Simon, Scott 1952–

U.S. Public Radio Journalist and Host

Scott Simon has since 1985 served as host of National Public Radio’s (NPR) *Weekend Edition Saturday*, a two-hour morning show known for its offbeat take on the past week’s news events intermixed with aurally distinctive long-form feature pieces.

Simon credits the Canadian Broadcasting Corporation (CBC), Edward R. Murrow’s broadcasts, and his family’s show business background as early influences on his career in radio journalism. While working for Chicago public television station WTTW, Simon began filing stories as a freelancer for NPR in the wake of the death of Chicago Mayor Richard J. Daley in 1976; he eventually became the full-time Chicago bureau chief for the radio network. Simon first came to national attention for his coverage of an American Nazi Party rally. Simon’s report deftly edited the sounds coming from the rally organizers, the counterdemonstrators, and even the apathetic, creating for listeners a three-dimensional account of the 1978 Chicago event unrivaled by any other media report. Later assignments moved Simon to NPR headquarters in Washington, D.C., where he specialized in covering wars and human rights.

NPR created *Weekend Edition* in November 1985 as a showcase for Simon’s talents and as a symbol of NPR’s re-emergence after a period of financial difficulty. The Saturday morning show quickly earned critical approval from adults dissatisfied with commercial television’s competing lineup of

programming designed for children. In an interview, Simon names three main factors that have given his show staying power over the years. First, the show is not news-driven but rather news-intensive. For example, the show is flexible enough to cover breaking news, but it is also more reflective, with longer features than NPR’s daily radio news programs, such as *Morning Edition*, typically have. Second, Simon credits the regular cast of characters who contribute to the show, such as entertainment critic Elvis Mitchell and political news veteran Daniel Schorr. Finally, Simon says that staff of *Weekend Edition Saturday* do not run story ideas by focus groups but instead try to find interesting stories that are often overlooked by other media.

Independent observers also credit Simon’s signature style as the key to the longevity of *Weekend Edition Saturday*. Like Garrison Keillor, Scott Simon’s style of presentation is distinctive. His soft-spoken voice, somewhat high-pitched by commercial radio standards, is capable of conveying subtle emotional emphasis, especially when powered by his skillful writing, which colleagues have described as being among the best in broadcasting. Indeed, the show gives Simon a weekly slot for commentary, which is known within NPR as the “music cue” because of the music used as a bridge after the feature. Simon’s commentaries often speak to overnight news developments, because he frequently works on his scripts until

very close to airtime. In 1989 Simon won a George Foster Peabody Award for his radio essays and commentaries, which are often the subject of listener mail.

Simon's writing kindles audience members' attention in part because of his willingness to discuss his personal views. This attitude also fuels Simon's critics, who praise journalistic objectivity and see Simon's injection of his personality into the broadcast as being at odds with that aim. An example is Simon's Quaker faith: though raised in a Catholic-Jewish household, Simon is affiliated with the Society of Friends. His strong views on the death penalty, alcoholic beverages, and human rights are well known to listeners. While respecting the notion of objectivity, Simon believes it is important for journalists to have opinions and to be willing to stand publicly for issues of conscience. Addressing critics, Simon points out that he was a respected war correspondent and covered military engagements fairly despite the conflict with his religious beliefs.

In August 1992, Simon went on hiatus from NPR and hosted National Broadcasting Company (NBC) Television's revamped weekend *Today* morning programs. By all accounts, Simon's first shows were awkward and riddled with technical mistakes. Contributing to the problem were miscasting with his cohost and Simon's discomfort with the soft news features that the television show's producers wanted. After disagreements with management about the direction of the show, Simon returned within a year to host NPR's *Weekend Edition Saturday*. Since NBC, Simon's most frequent television appearances have been on the Public Broadcasting Service (PBS). In 1997 he narrated a documentary, *Affluenza*, reviews of which again focused on Simon's personality. One reviewer described *Affluenza* as Simon's sermon about Americans' wasteful consumption habits. To less controversy, Simon co-anchored segments of PBS's millennium celebration coverage.

Simon's fascination with Chicago's sports teams is a frequent topic of conversation on *Weekend Edition Saturday* and the subject of Simon's autobiographical *Home and Away: Memoir of a Fan*.

Despite his long association with public radio, Simon maintains he is not a "radiohead." He sees himself primarily as a communicator and remains loyal to public broadcasting because of his conviction that good journalism, like the best

work of Edward R. Murrow, should challenge the audience. Reflecting on the state of contemporary commercial radio, Simon says NPR alone offers him that opportunity.

Simulcasting

As television replaced radio in the 1950s, many previously successful network radio programs shifted to television. For a time, some television programs simultaneously aired their audio portion on network radio stations. Although radio listeners were sometimes annoyed by performers' references to images seen by the television viewer but invisible to the radio listener, the simulcast broadcast, with visual references, often provided a program incentive for the radio listener to purchase a television set. Music and variety programs were especially favored for radio simulcast because there was little or no loss of content for the radio listener. As television grew in popularity, simulcasting of television audio on radio declined.

A far more common form of simulcasting that went on for years involved duplication of AM programming on FM stations. As FM stations began going on the air in the 1940s, FM stations often provided 100 percent duplication of all network programs supplied to an AM sister station. Most new FM outlets were owned by and co-located with AM stations. The former nearly always carried the latter's programs. Broadcasters claimed they were trying to assist the new medium with popular programs from the old, but in fact the chief reason was that because of FM's small audiences, extra program expense made little sense. In reality, of course, simulcasting created little incentive for listeners to purchase an FM receiver. The public saw little advantage in buying an FM receiver to pick up programs they were already receiving from an AM station. About 80 percent of the FM stations signing on the air in the late 1940s were co-owned with an AM station—and most simulcast.

Duplication of programming by FM stations began to decline only in July 1964 when the first rules limiting such practice went into effect. The Federal Communications Commission specified that in markets of 100,000 residents or more, at least half the programming aired on an FM station had to be original. Full implementation of the nonduplication rule took place through the late 1960s, and the rule was extended to small-market stations by the 1970s. Although duplication did not always mean simulcasting, simultaneous delivery of programs from an AM station on an FM station was the most common form of duplication. The nonduplication rule also ended the practice of recording AM programs for playback in a nonsimulcast manner. Although widely criticized by broadcasters at the time (who would have to provide separate programming at considerable expense), the end of simulcasting soon provided a huge boost to FM popularity and a concomitant increase in demand for FM receivers.

In the late 1990s, simulcasting took on a very different meaning. Passage of the Telecommunications Act of 1996 allowed operation of multiple radio stations by a single owner

in individual markets. Some group owners have used simulcasting to extend the reach of successful urban stations to additional stations in outlying suburban areas. This strategy has also been used to introduce news or talk programs found on AM stations to listeners accustomed to FM stations. Rather than hoping to convince listeners to change their car radio programming to the AM band, a simulcast allows the listener to find the same programming on FM.

A closely related use of simulcasting has been to create a local "network" by purchasing two or more stations, usually FM outlets licensed to communities outside a major metropolitan area, and to simulcast programs on both. When the stations simulcasting the signal are not of sufficient power to cover the market, the simulcast enables listeners to change to a sister "network" station as the listener travels from the coverage area of one station into the coverage area of another.

Simulcasting has also returned as a promotional vehicle for radio stations and music video channels. Radio stations have simulcast the audio of concerts or music videos appearing on cable program services such as Music Television (MTV), Video Hits One (VH1), and Country Music Television (CMT). The simulcast enables the listener to enjoy the visual aspect of the program through cable while hearing a stereo broadcast of the same program via a radio station.

Simulcasting has also become a revenue source for some radio stations. These stations air the audio portion of a local television station's newscast either as paid programming or in exchange for station promotional mention by the television station. In some markets, group owners of radio and television stations in the same market regard simulcasting as a mutually beneficial promotion for both operations.

Singers on Radio

From the beginning of radio broadcasting, the singing voice has been a staple. While some early microphones had trouble adequately carrying powerful voices (the carbon powder would congeal, cutting off sound transmission), as technology improved, vocal music and musical variety became—and have remained—radio’s program norm.

Origins

Many pioneer stations used local singers who craved audiences and would gladly perform free for the honor of singing on radio. Early announcers were often selected for their singing ability, as they could be called upon to fill unused air time at a moment’s notice. (There were pianos in many early studios for just this purpose.) When WEAJ dedicated its New York City studio on Broadway in 1923, the broadcast featured an assortment of singers ranging from opera stars to popular songsters. Indeed, well over 60 percent of radio air time in the 1920s was devoted to some form of music, often singing.

Reginald Fessenden engineered the first broadcast of a human voice—as distinguished from transmissions of Morse code—in December 1906. His broadcast included a recording of Handel’s “Largo,” a tenor aria from the opera *Scipio*. Fessenden himself sang a Christmas song, thus becoming the first person to sing live on radio. Fessenden’s audience was made up mostly of radio operators at sea in the North Atlantic off the coast of Brant Rock, Massachusetts. About two months later, in February 1907, vaudeville performer Eugenia Farrar became the first woman to sing live on radio when she performed “I Love You Truly” as part of a similar broadcasting experiment by radio pioneer Lee de Forest.

It would be another 13 years before radio broadcasting as it is known today had its true beginning. But from the earliest days of radio, listeners left little doubt about what they wanted to hear. For example, in 1922 listeners responding to a poll by WBAY (later WEAJ) in New York City said that music was what they most enjoyed hearing on radio. But their tastes in music were widely divergent, just as they are today. Various factions wanted to hear dance music, symphony concerts, old-time ballads, religious hymns, and brass band selections,

among other styles. One decision that played a large role in determining the type of music and singers to be heard on the radio came following World War I when Congress decided that radio broadcasting would be a commercial enterprise. Secretary of Commerce Herbert Hoover, who guided the fledgling industry in its earliest days, was aghast: “It is inconceivable that we should allow so great a possibility for service, for news and entertainment, for education and vital commercial purposes, to be drowned in advertising chatter.” However, the decision to support the operation of radio broadcasting through advertising helped to ensure that most of the music broadcast on radio eventually would be popular in nature.

Early radio broadcasters were image-conscious, and operas played a major role in the content of early radio programs. Broadcasts by operatic vocalists and orchestras generated a wider appreciation for “fine music,” often among those who previously had little interest in music of any kind. As classical music impresario Sol Hurok said:

People who own sets look up programs to find out what is being broadcast. They read that an aria from *La Boheme* will be sung that night. They become interested and ask themselves, “What is *La Boheme*?” . . . In this way an interest in music is created which is beneficial because all of the listeners are prospective attendants.

Evidence of this came from the sale of phonograph recordings. Early on, phonograph record manufacturers were hostile to radio, as the sale of records initially dropped noticeably following the emergence of radio. In response, the Victor Talking Machine Company (which would later become part of RCA Victor) kept almost all of its major artists off the air, reasoning that if listeners could hear singers free over the radio, no one would pay for their records.

But by late 1924, more visionary ideas had prevailed. Victor announced “the beginning of a new era in radio broadcasting.” The company would feature its greatest recording artists in a series of radio programs. Every selection was, or soon would be, available on Victor’s prestigious Red Seal label. On New Year’s Day 1925, two of Victor’s most popular singers,

Lucrezia Bori and John McCormack, performed an hour-long program on WEA. The station estimated that 6 million listeners tuned in the broadcast, and within a week, listeners purchased more than 200,000 Bori and McCormack disks. The alliance between the recording industry and radio had been established.

Crooners

The phenomenon of the national pop music star had its beginnings on network radio. On 29 October 1929, only two days after the Wall Street crash known as "Black Tuesday," Rudy Vallee sang "My Time Is Your Time" for the first time as the host of *The Fleischmann Hour* on the National Broadcasting Company (NBC) network. Vallee's greeting, "Heigh-ho, everybody," had already become familiar to New York listeners on WABC and WOR. Soon fan mail was pouring in to NBC, so much so that the network bought the rights to "The Maine Stein Song" and gave it to Vallee to record. The song became a huge hit and earned what the *New York Times* described as "a small fortune" for NBC.

Vallee remained a popular entertainer well into the television era. He was the first well-known exponent of the singing style known as "crooning," which employed a soft, sensual style in contrast to the booming, straightforward manner of singing that had existed before electronic amplification. Crooning elicited strong attacks from traditionalists such as Cardinal William Henry O'Connell of the Boston Roman Catholic Archdiocese, who strongly denounced crooning in the January 1932 edition of *Literary Digest*, calling it

Immoral and imbecile slush. A degenerate, low-down sort of interpretation of love. A love song is a beautiful thing in itself . . . But listen again with this new idea in your head and see if you do not get a sensation of revolting disgust at a man whining a degenerate song, which is unworthy of any American man. . . . It is a sensuous, effeminate luxurious sort of paganism. . . . Think of the boys and girls who are brought up with that idea of music.

But as author Thomas DeLong explains in *The Mighty Music Box* (1980), crooning was a natural consequence of technology: "In essence, it was an adaptation to the techniques of radio broadcasting. The highly sensitive mike demanded a different mode of vocal production. Singing into the delicate carbon microphones compelled artists to use soft, almost caressing tones lest a loud or high note shatter a transmitter tube."

The Columbia Broadcasting System (CBS) soon had a large stable of crooners, including Morton Downey, Will Osborne, Kate Smith, Ruth Etting, the Boswell Sisters, and Art Jarrett. The network featured one or two 15-minute song programs

during every hour of evening programming. NBC had its own programs with Russ Columbo, Little Jack Little, Jack Fulton, Jane Froman, and the Pickens Sisters.

But crooning found its ultimate expression in Bing Crosby's vocal stylings. Crosby had already found some measure of success as a vocalist with the Paul Whiteman orchestra, singing in a group called the Rhythm Boys. As part of Whiteman's band, they had sung on a CBS program, but Crosby came to the attention of CBS's young president, William Paley, when he repeatedly heard a recording of Crosby and the Rhythm Boys performing "I Surrender, Dear" while he was on board a cruise ship. He personally signed Crosby to a CBS contract and gave him a nightly program opposite NBC's *Amos 'n' Andy* in the fall of 1931.

Singers Eclipse Dance Bands

Until this time, instrumental music performed by dance bands had enjoyed at least as much popularity on radio as vocal music. If a bandleader wished to include a vocal within an arrangement, one of the band members, often the leader himself, would step forward to sing a verse. The quality of the singing was of little concern. But after Bing Crosby shot to stardom, the singer of popular songs on the radio became as important as the dance band, and bands began to feature star vocalists. The big bands remained extremely popular, but they were fronted by popular singers such as Jo Stafford, Rosemary Clooney, Doris Day, Dick Haymes, Tex Beneke, and the young Frank Sinatra. Like Sinatra, who sang with the Tommy Dorsey band, many of the singers came to eclipse the popularity of their bands and went on to become stars in their own right. Crosby's interpretive ability also brought a new appreciation for the words of the song, and as time went on, a musical performance without the singing of a song's lyrics became increasingly rare.

Sinatra's popularity as a singer blossomed in 1943 and 1944 on *Your Hit Parade*, an NBC program that featured an ensemble of male and female singers performing the 15 most popular songs of the week. His ardent following soon surpassed those of Vallee and Crosby at their peaks. Sinatra returned for a second stint on *Your Hit Parade* from 1947 to 1949, by which time song stylists had come to dominate popular music on the radio. In a time when several recorded versions of a popular song might compete for popularity on the airwaves, the *Your Hit Parade* stable of singers, popular in their own right, would present their own versions of the songs.

Royalty Fight Brings Diversity

A struggle over the payment of royalties to composers of music broadcast on radio had the unintended consequence of bringing new musical styles to the medium. The American

Society of Composers, Authors, and Publishers (ASCAP) and the National Association of Broadcasters (NAB) clashed over a new contract that was to take effect in 1941. The broadcasters felt that the fees being demanded were far too high. When discussions over a new contract reached an impasse, the NAB created its own performing rights society, Broadcast Music Incorporated (BMI). Stations stopped playing ASCAP songs and played only BMI or public-domain tunes. BMI's creation had opened the airwaves to new styles of music. ASCAP represented the traditional popular-music composers of Broadway, Tin Pan Alley, and Hollywood. BMI opened the door to the composers of regional music—rhythm and blues, country and western, and eventually rock and roll. As a result, the talents of songwriters and singers such as Fats Domino, Chuck Berry, and Hank Williams eventually found a place on the air.

New Song Styles

Even before BMI opened the airwaves to new, sometimes earthier styles of music, black singers had been prominent on radio. Although civil rights leaders criticized the creators of radio comedies and dramas for allowing blacks to perform only in limited and often demeaning roles, numerous black singers performed on sponsored programs. As early as the 1930s, the Mills Brothers, the Ink Spots, and Louis Armstrong had network programs. Although many advertisers shied away from sponsoring programs featuring African-Americans, Ethel Waters had a program sponsored by the American Oil Company, and Paul Robeson was the featured singer on General Electric and Eastman Kodak programs. At the beginning of World War II in Europe, when Nazi oppression focused attention on the broader implications of racism and intolerance, Robeson sang the "Ballad for Americans" on the CBS series *Pursuit of Happiness*. He received a 15-minute ovation from the studio audience that continued after the program left the air. In his commanding bass voice, Robeson performed the song, which proclaimed the values of freedom and human rights, on radio programs several times during World War II. Gospel music sung by black choirs and smaller vocal groups such as the Southernaires also received a significant amount of airtime during this period.

But radio also perpetuated unflattering racial stereotypes with offerings such as the minstrel program *Plantation Nights* on KFI in Los Angeles, in which "the imaginary locale is an old Southern plantation where darkies come to serenade the owner." As with music sung by African-Americans, country and western music had a place on radio prior to the dispute with ASCAP. Network radio carried many Western programs that were especially popular with children. Many of these programs featured singing cowboys. Two of the most popular, Gene Autry and Roy Rogers, had long-running network radio

programs. *The Grand Ole Opry*, a live, Saturday night barn dance style program from Nashville, debuted on WSM in 1925. *The National Barn Dance* on WLS in Chicago became the first such program to be broadcast to a national audience. Both featured a host of new singers on radio.

Postwar Radio

By the end of the 1940s, radio had a powerful new competitor—television. As network radio lost more and more of its audience to the new medium in the early 1950s, it also lost many of its biggest stars, such as Bing Crosby, to network television. Obviously, a new localized programming format was needed if radio was to survive. The answer was "Top 40," a format that first emerged in 1949 at KOHW in Omaha, Nebraska, and at KTIX in New Orleans in 1953 under the guidance of Todd Storz. The fast-paced format was based on repetitious playing of the most popular hit records of the moment, the "Top 40." Gordon McLendon is credited with giving the Top 40 format much of its brash, flashy quality at about the same time at KLIF in Dallas.

The foundation for the Top 40 format had been laid by WNEW in New York. Under the leadership of station manager Bernice Judis, WNEW had eschewed network programming, building its success on local news and the playing of popular records since going on the air in 1934. On one of its programs, *Make Believe Ballroom*, Martin Block created the illusion of a live performance in a dance hall with a "revolving bandstand," as he played records by various groups and singers.

In New Orleans, Storz's original Top 40 format originally was a broad-based, adult-oriented format featuring hits by traditional pop singers such as Perry Como and Patti Page. Gradually, as the 1950s unfolded, the new, energetic, sexually charged music called "rock and roll" began to replace such conventional performers. Soon the growing population of young people who were its natural constituency found a messiah in Elvis Presley. When Presley hit it big in 1956 with "Heartbreak Hotel" and "Don't Be Cruel," the rock and roll landslide soon hit Top 40 radio, which quickly became synonymous with the new music. The denigration of crooning 25 years earlier paled in comparison with the criticism of rock and roll singers. But Storz defended Top 40 radio's right to play rock and roll music in the May 1958 edition of *U.S. Radio*: "Our desire is that our stations shall please the majority of the people the majority of the time. . . . Our format was built on the premise that it is not within our province to dictate by censorship, programming tastes to the American public."

Many changes have occurred in radio programming since the Top 40 format emerged. FM radio grew in acceptance throughout the 1960s and 1970s. It eventually surpassed the popularity of AM radio, greatly increasing the number of stations on the air and encouraging the development of special-

ized music formats such as urban contemporary and alternative rock. But the voices of singers heard on radio, as during the Top 40 era, continue to emanate from popular recordings.

Situation Comedy

Fibber McGee trying to get something out of his junk-filled hall closet without starting an avalanche; Amos 'n' Andy caught up in the Kingfish's latest scheme; Jack Benny considering his options when confronted by a mugger with the classic question, "Your money or your life"—these are but a few of the vivid memories from the "golden era" of radio situation comedy. With their offbeat personality flaws, idiosyncratic neighbors, and disrespectful domestic help, these characters were not just friends to their millions of listeners—they were "family."

Defining a Format

"Family" is, in fact, the linchpin of radio situation comedy. Unlike its comedy/variety relative, the "sitcom" retained the recurring cast of the dramatic serial. In fact, historians once labeled programs such as *The Goldbergs*, *Henry Aldrich*, and *The Life of Riley*, which we call situation comedies today, as "comedy dramas," thus emphasizing their dramatic story line.

Each character in the situation comedy is often a two-dimensional parody of one or two human foibles. Listen to any classic radio sitcom and you often find the "drunk," the "tightwad," the "know-it-all," the "dumbbell," and many other stereotypes. These exaggerated personality flaws define each "family member," and determine how that character interacts with the rest of the show's family, and how he or she will deal with this week's adventure. Radio sitcoms are very consistent in basic structure, but they do vary in length. Although many radio sitcoms ran for 15 minutes, most eventually settled into the more popular 30-minute length. A few even stretch to 45 or 60 minutes, but these are rare.

In the simplistic world of the radio sitcom, with its recurring characters, settings, and themes, stories focus on the main character's adventures—be they big or small. Although most stories were about the central personality, episodes occasionally spotlighted secondary characters. Unlike the radio drama, though, the situation comedy played story lines for laughs.

The basic structure of a radio situation comedy is very consistent. The show's regular cast of characters is (re)introduced to the audience. At the same time, the "comfortable" environment of their sitcom world is made clear. Then someone or something upsets the routine, adding instability to this self-contained world. The story line takes the characters through a series of dramatic yet comic adventures, each one building until the climax of the show. Along the way the audience is exposed to "running gags" and a comedy of character that transcends the week's episode. The audience also hears commercials, sometimes performed by the characters and "subtly" embedded into the story. Although not a variety show, the radio sitcom would sometimes rely on such variety staples as musical numbers and celebrity guests. At the end of the comedy drama, the adventure is resolved, and the characters are back to where they started. Change is rarely permanent in the radio sitcom world.

The term *family* is used broadly when describing the sitcom cast of characters. It identifies traditional family members but also friends and coworkers. Any group of people that the main character spends significant amounts of time with and cares a great deal for make up his or her sitcom family. Because of this liberal definition of *family*, the situation comedy might be primarily centered on the home but might just as often gravitate to a social gathering place (such as a bar) or a work environment. Any time a small group of characters could gather together, interact, and share adventures, a situation comedy was born. Radio sitcoms have often appeared in the form of soap operas, adventure programs, science fiction, even as variety shows. In fact, among the earliest sitcoms were the fictional adventures of performers such as Jack Benny and Fred Allen as they went about the day-to-day tasks of putting on their variety shows!

An important characteristic of radio comedy was that the home audience had to imagine certain elements. Radio's lack of a visual element created "theater of the mind," allowing listeners to imagine Jack Benny's clunky old Maxwell car (played by veteran voice actor Mel Blanc) and to assume that the many characters in *Amos 'n' Andy* were actually African-American (when in fact they were initially all portrayed by two white actors, Freeman Gosden and Charles Correll). But in its early days, this radio format proved to be a challenge for its stars. Coming primarily from the vaudeville circuit, radio's comedians were accustomed to interacting directly with their audience, and they often relied on visual as well as verbal humor. The former problem was solved by adding an in-studio audience.

Origins

Both radio comedy/variety and situation comedy programs trace their roots to the days of the touring circuses, burlesque shows, medicine shows, musical reviews, and vaudeville companies that thrived from the late 19th century into the early

20th. Troupes of actors, singers, dancers, poets, and comics—plus an almost infinite variety of more esoteric acts (such as sword swallowers, jugglers, and animal acts)—would take their show on the road, playing in various towns and cities on a predetermined "circuit." The makeup of these troupes may have differed, but their basic components tended to be similar. An introduction by a master of ceremonies, emcee, or troupe manager would be followed by a wide variety of acts strung together with interim commentary by the emcee. This would often build up to a grand finish featuring a more extravagant sketch or a featured humorist or singer of the day. And in most of these forms, the salesman hawking his products—an early example of a program "sponsor"—was one of the more important parts of the show.

The typical nine-act vaudeville bill would usually include as its seventh act a full-stage comedy or drama playlet as a preliminary act to the bill's climactic eighth act—often a famous comedian or vocalist. Not every vaudeville house could afford playlets featuring well-known stars. Consequently, another sort of playlet, one that relied more upon action than upon stars, was developed. Most of these were comedies, and the vaudeville comic playlet became a well-recognized model for stage comedy. These comedies of situation structure are the ancestors of the modern sitcom.

When the radio networks were first looking for talent in the late 1920s, they turned to the vaudeville circuits for acts that might make the transition to an "audio-only" medium. Radio variety was born of this siphoning of vaudeville talent for use on radio. The radio programs usually included one or two hosts, whose presence provided a skeletal structure for the program, which would showcase a variety of acts by both new and established performers. Radio adopted many vaudeville program types. The situation comedy, or "comic playlet of situation," was one of the last formats borrowed from vaudeville, possibly because it did not promote star value as other formats did.

Sitcoms in Radio's Golden Era

Situation comedy premiered nationally during the 1929–30 radio season with *Amos 'n' Andy*. Soon, situation comedies such as *Our Miss Brooks*, *Beulah*, *Leave It to Joan*, *My Favorite Husband*, *The Goldbergs*, and *My Friend Irma* filled the airwaves, and a new genre for a new medium was born.

Many of the earliest radio sitcoms were not much more than a showcase for vaudeville and film comedians who cobbled together bits from their existing bag of tricks. The Marx Brothers' situation comedy *Flywheel, Shyster, and Flywheel*—a Monday night installment in the *Standard Oil Five Star Theater* series on the National Broadcasting Company (NBC) in the early 1930s—is a prime example. Ostensibly a sitcom about the mishaps of three "shyster" lawyers, scripts were

mostly a rehash of gags from the brothers' vaudeville and film performances.

Gradually, though, more and more of the comedy in radio sitcoms was based on character, plot, and story line. A large number of shows in the 1930s straddled the fence between sitcom and variety show. Stars such as Jack Benny "played themselves," and stories were set around their fictional adventures with their equally fictional friends, family, and coworkers. ("Real person" and radio sitcom star Fred Allen maintained a fake feud with Benny for years, although the two admired each other very much in real life.) In the work environment, stories often involved putting on the star's radio variety show; thus the situation comedy was able to sneak in many of the conventions of the variety format. Although Jack Benny's fictional variety show was never actually heard during the sitcom, audiences were treated to performances by guest acts during "rehearsals" that Jack and other characters were involved in "at the studio."

As radio and its audience evolved, so did the quantity and quality of its programs. The situation comedy became one of the staples of 1930s and 1940s radio entertainment. But sitcoms about "real people" were supplanted by the adventures of fictional characters. Stories about *Fibber McGee and Molly*, *Blondie*, and *Our Miss Brooks* soon dominated the airwaves. In another indicator of radio's impact, *Lum 'n' Abner* was set in the fictional town of Pine Ridge, Arkansas, and in 1936 the real Arkansas town of Waters changed its name to Pine Ridge in honor of the show.

Demise of the Radio Situation Comedy

As radio had borrowed from vaudeville, so television borrowed from radio—for both talent and program formats. Television's first situation comedies were "inherited" from radio, beginning with *The Goldbergs* and *The Life of Riley* in 1949. Network television turned to successful formats on radio, partly as a quick fix to find programming and partly to save money. Three-quarters of early television station owners were already radio station owners.

The direct ancestry of radio to television allowed radio to contribute format styles and even entire programs to the new medium. Many programs, such as *The Chesterfield Supper Club* (hosted by Perry Como), were simulcast in an effort to save money and provide programs for the new medium. Popular radio shows were not necessarily picked up by their respective networks' fledgling television franchises. The big-three radio networks soon foresaw that their future was in television, and bidding wars erupted for the most popular radio programs. Columbia Broadcasting System (CBS) TV "stole" many popular radio shows from rival NBC's radio programs. NBC retaliated, and the American Broadcasting Companies (ABC) participated—but on a smaller scale. Radio networks became a less important part of the national media picture. Most of their

familiar program formats shifted to television, as did advertiser dollars. Radio eventually evolved into a provider of music, talk, and news.

Many established radio stars, such as Jack Benny, Red Skelton, Bob Hope, and Fred Allen, attempted to make the transition to television. Some were successful, but others were not. There were many advantages for the situation comedy in the new medium. Viewers could now see how characters fit in with their surroundings. More important, thanks to the television camera, gestures and mannerisms assumed a role impossible on radio. However, there were quite a few problems to overcome in the transition. George Burns and Gracie Allen had to throw out their scripts and learn to memorize their complex verbal comedy routines, and cameras had to be placed so they did not block the live audience that Burns and Allen and other performers needed. Ironically, performers who, several decades earlier, had had to learn how to entertain through sound alone now had to relearn how to *appear* before an audience's very eyes and still stay in character.

When *The Jack Benny Show* first aired on television, Benny had several things to overcome. At first he could not decide between an hour format or a half hour, so he settled on 45 minutes for his debut program. Future programs settled into the increasingly popular half-hour mold. Sets had to be designed and built to portray what had been left to the imagination on radio. One-time scenes and elaborate sets, such as Benny's famous vault, had to be deleted because of cost or the inability to create them effectively. But now viewers could *see*, not just hear, Benny's slow burn and his look of malaise. Visuals added a wealth of information for the viewer, but producers had to spend a lot on props, costumes, and set pieces to show us all how cheap Jack was.

One of the biggest changes to a transitioning sitcom occurred on the new television version of *Amos 'n' Andy*. Because the entire cast of characters was black, but many of the roles had been played on radio by white series creators Freeman Gosden and Charles Correll, CBS decided to do a four-year talent search for experienced black comedy actors to portray the roles. Only African-American actors Ernestine Wade and Amanda Randolph were retained from the original radio cast. Like its radio ancestor, the television version of *Amos 'n' Andy* relied on many stereotypical sitcom personalities, including ignorant, naive, and conniving characters. During its run and afterward, many groups, such as the National Association for the Advancement of Colored People (NAACP), protested the wildly popular series because of its negative representation of blacks. In spite of these protests, CBS moved the popular radio show to television, and in 1951 *Amos 'n' Andy* became America's first television sitcom with an all-black cast (it ran for two seasons). The radio version continued but evolved into a quasi-variety show called *The Amos 'n' Andy Music Hall*, which ended in 1955.

By the mid-1950s radio sitcoms—like most network radio formats—had migrated almost completely to television. One strange “reverse crossover” was *My Little Margie*, a sitcom about a well-to-do widower and his 21-year-old daughter, who was intent on “protecting him” from various female suitors. The show premiered on CBS television in June 1952 for a three-month run. NBC ran the series for a few months before it resumed broadcast on CBS in January 1953. At about the same time, the series began producing new episodes for CBS network radio. The television series returned to NBC in September 1953 and stayed there until August 1955. The radio version remained on CBS, but it also ended in 1955.

Only three radio sitcoms, *Our Miss Brooks*, *The Great Gildersleeve*, and *Fibber McGee and Molly*, were still broadcast during the 1955–56 season. *Our Miss Brooks* began on CBS radio in 1948, but it began running on television as well in 1952 with almost the same cast. Both versions of the show ended in 1956. *Gildersleeve*, a character on the *Fibber McGee and Molly* show, spun off into his own radio series in 1941. Although it had a 15-year run on radio, *Gildersleeve* was not popular enough to make the transition to television. *Fibber McGee and Molly*—which aired for 22 years—left NBC radio in 1957, permanently closing the door on network radio’s situation comedy closet. The show reappeared on NBC television for a very short 6-month run in 1959. The characters and situations in the McGee household did not transfer well to the new television neighborhood.

Although radio sitcoms ceased to air nationally in the United States in 1957, the format has not entirely disappeared. Occasionally, comedy dramas have been produced for American public radio. Imports from Canada, the British Broadcasting Corporation (BBC), and other international markets have also made their way to American airwaves. One of the more popular of these was a BBC radio sitcom disguised as a science fiction episodic serial, *The Hitchhiker’s Guide to the Galaxy*. It premiered in Great Britain in 1978 and traveled to American public radio in the early 1980s.

Skelton, Red 1913–1997

U.S. Comedian and Actor

An entertainer whose career extended from vaudeville to television, Red Skelton first gained national prominence on U.S. network radio during the late 1930s and 1940s.

Origins

Richard Bernard Skelton was born in Vincennes, Indiana, in 1913, two months after the death of his father. His mother worked as a cleaning woman and elevator operator while raising her four sons. In 1923, at age ten, young Skelton enjoyed his first taste of the entertainment business when he went backstage with actor Ed Wynn following a performance in Vincennes. Five years later, at age 15, he joined a traveling show and began to develop his many trademark characters as a vaudeville and circus clown. He appeared in the famed Haggen and Wallenbach Circus, the same circus his father had joined during the 1890s. Throughout his teens, his varied jobs included newsboy, traveling medicine show pitchman, and showboat entertainer.

While working at a Kansas City theater in 1930 he befriended an usher, Edna Marie Stilwell, and married her the following year. She became his manager and sidekick, writing some of the original material for their acts even after their marriage ended in 1943.

Radio Years

By 1937 Skelton's stage appearances were gaining national attention. Following a Toronto performance that year, he returned to the United States and appeared as a guest comedian on *The Red Foley Show* on WLW radio in Cincinnati, Ohio (his first radio appearance), and later that year on *The Rudy Vallee Show*, where he continued to appear during 1938. In 1939 he was the headline act on *Avalon Time*, a half-hour network variety show, and in October 1941 was given his own program, *The Red Skelton Show*, also known as *Red Skelton's Scrapbook*, on NBC radio.

Sponsored by Raleigh Cigarettes, the Tuesday night show featured comedy skits and musical numbers by Harriet Hilliard, Wonderful Smith, and the Ozzie Nelson Orchestra. Usually at the center of attention was one of Skelton's many zany characters, including Junior the Mean Widdle Kid ("I dood it," Junior's favorite expression, became a popular national catch phrase in the early 1940s), San Fernando Red, Willie Lump Lump, Clem Kadiddlehopper, Bolivar Shagnasty, J. Newton Numbskull, and Sheriff Deadeye, "the fastest gun in the west." By the end of its second year, *The Red Skelton*

Show was a smashing success, rated second among the national radio audience.

During World War II, Skelton performed at several military bases and munitions plants, and in March 1944 was drafted into the U.S. Army, where he served as a private. Following his discharge in December 1945, he resumed his weekly NBC broadcast with a new supporting cast, including vocalist Anita Ellis and the David Forrester Orchestra. (Harriet Hilliard and the Ozzie Nelson Orchestra had their own NBC show by that time.)

Like many popular NBC radio programs following the war, *The Red Skelton Show* attracted the attention of rival CBS chief William Paley, who lured Skelton to his network in 1949 during a talent raid that also included renowned comedians Jack Benny and Edgar Bergen. Skelton's radio variety show continued on CBS until 1952. With the advent of television, he returned to NBC to host a weekly TV variety show. After two seasons he moved to CBS television. For nearly two decades, from 1951 to 1970, *The Red Skelton Show* enjoyed consistently high audience ratings, ranking among the top 15 prime time network television series for 16 of its 19 seasons on the air.

Typical of Skelton's humor were his exaggerated jokes. "My electric toaster broke down," he once said. "So I repaired it with parts from an airplane. Now when the toast pops out it circles the table twice before coming in for a landing." In addition to radio and television, Skelton appeared in over 40 films, many of them MGM comedies in the 1940s and 1950s. They include *A Southern Yankee*, *Watch the Birdie*, *Whistling in Dixie*, *Whistling in the Dark*, and *Whistling in Brooklyn*, in which Skelton pitches in a baseball game against the Brooklyn Dodgers.

In 1986, 15 years after the cancellation of his television variety program (CBS cited "rising production costs" as the reason for canceling), Skelton accepted the Governors Award of the Academy of Television Arts and Sciences at the Emmy Awards show. His lasting distress over his program's cancellation was evident after the audience had given him a standing ovation for his award. "I want to thank you for sitting down," he said. "I thought you were pulling a CBS and walking out on me." Two years later, he was inducted into the Academy's Television Hall of Fame. He also received the Screen Actors' Guild's Golden Globe Award.

An accomplished artist, Skelton made and sold paintings of clown faces after his television career ended, fetching thousands of dollars. He also supported children's charities, including the Shriner's Crippled Children's Hospital. A foundation bearing his name is based in Vincennes, Indiana, and aids children in need.

Following a lengthy illness Skelton died at a hospital in Rancho Mirage, California, on 17 September 1997, at age 84.

DAVID MCCARTNEY

Richard Bernard "Red" Skelton. Born in Vincennes, Indiana, 18 July 1913. Performed in burlesque and vaudeville from age 15; worked in the circus as a clown; made Broadway debut, 1937; debuted on radio, 1937; debuted on film, 1938; made television debut, 1951. Recipient: 3 Emmy Awards; Screen Actors Guild Achievement Award; Governor's Award, Academy of Television Arts and Sciences; Freedom Foundation Award, 1970; National Commanders Award, American Legion, 1970; Golden Globe Award, 1978. Died in Rancho Mirage, California, 17 September 1997.

Sklar, Rick 1930-1992

U.S. Program Innovator

Rick Sklar was an important and widely imitated figure in the development and promotion of Top 40 radio, especially for ABC in New York.

Early Years

Sklar was born in New York and grew up in the Brighton Beach area of Brooklyn. He attended New York University and

while there volunteered as a writer at the city-owned WNYC radio station. After graduation he got his first commercial job at WPAC in Patchogue, on Long Island, where, as was typical with such a post, he undertook everything from writing copy to announcing news. Seeking more income, in 1954 he answered a want ad that read "copy/contact-Radio" and went to work for WINS in New York City. There he worked with legendary disc jockeys Alan Freed, Murray the K, and Al

“Jazzbo” Collins. While at WINS, Sklar wrote station jingles, created original contests and promotions, and was instrumental in the station’s dramatic rise in the ratings.

By 1960 he was at WMGM (soon changed to WHN) as program director, but within a couple of years he departed for WABC, the station that would make him a legend in the industry.

ABC Years

Sklar started at WABC in June 1962 as director of community affairs, although he played a role in most program operations from the start, including the production of promotional announcements for the station. He became the station program director late in 1963, and in a very few years he had moved the station from mediocre to spectacular ratings based on both his program and promotional ideas.

Despite the station’s miniscule promotion budget, Sklar devised brilliant ways to promote the station. His first big promotion required listeners to paint a likeness of the Mona Lisa. Sklar scored a major victory when he got surrealist painter Salvador Dali to serve as the judge. Listeners who painted the best, worst, biggest, and smallest rendition of the Mona Lisa were each awarded \$100. The promotion resulted in the station being overwhelmed with entries, but it significantly raised the public’s awareness of the low-rated outlet. By the early 1970s, nearly 6 million people a week were listening to WABC, which had jumped to the top two or three New York stations in ratings reports.

Ironically, this success got somewhat in the way of further promotional ideas. No longer could the station offer simple call-in contests for fear of wiping out the entire phone system. Taking a different tack, Sklar devised the “\$25,000 button” contest in 1974. Rather than have thousands of calls jamming the New York phone system, button spotters were hired to comb the New York area streets and award prizes to people wearing WABC promotional buttons. Sklar’s last big WABC promotion was “The Big Ticket,” in which local newspapers carried an insert that contained a ticket from WABC with a number on it. Those who heard their number announced over the air won prizes. Naturally such stunts encouraged people to listen in the hope of winning something.

Among Sklar’s many special talents was his ability to create a music playlist that attracted a young audience. Record companies courted Sklar’s imprimatur for their new artists, because exposure on the nation’s flagship Top 40 station meant other pop music outlets around the country would add the artists to their playlists. Many top performers, among them Barbra Streisand, John Lennon, Neil Sedaka, and Stevie Wonder, became admirers of Sklar and sought his support for their own recording efforts. No contemporary music station in the country was

as influential as WABC during its heyday. While at WABC Sklar was also instrumental in the development of the careers of several of the nation’s most popular disc jockeys, most notably Bruce “Cousin Bruce” Morrow, Dan Ingram, Ron Lundy, Herb Oscar Anderson, and Harry Harrison.

In March 1977 Sklar shifted focus from station to network operations when he was promoted to vice president of programming for ABC’s radio division. He helped to further develop the various ABC networks, including developing a talk-radio format. Within a couple years of Sklar’s departure from WABC, the station began a precipitous slide in the ratings, which led it to abandon its music programming in favor of talk.

Later Life

In 1984 Sklar left ABC to start his own consulting firm known as Sklar Communications, and he became a consultant to many stations around the country, including some with which he had once competed. In addition to his consulting, Sklar found great satisfaction in sharing his knowledge with students at New York area colleges. A marathon runner in his spare time, in 1992 Sklar entered the hospital for minor foot surgery to repair a torn tendon in his left ankle. An anesthesia complication took his life on 22 June 1992.

Smith, Kate 1907–1986

U.S. Radio Singer and Personality

Often referred to as “the First Lady of Radio,” Kate Smith was one of the most popular radio singers and personalities of the 1930s and 1940s. Her radio variety show rivaled that of Rudy Vallee in its popularity and impact; her daily commentary at “high noon” was part of the routine of millions of homemakers; and she set sales records in her marathon radio war-bond drives during World War II. She was known especially for her patriotism; Irving Berlin’s song “God Bless America,” which she debuted on her program in 1938, became her trademark. A generously proportioned woman with a motherly attitude toward her listeners, Smith projected a warm friendliness that suited the intimacy of the radio medium and caused many listeners to identify with her.

According to her birth certificate, Kate Smith was born in Washington, D.C., on 1 May 1907, although she later claimed to have been born in Greenville, Virginia, which more appropriately represented her small-town persona. Her father was a newspaper agent, and both her parents were amateur singers. Kate first sang publicly at a war-bond rally in 1917 at the age of nine. She was a born performer and proved a popular local attraction, winning many amateur vaudeville competitions in the D.C. area. After she graduated from high school, her father insisted that she attend George Washington University’s School of Nursing rather than go on the stage. After nine months, Smith quit and began performing in vaudeville in Washington. *Variety* reviewed her in February 1926, noting that she had “not only a good voice, but one of much volume.” Smith was a contralto and was described most often in early reviews as a “blues singer” or as a “coon-shouter” in the tradition of Sophie Tucker. Her renditions of songs were “straight” rather than jazzy; she sang in a clear, strong voice that reflected the melody and lyrics as written.

Broadway producers soon took note of her, and she appeared in three successful Broadway productions between 1926 and 1931: *Honeymoon Lane*, *Hit the Deck*, and *Flying High*. She also enjoyed several vaudeville successes, including one at the famed Palace Theatre. Smith was unhappy with stage work, however, because she felt that she did not fit in with the Broadway crowd. She neither drank nor smoked, and her weight (topping 200 pounds) often made her the object of ridicule both on stage and off. But a 1930 backstage meeting with Columbia Records talent scout Ted Collins changed her life. Collins was impressed by the power of her voice and persuaded her to make some records with Columbia. Eventually, Collins offered to become her manager, splitting the profits 50-50. Smith agreed, and their relationship, which began on a handshake, became one of the most successful partnerships in

radio history. In addition to managing her career, Collins also served as the announcer on all her programs, carefully framing and protecting her public image.

Collins decided the growing medium of radio would be an appropriate venue for Smith. He arranged a 15-minute music segment on the National Broadcasting Company (NBC) in the spring of 1931, *Kate Smith Sings*, but he switched networks when he was able to arrange a better deal with the Columbia Broadcasting System (CBS). *Kate Smith Sings*, as well as a few well-placed appearances on Rudy Vallee’s popular *Fleischmann Hour*, made Kate Smith a radio star by mid-1931. In July 1931, she was crowned “Queen of the Air” by New York mayor Jimmy Walker on the city hall steps. By the fall, her program had found a sponsor in La Palina cigars, and the program *Kate Smith and Her Swanee Music* was a big hit for CBS from 1931 through 1934. Listeners responded so quickly to Smith not only because of her vocal talent but also because she used the radio medium in particularly successful ways. From the beginning of her broadcasts, she used the same theme song, “When the Moon Comes Over the Mountain,” and the same greeting (“Hello everybody”) and closing (“Thanks for listenin’, and good-bye folks”). The repetition of these elements, as well as Smith’s simplicity and uncondescending manner, greatly appealed to her domestic audience.

When the La Palina program ended, Collins decided it was time for Smith to tour America so that her radio fans could see her. The tour, *Kate Smith’s Swanee Revue*, was meant to last several weeks, but it proved so popular that it ran for eight months. Smith also used this time to appear in a couple of films: *The Big Broadcast of 1932*, in which she had a cameo, and *Hello Everybody!* (1933), a feature film for Paramount in which she starred. Although she always liked performing live and enjoyed her tour, she did not like Hollywood and was happy to return to radio. After trying a few different formats, CBS, Collins, and Smith struck gold with *The Kate Smith Hour*, a variety program that ran from 1936 to 1945 (1936–37 as *Kate Smith A&P Bandwagon*). This enormously popular program combined song with comedy sketches, dramatic scenes from movies and Broadway, and a talk segment called “Women of America” in which Smith spotlighted and interviewed women she found noteworthy. This program launched the careers of comedians Henny Youngman and Abbott and Costello, among others, as well as the popular 1940s comedy *The Aldrich Family*.

Smith’s “talk” segments proved so successful that Collins and CBS arranged a second program for her, *Kate Smith Speaks*, a daily 15-minute segment addressed primarily to

The Kate Smith Show, 1932
 Courtesy CBS Photo Archive

housewives. "It's high noon in New York, and time for Kate Smith" began Collins' famous introduction to the series, which ran from 1939 to 1951 and was the number-one daytime program. It began with a news segment by Collins, and then Smith commented informally on various timely topics she thought would interest her readers, from current movies to recipes to social welfare issues. She often "chatted" with guest stars who "dropped by." Smith framed these programs as "heart-to-heart" talks with her listeners and did not present herself as an authority on any subject.

Smith's patriotism and her homey persona made her an especially effective morale builder during World War II, and she devoted herself to this work with uncommon energy. She expanded her broadcast schedule for Armed Forces Radio, sang countless patriotic songs, entertained the troops whenever she could, and conducted the most profitable war-bond drives of the war. She conducted four bond-drive marathons over the radio, in which she promised to stay awake as long as listeners

donated money. The most famous of these drives took place on 21 September 1943; Smith stayed on the air from 8:00 A.M. to 1:00 A.M., raising over \$36 million. The success of this particular broadcast was so remarkable that sociologist Robert Merton of Columbia University's Department of Psychology published an analysis of it in 1946. Merton interviewed several hundred of Smith's listeners and found that people responded to her appeals more than those of other stars because they believed so completely in her sincerity and felt a personal relationship with her.

Smith's popularity declined after the war, although she hosted a fairly successful television variety program early in the 1950s. She remained a popular and respected guest star on television, however, until her health began to fail in the late 1970s. She died in Raleigh, North Carolina, on 17 June 1986.

Smulyan, Jeffrey H. 1947–

U.S. Radio Executive and Entrepreneur

As a young boy, Jeffrey H. Smulyan had three things in mind: sports, radio, and the desire to start a business. A native of Indiana, Smulyan was born in Indianapolis in 1947 and grew up in a family of entrepreneurs, so such a vision came naturally and was in his blood.

He attended the University of Southern California and graduated cum laude in 1969 with a bachelor's degree in history and telecommunications; he went on to receive his J.D.

degree from the USC School of Law in 1972. He experienced his first taste of radio at USC's student radio station and developed leadership skills as senior class president. Smulyan's love of radio was greater than his experience, yet his inborn understanding and leadership abilities served him well. He returned to his native state in 1973 and officially entered broadcasting by taking on the management of WNTS, a small AM station in Indianapolis. Three years later Smulyan became manager of

another small AM station, KCRO in Omaha, Nebraska. In each case, Smulyan's father, Samuel W. Smulyan, purchased the station after his son became its manager. WNTS was acquired in 1974 and KCRO in 1979. Today both are still owned by Samuel Smulyan's estate, but they have no affiliation with Emmis.

By 1979 Smulyan was ready to begin making an impact on radio on a grander scale. He organized and became principal shareholder of the Emmis Broadcasting Corporation (*emmis* means "truth" in the Hebrew language), which purchased a small FM station licensed to Shelbyville, Indiana, located some 25 miles from the center of Indianapolis. Smulyan's intent was to build a tower close to the city and compete in the larger market. This was accomplished, and WENS went on the air on 4 July 1981 as the Emmis flagship station.

With WENS quickly becoming competitive and profitable, Smulyan and Emmis began their expansion. During the next five years, six stations were acquired, and Emmis entered the nation's number-one market, New York, in 1986 with the purchase of WHN. Smulyan renamed it WFAN (the "Fan") and launched the nation's first 24-hour all-sports radio station. He later purchased the National Broadcasting Company (NBC)-owned AM and FM stations in New York, moving WFAN to WNBC's frequency of 660 kilohertz, which provided better coverage of the market.

The all-sports concept rapidly took hold and has been copied in many other cities. Although not achieving high audience ratings at WFAN or anywhere else, it is extremely popular with advertisers, as the prime listeners are young adult males. This factor has helped WFAN become the highest revenue-generating radio station in America for several years running.

By 1989 Emmis was the owner of ten stations, and Smulyan began to diversify his interests by leading a group of investors in purchasing the Seattle Mariners baseball team. However, shortly after the acquisition, the combination of a heavy debt load, a change in bank credit rules, the oncoming national recession, and low baseball revenues forced Smulyan to sell some of Emmis' prized station holdings, most notably WFAN. The team was sold two and a half years later. Just prior to the baseball team purchase, Smulyan had moved the company into the publishing arena, acquiring *Indianapolis Monthly*, the first of several regional magazines Emmis would buy. This action would lead to the eventual name change to Emmis Communications.

After returning the company to a solid financial footing, Smulyan again began to move forward, although more prudently than during the 1980s, on the acquisition front. In 1994 it became a publicly owned company traded on the Nasdaq exchange. In 1998 Smulyan took Emmis into television ownership with the purchase of six medium-market stations. Others have since been added. It became an international company when in 1997 Emmis was awarded a license to operate a new national radio network in Hungary, which was named Slager

Radio. *Slager* is a Hungarian word, adopted from German, that means "hit." This was followed in 1999 by the purchase of FM News and Radio 10 in Buenos Aires, Argentina. The year 1999 also brought a new commitment to Indianapolis—which has been Emmis' corporate home since the company was founded—with the unveiling of a state-of-the-art building for headquarters and for housing its several area radio stations. At the time of completion, the \$35 million structure was considered by some to be the best radio facility in the nation.

Some two decades after its beginnings, the names Jeffrey H. Smulyan and Emmis are still virtually synonymous. Smulyan continues as the driving force behind the organization and has built a corporate environment known for its highly focused commitment to excellence and for its willingness to invest in its people, creating a culture that keeps employees on board for a long time. Many of the Emmis stations are among the best-performing stations, in terms of both audience ratings surveys and advertising revenues, in the radio industry.

To formalize his different approach to traditional business philosophy, some years ago Smulyan created the 11 commandments of Emmis, which are prominently displayed in all facilities. They are: admit your mistakes; be flexible and keep an open mind; be rational and look at all opinions; have fun and don't take this too seriously; never get smug; don't underprice yourself or your medium, and don't attack the industry—build it up; believe in yourself—if you think you can make it happen, you will; never jeopardize your integrity—we win the right way or we don't win at all; be good to your people—get them into the game and give them a piece of the pie; be passionate about what you do and compassionate about how you do it; and take care of your audience and advertisers. Smulyan holds or has held leadership positions within industry organizations such as the National Association of Broadcasters and the Radio Advertising Bureau, as well as with the U.S. Olympic Committee.

By 2003 Emmis owned 27 radio stations, including three FM outlets in New York, two in Los Angeles and one in Chicago, plus four stations in its hometown of Indianapolis. It also owned 16 television stations, with the announced intention of stepping up its acquisition pace by adding several more in the coming years.

MARLIN R. TAYLOR

Jeffrey H. Smulyan. Born in Indianapolis, Indiana, 6 April 1947. Attended University of Southern California, B.A. in History and Telecommunications, 1969; University of Southern California School of Law, J.D., 1972; manager, WNTS-AM, Indianapolis, Indiana, 1973–76; manager, KCRO-AM, Omaha, Nebraska, 1976–79; formed Emmis Communications Corporation, 1979; director, National Association of Broadcasters; member of American, Indiana and Federal Communications bar associations; chairman,

Board of Radio Advertising Bureau; board of trustees, Ball State University, from 1996. Received American Women in Radio and Television's Star Award, 1994; named by White House to lead U.S. delegation to Plenipotentiary Conference of International Telecommunications Union, 1994; Entrepreneur of the Year Award, Ernst and Young, 1995; Entrepreneur of the Year Award, *Indianapolis Business Journal*, 1995; ranked one of 10 most influential radio executives of past two decades, *Radio and Records*, 1995; ranked one of 40 most powerful people in radio, *Radio Ink*, 1998 and 1999; honored by National Association of Broadcasters with its Year 2002 National Radio Award.

Soap Opera

Daytime Radio Drama

Although many critics disagree on when the first soap opera was actually broadcast, most would concede that the earliest prototype for serial drama appeared on Chicago radio in the 1920s: Irna Phillips' *Painted Dreams*, a mosaic of fanciful stories about heroes, villains, and helpless victims. *Painted Dreams* did not fare very well on local radio initially, but Phillips was never discouraged by her perceived failure. She (along with Frank Hummert, an advertising executive, and his wife Anne) was convinced that a successful serial format in newspapers and magazines could translate well into radio. Within a short time, Phillips and both of the Hummerts were proven right; *The Smith Family*, premiering nationally in 1925, became an instant hit. The program was built around two vaudevillians, Jim and Marion Jordan (who later became Fibber McGee and Molly). Later, *The Smith Family* was joined by *Clara*; *Lu 'n Em*; *Vic and Sade*; *Just Plain Bill*; *The Romance of Helen Trent*; *Ma Perkins*; and *Betty and Bob*.

The meteoric rise of daytime serial drama was a phenomenon that had not been foreseen by most programmers, and certainly not by any advertisers. In fact, the networks' first impulse was to reject the notion of any type of series targeted toward women. They thought it foolhardy and unprofitable because of the seemingly unattractive listening population of unpaid workers (housewives—unattractive because of their perceived lack of impact on revenues generated for sponsors) during the afternoon time block, and also because of the questionable cost efficiency of providing serious drama in continuous segments.

Despite these reservations, however, the networks decided to experiment with several 15-minute "episodes," provided at discounted prices, to interested sponsors in the early 1930s. Most advertising support for these daytime dramas came from corporations such as the Colgate Palmolive Peet Company and Procter and Gamble, who sold household products to interested female listeners. Thus, the term *soap opera* was coined to describe the melodramatic plotlines sold by detergent companies.

In retrospect, those who gambled on the success of radio soap operas need not have worried; the format seemed to be a perfect complement to the medium. Relying completely on sound, radio producers spread news, information, musical entertainment, and folktales. In minstrel tradition, narrators could easily set the stage for radio drama, providing descriptions of characters and settings for the stories. Within minutes, listeners (mostly women) were ushered into an imaginary world (guided by the narrator) with friends and enemies they might never encounter otherwise. In short, they became participants in a place more exciting, dramatic, and compelling than the home from which they listened.

Thus, the introduction of daytime drama met with as immediate a success as the evening serial counterpart had enjoyed. Devoted listeners faithfully followed the lives and loves of their favorite soap opera characters. And, much to the networks' surprise, housewives were not an unattractive listening demographic to possess. In fact, programmers soon discovered that homemakers, though not directly in the labor force, often con-

trolled the purse strings of the household economy. By 1939 advertising revenue for the popular serials had exceeded \$26 million. Less than ten years later, Procter and Gamble was spending over \$20 million each year on radio serials. Housewives had indeed found an alluring substitute for previous programming fare (such as hygienic information, recipe readings, and household tips) and were demonstrating their consumer power as well. Network programmers and advertisers had inadvertently stumbled onto an undiscovered gold mine. However, creative programming was not the only reason for the immediate popularity of radio soap operas. To better understand the success of daytime drama in the 1930s, it is important to look at two additional factors: the story formula and its relationship to Depression-era America

Serial Drama and the Cultural Landscape of 1930s America

Irna Phillips was a major contributor to early soap opera formula and content. She concentrated on characterization more than plotline fantasy and later became noted for introducing “working professionals” (doctors and lawyers) to daytime serials. To her, the events were far less important than how they were interpreted or acted upon by her characters. Unlike Phillips, Frank and Anne Hummert believed strongly in plot-driven stories, developing an “assembly-line” or formulaic approach to soap operas that has continued to be successful in today’s media. Together, these radio pioneers created a solid genre for future generations.

The Hummerts originated many of the popular early daytime dramas such as *Just Plain Bill*, *The Romance of Helen Trent*, and *Ma Perkins*. They based most of their stories in the Midwest—an ideal setting for several reasons. First of all, the Hummerts’ ad agency was located in Chicago. Practically speaking, they felt their soap operas should be produced there to cut expenses and to enable them to exert more creative control. Further, since most of the Hummerts’ life experience came from the Midwest, they were more confident having their ideas and plots set there. Finally, the Hummerts felt that the Midwest carried with it an accurate reflection of American values, attitudes, and lifestyles. It seemed to be an ideal part of the country for audiences to associate with the familiar themes of daytime drama, known as the “Hummert formula.”

The Hummerts’ story formula was really quite simple: they combined fantasies of exotic romance, pathos, and suspense with a familiar environment of everyday life in a small-town or rural setting. Combined with an identifiable hero or heroine, this formula produced an overwhelming audience response: people everywhere shared common needs, common values, and common problems.

This broadcast unity of beliefs and attitudes was especially important during the Depression era, when poverty, unemploy-

ment, and general political pessimism threatened the very fiber of American family life. Women, in particular, felt threatened. Although most were not laid off from jobs themselves, they found themselves demoralized as those around them, one by one, lost work. Household incomes declined markedly, and women were forced to feed, clothe, and shelter their families with far fewer resources than before. Amid their discouragement, listeners relied on soap opera characters such as Ma Perkins and *Just Plain Bill* Davidson—common folks who could survive despite overwhelming odds. Their victories over the trials and tribulations of daily living gave many Americans the feeling that they, too, could and would survive.

By 1936 soap operas began to dominate the daytime radio dials. *The Goldbergs* moved from its prime-time perch to afternoons (followed in 1937 by *Myrt and Marge*); several Hummert dramas premiered (including *David Harum*, *Rich Man’s Darling*, *Love Song*, and *John’s Other Wife*); and a soon-to-be-famous soap writer, Elaine Carrington, debuted her first work, *Pepper Young’s Family*. In 1937 more daytime drama appeared, some worthy of note (such as *The Guiding Light*, the longest-running soap opera in radio/television history), and some better forgotten. However, the total impact of radio serials had finally been realized—both negatively and positively—and as such, the serials became open to criticism from women’s groups such as the “Auntie Septics,” who argued that story lines with suggestive sex, faulty marriages, and subsequent divorces threatened the survival of the American family unit; or followers of New York psychiatrist Louis Berg, who argued through his “hypodermic theory” that messages from soap operas, when “injected” into American listeners’ heads, directly precipitated all sorts of psychosomatic traumas, including blood pressure problems, heart arrhythmias, and gastrointestinal disorders. These political action groups were often supported by male doctors who resented the implied superiority of serial female protagonists. The moral proselytizers ultimately faded away, in large part because of network and advertiser resistance as well as public admonishment of people like Berg, who was found to have based his research solely on his *own* blood pressure and pulse. Soap operas had survived not only the effects of the Great Depression, but the potential ruin caused by their detractors as well.

The 1940s: A Golden Age for Radio Soap Operas

As daytime drama entered the 1940s, several characteristics of serial writing emerged. First, characterization was simple, straightforward, and easily recognizable. Since most daytime radio listeners were women, listeners could identify with a woman who led a simple life yet was also a solid citizen and model for others in her mythical community.

Second, characters found themselves in predicaments that were easily identifiable by their listeners, with settings easily

imaginable to those who had never traveled far beyond their home environment. As Rudolf Arnheim discovered in his study “The World of the Daytime Serial,” soap opera characters seemingly preferred commonplace occurrences in their own hometown, as opposed to problems in an unknown environment. And, when circumstances necessitated travel, the new setting invariably was in the United States. Arnheim surmised that soap opera producers refrained from international travel because they felt listeners would not enjoy a foreign setting that would demand that they imagine a place outside their own realm of experience.

Third, most of the action revolved around strong, stable female characters, who were not necessarily professionals, but who were community cornerstones nonetheless. Men were very definitely the weaker sex in soap opera life—a direct reflection on the primary listening audience during the daytime hours.

Finally, daytime drama was often used as a vehicle for moral discussions or a rededication to American beliefs and values. Soap opera heroines often voiced the platitudes of the Golden Rule as well as the rewards that would come to those who could endure the trials and tribulations of living in a troubled society.

After World War II, economic “happy days” returned and soap operas reflected this boom with more career-oriented characters (especially women). But negative postwar elements also emerged, such as postwar mental stress and alcoholism. All these and more were discussed on Ma Perkins’ doorstep—with often easy solutions—keeping the “painted dream” of America alive and well.

Career women became more numerous in the 1940s because of writers like Irna Phillips. Phillips also introduced mental problems and amnesia to daytime drama, to reflect America’s postwar interest in psychology. Usually a central character suffered some type of emotional malady such as memory loss, a nervous breakdown, alcoholism, or shell shock as a result of wartime stress. Also, psychosomatic paralysis was a common affliction of the long-suffering soap opera heroes and heroines.

Toward the end of the 1940s, crime emerged as an important plotline theme, especially in the area of juvenile delinquency. This direction was also reflective of the times, for Americans were becoming increasingly concerned about youth crime. Criminal story lines continued throughout the early 1950s and continue to be an important theme in daytime drama on television (although the situations have been updated considerably).

The 1950s: The Move from Radio to Television

In the early 1950s, most soap operas moved from radio to television, and the resulting change in technology was felt at all levels, including scriptwriting, acting, and production. The

visual medium of television allowed for a wider choice in soap opera settings, because writers were not forced to limit themselves to the experiential world of radio listeners. Rather, they could take their characters anywhere, as long as they visually established the appropriate setting. However, the visual element in television also had distinct limits, for soap writers could no longer rely on “imagination” to set a scene.

Despite many writers’ strong preference for radio, most writers, like Irna Phillips, readjusted themselves to the new medium. Phillips’ way to explore television’s strengths was to use more reality-based themes in established soap operas like *The Guiding Light* (a Phillips creation, moving from radio to television in 1952) as well as to write new soaps, such as *As the World Turns* (with Agnes Nixon), *Another World* (with Bill Bell), *Days of Our Lives*, and *Love Is a Many Splendored Thing*. Phillips’ stories, along with those of other serial writers, such as Roy Winsor (*Search for Tomorrow*, *Love of Life*, and *The Secret Storm*) and Irving Vendig (*Edge of Night*), were lauded by both viewers and critics: ratings skyrocketed and scholars now asserted that daytime TV drama was both entertaining and informative.

In the mid-1950s, some soap operas expanded to 30 minutes, as compared to the 15-minute capsules of the 1930s and 1940s. Because viewers could now see their characters, plotlines became more slowly paced to capitalize on all the advantages of the visual medium such as character reactions and new locales. In fact, a common plotline such as a marriage proposal could last for weeks in a 1950s television soap. After the male character “popped the question” in *Secret Storm*, for example, several days of programming would be spent learning the reactions of both principal and supporting characters for this event: the bride-to-be, her mother, her old boyfriend, his old girlfriend or ex-wife, his secret admirer, her secret admirer, and so on. The possibilities were endless. Thus, one major plotline could sustain itself for weeks longer on television than would be possible on radio despite the added 15 minutes of programming each day. But was it any more effective? Some would argue yes; others would disagree.

The fact remains that many television soap opera plots in the 1980s and 1990s seemed to have changed little since their birth in the late 1920s. Stories still revolve around issues of love, family, health, and security within a cultural context—much like early radio serial drama. And even today, according to author J. Fred MacDonald (in *Don’t Touch That Dial*), TV soap opera characters respond to these issues with the same philosophy as their radio predecessors used, which was best expressed by Kay Fairchild, a central character in a 1940s radio serial called *Stepmother*:

All we can be sure of is that nothing is sure. And that tomorrow won’t be like today. Our lives move in cycles—sometimes that’s a good thing to remember,

sometimes bad. We're in a dark valley that allows us to hope, and to be almost sure that we'll come out after awhile on top of a hill. But, we have to remember, too, that beyond every hill, there's another valley.

One of the greatest frustrations of serial drama is that the storylines are neverending—though the last seven daytime serials left the Columbia Broadcasting System (CBS) altogether in late 1960. Ironically, this is also one of its greatest attractions. As a result, soap operas are one of most recognized genres of broadcasting today, enjoying consistent audience devotion and popularity in a world where most success is as ephemeral as the last ratings period. And it all began on radio.

Social Class and Radio

Research in social class attempts to explain how and why societies are divided into hierarchies of power, prestige, or wealth. Studies of social class and media examine how mass media reinforce or reproduce this persistent "stratification" of society. Of all the mass media, radio is an especially rich subject area for the study of social class because radio itself has had several definitions over its history. Each of its several incarnations—wireless telegraph, popular hobby, mass medium, and music utility—presents different opportunities for the exploration of social class.

Radio was a conspicuous newcomer in both U.S. and British culture between 1920 and 1950, the subject of constant debate among scholars, journalists, and politicians. During this period, radio's prominence may be likened to the role of television in today's culture. As a result, nearly all in-depth studies of radio take this golden age as their subject. Very few studies

focus on social class in their research; however, from the many cultural, social, and oral histories of radio as well as ethnographic accounts that make up our understanding of radio's audience, it is possible to arrive at some generalizations about radio and social class. Foremost of these is radio's image as an essentially middle-class medium and the creation of a new middle-class culture of consumption and home-centered leisure in the advanced industrial world.

What Is Social Class?

Journalists, critics, and academics often use the concept of class rather casually, referring to the lower, middle, and upper classes, without explaining what they mean by these terms. Typically class is used as a synonym for level of income or wealth. Class is considerably more complex, however, than

this casual use suggests. Most media researchers adopt one of two approaches to class: either the approach in the United States that emerged from a sociological tradition in the 1940s and 1950s, or the British Cultural Studies (BCS) approach that developed out of a Marxist literary studies tradition in the 1960s.

American media studies rarely use social class as an object of study or a unit of analysis. Social critic Benjamin DeMott has criticized U.S. culture and other cultural critics for accepting a “myth of classlessness,” the assumption that nearly everyone in U.S. culture is (or aspires to be) within the bounds of middle-class taste and values. U.S. media, according to DeMott, reinforce this myth (DeMott, *The Imperial Middle: Why Americans Can't Think Straight about Class*, 1990). On the rare occasion that social class is defined in the sociological tradition, it is often considered a product of four factors: occupation, education, income, and/or self-identity. As an example of this approach, Melvin Kohn's 1969 book *Class and Conformity: A Study in Values* uses the factors listed above, coupled with statistical analysis, to arrive at useful insights into the workings of social class within families and society.

BCS has grappled with the meanings and definition of social class in a much more critical manner than has sociological analysis in the United States. Accordingly, there are many interpretations of class within BCS. However, most cultural critics would agree that the BCS conception of class fuses the thinking of three important figures: Karl Marx, Antonio Gramsci, and Pierre Bourdieu.

In Marx's conception of class, the divisions between the “three great classes” (capitalist, bourgeoisie, and proletariat) are essentially economic. The capitalist class uses its wealth and property ownership to dominate and organize society according to its own interests.

Antonio Gramsci, an Italian intellectual writing in the 1920s and 1930s, highlighted the role of conflict and negotiation in social structures. Gramsci's theory of “hegemony” states that maintaining control in a social order requires the upper class to constantly *reinvent* its social dominance. Because the upper classes cannot simply dominate all classes at all times, Gramsci argues, class power must operate through the power to define the nature of “prestige” in a society as well as control of political and military force. Gramsci's ideas are significant in their recognition that power relations between social classes are inherently unstable. He also acknowledges schools, families, and media as important battlegrounds in the ongoing struggle for class hegemony. These ideas opened the door to thinking about social class as more than a product of economics, but also a cultural process.

Pierre Bourdieu, a French sociologist, coined the term “cultural capital” to describe how cultural products (books, media) and cultural knowledge (languages, rituals) serve as markers to reinforce social class as it passes from generation to

generation. Cultural capital not only helps reproduce social class, but can also translate into an economic advantage and thus a better economic class position for individuals. Using Bourdieu's ideas, media researchers are able to link cultural experiences, such as listening to the radio, accessing the internet, or attending “high art” events such as the opera, directly to the formation and reproduction of social stratification.

Social class can be a powerful analytic tool, a way to better understand group or individual behavior and choices within a historical and social context. However, social class is also difficult to define; the stratification it describes is subject to change and multiple interpretations. Social class may be defined as a product of economic position, cultural position, psychology, or values, yet any particular set of class labels—lower class, working class, middle class, upper class, or elite—will always be inadequate, a simplification of a complex reality. Furthermore, the boundaries between classes are often unclear, and individuals may belong to multiple classes.

Radio: The Middle-Class Medium?

The prevailing attitude toward social class and radio in most historical or institutional research can be summed up by a quote from Fred MacDonald's 1979 book *Don't Touch That Dial*: “Seeking to please an audience of millions of relatively free-and-equal, middle-class citizens, radio inevitably reflected the democratic environment which it served.” In other words, radio is widely perceived as a medium successfully catering to all people, serving up a stew of politics, news, sports, music, and drama that represents a perfect mix of the tastes and values of the population as a whole. Some see radio as the beginning of “homogenizing” the culture of the United States. National networks standardized the nation's news and entertainment as it pulled together the first mass audience in history. It ironed out sectional differences and gave the nation a common culture. However, more recent studies have begun to question whether radio is truly a “middle-class medium.”

Radio's association with the middle class began early in its history. In her 1987 book, Susan Douglas describes radio's most prominent inventors and entrepreneurs, most of whom emerged from middle-class or upper-middle-class backgrounds. After the turn of the century, thousands of hobbyists converged on the new technology, building transmitters and receivers to experiment and socialize in “the ether.” This subculture, Douglas says, was “primarily white, middle-class boys and men who built their own stations in their bedrooms, attics, or garages” (see Douglas, 1987). The amateur operator credited with making the first professional broadcasts, Frank Conrad, was a white, middle-class engineer employed by Westinghouse.

The popular press and news media supported the image of resourceful, average, middle-class boys and men mastering this

“new frontier.” However, there were female and working-class radio buffs as well. Michele Hilmes (1997) has countered Douglas’ description of the amateur operator subculture, arguing that the popular press ignored amateurs outside the mainstream of male, middle-class culture. From its beginnings, Hilmes argues, radio was seen as a threat to established social hierarchies such as class, race, and gender—that is, a threat to the hegemony of white, middle-class values. According to Hilmes, the popular press chose to portray white men and boys as icons of wireless because they were less threatening to the social order than women or working-class male operators.

The opposition between “working-class culture” and “middle-class culture” animates many of the inquiries researchers have made into radio’s development as a mass medium. Cultural critics, including Raymond Williams, Jacques Donzelet, and Simon Frith, have noted how radio’s success shifted entertainment into the domestic sphere, away from collective spaces such as taverns, dance halls, or simply the front porch or street. Such a change was related to class because outdoor amusements were associated with the lower classes, the “unruly masses,” while home-based entertainment was considered more genteel and middle-class. In an oral history of early radio, “The Box on the Dresser,” Shaun Moores writes that the radio could only become a fixture in the home if it could be accommodated within an existing structure of family relations, routines, and patterns. The radio schedule was quickly shaped to fit the patterns of middle-class family life, intertwining with mother’s housework, father’s job, and the children’s schoolwork and bedtimes. Radio’s reorganization of leisure time is one example of how radio interacted with large-scale social transformations in the early 20th century, such as industrialization, urbanization, and the rise of consumer culture. If radio seemed to represent the interests of the middle class, it was in part because middle-class interests were beginning to occupy the culture as a whole.

Radio’s threat to established hierarchies extended into its golden age. Hilmes locates class awareness in the advertising men who produced radio’s most popular programs, most of whom were well-educated, upper-middle-class men. As the group responsible for filling the radio schedule, they reinforced existing class, race, and gender distinctions through their programming choices. For example, the dialects heard on *Amos ‘n’ Andy* or *The Goldbergs* and the ethnic stereotypes used by Fred Allen in his “Allen’s Alley” sketches reinforced long-standing social differences. Meanwhile, the stories on dramatic programs and soap operas and ubiquitous home economics programs presented middle-class family life as the social norm.

Economic reasoning lay behind this appeal to the middle class. In the United States, radio programs were built with a powerful imperative: to appeal to an identified market of listening consumers. As Eileen Meehan has written, ratings systems developed to measure this market were deeply influenced

by class. For instance, the first two widely used ratings methods, the Cooperative Analysis of Broadcasting (CAB) and C.E. Hooper’s “Hooperatings,” relied on telephone interviews to gather data. However, the telephone was still a relative luxury in the early 1930s. Thus, CAB and Hooperatings did not measure the listening habits of all homes with radios but rather only the habits of homes with radios *and* telephones—homes that represented what Meehan calls the “thoroughly modern, consumer-oriented middle-class” (see Meehan, 1990). Subsequent ratings systems for radio and television, including the Arbitron ratings, still rely on this conception of the audience, literally defining *audience* as only those people that most appeal to advertisers.

Unlike the American broadcasting model, which served predominantly commercial interests, the British Broadcasting Corporation (BBC) was formed to serve the principle of public service. Perhaps as a result, social class is more prominent in British studies of mass media. By most historical accounts, assumptions about class differences and tensions deeply influenced the BBC’s programming. “Serious” programs, such as classical music and public affairs, targeted the bourgeoisie, while popular “light entertainment,” such as dance music, was included for the working-class audience. In a 1983 article, Simon Frith challenged this interpretation of the BBC’s popular programming. Frith argued that light entertainment on the BBC was a “middlebrow” form that both entertained a mass audience and fulfilled the BBC’s public service charge, but at the cost of producing programs that were wholesome, yet bland and repetitive. David Cardiff revisited Frith’s argument in a 1988 article to suggest that comedy on the BBC was also a middlebrow creation, but in no way bland or repetitive. Rather, by simultaneously addressing a mass audience and representing the culture of the elite through comedy, the programs resolved class tensions by deflating perceived differences with laughter.

The construction of middle-class audiences does not tell the entire story of social class and radio. The power of radio (or any form of media) to reshape the identity of its audience is an open debate. Elizabeth Cohen (1989) has questioned the ability of institutions of mass culture—chain stores, movies, and radio—to erase the differences between classes at the grassroots. In her studies of Chicago’s working class, Cohen has pointed out that broadcasting was an intensely local enterprise through the 1920s and into the Great Depression. It featured talks by local personages, ethnic/nationality hours, labor news, church services, and vaudeville acts familiar to local communities. Furthermore, working-class audiences were likely to build their own radios (avoiding high-priced, mass-produced “parlour sets”) and engaged in communal listening in stores, social clubs, and neighbors’ homes. In other words, rather than blanketing communities with a unified mass culture, early radio promoted affiliations within existing groups through their ethnic, religious, or working-class identities. Similarly, radio had

an appeal to rural populations distinct from its urban, middle-class image. As late as the 1940s, the differences between rural and urban life in the United States were stark. To label these families as representative of either the middle class or the working class would be inaccurate, for rural America was a culture apart in many ways. Nonetheless, as Richard Butsch (2000) describes, radio broadcasts as early as the 1920s began to address the particular needs and tastes of rural audiences. Although radios spread slowly into rural areas because of the prohibitive cost of owning and operating the radio sets, they were among the most coveted and prized possessions for rural families. Like Cohen's working-class audiences, rural families built and maintained their own radios and practiced communal listening well after most urban audiences had retreated into isolated domesticity.

The emergence of talk radio as a potent political force over the last 20 years has raised questions about the potential for radio to represent social classes traditionally cut off from political discourse. For instance, the populist uprising that derailed President Bill Clinton's nomination of Zoe Baird for Attorney General in 1993 has been attributed to a "spontaneous combustion" of working- and lower-class voices. Benjamin Page and Jason Tannenbaum (1996) have described how mainstream media communicators, influenced perhaps by their own class position, initially treated Baird's tax violations as a trivial matter (she failed to pay Social Security taxes for illegal aliens she had employed). However, an intense reaction materialized through the medium of participatory talk radio, influencing members of Congress and the media and leading to the withdrawal of Baird's nomination. The Baird case may be an exception. In other instances, talk radio commentators have been critiqued for the intensity of their political rhetoric and attraction to scandal. Whether talk radio has inspired a kind of "direct democracy" for the working-class, as the Baird example suggests, or simply given voice to the more angry and intolerant voices in society is a matter for debate.

The case of WCFL, the only radio station to be owned and operated by a labor union, presents another example of working-class interest in radio. The Chicago Federation of Labor founded WCFL in 1926 as a platform to broadcast entertainment and information of interest to the labor unions and the working class. WCFL struggled to survive as a listener-supported station, undermined by a hostile business and regulatory environment, high operating costs, and stiff competition from better-financed commercial stations. By the late 1930s, WCFL had adopted the commercial model of broadcasting. However, the station remained a symbol of resistance to corporate-controlled media and continued to provide news from the perspective of organized labor. WCFL's organizers also hoped to preserve working-class culture, including the music, theater, and art of local ethnic groups and pro-union artists, much of which was being replaced by the avalanche of popular culture

coming from Hollywood and New York radio studios. WCFL stayed on the air into the 1970s, although it had lost nearly all pretensions of being the "Voice of Labor." The barriers faced by WCFL are a good illustration of the problems faced by all alternative media. Today only community radio, low-power radio, and, to a lesser extent, public radio provide media outlets for social classes whose art and issues are rarely seen or heard, yet all face perennial problems securing adequate funding and political support, and proving their "relevance" in an industry driven by audience ratings.

Although radio technology and programming have changed dramatically since the 1930s, the economic realities of commercial radio have changed very little. Nonetheless, there are few studies of modern radio that address social class in even a peripheral way. There is some irony here, because the modern radio environment may be more class-inflected than ever. Contemporary radio is marketed to narrow, well-defined niches of the population as ratings companies track the age, gender, ethnicity, and education of audiences in fine detail. Formats are built with a particular audience's tastes, politics, and languages in mind. Meanwhile, the ideal listener is still conceived of in terms of his or her ability to buy advertised products. Understanding how society is organized economically and culturally is central to the task of understanding social class, and radio remains a powerful expression of both economics and culture in the 21st century.

Social and Political Movements

Radio has often played a very significant role in social and political movements. Its relative cheapness and portability (especially in the age of transistors), and even its ability to be concealed, have rendered radio particularly suitable for waves of public protest and movements of dissent. The focus here will be not the rendition of social movements by mainstream radio stations, but rather three examples of the direct use of radio by such movements: the anti-colonial revolution in Algeria in the years 1956-62; the role of two "movement" radio stations in the defense of Portugal's democracy following the overthrow of its fascist dictatorship in 1974; and the free radio movement in Italy in the mid-1970s.

Algeria, 1956-62

The Algerians' anti-colonial revolt was a supreme litmus test for France. Defeated militarily in its colony of Vietnam just two years previously, the French elite officially viewed Algeria not as a colony at all, but as "overseas" France. Seemingly confirming this was the presence of a million French settlers, some there for generations. To lose Algeria in battle meant a second, unthinkable humiliation, striking at the heart of the French elite's sense of their nation's world power. Even the French Communist Party sharply distanced itself from the Algerian rebel.

Frantz Fanon, a psychiatrist from Martinique working in Algeria who subsequently joined the rebels, has provided an

extraordinary account of the role of radio in the uprising. Until the revolutionaries began to use radio to communicate their message, radio had been widely seen among ordinary Algerians as a technology to support French cultural domination and the settler colony. For language reasons in part, but also for reasons of cultural propriety, a radio set in the house would have symbolized the welcome of French authority and an alien culture.

However, when the Voice of Fighting Algeria went on the air, there was an almost immediate change in Algerians' attitude to the medium. Receiving sets began to sell in droves. The organizers of the station were members of the Front de Libération Nationale (FLN), a guerilla organization. The station began to broadcast more frequently from 1954 and announced schedules from the end of 1956. It broadcast from Rabat (Morocco), Tunis (Tunisia), Cairo (Egypt), and Damascus (Syria). The broadcasts were made in Arabic, French, and Berber in an attempt to emphasize the unity of all anti-colonial forces in the country.

The French occupation forces' propaganda now had an interlocutor who could challenge such claims as that the rebels were responsible for invading a village, blowing up its houses and massacring its inhabitants. The rebels' radio could also bring news of United Nations votes condemning the French occupation forces, and of support from Egypt and other voices in the Arab world. Not least, it could set out its proposals for the future when colonial rule had been overthrown.

The French authorities' response was to ban the sale of battery chargers (few Arab homes had piped electricity) and to take the presence of a radio set in any house they invaded as direct evidence of support for the rebels, with corresponding violent reprisals. They also jammed the station, forcing it to relocate its signal several times a day. People would spend hours roaming the dial to find the new frequency, but even when they could not, the mere sound of the continued jamming static signified that the struggle was still continuing.

The Algerians' story has global implications. Algeria, Cameroon, Cyprus, Vietnam, and Zimbabwe were among the relatively few colonial territories that fought their colonial masters militarily. They were tremendously important in convincing Britain and France that they could not hold on to their empires forever, and in persuading them to negotiate with independence movements peacefully elsewhere. The role of radio in helping to galvanize the Algerian revolt thus had implications far beyond Algeria's borders.

Radio and the End of Portuguese Fascism and Colonialism

In April 1974, the Portuguese dictatorship (in place since 1926) was overthrown by a group of army captains. They were of different minds, but two desires united them: their determination to be rid of the regime and its brutal secret police, and their resolve to end Portugal's centuries-long but hopelessly costly colonial rule in Africa. There were several attempts to restore the former regime in the 18 months that followed. During this period, two stations, Rádio Renascença and Rádio Clube Português, steadfastly operated in the capital of Lisbon as a forum for the public to unite around the country's new direction.

It is important in evaluating these stations' role to realize that not only Portugal had a stake in the outcome. The new independence of Angola and Mozambique left apartheid South Africa and the white racist regime in former Rhodesia geographically isolated as the last holdouts of European rule on the African continent. Spain, in the last years of dictator Francisco Franco (1939–75), no longer was a haven for fascists as it transitioned to democracy, which in turn was a beacon for many Latin Americans in the 1970s as they struggled with their own military regimes.

Until April 1974, Rádio Renascença had been nominally a Catholic station, but with minimal religious programming. Its political slant was extremely conservative, with its news staff forbidden to mention the reform-oriented social doctrines of the Second Vatican Council. Rádio Clube Português had had owners close to the Franco regime. With the long-suppressed voices of the Portuguese public suddenly unleashed in the streets (in wall-posters and murals and graffiti) and in parts of the press, these two stations opened up the airwaves to the throng of those delirious with the opportunity to be heard at

long last. It was over Rádio Clube's transmitter that the popular song "Grandola" was broadcast, serving as the signal for the army captains' bloodless overthrow of the dictatorship.

Of the two, Renascença was the more free-form and anarchic, Rádio Clube the more recognizable in conventional professional terms. Renascença made its microphones available to virtually every group involved in the movement of change. It also tried to broadcast regular religious services (which its previous management had not done), but ran into a wall of opposition from the Catholic hierarchy, itself deeply compromised with the former regime. Some Rádio Clube newsmen were close to the Communist Party, but they were a small minority. Basically its structure and format, although hospitable to the new political climate, strove to provide balanced news.

Both stations were popular in different ways. When it looked as though Renascença might be closed down because of Vatican and Western governments' pressure, a huge demonstration spontaneously erupted in its support. Rádio Clube always had solid finances because advertisers accepted that its determination to be fair to all sides was popular with its listeners. However, both stations, but particularly Renascença, became international political footballs among the member nations of the North Atlantic Treaty Organization (NATO), whose elites were terrified that Portugal might become a Soviet neo-colony. Even Pope Paul VI publicly denounced Renascença. The actual prospect of a Soviet takeover was highly implausible, but was energetically touted by other political parties in Portugal who saw this as a means to garner foreign support and funds, as Portugal was the poorest nation in Western Europe at that time.

In November 1995, as a major gesture to the stations' symbolic status for NATO governments, a new government first dynamited Renascença's transmitter and then took over Rádio Clube. It was a sad and messy ending, in the name of democracy, for two stations that had sought to serve the public rather than the prevailing power structure.

Free Radio Explosion in Italy

In 1976, faced with a series of unauthorized broadcasts that challenged the government's airwaves monopoly, the Italian Constitutional Court ruled that local broadcasting need not be under that monopoly. There followed an immediate and dramatic expansion of such stations, such that two years later there were more radio stations listed in Italy (a nation then of about 55 million people) than in the United States. Admittedly, these stations varied tremendously in type. Some were proto-commercial stations (indeed, it was one such, a conservative operation called Radio Parma, that had mounted the main challenge), but others were voices of the revolutionary left, of specific local communities, or simply of a group of teenagers with a pile of discs on the floor and a mini-transmitter.

One important aspect of this sudden transformation of Italy's radio scene was its relationship to the labor and student political movements that roiled Italy from 1969 onward. Unlike the political earthquake in France in May–June 1968, which seemed to subside after a year or two, the turbulence in Italy continued for at least a decade, beginning in 1969. The use of radio by the labor and student political movements was extensive, and the fact that their broadcasts could not be national in scope was not a huge limitation. Such stations were concentrated in cities in northern and central Italy, as southern cities were generally less hospitable to the political upsurge. The distances between many of the northern and central cities were not large, and the local orientation made for an immediacy that might have been difficult to achieve on a national plane.

The stations of the far left varied in style. Some, such as Radio Popolare in Milan, set out from the beginning to be forums for a variety of voices and interests within the general public in a city. These also included the concerns of migrant workers. Others, such as Controradio in Florence, after brief initial periods of 100 percent support for one particular far left group, set their sights on serving a city's youth, who were often overlooked in the bustling tourist and visitor trade. Some stations positioned themselves on the far left, but with no particular affiliation to any political group. And still others adopted the Leninist role of transmitting the official propaganda of the moment for their chosen political sects.

One fairly short-lived radio station in this movement—and more than a few were short-lived—was Radio Alice in Bologna, which was named after the character in Lewis Carroll's *Alice in Wonderland*. The programming here was an intense mixture of poetry, far left politics, performance art, innovative music, call-ins (the far left pioneered call-ins on Italian radio) and other dramatic moments. The most dramatic broadcast occurred in March 1977, when the station was the epicenter of a major student revolt at the ancient University of Bologna. At one point, armed city police broke the door down and listeners heard the commotion and the station's young staff shouting, "We have our hands up! Don't shoot!"

Interestingly, many of these stations also had a long-term impact on the musical realm. For all their fiery political questioning and deep involvement in demonstrations and other challenges to the status quo, they also provided a new generation with access to some of the finest international popular music available, some of which was dedicated to challenging injustice and poverty. Thus their work in the zone of the imagination continued long after the demonstrations and the eventual dissolution of the far left movements in the wake of Red Brigades terrorism in the late 1970s. They also served to fuel the 1980s ecological and antinuclear movements in Italy,

attracting some of the most sincere movement activists, who were disillusioned with sectarian politics. And finally, these stations sparked the ensuing free radio movement in France during the late 1970s.

Many other instances of radio's role in social and political movements could be cited. The medium's directness, flexibility, and low cost have made it a favorite instrument of horizontal and interactive communication.

Soft Rock Format

The soft rock format of radio programming features songs containing elements of both rock and roll and pop music. This musical subgenre originated in the early days of rock and roll, developed into a separate radio format on FM in the early 1970s, and eventually evolved into the adult contemporary format of the 1980s and 1990s.

The term *soft rock* refers to that side of rock and roll music characterized by, naturally, a softer, less raucous style than classic rock and roll. Stuessy and Lipscomb (1999), in *Rock and Roll: Its History and Stylistic Development*, trace the beginnings of soft rock as a musical trend back to the 1950s and the sock hops popular in U.S. high schools. Danceable, upbeat music needed a counterpart musical style, one to which teenagers could “slow dance.” Soft rock also filled a need “to balance the harder mainstream rock with a softer, less raucous alternative, while still maintaining some essential elements of the rock style.”

In terms of composition and musical style, Stuessy and Lipscomb describe soft rock songs in general as possessing the following characteristics: slow to moderate beat, a soft backbeat, triple division of the rhythmic pattern, strong emphasis on “beautiful” melodies, harmonies that follow a “major tonic—minor subdominant—major subdominant—dominant” chord progression, chords held for two to eight beats, musically conjunct tunes, love-oriented lyrics, and a lead singer with backup vocals. Regarding the singing found in soft rock music, vocalists might use falsetto, blue notes, and variations of rhythm and blues and gospel style. Specific components aside, the label “soft rock” applies to music that includes either a bass line or a rhythmic pattern derived from rock and roll, or both. Pure pop songs lack these basic rock elements.

Popular artists with soft rock hits during the early days of the genre included “white soft rock” singers Elvis Presley and Pat Boone and “black soft rock” acts such as Frankie Lymon and the Teenagers, the Five Satins, and the Monotones. The songs “Crying in the Chapel” by the Orioles and “Sh-Boom” by the Chords epitomize the softer style of rock music during that era. Other artists whose hit songs exemplified the soft rock style included Paul Anka, Bobby Darin, Frankie Avalon, Johnny Mathis, Connie Francis, and Brenda Lee. Soft rock as a trend continued into the 1960s, with Neil Sedaka, Bobby Vee, Bobby Vinton, and Frankie Valli and the Four Seasons among the more successful teen idols whose songs fit the genre (Stuessy and Lipscomb, 1999).

Although soft rock as a popular music style had already coexisted with harder-edged rock and roll since the 1950s, it became a separate and distinct format during the 1960s, when the radio industry began to experience widespread fragmentation resulting from diversification in the music business itself.

Keith (1997) notes that the wide array of popular artists’ styles, such as those of the Beatles and Glen Campbell, resulted in myriad format variations: “the 1960s saw the advent of the radio formats of Soft Rock and Acid and Psychedelic hard rock.” During this decade of change, there emerged the “chicken rock” stations, those that only “flirted” with rock and roll by airing softer tunes of the popular rock music genre: “While a Chicken Rocker would air ‘Michelle’ and ‘Yesterday’ by the Beatles, it would avoid ‘Strawberry Fields Forever’ and ‘Yellow Submarine’” (Keith, 1987).

The soft rock format truly came into its own during the 1970s, when, as Keith (1987) outlines, chicken rock, which appealed to the younger end of the 24- to 39-year-old adult demographic, evolved into mellow rock, which found its core audience among 18- to 24-year-olds. Mellow rock, an FM specialty, at first featured playlists containing soft rock tunes both popular and somewhat unknown. Eventually the word *mellow*, a throwback to the 1960s drug culture vocabulary, became outdated. With the change in terminology to soft rock came a narrowing of the soft rock playlist, which included more popular hits of the time. By the mid-1970s, soft rock found its target audience—“the young adult who had grown weary of the hard-driving rock sound but who still preferred Elton John over Robert Goulet” (Keith, 1984).

Soft rockers came from a variety of musical backgrounds, including folk, country and western, and soul. Stuessy and Lipscomb (1999) point to the Carpenters, Barry Manilow, Neil Diamond, America, the Osmonds, John Denver, and Roberta Flack as examples of important artists in soft rock music of the 1970s. Gregory (1998) credits the success of the country-rock band The Eagles with the proliferation of “an entire sub-genre of Soft Rock bands,” such as Fleetwood Mac.

As the 1970s came to an end, so, too, did soft rock as a distinct format. Keith (1987, 1997) attributes its demise to the emergence of disco as a station format, the rise in popularity of hit music stations, and the updating of playlists featuring “easy listening” music. Soft rock the format might have disappeared, but its style lived on in the 1980s through the music of groups such as Air Supply, the Alan Parsons Project, the Police (and their number-one hit single “Every Breath You Take”), and Huey Lewis and the News (Stuessy and Lipscomb, 1999).

Soft rock eventually evolved into the adult contemporary format popular during the 1980s and 1990s. In the late 1990s and at the turn of the century, some adult contemporary stations still use the term *soft rock* to describe themselves and the softer rock style of the artists and music they feature.

Sound Effects

As vaudeville faded from popularity and silent films grew, many of the musicians who created music and sound moved to providing accompaniment for silent films. The dexterity required of these musicians, especially the drummers, allowed them to expand their repertoires to include additional sounds that enhanced the movie for viewers. Robert L. Mott, a sound effects artist from the early days of radio, wrote that the earliest actors who moved from live theater and vaudeville to radio brought with them their props, costumes, and gags. These comedians, who relied on the visual gags for laughter, were often lost when they tried to make it in radio. Radio presented a completely new set of opportunities and problems for actors and producers.

The need for people able to produce sound effects to complement radio performances was recognized early. The earliest use of sound effects in a dramatic radio program was, according to Mott (1993), an unknown radio show in the early 1920s in Schenectady, New York. It wasn't until the late 1920s that the CBS network hired sound effects personnel to work with their dramatic programs. Arthur and Ora Nichols, a husband and wife team who were the first sound effects artists in radio, had been musicians for vaudeville acts. The couple perfected their sound effects skills in movie houses, learning additional instruments and ways to perform sounds so the silent films were more realistic to audience members. Arthur Nichols learned to use drums to provide a more diverse range of sounds. Many of the early sound effects artists were drummers, who found the dexterity instilled by their instrument was useful when producing multiple sound effects at one time. These musicians were also experienced in using a variety of contraptions ("traps") to produce different kinds of sounds.

Before the Nicholoses introduced the concept of sound effects to network radio, writers had to script cues that allowed listeners to understand what was happening. The dialogue was often confusing but necessary to let listeners know, for example, that someone was supposed to have knocked on the door. The actors found it as awkward as did the listeners. With the introduction of sound effects, the listening experience was enhanced for the radio audience.

As if by magic, sound effects aided listeners in more fully visualizing the stories they heard on the radio. Mott (1993) writes that sound effects relied on the art of deception. Nisbett (1962) emphasizes that the responsibility of the sound effects artist is not to reproduce sounds exactly as they are but to *suggest* the sound—that to be too realistic may even be detrimental to the desired effect. Most programs had one or two sound effects artists working on any production, though a network record of eight sound effects people were used for CBS Radio's production of *Moby Dick* in 1977.

A sound effects artist needed a variety of skills and talents to be successful. The first requirement, according to Mott, was timing. The second was to be ambidextrous; there were numerous occasions that required independent movement of each hand simultaneously. Additionally, sound effects artists had to be aware of pitch, timbre, harmonics, loudness, attack, sustain, and decay. These nine components, according to Mott, were integral to producing realistic sound effects. Despite the tremendous amount of skill and work involved in producing sound effects, the artists rarely received mention in the credits of a show. Management believed that to acknowledge that the sounds of radio were merely people creating the noises rather than the actual sound would damage the credibility of the programs.

Types of Sound Effects

Sound effects can be categorized into two types: spot (live) effects and those that are pre-recorded. Spot effects are those sounds that are produced live in the studio, whereas recorded effects are produced independently and inserted into the program at the appropriate time. In the earliest days of radio, spot effects were the only type of sound effect used. The technology for recorded effects was developed for sounds that could not be conveniently created within the studio such as cars, airplanes, weather, large crowds, etc.

Sound effects artists frequently needed to create sounds for ordinary sounds and for extraordinary sounds. Ordinary sounds (those we hear all the time) were often the most difficult to create in a realistic fashion. For example, Mott noted that visually-oriented producers were the most difficult to work with, as they often believed that if a telephone bell is to ring, there must be a telephone with the bell to “make it sound like a telephone.” The artists were skeptical because experience had shown them that producers often thought it was a telephone ringer until they saw it wasn’t attached to a telephone, and only then did they insist that the ringing “Just didn’t sound like a real telephone.”

In the early days of radio, sound effects artists were often called on to produce sounds that no one had ever heard before. For example, the early science fiction programs often included an invasion from outer space. The sound effects artists needed to produce sounds of a space ship entering Earth’s orbit for an invasion. The artists relied on imagination, creativity, and the odds and ends that comprised the sound effects prop room to create sounds that would induce an audience to believe a space ship was fast approaching Earth.

Important Sound Effects People

Ora Nichols was one of the first sound effects artists and the first female in the industry. Ora and her husband, Arthur, spent 23 years as musicians for vaudeville acts and for silent films in movie houses before entering radio. They worked several years as freelance artists and then were hired at CBS along with Henry Gauthiere and George O’Donnell. They were the first staff sound effects personnel in the fledging radio industry. Ora Nichols directed the CBS Sound Effects Department for several years until Walt Pierson was hired in 1935 as director. This allowed Nichols to return to her preferred spot as a sound effects artist.

Arthur Nichols brought his skills as a craftsman to create props that were necessary to produce realistic sounds. According to Mott, Nichols spent nine months working on a piece of equipment that could produce a wide variety of sounds, from a small bird chirping to 500 gunshots a minute. Together with

his wife, he created many of the props and tools that were used to create many of the sound effects for radio.

Orval White was the first African American sound effects artist. He started out in 1949 as an equipment man and worked his way up to be a talented and respected sound effects artist. White worked for 22 years on one of best-known programs on CBS, *Gangbusters*. He was, according to Mott, the first and only African American sound effects artist in radio, television, and film.

Jack Amrhein was considered by directors and peers to be one of the best sound effects artists in radio. His creativity and imagination were his strongest assets. Amrhein worked for the CBS radio network in New York as the sound effects artist for many shows, including *Mr. Keene*, *Tracer of Lost Persons*; *The Mysterious Traveler*; *Mr. Chameleon*; *The Fred Allen Show*; *Inner Sanctum*; *The Phillip Morris Playhouse*; and *The Robert Q. Lewis Show*.

With the rapid growth of radio, there was rapid growth among the cadre of artists who performed sound effects. CBS expanded its sound effects department from 8 artists to 40 in the early 1930s, despite the Depression, hiring engineers, music arrangers, film studio personnel, and other people with varied backgrounds who could contribute diverse skills to the growing department.

As the need for more complex sound effects expanded, four unofficial groups emerged: stars, artists, button pushers, and technicians. Though well known among the sound effects artists, this hierarchy was kept unofficial because CBS wanted to be able to randomly assign personnel to shows rather than having to accommodate requests for certain artists. The producers with shows that were rated highly did request certain personnel, but those requests were fulfilled only when the producers threatened to go to the advertisers. Sound effects personnel soon became specialized with different functions.

Lowest in the hierarchy were the technicians. They designed, built, and maintained the props. Occasionally a technician might fill when needed as a button pusher or for some other minimal sound effect production. The button pushers worked on shows with a limited need for sound effects and, according to Mott, literally pushed buttons to produce those sounds. These could be doorbells, buzzers on game shows, phone ringers, or oven timers on the soap operas. Mott noted that many sound effects artists hated the button pusher shows because they found the work boring, even though it was easy, the pay was the same, and the hours were better.

Next in the hierarchy were the sound effects artists, who made up the majority of the sound effects department at any radio network. These artists were used mostly for prime-time shows (both drama and comedy). Producers did not request them, and they were not paid as much as the artists who were considered stars.

Sound effects being created for *March of Time*, 1933
Courtesy CBS Photo Archive

The stars were those personnel at the top of the hierarchy. Mott wrote that these people had an uninhibited approach to performing sound effects. They didn't worry how they looked or what others thought of them. These artists were as successful in eliciting laughs from the studio audience as the comedians. Most often the producers allowed them to improvise, and the more freedom they had in their work, the more they performed for the audience. Some actors accused these sound effects artists of upstaging them, but audiences loved them. The stars demanded and received higher fees, overtime compensation, and a variety of other perks not given to most sound effects personnel.

Techniques for Creating Sound Effects

The tools used to produce sounds and noises varied greatly and often had no apparent connection to the sounds they were used

to emulate. For example, in one program, Mott used a bowl of spaghetti to convince the audience a hungry worm was devouring people in their sleep. Other sound effects artists employed large open drums with BB shot to replicate the sound of waves at sea, a thunder screen to create claps of thunder, or a scratch box, a small wooden box with one side of tin. The tin was punched with nail holes, that, when swept with a wire brush, sounded like a steam engine train pulling out of the station.

A concept that became important to realism was layering. Layering sounds means using multiple sounds and mixing them to create a more realistic sound effect, an effort that requires the use of additional people (or recorded sounds). For example, to create the sound of a dinosaur for some of the early radio programs, sound effects artists mixed the sounds of real animals (a lion's roar, an elephant's trumpeting, and a tiger snarling), which when played at a slower speed became the industry standard for the sound of a dinosaur.

Sound effects personnel often had to make extraordinary efforts to create everyday sounds that sounded “right” on radio. For example, they used flash bulbs dropping into a glass for ice, a cork dipped in turpentine and then rubbed on a bottle to create the screech of a monkey or rat. They could squeeze a box of cornstarch to sound like footsteps in the snow or use their arms and elbows to hit a table to sound like a body falling. Splash tanks were important for sounds that required water, such as washing dishes on a soap opera or for creating storms at sea on the dramas.

Footsteps were the most commonly requested sound effect for radio. Most artists had special shoes, called “walking shoes,” used only for creating the footsteps on air. The artists paid careful attention to the maintenance of the soles and heels of these shoes to be sure they would produce adequate sounds.

A variety of materials and techniques were used to create the illusion of walking on different surfaces. For example, plywood boards were most commonly used for floors and steps inside buildings such as offices or homes. Sound effects artists preferred a piece of plywood to a portable stair because they found the stairs too limiting; instead they perfected a technique of stepping on the board and then rubbing the sole over the end to replicate the sound of someone climbing or descending the stairs. When the script called for someone going up the stairs, they placed the weight of the step on the sole of the shoe, and for descending stairs, the weight was on the heel. To produce the sound of someone walking on a sidewalk, in the street, or indoors on a concrete floor, they used a slab of marble.

A large wooden box that could be filled with gravel, cornstarch (for footsteps in the snow), or other materials was used when needed, as were palm fronds or broom corn to imitate footfalls or movement through a jungle.

Recorded Sound Libraries

As the technology for recording sounds increased, recorded effects of those sounds not easily reproduced in the studio became commonplace. Initially, recording equipment was large and cumbersome, limiting artists’ ability to go into the field and record needed sounds. Manufacturers responded by developing portable equipment that allowed artists the freedom to record realistic sounds to 78 rpm records and to alter the speed

at which the records were played back, changing the nature of the sound. These recordings were used to provide general, background noises whereas the manually produced sounds were for specific actions such as someone walking down stairs.

Although recorded sound effects provided standardized sounds, the artists still had to be skilled to produce the correct volume, quality, and speed. According to Robert Turnbull (1951), sound effects artists had to be adept with the record to cross-arm, double-arm, segue, slip-speed, or spot-cue. By 1950, sound effects artists had access to over 15,000 recorded sounds. The major networks had extensive libraries of commercially recorded sounds for their sound effects artists. These were often complemented by a collection of specially recorded sounds that the artists recorded locally.

Well before the coming of television, most sound effects had been reduced to recordings, and stations as well as networks could stock hundreds of discs with all types of recorded sound carefully catalogued and indexed. These could be inserted or brought in under actors creating a precise and smoothly integrated sound—at a fraction of the cost of an extensive live sound effects operation. Virtually all modern television sound effects are achieved in this fashion.

Soundprint

U.S. Documentary Series and Media Center

Soundprint is one of the few ongoing nationally broadcast, noncommercial radio documentary series in America. The series is produced by the Soundprint Media Center, Incorporated (SMCI), a nonprofit media production and training facility based in Laurel, Maryland, near Washington, D.C.

Since 1988 *Soundprint*'s weekly broadcasts have featured documentaries by independent radio producers who explore a wide range of topics in half-hour segments. Most of the shows provide more context than one finds in deadline-driven, time-specific radio news stories. The series also provides an outlet for international voices through its documentary exchange program with producers in England, Canada, Australia, New Zealand, South Africa, Scotland, Hong Kong, the Netherlands, and Ireland.

In addition, *Soundprint*'s parent company, SMCI, embraces cutting-edge media technologies. The center maintains state-of-the-art digital audio production facilities and offers world wide web hosting and other internet services.

Soundprint was created in 1986 by the meeting of the minds of some innovative public radio managers and producers. At the Johns Hopkins University station then known as WJHU in Baltimore, Maryland, station managers David Creagh and Dennis Kita hired William Siemering to be the executive producer of their proposed new national documentary series. Siemering was a visionary leader, having co-created National Public Radio's (NPR) flagship daily evening news program, *All Things Considered*. Also, at WHYY in Philadelphia, Pennsylvania, Siemering was a major force behind the creation of the station's celebrated daily national interview program *Fresh Air*. And multi-award winning producers Jay Allison and Larry Massett were two of *Soundprint*'s first documentarians.

Although NPR, the largest of America's public radio networks, maintained its own vehicle for documentaries, *Soundprint* enabled producers outside of the NPR system to air programs dealing with extremely personal issues or with broader societal concerns. For example, one award-winning *Soundprint* show, "Mei Mei: A Daughter's Song" by producer Dmae Roberts (1989), provided an intimate view of a woman's difficult relationship with her mother. The Canadian production "Forever Changed" by Kelly Ryan (1999) examined how people from different walks of life in Nova Scotia dealt with the aftermath of the 1998 crash of Swiss Air Flight 111.

From the start, *Soundprint* encouraged producers to engage listeners aurally in such a way as to allow them to "see" a story through creative sound design—often a com-

plex, multi-layered mix of ambient sound, music, narration, and sound bites from event participants. Moreover, *Soundprint* attempts to provide unique perspectives on social, political, cultural, or scientific issues. One of *Soundprint*'s science programs, for example, entitled "A Plague of Plastic Soldiers" produced by Stephen Smith (1996), examined the technological impact of land mines in Southeast Asia— instruments of war that continue to maim and kill long after fighting has ceased. Another program, "Heavy Petting" by Gemma Hooley (1998), humorously chronicled America's infatuation with pets.

The series has always been produced in stereo—technically distinguishing itself from the monaural sound of most radio news programs. And as early as its first broadcast year, *Soundprint* employed the multitrack mixing format used by the music recording industry—enabling the series to better achieve its layered soundscape. In recognition of its technical and contextual daring, the series had won more than 50 major national and international awards through 2002.

Yet for all its success, *Soundprint* has had to wage an ongoing financial battle for survival. Documentary production can be expensive—requiring costly research, travel, sound gathering, editing, and mixing expenses. For the first five years of its life, the series was funded by grants from the Corporation for Public Broadcasting (CPB), the National Endowment for the Arts, and WJHU-FM funds. But as CPB funding (then *Soundprint*'s largest funding source) ended in 1993, WJHU support also dwindled. *Soundprint* executive producer Moira Rankin and technical director Anna Maria de Freitas decided to incorporate the series into a nonprofit company called the Soundprint Media Center, Inc.

The newly formed company landed a major grant from the National Science Foundation (NSF) and rented space at American University's station WAMU-FM in Washington, D.C. But it was clear that the center could not survive on grants alone—especially grants exclusively linked to radio documentary production. So in an attempt to expand its support base, the SMCI began exploring the emerging world of the internet. Through this exploration, the company could also continue to satisfy its desire to utilize new media technology.

In 1994 the SMCI took its documentary series to high school students through the internet and developed some basic webpages for students and teachers. This work led to the center's development of a pioneering mini-network of public broadcasting stations on the internet in 1995. Participating stations included Norfolk, Virginia's WHRO; Athens, Ohio's WOUB; Boston, Massachusetts' WGBH; Minnesota Public

Radio; and the Louisiana Public Broadcasting system. Participants could share programs and compare programming strategies through SMCI's on-line network.

The SMCI later expanded its on-line efforts by providing the technical architecture, securing the funding, and project-managing "ArtsFest '97," one of the first public broadcasting internet arts festivals. Programming from about 15 noncommercial radio and television stations nationwide was featured almost 24 hours a day during a two-week period. Web users could hear arts programs as varied as cowboy poetry from KGNU-FM in Boulder, Colorado; zydeco music from WWOZ-FM in New Orleans, Louisiana; and radio theater from KCRW-FM in Santa Monica, California.

The SMCI is now continuing its internet innovations by offering database management along with website hosting, updating, and content development. In fact, the company's internet projects have brought in substantial funds from the NSF and the United States Department of Education, as well as contractual work with federal agencies and public radio and television research or production organizations.

SMCI's internet operations have financially bolstered the *Soundprint* radio series. Yet *Soundprint* continues to face challenges. During the mid-1990s, some independent producers boycotted the series until program ownership rights and compensation concerns were resolved. And although *Soundprint* can be heard on stations in several of the country's major markets, the series' station carriage numbers have dropped from a previous high of more than 100 stations during the early 1990s to about 50 stations in the year 2002. Since 1995, radio stations have had to pay for the series. It had been free to affiliate stations when *Soundprint* was distributed by the American Public Radio network (now known as Public Radio International) from 1988-93, and by NPR from 1993-95.

Soundprint produces roughly 45 new documentaries along with 53 reruns a year. Each week, two half-hour programs are fed via satellite to participating stations throughout the country. Current or archived programs can be heard at *Soundprint's* website, located at www.soundprint.org.

South America

South America consists of 13 countries—ten with cultural roots tied to Spain or (in the case of Brazil) Portugal, and three smaller nations with non-Iberian backgrounds. Radio penetration is high and is an important part of the media environment, as many of the countries are poor and people rely on radio as an inexpensive means of communication, education, and entertainment.

Origins and Development

Radio developed during the 1920s and 1930s following the U.S. commercial model. Most governments allowed private development by large media companies owned by a few wealthy families. This relationship allowed the media companies to benefit from favorable decisions by the government. In addition, there was much influence by foreign media concerns, especially those in the United States. For example, in Argentina the big three U.S. networks—the American Broadcasting Company (ABC), the Columbia Broadcasting System (CBS), and the National Broadcasting Company (NBC)—were all present by the 1950s and influenced radio's structure and commercial development. Another influence was the political climate. Many countries of South America changed governments frequently, fluctuating between military dictatorships and ineffective democratic rule. Bolivia, the most extreme example, has had 200 governments (one every nine months) since gaining independence in 1825. Today many democratic reforms are influencing the political landscape but the history of repression is still felt, especially in media laws.

International radio broadcasts are used by the governments of South American countries, on shortwave and medium wave signals, to communicate political, economic, social, and cultural information to the world community. Many of these international services offer multilingual programming. For example, Radiodifusion Argentina al Exterior has English, German, Italian, Japanese, Portuguese, and Spanish services. International broadcasts are also popular with the local audiences. Los Medios y Mercados de Latino America, a marketing research company, reports that audiences in 1998 listened to Radio Nacional do Brasil, the Voice of America (VOA), the British Broadcasting Corporation (BBC), Radio Mexico International, Radiodifusion Argentina al Exterior, Radio France International, Deutsche Welle, and Radiotelevisione Italiana. The listeners to these broadcasts are usually more affluent, better educated, and of higher occupational status (managers and professionals) than average. The competition for these services are internet broadcasts that deliver clear signals across international borders. Of the 9.21 million people who listen to inter- choice and read an announcement such as "Happy Birthday"

national radio broadcasts, 5 percent of them have internet access in their homes.

Despite poor economic conditions in many South American countries, new technology is present, such as cable television and web radio stations. Because of limited computer ownership, however, web access to radio stations in South America remains limited. Zonalatina, a comprehensive website covering Latin America, has links to 750 Latin American radio stations, including some that have live internet broadcasts. Most are from large cities such as São Paulo, and their audiences seem to be from outside the cities of origin, so the broadcasters can appeal to a larger audience over a wide area.

Community radio stations are owned, run, and controlled by the public they serve and provide "alternative" programming to commercial or state-run media. They generally have a very small range and operate on a small staff and budget. Although they are not profit oriented, these stations will sometimes accept advertising to survive. Since the 1950s, community radio has grown rapidly in Latin America and today numbers about 2000 stations. It currently operates in Argentina, Bolivia, Brazil, Columbia, Chile, Ecuador, Paraguay, Peru and Uruguay. One goal of the programming is to focus on local interests, rather than national or world interests caused by consolidation and globalization of the media. The World Association of Community Radio Broadcasters (AMARC; L'Association Mondiale des Radiodiffuseurs) helps with this goal. One example of globalization is the influence of international news agencies, primarily from Europe and the United States, on local radio news. To balance this influence, AMARC sponsors a news agency that provides community radio stations in Latin America with information useful for their listeners. Agencia Informativa Pulsar (referred to as Pulsar) began in March 1996 and produces daily bulletins and specialized services. One such service is "Nuqanchik," a daily news service in the Quechua language, which is spoken by almost 10 million people in the Andean region. Headquartered in Ecuador, services are distributed via the internet.

Although advertising and government support form the basis for much of South American radio, other means of funding are necessary for the small stations that operate in many economically poor areas. *Comunicados* (personal messages) are used as a primary means of communication between rural towns, government, businesses, and people. Listeners pay the local station to broadcast personal announcements, often at noontime when listenership is high. The price can be as low as 30 cents (U.S.) for three airings. Another source of income is song dedications, with listeners paying for the privilege. For as low as 20 cents (U.S.), the stations will play a record of one's or "I love you."

Radio may follow formats (usually in urban areas) or block programming (usually in rural areas). The 1998 *Los Medios y Mercados de Latino America* (The Media and Markets in Latin America) listed the most popular radio formats for Spanish-speaking Latin America, grouping them into six general categories (percentages reflect the number surveyed who said they regularly listen to that format): popular music, which includes Spanish-language popular music (31 percent) and rock music (22 percent); information, including news (46 percent) and sports (24 percent); *exotica*, which includes classical music (10 percent) and jazz (4 percent); talk, including commentary (15 percent); relaxation, including tropical music (44 percent) and Spanish-language ballads (38 percent); didactic, which includes religious programs (5 percent); and *radionovelas*, or soap operas (2 percent).

Marketing research is used in larger cities. The results show similarities to other countries in listener preferences. Rock music is popular with males ages 12–29, advice/variety/family programs with older females, and sports with older men. The daypart patterns of listening are also very similar to other parts of the world. Radio listening is heaviest in the morning and lighter in the evenings and on weekends. The heaviest listening is on Monday through Friday from 6:00 A.M. to 10:00 A.M.

Radio in Selected Countries

Argentina

Argentina can claim the oldest radio station in the world. On 27 August 1920, ten weeks before KDKA in Pittsburgh signed on, Sociedad Radio Argentina began regular broadcasts from Buenos Aires. Until 1922, it was the only radio station on the air. It had no government license, as the Argentina government did not begin to issue them until 1923. By 1925, there were 12 stations in Buenos Aires and ten in the interior. Three networks also developed: Radio El Mundo, Radio Splendid, and Radio Belgrano.

Radio programs and music from the United States became popular in the early years of radio in Argentina. One of the most famous Argentine radio broadcasts was of the U.S. boxing match between Jack Dempsey and Argentine Luis Angel Firpo on 24 September 1923; the match increased the sale of radio receivers considerably. In the early years, U.S. dance music such as the fox trot, boogie woogie, and swing competed with the tango in Argentina. In 1934, Carlos Gardel, one of the most famous tango singers in Argentina, broadcast from NBC studios in New York to Buenos Aires. Orson Welles came to Buenos Aires in 1942 as a special guest of Radio El Mundo to talk about the impact of his famous broadcast, "War of the Worlds."

Broadcasting developed in complete freedom until 1943, when stations were seized by the fascist military government

for propaganda purposes. All programs became scripted and no shortwave reception from any Allied power was permitted. Juan Perón, who was appointed head of the National Labor Department, was the first to use radio to communicate effectively to a large population. In 1945 when he was arrested, his wife Evita used Radio Belgrano to incite 200,000 workers to demand his release. (Evita had been working as one of the leading producers of *radionovelas* for Radio El Mundo and Radio Belgrano.) Perón eventually declared all radio licenses expired and passed ownership of them to his friends. When he was deposed in 1955, the number of both government and private stations increased. There was a virtual monopoly by wealthy media conglomerates who relied on advertising from U.S. companies doing business in Argentina. In the 1970s military coups repressed all media and put a former German Nazi radio propagandist in charge of all programming at government stations.

Today, Argentine radio broadcasts mostly music and news, with the Top 100 Hits format ranking among the most popular. Although formats are similar to U.S. programming, tango and tropical music is included. And The University of Buenos Aires broadcasts educational programs for credit over their radio station, UBA XXI.

Bolivia

Bolivia has a large number of radio stations because of the size of the country and its mountainous terrain. La Paz has about 40 stations that broadcast in Spanish and two native languages, Quechua and Aymara. The government operates its own stations and tries to maintain control over private stations, with little success due to the vague rules and regulations for telecommunications.

In Bolivia a small grassroots union movement became an important part of the radio system. Miners' radio began in 1946 as clandestine broadcasting to support the miners in the Siglo Viente mines, where conditions were abysmal. The movement was crushed by the government in 1949, but in 1952 when the mines were nationalized, the miners again began to broadcast. Included were news, folk music, education, information, and union news. Local events such as festivals were covered live. Some stations were supported by miners donating a day's pay every month. By 1956 there were 19 such stations. In 1959, fearing a communist takeover of the mines, the Roman Catholic church started Radio Pio Doce. Its broadcasts reached the entire country and spoke against the miners' movement, and twice the miners dynamited its transmitters. However, the competition improved the miners' broadcasts, and by 1963, when the government again closed the miners' radio stations and slashed their already low wages by 40 percent, the church took the side of the miners and Radio Pio Doce became their voice.

By 1974, after numerous coups in which the miners' stations were closed and reopened, the government distributed 5,000 TV sets in mining communities, attempting to get the miners away from the influence of radio. In 1980, the bloodiest coup of all took place and the miners' stations became the focus of resistance, staying on the air for 19 days following the coup. The Bolivian Air Force bombed at least one station, and no one knows how many miners and their families died during this struggle. In the 1980s Bolivia faced economic difficulties and many mines were closed. By 1993 the miners voted to support just one radio station in each of the three regions. Pio Doce also remains as a strong voice for the miners.

Brazil

Brazil is the largest country in South America and has an extensive communication system. There is a nationwide radio system and almost every household has at least one radio set. Radio is a very localized medium and most stations are independent. In major cities stations are usually affiliated with Radio Globo and Radio Bandeirantes.

Radio began in 1920. Most programming was live in the 1920s and 1930s; it included news, variety, and comedy. To support these early stations, radio clubs were formed, with donations given to the stations by the wealthy members. Often these stations were called "Radio Clube de . . ." or "Radio Sociedade . . ." There was also political influence for media owners who could provide coverage for politicians. One of the major networks was Diarios e Emissoras Associadas, which by 1938 owned 5 radio stations, 12 newspapers and 1 magazine led by Assis Chateaubriand. Other large media conglomerates include Radio Bandeirantes owned by Grupo Carvalho and Radio Globo owned by Roberto Marino. By the 1940s recorded music and soap operas were popular and commercial radio networks had been developed, primarily by newspaper chains. National and provincial governments also established networks, and the stations' main purpose, then as now, was to serve areas not economically viable for commercial interests, especially in the Amazon Basin.

Radio set a pattern in Brazil that television was to follow, which included a dominance of entertainment, advertiser supported stations, the importation of a considerable amount of programming in the early years, and, in later years, the use of much Brazilian material. Colgate was one sponsor of these early programs and used the same type of advertising aired in the United States. Variety shows developed a distinct local characteristic, the *show de auditorio* with a host and a live studio audience. This was one of the few formats in which the traditional Brazilian oral folk culture of story telling and song (including samba music, circus-type talk, and folk music) were brought to commercial media.

Today, radio offers diverse programming, market segmentation, and competition, especially in the large cities. Surveys indicate that radio is rated the most popular source of music, while television and newspapers are preferred for news. Entertainment varies by region, but radio dramas, soap operas, and variety shows are common throughout the country.

AM radio is more widely available; in cities, it focuses on music and formats that appeal to less affluent audiences, such as Brazilian country music, Brazilian popular music, sports, and talk. AM talk shows seem to appeal to a wider audience, especially during commuting hours. FM is primarily urban and plays more imported music as well as a great deal of Brazilian popular music. Large cities have 20 to 30 stations, which increases competition and audience segmentation. Many formats resemble U.S. radio.

Three government-sponsored programs must be carried by all stations. *Avoz do Brasil* is broadcast Monday through Friday at 7:00 P.M. and *Projecto Minerva*, sponsored by the Ministry of Education, is broadcast Monday through Friday from 8:00 to 8:30 P.M. Stations are also required to carry a one-hour evening newscast produced by the government, *Hora do Brazil*.

Chile

Chile is the only Latin American country classified as "developed" by the United Nations (UN). In the early 1920s, the Chilean congress considered setting up a BBC-type public broadcasting monopoly, but later decided to follow the U.S. model of private broadcasting. A solid radio industry was formed, and by the 1960s Chilean universities offered degrees in broadcasting and journalism. In 1971 when Salvador Allende nationalized the country's industry, advertising revenue dried up and many stations failed and were sold, mostly to political groups. During this period, about ten of 156 stations remained politically neutral; the others were owned by socialists (33), Christian democrats (29), and communists (28). Supporters of political agendas harassed the stations representing other viewpoints, by cutting their power lines, among other tactics.

After the coup that overthrew Allende, former staff members of Radio Magallanes moved to Moscow and were given a transmitter for special broadcasts to Chile. Other networks include the government-operated Radio Nacional (National Radio); Radio Chilean, run by the Roman Catholic church; Radio Minería, which takes its name from the mining interests but is a source of reliable news; Radio Agricultura, which focuses on news and programs of interest to Chile's farming community; and Radio Tierra, established in 1983, which claims to be the first all-woman radio station in the Americas.

Colombia

Early on Colombia used radio for education to rural communities. Hundreds of thousands of transistor radios were given away by political groups and religious organizations. The radios were locked onto frequencies that broadcast housing repair, nutrition, health, history, and geography. Radio Sutatenza was a pioneer in educational radio. Begun in a small village in 1948, its purpose was to educate the rural adult campesino. A multimedia approach was used to eliminate illiteracy among the 8 million rural adults. Areas of education included health, reading, arithmetic, economy and work, and spirituality. A newspaper, *El Campesino*, was used to support the lessons. Also developed were rural libraries, extension schools, and institutes for farmers. Radio Sutatenza has served as a model for countries in Asia and Africa, as well as others in South America; however, due to financial difficulties it was sold to the Caracol network in 1990.

Today, government stations still provide this type of programming; private stations broadcast music, sports, and news. The National Institute of Radio and Television (Inravisión) produces programs for the government-affiliated stations, but many are privately owned. Radio is viewed primarily as a source of entertainment or culture, rather than news. It has operated more freely than television and the two largest networks reflect opposing political viewpoints: liberal (Caracol) and conservative Radio Cadena Nacional (RCN). Caracol is the largest AM/FM network, with powerful transmitters that reach the entire country; the next largest network is RCN. Both have a large number of network-owned stations throughout the country that produce local news and information programs but also act as regional news bureaus. By law, they must broadcast some shortwave for Colombians out of the country, and the state imposes some guidelines to ensure equal time for political candidates. Caracol has an affiliate in Miami, Florida, that rebroadcasts from Bogota but also includes local news and information.

Other privately owned networks include Todelar, Super, and the evangelical Colmundo. Univalle Estereodio Station of the University of Valle from Cali broadcasts live on the internet 24 hours a day. Begun in 1995, it is concerned with news and culture and also broadcasts BBC and Radio France International.

Ecuador

Ecuador has over 260 commercial radio stations, including ten cultural and ten religious stations. The Voice of the Andes has operated for more than 50 years as a shortwave, evangelical Christian station, supported largely by contributions from the United States. Begun in 1931, it broadcasts in 16 languages and 22 dialects of the Quechua languages. In 1994, it began *America Latina via Satellite* (ALAS) as a joint project of HCJB

World Radio and Trans World Radio to deliver quality gospel programs to more than 60 affiliate stations in 12 Latin American countries.

Media ownership has remained in the hands of a few large interests. By the late 1980s, all media were privately controlled, except for Radio Nacional which at the turn of the century was still operated by the National Communications Secretariat (SENAC-Secretaria Nacional de Comunicaciones). The government controls the allocation of radio and television frequencies. The Febres Cordero government used the media in an effort to gain support for its free market economic policies and in the process infringed on press freedoms. In late 1984 the government temporarily closed five radio stations after they broadcast criticism of the government.

There is a well-developed infrastructure, so radio is better established and more professional than in some other South American countries. The Roman Catholic church has a large network run by the Franciscans. Programming usually includes Ecuadorian music and reciting of the rosary or inspirational thoughts for the day. The Bahai faith sponsors its only shortwave station here. There also is a trade union station owned and operated by the taxi drivers union in one province.

The largest commercial station, Radio Quito, was begun in 1940 and is owned by the largest newspaper, *El Comercio*. In the beginning, this station was affiliated with CBS and the BBC. In 1941 it carried the Joe Louis and Chilean Arturo Godoy boxing match and used loudspeakers in plazas for those who did not own radios. In 1949 Radio Quito did a takeoff on Orson Welles' "War of the Worlds" that created a riot in the city. The radio and newspaper offices were burned and 20 people died. Today, its programming is mostly news and sports.

Founded as a broadcast station in 1940, Acerca de CRE is now also transmitting on the internet with programs including information and sports events.

Paraguay

Although Paraguay was the first South American country to enjoy telegraph service, later communication systems developed slowly and the military maintained control over the media. In the 1980s, only one Paraguayan in 20 owned a radio. In every category of ownership, Paraguay ranked last in South America, well behind less developed countries such as Bolivia and Guyana. In the late 1980s there were 52 radio stations in Paraguay, only three of which were independent. One of these was Radio Caritas, sponsored by the Roman Catholic church. The most important independent radio station (until its closure in January 1987) was Radio Nanduti, which had a live phone-in program that frequently aired complaints about corruption and lack of democracy. In July 1983 station director Roberto Rubin was arrested several times, and in April and

May of 1986 the station was attacked by Colorado vigilantes. After months of jamming and other harassment, it was finally forced off the air.

Today, commercial and private stations are able to broadcast a range of views, including those of the opposition party. Radio Nanduti is back on the air. Programming includes news/talk, classical, jazz, pop, rock, and retro. A popular retro station, Radio Venus, can be heard on the internet at www.venus.com.py.

A popular form of folk music heard on many radio stations is harp music. Spanish and Guaraní (the native language) are heard over the air. *Radio Oberdira*, located in southern Paraguay, is available on the internet. The station uses block programming, as various music styles are heard 20 hours per day, offering something for everyone.

Peru

Radio began in Peru in 1921, and military rulers maintained strict control over all forms of media. In 1971 a general telecommunications law gave the government a 25 percent ownership interest in all privately owned radio stations. A new telecommunications law in the 1980s, however, gave stations more freedom. In 1992 President Fujimori seized control of all media in the name of national security.

Today, Peru's media has much more freedom under President Alejandro Toledo, elected in 2001. Privately run radio stations are the most popular; state run media have small audiences. While broadcasters have regained some independence, the Fujimori-era scandals (Congress dismissed Fujimori on the grounds of "moral incapacity") have adversely affected public confidence in media.

Radio broadcasts consist mainly of music and news, with 30 percent of total time given to advertising. Regulations require that 65 percent of programming and 100 percent of advertising on radio be of domestic (Peruvian) origin. Small stations in rural areas are often not officially licensed and only broadcast part of the day, as electricity is often only available in the evening. Because of the country's geography, shortwave transmission is used. In the early years of radio, AM was in the cities and could not reach outlying areas. By the 1970s there were many shortwave stations, especially in the smaller towns in the rural north, which is either mountainous or jungle. Rural audiences prefer block programming and a popular folk music, *huayno*.

Many stations fail because competition is strong and costs are high. Stations often use kerosene generators for power, and at times there may not be enough money to buy the kerosene, as a station's income may only be 10 to 20 dollars per day. Due to economic factors, stations may be off the air for days, weeks, or months at a time. Radio Sol Armonia began on 1 January 1984. It is devoted to classical music and educational

programs for the country. Although it is associated with commercial Radio El Sol, sponsors from all over the world provide money and material donations. International radio stations and broadcasting organizations that provide programs include Deutsche Welle, Radio France International, Nederland Radio, Radio Exterior Espana, Radio Canada International, and Swiss Radio. Programs are a mixture of lectures and conferences on cultural themes. The station publishes a monthly bulletin with information on specials and news and is available through the internet. Radio Sol Armonia also produced a cassette dedicated to the German-Peruvian composer Rudolfo Holzmann. In 1998 they released their first CD of Peruvian baroque music. The service has received several awards from Brazil, Chile, and the Peruvian congress for its cultural work. The station is owned by a non-profit organization, Asociacion Cultural Filarmonia.

Uruguay

The Uruguayan Broadcast Corporation has control over all communications media in Uruguay. Radio FEUU was a pirate station started by university students in Montevideo in 1995. They demanded a better budget and free radio stations as alternatives to the commercial system. However, the government eventually shut them down. All parts of the country receive at least one AM radio station, but 25 percent of its radio stations are found in the Montevideo area. Ten of the AM stations also broadcast on shortwave frequencies to reach a larger audience, both at home and abroad. All stations except for one government-owned transmitter are commercial and broadcast in Spanish.

Begun in 1924, Servicio Oficial de Difusion Radiotelevision y Espectaculos (SODRE) is the national government radio station. It primarily sponsors medium wave and FM transmissions. There are some international shortwave broadcasts for Uruguayans abroad. An internet station, Radio El Espectador, offers a mix of news, sports, information, and travel.

Venezuela

Venezuela's broadcast industry is a quasi-monopoly that was influenced during its development by foreign investment and personnel from the United States and Cuba. After the fall of dictator Perez Jimenez in the late 1950s, democratically elected leaders built a relationship with private media that allowed for largely unregulated development of commercial broadcasting. The government retains some control over content of an adult nature. The government operates the *Radio Nacional* network, which informs listeners (especially those in rural areas) about education, agriculture, and civic matters. Most stations are concentrated in Caracas, but transmitters are located throughout the country. There is also an international shortwave service.

There is very little religious broadcasting. Colombian radio can also be heard in western Venezuela.

FM is a relative newcomer. In the early 1950s, the government had a law that limited service to one radio station per 60,000 people, and by the time FM radio stations were developed in the 1970s, there was no room for them. The law made it impossible to operate FM stations except in the urban areas with sufficient populations to meet this requirement. In 1988 the government decided that the law applied only to AM stations, and officials began awarding numerous FM frequencies to political favorites. They also added Class D FM for lowpower FM stations in small towns. Some industry experts feel that the oversaturation of radio is a major crisis in Venezuelan broadcasting.

A unique type of financial support is used by Globo FM. Announcers contract with the station for hours of airtime and then are responsible for finding ads. Listener growth in FM is primarily among younger people. Radio Rumbos (anchor of the largest radio network) runs two AM stations and feeds newscasts to affiliates using a satellite link. Radio Mundal also has satellite uplinks and broadcasts news all over the country.

Other Nations

The non-Latin countries of South America are French Guiana, Guyana (a former British colony), and Suriname (a former Dutch colony). French Guiana operates a national radio broadcast, Radio-Télévision Française d'Outre-Mer (RFO), Radio FM from Cayenna, with several repeater stations throughout the country. Two radio stations are on the internet, one of which is part of a ten-station group of French-language stations providing coverage across three oceans.

In Guyana today, almost all people own a radio set. There is no clear telecommunications policy and the government controls what were once private stations. There are two AM stations and one FM station in the capital and one FM station in Lethem. None are on the internet. The government runs Radio Roraima and the Voice of Guyana.

Suriname has total radio saturation with one radio set per 1.5 persons. Reflecting its unusual past are broadcasts in Hindustani, Javanese, and Dutch. Four stations are available on the internet.

For most of South America, radio remains the most accessible and affordable mass medium. According to Bruce Girard, low production and distribution costs have made it possible for radio to focus on local issues, provide a local perspective on world issues, and to speak in local languages. For example, Quechua is almost absent from the television screens in Bolivia, Ecuador, and Peru, but in Peru it is estimated that 180 radio stations regularly offer programs in that language. Radio is also used in agricultural extension programs, education, and the preservation of local language and culture.

However, local and regional radio is threatened by national and international networks. For example, in Peru three satellite networks, broadcasting from the capital via repeater stations throughout the country, have more audience share than the 40 largest provincial stations put together. In Argentina and Brazil, national multi-media empires have built satellite radio networks that have converted hundreds of independent local radio stations into repeater stations that provide programs produced by the nation's capital. Technically superior, these networks have resulted in the loss of choice, local information, and alternative perspectives. Although the internet has the potential to develop a local role like radio's, internet access is very limited and requires an infrastructure that most countries in South America cannot afford. Currently, most radio programming remains local. The future of radio in South America could be one of consolidation and privatization, which will result in ownership and control in fewer hands and the loss of local and alternative voices.

South Pacific Islands

Radio in the Pacific presents its own set of unique challenges to radio broadcasting that include remoteness, multiple languages, shortage of skills and resources, irregular transport, awkward low lying coral atolls, high humidity, salt spray, cyclones, electric thunderstorms, and less than certain power supplies. The South Pacific Ocean is home to a number of small island nations affected by the tyranny of distance. Vast oceans exist not only between states but also within them. The 84,000 citizens of Kiribati live on small islands dotted over 2,131,000 square kilometres. The state of Niue has fewer than 2,000 people. Only two countries other than Australia and New Zealand, treated separately, have populations in excess of a half million: Papua New Guinea (4.2 million) and Fiji (900,000). Of the 18 jurisdictions, nine microstates have independent sovereignty (Fiji, Kiribati, Nauru, Papua New Guinea, Samoa, Solomon Islands, Tonga, Tuvalu, and Vanuatu) and two have an independent association with New Zealand (Niue and Cook Islands). The remainder have some form of legislative arrangement with other countries (principally France, the United States, the United Kingdom, and New Zealand).

Papua New Guinea

Radio began in the South Pacific during the colonial period and continued to play a significant role as the region's states sought and gained independence. An early radio broadcast station was set up by Amalgamated Wireless in Papua New Guinea in October 1935. The station took advertising and provided a two-hour daily schedule except for Sundays when, in deference to the strong Christian traditions in the community, the station was silent. The station was not successful and closed in 1941.

In 1944 the U.S. military requested that Australia, a U.S. wartime ally and Papua New Guinea's neighbor, establish a radio station in Port Moresby for the United States and allied military. Following the war, Australia took administrative responsibility for Papua New Guinea and the Australian Broadcasting Corporation expanded from Port Moresby, developing a nationwide service that by 1963 could be heard over much of the territory. Programs were 40 percent indigenous and 30 percent expatriate; the rest were of general interest. During the 1960s the administration sought to develop a more proactive government broadcasting policy that could act as a barrier to the influence of broadcasts from the less stable Dutch and Indonesian northern neighbors. The Administration Broadcasting Service opened its first station in Rabul in 1961 and by the decade's end had a range of stations in densely populated areas with the aim of increasing awareness and acceptance of what the government was trying to do.

The two services combined following independence (in 1975) when the Papua New Guinea National Broadcasting Commission was established. It is the largest broadcasting organization in the Pacific islands with over 500 employees currently operating 19 provincial stations and three networks: the *Kundu* (provincial), the *Karai* (national), and Hits and Memories, FM100 (commercial) services. In 1994 private radio began in Port Moresby with the launch of Nau FM, a station locally owned but operated by Communications Fiji. A second station, Yumi FM, was added in 1997, broadcasting in local pidgin. Local stations have sprung up, including FM Central in Port Moresby and Lae. In addition a Christian radio network, supported by the Roman Catholic church, is being considered.

Fiji

Fiji, with a much smaller and more compact population, has been well served with radio coverage by the Fiji Broadcasting Commission, which was established with expatriate British Broadcasting Corporation (BBC) management playing a key role. In 1999 the Fiji Broadcasting Commission was corporatized, changing its name to the Fiji Broadcasting Corporation (FBC).

The FBC currently offers numerous radio services: two AM networks that reach most of the country's population centers—Radio Fiji One (in Fijian) and Radio Fiji Two (in Hindi)—and several FM stations including Bula 100 (in English), Bula 102 (in Fijian), and Bula 98 (in Hindi) and 2-Day FM.

Fiji was the first Pacific island state to permit private commercial radio broadcasting. Private broadcaster Communications Fiji, established in 1985, operates five networks and stations. Two are English language networks, FM96 broadcasting a contemporary Hit/Pop music format and Legend FM broadcasting a "Gold" format. It also broadcasts Radio Navtarang, a Hindi language network, and Viti FM, a Fijian language network. Both these programs are in an adult contemporary format. They also rebroadcast the World Service program of the BBC. Others include Radio Light, Radio Hope, and FM97, all independent Christian radio stations, as well as Z-FM, a private station operating in Lautoka and Nadi. Currently the radio market in Fiji is very "flexible," with Christian and other private stations coming and going depending on enthusiasm, finance, and opportunity.

Other Nations

Tuvalu also has a broadcasting system developed during colonial times by expatriate staff from the BBC. Local Tuvaluan

staff even went to the United Kingdom for training, as did staff from other colonial broadcasting services. Radio Tuvalu, broadcasting on a medium wave station for about six hours each day, serves this nation of just 10,000 people.

Other small nations also maintain radio services. Niue (population 2,000) has Radio Sunshine, a part-time station providing local and overseas news, notices, advertisements, and light entertainment. Nauru (population 10,000) has Radio Nauru, a state-run service broadcasting 18 hours per day and providing local news coverage as well as rebroadcasts of news from Radio Australia. In Kiribati (84,000) the government-owned Broadcasting and Publications Authority operates Radio Kiribati. It has two transmitters to cover its far-flung atolls, and broadcasts (mainly in the local language) a morning and evening program each day.

The Cook Islands (20,000) has the Cook Islands Broadcasting and Newspaper Corporation (CIBNC), previously state owned but now privately owned and operated by religious broadcaster Elijah Communications. It operates on medium wave and shortwave broadcasts in English and also in Cook Islands Maori. It carries national and regional news bulletins and retransmits news from Radio Australia and Radio New Zealand International. A competing private FM radio station, KC FM, covers the main island of Rarotonga. The Kingdom of Tonga (99,000) has a state broadcasting system, the Tonga Broadcasting Commission, operating a medium wave station and an FM music station. A private Christian radio station, 93FM, also operates in Tonga. Two territories, Pitcairn Island (population 47) and Tokelau Islands (1,900) do not have broadcasting services.

In the Solomon Islands (404,000), the state-owned Solomon Islands Broadcasting Corporation operates the national AM service, Radio Happy Isles, as well as two AM stations on distant islands and a new youth-oriented FM service (Wan FM) broadcasting in both English and pidgin. In 1996 Z100, a locally owned private station, began broadcasting. In 1999 Paoa-FM ("Power FM" in pidgin) began operating nationally. This station is owned by a local newspaper (*The Solomon Star*).

Vanuatu (population 178,000) has a state owned and operated Broadcasting and Television Corporation. This former French and British controlled nation recognizes three official languages: Bislama (local pidgin), French, and English. Radio Vanuatu broadcasts programs in all three. The corporation also operates a commercial FM station in the capital, Port Vila.

Samoa recognized 50 years of continuous radio broadcasting in 1997, as the state-owned radio station 2AP began operations in 1948. Its strong transmitter means that its programs are widely known through the Pacific, with the signal being received as far away as Fiji and the Cook Islands. An FM station began operation in 1992, and both stations operate commercially. Complementing state radio are two private FM

radio stations, the fully commercial Magik FM and Radio Graceland, a Christian broadcasting station.

External Support

Many of the South Pacific island states rely on international aid for development and, in many cases, survival. A number of the region's state broadcasters have also had such support. Australia, New Zealand, and other countries provide financial support to island broadcasting. International organizations such as the United Nations Educational, Scientific, and Cultural Organization (UNESCO) and the Commonwealth Broadcasting Association have funded broadcasting activities in the islands. Two German agencies, Friedrich Ebert Stiftung and Deutsche Gesellschaft für Technische Zusammenarbeit, have provided extensive funds to promote the development of broadcasting. Funds have been used to support regional training initiatives (PACBROAD), the establishment and operation of a regional independent news service (PACNEWS), a professional association of news organizations (Pacific Island News Association) and a professional association of broadcasting organizations (Pacific Islands Broadcasting Association). In 2003 the professional association merged with the news association to form one group.

Challenges

Three significant challenges face South Pacific islands radio broadcasting. First, aid support is neither guaranteed nor consistent. Thus organizations that are created and developed using such funds struggle to survive when funding is reduced or ceases altogether. All of the regional organizations mentioned above have had this experience. Second, independent journalism in the Pacific has always had an uncomfortable relationship with the region's conservative and cautious governments. Historically all of the broadcast media and much of the print media have been state controlled or influenced. Some governments object to criticism, reports that reflect badly on authorities, or any form of independent investigative reporting. Offending journalists have been treated harshly in the past, losing their jobs and even facing imprisonment. Pacific island states are slowly adapting to a more critical media environment but many see the form of freedoms and independence enjoyed by Western news media organizations as not appropriate nor in the best interests of their culture and politics.

Finally, and perhaps most significantly, many South Pacific island governments are following recent international trends and reducing expenditures. State media organizations are facing both budget cuts and requirements to provide a revenue stream. There is a move to privatize state media in some countries. Papua New Guinea is currently considering the privatization of several state-owned assets, including broadcasting. The

Cook Islands Broadcasting and Newspaper Corporation was privatized amid controversy in 1997, and others such as Fiji Broadcasting and the Samoa Broadcasting Services have incorporated their broadcasting organizations, requiring them to act as business entities, although they still receive significant state funding.

Commercial operators are a big threat to state broadcasters, which are often steeped in tradition, slow to react to market forces, and not responsive to audience wants. The independents are thus taking large audience shares. Navtarang, FM96, and Viti are in the first-, second-, and third-rated positions in the Fijian market, with nearly 70 percent of all listenership. In Papua New Guinea, Yumi FM and Nau FM are first and second in the market. Paoa FM and Z100 hold similar positions in the Solomon Islands (all 1999 figures). Meanwhile, despite the recent introduction of television (serving urban elites) in many countries, radio remains the only effective national communication system in most South Pacific island countries. But with competition from private radio and television, many national broadcasters have trouble servicing

outer island communities, which thus risk increasing isolation and estrangement. However, as new technology is providing more efficient and cost-effective delivery systems, it is only a matter of time until even the smallest island nation will receive a commercial network feed from one or another of its larger neighbors.

Sportscasters

Sportscasters are the play-by-play and color announcers of sporting events and the hosts of shows that highlight games and athletic performances. From radio's earliest days, live sporting events have been surefire audience gatherers. Beginning in 1921 with Harold Arlin, announcer of the first professional baseball game over radio station KDKA, and lasting all the way to Bob Costas hosting the National Broadcasting Company's (NBC) 21st century's Olympic Games, sportscasters have been central to the popularity of electronic coverage of games, events, and sports-related celebrations. Indeed, a broadcast network once televised the first half of a National Football League (NFL) football game without any announcing merely to demonstrate to television audiences how crucial the announcers were to their entertainment and understanding of the game. Radio, of course, could not even attempt such a voiceless experiment.

Background

Although nearly all sportscasters began their careers as play-by-play announcers, a few came laterally from careers as players or coaches. Nonetheless, most sportscasters can point to years of routine play-by-play announcing of baseball, basketball, soccer, hockey, and football games, as well as tennis and golf competitions, swimming, wrestling, and track meets, at the local high-school and college levels before their moves into regional or national radio sports announcing of college and professional sports. At the regional and network levels, many began as spotters or statisticians before they were permitted on the air.

Although sportscasting has often been a profession of white men, African-American sportscasters began gaining small network on-air roles during the 1980s; brothers Greg and Bryant

Gumble, for example, moved into sportscasting, Greg permanently. Bryant, during his 15 years as host of *The Today Show* (1982–97), served as the main anchor for the 1988 Olympics. Greg hosted CBS's *The NFL Today*, NBC's *NFL Live*, and the 1994 Lillehammer Olympics, later becoming the host of HBO's *Real Sports*. Former Minnesota Viking Ahmad Rashad anchored the pregame *NBA on NBC*, *NBA Stuff*, and *Sports World* for NBC, while also serving as studio host and/or commentator for several Olympics (1988, 1992, 1996).

Women sportscasters first earned national visibility in the 1990s. Their voices quickly became part of radio as well as television sportscasting. Like their male counterparts, such nationally known sportscasters as Robin Roberts of ESPN, Leslie Visser of Columbia Broadcast System (CBS) and American Broadcasting Company (ABC), and Hannah Storm of NBC earned their network positions after years of local play-by-play announcing. Others, such as Mary Carillo, widely respected for her CBS and Olympic tennis reporting, came to announcing after playing and coaching.

Many luminaries of the television era began their careers in radio, including Jim McKay, Brent Musburger, and Curt Goudy. Moreover, these and such other famous television sportscasting personalities as Howard Cosell, Dick Vitale, Pat Summerall, and John Madden have regularly contributed to radio sports programs, generally as commentators within sports newscasts or sports talk programs. One of the most controversial of present-day sports commentators, Frank DeFord, contributes a weekly on-air essay to National Public Radio (NPR) and appears regularly on Home Box Office's (HBO) *Real Sports*, in addition to writing columns for *Sports Illustrated*.

Generalists and Specialists

Sportscasters come in two varieties: the generalists, who announce and host all kinds of sporting events and contests, and the specialists, who are experts in a single sport. Jim McKay and Bob Costas epitomize the generalists. Each has announced hundreds—if not thousands—of baseball and football games and hosted many Olympics. McKay was also the much respected host of the long-running *Wide World of Sports*, ABC's pioneer sports anthology TV program that covered numerous sporting events from around the world. Costas is especially known for his extraordinarily meticulous preparation before broadcasts, sometimes devoting months to thorough researching and writing before a major event. But in the very early days of radio, all announcers were expected to be able to move from sport to sport, just as newscasters reported on any newsworthy topic. The best generalists often migrate to the network level, and many big-name sportscasters of ABC, CBS, NBC, and Fox still call several different sports.

Announcers hired by teams (or in radio's early years, by advertisers) are usually specialists, either because they must be

seen by fans as home team partisans or because they have special expertise. Specialists range from team baseball or basketball announcers (often doing play-by-play coverage of just one or two college and professional teams in a region) to professional auto racing or horse racing experts who bring a notable depth of knowledge to announcing their chosen sport. Professional football on radio is often the audio portion of the concomitant telecast with little added, but other sports with long moments of inaction (such as baseball and car racing) or very swift action (such as basketball and horse racing) require announcers who speak continually just for radio. These sportscasters need to be able to provide a wealth of background and statistical information for listening fans, who often can be highly critical of misinformation and outright errors.

Television versus Radio

Television has places for both the generalists and specialists, and at the network level it attracts the best of both groups. Each broadcast and cable sports network maintains a stable of on-camera house anchors, hosts, reporters, and commentators. They announce the big games and events on network television, especially all of NFL football, the top ratings generator, and the mega-events in golf and tennis, sports that attract the upscale executives sought by some advertisers. Radio, a more local or regional medium, provides jobs for hundreds of sometimes relatively anonymous announcers who call play-by-play for thousands of near-daily professional baseball and basketball games and college track and field, soccer, tennis, golf, and other sports for local radio over the course of a year. In each market, at least one commercial radio station pegs its image (its brand-name) on its status as the local provider of sports, and its coverage is often supplemented by even smaller college and/or high-school radio stations. As in most media, the large markets get the stars, and the small markets get the beginners.

Beginning in the 1950s and lasting well into the 1970s, sponsors controlled sportscasting to a degree hard to imagine today. Falstaff Beer and Gillette, for example, hired and fired their own announcers, and most commercials were read—and often acted out—by the announcers live on the air, lending whatever credibility they had to the product. The legendary Red Barber, for example, had to wear a gas attendant's cap during one set of commercials and dump Wheaties into a bowl in another. Being able to pour beer so that it made just the right noise for radio or just the right foaming head for television had enormous career implications in the era before audio cartridges and videotape. Big advertisers also intervened to avoid giving competitors even tiny on-air advantages. In one story, Chevrolet's objections led announcers to refer to the Southern Methodist University football team as the "Ponies" for the entire 1967 season, when the team was really the

“Mustangs,” coincidentally the name of Ford’s hot-selling car that targeted the collegiate market.

Recreations and Early Play-By-Play

During the 1920s, outside of Opening Day and the World Series, baseball fans had to follow teams through the local newspapers except in such large cities as Chicago, Boston, and Detroit (but not New York). Many owners were afraid that radio would hurt ticket sales. As late as 1936, only 13 teams in the major leagues consistently broadcast their games. Even then, few away games were broadcast because the team owners saw radio as a means of publicity and used it to raise stadium attendance. Well into the 1950s, outside of the largest markets, much of radio sportscasting consisted of summaries and recreations of regular season games. Recreations were dramatized studio versions of away games demanded by radio stations because announcers did not travel with the teams. The sportscasters usually had only the Western Union ticker from the field or a bad telephone line and had to make up action to account for the truncated facts coming from the field. Some stations wanted summaries of key action, sometimes a day or more after an event (before the invention of audio tape). Such recreations and summaries tended to resemble fantasies rather than the actual games. The announcers had far too little information and told long stories, invented plays, and concocted events in the grandstands to fill the airtime.

Because the audience at home could not see the action for itself, even during live events announced from the field, early sportscasters were free to make up events to keep games interesting or to account for game delays and crowd noise in the stadium. Bill Stern’s reputation was as a premiere storyteller rather than an accurate reporter, for example, and he felt free to stick in lateral passes and fumbles to account for his mistakes about who was carrying the football. Other announcers routinely invented unbelievable catches or fan disputes in the stands to explain roaring crowds. As late as 1951, Gordon McLendon (the Old Scotchman) broadcast recreations as *The Game of the Day* over the Liberty Broadcasting System (LBS). These broadcasts were popular for their variety because, rather than sticking to one team, McLendon chose popular games for recreations from all over the country. Much of the concern for exceptional accuracy in announcing exhibited by Red Barber, for example, came from his distaste for recreations and summaries that had little to do with the reality of the games that were played. Barber was determined to report in detail what actually happened as it happened on the field. And by Barber’s era, announcers had begun getting support from assistants, spotters, and statisticians who kept the facts accurate. In the 1920s and 1930s, radio sportscasters worked without scorecards, press guides, or a history of player or game statistics. A great deal had to be imagined.

While the networks have carried league championship and World Series games live since their inception, regular-season baseball and other sporting events got little or no national airtime, although baseball became a mainstay of local radio during the Depression of the 1930s. But during World War II, the Armed Forces Radio Service relayed shortwave broadcasts of daily baseball to service men overseas, and their immense popularity on wartime radio continued at home after the war ended. It was not until the postwar period that team or network announcers were allowed to travel with the home teams, and all games (at least those involving the most popular teams) began being delivered live to fans on radio. By the 1950s, sports had become a mainstay of the electronic media, with the clashes of football on the air in winter and the mellow sounds of baseball filling summer afternoons around the nation. Fifty years later, the pace of games has become faster, the variety of radio voices is much greater, and the competition from media coverage of other leisure activities splinters the audience. To compete, most radio stations and sports networks maintain interactive websites, and the internet provides up-to-the-minute sports scores, live play-by-play, ESPN’s *SportsCenter*, as well as archived commentary, interactive games, and chat rooms devoted to fans of a sport or a particular team.

All-Sports Radio

One recent change in radio has been the rise of the all-sports format. Sport is especially successful on radio because the public has become so mobile, and radio lets fans stay in touch. In the largest markets, sufficient numbers tune in to successfully support one-format stations; in smaller markets, live sports coverage tends to be combined with syndicated talk and satellite music to keep costs down. Between 1988 and 2000, the number of stations claiming sports formats went from zero to more than 600. Such stations provide both live and taped play-by-play game and event coverage accompanied by constant updates on the day’s game scores and sports news about individuals and the industry. For affiliated stations, part of the programming usually comes from the staffs and commentators of the network television sports divisions; in addition, syndicators, such as Sports ByLine USA, supply sporting events and a range of commentary to hundreds of subscribing stations, including the 400 stations of Armed Forces Radio. ESPN provides an audio feed of its celebrated *SportsCenter* that can fill the overnight time period or portions of daytime radio schedules. Mixing the voices of famous broadcast and cable sportscasters with local voices establishes an aura of credibility and provides a connection to big-time sports that listeners recognize, positively branding even the smallest station. Some stations specialize in an irreverent approach to sports, intended to appeal to younger fans; others take a more traditional, straightforward approach. Sports fans tend to be very loyal

and listen for long periods of time to radio, and because listeners are largely male, stations carrying sports generally have strong appeal to advertisers. The first station to adopt an all-sports format, WFAN (AM) in New York was for years the top-billing radio station in the country. It combined a heavy load of play-by-play with a very local orientation.

Talking Personalities

Another big change from sportscasting's early days lies in the amount of time broadcasters have to talk on the air. With only a few commercials to insert, early sportscasters had to fill the time between innings and plays. They had the leisure to tell stories and discuss events on the field or dugout, in effect creating personalities for themselves and the players that resulted in long-term relationships with listeners. In contrast, present-day announcers can only talk during the action on the field, because commercials and cut-aways to studio announcers fill breaks in games. The upshot is that such beloved personalities as Mel Allen, Harry Caray, and Bill Stern would not be hired today. Management wants swift talkers who stick to a schedule, get in and out of commercials, and keep the games to the point—not storytellers or celebrities who generate controversy.

One current catchphrase is that fans don't tune in to hear broadcasters talk, but they did tune in to hear Red Barber, Mel Allen, Harry Caray, and Lindsey Nelson, as well as others of the great early radio and television sportscasters. For most fans, these much-beloved broadcasters were and are as much a part of the games as the players.

Major Sportscasters

More than a dozen announcers and commentators stand out in the history of sports radio; most of them have been elected to one of the halls of fame (Baseball Hall of Fame, Boxing Hall of Fame, Radio Hall of Fame, National Broadcasting Hall of Fame, etc.). Some of the younger individuals went on to careers in televised sports, but all made important contributions to the development of sports on radio.

Mel Allen (1913–96)

Idolized as “The Voice,” Melvin Allen Israel was the mellifluous announcer for the New York Yankees for 25 years, including the six years in the 1950s when they were the annual World Series champions. He became the Yankee voice just when recreations of away games were dropped in favor of sending key play-by-play and color announcers to all games, and he benefited from this move, which allowed him to announce more games. Considered in his heyday the very best play-by-play man ever, Allen announced 20 World Series, did play-by-play for 24 All-Star Games, and broadcast more than 20 college bowl games. Allen's soft Alabama twang was

instantly recognizable, and his trademark phrases (“How about that!” and “Going, going, gone!”) have become legendary sportscasting calls. He received every award offered to a sportscaster, often many times over, demonstrating his peers' enormous respect and admiration for his sports knowledge, his communication abilities, and his love of baseball and football. Allen was voted the Sportscaster of the Year for an extraordinary 14 years in succession.

Harold Arlin (1895–1986)

Not to be forgotten, Harold Arlin was the first announcer of sports, broadcasting the first professional baseball game over KDKA in 1920, and in the next year, the first tennis match and the first football game (a college game between the University of Pittsburgh and the University of West Virginia). Arlin was not a career sportscaster, and he moved into corporate relations after about six years. But he left a unique legacy for radio sportscasting history.

Red Barber (1908–92)

A tally of sportscasting greats has to include patriarch Walter Lanier “Red” Barber, who was one of the early popularizers of daily radio play-by-play and one of the most respected and influential mentors of baseball announcers. The “Ol' Redhead” had one of the longest careers in broadcasting—about 63 years. He broadcast the Cincinnati Reds from 1934 to 1938, then became the voice of the Brooklyn Dodgers, the team with which he is most associated in sportscasting history, for more than two decades. However, he subsequently announced the New York Yankees and the New York Giants from 1954 to 1966 alongside such greats as Mel Allen, Ernie Harwell, and Vin Scully. Barber announced dozens of World Series, and after the Yankees fired him in 1966 (in part for commenting on the sparse attendance at a September home game), he ended his long career with a decade of Friday morning sports commentary on NPR. He anchored the first televised major league baseball game in 1953—to a minuscule audience. In contrast, the radio audience for the 1942 World Series, announced by Barber and Mel Allen, was estimated at 25 million. Known for his intense pre-game preparation and exceptional memory for and recognition of players' styles, on the air Barber charmed listeners with self-effacing humor and vivid homespun imagery. A fastidious and reserved man, he worked at a style that was precise and detached, reflecting integrity and professionalism. One of his greatest contributions was his quiet acceptance of Jackie Robinson in 1947, the first African-American player in major league baseball. Among many other honors, in 1978 Barber and Mel Allen were the first broadcasters to receive Ford C. Frick awards (Baseball Hall of Fame). Barber was installed in the National Sportscasters and Sportswriters Hall of Fame in 1973, inducted into the American Sportscaster Hall of Fame in 1984, and elected to the Radio Hall of Fame in 1995.

Jack Brickhouse (1916–98)

Before, during, and after World War II, Jack Brickhouse was the first daily announcer of the Chicago Cubs and White Sox, calling play-by-play games in his breezy style and imbedding his characteristic “Hey-Hey!” and “Back, back, back . . . That’s it!” in the hearts of four decades of baseball fans. Atypical for local sportscasting, for 20 years he called the city’s rival baseball teams on WGN radio and television: the White Sox from 1940 to 1967 and the Cubs from 1941 to 1981. Perhaps because his manner was warm and friendly, he was popular with both White Sox and Cubs fans, and like many generalists of the 1940s and 1950s, Brickhouse announced other local events in addition to baseball. He called Chicago Bears games for 24 years, and Chicago Bulls, Zephyrs, and Packers basketball, along with Notre Dame football, boxing, golf, and wrestling. As a national announcer for Mutual for one year in the 1940s, he called New York Giants baseball, and later for NBC he announced four World Series, five All-Star games, 12 NFL All-Star games, and many college bowl games. His style was avuncular and entertaining rather than abrasive or critical, and for 50 years he was a beloved part of Chicago history. Brickhouse died in 1998, just six months after his flamboyant Cubs successor, Harry Caray. He received a Ford C. Frick Award in 1983 (Baseball Hall of Fame), was installed in the National Sportscasters and Sportswriters Hall of Fame in 1983, and inducted into the American Sportscasters Hall of Fame in 1985 and the Radio Hall of Fame in 1996.

Jack Buck (1924–2002)

John Francis “Jack” Buck spent more than four decades broadcasting the St. Louis Cardinals, including the periods in the 1960s and 1980s when the team won pennants and the World Series. Alternating with baseball, Buck also had another career as a network football announcer, calling play-by-play for more Super Bowls than any other sportscaster. Beginning as a minor league baseball announcer after his military service and study at Ohio State University, Buck called the minors on radio for four years before moving to the big leagues at Busch Stadium in St. Louis. He started as a supporting announcer paired with the inimitable Harry Caray in 1954 and later worked with Joe Garagiola. His signature “That’s a winner!” was a phrase beloved of generations of Cardinal baseball fans. After being crowded out at KMOX in 1959, Buck spent a year with ABC Television’s baseball program *Game of the Week* and had the distinction of calling the first American Football League telecast. He returned to St. Louis to a warm welcome from Cardinal fans, and in 1969, when Caray went to Chicago, Buck stepped into the lead position as the Voice of the Cardinals. But Buck had a very different style: whereas Caray exhorted and stirred fans up, Buck was known for his silver voice, his satirical wit, his personal charm, and his low-key storytelling approach to sportscasting. Using no excess words,

in a quietly emotion-laden voice, he called the game action as if it were a series of unfolding stories, causing listeners to hang on until each “story” concluded. Carried on KMOX, a 50-kilowatt station, the Cardinals could be heard all over the Midwest and built an enormous fan base across many states, creating enthusiastic devotees of the long-time St. Louis announcers (Caray and Buck), as well as of the team. In 1975 Buck once again took a stab at network sportscasting, this time as the host of the ill-fated *Grandstand* on NBC. Returning to St. Louis in 1977, Buck continued as the Cardinals’ voice, but also called play-by-play for both baseball and football over CBS Radio, eventually becoming the radio Voice of the National Football League for many years. Buck was also widely recognized for his masterful hosting of ABC’s *Monday Night Football*, and his technique influenced such familiar sports voices as Bob Costas, Tim McCarver, Dan Dierdorf, and his son, Joe Buck. His lasting presence remains a testimony to his greatness as a sportscaster. Buck received the prestigious Ford C. Frick Award in 1987 (Baseball Hall of Fame), and was inducted into the Broadcaster’s Hall of Fame in 1990 and the Radio Hall of Fame in 1995.

Harry Caray (1920–98)

Born Harry Christopher Carabina, Harry Caray became a folk hero who stood larger than life. He was the gravelly-voiced, beer-swiggling, beloved voice for Chicago Cubs fans on WGN for the 16 seasons between 1982 and his death. Much earlier, he was the darling of St. Louis Cardinal fans on KMOX for the 25 seasons between 1945 and 1969 and later for Chicago White Sox fans for the 11 seasons from 1971 to 1981. Caray is cherished in memory for his outspoken personality, his signature “Ho-o-o-ly Cow!,” his home-run call of “It might be . . . It could be . . . It is!,” and such diversions as participatory singing of “Take Me Out to the Ballgame” in the seventh inning stretch. Broadcasting more than 8,000 regular-season games over a long career, Caray made it fun to be a fan, even of a losing team. His raw exuberance and sarcasm over the air, combined with eternal optimism for the home team, set him apart from many of his contemporaries who tended toward the smoother styles of Barber and Allen. A showman with a can of Budweiser beer in one hand and a big wave in the other, Caray was part of the entertainment. He drew fans to the White Sox when the team had no stars, no marketing, and no winning record. He drew fans to Wrigley Field to cheer on the Cubs even when they hadn’t won in decades. Successor to the kinder Jack Brickhouse, Caray loudly criticized the players and the management for plays on the field or decisions in the front office he didn’t like, a practice that occasionally got him fired, while his energy and devotion to baseball got him hired again. Caray was a fan’s fan: he praised, criticized, and rooted for the home team like fans do, and in several surveys, baseball fans chose him as the celebrity with whom they would most like to

share a beer. By the end of his career in Chicago, Caray was a bigger star than the team he announced, and he remains a giant figure among all sportscasters. For seven years in a row, he was named Baseball Announcer of the Year by *The Sporting News* for his work with the Cardinals. He received the Ford Frick Award in 1989 (Baseball Hall of Fame) and was inducted into the American Sportscasters Hall of Fame in that year; he was elected to the Radio Hall of Fame in 1990 and received a National Sportscasters and Sportswriters Hall of Fame award in 1994. When Caray died, he left behind two of the next wave of sportscasters, son Skip Caray and grandson Chip Caray. At Wrigley Field, fans built an oversized statue of him holding a beer can and waving to his audience.

Bob Costas (1965–)

Although best-known to present-day sports fans as the most celebrated of network television sports hosts for the NFL and the Olympics, Bob Costas, like so many other sportscasters, got his start in radio and continues to be heard over that medium. Costas is part of the generation that was able to study broadcasting in college, in his case, at Syracuse University. Relaxed in manner but passionate about baseball, with a seemingly bottomless knowledge of players and games, he attracted the networks when he did play-by-play of professional basketball on KMOX in the late 1970s. After a short time at CBS, he switched to NBC in 1980 and became one of the youngest ever NFL game announcers. Nonetheless, the slower pace and romantic past of baseball remained his passion, and after a stint as a play-by-play voice for NBC's backup game for the *Game of the Week*, he soon advanced to the status of NBC's centerpiece sportscaster. Rapidly recognized for his superb advance preparation, professionalism, and intense commitment, coupled with a wry wit that appeals to fans, Costas hosted NBC's 1992, 1996, and 2000 Olympics and received wide acclaim. He is frequently compared to the legendary Jim McKay, ABC's long-time Olympic host. In addition to superb play-by-play skills, Costas is widely believed to be the best interviewer and the best studio host in broadcasting. Host of a weekly radio show, *Costas Coast to Coast*, and of the late-night television talk show, *Later . . . with Bob Costas* early in his network career, in 2001 he launched a new sports magazine show on HBO, *On the Record*. Although primarily a big-event television announcer and host for NBC, his voice continues to be part of radio sports reporting and commentary. Able to mix anecdotes and history with perfect timing and delivery, Costas is the most recent of sportscasters to become an event within the events he covers. His exceptional vocabulary and wealth of poetic expression reaches across generational boundaries and sets an impossibly high standard for most aspiring broadcasters. He appeals to audiences because his great knowledge of baseball, football, and other sports is accompanied by a comfortable on-air style. Launched toward the peak of a luminous

career as the 21st century commences with an extraordinary 11 Emmy awards, he has already been selected four times as the Sportscaster of the Year by the American Sportscasters Association. The much-respected Costas can most likely look forward to another decade of announcing professional football, baseball, and basketball games in addition to hosting NBC's Olympic coverage. While *Time* writer David Ellis called him "America's Host," *Newsweek's* David Kaplan elevated him further, labeling Bob Costas "Anchor to the World," a fitting title for someone whose commitment to thoroughness and, above all, fairness stands out in the minds of millions of radio listeners and television viewers around the globe.

Dizzy Dean (1911–74)

Raised in rural Arkansas, Jay Hanna "Dizzy" Dean began his sports career as a pitcher for the St. Louis Cardinals in the 1930s, winning an astounding 120 games in his first five full seasons and achieving a career total of 150 games with 30 saves. After an injury and a few years with the Chicago Cubs, he turned to broadcasting the Cardinals and Browns games in 1941, and his distinctive folksy manner attracted enormous audiences on radio in the 1950s. His unique brand of upbeat, humorous color often appeared alongside the famed Mel Allen or paired with former player Pee Wee Reese. Dizzy Dean was a national voice of baseball in the period when baseball dominated the ratings. An eccentric and original with only a fourth-grade education, Dean had a total disregard for standard grammar and pronunciation, mangling the language to such a degree that colleagues used to joke that at least some of his words were English. In 1944 Judge Landis, the commissioner of Major League Baseball, refused to allow Dean to announce the World Series, calling his diction "unfit for a national broadcaster." His garbled syntax assaulted listeners' ears, and his long speeches often rambled on about something unrelated to the game at hand, but his exuberance, warmth, and humor endeared him to radio listeners. During the 1950s, he was one of radio's most widely recognized and most beloved broadcasters. Beginning in 1953, Dean provided color for Falstaff Beer's new *Game of the Week* on ABC, one of the events that helped make ABC a truly competitive national network. Moved to CBS in 1955 along with *Falstaff's Game of the Week*, Dean announced baseball on CBS Television until 1965, followed by three years at NBC (until 1968). In 1973, he had two popular guest appearances on ABC's *Monday Night Baseball*. He was selected for the National Sportscasters and Sportswriters Hall of Fame in 1976 for his decades of dedication to baseball.

Don Dunphy (1908–98)

Best known in the 1940s and 1950s, Don Dunphy announced the Friday night fights over the Mutual Broadcasting System (MBS) at the peak of boxing's popularity over network radio. Getting his start on WINS in New York, he began by inter-

viewing fighters and then moved into event announcing, enduring for 24 years as the best-known voice of boxing. Dunphy was known for his eloquence and his ability to bring the drama and excitement of bouts to radio listeners. At one point, he and a colleague were hired by Gillette to cover the Giants and Yankees games over WINS in New York. During America's participation in World War II, there were no televised games, and radio reached enormous audiences. But Dunphy and his colleague Bill Slater were unsuccessful, with the huge audiences going to the Brooklyn Dodgers instead of the teams they announced. Dunphy stuck with boxing and continued to announce the big fights, including the classic matches of Joe Louis, until the boxing business declined in the 1960s. In 1964 he shifted largely to other sports but handled the national broadcasts of the *Fight of the Month* into the 1980s, and the inimitable Howard Cosell often provided color for him. Dunphy has broadcast track meets, bowling, wrestling, college football bowl games, and even some World Series, but he is remembered most for his clarity, skill, and drama as an announcer of boxing at the Polo Grounds in its heyday on radio. Dunphy was inducted into the American Sportscasters Hall of Fame in 1984 and into the National Sportscasters and Sportswriters Hall of Fame in 1986. He was elected to the Radio Hall of Fame in 1988 and to the International Boxing Hall of Fame in 1998.

Marty Glickman (1917–2001)

One of the first athletes to turn announcer, Marty Glickman popularized college and professional basketball games from Madison Square Garden. While still a college football player at Syracuse University, he began broadcasting and, after graduation in 1939, moved to WHN in New York, where he was one of a team doing pre- and post-game for the Brooklyn Dodgers. After military service during World War II, Glickman returned to WHN as sports director and became the New York Knickerbocker's first radio announcer in 1946. He remained the Knicks' voice for 21 more years, delivering the basketball play-by-play in his characteristic rapid-fire, staccato style. His widely recognized trademark call of "Swish" signaled a "nothing-but-net" Knicks' basket to decades of listeners. Beginning in 1948, Glickman did radio play-by-play of the New York Giants football games for 23 years, at a time when the New York television market was regularly blacked out, thus creating huge radio audiences for professional football. A versatile talent, Glickman also broadcast the Yonkers Raceway for 12 years and the New York Jets for 11 years on radio. In addition, he hosted pre- and post-game shows for the Dodgers and Yankees for 22 years, announced the first National Basketball Association (NBA) game carried on television, as well as many National Hockey League (NHL) games. On radio, he broadcast a plethora of wrestling meets, roller derbies, rodeos, and track and field events. He was also sports director for HBO

Sports in its early years (the beginning of the 1970s) and a consultant for many years thereafter. Later in life, he became an executive of Manhattan Cable TV, which telecast all Madison Square Garden events to subscribers. He was particularly known for the enormous energy conveyed in his restrained voice that communicated excitement to the fans. Glickman provided an enduring model of restraint in early game announcing. For a time late in his 55-year career, he personally trained some of NBC's sports announcers, steering them away from the hyperbole of the first generation and toward concise, crisp, clear descriptions of events on the field. But it was his decades of nearly daily announcing that provided the strongest model for such later luminaries as Bob Costas and Marv Albert. In 1998 the United States Olympic Committee gave Glickman a plaque to make up for, in small measure, an Olympic medal he did not have a chance to win as a college runner. While a student at Syracuse, he had been chosen to run in the 400-meter relay in the now infamous 1936 Berlin Olympics, but the day before the race he and another runner were dropped from the team. Glickman always believed that Jesse Owen won the gold medal in his place. He maintained throughout his lifetime that he and his teammate were dropped because they were Jewish, a reasonable claim in the anti-Semitic climate of 1936. His 1996 autobiography recounts this bitter story, along with tales of many rewarding experiences in his long announcing career. Among his fellow broadcasters, Glickman was also known for his acidic criticism of colleagues' announcing (and decades later, he even had critical comments for Bob Costas after the 2000 Sydney Olympics). His reflexive analysis of the practice of broadcasting had the eventual benefit of improving sports coverage, and Glickman is admired for devising some of the enduring structures of sports documentary and top-quality event coverage. He was inducted into the American Sportscasters Hall of Fame in 1993 and the National Sportscasters and Sportswriters Hall of Fame in 1992. He died in Manhattan on 3 January 2001.

Curt Gowdy (1919–)

Known as the consummate professional to his colleagues and fans, after graduating from the University of Wyoming where he played basketball, Curt Gowdy began by announcing a variety of sports over local radio in Cheyenne during the early 1940s and soon moved to KOMA in Oklahoma City to do college football and basketball. In 1940 he was invited to New York to do radio play-by-play for the Yankees; there he worked under the celebrated Mel Allen until 1950, and also announced some college basketball, track, and boxing. From 1951 until 1965, he was the radio and television voice of the Boston Red Sox, and then became a network announcer for baseball's *Game of the Week*. Gowdy has been widely recognized as exceptionally versatile, equally competent at basketball, baseball, and football announcing, and as host of ABC's *The*

American Sportsman, endearing himself to hunting and fishing fans everywhere for over two decades. Younger football fans may know him best as a top television sportscaster for NFL football on NBC today, but he has also announced 15 All-Star games, 12 World Series, seven Olympics, and from 1966 to 1975, he called virtually all NBC network baseball games. In 1970 Gowdy was the first sportscaster to receive a Peabody Award for the highest achievement in radio and television. In the same year, he was honored as the Sportscaster of the Year for the fifth time. Indubitably the voice of NBC Sports in the 1960s and 1970s, in 1984 he received a Ford C. Frick Award (Baseball Hall of Fame), was included in the National Sportscasters and Sportswriters Hall of Fame in 1981, and was inducted into the American Sportscasters Hall of Fame in 1985.

Ernie Harwell (1918–)

Ernie Harwell is another voice from the earliest days of radio sports. He began announcing play-by-play for the minor league Atlanta Crackers in 1940 and is unique for being the only broadcaster ever traded for a player (Dodger catcher Cliff Dapper, so that Harwell could fill in as Brooklyn Dodger announcer for a hospitalized Red Barber). After working two years with a recovered Barber, Harwell joined Russ Hodges in 1948 with the New York Giants at the Polo Grounds. Beginning in 1954, he announced the Baltimore Orioles for six years, and then in 1969 Harwell went to Detroit as the voice of the Tigers, where he stayed for more than 40 years. Fired in 1991 (to the horror of fans and colleagues nationwide) after acrimonious verbal battles with the then-owner of the Tigers, he was rehired the next year by the new owner—after spending the intervening year with the California Angels. At the time he retired in 2002 at age 84, Harwell was said to be the most famous man in the state of Michigan. His name was synonymous with Motor City baseball. His peers say Harwell's lyrical announcing sounded as much like preaching and poetry as game calling; whatever he did, it was much admired by fans and colleagues. Harwell had two notable firsts in his long career: in 1942 he announced the first national broadcast of golf's Masters for CBS, and later he provided the first coast-to-coast television broadcast of a sporting event, the 1951 MLB playoff game when the Giants beat the Dodgers for the pennant. He has called three World Series, two All-Star games for CBS Radio, and numerous football games. He received the Ford C. Frick award in 1981 (Baseball Hall of Fame), was elected to the National Sportscasters and Sportswriters Hall of Fame in 1989, and was inducted into the American Sportscasters Hall of Fame in 1991 and the Radio Hall of Fame in 1998.

Graham McNamee (1888–1942)

Because he was the first network sportscaster, Graham McNamee virtually invented play-by-play and color commentary and, for many years, was the most prominent voice in

America, enjoying celebrity status and a fan following. In the 1920s he announced the first World Series, the first Rose Bowl, and other major college football games as well as many tennis and boxing matches. Probably owing to his previous musical training as a singer, McNamee spoke with careful diction and used polished phrasing in his descriptions of the scene of a sporting event. Although his style was inventive and delivered in an enthralling voice, McNamee was not necessarily accurate or historically insightful about the players or the game. He was an unabashed generalist with little sports knowledge, convinced that he should broadcast sporting events much as he did news events. Nonetheless, McNamee significantly influenced the generation of sportscasters that followed by attracting many to this new profession and providing a model of how broadcasting a sporting event could be done. McNamee was installed in the National Sportscasters and Sportswriters Hall of Fame in 1964 and inducted into the American Sportscasters Hall of Fame in 1984.

Lindsey Nelson (1919–95)

A mellifluous charmer in the media spotlight and out of it, Lindsey Nelson is best known by fans for his trademark sports jackets—the loudest he could find—and his liquid voice. Near the beginning of his career, he determined that to stand out from crowds of sports journalists he needed some visual signature, so he adopted the practice of wearing the most outrageous plaid sports coats that he could buy (he eventually owned between 350 to 700 at any one time). Long after he was established at the top of the sports media world, he continued wearing such psychedelic jackets, fully understanding that they were truly horrible to behold but enjoying the joke. After army service during World War II, during which he became a war correspondent and friends with such giants as Dwight Eisenhower, Omar Bradley, and William Westmoreland, Nelson wrote for newspapers. Bored by the routines of reporting, he soon turned to baseball game recreations on Gordon McLendon's very successful Liberty radio network. Once in 1950, a very young Nelson served as game spotter for the legendary Bill Stern, but to his surprise, the following year he was asked to produce the NBC radio coverage of the U.S. Open golf tournament, with Stern and Dizzy Dean as his announcers. In 1952 Nelson went to NBC Sports in New York, now sharing office space with Stern, where he remained for the next decade. For many years, he was the all-purpose announcer for NBC, seemingly indefatigable and able to cover any sport with great accuracy, reliability, and humor. He broadcast major league baseball on radio and television from 1957 to 1961, and when the New York Mets were franchised in 1962, Nelson became their first voice. It was his view that many early network generalists burnt out from the travel and the stress of being the perfect announcers for a continuous stream of big events, whereas baseball announcers, employed by a team or sponsor, seemed

to go on forever. At any rate, Nelson went to the Mets and stuck with them through all the crazy up and down years, eventually celebrating their 1969 World Series championship. In 1979, after 17 years, Nelson left the Mets to move to California, where for three seasons he served as the San Francisco Giants announcer. He then retired to teach at his alma mater, the University of Tennessee, and call some college football games for Turner Sports. Altogether, Nelson announced four Rose Bowls, 26 Cotton Bowls, two World Series, 19 years of National League Football, and five years of college basketball, but is best known for his 17 years as the voice of the Mets and 13 years with Notre Dame football. Among his special qualities were his exceptional storytelling ability, his great warmth and wit, and his reporting accuracy. He was elected to the Radio Hall of Fame in 1988 and beginning in 1959, was named the top sportscaster in the nation for four consecutive years by the National Sportscaster and Sportswriter Association; he was inducted into the NSSA's Hall of Fame in 1979 and into the American Sportscasters Hall of Fame in 1986. He received a Ford C. Frick Award in 1988 (Baseball Hall of Fame) and a Life Achievement Emmy Award in 1991.

Vin Scully (1928–)

Born in New York, after serving in the army Vin Scully attended Fordham University and then began his broadcasting career in 1950 with the Washington Senators on WTOP. After three years, he was lured to New York to join the Dodger team. Scully said the best thing that ever happened to him was learning the fine points of baseball announcing under the rigorous training of Red Barber at Ebbets Field. Replacing Ernie Harwell at Barber's side, Scully learned from a perfectionist, and he was later to assert that those paternal lessons were responsible for his own successful career. Succeeding Barber as the Dodger voice in 1954, four years later Scully moved with the Brooklyn Dodgers to California and became a crucial part of the Dodgers' popularity in Los Angeles. He brought with him the team's history and traditions and communicated them to southern California listeners who were establishing their first connection to major league baseball. In the poorly designed Los Angeles Memorial Coliseum, the initial home of the Dodgers, fans in the stadium had to listen to Scully on transistor radios to know what was going on, and that radio custom continues today. Beloved of California baseball fans, Scully was once voted the "most memorable personality" in Dodger history. In addition to carrying baseball tradition to the West Coast, he is known for his warm, resonant voice, his impeccable diction, and his intelligence and quiet erudition. Many of his peers have called Scully the best announcer ever (with the possible exception of Mel Allen), and many top sportscasters today exhibit the same smooth style, particularly Al Michaels and Dick Enberg. Besides announcing the Dodgers, Scully has called play-by-play for NFL football games and

Professional Golf Association (PGA) Tour events on CBS-TV and Radio, and play-by-play baseball for *Game of the Week*, World Series, and All-Star Games on NBC. Altogether, he has announced 25 World Series and 12 All-Star Games. Widely recognized as the premiere baseball sportscaster, Scully's career has entered its sixth decade, and he has continuously broadcast one team longer than any other major league sportscaster. He was selected Outstanding Sportscaster of the Year four times, received a Fred C. Frick award in 1982 (Baseball Hall of Fame), and was inducted into the American Sportscasters Hall of Fame in 1992 and the Radio Hall of Fame in 1995. He has a Peabody Award and received a Lifetime Achievement Emmy Award in 1995.

Bill Stern (1907–71)

A major star of early radio sports talk and game hosting, Bill Stern was famous for his highly dramatic storytelling ability and his only passing concern for accuracy in game announcing. He was part of the first era of radio announcers along with Graham McNamee, sometimes called "the shouters" because they worked so hard to stir up excitement among the scattered listeners to the new medium of radio. He is especially remembered for his spellbinding stories, which got full rein in the sport talk programs he hosted and showed up often in the baseball and football games he called. One story told with affection about Stern is that he covered up his errors in early radio play-by-play by reporting imaginary lateral passes of the football to other players, an invention that has spawned decades of "lateraling" jokes among erring sportscasters. Operating in an era without extended pregame preparation and strong support from experienced assistants and statisticians, few announcers of the 1930s and 1940s managed an entire game without miscalling some action or some player's name. Stern started broadcasting as a teenager in Rochester, New York, and after college and a stint at the Radio City Music Hall, he assisted Graham McNamee with some football games and worked for Gordon McLendon's Liberty network doing recreations—a format at which he excelled. He was invited to become an NBC network sports announcer in 1937, and his rapid and dramatic calling of college football games set the pattern for the subsequent generation of football announcers. He was NBC's announcer for the first network telecast of a sporting event, a college baseball game in 1939. He hosted NBC's *Colgate Sports Newsreel* and other sports programs, and by 1941 was voted the most popular sportscaster in America in several polls. He broadcast for ABC in the mid-1950s, and after recovering from morphine addiction resulting from a gangrenous leg amputation, he resumed announcing for the Mutual network and hosted a television sports series. Like Mel Allen, Stern was wildly controversial and a bigger celebrity than the players he announced. He was selected for the National Sportscasters and Sportswriters Hall of Fame in

1974, inducted into the American Sportscasters Hall of Fame in 1984, and elected to the Radio Hall of Fame in 1988.

These legends of broadcasting inspired and enthralled generations of radio sports fans. There are others who could have been mentioned—one-time sportscaster turned sportswriter Grantland Rice; Tom Manning, Indians' announcer in the 1920s; Byrum Saam, voice of the Philadelphia Phillies for three decades; Russ Hodges of the New York Giants (who shouted "the Giants win the pennant! The Giants win the pennant!" in 1951); Milo Hamilton, voice of the Atlanta Braves and the Houston Astros; and on and on. All these radio sportscasters left their imprints on players and fans, and set the bar high for those who succeeded them.

Sports on Radio

Sports have been a constant feature of radio literally since the beginning of the medium. When Guglielmo Marconi visited New York City in 1899 to demonstrate his wireless telegraphy equipment, he relayed the outcome of the America's Cup yacht race through the ether. Radio sports broadcasts provided some of the first mass-audience programming, enticed Americans to buy radio sets, helped national networks and local stations establish themselves as legitimate entities, and spurred technological and cultural innovations in attempts to capitalize on the appeal of sports. Radio broadcasts of sporting events have also been credited with, or occasionally blamed for, helping to create a sense of national identity, particularly during the 1920s and 1930s.

Origins

Sports—especially boxing, college football, and baseball—became common on some stations as early as the 1920s. The first boxing match broadcast, between heavyweight champion Jack Dempsey and challenger Georges Carpentier on 2 July 1921, was orchestrated by the Radio Corporation of America's (RCA) David Sarnoff and Major J. Andrew White. RCA applied

for, and received, a one-day license to broadcast the event using a radio tower borrowed from the Lackawanna Railroad and equipment borrowed from the U.S. Navy. The improvised arrangement, fraught with problems, succeeded in its task. White's narration of Dempsey's victory, which traveled on a signal powerful enough to be received across much of the United States and even in Europe, is credited with sparking a surge in the construction of radio towers and the purchase of receivers. Radio broadcasts of other major bouts, particularly the battles between Dempsey and Gene Tunney in 1926 and 1927 and the Joe Louis–Max Schmeling fights in 1937 and 1938, became mass radio spectacles that attracted audiences of unprecedented size and helped make household names out of broadcasters such as Graham McNamee, Ted Husing, and Bill Stern.

The popularity of college football also grew rapidly in the first two decades of radio. During the 1920s, Notre Dame football became a regional and then a national phenomenon, thanks in part to its prominence on radio, and the annual Army-Navy contest, Ivy League games, and holiday bowl games became nationally recognized events. Bowl games in particular benefited from their appearance on radio: the Rose

Bowl, begun in 1927, was carried from the beginning by the National Broadcasting Company (NBC) and became the first coast-to-coast broadcast conducted by the fledgling network. The Sugar Bowl, Orange Bowl, and similar contests begun in the mid-1930s were hyped so vigorously by stations carrying them that radio can be credited for their continued existence. Ted Husing, who began announcing the Orange Bowl in 1937 for the Columbia Broadcasting System (CBS) and hyping the game on his weekly regular-season college broadcasts leading up to New Year's Day, almost single-handedly turned the little-known, sparsely attended event into a major spectacle. His success with the Orange Bowl convinced the industry that other bowl games could become similarly profitable.

Baseball, however, is the most remembered and romanticized radio sport. The inaugural baseball broadcast aired on 5 August 1921, when Harold Arlin called the Pittsburgh Pirates' 8-5 victory over the Philadelphia Phillies on KDKA in Pittsburgh; the first World Series broadcast also occurred that year. These early efforts were little publicized, however, and thus were not widely heard. The next year, however, New York station WJZ's broadcast of the 1922 World Series was heavily publicized by Westinghouse, General Electric, and RCA in an attempt to sell receivers, prompting other New York stations to sign off rather than interfere with the signal. The broadcast was a smashing success: it was heard clearly up to 800 miles away, and immense crowds gathered in front of radio stores to hear the game over loudspeakers.

Demand for baseball broadcasts, especially the World Series, also provoked some of the first experiments in networking. Two New York stations, WJZ and WEAJ, were granted broadcast rights to the 1923 World Series; WEAJ, owned by telephone giant American Telephone and Telegraph (AT&T), fed the broadcast to WMAF in Massachusetts and WCAP in Washington, D.C. Telephone lines linked seven stations in the Northeast, from Boston to Washington, to carry the Washington Senators' seven-game triumph over the New York Giants in 1924. The World Series quickly became one of radio's biggest and most popular events, with the distinctive voices of McNamee, Husing, Red Barber, Mel Allen, Jack Brickhouse, Jack Buck, Ernie Harwell, and Vin Scully becoming synonymous with baseball over the years for their work behind the microphone during both the regular season and the World Series.

When more regular schedules and commercial radio became established in the late 1920s and early 1930s, sports became more difficult for stations and networks to categorize. Sports resembled news programming in being live, unscripted, and spontaneous, but sports were rarely considered as weighty as other news items. Their mass appeal gave them nearly limitless profit potential, making them resemble entertainment programming, but their spontaneity, timeliness, and control by other entities (team owners, sports commissioners, universities, etc.) limited access and made them difficult to control—partic-

ularly because overtime or extra innings could disrupt schedules. In addition, the mixed feelings that outside entities had toward radio broadcasts were a particularly strong obstacle the radio industry had to overcome. Some, such as the Chicago Cubs and Chicago White Sox, viewed radio as a way to expand their sport's (or team's) fan base. Others—such as the New York Yankees, Brooklyn Dodgers, and New York Giants, which agreed to ban baseball broadcasts from 1932 through 1938—considered broadcasts that could be received free of charge a detriment to their box-office revenue. Still others, such as minor-league baseball clubs, believed radio undermined their own profitability while benefiting others in their industry (i.e., the major-league baseball clubs).

Developing Patterns in the 1930s

Reluctant to pay for broadcast rights early in the medium's history, stations and networks initially asked for, and often received, the same treatment as print news media in terms of access to sporting events. There was little exclusivity, and stations competed for listeners rather than for broadcast rights: for instance, during the early 1930s as many as five local stations in Chicago were broadcasting Cubs games from Wrigley Field simultaneously. Although most such broadcasts were noncommercial in character, this approach also allowed radio stations and networks to claim that they met federal responsibility/public service requirements by offering programming of substantial community interest. By the early 1930s, however, most stations accepted advertising revenue for sports programming, spending some of the money to obtain exclusive broadcasting rights. Cereal maker General Mills, Mobil Oil, Goodyear tires, and (after the repeal of Prohibition) numerous beer companies quickly became the major sponsors of major- and minor-league baseball, college football, boxing, horse racing, and, to a lesser degree, college basketball and professional football, in an attempt to reach male listeners.

To reduce costs, stations in the 1920s and 1930s rarely sent announcers on road trips with the local team. Instead, they relied on re-creations: broadcasts produced from skeletal Morse code descriptions of the contest relayed by Western Union to announcers in the radio studio. Baseball announcers became especially famous for their evocative accounts—and for their ingenuity when the wires failed, which announcers usually covered by inventing sudden storms, a ruckus in the stands, or innumerable foul balls. Re-creations slowly disappeared as technology became cheaper and the effects of the Depression were alleviated, and virtually none were heard after World War II except on the Armed Forces Radio Network and on Gordon McLendon's Liberty network.

The networks, oddly, eschewed exclusive sponsorship for sports programming longer than local stations did, for reasons best illustrated by examining the World Series. Network World

Series broadcasts from 1926 through 1934 were sustaining fare; NBC and CBS argued that the series was so important to the public that granting exclusive commercial rights to one network would prevent listeners from hearing this sacrosanct event. Because neither network could reach the entire United States through its affiliates, but taken together both could, they contended that nonexclusive rights were imperative. Moreover, the networks contended that commercializing the broadcasts would cheapen the great national pastime. This argument also enabled the networks to justify pre-empting commercial radio programming in order to air the sporting event: because the airtime was not given to another sponsor, an advertising agency that originally paid for the time slot had no basis for complaint.

When the Ford Motor Company acquired exclusive broadcast sponsorship rights to the Series from the commissioner of baseball from 1934 to 1937, the networks feared a backlash from the public, sponsors, and the federal government. Over Ford's objections, NBC and CBS persuaded Baseball Commissioner Judge Kenesaw Mountain Landis to make the broadcast available to all networks and unaffiliated stations; this provision was extended to the Mutual radio network in 1935. This allowed the networks to claim that they met the "public interest, convenience, and necessity" clause codified in the Communications Act of 1934, serving the entire nation in a way that no single station could and alleviating Federal Communications Commission (FCC) concerns. The print media and the public responded favorably to Ford's sponsorship. Jilted sponsors were livid about the arrangement, but they grudgingly agreed to accept compensation from the networks when the networks (legitimately) claimed they had not been privy to the deal. And even though Ford was upset at paying \$350,000 for production costs on top of the \$100,000 it had spent for exclusive rights, its sales for 1934 doubled, and the sponsorship was publicly hailed as a success.

The networks were ambivalent about this arrangement; although it served several of their needs, each network wanted exclusive rights to the event so it could turn a profit. CBS and NBC executives discussed forgoing their gentleman's agreement and competing for exclusive rights, but neither was able to obtain rights without a sponsor already lined up—and few sponsors were willing to advance the money without rights having been secured. Further, fears about FCC intervention made the networks reluctant to surrender their "public service" claim, and network executives fretted about how much the exclusive rights to all major sporting events would cost.

The commercial sponsorship model, however, developed quickly. In the wake of Ford's World Series deal, CBS acquired exclusive rights to the 1935 Kentucky Derby, and the major networks began to compete for rights to all major sporting events. College football bowl games, boxing matches, and other major events of national importance were all bought up quickly—except the World Series, the rights to which were already owned

by Ford. After the automaker reneged on the final year of its contract, the series was broadcast on a sustaining basis by all major networks in 1937 and 1938. In 1939 Gillette began its long run of exclusive World Series advertising—and the upstart Mutual network acquired exclusive broadcast rights. The deal not only established Mutual's status as a competitive network rather than third banana to the older networks, but also led to FCC investigations of NBC and CBS when affiliates complained that they were pressured not to opt out of their affiliate contracts to carry Mutual's World Series broadcast.

Affiliates' local sports contracts also threatened to destabilize the networks. Although stations often wanted the high-quality programming, national appeal, and other benefits that network affiliation offered, they also wanted to appeal to a local audience—and many regularly pre-empted network programming to air local sports, particularly baseball. The NBC Blue network was particularly lax in policing its affiliates; after all, the high Crossley ratings earned by local baseball team broadcasts in cities such as Pittsburgh and San Francisco helped offset the lower ratings produced by its highbrow public-affairs programming. Both NBC and CBS used the "public interest" clause of the 1934 Communications Act to justify their affiliates' actions to national sponsors, but sponsors increasingly chafed at losing the exclusive access they paid for—particularly in the West, where broadcasts in prime time on the East Coast were often deferred in favor of sporting events in the late afternoon on the West Coast.

Since Television

The advent and diffusion of television throughout the United States in the 1940s and 1950s caused a slow but steady decline in national audiences for radio sports. Sports on American radio became an almost exclusively local or regional affair from the late 1940s through the late 1980s as radio networks declined in prominence and programming shifted from serial comedies and dramas to music, talk, and local-affairs formats. The primary innovation during these years came in the late 1940s, when networks began to cover several baseball or college football games simultaneously, airing different contests regionally while having a national anchor provide updates of distant contests—a practice since imitated by television. Though national broadcasts of regular-season baseball and professional football and of major events such as the World Series and the Super Bowl remain on network radio today, they have a much lower profile than in their heyday.

Radio sports broadcasts were marked by little change from the 1940s through the 1980s. The deregulation of radio and the proliferation of FM stations in the 1980s, however, siphoned listeners from AM radio, and the search for new, profitable formats resulted in a renewed emphasis on sports. The transformation of New York station WNBC into WFAN

in 1987 marked the beginning of all-sports radio; other than a morning show hosted by Don Imus, the station devotes its entire programming day to sports talk and sports broadcasts. The debut of ESPN Radio in 1992, with 147 affiliates in 43 states carrying up to 16 hours of programming weekly, was another significant event in sports radio. Initially limited to sports news shows, update segments, and occasional features, the network has expanded to include seasonal baseball and football packages as well as talk shows featuring the likes of "The Fabulous Sports Babe" and Tony Kornheiser that can be acquired through affiliation or syndication, facilitating the development of the all-sports format.

Despite typically small audiences, often less than 3 percent of the market, the all-sports format's lucrative 25-to-54-year-old, mostly white, mostly affluent, male demographic has enabled WFAN to become the top-billing radio station in history, breaking the \$50 million mark in 1997. Moreover, because sports talk shows are inexpensive to produce, because syndicated shows can be accepted in barter deals from networks like ESPN and CBS, and because local team broadcasts gain loyal audiences, the format offers a higher profit margin than other formats. The format appears to be proliferating rapidly: though estimates of the number of all-sports stations vary widely, *Broadcasting and Cable* magazine reported that there were more than 600 all-sports stations by 1998, with four dozen stations turning to an all-sports format in 1997 alone.

Many sports teams have also made their teams' radio broadcasts available over the internet, usually for a nominal fee, greatly extending their potential fan base without needing to rely on radio networks. The National Hockey League added access to live radio calls through its website, and the National Basketball Association has capitalized on basketball's popularity by allowing ESPN's website to carry its teams' radio broadcasts. Baseball and the National Football League have been slow to adopt webcasts, though some clubs, such as the Baltimore Orioles and the San Francisco Giants in baseball, have embraced this hybrid computer/radio transmission faster than

others. This fusion, combined with the expansion of sports talk programming and the proven profitability of all-sports formats, may signal substantial future changes for sports radio.

Stamberg, Susan 1938–

U.S. Newsmagazine Host

Public radio pioneer Susan Stamberg is probably best known as the first woman to anchor a nightly national news program, but she has had a far wider influence on the sound, style, and achievement of National Public Radio (NPR).

Stamberg came to NPR at its beginning in 1971, as Program Director Bill Siemering was developing NPR's first newsmagazine, *All Things Considered* (ATC). She began as a part-time tape editor and then moved up to reporter; after ten

Susan Stamberg
 Courtesy National Public Radio

months Siemering and producer Jack Mitchell chose her to be the program's cohost. Siemering says he chose Stamberg "because I thought she expressed the most important quality for a host or a reporter—curiosity. I just assumed that the NPR listener was curious." Siemering says the fact that Stamberg was a woman wasn't the first consideration. "She was a bright, engaging person . . . and she had a good sense of radio." It was a revolutionary decision then to have a young woman anchor, report on the day's events, and interview world newsmakers about serious issues. There was opposition from some public radio station managers, who worried that a woman couldn't sound authoritative and wouldn't be taken seriously. Stamberg has said it was characteristic of Siemering's leadership that he didn't mention the station opposition to her until a dozen years later, preferring to let her on-air presence develop without that particular pressure. Noah Adams, who hosted *ATC* with Stamberg, says Siemering's confidence was rewarded: "I can't think of a tougher interviewer in a difficult situation."

Stamberg proved herself when the network was still a precarious operation, making do with scant funds, bad telephone lines, and the resourcefulness of its handful of reporters and cohosts. "In those days," says Adams, "a lot of the decisions about what went on the air were made at the microphone

level." Stamberg's performance helped open doors for many other women in broadcasting. As *ATC* host Robert Siegel told the *Los Angeles Times*, "Once she established her presence on the air, it became unthinkable to have a broadcast with all male voices." Siegel also says the decision to put Stamberg on the air helped break down the barriers against regional accents. "The New Yorkisms in Susan's speech would have disqualified her" from the major networks, but Bill Siemering had pledged to let the American voice be heard in all its accents and dialects.

Stamberg's influence went further than her own example. She kept a "gender watch," urging producers to run stories by and about women and to use female analysts. Her answer to Freud's question "What does a woman want?" she says, is "to hear and see herself on the air."

Stamberg has said that she has mixed feelings about the role of public radio in bringing women into broadcasting, because some of it had to do with salaries that were too low to attract many talented men. As a married woman, it was assumed she could afford to accept less money, as she was only supplementing her husband's salary. She says that talented women came to NPR and put up with the low pay in order to do challenging work.

Stamberg cohosted *All Things Considered* for 14 years, developing an interview style that was fresh and sometimes startlingly down-to-earth. Toward the end of a long interview with orchestra conductor Kurt Masur, she asked whether his arms ever got tired. She brought warmth, curiosity, and a probing intelligence to encounters with Nancy Reagan, Annie Liebowitz, Rosa Parks, Dave Brubeck, James Baldwin, and thousands of others.

Stamberg's work helped to redefine the position of host on a newsmagazine. Robert Siegel says she came to the job with a background in radio, rather than reporting or newscasting. She didn't feel constrained by the old-fashioned stentorian style of radio delivery. She established that hosting was a job in its own right, making both guests and listeners feel at home in the program's world of ideas and experience. In the early years of *ATC*, Stamberg served as a managing editor of the program, suggesting and influencing story choices and decisions.

As a broadcaster, Stamberg sometimes revealed herself in a way that was unprecedented in broadcast journalism, sharing glimpses from her personal life when they touched on universal experiences, such as an essay on her son Josh's first day at kindergarten. In July 1986, Stamberg wept on the air after a farewell to commentator Kim Williams, who died from cancer just two weeks later. Just before conducting the interview, Stamberg had learned that she herself had breast cancer.

Stamberg left *ATC* to seek less stressful work and began planning a new NPR program, *Weekend Edition/Sunday*. The idea was to make a place for interesting radio on Sunday mornings, a traditional dumping ground where many stations

aired the public-affairs programming that used to be required by the Federal Communications Commission. The current *Weekend Edition/Sunday* host, Liane Hansen, says Stamberg recognized that people listen to radio differently on Sunday, just as they look for different things in the Sunday *New York Times*. The result was a program that felt a bit like a Sunday paper, with a big "Arts and Leisure" section and even a puzzle.

Stamberg hosted *Weekend Edition/Sunday* from January 1987 through October 1989 and then became a special correspondent, covering cultural issues for all the NPR programs. Often she has reported on the visual arts. ATC host Robert Siegel says "she has almost a unique talent for describing pictures on the air, not just the images we all have in common, but an ability to convey images you haven't seen. It shows the quality of her writing." Stamberg also serves as a guest host on *Morning Edition*, *Weekend Edition/Saturday*, and *Weekly Edition*.

Stamberg was inducted into the Broadcasting Hall of Fame in 1994 and the Radio Hall of Fame in 1996. She has won almost every major award in broadcasting, including the Armstrong and duPont awards and the Edward R. Murrow Award from the Corporation for Public Broadcasting.

People who have worked with Stamberg say the essence of her personality, both on air and off, is her sincerity, curiosity, intelligence, and unrestrained exuberance. Noah Adams remembers that when Stamberg hosted ATC, the question most asked of reporters traveling around the country was "what's Susan Stamberg really like?" . . . and the answer was always "exactly what you hear, not any different."

Stanton, Frank N. 1908–

U.S. Broadcast Executive and Pioneer in Radio Research

President of the Columbia Broadcasting System (CBS) for nearly three decades, Frank Stanton was an austere manager who, to a considerable degree, gave the network much of its “Tiffany” image. He joined the network as a scholarly audience researcher in the mid 1930s and rose rapidly in the network hierarchy, although he never lost his interest in or reliance upon research findings.

Early Years

Frank Stanton learned statistics and methodology while pursuing a graduate degree in psychology at Ohio State University. He sent a copy of his master’s thesis, “A Critique of Present Methods and a New Plan for Studying Radio Listening Behavior,” to Paul Kesten at CBS; Kesten was duly impressed. It laid the groundwork for his eventually joining CBS in October 1935.

In 1937 the Rockefeller Foundation funded the first large-scale research project on the nature and social effects of radio for the Office of Radio Research at Princeton. Hadley Cantrel and Frank Stanton recruited Paul Lazarsfeld to direct the project. One of its objectives was the study of attitudes and opinions of radio programs. Shortly after the project was completed, Stanton and Lazarsfeld developed media research’s first in-process measure of audience response—the Lazarsfeld-Stanton Program Analyzer. The unit was a simple two-button device. Subjects were recruited to come to a small studio or theater to hear a test program. If a subject heard something that appealed to him or her, that subject pressed the green button—if something unappealing, the red button. The data were recorded on paper tape and summarized. In this fashion audience reaction could be matched with specific program content.

Stanton’s relationships with the leading social scientists of the day were productive and influential. He had professional associations with both the Office of Radio Research at Princeton and Columbia University’s Bureau of Applied Social Research, the two centers that were responsible for introducing and developing the empirical research tradition for mass communication research in the United States. Stanton coedited three volumes on communication research. Lazarsfeld and Stanton’s chief editor for their *Communications Research 1948–1949* was Joseph Klapper, who would later become director of the Center for Social Research at CBS. Stanton and the other researchers of this era concluded that radio and other mass media did not have a direct effect on audience attitudes and behavior. Rather, the media’s impact on attitudes, values, and beliefs was shown to operate among a host of

other factors. Radio was seen as being used by listeners to meet their needs.

CBS Presidency

In 1945 Stanton was promoted to vice president and general manager of CBS to replace the ailing Paul Kesten. His leadership in research and management prompted this promotion to oversight of eight different network departments. Shortly thereafter, when Stanton was 37, he was named president of the network, when William S. Paley became chair of the board of directors. For the next 25 years, these two charted the course by which CBS became one of the most respected news and entertainment networks of its time.

A superb administrator, Stanton took on the day-to-day network management functions that no longer interested Paley. He was interested in technology and supported CBS engineer Peter Goldmark in the late 1940s in developing and promoting the long-playing record, as well as development of a partially mechanical system of color television that briefly enjoyed FCC acceptance as the national standard in the early 1950s (although it was eventually too expensive and unsuccessful). Stanton diversified CBS’s holdings, reorganizing the network to give greater autonomy to the radio network and stations as well as television while decentralizing some decision-making. CBS invested in Broadway shows (most notably the highly successful *My Fair Lady* in 1956), built an impressive headquarters building, and bought the New York Yankees baseball team in addition to acquiring other information and entertainment businesses.

Stanton performed two vital roles for all of broadcasting in the 1950s and 1960s, and these formed his lasting legacy. He was a primary industry spokesperson before Congress and the Federal Communications Commission (FCC), where he evoked considerable respect and attention, even among industry critics. His measured views and words reflected well on CBS and broadcasting as a whole, and he was widely recognized as the thoughtful conscience of the industry. Stanton was also committed to the role and value of news and public affairs programming, although this led, ironically, to some notable clashes with the primary CBS news figure, Edward R. Murrow, as these two strong-minded men held differing views about the commercial role of radio and television journalism. Whereas Stanton held the business priorities of the network uppermost in his mind, Murrow had a more idealistic outlook.

Stanton is generally regarded as the prime force behind the U.S. Congress’ suspension of Section 315 of the Communica-

tions Act in order to televise the Kennedy-Nixon presidential debates in the fall of 1960. Among his favorite stories are those recounting telephone calls from U.S. presidents trying to influence him and his fellow broadcasters to provide favorable coverage of events or complaining about news programs seen as unfair or critical.

On leaving CBS, Stanton accepted a presidential appointment to be the head of the American National Red Cross, serving two three-year terms. At the same time, he headed a panel of experts seeking ways to improve U.S. international information, education, and cultural relations. He served on the boards of directors for Pan American Airways, Atlantic Richfield (the petroleum company), and American Electric Power, among others. He was also elected as a Harvard University overseer for six years—the only non-alumnus to be so honored in the 20th century. He invested in a host of start-up firms in many lines of business, some of which did quite well.

The most noteworthy honors and awards received by Frank Stanton included a 1961 Peabody Award for his efforts

leading to the Kennedy-Nixon presidential debates and a 1972 special Peabody Award for his response to a congressional contempt citation and his defense of “the people’s right to know” that grew out of “The Selling of the Pentagon,” a *CBS Reports* television documentary. The Radio and Television News Directors Association further honored his support of broadcast journalism in 1971 when he was given the Paul White Memorial Award for his advocacy on behalf of journalists’ constitutional rights.

Star Wars

Public Radio Drama Series

The 1980 radio drama *Star Wars* was an adaptation of the groundbreaking motion picture of the same name. It can be seen as a radio landmark in several ways. Its production brought to bear the very best stereophonic, multitrack audio technology available. It was a collaboration between a major motion picture production company and a public radio network, with Lucasfilm, Limited supplying elaborate sound effects and music used in the original motion picture plus promotional and marketing practices hitherto thought beyond the scope of public radio. The series used six and a half hours of airtime to tell a story that, in the motion picture, was originally told in less than 30 minutes of dialogue, meaning that the characters could be treated in more depth and the story told in more detail. In addition, the series raised National Public Radio's (NPR) audience ratings spectacularly and brought a new awareness of the high quality of programs broadcast by public radio.

When the motion picture *Star Wars*, written and directed by George Lucas, opened in 1977, it was a great success, lauded for its music, special effects, and rip-roaring approach to telling an adventure story. It immediately became an icon of American culture, so embedded in the popular consciousness that, some time after the motion picture was released, a major shift in the defense policy of the Armed Forces of the United States was titled the Star Wars Strategic Defense Initiative.

A short while after the motion picture opened, Richard Toscan of the University of Southern California (USC) approached George Lucas about making a radio version of the film. This project was to be produced by the university's NPR affiliate, KUSC-FM. A USC alumnus, Lucas was fascinated by the idea of helping out his alma mater in such a novel way. Adaptations of film scripts were not new to radio—such programs as *Lux Radio Theater* were aired on the commercial networks in the 1940s, often with the stars of the motion picture re-creating their roles on radio as a means of advertising major films. But in the late 1970s, it was a given in the entertainment industry that radio drama, except for a few struggling exceptions, such as *Columbia Broadcasting System (CBS) Radio Mystery Theater* and NPR's *Earplay* and *Masterpiece Radio Theater*, was dead in the United States. The idea for a radio drama made in cooperation with a film company was communicated to NPR head Frank Mankiewicz, who was intrigued by it.

In July 1978 George Lucas' production company Lucasfilm, KUSC-FM, and NPR held initial meetings to get the project underway. In March 1979 an agreement was reached in which, for the price of \$1, Lucasfilm subsidiary Black Falcon, Limited

turned over to KUSC-FM the rights to write, produce, and broadcast a radio version of *Star Wars*. Lucasfilm also expressed interest in supplying technical help and in assisting to advertise the series. In April 1979 the project was publicly announced as an NPR/KUSC-FM coproduction with the British Broadcasting Corporation (BBC), in cooperation with Lucasfilm. The BBC was brought in by NPR in an effort to launch a cooperative venture with a well-respected colleague organization, experienced in the production of radio drama. But the BBC was uncomfortable with Lucasfilm's control over the script, which was being written by Brian Daley. Daley, who was not the first choice for writer, was familiar with the *Star Wars* stories, having written three novels based on *Star Wars* characters; however, for this undertaking, his scripts were subject to the approval of Lucasfilm's Carol Titelman. Eventually the BBC backed out of its agreement with NPR.

In May 1980 John Madden, who had directed for the National Theater in London and the BBC, as well as *American Playhouse*, was set as the director of the series. Tom Voegeli, who had worked on NPR's *Earplay* drama series, joined the production staff as sound mixer and supervisor of the postproduction period, the period when music and sound effects are added to the voice tracks already recorded by the actors.

Mark Hamill agreed to repeat his motion picture role as Luke Skywalker because he could not see anyone else in the part. Anthony Daniels, a veteran of British stage and radio, was eager to get back into a radio studio, so he, too, repeated his motion picture role as the robot C3PO. In late June 1980, the actors gathered at Westlake Audio Studios in Los Angeles for 13 weeks of recording. Many of the actors, more familiar with acting for screen than for radio, found the two media to be quite different in their demands. The actors had to learn to put the physicality of motion and facial expression into their lines because, in the recording studio, the voice had to do all the acting. With John Madden's help, actors and writer Brian Daley fine-tuned the scripts for the spoken word. Tom Voegeli engineered the stereophonic recording, using sensitive omnidirectional microphones; setting up a scene in which an actor moved across the room, which gave a sense of real spatial movement to the sound of the lines; and placing Anthony Daniels (C3PO) in a separate booth so that his voice could be processed to add a hollow, robotic sound.

The finished recordings of the actors were then taken to Minnesota, where Voegeli added John Williams' music, performed by the London Philharmonic, and sound effects, including the major characters R2D2 and Chewbacca, created by Ben Burtt, both from the original *Star Wars* motion picture.

A very small amount of dialogue had to be cut to accommodate the prerecorded music, but generally the actor tracks were left as they were originally recorded.

NPR distributed the finished series to its member stations via satellite in stereophonic sound for broadcast in 13 half-hour episodes beginning 2 March 1981. Audience response was overwhelming. In March 1981 NPR's special telephone number for the series received 40,000 calls. The network managed to answer more than 12,000 of the calls, some 7,000 of them from children. During the same period NPR received more than 10,000 letters from *Star Wars* listeners. Many of these people had never listened to public radio before. The network later calculated that its listening audience nearly doubled during the *Star Wars* broadcasts. Lucasfilm had insisted that the release of the radio series be scheduled to coincide with the release of its new motion picture, *The Empire Strikes Back*, and the rerelease of the original *Star Wars*. Perhaps not totally coincidentally, all this occurred during the annual public radio fund-raising drive, which saw an enormous increase in donations for that year. In May 1981 NPR's Frank Mankiewicz wrote to Lucasfilm expressing the positive impact of *Star Wars* on the network in terms of audience awareness, fund raising, and public perception of the quality of NPR's programming.

By June 1981 planning was underway for *The Empire Strikes Back*, the ten-episode radio sequel to *Star Wars*. Recording of the actors' tracks took place over ten days in June 1982, at A and R Studios on Seventh Street in New York City. Many of the *Star Wars* radio actors returned to continue the story. Mark Hamill and Anthony Daniels were joined by Billy Dee Williams, also from the original motion picture cast. Several noted theatrical names were added to the cast list in relatively small parts. *The Empire Strikes Back* was broadcast by NPR beginning 14 February 1982. Subsequently, planning began for a second sequel, *Return of the Jedi*. But all plans had to be laid aside when NPR found itself in a severe financial crisis. Over ten years passed before Highbridge Company, an affiliate of Minnesota Public Radio, managed to raise funds for a six-episode radio production of *Return of the Jedi*, with Tom Voegeli as producer, John Madden as director, and Brian Daley as writer. The actors were recorded in 1996 at Westlake Audio Studios in Los Angeles, and postproduction took place in Minnesota. The finished product was given to NPR, which broadcast it beginning 5 November 1996, bringing to a close the *Star Wars* radio trilogy. The satisfaction gained from this third successful production was tempered by the fact that Brian Daley, the writer of all three of the *Star Wars* radio series, who had become ill and was unable to attend the taping of the actor tracks, had died in February 1996, on the final day of recording.

Station Rep Firms

Representing Radio Stations to Advertisers

Station representative companies help local radio stations obtain national advertising. They have become known by many names—station reps, rep firms, media reps, sales reps, or simply "reps." Whatever the name, they exist to promote a station and its market and sometimes to assist client stations to improve their advertising appeal with changes in programming. For many years, a station rep firm did not represent competing stations in the same market, but that changed with consolidation of the industry in the late 1990s. From an industry once made up of several hundred companies, the radio station rep business has shrunk to a handful of major players.

Origins

As radio advertising became widespread in the late 1920s, a problem arose that had appeared decades earlier in the newspaper business: how could local stations successfully appeal to advertisers outside their immediate market area? The problem was, in part, a matter of communication, time, and efficiency. The station could not afford to have its own sales representatives in major cities, and advertisers and their agencies could not be troubled to contact dozens or even hundreds of individual stations across the country.

The first—and, as it turned out, temporary—solution was the rise of time brokering. A time broker represented no specific station or advertiser but rather sold (brokered) advertising time from many outlets to advertisers. A time broker might sell time on competing outlets in the same market. For example, around 1930 a broker named Scott Bowen began buying radio time for advertising agencies for a fee and then obtained a commission from the stations when he placed a schedule.

The Katz Agency

Emanuel Katz formed the Katz Agency in 1888 to represent newspapers. In 1931 the company sought to represent radio stations since several of the Katz newspaper clients had acquired radio licenses. Emanuel's son, Eugene Katz, the youngest member of the family and relatively new to the firm,

was assigned the responsibility of selling time for the Oklahoma Publishing Company's new radio station, WKY in Oklahoma City. Hoping to organize a southwestern group of National Broadcasting Company (NBC) Radio affiliates, Eugene succeeded in gaining representation of KPRC in Houston, WFAA in Dallas, and WOAI in San Antonio.

Upon his return to New York, Eugene was told by his father to go back to Texas and call off the deal, because other Katz newspaper clients, including the *Houston Post* and *Dallas News*, had complained vigorously. Eugene was forced to withdraw the contracts and was unable to resume soliciting radio clients until a separate division was established in 1935. By that time Edward Petry, Paul Raymer, and the firm Free, John and Fields (later Peters Griffin Woodward) had all established themselves as radio reps, and Katz re-entered radio representation as a latecomer. The first non-newspaper-related radio clients at Katz were WGST, Atlanta; KRLA, Los Angeles; KRNT, Des Moines; and WMT, Cedar Rapids.

The Katz sales staffs for different media were separated after World War II. When television emerged in 1947, Eugene did not make the same mistake that his father had made with radio and moved quickly into television representation. He contracted with most of the big city television stations in the country. Ironically, other radio representatives were reluctant to enter the new medium, leaving Katz dominant until the major television groups such as Storer and Westinghouse formed their own in-house sales organizations. The Katz newspaper representation business continued its downward trend throughout the late 1960s, and the company ceased representing newspapers in 1973 to concentrate on electronic media.

In 1972 one of James Greenwald's first major steps as president of Katz Radio was to begin selling FM radio audience. Until then, most FM stations, if they were sold to national advertisers at all, were coupled with sister AM stations. Nearly all FM stations, except those that programmed classical music, simulcast programming with their AM counterparts, and Katz Radio was particularly steeped in the history of selling only large AM stations. Greenwald visited with the owners of the major Katz AM stations that also had FM

stations and first convinced them to sell their fledgling FM stations in combination with their AM stations. In many instances the additional audience, which was essentially sold for the same price as the AM-only audience, resulted in higher rates and larger shares of budgets for the AM station. The Katz clients responded favorably.

When the Federal Communications Commission (FCC) in 1965 passed the rule limiting simulcasting to 50 percent of the program day, Greenwald formed an in-house programming consulting unit within the Radio Division that urged the owners of FM stations to program their FM properties independently. Greenwald foresaw a national sales market rapidly developing that was willing to spend large sums to reach the emerging FM audience. By 1976 national sales on Katz-represented FM stations had grown to represent over 20 percent of the company's total volume. By 1980 it had eclipsed 35 percent, and by 1990, 70 percent.

Eugene, the last member of the Katz family to be associated with the firm, helped to organize the company's sale to its employees in 1976 at the time he retired. Two years later, Katz had 450 employees and 17 sales offices, and the company represented 170 radio (and 108 television) stations with national spot billings of about \$250 million. By 1980 the firm had grown to become the largest representative of radio and television stations in the nation. By the company's 100th anniversary in 1988 (two years after Greenwald retired as chairman), Katz had 1,400 employees in 22 offices and represented 1,440 radio (and 193 television) stations with total billings of \$1.5 billion, two-thirds of that in television. By then it was the only rep firm still active in both radio and television.

In 1984 Katz took over the Henry Christal Company (which had specialized in high-power clear channel stations) and spun it off as a division along with RKO Radio Sales, which became the Republic Radio division. Katz took over the John Blair radio business in 1987, and it became the Banner Radio division. Katz also purchased the Jack Masla Company, Eastman Radio, and Metro Radio Sales. Katz set up a Hispanic radio division, and all the Katz divisions competed with one another nationally and in specific markets. By 2000 Katz Radio Group—Katz, Christal, and Clear Channel Radio Sales (set up in 2000, dedicated to the 1,200 stations in 48 states owned by Clear Channel Communications)—represented 2,000 stations in all. Emmanuel Katz died that same year.

Edward Petry

In 1932 Edward Petry established his own radio sales representative company—the first company devoted solely to radio. Petry was the first to develop the notion of “exclusivity,” the idea that a station rep should handle only one station in any given market. He also developed a system of rates and standards to the spot broadcasting business that allowed it to grow

and flourish. He was also the first rep to open a separate television division. Petry (as with several other rep firms) eventually left the radio business to focus on television.

Both Petry and Katz differed from time brokers in that they provided exclusive representation of client stations, never more than one in a given city. In this way the station rep could “sell” a market and the represented station as the best way to serve that market. By 1935 there were 26 such companies, and by 1937 at least 60 different rep firms were vying for radio station business.

The Industry Matures

Station rep firms increasingly competed with the national networks in the 1930s and 1940s, for the national chains usually represented not only their own stations, but also many of their affiliates. The National Association of Radio Station Reps (which became the Station Reps Association in the early 1950s) filed a complaint in 1947 with the FCC about networks representing non-owned-and-operated affiliate stations. After seven days of hearings in 1948–49 concerned with whether this was a violation of the chain broadcasting rules of the FCC, the commission took no action. American Broadcasting Companies (ABC) stopped representing affiliates in 1952. Only in 1959, by then alarmed at the degree to which television networks already dominated the advertising revenues of the relatively new medium, would the FCC ban networks from acting as reps for their affiliate stations.

With the demise of most programming on radio networks in the face of television competition after 1948, however, a new world opened for station reps. Not only did the networks rapidly fade from the competitive picture, but many more stations were going on the air each year, and each needed representation to reach national advertisers.

Following the Katz example, other radio rep firms were entering the television market. Starting in the late 1950s, a few stations (primarily those controlled by group owners) began again to represent themselves, and by the late 1970s these accounted for about a third of national spot billings for radio and television combined. By the 1970s there were some 230 rep firms, most of them regional, and they increasingly focused on radio or television, but not both.

Ralph Guild and Interep

The man who would change the face of the station rep business, Ralph Guild, began his radio career as an advertising salesman at KXOB in Stockton, California, in 1948. He moved to a similar post at a Sacramento station two years later and became manager of KROY in the state capital in 1955. He turned to the station representative business in 1957 when he joined McGavren-Quinn, then a San Francisco-based rep firm

operated by Guild's college classmate Daren McGavren. Later that year, Guild moved to New York to open the company's first East Coast office. He became national sales manager in 1963 and moved up to become a partner of what became McGavren Guild in 1967. The firm was sold to employees in 1975 in an employee stock ownership plan.

In a break with station rep tradition, McGavren Guild began to represent more than one station in a given market. In 1981 Guild formed Interep as a holding company of separately managed and competing station rep firms. Over the next several years, several rep firms came under the Interep umbrella, including Major Market Radio in 1983 and Group W Radio Sales and Torbet Radio in 1987. Interep became the Interep Radio Store in 1988, all the while expanding its research and related services to both ad agencies and stations. By 1990 there were eight separate rep firms within Interep, which had become the largest radio rep organization. Billings rose from \$60 million in sales in 1981 to \$500 million by 1990 (half of the radio advertising in the largest 150 markets) and more than \$1.25 billion a decade later. Through an initial public offering in December 1999, Interep became a publicly traded company.

With the consolidation of radio station ownership in the late 1990s, the rep companies' policy of exclusivity began to break down as stations changed hands. The huge merger between Clear Channel and AMFM in 1999, for example, caught the Katz and Interep firms in the middle. When Clear Channel gobbled up AMFM (which was the corporate parent of Katz), Guild promptly filed a \$56 million lawsuit against Clear Channel for damages arising from Clear Channel's diversion of its business to Katz, and thus its alleged breach of the national sales representation agreement with Interep.

By the late 1990s, thanks in part to considerable ownership consolidation, the relatively small radio station rep firm was rapidly disappearing, unable to compete with the two dominant giant companies (Interep and Katz), each with hundreds of stations on their client list. Fewer than 40 radio station rep

firms survived by 2000, and of those, 15 came under either the Interep or Katz umbrella. The largest independents were Lotus Hispanic Reps, Roslin Radio Sales, Savalli Radio and TV, and Howard C. Weiss Company.

Several smaller companies represented stations in specific parts of the country. Regional Reps, with offices in Cleveland, Cincinnati, Chicago, and Atlanta, was the largest. Others included Michigan Spot Sales, Midwest Radio, New England Spot Sales, and Western Regional Broadcast Sales. At the same time, radio station representative firms were venturing into internet sales with the rapid growth of internet radio.

Stereo

Stereophonic sound, or "stereo" for short, is a system of sound reproduction in which separately placed microphones or loudspeakers enhance the realism of the reproduced sound. The effect of using multiple sound inputs and outputs in separated right and left audio channels is the creation of sound reproduction that is "three-dimensional," since aspects of

right- and left-channel sound can be heard separately by persons with normal hearing.

Stereophonic sound is important to radio for two principal reasons. The popularity of stereophonic frequency modulation (FM) broadcasting in the second half of the 20th century contributed to public acceptance of that mode of radio transmission

and reception. FM stereo gradually became the listening public's preferred medium for receiving music, which makes up the majority of entertainment programming for radio stations in industrialized nations. Second, the controversial method by which the Federal Communications Commission (FCC) authorized amplitude modulation (AM) stereo broadcasting in the United States in the early 1980s is thought by many to have contributed to its relative failure.

History of FM Stereo

Stereophonic radio broadcasting was invented in 1925, when WPAY radio in New Haven, Connecticut, experimented with two-station simulcasting. This early attempt featured the station's broadcast of the right channel of sound on one AM carrier frequency, while a second separate AM signal transmitted the left channel of sound. Despite experiments such as this, the real push for stereophonic broadcasting came in the 1950s, when the United States and British recording industries perfected "high-fidelity" sound reproduction, which included stereophonic recording technologies. The Record Industry Association of America (RIAA) adopted recording industry standards for stereo in January 1959. In the years preceding the adoption of the RIAA standards, interest in stereophonic radio broadcasting also increased. A variation of the technique used in the 1920s by WPAY was used experimentally in 1952 by station WQXR, owned by *The New York Times*. Like the WPAY system, this later variation featured a two-station approach, but with an AM signal for the right channel and an FM frequency for the left. In 1954, station WCRB in Boston began using this type of two-station stereo broadcasting for approximately four hours of programming per week, and for up to 40 hours per week by 1959. Nonetheless, there were problems with this type of stereophonic AM-FM broadcasting, mostly related to the wasted spectrum space of such two-station arrangements and to the fact that listeners needed two radios to get the full stereo effect, while listeners using only one radio receiver received just "half" of the intended sound. Further, the AM channel lacked the frequency response of the FM channel.

Such technical and practical limitations prompted both AM and FM broadcasters to push for the use of single-station, multiple-channel stereo broadcast authorization. Single-station stereo broadcast technology had become a reality with the FCC authorization of FM multiplexing in 1955. Multiplexing refers to the simultaneous transmission of two or more signals over the same radio channel. In FM broadcasting, a "carrier" frequency (the channel's center frequency) and its sidebands transmit the main electronic program information. However, additional electronic information can be transmitted using other frequencies within the station's designated channel, as long as the information generated and modulated on the side-

bands does not interfere with the main carrier-frequency signal. This sideband frequency signal is called a "subcarrier," and the second-channel (right or left channel) audio information for FM stereo is carried in a subcarrier transmission. The technique was originally developed as a means to allow FM stations, which were financially struggling at that time, to pick up additional revenue by using the sidebands of their allocated frequencies to carry business background music or financial data information. The same technology that enabled this use of multiplexing for subsidiary communication authorization (SCA) broadcasts could be adapted so that the multiple portions of the signal would carry separate right and left audio channel information.

Developments in AM stereo broadcasting also moved forward. In 1959 AM stereo was successfully tested by the Radio Corporation of America (RCA) in conjunction with Belar Electronics Laboratory. That same year, Philco developed an AM stereo system that was tested on WABC in New York. Television industry engineers also developed their own adaptations of these stereophonic sound transmission techniques for the audio portion of TV transmission and reception systems.

In 1958 the FCC issued a *Notice of Inquiry* on further uses of FM radio, which included not only stereophonic broadcasting, but also other SCA services such as paging and calling services, traffic light-switching control, radio reading services for visually impaired persons, public utility load management, and specialized foreign language programming. A year later, the FCC separated the question of stereo from the more general SCA inquiry by issuing a *Further Notice of Inquiry*. A new industry testing group was set up in cooperation with the Electronic Industries Association (EIA) in order to sort out the features of the 17 proposed (and mutually incompatible) systems of FM stereo. This engineering test group was called the National Stereophonic Radio Committee (NSRC). Because of antitrust concerns, industry heavyweights RCA and the Columbia Broadcasting System (CBS) did not participate in the standardization testing process.

Boosters promoted FM stereo as "the one big thing" needed to ensure consumer acceptance of FM. Although several stations kept using the AM-FM two-station experimental procedure, most in the industry awaited permission to adopt single-station stereo. In the end, the FCC authorized *only* FM stereo in April 1961, accepting with modification the recommendations of the NSRC. In October of that year, the FCC denied petitions for AM stereo authorization, claiming that FM was "the ideal medium" for the development of high-quality stereo broadcasting and that the beneficial effects of AM stereo were *de minimis*. The FCC similarly denied two 1962 petitions to reconsider its negative AM stereo decision.

It appears that there were four overlapping reasons for the FCC to allow stereo FM while denying stereo AM radio or stereo television broadcasting. The most often-cited rationale is

that the FCC recognized the need to give struggling FM stations a boost in order to allow them to compete economically with then-dominant AM radio stations. Second, the Commission recognized that FM, with its 200-kilohertz channel (20 times wider than the width of AM carrier frequencies) had the ability to faithfully reproduce a wider range of frequencies without suffering from fading, interference, or static. This made FM a technically superior medium for broadcasting with the use of sideband stereo technologies. Third, the FCC did not feel that it (or the industry) had adequate resources to introduce FM, AM, and TV stereo simultaneously. Finally, regarding stereo television, FCC engineers felt that “stereo sound mated with the small-screen pictures of a typical television set would be distracting and unsatisfying.”

Although FM radio, with its full-frequency stereophonic sound, did gain consumer acceptance over the two decades that followed, the innovation diffusion period for FM stereo broadcasting was relatively protracted. Initially, the cost of stereo transmission equipment (estimated at \$2,000 to \$4,000—no small sum in the early 1960s) was considered prohibitive by many unprofitable FM broadcasters of the day, especially since there were too few stereo receivers in the consumer marketplace to make the investment pay off. Consequently, only about 25 percent of all FM stations in the United States were using stereophonic transmitters by 1965, and fewer than 50 percent were broadcasting in stereo by 1971. However, with the gradual growth of the FM industry in the 1970s, fueled by a turn from strictly upscale programming to more progressive rock music formats, a large majority of FM radio stations in the United States were broadcasting in stereo by 1975. In 1978, FM surpassed AM in terms of U.S. listenership.

Interest in AM Stereo Rekindled

The success of FM broadcasting, boosted in no small part by FM's ability to broadcast in stereo, was accompanied by a commensurate decline in AM listenership. By the late 1970s, once-dominant AM stations in several major markets expressed hope that AM stereo might be developed as part of a package of AM improvements that would enable them to compete more effectively with FM stereo.

A number of AM stereo proponents had continued to work on AM stereophonic transmission and reception throughout the 1960s and 1970s. In the early 1960s, CBS experimented with a modification of the AM stereo system developed by Philco and conducted transmission tests on its New York station, WCBS. AM stereo proponent Leonard Kahn, who in the late 1950s had introduced a “single-sideband” method of AM stereo, also refined his system and conducted stereo tests beginning in 1970 just south of San Diego at the 50,000-watt Tijuana, Mexico, AM station XETRA.

The FCC granted permission for a six-month test of Kahn's system on WFBR, Baltimore, in 1974. In 1975 RCA demonstrated its AM stereo broadcasting system as its “big draw” at the National Association of Broadcasters (NAB) convention, and Motorola collaborated with a firm called Modulation Systems Laboratory to begin work on its C-QUAM system of AM stereo, which would eventually become the industry standard. Perhaps the greatest development was the 1975 united sponsorship of a new National AM Stereophonic Radio Committee (NAMSRC) under the auspices of the EIA, the NAB, the National Radio Broadcasters Association, and the Broadcasting Cable and Consumer Electronics Society of the Institute of Electrical and Electronics Engineers. Stations WGMS and WTOP in Washington, D.C., volunteered their facilities for on-air tests, and Charlotte, North Carolina's WBT was chosen as the site of the skywave tests. Although early proponent Leonard Kahn refused to participate in the joint-testing process, four companies did submit proposals to the NAMSRC in early 1976, and three systems were eventually tested.

The FCC adopted a *Notice of Inquiry* on AM stereo in 1977, but when no standard was announced by 1980, AM broadcasters grew restless. By that time a political and philosophical shift had taken place in Washington, and the consensus among the increasing number of economists at the FCC was to favor a “marketplace” option. Under this untested mechanism, the FCC would not pick one single AM stereo standard but would instead set only minimal technical standards that would enable any compliant system to be put on the air; theoretically, this system would allow the economics of the free marketplace to select its own de facto standard. Meanwhile, the FCC engineers continued to push for the more traditional single-standard outcome.

At first it appeared as if the traditionalists had prevailed when, in April 1980, an AM stereo standard decision favoring the Magnavox Corporation's proposal was announced. However, for a variety of reasons, this decision was reversed by the FCC shortly after it was announced, and in 1982 the commission adopted the “marketplace” option. This experiment was subsequently criticized as “technological Darwinism” and was widely blamed for the ultimate failure of the AM stereo technology to gain public acceptance. Although attractive in theory and certainly politically sensitive to the deregulatory impulse to create a less intrusive FCC, the marketplace experiment ultimately failed. However, it is impossible to sort out the exact reasons for the failure. Many felt that the lack of a single standard proved to be too economically unstable for broadcasters, who were in the position of trying to invest large sums of money in a transmission system that might not be adopted either by competing stations within its market or by portions of its listening audience. Likewise, the marketplace battle was also seen as too confusing for consumers trying to purchase

home and auto receivers, which featured up to five different means of decoding AM stereo signals.

After a decade of uncertainty, during which time no AM stereo system emerged as the clear winner in the resulting innovation diffusion process, Congress stepped in and required the FCC to set an AM stereo standard. In 1993 the commission selected Motorola's C-QUAM system as the national AM stereo standard because, although it had not yet reached the level of acceptance that would make it the de facto standard, it nonetheless had the largest share of the AM stereo broadcast transmitter and receiver markets.

Television stereo, also approved in the 1980s, avoided this marketplace skirmish because the consumer electronics industry, through the formation of the Broadcast Television Systems Committee (BTSC) was able to agree on a preferred TV stereo transmission and reception system. As a result, in 1984 the FCC ruled unanimously that the Zenith-dbx TV stereo system's pilot subcarrier frequency would be "protected," without excluding the use of other competing systems. If other systems were to be used, a station would have to choose a subcarrier frequency different from that outlined in the Zenith-dbx standard. This was an unlikely outcome both because the Zenith system was the *only* system recommended to the FCC by the BTSC after exhaustive testing, and because Zenith had purposely used a stereo pilot subcarrier preferred by the television broadcast industry because of its compatibility with existing transmission systems.

The Future of Stereo Radio

In 1996 a system of high-capacity FM multiplex broadcasting called Data Radio Channel was proposed. This technology allows for additional text and graphics to be broadcast while maintaining compatibility with existing stereo-broadcasting technology by multiplexing digital signals at a higher frequency than the baseband FM stereo signals. The system was field-tested in NHK's Tokyo, Japan, FM station. However, such Radio Broadcast Data System technologies, which will be able to transmit text data such as artist information or station promotional graphics or text, have not yet caught on with consumers, and with only about 10 percent penetration in broad-

cast markets, they are compared to the unpopular AM stereo innovation.

Experiments in the late 1990s investigated the use of lasers as efficient high-speed subcarrier transmitters of stereo multiplexing. Although this method may be far off in the future of radio, digital audio broadcasting using S-band (2.3–2.6 gigahertz) or L-band (1.452–1.492 gigahertz) frequencies are very much on the horizon in the United States as part of the new digital audio radio services. In addition, five- and six-channel music-recording techniques are expected to revolutionize audio electronics and are being referred to as "beyond stereo" options.

Stereotypes on Radio

As with any other mass medium, early radio broadcasts made use of (some more recent critics might say “suffered”) stereotypes in dramatic and other programming. Often, the use of clichés simplified groups by labeling them as “other” (that is, outside the mainstream of society) and emphasizing differences between outsiders and the core society. Such reductive portraits may not have promoted universal brotherhood, but they aided radio show popularity by relaxing audiences so that they would continue to listen and to buy the sponsor’s products.

The focus here will be primarily on American radio’s “Golden Age” (to about 1948) with its greater variety of programs and stereotypes, with a few comments about radio in the years since that time. That there is less stereotyping today is clearly owing to the stronger sense of political and social correctness now pervasive in society.

Precedents

The minstrel tradition began in the 1840s and produced two enduring stereotypes of African Americans: “Zip Coon” and “Jim Crow.” The Zip Coon character was depicted as an individual who wore loud-colored clothes, used language inappropriately (malapropisms), and exhibited an air of self-importance. The Jim Crow character, on the other hand, was mentally slow and exhibited features that Caucasians associated with African-American field hands: speaking slowly and moving sluggishly, with thoughts that seemed to match both speech and movement. In addition to these two enduring stereotypes, other representations of African Americans included the trusted servant and maid. Thus, from the days of minstrelsy there were also such figures as Uncle Tom or Uncle Remus, Aunt Jemima or Mandy the maid, Preacher Brown and Deacon Jones, Rastus and Sambo and the old Mammy.” These stereotypes persisted throughout the 19th century, became part of vaudeville, and later were transferred to radio.

Most Americans accepted these stereotypes as a real depiction of African Americans; they were, for the most part, unquestioned. Their comical nature became a defining feature of all of such stereotypes. They made Americans laugh and could be easily laughed at. Hence, racial stereotypes of African Americans served the interest of the status quo by articulating how African Americans would interact with white society, primarily as comedians and servants.

Stereotypes in Early Radio

Early radio often used stereotypes of other ethnic groups in addition to its portrayal of African Americans. For example, there were the *Cliquot Club Eskimos* and the *A&P Gypsies*,

both programs featuring orchestras. Moreover, *The Goldbergs* also used heavy dialects and distinct accents, which had been part of the vaudeville and minstrel traditions.

Vaudeville programs that made heavy use of African-American stereotypes were also heard during the early years of radio. For example, the Columbia Broadcasting System (CBS) network broadcast a show featuring George Moran and Charlie Mack, cast as “The Two Black Crows,” during the network’s *Majestic Theater Hour*. New York radio station WEAJ broadcast the *Gold Dust Twins* on Tuesday nights, another show that featured stereotypes of African Americans (played by two white men, Harvey Hindermyer and Earl Tuckerman) in 1924.

Variety show formats often featured minstrel routines during the 1920s. *Dutch Masters Minstrels*, for example, was first broadcast by the National Broadcasting Company (NBC) in 1929. Moreover, daytime serials also featured caricatured stereotypes of African Americans. For instance, in 1929, NBC broadcast a serial based upon the Aunt Jemima trademark of the Quaker Oats Company, the show’s sponsor. The focus of the program was the Aunt Jemima character and her family. All members of her family spoke with the heavy black dialect often heard in minstrel shows. (Significantly, and as was usual in this period, white actors played the parts of each character in this show.) Not to be outdone, the Cream of Wheat Company sponsored a program based upon its trademark African-American chef, Rastus. It featured musical selections performed by Rastus’ imaginary animal friends and minstrel-type introductions to each song.

Sam ‘n’ Henry, created by Charles Correll and Freeman Gosden, made its radio debut on WGN, Chicago, in 1926. The program was based upon the minstrel tradition. Although this program never made network radio distribution, it served as the basis for *Amos ‘n’ Andy* which made its debut on 19 March 1928 on Chicago’s WMAQ. The program changed stations and name because WGN refused Correll and Gosden a salary increase; as WGN owned the program/character names, a new name had to be chosen. Radio network NBC picked up the *Amos ‘n’ Andy* program a year later. As a network program, it soon became immensely popular—even among blacks—because it drew upon the minstrel tradition, made use of vaudeville ethnic humor, and offered sympathetic characters with whom the audience could identify.

Stereotypes of Foreigners, Women, and Children

Stereotypes of foreigners, women, and children appeared on dramatic, adventure, and comedy programs throughout radio’s Golden Age. Scripts pictured foreigners, women, and children as predictable creatures who would not cause anxiety in listeners.

Foreigners

Historically, the number of immigrants to the United States between 1925 and 1950 barely equaled the number who entered in one important year—1907. Yet on radio, heavy accents and “ethnic” behavior routinely identified a large number of recent arrivals, nearly all of whose characters agreed to play by American rules. Radio boiled down the enormous Russian empire into Bert Gordon, the Mad Russian of *Eddie Cantor*, or Professor Kropotkin of *My Friend Irma*; all of Mexico’s richness was diminished into Pedro, *Judy Canova*’s pal. On *Life with Luigi*, Luigi Basco told his “Mama mia” in Naples about America with the terminal vowels that placed him as one fresh from Ellis Island. Typically, he affirmed the values of his native-born listeners by studying English in night school, avoiding an old-world arranged marriage with Pasquale’s daughter Rosa, and singing the ditty, “A-may-ree-kah, I love-a you, you like a papa to me.” At least two other shows dealt more cautiously with Italian material: *Little Italy* and *The Great Merlini*.

Similarly, Englishmen, supposed masters of snobbishness, were neutered into stuffy blimps (Harry McNaughton, *It Pays to be Ignorant*; Count Benchley Botsford, *Judy Canova*); cool, work-obsessed police officials (*Scotland Yard’s Inspector Burke*; *Hearthstone of the Death Squad*); or valets (*It’s Higgins, Sir*). Even titled gentlemen were domesticated: Lord Bilgewater couldn’t compete with *Al Pearce*, and Lord Henry Brinthrope catered to *Our Gal Sunday*. Untitled Britons such as Nicholas Lacey gratefully fit into *One Man’s Family*.

French characters, too, lost touch with authentic identity. Jack Benny’s violin teacher, Professor Le Blanc, suffered every time Jack produced a tortured “Love in Bloom” from his strings yet stayed because he’d still not been paid. He satisfied some comfortable expectation in the audience about starveling bohemians. *Alan Young* once disguised himself as “Pierre Eclair, decorator” in order to escape the rough treatment a real man might have expected at the hands of his girl’s irked father. The supposed French connection to romance justified the character of Mademoiselle Fifi, the sultry flirt on *Eddie Cantor*. Similarly, a heavily-accented French teacher at Madison High School generated excitement in *Our Miss Brooks*.

The same Americans who slammed their geographic doors to genuine foreigners admitted through radio a surprising number of often vilified groups, especially Asian, Irish, Jewish, and African American. Some Asians on the air had been part of earlier tales in other media: *Fu Manchu*; *Charlie Chan*; Ming the Merciless, dread Emperor of Mongo, enemy of *Flash Gordon*; and *Mr. I. A. Moto*. Many “Easterners” were servants or, at best, sidekicks. *Bobby Benson* had a Chinese cook; so did *Little Orphan Annie* and *Tom Mix*. Ling Wee was a waiter in *Gasoline Alley* and, a little higher on the excitement ladder, Lai Choi San helped Terry against the pirates, Chula

assisted on *Island Venture*, and Botak backed up *Green Lantern*. Asians often had simple two-syllable names such as Kato on *The Green Hornet* and Toku on *The Green Lama*.

Other linguistic clichés set Orientals apart from Caucasians. Gooley Fooley, laundryman on *Fibber McGee*, gibbered in a manic singsong; *Fred Allen*’s bumbling sleuth One Long Pan threatened crooks with his “lewoloweh.” However, radio soothed listeners by implying that the ancient empires were eager to adopt Western ways. From 1938 to 1940, *This Day Is Ours* told how a dead missionary’s daughter carried on his noble religious work, meeting small frustrations with grace because she had so much support from her adoring Chinese proselytes. The VJ episode of *The Charlotte Greenwood Show* (26 August 1945) featured the Chinese refugee Mrs. Lee who spoke, as the stage directions say, “definitely Oxford.”

Irish characters used more recognizable words but expressed equally simplified personalities. Many real-life Irishmen had become police officers, so Mike Clancy aided *Mr. Keen*; Harrington helped *Mr. District Attorney*; Sergeant Velie supported *Ellery Queen*; Mullins abetted *Mr. and Mrs. North*; Sergeant O’Hara facilitated *The Fat Man*; and Happy McMann backed up *Martin Kane, Private Detective*. These Irish helpers loyally appreciated their more nimble-witted superiors. Such public servants softened a second Irish cliché, that of the bibulous blowhard. Best exemplified by Molly McGee’s Uncle Dennis, this stereotype presented the Irish as ever thirsty and gregarious. *Duffy’s Tavern* seemed the logical gathering place for them.

Jewish roles on radio exuded sentimentality. *The Goldbergs* led this saccharine parade, followed by Izzy Finklestein, the helpful foil on *Kaltenmeyer’s Kindergarten*. Some characters, such as Papa David Solomon on *Life Can Be Beautiful*, became earth oracles in the pattern of Molly Berg. Others, such as the Levys of *Abie’s Irish Rose*, radiated warm humor. Similarly, another Finklestein on *Houseboat Hannah* and *The House of Glass* series projected exuberant geniality. Mr. Kitzel, one of *Al Pearce and His Gang*, and his namesake on *Jack Benny*—the one who offered hotdogs having a “pickle in the middle, with the mustard on top”—glowed with the same lower-East-Side conviviality that made Pansy Nussbaum on *Fred Allen* so endearing.

Black characters best demonstrate how small a cookie cutter radio used to extract innocuous material from a complex culture. No George Washington Carvers or Marcus Garveys pushed their way to the front of radio’s bus. The lethargic Lightning could never do more than run errands on *Amos ’n’ Andy*; Molasses ’n’ January (*Maxwell House Show Boat*) could only be minstrels; Cyclone could only be a ludicrous handyman for the equally silly *Hap Hazard*. The most independent, Birdy Lee Coggins, kept house for *The Great Gildersleeve*, and Geranium the maid chatted with *Judy Canova*. Even versatile African-American actresses such as Amanda

and Lillian Randolph could only serve *Pepper Young's Family* and *Kitty Foyle*. Occasionally these characters bossed their bosses: Rochester van Jones twitted Jack Benny, and Beulah revealed a life outside the McGee household. Usually, like other outsiders, the characters portrayed by black actors merely augmented the lives of the characters they served, apparently content to live in the background and never rebel against middle-class expectations.

Women

Female characters on radio were squeezed into some confining aesthetic corsets. On soap operas they endured, suffered, and occasionally triumphed. Some women assisted male heroes on detective programs, either as compliant secretaries such as Effie Perine on *Sam Spade* or tagalong pals such as Margo Lane on *The Shadow*. Ironically, women were perhaps more fully represented on comedy programs. There they could stretch social molds and carry on at least a century's tradition of amusing, ironic, and flamboyant female speakers. Radio controlled the clichés so they would not discomfit audiences or sponsors. Robert J. Landry suggested in 1946 that the comedy programs (usually aired on Sundays and Tuesdays) repeated formulas because "American radio fans seem to be profoundly amused by the troublesomely imaginative adult and the juvenile equivalent, or brat" (in *This Fascinating Radio Business*). His typology can be expanded to include six major categories of funny females:

1. The brat
2. The teenager
3. The single working girl
4. The household servant (usually black)
5. The girlfriend or wife
6. The erratics: older spinsters, meddlers, society ladies, rebels.

Replicating Max und Moritz/Hans and Fritz models, brats relentlessly demanded attention or treats or information. Pipsqueak kids rose above gender so that the 10-year old boy on *Daddy and Rollo* couldn't claim much difference from the girlish Teeny who pestered *Fibber McGee*. Many of these characters incorporated the mannerisms of *Baby Snooks*.

Radio exploited the pre-World War I discovery of teenagers by unleashing a gaggle of adolescents. The females varied more than their dithering male counterparts. Admittedly there were the nonstop talkers, such as Gildersleeve's neighbor: by the time she pauses for breath, he has forgotten his message. (She had been commenting on what a quiet man Gildy was.) She belongs with chatty flirts such as Veronica on *Archie Andrews*.

A subdivision of teenage girls, the almost-mother, include Marjorie Forester, who managed much of the *Great Gildersleeve's* household; Maudie, who kept *Maudie's Diary* with

wry sensitivity; *Corliss Archer*; *My Best Girls*, who ran their widowed father's home near Chicago; Harriet Conklin, the mature daughter of *Our Miss Brooks's* school principal; Babs Riley, who assisted her mom in helping father Chester lead *The Life of Riley*; and Judy Foster, who did more than go out with Ooge Pringle on *A Date With Judy*. All of these buyers into adult responsibility helped to rectify the slur upon young women implied by the twit or coquette images.

The Single Working Girl stereotype offered more memorable characters than their accompanied or married sisters. These plucky females toiled in a world they did not create. Alone but not afraid, they confronted a commercial universe that insisted they were more bother than aid. Most radio singles were eager to remove themselves from the workplace to the sacred space of a kitchen. They lived according to Elizabeth Cushman's maxim, "No girl should remain in business more than five years" ("Office Women and Sex Antagonism," *Harper's Magazine*). *Maisie* pluckily endured low wages and unpromising boyfriends while dreaming of fulfillment.

The U.S. census for 1950 listed more than 1.6 million "stenographers, typists, and secretaries." However, these vital functionaries appeared on radio as airheads. In 1953 Lorelei Schmeerbaum, stalwart member of the club "Girls Who Say No But Mean Yes" and adviser to *My Friend Irma*, announced that Irma had won the money to go to England. Lorelei's group tells Irma to order everything new. She does, and then wastes the money by buying a ticket to *New England*.

Only a few women workers earned some validity as mature individuals. A predecessor of TV's *Moonlighting*, the 1941 *Miss Pinkerton* allowed one woman to enter a man's world. A pretty, bright, principled young woman who inherited a detective agency, she enlisted as her partner a brash, suggestive guy who both attracted and annoyed her. Likewise, *Penny Williamson*, a war widow with two children, coped poignantly with life in 1950 as a single parent by selling real estate in Middletown. Connie Brooks, the unsinkable English teacher at Madison High, and Miss Spaulding, who taught night school for immigrants on *Life with Luigi*, also managed to stay afloat in the workplace.

Household servants were predictable. One need only think of Beulah (*Fibber McGee and Molly's* maid), or Geranium (*Judy Canova*) or Nightingale (*A Date with Judy*) to realize how automatically linked were the concepts of "house servant" and "woman of color." Here there exist traces of the wise woman archetype and a certain respect for people whom society often suppressed. Repeatedly, Birdy on *The Great Gildersleeve* moderated her portly employer's pomposity by reminding him of his own need to diet or to get closer to his ward Leroy.

The Girlfriend or Wife represented the grown-up female (as a group comprising nearly half of the total number of women in comedy). Whether she tried to teach *Slapsy Maxie*

Rosenbloom that there's more to life than boxing, or to soothe neighbors when *Lorenzo Jones's* inventions made noise, or to moderate *Fibber McGee's* bumptiousness, this helper civilized her man. Alice Faye took away Phil Harris' booze; Margaret Anderson sounded as wise as her husband on *Father Knows Best*; Mrs. Blandings altered her husband's schemes to build his dream home; Betty, *Alan Young's* girl, encouraged him; and Judy Garland on *The Hardy Family* preserved Andy from embarrassment.

Erratics include the many censorious Mrs. Uppington/Mrs. Carstairs (*Fibber McGee and Molly*) types who corrected grammar and chastened mischief. Fussbudgets almost drowned out a small group of revolutionaries such as Lucy Arnaz or *Hogan's Daughter* or Jane Ace (*Easy Aces*). *Charlotte Greenwood* managed to be single, moral, and peppy. When Gracie Allen wandered onto other people's programs during 1937, apparently looking for her brother, she flummoxed normally self-possessed performers such as Walter Winchell, Fred Allen, Ben Bernie, and Singing Sam. The transgressions of erratics could be tolerated because everyone understood that it was temporary.

Children

Golden Age radio drew stereotypes of young characters from two deep wells of tradition. In public Americans looked up to the young. Citizens saw them as the lucky receptacles for their elders' accumulated wisdom and wealth; immigrants valued them because they could make a fresh start, learn to speak English well, and ascend socially. With luck and pluck, some admirable youths strove to succeed in adult-approved universes by helping their families like Horatio Alger heroes, or by comforting their elders with fey wisdom like that of *Pollyanna*, or by traveling so they could learn about grown-up activities like the jolly rovers of G. A. Henty and Edward Stratemeyer. Such characters might be called "collaborators."

The reverse of this optimistic view of children involved annoyance, helplessness, and embarrassment. Out of adult reach, past rational understanding, and immune to good advice, children were sometimes thought to have a life quite different from that of adults. This notion recognized that two forces contended in young people: the desire to belong and the bothersome urge to be an individual. Like the Katzenjammer Kids, spunky tykes discomfited adults. This second group of stereotypes may be called "confounders."

Radio judged, no doubt correctly, that abused, hungry, sexual, angry, homeless, or delinquent children would offend listeners. However, a medium that claimed to be immediate and realistic could not remain silent about young people, so it chose to present them nostalgically. Out of 55 programs that gave significant roles to young characters, 33 presented juniors who collaborated with adults. These collaborators worked to

keep families intact. *Mrs. Wiggs of the Cabbage Patch* managed her modest household (during the Depression and on the wrong side of town) with the dependable aid of her little son Billy. The two Nolan kids, Francie and Neely, helped their similarly poor-but-proud family in *A Tree Grows in Brooklyn*. In 1936 *Wilderness Road* (an early version of TV's *The Waltons*) appeared, reporting how five Midwestern "younguns," the Westons, helped their folks homestead in the 1890s.

Even kids such as the orphans in 1942 Buffalo on *Miss Meade's Children*—who, in some real world, might exhibit anxiety or use unconventional language—merely frisked through one radio day after another. *Little Orphan Annie* defeated kidnappers and despair throughout the 1930s. *Mommie and the Men* had a level-headed mother managing four "children" in 1945: three kids and one infantile husband. They resembled *My Best Girls*, the three daughters of a widower who dealt amusingly with events in 1944 Chicago. Ethyl Barrymore and her daughter and son cooperated to keep the Thompson family intact on *Miss Hattie*.

Perhaps the most palatable form of the sugary category of home-centered helpers was the comedy program. Jack Barry's son and wife compensated for his flakiness on *It's the Barrys*. In *That's My Pop*, Hugh Herbert's son and daughter supported him (in 1945) because his last job had been peddling sunglasses during the eclipse of 1929. Niece Marjorie Forrester helped her aunt manage *The Great Gildersleeve*.

The kids who glued families together blended with a second subset of collaborators acting in non-residential settings. *Dick Cole* took time off from the Farr Military Academy to foil Nazi-type spies; *Jack Armstrong* skipped out of Hudson High to catch gamblers; and *Frank Merriwell*, no nearer shaving in 1946 than he was in the 1890s, found a huge underground reservoir of water that would enable farmers to make a profit.

Other compliant youths moved beyond home and school to work with adult mentors. Sixteen-year-old *Jimmy Allen* scurried about the 1930s-era Kansas City airport in order to teach 1946 listeners that a bright lad can rise if he keeps his eyes open for mechanics who might sabotage planes. Similarly, Jimmy Olsen and Beanie the office boy worked to keep *The Daily Planet* operating while *Superman* was on the road (or in the air). Junior interned with *Dick Tracy* and Pat Patton. Penny and Clipper aided *Sky King* so enthusiastically that audiences knew the maxims he spouted would inspire them to imitate his career as navy pilot, FBI agent, and rancher-detective. Jimmy, the heir of *Tom Mix*, resembled another apprentice, *Howie Wing*, who was learning to fly (as his name suggests) from Captain Harvey in 1938. Even 10-year old Barney Mallory helped his war-hero uncle Spencer Mallory during 1945 on *The Sparrow and the Hawk*.

A final group of collaborators performed noble deeds with little adult supervision, but still in harmony with adult aspirations. At one end of this spectrum of apparently individuated

kids are Isabel and Billy, who hunted under the sea for misplaced toys in *Land of the Lost*. True, they were guided by a talking fish, but still they moved with relative autonomy. 1935's *Billy and Betty* scampered through perils, contacting adults only when they needed a policeman to take away the criminal they had collared. *Chick Carter* learned so much from his adoptive father that he could pursue criminals on his own or with his pal Sue.

In opposition to the goody-goodies, the confounders were an undisciplined parade of scamps who chipped away at adult composure. They were both male and female, with Red Skelton's "mean widdle kid" complementing Fanny Brice's *Baby Snooks*. For each pair of cooperators such as Tank Tinker who supported *Hop Harrigan*, there were opposites such as Archie and Jughead on *Archie Andrews* or Henry Aldrich and Homer Brown on *The Aldrich Family*. For caretaking niece Marjorie on *The Great Gildersleeve*, there was Leroy, the water commissioner's restive nephew; balancing dutiful daughter Babs was Junior, a true son of his fumbling father on *The Life of Riley*. In contrast to the attentive students of adult mentors (such as *Bobby Benson* and Tex Mason or Little Beaver and *Red Ryder*), there was Teeny, the exasperating kid who flummoxed *Fibber McGee*. Dinky added to the problems on *Today at the Duncans*, and teenagers such as those who dithered on *Junior Miss*, *Corliss Archer*, *A Date with Judy*, and *That Brewster Boy* did not exactly rebel, but their enthusiasms often torpedoed parental expectations.

Radio left each confounder's future in amiable doubt: would Harriet Conklin, sensible daughter of the high school principal, eventually marry Walter Denton, nemesis of authority but friend to *Our Miss Brooks*? Radio implied that this class of young people, like foreigners and women, might someday conform to the dictates of middle-class normalcy, but only after amusing tribulations. Darker visions of youth seldom surfaced. A few malevolent children appeared on science-fiction programs, but such characters were not typical in radio programs of the day.

Radio Stereotypes since the Advent of Television

After 1947 the radio industry was forced to change owing to the new competition for audiences from television and the subsequent loss of national advertisers, as well as the movement of radio stars and personalities to television. Of necessity, the kinds and types of radio programming changed.

Despite these changes in the medium, racial stereotypes of African Americans and others did not change quickly; as they had existed prior to radio's Golden Age, they persisted after it ended. In 1948 Joe Scribner developed *Sleepy Joe*, a children's show that used black dialect and "Uncle Tom" stereotypes in its broadcast. *Beulah* made its debut on network radio in 1947. This program made use of the "Mammy" stereotype

with African-American actress Hattie McDaniel (of *Gone with the Wind* film fame) in the role of Beulah, after protests forced the network to replace a white man who had originally played the part. In addition to this program, several other network radio programs featured African-American women in stereotypical roles, often cast as maids and servants with flower names. (For example, Ruby Dandridge was cast as Geranium on the *Judy Canova Show*.)

Although the majority of stereotypes on network radio, even after the Golden Age, continued the negative portrayal of African Americans, other groups were also similarly depicted. Native Americans and immigrant ethnic groups were also stereotyped on network radio after radio's Golden Age. For example, *The Lone Ranger* used the Tonto character to denigrate Native Americans. Significantly, this Native American character referred to the *Lone Ranger* only as "Kemosabe," a word supposedly meaning "wise one" in an otherwise unidentified Indian language.

Stern, Howard 1954-

U.S. Radio Personality

Howard Stern is one of the best known and most controversial "shock jocks" on radio today. Stern's early interest in radio stemmed from his father's work as a radio engineer for WHOM (later WKTU). Stern attended Roosevelt High School in Long Island and went on to the Boston University School of Communication, where he first appeared on radio at the Boston University station. His first professional radio job was as a progressive rock disk jockey at WNTN AM in Boston. During the first 10 years of his professional career, he moved from station to station, working at WCCC, Hartford, Connecticut; DC-101 FM, Washington, D.C.; and WNBC, New York.

In 1985 Stern was fired from WNBC after pressure from upper management at the National Broadcasting Company (NBC). After several suspensions for refusing to follow station guidelines for on-air personnel, he was finally dismissed. Within a month, he was hired to work the afternoon drive shift on WXRK, a New York station owned by Infinity Broadcasting. This was the beginning of what was to be a long and profitable relationship for Stern and Infinity. After success in the afternoon shift, the show was moved to the morning drive slot.

The next year, Stern's show began to simulcast on Infinity's classic rock station in Philadelphia, WYSP. This was to serve as a test of the show's potential for simulcast on other stations around the country. It was also the beginning of problems arising from the content of Stern's program. By this time, Stern's reputation as a "shock jock" was beginning to attract attention from critics. His program combined profanity, sexual references, and an argumentative narrative style with a "nothing is sacred, no holds barred" approach to talk radio.

In 1986 the show became the target of a religious campaign led by the Reverend Donald Wildmon, who proposed that Stern's program be taken off the air because it was "indecent."

Wildmon took his complaints, along with transcripts and tape recordings of Stern's show, to the Federal Communications Commission (FCC). He claimed that the content of the Stern show violated the indecency policy of the FCC.

The FCC had long held that indecency should not be broadcast during times when children were likely to be in the audience. The FCC developed a definition of indecency over time, initially focusing on indecent language or "dirty words." The policy was upheld by the Supreme Court in 1978 in the *Pacifica* case. A New York station challenged the FCC's indecency policy after complaints that it had aired George Carlin's "Seven Dirty Words" monologue during the afternoon hours. The FCC maintained that the station violated the indecency policy by airing the material when children were likely to be in the audience.

The *Pacifica* decision upheld the FCC's policy of channeling questionable content to a "safe harbor," a period of time during which stations could air indecent material. After several appeals, the safe harbor was settled at the period from 10 P.M. to 6 A.M. As of 1992, the FCC definition of indecency was "language or material that, in context, depicts or describes, in terms patently offensive as measured by contemporary community standards for the broadcast medium, sexual or excretory activities or organs."

Howard Stern's morning program on WXRK, New York, and WYSP, Philadelphia, was broadcast during a time that was outside the FCC safe harbor for indecency. So, in late 1986, after reviewing Reverend Wildmon's complaint, the FCC issued a *Notice of Apparent Liability* to Infinity Broadcasting. In it, the commission claimed that Stern's radio program was in violation of the indecency policy. Infinity was warned to bring Howard Stern under control or be fined.

Howard Stern, December 1993
 Courtesy AP/Wide World Photos

In 1987 Stern held a free-speech rally in New York to protest the FCC indecency policy. Several thousand Stern fans showed up to support his right to free speech. Soon after the rally, the FCC broadened its indecency definition to include offensive references beyond the “seven dirty words” cited in the 1978 *Pacifica* case. Infinity and Stern claimed they would fight the FCC indecency policy in court.

In 1988 Stern added WJFK, Washington, D.C., to his program simulcast. In 1990 he signed a five-year contract with Infinity, which included the right to syndicate his show in other cities. Later that year, Infinity was fined \$6,000, and the three

stations carrying the Stern show were fined \$2,000 each. Infinity and its stations refused to pay the fines.

Over the next five years, more FCC fines for indecency were issued. The fines were issued not only to Infinity and its own stations but also to independent stations that carried the Stern show. In 1992 KLSX, Los Angeles, was fined \$105,000 for indecency on the Stern show, the first station not owned by Infinity to be fined. By 1995 FCC fines related to the Howard Stern show had reached a total of \$1.7 million. Finally, the FCC and Infinity reached an agreement in which a “voluntary contribution” of \$1.7 million was made to the U.S. Treasury

by Infinity. It was rumored at the time that Infinity made the payment to clear the way for FCC approval of additional radio station purchases.

In 1996 CBS/Westinghouse purchased Infinity and Stern's radio show. Although the program has been highly rated in the 39 cities where it was sold as of 1997, expansion into other cities has been slow because of concerns about high cost and controversial content. In 1998 Stern took his radio show to television. The syndicated television program, *The Howard Stern Radio Show*, is distributed by Eyemark Entertainment, a division of the Columbia Broadcasting System (CBS). The program achieved high ratings initially but has been canceled in some cities because of controversial content. In spite of all the controversy, however, Howard Stern still proclaims himself "The King of All Media."

Storer, George 1899–1975

U.S. Broadcast Executive

George B. Storer was one of radio's foremost entrepreneurial pioneers. Having entered radio at its inception in the 1920s, Storer became one of the medium's first important local group owners. From his early successes in radio, Storer went on to create a radio, television, and cable TV empire that was the nation's sixth-largest broadcast enterprise at the time of his death in 1975.

The product of a wealthy family in Toledo, Ohio, and raised and educated in Wyoming and Florida, Storer entered broadcasting by chance after having begun a career in the oil industry. What became Storer Broadcasting started as a

Toledo-based service station chain that Storer, at the age of 25, formed in a partnership with his brother-in-law, J. Harold Ryan. After obtaining a franchise for Speedene gasoline products, Storer arranged advertising on Toledo's lone radio station to promote the Speedene brand. Impressed by the results, Storer then purchased this station in 1927. Originally known as WTAL, its call letters were changed to WSPD (to signify Speedene), and it would remain part of the Storer complex until 1979.

Storer's reputation for creating large value out of relatively small assets was demonstrated almost immediately at WSPD,

initially a weak 50-watt outlet in a midsized city. Just months after the purchase, Storer extended overtures to Columbia Broadcasting System (CBS) founder William Paley, which resulted in WSPD's being named as the eighth affiliate of the year-old CBS radio network. By increasing the transmitting power of the facility, Storer transformed WSPD into a 5,000-watt station that attracted listeners and advertisers in many parts of the Midwest. With profits generated by the one Toledo station, Storer was able to launch a second outlet, CKLW in Windsor, Ontario, in 1932 and to purchase a third, WWVA in Wheeling, West Virginia, the following year.

Storer's most ambitious undertaking in radio was his unsuccessful attempt to form a fourth national radio network to compete with CBS and the Red and Blue networks of the National Broadcasting Company (NBC). This plan took shape in March 1934 when Storer acquired radio station WMCA in New York City. After designating this outlet as the key station, Storer formally chartered the network under the name American Broadcasting System. However, by this time, organizers of a competing venture, the Mutual network, had assembled a superior lineup of local affiliates. By 1937 Storer's hopes of entering network radio had collapsed.

It was largely because of his setback with the American Broadcasting System that Storer shifted his primary interests to the coming new medium of television, where his major achievements would unfold. At large premiums, Storer sold the stations in New York, Windsor, and Wheeling and used the proceeds in 1939 to initiate the first 50,000-watt station in Miami, with the call letters WGBS (for George Butler Storer). Then, in 1943, Storer was an indirect beneficiary when the U.S. Justice Department forced NBC to sell its Blue network. The buyer, Edward Noble, paid Storer \$3 million for Storer's "American Broadcasting" moniker to begin the modern American Broadcasting Companies (ABC). This windfall cleared the way for Storer's formidable entry into TV.

Storer's most important accomplishment was licensing and launching three of the 108 prefreeze local television stations that were begun prior to the Federal Communication Commission's (FCC) 1948 "freeze." These stations were WSPD in Toledo, WJBK in Detroit, and WAGA in Atlanta. Shortly thereafter, Storer acquired a fourth station, WJW in Cleveland, and a fifth, KPTV in Portland, Oregon. In 1958, after the Portland station was sold, Storer acquired WITI in Milwaukee. In 1964 and 1965, Storer added two more outlets, WSBK in Boston and KCST in San Diego. Storer's company was the first to own seven television stations, the maximum originally allowed by the FCC. Among broadcasting companies, it trailed only NBC, CBS, ABC, Westinghouse, and Metromedia in annual revenues.

Radio, however, remained an important component of Storer's operations. Storer's entry into Cleveland in 1954 had included the acquisition of WJW radio. It was at this station,

under a Storer-enlisted announcer named Alan Freed, that the rock and roll music craze was born. Storer's Detroit radio station, WJBK, likewise became a trendsetting rock and roll station. In 1960 Storer returned to New York and for \$10 million, the largest amount that had then been paid for a radio station, acquired WINS. This outlet, too, was converted to rock music. Freed was transferred to WINS, and he, along with two other WINS personalities, Murray "The K" Kaufmann and Bruce "Cousin Brucie" Morrow, helped popularize the rock music trend.

Storer was featured in news reports in 1960 when FCC Chairman John Doerfer was forced out of office after accepting airplane flights and a six-day cruise on board the broadcaster's yacht. Congress did not pursue allegations, heard before a House Oversight Subcommittee, that Storer had given favors to Doerfer in order to expedite FCC licensing of a TV station in Miami that Storer had planned. The Miami station was abandoned. Two years earlier, Storer had been brought before the FCC to answer charges that his company was engaged in station "trafficking." These charges had stemmed from Storer's sale of KPTV and immediate purchase of WITI. Storer was cleared of wrongdoing following an FCC investigation.

Storer's business interests were not confined to broadcasting. Through the 1960s Storer owned Standard Tube and Nemir Industries, both plastics firms. He briefly controlled the Boston Gardens sports arena and in 1965 outbid Howard Hughes for the ownership of Northeast Airlines.

In the early 1970s, Storer passed control of his broadcast operations to his two sons, George B. Storer Jr. and Peter Storer. Between 1978 and 1980, the younger Storers sold all of the company's radio properties in order to expand holdings in cable TV. In 1993 the company broke up. Storer Cable, the country's third-largest multisystem operator, was absorbed by TCI, while several of the television stations were purchased by Rupert Murdoch and became cogs in Murdoch's Fox network.

The elder Storer died on 7 November 1975. Earlier that year, he had received broadcasting's top honor, the Distinguished Service Award of the National Association of Broadcasters. He remains the namesake of the Storer Foundation's philanthropic foundation.

CRAIG ALLEN

George B. Storer. Born in Champaign, Illinois, 10 November 1899. Established radio station WTAL (later WSPD), 1927; launched CKLW, Windsor, Ontario, 1932; WWVA, 1933; WGBS, Miami, Florida, 1939; received \$3 million for "American Broadcasting" moniker, 1943; acquired WJW, Cleveland, Ohio, which launched rock and roll disc jockey Alan Freed's career, 1954; acquired WINS, New York City, to expand rock and roll format, 1960; owned seven television stations, 1965; rendered control holdings to sons, 1970s; recipient: Distinguished Service Award of the National

Association of Broadcasters. Died in Miami, Florida, 7 November 1975.

Storz, Todd 1924–1964

U.S. Station Owner and Music-and-News Innovator

Todd Storz was an entrepreneur who headed a chain of trend-setting AM radio stations in the Midwest and South from 1953 until 1964. He is best known for his role in the development of Top 40, a variant of the music-and-news management philosophy that evolved during the decade following World War II when television spread throughout the United States. The Top 40 formula popularized by Storz included three key elements: limited playlists, “giveaway” promotions requiring audience participation, and sensationalistic newscasts.

Origins

Robert Todd Storz was born into a prominent Nebraska family in 1924. His father, Robert H. Storz, was a wealthy Omaha civic leader who served as vice president of the Storz Brewing Company. Todd Storz was attracted to radio at an early age. He built a crystal set as a child and became a ham operator as a teenager. After an eastern college preparatory education at the Choate School in Wallingford, Connecticut, Storz attended the University of Nebraska in Lincoln for one year, followed by a three-year stint in the U.S. Army Signal Corps, an experience Storz referred to as the completion of his formal education. After his discharge, Storz attended a summer institute in radio sponsored by the National Broadcasting Company (NBC) and Northwestern University. He then worked briefly as a disc jockey and salesman at radio stations in Hutchinson, Kansas, and Omaha, Nebraska. In 1949 Storz and his father formed the Mid-Continent Broadcasting Company, which became the licensee of a marginal (500-watt, daytime-only) station in Omaha, KOWH.

Shortly after taking over KOWH, Storz replaced block programming with music and news throughout the broadcast day. This decision was far from innovative. As television emerged

as the primary medium for expensive, nationally distributed programming, radio managers throughout the nation opted for low-cost schedules of recorded music hosted by local disc jockeys. Storz used the term *Top 40* as early as 1953, the year he acquired WTIK in New Orleans. At that time, disc jockey Bob Howard was using “The Top 20 at 1280” as his slogan at competitor WDSU. Storz and his New Orleans manager, George Armstrong, doubled it to “The Top 40 at 1450.” Both the *Top 20* and *Top 40* terminology was an extension of the popular *Your Hit Parade* concept.

By 1953 music-and-news programming had pushed Storz’s KOWH from the bottom to the top of the Omaha ratings, passing several full-time regional facilities and a 50,000-watt clear channel outlet. Storz began to promote the station aggressively in industry publications. He also began to acquire additional stations. After similar successes with music and news at WTIK in New Orleans and WHB in Kansas City, Storz began to attract both competitors from within his markets and imitators nationwide.

The Limited-Playlist Concept

Perhaps because of his untimely death at age 39, Storz became known in retrospect as “the man who invented Top 40 by watching people select songs on a jukebox.” This legend is today part of radio’s folklore. As the story goes, around 1955 Storz conceived the idea of repeatedly broadcasting only a few popular records after observing customers and waitresses at Omaha restaurants and bars play some records on the jukebox over and over while ignoring others. Most versions of the legend place Storz in the company of his associate, Bill Stewart. Although Storz did not deny that he had observed the jukebox phenomenon, he said he had first noticed it while in the army. Storz also considered the findings of a local research study sug-

gesting that Omaha radio listeners preferred music to other forms of programming.

Regardless of origin, a limited playlist was implemented by Todd Storz and Bill Stewart at KOWH in early 1956 as a reaction to competition from KOIL, a full-time Omaha station that had begun airing a music-and-news format the preceding year. The limited playlist was an attempt to minimize dial switching to KOIL when KOWH played less popular songs.

Limiting all of the music played on a radio station to the most popular records of the week was counterintuitive to the conventional wisdom of programming variety, a vestige of the golden age of radio networks. During the early 1950s, disc jockeys at music-and-news stations selected from a wide array of recordings that included several renditions of particular songs and white “cover” versions of songs recorded by black artists.

After 1956 Storz began to remove much of the discretion his disc jockeys had previously exercised regarding which records were aired. He also began programming only the “best” version of a given song. It is important to note that because this occurred three years prior to the payola investigations, it represents a true programming innovation and not a reaction to the threat of regulatory scrutiny.

Audience-Participation “Giveaways”

In the summer of 1956, the four Storz stations were worth \$2.5 million, and at age 32, Todd Storz was the fastest-rising figure in the radio broadcasting industry. *Time* magazine branded Storz the “giveaway king” and severely criticized his audience-participation promotional activities in Omaha, New Orleans, Kansas City, and Minneapolis–St. Paul. While drawing national attention to the Storz formula, reaction to the article in *Time* also might have influenced the members of the Federal Communications Commission (FCC) to entertain second thoughts about approving Storz’s application for the license of WQAM in Miami. On 12 July 1956, the Mid-Continent Broadcasting Company received a letter from the FCC announcing that a hearing would be required on the pending WQAM purchase. Among their concerns, the commissioners cited “treasure hunts” in Omaha and Minneapolis/St. Paul, which indicated a “giveaway pattern” on the Storz stations designed to “buy” the listening audience.

One particular Storz giveaway received nationwide publicity. Criticized in the aforementioned *Time* article, the campaign landed a WTIIX disc jockey in jail for stopping late-afternoon traffic in New Orleans. This giveaway was staged on a weekday in the middle of May 1956, during Bob “Robbin” Sticht’s afternoon Top 40 program on WTIIX. The promotion began with about 30 seconds of dead air at 5:05 P.M., after which a breathless announcer gasped, “I don’t know what happened to Bob Robbin. He’s gone. Oh, yes, we’ve just discovered that the

cash box is missing. He apparently has skipped the station with the cash!”

By then, Sticht was atop a three-story building at the corner of Canal and Carondelet streets in downtown New Orleans. He was wearing a long raincoat in which he had stuffed 200 one-dollar bills. At about 5:15 P.M., after dropping a few bills to the street below, Sticht began shouting, “I’ve got this money and I’m going to give away this money. I hate money!” According to detailed instructions, several WTIIX employees stationed at the four corners of Canal and Carondelet started to shout, “It must be Bob Robbin from WTIIX!” People started fighting as he threw the rest of the bills over the side of the building. Some people almost fell through the plate glass window of a street-level clothier as they leaped into the air frantically trying to grab the money.

When the police arrived, Sticht was booked for disturbing the peace and inciting a riot. An announcement was broadcast on WTIIX to the effect that Sticht had been arrested, the banks were closed, and the station did not have enough cash on hand for his bail. Listeners were asked to come to the police station and lend money to WTIIX until the next morning so Sticht could be released. Sticht said that several hundred complied.

This type of “throwaway” promotion had been staged earlier in Omaha, when a Storz employee climbed a tree in a park and periodically tossed out money. Such promotions enabled the first two stations acquired by Storz to dominate their markets, even with limited facilities. For example, in 1956 WTIIX operated full-time with 250 watts at 1450 kilohertz. Its signal barely covered the New Orleans city limits, especially at night. Yet in the April–June Hooperatings for 1956, the WTIIX share of audience from 7 A.M. to 6 P.M. averaged 26.6. The next highest-rated station was 50,000-watt WWL, which averaged only 14.9. Storz later sold daytime-only KOWH in Omaha to William F. Buckley, Jr. and purchased a 5,000-watt regional station, WWEZ in New Orleans, to which he transferred the WTIIX call letters after cleverly donating the original 250-watt facility for noncommercial use.

Storz’s response to the FCC letter was to discontinue these types of giveaways on his stations in return for favorable FCC action on WQAM, which he received. The audience-participation contests later resumed and remained a programming staple throughout the Top 40 era.

Sensationalistic Newscasts

The third element of the Storz formula was designed to maintain the audience for his stations while fulfilling the news commitments of his licenses. This was accomplished by airing short newscasts during peak listening times and longer newscasts at other times. It also involved scheduling newscasts at five minutes before the hour so music could be played on the hour, the time most competitors aired news.

The newscasts on Storz's stations were delivered in a sensationalistic style designed to hook listeners and keep them listening. The procedures generally included program elements such as echo, shouted datelines, stories punctuated by the sound of a telegraph key à la Walter Winchell, and so on.

The Storz Disc Jockey Conventions

In 1958 the Storz organization sponsored "The First Annual Pop Music Disk Jockey Convention and Programming Seminar" in Kansas City. The objective was to improve the general perception of music-and-news stations by transferring an image of "professional" respectability to the Top 40 disc jockey, which was at best a low-prestige occupation.

The following year Storz sponsored a final gathering titled "The Second International Radio Programming Seminar and Pop Music Disk Jockey Convention," held in Miami Beach a few months before the first payola investigations. Both conventions were underwritten by record companies.

Impact

By the late 1950s Storz and his managers had perfected a fast-paced brand of music and news that came to be known as Top 40. The procedures changed slightly from time to time but basically involved airing records from the limited playlist in spaced repetition and sometime in a countdown order, skipping some records during certain time periods. News continued to air at five minutes before the hour, delivered in a sensationalistic manner. The rest of the time was filled with commercials, audience-participation giveaways, and various time, weather, public service, and call letter announcements.

By 1960 the Storz roster included WTIK, New Orleans (acquired in 1953, facility upgraded in 1958); WHB, Kansas City (acquired in 1954); WDGY, Minneapolis (acquired in 1955); WQAM, Miami (acquired in 1956); KOMA, Oklahoma City (acquired in 1958); and KXOK, St. Louis (acquired in 1960). When Todd Storz died less than a month before his 40th birthday, he had built a successful business by doing one thing well: Top 40 on AM. Top 40 would continue to be featured on AM stations until the early 1980s. Storz lived to see the programming formula he pioneered reach from the Midwest and South to all parts of the country, including major-market clear channel stations such as WABC in New York and WLS in Chicago. Within two years of Storz's death, RKO General's KHJ in Los Angeles became the most imitated radio station in North America when programming consultants Bill Drake and Gene Chenault achieved phenomenal ratings with a streamlined version of the basic Storz formula.

It would be inaccurate to infer that Storz's decision to program Top 40 on his stations was grounded in anything other than business interests. Storz said his mission in life was not to

educate radio listeners. He maintained an objective stance regarding the program content of his stations and said he was ready to change if listener preference so warranted.

Moreover, it is doubtful that Storz anticipated the shift in listener preference from AM to FM. When he was acquiring stations, FM licenses were albatrosses. Storz therefore sold each FM station that he acquired in combination with an AM purchase. Although television licenses were hot properties in the early 1950s, Storz said he had no interest in that medium.

After Todd Storz died in 1964, the six Storz stations continued to operate as stand-alone AM facilities under the leadership of George W. Armstrong. By 1982 almost all former Top 40 AM stations had switched either to country or adult contemporary variants of the music-and-news format. Most of the Storz stations adopted country formats, but a news/talk format was eventually implemented at KXOK in St. Louis, a move that suggests adaptability on the part of Storz management to the rapidly changing market environment for AM radio in the early 1980s. Robert H. Storz nevertheless began to sell the stations when the pattern of audience migration to FM appeared irreversible. KOMA, WTIK, and WDGY were sold in 1984; WHB, KXOK, and WQAM were sold the following year. Sales prices averaged between \$2 million and \$3 million per station.

Todd Storz and Gordon McLendon

In many accounts, Todd Storz has been overshadowed by his contemporary, Gordon McLendon, who also made significant contributions to Top 40 and who outlived Storz by more than 20 years. Both Storz and McLendon were sons of the American heartland. They were about the same age, benefited from privileged upbringings, and became business associates of their successful fathers. In ways most directly related to their careers in radio, however, Storz and McLendon were quite different. McLendon possessed far more flair for creative programming (a floating pirate station, the first all-news station, the first beautiful music station, and legendary baseball recreations over his nationwide Liberty network). Storz stuck with Top 40. Perhaps most significant, McLendon and his representatives were more helpful to early scholars of the music-and-news era than were representatives of the Storz organization. As a result, far more has been written about McLendon than Storz.

The viability of commercial radio broadcasting during the early years of television sprang in large part from the efforts of young licensees such as Todd Storz who objectively conformed their management strategies to the changing structures within the radio industry. Storz received the National Association of Broadcasters Hall of Fame Award in 1987 for his contributions to radio broadcasting. In 1989 he entered the Nebraska Broadcasters Association Hall of Fame.

Striker, Fran 1903–1962

U.S. Radio Scriptwriter

Fran Striker was a prolific writer of scripts for some of the most popular programs on network radio in the 1930s and 1940s, including *The Lone Ranger*, *The Green Hornet*, and *Sergeant Preston of the Yukon*. The character and adventures of *The Lone Ranger*, especially, have lived on as part of American popular culture, and the Ranger has continued in a wide variety of media forms, including books, comic strips, comic books, television, and film.

Fran Striker was working at WEBR radio in Buffalo, New York, when he was contacted in December 1932 by radio station WXYZ in Detroit, Michigan. The station had severed its relationship with the Columbia Broadcasting System (CBS) network, and one of the station owners, George W. Trendle, had determined that WXYZ could be more profitable if it developed its own programs to fill the air and attract both audience and advertisers. During an earlier conference, Trendle, James Jewell (a WXYZ dramatic director), and other station personnel had pooled their ideas in outlining the characteristics of a dramatic program that would be designed to appeal primarily to children. It was to feature a sort of modern Robin Hood, a hero who Trendle insisted should somehow symbolize justice. The scripts for the show should portray a character of the West who would right wrongs, who would accept no thanks, and who would be fulfilled simply by doing

his job well. This hero was also to convey an aura of mystery and operate in a realm beyond the constraints imposed upon official lawmen. After trying various locally written scripts and finding them lacking, Trendle turned to Fran Striker.

Striker had attended the University of Buffalo from 1922 to 1925, but he left before graduating, finding work as a transmitter operator, announcer, program producer, and continuity editor, as well as employment in writing for radio. He had successfully scripted *Covered Wagon Days*, a show for WEBR in Buffalo, and *Warner Lester, Manhunter*, which was being aired on a station in Boston. His professional aspiration was to write scripts for programs that he could sell to stations around the country. He hoped this would provide a reasonable standard of living for himself and his family, even during the Depression years.

Striker accepted WXYZ's offer to write for *The Lone Ranger*, and his pilot scripts met with Trendle's approval. The character of the Ranger may have grown partly from Striker's *Covered Wagon Days*, although his initial idea that the Ranger should display a happy-go-lucky attitude and a strong sense of humor was soundly rejected by Trendle. Striker is generally credited with fashioning the character of Tonto, however, and both the use of silver bullets and the Lone Ranger's famous cry, "Hi Yo Silver, away," may also have been Striker's contribution. There is

Fran Striker, creator of *The Lone Ranger*
 Courtesy AP/Wide World Photos

no doubt that his writing fleshed out the style and personality of *The Lone Ranger*, although strong differences of opinion as to exactly who was responsible for the character's initial creation continue today. Trendle consistently maintained that the Ranger was a result of his own conception, and he successfully convinced Striker to sign over all legal claims to having originated the Ranger. Striker gave up all legal rights to the ownership of current and future printed, published, or broadcast versions of the Ranger on 22 May 1934, although some historians believe he may have been inappropriately manipulated into doing so. On more than one occasion, Trendle vigorously defended his view of himself as the sole originator of the Ranger, and he moved quickly to counter references to anyone else as the creator. A modest, unassuming, friendly personality, Fran Striker did little to push for his own personal recognition as the Ranger's creator.

Striker continued to work for Trendle, however, as a paid employee, turning out three half-hour *Lone Ranger* scripts each week and for many years earning only \$4.00 for each. Working in Buffalo, largely at night and sustained by huge quantities of coffee and cigarettes, Striker produced scripts for

a variety of programs aired by more than 50 radio stations around the country, in addition to writing for WXYZ. Conforming to Trendle's demands and constraints, Striker developed a formula for scripting characters, setting, complications, and resolutions for *Lone Ranger* episodes, allowing him to maximize his efforts in turning out scripts for the other programs. He pounded heavily on the keys of his typewriter in order to produce the required eight carbon copies of each page of his scripts. Striker worked 14 hours a day, writing the equivalent in words of four Bibles a year, and found relaxation and inspiration in watching western movies.

WXYZ joined WGN Chicago, WOR New York, and WLW Cincinnati to share programs and sell commercial time in September 1934, offering *The Lone Ranger* as part of the package deal. The expenses and income were to be mutually shared; this agreement resulted in the creation of the Mutual Broadcasting System in 1934. Trendle persuaded Striker to move to Detroit later that year, and although Striker continued to write for other stations as well as for WXYZ, he was instrumental in the development of new shows for the station and network, including *The Green Hornet* and *Sergeant Preston of the Yukon*, serving as script writer for both. When Trendle incorporated *The Lone Ranger* in 1935, Striker was again left out of any actual ownership in the program.

By 1940, in addition to his many radio scriptwriting duties, Striker was writing for *The Lone Ranger* comic strip, children's books, and adult novels. A major challenge for Striker came in 1941, when Earl Graser, the actor who played the Lone Ranger, was killed in an auto accident. At Trendle's direction, Striker wrote scripts for programs in which Tonto nursed a wounded and silent Lone Ranger back to health. When Brace Beemer later replaced Graser in the role of the Ranger, few in the listening audience were aware of any difference in the Rangers.

Late in 1943, following an argument over salary, Trendle refused to increase Striker's pay, and Felix Holt was brought in to replace Striker as head of WXYZ's script department. Holt rejected several of Striker's scripts for *The Lone Ranger*, and Striker became depressed and disillusioned about his career and his future. His life seemed brighter by early 1944, when Trendle reinstated Striker as department head and chief writer for the Ranger. Striker continued in this role and later assisted in the selection of Clayton Moore to play the Ranger for television in 1949. He adapted many of the radio scripts for the television version of the Ranger and continued writing additional scripts for radio and television during the 1950s. In the early 1960s, Striker turned to teaching and was preparing to move his family from Arcade, New York, to Buffalo when he was killed in an auto accident near Buffalo on 4 September 1962.

Subsidiary Communications Authorization

Radio stations, both AM and FM, are permitted to generate programming in addition to their main programs. Subsidiary Communications Authorization (SCA) uses multiplexing techniques and transmits audio or data on a separate channel, but still as part of the modulated carrier. SCA services, called “sub-carriers,” are not receivable with a regular radio. A special receiver or adapter is required.

Origins

The principle of multiplexing (sending separate signals with one transmitter) was first demonstrated by FM system inventor

Edwin Howard Armstrong in the mid 1930s. In 1948 the inventor returned to perfect the multiplex technology and announced it in 1953. Armstrong and his associates saw the system as a way to assist then hard-pressed FM outlets with an additional revenue stream by allowing them the ability to transmit—and sell—a secondary transmission different from the main broadcast signal. This derived from the fact that stations rented or sold the separate receivers needed to pick up the secondary (to the main broadcast channel) transmission, be it music (as most were) or some other format. Early in 1955 the FCC adopted rules for such a service, based in part on the experience from 20 experimental subsidiary multiplex operations

already underway. The first new subsidiary communications authorizations were issued in October 1955 to WPEN-FM in Philadelphia and WWDC-FM in Washington, D.C.

In the years that followed, FM stations made wide use of SCAs. Some 30 subcarriers existed by 1958, and more than 600 by 1967. Most were used for “musicasting” (transmitting background music for stores and offices provided either by the station or a service leasing station facilities—the most common application), special news and information services, weather warnings, educational programming, and (by the 1970s) reading services for blind listeners. In the days before widespread FM listenership in the 1970s, operation of SCAs often made the difference between profit and loss (or prevented a larger loss) for stations.

Operations

SCA services are not allowed to disrupt or degrade the station’s main programming or the programs of other broadcast stations. Permissible SCA uses fall into two categories: the first includes broadcast transmission of programs or data of interest to a limited audience. Examples include paging services, inventory distribution, bus dispatching, background music, traffic control signal switching, point-to-point or multipoint messages, foreign language programming, radio reading services for the blind, radio broadcast data systems (RBDS), storecasting, detailed weather forecasting, real-time stock market reports, utility load management, bilingual television audio, and special time signals. The second category includes transmission of signals that are directly related to the operation of the radio station. Examples include relaying broadcast material to other FM and AM stations, distribution of audio networks, remote cuing and order circuits, and remote control telemetry.

Many of the programming requirements for broadcast stations do not apply to SCA programming, including station identification, delayed recording, program logging, and sponsor identification announcements. For FM stations only, SCA operation may continue when regular FM programming is off the air. However, regular hourly station identification must continue. Noncommercial FM stations, usually located

between 88.1 megahertz and 91.9 megahertz, may generate SCA programming for profit. But such stations are then required to provide another SCA channel for any radio reading services for the blind that may request such a channel. The station is limited to charging the radio reading service only for actual operating costs.

There are several technical restrictions for SCA services. SCA subcarriers must be frequency modulated (FM) and are restricted to the range of 20 to 75 kilohertz, unless the station is also broadcasting stereo, in which case the restriction is 53 to 75 kilohertz. This allows a subcarrier to be modulated at audio frequencies and prevents it from interfering with the main program, as listeners cannot hear modulation above 20 kilohertz. SCA use is secondary to the audio on the main channel and must not interfere with the main broadcast audio channel.

SCA programming is retrieved by a detector in a special receiver, in which a tuned circuit filters out all subcarrier signals except the desired one. A second detector retrieves the information that modulates the selected subcarrier. Generally, tunable subcarrier receivers are prohibited by the FCC.

Suspense

Suspense Thriller

In 1941 there were 16 suspense programs on the radio networks; by the end of the war there were more than 40. The suspense-thriller was the fastest growing genre during the wartime period. The most famous and prestigious of these programs was *Suspense*, which debuted as a series in 1942 after a single episode premiered in the summer of 1940 (this first episode was directed by Alfred Hitchcock, his only direct connection to the show). *Suspense* set the artistic and thematic standard for the programs that followed.

Originally a sustaining program, *Suspense* was promoted as a prestige drama because of the talent of its creative team, its first-rate stars, and the high quality of its original scripts. Producer/director William Spier fine-tuned each episode, coordinating music, actors, and sound to maximum effect and earning himself the nickname of the “Hitchcock of the Air.” Bernard Herrmann (famous for his musical scores for Hitchcock films) composed and conducted music for the series until 1948; his theme for the show was used throughout its 20-year run. *Suspense*’s popularity and effectiveness, however, were also due to its realism. Unlike previous thriller programs such as *Lights Out*, *Suspense* programs did not incorporate the supernatural but rather focused on the psychological and social horrors that could be visited on the lives of everyday people. Radio critics of the time saw the growth of the genre as a testament to the audience’s need for “escape” during the war, but part of the impact of such programs lay in their ability both to capitalize on audience’s wartime fears and to address some of the feelings of trauma the war produced. This is particularly obvious in the many programs that focused on mistrust between husbands and wives, which tapped into both men’s wartime traumas and their fear of women’s independence.

Suspense’s popularity and influence can be traced to one particular episode during its second year, “Sorry, Wrong Number,” which was broadcast on 25 May 1943. This half-hour program, written by *Suspense* regular Lucille Fletcher (Herrmann’s wife) and starring Agnes Moorehead, was a watershed moment in the history of radio drama and became perhaps the most famous original radio play of all time. In “Sorry, Wrong Number,” Moorehead plays an invalid who overhears a conversation on the telephone between two men who are planning to murder a woman in half an hour. Moorehead’s character, known only as “Mrs. Elbert Stevenson,” tries desperately to prevent the murder by calling on various public institutions for help—the police, the phone company, public hospitals—but they do nothing for her, and her frustration increasingly borders on hysteria. In the last few moments,

she realizes that she is the intended victim, that her husband has paid to have her killed. She calls the police but she’s too late, and the play ends with her desperate screams as she is stabbed to death.

The play touched a nerve, and the Columbia Broadcasting System (CBS) was flooded with calls commending the program’s realism and Moorehead’s performance. The program was repeated within a few months, and then seven more times within the next few years. Audiences identified with a character who ultimately has no control over her fate and whose cries for help are ignored by those in power; the insecurity this created in audiences was enhanced by the fact that the character’s killers go unpunished (an exception to Spier’s usual policy). The success of the play proved the popularity of the suspense genre and encouraged the proliferation of suspense-thriller programs. It also led to more programs with female leads and narrators (Moorehead herself would become *Suspense*’s most frequent star). Finally, it encouraged a focus on domestic tensions in the genre as a whole, in particular making the stalked wife and the killer husband staples of the genre for the next several years. Like film noir of the time, suspense programs seemed to mirror the frustration of many Americans faced with postwar social requirements, particularly the social conformity, suburban ideal, and standards of wealth (husbands frequently killed wives for money) expected of them during the Cold War period.

Although *Suspense* programs developed a stable of talented stars (most notably Nancy Kelly, Cathy Lewis, and Elliot Lewis), producers often called on Hollywood stars to fill the title roles. Frequently, the star’s persona was tweaked to accommodate his or her role as a killer or psychotic, adding to both the thrill and the discomfort the program could cause. Stars enjoyed doing *Suspense* programs, in part because it gave them the opportunity to play against their Hollywood images. Ozzie and Harriet Nelson schemed to kill their elderly relative in “Too Little to Live On” (1947); Frank Sinatra played a murdering psychotic in “To Find Help” (1945); Robert Taylor shot and killed his crazed werewolf-wife in “The House in Cyprus Canyon” (1946); and Orson Welles dug into his own living son’s skull in the gruesome “Donovan’s Brain” (1944). Paul Henreid, Joseph Cotten, Charles Laughton, and Lloyd Nolan all killed their wives or girlfriends on the show, and Eve Arden and Geraldine Fitzgerald killed their husbands or boyfriends.

Female stars could look forward to a particularly wide range of meaty roles, in which they had to use their smarts to outwit stalkers as well as to climb the corporate ladder. Some

of the more memorable of these include Lucille Ball as a gold digger in "A Little Piece of Rope" (1948), Anne Baxter as a struggling career woman in "Always Room at the Top" (1947), and Ida Lupino as a businesswoman coping with her ex-convict husband in "The Bullet" (1949). *Suspense* also helped shape star personas, first casting Vincent Price as a murdering sophisticate in one of Fletcher's best stories, "Fugue in C Minor" (1944); in addition, Jimmy Stewart's turn as a paralyzed veteran who believes he is being stalked by his Japanese torturer in "Mission Completed" (1949) anticipates the actor's work for Hitchcock in the 1950s in films such as *Rear Window*.

In later years, the direction of the program shifted to Anton M. Leader and then to Elliot Lewis, but the high quality and star power of the programs continued until the mid-1950s. Comedians and musical stars continued doing interesting variations on their star personas, with Jack Benny as a bank thief in "Good and Faithful Servant" (1952), Red Skelton haunted by dreams in "The Search for Isabel" (1949), and Danny Kaye as a scapegoat for murder in "I Never Met a Dead Man" (1950). Past shows were frequently repeated using different stars. In 1949 *Suspense* made its television debut, and the two shows ran simultaneously until 1954, when Autolite dropped sponsorship of both. The television show ceased production, but the radio program continued until 1962 under multiple sponsorship, making it one of the longest-running programs in radio history. Fortunately, recordings of well over 900 of the program's 945 episodes are available commercially. Listening to them today, they not only provide thrills and chills but are also an invaluable historical record of their time.

ALLISON MCCRACKEN

Hosts

"The Man in Black" (1942-43), Joseph Kearns or Ted Osborne (1943-47), Robert Montgomery (1948)

Announcers

Truman Bradley, Ken Niles, and Frank Martin (1943-47), Bob Stevenson, Harlow Wilcox (1948-54), Larry Thor and Stu Metz

Actors

Cathy Lewis, Agnes Moorehead, Jeanette Nolan, Hans Conreid, Joseph Kearns, Elliott Lewis, Lurene Tuttle, Mary Jane Croft, Bill Johnstone, William Conrad, Lillian Buyeff, Paul Frees, Irene Tedrow

Producers/Directors

Charles Vanda (1942), William Spier (1942-48, 1949-50), William Robson (1948), Anton M. Leader (1948-49), Elliott Lewis (1950-54), Norman Macdonnell (1954), Antony Ellis (1954-56), William N. Robson (1956-59), Bruno Zirato Jr. (1959-62), Fred Hendrickson (1962)

Sustaining Programs

Sustaining programs are those not supported by advertising revenue; the cost of airtime is said to be *sustained* by the network or station. Sustaining programs may be of any format but most are usually (especially in recent years) of some public service variety.

Although never formally required by law, sustaining programs have been seen in the past as a key part of radio's responsibilities under the "public interest" portion of federal regulations concerning radio. The original regulatory theory held that only by providing programs on a sustaining basis

could networks or stations offer the diverse points of view and coverage of public affairs that advertisers might not support. Deregulation has swept away most such thinking, and sustaining programs today are few and far between.

Origins

At first, virtually all radio time was provided on a sustaining basis; there was no commercial advertising on the air. Station operators sustained the entire cost of their broadcast activities.

This began to change in the early 1920s as various means of supporting the cost of radio broadcasting were discussed and tried and all proved unworkable—except for the sale of airtime for advertising.

After AT&T's New York City station WEAf first sold time in mid 1922, other stations slowly began to do the same. As the potential for revenue became clearer, more stations began the practice, so that by the end of the decade, time sold to advertisers was widely accepted as the standard for broadcasting.

Well into the 1930s, advertiser-supported time was typical only of the most popular programs on the air; substantial portions of the broadcast day were still sustaining. More than a third of U.S. radio network offerings were sustaining, even on the eve of World War II. Only the lack of print alternatives during paper-short World War II helped to fill most network time slots with paid advertising, reducing sustaining programs to a few public service offerings.

As the most popular (and highly rated) entertainment programs siphoned off advertising, such non-entertainment programs as religion, agriculture, children's shows, public affairs, discussion and talk, and news were offered on a sustaining basis to fill out station and network schedules with the broad program diversity sought by regulators. Many of these were broadcast in daytime hours when fewer people listened to radio. By 1940, "55 out of 59-1/2 daytime hours of sponsored programs per week [carried by the four national networks] were devoted to soap-operas. The broadcasting industry has thus permitted advertisers to destroy over-all program balance by concentrating on one type of program" (Warner, 1948). Similarly, stations in larger markets with more advertiser appeal were carrying fewer sustaining hours.

At the same time, many sustaining programs were providing important radio services. Some experimental drama work appeared, for example, on the Columbia Broadcasting System (CBS) sustaining program *The Columbia Workshop*, beginning in 1936. Stations in a number of larger markets provided sustaining time for programs concerning public affairs, agriculture, children's interests, and other important issues that usually appealed only to a minority of listeners. Although such programs rarely aired in the prime evening time of greatest interest to advertisers, the important fact is that they were provided and were also touted by broadcasters as evidence of their public service role.

The Public Interest

Government and industry perceptions of just what radio's "public interest" responsibilities were comprised a major factor in the long survival of sustaining programs. Prior to the Radio Act of 1927, there were no formal government-mandated rules for radio programs or advertising on the air. The 1927 law established the phrase "public interest, convenience

or necessity" as the guiding principle for government licensing of radio stations. Regulators from the Federal Radio Commission (1927 to 1934) and the Federal Communications Commission (FCC) have attached various measures of importance to the provision of sustaining programs as a key part of meeting the public interest rubric.

The clearest statement of how the FCC saw sustaining programs as a key part of radio's fulfillment of its public interest responsibility came in its 1946 policy statement informally dubbed *The Blue Book*. In that high-water mark of pro-regulatory thinking—authored in part by former British Broadcasting Corporation (BBC) officials who thought only in terms of sustaining time—the commission's staff held that sustaining programs filled five essential functions: (1) to secure for the station or network a means by which, in the overall structure of its program service, it can achieve a balanced interpretation of public needs; (2) to provide programs that, by their very nature, may not be sponsored with propriety; (3) to provide programs for significant minority tastes and interests; (4) to provide programs devoted to the needs and purposes of non-profit organizations; and (5) to provide a field for experimentation in new types of programs, free from the program restrictions dictated by an advertiser's interest in selling goods. Nearly half of the FCC report was devoted to a detailed discussion of these points and of actual industry practice statistics of sustaining programs during the war years (1940 to 1944).

Industry spokespersons responded by strongly arguing that they could fulfill all of their public service requirements without having broadcasters sustain program costs. Advertisers, they said, were more than willing to take up the slack. And industry economic realities—already evident in radio and soon to be so in television—made it impossible for the FCC to sustain its thinking about sustaining programs. As advertiser demand for radio time expanded after the war, stations sought and often found support for formerly sustaining programs.

When the FCC issued a new program policy statement in 1960, it clearly indicated its acceptance of industry arguments that "There is no public interest basis for distinguishing between sustaining and commercially sponsored programs in evaluating station performance. . . . Sponsorship of public affairs, and other similar programs may very well encourage broadcasters to greater efforts in these vital areas." Sustaining time was now merely that which had not been sold, so it no longer held a special interest for regulators.

When in the early 1980s the FCC removed radio license processing guidelines that called for at least minimal amounts of non-entertainment programming and strongly encouraged public service (i.e., sustaining) messages, another support mechanism for sustaining time disappeared. No longer was the commission interested in how much advertising time a station sold—the marketplace would set the standard.

The decline of the FCC Fairness Doctrine in 1987 took away another prop of sustaining program time. The commission no longer required careful station records demonstrating that various sides of public controversies were being aired even when that meant some had to be given sustaining airtime. On the other hand, expression of controversial points of view in paid time—another long-time industry taboo—was quickly accepted when it became clear that there were plenty of people and institutions eager to buy time in order to broadcast their views. The lapse of the Fairness Doctrine made such sales easier for stations, as they were no longer required to use expensive airtime to provide balancing points of view.

Religion

Religious programs offer a useful window of insight into the subsequent decline of sustaining time. As a category, these were once provided free of charge (i.e., on a sustaining basis) to established or mainline religious groups of the Protestant, Catholic, and Jewish faiths. The major networks offered such programs at least weekly, as did many other stations. Some of these programs ran for decades. For many years it was a proud radio industry policy (a boast?) that time was not to be sold for religious programs, as such programs were offered on a sustaining basis as part of radio's public interest responsibility. But some critics—especially those in smaller religious organizations not included in the mainstream programs—argued that the networks and stations were effectively censoring minority religious viewpoints with their refusal to give equal time to programs from other denominations.

Beginning on the fringes, with small stations in local markets in the late 1940s and early 1950s, evangelical and other generally conservative religious figures began to purchase time

from financially-strapped outlets happy to make the sales and unconcerned with broader industry policies. Soon larger market stations were doing the same, while continuing to carry their traditional sustaining mainline religious programs. And gradually the mainline programs disappeared, religion on the air being effectively redefined to mean those denominations willing to pay for their time. Such paid programs often spent much of their time (or so it seemed) seeking donations to help purchase still more airtime.

At the beginning of the 21st century, some stations still provide sustaining time for community or other nonprofit organizations. And stations often provide time for their own special campaigns or public service benefits. But for the past four decades, sustaining time has been seen merely as time not (yet) sold, rather than as a special category in and of itself.

Swing, Raymond Gram 1887–1968

U.S. Radio News Commentator

With his earnest "Good Evening," Raymond Gram Swing introduced one of the most influential political and foreign affairs commentary programs on network and shortwave radio between 1930 and 1963. Within the United States, he developed a reputation as an uncompromising New Dealer and anti-isolationist, and to the largest international audience ever drawn by a newscaster he was considered a faithful friend to

England, a virulent opponent of world fascism, and the "voice of America."

Swing was born in Cortland, New York, on 25 March 1887. In 1906, after spending only one year at Oberlin College, he launched his news career as a reporter for the *Cleveland Press* and a variety of other Midwestern newspapers. He became a foreign correspondent for the *Chicago Daily News* in

1912 and covered many of the principal events leading to World War I. In 1915 he was an eyewitness to the naval battle for Gallipoli. After the war he continued as a newspaperman, but in the 1920s he became fascinated with radio's ability to reach a vast audience and joined a number of other print journalists (Boake Carter, Edwin C. Hill, and others) who changed professional media.

Swing's first experience with broadcasting came in 1930, when he began a series of commentaries on U.S. affairs for the British Broadcasting Corporation (BBC). This series was soon followed by reports on the Geneva Disarmament Conference for the National Broadcasting Company (NBC) and on the London Naval Conference and the British election of 1931 for the Columbia Broadcasting System (CBS). In 1932 Swing helped make radio history when, from London, he participated in the first two-way transatlantic broadcast, with Cesar Saerchinger in New York.

By the end of 1934, Swing had developed a large following on both sides of the Atlantic. His *Things American* broadcasts were especially popular in England, where an estimated 30 percent of adults regularly tuned in. King George VI (who once requested an autographed photo) and Winston Churchill listened faithfully, and "Swing Clubs" were formed in parliament.

In 1935 Swing began a weekly "Behind the Week's Foreign News" feature for CBS's *American School of the Air*. Network executives were impressed by Swing's carefully measured delivery, precise timing, and meticulous and lengthy pre-broadcast preparation, but they felt his voice was uninspiring and his overall microphone presence pedantic and dry. When CBS Vice President Edward Klauber tried to entice him away from the studio with an offer of a position as European director of talks, Swing left the network (transferring the job to a relatively unknown Edward R. Murrow) and began a long association with the Mutual Broadcasting System (MBS). From 1936 to 1938, Swing broadcast every Friday night over MBS's flagship New York station WOR and occasionally spoke over the Canadian Broadcasting Corporation.

By the mid-1930s, Swing became increasingly conscious of the dangers of world fascism. In 1935 he published *Forerunners of American Fascism* and used his broadcasts to alert listeners to the demagogic abuses of Huey Long, Father Charles Coughlin, and Dr. Francis Townsend. In 1937 he urged Britain and France to intervene in the Spanish Civil War and defend the republican government against Franco's paramilitary Falange. In March 1938 Swing condemned the *Anschluss* (Germany's annexation of Austria). He reserved his sharpest criticism for the appeasement of Hitler at Munich in October 1938. Swing's firsthand accounts of the Czech situation for Mutual earned him a National Education Conference on Radio citation and an extra weekly slot in the network's broadcast schedule. At the end of the year, a radio editor's poll identified Swing as the third-most-popular commentator on

Raymond Gram Swing, 30 July 1941

the air. One of the 15 million listeners who now regularly tuned in to him remarked: "Everybody reads the foreign news these days, but very few can fit the myriad events and rumors into a coherent whole. Swing can. With deceptive ease he molds the hodgepodge of reports into a sharply-defined picture of the actual situation at the moment."

The Polish crisis of August 1939 gave Swing another opportunity to distinguish himself. When the Nazis and Soviets signed the non-aggression pact that would seal the fate of Poland, Swing was one of the first newscasters to comment on it. When Poland was invaded in September, Swing illuminated the military situation for listeners three times a day over Mutual's full 110-station network. His most memorable broadcasts were published at the end of the year in *How War Came*. In recognition of his growing appeal, the General Cigar Company offered Swing a contract with complete editorial freedom and limited commercial interruptions.

As the United States moved closer to war in 1940, Swing became an ardent supporter of the Roosevelt administration's interventionist policies. He made no effort, on the air or off, to conceal his anti-isolationist tendencies, and he became a

prominent member of both the pro-war Council for Democracy and the Committee to Defend America by Aiding the Allies. In October 1940 he facilitated America's first peacetime draft by producing several broadcast appeals for the Selective Service. His commentaries in favor of Roosevelt's Destroyers for Bases agreement, Lend-Lease, and other measures to aid Britain against Hitler (even at the risk of the United States' own involvement) were delivered with an almost crusading zeal.

Although most of Swing's 1940-41 newscasts focused on the deteriorating European situation, he also supported Roosevelt's effort to halt Japanese expansion in the Far East through diplomatic and economic pressure. Roosevelt valued Swing's favorable treatment and allowed him to use government-owned shortwave facilities to broadcast daily Spanish and Portuguese translations of his analyses to Latin America. When combined with regular BBC relays of his programs to Australia and the British Commonwealth, this gave Swing the largest international audience of any newscaster (37 million).

The rapid pace of diplomatic and military events after the disaster at Pearl Harbor and the United States' official entry into the conflict ensured the need for serious commentators like Swing who could make sense of the daily flow of communiqués, speeches, and reports from distant battlefields. In 1942 Swing left Mutual and began a four-times-a-week program on NBC Blue for Standard Oil's Socony Vacuum. His 12 April 1945 commentary on Roosevelt's death is considered to be his finest. After the destruction of Hiroshima in August 1945, Swing began to devote considerable airtime to pressing the cause of global interdependence. By the end of the war, Swing was heard on 120 stations and enjoyed a Hooper rating of 14.5, a figure twice as high as the average newscaster and comparable to some of the more popular entertainment programs of the day. His wartime broadcasts and work on behalf of world peace earned him DuPont and Peabody awards and six honorary doctorates.

In 1947 Swing switched to the American Broadcasting Companies (ABC), but within a year declining health compelled him to turn over his thrice-weekly program to Elmer Davis and broadcast only on Sunday. He left the air completely in 1949 but returned briefly for WOR the following year when the United States became embroiled in Korea. In May 1951 Swing retired from commercial radio and became the first political commentator for the Voice of America (VOA). His nightly VOA broadcasts were shortwaved around the world in 36 languages. In 1953 he resigned to protest McCarthyism and served as a writer and editor for Edward R. Murrow's *This I Believe* series. He returned to VOA in 1959 and remained

there until his final retirement in 1963. In 1964 he published his autobiography, "*Good Evening*": *A Professional Memoir*. He died of a heart attack in December 1968.

Syndication

Supplementing Local and Network Sources

Stations have three sources of programming: they can produce programming themselves, receive it from a network, or get it from an outside supplier, called a syndicator. For three decades, syndication provided dramatic series to stations; then, when radio formats changed, syndication provided music-oriented programming. Today, many stations rely on syndication for music and talk programming.

Origins

In the early days of radio, station owners relied on live talent and scratchy-sounding records for programming. The advent of the National Broadcasting Company (NBC) in 1926 and the Columbia Broadcasting System (CBS) in 1927 meant that stations could have access to the top talent in New York City for the production, writing, directing, and performing of programs. (Network programs were delivered to a permanent hookup of stations across the country, which were expected to broadcast the shows simultaneously as they were fed and which were compensated for carrying the programs and their network advertising.) But not all stations could be affiliated to the networks, and not all affiliates were satisfied with network programs and the compensation they received for carrying them.

To meet this demand, shows were distributed on records. The first syndicated radio program is credited to Freeman Gosden and Charles Correll, the creators of *Amos 'n' Andy*. When their series moved to WMAQ, which was owned by the *Chicago Daily News*, they acquired the right to record their program and sell it to other stations. In 1928 the newspaper mailed out the show to 30 stations.

Opposition

Although the idea of stations sharing programs on records seemed logical enough, problems arose. Stations, advertisers, and listeners were reluctant to accept an alternative to live programming. A major difficulty was that records were inferior in sound quality, partly because of the method of recording and partly because of the station's playback equipment. Development of electrical transcription in 1928 helped solve the problem, and stations slowly adopted the playback equipment.

Another problem was that some powerful organizations in the industry had a vested interest in live programming. The American Federation of Musicians insisted that major stations continue to employ staff musicians, even if recorded programming was used. If stations had to pay the salaries,

they might as well use the employees rather than buying a recorded program. As transcriptions became more popular, the union stepped up its opposition. In 1942 the president of the musicians' union ordered his members to cease making transcriptions for broadcast use. The battle between syndicators and the union continued until television made the issue moot.

The radio networks also felt threatened by transcriptions. If a station could order a good-quality series through the mail, then who needed a network? Transcriptions also cut into the networks' revenue. Advertisers paid networks on the basis of the number of stations that aired or "cleared" their programs. If too many affiliates used transcriptions, then the networks would be hurt financially.

Network Option Time

To minimize the competition, NBC set up compensation rates to its affiliates in such a way that the use of recordings and the acceptance of national spot advertising were discouraged. These practices ended in 1941 after a Federal Communications Commission (FCC) investigation created new rules controlling network practices.

Both CBS and NBC required that their affiliates be willing to carry a certain amount of network programming at set times of the day. This practice of "optioning" portions of a station's schedule made the syndicator's job more difficult. Sponsors usually wanted their programs to run at the times when viewing levels were highest, but those were the hours the networks had claimed for themselves. If a station scheduled a syndicated program during those hours, the networks could demand that their own program replace it. Advertisers on syndicated programs had to settle for hours with fewer listeners or for nonaffiliated stations, which were usually less prestigious and had smaller audiences. The FCC tried to end the networks' optioning of their affiliates' time with its Chain Broadcasting Rules in 1941, but this move raised so much opposition that the Commission settled for reducing the amount of time the networks could stake out.

The failure to end option time was not the only reason syndicators complained about the Commission. The FCC insisted that announcers state after each record that the program had been transcribed. Syndicators claimed that the practice made their properties seem inferior to live programming. The rule had originated when recorded programs had poor quality, but despite improvement in recording techniques, the policy continued in effect until after World War II.

Advantages

Despite all of these problems, the syndication industry survived. By 1931, 20 percent of the stations in the United States could play electrical transcriptions, including many higher-powered stations. Syndicators claimed that their product was superior to network product because the listener received the best possible performance, without the mistakes that could happen in live situations. And stations could profit, because there was no network to keep commercial minutes and revenue for itself.

National, regional, and local advertisers found the use of syndicated transcriptions beneficial at times. The national advertiser could use syndication as a substitute for or a supplement to the networks. With a recorded program, a sponsor could reach and pay for only a certain region of the country, if desired. Or a seasonal product could be sold using different approaches in different parts of the country.

Stations usually charged less than the networks, and so the advertiser could get a bargain. For example, the Beech-Nut Packing Company syndicated *Chandu, the Magician* to 15 stations. Had syndication not been an option, the sponsor would have had to pay the networks for a cross-country lineup of stations that it didn't need. For local and regional advertisers, syndication was even more attractive. They could have big-name talent at local costs.

The Depression

By 1931, 75 commercially sponsored programs were available by syndication, an increase of 175 percent over the previous year. The most common syndicated shows were musical variety shows, dance bands, and programs that re-created news events.

The Lone Ranger was created on WXYZ in Detroit and syndicated to other stations. The program's success led to the founding of the Mutual Broadcasting Company, a cooperative network that began with the idea of stations sharing programs among themselves.

But as the Depression deepened, the industry faltered. (Sometimes syndicators would sign up some advertisers based on an audition disc but then go out of business if not enough sponsors were found.) During this period, smaller stations and regional advertisers were the main users of syndicated programs.

Two other organizations also became prominent in the syndication industry, NBC and CBS. Both networks maintained that live programs were better, but they recognized that recorded shows might be useful in some circumstances. NBC entered the field in 1935 with three services: a collection of musical numbers, series produced for syndication, and

recorded series that had run live on the network. CBS followed in 1940.

Frederic Ziv

Perhaps the leading radio syndicator was Frederic Ziv, who began distributing radio programs in 1937 and later went on to syndicate television programs. He had owned an advertising agency in Cincinnati and wanted to create a product his bakery client could use. Once the program was produced, he started selling it to other stations. This first program was a series aimed at children, *The Freshest Thing in Town*.

World War II brought restrictions on the materials used to make electrical transcriptions, but after the war, radio syndication reached its height of popularity, as more stations went on the air and as the networks concentrated their efforts on television. Two of the more popular syndicated programs were produced by Ziv: *Boston Blackie* and *The Cisco Kid*. Stars such as actor Ronald Colman, singer Bing Crosby, and musician Kenny Baker were available on electrical transcriptions. With the advent of audiotape in the United States, syndicators had a new medium for distribution, and they used it mainly for features and short music programs.

By the mid-1950s, syndicators had to deal with the changes in the radio industry wrought by competition from television. Disc jockeys spinning records had replaced network serial programming. At first, stations desperate to maintain their traditional formats turned to the syndicators to provide the old-fashioned programs, but soon half-hour dramas and adventure shows became rare on radio.

Automated Formats

In the late 1950s, syndicators found another niche. They created hours of recorded music with announcements on audiotape and mailed the reels to stations around the country. Music format syndication offered several advantages to the station. It was cheaper and more reliable than the average live disc jockey. For unpopular time periods, late night and weekends, recorded programming could be the difference between profit and loss for a station. The supply of reels meant that even the smallest town could have an announcer with national appeal and a smoothly produced program aimed at a target audience. The main disadvantage was that the automated programming couldn't be localized. Some stations did use a local announcer during some of the programming in a practice called "live assist."

The FCC provided an impetus to the growth of automated radio by declaring in 1964 that FM and AM stations in the larger markets could no longer simulcast (i.e., carry the same programming at the same time). Because AM radio was the

dominant medium at that time, stations scrambled to find programming to put on their FM channels. Automation was a cheap and easy solution.

Other Formats

Other types of programming were also syndicated. In 1968, 300 stations carried a special featuring mythical boxing matches between the all-time best heavyweights. By the mid-1970s, weekly programs were back in style. Successful formats included weekly musical specials, such as the *King Biscuit Flower Hour*, and musical countdowns hosted by Casey Kasem and Dick Clark. *The National Lampoon Radio Hour* and *Dr. Demento* were examples of successful comedies. These programs were carried mainly on weekends.

The mainstay of the industry remained automated programs. The most popular format was “beautiful music,” standard songs done without lyrics and in lush arrangements, usually replete with strings. Other formats, though, such as rock and roll and country/western, were also syndicated. By 1977 almost 1,500 stations were fully automated, and another 1,000 relied at least some of the time on automation. The major syndicators were also expected to act as consultants, providing advice on technical matters, promotion, and advertising, as well as format.

Modern Syndication

In the 1980s, satellites made the delivery of programming cheaper and allowed the added quality of timeliness. Disc jockeys could comment on the day's events. A satellite could send a signal to a subscribing station's computer, which could be programmed with local news, commercials, and weather. Several channels of programming could be sent and received at the same time with no loss of quality. A station could carry some programming from one supplier and easily switch to another supplier on the satellite.

A new market developed as AM radio started to lose its audience to FM. Talk shows distributed by satellite began to be in demand. Call-in shows, such as those of Larry King and Tom Snyder, were popular late at night. In 1988 Rush Limbaugh's show was put into syndication for the daytime audience and became successful enough to attract imitators such as Howard Stern and Don Imus. Other types of talkers joined in the competition with topics such as sports, psychological advice, and business information.

Syndicators increased their use of satellites as the cost of equipment went down and as compression technology allowed them to squeeze more signals onto one transponder. The difference between them and networks blurred. Syndicators offered simultaneous delivery of signals to affiliates across the country

via satellite, just as networks did, and the type of programming was the same. Traditional networks and syndicators became part of the same companies, as mergers and buyouts led to industry consolidation. Networks didn't always provide compensation, and both industries offered similar formats.

By 2000 the two most successful syndicated radio formats remain the talk show and automated programming delivered by satellite, tape, or disc. With the aid of a computer and the satellite, the syndicator can provide announcing, music, and cues for commercials, local news, and weather. This type of service had existed before but was delivered on tape to the station and was therefore not as versatile. For some markets, the national announcer records local announcements, which can be inserted smoothly into the program. Short features with medical advice, interviews with stars, and David Letterman's top 10 list are also syndicated.

Syndicated programming can be purchased outright, or the sale may involve barter or a combination of the two (cash plus barter). Some form of barter is the most common method: The producer sells some commercial minutes in the program but leaves time for the station to sell others. In other words, the station trades time for a free program or one with a reduced price. If cash is involved, the cost of the program will depend on the size of the market, its competitiveness, and the station's revenues.

Syndication should remain an important part of the industry. Because syndication of music formats is a cost-effective method of delivering programming, station group owners may rely more on it especially for their weaker outlets.

T

Taishoff, Sol 1904–1982

U.S. Editor and Publisher

For more than a half century, Sol Taishoff was a leader in radio's trade press as editor and publisher of *Broadcasting*, its most important weekly magazine. Based in Washington, D.C., the trade periodical reported important government (Federal Radio Commission, Federal Communications Commission, Congressional) decisions concerning radio. For 51 years, first as co-founder of the magazine in 1931, and then as the sole owner, Taishoff chronicled radio's spectacular growth. Through the 1940s, Taishoff also began reporting the early development of television and, to the chagrin of some radio station owners, renamed the magazine *Broadcasting-Telecasting* in 1950, before many Americans could even view the new medium. In the 1960s, cable television became part of Taishoff's beat, as did satellite distribution in the 1970s.

Through all of radio's growth and change, Taishoff became as much a part of the industry he covered as the network and station executives who bought and read the weekly *Broadcasting*. He even fit the mold of the typical broadcasting executive: he was personable, could tell a good story, and made friends easily. He walked a fine line: he was both a highly respected journalist and a beloved friend to hundreds in the American broadcasting community. In 1981 more than 1,200 people attended a banquet held to mark *Broadcasting's* 50th anniversary, and then-President Ronald Reagan, a former WHO-AM sportscaster, lauded (via tape) Sol Taishoff's considerable talents and accomplishments.

Origins

Born in Minsk in Czarist Russia in 1904, Sol Taishoff immigrated to the United States when he was three years old. His family settled in Washington, D.C., where Taishoff lived and worked for the rest of his life. He dropped out of the city's Business High School when he was 16 to become a night-shift copy boy for the Associated Press. After leaving the Associated

Press in 1926, Taishoff continued his journalism career by joining the original staff of David Lawrence's *United States Daily* (which became *U.S. News and World Report*).

Although he had occasionally written about radio while with the Associated Press, by the late 1920s radio had become Taishoff's entire beat. At that time, David Lawrence also owned a wire service called the Consolidated Press Association, and for his radio writings Taishoff used the pseudonym "Robert Mack." His predecessor as "Robert Mack" had been Martin Codel, who had moved on to work for a competing news wire. Taishoff and Codel had become friendly during their time with Lawrence and had often spoken of radio's need for a trade publication, its own version of the newspaper industry's *Editor and Publisher*. Taishoff and Codel raised barely enough capital to get their venture off the ground, and in October 1931 the Washington, D.C.-based *Broadcasting* was born as a biweekly publication. The FCC was established in 1934, forming one of Taishoff and Codel's key newsbeats.

Although 1931 was not viewed as an auspicious time to start any new business, Taishoff and Codel persevered and soon established their magazine as the bible of the fledgling industry. At first the battle was to stay afloat, so Taishoff and Codel met with some of their subscribers and advertisers and granted discounts to those who would pay in advance. In 1935 they issued the first *Broadcasting Yearbook*, a substantial directory of stations, networks, and related radio services. It continued to appear annually into the 21st century.

But in time, Taishoff and Codel disagreed about the magazine's direction, and after Codel went on leave in January 1943 to work for the Red Cross as director of information for the African Combat Area, he never returned to the magazine. Taishoff bought him out a year later and thereafter ran the magazine solely and completely. (Codel went on to create a rival publication, *Television Digest*, in 1945.)

So closely did Taishoff come to be associated with *Broadcasting* that network and station executives talked of placing ads in "Sol's magazine." In his many years at the helm of the magazine, Taishoff exhibited an editorial stance fundamentally in favor of free enterprise, opposing any proposal that might interfere with the free workings of the marketplace, including public broadcasting. He strongly advocated First Amendment rights for radio broadcasters, arguing consistently for freedom from government regulation and control.

But Taishoff knew that his magazine's strength lay in covering the Washington political scene, and he kept his subscribers well informed on any issue or proposal that could affect their interests. He made friends with FCC commissioners and politicians of both parties and became an unofficial adviser on communications policy to many of them, including several presidents. He was perhaps closest to Lyndon Johnson, whom he met when Johnson arrived in Washington as a congressional staffer in 1931. In the 1940s, when Johnson himself was in Congress, Lady Bird Johnson came into an inheritance. The story goes that Johnson was considering buying a newspaper, but Taishoff advised them to invest in an Austin, Texas, radio station. The future president protested that the station was not making any money, but Taishoff assured him radio was where large profits lay. He was, of course, right. And in time, the Texas Broadcasting Company, as it came to be known, owned, at least in part, nine radio and television stations and made Lyndon Johnson a multimillionaire (the licenses were always listed in Lady Bird's name).

At the end of his career, the broadcasting industry lauded Taishoff by presenting him with a George Foster Peabody Award and naming him the National Association of Broadcasters "Man of the Year." Though he slowed down during the 1970s, Taishoff never stopped working. Indeed, the last piece of copy to bear his name was written just weeks before his death in 1982.

The magazine lived on, first under Taishoff's son Larry, who sold the publication and its Washington headquarters in 1986 to Times Mirror, which in turn sold *Broadcasting* to Reed International in 1991. The magazine was part of the Cahners Business Information empire (as *Broadcasting and Cable*) and was published in New York, no longer from Washington, as the 21st century began.

Talent Raids

In 1948 Columbia Broadcasting System (CBS) Chairman William S. Paley initiated a raid on the National Broadcasting Company's (NBC) top radio talent in order to compete with the better-fortified network. This bold move changed the balance of power in radio and affected key programming strategies in radio and later in television.

Background

Throughout the 1930s and much of the 1940s, NBC reigned as the dominant radio network. NBC had the financial backing of a wealthy corporate parent in the Radio Corporation of America (RCA), boasted a larger number of affiliated stations than

CBS, and had a popular roster of vaudeville-trained comedians. CBS initially tried to even the standings in the mid-1930s by capturing some of NBC's key affiliated stations. Paley also went after some of NBC's talent in 1936, luring such stars as Al Jolson and Major Edward Bowes over to the smaller network. NBC was angered by these maneuvers, particularly because the network thought it had an unwritten agreement with CBS not to participate in such raids. But given CBS's inferior position in the industry, Paley insisted it was the only way he could reasonably compete. NBC battled back heartily, winning back some of its stars and stations.

Thus, after World War II, CBS was still a distant number two. Dissatisfied that his previous coup attempts had failed, Paley began outlining a new strategy. Lew Wasserman and Taft Schreiber of MCA, the mammoth talent agency, ultimately helped lead Paley to a crafty solution in 1948, during a lunch date with CBS President Frank Stanton. MCA represented Freeman Gosden and Charles Correll, the stars of *Amos 'n' Andy*, and Wasserman offered the popular NBC actors to Paley along with a unique financial arrangement. Stars certainly earned a high salary at NBC (Jack Benny reportedly earned \$12,000 a week), but this placed them within a very high income-tax bracket, and they were taxed at a rate as high as 77 percent. Wasserman and Paley thus devised a scheme wherein Gosden and Correll would incorporate, with CBS purchasing the resulting company and its assets, namely the characters and scripts for the shows. The money that CBS subsequently paid out to Gosden and Correll could thus be considered a capital gain, taxed at the considerably lower rate of 25 percent. Moreover, because CBS would now own the properties and names themselves, NBC would not be able to lure its talent back as easily as it did after Paley's first talent raids in the late 1930s.

The Raids

With Gosden and Correll signed, Paley next set his sights on Jack Benny, with Wasserman again brokering the deal. But because Benny and other NBC comedians went by their own names, rather than playing characters as did Gosden and Correll, it was initially unclear if they could legally incorporate their names for CBS to purchase. As a result, when Paley cemented a deal with Benny, the Internal Revenue Service challenged it in federal court. Though the Supreme Court did declare the maneuver legal in 1949, a more immediate obstacle came from Benny's sponsor, the American Tobacco Company, and his corresponding advertising agency, Batton, Barton, Durstine, and Osborn (BBD&O). Benny had a long-term contract with these companies, and they initially objected to the move to CBS, expecting a decline in Benny's ratings, if only because CBS had fewer affiliated stations. BBD&O thus vigorously complained to NBC about the decision to let go of Benny. NBC responded with a major counteroffer to Benny,

totaling twice the value of CBS's offer. However, Lew Wasserman again intervened, obtained the NBC contract, changed every mention of NBC to CBS, and reoffered the deal to Benny, who then signed it. Reportedly, the personal attention given to Benny by CBS executives was enough to provide the deciding factor—Benny was continually insulted by the impersonal atmosphere of NBC and had reportedly never even met David Sarnoff, the head of the network's parent firm, RCA.

To counteract the sponsor's concerns about NBC's greater number of affiliates, Paley went to the unprecedented length of offering American Tobacco \$3,000 for every rating point that Benny fell below his usual NBC total. Such a drastic move proved that CBS was not planning to merely buy out NBC's talent, but hoped to surpass NBC's success with this same talent. The deal was finally cemented in November 1948, despite the legal uncertainties at that point, and CBS bought Benny's company, Amusement Enterprises, for \$2.26 million. Benny's CBS ratings were initially stellar, and despite a ratings decline shortly thereafter, Paley was pleased that he finally had a strategy in place to battle NBC. Bing Crosby, Red Skelton, Edgar Bergen, and George Burns and Gracie Allen were the next NBC stars to head to CBS.

Surprisingly, NBC and Sarnoff had little reaction to this continued upheaval. Some historians simply credit Sarnoff's arrogance for ignoring CBS's moves, and others highlight Sarnoff's belief that paying a performer so much money would set a dangerous precedent, resulting in a system that would give performers too much power over their network bosses. Whatever the reason for NBC's lack of a countermove, these events had the potential to devastate the network's industry standing. Indeed, by the end of 1949, CBS would tout 12 of the top 15 radio shows. But the emergence of television altered the playing field once again, and now both networks had to try out new strategies for the developing visual medium.

The success of its new talent did give CBS a profit infusion that helped launch the company into television. Lacking the benefit of a deep-pocketed corporate parent like RCA, CBS desperately needed such capital for its first steps into television. Additionally, CBS not only captured the radio ratings lead in 1949, but held onto that lead right into television and for the next 25 years. Finally, the talent raids related to a crucial industry strategy of developing and scheduling network-owned programming. Such direct connections with talent gave the network more control over their program decisions, rather than sponsors and advertising agencies making these decisions. This would prove to be a key difference between television and radio programming structures. In the end, an initial investment of less than \$6 million brought huge benefits—the talent raid nearly eradicated NBC's top line-up of stars, brought CBS to equal status with NBC, and foretold of both networks' coming supremacy in television.

Talent Shows

American radio in its earliest days was similar to an amateur hour, in that early performers were all volunteers, many of whom had great enthusiasm but minimal talent. As radio matured during the 1920s, more selective criteria for getting on the air were established, and that usually meant passing an audition. Local radio shows made a contest out of it—so-called *opportunity nights*, when those who envisioned themselves as tomorrow's radio stars could perform, and listeners voted by sending in postcards. Prizes were not very big, but the thrill of winning seemed to suffice.

Popular network talent shows had higher standards since performers would be heard by a national audience. The biggest shows held several rounds of auditions. To appear on *Roxy and His Gang*, would-be talent first auditioned for “Roxy” himself (Samuel Rothafel); he decided which amateurs would compete on the show. Some network programs also involved sponsors or advertising agencies in the decision-making process; because the money was coming from them, it seemed prudent to consider their input.

A successful show could be quite lucrative for its stars: in 1936, for example, Eddie Cantor was paid \$10,000 a week by his sponsor, Texaco gasoline. George Burns and Gracie Allen made the same amount from their sponsor, Grape-Nuts Cereal. And topping the list was the \$25,000 a week paid by Chrysler Motor Corporation to Major Edward Bowes. It is no wonder, with the media writing about these big salaries, that the average person dreamed of winning a talent show and becoming a network celebrity.

Radio talent shows became a national craze during the 1930s; with so many people out of work because of the Depression, the idea of striking it rich in radio was especially compelling. One network show that capitalized on this hope was *National Amateur Night*, which ran on the Columbia

Broadcasting System (CBS) from December 1934 to December 1936. But thanks to its popular master of ceremonies, it was *Major Bowes' Original Amateur Hour* that would capture the largest audience. Major Edward Bowes (he had earned the rank of major in an obscure Reserve unit during World War I) had started out as a master of ceremonies for *Roxy and His Gang* at the Capitol Theatre in the mid-1920s. A few years later, while he was manager of New York radio station WHN, Bowes and two producers developed a new concept for a talent show: broadcast historian John Dunning (1998) explains that, unlike other shows, in which the master of ceremonies made fun of the contestants, “Bowes saw the amateur hour in terms of a prize fight. The amateurs were the combatants. . . . The bell between rounds [would be] utilized . . . to dismiss an amateur who wasn't making it. The gong was like sudden death, like the hook in the rough-and-tumble days of amateur nights in vaudeville. . . . its presence . . . add[ed] another element of suspense.”

Major Bowes' Original Amateur Hour debuted on the National Broadcasting Company (NBC) radio network in late March of 1935, sponsored by Chase and Sanborn coffee. The show was an immediate sensation, both in its ratings and in the number of would-be participants. At its highest point, it was receiving more than 10,000 applications a week for the 20 available slots on the program. The show's opening lines—“the wheel of fortune goes round and round, and where she stops, nobody knows”—became an American catchphrase. But *Major Bowes' Original Amateur Hour* also attracted controversy, with critics questioning how honest the voting process was (people called in to vote for their favorite amateur, leading to charges that a sponsor or any amateur with a lot of friends could easily manipulate the totals) and whether Bowes decided on the winners in advance. And although the show did get

huge ratings for a while, it resulted in the discovery of very few major stars—opera star Beverly Sills and crooner Frank Sinatra were the best known of the winners. (Some critics have also suggested that the idea for Major Bowes' program really came from comedian Fred Allen, who did a forerunner of the amateur hour in 1934 as a segment of his NBC show *Town Hall Tonight*.)

Another show that gave amateurs a chance at fame and fortune was *Arthur Godfrey's Talent Scouts*, which started in early July 1946 on CBS Radio and went on TV in 1948. Godfrey, who was also the master of ceremonies of a successful variety show, *Arthur Godfrey Time*, had a special reason for creating *Talent Scouts*. Unlike other talent shows, Godfrey did not give winners cash prizes or gong losers off the stage. Rather, he gave contestants the chance to graduate from *Talent Scouts* and become regular performers on *Arthur Godfrey Time*, a top-rated radio show that would be equally successful on television. Several *Talent Scouts* winners not only joined the "Little Godfreys" on *Arthur Godfrey Time*, but later had their own hit records on radio. Two of the best examples were the McGuire Sisters, whose song "Sincerely" went to number one on the U.S. pop charts in 1955, and the Chordettes, who had

three top five songs during the mid-1950s. On the other hand, sometimes Godfrey got it wrong; among those who failed his audition was Elvis Presley.

One other network talent show with appeal was bandleader Horace Heidt's *Youth Opportunity Program*, heard on Sunday nights from 1947 to 1951. But by the early 1950s, most radio talent shows had moved to TV (where a few can still be found). And although the odds of becoming the next big celebrity are very small, the thrill of competing and the chance to get on the air still motivate people to come to auditions, hoping that this time the wheel of fortune will stop for them.

Talk of the Nation

Public Radio Call-In Program

Talk of the Nation is a two-hour radio show combining the news experience of National Public Radio (NPR) and the participation of call-in listeners from across the country. For the first four days of the week, the *Talk of the Nation* host (Neal Conan beginning late 2001) discusses a variety of national issues, while on Friday Ira Flatow hosts *Talk of the Nation Science Friday*. As stated by former host Ray Suarez, NPR designed the show to be "a news program that would bring in a caller who really wanted to understand better all the hanging questions out there." Although the show premiered in only nine markets, the midday voice of NPR News and NPR Talk, airing 2 P.M. eastern standard time (EST), boasted more than 2 million listeners from over 150 markets nationwide by 2001. The show has won several honors including the 1993 Corporation for Public Broadcasting Silver Award.

U.S. President Bill Clinton's presidential pardons in early 2001, U.S. international policies, environmental issues, school privatization, the economics of baseball, and international slavery are examples of the topics broached on *Talk of the*

Nation. Jesse Jackson, Stephen King, Ralph Nader, Christopher Darden, Walter Mondale, and Yogi Berra all have graced *Talk of the Nation* as guests. As described by Suarez, "It's not a prissy, pointy-headed intellectual show, but we do give the audience a great deal of credit for being intelligent and literate, and they never let us down."

Originally hosted by John Hockenberry, *Talk of the Nation* began as a series of special call-in shows during the 1990–91 Gulf War and the Soviet coup. These shows received enough interest that they became a permanent addition to NPR on 4 November 1991. After approximately nine months with the show, Hockenberry departed to become an ABC news correspondent, and although Robert Siegel took over as interim host, it was Brooklyn-born Ray Suarez who took the torch from Hockenberry. Suarez remained the host for the next seven years and received two awards for journalistic excellence while watching the program's audience double. Specifically, during Suarez's tenure the program won the prestigious Alfred I. duPont-Columbia Silver Baton Award in 1994–95 for "The

Changing of the Guard: The Republican Revolution” and for NPR’s coverage of the first 100 days of the 104th Congress; the program also won the 1993–94 duPont-Columbia Silver Baton Award for part of NPR’s coverage of the South African elections. Suarez has been described by the Copley News Service as a highly intelligent navigator with “the compelling magic of intimacy spun from intense conversations while maintaining his professional distance.” Suarez won honors from the *Los Angeles Times*, which listed him as one of “100 People to watch 1996.”

By 2000 Suarez followed the path of the host he replaced when he too left *Talk of the Nation* for *The Newshour with Jim Lehrer*. At the end of February 2000, Emmy-award winning writer and reporter Juan Williams replaced Suarez. Williams, who has described radio as “the temperature of our times,” and executive producer Greg Allen, took *Talk of the Nation* on the road as part of the continuing series “The Changing Face of America.” The series, which debuted in February 2000 in Austin, Texas, travels cross-country on the final Thursday of every month and puts forth a nationally broadcast live town hall meeting. As described by the host, the goal is rather straightforward: “to paint a picture of America at the turn of the century.” For example, this format took *Talk of the Nation* to Indiana to look at small-town life and to Los Angeles to look at spirituality. The attitude of the show and its host was described quite eloquently by Williams:

Talk radio has been boiled down to the point where people tune in to have their prejudices confirmed. . . . The host drives the show by being intentionally provocative and taking very strong views intended to polarize the audience. You tune in to try to see what [outrageous thing] this guy is going to say today, or you tune in to hear him say what you believe but have never articulated. . . . I want people to tune in to *Talk of the Nation* because they want to know what’s going on and want to have a full understanding of the arguments that people are making around the country and the different perspectives. . . . Hearing other people talk about the way they see American life today—that’s energizing to me. And if I work as the host of the show, it will be energizing to the audience as well (*Minneapolis Star Tribune*, 1 March 2000).

Talk of the Nation has been described by one newspaper as “talk radio at its zenith, a rare quasar of civility and intelligence in the usually rabid world of boom box shriek and shout” (South Florida *Sun-Sentinel*), and the San Diego *Union-Tribune* stated, “In the argumentative archipelago of talk radio, *Talk of the Nation* is an island of civility”; however, the executive producer Allen may have said it best: “The main thing is we want a good talk show. . . . That’s what we’re there for.”

Talk Radio

Talk radio (sometimes referred to as All Talk) is a general term covering many closely related types of radio programs that do not focus on music or narrative comedy or drama. Most common are interview and call-in programs. Nearly all rely on a host, often a highly opinionated one. Some of the earliest talk programs in the 1920s and 1930s got station licenses in trouble for being one-sided. By the 1990s such polemical radio was common and widely popular. Talk programs today range from serious and balanced discussion of public affairs to scandal-studded rhetoric offering far more heat than light.

By the early 21st century, talk radio had become one of the most popular formats. More than 700 of the 12,000-plus radio stations in the United States identified their program format as talk. An additional 525 were in the hybrid category news/talk. Talk Radio tends to be found mostly on commercial AM stations, but it is starting to expand to FM outlets as well. The talk format is generally a mix of interviews and call-in programs frequently hosted by one or more personalities. Content ranges from information to politics to “shock” radio characterized by sexual innuendo and the flouting of social conventions. Many talk show hosts are as famous for the audiences they offend as for those they entertain and attract. News-talk became the generic radio industry term for all stations that carry both news and talk programming. The phrase *talk radio* includes the news-talk format as well as formats that rely on all-conversation programming.

Origins

Legendary Boston talk host Jerry Williams claimed he invented talk radio in 1950 when he worked at an obscure station in Camden, New Jersey, hosting a show called *What's on Your Mind?*

Actually, the form was developed—not as a radio format, but as individual programs—two decades before Williams' arrival. His may have been the first radio show to take calls, but he was hardly the first talker. As early as the 1930s, columnist Walter Winchell and Father Charles Coughlin were sowing the seeds of what would become talk radio. During the following decade, Arthur Godfrey mixed interviews and chat with his musical guests on *Arthur Godfrey Time*, and Don McNeill introduced regular talk segments on his *Breakfast Club* broadcasts from Chicago in the early 1950s.

Talk shows (including Williams' show in Camden) became familiar to listeners in the 1950s as music stations devoted time to discussion of local issues. Most were interview programs, although some stations devoted hours during evenings or overnight to call-in shows. Technology did not allow the protection of a delay system to delete objectionable phone

calls. Many station operators avoided airing calls live, and often the host would repeat or paraphrase what a caller said. The motivation behind most early talk programming was to satisfy public affairs requirements as specified in licenses granted by the Federal Communications Commission (FCC).

KLIQ in Portland, Oregon, debuted a format described as All Talk in 1959. *Broadcasting* magazine headlined the story with the words “Talk, Talk, Talk” and called it “Top 30” because the station used 30 different announcers. The new format was a mix of news and talk. Twenty-five minutes of every hour were devoted to a “topic of the day” that listeners called in to discuss. Under special agreement, reporter-announcers read items from 15 national magazines from two to ten days prior to their publication. Taped interviews by British Broadcasting Corporation correspondents in England and Europe were sent daily by plane and aired in three-minute segments.

The term *talk station* came into being when KABC in Los Angeles discarded its music format in 1960 and filled its 24-hour day with talk shows. The station was originally promoted as “The Conversation Station.” A four-hour news and conversation program was instituted from 5:00 A.M. until 9:00 A.M. using the title *News-Talk*. Not long afterward, KABC's sister station, KGO in San Francisco, adopted the phrase *News-Talk* as a positioning slogan because it carried news blocks in morning and afternoon drive-time periods with talk shows in between.

Listeners searching for something other than music could tune in Jean Shepherd and other hosts on WOR in the New York area. *Sponsor* magazine trumpeted the advertising and audience successes of WOR's talk radio formula early in 1964. With ratings among the highest in the New York metropolitan area, WOR was grossing \$7 million annually. *Sponsor* cited WOR's success as reasons for shifts to talk by WNA Boston, KABC Los Angeles, KMOX St. Louis, and WNBC New York to WOR's success.

The success of early talk formats led to increased industry interest. In May 1965 the National Association of Broadcasters (NAB) featured talk radio at a Chicago programming clinic for program and management executives. The 125 slots quickly filled, and 75 broadcasters who wished to attend were turned away.

Pioneering Talk Hosts

One of the first stars of the new talk radio medium was Joe Pyne, who first appeared on another Los Angeles station that abandoned its music format in the early 1960s—KLAC. Pyne's reputation was built on his style of verbal bombast against almost everyone, guest and caller alike, leading pundits to call his brand of talk “insult radio” because his callers risked verbal

skewering (“Look lady, every time you open your mouth to speak, nothing but garbage falls out!”). Pyne’s listeners were generally delighted. Pyne had no philosophical leaning except to the contrary. He established the habit of hanging up the phone on callers he disagreed with, a habit later adopted by talk hosts seeking to create the reputation of firebrand.

Pyne achieved some national notoriety, primarily through a short-lived television show. His radio work was not syndicated because technology at that time was too expensive to link stations not already affiliated with one of the three major networks. During a stint at KABC, Pyne took controversy to new heights as a rabid and vocal hater of President John Kennedy. When the president was assassinated in 1963, Pyne was pulled off the air. His exile created opportunity for another KABC host, Bob Grant, who was assigned Pyne’s slot during the hiatus.

In 1970 Grant moved to New York and created a name for himself by creating his own brand of controversy. Grant said what he felt, and his comments were often explicitly racist. He held forth for many years at WABC, New York, generally defended by station management as “misunderstood.” When black activists picketed WABC after race-baiting by Grant, a WABC spokesman said, “He is extremely angry with rioters and criminals, period. If critics want to say that means blacks, that’s their problem.”

When the Walt Disney Company acquired WABC with the rest of the ABC Network properties, the tone of management changed. Grant’s remarks after the death of Commerce Secretary Ron Brown in a plane crash proved too much for Disney, who yielded to public outcry and pulled Grant off the air. His absence was short-lived, since New York’s WOR hastily made a place for Grant on their schedule and on their WOR Network.

Jerry Williams moved to Boston in 1957 where he sought out topics controversial enough to create talk about him and his show. He was one of very few media people to interview Malcolm X, and Williams took pride in announcing that the Boston TV stations and newspapers did not offer coverage to the black leader. For a brief period in the mid 1960s, Williams moved his show to Chicago and WBBM, where he would pit blacks against whites on the air to, in his words, “start a dialog.” The result was often more of a fight. He returned to Boston in 1972, where he became a talk radio fixture until his death in 2003.

New York’s Barry Gray was the longest running talk host on radio. He began as a celebrity interviewer in the mid-1940s and was still going strong when he died in 1996. For most of his career Gray was at WMCA in the overnight slot.

Evolution of the Host

Early talk radio was compared to broadcast journalism, but with the added pressures of live radio. As talk radio programmer Bruce Marr wrote:

Management has to acknowledge that the members of the on-the-air team have their own biases and leave them free to express their stands on the issues being discussed. . . . This philosophy has grown slowly from the understanding that it is fruitless to ask on-air personalities to be unbiased. They are often investigators, sometimes advocates, and biases are doubtless part of their stock-in-trade.

There is structure in the talk show, but there is also enough fluidity for a host to change subjects and reflect the mood and interest of the audience. When an issue or news event is significant enough to capture the attention and interest of the listeners, the talk station changes subjects to respond. Thus a school shooting, a political scandal, or other “hot button” topics could prompt a talk station to abandon a pre-set list of guests or topics and take free-wheeling conversation about the topic at hand.

The most memorable talk hosts have been those whose political leanings are hardly the stuff of balanced journalism. By and large, talk radio is politically conservative. Those attempts at presenting liberal or left-leaning programming have been able to attract only a fraction of the audience that more conservative hosts can attract. The most notable experiment with a liberal bias on a talk station was at KFSO in San Francisco. The programming was dropped after a few months in favor of a lineup that included conservatives Pat Buchanan and Michael Reagan.

Former Texas Agriculture Commissioner Jim Hightower, a talk host syndicated at one time by ABC Radio, explains talk radio’s conservatism this way:

What happened is the progressive side forgot radio. My generation looked to television and mass demonstrations and other ways of communicating, whereas the conservatives—Ronald Reagan, Paul Harvey—hung in there and continued to build an audience. Now it’s just follow the leader. People look across the street and say, “If that sucker is doing well with a conservative, that’s what I need, too.”

The rise of talk radio has been accompanied by an equally dramatic rise in harsh rhetoric under the guise of political opinion. The combination is often a breeding ground for what Peter Laufer called “hate, scapegoating and stereotyping” in his book, *Inside Talk Radio*. “The talk show demagogues are adept at manipulating anger and turning righteous resentment into fearful hatred of the oppressed,” Laufer writes.

In *Hot Air*, Howard Kurtz says that the way to get attention in talk radio is “to shout, to polarize, to ridicule, to condemn, to corral the most outrageous or vilified guests.” Kurtz points out that when White House chief of staff Leon Panetta wanted

to attack House Speaker Newt Gingrich, he accused Gingrich of acting like “an out-of-control radio talk show host.”

Scrappy and Intimate

In an era of blow-dried TV anchors, homogenized sitcoms and cookie-cutter Hollywood sequels, talk radio stands out as unpredictable. It is less politically correct than mass television. “It’s more scrappy,” said John Mainelli, the programmer who built WABC into a 1990s talk powerhouse. “It’s also more intimate because it’s radio,” he said. That intimacy allowed Boston talk host David Brudnoy the permission to let his audience know that he was gay and that he had AIDS. There was a tremendous outpouring of affection from long time WBZ listeners who heard Brudnoy’s late night program in 38 states. A number of listeners told Brudnoy that his confession had moved them to tell their own families that they, too, had the AIDS virus. As Brudnoy explained it, “Talk Radio is the last neighborhood in town. People know their talk hosts better than they know the person who lives next to them.”

Technology and New Networks

In its early days, talk radio was expensive to produce. In addition to a skilled host, the station had to pay a producer, programmer, and engineer. A researcher was also a necessity. Much of talk radio consisted of interviews, easy enough to do over telephone lines, but long-distance charges could be substantial. To make talk radio a success, the stations needed the vast audience provided by large, urban areas. In the 1960s and 1970s it was nearly impossible to make talk a successful format in anything but a large market. It took technological innovation to make talk radio financially feasible.

Chief among the technical factors underlying talk radio as a mass format was the growing commercial success and expansion of FM radio in the 1970s. By 1977, a generation had grown up with their radios tuned as much to FM as to AM. Broadcasters who owned AM stations developed a strategy of counter-programming to retain audience. Some shifted their programming from music to the spoken word, as KABC and KGO had done a decade and a half earlier. The counter to music programming on FM gave rise to information programming.

Satellite technology gave syndicators the type of access to local stations that only networks had enjoyed previously. Initially, syndicated programs were sent via telephone lines at great expense. By the late 1970s geosynchronous satellites made it possible to distribute radio shows nationwide at a relatively reasonable cost, giving the radio program a national audience of simultaneous listeners. That gave rise to ABC Talkradio, featuring hosts from various ABC-owned talk stations. Host Michael Jackson’s mellow Australian accent was networked from ABC’s KABC in Los Angeles, as was Ira Fis-

tell’s daily program. From San Francisco’s KGO came Dr. Dean Edell’s medical advice and a general interest talk show with Ronn Owens.

The importance of the telephone caller led to improvements in on-air telephone systems. Nationally syndicated talk shows today use phone systems that handle more than 30 incoming lines. Special automatic gain-control devices compensate for the different levels and sound qualities of the callers’ telephones. Specially designed computer software allows the producer and the show host to communicate with one another. Sitting in different rooms, the producer and host can both see on screen the caller’s name and location and the topic of interest he or she called to discuss. More advanced versions can create a caller database that can include telephone number, address, regular topic of interest, occupation, birthday, and zip code. The information is available for the host the next time the listener calls. It can also be used for the radio station’s marketing purposes.

Technology also fueled NBC’s Talknet, where Bruce Williams answered financial and legal questions in an understanding, fatherly manner. If Williams was father, Sally Jesse Raphael was mother, offering personal advice and relationship counseling. New York personality Bernard Meltzer sounded like a loving grandfather presenting general interest topics. The family doctor was Harvey Rubin, who conducted a daily health program.

New York’s WOR Radio, long a leader in talk programming in its own city, used satellite technology to deliver its talk shows to a national audience. Former libertarian candidate Gene Burns, money advisers Ken and Daria Dolan, psychologist Dr. Joy Brown, and others talked about issues that transcended New York. When WOR moved conservative host Bob Grant from rival WABC, he was added to the daily syndication schedule. Comedienne Joan Rivers joined the WOR Network in 1997.

Westwood One Radio Networks inherited the original talk programming of Mutual Radio in a series of mergers that ultimately put Westwood in the CBS family. Once the home of Larry King’s overnight talk show, Westwood moved King to afternoons in order to increase his audience. Replacing King overnight was Jim Bohannon, who was the usual replacement when King was on vacation. King’s move to afternoons proved unsuccessful, but Bohannon’s installation in the overnight chair was a long-term proposition.

Westwood also carried the *Tom Leykis Show* from Los Angeles, the *G. Gordon Liddy Show* from Washington, and *Imus in the Morning* with long-time New York funnyman and curmudgeon Don Imus. Westwood’s parent company, Infinity Broadcasting, a division of Viacom after its merger with CBS, also syndicated “shock jock” Howard Stern.

Stern is not a talk host per se, but his program abandoned music in favor of free-wheeling conversation often centered on

Stern and his private parts. Stern's program was seldom heard on talk stations; his affiliates were primarily rock music outlets. As one station manager described it, "Stern says what The Who used to sing." That statement reinforces the rock context of Stern's unpredictable broadcasts. In Los Angeles, Stern's program appeared on KSLX, one of a few talk stations on the FM band. In presenting Stern's and other hosts' shows to advertisers, however, KSLX account executives compared them to personalities on rock stations, not to traditional talk personalities such as Rush Limbaugh.

Other syndicators found success as consolidated radio companies attempted to cut expenses. A fledgling network called American View presented host Ken Hamblin. Known as "the Black Avenger," Hamblin was one of only two nationally known black conservative talk hosts in the late 1990s (the other was 2000 presidential candidate Alan Keyes). Cox Radio, owner of several news and talk stations, syndicated hosts Neal Boortz and Clark Howard from WSB in Atlanta for their own stations and others outside the Cox fold. Former WABC host Mike Gallagher created his own network and fed *The Mike Gallagher Show* to more than 200 stations. Jones Radio Networks, best known for long-form music programming, entered the talk field with several programs.

Exponential Growth

Talk radio's growth through the 1990s was fueled by Rush Limbaugh and the network built around the host by entrepreneur Edward F. McLaughlin. A former ABC Radio executive who had been Vice President and General Manager of KGO, McLaughlin rose to the presidency of the ABC Radio Networks in 1972, a position he held through 1986. In 1987, McLaughlin retired from the network and packaged Limbaugh, then a local Sacramento personality, and KGO's Edell into a fledgling syndication company. Officially called EFM Media (for McLaughlin's initials) the network was known publicly as the "EIB Network" because of Limbaugh's boastful catch phrase, "Excellence in Broadcasting." In 1997, EFM's assets, including *The Rush Limbaugh Show*, *The Dr. Dean Edell Show*, and the monthly publication *The Limbaugh Letter*, were sold to Jacor Communications and its Premiere Radio Networks. Both Jacor and Premiere were ultimately acquired by Clear Channel Communications.

Premiere began as a syndicator of short-form programming for music stations and developed through mergers and acquisitions into the leading provider of talk radio programming based on sheer numbers of shows. Premiere would ultimately be home to Limbaugh, Dr. Laura Schlessinger, UFO-chaser and expert in the paranormal Art Bell, sports personality Jim Rome, Michael Reagan, Edell, internet publisher Matt Drudge, and Los Angeles satirist Phil Hendrie. Because Premiere was acquired in 1999 by Clear Channel, that company was able to

leverage key Premiere talents onto Clear Channel-owned news and talk stations.

Deregulation

If technology was one parent of talk radio, deregulation was the other. For 42 years, radio and television were ruled by the Fairness Doctrine, which required stations to broadcast opposing views on public issues. The Fairness Doctrine was born in 1949 in response to a court case involving the owner of powerful radio stations in Los Angeles, Detroit, and Cleveland, and an early organization of professional newspeople. The newspeople charged the licensee with slanting news on his radio stations.

The doctrine ordered stations to work in the public interest and guarantee equal time for disparate viewpoints. The FCC decided that, contrary to its stated purpose, the Fairness Doctrine failed to encourage the discussion of more controversial issues. There were also concerns that it was in violation of the free speech principles of the First Amendment. The FCC abolished the rule in 1987, leaving talk hosts unrestrained.

Congress tried to reinstate the Fairness Doctrine as law that same year, but President Ronald Reagan vetoed it. Later attempts failed even to pass Congress. Those failures have led many to believe that it will take an act of Congress to bring back the doctrine. In fact, however, the FCC has the power as an independent regulatory agency to re-impose the Fairness Doctrine without either congressional or executive action.

Talk radio as it developed through the 1990s could not exist in the Fairness Doctrine era. In 1987, the year the doctrine was discarded, there were 125 news-talk stations nationwide. By early 2003, there were a total of 1,785 news, talk, and information stations. In 1986, news, talk, and information stations captured 8.7 percent of the national listening audience, good enough for fifth place overall among all radio formats. The Fall 2002 Arbitron Format Trend Report showed news, talk, and information radio as the leading radio format, capturing 16.5 percent of the national radio audience.

Power Shift

The power of talk radio had been felt on a local level since the format's inception. Local stations traditionally staged debates and allowed unprecedented access to politicians. Deregulation merged journalism and populism. The public asked questions that had previously been the domain of reporters and gossip columnists.

Boston's Jerry Williams and listeners who heard his show on WRKO were credited with overturning Massachusetts' seat belt law in 1988. Williams and other show hosts claimed credit for public opposition to a congressional pay raise and for a boycott against Exxon in the wake of the Alaska oil spill.

At an organizational meeting of the National Association of Radio Talk Show Hosts (NARTSH) in 1989, Williams called talk radio “the greatest forum in history . . . the last bastion of freedom of speech for plain ordinary folks.” The organization attempted to set a political agenda: “It’s our government and we’re going to take it back from those aristocrats,” said Mike Siegel of Seattle’s KING Radio on a broadcast from the NARTSH meeting. Siegel later had a short run in syndication on the Premiere Radio Network.

Talk radio created a new dynamic during the 1992 Presidential campaign. Most candidates, prompted by exposure given to independent Ross Perot, appeared on both radio and television talk shows to disseminate their views and corral support. The notable exception was incumbent President George H. Bush, who lost to a regular talk show guest, Bill Clinton. The proliferation of appearances by candidates on both television and radio talk shows prompted *Washington Post* television critic Tom Shales to label the 1992 election “the talk show campaign.”

Aides in the Clinton campaign believed their candidate reversed his fortunes in New York with an early morning appearance with Don Imus, morning man on Sports station WFAN heard on a national network. As president, Clinton hosted talk personalities at the White House. California’s Jerry Brown surprised political pundits by winning Connecticut’s Democratic primary in 1992. Some observers felt his key move was an appearance on Michael Harrison’s program then heard on WTIC in Hartford. Brown later hosted his own talk show.

Brown was not the only personality to join the talk host ranks from outside radio. G. Gordon Liddy, of Watergate infamy, had the highest profile because of his national network program. Conservative presidential candidate Pat Buchanan tried his hand for a short while at talk radio. On the local level, former Los Angeles police chief Daryl Gates, former New York Mayor Ed Koch, and former San Diego Mayor Roger Hedgecock gained new careers in their hometowns. Hedgecock became Rush Limbaugh’s primary substitute host in 2002.

Audiences and Impact

For a while in the 1990s, talk radio and its effect on politics dominated media discussion. An entire issue of *CQ Researcher* in 1994 was focused on the question “Are call-in programs good for the political system?” A *Newsweek* cover story was headlined “The Power of Talk Radio.” Other publications also expressed concern in articles entitled “Tower of Babble,” “How to Keep Talk Radio from Deepening America’s Divide” and “Talk Radio Lacking Real Dialogue.” FCC Chairman Reed Hundt, speaking to members of the NAB, asked if talk radio created “such skepticism and disbelief that as a country we just can’t get anything done?” The *New York Times* suggested that “modern politicians have become slaves

to public opinion” in the “electronic din” of talk radio. Following the Oklahoma City bombing, there were suggestions that the rhetoric of talk radio might have fueled the bombers’ discontent. *World Press Review*, in an article titled “A Bitter, Self-Doubting Nation,” suggested that talk radio hosts who were cynical about the federal government and public officials more accurately represented the disillusionment of the U.S. voter than the mainstream press. Editorials and commentators pointed to talk radio’s influence on the increasing incivility in U.S. society. Howard Stern continued to draw attention for his sexist and racist talk. Over the airwaves he regularly made fun of women, minorities, and disabled people. Toilet jokes and sex jokes continued to be regular fare on the Stern show in the 21st century.

Scholars began to study talk radio and its effects. In 1995 the Times Mirror Center for People and the Press challenged the view that talk radio listeners were ignorant and ill-informed. The research concluded that talk radio listeners paid close attention to the news and knew what was going on in the world. They were more likely to vote than the average American and were better educated, made more money, and were more focused on the issues than those who did not listen to talk radio. As an indication of its power, some supporters pointed to a three-way political race in Minnesota, where former wrestler turned radio talk host Jesse “The Body” Ventura was elected governor.

Randall Bloomquist, former news/talk editor of *Radio and Records* and a regular observer of the talk radio phenomenon, argues that its ability to influence political developments is heavily dependent on support from mainstream media. Talk show fans do not tune in to get their opinions changed. They listen to the hosts who affirm their personal and political beliefs. Bloomquist suggests that talk radio’s power is not in its influence on its own listeners, but in its ability to trigger national media coverage of an issue. That national coverage is what truly affects issues.

Radio market research indicates that the average listener tunes in to talk radio for an hour or less at a time. In 1998, according to the Radio Advertising Bureau, 42 percent of listeners were doing so in their automobiles, 37 percent listened at home, and 21 percent tuned in at work. Most listened to radios while doing something else. In large metropolitan areas, more and more people are commuting greater and greater distances. Those commuters are the perfect captive audience for talk radio. In 1999 national research conducted for *Talkers* magazine, an industry trade journal, indicated that 52 percent of the audience was male, 72 percent had some college education, and nearly 60 percent had an annual household income higher than \$50,000.

By the early 2000s, politics and “heavy” national issues were no longer the main focus of talk radio. Instead of the traditional older listener, radio stations were hustling to get

younger (18 to 44) listeners. Sports, sex, and lifestyle were the "in" topics, and the goal was entertainment. Howard Stern imitators were as evident as Limbaugh clones. Hot talk ("rock and roll without the music," as one radio insider put it) was shouldering political talk out of the way. The new version of talk, "sports talk/guy talk," targets younger listeners with cruder, ruder talk.

Listeners were also discovering the internet, and their computers allowed access to stations too far away to tune in on radio. A number of websites provide listings of radio stations by format. Although some are web versions of broadcast stations, others are internet-only stations. Choices range from traditional talk show hosts to a variety of information and entertainment targeted at specific audiences such as computer technology specialists, lawyers, and entrepreneurs.

Taylor, Deems 1885–1966

U.S. Radio Commentator, Author, and Critic

Deems Taylor is perhaps best remembered as the narrator of Walt Disney's 1940 film *Fantasia*, the goal of which was to bring classical music to life by pairing it with animation to make it more accessible to the audience. When viewed in this light, Taylor was the perfect choice for the project. An unabashed populist, he was the composer of the first truly successful American opera; he was also a highly regarded radio commentator, author, and critic. Well known for his intermission talks during broadcasts of *The New York Philharmonic* on CBS, he was second only to Walter Damrosch as an advocate of music for all, not just an intellectual or economic elite.

Making a Name

A native of New York City, Taylor was born in 1885. Musically, he was largely self-taught, writing his first composition (a waltz) at the age of 10. He attended the Ethical Culture School of New York and went on to New York University (NYU), from which he graduated in 1906. While at NYU, Taylor honed his skills as a composer by writing Grand Opera parodies, as well as the music to four campus shows. The first of his works to garner serious attention was the prize-winning symphonic poem *The Siren Song* in 1913. *Witch Woman*, his first published work, appeared the following year.

True musical success being some years ahead, Taylor pursued an editorial career. A series of positions, including a stint with *Encyclopaedia Britannica*, led to his appointment as the Sunday Editor of *The New York Herald Tribune*. In 1916 he went overseas as a war correspondent for the paper, returning to the U.S. the following year. He later served as editor of *Musical America*, and was music critic of *The New York World*, *The New York American*, and *McCall's* magazine.

The war led, at least indirectly, to Taylor's first major success. Trying to transfer his wartime experiences into music, he proposed writing a series of "War Sketches." Finding the events still too fresh "to interpret into music," he turned his thoughts to a subject as far removed from the grim realities of war as possible. The result was a suite based on the works of a favorite author since childhood, Lewis Carroll. *Through the Looking Glass* is the most frequently performed of Taylor's works.

On the strength of this success, Taylor was approached by the Metropolitan Opera to compose a "successful American Opera." After convincing poet Edna St. Vincent Millay to write the libretto, Taylor set to work. The result was *The King's Henchman*, which opened at the Met in 1927 and played for the next three years—then a record for an American work.

Radio

It was the popularity of this opera that launched Taylor's radio career. *The King's Henchman* was chosen for the inaugural evening's broadcast on 18 September 1927 of what was then called the Columbia Phonograph Broadcasting System (later CBS). Taylor provided the narration and commentary.

His second opera for the Met, *Peter Ibbetson*, debuted in 1931. An even larger success than his first, it brought him to the attention of the National Broadcasting Company (NBC), who engaged him to do commentary on its broadcasts of the Metropolitan Opera. His efforts were not well received, however. Still a radio neophyte, Taylor made the mistake of delivering his observations over the music. A storm of protest from opera purists led to his rapid ouster. He rebounded with his own program (briefly), and soon secured a spot on the popular *Kraft Music Hall*, then featuring Paul Whiteman and his Orchestra. Eventually a long-term assignment doing commentary for broadcasts of the New York Philharmonic on CBS brought him back to the classical arena. This time, he did not talk over the music.

In retrospect, the time was right for someone like Taylor. Both CBS and NBC's commitment to music was strong, and classical and light classical fare was an important part of the mix. The networks had their own symphony orchestras for most of the radio era, and big band, swing, sweet music, and jazz were all well represented on the dial. Taylor was an established composer with a strong journalism background, an acknowledged expert on things musical. He was articulate and possessed a dry wit. He looked the part of a musical scholar, and more importantly for radio, he sounded the part as well.

As a result, Taylor was in fairly constant demand throughout the peak years of network radio. He was a regular on many programs and a frequent guest on others. An inveterate replacement panelist on the erudite quiz show *Information, Please*, he appeared more than 40 times on the program during the 1940s. He even turned up on the comedy *Duffy's Tavern*, showing his willingness to poke fun at his "longhair" image in the process.

Taylor was the author or editor of a number of books, including three works of musical musings based largely upon his radio commentaries; *Of Men and Music*, *The Well Tempered Listener*, and *Music to My Ears*. Despite his accomplishments as an author and radio personality, however, he remained at heart a composer, viewing his other activities as merely a means to an end. "For many years," he said towards

Deems Taylor hosting a music program
Courtesy CBS Photo Archive

the end of his life, "I, the composer, have been supported by me, doing other things." He eventually wrote over 50 musical compositions.

A member of the Institute of Arts and Letters, Taylor was also a long-time Board member of the American Society of Composers, Authors and Publishers, serving as President from 1942–48. Each year since 1967, ASCAP has presented the "ASCAP-Deems Taylor Awards," honoring the best in print, broadcast, and now internet coverage of music. Deems Taylor died in 1966, at the age of 80.

CHUCK HOWELL AND DOUGLAS GOMERY

Joseph Deems Taylor. Born in New York City, 22 December 1885. Bachelor of Arts degree, New York University, 1906. Staff member, *Encyclopaedia Britannica*, 1907; his symphonic composition, *Siren Song*, won prize, National Federation of Music Clubs, 1913; first published work, *Witch Woman*, appeared in 1914; assistant editor, *New York Tribune Sunday*

Magazine, 1916; war correspondent, *New York Tribune*, 1916–17; music critic, *New York World*, 1921–25; wrote music for Broadway, 1922–24; *Through the Looking Glass Suite* debut, 1922; commissioned by Metropolitan Opera to write a "successful American Opera," 1925; editor, *Musical America*, 1927–29; the opera, *The King's Henchman*, opened at the Metropolitan Opera, 1927; critic, *New York American*, 1931–32; made radio debut as commentator, 1931; noted for having more Metropolitan Opera performances than any other American composer; member, Board of Directors of ASCAP, 1933–66; narrator and musical advisor for the Walt Disney film *Fantasia*, 1940; president, American Society of Composers, Authors, and Publishers (ASCAP), 1942–48; honored by ASCAP with the establishment of the ASCAP-Deems Taylor Award for meritorious writing about music and musicians, 1967. Recipient: honorary doctorates, New York University, 1927; University of Rochester, 1939; Dartmouth College, 1939; Cincinnati Conservatory, 1941; Syracuse University, 1944. Died in New York City, 3 July 1966.

Taylor, Marlin R. 1935-

U.S. Music Programmer

Marlin Taylor once said, "My personal and professional goal was always to bring joy to others through what I could provide them in the way of musical entertainment." Taylor pioneered the "Good Music" format that was later popularized as "Beautiful Music."

At radio station WDVR in Philadelphia, Taylor built his Good Music format on his judgment of what songs and arrangements the station would play. Taylor said then, "The music selection is very much mine. No one really influences what I program." WDVR quickly began to achieve higher ratings and notice by the industry at large.

The sound was string-orchestra based and selections ranged from light classical melodies to the "Banjo Barrons Play Hawaiian Melodies." Taylor introduced heavy use of instrumental recordings of the most popular songs of the day, with artists such as Percy Faith, Mantovani, Bert Kaempfert, and Billy Vaughn. Very few vocals were incorporated into the music mix; only groups such as the Norman Luboff Choir and the Ray Conniff Singers were chosen. The concept of playing instrumental versions of popular songs was unique to the Taylor format and would be incorporated by programmers following him, including Jim Schulke. Taylor gives great credit to the

use of instrumental records of popular songs for the format's ratings success, particularly among women.

The success of WDVR led Taylor to the Boston radio market, and in 1967 he was named program director of the Kaiser-owned station WJIB. At WJIB Taylor established a relationship with Bob Richer and Jim Schulke, who had formed a sales representative firm called Quality Media Inc. (QMI). The singular purpose of the company was to market Good Music stations to national advertisers. Schulke requested Taylor's help in setting the parameters for a new syndicated music service that QMI was establishing. Phil Stout, who later became the programmer for Schulke Radio Productions Beautiful Music format, was first hired by Taylor at WDVR and was recommended to Schulke and Richer as their programmer.

In 1969 Bonneville Broadcasting hired Taylor as the general manager of WRFM in New York City. In the summer of 1969 Taylor began programming music "bonus hours," which later became "total music hours." No public reference was ever made that the hours were commercial-free for fear of alienating advertisers. This concept was expanded to the Christmas season with the Christmas Festival of Music consisting of 36

hours of continuous holiday music on Christmas Eve and Christmas day.

Both in terms of ratings and profits, WRFM became a huge success. Because it was located in the nation's advertising capital, the station had an enormous pioneering impact on advertiser awareness of the success of the format. WRFM played a major role in overcoming a perception that Beautiful Music stations were playing "elevator" music that was not an attractive advertiser investment.

By the end of 1970, Bonneville recognized that Taylor could develop a company that could syndicate the WRFM format nationally. Bonneville Programming Services was formed, with its first client Bonneville-owned WCLR in Skokie (outside of Chicago), Illinois. The initial success of Beautiful Music led the company into several other formats, including Adult Contemporary and Bonneville Rock.

Bonneville Programming Services offered a unique twist to its Beautiful Music format, which was another Marlin Taylor innovation. The format was offered to broadcasters in two forms. The first was the traditional matched flow format, in which each quarter hour segment was packaged. A second option offered stations was a "random select" format based on single cuts that could be customized to individual markets and times of day. With the development of more sophisticated station automated systems, the random select service became much sought after, particularly in the most competitive markets. This concept was utilized by nearly all syndicated contemporary formats.

Bonneville Programming Services grew to serve stations in over 150 markets, and in the 1970s and 1980s was the chief head-to-head competitor with Schulke Radio Productions. Bonneville later bought Schulke Radio Productions from Cox Broadcasting. Taylor expanded Bonneville Programming Services to include marketing, research, and management consulting to its client stations.

After 18 years, Taylor left Bonneville at the end of 1987. He subsequently worked on a number of programs, wrote articles for industry publications, and packaged and distributed recordings of Beautiful Music under the Surry House Music label. In 2000, Taylor returned to the industry full time as a Program Director for XM Satellite Radio.

Marlin R. Taylor. Born in Abington, Pennsylvania, 26 August 1935. Worked at Armed Forces Radio in Thule, Greenland, June 1959–April 1960. Attended Army Information School, Ft. Slocum, New York, 1960. Developed Good Music (Beautiful Music) format at WDVR, Philadelphia; moved to WJIB, Boston, 1967; moved to WRFM, New York, 1969; began association with Bonneville Programming Services, 1970–87; Program Director for XM Satellite Radio, beginning in 2000.

Technical Organizations

Organizing Radio's Engineers

Four types of technical organizations have emerged during radio's development in the U.S. The first were professional organizations for engineers. The second helped to assemble amateur radio operators and were organized in the early years of radio. The third were company-specific employee organizations begun to counter independent unionization by their radio employees. And the fourth were independent labor unions for radio's engineers and related technicians.

Professional Organizations

Perhaps the most important organizations were those started by leading scientists, electrical engineers, and business leaders

to advance the scientific study of radio. These have gone through several iterations but have consistently included the key figures and provided the most important publications.

American Institute of Electrical Engineers

On 13 May 1884, a group of scientists, inventors, and electrical engineers, which included Thomas Alva Edison, Alexander Graham Bell, and Norvin Green, president of the Western Union Telegraph Company, organized the American Institute of Electrical Engineers (AIEE). Spurred in part by an International Electrical Exhibition in 1884, the new AIEE included inventors, entrepreneurs, telegraph operators, and company

managers. Technical publications (eventually *Electrical Engineering*), an annual meeting, and even a museum were contemplated. The AIEE changed as the industry became dominated by large manufacturing and service companies that employed “electricians.” Creation of research laboratories added more members. AIEE also became centrally involved in the development of technical standards, allowing one company’s device to work with another’s. And it helped to promote professional standards. But the AIEE became increasingly focused on power engineering, leaving an opening for a new group focused on wireless and radio.

Society of Wireless Telegraph Engineers

The Society of Wireless Telegraph Engineers (SWTE) was started in 1907 by the head of the Stone Wireless Telegraph Company, John Stone Stone [sic]. In the first years, Stone limited membership in the SWTE to only the employees in his small Boston-based company, although he later permitted the rolls to be opened to the employees of Reginald Fessenden’s National Electrical Signaling Company (NESCO) and other companies.

The Wireless Institute

The Wireless Institute (WI), a rival organization to the SWTE, began in 1909 when Robert Marriott organized about 100 wireless U.S. devotees in the United States. Three years later, however, WI membership dropped to 27 members and was teetering on collapse.

Institute of Radio Engineers

The SWTE and Marriott’s WI merged on 5 April 1912 and agreed to name the new organization the Institute of Radio Engineers (IRE). The new organization became more international in scope, thus excluding the word “American” in its name. The IRE focused on extending the use of radio to protect and save lives at sea. Because of its ubiquitous nature, radio soon became a tool of war and many IRE members joined the effort as military needs meshed with rapid technical development. By 1916 there were 83 members in the IRE from 11 other countries besides the United States.

In addition to its prestigious monthly, *Proceedings of the IRE*, the IRE focused on improving technical standards as the international radio industry grew into a new economic sector. During the 1920s, the IRE synchronized its scientific and electronic research work with the National Electrical Manufacturers Association and the Radio Manufacturers Association. The IRE also assumed a leadership role as a trade representative for its members of U.S. radio manufacturers and broadcasters such as the Radio Corporation of America

(RCA), American Telephone & Telegraph (ATT), and General Electric (GE).

Working for scientific progress and technological insight, the IRE lobbied for a major role in deciding how U.S. radio broadcasting would be regulated. The IRE was invited to participate in a series of National Radio Conferences between 1922 and 1925 that were organized by Secretary of Commerce Herbert Hoover to develop policies concerning station licensing and technology. These four meetings eventually led to Congress passing the Radio Act of 1927.

After World War II, the IRE focused on the developing technologies of television, FM radio, audio recording, and developing standards of excellence in engineering practice. The society delineated its membership along two specialties of interest: broadcast engineers and audio. With the rise of electronic technologies being used by the U.S. military during World War II, the IRE broadened its interest groups with radar, computers, television, solid-state electronics, and space exploration. By 1947, there were nearly 18,000 IRE members.

Institute of Electrical and Electronic Engineers

In January 1963, the AIEE and the IRE merged and formed the Institute of Electrical and Electronics Engineers (IEEE). As of the early 2000s, the IEEE remained the largest professional society in the world with more than a quarter of a million members.

The IEEE quickly expanded to include virtually all arms of electronics as shown by its steadily growing number of specialized technical journals, plus the general appeal *IEEE Spectrum*. Building on the IRE model, the IEEE developed dozens of professional divisions—called societies—each of which held their own meetings and issued their own publications. Among those of particular interest are the societies concerning broadcast technology, consumer electronics, and the society on social implications of technology. A history center was created in 1980.

Society of Broadcast Engineers

Not everyone was pleased with the AIEE-IRE merger, and the Society of Broadcast Engineers (SBE) was one dissident spin-off created at the same time to allow a focus on broadcasting. The SBE’s international membership soon covered a broad scope of industry employees: studio and transmitter operators and technicians, supervisors, announcer-technicians, chief engineers of commercial and educational stations, engineering vice presidents, consultants, field and sales engineers, broadcast engineers from recording studios, schools, closed-circuit systems, cable TV, production houses, corporate audio-visual departments, and other facilities. The SBE began in 1977 to certify broadcast engineers in several categories, including the

Certified Broadcast Radio Engineer (CBRE) and Certified Senior Radio Engineer (CSRE). These certifications are renewed every five years. More than 100 local chapters meet regularly. As with other technical bodies, the SBE holds an annual meeting, issues publications, and holds training courses and workshops.

Amateur Radio Groups

To further the developing “ham” hobby, amateur radio clubs began to proliferate early in the 20th century.

The Wireless Club of America

The Wireless Club of America was begun in 1910 by Hugo Gernsback, a Luxembourg immigrant to the U.S. Sometimes referred to as the father of science fiction, Gernsback was an early wireless enthusiast who saw the potential in marketing wireless units to the general public while creating a market for the new technology of amateur radio. By 1912, the *New York Times* reported that there were some 12,000 amateur radio operators in the U.S. and some 122 radio clubs. Most of the meetings for these clubs took place over the air. Message handling, where one operator or groups of operators would relay messages and information to others, became a central feature of amateur wireless clubs. While these exchanges were most often for fun and fraternal reasons, they were sometimes needed to protect or inform others in public emergencies.

American Radio Relay League

In 1914, Hiram Percy Maxim, a Boston radio enthusiast, contacted others through his Hartford Radio Club and offered to set up a network of relay stations comprised of amateur radio operators. Calling the new network the American Radio Relay League (ARRL), Maxim tapped into the unrealized dreams of many in the field at the time. Within some four months, the League boasted 200 relay stations in the U.S. alone. The ARRL asked the Commerce Department to establish a special license for stations in order to make up a national relay network of stations. Maxim, the ARRL’s visionary leader and an MIT graduate, set up a sophisticated system that would serve the nation in the event of war. When the U.S. entered World War I in 1917, amateur radio stations were ordered to close down. At the same time, the military began a full-blown recruitment effort to attract some 6,700 radio operators (many of whom began as amateurs) to the U.S. navy. Instead of being outside of the mainstream, amateur wireless operators became part of the system. After the war, the amateurs were intent upon getting back to where they left off when the war started. By 1921, the

Commerce Department listed some 11,000 amateur radio operators in the U.S.

Amateurs were forced off the air again during World War II (1941–45), making ARRL an important means of keeping the hobby alive for what became strong postwar growth. Today ARRL thrives with meetings, the monthly *QST*, the annual amateur operators’ handbook, and a host of other publications. In addition to the ARRL, more regional groups developed. Among them was the Radio Club of America (RCA—*not* to be confused with the former manufacturing company), a New York area group that enjoyed the participation of such key radio figures as Edwin Howard Armstrong, among others.

Technical Unions

The first attempts to organize radio technicians and engineers (often called the “below-the-line” employees to distinguish them from the “above-the-line” creative personnel) occurred in the 1920s. By the 1940s two national labor unions, one devoted to broadcasting, had between them organized most of radio’s technical workers. They sought to overcome the relatively low pay and sometimes poor working conditions of workers. Broadcast employees often had to work split shifts, with no pay or time off for holidays, and no overtime pay. The typical wage was about \$20.00 per week—\$40.00 was big money in the 1930s. The same two unions—The International Brotherhood of Electrical Workers and the Association of Technical Employees—dominate the radio scene today.

International Brotherhood of Electrical Workers

The International Brotherhood of Electrical Workers (IBEW) was formed in 1891 out of several earlier attempts to organize those involved with electrical wiring and manufacturing. IBEW was behind what was probably the first labor strike in radio, in late 1925 at KMOX in St. Louis, Missouri. Concerned with wages and working conditions—the universal labor issues—the strike led to the union’s recognition as the bargaining agent for KMOX technicians. In 1931, KMOX became a CBS owned-and-operated station that spread the IBEW idea to others at the network. IBEW also organized stations in Chicago and in Birmingham, Alabama. In 1939, the union hit the big-time when it successfully organized the technical employees at CBS. As it made plans to create more broadcast-centered locals on a national basis, however, IBEW increasingly came up against the National Association of Broadcast Engineers and Technicians (see below) in jurisdictional disagreements. In 1951 IBEW organized its broadcasting and recording members into a separate department, though they continued to represent but a tiny part of the larger union.

Association of Technical Employees

In 1933 some 300 employees at NBC formed the Association of Technical Employees (ATE) to represent themselves with the network. A year later they signed their first contract with NBC. This contract set a wage scale of \$175.00 per month, rising to \$260.00 after nine years' service. The work week was determined to be 48 hours. ATE was the first organization created exclusively to represent radio employees. By 1937 the ATE contract spelled out their jurisdiction, and the first independent (non-network) station joined the unit. A union shop clause came two years later.

National Association of Broadcast Engineers and Technicians

ATE became the National Association of Broadcast Engineers and Technicians (NABET) in 1940. Contracts negotiated the next year set the first eight-hour day. Some 23 small stations were also under NABET contracts. When NBC-Blue split off in 1943 (becoming ABC in 1945), NABET contracts carried over, giving the union two of the major radio networks. Seeking some organizational strength and thus organizing clout, NABET affiliated with the Congress of Industrial Organizations (CIO) in 1951, and changed its name to National Association of Broadcast *Employees* and Technicians, thus retaining the same acronym.

Recent Union Trends

The coming of television in the late 1940s, and later cable television, dramatically increased employment in the electronic media industries—and thus organizing opportunities as well as jurisdictional battles among the unions involved. One union, the International Alliance of Theatrical and State Employees (IATSE), never organized radio workers, building from its 1893 theater and later film bases to expand into television. But both the IBEW and NABET also grew into television, thus precipitating a host of jurisdictional disputes in the 1950s and 1960s, some resolved with strikes and others with arbitration.

The degree of unionization in radio varies greatly by market and region of the country. Union agreements are far more likely at the network level, in large markets, and in the Northeast and West Coast, as well as major Midwest cities. Smaller markets and stations tend not to be subject to union agreements. Recent mergers in the radio business, with huge numbers of stations coming under common control (including multiple stations in the same market) have not thus far had union implications. On the other hand, greater use of automation has trimmed employment ranks as has such FCC deregulation

as no longer requiring licensed engineers to supervise radio transmitter operations.

In the constant search for new members and bargaining units, each union emphasizes what it has gained for its rank and file. NABET, for example, listed its accomplishments by the 1990s as the wide-spread acceptance of the union shop, a seven-hour day and 35-hour week, paid vacation and statutory holidays, lay-off and rehiring on a seniority basis, differential pay for night work, discharge only for just and sufficient cause, established grievance procedures (including arbitration), contract provisions covering increased automation, and pension plans. IBEW could make similar claims.

In 1993, NABET sought organizational support with the Communication Workers of America (CWA), heretofore a union of telephone workers, although it had also organized many cable television workers. After a one-year test run in 1993, the two merged into what became the NABET-CWA.

Telecommunications Act of 1996

Changing Radio's Licensing and Ownership Rules

In February 1996 President Bill Clinton signed the Telecommunications Act into law, the result of two decades of industry and congressional effort to update government regulation of the industry. Cast as amendments to the benchmark Communications Act of 1934, the complex 1996 law wrought important changes in the radio industry as a fairly small part of a law primarily addressed to substantial policy change in the telephone business. Provisions of the law contributed to substantial consolidation of station ownership while at the same time furthering the aims of deregulation.

Origins

The 1934 Communications Act has often been amended in the decades since its passage. Important revisions were enacted every few years as regulated industries changed and expanded. Attempts to replace the law (especially a series of draft "rewrite" proposals from 1976 to 1981) failed to pass, however, because they tried to do too much at one time. The more focused public broadcasting act of 1967 and the cable acts of 1984 and 1992 are examples of more industry-specific legislation that did successfully amend the 1934 law.

Development of what became the 1996 amendments took several years. The issues involved were complex as Congress considered substantial deregulation of and other changes in traditional regulatory approaches to the telephone and electronic media industries. Growing digital convergence among all electronic communications services forced a rethinking of long-accepted regulatory assumptions. At the same time, largely defensive industry positions amidst rapid technical change were deeply entrenched, making compromise difficult (it is nearly always easier to stop legislative progress than to maintain its momentum). Moreover, a continuing trend toward less governmental and more marketplace control was

changing the way Congress perceived the telecommunications sector.

For broadcast deregulation was not new. The Federal Communications Commission (FCC) had begun cautious moves in this direction in the mid-1970s, and they accelerated during the Reagan administration in the 1980s. To deregulate radio broadcasting, for example, the FCC lifted a number of "behavioral" regulations (such as guidelines encouraging at least minimal non-entertainment programming) in the early 1980s. Over the next decade, the commission also loosened its "structural" regulation by slowly increasing the number of radio stations any single entity could own from seven AM and seven FM stations (the longtime national limit) to 12 of each type in 1985, raised to 18 in 1992, and 20 by 1994. In an even more basic change, in 1992 the FCC removed a longtime restriction by allowing any entity to own more than one AM or FM station in the same market.

The first potential bills were considered by Congress, then under Democratic control, in the early 1990s, although none of them progressed far. Dramatic changes in telephone industry policy were at the core of each bill; electronic media provisions were relatively minor parts of the proposed legislation. Republican takeover of both houses of Congress in the 1994 elections delayed progress briefly as the longtime opposition party learned how to run things and trained a new cadre of staffers and members in the intricacies of the telecommunications field.

Finally, in the fall of 1995, both houses passed substantial telecommunications deregulation bills, albeit with the differences usually found in the legislative process in which each house acts independently of the other. A conference committee worked for many weeks and early in 1996 produced the compromise bill passed by both houses on the first day of February 1996. The president signed the bill a week later.

Radio Licenses

The new legislation had four important effects on the radio business, two concerning station ownership, and two focused on licensing. Reasoning that with nearly 13,000 radio stations on the air old restrictions (established when less than 10 percent of that number existed) could now be eliminated, Congress opted to free the marketplace. Provisions in the 1996 law (a) dropped limits on the number of radio stations that could be owned nationally; (b) increased the local market stations that could be owned by a single entity; (c) lengthened station licenses; and (d) eliminated competitive applications at license renewal time.

The license term change was relatively minor: Section 307 (c) of the 1934 law was changed to extend radio licenses from seven to eight years (until 1981 licenses for radio or television had run for only three years). But the end of potential competitive applications may have more far-reaching impact. Acting on a long-existing industry desire for license “renewal expectancy,” the 1996 law added a new subsection (k) to Section 309 of the Communications Act to make clear that existing station licenses will be renewed unless the FCC finds important and continuing transgressions of its rules and regulations to have occurred. Even in such a situation, the commission retains the discretion to renew or deny a license. But the law also forbids the FCC from considering a rival application during a license renewal proceeding—until and unless it has first decided that the existing license must be terminated. Given the FCC’s track record over seven decades of license renewals, such terminations are very unlikely. While only a tiny fraction of one percent of all stations were denied renewals under the old rules, the new law makes license renewal virtually automatic in the future.

Station Ownership

Statutory changes governing radio station ownership were more dramatic, as the initial years of station trading after passage of the 1996 law have shown. Stations may now be bought and sold or traded much as with any other business, although the FCC retains the right to approve each new licensee. The 1996 law directed the FCC to eliminate its national cap on radio station ownership (then standing at no more than 20 AM and 20 FM). Any company could now own as many stations as money would allow. Within a month of the law’s passage, two radio station groups were approaching 50 stations each—by the end of the year the first group exceeded 100 stations. From there the pace of station buying and selling increased and station prices soared. By early in the 21st century, the largest radio group owner controlled more than 1,200 outlets, by which time 40 percent of all radio stations had changed ownership since 1996.

The market-level situation was more complex. The 1996 law allows a single owner to control up to eight stations in any of the largest markets (more than the *national* cap before 1985) as long as no one owner controls more than half the stations in a given market. The table provides the specific new limits, and the law allows for even these to be exceeded if such an action “will result in an increase in the number of radio broadcast stations in operation,” although just how that might work in practice is not yet clear.

To further complicate matters, in August 1996 the U.S. Department of Justice’s Antitrust Division announced that no single market radio owner would be allowed to control more than half of that market’s radio advertising revenue. A few group owners had to divest themselves of one or more stations to comply.

<i>In a market with this many radio stations:</i>	<i>A single entity can control up to this many commercial stations:</i>
45 or more	Up to 8, no more than 5 in the same service (AM or FM)
30-44	Up to 7, no more than 4 in the same service
15-29	Up to 6, no more than 4 in the same service
14 or fewer	Up to 5, no more than 3 in the same service

Impact on Radio

Although many policymakers have cited its positive effects, such as eliminating outdated rules, encouraging innovation and development of new technology, and encouraging a more competitive environment, the 1996 law has had negative implications as well. For example, in some smaller markets, only two companies may end up owning all the available stations. The overall number of different radio station owners in the country declined by 30 percent in seven years, from the passage of the act to early 2003.

The Telecommunications Act has also allowed owners of multiple stations to operate multiple outlets with the same personnel (often with voice tracking technology), programming, and administration. Critics argue that such practices can also lead to more music homogenization and fewer different “voices” (points of view) being heard over the air. Major group owners now significantly control multiple local radio markets and can largely dictate the terms of advertising. CBS, for example, quickly expanded to control 40 percent of all radio revenue in Boston, Chicago, New York, and Philadelphia. At the same time, station ownership by ethnic minorities

declined as radio station prices rose and groups expanded. Among FM stations, for example, minority-owned stations declined from 127 to 100 in just the first year after the 1996 law was passed.

When Congress passed the 1996 law, many proponents hailed it as an opportunity to create a pro-competitive, deregulatory national framework, as well as more industry employment. Then FCC Chairman William Kennard predicted that the 1996 Act would hasten "the transition to a competitive communications marketplace." Commissioner Susan Ness concluded that the main goals of the 1996 amendments were to promote competition, reduce regulation, and encourage rapid deployment of new telecommunication technologies.

On the other hand, commissioner Gloria Tristani later pointed out the dramatic and potentially negative impacts on radio station ownership and operations programming since passage of the Telecommunications Act. Tristani noted that group ownership reduces the number of different and competing voices and opinions heard on local radio stations. More recently, commissioner Michael Copps expressed concern that local radio markets had become oligopolies where programming originated outside the local station "far from listeners and their communities." Even FCC Chairman Michael Powell agreed that the consolidation of radio station ownership "concerned" him. The growing number of group-owned radio stations, of course, mirrors a similar trend in chain-ownership of newspapers, television stations, and cable systems. Many of the conglomerates buying radio stations also own other media.

Although proponents of the Telecommunications Act of 1996 still trumpet its successes, the law was subject to years of substantial litigation and has yet to achieve all of its goals. As with other deregulatory legislation, the 1996 amendments have tended to place business interests ahead of those of the listening public. A growing number of critics (some of them in

Congress, others in the radio business) have argued that consolidation allowed by the 1996 law is at the heart of radio's declining audience appeal as more stations sound increasingly alike.

Television Depictions of Radio

Fictional Portrayals in American Series

Television's eclipse of radio as the dominant mass medium of entertainment in the decade following World War II was propelled in large measure by the transformation of radio shows into video versions. More than 200 radio programs moved to television, including *The Adventures of Ozzie and Harriet*, *Truth or Consequences*, *The Lone Ranger*, *Your Hit Parade*, *Suspense*, *Arthur Godfrey's Talent Scouts*, and *Studio One*.

Several comedians who had achieved enormous popularity on radio, such as Jack Benny, George Burns and Gracie Allen, Red Skelton, and Bob Hope, found similar success with their television series.

By the late 1950s, both the radio industry and American life had been profoundly altered by the rise of television. Big-budget network radio shows that appealed to the whole family

had given way to cheaply produced local disc jockey programs catering to specialized audiences. Teenagers were an especially attractive market segment as the sale of transistor radios boomed and the age of rock and roll arrived.

The nostalgia many older Americans felt for the glory days of network radio in the 1930s and 1940s was inspiration for a March 1961 episode of *The Twilight Zone* entitled "Static." An elderly bachelor living in a boardinghouse retrieves his elegant radio console, circa 1935, from the basement. When he's alone in his room, he hears programs from the past. Fearing for his sanity, his former fiancée gives the radio to a junk dealer. Infuriated by her meddling, he gets the radio back and is relieved to find that it still works. When he calls the disbelieving woman to his room to hear for herself, she appears as she did in 1940 as his young sweetheart. He too has become a young man. The radio, a magic machine, sent them back in time and gave the couple a second chance.

But there was no return for the radio industry to its earlier splendor. It adapted to the modern era and itself became grist for TV's storytelling mill. Since the late 1960s a number of television series have had main characters who work in radio stations. *Good Morning, World*, for instance, was a 1967 Columbia Broadcasting System (CBS) situation comedy about a team of early-morning drive-time disc jockeys, Lewis and Clarke, who worked for an overbearing boss at a small station in Los Angeles.

WKRP in Cincinnati

A thoroughly realistic depiction of any occupation or workplace on television is limited by the narrative conventions of drama and comedy. But the spirit and flavor of a profession can be vividly conveyed. The series *WKRP in Cincinnati*, which ran on CBS for four seasons beginning in September 1978, was a show that earned high marks among radio industry insiders for its authentic ambience. *WKRP* creator, executive producer, and head writer Hugh Wilson received many letters complimenting the show's realism.

The show was, in fact, based on a real station—Atlanta's WQXI, a successful AM/FM combination with a rock format. In the early 1970s, Hugh Wilson, who was working in advertising in Georgia's capital city, met WQXI salesman Clark Brown at Harrison's, a bar that catered to the media crowd. Through Brown, Wilson was introduced to a number of people who worked in Atlanta radio. In 1977 these friendships proved valuable as a source of inspiration when the vice president for comedy development at CBS gave Wilson the go-ahead to write a pilot for a situation comedy about a radio station.

The premise of *WKRP in Cincinnati* was that the station, a ratings loser with an "elevator music" format, would change to rock and roll. A new young program director, Andy Travis, was brought on board to implement the switch, which alien-

ated some longtime sponsors, such as Barry's Fashions for the Short and Portly.

The other employees of Arthur Carlson, the inept station manager whose mother owned WKRP, were Jennifer Marlowe, a brainy bombshell receptionist; Les Nessman, the naive, conspiracy theorist news director; Herb Tarlek, a salesman with a penchant for wearing white shoes and white belts; Bailey Quarters, Andy's shy assistant; and two disc jockeys—the burned-out hip cat, Dr. Johnny Fever, and the jive-talking sartorial sensation, Venus Flytrap.

Although the focus of *WKRP in Cincinnati* was character development, not the illumination of issues in the radio industry, viewers were introduced to the tribulations that came with the competitive territory. The show's theme song alluded to the uncertain lives of on-air talent and radio managers with a reference to "packing and unpacking up and down the dial." Throughout the 90 episodes, the WKRP staff was faced with many legal, ethical, and business matters that reflected the reality of local radio, including the dwindling length of playlists, the anxiety over the arrival of Arbitron ratings books, the use of programming consultants, the emergence of computer-operated radio stations, and the protests of disaffected listeners.

TV's Talk Radio

Another series of the late 1970s having a radio theme was *Hello, Larry*, a major disappointment for the National Broadcasting Company (NBC). It was hoped that the star power of McLean Stevenson, who had played Lt. Col. Henry Blake in *M*A*S*H* for three seasons, would ensure the success of the show. But viewers did not warm to the series about radio talk show host Larry Alder, who moved from Los Angeles to Portland, Oregon, after a divorce in which he gained custody of two teenaged daughters. Working with him on his phone-in show at KLOW were a female producer and an obese engineer. Even a crossover stunt with the popular lead-in series *Diff'rent Strokes*, in which Larry's old Army buddy Phillip Drummond buys the radio station, couldn't generate audience interest.

By the late 1980s, talk radio had become a growth format, and the hour-long dramatic series *Midnight Caller*, which debuted on NBC in October 1988, tapped into the trend. The lead character, Jack Killian, was a San Francisco police detective who had quit the force in despair after he accidentally killed his partner in a shoot-out. His new career as "The Nighthawk," host of an all-night call-in show, allowed him not only to offer advice, but also to become involved in the investigation of crimes and corruption.

The title character of the Fox comedy series *Martin*, which began in 1992, was also a talk show host. He worked for Detroit radio station WZUP until the end of the second season, when the station was sold to a large radio group, the format was changed to country, and Martin was fired by the new

owner. Whether they realized it or not, viewers were getting a feel for the fruits of radio's deregulation.

Frasier

In September 1993, *Frasier*, an NBC spin-off of *Cheers*, introduced a radio-related character who would become one of the most popular in television history. Dr. Frasier Crane left his psychiatric practice in Boston, divorced his neurotic wife Lilith, and moved back to his hometown of Seattle, where his new job was hosting a radio advice show.

Unlike *WKRP in Cincinnati*, *Frasier* was not set principally in the workplace. Frasier's home—an ultramodern luxury apartment with a breathtaking view of the Seattle skyline—was just as often the scene of the action. But Frasier revels in his radio celebrity, and troubles at the station often overflow into his personal life. The heartless economics of radio in the 1990s created many complications for Frasier and his colleagues. Changes in management and a slavish adherence to the bottom line in station decision making are the only permanent features of their careers.

In a 1997 seminar at the Museum of Television and Radio, the executive producer of *Frasier*, Christopher Lloyd, acknowledged that faithful realism to the world of radio was not a consideration in the show's production: "We have people that we consult with that kind of help keep us in check as far as how legitimate things are that we do—you know, the buttons that they push and the carts they throw in and out are sort of like what would happen at a radio station. But beyond that, we don't hem ourselves in too much."

One memorable episode of *Frasier* that was based on an actual radio personality, however, took a swipe at Dr. Laura Schlessinger, whose syndicated daily talk show had become a phenomenon by the late 1990s. In the story, Dr. Nora joins the staff of KACL and begins to dispense harsh criticism and questionable advice to her troubled callers, such as calling a bisexual woman an equal-opportunity slut. But despite her rigidly moralistic approach, Dr. Nora in fact has a tarnished past—including two divorces, an affair with a married man, and estrangement from her mother—that renders her righteousness hollow.

Another 1999 episode of *Frasier* parodied the proliferation of crude shock jocks. KACL's new morning team, Carlos and the Chicken, sponsor a contest with a \$1,000 prize to the listener who sends in "the best picture of Frasier Crane's humongous ass for our website." Though Frasier laments the success of "so-called humorists who rely on cruel pranks and scatological references," he's warned by his friends and family not to confront the duo or he'll continue to be fodder for their gags. As it turns out, Carlos and the Chicken become victims of their own pettiness and thin skins when an argument over who is the funnier of the two breaks up the team.

Alternate Formats

In 1995 two comedy series with a radio backdrop appeared in prime time. *The George Wendt Show* on CBS was based on a popular program on National Public Radio, *Car Talk*, hosted by brothers Tom and Ray Magliozzi. In the short-lived TV series, unmarried brothers George and Dan Coleman cohosted the radio call-in show *Points and Plugs* from the office of their auto repair shop in Madison, Wisconsin. The more successful entry was NBC's *NewsRadio*, which was set at WNYX, an all-news station in New York City. The domineering and abrupt station owner, Jimmy James, hires yet another in a long succession of news directors. The latest news director (played by Dave Foley), young and energetic, leaves Wisconsin for his big break in a big market. In over his head, he also has to contend with the idiosyncratic personalities of his staff, especially the huge ego of on-air anchor Bill McNeal (played by Phil Hartman).

The cable network American Movie Classics presented an original comedy series, *Remember WENN*, beginning in 1996. The show, set in Pittsburgh during the early years of World War II, soon developed a fanatically loyal audience. In each episode the cast and crew of station WENN struggled to create hours of ambitious daily programming on a shoestring budget—and as a result, viewers were well-schooled not only in the vintage art of sound effects and the logistics of microphone performance, but also in the radio genres of the era.

The heroine of *Remember WENN* is Betty Roberts, who came to the station as the winner of a writing contest with the prize of an unpaid internship. When the station's sole writer is overcome by alcoholism, Betty steps into his job and rises gloriously to the task. The show is evocative of the screwball comedies of the 1930s and 1940s but also weaves in elements of engrossing drama. The overarching theme of *Remember WENN*'s four seasons is the sheer romance and unbridled excitement of the medium at its zenith.

Other series that revolved around the radio industry include *The Lucie Arnaz Show* (CBS, 1985); *Knight and Day* (NBC, 1989); *FM* (NBC, 1989); *Rhythm and Blues* (NBC, 1992); *Katie Joplin* (WB, 1999); and *Talk to Me* (ABC, 2000). Several made-for-television movies also depicted historical events and personalities in American radio, such as *The Night That Panicked America*, the story of the 1938 *War of the Worlds* broadcast, and biographies of Edward R. Murrow and Walter Winchell.

Radio in the Lives of Characters

In addition to television's bounty of direct portrayals of the radio industry, a vast amount of fictional TV programming has embedded in it a sense of the importance radio has always held in the daily lives of American listeners. Throughout the nine seasons of *The Waltons*, for instance, the family radio in the

living room was part and parcel of their existence and even served as a key plot element in several episodes. In "The Inferno," aspiring journalist John-Boy travels to Lakehurst, New Jersey, in May 1937 to cover the landing of the German zeppelin *Hindenburg*, the world's largest airship. When he returns to Walton's Mountain after the traumatic incident, there's no need to explain why he's mired in depression. "We heard about it on the Blue Network," says his younger brother Jason. The next day, his little sister Elizabeth makes reference to announcer Herbert Morrison's famous eyewitness account. The night of the disaster, NBC had broken its rigid rules against the broadcast of recordings and aired the dramatic on-the-scene transcription. "Sure sounded gruesome on the radio," says Elizabeth. "The announcer was crying."

As the Depression years gave way to the war years, the Walton's tabletop radio continued to connect them with the world. In the episode "Day of Infamy," Christmastime 1941 is approaching. Oldest daughter Mary Ellen is planning to go to Hawaii to join her husband Curt, a doctor drafted into the U.S. Medical Corps, when, like millions of other stunned Americans, she learns from the radio that the Japanese had bombed Pearl Harbor.

Brooklyn Bridge, a 1991 series set in 1956, presents radio as an essential element in postwar popular culture. The lead character, 14-year-old Alan Silver, and his 9-year-old brother Nate follow the Dodgers baseball games on the radio with religious devotion. In a 1963 episode of *Leave It to Beaver*, Wally explains to his mother June the redeeming social value of the transistor radio. After every ten records they give a news report. "Heck," says Wally, "that's how Lumpy found out about Cuba."

Whatever changes technology will impose on the production and delivery of television programming in the decades ahead, stories of the American experience will continue to include radio as a key player and a rich source of plots and conflicts. In a world seemingly dominated by images, radio remains the most resilient and ubiquitous mass medium. Radio's pervasiveness in modern life cannot be overlooked by storytellers hoping to create characters and situations that, even if impressionistic, ring true.

Ten-Watt Stations

Educational FM Outlets

Ten-watt (Class D) FM stations were created in 1948 as an inexpensive way for noncommercial organizations to operate their own outlets and, at the same time, increase listener traffic on the slow-to-develop FM band. Although educational radio efforts had begun as early as 1930 with the formation of the National Committee on Education by Radio, early operations were limited to a few programs broadcast from commercial AM facilities. By 1936, however, more than three dozen stations licensed to educational entities had managed to get on the air and remain there. Even though these outlets

were not operating on frequencies especially reserved for their use, they did provide a service to limited areas of the country and kept the dream of educational radio alive. Consequently, when the Federal Communications Commission (FCC) authorized full-scale FM broadcasting to begin in 1941, five of the original 40 channels (42–50 megahertz) were reserved for the use of noncommercial educational institutions. Seven school systems and universities were granted FM noncommercial licenses before wartime priorities brought most FM activity to a halt in early 1942.

At the war's end the FCC moved the FM band to a higher (88–108 megahertz) and larger band of 100 channels. The first 20 of these (88.1–91.9 megahertz) were again specifically reserved for noncommercial broadcasters. Educators moved quickly to take advantage of this greatly expanded allocation. Their sense of urgency was heightened by the realization that the commercial networks were abandoning their sustaining (unsponsored and often educational or cultural) programming in search of postwar profits.

The cost of building an FM station, however, remained an insurmountable barrier to many educational institutions. In 1948, at the urging of the National Association of Educational Broadcasters, the FCC approved a new low-power category of FM station. These Class D outlets could broadcast at an effective radiated power of just ten watts and were under less stringent operational and licensing requirements than were larger stations. The policy aim was to create a participatory broadcasting entity with low construction and operating costs that would make it affordable to educational institutions of all sizes.

Ten-watt stations were all to be allotted to the first and lowest channel (88.1 megahertz) on the FM band. Because the audio portion of television channel 6 ends at 88 megahertz, this meant that, by using the fine tuner on their new TV sets, consumers could pull in the signal from their neighborhood Class D radio stations without having to invest in FM radio receivers. If 88.1 had already been spoken for in its locale, a ten-watt applicant was free to request any higher available frequency within the educational band. Although Class D signals seldom carried more than four or five miles unless a more expensive high-gain antenna was deployed, school superintendents and college administrators saw these new audio vehicles as valuable community relations tools.

A typical example was WNAS in New Albany, Indiana, which went on the air in 1949. As chronicled in the high-school oriented *Senior Scholastic* magazine two years later, "Superintendent Henry Davidson wanted a 'voice' for his schools. He couldn't see a way to finance the only kind of station then possible—a high-power station costing from \$50,000 to \$100,000. He waited until the low-power FM station became a possibility for schools. Then he went into action. He found that a 10-watt FM station would cost about \$3,000 to build and equip. (Actual final cost \$3,500.)" Taking the air on 28 May 1949, WNAS was one of the pioneering Class Ds. But honors as the first such facility were claimed by De Pauw University's WGRE, which had fired up its Greencastle, Indiana, transmitter 33 days earlier.

At the time, the FCC required that stations in other classes have full-time first-class licensed engineers on site to perform required technical functions. In contrast, Class D stations were allowed to use non-technical third-class license holders to turn the transmitter on and off and operate the station. Technical

servicing for a ten-watt outlet could be performed by a second-class operator available on call rather than an on-site first-class holder. Class Ds could also go on and off the air at will, a privilege denied higher power stations and one that meshed well with school and university calendars.

In the ensuing years, scores of Class D stations were built. Although the majority were constructed on college and university campuses, some of the most public-spirited were the licensees of independent school districts. The 20 such stations on the air in 1965 programmed a mix of in-school instructional lessons, general enrichment offerings (such as classical music and drama), and community-oriented services (ranging from school basketball games to school board meetings). The formats of college stations, on the other hand, often were more student-programmed and popular-music focused.

By the end of the 1960s, new realities began to threaten the Class D stations' continued existence. FM was now becoming widely popular—especially with younger listeners. As it rose to prominence, the medium's educational channels became increasingly occupied by high-power facilities whose professional staffs viewed ten-watt operations as inefficient amateurs clogging scarce spectrum space. That many of these now full-power outlets had originated as Class Ds was seldom mentioned. The raucous and undisciplined material aired by some under-supervised college-licensed Class Ds was used to indict all ten-watt outlets and undermine the case for their continued existence. The passage of the 1967 Public Broadcasting Act and its creation of the Corporation for Public Broadcasting (CPB) also worked against low-power stations. Expanded and more centralized government funding favored support for wide-coverage-area and professionally staffed public broadcast facilities, rather than limited-range student stations or volunteer-heavy ten-watt operations that were impractical to network and incapable of contributing quality programs for national or regional distribution. When National Public Radio (NPR) was founded in 1971, it brought further structure and substance to national noncommercial radio service, but it marginalized Class D stations even more.

In the early 1970s the public radio establishment introduced via NPR a series of gradually increasing facility, schedule, and personnel requirements for stations to remain NPR members. At the same time, CPB and other federal funding sources dovetailed their requirements for fiscal support with the standards for NPR membership. Although these moves made public radio much stronger, they walled off Class D and other small stations from most external funding. This happened despite the fact that by 1978, 426 outlets (almost half of U.S. noncommercial radio stations) were low-power operations. That same year, the FCC decreed that ten-watt facilities must make plans either to increase output to 100 watts or to assume secondary and preemptable status (meaning that a higher-power station could take their frequency or push them

out of business from an adjoining one). Most Class Ds chose to increase power, although spectrum limitations forced some to relocate. By 1980, the ten-watt noncommercial station was functionally extinct.

Ironically, in 1999 the FCC proposed a new class of "micro radio" low-power FM outlets designed to better serve neighborhood needs and to advance the cause of minority ownership. These "secondary" stations could be commercial, and were projected to operate with outputs of as little as ten watts.

Terkel, Louis "Studs" 1912–

U.S. Disc Jockey, Commentator, Interviewer, and Author

As a self-proclaimed "oral historian," interviewer Louis "Studs" Terkel practiced his craft on Chicago radio station WFMT-FM. During his career, which spanned 45 years, Studs interviewed the rich and famous as well as the average citizen and, in so doing, created a "bottom up" audio history of 20th-century America.

Origins

Louis Terkel was born to Russian-Jewish parents in New York City in 1912. In his youth, his family moved to Chicago, where his father was a tailor. During the 1920s, his family resided in a men's hotel in which transient workers of the day took up temporary residence and practiced their craft until they moved on to the next job in another city. It is there that young Louis spent hours in the main lobby listening to people's stories. In the 1920s, various political movements, such as the Communist and Socialist Workers' Parties, were rising in popularity in America, and many of the workers who lived in the hotel espoused those beliefs. Their stories not only helped to form Terkel's political views but also helped him to develop his unique style of interviewing.

After high school, Terkel attended the University of Chicago and graduated in 1932. He went on to study law at the same institution and received his law degree in 1934. It was in law school that he received his nickname "Studs." Louis was fond of the James T. Farrell *Studs Lonigan* novels. Since Terkel

was often seen carrying those books around, the nickname "Studs" stuck.

After law school, Terkel found work producing radio shows in Chicago as part of the Federal Works Program. He also became involved with the Chicago Repertory Theater, acting as a producer and performer. At the outbreak of World War II, Terkel attempted to join the U.S. Army but was rejected because of a perforated eardrum. He joined the Red Cross, but was again unable to serve overseas. Later he learned that it was actually his left-wing political views that kept him from serving overseas in either capacity.

Terkel on Radio

During the 1940s, Studs Terkel became a familiar voice in Chicago radio as a news commentator and disc jockey. In 1949, he tried his hand at television interviewing when he was given the host's spot on *Studs' Place*, a series on the NBC station in Chicago. After one year, NBC canceled the program. Many believed that the cancellation of *Studs' Place* stemmed from an investigation of Terkel by Senator Joseph McCarthy and the House Un-American Activities Committee. For many years the impact of the investigation made it difficult for Terkel to work in broadcasting, but he found employment with the Chicago *Sunday Times* as a jazz columnist and working in plays around Chicago. Not until the mid-1950s was he offered a daily one-hour program on WFMT called *The Studs Terkel Show*. He

stayed with the program for more than four decades until his last regularly scheduled show on 1 January 1998.

Toward the end of his radio career, Terkel began to flourish as an “oral historian.” He had become famous for getting guests to open up about themselves. Even though he interviewed the famous, he found the average American to be his best subject. He had a reputation for being fair as an interviewer—eschewing the sensational or bombastic and always showing proper respect for his guests.

Perhaps his greatest asset was his unique interviewing style. While Terkel was known worldwide for talking about any subject, his listening skills made him such a good “oral historian.” His subjects were allowed to think out their answers. While this often resulted in moments of “dead air,” Terkel worked with the silence, allowing a person to think through a question and answer at his/her own pace.

Terkel’s work evolved into many best-selling books and oral histories of the 20th century. More than 7,000 hours of interviews have been compiled by Terkel and WFMT and are housed at the Chicago Historical Society.

Tesla, Nikola 1856–1943

U.S. (Croatian-Born) Inventor and Radio Pioneer

Nikola Tesla, the man who made possible the control of electricity using alternating current (AC), also pioneered the wireless transmission of energy, the fundamental principle of radio. In 1943 the U.S. Supreme Court ruled that Tesla’s radio patent for “System of Transmission of Electrical Energy,” granted in 1900, in large part anticipated that of Guglielmo Marconi.

Early Years

Born of Serbian parents in 1856 in Smiljan, Croatia, Tesla demonstrated a phenomenal memory and performed brilliantly in school. He attended the Austrian Polytechnic School, but never completed a degree. Reportedly, Tesla then attended the University of Prague. He eventually found work in Budap-

est as a draftsman for the Hungarian government’s newly established Central Telephone Exchange.

In 1884 Tesla immigrated to New York, where he worked briefly for Thomas Edison, the leading proponent of providing electricity by direct current (DC). As an independent inventor, Tesla developed the AC motor and eventually made the legendary decision to sell all of his 40 AC patents to George Westinghouse. Though his inventions could have made him a millionaire many times over, Tesla “had no business sense nor any real interest in commercializing his work” (Johnston, editor, *My Inventions*, by Tesla, 1982). Tesla received U.S. citizenship in 1891, an honor he cherished above all others.

Tesla’s sensational experimentation and demonstrations with electricity made him a public celebrity and media attrac-

tion. Regardless of his showman persona, “Tesla’s command of high frequency currents placed him at the forefront of late-nineteenth century research into x-rays, diathermy, discharge lighting, robotics, and wireless—his lectures on these and other subjects were stunning successes” (Johnston, 1982). Between 1886 and 1928, Tesla was awarded more than 100 U.S. patents.

Radio Years

Beginning in 1900, the visionary Tesla aimed to create a “World-System” of wireless transmission; the system would use a central transmitter to distribute virtually all forms of information, including voice, music, written communications, and photographs. In essence, it would be a universal wireless radio, fax, and telephone system, but financial difficulties prevented its realization. Tesla had already demonstrated his practical achievements in wireless in 1893 before the National Electric Light Association in St. Louis (Wagner, 1995), and in 1899, when he operated a radio-controlled boat in Chicago. Notably, Tesla’s work influenced Lee de Forest, inventor of the Audion, which made wireless voice transmission possible: “*I aim at Tesla . . . if I reach that I am a long way ahead,*” de Forest claimed (cited in Lewis, 1991).

Tesla’s basic radio application, “System of Transmission of Electrical Energy,” filed on 2 September 1887, was granted 20 March 1900 as patent number 645,576; a subsequent patent, number 649,621, “Apparatus for Transmission of Electrical Energy,” was granted on 15 May 1900. Marconi filed for his first U.S. radio patent on 10 November 1900, but during the next three years, even after his historic transatlantic transmission, the U.S. Patent Office denied Marconi’s patent because of the priority of Tesla, Sir Oliver Lodge, and German inventor Carl F. Braun.

In 1904 the U.S. Patent Office “suddenly and surprisingly” reversed its prior decisions and granted Marconi his patent for radio: “The reasons for this have never been fully explained, but there is little doubt that the decision was influenced by the powerful financial backing for Marconi in the United States” (Cheney and Uth, 1999). The editor of Tesla’s autobiography, Ben Johnston, notes that Tesla “kept a toehold in wireless until World War I by licensing his potentially lucrative wireless patents, but his lack of either financing or corporate ties prevented his litigating the patents effectively” (Johnston, 1982).

Vindication

In 1943 the U.S. Supreme Court finally heard and decided a suit filed by Marconi against the U.S. government for its “infringement” during World War I, when the military took control of all U.S. wireless technology without paying patent royalties. As part of its decision in *Marconi Wireless Telegraph*

Company of America v United States, the Court reviewed the radio patents of Tesla, Lodge, and John Stone. Specifically, it examined Marconi’s patent concerning “the use of two high frequency circuits in the transmitter and two in the receiver, all four so adjusted as to be resonant to the same frequency or multiples of it.”

Chief Justice Harlan F. Stone, in writing the Court’s opinion, pointed out that Tesla’s patent 645,576 “disclosed a four-circuit system, having two circuits each at transmitter and receiver and recommended that all four circuits be tuned to the same frequency.” Although “devised primarily for the transmission of energy,” Tesla also recognized that his apparatus “could, without change, be used for wireless communication, which is dependent upon the transmission of electrical energy.” This included the transmission of an “intelligible message to great distances.”

Regarding the specifications of Tesla’s radio apparatus, Stone wrote that Tesla “anticipated the four circuit tuned combination of Marconi,” save for one feature, the use of a “variable inductance as a means of adjusting the tuning [of] the antenna circuit of transmitter and receiver,” which in actuality “was developed by Lodge after Tesla’s patent but before the Marconi patent in suit.” Based on its review of the patents in question, the Court concluded that “Marconi’s patent involved no invention over Lodge, Tesla, and Stone.” The events of World War II overshadowed the significance of the ruling; its impact diminished even further in that all the patentees and patents involved had expired.

Tesla died, bankrupt and alone, at age 86 in his New York hotel room on 7 January 1943, six months before the Supreme Court essentially rendered Marconi’s patent invalid. More than half a century after his death, Tesla experts and advocates seek to rectify what they see as a historical bias against the unorthodox inventor, whose groundbreaking work in electricity and radio serves as the foundation for many of the devices modern society takes for granted.

Nikola Tesla. Born in Smiljan, Lika, Croatia, 9 or 10 July 1856. Attended Austrian Polytechnic School and University of Prague; worked as draftsman at Central Telephone Exchange, Budapest, Hungary; Continental Edison Company, Paris, France, 1882; arrived in United States, 1884; worked for Thomas Edison briefly; sold patent rights to his system of alternating-current dynamos, transformers, and motors to George Westinghouse, 1885; became independent inventor, 1887; invented Tesla coil, 1891; U.S. citizenship granted 30 July 1891. Granted total of 112 U.S. patents between 1886

and 1928, including radio patents nos. 645,576 and 649,621 granted in 1900. Died in New York City, 7 January 1943.

Theater Guild on the Air

Radio Drama Program

After World War II, the executive officers and board members of the U.S. Steel Corporation became willing converts to anthology drama showcasing company voice advertising. Their program *Theater Guild on the Air* (the *United States Steel Hour* after 1952) helped promote the corporation's public and government relations during reconversion, the postwar period that saw the lifting of price and wage controls and intertwined negotiation of agreements with the Truman administration and the United Steel Workers of America. *Theater Guild on the Air* featured distinct entertainment and educational components. By arrangement with New York's Theater Guild, the program presented adaptations of plays that had little bearing upon corporation "messages" (intermission talks) and messages with little connection to the plays. The separation of the program's dramatic and editorial control extended to U.S. Steel executives' admirable defense of their program in an era of rampant blacklisting, while the show simultaneously provided one of radio's last examples of corporate voice advertising read by corporation officers themselves.

Among large radio sponsors using the anthology format for institutional promotion, U.S. Steel was unique in contracting for program production and, effectively, dramatic control outside of its advertising agency, Batten, Barton, Durstine, and Osborn (BBD&O). Program production responsibility fell to the Theater Guild. Founded in 1918, the Guild aspired to the production of plays not then found in the commercial theater. The Guild championed the work of Bernard Shaw, Eugene O'Neill, Maxwell Anderson, Elmer Rice, Sidney Howard, Wil-

liam Saroyan, George Gershwin, Richard Rogers, and Lorenz Hart. By 1945 a back catalog of some 200 Guild productions provided a ready source of adaptable material for the *Theater Guild on the Air*. Under contract to U.S. Steel, the Guild supplied plays and casts, retaining artistic control under managing director Lawrence Langner, whose long career as a patent attorney representing inventor Charles F. Kettering and others enabled his easy circulation in the world of corporate affairs. The broadcasts were produced by BBD&O's George Kondolf, the former director of New York's Federal Theater Project, and directed by Homer Fickett, formerly the director of radio's *March of Time* and the *Cavalcade of America*.

The autonomy enjoyed by the Guild in the selection and casting of plays, and the confinement of corporation messages to two intermissions, conformed to the broad goals of public relations education and entertainment desired by the corporation. In addition to the *Theater Guild on the Air*'s "commercial aspects," explained U.S. Steel public relations director J. Carlisle MacDonald, the program's "two main objectives were (1) To create a better understanding of the affairs of United States Steel through a series of weekly, informative messages explaining the corporation's policies and describing its widespread activities; (2) To provide the nation's vast listening audience with the finest in dramatic entertainment by bringing into millions of homes every Sunday evening the greatest plays in the legitimate theater." Exemplifying the rewards of such thinking, the first season's plays ("building bigger and bigger audiences for U.S. Steel") included *I*

Remember Mama, *On Borrowed Time*, and *The Front Page* and featured Lynne Fontaine and Alfred Lunt, Walter Huston, Katherine Hepburn, Ray Milland, Helen Hayes, Frederick March, Pat O'Brien, and Walter Pidgeon.

The hour-long *Theater Guild on the Air* featured two intermission talks prepared by BBD&O and read by announcer George Hicks, the "Voice of United States Steel." An American Broadcasting Companies (ABC) radio newsman who had broadcast the 1944 D-Day invasion in Normandy, Hicks brought his dispassionate reportorial style to the delivery of each week's talks. The first described the policies and objectives of the umbrella corporation, and the second described the activities of a subsidiary of "United States Steel—the industrial family that serves the nation." At intermission time, announcer Hicks served up veritable chestnuts of institutional promotion: paeans to the widespread ownership of U.S. Steel corporation stock among all classes of individuals and hospitals, schools, and charitable organizations; to the re-employment of veterans; and to the upgrading and training of personnel. An anthology of plays, including two intermission talks, published in 1947 suggests the program's aspiration to low-pressure salesmanship. A talk inserted between the acts of Sidney Howard's *They Knew What They Wanted*, for example, described the latent consequences of U.S. Steel's vast scale of production, namely, the employment of men and the movement of raw materials. Striving to convey the personal meaning of it all, the text concluded, "So, next time you use any product of steel from a can opener to an automobile, remember—you are benefitting from the skills and energies of literally millions of men who have helped to transfer the raw materials from the earth into the steel out of which come many things to make our lives more comfortable."

Again and again, the U.S. Steel board of directors expressed satisfaction with their radio program, renewing it on an annual basis from 1946 through the 1952 broadcast season. Chairman of the Board Irving S. Olds and President Benjamin F. Fairless remained sold on the bifurcated production arrangement, owing in part to the corporation's prestigious association with the Theater Guild and in part to the public platform that the program provided for Fairless, who personally took to the air to explain the corporation's position during the steel strike of 1949. Anticipating U.S. Steel's move to television, and with it the improved prospect of an agency-produced show, broadcast producer BBD&O successfully lobbied to change the program's title to the *United States Steel Hour* beginning

with the fall 1952 broadcast season. The program's final radio season commenced with Joshua Logan's *Wisteria Trees*, starring Helen Hayes and Joseph Cotten, and concluded with Shakespeare's *Julius Caesar*, starring Maurice Evans and Basil Rathbone.

This American Life

Public Radio Program

This American Life is an hour-long, weekly public radio program that stretches the boundaries of magazine-style entertainment radio with a poignant honesty and flair rivaling, and even exceeding, the journalistic efforts of groundbreaking programs such as *Morning Edition* and *All Things Considered*.

This American Life's website describes the show as follows: "It's a weekly show. It's an hour. Its mission is to document everyday life in this country. We sometimes think of it as a documentary show for people who normally hate documentaries. A public radio show for people who don't necessarily care for public radio."

The brainchild of former National Public Radio (NPR) reporter Ira Glass, *This American Life* is largely a collection of stories that endeavor to examine America from the inside out. Not unlike Charles Kuralt's video essays gathered "on the road," *This American Life* examines America by examining the lives and challenges faced by individual Americans. It does so with a writing style that is highly conversational and uses an "audio vérité" feel, with the frequent use of natural sound (ambient background sounds) and interview segments that are sometimes raw and unpolished.

Although a team of producers, regular contributors, and guests all provide pieces for the show, the soul of *This American Life* comes from host and producer Ira Glass. A Baltimore native who resisted his parents' idea of a medical career to pursue a career in media, Glass originally sold jokes to radio hosts and eventually found a job editing promotional spots for NPR as an intern at age 19.

During his internship at NPR, Glass immersed himself in all areas of news production and reporting, also filling in as a host on NPR programs *Talk of the Nation* and *Weekend All Things Considered*. As a reporter in NPR's Chicago bureau for six years, Glass emerged as an award-winning education reporter, receiving accolades from the National Education Association, Education Writers Association, and the Harvard Graduate School of Education. His best-known work was a longitudinal profile of several Chicago Public Schools students and the successes and failures of the changes imposed on their respective schools by education reforms.

Each hour-long program of *This American Life* is divided into acts—usually three—which communicate a general theme. Each segment is accompanied by a piece of music that supports the theme—either through its title or through the lyrics.

Among the segment titles *This American Life* aired in 2000 were: "Twenty-Four Hours at the Golden Apple" (a Chicago diner, where poignant stories are told by customers

who wander in and out), "Election" (dealing with a high school class election, the production of negative presidential campaign ads, and the genealogy of then candidate George W. Bush, who, the piece claims, may be related to half of Americans), and "Immigration" (which studies the impact of immigration laws on individuals, including a deported legal alien whose country would not take him back). Contributors range from independent producers whose work is heard on other public radio programs to quirky characters such as "Dishwasher Pete," who share their wisdom and stories of real life.

Distributed by Public Radio International, *This American Life* is produced by WBEZ in Chicago, where it is mixed live each Friday evening for distribution to 370 public radio stations around the country. Glass introduces each segment in his matter-of-fact style, never afraid of a lengthy pause or unconventional voice inflections. While his delivery appears somewhat unpolished, the sound of the program is anything but. He and his producers spend a great deal of time editing pieces and copy to create the "relaxed" style of the program.

Glass is responsible for many of the stories told on *This American Life*. *Chicago Magazine* said this about his work: "Glass does stories that are casual and intimate in feeling, that seem almost to start in the middle of the story and are told in unfolding scenes. Sort of like a hipster version of Garrison Keillor." Marc Fisher, writing in the *American Journalism Review*, says that, "Glass is the boy wonder, a rumpiled genius in the minuscule world of radio documentaries, a quizzical character who hides behind trademark oversized black plastic eyeglass frames and takes radio journalism to places it has not traveled before."

This American Life is a program with a clearly humanist slant, which is expressed through compelling stories and amusing send-ups. Its innovative approach and broad appeal helped land a \$350,000, three-year production grant from the Corporation for Public Broadcasting's Program Development Fund in 1997.

As one of the most listened-to public radio programs, it also helps generate significant revenue for stations that carry it during pledge drives. Glass is among the most dedicated of public radio program producers in helping stations with their fundraising, producing a number of highly effective fundraising spots for station use and creating gimmicks such as a "decoder" ring as an incentive for listeners to contribute.

This American Life joins *All Things Considered*, *Morning Edition*, *A Prairie Home Companion*, *Michael Feldman's Whad'Ya Know?*, and *Car Talk* as one of the leaders in public

radio's stable of national programs. The show was honored with a Peabody Award in 1996.

Thomas, Lowell 1892–1981

U.S. Radio Newscaster and Author

Lowell Thomas was one of radio's best-known newsmen from 1930 into the 1970s, but he was also known as the voice of many movie newsreels, the author of more than 50 popular books, and a world traveler and lecturer. He is important in radio history as one of the first national radio newscasters. His evening network news program ran for 46 years.

Early Career

Thomas was born in 1892 in Ohio but spent his formative years growing up in the gold-mining towns of Cripple Creek and Victor, Colorado, where his father was a mining-town surgeon. In the second decade of the 20th century, he focused on developing a career in newspaper journalism while seeking an education, eventually earning several degrees from different schools.

He was sent by the federal government's Committee on Public Information (the Creel Committee) to Europe in 1917

with photographer Harry Chase to report on World War I battlefields in Italy and then in the Middle East. Many of the costs of the trip were underwritten by a number of Chicago businesses. During this period, Thomas met and reported on the activities of T.E. Lawrence, whom other reporters had generally ignored. Thomas helped to make him famous as Lawrence of Arabia with a series of highly popular illustrated lectures in Europe and the United States entitled "With Lawrence in Arabia and Allenby in Palestine." This highly romanticized version of the war in the Middle East played before some 6 million people over six months, helping to make Thomas and Lawrence household names. His 1924 book *With Lawrence in Arabia*, based on his experiences and the lectures, became a best seller.

Thomas spent the 1920s in travel, book writing, and promotion of air travel. He made two trips to the Arctic and a steady income as a popular lecturer, drawing on his extensive travels and adventures in remote areas of the world.

Radio Newscaster

Thomas' first radio broadcast was aired on Pittsburgh's KDKA in March 1925. He talked for an hour about the 1924 around-the-world flight sponsored by the U.S. Army in which he played a small part, about which he'd written a book and on which he was then lecturing. He continued his lucrative travel lectures for another five years. He was then approached by Columbia Broadcasting System (CBS) president William Paley (who had heard him speak in London) to consider anchoring (as we would term it today—the word was not used as such then) a news program on that radio network.

After several auditions, Thomas aired his first 15-minute newscast on CBS on 29 September 1930. In a unique arrangement, CBS carried *Lowell Thomas and the News* in the western United States and the National Broadcasting Company (NBC) carried it in the eastern states for the first year. In 1931 Sun Oil became the program's sponsor and NBC its home network. Over the next several years, Thomas became known for broadcasting from many places—not just a radio studio. He broadcast from an airplane circling above New York in 1930, from a coal mine in West Virginia shortly thereafter, and later from a submarine, a ship at sea, and (after World War II) a helicopter.

He quickly developed an audience who liked his conversational approach to news and his frequent use of anecdotes and human interest stories—perhaps a dozen stories in each newscast. He would make occasional personal asides or comments but avoided any on-air position or political commentary. Thomas wrote and edited his newscasts with the help of Prosper Buranelli (a feature writer for *New York World* and an editor at Simon and Schuster) and Louis Sherwin (a respected drama critic and columnist). His popularity with listeners and advertisers allowed him to negotiate with NBC for permission to broadcast from many remote sites as he continued to travel. He also frequently broadcast from a studio on his estate near Pawling, New York.

By 1936 Thomas' entertaining approach to news reached up to 20 million listeners each weeknight. By 1940, his audience had dropped to perhaps half that size, as many other newscasts had become available, and declined to about 8 million by 1947 when Procter and Gamble brought his weeknight news program back to CBS. In mid 1939 his radio news program was simulcast on W2XBS, the CBS experimental television station in New York, with Sun Oil as sponsor (this is said to have been the first regularly scheduled TV news broadcast). Thomas undertook regular television newscasts in 1943 and 1944, but always preferred radio, which allowed him to broadcast from a variety of places. His weeknight program ran 15 minutes for years, but by the 1970s, with the demise of most network programming, it had been reduced to six minutes.

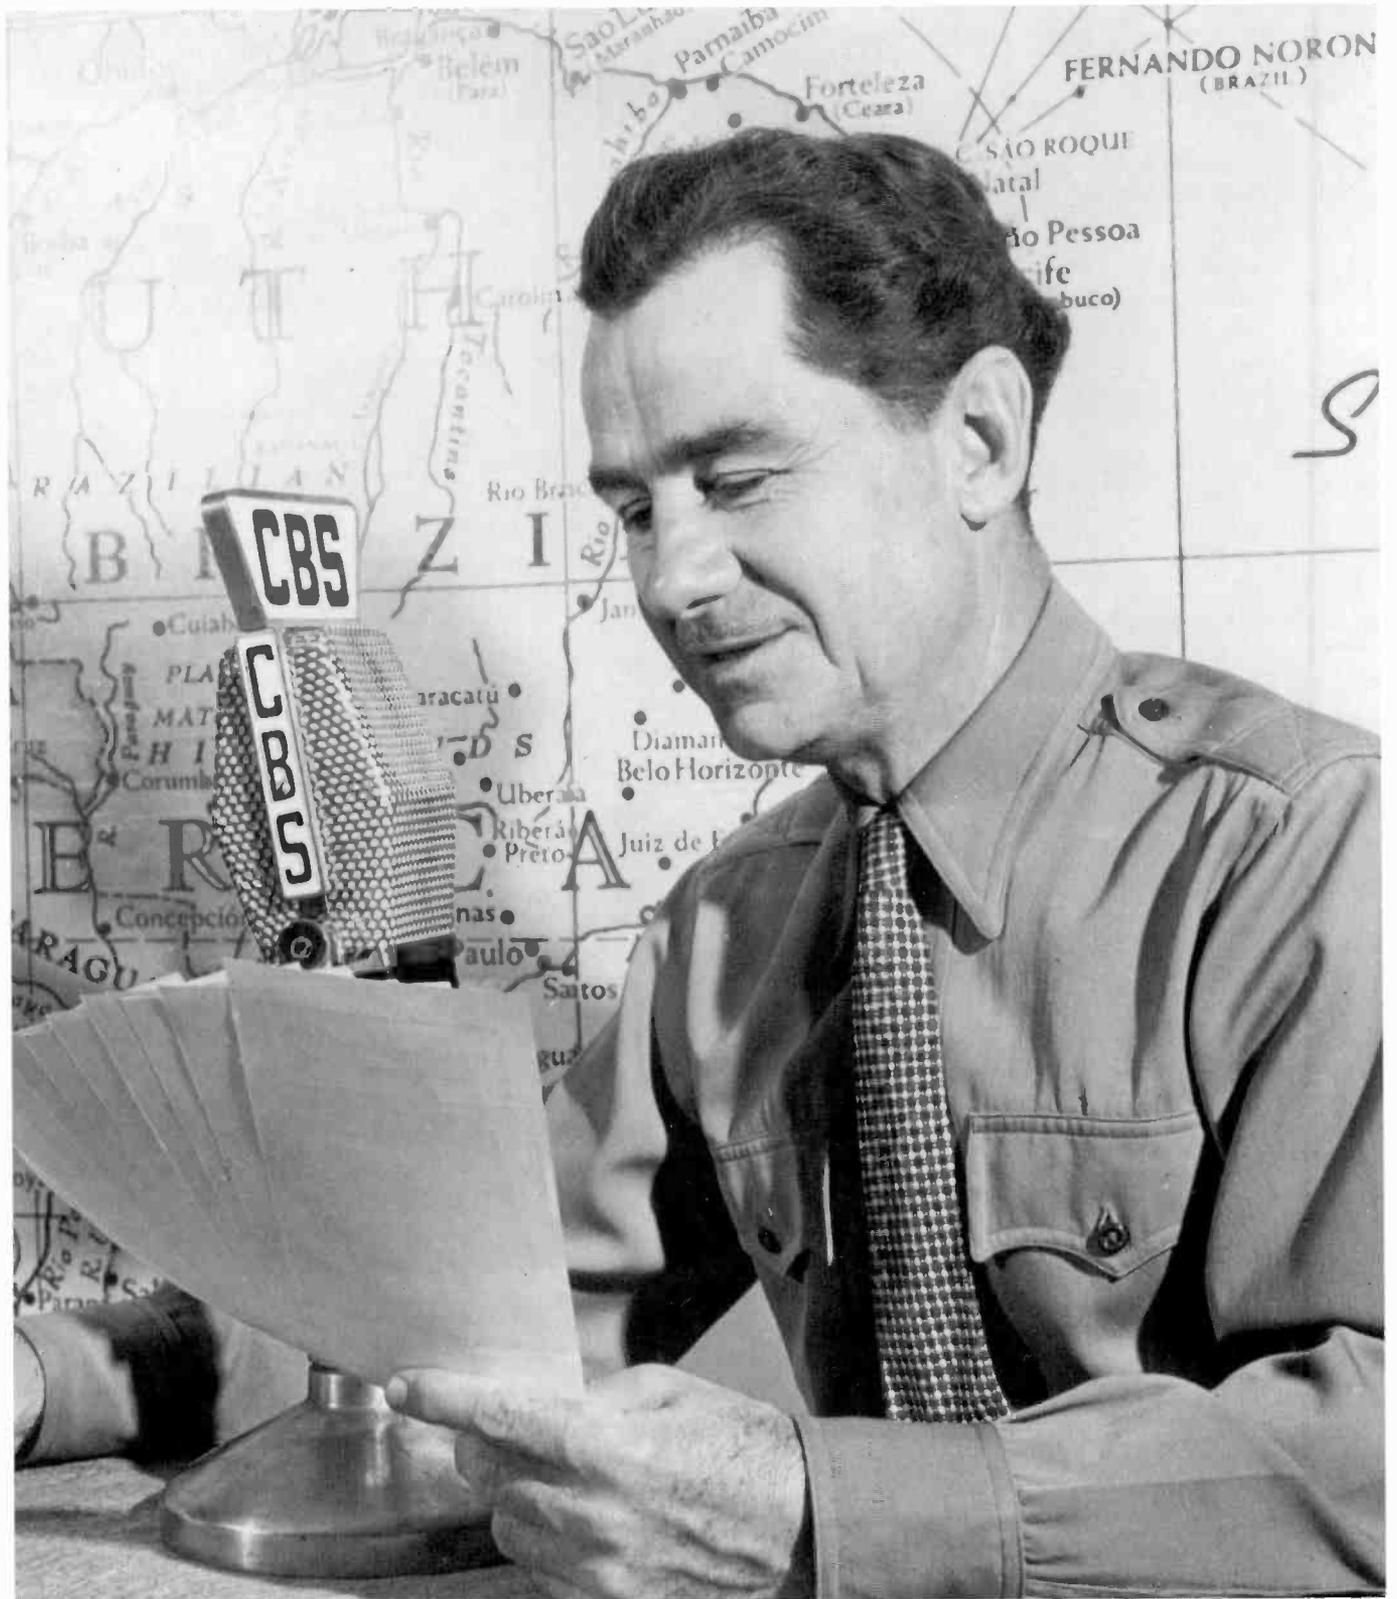

Thomas helped cover the national political conventions of 1952, 1956, and 1960 for CBS. He retired with a final broadcast on 14 May 1976 at age 84 but continued to travel and write until his death five years later. Unique at the start of his career, he was outclassed and bypassed by a younger generation of war-trained radio correspondents during World War II. Still, he retained his popularity virtually to the end of his long radio (and television) career.

The prestigious personal Peabody Award given to Thomas in 1973 noted in its citation:

To Lowell Thomas, twentieth century Marco Polo, a special, personal George Foster Peabody Award in recognition of his incredible 43 years of continuous daily broadcasts on CBS, often originating from every corner of the globe. During this record-setting series which has become the longest continuous run in network history, Lowell Thomas' voice has been heard by an estimated 70 billion persons. During his brilliant career, he has received 25 degrees from universities and colleges. For his authoritative voice and his friendly 'So Long . . .' he has become beloved by listeners of every age in every place. To Lowell Thomas, a Peabody Award in recognition.

Unfortunately, and somewhat strangely, Thomas' two-volume autobiography (*Good Evening, Everybody*, 1976; *So Long Until Tomorrow*, 1977) says little about his broadcasting career. Thomas was never a radio news heavyweight, providing a light touch in his newscasts rather than serious commentary. Although he traveled extensively, he was not a foreign correspondent as those are thought of today—his travels were reflected in his early lecture tours and his books, although not in his broadcasts, which focused on the events at hand. Only in a short-lived series (*High Adventure with Lowell Thomas*) on CBS television in the late 1950s did his programs focus on his travels.

In addition to his broadcast work, Thomas had narrated a host of motion pictures over the years, chiefly acting as the voice for the *Movietone News* series produced by the Fox Studios. In the 1950s, he also provided the voice (very well recognized by then) for early feature films shot in the wide-screen Cinerama process. Convinced that the new format was an important breakthrough, he was an investor and officer in one of the companies making the new movies. Thus he was able to film his commentary for *This Is Cinerama* (1952) in a specially built office (also used for his daily broadcasts) on his estate in Quaker Hill, New York. He also voiced *Cinerama Holiday* (1953) and several later titles, most of which paralleled his own adventurous traveling life.

Lowell Thomas

Lowell Jackson Thomas. Born in Woodington, Ohio, 6 April 1892, first child of Harriet Wagner and Harry George Thomas, both teachers; his father later studied medicine and became a mining-town surgeon. Spent early years (1900–1907) in Cripple Creek and Victor, Colorado, gold-mining camps. Attended University of Northern Indiana (now Valparaiso) and graduated in two years (1911). Reporter, *Cripple Creek Times*; editor, *Victor Daily Record*. Earned second bachelor's degree and a master's degree from University of Denver while working on Denver newspapers. Reporter for *Chicago Journal* while attending Kent College of Law, 1912–14. Master's degree, Princeton University, 1916. World War I correspondent, 1917–1918. Travel and lectures, 1918–1930. CBS news division, 1930; NBC news division, 1931–47; CBS news division, 1947–76. Retired from radio, 1976. Received 30 honorary doctorates and innumerable awards, including the Peabody (1973) and the Medal of Freedom (1976). Died in Pawling, New York, 29 August 1981.

Thomas, Rufus 1917–2001

U.S. Radio Personality

Rufus Thomas was one of the most colorful radio personalities and entertainers of the 20th century. Thomas' training on the American stage in the 1930s and 1940s as a dancer, singer, and comedian catapulted him into broadcasting in the early 1950s. By the turn of the 21st century he had become a highly respected broadcaster and legendary recording artist admired by fans on both sides of the Atlantic Ocean.

Thomas was born to Rachel and Rufus Thomas Sr. on 26 March 1917 in rural Cayce, Mississippi. Two years later the

elder Thomas moved his family to Memphis and worked several jobs to support his wife and four children. At age six Thomas was inspired to pursue a career in show business after he danced on a Beale Street theater stage in the role of a jumping frog for his elementary school play. That experience led Thomas to tap dancing, and he set his goal of becoming the world's best. Later, many of his teachers at Booker T. Washington High School attempted to dissuade him, but Nat D. Williams, his history teacher and a Beale Street emcee, encouraged Thomas.

Williams became Thomas' mentor, but it was Thomas who taught Williams how to tap-dance.

In 1936, after graduating from high school and enduring one economically depressing academic term at Tennessee State University in Nashville, Thomas joined the famous Rabbit Foot Minstrels. He spent three seasons touring with the acclaimed troupe and danced with Johnny Dowdy as part of "Rufus and Johnny." Upon leaving the Minstrels around 1939, he returned to Memphis and began to forge a career on Beale Street. However, as the audience for tap dancing had begun to diminish, Thomas refocused his efforts to writing blues songs for nightclub singers. Thomas commenced his own singing career on Beale Street when a female blues singer did not appear for her show at the Elks Club. He filled in for her on the program and performed "Mr. Jelly Roll," a Lonnie Johnson tune: "She said, Mr. Jelly Roll baker let me be your slave. Be your good jelly I'll rise from my grave." The audience's enthusiasm surprised Thomas; spectators applauded and tossed coins, and Thomas was presented on stage with a \$5 tip coupled with a kiss from a female patron.

By the early 1940s Thomas had made singing a permanent part of his repertoire. He performed with the Bill Ford Band, and worked with the Al Jackson Sr. Band on Beale Street. During the 1940s he rose through the ranks to become a complete entertainer. Always a natural comic, he expanded his skills by forming the comedy team of "Rufus and Bones" with Robert Couch. Under the influence of his mentor, Nat D. Williams, who hosted *Amateur Night from the Palace* on Wednesdays, Thomas perfected his own emceeing skills.

In 1951, three years after Nat D. Williams became a radio disc jockey and helped rescue WDIA from financial ruin, the station hired Thomas. Initially, he imitated a more stoic or "white announcers" style that did not project his personality. He was close to being terminated, but David James Mattis, WDIA's white program director, encouraged him to relax, have fun, and showcase his entertainment background and skills. Thomas credited Mattis with helping him to eschew the anger and hatred that had accrued in response to white-imposed segregation practices and enjoy the new WDIA environment. "After that," Thomas recalled, "I took off like a late freight!"

A relaxed Thomas unleashed his entertainment personality to combine rhythm and blues music with classic Beale Street patois: "I'm loose as a goose and full of juice, so what's the use?" His comedy, up-tempo pace, and rhyming style helped secure WDIA's historical significance as the nation's oldest full-time African-American-oriented broadcasting operation. Equally legendary is the teamwork Rufus Thomas and Nat D. Williams displayed Saturday afternoons on *Cool Train*. Williams hosted the first hour solo, followed by Thomas' own one-hour show. In the third hour they teamed up for pure original vaudeville jokes, laughter, and music (Cantor, 1992).

Thomas made his recording debut in 1943 with "I'll Be a Good Boy and I'm Worried" for Texas-based Star Talent Records, but sales were unimpressive. A decade later, at age 35, his recording of a Sam Phillips song, "Bear Cat," empowered the newly established Sun Records by hitting number 3 on *Billboard's* Rhythm and Blues chart. His national acclaim quickly attenuated after rhythm and blues writers Jerry Lieber and Mike Stoller successfully sued Phillips for copyright infringement on their original "Hound Dog" composition. Thomas' second release on Sun was unsuccessful. Phillips released him, along with other black artists such as Little Milton and Junior Parker, and began recording whites, such as Elvis Presley, who sounded black. Thomas continued to work at WDIA and perform with his band on Beale Street and throughout the mid-South.

In 1959 Thomas wrote "Cause I Love You" and recorded it as a duet with his teenage daughter, Carla, for another newly established company, Satellite Records. The recording became a Southern hit, earned the nascent Memphis label a national distribution contract with Atlantic Records, and helped transform the company into the legendary Stax Records. Then, in 1962, while singing with his band, Thomas experienced a musical epiphany. He noticed a sexy female dancer engrossed in the spirit of a new dance called "The Dog" and performing directly in front of him on the floor-level bandstand. In mid-performance he made a segue into free style rap, ad-libbed, and wrote the song "The Dog" on the spot.

By January 1963, Rufus Thomas' composition and recording of "The Dog" reached number 22 on the *Billboard* chart. His derivative mantra, "Walking the Dog" rose to number 5 on the *Billboard* chart in the fall of 1963. Thomas, then 46 years old, finally retired from his full-time day job as a boiler attendant at American Finishing Company, but not from WDIA. Between 1963 and 1971 he ran off a string of hits that included "(Do the) Push and Pull, Part 1," which went to number 1, and "Breakdown, Part 1," which rested at number 2. Overall, the popular Memphis disc jockey achieved 12 *Billboard* hits between 1953 and 1971.

By the mid-1970s, serious events had shaken Memphis and WDIA such as the civil rights movement, the James Meredith march and shooting, Martin Luther King Jr.'s assassination, and integration's impact on rhythm and blues music. Thomas was affected, too. New WDIA ownership and management did not fully appreciate him or the environment that Mattis had fostered at the station. Mattis left, and Thomas was eased off WDIA as an air personality and assigned to conducting tape delayed interviews. He took a position at cross-town rival WLOK radio for a brief period and then retired to concentrate on music and entertainment. His heart remained at WDIA.

In 1986 WDIA invited Thomas back to the station to make a Saturday morning guest appearance on the *All Blues Show*, in conjunction with the station's 38th anniversary celebration.

Original disc jockeys from the 1940s and 1950s were to be paired with WDIA's current on-air staff. Thomas was teamed with Jay Michael Davis, who had never heard Thomas on the air. Davis found himself brilliantly playing the straight man against Thomas' legendary personality and quick wit. The two men bonded instantly, and Davis asked Thomas back the next week and repeated the invitation until Thomas returned each week as de facto cohost. Thomas worked each Saturday morning call-in music show for a solid year without compensation. Said Thomas, "WDIA is more than a radio station, it is an institution!"

The Rufus and Jay Michaels combo went to number 1 in the market among 35 stations in Memphis, and Thomas was hired a second time by WDIA. The *All Blues Show* remained number 1 on Saturdays for nearly 15 years. At age 82, Thomas was still broadcasting with Davis, even from remote sites when he traveled around the world to perform as a famous recording artist.

In the mid 1990s, Porretta, Italy expanded Rufus Thomas Park and named it Rufus Thomas Camp in honor of his enormously successful annual appearances. In June of 1997 a star-studded gala with blues and rhythm and blues artists such as B.B. King and Millie Jackson saluted him in thanks and praise. The City of Memphis named a street in his honor, and The American Society of Composers, Authors, and Publishers

(ASCAP) Foundation honored Thomas with its Lifetime Achievement Award.

Thomas died in December 2001. People lined the street and applauded as the hearse slowly carried his remains down Beale Street.

LAWRENCE N. REDD

Rufus Thomas. Born in Cayce, Mississippi, 26 March 1917; moved with his family to Memphis, Tennessee, 1919. Began performing at age six. Attended Booker T. Washington High School; graduated 1936. Performed as dancer, singer, and song-writer on Beale Street, from 1936. Began working at WDIA, Memphis, 1951; remained at WDIA off and on for the rest of his life. Helped found Stax Records, early 1960s. Died in Memphis, 15 December 2001.

"Tokyo Rose" (Ikuku Toguri D'Aquino) 1916–

Japanese (U.S.-Born) Wartime Radio Propagandist

No one person specifically identified as "Tokyo Rose" broadcast Japanese World War II propaganda. But after the war, one of several female propaganda broadcasters, U.S.-born Ikuku Toguri, was identified and achieved notoriety as *the* "Tokyo Rose." From 1943 to 1945, she had broadcast messages directed toward U.S. troops fighting Japan in the South Pacific for Radio Tokyo. The term *Tokyo Rose*, however, appears to have been a creation of those troops, as several studies found no trace of the name being used in the actual broadcasts.

Origins

Toguri was born in Los Angeles on the Fourth of July 1916. Her father had come to the United States from Japan in 1899 and married in 1907. His wife immigrated to the United States

in 1913 and the family moved to Los Angeles. Toguri used the first name of "Iva" during her school years in Calexico and San Diego (where her father tried farming). She attended high school and junior college in Los Angeles, where her father had become a successful importer. Toguri then received a zoology degree from UCLA in January 1940 and continued with graduate work in pre-med for another six months.

On 5 July 1941, Toguri sailed for Japan from San Pedro, California; she later gave two reasons for her trip: to visit a sick aunt and to study medicine. That September she appeared before the U.S. vice consul in Japan to obtain a U.S. passport (she had only a birth certificate), stating that she wished to return to the United States for permanent residence there. Because she lacked a passport, her application was forwarded to Washington for consideration, but war intervened before the passport could be issued.

After the December 1941 Japanese attack on Pearl Harbor, Toguri applied for repatriation to the United States through the Swiss legation in Japan but later withdrew the application, indicating that she would voluntarily remain in Japan for the war's duration. Meanwhile she had enrolled in a Japanese language and culture school (having grown up in America, she spoke English far better than Japanese, which she barely understood). For about 15 months beginning in mid 1942, Toguri worked as a typist for the Domei News Agency in Tokyo. In August 1943 she obtained a second typing position with Radio Tokyo. This latter position led to the role for which she became famous.

“Tokyo Rose”

In November 1943, Toguri began her brief career (which would eventually result in her conviction for treason in the United States) as a broadcaster for Radio Tokyo. There were several on-air hostesses for the program known as the *Zero Hour* that became part of Japanese psychological warfare designed to lower the morale of U.S. soldiers in the Pacific theater. *Zero Hour* was broadcast daily (except Sundays), from 6:00 to 7:15 P.M. Tokyo time. Toguri was variously introduced as Orphan Ann, Orphan Annie, “Your favorite enemy Ann,” or “Your favorite playmate and enemy, Ann,” but never as Tokyo Rose. (She apparently adopted the “Ann” name from the abbreviation for “announcer” which appeared on her scripts.)

A typical program in October 1944 began, “Hello, boneheads. This is your favorite enemy, Ann. How are all you orphans of the Pacific? Are you enjoying yourselves while your wives and sweethearts are running around with the 4F's in the States? How do you feel now when all your ships have been sunk by the Japanese Navy? How will you get home? Here's another record to remind you of home.” And with that, the band music that had begun the program (and which made it so popular with its soldier listeners) resumed. Toguri was on the air for about 20 minutes of each program, during which she made comments similar to those noted above and introduced popular records of the day. The rest of the program consisted of news items from the United States and general news commentaries by other members of the broadcasting staff.

It was not until early 1944 that Toguri became aware that U.S. troops had given her—and the other Japanese women broadcasting over Radio Tokyo—the “Tokyo Rose” title. She was the only U.S. citizen given that nickname; as far as is known, the others were all Japanese citizens (and thus were never tried after the war). Reportedly, Toguri was proud of the nickname. On 19 April 1945, she married Felipe D'Aquino, a Portuguese citizen of Japanese-Portuguese descent; their marriage was registered with the Portuguese

consulate in Tokyo. The new Mrs. D'Aquino did not renounce her U.S. citizenship, nor did she discontinue her *Zero Hour* broadcasts despite apparent repeated warnings by her husband. (They were separated in the postwar confusion, though they remained in touch by letter, not divorcing until 1980.)

Postwar Trials

After Japan's surrender in August 1945, the U.S. Army arrested D'Aquino as a security risk, and she was held in various Japanese prisons until her release later that year. After further research, some ill-advised admissions by her to the press about her wartime role, and inflammatory stories by columnist Walter Winchell and others, she was again arrested in September 1948. She was then brought to the United States to stand trial for treason, “for adhering to, and giving aid and comfort to” Japan during the war.

The Federal Bureau of Investigation (FBI) took several years to probe D'Aquino's activities. Hundreds of former members of the U.S. military who had served in the South Pacific during World War II were interviewed; forgotten Japanese documents were unearthed; and six recordings of D'Aquino's broadcasts believed to have been destroyed were discovered. D'Aquino's trial began in San Francisco on 5 July 1949, ending 61 days later on 29 September, when the bitterly divided jury brought in a verdict of guilty on one of the counts against her, after four days of debate. The trial was said to have cost the federal government about a half million dollars and the transcript of the proceedings ran to more than a million words. Of the 46 government witnesses, 16 were brought from Japan, where they had been interviewed originally by the FBI; 26 witnesses appeared for the defense. On 6 October 1949, D'Aquino was sentenced to ten years of imprisonment, fined \$10,000 for treason, and stripped of her U.S. citizenship. She had become only the seventh person in U.S. history to be convicted of treason.

On 28 January 1956, D'Aquino was released from the Federal Reformatory for Women (Alderson, West Virginia), where she had served six years and two months of her sentence. She successfully fought several government efforts to deport her and went to work for her father's store in the Chicago area. She later operated an oriental gift shop there. In 1971 a U.S. district judge held that she still had to pay the remaining \$5,255 of her fine. In November 1976, D'Aquino filed a third petition seeking a presidential pardon (she had previously applied unsuccessfully in 1954 and 1968). This time, one of her supporters was the foreman of the jury that had convicted her in 1949. On 19 January 1977, President Gerald Ford issued her a full pardon.

Top 40. See Contemporary Hit Radio Format/Top 40

Topless Radio

Multiple sexual partners, methods of self-gratification and the pleasuring of others, odd sexual proclivities: though these may sound like some of the recurring topics of shock jocks like Howard Stern, they are actually examples of the hot topics discussed three decades ago on radio. The format of such programs became known as "topless radio."

Similar to much of today's "adult talk" radio and TV, topless radio was a format in which audience members called in to discuss graphically sexual issues with hosts who tried to titillate the audience by teasing every explicit detail out of a caller. Although a predecessor, and perhaps an ancestor, of today's "adult" radio, topless radio initially began as quite a different format and was certainly targeting an entirely different audience.

Origins

Topless radio's humble beginnings in the United States date back to the late 1960s, when some AM talk programs began to experiment with light, humorous discussions about relationships with female callers—aimed at younger female listeners.

FM radio stations, with their higher-quality stereo signal, had begun replacing AM stations as the place of choice to listen to popular music. As traditional talk radio began to fill up the AM airwaves, female listeners tuned out. The new format was an attempt to bring younger female listeners to a format (talk) that attracted predominantly older listeners. Program hosts would ask female listeners to call in to have a candid discussion about "relationship issues." Up until then, radio had carefully avoided direct reference to sex—and innuendo was often dealt with swiftly by the Federal Communications Commission (FCC) with "cease and desist" orders. The medium, and the FCC's oversight of it, lagged behind television, print, and film of the era in terms of dealing with explicit subject matter.

The first topless radio programs required callers to phone the station the night before a program aired. Hosts would discuss topics with callers off the air and edit together a program for later broadcast. Compared to books, film, and even television of the time, the resulting programs were considered to be quite tame. Despite that, the format was considered somewhat risqué by the extremely conservative radio standards of the day. More important, producers felt the shows sounded

“canned” and dry. So in 1971, KCBS in Los Angeles began experimenting with live discussions of sex by women callers that were aimed at female listeners. A male all-night disc jockey for the station, Bill Ballance, hosted the midday show, *Feminine Forum*.

Topless radio was an instant success and quickly spread across the nation. By 1973 there were 50 to 60 stations that allowed only women to call in and talk about the predetermined topic of the day. As the format became more popular and spread to other stations, the content became more explicit. Truly talented hosts were able to draw extremely detailed and explicit answers from their callers. Naturally, listenership grew dramatically.

Complaints to the FCC were also on the rise. As a result, the commission announced that it did not consider topless radio to be in the public interest, as prescribed by the Communications Act of 1934, and the FCC threatened to take action if the industry did not police itself. FCC Chairman Dean Burch considered the format “prurient trash” and did not feel that the format was broadcasting in the public interest, convenience, or necessity. Further, he did not feel that the First Amendment protected broadcasting discussions of this sort in such an easily accessible medium—a medium particularly available to children. Despite these warnings, topless radio programming did not change.

In 1973 the FCC announced its intention to fine WGLD-FM in Oak Park, Illinois, \$2,000 based on two individual excerpts from a show called *Femme Forum*. This was the stiffest penalty then available under the Communications Act of 1934. The declaration did not go without dissent. Two organizations, the Illinois Citizens Committee for Broadcasting and the Illinois Division of the American Civil Liberties Union, along with one FCC member, complained that the ruling was outside the purview of the FCC and went against the organization’s goal to maintain broadcasting in the public interest. They stated that the ruling would have a chilling effect on the discussion of important public issues and that, taken as a whole, the content of topless radio programming (specifically *Femme Forum*) was *not* patently offensive by community standards.

Hoping that this would be a test case of the FCC’s ability to fine stations based on the commission’s perceptions of the obscenity or indecency of the programming, the agency invited WGLD’s parent company, Sonderling Broadcasting, to take the case to court. However, Sonderling, stating that they could not afford the cost of testing such broad constitutional issues in the legal arena, paid the fine instead, and the FCC was denied a judicial declaration of its ability to police radio decency. Despite the lack of a court ruling, the FCC achieved its goal. Not only did Sonderling pay the fine, they also canceled their sex-talk show. Indeed, such shows nationwide were canceled or drastically restructured after this event.

Topless radio was quickly banished. Thanks to the Sonderling fine and similar cases over the ensuing years—particularly the “Seven Dirty Words” case in 1978—the FCC managed to keep references to sex on radio primarily limited to risqué jokes and somewhat suggestive song lyrics. However, the FCC was not able to keep this format off the air for long. Not only did sex talk on the radio return, it evolved into a variety of forms, showed up in a number of parts of the day, and sought out multiple audiences. Particularly important were shifts in the regulatory focus of the FCC from behavioral regulation to allowing marketplace competition to “police” the actions of stations. In 1980, Dr. Ruth Westheimer began her serious but frank discussion of sex on local New York radio. In the early 21st century, Dr. Laura Schlessinger’s nationally syndicated program dealt with moral and ethical discussions of relationships, sometimes resulting in discussions of sexual behavior and choices.

Another offshoot of topless radio is exemplified by Howard Stern—the self-proclaimed “King of All Media.” In the mid-1980s, Stern and several other national and regional hosts stretched the limits of “patently offensive” to the breaking point—dealing with religion, politics, race, and naturally sex in a manner many consider particularly juvenile. Unlike earlier programming, shock radio sought out the lucrative male 18-to-49 demographic. These programs caught and held the attention of their audiences with guests from the porn industry, celebrity feuds, off-color phone pranks, stripping on the air, outlandish phone-in contests, and alternative dating games. Surprisingly, corporations backing this type of radio have managed to forestall significant FCC censure—in many cases simply paying massive fines after stalling the organization for a number of years. As the format cannot advance much further than it has, it appears to have simply spread into other parts of the day. Not only is this format aired at night, it has actually become most popular in evening and morning drive times.

Although the antics in this format have escalated since the early 1970s, topless radio may have helped usher in the new era of explicit radio discussions of sex.

Totenberg, Nina 1944–

U.S. Reporter and Legal Affairs Correspondent

Most of Nina Totenberg's radio reporting career has been focused on the Supreme Court and the other highest levels of America's legal system, including the investigations that have shaken presidents and the role of Congress in legal affairs. She may be best known for breaking stories that helped derail or disrupt the confirmations of Supreme Court nominees. In the process, Totenberg has made powerful enemies and won most of the top awards in broadcasting.

Born in New York City and reared in nearby Scarsdale, New York, Totenberg is the eldest of three daughters of concert violinist and music educator Roman Totenberg. She attended Boston University but left in 1965 to take various newspaper jobs until 1968, when she moved to Washington, D.C., and landed a job on the now-defunct *National Observer*.

While at the *Observer*, Totenberg wrote a profile of J. Edgar Hoover that so enraged the Federal Bureau of Investigation (FBI) director that he tried to have her fired. She recalls it as "the first time a credible news organization wrote a profile of Hoover that was neither a fan letter nor a hatchet job." At the *Observer*, Totenberg began to develop her interest in legal affairs, especially in the background of decisions at the Supreme Court.

In 1973 Totenberg moved on to *New Times*, an irreverent and short-lived national journal, where she created a stir on Capitol Hill with an article called "The Ten Dumbest Members of Congress." One of the men profiled, Senator William Scott of Virginia, compounded the publicity by holding a news conference in which he denied that he was the dumbest.

Totenberg went to work for National Public Radio (NPR) in 1974, learning the basics of radio production from colleagues as she perfected her legal research skills. Her persistent and aggressive reporting style won the admiration of many Washington news people but the ill will of those who were used to thinking of reporting from the Capital as an all-male club. "When I started," Totenberg recalls, "I was pretty much the only girl, and I thought the way to succeed was to be tough as nails. Over the years I've mellowed, but I'm also not the only girl anymore."

Linda Wertheimer, cohost of NPR's *All Things Considered*, ascribes Totenberg's success to hard work and persistence: "She'd do a tremendous amount of research on the whole Supreme Court docket before each session, so she'd go into all those cases knowing a lot about them." Wertheimer, who shared office space with Totenberg in the early years, also recalls that Totenberg was "dogged and tenacious when it came to following up leads. She just wouldn't take no for an answer."

Iran-Contra Special Prosecutor Lawrence Walsh says Totenberg has cultivated a wide network of sources over the years because of "her absolute honesty and trustworthiness" and because she is always imaginative in seeking out people to question.

Her imagination and persistence paid off in 1987, when Totenberg broke the story that Supreme Court nominee Douglas H. Ginsburg had openly smoked marijuana in the 1970s when he taught at Harvard Law School. Totenberg interviewed people who knew Ginsburg at the time, including former students and colleagues. "I was there before the FBI was," she recalls, "and I'm not sure they would have asked." The disclosure embarrassed the Reagan administration, which had promoted the federal appeals judge as a strict upholder of the law. Shortly after Totenberg's report, Ginsburg withdrew his name from consideration.

Totenberg's national fame stems from scoops such as the Ginsburg case and an even bigger one: uncovering sexual harassment allegations against Supreme Court nominee Clarence Thomas in 1991. Thomas' supporters were furious that the allegation had leaked. Senator Alan Simpson of Wyoming attacked Totenberg's integrity when the two appeared together on American Broadcasting Company's (ABC) *Nightline*, and the two had an angry exchange outside the studio that was widely reported. The *Wall Street Journal* ran an editorial accusing Totenberg of being fired from the *National Observer* for plagiarism 19 years earlier. In interviews with *Vanity Fair* and other journals, Totenberg has said that she did copy quotes for a story, calling it "a stupid mistake," but she main-

tains that she left the *Observer* because of sexual harassment from a supervisor. In the end, the Senate narrowly confirmed Thomas' nomination. Totenberg and Timothy Phelps were questioned by the Senate's general counsel but refused to reveal their sources, and Senate leaders declined to pursue contempt citations against them.

Although the more sensational stories have brought her fame, Totenberg has spent most of her career navigating the tamer twists and turns of Supreme Court arguments and congressional investigations. NPR editor Barbara Campbell says Totenberg's forte is summarizing the arguments in Supreme Court cases. "Her paraphrase can often tell you what's going on more succinctly than the speakers themselves, and she gives you the real flavor of the argument." Totenberg often recites portions of the dialogue among the justices and lawyers to show their thinking as it evolves. As she puts it, "The best thing I do is the everyday explanatory work of covering the law and making it interesting and understandable to people who might not otherwise listen, and at the same time, have lawyers say 'she got it right.'"

Tracht, Doug "GreaseMan" 1950–

U.S. Radio Personality

Doug Tracht's alter ego, The GreaseMan, is rude, crude, and politically incorrect. He is also one of the funniest and most creative air personalities on the radio. Rooted in a boss jock routine based on the music-driven radio style of the 1960s, the persona of The GreaseMan led Tracht into the new shock jock arena, using humor that is often sexist and offensive to many groups. The GreaseMan character attracted a loyal fan base by telling elaborate stories and jokes with himself as the central character. He opines about people and events in the news, frequently taking his humor to rude, crude, and violent extremes. To avoid trouble with the Federal Communications Commis-

sion (FCC) and to go over children's heads, he created code words for body parts and bodily functions.

Origins

Doug Tracht was born and raised in the Bronx, New York, where he lived until graduating from DeWitt Clinton High School in 1968. Tracht, a tall, skinny kid, wanted to be macho, and he realized his ambition on radio. At Ithaca College, he worked at the student radio station, vomiting the first time he went on air. Noting that while other announcers "cooked," he

told listeners he cooked with grease. Tracht began developing his unique style, preparing the macho character Nino "Grease-man" Mannelli. After graduating from Ithaca College in 1972 with a broadcasting degree, Tracht developed his Greaseman persona at a string of stations. He worked in New York in 1972 for both WTKO-AM 1470 in Ithaca and WENE-AM 1430 in Endicott. He worked at WAXC-AM 1460 in Rochester, New York, from 1972 to 1974 before moving to WPOP-AM 1410 in Hartford, Connecticut, where he worked from 1974 to 1975.

Washington, D.C.'s WRC-AM 980 hired Tracht to work evenings in 1975–76. Station management was not amused and asked Tracht to drop the Greaseman or leave. He chose to go to Jacksonville, Florida, where Greaseman hit his stride, rising to infamous heights at the Big Ape, WAPE-AM 690, from 1976–81. Tracht developed Greaseman into a "God-fearing, truck-driving redneck." Greaseman became known for his bits, parodies, running gags, ad libs, and his ability to play off of phone callers. For his shows, Tracht does no advance preparation, getting ideas from callers or newspapers while on the air. Tracht's characters include the Lawman, a career he would have chosen had he not found radio. In Jacksonville, Tracht worked as a reserve police officer at night, often doing his morning drive program in full uniform complete with a .44 Magnum pistol. He later volunteered as a deputy sheriff in Falls Church, Virginia.

After leaving WAPE, Tracht returned to Washington, D.C., and WWDC-FM 101.1, replacing Howard Stern in the morning drive slot after Stern's firing. Greaseman maintained Stern's number-one rating and increased the size of the audience. Stern's show, syndicated by Infinity Broadcasting, competed with Greaseman until Tracht joined the same company.

Greaseman prospered at WWDC from August 1982 until 22 January 1993, commanding more than 10 percent of Washington's morning drive listeners. He employed numerous publicity stunts, including a mock presidential run in 1984. In 1993 he turned down a \$6.5 million renewal offer from WWDC to move to Los Angeles, where Infinity Broadcasting nationally syndicated *The Greaseman Show* until 1996.

In 1997 Tracht published *And They Ask Me Why I Drink?* a collection of Greaseman stories and anecdotes presented entirely "in character," with Tracht's real name mentioned only as the copyright holder. Greaseman joined Washington's WARW-FM 94.7 in May 1997, taking over the morning drive time. Tracht was suspended and subsequently fired on 24 February 1999, after playing an excerpt from a song by African-American Lauryn Hill and having "Greaseman" say, "No wonder people drag them behind trucks." His comment referred to the recent dragging death of a black man in Texas. Tracht appeared on TV and radio, including ABC's *Nightline*, BET's *Tonight with Tavis Smiley*, and MS-NBC's *Equal Time* to apologize. Although Tracht does not have a personal repu-

tation as a racist or bigot, he had made a similar comment about Martin Luther King, Jr.'s birthday when it was made a national holiday in 1986. Greaseman suggested "killing four more and getting the rest of the week off." He was suspended but not fired after offering an apology over Washington's WRC-TV.

Tracht has moonlighted as an actor in TV movies and appeared in the play *The Last Session* in Los Angeles during the summer of 1996. Tracht portrayed a sleazy lawyer in a 7 December 1999 installment of *The FBI Files*, a Discovery Channel docudrama series. After being fired in Washington, Tracht hosted *Matchmaker.com*, a cable television dating show using the internet to make love matches. He also did some standup comedy at clubs in Washington, D.C., and Maryland.

The Greaseman returned to the airwaves via syndication on 5 March 2001, working from a studio at "The Grease Palace" (his name for his home). On 10 July 2002, Washington, D.C.'s WGOP-AM became the flagship station for *The Grease Show*, which is syndicated on stations in Maryland, New York, Pennsylvania, and Florida.

W.A. KELLY HUFF

Doug Tracht. Born in the Bronx, New York, 1 August 1950. Attended Ithaca College, New York, 1968–72, majored in broadcasting; worked in radio at WTKO-AM, Ithaca, New York, 1972; WENE-AM, Endicott, New York, 1972; WAXC-AM, Rochester, New York, 1972–74; WPOP-AM, Hartford, Connecticut, 1974–75; WRC-AM, Washington, D.C., 1975–76; WAPE-AM, Jacksonville, Florida, 1976–81; WWDC-FM, Washington, D.C., 1982–93; hosted nationally syndicated *Greaseman Show*, Los Angeles, 1993–96; worked at WARW-FM, Washington, D.C., 1997–99, and fired for racial comment; host of the syndicated *The Grease Show*, from 2001.

Trade Associations

The American radio business has organized a variety of trade associations to both lobby government and promote radio to the general public. While the largest and longest-lasting such group has been the National Association of Broadcasters (NAB), many others have focused on more specific concerns or groups, some of them lasting only a few years. This entry details a few such groups (many others, such as NAB, have their own entry) to illustrate the variety of their concerns.

Clear Channel Broadcasting Service

Organized in 1941, the Clear Channel Broadcasting Service (CCBS) was an association of a relative handful of large AM radio station owners whose goal was to operate maximum-powered (50,000 watt) AM radio stations on “clear channels” without being subject to co-channel skywave interference from other stations, which might reduce their nighttime coverage. Although its stated mission was to conduct “an educational and promotional campaign to acquaint Congress and the members of the public with the need for clear channel stations,” the CCBS—the first special-interest trade organization in the broadcast industry—sought to use every political and legal means available to protect the frequencies its members occupied.

By 1934 numerous smaller stations were already asking the FCC for permission to operate on one of the 40 clear channel frequencies. To fight for the preservation of clear channels and repel this potential incursion, and to lobby for *superpower* license grants similar to the 1934–39 experimental permit obtained by WLW, Cincinnati, Ohio, Edwin Craig of WSM in Nashville, Tennessee, organized 13 independently owned (non-network) clear channel stations into the Clear Channel Group. (Stations owned by the National Broadcasting Company [NBC] and Columbia Broadcasting System [CBS] networks were not welcome to join, because it was felt that the networks had their own agendas and were not passionate about, or necessarily even in favor of, the clear channel movement.)

The CCBS was established on 4 February 1941 and eventually became a replacement for the predecessor Clear Channel Group, because the membership was essentially the same and Edwin Craig was the singular driving force behind both orga-

nizations. The CCBS, however, took a more aggressive stance than the Clear Channel Group had and, with the support of member station contributions, opened a Washington, D.C., office and employed Vic Sholis, a former public information official for the U.S. Department of Commerce, to lead the cause.

Following World War II, the Federal Communications Commission (FCC) launched a plan to break down a number of the clear channels (by letting other stations use them) in a proceeding labeled as Docket 6741. To fight the plan, the CCBS concentrated on building alliances with farm groups and others living in rural America who would support their claims that protecting the clear channel stations was vital to providing satisfactory service to these vast areas.

Although the CCBS was able to delay action, it was not able to stop the FCC from issuing its decision. This occurred on 13 September 1961, concluding that 13 of the clear channels would be duplicated, with the assignment of one fulltime Class II (regional) station to each, with the Commission designating in what area each could be located. CCBS spent the balance of the 1960s seeking congressional reversal of the FCC action while allowing superpower status for several stations. Although it received a degree of support, no bills passed into law. By the 1970s, members' interest in the issue was waning and the organization largely abandoned further legislative battles. The climax of the fight to retain major protected status for clear channel stations came on 20 June 1980, when the FCC released its decision in Docket 20642, declaring that the nation's population would be better served by allowing even more stations to operate on clear channel frequencies than had been permitted under the 1961 decision. Thus, all remaining clear channel stations were now subject to multiple Class II stations, which could operate on what had once been “cleared” channels.

The CCBS, which represented only a limited group of radio stations, was unique as it continued to champion that cause for nearly 50 years. Although CCBS became inactive after the 1980 decision, all of the AM frequencies established as “clear channels” in 1928 are still so designated, and stations originally licensed as Class I still receive a measure of interference protection over and above all other stations on the AM band.

National Association of Farm Broadcasters

By the 1930s, as farm-related broadcasters began meeting informally at various agricultural and broadcast industry gatherings, the need for an organization that focused on their specific needs became evident. On 4 May 1944 the National Association of Radio Farm Directors was officially formed to promote more and better programming directed to American farmers. As TV stations began operating (and, with them, farm-oriented TV reports), the group became the National Association of Television and Radio Farm Directors, adding more than 100 new members, for a total membership of approximately 500. The name was later shortened to the National Association of Farm Broadcasters (NAFB).

Members became aware that to survive, farm programming needed to produce revenue for stations. New emphasis was placed on sales and the acceptance of commercials. By the 1960s the NAFB had made good progress in becoming a business-oriented organization. They set out to tell about producing results for advertisers and proving there was an audience for farm programs.

Early in 1989 the NAFB employed its first fulltime executive director, Roger Olson, who served until 1996 and was followed by Steve Pierson. Under these two men, major focus has been placed on research and obtaining both qualitative and quantitative information about the farm market. By 1998 the NAFB had produced a farm broadcasting presentation on CD-ROM for use by media sales representatives in telling the story of how radio and television continue to provide the vital information needed by farmers as they labor to feed the nation.

The National Farm Broadcast Service was created in 1992 for the delivery of information via satellite, which also made possible the exchange of news stories and interviews by members.

Radio-Television News Directors Association

The Radio-Television News Directors Association (RTNDA) was founded in March 1946 under the name National Association of Radio News Editors for the purposes of setting standards for newsgathering and reporting, exchanging ideas, and “convinc[ing] news sources that broadcast reporters were legitimate members of the journalistic profession.” Later that year the name was changed to the National Association of Radio News Directors. With the onset of TV news programming, the present name (including the word “Television”) was put into place in 1952. Over the years, RTNDA focused on developing both ethical and operational standards for both radio and television news departments.

RTNDA is now a worldwide organization devoted to electronic journalism in all its formats. Thus it represents station and network news executives in radio, television, cable television, and other electronic media in more than 30 countries. By

the turn of the century, membership in the RTNDA totaled more than 3,000 news directors, news reporters and editors, educators, and students.

RTNDA offers professional development programs as well as programs for students of journalism and young professionals, including scholarships and short-term paid Capitol Hill internships. RTNDA also produces an extensive lineup of publications and resources to support the work of electronic journalists, including the *Communicator*, a monthly magazine devoted to reporting on new technological advances, developments in reporting and newsroom management techniques, and topics vital to news facility managers.

Many attend the Association’s annual international conference and exposition held in a different city each year. An independent affiliate of the RTNDA is the Radio and Television News Directors Foundation, which promotes “excellence in electronic journalism” through research, education, and training for news professionals and students.

National Association of College Broadcasters

The National Association of College Broadcasters (NACB) is a nonprofit trade organization for student-operated radio stations. NACB is fairly young, having been founded in 1988 by students at Brown University. In their efforts to establish a student TV station at the Providence, Rhode Island-based school, the Brown students realized the need for an entity that could assist student-operated radio and TV stations in their startup efforts and provide a conduit for exchanging programming, operational, and legal information with other student outlets.

NACB exists to provide students a ready resource for advice and information and a venue for exchanging ideas and innovative concepts. Through such events as its annual National Conference, the NACB functions as a link between the academic and professional worlds of the radio/TV industry. It presents an annual awards program, where individuals and station members from the United States and other countries honor the best work in student electronic media. In addition, the NACB devotes itself to encouraging and supporting student stations and individuals in reaching for and attaining high standards so as to enhance the communities they serve, to provide opportunities for individuals with an interest in media and communications, and to argue their position on pending laws or regulations that might affect student media.

Radio Music License Committee

The Radio Music License Committee has a very specific function. Made up of broadcasters who volunteer to represent their industry’s interests, the committee negotiates with the two largest musical performing rights organizations, American Society of Composers, Authors, and Publishers (ASCAP) and

Broadcast Music Incorporated (BMI), to establish acceptable fees and terms for the performance of music by commercial radio stations in the United States.

Originally known as the All-Industry Music Committee, the committee took over this function from the NAB in the early 1940s. The NAB itself had been formed (in 1923) by a group of broadcasters who found ASCAP's fee requests to be unacceptable. In 1970 it was agreed that radio and television's performance of music raised different negotiating concerns requiring different approaches. Hence, the organization divided itself into two separate entities, and the Radio Music License Committee was born. It is an independent body, having no affiliation with the NAB.

Officially, the Committee negotiates on behalf of its member stations—those who voluntarily fund it—yet, for all practical purposes, it represents most of the radio industry, because the blanket and per-performance license fee structure agreed upon applies to all stations and producers. When unable to reach agreement with either ASCAP or BMI, the Committee more than once has commenced litigation under the federally imposed consent decrees, which require both music licensing organizations to set reasonable fees and terms for radio station licenses. Generally, agreements are renewed with the two entities for a four- or five-year term.

Broadcast Measurement Bureau

The Broadcast Measurement Bureau (BMB) was a brief experiment by the National Association of Broadcasters to provide a service comparable to that of the Audit Bureau of Circulation (ABC).

Beville (1988) describes the ABC as “a nonprofit, tripartite, self-regulatory, voluntary organization established in 1914 and supported by the entire print media and advertising industry.” The ABC provides independent audits of circulation figures of newspapers, magazines, journals, and internet media. In its own words, “by creating an independent currency for measuring its value, the ABC makes the sale and purchase of print, exhibition, and internet media both easier and efficient.” In the audits, individuals whom the various media assert are in the audiences of a publication or exhibition are independently contacted to assure that they are indeed readers, participants, or viewers as claimed. The governing board of ABC includes representatives of national and regional advertisers, newspapers, and other organizations. Advertisers, agencies, and publications pay an annual fee to receive publications reporting the independent audits.

In 1945—in an attempt to parallel ABC methods for radio—the broadcast industry organized the BMB to conduct radio station coverage surveys. Their method involved a survey form mailed to listeners, who would verify the stations they received and listened to. A private research firm that had con-

ducted some methodological work along these lines was engaged to conduct a national survey. Broadcaster subscriptions supported this study.

Following the apparent success of an initial survey, a second was launched three years later. It did not meet its expenses because of a lack of subscriptions by radio stations. It appeared that some stations, pleased with the results of the first study, did not wish to risk less impressive results in a second survey, while other stations, dissatisfied with the first survey, saw no reason to support a survey likely to deliver bad news a second time.

Faced with this lack of support, BMB collapsed. The NAB paid \$100,000 to the researchers so that the few broadcasters who had subscribed would receive complete reports. Beville theorizes that BMB was doomed to failure, if the objective was to impress advertisers. In his view broadcaster-supported research would always seem tainted to advertisers and their agencies.

International Radio and Television Society Foundation

The International Radio and Television Society (IRTS) Foundation is a New York City-based service organization whose goal is to “bring together the wisdom of yesterday's founders, the power of today's leaders, and the promise of tomorrow's young industry professionals.” The emphasis here is more on education than lobbying.

The IRTS evolved from an organization founded in 1939 when a group of radio executives began meeting informally to discuss mutual interests. Because electronic media face continual change at every level, there is a constant need for development of training and information. IRTS seeks to provide education and on-going dialogue about important communication issues.

IRTS membership includes professionals across a variety of disciplines encompassing all modes of electronic content distribution, including radio, broadcast television, cable television, computer, direct broadcast satellite, and telephony.

Each year, IRTS presents approximately 45 programs, including monthly luncheons with a newsmaker as the guest speaker, seminars, and dinners, which help fund the organization's electronic media educational programs. These include a faculty/industry seminar, where university professors meet with industry leaders in New York for five days of intense sessions; the preparation of case studies to assist communications and business school professors in their teaching of media-related topics; minority career workshops; and an annual nine-week summer fellowship program.

Many other radio organizations have appeared and faded away over the years, including those representing radio DJs, sales personnel, financial managers, promotional personnel, stations interested in providing on-air editorials, and classical music stations.

Trade Press

Reporting Radio's Business

The radio or broadcast trade press consists primarily of weekly magazines and newsletters (some now available via internet delivery) that serve an audience of people working within the radio industry—including broadcasters, engineers, managers, program personnel, manufacturers, investors, and others. These publications report what is happening in the radio business and related fields, technological developments and trends, regulatory actions and decisions, and information about people in the industry. They often take a strongly pro-business editorial stance. Some trade periodicals are published as a function of professional organizations, others are published by manufacturing companies, but most are advertiser-supported commercial ventures. Most focus on the American scene, but some deal with comparative or international activities as well.

The trade press excludes publications directed at the general public, including fan magazines, hobby publications, scholarly journals, radio program guides, and the like. A selection of radio-specific titles (most of them American) are highlighted here. Some lasted for only a short time and either disappeared or merged with other periodicals, but others have continued on for decades.

Origins (to 1940)

The earliest related trade periodicals served the electrical and telegraph and telephone industries in the late 19th and early 20th centuries. Journals such as *The Electrical Engineer* (1882–99, weekly) and *Journal of the Telegraph* (1867–1914,

monthly) included early reports on wireless telegraphy experiments and applications. The venerable show business papers *Billboard* (1894–present, weekly) and *Variety* (1905–present, weekly) created models of the entertainment trade paper genre that would blossom in the decades to come, and both regularly covered broadcasting from its inception. For a few years from the late 1930s into the early 1940s, *Variety* published an annual *Variety Radio Directory*.

Trade publications focusing on radio broadcasting emerged as regular broadcasting began in the 1920s. Some of these early publications included information of interest to amateurs, broadcasters, manufacturers, and even audience members, but they became more focused as the industry itself began to settle into a pattern. *Radio Broadcast* (1922–30, monthly) was the most important of these early titles, combining feature articles that at first appealed to both listeners and broadcasters. Technical information concerned building and operating receivers as well as station equipment, and the magazine carried more advertising than any of the other early radio journals. The monthly provided its readers with a broad cultural understanding of radio at first, but it became more technical and aimed at industry figures later in the decade, when the masthead noted that it was published “for the radio industry.”

Focusing on the equipment side, as many early trade papers did, *The Radio Dealer* (1922–28, monthly) was a pioneer aimed at retailers of radio receivers. *Radio Retailing* (1925–39, monthly) took similar aim and was also supported by manufacturer advertising. Its editor, Orestes Caldwell, eventually served as a member of the Federal Radio Commission (most early edi-

tors were radio enthusiasts, and several others emerged as key figures in the development of the radio industry).

Perhaps the most influential of radio industry trade magazines is *Broadcasting* (1931–41, biweekly; 1941–present, weekly). The creation of Sol Taishoff and Martin Codel, this was primarily a newsmagazine from the start, and it built close relationships with the Washington industry and policy community. Taishoff and Codel's combination of journalistic experience with a wide network of contacts rapidly built the magazine into an industry staple, which added an annual year-book directory number in 1935 (which is still published). Its advertising featured major stations, network and syndicated programs, and broadcast equipment.

As the industry grew in size and complexity, weekly publication was insufficient to follow all the developments and issues. This fact gave birth to *Radio Daily* (1936–50), which began to focus more on television and became *Radio Daily–Television Daily* (1950–62), and finally *Radio-Television Daily* (1962–66), “the national daily newspaper of commercial radio and television.” The daily grew in size—from four pages in the 1940s to eight pages in tabloid format with photos. (It published a long-running *Radio Annual* beginning in 1938.) No publication devoted to radio has appeared on a daily basis since, though many broader publications (e.g., *Communications Daily*, which began in 1981) include radio issues and trends.

Radio Faces Television (1940–80)

The rise of a more complex broadcast industry during and after World War II gave rise to more specialized periodicals. *FM* (1940–48, monthly) underwent several title changes as it broadened its coverage to deal with shortwave and television in addition to frequency modulation broadcasting. *Frequency Modulation Business* (1946–48, monthly) was even more focused on management issues, perhaps explaining its shorter life, given FM's quick initial postwar peak and slow demise at the end of the 1940s. Because of wartime production shortages, *Radio Retailing Today* (1942–44, monthly) had a short life. *Radio Showmanship* (began monthly publication in 1939) offered stories and features for advertisers and station executives on program ideas and promotions for different types of products.

As radio began to face fierce competition from television, previously radio-only publications expanded their coverage. *Broadcasting*, for example, became *Broadcasting Telecasting* from 1949 to 1957, devoting increasing space to television beyond that point, and *Radio Daily* focused more and more on the visual medium. *Sponsor* (1946–68, monthly) increasingly focused on television, having begun with a devotion to radio advertising. On the other hand, a growing number of specialized radio-only publications began to appear. *Inside Radio*

(1976–present, weekly) is a newsletter aimed at radio executives, programmers, and syndicators that is filled with competitive tips in a no-advertising format.

Development of a host of competitive radio management and programming journals demonstrated radio's post-television comeback and the growing competition among both FM and AM stations. *Radio and Records* (1973–present, weekly), touting itself as “the industry's newspaper,” built on the symbiotic relationship between recorded music and broadcasting, including widely used music playlists. Claude Hall's *The International Radio Report* (1978–present, weekly) plays a somewhat similar role, claiming “the most accurate [music popularity] charts in the world.” *Radio Only* (1978–present, monthly) calls itself “the management tool” and deals with all aspects of radio management, sales, and programming. *Inside Radio* (1976–present, weekly) is “the confidential newsweekly for radio executives, programmers, and syndicators,” focusing on hot news, sales tips, and ratings news. With the dramatic post-1996 ownership changes in the radio business, *Inside Radio* began to issue *Who Owns What* (weekly), a newsletter listing the merger and acquisition activity of major radio group owners.

Company Publications. Several manufacturers published their own trade journals, which sometimes rose above being mere advertising vehicles. Perhaps the first was a product of the Marconi Company, which began publishing the monthly *Wireless Age* in 1913, well before broadcasting began, and continued it until 1925. *RCA Review* (1936–85, quarterly) and *Broadcast News* (1941–68, monthly), both published by the Radio Corporation of America (RCA), largely touted company products and applications but also provided useful information on studios and broadcast equipment. The *Review* offered research papers by RCA engineers. Archival copies remain a useful way to trace station technical development and design. Philips, General Electric, and several other firms issued house organs as well, many of which focused on radio technology.

Association Publications. Issued for members of organizations, such as engineers or broadcast journalists, or for broader trade associations, these often focused on radio. Over the years, for example, the National Association of Broadcasters (NAB) issued many (usually monthly) periodicals concerning radio, including *FMphasis* in the 1960s as the FM industry began to grow again, and *Radio Active*, a monthly, which became *Radio Week* (1988–present, weekly). All of these focused on Washington policy concerns, general industry trends, and NAB activities—and took a strongly pro-industry point of view. The monthly *RTNDA Bulletin* (1952–70) and *Communicator* (1971–88) helped to tie the nation's news directors together with reviews of common problems, though from the beginning the focus was on television rather than radio. With a focus on stations devoted to Christian programs

and music, *Religious Broadcasting* (1969–present, monthly) is a publication of the National Religious Broadcasters.

Technical Journals. Engineering association publications are technical in nature or focus on radio production techniques. *The Proceedings of the Institute of Radio Engineers* (1913–62, monthly) was the vehicle for many important technical announcements, including Edwin Armstrong's pioneering FM paper in 1936. Aimed at electrical engineers, its contents were wholly technical, with advertising to match. It has been superseded by a host of publications from the Institute of Electrical and Electronic Engineers. *Audio* (1954–present, monthly) has long dealt with "The World of Sound." It began as *Pacific Radio News* (1917–21), then became *Radio* (1921–47), and later became *Audio Engineering* (1947–54). The *Journal of the Audio Engineering Society* (1953–present, quarterly, monthly, then semimonthly) began as the *Broadcast Equipment Exchange*, a tabloid newspaper dealing with both new and used station equipment. It took on its present title in 1980 and broadened its coverage to station engineering management as well as new technology. *Mix* (1977–present, monthly) is one of the recording industry journals that blur the line dividing radio and sound studio work. First a quarterly and then a monthly, *Mix* offers information on both new technology and its applications.

Non-U.S. Publications. Naturally, a thriving broadcast trade press exists in several other nations as well. There is space here to cite only a few English language titles. *Broadcast* (1973–present, weekly) began in 1959 as *Television Mail* and has become the key trade periodical for British broadcasting, covering all aspects of radio and television, including the British Broadcasting Corporation (BBC) and commercial services. *Broadcaster* (1942–present, monthly) does the same thing for all aspects of Canadian radio and television broadcasting. It provides directory issues listing stations and systems plus related firms and associations twice a year. *Asian Broadcasting* is a Hong Kong–based bimonthly reporting on programming and business aspects of radio and television; it also issues a technical overview covering the region from Egypt to Japan. *The Asian Broadcasting Technical Review* (1969–present, bimonthly) reports on technical developments and equipment trends among Asian nations.

Modern Era (Since 1980)

By the 1980s, specialized radio publications broadened their comeback, encouraged by the continued growth of the industry. *Radio Ink: Radio's Premier Management and Marketing Magazine* (1985–present, monthly) deals with all aspects of commercial radio operation, especially programming. *Digital Radio News* (1990–present, bimonthly) is a newsletter that first appeared just as serious thinking about digital radio began. Although regular digital audio broadcasting has been

delayed in the United States, this publication has reported on related terrestrial and satellite developments.

On-Line Publications

The rise of the internet as a means of effective business communication is very evident in the radio trade press. Indeed, in time, the internet will probably totally transform the whole trade press business. Many radio magazines, including *Billboard*, *Broadcasting & Cable*, *M Street*, *Radio Business Report*, *Radio Ink*, and *Radio & Records*, offer extensive on-line versions of their print publications, some available only to subscribers, others to all comers. *Streaming: The Business of Internet Media* (formerly *eRadio*, it is published by Eric Rhodes, who also issues *Radio Ink*) first appeared as a monthly in May 2000 and offers (fittingly) on-line features. *Radio World* offers readers an email updating service. *FMQB (Friday Morning Quarterback)* began in 1968 and is now a 50-plus page glossy weekly, covering programming, management, music, promotion, marketing, imaging, and airplay for various rock and rhythm crossover formats—with an extensive internet presence as well. On-line versions of these titles often closely parallel the print editions, even to layout. But on-line editions often provide more stories and greater depth than the print version can.

Others, such as the *Radio and Internet Newsletter* (founded in 1999), are primarily on-line publications. Such "publication," of course, is vastly less expensive in that printing and distribution costs are non-existent. Further, on-line publication allows regular updating, even new daily releases. How many of the internet-only publications can survive without a strong advertising or subscriber base, however, remains to be seen.

Transistor Radios

When the first transistor radio was introduced to the American market during the November 1954 holiday season, no one recognized it as the precursor to a technological revolution. Apart from electronics buffs, consumers appeared to greet the miniature radios with a collective yawn.

The initial development of transistors in the late 1930s was conducted by physicists working for Bell Laboratories, the research division of American Telephone and Telegraph (AT&T). They were trying to create an electronic device that could replace vacuum tubes, something much smaller that would consume significantly less electricity and generate less heat. World War II interrupted those efforts. In 1948 Bell Labs announced the development of the transistor. William Shockley, John Bardeen, and Walter H. Brattain would share the 1956 Nobel Prize for Physics for its invention.

Texas Instruments (TI) was a small seismic-survey company that built its own survey equipment. During World War II, there was little demand for oil exploration, so the company used its electronics capability to build systems for anti-submarine warfare. In 1952 TI was one of 20 companies that paid Western Electric (the manufacturing division of AT&T) \$25,000 for the right to produce transistors.

In 1954 TI constructed a transistorized pocket radio. Concerned that it was introducing an unknown in the consumer electronics market, TI took its six-transistor design to radio manufacturers. The reception, according to marketing director S.T. Harris, was unimpressive. His phone calls, letters, and telegrams to every major radio manufacturer in the United States produced no response.

Finally, in June 1954 a small Indiana company, the Industrial Development Engineers Association (IDEA), agreed that its Regency division would produce and market the 12-ounce, 3-inch by 5-inch radio. Production began in October just in time for Christmas sales in November. The TR-1 sold for \$49.95, and the accompanying brochure extolled its pleasures: "in pocket or purse anytime, anywhere, you can be sure to hear that favorite program . . . be sure not to miss that vital

installment of soap or horse or space opera . . . check scores, weather results, news . . . have music wherever you go at those times when music adds so much . . . and the Regency Radio can play for you alone without disturbing others around you or the whole group can share" (White, 1994).

Initially, consumers were slow to adopt transistor radios. After World War II, Americans wanted products that left behind the austerity of the war years. Automobiles and appliances were bigger and flashier. A tiny radio with an earphone resembling a hearing aid did not fit the American shopper's self-image as a prosperous trendsetter—and the relatively high price was an obstacle as well.

It was not until the end of the 1950s that the tiny portable radio would find its niche, but it would take the rock and roll revolution to fuel the increased demand for pint-size radios that teenagers could carry with them wherever they went. In 1955 Bill Haley and the Comets were the first to have a rock and roll record reach number one on the Billboard chart. "Rock Around the Clock" stayed in the number-one slot for eight weeks. A number of music historians mark the occasion as the birth of the rock and roll era.

Radio stations quickly realized that teenagers were a large part of the audience—and that they were clamoring to hear more Elvis, Paul Anka, the Everly Brothers, and others. Stations across the country quickly adopted the new Top 40 format. Parents were less than thrilled with rock music. "Turn that thing down," was the common refrain. Earplugs allowed teenagers to listen to transistor radios without antagonizing adults. The small size also permitted surreptitious listening while huddled under the covers at night after lights out. One of the inventors of the transistor is reported to have joked that he might have reconsidered the invention had he known it would allow kids across the United States ready access to rock and roll.

The head of International Business Machines (IBM), Thomas J. Watson, Jr., was another who recognized the importance of transistors. After reluctant engineers made little effort

The first commercial transistor radio, the Regency TR-1

to incorporate transistor technology in computers they were designing, Watson bought several hundred Regency TR-1 radios. He ordered that no more computers be built using vacuum tubes after 1 June 1958. To those engineers who complained, he gave a TR-1 to make his point. Soon IBM was building computers using transistors from TI, \$200 million worth by 1960.

American radio manufacturers started building transistor radios in the mid-1950s, with nearly 5 million radios produced by Admiral, Arvin, Emerson, General Electric, Raytheon, Radio Corporation of America (RCA), Westinghouse, and Zenith by 1957. That same year, the first Japanese transistor radio was sold in the United States. It was manufactured by

Tokyo Telecommunications Engineering Company, a new corporation created immediately following World War II. Soon its name would be changed to something catchier for the international market: Sony. Other Japanese companies quickly followed Sony's lead. By 1959, 6 million radios were coming into the United States from Japan, a highly successful launch into the world market of consumer microelectronics.

In 1960 almost 10 million transistor radios were sold in the United States. That number would increase to 27 million radios in 1969. No longer were they owned exclusively by young people. Americans of all ages had discovered the convenience of a tiny radio that could go anywhere. The transistor radio had become ubiquitous in American life. Baseball fans kept up with the World Series; American soldiers in Vietnam listened to Armed Forces Radio broadcasts.

In the 1960s, innovators realized the transistor radio apparatus fit nicely into a variety of small cases. Model cars, soft drink bottles, and wristwatches were among the many novelty radios that needed only a company's name and message to make it a successful advertising tool. Novelty radios continue to be popular today, coming in every shape imaginable from a radio in a stuffed teddy bear to a fish containing a water-resistant shower radio.

Tremayne, Les 1913–

U.S. Radio and Film Actor

With a long acting career marked by his first film role in 1917 as a child actor, initial radio role in 1931, an appearance on television in 1939, and re-entry into films in 1951, Les Tremayne was a frequently heard and seen actor in a variety of media. His role as a radio actor on soap operas and mysteries included *Adventures of the Thin Man* and *The First Nighter Program*.

Born in London, Tremayne moved with his family to America in 1930 while in his early teens. He was educated in classical Greek drama at Northwestern University, and later took courses in anthropology at both Columbia University and the University of California, Los Angeles. Tremayne first went on the stage in the early 1930s, where his distinguished approach and full deep voice served him well in a variety of roles.

He began his long radio career playing a suitor in *The Romance of Helen Trent* (1933), the first of what would become thousands of golden age broadcasts, notably as the star of the long-running anthology *The First Nighter Program*, where he played a variety of usually romantic leads (1936–43). At almost the same time he played regularly on the drama *Grand Hotel* (1934–40) and (more occasionally) the role of Bob Drake on *Betty and Bob* (1935–39). After the war he played the lead role of Nick Charles in *Adventures of the Thin Man* (1945–50) and Michael Waring in *The Falcon* (1946–49). He found time to star in a Broadway production in 1948–49. In 1949 he and his wife appeared on a noontime interview and chat program on New York's WOR.

With the decline of network radio acting opportunities, beginning in 1951 Tremayne turned primarily to playing roles as a film actor. His initial roles were as fairly serious characters (often military officers or scientists) in otherwise somewhat fantastic science fiction films, some of them distinctly "B" movies. In addition Tremayne showed up in several non-genre efforts, usually in small but substantial roles such as the auctioneer in Alfred Hitchcock's thriller *North by Northwest*.

Still later Tremayne became busy with television roles, including those as a commercial spokesman and voice-over artist. He appeared in, among other series, the prime-time TV version of radio's *One Man's Family* (1951); as Inspector Richard Queen in the reincarnation of the early 1950s *Ellery Queen* series (1958–59); and as the character Mentor on the Saturday morning weekly cartoon *Shazam!* (1974–77). He

played various voice roles in a host of other animated television and film productions.

Tremayne was voted the best radio actor in 1938 and one of the three most distinctive voices in the United States in 1940. He was elected to the Radio Hall of Fame in 1995.

CHRISTOPHER H. STERLING

Lester (Les) Tremayne. Born 16 April 1913, in London to Walter Carl Christian and Dorothy Alice Gwilliam. Moved from England to the United States in 1930. Educated in Greek drama at Northwestern University (1937–39), and in anthropology at both Columbia (1949–50) and UCLA (1951–52), but no degrees earned. Many roles in radio dramas, 1933–49.

Trout, Robert 1908–2000

U.S. Broadcast Journalist and Radio Commentator

In a long and varied career, Robert Trout brought a professionalism and legitimacy to the fledgling news operations of commercial radio. Beginning with his work as announcer on President Franklin Roosevelt's "fireside chats," Trout also established himself as radio's premier commentator on the political process.

Born in 1909 in North Carolina, Trout became obsessed with radio, building a crystal set when still an adolescent. Like many young boys, he was amazed at tuning in to all parts of the country, and a wanderlust was also sparked that would define his adult personality. Wanting to become a novelist, he got into the radio business by accident. In 1931 he applied for a job for which he had no skills at WJSV, a small station in Mount Vernon Hills, Virginia, and was given an unpaid position of all-round handyman. When one announcer failed to show up, Trout was asked to substitute, and his deep, resonant voice impressed the station manager. Seeing himself as a "very poor man's Will Rogers," Trout performed a variety of tasks on the air: reporting local events; playing country records; giving folksy advice; and parodying the Ku Klux Klan, which he quickly learned was financially involved with the station.

In 1932 WJSV moved to Washington, D.C., and became affiliated with the Columbia Broadcasting System (CBS) network, changing its call letters to WTOP. Trout became a remote reporter for the network, covering such events as President Herbert Hoover's Christmas tree lighting and the 1932 election. With the inauguration of Franklin Roosevelt (FDR), Trout was appointed presidential announcer and was responsible for introducing FDR's radio broadcasts, which became known as "fireside chats." For the first talk he prepared two introductions: a formal one, underlining the dignity of the office, and a more familiar, folksier one. Roosevelt chose the informal opening, and this rapport with Trout helped to define the president's intimate style of communication and the importance of radio in his administration.

In 1935 Paul White, director of CBS's news and public-affairs unit, transferred Trout to the network's flagship station in New York. Trout joined a small staff that included Edward R. Murrow, who was head of talks. Trout's coverage of both 1936 political conventions underlined his facility with improvising under any circumstance and orchestrating complex proceedings. Reporting on lengthy, breaking events with an indefatigable stamina and verbal grace became Trout's forte, leading to his sobriquet, "the iron man of radio." In 1937 Trout accompanied Paul White to London and reported on the installation of George VI as king of England, the first broadcaster to cover a live coronation. The dapper Trout also made

his first television appearance, as guest commentator on the British Broadcasting Corporation (BBC).

By the late 1930s, Trout had hosted several conventional public-affairs series, including *History Behind the Headlines* and *Headlines and Bylines*. But the developing European war in the late 1930s demanded a new form of news. On 13 March 1938, following the *Anschluss*, Trout anchored the first news roundup, with reports by Murrow and his team from the major overseas capitals. American radio now participated in the larger world, with Trout's sureness and expertise giving the new broadcast a credibility and urgency. As historian Susan Douglas notes, Trout used "language that helped listeners see and even hear what [the war] had been like, and related events to those that Americans might remember or have participated in."

Even as Nazism was on the rise in Germany, Trout continued to report on such domestic affairs as the opening of the 1939 World's Fair and the havoc wrought by Mississippi River floods. In October 1941 Trout replaced Murrow as the European news chief and began his coverage of the Blitz of London. He hosted a series, *Trans-Atlantic Call*, in which he interviewed ordinary Englishmen about their struggles.

Trout reported many of the most significant events of World War II. For more than seven consecutive hours on D-Day, he read the latest news bulletins about the Allied invasion of Normandy from a New York studio. *Broadcasting* cited his anchoring of these breaking reports, 35 times in a 24-hour stretch, as "a masterful orchestration of maintaining a running report of 'the greatest story ever told.'" Trout hosted the memorial service for President Roosevelt in April 1945, ad-libbing for almost 30 minutes with memories of the former leader. He covered the celebrations on V-E and V-J days, and the end of fighting inspired one of Trout's succinct wrap-ups: "This, ladies and gentlemen, is the end of the Second World War."

After the war, as CBS news experimented with television, Trout remained the reassuring voice of accuracy on radio. Managing a team of 22 correspondents, he anchored a weekday daily news broadcast, *The News Till Now*. After he was replaced by Murrow in 1948, Trout joined the National Broadcasting Company (NBC) and hosted two television series: *Who Said That?* a quiz show that took advantage of Trout's unflappability, and *Presidential Timber*, which featured talks with candidates for the White House. In 1952 Trout, the dean of political reporters, was wooed back to CBS to once again cover the conventions; "the iron man" proved his mettle, anchoring one convention broadcast on the radio for 15 consecutive hours. In retrospect, Trout considered his return to CBS a mistake because he was overshadowed by so many

Robert Trout

younger personalities who were being groomed for television, including Walter Cronkite, Eric Sevareid, and Charles Collingwood. Throughout the 1950s, Trout continued to host convention coverage on radio and lent his voice to several television documentaries produced by Fred Friendly.

In 1964 Friendly, who had been promoted to president of CBS News, decided that television news was badly trailing the NBC team of Chet Huntley and David Brinkley, especially in ratings of convention coverage. For the Democratic National Convention, Friendly, in consultation with chairman William Paley, paired the elegant veteran Robert Trout with the up-and-comer Roger Mudd. This marked the first time that Trout anchored a convention on television, having reported on radio on every nominating gathering since 1936. As always, Trout received impressive reviews from the critics; Jack Gould of the *New York Times* cited two qualities that were forever associated with Trout—his “smooth and unruffled administration of the anchor desk” and his “effortless ad libs in periods of emergency.” Unfortunately, the ratings did not improve dramatically, and Trout decided to go into semi-retirement in Spain while also serving as a roving reporter in Europe.

In 1974 Trout joined American Broadcasting Company (ABC) News and began his “third career.” For ABC Radio he remained a fixture at all conventions, and for both the radio and television networks he reported on his new specialty, European culture. In 1982 he narrated a three-hour documentary on the centennial of Franklin Delano Roosevelt; for many, his rich voice evoked the entire era of the New Deal. He participated in the 50th anniversary of D day in 1994 with a series of reports from France, seeing firsthand the beaches of Normandy about which he had read news wires from his New York studio during the 1944 invasion. In the mid-1990s, he semi-retired again from the news profession that he had helped to shape beginning in the early 1930s. He sustained a long career with his ability to persevere at any cost and to ad-lib gracefully whenever the occasion arose. The essence of civility and objectivity, Trout helped to define the role of the anchorman in broadcasting.

U

Underground Radio

Alternative and Free-Form Programming

The 1960s gave rise to one of radio's most unique programming genres. During its short existence (1966–72), this format became known variously as progressive, alternative, free-form, psychedelic, and acid and was ultimately dubbed underground radio because of its unorthodox and eclectic mix of music and features and disc jockeys who broke from the traditional delivery style embraced by other youth-oriented stations of the day.

Origin

FM provided the fertile soil from which commercial underground radio would grow. It was where experimentation was permitted, because there was so little to lose at the time. Until the mid-1960s, FM moved along in low gear. A nearly negligible listenership provided FM with little status and currency among the general public and industry. It was perceived by many as the province of the so-called eggheads and the terminally unhip—the place to tune for Mahler and fine-arts programming. Tuning to FM for most people was like choosing to attend a foreign film with subtitles when there was a new action-packed Audrey Murphy movie just around the corner. Most 20-year-olds had never tuned between 88 and 108 megahertz, because the “in” music and “cool” disc jockeys were spinning the hits on AM.

Many social and cultural factors contributed to the rise of commercial underground stations. The repressive behavior and social conformity of the postwar years led to the volcanic eruption of the 1960s, particularly among youth. Political assassinations, racial upheaval, and an undeclared war in Asia, along with the growing use of mind-altering drugs by young people, contributed to the blossoming of what came to be called the counterculture.

Rock music began to more astutely and candidly reflect the troubles in American culture by incorporating thoughtful and challenging themes and more provocative and innovative

scores and arrangements. The increasing popularity of rock albums among youth helped encourage FM stations to abandon their conventional fare and launched them on a quest for disenfranchised and disenfranchised radio users—those who had rejected the 45 rpm–driven pop chart outlets. Also enhancing the enthusiasm for FM was its ability to broadcast in stereo—a process that recording companies had embraced for their best-selling groups and a feature that AM lacked.

Breaking the Mold

Several young programmers of the early 1960s had grown weary with the conventional sound of youth-oriented radio. Its frantic disc jockeys and two-and-a-half-minute doowop records left them wanting something more. The repetition and banality of Top 40 stations provided a primary impetus for movement in a very different direction. The pioneers of commercial underground radio, among them Tom Donahue, Larry Miller, Scott Muni, Thom O'Hair, Murray the K, Rosco, and Tom Gamache, took their lead from a couple of early 1960s noncommercial broadcasters and from a handful of innovators on the AM band in the 1950s, all of whom offered listeners a sound antithetical to the highly formulaic formats offered by mainstream stations.

Many stations claim to have debuted the new program genre, but two make the top of the list: WOR-FM in New York and KMPX-FM in San Francisco. The former went on the air in 1966 but changed format within a few months, and the latter was launched in 1967 and marked the beginning of a period in which the underground sound was sustained for several years. Within a year, KMPX lost its on-air staff during a strike to KSAN-FM, which grew to considerable prominence and won a special place in the underground firmament.

Although these stations are traditionally accorded landmark status, development of the underground format was

foreshadowed by other stations as early as the 1950s. For example, WJR-AM in Detroit featured the “Buck Matthews Show,” which mixed all kinds of music together in a fairly unrestricted, free-form way. Matthews employed a conversational, laid-back announcer style as well, which was atypical for disc jockeys of that day.

Other precursors to FM underground radio could be found on the AM band. For instance, Chicago’s WCFL-AM offered a free-form mix of rock music in the 1960s. Soon Newton, Massachusetts, had progressive rock over WNTN-AM. Other low-power AM stations experimented with the “open” technique to music programming, despite the fact that the format was nearly the exclusive domain of FM.

A number of noncommercial stations also presaged the arrival of commercial underground radio. Perhaps most significant among them were WBAI-FM and WFMU-FM. At the former, young disc jockey Bob Fass worked the overnight slot airing a program called *Radio Unnamable*. Across the river in New Jersey, college station WFMU-FM’s Larry Yurdin was doing much the same thing by offering a creative and innovative mix of sounds. Undoubtedly, like those mentioned above, others helped set the stage for the surfacing of commercial underground radio, which got under way at about the same time on both coasts.

Most radio historians point to WOR-FM in New York as the first commercial outlet to break from the “primary” or single-format approach to music programming. However, the station’s free-form experiment lasted only a few months, and it was on to other things by the time KMPX-FM in San Francisco introduced Tom Donahue’s version of the format in spring 1967. A few months after assuming the programming duties at KMPX-FM, Donahue took on its sister station, KPPC-FM in southern California, simultaneously working his format magic at both.

The underground radio programming genre, the “nonformat” format, as it has been described, was soon emulated by stations around the country. By 1968 dozens of stations around the United States were offering listeners their own brand of underground radio. Most large metropolitan areas (including Detroit, Cleveland, Chicago, and St. Louis) boasted what many were calling “flower power” stations. This was no longer an avant-garde form of radio restricted to the enclaves of the East and West Coasts.

By late 1968 there were over 60 commercial underground radio stations in operation around the country. By the summer of 1969, San Francisco alone could claim a half dozen, whereas New York had only three. One company (Metromedia) owned the two stations that *Billboard* magazine ranked the top underground stations in the country—KSAN (San Francisco) and WNEW (New York).

At this early stage in underground radio’s evolution, these two stations were frequently held up as models of the genre.

Both attracted listeners and advertisers. Though often compared, the stations had forged their own distinct personas, mainly by creating unique and distinctive sounds that reflected not only the times and the areas in which they broadcast but also the philosophies of their programmers.

The “Nonformat” Format

Programmer Tom (“Big Daddy”) Donahue considered the underground radio sound the antidote to Top 40, and by declaring this, he wanted to make it amply clear to everyone that things were being done quite differently at his station. In fact, he even rejected the notion of the term *format*, believing it had little to do with his new brand of radio. In his eyes, underground radio, if anything, was the antithesis of standard format programming because it embraced the best of rock, folk, traditional and city blues, electronic music, reggae, jazz, and even classical selections as opposed to any single type of music. This musical ecumenism was evident at underground stations around the country.

Indeed, the way in which songs were presented by undergrounders was unlike that of any other contemporary radio station at the time. Interestingly, if not ironically, these new outlets did reflect an older adult format, which had been responsible for bringing the FM band to a larger audience in the 1960s. Its name was beautiful music or, as many called it, “elevator” music. It was the Muzak format of the radio world. The common ground between the two seemingly disparate forms of radio programming was the way in which they structured music into sweeps—that is, uninterrupted segments or blocks—typically of a quarter hour’s duration. Evolving from the sweep approach was the idea of music sets, wherein a series of album cuts would establish a particular theme or motif.

Just as the approach to music programming in underground was antithetical to conventional AM radio, particularly Top 40, announcing styles were no less contrary to the long-standing norm. Since the medium’s inception in the early 1920s, announcing techniques had undergone relatively subtle changes, never wandering too far from the affected “radioese” presentation style. The old-line announcing manner, characterized by its air of formality and self-consciousness, remained prevalent well into the second coming of the radio medium after the arrival of television.

The “stilts,” as they have been called, found their way into the FM band as well, migrating to the beautiful music format and others. This announcing style was emphatically rejected by underground stations, which militated against its disingenuous affectations and mannerisms—the hype and histrionics. However, sounding “hip” was considered acceptable and even preferable, but not hip like the “screamers” on Top 40. Underground disc jockeys were intent on projecting a natural, friendly, and mild-mannered “grooviness” when they were on

the air. In fact, the “stoned” announcer persona was often an integral part of this radio genre’s repertoire. The idea was to be at one with the audience in every way possible. Staying “loose” was the underground disc jockey’s mantra.

As with all formats, there are other programming ingredients besides the music and announcing that contribute to a station’s general appeal, identity, and overall listenability. News and information broadcasts represent one of those elements. Despite the underground radio’s dominant emphasis on album music designed for an under-30 crowd, it differed from other youth-oriented music outlets in that news and public-affairs features were frequently regarded as an integral part of what many of these stations sought to convey to their public. That is, they wished to be perceived as members of the caring and socially conscious community and not simply as record machine operators.

The Fate of the Nonformat Format

As the counterculture movement of the 1960s and early 1970s faded, so did commercial underground radio. Many members of the movement were embracing more mainstream and traditional goals and aspirations, if not values, while the anger and altruism inherent in rock music for nearly a decade bowed to the insipid patter and rhythms of disco and new-wave or “corporate” rock. Underground radio became a thing of the past as the baby boomers sought a less uncertain and chaotic future, taking refuge in that once unsavory realm known as the material world. A survey of published perspectives and conventional wisdom on the 1960s and 1970s and on the

underground radio phenomenon itself reveals that numerous factors came into play that ultimately contributed to the non-format’s rather swift departure from the airwaves.

In addition to the changing cultural mores and attitudes, which diminished the relevance and appeal of the underground sound, the growing profitability of FM radio inspired a shift away from the nonformat programming approach to something with more advertiser appeal. Station owners sought greater control over program content to maximize bottom-line figures and profits. The role of disc jockeys in shaping the air product returned to the executive suit. FM was corporatized in the 1970s, and by the middle of the decade, commercial underground radio had been reconstituted in the form of album-oriented rock—a highly structured and formulaic offshoot of the former free-form sound.

United Fruit Company

Early Wireless System Operator

Spurred by its need to communicate with its many banana plantations and with its shipping fleet, the United Fruit Company became a pioneer wireless operator in the early 20th century. Company operators developed many early radio techniques and helped to pioneer networking of stations and the use of crystal detector receivers in high-humidity conditions.

Origins

Through the merger of the Boston Fruit Company and other companies involved with the production of bananas in the

Caribbean, the United Fruit Company was formed in 1899. The largest banana company in the world, the United Fruit Company was also the first transnational, corporate giant in the Americas. During the 20th century, the United Fruit Company would have a significant impact, both positive and negative, on many Central American nations, including Guatemala, Honduras, and Costa Rica. The company’s influence in these countries was pervasive, extending into the political, transportation, and communication systems.

At its formation, the United Fruit Company owned banana plantations in seven countries throughout the Caribbean area.

The need for efficient means to harvest and transport the perishable banana product was of paramount concern, as errors in the timing of banana deliveries to United States markets often resulted in spoiled cargoes. As a result, the United Fruit Company took an aggressive role in developing railroad links to deliver the bananas to coastal ports for shipping. Because timely communications was essential to coordinate the harvesting and delivery of the bananas, the company also built and maintained telegraph and telephone lines between farms, local company headquarters, and Caribbean ports. Difficult terrain made the construction of land lines impractical in some areas, however, and the tropical weather conditions and political instabilities often rendered them unreliable when they were built. In addition, communication from shore to ship and from ship to ship required the use of radio. Faced with these obstacles, the United Fruit Company became one of the first companies, and the only major American company, to invest major capital and manpower into developing and adopting the new telecommunications mode of radio.

Implementing Wireless

During the summer of 1903, United Fruit Company employee and electrical engineer Mack Musgrave began investigating the possibilities of using radio for company business in Central America. United Fruit bought its first radio equipment from the American De Forest Wireless Company in 1904 and established its first two stations approximately 150 miles apart at Bocas del Toro, Panama, and Puerto Limon, Costa Rica. In 1906 two more stations were built at Bluefields and Rama, Nicaragua. The expenditures for these and future facilities were great, but the costs were deemed a necessity for company development. United Fruit faced many obstacles in its efforts to establish a radio communications network. One important obstacle was the comparative youth of the radio industry and the experimental nature of its equipment. Unlike the case today, transmission distances were relatively short and required the construction of relay stations throughout the Caribbean. Static, common to the tropics, interrupted transmissions and often made the point-to-point radio links unreliable. In addition, hurricanes destroyed island relay stations with alarming frequency.

By 1908 the United Fruit Company had built six more shore stations and had installed radio equipment on all of its ships. Later known as "The Great White Fleet," these ships delivered bananas but also transported passengers between the United States and the Caribbean. In addition to serving the company's needs in transporting its product, the radio network became an essential tool for ensuring the safety and convenience of the fleet's passengers. Recognizing the further commercial value of the network, United Fruit also made its

communications system available to paying customers along the Caribbean coast and thus became Latin America's major commercial alternative to the European owned and operated radio systems of Marconi and Telefunken.

Now an independent provider of radio communications services, United Fruit purchased a controlling interest in the Wireless Specialty Apparatus Company in 1912. This acquisition provided United Fruit with ownership to important radio technology patents and thus the means to develop and manufacture advanced equipment. United Fruit would continue to operate the Wireless Specialty Apparatus Company until 1921 when, through a complicated process of corporate patent pooling, the newly formed Radio Corporation of America became owner of the patent rights.

In 1913 the United Fruit Company radio department was formally incorporated as a wholly owned subsidiary named the Tropical Radio Telegraph Company. The Tropical Radio Telegraph Company took over all company ship stations and most of the land stations. By 1920, the United Fruit Company had invested nearly \$4 million in radio. The Tropical Radio Telegraph Company had established an extensive radio network including a radio-telephone communication system serving the general public and the banana trade and connecting many of the principal population centers of the Caribbean to the United States.

The United Fruit Company's remarkable adoption of the fledgling radio technology and its development of a large, privately owned radio communications system in Latin America is a success story. Other companies, including the U.S. Rubber Company subsidiary Amazon Wireless Telephone and Telegraph established in 1901, failed where United Fruit had succeeded. Numerous factors supporting the United Fruit Company's ultimate success in developing its radio system include the dominating U.S. influence in Central America, which assured minimal or no opposition to United Fruit's expansions; the demand for radio communication by passengers on the company ships and by shore customers complementing the banana business communication needs; and the fact that the United Fruit Company's product, bananas, was an economically stable product.

United Nations Radio

United Nations Radio is a news and information service that has been provided by the United Nations Department of Public Information since 1946. Programs address United Nations (UN) initiatives and are produced in Arabic, Chinese, English, French, Russian, and Spanish, the official UN languages; many are also available in Bengali, Dutch, Papiamentu, French Creole, Hindi, Indonesian, Kiswahili, Portuguese, and Urdu. The people of nearly every country are now within range of a UN Radio broadcast.

A primary method of broadcasting has been shortwave radio, although much UN Radio programming is distributed by mail, telephone, and the internet. Timely short-form programs are accessible around the clock through the UN Radio Information System by touch-tone telephone. Regular audio feeds from UN Headquarters (in New York City) include daily briefings, press conferences, news concerning peace-keeping missions, breaking news from UN member countries, and coverage of the activities of the Secretary-General, as well as open meetings of the General Assembly and the Security Council. Audio and written transcripts of long-form programs and archival material are provided to broadcasters by request. UN Radio facilitates access to historical recordings from the United Nations' audiovisual library as a service to media organizations, government agencies, and researchers. The library includes *UN-TV*, film documentaries, a photograph collection, and extensive archives.

Members of the UN Radio production staff in New York work with field reporters throughout the world and a production facility at the United Nations in Geneva to provide daily updates, weekly magazine shows, regional news briefs, and "round-ups" on a number of topics. These include events and issues of interest in the areas of health, human rights, drug trafficking, women's issues, solar energy, poverty, education, sustainable development, the rights of children, global treaties, the environment, refugees, natural disasters, and reports on the progress of the UN's humanitarian assistance.

UN Radio does not own or operate any broadcast facility, relying on other organizations and institutions to disseminate

its programs. The internet has facilitated broad availability of its programming to anyone with computer access to the worldwide web. In its early years, France, Switzerland, the United States, and Britain were among the countries that leased transmission facilities to UN Radio. Its first worldwide broadcast, via the British Broadcasting Corporation (BBC) in 1946, proclaimed, "This is the United Nations Calling the People of the World," then soundly provided the entire proceedings of the United Nations Security Council.

The United Nations has never been a broadcast operation, per se. Debate on this issue ensued from 1946 to 1953, resulting in leasing agreements with shortwave and standard radio licensees throughout the world—including private, commercial, and state-run broadcasters—to transmit daily UN Radio programs. During the 1960s and 1970s, UN Radio expanded its coverage in Africa, Southeast Asia, the Middle East, and Latin America. By the mid 1980s (with program production growing rapidly and a lessening reliance on leasing shortwave facilities), UN Radio added Egypt, India, and China to the growing list of countries with radio operations that agreed to carry its programs.

From 1953 to 1985, the Voice of America broadcast UN Radio programs consistently throughout Asia and Africa. The 1990s saw more programs concentrating on Asia and the Caribbean, as well as an increase in distribution by tape mailings and telephony. The start of the 21st century marked an increased reliance on digital distribution methods and cable. In 2000, a daily live multilingual news program was developed, anchored at UN Headquarters in New York and featuring a mix of news, news analysis, and feature segments.

Issues related to population, water, indigenous peoples, health, and human rights are among the priorities for much of UN Radio's program content. Programs are available as event coverage, daily news feeds, radio documentaries, special reports, and regional sound recordings at virtually no cost to broadcasters. The primary production facility in New York is staffed by numerous editors and producers, providing thousands of hours of programming each year to broadcasters

interested in advocating UN positions and providing quality world news coverage to their audiences. In addition, UN Radio is a mechanism by which the United Nations can inform the world population of its mission and garner public support.

United States

This essay surveys highlights in American radio broadcasting's development, from the experimental era before 1920 to the rapidly changing industry eight decades later. That history is described using a series of specific periods that help to characterize key developments. Many of the topics touched on here are treated more extensively in their own entries; the reader should use the table of contents as well as the index for more in-depth discussions of specific topics.

Before 1920

Prior to the end of World War I, there was little sustained radio broadcasting, except for occasional experimental and amateur transmissions. This era was characterized by rapid wireless technical innovation over a three-decade period that made broadcasting possible.

After the theoretical foundations of wireless transmission of information were established by James Clerk Maxwell in the 1860s, and the theory was proven with Heinrich Hertz's experiments in the late 1880s, the stage was set for the key innovator, Guglielmo Marconi. Beginning in the mid-1890s he developed and improved the key elements for wireless telegraphy (code) transmission—transmitter, antenna, and receiver. By the end of the 19th century, Marconi was the head of a thriving British company introducing wireless transmission to merchant and navy ships and, with high-powered shore stations, long-distance competition to undersea telegraph cables. Other companies developed in France, Germany, Russia, and the United States, and all shared a common goal—perfecting point-to-point wireless telegraphy as the most lucrative future for wireless. Broadcasting was barely a glint in anyone's eye.

A few early wireless experimenters did stumble onto the key elements of radio broadcasting, beginning with Reginald Fessenden. On Christmas Eve of 1906 he transmitted voice and music in what many consider the first broadcast in the world. Another important inventor-innovator, Lee de Forest, offered occasional broadcasts in 1907 and 1908. Beginning the next

year, Charles Herrold initiated a regular radio broadcast service in San Jose, California, as an adjunct to his radio school. He remained on the air (typically for a few hours per week) until World War I. Amateur experimenters in other cities also offered sporadic broadcasts for fellow amateurs to tune in, but these were seen largely as exceptions to the point-to-point focus of most people in the fledgling wireless business.

Recognizing the need for some order among the slowly increasing number of transmitters needing frequencies, Congress passed legislation in 1910 and again in 1912 to regulate the use of wireless at sea. These were followed by the more important Radio Act of 1912, which was to stand for 15 years as the basis for any government regulation of wireless transmission. Following industry advice and expectations, the Radio Act was predicated on wireless as a point-to-point means of communication. It made no mention of nor provision for radio broadcasting.

What grabbed the public's imagination early in the 20th century was the role of wireless in some spectacular maritime disasters. In 1909 the White Star liner *Republic* was rammed in the fog by an incoming vessel a few hours outside of New York. Wireless operator Jack Binns called for help (the other ship lacked wireless), and virtually everyone—some 1,500 people—was saved. Radio could not save as many in the horrific *Titanic* disaster of April 1912, when another White Star liner, on her glittering maiden voyage, hit an iceberg and sank, this time taking 1,500 lives with her. But Marconi operators Jack Phillips and Harold Bride stayed at their posts (Phillips died after the vessel sank) and, transmitting both the old "CQD" and newer "SOS" emergency signals, brought a rescue vessel to pick up the 700 survivors, who told the tale that fascinates people still.

Radio played a lesser role in World War I. Demands of reliability and secrecy and the relative immobility of trench warfare made telephone and telegraph service more common than wireless. But military and naval needs and orders helped increase the pace of technical development, and wireless manu-

facturers rapidly improved both transmitters and receivers. The U.S. Navy took over high-powered transmitting stations from private operators (most other transmitters, including those operated by amateurs, were closed down for the duration of the war) and trained thousands of radio operators to run them. Demand for the best equipment saw development of a Navy-sponsored pooling of patents of different companies to allow the latest developments to more rapidly reach battle fronts.

With the end of the war, Congress briefly considered making permanent the wartime system of government operation of both wired and wireless telecommunications (as was then the rule in most other countries). But despite urging by the Navy, Congress ordered that transmitters be returned to civilian control in 1919–20. The radio industry made plans to expand production and operations in peacetime with the thousands of trained radio technicians and amateurs. Some of them expressed interest in broadcast experiments.

1920–26

The initial period of regular radio broadcasting was one characterized by growth and excitement, little effective regulation, program experimentation, a lack of permanent networks, only limited advertiser interest, and almost no knowledge of its audience.

Among the pioneering American stations taking to the air in 1919–20 (others began at about the same time in Canada and in Europe) were WHA in Madison, Wisconsin (which had begun as a University of Wisconsin physics department transmitter 9XM, sending wireless telegraphy market reports to Wisconsin farmers before World War I); Charles Herrold's station, which became KQW in San Francisco; KDKA in Pittsburgh, Pennsylvania (which had begun as amateur 8XK station in 1916); and Detroit's WWJ, which grew out of amateur operation 8MK.

Each began under a different owner with a different purpose in mind. The University of Wisconsin's WHA, the first educational station on the air, was interested in spreading the university's courses and research to the boundaries of the state. KQW at first continued Herrold's interest in operating his radio school, but it soon passed into the hands of a local church and later a national network interested in commercial operations. KDKA was developed by Westinghouse, which in 1920 was interested in keeping its assembly lines of highly trained personnel together despite the loss of huge government contracts with the end of the war. By providing a radio music and talk service, the company figured it might attract people to buy receivers. Over the next two years, Westinghouse added other stations in different cities. General Electric and the Radio Corporation of America (RCA) entered the radio station business at about the same time. WWJ was the first of many sta-

tions to be owned by a local newspaper. Initially seen as another community service, operating a radio station would become a common means of hedging bets as to which medium would survive. Other stations went on the air as auxiliaries to the owner's primary business—a retailer or service firm.

The radio station business began slowly in 1920–21, but it exploded in 1922, when more than 600 stations went on the air. Many went off again in a matter of weeks or months, unable to find a means of supporting operations. Early stations were primitive operations, the studios of which were often merely hotel or office building rooms, with walls covered in burlap to deaden sound and equipped with a microphone and the near-ubiquitous piano. Transmitters were largely hand built, and many radiated with less power than a reading lamp. A few stations experimented with temporary hookups, using telephone lines to allow two or more stations to carry the same program at the same time (and perhaps share in its costs)—the germ of networking. But multiple station linkups were largely limited to special sports or political events, such as presidential speeches.

Strictly speaking, there was no “programming” at first—merely different times given over to talk, music, or comedy, and this was usually in an unplanned fashion. The paramount idea was to fill airtime, even for the very few hours that most stations were initially on the air. Ironically in light of more modern experience, few stations made use of phonograph records. Although records would have been an obvious and easy means of filling time, they were then of low acoustical quality, and their use was considered a poor application of radio's potential. As radio had no ready means of making money, stations could offer no payment to singers and performers, which further limited program options. It was a brief but golden age for amateurs of all types and ages, who would gladly come into the studio just for the chance to have an audience—even an unseen and unheard one. It sounded much like the vaudeville circuit from whence came many early radio stars.

More formal, preplanned schedules of programs, with clear formats, beginnings, and endings, developed only by the mid-1920s, and then first in the largest markets. One vaudeville pattern that carried over to radio was the “song and patter” team—usually two men with comedy and musical experience—who could easily expand or shorten their act as broadcast time permitted. About the only role for women in early radio was as singers. There was little or no drama or situation comedy, little play-by-play sports, and no regular newscasts or weather reports—all these would come later in the decade or in the 1930s.

Radio was a novelty for its audience as well—indeed, it became a huge fad, which many observers figured would not last, especially as multiple-station interference grew in the mid-1920s, raising listener frustration. But the excitement of

hearing disembodied voices and music, often from a considerable distance, was enough to persuade more and more people to build or buy the available crude receivers, which required a fair bit of manual dexterity even to tune in to a nearby station. That ready-made receivers cost a lot was indicated in early radio programs, which included a substantial amount of classical music, aimed at discriminating (i.e., wealthy) ears. Countless radio books and magazines appeared to cater to the growing audience. There was no audience research in this initial period—stations determined who was listening merely by audience mail or requests for cards confirming programs (a spin-off on ham radio “QSL” cards).

Despite this audience interest, the biggest problem broadcasters faced in the 1920s was how to pay for their operations. Although advertising may now seem to have been preordained, there were then many strong arguments against allowing radio to sell airtime. Some observers suggested a tax to pay for programming, others called for voluntary contributions, and still others promoted an annual tax on receivers, a method adopted by many other countries. And a few states or cities operated stations as government services.

Interestingly, it was the American Telephone and Telegraph Company (AT&T) that brought advertising to radio, when their New York station WEAf first offered to sell airtime much as the company did for long-distance telephone calls, dubbing radio’s version “toll broadcasting.” A 15-minute real estate ad in August 1922 was probably the first radio commercial. Others slowly followed suit, encouraged by initial sales results. Yet these early ads almost never mentioned price—instead they promoted a kind of institutional or image advertising common on today’s public radio. Another way advertisers made themselves known was to add their name to the program title or stars—thus the *Lucky Strike Hour* or the *A&P Gypsies*. But many in and out of broadcasting still resisted the notion of bringing business into the home (forgetting perhaps that newspapers and magazines had long done just that). The rapid expansion of advertising came only after 1926, when AT&T sold its stations and ended industry debates over whether the telephone company could force stations to pay a fee for the right to sell advertising.

That radio was developing as more of a business became increasingly evident in the industry’s call for firm government licensing policies and related regulations. Secretary of Commerce Herbert Hoover called together four national radio conferences from 1922 to 1925, each of them larger and more strident in calling on Congress to reduce the interference resulting from trying to administer a growing broadcasting system under provisions of the 1912 legislation, which had not foreseen broadcasting. Acting largely on his own, Hoover did succeed in expanding the number of frequencies available for broadcasting from one (833 kilohertz) in 1920 to three in mid-1922 and to the beginnings of a “band” of frequencies in May

1923. More frequencies allowed more stations without the need to share time—but only if broadcasters cooperated, because the government had no enforcement power. Court decisions in 1926 took away what little authority Hoover had exercised and increased pressure on Congress to act.

1927–33

The 1927–33 period is one of the most important in the history of broadcasting. By the late 1920s American radio began to take on most of the characteristics of the system still recognizable today—definite program patterns, advertising support, reliable audience research, and far more effective regulation. The latter came with Congressional action early in 1927.

The Radio Act of 1927, though in force for only seven years, would set broadcast patterns that persist to the present. Stations were to be licensed for up to three years, on a specific frequency and with specified power that could only be changed on application to the new Federal Radio Commission (FRC), which had the legal power to enforce its decisions. No longer could stations shift frequency, increase power, or literally move their transmitters overnight, as had become common just before the act became law. The driving impetus of the new FRC and its rules and regulations (first codified in 1932) was to reduce interference on the air so that people could hear stations clearly. A key part of that process was to expand on Hoover’s beginnings by allocating most of the modern AM radio “band” of frequencies and by classifying stations by power. A few stations were restricted to daytime-only transmission to reduce evening interference even further. The FRC often had to defend its expanding role in court. A series of four landmark cases in 1928–30 concerning program controls helped confirm the agency’s authority and the constitutionality of its licensing decisions. Now subject to federal legislation and rules, it seemed clear radio was here to stay.

The other fundamental change in the business took place at nearly the same time—the development of permanent national networks. The National Broadcasting Company (NBC) was the first, built around the informal network of stations that WEAf had initially developed. After purchase of that station from AT&T late in 1926, RCA formed NBC as a subsidiary that in November 1926 began to operate a continuing network of entertainment and cultural programs.

In fact, NBC began—and would operate until 1943—as two networks, the Red and the Blue. The former was based on WEAf and its connected stations, and the Blue was built around RCA station WJZ (also in New York) and a parallel chain of affiliated stations. From the start, the Red network had the stronger stations, greater audience reach, and greater advertiser appeal. NBC’s chief competitor, the Columbia Broadcasting System (CBS), had a far more complex birth and only became a stable competitor in 1928. Together, the two

New York-based networks soon contributed hugely to radio's expanding audience popularity and advertiser appeal.

Advertising became more widely accepted in this period—at least by the industry, if not by all of its listeners. Based on initial success stories, advertisers and ad agencies had begun to recognize the medium's potential, encouraged by the inception of regular audience research, which had been brought about by the new networks. The first books on radio advertising appeared in 1927. After 1929 the Depression pushed more direct or "hard sell" approaches to radio advertising, first at local stations and more slowly at the network level. Indeed, by 1931–32, major ad agencies had taken on the role of programmers for many networks and a few large station programs, providing casts and even finished productions. The first station representative (rep) firm, Edward Petry, was formed in 1932 to ease the buying of radio spot advertisements in markets across the country. That all of this was successful is indicated in radio's proportion of all advertising, which grew from only 2 percent in 1928 to nearly 11 percent just four years later. By 1932 an FRC survey found that 36 percent of all radio time had commercial sponsorship, meaning that for 64 percent, networks and stations sustained the costs of production.

With half or more of all broadcast time, music remained the most important kind of program on both networks and local stations, with variety (still drawn heavily from vaudeville) a close second.

Virtually all of these programs were broadcast live, because recorded programming was looked down upon by major broadcasters. Drama and comedy developed more slowly as writers and actors overcame the problem of an audience that could not see the action taking place. Though certainly racist by modern standards, *Amos 'n' Andy* became the first network comedy hit in 1929. The first westerns and thriller dramas began in 1929 and 1930, including such long-lasting hits as *The Shadow*.

Evening network news programs began with Lowell Thomas' weeknight 15-minute program on NBC in 1930. That even in its fledgling state, radio represented a threat to the press became increasingly obvious, and a short-lived press-radio "war" began in 1933, with newspaper and major news associations attempting—unsuccessfully as it would soon turn out—to limit the amount of news reports made available to radio. As it had since 1920, radio continued to cover national political conventions and election nights with the latest voter tallies and analysis.

Radio's audience continued to expand, thanks in part to better and easier-to-tune radio receivers. By 1928 plug-in receivers began rapidly replacing cumbersome battery-powered sets. Speakers improved, and users could tune radios using a single control rather than the former two or three. Radios also became fancier, virtually furniture in their own right, made by dozens of manufacturers. That more people

were listening became obvious after 1929 and the inception of regular audience research. Archibald Crossley created the Cooperative Analysis of Broadcasting (CAB) to develop program ratings—how many people were tuning to CBS and NBC programs. The CAB relied on random telephone calls to households for its listening information.

1934–41

Viewed in retrospect, the golden age of network radio programming during the later Depression years saw a flowering of radio creativity in the last peacetime era that had no competition from television. More than 200 stations went on the air, including the first stations to serve many smaller communities. The growing number of stations forced many to utilize directional antennae to avoid interference with other outlets—fully a quarter of all stations used such antennae by 1941. Still, about a third of the nation's listeners got their only reliable evening radio service from one of 52 "clear channel" stations, all located in major cities.

The period's beginning is marked by the FRC's replacement in mid-1934 with the Federal Communications Commission (FCC), which had expanded regulatory responsibilities for wired as well as radio communications. Key provisions of the 1927 act, including most of those concerning radio, simply carried over into the new law.

By this time, success in broadcast station operation meant having an affiliation agreement with CBS or NBC Red or Blue—or, after mid-1934, with the Mutual Broadcasting System—and being able to carry their popular programs. A number of outlets also joined such regional chains as the Colonial or Yankee networks in New England, the Texas network, or the Don Lee network on the West Coast. The networks' efficient provision of programs and advertising truly dominated radio by the late 1930s. Networks also dominated their affiliates with one-sided contracts that bound the station for up to five years but bound the network for only one year at a time. This led to an FCC investigation of network operations from 1938 to 1941, which concluded that network control was too strong and that many practices needed change, chief among them the ending of NBC's operation of dual networks.

Most urban and some rural stations programmed 12 hours a day, some for as many as 18. An FCC survey of program patterns in 1938 found that 64 percent of programs were broadcast live (roughly half network and half local), with the remainder being some kind of recording. More than half of all programming was music; talks and dialogues accounted for 11 percent (including President Roosevelt's fireside chats); and 9 percent each were devoted to drama, variety programs, and news. Three new types of program soon dominated this period. Daytime hours were soon saturated with dozens of "soap operas," 15-minute domestic serial dramas, broadcast

one after the other. By 1940 the national networks devoted no less than 75 hours a week to such programs, some of which would last into the late 1950s. Quiz and audience participation programs also became hugely popular. On the more serious side, news and news commentary programs greatly expanded with the rising world political crisis in Europe and the Far East and the beginning of World War II in 1939. From about 850 hours annually in 1937, network news and commentary programs grew to fill nearly 3,500 hours by 1941.

Perhaps the single most famous radio program, Orson Welles' dramatization of *The War of the Worlds*, was broadcast in October 1938. Realistic in its use of reporters breaking into music programs (as listeners had just heard during the Munich crisis a month before), the hour-long drama panicked millions and demonstrated both how radio had grown in importance in American life and how much it was trusted by its listeners to tell the truth. More than 90 percent of urban households owned a radio, as did 70 percent of rural homes, and half the country's homes now had at least two radios.

All the earlier talk about radio's educational potential (some 200 noncommercial stations took to the air in the 1920s) had dwindled to the activities of about 35 stations by 1941. These survivors, many licensed to universities, provided in-school enrichment and adult cultural and educational programs to small but loyal audiences. Several national organizations promoted conflicting notions of how radio might best serve educational needs, one urging cooperation with the commercial networks and stations, the other insisting on separation to promote purity of mission.

Another, the National Association of Educational Broadcasters, lasted from 1934 into the early 1980s. Frustrations of educators with an increasingly commercial system led to pressure on the FCC to set aside some channels specifically for noncommercial operations, which resulted in the first such set-aside when FM was approved for regular operation in 1941.

1941-45

In part because of wartime paper rationing, which limited newspaper reporting, radio journalism came of age in the war years, supported by high advertising income and popular entertainment programs. But the industry itself grew only a little during the war because of construction and material limitations. Full wartime restrictions remained in force until August 1945.

The proportion of stations affiliated with a network rose from 60 to 95 percent of all stations. Some stations in smaller markets held agreements with more than one network. The FCC's *Report on Chain Broadcasting* (1941) caused a huge controversy, in large part because it called for an end to NBC's operation of two networks, but also because it sought many other changes in the relationship between networks and their

affiliate stations. Two years later the NBC Blue network was sold, becoming the basis for the American Broadcasting Company (ABC) in 1945. Radio prospered during the war as advertising spending rose sharply (in part so businesses could avoid simply paying profits out in federal taxes). Whereas a third of all stations reported financial losses in 1939, only 6 percent did by 1945.

Radio reporters became famous during the war, led by long-time newsman H.V. Kaltenborn on NBC and the CBS team that included Edward R. Murrow in London and William L. Shirer in Berlin. Covering cities under attack and forces fighting in Europe and the Pacific, radio brought the war to listeners at home while also providing propaganda broadcasts by enemy and Allied countries alike.

1945-52

Radio both expanded and contracted in this period—the number of stations more than tripled, but radio networks all but disappeared in the face of television competition. Most of radio's growth took place in smaller markets. What had been a largely AM-centered small industry grew in complexity to include FM and television outlets and networks. One measure of radio's declining glory was the release in March 1946 of the FCC *Blue Book*, which traced wartime profits and compared them unfavorably with radio's heavily commercial programming.

This weakening is most evident in the rapid decline of radio networks, which had dominated the business in 1945 but had all but disappeared by 1952. By then networks provided only a memory of their former service, with daytime soaps, some sustaining dramas, newscasts, and special events—including political year broadcasts. At the same time, their share of radio advertising dropped from nearly half in 1945 to just over a quarter by 1952. Large parts of the broadcast day once programmed by networks were now returned to stations to fill as best they could. One new network—the Liberty Broadcasting System—briefly thrived in 1949-52 based largely on Gordon McClendon's skillful recreations of professional baseball games based only on wire service reports and sound effects.

But radio's chief role in this brief but important period of transition was to provide the revenues that supported expansion of television service. Radio revenue increased each year, though it had to be divided among a vastly larger number of stations, which meant that many radio outlets operated in the red. Noncommercial radio expanded as well, thanks to reserved FM channels.

The most popular dramatic and comedy programs either began to "simulcast" on radio and television, or they moved over to television entirely. The networks began to offer cheaper music and quiz shows, of which *Stop the Music* was one example, to attract listeners by offering a chance at big-money

prizes. ABC, the newest and smallest network, broke the long-lasting national taboo on recorded programs by using prerecorded transcriptions of many of its programs. Local stations paralleled that practice with “musical clock” programs that provided a local disc jockey with records, weather, news, occasional features—and constant time checks. Affiliates were soon providing more local than network programming—a throwback to the 1930s.

1952–80

This was an era of competition—with radio playing a distinct second fiddle to the country’s fascination with television—and of creativity, as radio developed the many music formats that would give the medium a renewed lease on life. At the same time, the coming of stereo recording and then stereo FM gave that medium a huge boost.

The number of stations continued to expand—by about 100 AM outlets each year, and after 1958 by a revived FM business as well. The rising station population led to problems—where a third of AM stations operated only in the daytime in 1952, fully half were required to do so by 1960 in a continuing FCC attempt to reduce nighttime interference. More stations used directional antennae to reduce daytime and evening interference. Indeed, for much of the 1962–73 period, the FCC froze AM applications and tried—largely successfully—to steer radio growth to the FM band. The commission’s decision to ban simulcasting by co-owned AM and FM stations in the late 1960s speeded the expansion of FM, which for the first time had a separate identity for most listeners.

Radio networks still demonstrated some program originality in the 1950s. NBC’s *Monitor* created a weekend magazine program beginning in 1955, and the same network offered science fiction with *X-Minus-One*; CBS created *Gunsmoke* for radio before transferring the show to television. *Amos ‘n’ Andy* became a variety program. The last bastion of advertiser-supported network radio was the daytime soap opera, which only finally disappeared in 1960. The networks reverted to “news on the hour” for affiliates.

Freed of their network ties, most local stations at first stuck with middle-of-the-road (MOR) formats, trying to offer a bit of everything to everyone, including music, talk, variety, and features. Of more fundamental importance to radio’s future was the slow mid-1950s development of formula or “Top 40” formats, which were dependent on the personality of a local disc jockey and on tightly formatted music and advertising. Tod Storz and Gordon McClendon are both credited with creating the program approach first used by about 20 stations in 1955 and by hundreds by 1960. Top 40 aimed primarily at teens with what became known as rock and roll music, which was based closely on African American rhythm and blues. The arrival of Elvis Presley in 1956 as the

first rock superstar helped cement the new radio trend, though Congressional investigations of payola late in the decade cast doubts, certainly in adults’ minds, about the wholesomeness of the format.

Educational radio received a huge boost with the establishment of National Public Radio (NPR) in 1968, the first national network for noncommercial stations. Though excluding hundreds of smaller FM outlets, the 300 to 400 large-market FM outlets that served as NPR “members” brought listeners the highly popular programs *All Things Considered* and *Morning Edition*, among others.

Since 1980

In one sense, the story of radio since 1980 is turned upside down from its history before that date, because beginning in 1979, radio was increasingly dominated by FM listening. By the late 1980s, FM stations attracted three-quarters of the national audience—and by 1995 nearly 60 percent of the stations. All radio outlets specialized in programming in their attempt to gain and hold a tiny sliver of the audience divided by the early 21st century across more than 13,000 stations.

Two technical developments with AM radio were failures. The first was an FCC attempt to narrow AM channels to 9 kilohertz (parallel to practice in most of the rest of the world) down from the 10-kilohertz channels standard since the 1920s. But industry opposition (based on fears of an influx of new competitors) stopped the idea cold in the early 1980s. The second attempted development, offering stereo on AM outlets, was seen by some as one means of slowing AM’s decline. Competitors developed a half-dozen mutually incompatible means of delivering stereo in AM’s narrow band. Though in 1980 the FCC selected one (by Magnavox) as it had done with prior new technologies, industry ridicule of the decision and the very close parameters of the competing systems led the commission to revisit the matter and in 1982 to allow any stereo system. This experiment in marketplace economics failed because nobody could agree on which system to select (or how best to make such a choice), and thus most stations ignored all of them. That most AM programs by then were talk and news formats less susceptible to the benefits of stereo contributed to the stillborn technology. Extension of the AM band up to 1705 kilohertz by 1990, the first change since 1952, allowed the FCC to reassign a number of stations to the new frequencies to reduce interference lower in the band.

A popular new format appearing by the late 1980s was nostalgia—“golden oldies”—stations, which allow former teens to relive their childhoods with the music of the 1950s through the 1970s. Another was religious stations. Although such outlets had existed from the early days of radio, by the 1980s hundreds of conservative and evangelical religious broadcasters were becoming a force in the business. By 2000 both AM and

FM radio were continuing to grow, with both high expectations and fears being expressed about the inception of digital audio broadcasting (DAB) in the new century. Further, many radio stations had expanded operations to the internet by means of audio streaming, thus greatly expanding their reach beyond their home markets.

Passage of the Telecommunications Act of 1996 along with related FCC rule changes triggered a wave of consolidation in radio station ownership lasting into the early 21st century. More than 40 percent of all stations changed hands and group owners with more than 100 stations became common; the largest owner controlled more than 1,200 outlets. Additionally, it became possible to own up to eight stations in the largest markets. Critics argued that this consolidation contributed strongly to programming that offered broad appeal but little specialization or inventiveness. One response was the launch of two satellite-delivered subscription digital radio services in the early 2000s, both of them providing 100 channels (with about 60 music and 40 talk formats), many without any advertising.

The FCC approved technical standards for digital terrestrial stations that over time would totally replace analog AM and FM outlets. Many stations offered their service over the internet (indeed, there were a growing number of internet-only audio services), although copyright controversies threatened their future.

In its ninth decade, radio in America was truly ubiquitous, ever-present yet often heard only in the background against a growing din of media services. The coming transition to an all-digital service promised finer-quality sound, though less change in program content.

United States Congress and Radio

Broadcasting of House and Senate Proceedings

Congress and radio broadcasting have been closely linked for more than 90 years. By virtue of the U.S. Constitution's "commerce clause," Congress has created and amended basic legislation to regulate the industry. It has also funded regulatory agencies and approved appointments to them. But only after years of debate was regular broadcast coverage of Congressional committee and floor activity finally allowed, thereby joining the long-time use of broadcasting media by individual members seeking reelection.

Legislative interest in radio began with the 1910 Wireless Ship Act that regulated maritime use of radio. The Radio Act of 1912 was the first comprehensive radio statute, but it was not designed to regulate radio broadcasting, which did not then exist. During and after World War I, Congress heard testimony from the military and from the Post Office urging federal control and operation of radio broadcasting. Turning away from that option, Congress was perplexed over what to do to regulate early radio broadcasting, and it did not pass the first law designed to regulate broadcasting until the Radio Act of 1927. The new law laid the regulatory foundation of U.S. broadcasting, and most of it is still in effect today. In mid-1934, acting on recommendations from President Roosevelt and its own extensive investigation of communication companies, Congress passed the comprehensive Communications Act of 1934, which is still in force in amended form nearly seven decades later. In the years since, Congress has regularly tinkered with the law, considering and sometimes adopting amendments (of which the Telecommunications Act of 1996 was by far the most extensive). When not actually legislating, Congress plays three other regulatory roles with radio: it provides annual budgets for operation of the Federal Communications Commission (FCC) and related agencies; the Senate approves (nearly always) presidential nominations of FCC commissioners; and commerce committees in both houses regularly conduct "oversight" hearings into industry and FCC activities and decisions.

Seeking to Broadcast Congress

From the inception of radio, some members of Congress perceived the new medium as the perfect way to carry the people's business to those unable to travel to Washington to visit the House and Senate in person. And such coverage would provide radio with just the kind of content that would help popularize the medium.

Efforts to initiate some form of congressional radio began with a resolution introduced by Representative Vincent Bren-

nan (R-Michigan) in 1922 that was intended to allow for the "installation and operation of radiotelephone transmitting apparatus for the purpose of transmitting the proceedings and debates of the Senate and the House of Representatives." Though the Brennan resolution failed, its intent remained alive when Senator Robert Howell (R-Nebraska) introduced a resolution two years later directing that radio experts from the War and Navy Departments be appointed to study the feasibility of "broadcasting by radio of the proceedings of the Senate and the House of Representatives throughout the country, utilizing the radio stations of the War and Navy Departments." As the Senate discussed the Howell resolution, several arguments were made for and against broadcasting from the congressional chambers that would be repeated in years to come. On the one hand, listeners to congressional debate could hear their elected officials engage in the country's business—and in the process, that debate would be improved in order to give listeners a good impression of Congress. On the other hand, listeners' impressions might be detrimental to congressional members whose speaking skills were not up to radio standards or who were absent during chamber debate.

The report prepared by the War and Navy Departments finally materialized in 1927; the report concluded that broadcasting from the House and Senate chambers would be not only too costly, but also technically infeasible. This effectively ended any substantive efforts to implement congressional radio. Nonetheless, the idea remained alive. In fact, it was invigorated by radio's coverage of President Calvin Coolidge's 4 March 1925 inaugural address. Excitement over the president's radio remarks led the editor of *Radio Broadcast* to "hope that soon Congress will be forced to broadcast its activities." The editor's remark ironically draws attention to another argument that would be used in years to come by congressional broadcasting advocates: that of the imbalance in power that the president's effective use of radio caused with regard to clashes between presidential policy initiatives and congressional policy initiatives.

Efforts to persuade their congressional colleagues to allow broadcasting of Senate and House proceedings were continued by members of both bodies, most notably by Senators Clarence Dill (D-Washington) and Gerald Nye (R-North Dakota), into the 1940s. Meanwhile, parliamentary bodies in other countries experimented with broadcasting deliberative activities during the late 1920s. Germany and Japan were two countries where the idea seemed to be catching hold. The British House of Commons considered but rejected the idea of broadcasting its parliamentary sessions in 1926.

Congressional broadcasting of a very limited and decidedly clandestine nature did occur in December 1932, when the U.S. House voted on the repeal of the 18th Amendment. Radio network representatives had requested permission from House Speaker John Nance Garner (D-Texas) to cover debate on the matter from the House chamber. Undeterred by Speaker Garner's refusal to grant permission, the networks positioned microphones in the doorway of a library adjoining the House chamber and boosted the microphones' volume high enough to pick up the proceedings. Radio listeners had the rare privilege of hearing the repeal vote as it occurred. Afterwards, the *New York Times* took note of the event, saying that "broadcasters have taken a new hope that before long radio will invade Congress just as it has almost every other realm where people speak or sing."

Interest in congressional broadcasting emanated from other directions during the 1940s. For instance, a number of organizations, including the Congress of Industrial Organizations, the Writers War Board, and others, advocated allowing radio coverage of congressional proceedings. World War II certainly stimulated interest in the matter, but more important were the shortcomings of newspapers during the period in properly informing the public about congressional consideration and discussion of important wartime issues. A 1946 poll showed that the general public favored the idea of congressional broadcasting, and a poll of radio executives taken at roughly the same time showed that an overwhelming 70 percent of them also favored such broadcasts.

The first serious consideration of congressional broadcasting occurred during hearings conducted by the Joint Committee on the Organization of Congress in 1945. The committee, cochaired by Senator Robert M. LaFollette, Jr. (Progressive-Wisconsin) and Representative Mike Monroney (D-Oklahoma), was charged with exploring methods to improve the legislative process. Witnesses at hearings addressed many of the issues about congressional broadcasting that had been raised before. The issues dealt with both style (public reaction to poor or verbose speakers, to the Senate filibuster, or to the absent speaker) and substance (equal treatment of important issues during floor debate and the manner by which chamber proceedings from the House as well as the Senate might be broadcast simultaneously). Advocates for congressional broadcasting failed to win a great following, and in the end the Legislative Reorganization Act of 1946 that evolved from the work of the Joint Committee on the Organization of Congress ignored broadcasting.

Initial Efforts

Interest in congressional broadcasting changed direction by the late 1940s after television forced radio into a secondary role. Members of Congress had grown more at ease with broadcast-

ing in general and thus were willing if not eager to allow television cameras to cover congressional hearings. Rules devised by each congressional committee soon emerged to regulate such coverage; these rules placed television and radio on an equal footing. Committee members had final approval as to whether television and radio could cover committee proceedings, but television and radio networks and stations that controlled the cameras and microphones determined how much of the proceedings would be broadcast. Several famous Senate investigations were televised in the 1950s, including the Kefauver crime hearings in 1951 and the Army-McCarthy hearings in 1954. Radio networks and local stations rarely chose to carry more than short excerpts from committee proceedings during newscasts. Only during the 1970s did National Public Radio (NPR) break tradition by airing some of the more notable congressional hearings virtually gavel to gavel, such as a hearing on a new Panama Canal treaty.

Efforts to regularly broadcast House and Senate chamber proceedings were reignited in the early 1970s, possibly owing to successful broadcasts of committee proceedings. The matter received special attention by the Joint Committee on Congressional Operations in 1973. The favorable view taken by the committee—that broadcasting from the House and Senate chambers could help Congress better communicate with the public—led directly to a decision by the House of Representatives to open itself to television cameras and radio microphones in March 1979. The Senate was slower to act but finally opened its own chamber to television and radio in June 1986.

Regular Live Coverage

Ironically, the Senate actually preceded the House in allowing live broadcast coverage to originate from the Senate chamber. A resolution introduced by Senator Robert Byrd (D-West Virginia) in 1977 called for the Senate to allow broadcast coverage of debate over ratification of the controversial Panama Canal Treaty, approval of which would return control of the Panama Canal from the United States to Panama. Senator Byrd's resolution would have allowed both television and radio coverage of the debate, which began on 8 February 1978, but unresolved technical questions forced the Senate to drop plans for television and to allow exclusive coverage to radio. The Columbia Broadcasting System (CBS) and the National Broadcasting Company (NBC) aired portions of the debate, and NPR aired the entire debate, with only brief interruptions to identify speakers.

Not to be outdone by the Senate, House Speaker Thomas "Tip" O'Neill (D-Massachusetts) announced that beginning on 12 June 1978, radio networks, stations, and news organizations would be able to pick up feeds from the House audio system for broadcast. The decision came in response to a request

by Associated Press (AP) Radio. As it happened, AP Radio elected to carry only five minutes of live House debate on the day that radio was finally given a green light to cover chamber proceedings. This brief coverage, however, outdid other radio networks, which carried only brief taped excerpts of House debate during regular newscasts.

Just as rules exist for broadcast of congressional committee proceedings, so do similar rules exist for broadcast coverage of House and Senate floor debate. The Speaker of the House has final authority over all broadcast activity from that body, but House rules also stipulate that coverage of chamber proceedings must be unedited and must not be used for political purposes or commercial advertisements. The Senate Rules and Administration Committee has ultimate authority over the Senate broadcasting system, but the Senate sergeant at arms is authorized to act in the committee's behalf. The same rules on editing and on the political and commercial use of chamber broadcasts that exist in the House also govern the Senate.

Anything that emanates from the microphones in the House and Senate chambers may be broadcast by any radio network or station. As is the case with committee proceedings, neither networks nor stations generally choose to air more than brief excerpts of floor debate. A departure from that practice occurred during the House impeachment and Senate trial of President Bill Clinton. Radio coverage of these two events during late 1998 and early 1999 was extensive, and in the case of NPR the coverage was gavel to gavel.

Radio and Individual Members of Congress

The unsuccessful efforts to ignite interest in broadcasting chamber debates during the 1920s and 1930s might have stemmed from radio network policies that allowed U.S. senators and representatives free airtime. Records show, in fact, that between 1928 and 1940, CBS allowed some 700 U.S. senators and some 500 House members to speak on the network.

Possibly spurred by the interest shown in congressional radio during the 1945 Joint Committee on the Organization of Congress, in 1948 Robert Coor created a commercial operation known as the Joint Radio Information Facility, which provided a recording studio for individual members of Congress to record speeches and interviews for use by radio networks or local radio stations. Congress brought recording under its own control as part of the Legislative Appropriations Act in 1956, creating separate House and Senate recording studios. Studio operating costs were covered by charges to those members of Congress who actually used them. In later years, both the House and the Senate studios were upgraded for television and for live links with news-gathering organizations via satellite. And besides the congressional studios, individual senators and representatives by the 1990s had access to recording facilities operated by the Democratic and Republican parties.

Radio used purely as a campaign tool—a practice nearly as old as broadcasting itself—stands apart from the other uses of radio already noted. The first known use of radio for campaigning occurred in 1922, when Senator Harry S. New (R-Indiana) used the U.S. Navy's radio station in Washington, D.C., to address his constituents at home. The *New York Times* took note of the occasion, saying that "campaigning by radio soon might leave the field of novelty and become a practical everyday proposition during political fights." The small first step into campaign radio became a rush by 1924.

Radio was readily regarded as a valuable campaign tool, but fears arose over the possibility that those who owned radio stations might create unfair advantages by allowing candidates whom they supported easy access to the airwaves while refusing to allow use of their radio facilities to candidates whom they opposed. The issue was thoroughly discussed during the Washington Radio Conferences, with the resulting recommendation that Congress include some provision in the Radio Act of 1927 that would ensure not only that there would be equal opportunities for use of radio facilities by candidates for public office, but also that the content of any campaign message via radio would not be censored. The recommendation was approved by Congress and fashioned into Section 18 of the Radio Act, which was transferred intact as Section 315 of the Communications Act of 1934. Section 315 required that equal opportunities be extended to political candidates after their opponents had been granted use of a broadcasting facility. Broadcasters were still free to decide whether to extend initial use of their facilities for campaign purposes. That changed somewhat in 1971, when Congress amended the Communications Act to include language in Section 312 that required broadcasters to provide time for legally qualified candidates for federal elective office.

Radio and the Contemporary Congress

Radio has not only held its own as an important congressional medium, but its importance may be expanding. The "niche" medium that radio has become—meaning that radio stations now fine-tune their formats to reach specific demographic groups of listeners—means that members of Congress can design specific messages and utilize carefully chosen radio stations in their home states or districts to reach precisely the intended audience. This makes radio an especially valuable tool for campaigning. "Talk radio," one of the most popular formats in the 1990s, requires a steady flow of guests willing and able to discuss a range of issues, and the need of members of the U.S. Senate and House to have access to constituent listeners has created a near-perfect symbiosis between radio and members of Congress.

United States Influences on British Radio

Commercial Thinking and Public Service Systems

United States radio broadcasting has had varied impacts, both positive and negative, on British and European domestic radio systems over the years. Only relatively recently have most foreign radio systems begun to substantially parallel U.S. program and commercial approaches.

The attitudes of British radio broadcasters, managers, and listeners toward American radio have ranged from contempt, hostility, and condescension to craven admiration and imitation. The British system of a monopoly public-service broadcaster, largely financed by a compulsory license fee on radio receivers (which lasted for more than 50 years) was in part due to a reaction against the commercial U.S. system.

To World War II

In the 1920s and 1930s, the British establishment was appalled that advertisers might influence as well as finance programs on the new and powerful medium—as they were clearly doing in the U.S. The view of the British Broadcasting Corporation (BBC)—personified by its severe and highly religious first director-general, John Reith—was that radio should be used primarily as a means of educating and informing the public, ensuring that the highest and most sophisticated cultural forms are available to the humblest citizen. There was concern that

British culture would be corrupted by "American-style" programming, and not just in "high culture." There was a belief among the British elites that U.S. popular music and comedy were inherently inferior and less intellectually demanding than the U.K. forms. United States radio, it was argued, was merely serving the "lowest common denominator," and any adoption of its forms and values would diminish and even corrupt the potential of the medium and the audience that it served. Many in the BBC and other parts of the establishment were especially dismissive of the production of drama in the United States in strict 30- or 60-minute slots, unlike the longer and often untidily timed dramas on the BBC (which of course did not have to worry about a matrix of programming to comply with numerous network/local "junctions"). British critics also inveighed against the preponderance of "soap operas" and thrillers, which were regarded as evidence of an intellectually limited use of the medium.

The idea that radio should have an entertainment and populist aim was the antithesis of Reith's driving philosophy; so long as the public did not have a choice of listening to alternative, lighter fare, then the "improving" nature of British radio would continue unchallenged. To Reith's dismay, however, in the early 1930s entrepreneurs aware of U.S. commercial stations realized there was a potentially lucrative gap in the market. Several

commercial radio stations sprang up on the European continent (naturally outside the jurisdiction of British law), targeting British listeners with a diet of popular dance band music, comedy programs, and other forms of light entertainment. This was especially true on Sundays, which Reith insisted on dedicating to serious-minded programs, including religious services. These stations—with Radio Normandy and Radio Luxembourg having the greatest impact—copied many of the forms and financing of U.S. commercial radio of the time, including sponsored programs. The continental stations achieved audiences in the tens of millions and easily outstripped those tuned to the BBC services on Sundays and in the early-morning periods.

World War II and After

The European commercial stations closed down when Nazi Germany occupied most of Europe. More controversy was created in July 1943 when the American Forces Network (AFN) established a radio service carrying many American network programs for U.S. troops stationed in the United Kingdom using the BBC's emergency facilities. This was the only time in the half century from the inception of the BBC in 1922 to the introduction of authorized commercial radio in 1973 when the BBC's monopoly of British radio broadcasting was officially broken. There was much nervousness and even antagonism from many in the British establishment that listeners might find AFN's more informal and populist programming very attractive and demand something similar when the war ended. Indeed, many British servicemen heard AFN services in other parts of the globe and enjoyed the programming, in some cases more than their own Forces' Programme.

After World War II, the BBC made some concessions to popular fare by establishing the Light Programme, which shared its transmissions with the postwar Forces' Programme. However, for the most part, the BBC remained impervious to American style radio, and the policy of succeeding governments was to continue the BBC's radio monopoly—even after commercial television was introduced in 1955. Once again British listeners had to tune to Radio Luxembourg for a taste of U.S. style diet of record request programs and quiz shows.

It was the arrival of rock and roll, the attendant development of a distinctive youth culture, and television's growing domination of evening hours that presented the greatest challenge to the BBC's policies. The BBC seemed content to allow the slow death of radio as a mass medium. In particular its managers were appalled by rock and roll and only reluctantly allowed a few hours a week of such music even on the Light Programme. Only pirate stations and Radio Luxembourg provided an American-style alternative for British listeners.

Although the U.K. government forced most of the pirates off the air through an Act of Parliament that made it illegal for a U.K. citizen to supply or be employed by such a station, the

BBC was ordered to produce a replacement, called Radio 1. Now the U.S. Top 40 station jingles were recycled yet again—"Wonderful Radio London" became "Wonderful Radio One," and the BBC employed many of the best-known pirate broadcasters—especially those from Radio London.

British Commercial Radio

Nevertheless, pressure for legalized commercial radio continued to grow, and in 1972 the Conservative government introduced an Act of Parliament that led to the establishment of a chain of independently owned commercial services. However, the Act specifically proscribed continuous music channels on the U.S. model: the U.K. stations were to be based on the public service model and to be "full service," including high levels of current affairs output and even drama and comedy programs, although many of these were modeled more on those common on U.S. network commercial radio in the 1930s and 1940s than on the BBC's output. Many U.K. broadcasters and managers who had hoped for something equivalent to the U.S. system were very disappointed by the strictures of the U.K. system. Some did their best to get around the regulations and produce as close a format to the U.S. stations as they could get away with. Piccadilly Radio in Manchester was perhaps the most notable example of this, which is not surprising, as its managing director, Philip Birch, had also been managing director of pirate Radio London. Several stations—including Radio Trent in Nottingham, Metro Radio in Newcastle-upon-Tyne, and Beacon Radio in Wolverhampton—imported U.S. jingles, although these had to be partly rerecorded in the United Kingdom to comply with Musicians' Union rules.

Nor were the attempts at imitation of U.S. radio confined to the Top 40 format. Many in the U.K. industry recognized that by the time commercial radio was legalized in the mid-1970s, this format, based on the sales of the 45-rpm single, was past its peak, with record sales now dominated by the 33 1/3-rpm album. Some managers and broadcasters also felt that the early vitality of Top 40 radio had now been dissipated and was now perceived as embarrassingly unsophisticated and "uncool." Consequently, stations such as Capital Radio in London (at least in its early days) and Beacon Radio opted for a U.S.-style FM format. Beacon in particular, which had an American managing director and a Canadian program director, attempted a U.S. West Coast FM-style format for its main daytime hours. This style was also much favored by Radio 1 disc jockey Johnnie Walker (formerly of Radio Caroline and Radio England) who, in ill-concealed protest at the "pap" he was forced to play, left Britain at the height of his popularity in 1976 to go to the United States, where he worked for a time at San Francisco's "free-form" FM station, KSAN.

A number of British stations continued to demonstrate a fascination with U.S. chart music: Beacon, for example, had a

four-hour program on Sunday nights of the *Billboard American Hot 100*, and Casey Kasem's legendary *Countdown* program was transmitted on several U.K. stations in the 1980s and 1990s. BBC Radio 1—and later Radio 2—also featured a weekly U.S. chart countdown.

As the price of transatlantic air fares dropped in the 1970s, many British disc jockeys and programmers traveled to America for the first time. Although many had heard tapes of U.S. stations, the impact of hearing U.S. stations at first hand—in particular, the tightly defined format of most stations, their relative lack of public service elements, more aggressive presentation styles, and less reverential attitudes toward authority figures—greatly impressed some of the Britishers. Many returned from such vacations determined to radically alter their approach, sometimes with startling results. The use of U.S. topical humor services also became vogue among British disc jockeys. Contests, promotions, production techniques, technical innovations such as compression, the use of computer programs for music selection backed by intensive audience research, and, not least, the style of U.S. commercial copy provided much material for British stations.

Specialization

Nor was it only music radio formats that impressed U.K. station managers, investors, and broadcasters. The only commercial all-news service, LBC in London, was largely modeled on New York's WINS, and the informality of news presenters at WINS and their willingness to mix news with comment were enthusiastically adopted by the station. Some of this imitation in turn fed through to the BBC services nationally and locally.

Many local full-service commercial services included a late-night controversial phone-in show, some of which were clear imitations of the U.S. "shock jock" phenomenon—albeit considerably toned down in recognition of the different regulatory requirements, the absence in the United Kingdom of an equivalent to the U.S. Constitution's guarantee of free speech, and the necessity to maintain political balance and to conform to much stricter libel laws. But on both music and talk programs, the attitude of British presenters became noticeably less polite and deferential, especially toward figures in government and the royal family—although not all of this can be directly linked to U.S. radio's influence.

The imitation of the U.S. shock jock form reached its peak in the mid-1990s, when the last of the analogue national commercial stations, Talk Radio, adopted an all-phone-in format. However, the station produced disappointing audience figures, and after several changes of management and ownership, it changed format and name in January 2000 to Talk Sport.

In the meantime, there was continued political pressure for a more U.S.-based commercial model of licensing and regulation, which found favor under Conservative governments in the

1980s and 1990s. Most significantly, following the Broadcasting Act of 1990, there was a rapid end to the full-service or mixed British programming model—the middle-of-the-road format that had already been dropped by U.S. stations by the mid-1950s. Instead there was a trend toward a single format, usually either contemporary hit radio on FM or "Gold" on AM (most stations at that time were on both AM and FM; the ending of simulcasting was some 25 years behind the United States). Further, the large-scale switch to automation, networking, and conglomeration of radio companies in the United States has to some extent been replicated in the United Kingdom.

The manifest influence by the United States on British radio, however, seemed to be diminishing by the end of the 1990s. Radio 1 had restyled itself as a noncommercial, adventurous, youth-oriented station, less concerned with audience ratings than it had been in the past—in many ways the antithesis of most U.S. radio. Meanwhile, the commercial sector, now attaining at least 50 percent of all listening and with rapidly growing revenues, appeared to be less impressed by U.S. forms, and some managers even proclaimed that now the United States had more to learn from the United Kingdom than the other way around. The United Kingdom's adoption of the "European" digital radio standard (rather than the IBOC system developed in the United States), was another indication of a deliberate distinction between the two countries' radio services.

Nevertheless, much of the criticism of U.S. commercial radio—that it has become overcautious and that it increasingly lacks creativity and diversity—are also now leveled at radio in the United Kingdom. Some in the industry, along with many observers, believe that the swing from the peculiarly British, highly regulated public service commercial radio model to the laissez-faire United States style system has been too great. Some concede that Reith's belief that commercial broadcasting must inevitably lead to crass and undemanding broadcasting aimed at the "lowest common denominator" has been vindicated.

United States Navy and Radio

During the first two decades of the 20th century, the U.S. Navy served as a principal force in the development of radio communications in the United States. From the introduction of practical radio systems at the turn of the century to the beginning of U.S. radio broadcasting in the early 1920s, the Navy's influence on American radio was powerful and multifaceted. These significant influences included the application and expansion of radio for military and diplomatic purposes, the control of radio communications, technological developments, and the fostering of development in the radio industry.

Origins

At the beginning of the 20th century, electrical communication by telegraph and telephone provided Navy officials with rapid communications between most ports and naval stations worldwide. At sea, the situation was radically different. When a ship left port and disappeared over the horizon, it was isolated from shore communications. Free of new directives from Washington, the captain and fleet could act with complete autonomy.

The invention of radio communications and its application to maritime use brought both benefits and difficulties to the Navy. Some naval officials recognized very early the strategic and tactical benefits of being able to communicate between distant ships and from ship to shore, but the adoption and widespread use of radio on shore and ship installations was slow in coming. The early resistance to radio in the Navy can be attributed to several factors, including the traditional bound bureaucracy and the strong desire of many naval officers to preserve the independence a captain traditionally exercised at sea. To many naval officers, radio was viewed as the ultimate centralizing force from Washington. The Japanese Navy's success in

using radio during the 1904-05 Russo-Japanese War aided in diminishing this resistance.

The Navy first tested radio apparatus in 1899, but serious attention and further testing did not occur again until 1901. Over the next decade, the navy tested and purchased various types of wireless equipment from both U.S. and foreign countries, often resulting in stations with unfavorable composite equipment. The Navy was an early and important potential client for new radio companies; it exerted a positive force in developing the U.S. radio industry, but it was also a force to be reckoned with. Inventors eager to gain valuable Navy contracts regularly found themselves frustrated by the Navy's hardball business tactics and lack of respect for patent rights. The Navy simply acquired equipment as needed and from whom they wanted, regularly ignoring patent restrictions. Complicating the Navy's relationship with U.S. radio equipment suppliers was the perception that the Navy often gave preference to foreign companies. A clear exception to this was its negative attitude toward the British Marconi Company.

The Navy's strong aversion to the Marconi Company and its equipment can be traced to concerns about British domination of the world cable system. Navy fears that the Marconi Company would grow to dominate radio communications, and therefore establish a British hegemony over worldwide communications, were very strong. As a result, Marconi equipment was rejected and the Navy began a two-decade-long effort to establish U.S. control of its own radio communications. Radio waves do not recognize national borders, and the need to dominate and so control the ether was a compelling security issue for Navy officials.

Beginning with the 1903 international radio conference in Berlin, the Navy took on the leadership role of representing U.S. radio interests worldwide. This leadership role had great

influence over two decades of shaping the evolving international radio regulations. The Navy's influence in directing self-serving lobbying efforts was also ever-present on the Washington political scene. Congress recognized the importance of radio for the Navy and the national interest, placing the Navy in an influential and dominant position, especially for federal funding. Despite the Navy's efforts to support legislation that would wrest control of radio from commercial and amateur interests, however, access to the airwaves by non-military operators and interests prevailed.

World War I

U.S. entry into World War I on 6 April 1917 changed the entire radio communications scene. The following day, with the exception of army-operated transmitters, the Navy took control of all radio stations in the United States, acquiring 53 commercial stations and closing another 28 transmitters. In addition, all amateur radio stations were shut down "for the duration" of the war. In one swift move the Navy had taken control of the entire radio communications system in the United States, along with its existing international ship and port radio system.

Because of the sudden increase in radio communication traffic, Navy orders for equipment from private manufacturers increased dramatically. The Navy's centralized control over the equipping of ship and shore stations produced many improvements in equipment quality and, importantly, standardization in equipment design. The Navy also conducted significant wartime research and development in radio technology, greatly improving the consistency and quality of long-distance radio communications.

With the complete takeover of radio communications by the Navy, the question arose as to what would happen at the war's end. After the armistice on 11 November 1918, Secretary of the Navy Josephus Daniels began a strong lobbying effort for legislation that would leave radio permanently under Navy control. His efforts ultimately failed—Congress was in no mood to continue an activist federal establishment—and government control of the wartime-seized radio stations was eventually relinquished. On 11 July 1919 President Wilson ordered that all commercial stations be returned to their original owners by 1 March 1920. In addition, amateur radio stations were allowed to resume operation on 1 October 1919.

Radio Corporation of America

The Navy's postwar loss of the control of radio communications was a blow to its geopolitical aspirations, but its influence and power were still very significant. The drive to assure the U.S. a major role in global radio communications and to prevent the British Marconi Company from obtaining too

strong a foothold in the U.S. communications market resulted in the Navy initiating and facilitating the formation of the Radio Corporation of America (RCA).

The specific technological innovation driving the navy's concern was the Alexanderson alternator, then the only effective means of achieving long-range radio communication. Developed from designs of Reginald Fessenden and greatly improved by General Electric (GE) engineer Ernst F.W. Alexanderson, rights to the device were controlled by GE. But GE was not interested in getting into the service side of radio; the company defined its role as a manufacturer and sought to sell the devices to recoup its extensive investment. Beginning during the war (1915), the most likely purchaser appeared to be Britain's Marconi Company which, however, sought full and exclusive rights to the alternator. GE was tempted at what would be a lucrative agreement. Navy officials, including assistant secretary Franklin Roosevelt, however, expressed strong concern about such an important device passing into the hands of even a friendly (but still foreign) country. Navy officials pressed GE to seek a domestic means of selling the alternator.

GE's concern paralleled another: the wartime pooling of radio patents so that manufacturers could perfect the best possible radio equipment for army and navy procurement contracts. The end of the war also ended the patent pools, and companies faced the need to develop a peacetime pool if radio was to continue its development. These related needs—GE's for the alternator, and the industry at large to develop a peacetime patent pool—led to the rise of RCA.

Through a series of complex company buyouts and new patent pooling agreements, General Electric established the Radio Corporation of America as a subsidiary in October 1919, and important technological patents (the alternator among them) were eventually pooled under RCA's corporate umbrella, thus preventing any possibility of British radio communications hegemony within the United States. Ownership in RCA was later spun off and it became the single most important firm in early radio broadcasting development.

United States Presidency and Radio

On 21 June 1923, when President Warren Harding stepped to the microphone to deliver a speech on the World Court from St. Louis as part of his tour of the western United States, he spoke not just to the citizens of St. Louis, but to those in Washington, D.C., and New York as well. This was the first time that a chain or network of radio stations had been assembled to carry a presidential message simultaneously to several parts of the nation. The speech was heard in St. Louis over KSA and in New York and Washington over American Telephone and Telegraph (AT&T) stations WEAJ and WCAP, respectively. Perhaps 1 million Americans heard Harding speak, more than any president had reached before. No longer was a president bound by the flatness of daily newspaper coverage or the geographical limitations of single-station radio coverage; he now had the potential to speak to the entire electorate at once, a power that would enlarge the "bully pulpit" beyond any expectation of the day. With a single flip of the switch, broadcasters could help a president rise above his adversaries in Congress and go directly to the people.

A strong national broadcasting system contributed to a strong presidency. A politician whose voice commanded attention in every corner of the land simultaneously could build a strong national constituency. Conversely, a strong presidency contributed to a strong national broadcasting system. Presidential speeches created a demand and provided one of the few programs that could unite American interests. The American people were eager to hear their national leader over the fascinating new medium of radio, and broadcasters were pleased to be the purveyors.

Early Experiments in Networking

After the success of his first attempt at chain broadcasting in St. Louis, President Harding tried another major speech in Kansas City and had scheduled still another big speech on 31 July 1923. For the occasion, AT&T assembled its first coast-

to-coast linkup stretching from San Francisco to New York. Radio had become such an important part of President Harding's western tour that he installed a powerful radio transmitter in his railroad car to give him a mobile broadcasting studio.

Harding died while on his western trip, and within a few days of his death the National Association of Broadcasters (NAB) was proposing to the new president, Calvin Coolidge, that he substitute radio addresses for public appearances to conserve his health and reach a wider audience. By the end of 1923, as the 1924 campaign approached, President Coolidge heeded the advice and took to the airwaves regularly. When Coolidge spoke to Congress at the end of the year, AT&T assembled a chain of seven stations to carry the speech. The president followed that speech with five additional nationally broadcast addresses. The 1924 party conventions reached an estimated 25 million listeners, and the subsequent campaign provided abundant opportunities for chain broadcasting.

A small group of broadcasters questioned whether politicians should be turned loose on radio. At the NAB's first convention in October 1923, John Shepard, III, of WNAC proposed that a political party applying for airtime be required to give comparable time to a speaker from the opposing party. The NAB accepted the measure and followed these "equal time" ground rules during the 1924 campaign. Presidential speeches, however, were not considered "political" except during campaigns and were not subjected to any "right of reply" mechanism until the campaign actually started. Still, voices were raised early to warn of the dangers of a one-sided political dialogue in which the party and congressional opposition had no standing.

By 1924 proponents of chain broadcasting had realized that politics was the perfect bait to lure America into a permanent national system of broadcasting. The presidential election campaign that year provided ample opportunities for demonstrating the virtues of chain broadcasting. AT&T was poised to erect a permanent network of stations and believed

that political speeches were an excellent way to ensure frequent use of a system that could reach 78 percent of the nation's purchasing power through the top 24 markets.

The closer the fledgling broadcasting industry could bring itself to the presidency, the higher the status it could bring on itself. Thus, initially there was little concern for the newsworthiness of presidential addresses. Broadcasters saw presidential broadcasting as a means of providing a public service and basking in the prestige of the presidency. Given the open-ended invitation extended early on to presidents by broadcasters, it is no wonder that presidents ever since have regarded their access as a right of the office.

The *New York Times* reported in 1924, "It is a source of wonder to many listeners how a speaker can sit in the White House or stand before Congress and have his voice simultaneously enter the ether over Washington, New York and Providence." The inauguration of Calvin Coolidge on 4 March 1925 showed how far chain broadcasting had come in less than two years. On that day, President Coolidge reached at least 15 million Americans over a hookup of 21 stations from coast to coast. The transmission was so clear that people could hear rustling paper as the new president turned the pages of his text. The inaugural coverage was so successful that talk circulated about broadcasting sessions of Congress. Meanwhile, "Silent Cal" began speaking an average of 9,000 words a month over radio. Although his speeches lacked persuasive content, he was credited with being a strong and effective radio performer.

By the time Herbert Hoover took his presidential oath in 1929, two powerful broadcasting companies supporting three national networks were flourishing. President Hoover spoke on radio 10 times during 1929 and 27 times the following year. By the end of 1930, he had equaled the number of talks Coolidge gave during his entire administration. President Hoover's cabinet reinforced the administration's line by giving even more radio talks. In 1929 the National Broadcasting Company (NBC) devoted from 5 to 25 hours per week to presidential speeches, reports on national events, and addresses by public figures. By 1930 the government was using 450 hours of broadcasting time on NBC alone.

Despite his unmatched experience on the air, President Hoover was a reluctant and not particularly gifted participant in the broadcasting arena. Aides pushed him into making radio speeches. The president also had the unenviable task of selling an economic program that the American public did not want to hear in the depths of the Depression. Hoover's speeches progressively brought diminishing returns. Soon, everyone realized broadcasting was a two-edged sword; it could not only help elevate presidents but help bury them as well. Broadcasting worked its magic best when the potential for persuasion and good feeling were at a peak, a fact not lost on Hoover's successor.

A Radio Star Is Born

Until Franklin Roosevelt (FDR) became president, the networks were more captivated by the presidency than by any particular occupant of the office. The networks clung tightly to FDR's rising star and used his engaging personality on the airwaves to enhance their own status. Columbia Broadcasting System (CBS) commentator Frederic William Wile was one of the first at the networks to realize how high a priority Roosevelt placed on broadcasting. Wile emerged from a talk with the president-elect predicting that the new president would be "highly radio-minded," which would cause Washington to become more "radio conscious" and the American people to become more conscious of Washington.

Following his success in using radio to push a recalcitrant New York Legislature into action, Roosevelt told Wile that he expected to request time frequently. The new president's fascination with radio was surpassed only by the networks' fascination with him. Merlin Aylesworth, president of NBC, not wanting to miss a piece of presidential action, approached Roosevelt before he was inaugurated to offer him airtime on a regular basis. Although FDR was tempted by the alluring network offer, he feared overexposure and preferred to use the airwaves according to his own timing and his own priorities.

Starting with his first inaugural address, in which he told Americans the only thing they had to fear was "fear itself," the new president proved himself to be an exceptional communicator. The networks quickly realized that Roosevelt had different motivations for using radio than had his predecessors. To him, the medium was no longer a novelty for sending ceremonial greetings; it was a vital tool for persuasion. President Roosevelt used all the intimacy and directness radio could offer to rally support for his policies. Just eight days after being sworn in, FDR put radio to the test. Eschewing his fiery and strained campaign oratory, Roosevelt crafted a subdued, conversational style exclusively for radio. He spoke calmly, intimately, and above all, persuasively in what immediately became known as "Fireside Chats."

As more Fireside Chats poured out of the White House, the American people responded favorably. FDR became a friend and a neighbor who could captivate a nation and develop a truly national constituency. When FDR came to office, one employee could handle all the White House mail. By March 1933, a half-million letters sent the White House scrambling to hire additional staff.

Franklin Roosevelt presented only 28 Fireside Chats during his three terms (and a few months of his fourth), but they had an extraordinary impact on a nation seeking desperately to pull itself out of depression and to win a world war. He boosted his radio speeches' appeal by making them during the "prime" of prime time (between 9:00 P.M. and 11:00 P.M. EST) on weekdays when families were home together.

Roosevelt's political adviser Jim Farley said that radio could wash away the most harmful effects once "the reassuring voice of the President of the United States started coming through the ether into the living room."

FDR took advantage of his platform to persuade voters to support him and his programs. Later in the century, broadcasting executives would chafe at a president's using the airwaves solely to persuade voters or Congress to support a particular program, but there was no such resentment of Roosevelt. On the contrary, broadcasting executives delighted in the drama and excitement Roosevelt created. Merlin Aylesworth of NBC effusively wrote President Roosevelt that "I can honestly say that I have never known a public official to use the radio with such intelligence."

Behaviors were locked in during World War II that would greatly influence the way politicians communicated in the coming television age. Americans became even more dependent on the president as a national leader—accustomed to hearing the man who led them through the crisis of the Great Depression, they were prepared to hear him lead them confidently through another. More important, they expected direct communication from the commander in chief. Radio was no longer a novelty; it was a necessity. During the war, Roosevelt always had access to all four networks—CBS, Mutual Broadcasting System, and NBC Red and Blue—simultaneously. When Franklin Roosevelt spoke to the nation two days after the bombing of Pearl Harbor, he achieved the highest ratings of all time; 83 percent of American households that owned radios were listening to the president.

By the end of the Roosevelt administration, presidents had gained a *de facto* right of access to all radio networks simultaneously, creating a captive audience of millions. Perhaps most important, the president could enjoy this radio access without worrying about a direct rebuttal by the opposition party.

President Versus Candidate

President Roosevelt was a master at inching his presidential addresses closer and closer to election periods to avoid purchasing time from broadcasters. This tactic not only increased his exposure when the voters were starting to focus on the elections but also allowed him to speak without fear of opposition reply. Section 315 of the Communications Act of 1934 required broadcasters to offer "equal time" to opposing candidates during "candidate" uses of airtime. Roosevelt insisted that he was speaking as a "president" rather than as a "candidate" and that his speeches were not subject to the reply rule.

When the president held a Fireside Chat on 6 September 1936 about drought and unemployment, the Republicans charged (to no avail) that the speech was political. Roosevelt used the same successful strategy in the 1940 campaign to

make as many free "presidential" rather than paid "candidate" speeches as possible. Roosevelt was particularly adamant about securing free network time for "fireside chats" because toward the end of the campaign, the Democrats were almost out of money. Earlier that year, the NAB had boosted the president's case by ruling that rival political candidates had to prove that FDR's speeches were political, something difficult for an opponent to do. The question of whether addresses were "presidential" or "political" continued into the Truman administration. The Republicans were outraged on 5 April 1947 when NBC, the American Broadcasting Company (ABC), and Mutual carried President Truman's Jefferson Day speech at a \$100-per-plate Democratic fund-raising dinner. GOP National Chairman Carroll Reece said the networks' giving airtime constituted an illegal corporate campaign contribution. Reece also charged that "free radio time is a royal prerogative, something to be given without question whenever requested and without regard for the purpose to which it may be devoted."

When television ascended to preeminence in the early 1950s, radio was forgotten as a tool of presidential communication. During the Eisenhower, Kennedy, and Johnson administrations, radio found no place in the presidential arsenal—this despite the fact that Vice President Nixon had "won" the first "Great Debate" of the 1960 campaign on radio where people could not see his exhaustion. The televised presidential speech, broadcast simultaneously on all three major networks, had become the oratorical weapon of choice. Radio became a low-key form of communication that President Nixon used in 1973 to downplay the strident debate over highly controversial budget initiatives, choosing to deliver his State of the Union addresses as a series of radio speeches rather than making a formal, more visible presentation before Congress and a nationwide television audience.

Reagan on Radio

It wasn't until 1982 that the presidential radio speech made a comeback with the arrival of Ronald Reagan in the White House. The administration approached the networks about a series of radio speeches that would be broadcast each Saturday morning from the Oval Office. The Reagan administration saw radio as an opportunity to take its case directly to the people on a sustained basis in a way that would allow the White House total control of the broadcasts. At a time when the president's popularity was sagging, the radio addresses also presented an attractive complement to a broad multimedia offensive. Because the addresses would be broadcast on a traditionally "slow news" day, the White House expected abundant residual media exposure on Saturday network radio and television newscasts and Sunday newspapers. Finally, the White House staff realized how effective "the

great communicator” could be on a medium with which he felt so confident.

With the radio speeches, the White House could achieve access in an entirely controlled way. There would be no editing of material, no filtering through reporters’ minds, no distracting or nagging questions by the press. It would be a perfect opportunity to “let Reagan be Reagan.” Even in the residual coverage, when reporters could edit as they wished, White House aides believed the Reagan momentum would still be present.

On Saturday, 4 April 1982, President Reagan began his radio initiative in the Oval Office with the first of ten five-minute speeches. The president said he was making the speeches to overcome “all the confusion and all the conflicting things that come out of Washington” by bringing “the facts to the people as simply as I can in five minutes.” Aides said the speeches’ brevity was an effort to prevent having Reagan’s message “truncated” or “filtered” by the news media.

The White House staff said that Reagan wrote most of the first ten speeches himself, often rejecting drafts and writing the script in longhand shortly before airtime. Reagan set a folksy, conversational tone in the first address by beginning, “I’ll be back every Saturday at this same time, same station, live. I hope you’ll tune in.” The president’s personal input sometimes startled aides.

When President Reagan settled into his radio routine, it was obvious his targets were the Democrats in Congress. The president used six of his first ten speeches to defend his economic programs and to attack the Democrat-controlled House for not supporting him. Not surprisingly, these speeches gained the greatest press coverage: the *Washington Post* carried news about all six of them on the front page, and the broadcasting networks gave them prominent placement on the evening news. Although it is not difficult for the president to make news, it can be difficult for him to make news that he controls. Therefore, extensive regular coverage in Sunday newspapers and on Saturday network news about subjects that he initiated was a positive sign. Not surprisingly, when President Reagan signed off for the last of his ten speeches, he said, “I’ll be back before too long.”

After an 11-week hiatus, President Reagan continued his radio speeches on a regular basis. By the end of his term, they had become the longest-running regularly scheduled broadcast initiative ever taken by an American president, establishing Ronald Reagan as the person who resurrected radio as a persuasive tool of the presidency. These speeches also reinforced the value of radio as a campaign tool in non-election years. They brought the president a sustained, controlled forum for his views and significant residual media coverage. The fact that the Republican National Committee continued the radio speeches as paid political broadcasts gave clues to both their purpose and their effectiveness.

Opposition Response

Unlike televised speeches, in which the opposition got to reply on a hit-or-miss basis regulated by the networks, with radio speeches the Democrats in Congress were guaranteed automatic access. The automatic replies to President Reagan’s radio speeches gave 28 senators, 41 congressmen, and 4 non-congressional Democrats an opportunity to go head-to-head with the president. Speaker Tip O’Neill and Senate Minority Leader Robert Byrd chose the spokesmen who wrote their own speeches, with guidance being made available from the leadership.

The opportunity to reply to one of President Reagan’s radio speeches was sought by several rank-and-file members, especially younger, less visible congressmen. It was considered an honor and sign of approval to be asked by the Speaker to make the reply. Many members were more interested in the local audience in their districts rather than the nationwide audience. Some media-conscious congressmen heavily promoted the speeches in advance, advising their constituents to listen on Saturday.

The lure of a radio reply was not as appealing to senators and senior House members. The Saturday afternoon time posed an obstacle to recruiting the best and brightest of the party. Many senior members had important weekend commitments that they were not willing to change. Some senators resented the double standards the networks imposed on the Congress. The broadcasters followed President Reagan anywhere in the world for his Saturday speeches but made congressmen and senators come to a studio in downtown Washington, D.C. This gave President Reagan great flexibility—he gave less than one-third of his speeches from the White House—but posed a logistical problem for the Democrats in Congress. Furthermore, listening to the president, drafting a relevant reply, rehearsing it, and presenting it all in one hour did not strike some legislators as the most relaxing way to spend a Saturday afternoon. By the time President Reagan announced his bid for reelection in January 1984, the Democratic leadership and its members seemed ready to give up the Saturday replies. Still, the opportunity for “the loyal opposition” to have automatic, direct access to the president of the United States had been unprecedented, and the Democrats took full advantage of the opportunity.

President Reagan’s success with getting residual print and broadcast exposure through his radio addresses caused his successors to carry on the tradition. Although few Americans listen to the Saturday radio speeches live, many see the aftermath of the speeches in the Sunday newspapers, on daily news broadcasts, or Sunday talk shows. The radio addresses have become a significant agenda-setting vehicle for television-age presidents. Despite the burden of having to make the addresses 52 Saturdays per year, Presidents George H.W. Bush, Bill Clin-

ton, and George W. Bush embraced the radio speech format and found it to be beneficial to their presidencies. It is likely that the radio tradition resurrected by Reagan will continue.

United States Supreme Court and Radio

The United States Supreme Court has played an important role in defining the relationship between government regulation and radio broadcasters, as well as what is permissible behavior by the broadcasters themselves. Numerous cases decided over six decades help to underpin and sometimes explain current regulatory practices.

Operation and Membership

Mandated by Article III of the U.S. Constitution, the Supreme Court stands at the apex of the judicial branch of the federal government. As its name implies, it is the final arbiter of legal issues involving the Constitution and governmental actions. It acts as an appellate court, meaning that it reviews decisions appealed from lower federal courts and from state supreme courts when cases involve questions of federal law—such as

the First Amendment, a common ingredient in many media cases. Cases appealed from different states concerning the same federal issue may also end up in the Supreme Court. To be considered, the losing side in the lower court files a petition for *certiorari* or review, along with supporting documents in an attempt to persuade the High Court of the importance of the case and of the wrong done to the litigant.

Unlike federal appeals courts, the Supreme Court need not accept all cases appealed to it. Indeed, the court selects a small portion (about 200 achieve the needed four votes for consideration) of the thousands of cases appealed to it annually. Most are denied (*certiorari* or *cert. denied*) without any reason being given, leaving the lower court decision in place. Once a case is accepted, attorneys for each side file briefs (formal written arguments) and the court schedules an oral argument to highlight the key issues and give justices a chance to question

counsel. A decision often appears months later, usually with an opinion representing the majority, and often with concurring or dissenting opinions as well.

Though its membership and operations have varied over time, for more than 100 years the court has operated with nine members, one of them designated by the president as Chief Justice of the United States. Appointments to the court, made by the president and subject to Senate approval, are for life-long terms. Vacancies, owing to retirement, death, or resignation (the latter is not common), thus occur at irregular times. President Johnson named the court's first minority justice, Thurgood Marshall (served 1967–1991), while President Reagan named the first woman, Sandra Day O'Connor (served 1981–present). The chief justice is usually a newly appointed justice; only three times in history (most recently in 1986 with William Rehnquist) has a sitting associate justice been so elevated.

Radio Rulings

On numerous occasions since the early 1930s, the court has issued decisions involving radio broadcasting. These have ranged from appeals of FCC decisions to specific sections of the Communications Act or other legislation. Most have concerned procedure and jurisdiction, while others have focused on permissible content. The majority of decisions have upheld commission actions.

The first important Supreme Court case to concern broadcasting was *Federal Radio Commission v Nelson Brothers Bond and Mortgage Company* (289 US 266, 1933), in which the court upheld the public interest statement in the 1934 Communications Act as being constitutional and not too vague for proper enforcement. The court also found that the commission had substantial discretion in applying the public interest standard to specific situations. Seven years later, in *Federal Communications Commission v Sanders Brothers Radio Station* (309 US 470, 1940), the court tackled the difficult question of how much the FCC had to be concerned with economic pressure on licensees caused by allowing additional stations on the air. In a decision that provided rhetorical meat for proponents of both sides of the question, the court determined that “economic injury to an existing station is not a separate and independent element to be taken into consideration by the Commission in determining whether it shall grant or withhold a license.” Taken together, these first two court decisions served to strengthen the authority of the FCC to read the Communications Act with some discretion.

In *National Broadcasting Company v United States* (319 US 190, 1943), the court issued a landmark decision that further strengthened the FCC's discretionary power. Upholding the commission's network rules that, among other things, forced NBC to sell one of its two national radio networks (it became ABC in 1945), the court determined that the commis-

sion could regulate the business relationships between networks and their affiliates. A decision still widely cited in the legal literature, it included the key rationale for government's control of radio: “Freedom of utterance is abridged to many who wish to use the limited facilities of radio. Unlike other modes of expression, it is subject to governmental regulation. Because it cannot be used by all, some who wish to use it must be denied.” The *NBC* case remains one of the most important media decisions of the Supreme Court.

On rare occasions, the FCC comes out on the short end of a Supreme Court decision. In *American Broadcasting Co. v Federal Communications Commission* (347 US 296, 1953), the court focused on commission procedures. The radio networks broadcast a variety of quiz programs in the late 1940s, and the commission determined that at least some of them violated the Criminal Code provision banning the broadcasting of lottery information. The Code and existing cases only partially defined what a lottery was, and the FCC had therefore issued a rule further defining what was illegal on the air. It was overturned in the lower court, and the Supreme Court agreed, holding that “the Commission has overstepped the boundaries of interpretation and hence has exceeded its rulemaking power.”

More directly focused on program content was *Red Lion Broadcasting Co. v Federal Communications Commission* (395 US 367, 1969). A conservative religious radio station licensee in Red Lion, Pennsylvania had refused to allow free time to a man who had been attacked on the air during a syndicated religious program. After the station refused FCC orders to comply with its personal attack rules, the case went to court. At the same time, the Radio Television News Director's Association (RTNDA) appealed aspects of the FCC's “Fairness Doctrine.” Lower courts found for the FCC in the Red Lion case and against the commission in the RTNDA case. Because they dealt with similar aspects of the law, they were combined when appealed to the Supreme Court. The court's ruling upheld the Fairness Doctrine, again justifying its decision because of the limited spectrum available for broadcasting that provided the groundwork for government regulation of the service. In its widely quoted line, the court concluded “It is the right of the viewers and listeners, not the right of the broadcasters, which is paramount.”

Another radio content case came nearly a decade later in *Federal Communications Commission v Pacifica Foundation* (438 US 726, 1978) which effectively defined that which was indecent, and thus could be broadcast within certain conditions, as opposed to something obscene, which lacks First Amendment protection and may not be broadcast at all. Citing the “uniquely pervasive presence” of broadcasting (in this case a New York City noncommercial FM station) in the home as rationale for some limits on what could be broadcast, the court held (by a narrow 5-4 margin) that the FCC had been right to fine the station for broadcasting material (a satire on dirty words) in the

early afternoon that might be permissible late at night when, presumably, children were not present in the radio audience.

In most matters dealing with media content, the Court has held in favor of the First Amendment and thus against government meddling or interference with media decisions. After a decade of legal wrangling, *Federal Communications Commission v WNCN Listeners Guild* (1981) resolved once and for all who would determine station formats—a government agency or the marketplace. After 1970, the Court of Appeals for the D.C. Circuit, in a series of cases, had held that the FCC did have to determine whether station format changes were in the public interest. In response, the FCC in 1977 issued a policy statement citing the *Sanders* case (that competition should “permit a licensee . . . to survive or succumb according to his ability to make his programs attractive to the public”) and determining that the agency did *not* have to make public-interest determinations concerning format changes. An appeals court decision in 1979 once again held against the FCC position, and the agency appealed to the High Court.

In a 7-2 decision, the Supreme Court held that the lower court had made an “unreasonable interpretation of the act’s public-interest standard” and reversed it, agreeing with the FCC finding in favor of marketplace determinations of station formats. The court determined that the FCC policy statement was both reasonable and consistent with the legislative history of the Act. Kahn notes of this decision that “[t]his document is a restatement of the notion that reviewing courts are to grant substantial deference to the discretion of the expert administrative agency Congress established to determine what serves the public interest in broadcasting” (Kahn, 1984).

In sum, the Supreme Court has been called on to determine whether FCC decisions meet Constitutional tests as to their substance or procedure, and in most cases (where lower court decisions have been accepted for review) has supported the federal agency. The court’s rationale for upholding federal authority over radio has varied over time, but such rationale usually includes spectrum scarcity and thus the need to select among those who would broadcast, and the pervasive presence of the medium in the home. Combined, these considerations have led to a more limited First Amendment right for radio broadcasting compared to print media.

Urban Contemporary Format

Following the arrival of television, radio's new program specialization approach (formats for targeted audiences) provided a previously unavailable venue for a number of music genres, among them rhythm and blues, the "mother" of the urban contemporary radio format. Rhythm and blues, jazz, and black gospel music were developed from the lifestyles and experiences of African-American musicians and artists. Rhythm and blues provided the optimum entertainment and storytelling experiences about life, love, and pain in the African-American community. Artists such as Little Richard, LaVerne Baker, Ruth Brown, Jerry Butler, Jackie Wilson, James Brown, The Platters, The Coasters, The Drifters, Fats Domino, Ray Charles, Chuck Berry, The Spaniels, Faye Adams, Little Anthony and the Imperials, The Moonglows, The Flamingos, The Five Satins, Oscar Brown, Buster Brown, Frankie Lymon and the Teenagers, Big Jay McNeely, and a host of others sang, wrote, and performed their music with a unique flair that captivated listeners throughout the world. These artists provided an excellent source of radio programming material for the development of the rhythm and blues radio format.

In 1946 WDIA-AM, Memphis, Tennessee, became the first radio station to air a complete rhythm and blues radio format. Its 50,000-watt signal introduced new African-American musicians and disk jockeys to the airwaves, including B.B. King and Rufus Thomas, who would go on to legendary careers in the music industry. The powerful AM signal provided coverage throughout the Southeastern and Midwestern states. The station was so successful with the rhythm and blues format that its owners proclaimed that there was "gold in the cotton fields of the South." WDIA became the "Mother Radio Station" of the rhythm and blues format, thus laying the historic foundation for this broadcast style and its future offspring, urban contemporary.

Rhythm and blues radio stations grew in number during the 1950s to include such stations as WOOK, Washington, D.C.; WERD, WAOK, Atlanta, Georgia; WRAP, Norfolk, Virginia; WEBB, Baltimore, Maryland; WANN, Annapolis, Maryland; WDAS, WHAT, Philadelphia, Pennsylvania; WLIB, WWRL, New York, New York; KNOLL, San Francisco, California; KGFJ, Los Angeles, California; WVON, Chicago, Illinois; WYLD, New Orleans, Louisiana; WCHB, Detroit, Michigan; WSRC, Durham, North Carolina; WANT, Richmond, Virginia; WILD, Boston, Massachusetts; WJMO, Cleveland, Ohio; KATZ, St. Louis, Missouri; and WAAA, Winston-Salem, North Carolina.

Broadcast groups such as Rollins, Rousanville, Sonderling, Speidel, and United Broadcasting established rhythm and blues stations in large and medium markets throughout the country. Rollins was important because it operated stations in major

markets, including WNJR, New York, New York/Newark, New Jersey; WBEE, Chicago, Illinois; KDAY, Los Angeles, California; WGEE, Indianapolis, Indiana; and WRAP, Norfolk, Virginia. The Sonderling group laid the original foundation for the "new" sound of rhythm and blues radio, soon to be called urban contemporary. Jerry Boulding, program director of WWRL, New York, during the 1960s, was the architect of this new sound of rhythm and blues radio. This air sound, which was very smooth, became the sound of soul on WOL, Washington, D.C.; WWRL, New York; WDIA, Memphis; WBMX, Chicago; and KDIA, San Francisco/Oakland.

The major change that transformed rhythm and blues radio into urban contemporary was the shift of the format from AM stations to FM outlets in the early 1970s. Four radio stations, WBLS-FM, New York; WDAS-FM, Philadelphia; and WHUR-FM, WKYS-FM, Washington, D.C., were major players in this transformation. WBLS-FM in New York received programming directions from veteran disc jockey Frankie Crocker. His efforts transformed WBLS-FM into the number one station with an urban contemporary format in New York City. This success also was responsible for the early ratings erosion of the then-number-one-rated Top 40, 50,000-watt WABC-AM. The format of WBLS-FM was a mix of rhythm and blues, jazz, Latin, and gospel. WDAS-FM, Philadelphia, with disc jockey personality Hy Lit and Doctor Perri Johnson, also pioneered in urban contemporary radio. This format was a mix of jazz, blues, rhythm and blues, reggae, Latin, and urban rhythms. The format soon moved the station to high ratings.

Howard University's WHUR-FM in Washington, D.C., first aired in December 1971 with an urban contemporary format. The format was quite similar to the WBLS-FM urban sound, but with an added emphasis of news, educational features, and community programs. Just about every urban contemporary radio station in the United States has adopted one of its programs, *The Quiet Storm*. This program, which features love ballads and slow tunes, was originally aired under the *Quiet Storm* title at WHUR-FM and has become an integral part of the urban contemporary format.

WKYS-FM played a major role in giving the urban contemporary format a mainstream audience and the popular nickname "Kiss." In July 1975 the National Broadcasting Company (NBC) station switched from "beautiful music" to a disco format, a variation of urban contemporary. This helped the station move from a number 17 Arbitron rating to number three in Washington, D.C.

WKYS-FM, Washington, D.C., made format adjustments and moved urban contemporary radio to new programming heights. Veteran radio programmers Donnie Simpson, Bill Bailey, Eddie Edwards, Melvin Lindsay, Ed McGee, Rick

Wright, and Jack Harris laid the original foundation. In 2000 WKYS-FM was owned by Radio One, the largest African-American-owned radio broadcasting company in the world.

Urban contemporary is a radio format designed to attract an urban but demographically diverse audience. The overall air sound is that of music performed mainly by African-American artists, with the announcers presenting material such as commercials, features, public service announcements, station breaks, announcements, jingles, and news in various styles ranging from smooth and mellow to wild and zany to authoritative and informational.

Urban contemporary radio stations have become major electronic media entertainment, informational, promotional, and marketing tools. In Washington, D.C., the top three stations, WHUR-FM, WPGC-FM, and WKYS-FM, are all urban contemporary, but syndication, technological innovations, and station competition have brought major changes to urban contemporary radio. Most stations have decreased the use of local disc jockeys and moved toward the use of nationally syndicated programs.

One major syndicated urban contemporary service is "The Touch," which is delivered by satellite and downlinked to station affiliates. This service allows staff on-air announcer Tim Garrison to air his *Love Zone* show, with its mellow urban sounds, to audiences at night throughout the world.

The highly popular Tom "Flyjock" Joyner and the Doug Banks Show are two other examples of successful syndicated morning drive-time urban radio programs heard on many stations. The American Broadcasting Company (ABC) radio networks both syndicate radio shows and program a mix of music, news, comedy, contests, political information, features, and interviews with celebrities and people in the news. Both

originate from studios in Dallas but also broadcast from various locations around the country, thereby attempting to localize the programming content and focus while still reaching a national audience.

The sound characteristics of urban contemporary have changed from its rhythm and blues roots. This change has been caused by competition from other contemporary formats, such as contemporary hit radio and its variation, called CHURBAN. The latter combines trendy popular musical hits from Top 40 and urban charts and presents it in a tight, fast-paced manner.

To maintain its popularity, urban contemporary radio must seek a balance between the hot, hip-hop, contemporary music choices and the basic staples of radio programming. These staples include the use of local disk jockey personalities, on-going musical experimentation, creative use of technology, news programs, and programming research for discovery of new audience demographics and format designs.

The power of urban contemporary radio is best defined and reflected in its rich history of strong community service (fund-raising efforts, crime-fighting campaigns, and drug-awareness programs foremost among them) and the solid presentation of news, education, and entertainment.

V

Vallee, Rudy 1901–1986

U.S. Radio and Film Star

Radio personality Rudy Vallee is associated with many radio landmarks: he was the first national network star created by radio; he was the first crooning idol, predating both Bing Crosby and Frank Sinatra; and he inaugurated the most influential radio variety show in the history of the medium. Vallee was a product of both the traditional middle-class culture of his New England youth and the sophisticated urban values of 1920s New York City. An emotional, even volatile performer credited with giving the radio voice sex appeal, he was also an exceptionally hard worker who strove for and demanded the highest standards of performance and who took pride in his responsiveness to fans.

Hubert Prior Vallee was born in Island Pont, Vermont, on 28 July 1901, to middle-class parents with French and Irish roots. His family moved to Westbrook, Maine, when he was very young, and he prided himself on his New England heritage. His father was a pharmacist, and it was expected that Vallee would follow in his father's footsteps. Instead, young Vallee developed an early interest in music and participated in amateur bands in high school as a singer and drummer. After graduation, he became passionately devoted to the saxophone (a relatively unknown instrument at the time) and began a correspondence and friendship with Rudy Wiedoeft, a saxophonist whose talent so impressed Vallee that he changed his first name to Rudy.

Vallee became one of the most famous collegians to emerge on the national scene in the 1920s, a time when the college culture had an unprecedented influence on popular culture. A student first at the University of Maine and then at Yale, where he transferred in 1922, Vallee was at the center of this new youth culture because of his work as a "sweet" jazz musician. By this time, Vallee was not only playing the saxophone but was also singing through a makeshift megaphone, a necessary tool of amplification that would become his trademark.

After taking his degree at Yale in 1927 (he took time off to perform in London in 1924–25), Vallee worked with several bands in the New York and Boston areas, most prominently Vincent Lopez's orchestra. He was soon given the opportunity to form and lead his own band; in December 1927, Vallee and his Yale Collegians (soon to be renamed the Connecticut Yankees) opened a posh new nightclub in New York called "The Heigh-Ho Club," with Vallee as leader, saxophonist, and singer. It was while at the Heigh-Ho that Vallee became famous, largely because some of his performances were broadcast over WABC. Vallee proved so immensely and immediately popular with radio listeners that other stations signed him up within days of his first broadcast. Within a year, the National Broadcasting Company (NBC) signed Vallee to an exclusive contract and began broadcasting his band nationally. In October 1929, just two days after the stock market crash, Vallee debuted his own weekly program, sponsored by Fleischmann's Yeast. The program consisted of Vallee announcing, singing, and playing music with his band for an hour, with interruptions for commercial announcements. The show was a huge hit, generating thousands of fan letters daily.

In many ways, Vallee's approach to his music made him ideally suited to radio broadcasting. He made several innovations in the way he presented music that allowed radio audiences to become easily involved in the program and that kept them from switching the dial. Because he wanted his music to be accessible to people, Vallee typically cut out the verses of a song and played only the chorus. Where other musicians focused on the music and treated the singer's voice as just another instrument, Vallee emphasized a song's lyrics in order to encourage listener identification and emotional involvement, and he employed more vocal solos than any other bandleader. Although Vallee played a variety of music, he also understood the value of repetition in fostering audience

Rudy Vallee

familiarity and anticipation, and he developed several “signature” tunes that clearly identified him to listeners. He was also the first bandleader to do his own announcing; his friendly, conversational speaking style (marked by his famous greeting “Heigh-Ho Everybody”) and the anecdotes he told about each number endeared him to his audience and created an identity that made him seem like a familiar friend to his listeners.

Most important, Vallee gave the radio voice sex appeal. He was the first radio performer to take full advantage of the intimate singing that radio microphones and amplification made possible, a style of singing that soon became widely known as “crooning.” During his early years on radio, Vallee sang his love songs in a soft, yearning voice that made him the idol of millions of female fans. By romancing women within their homes, Vallee broke down established boundaries between public and private and helped to inaugurate an era of unprecedented mass media availability in domestic space. Vallee’s popularity proved both radio’s potential as a starmaker and the power of its domestic audience, resulting in airwaves full of crooners by the early 1930s.

Crooning’s popularity did not come without controversy. Because male crooners amplified their voices and sang so emotionally, critics and moral watchdogs complained that they were effeminate and worried about their tremendous influence on popular culture. Vallee was singled out for criticism, and his handlers at NBC worked hard to change his “slushy” image. The network and the sponsor, J. Walter Thompson, restructured Vallee’s program in 1932–33 to focus more on variety, bringing in more guest stars to balance Vallee’s singing. They also reworked Vallee’s persona into more of a “master of ceremonies” than a star performer.

This format proved to be enormously successful, and *The Rudy Vallee Hour*, which aired from 1929 to 1939, became one of the most influential early radio programs and is considered by many to be the best variety program in the history of radio. Based in New York, Vallee was able to take full advantage of access to Broadway and vaudeville stars, as well as visiting international performers. The hour-long show combined musical pieces with dramatic and comic sketches from recent shows, films, and vaudeville acts. Many already famous performers were given their first radio exposure on Vallee’s program, among them Fred and Adele Astaire, George Burns and Gracie Allen, and Fannie Brice; the show also launched the careers of many others, such as Alice Faye, Edgar Bergen and Charlie McCarthy, Bob Hope, Frances Langford, Red Skelton, and Milton Berle.

Vallee’s later attempts at radio were never as successful as his first show, but he became quite popular as the quintessential “stuffed shirt” figure in films of the 1940s, most notably those of director Preston Sturges. He also had a career-reviving turn in the Broadway show *How to Succeed in Business with-*

out Really Trying in 1961. Although today Vallee is best known for his film roles, his groundbreaking broadcasting work as both a crooner and a showman remains his most significant legacy to American entertainment. Vallee died at his home in Beverly Hills on 3 July 1986.

Variety Shows

Music and Comedy Formats

Inspired by live stage vaudeville, variety programs on network radio through the 1930s and 1940s—whether oriented to music or comedy—offered significant examples of core network radio programming. Variety programs on network radio proved a powerful lure, but except for the popularity of Arthur Godfrey, they declined and disappeared as radio programming changed in the 1950s.

Origins

Vaudeville started in the late 19th century, and by the early years of the 20th century, it was a staple of mass entertainment in U.S. cities. Jugglers, comics, singers, tumblers, and indeed any talent that could operate in 10- to 20-minute units toured the United States, honing their acts in front of live audiences. This infrastructure of well-practiced talent was in place when radio appeared as a mass medium starting in the 1920s.

Just as radio began to make individual vaudeville stars famous, the new medium slowed and then killed the live vaudeville circuit. Along with the Great Depression, the coming of radio and the arrival of movie sound in the late 1920s

ended live stage vaudeville, because live shows could not amortize their costs over huge audiences as did radio and the movies. Thus, vaudeville talent either went west to Hollywood or shifted to radio, particularly the comics and singers whose voices represented the core of vaudeville's appeal.

The National Broadcasting Company (NBC) and the Columbia Broadcasting System (CBS) sought what they called "variety talent" to host shows in prime time. Some long-time vaudeville stars such as Eddie Cantor and Ed Wynn had grown up on the boards and made a successful transition to radio. Others, such as Buster Keaton and Harry Lauder, did not. Indeed, most did not, but Jack Benny and the Marx Brothers smoothly moved to radio (and the movies), bringing their considerable talents to listeners across the United States. Even ventriloquists such as Edgar Bergen thrived in radio, where the skill of throwing one's voice was not necessary, but Bergen's comedy overwhelmed any consideration of the radio inappropriateness of his act.

And the radio variety shows with guest stars thrived. Comics such as Eddie Cantor on Sunday night drew audiences measured in the millions and inspired millions more to purchase

radio sets. Others from vaudeville adapted to radio. Will Rogers, for example, who talked on stage as he did his rope tricks, gave up the rope to just tell stories on radio. There was a constant need for new talent, and so amateur hour programs began in 1934 with the introduction of *Major Bowes' Original Amateur Hour*. Scouts roamed the United States looking for skilled entertainers who might win the big prize and then make the next step into radio variety show stardom. According to one report, at the height of his popularity in the late 1930s, Major Bowes received more than 10,000 applications per week, and when local Hoboken, New Jersey, singer Frank Sinatra won, the legend of discovery became firmly established as part of radio's myth.

These radio variety shows seemed safe, because they booked stars who appealed to those in what surveys determined was a group and/or family listening demographic. As was the practice of the day, advertising agencies developed most such programs on behalf of their sponsor clients. Rudy Vallee, for example, was an employee of the J. Walter Thompson advertising agency as a client for Standard Brands. He was not employed by NBC, his network, although most fans surely thought so. But this practice would change as the star system—adapted from the movies and live stage vaudeville—developed and soon dominated.

By the early 1940s, radio stopped inheriting stars from other sources, such as the live vaudeville stage or Hollywood. Instead, radio began to make its own stars. Both Kate Smith and Arthur Godfrey started in radio and then moved to other media to exploit their radio fame.

The Variety Show Schedule

From the beginning—as early as January 1927—listings of network schedules included numerous prime-time variety radio programs. Through the late 1920s, dozens of network prime-time radio variety shows aired on NBC Blue and Red, and later also on CBS. Most programs from this early stage were either music or comedy oriented. Musical variety shows made up a third of all prime-time radio at that early point. These shows were headlined by bands or groups of musicians whose very names incorporated references to their sponsors' products: A&P Gypsies, Goodrich Zippers, the Cliquot Club Eskimos, and the Hires (Rootbeer) Harvesters. These were mostly 30-minute shows, with few running an hour.

With the rise of CBS in 1928 came a doubling of variety programming, and although sponsorship still dominated, a new trend arose, because CBS chairman William S. Paley immediately embraced the star system. The first such star was probably *Roxy and His Gang* on NBC Blue, hosted by the noted movie theater impresario, and Roxy's name—not the sponsor's—was above the title. But gradually CBS was to lead the way in exploiting the star system. Such stars would come

to equal sponsorship, as Hollywood and then radio itself created the larger-than-life figures the public sought out in their daily listening.

In the early 1930s, with dozens of variety shows on the air, most still featured the names of their sponsors—with new attractions including the Atwater Kent (a radio set manufacturer) Dance Orchestra, the Happy Wonder Bakers, and the Palmolive Hour. But as the 1930s progressed, the stars began to headline in a variation of the star system that Hollywood, and vaudeville before that, had used since the late 19th century. There were variety shows with such names as *The Ben Bernie Orchestra*, *The Guy Lombardo Orchestra*, and *The Paul Whiteman Orchestra*.

Many combinations of variety talent were tried as NBC and CBS tried to win the ratings war and thus to be able to charge more for their increasingly precious airtime. The search was intense for new stars. Some still came over from the New York stage, none more successfully as a variety host and talent than Eddie Cantor, who gained initial stardom as a member of the annual Follies of Florence Ziegfeld. Cantor adapted his talents neatly to radio, and from 1931 through 1949 his NBC variety show was a highly rated network fixture. Jimmy Durante was surely Cantor's biggest rival, but radio-made comic talent such as Bob Hope would take over this subgenre of the variety program.

For example, Fred Waring headed a relatively unknown big band in the 1920s. When he started his radio variety show in 1933 on CBS, he quickly rose to stardom. He moved to NBC in 1939 with a show that was titled *Chesterfield Time* until 1945, when he had become such a big star that his name went into the title. The show became *The Fred Waring Show* and lasted until 1950, spanning the whole of the variety show era.

Rudy Vallee was a nightclub and vaudeville star when he came to radio on NBC in 1929, first in *The Fleischmann Hour*, and then under his own name, with Vallee telling jokes and singing but also delivering guest talent. Vallee first introduced Eddie Cantor, Noel Coward, Beatrice Lillie, Alice Faye, Edgar Bergen, and Red Skelton to radio fans—all of whom would go on to host or star on radio through the 1930s and 1940s. But it was Vallee's name that carried this radio variety show.

Ed Sullivan would become a television variety show legend, but he never claimed that he did any more than simply to offer New York-centric entertainment gossip and to bring as guests the top music, comic, and other talent. Supposedly, comic Fred Allen once remarked that Sullivan would last as long as someone else had talent that radio could showcase.

Some radio-made stars came through the ranks of local stations. For example, bandleader Guy Lombardo and his newly minted Royal Canadians made their radio debut on Chicago's WBBM-AM in 1927, and within a couple of years Lombardo

was appearing on the CBS network, of which WBBM was a long-time affiliate.

Robert Ripley proved that stardom could be transferred to a radio variety show—even if it seemed improbable. Ripley had first introduced his *Believe It or Not* newspaper cartoons in 1918; then, using vivid descriptions and sounds, he was able to develop a variety act for NBC, CBS, and the Mutual Broadcasting System. He was a good host as well and invited his guests to share in his glory.

By 1940 the movies and radio were inexorably linked. Long-retired silent film star Mary Pickford—with third husband, bandleader Buddy Rogers—hosted her own variety shows, first titled simply *Mary Pickford and Buddy Rogers* and later titled *Parties at Pickfair*, referring to their posh and noted Hollywood estate. Here was a star play pure and simple. And once performers such as Bob Hope or Bing Crosby became big in radio, they could also go to Hollywood and then smoothly back to radio. Indeed, both CBS and NBC set up major studios in Los Angeles in the late 1930s to take advantage of this growing Hollywood-radio connection.

Program Strategies

Variety shows almost always revolved around music and/or comedy, because the dancing, acrobatics, magic tricks, and other staples of the vaudeville stage had no appeal on radio. There were general variety shows, music-oriented variety shows, and comedy-oriented variety shows. Subgenres included the amateur hours, ethnic music comics (such as Jewish comics who had crafted their comedy on the Catskills circuit), and subcategories of music (such as the barn dance programs, which would later evolve into the country music format radio).

The distinction between programs was in how much of a story was told. *The Jack Benny Show* offered a variety of musical acts with Jack and his gang of comics, but the show was more the story of the Benny group. On the other hand, Al Jolson's various radio variety shows featured the singing of Jolson, with only an occasional sketch and comic guest star.

Sometimes the appeal for radio made little sense. Ben Bernie was a vaudeville star as the genre was dying, killed by the movies. He started on a local New York City radio station in 1923, and thanks to a long-running feud with gossip columnist Walter Winchell, he became famous and was a radio fixture from 1931 until his death in 1943. Like many famous variety talents, he had one strength—in his case, music—but could offer enough talent in comedy, simple patter, and an ability to play master of ceremonies that he could become a star in variety.

Stars were often made by first appearing on a variety show and then moving to their own programs. For example, Dinah Shore was discovered in the late 1930s and early 1940s by

Ben Bernie and Eddie Cantor, and by 1940 she was voted top new star in a Scripps Howard newspaper chain national radio poll. A year later, NBC had her on its schedule with her own show.

By the late 1930s, variety, whether categorized as comedy driven, music driven, or general, offered the most common program type on network radio. Musical comedy always trailed musical variety, but sometimes it was hard to tell the difference. Indeed, Harrison Summers categorized the *Al Jolson Program* on CBS during the 1937–38 season as “comedy variety.” Even programs centered on individual stars frequently filled out their 60-minute time slots with guest stars and so should be thought of as variety shows, such as, for example, *The Edgar Bergen and Charlie McCarthy Program*.

Orchestras dominated, because this was the big band era. There were Horace Heidt, Morton Gould, Russ Morgan, Sammy Kaye, Benny Goodman, and Tommy Dorsey, as well as the long-running Paul Whiteman, Wayne King, and Rudy Vallee.

In the 1940s, bands made their singers into individual stars in their own right. Doris Day, Bing Crosby, and Frank Sinatra could be backed by any band. The fans wanted to hear them as singers, not as appendages of notable big bands. Radio indeed sparked the sales of phonograph records, as stars introduced their new tunes and stylings via radio and then fans flocked to purchase copies of the discs of their favorites.

But there were other forms of music than big bands, notably hillbilly, which was later called country music. On Saturday nights, NBC broadcast both the *National Barn Dance* and the *Grand Ole Opry*, complete with singers, dancers, and comics. But these variety shows borrowed from another, alternative musical tradition and aimed exclusively at a rural audience. Variety shows most often were fed by the New York City-based Tin Pan Alley tradition and then later melded this with the music and comedy coming from Hollywood.

When in 1943 NBC spun off what became the American Broadcasting Company (ABC), the new company began with the *Alan Young Show*, the *Mary Small Revue*, the *Paul Whiteman Radio Hall of Fame*, and the *Woody Herman Band Show*. This is a partial listing, but surely ABC embraced all the strategies and scheduling opportunities that NBC and CBS had pioneered. ABC hit an apex in 1946 when Bing Crosby moved to the network for reasons of convenience and technical change. During the summer of 1946, Crosby left NBC after fulfilling his obligation with long-time sponsor Kraft and signed with Philco (maker of radio and later television sets) for a weekly salary of \$7,500. Philco and ABC would permit Crosby to pre-record his *Philco Radio Time* on newly developed audiotape. He did not need to be in the studio when his show debuted (on 16 October 1946), nor as it ran on ABC until 1 June 1949. With the transcription ban broken, Bing Crosby then took advantage of the talent raids by CBS and so switched to a new

sponsor—Chesterfield cigarettes—and to a new network—CBS—on which *The Bing Crosby Show* debuted 21 September 1949 and ran until the end of the 1951–52 radio season.

CBS and NBC built studios in both New York and Los Angeles to house these variety productions. Sometimes they simply adapted old vaudeville or movie palaces, but more often through the late 1930s and before building restrictions imposed by World War II, they built original, art deco-style studio spaces made for radio. The early 1930s NBC studio at Rockefeller Center—Radio City—best represented these sizable commitments to variety show's popularity.

Demise

The war years were the final hurrah for the radio variety show. National defense bond rallies often functioned as all-star radio variety shows, meant to outdo all other radio extravaganzas. Programs such as *Music for Millions*, *Treasury Star Parade*, and *Millions for Defense* not only drew needed bond sales, but also were beamed across the ocean or recorded for later playback for the troops fighting in Europe and the Pacific. The stars of radio—led by Bob Hope and Bing Crosby—toured for the United Service Organizations (USO) and went abroad to entertain the soldiers near the fronts. Indeed, radio star and big band leader Glenn Miller was killed in a plane crash while traveling from one show to another.

In the 1940s there was no more popular genre of radio program than variety. But late in the decade, both CBS and NBC shifted their variety stars to their television networks. Music for radio started with the combination of one of network radio's subgenres—hillbilly turned into country music—and another that never appeared on network radio—rhythm and blues. This amalgamation became rock and roll, and television maintained the Tin Pan Alley variety format through the 1950s and 1960s until rock proved so powerful that the variety tradition all but disappeared from television, as it had from radio two decades earlier.

But radio did have a last hurrah during the late 1940s, when CBS's William S. Paley—in alliance with Hollywood agent Lew Wasserman—incorporated stars such as Jack Benny, Red Skelton, Bing Crosby, Groucho Marx, and Edgar Bergen and then had their corporations sell their shows to the networks and sponsors. This incorporation meant vast savings in income taxes for the stars, but it led to the creation of a stable of CBS-housed talent that then transferred—by the middle 1950s—to the dominant CBS television network. By 1949 CBS was winning the radio rating wars with all but four of the top 20 radio shows; a decade later, the ratio would be about the same for CBS television in its battle with NBC.

It was not that participants in the radio variety show tradition gave up easily. There were sizable institutions that had a vested interest in keeping the live variety show going. First,

there were the performing music societies: the American Society of Composers, Authors, and Publishers (ASCAP) and the new Broadcast Music Incorporated (BMI). Even more concerned was the union of musicians, the American Federation of Musicians, who tried to slow the innovative recording techniques—tape and discs—that union leaders and members correctly felt would lessen the demand for their live services.

NBC tried to keep the radio variety show alive with *The Big Show* on Sunday nights in 1951, but even this splashy revue could not keep the variety format from switching over to TV. A better symbol of the change was Paul Whiteman, who had hosted many golden age radio variety shows but who in 1947 became an early disc jockey on ABC, symbolizing the transformation to a new form of musical presentation on radio.

One man did keep radio variety alive until 1960 by doing variety in both media—Arthur Godfrey. His morning show was in the variety tradition, and his prime-time hit *Talent Scouts* was able to continue the form through the 1950s, with simulcast over radio until 1956. Godfrey's gift for gab was so popular on radio that he could book whomever he wanted, and fans tuned in. But with the cancellation of first *Talent Scouts* and later his morning show, variety on radio reverted to pure and simple nostalgia. These shows—more than any other form—offer in their preserved form a record of the top variety talent of the first two-thirds of the 20th century.

Vatican Radio

The Vatican's need for an effective means of communicating with the outside world can be traced back at least to 1870, when Pope Pius IX was restricted to Vatican City by the Italian Army. Only after the Lateran Pact of 1929—four decades and five popes later—was Vatican City recognized as a sovereign and independent state. But as tensions began to grow between Pius XI and Italy's fascist dictator, Benito Mussolini, the implicit threat of isolation lingered.

Cardinal Eugenio Pacelli (then Vatican secretary of state) was determined to avoid any possibility of future papal isolation. He suggested that the Holy See integrate a new medium—radio—into religious dissemination, thereby making geographic and political borders virtually meaningless when challenged by the “airwaves” of broadcast technology. After gaining papal support, Pacelli began negotiations with inventor Guglielmo Marconi to create a powerful shortwave radio system as well as an efficient telephone operation for Vatican use. Within months, Marconi's plans became a reality, and on 12 February 1931 Pope Pius XI sent his first message via “Vatican Radio” to the world.

During its first seven years of operation, Vatican Radio, under Jesuit management, became a significant force in the propagation of church views, programming portions of its content to diverse audiences in seven languages. In 1938 Pius XI increased his use of the medium by instituting a “Catholic Information Service,” created solely to attack the atheistic propaganda coming from Germany, Italy, Japan, and Russia. With added broadcast power (now transmitting in ten languages on both shortwave and medium wave), radio had now become the primary medium for the Pontiff's anticommunist message. This “new” propaganda campaign continued through the last days of Pius XI's life, as well as during the reign of his successor, Cardinal Pacelli, as Pope Pius XII.

Pius XII quickly confirmed the importance of radio as a message disseminator to vast territories: he reached far greater numbers of people within a shorter period of time than any of

his predecessors. Further, he realized that radio often communicated more emotionally, dramatically, and persuasively than other informational sources—a characteristic that figured prominently when open aggression became more severe and global battle seemed to be inevitable.

Against this backdrop, personnel at Vatican Radio were asked to do many things, involving covert activities as well as humanitarian assistance. Some of the most courageous broadcasts aired by the transnational service at this time were those that unveiled the horrors of the Nazi Holocaust. News reports featured stories on concentration camps, torture, and the ghettos, based on eye-witness testimony. From 1940 to 1946, Vatican Radio also ran an Information Office, transmitting almost 1.25 million shortwave messages to locate prisoners of war and other missing persons. Later the radio system combined its information services with the International Refugee Organization, forming a team “Tracing Service” to reunite war-torn families and friends.

After World War II, Vatican Radio returned to its prewar programming schedule, broadcasting in 19 languages throughout the world and competing for transnational listenership with such networks as the Voice of America, the British Broadcasting Corporation (BBC), Radio Moscow, and Radio Peking. However, the onset of the Cold War (and Stalin's growing number of “godless communism” messages) renewed Vatican Radio's commitment to boost the church's religious message.

In 1950 Vatican Radio officials asked for contributions from the faithful to expand the transnational system's facilities. With this money, Pius XII proposed to use Vatican Radio vigilantly, broadcasting 24 hours each day, in at least 28 languages. The “free world” responded to this announcement enthusiastically, contributing almost \$2.5 million to the cause. The new facilities took almost six years to build, but in 1957, Radio Vaticana introduced its newly finished, high-powered station to the world. The renovated system now sent its signal via two new 10-kilowatt shortwave transmitters (to add to the

Pope John XXIII records radio and TV speech from the Vatican, 11 September 1962

shortwave transmission power of its 100-kw transmitter), one 250-kw medium wave transmitter (augmenting the earlier 100-kw medium wave transmitter), a 328-foot multidirectional antenna for medium wave broadcasts to Southern, Central, and Eastern Europe, and 21 additional antennas. In addition, the new transmission power of Vatican Radio reached new areas in North and South America and much of Asia. Coupled with the establishment of a Pontifical Commission for Cinematography, Radio, and Television, the Holy See clearly established its commitment to transnational media propagation of the faith.

In 1958 Vatican Radio had the unhappy task of broadcasting the last days of Pius XII's life. The next pope, John XXIII, was modern, liberal, and extremely media-literate. Immedi-

ately after his election, the new Pontiff proclaimed plans for a Second Vatican Council; much of the progress of the council was conveyed through Vatican Radio.

On 12 February 1961, the Pope celebrated Vatican Radio's 30th anniversary by imparting his apostolic blessing to use radio "to overcome the barriers of nationality, of race, [and] of social class." By 1962 the world's oldest transnational broadcast system communicated in 30 languages, 17 of which were specifically intended for nations behind the Iron Curtain. The Pope used the airwaves in an attempt to mediate the Soviet-American standoff over missiles found in Cuba, broadcasting pleas to both Khrushchev and Kennedy in 1962.

After John XXIII's death in 1963, however, Pope Paul VI was not as supportive of Vatican Radio as his predecessor had

been. Some analysts attribute the new Pontiff's indifference to his general mistrust of the secular media. Whatever the reason, station personnel suffered from low morale through the 1960s and 1970s. Their program schedule was singularly noncreative, filling valuable broadcast time with organ recitals, sacred choral presentations, and detailed announcements of minor papal appointments. Fortunately, however, the dark era at the Catholic station was temporary and would later be reversed by an increase in professional station management and creative programmatic direction, as well as by a more media-wise pope.

In 1995 Vatican Radio began broadcasts on its new satellite network. Combined with newly developed cooperative programming efforts on AM and FM stations throughout the world and an internet homepage, one of the oldest transnational broadcast services continues its work as a major voice of the Roman Catholic church.

In 1998 the Italian government issued stringent restrictions on radio emissions (to make them three times lower than most other European countries), and thus began a long struggle with Vatican Radio over the amount of power used by the international service. Some people living near the antennas (on Vatican land and thus not directly under Italian jurisdiction) claimed various health hazards from the power emissions. Early in 2001, things went so far as to witness the environmental minister threatening to cut off the electricity used to power the antennas, an action overridden by the prime minister. Instead Vatican Radio officials agreed to begin to limit the amount of transmitter power used.

Vatican Radio in 2002 programmed a 24-hour news day, using more than 200 correspondents from 61 countries. The content included classical, jazz, and popular music, as well as news/commentary programs and daily church services. Much of this programming was being relayed to millions of Catholics in 40 languages, by a staff of more than 425 employees.

Vaudeville

In a world where vaudeville is all but forgotten, it is difficult to imagine what a great impact this art form had on people's lives. For some immigrants who had talent, it was a way out of poverty. It gave others comfort and cheer when they were lonely. It was catharsis. It was amusement. In some ways, it was remarkably egalitarian. To truly understand the development of radio, one has to understand the vaudeville circuit that nurtured most of radio's early stars and provided the model for many early radio programs.

Origins

The origin of the word "vaudeville" is uncertain; some reference books say it comes from the French drinking songs called "chansons du Val de Vire." Others say it comes from the

phrase "voix de ville," meaning "voice of the city" (or "voice of the people"). In Europe the term came to mean comic entertainment, comprised of farce and satire, often in song or skit. In America vaudeville developed gradually, emerging from the burlesque shows performed in frontier towns and mining camps. As America became more urban, a growing middle class wanted entertainment, and that potential audience included women and children. Vaudeville historian Frank Cullen credits Tony Pastor with giving this form of entertainment some much-needed refinement. Pastor, Cullen writes, used a variety format that would become the standard for vaudeville: his first performances featured "a concert singer, a popular balladeer, a lady who played a [number of] instruments, an Irish act . . . and a comedian who did only clean material."

Vaudeville theaters multiplied; by 1910, there were 2000 of them across the United States. In a world where radio broadcasting did not yet exist, movies were silent, and phonograph records were still fairly new, an enjoyable way to pass the time was to take the family to a vaudeville performance, where there was something for everyone. Some of the comedians used old jokes that the audience knew, and the fans would say the punchline along with the performer. People also sang along if they knew a song, and requests were sometimes taken. Song pluggers, with no radio to promote their potential hits, would persuade performers to do a certain song and then hire people to stand up and request it again or to cheer loudly at the end; the pluggers would then stand outside the theater to sell the song on record or sheet music. On the other hand, if spectators did not like a performance or found a routine boring, they might express their disapproval in a chorus of boos. The vaudeville stage was no place for a person with a fragile ego.

The lives of vaudeville performers must have seemed exciting and glamorous to the audience, but the reality of being a performer was endless touring, sometimes playing several theaters a night, staying in cheap hotels, and sharing cramped dressing rooms with others on the same bill. Many impresarios—such as E.F. Albee, Samuel Rothafel, the Shuberts, and Florence Ziegfeld—booked the major theaters and acts, though they were not always the kindest people with whom to deal. There was also a hierarchy of vaudeville theaters: the unknowns played in smaller houses and rural towns, while the biggest and the best got booked for New York City's Palace Theatre.

Until an entertainer developed a following and became a star, there was not much luxury, and sometimes there wasn't much money. But having to pay some dues did not dissuade the hopefuls: for those who dreamed of being famous, vaudeville was their best chance. In that era before talking pictures and broadcasting, there was a constant need for new and interesting live performers at the many vaudeville houses; some theaters had nine or ten acts on the bill, and performers tried their hardest to be memorable, or at least unique in some way. A few performers who were moderately successful hired their own press agents to get them even more visibility, and, they hoped, better bookings. Nellie Revell, one of the few women press agents, not only worked with vaudeville stars and for several theaters, but also wrote about vaudeville for such publications as *Variety*.

Vaudeville helped the sons and daughters of immigrants become successful in America. Al Jolson and Eddie Cantor are two examples of young men from impoverished immigrant backgrounds whose careers took off thanks to their time on the vaudeville stage. In the North talented black performers often performed as well. (In the South, there was a separate circuit for blacks only.) In New York the legendary black comedian Bert Williams offered his amazing routines consist-

ing of song and dance interfused with comedy; Williams became one of the highest paid black performers of his day and earned the respect of his white colleagues. Earning respect was not easy for a minority performer, especially when vaudeville reinforced every stereotypic representation in society—the greedy Jew, the cheap Scotsman, the drunken Irishman, the unintelligent black man. Williams was able to bring dignity to even those skits where he was supposed to play a bewildered Negro. There was no “political correctness” on the stage—immigrants who could not speak proper English, the nouveau riche who did not know how to behave—any foibles of any group could become the butt of jokes. At the same time, numerous foreign language theaters featured performers who poked fun at life in mainstream America.

Vaudeville on Radio

When radio developed, many of the performers who had made a name for themselves on the stage ignored the new medium. *Variety*, the “bible” of show business, said radio was a fad that would not last, and besides, most stations had no money to pay the big name stars from Broadway. But by 1922 it was obvious that radio was winning new friends every day. Some of the vaudevillians decided that making an appearance on radio might be useful after all. At first, most performers and all of the impresarios had been opposed to going on the air; a 3 March 1922 cover story in *Variety* headlined, “Vaudeville and musicians declare against Radiophone,” with several major impresarios expressing the belief that radio would only encourage people to stay home and not come to the theater anymore. But the novelty and the chance for publicity had already attracted a few entertainers, and more would follow.

One of the first big vaudeville names to do so was comedian Ed Wynn. In February of 1922, he performed the first live play, “The Perfect Fool,” on WJZ in Newark, New Jersey. The legend is that Wynn, ill at ease about performing in a silent studio with only an engineer to watch him, gathered up whoever was still in the building, including the cleaning crew and even a few people on the street, and invited them to watch his routine, thus creating the first studio audience. Their natural reactions to his humor greatly aided his timing. Radio made most vaudevillians uncomfortable because in the early days, studios were usually located in factories or on top of a roof, and there was no audience with which to interact. But Ed Wynn's innovation soon changed that, and as stations began building nicer studios (or moving into hotels that had ballrooms) it became acceptable to allow the public to watch performances.

Paying the big names was still a problem, but several of the impresarios decided to expand their use of radio and began putting their stars and theater acts on the air. Samuel Rothafel (better known as “Roxy”) and Charles Carrell were two who did very well with this initiative. Roxy broadcast from the

Capitol Theater over WEAJ in New York City as early as 1923; he would be heard on the NBC network starting in 1927. Carrell, who ran numerous theaters in the Midwest in the mid 1920s, had a novel way of attracting attention to his vaudeville shows: he brought a "portable" station into towns where people had few opportunities to see a performance. His traveling companies then put on a show and the entire event was broadcast on his own station, which often encouraged listeners to make a trip to Chicago (where one of his theaters was located) to see a show in person. Of course, once the networks began operations, the problem of paying talent was solved. Early advertisers hired and paid the most famous stars.

Most of radio's best loved early entertainers got their start in vaudeville: Eddie Cantor, Al Jolson, Ed Wynn, comedienne Fanny Brice, singer Ruth Etting, comedians Jack Benny, George Burns and Gracie Allen, singer Sophie Tucker (who billed herself as the "Last of the Red Hot Mamas"), and many more. Nellie Revell (whose clients had included Jolson) ended up offering her show business gossip column over the air on NBC, under the name "Neighbor Nell." She also invited the stars to her show for interviews.

The variety show on radio operated somewhat as the vaudeville show had—a number of acts in which each performer's job was to win over the audience both in the studio and listening at home. The mid 1930s talent show craze (characterized by Major Bowes' program) also harkened back to vaudeville days when managers offered an "opportunity night" for new performers to try out. If the public liked them,

they might win a small prize (Eddie Cantor won \$5); the real prize was the chance to come back and perform again, and ultimately to be hired.

Some critics later accused radio of killing vaudeville, but the truth is that the genre had begun to decline before the radio craze really took hold. Perhaps radio hastened its demise, but then, vaudeville really didn't die: it became a part of radio, and later a part of television. Thanks to vaudeville, a generation of entertainers perfected their craft and brought it to the airwaves, where a national audience could appreciate it all over again.

Vic and Sade

U.S. Radio Comedy Serial

For 13 years, from 1932 until 1945, devoted radio listeners tuned in daily to "smile again with radio's home folks," Vic and Sade Gook. Over the course of more than 3,500 scripts, writer and creator Paul Rhymer produced an intimate, idyllic, and eccentric portrait of small-town life in Depression-era America.

Neither its serial format (*Vic and Sade* appeared alongside dozens of daytime soap operas) nor its subject matter (*The Aldrich Family* and *One Man's Family* also featured accounts of white, middle-class American life) made *Vic and Sade* unique. What distinguished Rhymer's radio tales of life in "the small house half-way up on the next block" were its odd place-

ment on the network schedule, the inimitable perspective of its creator, and its creative use of the aural medium. James Thurber (1948) wrote that amidst the tears and tragedy of daytime soap operas, *Vic and Sade* "brought comedy to the humorless daytime air." Indeed, *Vic and Sade* was one of the earliest and most enduring radio comedies about middle-class families in the American Midwest. Because of its unwavering focus on the humor of domestic life and its large fan following, *Vic and Sade* influenced the shape and form of situation comedies on both radio and television. Using only three (and later four) voices, a microphone, and a vivid imagination, Paul Rhymer collected everyday conversations, trivial events, and

Bernardine Flynn as "Sade" and Art Van Harvey as "Vic"
Courtesy CBS Photo Archive

mundane details and wove them into fantastic vignettes of small-town life. Few other radio programs capitalized so successfully on the intimacy and imaginative potential of radio as did *Vic and Sade*.

Rhymer wrote all the scripts during the serial's run. His experiences as a young boy growing up in Bloomington, Illinois, served as a model for the Midwestern town life chronicled in *Vic and Sade*. After attending Illinois Wesleyan University, he was hired by the National Broadcasting Company (NBC) in Chicago to write continuity for music programs. As a special assignment, Rhymer was asked by NBC's program director, Clarence Menser, to develop a skit for an up-and-coming client, Procter and Gamble. Although Procter and Gamble did not recognize the early promise of this serial, Menser put the program on the air on a sustaining basis on 29 June 1932. (It was briefly sponsored in 1933 by Jelke and Ironized Yeast.) But not until November 1934 did Procter and Gamble realize its mistake; for the remainder of its run, *Vic and Sade* was sponsored by Procter and Gamble's Crisco. Paul Rhymer quit his position at NBC and devoted himself full-time to writing the serial. Although Rhymer was once fired as a journalist for writing stories about people he had not yet interviewed, his talent for creating stories about eccentric townsfolk was rewarded on radio.

Many contemporaries sought to distinguish *Vic and Sade* from the serials surrounding it on the network schedule. In addition to sharing the format of daytime soap operas (running five times a week), *Vic and Sade* also shared the serials' focus on family life and interpersonal relationships. *Vic and Sade* was set in the Gook household on Virginia Street in Crooper, Illinois. The serial focused on Victor Rodney Gook (Art Van Harvey), a bookkeeper for Plant No. 14 of the Consolidated Kitchenware Company; his wife, Sade (Bernardine Flynn), a not-so-brilliant housewife who talked in mixed metaphors and malapropisms; their adopted son, Rush (Billy Idelson); and absent-minded Uncle Fletcher (Clarence Hartzell). Each episode focused on the conversations of the Gook family about household events and the daily happenings of their small town—Rush's stomachache; Vic's failure to notice that Sade has cut her hair; or Sade's fight with her best friend, Ruthie Stembottom. As Fred E.H. Schroeder (1978) observed, there is never a scene in *Vic and Sade* "that goes farther than the front porch, attic, or cellar." What distinguished *Vic and Sade* from other daytime serials were its noncontinuous story lines and quirky account of life in Crooper, Illinois. Unlike most radio serials, each episode of *Vic and Sade* was self-contained; the conflict introduced in each episode was often resolved by the end of the 15-minute program.

Through references and conversations of the main characters, a whole town came to life on the air. Listeners knew that Sade was a member of the ladies' Thimble Club, loyally attended the washrag sale at Yamilton's Department Store with

Ruthie Stembottom, and specialized in making "beef punkle" ice cream for her family. Vic, the Exalted Big Dipper of his lodge, the Sacred Stars of the Milky Way (Drowsy Venus Chapter), was both antagonized by and devoted to his family. Young Rush often went to the Bijou theater with his friends Smelly Clark, Bluetooth Johnson, and Freeman Scuder to catch a feature film such as *You Are My Moonlit Dream of Love* or *Apprentice Able-Bodied Seaman McFish* when he wasn't playing rummy with Vic and Uncle Fletcher. Listeners knew the places in Crooper, Illinois, visited by Vic and Sade—the Butler House; the Bright Kentucky Hotel; and the Tiny Petite Pheasant Feather Tea Shoppe, which served scalded cucumbers and rutabaga shortcake—and the friends and neighbors who inhabited Vic and Sade's world—Reverend Kidney Slide; Chuck and Dottie Brainfeeble; Jake Gumpox; Rishigan Fishigan of Shishigan, Michigan (who married Jane Bayne from Paine, Maine); and Robert and Slobert Hink, who had brothers named Bertie and Dirtie and sisters named Bessie and Messie. When the eccentric Uncle Fletcher became a permanent character in 1940, the absurdity of the serial reached new heights. Uncle Fletcher entertained audiences with his rambling tales about Vetha Joiner, who went daffy after reading dime novels, or Ollie Hasher, whose friend painted his table every day so he wouldn't have to dust it.

Vic and Sade soon became one of the most popular serials on radio. In fact, in early 1935 *Radio Stars* reported that business in one South Dakota town literally halted each day so people could listen to the program. That same year, the Women's National Radio Committee named *Vic and Sade* one of the few daytime programs worth listening to. Just four short years after the program's introduction, a promotional offer featured on the show prompted an extraordinary 700,000 requests. By 1938 nearly 7 million listeners tuned in daily. Over 600 radio editors polled named *Vic and Sade* the best radio serial. *Vic and Sade* was also admired by contemporary writers and humorists, including Jean Shepard, James Thurber, John O'Hara, Sherwood Anderson, Edgar Lee Masters, Ogden Nash, and Ray Bradbury, for its whimsical and humorous look at small-town America.

In its focus on three or four central characters, *Vic and Sade* remained largely unchanged until the last years of the serial. Art Van Harvey (Vic) was temporarily written out of the show while recuperating from a heart attack, as was Billy Idelson's character (Rush) when the actor enlisted in the navy during World War II. In this period, many of the characters previously only described by the Gooks (such as Orville Wheeney and Mayor Geetcham) were given voice as supporting characters in the serial. Although the program ended its continuous run in 1944, it was briefly revived by the Columbia Broadcasting System (CBS) in mid-1945 as a variety show and in 1946 by the Mutual network as a 30-minute sitcom. Two unsuccessful attempts were made to bring the program to television—to

NBC's *Colgate Theater* in 1949 and to a local station, Chicago's WNBQ, in 1957. But the aural magic and the serial's peculiarity did not translate easily to a new visual medium (it was not perhaps until the debut of the *Andy Griffith Show* that eccentric small-town life successfully appeared on television). Although lack of storage space led Procter and Gamble to destroy original recordings of more than 3,000 episodes of the show, some remaining scripts were preserved in two edited volumes and in the archives at the State Historical Society of Wisconsin. Fan clubs such as the Vic and Sadeists and the Friends of Vic and Sade and websites such as "Stephen M. Lawson's *Vic and Sade Fan Page*" and "Rick's Old-Time Radio *Vic and Sade Page*" have emerged since the serial's demise to share information, scripts, and the few recordings of the program that remain.

Violence and Radio

Among the issues associated with any medium is a concern about violent and antisocial content. Many of the concerns about television and violence in contemporary society have antecedents in the history of radio. Violence, for the purposes of this essay, is defined as physical aggression toward humans by other humans, or the threat of such aggression. Radio has been associated with both "real" and fictional violence since its inception.

War and Radio's Beginnings

Radio has been related to violence since its inception in the late 19th century. Indeed, radio's applications for purposes of war and defense nurtured its early development. Guglielmo Marconi persuaded Great Britain to utilize his invention for mili-

tary and commercial ships before the turn of the century. Radios were installed in military ships to enable communication between the sea and the shore, radically changing the nature of sea warfare. The ability to communicate with shore and with other ships greatly enhanced the ship as a weapon.

In the years between 1907 and 1912 in the United States, amateur radio grew steadily, to the agitation of the military. The U.S. Navy became concerned when official messages were undeliverable because of East Coast amateur chatter. President Taft signed the first general radio licensing law in 1912 in part as a response to military concerns. A clause of this law stated that "in time of war or public peril or disaster," the President might seize or shut down any radio station (Public Law No. 264, 62nd Congress, Sec. 2). In 1915 the Navy, acting on a tip from an amateur monitor, took control of a Telefunken-owned

station on Long Island, New York, that had been transmitting radio messages regarding movements of neutral ships, presumably to German submarines. On 6 April 1917, as the United States declared war on Germany, all amateur radio operations in the United States were ordered to be shut down. On 7 April all commercial wireless stations were taken over by the Navy. Amateur radio enthusiasts protested the new regulatory atmosphere, but to no avail.

Radio coverage of violence and warfare during World War II ensured radio's place at the pinnacle of journalism. Live reports from Europe enabled audiences to learn about the aggression of Hitler's Germany. Radio contributed to the United States' move out of isolation and into World War II. Journalists such as Edward R. Murrow had broadcast vivid reports of the European conflict that helped convince the populace of the United States that it would be in the best interest of the nation to enter the war. After the bombing of Pearl Harbor, radio brought news of war from both Europe and the Pacific. The American public became adjusted to radio's providing details of violence during the worst war of human history.

Contemporary War and Radio

Radio has played important roles in contemporary violent conflicts. Among the unique uses of radio in wartime occurred during the Gulf War in 1990–91. Israelis tuned in to radio stations for warnings of incoming SCUD missile attacks from Iraq. The Israeli Broadcasting Authority and the radio station of the Israel Defense Forces unified to form the Joint Channel in an effort to keep the Israeli populace informed. The Joint Channel became immensely important to Israeli civilians. An interesting variation was the Quiet Channel. Reacting to audience suggestions, the Joint Channel broadcast silence on one frequency with the exception of missile warning alarms. This permitted Israelis unable to sleep with music or other radio programs an innovative alternative that allowed them to receive missile alarms.

Christine L. Kellow and H. Leslie Steeves (1998) documented the role of radio in the Rwandan genocide of 1994. The government-controlled Radio-Télévision Libre des Mille Collines (RTLM) served as the propaganda mouthpiece of the Hutu government. Messages intended to incite violence by Hutus against Tutsis were broadcast over Radio Rwanda, the official government station, immediately following the mysterious downing of a plane carrying the presidents of Rwanda and Burundi. With radio as the prominent source of information, RTLM was able to have a greater impact on the Rwandan populaces, both Tutsi and Hutu, in terms of both attitude and behavior. The Hutu-controlled RTLM used reversal techniques, emphasizing Tutsi hatred of the Hutus in order to encourage Hutu hatred of the Tutsis. In this fashion, Rwandan radio audiences were manipulated by messages of violence.

Terrorism

Terrorism has a particular and controversial relationship to media, including radio. To be successful, terrorism relies upon the public reporting of violence. A violent act itself gains nothing without public knowledge of the event. Thus, terrorism is inherently linked to the propaganda value of violence enacted. Terrorist acts are often consciously planned to gain media attention, making media's role even more controversial. The ethics of reporting terrorism are complex. Media organizations face the difficult task of determining what are newsworthy events without encouraging terrorism. At times, radio has inadvertently served the needs of terrorists by reporting police and military activity around the event, placing victims in more danger. Also of concern is violence directed against radio personnel or stations. Dozens of journalists, some working in radio, are killed every year. Government radio stations are often initial targets in military coups.

Violence and Children

Much of the controversy in recent years concerning television's violent content parallels charges raised against radio in the 1930s and 1940s. Concern over violent programming may be seen in the production process undergone in the making of *Jack Armstrong, the All-American Boy*, broadcast on several radio networks from 1933–51. This serial cliff-hanger adventure series featured Jack, a high school athlete, who had many adventures, each and every one of which was examined by child psychologist Martin Reymert before production to ensure that the program was not excessively violent. Still, complaints were heard from critics and some listeners, largely because the program targeted younger, more impressionable listeners.

Mrs. George Ernst of Scarsdale, New York, organized a 1933 campaign against the "Ether Bogeyman" of radio, whose characters were said to be causing nightmares among children. Her group analyzed 40 popular children's radio programs and found 35 unacceptable, including *Little Orphan Annie* and *Betty Boop*, both for violent and suspenseful content. In a 1934 symposium held in New York City, members of the Ethical Cultural Society, the Columbia Broadcasting System (CBS), the National Broadcasting Company (NBC), the Child Study Association of America, and other groups recommended the formation of a clearinghouse to offer a mechanism by which advertisers, the public, and broadcasters might make more informed decisions concerning the content of radio programs, especially those aimed largely at children.

Few studies examined psychological effects of radio listening on children during this period; most focused instead on what children wanted to hear. Paul Dennis (1998) characterized the experts who examined the psychological effects of

radio listening during this time as falling into two camps. The dominant view held that dramatic and violent programming was cathartic for children, providing an outlet for tendencies of aggression. A smaller number of researchers argued that violent dramatic content promoted violent behavior, delinquency, and negative emotions.

Proponents of the dominant cathartic model relied on the idea that radio's programming functioned as pragmatic fantasy. In 1924, well before the children's programming boom, Mansel Keith claimed that a 41 percent reduction in juvenile court cases was attributable to radio's provision of adventure and romance for youth audiences. Jersild stated in 1938 that the vicarious enjoyment of excitement was a right of children, for "a cold, intellectual diet does not fill all of their needs." Ricciuti's comprehensive 1951 study found there was no scientific evidence that thriller programs contributed to fears or daydreaming in child audiences. Comparative studies frequently found no difference between audiences of violent radio content and nonlisteners.

Those arguing for scrutiny of violent radio content claimed negative impacts of exposure. The early 1940s witnessed a rise in juvenile delinquency, which was frequently attributed to violence in radio programming and comic books. Herzog (1941) found that 72 percent of fourth to sixth graders who dreamed about radio said their dreams were unpleasant. Several other researchers claimed to have found evidence that dramatic radio program content had a significant influence on children's reality expectations.

Dramatic radio programming sometimes had very tangible and obvious effects. An understanding of both the penetration and the potential impact of radio in terms of perception of violence may be gleaned from an examination of audience reactions to CBS's Halloween broadcast of a dramatic adaptation of H.G. Wells' *War of the Worlds*, on 30 October 1938. The program simulated a news program, with announcers interrupting seemingly standard-formatted programming for reports of aliens invading New Jersey. The American Institute of Public Opinion poll estimated that 1.7 million people believed the program was a newscast, and that 1.2 million people were at least excited by the news, approximately one-sixth of the total audience. Hundreds of people left their homes in fear. Such a mass reaction to dramatized violence in a radio program indicated the potential impact of radio and of American reliance upon the medium as a primary source of information at that time.

By the 1960s social learning theory had gained credence and was used as a foil for the cathartic model. Most of the research community turned away from the cathartic theory for lack of any evidence that such a positive impact existed. Many researchers in the 1960s, generally examining television and not radio, used social learning theory to explain how and why violent content leads to aggressive behavior in audience members.

Research findings concerning violent content of radio remain inconclusive. Many studies indicate that violent content is a cause of social violence, whereas many other studies conclude that violent content is not a cause of social violence. Many social scientists agree that violent media content can be a contributing factor to social violence, but there is disagreement concerning the magnitude of this relationship and the role and extent of other factors.

In 1929 the National Association of Broadcasters (NAB) established self-regulatory practices for program content and advertising. These codes of practices were non-binding. Often revised, by 1967 the NAB Radio Code reflected the nation's concern for violent material and responsibility toward children. Specifically, the 1967 code stated: "They (radio programs) should present such subjects as violence and sex without undue emphasis and only as required by plot development or character delineation. Crime should not be presented as attractive or as a solution to human problems, and the inevitable retribution should be made clear." While modified slightly from year to year, the Code wording did not have much impact on radio programming at any time. The Code was eliminated in the early 1980s.

Radio Music and Violence

The violent content in the lyrics of some popular songs broadcast over radio has caused controversy for years. There has been concern about lyrics of music since the first broadcasts of rock and roll records, especially with regard to lyrics dealing with sex, drugs, and violence. In the 1980s and 1990s, the wording of heavy metal, rap, and alternative songs was scrutinized by and became targets of advocacy groups and congressional inquiries. The Parents' Music Resource Center was founded in 1985 by Tipper Gore and Susan Baker, wives of powerful political figures in Washington, to advocate labeling music that dealt with violence, drug usage, suicide, sexuality, or the occult. In 1985 the Recording Industry Association of America agreed to use a uniform warning phrase, "Parental Advisory Explicit Lyrics," for such content.

In 1990, 8.5 percent of all music sold in the United States was classified as rap music, with lyrics often thematically linked to urban lifestyles and hip-hop culture. What became known as "gangsta rap" used themes of crime, violence, anti-police sentiments, and gang activities. Some of the notable figures affiliated with gangsta rap as it became popular in the late 1980s and early 1990s were Ice-T, Easy-E, Dr. Dre, Tupac Shakur, Biggie Smalls, and Ice Cube. Radio was a vital link in the distribution of such music, since after hearing songs on the air listeners then sought out their own copies.

Several politicians and public figures, including Senator Joseph Lieberman (D-Connecticut), Senator Sam Nunn (D-Georgia), and former Education Secretary William Bennett,

held a series of news conferences in 1995 to protest lyrics in the music industry that were considered pro-drug, degrading to women, or advocating violence against the police. Senator Bob Dole (R-Kansas) praised the effort, calling for an outright ban on gangsta rap during his presidential campaign of 1996. The advocacy group targeted Time Warner because of its 50 percent ownership of Interscope Records, which served as distributor for such artists as Dr. Dre and the band Nine Inch Nails. The group accused Interscope of distributing music of artists who promoted drug use as well as the rape, torture, and murder of women. Time Warner sold its stake in Interscope records later in 1995, insisting the sale was not precipitated by pressure from the senators' advocacy group.

There have been several efforts by the radio industry to self-censor violent lyrical content. In 1993 WBLS (FM) of New York and KACE (FM) of Los Angeles publicly pledged not to give air-time to the most offensive and violent rap songs. In December 1993 Inner City Broadcasting Corporation, one of the largest African-American-owned broadcasting firms in the United States, announced it had banned lyrics it considered derogatory, sexually explicit, or violent. Entercom Communications, owner of many radio stations around the country, announced in July 1999 that it had adopted a policy to reject any music or advertising with violent content or that condoned violence.

The historical controversies concerning radio's violent dramatic programming and potential impacts on its audience reflect current debates concerning violent content of television. The controversy of the 1980s and 1990s concerning violent

song lyrics; the contemporary concern with hate groups' use of radio; and the penetration of radio in developing nations, greatly exceeding that of other mass media, ensure that the topic of violence and radio will have great importance into the 21st century.

Virtual Radio

Though a trademarked phrase, Virtual Radio has become a generic term in the radio industry for the practice of using voice tracks to produce a radio station's programming, usually at a location other than at the station. At the most basic level, voice tracking is the integration of prerecorded tracks into music programming, with the intention of giving small market stations access to air talent that only larger markets could afford.

Origin

The true origins of Virtual Radio were tape syndication companies that began to provide services to stations in the 1960s. First was International Good Music, or IGM, which pre-

recorded classical music with announcer tracks and distributed the programming on tape to automated stations.

In the 1970s, the firm Drake Chenault did the same with Top 40 programming based on the "Boss Radio" concept founder Bill Drake had pioneered at KHJ in Los Angeles. TM Productions—later known as TM Century after a merger—became the largest supplier of syndicated programming for automated radio. Satellite radio formats were never classified as Virtual Radio because they were delivered in real time and not in disassembled form to be reassembled by the radio station.

As a generic name, Virtual Radio is also applied to internet audio streaming services, which deliver radio-like content without transmitters. Some of the content was produced for

internet entities, and some was originated by terrestrial radio and repackaged for internet use.

Further Definition

The phrase was given specific definition in 1997 by The Research Group, a Seattle-based consumer research firm serving the radio industry. As the company expanded beyond audience research studies, it added voice tracking as a service for their client radio stations using announcers from the Seattle area. The new service was termed Virtual Radio, and The Research Group sought trademark registration.

The concept was both praised and derided in the industry—praised by station operators who saw voice tracking from distant studios as a way to reduce costs and increase efficiencies, and derided by local disc jockeys displaced by the systems. Internet chat rooms were filled with postings from air talents complaining about “corporate radio” and the lack of localism that resulted from most virtual radio operations. “How does someone in Seattle know what’s going on in Fayetteville, Arkansas?” asked a typical posting on broadcast.net. The answer to that question was in the original plan for voice tracking systems: the local station was expected to provide content information to the voice-tracked disc jockeys so their performances could contain references to events, landmarks and personalities in the town.

Writing in the *BP Newsletter*, Klem Daniels of Broadcast Programming, Inc., stressed that voice tracking “is not an exercise in mediocrity, but a chance to achieve perfection.” Daniels said, “Many feel that this is a blow to the creativity that has made great jocks and entertaining radio for years. Actually, only the most talented and creative personalities can make voice tracking a success.”

Broadcast Programming (later known as Jones Radio Networks) provided a voice tracking service called Total Radio, and its accompanying *Total Radio Users Guide* asked local stations to provide the following information on a long questionnaire:

Call letters, dial position and station name (i.e.,

“Mix 96”).

A list of personalities and disc jockeys on the station.

What sets your city apart from other area cities? Manufacturers, football teams, universities, landmarks?

Names of dignitaries and famous residents.

The target audience: Married? Kids? Income level?

Hobbies?

A Boon to Cash Flow

The efficiencies and cost savings of Virtual Radio were so lucrative that Capstar Broadcasting Partners built its business plan around computer and internet links among its stations.

The first of the links was the Austin, Texas-based Star System, which was first used in Capstar’s Gulf Star division, made up of Capstar stations in Texas, Louisiana, and the Southwest. In a 1998 analysis of Capstar’s business by Credit Suisse/First Boston financial group, technology, including the Star System, prompted a “buy” rating for shares of Capstar stock:

Using T-1 lines and other Intranet like systems, Capstar is able to have a DJ in Austin doing a live show in Waco or Tyler. Morning shows are primarily kept local, but other dayparts are done remotely. If the need arises, a local manager can tell a remote DJ what is happening in town over a computer screen, and the DJ can then report. So, if there is a large police chase in Tyler, a DJ in Austin can report on it as if he or she is actually there.

By linking all of its stations to a central location in each “Star” region, interviews of large celebrities can be made to sound local. News and weather are localized, yet music playlists are selected for the individual markets. Thus, local listeners get the researched programming they demand, and Capstar is able to save money on talent by getting more productivity out of each member of its on-air staff.

Credit Suisse/First Boston pointed to Capstar’s Baton Rouge stations as good examples of the results of using the Star System: in 1997 revenues were up 18 percent and broadcast cash flow was up 45 percent because of the savings on talent. The Star System digital voice-tracking network became part of AMFM, Inc., in a merger with Capstar. AMFM added a second voice track studio location in Fort Lauderdale, Florida. At its height, Star System fed 400 shows a day from the two operations, employing about 50 full-time air talents in each city.

After yet another merger that absorbed AMFM, Inc., into Clear Channel Communications, Clear Channel elected to close the Star System operations in 2001 in favor of its “hub and spoke” voice tracking concept. Hub and spoke is also virtual radio with voice tracks recorded at major market stations (the hub) and fed to nearby smaller markets in the same region (the spokes). Thus, a Clear Channel station in Columbus, Ohio, would feed voice tracks to sister stations in nearby Ohio towns. At about the same time Clear Channel closed the Star System, Jones Radio ended their marketing efforts for Total Radio because client demand for the service had dwindled to half a dozen stations. The Research Group had folded Virtual Radio in 1999 when Jacor Communications acquired the company before Jacor’s merger with Clear Channel.

Local Input

Virtual Radio remained as a local operation, either in the hub-and-spoke style of Clear Channel or with individual station

clusters using in-house talent to feed multiple stations in the same market. It would not be unusual to hear the same voice using one name on a Top 40 station and then later that same day using another name on the co-owned Country station. In some situations, voice-tracked disc jockeys even competed with themselves in the same time slot.

The advantage of voice tracking within the local station or cluster is the effective use of time and talent. Instead of waiting for songs to end before performing, disc jockeys and other air talent can spend time producing commercials, making local appearances, or selling advertising. Also, by keeping the talents

local, it is less likely that they will mispronounce an important local celebrity's name or miss a reference to a local event.

Voice of America

International Radio Service

The legacy of the Voice of America (VOA), which has offered nearly six decades of broadcasting in multiple languages, began on 11 February 1942 with this opening for the first broadcast to Germany:

OPENING MUSIC: The Battle Hymn of the Republic

ROLAND WINTER: Attention! This is the Voice of America!

WILLIAM HARLAN HALE: The Voice of America at War.

PETER KAPPEL: Our voices come to you from New York across the Atlantic Ocean.

STEFAN SCHNABEL: America is today in its sixty-sixth day of the war.

HALE: Today and every day from now on we shall be speaking to you about America and the War. Here in America we receive news from all over the world. This news may be favorable or unfavorable. Every day we shall bring you this news THE TRUTH.

Later, Fred Waring's orchestral rendition of *The Battle Hymn of the Republic* was replaced with *Yankee Doodle* when it was discovered that the German marching song *Laura, Laura* had the same tune.

Origins

From that first broadcast during World War II to the present, the VOA grew to be a dominant presence in international

broadcasting. Reaching the world through shortwave radio, the service was initiated to counter propaganda broadcasts from Germany and Japan. When Secretary of War Henry L. Stimson warned that Germany was undermining the American institution of free speech, Robert E. Sherwood, a noted playwright and President Franklin Roosevelt's speechwriter, observed the national reaction to the president's Fireside Chats and responded with a plan. With presidential authorization, Sherwood created the Foreign Information Service (FIS) in 1941.

After the FIS became the Overseas Branch of War Information (OWI) under Executive Order 9182, President Roosevelt authorized the VOA to become part of OWI in December 1942. Sherwood persuaded John Houseman to serve as VOA's first director. According to Houseman, Sherwood instructed him to consider all VOA transmissions as continuations of Roosevelt's speeches.

Houseman had an extensive background in radio, which included being the producer of the 1938 "War of the Worlds" broadcast for the *Mercury Theatre of the Air*. Drawing on his training in drama, Houseman decided to avoid the single-voice format used by the British Broadcasting Corporation (BBC). Houseman gave credit to Norman Corwin's radio styling for the idea of using several voices to maximize variety and energy. Moreover, he also hoped to counteract jamming with the diversity of pitch and rhythm.

Once launched, the VOA was praised for becoming a credible source of news for the rest of the world. In his book *Front and Center*, Houseman quoted a letter from Cannes, France, showing VOA's impact on the Resistance in France:

You in America cannot imagine how even a few minutes of news from America, heard by a Frenchman, is spread around. An hour after it is heard hundreds, thousands know the truth. (Houseman, 1979)

Since the goal was to reach as many people worldwide as possible, VOA transmitted via shortwave, which allows low-powered, high-frequency transmissions to be received thousands of miles from the point of origin. VOA also deemed it an advantage that shortwave transmission was not considered an effective delivery system by the commercial American radio industry. Moreover, though this type of transmission posed no threat to commercial broadcasters in the United States, all the other major foreign powers were sending international communications via shortwave. Through VOA, the United States joined the international broadcasting ranks—especially when all American shortwave transmitters were placed under government control eight months after the bombing of Pearl Harbor.

Postwar Change

The postwar period brought many changes for the VOA. In late August 1945, President Harry Truman abolished the OWI. The VOA remained on the air, and the State Department took over operations under the Interim International Information Service. Archibald MacLeish, assistant secretary of state for public and cultural affairs, coordinated VOA until he was replaced by William B. Benton, who cut expenditures to the bone, trimmed VOA programming, and terminated many members of the staff. Soon Congress decreased appropriations. VOA was in danger of ceasing operations until Truman and Secretary of State George C. Marshall intervened with the advent of the Cold War in 1948.

The threatening aspects of the Berlin Blockade heightened feelings that an American radio voice was important. In January 1948 Congress passed the Smith-Mundt Act, which authorized the VOA to continue its service to “disseminate abroad information about the United States, its people and policies promulgated by the Congress, the President, the Secretary of State and other responsible officials of government having to do with matters affecting foreign affairs.”

However, in 1953 Senator Joseph McCarthy attacked VOA’s programming practices and its propaganda implications with charges of subversive activity. Although never proved, widespread dismissals and resignations, and a sharp drop in agency morale, followed.

Just as the administration of VOA was changing, so also was the radio format for newscasts. Speculating on this new style of reporting, Shulman comments:

The shift from multiple-voice plays to single-voice news stories that were based on outside sources emphasized

the reliability and objectivity. . . . The Voice of America spoke in terms that were increasingly concrete and factual. In an atmosphere in which “propaganda” . . . was discredited both abroad and at home, precise information sounded neutral. . . . News stories replete with official quotations and a remote authorial voice established distance and command. Increasingly, Voice writers used the passive voice or impersonal form to indicate a weighty authority. These overall changes . . . emerged from discussions. . . . Was it artistic, dramatic radio, or was it clear informational journalism? (Shulman, 1990)

This movement to increase the prestige of the Voice was reflected both in VOA’s move to Washington, D.C., in 1954, and in President Gerald Ford’s signing of the VOA Charter (Public Law 94-350, FY 1977 Foreign Relations Authorization Act) on 12 July 1976. The Charter’s purpose was to protect the integrity of VOA programming and define the organization’s mission:

The long-range interests of the United States are served by communicating with the peoples of the world by radio. To be effective, the Voice of America (the broadcasting service of the United States) must win the attention and respect of listeners. These principles will therefore govern Voice of America (VOA) Broadcasts.

1. VOA will serve as a consistently reliable and authoritative source of news. VOA news will be accurate, objective and comprehensive.
2. VOA will represent America, not any single segment of American society, and will therefore present a balanced and comprehensive projection of significant American thought and institutions.
3. VOA will present the policies of the United States clearly and effectively, and will also present responsible discussion and opinion on these policies.

VOA kept the world informed about developments in the United States. For example, in 1969 when Neil Armstrong took those steps for mankind on the moon, nearly 800 million people were tuned to VOA or to one of the hundreds of stations around the world that were relaying VOA’s live coverage. Outpacing its counterparts throughout the world, in 1977 VOA became the first international broadcast service to use a full-time satellite circuit to deliver programming from its own studios to an overseas relay station, which was located on the Greek island of Rhodes. Because of its commitment to present factual information to the world, VOA dramatically enhanced its credibility through its candid reporting of two events that traumatized the nation—the 1965–72 war in Vietnam and the 1972–74 Watergate scandal.

Challenges Since 1980

The 1980s began with promise. In 1983 VOA launched a \$1.3 billion program to rebuild and modernize programming facilities. In 1985 Radio Martí, which was affiliated with VOA, began daily broadcasts to Cuba. In 1988 Congress enlarged the VOA Charter to include WORLDNET Film and Television Service. VOA Mandarin and Cantonese broadcasts were increased in 1989.

On 30 April 1994, President Bill Clinton signed the International Broadcasting Act of 1994 (Public Law 103-236), establishing the International Broadcasting Bureau (IBB) within the United States Information Agency (USIA), which consolidated all civilian U.S. government broadcasting, including VOA, WORLDNET, and Radio and TV Martí, under a Broadcasting Board of Governors (BBG), and funding a new surrogate Asian Democracy Radio Service (later called Radio Free Asia [RFA]). This extended the BBG's oversight to government grantee organizations Radio Free Europe/Radio Liberty (RFE/RL) and to RFA. The bipartisan Board includes the Director of the USIA (ex officio) and eight other members who are appointed by the president and confirmed by the Senate. The first Board of Governors was sworn in on 11 August 1995.

The Board oversees the operation of VOA, WORLDNET Television Service, and Radio and TV Martí to Cuba, as well as two other international broadcast services—RFE/RL and RFA, which were shifted to its jurisdiction under the 1994 legislation. VOA, WORLDNET, and Radio and TV Martí are part of the USIA and are U.S. government entities; RFE/RL and RFA were nonprofit, grantee organizations that received annual grants of congressionally appropriated funds from the BBG.

In 1994 VOA began distributing its newswire and selected newscast and program audio files in 19 languages, VOA frequency and satellite information, and other general material, via the internet. The Office of Business Development was established in 1994 to investigate the possible privatization of VOA language services, procurement of corporate underwriting for broadcasts, coproductions with major broadcast networks, and fund raising from various foundations. From 1994 through 1996, the office raised \$4 million. VOA became the first international broadcast service to launch a webpage on the internet in May 1996.

On 25 October 1996, VOA broadcast its first simulcast radio and TV program—an hour-long Farsi broadcast—from a new TV studio at VOA's Washington, D.C., headquarters. Programs in Arabic, English, Mandarin, Russian, Serbian, and Spanish followed.

In 1997, an agreement was signed between the IBB and the Asia Satellite Telecommunications Company (AsiaSat) giving VOA, WORLDNET Film and Television Service, RFA, and RFE/RL access to AsiaSat 2 with a footprint reaching more than 60 percent of the world's population.

In October 1998, President Clinton signed the Foreign Affairs Reform and Restructuring Act. This abolished the USIA effective 1 October 1999 and integrated all the agency's elements, except the IBB, into the Department of State.

For 60 years, the VOA has earned the reputation of providing current, accurate, and balanced news, features, and music to its international audience. VOA continues to attempt to reach its announced goal of providing listeners from every walk of life, race, and religion with reliable, comprehensive news of events from around the world. Occasionally, VOA also offers practical information about how to maintain new democracies and free-market economies.

Fourteen relay stations worldwide transmit VOA's programs 24 hours a day to international audiences via satellite, shortwave, and medium wave. Most "affiliates" now receive their programming via one of the 37 satellite circuits that deliver VOA broadcasts to virtually every corner of the globe. According to VOA figures, the service is successfully competing with nearly 125 similar broadcast services worldwide and remains one of the top international broadcasters in today's vast global media market. Each week 86 million listeners around the world tune in to VOA programs broadcast in 53 languages via direct medium wave (AM) and shortwave broadcasts. Millions more listen to VOA programs placed on local AM and FM stations around the world and give VOA a vast global reach that is unequaled by any of the other international broadcasting services.

VOA credits its extensive programming to the more than 80 writers/editors in its newsroom and to the 40 correspondents at 22 news bureaus in the United States and throughout the world. These broadcast journalists write and report an average of 200 news stories each day. VOA's original programming totals almost 700 hours each week.

Voice of the Listener and Viewer

British Audience Pressure Group

The Voice of the Listener and Viewer (VLV) has become an influential audience pressure group, describing itself as the “citizens’ voice in broadcasting in Britain.” It was founded by a group of mainly professional and middle class radio listening enthusiasts who had heard of proposed changes to one of the British Broadcasting Company’s (BBC) national radio networks.

Origins

In 1982, during the war in the South Atlantic between British and Argentinean forces for control of the Falkland Islands, the BBC had used its Radio 4 network to carry live news of the conflict. Radio 4, although it carried more news than any of the BBC’s other networks, was a mixed service, and it included regular radio drama, a daily “soap” (*The Archers*), culture and arts, religious, and magazine programs, documentaries, and much else. But the news coverage of the war was deemed a success, and some senior BBC executives thought that the network could in future become a mainly news network, equipped to carry breaking news, as well as analysis, background, and comment.

The protestors, all very keen Radio 4 listeners, saw the possible disappearance, or at best the serious downgrading, of many of the programs they most enjoyed. Although the BBC is a publicly owned corporation, they felt powerless to make the

broadcast planners listen. As license payers, they believed that the BBC had an obligation to listen to them. They met with Geoffrey Cannon, the media correspondent of the *Sunday Times*. Cannon wrote about their concerns in his paper, and many more people added their support. They wanted to create a voice for the listener, and hence the name of the new group was born. In late 1983 the Voice of the Listener and Viewer came into existence at a public meeting in London. By this time the BBC plan to change Radio 4 had been shelved, but the momentum for a consumer group for radio (and later for television) was unstoppable.

It is significant that changes to public radio rather than television had stimulated the formation of the group. In Britain and elsewhere, radio stations and networks often evoke greater feelings of ownership and consumer concern than television stations and networks. Listeners often develop stronger attachments to radio than they do to television.

The VLV is widely recognized as a significant and important consumer voice in British broadcasting policy making. It makes representations to the government, to the BBC and commercial broadcasters, and to the broadcasting regulatory authorities. It holds regular meetings on current topics, arranges visits to broadcasting stations, and issues a quarterly newsletter. Through its charitable arm, the Voice of the Listener Trust, it also promotes public education about all aspects

of broadcasting. Finally, the VLV makes annual awards to programs and broadcasters, both in radio and television that, unlike most others, are chosen by its members: ordinary listeners and viewers.

The main thrust of the organization's efforts is in support of quality in broadcasting. As the deregulation of both radio and television in Britain has progressed, concerns have been expressed by many at what they see as reduction in the number of high-quality programs being made, as public and private networks compete for audiences. It makes a strong defense of the principle of public funding for the BBC through the compulsory license fee for all television set owners, unless and until an alternative, non-commercial means of funding can be found. It says that the license fee gives it the freedom to concentrate on delivering quality programs to audiences, while their commercial competitors have to deliver audiences to the advertisers who fund them. The VLV thus sees the BBC as the standard setter of British broadcasting.

Another major concern of the VLV has been to maintain and even increase the quality and range of programs for children. And in the increasingly commercial world of broadcasting in the U.K., it seeks to ensure that older listeners and viewers are not neglected as a result of being of less interest to commercial sponsors and advertisers.

The VLV has developed links with similar bodies in other parts of the world, especially those with related origins and

philosophies, such as the Friends of New Zealand Radio, the Friends of the ABC in Australia, and the Friends of Canadian Broadcasting. It has organized several successful international conferences on wider global issues. At its third international conference in 1996, it joined with other groups in Europe to form the European Alliance of Listeners' and Viewers' Associations (EURALVA). This group seeks to represent the interests of listeners and viewers of broadcasting services in Europe and maintain the principle of public service in broadcasting. The member groups come from Denmark, Finland, France, Portugal, Spain, and the U.K.

The VLV has its critics, who often say it represents a middle class, well-educated, and privileged minority who has dominated the style and content of British radio broadcasting for too long. But it has gained respect and support from many in the industry, and some well-known broadcasting names are to be found among its membership.

Vox Pop

Radio Interview Program

The radio program *Vox Pop* (from the Latin for "voice of the people"), one of the first "man on the street" interview shows, was also one of the earliest quiz programs. Later it became a popular human-interest program and one of the biggest home-front morale boosters of World War II. It was also probably the best-traveled program in broadcasting history.

Origins

The show began in 1932 at station KTRH in Houston, Texas. Someone had the idea of dangling a microphone on a very long cord out the window of the hotel from which KTRH broadcast so that passersby could be interviewed. Station ad man Parks Johnson and station manager Jerry Belcher took on the task of

talking to the man or woman on the street. They started out by asking about current events, then segued into lighter topics. The results were alternately fascinating and hilarious.

Once in those early days, after a large storm had swept through Houston, the hosts found themselves facing an empty street. They had no one to interview. Necessity being the mother of invention, Johnson quickly relieved the program's crew of all their money, emptied his pockets as well, and had it all changed into dollar bills. He collared an usher from a nearby theater and proceeded to ask him questions, giving him a dollar for every correct answer. Soon the street was mobbed, and the "quiz show" was born.

This device worked very well during the depths of the Depression, and it began to alter the focus of the show. The

opinions of the people, their voices, were downplayed as the quiz element gained in popularity. Current events questions were used as a warm-up to the *real* questions, the ones worth a dollar. Johnson often asked questions that originated from everyday life and was known for carrying a notebook with him and jotting down new topics for questions. Participants were asked questions that tested their knowledge of the Bible (“What did Pharaoh’s daughter find?”) or their vocabulary (“Can you ad-lib?”) or questions meant to elicit a humorous response (“Why can’t a cat be called ‘Fido’ or ‘Rover?’”). Questions regarding the so-called war between the sexes were practically a regular feature. Such queries as “What makes a person fall in love?” and “What is a woman’s place?” were sure to trip up the guest.

Network Popularity

Vox Pop was almost totally unrehearsed, and this spontaneity proved to be a hit with listeners. The show was broadcast from the streets of Houston for more than two years, but it also attracted attention outside of Texas. On 7 July 1935, *Vox Pop* began appearing on the National Broadcasting Company (NBC), broadcasting from the sidewalk at New York’s Columbus Circle. The following week, the show took its microphones to the waiting room of Grand Central Station, moving the show around New York City for the rest of the summer. Brief interviews with contestants before the quizzing began became part of the proceedings, and soon *Vox Pop* was dropping in on events as varied as a Hollywood movie premiere and the “Days of ’76” celebration in Deadwood, South Dakota.

Into early 1940, the program was still giving away dollar bills at a furious pace, but as the nation edged closer to war, the focus of *Vox Pop* began to change once again. Johnson, a World War I veteran, threw the program wholeheartedly into the war effort at least 17 months before the bombing of Pearl Harbor. The quiz show structure was phased out, and the program changed to a focus on human interest, going into a community or attending an event and deciding beforehand which guests to interview.

The show traveled up to 1,000 miles per week throughout the United States, visiting military bases, military schools, and factories and showcasing different communities that were helping on the home front. Themes such as “Lumber at War,” “Food at War,” and “Dogs for Defense” were typical of this period; later in the war years, the show’s visits included military hospitals. The show broadcast from 45 states as well as to Canada, Mexico, Puerto Rico, and Cuba. At this time, Parks Johnson’s wife Louise began helping the show by buying gifts for the interviewed guests. “Mrs. Santa Claus,” as she became known, eventually had a budget of \$1,000 per week and was quite adept at locating hard-to-find items during the war years.

These were halcyon days for *Vox Pop*. The show seems to have connected with the country in a very real way, and its ratings climbed steadily during this period, reaching a respectable 15.3 during the last two years of the war.

Parks Johnson was the guiding force throughout the life of the radio program. Jerry Belcher left the show in 1936 and was replaced by Wally Butterworth, a well-known radio announcer. Butterworth hosted the show with Johnson from 1936 until 1941. Neil O’Malley filled in briefly but was replaced by Warren Hull in 1942. Hull, an actor and announcer who had played the Green Hornet in the movies and was later master of ceremonies for the popular TV program *Strike It Rich*, stayed with the program until *Vox Pop* left the air in 1948.

Advertising Squabble

The show had several sponsors through the years. Deals with Kentucky Club Tobacco and Bromo-Seltzer lasted longest, but it was the sponsor *Vox Pop* had for the least amount of time that made the biggest impact. Lipton Tea sponsored the show in a Tuesday night slot starting in 1946, but the relationship between program and sponsor quickly soured. T.J. Lipton, Inc. thought its products did not get enough attention on the program and insisted that each guest (as many as six per show) be presented with a box of Lipton products before receiving his or her personalized gift. These presentations were in fact commercials, commercials that “must do a hard selling job,” according to a memo from Lipton.

Johnson, as sole owner of the show, did not like the new requirement, and after negotiations failed, he took the unusual step of firing his sponsor. Many a sponsor had canceled a program for low ratings, but never had a performer canceled a sponsor! Newspapers around the country picked up the story. Johnson was hailed as a “radio knight,” a man of high moral principles who refused to compromise. This favorable publicity meant that *Vox Pop* had little trouble finding a new sponsor, and the show continued until 1948 for American Express. By this time, however, radio was changing, and Johnson was weary of traveling. The last show aired on 19 May 1948, and Johnson retired to his ranch in Wimberly, Texas, where after a second career of civic boosterism he died in 1970.

WABC

New York City Station

One of the most powerful New York City stations (in terms of both transmission and ratings strength), WABC has been successful first as a Top 40 station and more recently as a talk-radio outlet. The flagship station of Disney/American Broadcasting Companies (ABC), WABC traces its history back to 1921. (It should not be confused with another WABC, also in New York City, that served as the flagship for the CBS network and became WCBS in 1946.)

Origins

WABC began broadcasting in 1921 in Newark, New Jersey, with the call letters WJZ, a 3,000-watt station owned by the Westinghouse Broadcasting Company transmitting at 833 kilohertz. Two years later it moved into New York City and was purchased by the Radio Corporation of America (RCA), which in 1926 created the National Broadcasting Company (NBC). NBC, in turn, established its Blue network with WJZ as the flagship station. The station increased its power to 50,000 watts in 1935 and changed its frequency several times, finally settling on 770 kilohertz in 1941.

In 1943 the Blue network and WJZ were sold to Edward J. Noble and Associates, which in 1945 changed its licensee name to the American Broadcasting Companies. Station call letters were altered to WABC in 1953 to reflect the transition. The ABC networks and WABC were taken over by United Paramount Theaters in 1953. Decades later the station and network were sold (1996) to the Disney Corporation.

Programs and Promotion

In the late 1950s WABC was lagging behind New York's leading popular music stations, WMCA and WINS, and was struggling to find its own niche in the highly competitive market. By 1964 WABC was not only the top station in New York, it was

also the most-listened-to radio station in America. With weekly audiences of between 5 and 6 million from the mid-1960s to the mid-1970s, WABC could be heard in 38 states and Canada. Its Saturday night *Dance Party* with Bruce Morrow (universally known as "Cousin Brucie") reached 25 percent of the total radio audience in the New York metropolitan area.

The phenomenal change in WABC's fortunes is largely credited to the vision of Rick Sklar, station program director from 1963 to 1977. Sklar helped WABC stand out from its competition with a number of approaches. He limited the music playlist while at the same time trying to bridge the generation gap of rock and non-rock listeners. Sklar held weekly music meetings with his staff, assiduously choosing appropriate selections for diverse groups and tapping into the rapidly changing music of the era. The repeated airing of music by the Beatles (and on-air interviews with the members of the group) led to the hyping of the station as "W A Beatle C."

WABC's on-air lineup was built to create recognizable personalities, among them radio legends Harry Harrison, Dan Ingram, and Ron Lundy, as well as one of the best-known disc jockeys in the country, "Cousin Brucie" Morrow. These men had mellifluous voices, but more important, they established a rapport with their devoted listeners and hosted programs that were fun to listen to.

To establish loyalty and to garner attention, the station conducted unusual and ultimately enormously effective promotions. One such gimmick allowed people to vote for the School Principal of the Year. Listeners of all ages could vote as often as they wanted; the idea was to get entire families and school faculties tuned to the station. By the second year of the promotion in 1963, the program was so successful that the station received 176 million ballots—many of them from well beyond the tristate (New York, New Jersey, and Connecticut) standard audience area.

In 1964 WABC sponsored a contest honoring the best and the worst copy of the *Mona Lisa*, which was being flown from Paris to New York for exhibition at the Metropolitan Museum of Art. With Nat King Cole singing the promotional jingle and surrealist painter Salvador Dali serving as the judge, WABC received more than 30,000 entries.

Jingles and slogans were a key aspect of the station and were broadcast constantly. There were special jingles promoting the station's place on the dial, its news and sports reports, its disc jockeys and their time slots, and—above all—its ranking of songs and attention to music. The station's sounds became so distinct that even listeners tuning in during advertisements knew they were hearing WABC.

News and Talk Radio

The demise of all-music WABC came on 10 May 1982—dubbed by some as “the day the music died”—when “MusicRadio 77” gave way to “NewsTalk Radio 77.” A range of factors contributed to the need for the switch, among them the development of FM radio with its superior sound quality and the transfer of most music formats (and their audiences) to FM. AM stations like WABC needed to develop viable talk-based formats where sound quality was less crucial. By switching to an all-talk format, WABC was following the trend of many AM stations across the country.

By 2000 WABC was a powerhouse in personality-driven talk radio. As in years past, its promotions emphasize the station's approach: “If you're talkin' about it, we're talkin' about it.” The station's two daytime hosts, Dr. Laura Schlessinger (9:00–11:45 A.M.) and Rush Limbaugh (12:00–3:00 P.M.) were

the two top-rated hosts in the county; Limbaugh's Excellence in Broadcasting production operation shares studio space in the same building as WABC. Others in WABC's program lineup include the locally based conservative host Sean Hannity, liberal Lynn Samuels, former New York mayor Rudolph Giuliani, and former Guardian Angel Curtis Sliwa.

The station is also the broadcast home of the New York Yankees and New York Jets, and scheduled programs are pre-empted to broadcast the baseball and football games live. The only indication that WABC was once the premier music station in the nation is a three-hour program on Saturday nights devoted to Frank Sinatra.

Walkman

Portable Audio

Begun in 1979 as a risky consumer electronics experiment by Sony and soon after almost a generic term (it was added to the Oxford English Dictionary in 1986), the Walkman was the first personal stereo, a tiny portable cassette tape playback device with a lightweight headset. Perhaps the most important consumer audio product since the development of the transistor radio in the mid 1950s and of stereo FM in 1961, the Walkman and its many imitators became one of the biggest world-wide consumer successes of the 1980s and 1990s. Begun as a tape-playing device, the Walkman changed over the years

to add recording capability, radio reception, and eventually digital formats including CDs. The trade name became almost synonymous with any portable radio or disc player.

Origins

The Walkman began with an earnest request from engineer (and Sony co-founder) Masaru Ibuka, (1908–97) in late 1978 for a device on which he could listen to music while on long international flights from Japan. The first prototype was devel-

oped in Sony's tape recorder division in just a few days early in 1979, based on the existing "Pressman," a tape recorder designed for reporters. Given the short time for development, the new device made use of a tape transport and stereo circuits from existing Sony products.

As it was not a sophisticated piece of electronics that provided something technically new, many Sony engineers and some managers were not interested in the device. But Sony co-founder Akio Morita (1921–99), with his strong sense of product appeal and marketing, soon became a strong proponent of the innovation he saw as a potential best-seller. At his urging, engineers added dual headphone connections (the "his and hers" option) to make the device less off-putting, and an orange button mute to reduce volume so that the listener could hear outside sounds without having to remove the headphones (the "hotline function").

Perhaps the most important part of the package was the new lightweight headphones. Sony would emphasize the stylish nature of the tiny headphones in comparison to what people then used—large earmuff-size devices. This attempt to create a headphone culture was risky in a society with a phobia about deafness or other physical impairment. Also risky was the potential market value of a machine that could play cassette tapes but could not record. Batteries could operate the tiny machine for up to eight hours (two decades later batteries could last for 60 hours). Finally, the machine offered quality sound reproduction despite its tiny size—a key selling point.

Sensing an untapped market, Morita wanted to focus sales efforts on youngsters during the summer of 1979. There was no advance market testing, in part for lack of time. A relatively low sales price (projected to be about \$125) would mean thousands would have to be sold to break even. Morita suggested an initial batch of 30,000—easily twice what their most popular tape recorder sold in a year—and again horrified his colleagues. The first product announcement and demonstration took place in June. Reporters were invited to an outdoor park in Tokyo to demonstrate the many ways the "Walkman," as it was now named, could be used while performing other activities.

Phenomenon

The first Walkmans went on the Japanese market 17 July 1979 (for \$200), three weeks later than Morita had hoped. The delay made Sony even more concerned when initial sales were very slow, especially given its huge stock of the devices. By mid-August, however, word of mouth began to propel the Walkman to widespread popularity and sales took off. The first 30,000 were sold in a month, largely to the teenage buyers Morita had projected would be most interested. Sony had to constantly increase production to keep up with demand. Indeed, the first foreign sales had to be postponed for

months—despite already running advertising campaigns—just to keep up with burgeoning Japanese demand.

The Walkman device was first sold as the "Soundabout" in the U.S. and Europe only in February 1980. Initially the plan was to sell the device under various names, depending on the country's language, but Sony quickly decided to stick with the Walkman label everywhere, which made advertising campaigns easier and helped the product build a global image.

Some later models added radio reception and by the 1990s were increasingly digital, built around CDs (as the "Discman"). Walkman had become a generic (though still trademarked) term for all the many small, portable CD or tape players and recorders as well as small radios. A variety of Sony models were made available—by 1990 more than 80 different models; by 1999, 180 in Japan alone and more than 600 worldwide. More than 250 million had been sold worldwide by late 1998 at prices ranging from as little as \$25 up to \$500. By the mid-1990s, the "portable audio product" category of consumer electronics devices was selling more than 25 million units a year. The Walkman principal was extended to television, with the eventual development of the Watchman (tiny portable TVs).

Perhaps the major social impact of the Walkman was to create a "personal sound" space for its users. Now one could listen to a recording or broadcast in a crowd—as in public transportation or even an elevator—without invading others' space. The very unobtrusiveness of the light, tiny device allowed users to carry sound with them almost everywhere—even on strenuous workouts or hikes. The Walkman represented ultimate portability even two decades after its introduction.

War of the Worlds

Radio Drama

Broadcast as part of the *Mercury Theater of the Air* in October 1938, the style and format of *War of the Worlds*, an hour-long live drama, coming just a month after radio's news bulletins about Europe's Munich crisis, pushed some of the U.S. listening audience into a panic—and clearly demonstrated the growing trust in and power of radio broadcasting.

The Script

In 1898 English author and social thinker H.G. Wells (1866–1946) published *War of the Worlds*, a novella concerning an attack on Earth by creatures from Mars. Drawing on fears of a rearming Germany and concerns about the impact of such modern technologies as the telegraph and improved modes of transport, Wells' invasion story took place in England at the end of the 19th century.

Four decades later, in July 1938, the Columbia Broadcasting System (CBS) radio network began to offer weekly radio adaptations of literary works on the *Mercury Theater of the Air* on Monday evenings at 9:00 P.M. (changing to Sunday in September). The program featured the cast and producers of Broadway's successful and creative Mercury Theater troupe, headed up by the 22-year-old *wunderkind* Orson Welles (1915–85) and his producer John Houseman (1902–88). For each weekly broadcast, the cast would have only a few days to develop, rehearse, and finally broadcast each script. Several weeks into the radio season, Welles came upon H.G. Wells' story, which he felt would be perfect for the Halloween eve broadcast of his series.

By this point, Howard Koch (1901–95), undertaking his first professional scriptwriting job, had joined Houseman (who had written all program scripts to that point). In what became his third script for the series, Koch modified the original Wells story to take place in the present time and in tiny Grovers Mill, New Jersey (picked at random), not far from Princeton. Most important, in light of what would happen, Koch applied Welles' idea of a radio news bulletin approach (rather than straight narration) for the first portion of the drama. Listeners would hear what appeared to be news bulletins breaking into ongoing network musical programming. But Koch had to create a modern radio script from the 40-year-old story in less than a week.

He wrote the 60-page script over four days, with about 20 pages at a time being turned over to the producers for their comments and changes. With Houseman's aid, the script was finally finished on Wednesday so that the cast (save Welles, who was committed to Broadway activities) could rehearse on

Thursday. The recorded results, however, sounded stilted and dull to all involved, and the script was revised again. Houseman and Koch added bits and pieces to enhance the eyewitness sound of the story with real places and some realistic government voices at key moments. When CBS received a copy on Friday, the network censor also asked for numerous script changes to make the story's fictional basis more obvious. This usually involved the changing of place names or organizations. Whereas the network seemed concerned that listeners might think the story too realistic, Mercury people feared listeners would not stay tuned in or would find the story too fantastic.

Busy with Broadway commitments, Orson Welles did not even see the script until Sunday morning, 30 October—mere hours before it would be broadcast live. At that point he took charge, making further script changes at the opening of the drama to increase the reality of the news bulletins breaking into other programs.

The Broadcast

Sunday evening network radio listening was dominated by Edgar Bergen and Charlie McCarthy on National Broadcasting Company (NBC) Red, the only commercial program in the time slot. On NBC Blue, listeners heard *Out of the West*, narrated dance music from San Francisco presented on a sustaining (noncommercial) basis, while Mutual stations were carrying the WOR symphony orchestra, though many carried a speech by Father Charles Coughlin, as it was sponsored (paid) time. Not all CBS stations carried the Mercury broadcasts—the Boston outlet, for example, was carrying a local program.

At 8 P.M. in CBS Studio 1 on the 20th floor of CBS headquarters at 485 Madison Avenue in New York, the cast and sound effects people were in place. Besides Welles playing Professor Richard Pierson, Dan Seymour played the New York studio announcer, Kenneth Delmar played several roles (he became famous several years later on the Fred Allen show), and Ray Collins also performed several different roles. The music background was by Bernard Hermann.

Relatively few listeners heard the program opening—a fairly standard announcement of what was to come followed by Welles setting the stage for the actual inception of the story. Some simply tuned in late, but many were listening to Bergen and McCarthy on NBC and would tune over to CBS after the play had begun. These patterns were a critical factor in the panic created by the program, for when listeners tuned in they

Orson Welles broadcasts H.G. Wells' *War of the Worlds*, 30 October 1938

heard what seemed like a normal weather forecast and then a cut-away to a hotel orchestra in downtown New York. The music was announced and was just getting under way when an announcer cut in with the first bulletin—about “reports observing several explosions of incandescent gas, occurring at regular intervals on the planet Mars.” More music, then another bulletin, followed by a brief interview with a Princeton astronomer played by Welles. Then a bit of piano music, and still another news bulletin about those Mars explosions, but this time adding that “a huge, flaming object, believed to be a meteorite” had fallen on a farm “in the neighborhood of Grovers Mill, New Jersey.” After about 20 seconds of a hotel swing band, another announcer broke in—and indeed, the next half hour was a series of increasingly exciting live on-the-scene reports from different reporters at various points in New Jersey. After the hostile nature of the “invasion” became clearer, about 25 minutes into the program, an announcer said,

Ladies and gentlemen, I have a grave announcement to make. Incredible as it may seem, both the observations of science and the evidence of our eyes lead to the inescapable assumption that those strange beings who landed in the Jersey farmlands tonight are the vanguard of an invading army from the planet Mars.

This was followed by several more reports—from an army detachment and then a bombing aircraft—all of them giving way to the seeming invincibility of the invaders. By 8:40 P.M., clouds of poisonous gas were reported to have covered Manhattan, and a lone radio operator elsewhere was heard calling out with no response.

At about this point, a CBS announcer made a brief station break, noting that the program in progress was a drama, and then the final portion of the program began. Little remembered today, this consisted of Welles playing the Princeton astronomer, Richard Pierson, fearing he may be the last person on earth. He puts down his thoughts in a diary; then he runs across another survivor and, at the end of the hour, the remains of the invading Martians, killed by earthly organisms and bacteria. This segment ran 20 minutes.

At the end, and “out of character” as he put it, Welles spoke briefly to “assure you that the *War of the Worlds* has no further significance than as the holiday offering it was intended to be.” A network announcer wrapped up with a hint of next week’s broadcast and a Bulova Watch advertisement for the 9:00 P.M. hour.

The Effect

The first the program’s cast knew of the commotion being caused came as the broadcast ended and police entered the studio, confiscating copies of the script and questioning actors on

how much they knew about what was going on outside. Network telephone lines were flooded with calls of concern. Three more times during the evening, CBS announcers made clear the broadcast had been merely a drama and not a real news event. More than half of the stations that carried the play also made their own announcements.

But these cautionary announcements came too late for many listeners. Thousands of them, especially those in the seeming New Jersey and New York “target” zone of the Martian attack, had heard more than enough well before the program was over and were trying to flee the scene. If they heard one of the characters note that people were fleeing, they would, as later reported to researchers, look out the window. If streets were busy, they would assume people were fleeing. If streets were empty, the conclusion often reached was that others had already fled. Amazingly, few of those who panicked thought to tune another radio station to check or even to look at newspaper listings of programs to see what CBS was supposed to be broadcasting at that time. Few even telephoned others. If radio said we were being invaded, then it must be true.

Hundreds of calls were placed to newspapers (the *New York Times* alone received more than 800), radio stations, and police. The Associated Press put out a bulletin to its member papers explaining what had happened. Only slowly on the evening of the broadcast was widespread panic reduced. Though there were many accidents on crowded roadways, luckily no one was killed.

Over the next several days, there were widespread press reports about what had happened. Ironically, the program’s impact that night helped it to gain commercial sponsorship, and it became the *Campbell Playhouse* in December and lasted in modified form until mid-1941.

Fascinated by the reaction to the program, the newly formed Office of Radio Research at Princeton University undertook a research study, under sociologist Hadley Cantril, to determine why so many had been driven to panic. The results, published as a book two years later, were largely based on interviews with 135 listeners. Researchers learned that people had grown accustomed to radio breaking in with important news during the Munich crisis of a month before and that such bulletins were assumed to be true. Of the roughly 6 million who tuned in, 1.7 million reportedly believed what they heard.

The Aftermath

A number of lawsuits were filed against CBS, all of which were eventually settled out of court. The Federal Communications Commission (FCC) launched a brief investigation out of which came an industry ban on program interruptions for fake news bulletins.

Rebroadcasts or sequels appeared on the anniversary of the original broadcast. In one case, a 1949 Spanish language sequel in Quito, Ecuador, led to enraged listeners' burning down the station, with several lives being lost. The story became a popular 1953 movie, with the setting shifted to Los Angeles. The first commercial recording of the original broadcast was issued in 1955 by Audio Rarities. "The Night America Trembled," presented on CBS's *Studio One* in September 1957, provided television viewers with a dramatic portrayal of the radio program. Buffalo station WKBS offered an updated version on the 30th anniversary of the original broadcast (30 October 1968), with radio in a Top 40 format style using station disc jockeys and newscasters. It was replayed a year later. Scriptwriter Koch provided a brief 1970 book with his own version of what had happened. For the 50th anniversary (30 October 1988), National Public Radio (NPR) offered a program based on a modified script by Howard Koch. A long documentary of the whole story appeared on the Discovery Channel in October 1998.

No other single radio program has had such a long-lasting impact as *War of the Worlds*. Both as a highlight of creative radio writing, and as an inadvertent measure of radio's growing place in society, the 1938 drama stands alone.

WBAI

New York City Station

From its inception, WBAI (99.5 FM) has broadcast alternative and often controversial programming to the greater New York City metropolitan area. WBAI has become one of the largest stations in the community radio network, with an operating budget of about \$3 million per year.

Origins and Free Speech Heritage

The station became the third in the educational and noncommercial Pacifica network when then-owner and philanthropist Louis Schweitzer donated it to the Pacifica Foundation in the midst of a contentious city newspaper strike in 1959 because he believed that media should be used for the public interest.

WBAI has had a rich and sometimes combative broadcast history and is renowned for programs raising issues related to

the First Amendment. In 1968 WBAI incited controversy in a widely publicized incident when a guest on writer Julius Lester's program read an anti-Semitic poem written by one of his students. The airing of the poem, "Anti-Semitism," which vividly described the African-American teenager's views toward the largely Jewish population of schoolteachers, again raised issues of what could and could not be broadcast. Although the United Federation of Teachers union filed a complaint with the Federal Communications Commission (FCC), that agency ruled in favor of the station, asserting that it allowed for "reasonable opportunity for the presentation of conflicting viewpoints."

The most prominent case involved the 1973 broadcast of "Seven Words You Can't Say on Television" by comedian George Carlin. The FCC cited WBAI's owner, Pacifica, for

indecenty for airing the 12-minute monologue in the early afternoon when children might be in the audience. The case eventually reached the Supreme Court, which ruled in 1978 that the government could regulate “indecent” broadcast speech from the airwaves but could not ban it.

In 1987 WBAL addressed free speech concerns again when it sent the FCC a list of questionable words and phrases without acknowledging that they were from James Joyce’s *Ulysses*. Though originally the FCC responded that it could not judge the material until it was broadcast, the agency later ruled that context was critical and allowed the text to be aired as part of a program on Bloomsbury writers.

Programs

WBAL is best known for its extensive, thorough, and often subjective reporting. Beginning in the 1960s the station sent reporters into the South to report on the civil rights movement, including coverage of the murders of three young volunteer workers (James Cheney, Mickey Schwerner, and Andrew Goodman) in 1962. In 1965, WBAL participated with the other two Pacifica stations in holding Vietnam Day “teach-ins,” providing nontraditional discussion-type broadcasts.

WBAL pushed the limits even further that same year when program director Chris Koch traveled to North Vietnam to report on the war. His reports were attacked by supporters of the Vietnam War and even by many on the Pacifica Board who were conflicted about the coverage. After attempts were made to have Koch delete parts of his reports, he and five others resigned. Nearly one-third of station member subscribers also canceled their subscriptions in protest.

WBAL’s exhaustive foreign coverage has continued through the years, and long after the mainstream media have left the scene, WBAL has reported from battlefronts in countries such as Iraq, Haiti, and East Timor. Over the years the station has applied the same scrutiny to domestic conditions, examining the practices of the Federal Bureau of Investigation (FBI), federal and state prisons, and city homeless shelters, in addition to other problems.

While news is clearly a mainstay of WBAL’s orientation, just as significant are its music and innovative programming. The station is known for introducing free form radio, specifically in *Radio Unnameable*, a program developed in 1963 by WBAL’s Bob Fass, which still runs today. The broadcasts—precursors of much subsequent radio—feature a blending of sounds from many different sources. Musicians who would later become popular entertainers appeared regularly on *Radio Unnameable*, among them Judy Collins, Bob Dylan, Jose Feliciano, and Arlo Guthrie (who debuted “Alice’s Restaurant” on the show).

It continues its hard-hitting news reporting and also broadcasts an eclectic range of programming, including shows on

alternative lifestyles, health, labor, technology—and, of course, music. In the noncommercial “free radio” tradition, WBAL continues to inform, provoke, and rankle its listeners. It has also been honored for its coverage: in 1999 Amy Goodman, the morning co-host of *Wake Up Call*, a local call-in show, won a George M. Polk reporting award for a piece about two unarmed environmentalists who were killed in Nigeria as a result of the Chevron Corporation’s involvement with the military there. More recently, the station won a Rodger N. Baldwin Award for outstanding contributions to the cause of civil liberty. As the plaque read, “From the armies converging on Iraq to the march for women’s lives in Washington, from the killing fields of East Timor to the mean streets of Manhattan’s homeless, WBAL covers the local, national and international scene with a depth and integrity not even conceived of by commercial broadcasting.”

Staff Protests

WBAL has regularly been subject to various protests within its own staff. As an operation making heavy use of volunteers, and catering to a broad range of political opinion, heated disagreements are not surprising.

In 1977 a bitter strike over issues of race, staff authority, and finances kept the station silent for seven weeks and still remains one of the most contentious episodes in New York radio history. The strike came about because the staff protested management’s reorganization of the station, which they perceived as taking away their power and softening the station programming. Very little was resolved as a result of the strike; it ended when the staff voted (by a narrow margin) to obey a court order requiring them to leave the transmitter room they had taken over.

An even longer and fiercer battle broke out in 1999. Pacifica Foundation management moved to make WBAL sound more professional and mainstream in its programming as they sought larger audiences and additional sources of funding. The move immediately ran into opposition from staffers wedded to their own sometimes controversial programs, often with strong listener support. Many staffers saw the move as an attempt to muzzle unpopular points of view. The host of *Democracy Now!* got into a battle with station management over the direction of her program. By late 2000 a 20-year veteran (including a decade as station manager) had been fired and the staff was in an uproar, talking to newspapers and filing various legal grievances. Soon some staffers were being locked out of the station (somewhat ironically housed on Wall Street) by foundation management. The battle—which had even featured street protests by listeners and disaffected staff—was finally settled in December 2001. WBAL retained the right to work with its own board of direc-

tors, only loosely controlled by the foundation in California. After a six-month search, a new station manager was appointed late in 2002.

WBAP

Fort Worth, Texas Station

Clear channel WBAP in Fort Worth, Texas, has been a dominant force in Texas and Southwest broadcasting since the very dawn of the radio-television era.

Like many infant stations in the early 1920s, WBAP was an extension of a powerful newspaper, the *Fort Worth Star-Telegram*, published by Amon G. Carter Sr. and Carter Publications. *Star-Telegram* circulation manager Harold Hough convinced a skeptical Carter to put WBAP on the air. Carter grudgingly approved the expenditure of \$300 to put the 10-watt station on the air on 2 May 1922. "But when that \$300 is gone, we're out of the radio business," Carter admonished Hough. Of course, it soon became obvious that radio was more than a \$300 experiment. Hough became WBAP's most popular on-the-air personality in the early days, going by the moniker "The Hired Hand."

Dual Channels

For more than 40 years, WBAP shared airspace with WFAA, owned by the *Dallas Morning News*, first on a single frequency, and later, uniquely, on two separate frequencies. It is the only known case of stations sharing more than one frequency.

WFAA had been saddled with a frequency-sharing deal not to its liking with KRLD, owned by the *Morning News*' bitter rival, the *Dallas Times Herald*. The stations were assigned to share 1040 kilohertz, also a clear channel. *Dallas Morning News* publisher George B. Dealey apparently preferred to cooperate with Carter's station, across 30 miles of then open prairie, rather than with the station of his intra-city rival. WBAP had been paired with KTHS in Hot Springs, Arkansas. The station found the awkwardness of sharing airtime with such a distant station untenable. So WBAP and WFAA peti-

tioned the Federal Radio Commission (FRC) to allow them to share the 800 kilohertz channel (820 kilohertz beginning in 1941), and the FRC granted the change effective 1 May 1929. At the same time, the FRC authorized WBAP and WFAA to broadcast at 50,000 watts on 800 kilohertz, an increase of 100-fold from their previous wattage.

In 1935 the resourceful Carter acquired KGKO in Wichita Falls, Texas, broadcasting on 570 kilohertz, setting the stage for the unique dual-channel time-sharing arrangement. Carter had the station's license transferred to Fort Worth, and WBAP began broadcasting on KGKO's channel in 1938. Soon WFAA bought into KGKO, and in 1940 the two stations began sharing time on two separate frequencies.

Don Harris enjoyed a career of 33 years on the air at WBAP starting in 1965, in the final years of the dual-frequency days. "There was a 10-second changeover [for each station to sign off and the other to sign on]," Harris recalls. "Sometimes, those WFAA guys would cheat us a couple of seconds, and we would have two or three seconds of dead air [as WBAP waited for WFAA to complete its sign-off]." Harris admitted that sometimes it happened the other way around.

Fort Worth is also known as "Cowtown," and WBAP became famous for a cowbell station identification. The cowbell was almost certainly the innovation of the ubiquitous Hough, the station's most identifiable air personality in the 1920s and 1930s. WBAP claimed that its cowbell jangle was U.S. broadcasting's first "memory signal." The cowbell would be heard when WBAP identified itself before and after exchanging frequencies with WFAA.

WBAP prided itself (then and now) on its farm and ranch programming. A brief 1947 history of the station commented, "The station had a definite field to serve—the vast area of Texas (and West Texas in particular), where distance is most

unusual, and which was, and is, a ranching and farming area.” Until radio came to Texas, farmers and ranchers relied only on their limited powers of observation to prepare for rough weather. “More than once, ranchers were saved millions of dollars in livestock losses by WBAP’s warning of approaching blizzards and storms. National recognition has been given the station for that service,” a 1949 *Star-Telegram* article reported.

In the 1940s WBAP broadcast a night-time program from the state prison in Huntsville called *Thirty Minutes behind the Walls*, which was written, performed, and produced by prisoners. WBAP claimed in 1943 that the program received nearly 200,000 fan letters in one month from 45 states, Canada, and Mexico.

As television emerged in the 1950s, the WBAP and WFAA formats gradually evolved toward middle-of-the-road music. The decision by WBAP to hire the legendary Bill Mack to play country music on 820 kilohertz from midnight to 7:30 A.M. in 1969 marked the first clear break between the two stations. Harris credits general manager James A. Byron, who had been the station’s news director, for having the foresight to make the change to country music.

In April 1970 the Federal Communications Commission (FCC) approved the sale of the Belo Corp’s share of the 820 channel to Carter Publications for \$3.5 million. Belo and WFAA received WBAP’s interest in the 570 channel facilities. The end of the partnership came on 1 May 1970, when WFAA went to 570 kilohertz full-time and WBAP took over 820 kilohertz. It was the 41st anniversary of the time-sharing agreement. WFAA radio left the air in 1983.

After the split, WBAP initiated a country music format full-time. Other stations were playing country music, but Harris

says WBAP immediately shot right past them and everyone else. “Six months after the change, we were number 1 in the market,” he said, “It was an overnight success, just phenomenal.”

In 1973 Capital Cities Communications bought WBAP and WBAP-FM (now KSCS) from Carter Publications for \$80 million. In 1996 WBAP and KSCS became part of the merger of Capital Cities/American Broadcasting Companies (ABC) and the Walt Disney Company. In 1993 WBAP switched from country music to news/talk.

WBBM

Chicago, Illinois Station

This AM radio station, the long-time Columbia Broadcasting System (CBS) affiliate in Chicago, has been linked to the history of CBS as a radio (and later television) network. Chicago has long been famous as a pioneer in radio, but WBBM-AM never set in motion any significant shows. It simply aired what CBS sent along, and for radio in the late 1940s and network television through the 1970s, this usually meant the top-rated shows being broadcast. There is only one sense in which WBBM was a pioneer, and that was as an early FM station, beginning its broadcasts on 7 December 1941.

With WBBM standing for “World’s Best Broadcast Medium,” WBBM went on the air on 14 November 1923. WBBM has spent three-quarters of a century on Chicago’s AM dial, beginning its life in the basement of the Atlass family home, then moving to the Broadmore Hotel, and then to its long-time home in the Wrigley Building on Chicago’s north side. Within three years of its debut, the station bragged that it had aired the first dance music and the first church service, carried regular remote broadcasts, and acquired the leading number of local advertisers.

In 1933 CBS purchased WBBM, and station cofounder H. Leslie Atlas was made its general manager on a lifetime basis as part of the sale. By the late 1930s WBBM transmitted with 50,000 watts, and in 1936, the station often ranked number one in Chicago with a significant set of locally produced shows, such as *Piano from Warehouse 39*, *Sunday Night Party*, *One Quarter of an Hour of Romance*, *Dugout Dope*, *Women in the Headlines*, *Radio Gossip Club*, *Man on the Street*, and *Sports Huddle*. But none of these—unlike many other Chicago-based programs—ever made a national splash. From its 410 North Michigan Avenue studio, the station could air from the WBBM Air Theatre, which seated 300 persons. Through most of the 1930s and 1940s, it was a clear channel powerhouse at 780 kilohertz, able to be picked up throughout the upper Midwest and beyond. This meant that WBBM broadcast CBS news into Chicago and served as the Midwest base for the Columbia News Service set up in 1933.

WBBM-FM went on the air on 7 December 1941, but the FM station long merely duplicated the AM broadcast. In recent years, as FM has ascended in popularity, it has tried a number of different music formats. In 2000, WBBM-FM (96.3 FM) had the format of “dance hits,” but the station had the same studio as WBBM-AM at 630 North McClurg Court. It was not until well into the 1960s that WBBM-FM did more than duplicate WBBM-AM.

With the rise of television, WBBM-AM needed to reinvent itself. The new format grew out of CBS chairman William S. Paley’s desire to come up with a format that was on one hand

prestigious (and not simply another rock variation) while also making money. WBBM found this with all-news radio in 1968, and the network reinvented itself as the link among the CBS all-news radio stations. WBBM-AM has provided all-news radio broadcasting in the nation’s second city for more than a third of a century, with classic drive-time formatting. WBBM-FM has not been so lucky and has tried a number of formats that might work—with “dance hits” the format by 2000. Both AM and FM remained at studios at 630 North McClurg Court, though there was talk in 1999 of moving to another part of downtown. WBBM’s AM antenna is located on the west side of the region, in Elk Grove Village, and the FM antenna is located atop the landmark John Hancock Building.

WBT

Charlotte, North Carolina Station

Dubbed the “Colossus of the Carolinas,” WBT was the first commercially licensed station in North Carolina and, with WSB in Atlanta, was one of the first two such licensees in the southeastern region of the United States. From its debut in 1922, the station has also been one of the region’s most powerful. In 1929 William S. Paley purchased WBT, establishing it as a key link in the distribution of the Columbia Broadcasting System (CBS) programming.

WBT’s roots stretch back to 1920, when Fred M. Laxton (a former General Electric employee), Fred Bunker, and Earle Gluck began transmitting experimental station 4XD from Laxton’s home in Charlotte. Laxton and his friends had con-

structed the transmitter in a chicken coop behind Laxton’s house; they broadcast music from phonograph records to the few people who owned receivers at the time. On 10 April 1922, Laxton, Bunker, and Gluck—operating as the Southern Radio Corporation—received a license from the federal government to broadcast with 100 watts of power as WBT. Initially, the station aired from 10:00 to 11:45 in the mornings and from 7:30 to 9:45 in the evenings.

Southern Radio Corporation sold WBT in 1926 to C.C. Coddington, a local Buick automobile dealer, and over the following three years, the station grew to be a regional power. During the years following Coddington’s purchase of WBT, the

station acquired permission to broadcast at 5,000 watts and affiliated with the National Broadcasting Company (NBC).

In the late 1920s William S. Paley of CBS, in fierce competition with NBC to garner affiliates, had begun purchasing established stations in key regions to ensure the expansion of the CBS network. In late 1928 the broadcasting titan bought WABC (later WCBS) in New York, and in 1929, he added to his collection WCCO in Minneapolis, Minnesota, and, with an eye toward reaching the southeastern United States, WBT.

Soon after acquiring WBT, CBS persuaded the Federal Radio Commission to allow the station to broadcast with 25,000 watts of power. Four years later, in 1933, the station's power rose to 50,000 watts. Listeners from Maine to Florida could clearly receive WBT's signal.

WBT would be a CBS-owned-and-operated station until 1945, when the Federal Communications Commission's (FCC) network rulings forced CBS to divest itself of certain high-power stations. Reluctantly, CBS sold its gold mine in the Southeast to Jefferson Standard Life Insurance Company, the enterprise (known today as Jefferson Pilot) that currently owns the station. WBT would maintain its CBS affiliation and continue to be a powerful outlet for the network's programs.

Just as WBT proved to be an important cog in the distribution of CBS network programming, by the late 1920s the station had also become an important source of local news, information, and entertainment for listeners in the Charlotte region. Led by program director (and later station manager) Charles H. Crutchfield and personalities such as Grady Cole and Kurt Webster, the station broadcast tobacco auctions, professional baseball games, old Confederate veterans reeling off their "rebel yells," country music performances, and other events of local flavor. Many of WBT's local productions were picked up by the CBS network for national and regional distribution.

Numerous entertainers would receive valuable exposure via their appearances on WBT productions. Before achieving fame as *Amos 'n' Andy* over the NBC network, Freeman Gosden and Charles Correll performed on the station in the

1920s. In addition, saxophonist Hal Kemp, who would become a well-known big band leader, had performed over WBT in the 1930s, as had bandleader Kay Kyser. Country music performers, such as the Briarhoppers and Arthur Smith and the Crackerjacks, watched their reputations grow on regularly scheduled WBT programs such as the *Carolina Hayride*, a weekly barn dance program picked up by the CBS network in the 1940s. Perhaps the best-known of the traditional music performers who emerged from WBT were the Johnson Family Singers, a gospel-singing sextet who, as a result of their success on WBT in the 1940s, broadcast regularly over the CBS network and attracted recording contracts from Columbia and, later, Radio Corporation of America (RCA) Victor. WBT also claimed a role in grooming newsmen for CBS: Charles Kuralt and Nelson Benton worked at the station before going on to the network.

WBT helped pioneer radio broadcasting in the Southeast and became a widely disseminated source of regional news, information, and entertainment. The station would also spawn North Carolinian entertainers and news personalities who would go on to national fame in broadcasting. WBT will be most remembered for its role in building the CBS network.

WBZ

Boston, Massachusetts Station

One of the Westinghouse group of stations, WBZ Radio went on the air on 19 September 1921, with studios at the Westinghouse Electric plant in East Springfield, Massachusetts, approximately 85 miles west of Boston. WBZ's first broadcast

was a remote from the Eastern States Exposition, a large New England county fair; among the speakers helping to dedicate the station were the governors of Connecticut and Massachusetts. WBZ operated on a frequency of 800 kilohertz, with a

power of 100 watts. Within several years, the station would move to 900 kilohertz, and by 1928 it was placed at 990 kilohertz by the Federal Radio Commission.

By early 1922, WBZ had moved its studio to Springfield's Hotel Kimball. Station programming was typical of radio in those pioneering days: an occasional star but mostly eager amateurs willing to perform free. By early 1924, it was already becoming difficult to get good free talent, as more stations competed for performers. WBZ decided to open a Boston studio in conjunction with the *Boston Herald* and *Boston Traveler* newspapers, from which they got their news at that time; the new station was known as WBZA. The studios were first in Boston's Hotel Brunswick; they moved to the Statler Hotel in 1927 and to the Bradford in 1931. Meanwhile, the Boston station grew in importance, and its ability to attract major talent was a big plus for Westinghouse. WBZ was the first Boston station to broadcast Boston Bruins hockey games (featuring *Herald* sportswriter Frank Ryan doing play-by-play reports), and when not doing sports, the station provided a regular schedule of dance bands, well-known singers, political talks, a storyteller for kids, and a staff of announcers who became very popular in their own right. By March of 1931, it was decided that the WBZ call letters should belong to Boston and the WBZA letters should go to the Springfield station.

In 1926 WBZ began broadcasts of the Boston Symphony Orchestra, and in 1927, the station became one of five original affiliates of the National Broadcasting Company (NBC) Blue radio network. (As time went on, many of the WBZ announcers would be hired by the network.) When WBZ had its tenth anniversary celebration in September 1931, the NBC Blue network carried it. But in April 1932 WBZ got a rather dubious bit of publicity, which showed the perils of live radio. A supposedly trained circus lion (he was trained to roar on cue) was brought to the studio, and for some reason, he broke away and went rampaging through the studios, destroying equipment, terrifying spectators, and injuring seven people before the police arrived and had to shoot him.

By the mid-1930s, WBZ was using 50,000 watts; in 1941, the station was moved to 1030 kilohertz, a dial position it still has today. WBZ began doing a morning show featuring country vocalist Bradley Kincaid during the late 1930s. In 1942 Carl DeSuzé joined the station; he would go on to a long career as the morning show host. The programming in the 1930s and 1940s included a daily women's show (radio homemakers were very popular, and WBZ had Mildred Carlson and later Marjorie Mills), as well as an increasing emphasis on news. The WBZ news staff included some of the best-known reporters, many of whom would later go on to join WBZ-TV.

Experiments with FM were taking place in the late 1930s and early 1940s; WBZ used its FM station (W1XK) to broadcast the Boston Symphony Orchestra in 1941, which was probably the first time the orchestra had been heard via the

new FM technology. In June 1948 WBZ radio was joined by WBZ-TV, channel 4, and the stations moved into their own new facility, which had been specially designed for both radio and TV.

In the mid-1950s, WBZ moved away from its previously "middle-of-the-road" programming, dropping NBC and abandoning big bands for a more popular, hit-oriented sound. The station hired five well-known announcers and called them "The Live Five" to let the audience know that WBZ was now locally programmed. By the 1960s, WBZ had moved to a soft Top 40 format (detractors called it "chicken rock"—rock without any loud songs), but it still offered a nightly talk show and a heavy news commitment. WBZ's disc jockeys were personalities, and the younger audience found them very entertaining. Disc jockeys such as Bruce Bradley, Dick Summer, and Dave Maynard did more than just play the hits—they also interacted with their fans at numerous remote broadcasts and events: it was the era of the "record hop," and WBZ announcers were masters of ceremonies at dances all over Massachusetts.

By the 1970s, WBZ was moving away from Top 40 to a more Adult Contemporary sound and increasing its news. The station had long been known for public service, raising money for worthy charities; this activity was also increased, such that by the 1980s music was gradually being phased out in favor of longer news blocks, more sports, and more talk shows. By December 1985, WBZ had an all-news and information format during afternoon drive time, and by September 1992 the station completed the transition to being an all-news station.

Ironically, the city where it all began for WBZ—Springfield—was no longer a part of the WBZ game plan after 1962. WBZA was shut down by the parent company in order to buy another station in a larger market. But as a tribute to the station's beginnings, when WBZ celebrated its 50th anniversary in 1971, festivities were held both in Boston and at the Eastern States Exposition in Springfield.

WBZ is one of the few stations that still has its original set of call letters, and it has experienced minimal staff turnover on air: for example, several current members of the sports department have worked there since the 1960s, the news staff includes men and women with 10 to 15 years of service, and announcers such as Carl DeSuzé and Dave Maynard retired after more than 40 years on air. This is a tribute to WBZ's stability: although it is no longer called a Westinghouse station (Westinghouse purchased the Columbia Broadcasting System (CBS) in 1995, and by the end of 1996 the parent company became known as CBS rather than Westinghouse), it is still known for news, public service, sports, and night-time talk shows. The annual telethon/radiothon for Children's Hospital consistently brings in large sums of money; in fact, WBZ Radio has won numerous awards for public service and excellence in broadcasting, including the National Association of Broadcasters' Crystal Award and the Marconi Award. WBZ

has consistently earned number one ratings in Boston since the station changed over to an all-news format. And with a signal that can reach 38 states at night, WBZ continues to be among the most respected and most listened-to AM radio stations.

WCBS

New York City Station

The flagship station of the Columbia Broadcasting System (CBS) radio network, WCBS traces its lineage back to WAHG, which first aired in 1924. It was long the radio home of Jack Sterling and other local radio figures before becoming an all-news outlet in 1967.

Origins

WCBS got its start as part of a radio manufacturer's business. Alfred H. Grebe began to make radio receivers in 1922, and two years later he placed WAHG ("Wait and Hear Grebe") on the air on 24 October 1924 at 920 kilohertz with 500 watts of power. As was common at the time, WAHG soon shifted frequencies to 950 kilohertz and had to share time with another New York City station. By 1926 power had been increased tenfold. That same year, Grebe organized the Atlantic Broadcasting Company and changed the call letters to WABC, moving the studios from Queens into Manhattan.

Grebe had plans to develop a network, following the example set by the National Broadcasting Company (NBC) beginning in 1926. His outlet became one of two New York stations for the new CBS network, because as stations commonly shared time, more than one was necessary for the new network to provide a full week's coverage. Instead, late in 1928 Grebe sold his station to William S. Paley, head of CBS.

Network Station

CBS moved the new flagship station and its network headquarters into 485 Madison Avenue, where both would remain for several decades. The station moved to 860 kilohertz and by late 1929 was up to 50,000 watts of power. The final shift, to the present 880 kilohertz, came in 1941, part of the readjustment of American stations because of the North American Regional Broadcasting Agreement treaty.

WABC carried virtually all of the developing network's programming, plus some New York-only shows. With the creation of the new American Broadcasting Companies (ABC) in 1945, however, CBS was broadcasting from a station with a competitor's initials, and in November 1946, WABC became WCBS (after involved negotiations, as the new call letters had been used by a small station in Illinois since 1927). At the same time, it began to offer *This Is New York*, a combination of interviews and features on the city that would run for 17 years, first in the morning and finally as an evening program. Another long-lasting program was *Music Til Dawn*, which began in 1953 and lasted until 1970 as an inexpensive way of filling the late night and early morning hours, sponsored by American Airlines (then still headquartered in New York).

With the demise of evening network daytime programs in the early 1950s, WCBS tried a variety of programs with a "middle of the road" approach. Among them was *The Jack Sterling Show*, a morning music DJ show beginning in 1948 that ran for years. Not finding success, WCBS converted to an all-news format (for most of its schedule) in August 1967. Ironically, the premier of the new service was delayed when an airplane hit the station's transmitter tower. But, as often happens in such disasters, WCBS was able to use other station facilities while getting its own back on the air full-time. In the early 1970s the remaining non-news programming was terminated, making the station all news, all the time.

In recent years advertised as "WCBS 880," the station is formally owned and operated by Infinity Broadcasting Corporation, a publicly traded subsidiary of CBS Corporation. Offices and studios are located in the CBS Broadcast Center on West 57th Street in Manhattan.

WCCO

Minneapolis, Minnesota Station

The Twin Cities' "Good Neighbor to the Northwest," a 50,000-watt, clear channel AM station, is said to have dominated local audience ratings like no other station in the country. Legend has it that radio executives from across the United States would travel to Minnesota and sit in their hotel rooms listening to WCCO in order to "research" its format. They could only shake their heads in wonder. What they heard was a homespun blend of often insipid comedy featuring Scandinavian humor; remote-location broadcasts of amateur glee clubs and ethnic musicians; a schedule heavy on local news, farm markets, and weather; and ubiquitous live chats with political figures such as Hubert Humphrey. It was a sound that could not be duplicated elsewhere, called "Just Folks Radio" by *The Wall Street Journal*. At the height of its popularity, surveys showed WCCO to be the favorite among listeners in 128 counties by a 19-to-1 margin. WCCO was as much a part of the fabric of the Northwest as were snow days in January.

The station's predecessor, WLAG, went on the air in 1922 as a marketing tool for a Minneapolis radio manufacturer. In September 1924 the failed station was resurrected when a promoter convinced executives of the Washburn Crosby Company to buy it (hence the call letters "WCCO"). The company, known today as General Mills, used its new "Gold Medal Station" to promote its many brands of flour and cereal products. The first day's log boasts two home service programs performed by "Betty Crocker," and on Christmas Eve 1926, WCCO aired radio's first singing commercial, "Have you tried Wheaties?"

The station was one of 21 original affiliates of the National Broadcasting Company (NBC) Red Network, but within two years it switched to the fledgling Columbia Broadcasting System (CBS). In 1929 CBS chief William Paley bought one-third of WCCO for \$150,000, with an option to buy the rest in three years for \$300,000. The station's first general manager, Henry Bellows, was a University of Minnesota rhetoric professor who later served on the Federal Radio Commission and is said to have helped WCCO gain its favorable 50,000-watt clear channel designation in the early 1930s. Bellows and his

successor at WCCO, Earl Gammons, eventually became CBS vice presidents. Although CBS network programming came to fill about three-quarters of WCCO's broadcast day, Gammons built an immensely loyal audience for local programming in the 1930s. Gammons' trademark was hiring air personalities with a warm, neighborly style of delivery that contrasted with the more sophisticated sound of most New York-based network entertainers. The sound was called "personality radio."

In 1934 the resonant voice of Cedric Adams took over the WCCO evening news, and, bolstered by a nighttime signal that spanned half the country, WCCO and Adams together became a U.S. radio phenomenon. He was perhaps the most widely known and highest paid local radio personality for over a quarter of a century. At the height of his popularity, he did a daily five-minute program on CBS and occasionally substituted for network star Arthur Godfrey. WCCO took *Cedric Adams' Open House* on the road, annually logging over 15,000 miles with 49 weekend road trips. At one time his weekend traveling troupe consisted of an accordion player, a magician, three singing sisters, a comedy act, two baton twirlers, an eight-year-old girl who yodeled, and the Minneapolis Aquatennial Queen. CBS executives in New York may have snickered at the hokey lineup, but they never failed to notice the bottom line. Cedric Adams' 12:30 P.M. newscast had the largest Hooper rating of any non-network radio show in the country.

In 1938 the station moved from its cramped studios in the Nicollet Hotel to a spacious headquarters in the Minneapolis Elks Club building. The new location had the high ceilings favored by CBS architects and was quickly transformed into an art deco landmark with cream-and-Columbia-blue interiors. It was remodeled in the classic CBS design that had been used in other network projects in Boston, Saint Louis, and Chicago, featuring "floating studios"—in which the floors, walls, and ceilings were separated from the main building structure. Best of all, the new location had a fourth-floor auditorium that seated 700 people. Although unpretentious, with its tiny stage and its stage right main-floor engineering booth, the room

became the source throughout the 1940s for some of the country's best live radio. At its peak, the WCCO auditorium was home to seven consecutive individually sponsored live-audience programs on Friday evenings.

The growth of television caused a change in WCCO ownership in the 1950s. Because CBS could own only a minority interest in a Twin Cities television station (it already owned five television stations in other markets), CBS merged WCCO with Mid-Continent Radio and Television in 1952. The firm became Midwest Radio-Television. The Ridder and the Murphy newspaper families held a 53 percent majority, and CBS owned the remaining 47 percent. Two years later Federal Communications Commission (FCC) rules (requiring that minority interests be counted) forced CBS to sell its minority share of the company. The *Minneapolis Star and Tribune* bought this minority interest for \$4 million. Under the reorganization, WCCO Radio was set up as an independent entity within the company, controlled by neither the parent company's television nor the newspaper's interests, which now included both the *St. Paul Dispatch-Pioneer Press* and the *Minneapolis Star and Tribune*. This independence probably helped WCCO Radio compete and even thrive in the post-television era and to maintain its market dominance well into the decades that followed. The "variety" programming of the 1960s and 1970s gave way to a more uniform "news-talk" format in the 1980s and 1990s. As late as the mid-1980s, Arbitron showed that WCCO-AM was still the number one

rated major-market station in the entire country, although this unusual market dominance was later moderated by local FM competition.

In 1992, 40 years after WCCO was sold to local owners, CBS reacquired the stations, purchasing the assets of Midwest Communications in a deal worth over \$200 million. In addition to WCCO Radio and WCCO-TV, the acquisition included WLTE-FM, Minneapolis (formerly WCCO-FM); three smaller television stations in Wisconsin and Minnesota; and the MSC regional sports cable TV channel.

WCFL

Chicago, Illinois Station

The Chicago Federation of Labor's (CFL) 1926 plan to open its own radio station initiated one of the most notorious controversies in early broadcasting. As planned by the CFL, the proposal would create the only radio station in the country specifically devoted to the interests of organized labor. The CFL planned to call its new station WCFL and decided to use the same frequency as KGW in Portland, Oregon, and WEA, the popular American Telephone and Telegraph (AT&T) station in New York City. These plans were drawn without first consulting the U.S. Department of Commerce, which was then charged with station licensing.

When the Commerce Department was approached for a license, the CFL was told that none would be forthcoming. Acting Secretary of Commerce Stephen Davis explained that

there was no room in the overcrowded broadcast frequency spectrum to accommodate the station. In response, the CFL declared on 17 May 1926 that the organization fully intended to broadcast with or without a license. The CFL intended to transmit primarily educational programming, including labor-related information, public affairs, and discussions of economic issues, in addition to entertainment features.

CFL secretary Edward N. Nockels protested the commerce department's preferential treatment of corporate giant AT&T. Nockels expressed shock that no room could be found on the airwaves for WCFL, while AT&T's WEA was able to occupy a clear channel frequency. Nockels wrote Davis asking if it might be possible for WCFL's signal to occupy half of the territory reached by WEA.

The Department of Commerce intimated that if the CFL would broadcast illegally, the department would bring the matter before a federal court to test the legality of the Radio Act of 1912. Nockels said in reply that the CFL was willing to allow the courts to settle the matter. He expressed confidence that the courts would support the CFL's plans. The CFL began construction of its new station, WCFL, without official approval.

Ultimately the CFL was able to secure an inspection for the station from the Department of Commerce, and WCFL received its license. After a week of experimental transmissions, the station officially opened on 22 July 1926 with a special two-hour inaugural broadcast from 6:00 to 8:00 P.M. on 491.5 meters, "just a shade away" from WEAf. WCFL broadcast from transmitter facilities on Chicago's Municipal (Navy) Pier, which was linked to studios elsewhere in the city. WCFL was supported by the contributions of labor unions and quickly established itself as "the Voice of Labor."

The station quickly became the target of attacks because of its hindrance of long-distance ("DX") reception of AT&T's WEAf in New York. *Radio Broadcast*, for example, suggested that WCFL had chosen its frequency as a direct attack on AT&T, out of indignation that WEAf could control an exclusive frequency. *Radio Broadcast* engaged in something of a crusade against WCFL, at one point putting the CFL in the same class as the Ku Klux Klan, since both were special-interest broadcasters.

By October 1926, the station was on the air from 6:00 P.M. until midnight six days a week. The 6:00 to 7:00 slot each evening was devoted to labor issues discussed in a program called *CFL Talks and Bulletins*. The program's length was quickly cut in half, however, because of a lack of material. WCFL filled the remainder of the evening with entertainment features, predominantly music. The station later also offered educational lessons, farm market reports, weather reports, and religious services.

Throughout the history of the CFL's involvement in the station, most WCFL programming was not directly union-oriented, a fact that occasionally generated complaints from union officials but that did not stop the Federal Radio Commission (FRC) from labeling WCFL a "propaganda station." To some extent, WCFL became a victim of General Order 40, issued by the commission in 1928. Severe limitations were placed on the station's activities. WCFL was made to share its frequency, and its power was drastically reduced before the commission finally insisted that the station could not operate in the evening, so as not to interfere with other stations.

After the CFL found that the FRC's stance could not be shifted, the organization sought support for the station from Congress. As a result of congressional pressure, the FRC moved WCFL in 1929 to a new frequency, on which the station could again operate on a full-time basis. When Nockels

found that reception of the station was poor on that frequency, the commission allowed the station to return to 970 kilohertz and to broadcast for an additional four hours in the evening. By 1932 WCFL and the National Broadcasting Company (NBC) had entered into an agreement whereby WCFL would broadcast at 970 kilohertz full-time and at increased power (5,000 watts), despite the NBC station KJR in Seattle, which shared the frequency. The proposal quickly found approval with the FRC.

WCFL faced financial woes in its early days, which were to some extent alleviated by the acceptance of advertising, a practice that began in 1927. The station ushered in a lucrative rock and roll format in 1965 and subsequently became known as the home of some of radio's legendary disc jockeys, including Dick Biondi and Larry Lujack. The station's format change, however, prompted controversy among the membership of organized labor, with AFL-CIO president George Meany asking at one point what rock and roll had to do with the labor movement. By the early 1970s, WCFL had become Chicago's leading rock station.

Emphasis on entertainment, coupled with the competitive pressures of the Chicago commercial radio market, resulted in WCFL's abandoning an ever-increasing portion of its remaining public service programming. In spite of criticisms that the station was no longer significantly engaged in public service, WCFL survived challenges to its 1975 license renewal. Because the station eventually lost its ability to compete adequately in the Top 40 market, however, WCFL switched to an easy listening format in 1976. The station increasingly became a burden on the CFL without financial reward, until WCFL was finally sold for \$12 million to the Mutual Broadcasting System in 1979.

Unable to make the station financially viable as an all-news operation (which would have cost twice the then \$4 million annual operating budget), Mutual attempted by 1980 to turn WCFL into an adult contemporary music station. However, that failed as well, because most music listening by then was to FM, and AM outlets focused more on talk. Three years later, Mutual sold the station to Statewide Broadcasting, which turned WCFL into a religious music operation. Consistently last in city-wide ratings, WCFL was finally merged with Heftel Broadcasting's WLUP-FM, and in April 1987 the long-time voice of labor became WLUP-AM, an adult rock station.

WDIA

Memphis, Tennessee Station

Known as the "Mother Station of the Negroes," WDIA in 1949 became the first black-oriented radio station in the United States. Radio had featured black talent and black-appeal programs since the 1920s, but never before had a station directed its entire broadcast schedule to the black audience. This novel and long-overdue development in radio programming that WDIA pioneered spawned dramatic growth in the number of radio stations tailored exclusively for the black market.

The station, whose original studios were at 2074 Union Avenue in Memphis, had signed on the air in June 1947 with a white-oriented format that featured country and western music; classical music; and a smattering of news, sports, religion, and children's programs. This format garnered pale ratings, so in the fall of 1948 WDIA's founders, John Pepper and Bert Ferguson, began to experiment with black-appeal programming. It proved to be a profitable decision for the white owners and one that would open opportunities in broadcasting to black men and women. Initially, WDIA featured only a handful of black-oriented programs, but by 1949 the station had made a complete conversion.

To spearhead the new format, Pepper and Ferguson hired Nat D. Williams, a leader, educator, and impresario in the black community of Memphis. Williams's established popularity and ebullient on-air style virtually guaranteed the success of the programs he hosted; he and his shows became the core around which WDIA built the remainder of its black-appeal format.

In establishing the first black-appeal radio station in the United States, Pepper and Ferguson capitalized on the large black population in the Memphis area and its growing postwar prosperity. The ratings and revenue improvements for WDIA were startling and almost immediate. Among the tens of thousands of black Memphians, WDIA was number one. Soon the station was reporting that it attracted 33 percent more daytime listeners on weekdays than any other Memphis station did. Naturally, with more listeners came more advertisers, and although many advertisers, fearing racist backlash, avoided

WDIA, they soon shed their fears and latched on to the very real earning potential that the station offered. Ford, Kellogg's, Sealtest, Lipton's Tea, and other companies with deep advertising budgets became regular sponsors of WDIA programs. Confirming that their venture into black-oriented programming had succeeded, Pepper and Ferguson reported in 1951 that their local and national advertising sales had increased 75.4 percent and 80 percent, respectively, in 1950 over 1949.

In 1954, over protest from radio station WMPS in Memphis, the Federal Communications Commission (FCC) granted WDIA the authority to operate with 50,000 watts daytime and with 5,000 watts nighttime with different antenna patterns both day and night. As a result, the station expanded its influence well beyond Memphis into parts of Mississippi, Arkansas, Texas, Louisiana, and Illinois. WDIA claimed to have access to 1,466,618 blacks, or ten percent of the black population in the United States. By 1957 WDIA had the highest ratings and advertising income among radio stations in the mid-South.

Fueled by the example WDIA set and by the general decline in radio audiences, other radio stations sought to bolster their bottom line by becoming exclusively black-oriented. In WDIA's wake followed WMRY in New Orleans, WEFC in Miami, WCIN in Cincinnati, WJNR in Newark, and others.

WDIA employed various tactics to build loyalty among the black population it reached. Noting the success in 1948 of Nat D. Williams—first on his afternoon *Tan Town Jamboree* and then on his morning *Tan Town Coffee Club*—management quickly set about hiring more black talent until virtually the entire on-air staff was black. (Despite this groundbreaking opportunity for black on-air talent, it is important to note that Jim Crow still hovered about WDIA in the 1940s and 1950s: blacks were barred from sales, management, and engineering positions.) Joining Nat D. Williams were disc jockeys Martha Jean Steinberg, Maurice "Hot Rod" Hulbert, B.B. King, and Rufus Thomas, all of whom featured blues, rhythm and blues, and other popular music of the day. (B.B. King and Rufus Thomas would achieve fame as blues and rhythm and blues performers.) Ford Nelson, Theo "Bless My Bones" Wade, and

Rev. Arnold Dwight "Gatemouth" Moore presented gospel music programs, and the popular Willa Monroe hosted the *Tan Town Homemaker's Show*, which was geared to women in the radio audience. Blacks who listened to WDIA heard their own voices, which nurtured loyalty to the station as well as pride in the status that blacks had achieved on Memphis radio.

WDIA also built and maintained its listenership with comprehensive community relations efforts. The station's public service pervaded the black community: it traced missing persons, pleaded for blood donors, sponsored baseball teams, and collected food and clothing for needy Memphians. The centerpieces of the station's community focus were its roundtable broadcasts, which often dealt with racism, and the *Goodwill Revue* and the *Starlite Revue*, live concerts that raised money for a school for handicapped black children. Throughout the 1960s, WDIA's programs played an important role in the civil rights movement in Memphis, appealing for black equality and for calm when violence threatened to erupt.

A price was put on WDIA's success when, in 1957, John Pepper and Bert Ferguson sold their station to the Sonderling Broadcast Corporation of Chicago for \$1 million. Although Bert Ferguson stayed on as executive vice president and general manager until 1970, many complained that absentee ownership resulted in WDIA's losing its local focus. The entertainment conglomerate Viacom took control of the station in 1980.

In 1983 Ragan Henry of Philadelphia added WDIA to his chain of stations and became the station's first black owner. Henry's ownership capped a period of growing black influence

on the station's operations and management. Since the 1960s, blacks had been working in all facets of the station, and in 1972, WDIA welcomed its first black general manager, Chuck Scruggs. In 1996 Ragan Henry sold WDIA to Clear Channel Communications, the company that currently owns and operates the station.

WEAF

New York City Station

WEAF is significant in radio history as the first station to broadcast a paid commercial and as the originating point for American Telephone and Telegraph's (AT&T) pioneering network experiments. AT&T owned the station for only four years, after which it became the flagship of the developing National Broadcasting Company (NBC) network, becoming WNBC after World War II.

Origins

During the 1920s, AT&T was actively involved in the development of radio. The corporation was a member of the radio patent pool (along with the Radio Corporation of America

[RCA], Westinghouse, and other companies), owned radio stations, and experimented with networking. It also owned the highest-quality intercity connection circuits in the United States and so was crucial to the efforts of other radio broadcasters to interconnect stations. WEAF actually began as short-lived radio station WBAY. Construction of its antenna was begun in March 1922, and it broadcast its first program on 25 July 1922. WBAY was a technological failure, its signal barely audible. After reconfiguration and location elsewhere in the city, WBAY gave way to WEAF on 16 August.

WEAF was the first station in the United States to broadcast a paid commercial, engaging in what AT&T called "toll broadcasting" at the time. AT&T saw the possibilities for

treating radio the same way it treated its long-distance telephone service: it would provide the facilities, and others would provide the content. It would lease its facilities to those who had a message to deliver to the public, just as it provided long-distance service to customers who paid for the time they used its lines. At the same time, it saw toll broadcasting as a means of destroying its most significant rival in the provision of long-distance services, RCA. Although RCA did not own long-distance telephone lines, it had been established in 1919 to provide point-to-point wireless communication services, thus making it a potential rival to AT&T. RCA was also involved in radio broadcasting but planned to provide radio services on a public service model, subsidizing program production and broadcasting through the profits from the sale of radio receivers. AT&T, whose long-distance services provided massive profits, saw the potential of toll broadcasting to accomplish the same thing, which would give it an unassailable financial base from which to battle RCA.

WEAF broadcast its first commercial on 28 August 1922 at 5:00 P.M. It was a commercial for the Queensboro Corporation that lasted ten minutes and promoted the sale of apartments in Jackson Heights, New York City. The cost was \$50. Queensboro Corporation quickly became a repeat customer, leasing time from WEA F on five additional occasions over the ensuing few weeks. Its initial broadcast was shortly followed by others for Atwater Kent (a radio receiver manufacturer), Tidewater Oil, and the American Express company.

WEAF did not permit these early advertisements to make direct pitches to the public. It was concerned to preserve the dignity of broadcasting—and of advertising—so it did not allow prices to be mentioned, and the advertisements provided little in the way of graphic descriptions of products. Queensboro's initial advertisement, for instance, told the audience that its apartments had been named to honor Nathaniel Hawthorne, "the greatest of the American fictionists," and invited people to visit the development "right at the boundaries of God's great outdoors." The commercial claimed that just this sort of residential environment had influenced Hawthorne, and it "enjoined" the listeners to "get away from the solid masses of brick" with meager access to the sun. But even this indirect sort of appeal was enough to change the philosophy of broadcasting in America.

WEAF's second significant impact on American radio stemmed from its role as the central point for AT&T's network experiments. The first networked broadcast in the United States occurred on 4 January 1923, when WEA F was connected with WNAC in Boston, although the broadcast lasted only five minutes. In June of that year, WEA F was networked with WGY (Schenectady, New York); KDKA (Pittsburgh); and KYW (Chicago) for a single program broadcast, and the following month WEA F and WMAF (Portsmouth, New Hampshire) were permanently networked, allowing WMAF to take a

three- to four-hour-a-day feed from WEA F. By the middle of 1925 WEA F had become the flagship of the AT&T radio network, which connected 20 stations. All of these early experiments consisted of other stations' carrying programming that originated at WEA F.

National Broadcasting Company Flagship

On 15 November 1926, the true era of network radio arrived when a permanent arrangement was concluded whereby programming could originate at multiple points and be carried by multiple stations. On that date, WEA F originated remote programming from the Waldorf Astoria Hotel ballroom in New York City, and stations in both Chicago and Kansas City originated programs as well. These programs were carried on 21 network affiliate stations and 4 other stations. This broadcast was the result of complicated industry negotiations.

By the mid-1920s the cross-licensing agreement that formed the basis of the radio patent pool was in jeopardy. RCA and AT&T were part of arbitration hearings that began in early 1924, but before the final report was issued, the legal basis for the cross-licensing agreement itself was called into question, and the arbitrator's report, released in November, essentially affirmed RCA's position, which, among other assertions, denied AT&T's claim that it had an exclusive right to toll broadcasting. On 11 May 1926, AT&T announced that it was forming a separate company to conduct its broadcasting business, and on 7 July the final agreement between AT&T and RCA gave RCA an option to purchase AT&T's broadcasting interests, including WEA F—an option that RCA exercised on 21 July. On 1 November RCA paid the telephone company \$1 million for WEA F, which became the flagship station of NBC's "Red" network.

A year later, NBC moved the station's transmitter from downtown Manhattan out to Bellmore, Long Island, increasing its power tenfold, to 50,000 watts. Studios moved from what had been AT&T space to a new headquarters at 711 Fifth Avenue, expanding from several rooms to five full floors of operating space. In 1933 the station shifted once more, this time to the new Radio City complex of Rockefeller Center in midtown Manhattan. Nearly 30 studios fed signals to the NBC Red and Blue networks, as well as providing resources for WEA F.

The station's programs were effectively those of the NBC Red network. Only relatively late in its history (during and after World War II) did the outlet develop a local sound for part of the day, adding morning and other talk shows appealing specifically to New Yorkers. In late 1946 the WEA F call letters were dropped, as the station became WNBC.

Weaver, Sylvester (Pat) 1908-2002

U.S. Broadcast Network Producer and Executive

Sylvester (Pat) Weaver is remembered as one of television's most innovative and farsighted executives. Although the changes he instituted as president of the National Broadcasting Company (NBC) were responsible for the network's assuming control of its television programming, his tenure at the network during the 1950s lasted less than seven years. For 20 years before, Weaver's programming philosophy had been shaped through his work as a radio producer for local stations and advertisers. During his years as a radio executive, Weaver conceived many of his revolutionary ideas about broadcasting, including the magazine concept of advertising and the educational potential of the electronic media.

Early Radio Work

After graduating *magna cum laude* from Dartmouth College with a degree in philosophy and the classics, Weaver worked as a direct mail advertiser and in 1932 joined Don Lee's regional network of eight West Coast radio stations. Because the country was not yet entirely hooked up for coast-to-coast transmission, Lee's stations, although affiliated with the Columbia Broadcasting System (CBS) network, developed their own programming. Weaver began at the Los Angeles station KHJJ as a comedy writer on *The Merrymakers*, a variety show starring Raymond Paige and his orchestra. Weaver used his marketing expertise and began to create specific programs targeted to potential sponsors. For example, for the Western Auto Supply Company, which wanted to underwrite an uplifting show during the Depression, Weaver concocted the first of his many educational series, *America Victorious*, which dramatized examples of the country overcoming severe obstacles.

In 1934 Weaver was put in charge of news, sales, and programming at Lee's San Francisco station KFRC. Weaver supervised a weekly two-hour extravaganza, *The Blue Monday*

Jamboree, which featured the music of Meredith Wilson, who would later create *The Music Man*. Believing from the beginning that "comedy will always be the key ingredient of successful programming," he also produced a daily humor show, *Happy Go Lucky*, spotlighting the antics of Morey Amsterdam, who would star in Weaver's first television hit, *Broadway Open House*. Weaver's successes gained attention, and he was hired in New York to create and package musical and variety series for Bourjois Toiletries (*Evening in Paris Roof*) and for United-Whelen stores (*Evening Serenade*).

Realizing the importance of advertising agencies in producing network radio shows, Weaver joined Young and Rubicam in 1935. He was put in charge of one of radio's most popular shows, *Town Hall Tonight*, starring the acerbic comedian Fred Allen. Two years later, Weaver was managing all of Young and Rubicam's radio shows, and he was still intrigued by how radio could market ideas and products during this so-called golden age of the medium. Using his extensive knowledge as producer and executive, Weaver balanced the needs of sponsors with those of Young and Rubicam talent, whose roster included Jack Benny, Kate Smith, and George Burns and Gracie Allen.

In 1938 a sponsor, the American Tobacco Company, impressed with Weaver's accomplishments, recruited him to reposition its flagging Lucky Strike brand. He worked for the legendary champion of the hard sell, George Washington Hill, who made LSMFT ("Lucky Strike Means Fine Tobacco") his incessant advertising mantra. Weaver found an affluent, educated audience for the cigarette by sponsoring the popular quiz series *Information Please*; he also lured the Jack Benny program from the General Foods account at Young and Rubicam to secure mainstream exposure for Lucky Strike. Weaver's judicious placement of advertising money, actually using fewer dollars than had been allocated when he arrived, reinvigorated

the brand, and Lucky Strike became the best-selling cigarette again.

During World War II, Weaver took a leave of absence from the tobacco battles and organized antifascist broadcasts to South America as part of the Office of the Coordination of Inter-American Affairs. He also joined the navy and produced the popular radio series *Command Performance* for the armed forces overseas.

Despite his success in and out of the corporate world, Weaver was passed over for a senior management position at American Tobacco after Hill's death in 1946. Thoroughly embarrassed, he not only returned to Young and Rubicam as vice president in charge of radio, television, and movies, but also went cold turkey on his own four-packs-a-day smoking habit. Instead of creating programs, Weaver began to advertise on such radio series as *Arthur Godfrey's Talent Scouts* and *My Favorite Husband*, which were owned by the networks. The advertising industry was in flux, grappling with a whole new environment: a peacetime economy and the advent of the most potent selling tool in history, television. Weaver was convinced that the old system would not remain the same for the new medium: the cost of television production would be too prohibitive for any one agency to create and own the programs.

NBC Years

To implement his vision for the new technology, Weaver joined NBC as vice president in charge of television. He maintained complete control over the network's schedule and refashioned its production philosophy, inviting multiple sponsors to invest in new series and specials. With his structural changes, Weaver shifted the power of production and scheduling from the advertising agencies to the networks. In the process, he also envisioned programming concepts that had not been tried in agency-controlled radio: early and late-night programs (*Today* and *The Tonight Show*), big-budget spectacles (*Peter Pan* and *Amahl and the Night Visitors*), and ambitious public-affairs and cultural series (*Wisdom* and *Wide Wide World*).

Weaver was renowned as "thinker-in-chief" of NBC, inspiring his company to create "an aristocracy of the people . . . to make the average man the uncommon man." He was appointed president of the NBC network in 1953 and chairman two years later. Weaver talked and wrote extensively about the new role of radio, no longer "the dominant element in American leisure time activities." He conceived of building programs for both radio and television simultaneously; radio could replay in a variety of formats the best of *Today* or *Tonight* with new introductions. In addition to radio programs for a mass audience, Weaver foresaw a specialized use for the medium. He dreamed of shows for special interest groups, notably the business community and the book-reading public. These new concepts were planned to get leaders and opinion

makers involved in radio as both listeners and advertisers, opening up NBC to greater influence on the national stage. In 1955 Weaver introduced his defining radio project, *Monitor*, a 48-hour weekend radio spectacular of news and special events.

By the mid-1950s, David Sarnoff, chairman of NBC, found most of Pat Weaver's ideas financially extravagant. Weaver's vision of an uplifting medium of live programming had given television an artistic legitimacy earlier in the decade, but now NBC's task was to make the business economically viable with a predictable schedule of mostly film programs. Sarnoff gave the reins of NBC power to his son Robert, and Weaver left the company in September 1956. After that, Weaver kept his eye on the future of telecommunications. In the early 1960s, he ran the first major pay television operation. He later became a consultant to cable and videocassette ventures. Throughout his career, Pat Weaver was among the more unorthodox of broadcasting executives, trying to keep a simultaneous focus on both the bottom line and the big picture.

Wertheimer, Linda 1943–

U.S. Commentator and Host

The distinctively elegant voice of Linda Wertheimer has been heard on National Public Radio's (NPR) afternoon newsmagazine, *All Things Considered*, since 1971. Wertheimer remains today one of the best-known figures on National Public Radio.

Linda Cozby was born in Carlsbad, New Mexico, on 19 March 1943, the first of two daughters of Miller and June Cozby. After graduating from Carlsbad High School in 1961, Cozby received a scholarship to Wellesley College in Massachusetts, where in 1965 she earned a Bachelor of Arts degree in English literature. Her childhood heroine was Pauline Frederick, a pioneer female radio and later television reporter for National Broadcasting Company (NBC) News.

Cozby began her broadcasting career as an intern at the British Broadcasting Corporation (BBC) in London, serving as a production secretary responsible for writing radio copy and audio production. Two years later, in 1967, she accepted a job as a researcher at the all-news radio station WCBS in New York. Lou Adler, a well-known journalist at WCBS, worked closely with Cozby to help her polish her skills as a writer. The mentoring proved fruitful, and she was eventually allowed to produce features and write radio copy. During this time she was the only woman in the building who was not a secretary, aside from the vice president of advertising. In 1969 Cozby married Fred Wertheimer.

From 1969 to 1971, Wertheimer took time off from her broadcasting career until she heard about a new radio network that was being created as a result of the Public Broadcasting Act of 1967. The first NPR broadcast of *All Things Considered* was on 3 May 1971, and Wertheimer worked as a director of the afternoon program that broadcast in-depth news reports and offbeat features. Wertheimer states, "I have never forgotten the terror of directing the early programs . . . I remember mistakes, dead air, missing tapes, and moments of

panic." Before 1971 concluded, her dream of becoming an on-air reporter came to fruition when she became NPR's congressional correspondent. By 1976 she was promoted to political correspondent. In 1989, Wertheimer was promoted to cohost of the afternoon program with Bob Siegel and Noah Adams. Wertheimer became part of a collaborative team that decided what would be aired during the two-hour program; the job included writing news copy, introducing reports, and conducting interviews.

Wertheimer has covered a number of significant news events, ranging from Watergate to Iran-Contra to all presidential campaigns since 1976. Moreover, she has reported on every major congressional news story since Watergate as well as major elections and national politics. Wertheimer anchored NPR's coverage of the Iran-Contra hearings in 1987 and provided summaries of each day's testimony. She covered the 1976, 1980, 1984, and 1988 presidential campaigns full-time. She hosted *All Things Considered* after that and only traveled part-time during the 1992, 1996, and 2000 presidential campaigns. While covering the presidential campaigns, she followed major candidates as they campaigned across the country during both state primaries and national conventions. Wertheimer has also anchored NPR's live coverage of nominating conventions and presidential debates.

Wertheimer's tenure at NPR has afforded her the opportunity and knowledge to edit a book titled *Listening to America*, the purpose of which was to mark the 25th anniversary of National Public Radio. It included NPR's coverage of major stories as well as features from each of the years NPR had been on the air. Wertheimer placed the NPR features in historical context.

Wertheimer has become one of America's most experienced and highly regarded broadcast journalists as host of NPR's *All*

Things Considered, with a radio audience of 15 million listeners. She also appears as a contributor on Columbia Broadcasting System (CBS) Television's *Face the Nation* and as a political analyst on Cable News Network (CNN). She has paved the way for women to enter the broadcasting industry as on-air talent or broadcast journalists, as opposed to starting out as researchers and working their way into broadcast journalist positions.

Westerns

Radio Drama Format

"Hi-yo, Silver, away!" "You betchum, Red Ryder!" and "Happy trails to you" are just a few of the expressions that have entered America's lexicon from the majestic Old West as presented on network programming during the golden age of radio. From the 1930s through the 1950s, westerns entertained millions of listeners—and sold lots of sponsors' products. While westerns varied in their narrative styles and tone, they shared the customary motifs that defined the genre: six-guns and horses, heroes and villains, cowboys and Indians, dusty trails and mountain passes. Radio westerns constitute four overlapping sub-genres: anthology series, singing cowboy shows, juvenile adventures, and so-called adult westerns.

Origins

One of the earliest western series was *Death Valley Days*, broadcast on NBC-Blue from 1930 to 1941 and on CBS from 1941 to 1945. As an anthology series, *Death Valley Days* featured new characters each week, although all stories were set in 19th-century California. Stories were reportedly based on

fact as collected and dramatized by producer Ruth Cornwall Smith, one of the few women radio producers of the era.

Anthology series not specifically dedicated to the western genre sometimes featured western dramas as well. For example, *Lux Radio Theatre*, which presented weekly radio versions of famous movies, occasionally broadcast western stories such as *The Plainsman* (1937). Similarly, anthology programs featuring original radio dramas, such as *Suspense*, broadcast western radio stories from time to time.

Most radio westerns, however, were episodic series or serials with recurring characters, many of which cultivated fanatically loyal audiences—particularly among children. As such, these programs were a boon to advertisers whose products were carefully associated with the values embodied in and verbalized by mythic, straight-shooting, clean-cut cowboys.

Song-filled programs with a western flavor and recurrent characters included *Grapevine Rancho* (CBS, 1943), *The Hollywood Barn Dance* (CBS, 1943–47), *The National Barn Dance* (various networks, 1924–1950), and *The Grand Ole Opry*, which began in 1925 and continues to this day. While

these musical programs lack some of the generic qualities of the classic western—shootouts, for example—their emphasis on country music and folksy dialog delved heavily into romanticized imagery of the mythic West. In contrast, *Hawk Larabee* (CBS, 1946–47) also featured songs but leaned in the opposite direction; its primary emphasis was on adventures of the series' protagonist, and songs linked narrative segments.

Children's Series

Juvenile adventure westerns were more ubiquitous than their musical counterparts. The most famous was *The Lone Ranger*, which was developed at Detroit station WXYZ in 1933. The story of the famous western hero quickly became a local sensation. Soon, it functioned as the programming glue that connected stations in the fledgling Mutual radio network. In 1942, the series moved to NBC-Blue (later ABC) where it remained until 1955. Throughout its production, the series featured voices of a well-honed stock company who also were heard in other WXYZ programs including *The Green Hornet* (various networks, 1938–52) and *Sergeant Preston of the Yukon* (ABC, 1947–50; Mutual, 1950–55)—the former a Lone Ranger spin-off set in contemporary America (the Green Hornet was the Lone Ranger's great-nephew) and the latter a Canadian Mountie, aided by his famous dog, Yukon King.

The Lone Ranger was warmly received, not only by avid young listeners, but also by the national press as a successful and laudable role model. This was particularly true during World War II when *The Lone Ranger* was peppered with patriotic dialog intended to boost the domestic war effort and overseas troop morale. Also, despite its simplistic story lines and two-dimensional characters, the Lone Ranger was a highly polished program penned by a one-man script mill, Fran Striker, who reportedly wrote some 60,000 words of radio dialog per week. The program soon was spun off into highly profitable movie series, a comic strip, and numerous toys.

The tremendous success of *The Lone Ranger* led to many copycat series for young listeners, especially boys. The Lone Ranger's major ratings competitor was *Red Ryder*, heard on various networks from 1942 until the 1950s. Other western heroes were featured in series such as *Hopalong Cassidy* (Mutual, 1950; CBS, 1950–52) and *Wild Bill Hickok* (Mutual, 1951–56). *Tom Mix* (various networks, 1933–50), *Bobby Benson* (various networks, 1932–55), and *Sky King* (various networks, 1946–54) were similar programs set in the modern West.

Among these series' most memorable features was their unrelenting push for sponsors' products, often transforming young listeners into a potent sales force. For instance, in 1939, *The Lone Ranger* mixed hero worship with salesmanship by offering a Lone Ranger badge to listeners who convinced three of their neighbors to buy the sponsor's product. A reported 2

million such badges were distributed within the first year of the campaign.

Like the singing cowboy programs, juvenile adventure westerns were highly formulaic, once a successful pattern had been established. *The Lone Ranger* episodes, for instance, were formed around recurring narrative elements, beginning with a character and his/her seemingly hopeless problem and moving through the Ranger's appearance and involvement, a trap set for the Ranger, the Ranger's overcoming the trap, his solution of the problem, and resolution of the narrative. Fistfights, gunplay, and chases on horseback were predictable narrative devices. Despite the fact that these programs were intended for young audiences, bloodshed and death were dolled out on a regular basis. In one episode of *The Lone Ranger* from 1939, for example, no less than twelve people were killed within the first three minutes of the program.

Western series with a strong emphasis on cowboy songs and campfire chat included *Gene Autry's Melody Ranch*, which ran on CBS from 1940 to 1956, sponsored by Wrigley's Gum. Episodes of this series consisted of jokes and stories told by Autry and his pals, dramatized tales, and plenty of songs, including the classic closing theme "Back in the Saddle Again." Gene Autry's major ratings competitor was *The Roy Rogers Show*, a program with a similar format that ran from 1937 to 1955. Stars of both series were also featured in popular films of the era.

Contrary to their musical counterparts, heroes of juvenile adventure series tended to live outside the bounds of their communities, even while working to preserve and help expand white society throughout the West. They roamed the frontier looking for adventure and people in need of help, but they never tarried long. (An exception was Red Ryder, who lived with his aunt.) Radio cowboy heroes' combination of placelessness and service to strangers is typical of the western mythos prevalent in other forms of popular culture, such as dime novels and western films, with roots reaching back to James Fennimore Cooper's *Leatherstocking Tales*.

Indeed, the western outsider/hero motif has a deep cultural resonance, and given their immense popularity, juvenile western adventures are worth considering as important cultural artifacts. For example, while heroes such as the Lone Ranger deliberately exemplified values such as honesty and fair play, closer reading also suggests that these programs served to affirm white and male forms of cultural dominance and westward expansion. The Lone Ranger, for instance, may be indebted to Tonto for certain "native" skills such as tracking and healing; nevertheless, power in the relationship is clearly skewed toward the Ranger, as Tonto acts as intermediary between settlers and "hostile" Indians, always under the Ranger's guidance. Similarly, Red Ryder was aided by his Indian protegee, Little Beaver. Other sidekicks who helped their white friends tame the West included a Latino character named

“Pablo” on *Dr. Sixgun* (NBC, 1954–55) and the Asian Heyboy of *Have Gun, Will Travel* (CBS, 1958–60). A variant of this pattern was *Straight Arrow* (Mutual, 1949–51), whose white hero, Steve Adams, had been raised by Comanches. (One exception to the pattern was *The Cisco Kid*, which was broadcast in the 1940s; in this series, Cisco was a vaguely Latino adventurer who had a humorous sidekick named Pancho.)

Similarly, in juvenile western adventures, female characters tend to be victims in need of heroic rescue, rather than strong, independent forces in their own right. The mythic West of juvenile western adventures, in other words, was rhetorically constructed as a domain to be settled and supervised by white men. While this was never explicitly spelled out as such, recurring rhetorical tropes in thousands of episodes heard on a regular basis (in combination with accompanying costumes, decoder rings, and other accessories) endowed juvenile western adventures with a ritualized aura, reaffirming dominant values of their era.

Adult Westerns

While juvenile westerns ran well into the 1950s, by 1953 a new breed of western drama appeared. These “adult westerns” were grittier, more realistic, and clearly intended for an older audience. Adult westerns were less the descendants of their juvenile predecessors than they were cousins of western films such as *Shane* and *High Noon*, which were produced at about the same time. These postwar western films (as well as detective movies—with their own radio counterparts) reflected national feelings of postwar disillusion as the U.S. plunged into the Cold War and communists were thought to infiltrate all aspects of American society. In both film and radio, good and evil were far more difficult to distinguish than in juvenile fare. Both heroes and villains were finely shaded, unstable mixes of virtue and vice, suggesting a re-working and reinterpretation of dominant ideological assumptions.

The most notable reluctant hero of the adult radio westerns was Matt Dillon in *Gunsmoke*, played on CBS by gravelly-voiced radio veteran William Conrad from 1952–61. Matt Dillon was the Marshall of Dodge City, a frontier town that attracted the worst sorts of outlaw scum ever heard on radio. Dillon’s sidekick was his dimwitted deputy Chester Proudfoot, played by Parley Baer. Georgia Ellis played Kitty, and Howard McNear played Doc. While Kitty’s job was never spelled out, *Gunsmoke* creator Norman McDonnell described her as “just someone Matt has to visit every once in a while. . . . We never say it, but Kitty is a prostitute, plain and simple.”

Kitty, in fact, represents a complete revolution in portrayals of women in radio westerns; a shrewd, outspoken professional, Kitty is a far cry from the innocent school marm and rancher’s daughter common among juvenile western programs. Whereas women on other western programs personified domi-

nant values of white America (specifically values regarding family, religion, and education), Kitty simultaneously represents challenges to the moral status quo and the gutsy determination of independent women.

McDonnell’s relish in describing Kitty’s profession exemplified the realistic presentation of the West that *Gunsmoke* strove to create. Matt Dillon clearly hates his job, and his decisions are never easy or clear-cut. *Gunsmoke* is also notable for its intense emphasis on sound effects, ranging from the clinking of spurs to ever-present background sounds such as twittering birds and far-off barking dogs. Having established himself as a force in adult radio westerns, McDonnell went on to produce *Fort Laramie*, a series about a Wyoming cavalry outpost broadcast on CBS in 1956.

Other adult westerns of note included *Frontier Gentleman* (CBS, 1958), a well-written, highly polished drama concerning an English newspaper reporter who wandered the Old West. And *Luke Slaughter of Tombstone* (CBS, 1958) was set amidst cattle drives in 19th-century Arizona.

The shift to adult fare among radio westerns can partly be explained by the Cold War milieu within which they were produced. The Red Scare hit the radio industry hard, as many top performers and other creative personnel were blacklisted, while many more were silenced by intimidation. Westerns were removed in time and place from the reality of urban America. As such, they could be arenas in which writers expressed dangerous political concepts and dramatized social issues such as racism, albeit couched in the past and far from contemporary society. (Similarly, adult science fiction—notably *X Minus One* [NBC, 1955–58]—played upon the same themes, but was set in the future instead.)

Beyond sociopolitical conditions of the times, the development of adult westerns can also be explained by analysis of the economic state of radio in the 1950s. The popular and trade presses had long since announced the death knell of radio drama’s golden age, correctly emphasizing television’s immediate and immense popularity. As audiences moved toward the newer medium, radio broadcasters needed fresh, new products to hold onto their advertising base. Also, network affiliates were going independent, having discovered that local programs were more lucrative than network fare. Networks, in turn, scrambled to cancel most of their long-running daytime series and develop evening and weekend programming with ambitious new concepts in order to retain their rapidly dwindling number of affiliates. *Gunsmoke* was clearly such a product. Other new series featuring major film stars were created to keep dwindling audiences tuned to radio. These programs included *Tales of the Texas Rangers* (NBC, 1950), a modern-day western starring Joel McCrea, and *The Six Shooter* (NBC, 1953), starring Jimmy Stewart as a well-meaning, though intensely lethal, gunfighter. Both series were high-quality productions, although of the two, *The Six*

Shooter was more in the adult-western mold, given its finely nuanced protagonist, compelling stories, and close attention to historical detail.

Third, the development of adult westerns resulted from changes in the producer/network/sponsor relationship in radio. Prior to the popularity of television, most radio programs were produced by advertising agencies on behalf of sponsors. Censorship was strict, because neither agencies nor sponsors wanted their programs or products associated with controversy. As sponsors moved into television, radio dramas were increasingly produced by networks in hopes of selling commercial time. If left unsponsored, these "sustaining" programs provided a public-service function for networks. Sustaining programs were touted as experimental venues whereby the networks gave something back to the people for the use of public airwaves. Nevertheless, commercial time on series such as *Gunsmoke* would be sold when possible. Norman McDonnell noted the dilemma of sponsorship versus sustaining programming, quipping "I'd feel great if someone did buy it, but there would be problems. We'd have to clean the show up. Kitty would have to be living with her parents on a sweet little ranch." Whether sponsored or sustaining, network-produced radio dramas, including westerns, were less burdened by direct censorship from the advertising industry.

Decline

Despite the effort put into their development, westerns eventually met the same fate as other forms of network radio theater. The final network radio western was *Have Gun, Will Travel*, last heard on CBS in 1960. *Have Gun, Will Travel* was something of an oddity in radio drama. Whereas most radio westerns, such as *The Lone Ranger* and *Gunsmoke*, moved to television after (or even during the time) they were on radio, *Have Gun, Will Travel* began on television and then was developed for a dual radio/TV presence. As such, the series exemplified not only the end of radio westerns, but also the undeniable ascendancy of television.

Reruns of original western radio dramas, now often termed "old-time" radio, are still heard on some stations, where they have a loyal following. Also, westerns from radio's golden age are readily available on cassette tapes. Radio Spirits of Schiller Park, Illinois, for example, markets *The Lone Ranger*, *Gun-*

smoke, *Frontier Gentleman*, and other series. The Smithsonian Institution, in association with Radio Spirits, similarly offers a package of classic western series for sale on cassette and compact disk. These series are marketed not just as nostalgia but also as first-rate forms of entertainment, which, given their fairly high costs, suggests that many radio westerns retain their vitality decades after their original production.

Although new radio westerns are rarely produced apart from a handful of special-event programs, a descendent of the radio western can be found in books on tape which feature a variety of western novels read by famous actors. Also, a well-produced series of dramas based on the novels of Louis L'Amour is available, often for sale in interstate highway gas stations—strongly appealing, no doubt, to truck drivers and other lonesome travelers eager to pass the time on long hauls under western skies.

Westinghouse

Electrical and Radio Manufacturer

The Westinghouse Electric Company was founded in 1886 and became well known for both industrial and consumer products, such as washing machines and refrigerators, as well as many consumer electronic products. For many years its widely known advertising slogan was "You can be sure if it's Westinghouse."

Origins

American engineer George Westinghouse (1846–1914) would eventually receive more than 360 patents including the invaluable one in 1869 for the air brake used by railroads. Although he formed nearly 60 companies, the largest and longest lasting, Westinghouse Electric, was created in 1886, with headquarters in Pittsburgh, Pennsylvania. Westinghouse received numerous honors in the U.S. and abroad. Perhaps his finest tribute came from inventor Nikola Tesla, whose patents for one system of alternating current and the induction motor were acquired by Westinghouse in 1888 and gave the company its early leadership in electric power developments. Westinghouse used Tesla's system to light the World's Columbian Exposition at Chicago in 1893.

By the turn of the 20th century, Westinghouse had become one of the two or three largest electrical manufacturers in America, employing more than 50,000 workers. The company was active in electric power generation, electric traction (trolleys) and railway equipment, and various industrial applications of electricity. A research department was formed in 1904, becoming a division two years later.

In the financial panic of 1907, Westinghouse lost control of the several companies he had founded and then still headed. In 1910, he founded his last firm to exploit the invention of a compressed air spring for absorbing the shock of riding in automobiles. By 1911, however, he had severed all ties with his former companies. He had shown signs of a heart ailment by 1913 and was ordered to rest by doctors. Not long after deteriorating health confined him to a wheelchair, Westinghouse died in March 1914. His last patent was granted four years later.

As with some other electrical companies, Westinghouse Electric began to investigate the manufacturing potential of wireless. During World War I, Westinghouse held huge government contracts to manufacture wireless equipment for the army and navy. Those contracts were canceled with the end of the war in November 1918, leaving the company with a trained cadre of workers and a considerable investment in production equipment but not enough work to keep them busy.

Radio Receivers

To better its manufacturing position for a possible civilian radio market, in 1920 Westinghouse purchased the International Radio Telegraph Co. to obtain important Fessenden heterodyne circuit patents. A few months later, seeking to head off developing competition from the new Radio Corporation of America (RCA), Westinghouse also purchased Edwin Armstrong's regeneration and superheterodyne tuning circuit patents.

At about the same time, a chance event helped pull all the pieces together. Westinghouse engineer Frank Conrad had been experimenting with wireless since 1912. In 1919–20 he operated amateur ("ham") station 8XK, playing recorded music one or two nights a week for the amusement of fellow hams. While hobbyists preferred to build their own equipment, others wanted to tune in as well. A September 1920 newspaper advertisement by a Pittsburgh department store seeking to sell receivers to those who wanted to hear Conrad's broadcasts caught the eye of Harry Phillips Davis, a Westinghouse vice president in charge of radio work. Davis perceived that making receivers for the public to receive a possible new radio broadcasting service could be the answer to Westinghouse's canceled-contract predicament.

Within a year or so, a very basic Westinghouse crystal receiver marketed as the "Aeriola Jr." could be purchased for about \$25 in department stores. A more sophisticated tube set, sold as the "Aeriola Sr.," offered better reception and cost about \$60. Westinghouse was soon turning out thousands of radios from its factories, primarily those in Springfield, Massachusetts. Unlike many other set makers, Westinghouse had the advantage of owning several radio stations, which were useful as a means of promoting company products. In addition to radio receivers, Westinghouse also built transmitters for its own and some other stations. The company made increasingly powerful transmitters throughout the 1920s: whereas a typical station of that time transmitted with 100 watts, in the mid-1920s Westinghouse station KDKA was broadcasting with 10,000 watts.

Westinghouse's control of the Fessenden, and especially the Armstrong patents, gave the company the clout it needed to enter into agreements with its main competitors, General Electric (GE), RCA, and the Western Electric manufacturing arm of American Telephone and Telegraph. The "patent pool" allowed each company to license the patents of the others, and established a division of the equipment market. The pool had a flaw, however, for it concerned only the international or "point-to-point" radio market, not broadcasting which was

then still small and seemingly insignificant. According to the company's version of the story, Westinghouse saw this alliance as a way to get into the international market, but media historians have suggested that Westinghouse felt it could not remain independent and still succeed in outselling the others, especially RCA, which was already solidifying its power and could easily have shut out any meaningful competition. Since Westinghouse couldn't beat its competitors, it decided to join them.

After 1922—and until an anti-trust case was filed against RCA in 1930—Westinghouse radios were sold under the RCA trade label, usually as “Radiola” receivers. The patent pool agreement reserved 40 percent of the business for Westinghouse while the larger General Electric took 60 percent.

Expanding Consumer Electronics

Westinghouse began to expand its consumer electronics business early on. Television pioneer Vladimir Zworykin undertook his early development work for the television camera tube (dubbed the iconoscope) at Westinghouse before transferring to RCA in 1930. Nearly four decades later, a Westinghouse television camera accompanied the first men to land on the moon.

In 1945, and again fattened by large wartime government contracts (including many for radar, which remained a company specialty), what had long been Westinghouse Electric and Manufacturing Company reverted to an older and simpler name, becoming known simply as the Westinghouse Electric Corporation.

Postwar Westinghouse products included a full range of radios and phonographs, and soon, television sets. In 1954 Westinghouse formed a Westinghouse Credit Corporation subsidiary that assisted consumers in making major appliances over time. The 1950s were a boom period for the company, whose public face was the ubiquitous spokesperson Betty Furness, who touted refrigerators and other Westinghouse appliances on prime-time television.

But as was true for all American manufacturers of consumer electronics, competition was fierce, and by the late 1950s inexpensive foreign imports began to cut into sales of radios and related products. Soon Westinghouse-labeled models were being manufactured overseas and American plants were closing down.

Demise

Westinghouse's manufacturing divisions began to show some signs of financial trouble and seemed to lose their way. By the 1970s the firm was beginning to sell off some of its units—including the once-lucrative major appliances division in 1974. The electric lighting business was sold in 1983. On the other hand, Westinghouse also got into the cable business, paying

\$646 million to acquire the Teleprompter Corporation (renamed Group W Cable) in 1981. When it proved extremely expensive to upgrade the cable systems, they were sold at a profit in 1985. Throughout this period, Westinghouse made some bad real estate loans and made a number of risky acquisitions—all in an attempt to diversify the industrial firm more into the services sector. One important part of the company's service continued to be the broadcast station-owning subsidiary, known as Group W. The East Pittsburgh operations, once the birthplace of commercial radio broadcasting, were closed in 1987. The power transmission and distribution unit was sold two years later.

Major change continued into the 1990s for what had once been one of the country's most stable manufacturing concerns. Layoffs were widespread as a series of restructurings took place. The motor manufacturing divisions were spun off in 1995 to become an independent firm. A new chairman and chief executive officer, Michael Jordan (who had formerly been at PepsiCo), was brought in to redirect Westinghouse.

In 1994 Jordan allied the Group W broadcast stations with CBS in a joint venture. Just a year later came a more dramatic move as Westinghouse agreed to purchase CBS for \$5.4 billion. After the Telecommunications Act of 1996 lifted limits on radio station ownership, Westinghouse acquired a much larger group of radio stations, Infinity Broadcasting. Defense electronics manufacturing was sold off in 1996.

But what was supposed to make a hero of Jordan and save Westinghouse had ironic results. Infinity's chairman, Mel Karmazin, became the largest shareholder in Westinghouse, and as financial columnist Steve Massey (1998) observed, he “had no sentimental attachment to the old Westinghouse.” He also did not get along with Jordan. The plan had been for Westinghouse Electric to survive and for Jordan to be in charge. In the end, Jordan was forced out (early retirement, the story went), Karmazin took over, and the Westinghouse name officially vanished from the broadcasting division in December 1997 as the huge entity became known as CBS/Infinity. The nuclear power manufacturing parts of the company were sold in 1999, and with them the Westinghouse Electric Company name, and became a part of the Nuclear Utilities Business Group of British Nuclear Fuels.

Westwood One

Radio Program Service

Westwood One is one of the largest radio service companies in the United States, producing and distributing entertainment, news, sports, talk, and traffic programming to more than 7,500 stations. It runs the nation's largest radio network, which includes National Broadcasting Company (NBC), Columbia Broadcasting System (CBS), Cable News Network (CNN) and Fox radio programs, and maintains an international radio programming service called Westwood One International. It owns local programming subsidiaries Shadow Broadcast Services and Metro Networks, which dominate the industry in localized traffic reports; and it has an ownership stake in an internet radio company called WebRadio.com. With its emphasis on music, personalities, and large-scale events, Westwood One has made a significant contribution to the return of entertainment to network radio.

Origins

Westwood One was founded by Norman J. Pattiz in 1974 after he lost his job as a sales manager at KCOP-TV in Los Angeles. Pattiz had heard a weekend-long Motown music program on local rhythm and blues radio station KGFJ and had the idea of producing such programs for national syndication, as was common in the television industry. Although he had no radio production experience, Pattiz convinced the KGFJ station manager to let him put together another Motown show for national distribution. After nine months of production and lining up advertisers, *The Sound of Motown* aired on about 250 stations and grossed several hundred thousand dollars. The program was provided to the stations at no cost. Local stations were allowed to sell local ad time while Pattiz and KGFJ collected the revenue from national advertisers.

From there Pattiz went on to produce more programs and incorporated his own company, Westwood One, late in 1974. Its name is derived from the Westwood neighborhood of Los Angeles where Pattiz started his new company in a one-room office. In the next nine years, Westwood One would continue to produce programs for syndication and to package the programs with national advertisers, eventually offering 52-week vehicles for those advertisers.

In 1984 Westwood One became a public company. The infusion of capital allowed the company to change quickly from a small syndicator wholly dependent on the success of each program to a national radio network with multiple resources. In 1985 Westwood One acquired the struggling and aged Mutual Broadcasting System from Amway for \$39 million. Pattiz consolidated operations and reprogrammed the network, turning the debt-ridden Mutual into a profit source. Mutual, like other traditional radio networks, had become primarily a distributor rather than a producer of radio programming, although it still retained its news division. By acquiring Mutual, Westwood One was able to offer and market sports, news, and talk radio, as well as its original entertainment programming, becoming a more full-service network. Two years later Westwood One bought the NBC Radio Network from General Electric for \$50 million, and in 1989 it launched the Westwood One News and Entertainment Network.

Sharpening the Focus

After several years of expansion, Westwood One found that its debt burden was becoming a problem. NBC Radio was losing \$11 million a year when it was purchased by Westwood, but

unlike Mutual, its employees were heavily unionized, making cost-cutting more difficult. To make matters worse the radio industry went into a recession shortly after the purchase and advertising revenue declined by nearly 15 percent. In 1988 the company made a secondary stock offering, but after posting continued losses, its stock plummeted. By the early 1990s it became clear that cutbacks had to be made. Pattiz sold off his three radio stations and his trade publication *Radio and Records*. He also consolidated news operations, merged four networks into three, and reduced compensation payments to stations.

By 1994 the company had reduced its debt significantly and could concentrate on its programming. That same year, in an effort to secure station contracts and expand its network capacity, Westwood One made another very significant move. It traded 25 percent of its ownership to Infinity Broadcasting, the largest owner of radio stations in the United States, in exchange for Infinity's Unistar networks. Infinity was hired to take over management and Pattiz gave up the position of CEO while retaining his position as chairman and executive producer of all programming. (He also remained a major stockholder.) Mel Karmazin, then CEO of Infinity, became the new CEO of Westwood One. After merging with Unistar, the company formed two new divisions: Westwood One Radio Networks and Westwood One Entertainment. The networks division managed the six networks, news, and 24-hour formats, and the entertainment division produced programming and live concerts.

In order to tap into the local advertising revenue stream, Westwood One purchased Shadow Broadcast Services in 1996. Shadow provided localized traffic reports as well as local news, sports, weather, and entertainment. Three years later, Westwood bought the number one traffic news service, Metro Networks, in a \$900 million stock deal and merged it with Shadow Broadcast Services. In 2000 it added SmartRoute Systems to this lineup, providing wireless and internet services as well. By providing localized products in exchange for ad time, these services account for a substantial percentage of Westwood's revenue.

Shortly after Westwood picked up Shadow Broadcast Services, Karmazin attempted to buy CBS's owned-and-operated radio stations. When CBS CEO Michael H. Jordan declined, Karmazin offered to sell Infinity to CBS in return for allowing Karmazin to run the radio group. Jordan accepted the offer and in December 1996, CBS bought Infinity for \$4.9 billion in stock. By the following March, management of the CBS Radio Networks division was spun off to Westwood One. The deal provided that Westwood One would represent CBS Radio Networks, managing its sales, marketing, and promotion, and that CBS would continue to produce and control the programming. CBS, by virtue of owning Infinity Broadcasting, now owned a stake in Westwood One.

After becoming president of CBS in 1998, Karmazin decided to move out of the CEO position at Westwood One, making way for a new full-time president and CEO, Joel Hollander, formerly head of New York station WFAN. Hollander led the company through the Metro acquisition and continued to secure deals for college and professional sports programs, new entertainment venues, and web-based radio programming. In 1999 Westwood made the decision to shut down its Mutual News division, ending the network's 65-year broadcasting legacy. The following year, Westwood bought a six percent stake in WebRadio.com, an internet broadcasting company, and secured an equity stake in Fanball.com, a sports-fantasy multimedia company. In May 2000 Viacom merged with CBS, making Viacom the new parent company of Westwood One. Karmazin became president and chief operating officer of Viacom at that time.

Programs and Operations

Westwood One made a name for itself by focusing on entertainment programming for radio and particularly on large-scale entertainment events. Its advertising slogan became "Westwood One, for the biggest events in radio." In the 1970s, when Westwood first started, traditional radio networks provided mostly news, sports, and talk, and very little (if any) musical or dramatic entertainment. Starting with *The Sound of Motown*, Westwood went on to produce dozens of radio specials. In the early 1980s, it produced a live broadcast of the US Festival, a four-day rock concert in Riverside, California. Although individual stations such as KRLA had sponsored concerts in the 1960s, no radio network or syndicator had ever produced such a large event for live broadcasting. At that time Westwood also decided to hire its own sound crew and build a state-of-the-art mobile recording studio for concert production. It then produced the first live stereo radio broadcast from Japan with its concert "Asia from Japan."

When Westwood One began to acquire traditional networks, its youth-oriented entertainment emphasis clashed with the staid culture of the older networks. Although these networks were brought in specifically to provide a wider variety of programming, Pattiz set about to restructure and reprogram them to reflect the energetic style of Westwood One. When Karmazin came on board with the purchase by Infinity Broadcasting, he pushed for expansion into new markets such as traffic and satellite formats. However, as executive producer of programming, Pattiz continued to pursue the exclusive superstar concert broadcasts for which Westwood was known, such as the Rolling Stones, the Eagles, and Barbra Streisand.

Westwood One's network division currently provides programming in several categories. In news it carries Fox News Radio, CNN Radio, NBC Radio Network, CBS Radio News and CBS MarketWatch.com. Both CNN Radio and CBS

MarketWatch.com air 24-hour services. The Associated Press (AP) is the primary provider of news content to Westwood's syndicated and network programs. In sports Westwood features broadcasts for the National Football League, the National Hockey League, the National Collegiate Athletics Association, the Olympics, championship boxing, and professional golf. Westwood's talk personalities include Jim Bohannon, Larry King, G. Gordon Liddy, and Tom Leykis. Dozens of music formats are available, including a number of full-time and international services.

Shadow Broadcasting Services and Metro Networks provide local traffic reports, localized news, weather, and sports to hundreds of local radio markets across the country. Each program is customized for the individual station and made to sound as though it is being delivered by local talent. Traffic reports make up the bulk of affiliate contracts, but the other areas, particularly news, are growing with increased demand. The Shadow division has added short-form entertainment and health news reports to its lineup of services. SmartRoute Systems provides traffic, news, sports, and weather information to wireless and web services.

Westwood One also provides prep services such as the MTV Morning Facts and The CBS Morning Resource, which

supply stations with interviews, celebrity and entertainment industry facts, sound bites, news, and gossip. Program directors integrate this material into their local programming, using local talent.

WEVD

New York City Station

WEVD-AM was established in 1927 as a memorial to socialist leader Eugene Victor Debs. A famous unionist and five-time presidential candidate on the Socialist ticket, Debs died in 1926, and the Socialist Party was moved to erect a monument in his honor. The Party raised enough money to buy Long Island radio station WSOM in 1927 and subsequently changed the station's call letters to WEVD. The station signed on at a frequency of 1220 kilohertz on 20 October 1927, the anniversary of Debs' death, and immediately became an electronic voice for the ideas and causes that Debs had championed.

On a typical day, WEVD would broadcast a mixture of poetry, music, and speeches reflecting the ideals of labor and socialism. The station presented shows for New York's minority population, including a *Jewish Hour*, a *Negro Art Group* program, and shows on African-American literature, music, and history. Debates on topics ranging from foreign policy in Nicaragua to general labor conditions were common. It was

station policy to provide free access to labor unions, including, among others, the Teacher's Union, the Union of Technical Men, the Office Workers, the Garment Workers, and the Neckwear Workers. WEVD's fiscal health was dependent on donations from these and other unions. Consequently, the station was plagued with financial difficulties from the start, and plans to increase power and form a network were suspended.

The first task confronting the Federal Radio Commission (FRC) in 1927 was to resolve the problem of congestion on the airwaves. The commission concluded that the solution was to eliminate at least 100 radio stations. Toward that end, the FRC issued its famous General Order Number 32, which asked 164 stations, including WEVD, to show cause why their licenses should not be revoked.

The commission held hearings for two weeks in July 1928 in Washington, D.C., and the WEVD case was the first to be heard. The burden was placed on WEVD and 163 other sta-

tions to demonstrate why license renewal would be in the public interest. The FRC insisted that WEVD was placed on the list because of complaints of interference and technical violations. Station officials believed WEVD was singled out because of the unpopular and controversial doctrines expressed in its programming. Station officials invoked the First Amendment, arguing for the right of dissident minorities to free speech and arguing that labor, socialist, and other forms of unpopular rhetoric are in the public interest.

Approximately one month after the hearing, WEVD's license was renewed. Of the 164 radio stations called before the commission, only 81 (including WEVD) escaped adverse action by the FRC. In 1929 WEVD moved to 1300 AM, a frequency it would share with three other stations. By 1930 continued financial problems, the Great Depression, and the weakening of the Socialist Party would bring WEVD into a second confrontation with the FRC. The commission accused WEVD of several operational violations, but station officials again suspected they were being singled out for their unpopular programming.

WEVD's license was renewed in early 1931, but in a highly unusual decision, the FRC changed its mind three days later and revoked the license. The revocation was apparently prompted by a competing applicant, the Paramount Broadcasting Corporation of New York, which vowed to provide better public service. WEVD officials pledged to continue operating the station in defiance of the commission's decision. The FRC decided to grant temporary license extensions to WEVD, during which time the commission would conduct hearings on WEVD's renewal application. One hearing before the commission in 1931 lasted an entire week, which was the longest hearing before the FRC to that time.

In a narrow decision, the FRC finally renewed the license of WEVD in October 1931. However, the delays had involved WEVD in a long and costly battle, and the station's financial problems became acute. The *Jewish Daily Forward* rescued WEVD with a commitment of \$250,000, but this and later contributions from the daily newspaper gave that organization effective decision-making power. Within a year, the station's

staff was reorganized, and the studios moved to the Times Square area. The Debs Memorial Radio Fund later merged with the Forward Association to run WEVD as a commercial outlet. Six years later the station moved again, to occupy its own building on West 46th Street.

Throughout this period, WEVD shared the broadcast day with other New York stations. Gradually those other operations either sold out, moved, or were taken over by WEVD, which was on the air nearly 90 hours a week by 1938. In the 1980s, the station underwent a host of ownership and frequency changes, selling the AM outlet in 1981 and operating only with FM for much of the decade. In a complex exchange, WEVD sold the now-valuable FM station for \$30 million in 1988, and as part of the deal it took over the 1050 kilohertz AM frequency that had been WSKQ. By the mid-1990s, the 50,000-watt station specialized in syndicated talk shows and news programming.

WGI

Boston, Massachusetts Station

Although WGI never had expensive studios, it did have a woman engineer/announcer, a morning exercise program, on-air college courses, and the best-known children's show in town. Furthermore, it may have been the first station to run paid commercials, and several well-known performers got their start in those not very opulent studios. Yet today, few people know that the Boston station ever existed.

Origins

Harold J. Power fell in love with “wireless” when he was nine years old, and by the time he attended Tufts College, at Medford Hillside (about five miles from Boston), he was already an experienced ham radio operator who enjoyed building his own receiving equipment. After graduating in 1914, he and several fellow hams decided to start their own station, along with a company to manufacture receivers. They named this new venture the American Radio and Research Company; most people knew it as AMRAD. As for the new station, because radio broadcasting was still considered experimental by the Department of Commerce, it received the call letters 1XE. But even six years later, when the station was assigned the commercial call letters “WGI,” listeners still thought of it as either “the AMRAD station” or “the Medford Hillside station.”

Harold Power became the president of AMRAD, and he soon began to air wireless concerts of phonograph records to promote the new company. In early 1916 this was so unusual that the *Boston Globe* wrote an article about the amazing music programs being heard by the ships at sea. At first, AMRAD targeted the ham radio audience (since there was no commercial broadcasting yet), but at some point in 1920, everything began to change.

We may never know who was really first to broadcast commercially. Scholars have debated endlessly whether KDKA, WWJ, or any of several other stations were the first, but there is evidence that 1XE was in the elite group of stations on the air in the fall of 1920. Unfortunately, most of AMRAD's and 1XE/WGI's files were long ago destroyed in a fire, but based on the radio columns of several Boston newspaper reporters of the early 1920s and an interesting interview from the manager of a competing Boston radio station, the consensus is that 1XE was on the air at around the same time as the much better known KDKA.

By the spring of 1921, 1XE was on the air every day with a regular schedule. The station's air staff included a popular woman announcer, Eunice Randall. She read the nightly police reports, gave children their bedtime story several nights a

week, sang when a guest didn't show up, and worked as one of the station's engineers—all highly unusual for a woman in those days. Randall also had a show that may have been sponsored—although as with many such arrangements in the early days, it may have been a barter arrangement. Randall's bedtime stories were presented by *Little Folks Magazine*, which may have provided free copies as prizes rather than paying for sponsorship.

The need for revenue was a constant problem for small stations of the early 1920s. Stations owned by individuals or small companies like AMRAD ran into financial trouble when lightning struck their towers or when equipment broke and was expensive to repair. At first, entertainers performed free because radio was a novelty, but eventually the bigger names wanted compensation; small stations had to depend on eager volunteers or up-and-coming performers who would still work in exchange for exposure.

AMRAD had originally been backed by financier J.P. Morgan's son Jack, who had known Harold Power ever since Power worked for him while still in high school. Morgan had been persuaded by Power's dreams of success in the radio business and was a silent partner in AMRAD for its first few years. But although Power had big dreams and good intentions, running a company was problematic for him. AMRAD became famous for good concepts but poor implementation: equipment was often delivered to suppliers late, and AMRAD was slow to react to new trends. Morgan gradually phased out his support of AMRAD, leaving the company to deal with its own financial problems by 1923.

Decline

In spite of financial and technical problems, 1XE gained fans all over the eastern United States (the station's 100-watt signal was even heard in England one night). Guest speakers, from politicians to professors, and even the famous economist Roger Babson, gave talks from Medford Hillside. By late 1921, WBZ was on the air (although it did not yet put a good signal into Boston), but musicians and celebrities continued to appear at the AMRAD station, because it was so close to the theaters and clubs of Boston, whereas WBZ was 80 miles away in Springfield. 1XE became WGI in February 1922: Power later said that he never saw a good reason to get a commercial license until then; he believed his experimental license was sufficient. By March of that year, it was airing Boston's first radio newscasts, courtesy of the *Boston Traveler* newspaper. WGI consistently provided good entertainment throughout the early

1920s: musicians such as *Hum and Strum* and Joe Rines went on to successful careers on the networks and on records; the popular children's show the *Big Brother Club* enjoyed a 45-year run on radio and then TV; and the famous poet Amy Lowell and the African-American actor Charles Gilpin were heard first over WGI, as was Harry Levi, the "Radio Rabbi."

Harold Power's attempt to bring in some revenue at WGI got the station in trouble with the Department of Commerce in the spring of 1922. In early April, Power had accepted money from a car dealer and an advertising agency to air some commercial announcements. Evidently, somebody notified the department (direct advertising was frowned upon, and Secretary of Commerce Herbert Hoover wanted to keep it that way). A series of "cease and desist" letters were sent by Radio Inspector Charles Kolster, beginning on 18 April and continuing into May. His correspondence to the station suggests that WGI aired commercials in April (well before WEAFF's first commercial in August) and that the department had to warn WGI management several times before these commercials stopped.

By the fall of 1922, a new station, WNAC, was on the air, owned by the Shepard Department Stores. With substantial financial backing, it paid its talent and soon enjoyed handsome studios as well. In the meantime, AMRAD's financial worries increased, and some of WGI's best performers (and several announcers) accepted jobs at WNAC. Over the next two years, WGI continued to win praise from listeners, magazine editors, and radio columnists, but as more Boston stations came on the air—all with more powerful signals, better equipment, and money to pay the performers—it was only a matter of time before WGI could no longer compete. AMRAD went into bankruptcy in late April 1925, and as a result one of America's pioneer stations came to an end. When a buyer was not found, WGI left the air.

WGN

Chicago, Illinois Station

Named for the "World's Greatest Newspaper," this Chicago radio (and later TV) station was not actually started by its long-time owner, the Tribune Company, but was purchased by the newspaper giant soon after it went on the air in June 1924.

Origins

By no means the first Chicago broadcaster (which was KYW), the *Chicago Tribune* entered radio by providing that pioneering outlet with news and market reports. At least four other stations soon followed KYW on the air. The first station located in the handsome Tribune Tower building was WDAP, which aired from May 1922 until a July tornado destroyed its antenna. The station moved and continued operating with a single (very busy) employee, one Ralph Shugart. When station mail piled up, the second employee, Myrtle Stahl (who would stay in radio until 1960) joined him. In 1923, the Chicago Board of Trade purchased WDAP. By March 1924, however, the *Tribune* had purchased enough air time to take control of the station, and changed its call letters to WGN. Full page ads in the newspaper announced the "new" station on 28 March

1924, and WGN's inaugural broadcast came the next evening from studios in the Edgewater Beach Hotel.

WGN pioneered a significant number of radio firsts. Probably the best-known special news radio broadcast of the middle 1920s was WGN's broadcasts from the Scopes "monkey" trial from Dayton, Tennessee, which cost the station \$1,000 a day in personal expenses and in telephone lines to send the signals back to Chicago. Freeman F. Gosden and Charles J. Correll, who started together in vaudeville, created *Sam 'n' Henry* for WGN, but in 1929 they were tempted by the National Broadcasting Company's (NBC) greater offer; they then moved to WMAQ and came up with a new form of the same act, *Amos 'n' Andy*, national radio's first great hit. Soap opera pioneer Irna Phillips created *Painted Dreams* on WGN as one of the early soap operas.

Tribune executives tried to take early advantage of radio and newspaper common ownership. In the immediate wake of the Saint Valentine's Day Massacre in 1929, at company expense, WGN installed radio receivers in all 40 of the light blue touring cars driven by members of the Chicago Police Detective Squad. Detectives were instructed to listen to

WGN—and only WGN—throughout their shifts. When word of a crime, either in progress or recently completed, reached police headquarters, a dispatcher was instructed to telephone WGN and pass along whatever details were available to the announcer on duty, who interrupted programming and broadcast the information in the form of a bulletin. The nearest squad car would hear the bulletin and rush to the crime scene (but so might others who heard the same bulletin). WGN and the *Tribune* boasted that this experiment was a success, but it lasted only a few years, proving how difficult what would be labeled “synergy” two generations later was to accomplish.

Robert McCormick, long-time *Tribune* editor and publisher, saw radio as an ally, not as an adversary. His most important innovation in radio was to assist in forming the Mutual radio network in 1934. From its studios at 435 North Michigan Avenue, WGN aired Mutual with its 50,000 watts and poured the network’s offerings into homes all across the upper Midwest.

Through the 1930s and 1940s, WGN functioned as Chicago’s link to the Mutual radio network. As a founding station of Mutual—along with WOR (New York), WXYZ (Detroit), and WLW (Cincinnati)—through this period WGN and WOR functioned as the only clear channel stations not affiliated with either NBC or the Columbia Broadcasting System (CBS). On 1 March 1941, W59C (later WGNB) aired as the first WGN-owned FM radio outlet. Just a year before WGN had initiated 24-hour operation, a fairly rare service at the time.

Decline of Mutual

In reaction to TV’s growing popularity after 1948, WGN-AM had to lessen its dependence on the Mutual radio network. WGNB, WGN’s FM sister, was donated to Chicago Educational TV (WTTW) in the early 1950s and became WFMT. Receiving fewer network programs as Mutual declined, WGN had to resort to developing its own programming. Station manager Ward Quaal developed local talk stars as many of the radio studios were converted for use by WGN television. In October 1956 Quaal hired Wally Phillips away from another

powerhouse clear channel station, WLW in Cincinnati. Along with Bob Bell, who later became WGN-TV’s Bozo the Clown, the duo did comedy and talk to entertain Chicago’s growing mass of daily commuters. Phillips proved so popular that he also appeared on WGN-TV in *Midnight Ticker*, but it was his solo drive-time show, which debuted in 1959, that lasted until 1986.

In 1961 WGN radio and television moved to a new building on Chicago’s north side. At the time the radio station adopted a new slogan: First in sound, first in service, first in sports. By the turn of the century, WGN had long operated as a high-class major market talk station. Its broadcast day started at 5:00 A.M. with *The Bob Collins Show*, then switched at 9:00 A.M. to *The Kathy and Judy Show*, followed by 20 minutes of news starting at 11:55 A.M., and then offered talk with John Williams and Spike O’Dell all afternoon. The evening was allocated mostly to sports broadcasting, and the station, at 720 kilohertz, broadcast the baseball games of the Chicago Cubs, which was owned by the Tribune Company.

WHA and Wisconsin Public Radio

WHA (originally 9XM) is significant for three reasons: (1) it has a disputed claim to the title “oldest station in the nation”; (2) it has a strong, and less disputed, claim to having provided educational radio in the U.S. with its guiding philosophy and

operating model; (3) it undisputedly pioneered the nation’s first statewide FM network, which was later complemented by a second statewide network and the concept of dual program services. Today that network, Wisconsin Public Radio, remains

the country's largest institutionally based public radio operation and a significant provider of national programming.

"The Oldest Station in the Nation"

A historical marker on the University of Wisconsin campus proclaims 9XM/WHA to be "the oldest station in the nation." Other stations dispute that claim, of course, but if nothing else, the early history of WHA demonstrates the importance of land grant universities in the early development of radio, particularly in the period before anyone recognized the commercial potential of the medium. The University of Wisconsin's story is emblematic of similar, if smaller-scale, efforts at more than 200 colleges and universities in the second and third decades of the 20th century.

Physicists and engineers began the University of Wisconsin's activities in radio. First Professor Edward Bennet (Engineering) and then Professor Earl Terry (Physics) experimented with radio apparatus in the first two decades of the 20th century. The Commerce Department issued a license for experimental wireless telegraphy station 9XM to Professor Bennet in 1912. The license later was transferred to the Regents of the University, who have been licensed to use radio since 1916, perhaps Wisconsin's strongest claim to the title of "oldest."

In December 1916, 9XM joined stations at the University of North Dakota, the University of Nebraska, and Nebraska Wesleyan University in regularly scheduled daily noontime wireless telegraphy broadcasts of weather and agricultural markets in cooperation with the U.S. Department of Agriculture. With these reports, the four institutions began "broadcasting" in the sense that they sought to serve a dispersed audience on a regular basis. Of course, only those familiar with Morse code could understand the broadcasts, severely limiting the effectiveness of the service. For the most part, local offices in scattered communities received the messages and posted the information for farmers and other citizens to read. By early 1917, however, Wisconsin had added voice to the telegraphic broadcasts, making them accessible to the few ordinary listeners who built or owned receivers. Hence, the historical marker cites 1917 as the beginning of "broadcasting" on station 9XM.

Wisconsin's claim to "oldest" status draws on its exemption from the government order closing down all private radio apparatus during World War I. Rather than cease operations, 9XM formed a partnership with the U.S. Navy to help in developing a cadre of radio operators at the Great Lakes Naval Training Station. That wartime activity allowed the proponents of WHA to trace its continuous operation back to 1916–17, even though the "broadcasts" during the war years could not be heard legally by anyone outside the U.S. Navy.

Broadcasting to the public resumed on a regular basis in 1919, the second date cited on the historical marker as the

beginning of continuous regularly scheduled broadcasting. That continuity was not unbroken, however. 9XM stopped broadcasting for six months in late 1920 in order to build a new, larger transmitter. During those six months of silence, KDKA in Pittsburgh, Pennsylvania, broadcast its famous coverage of the November 1920 election results, an event often cited as the beginning of radio broadcasting. When it returned to the air on 3 January 1921, two months after KDKA's "birth of broadcasting" event, 9XM could no longer be dismissed as an engineering experiment. It had a program director, speech professor William Lighty. It published its program listings in the local paper. It broadcast voice and music. The call letters changed from experimental 9XM to WHA a year later in 1922.

The Wisconsin Idea

The debate over who broadcast *first* obscures the true significance of WHA. More than any other educational station, WHA enunciated a clear mission of public service and implemented it on a scale far beyond any other. WHA developed as a unique broadcasting institution at a unique time. The combination of a progressive state government working closely with a service-oriented university became known as "The Wisconsin Idea," and out of that idea came a unique commitment to serve the state with radio from the campus in Madison, combining education with broader public-service goals.

In its educational role, WHA's programming initially emphasized the practical, particularly agricultural information and "home economics." In this, the radio station complemented the work of the university's network of county agents who assisted farmers and their families throughout the state. The station offered, in addition, music-appreciation series and talks and dramatizations written in conjunction with faculty members on a wide range of historical, literary, and contemporary topics. In 1932 the charismatic director of WHA for almost 40 years, H.B. (Mac) McCarty, and his meticulous and diplomatic deputy, Harold Engel, gave the umbrella title "College of the Air" to these diverse offerings, which they said would make a college experience available to those whose circumstances had denied them the opportunity. When portable tape recorders liberated radio from the studio in the 1940s, the College of the Air literally moved into the lecture halls of the University of Wisconsin. At its height, lectures from university courses filled three hours each day on the WHA schedule. Faculty lecturers became statewide celebrities.

A year earlier, in 1931, McCarty and Engel had begun a separate series of programs called "School of the Air" for rural "one room school houses," of which Wisconsin still had many. *Let's Draw*, *Let's Sing*, and *Ranger Mac* provided the art, music, and science lessons otherwise unavailable in small schools without specialist teachers. More than anything else, the School of the Air justified continued state investments in

educational radio, particularly in the lean Depression years, and introduced hundreds of thousands of children and their families to the state radio service.

Narrowly defined education constituted only part of the programming mix, however. Variety shows, radio drama, folk, and popular music found their way to the airwaves. The station also pioneered in covering public issues. Radio provided a means for people to learn about issues and to consider alternative directions. In 1931, for example, WHA offered advocates of different farm policies the opportunity to present their views. This led, in turn, to offers of free airtime to all candidates for statewide office, including those of the minor parties, in the 1932 elections and in every subsequent election for the next 40 years. The 1932 "Political Education Forum" marked the first time any American radio station had used its facilities as a forum for public debate. *The New York Times* praised this initiative, and Professor Bennet made it his theme when he testified before Congress in an unsuccessful effort to reserve 25 percent of radio frequencies for noncommercial stations in the Communications Act of 1934.

The State Radio Network

The dramatic boom in commercial radio in the late 1920s and early 1930s forced most educational radio stations off the air, their frequencies taken over by commercial stations, either through purchase or reassignment by the Federal Radio Commission. The handful of educational stations that survived found themselves relegated to inferior "regional" channels and usually only during daytime hours. Whereas in its earlier years WHA transmitted broadly outside Wisconsin, it ended up with a daytime regional frequency in Madison that covered only a portion of the state by day and none of the state by night, when most people listened to the radio. The addition of a second regional daytime station (WLBL) in the central part of the state helped, but it still left WHA with inadequate facilities.

To solve its coverage problems, in the early 1940s WHA proposed to take over the frequency of the National Broadcasting Company (NBC)'s Chicago station, WMAQ, arguing that Chicago had five clear channel stations and Wisconsin had none. Not surprisingly, NBC was able to beat the challenge, as did Atlanta's WSB when WHA proposed to share its clear channel. Thwarted in two attempts to improve its AM facility, Wisconsin looked to the new technology of FM, which had been authorized by the FCC in 1941 but had remained mostly undeveloped in the war years. In 1944, the Wisconsin Legislature created a State Radio Council separate from the university to develop a network of FM stations to carry WHA programming throughout the state. Although legally separate from the University of Wisconsin, the State Radio Council effectively operated as an adjunct to the university broadcasting operation. McCarty headed broadcasting for both the university and

the State Radio Council, and WHA was the sole source of programming for the network. In March 1947 the State Radio Council activated WHA-FM in Madison, the first of nine FM stations that would go on the air at the rate of one per year until the network achieved statewide coverage in the mid-1950s. Because McCarty and Engel saw the role of these stations as broader than narrowly defined education, they named the system the Wisconsin State Radio Network or the State Stations rather than the university network or the educational network. Already the oldest and largest educational broadcaster in the country, the Wisconsin operation soared past any potential rival with the state's commitment to build and operate those nine FM stations. On the eve of the Public Broadcasting Act of 1967, the budget of the Wisconsin State Stations tripled that of any other educational radio operation.

Wisconsin Public Radio

McCarty and Engel chose 1967 to retire, just as Congress enacted the Public Broadcasting Act, which gave a new name and a somewhat different concept to "educational" broadcasting. In a sense, the national legislation vindicated Wisconsin's vision of radio as a public service broader than university-level education. Indeed, the principle author of the vision for the new enterprise that would be called National Public Radio (NPR) was Bill Siemering, a former WHA staff member who often acknowledged his debt to McCarty and the Wisconsin Idea.

Without McCarty to hold his creation together, the university and the Educational Communications Board (successor to the State Radio Council) struggled for control of the state stations. At first, the advocates of a narrow view of educational radio seemed to prevail. Indeed, the Educational Communications Board changed the call letters of WHA-FM to WERN, for Wisconsin Educational Radio Network, its new designation for the State Radio Network. That name, however, ran directly counter to what was happening to the stations. School of the Air programming essentially moved over to television, and programming from NPR replaced some of the College of the Air programming. The State Network was becoming less "educational" at precisely the time it added "educational" to its name.

In 1978 the university and the Educational Communications Board accepted this reality and agreed to designate their joint enterprise "Wisconsin Public Radio." They appointed Jack Mitchell, formerly of NPR, as director of radio for both organizations. They put in place a long-range strategy to provide two formatted services in most parts of the state. One of the services—headed by WERN (the former WHA-FM)—would build a format around music and arts. The other service—headed by WHA (AM)—would feature news and information. The music and news division became a common pattern among public

radio organizations that controlled two stations in one community. In 1989 WERN's music and arts service evolved into the "NPR News and Classical Music Network," while WHA's information service narrowed its focus to emphasize unique Wisconsin talk programming, particularly statewide call-in shows on a range of informational, educational, and public-affairs topics. As residents across the state talked with academics, authors, officials, advocates, and one another, this service echoed the traditional educational and public-service purposes of the Wisconsin Idea, as did the name of the new service, "The Ideas Network of Wisconsin Public Radio."

As the "Ideas Network" focused inward on the state, Wisconsin Public Radio exported several programs nationally. For a decade in the late 1970s and early 1980s, WHA served as home to public radio's national drama project *Earplay*, under the direction of Karl Schmidt. Although *Earplay* won critical acclaim, it fell victim to the budget cuts of the Reagan administration. Since 1985 WHA has been the home of Michael Feldman's *Whad'Ya Know?*—a comedy quiz program carried by more than 200 public radio stations to a weekly audience of more than 1 million people. The station also distributes two national advice programs and *To the Best of Our Knowledge*, a weekly two-hour interview magazine covering the world of ideas. Often considered the "brainiest" program on public radio, *To the Best of Our Knowledge* is a fitting product of the radio station that gave America the concept of educational radio.

WHER

Memphis, Tennessee Station

When WHER-AM 1430 broadcast for the first time on 29 October 1955, it was staffed almost entirely by women, a phenomenon never before seen in U.S. radio. An experiment in novelty during a period of declining radio audiences and revenues, WHER would demonstrate and confirm women's competencies in the radio industry and inspire women to pursue careers in the industry.

The brainchild of Memphis record producer Sam Phillips (who first recorded Elvis Presley, Johnny Cash, and other

important figures in American music on his Sun Records label), WHER came to life with a \$25,000 investment from Kemmons Wilson, the founder of the Holiday Inn hotel chain. Together, Phillips and Wilson formed Tri-State Broadcasting Service, Inc. It was a difficult time for radio in 1955 when the station began operations; television was stealing radio listeners and gobbling up advertising dollars. To remain profitable, station owners sought new ways to reach audiences and looked to audiences that radio had traditionally ignored.

After hiring station manager Dotty Abbott, a veteran radio manager from Phoenix, Phillips selected seven other women (Teresa Kilgore, Marion Keisker, Dot Fisher, Pat McGee, Denise Howard, Barbara Gurley, and Laura Yeargain) to run the station. Phillips' wife Becky, a prominent on-air personality in Southern radio, also joined the team. WHER set up its first studios in several rooms provided by Wilson at the Memphis Holiday Inn (only the third Holiday Inn in existence at the time). Painted in pink and purple pastels, the radio studio featured distinctively feminine decor, somewhat resembling a dollhouse.

Despite skepticism and shock when Keisker's first broadcast aired in Memphis with little warning on the morning of 29 October 1955, the station was an immediate success. Audiences enjoyed tuning in to hear female voices and perspectives on radio. The "girls" lived up to their slogan, "A smile on your face puts a smile in your voice." Their broadcasts were energetic and fun, and they were not afraid to laugh at themselves and their mistakes. Initially the station catered primarily to female homemakers and featured love ballads, jazz, and light content. But as the station evolved, the format matured and diversified. The station fielded competent news and sports staffs, and by the 1960s it programmed one of Memphis' early call-in talk shows, *Open Mike*, hosted by Marge Thrasher. *Open Mike* and the station's other news programs addressed issues of importance in Memphis, such as the city's festering racial tensions that led to the 1968 sanitation workers' strike, the backdrop of Martin Luther King Jr.'s assassination.

Memphis radio had already seen such experimentation in 1949 when radio station WDIA began offering an all-black format, and although WHER's format was never strictly all-female-oriented, the station's all-female staff did represent the lengths radio entrepreneurs were going to in order to distinguish themselves in the ever-tightening radio market.

Although Sam Phillips and Kemmons Wilson's endeavor bordered on outright gimmickry, the station remained viable for almost 20 years and became a landmark in the history of women's broadcasting. During a period when female reporters were still banned from the National Press Club in Washington, D.C. and most radio stations rarely hired more than one female air personality, WHER boasted a staff of forty women who held positions ranging from general manager to program director to disc jockey. (Among the few stations that adopted WHER's all-girl approach was WSDM, Chicago, which

employed "Hush Puppy" Linda Smith, later known as Linda Ellerbee.)

The social upheaval that accompanied the late 1960s would ultimately contribute to WHER's demise. The notion of an "all-girl" radio station that traded on stereotypical feminine qualities seemed out of step with the resurging women's rights movement (hosts of music programs were known as "jockettes," and one of WHER's taglines was "One thousand beautiful watts"). As a result, the station added more men to its staff and sought to broaden its appeal. In 1971 (after 16 years on the air) WHER was changed to WWEE, a talk radio station that later became a gospel station. In 1988, Phillips and Wilson sold the station first known as WHER. Currently a WHER broadcasts from Hattiesburg, Mississippi, but the outlet has no connection to the original WHER.

In October 1999, to commemorate WHER's inception, Davia Nelson and Nikki Silva produced a documentary highlighting the history of WHER for National Public Radio's "Lost and Found Sound" series on *All Things Considered*. Also featured on local and national news programs, the women were brought together by Sam Phillips in New York for a reunion.

WHER's female orientation represented radio's general effort to find stable ground in the burgeoning television age of the 1950s, but the station will be best remembered as having played an important role in the development of opportunities for female radio professionals in all areas of radio operations. Many women working in radio today owe a tremendous debt to Sam Phillips and the more than 50 women who worked at WHER from 1955 to 1971.

White, Paul 1902–1956

U.S. Executive, Editor, Creator of CBS News

Because Paul White built one of the first network news operations and then led it through its glory days of covering World War II, he can be said to have established precedents for broadcast journalism that are still followed and principles that are still admired.

Early Years

The son of Paul W. White, a stone contractor, and Anna Pickard, White was born in Pittsburg, Kansas, in 1902. His interest in journalism began early. In high school, he reported for the *Pittsburg Headlight*. After he graduated, rather than go to business school as his parents intended, White ran away from home and became a reporter for the *Salina*, Kansas, newspaper.

He majored in journalism at the University of Kansas for a year in 1920 while working as telegraph editor at the *Kansas City Journal*. He then earned a bachelor's degree in literature at Columbia University in New York City and in 1924 a master's degree from Columbia's School of Journalism. During his years at Columbia, White contributed articles to the *New York Evening Bulletin* and the *New York Sunday World*. After graduation he was hired as a reporter for the United Press in 1924 and later was promoted to features editor.

Developing CBS News

White came to the Columbia Broadcasting System (CBS) in 1930 with the title of news editor, but he was in the publicity department. Under him were only three people—an assistant, a secretary, and an announcer—and their main job was to cover special events rather than to gather news. CBS's journalism at that time consisted of weekly news commentaries and occasional bulletins.

Like other broadcasters, CBS depended on wire services as the major source of information, but the newspapers controlled them and felt that broadcasting was becoming too strong a competitor. When the wire services cut off the flow of information to radio, CBS was forced to go out and collect its own stories. The Columbia News Service was organized by White with news bureaus in major U.S. cities and stringers from around the world.

The results were so successful that the print industry applied more pressure by threatening to charge for the listing of radio programs and by refusing to do publicity on sponsors of radio news. Broadcasters signed the "Biltmore" agreement (much to White's dismay), severely limiting their ability to

gather and report the news. They had to dismantle their news-gathering efforts (including the Columbia News Service) and be satisfied with short bulletins provided by the wire services. In 1935, though, the more independent wire services resumed supplying broadcasters with the news, and the agreement was ignored by everyone soon. The result of this intermedia conflict was that the National Broadcasting Company (NBC) and CBS were forced to hire more news people and expand their news-gathering process.

Radio journalism entered its maturity with the coming of war in Europe. At first, White was reluctant to allow his special-events employees, Edward R. Murrow and William Shirer, to go beyond their assigned duties of arranging talks by European leaders, but Germany's 1938 takeover of Austria led to a temporary change in CBS's policy. For a while, news became the norm rather than a special event.

To cover the crisis, White developed the first *CBS News Roundup*, which allowed the audience to hear live reports via shortwave from each of the trouble spots in Europe with an anchor to provide continuity—much the pattern for today's nightly TV newscasts.

Then, when Germany threatened to invade Czechoslovakia in 1938, the network made a full commitment to international coverage under White's leadership. His team covered the crisis with hours of live newscasts. When World War II broke out a year later, CBS became the leader in news both because of the quality of its correspondents on the scene, headed up by Murrow in London, and because of White's leadership. At the end of the war, the network received the Peabody award for its outstanding coverage.

White was an actively involved news director. He talked frequently via shortwave from his desk to correspondents around the world. It is no surprise that he and his crew of broadcast journalists sometimes clashed. The main cause of conflict was the CBS policy stipulating that reporters and commentators analyze the news without offering their own opinions. His staff maintained that pure objectivity was difficult to achieve and did not serve the audience.

After the war, Murrow returned to New York City and was promoted to network vice president for news and public affairs. White resigned soon afterward in 1946.

Later Years

From 1939 to 1946, White also taught at his alma mater, Columbia University. His textbook on the practices and techniques of broadcast journalism was published in 1947 and

Paul White
Courtesy CBS Photo Archive

became a standard for many years. He also taught at the University of Iowa for a short time.

The Associated Press in 1947 hired White as a consultant to improve the radio wire service. In 1948 he became associate editor of the *San Diego Journal*. When it went out of business in 1951, White became executive news director of KFMB AM and TV in San Diego, where his main duty was delivering editorials. (He explained that he had changed his mind and now thought under some circumstances, opinions *should* be allowed on the air.) He also helped the American Broadcasting Companies (ABC) with its coverage of the 1952 Republican and Democratic national conventions. White died in 1955.

White, Wallace H. 1887–1952

U.S. Legislator of Radio

Wallace H. White Jr. was a member of the U.S. House of Representatives from 1917 to 1931 and the Republican senator from Maine from 1931 to 1949. He was the radio authority in Congress—no one knew more about radio legislation than White. He was a major influence in drafting the Radio Act of 1927 and the Communications Act of 1934. As the radio act wound its way through Congress, it was known as the White Radio Bill. After the passage of the 1927 Radio Act, it was White who, without the flair of oratory, acquired the support of Secretary of Commerce Herbert Hoover and the signature of President Coolidge. He had at first proposed control of radio within the Department of Commerce, but by 1928 he was an outspoken proponent of the Federal Radio Commission and an ardent supporter of the “public interest” provisions of the law.

It was White’s work in the Merchant Marines and Fisheries Committee and the Committee on Commerce that placed him in early association with Secretary of Commerce Hoover and the challenge of radio legislation. White’s first attempt at radio legislation was in 1919. The bill, H.R. 10831, directed control of radio to the president of the United States and the secretary

of the navy. Authored by White, it was referred directly to the Merchant Marine and Fisheries Committee. The bill and its predecessor, H.R. 11779, introduced 15 January 1920, were written “only to fill the gap until a general [radio] bill [could] be gotten into shape.” H.R. 10831 was the first to designate control of radio with the secretary of commerce (White Papers). The exigency of World War I and the rapidly growing technical complexities of radio deflected the interest of legislation, and control at the time was turned over to the navy for the duration of the war.

Following the war, when the navy relinquished control of radio, White again began work at drafting legislation for the new industry. After Secretary of Commerce Herbert Hoover called the First Radio Conference, 27 February 1922, Representative White proceeded to draft proposed legislation from the recommendations of the conferees. The first radio bills fell on an uninterested House of Representatives, but White hammered away at passage until 1927. During each of the Radio Conferences called by Hoover, White provided leadership and created legislative action. By the late 1920s, he was known in the House for his “perennial radio bills” (Archer,

Wallace H. White
 Courtesy AP/Wide World Photos

1938). During the Third Radio Conference, White participated in the Coordinating Committee, which Hoover chaired, and White chaired the Committee on Problems with Marine Communication. During the Fourth Radio Conference, he chaired the Committee on Copyright Relations to Broadcasting. White's perennial bills fell upon deaf ears, but each succeeding bill grew with the refinements and complexities of the technology.

Most historians associate the White Radio Bills with placing licensing control in the hands of the secretary of commerce. However, it was White's work that specified the concept of public service as the foundation of radio legislation. He was an outspoken advocate of the public's rights in electronic media. In a speech before the National Association of Broadcasters on

26 October 1931, White extolled the public-interest virtues of the law. It was the public-interest provision that, according to White, "gave it [the law] the virtue of flexibility" for a growing and dynamic new industry (White Papers).

White was born in Lewiston, Maine, on 6 August 1877. He graduated from Bowdoin College in Brunswick, Maine, in 1899 and studied law at Columbia University. He was admitted to the bar in the District of Columbia in 1902 and began his career in Lewiston in 1903 at his father's firm, White and Carter. He was first elected to the House of Representatives in 1916, as Maine's second district congressman. His first service was in the extra session called by President Woodrow Wilson in April 1917. White was one of the few men in Congress who served through World War I. Many of his colleagues, including

his radio colleague, Washington's Representative Clarence C. Dill, had their careers cut short because of their votes against U.S. entry into World War I.

The State of Maine's coastal interests in fishing and marine industries dictated White's initial legislative agendas. As the grandson of the former Senator William P. Fry of Maine, White had served for a time as his grandfather's personal secretary while Fry was chair of the Committee on the Merchant Marine and Fisheries and the Committee on Commerce. This experience turned out to be an important foundation, as White later occupied his grandfather's positions.

White's career was not marked with spectacular notoriety, but he was nevertheless an effective legislator. He was not a press hound or even a legislative debater. In his legislative exchanges with his colleagues, his voice could barely be heard in the audience galleries. *Newsweek* described him as "short, slight and sad-eyed; amiable, but reticent" ("GOP: Top Ten," 13 January 1947). White was earnest, knowledgeable, and persuasive. *U.S. News* reported that he was "gentle and uncontentious, soft spoken and retiring. Mr. White was more valuable . . . as a quiet backstage negotiator rather than as a debater" ("Republicans Who Take Over Leadership . . .," 3 January 1947).

White's achievements were found in the services he rendered. Primarily known for his work on radio, White nonetheless devoted the bulk of his work to marine and fishery issues. He was the author of 550 bills, resolutions, and amendments; 216 congressional reports; and 385 addresses. He was a trusted confidant of both Presidents Coolidge and Hoover, serving under both Republican presidents. According to the *Marine Journal*, his crowning achievement was the passage of the Jones-White Shipping Bill, which was passed into law as the Merchant Marine Act of 1928. During the last years of his tenure, he was described by *Newsweek* as one of the top ten senators in the nation. White served for 30 years—an outspoken proponent of people's rights to enjoy radio as means of communication and of his state's interest in maritime law. He was a practical politician with a humanistic approach to the issue of public concern.

Williams, Bruce 1932–

U.S. Radio Talk Show Host

Bruce Williams began dispensing financial advice on the air in 1975, when he first hosted *At Your Service* on WCTC, a small New Brunswick, New Jersey, station. At the beginning of the 21st century, he was broadcasting for three hours every week-night on about 400 stations nationwide, offering the same homespun philosophies and common-sense wisdom to a radio audience of about 8 million.

Origins

Born in 1932, Williams sees himself first and foremost as a “regular guy” who has been an entrepreneur since his junior high school days in East Orange, New Jersey. At the age of 11 he took advantage of the toy shortage during World War II by melting down lead pipes in the coal furnace of his basement, casting toy soldiers, and selling them to friends, thus establishing the first of his many enterprises. Over the years his ventures have included floral concessions in hospitals, barbershops, insurance agencies, preschools, nightclubs, and radio stations in several cities.

Before entering the world of broadcasting, Williams served in the U.S. Air Force during the Korean War and attended Newark State College—now Kean College—in New Jersey. In the 1960s he was a city councilman in Franklin Township, New Jersey, where he later served as deputy mayor and then mayor.

Radio Career

After his defeat in a race for the state’s General Assembly, by his own account Williams bombarded New Brunswick station WCTC with letters and phone calls. Several years later he moved to WMCA in New York, where he hosted a finance show six days a week. In 1981 the National Broadcasting Company (NBC) network put together a nightly package of advice-oriented talk shows, pairing Bruce Williams with former WMCA colleague Sally Jessy Raphael. The format for *Talk-Net* placed Williams’ focus on finance and Raphael’s on sex and relationships; *Talk-Net* is now part of the Westwood One Radio network.

What sets Williams apart from other broadcasters is his avuncular approach. With a decidedly folksy style, Williams can be both soothing and blunt in his broadcasts from his suburban home in New Port Richey, Florida, just north of Tampa. During his program—which generally runs from 7:00 to 10:00 P.M. Eastern time—he shares his own life experiences, setting

the stage for others to do the same. Williams talks to callers about their lives and their dreams for the future. Although his advice is centered mostly on financially oriented issues of credit, investments, and decision making, he sprinkles in old-fashioned bits of philosophy on tenacity, common sense, and the importance of maintaining good physical and emotional health. He establishes a rapport with his listeners, referring to the women as “honey” or “sweetheart” and ending calls with his trademark, “I wish you well, my friend.”

Each year Williams is cited by *TALKERS Magazine: The Bible of Talk Radio and the New Talk Media* as one of the 100 most important radio talk show hosts in America; the magazine describes him as a “solid nighttime advisor for everyday business situations.” In 1994 he was honored as the host of the year by the National Association of Radio Talk Show Hosts.

Although Williams’ broadcasts are not outwardly political, he is quick to attack certain business practices that he perceives as unfair to consumers. He also encourages his listeners and readers to let their views be known to candidates for public office as well as to those already elected. For example, his website features a link to his strong stance against airline pricing; in it he states that he is opposed to the “tyranny inflicted on the public by airlines with regards to certain ticketing practices.”

Williams eschews what he perceives as elitists who dismiss the appeal of programs like his. After hearing the assertion that “nobody” listens to talk radio, he urged his listeners to prove otherwise. Soon, Williams’ legions of listeners, the “nobodies,” responded with tens of thousands of postcards and letters; in turn he displayed the correspondence prominently at the National Association of Broadcasters annual convention.

In 1995 Bruce Williams told the Freedom Forum First Amendment Center, “We’re not in the news business; we’re in the entertainment business.” As he is quick to point out, the information and wisdom he instills to his listeners night after night comes from firsthand experience and is meant to interest and inform. His audience responds in kind; they know his father had owned a profitable shoe salon in New York City but lost money in the Great Depression, and as a result, his listeners are open to his thoughts on how to protect their financial futures. Many have heard of Williams’ successes and failures in a variety of different fields and are phoning to learn what he has to say about which risks to take and which to avoid. Although they may share some of Williams’ frustrations with

Bruce Williams
Courtesy Radio Hall of Fame

bureaucracy and politics, they are after practical information, not speeches or news analyses.

Other Activities

In addition to his nightly broadcasts, Williams writes "Smart Money," a column syndicated by United Features that appears three times a week in about 600 papers nationwide. He has written several books, including *In Business for Yourself*,

HouseSmart, *CreditSmart*, and *America Asks Bruce*. He has also produced the tapes *The Road Map to Financial Security* and *The Bruce Williams One-Hour Crash Course in Getting the Job*. Williams is also popular on the public-speaking circuit, presenting "An Evening with Bruce Williams" to diverse groups of audiences.

A man of many passions, Williams has been a small-plane enthusiast for 50 years, even though in the mid-1980s he nearly died when his plane hit a tree while he attempted to abort a landing. He is currently part of Young Eagle Flights, a program that pairs pilots with students ages 8-17 to take them flying. Pilots such as Williams donate their time and use of their aircraft as part of the larger goal of promoting aviation as a career or as recreation.

Williams, Jerry 1923–2003

U.S. Talk Radio Host

In over half a century on the air, more than any other broadcaster Jerry Williams has played a crucial role in the invention and development of nearly every feature of the modern talk radio format. Known nationally as the “Dean of Talk Radio,” Williams owes his success to his ability to adapt to the changing technological and political terrain of the medium. Despite a career based almost exclusively in local, rather than national, broadcasts, Williams gained a national reputation by helping to invent talk radio as a forum for political advocacy and dissent, rather than just another form of audience participation programming. Moving from angry populism to friendly chatter to old-fashioned shtick, Williams connected with audiences and earned consistently high ratings in cities all over the nation. Callers to Williams’ program trusted him with their stories of economic ruin and the most intimate details of their sex lives; stories like these helped boost his ratings into the stratosphere.

Williams began his career in radio fresh out of military service in World War II, at WCYB in Bristol, Virginia, where the Brooklyn, New York, native hosted a country music program and a variety show entitled *Farm and Fun Time at Noontime* and read the news. From there he bounced around several stations in Pennsylvania including WKAP in Allentown, where he served as program director and as disk jockey on a hit parade program called *A Date with Jerry*. Inspired by the radio comedy of Henry Morgan, Williams helped to invent a style of talk that combined humor, listener interaction, and attention to the issues of the day.

Throughout the postwar years Williams sought new ways to engage listeners in his broadcasts and, in the process, invented some of the first programs of the talk-back radio genre. In 1948, while hosting a noontime program on WKDN, a Philadelphia, Pennsylvania, station, Williams invited listeners to call in and voice their opinions on a variety of local topics. Lacking the technological wherewithal to place callers’ voices on a tape delay, Williams, who was also the program director at WKDN, took calls and then repeated the callers’ comments to great comic effect. Around this same time, broadcasters in various markets began experimenting with live, impromptu interview programs—in many cases, from restaurants frequented by celebrities. Barry Gray at WXXX and Jack (“I’m at the Copa, where are you?”) Eigen pioneered this form. Williams mastered this interactive format as well, hosting his own interview show from a table in a Philadelphia restaurant for two years.

In 1957 Williams, now at WMEX, Boston, Massachusetts, made use of tape delay equipment to field “live” phone calls

about Boston politics on the air. His high ratings in Boston—one month he earned a phenomenal 46 share—were so tough on competitor WEEI that its parent company, Columbia Broadcasting System, lured him away from Boston to its Chicago, Illinois, affiliate, WBBM. In 1968 Williams returned to Boston for an eight-year run on WBZ, a clear channel station that could be heard in 38 states and six provinces of Canada. Despite his popularity, Williams was still subject to the peripatetic nature of the business and so his stint in Boston was followed by briefer sojourns at stations in New York, Philadelphia, and Miami, Florida.

With his return to Boston in 1981, Williams became a fixture on that city’s 50,000-watt station, WRKO. The power of his program to evoke the spirit of populist discontent, political cynicism, and economic despair was analyzed in Murray Levin’s *Talk Radio and the American Dream*, a study of two Boston-area talk radio programs in the post-Watergate, post-Vietnam era of liberal disillusionment and resurgent conservatism. Levin categorized Williams as “liberal” and, compared with the conservative Avi Nelson, whose program Levin also studied, he surely was, but the central themes of Williams’ program in this period tapped into a broader populist distrust of government, big business, and the mass media.

In 1986 Williams served as the key rallying point for widespread opposition to a proposed seat-belt law in Massachusetts. Energized by the host’s attention to the issue, impassioned callers decried the governmental intrusion into personal liberties. Williams’ consistent attention to the matter helped to galvanize opposition to the bill, which took the form of letter-writing and phone-call campaigns to state lawmakers. The issue took on a surprising ferocity and, when the bill was soundly defeated, many gave Williams much of the credit.

In 1989 Williams demonstrated the grassroots power of talk radio on a national level when he led a campaign to halt congressional pay raises. Working with Ralph Nader and fellow talk radio hosts around the country, Williams helped galvanize powerful nationwide opposition to the bill. This incident focused national attention on the political and cultural power of talk radio, particularly on its ability to reach a vital demographic: politically aware citizens who felt alienated from the political process and traditional forms of news media. Williams helped to consolidate talk radio’s national influence by founding the National Association of Radio Talk Show Hosts (NARTSH), an organization that conferred a degree of legitimacy and political clout on the upstart medium. This newfound influence was most clearly in evidence during the presidential election of 1992, when the candidates accorded

talk radio hosts in general, and NARTSH in particular, a new level of respect.

In addition to his passionate interest in politics, Jerry Williams also became notorious during this era for his semi-annual "Sex Survey." Inspired by *Cosmopolitan* magazine, Williams first tried the survey in 1976 at WWDB in Philadelphia, but it became an enduring institution on Boston's WRKO. Williams set aside a week of his program to conduct a surprisingly frank survey of the sexual habits, pleasures, and disappointments of his female listeners. Williams' remarkable success in soliciting willing female callers, their accounts often graphic, was most likely because of his deadpan delivery and his reputation for avoiding exploitative or nasty forms of talk show humor.

Williams was inducted into the Radio Hall of Fame in Chicago in 1996, the same year that Congress passed legislation weakening most of the ownership limitations on broadcasters. Williams credits this latest round of deregulation with the declining quality of talk radio nationwide, because corporate-owned stations increasingly lack the local touch, and respect for callers and listeners is replaced by a focus on the bottom line. In 1998 the Dean of Talk Radio himself became a victim of corporate consolidation in the industry. Days after Entercom purchased WRKO, Williams was summarily fired. In 2000 Williams tried for a comeback attempt on the Boston air-

waves, as host of WMEX interview show to be broadcast from local restaurants, harking back to the days of Jack Eigen, Barry Gray, and the first stirrings of talk radio. Never inclined to retire, he finished his career at Boston's WROL, as host of a one-hour call-in program even as he battled the early stages of Parkinson's disease, kidney disease, and other ailments. He suffered a stroke in March 2003 and died 29 April of that year.

Williams, Nat D. 1907–1983

U.S. Radio Personality

In 1948 Nat D. Williams became the first black personality featured on the historically important station WDIA in Memphis, Tennessee. WDIA would become the nation's first all-black-oriented radio station in 1949.

Williams, also the first black air personality in Memphis and one of the first in the South, was hired by WDIA's owners, John Pepper and Bert Ferguson, in the fall of 1948 after they had decided to feature black-oriented programs. Williams' *Tan Town Jamboree*, which featured jazz and blues music, debuted in the afternoon of 25 October 1948 and met immediate and overwhelming success. The popularity of the new disc jockey among black Memphians convinced Pepper and Ferguson that black-oriented programming could be profitable. They soon plugged Williams into additional time slots, including their keystone morning show, *Tan Town Coffee Club*, and set about building the station's all-black format

around him. By 1949, with Nat D. Williams as its primary ambassador to the Memphis market, WDIA had completed the conversion to an all-black-oriented format, featuring an all-black on-air staff and programming tailored exclusively to the black audience. Within a year, WDIA boasted the highest radio ratings in Memphis' black market as well as the city's highest overall ratings.

The wisdom of hiring Williams and then featuring him heavily in the format became increasingly evident as WDIA's popularity and profits grew with zephyr-like speed. His well-established prominence in the Memphis community and his exuberant on-air style virtually guaranteed that black listeners in Memphis would flock to WDIA. For more than 15 years before joining WDIA and continuing throughout his tenure at the station, Williams taught history at Booker T. Washington High School, which produced many of Memphis' black elite,

and he wrote a weekly column in the *Memphis World*, a black newspaper. Williams was also well known in Memphis entertainment circles as the originator and host of *Amateur Night on Beale*, a weekly black talent show staged at the Palace Theater. There is no question that by 1948 much of the black community in Memphis was quite familiar with Nat D. Williams; they willingly followed him to WDIA.

WDIA co-owner Bert Ferguson had known Williams since 1937, when the station Ferguson worked for at the time, WHBQ, began airing *Amateur Night on Beale*. WHBQ aired the program only for a short time, but ten years later Pepper still remembered Williams' skills behind a microphone and brought him to WDIA. (Williams' appearance on the WHBQ broadcast of his show in the late 1930s places him among the first black announcers to appear on radio in the South.)

Williams had an on-air ebullience that caught the ear and brought a smile. Williams told author Mark Newman, "When [the engineer] pointed his finger at me I forgot everything I was supposed to say. So I just did what became typical of me. I laid out for dead. I just started laughing 'cause I was laughin' my way away. And the man said, 'the people seem to like that thing' and they told me to make it standard. . . . So ever since then . . . Nat has started his program laughin' and closed his program laughin'" (see Newman, 1988). Williams' style—and his established prominence in the Memphis community—helped him and WDIA maintain a loyal listenership.

In the wake of Williams' hiring and WDIA's conversion to an all-black-oriented format came a host of black disc jockeys and announcers, many of whom had been Williams' students at Booker T. Washington or performers on *Amateur Night on Beale*. Many were recruited by Williams or drawn to WDIA because of the respectability that Williams' name and presence brought to the station. He became the godfather of Memphis radio for blacks, attracting talented employees, recommending new employees for hire, and, of course, shepherding listeners to the station. As WDIA gained national prominence in the 1950s for its pioneering and complete march into black-oriented programming, Nat D. Williams, too, became nationally prominent. His name and face were frequently featured in national stories about black radio and in WDIA's national trade advertisements. Williams became one of the deans of

black disc jockeys in America, inspiring many blacks to enter professions in radio and demonstrating that blacks could make important contributions to the radio industry. Nat D. Williams broke ground for the legion of black radio personalities who would enter the profession in the 1950s and 1960s, just as the nation's first black announcer and disc jockey, Jack L. Cooper, had broken ground for the handful of blacks hosting radio shows in the late 1940s.

Nicknamed "The Professor" by many, Williams continued to host musical programs and public-affairs programs on WDIA until 1972, when a stroke forced him to retire. Until the end, his programs continued to post high ratings. A series of strokes would bring on his death in 1983.

Wilson, Don 1900–1982

U.S. Radio Announcer

Beginning in 1934 and for more than 40 years, Don Wilson was known primarily as the heavy-set announcer with a hearty laugh who acted as a foil to Jack Benny's comedy. Wilson began as Benny's radio announcer and made a smooth transition to being the announcer for Benny's television program. He was strongly identified as the announcer of Benny's radio sponsor, Jell-O (at a time when most programs were sponsored by one advertiser). Like most announcers of that time, he was well educated and a credible actor, and he performed in many radio and television sketches with Benny.

Born in Lincoln, Nebraska, on 1 September 1900, Wilson grew up in Colorado after his parents moved there when he was two years old. He was a star on the University of Colorado football team, graduated in 1923, and began his professional life as a salesman. Shortly thereafter, he began his show business career as a member of a vocal trio that toured the western United States. In 1927 in San Francisco, an advertiser heard the group perform and put them on the air on KFRC. When the contract ended after more than a year, Wilson and another member of the trio went to Los Angeles, where they worked on various radio shows.

Finally, in 1929 Wilson abandoned his singing career and became an announcer on KFI in Los Angeles and soon moved up to chief announcer. He covered the Rose Bowl from 1930 to 1933. He was a very popular sports announcer, and as a result, in 1933 the vice president of the National Broadcasting Company (NBC) invited him to move to New York to cover sports for NBC. At the same time, he was also working on many of the high-rated NBC shows as an announcer. In 1934 he began working on Jack Benny's Sunday night broadcasts; the first program was *The General Tire Revue*, which aired on 20 July 1934.

When Jack Benny offered him the announcing job for the Benny show, Wilson joined regulars such as Dennis Day, Eddie Anderson (Rochester), Phil Harris, Mary Livingston, and Mel Blanc both as a character in skits and as a straight man and announcer. Wilson helped to develop the job that became known as the radio announcer. During the golden years of radio in the 1930s, Wilson established himself as a strong personality, as important as that of the star of the show. Benny recognized this, and when Benny took the show on the road, he made an effort to bring Wilson along.

His large size, 6 feet 2 inches tall and 220 pounds, made him the butt of many of Benny's jokes. The constant joking made it seem that Wilson was actually larger than he was, and Benny once said that he made Wilson "the biggest man in radio." On one program, Wilson began by teasing Benny for

not having an overcoat for a New York visit. Benny replied, "Listen, Don, are you selling clothing or Jell-O?" Wilson replied, "Jell-O." Benny's response was, "Stick to that or I'll fatten up [announcer] Graham McNamee for your job!" Wilson's association with Jell-O was so strong that one of the most memorable aspects of the program was Wilson's weekly selling of the "the six delicious flavors" and "a treat without equal." Wilson claimed that one of the most attractive gifts was a "big shimmering mold of Jell-O." For the 1942–43 radio season, Benny's sponsorship was changed by General Foods to Grape-Nuts. Wilson's reaction to the change of sponsors was panic, and on the first program of the new season, he claimed, "I won't do it, I tell ya, I won't do it!"

On another program, Wilson introduced Benny with a poem honoring their location in Palm Springs: "And there, out by the pool / far from strife and toil / is our blue-eyed star / selling suntan oil." Benny reacted by calling Wilson "Henry Wadsworth Fatfellow." Wilson once tried to get back at Benny by saying that Fred Allen was his favorite comedian. Another running gag featured Wilson trying to get the commercial on the air with Benny trying to stop him. Wilson would sometimes have the Sportsman Quartet sneak in the commercial. He would tell Benny there was just one more chorus for the quartet to sing, and then they would sing the commercial.

From 1950 to 1965, Wilson was part of Benny's television show. He continued his role as announcer and appeared in many television skits. In one parody of Art Linkletter's *Kids Say the Darndest Things*, he dressed in a child's sailor suit and was interviewed by Linkletter, along with Benny and Rochester, dressed in similarly outrageous costumes.

From 1937 to 1944 he was voted the most popular announcer by the press and the audience. When *The Jack Benny Show* ended as a weekly program, Wilson spent a year as the announcer for the *Kraft Music Hall* and *The Tommy Riggs and Betty Lou Show*, both on radio. Through 1973, he continued in his role as announcer on Jack Benny television specials.

Wilson's wife, Lois Corbet, appeared on the Jack Benny radio show, and when they moved to Palm Springs in 1967, both Wilson and his wife worked in radio and television. He hosted *Town Talk* until 1975, and in 1975 they both appeared on a television show that lasted six months, *The Don and Lois Wilson Show*. He died 25 April 1982.

Winchell, Walter 1897–1972

U.S. Radio Commentator

One of the most popular American radio gossip journalists in the 1940s, Walter Winchell reached a huge audience with his newspaper column and radio program mixture of gossip and news tips, and he became one of the first celebrity journalists to build a career partially in the electronic media.

Origins

Winchell was born in Harlem and had a difficult childhood of poverty and parental discord. He sold newspapers and early on practiced to perform in the vaudeville circuit. He left school in the sixth grade. Working with George Jessel and Jack Weiner as the "Imperial Trio," he began to entertain while still a youngster. He worked through a number of vaudeville troupes until 1918, when he served for five months as an admiral's aide in the navy.

In February 1920 *Billboard* published the first of his columns, "Stage Whispers," which combined gossip and one-liners about Broadway and vaudeville. The column was credited not to the unknown Winchell but to "the busybody." He then began contributing to the new *Vaudeville News* a column called "Newssence." At the same time, he and spouse Rita Greene continued on the vaudeville circuit. He soon moved off the stage and into full-time journalism with "On Broadway"

for the New York *Evening Graphic* (1924–29) and later for the *Daily Mirror* (1929–63). The column would become syndicated in nearly 1,000 papers by the 1930s and 1940s.

Radio Career

Winchell moved into radio for the first time with several guest appearances on various programs and, in May 1930, a program on the Columbia Broadcasting System (CBS) called *Before Dinner—Walter Winchell*, which provided an audio version of what he was writing in his daily column. Shortly thereafter he moved to the National Broadcasting Company (NBC) with a gossip news program three times a week. He was soon tapped to be a part of NBC Red's *Lucky Strike Hour*, having attracted the attention of advertiser George Washington Hill. By 1932 Winchell was being touted on billboards across the country.

Winchell's chief radio vehicle, *Jergens Journal*, began in December 1932 on NBC Blue with a Sunday evening 15-minute broadcast that was briefly carried on CBS as well. The program began with Hollywood and Broadway gossip but moved into political news over time. The program continued on NBC Blue and later on the American Broadcasting Companies (ABC) networks until 1948. His opening line—"Good

evening Mr. and Mrs. North America and all the ships at sea—let's go to press!"—and his tapping telegraph key became nationally recognized. He tapped the key himself (it was mere background noise, as he did not know Morse code) while chattering away at some 200 words per minute. The program was a mixture of rumor and "fact"—and was often wrong. It mixed minor Broadway or Hollywood gossip with more important items. As his fame increased, Winchell basically edited what others often wrote (including many press agents eager for a good mention of their client). He constantly sought—and received—favors from those he covered. Along the way he continued a pattern begun years before with created words and phrases that listeners loved and that often entered the language: "making whoopie" (having fun) and "phfft" (getting divorced) are but two examples.

Throughout this 16-year period sponsored by the lotion company, Winchell was essentially liberal in his views, supporting President Roosevelt, but at the same time cozying up to Federal Bureau of Investigation chief J. Edgar Hoover. He was strongly antifascist in tone. He strode mightily across the New York social scene, holding court at table 50 of the swank Stork Club almost nightly. His was a voice to be reckoned with by Hollywood, Broadway, and even politicians.

After the war this began to change, as he slowly swung to the right and became a critic of President Harry Truman. As complaints rose, Jergens dropped the program. Other sponsors quickly picked up Winchell, who continued on ABC on Sunday evenings until 1955. But the final years of his weekly broadcast took on a darker tone, with constant attacks on the left and support for Senator Joseph McCarthy and others on the far right. His coverage of show business seemed to give way to a sharper political tone, and his once huge audience began to drop off. In 1955 Winchell walked away from a lifetime ABC contract and continued his weekly Sunday program on the Mutual network for two more years. A thinly veiled portrayal of him in the movie *The Sweet Smell of Success* (1957) showed the gossip columnist in the most negative fashion.

Winchell made several attempts in the 1950s to carry his persona to television, but the programs were all short-lived, as his intense approach did not work well on the small screen, seeming dated to younger viewers. In his one television success, he reverted to an audio role as the fast-talking narrator of ABC's *The Untouchables* on ABC from 1959 to 1963. His press column was a shadow of itself by the time the New York

World Journal Tribune closed in 1967, ending his newspaper outlet in New York after more than four decades.

WINS

New York City Station

WINS, important as an all-news radio pioneer in the nation's largest market, traces its history back to the 1920s.

Origins

WINS-AM emerged from pioneering WGBS-AM, part of the Gimbels Brothers department store empire. In 1922 Gimbels had put WIP-AM in its Philadelphia store, and thus it was logical that in 1924 Gimbels would follow with a New York City broadcasting station from its landmark 33rd Street and 6th Avenue location. On opening night, Eddie Cantor was the master of ceremonies, with guests George Gershwin, Rube Goldberg, and the Vincent Lopez Orchestra. In November 1928 Gimbels reorganized its radio operations as the General Broadcasting System and announced plans for national expansion. But the General Broadcasting System failed, and on 10 October 1931, as the Depression deepened, Gimbels sold out to William Randolph Hearst, which changed the call letters to WINS (the *INS* stood for Hearst's International News Service).

In July 1932 WINS moved its studios to Park Avenue and 58th Street. Through the 1930s Hearst tried unsuccessfully to use its newspapers, the *New York Journal-American* and the *New York Daily Mirror*, to make WINS a success by carrying feature stories on station programs and stars, including full listings of the daily schedule. WINS moved to 1010 on the AM dial and to new news studios at 28 West 44th Street in the heart of Times Square. But when these changes brought no higher ratings, in 1945 Hearst sold WINS to Crosley Broadcasting for a reported \$2 million, at the time a record amount paid for a single radio station.

Postwar Changes

The deal was consummated in July 1946, and WINS began to carry programming from WLW-AM Cincinnati, including news broadcasts by Gilbert Kingsbury, the Cincinnati Symphony Orchestra, and *Top o' the Morning*. Crosley also tried *Going to Town*, *Morning Matinee*, and the *Three Corner Club*. New York City was not the Midwest, however, and the station's only ratings winner was New York Yankees baseball.

Crosley owned WINS for seven years before selling the station to a consortium headed by J. Elroy McCaw (a radio station owner on the West Coast), Charles F. Skouras (a movie-theater exhibitor), and Jack Keating (a Honolulu and Portland, Oregon, radio station owner) in 1953. Operating as Gotham Broadcasting, WINS was reformatted as a disc jockey station

centered on the talents of Mel Allen, Johnny Clark, Jack Eigen, and Jack Lacy. A pivotal moment came when WINS's union contract with musicians expired in the summer of 1954, and McCaw said that WINS would no longer air any live music. The American Federation of Musicians protested, but to no avail.

Disc jockeys Murray "the K" Kaufman, Paul Sherman "the Clown Prince of Rock and Roll," Sam Z. Burns, and Herb Sheldin boosted WINS to the top tier of New York radio. Murray Kaufman became so popular that when the Atlantic record label issued Bobby Darin's "Splish, Splash," composer Darin assigned half the publishing rights to Murray Kaufman's mother so that Murray would plug the song on WINS. This transformation had formally begun in the fall of 1954 when McCaw hired Alan Freed from Cleveland. However, Freed proved so controversial that, despite his popularity, he was fired in May 1958. As the "Fifth Beatle," Murray the K would prove a far more lasting figure.

All News

In July 1962 McCaw and his Gotham group cashed in and sold WINS to Westinghouse Broadcasting Company for a reported \$10 million. Westinghouse at first continued to seek a musical format to top market leader WABC-AM, but it never succeeded. So on Monday, 19 April 1965, WINS went to an all-news format, becoming one of the first stations to make what was then considered a radical format transition. Importantly, WINS pioneered the all-news format in the largest media market in the United States. The station donated its massive music library to Fordham University, and a radio era was over.

WINS-AM became the station where New Yorkers tuned to learn about breaking news. In November 1965, when a major blackout darkened northeastern cities, WINS kept millions informed during the crisis as they listened on battery-powered portable radios. That same year WINS-AM became New York City's first all-computerized news operation, but advanced automation sometimes caused problems. For example, in December 1973 the station falsely reported that New York's Governor Nelson Rockefeller had been stabbed during a visit to Atlanta. Better for the station's image was the March 1974 event when Joseph Yacovelli, wanted for nearly two years by New York City police in connection with the shooting death of underworld leader Joseph Gallo, turned himself in at WINS studios. Yacovelli's attorney said that the purpose of broadcasting the surrender was to protect against police "manufac-

ture” of evidence against his client. Credit for arranging the public surrender went to WINS newsman Paul Sherman, long-time friend of Yacovelli’s attorney.

By 2000 WINS was still part of Westinghouse, which was in turn part of media conglomerate Viacom. WINS-AM was simply one profitable AM radio station within a vast group of radio stations, allied with Viacom’s other interest in television and film. To New Yorkers, WINS-AM was still “all news, all the time.”

Wireless Acts of 1910 and 1912; Radio Acts of 1912 and 1927

Pioneering U.S. Legislation

Four acts of Congress concerning radio preceded the definitive Communications Act of 1934. The first two focused on maritime wireless telegraphy and are mostly important as initial precedents. The Radio Act of 1912 was to stand for 15 years and was thus in force for the first seven years of regular broadcasting. Its many defects led to the more complex Radio Act of 1927, many provisions of which remain in force three-quarters of a century later.

Origins

The history of congressional action in the field of communications reaches well back into the 19th century with the Post Roads Act of 1866, in which Congress sought “to aid in the construction of telegraph lines and to secure to the government the use of the same for postal, military, and other purposes.”

As experimental wireless activity increased after 1903, attempts were made to regulate the “wireless telegraph” industry. Between 1902 and 1912, some 28 bills were introduced in the U.S. Congress to deal with the problem of interference. In 1903 Germany called the First International Convention on radio, and the U.S. Navy made its first attempt to regulate wireless transmission. On 12 July 1904, President Theodore Roosevelt formed an inter-departmental radio advisory board consisting of the departments of commerce and labor, navy, war, and agriculture. Its recommendations constitute the first well-defined radio policy of the U.S. government. One of its rec-

ommendations was the necessity for legislation to prevent the control of radio telegraphy by monopolies or trusts by placing supervision in the Department of Commerce and Labor.

In 1906 the German government called the Second International Radio-Telegraph Conference, which was attended by 27 nations. The U.S. Senate’s failure to ratify the resulting Berlin Convention caused all government departments concerned with radio to intensify their efforts to obtain legislation for federal supervision of radio usage. The navy department led these efforts, because the commercial wireless companies and amateur interests were opposed to any legislation that would affect their interests.

The marine disaster on 23 January 1909—when the liner *Republic*, with 440 passengers, collided with the Italian SS *Florida*, crowded with 830 immigrants, virtually all of whom were saved thanks to wireless distress messages—focused the public’s attention on the safety applications of wireless. Within days there was considerable editorial comment on the role wireless had played in limiting the loss of life, creating such a favorable impression that radio, like life preservers, came to be considered a necessity by individual sea voyagers.

Wireless Ship Acts of 1910 and 1912

On 8 February 1909, President Theodore Roosevelt sent a special message to Congress recommending the immediate passage of legislation requiring, within reasonable limits, ocean-

going vessels to be fitted with efficient radio equipment. The Wireless Ship Act of 1910 contained in just one page nearly all that was called for in the 1906 Berlin protocol. The first step to carrying out the provisions of the law was the creation of a radio inspection service.

On the night of 14 April 1912, two months before the Third Wireless Conference was to be held in London, the liner *Titanic*, on its maiden voyage, struck an iceberg 800 miles off the coast of Nova Scotia. The *Titanic* disaster, in which some 1,500 people lost their lives, is often cited as the reason for amending the Wireless Ship Act. However, the subcommittee of the Senate commerce committee had completed its work and the bill had been reported out prior to the *Titanic* disaster. It had become apparent that the United States would have to ratify the 1906 Berlin Convention in order to be invited to a forthcoming London Conference. The new bill became the Wireless Act of 1912. The *Titanic* disaster, however, had awakened congressional concerns for such legislation and ensured its final enactment.

Radio Act of 1912

The Radio Act of 13 August 1912 was a totally new piece of legislation to provide for the licensing of terrestrial (not maritime) radio operators and transmitting stations. For nearly 15 years, radio operators and radio stations were licensed under this law, which was in effect until 1927.

The law was designed to serve two purposes: (1) to promote safety of life and property at sea and to promote commerce by facilitating the dispatch of ships; and (2) to secure the fullest use of radio communication by means of federal regulation, which was made necessary by the fact that in the state of the art at that time, unregulated use and resulting interference would impair or prevent almost all use. To give effect to these two purposes, both based on the Commerce Clause of the Constitution (Article I, Section 8), Congress provided for licensing and entrusted the administration of the system to the Department of Commerce and Labor's Bureau of Navigation, which previously had inspected ships leaving the United States' harbors for proper wireless apparatus.

The term *radio communication* instead of *radio telegraphy* was used throughout the bill so that its provisions would cover the possibility of the commercial development of radio telephony (or the use of radio waves to carry voice and other non-code signals). One feature of the Radio Act of 1912 that had far-reaching consequences was the fact that 19 specific regulations were embodied in the law, and thus no discretion to make further regulations was allowed to the Secretary of Commerce and Labor. It was the judgment of some members of Congress that doing so would be a surrender by Congress of its powers and would, to all intents and purposes, bestow discretionary legislative power on administrative officers.

Secretary of Commerce and Labor Charles Nagel soon attempted to deny a license to a station that was a subsidiary of certain German interests. Germany did not allow American-owned or -controlled stations to operate in that country, and the secretary wished to apply pressure until a reciprocal arrangement could be made with Germany that would allow U.S. capital the right of investing in and controlling corporations organized under German laws. The secretary of commerce asked for an opinion from the U.S. attorney general concerning his licensing power, and on 22 November 1912, he was advised that Congress had not intended to repose any discretion in the secretary. Although the 1912 opinion clearly restricted the secretary of commerce, he used as a lever a clause that directed him to license for the "least possible interference." However, in reality no one had been given the authority to meet the new problems that were to arise with the rapid development of radio telephony. The fact that a "normal" wavelength might be written on the face of the license did not give the Department of Commerce (as it was after 1913) actual power of wavelength assignment.

Nevertheless, the assumption of controls was a step forward, and no serious problems arose for some eight years, until the era of regular broadcasting began in 1920. The development of radio broadcasting was delayed first by the threat of government ownership and then by renewal of the patent wars of the radio manufacturing industry. Bills on behalf of the Navy Department, which desired to take over wireless, were presented in January 1917 and again late in 1918. On both occasions, Congress, reluctant to establish outright governmental control, tabled the proposals. The cross-licensing agreements of General Electric, Western Electric, and Westinghouse in 1920-21, involving some 1,200 radio patents, ended the long patent war in radio.

Early Broadcast Regulation

After 1920, the biggest problems the Department of Commerce faced were the licensing of broadcast stations and the control of interference. Twenty bills were placed before the 67th Congress (1921-23); 13 proposed laws were submitted to the 68th Congress (1923-25); and 18 bills were introduced to the 69th Congress (1925-27)—all to regulate radio communication. Of these 51 bills, only one was to pass both houses of Congress—the Radio Act of 1927. Of importance is what took place while these various bills were being debated.

The first step to controlling interference was the closing down of amateur radio transmission. Another reason for stopping amateur work was the fact that many amateurs were attempting "broadcasting." To prevent this, the Department of Commerce began stipulating on all licenses the material that particular classes of licenses could transmit, restricting music,

weather, market reports, speeches, news, and so forth to the "limited commercial" or broadcasting stations.

Radio conferences were held to obtain industry support. At the First National Radio Telephony Conference, held at Secretary of Commerce Herbert Hoover's invitation in Washington in 1922, priorities were assigned to stations according to the services they rendered, with toll stations (i.e., those that sold their airtime) being last on the list. The concepts that the wavelengths being used were public property, that broadcasting should be performed by private enterprise, that there should be no monopoly, and that there must be regulation by the government were presented at these meetings.

The numbers of stations continued to increase, and time sharing became increasingly difficult. The Department of Commerce made available another wavelength for a special class of stations, called Class B. These stations were to be the higher-grade stations in terms of both equipment and programming. Congestion still grew on all three available frequencies. Time sharing of Class B stations began to be required before 1923. The new station classification system with the extra frequency did not solve the problems of interference or time sharing.

The Department of Commerce then decided that a complete band of frequencies was necessary, with specific wavelengths assigned to cities for use by broadcasting stations in those localities. Upon consultation with the navy, which agreed to relinquish its control of the 600- to 1600-meter wavelengths to obtain new equipment, the band of 500 to 1500 kilohertz was made available exclusively for broadcasting on 15 May 1923.

The Second National Radio Conference in Washington then formally recognized and supported the Department of Commerce's classification system. However, with the increasing number of stations, all of which had great difficulty maintaining a constant frequency with accuracy, the interference and time-sharing problems continued.

A third conference was called by Hoover in an effort to deal with interference. Power increases continued, and experimentation was conducted to reduce the kilocycle separation between adjacent stations. The very success and popularity of broadcasting gave rise to its principal difficulty, which came to a head in 1925. The frequencies of broadcasting stations, which were in 10-kilohertz bands, provided 89 channels or frequencies. Since there were about 578 stations operating in 1925, not every station could have an exclusive frequency, and most of the stations had to share time with one or more stations. This duplicate assignment of frequencies required that stations alternate in the use of the frequencies, for instance, by transmitting on alternate evenings. This was generally recognized as undesirable. In spite of this, the building of stations and the applications for broadcasting licenses increased. Because all of the channels for broadcasting were already completely filled, the Department of Commerce could see no way of complying with more applications.

The discussions at the Fourth (and final) National Radio Conference in 1925 clearly brought out the fact that broadcasting would be harmed unless a severe check were put on the numbers of stations being authorized. The Department of Commerce in 1926 refused to license any further radio stations, leading to increased pressure from those individuals and corporations who wished to enter this growing field. Scarcity inevitably brought about an increase in the practice of renting the airtime of broadcasting stations to parties who wished to reach the public.

The Zenith Radio Corporation, which had obtained a license in 1925 by promising to restrict their schedule to two hours of operation a week, pressed for either increases in broadcast time or another frequency. Without permission, Eugene F. McDonald placed the company's station, WJAZ, in operation on a Canadian frequency. The Department of Commerce initiated court action, and on 16 April 1926, the court found that the Department of Commerce had no right to make regulations other than those prescribed in the Act of 1912 and could not, therefore, limit a license as to frequency.

Secretary of Commerce Herbert Hoover, instead of appealing the court decision, forced the issue by requesting an opinion on his powers from the attorney general of the United States. This opinion supported the WJAZ-Zenith Company decision and restricted the Department of Commerce's powers to the issuance of licenses to any and all applicants. Because of this decision, at least 100 stations changed frequencies, and over 200 were issued licenses when they applied for them. This created chaos. The main difficulty in achieving legislation was resolving the question of which agency should control radio regulation. Secretary Hoover compromised his stand of keeping the control within the Department of Commerce and agreed to leave some control in the radio service and regulatory and licensing control in an independent commission.

Radio Act of 1927

The Department of Commerce's involvement with broadcast regulation diminished but did not cease. The Act of 1927 was an experiment in the field of administrative legislation, as it combined a semi-independent agency with the Department of Commerce's newly formed Radio Division.

First, the Act created a Federal Radio Commission of five members, appointed by the president with the advice and consent of the Senate. The commission was given broad administrative and quasi-judicial powers to classify radio stations, prescribe the nature of their service, assign frequencies and wavelengths, determine locations for classes of stations, regulate the apparatus used, prevent interference through regulation, hold hearings, and summon witnesses.

The Radio Division of the Department of Commerce retained the power to accept applications for station licenses,

renewals, or changes, but these were to be referred to the commission for definite actions. The secretary of commerce might refer to the commission any matter upon which he desired its judgment. An appeal could be made to the commission from any decision or regulation that the Radio Division, through the secretary of commerce, made.

Second, certain purely administrative powers were left in the hands of the secretary of commerce. He was to receive all applications, although he could not act on them. He was to license and fix the qualifications of station operators and suspend such licenses for cause. He was to inspect, through the Radio Division, transmitting equipment; designate call letters; and conduct investigations designed to uncover violations of the act or the terms of the licenses.

Third, this division of labor was to continue for one year only. The secretary of commerce was then to take over all the powers and duties of the Federal Radio Commission except its power to revoke licenses and its appellate powers, and the commission itself was to become merely an appellate body. However, at the end of one year it was apparent that only the worst cases of radio interference had been eliminated, and for the next two years Congress continued the year-by-year status of the commission.

In December 1929 the Federal Radio Commission was made a permanent agency of government. The Radio Division of the Department of Commerce became the field staff of the Federal Radio Commission on 20 July 1932.

The Department of Commerce radio actions influenced almost all of the provisions of the law that was passed in 1927. Through trial and error, the essential ingredients of the regulatory scheme embodied in the Radio Act of 1927 had been developed and refined. The Radio Act of 1927 codified that (1) the radio waves or channels belong to the public; (2) broadcasting is a unique service; (3) not everyone is eligible to use a channel; (4) radio broadcasting is a form of expression protected by the First Amendment; (5) the government has discretionary regulatory powers; and (6) the government's powers are not absolute. Perhaps most importantly, the 1927 law created the principal under which radio was to be regulated—"the public interest, convenience, or necessity," a phrase not

defined in the act. Carried over into the definitive 1934 Communications Act, and still in force, the words have been variously defined over the years by the courts, adding to a considerable degree to the Act's flexibility.

Wire Recording

Early Means of Radio Recording

Wire recording technology, used briefly in the 1940s, was an interim approach to recording of radio programs. It helped mark the transition from electrical transcriptions in the 1930s to the soon-to-be-developed plastic tape recording process introduced in the late 1940s and widespread by the 1950s.

Origins

The phonograph and later the wire recorder were developed as dictation devices for stenographers, not for entertainment value. After the 1877 invention of the phonograph, Oberlin Smith, an American mechanical engineer, suggested in the September 1888 issue of *Electrical World* that a thread or ribbon of magnetizable material could record and play sound electromagnetically.

Building on Smith's suggestion, Danish inventor Valdemar Poulsen built the first magnetic recorder in 1893 using a steel piano wire. Poulsen's "telegraphone," patented in 1898, was designed as a dictation device for office use and as an alternative to the phonograph. A working model was demonstrated at the 1900 Paris Exposition and was apparently received well, winning the *Grand Prix*. It was capable of recording for 30 minutes with the wire traveling seven feet per second. Following the device's success, Poulsen and others searched for financial backing but were not successful.

Early wire recording had inherent technical problems. The first wire recorders utilized acoustical (mechanical) technology as opposed to electronic recording. This frequency response was limited; the dynamic recording range did not exceed about 20 decibels, and there were high noise levels and low acoustical output in comparison with other mechanical systems then in place. In time some of these technical problems were overcome. Wire recorders recorded crosswise in a perpendicular direction as opposed to longitudinal magnetization. The discovery of AC or high frequency bias technique and better recording head design aided the process.

Most wire recording improvements occurred in Europe. In 1930 several movies were completed by Ludwig Blattner in England using a sound track recorded on synchronized steel tape. The British Marconi Company acquired Blattner's company and improved the recorder (called the "Blattnerphone") to produce the "Marconi-Stille" machine used by the British Broadcasting Corporation (BBC). But this machine weighed almost a ton and thus was not portable.

In Europe the "Dailygraph" was a wire recorder used for dictation and telephone recording by the Echophone Company. One interesting feature was the device's cartridge loading

capability. In 1933 the C. Lorenz Company sold the "Textophone," an improved version of the Dailygraph that featured wire or steel bands. Both machines were used throughout Europe to provide a central station telephone answering service or for centralized office dictation systems. The machine was eventually used by Nazi party officials in 1933.

About this time various versions of tape recording entered the marketplace. One example was the "magnetophone" exhibited at the 1935 Radio Exposition in Berlin. The medium used was a 6.5-millimeter-wide plastic tape. Another machine, the German "Lorenz Stahltonmaschine," used steel tape. Other steel tape machines followed.

Government-operated radio systems were another catalyst for the development of wire recording in Europe, as a method of storing programming and broadcasting programs across various time zones was needed. Military interest in the United States also spurred wire recording. Immediately prior to the U.S. entry into World War II, wire recorders built by Armour Research Foundation were used for research in submarine detection, language classes, and music recording. Wire recorders also were used increasingly by the U.S. military in the war effort. Manufacturers included Peirce Wire Recorder, the Armour Research Foundation, and Minifon.

An early American pioneer in the development of wire recording was Marvin Camras (1916–95). In 1938 he helped develop a consumer wire recorder, "Model 50," from the Armour Research Foundation. The U.S. military used these wire recorders to train pilots. They were also used to record battle sounds and then play them back, amplified, in places where the D-Day invasion would not take place, thus deceiving the German military. Brush Development (a company in Cleveland, Ohio) also designed and built wire recorders for the U.S. military. One model had a magazine that totally enclosed the spools of wire, level winders, heads, and indicators; it also featured bronze wire. (The first use of stainless steel in 1943 was an important development for wire recorders. It was magnetically superior to previously used carbon steel and even to chromium and tungsten alloy magnet steels; it did not rust or corrode.)

Active Use

After World War II, the production of consumer wire recorders increased until it peaked around 1948. Webster-Chicago and Sears, Roebuck and Company began large-scale wire recorder production. Wire recorders were an alternative to high-priced dictation equipment as they featured advanced

electronics and were erasable, a feature not feasible with wax or vinyl. A typical wire machine would use a wire gauge from .004 to .0036 inches. At a speed of 24 inches per second, typical recording time would be 15 minutes, 30 minutes, or one hour. Magnecord produced a wire machine with a frequency response from 35 to 15,000 hertz and flutter below 0.1 percent. (School systems had been among the first to buy wire recorders; a typical model would cost about \$150, an affordable price for many school systems. However, the wire would easily snarl and the devices were too difficult for young children to use.)

One of the most popular models was the Webster-Chicago (Webcor) Model 80 because of its low cost, portability, and relative reliability. A similar model was built by Crescent Industries of Chicago. A compact automobile recorder was built by WiRecorder Corporation of Detroit. However, it saw only limited production. Utah Radio Products introduced its "Magic Wire" machine in 1945, touting its ability to record up to 66 minutes of talk or music on one spool. Advertisements emphasized the point that the portable recorder-reproducer had been originally developed for the military.

The value of wire recorded audio segments became clear in postwar radio news departments, several of which were using the device by 1946 and 1947. In January 1948 Mutual's Washington bureau reported that the chairs of all congressional committees had agreed to wire recorder use in committee sessions. By this time some reporters were using wire recorders to

create "cut-in" recordings that allowed the broadcast of speech or interview highlights within newscasts.

Decline

The rise of a vastly improved competing device—plastic tape for recording—soon spelled the end of wire recording as a mainline technology. The formation of Ampex in 1946 (and the financial support of its research by singer Bing Crosby) helped to focus work on seeking an effective means of recording popular weekly shows to avoid live rebroadcasts for different time zones. Wire recording continued to be used for many years by military personnel, who appreciated the ruggedness of the equipment and had less need for high fidelity recordings.

WJR

Detroit, Michigan Station

Perhaps best known in the latter half of the 20th century for its award-winning news, documentaries, and sports coverage, WJR is a 50,000-watt clear channel station with a long and colorful broadcast history.

Origins

When newspaper rival *The Detroit News* put its station WWJ on the air in 1920, *Detroit Free Press* owner and publisher E.D. Stair felt compelled to begin his own station. So WCX, WJR's precursor, began broadcasting on 4 May 1922 from a studio located on the ninth floor of the Free Press Building. Operating at 580 kilohertz, WCX became known as "The Call

of the Motor City." One of its popular programs was a variety show called the *Red Apple Club*, named after WCX's first manager, C.D. Tomy, who offered a "nice red apple" to the first person to call in with the name of the next singing guest. Tomy later became "Uncle Neal" to two generations of listeners who grew up with his children's programs on WJR.

On 16 August 1925, the Jewett Radio and Phonographic Company of Pontiac bought into WCX and moved it to the Book-Cadillac Hotel. The station became WCX/WJR (the "JR" stood for Jewett Radio). Power was increased from 517 watts to 5,000 watts, making it the second "super power" station in the country (Cincinnati's WLW was the first). For more than two years the *Free Press's* WCX broadcast news, sports

and *The Red Apple Club* while WJR aired commercial programs on their shared frequency.

On 20 December 1926 WCX's call letters were changed to WJR and it moved from 580 to 680 kilohertz. Jewett had hired Leo J. Fitzpatrick, a popular personality from Kansas, as program director in hopes of increasing sales of his radios, but Jewett went out of business. It soon became clear to most radio manufacturers who owned radio facilities that stations could not survive on radio set sales alone.

In 1926 WJR offered several religious programs on a commercial basis, and Sundays were especially profitable. Now station manager, Fitzpatrick persuaded Father Charles Coughlin of the Shrine of the Little Flower in Royal Oak to experiment in using radio for fund-raising. The program was a success and the controversial priest soon became known over the Columbia Broadcasting System (CBS) network for his vitriolic political views.

George A. Richards (president of Pontiac automobiles of southern Michigan) and the Richards-Oakland Motor Car Company bought the *Detroit Free Press's* interest in WJR in 1927 and constructed a street-level studio for it in a show-room in the General Motors Building. It was perhaps the only station in the country to operate a ground-floor studio, and entertainers could be seen by passersby. Its new slogan was "The Goodwill Station." In April 1927 WJR/WCX became affiliated with the Blue Network of the National Broadcasting Company (NBC), and in 1928 the WJR orchestra was formed, beginning almost 40 years of music performed live by various WJR staff.

After the Federal Radio Commission revised the entire broadcasting band in 1928, WCX/WJR moved to 750 kilohertz. In December 1928 WJR physically separated from WCX. The station installed studios in the new Fisher Building for a token rental fee and regular on-air mentions of its location. On 17 April 1929 WJR bought all of WCX's equipment and WCX left the air. In July 1929 WJR, the Good Will Station, was formed.

In 1932 WJR increased its power to 10,000 watts and became "In the Golden Tower." Programs during the 1930s included *Detroit Police Drama*, based on actual crimes, and *The Seven-Day Trial of Vivienne Ware*, featuring Judge John Brennan overseeing a trial and then basing his verdict and sentence on listener votes.

WJR switched from the NBC network to CBS in 1935 and constructed a 50,000-watt transmitter. On 29 March 1941 WJR moved again from 750 to 760 kilohertz, where it remains today. In 1942 it began operating 24 hours a day. Future Federal Communications Commissioner (FCC) James H. Quello was hired in 1947 as publicity and promotions director, rising to become vice president and station manager of WJR 22 years later.

In the 1940s WJR created hundreds of special programs devoted to the war effort. In 1944 owner George Richards began *Victory F.O.B.*, a series that featured a businessman supposedly discussing postwar problems. By this time Richards owned two other 50,000-watt stations. It had become clear that he had a strong political agenda and wished to use his stations to further his causes. According to broadcast historian Erik Barnouw, Richards wanted to use *F.O.B.* to influence the 1944 and 1948 elections. He had a history of encouraging both anti-Semitism and comments against President Franklin D. Roosevelt on his stations. A petition in March 1948 to the FCC from the Radio News Club of Southern California accused Richards of instructing his newsmen to slant, distort, and falsify news. It led to a struggle by Richards to keep his station licenses. Richards died in 1951 during the extensive hearings, but the station licenses were renewed by his family.

The Modern Station

By the late 1950s WJR had developed an intensive news schedule, producing eight five-minute daily newscasts as well as five-minute network news summaries throughout the day. A variety of programs aired in the 1950s, including symphony concerts, opera, and sports. Rock and roll was excluded, according to then executive vice president Worth Kramer, because it was "music to steal hubcaps by." Popular host J.P. McCarthy began at WJR in 1956 as a staff announcer and took over *Music Hall*, a morning music show, in 1958. He went on to dominate the Detroit market for many years with his blend of music and talk on WJR. In 1959 the station left the CBS network to commit itself to more local programming.

CBS and WJR joined forces again on 30 December 1962. CBS agreed to let the popular WJR censor any network advertisements and programs. It was the only CBS station in the country that didn't broadcast Arthur Godfrey's show live, as it aired at the same time as WJR's showcase program, *Adventures in Good Music* (hosted by Karl Haas, the station's director of fine arts). One of the most celebrated educational programs during the 1960s was the award-winning *Kaleidoscope*, a blend of recorded music and dramatic narrative on a particular topic, hosted by Mike Whorf. WJR was sold to Capital Cities Broadcasting Corporation on 9 September 1964. Its on-air slogan became "The Great Voice of the Great Lakes," and it changed to a middle-of-the-road talk and variety format.

On 1 January 1976 WJR dropped its CBS affiliation and joined the NBC radio network. In early 1983 WJR "Radio 76" began C-QUAM stereo broadcasting. When Capital Cities Broadcasting merged with the American Broadcasting Companies (ABC) in the spring of 1985, WJR's NBC affiliation was dropped for the ABC Information Network.

In 1990 WJR changed to an adult contemporary music/news/talk format but dropped the music in 1993. On 9 February 1996 Capital Cities/ABC, including WJR, was purchased by the Walt Disney Company, and its licensee name was shortened to ABC. WJR continued into the 21st century as "The Great Voice of the Great Lakes" with its award-winning news and sports coverage.

WLAC

Nashville, Tennessee Station

WLAC is the powerful radio station in Nashville, Tennessee, that played an influential role in the national diffusion of music recorded by African-American artists from the late 1940s through the mid-1960s. The call letters represent the Life and Casualty Insurance Company of Tennessee, which established the station in 1926. In its early years WLAC was known as the "Thrift Station," reflecting the inscription "Thrift—the Cornerstone" chiseled on the Life and Casualty headquarters building in downtown Nashville.

After operating the station for about a decade, in 1935 Life and Casualty sold WLAC to a company executive, J. Truman Ward. During Ward's tenure as licensee, WLAC enjoyed a close relationship with the Columbia Broadcasting System (CBS). Ward's station manager, F.C. Sowell, served as head of the CBS affiliate group, and the network carried a few of WLAC's local programs coast to coast.

WLAC began operation with 1,000 watts of power and increased to 5,000 watts within a few years, but in 1941 Ward won a class 1-B clear channel assignment. For full-time operation with 50,000 watts at 1510 kilohertz, WLAC engineers designed a new transmitter facility about seven miles north of Nashville. The antenna system accentuated night-time skywave radiation, resulting in a reliable signal that carried the CBS prime-time schedule into 28 states and parts of Canada.

Following World War II, WLAC developed a lucrative niche advertising market by promoting the products of the many small, independent record companies of the period that specialized in "race music" or "sepia and swing." Sometime around 1946 or 1947 WLAC announcer Gene Nobles began to generate a large volume of mail by playing African-American artists on a late-night disc jockey program sponsored by a

middle-Tennessee record store. WLAC's management soon recognized the revenue potential of selling access to its widespread night-time audience on a per-inquiry (PI) basis. As network programming dwindled, PI programming on WLAC was gradually extended into the earlier evening hours. During the height of WLAC's PI years, the station maintained a large mail room to handle the orders for products advertised nightly such as 45-rpm recordings, pomade, petroleum jelly, and live baby chicks. These orders were delivered daily to the station by the postal service in large canvas bags. WLAC also sold blocks of time at night for paid religious broadcasts.

In addition to Gene Nobles, the night-time announcing staff included Herman Grizzard, John Richbourg ("John R"), Bill Allen ("The Hossman"), Hugh Jarrett ("Huey Baby"), and newscaster Don Whitehead. The music varied according to the products being pitched. On-air descriptions included "the sweet and the beat," "rock and roll," "rhythm and blues," "spirituals," and "gospel." Several African-American artists who became major recording stars after Motown brought rhythm and blues music into the cultural mainstream have attributed their early success to WLAC airplay in general and in particular to Bill Allen and John Richbourg, both of whom maintained close ties to the recording industry.

Truman Ward sold WLAC back to Life and Casualty in 1953 during the early years of the music-and-news era. His son, Jim Ward, later served as the station's general manager during Life and Casualty's second period as licensee. Although well positioned for a television license, Life and Casualty chose to merge interests with two competing local applicants in order to facilitate the construction of Nashville's third television station, WLAC-TV, in 1954. From 1964 to 1967, WLAC-TV

aired a local weekend variety program, *Night Train*, which featured many of the African-American artists heard nightly on WLAC "blues" radio.

Life and Casualty also operated a successful separately programmed FM station during the 1960s and 1970s. From studios on the observation deck of the company's Nashville skyscraper—the tallest building in the southeastern United States when built in 1957—WLAC-FM featured an easy listening format that introduced many middle Tennesseans to FM.

It is important to recognize that during the day, when its signal covered a 125-mile radius of Nashville, WLAC sounded like an entirely different radio station from the one listeners in distant places received via night-time skip signals. Daytime listeners in middle Tennessee, southern Kentucky, and northern Alabama heard a full array of mass-appeal adult programming that included CBS news and features, local news and interview programs, editorials by F.C. Sowell ("The South's Foremost Radio Commentator"), helicopter traffic reports, and upbeat middle-of-the-road music.

In 1971 WLAC introduced Nashville's first news-talk format, but the next year the station dropped its CBS affiliation and switched to a Top 40 music format. WLAC enjoyed several years of good audience ratings with Top 40. It was during those years that the station gradually retreated from its legendary night-time schedule. John Richbourg retired in 1973 rather than play Top 40 music. Bill Allen and Gene Nobles continued to host a few late-night PI shows for long-time sponsors, but by 1977 Top 40 music aired until midnight. The PI and paid religious programming that had distinguished WLAC from other clear channel stations was relegated to overnights.

In 1968 the Life and Casualty Insurance Company of Tennessee was acquired by American General, the Houston-based insurance conglomerate. Life and Casualty's 50 percent interest in WLAC-TV was sold in 1975, and in 1977 WLAC AM-FM were sold to the publishers of *Billboard* magazine.

By 1980 historians of popular culture had begun to recognize Gene Nobles as the first person in the United States to play "race music" on a "power" station. WLAC's impact as a principal conduit of rhythm and blues music throughout the eastern half of North America during the 1950s and 1960s has made it one of America's most frequently cited radio stations in historical treatments of the early rock and roll era. In 2003 WLAC was again a CBS affiliate and featured an award-winning all-news-talk format.

WLS

Chicago, Illinois Station

Chicago's WLS-AM started as WJR, but in April 1924 the Sears-Roebuck company took over the station and renamed it—in one of the most famous of radio's early logos—for the "World's Largest Store." First under Sears, then after 1928 under a new owner—the *Prairie Farmer* magazine—and finally later in the 20th century under the American Broadcasting Companies (ABC), WLS-AM has long helped define radio broadcasting in Chicago and the upper Midwest. Clear channel status, granted in the early 1930s, made WLS-AM a fixture

in homes from Minnesota to Ohio, from the Upper Peninsula of Michigan to the cotton fields of Arkansas and Mississippi.

WLS-AM ought to be remembered as the home base for one of radio's most popular programs of its golden age. Although the *Grand Ole Opry* survived longer, the WLS *National Barn Dance* before World War II pulled in a far larger listenership and ranked as America's most popular country music program. After being picked up by the National Broadcasting Company (NBC) network in 1933, the *National*

Barn Dance expanded to all Saturday night once *Prairie Farmer* took charge. Renamed simply *The WLS National Barn Dance*, the show became an NBC Saturday night fixture. Indeed, it was only seven years later, in 1940, that NBC paired the *WLS National Barn Dance* with the *Grand Ole Opry* on the network. The two programs battled evenly during World War II, but the postwar years saw the *Opry* surpass its predecessor in ratings. In time, country format radio, playing recorded music, would replace all barn dance live radio shows—except for the *Opry*.

Still, WLS-AM offered more than the *Barn Dance*. *Prairie Farmer* sold not only its magazines, but also membership in the WLS–Prairie Farmer Protective Union, which promised farmers that it would keep thieves away from listeners’ farms. Resident announcers, such as Hal O’Halloran, Martha Crane, Al Rice, Jack Holden, Margaret McKay, and Bill Cline became household names. Ralph Waldo Emerson, organist for WLS, offered an alternative to string hillbilly music. Bill Vickland, the voice of the *Book Shop*, produced live drama. The Sunday School Singers Trio was heard each week on the *Cross Roads Sunday School*. The WLS Staff Orchestra, under Herman Felber’s direction, played Tin Pan Alley standards and the latest big band hits. The Chicago Gospel Tabernacle offered another alternative. And Jim Poole offered the necessary reports from the Chicago Live Stock Exchange.

WLS-AM became part of the ABC radio network in 1960. By then, in response to the ascendance of television, WLS-AM needed to reinvent itself. In May 1960 it joined the Top 40 ranks and helped bring mainstream rock sound to the Chicago

area through the 1980s. New management hired and promoted many local disc jockey stars—none hotter or more famous than Larry Lujack, who, based at WLS-AM, became one of the symbols of the Top 40 era.

In the 1990s, WLS-AM became news plus talk radio 890, adapting to the new ownership by the Walt Disney company in 1995. The program lineup by 2000 included Dr. Laura Schlessinger, Rush Limbaugh, and Electronic Town Hall meetings over radio.

WLW

Cincinnati, Ohio Station

“The Nation’s Station,” founded in Cincinnati in 1922 by Powel Crosley, Jr., was for many years the United States’ most powerful radio station, not only in wattage but in the wide geographical range of its audience. From 1935 to 1939, it used 10 times the wattage allowed today. WLW produced and broadcast popular local programming over a large area in Ohio, Indiana, and Kentucky, and also had listeners in Michigan, West Virginia, Illinois, and Tennessee—and in many more states at night. Numerous stars began their careers at WLW (the talent roster includes Fats Waller and Rod Serling), and the station developed programs that were later carried on the national networks. After nearly 80 years WLW remains the

most popular radio station in Cincinnati and a large surrounding area, aided by its favorable combination of power and frequency—50,000 watts at 700 MHz.

Origins

Crosley, a manufacturer in Cincinnati, Ohio, became interested in radio in 1921 when his son asked for a “radio toy” as a birthday present. Crosley’s interest in radio grew to fascination as he built a set for his son from an instruction booklet and an assortment of loose parts. That same year he started an amateur radio station in his home, licensed as 8XAA, and within

about a year the Crosley Manufacturing Corporation was the world's largest manufacturer of radio sets and parts. In March 1922 Crosley's station was assigned (at random, as was the practice) the letters WLW as a call sign for a "land radio station" of 50 watts on 360 meters. Such a station could have had a range of about 100 miles, but it shared that frequency with hundreds of other stations.

Because he was manufacturing small, inexpensive, and therefore less sensitive radio receivers, Crosley had a more compelling interest in higher power than did many other radio broadcasters. The station's power was increased to 500 watts in April 1923, then to 1,000 watts a year later, and the Commerce Department announced it might use five kilowatts on a "strictly experimental" basis.

At first WLW was operated mainly to provide programming for purchasers of Crosley radio sets "as a medium of advertising and publicity." The company's weekly magazine, distributed to radio retailers and purchasers of new sets, asked listeners to fill out a questionnaire to vote for the type of programs they would most like to hear, out of a choice of music, talk, and drama categories.

The station's earliest programs were musical variety shows featuring amateur talent, talks, and soloists. In August 1922 Crosley hired Fred Smith as station director; he was WLW's first employee. Smith, who later conceived of the news digest program that became *The March of Time*, inaugurated a regular daytime schedule of market reports, financial news, weather, and recorded music. For the evening hours he arranged musical variety shows and live music remotes. Smith also wrote original radio dramas, the first of which aired on 22 December 1922. On 3 April 1923, WLW broadcast *When Love Wakens*, an original play that Smith wrote especially for radio—probably the first in radio history—and for one station in particular (note the title's initials).

Fred Smith tried many other formats at the station, too, to provide entertainment and information, such as programs for children, lectures to teach swimming, and re-creating a boxing match based on telephone reports from a station staff member at the arena. He also read news items interspersed with musical selections played by an organist in the studio; Smith later revised this news digest program as the basis for the news drama program *The March of Time*.

The U.S. Commerce Department designated WLW as a class B station in June 1923, making the Cincinnati station one of only about 39 (of 500 total stations) in the United States that could use higher power. When the Federal Radio Commission (FRC) set about "cleaning up the broadcast situation" and announced frequency assignment for 694 stations beginning 1 June 1927, WLW was assigned 700 kilocycles (kHz). Soon it was the only station in the United States using that frequency, and thus became a "clear channel" station. It was one of only ten stations using five kilowatts of power, and it grew

more powerful after 25 May 1928, when the FRC authorized WLW to begin construction of facilities for 50 kilowatts. At that time there were probably only four other stations with that output, but WLW's staff kept producing original programming that (in Crosley's view, anyway) warranted further expansion.

By the late 1920s, WLW was affiliated with both the NBC Red and Blue networks, but the station originated more expensive and high-quality local programming than most other stations in the country. Only the network-owned stations in New York, Los Angeles, and Chicago had staffs as large as WLW's. In June 1929, a hookup was arranged connecting WLS Chicago, WOR New York, and WLW. The Quality Radio Group, as the coalition came to be called, carried each other's programs and made available to advertisers a huge audience in most of the northeastern United States. In 1934 WLW got together with WOR New York, WGN Chicago, and WZYZ Detroit (with its prize show *The Lone Ranger*) to establish the Mutual Broadcasting System (MBS).

Superpower Experiment

In June 1932 the FRC authorized WLW to construct a 500-kilowatt (500,000-watt) experimental station and to conduct tests from 1 A.M. to 6 A.M. On 2 May 1934, the station began using this "super power" at all hours after a dedication ceremony in which President Franklin Roosevelt activated the new water-cooled transmitter by pushing a gold key on his desk at the White House. This power increase allowed WLW to transmit with ten times more power than any other AM station—then or now—until 1 March 1939, when the Federal Communications Commission (FCC) refused to renew the "experimental" license for higher power. After a Canadian station in Toronto complained of interference with its signal on 690 kHz, WLW was briefly limited to 50 kilowatts after local sunset. Soon a directional signal was arranged so that no more than 50 kilowatts was transmitted northwest of Buffalo, New York.

The decision to end the 500-kilowatt experiment was controversial and complex for political and technical reasons, but it was primarily the result of complaints by other stations resentful of WLW's enormous economic advantage. A "sense of the Senate" resolution had been passed that directed the FCC to limit stations to 50 kilowatts. The resolution stated that an increase of superpower stations in the United States (at least 15 other clear-channel licensees had applied to the FCC for superpower status) would deprive other local and regional stations of valuable network affiliations and national advertising revenues.

Although its 500-kilowatt experiment was discontinued, WLW had proved that higher power was possible, that it did not cause more than normal interference with adjacent stations,

and that it did not blanket out other stations for nearby listeners. Many other AM stations around the world soon began using this much and even more power. However, it was because of its superior programming, not its powerful wattage, that WLW achieved much higher ratings than even the hometown station in many cities in its vast coverage area, which extended in a circle around Cincinnati stretching nearly to Chicago, Detroit, Pittsburgh, and Nashville. (As an indication of WLW's reach, one fundraising appeal during floods on the Ohio River brought donations from 48 states.) In 1936, as part of an FCC study of channel allocations and utilization, a survey returned by more than 32,000 rural listeners (of 100,000 surveys mailed) showed that WLW was by far the favorite station and the listeners' first choice in 13 states and second in six more, from Michigan to Florida and Texas. While its powerful signal made WLW available in homes out of the reach of many other stations at night, its popularity derived from its use of the most popular shows from four networks, a large staff of local talent and specific programming—especially in the early-morning hours aimed at farm audiences—and its geographical position near the center of the agricultural Midwest.

WLW also began a shortwave service and relayed the station's programs around the world until the facility was taken over during World War II for government wartime propaganda broadcasts. In 1942 six new transmitters installed at that facility became the largest installation for Voice of America.

During the 1930s WLW's staff numbered about 350, of whom about 200 worked in the programming division. The station carried programs from both NBC networks (Red and Blue), CBS, and MBS. The station called itself "The Cradle of the Stars," in reference to those who worked there early in their careers, including Virginia Payne (who created the serial heroine Ma Perkins), the Mills Brothers, Andy Williams, writer Rod Serling, Betty and Rosemary Clooney (their younger brother Nick was later a news anchor at WLW's television affiliate), the McQuire Sisters, actor Frank Lovejoy, Red Skelton, Durward Kirby, Eddie Albert, Thomas W. "Fats" Waller, Red Barber, the Ink Spots, Norman Corwin (who quit after only a few weeks when the station refused to broadcast news about labor strikes), and Erik Barnouw. Many performers soon moved on to stations in New York, Chicago, and Los Angeles, and some joked that the call letters WLW stood for World's Lowest Wages.

In the 1930s about 50 percent of all WLW programming was local, 40 percent in evening hours. The station's staff originated programming carried on NBC, especially variety and hillbilly (later called country) music, and many Mutual programs. It also produced original drama—some destined for the networks included *Ma Perkins* (soap opera) and *Mr. District Attorney* (crime). In the late 1930s, station executives added a great deal of agriculture programming, and WLW even started

its own experimental farm in an attempt to retain the 500-kilowatt superpower transmitter by providing more unique and rural programming.

The station produced popular early morning hillbilly variety programs and, in cooperation with Ohio State University and the state's department of education, an educational series for in-school listening. WLW was a "regional" service, nearly a network unto itself. The same could be said of other major clear-channel stations such as WGN, WCCO, and WSM, but none matched WLW's quantity of original local programming.

Postwar Change

From 1949 to April 1953, as the station sought to duplicate the huge WLW AM coverage in the new medium of FM (frequency modulation), WLW's programming was broadcast simultaneously on FM stations in Cincinnati, Dayton, and Columbus, Ohio, but the growth of the FM audience was slow. The company concentrated on television. Many WLW radio programs were first simulcast on the television outlet, then later were shown only on TV. In 1955 WLW was the first radio station to provide weather forecasts based on radar (which it shared with the TV station), and in 1958 it became one of the first with helicopter traffic reports. In the 1960s WLW often ranked only third or fourth in Cincinnati ratings (losing out to Top 40 formats), but it had the largest total audience of any station in the city because of its larger coverage area. For example, in 1961 Nielsen reported WLW as having listeners in 184 counties in four states.

As network programming declined in the last half of the 1950s and into the 1960s, WLW became what was often called a Middle of the Road (MOR) station, producing "magazine" programs of news, information, talk, and limited amounts of recorded music during the morning and afternoon hours. Other types of music, including classical all night long, filled most of the rest of the hours. The station's format in the 1970s and 1980s was "adult contemporary." In the 1990s and into the new century, by which time there were many competing stations with a variety of popular music formats (most derived from the earlier Top 40 formula), WLW was usually the station with the highest audience share in the Cincinnati market. The station consistently maintains the largest total audience of any Cincinnati station because it reaches audiences over a wide area in Ohio, Indiana, and Kentucky.

Modern WLW

The programming on WLW is now what is generally described as "full service," being a combination of news, talk, and sports with well-known local personalities—a format that is usually found only on a few stations (mostly 50-kilowatt stations) sim-

ilar to WLW in the largest markets with very big revenues. More news and information are offered during peak listening times in the mornings and afternoons. Evenings are generally call-in talk, including sports. Typically WLW has slightly higher overall ratings during the summer and spring, when Cincinnati Reds play-by-play baseball is broadcast.

At the turn of the century, WLW was estimated to have revenues of about \$21 million, which would place it in the top 20 of all-talk, news/talk and so-called full service radio stations. All the other full service stations earning more money were in markets larger than Cincinnati (ranked 26th in radio), mostly in New York, Los Angeles, and Chicago, the three largest markets. It is regularly rated among the top 20 stations in other markets in a radius of 35 to 135 miles from its transmitter in Mason, Ohio, such as Dayton, Columbus, Lima, Lexington, and Fort Wayne. After several changes of ownership and mergers, WLW is now owned by Clear Channel Communications, which operates seven other facilities in

the market, and owns more radio stations than any other single company.

WMAQ

Chicago, Illinois Station

The origins of WMAQ-AM go back to the beginnings of radio when, in the spring of 1922, the *Chicago Daily News* put WGU on the air as a 500-watt forerunner of what the National Broadcasting Company (NBC) would turn into a mighty 50,000-watt broadcast giant. In 1923 the station acquired formal studios in the LaSalle Hotel; in 1929 the station moved to the new *Daily News* building. Two years later, on 1 November 1931, WMAQ-AM was purchased by the Radio Corporation of America's (RCA) NBC, which moved the studios to the Merchandise Mart and made WMAQ a flagship station.

WMAQ-AM remained a key NBC-owned and -operated station until General Electric (which purchased RCA, NBC's parent, in 1985) sold it to Group W in 1988. (There was also a WMAQ-FM, which was sold in the early 1970s.) The related television operation—also named WMAQ—was also an NBC-owned-and -operated station in Chicago.

NBC's acquisition of WMAQ-AM gave the network primary Chicago outlets for both its Red and Blue network programming, because WENR-AM had been purchased by NBC earlier. WMAQ-AM was a programming pioneer. Freeman Gosden and Charles Correll started *Sam 'n' Henry* for WGN-AM, but they moved to NBC and WMAQ to become *Amos 'n' Andy* in 1929. Another one of WMAQ's biggest achievements

was the discovery of a new act by Marian and Jim Jordan, later widely popular on the show *Fibber McGee and Molly*, who made their first appearance on radio in February 1931. Other first-timers were Count Ilya Tolstoy, son of the noted author; Cyrens Van Gordon, opera star; Lorado Taft, the sculptor; Rosa Raisa, the famed soprano; George Arliss; Ben Hecht; Otis Skinner; Ruth Chatterton; and Jane Addams.

Indeed, the station was within a day of being six months old when it presented the first music appreciation program—on 12 October 1922. Mr. and Mrs. Max E. Oberndorfer began a series of broadcasts with an analysis of the opening program of the Chicago Symphony Orchestra that year. On the following day, WMAQ-AM led the radio industry into the field of children's programs with Mrs. Oberndorfer's *Hearing America First* series. This phase of broadcasting was expanded on 16 October of the same year when Georgene Faulkner, the "Story Lady," gave the first of her *Mother Goose* broadcasts. On 28 November 1922, the first educational broadcast was presented by WMAQ when Professor Forest Ray Moulton, head of the astronomy department at the University of Chicago, gave a lecture on "The Evening Sky." It was the first in a series of broadcasts by University of Chicago professors and was the forerunner of the *University of Chicago Round Table*.

WMAQ-AM also led the field in sports and news broadcasting. It presented one of the first daily play-by-play descriptions of major-league baseball on 20 April 1925 and one of the first play-by-play descriptions of a football game on 3 October 1925. For news, WMAQ-AM ran the first transatlantic news broadcast in history, on 4 December 1928, which consisted of a telephone conversation between John Gunther, then *Chicago Daily News* correspondent in London, and Hal O'Flaherty, then foreign news editor of the *News*, regarding the condition of King George V, who was seriously ill. WMAQ-AM was also the only Chicago station to broadcast the first presidential inaugural ever put on the air, that of Calvin Coolidge, on 4 March 1925.

That the best in radio entertainment was continually on WMAQ-AM is obvious after a glance at a list of stars, both past and present, who made their radio debuts over Chicago's oldest station. Wayne King, for instance, made his first broadcast anywhere over WMAQ-AM on 28 January 1928. Fred Waring and his Pennsylvanians made one of their earliest broadcasts on WMAQ in August 1922; Ed Wynn made his ini-

tial radio broadcast in October 1922; Vincent Lopez made his radio debut in September 1924; and so on.

Because of the success of WMAQ-TV, WMAQ-AM, as a NBC network mainstay, had to reinvent itself as TV forced radio's redefinition. It was never very successful, and so few were surprised when WMAQ-AM was acquired by Westinghouse and became a news/talk station, still based in the NBC Tower on North Columbus Drive.

WNBC

New York City Station

Begun as WEAJ by AT&T in 1922 and becoming the flagship of the new National Broadcasting Company (NBC) network in September 1926, this network-owned-and-operated station's call letters changed to WNBC in November 1946 as part of a process of "rationalizing" network station call letters in the city. Operating with 50,000 watts on 660 kilohertz, WNBC was both the network flagship and a local market station.

With the decline in network radio in the early 1950s, WNBC took on a middle-of-the-road format like many other big-city stations, offering a variety of programs aimed at different tastes during the day, trying to provide something for everyone. Boston radio humorists Bob and Ray joined the station in 1951 with their parade of characters and radio take-offs. Public service features such as daily pollen counts and traffic reports became important program elements by mid decade. From 1954 to 1960, WNBC became WRCA to better promote the initials of owner Radio Corporation of America (the NBC call letters went to a network-owned UHF television station in Connecticut, so the network did not lose control of the identity).

WNBC, as with most stations, had for its entire history signed off the air after its late-evening programs concluded. Beginning in 1952 it began to provide 24-hour service with the *Music through the Night* mixture of easy talk and both classics and light classical music. In 1959 daytime programming featured "wall-to-wall" music, a combination of easy listening and pop tunes and talk. For a time the program could be heard in a kind of stereo with one channel broadcast on the network's AM outlet and the other on the co-owned FM station.

But even in New York City, radio was in decline. By 1962 the station's facilities had shrunk from studios on five floors of the RCA building in Rockefeller Center to just two. A long-time transmitter location on Long Island was closed down and NBC radio shared a transmitter with WCBS, also on Long Island. By the 1960s WNBC was trading more on its traditions and history than its current listenership, and ratings were far from market leaders. From 1964 to 1970, WNBC programmed a talk format, including some of New York's first call-in programs.

By 1970 music had once again taken over, although the format concentration on "66 NBC" (emphasizing the station's location on the AM dial) varied. The music was all contemporary, sometimes current hits and sometimes a mixture of new and older top songs. A major change came with the 1972 hiring of a Cleveland disc jockey, Don Imus, for the morning drive time period, and the beginning of shock jocks in the New York market. A decade later Howard Stern moved into the afternoon drive time period. WNBC soon added former TV entertainers Soupy Sales and Joey Reynolds. Although their comments were embarrassing at times, the jocks and their music helped the station climb in audience ratings.

But the ratings turnaround could not save the station. In 1986 parent company RCA was sold to General Electric, which soon decided not to continue radio operations. The NBC network was sold to Westwood One and the New York AM and FM outlets were sold to Emmis Broadcasting. WNBC's last broadcast was heard on 7 October 1988. The

next day, its frequency was taken over by WFAN, the city's first all-sports station.

WNEW

New York City Station

A comparative novelty during network radio's pre-World War II heyday, independently programmed WNEW generated respectable ratings and profit without ties to the likes of the National Broadcasting Company (NBC), the Columbia Broadcasting System (CBS), or Mutual. By the late 1940s, television's widening influence cut deeply into revenues of radio network affiliates that continued to embrace soap operas, sitcoms, and drama. Meanwhile, WNEW's pop music format proved relatively impervious to video competition. Curious broadcast insiders were drawn to WNEW. They wanted to see how the locally programmed AM outlet could succeed with just a handful of disc jockeys, some phonograph records, and a bit of news.

The WNEW story begins in New Jersey, where the station was formed primarily from remnants of comedian Ed Wynn's failed network venture. The performer had tried competing against CBS and NBC with his Amalgamated Broadcasting System, but the effort succumbed to fiscal woes. The Wynn connection is mentioned owing to its legendary nature, but was largely a province of studio facilities acquired from the comic's then-defunct broadcast ownership foray. WNEW more accurately originated from the amalgamation of New Jersey

stations WAAM at Jersey City and WODA in Paterson, which timeshared 1250 kilohertz in the metropolitan region. (Another outlet, WHBI of Newark, occupied the 1250 dial position on Sundays and Monday nights.)

Watch manufacturer Arde Bulova, advertising man Milton Biow, and WODA's owner Richard O'Dea were principals in the station consolidation. Because—at least for a time—their broadcast enterprise would qualify as the New York area's newest, WNEW seemed a perfect call sign choice. President Roosevelt was selected to inaugurate the station, and on 13 February 1934, he pushed a button in the White House that was wired to a light in WNEW's Carlstadt, New Jersey, transmitter building. The button signaled a singer to belt out the "Star Spangled Banner," and the facility's 1250-kilohertz channel carried it with 1,000 watts. In 1939, its frequency got reassigned to 1280 kilohertz while the wattage was raised to 5,000.

For two decades, the station's real power came from a metropolitan socialite blessed with an intuitive knack for programming. Bernice Judis had no previous radio industry experience when a friend (wife of co-owner Milton Biow) suggested that she become part of the WNEW staff. Consequently,

she thought more like a listener than a detached, by-the-book executive. This, as well as a limited budget, caused Judis to fill much of WNEW's schedule with a pleasant output of pop music records and smooth-voiced announcers skilled at describing the music's performers. Audiences soon equated the station with an endearing kind of companionship that gave them a sound track for their daily routine. Ratings rose, prompting Bulova and Biow to name Judis general manager of what had evolved from Newark, New Jersey-based studios to an exclusively downtown New York operation. Judis felt that a city that never slept needed a station that stayed on all night. In 1936 with an early-morning broadcast dubbed *Milkman's Matinee*, WNEW became the first to do so.

The thought of their records being freely spun, even at 3:00 A.M., irritated some musicians, who would rather perform live and be paid. In a resulting lawsuit, the plaintiff artists were disappointed to learn that because WNEW had purchased the recordings, it could use the transcriptions for any desired purpose. This decision prompted independents in other U.S. communities to proudly play records (a practice "big radio" had considered laughably low class in the 1920s and 1930s). Columnist Walter Winchell so enjoyed the way Judis' announcers deftly rode ad-libs around their discs that he coined their professional title—disc jockey.

In a 1941 frequency swap with co-owned WOV, WNEW was moved from 1280 to 1130 kilohertz, and power was increased to 10,000 watts. This shift also rid WNEW of the time-share arrangement with WHBI. Programs included news, public service, celebrity interviews, and even a series about good grooming. Broadcast schedule diversity included actor James Earl Jones' WNEW debut, circa 1945, in an American Negro Theater radio production. The next year, radio's first two-man morning show hit WNEW's air. This wake-up session garnered a following as loyal as that of the station's cornerstone, *Make Believe Ballroom*, a show on which a recording star might just drop in while disc jockey Martin Block happened to be playing his or her latest release.

A group including general manager Judis purchased WNEW in 1950. The station saw revenues jump due in part to a 1949 quintupling of its transmitter power (to 50,000 watts). The group sold to Dick Buckley and associates in 1954. Subsequently, Buckley's principals merged with remnants of the DuMont Television Network, before selling in 1957 to what became John Kluge's prominent Metromedia.

As radio "flagship" for this growing media conglomerate, WNEW received what was arguably the largest and most skilled news department of any independent outlet. By 1961 New York Giants (football) play-by-play broadcasts brought listeners to the 1130 dial position. And the list of excellent air personalities (William B. Williams, Ted Brown, Gene Klavan, Jim Lowe, Bob Landers, Gene Rayburn, and others) made for a very secure-sounding product. That's why, when-

ever they were in Manhattan, America's most sophisticated pop music icons (such as Dean Martin, Jack Jones, Peggy Lee, Steve Lawrence, and Eydie Gorme) eagerly sampled WNEW. Toting their just-released 33 1/3-rpm album, they would often drop by the Fifth Avenue studios for a surprise on-air appearance.

But by the late 1960s, most advertisers had become more interested in baby boomers and focused their advertising budgets on stations playing records kids demanded. Metromedia watched its venerable AM property slip, while WNEW-FM (established in 1958 as the remaining supply of vacant 50,000-watt New York City-area FM allocations had dwindled to three) achieved high ratings among the young demographic by dumping its "all-girl" announcers and easy listening music format in favor of progressive rock.

The old WNEW tried attracting new audiences by trying various incarnations of adult contemporary records and sports talk shows. A variety of air-personality and other changes never drained WNEW of broadcasters who could make a shampoo commercial entertaining, but such classic announcing talent was a poor fit with disco-era chart toppers. Fortunately for WNEW, advertising priorities had changed by the late 1970s. Advertising agencies were suddenly interested in America's comfortably affluent 40-plus population, giving the original "good" music, personality, and news station an economic reason to return to the most familiar shelves in its (1930s through 1960s non-rock hits) record library. Targeted listeners gratefully responded. For most, the change represented a surprise homecoming, lifting the station into a second heyday circa 1979. Other AM operators in what was by then an FM world studied this round of WNEW success. Arguably, all music stations that transmit disc jockey patter and recorded music can trace some of their roots to WNEW's original programming practices.

Rupert Murdoch's 1986 Fox acquisition of the Metromedia television properties orphaned WNEW radio. The FM station was bought by Westinghouse (in 1989), and WNEW-AM eventually ended up with the Bloomberg organization for a 1992 rechristening as the 24-hour, business-formatted (Bloomberg Business Radio) WBBR. So great was WNEW's personality-delivered big band/standards void that the *New York Times* came to the rescue. The paper's perennially classical WQXR-AM switched call letters to a mnemonic WQEW (Westinghouse didn't wish to relinquish the WNEW name) and accurately reconstructed, in full AM stereo, WNEW's programming spirit there. That legacy ended in late 1998, when Disney contracted with the *Times* to shift WQEW's programming to a juvenile focus.

WNYC

New York City Station

For more than 75 years, WNYC, the nation's "most listened to" public radio station (93.9 FM and 820 AM), was funded by New York City municipal tax dollars. The station has weathered a long history of stormy relations as a result of its control at the hands of a line of New York City mayors extending from Mayor John F. Hylan in the 1920s to Mayor Rudolph W. Giuliani in 1995. This mayoral prerogative ended when ownership of the AM and FM stations was sold by the Giuliani administration to the WNYC Foundation, a nonprofit entity, in 1995.

Origins

In 1922 city official Grover A. Whalen, then commissioner of the Department of Plant and Structures, convinced Mayor John F. Hylan to appoint a committee to study the feasibility of operating a city radio station. The committee recommended the establishment of a municipally owned station, despite opposition from city Republicans and various big-business interests. When Western Electric was the sole bidder for the construction of the station and charged "exorbitant prices" for the use of its wires for remote broadcasts, the city searched for another alternative. In March 1924, a solution appeared in the form of a slightly used 1,000-watt broadcasting plant, which Westinghouse sold to the city after removing the equipment from its site at a Brazilian Centennial Exposition in Rio de Janeiro. During construction, an experimental license was granted to "station 2XHB." The station premiered on 8 July 1924, broadcasting from the top of the Municipal Building using the new official call letters WNYC. The opening evening featured crooners and instrumentals by the Police Band and the Vincent Lopez Orchestra. Mayor Hylan and city officials provided stirring orations, solemnized by blessings by clergy from three

major faiths. The premier broadcast interfered with broadcasts of ships at sea and annoyed WEAJ listeners when the transmission interrupted a broadcast from the Democratic National Convention.

Early broadcast schedules were erratic, beginning in the evenings at approximately 6:00 P.M. and concluding at around 11:00 P.M. Live performances from musical artists promoting the sale of sheet music and a series of one-hour foreign language lessons were among the staples of the evening broadcasts. Ad hoc longer broadcast hours accommodated visiting dignitaries and events ranging from band concerts to visiting monarchs, record-breaking aviators, and channel swimmers. H.V. Kaltenborn was an early contributor to WNYC and organized a radio quiz, and WNYC's *Air College* offered scholarly discussion on a variety of topics.

The station's service to the city consisted mostly of a nightly broadcast of missing persons. When Mayor Hylan sought to air a report of progress to the board of aldermen over the air in 1925 while running for his third term of office, the Citizen's Union, a watchdog advocacy group, brought legal action to prevent the mayor from using the station as a tool of propaganda. It was the beginning of a long history of contentious relationships between the mayor or board of city aldermen and the station. In the late 1920s, the station was criticized by a "Freethinker" for broadcasting religious services promoting the Catholic and Jewish faiths. To avoid such criticism, management codified a statement of its mission in 1930; the station would feature music, concerts, and entertainment; talks on current affairs; meetings of civic bodies, associations, and societies; lectures and addresses; and the reception of distinguished visitors.

Upon his election, Depression-era Mayor Fiorello H. La Guardia planned to sell the station as a cost-cutting move. A

report by La Guardia aide Walter Chambers argued eloquently for the retention of the station as a public relations arm of the mayor's office. La Guardia detested the station at first, reportedly shouting upon spotting the old-fashioned carbon microphones of WNYC at a speech at the Commodore Hotel in 1934, "Get that damn peanut whistle out of here!" WNYC weathered the Great Depression partially through staffing provided by the Works Progress Administration (WPA) from government relief rolls, and the station embarked on a "Radio Project" to increase cultural programs, vary content, and find new sources of information and entertainment. In 1935 WNYC received a \$30,000 WPA grant, and its transmitter was moved to the Greenpoint section of Brooklyn.

Controversies

Almost from its inception, the station was embroiled with federal regulators, fighting to protect its frequency assignment or to maintain broadcast hours. Under the Radio Act of 1927, the station was assigned 570 kilocycles and would be forced to share its frequency with radio station WMCA, broadcasting on alternate days at a reduced power of 500 watts. The city fought the assignment, and the Federal Radio Commission agreed that WNYC could swap frequencies with another station also owned by the management of WMCA, at 810 kilocycles. The swap allowed WNYC to operate during the daytime on clear channel until sunset at Minneapolis, when the 50,000-watt WCCO assigned to the same frequency came on the air.

In 1937 city councilmen seeking to embarrass Mayor La Guardia accused the station of anti-Semitism and racial hatred following a broadcast discussion of the Arab position on Palestine. The city council attempted to engineer another frequency swap that would have given the 810 AM frequency to the Paulist Fathers and forced WNYC to operate on a half-time basis from frequency 1130. La Guardia successfully fought the move. He was then targeted by political opponents as a supporter of communism for appointing the former secretary to the American Labor Party, Morris S. Novik, as director of radio communications for the city. WNYC was again accused of communist sympathies when the producer George Brandt's National Travel Club program on Soviet Russia on 27 February 1938 expressed admiration for Soviet accomplishments, but station management successfully defended itself against the charges. Concurrently, WNYC began broadcasting city council meetings, and the proceedings quickly became a source of public amusement. The *New York Times* commented that whereas the former board of aldermen had taken 135 years to make fools of themselves, the council had accomplished the same in only 2 years of radio broadcasts. Despite WNYC political broadcasts, the *New York Post* noted in 1938 that the station also provided more live unrecorded music than any other station in the city.

By 1940 La Guardia was a WNYC enthusiast, using the station to promulgate his political agenda. In 1944 the mayor began a weekly radio show, most memorably reading the Sunday comics to New York City children during a newspaper strike in July 1945. Comedian Fred Allen quipped to the *New York Times*:

The Mayor's . . . program is a happy blend of *Mary Margaret McBride*, *Information Please*, and *Gang Busters*. One week the Mayor will tell you how to make French-fried potatoes with artichoke roots. The next week he gives you the name of the bookmakers and hurdy-gurdy owners he has chased out of the city." (cited in Scher, 1966)

Mayor William O'Dwyer, a former district attorney and judge, was the last of the line of early New York City mayors to routinely review the merits of WNYC and contemplate its sale immediately following election. O'Dwyer eventually was convinced to maintain the station and its noncommercial status.

During World War II, the station requested additional hours of broadcast for wartime information, and in 1942 the Federal Communications Commission granted a Special Service Authorization to allow WNYC to broadcast from 6:00 P.M. until 10:00 P.M., despite the conflict with Minnesota's clear channel frequency. The additional time slot was extended after retired Mayor La Guardia lobbied the Columbia Broadcasting System (CBS), owner of the Minneapolis clear channel station, to permit the Special Service Authorization to continue, and the hours were made permanent in 1955. In 1943 New York City launched a companion FM station that would allow WNYC to operate around the clock. Initially, the two stations carried the same programming until sign-off at 10:00 P.M. for the AM band. In 1953 WNYC also received a permit to construct an ultrahigh-frequency (UHF) band television station, which was renamed WNYC-TV in 1962. In 1987 WNYC moved to 820 kilohertz and boosted power tenfold—to 10,000 watts.

WNYC has built its reputation over the years on its ability to craft a mix of local, national, and world politics; culture; education; the arts; and classical music. The station claims it was the first to broadcast the Japanese attack on Pearl Harbor, and it has broadcast more Senate hearings, conferences, and conventions, including the presidential conventions of smaller political parties, than any other station. In the 1960s, the station offered an outlet for foreign programs and the views of various national news such as the *French Press Review* and the *Review of British Weeklies*. Its broadcast of public hearings on the increase of the New York City subway fare was called "one of the greatest mass civic lessons in the history of radio" by *Variety* magazine. Bob Dylan made his radio debut in 1961 on Oscar Brand's *Folk Song Festival*, and experimental and modern music found an outlet on WNYC.

In 1994 Mayor Giuliani announced that the city would sell the station, and a deal was struck whereby the AM and FM stations would be sold at a reduced price of \$20 million to the WNYC Foundation, and the television station would be sold to commercial interests. For the first time, WNYC would be a public- and grant-supported station, and its president would no longer be a political appointee of the mayor but rather hired by the board of the WNYC Foundation. The board appointed Laura Walker, a former producer of Children's Television Workshop, as president. Her management team succeeded in doubling public contributions to the station and raising \$1.4 million in June 1995 in a four-day campaign while garnering support from corporations and other high-profile supporters. WNYC 93.9 FM is a member station of National Public Radio (NPR) and of Public Radio International (PRI), and it features NPR and WNYC news and cultural programming along with classical music. WNYC Radio New York at 820 kilohertz broadcasts news, talk, and public-affairs programs. In 1998 the station launched a website, wnyc.org, which also allows web users to receive radio programming, both live and in archived segments.

In 2001, the station lost its FM transmitter and antenna in the September 11th attacks on the World Trade Center and temporarily used borrowed transmitters and antenna to simulcast the news talk programming of its AM station over both AM and FM outlets. The subsequent soar in ratings and fundraising was instructive. Within a few months of restoring the FM tower, the station announced it was eliminating five hours of classical music programming each day on the FM

channel in favor of more news/talk programming, to the consternation of many listeners and performers who saw WNYC as one of the few outlets for both original and recorded classical programming.

Wolfman Jack (Robert Smith) 1938-1995

U.S. Radio Personality

Robert Weston (Bob) Smith, born in Brooklyn, New York, on 21 January 1938, was mesmerized as a youth by Jocko Henderson at WDAS in Philadelphia, John R. (John Richbourg) at WLAC in Nashville, and Alan Freed at WINS in New York. Smith's career started modestly, as a gofer for WNJR in Newark, New Jersey. When his parents discovered he was at WNJR and missing school, they banished him from home. Smith left for Hollywood but made it only to his sister's Alexandria, Virginia, home, where he entertained her children as "Wolfman." Smith recalled, "The 'Jack' part got added on because that was a hipster's style of speaking, to end your sentences with the name Jack."

Smith sold encyclopedias and Fuller brushes until attending Washington, D.C.'s National Academy of Broadcasting. Upon graduation in 1960, Smith worked at WYOU-AM in Newport News, Virginia, a station programmed for African-Americans. Smith (a.k.a. "Daddy Jules") did everything from sales to cleaning. WYOU became WTID and changed formats to beautiful music. Smith was retained by the new management but changed his air name from "Daddy Jules" to the more sedate "Roger Gordon." In his autobiography, Smith wrote: "[I]t wasn't where my heart was. To this day, I feel a lot worse about cracking open a mike and announcing, 'Good morning. This is Roger Gordon bringing you Music in Good Taste,' than

Wolfman Jack
Courtesy Radio Hall of Fame

I do about the fact that I was transporting weed and brokering mattress action on the side.”

Mo Burton, WTID sales manager, bought KCIJ-AM in Shreveport, Louisiana, in 1962 and hired “Big Smith with the Records” to play country music. By 1963 KCIJ merged with KREB in Marshall, Texas. KREB could not boost its power as long as KCIJ was on the air, so the owners worked out an unprecedented deal with the FCC. The owner of KCIJ took its station off the air in exchange for half ownership in KREB, which was then allowed to increase its power. A weak station, then, went dark so a stronger one could grow. (Such an arrangement has now become commonplace.) Big Smith was now on KREB, but he had bigger aspirations.

All his life, Smith had listened to the most powerful commercial radio station on earth. XERF was a 250,000-watt blowtorch on the border near Del Rio, Texas, in Ciudad Acuña, Mexico. XERF was notorious for transmitting, as Smith explained, “old-time, prayer-cloth-selling preachers, fervent gospel singers, hillbilly mountain music, all kinds of stuff that was just a little too weird, a little too dangerous for American stations.” The station “sold gain-weight plans, lose-weight plans, baby chicks, pep pills, sex-drive-boosting pills, songbooks, records, hair dye, anything that could be stuffed into a box or corked up in a bottle and sent off in the mail for ‘cash, check, or money order.’” Smith initially got in on the action by selling KCIJ airtime to about half the preachers who bought slots on XERF. The preachers taped their shows and paid XERF about \$1,500 to air 15-minute programs five days a week. Smith gave them a cut rate to air the programs over KCIJ, too. Meanwhile, he continued to dream of developing his own show for XERF. Smith recalled: “I’d do exactly like the preachers do, make my money on mail order. Except there wouldn’t be any preaching. Instead, I’d stir people up with the power of the music, and a crazy DJ character who had the same blend of coolness and hipness as all the great ones that had zapped my imagination when I was a strange little kid transfixed by what was coming through the radio.”

Smith secretly developed his Wolfman Jack character. In December 1963 he took a demo tape to XERF but instead ended up operating the station. For eight months, he aired *The Wolfman Jack Show*, featuring a “superjock” who relied on personality as much as music. Wolfman Jack played rock and blues, had an unconventional delivery, used strange language, and howled like a wolf.

Smith returned to KCIJ but continued to tape *The Wolfman Jack Show* for XERF. Few people knew that Smith was Wolfman Jack. In character he recorded a live singing performance. *Wolfman Jack—Live at the Peppermint Lounge*, an embarrassing yet profitable recording, was sold over XERF, which Smith continued to control. Burton bought KUXL-AM in Minneapolis in 1964, and Smith ran the station. XERF continued airing tapes of *The Wolfman Jack Show*, but Wolfman Jack was not

seen for years. The show soon aired on other border stations, XEG and XERB. In 1965 Smith moved to Los Angeles to run XERB as though it were local.

Smith had always kept the Wolfman Jack character separate from his real identity. To almost everyone, he was radio businessman Bob Smith. Wolfman Jack was something Bob Smith did for fun, but as the popularity and profits rose, people wanted to see Wolfman Jack and they paid big money to see him. For Wolfman Jack to appear in public, Smith’s wife designed the look, and a makeup artist added a wig, dark makeup, a big nose, fangs, false fingernails, and facial hair. In 1971, Smith’s empire crashed when the Mexican government banned evangelical religious programming, costing XERB 80 percent of its income. As XERB went out of business, Smith turned completely to Wolfman Jack.

In 1972 Wolfman Jack was hired for the 7 P.M. to midnight shift at Los Angeles’ KDAY for one-tenth of his XERB salary. He put together tapes of old XERB broadcasts for syndication and for Armed Forces Radio. Wolfman Jack played himself in 1973’s *American Graffiti*, where he was seen widely for the first time. He surprised fans who assumed he was black. In 1973 he started a nine-year stint as host of NBC TV’s concert show *The Midnight Special* (which ran from 2 February 1973 to 1 May 1981). The program was network TV’s first foray into late-late-night hours. The same year, New York’s WNBC hired Wolfman Jack to compete with WABC’s Cousin Brucie. WNBC wanted Wolfman Jack to be crazy but constantly complained about things he said and did. He made it to number one doing a shock jock routine that influenced Howard Stern. At one point, Wolfman Jack, Don Imus, and Stern worked simultaneously at WNBC. The Guess Who, who did the 1974 song *Clap for the Wolfman*, asked Wolfman Jack to join them on tour that same year. To get out of his contract, he convinced WNBC to hire Cousin Brucie. He continued to fly to Los Angeles twice monthly to tape *The Midnight Special*.

Wolfman Jack recorded his second album in 1974, called *Fun and Romance*. In the 1980s, he appeared at oldies concerts and car shows. He hosted a short-lived oldies revival on the Nashville network (TNN) in 1989. In 1995 he hosted a live weekly radio show on WXTR from Washington, D.C.’s *Planet Hollywood*. On 1 July 1995, he died at home in Belvidere, North Carolina, of a heart attack after a 20-city promotional tour for his autobiography. He was inducted posthumously into the Museum of Broadcast Communications Radio Hall of Fame on 27 October 1996 and into the National Association of Broadcasters Hall of Fame on 20 April 1999.

W.A. KELLY HUFF

Wolfman Jack. Born Robert Weston Smith in Brooklyn, New York, 21 January 1938. Began radio career as a gofer at WNJR, Newark, New Jersey; graduated from National Academy of

Broadcasting, Washington, D.C., 1960; on-air and sales, WYOU-AM, Newport News, Virginia, 1960; on-air at KCIJ-AM, Shreveport, Louisiana, 1961; operated XERF, Mexico, 1963-64; *The Wolfman Jack Show*, XERF, 1964; operated KUXL-AM, Minneapolis, Minnesota, 1964; operated XERB, Los Angeles, California, 1965-71; permanently became Wolfman Jack, 1971; on-air at KDAY, Los Angeles, 1972; syndicated XERB broadcasts, 1972; appeared in *American Graffiti*, 1973; hosted NBC's *The Midnight Special*, 1973-81; on-air at WNBC, New York, 1973-74; on-air at WXTR, Washington, D.C., 1995; inducted into Museum of Broadcast Communications Radio Hall of Fame, 1996, and NAB Hall of Fame, 1999. Died in Belvidere, North Carolina, 1 July 1995.

Women in Radio

Why is it necessary to have a separate entry on the subject of women and radio? Haven't women—as producers, stars, industry personnel, and audiences—been so deeply interwoven in radio's history, development, innovation, marketing, and reception as to make them an integral part of a work such as this? Won't women's contributions and concerns turn up as a natural component of the general run of entries, without need for special consideration? The answer to the former question is undoubtedly “yes”—women have been deeply and centrally involved in radio's development from the 1920s to the present. Yet their near-exclusion from most standard histories of the medium, along with special characteristics of the ways that U.S. radio has handled the presence and contributions of women, underline the need for additional consideration.

The basic structures, programming, marketing strategies, and audience definitions of U.S. radio have been deeply affected by gender. From radio's earliest days, women's interests were segregated in a separate “women's ghetto” of daytime programs, while the prime-time hours—those most often written about by historians and enshrined in popular memory—carefully relegated women to ancillary roles. The industry very early on devised an understanding of its public in which daytime audiences were seen as fundamentally female

(despite a sizable male minority) and night-time audiences were addressed as primarily male (despite a sizable feminine majority). These understandings carried over into television and have only begun to change since the 1980s.

Yet this kind of gender segregation—conforming to a held-over “separate spheres” philosophy from Victorian times—also worked to create a space on radio that was dedicated to female interests and points of view. That this space was commercially driven (women have long been understood as the primary consumers for the household) marks out its limitations but doesn't take away from its unique contributions to radio's development. Women became powerful independent producers, writing and marketing programs that employed hundreds of men and women and creating genres that, 70 years later, form the backbone of popular television. Daytime programs addressed topics of direct relevance to women's lives, created dramas in which women controlled events and saw their experiences played out, and encouraged talk programs that discussed women's interests and concerns. Meanwhile, night-time radio, and later television, carefully contained female voices and faces within secondary roles, situation comedies, and family programs; excluded them from “serious” genres such as news, discussion, and documentaries; and marginalized

women's contributions to prime-time drama. But gradually daytime conventions crept into the night-time hours, and with them a more extensive female presence, especially during the World War II years.

On post-television radio, a similar route was traced as female disc jockeys and artists slowly developed a more extensive presence on the airwaves. This overview of how women have operated within the cultural structures of the radio broadcasting field should provide a contextual framework for the separate entries on some of the individuals who appear elsewhere in this encyclopedia. Their achievements—and limitations—took place within a highly gendered social and industrial system that guided not only these women's lives and practices but the way they have been treated by historians, critics, and regulators.

Early Experimenters, Amateurs, and Managers

Although it has become a cliché of history to think of the period of radio amateurs—roughly 1915 to 1926—as the domain of “small boys,” in fact wireless experimentation offered a fairly welcoming venue for women. The American Radio Relay League (ARRL), one of the earliest and largest of the radio amateur organizations, began to recognize women members in 1916 and predicted a flood of female membership after World War I, because the army had recruited hundreds of young women as wireless instructors. The ARRL's journal, *QST*, offers a number of profiles of female amateur operators during the early years, including Emma Candler of station 8NH in St. Mary's, Ohio, one of the key operators in the ARRL's cross-country relay network, and amateur M. Adaire Garmhausen, who was a regular contributor to the journal. Other early experimenters—selected for their presence in the historical record more than for any difference from hundreds of others—were Eunice Randall of 1XE, Boston, an engineer with the American Radio and Research Corporation (AMRAD) company who became chief announcer for WGI from 1922 until 1925; Marie Zimmerman, who with her husband Bob broadcast from WIAE in Vinton, Iowa, from 1920 to 1923; Eleanor Poehler, station manager of WLAG, Minneapolis, from 1922 to 1924 and later music director at WCCO, Minneapolis; and Ida McNeil, who ran station KGFX in Pierre, South Dakota, from 1922 until the mid-1940s.

Announcers and Network Executives

Many more women came on board fledgling commercial stations as they began to make their debut in the mid-1920s, and radio shifted from the province of amateurs toward becoming an industry. Gwen Wagner of station WPO in Memphis, Tennessee, began as the station's one on-air employee, announcing, planning the broadcast schedule, inviting the guests, and

reporting the news. Both Bertha Brainard and Judith Waller started out in such jill-of-all-trades on-air positions. Brainard began as a volunteer program producer on WJZ, “Broadcasting Broadway” over the Radio Corporation of America (RCA) lead station. She then went on to become first program director, then station manager, and then director of commercial programming for the newly organized National Broadcasting Company (NBC). Similarly, Waller started out on Chicago's WMAQ as an announcer and station manager. When NBC purchased the station in 1932, Waller became the network's director of public service programming for the central region, where she innovated with such respected shows as *American School of the Air* and *University of Chicago Round Table*.

A number of female pioneers, whose voices were heard on the air during the early 1920s, also filled secretarial roles and later went into audience relations (via their duties of answering audience mail); still more, like most of those above, were directed toward women's, children's, and public service programming. A turning point occurred in 1924, when Jennie Irene Mix, a columnist for *Radio Broadcast*, one of the most influential of the new radio magazines, opened up a discussion on the suitability of women's voices for radio transmission. Though many station managers—mostly male—dismissed the notion that there was any significant difference between male and female broadcast capabilities, others argued that women voices were monotonous, were overly emotional, lacked personality, had too much personality, didn't transmit well over radio because they employed higher frequencies (a frequently repeated error, only applicable to the highest soprano notes and not to the spoken voice), or “lacked body.” The opinion that women's voices were untransmittable, however specious, had a great effect on the standardization of the broadcast schedule that would take effect over the next five years, and on the exclusion of women from many aspects of broadcasting.

Program Producers and Innovators

Radio, as a new field whose barriers for women were only slowly developing, attracted female pioneers through a variety of routes. Gertrude Berg developed her popular and long-running radio serial *The Rise of the Goldbergs* in 1928, writing, acting, and producing throughout the show's radio decades and into its run on television. The show ran on NBC's nightly schedule with high ratings until 1936, when it moved to daytime. College sorority sisters Louise Starkey, Isobel Carothers, and Helen King created their heavily improvised comic serial *Clara, Lu, and Em* for WGN in Chicago in 1930, about three neighbors in a Chicago apartment building and their humorous travails; it became a prototypical soap opera when it transferred to daytime in 1932, and it ran there until Carothers' death in 1936. Myrtle Vail created the dramatic serial *Myrt and Marge* with her daughter Donna Damerel in 1931; it kept

audiences tuning in for its tales of a mother-and-daughter theatrical team on Broadway until Damerel's untimely death in 1941. Also a night-time original, it went to daytime in 1937. Although *Amos 'n' Andy*, created in 1926, must be counted as the first radio program to develop the genre of serial comedy/drama, these programs took the form in a feminine direction and led not only to the daytime serial format but to the later genre of situation comedy.

As the history of these programs shows, the debate over women's suitability on the air led to a major change in programming practices in the early to mid-1930s. As radio's commercial support grew larger, and as networks began to turn over much of their programming function to the radio departments of advertising agencies, a new way of understanding the radio audience arose. Research conducted by first the Crossley and later the Hooper companies, as well as in-house network and agency data, showed that the daytime audience consisted of about 70 percent women and that the night-time audience had a slightly smaller feminine majority, about 55–60 percent. Women were known to purchase roughly 85 percent of all household goods, making this an extremely desirable market to approach. Yet radio's regulatory status mandated a restriction of its purely commercial aims, requiring public service standards to be applied to its program offerings.

Broadcasters resolved these two contradictory claims on their attention by separating daytime and night-time schedules by gender. Women's programs—those featuring primarily female characters, usually produced by women, and selling products to women—were placed on the daytime schedule, even though many had had a fairly large mixed audience at their former night-time hours. Here the networks could sell unabashedly to their primary audience, indulging in program types and subject matter that were not seen as wholly respectable and that often provoked controversy, as long as they attracted the target audience of women. Night-time programs, although still commercially supported, were increasingly seen as more prestigious and of higher quality; the night-time schedule became a place for sponsors and networks to display their big names and big-budget productions for an audience increasingly defined as masculine despite its majority female composition. Advertising was held to a minimum and was often worked into the content of the show to keep it as unobtrusive as possible. This “separate spheres” approach would at once spark a lively wave of creative activity addressed to and created by women in the daytime and create serious barriers for women's ability to compete on the night-time schedule.

Ladies of the Daytime

In the space allotted to them, the ladies of radio's daytime sphere developed programs that not only appealed to women but also tended to feature women in central roles in a way that

created a woman-centered discourse that few other media genres cared to touch. Its closest precedent was probably the field of women's magazines, whose serialized fiction; interview pieces; discussion of the “private” realm of home, family, health, and relationships; and interaction with their readership in many ways influenced the development of daytime genres. Irna Phillips is often credited with being “the mother of soap operas,” and indeed, her pioneering serial *Painted Dreams*, begun on WGN in 1930, represents one of the earliest examples of a woman-centered drama created specifically for the daytime schedule. This program mutated into *Today's Children* on rival station WMAQ, and Phillips went on to become one of the most prolific individual producers of daytime soaps. Perhaps more important, she discovered that retaining ownership of her intellectual property and incorporating as her own producer made far more sense—and gave her far more creative control—than working as an agency or network employee. Her most famous serials include *Women in White* and *The Right to Happiness*, along with the still-running *Guiding Light*. Production control was a lesson most female innovators needed to learn. Jane Crusinberry, author of the extremely popular serial *Story of Mary Marlin*, learned the hard way that her own property could be taken from her: after a series of escalating disagreements with the ad agency that produced the show after the war—mostly about Mary's “redomestication” after serving as a U.S. senator—Crusinberry was fired from her own soap, and she never wrote another.

Anne Hummert, in partnership with her husband Frank, owned one of the biggest radio production houses in the country, at one point producing almost half of the soaps on the air. These included *Ma Perkins*, *The Romance of Helen Trent*, and *Mary Noble*, *Backstage Wife*. Elaine Carrington produced a number of soaps that enjoyed a relatively high critical reputation (*Pepper Young's Family*, *When a Girl Marries*, and *Rosemary*), as did Sandra Michael (*Against the Storm*—the only soap ever to win a Peabody award—*Lone Journey*, and *Open Door*). Many other popular serials were written by women who, not having become producers, labored in obscurity for agencies and other producers: Helen Walpole of *Our Gal Sunday* and *Stella Dallas*; Elizabeth Todd of *Young Widder Brown* and *Amanda of Honeymoon Hill* (and later of the night-time *Fred Allen Show*); and Addy Richton and Lynn Stone, who wrote under the joint pen name Adelaide Marston for *Valiant Lady*, *Hilltop House*, and *This Life Is Mine*, just to name a few.

Besides the ever-popular and ever-expanding soaps, a staple of daytime was the talk show. This form evolved from the “household chat” format of advice aimed at modern busy housewives. Early innovators of this genre include Mrs. Julian Heath, Ida Bailey Allen, Ruth Crane, the various Betty Crockers (a made-up identity filled by a series of female broadcasters), and, perhaps most famous, Mary Margaret McBride. In

the mid-1930s this format began to make the transition from solely domestic topics to a wider range of material, including news and interviews. It also went from a highly scripted format to one that emphasized informal, ad-libbed discussion. In both of these trends, McBride was a leader. A former journalist and feature article writer, McBride brought her reportorial and interviewing skills to a freely ad-libbed format that also involved highly effective product pitches. Starting out as *Martha Deane*, a Betty Crocker-like fictional character, she soon broke out on her own. By 1940 she had two 45-minute shows daily, one on NBC and one on the Columbia Broadcasting System (CBS), with over 6 million regular listeners.

Others took note, and by the mid-1940s a variety of "breakfast shows" abounded on the airwaves, usually featuring a husband-and-wife team who bantered back and forth on a wide range of topics, bringing in a guest or two and providing light news and weather updates. Innovators here include Pegeen Fitzgerald, whose *Pegeen Prefers* was modeled after McBride's show; husband Ed Fitzgerald also had a similar program called *Small Talk* on WOR. Their combined efforts produced *The Fitzgeralds* over WOR from 1940 to 1945, which then ran on the American Broadcasting Company (ABC) network from WJZ from 1945 to 1947. WOR replaced them with the breakfast team of Dorothy Kilgallen and Richard Kollmar in *Breakfast with Dorothy and Dick*. A third team graced the airwaves from 1946 until 1948, *Tex and Jinx*, featuring married duo Tex McCrary and Jinx Falkenberg. From here, the *Today Show* was only a short step in the future, although the early television version would "defeminize" itself, relying on all-male hosts until Barbara Walters' debut in 1964.

The breakfast show also marks one of the few venues for women to report the news. News formats remained largely closed to women on radio unless, as with print journalism, they could adapt their reportorial skills especially for the "female" audience and air in the daytime. Some early broadcasters of "news for women" include Ann Hard; Kathryn Cravens, whose *News through a Woman's Eyes* aired on CBS from 1936 to 1938; and Marian Young, who took over the *Martha Deane* show after McBride left and who began to include more outright news content. The years before and during World War II brought increased opportunities for women, as network news operations began to build up, and a number of journalists found their way to radio, including Helen Hiatt, who had a morning news spot daily on NBC Blue from 1941 to 1942, and Mary Marvin Breckinridge, who was recruited by Edward R. Murrow as the first CBS female staff broadcaster from Europe in 1939. Dorothy Thompson, the world-famous journalist, had held a news commentator spot on NBC in the mid-1930s until her strong anti-Hitler stance led the sponsor to dismiss her. But she returned in the middle of the war years after a brief stint at Mutual Broadcasting Company, providing news

reports from various locations around the world. Janet Flanner, too, had established a reputation as a columnist at the *New Yorker* magazine before turning to radio in 1944 with a series on NBC Blue.

Pauline Frederick represents a breakthrough for women in broadcast news, as the first to build a career in the medium. Beginning as a print journalist for the North American Newspaper Alliance, she appeared on NBC starting in 1938 for occasional pieces and covered the later years of the war in Europe. In 1946 she became the first woman to cover "hard" political news on the ABC network, and she began to appear on television. By 1953 she had her own NBC interview show, *Pauline Frederick Reporting*, a daily 15-minute program aired in the afternoon, as well as a program called *Listen to the Witness* on Sunday afternoons. She later joined National Public Radio (NPR) as foreign-affairs commentator.

Another important innovator was journalist Martha Rountree, whose *Meet the Press* debuted in 1945 with herself as coproducer and cohost. Although she sold her interest in the program to her partner, Lawrence Spivak, in 1953, the show continues on the air today, widely recognized as one of the most successful panel formats on television. Rountree's previous radio effort, *Leave It to the Girls*, was a witty, fast-paced all-female panel show that ran on Mutual from 1945 to 1948.

Women also featured prominently in the field of children's programming. One of the best known is Dorothy Gordon, who began on station WEAJ in 1924 with children's story hours and continued into the *Children's Corner* on CBS in the mid-1930s. She also served as music director for *American School of the Air*. The male/female duo format made a children's hit in the *Roy Rogers Show* with Dale Evans from 1944 well into the television years. Many local stations included children's shows in their schedules, and many of these featured female hosts or were produced by women.

Ladies of the Night

Although night-time radio remained a less hospitable spot for woman-controlled productions, many talented performers lent their names to the worlds of variety, comedy, and musical performance that made up the prime-time hours. Kate Smith remained for many years the only female host of a prime-time variety show, the *Kate Smith Hour*, which ran on CBS from 1931 to 1947 under a number of titles and sponsors but always featured Smith's singing interspersed with guest acts and sketches. Not until 1943, when Joan Davis took over Rudy Vallee's spot for Fleischmann's Yeast, did radio hear the second woman to single-handedly headline a major night-time vehicle. Fanny Brice would make a third female headliner after 1940, when her *Baby Snooks* routine slowly took over the *Maxwell House Coffee Time* and gradually metamorphosed into the *Baby Snooks Show*.

Until the early 1940s, almost all of night-time's female stars appeared either only occasionally, as guests, or as part of the traditional male/female duo act carried over from vaudeville. Usually the male/female duo involved a male straight man and a female "dumb Dora," a successful format illustrated not only by the teams of Jack Benny and Mary Livingston, and Fred Allen and Portland Hoffa, but most famously by George Burns and Gracie Allen. All of these famous radio duos were married in real life, too. So were Jim and Marian Jordan, playing *Fibber McGee and Molly*, although this time with the husband in the dumb Dora role.

In the late 1930s, a number of shows spun off from variety sketches also featured such teams, as in the *Bickersons*, *Easy Aces*, and *Duffy's Tavern*. However, the absence of available male talent, as well as the larger domestic audience of women and better audience research techniques, led to a breakthrough for women during the war years. Former Hollywood second-tier stars such as Lucille Ball (*My Favorite Husband*), Ann Sothern (*Maisie*), Eve Arden (*Our Miss Brooks*), Hattie McDaniel (*Beulah*), and Marie Wilson (*My Friend Irma*) took the opportunity to move into night-time radio, and most of them obeyed the rule that Irna Phillips had set down years before: form your own production company and retain production control. Not only would these women's efforts transform the night-time comedy scene, making important innovations on the emerging situation comedy format, but their shows would dominate early television as well.

Radio in the Age of Television

After television's widespread debut in the early 1950s, radio was transformed into a local, music-oriented medium whose new stars were the disc jockeys who introduced songs and provided chatter in between. Though a few women moved into this sort of work, the remnants of the "separate spheres" system mandated that they mostly stay in the daytime, speaking to an audience still conceived of as women in the home. Until the early 1960s, a few network daytime serials and talk shows still remained, and in the newly disorganized world of local radio, many different experiments could be tried. Martha Jean "the Queen" Steinberg became well known on the new black-format station WDIA Memphis in the 1950s. She cohosted an evening swing and rhythm and blues show with famed disc jockey Nat Williams; soon, she had her own show, called *Nite Spot*, and she had also replaced an earlier female talk host, Willa Monroe, on a daytime program called *Tan Town Home-maker*. She introduced her own rhythm and blues show, *Premium Stuff*, a little later and soon became known nationwide, eventually moving to Detroit station WCHB. Other African-American women rose to prominence in the postwar years of black radio: Vivian Carter on WGRY in Gary, Indiana; Louise "Louisville Lou" Saxon on WLOU in Louisville, Kentucky;

"Chattie" Hattie Leeper on WGIV in Charlotte, North Carolina; and Irene Johnson on WGOC, Mobile, Alabama. These disc jockeys and their male counterparts became important sources of community inspiration and information as the civil rights struggle heated up in the late 1950s and early 1960s.

Other women served as announcers and disc jockeys on stations of all kinds in the 1950s and 1960s, but they rarely surface in the historical record. Dottie Miller was featured on WBBQ Atlanta as "the miss with the hits" in the mid-1950s. Pola Chasman anchored a classical music program on WQXR in New York. In 1955 Memphis recording entrepreneur Sam Phillips experimented with an "all-female" format on station WHER, whose slogan was "1,000 Beautiful Watts." To differentiate himself in a market that was already becoming crowded, Phillips determined that this would be a station run by women, for women. Specializing in "pleasant, light music" and the usual mix of news, weather, and talk, this time all the voices heard were female, as was the station's management. The station was successful enough to last until 1966, and it spawned several imitators. As the climate of the country started to change in the late 1960s, underground radio brought its style of female broadcasting onto the airwaves. Rachael Donohue and Dusty Street were important early alternative broadcasters. WNEW in New York put out a nationwide call for female disc jockeys in 1966, and at least one stayed on: Alison Steel, known as the "Nightbird," whose "sultry voice and iron will" in her late-night slot made her one of the few women in rock radio throughout the 1970s and 1980s.

National Public Radio

In 1967 the United States finally caught up with many other countries by creating its first public broadcasting system; in 1970 National Public Radio (NPR) was founded. Its first major offering, the daily afternoon newsmagazine *All Things Considered* (ATC), introduced a new breed of serious female journalists to the still deeply gender-divided world of radio. With Susan Stamberg in the cohost position from the program's inception in 1971 and soon adding talented reporters and correspondents such as Linda Wertheimer, Cokie Roberts, and Nina Totenberg, NPR provided a different take on the news, broadening its mission to include those issues that affect the lives of ordinary people—including women. By 1984 ATC's staff was more than 50 percent female, which may have reflected the lower salaries women journalists were obliged to take (NPR's salaries were a third lower than the industry average); nevertheless, women had an enormous effect on the news content provided. Not only everyday news but also politics, law, international affairs, science, sports, and culture became the proper domain of women in this female-anchored medium for a general audience of the entire national public.

NPR's ability and mission to cover stories not just as breaking news but in depth and over time helped to build these women's careers into national reputations, and they are now frequently seen on television. Terry Gross developed one of NPR's top talk programs, *Fresh Air*, in 1975; it is still going strong. NPR's two additional newsmagazines, *Morning Edition* and *Weekend Edition*, continue the emphasis on women's voices as equals. Public radio remains a hospitable forum for female broadcasters on both national and local levels, although its lower pay scales and frequent use of volunteer talent may not do much to dispel the wage discrimination prevalent in society at large. Yet as talk radio developed into a forum for conservative white men in the 1980s and 1990s, public radio's feminine alternative occupies an increasingly important position in the U.S. public sphere.

Talk Radio

With the development of music formats on the FM band, AM became a radio graveyard, largely empty of all except news and sports and struggling local mavericks. Then talk radio came along in the late 1970s, made interactive by the new 800 number telephone technology that allowed listeners to call in from all over. Just as format radio had begun to go nationally syndicated, so too could popular local talk show hosts begin to attract national audiences.

One of the earliest to discover radio's potential in the field of talk and advice was the well-known psychologist Dr. Joyce Brothers. In the late 1960s, she took her advice to radio with syndicated shows on both the ABC and NBC networks, and she was later featured on WMCA in New York. Her shows, usually built around questions called in by listeners, were among the first to bridge the public/private divide, bringing personal problems into the light of publicity, including issues of sexuality, menopause, intimacy, and mental illness. Following in Brothers' footsteps came two more divas of the airwaves, Sally Jesse Raphael and Dr. Laura Schlessinger. Raphael got her start in Miami, with both a morning television show and an afternoon radio interview program. In 1976 she won a morning slot on New York's WMCA, and in 1979 hers was one of the original programs gathered together in NBC's syndicated Talknet package of night-time radio call-in shows. Schlessinger got her start at KABC in Los Angeles in 1975 as a frequent guest on another show, as an expert on human sexuality issues. This format had been introduced to the Los Angeles market by Dr. Toni Grant over KABC that same year. In 1976 Schlessinger began her own show on KWIZ Santa Ana, later moving back to Los Angeles at KMPC. Her major vehicle, *The Dr. Laura Schlessinger Show*, debuted in 1990 over KFI as a three-hour daily call-in program focused around personal advice and went into national syndication in 1994. In the late 1990s, Schlessinger's show surpassed talk king Rush Limbaugh's as the most popular talk program

on the air, although her conservative views brought controversy and declining status by 2002. Another broadcaster famous for her sexual and medical advice is Dr. Ruth Westheimer, whose show *Sexually Speaking* debuted in 1980 on WYNY-FM; by 1983 it was the top-rated radio show in the New York City area. In 1984 NBC began syndicating her show, which was renamed the *Dr. Ruth Show*, and Westheimer also ventured into television on the Lifetime network.

Into the Future

As the discussion of popular female radio talk show hosts above indicates, a peculiar kind of "separate spheres" philosophy still operates in the radio industry today. Most nationally recognized female broadcasters, with the exception of those on NPR, operate in the world of personal and private issues, giving advice in the areas of psychology, health, lifestyle, and culture, whereas political talk radio is largely the province of men. In commercial music formats, the "morning team" program, epitomized nationally by such "shock jocks" as Howard Stern and Don Imus, typically features a male host with a female sidekick in a markedly subordinate position (sometimes called "the giggle box"). Though a few women achieve prominence in the highly rated morning slots, their numbers are small, and it is usually still as half of a male/female team.

Meanwhile, behind the scenes and out of the public eye, more and more of radio's program, music, promotion, and marketing directors are women, and women make up the largest slice of the commercial audience. There are a few women station owners and syndicated producers, but the vast bulk of management remains male. Things have changed, but in many ways they have remained the same. The "women's daytime ghetto" may be gone, but certain occupational ghettos remain. However, turn on your radio and the chance that you'll hear a female voice announcing the upcoming hits, reporting the news, or delivering a commercial has increased enormously over the last 20 years. The controversy over women's voices on the air would appear to be settled, though now we must wait for industry control to catch up.

WOR

New York City Station

WOR-AM (710), now a leading talk/news format radio station in New York City that is heard in 35 states, began in 1922 as the New York metropolitan area's second radio station. WOR was constructed as a marketing promotion for the L. Bamberger and Company Department Store, and it originally served the New York area from Newark, New Jersey. Although its transmitter remains in New Jersey, its studios have been located in New York City for more than 70 years.

After New York station WJZ (later WABC) was launched in October 1921, Edgar Bamberger decided to start a radio station to promote both the crystal radio sets sold at the L. Bamberger and Company store and the store itself. Jacob R. Poppele, a former wireless operator for the U.S. Army who worked in the store's radio department, strung up antenna wires and launched station WOR on 22 February 1922 as its chief engineer. Initially, WJZ and WOR alternated daylight and evening hours. WOR operated at 833 kilohertz with 250 watts of power and moved to 740 kilohertz when it increased its power to 500 watts. When the American Society of Composers, Authors, and Publishers (ASCAP) sued WOR for copyright fees in 1923, WOR argued that it was providing a cultural service rather than broadcasting for profit. However, the courts decided that repeated emphasis of the station's sponsorship by L. Bamberger and Company as "one of America's Great stores" excluded it from the realm of charitable enterprises.

Early schedules alternated vocal and instrumental numbers with talk and various programs aimed at self-improvement. One of the most enduring of these early shows was a morning exercise program begun in 1925 featuring Bernarr Macfadden, a physical culture enthusiast and publisher of the magazines

Physical Culture and *True Story*. Macfadden paid WOR for the privilege of hosting the program. When Macfadden came down with laryngitis, John B. Gambling filled in and eventually took over the morning exercise show. That show ended in 1934, but John Gambling stayed on as a morning fixture. Two succeeding generations of Gambings have held the morning-show host position since—John A. until 1991 and John R. Gambling for the final decade, 1991–2001.

In 1927 WOR moved to the 710-kilohertz clear channel frequency. That same year, WOR joined with a group of radio stations enlisted by Arthur Judson and George A. Coats to form the United Independent Broadcasters (UIB), which required that participating stations sell ten hours of station time each week to UIB. WOR was the key station for the UIB group, which merged with Columbia Phonograph Broadcasting System and later became the Columbia Broadcasting System (CBS). However, WOR separated from the CBS chain in 1928 when WABC joined and became the key transmitter station for the chain. Competing department store chain R.H. Macy and Company acquired a controlling interest in L. Bamberger and Company in 1929, and the licensee name for WOR was changed to the Bamberger Broadcasting Service. By 1935 a new 50,000-watt transmitter and directional antenna sent WOR airwaves over a "bean-shaped area" up and down the eastern seaboard, garnering it a huge audience.

WOR joined three other major-market stations in 1934 to form the Mutual network, and it was the anchor station for Mutual for many years before leaving the network in 1959. Mary Margaret McBride got her start as *Martha Deane* on WOR from 1934 to 1940. *Uncle Don*, played by Donald Carney, a popular figure with young listeners, told stories and pro-

vided avuncular advice. In 1940 Ed Fitzgerald and his wife Pegeen created *The Fitzgeralds*, a breakfast show broadcast from the couple's 16th-floor apartment overlooking Central Park that achieved an audience of 2 million listeners as they discussed the day's upcoming social events and the morning news. The station featured another long-lived radio family—the McCanns. Alfred W. McCann, a muckraking journalist, used *The McCann Pure Food Hour* to expose the practices of the food industry in the late 1920s. After his death in 1931, son Alfred W. McCann Jr. took over and was later joined by his wife, Dora, to broadcast *The McCanns at Home* from their house in Yonkers. Daughter Patricia McCann continued the family tradition with *The Patricia McCann Magazine* until 1983.

In 1940 J.R. Poppele oversaw the creation of another WOR entity—New York's first commercial FM station, carrying WOR programs. During the 1940s, the *American Forum of the Air* staged debates on various topics. The station also originated dramatic series, such as *Nick Carter, Master Detective*; game shows; and soap operas. It attracted talent such as Henry Morgan, Cab Calloway, Arlene Francis, and theater critic Jack O'Brian. In the mid-1950s, Jean Shepherd joined WOR and stayed for 21 years as a personality and raconteur. In 1948 Bamberger Broadcasting System became a part of General Tel-radio, and in 1952 Don Lee Broadcasting System purchased WOR. In 1955 the station was acquired by RKO Pictures (later RKO General).

WOR-FM developed a new format described as “ahead of its time,” featuring “alternative” music such as the Beatles and Rolling Stones album cuts in 1966. It switched to an oldies format called the “Big Town Sound” in November 1967. When, in 1972, it dropped its oldies format and lost half its audience, WOR-FM became WXLO and later WRKS.

Attempting to update its programming in the 1970s, WOR-AM moved increasingly toward a talk format. A 1978 New School of Social Research survey reported that independent stations such as WOR produced more public-affairs programming than network radio competitors. From 1973 and for the next 20 years, “folksy foggy-voiced” radio personality Bernard Meltzer hosted the programs *What's Your Problem?* and *Guidance for Living*, which combined advice on finances, real estate, taxes, and personal problems. During the 1980s, both WOR and its archrival WABC adopted the talk radio format and struggled with revamping their programming to attract a younger audience. In 1988 the Federal Communications Commission (FCC) approved the sale of WOR-AM to S/G Communications, which in turn sold it a year later to Buckley

Broadcasting Corporation for \$25.5 million, after RKO General lost its licenses because of fraudulent billing practices in the mid-1970s.

Along with its mellow programming personalities, WOR also had its share of controversial figures. Irwin H. Sonny Bloch, a financial talk show host, was aired by WOR until Bloch admitted to swindling his listeners and was jailed. Eric Braverman, a doctor with a weekly show on alternative medicine, lost his medical license in 1996. WOR also hired controversial talk show host Bob Grant from rival WABC-AM in 1996 after Grant was fired for racial slurs against deceased Commerce Secretary Ron Brown.

WOR-AM talk format includes *Rambling With Gambling*; *Dr. Joy Brown*, a radio psychologist; *The Bob Grant Show*; financial advice from Ken and Daria Dolan; *The Joan Rivers Show*; *Health Talk* with Dr. Ronald Hoffman; and a food program by *Daily News* critic Arthur Schwartz. The station also carries sports coverage of the New Jersey Nets and Rutgers University.

WOR-AM talk format includes journalist Ed Walsh on *The Morning Show*, *Dr. Joy Brown*, a radio psychologist; *The Bob Grant Show*, financial advice from Ken and Daria Dolan, and Joan Hamburg, a talk show host wildly popular with women over 30 and whose style is reminiscent of WOR's earlier successes such as *The Fitzgeralds*. *Health Talk* with Dr. Ronald Hoffman, a food program by *Daily News* critic Arthur Schwartz, and an evening talk show host Tom Marr, brought in from Baltimore to replace Joan Rivers, were on the 2003 roster. Joey Reynolds, a former shock jock who is billed by the station as the “Mr. Nice Guy of Night Radio,” holds down the night time hours; his show is distributed by satellite to 35 stations nationwide. WOR does use some outside programming—Fox-syndicated commentator Bill O'Reilly's program *The Radio Factor* is featured during late afternoon hours.

World Radiocommunication Conference

The World Radiocommunication Conference (WRC) is an important global forum in the planning for and utilization of radio spectrum. Though only created in 1992, it builds on more than a century of international cooperation in telecommunications.

In response to unprecedented communication and technological convergence, the International Telecommunication Union (ITU) was restructured in 1992, and a new sector, the Radiocommunication Sector (ITU-R), was created. Under the 1992 ITU Constitution and Convention, the ITU-R replaces the World Administrative Radio Conference (WARC), which met every few years on matters related to radio spectrum.

The ITU-R is responsible for all ITU radiocommunication activities. Its mission includes ensuring worldwide rational, equitable, efficient, and economical use of frequency spectrum by all radiocommunication services and users around the world. WRCs are organized under the auspices of the ITU-R and serve as its governing body.

Functions

As the main legislative and policy-making body of the ITU-R, the WRC coordinates allocation of spectrum bands for national and international radio communication services among the 189 member countries. Unlike its WARC predecessor (which convened on an ad hoc basis to discuss specific matters related to international regulation of the radio spectrum), the WRC meets regularly (every two years) to discuss and adopt regulations governing the use of the radio-frequency spectrum. The WRC is designed to maintain a fair and efficient allocation of the radio spectrum for multiple uses by avoiding or at least reducing international disagreement and technical interference. The rationale for WRC's action is that the electromagnetic spectrum is a limited resource that must be managed for the benefit of all nations.

The WRC serves as an ITU legislative organ, and its resolutions, recommendations, and regulations have the status of treaties and conventions. However, ITU member countries are not bound by all WRC agreements. Although WRC resolutions and decisions are adopted by consensus, member countries are allowed to issue declarations reserving their right to take actions necessary to safeguard their national interests. For example, the United States has taken a number of these so-called exceptions to WRC or ITU decisions. Various national declarations and reservations notwithstanding, however, most nations participate in the technical standardization of worldwide radio communication to facilitate communications as well as world trade in radio equipment.

Nongovernmental Organization Participation

The ITU has over 600 nongovernmental organization (NGO) members representing a wide range of interests in telecommunications. These private-sector NGOs include major telecommunication and internet service providers, equipment manufacturers, broadcasters, and network and radio infrastructure designers, as well as regional and international organizations. These all play an increasingly important role in the WRC. They serve as information technology developers, exhibitors, consultants, and advisers, among other roles. Despite the active participation of the private sector in WRCs, NGOs do not have the rights and obligations generally appertaining to ITU member states. Only member countries or their accredited representatives are allowed to vote on WRC resolutions and conventions.

The WRC in the Digital Age

WRC meetings may revise radio regulations and associated frequency assignment and may address any radiocommunication matter of international importance. The WRC is concerned with the entire range of radio services: both AM and FM broadcasting, satellite broadcast services, mobile and amateur broadcasting, and a host of nonbroadcast services. In the last ten years, WRCs have allocated frequencies and set standards for wideband high-definition television (HDTV), mobile satellite services, terrestrial public communication, aeronautic services to provide telephone communication for passengers in commercial aircraft, satellite or terrestrial digital audio broadcasting, and maritime distress communications. The most significant recent WRC resolutions and agreements include treaties governing the use of the geostationary-satellite orbit, HDTV, low earth-orbiting satellites, and high-frequency national and international radio services (including amateur and government-sponsored international broadcasting). WRC meetings are usually forward-looking conferences held to consider and update regulations on specific terrestrial and space radiocommunication services in order to keep up with technological changes. For example, the WRC-2000 conference, which took place in Istanbul, Turkey, allocated additional radio spectrum for third-generation international mobile telecommunication; agreed on conditions under which a new wave of non-geostationary satellites will operate; and assigned new broadcasting satellite orbits to Europe, Africa, and the Asia-Pacific region.

WRCs and International Politics

Because all countries negotiate WRC agreements in the light of their national interests, WRC meetings have not been free of controversy. For example, in the WRC that charted the method to be followed in planning fixed satellite services ("Space WARC 1985"), regional and national interests were very evident. Developing countries, which did not have the financial or technological resources to launch their own satellites, feared that all satellite orbital slots would be occupied by industrial nations before poorer countries could develop means of launching their own satellites. The larger number of poorer countries therefore demanded that slots be reserved for their future use as a means of creating equitable access to the geostationary orbit for all countries. The United States and other developed countries preferred an evolutionary system in which countries would be assigned bands on a first-come, first-served basis. The same kinds of pressures were evident in more recent HF (high-frequency or shortwave radio) WRC conferences.

Technological developments in the field of radiocommunication and the convergence of telecommunications, voice, video, and information technology have tendered the role of the WRC more crucial than ever before. Without WRCs' forward planning, resolutions, and treaties, radiocommunication around the world would be chaotic at best and impossible at worst.

World War II and U.S. Radio

A brief radio bulletin brought the reality of another world war to American listeners on 7 December 1941. At 2:26 P.M. EST, the Mutual Broadcasting System (MBS) interrupted coverage of a Sunday afternoon football game to announce that Japanese warplanes had bombed U.S. forces at Pearl Harbor, Hawaii. The other networks quickly followed suit, John Daley of CBS mispronouncing the name of Oahu in his excitement, for example. America and its Allies soon were engaged in a monumental struggle, every aspect of which was in one way or another connected with radio. U.S. radio's prominence during World War II proved to be the medium's journalistic high-water mark. In a sense, radio was the perfect medium to undertake the wartime task of informing, entertaining, and

boosting the morale of the American public. In doing so, radio adapted itself to serve three program settings—international, domestic, and military.

International Radio

Such a purpose for radio came not from the United States but rather from the Axis nations of Germany, Italy, and Japan. As early as 1933, German shortwave broadcasts were flooding the airwaves with programming designed initially to provide Germans living abroad a link to the "Fatherland." Such programs gradually became conduits for coded messages meant for German agents living in the United States. And once the United

States' intention to ally with Great Britain became obvious, the German broadcasts began filling with propaganda messages, of which the purpose, according to Adolf Hitler, was "psychological decomposition of the masses."

The international or "external" voice that radio provided the Axis powers soon spread worldwide in some 30 languages. Shortwave listening nonetheless was limited to a U.S. audience of between 3 and 7 million, according to a 1941 survey by the American Institute of Public Opinion. The survey also found that persons listening specifically to German shortwave programming numbered only about 150,000 on any particular day. Those in charge of Germany's North American Service were well aware of the small audience but still found success with the manner in which loyal listeners (many of whom had formed into "listening groups") were able to spread radio's propaganda messages to non-listeners by word of mouth.

In order to counter the prewar propaganda available to American listeners via shortwave radio, President Franklin D. Roosevelt encouraged several members of Congress to introduce legislation that would create a government-owned shortwave radio station to aim programming toward Axis countries. When several bills to this effect failed, Roosevelt encouraged the existing privately owned U.S. shortwave stations not only to assist the government's propaganda efforts, but also to air propaganda programs produced by government agencies.

Several U.S. companies had constructed shortwave radio stations during the 1930s in order to experiment with high-powered, high-frequency broadcasting. The experimental nature of these stations changed in 1936 when the Federal Communications Commission (FCC) reclassified them as "international broadcast stations." Six companies or organizations—National Broadcasting Company (NBC), Columbia Broadcasting System (CBS), Westinghouse, General Electric, Crosley Corporation, and World Wide Broadcasting Foundation—transmitted shortwave signals to Europe, Latin America, and Asia via 14 transmitters just prior to America's entry into World War II. The number of transmitters jumped to 38 as the war began. Similarly, the number of languages in which international programming was aired jumped from six in 1939 to nearly two dozen by 1942. Privately owned U.S. shortwave stations were not openly cooperative with the government's efforts to use their facilities. Nonetheless, the Office of the Coordinator of Inter-American Affairs (OIAA) began supplying news items in August 1941 for broadcast to Latin American countries.

Matters changed substantially when the United States entered the war in December 1941. War emergency provisions of the Communications Act of 1934 empowered the president to order any U.S. radio station, domestic or international, either to cease operation or to operate under government control. Neither of these options was applied to domestic stations

(with the exception that all amateur radio operators were ordered off the air), but such was not the case for international stations. The government arranged to "lease" the transmitters of these stations and to place their control under the Office of War Information (OWI) in June 1942. Assurances were given all international broadcast station licensees that stations would be returned to them following the war. Station staffs were retained by the government, partly because of their experience and partly as reassurance to station owners that government supervision was only temporary. The broadcast service of the now-combined international stations was called the Voice of America (VOA). Seventy-five percent of VOA programs consisted of news, with the remainder of program time devoted to music and features.

The broad objectives of the VOA were to engage in psychological warfare against the enemy and to provide news and morale-building programs for U.S. Allies and armed forces. Programs of the former type were supplied by the Office of Strategic Services (OSS). Much of the OSS effort was aimed at formulating quick responses to Nazi propaganda broadcasts that had been intercepted and translated by the newly created Foreign Broadcast Monitoring Service (later called the Foreign Broadcast Intelligence Service). News programs were typically 15 minutes in length and were designed to provide a true account of whatever events were reported.

VOA entertainment programming was meant to reflect life in the United States. Programs ranged in length from 15 to 30 minutes and were produced primarily in the New York studios of CBS and NBC. By September 1943 the VOA was transmitting approximately 2,600 shortwave programs per week. A majority of these programs were beamed to Europe, but two West Coast shortwave stations also beamed VOA programming to the Far East in Japanese and a number of Chinese and Filipino dialects. The VOA was assisted by Australian radio stations that picked up and rebroadcast its programming. The same was true in Europe, where the British Broadcasting Corporation (BBC) relayed VOA programming into occupied countries via BBC standard-band radio stations. The European operation actually began in May 1944, just prior to the D-Day invasion, and was called the American Broadcasting Station in Europe (ABSIE). ABSIE was programmed much like the BBC, with music and news. The news was broadcast in seven languages and often carried comments from exiled leaders; nearly a third of the ABSIE broadcast day was aimed into Germany. ABSIE disbanded in July 1945, after reaching a peak of nearly 80 percent of listeners in occupied Europe.

Domestic Radio

Nearly 82 percent of U.S. households and 30 percent of U.S. automobiles were equipped with at least one radio receiver as World War II began, and more than 900 U.S. radio stations, 76

percent of which were affiliated with one of the four major networks—NBC Red, NBC Blue, CBS, and MBS—served listeners before war's end. A demonstration of radio's power to reach listeners occurred on 8 December 1941 when President Roosevelt delivered his noontime address asking that Congress declare war on Japan. A daytime record of 66 percent of radio listeners tuned in to the address. The night-time record was broken the next evening when 83 percent of the audience heard another address by the president.

As the United States entered the war, radio, especially radio news, had achieved stature as a major unifying force. Radio network and station executives who had been reluctant to program anything that appeared to breach the nation's declared neutrality now were able to act in concert. As a result, practically all of the radio programs that listeners were accustomed to hearing—from drama to comedy and from variety show to soap opera—incorporated patriotic, morale-boosting themes.

Radio news during World War II was, for all intents and purposes, NBC and CBS News. CBS News became a force in journalism in a sudden burst of improvised reporting activity at the very outset of the war. On 11 March 1938, when the German army occupied Austria, Edward R. Murrow and William L. Shirer were the only two foreign correspondents employed by CBS Radio. Both, however, were resourceful enough to arrange to cover the *Anschluss*, and at 8 P.M. on 13 March 1938, Murrow and Shirer, along with several newspaper reporters scattered in various European cities, went on the air with live reports of reaction to the German occupation. The CBS *World News Roundup*, as it came to be called, was successful enough to be made a permanent wartime fixture. Radio from then until war's end was not only the chief information source for most Americans, but also the information source that Americans held in highest esteem.

Radio performers such as Jack Benny mixed regular program fare with wartime requests to conserve scarce items or to grow "Victory Gardens." Networks also produced special programs built around stars to make particular mobilization appeals. One such program with Kate Smith, airing on CBS in February 1944, was successful in raising some \$112 million in war bond sales. Comedian Bob Hope began a tradition that lasted until the Vietnam War era of taking his show on the road, entertaining radio listeners and military personnel alike at various military locations at home and abroad. The music programs (most of which were in the popular or "pop" category) that filled nearly a third of the network schedules also joined the war effort with the likes of Frank Sinatra or Glenn Miller and his Orchestra performing tunes such as "Praise the Lord and Pass the Ammunition" and "This Is the Army, Mr. Jones."

New dramatic programs such as *Counter Spy* and *Alias John Freedom* incorporated wartime themes exclusively, as did documentary series such as *To the Young, Report to the*

Nation, and *This Is War*. All of these were meant to stimulate morale as well as to inform listeners about U.S. war policy. Youthful radio listeners were introduced to Americanism and patriotism via the heroic deeds of such characters as Jack Armstrong, Superman, Tom Mix, and Captain Midnight. These and similar characters battled the treacherous deeds of assorted Axis villains. Messages imploring children to collect paper or to buy war stamps were also inserted into programming especially produced for that age group. And many of the nearly 50 morning and afternoon serials or "soap operas" such as *Young Dr. Malone*, *Backstage Wife*, and *Front Page Farrell* adapted their plots and characters to wartime situations.

Special programs that demonstrated the unified spirit of the American entertainment industry occasionally appeared throughout the war. One of these, "We Hold These Truths," was produced by the U.S. government and had been intended as a commemoration of the 150th anniversary of America's Bill of Rights. It aired live simultaneously in prime time on all four U.S. radio networks only eight days after the Japanese attack on Pearl Harbor. Created by noted writer Norman Corwin, "We Hold These Truths" reached a radio audience estimated at the time to have been the largest ever to hear a dramatic performance. President Roosevelt, along with a cast of some of America's most famous performers, including Lionel Barrymore, Walter Huston, Marjorie Main, Edward G. Robinson, Orson Welles, and James Stewart, all lent their voices and talent to a program in which the original intentions of celebration gave way to a more somber call to patriotism.

The U.S. government played other prominent roles in radio programming during the war. For example, *The Army Hour*, financed by NBC but produced by the U.S. Army, began its hourly Sunday afternoon broadcasts in April 1942. *The Army Hour* was produced not only for domestic listeners, but also for military personnel around the globe. The show gave listeners a blend of entertainment and information about the army's mission and featured well-known celebrities and army personnel from privates to generals. For instance, it was here that listeners heard General Jimmy Doolittle tell of Army Air Corps bombing runs over Tokyo. *The Army Hour*, originating from military bases around the globe, remained popular throughout the war.

The U.S. War Department found radio of use in other ways. Noted writers such as Norman Corwin and William Robson were commissioned to prepare scripts for programs meant to raise public perception regarding women serving in the armed forces and regarding the fighting abilities of African-American troops. And when morale problems crept into the numerous military training bases around the country, the War Department requested that networks provide some entertainment relief by originating programs from the bases themselves. The networks complied, but before the originations began, the networks had to promise to abide by another request—to begin

each program with a disclaimer for endorsements by either the army or War Department of commercial products represented by the programs' sponsors.

A number of government agencies produced radio programs that were available to networks and local radio stations wishing to air them. All such programs had to be approved by the OWI, and many of the agencies producing them were assisted by such civilian groups as the Writers' War Board, the War Advertising Council, the Council for Democracy, and the War Activities Committee of the Motion Picture Industry. Members of these wartime organizations devoted time, talent, and expertise to the cause. *Treasury Star Parade* was one such product of this civilian/government collaboration. The 15-minute series was produced by the U.S. Treasury Department and was meant to persuade listeners to buy war bonds. Leading performers of the day donated their dramatic and musical talents to *Treasury Star Parade*. The program, reproduced on electrical transcriptions (called "ETs") that resembled the contemporary long-playing record, was distributed free upon request to over 800 radio stations nationwide.

The government played other key roles during World War II that affected the radio industry. For instance, in April 1942 the FCC discontinued issuing permits to construct both AM and FM stations until war's end. The commission's rationale for its decision was the shortage of construction material resulting from wartime needs and the shortage of trained personnel necessary to operate radio stations. Even before the war had begun, in September 1940, Roosevelt had created the Defense Communications Board (later renamed the Board of War Communications), which was made up of government representatives and civilian representatives of the radio industry and was charged with deciding how best to utilize American radio during the war. The Board's most significant contribution was allowing radio networks and stations to operate as usual with only a modicum of extraordinary government oversight.

Practically all of that oversight came via the Office of Censorship (see following) and units of the FCC. The FCC's Radio Intelligence Division had been created prior to the war to search for unlicensed radio stations. That job became more critical during the war with the threat of clandestine stations broadcasting subversive messages. The FCC's Foreign Broadcast Intelligence Service also existed prior to the war to monitor and transcribe foreign broadcasts and to make their transcriptions available to the appropriate government agencies.

Voluntary censorship was assisted by an Office of Censorship (OC), which was created by the president's executive order only two days after the Pearl Harbor attack. One of the OC's first objectives was to prepare a code for broadcasters that would include advice on what should or should not be said on the air and how certain kinds of information might be handled.

The OC issued the first of five editions of its *Code of Wartime Practices for American Broadcasters* in January 1942. Because of ways in which the enemy might make use of otherwise innocent kinds of programming, radio station licensees were cautioned to abstain from broadcasting, among other things, weather reports, information about military troop locations or deployments, identification and location of naval ships or military aircraft, military base locations, and casualty counts as a result of military action. Licensees were also cautioned to avoid musical request programs or interview programs that relied on extemporaneous comments and to avoid dramatic content that portrayed the horrors of battle. The OC staff spot-checked network programs for any content that might prove problematic. The staff also reviewed program scripts that networks or stations submitted voluntarily. With few reported breaches of security, the radio industry's ability to look after its own house during the war worked exceptionally well.

The one new FCC unit was the War Problems Division, which the commission established in its law department in 1942 to monitor the nation's 169 radio stations that broadcast all or a major portion of their programming in foreign languages. Because German and Italian were the predominant languages of these programs, there were fears that agents of the Axis powers could easily use the programs to plant subversive messages. The stations could have been ordered off the air, of course, but the FCC realized that they served a significant number of listeners (estimated at 14 million foreign-born and first-generation Americans) who might otherwise listen to shortwave stations originating in Axis countries if they were not served by American stations. In order to police themselves, the stations created the Foreign Language Radio Wartime Control, which adopted a code requiring strict oversight of program content and station employee loyalty. This code eventually was incorporated into the *Code of Wartime Practices for American Broadcasters*.

The abundance of programming for World War II radio was matched by the abundance of advertising. In fact, only one year after the war began, the U.S. radio industry billed a record \$255 million for commercial time. And things simply got better after that. Two factors contributed to radio's economic well-being. One was the shortage of newsprint, which curtailed the amount of space many newspapers could allow for advertising. Businesses naturally turned to radio, where no such space constraints existed. As a result, radio's total share of the advertising dollar climbed steadily throughout the war years. The second economic factor favoring radio derived from a tax levied by the government on excess profits as a means of curtailing wartime profiteering. The 90 percent tax on profits exceeding what a company would normally be expected to make was exempted when these profits were spent for advertising. Instead of keeping what amounted to only ten cents for

every dollar, companies dumped much of their excess profits into radio advertising.

Radio advertising in the form of program sponsorship also benefited from government largesse. Companies under contract to manufacture war-related products were allowed to count advertising along with other manufacturing costs and to pass along to the government all the bills for doing business. This formula allowed a number of companies to dedicate large amounts of money to sponsoring radio programs. Such sponsorship amounted to paying the full production costs of programs, with the results that a number of network programs either remained in production or were created as a result of funding that came indirectly from the government.

Wartime conditions changed radio advertising content in a number of ways. For one, a number of consumer products either were not available or were in short supply and thus rationed. Companies whose products were thus affected often turned to institutional advertising just to keep their name or brand in the listener's mind. This kind of advertising was particularly beneficial to the fine arts when, for example, a corporation such as General Motors that had no cars to sell nonetheless gave its name to sponsor the NBC Symphony Orchestra. Other companies tied their name or product to the war effort by the messages they chose for their radio commercials. A famous western hat company, for example, mixed its product name with a plea to guard against spreading rumors by admonishing Americans to "Keep it under your Stetson."

Finally, domestic radio stations underwent some wartime changes. Many stations located in markets that were also the homes of important war industries adjusted their broadcast day in order to provide industry and plant workers something to listen to as they worked. Radio was also considered an essential industry by the government, and many key radio station personnel were granted deferments for military duty by the Selective Service System. Of course, although some decisions were made to take advantage of these deferments, many broadcasters still joined the military when duty called. Broadcast engineers in particular provided technical expertise that was useful to the military. They contributed considerably in developing America's wartime electronics capability. And their skills advanced in such ways that the radio engineers who entered World War II left it in 1945 to form the advance troops in postwar development of the television industry.

Military Radio

U.S. military personnel were among the most avid listeners of the shortwave international stations that had been transformed by the OWI into the Voice of America. Programming produced especially for the "G.I." began appearing in early 1942 as a result of the U.S. Army's Bureau of Public Relations (BPR). The BPR's first and perhaps best-known program was *Com-*

mand Performance. The one-hour program aired weekly on Sundays and carried a blend of comedy, sports summaries, popular music, and celebrity appearances. The *Command Performance* title derived from the program's key element of entertainers responding to military personnel requests such as singing a special song. The program was produced from several takes, allowing deletion of questionable material or material deemed censorable by the military, and then recorded finally onto wax disks for the Sunday airing. *Command Performance* originated in New York but was moved to Los Angeles shortly thereafter because of the Hollywood talent pool. After producing 44 of the programs, the BPR relinquished control of *Command Performance* to the Armed Forces Radio Service (AFRS).

The AFRS was created in 1942 as a unit within the War Department's Information and Education Division and was headed by Col. Thomas H.A. Lewis. The AFRS was headquartered in Los Angeles and run by staff members from the army and navy as well as civilians. The service was closely connected to the entertainment industry and thus attracted top talent for AFRS programs. By the end of 1943 AFRS had 306 outlets and stations in 47 countries. Each outlet received more than 50 hours of recorded programming per week, delivered by plane, as well as special shortwave programming (e.g., news and ball games) and programs that were produced in the field or at the stations themselves. All programs were reproduced on unbreakable 12-inch vinylite disks, some 83,000 of which were shipped every month from Los Angeles to AFRS outlets. Reuse of commercial programs required cooperation of network and transcription companies as well as concession of rights of entertainers, sponsors, advertising agencies, musicians, copyright claimants, and publishers.

AFRS programs either were produced by the AFRS itself or were network series that had been "denatured." Denaturing meant deleting commercials that normally appeared in the network programs from the transcribed versions heard by the G.I. so as not to give unfair advantage to particular advertisers. There also was fear that soldiers far from home and living under less than ideal conditions would be depressed to hear commercials for food and drink products or goods meant to provide comfort and relaxation. But when soldiers complained of missing the familiar sound of commercials, the army began inserting gag commercials that spoofed the real ones. And since many commercial network programs used the name of the program sponsor in the show's title, completely new openings and closings had to be created by the AFRS and substituted for the actual title. Thus, *Camel Caravan* became *Comedy Caravan* and *Chase and Sandborn Hour* became *Charlie McCarthy*. AFRS also combined dramatic episodes of several programs into anthology-like series with titles such as *Front Line Theater*, *Globe Theater*, and *Mystery Theater*.

Besides entertainment programs, educational and documentary programs were carried on the AFRS network. *Heard at Home* was another combination program that pulled segments from such shows as *The Chicago Roundtable*, *America's Town Meeting of the Air*, and *People's Platform*. The AFRS also produced its own educational programs, such as *Know Your Enemy* and *Know Your Ally*. *Mail Call*, a musical variety program that began in August 1942, was the first AFRS-produced program. For commercially produced shows, several different AFRS offices were responsible for examining program content for security violations, technical quality, authenticity, and compliance with current policy, such as race relations policy. AFRS could not supply all programming needs, and besides, troops preferred the familiarity of U.S. commercial network programs.

Most of the AFRS military radio stations operating in the field were called "American expeditionary stations." Their prototype was a station in Kodiak, Alaska. Soldiers stationed there soon after the war began were unhappy with the unreliable shortwave service in that remote area. To improve matters, the soldiers built and operated their own low-powered transmitter and a makeshift station that broadcast to troops stationed nearby. Programs consisted mainly of recorded music supplemented by occasional news reports as items were received via shortwave.

A more significant makeshift radio operation began in Casablanca shortly after U.S. forces invaded North Africa in November 1942. Present with the troops was Major Andre Baruch, who had been a CBS radio announcer prior to the war and who asked permission of General George H. Patton to construct a radio station for his comrades. The general approved, and Baruch set about molding spare parts into what became the U.S. Army's first expeditionary radio station on 15 December 1942. Major Baruch entertained troops with "platter-chatter" and music from his own limited collection of records. Radio receivers were not plentiful and either had to be purchased from French Moroccan radio shops or built from spare parts. A short time later, soldiers at Anzio were creative enough to build a simple receiving device called "Foxhole Radio" that was similar to the crystal sets of the 1920s.

The idea that radio was an important element in keeping troop morale high led to General Dwight D. Eisenhower's ordering the creation of additional stations that either were stationary or traveled with troops. Transmitters for the 50-watt mobile stations were carried in five portable cases and accompanied the Fifth Army as it advanced into Italy. At key locations along the route, permanent stations were established by Major Baruch. By March 1943 these stations were joined to form the Mediterranean Army network. A similar network of stations, called the Armed Forces network, was built to serve American troops stationed in England and

began broadcasting in July 1943. And in due course, an equivalent South Pacific operation called the "Mosquito" network was created with stations built on islands scattered throughout the area. All of these stations, of course, carried the AFRS programming supplied on disk, but they also provided listeners with localized programming produced at the stations themselves.

Radio at War's End

Reporting about military matters became more sophisticated as the war progressed. Radio reporters who accompanied troops were assisted in their reporting efforts by field recording techniques using portable wire recorders. During the latter part of the war, these reporters were indirectly assisted by German technical advances that had replaced the difficult-to-edit wire recorders with plastic tape recorders. Captured recorders of this new variety allowed reporters to cover a variety of dramatic wartime events and to quickly get their eyewitness accounts back to their respective networks. Thus, ABC's George Hix provided listeners with vivid accounts of the 6 June 1944 D-Day invasion from his observation point aboard a navy ship. And listeners heard the recorded reactions to nearly incomprehensible horrors on 13 August 1944, when a Mutual reporter first entered Maidanek extermination camp, which had been liberated only a few days earlier by the Russian army.

At least three months of fighting remained in the Pacific when Germany surrendered in May 1945. There was much V-E Day celebrating over the triumph of the Allied forces, and radio was in the thick of it. On 8 May 1945, CBS aired *On a Note of Triumph*, written by Norman Corwin to commemorate the event. *On a Note of Triumph* proved so popular that CBS rebroadcast it live on 14 May. The program eventually was released as a commercial record album, and Simon and Schuster put out a book version of the script that quickly made the best-seller list. The program in a symbolic sense brought radio full circle. Radio had made a commitment of so many of its resources to join in the collective experience that World War II became. Radio and its listeners—wherever they might have been and in whatever endeavor they might have been engaged—had formed a community during the war and had effectively woven themselves into the very fabric of that event.

WQXR

New York City Station

One of the very few radio stations to begin as part of an experimental TV operation, WQXR (as it became in 1936) and its later FM associate station became in 1944 the voice of the *New York Times* in New York City, renowned for classical music and arts programming. Elliott Sanger, both father and son, played key roles in the station's creation and operation for decades.

Origins

This New York classical music station had a unique start—as the sound channel for a very early experimental TV transmitter. In 1929 radio inventor J.V.L. Hogan received a Federal Radio Commission (FRC) license for W2XR, based in Long Island City, New York, to develop a mechanically scanned TV and facsimile service. Whereas the pictures were sent out on 2100 kHz, as of 1933 a second, sound, channel at 1550 kHz was added. In accord with FRC rules of the time, this was one of three 20 kHz channels (each twice the width of existing AM radio channels). Using this new channel, Hogan used classical

music recordings as his sound background for the crude pictures. Audience interest in the music (most could not receive the pictures) prompted the idea of a commercial station providing such content. Indeed, the eventual failure of mechanical approaches to television led to an increased focus on the sound channels.

Working with engineer Al Barber, Hogan focused on providing high fidelity sound by using special broadcast-only electrical transcription recordings and various filters to improve the music transmitted. Equipment was the best available—or was made especially for W2XR operation. By 1934, using 250 watts, the station was on the air four hours daily and was providing a program log for listeners.

The big change came two years later when, teamed with advertising and public relations expert Elliott M. Sanger, the experimental W2XR became commercial station WQXR with 1,000 watts of power, still on 1550 kHz. But this was a different kind of commercial operation, because the station (with all of six employees) picked and chose its advertisers and their messages carefully to match the high tone of the programming.

WQXR would not accept advertising for products that were in poor taste or represented a bad value—and the method of presentation of those that were accepted “must be in keeping with the quality of the broadcast programs.” Prophetically, in light of what happened eight years later when the *Times* bought the station, the original license application stated that the new station would seek to emulate the values of the *New York Times*. Many radios could not even tune in to the station, which was just above what were then the uppermost frequencies on the AM band.

A focus on top-quality sound continued and in 1938 WQXR broadcast the first tape-recorded program (part of the opera *Carmen*), although the method of recording used was short-lived. Power rose to 10,000 watts (on 1560 kHz) in 1941. Hogan and Sanger’s Interstate Broadcasting Co. became an FM licensee, with New York’s first FM station, W2XQR (with a transmitter loaned by FM inventor Edwin Armstrong) on 26 November 1939, which became W59NY (45.9 MHz) when the FCC approved commercial operation in 1941. When FM call letter rules changed in 1943, the station became WQXQ, and with the service’s frequency change it shifted operations up to 97.7 MHz after World War II. Both stations provided the same programming and were now operating from a Fifth Avenue address.

Voices of the *Times*

In mid-1944, the *New York Times* purchased the stations from Sanger and Hogan for \$1 million. The program emphasis on fine music continued, as did the extensive schedule of live studio performances. Six years later, the studios moved to the *Times* building. In October 1952 the stations began a two-station transmission of stereo, with AM providing the right channel and FM the left. These were replaced in 1961 with the inception of FM multiplex transmission. The AM outlet’s power received a final power boost, to 50,000 watts, in 1956.

In a decade-long experiment, the New York-based classical programming was shared with more than a dozen “affiliate” stations in the WQXR network. Beginning in 1953 stations from Buffalo, New York, to Boston, Massachusetts, to Washington, D.C., formed the “WQXR Network.” It closed 10 years later because of insufficient income and the desire of the

other stations to have more local say in their program offerings. December 1963 saw the end of the station’s monthly program guide, which had first appeared in 1936 (the *Times* carried the program listings in its pages).

The stations won a Peabody Award in 1959, which noted “no station anywhere has devoted more time or more intelligent presentation to good music than has WQXR.” In 1967, in response to FCC rules not allowing AM-FM outlets to duplicate their programming, WQXR began to focus on lighter classics, show tunes, and jazz. Several other approaches were tried, but all angered listeners and did not please advertisers. The *Times* briefly considered selling the outlets in 1971, but instead obtained a nonduplication exemption from the FCC and went back to both stations providing the standard classical repertoire that had done so well for so long.

In December 1992 the AM outlet (which over the years had lost much of its audience to its higher fidelity FM twin) became WQEW, with much of the popular music programming that had been on now-defunct WNEW. At the end of 1998 WQEW entered a new stage when the *Times* leased the outlet to Disney for an eight-year period and the format was directed toward children (with a back-up of New York Jets game broadcasts), delivered by satellite and carried by about 40 other stations across the country. WQXR (FM) continued to provide classical music and in January 1997 began an internet website.

Wright, Early 1915–1999

U.S. Disc Jockey

Early Wright was one of the earliest and longest-running black disc jockeys in the South. In 1947 he began as a disc jockey at WROX in Clarksdale, Mississippi. For nearly 50 years Wright broadcast blues and gospel to the people on the northern Mississippi Delta. Many internationally known blues artists began their careers on his show. He is credited with popularizing the Delta blues sound.

Wright claimed he was born in 1915 on a farm in Jackson, Mississippi. In 1937, after moving to Clarksdale, he became an auto mechanic. During his spare time, he was the manager for the Four Star Quartet Singers, a local gospel group. The group appeared on KFFA's *King Biscuit Time* program, which originated across the Mississippi River in Helena, Arkansas. Named after the sponsor's product, King Biscuit Flour, the show was one of the earliest (1941) to feature live blues artists.

When WROX started broadcasting from Clarksdale in 1944, the Four Star Quartet appeared there. After hearing Early Wright deliver Sunday morning announcements for the quartet, WROX's station manager, Buck Hinman, offered him a job. Two weeks later, after consulting with a preacher to be sure there was nothing sinful about playing blues records on the radio, Wright accepted the job.

From 1947 Early Wright's radio career continued until his heart surgery in 1997. His radio fame is interwoven with the rich blues tradition surrounding Clarksdale and Coahoma County. W.C. Handy, "Father of the Blues," lived there, and the area has been a gathering place for blues musicians since the 1920s.

In the early years Wright hosted live broadcasts of blues artists he knew from the *King Biscuit Time* show. Many, such as Sonny Boy Williamson, Robert Nighthawk, and Joe Willie "Pinetop" Perkins, achieved worldwide fame. Wright's programs were broadcast from the WROX studio at Clarksdale's Alcazar Hotel. The program reached listeners across the northern Delta and sections of eastern Arkansas.

During the 1940s Clarksdale's Issaquena Avenue was the hub of blues entertainment. Early Wright's program on WROX set the pace for the festivities. Roaring bands led by emerging musicians such as Ike Turner played all night. The Riverfront Hotel was another hot spot for blues music. Artists performed there while rooming at the hotel and traveling through Clarksdale. Before becoming a hotel, the Riverfront had been a black hospital; Bessie Smith, "Empress of the Blues," died there after a car accident in 1937.

At WROX Wright opened the door for Ike Turner in the early 1950s. Turner first appeared on Early Wright's program

with the "Kings of Rhythm." Later Turner did his own 30-minute show before moving to WHBQ and Sun Records in Memphis. According to Wright, Ike Turner first recorded "Rocker 88," considered by many to be the first rock and roll tune, at WROX.

Other well-known blues musicians, such as Muddy Waters and B.B. King, gave live performances hosted by Wright. In 1989 the *New York Times* reported that a little-known Mississippi country boy named Elvis Presley had made a radio appearance on the Early Wright show. Impressed with Presley's politeness and showmanship, Wright said "He always had a motion, you know" (Applebome, 1989).

In time the format of his program involved two segments. Usually beginning in the evening around 7:00 P.M., he was the "Soul Man," playing blues music. Later in the evening he was "Brother Early," playing gospel songs.

His delivery, which did not change during his career, was folksy, country, and deep-South sounding. *Living Blues Magazine* wrote of the time Wright delivered a warning about snakes in the black neighborhood. "I want to let you know that some snakes has been seen in the Round-yard neighborhood. The grass has grown up around the sidewalks and snakes has been seen, looking for water. And a man told me the other day, he saw a snake in the street. That's right—snakes has been seen in the street; it's been dry and they are looking for water. . . . Tell the children to be cautious in the street, too, and look out for cars" (McWilliams, 1988).

His down-home style engaged listeners, many of whom were white. Even during the heated 1960s racial disturbances, Wright held a sizable white audience, about a 50-50 split with black listeners. Responding to phone callers, he would say, "Soul Man speaking." On occasion, he left the microphone on, and the audience could hear him talking over the music: "and you wanna dedicate it to who?"

On a typical program, as reported by Peter Applebome of the *New York Times*, he introduced "an extinguished guest," then played the blues of Bobby Rush or the gospel tunes of the "Mighty Sons of Glory," and then reported on who was about to be "funeralized."

He would deliver commercials with the same folksy style. "Now I want to tell you about the Meat House. It's on Highway 61 South, owned and operated by Mr. Askew, the nicest man who ever sliced a piece of meat. . . . They've got two female meat cutters. They're A's instead of B's. The cashier's so nice, it makes the meat taste even better."

Early Wright is a radio legend who spoke the language of his listeners. He died in a Memphis hospital in December 1999. The Delta Blues Museum in Clarksdale has exhibits on the history of the blues and Early Wright. In his honor the city named the street where he lived Early Wright Drive.

WRR

Dallas, Texas Station

WRR-FM has the distinction of being one of the few municipally owned commercial FM stations in the United States. **WRR-AM** began broadcasting in 1920; the FM station began broadcasting in 1948. Rising station values convinced the Dallas city government to sell the AM station in 1978, but the city retained the FM service. Although rising station values have again prompted the city to consider selling **WRR-FM**, the city has so far elected to retain the station and the distinct fine-arts and classical programming contribution the station makes to the city of Dallas.

A Radio Emergency Service

WRR-AM is one of the pioneer radio stations in the United States. In March 1920 **WRR** was issued a limited commercial license by the Department of Commerce to begin a specialized wireless service. While **WRR** claims to be the first station west of the Mississippi River, its original specialized function excludes it from being considered for many of the "firsts" in radio history. **WRR** was conceived as a two-way communication system to send and receive emergency calls from the city's fire and police departments. Thus its services were not intended for reception by the general public, nor did the station provide general-interest programs in its early years. When

not in use, the transmitter's carrier frequency would remain on the air. In the event of a fire or rescue emergency, the silence of the carrier frequency was interrupted with an emergency announcement for firefighters. What would today be termed "programming" was added during the interludes between emergency calls to enable listeners to know that their receivers were set on the correct station frequency.

As with radio in other parts of the United States, the presence of a station and at least limited programming service encouraged listeners to tune in to receive the miracle of wireless transmission. As the radio system developed, the central Dallas fire station served as the base of transmission. Fire Department personnel and dispatchers soon developed an eclectic broadcasting schedule, typical of many early radio stations, consisting of weather reports, joke telling, reading the newspaper on the air, announcing birthdays, and playing music. Such general-interest programming served to encourage more citizens to buy receivers, which in turn increased listener demand for more and improved programming. Eventually, the station was airing not only recorded music but broadcasts of local amateur musicians as well.

The success of **WRR** led its operation to shift from the fire department to being a municipally operated station. The station began accepting advertising in 1927. By 1939 the station's

trailblazer operations led to the construction of a radio building and transmitter tower at the Fair Grounds Park near downtown Dallas. In 1940 the station affiliated with the Mutual Broadcasting System and the Texas State network. Much of the station's format consisted of block programming.

By the 1970s WRR-AM was operating with 5,000 watts of power on 1310 kilohertz. Rising station values led the city of Dallas to sell WRR-AM for \$1.9 million in 1978 to Bonneville Broadcasting. Later, Bonneville sold the station to Susquehanna Broadcasting. The station is still on the air using the call letters KTCK and is a profitable all-sports station.

WRR-FM Begins Operation

WRR-FM began broadcasting in 1948, a time when few members of the public owned an FM receiver, but when hopes for the new radio service were high. As with many other FM outlets, WRR-FM began by programming classical music.

WRR-FM has survived a series of city government debates regarding its ownership and operation. Some members of the Dallas City Council have characterized ownership of a commercial radio station as socialism and have viewed the station as being in direct competition with commercial station owners. WRR-FM has consistently maintained a classical music format with a strong emphasis on local news. It is perhaps the classical format that has enabled the station to continue its status as a municipally owned station. Few commercial station operators would be likely to continue the commercial classical music format if the station were sold. The Dallas-Fort Worth market is also served by a classical and news affiliate of National Public Radio (NPR).

WRR-FM Extends Its Coverage

WRR increased its transmitter power and relocated the transmitter and antenna in 1986. The station currently broadcasts in stereo with 98,000 watts on 101.1 megahertz. The station's primary coverage radius extends more than 65 miles from its transmitter location, enabling the station to reach listeners in Fort Worth and the suburbs in north Dallas.

Though a commercial radio station, WRR has adopted a tactic of many noncommercial classical-formatted stations. The group "Friends of WRR" is a nonprofit organization whose mission is to support the station's classical programming. WRR also generates revenue by selling time for religious broadcasts, and it sells a weekday half-hour segment at 6:00 P.M. to a local television station to air the station's local newscast.

WRR programming includes symphonic and opera broadcasts, local arts and cultural programming, and children's programming; the station also broadcasts the bimonthly meetings of the Dallas City Council. WRR-FM continues to be a self-sustaining and profitable radio station. The station is typically one of the 20 most-listened-to stations in the Dallas-Fort Worth radio market, one of the ten largest radio markets in the United States.

WSB

Atlanta, Georgia Station

Atlanta's WSB radio is the oldest radio station in the South, born of a competition between two Atlanta newspapers. A clear-channel station, WSB signed on the air 15 March 1922.

Origins

As early as 1921, ham radio operators in Atlanta were asking for a station. Since the sign-on of KDKA in 1920, radio was becoming a big amateur venture, and Atlanta—and surrounding Georgia—jumped on the bandwagon. A former Navy wire-

less operator named Walter Tison approached Major John S. Cohen, editor and publisher of *The Atlanta Journal*, to discuss the feasibility of a local radio station. Tison persuaded Cohen, and plans went into action for the new station; Tison would become the first federally licensed operator. George A. Iler, an engineer with the Georgia Power Company, was hired to be the first station director.

The Atlanta Journal and *The Atlanta Constitution*, then rival newspapers, were fighting to get the first Atlanta radio station on the air. On 15 March 1922, *The Journal* won when

it received this telegram, signed by acting secretary of commerce C. H. Huston:

The Atlanta Journal is authorized to temporarily broadcast weather reports on the wavelength of four hundred eighty five meters pending action on the formal application for a radio license. Station must use radio call letters WSB repeat WSB and employ commercial second class or higher radio operator licensed by this department.

The telegram ended with these words: "If you desire to broadcast news entertainment and such matter this is permitted on wavelength of three hundred sixty meters only."

According to the station's history, by nightfall the station was on the air with these words, "Good evening: This is the Radiophone Broadcasting Station of *The Atlanta Journal*." That first broadcast came from *The Atlanta Journal* office on Forsyth Street; the station broadcast at a mere 100 watts of power. *The Journal* wrote the next day, "Atlanta is on the radio map of the world today." Three months later, according to the station history, that map grew as the station increased to 500 watts.

WSB Radio remained a noncommercial station located at *The Journal's* office for its first three years but moved in 1925 to the Biltmore Hotel. On 9 January 1927, according to the station's official history, WSB became a charter affiliate of the National Broadcasting Company and began to sell advertising. These moves paralleled the station's power boost to 1,000 watts.

WSB was a station of firsts. In addition to being the first station in the South, it was the first in the country to have a slogan. According to the station's golden anniversary history, a listener coined the phrase "The Voice of the South," writing, "Because of its remarkable powers of transmission, penetrating alike into lonely cottages in isolated sections and palatial residences in distant cities, WSB has truly become 'The Voice of the South'." A listener contest gave meaning to the call letters WSB—"Welcome South, Brother." Lambdin Key, the first full-time general manager, led programming.

According to the station's official history, WSB was also the first station in the nation to present an entire church service—on Easter Sunday in 1922. The station claims many other firsts, including the first radio fan club, the WSB Radiowls.

By 1933, the station's wattage was increased to 50,000, and WSB had become a permanent and national fixture at 750 kHz. The station made its name by offering first-class news coverage as well as entertainment options.

In December 1939, Governor James M. Cox of Ohio bought the station and *The Atlanta Journal*, adding them to his company that would become the Cox Broadcasting Company. He put J. Leonard Reinsch in charge of the station as general manager. In 1944, Governor Cox made Reinsch managing director of all of his broadcasting properties. Reinsch and former vice president and general manager Elmo Ellis moved the radio station through the initial days of television in Atlanta, a time that saw a national decline in radio usage. Both men saw the station through the turbulent 1960s and into the 1970s. Ellis retired from the station in 1982.

According to the station's history, WSB achieved another first on 16 November 1944, when it put Georgia's first ever Frequency Modulation (FM) station on the air. That station, now known as B 98.5, has changed music format over the years, but it remains a leader and soft rock alternative in the vast Atlanta market.

WSB radio made its last big location move on 28 December 1955 joining its sister television station at Cox's new broadcasting facility known as White Columns, and both remain at that location.

WSB-AM at the turn of the century led its market as an all-news radio station, a format it adopted in the 1980s. It remained a clear-channel station at 50,000 watts and was the national broadcasting center for the Atlanta Braves.

WSM

Nashville, Tennessee Station

WSM, “The Air Castle of the South,” is the powerful radio station in Nashville, Tennessee, largely responsible for that city’s emergence as a major entertainment and media center. The call letters WSM represent “We Shield Millions,” slogan of the National Life and Accident Insurance Company of Nashville, the station’s founding licensee.

Other Tennessee radio stations had already begun broadcasting in Memphis, Knoxville, and Nashville by the time WSM signed on the air in 1925. Although most of the inaugural WSM schedule consisted of programs characteristic of the mid-1920s (i.e., light classical and dance music), some of the station’s programs were tailored for the farmers and wage earners who constituted National Life’s main business, the sale of weekly premium insurance. Very early in WSM’s history, a program of rural-flavored music was modeled after the WLS (Chicago) *Barn Dance*. Shortly after its start, WSM’s program became known as the *Grand Ole Opry*. The content of the *Grand Ole Opry* engendered some distaste in certain sections of Nashville, but the “*Grand Ole Opry* Insurance Company” prospered from its affiliation with the broadcast.

A “W S Empire” emerged from National Life’s 1931 authorization to operate WSM as an unduplicated class 1-A clear channel (650 kilohertz), with 50,000 watts of power full-time and a nondirectional radiation contour. When National Life won the clear channel for WSM, it erected North America’s tallest radio tower near Brentwood, about 15 miles south of downtown Nashville. At the dawn of radio’s golden age, WSM thus became one of about 25 stations in the United States that could be received reliably at night throughout much of North America.

Although barn-dance programs aired on other clear channel stations during the 1930s and 1940s, Nashville’s *Grand Ole Opry* emerged as the leader of that genre for three principal reasons. First, the National Broadcasting Company (NBC) Red network carried a portion of the *Grand Ole Opry* coast to coast for several years starting in 1939, thereby extending the reach of WSM entertainers beyond the range of “clear channel six-fifty.” Second, WSM’s association with a rural style of music diffused by word of mouth during World War II, as people from various parts of the country served together in the armed forces. Third, touring *Grand Ole Opry* musicians and personalities who entertained World War II troops fostered the image of Nashville as a center for “hillbilly” or “country and western” music.

National Life also was an early commercial FM licensee but abandoned FM broadcasting in favor of television in 1950. The present WSM-FM at 95.5 megahertz (formerly WLWM) was purchased in 1968. In 1950 National Life established

Nashville’s first television station, WSM-TV, which operated without competition for three years. This head start in television did much to solidify WSM’s position of dominance in the Nashville radio and television market, which continued at least through the 1970s.

WSM remained a basic affiliate of the NBC radio network during radio’s music-and-news era. Only after television displaced much of the evening radio audience in the 1950s did WSM begin to devote large amounts of its weeknight schedule to recorded country and western music. During the day, however, WSM remained a full-service, mass-appeal station. Middle-of-the-road and, later, adult contemporary recorded music filled the time between network features, local news, and business and agricultural reports. The station maintained a staff of musicians who performed pop standards during a live studio morning show well into the 1970s.

By 1968 National Life had become Nashville’s largest corporation, the nation’s sixth largest stock life insurance company, and the principal subsidiary of NLT Corporation. In 1972 NLT capitalized on WSM’s *Grand Ole Opry* as the theme for Opryland USA, a \$40 million entertainment complex followed in 1977 by a \$26 million hotel.

The decade of the 1970s probably captures the peak of WSM’s influence in Nashville and middle Tennessee. As the radio and television industries began to undergo tremendous change during the late 1970s, NLT broadcasting executives led by Tom Griscom envisioned a way to extend the company’s advertising base beyond the reach of WSM, WSM-FM, and WSM-TV. They foresaw the inevitable decline in the audience for AM stations in general and in particular the erosion of the clear channels, as federal regulators increasingly viewed the extensive protection of night-time signals such as WSM’s as a vestige of the radio age. They also recognized the widespread market potential of cable television. In response to these structural changes in telecommunications, NLT executives advanced a plan that would fully utilize Nashville’s extensive talent pool and NLT’s large investment in television production while maintaining *Grand Ole Opry*’s core audience.

That plan eventually took form as the Nashville Network. Seed money for the Nashville Network was obtained from the 1981 sale of WSM-TV to George N. Gillette. An even more significant change at WSM occurred that same year, when NLT was acquired by American General, the Houston financial services giant. Executives at American General made it clear that their interest was limited to NLT’s insurance business and that the NLT broadcasting and entertainment operations were to be sold. For a time, there was concern that a single buyer would

not be found for WSM, WSM-FM, the Opryland complex, and the Nashville Network. Speculation abounded that splitting the NLT broadcasting and entertainment division through sales to multiple buyers would have the effect of ending the historic *Grand Ole Opry*, which by then had been recognized as the world's longest-running live radio program.

Gaylord Broadcasting Company, a family-owned firm itself wholly owned by the Oklahoma Publishing Company (publisher of the *Daily Oklahoman*), stepped in and purchased the NLT broadcasting and entertainment properties as a group in 1983, and the *WSM Grand Ole Opry* continued uninterrupted. In 2000 WSM featured a fine local news department and a country music format carried live on Sirius Satellite Radio.

WTOP

Washington, D.C. Station

"The spot at the top of your dial," WTOP-AM, at 1500 kilohertz, has been a fixture in the Washington, D.C., market (with various owners, frequencies, and call letters) since 1927. Still an affiliate of the Columbia Broadcasting System (CBS), WTOP was owned by the network from 1932 to 1949 and then by the *Washington Post* before undergoing a series of ownership changes in the 1980s and 1990s. The station's Washington location and the reach of its signal made WTOP a key originating station for CBS, and it launched important careers, including Arthur Godfrey's. In 1969 WTOP became a pioneer of the all-news AM format, and in the 1990s it began providing its signal over the world wide web.

Origins

Although long based in the Washington, D.C. area, WTOP began under different call letters more than 200 miles to the north. A Republican Party political club placed station WTRC on the air in Brooklyn in September 1926. It offered music and some talk programs. Just a year later the station's equipment was sold to John S. Vance, a Virginia publisher with Ku Klux Klan affiliations. Vance's station, first as WTFF and then carry-

ing his initials as WJSV, began broadcasting from Mount Vernon Hills, Virginia, as a self-styled "independent voice from the heart of the nation." CBS purchased WJSV in 1932, took it off the air for three months, then returned to broadcasting from a facility beside the Potomac River in Alexandria, Virginia, using a submarine telephone cable to communicate with a second studio in Washington's Shoreham Hotel. An increasing number of live location broadcasts motivated a full move into Washington in 1933, with a new studio in the Earle Theatre Building. Station engineers set up for Franklin Roosevelt's fireside chats, concerts from Constitution Hall, the visit of George VI and Queen Consort Elizabeth in 1938, and other live broadcasts throughout the 1930s and 1940s.

A complete tape exists of WJSV's broadcast day on 21 September 1939, an invaluable snapshot of radio's golden era. Signing on at 5:58 A.M., the station broadcast *Sundial with Arthur Godfrey* at 6:30, CBS serials (including *The Goldbergs* at noon), a live Roosevelt address to Congress (repeated later in the evening), a Washington Senators baseball game, *Major Bowes' Original Amateur Hour*, and Louis Prima's orchestra at midnight, prior to a 1:00 A.M. signoff. During World War II, because its night-time signal reached the entire East Coast, the

station was designated by the Federal Communications Commission (FCC) as a conduit for alerts, and its studios were staffed 24 hours a day even when not broadcasting.

After several frequency changes, the station in 1941 settled at 1500 kilohertz, at that time the highest AM frequency. This move in turn motivated new call letters, WTOP, adopted in 1943 along with the “top of your dial” slogan. A 50,000-watt transmitter had been established in a new international-style building in Wheaton, Maryland, in 1940, where it remains today. (In the 1960s, Sam Donaldson hosted *Music Till Dawn* from the Wheaton transmitter.) The Washington Post Company purchased 55 percent of WTOP in 1949 and assumed full ownership in 1954. Under *Post* control, the station adopted an all-news format in 1969. For 25 years, WTOP-AM shared “Broadcast House” studios and some personnel with WTOP television, channel 9, which was also a Post-Newsweek station and CBS affiliate. The connection ended in 1978 with the sale of the AM station to the Outlet Company of Providence, Rhode Island; WTOP radio moved its studio to an office building next door to Broadcast House. WTOP was acquired in 1997 by Bonneville International Corporation, which also owns classical, contemporary, and country music stations in the Washington market.

From 1947 to 1966, WTOP simulcast its programming on FM. At that point, FCC regulations intervened to stipulate that eight hours daily be separately programmed for FM. In the uncertain regulatory environment, the Post-Newsweek Company eventually sold WTOP-FM for one dollar to Howard University, where it became WHUR. In an attempt to improve its signal in Virginia, another attempt at FM began in 1997, with a signal purchased, upgraded, and moved to 107.7 megahertz (near the top of the FM frequency band). In 1998 WTOP launched its website, wtopnews.com. Web newscasts quickly became popular in Washington’s government offices (where broadcast signals were sometimes weak), and webcasting figures significantly in WTOP’s plans for the future.

Like other AM stations, WTOP had lost audience in the 1960s, and in response the station experimented with a variety

of formats before adopting an “all-news” format in 1969. (Originally “all news, all the time,” the station soon went from 24 hours a day to a 2 A.M. sign-off; WTOP returned to around-the-clock broadcasting, initially with a talk program, after its purchase by the Outlet Company.) News was a smart choice given the station’s history, its location in the political capital, and its affiliations with the *Washington Post* and CBS. Through three subsequent decades of ownership changes and technical developments, WTOP has maintained its highly successful version of all news. One or two anchors coordinate a mix of live reporting and feeds from CBS. There is a strong emphasis on local reporting, not necessarily focused on the federal government. Local leaders are featured on regularly scheduled call-in shows. Well-coordinated local news resources culminated in WTOP’s award-winning live coverage of the July 1998 shootings inside the U.S. Capitol.

In its successful news mix, WTOP’s sports coverage emphasizes local professional teams, and “traffic and weather together” appear every ten minutes. WTOP has not been immune to trends that are only marginally related to traditional “news.” The long-running *Call for Action* consumer feature was joined in the late 1990s by a series of *Place for the Kids* fund-raising activities for boys clubs and girls clubs. Although on-air personnel still emphasized professionalism over personality, a WTOP’s *Man about Town* was created through sponsorship by a luxury automobile. Activities stretching the all-news focus at WTOP had a long-standing precedent: the station for many years broadcast the full season of baseball games by the Baltimore Orioles. By 2000, three technologies—AM, FM, and the world wide web—were delivering WTOP’s “all-news” content.

WWJ

Detroit, Michigan Station

WWJ Radio was the first radio station in the world to be started by a newspaper, the *Detroit News*, in 1920. By 1924

the radio station was to achieve a number of other first-time events in the history of radio.

Origins

At 8:15 P.M. on 20 August 1920, WWJ radio was born when eight automobile batteries powered what was then called 8MK. The equipment for the station came from a local electrical retail store. The station put out a 20-watt signal on that first broadcast. Listeners (mainly ham operators) were asked to call in if they could hear the broadcast.

According to newspaper accounts of the historic event, the first words on the station were spoken by a 17-year-old Canadian named Elton Plant: "This is 8MK calling." A Windsor, Ontario, native, Plant had worked his way up to cub reporter at the *Detroit News* when the managing editor approached him with the idea of going on the air. Plant agreed to do it. He noted later, "It didn't mean a thing as far as I was concerned . . . because I didn't know what it all was."

The name of the station was changed from 8MK to WBL when it received its radio license in October 1921. In March 1922 the call letters were changed again to WWJ, reportedly because listeners kept getting the call letters wrong. Over the years, a dispute developed over whether WWJ in Detroit, KDKA in Pittsburgh or WHA in Madison, Wisconsin, was the oldest radio station in the United States. Those who favor WWJ argue that it was the first station to actually get on the air when wireless restrictions were lifted after World War I.

Initial Programs

Between 1920 and 1924, WWJ aired the first news program, the first election returns (a Michigan race in the summer of 1920), the first complete symphony broadcast, the first regularly scheduled religious broadcast, and the first sports broadcast. The early sports broadcasting duties for WWJ were handled by Ty Tyson, later credited with being the world's first radio sports broadcaster. He got his job at WWJ through an orchestra leader whose band was invited to play on WWJ. Tyson was hired to do weather reports but went on to do sports and live interviews with celebrities such as Charles Lindbergh and Will Rogers. In 1924 he broadcast the first college football game and the Gold Cup powerboat races. On 19 April 1927 Tyson became the first radio sports broadcaster to do a regular season major league baseball game. He was also known for his ability to communicate the essence of the game even when he was not physically present. When the Detroit Tigers played out of town before direct radio lines became common, a telegraph operator in the opponent's park would

tap out coded play-by-play messages to Tyson back in Detroit. Tyson would decode the taps and broadcast the plays as if he were seeing them himself.

Later Years

By the mid-1970s, WWJ radio was moving to an all-news format. In 1978 the *Washington Post* acquired WWJ-TV from the Evening News Association. In exchange the Evening News Association acquired WTOP, a Washington, D.C. television station owned by the *Washington Post*. The station trade followed speculation about forthcoming FCC rules banning local market cross-ownership. The Evening News Association kept WWJ radio. In 1985 the Gannett Company announced that it would sell five broadcast properties to satisfy FCC rules affecting its proposed \$717 million purchase of the Evening News Association in Detroit. (FCC rules at the time prohibited companies from owning newspapers and broadcast properties in the same city.) The broadcast properties in Detroit that were to be sold included WWJ radio. WWJ was purchased by Federal Broadcasting, but in March of 1989 the Columbia Broadcasting System (CBS) announced that it had acquired WWJ and its sister station WJOI from Federal Broadcasting for \$58 million. WWJ and WJOI continue to be a part of the CBS news family, even though the network has been through several ownership changes, and WWJ remains the only commercial all-news radio station in Michigan.

WWL

New Orleans, Louisiana Station

The first radio station in the lower Mississippi Valley, WWL has long provided a 50,000-watt clear channel voice to one of America's most culturally distinctive cities, serving as a window on New Orleans for much of the nation. This powerful commercial radio station was owned and operated through most of its history by a Jesuit university.

Origins

From the opening of Loyola University of New Orleans in 1914, its physics department offered courses in "wireless telegraphy." By 1922, after several years of accumulating radio equipment to support its curriculum and two years after the U.S. debut of regular broadcasting, Loyola established WWL radio. Although the goals outlined for the station included some educational, cultural, and public service programs (the latter in the form of weather and agricultural reports for farmers), WWL was intended first and foremost to serve as a fund-raising tool for the private university. The station's first broadcast, on 31 March 1922, was a direct appeal for funds by the university president. Not only were listeners urged to contribute to a \$1.5 million campaign for the construction of six new classroom buildings, they were urged to spread word of the university's financial needs to those not fortunate enough to own radio receiving sets.

WWL's first two years saw it off the air more than on. Once the initial enthusiasm wore off, live, original programs became burdensome to produce. The fund-raising appeals were not having the desired effect; the station cost more to operate than it was bringing in. The original 100 watts of operating power was reduced to 10 watts in an effort to cut costs. This only served to diminish further the station's broadcast range and fund-raising potential.

The station seemed doomed in 1924, when new physics faculty decided to attempt resuscitation. Committing to a reliable if extremely modest broadcast schedule of one hour per week, WWL's power was increased in increments over the next few years to 500 watts. In an effort to find a safe haven from the rampant interference problems of the era, the station moved up the radio dial, from 833.3 kc, to 1070 kc, to 1090 kc, and finally up to 1220 kc.

The Federal Radio Commission permitted WWL to increase its power to 5,000 watts, but the Commission moved the station back down the dial to 850 kc, a frequency that it was forced to share with KWKH of Shreveport, Louisiana, a city 350 miles northwest of New Orleans—the stations were too

close to both be on the air at the same time. KWKH was owned by W.K. Henderson, a social activist who used his station to broadcast his political views. For the next several years, WWL's growing program schedule had to be squeezed into a complicated time-sharing arrangement with Henderson. Depending on the time of day or day of the week, radio listeners tuning in to 850 kc would hear either WWL's classical music and lectures or Henderson's political harangues.

In 1929 the administration at Loyola made a pivotal decision: the university's goals would be best served if WWL operated as a money-making commercial enterprise, thus providing a continuing endowment to the university. Educational and religious programming, with few exceptions (such as the long-running *Mass from Holy Name Church*), gave way to popular entertainment. However, for WWL to realize its full revenue-producing potential, it needed the reliable source of quality programs that only affiliation with one of the major networks could provide. Although WWL was the most powerful radio station in New Orleans (reaching 10,000 watts in 1932), the networks were not interested in a part-time affiliate. As long as it was saddled with the KWKH time-sharing arrangement, WWL would have to continue producing most of its own programming. To this end, Loyola moved the station from the university campus to new studios in New Orleans' Roosevelt Hotel in 1932.

In 1934, KWKH moved to 1100 kc, and WWL achieved full-time status. With this hurdle cleared, negotiations regarding network affiliation could begin in earnest. WWL joined the Columbia Broadcasting System (CBS) on 2 November 1935 with a live, one-hour network show entitled *A City of Contrasts*, which dramatized events from New Orleans history.

The year 1937 saw the debut of *Dawnbusters*, a local morning show featuring live music and comedy. The program would be one of the most popular in WWL's history, running until 1959. In 1938 WWL reached the maximum permissible power of 50,000 watts, permitting its signal to cover much of eastern North America at nighttime. President Franklin Roosevelt sent the station a congratulatory telegram, noting that the station's far-reaching signal "should be a source of great satisfaction to the Jesuit Fathers who have worked so assiduously building up the station from a small beginning. I trust that its future will be one of great usefulness in the service of God, of Home and of Country." In 1941, to comply with a treaty seeking to reduce interference throughout North America, WWL changed frequencies one final time to its current 870 kilohertz.

Postwar Change

After World War II, WWL, like all of the nation's AM radio broadcasters, faced a new set of options: expand into television and/or FM or stay the course with AM. WWL's initial decision was to move into FM and leave television to others. WWL's FM station, WWLH, went on the air in 1946. A halfhearted effort from the outset, WWLH mainly simulcast WWL programming. The public failed to buy FM receivers in sufficient quantities to make the enterprise viable, and WWLH went off the air in 1951.

Loyola now decided that television was the more valuable path, but between the Federal Communication Commission's (FCC) four-year freeze on new television licenses and a post-freeze battle with competing interests for the few channel allocations available to the New Orleans market, WWL-TV (channel 4) didn't become a reality until 1957.

With the advent of television and the decline of traditional radio network programming in the late 1950s, WWL's schedule became increasingly centered around local talk shows.

WWL's present-day programming is dominated by live, local news programs; "topic of the day" phone-in shows; sporting events; and sports talk programs.

In the late 1980s, the Loyola administration decided to abandon broadcasting. WWL-AM and WWL-TV were sold to different companies, and, through a series of sales and mergers, the AM station has since changed owners several times. Its current ownership, Entercom Communications, holds seven other stations in New Orleans, including WSMB, a long-time National Broadcasting Company (NBC) radio network affiliate that, along with WWL and WDSU, once defined broadcasting in "the city that care forgot."

WWVA

Wheeling, West Virginia Station

WWVA is the oldest station in West Virginia, and from early in its history it proved to be an important factor in the popularization of country music.

WWVA first aired on 13 December 1926. Founder John Stroebel, a physics teacher and for years an experimenter with crystal sets and wireless telephone, transmitted from his basement in Wheeling. The 50-watt station was licensed to broadcast on 860 kilohertz.

Offering a menu of local information and entertainment, the station received permission to broadcast at 500 watts in 1927. WWVA evolved quickly over the next five years. Stroebel sold the station to Fidelity Investments Associates in 1928, and the Federal Radio Commission raised the station's power to 5,000 watts in 1929. "The Friendly Voice from out of the Hills of West Virginia" affiliated with the Columbia Broadcasting System (CBS) in 1931, which helped to fill out the station's program schedule. In 1931 Fidelity Investments sold WWVA to George B. Storer, whose Fort Industry Company (later renamed Storer Broadcasting Company) would hold the license for three decades.

At the time, Storer was collecting a wide array of radio stations, which would make him one of the largest chain owners of radio stations. Under Storer's ownership, WWVA would see its most dramatic developments: the introduction in 1933 of the *Jamboree*, a regular Saturday night broadcast of country music, and the increase of the station's power to 50,000 watts in 1941, just as the station moved to 1170 kilohertz.

The station had featured country music almost since its inception, but the debut of the *Jamboree* on 7 January 1933 would secure its prominent role in the popularization of country music. The show became an important stage for regional artists, whose reputations grew with every appearance, and when the station began broadcasting with 50,000 watts, the *Jamboree* became a force in the dissemination of country music in the Ohio Valley and far beyond. WWVA sent the *Jamboree* and country music surging into 18 eastern states and 6 Canadian provinces during the night-time hours on Saturdays. Along with the *Grand Ole Opry* on WSM (Nashville), the *National Barn Dance* on WLS (Chicago), and the *Louisiana Hayride* on KWKH (Shreveport), the WWVA *Jamboree* was

one of a number of widely heard barn dance radio shows that carried country music to large audiences around the nation.

Country music scholar Bill C. Malone (1985) has noted that although many of the barn dance radio programs were important in expanding country music's audience, the *Jamboree* did the most to carry country music to Northeast audiences and to help create new audiences in the Northeast and Canada for country music. The program also helped propel to national prominence the careers of a number of country and bluegrass artists. Artists who prospered from their exposure on the *Jamboree* included Grandpa Jones, Hank Snow, Hawkshaw Hawkins, Wilma Lee and Stoney Cooper, and Reno and Smiley. For a period in the mid-1950s, the CBS network carried the *Jamboree*, giving the program an even wider sphere of influence.

The *Jamboree* wasn't the only conduit for country music on WWVA. Starting in the 1950s, the station featured a popular overnight disc jockey program (hosted for many years by performer Lee Allen, "The Coffee Drinking Nighthawk") that covered the station's wide listening area, and in the 1960s, the station was among the first to adopt a "modern country" format, which featured the lush musical stylings popularized by performers such as Eddy Arnold and Jim Reeves.

WWVA, owned today by AM-FM Incorporated, dropped its all-country programming in 1997 in favor of a news/talk

format. But the station's Saturday night country show survives; it is the second-longest-running country music stage show on radio, behind only WSM's *Grand Ole Opry. Jamboree U.S.A.*, as the barn dance is known today, still airs from Wheeling's Capitol Musical Hall, which first hosted the show in 1933 (although the show changed venues a number of times after its debut before returning to the Capitol in 1969).

WXYZ

Detroit, Michigan Station

Despite its comparatively remote Midwest location, WXYZ pioneered network radio and radio drama. The station and its *Lone Ranger* series were instrumental in the founding of the Mutual Broadcasting System.

Early Years

WXYZ began life on 10 October 1925 as WGHP, a Class B (medium power) station at 1270 kilohertz. This frequency was far enough removed from other Detroit stations to avoid serious interference. The WGHP call letters signified founding owner George Harrison Phelps, who had directed automobile advertising for Dodge since 1914. The station secured an affiliation with the fledgling Columbia Broadcasting System (CBS) in 1927 and moved its studios from an alley garage to the 15th floor penthouse of the Maccabees Building, near the Detroit

Institute of Arts, and the new Detroit Public Library main branch. The station was a money-loser, however, and when Dodge was purchased by Chrysler Corporation in 1928, Phelps' agency lost the Dodge account. To lessen the cash crunch, Phelps peddled WGHP to J. Harold Ryan and his brother-in-law George Storer, owners of profitable WSPD in Toledo, Ohio. In October 1928 these two oil and steel magnates purchased WGHP for \$40,000.

WGHP's airtime was now aggressively marketed in a variety of commercial lengths. Just 18 months later as the Depression was deepening, the Storer group sold the station for \$250,000 to John Kunsy and George Trendle, owner and manager, respectively, of the Kunsy Theatres movie chain. In July 1930 the new owners unleashed a movie-business-like promotional campaign for their outlet, whose call sign they also changed to WXYZ—call letters Trendle had persuaded

the U.S. Army and Navy (separately) to relinquish. Programming now included *Carl Rupp and His Orchestra*, the first network show to originate from Detroit.

Trendle's background as a newsboy and lawyer and his grasp of management, promotion, and show business would soon propel the station onto the national stage as he stocked WXYZ with exceptional executives, writers, and on-air talent. All of this potential was nearly discarded, however, when station management decided they were being forced to give up too much time—and therefore advertising revenues—to the Columbia Broadcasting System (CBS). At the end of 1931, WXYZ abruptly canceled its network affiliation and suddenly faced vast amounts of empty airtime for which programming quickly had to be found. Two studios now became four, rehearsals for one show cleared the studio only moments before the cast for another arrived to take the air, and announcers, actors, and musicians jostled each other in the narrow corridors.

Creating National Programs

The first network show to emerge from this creative chaos was *The Lone Ranger*, which debuted in January 1933 with scripts developed by Buffalo syndicated writer Fran Striker and a concept refined by George W. Trendle himself. Only days after the program's first broadcast, the Michigan Radio Network began linking stations in the state's major cities with WXYZ as the key outlet and *The Lone Ranger* as a centerpiece offering. By November the show was also airing over Chicago's WGN, and New York's WOR was added in early 1934. A few weeks later, the series was made available via transcription to stations in seven southern states under the sponsorship of American Bakeries. WXYZ's sales manager H. Allen Campbell then persuaded the general managers of WGN and WOR to expand their relationship into a program-sharing network that would feed multiple programs among their stations as well as to new partners in Cincinnati, Pittsburgh, St. Louis, and Washington, D.C. On 19 September 1934, the seven outlets were linked with telephone lines and became the Mutual Broadcasting System.

In the next year, WXYZ's partner stations began adding far more outlets to Mutual than Trendle thought wise. So while WXYZ continued to feed *The Lone Ranger* to Mutual, it joined the National Broadcasting Company (NBC) Blue Network to secure its own source of programming. In a successful attempt to repeat *The Lone Ranger*'s success, Trendle and Striker debuted *The Green Hornet* in early 1936.

WXYZ's success with these and other programs was recognized in 1937 by *Variety*'s award of its Citation for Showmanship in Program Origination, given each year to the station judged best in new show production. Three years later, to ensure continued access to the talent that made such distinc-

tions possible, WXYZ became the first Detroit station to sign a contract with the American Federation of Radio Artists (AFRA). Future television news stars getting early experience on the station at this time included Douglas Edwards, Hugh Downs, and Myron Wallace, whose first name was changed by WXYZ executives to "Mike."

Postwar Transition

To enlarge its production space, the station moved in 1944 to the Mendelssohn mansion in suburban Grosse Pointe. WXYZ's continued success made it a desirable purchase for the former NBC Blue Network, which had become the separately owned American Broadcasting Company (ABC). ABC badly needed to upgrade its owned-and-operated station holdings, and WXYZ was among the most desirable of its affiliates. In April 1946 the sale was consummated. Key programs such as *The Lone Ranger* and *The Green Hornet* remained the property of George Trendle and longtime station sales executive H. Allen Campbell. The other former station owners, John Kunsky and Howard Pierce, cashed out of the business entirely. The sale of WXYZ marked the end for the Michigan Radio Network stations, which now received program feeds directly from ABC.

Despite wooing by rival WJR, WXYZ sales manager Jim Riddell accepted ABC's Trendle-brokered offer to stay on as the new general manager. A separately programmed WXYZ-FM went on the air on 1 January 1948 at 101.1 megahertz, but before the end of the year it reverted to simulcasting the AM station signal. Meanwhile, WXYZ-TV had taken to the air from the Maccabees Building, under the direction of the radio operation's former wire recording technician John Pival. Pival lured some of the radio outlet's top personalities to the television side and the shift of dominance began. As happened around the country, the number of network radio shows withered, to be replaced by local disc jockeys. Chief among them on WXYZ were Paul Winter, Jack Surrell, Ed McKenzie, and Fred Wolf. *The Green Hornet* went off the air in 1952. *The Lone Ranger* hung on, but the last live broadcast was in 1954.

The radio station moved to a caretaker's cottage near the transmitter in 1955 while Fred Wolf's converted house trailer, the "Wandering Wigloo," became a vehicle for a hugely successful remote program; radio executives came from around the country to study the show. Unfortunately for Wolf and other program hosts, however, WXYZ embraced the Top 40 concept in 1958 and tight music formatting now overshadowed individual air personalities. In 1959 the WXYZ television and radio properties moved to the newly constructed suburban Broadcast House—in which radio was relegated to an obscure corner. Four years later, Charles Fritz, former manager of Blair Radio's Detroit office (the firm representing the station to national

advertisers), became WXYZ's general manager, but the station's prominence continued to wane. Even though disc jockey Lee Alan's record hops were proving tremendously popular, the station subsequently lost its Detroit market dominance to WKNR (programmed by Mike Joseph). In the years that followed, a string of competitors would continue to beat both the AM and FM (which became the harder-rocking and separately owned WRIF in the 1980s) at the music game.

Fritz bought the AM from ABC in 1984, changed its call letters to WXYT, and thereby launched Detroit's first all-talk outlet. The WXYZ designation thus disappeared from radio but survived as the call letters of the formerly co-owned television station that was purchased by the Scripps Howard News Service in 1986. WRIF (the old WXYZ-FM) continued its mainstream rock format and ultimately was purchased by Greater Media. The AM facility that began it all was acquired by Infinity Broadcasting in 1994. Ironically, when Infinity subsequently merged with CBS, the station found itself owned by

the same entity its first owners had unceremoniously jettisoned in 1931.

Wynn, Ed 1886–1966

U.S. Radio Comedian

Ed Wynn, arguably the first all-out clown superstar of radio, began in the medium reluctantly. His career would cover radio's golden years, extended into television, and included several other media as well.

Origins

A "Broadway Baby" if ever there was one, Wynn (born Isaiah Edwin Leopold) ran away from home at age 15 to join a theater company. After that stint ended with the company's bankruptcy, Wynn returned home, only to run off again, this time to New York. By the age of 19, he was a headliner on the vaudeville stage, and by 1914 he was working for Ziegfeld. By this time, Wynn had perfected his comic persona, "The Perfect Fool," a moniker he took from his stage show of the same name.

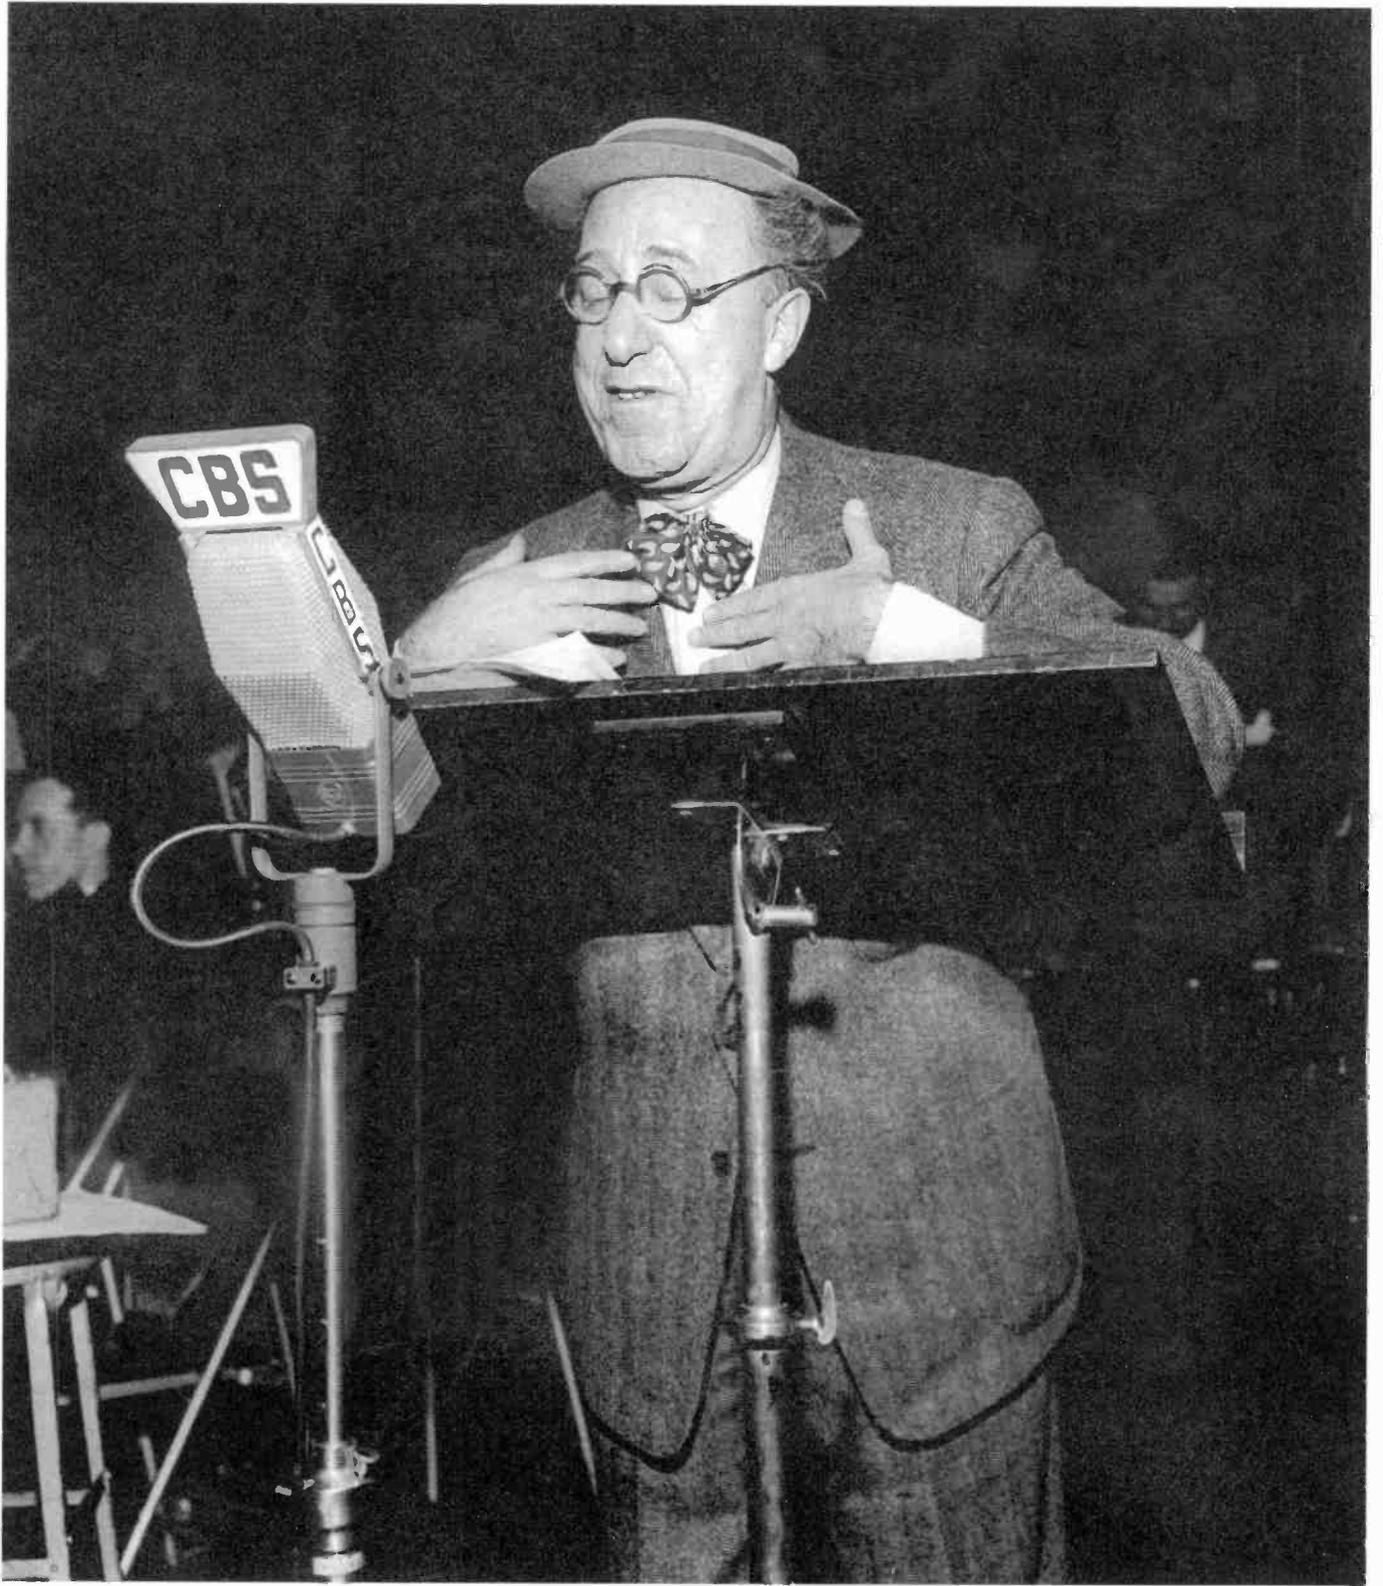

Wynn's act—old-school probably even at that time—was pun-heavy with shopworn, groan-inducing lines and relied heavily (though with great success) on exaggerated shoes, over-the-top costumes, and funny hats. (In some ways Wynn was carrying on the family tradition; his father had been a successful hat manufacturer.) But, nevertheless, Wynn's schtick, his

rubbery face, and his all-out, eager-to-please style were huge crowd-pleasers.

Radio Years

Wynn made his first radio appearance in a 1922 in-studio broadcast of his show *The Perfect Fool*. It was not a complete success, certainly not for Wynn. Accustomed to the stage, Wynn was used to playing to an audience, not just to a lone microphone. Legend has it that on learning he would have no people to perform in front of, he quickly rustled up an impromptu audience at the station that consisted of cleaning women, stage hands, and technicians. After that appearance, Wynn returned to the stage.

Despite additional offers, Wynn resisted the new radio craze, thinking (perhaps rightly) that his physical clowning and dependence on props and costumes wouldn't translate well to a nonvisual medium. But when promised a weekly salary of \$5,000 by Texaco to star in their program *The Fire Chief*, Wynn saw it as what it was: an offer too good to refuse. Wynn's *The Fire Chief* debuted on 28 April 1932, broadcast live and, at Wynn's insistence, in front of an audience.

Ed Wynn
Courtesy CBS Photo Archive

At the time, doing a radio show in front of a crowd seemed foolhardy, but Wynn's instinct would prove prophetic for the entire radio industry. Later, almost all radio comedy programs played to packed theaters while being broadcast. In its own way, this approach was the precursor to Lucille Ball's and Desi Arnaz's revolutionary "live on film" recording technique pioneered for their *I Love Lucy* television show.

To further blur the line between radio show and live theater, Wynn continued to perform in full makeup and in outrageous costumes. He even went so far as to change clothes several times during a performance. Each of Wynn's entrances would be greeted with applause and laughter, which obviously left radio listeners totally in the dark about just what was going on; in turn, it gave listeners the feeling they were not so much hearing something *meant for them* as much as they were eavesdropping onto a stage show already in progress. Nevertheless, Wynn persisted with his clothes and his silent, goofy antics, believing that listeners would assume something funny was going on and enjoy the merriment as if by proxy. (It should be noted, though, that radio audiences were surprisingly tolerant of "visual" comedy: Eddie Cantor, a comic of the Wynn variety, thrived for a time, as did Edgar Bergen's ventriloquism, where listeners just had to assume that his dummy was really there.)

Ed Wynn's on-stage, on-microphone comic persona was an interesting one. In describing it, writers and critics over the years have used a long list of colorful adjectives: "giggling," "befuddled," "frantic," and "fey." Wynn also used on the air a lispy, high-pitched voice (supposedly originally evoked by him out of "mike fright," but considered funny enough for him to retain it). Had Wynn entered the popular culture not in the 1930s but today, when the media is anxious to label, to "out," actors and characters, Wynn would no doubt have found himself labeled as "gay." But, of course, the subject of homosexuality was completely closeted at that time, and despite whatever signals Wynn's on-air personality sent out to the public, he was granted an entertainer's license to exist, in fact flourish, without being co-opted by or associated with any political or social agenda.

Wynn, married three times and a father, was not gay in real life, and despite the stereotypically "feminine" qualities of his show-business character, his comic self was not really a "sexual personae": indeed his character (similar in some ways to Jerry Lewis' boy-man persona in his early work or even to Chaplin's Little Tramp) was more asexual, practically genderless, possessing a childlike innocence that belied Wynn's real age.

But whatever Wynn was or represented, he was certainly popular at least for a time. As soon as *The Fire Chief* premiered, it was a hit, one of the largest in radio up to that time. But his on-air success was short-lived, declining each month the show was on, making it something of a flash in the pan. Only three years after its debut, Wynn's *Fire* went out.

By this time comics like Jack Benny and Bob Hope had premiered with their shows, which were more attuned to the limits and possibilities of radio and were, when compared with Wynn's vaudeville style, downright sophisticated and urbane. Wynn, by contrast, soon found himself something of a dinosaur in the medium he had conquered only a few years before.

Television and Film

Wynn tried other radio vehicles (*Gulliver*, *Happy Island*) with mixed artistic and little popular success. Luckily though, by that time, the age of television had dawned. Wynn was one of the first big-name stars to enter television, having realized it would be better suited to his brand of sight-gag humor. Though he didn't quite cotton to all the technical possibilities in the way that Ernie Kovacs later would, Wynn's clowning was well appreciated, at least briefly, by kids, until they, like the generation that preceded them in radio, gradually grew bored with Wynn's clown-at-all-costs identity.

By about 1950 Wynn, trapped by his own show-biz invention of himself, had nothing left to do but reinvent his persona and career. With the help of his talented son, actor Keenan Wynn, Wynn developed into an acclaimed character actor, especially good at playing saddened clowns or washed-up old men. Reining in his trademark voice and gestures, Wynn delivered acclaimed performances in television's landmark *Requiem for a Heavyweight* (1956) and later in the film *The Diary of Anne Frank* (1959), among other productions.

Wynn had also by this time developed into a singular presence in the canon of popular culture, as television and radio commercials, impressionists, and others all mimicked his voice and mannerisms to sell products or gain immediate, positive recognition from an audience. Wynn's place as a permanent fixture in the lexicon of Americana was further solidified with his long professional association with the Walt Disney Company. Disney's farcical, far-fetched stories, whether live-acted or drawn, seemed perfect for Wynn's gifts—he was always a sort of human cartoon anyway. The company paid him perhaps the highest compliment when they used his voice (and his visage) for the role of the Mad Hatter in their animated *Alice in Wonderland* (1951). After all, who besides Wynn could be more believable in that role—more delightfully clowny, wildly irrepressible, or completely madcap?

Yankee Network

New England Regional Network

The Yankee network was one of several regional radio networks from the 1930s into the 1950s that linked stations to share programs and advertising.

Although Boston broadcaster John Shepard III knew little about engineering, he knew enough to hire good people who did understand the technical side of the radio business. In early 1923 he encouraged them to experiment with networking (WNAC linked up briefly with New York's WEAJ). It was not long before WNAC in Boston and WEAN in Providence, Rhode Island, were frequently sharing programming, connected by a telephone line. But Shepard wanted to expand: he had begun paying salaries to talented musicians so they would appear on his stations (early radio was still mainly volunteer, so being able to pay was a major plus in getting the big names to appear), and he felt confident he could offer good programs. When the National Broadcasting Company (NBC) and the Columbia Broadcasting System (CBS) were formed in 1926–27, Shepard was convinced that a local network that emphasized New England news, sports, and music would be well received. He called it the Yankee network, and by early in 1930 he had begun signing up a number of stations in New England. The first affiliates were WLBZ in Bangor, Maine; WNBH in New Bedford, Massachusetts; and WORC in Worcester, Massachusetts. In August 1932, *Broadcasting* magazine published a tribute to Shepard, noting that he now had eight affiliates, with number nine soon to go on the air. In 1939, Shepard would put the first experimental FM station in Massachusetts (W1XOJ) on the air, and it too would carry Yankee network programming. By then, the network had its own house orchestra, a music director, staff vocalists, and a large number of talented performers who could offer the affiliates everything from a radio drama to an evening of hit songs. Always innovative, Shepard sometimes ran synagogue services on the Yankee network, as he would also run church services and sermons by well-known priests and ministers.

Perhaps his biggest innovation was with radio news: in March 1934, thanks in large part to the hard work of editor in chief Leland Bickford, the Yankee News network went on the air. In a jab at newspapers, the network used the slogan “News while it IS news; the Yankee Network is on the air!” A former Boston newspaper reporter, Dick Grant, was hired to run the news department at a time when relationships between radio and newspapers were becoming more contentious. Local newspaper reporters were not amused and tried to bar the network's reporters from getting press passes and covering city hall. But Shepard and his team persisted, and gradually radio reporters gained credibility and came to be accepted as journalists. The Yankee News network made “radio news reporter” a career choice: in radio's first decade, what little news radio stations offered came mainly from newspapers, many of which had agreements with a local station that allowed a reporter to go on the air several times a day with headlines and top stories. But for radio journalists to cover news and generate their own stories (the network even established a news bureau in Washington, D.C.) was something new, and it made the Yankee News network unique in New England.

One popular news program the Yankee network offered was *Names in the News* (late 1930s through early 1940s), in which local heroes and newsmakers were invited to talk about their achievements against a backdrop of Yankee network performers dramatizing the important events that made the guests famous. This was similar to the famous CBS program *The March of Time*, but with a New England emphasis. Such radio newsmagazines were very popular and helped make the news more interesting to the average person.

The more benefits the Yankee network offered, the more New England stations wanted to affiliate. By retaining their affiliation with a national network—which provided the major music, drama, and comedy programs—as well as the regional

link, smaller stations benefited from the best of both worlds: professional-sounding local news coverage and access to the best-known national radio stars. By the early 1940s, the Yankee network had 19 affiliates. Shepard was becoming more involved with FM and was also active in Mutual Broadcasting. In late 1937 Bostonians had been shocked when he sold the Shepard Store in downtown Boston; the store in Providence still remained under Shepard family control, however. Shepard invested in technological improvements for his Boston stations—in early 1942, six new studios (for Shepard's AM stations, his FM stations, the Yankee network, and the Yankee News bureau) were dedicated; he was also attempting to organize a national FM network (this venture was not successful; his interest in FM was ahead of its time).

In late 1942 Shepard, rumored to have health problems that led him to sell off various assets, agreed to sell the Yankee network to the General Tire and Rubber Company, although he stayed on as a board member and general manager. (Later, in 1958, long after Shepard's death, the corporate ownership's name would change to RKO [Radio-Keith-Orpheum] General.) Shepard's poor health forced him to retire altogether from radio in 1948; he died two years later. The Yankee net-

work acquired more affiliates and remained a major player in New England through the 1950s. But radio was changing: the youth market wanted Top 40, and news was not as important to that demographic. Affiliates began programming for the younger audience, and gradually they dropped the Yankee network to "play the hits." Although a few stations did remain faithful to the older audience, allowing the Yankee network to survive into the 1960s, in early 1968, without much fanfare, RKO General disbanded the network, ending its 38 years of distinguished service.

You Bet Your Life

Comedy Quiz Show

Reruns have made Groucho Marx's *You Bet Your Life* familiar to generations of television viewers. Few fans realize that they are also "watching" radio. For 6 seasons of its 14-year run, the program was recorded simultaneously for both media. The versions were then edited separately and broadcast on successive nights. Its circumstances of production, editing, and broadcast were just one aspect of the show's distinctiveness. A comedy show masquerading as a quiz, *You Bet Your Life* was "postmodern" before the term was invented.

The origin of *You Bet Your Life* was the appearance by Groucho Marx on a radio variety show in April 1947, when an ad-lib by Groucho led to a verbal duel with Bob Hope that made the segment run many minutes over. Producer John Guedel (who had made Art Linkletter a radio success) immediately went backstage and suggested to Marx a quiz show with an emphasis on ad-libs. Groucho replied, "I've flopped four times on radio before. . . . I might as well compete with refrigerators. I'll give it a try." *You Bet Your Life* premiered Mon-

day, 27 October 1947, on the American Broadcasting Companies (ABC), then moved to Wednesday night as lead-in to Bing Crosby's popular variety show.

A success by any measure, *You Bet Your Life* secured for Groucho the career he sought apart from the Marx Brothers. It also made a celebrity of its announcer and Groucho's comic foil, George Fenneman. The first season sold out the entire stock of its sponsor, Elgin Watches. Groucho received a 1949 Peabody Award as best radio entertainer, with cover stories in *Newsweek* and *Time*. Guedel and Marx moved *You Bet Your Life* in 1949 to the larger Columbia Broadcasting System (CBS) network for a longer, 45-week season. (The show continued to precede Bing Crosby's.) A year later, the National Broadcasting Company (NBC) won a bidding war to begin a televised version. The radio broadcasts moved to NBC in October 1950, where they remained in the Wednesday 9 P.M. time slot. The televised version, recorded simultaneously but edited separately, aired a day later, on Thursdays. At the

*Groucho Marx, You Bet Your Life
Courtesy of family of Groucho Marx*

show's peak, in 1955, the broadcasts drew a combined audience of 35 million. The radio version folded late in 1956, with *You Bet Your Life* continuing on television until 1961.

Though its content was decidedly low-tech—Groucho interviewed contestants and asked simple quiz questions—*You Bet Your Life* was innovative in its production and delivery. *You Bet Your Life* pioneered a version of what became the “live on tape” approach adopted by television talk shows in the 1950s. Guedel's original intention to broadcast live was scrapped, apparently at the last minute, because of concerns about Groucho's ad-libs. The producers then procured acetate disks, of the kind used by Armed Forces Radio, which had the advantage of allowing content to be minimally edited. Later, the program was a pioneer in the use of magnetic tape. For a standard program, one hour of tape was edited down to 26 minutes. When the American Federation of Musicians in 1948 changed its policy to allow network radio shows to be prerecorded, *Daily Variety* attributed the “cry and hullabaloo for tape” to the influence of a single program, *You Bet Your Life*. With the debut of the televised version, the producers recognized the need for separate postproduction for different media. The Wednesday radio program and the Thursday television version were often quite different, to the extent of presenting different contestants because of time shifts during editing.

Ironically, neither version was the spontaneous fest of ad-libs originally conceived by Guedel and Marx. On the contrary, pre-production was as crucial to *You Bet Your Life* as its postproduction editing was. Groucho's writers were disguised in the program's credits, but most of his repartee was scripted. Room was left for spontaneity: for example, Marx declined to meet contestants beforehand, but his writers did extensive pre-interviews with them. Genuine ad-libs were always a prospect: director Bernie Smith commented, “At his peak you could never write for this man.” Nevertheless, the key was Groucho's ability to deliver scripted lines as if they were ad-libbed. Thus, to a tree surgeon: “Have you ever fallen out of a patient?” To a cartoonist: “If you want to see a comic strip, you should see me in the shower.” To a fat woman: “I bet you're a lot of fun at a party. . . . In fact, you *are* a party.” The remarks often had a cruel edge, but as writer Howard Harris observed, “If they weren't insulted, they were insulted.”

Scripted ad-libs and edited “live” content were aspects of what might now be called the “postmodern” approach of this quiz show. *You Bet Your Life* was almost pure process, inverting the conventions of its ostensible genre. For example, introductory interviews with contestants, ordinarily perfunctory on quiz shows, occupied half the running time of Groucho's program. Contestants usually appeared in male-female couples—carefully paired to create possibilities for comic repartee—yet

despite Groucho's standard compliment to “an attractive couple,” they rarely knew each other. The quiz portion of the program was played straight: contestants began with \$20 (later \$100) and bet on four questions in a set category; the couple with the highest total for each program got a chance at a jackpot question for \$1,000 (increased by \$500 per week if nobody won). Nevertheless, prizes were never very important; in an era of big-money quiz shows (and scandal), *You Bet Your Life* awarded an average of \$333 to 2,100 contestants over a decade. Besides, it was impossible *not* to win: if contestants blew the standard quiz, Groucho would ask a variation of the most famous of all quiz show questions: “Who's buried in Grant's Tomb?” Contestants could also win money accidentally, by speaking the previously announced “secret word.”

Periodic journalistic exposés, such as *TV Guide's* 1954 “The Truth about Groucho's Ad Libs,” had no effect whatever on his program's popularity. The audience knew they were listening to a comedy program in quiz show guise. If Groucho was funny, nobody cared that his quips were scripted and edited. *You Bet Your Life* presented a perfect match of star and vehicle. Later attempts to duplicate its success on television with Buddy Hackett and Bill Cosby failed. The show's opening audience-response formula turned out to be literally accurate: “Here he is—the one, the only . . . GROUCHO!”

Your Hit Parade

Musical Variety Program

Your Hit Parade reflected popular music trends of its era, especially the big band sound; the program also helped sell millions of Lucky Strike cigarettes. Yet despite its status as a Saturday night radio staple, *Your Hit Parade* underwent many changes over its long history, notably its continual shifting of length, its scheduled time slot, and even its network.

Your Hit Parade emerged in early 1935 as the National Broadcasting Company (NBC) looked to fill its Saturday night schedule. The Rogers and Hart ballad "Soon" ranked as the

number-one hit. This alliance between big band hits and Lucky Strike cigarettes would continue to define the style and shape of *Your Hit Parade*: as a generation of executives for the American Tobacco Company's Lucky Strike division correctly figured, the public would tune in to the cover versions of hit songs by unknowns, and so show costs would be low while retaining a broad-based appeal.

Although its Saturday night venue never changed, its lineup of announcers, orchestras, and singers surely did. For

W.C. Fields and soundman Al Span, *Your Hit Parade*
 Courtesy CBS Radio Archive

example, in 1937, when *Your Hit Parade* shifted to the Columbia Broadcasting System (CBS), out went the old talent, and in came the Lanny Ross Orchestra, with Barry Wood and Bonnie Baker as the leading vocalists. But in 1939, out went Ross, and in came the Mark Warnow Orchestra. Such shifts were frequent for the program. Its time slot and length also varied over the years. Starting times of 8:00 P.M., 9:00 P.M., and 10:00 P.M. were tried and retried, as running time fell from one hour, to 45 minutes, down to 30 minutes.

Generally the names of the *Your Hit Parade* vocalists and orchestras have been forgotten, with a few exceptions such as Dinah Shore, Frank Sinatra, and Doris Day. Sometimes, to boost ratings, American Tobacco brought in guest stars, including most notably W.C. Fields and Fred Astaire. Indeed, *Your Hit Parade* reached its peak during the World War II years when executives—in a rare spending spree—hired Frank Sinatra, and thus the CBS Radio Theater at Broadway and 53rd Street became the focus of young female fan attention. The theater, which held 1,200, filled with teenagers who roared as Sinatra rendered hits such as “Paper Doll,” “You’ll Never Know,” “Long Ago and Far Away,” and “I’ll Be Seeing You.” In January 1945 Sinatra’s contract expired, and rather than pay a higher wage to this budding star, American Tobacco reverted to its low-cost approach. Sinatra would return in September 1946, bringing as his costar former Les Brown Orchestra star Doris Day, but only temporarily.

If there was an omen of the impending end of radio’s *Your Hit Parade*, it was surely when Mark Warnow, the show’s longest orchestra leader, died in 1949, immediately after completing his 493rd *Your Hit Parade* broadcast. He was replaced by Raymond Scott, and it was Scott who led the show to television by hiring and developing Snooky Lanson, Dorothy Collins, and Russell Arms. Scott did not change the programming formula.

The constant was that both the radio and television versions featured relative unknowns reprising the most popular pop songs of the week as determined by a national “survey” of record and sheet music sales. (The methodology of this survey was never revealed, but it could hardly have been scientific, as it probably never went beyond calls to a few major

city record stores and to the leading publishers of sheet music.) Repeated chart toppers were simply played again and again, with slight variations. “Race” music from and for African Americans and “Hillbilly” music from and for rural and small-town whites was wholly ignored unless a version “crossed over” and was covered by a mainstream crooner or band. So although Texas western swing band Bob Wills and the Texas Playboys composed, created, and initially recorded “The New San Antonio Rose,” it would be Bing Crosby’s version that would make it onto *Your Hit Parade*. This Tin Pan Alley focus and inability to deal with the synthesis of Race and Hillbilly music that eventually led to rock and roll signaled the end of the formula and of *Your Hit Parade*—on both radio and television.

Yours Truly, Johnny Dollar

Drama Program

Yours Truly, Johnny Dollar was the last surviving network dramatic show after the inception of television. From 1949 to its demise in 1962, Johnny Dollar entertained those detective fans who had not yet been seduced by “the tube.” *Yours Truly, Johnny Dollar* and *Suspense* were the last two original radio dramatic series produced for the Columbia Broadcasting System (CBS), and they ended their run on 30 September 1962.

The radio series recounted the detective cases of Johnny Dollar, “America’s fabulous freelance insurance investigator.” He would often receive his assignments from Pat McCracken of the Universal Adjustment Bureau, a clearinghouse for several insurance firms. Hartford, Connecticut, the headquarters for many major insurance companies, was his home base, but his assignments took him all over the world. His investigations of such matters as stolen jewels, paintings, or furs; missing persons; and insurance fraud of various types would inevitably lead to a murder investigation and an encounter with the criminal element. However, Johnny Dollar could take care of himself; he could be as hard-boiled as the toughest detective. His wisecracking betrayed a cynical attitude, and his encounters with women certainly resulted in some suggestive language.

Johnny Dollar was a confirmed bachelor, although he did have a girlfriend, Betty Lewis, who appeared occasionally. He was basically a loner, and each story was told from his first-person point of view. “Dollar” was a metaphor for the detective’s interest in money. Described as the detective “with the action-packed expense account,” he tallied each and every expenditure, no matter how small. Each show concluded with the revelation of his total expenses, as if dictating a memorandum to his employer, before he signed off with “yours truly, Johnny Dollar.”

The series premiered on 11 February 1949 with a 30-minute episode entitled “The Parakoff Policy,” in which the insured was being held for the murder of Mr. Parakoff. Johnny Dollar’s encounter with Parakoff’s widow allowed for some suggestive dialogue. Paul Dudley and Gil Doud wrote the pilot script for the series, and actor Dick Powell auditioned for the title role on 8 December 1948, but he went on to star in *Richard Diamond, Private Detective* instead. Charles Russell was the first of six radio actors to play Johnny Dollar on the air. Russell played the role as the stereotypical hard-boiled investigator with his own little quirks, such as flipping silver dollars to hotel bellboys.

Russell played the role of Johnny Dollar for one year, through 34 half-hour episodes. Edmond O’Brien assumed the role in February 1950, starring in 103 episodes until Septem-

ber 1952, and John Lund continued in the role for the next two years, starring in 92 episodes through September 1954, when the show was canceled, probably because of a lack of sponsorship. Most often the shows were broadcast on a sustaining basis. Wrigley’s gum had the longest continuous sponsorship, from 10 March 1953 to 10 August 1954.

Yours Truly, Johnny Dollar returned to the air in October 1955 with a new format, star, and producer/writer/director. Instead of the 30-minute series format, the show moved to a serial format, with five 15-minute episodes per week. The listeners seemed to like this format because it allowed more time for story and character development—75 minutes each week, including commercials or other promotional material, of course. They liked the new star as well. Bob Bailey played Johnny Dollar as a more caring and less cynical and hard-boiled investigator. Bailey’s portrayal made the hero seem more human, but nevertheless a tough and smart detective. Gerald Mohr, who had played the lead in *The Adventures of Philip Marlowe*, made an audition tape on 29 August 1955, but it never aired. Jack Johnstone, who was responsible for the new directions in the program, began producing and directing the show at this time, and he contributed several scripts before the series ended in 1962.

Bailey played in 55 of these weekly serials before November 1956, when CBS reverted back to the original 30-minute, once-a-week format. Continuing until 27 November 1960, Bailey played in 203 episodes, more than any other star of the series. At that time, the show was moved from Hollywood, where it had been produced from its beginning, to New York City. Robert Readick assumed the role on 4 December 1960 and played in 28 episodes until 11 June 1961, when Mandel Kramer took the part. Kramer played Johnny Dollar for 69 episodes until the series ended with the last case, “The Tip-Off Matter,” on 30 September 1962.

Zenith Radio Corporation

Radio and Electronics Manufacturer

Zenith Radio Corporation, now Zenith Electronics Corporation, was the longest-surviving American-owned consumer electronics corporation. Founded in 1919 as Chicago Radio Laboratory, Zenith manufactured a wide range of electronic products for 80 years and continues to be one of the most respected and widely known American names in consumer electronics. The United States-based company has been a wholly owned subsidiary of Korean electronics giant LG Electronics since late 1999.

Under the guidance of founding genius “Commander” Eugene F. McDonald, Jr., and innovative financial manager Hugh Robertson, Zenith grew from its beginnings on a kitchen table on Chicago’s North Side to a leadership position in radio and, along with archrival Radio Corporation of America (RCA), to continued dominance in the postwar television boom. Along the way, Zenith and McDonald made significant contributions to the very form of the consumer electronics and broadcasting industries. Zenith is best known for the high quality and reliability of its products and its innovative concepts in product development and marketing.

Origins

The founders of what was to become Zenith Radio Corporation were two radio amateurs, Ralph H.G. Matthews and Karl Hassel. Matthews built his first amateur station in Chicago in 1912. In 1913 and 1914 he perfected a distinctive aluminum sawtooth rotary spark gap disk that later became the company’s first product. Matthews also became heavily involved in the newly formed Amateur Radio Relay League (ARRL), and in 1917 his radio call sign was changed to 9ZN. While serving as a radioman at the Great Lakes Naval Training Station at the end of World War I, he met a radio code instructor, Karl Hassel. Upon release from the navy, the two entered into a partnership producing first the aluminum spark gap transmitting disk and then other amateur equipment. They were soon producing

complete receivers and transmitters of their own design. Operating as the Chicago Radio Laboratory, the two quickly outgrew their manufacturing space at 1316 Carmen Avenue (actually Matthew’s house) and moved into half of a garage on Sheridan Road, on the lakeside grounds of the Edgewater Beach Hotel. The other half of the garage served as the home of 9ZN, one of the best-known amateur stations in the United States. Because their equipment was built for the radio amateur, the earliest advertising was placed in *QST*, the magazine of the American Radio Relay League. By late 1921 *QST* advertisements listed the 9ZN call followed by a small “ith,” the origin of the trade name Z-Nith.

In 1921 Eugene F. McDonald became involved with the Chicago Radio Laboratory. McDonald was a savvy businessman who was looking for a business investment when he discovered Matthews, Hassel, and radio. McDonald offered to become a financial partner in their undertaking, and a partnership was formed, with McDonald as the general manager. A period of rapid growth followed.

As demand for the product increased in the spring of 1922, McDonald engaged his friend Tom Pletcher, a well-known figure in the music industry and president of the QRS Music Company, to take over the sales and manufacturing of CRL receivers in his large (and partially empty) new factory. By July, production had reached 15 sets per day.

Because the Armstrong receiver circuit patent was licensed to the Chicago Radio Laboratory, which produced Z-Nith products, McDonald formed Zenith Radio Corporation to become the marketing arm for the Z-Nith radios. The corporation was founded on 30 June 1923 with capital of \$500,000 derived from common stock sold at \$10 per share.

McDonald’s Zenith

In 1923 McDonald built one of Chicago’s pioneer radio stations, WJAZ, to stay in contact with the 1923–24 MacMillan

Arctic Expedition, which was carrying Zenith radio equipment. The experiment was successful, allowing the expedition to be the first to maintain contact with civilization during the long polar night and generating considerable publicity for the small radio company.

McDonald also equipped the 1925 MacMillan Arctic Expedition with Zenith shortwave equipment. That expedition was the first to use shortwave in the Arctic and the first to fly heavier-than-air craft in the Arctic; it was also Richard Byrd's first introduction to the polar regions. McDonald accompanied the expedition as second-in-command, and the Zenith equipment performed flawlessly. Experimental shortwave communications from the expedition in North Greenland to U.S. Navy vessels in New Zealand played a seminal role in the adoption of shortwave radio for long-distance communications.

McDonald's work with WJAZ highlighted for him emerging problems with the American Society of Composers, Authors, and Publishers (ASCAP) over royalties for performers whose music was played on the radio. Dissatisfied with the arbitrary nature of ASCAP's rate schedules, McDonald organized a meeting of a small group of broadcasters in Chicago in early 1923 to oppose ASCAP; this organization was to become the National Association of Broadcasters, with McDonald serving as its first president.

By the end of 1924, the production rate at the QRS factory could not keep up with increasing demand, and Zenith resumed manufacturing its own products in a new four-story plant on Iron Street in Chicago.

In 1925, Zenith introduced the grandest Zenith radio models the company had ever manufactured, the ten-tube Deluxe receivers. There were five cabinet styles, each handmade: the Colonial, the English, the Italian, the Chinese, and the Spanish. The price for these models ranged from \$650 to \$2,000 (\$5,800 to \$21,400 in 2000 dollars) and were the most expensive radios being manufactured at that time. They illustrated the company's commitment to building the very best equipment, regardless of cost.

McDonald became embroiled in another broadcasting battle in 1926, when his WJAZ shifted ("jumped") to another frequency, seeking a less-congested channel, but also challenging the authority of the Secretary of Commerce to assign radio frequencies. On 16 April 1926, the case was decided in federal court in McDonald's favor (*United States v Zenith Radio Corporation*, 1926), proving finally that the existing frequency allocation laws, dating to 1912, were unenforceable and that the secretary lacked authority.

Zenith Radio Corporation was first listed on the Chicago Stock Exchange in March 1928 and on the New York Stock Exchange in July 1929. Stockholders increased from 250 in

April 1928 to 2,750 in April 1929. Fiscal year 1929 earnings exceeded \$1 million.

When the stock market crashed in 1929, Zenith found itself with a large inventory of materials to build new sets, but not many finished sets, primarily because of an innovative inventory control plan. That, and the selling of 100,000 shares of stock (worth \$1 million) just before the market collapsed, enabled Zenith, with proper management, to ride out the rough times without missing loan payments, borrowing money, or releasing large numbers of employees. The company continued to manufacture high-quality, high-priced radios during the Depression but also added a less expensive line, the Zenette series, to appeal to the average buyer.

Recovery for Zenith began in 1933 when deficits, which had been running at about \$500,000 a year, were converted into a \$50,000 profit for the fiscal year ending 30 April 1934. At the beginning of 1934, Zenith was the lowest-priced radio stock quoted on the New York Stock Exchange; by the end of 1934, it was the highest. The Depression recovery assumed spectacular proportions for Zenith in 1935, when net earnings returned to the pre-Depression high of just over \$1 million. Zenith also undertook major efforts to maintain its distributors' profit margins during the rough times, and Zenith emerged from the Depression with a fiercely loyal band of distributors who would serve the corporation admirably for many decades in the boom ahead.

In 1937 Zenith supplemented its factory space with the addition of the 400,000-square-foot West Dickens Avenue facility. In 1937 the radio industry as a whole showed a 15 percent drop, but Zenith's sales rose. New developments prior to World War II included the chairside radio-phonograph; a "Radio Nurse" baby monitor; and a line of portable radios, including the venerable Zenith Trans-Oceanic radio, which would go on to become the longest lasting radio brand in radio history. By 1938 most Zenith radios contained the Zenith-patented "Wavemagnet" antenna.

The ensuing years were marked by steady progress. The Zenith experimental television station, W9XZV, began operating in black and white in February 1939 and began color transmissions in 1941.

Because of the war, all domestic production stopped on 1 April 1942. Zenith's war efforts centered on development and production of sophisticated frequency meters, work on the V-T proximity fuse, and military-grade radio communications devices. It was through Zenith's efforts that most manufacturers, except RCA, granted the government free license under all patents covering war work. Zenith was awarded the Army-Navy "E" in November 1942, the first of five it would receive. Zenith was given special permission to manufacture only one civilian product during the war years, an inexpensive hearing

aid that allowed the hard-of-hearing to be gainfully employed in war work.

Postwar Radio

Zenith planned for the resumption of civilian production in the closing years of the war and was among the earliest to attain volume production after the war. In 1945 Zenith began production of many of its own components, such as loudspeakers, record changers, and coils. The company was also an important early manufacturer of FM receivers. In 1947 Zenith introduced the "Cobra" phonograph arm. In 1948 the company introduced turret tuning for television, allowing the expansion of the tuner for future UHF reception. Zenith acquired television tube manufacturer Rauland Corporation in 1948 and in 1949 introduced the first "black tube" television sets, which quickly became the industry standard. In 1950 Zenith stopped manufacturing automobile radios, in spite of excellent sales, to provide space for the rapidly expanding television business. The continuously variable speed (10- to 85-rpm) Cobra-Matic record changer was introduced in 1950.

Major expansion of manufacturing occurred again in 1950-51, when a large facility in Chicago was acquired for television production and for Korean War military contracts. The removal of the television station "freeze" in 1952 greatly stimulated the company's television business, and the Zenith turret tuner made Zenith the only sets in production that could be easily converted to UHF. In the fall of 1953 Zenith introduced a three-transistor hearing aid, the first of many solid-state models to follow. By 1954 Zenith was selling more hearing aids than all other companies combined, and their dominance of the industry continued through the 1970s. Zenith entered the high-fidelity market in 1953 and was among the first to provide high-fidelity sound for television receivers. The ultrasonic Zenith "Space Command" remote TV control was introduced in 1956. Zenith's founder, Eugene F. McDonald, Jr., died in 1958.

By the mid-1970s, because of increasing competitive pressures from offshore (mostly Asian) manufacturers of radio and television, Zenith established its own manufacturing operations in Mexico and Taiwan, while forging an alliance with LG Electronics to build Zenith-brand clock radios in Korea. While

growing its television business and venturing into new areas such as VCRs and cable set-top boxes, Zenith continued to play a role in transistor and portable radios and in component and console stereos until the company phased out its radio and audio products business in 1982 to concentrate on television and other video-related products. That year, the last of the legendary Trans-Oceanic radios was produced, marking the completion of the four-decade reign of that famous series of multiband shortwave radios.
