He helped get food to striking miners in Harlan County, Kentucky, in 1932. Later that year, he became the director of the American Civil Liberties Union (ACLU), which, under his guidance, opposed censorship. Howe served as director of the ACLU until 1940.

In 1934 Howe published *World Diary: 1929–1934*, an arresting study about the causes of the Great Depression as well as a prediction about the growth of nationalism. A year later he became editor in chief of Simon and Schuster. Under Howe's leadership, the company published more topical non-fiction. In 1937 he published his controversial book *England Expects Every American to Do His Duty*, in which he proposed isolationism for the United States. Howe argued that the

Quincy Howe
 Courtesy CBS Photo Archive

United States should not get involved in another war merely to protect Britain's empire. Politicians on both sides of the Atlantic discussed his ideas. Two years later, he published *Blood Is Cheaper than Water: The Prudent American's Guide to Peace and War*, which examined the differences between isolationists and interventionists.

Howe gained experience on radio in 1938, when he provided analysis of the Munich Agreement for the Mutual Broadcasting System. Then, beginning in 1939, he provided three 15-minute news commentaries a week for WQXR, a radio station in New York. Howe's New England twang and educated opinions were well suited for radio, and his voice became one of the most recognizable for listeners almost immediately. Howe maintained his isolationist views until the United States entered World War II in December 1941.

Howe moved to CBS in 1942. He was hired to do news commentary, and he helped to make commentary an important ingredient of broadcast journalism. Like other notable commentators at the time, Howe wrote his own scripts, each containing about 1,500 words. These scripts contained informed

opinion about newsworthy events, especially about the war in Europe. Howe was able to accomplish the task because he was a professional writer as well as an excellent speaker. He usually opened his analysis with several maxims about world affairs to make his commentaries interesting and coherent. He became known for his insightful analysis. Others who worked in radio viewed him as one of the most authoritative news analysts around, primarily because of his vast knowledge about world affairs. Howe did more than read the news: he informed his listeners as to how national and international events would affect their lives.

Under H.V. Kaltenborn's leadership, Howe and 30 other commentators based in New York helped organize the Association of Radio News Analysts in 1942. The guild advocated that commentators be permitted to comment when presenting news. In 1943 Howe wrote about the power of those who advertised on radio in "Policing the Commentator: A News Analysis," published in the November *Atlantic Monthly*. He warned that advertisers could cause news and commentary to become slanted.

When World War II ended, Howe attempted to enter television. He worked as a commentator on the CBS evening news until the network was urged by an advertiser to let him go because he was too bombastic and too liberal. Howe was dropped from the evening news, but he continued to work as a reporter and narrator of documentaries for the network. In 1948, for instance, he covered the Republican and Democratic national conventions.

In 1949 he published the first volume of his three-volume history of the 20th century, *A World History of Our Times* (the last volume appeared in 1972). Later that year he left CBS and taught journalism at the University of Illinois until 1954; he left when the American Broadcasting Companies (ABC) hired him. At ABC Howe covered world affairs. In addition, he moderated the last presidential debate between John F. Kennedy and Richard M. Nixon in 1960 as well as the trial of Adolf Eichmann in Israel a year later. He received several awards, including the George Foster Peabody Award and the Overseas Press Club Award, for his work in broadcast journalism.

In addition to his work for ABC, Howe contributed articles to the *Saturday Review of Literature* and other magazines. In 1961 he became the editor of *Atlas: The Magazine of the World Press*, a monthly that featured articles from the foreign press. He served as editor until 1965. Howe died in 1977.

Hulbert, Maurice "Hot Rod" Jr. 1916–1996

U.S. Disc Jockey

Maurice "Hot Rod" Hulbert Jr. was one of the most popular black disc jockeys in radio during the 1950s and 1960s. For a period during his heyday, he could be heard hosting different programs on radio stations in Baltimore, Philadelphia, and New York. His fluid and at times nonsensical on-air patter and high profile in the black broadcasting world helped him inspire a generation of black disc jockeys who came of age in the late 1950s and the 1960s.

Hulbert was also one of America's pioneering black disc jockeys, joining WDIA in Memphis, Tennessee, as it was evolving into the nation's first all-black-oriented radio station. Before arriving at WDIA in 1949, Hulbert had worked as a dancer, comedian, bandleader, and emcee in various mid-South nightclubs and traveling tent shows. Hulbert also helped produce musicals with black students in the Memphis school system, and it was while working on one such production that WDIA's general manager, Bert Ferguson, approached him about working at the station. The meeting led to a job, and soon Hulbert was hosting three shows for WDIA: *The Sepia Swing Club*, an afternoon blues and jazz show; *The Delta Melodies*, an early-morning program of spiritual music;

and *Moods by Maurice*, a midmorning program tailored to housewives.

At WDIA Hulbert became increasingly adept at switching personas as each show required. On his *Sepia Swing Club*, he became "Hot Rod," describing for listeners his rocket ship on which they would be flown through a solar system of hot music. Listeners to the *Sepia Swing Club* responded enthusiastically, as did those who were charmed by the suave "Maurice the Mood Man" on the *Moods by Maurice* program. By 1951 Hot Rod prepared to board his rocket ship for a galaxy in a larger market called Baltimore.

The management of WITH in Baltimore had cast its net for a popular established black disc jockey to pull in black listeners, and after a national search, they had located Hulbert, whose high ratings in Memphis confirmed his popularity. WITH hired him in 1951, making him the first full-time black disc jockey in Baltimore history. The Hot Rod-rocket man persona followed Hulbert to Baltimore, and almost immediately the rhythm and blues music shows he hosted became popular among young blacks and whites. Listeners enjoyed Hot Rod's outer-space persona as well as the tongue twisters and slick

shtick that he rained on Baltimore. They had never heard such on-air wildness before. With good-natured bravado, he might greet the city with, "Not the flower, not the root, but the seed, sometimes called the herb, not the imitator but the originator, the innovator, the true living legend—The Rod!" In addition, he peppered his on-air patter with extra, nonsensical sounds, for example, *ee-us*, as in "This is Hee-us-ot Ree-us-od." This jive complemented the music he played and tickled the ears of his listeners. He ended many programs and pronouncements by proclaiming "VOSA," which meant the "Voice of Sound Advice."

By the late 1950s, Hot Rod moved on to WHAT in Philadelphia where, in his morning time slot, he repeated his Baltimore success. It was in Philadelphia that he became a three-market personality. WWRL in New York, hoping to grab some of Hulbert's luster, paid him to commute to Manhattan for an afternoon show, and then WWIN in Baltimore asked him to tape a program for broadcast there. Few, if any, black disc jockeys enjoyed such exposure in the 1950s and 1960s.

Hot Rod was back in Baltimore exclusively by the late 1960s, hosting a popular live show, first on his old home station WITH and then on WWIN. Hulbert's popularity, particularly among Baltimore's black audiences, was never more evident than during the riots that plagued the city in the wake of Martin Luther King Jr.'s 1968 assassination. Government officials asked the popular local figure to go on television to help calm the violence and tension. "I could get through," he told author Gilbert Williams in 1991, "and I talked to the people, trying to sober them up because people had gone mad. . . . I think many jocks did that all over the country." Hulbert frequently spoke out in advocacy of civil rights for blacks, marching in the streets and discussing related issues on the air.

In the 1970s, Hulbert switched to the sales and management side of radio, working for various Baltimore radio stations. By the time of his retirement in 1993 he was the general

manager of WBGR/WEBB. He died in 1996 after a battle with throat cancer.

Hummert, Anne 1905–1996 Hummert, Frank 1885–1966

U.S. Writers and Producers, Creators of Soap Operas

Anne and Frank Hummert nearly monopolized the creation of radio daytime serials—soap operas—in the 1930s and 1940s. Working within an advertising agency, they took advantage of the advertiser's interest, the new medium, the available audience, and the era. The Hummerts were not the

creators of the first soap opera, a form that evolved over a few years, but they were responsible for molding the genre and moving soap operas from evening to daytime, convincing advertisers that women could listen to radio while they were doing their housework. The Hummerts provided programming

that included advertising and propaganda (the latter including messages supporting government policies during World War II) plus entertainment for as much as half of daytime network; they also originated sponsored children's programming and many other programs.

Despite speaking to so many people for decades, the Hummerts maintained a very private, secluded life, leaving few biographical details. Frank is reputed to have been a Texas Ranger, a reporter on the *St. Louis Dispatch*, a manager of a writing school, and then a highly regarded copywriter in New York City. He is credited with coming up with the idea of writing advertising as feature news, having written the slogan "Bonds or Bondage" during World War I and Camay's slogan, "For the skin you love to touch." Blackett and Sample lured Frank Hummert away from the Lord and Thomas agency in New York to Chicago with the opportunity to set up his own radio production unit in 1927. Although Hummert was not a partner in the agency, his name was put on the masthead and he retained ownership of all the programs he produced. Hill Blackett and John Glen Sample were interested in attracting clients by providing programming for women during the day, and to get their desired audience's perspective they encouraged Frank Hummert to hire a woman. Anne S. Ashenurst had just come from a newspaper job with the *Paris Herald*, had a young son, and was looking for a job. Frank reluctantly hired her in 1927. Anne was a very deft writer and was able to communicate with Frank. They married after seven years, and were partners in producing serials for three decades.

After Pepsodent's success with the daily 15-minute program *Amos 'n' Andy*, other writers attempted to produce popular evening serials. As advertisers, Frank and Anne Hummert had program ideas for their clients and hired their writers. It was one way both to control the content and also to produce many hours. In 1931 Anne Ashenurst and Frank Hummert hired Charles Andrews to write *The Stolen Husband*, a very simple program that was then adapted to become *Betty and Bob*. Their first success was *Just Plain Bill* in 1932, also written by Andrews, and Anne convinced the sponsors to move it to daytime in 1933, arguing that women would be able to listen while doing their chores. Within a few years the Hummerts had as many as 18 daytime serial dramas on the air at the same time, bringing in as much as one-half of network daytime revenues.

The Hummerts used a technique that many have called a soap opera factory to produce the programs. By 1935 the Hummerts had moved their agency to New York City and had a staff of about 20 writers, 6 editors, and 60 clerical workers. Anne and Frank worked out of their house in Connecticut, first creating the title and the rough summary for each show. The staff in the office expanded this, and then the Hummerts created the story line, a sketch of the action for five to six episodes. The Hummerts then sent the theme and story line to five

writers, called dialoguers, who would produce sample scripts, with the best script winning the writing job. The writer would then have to stay at least three weeks ahead at all times. The Hummerts would relay any ideas they had for character and plot development to the writer through one of the six editors—all in writing. By 1938 more than 5 million words were being written annually for the Hummert serials alone, the equivalent of 50 full-length novels.

Their control is documented by noting the copy on the first page of all scripts, written in lavender ink: the title followed by the notation that this is a Hummert Radio Feature. The Hummerts gave themselves the credits for the title, original story line, the general supervision of script and production, and ownership. They had a set of rules that covered every eventuality. Nothing could be added in production that was not in the script: no extra sound effects, lest the dialogue not be heard; no overlapping of speeches; and the actors had to have the clearest enunciation—a trait Anne Hummert had herself.

Most of the 36 daytime serials produced by the Hummerts were melodramas about domestic life that moved very slowly and included lengthy advertisements. The Hummerts described them as "successful dramas about unsuccessful people, people who were not wealthy but had successful family lives and were able to help others have good relationships." The themes were often based on relationships of people from different backgrounds, worried about their future happiness. As Anne later said, "Worry, for women, is entertainment. . . . Nobody can understand the phenomenal success of the soaps without knowing when they were born. It was during the Depression. The housewife was at home worrying about everything. Would her husband lose his job? Where was the family's next meal coming from? They found escape in the lives of the people on the soaps."

The format for most of their daytime serials started with a lead-in delivered by the announcer; for example, for *Our Gal Sunday*, the lead-in was, "Can a girl from a little mining town in the West find happiness as the wife of England's richest, most handsome lord?" with "Red River Valley" as theme music. Then the announcer read a chatty commercial for a minute and a half and gave background for this particular program, followed by nine minutes of dialogue, a few leading questions for the next day's show, and a closing commercial. The commercials were written in the problem-solution formula—for example, try new improved Oxydol to make washing easier. Premium promotions were also written in as a means of proving there were large audiences for the advertisers. The offer of a Love Bird Pin just like Helen Trent's with "real simulated-gold flashing," a lavalier designed by Mary Noble, or a can opener said to have been invented by Lorenzo Jones were written into the scripts months ahead. The audience was asked to send in a dime with a box top or some other proof of purchase of one of the advertised products to receive

the premium. During World War II, at the request of the Office of War Information, the Hummerts wrote their dramas to help overcome the white soldier's fear of the black soldier and to help the war effort in general. After the war, the Hummerts were two of the few writers who never flinched during the McCarthy Era, continuing their work without any concern about the blacklist.

Some say that the reason the Hummerts led such a secretive life was that they were aware of the disdain held by much of the public for their work. Anne did admit that her son disapproved of her work and told a reporter, "As a matter of fact I sit behind my desk with two black eyes." But they did feel they were writing for audiences all over the country. The Hummerts also produced musical programs and crime dramas and were the first to convince advertisers to sponsor children's programming.

When the networks cut back on programming and the soaps were taken off the air in the early 1950s, the Hummerts retired to travel rather than taking their soaps to television.

I

I Love a Mystery

Adventure/Mystery Thriller Series

Though relatively short-lived (five years in its original run with a three-year revival based on the original scripts), *I Love a Mystery* (*ILAM*) continued its hold on radio aficionados for several decades after it aired. This was due in part to its creator and writer—Carleton E. Morse—but also to the wide-ranging nature of the adventures of the three key characters.

The Radio Serial

A serial with dozens of continuing stories that were usually presented in three-week units for a total of 1,784 episodes, the program varied from 15-minute to half-hour segments depending on the network carrying it. The program was more of an adventure/thriller than a classic detective story, despite its detective agency basis. *ILAM* originated in Hollywood for its original five-year run, moving to New York when the Mutual Broadcast System reused all but five of the original scripts (and added one new script) with a new cast. Adding to later collector confusion, the Mutual series often used different story titles. Though audition tapes were made in 1954 for a revival on CBS, that series never materialized.

In the program, Jack Packard, a one-time medical student, is head of the Triple A-1 Detective Agency, located “just off Hollywood Boulevard and one flight up,” whose motto is “no job too tough, no mystery too baffling.” At 37, he is older than the other staff members and is clearly the most cool-headed and clear thinking under pressure. His fellow-adventurers include the Texas-born roughneck “Doc” Long, who loves women and adventure in about that order. The third member of the original trio is Britisher Reggie Yorke, who is refined but also serves as the group’s muscle. These original protagonists met in China while fighting the Japanese, and they took over an abandoned detective agency on returning to the United States.

Yorke was written out of the series in 1942 when the actor portraying him took his own life. His character was replaced

with distaff interest in the form of handsome secretary Jerry Booker. When she joins the WACs during World War II, her secretarial role is taken on by Mary Kay Brown.

Carlton E. Morse, writer-producer of *I Love A Mystery*, working with soundperson
Courtesy CBS Photo Archive

The programs concerned exotic adventures, and while they sometimes had far-fetched aspects, the resolution of the stories was always rational and realistic. Each segment ended with a cliff-hanger situation designed to bring listeners back regularly. Unlike many serials, a given ILAM story ended before another began.

ILAM in Other Media

Three movies (only the first with a script by Morse) were developed from the series, and a 1967 television pilot film, *I Love a Mystery*, was made though not shown until 1973. No series resulted. An earlier (1956) attempt to develop a television series had also failed.

Don Sherwood created a short-lived 1960s comic strip based on the stories and characters of the radio series. ILAM creator Carleton E. Morse wrote one related novel and published it before his death; others were planned but did not appear.

Imus, Don 1940–

U.S. Radio Disc Jockey and Host

Don Imus moved to WNBC New York in 1971 after just three years in radio. After working at stations in California (Palmdale, Stockton, Sacramento), as well as in Cleveland, Ohio, Imus came to the largest market in the U.S. and to the station with the best combination of a low frequency and high power—arguably the biggest station in the United States. Thirty years later, Imus is still at WNBC.

Origins and Early Radio Years

John Donald Imus, Jr., was born 23 July 1940 in Riverside, California, and lived with his family in the nearby town of Perris. While in high school, he lived briefly in Scottsdale and then Prescott, Arizona. Imus wanted to be a popular singer and participated in theater, but he joined the Marine Corps before his

last year of high school. After two years in the military and the failure of a rock band formed with his brother Fred, he worked as a miner in Arizona and for a railroad in California. Using money from an injury lawsuit (and/or the GI bill), he attended the Don Martin School of Broadcasting in Hollywood—then a well-established trade school known for turning out a number of announcers and disc jockeys.

Before graduation, and apparently still owing the school tuition money—which he says he has never paid—Imus got a job at a Palmdale station in the high desert north of Los Angeles. Like most morning DJs, he got attention with stunts like saying he was running for congress in 1968 and holding a press conference—“Put Don Imus on the gravy train.” He quickly moved to KJOI in Stockton, where he apparently completed one course in political science at San Joaquin Delta College. Then he moved to KXOA in Sacramento, began calling his show *Imus in the Morning*, and created outrageous characters such as “Judge Hanging,” “The Reverend Billy Sol Hargis,” and “Crazy Bob,” who presented his own suggestive versions of fairy tales. Imus often used phone calls in his stunts—such as calling a local McDonald’s one morning, identifying himself as a sergeant in the Air National Guard and ordering 1,200 hamburgers to go. Then he confused the manager by specifying, “on 300 hold the mustard but put on plenty of mayonnaise and lettuce.”

Imus began broadcasting in Cleveland in September 1970 and was named by *Billboard* as “the major market DJ of the year.” For many of his more memorable bits, he called people on the phone: asking to buy silver bullets as the Lone Ranger, trying to order a rental car to race in the Indianapolis 500, and saying that he had left his clothes in a hotel phone booth after changing from Clark Kent to Superman and asking that they be returned. Often he talked with women whom he told to “get naked.”

One character, The Reverend Billy Sol Hargis, who sounded much like Billy Graham, was from “The First Church of the Goopy Death and Discount House of Worship, right here in Del Rio, Texas,” and sang “I don’t care if it rain or freezes, long as I’ve got my plastic Jesus riding on the dash board of my car, I can go a 100 miles an hour as long as I got the almighty dollar glued up there by my pair of fuzzy dice.”

Imitating President Lyndon Johnson, Imus explained “Why shouldn’t the Viet Nam war costs 150 billion dollars?” with: “Let Judge Hanging remind you, my fellow Americans, that you pay for what you get. You don’t run down to Sak’s Fifth Avenue and pick up some slick suit for \$29.95 and you don’t wage war for 15 cents. It cost money to dress well and it cost money to kill people.”

An Imus character called “Tricky Dick” sold used cars from 1600 Pennsylvania Avenue. Like many other radio comedians, Imus crafted characters that sounded a bit like real life radio

Don Imus
Courtesy of Don Imus

personalities of his youth. Certainly anyone hearing Rev. Hargis was instantly reminded of various paid religious programs from stations across the Mexican border that Imus had heard as a young man in Arizona or while in the Marines at Camp Pendleton.

Cleveland newspaper reviews called Imus “gross, tasteless, vulgar, and nauseating.” But in just a few months the station ranked number one in ratings. In December 1971, Imus was hired by WNBC in New York, which then was an adult contemporary to middle-of-the-road music station.

New York Radio

The transition was not easy. Imus missed many days of work—an average of two days a week in 1973—and later admitted to problems with alcohol and cocaine. Later he said: “I was drunk and coked up for 20 years, it’s a wonder I’m even alive.” In a 1976 interview Imus explained, “I have an aversion to authority, some kind of immaturity . . . it’s just the way I am.” His appeal, he assumed, was to those many people who rose each morning thinking that they would like to “take their job and shove it,” as a song of the time put it.

While insisting that he had 19 lawyers to protect him against his employers, Imus said that he thought he could find

a job in radio anywhere. But he was fired from WNBC at the end of August 1977 and remained out of work for some time, eventually ending up back in Cleveland. The shooting star seemed to have fizzled.

Imus did return to WNBC in 1979, but there was more drinking and drugs. In 1985 he was one of the first video jockeys on the cable program service VHI. In 1988 WNBC, with the new call letters of WFAN, adopted a sports talk format, and Imus continued to produce about one half of the station's revenues during his morning shift. He adopted a more mature tone, which better fit with the station's new format and with the fact that fewer AM stations were playing music, but his trend to more serious topics, he says, was accelerated by the Gulf War controversy beginning in the fall of 1990. Now more and more of his phone conversations were with journalists and politicians, the latter particularly during campaigns.

Beginning in July 1993 the program was also syndicated, and by 2001 it was carried on about 55 stations. Since 3 September 1996, it has also been carried on MSNBC and was said at times to be the highest-rated program on the cable channel. While MSNBC uses multiple cameras and adds many graphics and tape clips, Imus insists that he is still doing a radio show and usually ignores or disparages the video coverage.

In 1981 Imus and Charles McCord, the newsman on his program, published a novel, *God's Other Son*, but it did not sell well. Reissued in 1994, it became a best seller. In 1997 Imus also published, with his brother Fred, a book of photographs of the American Southwest.

Yet another controversy involved remarks he made 21 March 1996, at the Radio and Television Correspondents dinner in Washington. Beforehand he had apparently told Bill Clinton it would be a little "rough" and the President said that would be "fine." The President also said that appearing on the Imus show might have helped him get elected. However, as Imus spoke of Clinton's legal problems, his family, and other matters, it was clear from the telecast and from later news reports that the President was angry.

In 1997 *Time* magazine named Imus one of its "most influential" people, and *Newsweek* did a cover story on him in December 1998. Since 1997, he has also operated a ranch in New Mexico for children with cancer. His program is frequently broadcast from the ranch, especially during the sum-

mer when the children visit, and fund raising for the ranch is often discussed.

Since the beginning of his radio career in 1968, Imus' strong opinions and remarks about people in public life have been the main attraction for his listeners. Here is a recent sampling:

Bill Clinton: "is a dirt bag and a low rent weasel."

Al Gore: "phoniest person on the planet, disgraceful human being."

George W. Bush: "we're going to be stuck with that moron George Bush [and] Cheney and a bunch of old people will run the country."

Chris Matthews (who is also on MSNBC): "a blow hard and the most annoying person on television."

XFL football (carried on channels owned by Viacom which also owns WFAN): "The fans are neanderthal morons. It is lame. It really sucks."

"I'm trying to be entertaining, I'm trying to show a different side of these people. We are not trying to hurt people. We are trying to make people laugh."

LAWRENCE W. LIGHTY

John Donald Imus, Jr. Born in Riverside, California, 23 July 1940. Quit high school, but later earned GED. U.S. Marine Corps 1957–1959. Worked at radio stations in California before moving to Cleveland, Ohio, 1970; on-air host at WNBC (later WFAN), New York, 1971–77, 1979–present.

Infinity Broadcasting Corporation

Infinity Broadcasting Corporation, a subsidiary of media giant Viacom, is one of the largest radio broadcasting companies in the U.S. Infinity is focused on the "out-of-home" media business, which includes operations in radio broadcasting through Infinity Radio and outdoor advertising through Viacom Outdoor. Infinity's self characterization of being an "out-of-home" media business comes from the fact that the majority of radio listening and practically all viewing of outdoor advertising occurs outside the consumer's home, from places such as automobiles and public transportation systems. The majority of Infinity's revenue, therefore, is generated from the sale of advertising. Infinity Radio consists of more than 180 radio stations serving over 40 markets. Approximately 94 percent of Infinity's radio stations are located in the 50 largest U.S. radio markets. Infinity also manages and holds an equity position in Westwood One, Inc.

The original Infinity Broadcasting Corporation is not the same as the Infinity currently in existence. The original Infinity was formed by two former Metromedia Communications Corporation executives, Gerald Carrus and Michael A. Weiner, in 1972 and acquired its first radio station in May 1973. Carrus and Weiner planned to emulate Metromedia president John W. Kluge's strategy of acquiring unsuccessful radio stations in the country's largest media markets, where the greatest amount of radio advertising dollars are spent, and developing them.

Seeking someone to run the original Infinity, Carrus and Weiner turned to Mel Karmazin in 1981. Karmazin had spent the previous 11 years working for Metromedia, where he managed the company's AM and FM outlets and gained a reputation for paying substantial amounts of money for on-air talent while exercising the tightfistedness he had learned from Kluge to keep operating costs down. When Karmazin requested the opportunity to manage one of Metromedia's TV properties, Kluge turned him down, and Karmazin began to consider other options. By offering him a lucrative salary and equity in the original Infinity, Carrus and Weiner were able to lure Karmazin to the company.

The original Infinity, under Karmazin's leadership, substantially increased its acquisitions by paying record prices for top radio stations in large cities. The success of the original Infinity

was also based on its ability to acquire the radio broadcast rights to a number of professional sports teams and to seek out high-profile radio personalities for its stations.

One of those high-profile personalities was "shock jock" Howard Stern, who signed on with the original Infinity in 1985 after being fired from WNBC. The original Infinity provided Stern with a national platform. As a result of Stern's bold activities on the airwaves, the company received numerous warnings from the Federal Communications Commission (FCC) that the *Howard Stern Show* was dangerously close to violating indecency standards. The warnings brought substantial publicity to the original Infinity, and the show's ratings soared, to the dismay of the many national and community watchdog groups working to have the show taken off the air. In 1995, as the fines from the FCC escalated, the original Infinity agreed to put the controversy to rest by paying \$1.7 million in exchange for the FCC's dismissal of all pending complaints against the company's stations.

Despite the controversy, the original Infinity became popular not only with the listening audience, but also with Wall Street. The original Infinity went public in 1986 and was then bought back in a leveraged buyout in 1988. The original Infinity was again taken public in 1992. Shares issued in 1992 for \$17.50 each were worth \$170 when the company was eventually purchased in 1996.

In November 1995 Westinghouse Electric Corporation acquired the Columbia Broadcasting System (CBS), creating the nation's largest TV and radio station group. After Congress passed the Telecommunications Act in February 1996, which permitted the expansion of TV and radio station holdings, Westinghouse began considering its options for growth and, recognizing the potential of the radio industry, purchased the original Infinity in December 1996 for \$4.7 billion. After acquiring the original Infinity, Westinghouse decided to sell its industrial businesses and reinvent itself solely as a media company. In December 1997 the new media company was launched as the CBS Corporation, the largest radio and television entity in history, with Karmazin as its president and chief operating officer.

In September 1998 CBS formed the currently existing Infinity Broadcasting Corporation in the largest initial public

offering in media history. The “new” Infinity was created as a wholly owned subsidiary to own and operate CBS’s radio and outdoor-advertising business. In addition to his duties at CBS, Karmazin was named president and chief executive officer of Infinity. The name of the original Infinity had been changed to Infinity Media Corporation in anticipation of the creation of the new corporation with the same name.

In May 2000 CBS was merged with and into Viacom, Inc. with Farid Suleman becoming Infinity’s Chief Executive Officer. In March 2002 John Sykes replaced Suleman as Chief Executive Officer. The company is headquartered in New York City. Among its stations are WFAN-AM in New York (sports format), which is the nation’s top-billing station in terms of advertising dollars, and KDKA-AM in Pittsburgh (news/talk format), the oldest regular radio broadcaster in America. In addition to Stern, notable personalities at Infinity include Don Imus, Casey Kasem, Larry King, Charles Osgood, and Tom Snyder.

Inner Sanctum Mysteries

Horror Series

Squeeeeeeakkkk!!!!!! “Good Evening, friends of the inner sanctum. This is your host, Raymond, to welcome you through the squeaking door. Been shopping around for a nice case of murder? Of course you have. And you have come to the right place because the characters on this program simply *kill* themselves to keep you amused. Why only the other day we were accused of making murder our business. But we wouldn’t do that friends, oh no, because that would be mixing business with pleasure, and we consider it a *pleasure* to give some stiff the *business* . . . heh heh heh.”

So began one of the most famous openings in radio history. The squeaking door and host Raymond’s gallows humor marked *Inner Sanctum Mysteries* as a distinctively campy horror series that reveled in its grisly subject matter. It was one of the first and most successful of radio thriller dramas, a genre that peaked in popularity during the 1940s. *Inner Sanctum* was created, produced, and directed throughout its entire run from 1941 to 1952 by Himan Brown, one of radio’s most prolific showmen. Brown balanced the program’s macabre humor with carefully chosen organ sounds, blood-curdling screams,

and other effects, creating some of the most unsettling soundscapes ever heard on radio. Brown used the organ to heighten the listener’s fear, incorporating sharp stings to spark terror and creating suspense by using what John Dunning has called “doom chords” to signal approaching trouble. Murders were conveyed in the most disturbing manner possible through sound effects: Jim Harmon notes that when Brown wanted to produce the sound of a head being bashed in, he “devised a special bludgeon with which he would strike a small melon” (1967).

Inner Sanctum took its name from a line of Simon and Schuster mystery novels, but its scripts were generally original (although Edgar Allen Poe’s work was a favorite of Brown’s and was frequently adapted). Like other programs of the genre, *Inner Sanctum* relied on realism to heighten the listener’s fear that “this could happen to me!” Ghostly behavior was commonly explained by the presence of a mad relative or an actual dead body that refused to stay quiet. As critics and even the show’s own writers have noted, however, *Inner Sanctum*’s plots were driven by contrivances and coincidences that were highly implausible. The nurse hired by the judge’s wife happens to be the girlfriend of the murderer the judge just sent

to the gallows (and she's not happy with him!). The wailing of a man's dead wife that haunts him for 40 years is actually caused by a hole in the wall in which he entombed her body (and which he, so terrified, had never thought to investigate earlier). Frequently, the program employed the device of an insane narrator to throw listeners off track and increase their horror at identifying with a murderer. The violence and gore of the program occasionally got Brown into trouble with parents and with the Federal Communications Commission, who were particularly concerned that youth, especially, might be unduly traumatized and might even pick up a thing or two about how to carry out a murder. Brown himself was proud of the fact that "[s]hrinks said [the program] was scaring people out of their wits."

Like other programs in the genre, *Inner Sanctum* stories were a counterpoint (some might even say an antidote) to the suburban ideal of the postwar period. Husbands and wives did not get along well in *Inner Sanctum* stories, which were replete with film noir-type characters (including a healthy number of femme fatales) who murdered each other at terrific rates. Titles such as "Til Death Do Us Part," "Til the Day I Kill You," "Last Time I Killed Her," and "Honeymoon with Death" give some sense of the program's portrayal of marriage. Host Raymond took great glee in the violent disintegration of the postwar family and the impossibility of happy coupling; his closing puns or rhymes commented approvingly on the evening's grim outcome: "He hid her body in a bell, and that's where he made his mistake because she *tolled* on him." "Never tangle with a girl with red hair," he would chuckle, "A man is safer in the electric chair" (which, of course, is where this particular man ended up). The trademark tongue-in-roting-cheek humor of the program is perhaps best conveyed by some of its more amusing titles, including "Hell Is Where You Find it," "The Dead Want Company," "Death Has a Vacancy," "The Meek Die Slowly," "The Girl and the Gallows," "Death Is a Double-Crosser," "The Long Wait Is Over," "The Man on the Slab," "Ring Around the Morgue," "Corpse on the Town," "Corpse without a Conscience," "The Corpse Who Came to Dinner," "Blood Relative," "One Coffin Too Many," and "The Corpse Nobody Loved."

Screen horror great Boris Karloff was the program's regular star for much of its first season, appearing in the Poe classics "The Tell-Tale Heart" and "The Fall of the House of Usher." According to radio program historian John Dunning, Karloff wanted more gore than the networks would allow, and he appeared much less frequently thereafter. *Inner Sanctum* devel-

oped its own stable of stars, which included Larry Haines, Mason Adams, Alice Rhinehart, Everett Sloane, Santos Ortega, Lawson Zerbe, and Elspeth Eric. In addition, up-and-coming film stars such as Mercedes McCambridge and Richard Widmark made frequent guest appearances. Although the programs emphasized plot over character, the alternately haunted and psychotic characters gave the actors a chance to stretch their range; women especially got the rare opportunity to narrate stories and play some very unladylike people.

Paul McGrath replaced Raymond Edward Johnson as host in 1945; he set a lighter tone than his predecessor, but the substance of the programs remained the same. Himan Brown attempted to revive the program in other forms in 1959 (as the *NBC Radio Theatre*) and 1974 (as the *CBS Radio Mystery Theatre*), but neither version proved as successful as the original. Of the more than 500 programs that were produced of *Inner Sanctum Mysteries*, more than 100 are available on tape, providing a unique and still entertaining radio legacy.

Intercollegiate Broadcasting System

The Intercollegiate Broadcasting System (IBS) was founded in 1940 by the originators of AM carrier-current college campus radio. Initially, college radio's primary interest concerned exchanging technical information among colleges via this new avenue of transmission. As more college stations were established, the interest evolved to include station management, programming, funding, recruiting, and industry training. Today, IBS is a nonprofit association of student-staffed radio stations located at schools and colleges throughout the United States. Approximately 600 IBS stations operate various types of radio facilities, including closed-circuit, AM carrier-current, cable radio, and Federal Communications Commission (FCC)-licensed FM and AM stations.

The majority of the early college radio stations in the United States were operated under the auspices of campus academic departments of electrical engineering; the primary objectives of these stations focused on the technical aspects of radio broadcasting rather than the public service potential. In 1925, 171 such stations were on the air, but by 1937, only 38 remained in operation. The decline in stations is credited to a general loss of campus interest or funding after the novelty of radio wore off. The few stations that sought to continue as AM broadcasters lost their licenses to commercial interests through comparative hearings before the FCC.

Lobbying in favor of college-based stations led to the FCC's 1938 decision to preserve such stations and to its 1941 and 1945 decisions to reserve FM channels designated for educational use. From the 1960s into the 1980s, the FM stations licensed to colleges and universities in the United States continued to provide leadership for the nation's public radio movement. By the mid-1990s, the majority of the 1,800 noncommercial so-called public radio licenses were granted to colleges and universities.

The formation of IBS was crucial to the preservation of college radio. IBS actively campaigned for reserved FM channels for college radio use. The result was the 1945 continuation of a reserved band of FM frequencies (this time at 88.1 to 91.9 MHz) where most noncommercial stations are now located. IBS was also active in convincing the FCC to establish the category of Class D (10-watt) noncommercial FM stations as an entry-level training ground for college radio. The Class D decision permitted hundreds of fledgling stations to get started; most of these gained momentum and graduated to the increased power of a Class A facility, 100 watts.

Increasingly throughout the years, IBS has taken on the fight for the protection of college radio. In 1978, when copyright laws changed to allow performing rights associations to collect fees for noncommercial broadcast performances, IBS presented testimony that resulted in lower rates being applied

to college radio than to other classes of broadcast stations. IBS also filed objections against FCC on a proposal governing underwriting announcements. The IBS favored changes, which were adopted, and gave stations unprecedented latitude in the frequency and content of broadcast announcements, thus encouraging new interest from potential underwriters. Additionally, IBS was the first industry organization to file an FCC Petition for Reconsideration, which resulted in the FCC ruling exempting noncommercial operators from the \$35 application permit fee.

IBS is a centralized information source by which college radio remains informed about industry politics, problems, and solutions. IBS lobbies for educational radio through an aggressive campaign of printed materials, e-mail, ground mail, telephone and fax communication, and regional and national seminars and workshops. Beyond addressing the needs of individual member stations, IBS acts as college radio's primary representation before the FCC and other governmental and industry agencies. IBS directors comprise a cross section of professionals representing a broad range of industry-experienced people who contribute their expertise on a voluntary basis.

The volunteer efforts of IBS personnel make sponsorship of new stations possible. IBS assists in launching new stations through a plan of action that includes advisory tips on conducting a frequency search; purchasing an existing station; and implementation of legal alternatives, such as utilizing on-campus carrier-current AM or cable FM piped into existing cable systems. Additionally, IBS offers basic advice regarding the complicated paperwork involved in filing for FCC permits.

IBS also provides helpful tips to member stations on increasing a station's coverage. IBS advises conducting frequency research to see if expansion is possible. They will assist in discussing the pros and cons of increased power versus increased height. For example, maintaining the same power but increasing the antenna height could give the increased coverage desired.

International Radio Broadcasting

International radio broadcasting is usually associated with national governments, which certainly do make great use of it to communicate their viewpoints to listeners in other nations. Yet that is only one of many uses by one of many agencies: religious groups, commercial firms, and numerous others have also employed it. By the end of the 20th century, more than half of the world's sovereign nations were or had at one time been hosts to such services, which continued to attract many listeners despite the ending of the Cold War and the rising worldwide popularity of television.

Origins

Although radio amateurs often communicated across national borders, it was not until 1926 that any nation made even occasional use of radio to reach listeners in other nations. The Soviet Union broadcast to the then-Romanian (but formerly Russian) province of Bessarabia in an attempt to intimidate Romania into relinquishing its control of the province. The broadcasts lasted for several days and had no immediate effect. The Soviets also broadcast to miners in Great Britain for a few days during the General Strike of 1926, encouraging their dissatisfaction with the government, but again without visible effect. Both ventures were early examples of short-term tactical uses of the medium, but in 1927 the Netherlands launched the first long-term international broadcasting service when the Phillips electronics company's shortwave radio station PCJ began to broadcast to Dutch citizens living overseas. Over the next five years, Great Britain, France, and Germany launched similar services for their present and former citizens living abroad; the Soviet Union joined their ranks, but mainly for the purpose of reaching communists and gaining converts to communism from around the world.

It is doubtful that any of those services attracted large numbers of listeners since they broadcast almost exclusively over shortwave transmitters, and the shortwave radio sets needed to receive the signals were expensive. France and Great Britain ruled large colonial empires and used the newly created international radio services to keep overseas citizens in touch with their homelands; in those cases, the investment in receivers

probably seemed little enough to pay in order to have a touch of "home away from home." However, as fascism began to spread through Europe in the 1930s, Germany, Italy, and Spain began to use mediumwave transmissions to reach nearby nations (in the case of Spain, reaching the opposition during the Spanish Civil War was at least as important as reaching foreign listeners), intimidating some with threats, reassuring others of their good intentions, and even attempting to persuade a few to join them. Because most of Europe was in the midst of an economic depression at the time, the relative economic strength of Germany and Italy provided their international radio services with potentially attractive success stories, and workers in other European nations were a frequent target of those services. Whether the messages were persuasive is an open question, because survey research was still in its infancy.

The increasing level of activity in international radio wasn't limited to politically motivated services. Radio Vaticana had come on the air in 1931, thanks in part to a generous financial donation by Italy's "father of radio," Guglielmo Marconi. Radio Vaticana brought a Catholic message to much of the world, in many languages. It also had company before the end of the year: a Protestant service to Latin America, HCJB, operated from Quito, Ecuador, but received financial and administrative support largely from the United States. HCJB was far more interested in converting its listeners to its version of Protestantism, whereas Radio Vaticana hoped to sustain its listeners in their Catholic faith. A commercially oriented service also appeared during the early 1930s: Radio Luxembourg, taking advantage of its location amid several European nations with little or no commercial broadcasting of their own, began to provide these nations with services in their own languages, heavily laden with popular music and ads.

But it was the politically motivated services that dominated, a domination that only increased as World War II drew nearer. The Soviet service, Radio Moscow, and the German *Weltrundfunk-sender* had been exchanging condemnations of each other's governments since the early 1930s. Italy's Radio Bari began to foment discord in British-ruled Palestine starting in 1934; four years later, the British Broadcasting Corporation (BBC) began its first foreign language service with its Arabic

language broadcasts to listeners in the Middle East, largely to defend Great Britain against the continuing attacks of Radio Bari. Japan's Radio Tokyo became active in broadcasting intimidating messages to China in the late 1930s, as the Japanese army moved to occupy parts of the country. Some broadcasters began to make use of a more personality-oriented approach, with conversational styles breaking the pattern of highly formal speech that had predominated on most stations. Some also made use of clandestine (concealed or false identity) stations in hopes of deceiving listeners into believing that broadcasts came from within the listeners' own nations.

World War II

Once World War II had begun, international radio moved into high gear, with most of the major combatants—Great Britain, the United States, Germany, Italy, and Japan—rapidly adding language services, increasing their broadcast hours, and strengthening their transmitter power. The Nazis also attempted to ensure that German citizens would not have access to German language broadcasts from the Western allies by using jamming (electronic interference), by exacting severe penalties for such listening, and by making available only inexpensive radio receivers incapable of picking up the more distant incoming signals. Nevertheless, the Allied services developed an array of specialized programs designed to reach German officers, frontline soldiers, U-boat (submarine) crews, and others; these programs featured fake Germans in roles such as “Der Chef,” a German “officer” who spread rumors about misconduct and luxurious lifestyles among high-level German civilians in his broadcasts over Great Britain's *Soldatensender*—a clandestine radio service for German military personnel. However, the success of any of the broadcasts was difficult to determine. Survey research was not well developed at the time, and conducting surveys in areas governed by the enemy was not an option.

The Cold War

When the war ended in August 1945, there was considerable sentiment in Great Britain and the United States favoring sharp reductions and even elimination of the international radio services. The Voice of America (VOA) was nearly disbanded in 1945–46, and BBC external services were considerably reduced. Radio Moscow at first reduced its services slightly but then expanded them, even as it worked with the Central and Eastern European nations now under Soviet influence to create miniature Radio Moscows in Poland, Hungary, and elsewhere. Influential legislators returning from trips to those nations reported hearing strong anti-Western messages over Radio Moscow, Radio Warsaw, and other stations in the region. This fact, coupled with the virtual disappearance of cooperation

between the Western allies and the Soviet Union, helped lead to dramatic reversals of fortune for VOA and BBC, which soon had sizable Czech, Romanian, Russian, and other language services appropriate for the situation.

The United States went even further. The British had operated more clandestine stations during the war, but now the United States took the lead on a grand scale with the creation of Radio Free Europe (RFE) and Radio Liberation from Bolshevism (later Radio Liberty [RL]). The U.S. authorities considered these to be “the sorts of services the captive peoples of eastern Europe and the Soviet Union would want if they had a free choice.” Although their broadcast messages did not call for the overthrow of communist governments, RFE and RL at times suggested work slowdowns and other actions that might help weaken those governments and eventually lead to liberation from communism. The stations spent far more time pointing out the rapid economic growth of the West, comparing that growth with the allegedly poor economic progress of the East. The communist international stations reported on strikes and other signs of the “inevitable decline of capitalism,” contrasting that decline with what they claimed was the generally robust performance of the communist economies. Increases in broadcasts from the West were met by increases in jamming in the East. However, surveys taken among refugees from Eastern Europe indicated that some of the signals were getting through and that they seemed particularly effective in causing those who heard them to be more and more skeptical of communist media claims that life under communism was far superior to life under capitalism and that the gap between the two was steadily growing.

When China joined the ranks of communist nations in 1949, it soon added its own international broadcast voice, causing the United States to create an Asian equivalent of RFE/RL in the form of Radio Free Asia (RFA, 1951–55; a new Radio Free Asia came on-air in 1996). The small numbers of radio receivers in North Korea and in China, the difficulty of recruiting suitable Asian language speaking talent, and heavy jamming of RFA caused the United States to drop the service, even as China's newly founded Radio Peking (later Beijing) grew to become one of the largest of all international broadcast services, with North Korea's Radio Pyongyang not far behind. In each case, the Soviet Union assisted both materially and ideologically; the Soviet Union played a similar role with respect to Radio Havana Cuba starting in the early 1960s.

The Third World Speaks and Listens

The Soviet Union had become increasingly active in broadcasting to the Third World (industrially developing nations) during the late 1950s, as African, Asian, and Latin American nations emerged from their colonial status. The Chinese, North Korean, and Cuban international services added their voices to Radio Moscow's in denouncing colonialism where it still

existed while praising the efforts of the newly independent nations to stake out their own ideological positions in the Cold War. Two of those nations—Egypt and India—were already operating international radio services by the mid-1950s, with Africa and the Islamic nations as prime targets of the former and South and Southeast Asia the targets of the latter. Although they too denounced colonialism, and therefore Western nations such as France and Great Britain, they were not necessarily sympathetic to communism, either. Thus, they constituted yet another international radio voice with yet another cultural and political perspective. As more newly independent nations emerged, some of them also developed international services; Radio Ghana was broadcasting in several West African and European languages by the end of the 1950s. But no single nation among them ever set out to coordinate their efforts into a unified anticolonial voice, as the Soviet Union managed to do to some degree with the other communist international services during the 1950s.

That coordination began to crumble as China increased in strength and in prestige. By the late 1950s, China had begun to part ways with the Soviet Union over the correct interpretation of Marxism–Leninism. The disagreement gave rise to the broadcast of many verbal duels between the two communist powers, generally of little or no interest to anyone but committed Marxist–Leninists. The United States and Great Britain were beginning to see that, as the old colonial system broke apart, they faced both an opportunity and a challenge in reaching African, Asian, and Latin American audiences. It took a few years for each to realize that a new message would have to speak to a new relationship—one that respected the independence of what were now sovereign nations. BBC's World Services and VOA were sufficiently alert to recognize, as Radio Moscow often had not (although it made an effort to do so through Radio Peace and Progress, founded in 1964), that programs dealing with African, Asian, and Latin American events, cultures, and personalities were likely to prove far more attractive than had the one-worldwide-size-fits-all approach generally taken by Moscow. (Radio Peking was generally more sensitive to Third World cultural aspirations and often portrayed the People's Republic of China as a Third World nation.)

By the late 1960s, both VOA and BBC had developed African, Asian, and Latin American services with a variety of cultural and informational programs tailored for those regions. VOA also had introduced a limited-vocabulary/slow-rate "Special English" newscast in 1959; because it was well suited to English language learners, of which there were many in the Third World, the newscast was able to attract listeners. Surveys taken by or for VOA and BBC during the 1960s showed increasing numbers of Third World listeners for both and minuscule numbers for the communist services, with the notable exception of Radio Havana in Latin America. Cuban President Fidel Castro enjoyed considerable popularity among

Latinos for his willingness to stand up to the United States, and Radio Havana blended programs featuring Cuban and other Latin American cultures with informational programs that generally avoided the heavy ideological jargon of many such programs broadcast over Radios Moscow, Peking, Pyongyang, and other communist stations.

Religious Voices

There was yet another major entrant in the post–World War II international radio lists, although it grew more slowly than had the communist or Western sectors. Religious stations, few in number in the 1930s, began to multiply in the late 1940s and early 1950s, in part as a reaction to the spread of "godless communism," in part in recognition of the beneficial effects for fund-raising of broadcasting international religious programs for non-Christians and for religion-deprived listeners in communist nations around the world. Most of the new services were financed by U.S. religious groups, most were evangelical, and virtually all were Protestant. They established stations and relay transmitters in Africa (Morocco, Liberia, Ethiopia; in the 1960s, Burundi and Swaziland); Asia (Sri Lanka, the Philippines, Korea); Latin America (Netherlands Antilles); and also in the United States and Europe. Many of the English language programs were rebroadcasts of U.S. evangelical preachers, many of whom had heavy southern accents and made references to people and places that would be unfamiliar to foreign listeners, so it was not surprising that religious stations on the whole did poorly in listener surveys. The exceptions were HCJB in Quito, Ecuador, and FEBC in the Philippines, both of which provided a widely varied assortment of information and entertainment and were careful to show respect to other religious denominations and faiths.

Clandestine Services

Clandestine stations generally flourished in the unstable atmosphere of the Cold War. Not only were they prominent in the conflict between East and West, but they also played roles in the many regional conflicts taking place in Asia, Africa, and the Middle East. Their programs generally were political and often featured exceptionally strong language, including calls for the assassination of political leaders. They also served as channels through which politicians in exile could reach their former homelands with messages criticizing government officials and even encouraging uprisings.

The Cold War Ends

With the collapse of communism in Eastern Europe and in the Soviet Union by the early 1990s, the Cold War came to an end. That also brought radical changes for international radio,

which had been so heavily involved in the struggle between communism and capitalism. No longer did many of the governments that had financed the stations see the need for so many language services, so many hours of transmission, and so many foreign transmitter bases, and annual financial appropriations began to decline. Most of the communist countries either cut their international services to the bone or dropped them altogether. The clandestine stations also felt the pinch, since many of them had been partially or wholly financed by the East and the West so that they could play roles in Cold War politics in addition to serving the more narrowly focused ends of some of the groups operating them. Their places were taken to a limited extent by Islamic fundamentalist and paramilitary group operations, and political exile groups continued to use them in Africa and Asia.

Still, there were some bright spots for the international stations during the 1990s. The spread of the internet made it possible for them to begin to provide interference-free service through websites, and by the end of the decade virtually all of the major stations were doing so. There was also the prospect of direct transmission via satellite to individual receivers (the use of satellites to relay signals to foreign transmitter bases had been around since the early 1980s), although the cost of such receivers was discouragingly high. A U.S.-based commercial firm, WorldSpace, launched a satellite-delivered multichannel radio service to Africa in October 1999, but economic data suggested that few African listeners could afford the specialized receivers needed to bring in its transmissions.

As the new millennium dawned, there was every indication that international radio would continue to be viable, even if on a reduced scale. Some of the international commercial radio services from France—Radio Monte Carlo Middle East, Radio Méditerranée Internationale, Afrique Numéro Une (Africa No. 1; for sub-Saharan Africa)—still enjoyed financial success, largely because they provided their audiences with more “worldly” entertainment (largely Western or Western-flavored pop music) and broader and less-biased perspectives on regional and world events than did domestic stations in those areas. Instability in parts of southeast Asia, Africa, the Balkans, and the former Soviet Union helped to ensure that the comprehensive and generally reliable informational broadcasts of the BBC World Service, the Voice of America and Radio Free Europe/Radio Liberty, Germany’s Deutsche Welle, and smaller-scale services such as Radio Netherlands, Radio Canada International, Radio Australia, and Radio Japan would have audiences, especially in the areas of conflict themselves.

The Voice of Russia (formerly Radio Moscow), Radio Beijing, Radio Pyongyang, and certainly Radio Havana Cuba also continued to provide their versions of current events to listeners who appreciated Russian, Chinese, North Korean, and Cuban perspectives, even if those perspectives might have become less meaningful with the ending of the Cold War. Reli-

gious stations seemed no more or less popular than they had been in earlier decades, but the chief reason for the existence of many of them—to help stimulate contributions from those anxious to bring the gospel message to nonbelievers—remained viable. Increases in the efficiency of distribution of television broadcasts on an international basis, especially when coupled with the invention of modestly priced television sets capable of receiving signals directly from satellites, almost certainly would reduce the attraction of international radio. So would the provision by domestic broadcast services in presently autocratic nations of more balanced and detailed coverage of events at home and abroad. Neither of those changes seems an immediate prospect.

International Telecommunication Union

The International Telecommunication Union (ITU) is a specialized agency operating under the auspices of the United Nations. It attempts to assist in the development of broadcasting and point-to-point communication by providing fora for the discussion of, and adoption of agreements on, issues common to all countries' communications activities, including tariffs, technical standards for interconnection across frontiers, the sharing of broadcasting frequencies, the allocation of geosynchronous satellite locations, and the permissible uses for international communication. It also registers countries' use of shortwave frequencies to provide the basis for frequency coordination among the different users of this broadcasting medium.

Origins

Originally called the International Telegraph Union, the ITU was formed on 17 May 1865 by 20 European countries that desired to facilitate international telegraph communication. Until the convention that established the ITU was signed, telegraph activities occurred entirely within individual countries: messages had to be transcribed at each border, translated into the language of the neighboring country, and then carried across the frontier where they would be rekeyed for further transmission. Each country also used its own telegraph code to safeguard its military and political messages. This made international telegraphy cumbersome at best and prevented the new technology from having a significant positive impact on the relations of the suspicious European powers.

Linking up the different domestic telegraph systems required that three issues be resolved. First, the electrical transmission systems used had to be standardized. Different wire gauges, signal voltages, and wire connection systems had to be standardized so that there would be no technical breaks in lines traveling across frontiers. Otherwise, communication

would be impossible. Second, the allocation of revenues had to be agreed on, so that if a message traveled, say, between London and Berlin, the British, French or Belgian, and German telegraph companies (usually state-owned) would each receive an equitable portion of the tariff. Otherwise, there would be no financial inducement to connect the lines. Messages often traveled through a country's system without actually being delivered to anyone within it. (As in the above example, in which the message must travel across France to Germany for delivery.) So a system was devised that compensated different telegraph authorities according to the miles of line used for a message to reach its destination, regardless of origination or destination point. Third, a common language had to be used for messages so that their meaning could be accurately transcribed regardless of the language of the telegraph operator. Morse code, which represented all the letters of the alphabet with a combination of short and long pulses, was adopted as this common language. Also, agreements forbade private codes that shortened messages (such as FYI for "for your information") to assure that those who used the telegraph system were paying their fair share of its costs.

The original Telegraph Convention (or treaty) established the basic rules that the ITU was to administer on behalf of the signatory states and provided the foundation for subsequent agreements as new technologies developed. The ITU was not granted, and still does not have, any enforcement powers to use against states (called administrations) that break the conventions, so it functions as technical advisor, facilitator of new conventions as required, and administrator of agreements between signatory nations.

Since that first convention adopted to coordinate telegraphy, new technologies have called for new agreements and expansion of the ITU's activities. The submarine cable, which connected countries under the sea, began to be widely used in the 1850s, and the first transatlantic cable was successfully laid

in 1866. This new form of telegraphy, as well as wired telephony, invented in 1876, both required essentially the same type of agreements between states that the overland telegraph had.

The ITU and Radio

Wireless telegraphy, however, required a different set of agreements. Wireless crossed international frontiers whether a country objected or not. And although wireless operators did not require the use of facilities within every country whose territory they crossed, signals were subject to interference from other transmitters using the same frequency. Furthermore, wireless signals were important as a means to communicate with ships that were not on any country's actual territory. Two issues emerged beyond the earlier concerns. First, should all ships, regardless of country of registry, be required to have both wireless apparatus and trained operators on duty 24 hours per day? Second, were the private monopolies that were being pursued by private companies (such as British Marconi) to take precedence over safety at sea? Marconi, for instance, forbade its operators from communicating with ships using wireless apparatus manufactured by its competitors. This policy was not successfully broken until the *Titanic* disaster (1912) demonstrated the necessity of doing so. The development of wireless telegraphy resulted in the convening of a preliminary radiocommunication conference at Berlin in 1903 and a Radiotelegraph Conference in 1906 that resulted in the first International Radiotelegraph Convention. Three principles emerged from these radiotelegraph meetings. These were (1) that frequencies should be reserved for specific services; (2) that all administrations should take the steps necessary to avoid interference with other users; and (3) that all use of frequencies should be registered.

During the 1920s, three consultative committees were established under the auspices of the ITU to draw up international standards for the telegraph, telephone, and radio. The International Telephone Consultative Committee was set up in 1924, the International Telegraphy Consultative Committee in 1925, and the International Radio Consultative Committee (CCIR) in 1927. These committees all coordinated the technical studies undertaken to develop new standards, developed means to conduct tests and measurements, and made recommendations to conferences convened to adopt new regulations. The telephone and telegraph committees were combined in 1956 into the International Telephone and Telegraph Committee (CCITT).

In 1927 the ITU allocated frequencies to the different radio services that were in operation at that time. These included fixed services (point-to-point wireless radiotelegraphy), maritime and aeronautical mobile services (for ships and airplanes), radio broadcasting, and amateur and experimental services.

The Modern International Telecommunication Union

On 1 January 1934, the old ITU officially became the International Telecommunication Union. This was a result of a decision made at the 1932 Madrid plenipotentiary conference to combine the two original agreements (the International Telegraph Convention of 1865 and the International Radiotelegraph Convention of 1906) into a single International Telecommunication Convention. The ITU became a specialized agency of the United Nations on 15 October 1947.

In the same year, the table of frequency allocations that had been established in 1912, which allocated to each type of radio service specific frequency bands to use so as to avoid interference with other types of uses, was made mandatory. The International Frequency Registration Board (IFRB) was set up to manage the radio frequency spectrum under the auspices of the ITU.

In 1959 the CCIR established a study group to look into space communications as a result of the launch of the Soviet *Sputnik* in 1956. In 1963 the first administrative conference on space communications was held to allocate frequencies to space services.

The ITU has divided the world into three regions for purposes of dealing with frequency allocation issues and technical standards. These regions, roughly, are Region 1, Europe and Africa; Region 2, Asia; and Region 3, the Americas. Some differences in technical standards may exist among these regions, although within each area technical standards are consistent. For instance, in Europe medium wave (or what Americans call AM) bands are 9-kilohertz wide, whereas in the Americas they are 10-kilohertz wide. This small difference allows the larger number of countries in Europe to have additional frequencies for this service that are not needed in the Americas, which are dominated by large countries (especially Brazil, Canada, Mexico, and the United States).

The ITU has a complicated organizational structure. Its permanent staff is included in the General Secretariat headed by the Secretary-General of the United Nations. Since a 1990s reorganization, there are three bureaus in this secretariat, including the Radiocommunication Bureau, the Telecommunication Standardization Bureau, and the Telecommunication Development Bureau. The members of the ITU elect a Council that oversees the secretariat between their plenipotentiary conferences, which is where major policy changes are made and regulations or resolutions are adopted concerning either radiocommunication or telecommunication. Specialized conferences are also held to deal with specific issues, such as World or Regional Administrative Radio Conferences (WARCs and RARCs), World Telecommunication Standardization Assemblies, and World or Regional Telecommunication Development Conferences. Each of these three types of conferences also has advisory and study groups that survey

world practice in their subject concern, commission studies, or distill technical information that is used as the basis for determining new regulations or standards in the different areas. In addition, the WARC/RARC conferences have a Radio Regulations Board because of the more difficult matter of administrations coming to agreements and enforcing them when the communications activity in question is wireless (whether terrestrial or satellite point-to-point or terrestrial or satellite broadcasting). This is because such radiocommunication activities (including the assignment of geosynchronous satellite “parking spaces”) either cross frontiers or operate in the “air space” above countries that may not derive any benefit from them.

ITU Functions

The ITU’s responsibilities under this organizational structure can be grouped into three main activities. First, it coordinates radio frequency assignments, including band assignments for services and the use of the geostationary orbit for satellites, including orbital slots. Second, it recommends technical standards for international communications, including those for wired connections, bandwidths, and other technical parameters. Third, it regulates international common carrier services, including telegraphy, telephony, and data communication.

The globalization of communication that has occurred in the satellite age—including intercontinental distribution of radio and television programs, satellite-based telephony, the development of Global Positioning System (GPS) receivers and maritime communication; the explosive growth of the internet; and the need to allocate the limited number of “parking spaces” for geosynchronous satellites serving countries that are, themselves, not on the equator above which these satellites “park”—has involved the ITU in an increasing number of sovereignty-based technical issues. For instance, developed countries have argued that the allocation of orbit slots should be based on need, whereas developing countries have contended that, despite their inability to use satellites at a given time, slots should be reserved for their future use. So the question of whether technological change will enable more satellites, or more powerful satellites, to be deployed in time to meet future needs has had to be considered alongside the demands for access made by those over whose territory the satellites orbit. And because all geosynchronous satellites must orbit above the equator to maintain their positions relative to the Earth’s surface (and thus appear to be stationary), the application of sovereignty arguments has had to be considered alongside the

technical or economic arguments of more advanced countries. It is under the auspices of the ITU and its various technical committees, study groups, conferences, and plenipotentiaries that such issues are ultimately resolved.

One significant issue that the ITU has had to confront concerning radio has been the use and abuse of shortwave frequencies. Shortwave is the one radio service for which individual stations are not assigned particular frequencies. There are a variety of technical reasons for this, but the bottom line is that, depending on various factors, shortwave radio stations have to change their frequencies periodically. Keeping track of the use of stations’ use of these frequencies is thus a major activity of the IFRB. Also, shortwave radio has historically been used for international broadcasting, and stations have purposely broadcast in multiple languages to the people of other countries. Two contentious issues developed. The first was the question of whether stations were engaged in propaganda. The second, related issue was whether a country was deliberately interfering (or jamming) the signals of a station originating outside its borders to stop the station’s propaganda. Purposely interfering with another station’s signal is against ITU radio regulations, so even countries that are widely known to jam others’ signals have steadfastly denied that they engage in such practices. The IFRB could only register use, however, since it had no enforcement power to use in such cases.

Internet Radio

Delivering Radio Programs Online

Internet radio involves the delivery of audio programming via digital means from one computer to other computers over the internet. It involves both simulcasts of existing over-the-air radio stations and content from internet-only stations. Internet radio was made possible by the 1995 arrival of streaming. Previously, users had to download an entire audio file before being able to listen to it. Even audio clips of short duration could take hours to download. Streaming allows the user to listen to the audio programming as it arrives in real time. This means users do not have to wait for a complete audio file to download before listening to it. Internet radio streaming can involve both live material and archived clips of audio content recorded earlier. In either case, the user must have special software that matches the software used by the station to encode and transmit the data.

Internet radio was a booming enterprise into the late 1990s, but legal decisions and a downturn in internet advertising have effectively shut down many stations today. In 2002, a dispute between internet broadcasters and the music industry came to a head when a copyright appeals board required internet radio stations to pay a per-song, per-listener fee that was prohibitively expensive for many stations. The fee was an especially great hardship for small operations, such as religious broadcasters and college radio stations, and amounted to thousands of dollars more than they made. This led to hundreds of internet-based radio stations shutting down.

By late 2002, a compromise was worked out whereby internet broadcasters could pay royalty fees on a percentage of their revenue instead of on a per-song, per-listener basis. The *Small Webcaster Settlement Act of 2002* was seen as a big victory by small webcasters and by early 2003 many small internet broadcasters were beginning to reappear.

The three leading technologies for delivering internet radio are the RealOne Player, Microsoft Windows Media, and MP3 streaming. Internet radio stations will often select one of the technologies for the delivery of their content. In some cases, stations choose to make their audio stream available in more than one of these formats, allowing listeners to choose the way they want to listen.

Streaming generally sacrifices audio quality because of the need to compress the data for delivery via narrowband (56k) telephone line modems still used by most households. Early internet radio quality was very poor, and many listeners became discouraged by the poor audio quality and problems maintaining a continuous stream. The stream would often stop and buffer (download data before it was used), inhibiting continuous delivery of the program.

Today, technological improvements and new broadband connections allow better streams and near-CD-quality sound. Listeners with cable modems or telephone DSL (digital subscriber line) services are the biggest beneficiaries. The adoption of these faster broadband connections is rising sharply. In an 18-month period between January 2001 and July 2002, the percentage of Americans with residential broadband internet access surged from 13 percent to 28 percent. As that number continues to grow, the audience for internet radio services will build as well.

Radio Stations on the Internet

Studies show that internet usage is cutting into time people would otherwise spend listening to broadcast radio. For traditional broadcast stations, delivery of programming on the internet may help recapture some of these listeners and may even generate new listeners in distant locations. Even small-market radio stations can reach the same international audiences as stations in larger markets. The concept of signal strength does not apply in the on-line world, and all stations start out on equal footing. Location is no barrier, either. It costs no more to send an internet radio program 1,000 miles than it does to send it 10 miles. On-line radio listeners say they listen more to radio stations outside their local market than they do to stations in their own locale.

One Arbitron and Edison Media Research study showed that by the middle of 2002, 35 percent of Americans had listened to internet radio, compared with 19 percent in 1998. This growth has given traditional radio broadcasters cause for concern because radio listeners now have a much greater number of listening choices on-line than they do on the radio dial.

Internet radio listeners are sometimes referred to as "streamies." As a group, streamies represent a very desirable demographic for advertisers. Streamies are among the most active group of internet users, spending more time on-line than the average internet user. Streamies are twice as likely to click on web ads and to make on-line purchases and are very interested in new devices to enable even more convenient listening. Internet radio listeners tend to be better educated and come from homes with higher incomes than regular internet users.

Capturing the internet audience and persuading listeners to revisit, however, is made more difficult with such a range of choices. Developing content worthy of repeat visits is one of the biggest challenges for internet broadcasters. Merely having a web presence to promote a station's broadcast operation is not enough. Internet broadcasters are using interactive features

such as contests and live chat rooms to gain and hold on to the elusive internet audience. Concert information, celebrity interviews, and fashion information are also important content categories for the young internet radio audience.

Broadcast radio stations have traditionally had strong local identities. On the internet, some stations may decide to adopt a more national identity. Far-flung listeners with ties to a community can stay up to date with “local” news, sports, and community events from anywhere in the world.

Stations looking for a national audience may develop niche programming such as specific music genres or sports. Certain music formats may be more popular than others in the on-line world. A 1999 Arbitron and Edison Media Research study showed that 91 percent of radio listeners who have internet access prefer alternative rock. The next highest categories were Top 40 (68 percent), classical (68 percent), religious (54 percent), adult contemporary (52 percent), and news/talk (50 percent). The top-rated internet radio stations tend to be eclectic and unique-sounding outlets not commonly found on the air.

Some broadcasters remain unconvinced of the value of internet radio. For one thing, there are far fewer internet-connected computers than there are available radio sets. Internet radio also lacks the portability of broadcast radio and is not generally available in cars, at the beach, a picnic, or other gathering places outside the home or workplace. Sound quality of internet radio varies greatly, and listeners with low-speed modem connections or slow computers are often disappointed with the overall quality. Furthermore, studies have shown that many people sample on-line stations but don't return regularly. Many broadcasters are still waiting to see a return on their investment in internet radio.

Making Money on Internet Radio

Although broadcast radio is an audio-only medium, internet radio stations are free to offer interactive programming and can include images, animation, and even video. Whereas broadcast radio relies on estimating the size of audiences via ratings, internet radio can measure each time a user accesses a particular page or program and in many cases can provide detailed demographic data about the people visiting their sites.

There are three ways for internet radio stations to make money on-line; advertising, transactions, and subscriptions. Advertising is the model broadcast stations have adopted and used for decades. The ability of internet radio to reach a global audience means not only the potential for a greater number of listeners, but also that stations may be able to attract national, as well as local, advertisers. Internet radio listeners represent a desirable demographic of technology-savvy young people to advertisers as well.

Besides the standard audio-only commercials so familiar on the radio, internet radio allows stations to generate revenue

through graphic advertising banners and pop-up ads as well. The “banner ad” is an easy and effective way to display advertising on a station's website. Stations charge different amounts, depending on banner size, placement, and duration on a page. The banner ad may be placed on the same page listeners go to when they want to listen to the station on-line. A greater amount can be charged for what are called “click-throughs” (money earned when users click the banner ad and go to the advertiser's site).

Other sources of revenue can be generated through classified ads and direct sales or transactions. For example, many internet radio listeners say that they would like to be able to buy music on a station's site. Advertising on internet radio stations can be tied directly to transactions conducted on-line. Whereas broadcast radio commercials depend on delayed gratification (listeners hear a commercial and will ideally buy something later), internet radio is more interactive and allows the user to go immediately from the desire to buy directly to a page where a purchase can take place. This immediacy in the on-line world changes the very nature and approach of advertising for the new medium.

Many internet radio stations have moved away from being a free service and are now charging a subscription fee. KPIG in California was the first commercial broadcaster to use the internet back in 1995. Because of copyright fees and dwindling advertising revenue, KPIG is now charging a per month fee for listeners to access their content.

Internet-Only Radio Stations

In many cases, internet radio stations exist only on the internet. Often referred to as music “channels,” these ventures often play lesser-known groups and alternative music formats. In many cases, internet-only sites are providing original content, multiple channels, and fewer commercials. For artists and labels finding it difficult to get playtime on traditional stations, internet radio provides a viable option for exposure of new music.

The cost for starting up an internet radio station is far less than the cost of building or buying a broadcast station. An internet radio station can be established for less than \$10,000 and does not require a license from the Federal Communications Commission.

One of the major targets of internet-only stations is the workplace. There tend to be more computers in use around offices than radio and television receivers. Internet-only stations hope to attract workers disenfranchised by traditional radio by offering more finely niched music choices, fewer commercials, and the opportunity to buy on-line. However, since internet radio uses a tremendous amount of bandwidth, workers listening to it could put a strain on a company's network and the ability to handle e-mail and other work-related applications.

Personal Internet Radio Stations

New technology and software allow anyone to become an internet radio broadcaster. Individuals can start their own stations and operate them from their homes. All it takes is a computer, an internet connection, and some free software. Users can create and customize their own radio stations on-line without the trouble of acquiring and setting up a server. Some on-line sites allow users to create their own playlists of genres and artists and to actually specify how often each is heard. The sites have large archives of music available. Once users have built their stations based on their music preferences, they can go to a webpage and listen to their own personalized station. The web address can be given to others so they can listen to the station as well.

One of the most successful audio technologies on the internet is the MP3 format. MP3 (MPEG Audio Layer 3) is a highly compressed audio format that delivers near-CD-quality sound with very small file sizes. Users can download high-quality MP3 music files even on low-bandwidth connections. On-line MP3 sites offer a great deal of free downloadable music, and one is often able to listen to new artists who promote and distribute their music on these sites. MP3 player software is available free on-line.

Ireland

Radio enjoys a special place in Irish public discourse. Ireland is a society of strong literary and verbal traditions, out of which have emerged writers such as William Butler Yeats, James Joyce, Kate O'Brien, and Samuel Beckett. The words spoken on Ireland's airwaves likewise have had considerable significance and power. From 1926, following the formation of an Irish state independent of the United Kingdom, radio came to play an important role in creating a new sense of nationalist identity. Extensive radio coverage of the Eucharistic Congress of 1932 greatly helped to consolidate close connections between the

Roman Catholic Church and Irish politicians, connections that remained until recently a characteristic feature of the state.

Before 1988, the single state-owned broadcaster (Radio Eir-eann, later Radio Telefis Eireann [RTE]) enjoyed a monopoly of all broadcasting in the Republic of Ireland. Eamon de Valera, the predominant Irish prime minister (*Taoiseach*) of the mid-20th century, used radio effectively to disseminate his protectionist vision of an Ireland that was not only politically neutral but that he thought might also stand apart culturally from the modern world.

Listening to radio in the Republic of Ireland has often been a community experience, and people have consistently shared their relationship with the medium. In the 1950s and 1960s, men regularly gathered around a radio set on Sunday afternoons to listen to the distinctive commentaries of Michael O'Hehir on "Gaelic" football, a sport with its own special rules designed to distinguish it from "foreign" games. Today the contents of particular radio programs frequently provide a principal topic of conversation at home and in the pubs or restaurants.

Notwithstanding the fact that most householders in the Republic of Ireland now receive directly from the United Kingdom many English language television services of high quality, in addition to the four national Irish television channels, radio still has a wide listenership during the daytime and significantly influences political and media agendas. The Irish have for many years spent more time tuned to the radio than have their British neighbors.

In particular, Radio 1, the main radio service of the state-owned RTE, has provided coverage that emulates the best of the tradition of public broadcasting in Europe. During the daytime, Radio 1 creates a public space within which current and sometimes sensitive or controversial issues are discussed in a participatory fashion by well-known presenters; their guests; and members of the public, who are encouraged to phone in. During the 1990s, a wide variety of privately owned county and local radio services developed rapidly and have attracted many listeners away from RTE. Yet the main characteristic of most of these services is their local speech content. The most critically acclaimed programs on the privately owned national radio service, Today FM, are also speech centered, as opposed to music centered.

The perceived power of the spoken word in Ireland is reflected in special legislative provisions, known as Section 31, that have allowed the government to prohibit from time to time the broadcasting of interviews or reports of interviews with spokespeople for organizations that are deemed by the government to be involved in violent and undemocratic political activity, especially that relating to the conflict in Northern Ireland (the broadcasting of visual images of such organizations has never been banned).

The Republic of Ireland's transition from being a postcolonial and economically underdeveloped country to its status as the thriving "Celtic Tiger" of Europe has been reflected in part by the emergence of populist music-driven radio. Perhaps the most anomalous example of this phenomenon was Atlantic 252 (also known as Radio Tara), a long-wave station owned ultimately by RTE but managed in practice by CLT (Luxembourg). This station's diet of pop music and Americanized disc jockey patter was targeted principally at audiences across the Irish Sea and was created in 1989 to derive revenue from British advertisers, who were eager to sell their products to young

English audiences. As the U.K. gradually licensed new national stations aimed at the same audience, Atlantic 252 ceased to be viable and finally went off the air on 31 December 2001.

Development

The history of Irish radio enjoys associations with several "firsts" in broadcasting. Most Irish histories of wireless point to the early radio broadcast from leaders of the Irish uprising that occurred during Easter week, 1916, when leaders of the uprising transmitted Morse code messages from their headquarters in the General Post Office on what is now Dublin's O'Connell Street. Many of the early experiments in wireless conducted by Marconi emanated from Ireland (RTE's headquarters in Dublin's Donnybrook area, the home of Marconi's Irish mother, Annie Jameson). The development of Irish radio can be seen as emerging in five phases.

Beginnings of Irish Broadcasting 1926–1945

Irish broadcasting had a modest beginning. Broadcasting began with a 1-kilowatt transmitter and an aerial system mounted on wooden sailing masts in the center of Dublin. The first broadcast was a speech by the soon to be first President of the Republic, Douglas Hyde, in January 1926. The radio service reported to the minister for post and telegraphs, and by the early 1930s the service had transmitters in Dublin, Cork, and Athlone, allowing for national coverage. Sponsored programs were part of Irish radio from the beginnings, and news coverage was provided by Irish radio reporters, rather than relying on news services. In 1937, the year that the Irish Constitution was adopted, the service became known as Radio Eir-eann; it held that name into the 1960s.

Quest for Independence 1945–1953

This period saw Irish radio attempt to forge a model of broadcasting that was different from that of the British Broadcasting Corporation (BBC) and one that was not mired in the bureaucracy of government. With the government of Eamon DeValera firmly in place, the radio service continued to develop in order to serve the political and economic goals of the new Free State.

Ireland did not participate in World War II, officially referring to this time period as "The Emergency." Radio Eireann featured a professional repertory company, symphony orchestra, light orchestra, news service, staff scriptwriters, outside broadcast officers, and engineers. Broadcasting during The Emergency and maintaining neutrality put a strain on what could be reported. All programming was required to be cleared by the director, and often this spilled into the Dail (parliament) debates and became a matter of public debate. Mentions of the

weather, for example, were prohibited from all broadcasts, as was the coverage of sporting events. As Gorham noted, "the Government was not going to let Radio Eireann be used as an advanced weather station in the Atlantic for the belligerents of either side" (Gorham, 1967).

It was from this "emergency" situation that Radio Eireann sought independence in the years immediately following the Allied victory in Europe. The postwar move toward freedom of expression for broadcasting included the establishment of an advisory panel in 1952 that laid the groundwork for the establishment of an independent authority to oversee broadcasting that was not directly under the control of the government.

Rise and Fall of Comhairle Radio Eireann 1953-1960

The deficiencies of Irish radio were the subject of much public and government debate during this period. Some favored the continuation of direct government control, whereas others advocated following the European ethos of public service broadcasting with oversight by an independent authority. A compromise established an advisory committee, Comhairle Radio Eireann.

Comhairle Eireann's five-member council provided oversight for the radio service, subject to the approval of the minister for post and telegraphs, until the 1960 establishment of Radio Eireann. The director of broadcasting was Maurice Gorham. There was continual disagreement over the scope and function of Irish broadcasting because of lack of public funds, the need to make a decision about television, and the British electronic "invasion." There were nearly 500,000 licensed listeners for Irish radio during this period, though not all areas of the country could receive a signal. The government subsidy was augmented with the sale of program sponsorships. There were 380 employees of the radio operation, including actors, writers, and engineers, as well as the Irish Symphony Orchestra.

Radio Telefis Eireann, the "Pirates," and the Coming of Television 1960-1984

Irish radio in this period found a new regulatory environment, new sources of revenue from advertising, expanded coverage throughout the day, a Gaelic language station, authoritative news coverage, FM stations, and radio pirates. It was during this era that building a television service appeared foremost in the minds of government officials. Radio Eireann was established as an autonomous entity to be the authority over both radio and television. The first director general of the authority was an American, Edward Roth, who had been a consultant to the National Broadcasting Company (NBC) and had experience in starting up stations in Mexico and Peru. His attention, and that of others at Radio Eireann, was on television. There

was a grand exodus from the radio service to the television side of "The House," which moved to new quarters in Donnybrook. Radio Telefis Eireann (RTE) was adopted by the authority as the official name of the public service broadcaster.

The rise of rock and roll and pirate radio stations had a tremendous impact on Irish broadcasting. In 1978 alone, more than two dozen pirate stations went on the air. There were numerous raids to shut them down in the early years, but these proved to be ineffective. There was little direction from the government regarding these popular broadcasters, and this, coupled with the lure of advertising dollars, allowed illegal radio operators to play popular music to the delight of their audiences. RTE's response was to launch its own music station (RTE 2) directed toward the under-25-year-olds, who represented more than half of the population. By 1984 there were more than 70 illegal radio stations operating and gaining increasing numbers of listeners and advertising dollars.

Pirate radio became a part of Irish life, it was commercially successful, the announcers had "star" status, and the government appeared helpless to do anything about it. Raids to shut down Radio Nova and Sunshine Radio in Dublin in 1983 resulted in large public demonstrations in support of these highly popular stations.

Rise of Independent Broadcasting since 1984

Ireland entered the local and private broadcasting arena at a different time and under different circumstances than most countries. The procedures and means for silencing the pirates and bringing on board replacements suitable for the audience was to be no small feat. The Irish audience had grown to depend on the illegal broadcasters during their raid on the island. The Radio and Television Act of 1988 created Ireland's independent broadcast operators and silenced the illegal operators. The Independent Radio and Television Commission (IRTC) was formed, and by the summer of 1990, new radio licenses had been awarded to 24 different ownership groups serving all counties. By 2000, 12 community radio stations, 21 independents, and a new national radio service (Today FM) were serving Irish listeners—with several new licensees set to go on the air as well. RTE introduced Lyric FM as a new service specializing in classical music and extended coverage for its Gaelic language stations.

Organizations and Stations

There are three major types of radio in Ireland, all of them claiming some allegiance to the public service broadcasting ideals that are associated with European radio generally: the state-owned RTE radio network stations, independent local commercial radio, and community radio. In addition, there are five hospital/institutional radio stations.

RTE radio channels that provide national coverage on a variety of frequencies throughout the country include RTE Radio 1; 2FM; Lyric FM; and the Irish language station, Raidió Na Gaeltachta. One local RTE radio service, Radio Cork, operates a limited schedule.

There is one independent national radio channel that provides national coverage on a variety of frequencies throughout the country, called Today FM. By 2000, there were 21 independent local commercial stations: CKR FM, East Coast Radio, Radio Kilkenny, South East Radio, WLR, Radio Kerry, Galway Bay FM, Clare FM, FM 104, LFM, Tipp FM, Shannonside 104 FM, Highland Radio, Cork 96 FM/County Sound, 98 FM, North West Radio, Midlands Radio 3, Tipperary Mid West Radio, Northern Sound Radio, Limerick 95FM, and Mid West Radio. Ten of these stations serve the Dublin metro area, and the others serve listening areas across the countryside.

The newest radio stations on the air are the community and community of interest radio stations. Community radio stations are owned and controlled by not-for-profit organizations whose structure provides for membership, management, operation, and programming primarily by members of the community at large. These include Community Radio Castlebar, Wired FM, Dublin South Community Radio, West Dublin Community Radio, FLIRT FM, Phoenix FM, South West Clare Community Radio, Cork Campus Radio, Connemara Community Radio, NEAR FM, Community Radio Youghal, Tallaght Community Radio, Radio na Life, and the special interest station Anna Livia FM.

There are three hospital/institutional stations in Dublin, one in Waterford, and one in Cork city.

Programming

Radio programming in Ireland was long associated with extensive sports coverage of the "national" games of Gaelic football and hurling and in particular with the voice of Radio Eireann's best-known sports commentator, Michael O'Hehir. The broadcasting of popular music from outside Ireland was for decades restrained, although an antijazz campaign led by a Catholic priest in the 1930s was not entirely successful. In the 1970s young people in large numbers began to tune into foreign and domestic pirate (unlicensed) radio stations. Since 1988, local independent broadcasting has steadily grown in size and stature.

During the last quarter of the 20th century, the most influential programs on Irish radio were broadcast by RTE Radio 1 and included *Women Today*, which was feminist in concept and execution, and *Morning Ireland*, which still enjoys a very large breakfast and drive-time listenership. The main presenters associated with the great success of daytime speech programming on RTE Radio 1 during this period included David Hanly; Marian Finucane; Pat Kenny; John Bowman; Colm Keane; Myles Dungan; and Ireland's best-known broadcaster,

Gay Byrne. Other well-known RTE radio personalities who present lighter programs on 2FM include Gerry Ryan, Dave Fanning, and Larry Gogan. The abiding influence and popularity of speech programming in Ireland is underlined by the fact that the most critically acclaimed program on Ireland's only privately owned national radio service, Today FM, has been *The Last Word*, which is presented in the early evening (5:00 P.M. to 7:00 P.M.) and whose establishing presenter Eamon Dunphy developed a distinctive style of in-depth discussion of controversial issues.

The programming of the independent and community radio stations reflects local content and in some cases local music. They have captured the listening ears of the contemporary audience with personalities and recorded music. Both RTE major radio services (2FM and RTE 1) and the majority of the independent stations also have digital signals that allow Irish programming to be heard worldwide via the internet.

Financial Support

Most revenue for radio comes from advertising, although RTE does receive a subsidy from a broadcast license fee, which in 2000 was 70.00 Irish punts (approximately U.S. \$100) per subscribing household. In addition to RTE stations, the license fee also subsidizes the National Orchestra and three television services, among other entities. Traditionally, two-thirds of RTE's revenue has come from advertising.

The advertising and sponsorship revenue for the independent radio sector has seen steady growth, with increases of 14 to 17 percent in the years 1997 and 1998. The total radio advertising revenue in 1998 for independent stations was £32.87 million (\$45 million U.S.).

Policy and Regulation

Irish radio was first established under the aegis of the Wireless Telegraphy Act of 1926, four years after a bitter civil war and six years after Ireland won its independence from Great Britain. The act defined "wireless telegraphy," in a prophetic manner, as "any system of communicating messages, spoken words, music, images, pictures, prints or other communications, sounds, signs or signals by means of radiated electromagnetic waves." Radio in Ireland operated under the portfolio of the minister for posts and telegraphs until the Broadcasting Authority Act was passed in April 1960. Under terms of this law, the Radio Eireann Authority regulated radio broadcasting; it became the Radio Telefis Eireann Authority in 1966 and is most commonly referred to as RTE. The Radio and Television Act of 1988 created Ireland's independent broadcast operators.

The Irish Constitution and its regulations regarding broadcasting pose several restrictions on freedom of expression. Irish

radio, like other broadcasting, operates with a “fairness doctrine.” There is an affirmative obligation on the part of all broadcasters, RTE, private, and community stations to be fair, objective, and impartial. The legacy of public service broadcasting includes statutory restrictions on several content areas, including an absolute prohibition on editorializing, the requirement that private radio broadcasting services devote a minimum of 20 percent of their airtime to news and public-affairs programming, and the absolute prohibition on broadcast advertising of religious or political advocacy.

The amount of advertising is statutorily limited to 5 percent for RTE stations and 10 percent for independents. The Broadcasting Authority Act of 1993 amended the Broadcasting Act of 1990 (passed in order to implement the European Communities Directive on Television Broadcasting) and liberalized the amount of revenue that RTE could make from advertising. A 1995 Green Paper on broadcasting examined philosophical and strategic issues for Irish radio and other electronic media.

Two separate oversight committees govern regulation of Irish radio. The Broadcasting Commission of Ireland (BCI, known as the Independent Radio and Television Commission from its foundation in 1988 until 2001) provides oversight and licensing for the independent broadcasters, and the RTE Authority sets policy and oversight for the government-owned broadcasters. Members of both these autonomous policy-guiding bodies are government appointees.

Audience Research

The Joint National Listenership Research Committee (JNLR), comprising all broadcasting organizations, the advertising agencies, and the major advertisers, conducts audience research in the Republic of Ireland. Control of the comprehensive twice-yearly survey is handled by a JNLR Technical Committee consisting of representatives of RTE (the state-owned broadcaster), Today FM (the only privately owned national radio station), the BCI (the regulator), and the Institute of Advertising Practitioners in Ireland (the agencies). The JNLR data provide very specific information on audiences and their preferences, including a detailed analysis of the social class, age, and gender of listeners over the age of 15 for each quarter hour of the day. A JNLR software package is available to permit media buyers to plan their advertising campaigns.

JNLR findings are based on personal interviews, conducted in the home, with a sample of 6,660 people over the age of 15 in the Republic of Ireland. Special adjustments are made to ensure a minimum sample of 200 for each local radio franchise area. Results of the JNLR research are divided into “listenership” and “market share.” The “listenership” figures total more than 100 percent because they give equal weighting to

any stations heard by the respondents on the day before the survey date, regardless of the duration of listening in each particular case. The “market share” information does total 100 percent and requests that respondents state how long they tuned in to any particular station on the day before the survey date. The latter figure is a better indicator of overall performance than is the former.

During 1999, for the first time, the combined market share of privately owned radio stations edged ahead of the combined market share of the radio services operated by the state-owned RTE. However, Radio 1, which is RTE’s flagship radio service and which broadcasts mainly speech programming, continues to surpass by far any other single service, either public or private, with a national audience share around 33 percent.

As the state-owned RTE is dually funded, both from public monies and from advertising, the JNLR results are important to both RTE and the private sector in their competition for revenue.

Radio Audience and Irish Emigration

In the United States, some 30 to 35 million Americans claim Irish ancestry, quite a feat for a country of 3.5 million people. Since the beginning of Irish radio, broadcasters have considered ways and means to reach the millions of people who are connected via ancestors or interest. In 1946 the Irish Government initiated a plan to develop a high-power shortwave station that could broadcast to the United States. The project was aborted before its first broadcast, but not before a 100-kilowatt transmitter and a directional antenna that stretched over 40 miles were constructed. Today’s satellite feeds and digital radio on the internet finally allow Irish broadcasters to serve their extended world audience. Irish radio stations are electronically connected via e-mail; all of the national networks and most of the local independent stations have websites; and many are “streaming” their programming, making it available to listeners worldwide. A metamorphosis of Irish radio policy and practice from an insular, nationalistic, and pastoral focus to one that includes international, local, and national constituencies has occurred over four decades. The 21st century promises continued transformations for Irish radio. The voices of Irish radio have always had something to say. They have said it with style. Today they have an expanding world audience tuning in.

Isay, David 1965–

U.S. Radio Producer

Independent producer David Isay's acclaimed documentaries and features, broadcast on National Public Radio (NPR), beginning in the 1990s served as the benchmark for aurally lush, compelling, and socially responsible radio. Isay, the first radio producer awarded a Guggenheim Fellowship, received a MacArthur Fellowship in 2000.

In an era in which marginalized group members are often depicted as freakish or dangerous, Isay's work paints sensitive portrayals of people living in poverty (*Charlie's Story*, among others), people with all-consuming passions, or people caught up in social struggles (*Remembering Stonewall*). Many pieces investigate spirituality; others highlight vanishing professions or fading historical icons, such as Coney Island, roadside dinosaur museums, and Jewish synagogues in the South.

Isay attended a Jewish elementary school and then a prep school in Connecticut before moving to Manhattan, where he attended high school at Friends Seminary. He graduated from New York University in 1987 and planned to start medical school, a path chosen because many of his family members are physicians. Meanwhile, however, he received grant money to produce a small documentary film about drug addiction. He

notified local media about a story he felt merited attention when he met two former addicts planning to open an addiction museum. Only Pacifica station WBAI was interested, and they asked him to report the story. WBAI provided equipment and later helped edit the piece. NPR editor Gary Covino heard the broadcast and lightly re-edited it for airing on NPR; Isay earned \$250 for this five-minute debut. Covino has edited most of Isay's projects since then, and Isay set aside plans for medical school to take up a brilliant career as an independent producer. He found that working in audio neatly drew together his abilities and interests.

Isay's mother, Jane, served as an early mentor; her work as a book editor influenced his finely honed editing style. From his father, Richard, a psychoanalyst, he developed an interest in people on the margins of society.

Though based in New York City, Isay has interviewed individuals across America: he has stalked poisonous reptiles with snake handlers in West Virginia and has spent time with men serving life terms in Louisiana's Angola Prison. This latter piece, *Tossing away the Keys*, resulted in the release of an inmate who had unfairly served more than 40 years in Angola.

His concerns about capital punishment earned him his third Peabody Award, one shared with longtime collaborator Stacy Abramson. The 2000 piece, *Witness to an Execution*, provided an insider's glimpse into the Texas death chamber as experienced by the narrator, Warden Jim Willet, and others who work on death row. The program generated more correspondence than any NPR had ever broadcast.

Isay's best work springs from collaborations in which he guides people as they provide accounts of their own lives. His most celebrated pieces, *Ghetto Life 101* and *Remorse*, resulted from a collaboration with African-American teenagers LeAlan Jones and Lloyd Newman, who reported on life in and around a Chicago housing project. *Our America*, a book compiled from transcripts from these collaborations, has sold 50,000 copies. In 1999 Miami University required freshmen to read the book, and companion materials for high schools have been prepared. Because the teens' forthright on-air conversations encompassed revelations of criminality by the boys and others in their neighborhood, *Ghetto Life 101* infuriated some African-American staff members at NPR, who argued that it propagated racist stereotypes. Isay, devastated by the criticism, feared that the network might bar all future work, but the piece then won several prestigious awards.

NPR occasionally turns down Isay's pieces, claiming that materials are too raw or exhibit a lack of balance. Documentaries about a Mormon town and about a former prostitute dying of AIDS were rejected, as was one about a hospital for the criminally insane, a piece later commended by the American Psychological Association.

Most of Isay's work, however, is virtually guaranteed distribution, and many of his works are reviewed in the *New York Times* and elsewhere. Isay feels this acclaim from outside NPR has been crucial to his success at the network and with grantors.

Although Isay is known for his meticulous editing and strong story sense, his writing is also superb. Drawing from conversations with collaborators, he writes a highly natural-sounding script. His use of outsider narrators is often copied; he himself is rarely heard in his pieces.

Isay's style is richly symphonic. Such intricately edited surround sound results from painstaking work and deep on-site immersions. Isay and colleague Stacy Abramson spent 14 months working on *Sunshine Hotel*, an award-winning project recorded at a New York City flophouse.

The Corporation for Public Broadcasting underwrites most of Isay's productions, but this support and NPR's fees cover only a portion of production costs. Because few foundations provide grants to individuals, Isay established his nonprofit Sound Portraits Productions in 1994. Support comes from a wide array of large and small foundations. Grant monies are supplemented with outside projects, such as a Showtime movie deal about his relationship with the Chicago teens; monthly

transcripts, newly collected, for the *New York Times Sunday Magazine*; and a deal with audible.com to lend his name and some of his work to their enterprise. He allots just \$50,000 for his salary. His business model and high-quality work provide inspiration for other independent producers.

Isay's website, soundportraits.org, is often mentioned in the press as a "cool site." The site, which receives about 1,000 hits weekly, posts soundfiles and updates about people profiled in previous pieces.

Isay shares his fees and prize money with collaborators and develops long-lasting, supportive friendships. He hopes to expand his organization to include a social worker and an education coordinator.

Isay has also collaborated with mainstream writers to produce features. Isay sometimes finds such work frustrating because of pressures from marketing departments. He now prefers to collaborate only if the writer is obscure. He believes his mission is to broadcast voices from the margins; he aspires to draw attention to poverty and other social ills.

Sound Portrait's productions have been translated into many languages and broadcast in Europe. A 1999 work, *The Jewish Giant*, debuted at a Jewish museum, an unusual way to draw audiences to radio fare. Working with all-but-forgotten Yiddish-language programming miraculously salvaged by ethnomusicologist Henry Sapoznik, Isay showcased "The Yiddish Radio Project" on NPR and in a multimedia presentation that toured major cities in 2002.

In 2003, Isay began a long-term initiative called Story-Corps, a network of public kiosks where families can work with facilitators to record intergenerational interviews. A related Sound Portrait project includes training for high school students in conducting and editing oral histories.

Israel

It is not uncommon to observe parallels between a nation's political events and the development of its media. Because of the ability of the media to influence opinion, governments recognize the value of using those media to propagate political points of view. At the same time, citizens in free societies recognize the value of media that are not under the control of governments, and those citizens often exert great and passionate effort to contend for free media. Such has been the case with the history of radio in Israel, a history that can be divided into three periods corresponding to diverse political and historical circumstances.

Three Historical Eras

Israel's radio history begins with the Palestine Broadcasting Service (PBS) era, which began in 1936 when the British Mandate Authority introduced radio to the Middle East. Not surprisingly, PBS was modeled after the British Broadcasting Corporation (BBC) domestic service. Programming was produced in Hebrew, Arabic, and English by broadcasters who were given some degree of autonomy. But ultimate authority remained with the government, first as part of the British Post Office and then as a department of the colonial government of Palestine. A number of clandestine radio services were also in operation. Although the British attempted to stop the illegal broadcasts, various Jewish and Arab political organizations were engaged in a discreet electronic battle, voicing their respective views on underground stations while the Palestinian conflict ensued.

The second period might be referred to as the Voice of Israel era, which began in 1948 when the State of Israel was established. With the organization of the new independent government, broadcasting was first placed under the control of the Ministry of Interior and was later transferred to the prime minister's office and given the name *Kol Yisrael* (the Voice of Israel). During this time, the government exercised great control over the medium in an effort to maintain security and to protect Israelis from potential negative influences by immigrants of diverse backgrounds. An official Israeli military station was also established.

The third period of Israel's radio history is the Israeli Broadcasting Authority (IBA) era, which began in 1965 and has continued into the 21st century. The IBA was established when the Israeli government yielded to public pressure to create a public authority to manage broadcasting. Radio in Israel had come full circle and again resembled the British model. Like the BBC, its existence was created by legislation, its economy funded in part by taxation, and its function mandated by law.

Israeli Broadcasting Authority

Under the Broadcasting Authority Law, the IBA serves five functions: information and entertainment; the promotion of Israeli creative efforts; Arabic language broadcasts promoting peace and understanding with Israel's Arabic-speaking population; broadcasts targeting the Diaspora (dispersed Jews); and broadcasts to foreign countries. Within the scope of that mandate, the IBA formulates policy related to programming, management, and operations.

The organizational structure of the IBA is three-tiered. A 31-member *Plenum* (council) is appointed by the government. The *Plenum* is responsible for general broadcasting policy, including a range of matters from budget oversight to program schedule approval. It is helpful to note that because the council's membership politically reflects the membership of the *Knesset*, or legislature, consensus can sometimes be elusive. From the *Plenum*, the government selects seven members to serve as the Managing Committee, which has responsibility for broadcast operations, including budget preparation. Finally, a director general is appointed to implement the policies and procedures put in place by the *Plenum* and the Managing Committee.

In addition to the three-tiered structure of the IBA, there is the potential for further governmental involvement with radio in Israel. The Ministry of Telecommunications is responsible for the technical operation and transmission facilities. The Ministry of Defense and the military both have censorship authority when it is deemed to be in the national interest. The Ministry of Finance has significant control over budget matters, at least on the revenue side of the ledger, because of the methods used for funding broadcasting in Israel.

The IBA—and consequently radio in Israel—receives its funding from several sources. Like the British model, it is funded by a hybrid of public and private revenues. Israeli citizens pay a license fee each year for television sets in the household and an additional fee for radios in automobiles. These license fees are a major part of funding for the IBA. In addition, radio advertising is a growing source of revenue, and some funds also come from the Jewish Agency (specifically for broadcasts targeting the Diaspora) and the Ministry of Foreign Affairs.

Although advertising has become a significant source of revenue for radio in Israel, it should be noted that there are restrictions and guidelines on advertising, mostly related to the religious aspects of Jewish law. For example, until recently radio advertising by physicians, dentists, lawyers, psychologists, and many other professionals was banned. There are stringent controls on advertising copy and commercial content.

Commercial scheduling is limited or forbidden on the Sabbath and on religious holidays.

Radio programming in Israel is quite varied, owing in part to the diverse mix of cultures and languages within the population. Additionally, some programming targets audiences beyond the geographic boundaries of the state. Programs are broadcast in Hebrew, Arabic, English, French, Hungarian, Romanian, Russian, and Spanish, as well as in several Jewish dialects. Domestic radio service includes music and entertainment, variety, news and public affairs, drama, children's programming, and religious features. An Arabic channel programs music, talk, and news to Arabic-speaking citizens of Israel, as well as to the Arabic-speaking populations of neighboring states. An external radio service broadcasts news programs and features on Israeli culture in various languages to nations around the world by shortwave.

Beyond standard entertainment and information, radio in Israel is involved in the media battle of ideologies being waged by the different participants in the Middle East conflict. On one hand, Israel presents the issues from its perspective using its terrestrial media system. At the same time, the United States beams its Radio Sawa ("together") signal into Israel, targeting young Arabs by mixing popular music with Western ideology in Arabic. On the other hand, the Palestinian "intifada"—using the internet—attempts to counter the Israeli message

with its own take on the issues, while Syria, Egypt, and Iran transmit messages into Israel (in Hebrew) that oppose Israel's governmental policies.

Italy

Italy, the country where radio was invented, is home to one of the most advanced and diversified of the world's radio systems. The distinguishing feature of Italian radio is its 3,000 different stations, a figure that places Italy second only to the United States in the total number of signals available. With an average of one radio set for each of its 60 million people, Italy has one of the world's highest levels of radio penetration. Generating more than \$400 million in annual revenues, Italy's commercial radio sector is the seventh largest in the world.

Developments

In few other countries does radio have a more colorful history. The home of Guglielmo Marconi, the Italian city of Bologna was where, in 1895, a practical system of wireless communication was first demonstrated. Patents for radio that Marconi subsequently obtained in Great Britain led to the formation of Compagnia Marconi, a multinational radio manufacturing

enterprise that in the 1920s and 1930s helped advance the growth of radio in Europe.

State control of the Italian radio system began shortly after the country's first regular radio broadcasts in October 1924. Although a private company called URI (Union Radio Italiana) had transmitted the first broadcasts, from a facility located in the Corrodi Palace in Rome, radio was soon nationalized when URI was compelled to enter into a licensing compact with Italy's Fascist government. In 1927 Fascist leaders gained full control of URI and transformed the operation into the state-owned monopoly that became RAI.

Italian radio grew steadily during the 1930s and 1940s. Although most of its facilities were destroyed during World War II, RAI was rapidly rebuilt. Second and third RAI channels had been added by 1950. In 1952 RAI launched Italy's first TV service. The first attempt to privatize and expand Italian radio ended unsuccessfully in 1960 when the country's Constitutional Court upheld RAI's monopoly status.

In the early 1970s, however, a public protest movement directed at the management of RAI and at the system's close ties to the Christian Democratic Party erupted throughout Italy. The result was sweeping reforms. Beginning in 1974, a series of rulings by the Constitutional Court not only rescinded the RAI monopoly but expedited the rapid proliferation of privately owned local stations. Italy's terrestrial, cable, and satellite TV systems were similarly deregulated.

Contemporary Italian Radio

Contemporary Italian radio was shaped during a significant period of deregulation and privatization that began in the mid-1970s and culminated in the early 1990s. Ten to 15 years before Great Britain, France, Germany, and other European countries took similar steps, Italy was the first country in the region to abandon a system that had begun as a state-run public broadcasting monopoly. In Italy, this public broadcast unit is known as RAI (Radiotelevisione Italiana). Operating several channels, RAI remains one of the most widely used Italian radio services. Yet Italy's vast number of additional stations—all propelled by privatization—now define radio throughout the country.

In structure, Italian radio is similar to that in the United States. Regulation defers to a radio-television governing board that is active mainly in the licensing of stations and in spearheading a strict policy of local operations. In a country no larger in area than the state of Arizona, more than 150 cities, towns, and communities have licensed local radio stations. In major cities such as Rome, Milan, Naples, and Turin, upward of 100 stations can be heard. Roughly 60 percent of the stations operate on an FM band nearly identical to that in the United States. The remainder are medium wave stations with frequencies analogous to those of the American AM band.

One of the main outcomes of privatization has been the conversion of Italian radio from a taxpayer-supported public system into a system supported mainly by commercial advertising. Virtually all of Italy's 3,000 stations depend on advertising. Although RAI, the public unit, still relies on tax support, it, too, has developed commercial revenue streams. No country (including the United States) surpasses Italy in levels of commercial competition.

Radio stations in Italy narrowcast to niches in the broadcast audience. The culture of Italy has generally led to a preponderance of music and personality-driven entertainment formats. Music, ranging from symphonies and operas to popular fare, has been a mainstay of programming on RAI. The many newer stations have dramatically increased the number of offerings and, in many cases, have imported musical formats—from country and western music to Top 40 and blues—that were developed in the United States.

Two of Italy's most popular radio stations are Radio DeeJay and Radio Sunshine. Both specialize in popular music and high-profile announcers, and both are available in Rome and Milan, the country's two largest cities. Another leader is the Milan-based progressive music outlet Radio Planet FM. Other well-known Italian radio stations, all with music and entertainment formats, are RClub (Naples), Musica (Milan), Dimensione Suono (Rome), Radio Babboleo (Genoa), and Radio Base Popolare (Venice).

Although Italian radio has not traditionally been a showcase for news and public-affairs broadcasting, a series of political scandals in the 1990s, which resulted in the removal of Italy's long-dominant Catholic-oriented Christian Democratic Party, helped inspire several news-and-information ventures. RAI, traditionally the main source of news in Italy, is now challenged by the country's first all-news broadcast station, the Rome-based Radionews, which has correspondents and outlets in most major Italian cities. Another all-news station is Radio Reporter. In addition, talk and discussion stations are widely available. Although most news and talk stations broadcast in Italian, several cater to French, German, and Slovenian audiences in and around the country's northern border regions.

Although Italian radio thrives, the country's general lack of a public service philosophy, its assimilation of new technologies, and its collaboration with other European Union countries are issues. Another concern is the consolidation of Italy's leading radio properties into corporations such as those owned by Italian media magnates Silvio Berlusconi and Callisto Tanzi, who dominate the country's television industry.

Besides its domestic operations, Italy is identified with two important international radio services. One of these is Vatican Radio, initiated under the leadership of Marconi in 1931 and today available in 34 languages on shortwave, medium wave, and FM radio. Like Vatican Radio, Radio Roma, a shortwave service operated under the auspices of RAI, has a global audience.

J

Jack Armstrong, the All-American Boy

Children's Adventure Series

Even before World War II, Jack Armstrong of *Jack Armstrong, the All-American Boy* (a sort of *Johnny Quest* of the radio airwaves) was the image of the patriot, the great white hope, the upstanding citizen. The creation of former journalist Robert Hardy Andres, *Jack Armstrong, the All-American Boy* was a daily adventure series whose core audience skewed just slightly older (and, we can assume, more male) than its closest radio rival, *Little Orphan Annie*. It ran on various networks from 1933–51.

Jack, a perpetual teenager despite his nearly 30 years on the air, was a student and star athlete at Hudson High, where the school fight song (which doubled as the series theme) frequently cheered him on to end-of-the-game saves. But young Jack's real role was as globe-trotting adventurer with his Uncle Jim Fairfield and cousins Billy and Betty. Only barely into the first year of the program, the pep rallies and classrooms of Hudson High were abandoned by Jack and his program's writers in favor of death-defying, hair-raising adventures played out at the four corners of the world. From mountain climbing and airplane flying (Uncle Jim owned a hydroplane) to undersea diving and chasing down evildoers and pirates, from the Arctic Circle and the Philippines to other "wild," "exotic," and "untamed" locales, Armstrong's adventures ran daily in late-afternoon, 15-minute episodes. In true serial format, similar to the Saturday afternoon matinee escapades of *The Crimson Ghost* and its ilk, each story had a cliff-hanger ending that encouraged listeners to tune in the next day. And millions of kids and preteens did so with near-religious devotion.

This being radio, the producers were free to create outrageous situations and transport their audience to any number of "real-life" places—Jack and company traveled from the Amazon jungle to the Far East via only a few carefully chosen sound effects. A foghorn simulated a ship, and conga drums conjured up images of the darkest places of the dark continent. Meanwhile, the actors never had to leave the comfort of a Chicago radio studio.

Though Jack Armstrong was not technically an orphan, he was one at least symbolically, for in his traipsing around the world with his uncle and cousins, little mention was ever made of Mom and Dad back home.

Though Uncle Jim, with his authoritative voice, was along on all the adventures as a parental role model (a catchall character to represent the entire world of adulthood), it was not unusual to find him missing in action or conveniently at a distance when the real events began, thereby leaving the three youngsters on their own. However, the adultless world that Jack, Bill, and Betty inhabited never devolved into a *Lord of the Flies*-like scenario. Instead, the trio, like a modern-day Tom Sawyer, Huck Finn, and Becky Thatcher with Jack acting as ad hoc leader, proved themselves smart, resourceful, and empowered enough to save the world, a message they no doubt imparted to their youthful audience. As the program ran during the entire duration of World War II, Jack and company did their bit for the war effort, encouraging listeners to plant victory gardens and to write letters to overseas servicemen.

As with Jack's streamlined family situation, his growing-up years were equally simplified. For Jack (and Betty and Billy, for that matter), there was no mention of such staples of adolescence as self-doubt, acne, and romantic yearnings—and no youthful rebellion. Such sentiment and realism would serve not only to turn off most of the young listeners but would surely also get in the way of all the exciting action. There was no time for planning for the prom in the world of Jack Armstrong!

Not to say that Jack's freewheeling lifestyle did not come under scrutiny during the program's long run. Several sources report that enough mothers (and perhaps fathers, too) wrote to criticize the program for Jack's never being in school that, in response, a few references to homework were eventually dropped into scripts, as was a later character who acted as the children's traveling tutor.

Charles Flynn as Jack Armstrong, the All American Boy
 Courtesy of Mrs. Charles Flynn

Although child psychologist Martin Reymert was engaged to scrutinize each script to make sure it contained no torture or excessive violence, such restraint did not extend to protecting children from heavy-handed consumerism. For *Jack's* entire run, the show was sponsored by Wheaties, and the show's ongoing celebration of athletics, clear good-versus-evil storytelling, and basic American values worked well for the "breakfast of champions." In addition, *Jack Armstrong* was the airwaves' perhaps most aggressive pitchman for product tie-ins. For the right number of Wheaties box tops, youthful listeners could send in for secret decoders or "hike-o-meters." Girls could send away for a bracelet "just like Betty's."

During its run, the broadcast went through many cast changes, including five different Jacks (the longest-playing one was Charles Flynn, whose voice sounded youthful enough that in his 30s, he was still playing the teen). Eventually, in the program's last years, it dropped Uncle Jim (played for the entire run by Jim Goss) and the others altogether. And Jack, who had become too old to be considered a "boy," became an adult agent for justice in the retitled series *Armstrong of the SBI*.

An entertaining, fun, quaint relic now, *Jack Armstrong, the All-American Boy*—the all-American kid from an all-American town—despite its wild, world-traveling adventures, always had a certain air of innocence about it, portraying a world of honesty and virtue, where the good guys always won.

Jamming

Jamming is the deliberate interference of one radio transmission by another. As long as there have been two or more radio transmitters on the air at the same time, there has been some form of jamming. A somewhat more technical definition describes jamming as an activity *designed* to interfere with someone else's effective use of the electromagnetic spectrum. The Voice of America (VOA) defines *jamming* as intentional interference created through the transmission of broadcasting noises or programming on the same frequency as a signal that some entity (often a political body) does not want others to hear.

More recently, jamming has been referred to as “electromagnetic countermeasures” to reflect more accurately the broad range of electronically based communication systems targeted. The most recent literature refers to jamming as “electronic attack.” No matter what you call it, jammers actually target receivers—not transmitters.

Origins

Before the inception of regular broadcasting in the United States, radio hobbyists and experimenters shared the radio spectrum primarily with government stations. Communication was restricted to signals using Morse code. By their nature, the spark-gap transmitters commonly used created very broad signals. Early detectors or receivers did not help the situation. Most were unable to discriminate between two signals of widely different carrier frequencies, much less between those in close proximity. What government operators often took to be deliberate jamming was really just hobbyists using equipment unable to detect the other signal.

By the 1920s, as broadcasting began to gain popularity, the number of stations grew while the frequency range made avail-

able was limited. Interference was inevitable, but some of it was intentional, because competing broadcasters jammed rival radio programs; still, much of the suspected jamming was really unintentional interference.

History generally attributes the first organized jamming to Germany's use of it during World War I. Jamming was used as a political weapon beginning in the 1930s. With the onset of World War II, sophisticated jamming networks were aimed at disabling military communication and radio-guided weapons systems. All sides participated in jamming.

Jamming of Shortwave Broadcasts

At the end of World War II, a massive jamming campaign became part of the Cold War. In 1948 the Soviet Union committed perhaps a dozen jammers to operate against Russian language broadcasts of the VOA. By 1956 the number of jammers in this service was estimated at 3,000—all aimed at Western broadcasters in a variety of languages—from approximately 200 different sites. It is estimated that more than 600,000 kilowatts of transmitting power was used to block shortwave broadcasts. According to estimates by the British Broadcasting Corporation (BBC) monitoring service, the equivalent of up to \$918 million was spent annually by the Soviet Union on jamming.

According to Rimantas Pleikys, author of *Jamming*, on 3 February 1948, one year after the VOA began broadcasting in Russian, jamming started to become a part of international shortwave broadcasting. This jamming effort continued for the next 40 years. On 29 November 1988, much of the jamming against Western broadcasters ceased. Soviet leadership stopped the activity without an announcement but apparently in response to the easing of East-West tensions.

Despite the reduction in jammers in Eastern Europe, other countries maintain active jamming operations. In addition to operations in Cuba, many jammers still operate from Asia and the Middle East. Radio Martí's AM-band transmissions from Marathon, Florida, have been jammed by Cuba since the service first went on the air.

Interestingly, some former jammers have found new life as local, regional, and international broadcasting outlets. George Jacobs, who spent nearly 40 years in government service, is credited with pioneering and developing the worldwide broadcasting system of the VOA and the post-1974 modernization of Radio Free Europe and Radio Liberty broadcasting facilities. Jacobs was involved in transforming the OPEN RADIO in Moscow from a Soviet jamming station into a successful Russian broadcasting operation; Jacobs also markets the leasing of shortwave facilities at a former Soviet jamming center in Tbilisi, Georgia.

Characteristics of Jamming

In order to effectively block international shortwave broadcasts, two different techniques can be used. *Skywave* jamming blocks shortwave reception in targeted areas by sending signals from one part of the world to another. The distance from the jammer to the area to be blocked needs to be the same as the distance from the broadcaster being targeted to the intended audience. In metropolitan areas, *groundwave* jamming simply overpowers signals by operating in close proximity to the targeted audience. In addition to these two basic forms of jamming, which are based on two different types of radio propagation, a variety of techniques are used to enhance the effectiveness of jamming.

Cochanneling involves operating a jamming transmitter on or very near the same frequency as the signal being jammed. The signal may be well modulated and carry a standard program from the host country. But the intent is not to reach the audience with this outlet; rather, blocking out or interfering with the unwanted signal is the goal. A variation on this technique is called *Mayak* jamming. A country's home broadcasting service is used to overmodulate the jamming transmitter, making it very unpleasant to listen to. This technique was commonly used against Radio Liberty and some VOA programs prior to 1987. So-called growling or grinding noise is likely a Mayak jammer when it is not being modulated by a program.

During the Gulf War and afterward throughout the Middle East, a bubble or warble sound had been used for jamming. *Wobblers*, *warbles*, or *bubbles* jammers modulate a single frequency with a slowly varying tone that is low in pitch. Howling noise is the result. Synthetic radio noise can be transmitted

with random variations in amplitude and frequency. Because of the similarity to background noise, these warbling methods are often difficult to detect as jamming.

By using a series of tones that increase and decrease in pitch, stepped tones can be used against AM or FM voice circuits. The result often sounds like bagpipes. Another technique electronically imitates the sound of sea gulls, and yet another technique creates the electronic equivalent of grunting. Even the venerable spark signal remains a very effective jamming technique.

Jamming systems may be relatively simple or highly sophisticated. International broadcasters often employ a worldwide monitoring system to determine the effectiveness of their broadcasts to allow adjustments in order to reach the target audience. These operations, sometimes known as control and correction facilities, can also be used to target stations for jamming and can be used to determine the relative effectiveness of the jamming efforts. Some jamming stations transmit an identification in Morse code, making it possible to coordinate efforts throughout a jamming network.

Countermeasures

Countermeasures are often used in order to overcome jamming. For example, during the 1960s, prior to the availability of communication satellites, Armed Forces Radio (AFRS) routinely used its shortwave facilities to deliver major events, especially professional sports, to its international outlets. Although the programming sounded just like that heard on advertised frequencies, these feeds were made on multiple shortwave frequencies determined just before the broadcast. On the receiving end, affiliates would choose the frequency with the least interference, often trying to stay one step ahead of the jammers.

In spite of the number of jamming stations available worldwide, often only a single jamming site would be assigned to such a broadcast, making it possible to try to stay a step ahead of the interfering signal. From a vantage point in Tokyo, Japan, for example—where one of the AFRS shortwave facilities used to feed stations in Vietnam was located—it was possible to monitor several of these frequencies and listen to the jamming follow as the control operator for AFRS in Tokyo switched between frequencies.

Using electronic spectrum analyzers, jamming operations can automatically detect a change in a targeted frequency range when a new carrier appears, automatically assigning a jamming signal to the new carrier. Some broadcasters appear to try to counter this technique by randomly popping up silent carriers to attract the jamming transmitters before beginning their scheduled broadcasts.

Jamming Across the Spectrum

Jammers target more than just AM, FM, and shortwave broadcast operations. A 1999 report released by the Federal Communications Commission (FCC) reports that the commission handled more than 1,200 interference complaints from federal, state, and local public safety and emergency officials during 1998. Jammers targeted police communication and interfered with communication between dispatchers and officers. Some pretended to be dispatchers or other police officials.

During 1998, the Federal Aviation Administration requested assistance from the FCC 75 times, including instances involving interference on air traffic control frequencies. Several cases of intentional jamming were discovered.

In late 1999 the FCC's Office of Engineering and Technology and the FCC's Compliance and Information Bureau warned against the "manufacture, importation, marketing or operation of transmitters designed to prevent or otherwise interfere with Cellular Radio Communication."

Entrepreneurs interested in addressing a perceived market for devices designed to prevent or jam the operation of cellular telephones in hospitals, theaters, and other locations asked for the FCC's position on such devices. According to the Communications Act of 1934 and the commission's rules, these devices are not allowed in the United States.

The history of jamming begins with the taming of the electromagnetic spectrum for communication and continues to this day. The basic techniques have changed little over the medium's 100-year development.

Japan

Japanese radio broadcasting was initiated by commercial corporations, transformed into a government corporation, used as an effective tool of government propaganda in World War II, and shaped by the democracy brought in by the Occupation after the war. Radio broadcasting has been an important medium for disseminating information, education, and entertainment to the people in Japan.

Origins

The Ministry of Communications—called *Teishinshou*—and various individuals had conducted wireless experiments after

Marconi's initial research in Italy. By 1920 the ministry began to consider establishing radio broadcasting stations in Japan, particularly when they heard about station KDKA in the United States. Responding to the call for radio broadcasters, a total of 64 applications were submitted to the ministry. Many applications came from manufacturers of wireless equipment, newspaper companies, or news agencies. The ministry encouraged them to consolidate among themselves and to form nonprofit public corporations to establish stations. After the consolidation process, stations in Tokyo, Nagoya, and Osaka each received a license and started broadcasting in 1925.

The successful deployment of radio broadcasting service by the three stations soon caught the attention of the government, which then proposed to incorporate them into one public corporation under government supervision. The government argued that such operation was necessary to spread the service across the whole nation. Some critics observed that the government could not leave broadcasting to the private sector after seeing the potential of its great influence.

Despite their strong resistance, the three stations were forced to merge, and *Nippon Hoso Kyokai* (NHK) was established in 1926 as a nonprofit legal entity under the supervision of the Ministry of Communications. NHK completed the construction of most of its nationwide broadcasting network by 1929. Two years later, it launched a second radio service called NHK Radio 2 to broadcast mostly educational programs.

NHK started broadcasting a national baseball tournament played by high school teams in 1927; *Radio Taiso* (an instruction for physical stretching with a special music) began in 1928; and NHK broadcast games of the 1932 Olympics from Los Angeles. *Radio Taiso* is still broadcast every morning and is the oldest radio program in the world.

Radio Before 1945

In the late 1920s, Japan began to experience turmoil, which was exacerbated by the deepening economic recession, the slump in the stock market, increasing unemployment, and the acceleration of antigovernment activity by right-wing groups. Under these circumstances, the government gradually tightened its control of NHK. In 1934 NHK's regional branches were dissolved and placed under the control of headquarters in Tokyo. Later, even NHK's program planning was to be largely dictated by government officials.

On 26 February 1936, a group of 1,400 military officers and soldiers attempted a coup d'état, which lasted three days. The government had little success in persuading them to surrender until a message was broadcast through NHK radio that led to the surrender of the group. This single incident made the government and the military realize the power of radio and encouraged both to use it as a propaganda tool.

On 8 December 1941, Japan began war with the United States (war in China had been underway for five years). NHK was placed under the direct control of military authorities. All programs were designed, produced, and broadcast to make the people understand government policy, to guide thinking favorable to the military, and to create patriotism among the people. Widespread broadcasting of false information about how well the Japanese military had been fighting ended when atomic bombs were dropped in Hiroshima and Nagasaki. On 15 August 1945, the emperor announced the nation's defeat over NHK radio facilities—the first time most Japanese had heard his voice.

Postwar Transition

The restructuring of Japan's radio broadcasting was set out by Supreme Commander Allied Powers (SCAP), headed by General Douglas MacArthur. SCAP aimed at democratizing radio broadcasting by removing all government and military controls over NHK. SCAP submitted a memorandum on 11 December 1945 delineating its plans to democratize NHK's organization. SCAP also instructed NHK to modify its programming by introducing continuous broadcasting from early morning to late evening without any break in between, changing the minimum length of a program from 20 minutes to 15 minutes, and establishing a weekly program. It also encouraged NHK to produce programs that would involve audience participation in various ways. *Nodojiman Shirouto Ongakukai* (Amateur Song Contest) was the first entertainment program in which non-media-related people appeared in a radio program. The program has been broadcast since 1946. Entertainment programs including games, quizzes, and soap operas (the concept for these having been brought from the United States) increased in number.

On 16 October 1947, the Civil Communications Section of SCAP presented to NHK and the government its view about the desirable nature of broadcasting in Japan. The four principles pushed forward were freedom of broadcasting, impartiality, a public service obligation, and conformance with technical standards. They also instructed that an autonomous regulatory organization be established, which would be completely separate from any ministry of the government as well as from any interest groups such as political parties and private corporations. In addition, they suggested that privately owned broadcasting companies be developed to compete with NHK in the future.

The then-Ministry of Telecommunications, called *Denkit-sushinshou*, which had replaced Teishinshou in 1949 following SCAP's recommendation, soon began to prepare necessary bills to establish these principles, and three bills were passed by the Japanese Diet in 1950: the Radio Law, the Broadcast Law, and the Radio Regulatory Commission Establishment Law. The Broadcast Law changed the characteristics of NHK from a monopoly public corporation financially supported by the government as well as by private media-related corporations to an independent public corporation of which income was mostly in the form of receiving fees collected from the audience. The Radio Regulatory Commission was made responsible for allocation of broadcasting frequencies and the granting of broadcasting licenses. On 21 April 1951, 16 preliminary licenses were given, and soon *Chubu Nihon Hoso* in Nagoya and *Shin Nihon Hoso* in Osaka aired programs as the first commercial radio broadcasting stations in Japan. Their financial source was advertising revenue. The Radio Regulatory Commission itself was dissolved in 1952, and its functions were transferred

to the Ministry of Posts and Telecommunications, called "Yuseishou," which was established by combining the Ministry of Telecommunications and the Ministry of Posts in the same year.

After World War II, NHK produced many popular radio programs influenced by similar American shows, and radio broadcasting played an important role in comforting people during the often difficult transition period after the war. Some of those NHK programs included a song program, *Nodojiman Shirouto Ongakukai* (Amateur Song Contest); radio dramas such as *Mukou Sangen Ryoudonari* (My Neighbors) and *Kaneno Naru Oka* (The Hill with a Bell); and quiz programs such as *Kiminonawa* (What Is Your Name?), *Watashiwa Dare-deshou* (Who Am I?), and *Tonchi Kyoushitsu* (The Wit Class). Commercial broadcasting stations also aired many entertainment programs.

Radio and Television

Following the postwar reestablishment of radio broadcasting, the first TV service was begun by both NHK and a commercial company, Nihon Television (NTV), in 1953. Because people were quite satisfied with radio broadcasting and enjoyed many favorite programs, initial deployment of the TV service was slow. However, a 1959 live broadcast triggered an increase in the sale of receivers—the wedding ceremony of Prince Akihito and Miss Michiko Shouda, who was the first ordinary citizen to become the bride of an imperial prince. Many advertisers shifted their messages from radio to television, and as a result, the radio services began to lose their major revenue.

Commercial radio stations came up with several strategies to rebuild the popularity of radio listening. They extended broadcasting hours after midnight to target individual audiences; marketed their disc jockeys' unique and interesting personalities as the appeal of a program; and reduced the number of dramas and quiz programs, which were more expensive to produce. Audience segmentation was introduced, meaning that a certain audience group, such as family, housewives, or young people, was targeted as the major audience sought during a certain time period in a day. Another strategy most commercial broadcasters began to use in 1964 was to air night games of professional baseball, especially those played by the *Yomiuri Giants*. Because of the necessity to broadcast those games across the country, commercial radio stations formed two networks, Japan Radio Network (JRN) and National Radio Network (NRN). As of December 2001, JRN had 34 affiliated stations, and NRN had 40. The networks are still mainly used to relay professional baseball games.

These strategies proved successful, and the popularity of radio broadcasting resumed by 1965. Midnight broadcasting was geared toward teenagers. Many disc jockeys played the roles of big brothers and sisters and became national celebrities

among younger listeners. In addition, as the number of automobiles in Japan increased significantly in the 1960s and 1970s, radio stations succeeded in demonstrating their importance by providing timely news and information in drive time.

Although there had been strong demand for a license for FM radio broadcasting since the mid-1950s, the ministry had been worried about the commercial feasibility of FM stations. In the meantime, the ministry encouraged NHK to try to explore FM broadcasting by granting it a license as an experimental station. By 1968, NHK's FM broadcasting network covered almost 80 percent of the country. People had begun to realize the high quality of FM reception, and FM radio receivers were becoming widely diffused. Because of that circumstance, Japan's first licensed FM radio broadcasting was started by FM NHK and FM Aichi Music in 1969, and by FM Osaka Music, FM Tokyo, and FM Fukuoka Music a year later.

NHK

A 1950 Broadcast Law reestablished NHK as an independent public corporation responsible for public broadcasting service. NHK neither receives direct funding from the government nor is responsible for any governmental work. Article 7 of the law states that NHK's goal is to broadcast for the public welfare throughout the country. In order to meet this goal, Article 9 requires that NHK be responsible for domestic and international broadcasting, plus research and development to improve broadcasting in general.

NHK has a Board of 12 governors as its supreme decision-making body. Each governor represents a geographical district, and governors are chosen from various fields such as education, culture, science, and industry. Governors are appointed with a term of three years by the prime minister with the approval of the Parliament, and they are expected to operate NHK for the benefit of the people. The board is responsible for an annual budget, operating plans, and master plans for program production. A board of directors runs NHK on a day-to-day basis and consists of a president appointed by the board and a vice president and three directors who are appointed by the president with the approval of the board. In contrast with many other public corporations in Japan, in which finance, management, and personnel matters are subject to strong government influence, NHK possesses complete autonomy.

NHK is financed by fees collected from the audience. The basis of the receiving fees is included in Article 32 of the Broadcast Law, which requires that those able to tune to NHK "have to agree on a receiving contract with NHK." What this means in practice is that listeners have to pay fees to NHK regardless of whether they listen to NHK programs. Because NHK is the sole public broadcasting station independent from any government organization, receiving fees are regarded as the price necessary for its operation. In 2000 such receiving

fees accounted for almost 99 percent of NHK's total operating income. A budget that includes projections of the amount of the receiving fees for the coming year, an operational report, and a settlement of accounts of the past year is annually prepared by NHK, submitted to the Minister of Posts and Telecommunications, endorsed by the Cabinet, and approved by the Parliament. Although the minister can add some comments to the budget plan, he or she is not allowed to change it.

NHK has several missions to achieve, as delineated in Article 44 of the Broadcast Law. They are (1) to broadcast quality programs in order to meet a variety of needs of the public and to contribute to the elevation of cultural standards through the broadcasting of quality programs; (2) to support the traditional culture as well as to foster new culture; (3) to provide a nationwide broadcasting network so that programs can be received at any place in the country; (4) to produce programs not only geared toward the whole country but also tailored to individual regions; (5) to conduct research and development and to disseminate the results as widely as possible; and (6) to broadcast NHK programs in foreign countries to contribute to better international understanding. Because of the public nature of NHK (and its past involvement in the government/military propaganda), the Japanese people expect NHK to produce programs that are accurate, fair, politically impartial, and neutral, with the presentation of the widest possible range of viewpoints.

NHK operates three radio services: Radio 1, Radio 2, and FM. According to 2000 statistics, Radio 1 devoted about half its time to news, about a quarter to cultural programs, and the final quarter to entertainment (a minimal amount of time, about 2 percent, went to education). On Radio 2, 66 percent was educational programs, followed by cultural programs with 20 percent and news with 14 percent. For the FM service, 41 percent was devoted to cultural programs, 37 percent to entertainment, 18 percent to news, and 4 percent to education. These data show that the primary focuses of Radio 1, Radio 2, and FM are news, education, and culture, respectively. In international broadcasting, 66 percent of the programs were news, and 32 percent dealt with various types of information. As of July 2001, Radio 1 had 214 stations, Radio 2 had 140 stations, and FM NHK had 520 stations in the country. These stations effectively cover all of Japan.

Present Radio System

All radio stations in Japan today are categorized as either general (i.e., they must air news, and more than 30 percent of programs must be education and culture related) or specialized. The latter are further divided into education or music. For an education station, more than 50 percent of programs must be educational, and more than 30 percent must be cultural. NHK Radio 2 fits into this category.

As of December 2001, there were 47 commercial radio companies, holding among them 252 AM stations; 35 of these companies were also operating TV broadcasting stations. There were 53 companies holding altogether 242 FM stations. All FM stations (except for nine outlets) were music stations and belonged to either Japan FM Network (JFN: 37 stations) or Japan FM League (JFL: five stations). Other stations included one short-wave station, one BS analog station, 10 BS digital stations, one CS analog station, six CS digital stations, and 140 FM community stations.

Sixty-eight percent of all radio programs in both NHK stations and commercial stations focused on entertainment, 14 percent was related to culture, 13 percent was news, and 3 percent was education. Advertising expenses in radio in 2000 amounted to \$1.73 billion in U.S. dollars and accounted for 3.4 percent of the total advertising expenses in Japan.

Jazz Format

The growth of television in the early 1950s gradually replaced commercial radio as the primary family entertainment medium in the home. Radio adapted to a new role by establishing radio formats. Individual stations targeted narrow audience segments by specializing in news, talk, or any of a variety of music genres.

Although jazz music traces its roots to the formative years of the United States, it did not evolve into a bona fide radio music format until the 1950s. During the 1920s and 1930s, mainstream society viewed jazz music in the same way that rock and roll was viewed in the late 1950s: it was considered decadent. Because jazz was closely identified with black culture and affected by the racism that prevailed nationwide during that time, many of the greatest black jazz artists fled to Europe, some permanently, where they and their music were accepted openly. Paris became a cultural center of American jazz music, and the jazz music genre remains very popular there to this day in clubs and on radio. In fact, jazz radio is probably more popular in Europe than it is in the United States.

What is jazz radio? Jazz fans sometimes refer to it as music by musicians, not electricians. It includes blues, swing, bebop, fusion, Latin, and a number of other subcategories within its overall definition. Music that includes flat line piano, boring guitar, and braying saxophone is sometimes associated with jazz, but not legitimately so. New-wave music is not jazz.

Jazz grew out of blues, ragtime, and Dixieland music during the early 20th century. Following the swing era of the 1930s and 1940s, the style evolved into bebop, modern, cool, and other straight-ahead sounds by the 1960s. By this time, jazz had also been accepted as a legitimate popular art form throughout the United States. American audiences embraced the music as much as the Europeans had a decade earlier.

Jazz radio on the East Coast most likely had its roots in "Symphony Sid" Torin's live WJZ-AM radio broadcasts from the Royal Roost in New York City. Trumpeter Rex Stewart and critic and composer Leonard Feather had their own shows on AM in the early 1950s, as did Felix Grant and Ed Beech. These jazz disc jockeys are important, because early jazz formats were very much personality driven and involved a lot of talk in addition to the music.

"Sleepy" Stein, who was doing all-nighters in Chicago, moved his show to KNOB-FM in Los Angeles in 1956, and West Coast jazz radio was established. KJAZ in San Francisco had Pat Henry. KNOB and KJAZ had similar formats: one- and two-hour programs that were oriented totally toward personalities, with disc jockeys involved in lengthy announcements preceding and following each song played, which included mentioning every player or sideman, the composer, and even the record label. There were not that many jazz recordings at the time, and talkative disc jockey personalities

could play virtually every current jazz record release over a 24-hour period. Other jazz radio personalities included Dick Buckley, Howard LaCroft, Frank Evans, Bob Young, Al Fox, Al "Jazzbo" Collins, Jim Gosa, Pete Smith, Dick McGarvin, and Chuck Niles. Niles, probably the "dean" of active jocks, was still doing a regular show on KLON-FM, Long Beach, as the new millennium began.

The growth of FM radio and the intrusion of album-oriented rock and underground radio during the 1970s resulted in the erosion of commercial jazz formats. For example, KKGQ in Los Angeles converted to a classical music format, and KZJZ in St. Louis simply went off the air. By the mid-1990s, only a few jazz formats remained on commercial radio stations in the United States. Noncommercial radio filled the void, however, with jazz being adopted as a format at several large public radio stations and at many college stations. In 1977 National Public Radio (NPR) initiated *Jazz Alive*, a public radio network show that almost all NPR stations carried. Today, the two stations with the largest international audiences are both noncommercial: WBGO-FM in Newark, New Jersey, and KLON-FM in Long Beach, California. Both of these large public radio stations are carried on numerous cable systems and are relayed via satellite to the far corners of the globe. KLON has a special program titled *Euro Jazz* that is relayed via satellite throughout the European continent.

The format itself has changed as well. Research into audience behavior has demonstrated that most listeners want less talk and more music. This "modal music research" calls for serving a greater number of people, replacing talk with 30-second breaks, limiting the number of announcements, and not airing anything squeaky or long. The jazz format of the future will involve less talk, sharpen the focus of the music, and include memorable moments in jazz history. In all likelihood, the music will be based in the jazz styles made popular in the 1950s and 1960s (i.e., bebop, cool, straight-ahead). The big band era is blending with early rock and roll popular music into a successful commercial format.

New developments in electronic technology, such as digital audio via satellite and multiple stream audio on demand via the internet, provide new venues for jazz radio formats. For example, DirecTV carries jazz programming in Japan, and the number of internet radio stations is growing rapidly. XM Radio and Sirius are two commercial satellite radio services that offer more than 100 channels each, several of which are devoted to various forms of jazz music. These mobile services are provided to subscribers for a monthly fee and are not likely to supplant FM radio as a mainstream jazz music format. Given the fact that mainstream jazz music will always target a narrow niche, the new multi channel environment provides an ideal conduit for delivering jazz to a

growing number of fans all over the world. The music itself is established as a truly American music genre; it is taught in schools and clinics and performed by prestigious musical groups throughout the world, much as classical music has been for centuries. Accordingly, the music will continue to evolve but will also remain a viable radio format for years to come.

Jehovah's Witnesses and Radio

The religious group that took the name Jehovah's Witnesses in 1931 (prior to that date the group preferred the name Bible Students) owned and operated several radio stations in the United States and Canada beginning in 1924 and used syndicated recordings on hundreds of commercial stations to supplement its broadcast outreach between 1931 and 1937. The controversial and often confrontational views of the sect involved it in frequent conflicts with other denominations and with broadcasting regulators.

The story of the Bible Students'/Jehovah's Witnesses' involvement in radio is largely the story of their second president, Judge Joseph Franklin Rutherford—a former Missouri lawyer and substitute judge with a commanding personality and a booming orator's voice. Born in 1869, Rutherford took control of the Watch Tower Society and its associated groups in 1916, following the death of the sect's founder, Pastor Charles Taze Russell. In 1917 Rutherford and several associates were convicted of sedition for their public opposition to the World War I draft; their convictions were overturned in 1919. Upon his release from prison, Rutherford took steps to revive the struggling movement, implementing a renewed program of publishing and public speaking.

As part of this effort Judge Rutherford delivered his first radio address over station WGL in Philadelphia on 16 April 1922. Soon afterward, the Bible Students acquired a plot of land on Staten Island, New York, and began construction of their own broadcasting station.

On 24 February 1924 the Bible Students inaugurated station WBBR. The noncommercial station featured classical music and hymns performed by Bible Student musicians, talks on home economics and other practical subjects, and lectures on the group's complex interpretations of Bible prophecy and

chronology by Rutherford and others. The success of WBBR led to the operation of additional Bible Student stations over the next several years, including WORD in Batavia, Illinois (later WCHI), KFWM in Oakland, California, CYFC in Vancouver, British Columbia, CHCY in Edmonton, Alberta, CHUC in Saskatoon, Saskatchewan, and CKCX in Toronto, Ontario.

During 1927 and 1928 the broadcasting activities of the Bible Students began to attract the attention of government regulators. In June 1927 Rutherford testified before the Federal Radio Commission (FRC) to protest a decision denying WBBR's application to share the frequency of station WJZ, owned by the Radio Corporation of America and the flagship of the newly formed National Broadcasting Company's (NBC) Blue network, alleging that NBC was part of a religious/commercial conspiracy seeking to deny his group fair access to the radio audience. Although the FRC dismissed Rutherford's complaint, NBC offered the Bible Students free air time for the broadcast of a talk by Rutherford. The speech, entitled "Freedom for the Peoples," was delivered on 24 July 1927 and in it Rutherford denounced all other religions, the clergy, big business, and all human governments as agents of Satan. A barrage of complaints received in the wake of this address led NBC to deny Rutherford and the Bible Students any further access to its stations.

The following year the Bible Students ran afoul of broadcasting authorities in Canada. Protests from clergymen over the broadcasts of Bible Student stations in Canada were followed by allegations that the group had on two occasions sold time over its Saskatoon outlet to the Ku Klux Klan. On the strength of these complaints the licenses for the Canadian stations were revoked in March 1928.

Unable to secure time on any established network, the Bible Students turned to a network of their own—buying time on over a hundred stations from 1928 through 1930 for “The Watchtower Hour.” Anchored by WBBR, and connected by American Telephone and Telegraph (AT&T) circuits, the “Watchtower Network” functioned for an hour each week, presenting talks by Rutherford and hymns performed by Bible Student musicians.

Increased costs led the organization to discontinue the live network at the end of 1930, replacing it with transcribed syndication. The Watch Tower Society purchased time on local stations and the lectures of Judge Rutherford were distributed on 16-inch shellac transcriptions manufactured by the Columbia Phonograph Company. By 1933 over 400 stations around the world were broadcasting these 12-minute talks. This “wax chain” would be supplemented by occasional live hookups from the organization’s annual conventions.

As the Depression deepened, the Witnesses (adopting that name in July 1931) became increasingly combative in their attacks on organized religion, politicians, and big business and this, in turn, brought them into further conflict with station owners and the FRC. Catholic authorities, especially, took offense at Rutherford’s statements and pressured station owners to discontinue the broadcasts. In 1933 the Witnesses began a nationwide petition drive for “freedom of broadcasting” and presented more than 2 million signatures to the FRC in early 1934. Allegations were immediately made that many of the signatures were forged, but the petition led Representative Louis McFadden (R-Pennsylvania) to introduce a bill that would require broadcasters to guarantee free and equal use of air time to all nonprofit organizations. Several Watch Tower Society representatives were among those testifying for this bill in March 1934. Buried under an avalanche of opposition from the National Association of Broadcasters, the established networks, and the Federal Council of Churches of Christ, the bill died quietly in committee.

Opposition to the Witnesses’ broadcasts mounted steadily during the mid-1930s, culminating in Philadelphia in 1936 when Catholic leaders urged a boycott of Gimbels Department Store, owners of station WIP, which had carried the Rutherford programs for several years. Stations became increasingly reluctant to sell time to the Watch Tower Society and finally, in October 1937, the organization announced its withdrawal

from commercial broadcasting, although it used special hookups for convention broadcasts until 1941.

Rutherford died in 1942 and his successors have moved away from his aggressive stances, ignoring the broadcast media in favor of direct house-to-house canvassing. Station WBBR remained in operation until 15 April 1957, when it was quietly sold. The call letters were changed to WPOW and the once-combative voice of the Watch Tower Society became a commercial station specializing in recorded music.

Jepko, Herb 1931-1995

U.S. Radio Talk Show Host

Herb Jepko began what would later become the Nitecap Radio Network on KSL, Salt Lake City, Utah, on 11 February 1964 and is acknowledged by many to be the father of network talk radio.

Origins

Born in Colorado and adopted as an infant by his stepparents in Prescott, Arizona, Jepko was the only child in his family. His adoptive mother left before he was four years old and his adoptive father, Metro, was forced into Veteran's Administration hospitals on and off for the next ten years for injuries he sustained in World War I. During those times Jepko was raised by a series of foster parents until he and his father were reunited for most of his late teenage years. At age 18 Jepko entered the U.S. Army, where he learned the crafts of film production and radio broadcasting.

In the late 1950s and early 1960s Jepko pursued a series of radio jobs along the California coast, in Idaho, and eventually in Utah. He was hired by KDYL in Salt Lake City to play late-night jazz, but he soon grew bored playing music. Working a late-night shift, he began talking to his listeners about the mountains, the weather, and non-controversial news of the day. Since there were no facilities for broadcasting calls over the air, Jepko would talk to his listeners over the phone off the air while music was playing. Mail began arriving from all over the Rocky Mountain area, and it was not long before the managers of Mormon-owned 50,000 watt KSL took note of the new, talented air personality across town. While KSL had a history of hiring only Latter Day Saints (Mormons), exceptions were sometimes made for on-air talent. Jepko's nominal Catholicism and occasional drinking would later create significant tensions.

In 1962 Jepko was hired to host KSL's midday program *Crossroads*. He quickly realized that this was a different audience than the one he had been connecting with in his late-night shift at KDYL. Perhaps in part because of his unstable childhood, it was this late-night audience of the lonely, fearful, sickly, or disaffected for whom he felt the greatest affinity. Despite being a 50,000-watt clear channel, KSL was off the air from 1 A.M. to 5 A.M., and Jepko was anxious to use that time period. KSL management felt no good could come from giving listeners a reason to be awake at that hour and no advertisers would pay to reach those listeners who were awake all night. Jepko had so much confidence in his ability to make the time period work, however, that he accepted a 50 percent cut in pay, resigned from his midday job, and agreed

to a six-week deadline to prove he could make the show work, or be fired.

Nitecaps Program

Just after midnight on 11 February 1964, Jepko began what would become the most successful program in KSL's history. For the first few weeks of the program, station engineers had rigged only one phone line that could be put on the air. Even on that first night, however, Jepko was seldom at a loss for callers. One of the first advertisers was for a venison cookbook, and Jepko's wife Patsy, who supported him in this late-night experiment, found herself filling orders on the kitchen table while listening to the show at night. After a night on the air, Jepko would return at 7 A.M. to shower, change, and begin making sales calls while Patsy took care of the kids. For the first year of the show, they subsisted on two or three hours of sleep each weeknight.

The program's unprecedented success was almost immediate. Within a year, local chapters of *Nitecaps*, as they became known following an on-air contest to choose a name, were meeting in five states. As the only workable method for responding to the thousands of letters received each day, Jepko began publishing *The Wick*, a monthly magazine, in June 1965. Conventions were held that drew thousands of listeners from over 30 states. KSL managers and Latter Day Saints church officials belatedly realized they had a perfect platform from which to reach those in need with proselytizing messages, but Jepko fought to keep the program away from issues of controversy and denominational religion. Some within the station expressed concerns that such a successful program was being run on church-owned facilities by a nonmember. Eventually Arch Madsen, president of KSL, would side with Jepko, allowing him to buy time from the station and operate as an independent contractor, but tensions between other KSL personnel and Jepko continued to intensify.

In January 1968 KXIV Phoenix signed on as the first Nitecap Radio Network affiliate, and network talk radio was born. The 50,000-watt clear channel KVOO, Tulsa, Oklahoma, carried the show from October 1969 to September 1971. In January 1973 WHAS Louisville, Kentucky, another 50,000-watt clear channel station, picked up the show, giving Jepko the first-ever coast-to-coast coverage for a talk show. By mid-1974, more than 80 "Nitestands" were active, with members meeting for socializing and to organize service to the elderly in their areas. While the core of the *Nitecap* audience was retired, Arbitron estimates showed a surprising number of 18-24 year

olds in the midnight-to-1 A.M. hour (the only overnight hour measured by Arbitron at the time). Outside of Salt Lake City (KSL) and Louisville, Kentucky (WHAS), the audience was largely rural, because of the difficulties of receiving, in a dense metropolitan area, a clear signal from a distant AM station.

Almost all revenues from the show were derived from direct-response advertising, and Jepko insisted that *Nitecap* staff handle all order fulfillment. Too often he had seen listeners of other programs robbed by direct-response advertisers who went bankrupt without fulfilling paid orders. So Jepko required Nitecap Radio Network advertisers to ship sufficient product to his Salt Lake City offices before allowing the commercials to air. Other revenue streams included commissions earned by a travel agency and insurance company franchise operated by Nitecaps International. At its peak, a staff of 15 full-time employees handled order fulfillment, insurance policies, Nitecap tours, membership cards, and publishing of *The Wick*.

In November 1974 WBAL Baltimore affiliated with the Nitecap Radio Network, providing a clear signal into Washington, D.C., Philadelphia, and New York. This provided the first exposure to the program for many media executives living on the East Coast. On 4 November 1975, the Mutual Broadcasting System (MBS) began carrying the *Nitecap* program nationally. Thanks to the dozens of new affiliates, membership in the Nitecaps International Association (NIA) soared to over 300,000. Within a year, Arbitron estimated 10 million listeners were tuned in to the program nightly. NIA memberships likewise soared as new "Nitestands" were established across the nation. Following the affiliation with MBS, Jepko distanced himself further from KSL by building separate studios and offices for the show.

Unfortunately, as part of the agreement for MBS to carry the show, Jepko had to relinquish control over order fulfillment and sales strategy to the network. MBS sales executives attempted to sell the program on a cost-per-thousand (CPM) basis to national advertisers, but the reputation of the show as appealing primarily to an older, less-affluent, rural audience made this a difficult sale. MBS account executives quickly moved on to more profitable dayparts, and Jepko, while still enjoying the largest audience in the history of the program, began to suffer extraordinary financial losses. The combination of the increased expenses of operating his own studios and the decrease in revenue from the shift in sales strategy away from proven direct-response advertising would ultimately prove fatal.

By the fall of 1976 Jepko was under intense pressure from MBS to change the program to attract a younger audience. MBS felt more controversy and conflict would serve to attract the younger demographics, which would be easier to sell on a CPM basis to national advertisers. Jepko in turn pressured MBS to continue to serve the existing audience, to whom he

Herb Jepko
Courtesy Radio Hall of Fame

felt a strong commitment. With MBS account executives unwilling, or unable, to work deals for sufficient direct-response advertising, the show began to fail. On 28 May 1977 MBS replaced the *Nitecap* program with Long John Neble and Candy Jones. When Long John died less than a year later, MBS gave Larry King his first shot at a national audience. (Others later mistakenly cite King's program as the first network radio talk show.)

In June 1977 the Nitecap Radio Network was reborn with 10 affiliates, including KSL, but without WHAS. By 1977 14 more affiliates had joined the network, but most used low power at night and the vast majority of the core audience was unable to receive the program. Network radio, in an era before satellite distribution, required expensive American Telephone and Telegraph (AT&T) landlines, which were feasible only with the economies of scale offered by scores of stations sharing the cost. Larry King, other all-night radio programs, 24-hour broadcast television, and cable TV had fractionalized the late-night radio audience. As renewal of *Wick* subscriptions dropped, Nitestands disbanded, and orders from direct-response appeals declined, old tensions between KSL management and Jepko resurfaced, aggravated by his increased drinking. In August 1978 KSL, without advance notice to listeners or to Jepko, dropped the *Nitecap* program.

The show continued for about a year before going off the air in August 1979. Jepko made several attempts to resurrect the program in the 1980s, with the most successful involving purchasing time on WOAI, a 50,000-watt clear channel in San Antonio, Texas, which lasted for several months. The last attempt to restart the program over was made at KTKK in Salt Lake City in 1990 with Randy Jepko, Jepko's son from Patsy's first marriage, serving as co-host, but the show lasted only a few months. When Jepko's son Herb Junior died in 1992, it

proved to be the final tragedy from which Jepko could not recover. He died in Salt Lake City of complications from drinking on 31 March 1995.

Jewish Radio Programs in the United States

Religious broadcasts usually connote church services and evangelists. Although it is true that most radio religious programs have been directed at a Christian audience, a number of Jewish programs have been on the air since radio's earliest years.

Origins

In March 1922 New York station WJZ's radio listing announced a "radio chapel service," featuring a talk by Rabbi Solomon Foster and music by cantor Maurice Cowan. Although it had been customary for radio stations to offer short inspirational messages (usually in the morning), these were usually provided by well-known Christian clergy. In some cities with large Jewish populations, however, a rabbi was occasionally asked to speak. To the listener in 1922–23, this was something of a social revolution. Most Christians had never met or heard a rabbi before.

Rabbi Harry Levi of Temple Israel, a Reform congregation, was invited to take a turn on a daily religious program that was broadcast over Boston's WNAC in mid-1923. He got such a positive response that he was invited back. By January 1924 WNAC made arrangements to broadcast Temple Israel's services twice a month, certainly the first time most non-Jews had encountered what a Jewish worship service was like. (In March 1926 listeners could also hear a Jewish wedding, as New York's WRNY made Winnie Gordon and Julius Goldberg,

along with Rabbi Josef Hoffman, radio stars for a day.) Boston's "Radio Rabbi" Harry Levi became so popular during 16 years on the air that two books of his sermons were issued, and numerous non-Jews who heard him on WNAC wrote him fan letters or came to his temple to ask for his autograph.

Radio in the early 1920s provided its audience with the chance to hear some of Judaism's biggest names, including New York's Rabbi Stephen S. Wise, long regarded by the print media as a spokesman for liberal Jews: both the *New York Times* and *Time* magazine often quoted him. As early as March 1922, Rabbi Wise gave a radio talk to encourage donations to help European Jewish refugees. On a fairly regular basis throughout the 1920s, his speaking engagements were broadcast from a number of cities; Rabbi Wise's sermons were often about the dangers of intolerance, such as a 1924 speech to protest the growing popularity of the Ku Klux Klan. A dynamic orator, Rabbi Wise developed such a following that the radio editors at major newspapers often used a bold headline and a photo to let the audience know that he was about to give another radio sermon.

Radio produced a sort of ecumenism; one listing for New York's WEAJ in December 1923 featured Christmas songs for children at 6 P.M. followed by Hanukkah songs at 7. Seeing the possibilities in radio as a vehicle to promote understanding, Dr. Cyrus Adler, a scholar and president of Dropsie College in Philadelphia, helped to create a weekly program that would not be limited to sermons. In cooperation with the United Syn-

agogues of America, an organization of Conservative Jews, the Wednesday night program went on the air in late August 1923 on WEAJ, after first offering an experimental broadcast in May to see if the response would be positive. It was. This weekly Jewish program featured Jewish folk and liturgical music (sometimes sung in Yiddish, sometimes in Hebrew), discussions of Jewish holidays, and a number of famous speakers from all over the United States.

Entertainment

Jewish programming in the 1920s was not only religious in nature. Thanks to radio, listeners were able to hear two famous Cantors—the great cantor Josef (Yossele) Rosenblatt, along with the popular Jewish comedian Eddie Cantor; both appeared at a 1924 banquet to honor the Young Men's Hebrew Association's 50th anniversary. There were also programs of popular music to benefit Jewish causes; Jewish bandleaders and performers such as Irving Berlin, Leo Reisman, and Eddie Cantor were among those who participated. And by the late 1920s, most cities from the East Coast to the West Coast had rabbis on the air, usually around the major Jewish holidays. In addition to rabbis and scholars discussing Jewish customs, there was at least one popular radio show with a Jewish immigrant family as the protagonists—Gertrude Berg had created a comedy-drama called *The Goldbergs*, which began a successful run on the National Broadcasting Company (NBC) in November 1929. It was an era when many performers with ethnic names changed them to sound more “American,” yet Gertrude Berg did not hide the ethnicity of her characters, nor did she hide her own ethnicity. She wrote a syndicated advice column for the Jewish press and did speaking engagements on behalf of Jewish charities. And unlike some comedy routines such as “Cohen on the Telephone,” a hit record that made fun of a Jewish immigrant who was losing his battle with the English language, the Goldbergs were portrayed sympathetically, and anyone of any religion could identify with their problems. (There were also a number of popular singers and comedians on radio who were Jewish, such as Jack Benny, Fanny Brice, and Al Jolson, but at a time when anti-Semitism still flourished, most Jewish entertainers did not make overt mention of their religion.)

By the 1930s, some network programs featured Jewish themes. One of the earliest was *Message of Israel*, first heard on NBC Blue in late 1934 and hosted by Lazar Weiner, the music director of New York's Central Synagogue. Boston's Harry Levi was invited to speak on this program, which featured some of America's best-known Reform rabbis, in 1937 and again in 1938.

There were also a number of charitable and philanthropic organizations that provided radio programs, such as Hadasah, the Federation of Jewish Charities, and the American Jew-

ish Joint Distribution Committee. Also, when a special occasion took place, such as the 50th anniversary of the Jewish Theological Seminary in March 1937, highlights from the event were broadcast. At a time when Federal Communications Commission (FCC) guidelines called for a certain amount of religion and public service, such programs served a useful purpose for the station while providing the Jewish organizations far-reaching exposure they would not otherwise have received.

And then there was the rabbi who decided to leave the pulpit to become a radio singer. Rabbi Abraham Feinburg took the air name “Anthony Frome”; known as the “Poet Prince of the Airwaves,” he could be heard singing love songs on several New York stations from 1932 to 1935, at which time he gave it all up and went back to being a rabbi again. On the other hand, there was a famous opera singer who also became a cantor; his radio concerts were critically acclaimed whether he was doing Hebrew prayers or portraying the lead tenor role in “La Traviata.” Jan Peerce was discovered by the famous impresario Samuel Rothafel (better known as Roxy) while singing at a hotel banquet in 1932. Soon, he was singing on NBC Blue's *Radio City Music Hall of the Air*, and by 1941 at the Metropolitan Opera, where he performed for 27 years. But throughout his life, as he had done in his neighborhood synagogue before he became famous, Peerce would chant the Jewish liturgical prayers at the High Holy days. He also made a number of recordings of sacred Jewish music, some of which have been reissued.

During the 1930s a few radio stations were airing mainly ethnic and foreign language programs, brokering out segments of the day to particular groups. One of the best known ethnic stations was New York's WEVD, where some long-running Yiddish programs made their home; thanks to WEVD, it was possible to hear anything from folk songs to entire Yiddish plays. And because WEVD had a working agreement with a Jewish newspaper called the *Forverts* (“Forward”), there were always commentators and critics who discussed the news from a Jewish perspective. WEVD also had Moses Asch, who would go on to found Folkways Records, but who in the mid-1930s hired and recorded many of the performers whose music was played on WEVD. America in the 1930s still had many immigrants who missed the culture of the old country, and radio helped to provide it. One program, *Yiddish Melodies in Swing*, went on the air on New York's WHN in 1939, and in 1941 fans were still waiting in line to get tickets to be in the studio audience.

Speaking Out

However, the 1930s became a more serious time for Jewish broadcasters as the situation in Europe worsened. As news of Hitler and the Nazis dominated newspapers, some Jewish

radio programs began providing news and information that the network newscasts were hesitant to mention. Nazi military conquests were front-page news, but it was not until the 1940s that newspapers such as the *New York Times* finally decided the extermination of Jewish people was a major story. Thus, it was up to the Jewish press, and the news commentators on Jewish programs (along with a few non-Jewish commentators who spoke out, most notably NBC's Dorothy Thompson), to make sure the story was told. Rabbi Stephen Wise took to the airwaves to condemn fascism overseas while also condemning bigotry in America, as personified by Father Charles Coughlin, the anti-Semitic radio priest. The chairmen and women of many Jewish organizations, such as the American Jewish Committee and the Jewish Labor Committee, decried the persecution of Jews in Europe and tried to raise funds to help them. But Jewish public affairs programs were usually short and were seldom on the air more than once a week. Although they did call attention to the problems Jews faced, they could not compensate for the lack of coverage the rest of the week.

Ethics and Culture

The next major network program with a Jewish theme came from the Jewish Theological Seminary. Developed by seminary president Louis Finkelstein, *The Eternal Light* first aired on NBC in October 1944, featuring radio dramas about biblical personalities and famous Jewish men and women past and present. It often presented thought-provoking stories with ethical dimensions, and it was still on the air (having moved to television) in the 1980s, celebrating its 40th anniversary in 1985. Among the famous performers who were heard on this award-winning program over the years were Ed Asner, Gene Wilder, and E.G. Marshall. At the height of its popularity, this program was heard on more than 100 stations, and it won a Peabody Award for excellence.

Some Jewish celebrities began to offer their own radio shows, making use of Jewish or Yiddish culture. From 1951 through 1955, parodist and comedian Mickey Katz starred in his own radio show on KABC in Los Angeles, and in the 1960s, actor and folksinger Theodore Bikel starred in *Theodore Bikel at Home*, which aired on FM stations in New York, Chicago, and Los Angeles. Some announcers who began their careers doing Jewish-oriented programming in the 1930s or 1940s could still be heard many years later. Zvee Scooler, who had originally been an actor in Yiddish theater, did commentary on WEVD for four decades. Max Reznick, whose show *The Jewish Hour* included everything from parodies to cantorial records to the popular style of Jewish jazz known as "klezmer," was on the air on several Washington, D.C., stations from the 1940s until he retired in 1986. Ben Gailing's Jewish program *Fraylekher Kabtsen* (The Happy Poor Man)

was on the air in Boston for more than 50 years. And in Chicago, Bernie Finkel's *Jewish Community Hour* celebrated its 37th anniversary in the summer of 2000.

Jewish Programs Today

Jewish music or commentary was readily available on radio as the new century began. There were radio talk shows with Jewish themes, such as *Talkline with Zev Brenner*, heard on stations in New York and New Jersey. (Brenner had even started an all-Jewish radio station, WLIR, Long Island, NY, in May 1993, and after that venture, he resumed his job as a radio and cable television talk host.) Another popular radio program with a loyal following combined requests and dedications with a wide range of Jewish music, plus commentary from an Orthodox point of view—*JM in the AM* ("Jewish Moments in the Morning") with Nachum Segal had been on the air since 1983 on WFMU in Jersey City, New Jersey. The growth of the internet enabled Jewish programs from foreign countries (including Israel) to be heard in America. The internet was also helpful to those Jewish programs that at one time were heard on small AM stations; they could now broadcast on the world wide web and gain a much larger potential audience. Newspaper owner Phil Blazer was among those who took advantage of the new technology; the *Phil Blazer Show* has been on radio in Los Angeles since 1965, but it began webcasting in 2000. Talk show host Zev Brenner also began doing webcasting, and Boston radio host Mark David, whose show *Yiddish Voice* aired on WUNR in Brookline, MA, also made his program available over the internet. National Public Radio has aired holiday concerts of Jewish music at Hanukkah (including one concert featuring Theodore Bikel), and a number of Jewish recording artists are making their music available to be heard or downloaded.

Unlike the Jewish radio programs of the early days, there are not as many radio sermons or famous radio cantors, although there certainly are Jewish programs that have a moral or ethical dimension and shows that stress Jewish theology. There are even internet programs that teach Torah (Jewish Bible) on-line and play sound files to help with singing and pronunciation.

Although much of Jewish radio programming today is oriented toward music, there are also shows about Israel and current events. And even though tolerance is much more a part of American life than it was during radio's early years, myths and stereotypes still exist; when a celebrity utters an anti-Jewish remark, or when there are questions about Jewish beliefs (such as in 2000 when U.S. Senator Joseph Lieberman, an Orthodox Jew, was the Democratic candidate for vice president), agencies such as the Anti-Defamation League or the American Jewish Congress send spokespeople to address the issue on radio and television talk shows.

One continuing controversy is the presence on the air of so-called Messianic Jewish programs, such as Sid Roth's syndicated *Messianic Vision* or *Zola Levitt Presents*, which is now heard over the internet in addition to its long run on television. Messianic programs are broadcast by Christian stations, but their intention is to convert Jews. Hosts claim they are still Jewish even though they have accepted Christianity; they use Hebrew words and Jewish terminology to disguise evangelical Christian concepts, such as referring to Jesus as "Yeshua HaMoshiah," with the hope that Jewish listeners will be less threatened by a show that says one can convert to Christianity without leaving Judaism. These shows have evoked some vehement protest from leaders of the organized Jewish community, who object to what they feel is a distortion of Jewish teachings and accuse the hosts of using deceptive tactics.

Now that there is no longer an FCC guideline encouraging religious programming, few stations are willing to give free time to a religious show. As a result, the majority of religious programs on the air are sponsored by Christian denominations or individual preachers. With the radio networks no longer providing free time, and with production costs so expensive, there are few if any religious shows of the caliber of *The Eternal Light* on radio anymore. In fact, most of the popular music stations air no religious programs at all, and yet there are still Jewish programs on radio, just as there were in the 1920s. The shows offer a wide range of styles: some are traditional, with old-timers who play the great cantorial music of the past and reminisce about the old days, but others are quite modern and exemplify the interests of the younger audience. One such show is heard on WSIA, Staten Island, New York; it features Jewish women's music and is hosted by Michele Garner, who calls herself the "Rockin' Rebbetzin" (the Yiddish word for a woman who is married to a rabbi is *rebbetzin*, and not only is her husband Eliezer a rabbi, but he too does a show on WSIA, playing Jewish rock music). Thanks to Jewish radio shows and the performers who love European Jewish culture, the Yiddish language is being kept alive; klezmer music has enjoyed a rebirth and newfound popularity with a younger demographic. Jewish radio shows are also proving helpful to Jews-by-choice, people who have converted to Judaism on their own and now want to learn more about Judaism's various customs and musical traditions.

Although it is certainly true that most religious programs on radio are done by and for Christians, there continues to be a consistent Jewish presence on the air, with shows that help to create a sense of community and a sense of identity.

Another interesting trend is the resurgence of Yiddish radio programs. Although only a few American Jews speak the language, there has been great interest in reviving it, especially given its impact on Jewish music and theater in the Golden Age of Radio. Leading this effort is the Yiddish Radio Project, which, beginning in March 2002 (some excerpts appearing in late 2001), could be heard on National Public Radio. Much of the work restoring the recordings and doing the historical research was done by a New York author and musician, Henry Sapoznik. A two-volume compact disc has been issued by the Yiddish Radio Project containing the first ten episodes of the NPR program, and the Project has a website with updated information (see below).

Jingles

Station identification jingles—catchy musical motifs often accompanied by vocals—are a basic ingredient of the sound of radio stations in most regions of the world. Although they are most associated with pop and rock music commercial radio services, jingles are also common in speech-based stations and even in publicly funded radio services.

Jingles are principally used by stations to insinuate their names and slogans into the minds of listeners. In so doing, jingles help ensure that, when questioned by audience researchers, listeners will recall particular stations over their rivals. This is especially vital for commercial stations, whose advertising rates are largely dictated by the results of such surveys.

In addition to this near-brainwashing technique of implanting the station names in the minds of listeners, radio jingles can be regarded as having the following attributes:

- They provide a positive, confident, “station sound” and a general “feel-good” factor.
- They promote the most important programming elements, for example, the style and quantity of music, contests, and local information.
- They “announce” different program elements, such as news, weather, sports, and disc jockey names.
- They serve as a way of “changing gears” between different program elements, for example, between news, commercial stop-sets, and travel information.
- They serve as a way of making musical transitions, for example, between slow- and fast-paced music.

Origins

The first known singing radio jingle was done in the mid-1920s, when Ernie Hare and Billy Jones, known as “The Happiness Boys,” sang songs for a number of consumer products. By the late 1930s, advertising jingles had developed to a sophisticated level of production, often involving singing choirs and full big band orchestras. The station identification jingle developed naturally from this by the 1940s: WNEW in New York, for example, asked recording artists to sing short ditties incorporating the station’s call letters.

By the mid-1950s radio station management saw the jingle as part of the battle for audience ratings success in a marketplace that was becoming ever more competitive—not just with other radio stations but with the new medium of television. In this period, radio stations were rapidly moving away from the “full-service” network model with a variety of programs and toward local operations, with most adopting one of three or four basic formats, and managements had to convince listeners that their stations were in fact better than and different from

the opposition. They therefore marketed and promoted in ways similar to those of any consumer product. The fact that the station jingles sounded very similar to the advertising jingles of products and services was no coincidence: they were often written, performed, and produced by the same companies.

The “founding fathers” of station jingles as a distinct entity were Bill Meeks and Gordon McLendon. The latter bought KLIF in Dallas in 1947 and appointed Meeks as his music director with a specific brief to put together live music shows. As with so many other innovations, the modern station jingle happened by accident: the jingles were used as a way of bridging the time needed in live broadcasting to set up each new vocal group.

Meeks left KLIF to start his own company, Production Advertising Marketing Service (PAMS), in Dallas in 1951. By the mid-1950s he was compiling individual station jingles into “packages”—whole series of jingles using variations of the same musical structure and slogans—to different stations across the country. By the end of 1964 the primary business of PAMS had become station jingles, and the company became the world leader in a new stratum of services to the radio industry. Meanwhile, McLendon hired another musical director, Tom Merriman, who developed and elaborated on the station identification jingles at KLIF; other stations in different parts of the United States heard these and asked for customized sets of their own. Merriman also left KLIF and in 1955 formed the Commercial Recording Corporation; his company produced some of the first jingles specifically for Top 40 radio, which was rapidly emerging as the number-one radio format.

There was a good deal of creativity and innovation in this period. PAMS is credited with being the first company to use the Moog synthesizer and the Sonovox—a device originally developed to enable people who had lost the use of their vocal chords to make intelligible speech—to create an extraordinary electronic “singing” voice. The “variable station logo” technique meant that many disparate programming elements could be linked and blended using variations on the same musical motif, often with lyrical variations of the same slogan or “positioning statement.”

Despite this, the overall style of these jingles—close vocal harmonies and lush orchestrations common in the pre-rock and roll period—was outdated even by the late 1950s, and yet, curiously, the style persisted for at least another 20 years. It appears that for many years, the radio jingle was accepted by the listening public as being a musical genre of its own, with no need to bow to changes in popular music.

Occasionally, though, attempts were made to overcome this anachronism by somewhat cheekily adopting more contemporary styles: one of the PAMS jingle sets adopted the Beatles’

sound, even using the group's trademark "yeah yeah." Even here, though, the jingles outlasted the creations of the form on which they were based. Stations playing more contemporary formats belatedly moved away from the traditional close harmonies and lush orchestrations, seeing these techniques as distinctly "uncool" and embarrassingly old-fashioned (U.S. FM rock stations had always taken this view of jingles and had consequently eschewed them from the start).

In 1974 former PAMS employee Jonathan Wolfert and his wife Mary Lyn set up a new company, JAM (Jon and Mary)—also based in Dallas, the world's center for station jingles—which quickly established itself as one of the leading companies in the jingles field. In 1976 they secured the contract for the most famous and imitated Top 40 radio station in the world—WABC in New York—which used PAMS jingles from 1962 to 1974. Probably the most-played jingle in the world was recorded for this station in the spring of 1976—lasting just two and a half seconds. In 1990 Wolfert bought up the rights to the jingles from PAMS (which had suspended operations in 1978 after a series of financial crises). These jingles were still in demand in many radio markets throughout the world—especially on golden oldies stations, which had their own station names and slogans sung over the original music tracks, often using many of the same singers.

Modern Era

The length of station jingles varies greatly, although most average between five and seven seconds. JAM also claims to have recorded the longest known jingle—for WYNY in the fall of 1979—which lasted three and a half minutes. "The New York 97 Song" is a vocal and musical narrative of a day in the life of a listener in New York, with repeated use of the station location, frequency, and call letters—"New York 97, WYNY."

The international ubiquity of the station identification jingle cannot simply be explained as the result of the competitiveness of the U.S. commercial radio system. Jingles are used in radio services in very different types of economic and media systems. For example, the British public service broadcaster, the British Broadcasting Corporation (BBC), which held a monopoly on domestic radio in the United Kingdom until 1973, began using PAMS jingles in 1967 on its new rock and pop network, Radio 1. This service was set up on instructions from the government after it had produced legislation outlawing the "pop pirates" of the mid-1960s—many of which had copied U.S. Top 40 and beautiful music formats and used jingles from PAMS in Dallas. Radio 1 ordered the same series of jingles that had been used by the most commercially successful

of the offshore pirates, the Texan-backed Radio London. Even though the BBC carried no commercials and had no authorized competition during the late 1960s and early 1970s, its managers thought that station jingles had become an essential part of pop music programming and youth culture. Many other state broadcasters have also felt the need to invest in the "Dallas Sound" of jingles, as have the publicly funded armed forces radio networks of both the United States and the United Kingdom. The jingles have also been sung in languages other than English: the U.S. radio jingle can be fairly regarded as a form of cultural imperialism, albeit one of a benign nature.

By the mid-1980s, a new vogue for electronically produced "Sweepers," with a spoken rather than sung vocal track, became the vogue on many contemporary hit radio and adult contemporary stations. As with all commercial operations, the jingles business—dominated in the world market by JAM and TM Century—had to adapt to these new demands or face extinction. In the late 1990s, there was some indication that the fashion had moved, if not full circle, then perhaps 180 degrees, when many stations—especially those targeted to the baby boom generation, which had grown up with the Dallas Sound—began investing in the more traditional type of jingle production, albeit with a more contemporary edge.

Although fashions in station jingles will no doubt evolve still further, the one constant need for stations faced with ever more competition for listeners' loyalty is to ensure that they promote themselves on the air in the most attractive and distinctive audio fashion possible.

Joyce, William. *See* Lord Haw-Haw

Joyner, Tom 1942–

U.S. Radio Disc Jockey

Tom Joyner's daily round-trip airline commute of 1,600 miles between Chicago and Dallas earned him the moniker "The Fly Jock." Beginning in 1985, Joyner continued this daily commute for eight years. It was one of several accomplishments that transformed a once small-town disc jockey into one of America's most well known on-air personalities. Another well-deserved nickname would come later, one that was just as fitting and appropriate as the earlier one—"The Hardest-Working Man in Radio."

Early Career and Life

The Tuskegee, Alabama, native started announcing during college. He had at first sung with Lionel Ritchie and the Commodores, a rhythm and blues group, but he was discouraged by his father in this pursuit. So Joyner tried announcing instead. He first worked as a local announcer at Tuskegee Institute, where he attended college, playing records in the university cafeteria and announcing at sporting events. Upon graduation, he landed an on-air position at WMRA-AM in nearby Montgomery, Alabama.

He left that job for other on-air positions in successively larger markets. For example, after WMRA, Joyner worked at Memphis' WLOK-AM. From Memphis, he moved up the river to St. Louis, where he found an announcing job at KWK-AM. From there, Joyner was hired as an announcer at Chicago's WJPC-AM. While there, he worked as a morning air personality and program director (1978–83). Moreover, he was also producer and host of the *Ebony/Jet Celebrity Showcase*, a television show. While at WJPC-AM, the station's owner and Joyner's mentor, John H. Johnson, publisher of *Ebony* and *Jet* magazines, gave Joyner his first big break. Johnson put Joyner's picture in *Jet* magazine each week as part of the promotion for the television program, and Johnson featured him in a television commercial with boxing great Muhammad Ali. In addition to his work at WJPC-AM, Joyner also worked as a disc jockey at several other Chicago radio stations, including WVON-AM, WBMX-FM, and WGCI-FM.

The Fly Jock

Joyner left WGCI-FM for a morning air personality position at Dallas' KKDA-AM. By the time his contract at the Dallas station was nearing its end, WGCI-FM management wanted him back. Joyner listened to both offers and decided to take both because neither contract had an exclusivity clause that would prevent him from working at another radio station. Joyner said "greed" got the best of him, and he signed two concurrent \$1 million-plus contracts, running six years (Dallas) and five years (Chicago). Thus began the odyssey of the Fly Jock.

From 1985 to 1993, Joyner accrued 7 million frequent-flier miles, as he made the round-trip commute three days each week between Dallas and Chicago. Joyner did a morning show in Dallas at KKDA-FM (the station had acquired the license for an FM facility) from 5:30 to 9:00 A.M. In the afternoons, from 2:00 to 6:00 P.M., he did an afternoon show at WGCI in Chicago. Joyner paid \$30,000 to reserve a guaranteed round-trip seat on an airline over five years.

The Hardest-Working Man in Radio

In 1994 the American Broadcasting Companies (ABC) Radio network approached Joyner with the idea of developing his radio program for national distribution and syndication. With its debut in 1994, the *Tom Joyner Morning Show* became the first live syndicated program produced by an African-American performer on radio. It is broadcast from 5:00 to 9:00 A.M. central time to a nationwide audience, Monday through Friday. Joyner's Dallas-based show combines, in more or less equal parts, rhythm and blues music, comedy, and politics. Although based primarily in Dallas, the *Tom Joyner Morning Show* is often broadcast from remote studios in various cities around the United States. It is the number-one-rated urban morning radio show in the country. Joyner's show is heard on 95 stations, reaching 5 million listeners. The show targets the 25–54 demographic group, an attractive group for advertisers. Joyner's show, when broadcast on other outlets, has catapulted many of these radio stations to number one in their respective

Tom Joyner
 Courtesy ABC Radio Networks

markets. Critics complain, however, that Joyner's success has come at the expense of local disc jockeys, who are fired because they are no longer needed. Joyner, on the other hand, sees his success as an opportunity for low-rated radio stations to increase listeners and advertising revenues and to provide national programming that comes with his syndicated show.

Joyner also produces a weekend program. The *Tom Joyner Movin' on Weekend Show* can also be heard nationally and is distributed by the ABC Radio network.

Community Service

Joyner's sustained support of community service activities has endeared him to the African-American community. Among the issues he has supported include a 1980s campaign called "Drop a Dime on the Man," which identified speed traps targeting African-Americans in Dallas. In 1999 Joyner, along with political commentator and fellow team member Tavis

Smiley, started a crusade to persuade retailers such as CompUSA, for example, to expand their advertising in black-owned media.

In addition, he has started the Tom Joyner Foundation, a nonprofit organization that assists college students in completing their college education at historically black colleges and universities. The foundation accepts donations from many sources, but Joyner's "Dollars for Scholars" campaign has raised more than \$40,000 for students at historically black colleges, which is made available to them through his Foundation.

Judis, Bernice 1900–1983

U.S. Station Manager

In the midst of network radio's golden age and on through television's first wave of success, Bernice Judis developed an inexpensive music-oriented radio program style that survived big-budget competition. Her implementation and massaging of the format over WNEW New York was analyzed and often imitated by countless media insiders from Los Angeles to Luxembourg.

Judis enjoyed admitting that she loved radio the way most men love fine cars. Reportedly, every room in her home, as well as a compartment in her handbag, was equipped with a receiver. She was always listening, or so it seemed: none of her announcers was exempt from an instructive studio hotline call, sometimes well past midnight. They affectionately nicknamed Judis "La Mama," though they never called into question their teacher's talent to motivate. Each remembered her as an executive with an instinct for hiring good people and then challenging them to be great. Even the disc jockey she fired for violating WNEW's "fashion code" by wearing red socks considered his strict boss a valued mentor.

Her entrance into broadcasting resulted from a friendship with a woman whose husband had recently purchased part interest in a radio station. In 1934 the well-heeled Judis had just returned from a European tour when her friend casually suggested that she help out the new enterprise. Within a year of Judis' agreeing to the request, her programming acumen was so evident that she graduated to general manager of fledgling WNEW.

The independent station had inadequate funding to stage the types of celebrity-oriented comedy, music, drama, or soap opera fare that was typically the province of network outlets. That never mattered, though, because Judis considered such offerings boring. She preferred a steady diet of positive pop tunes, and she maintained that others (especially young women, who often controlled the family radio dial) would share her tastes. One of her specialties was an instinct for hiring announcers who possessed the voice and ability to create a descriptive picture in the listener's mind. Judis looked for radio people ready to bloom into true "air personalities." Paramount was their potential to sell WNEW audiences the products offered by the station's growing list of advertisers.

Martin Block had a smooth spark in his delivery that Judis believed represented star quality. Her direction of the erstwhile \$20-per-week announcer rocketed him to disc jockey stardom and, for years, propelled Block's *Make Believe Ballroom* program to highly salable ratings. Judis instructed him to work closer than normal to the microphone in order to generate an air of gentle romantic authority.

When authoritative columnist Walter Winchell wished (in print) for a radio station that would keep metropolitan New York's all-night work force company during the wee hours, Judis introduced the *Milkman's Matinee*. In 1936 the decision made WNEW a pioneer in 24-hour broadcasting. Although she scheduled some shows with live musicians, most of her format (including *Milkman's Matinee* and *Make Believe Ballroom*) was built around disc jockeys skillfully ad-libbing between recorded tunes. Prior to the late 1940s, most other big-city programmers considered transcriptions (in place of live bands and singers) the stuff of minor-league presentation. WNEW's shrewd manager used her sizable record library to offer people an anticipated radio staple: consistency in repeated elements. Such is the stuff that turns an ordinary song into a familiar hit recording. Literally hundreds of daily record requests flooded WNEW's switchboard. Some listeners sought to hear again and again obviously goofy selections the airstaff had spun purely as gags.

Judis is also known for adding non-musical content to what would be subsequently dubbed the "modern radio format." In the mid-1930s, Americans were gripped by the kidnapping of the infant son of transatlantic flight hero Charles Lindbergh. During the ensuing trial, the then novice WNEW official ordered her station's remote news crew to report proceedings directly from the New Jersey courthouse. Since their microphones were barred from courtroom use, Judis had her staff headquartered in the venue's nearest lavatory. Although at risk of transmitting indelicate sounds, these bathroom broadcasts were the sole electronic media offerings from inside the judicial building. Between reports, disc jockeys in the main studio played popular music. Listeners were captivated.

When the Japanese bombed Pearl Harbor, Judis was convinced that people would want more news. She scheduled round-the-clock, hourly (initially, on the half hour) newscasts by 1942—something no one else was doing. Judis' hunch quickly made "WNEW—Your station for music and news" an even more important companion for increasingly busy audiences. She rightly speculated that regular bites of pertinent information sandwiched between friendly disc jockeys conveying uplifting pop would yield a compelling soundtrack. At World War II's end, the Judis-directed WNEW targeted a young, urbane demographic, and her approach received high marks for successfully standing up to radio's postwar enemy: television.

When many radio veterans were moving to the expanding visual medium, Judis, along with her husband Ira Herbert, Rhode Island broadcaster William Cherry, and several others

paid more than \$2 million for WNEW. The savvy general manager and new part owner wagered that the spread of suburbs and concomitant commute of workers into cities would strengthen radio's influence, even in the face of television's quickly growing popularity. Judis met TV's evening primetime dominance by further tweaking her various 6 A.M. to 8 P.M. slots. Fourteen hours daily of popular music favorites, news briefs, and chatty disc jockeys gave ample opportunity for reaching the increasingly mobile and sophisticated thirty-something audience that corporate America's advertising agencies desperately sought to influence around the clock. People not glued to nighttime TV caught Judis' unique early-1950s counter-programming experiments. For example, she had disc jockeys spin spoken-word records, hired Milton Berle to do a serious Shakespeare performance, and tried a game show spoof in which contestants were eligible to lose their personal effects.

An attractive offer for WNEW led its owners to sell in 1954. With their share of the proceeds, Judis and her husband bought an interest in a Southern broadcast group. She oversaw the firm's Birmingham, Alabama, AM outlet. By the late 1960s, the couple had left the radio business. Judis died in Fort Lauderdale, Florida, in 1983.

K

Kaltenborn, H.V. (Hans von) 1878–1965

U.S. Radio Commentator

Hans von Kaltenborn was radio's first news commentator and a pioneer in radio news for three decades. Prior to his broadcasting career, Kaltenborn engaged in newspaper reporting and editing and in public lecturing on current events. He is best remembered for his live broadcasts of battles during the Spanish Civil War, his marathon broadcasts of the 1938 Munich Crisis, and for President Harry S. Truman's mimicking of his 1948 election reports.

Origins

Kaltenborn was born in Milwaukee, Wisconsin, in 1878. His father, Baron Rudolph von Kaltenborn, was a former officer in the Hessian Army who came to the United States to protest the absorption of Hesse by Prussia. His mother, an American schoolteacher, Betty Wessels, died soon after Hans was born, and he was raised by a stepmother.

The family moved to Merrill, Wisconsin, when Hans was 14 years old. After only a year in high school, he ran away to work in a lumber camp. Then, for five years he worked for his father in the building material business and did odd jobs for the local newspaper, the *Merrill (Wis.) Advocate*. Later, while serving in the army during the Spanish-American War, young Hans sent articles about army life back to the *Merrill Advocate* and to the *Milwaukee Journal*. Although he did not leave the United States during the war, young Kaltenborn, who was athletic and nearly six feet tall, developed a desire for travel and adventure. After a short time as city editor of the *Merrill Advocate*, he worked his way to Europe in 1900 and spent the next two years in Germany and France. He attended the Paris International Exposition of 1900 and continued sending freelance news material back to newspapers in the United States. When he returned to the United States in 1902, he worked as a reporter and editor for the *Brooklyn Eagle*, a newspaper with which he would be associated, on and off, for about 27 years.

Lacking a high school diploma, Kaltenborn entered a special one-year program for journalists at Harvard College in 1903. After completing high school equivalency exams—he had great difficulty with the mathematics section—Kaltenborn was admitted as a regular student, majoring in political science. In 1909 he received his B.A. degree cum laude and was elected to the prestigious Phi Beta Kappa honor society. At Harvard, he debated, studied speech, won oratorical contests, ran cross country, organized a dramatic club, and perfected his distinctive German accent.

Following college, Kaltenborn traveled around the world on shipboard as a tutor to Vincent Astor. In 1910 he married Olga von Nordenflycht, a German baroness, and returned to the *Brooklyn Eagle*, for which he served as a Washington, and later, a Paris correspondent before being named the *Eagle's* war editor. With his growing reputation as a geopolitical expert, Kaltenborn delivered, as an *Eagle* editor, a series of weekly public talks about current events in the newspaper's auditorium.

On to Radio

In 1922 Kaltenborn delivered his first radio commentary from station WYCB on Bedloe's Island in New York Harbor. The following year, he became the first regularly scheduled radio commentator when the *Eagle* sponsored Kaltenborn's regular weekly news commentaries over WEAJ in New York. He remained with the *Brooklyn Eagle* until 1930, when he joined the Columbia Broadcasting System (CBS) to devote himself full-time to radio news.

During the early 1930s, when wire service reports were seldom available to radio stations, CBS and the National Broadcasting Company (NBC) employed a number of experienced newsmen to comment on the day's events. Although Kaltenborn had the advantage of being the first radio

Paul White and H.V. Kaltenborn
Courtesy CBS Photo Archive

commentator, he also benefited from his speech training, his lecturing experience, and several other unique abilities, all of which kept him in the forefront of news commentary. His spoken delivery was distinctive—clipped, precise, and easy to understand even when he spoke at a rapid pace. Among his special attributes were a firsthand knowledge of many world leaders, whom he interviewed during frequent travels abroad; fluency in the French, German, and English languages; and training in world politics. Kaltenborn also had the advantage of being able to speak without a script. For many years he delivered his radio commentaries extemporaneously with only a few notes. He also extemporaneously described political conventions, international conferences, wars, and other crises.

One of Kaltenborn's early broadcast triumphs was his live description of a 1936 Spanish Civil War battle. Perched on a haystack on high ground in France overlooking a besieged Spanish town, the commentator, wearing a steel helmet, described the battle to CBS listeners in the United States. His report was accompanied by live sounds of machine-gun fire in the background. Radio's first on-air battle report, though physically risky for 58-year-old Kaltenborn and his engineer, added greatly to his stature as a radio newsman.

Two years later, Kaltenborn was called upon by CBS to coordinate and anchor a series of radio broadcasts during the Munich Crisis in 1938. At stake was the future of the Sudetenland, as Germany's dictator Adolph Hitler, British Prime Minister Neville Chamberlain, and other European leaders met to

seek a solution to the conflict in Czechoslovakia. Kaltenborn's role was to interpret and analyze the wire dispatches, short-wave reports from CBS newsmen on the scene, and speeches by the participants. Relying on his ability to understand German and French, Kaltenborn translated and provided instantaneous commentary on the speeches of various government officials received in New York by shortwave. A *Time* reporter noted that without pause, Hans von Kaltenborn translated and distilled a 73-minute speech and then for 15 minutes proceeded extempore to explain its significance and to correctly predict its consequences. Kaltenborn remained at his post at CBS in New York for some 18 days, giving about 100 separate broadcasts. He subsisted mainly on soup brought to him by his wife and napped on a couch in the studio between the frequent broadcasts.

Because of a tendency for outspokenness on controversial issues, Kaltenborn had some difficulty keeping a sponsor during the 1930s. However, by the end of the decade the Pure Oil Company became Kaltenborn's regular sponsor on CBS. In 1940 the sponsor moved Kaltenborn's commentaries to NBC to get a better time on the evening schedule. Soon Kaltenborn's keen insight into geopolitical developments was evident in his warnings about Japanese aggression, including a warning only a few days before Pearl Harbor. During World War II, Kaltenborn was exempted from the Office of War Information's requirement that commentators not deviate from scripts submitted in advance of their broadcasts. Also during the war, Kaltenborn began using the initials *H.V.* to minimize his German ancestry.

In covering the 1948 presidential election while at NBC, Kaltenborn assured listeners that even though President Truman was running a million votes ahead in the early popular vote, when the rural votes came in, the winner would certainly be Thomas E. Dewey, the governor of New York. In probably the best-known instance of presidential mimicry of a news commentator, President Truman, at a post-election dinner, told the audience that he had heard Mr. Kaltenborn's broadcast. Then the president imitated the crisp Kaltenborn's remarks and said he just went back to sleep undisturbed. The next morning, the nation learned that, as Mr. Truman had never doubted, the president was reelected to serve a full four-year term.

Kaltenborn continued to broadcast his regular commentaries until 1953. Afterward, he did occasional broadcasts on a semi-retired basis until 1958. For 33 years, *H.V.* Kaltenborn had covered practically all of the world's major news events

and had given the public his views on the meaning of the news. He also contributed to many magazines and was the author of several books. He spent his retirement years living in Florida and died in New York City in 1965 while visiting his son.

HERBERT H. HOWARD

Hans von Kaltenborn. Born in Milwaukee, Wisconsin, 9 July 1878. Served in U.S. Army, Spanish American War; worked as city editor, *Advocate*, Merrill, Wisconsin, 1899-1900; traveled in Europe, 1901-02; reporter, *Eagle*, Brooklyn, New York, 1902; attended Harvard University, B.A. in political science, 1909; returned to *Eagle*, 1910, correspondent in Washington and Paris, later served as *Eagle's* war editor; delivered first radio commentary from experimental station on Bedloe's Island, 1922; first regularly scheduled news commentator on WEAJ, for *Eagle*, 1923; hired as full-time radio commentator by CBS, 1930; broadcast battle descriptions of Spanish Civil War live on CBS, 1936; broadcast 18-day coverage of Munich Conference from CBS in New York, 1938; moved to NBC, 1940; predicted Dewey victory in presidential election, 1948. Received Phi Beta Kappa, Harvard University, 1909; DuPont Foundation Award, 1945; honorary doctorates from University of Wisconsin and Hamilton College. Died in New York City, 14 June 1965.

Karmazin, Mel 1943–

U.S. Radio Executive

There was no more powerful executive in radio in the last two decades of the 20th century than Mel Karmazin. After gaining a decade of experience in radio sales and management, Karmazin formed and ran Infinity's profitable group of radio stations during the 1980s. He then merged Infinity with the Columbia Broadcasting System (CBS) in the 1990s and moved to "Black Rock," the Eero Saarinen-designed headquarters building for CBS on 6th Ave in New York City, first to run its radio operation and then to head the entire company as it merged with media conglomerate Viacom. Karmazin brought effective consolidation and cost cutting to radio station and group operation as he headed CBS's second most lucrative division and radio's top revenue-producing chain as the 20th century ended.

Born and raised in Long Island City, New York, across the East River from Manhattan, Mel (never Melvin, his given name) worked days as an account executive at the Ziowe Advertising Agency in the city while attending Pace University at night. Upon graduation, he took a position in sales, rising quickly to manager at WCBS-AM, an all-news radio powerhouse located in the heart of Manhattan. During the 1970s, Karmazin worked for Metromedia, eventually rising to general manager of its WNEW-AM and FM combination. It was from this position that he launched Infinity Broadcasting and became his own boss at the age of 37.

As a manager, Karmazin became most famous for his relentless cost cutting and format switching. Yet he was willing to try any technique to raise profits. In 1993, for example, as others were selling radio networks, Karmazin purchased Westwood One; three years later, with the merger with CBS (for \$5 billion), Karmazin lorded over all the major radio networks—save American Broadcasting Companies (ABC). These networks could and did feed programming cheaply not only to stations owned by Infinity and later CBS, but also to thousands of other stations across the United States.

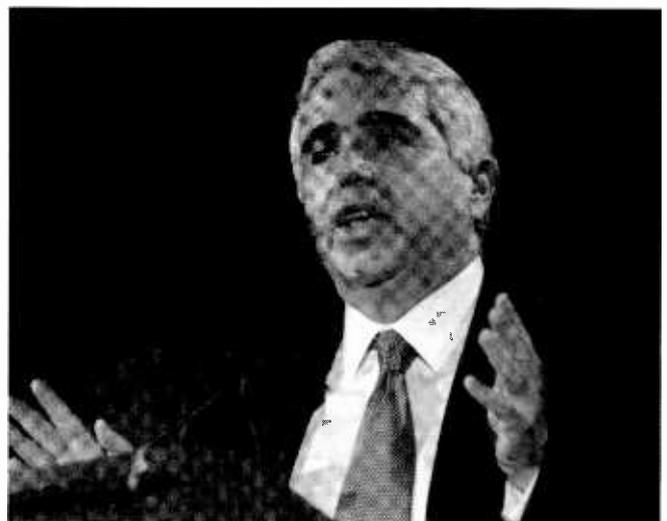

Karmazin never sought to own all radio stations; instead, he aimed to group stations in nearly every major city—led by stations in the top four markets of New York City, Los Angeles, Chicago, and San Francisco. Under Karmazin, CBS owned far fewer radio stations than 1999 top dog Clear Channel Communications, yet its more than 160 radio stations earned just as much in revenues, as advertisers looked to radio in major markets to couple with television and newspapers to complete their advertising plans.

Thus, through radio station operation, Karmazin was able to quietly generate about half of CBS's profits in the late 1990s. Karmazin aimed to be either number one or two in

every major radio market where CBS had stations. When Mel Karmazin succeeded Michael Jordan in 1998 in CBS's top executive position, he had already formulated this plan, and thereafter he always counted on squeezing significant profits from the CBS radio group while the world looked at the ups and downs of the far more famous television network. As the 1990s ended, Karmazin operated not only flagship WCBS-AM in New York City but dozens of other stations in the country's top-twenty media market cities, including eight stations in Los Angeles (the #2 media market) and seven in Chicago (#3).

Just after Labor Day 1999, a Hollywood company most people had never heard of—Viacom—took over CBS. Although the deal was announced by Sumner Redstone, chairman and chief executive officer of Viacom, Mel Karmazin was named president and chief executive officer of the new colossus. Redstone would step aside, and Karmazin would run the day-to-day operations. This made Karmazin one of mass media's top executives, with radio now only a part of his overall responsibilities.

Redstone and Karmazin's goal in the 21st century would be to make Viacom a media conglomerate the equal of Disney, Time Warner, or the News Corporation. Redstone retained his ownership majority and thus control of the new Viacom, and Karmazin took over day-to-day operations of a corporation able to produce, promote, distribute, and present all forms of mass entertainment, from radio and television to movies and music. With a portfolio of some of the world's most recogniz-

Mel Karmazin, 25 March 1999
 Courtesy AP/Wide World Photos

able brands, Karmazin and Redstone boldly proclaimed global superiority for an operation conservatively estimated as worth \$35 billion.

The union of CBS and Viacom promised to test the economic theory that owning significant stakes in many mass media can provide a synergy by which the parts together can produce more profits than if they operated individually. Could CBS's radio division cross-promote and make more profitable Viacom's cable music channels (MTV, VH1, and TNN)—and vice versa? Karmazin will test his management skills in an arena wider than radio, encompassing all of mass entertainment. Owner Sumner Redstone has passed the torch, because the fine print in the merger obligates him to stick with Karmazin until 2003.

Kasem, Casey 1932–

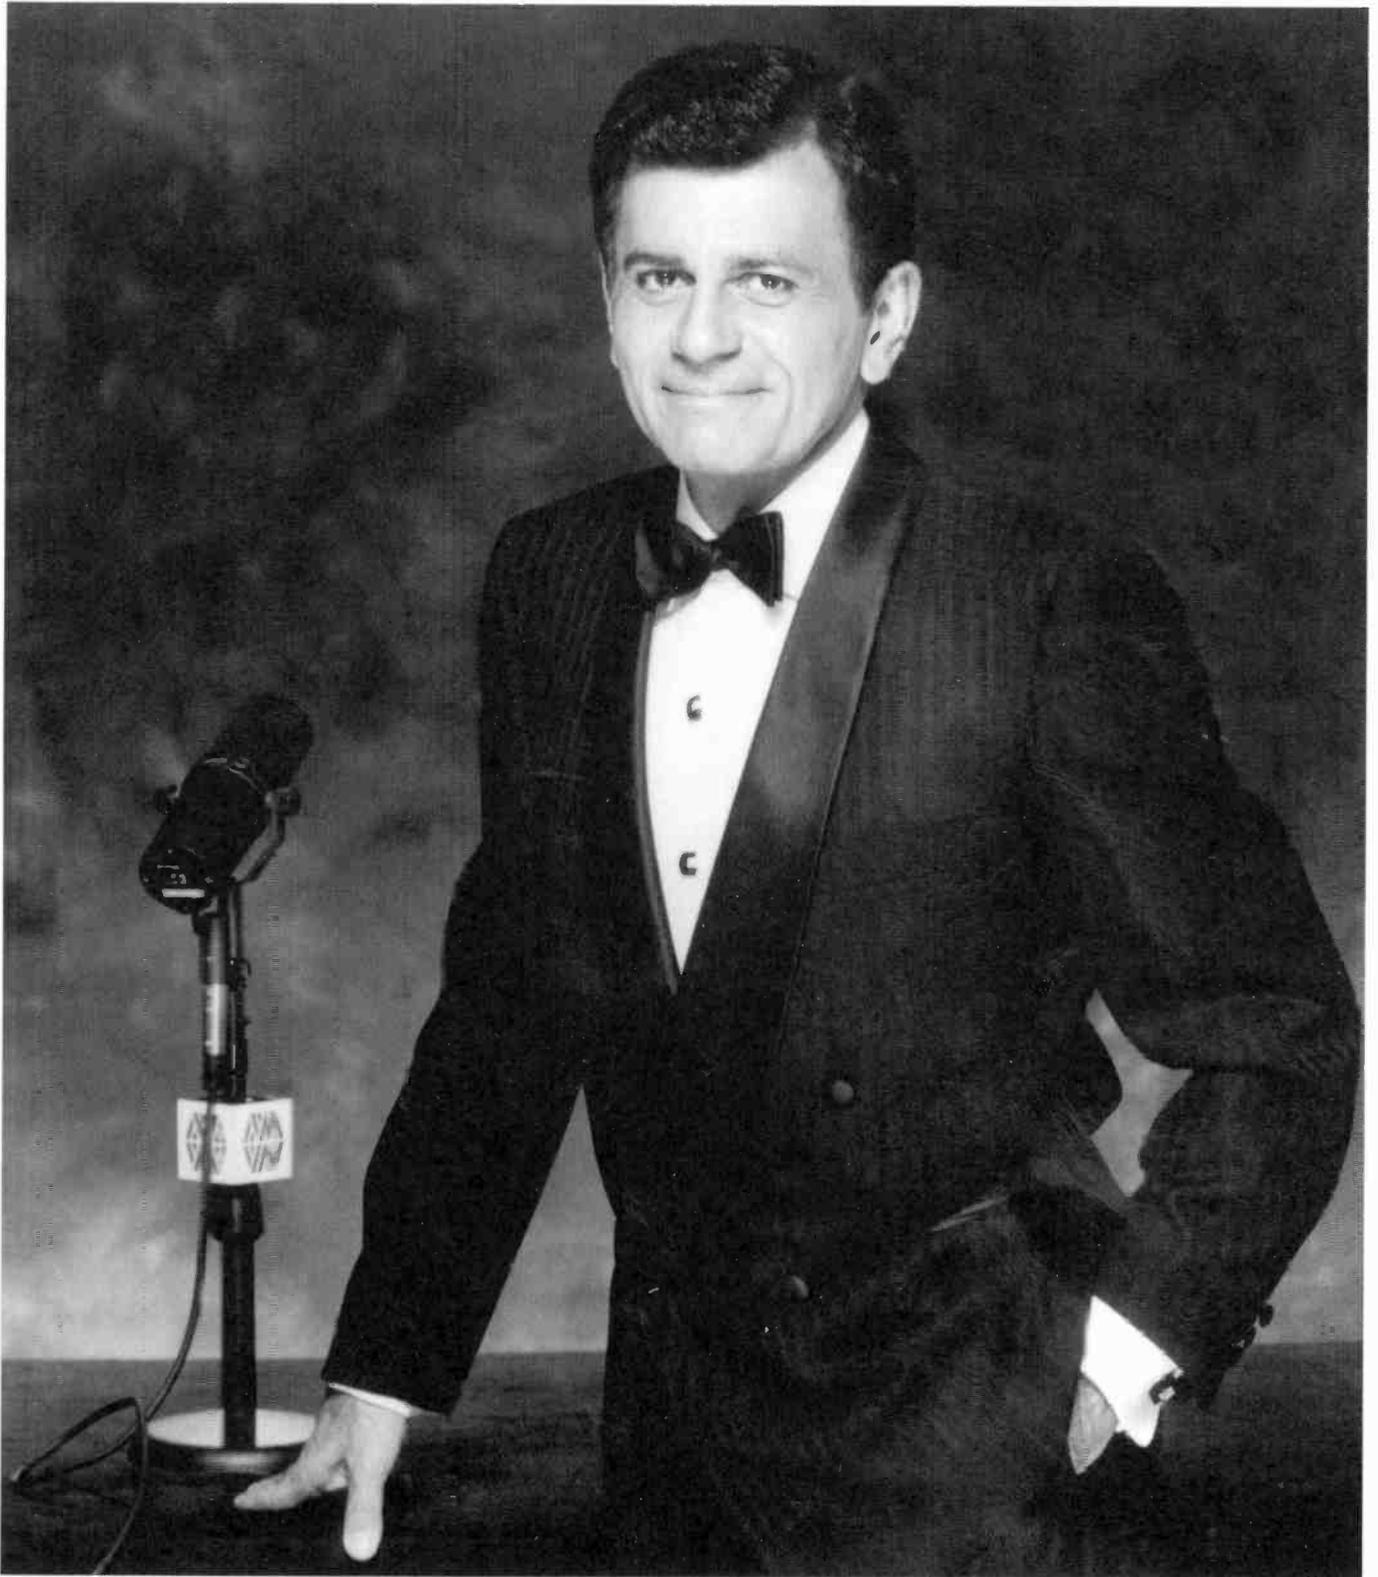

U.S. Radio Personality

For many rock and roll fans, the name Casey Kasem is synonymous with the American Top 40 Countdown, a weekly radio program of the most popular songs in the United States. It was the first nationally syndicated countdown program, and as its host and one of its founders, Kasem's impact on the landscape of American popular music is undeniable. His voice is among the most recognizable in rock and roll, joining the likes of Wolfman Jack as both a disc jockey and a celebrity.

The son of Lebanese immigrants, Kemal Amen Kasem was born in 1932 in Detroit, Michigan. Upon graduating from Northwestern High School, Kemal became an intern at WDTR, Detroit Public School's radio station. From there, he attended Wayne State University, where he landed the lead role as "Scoop Ryan, Cub Reporter," the most popular show on the campus station. As a result of his success there, he earned his own 15-minute Saturday morning show on WJR, a 50,000-watt Detroit station. He also took a position as a full-time actor on WXYZ, an American Broadcasting Companies (ABC) affiliate.

In April 1952, Kasem was drafted for army service in Korea. Because of his broadcast experience, he was assigned to Radio Station Kilroy, an Armed Forces Radio Network Affiliate in Taegu, Korea, where he started his own production team. After the war, he returned to Detroit and took a job as a newsman at WJBK, where he adopted the moniker "Casey at the Mike." After a successful stint of substituting for a disc jockey, Kasem became the station's primary disc jockey. That same year he became Krogo the Clown, hosting a children's TV program on WJBK-TV. He then left television to assist at his family's grocery store and finally relocated to Cleveland in 1959, where he took a job as a radio host at WJW.

The most prominent Cleveland disc jockey at this time was Mad Daddy (Pete Meyers), whose fast-talking, slang-laden, rhyming radio patter influenced Kasem's on-air personality. Kasem again used the nickname *Casey at the Mike*. In Cleveland, Kasem also hosted the television show *Cleveland Bandstand*, while working at WJW. The program was canceled after

Casey Kasem
Courtesy of Casey Kasem

a few months, and WJW switched formats, so he began looking for other work.

Kasem worked at WBNY in Buffalo and KEWB in Oakland before arriving at KRLA in Los Angeles in 1963. During the process, Kasem shed his comic routines and fast talk, and became a more serious, informative disc jockey following his chance discovery of a 1962 copy of "Who's Who in Pop Music," which he used thereafter to provide his listeners with information on bands and singers.

In Los Angeles, Kasem began calling himself simply *Casey Kasem*, a simpler and more serious name than *Casey at the Mike*, and he was hired by Dick Clark to host an *American Bandstand*-type program called *Shebang*, which ran on KTLA from 1965 to 1968. Kasem made his mark on the program by improvising his introductions rather than reading the prewritten cue cards. Mike Curb, a producer for Tower Records, introduced Kasem to the world of commercial voice-overs, which eventually led to his two biggest roles off the radio dial: providing the voice of Robin on the cartoon series *Batman and Robin* and also the voice of Shaggy on *Scooby Doo, Where Are You?* In addition, he provided voices for countless other cartoon shows and promotions for the National Broadcasting Company (NBC) network.

In late 1968, Kasem reunited with his old friend Don Bustany and created Kasem-Bustany productions, which they operated from Kasem's Hollywood apartment. In the summer of 1969, Kasem and Bustany met with Tom Rounds, an executive at Charlatan Productions, and Ron Jacobs, a respected program director in Los Angeles. Rounds and Jacobs had earlier formed Watermark Productions, a Los Angeles radio production company. With the financial backing of Tom Driscoll, heir to a strawberry-growing fortune, Kasem, Bustany, Rounds and Jacobs laid the groundwork for *American Top 40 (AT40)*, which would change Casey Kasem from a local disc jockey to a household name. *Casey's Coast to Coast*, in partnership with *Billboard Magazine*, was launched on 3 July 1970, a Friday night, at 7:00 P.M., by KDEO in El Cajon, a suburb of San Diego.

In order to increase its exposure, *AT40's* creators bartered with stations; for instance, they would provide a three-hour *AT40* program, and the station would receive airtime for two advertisements in exchange. However, in late 1971 Rounds decided to begin selling *AT40* for varying amounts depending on the size of the market. (The show lost approximately \$600,000 before it began to turn a profit.) In 1973 Kasem produced a special episode called "The Top 40 Disappearing Acts," a show based on one-hit wonders. This show highlighted his talent with human-interest storytelling and helped to put *AT40* on the map.

During the 1970s, musicians began to record much longer songs, which made the three-hour format difficult to maintain. So in 1978, *AT40* expanded to four hours, and Kasem intro-

duced two other signature features of the program. First, he would begin each program by playing the top three songs from the past week's countdown. This served as a teaser for the listening audience. Second, he would introduce the "long-distance dedication," *AT40's* most popular feature. On 26 August 1978, Kasem played Neil Diamond's "Desiree."

Kasem's work on the program was publicly recognized on 26 April 1981, when he received a star on Hollywood's Walk of Fame. His charm, storytelling ability, and embracing voice made *AT40* the most popular radio program in history, with an audience stretching from coast to coast. In 1988, he left *AT40* to begin *Casey's Top 40* for the Westwood One Radio Network, which he broadcast until March 1998, when he made a triumphant return to *AT40*. Kasem and Bustany bought the program, and revived it 38 months after it had been taken off the air.

Kasem's return to his countdown roots and the rebirth of his signature program seem to exemplify the phrase with which he ended each program: "Keep your feet on the ground and keep reaching for the stars."

KCBS/KQW

San Jose, California (Later San Francisco) Station

KQW, San Jose, was one of the pioneering radio stations in the United States, the eighth to receive a Department of Commerce license, which was granted on 9 December 1921. But the major significance of KQW was that its owner, Charles Herrold, was the first person to operate a broadcast station. And although being one of the earliest stations to go on the air is important, it is the story of how Herrold got there, beginning in 1909, that makes KQW important. Today KQW is the 50,000-watt all-news KCBS in San Francisco.

Charles Herrold, after dropping out of Stanford University in 1899 and spending a decade as a freelance inventor and college instructor, decided to go into business for himself. He borrowed money from his father and in 1909 opened the Herrold College of Wireless and Engineering in a downtown San Jose bank building. The purpose of the college was to prepare young men for what was becoming a lucrative profession: wireless operator. Herrold also had a vision of inventing a new technology for a radiotelephone. Wireless was primarily Morse code based, but several inventors were just beginning to find ways to make the wireless talk. Herrold had invented and patented a system based on an oscillating DC arc, a device with its roots in the bright arc lighting of the day. His patents were for a water-cooled carbon microphone, an array of arcs burning under liquid, and a unique antenna system.

Between 1912 and 1917 Herrold, his wife Sybil, and his assistants and students at the school began a broadcasting station, regular in schedule and announced in the newspapers, with programming consisting of phonograph music and news read from the local papers. It was new, it was popular, it attracted students to the college, and it allowed Herrold to have audio content for his radiotelephone inventing. Prior to 1912, the students on the air identified the station by saying, "This is the Herrold college station broadcasting from the Garden City bank in San Jose." Later, Herrold used the call sign FN, and in 1916 he received an experimental radiotelephone license, 6XE. The evidence indicates that Herrold's small audi-

ences began to look forward to the broadcasts, and he would have continued them were it not for the United States' entry into World War I. In April 1917, all amateurs and experimenters were ordered to cease all radio activities.

When the ban on radio activity was lifted in 1919, the arc technology once used successfully by Herrold was obsolete. So in 1919, Herrold opened a store in San Jose and built radios as a source of income. He wanted to return to the air and broadcast as before, but he lacked money for the equipment. By December 1921, Herrold had applied for and received a license as KQW, and a new transmitter using vacuum tubes was put on the air.

Like many broadcasters in the early 1920s, Herrold did not have a way to support his station. Advertising was in its infancy, and local stations had to share dial space, making it difficult for listeners to separate stations amid the interference. Many stations were sold or just went off the air, their operators giving up. In 1925 Herrold turned over his KQW license to the First Baptist Church of San Jose. In exchange for the license, the church agreed to retain and pay Herrold as its chief engineer. After a year, his contract apparently up, the church, citing financial problems of its own, fired Herrold. A headline in the San Jose paper read, "Father of Broadcasting Fired!"

In 1926 Fred Hart approached the church and offered to run KQW and make a profit with agricultural programming. In return, Hart promised the Baptists that KQW would air their Sunday morning services. The station made money as an agricultural news outlet, and Hart soon bought the station. By the end of the 1920s, broadcasting was a fully formed business, but Fred Hart still had his eye on the historical significance of his station. Contacting Charles Herrold, then a freelance sales representative for several Bay Area stations, Hart asked Herrold to try to resurrect some of the early 1909 to 1917 history and bring in materials and photos of the early station, and a promotion was developed around this information.

In 1934 Hart sold KQW to Ralph Burton and Charles McCarthy of San Francisco, and its power was soon raised to 5,000 watts. In 1942 KQW began its affiliation with the Columbia Broadcasting System (CBS). The main studios were moved to the Palace Hotel in San Francisco, although legally KQW was still licensed to San Jose, so its transmitter had to remain there. KQW was an important station during World War II, acting as a relay for shortwave transmissions for the Pacific Coast, along with airing well-known CBS network personalities. In 1945 KQW attempted one final time to publicize its pioneer history. An engineer was sent with a disc recorder to the local rest home where the aging Charles Herrold was spending his final days. A one-hour historical documentary was written, produced, and aired, with Herrold's recorded voice used at the end of the show. The actor hired to portray Herrold was Jack Webb.

After the end of World War II, KQW and CBS fought a long Federal Communications Commission battle with another station over the rights to relocate to 740 kilohertz and to increase power to 50,000 watts. In 1949 the call letters were changed from KQW to KCBS, and the transmitter was relicensed and legally moved to San Francisco; a 50,000-watt transmitter went into operation in 1951. Throughout the 1950s KCBS operated as a "full-service" station, airing a combination of news, personality, music, and CBS network offerings.

It was not until the late 1950s that CBS rediscovered that KCBS might have some status as a pioneer station. Research leading to this celebration began in 1958, when San Jose State University professor Gordon Greb discovered the Herrold history in a private local museum. The curator had pieces of the early Herrold arc transmitter technology and strong evidence that the long-forgotten broadcasts took place. Greb located the still-living witnesses to the events, including Herrold's first wife and son and former students and teachers at the Herrold school. Greb located a collection of Herrold correspondence, patents, and photographs from the important pre-1920 period. In 1959, 50 years after Herrold's 1909 beginning, a "50th Anniversary of Broadcasting" was staged by KCBS and San Jose State University's journalism department. A Herrold arc transmitter was reassembled from parts found in a local museum, and dignitaries and personalities from CBS in New York were brought to San Jose, where dinners and a parade highlighted a week of celebration. Several historical audio documentaries were aired, and a congressional resolution pro-

claiming KCBS the first radio station was read into the public record in Washington, D.C.

Then the most important event in the Herrold/KQW/KCBS story took place: the publication in 1959 of Greb's article in the *Journal of Broadcasting*. This story of Charles Herrold not only became the scholarly basis for the KCBS claim but also provided the historical community with evidence of Herrold's work, which has found its way into subsequent broadcast history texts.

What about the KCBS claim of "first station?" The most significant study on first broadcaster claims was published in the *Journal of Broadcasting* in 1977. In a study of four claimants by two respected historians, it was determined that KDKA in Pittsburgh could claim the title of "oldest station," because that station began on the air in 1920 and has continued, uninterrupted, to broadcast up until the present. KCBS, because of the lapse between when Herrold left the air during World War I and his return as KQW in 1921, was deemed not to be the oldest, but it could legitimately claim to be the "first station." In an ironic twist, the two large station owners, Westinghouse with KDKA and CBS with KCBS, who battled for years in the court of public opinion for the title of first broadcaster, are today owned by the same company—Viacom.

KCMO

Kansas City, Missouri Station

KKCMO-AM is known both regionally and nationally for two reasons: (1) it was once a high-power, 50,000 watt station that could be received across a large portion of the Midwest; and (2) because the station once employed Walter Cronkite, who has mentioned it often in discussing his early career. Originally based in Kansas City, Missouri, its studios are now located in a nearby Kansas suburb. It now operates on 10,000 watts during the day and 5,000 watts at night.

The KCMO call was first used in 1936 for a station formerly known as KWKC (which had been on the air since the 1920s) that was taken over by investors Lester E. Cox and Thomas L. Evans. By the mid-1930s, the station suffered from low power (100 watts) and no network affiliation.

Walter Cronkite, who worked for the station at that time, recalled in his biography that KCMO did not subscribe to a news wire. Cronkite, who was assigned the air name “Walter Wilcox” while at KCMO, recalls announcing sports play by play (from Western Union telegraph wire dispatches), covering news, and eventually leaving the station (but not before meeting his wife-to-be Betsy Maxwell, another station employee) when he had a dispute with management over how to react to reports of a fire at City Hall. Cronkite’s version of the story is that he wanted to verify the seriousness of the fire—which turned out to be minor—with the fire department, but the station’s program manager wanted to go on the air with false reports of people jumping from the building. Cronkite says that he was fired for “daring to question management’s authority” and that his KCMO experience “cooled any thought I had that radio might be an interesting medium in which to practice journalism” (*A Reporter’s Life*, 1996).

KCMO made major advances in solving its coverage problems by increasing to 1,000 watts in 1939 (the same year it

received National Broadcasting Company [NBC] network affiliation), to 5,000 watts in 1940, and to 50,000 watts (daytime, with reduced power at night) in 1947, at which time it was assigned the frequency of 810 AM, which it occupied until the late 1990s.

The station’s most stable period (and its longest continuity of ownership) began not in the golden age of radio, but as radio was being surpassed by television in 1953, when the Meredith Corporation purchased KCMO at a cost of \$2 million. Under Meredith, the station heavily promoted the range and quality of signal that its 50,000 watts gave it, allowing it to reach listeners across western Missouri, much of Kansas, and parts of Iowa and Nebraska. Despite its strong daytime signal, however, its reduced power and especially its directional pattern at night often resulted in poor reception after dark in the Kansas suburbs.

Under Meredith, the station built a strong news department, and from the 1950s through the 1970s KCMO offered popular and country music formats (at one time referring to its air sound as a combination of the two). After serious losses in ratings in the late 1970s, Meredith invested heavily in a news format in 1980, at one point employing well over a dozen people in news-related capacities alone. The hoped-for surge in audience never came, however, and the news format evolved to a less expensive talk format, which also failed to move the station to a dominant position in the market. In 1983 Meredith sold KCMO to Fairbanks Communications, beginning a string of ownership changes with subsequent sales to Summit (1983), Gannett (1986), Bonneville (1993), Entercom (1997), and Susquehanna (2000).

MARK POINDEXTER

KDKA

Pittsburgh, Pennsylvania Station

KKDKA in Pittsburgh began operation in 1920 and is often called the oldest regular broadcast station in the United States. The station, still owned by Westinghouse (now merged with Columbia Broadcasting System [CBS]), pioneered in many

areas during its initial years on the air. Within months of its debut, the station broadcast the first regularly scheduled church services; the first program broadcast from a theater; the first on-air appearance by a Cabinet member (the Secretary of

War); and the first sporting event, a 10-round boxing match, soon followed by regularly broadcast baseball scores. KDKA developed the first orchestra exclusively used on radio, another precedent soon adopted by many other stations. The station had by then hired the first full-time radio announcer, Harold W. Arlin, a Westinghouse engineer. And a regular farm program was begun in mid 1921.

Westinghouse experimented with different means of extending and improving KDKA's signal. A shortwave station, KFKX, was placed on the air in Hastings, Nebraska, in 1923 and another followed in Pittsburgh. These and others lasted into World War II, eventually under government operation. They were one means of providing KDKA's "Far North Service" that sent the sounds of home to explorers and pioneers in northern Canada in the 1920s and early 1930s, often their only connection with the outside world.

Origins

KDKA radio began as experimental radio station 8XK in the Wilkesburg, Pennsylvania, garage of Frank Conrad, an electrical engineer employed by the Westinghouse Corporation's East Pittsburgh plant. Conrad's experimental station was established as a point-to-point operation to test radio equipment manufactured by Westinghouse for U.S. military use in World War I. In 1919 the U.S. government canceled Westinghouse's remaining military contracts and the corporation was facing idle factories. Conrad was among the first to put his 8XK back on the air as an amateur radio telephone station and in contact with ham (amateur) radio operators. Conrad's main concerns were with the quality of his signal and the distance it would travel. He would read from newspapers and then await reports from listening posts commenting on the quality of the reception.

The people operating the listening posts soon tired of hearing news they had already seen in the newspapers and they grew weary of hearing Conrad's voice. One of them suggested that Conrad play a phonograph record. Conrad did so and soon the Westinghouse headquarters received a flood of mail requesting newer music and specific song titles. Frank Conrad had become the world's first disc jockey.

The news of Conrad's airborne music reached a department manager at Pittsburgh's Joseph Horne Department Store, who realized that people who wanted to listen to Conrad might want to purchase assembled radios. An ad was placed in the *Pittsburgh Sun's* 29 September 1920 issue, featuring wireless sets for \$10.00. That ad was seen by Harry P. Davis, a Westinghouse vice president who realized that a vast potential market could be developed for home wireless sets and that Westinghouse already had the ideal product: the SCR-70, a radio receiver made for the U.S. military in the recently concluded world war.

Decisions were made to move Conrad's station to the roof of the East Pittsburgh plant's administration building, to install a stronger transmitter, and to redesign the station for public entertainment. All was to be ready by early November 1920, a presidential election year. On 2 November, the Harding-Cox election results were broadcast by KDKA, the newly assigned call letters on its Department of Commerce license. The success of KDKA was rapidly assured, and soon many newspapers across the country were publishing the station's program schedule (usually an hour of music and talk in the evening).

According to Baudino and Kittross (1977), KDKA is the oldest U.S. station still in operation, as reckoned by the following standards: KDKA (1) used radio waves (2) to send out non-coded signals (3) in a continuous, scheduled program service (4) intended for the general public and (5) was licensed by the government to provide such a service.

Later Developments

The station's frequency shifted several times in the 1920s, between 950 and 980 kilohertz, and one final time in March 1941 (due to the North American Regional Broadcasting Agreement) to 1020 kilohertz, which it still uses. KDKA became a 50,000-watt clear channel operation by the late 1920s. In 1933, Westinghouse turned over daily management of KDKA and its other radio stations to the National Broadcasting Company (NBC) network, an arrangement that lasted until 1940.

Beginning in 1927, engineers experimented with FM transmission, using that mode for KDKA signals several hours a day. A Westinghouse commercial FM outlet was on the air in Pittsburgh by April 1942, initially programmed separately but simulcasting the AM outlet by 1948. Likewise, KDKA personnel experimented with a crude system of television in the late 1920s. However, a regular television operation appeared only when Westinghouse purchased DuMont's Channel 2 (then the only television station in Pittsburgh), dubbing it KDKA-TV, in January 1955.

As it did to most other stations, the decline of network programming brought hard times to KDKA for several years as management attempted a host of middle-of-the-road format ideas in the struggle to maintain listener loyalty, a challenge shared by other major market stations. In 1954 disc jockey Rege Cordic was hired from competing station WWSW and his huge morning drive-time popularity (in part because of his zany characters and fake commercials) helped propel KDKA up the ratings ladder over the next decade, until he left for Los Angeles. A decision in 1955 to resume broadcasts of Pittsburgh Pirates baseball games also contributed to KDKA's renewed popularity. Station newscasts expanded from several years of rip-and-read wire service-based summaries to a full news staff with substantial local presence.

The station celebrated its half-century anniversary in 1970 with considerable promotion and again laying claim to being the oldest radio station in the country. At that time it was the ratings leader in its market, reaching 50 percent more homes than its nearest competitor. In July 1982 KDKA became one of the first AM outlets to provide stereo service. A decade later the station switched from its long-time "full service" or "middle of the road" programming to take on a news/talk format that continued into the new century.

Keillor, Garrison 1942–

U.S. Radio Humorist

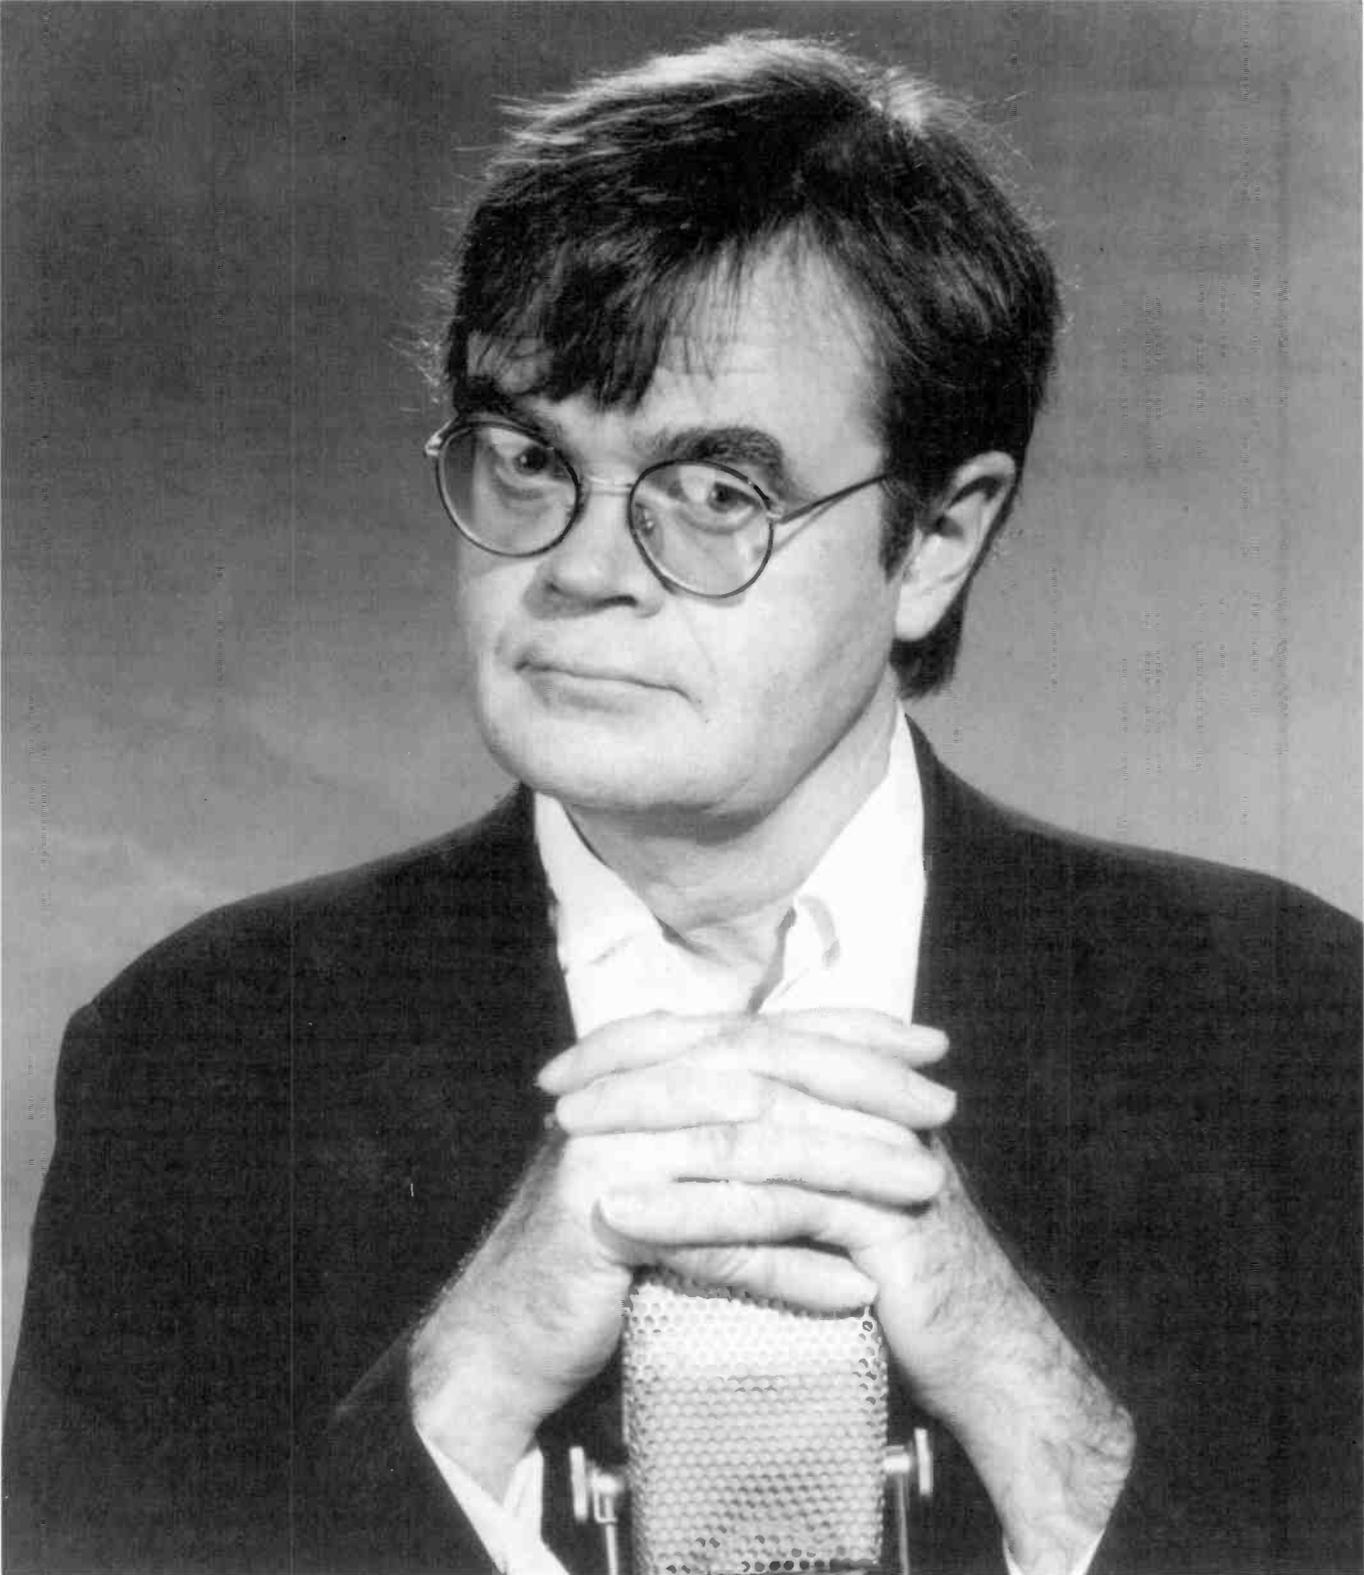

Garrison Keillor is a public radio personality and writer best known for his variety program *A Prairie Home Companion*, which is produced live on Saturday evenings by Minnesota Public Radio (MPR) and distributed by Public Radio International (PRI). The program features a weekly monologue from Lake Wobegon, Keillor's fictitious hometown, where "all the women are strong, all the men are good looking, and all the children are above average." Keillor's main contribution to modern radio was to reintroduce the variety-show format. A *Time* magazine cover story called Keillor "a radio bard" and noted that his "storytelling approaches the quality of Mark Twain's."

Keillor was raised Gary Edward Keillor in a rural area eight miles outside of his hometown of Anoka, Minnesota. His family belonged to a conservative religious sect called the Plymouth Brethren, which shunned television and motion pictures but found enjoyment in a "strictly monitored" Zenith radio set. Keillor's early radio idol was Cedric Adams, star of Minneapolis Columbia Broadcasting System (CBS) station WCCO, which also carried variety shows such as *The Red River Valley Gang* and *The Murphy Barn Dance*. As a boy, Keillor would also pull in clear channel radio station signals carrying exotic rhythm and blues from far-away cities. At age 14 he discovered *The New Yorker* and dreamed of being a literary figure. In

1966 he graduated with a BA in English from the University of Minnesota, where he performed on radio station KUOM and edited the campus literary magazine.

He went to work for Minnesota Public Radio in 1969 at KSJR in the central Minnesota town of Collegeville. There he developed a three-hour morning program that evolved from classical music into an eclectic mix of musical styles that included folk, rock, and bluegrass. It was on this show that Keillor began referring on the air to the fictitious town of "Lake Wobegon." He published his first *New Yorker* fiction piece in 1970. Entitled "Local Family Keeps Son Happy," it was a short parody of small-town journalism about parents who hire a live-in prostitute to keep their teenager off the streets at night. Keillor quit radio in 1971 to concentrate on writing, but after six months he joined the staff at KSJN, MPR's St. Paul flagship station. In 1973 he again quit in order to write full-time.

During the summer of 1973, Keillor spent time listening to tapes of his boyhood WCCO radio favorites, including *The Red River Valley Gang*, which featured a regular monologue about the banjo player's visits to an uncle in North Dakota. That summer he also listened to tapes of Gene Autry programs from the "Melody Ranch" studio and to recordings of Smilin' Ed McConnell's vintage radio program, which also featured a

Garrison Keillor
Courtesy Radio Hall of Fame

story in the middle of the broadcast. When he returned to KSJN in 1974, Keillor called his morning program *A Prairie Home Companion*, its name taken from the Prairie Home cemetery in Moorhead, Minnesota. In April of 1974 he traveled to Nashville to cover the *Grand Ole Opry*'s last broadcast from the old Ryman Auditorium for *The New Yorker*. During and shortly after this trip, an idea crystallized in his mind. Keillor pitched to MPR his concept for a weekly, live, old-fashioned musical variety show revolving around a monologue about Lake Wobegon. On 6 July 1974 he hosted the first broadcast of the program, which, like his KSJN morning show, was called *A Prairie Home Companion*.

Despite the growing popularity of the program, National Public Radio (NPR) declined to distribute the show nationally because it felt the show was too regional, contributing to Minnesota Public Radio's decision to set up its own network, American Public Radio (APR; today called Public Radio International). National syndication on APR began in May 1980. The program won the George Foster Peabody Award for broadcast excellence in 1981. In 1985 Keillor married Ulla Skaerved, who had been a Danish exchange student at Anoka High School and with whom Keillor became reacquainted at their 25th class reunion. Two years later, as the Twin Cities newspapers ran front-page coverage of what Keillor considered his private affairs, he abandoned *A Prairie Home Companion* and moved to Denmark, and later New York. In 1989 he began a new radio show in New York called *The American Radio Company of the Air*, which was similar in format to his earlier program. In 1992 he moved the program's production site to St. Paul, and in 1993 he reclaimed the concept and the title of *A Prairie Home Companion*, which at the beginning of 2003 was heard by some 5 million listeners weekly on more than 450 public radio stations. Keillor continues to publish works of fiction and keeps a rural Wisconsin home outside of the Twin Cities, as well as a residence in New York City.

Kent, A. Atwater 1873–1949

U.S. Radio Inventor and Manufacturer

From 1921 to 1935 A. Atwater Kent's company was one of the most important U.S. manufacturers of radio receivers.

Early Years

Born in New England of an upper-middle-class family, A. Atwater Kent (he never used his first name) attended the private Wooster Polytechnic Institute from 1895 to 1897 but left before graduating to enter business. (Three decades later, he was awarded an honorary doctorate by the institution, whose laboratory he endowed in his will.) His father had been a part-time inventor and machinist before becoming a doctor, and his handiwork may have been the son's first exposure to mechanical devices. Kent's first foray into the working world came with the Kent Electric Manufacturing Company, which he formed in about 1895, with financial support from his father, and which made small electric motors, fans, and even "Amperia," a battery-powered electrical game. Although this foretold his future, it may not have been financially successful, because in about 1900 he sold his firm to Kendrick and Davis of Lebanon, New Hampshire, and briefly worked for that company.

The central part of his career came with his formation of the Atwater Kent Manufacturing Works in downtown Philadelphia in 1902. The new company made telephones, small voltmeters, and other small electrical devices. Three years later the product line was expanded to include automobile devices, including the 1906 Kent-invented spark generator ignition system, later dubbed the "Unisparker," that remained widely used into the 1970s. By the end of his life, Kent would hold 93 patents granted from 1901 to 1943.

During World War I the Kent company, by now located on Stenton Avenue in Germantown just north of center-city Philadelphia, manufactured military equipment for the U.S. Army, including a panoramic gun sight, fuse-setting equipment, a gun-training (aiming) theodolite, and a device to precisely incline a rifle. Using his trained staff, which in 1919 numbered about 125, and the manufacturing facilities developed during the war (which after wartime contracts were completed or terminated would otherwise become largely redundant), Kent's company joined the postwar bandwagon to radio receiver manufacturing. Though other firms were also entering the radio market, Kent's company enjoyed the benefits of extensive manufacturing expertise and facilities as well as an existing chain of dealerships for his automobile and electrical devices.

Radio Years

The Atwater Kent firm began selling radio receiver components in late 1921, trading on its reputation and network of dealers. Just a year later Atwater Kent radio advertising depicted fully assembled receivers in response to the growing demand for sets. The several initial models were dubbed "breadboards" because they lacked an external case and arranged their components along a wooden base. Over several years more than 120,000 steadily improved breadboard models were sold. Though successful, the radio market was changing and demanded furniture-like devices rather than experimental-looking breadboards. The company needed more space and was unable to expand in Germantown, so a new 20-acre site on Wissahickon Avenue was purchased and a

Atwater Kent, 24 November 1942
Courtesy AP/Wide World Photos

new factory begun, the first part of which began turning out radios in 1923.

The first fully enclosed Atwater Kent receivers, the Model 20, appeared in April 1924. By the end of 1926 the company had manufactured 1 million radio receivers and was making them at the rate of more than 5,000 a day, or 11 sets per minute. The factory had been enlarged twice so that the roof covered 15 acres, a feature often noted in company advertising featuring the plant. By then virtually all radios were offering single-dial tuning, which was far easier to operate than the multiple dials required before. By late 1927 the company offered metal-encased AC-powered receivers that plugged into a wall socket, dispensing with heavy and messy batteries. The trend to ever-bigger and fancier radios worked well through the late 1920s. A 16.5-acre addition to the manufacturing plant opened in 1929; together all the buildings presented a half-mile frontage on Wissahickon Avenue.

The Atwater Kent company sponsored the popular *Atwater Kent Hour* of concert and opera music, which first aired in 1925 on New York station WEAJ and its hookup of stations. The program was continued on the new National Broadcasting Company (NBC) network from 1926 to 1931 and again briefly as a half-hour program on the Columbia Broadcasting System (CBS) in the fall of 1934. As a pioneering radio manufacturer, Kent was one of several hundred delegates to the 1924 and 1925 National Radio Conferences called by Secretary of Commerce Herbert Hoover, which called for a stronger governmental role in the licensing of stations.

The coming of the Great Depression in 1929 brought tighter competition from a number of small-radio manufacturers seeking to meet growing demand for less-expensive receivers. But the Atwater Kent firm had moved to manufacturing larger console radio models with higher profit margins—a classic case of poor timing. Atwater Kent models only belatedly met the demand for smaller sets as factory production peaked in about 1931. From that point on, however, production slipped, and little new research or improvement on receiver models took place. Parts of the newly enlarged factory lay idle. The added competition and lower profit margins from smaller receivers caused Kent to lose interest in the business.

Final Years

The company ceased operations in 1936, and Kent destroyed the firm's remaining records. Through his foundation he endowed the Atwater Kent Museum (1938), which focuses on social history and everyday life in Philadelphia, and purchased and refurbished the Betsy Ross Home in the same city. Kent retired to Hollywood, California, and lived a lavish retirement until his death there in 1949. An Atwater Kent Manufacturing Company (Wilmington, Delaware) still exists; now an investment entity, it is controlled by the family and retains some family papers.

Kesten, Paul 1898–1956

U.S. Radio Network Executive

Paul Kesten served as a key Columbia Broadcasting System (CBS) executive who helped to shape the network through the end of World War II. Before retiring because of ill health, he was the likeliest heir-apparent to network chief William Paley, having run CBS during the latter's wartime service.

Early Years

Born in Milwaukee in 1898, Kesten was the son of George Henry Kesten (a pharmacist and optometrist) and Lucy (Davies) Kesten. He attended high school in Milwaukee and briefly attended but did not graduate from the University of Wisconsin, Madison. He joined the U.S. Marine Corps in 1918 but was released a few months later at the war's conclusion.

For the next dozen years, he held a number of advertising positions, first in Milwaukee, then Chicago, and finally New York. He began as the assistant advertising manager for the Gimbel's Department Store in Milwaukee late in 1918, becoming manager in 1919. The next year he moved to the McJunkin Advertising Agency in Milwaukee and remained there as vice president and advertising manager until 1922. He returned to the retail clothing business as vice president and advertising manager for Foreman and Clark, a clothing store chain, for four years. In 1926–27, he took a year off and studied abroad at the Sorbonne, Oxford, and Heidelberg, among other places, before returning to Foreman and Clark. Kesten moved to New York as a copywriter for the Lennon and Mitchell agency in 1929.

Radio and CBS

Kesten moved into radio when Edward Klauber of CBS hired him as the first director of sales promotion for the network in 1930. As network founder William Paley later noted, Kesten “just bubbled from the start with ideas and strategies for promoting the network.” But perhaps more important—and a key to Kesten's rapid career growth from that point—was how closely he “clicked” with the boss. Paley relates:

Kesten and I were so compatible that we understood each other in a kind of mental shorthand. We could cover a lot of ground in a few minutes of conversation. We saw eye to eye from the start on the importance of design and good taste. In those early days it was necessary to persuade some advertisers about what was tasteful and effective in the spoken advertisement on radio. Kesten had a feeling for elegance and taste along with a

touch of majesty, with which he presented the image of CBS to certain advertisers. We proved to be able to work together as a unique and effective team (Paley, 1979).

Kesten's interest in fine arts, literature, and the theater paralleled Paley's and contributed to their good working relationship—and to Kesten's work for the network. This is especially evident, even today, in the host of research and promotion publications issued by the network, nearly all under Kesten's direct supervision, in the early 1930s. Each assessed some aspect of radio and featured CBS. They were handsomely designed and printed efforts—many in hardcover formats—far above the normal throwaway material issued by most companies of the time. Some featured strikingly handsome art deco photography and multicolor graphics. Most of them dealt with aspects of radio's audience and how that audience might best be reached (through CBS, of course) by advertisers. To many, Kesten was the father of the network's image.

Kesten also made his mark in his decisions to hire others. In 1935 he brought on Frank Stanton to work on audience research (Stanton would eventually succeed him as senior network officer under Paley in 1946), and he hired engineer Peter Goldmark in 1936. Encouraging the work of the latter, Kesten committed CBS to a strong television developmental effort. By 1940 he strongly backed Goldmark's system of semi-mechanical color transmission, which was designed to operate on UHF frequencies. Kesten was soon dubbed the “vice president in charge of the future” around CBS headquarters. Kesten persuaded Paley to bet much of the network's future on Goldmark's color system, a decision that would cost CBS heavily by the early 1950s, long after Kesten had left, when the network belatedly had to develop its own stations and operations in black and white.

As Kesten rose in the hierarchy of the expanding network—becoming a network vice president in 1934 and a member of the board of directors three years later—he increasingly clashed with his chief rival, ironically the man who had originally hired him, Edward Klauber. Men of very different character and personalities, both were featured as key network executives in a warm *Fortune* essay in the middle of the decade.

For a variety of reasons, chief among them Klauber's difficult personality, Kesten won out in 1942, becoming general manager of the network when his senior colleague left in 1942. For all practical purposes, Kesten was already running CBS when Paley left for war work in Europe. Kesten became executive vice president and chief executive officer for two

years in Paley's absence, 1943–45. At the same time, he served as a director of the National Association of Broadcasters (1942–44) representing CBS and as director of the War Advertising Council. Kesten was one of the industry's leading figures.

Final Years

During this period, he formed firm ideas about how best to develop CBS in the face of fierce competition from the National Broadcasting Company (NBC). On Paley's return in 1945, Kesten gave him a 15-page design for the network's future, arguing that CBS should concentrate on educated and cultivated listeners rather than on mass-appeal programs. He felt strongly that the network should play up what both Kesten and Paley had often discussed before the war—radio's proven ability to bring culture and elite-appeal programs into discerning homes. For perhaps the first time in their working relationship, Paley was appalled. He saw Kesten's plan as a surrender to NBC's hegemony, and he was having none of it. In many discussions, the two sharply disagreed over the future direction of the network.

Yet at the same time, Paley could see what Kesten had done for CBS. And being unsure of his own future plans, Paley offered Kesten a continuing top role, essentially working as in partnership. He was genuinely shocked when Kesten turned him down, first in 1945 and more finally a year later. Pleading ill health (Kesten had suffered serious arthritis for years), but also no longer comfortable working for Paley, both because of their divergent visions of CBS's future and because of Paley's increasingly autocratic ways, Kesten moved up to be vice chairman of the CBS board before his final retirement from the network in August 1946.

Kesten lived for another decade, but he played no further role in broadcasting save for occasional consulting work with CBS. He became vice chairman of the fledgling company Cinerama, working to develop a wide-screen system for theatrical films. Foreseeing television's impact on motion pictures, he worked to help the film industry develop one of the means of holding audiences in the face of the electronic box in the living room. He married late in life and spent more time on the arts

that he had always enjoyed. But his health continued to deteriorate, and he died at age 58 in late 1956.

KFFA

Helena, Arkansas Station

Starting in the 1940s, KFFA played an important role in disseminating blues music to black listeners throughout the upper Mississippi Delta region of the mid-South. The primary showcase for the station's blues offerings was the *King Biscuit Time*, a program that gave valuable exposure to blues performers and that inspired various young black listeners to pursue careers in blues music. The station's black-appeal programming also served as an example to other stations in the region that would later target the black audience.

Sam W. Anderson, a former superintendent of schools in Dyess, Arkansas, conceived the idea of establishing KFFA and recruited John Thomas Franklin and J.Q. Floyd to join him in the investment. Operating as the Helena Broadcasting Company, the men put the station on the air on 19 November 1941. Within a few months, KFFA was carrying a regularly scheduled blues music program.

At the time of KFFA's inception, blacks in the Mississippi Delta region had begun enjoying a measure of increased prosperity, in part because wage labor in farming had replaced the sharecropping system. As a result, businesses had begun marketing more frequently to blacks. Max Moore, who distributed flour through his Interstate Grocer Company, was seeking to market a high-quality flour to blacks and approached KFFA about sponsoring a program that would reach his target population. The new station, ready to try anything that might succeed, inaugurated *King Biscuit Time*, which aired blues music from 12:15 to 12:30 P.M. Monday through Friday. Named for Moore's high-grade flour, the show featured bluesman Rice Miller (also known as Sonny Boy Williamson II), a harmonica player who attracted a large number of listeners who, in turn, began to spend their dollars on the sponsor's product. The show became so popular that Moore began marketing to blacks a cornmeal dubbed "Sonny Boy Meal" after *King Biscuit Time*'s star.

Although KFFA and Max Moore paid Rice Miller very little, the musician could advertise his gigs, which helped fill the venues he played. Club owners, therefore, were more likely to book Miller and to pay him more because of his radio-fueled prominence. Shortly after *King Biscuit Time* debuted, Miller, who had initially performed solo, began recruiting a band for the broadcast. First came Robert Lockwood Jr. on guitar, and then James "Peck" Curtis on drums and Robert "Dudlow" Taylor on piano. Exposure on KFFA helped promote these men's careers. Furthermore, throughout the 1940s and 1950s bluesmen such as Muddy Waters, Little Walter Jacobs, Houston Stackhouse, Robert Nighthawk, Joe Willie "Pintop" Perkins, and Willie Love appeared on KFFA, reaching audiences

that otherwise would never have heard their music; each would go on to enjoy influential careers in the world of blues music.

As KFFA became an important amplifier for blues music in the 1940s, it was inevitable that aspiring blues performers would be influenced by the music and musicians they heard on the station. James Cotton, a well-known harmonica player, was so inspired by the sounds he heard as a child on *King Biscuit Time* that he traveled to Helena to learn from Rice Miller. America's foremost blues performer, B.B. King, also paid close attention to the sounds of *King Biscuit Time* during his boyhood in the Mississippi Delta. "We'd come in from the fields for our noon meal and relax by listening to Sonny Boy," wrote King in his 1996 autobiography. "He had him some famous songs like 'Fattening Frogs for Snakes,' but nothing made him as famous as this show, sponsored by King Biscuit Flour. I'd been listening to it so long, I felt like I knew Sonny Boy personally."

In the immediate wake of *King Biscuit Time*'s burgeoning success, other blues music shows joined the KFFA schedule as advertisers saw the value of reaching the black audience. By the mid-1950s, more than 30 hours of KFFA's weekly programming was black oriented. The station's success with the black-appeal programming that began in the early 1940s served as a significant model for other stations. The station helped fuel a small groundswell of black-oriented programming in the mid-South and was a major impetus in the rapidly growing number of black voices that actually appeared behind the microphones on mid-South radio in the 1940s. The growth of black-oriented programming on mid-South stations like KFFA culminated in the all-black format that debuted on Memphis radio station WDIA in 1949. Just as KFFA promoted the dissemination of blues music, it also promoted black-appeal programming.

Except for a few years in the 1980s, KFFA's *King Biscuit Time* has continued to broadcast on weekdays around noon-time, but now disc jockey Sonny Payne provides the music. Payne, who was working at KFFA on the day Rice Miller debuted on *King Biscuit Time*, has carried on the blues tradition at the station, featuring plenty of Rice Miller's recordings and helping to coordinate Helena's annual King Biscuit Blues Festival. KFFA is currently owned by Delta Broadcasting, which bought the station from the Helena Broadcasting Company in 1980.

KFI

Los Angeles, California Station

KFI radio was one of three Los Angeles radio stations to emerge from 1922's early broadcasting confusion and survives today as one of the top radio stations in the United States.

Origins

The story of KFI begins with California's leading Packard automobile distributor, Earle C. Anthony. He became one of the most important early radio station owners, not only on the West coast, but also in the entire nation. An article in the *Saturday Evening Post* gave Anthony the idea to use radio to communicate between his Packard auto dealerships. He built a 50-watt transmitter on his kitchen table and on 16 April 1922 began broadcasting in Los Angeles as KFI radio.

The KFI studios were on the roof of his Packard dealership at 1000 South Hope Street, at the corner of 10th (now Olympic) and Hope in downtown Los Angeles. The station started out with only two employees, who put the station on for a few hours per day. They would then take KFI off the air for a dinner break and return to the air for the evening program. One man booked talent for programs, announced them on the air, played musical accompaniments, and, when necessary, filled in program gaps with music. The other man's job was to take care of the technical aspects of putting the programs on the air. In 1923 KFI presented the "June Bride Contest of 1923." The winner had her wedding broadcast over KFI. The bride and groom also received \$1000 worth of electrical appliances (a tidy sum in those days).

With radio becoming the new national fad, KFI did its part to help new listeners. People who bought a crystal set or a more complicated radio could call KFI for help. The station would then send out a technician to help them set up their radio and antenna. KFI is also one of four stations that claim to have used musical chimes between programs before the National Broadcasting Company (NBC) began using them. The chimes were also used when KFI signed on the air each evening in the early 1920s. By the time KFI celebrated its fourth anniversary in 1926, the station boasted a staff of 20 people in the program, technical, and office departments.

Anthony soon realized that KFI could attract new customers into his car dealership. Programs were carefully tailored to the tastes of listeners that Anthony believed would buy Packards. High-class musical and educational programs were featured. The Los Angeles *Herald* and *Examiner* newspapers cooperated with KFI to provide news coverage in the early years. To promote both the station and his car business further, Anthony made sure that the station identification announcements always included the words "This is KFI, Los Angeles. The Radio Central Super Station of Earle C. Anthony, Incorporated, California Packard Distributors." The words "KFI-PACKARD" were also placed on the transmitter towers atop the Packard dealership to keep KFI radio in the public's mind as they traveled through that section of Los Angeles. Program listings in magazines and newspapers during the mid-1920s show that Anthony advertised Packard cars on KFI through such programs as the *Packard Six Orchestra*, *Packard Ballad Hour*, and *Packard Radio Club*.

Development

KFI soon initiated a policy of cooperating with schools, government agencies, and civic groups. In 1924 the first broadcast of a symphony orchestra in the West was presented over KFI; it also sponsored the first remote broadcast of a complete opera from the stage. That same year the first West coast network was set up when KFI exchanged programs with KPO in San Francisco. Over 500 miles of telephone lines connected the two stations. Another "first" was a broadcast of the Hollywood Bowl Summer Concert Season. As the station gained a reputation for its good programming and public service, nearly every important person who visited Southern California made it a point to be heard over KFI's microphone. A mid-1920s favorite of KFI listeners was real-life detective Nick Harris, a forerunner of the "who-done-it" shows. Harris would tell stories proving the folly of committing crime. The Nick Harris program remained a KFI feature through the 1930s.

KFI started a steady growth in popularity and began increasing its output power: from 50 to 500 watts in early 1923, to 5,000 watts by 1927, and finally to 50,000 watts in 1931, all on 640 kHz (since May 1923). The station's signal had already been heard coast to coast on cold winter nights, and radio fans in England and Australia sent in letters in 1924 and 1925 reporting reception of KFI—this owing to occasional sky wave reception. In 1927 KFI supplied the remote equipment for NBC to provide the first national radio coverage of the Rose Bowl football game from Pasadena. KFI's slogan, "A National Institution," made sense when readers of *Radio Listeners Guide* magazine voted KFI as the only West coast station among the 10 most-popular radio stations in the United States. KFI's program schedule was listed regularly in the *New York Times* and other Eastern newspapers.

KFI had several talented announcers on its staff over the years, including two of the most popular men heard on network radio throughout the 1930s and 1940s. Don Wilson was KFI's chief announcer from 1929 to 1933. He later gained fame as Jack Benny's longtime announcer on radio and TV. Ken Carpenter also served as chief announcer at KFI, was later heard on many network radio shows, and was chiefly identified with Bing Crosby's *Kraft Music Hall*. Roger Krupp was another network announcer who did local work on KFI. Chet Huntley was a newscaster from 1937–39 at KFI, years before he became a household name on NBC television's *Huntley Brinkley Report* in the 1950s and 1960s.

As an original NBC affiliate, KFI brought music, comedy, and dramatic programs from New York and Hollywood into Southern California homes, along with the daytime soap operas. The long-time NBC favorites included shows such as Jack Benny, Burns and Allen, *Fibber McGee and Molly*, Fred Allen, Abbott and Costello, and many others. KFI continued to carry its share of local programming, such as *Packard Fiesta*

and *Great Moments in History*. One longtime KFI feature that started in 1938, *Art Baker's Notebook*, was heard on the station for two decades.

By December 1939 KFI (and co-owned station KECA) had grown so much that it moved to new studios and offices at 141 North Vermont Avenue. The building included the latest broadcasting equipment and a 250-seat theater for audiences to see local KFI shows on the air.

During World War II, KFI was the station Southern Californians tuned to each night at 10 P.M. to hear the latest war news from reporter John Wahl, sponsored by Richfield gasoline. The 15-minute newscast was followed by *Inside the News*, with Jose Rodriguez and Sid Sutherland and later John Burton. Because the area surrounding Los Angeles was mostly agricultural at the time, KFI presented daily farm news reports and had a full-time farm director. Farmers were also served by KFI with nightly fruit frost warnings in the winter, at 8 P.M. each night. These were heard on KFI into the early 1970s.

Postwar Development

In the 1950s KFI's all-night talk show, *Ben Hunter's Nite Owls*, became quite popular. During the 1960s the station changed from block programming to middle of the road music with local disc jockeys, local and NBC news on the hour, and Los Angeles Dodgers baseball. Later, morning personalities Al Lohman and Roger Barkley tickled listeners' funny bones on KFI from 1969 until 1986.

KFI founder Earle C. Anthony died in 1961. His corporation held the KFI license until the station was sold to Cox Broadcasting in 1973 for \$15.1 million. The music on KFI gradually changed to a more contemporary Top 40 format, with several air personalities over the years, including Dave Hull, Bob Hudson, Dave Diamond, and Sonny Melendrez. The station also moved from the more than 30 year old studios on Vermont to a new facility at 610 South Ardmore Avenue in late 1975.

Since the late 1980s KFI has turned from broadcasting music and become one of the most listened to talk radio stations in the United States, using the slogan "More Stimulating Talk Radio." KFI's program director, David G. Hall, is behind much of that success. The station has been the flagship for such talk hosts as Dr. Laura Schlessinger and Phil Hendrie. KFI also has an award-winning local news staff of 16, which has won many Golden Mike and Associated Press awards. As of early 2001, KFI was owned by Clear Channel Communications.

KGO

San Francisco, California Station

When West Coast residents first tuned to KGO on 8 January 1924, the station was an innovative business experiment. The General Electric Company (GE) wanted to sell radio sets by attracting consumers to the new medium. During the next 75 years, KGO would symbolize the powerful "key stations" of radio's golden age, develop and name a major new radio format, and be recognized as one of the nation's most successful radio stations.

Early Years

KGO's first studios and transmitter were built at a GE factory in Oakland. This mid-coast tower site reached listeners up and down the West Coast. Its power of 1,500 watts at 790 kHz made it one of the five most powerful stations in the nation. It switched to 810 kHz in 1941. KGO's first program schedule totaled six hours weekly: 8-10 P.M. on Tuesday, Thursday, and Saturday. Most radio shows of this era were produced live in the station's studios. San Francisco's enormous wealth of musical, dramatic, and educational talent provided the station with an unlimited supply of performers. Adding studios in the St. Francis Hotel in May 1924 encouraged participation by world famous touring artists.

When radio drama was born on the networks in the late 1920s, KGO reacted by producing local plays. The station employed a full-time dramatic director for the *KGO Players*, a weekly drama. These shows broke new ground by fully enhancing the spoken word with music and sound effects. Top orchestras and community events were also broadcast live. But as broadcast hours expanded, all programming could not remain local. In 1927 both KGO and KPO became San Francisco affiliates of the National Broadcasting Company (NBC).

KGO was affiliated with NBC's Red Network and KPO was affiliated with NBC's Blue Network. KPO later became KNBC, then KNBR.

A momentous turning point in KGO's history occurred in 1929, when NBC assumed management of the station, named it the key station for the Blue and Gold networks on the West Coast, and moved it into NBC's studios with KPO. This placed KGO in the creative environment where nationally broadcast network programs such as *One Man's Family* were being produced. (It was the first network radio serial to originate in San Francisco, became the longest-running serial drama in U.S. radio history, and paralleled the golden age of radio from 1932 to 1959.)

In 1942 NBC, KGO, and KPO moved to a \$1 million state-of-the-art studio then called the most perfect plant of its kind ever designed. Ten air-conditioned studios were mounted on springs with suspended walls and ceilings for perfect sound-proofing and acoustics. One studio seated an audience of 500 people. NBC was ordered by the Federal Communications Commission (FCC) to sell the Blue Network in 1943 for anti-trust reasons. The change gave KGO a new owner, the American Broadcasting Company, and a network re-named ABC (in 1945).

When the FCC authorized an increase to 50,000 watts in 1947, a new three-tower transmitting facility was built near the Dumbarton Bridge. This facility included the first multi-tower directional antenna system in San Francisco. Three 300-foot towers were anchored in salt water and guided KGO's signal in a north-south direction. The station was then billed as "The Sunset Station" because of its powerful nighttime coverage of the Pacific Coast region from Alaska to Mexico. The new transmitting facilities also doubled KGO's daytime

coverage area. One of the towers partially collapsed during the 17 October 1989 Loma Prieta earthquake, but the station returned to the air in less than five minutes.

The explosive growth of television in the 1950s captured radio listeners and marked an end to the so-called golden age of radio. As KGO's network shows such as *Don McNeill's Breakfast Club* suffered declining ratings, the station turned to personality disk jockeys. Innovative programs such as *Coyle and Sharpe* (a combination of *Bob and Ray* and *Candid Camera*) and broadcasts by *Les Crane Live from the Hungry I* were featured. But by 1962 the ratings placed "The Sunset Station" eighth in the San Francisco market.

Introducing Talk

The most significant transformation in KGO's history came in 1964 when station manager Don Curran engineered a dramatic change in format by introducing an all-day talk format and leading a team that invented the terms *newstalk* and *infotainment*. The success of this experiment proved the viability of talk radio and eventually led to its expansion into a major new radio format; by 1998 talk radio was being offered by more than 1,000 stations and earned a national audience share of 10 percent. By 1978 KGO had become the most popular radio station in the Bay Area among persons 12 and over.

In October 2000 KGO celebrated its 75th anniversary by continuing its dominance of the nation's fourth-largest market for more than 20 consecutive years. The station's 6.3 share among persons 12 and over captured the number one slot for the 90th consecutive San Francisco Arbitron Ratings book. *Radio Ink* wrote, "This is something that has never occurred in a major market in America before." About 850,000 different listeners tuned in to KGO each week at that time.

A long list of "firsts" contributed to these impressive ratings. KGO was the first Bay Area station with helicopter traffic

reports. Its 27-member news department was the first to send a local radio reporter to cover national and international news. In 1997 KGO ranked as the 14th highest-billing station in the nation with revenues of more than \$30 million. In 1994 Duncan's *Radio Market Guide* called NewsTalk 810 "the most admired station in the nation." KGO's strengths lay in hiring and keeping enormously talented people and in understanding, serving, and relating to the people and issues of the Bay Area to an extraordinary degree.

In 2000 NewsTalk 810 was one of the first stations in the nation to add a "Push to Talk" feature to its website (www.kgo.com). This allowed visitors to the website to participate in talk shows via the internet with one click of the mouse. And the industry trend to ownership of multiple stations in a single market brought KGO's management team a fresh challenge from owner ABC/Disney—to duplicate their success at sister newstalk station KSFO-FM.

KHJ

Los Angeles, California Station

The second-oldest station in Los Angeles, KHJ was a broadcast pioneer and prominent originator of network programming during radio's golden age. In the late 1960s, KHJ became the most-imitated radio station in North America following a dramatic ratings turnaround by means of a variant of the basic Storz Top 40 formula.

KHJ began broadcasting with 5 watts at 760 kilohertz on 13 April 1922 from a 10- by 12-foot room atop the Los Angeles *Times* building. Although the *Times* operated the station, C.R. Kierulff, an electrical pioneer, founded it. The first program included "The Star Spangled Banner," an address by *Times* publisher Harry Chandler, vocal selections, a comedy

routine, news bulletins, and children's bedtime stories. Three days later the station aired Easter services. The *Times* purchased the KHJ call letters (kindness, health, joy) from Kierulff in November 1922 and increased power to 500 watts. During its earliest years, KHJ stopped broadcasting for 3 minutes out of each 15-minute period in order to clear the air for distress calls. On 31 December 1922, KHJ broadcast throughout New Year's Eve, reported to be an unprecedented event.

As radio entered its golden age, KHJ became the principal West Coast affiliate of Mutual and the flagship of the regional Don Lee network, which was named for its owner, an automobile sales tycoon. The station originated numerous network programs, including the Columbia Broadcasting System (CBS) show *Hollywood Hotel*, hosted by Louella Parsons (during the years before CBS acquired station KNX). Other programming included Raymond Paige and a 50-piece staff orchestra, *Chandu the Magician*, Eddie Cantor, Burns and Allen, *Queen for a Day*, and *Hopalong Cassidy*.

Some prominent figures in mass communication passed through KHJ during its early years. Sylvester (Pat) Weaver, later president of the National Broadcasting Company (NBC), was an announcer in 1934. Helen Gurley Brown, later responsible for revamping Hearst's *Cosmopolitan*, answered listeners' letters while she was a student.

In 1950 RKO General (Tire) purchased the Don Lee broadcast properties, which included KHJ, KHJ-FM, and KHJ-TV. As music and news began to dominate local radio programming in the 1950s, KHJ featured disc jockeys and popular records. In the early 1960s, the station featured the talk personality format that had been successful at RKO General's WOR in New York. Nevertheless, by the end of 1964 KHJ had not developed a niche in the competitive Los Angeles market. In the ratings, the regional facility—on 930 kilohertz with 5 kilowatts of power and a directional antenna at night—was a lusterless 17th from the top.

The management of RKO General's radio division announced that KHJ would undergo a complete change of programming by May 1965. Although initially opposed to rock and roll or country and western, management chose to pursue an around-the-clock contemporary music format that would draw the bulk of young listeners without offending any other segment of the potential audience. That decision set in motion a chain of events that ultimately brought KHJ from virtual obscurity to legendary status.

In early 1965 RKO General retained "two men who had previously taken 'average' stations and transformed them into number one ranking in areas similar to our own." Those specialists were Gene Chenault and Bill Drake. Chenault was licensee of KYNO in Fresno, the original Top 40 station in the central valley of California. Drake had worked for Gerald Bartell's WAKE in Atlanta and KYA in San Francisco prior to join-

ing Chenault as program director of KYNO. Drake's programming had led KYNO to victory in a tough ratings battle with KMAK, Chenault's tough Fresno competitor.

After Drake's success with KYNO, he and Chenault formed a consulting service. Their first client was KGB in San Diego, which rose from lowest to first in ratings on the 63rd day of Drake-Chenault programming. The success of KGB brought Drake-Chenault to the attention of RKO General management.

Drake and Chenault brought in Ron Jacobs, who had been program director of their Fresno opponent, KMAK, to be the new program director at KHJ. Drake and Jacobs crafted a streamlined version of Top 40 for KHJ centered on a very limited playlist of contemporary favorites aired, when possible, in sweeps of two or three songs. Most sound effects associated with Top 40 (e.g., horns, tones, beepers) were eliminated. A cappella jingles by Johnny Mann were short. Commercial loads were cut to 12 to 13 minutes per hour and clustered in strategically scheduled stop sets. News aired at 20 minutes past the hour or 20 minutes before the hour to counterprogram competitors' newscasts on the hour or at five minutes before the hour. The mix was given an on-air slogan, "Boss Radio."

Jacobs premiered a "sneak preview" of the Boss Radio format in late April 1965. Compared with other Los Angeles Top 40 stations (KFWB, KRLA in Pasadena), KHJ was noticeably uncluttered. KHJ rose to lead Los Angeles ratings during the first six months with Drake-Chenault as consultants. At the height of its popularity in the late 1960s, KHJ attracted one out of four Los Angeles radio listeners. After KHJ's phenomenal success, RKO General signed Drake and Chenault as consultants for KFRC in San Francisco, CKLW in Windsor (Detroit), WOR-FM in New York, WRKO in Boston, and WHBQ in Memphis.

By 1968 stations paid Drake-Chenault up to \$100,000 annually for Bill Drake's services. Although Drake-Chenault consulted a total of only nine stations (including KAKC in Tulsa), the influence of their 1965 win in the tough Los Angeles market diffused throughout the radio broadcasting industry as managers across the nation copied the KHJ format and conservative playlist. Drake-Chenault also attracted critics who blamed the widespread imitation of the KHJ playlist for constrained promotional efforts for innovative music during the late 1960s.

The turnaround of KHJ is a classic business success story of personalities, competition, performance, and impact. In 2000, KHJ continued to thrive with a successful Spanish language format, and the Drake-Chenault sound remained popular in Los Angeles via KRTH's (formerly KHJ-FM) oldies format, which is reminiscent of KHJ during the late 1960s.

King Biscuit Flower Hour

Syndicated Showcase for Rock Artists

During the 1970s and 1980s, the *King Biscuit Flower Hour* presented recorded concert performances by more than a thousand artists, including the Rolling Stones, the Who, Eric Clapton, Elton John, U2, John Lennon, Elvis Costello, Aerosmith, the Beach Boys, the Fixx, Led Zeppelin, and many current and future members of the Rock and Roll Hall of Fame. It was the first live performance radio show to offer a glimpse into the daily lives of rock bands on tour. At its peak of popularity, more than 300 U.S. radio stations carried the *King Biscuit Flower Hour*, and the syndicators estimated that the weekly audience surpassed 5 million listeners.

The program's name pays homage to *King Biscuit Time* (later called *King Biscuit Flour Hour*), a famous radio program that originated in 1941 on KFFA, Helena, Arkansas. Sponsored by the makers of King Biscuit Flour and hosted by Sonny Boy Williamson and Robert Lockwood Jr., *King Biscuit Time* showcased the country blues music of the Mississippi Delta region, one of the important roots of rock and roll. Every important performer who played the honky tonks and juke joints along the "Chittlin' Circuit" from New Orleans to St. Louis appeared on the show until it left the air in 1967. Helena is now the site of the annual King Biscuit Blues Festival, which keeps the musical tradition alive.

Bob Meyrowitz and Peter Kauff were the first producers for the *King Biscuit Flower Hour*. Their company, DIR Broadcasting, began syndicating the program in 1973. The first show featured John McLaughlin's Mahavishnu Orchestra, a popular jazz-fusion band; Blood, Sweat and Tears; and an unknown group named Bruce Springsteen and the E Street band. For the next 17 years, the format remained the same. Live performances were interspersed with backstage interviews and minimal intrusion from the hosts for continuity. Venues ranged

from stadiums to large auditoriums to small clubs. Every hour featured 50 minutes of music heard just as it had been performed before the live crowd.

Later, the company began a similar weekly series featuring country music artists. Production of the original *King Biscuit Flower Hour* ceased in 1990, with a library of more than 24,000 master tapes of classic rock and roll live performances. Soon thereafter, King Biscuit Entertainment bought the series and began syndication of reruns in the United States and Great Britain.

In 1996 King Biscuit Entertainment started releasing a limited number of *King Biscuit Flower Hour* performances on tapes and compact discs, using the syndicated program as a promotional vehicle. Although the classic rock radio format suffered from declining audience shares in the mid-1990s, *King Biscuit Flower Hour* retained its syndication base because its library contained material from other genres such as new wave, modern rock, blues, and alternative.

For the 25th anniversary of *King Biscuit Flower Hour* in 1998, the syndicator produced a two-hour special retrospective program, released a commemorative double compact disc, and made an important announcement. Production had begun on a new series of live performances for future *King Biscuit Flower Hour* programs. King Biscuit Entertainment also added a streaming media website (king-biscuit.com) to promote the radio series and sale of recordings and related merchandise. At the turn of the millennium, the *King Biscuit Flower Hour* could be heard weekly on nearly 200 radio stations in the United States as well as on BBC-2 in Great Britain.

King, Larry 1933–

U.S. Radio and Television Talk Show Host

Larry King, who estimates he has conducted more than 35,000 interviews during his 40-year career, revitalized the possibilities of the radio and television talk show for a national as well as worldwide audience during the cable era. Although King has crafted a laid-back persona in his signature suspenders, the *Guinness Book of World Records* recognizes the indefatigable King as having logged more hours on national radio than any other talk personality in broadcasting history. From the 1980s on, King's omnipresence on radio and television and in print made him the interviewer of choice for many celebrities and politicians.

King's agreeable style and "everyman" appeal refashioned the talk show format into an international town meeting. His first interview series, on Mutual Radio, pioneered the concept of the nationwide talk show. His television series on CNN, also simulcast on Westwood One radio stations since 1994, created the first international arena for talk, reaching more than 230 million households in well over 200 countries. King credits his innate curiosity as the main ingredient for this far-reaching popularity and commercial success.

Throughout King's career, critics have questioned his ability to ask insightful and tough questions of his guests. Howard Kurtz of the *Washington Post* labeled him "a great schmoozer who makes no pretense to being a newsman." King readily admits that he never covered a news event and that, in fact, he does little research or preparation for any interview. His technique is to ask short, conversational questions, hoping to connect with his guests on a friendly level. For King, who detests confrontation, the best guest is "anyone passionately involved in what he does."

Like many broadcasters of his generation, King grew up listening to network radio, which would disappear because of television as he came of age. Born Lawrence Zieger in Brooklyn, the young King was an indifferent student, enthralled only

with everything related to radio, from the escapism of *Captain Midnight* to the quiet satire of Bob Elliott and Ray Goulding. Aspiring to be the next Red Barber, the colorful sports announcer of the Brooklyn Dodgers, or Arthur Godfrey, whose on-air folksiness King would adopt with an urban twist, the frequent studio visitor was told to seek his broadcasting fortune in a smaller market. In 1957 King journeyed to Miami and got his first job, as a handyman at WAHR, a 250-watt AM station. He took over for the late-morning disc jockey and, at the station manager's suggestion, changed his name from the ethnic Zieger to King.

King was quickly noticed by larger Miami stations, and in 1958 he was hired by WKAT to anchor the valuable early-morning broadcasts. Encouraged to stand out among other drive-time disc jockeys, King created offbeat characters in the style of his comic heroes, Bob and Ray. The popularity of one such character, Captain Wainright of the Miami State Police, a *Highway Patrol* takeoff, led to his first talk show. Pumpernik's restaurant hired the entertaining upstart to host a four-hour show, live from the eatery. King discovered his talents in the ad-lib interview, first talking with waitresses and garrulous patrons, then with anyone who came by. Celebrities began to drop by the restaurant, and King flourished in the freewheeling atmosphere of the spontaneous interview. King's ability to draw people out was on display with such young performers as Don Rickles, Lenny Bruce, and Bobby Darin.

King's horizons began to expand when he was hired by WIOD in 1962. Management recognized his potential and moved his Pumpernik's show to the houseboat that served as the luxurious setting for the American Broadcasting Companies (ABC) television series *Surfside Six* for nightly broadcasts of interviews and phone calls. He realized his dream to be a sportscaster when WIOD offered him Sunday duty as color

Larry King
 Courtesy Radio Hall of Fame

commentator for the Miami Dolphins. His fame opened other media doors. King began writing columns, first for the *Miami Beach Sun-Reporter*, followed by stints at the *Miami Herald* and the *Miami News*. He hosted a local talk show on Sunday nights with no time limits on WLBW in 1963, and a year later he switched to WTVJ-TV with a weekend show.

King has said he felt as if he “owned Miami” and piled up outrageous debts. Embroiled in a larceny scandal, King’s career was shattered by his high-living notoriety. By 1972 he lost every media position he had accrued. During the mid-1970s King accepted any job he was offered, working as a public relations official with a horse-racing track in Shreveport, Louisiana, and as a radio commentator for the Shreveport Steamers of the World Football League. The freelance phase of his career ended when a new general of WIOD listened to archival tapes of King’s best work. He was rehired to host an evening talk show, and soon the newspaper and television assignments returned. King still could not control his spending and eventually declared bankruptcy in 1978.

While getting his finances in order, King was hired to do a late-night program on the Mutual radio network. The *Larry King Show*, running from midnight to 5:30 A.M. (EST), debuted on 30 January 1978 in 28 cities and legitimized the format of the nationwide talk radio show. There had been other national talk hosts, including Herb Jebco from Salt Lake City and Long John Nebel from New York, but King demonstrated that the talk format was not a local phenomenon. Although King reveled in an uncontrolled environment, there was a distinct tripartite structure to most broadcasts. Most programs featured an hour-long interview with a guest; two hours of call-in questions for that guest; and the final hour, “Open Phone America,” in which King’s assorted group of “insomniacs and graveyard-shift workers” would call and chat about anything. Unlike most hosts, King did not screen calls, and he described this formula as “talk show democracy.”

For the first two months, King’s radio series was broadcast from Miami, and then the show was relocated to Arlington, Virginia, so that government officials could appear as guests.

The coverage grew exponentially; by the time the broadcast switched to daytime in 1992, more than 430 stations were carrying King's brand of talk. In 1982 he received the coveted George Foster Peabody Award. As he did in Miami, King used his radio fame as a calling card for other pursuits, such as writing a weekly column for *USA Today* and working for Ted Turner's CNN.

In 1985 he adapted his mostly single-guest and call-in format for cable television. *Larry King Live* has consistently been CNN's highest-rated show, emerging as a national forum on topical issues. In 1992 the major presidential candidates courted King's viewers, including H. Ross Perot, who declared his availability if "drafted" by the people. King also made headlines by arranging a debate on the North American Free Trade Agreement (NAFTA) between Perot and vice president Al Gore. Guests have ranged from world leaders and newsmakers (Mikhail Gorbachev, Margaret Thatcher, Norman Schwarzkopf, and the Dalai Lama) to entertainment and sports luminaries (Frank Sinatra, Marlon Brando, Barbra Streisand, and Arthur Ashe).

Larry King emerged as one of the dominant figures from radio's post-network era. His agreeable interviewing style attracted a wide audience across diverse demographic lines. King demonstrated that radio still has possibilities as a national medium. When music programming held sway on the FM band in the 1970s, King was one of the pioneers to conceive of the AM band as a nationwide vehicle for talk radio. The self-described "street kid from Brooklyn" helped to revive the tradition of network radio that had inspired him as a youngster.

King, Nelson 1914–1974

U.S. Country Music Disc Jockey

Historians have rated Nelson King among the disc jockeys who exerted the greatest influence on the commercialization of country music in the years following World War II. For almost 15 years, King served up country music to millions of listeners on his *Hillbilly Jamboree*, broadcast from 50,000-watt radio station WCKY in Cincinnati, Ohio. King's *Jamboree* transmitted strongly into the eastern United States, proving that his show could garner large audiences for country music from that populous region. He belongs to a class of early pioneering country music disc jockeys that includes Randy Blake (WJJD, Chicago, Illinois) and Rosalie Allen (WOV, New York).

After graduation from Portsmouth (Ohio) High School in 1932, King worked briefly as a stock boy at Woolworth's, but soon joined a small band, serving as its master of ceremonies. His resonant speaking voice, exhibited on various Ohio bandstands, helped him land his first radio job at WPAY in Portsmouth, where he was a staff announcer. Two years later, he became the chief announcer and musical director at radio station WSAZ in Huntington, West Virginia. At WSAZ, King's tenure included his role as part of an announcing team that covered the devastating West Virginia floods of 1937 for 381 continuous hours.

Departing soggy Huntington for Cincinnati in 1938, King began hosting a recorded music program over radio station WCPO; his *Jam for Supper* showcased the swing music of Benny Goodman, Tommy Dorsey, Artie Shaw, and others. After subsequent brief stays at radio stations WGRC in Louisville, Kentucky, and WKRC in Cincinnati, he joined WCKY in January of 1946.

It was at WCKY that management asked the new employee (then known as Charles Schroeder) to find a radio name. He was handed a Cincinnati phone book and plucked from it the pseudonym Nelson King (a change he later legalized). Soon after his arrival, he took the helm of WCKY's *Birthday Club*, *Man in the Street*, *Keep Happy Club*, and *Hillbilly Jamboree*; however, it would be *Hillbilly Jamboree*, the latter program carrying his name to national prominence.

WCKY and King had introduced the *Jamboree* in 1946, riding the growing popularity of country music during that time. King and the *Jamboree* would fuel that popularity. On the nightly show, King featured popular country music recording artists Eddy Arnold, Ernest Tubb, Red Foley, and others who were helping to establish country music as a commercial force in the late 1940s. The music of Arnold and others enjoyed burgeoning record sales and exposure on Saturday night music programs such as WSM radio's *Grand Ole Opry* and WLS radio's *National Barn Dance*. Their following would

increase even more on the airwaves of the four-and-a-half hour *Jamboree*, one of the few nightly country music disc jockey programs to reach a national audience during the mid-to-late 1940s. The show also streamed into Canada, Mexico, and parts of South America.

From early in the *Jamboree*'s run, it was evident that King was attracting a significant audience during the nighttime hours. When WCKY offered to send listeners promotional pictures of the hillbilly jockey, more than 76,000 letters deluged the station over a two-week period. Products that King hawked on the air—everything from baby chicks to “genuine imitation granite” tombstones to Last Supper tablecloths that glowed in the dark—sold briskly.

King's ability to reel in a vast audience greatly impressed record companies. In an interview with the present writer, Bob McCluskey, a promotional representative for RCA Victor Records, recalled that King's show influenced tastes: “Nelson's program really controlled [the East] late at night. The people that listened to the station were very, very record conscious at that time because what was played, they bought” (see Streissguth, 1997). In light of King's influence, record companies worked diligently to court his favor. Major stars such as Gene Autry and Eddy Arnold regularly called on the powerful disc jockey, and the record companies rained refrigerators, color television sets, and crates of liquor on him. “One of the things I did . . . was I bought time on the station,” said McCluskey. “In doing so, I involved Nelson . . . with a promise to play the records that I asked [him] to play.” The record company practice of buying influence with popular disc jockeys was widespread during the 1940s and 1950s. However unethical the record companies' gifts and King's acceptance of them, the exchanges served to illustrate King's immense sway with listeners as well as his country music ambassadorship.

Nelson King also proved to be a boon to bluegrass music, the acoustic sub-genre of country music popularized by Bill Monroe, Lester Flatt and Earl Scruggs, and others. King loved the dynamic bluegrass sound, sitting mesmerized for hours at bluegrass performances and featuring a liberal helping of the music on his broadcasts. A major retailer of bluegrass records, Jimmie Skinner's Music Center of Cincinnati, advertised regularly on King's show and saw remarkable sales in part because of it.

Throughout the 1950s King continued to distinguish himself as an important conduit for country music. He became active in the Country Music Disc Jockey Association (which would evolve into the Country Music Association, an important trade group), and he collected *Billboard* magazine's top

disc jockey award for eight consecutive years. Not even the growth of rock and roll music could wrench him from his disc jockey slot.

In the end, it would take alcoholism to mute King. Years of alcohol abuse caught up with him in 1961, when the station fired him for going on the air inebriated. He worked outside radio until 1968 when he assumed the morning disc jockey shift at radio station WCLU in Cincinnati. But his continuing alcoholism and the onset of lung cancer ended his radio career in 1970. Although he eventually gave up alcohol, he succumbed to the cancer in 1974.

Nelson King was elected posthumously to the Country Music Disc Jockey Hall of Fame in 1975, recognized as one of country music's foremost emissaries.

Kirby, Edward M. 1906-1974

U.S. Broadcast and Advertising Executive

Edward Kirby had a long and successful career in broadcasting, advertising, and public relations. His most important contributions to radio, however, were made while wearing his nation's uniform, working for the biggest sponsor of them all, the U.S. government.

Origins

Born in Brooklyn, New York, on 6 June 1906, Kirby was the son of a coal merchant. Sent off to boarding school at a young age, he returned to New York for a time in his high school years before going to a private military academy in upstate New York. He was later accepted at the Virginia Military Institute (VMI), where he wrote for various humor and literary magazines. Kirby received his bachelor's degree from VMI in 1926.

After graduation, Kirby worked as a reporter for the *Baltimore Sun* and later undertook economic, statistical, and market analysis for several investment banks. He eventually worked his way into advertising and public relations with C.P. Clark, Inc., of Nashville in 1929. For that firm, he directed national advertising campaigns for several important clients, including the General Shoe Corporation. He also got his first radio experience, producing nationally distributed programs for General Shoe and others.

While with C.P. Clark, Kirby came to the attention of Edwin Craig, vice president of the National Life and Accident Insurance Company of Nashville, owner of radio station WSM. Craig hired Kirby in 1933, and soon the company had increased its insurance in force by 57 percent (to \$525 million) owing largely to Kirby's use of WSM as a sales tool. In 1936 Kirby married Marjorie Arnold, daughter of the dean of the

Vanderbilt Law School and a staff actress at WSM; in time they had two daughters, Patricia and Kip.

Toward the end of his tenure at WSM, Kirby gained valuable experience in working under duress during the disastrous 1937 floods. Radio's response proved exemplary and gave Kirby hints of what the medium was capable of in times of national emergency. Later that year Kirby became the National Association of Broadcasters' first full-time director of public relations, helping set up what later became the Broadcast Advertising Bureau. He initiated a campaign to make "radio as free as the press" and also participated in the creation of Broadcast Music Incorporated.

Wartime Service

In December 1940 Kirby was loaned to Secretary of War Henry L. Stimson as a "Dollar a Year" civilian adviser for radio, eventually becoming the de facto head of the army's radio branch. In that capacity, he successfully lobbied for the continued independence of radio in the face of the increasing inevitability of the United States' entry into World War II. Shortly after the U.S. entered the war, work began under Kirby's direction on two radio programs: the *Army Hour*, for listeners on the home front, and *Command Performance*, for all those in uniform. The *Army Hour* was an attempt to bring the war home to the American people through the power and immediacy of radio. As Kirby saw it, the show would "let the Army drop the stuffed-shirt approach . . . instead, go directly to the people with its own radio program, supplied by the men who were doing the fighting." The program was heard on the National Broadcasting Company (NBC), and highlights included interviews with top brass and returning combat veterans, as well as some of the most descriptive battlefield reporting of the war. The program did not sugarcoat the war: it showed the army at its darkest moments as well as in victory. An early broadcast featuring the terse translation of the last Morse code message from the besieged defenders of Corregidor in May 1942 had no equal for drama on the airwaves.

Command Performance was the brainchild of Louis Cowan, the creative force behind such hit programs as *Quiz Kids*, who was asked by Kirby to come up with a show to entertain the troops overseas. As Kirby later wrote, "The GI who was trained to obey commands in the line of duty could now command anything he wanted from the radio world in the way of entertainment. . . . It was unique, it was democratic, it was American." The requests ranged from the sentimental to the bizarre. A corporal who had never met his infant son reported that the "little guy is teething" and asked "to hear him yowl!" Soldiers from New York City asked to hear the hubbub of Times Square on New Year's Eve. Stars from Bob Hope and Bing Crosby to Judy Garland and Merle Oberon appeared gratis in response to soldiers' letters. The single most

famous request involved film star Carole Landis, who was commanded to "step up to the microphone and sigh. That's all brother, just sigh!"

In May 1942 Kirby became a lieutenant colonel in the army with substantially the same duties he had had as a civilian. In 1944 he was attached to General Eisenhower's staff to carry out perhaps the most important broadcasting-related assignment of the war: coordinating all radio coverage of D Day and the subsequent invasion, as well as establishing an Allied radio network to serve all the troops involved in the operation. For his efforts, he was promoted to full colonel and was awarded the Legion of Merit and the Order of the British Empire. In 1944 he was honored with a Peabody Radio Award for "Yankee Ingenuity on a global scale."

Later Years

After the war, Kirby did freelance public relations work for a time, gathering an impressive list of clients that included Paramount Pictures. He also wrote a book (with Jack Harris) chronicling radio's part in World War II. Called *Star-Spangled Radio*, it remains an excellent eyewitness description of the tremendous role played by radio during that period.

After Kirby made an abortive attempt at radio station ownership, the army recalled him during the Korean conflict for an emergency tour of duty as chief of the army's Radio-TV Branch. Col. Kirby reactivated the army's public information activities and effectively launched its use of television, creating the program *The Big Picture*, a fixture on American television for the next two decades. Kirby left the army in March 1953. Work with the Washington, D.C., Board of Trade (where he originated the Christmas "Pageant of Peace") and the People-to-People Foundation kept Kirby busy until 1957, when he accepted the position of director of public relations for the United Service Organizations (USO). He worked tirelessly to raise funds and established strong ties with the Advertising Council to facilitate national exposure for USO radio, television, and print campaigns. Col. Kirby resigned from the USO in 1970, and he and wife Marjorie returned to Washington, D.C., where he died in 1974.

CHUCK HOWELL

Edward M. Kirby. Born in Brooklyn, New York, 6 June 1906. Attended Virginia Military Institute, A.B. 1926; reporter and feature writer, *Baltimore Evening Sun* 1926-28; statistician, newsletter writer for investment banks, 1928-29; vice president and account executive, C.P. Clark Advertising Agency, Nashville, Tennessee, 1930-33; advertising manager, National Life and Accident Insurance, Nashville; Public Relations Chief for station WSM-AM, 1933-37; director of public relations, National Association of Broadcasters, 1937-40; civilian advisor to Secretary of War for Radio, 1940-42;

commissioned lieutenant colonel, U.S. Army, 1942; chief, Radio Branch, War Department, Bureau of Public Relations, 1942-44; produced *Army Hour* and *Command Performance*; attached to staff of General Eisenhower; coordinated D-Day radio coverage, acted as allied radio liaison for SHAEF (supreme headquarters, allied expeditionary forces), 1944-45; promoted to full colonel, 1945; public relations consultant, 1945-50; co-author *Star-Spangled Radio*, 1948; recalled to active duty as Chief, U.S. Army Radio-TV Branch, 1950-53; public relations work with Washington, D.C. Board of Trade, People-to-People Foundation, 1953-57; director of public relations, USO, 1957-70. Peabody Radio Award, 1944; awarded Legion of Merit and Order of the British Empire, 1945. Died in Washington, D.C., 1974.

Klauber, Edward A. 1887-1954

U.S. Radio Network Executive

Edward Klauber, a key Columbia Broadcasting System (CBS) executive through the 1930s, helped to formulate what would become CBS News, defining many basic policies for all of radio journalism.

Early Years

Born in Louisville, Kentucky, in 1887, Klauber graduated from high school in 1903. Intending to study medicine, he briefly attended the University of Louisville and the University of Pennsylvania. He did not earn a degree from either institution, having in the meantime become far more interested in journalism. His uncle, Adolph Klauber, was then drama critic for the *New York Times* and may have had something to do with Klauber's direction. In any case, his uncle helped Klauber obtain his first news job, as a copy editor for the *New York World* in 1912.

After four years in this post, Klauber moved uptown as a reporter for the *Times* in 1916, covering a variety of stories around the city. He became especially well known for his coverage of the September 1920 anarchist bombing of Wall Street, in which 30 were killed and 100 injured. By the late 1920s, he had become the *Times*' night city editor, although he was anything but popular to those who worked for him. In a pattern that would later become familiar at CBS, Klauber became a hated boss—taciturn in mood, quick to criticize (often in front of others), and slow to give compliments.

CBS Executive

In 1928 Klauber left the news business for public relations, joining the Lenman and Mitchell advertising agency in New York as director for that area. He served for a year, moving on to join the offices of Edward L. Bernays, already the guru of the growing field. But his sometimes abrasive personality did not work well in a small office, and Bernays suggested Klauber to William Paley, president of CBS, as a good organizational manager, knowing that Paley needed such a person. Klauber joined the network in 1930 as assistant to the president. Years later, Paley noted that Klauber was "an indefatigable day-and-night worker, always keeping in touch with me, providing me with written reports and eventually becoming my advisor on all sorts of things" (Paley, 1979). Indeed, he became the virtual gatekeeper controlling access to Paley and something of the network hatchet man (early on, he terminated the network's contract with his old boss Bernays, saying that CBS didn't need two public relations experts on salary). Klauber was also the oldest member of the management team.

Although he was given wide credit for imposing discipline and organization on Paley as he firmly streamlined CBS operations, Klauber's personality got in the way time and again. "Charmless and utterly lacking in humor, Klauber seemed the antithesis of everything Paley valued in a man" (Smith, 1990). Klauber was already uncomfortable with Paul Kesten, the promotion and advertising expert he had hired in 1930, who in

Ed Klauber

many ways was closer to Paley—the two increasingly became rivals for Paley’s attention and affection, which was somewhat evidenced in the *Fortune* profile of the network’s leadership that was published in 1935.

Radio Journalism

Where Klauber made a lasting difference in radio was in the rise of broadcast news. As Paley described him, he was an “advisor, guide and mentor on how CBS should handle news.” Faced with the cutoff of press association news during the 1933 press-radio “war,” Klauber persuaded General Mills to put up half of the cost to develop a Columbia News Service (the immediate predecessor to CBS News), hiring Paul White as his chief news aide. The two men added CBS news bureaus in Chicago and Los Angeles and contracted with many news stringers elsewhere. They hired the men (and virtually all were men at that point) who, in turn, provided the base for what CBS News became during World War II. In August 1939

Klauber persuaded respected journalist Elmer Davis (whose best man he had been) to join CBS as a commentator.

Behind all of this were Klauber’s strongly held views, growing out of his decade and a half in New York newspaper journalism, of just what radio news should be and thus could become. He knew and disseminated the importance of presenting news fully and fairly, in accurate form and without bias. He helped to shield news people and content from advertiser demands as needed. He was a perfectionist in his own work and required the same level of achievement by others. He enforced the network’s policy of not espousing editorial views when he wrote in 1939:

Columbia’s announced policy of having no editorial views of its own and not seeking to maintain or advance the views of others will be rigidly continued. In being fair and factual, those who present the news for Columbia must not only refrain from personal opinions, but must refrain from microphone manner designed to cast doubt, suspicion, sarcasm, ridicule, or anything of that sort on the matter they are presenting (quoted in White, 1947).

But Klauber also grew increasingly tyrannical as he assumed greater day-to-day responsibilities. By 1936 he was making \$71,000 per year (worth more than ten times that amount today), second only to Paley. This was a clear indication of his value to the network. But at the same time, Paley noted that “Klauber developed a strong sense of possessiveness toward me, which . . . caused management problems.”

The many complaints about Klauber’s working relationships with his subordinates began to wear. At the same time, as the network faced substantial wartime pressures in news and elsewhere, Klauber faced his own personal hell. His first wife was dying of cancer, and, torn between caring for her and his network duties, he had two heart attacks in a short span of time. Sometime in 1941 or early 1942, Paley made a decision on the network’s leadership future. To clear the way for Paul Kesten, Paley appears to have eased the way for Klauber to resign from CBS in March 1942.

Klauber moved to the Office of War Information (OWI), where he worked as associate director for Elmer Davis, OWI’s director, until 1945. While at OWI, he played much the same hatchet man and organizational role for Davis as he had fulfilled for Paley. After the war, many of his ideals for broadcasting showed up in the National Association of Broadcasters Code of Good Practices, which he helped to revise and update in 1948. Klauber died in New York in 1954 at age 67.

Kling, William 1942-

U.S. Public Radio Executive and Entrepreneur

William (Bill) Kling enjoys several distinctions in the field of public radio. His tenure of more than 30 years as head of Minnesota Public Radio (MPR) and its predecessors easily surpasses that of any of his peers heading major U.S. public radio services. The sheer scope of the enterprise that he has been largely instrumental in creating is unmatched in the field of public radio. And his particular devotion to local and regional broadcast journalism has helped the MPR news department to become the largest (more than 70 staff members as of 2003) and by some accounts the most prestigious local radio newsroom in the country.

Origins

Kling's background before public radio gives relatively little indication that he would excel along those lines. Born in St. Paul, Minnesota, in 1942, he attended grade and high school there (and also built radio sets), then went to nearby St. Johns University (SJU) in Collegeville. He began a liberal arts degree with an emphasis in physics but ended up majoring in economics. He worked briefly with the SJU student radio station but did not care for its pop music format. Following graduation, he enrolled in the master's program at Boston University's School of Public Communication, and returned to Minnesota early in 1966. His fellow students at various levels recall him as being bright, congenial, well organized, and very persistent in reaching his goals. He was devoted to a seemingly chimerical goal of creating a high-quality, non-commercial radio service based in central Minnesota that would

provide a balanced mix of classical music with local and regional news.

That devotion may be part of a world outlook nurtured by Kling's high school and college teachers, some of them Jesuit or Benedictine monks and priests. Broadly speaking, Jesuits stress the need to question, Benedictines the need to serve and the importance of the fine arts. Kling's brief experience with student radio, as well as his development of a self-operated "alternative" radio service while at SJU, showed him that radio can serve society and that it can do a better job of that by questioning existing models. Two non-commercial stations then operated in Minnesota: KUOM at the University of Minnesota in Minneapolis/St. Paul and WCAL at St. Olaf College in Northfield. Neither service impressed Kling in its presentation of classical music; both seemed inadequate in providing daily coverage of local and statewide news.

In 1965 Kling created the opportunity to realize his goal by convincing SJU professor (soon to be SJU president) Father Colman Barry that the school could further distinguish itself by supporting a public service-oriented radio station that would reach listeners throughout Minnesota. Barry agreed, but financial support would be modest. Kling recruited a staff that was willing to work for low wages, as he did, and to produce a classical music service that would improve upon what KUOM and WCAL were providing. There also would be a small-scale news service that would concentrate on Minnesota news, but its development would be slower. KSJR-FM came on the air from Collegeville in January 1967 under the title of Minnesota Educational Radio (MER).

The classical music service began to attract the attention of newspapers in the Twin Cities, as Kling had hoped it would. Listeners in the northwest suburbs could pick up the signal, and owners of lake cottages in central Minnesota found that they had a new and very different voice to add to the chorus of mosquitoes and the few stations readily available to them as they vacationed. Twin Cities residents began to write to the station, expressing the hope that there would be an increase in signal strength or perhaps even a Twin Cities version of KSJR in the near future. Kling secured additional financial backing, applied for a non-commercial license, and KSJN-FM came on air from makeshift St. Paul studios in September 1967. By the following year, it was providing a Talking Book Service over a subchannel—another idea of Kling’s and a service of particular pride to him.

The expansion to St. Paul was not without risk. Operating costs would be higher than they had been in Collegeville, especially as more of the KSJR staff moved. Although the U.S. Congress had passed the Public Broadcasting Act of 1967, stations such as KSJN and KSJR were realizing little financial benefit from that source. St. John’s had provided as much as it could, but that stretched only so far, and some people in the SJR administration found it difficult to argue for increased support as the service became more and more of a Twin Cities operation. In 1971 Kling reached an agreement with SJU that KSJR and KSJN would become independent public service radio stations affiliated with National Public Radio (NPR), although St. John’s would remain a sponsoring organization.

By the early 1970s, NPR was establishing itself as a major journalistic presence. Kling applied for a Corporation for Public Broadcasting grant to develop a full-fledged newsroom, and in 1972 KSJN began to provide daily coverage of Minnesota news. While operating costs increased, revenue did not keep pace, and Kling arrived at work one day to find a bank overdraft notice on his door. A bank loan resolved the crisis, but Kling realized that the financial situation needed major attention if the stations were even to survive, let alone expand. Yet, as he said in a 1999 interview with *Current*, he was determined to press on with expansion of the existing levels of service while at the same time redoubling efforts to attract corporate and individual sponsors.

Rather than emphasize MER’s precarious financial state, Kling indicated how far it had come in such a short time and how much more public service it could provide if financial support were to increase. Several institutions of higher education signed on as sponsors; so did some of the state’s larger businesses, foundations, and private donors. Listener pledge drives, which had been around since 1968, were expanded and made more attractive through the offering of premiums donated by individuals and businesses. The outpouring of support attested to Kling’s skills as a fund-raiser and also convinced him that one more aspect of his goal—a truly statewide service with

transmitters and studios in cities throughout Minnesota—might be attainable. So might a still more ambitious plan: separate frequencies throughout the state for a classical music service and a news and public affairs service.

Minnesota Public Radio

The statewide service proved easier to realize than did the dual service concept. Several institutions of higher education found it economical to affiliate with the renamed (in 1974) Minnesota Public Radio (MPR), to set up relay transmitters, and in some cases to create small studios. By 1980 most parts of Minnesota were served by at least one MPR signal. However, a few independent public radio ventures, notably in the Twin Cities (KFAI-FM), at St. Cloud State (KSCU-FM), and in Grand Rapids (KAXE-FM), found Kling to be an obstacle to their efforts to come on air or to increase their transmitter power. While reasons for the creation of a statewide service varied, a recurrent theme ran through them all: why put money into a host of small public radio stations when one large service could do the job so much better? A Governor’s Task Force on the future of public radio in Minnesota recommended in 1975 that steps be taken to develop a statewide dual-service public radio system and praised MPR for its efforts along those lines but stopped short of saying that MPR should necessarily be the parent organization for both. Kling had no doubts that it should.

Kling knew that he would have to obtain a second FM frequency in the Twin Cities if MPR were to function effectively as a dual service. However, all the reserved frequencies for non-commercial services were taken, and the commercial frequencies had long since been claimed. Purchase of an existing station seemed to be the only option, but the expense would be great. He secured pledges of financial support from business and industry, but the only stations available at a reasonable price were on the AM band. In 1979 the MPR board approved purchase of KRSI-AM (St. Louis Park, a first-tier Minneapolis suburb), which allowed MPR to shift the bulk of its news and public affairs programming over to 1330 AM and to make KSJN-FM into a largely classical music service. It wasn’t until 1990 that MPR was able to acquire a Twin Cities FM frequency (99.5) by purchasing WLOL-FM. The Minnesota Broadcasters Association objected on the grounds that the action deprived listeners of a commercial radio service and that the purchase itself probably involved state funding. (MPR and other public radio stations have received state support since the late 1970s.)

During the 1980s, Kling continued to develop “second channel” services throughout Minnesota (as of 2000, there were ten of them, plus an eleventh in Decorah, Iowa), aided by the money being generated through two further MPR initiatives in which he played a leading role: American Public Radio (APR), later named Public Radio International (PRI), and Riv-

ertown Trading Company. APR was created in 1983, after Kling and four other managers of major public radio stations were unable to convince NPR to syndicate some of its leading programs—in MPR's case, Garrison Keillor's *A Prairie Home Companion*. They leased satellite time, and soon had a sizeable lineup of public radio stations as paying subscribers. (PRI's revenues in 1999 were \$19.7 million.)

The popularity of Keillor's various fictional creations, especially Powdermilk Biscuits, led Kling to propose to the MPR Board of Directors that T-shirts and other paraphernalia associated with *A Prairie Home Companion* be marketed through a catalog. The board approved. The venture proved highly successful and led to the creation in 1981 of the Rivertown Trading Company but also drew criticism from commercial broadcasters as yet another example of MPR having its non-commercial cake and eating it, too. In the mid-1990s, a few state legislators pressed MPR for full disclosure of Kling's salary and called for details on the nature of the relationship between non-commercial MPR and the for-profit Greenspring Company (which by then included the MNN Radio Network, the MPR magazine *Minnesota Monthly* and other periodicals, and Rivertown). Kling and a number of MPR Board members defended their action by pointing out that this was just what the U.S. Congress and the Reagan administration had encouraged public broadcasting stations to do: become less dependent on government appropriations.

The Minnesota legislature eventually found nothing illegal in the MPR-Rivertown arrangement. However, Rivertown was sold to the Dayton-Hudson Corporation (now the Target Corporation) in 1998, by which time it had annual sales of about \$195 million. MPR's "parent" company, the Minnesota Communications Group (MCG), reported a gain on the Rivertown sale of about \$94 million, of which \$85.6 million was set aside as a permanent endowment for MPR. As Robert Unmacht (publisher of the radio industry newsletters *M Street Journal* and *M Street Daily*) observed of Kling, "He's figured out how to provide a service to the public and make a lot of money."

The "Klingon Empire," as some of Kling's critics and supporters alike have dubbed it, continues to grow. In May 2000, the public radio program service *Marketplace* was sold to MPR. This again raised speculation regarding Kling's motives. Was he bidding to compete directly with NPR? He dismissed that possibility and could point to a May 2000 agreement with NPR to develop an internet service. However, he clearly was delighted with the acquisition of Southern California Public Radio (KPCC-FM, in Pasadena), which would provide MPR with the opportunity to show listeners in the Los Ange-

les area what a *real* news and public affairs service was like: as Kling said in a May 1999 interview with *Current*, "I think we need a model in a tough city, a big city, the second largest city."

Kling's goal remains the same as it was more than 30 years ago: service. He has not exercised editorial control over MPR's news and public affairs programs, although he did stop a few stories (abortion, politics, feminist perspectives on violence) from appearing in *Minnesota Monthly* in the mid 1970s. Rather, it is the capacity of public radio to provide a reflection of the social, political, and cultural life of the community and the region that seems to continually excite him—and to drive him to seek the resources necessary to maintain excellence in that realm, whether he pleases or angers people in the process.

KMOX

St. Louis, Missouri Station

KMOX (1120 kilohertz) is a 50,000-watt clear channel AM radio station in St. Louis, Missouri. The station is best known for the talk-centered format it introduced in 1960, which for many years gave it the largest market share of listeners of any radio station in the top 50 U.S. markets. KMOX was put on the air on Christmas eve (the origin of the X in the station's call letters) in 1925 by a group of investors called "the Voice of St. Louis." In 1927 it began carrying programs from United Independent Broadcasters, which later became the Columbia Broadcasting System (CBS), initially receiving \$50.00 per hour of broadcast time. CBS has owned and operated the station since 1932.

KMOX was a fairly typical network station until February 1960 when, faced with erosion of audience to television and with competition from new radio stations that had joined the market in the postwar period, KMOX initiated a radical change in format and became one of the first stations in the United States to offer a talk-centered format. Although a number of stations pioneered the talk format in the 1960s (including KABC in Los Angeles), KMOX was unusual both in the success it achieved with the format (moving rapidly to first in the market) and in the amount of influence that was exerted over the station for decades by a single individual—Robert F. Hyland Jr., who became general manager of KMOX in 1955 and CBS vice president in 1959 and who continued in both those roles until his death at the age of 71 in 1992.

A number of characteristics set KMOX's air sound apart from that of other stations. In an industry where the norm is short stints for on-air talent, under Hyland's direction the station developed a reputation for just the opposite—talent stayed for decades. From the 1960s through the early 1990s, KMOX's style and content were often closer to those of the British Broadcasting Corporation (BBC) or public radio in the United States than to those of other commercial stations. The style was slightly formal, sometimes described as "dignified," and placed emphasis on both breadth and depth of information. Talk often consisted of a brief interview with a public figure or an expert on topics ranging from medicine to plumbing, followed by telephone calls from listeners. Although he eventually allowed some pure "open line" discussion in which the on-air talent simply chatted with callers, Hyland demanded even then that information of substance be a part of the presentation. If callers were kept on the line too long, Hyland would often reprimand hosts for "back fencing" or engaging in "therapy" with a listener, rather than keeping the discussion on topic. Hyland said in 1960 that one of the

purposes of the new talk-oriented format was to educate in addition to entertain.

One of the puzzling paradoxes of KMOX was how it could sound so much like noncommercial, public service radio and yet achieve ratings so much higher than such stations usually do. In 1976 KMOX had a 26 share of the audience in its market, with its nearest competitor holding less than a 9 share. The best clue to understanding this success may be found in a common saying that had developed among journalists and politicians in Missouri by the 1970s: "KMOX is more like a newspaper than a radio station." It was sometimes called St. Louis' "third newspaper" (when the *Globe Democrat* and the *Post-Dispatch* were the other two) and then the "second newspaper" after the *Globe-Democrat* ceased publication. It was idiosyncratic (running marches and prayers as part of a morning ritual) and involved in its community, much like some of the famous editor-dominated newspapers of the 19th century, such as Horace Greeley's *New York Tribune* and Joseph Pulitzer's *St. Louis Post-Dispatch*. The approach Hyland used to advance his radio station was indeed similar to what Pulitzer had tried successfully in the same city almost a century earlier: heavy community involvement (Hyland was reputed to have belonged to approximately 100 different organizations), aggressive investigative reporting, and a combination of entertainment (Hyland tied up all the major professional sports teams for KMOX and carried play-by-play broadcasts of important college games as well) and serious reporting, all seasoned with heavy self-promotion and one editorial campaign after another. Shortly after he became general manager, Hyland made KMOX the first CBS-owned station to carry editorials (the first was in advocacy of fluoridation of St. Louis county water and accused the county government of cowardice for refusing to take a stand). Hyland also followed the lead of newspapers and had KMOX endorse specific candidates for office.

The format that gave KMOX dominance and made it one of the most valuable properties owned by CBS (chairman William Paley once called it "the jewel in the CBS crown") was expensive. At its peak, the station employed more than 100 people, more than 70 of them full-time, and kept a number of "retainers" on the payroll, especially in sports, so that the station would have access to them and so that they would not sell their on-air services elsewhere (a practice that was abandoned as too expensive not long after Hyland's death). The station was intensely local, so much so that when President John F. Kennedy was assassinated in 1963, Hyland ordered the staff to

break away from the CBS network feed and to focus on reaction to the assassination in the St. Louis area.

KMOX's similarity to a newspaper illustrates its strengths as well as its vulnerability. The station's high costs required continued high ratings in order to remain profitable, and it could not maintain those ratings as younger people turned away from KMOX's type of serious talk, much as they had also turned away from newspapers. In 1989 a headline in the *Post-Dispatch* read "How Long Will KMOX Be No. 1?" and the accompanying article reported that the station (although still strong overall and especially among the older population) held only a 9.2 percent share of the audience aged 18 to 34. In the 1990s the share in that critical age group would drop even more, to less than 5.0. Even more important, by 2002 the station's overall share had dropped to below 10, which, although still enough to make it number one in the market, was down dramatically from what it had been a decade earlier. The shift from AM to FM listening and the aging of its audience had finally caught up with KMOX.

Robert Hyland maintained until his death in March of 1992 that KMOX should not trivialize or tabloidize its programming, asserting in a 1990 speech to the St. Louis Press Club:

The fact that we live in a fast-paced, entertainment-oriented age does not relieve us of the responsibility to live up to the sacred trusts inherent in our profession. . . . Virtually everyone reads newspapers, hears radio and views television. It must be our sacred mission that what they read, hear and view shall have meaning and import beyond filling space and killing time.

Hyland argued that as long as the station maintained its stronghold on major-league play-by-play sports, young listeners would learn its dial position and would eventually turn to KMOX as they got older and became more interested in being informed than in the latest music trends.

Following Hyland's death, a number of changes took place at the station and at CBS that would change KMOX's sound. Much of the station's long-standing on-air staff left. Bob Hardy, who had been on the air for more than 30 years, died, and Jim White and Anne Keefe, also on the air for decades, retired. Jim Wilkerson left for a competing station in a 1996 talent raid that also grabbed two other established voices at KMOX (Wendy Wiese and Kevin Horrigan), transplanting the station's morning sound almost intact to the competing station. But the most drastic change to come to KMOX in the wake of Hyland's death took place in 1994, when a key daytime slot once used for local interviews was turned over to Rush Limbaugh's nationally syndicated show. The decision to put Limbaugh on the air appears to have been primarily defen-

sive—Limbaugh had begun running on a competing station, and the choice was either to have him on KMOX or to compete against him. Limbaugh went on the air from 11 A.M. to 2 P.M. in April 1994, and late in 1999 he was still scheduled in that period. The decision to put Limbaugh on the air may or may not have saved KMOX from further ratings erosion, but it definitely changed the station's sound in three significant ways: (1) where KMOX had long been intensely local, Limbaugh's show has no sense of a particular place; (2) Limbaugh uses various news vignettes and excerpts to support discussion centering on a conservative political point of view; and (3) his sometimes frenetic delivery style is quite different from the calm, public service radio tone that even the younger, post-Hyland KMOX hosts employ.

In 1996 major cutbacks, including reductions in staff, were ordered by Westinghouse, the new owner of CBS. When one irate program host, Kevin Horrigan, walked out and took a job with a competing station, he charged that KMOX was in "chaos," that "part-timers and college kids are writing news and producing shows," and that "everything is being done on the cheap." The cause of the problem, according to the *Post-Dispatch*, was that Westinghouse was demanding a 40 percent profit margin, meaning that the station would have to produce a profit of about \$9 million on total advertising sales of about \$22.5 million per year, or about double what its past profits had been.

In November 2002 another program host, former CNN correspondent Charles Jaco, was fired (for reasons KMOX management never publicly revealed), and as he left Jaco blasted station management for "dumbing down" its program content in an attempt to raise ratings. The controversy over Jaco's firing (which was covered extensively by St. Louis news media) came on the heels of a number of setbacks, including the erosion of the station's dominance in professional sports play by play. By 2001, KMOX no longer had broadcast rights for the games of the St. Louis hockey and football teams, although it did still provide play by play for Cardinal baseball games. In the first years of the 21st century, KMOX could be viewed as embattled, owing to its decline in ratings and to increasingly negative coverage by other media, including the *St. Louis Post-Dispatch* (a 2002 headline proclaimed the station was "losing its grip on listeners") and the *St. Louis Journalism Review* (which in its December 2002/January 2003 issue carried an article on what it referred to as the "unsavory underside" of KMOX in which allegations of right-wing bias and anti-union policies appeared). However, the station could also be viewed as a survivor: in 2002, more than a decade after a newspaper article questioned how long it could remain in the top position, KMOX was still the number one station in St. Louis in total audience.

KNX

Los Angeles, California Station

From its beginnings in a small bedroom of a Hollywood residence more than 80 years ago, KNX has grown to become one of the nation's most substantial all-news radio stations. KNX is the oldest radio station operating in Los Angeles and one of the oldest stations in the United States.

Origins

What eventually became KNX started as a 5-watt amateur radio station, with the call sign of 6ADZ. The station was built and operated in a back bedroom of his Hollywood home by Fred Christian, a former shipboard wireless operator. KNX historical records indicate that on 20 September 1920 Christian began broadcasting records he had borrowed from music stores, in return for plugs on the air. It is not known how often Christian provided such broadcasts at 200 meters/1 500 kilohertz, and he had to leave the air quite often so other amateur radio operators could take their turns at their common hobby.

Christian's main occupation was running the Electric Lighting Supply Company on West Third Street in Los Angeles, selling parts for people to build their own receivers and broadcasting music for them to enjoy. By late 1921 the U.S. Department of Commerce decided to license radio stations that could broadcast music and entertainment to the public, thus removing congestion from amateur radio bands. On 8 December 1921 Christian was granted a license for 360 meters (833 kilohertz), with the call letters KGC.

Christian soon grew tired of broadcasting only recorded music. He moved KGC to the top of the California Theatre Building in downtown Los Angeles. His plans were to broadcast "live" music from the theater. KGC took up the new call sign of KNX when it moved on 1 May 1922. Christian built a new 50-watt transmitter to send its signal to more listeners. (The station was briefly off the air a year later while a new 100 watt transmitter was installed.) The station was also known as

the "California Theatre Radiophone" between 1922 and 1924. Because there were so few available frequencies and no viable government regulation, stations during that period had to share air time. KNX negotiated with about 15 active radio stations in the Los Angeles area to determine each month the hours the stations would go on the air. KNX usually featured Carli Elinor's California Theatre Concert Orchestra of 50 to 60 musicians during an afternoon or evening broadcast four days a week, along with music from the theater's organ. The orchestra often performed musical scores from movies playing at the theater, to draw KNX listeners to see the films. Several early Hollywood film celebrities were heard over KNX, including Conrad Nagel, Wallace Reid, Harry Langdon, and Lon Chaney.

Radio magazines of the day that printed KNX program schedules also showed ads for the Electric Lighting Supply Company. Christian sold radios and radio parts to help defray the cost of running the station, because advertising on radio was not common yet. He sold KNX to the Los Angeles *Evening Express* newspaper on 14 October 1924, and the station shifted from 833 to 890 kilohertz and increased power from 100 watts to 500 watts. Under the leadership of owner-publisher Guy C. Earl, KNX soon promoted itself to radio fans as "The Voice of Hollywood" and used that slogan for many years. Earl had used KNX before to promote his newspaper and soon sold advertising regularly on the station. When KNX showed a profit of \$25,000 in 1925, Earl focused more of his time on the radio side, and other Los Angeles stations took notice of what selling advertising could do for them. In the mid- and late 1920s, KNX offered a daily schedule from early morning to late night. One regular feature was music from Ray West's Cocoanut Grove Orchestra from the Hotel Ambassador. KNX also offered listeners sports and a variety of informational talks, plus drama from the KNX players. From its earliest days, news was an important part of KNX's broadcast day.

In late 1928 KNX shifted from 890 to 1050 kilohertz and moved to the Paramount Pictures lot in Hollywood. The station increased transmitter power to 5,000 watts in 1929 and doubled that in 1932. Earl sold the Los Angeles *Evening Express* but stayed in radio, running KNX under the ownership of the Western Broadcasting Company. When KNX moved its offices and studios again in 1933, to the corner of Vine Street and Selma Avenue, station power was boosted to 25,000 watts and finally to 50,000 watts in 1934. In 1936 KNX moved to Sunset Boulevard.

CBS Ownership

KNX was sold to the Columbia Broadcasting System (CBS) for \$1.25 million in 1936, then the highest price ever paid for a radio station. New KNX/CBS studios were constructed and opened on 30 April 1938 at 6121 Sunset Boulevard. The Hollywood landmark station remains there today. Known as Columbia Square, the studios were home to several top-rated radio shows through the 1940s, including *Silver Theater*, *Melody Ranch* with Gene Autry, *Lucky Strike Hit Parade*, Jack Benny, Burns and Allen, Edgar Bergen and Charlie McCarthy, and Red Skelton. The long-running *Lux Radio Theatre* originated from the Vine Street Playhouse nearby. During World War II, *GE Radio News* with Frazier Hunt was heard. Local shows such as *The Housewives Protective League*, *Hollywood*

Melody Shop, and *Hollywood Barn Dance* were favorites with southern California listeners. On 29 March 1941 KNX shifted its frequency one last time, to 1070 kilohertz.

In the late 1940s comedian Steve Allen worked at KNX as a disc jockey, but he soon turned his airtime into a very popular late-night interview and comedy show. The program got Allen noticed by CBS executives and was a springboard to his highly successful subsequent TV career. Bob Crane, who gained fame on TV's *Hogan's Heroes*, was a very funny morning personality on KNX from 1956 to 1965. During this time KNX had become mostly a music station with news and sports features.

In April 1968 KNX initiated an all-news format and soon operated the largest radio news department in the western United States. KNX claims to have won more awards for broadcast journalism than any other radio station in the United States. These honors include Best Newscast Award from the Associated Press and Best Newscast Award from the Radio-TV News Association (RTNA) 27 times in the past 30 years. KNX has also won more than 150 Golden Mikes from the RTNA.

KOA

Denver, Colorado Station

As a 50,000-watt clear channel station, KOA is said to stand for "Klear Over America." One of the first radio stations in Denver, KOA later became one of the West's most popular stations. KOA's powerful signal is capable of reaching 38 states in the evening hours, and the station has been heard in Canada, Mexico, and nearly every state in the United States under the right atmospheric conditions.

Changing Hands

KOA went on the air on 15 December 1924 and was authorized for 1,000 watts at 930 kilohertz. Built and operated by the General Electric Company, the station underwent many changes in operating power and dial position before settling at 50,000 watts in 1934 and at 850 kilohertz in 1941.

KOA underwent many ownership changes over the years. The station became affiliated with the National Broadcasting Company (NBC) in 1928. In 1929 NBC took over operation of KOA from General Electric, and the license was officially assigned to NBC in 1930. However, the actual change of ownership did not occur until NBC bought the transmitter from General Electric in 1934. NBC added a sister station, KOA-FM (later KOAQ-FM, now KRFX-FM), in 1948. The stations were sold to the Metropolitan Television Company (MTC) in 1952. One of MTC's principal stockholders was legendary radio, television, and motion picture entertainer Bob Hope. This group added a television station in 1953, channel 4 KOA-TV (now KCNC-TV). Bob Hope sold his interest in 1964, and General Electric repurchased the station in 1968. In 1983 General Electric sold KOA-AM and sister station KOAQ-FM to

Belo Broadcasting. In 1987 KOA was sold to Jacor Broadcasting, which merged with Clear Channel Communications in 1999.

Programming

The opening broadcast in 1924 was launched with much fanfare. With colorful prose, the station avowed its purpose “to serve with special intimacy the states that lie in the great plain—from the Dakotas and Minnesota to Texas—to the Mississippi and beyond; to spread knowledge that will be of use to them in their vast business—to further their peoples’ cultural ambitions—to give wider play to their imaginations, and make melody in their ears—to bid them lift up their eyes unto these western hills whence comes new strength” (cited in *Colorado Mac News*, 1984)

In the early days, a large number of KOA radio listeners were farmers, and the station had a heavy emphasis on farm, weather, and agriculture market-related programming. *Farm Question Box* and *Mile High Farmer* were two of the longest-running and most popular agriculture-related programs on the station.

KOA claims a number of historical “firsts” in broadcasting. On 18 February 1927 KOA did a remote broadcast of the “hole-ing through” of the Moffatt Tunnel, which was at the time the longest railroad tunnel in the world. Using the railroad’s telegraph circuit, which ran to the entrance of the tunnel, KOA engineers ran lines more than three and one-half miles into the tunnel to broadcast the event. On 15 November 1928 KOA engineers lugged a transmitter to the top of Pikes Peak near Colorado Springs to become the first station to originate from atop a 14,000-foot peak in the Rockies. On 6 May 1936 KOA successfully broadcast a concert nationwide from a specially equipped Radio Corporation of America (RCA) Victor train heading into Denver. Leopold Stokowski conducted Stravinsky’s *The Firebird* with a portion of the Philadelphia Symphony Orchestra on board. On 27 February 1937, a ski official involved in a ski race at Berthoud Pass in Colorado was set up with one of NBC’s first “pack sets” on his back and a catcher’s mask with a microphone mounted inside. The idea was for him to describe what he saw and felt

as he sped down the mountain. The nation waited to hear how it felt to ski down a challenging mountain course. The technical apparatus worked perfectly, but the skier forgot to talk, and all the nation heard was several minutes of heavy breathing and the rush of air.

For a number of years, the KOA Staff Orchestra, an all-string ensemble, was featured on the NBC network as a sustaining program. Such programs as *Golden Memories*, *Rhapsody of the Rockies*, and *Sketches in Melody* spread the fame of the KOA Staff Orchestra across the country.

The 1960s and 1970s saw the development of KOA as a news powerhouse. The station built a reputation as a leading source of news and information throughout the Rocky Mountain West.

On 18 June 1984 outspoken KOA talk show host Alan Berg was murdered in front of his condominium in Denver. The slaying, which had political and religious overtones, generated a tremendous amount of national media coverage because of the circumstances. Berg took on many groups on his high-rated talk show, including right-wing Christians, knee-jerk liberals, and the Ku Klux Klan. There were connections between Berg’s death and a group called “The Order,” a white supremacist group in Colorado and the Pacific Northwest. The murder weapon was later found in the home of Gary Lee Yarbrough of Sandpoint, Idaho, a member of The Order.

Today, KOA concentrates its efforts as a news/talk/sports station. The station has the largest news-gathering staff in the market and carries play-by-play coverage of the Denver Broncos National Football League team, the Colorado Rockies baseball team, and the University of Colorado football games. The station’s internet address is www.koaradio.com, which includes the KOA broadcast signal.

KOB

Las Cruces/Albuquerque, New Mexico Station

KOB was a pioneering noncommercial, educational radio station established in Las Cruces, New Mexico, in the years after World War I. Affiliated with the New Mexico College of Agriculture and Mechanic Arts (NMA&MA)—now New Mexico State University—and supported by the college's engineering department, KOB began as an experimental student project using equipment salvaged from the U.S. Army. Ralph W. Goddard, a professor of engineering at NMA&MA, organized the school's Radio Club on 11 October 1919. The campus organization soon acquired not only a 500-watt Marconi standard Navy spark transmitter and 60-foot tower, but also three experimental radio licenses—5CX, 5FY, and 5FZ. License 5XD, which would become KOB, was granted on 3 June 1920.

In 1922, 500 new stations began broadcasting and KOB was one of them, going on the air on 5 April. Programming included market and stock reports, live performances, recorded music, weather reports, and news accounts provided by two El Paso newspapers, the *Times* and *Herald-Post*. The college's Agricultural Extension Service was an early ally for KOB and provided ongoing support for the radio project's contributions to rural life in southern New Mexico.

Goddard, who was eventually named Dean of Engineering at NMA&MA, was a key figure in the growth and development of KOB. He was responsible for guiding the station from its beginning as a project of the Radio Club—which was largely interested in amateur and relay work—to its status a few years later as a station broadcasting to all of New Mexico. He led efforts to expand the station's programming, facilities, and wattage, negotiating for clear channel status and a power allotment of 5,000 watts with the Federal Radio Commission (FRC); both were granted on 11 November 1928. By March of the following year, the station had been approved for an allotment of 10,000 watts, making it the most powerful college radio station in the United States and the country's 13th most powerful station of any type. In the fall of 1929, Goddard applied for FRC permission to double the station's power again, which would increase its power to 20,000 watts.

Ironically, even as KOB developed as one of the country's premier radio stations, its support from the university community decreased. In spite of continuing interest in and contributions to the station by the Agricultural Extension Service, local civic groups, and segments of NMA&MA, the college administration began suggesting in late 1928 that Goddard should start looking for a buyer for the station. This diminished administrative support for KOB would ultimately prove fatal. Goddard's dream of building an educational radio station that would broadcast throughout most of the Southwest dissolved

with his tragic death on New Year's Eve, 1929. While attempting to shut the station down for the afternoon, Goddard—whose shoes were soaked from a walk in the rain—was electrocuted. Although another NMA&MA professor was named station director and the application for 20,000-watt status was approved, KOB never recovered from the loss of its founder and most ardent supporter. Lacking his hands-on leadership and personal drive, station staff could muster neither adequate management expertise nor local support to keep KOB on the air. When the FRC began sending off-frequency reports and complaints that the station was not modulating, the college decided to accept a lease-purchase offer from T.M. Pepperday, owner of the *Albuquerque Journal*.

The station's assets were subsequently leased to the *Journal* in the fall of 1931; all equipment was transferred by truck more than 200 miles to Albuquerque in September 1932; and KOB's first broadcast from Albuquerque aired on 5 October 1932. The station's disposition was completed in August 1936, when NMA&MA sold KOB to the *Journal*'s newly-formed subsidiary, the Albuquerque Broadcasting Company. KOB affiliated with the National Broadcasting Company (NBC) the following year.

KOB is one example of the way in which a number of non-commercial, educational radio stations were transferred from public to private ownership in the 1930s. Lacking financial resources, institutional support, and strong leadership, this flagship western station could not endure as a publicly owned, noncommercial entity. Like many college stations, KOB's purchase and network affiliation helped to facilitate the development of a network-dominated broadcasting system in the United States. Many local listeners in Las Cruces were grieved by the station's departure, and the New Mexico State Legislature conducted an extensive debate about the station's sale to a private company. Governor Floyd Tingley, a New Dealer with close ties to Franklin D. Roosevelt, suggested that KOB become a state owned and operated public station, an idea that would be echoed in later discussions of state public networks elsewhere.

The North American Regional Broadcasting Agreement (1941) forced KOB (and many other U.S. stations) to change frequencies. In 1941 KOB moved to 1030 kilohertz, the same channel used by a Boston clear channel outlet. Later that year, just before U.S. entry into World War II, KOB moved again, this time thanks to a Federal Communications Commission (FCC) temporary permit, to 770 kilohertz, a clear channel frequency then used by what is now WABC in New York. The potential for mutual interference between the stations led to

the longest legal battle in FCC history. Attorneys for each station inundated the commission with legal attempts to force the other outlet off the shared frequency. KOB was allowed to raise its power to 50,000 watts in the daytime but was required to drop back to 25,000 watts at night in an attempt to protect the New York station. In 1956 KOB was also required to install a directional antenna to reduce interference with WABC. By 1962 it had FCC permission to raise its nighttime power to 50,000 watts. Legal filings from both outlets continued to plague the FCC into the early 1980s, when KOB's final appeal to overcome WABC's primary status on the channel was turned down. Both stations remain on 770 kilohertz today, with KOB continuing to shield the New York outlet by means of directional antenna patterns.

A KOB television station was added in 1948, and in 1967 an affiliated FM outlet was added in Albuquerque. The station changed hands several times; it was purchased by Hubbard Broadcasting in 1957, which operated KOB for three decades before selling it in 1986. It changed hands again several times

in the 1990s, by which time its call letters had been changed to KKOB. On 15 October 1994 the station was purchased by Citadel Communications, and by 2000 it was programmed as news/talk.

In the meantime, the university that had first supported the radio outlet lost its right to free airtime in 1951, although for a number of years that arrangement continued informally. Ralph Goddard's important role in its early years was remembered when the Las Cruces university again became a licensee in 1964 and placed KRWG (Goddard's initials) on the air as the first college/university FM station in the New Mexico. It, too, was joined by a television outlet with the same call letters eight years later.

KPFA

Berkeley, California Station

KPFA-FM in Berkeley, California, is the first station of the Pacifica radio network and the first listener-sponsored station in the United States. Poet, philosopher, and conscientious objector Lewis Hill created the station as a means to "help prevent warfare through the free and uncensored interchange of ideas in politics, philosophy and the arts."

KPFA first went on the air 15 April 1949, and controversy dogged the non-commercial station from the start. In a post-war America known for Cold War conformity and rampant consumerism, KPFA brought many non-mainstream voices to its microphones, including African-American actor and activist Paul Robeson, Zen philosopher Alan Watts, leftist commentator William Mandel, Beat poet Lawrence Ferlinghetti, political theorist Herbert Marcuse, film critic Pauline Kael, and voices from the Bay Area's academic, pacifist, and anarchist communities.

Hill created the idea of listener sponsorship in order to fund the station's operation without having to sell commercials. This freed the station of corporate control and gave it the chance to promote political alternatives. The operating funds,

Hill theorized, would come if 2 percent of the potential audience paid \$10 a year to support the station.

Listener sponsorship was not the only unusual aspect of the station's operations. In the beginning, despite a bureaucratic hierarchy, everyone on staff at KPFA was paid the same salary, and decisions were made collectively. Also, clocks were removed from on-air studios so that programs could run to their natural conclusions.

Despite such innovations, financial problems and internal tensions among the staff, the volunteers, and the station's advisory board quickly came to the fore. In 1950 the station went off the air for nine months because of lack of funds. The following year, Pacifica received a \$150,000 grant from the Ford Foundation, which allowed it to resume broadcasting.

In June 1953 Lewis Hill resigned because of internal political struggles at the station. A new group felt constrained under his leadership. Despite the internecine problems, KPFA continued to make history with its innovative and intellectually challenging programming. Throughout the 1950s, the station's public-affairs programs regularly addressed such hot-button

issues as racial segregation, economic disparity, and McCarthyism. In April 1954 a pre-recorded radio program that advocated the decriminalization of marijuana created an uproar and led to the tape's impoundment by California's attorney general.

In August 1954 founder Lewis Hill returned to run the station. But three years later, in late July of 1957, the 38-year-old Hill, suffering from crippling rheumatoid arthritis and depression, committed suicide. He left the following note: "Not for anger or despair/but for peace and a kind of home."

KPFA and Pacifica won numerous broadcast awards for children's programming and for special programs on the First Amendment by legal scholar Alexander Meiklejohn. KPFA's public-affairs director, Elsa Knight Thompson, continued pushing the broadcast envelope despite attempts to censor the station. The Federal Communications Commission (FCC), for example, questioned KPFA's broadcasts of poets Allen Ginsberg and Lawrence Ferlinghetti, broadcasts that the government found to be "vulgar, obscene, and in bad taste."

In 1960 KPFA broadcast a three-hour documentary on the riots following House Committee on Un-American Activities (popularly known as HUAC) hearings in San Francisco. It subsequently broadcast programs on homosexuality, the blacklist, and the FBI. HUAC reacted by investigating Pacifica for "subversion," and the FCC investigated "communist affiliations" at the station, but the Commission ultimately renewed KPFA's license after a 3-year delay. KPFA later gave extensive coverage to the Berkeley Free Speech Movement, and many University of California, Berkeley, faculty members were heard regularly.
