### CONTENTS

**JUNE 1996** 

VOL. 46, NO. 8

549

550

#### Leader

#### Satellite Workshop

Jack Armstrong on his experiences running a satellite servicing business.

#### Test Case 402

#### Camcorner

#### 100V Test Power Supply 556

Ian Rees describes a simple power supply designed to test the operation of the line output stage in a 'dead set'. It is helpful to be able to assess line output stage operation independently.

#### Long-distance TV

558

562

564

DX conditions and reception, the satellite scene and news from abroad. Roger Bunney reports.

#### **Monitors etc**

Readers' reports on faults experienced with monitors and allied computer equipment.

#### **Going it Alone**

There is much to consider when you are thinking about setting up your own servicing business. John Pitt-Francis, who branched out successfully over three years ago, tells how to go about it.

#### VCR Clinic

#### 547 Servicing the Sony BE3B Chassis 548 In this concluding instalment Giles Pills

**572** 

586

593

594

605

In this concluding instalment Giles Pilbrow covers the signal processing and microcomputer control system in the chassis.

#### Servicing the Hitachi VTM720/722 576

John Coombes provides a rundown on fault-finding and maintenance procedures.

Satellite Notebook	578
TV Fault Finding	582

#### What a Life!

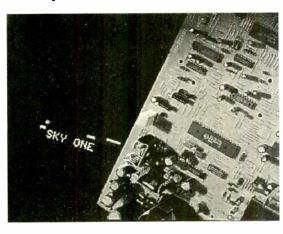

As well as TV and video troubles, Donald Bullock finds out about some problems with Amstrad PCW series wordprocessors.

Letters 58	Letters		588
------------	---------	--	-----

#### Amstrad SRD510 Mod

Peter Haylor on how to add front-panel channel up/down control to this popular satellite receiver.

#### **Teletopics**

#### Inside the Pace MSS1000 597

The electronics within this satellite receiver are quite complex. J. LeJeune starts off a new series with a description of the power supply, the tuning system and the video processing.

#### Help Wanted 604

#### 568 Next Month in Television

**Editor** John A. <mark>Reddihough</mark>

Production Editor Tessa Winford

#### Consultant Editor Martin Eccles

Publishing Director Susan Downey

Advertisement Manager Carol Nobbs 0181 652 8330

### Experience

trange the different attitudes to experience nowadays. Ms C. Raynor in a letter (February) that produced an interesting response complained of the difficulty in getting a job, despite having a sound technical knowledge, without experience. In these hard times many employers will not offer jobs to those who cannot show that they have done the same sort of work previously. Yet in many other employment contexts experience seems to count for little. Martin Pickering, in his article on design for reliability last September, commented that experience is simply not passed on. So firms and their employees have to learn by making the same old mistakes, and customers are let down because of product failures. And of course those of us in the repair trade find ourselves dealing with the same tiresome problems electrolytics mounted near hot resistors or transistors, heavy components in positions where they strain the PCB, and all that sort of thing – which should be old history by now. Well, perhaps it is, to the Japanese, but not to many other manufacturers. And maybe we should be thankful we still have these obvious sillies that are relatively straightforward to repair.

To my mind the failure of many, mainly Western, firms to recognise the importance of experience and benefit from it is a matter of some significance. There are a number of reasons that seem to contribute to this phenomenon. An obvious one is the current fad for workforce 'downsizing'. Get rid of all those useless people if what they are doing is not making an obvious, immediate contribution to profits (sometimes even if it is!). Thus the removal of large swathes of middle management and the vogue for early retirement to reduce staff. Some job losses as a result of changed work practices are clearly

inevitable. But this can equally clearly go too far. Because what is lost when older people are prematurely removed is the experience that companies have gained and has, in the past, enabled mistakes and misjudgements to be avoided. The experience that is built up by those who work for a firm for a number of years is a sort of collective knowledge that has great value.

Perhaps the most obvious example of the way in which things can go wrong is to be seen with the high street banks. Years ago the local bank manager was assumed - by the time he became the manager - to have gained a detailed knowledge of local businesses, their needs and viability. This enabled him to be judicious in making loans. But such an approach was not favoured in the commercial atmosphere that evolved in the late Eighties. Lend, lend, lend to grab market share was the approach, and if the traditional bank manager got in the way of this then get rid of him. The net result was extensive bad debts that contributed greatly to the recession. It has taken a long time for them to unwind. I gather that some of the main banks are coming round to realising that local managers with local experience are the best way of running their business profitably.

This is only one example, which is reasonably clear to see. Others are not quite so obvious. I strongly suspect that excessive reliance on computers is having an insidious effect. Install computers that can do much of the routine work and you can reduce your staff. But when the workers go they take their experience with them. This can't be replaced, and is one thing that the computer doesn't and can't have. You can't say to a computer "what do you think about this idea?" and get a considered reply based on a knowledge of what has happened in the past and a reasoned guess about prospects. Computers don't have experience to call upon, and don't have views or think laterally. They may one day, but certainly not for the time being. The failures of economic modelling by the Treasury and others is a clear example of the inadequacies of computers in this respect. This is not to suggest that humans have infallible judgement, far from it. But they can call upon experience, discuss prospects with each other and evolve a reasoned opinion. Assuming, that is, that you haven't downsized the organisation to the extent that few with any worthwhile experience are left.

Things could well get worse. The current move to increased use of casual staff, along with the idea that people should expect to have to keep changing their jobs, will add to the loss of collective experience. Why should anyone taken on to do a job for a couple of months do anything other than what they are in strict terms asked to do? If someone points out deficiencies in an organisation or its plans or products, they are not likely to find favour - or be asked back again! Those with critical minds don't seem to fit in with the current commercial ethos. Positive thinkers are wanted. People who will get on with it and make silly mistakes because they don't know any better.

Not all firms allow themselves to be dominated by the latest management fads of course, and it is a matter of fine judgement to decide the respective weights to give to and the enthusiasm of experience newcomers. But next time your car breaks down, your telly goes on the blink or your sat receiver blows up, reflect on the fact that someone out there might have had the answer had he not been downsized. How many vehicles is it that Ford is to recall for modification in the USA and Canada? Some 8.7m I read. Because of an incorrectly designed switch.

#### Jack Armstrong

s it's all organic farming around here – judging by the smell, anyway – the only mad cow is the one that's married to a local farmer. I could tell she was mad by the way she banged the shop door behind her.

"It's done it again" she announced as she slammed a Pace SS9200IRD down on the counter.

I didn't need to ask what it had done again. This was the sixth Monday in a row on which she'd arrived with the receiver. When it came in for the first time I replaced the usual parts, including C9, C11, the BUT11A chopper transistor and the fusible resistors. On the second occasion only the BUT11A transistor and the fuse had failed. but I fitted a new chopper transformer (T12) and large electrolytic (C7) for good measure. Since then it had arrived punctually each Monday to have the fuse and transistor replaced. I had checked everything but could find no cause for the failures.

This definitely had to be the last time. I decided to pay a home visit. That afternoon, with the receiver

## atellite WORKSHOP

once again in working order, I drove to the farm to check the installation.

#### Down on the Farm

It transpired that the living room was actually an extension to the old building, and that the mains socket used for the satellite receiver was supplied from the phase used in the milking sheds. The other sockets in the house were all on a different phase.

The cause of the trouble was not the difference between the phases but the power surges caused by the milking equipment. The milking was all done by hand during the week. On Saturdays and Sundays however it was done by machine.

The solution was simply to plug the receiver into a different phase. Before leaving I gave the farmer an invoice for my call out and advised him, in the interests of safety, to get an electrician to sort out the wiring.

#### Water Damage

It's often tempting to tell customers, especially on a busy day, to take away their water-damaged receivers. I accepted this customer's excuses however, since it was apparently all his wife's fault. She had been watering the plants on the shelf above the TV set and ... some things are inevitable, really.

As the receiver, a Pace PRD800, had been left in a nice warm room for a week without any attempt to dry it out I feared the worst. When I removed the cover the board had a stained appearance but there was no obvious corrosion and no green fur of the type you find when an animal has relieved itself.

After ensuring that there was no obvious water sloshing around I connected the receiver, switched on and looked at the picture. Perfect! But the only sound available was a loud hiss. Oddly, when I checked around the surface-mounted FM demodulator chip with my oscilloscope probe the stereo audio nearly blasted me off my stool.

With one hand gripping the scope probe, I tried to change the audio mode. I couldn't, so the demodulator chip was obviously working only partially, my probe simply adding the correct capacitance to the varactor to tune in the frequency for one mode.

I replaced the beastly chip, but this made no difference. The waveform on the SDA line looked like, well, data I guess, and the clock pulses on the SCL line seemed to be OK. The amplitude of the 4MHz oscillator signal at pin 1 was decidedly low however. I traced the source back to the Nicky chip, where the signal was at 4V peak-to-peak. Aha! Careful probing revealed a tiny break where the track had corroded away. Once this damage had been repaired, the audio was perfect.

#### The Pace MSS1000

This has been a week for MSS1000 problems. A dealer sent me several of these receivers by carrier. They arrived a bit the worse for wear, but I think they were probably like this before the carrier had touched them – they had apparently been bought second-hand as "good working units".

In each case the receiver had been dropped and the tracks around the chopper transformer had cracked. The damage was only slight however, and I was able to carry out good, safe repairs. With the power supplies now operational, it was possible to assess the full extent of the damage.

I'm guessing, but I think that the power supplies had all lost their feedback loops, allowing the secondary voltages to become too high. In one unit the tuner and the audio processor chip were shortcircuit. In another, the Dolby board had destroyed its output chips plus nearby transistors and zener diodes. Another had a short-circuit PTV chip on the card-reader board.

The Dolby board was a complete wright-off: I know when I'm licked! So I removed it and converted the receiver to an MSS500 simply by fitting a new front panel moulding – the microcontroller chip recognises the fact that a Dolby board is not connected and automatically reverts to the MSS500 menu system.

Although the receivers were now up and running, none of the front panel displays would light up. "Obvious" I hear you saying, "he's forgotten to replace C2". Well no, I'd done that and even replaced the control chip and the vacuum fluorescent display, all to no avail. Eventually it occurred to me to read the excellent service manual, which points out that the display filament requires a 22kHz drive waveform. This was not present. It was easy to trace the cause of the fault to the ZTX749 transistor Q5.

Now here came my big mistake. Familiary with Pace units led me to reach for my drawer full of FTX749 transistors. Yes, I'd misread the designation. Although both are medium-power pnp transistors, the pin connections are different. As a result, it took me another ten minutes to figure out why the replacement transistor wouldn't work! The receiver lit up when I'd fitted a ZTX type transistor from another working panel. As the same fault was present on three display panels, I'll order some ZTX749 transistors for stock.

#### **Card Invalid Problem**

In recent weeks I've been inundated with receivers that produce the "your card is invalid" display intermittently. At first I didn't have any difficulties when using my own Sky card but, gradually, it started to cause the problem. The stage was finally reached where I could put my card in any Amstrad receiver and everything would be fine, but several other types of receiver would tend to say that it was invalid. If I put an old series 09 Sky card into the same receivers the display would read "your card has expired", as expected. So the cause of the problem seemed to lie with the new card.

When I inspected the card more closely I noticed a small, black square on one of the contacts. The square was very worn with my card. I checked the square on a customer's card and found that it appeared to be a film resistor of about  $2k\Omega$ , although the actual value would depend on the spring contact area inside the card slot.

This resistance is in series with the 3-5MHz clock input to the card. Could it be needed with some receivers but not the Amstrad ones? I dismantled a Pace PRD900 receiver that had been giving "card invalid" messages when my card was inserted and cut the track to the relevant spring contact. The problem was cured by soldering a Jack Armstrong is willing to try to sort out readers' satellite TV receiver problems via email. You can teach him via the Internet at:

#### jackarm@netcentral.co.uk

No letters or phone calls please: he can cope with e-mail requests only. One model per message – state make/model and fault symptoms.

 $2.2k\Omega$  resistor across this cut. Since then I've carried out the modification to a dozen or more PRD receivers and clones (such as the Philips STU824) with 100 per cent success.

A call to Sky's technical man elicited the reply that they were unaware of a problem with this model though they thought that there was a problem with the SS9200 (at least he didn't tell me to "wipe the card to remove static", the usual response).

The intermittent "card invalid" problem has occurred with other receivers, for example the Cambridge RD480. Oddly, no one else seems to be getting it. I must have very fussy customers!

### Test Case 402

There's usually a lull in our workload at this time of the year, and it was as well that plenty of time was available for this particular repair. The patient was a Panasonic NVSD40 VCR which had come in on a chargeable basis, labelled "poor picture".

It was immediately obvious that the cause of the trouble lay with the video heads. The playback pictures were marred by tearing effects, with black worms and dots that streaked to the right from white edges of picture features. Playback of tapes recorded elsewhere was bad: with the machine's own recordings it was very bad. It's such a familiar sight that no further checking was required.

As this is a four-head machine, the quote was quite high. It was nevertheless accepted, and a new upper drum was ordered and fitted. In common with other modern machines, very little is required by way of setting up and alignment following head drum replacement. Once we'd checked the X setting of the ACE head and the video head-switching point we sent the machine on its way, with a three-figure bill attached.

It was a couple of days before the customer came on the phone to tell us that he wasn't happy with the performance of the repaired machine. He said that with all the recordings he'd made since its return there was a fine criss-cross/dot patterning on saturated colours in the picture. To prove that the problem was not present prior to fitting the new drum, he'd tried playing back a tape recorded when the machine was quite new. We told him to bring it in for us to sort out.

When it came back we found that the effect was as described: there was a fine cross-hatched pattern on the colours. It was also present with off-air recordings, and the more saturated the colour the more noticeable and intrusive the patterning was. As playback of a known good tape was fine, the cause of the problem clearly lay in the record circuitry. There was no sign of patterning in the E-E picture, which exonerated the receiver section, the r.f. modulator and some of the vision processing circuitry. So our investigation centred on the colour-under section and the chroma record amplifier.

This is all burried in two ICs, the Y/C processor chip IC302 and the drive amplifier chip IC501. A check with the service manual showed that the only relevant control is the chroma record current preset VR502: adjustment is carried out by using a 5V bias source to remove the luminance component of the signal, then adjusting VR502 for 32mV across a pair of test points in the head-drive circuit. We did this very carefully – the adjustment was found to be a little off – but there was no beneficial effect at all!

Filtering is very important for the avoidance of crosstalk and patterning effects with under recording. The relevant filters are all electronic however, burried deep within the Y/C pocessor chip IC302. The only possible check would be chip replacement, but the chip was very unlikely to have failed during drum replacement. It seemed likely that the replacement head drum was the culprit, though faults here don't usually cause this sort of symptom.

In fact a replacement drum was not required, and the Y/C processing and drum drive chips were both OK. Could the fault have been caused by something other than the chroma circuits or the heads themselves? There was one significant clue: for the first ten seconds of each new recording, the playback picture was marred by even worse colour patterning than subsequently. For the solution, turn to page 605.

#### **Ferguson FC28**

We've had intermittent power-up faults before with this model. The usual cause is a leaky capacitor that decouples the power-on line to the mechacon chip. This time there was a different cause. R302-304 in the same power-on circuit were dryjointed.

#### **JVC GRAX400E**

This unit would switch between the SP and LP modes and back during play. In addition the clock data was intermittent. The cause of both symptoms was at the connection of the VTR operation assembly ribbon to the main PCB socket. Cleaning and refitting cleared the troubles.

#### Sanyo VMD1P

There was no operation with this oldie. When it was shaken, something could be heard rattling around inside. A screw had become detached and had fallen into 'the words', causing failure of the 3·15A ceramic fuse. We fitted a replacement then checked for possible short-circuits etc. A soak test proved that even old machines can produce good results.

#### Panasonic NVS20B

Intermittent operation was the complaint with this unit. On test we found that it worked for long periods at a time with no problems. While observing its operation we noticed that failure usually occurred at the end of tape loading. If this operation was performed correctly all was well. If not, a second attempt would usually also fail. The final mechanical loading movement was the problem area. We first thought that the guide assembly was sticking. As checks here proved to be inconclusive, we decided to replace the mode encoder switch. This restored normal operation. The job is quite understandably left until last, as the switch is burried deep within the mechanism.

#### Canon A2H.E (Sony U Mechanism)

If you get one of these in with the common fault, which you also get with Sony models, of a detached coaster assembly, give a slightly higher estimate. Because of the amount of dismantling required to gain access, the time taken is likely to be considerably longer. If possible, before dismantling the unit check that the capstan motor bearing isn't noisy – this may avoid a repeat strip down.

#### Sony ACV25 Adaptor

There was no operation: after replacing Q301, R110 and R104/5/6 we modified the unit as laid down in the Sony bulletin.

#### Canon E230E

We had previously replaced most of the small can electrolytics, mentioned in other Canon reports, in this camcorder. Here it was back again, just within its guarantee. It wouldn't operate in any mode, being to all intents and purposes dead. The cause was simply failure of the VTR operation PCB assembly, which is stuck to the internal case moulding. A replacement restored normal operation.

When fitting a new unit, take care over its positioning – you don't get two goes! – and the dressing of the ribbon cable to the main PCB connector. Note that it's as well to disconnect this unit when working on the main PCB. On/off and eject can be achieved by earthing the appropriate connection to the operation PCB socket, all other functions being available via the remote control unit. Very clever to have a remote control unit that doubles as a means of operating the service modes. Even better, it can be used with most if not all Canon models.

#### Canon UC16E

This is a version of the UC15 with a colour viewfinder. The fault report said "picture disappears when warmed up", and so it did: after about five minutes the E-E picture gradually darkened until it disappeared completely. So we carried out checks around the camera processing circuitry, including the iris section. We found that C2115  $(1\mu F)$  was temperature sensitive: it's part of a clamp circuit at pin 26 of the sample-and-hold and AGC chip IC2101. Once a replacement capacitor had been fitted the picture behaved itself.

#### JVC GR303

Failure to record, playback OK was the complaint with this one. We found that connectors CN5 on the A-V PCB and CN14 on the main PCB had become detached from their locations: resoldering cured the problem. Reassembling the unit into its case parts can be a tricky operation – whoever designed it?

#### Sony CCDV30

Incorrect auto-focusing action was caused by a faulty limit switch: because of metal fatigue, one switch leaf had become detached.

#### Ferguson FC27

Intermittent power up and intermittent eject were the reported faults. The unit would sometimes run continuously without any trouble, only to fail when tried next day. We carried out cold checks on the mode switch and the buffer circuit to the mechacon chip and noted the usual readings. To cut a long story short, we eventually found that the electrolytic capacitor C317 (47 $\mu$ F) had leaked over much of the relevant circuitry. A new capacitor and a PCB clean up put matters right. Needless to say C317 was not itself involved with the circuitry that produced the fault symptoms!

### JUST ARRIVED !!!! NEW ITEMS

#### Satellite PSU Repair Kits

Experience shows that 50% of all receiver power supplies 'bounce' unless the correct precautionary measures are taken when being serviced. A kit of all the recommended parts is supplied for the 4 most popular models, which when fitted should overcome this.

## **100V** Test Power Supply

#### This simple power supply, devised by Ian Rees, is ideal for checking the operation of the line output stage in a dead set

t can be very useful to have available a substitute HT power supply to determine the ability of the line output stage in a dead TV set to work and the feasibility of carrying out a full repair.

While it is relatively easy to feed 5-30V DC to a set from a standard bench power supply, the 90-150V DC required by the line output stage is not readily available. The power supply described in this article will energise a line output stage at least to the point where a judgement can be made about the condition of the set, say after a lightning strike, without having to rebuild its own power supply. This can speed up the preparation of estimates, giving an overall impression of the circuit's condition with no need to carry out lengthy component substitution checks.

#### **Circuit Details**

The circuit is simple, see Fig. 1. For this application there's no need for stabilisation. In fact the lack of regulation is a virtue, enabling the power supply to kneel down in the presence of a heavy load without going phut or into the meltdown mode.

Two mains transformers from scrap monochrome TV sets are connected back-to-back. The mains input is fed to the first transformer (T1), whose low-voltage secondary winding drives the low-voltage winding of the second, identical transformer T2. This second transformer steps the voltage back up again. A switch (S2) between the two transformers controls the current flowing in the low-voltage winding of the second transformer, and hence the AC output from its high-

voltage winding, by selecting various series-connected wirewound resistors (R1-4).

The output from the bridge rectifier (D1-4), allowing for losses in the transformers, is around 250V off load. So steps are taken to hold it down on low-power switch settings. The power switch section S2B introduces R6 to discharge C1 rapidly in its off position (1), and reduce the output to 100V at its lowest setting (2).

To cushion the circuit under test, the series load resistor R7 can be brought into circuit by opening switch S3. The mains neon N strikes at around 90V, giving a useful indication that the output is reaching the operating voltage and that the leads are live.

#### Use

The suggested operating sequence for the power supply is as follows:

(1) Prepare the dead TV set for test. Take care to isolate and load any supplies that may be distressed by the sudden removal or insertion of expected/unexpected sources.

(2) With mains input to the test supply switched off (S1), rotate the power selector switch S2 to position 1 (off). If concerned about the outcome, open switch S3 to bring R7 into circuit.

(3) Connect the DC output leads to the set being tested (use a voltmeter to monitor the output). The connections to the set are best tack-soldered in place to prevent the

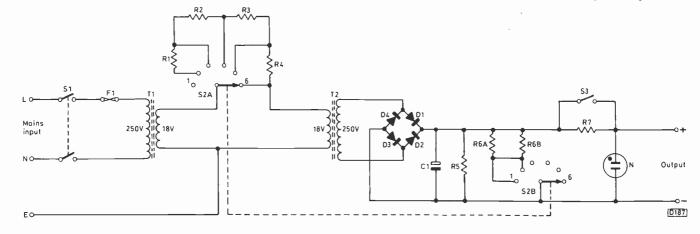

Fig. 1: Circuit of the 100V test power supply. possibility of disconnection and live leads zapping a swathe across the circuit tracks!

(4) Switch on the TV set and the test supply.

(5) Move the rotary power switch S2 to position 2. Look for signs that the TV set is operating.

(6) Close S3 to short out R7 if you are confident about the circuit under test.

(7) Continue to advance S2 until, hopefully, circuit operation is established.

(8) Always return S2 to its off position (1) before disconnecting the leads - ensure that the neon indicator is out and that you meter is reading zero.

#### **General Notes**

Whenever I've used the power supply the sets have worked and provided sufficient information to enable the circuit condition to be assessed. Portable colour sets operate normally. Larger sets, while functioning, may produce a raster with reduced height and width or show signs of hum bars as the supply struggles to provide the higher current.

No layout is required for such a simple design. Care is required however because the output is above 50V - the unit should be marked accordingly. The back-to-back transformers provide excellent mains isolation. As the various wirewound resistors run warm, their position requires careful attention.

No parts were purchased for the project. They were

#### **Component details**

from general stock or removed from scrap sets - the two mains transformers from a couple of old imports from the Far East.

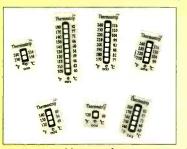

If the two transformers you use are not matched, ensure that the one which produces the lower secondary output drives the other one - to prevent a higher AC output than the mains supply input. Adjusting the values of the series resistors R1-4 and the load resistor R6 will restore the outputs.

Do not leave R5 out as this is the only discharge resistor present when S2 is in positions 3-6.

## Free to Television readers: irreversible temperature indicators

Called Thermostrips, these light, thin indicators consist of one or more heat-sensitive squares or dots. The centre of the indicator dot turns black once the temperature rating shown next to the dot is reached. The change to black is irreversible, so the strips become a permanent record of the upper temperature threshold of a component or piece of equipment.

To aid in maintaining of a piece of equipment, for example, Thermostrips applied for the usage period can be removed during

servicing and attached to the service report as evidence of correct functioning. They can also be used to help detect whether goods returned under warranty have been subjected to overheating.

Performance of the strips is not affected by contact with solvents, gases, steam, etc. Because of their size and the way they operate, Thermostrips can be the only

practicable way of measuring peak temperature in situations where equipment cannot be watched round the clock, or on moving parts, etc. Accuracy of the strips is ±1°C for ratings to 100°C and ±2% for ratings above.

To obtain your evaluation pack comprising:

One single-segment strip with a 40°C threshold One triple-segment strip for 40, 43 and 46°C One five-segment strip covering 60 to 82°C One eight-segment strip covering 77 to 116°C One four-segment mini-strip for 66, 71, 77 and 82°C

...simply fill in the reply coupon opposite.

ATP Instrumentation is offering an evaluation pack comprising five irreversible temperature indication strips - completely free to Television readers.

#### **Comprehensive instrumentation catalogue**

In addition to temperature strips covering the range 40 to 260°C, ATP also supplies a vast range of instrumentation, including: • timers

- weighers
- chart recorders
- multimeters
- pH meters

Send your request for a free catalogue on company letterhead to ATP's address shown below.

humidity detectors

light meters

• power supplies.

• dew-point indicators

To obtain details of the range of temperature strips that ATP Instrumentation supplies, write to Tournament Way, Ivanhoe Industrial Estate, Ashby-de-la-Zouch, Leicestershire LE65 2UU, or telephone 01530 416876, fax 01530 560373.

## Long-distance Television

DX-TV conditions and reception, satellite sightings and news, and DAB frequency allocations. Roger Bunney reports

he coming Sporadic E (SpE) season could well be a considerable improvement over those of the past few years. Signs that point to this are the improved mid-winter reception, the current sunspot minimum and a noticeable increase in the number of longer-duration though lowlevel signals throughout Band I during March. A mid-April SpE opening would set the scene for a mid-May start to the season, which should continue into early August. Remember to check for the possibility of transatlantic reception from mid-June to mid-July, which is normally the peak period for enhanced reception from the north west.

The first test transmission received from PAS-3 at 43°W. It carried a Morse identification at 8-2MHz.

Quality SpE reception was minimal during March, though there was a general background increase. This is typical for the time of year. Only one small SpE

opening was reported, on March 17th. It produced unidentified ch. E3 and E4 signals.

Conditions were right for enhanced tropospheric propagation in early April, with an almost stationary high-pressure system over the UK. The chilly, circulatory winds produced by this weather system prevented any substantial build-up in DX-TV reception however: there was a slight improvement in Band III reception from France and the Benelux countries, and breakthrough of the ch. 35 radar blip was evident with domestic receivers.

A two-hour six-metre band (50MHz) SpE opening on February 3rd is reported in the VHF News column in the April issue of the RSGB journal *Radcom*. This was instigated by high levels of X-ray flux, and is another pointer to an improved forthcoming SpE season. I hope that by the time you read this column you will be enjoying excellent, exotic Band I DX!

#### Satellite Sightings

Two news items produced intense activity across the European satellite sky during March, the Dunblane massacre and the BSE beef crisis.

Saudi TV seems to have departed from the Gorizont/Express satellite at 11°W, as the 11.525GHz transponder has been quiet since mid-March. I would expect that with the cluster of other Arabic broadcasters providing services to Europe from 13° to 19°W it will eventually reappear, perhaps via the forthcoming Arabsat 2 series satellites. There is still no

indication of a Hebrew service from Jerusalem. Colour bars with the identification "LIB TR1 002 TV TEST" appeared via the 11.076GHz horizontal transponder aboard Eutelsat II F3 at 16°E on Sunday March 31st. There was no accompanying audio. I wonder whether this was Libya testing? I had hoped that the Tyson v. Bruno fight would have been available via Orion. There were many one- and two-way interviews and news packages during the afternoon, but come evening and the transmissions went into hard encryption!

On February 21st our old SNG friend UKI-34 was at Smithfield market, using the usual telecomband transponder via Eutelsat II F3, with a live interview for Sky News on the safety of meat inspection in slaughterhouses. As several readers have commented. the media-led meat crisis resulted in many live programme inserts from this date onwards. GMTV for example carried a live insert from a supermarket meat department in its breakfast show on the 28th. More animals on the 29th, when UKI-76 appeared in the early morning sunshine at Aintree racecourse for discussion about the following day's Grand National. More exotic reception came via Intelsat K  $(21.5^{\circ}W)$  with coverage of the elections in Taiwan via Reuters' Taipei feed.

Fortunately Bandula Gunasekera (Sri Lanka) was unharmed by the recent bomb explosion near him in Colombo City, though he was showered with glass. He reports that most of the PAS-4 feeds use the telecom band and that there are problems in obtaining suitable LNBs for this locally at a reasonable price. Signals available include Arabic ART-3 at 11.525GHz and ART Europe at 11.655GHz, both horizontal, and NHK Television at 12.591GHz vertical.

On March 23rd Roy Carmen (Lake, Isle of Wight) counted 32 live news and reporter feeds providing Ku-band coverage of the German elections within the 1800-1900 time slot. Even Eutelsat II F1 (13°E) carried two FSS-band feeds amongst its conventional programme downlinks. On March 3rd Hispasat (30°W) was jammed with regional election-night feeds: this spilt over to Orion and Eutelsat capacity. Roy is one of the few to have logged an NTSC test pattern via PAS-3 (43°W) on March 20th, at 12.707GHz (vertical).

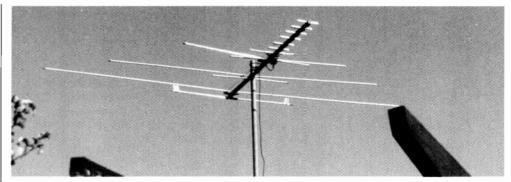

It seems that the AB-1 French cable service via Eutelsat at 13°E has gone digital. There are strong invisible telecom-band carriers at this orbital slot. Some of the news feeds previously here have moved to Eutelsat II F2 at 10°E.

John Adams (Oxford) has provided a translation of the Hebrew caption shown in the March issue (page 340). It apparently read "Live transmission from a synagogue 'Glory of Jerusalem' for the Jewish community in the Land of Israel around the World".

Finally, 'vibrant' religious programming from World Harvest Television (Berlin) has recently been present on most evenings via the 12·711GHz vertical transponder aboard Intelsat K. US evangelist folk have been featured, in recorded packages from churches across America. I assume that the feeds are intended for European public viewing venues.

#### **News Items**

Europe: Eighty five frequency blocks, many of which will be available "potentially" for digital audio broadcasting, were confirmed at the 1995 CEPT conference at Wiesbaden. Germany. This could have a direct impact on terrestrial TV transmissions across Europe. There are twelve blocks in Band I (47-68MHz), 12 in Band II (87-103MHz), 38 in Band III (174-240MHz) and 23 in Band L (1,452-1,492MHz). Most of Europe has opted to use Bands III and L. specific decisions being as follows: Denmark: 225-230MHz (two

blocks) to be used for national services, 235-240MHz (two-three blocks) to be used for regional services, 1,452-1,467.5MHz to be used for local services.

France: To use Band L.

Germany: To use ch. E12 (Band III) and Band L.

*Sweden:* In addition to the SBC's plans there is to be a Finnish DAB service to Finland from 1998, transmitted from Vaesteraas in Northern Sweden.

*Switzerland:* To use one block (ch. E12) in Band III and one block in Band L, both for national services.

UK: 12.5kHz will be used initially. in the upper part of Band III.

#### **Digital TV:** Experimental

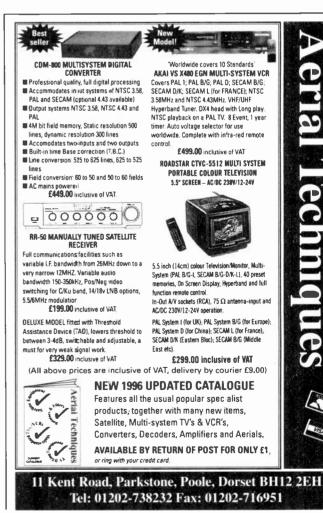

terrestrial digital TV transmissions by Deutsche Telekom are to start in the Berlin region this summer. The signal will incorporate various multi-media enhancements. Sweden is to have a nationwide digital TV network in operation by 2001. The Swedish government has promised to back the project. Hungary: MTV-2 moved to PAL last year; MTV-1 is moving this year. Previously, Secam had been in use since 1965.

Slovakia: Bardejov is to move from ch. R4 to channel R40, at 100kW; Namestovo from ch. R4 to ch. R26, at 20kW; Poprad from ch. R5 to ch. R47, at 463kW. These changes follow the FM radio band move from 68-73MHz to 88-108MHz. Additional transmitters will be built in the former ch. R4 and R5 areas to compensate for the reduced coverage at UHF. The commercial TV service Markiza should be in operation by August 31st, using the former TA-3/OK-3 network. It's backed by TV Nova. Sri Lanka: A new TV station, Dynavision, is due to start test transmissions on ch. E28. It will offer CNN and TNT/Cartoon

Network in a 60-80 mile radius around Colombo. The plan is to expand coverage to the main population centres.

#### DAB

The BBC's digital audio broadcasting (DAB) service continues to provide test transmissions in the London region, but there has been no DX reception as yet. In fact has anyone heard DAB at home? Grundig and Philips have both produced DAB radio receivcers. I'm told that the Eindhoven test and evaluation special costs £5,000. The Grundig receiver is hsted at DM3,000. Several other countries are now The wideband VHF/UHF aerial used by Wenlock Burton in Australia.

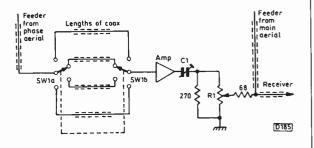

Fig. 1: A simple interference-cancelling system using two aerials plus phase shifting. The idea is that an unwanted signal picked up by the main aerial is mixed with an equal-amplitude anti-phase signal from the second aerial and is thus cancelled out. SW1 is a two-pole, 4/6-way Yaxley switch, C1 a 5-50pF air-spaced trimmer and R1 a 1k $\Omega$  linear carbon potentiometer. The amplifier has a gain of up to 20dB in the required band.

transmitting DAB on a test basis, but until receivers can be bought at Comet prices DAB is unlikely to take off.

Siemens/Plessey and chip company Ensigma, which specialises in "real-time embedded digital signal processing", are working on a DAB receiver that

#### 0336 422884

The latest news on ECM's new smartcards and encryption changes, updated every day. Use your fax telephone to call the number and follow the simple instructions.

TV Live Limited, 78 Shepherds Way, Rickmansworth, Herts WD3 2NR Providing Satellite News & Information since 1990 All calls to all the services above cost 39p per min cheap and 49p per min at all other times.

The Copyright in these services is owned by TV LIVE Limited. No part of these recordings may be reproduced or transmitted in any form without the written permission of the copyright holder. should reduce the cost. A prototype is expected in mid-1996 and the plan is to manufacture 10,000 digital adaptors initially.

In addition to terrestrial transmissions in Band III, satellite DAB allocations have been agreed. These are 1.5GHz in Europe, Africa, Mongolia, the Americas excluding the USA, Australasia and parts of SE Asia; 2.3GHz in the USA and Alaska; 1.5 and 2.6GHz in Russia, China and Japan; 1.5, 2.3 and 2.6GHz in India. Satellite DAB will offer CD quality reception across vast areas, possibly making short-wave radio redundant. But this will happen only when cheap receivers become available.

While Europe has adopted the term DAB, it seems that DSB (Digital Sound Broadcasting) is the preferred term in the USA.

#### A DXer's Satellite Receiver

Basic, manually-tuned satellite receivers have been popular amongst DXers and sat zappers for some years, being simple to operate and quick to tune across the bands. A UK importer of Korean equipment has recently promised me for evaluation a receiver that may offer DX potential with more sophisticated facilities.

Briefly, the unit has twin LNB inputs, a wideband IF tuner, threshold extension, variable-speed tuning/scanning, variable IF bandwidths, magnetic/mechanical polariser control, two external loops but no on-board decoders, optional TV screen frequency readout/menus plus LCD frequency readout on the front panel and lots of memories. There are several models in the range, which includes an in-built positioner. Of particular importance is the fact that the receivers are relatively inexpensive.

Should the receiver prove, on test, to be the answer, more details and a review will follow.

#### **Aerial Phasers**

An Australian contact has sent me an article by Andy Bolin and Dennis Jacob on the subject of aerial phasers. It covers the basic principles of aerial phasing to eliminate interference signals and provides various circuits. Andy stresses the all-important point that for unwanted signal cancellation the amplitude of the unwanted signal picked up by the main aerial and that supplied by the phase aerial system must be equal.

The simple circuit shown in Fig. l enables the phase conditions to be altered should it be impossible to achieve a null condition by adjusting R1 and C1. This is done by using switch SW1 to introduce various lengths of additional feeder. For FM band use the lengths suggested are 6.5in. (30° shift), 11in. (60°), 19.5in. (90°) and 26.5in. (120°). If a 6-way switch is available, 32.5 and 39in. lengths could be added for 150° and 180° shifts. I assume that these lengths are mid-band, with a cable velocity factor of 0.85.

#### Satellite News

Satellite TV services in SE Asia are expanding rapidly. Star TV/News Corporation has opened Phoenix TV, which will eventually provide a three-channel package directed at mainland China from Asiasats 1 and 2. First transmissions were on March 25th, from Hong Kong, but Pheonix is to use studios at Tianjin, 70 miles from Beijing. Another service from Hong Kong is Karaoke, a 24-hour music and sing-along channel.

Hong Kong has also welcomed the satellite news gathering group Newsforce, which will provide the first single-hop digital link to Europe, via Intelsat at 57°E.

There have apparently been problems with the Pace DVR500 digital satellite receivers sold in Africa. Overheating for one thing, also operational bugs and slow delivery of channels. The African Multichoice TV service offers sixteen channels, but the only MPEG receivers available are the Pace one and another from Panasonic. Reception produces grainy pictures, with pulsing in the background of slow-moving scenes as the MPEG circuitry tries to figure out whether the picture content has changed. Irdeto scrambling produces pictures that break up into coloured squares, and audio with loud, high-pitched squeals. Sometimes the picture freezes or goes blank for a second or two: the returning picture jumps forward when the system catches up. The squealing has been more subdued recently. The above comments were noted in the March 1996 issue of SatFacts monthly.

Europe is to have another music channel, MTV-2. It will use digital compression and will be launched in the USA first. MTV is to use Astra 1F for its digital transmissions to Europe.

### 'The Better Choice'

- More new products and spares
- More commitment to higher stock levels
- More technical know-how
- More choice
- More product support
- More dedication to customer care

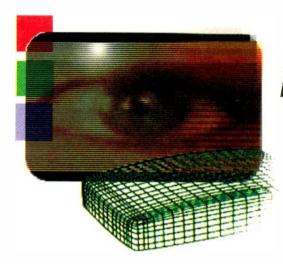

**Willow Vale** supplies parts for all these household names, with over 290,000 different spares available by letter, phone, fax or C.O.P.S. ('viewdata' based order/enquiry system).

Should you require any technical help, advice is available on our 'TECHLINE' **0891 615915** (\*all calls charged at premium rate).

Being **Willow Vale**, we don't just guarantee the quality of our spares. We also pride ourselves on our prices...and our genuinely friendly and knowledgable staff.

## MONITORS

**Reports** from Stephen Lenham, B.D. Andrew, Mark Garton, P.R. Runchman, Dave Lawrence, Chris Hawkins and Chris Watton

#### **AOC CM313**

This colour VGA monitor was used 24 hours a day in high ambient temperatures. It seems that the chopper power supply was running at close to its limit, as there was repeated failure of the chopper transistor Q901. When this happens, it's as well to check the current sensing resistor R925 ( $0.47\Omega$ ) and the current limit circuit. The latter, consisting if R926, R928 and Q909, also generally suffers. Incidentally the monitor has proved to be 100 per cent reliable since it was moved to a cooler environment. S.L.

#### AOC MM4135

This cheap mono VGA monitor was dead, with no power supply operation. Resistors R703 and R704 (both 150k $\Omega$ ) which bias the base of the chopper transistor Q701 were open-circuit.

The picture produced by these monitors seems to be none too square, but as there are no geometry adjustments there is little that can be done about it. **S.L.** 

#### Intra Mono VGA Monitor

This monochrome monitor was part of an **Elonex** PC system and was badged Elonex. It powered up normally, but there was a bright white screen – the CRT was being driven flat out. The cause of the fault was the M51392P 50MHz video amplifier chip, which is mounted on the tube's base board. It's a single channel version of the M51387P triple amplifier that's commonly used in colour VGA monitors. A replacement proved to be difficult to obtain. We eventually obtained a replacement from Nikko Electronics (telephone no. 0181-336 0566). S.L.

#### Amstrad HRCD VGA Monitor

Three of these 14in. monitors came along at virtually the same time, having died either at switch on or, in one case, while in use. In each case the cause of the trouble was dry-joints, mainly in the power supply and particularly around the STK7356 chopper regulator chip IC501 – one of these would have fallen out had it not been screwed to a heatsink!

Another problem you get with these monitors as they age is failure to focus, even with the LOPT based focus control set at maximum. The three units just mentioned all suffered from this fault to some extent. We understand that the potentiometers encapsulated in the Orion LOPT tend to deteriorate. With a replacement LOPT at around £30-£50, few people consider repair worthwhile. S.L.

#### Amstrad PCW8256

Chris Hawkins said to check the disc drive belt (February, page 255) in the event of slow disc functions or disc errors, but gave no warnings. When you remove the drive unit from the monitor, then its outer case, don't go any further until you have checked the position of the leaf switches. They are operated by small brass 'rods' about 3/16in. long. These will fall out when the two PCBs are separated for the belt check.

Spare leads will be found inside the PCW8256 when the drive unit is removed. They are for another drive unit. If the case is cut, a 3.25in. unit can be fitted. A memory update kit can also be fitted. Both items can be obtained from Silicon City, Windermere Business Centre, Oldfield Court, Windermere LA23 2HJ (01539 448 118). **B.D.A.** 

#### **Taxan Monitor**

C13 tends to fail in the small monitor. It's a non-polarised electrolytic that can be obtained only from Taxan (UK) Ltd., Taxan House, Cookham Road, Waterside Park, Bracknell RG12 1RB (01344 867 545). **B.D.A.** 

#### **Dell Monitor**

The problem you get with some of these monitors, which have the controls up the right-hand side, is that in time the focus control has to be adjus ted to the end of its track. Some people replace the CRT, which is wrong. It's far cheaper to fit the modification kit that's available from Dell Quality Control to correct the fault. Check with Dell Computers Corporation Ltd., Boghall Road, Co. Wicklow, Bray, Ireland (telephone 01344 720 000). **B.D.A.** 

#### **Milford Monitor**

We've had only one of these in for repair. All the electrolytic capacitors had changed value. **B.D.A.** 

#### **Sigmex Monitor**

If there's no EHT because the EHT unit, which is bolted to the side of the case, has failed it must be replaced – repair is not possible. In the event of power supply trouble, check the leads from the diodes etc. on the heatsink to the PCB. They tend to break where they bend through 90°.

This monitor will operate at 46kHz or 64kHz, selected by a switch. The line can be interlaced or non-interlaced. **B.D.A.** 

#### Mitsubishi 6200

We've had only two faults with this model. The usual one is in the power supply start-up circuit. The power supply is a well-designed, pull-out unit. Check the main diode, and make sure that it is mounted as high off the PCB as possible, otherwise it will burn the board. Check all the other components in the start-up circuit as well.

The other problem is radiation of whatever is on the screen. It will be picked up on a TV set at about channel 45. **B.D.A.** 

#### **Digivision Monitor**

This is one of the better monitors to work on: the sides drop down, with the PCB attached. Check whether the large capacitor in the power supply is bulging. For loss of height, check the 27/30V supply to the field output chip. **B.D.A.** 

#### Amstrad 1600 Series

When the STK7356 chopper chip IC501 fails, with a short-circuit between pins 15 and 13, you often find that the  $0.22\mu$ F feedback capacitor C512 is open-circuit. If this is not replaced, a new STK7356 will either blow again or not work.

R505 and R506 (both 100k $\Omega$ ), which bias the base of the chopper transistor in IC501, tend to go high in value. As a result there's no start up. A further item to check is R502 (1 $\Omega$ ) which goes open-circuit. M.G.

#### **Elonex Monitors**

Failure of the  $0.22\Omega$  power feed resistor R603 at first switch on occurred with a Model TE1438. We cured the problem by fitting a 3W wire-wound replacement.

With models in the CDS437K range, intermittent colour drive and mode changes can be caused by the video lead going open-circuit internally, mainly at the 15-pin D plug end. Replacing the lead cures these problems. **P.R.R.** 

#### Hewlett-Packard Laserjet II/III (Canon SX Engine)

A problem you get with these is that the upper cooling fan bearing seizes though the fan still appears to operate, sometimes because the bearing then turns in its rubber mounting. In most cases cleaning and lubrication is sufficient – provided the rubber mounting hasn't become hardened because of the heat. **D.L.** 

#### Tulip SX Compact 2/AT and 3

If one of these regularly loses partial set-up, e.g. disc drive type, or floppy discs don't work properly, suspect the 82C206 chip. **D.L.** 

#### Hewlett-Packard Laserjet IIP/IIIP (Canon LX Engine)

Grinding noises occur when the plastic bushes on the fixing roller break, with the result that the roller fouls on the lifting plates. If this is spotted early enough, before the roller's plastic surface is damaged where it normally comes into contact with the paper, only the bushes need to be replaced. **D.L.** 

#### Acer 7111D

What had failed first in the power supply is difficult to say: the UC3842 control chip IC601 had exploded, the 2SK793 MOSFET chopper transistor Q601 was shortcircuit, the four mains bridge rectifier diodes D601-4 had given up and the PCB track between the current sensing pin of IC601 and the 1k $\Omega$ , 0·125W series resistor R616 had burnt out. **C.H.** 

#### ADI DM3114/Buli DMU1967

If the symptoms are failure to start or a pulsing power supply, check whether the 2SC3883 line output transistor Q502 or the 4.7nF, 1.6kV line output stage tuning capacitor C518 is short-circuit. Alternatively the line output transformer T502 could be faulty.

If the picture dims when the set is hot, check whether C723 (10nF, 2kV) is leaky.

Dry-joints are often found around the three 2SD1609 RGB output transistors Q701/3/5. Another problem on the tube base panel is the four  $4.7\mu$ F, 250V electrolytics C703, C710, C716 and C724 which dry up. C.H.

#### **Taxan Super Vision 765**

If the 2.5AT fuse 901 is OK but the monitor won't start up, check the value of R906  $(270k\Omega, 0.5W)$  – it tends to rise – and the three  $100\mu$ F, 35V capacitors C908, C911 and C914.

If the fuse has blown, check the bridge rectifier D901 and the 2SC3152 chopper transistor Q901 for shorts. It's good practice to replace Q901 and the TDA4601 control chip IC901 at the same time. Don't forget to discharge the mains rectifier's reservoir capacitor C907 (220 $\mu$ F, 400V) first. C.H.

#### **Trust 2143**

If the 2.5AT mains fuse F101 has blown, check the degaussing posistor TR101, the degaussing coils connected to P101, and the mains bridge rectifier BD101. If the 2SK793 chopper MOSFET Q101 is short-circuit, replace the UC3842/SG3842M control chip at the same time. C107 (10nF, 1kV) and diode 102 have been known to go short-circuit.

If the power supply is pulsing, check the  $47k\Omega$ , 2W resistors R102 and R103 which tend to go high in value. They supply pin 7 of the control chip, where the voltage must reach 16V for the power supply to start. Also check whether C131 (47µF, 25V) and/or C108 (100µF, 25V) is leaky.

Pulsing because of a short on the secondary side of the power supply can usually be tackled by disconnecting the cathodes of diodes D107, D108, D109, D110, D111 and D112 one at a time until the pulsing stops. The most likely causes are a faulty TDA1675A field output chip (U601), which is supplied by D111, or a short-circuit BU2508DF line output transistor (Q408), which is supplied by D108. The 4-9nF, 1-6kV line output stage tuning capacitor C417 has been known to fail. C.H.

#### Hewlett-Packard D1182 (Mitsubishi)

If the mains fuse F901 has failed, check for shorts between pins 10, 11 and 14 of the STK7309 chip. This is an 80W device. An STK7310 (100W) chip can be used as a replacement. It's advisable to replace the three electrolytics C913 (47 $\mu$ F, 25V), C914 (22 $\mu$ F, 50V) and C915 (2·2 $\mu$ F, 50V) at the same time. The two 3·6V zener diodes D905 and D907 are often damaged when the power chip fails.

For intermittent loss of height, check for dry-joints around the 2SC1609 field output transistors Q401/2 and diodes D401, D402 and D403. C.H.

#### **Microvitec Cub**

Flat out brightness was the trouble with this old school monitor. We found that there was over 1kV at the tube's first anode pin because the  $2 \cdot 2M\Omega$  first anode preset was open-circuit at its earthy end. Replacing this restored a very good picture. C.W.

## Going it Alone

Running your own repair business is quite a different matter from being employed by someone else to do repairs. John Pitt-Francis on how to make a success of it

fter spending some twenty years as an employee in the TV and video rental and retail industry I have more recently spent over three years running a similar business of my own. The following notes are based on my experience and have been put together with the aim of helping those thinking of becoming selfemployed.

There is a world of difference between employment and self-employment. Engineers/technicians who work for a large national company need concentrate only on the demands laid down in the 'job description' that most people get on starting a job these days, and the 101

standing orders that everyone is supposed to know about but are often discovered only when you do it the wrong way!

With a large company the aims are better public relations, speedier diagnosis, more efficient journey times, a faster clear-up rate on second calls and enthusiastic retraining (in most cases probably self-training done in your own time). This can be called self-management. It is quite different from being selfemployed.

With self employment, while you no longer have to fit into a rigid scheme of conduct devised by a company all the factors listed above remain just as important and a whole extra raft of responsibilities that someone else would have looked after have to be taken on. These include spares ordering, overall planning, keeping work accounts. chasing arrears. dealing with problem customers, finding solutions to previously placing unknown faults, advertisements, searching for new business, vehicle maintenance, the purchase and maintenance of test equipment and more.

In addition, by giving up your regular job you have given up some of its certainties, such as the regular pay packet of much the same sum each month (it may have been hard to live on, but at least it was always there), the company-assisted pension scheme, the company car, the relief engineer who could be called in when too many people were sick or on holiday, the training and support provided with new products and so on.

#### **Advantages**

Yet there are advantages! The risks are higher and the demands on your time much greater, but the freedom to decide on your own course is well worthwhile. If you think the best approach is to specialise in say just VCRs, the decision is yours. You can change your car when you want to, and buy equipment when you think it best. More importantly the long-term financial prospects are, for the following reasons, better:

(1) Your income comes from hundreds of different customers. So you can't lose your job overnight through redundancy or a bad mistake. You still have to take great care over your reputation of course, and it is your responsibility to ensure that you are getting enough custom to keep the business going.

(2) The money you make is all yours, less expenses and overheads. You are not paying for an over-managed organisation, manifestly bad spending decisions, or contributing to shareholder dividends.

(3) If your workload justifies extra help with accounts or deliveries etc., you do the hiring and firing and thus maintain your own employment.

(4) At the end of your working life you have a business to sell or pass on in your family.

#### Choosing your Base

There are two basic ways of running your own business, either to use rented premises on or off the high street or to work from home. Each has its advantages and disadvantages, which are summarised in the box opposite.

Some of the factors listed are not in practice so cleancut. For example, while there will certainly be times when you wish for a clean separation between work and family, there are other times when it is a great advantage to be

Our photo above shows Michael Dranfield, a regular contributor to *Television*, in his workshop. Michael runs a successful business at Buxton, Derbyshire with his partner Michael Harrop who looks after the sales side. able to call on family help. Then those who live in a flat will have no option but to start from separate premises. Nevertheless a glance at the comparison will show that for the sole trader starting out with no partners or employees the home-based business entails a far lower risk. Indeed the lower the number of commitments, the lower the minimum income you have to generate. This is the route I took, and the following notes will hopefully help anyone else who is planning – or having to plan – such a course.

#### When to Start

The first consideration is when to start. This will probably be the single most important decision, so it shouldn' t be rushed.

If you don't have some capital to cover the start-up expenses and get-going period, you need to build up a circle of customers while you remain employed. This can be tricky. For understandable reasons, many trade employers have clauses built into their employment contracts to forbid this. Yet I've never met anyone who didn't do some work for relations, friends and their friends and relations.

Anyway, it should not be long before your own work builds up and you take the next stage, the big one – look out for part-time work, and hand in your notice. Do it in that order! There are plenty of businesses that have work for half or one and a half technicians but don't wish to take someone else on full time. Alternatively you may be lucky enough to find a warehouse or business to which you can offer a sub-contract service. But always regard these as stepping stones towards your own customer base, because the returns from such work are unlikely to lead to a long-lasting relationship.

There is of course the government enterprise allowance. It's very useful to have an extra £1,625 for the first year of trading, but it means a gap of two-three months between unemployment and start-up – more if you have received a worthwhile redundancy payment. It will do little more than fund the gap, but the local TEC (training and enterprise council) can provide a wealth of free help and information for those who are, as I was, green to the world of self-employment.

#### What you Require

With the start-up date fixed, what do you need? Well, you are carrying your main assets around with you! These are your skill, which has already been proved at work, and your confidence that you can overcome any new obstacles you encounter. Without these, you can forget about it.

To start up, you will need the following as a basic minimum:

(1) A dry storage area, of which part will be your heated workshop.

(2) An office, if this is not part of the workshop.

(3) A fit-for-the-purpose vehicle.

(4) A workshop spares stock.

(5) Test equipment and reference data.

(6) A spares kit for the vehicle.

(7) A tool carry kit for field and workshop use.

(8) A stock of second-hand items that you can sell, rent or loan.

#### Where to work

#### Rented premises offer these advantages:

The public location gives you a better chance of building up the business quickly.

Work and home can be kept separate.

You can have a sales section with a proper showroom.

There's a better chance of getting a good price should you decide to sell the business.

#### **Disadvantages are:**

High overheads. These include separate phone, electricity and heating bills in addition to the rent, business rates and possibly wages.

The cost of getting to your premises and the lack of flexibility – you may be tied down for the duration of the opening hours' time.

The cost of carrying a range of goods for sale – money "up front".

#### Working from home has the following advantages:

No travelling time or expenses are involved.

There are tax allowances for the parts of your home used for the business.

Rental and upkeep costs are much lower.

It's more easy for members of the family to help out with such things as taking telephone calls and doing collections/deliveries.

There are no business rates to pay.

#### Disadvantages are:

It will take you a lot longer to build up a customer base.

You will have to rely more on advertising, especially in a rural area.

It's very difficult to keep your work and home life separate.

(9) Printed stationery and advertising material.

#### The Workshop/Stock Room

In the typical suburban semi the garage is the obvious choice for this. But it's not ideal. In fact everything about working from home is a compromise. If the funds are available, it's better to leave the garage and build a separate workshop and stock room. Remember however that any part of your home used solely for business will, technically, attract capital gains tax when you come to sell. Few properties have enjoyed much capital gain during the past seven years, but no one knows what the next seven will bring. So reserve a corner for the lawnmower and bikes! Use the office jointly as a study, bedroom etc.

Workshop design involves a degree of personal preference. For what it's worth, the layout of mine is shown in Fig. 1. A glance at the dimensions will show how humble it is, yet provided I am tidy and methodical (wish I were!) it will cope with all the normal service requirements. There is no room for expansion, and the workshop is tailored for one person and no more.

I sectioned off approximately one third of the garage as an inner sanctum that forms the workshop proper. This makes it very easy and economical to heat in winter. Most of the structure was formed by laying standard chipboard on a  $2.5 \times 1.5$  in. timber frame.

The soak- and workbench surfaces can consist of either planking or Melamine-covered board. There's little need to buy this new when so many fitted kitchens and shopfittings are discarded to make way for a different style. My main workbench is a 3ft 2in. high chest of drawers with a Melamine top brought out an extra 9in. and a surround about 12in. high on the three sides, bringing it level with the soak bench and test shelf. A test

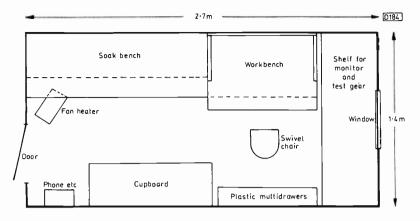

Fig. 1: Arrangement of John Pitt-Francis's workshop. The main garage area is 2 x 6m. monitor, variac, soldering iron and oscilloscope are thus close to hand.

The partition wall is far enough away to enable shallow cupboards, shelves and the essential clear plastic multidrawers to be accommodated. The aerial distribution box can go in one corner, providing all available terrestrial channels, along with a pattern generator and a satellite receiver. Be generous with your allocation of 13A and coaxial plug points: you will need more than you think!

The rest of the garage forms a stock room for TV sets, VCRs, panels and manuals. Racking will save you a lot of time moving sets about to get to the bottom of the pile, but make sure that it's strong. A Dexion frame with blockboard shelves is ideal, but the frame can be of wood provided you are sensible about the weight that's to be carried.

By far the best way of storing manuals is in a couple of filing cabinets, together with a data base program to give you instant access to what you have available and where it's located. Keep your information accurate, either by altering the data base or refiling in the same location. It would be helpful to have all your stock filed in a similar way on the data base, though I haven't personally had the time to do this and it would need amending on a daily basis. If space allows, you may prefer to have an office adjoining the workshop: this would be a logical place to keep the service manuals.

#### The Office

In theory a one-man business can still be run from an apple box under the spare table, but a modest investment in some additional aids will help. First and foremost is a computer. This need not be a state of the art machine. I use an Atari 1040STE with a 9-pin basic printer and good programs to provide wordprocessing, spreadsheets and a data base. The wordprocessing enables letters/estimates/ faxes to be prepared. The spreadsheet sets out daily invoices in (expenses) and invoices out (income). The data base sets out information on customers, manuals and stock.

This arrangement serves me well enough, though I appreciate that a PC is now the standard for commercial use and most home computing, and that integrated programs are available. What you decide to spend on this depends on the amount of work you intend to do yourself. It's perfectly possible to turn out respectable accounts with a large cardboard box, a ledger book, a supply of invoice books, large envelopes or document folders and a rubber stamp that carries your logo and address. Firms like Willow Vale and SEME can supply other items like job card/receipt books, rental contracts, etc.

Keep every scrap of information on expenditure, plus a record of invoices drawn up each month, in a new folder.

From these a ledger can be drawn up to show, over the trading year, (A) the total money received (turnover), (B) the total money paid out for goods (TV sets, VCRs, spares etc.) and (C) the other items that make up your operating expenses (heating, electricity, telephone, petrol, car repairs, stationery, advertising etc.).

(B) subtracted from (A) is called the gross profit, while (B) + (C) subtracted from (A) is the net profit. Even this is not the equivalent of take-home pay however, since you will have to take into account tax, self-employment stamps and, if you are prudent (or your circumstances allow!), a planned sum to cover investment and/or slack periods.

As mentioned above, a PC is nowadays standard for commercial and most home computing and programs are available to cover these requirements. Those who wish to go down this route will find previous articles such as those by David Botto (*Television* July and August 1994 and January 1995) useful.

No system is much good without a basic printer. A bubblejet printer enables you to produce your own stationery and advertising to a respectable standard (those with an Amstrad PCW should refer to Keith Wevill's article in the January 1994 issue).

Once you have a computer system the ledger can be done away with. In its place a spreadsheet that shows in an instant all key parameters of the business can be built up. There is no need to involve yourself in great expense  $- \pounds 200$  should buy a reasonable system on the secondhand market.

With my Atari 1040 I use a Kuma V2 spreadsheet, First Word wordprocessor program and Equinox personal organiser for the data base. Good programs are also available on the Amiga and early Amstrad machines.

Your office will also need a phone and fax. The fax is not essential but is very useful for sending urgent orders. A phone and answering machine are essential. If the phone isn't mobile you will need two, one for the office or house and one for the workshop.

It would be nice to have a secretary to deal with calls, orders etc. I can't afford this luxury, but various members of the family help out. One thing I cannot do without is an accountant, to take my records and sift out what can be presented and what can't and, most important, what I didn't realise could be presented in the first place! This is a couple of hundred that's well spent.

#### **Field Servicing**

I won't say much about vehicles, since everyone has different ideas and resources. There is of course the option of not making any field service calls, with all equipment to be brought in and collected by the customer. This may work in a large town or city, but was never a serious option for me in the depths of rural Devon.

The main requirements are that the vehicle, a van or hatchback, should be reliable with a good, clean appearance. Regular care of the bodywork and livery and regular servicing will pay off. A 'Trotters Independent Traders' image will do nothing for your prospects! Get a good signwriter to provide the final touch. We have two cars, with professionally made magnetic signs on the sides and hatch. Make sure that your field call charges reflect the extra cost, in time and maintenance, compared with a bench repair.

If you are going some distance to attend to a repair it's worth putting on board everything you are likely to need – if you've got it! You will usually know the model and symptom. In addition to specific spares and manuals, I carry the following items that will fit into a small multicompartment components box:

#### **Essential Equipment**

A general-purpose 25W soldering iron that will tolerate being left switched on, also a micro-iron for small ICs and surfacemounted devices.

A good digital multimeter – one with a capacitance range will save a separate purchase later. I'm very happy with the Escort EDM168 which is available from CPC. It also has a frequency counter and transistor and diode tests.

A double-beam scope with a minimum bandwidth of 20MHz, such as the Hameg HM203-7 (60MHz would be better). You may need to use it only occasionally but you can't do without one. A variac (variable transformer) such as the Regavolt 402-PSA. This will save you a fortune in blown chopper transistors. A portable TV set will be required for VCR repairs – you can't always use the customer's.

A degaussing stick. Beware of purity errors that don't look like purity errors!

A tube tester and reactivator is a worthwhile investment.

A VCR head puller – make sure you fit it right, otherwise you may break the rotating transformer beneath.

10 most popular mains switches.

100 mixed fuses, 20mm and PC types.

20 mixed safety resistors.

20 mixed wirewound resistors (mainly  $10\Omega$  or less). 100 mixed 0.5W and 1W resistors.

50 mixed electrolytics.

25 assorted transistors, to include BU208A, BU508A, BUT11A, BD137/138, TIP29E, TIP112/110,

BD241C/242C, BF757 and BC639/640. 25 assorted diodes – four BY133, four BY255, twelve

assorted 1.3A zeners and some 1N4148s.

2 positors, types 98009 and 98012.

12 batteries – four AA, four AAA, one PP3, one BR2/3A

lithium, one 1.2V nicad and one 2.4V nicad.

1 EHT anode cap and a couple of 2kV ceramics, values 1.5nF and 2.2nF.

10 assorted plugs – phono, coax, coax joiner, coax attenuator (6dB and 9dB), F connector and DIN.

Also a small bottle of isopropanol alcohol, switchcleaner wipes, butane (for the gas soldering iron), a wideband aerial amplifier, a portable aerial and a universal remote control unit.

#### **The Tool Kit**

Get a good quality executive case that has an aluminium band to hold the edges of the two halves. Cut some foam, as used in cushions, sliced to the depth of the case to fill it. Then cut out the shapes of your chosen tools in the top surface. Finally cut a piece of 5mm plywood to the same shape and cover its underside with 1cm of foam. This will keep your tools in position so that they don't fall all over the place, and also give you an instant tool check at the end of each job – I spent the first half of my working life parting with lost tools worth a fortune.

The top part of the case will hold your invoices, reference books etc., the bottom half your tools. Mine are as follows:

A side cutter, snipe-nose pliers and combination pliers.

Large, medium, small and mini slotted screwdrivers.

Large, medium, small and mini Pozidrive screwdrivers. A pick-up tool, desolder pump and braid.

A Portasol gas soldering iron kit.

An economy analogue multimeter.

I don't advise an expensive meter leaving the workshop.

#### Stock

This will be a more comprehensive version of the vehicle carry kit. If you are just starting up, open accounts with a range of suppliers and order as you need. Avoid stocking any high-cost items unless you know you are going to need them – parts that don't move are dead money!

Get hold of some non-working VCRs and TV sets. Repairing them is a good time filler when business is slack, and you will have a stock of loan sets to get you out of a jam. They can be rented out or sold, which will produce a greater short-term profit than selling a new equipment.

#### Workshop Equipment

Unless you have a blank cheque, equipment is best bought as and when you need it. Some items are essential at the outset however. I suggest those listed in the box above.

If your field service kit doubles up as a workshop kit you will also need a set of small Allen keys, jeweller and Torx screwdrivers, needle files, alignment tools, tweezers, inspection mirrors – and of course a good anglepoise lamp.

#### **Manuals and Reference Data**

A good set of semiconductor comparison tables is without any doubt the most important thing here. Probably the best ones currently on the market are the ECA range. Manuals are often needed and nearly always expensive. As I see it there are three courses:

(1) Join a manuals library. One or two advertise in this magazine. Make a copy of what you consider you might need again as you go along. This may infringe copyright law, but manuals are often out of print or the manufacturer may no longer be in business. Manuals may thus be unobtainable in any other way.

(2) Buy circuit/servicing books such as those available from U-View. This is an expensive outlay but is much cheaper than buying individual manuals.

(3) Buy manuals as you go along.

I had a bad experience with a manuals library, so I now use option (3) if option (4) doesn't work. Option (4)? Yes, borrow and lend locally: manuals must represent the highest single item in our overheads. so we all need to help each other with this one.

#### In Conclusion

I hope that these notes will help some of you to make a success of self-employment in the servicing business. A number of things have not been mentioned here, such as dealing with awkward customers. You will have to work out your own approach to such problems. Finally, good luck!

## VCR Clinic

Reports from Philip Blundell, AMIEEIE, Richard Flowerday, Paul Hardy, Justin Smith, John Pitt-Francis, Brian Storm, Michael Dranfield, Michael Maurice, Graham Richards and Roger White

#### Philips VR6470

"Chews tapes" was the complaint with this VCR. When we tested the machine the tape played for a while then the take-up spool stopped. With the clear cassette in place we saw that the brake magnet released, the brakes then coming on. Transistor 7053 on the servo board operates the brake magnet. The transistor was OK, but the wire between it and the magnet was open-circuit: there was a dry-joint where the wire is connected to the magnet. **P.B.** 

#### Toshiba V509B

Usually when play was tried the drum didn't rotate. Sometimes however it ran much too fast. Checks around the TD6361 servo chip showed that the voltage at pin 35 was incorrect. The Toshiba stock fault book suggests that C516  $(0.01\mu$ F) can be responsible for this. It was OK however. A new TD6361-A6 chip was required. **P.B.** 

#### Grundig VS600/700/ 800/900 Series

If the start and end sensors don't work, check that the LED tower is receiving drive pulses. Loss of these pulses can be caused by failure of transistor CT275 or CT285 (circuit reference depends on the model). It was originally type BC848B. Uprate it to type BC818A or B. **P.B**.

#### Hitachi VTM722E

A cassette had got stuck in this machine and had been removed by the customer (why do they do it?).

When we'd reassembled the housing the machine wouldn't accept a cassette. Checks at the loading motor drive chip IC753 showed that its 14V supply was missing. The cause of this was failure of the 2SD1765 series regulator transistor Q601, which had gone open-circuit. It's mounted on the main PCB. When we'd fitted a replacement the machine still wouldn't accept a tape, reverting to standby after a short time.

We eventually found that the loading motor was trying to run in the unload direction, despite the fact that the cassette lift was fully up. The reason for this was that the unload pin (42) of the system microcontroller chip IC751 (type CXP50116-116Q) was permanently high. Replacing this 80-pin chip restored normal operation. **R.F.** 

#### Mitsubishi HSM54

A cassette was stuck in this machine, with a large loop of tape in the works. When I removed the bottom cover to operate the wind mechanism manually I found that the pulley on the capstan motor was split. My manual doesn't show this as a separate item, but Willow Vale stock it (reference no. 77054P). It's not cheap for a bit of plastic but is a lot cheaper than a new motor. **P.H.** 

#### Toshiba V57/JVC HRD225/ Ferguson 3V36

This machine needed new heads. We fitted a new drum and carried out a full mechanical service After a couple of weeks however the customer reported that there was a problem with the sound – any sustained note suffered from wow. As a new pinch roller made no difference, I took the machine back to the workshop.

A scope check showed that the capstan servo would periodically hunt. The control pulses and signals from the capstan motor were present, and servo alignment failed to improve matters. So a new motor was tried. This again made no difference. The culprit turned out to be the capstan belt. The one I'd fitted as part of the service obviously had a tight spot, though it felt all right and there were no obvious signs of poor manufacture. **P.H.** 

#### Hitachi VT8000

After carrying out a mechanical service there was still intermittent fast-forward operation. The cause was traced to the rear-most microswitch on the deck. It had a loose fitting case, which resulted in premature operation. A replacement cured the trouble. **P.H.** 

#### Ferguson 3V42/JVC HRD455

Poor audio was the complaint with this machine. A piece of sticky label was found attached to the AC head. I removed this and cleaned the head but the fault persisted. Audio was fine at the AV socket and was present at the input to the modulator, which was the cause of the trouble. I sent it to MCES for attention. The returned unit fixed the problem. Full marks to MCES, as usual. **P.H.** 

#### Panasonic NVJ35

The complaint was that this machine wouldn't eject a cassette. On test it wouldn't power up. C9 in the power supply was open-circuit. After replacing this I found that the capstan speed was erratic and there were tracking problems on the picture. C18 and C22 in the power supply were low in value. **P.H.** 

#### Sharp VC681HM

After replacing the belts, pinch roller and reel drive unit this machine seemed to be all right. Several weeks later it was back on the bench, with the complaint that the audio was poor. This turned out to be intermittent, so we asked the customer for a tape that showed the symptom. Sure enough it sounded as if the capstan was running slow – but only at the start of a tape. The sound was fine a few minutes later.

I eventually traced the cause of the trouble to the tape guide between the audio/control head and the pinch roller. It showed signs of wear on its lower edge and was slightly out of alignment. Slight readjustment cured the problem. **P.H.** 

#### Ferguson FV31R

The original fault was failure to load. This was cured by removing the debris that jammed the entry guide. I then gave the machine a good clean up and tested it. Playback produced normal sound but no picture: the display consisted of white diamond shapes, about the size of a large postage stamp, on a black background. Using the AV connector output produced the same result.

I hinged out the top board and attached the scope probe to test point BW10. Normal video was present. Refitting the board produced the same fault symptom. The cause of the trouble was traced to the board fixing screw at the right-hand side, where it screws into the cassette housing. It was shorting an adjacent PCB track. An insulating washer beneath the screw cured the problem.

You could get the same trouble with Models FV30 and FV32. P.H.

#### Sharp VC750

The customer's complaint was that this machine would sometimes jam and now had a tape firmly stuck in it. I found that loading gear A had a broken tooth and that the master cam was worn. Replacing these items and the mode switch put matters right. **P.H.** 

#### Grundig VS310

This machine was reluctant to accept a tape and showed F9 in the display. Once many dry-joints had been resoldered and subpanel mounting pins cleaned the machine seemed to be more keen on the idea of working, but it still wasn't very co-operative. I then noticed that there was no tuning memory. After replacing the back-up battery the F9 indication disappeared and full operation was restored. The battery is mounted on the main panel and is heavily disguised.

Unfortunately however the E-E vision was very poor, especially from cold. Faults that appear before equipment has warmed up are usually caused by either dry-joints or defective capacitors. When all three capacitors (C2251, C2254 and C2261) on the video board, next to the tuner, had been replaced the customer was able to resume his endless taping of *Neighbours* and other such anodyne examples of antipodian culture. ... J.S.

#### Hitachi VT520

Low sound and intermittent jumping/critical tracking indicated that the audio/control head was faulty. At last we seem to be getting some sensibly priced alternatives. J.P-F.

#### Amstrad VCR4700

Fast forward and rewind were OK but when play was selected all we got was about two seconds of freeze frame. Surprisingly, the cause was simply the pinch lever arm action being too stiff. The 'grease' was more akin to glue that has nearly set. A good clean up with alcohol and a smear of Molyslip put the machine to rights.

We've had the same problem with other decks. J.P-F.

#### Sony SLV315

The cause of power failure was traced to C111 which had gone low in value **J.P-F.** 

#### Panasonic NVG21

This machine suffered from unreliable tape unlacing action. The cure was to replace the play arm unit, part no. VXL1490. **J.P-F.** 

#### Matsui VR805

The fast forward and rewind operations were poor and the machine chewed tapes. Although cleaning the idler helped with rewind, the reel motor wouldn't work at the low voltages supplied in the take-up mode. After ten years or so this VCR deserved and got a new motor. J.P-F.

#### Samsung SI7230

Unreliable eject was the problem with this machine. After fitting a new loading belt and release belt I received a recall. The final solution was a new motor, CPC code no. SS64769-052-140. J.P-F.

#### Pansonic NVHD100

The owner of this machine had included a recording to illustrate the fault: about once every half hour there was an interruption - a missing word, a flick of the picture or a jump in the scene. We came to the conclusion that the fault was probably caused by the capstan motor stopping briefly or slowing down every so often. Inspection of the XRA6439P capstan drive chip showed that its heatsink was very loose. For good measure we replaced the chip and refitted the heatsink securely. So far there have been no further interruptions. B.S.

#### Panasonic NVJ47

The head drum was very reluctant to rotate. It would eventually do so on about the third attempt. The result however was a picture that readily smeared across the screen as the drum servo struggled to maintain lock. Checks around the drum drive chip showed that C206, which is connected to pin 12, was defective. A new  $0.1\mu$ F electrolytic capacitor cured the fault. **B.S.** 

#### Panasonic NVFS100

The playback picture was marred by faint diagonal patterning. C3311 in the HQ pack is the usual suspect when this symptom is present. On this occasion it was OK. Deep in the bowels of the machine you will find the 1H CCD delay line pack – on the sub-luminance and chrominance board. Several small capacitors here can die: C3501, C3506 and C3516 often fail. This time C3509 ( $3 \cdot 3\mu$ F) had expired. After replacing it we had a very good, clean picture. **B.S.** 

#### Matsui VP9501

This machine's deck was jammed up solid: it would move neither forwards nor backwards. The cause of the problem turned out to be the reel drive clutch shift quadrant, which had jumped out of its track on the master cam. As a precaution we replaced the mode switch, in case it allowed the deck to over run. We've not seen the machine since. **M.Dr.** 

#### Matsui VP9301

Poor IF stability and streaking can be cured by replacing the three  $0.47\mu$ F, 50V capacitors in the IF module. We use  $1\mu$ F replacements. **M.Dr.** 

#### **Panasonic NVJ35**

The reported fault was that the counter had gone beserk. On inpection I found that in the search mode the tape moved up the head. The cause was post assembly P5 which was bent. Replacement restored normal operation. M.M.

#### Matsui VX2000Y

This machine would cut out intermittently and would snap the tape at the end of rewind. The cause of the trouble was a dry-joint at D01, the sensor LED on the deck PCB. **M.M.** 

#### Panasonic NVJ47

This machine kept on coming back to the workshop because it would intermittently switch itself on or off. The cause was simple: the VCR button on the front panel was gummed up. As a result it randomly switched on the power. A good clean up cleared the fault. M.M.

#### Akai VSF510

This machine wouldn't play tapes – the screen went green. The cause of the fault was absence of the playback 5V line because of a damaged port at IC504. A new chip cured the trouble. **M.M.** 

#### Matsui VP9301

The playback picture suffered from static interference which was caused by the drum assembly. Unfortunately the upper and lower drums cannot be separated for cleaning, so a complete new unit had to be fitted. **M.M.** 

#### Hitachi VTM822

There were intermittent problems with this machine: it would stop playing or go into other modes – in fact it seemed to have a mind of its own. Resoldering the microcontroller chip seemed to put matters right, but the repair bounced. The cause of the trouble was that the connectors between the main PCB and the operating PCB were dryjointed. Resoldering them put an end to the playing about. **M.M.** 

#### **Panasonic NVL25**

There were two faults with this VCR. The first was mechanical – it required a new carriage RHS,

connection gear and retiming of the gears. Secondly the booster circuit in the tuner block had low gain. We usually have to fit a new tuner, but these are expensive. On inspection however we found that there were several dry-joints in the booster section. Resoldering cured the fault. M.M.

#### Toshiba V711B

There was no power and we found that Z613 on the sub-PCB was opencircuit. Traces of liquid spillage were present in the vicinity of connector P603. Replacing Z613 and P603 and giving the machine a good clean up brought it back to life. **M.M.** 

#### **Panasonic NVF65**

This machine would turn itself off when any function was selected. The cause of the fault was the reel optocouplers, part no. ON2170. **M.M.** 

#### Sharp VC105HM/VCA111HM

Replace the belt if cassettes are ejected immediately. For erratic mechanical functions, remove and clean the mode switch or, better still, replace it. The cure for poor rewind is to remove the spools and clean both shafts. The up/down movement of the clutch reel mechanism can sometimes stick, causing search and wind problems. In most cases this problem can be cured by cleaning the shaft and lubricating with silicone grease spray. **G.R.** 

#### Toshiba V312B

The complaint was no functions. Voltage checks showed that the 14V supply was missing. A resistance measurement at pin 1 of the L2726 loading motor drive chip IC760 produced a short-circuit reading. The cause of the problem was the loading motor, which produced a reading of  $4\Omega$ . The chip and motor were replaced, also the cassette door lever, restoring the machine to rights. **G.R.** 

#### Amstrad DD8900

This is the double decker. The problem we had with one of them was intermittent recording. We found that the cause was dry-joints at IC53 (78M05) on the lower video PCB. Another of these devices, on the upper PCB, was OK. **G.R.** 

#### Samsung SI1260

This machine wouldn't respond when a cassette was inserted. A scope check on the logic condition at input pin 5 of the KA8301/ BA6209 loading motor drive chip IC206 showed that it changed state. So we replaced the chip, fitting a BA6209 as it seems to be much more reliable. This brought the machine back to life. The BA6219 is also a suitable replacement – it's higher rated than the BA6209. **G.R.** 

#### ITT VR3907/Samsung VI611

If there are hum bars on the E-E picture, check the  $100\mu$ F, 100V smoothing electrolytic capacitor C4 connected to the 33V line. G.R.

#### Alba VCR6700/Bush VCR185

There was no playback FM – though we'd cleaned the heads first! Careful checks on the record and playback 12V supplies to the head amplifier showed that in both modes the rec 12V line was stuck at 2.5V. Although it read OK, we replaced the rec supply switching transistor Q505. This cleared the fault. We used a BC546. **G.R.** 

#### Saisho VR1200

There was very poor take-up. Rewind and fast forward were OK, and the clutch seemed to be working. When I removed the idler it was obviously too stiff. So I dismantled it and cleaned the spindle. On reassembly all was well. **R.W.** 

#### Sony SVL625

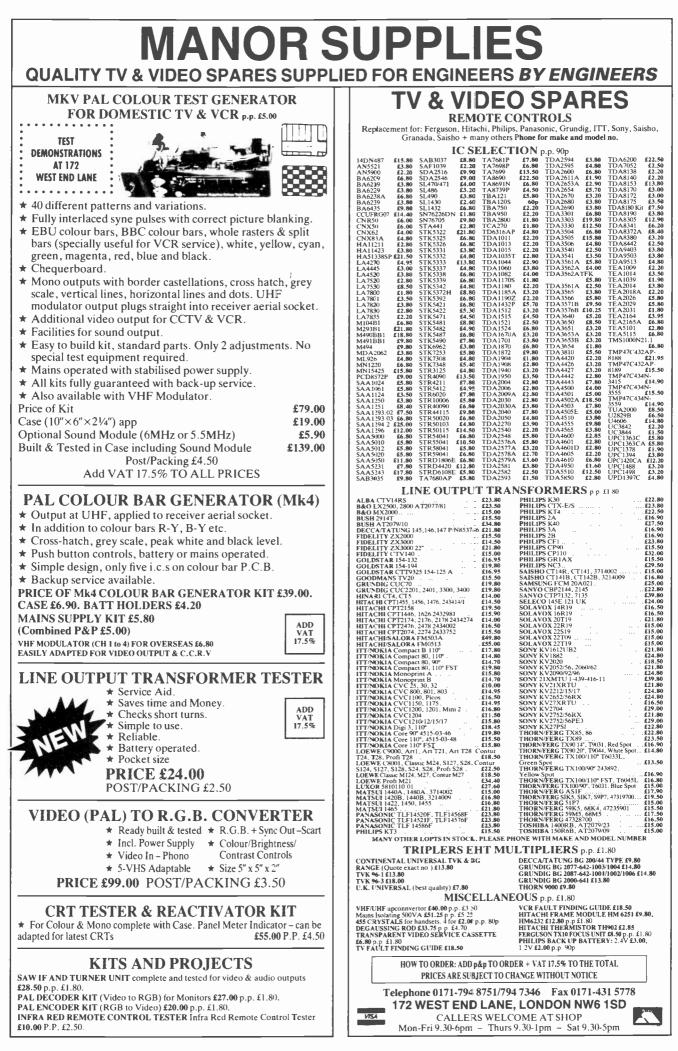

Some cassettes, but only a few, would go in but wouldn't go all the way down. After a few seconds they would come back up. After inserting one of these cassettes many times and watching what happened I noticed that the left-hand carriage release lever was bent back towards the cassette. Straightening it cured the fault. **R.W.** 

#### Alba VTV10

There was no playback picture. It was as though the heads were dirty. The cause of the trouble was that the record high supply to the head amplifier was present in the playback mode. Q10 was short-circuit. **R.W.** 

#### Samsung VI1860

This machine wouldn't accept a tape. The tape-in light was on, and when the power button was pressed the head rotated and the supply reel wound back. This lasted for about five seconds, then everything stopped with the power light flashing. It looked very much like an end sensor fault. In fact the 5V supply to the deck PCB was only 0.5V. D601, a 1N4148 diode on the print side of the syscon PCB, was faulty. **R.W.** ■

### Servicing the

# Sony BE3B Chassis

### In this concluding article Giles Pilbrow deals with the signals and microcontroller sections of the chassis

CB A carries all the signal processing circuitry including the tuner. In UK versions this is type U944C. It provides full frequency-synthesis tuning without need for any external components. Three supplies are required: 5V at pin 4 for the synthesiser chip; 12V at pin 2 for the signals circuits; and 33V at pin 3 for varicap tuning. There's an AGC input at pin 1 and the IF output is at pin 9.

Although the tuner is controlled by an I2C bus, the tuning voltage at pin 3 can be monitored since there's an external load resistor here. The voltage should vary between 1.9V for channel 21 and 24.5V for channel 68.

In the search mode Q134 is switched on to reduce the AGC voltage and prevent unwanted channels being selected.

The IF output is buffered by Q102 and is then fed to two separate SAW filters, SWF102 for the sound signal and SWF101 for the vision signal. Both signals go to the TDA9814P IF chip. This produces a compositie video output signal at pin 8, demodulated mono FM sound at pin 10 and a Nicam carrier at pin 17.

#### The Audio System

The SAA7283 chip IC1101 contains the complete Nicam decoder, with the 6-552MHz input (0-4V p-p) at pin 62. In some early sets (e.g. Model KVX2102U) Nicam dropout could occur under certain signal conditions. The symptoms would be clicks on the sound and the mono symbol flashing on the screen at random. The following modification puts this right:

(1) Change C1110 from 22nF to 47nF, part no. 116380991.

(2) Change R1104 from  $100k\Omega$  to  $33k\Omega$ , part no. 121608591.

(3) Change R1105 from  $2 \cdot 2k\Omega$  (or  $4 \cdot 7k\Omega$ ) to  $1 \cdot 8k\Omega$ , part no. 121605591.

These are surface-mounted components.

IC1101 is controlled via the I<sup>2</sup>C bus, the connections being at pins 53 and 54. The bus also relays information about the received signal, i.e. whether Nicam or FM. IC1101's audio outputs are at pins 11 and 3 for L and R respectively. They go to the TDA6622 chip IC201.

Although this device is referred to as a stereo decoder (it is, for the German system), in the UK version of the set it is used simply for audio control (volume, bass, treble etc.). The outputs at pins 15 (right) and 16 (left) drive the main audio amplifier chip on board D. There are also right and left outputs at pins 19 and 20. These drive the headphone amplifier chip which is also on board D and can be controlled separately.

#### **AV Switching**

Depending on their specification, sets fitted with the BE3B chassis may have up to three scart connectors and one front-mounted AV input. Signal switching is carried out by the CXA1855Q chip IC401 which is fully I2C controlled and is capable of routing signals from either the aerial or an external input to a scart output while a different channel is being viewed on the screen, thus enabling external equipment to be easily integrated.

The AV switching circuitry is very reliable. Any faults are usually caused by external factors. The input lines are protected from transients by zener diodes D401-411. These can go short-circuit, the result being the loss of the relevant input.

#### Teletext

The chassis uses the Texas Instruments' Eurotext chip set. This consists of two ICs, the CF72416 data slicer IC1001 and the CF70200CFNR decoder IC1002. In UK models, data is extraced from the teletext signal and is used during the auto-tune process to label programmes and sort them into the correct order.

The video input to the text circuit comes from pin 17 of the AV switch chip IC401, via buffer transistor Q402. The RGB outputs from IC1002 are fed to switch chip IC003, which selects either teletext or scart RGB.

A blank screen when text is selected is usually caused by a corrupt memory (see later). Should nothing happen when text is selected the 13.875MHz crystal X1001 is probably faulty. The text chips themselves have proved to be wholly reliable to date.

#### The TDA8366 Chip

The TDA8366 'jungle' chip IC301 carries out the following functions: luminance signal processing, chroma signal decoding, generation of the line and field drive signals, EW correction control and auto grey-scale tracking. There are no external presets associated with it: all adjustable values can be set in the service mode, where numbers 45 apply. Pins 16 and 17 are used for I2C bus control.

Video from the IF chip enters at pin 24. The external video input is at pin 29 while S video inputs are at pins 20 (C) and 21 (Y). An internal switch selects the required signal under I2C control. The selected output appears at pin 55 where it passes to the luminance delay line. This is split into three parts. The first is variable and can be altered via the service mode; the second is fixed at 110ns; the third (50ns) is used to bypass the chroma trap in the S video mode. The luminance signal emerges at pin 42 of IC301, at 450mV p-p, and is looped back at pin 43.

#### **Colour Decoding**

IC301 contains circuitry for either PAL or NTSC chroma signal decoding, only an external delay line and crystals being required. An additonal chip (IC303) is used in sets with Secam capability. R - Y and B - Y outputs appear at pins 45 and 44 respectively of IC301 and pass to the delay line chip IC302. They re-enter IC301 at pins 47 and 46. The crystals are connected to pins 49 (3.58MHz) and 50 (4.43MHz).

Colour faults tend to be caused by the delay line chip, which produces some strange effects – the usual result is that the chroma information is separated from the luminance information in the picture. Loss of colour or flashing incorrect colours can be caused by incorrect service mode settings.

#### **RGB** Circuitry

After re-entering IC301 the colour-difference signals are clamped then passed to a variable-gain amplifier where colour control is applied. This is followed by matrixing with the Y signal to produce RGB signals. Teletext RGB inputs are introduced at this point and are selected when pin 40 goes high. Next come brightness, contrast and white-point adjustments, with signals for auto grey-scale control being added during the field blanking period.

The RGB outputs at pins 31-33 go to the the tube base panel. At this point signals from the microcontroller chip are added to provide the on-screen displays. Circuitry on the CRT base panel monitors the cathode currents, with feedback to pin 30 of IC301. If, because of a fault on the CRT base panel, this feedback is incorrect the RGB outputs from IC301 will be blanked. IC301 can be forced into operation by connecting a 7.5V supply to pin 30.

#### **Beam Limiting**

The voltage at the earthy end of the EHT winding on the line output transformer is monitored for beam limiting purposes, with feedback to pin 35 of IC301. If the beam current is excessive, the contrast is reduced. The voltage at pin 35 should be in the region of 3V for peak white and 4V for black. If it's missing there will be no picture.

#### **Line Drive**

The line oscillator circuit within IC301 requires no external components. Correct timing is ensured by using a reference signal obtained from the colour subcarrier.

#### Table 1: IC001 key function voltages

Key function	Pin 35	Pin 36
No key pressed	4-85V	4·85V
Autotune	OA	-85V
AV select	1.19V	4.85V
√olume –	2-43V	4·85V
√olume +	4-85V	OV
Programme –	4-85V	1×19V
Programme +	4-85V	2.43V

This is done only at switch on and when sync is lost, e.g. on a channel change. If the subcarrier oscillator has stopped, line drive will still be present but the picture will be blanked.

The line drive output is at pin 57. A 6.4V p-p feedback pulse from the line output stage enters at pin 58 – if this pulse is missing there will be no picture.

#### **Field Drive**

There is no field oscillator. Instead, frequency division from the line oscillator is used for field timing. A capacitor connected to pin 5 of IC301 generates a field ramp. To ensure linearity, this capacitor is charged by an accurate internal current reference.

The ramp waveform is passed to the vertical geometry section of IC301, where size, linearity and shift adjustments are carried out under I2 $\mathbb{C}$  bus control. The field drive emerges at pins 64 (+) and 1 (-) of IC301, passing to IC500 on board D.

#### **Geometry Correction**

IC301 also drives the EW modulator on board D. All adjustments except V angle are controlled via the I2C bus in the service mode. RV301 on board D sets the V angle.

Pin 4 of IC301 receives a sample voltage from pin  $\overline{7}$  of the line output transformer. This is connected to the line and field amplitude circuits within IC301 to prevent picture breathing with beam current variations. Pin 4 can also be used for X-ray protection, but this feature is not used.

#### System Control

The CXP85232-117Q microcontroller chip IC001 is powered by the standby 5V supply. At switch on, IC001's reset input is held low until the 5V supply has stabilised. This is carried out by the MN1382S chip IC003. There's a test output at pin 1 of IC001: if the supply, the reset and

Table 2: Effects of disconnecting devices	
from the I2C bus	

Device	Effect
Tuner (TU101) Memory chip (IC002) Jungle chip (IC301) Nicam chip (IC1101) Audio control (IC201) AV switch chip (IC401) Teletext chip (IC002)	Standby LED flashes 13 times Continuous short flashes from standby LED Set goes to standby after 1.5 sec No Nicam – FM OK No sound. Everything else OK No AV, no text sync, sound/picture OK No text. No other effects

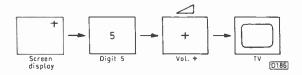

Fig. 1: Press this remote control unit key sequence to enter the service mode.

the internal self-test are all OK there will be a 5V p-p squarewave here.

The six on-board keys at the front of the set, on panel H3, are interfaced with IC001 by means of two ADC inputs at pins 35 and 36. Table 1 shows the voltages that should be present at these pins for the different functions. If the set tries to perform the same function continuously, or appears to have locked up, disconnect board H3 and look for signs of spillage.

Pin 38 of IC001 is the protection input. If this goes high for 1.5 seconds the set will go to standby.

IC001 generates on-screen displays and for sync purposes requires line and field pulses at pins 59 and 60 respectively. Loss of the field pulses will shut the set down after approximately fifteen seconds: this cannot be overridden.

#### **I2C Buses**

There are two I2C buses, one for the memory chip IC002 and the other for the rest of the chips that are linked to the control system. The service manual describes a diagnostic system to show communication failure of the devices connected to the buses: it doesn't appear to have been fully implemented however. Table 2 shows the effect of disconnecting various items from the I2C bus.

#### **The Service Mode**

To enter the service mode switch the set on at the mains, put it into the standby mode then press the remote control unit key sequence shown in Fig. 1.

The service mode is divided into two parts. The TT mode is mainly for manufacturing use: functions are selected by typing in the relevant number. Pressing the remote control unit's menu button selects the adjustment mode, which enables the variables in the items connected to the I2C bus to be changed. For UK use, only those listed in the TDA8366 1 menu should be altered. They enable the geometry and grey scale to be set up – this may be necessary after component replacement.

#### **Memory Corruption**

As nearly all the controls are carried out digitally, with the settings held in the memory chip IC002, memory corruption can cause perplexing symptoms. We have had the following:

No teletext. When text is selected the screen blanks – faint chroma may be seen. Erase the memory and reprogram it.

Set stuck in standby: Erase the memory and reprogram it – the possibility of a field scan fault should be investigated first.

Unlocked colour: Reset 'XTAL PLL' in the TDA8366 2 menu to 0.

Loss of one colour: Adjust the 'HWB' value in the TDA8366 l menu accordingly.

Incorrect picture size or geometry: Adjust accordingly.

It's advisable, before attempting adjustment or reprogramming, to make a note of the settings for the particular set – the symptoms could have been caused by a genuine fault!

If corruption recurs, replace IC002 and investigate possible causes such as CRT flashovers.

The following procedure enables the contents of IC002 to be erased and reset to factory values for system I:

(1) Select prog 59 and enter the service mode.

(2) Select TT49 (erase NVM test byte).

(3) Switch off at the mains supply, wait for a few seconds, then switch back on again.

(4) Select prog 59 and enter the service mode.

(5) Select TT24 (destination U).

(6) Select TT42 (general reset).

(7) Switch of at the mains supply, wait for a few seconds, then switch back on again.

(8) Autotune channels and carry out a complete set adjustment as described in the service manual.

#### **BACK COPIES**

We have available a limited stock of the following back issues of *Television*:

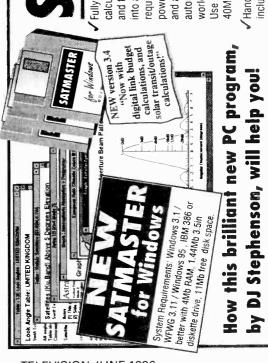

- 1992 February, April, May, July, August, September, October, November and December
- 1993 January, May, June, July, August, September, October and December
- 1994 January, February, March, April, May, June, July, August, September, October, November and December
- 1995 January, February, April, May, June, July, August, September, October and December
- 1996 January, February, March, April and May

Copies are available at £2.75 each including postage. Send orders to:

Reed Business Publishing, Television Back Issues, Room L302, Quadrant House, The Quadrant, Sutton, Surrey SM2 5AS.

Make cheques/postal orders payable to Reed Business Publishing Ltd.

**TELEVISION JUNE 1996** 

Time saving, integrated software tools for the satellite professional. This new version builds on the easy-to-use framework used by many broadcasters, antenna manufacturers and installation companies around the World. Features include antenna aiming with calculated compass bearings, downlink TVRO dish sizing, solar outage prediction, digital SCPC link budget calculations, footprint maps and a large global town/city co-ordinate browser.

Now includes a detailed digital SCPC link budget calculator. Indicates transponder bandwidth and power usage. Calculates rain fade margins for Ku and Ka bands, anywhere in the world, for any desired link availability. Handles BPSK, M-PSK and M-QAM modulation with any FEC code rate. Information rates from 56kbps to beyond 40Mbps. Ideally suited for SNG, data transmission and radio feeds.

S WIFT TELEVISION 17 Pittsfield, Cricklade, Wilts, SN6 6AN, England 16 44 (0)1793 750620 Fax 44 (0)1793 752399

# IMASTE

Fully detailed SCPC digital link budget calculator. Takes co-channel, adjacent satellite and transponder intermodulation interference into account. Finds uplink power requirements, transponder bandwidth and power usage per carrier. Atmospheric losses and appropriate rain fade margins are automatically calculated, anywhere in the world, according to a desired link availability. Use information rates from 56kbps to beyond 40Mbps. Handles all common modulation schemes including BPSK, QPSK, 8-PSK or 16QAM with any FEC code rate. A useful option is provided such that for a given input back-off total the corresponding output back-off total and intermodulation interference may be estimated from the stored parameters of a 'typical' TWTA or an SSPA transponder. Ideal software for SNG, Ku trucks, data transmission and radio station feeds.

- All output may be directly pasted into common spreadsheet packages, as tab delimited text, for editing, customisation or including in other documents.
- Calculates short form downlink budgets for both analogue and digital modulated TV broadcast signals. Ideal for TVRO dish sizing! Fast minimum dish size optimise for any selected target value of C/Nu, C/Nu, S/N, CCIR Grade, Eb/No or LNB output level. Furthermore, you can home in on either 'clear sky' or 'degraded sky' target values. Alter any link parameter and instantly see the result! Find LNB output carrier levels and the corresponding antenna size needed to design small IF distribution systems.

All link budget modules calculate atmospheric absorption, tropospheric scintillation fading and rain attenuation with its corresponding noise increase on the downlink. Calculations are performed for any desired signal availability and earth-space path and apply even at low elevations!

✓ Display world and regional maps of CCIR rainclimatic zones, seasonal water vapour density and mean surface temperatures (necessary for detailed link analysis). Partially completed forms are preserved if you need to consult other reference data.

- Incorporates fast and accurate solar outage prediction, presenting annual lists of date and time windows, for any satellite/ground station combination. All international time zones supported with convenient reference data.
- Accurately locates north/south anywhere in the world for polar mount set-up by producing selected monthly tabulation of 'Solar Transit Times' (the local time when the sun appears to cross your longitude).
- Select monthly tabulations of the local time when the sun and a selected satellite have the same azimuth. Enables a fixed dish to be installed where local magnetic anomalies may affect compass readings.
- Plots dish parabola graphs clearly showing focal distance. Calculates antenna focal distances from two simple dish measurements.
- Calculate elevation, true azimuth, compass bearing and skew for any geostationary satellite from any selected location.
- Automatic calculation of magnetic variation.
   Parameter files are automatically updated with current value when opened.
- Supplied with many tens of thousands of town and city records arranged in over 200 separate country data files. Easy browser transfer of this data to dialogue boxes. All town/city and satellite databases are fully editable.
- Input data from the last activated parameter file is automatically transferred to all supplementary dialogues to reduce form filling. A 'Clear' button is provided if not needed.

- Full context sensitive help on all input data fields by pressing the F1 key. This gives advice on typical values to enter such as cochannel interference and adjacent satellite interference. Abbreviated hints are also displayed on a status bar.
- Cenerate tables of antenna set-up data, including local compass bearings, for any geostationary satellite from multiple town/city locations in any selected country.
- Generates many graphs and tables relating to digital modulation, rain attenuation, atmospheric absorption and more.
- 40,000 + word help file packed with easy-tounderstand theory. Ideal as a staff training or self learning aid.
- Performs often used calculations and conversions but includes an editable mathematical expression evaluator for more complex needs.
- Supplied with a wide selection of popular footprint maps but you may use a scanner and graphics application to add more.
- Generate tables of 'visible' satellites from any selected global location. Print data to any Windows compatible printer with your company name at the top.
  - Convenient text editor for project notes etc.
- Plots main and side lobe patterns for uniformly illuminated antennas.
- Plots relationships between various useful link parameters.
- Includes convenient speed buttons for most often used menu selections.
- Multiple document interface allows simultaneous display of all reports, maps, graphs and tables on your desktop.
- Written entirely in C++ for incredibly fast response times.

## Servicing the Hitachi VTM720/722

## John Coombes on dealing with the problems you may encounter with these VCRs

The VTM720 and VTM722 were Hitachi's basic models during the period 1990-2, the 722 being a twospeed version. We've had the following fault conditions with them.

#### **Mechanical Faults**

**Failure to accept or eject a cassette:** The cassette side holders can jam in the runners. If these are not jammed, check whether the base holder is bent – this will also result in jammed side holders. Another possibility is the shaft assemblies: if force is used to insert a cassette the plastic ends break off. Should you have to replace the shaft assembly, be sure to lubricate the ends with Sonic Slidas oil (#1600).

If the gear bracket has to be removed because of a jammed tape, ensure that the worm shaft and worm are lubricated, the former with Slidas oil and the latter with Froil (G31SAY). The worm wheel assembly should be lubricated with Froil.

If a cassette is accepted but won't come back out because the door fails to open, you will find that the bracket which fits into the cassette door assembly to lift it is broken.

**Noisy rewind and/or fast forward:** Check the capstan motor – it may be necessary to remove the flywheel to clean and relubricate the shaft and bearing. If the capstan motor is at fault it will usually also be noisy when ejecting a tape. See below.

Alternatively the clutch base assembly could be at fault. Either replace or dismantle and clean all the cogs, removing any hard grease that could be causing friction and noise.

Change the reel belt if this has stretched.

Lines across the picture: If the off-tape FM waveform is incorrect, check that the guide poles are correctly set up. Reset as necessary, then lock the Allen screw tight and seal.

**Loading problems:** The loading motor block may be faulty. If the block is OK, check the worm gear and mode gear – the latter could have damaged teeth.

**Tape looping:** This can be caused by a worn pinch roller. Alternatively the take-up spool may not be running freely – clean and relubricate the spindle.

**Noisy operation:** The capstan motor could be faulty. In most cases however the cure is a spot of grease on the drum brush. The lower drum motor may be noisy.

**Poor sound and possible poor picture:** The audio/control head may be misaligned. If there is tape creasing at the bottom, check that the azimuth tilt is correct. Alternatively the head may be clogged – bad clogging will result in

muffled sound and/or a broken up picture, and the sound may be slow. If cleaning doesn't cure this, replace the head.

**Picture tearing or jumping:** If the tearing is mainly at the top of the picture, the audio-control head is probably faulty. The basic fault can be caused by incorrect back tension because the tension band is misadjusted or damaged. Don't confuse this fault with the TV set not being on an AV channel – this will cause hooking.

**Poor playback picture, sound OK:** The cause may simply be dirty video heads. When the VTM722 is used in the LP mode the picture may jump, roll or just be very unstable because the lower drum is worn. This may also make it look as if only one head is working. If you are unsure, check the off-tape FM waveform.

Failure to erase the previous sound track: If cleaning the erase head doesn't provide a cure, check the erase head connections.

**Guides not loading correctly:** Check that the guide rollers are tight and correctly positioned. If still in trouble check the plate for a bent piece of metal that prevents the guide reaching the stop position.

**Capstan motor faults:** The capstan motor requires regular servicing. There can be various symptoms: noisy rewind and/or fast forward operation, also very noisy eject, or sometimes you may get intermittent pauses during playback. Cleaning and relubricating the spindle will usually put matters right. If the spindle has a ridge on it and/or a heat mark however the capstan motor will have to be replaced. The motor can also stop and jam the tape. The result may be tape chewing or the VCR coming to a halt. With all these problems it is as well to replace the reel belt.

**Colour beating:** Possible causes are an excessively dirty erase head, poor connections to the head, also broken leads because of incorrect positioning.

#### Incorrect Loading

This can be caused by electrical or mechanical (see previous note) faults. It's often very intermittent and can usually be cured by replacing the loading motor block complete. You may get intermittent loading, half loading or half loading then eject, with the tape chewed or left half in/out. The VCR may fail to lace the tape and just eject it. These things can all be caused by the mode selector switch.

Alternatively the CXP50116-116Q microcontroller chip IC751 can cause the same problems when faulty.

When faulty the XRA6209U4 loading motor drive chip IC753 can be responsible for failure to load, intermittent

loading or slow eject. Check that its 14V supply is present at pin 7. If this is missing, check back to source. Before replacing IC753 check whether the HZS9A-2 zener diode D753 is short-circuit.

#### **Electrical Faults**

**Incorrect capstan motor speed:** The capstan motor can be the cause of this but, apart from the previous note under mechanical faults, it has proved to be reliable. Check that the FG pulses are reaching pin 2 of the BA6993 FG amplifier chip IC602. If they are missing, trace the path back to the capstan motor and FG pickup. If they are present, check for output pulses at pin 1. Replace IC602 if there are no pulses here. If IC602 is OK, check for pulses at pin 21 of the HD49747NT servo control chip IC601. No pulses here could mean that IC601 is faulty or perhaps C622 (0.47 $\mu$ F, 50V) is short-circuit. Next check for pulses at pin 27 of IC601. If there's no output, replace IC601. If IC601 is OK, trace through to the SA2007A capstan motor drive chip IC1M.

**Drum motor not locked:** The symptoms may be intermittent noise over the picture then normal lock for a short time. If there are no drum FG pulses, check the BA6459P1 drum motor drive chip IC1651. If this is OK, the FG coils could be at fault. They are in the lower drum unit. If this is all OK, suspect IC601 (HD49747NT) – check its output at pin 12. If this is present, trace back to the drum motor drive chip. If not, C603 (1µF, 50V) could be open-circuit. If C603 is OK, replace IC601.

**No colour:** Ensure that the DC conditions are correct around the M52057FP chip IC301. If all is OK here, X301 (4-433MHz) could be dry-jointed or faulty.

#### **Power Supply Faults**

The most common fault with these VCRs is no results. The cause might be an open-circuit mains feed, open-circuit input fuses or faulty bridge rectifier diodes. If these items are all OK, check the regulator chips. The 5V regulator is IC851 (RC78M05E), the 12V regulator IC852 (RC78M12FA). They can go open- or short-circuit. If necessary check whether C860 (10 $\mu$ F, 16V) in the 12V supply is short-circuit.

#### No Display

Ensure that the -30V supply is reaching the system control PCB. This powers the display unit's filament. If the supply is missing, check back to its source on the power supply PCB. If the supply is present, the display unit could be faulty. Check that the CXP50116-116Q chip IC751 is receiving the -30V supply at pin 76, and that its 5V supply is present. If so but the display is not being driven, crystal X751 (4·19MHz) could be dry-jointed or faulty or IC751 defective. Check by replacement.

If various segments are not lit or are partly lit. IC751 or the display could be faulty. Again check by replacement.

#### **Remote Control Faults**

If the remote control unit provides no functions or display, check that the battery connections are soldered correctly with no dry-joints and that the spring is pulled out far enough to make contact, also that the batteries themselves are OK. If the display is lit up but there are no commands, check the connections to the LED. The connections to the crystals could be broken, damaged or dry-jointed. If necessary replace the crystals. If the remote control unit is producing an infra-red output but there is no remote control operation, check whether the TV/VTR2/VTR1 switch SW01 is correctly set. There will be no operation if it's in

the TV position, or if the VCR is set to VTR1 and the handset to VTR2 or vice versa.

If various buttons don't work, check the rubber sheet for wear or clean the pad and buttons. Alternatively the M50933-102FP chip IC01 could be faulty. IC01 can also be responsible for no display, a dim display and/or various segments not lighting up.

The handset could have been damaged by rough use. If it has been dropped the PCB could be broken, giving total failure or intermittent operation. Spillage is another possible cause of intermittent operation.

#### **Regular Maintenance**

Regular replacement of the head cleaning roller is important. It can get very dirty: this can result in ruined heads. Check the complete tape transport system. Dirty video heads can cause loss of colour and/or field jitter, even horizontal jitter.

Replace the reel belt if fast forward/rewind don't work. If these operations are slow, the belt could be dirty. Clean the belt and all pulleys.

Check the pinch roller. If this is worn the tape might not run or be slack.

If the back tension is excessive the result can be bent verticals or hooking at the top of the picture. Check that the spring is set in position A. It may be necessary to check the tension pole position – refer to the service manual.

Always ensure that the plug top pins are insulated and that the correct (3A) fuse is fitted. Inspect the mains lead for cuts, damage or insulation breakdown.

# Satellite Notebook

Reports from Hugh Cocks, Ian Rees, Graham Thomson, Eugene Trundle and R.J. Longhurst

#### **Magnetic Polarisers**

I still come across a lot of magnetic polarisers, with both rotatable dish systems and the older fixed Astra installations using prime-focus dishes (it's rare to come across a 9.75GHz Astra 1D LNB with a magnetic polariser).

They seem to give problems after a lot of rain, either going opencircuit (the normal resistance reading should be in the region of  $100\Omega$ ) or seeming to lose their swing at the top and bottom of the band. More polariser current is required with channels at the ends of the band, so CNN and Children's Channel seem to be the ones that suffer. Possibly water gets in between the plastic moulding and the metalwork, causing reduced efficiency. The open-circuit effect seems to occur more during the hot summer months.

When trouble occurs I replace the polariser and LNB, where possible, with a prime-focus 13/17V LNB which has Astra 1D switching. To receive Telecom band signals with offset skew would, if this was a customer requirement, call for a wideband LNB and polariser.

Placing a cover over the polariser will prevent ingress of water and reduce problems in general. To prevent spiders getting into the prime-focus feed tube, place a thinnish piece of polystyrene at the front of the pipe – this doesn't seem to attenuate the signals to any extent and keeps the customer happy. **H.C.** 

#### Akai SX1000/Alba ISR7000

We had one of these receiver in recently with a blown mains fuse. The cause was varistor MOV1 which was short-circuit. **I.R.** 

#### Philips STU802/ Pace PRD800

The cause of loss of picture/sound after the warm up period was traced to the FTX749 transistor Q2 at the front right-hand corner.

The cause of a dead or tripping

receiver is generally the two  $10\mu$ F, 25V capacitors C7 and C8 in the power supply. In a recent case we found that they measured less than  $4\mu$ F. C5 ( $22\mu$ F, 16V) is also worth checking. **I.R.** 

#### Amstrad SRD510

This receiver's mains fuse would blow every two-three weeks. The failure wasn't violent, and there was no apparent cause. When I checked with Amstrad Technical I was advised to change the mains filter capacitor from  $1\mu$ F to  $0.22\mu$ F. Being a safety type, the correct component should be used – the Amstrad part no. is 253612. Doing this provide a complete cure. Thank you Amstrad Technical. G.T.

#### Pace SS9200

I had a case recently where the latest Sky 10 card became "invalid" with one of these receivers for no particular reason. One test to try first with any receiver should the card produce the invalid message is to disconnect the receiver from the mains supply and allow the decoder to reset itself. This was never necessary with earlier issue Sky cards. If you still get "invalid", check the card with another receiver and clean the card contacts in the normal way.

As a precaution with this SS9200 receiver I removed the high-voltage Vpp supply to the card reader. Since then it has produced no more "invalids" – it had disposed of two cards in the month prior to this modification! To remove the Vpp supply, cut the track that goes to the centre leg of the BD139 transistor Q16 near the front of the decoder board. **H.C.** 

#### Legende Receiver

This receiver was new to me. It said Legende at the front and "by Echostar" at the back, made in China. There is no decoder, and the Sharp type tuner is mounted at one end of the main PCB. The switchmode power supply PCB also incorporates the UHF modulator. The whole thing is reminiscent of the Amstrad 510/520 series in its construction.

This particular Legende didn't work. As I knew its owner I agreed to take a look, even though I didn't have any circuit information. The mains fuse was intact, and fortunately there were no signs of any carbonised components. I managed to find the switch-mode power supply's start-up resistor (R802,  $100k\Omega$ ) which was opencircuit. A replacement restored the set to life.

As the resistor seemed to be underrated, the replacement I fitted was a more substantial type. I then noticed a 1 $\mu$ F, 50V electrolytic near the chopper transistor Q801. This was changed to be on the safe side. The power supply produces a slight, HF rustling noise, but seems to be quite happy to run like this! **H.C.** 

#### Supply Problems

The owner of a Pace MSS200 receiver I had installed a few months previously phoned to say that it "goes off in the evening". I called to look at it, as it would surely be wellbehaved in the workshop and there might be an LNB problem.

When I arrived in the late afternoon all was well. But I noticed that the lights were a little on the dim side. Switching on an electric heater did the trick. The lights dimmed even more and the Pace receiver stopped. The mains voltage measured around 170V. The TV set kept going, but the fridge motor in the kitchen sound a little unhappy!

This kind of problem was quite common here in the Algarve a few years ago, especially at houses in the countryside at the end of a long supply line. It's now much more rare, fortunately. A standard domestic electrical installation here is rated at 6kW maximum consumption. Believe it or not, you can go down to 3kW and pay a lower standing charge per month. If you want more than 6kW you have to go over to a three-phase input at 6kW. Electricity here in Portugal is also expensive compared with the UK. **H.C.** 

#### Uniden UST7007

The problem with this receiver was poor video quality in general, whether via the decoder or video out connections. Checks took me back to the tuner, which runs very hot. At the demodulator end (farthest from the F socket) there are four 16V electrolytic capacitors – a 4 $\mu$ F one, a 100 $\mu$ F one and two 10 $\mu$ F ones. They looked decidedly the worse for wear. Replacing them restored normal pictures.

Be careful not to overtighten the F socket when reassembling the unit – the inner can part company with the link to the PCB. **H.C.** 

#### **Cable Troubles**

Not long ago we installed a satellite IF distribution system that serves a number of holiday villas. Just recently reception of the higher-frequency IF channels, above about 1,500MHz, became poor at one of them.

As the cable was difficult to get at, a substitute length of around 40m was connected along the ground from the "Magic Switch" to

#### Satellite Decoder Cleaner

Dirt and oxidation can cause poor connection with all electrical contacts and switches. This is not too much of a problem where the contacts are accessible for cleaning, but a lot of dismantling is required to reach those in a smart-card reader. Hence the recent introduction of a decoder cleaning card.

We were sent one of these to test. Its dimensions and 'feel' are identical to those of a smart card, but the area normally occupied by the contact lands is covered by a square inch of special dry cleaning material that's similar in appearance to fine linen cloth. To clean the delicate internal card-reader contacts, the card is inserted and removed a few times.

We tried the card with both VideoCrypt and Eurocrypt card readers and found that it worked well enough. Priced at £7.99 for ten including postage, we feel that the cards are a useful and inexpensive addition to the technician's armoury.

They are available from Allen's TV and Video, 53 Fordbrook Lane, Pelsall, W. Midlands WS3 4BW (telephone 01922 692 078). **E.T.** 

the villa concerned. This gave perfect results, confirming our diagnosis.

Since the original cable was only a few months old, it was a bit of a mystery to us why the problem had arisen. Once we reached the roof the cause of the trouble was immediately apparent: an old TV aerial (not installed by us, I hasten to add!) had keeled over during recent high winds, one of its elements piercing the cable's outer sheath. Heavy rain had followed the wind and water had got into the cable. The result was quite rapid signal degradation. **H.C.** 

NEW STOCK

#### Amstrad VS1000 Satcorder

The satellite receiver section of this unit was faulty. When it was cold, the picture was marred by pulling and distortion. The non-encrypted channels were fine once the unit had warmed up, but no card instructions or card invalid message was displayed with the other channels.

The cure is to replace the electrolytic capactors CA02, CA05, CA07, CV09 and CV42 inside the top, screened decoder section. My thanks to Amstrad Technical for helping me out with this one. **R.J.L.**

# **TV** Fault Finding

Reports from Chris Watton, John Edwards, Andrew Tebbutt, Terry Lamoon, Brian Storm, Nick Beer, Eugene Trundle, Michael Dranfield, Graham Thompson and Graham Riachards

#### Salora M Chassis

This set had no picture. I hate it when I look in the back of a set and think "where do I start?" All those huge chips! As the sound was present and the tube's heaters were alight it seemed that the combined power supply/line output stage was working normally. Then, for the briefest moment, I noticed a narrow band up the screen. This led me to the BS208 EW modulator driver tranistor TB526, which is a FET type. Replacing it restored normal operation. All I then needed was a few yards of solder to stick all the dry-joints together. . . C.W.

#### Philips G110 Chassis

This set would start up and run perfectly all day. But if it was switched to standby by remote control it would go dead, with no standby LED illumination. Switching it on and off at the mains would then restore normal operation. The culprit turned out to be the 20V zener diode D6657. C.W.

#### Hitachi C2118T (G7PS2 Chassis)

When we tried to tune this set in the correct display appeared on the screen but there were no signals. The 33V tuning voltage supply was missing because R044 (12k $\Omega$ ) was open-circuit. C.W.

#### Orion 14ARX

This set was stuck in standby. For the microcontroller chip to respond to remote control commands it must have a 5V supply. Only 2.8V was present. The 5V regulator that provides this supply obtains its input from the mains circuit, via D531, R531 and R158, the voltage at the junction of these resistors being smoothed by C530. Only 4.8V was present here, because C530 was open-circuit. This voltage was insufficient to operate the regulator correctly.

Incidentally, once the set is running the 5V supply is derived from the line output transformer. We discovered that if we applied 5V to the regulator's output the set would start up and continue to run until it was switched off and then asked to start from cold. C.W.

#### Finlux 1000 Series Chassis

This set would start off all right. But after about half an hour a band of torn lines would roll down the screen from the top to the bottom at a rate of about two per second. The cause was Ch11 ( $47\mu$ F, 63V). C.W.

#### Loewe MS56

This set's picture was marred by very severe Venetian blinds. We found that the  $1k\Omega$  LZ AMP preset P323 had gone open-circuit. C.W.

#### **Grundig CUC2800 Chassis**

The tripler had failed. After replacing it the set got going but there were other problems: the sound came from only one speaker, and the brightness couldn't be adjusted. They were caused by a duff microcontroller chip. It's type SDA2011-A005. Make sure that you get the right one for the set. C.W.

#### Salora L50 Chassis

The cause of intermittent poor starting was traced to CB601 ( $10\mu$ F, 63V) which smooths the supply to the LF0059 chopper control chip HB600. It had gone low in value. In the 110° version of the chassis a 2.2µF capacitor is used in this position. C.W.

#### **Salora J Chassis**

This set was dead though the power supply was trying – we found that there was about 50V at the collector of the line output transistor. A few resistance checks soon revealed that the BY133 diode DB510 in the EW modulator circuit was leaky. C.W.

#### Nikkai TLG1409

This set was dead. A squealing noise came from the chopper power supply and there was a smell of something cooking. The cause of the trouble was C617 (4,700pF, 1kV) which had split open and was very hot. You'll find it connected across the 109V HT rectifier diode D116, in series with R618. J.E.

#### GoldStar CIT2181FG

The customer said that for a long time the set had been switching itself off at random. As it was now permanently dead he figured it was time to get the set fixed. We found that the pins of the standby relay RL801 were all dry-jointed. The slightest tap on the relay's case would instigate the fault. Resoldering cured the problem. J.E.

#### Samsung CI541ZG

This set would intermittently shut down with the standby LED illuminated. It could take minutes or hours after switch on for the fault to occur. The set could be brought back into operation only by using its power button to switch it off then waiting for a few minutes before switching it on again. None of the remote functions worked when the set had shut itself down. We traced the cause of the problem to barely detectable poor joints at the pins of the chopper transformer. They looked healthy until viewed with a magnifying glass. Resoldering the pins cured the problem. J.E.

#### Hitachi CPT2476 (G6P Chassis)

This set displayed a bright green raster with flyback lines. Time was wasted checking components on the tube base panel until the penny dropped. When the M50450-023P character generator chip IC1104 was removed there was a normal picture (with no green on-screen displays of course). A new chip restored everything to normal. J.E.

#### Granada C66GZA

The problem with this Hitachibased set was field collapse – the TDA3654 field output chip IC501 had failed. A replacement restored the raster, but flyback lines occupied the top of the screen. C574 (100 $\mu$ F, 50V) was found to have fallen in value to only 49 $\mu$ F. A new electrolytic put that right. The capacitor is mounted very close to the field output chip's heatsink, which gets quite warm. We decided to fit a 105° capacitor for improved reliability. **J.E.** 

#### Samsung CI7230 (U88MT-1 Chassis)

This set's picture was shifted to the left. As a result the extreme righthand part of the picture was present at the middle of the screen. After a few seconds the EW modulator driver transistor started to smoke. The cause of all this was a badly dry-jointed connection at the anode of D405 (BYD33) in the line output stage. J.E.

#### Sharp DV51083H (D3000 Chassis)

This set was dead. When we disconnected the collector of the 2SD1546 line output transistor the HT voltage returned to the correct

figure. With a new transistor fitted there was a slight EHT pulse at switch on but the set immediately shut down. The line output transformer was faulty.

We fitted a replacement and powered the set up slowly via our variac. At about 100V input the set went into the tripping mode. The TDA8175 field output chip was found to be short-circuit and the  $1\Omega$  resistor in its power supply open-circuit. Once these items had been replaced the set worked normally. **J.E.** 

#### Ferguson 51A2 (TX100 Chassis)

This set switched on all right and channel one was displayed, along with a perfect picture and sound. But no other operations were possible, using either the remote control unit or the set's up-down buttons. The set's programme and LED display remained on channel one. The PCD8571P memory chip IC1805 was faulty. **J.E.** 

#### Samsung Cl6230 (U88MT-1 Chassis)

This set was dead, with just a highpitched squeal from the power supply. A check on the electrolytics showed that C416 ( $2 \cdot 2\mu F$ , 250V) was short-circuit. It decouples the supply to the line output stage. **J.E.** 

#### **Philips 2A Chassis**

This set was dead apart from a faint squeal from the power supply. When the supply to the line output transformer was disconnected (pin 7), the HT voltage returned to the correct level. As no faults could be found in the secondary supplies obtained from the transformer we suspected the transformer itself. The primary winding (pins 5 and 7) was OK, but our checker indicated that there was a fault between this winding and chassis, at pin 18. Resistance readings were normal, but a new transformer restored the set to life, proving the tester's worth. J.E.

#### GoldStar CIT9508

A problem you seem to get with these sets is the first anode (screen) control on the line output transformer becoming intermittent. This gives either the no picture or very dark picture symptom. I've had the fault on three of these sets now. **A.T.** 

#### Alba CTV841

This set would tune in only the low (Band IV) channels, with the tuning

scale at the top of its range. Although the output from pin 40 of the microcontroller chip was sweeping in the search mode and the voltage at pin 2 of the tuner module was sweeping with it, the actual tuning voltage at pin 2 was not within the correct range. The cause was R646 ( $10k\Omega$ , 2W) which feeds the 33V tuning voltage regulator. It was open-circuit. I had some difficulty finding it. So to help you if you encounter this particular fault, R646 is mounted in front of the line output transformer. A.T.

#### Sony KV1621

At switch on this set produced a rustle of EHT then remained dead. Suspecting a line output stage fault I started to check for heavy loading in this area, to no avail. When the HT voltage was measured it became apparent that the fault was being caused by lack of activity in the power supply. This was in turn caused by nothing more than one leg of the mains switch being opencircuit! I can only conclude that the switch made momentary contact at switch on, giving the misleading symptoms noted above. **A.T.** 

#### Alba CTV841/Bush 2114 and Clones

If, after repairing one of these sets, you have either no sound or field collapse, check whether you've connected the two-pin speaker plug to either CN602 (no sound) or CN403 (field collapse). It should be connected to CN201. A.T.

#### GoldStar CIT2190F

As there was no line drive this set didn't produce any EHT. The cause of the problem was D401 (1N4003) in the supply to the line driver stage. It was open-circuit, removing Q401's collector voltage. A replacement restored normal operation. **T.L.** 

#### Matsui 2092T

The brightness level would drop drastically when this set had been on for a while. Tapping around brought me to R195. It was not dryjointed: instead it was bent over, with the result that it made intermittent contact with a jump link. Straightening it cured the fault. **T.L.** 

#### Panasonic TX25A3 (Euro 1 Chassis)

There was no sound or picture. Quick checks showed that the tube's supplies were all present and correct. Subsequent checks showed that the 10V supply to the AV switching chips on board A was missing. This supply is provided by Q1011 (2SC3940), which was open-circuit. Its 4.7 $\Omega$  feed resistor R1102 was also open-circuit. The cause of these failures was the 0.1 $\mu$ F surface-mounted decoupling capacitor C1102. It had become leaky, shorting out the 10V supply. **B.S.** 

#### Panasonic TC1785 (Z3 Chassis)

This set suffered from a nasty looking and sounding intermittent fault. The picture size would fluctuate quite dramatically, with arcing in the neck of the CRT, then the set would shut down to standby. When the fault occurred, the HT voltage rose to about 155V. The cause of the trouble was the STR50103A chip in the power supply. Unfortunately the activity in the tube's neck had led to an intermittent blue gun short. I was able to sort that out by judicious use of the B&K 467 tube tester. **N.B.** 

#### Daewoo T512

This was an unusual fault. It was impossible to get the grey-scale correct. The CRT's guns could be matched at any one point in the range of the luminance signal, but they wouldn't track over the whole range. We eventually found that C504, a ceramic capacitor that couples the R - Y signal into the RGB chip, was short-circuit. E.T.

#### Hitachi C2574TN

A problem that has cropped up with several of these sets is sporadic and random failure of the EW output chip IC751 and EW modulator diode D706. The fault is most likely to occur when the set is switched on from cold. The cause is a dry-joint at R610 on the signals panel. E.T.

#### Bush 2714

This set was stuck in standby, with the power supply running normally. We found that the line driver transistor's 3.9k $\Omega$ , 5W feed resistor R603 was open-circuit. **M.Dr.** 

#### Samsung CI517Z

This set produced a blank, unmodulated raster, as if it was in the external video input mode. When video was selected, a signal could be displayed via the rearmounted AV input socket. So we took a look around the IF strip. The 2SC815 transistor EQ101 mutes the IF signal when the set is in the video mode. In fact the IF strip was permanently muted because EQ101 was leaky collector-to-emitter. We pressed a 2SC1815, which has a different pin configuration, into service. This cured the fault. **M.Dr.** 

#### JVC AV21H1EK

This fairly new set came in with a list of odd, intermittent faults. On test it worked faultlessly. When we took the back off however we found that IC552, a three-terminal regulator on a large heatsink, was dry-jointed at all three pins. We subsequently had another of these sets in with the same problem, so it looks as if it could become a stock fault. **M.Dr.** 

#### Hitachi G8Q Chassis

No teletext was the complaint with this set. That's what we thought too, but on closer examiniation very weakly contrasted teletext was present in the mix mode. The onscreen channel display was similarly affected. We tried a new teletext panel but this made no difference. Over to the video section therefore, where the text signals are inserted at pins 12, 14 and 16 of the TDA3562A colour decoder chip. A new TDA3562A cured the fault. **M.Dr.** 

#### Matsui 1455

The auto sweep tuning wouldn't stop when a station was found. This was because there was no sync pulse at pin 36 of IC202 when a station was passed, though the pulse was OK at the base of Q404. The cause of the problem was a small crack in the print. **M.Dr.** 

#### Akai CT2179NUK

This set is a Samsung clone. At switch on the power supply chirped then died out. We found that C807  $(47\mu F, 25V)$  had dried out. It lives next to the hot-running chopper transistor's heatsink. **M.Dr.** 

#### Panasonic TX2112 (U5N Chassis)

This set had a very odd fault: the sound mute was too long when channel changing with the remote control unit. It lasted anything from five to twenty seconds. The fault didn't occur when the set's manual controls were used. After careful study of the circuitry we decided that the cause of the fault must lie with the MAB8441-T005 microcontroller chip. But every supplier we contacted said that this device is no longer available. A fax to Panasonic confirmed this. It's a pity that sets are often scrapped for want of a relatively inexpensive component such as this. **M.Dr.** 

#### **Philips System 4 Chassis**

This set was dead because the power supply had shut down. A quick check produced a shortcircuit reading across the line output transistor. When it was removed for test we found that the transistor was OK. The culprit was the blue 1nF, 2kV tuning capacitor C2161. M.Dr.

#### Bush 2057/2059/2157/ 2159NTX

If the complaint is fluctuating brightness, or you find that the field output chip IC401, the line output transistor Q402 and ZD402 which stabilises the line output transformer derived 12V supply have failed, check the HT voltage. It should be 112V. The above problems arise when this supply is unstable.

The following components are usually responsible: Q901, Q902, Q903, ZD901, ZD902, C909, C910 and R907. They are all in the power supply, and as they are relatively inexpensive and the fault can be intermittent I replace the lot. This saves a recall. The power supply is used in several other models.

Another problem you get is dead, no standby. You will find that the  $0.68\Omega$  safety resistor R919, which is connected to pin 4 of the chopper transformer, is open-circuit. **G.T.** 

#### Realistic Portavision 16-7070

This is a monochrome portable with a radio and a cassette player. It lived in the kitchen and had no picture. I had to prise the case open because of the amount of grease on it. Why do I always get the best jobs? The PCB was in a similar condition. When I'd cleaned it I was able to get to the root of the problem, which was the  $4.7\mu$ F, 25V bipolar line scan coupling capacitor C74 – it was leaky. Cleaning the cassette deck and the case completed the repair. **G.T.** 

#### **NEI C28F1FXN**

The reported fault was "dead". As usual the mains fuse had blown because one of the diodes in the mains bridge rectifier was shortcircuit. Component reference numbers are D100-3. They are type BY255. G.T.

#### Alba CTV14R/Nikkai TLG14R

Field bounce was the complaint with this portable. After a long

search we found that one end of the 10kΩ. 2W resistor R137 was dryjointed. It's situated near the line hold control. G.T.

#### Samsung CI5012Z

This set was dead. After a good clean out with the vacuum we could see the PCB and start work! We found that the 5.6 $\Omega$ , 7W surge limiter resistor R801 was opencircuit, the cause being failure of C816 which was short-circuit. This 222pF, 1kV capacitor is connected in parallel with the chopper transistor Q801. G.T.

#### Samsung CI3312Z

This portable refused to search tune. A check showed that the tuning line voltage BT was stuck at 29.75V The cause was resistor RQ01 which was dry-jointed. G.T.

#### Decca D14RDD5

This portable had no sound. The onscreen display came up, but the cursor moved only about a quarter of an inch. With this set the maximum volume can be preset and locked. To unlock it, press the volume up button on the set and the button to the right of the zero button on the remote control unit. Thank

you Tatung Technical for this information. G.T.

#### Quickies

Bush 1407: For a dead set check whether R913 in the power supply is open-circuit. Philips GR1-AX Chassis: If

there's no tuning voltage, check whether R3703 is open-circuit. G.T.

#### Mitsubishi CT2227M

If the set is stuck in standby/dead, with no relay operation, check the  $1.2\Omega$ , 0.5W carbon resistor R7A0 on the remote control panel. G.R.

#### Toshiba 213R4B

The fault was field collapse, which to start with had been intermittent. A scope check at pin 1 of the TDA3651A field output chip showed that there was no drive. In fact a resistance check from pin 1 to chassis produced a reading of only  $20\Omega$ . The culprit was C312 (10nF) which was leaky. G.R.

#### Harwood CTV14

If the set is dead but there is 114V at the collector of the line output transistor, check the line driver transistors. There are two, TR3 (BC558) and TR4 (BC639).

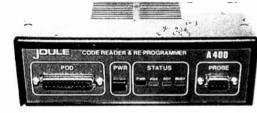

Replace them both as they are a DC-coupled pair. G.R.

#### Ferguson A59F (ICC7 Chassis)

This set had come from another dealer, the fault being power supply shut down at switch on. Following instructions from Fergsuon, they had replaced the TDA8178F field output chip. On this occasion the solution hadn't worked. The cause of the trouble turned out to be field related however. There was a short on the UL2 (65V) feed to the field output stage because the BA157 rectifier diode DL09 was shortcircuit. It's connected to pin 12 of the line output transformer. G.R.

#### Hinari CT15/ST200/ **VTV200/CDTV2/CT14/** Goodmans 5160TT

A fault you sometimes get with these sets is a bright, blank raster that sometimes clears if the set is left switched on. You will find that the 12V and 15V lines have linefrequency pulses on them - I've scoped 15V peak-to-peak on the 15V line. The problem is caused by C629, a 100µF, 25V electrolytic capacitor. It lives in a hot corner, so must eventually suffer. I've had this fault three times now. G.R.

## **JOULE A-400** ADVANCED CAR RADIO CODE READER

CE

The A-400 and associated computer software is a factory produced system designed and manufactured by our own team of experienced technicians

Covering the majority of models including the latest Blaupunkt RDS radios, the A-400 decoding system is a must for any repair workshop. Ongoing research and development means new makes and models are being added regularly. We offer full technical assistance via a telephone helpline to all registered users which even includes help with repairs and can make supply spares for a

Decoding a radio is simple – remove the base plate, place the probe on the PCB, press a key and the code is instantly displayed. Changing the code or Place the probe

PCB, press a key and the code is instantly displayed. Changing the code or fully re-programming is just as easy.
 On screen help and PCB layouts showing probe location and information on how to enter the code once the set has been decoded.
 Works on any IBM or compatible pc from an Amstrad 1512 to a 486.
 As well as its ability to decode and recode, the advanced design of the A-400 permits total re-programming of eeproms, lending itself for use in the servicing of television receivers etc.

Place the probe on the PCB and the code is instantly displayed

 There are now three options available to you in ordering your A-400 decoding system ...

 Option 1: Purchase the A-400 decoding system outright, price for full starter package (now covers over 100 models): £375.00 + VAT. Additional software modules available separately.

 Option 2: Take advantage of the new INDEX system where for a £100 refundable deposit you will be supplied with ALL of the available eeprom based software plus the Grundig processor based software.

 Decodes are charged at £5 + VAT each. There is no rental charge.

 If required, the Blaupunkt processor based software can be added to the index system. Please ask for details.

 Option 3: You may have the best of both worlds by purchasing any of the software and taking the remainder on the index system, therefore obtaining a very cost effective solution to your decoding requirements.

 The index system was pioneered by Electronic Sound Systems and we do not know of any other company offering a similar product.

 The A-400 has recently been tested for electromagnetic compatibility (EMC) and conforms to the stringent tests that were imposed. As a result, the product now bears the CE mark of conformity. This regulation came into force on the 1st January 1996 and it should be borne in mind that, from this date, it is illegal to supply or use any electrical or electronic equipment that does not carry the CE mark.

 The A-400 is manufactured by a company that has been involved in the servicing of car audio and TV/video for over 20 years and is a service agency for Philips, Grundig and Blaupunkt.

 When now for a free brochure and demonstration disk.

# What a life!

#### Donald Bullock finds the solution to an Amstrad PCW8512 problem and deals with a crop of TV faults

while back I wrote about the troubles I was experiencing with the Amstrad wordprocessors I use here in Spain, especially the two PCW8512s. Both started to give trouble when taken to Spain, after years of perfect operation in the UK. Field collapse with one of them was the first problem, caused by a faulty LA1385 chip. Then both of them became temperamental. They would gobble up writing that had been saved and which I thought I had for ever.

Two Television readers came to my aid. S. Pearson of Chipping Norton said that the fault was likely to be either with the discs or drive B. He suggested that I try to copy anything of importance on one of the suspect discs then reformat it with the PCW9512. If reformatting worked, the disc was OK. This would point to drive B as the cause of the trouble. He points out that the drives are belt driven, and that a slipping belt will result in the disc rotating at varying speeds, corrupting its format when an attempt is made to save data. This would explain the "disc format not

recognised" message on the screen. In passing he said that he believes the 3in. Amstrad discs are made by Matsushita, and also commented on my son Steven's "romantic" solder - the stuff that makes our workshop smell like a Casablancan ladies' powder room. He says that this sounds like a new product which is starting to gain popularity with some manufacturers. It differs in containing a synthetic flux that doesn't coat printed circuit boards, as rosin flux does, but requires a hotter iron (about 420°C) to activate it. Another advantage is that it makes the use of ozonedestroying solvents to clean off flux residues unnecessary. We live and learn!

Colin McCormick of Plymouth suggests that I retire the Amstrads and change to a PC with the LocoScript Pro 2 wordprocessor program – it's similar to the one I use, and would therefore be easy to change to. This is an interesting possibility, but I had to get the Amstrads right since only their format can handle every disc I have.

#### **Belts**

Anyway, I opened one of the PCW8512s, removed the B disc drive and dismantled it to examine the flat belt. It was stretched, and when I removed it I found that it was permanently pear shaped and stiff. I then looked at drive A and found that the belt was in the same state. When I opened the other PCW8512 the story was the same.

I ordered the right belts from JJ Components, then called at the village TV shop for some flat belts to tide me over. I bought four, all slightly different though similar in size and width. They got the machines working reliably, and I was able to work on. But the PCW8512s wouldn't handle each other's discs: obviously there was a slight difference in the way in which they were being driven. I was glad when the JJ belts arrived a few days later. Both machines are now working perfectly.

My thanks to Mr Pearson and to Colin McCormick for their interest and advice.

I soon tumbled to the reason for the sudden demise of the original belts. They'd led a hard life before they went to Spain, where my Amstrads live in a 12 x 10ft wooden chalet in our garden. In summer the heat inside is unbearable from mid-morning onwards. My printer ribbons have suffered similarly - the ink has dried out, so that even 'new' ones print faintly. My remedy has been to erect a covered gantry above the chalet to protect it from the sun and provide a draught between the chalet and the cover.

#### **Disc Drive Tip**

Here's a tip for anyone about to dismantle an Amstrad PCW disc drive. The drive uses a threequarter inch long brass pin, about a millimetre in diameter, to detect the disc's write-enabling shutter. This pin is located, but not secured, in a hole in the disc drive's cast deck, in line with the disc shutter. It can drop out and be lost without you knowing that it was there. You don't discover this until you've reassembled the drive, refitted it, reassembled the machine and then tried to use it. You find that the drive is prepared to write to your disc whether it's write-protected or not.

#### **The Difficult Ones**

Steven reckons that the difficult sets come in every time I slip off to Spain. I'm not too sure. I think he does the easy ones and saves the rest for me. He likes a quiet life, but doesn't get it. He's in the wrong trade for that.

The other day he presented me with a GoldStar CT2168P that was completely dead - there was not even a standby glow. This is unusual as these sets normally get stuck in standby. We didn't have the circuit diagram, but I dived in and checked the fuse and the  $2.2\Omega$ , 5W surge limiting resistor. They have sometimes been the cause of this symptom, but were all right. So I moved to the primary side of the chopper circuit and found that there was no drive at the base of the chopper transistor Q801P. A check on the 100µF, 16V coupling capacitor C805P showed that it had fallen in value to only a couple of microfarads. As it didn't look up to the job I fitted a 35V replacement, which restored the set to life.

#### **A Philips CTX-S**

Steven took the GoldStar set off and brought along a Philips receiver fitted with the CTX-S chassis. It was unwilling to start up, tripping three times at each of our first attempts. When the set did stay on it seemed to be suffering from a migraine attack. The picture was hopelessly scrambled, with no colour except some thick bands of green flashing about. Then the picture improved a little.

"Electrolytics" I said. Steven nodded and headed for the ones in the power supply. He found that the  $4.7\mu$ F, 63V chopper drive coupling capacitor C2351 and the driver transistor's 220 $\mu$ F, 10V emitter decoupling capacitor C2323 were both very low in value. When they had been been replaced the picture was all right at low brightness/ contrast control settings, but as soon as the controls were advanced a host of ragged black stripes appeared on the picture.

Steven checked the various electrolytics around the colour decoder chip and found that C2205 ( $4.7\mu$ F), which decouples the slider of the preset contrast control, was short-circuit. The rest were all right. He then moved to the sync circuitry where most of the electrolytics were low in value. When these had been replaced the set produced an exceptionally good picture.

#### **Kirk Douglas**

A decided oddball arrived with a Grundig set which turned out to be fitted with the CUC3400 chassis. "I'm Grewsome, Mr Buckland" he said, putting it down. "God, you look like Kirk Douglas."

"What's up with the set?" I asked.

"Dead" he said, "but it works". I looked at him for a second or two then waved him out.

I put the set on the bench and switched it on. It came out of standby, and the channel indicators lit up. It also changed channels. But there was no sound or raster. When I took the back off I found that the tube's heaters were out and there was no EHT.

A check on the voltages around the line output transformer showed that they were all haywire. So I removed the transformer and checked the resistance of the windings. Every pin read short to every other one. A new transformer cured the trouble and I prepared to make out the bill, intending to add a couple of quid for Grewsome's wisecrack. Then I looked in the mirror and added a pound.

#### Mr Gravel's General VCR

Mr Gravel is usually to be found in our local, nursing half a pint of lager. I've never seen him drink any. He shoved an ancient General VGX520B VCR across the counter.

"Not good enough" he complained. "Ain't had the thing long. Even bought a Testoscope to mend it, but no good." He waved a neon tester at us.

The machine's Panasonic deck had a tie-pin wedged in the mechanism. When this had been removed the machine worked well mechanically, but the video was haywire. We soon found that the RF converter's tuning screw had been screwed and screwed, mangling the circuitry inside.

Even MCES couldn't help with this one, saying that it was beyond repair. Still wanting to help, though I can't think why, we contacted General and were told that spares are no longer available, the machine dating from 1984. So we handed it back to Mr Gravel, who gave us his Testoscope. It was his way of saying thanks. Some readers might wonder why we don't learn. So do we.

#### A Vodka and Orange

Glenda Glenthorn's Ferguson 14M9 portable (TX86 chassis) led us a dance for two reasons. First because we'd not seen one before, though they've been around for four or five years. And secondly because she'd spilt a large vodka and orange into the back. The set was dead. A panel assembly to do with 12V DC operation is set on the back. It has to be removed before the rear cover can be taken off. We found it difficult to remove the panel, but managed it. Then we dismantled the set.

The switch-mode power supply uses a TEA2018A chip that was short-circuit. The 1.25A mains fuse had blown, as had the surge limiter resistor R88. Two of the bridge rectifier diodes were short-circuit. The TIPL791A chopper transistor TR6 was also short-circuit. When we'd replaced these items the primary side of the power supply was all right, but there was an HT short on the secondary side. Disconnecting the 95V feed cleared the short. We headed for the line output transistor, which is also a TIPL791A. It was short-circuit, and when this had been replaced the set sprang to life.

We stopped for a mug of tea before embarking on the job of reassembling the set and its 12V appendage. I won't mind if we don't see another of these sets for four or five years.

#### **Groucho Marx**

Bill Branston walks like Groucho Marx and seems to use his scripts. He strode in with a Tatung TN1616 portable (160 chassis).

"Tube's gone" he said, "line across the screen."

I pointed to the door. In fact the field collapse was intermittent. I took off the back and made for the TDA3651 field output chip I301. As nearly every one of its pins was dry-jointed, I reached for Steven's romantic solder and carefully resoldered them. Then I switched on, reasonably confident that I'd see a full picture. I didn't. There was still field collapse, and safety resistor R411 had popped open.

Feeling a bit like Stan Laurel, I replaced the chip and the resistor. Up came the picture, but after about five minutes it began to roll and I feared the worst. I needn't have done. All that was required was slight adjustment of the field hold control R303.

#### An Hinari CT18

Marilyn Murgatroyde came in with an Hinari CT18 portable that was stuck in standby. This set uses an STR50103A chopper chip (IC801) with an SR2M protection diode (D813) across its 112V output. The diode was short circuit and the  $6\cdot 2\Omega$ , 10W surge limiter resistor R801 open-circuit. The HT voltage had obviously risen drastically, as it does in these sets. When I replaced IC801, D813, R801 and switched the set on it sprang to life.

#### **Prepared Mains Lead**

My 'beef' – excuse the pun – is that with cheaper models of certain white goods you get a detachable lead but *no* 13A plugtop, just a 'prepared end'.

On many an occasion when collecting a TV for repair from a customer's home I've seen a unit's prepared lead fitted to the plugtop as it is, not trimmed properly to fit the plug. Consequently the cable grip is in fact not gripping anything, so sooner or later I get a call to say "my electric gismo has just blown, can you repair it?" (I service white as well as brown goods).

I just wish manufacturers would not do this, as in my opinion the general public is ignorant of the dangers of electrical equipment and some sort of education is required. Perhaps a good place to start would

#### **Antipodean Cowboys**

During the past year I have followed with interest the letters and comments regarding cowboys in the trade. I would like to point out that things are not always as they seem to be. In the photograph alongside you see a local cowboy with a very ordinary looking horse. The facts are that the horse is 'Just Red', winner of the 1996 Air New Zealand Grand National Steeple Chase. The cowboy is yours truly, a highly qualified TV serviceman.

Derek Roylands, Wellington, New Zealand.

be with school children, regardless of their gender.

I have commented to various adults about the correct fitting of plugtops, but most of them do not seem to care. Such an attitude often leads to tears. *M.K. Hayter*,

Moseley, Birmingham.

#### Film or Videotape

I was most interested to read Alan Pemberton's explanation (letters, March) of 'film-like' videotape dramas. Like others, I wondered where the specks of dust had gone! If tape has to be used, I would prefer to see this 'film-like' technique adopted than to have our screens dominated by 'soap-opera style' clean videotape dramas. Film/film-like productions look more professional, the 'degrading' method being highly effective – at least to these eyes. I was certainly fooled!

Perhaps for different reasons, 'degrading' the image isn't a new idea. Many Wednesday Play dramas from the Sixties for example were made from telerecorded studio material and external film stock. Telerecording was even listed in the end credits, together with the film editor! As 35mm film was easier to edit than tape, some episodes of Doctor Who, as another example, were directly telerecorded for ease of editing (a good example is The Krotons, episode one). Videotaped material was of course telerecorded for world wide sales, in variable quality.

US NTSC conversions have always looked terrible, often unwatchable unless you don't find the smears and jerky movements distracting. This is certainly a disturbing trend, as no doubt our own productions must look awful over there. As videotape is generally used nowadays, with all telecine material transferred to tape for transmission, some older US programmes – such as the current reruns of the original *Star Trek* series – come as NTSC conversions and not the clean, crisp and colourful film stock seen on our screen ten years ago. *Brian Renforth, Sandyford, Newcastle.* 

#### **Second-Class Citizens**

A letter to your sister magazine Electronics Weekly (10/4/96) from Andrew Garret, who is studying for his M.Eng., complains about the status of engineers in the UK. He says that he is "keenly aware of the second-class citizenship a British engineer must put up with", then goes on to say that he "would feel more proud of his chosen field if it were not generally considered as "television repair" work.

So Andrew Garret first complains about engineers' status, then airs his own perception, which appears to be that TV servicemen are of such low status that he doesn't wish to be identified with them! He signs off his letter with the comment that he "has never fixed a TV in his life and has absolutely no desire to ..."

My guess is that this demeaning attitude towards TV technicians will have upset others besides me. It's 20 years since I worked in the trade, but I believe I could hardly have had a better training, either trouble-shooting or in the rough and tumble world of the general public. I now work in the electronics industry and enjoy a good salary, along with some colleagues who are very well qualified but don't have much knowledge of things I take in my stride (like TVs or even how a fluorescent lamp works). They seek my advice on such matters.

I'm sure many reputable TV technicians could run rings round Mr Garrett, who might well find a day spent in a busy TV workshop to be a chastening and humbling experience.

The sad part is the meagre profit margin in the trade. This prevents many a TV man being paid his true worth. *Keith Cummins, Holbury, Hampshire.* 

#### Importance of Training

May I add some comments on the subject of entering the TV/video repair business, following the correspondence started by Ms Raynor's letter in the February issue?

Many engineers today have a negative view of the trade. This is understandable. There are various ways of being employed in the trade: if you work for a national multiple or rental company, the low rewards and pressure to achieve a high turnaround, despite the ever more complex technology with which we have to deal, are likely to lead to a negative view of the state of the trade and the prospects. Another common complaint is the difficulties caused by an ever more demanding and unreasonable public.

But there are many good things about the trade, and anyone who shows an interest in joining us should be made aware of how best to get involved. I think we have to be energetic and positive about replenishing our numbers. For many years I have trained 16-year old apprentices, leading them to the highest levels by taking full advantage of the local resources available. They have become a valuable asset, and provided we do well by each other we will have guaranteed engineering capabilities well into the future.

It is my intention to recruit again this year. The Devon and Cornwall TEC provides finance for the travelling and training costs, and students can be either employed (as ours are) or on placement. Exeter College provides CGLI 2240 courses at levels 1, 2 and 3, and we also have training support from manufacturers.

Unfortunately many small businesses don't have access to manufacturers' courses, and in some areas college courses are no longer available. But most established engineers are interested in their work, and this makes them naturally good teachers. We should all think seriously about the medium – and long-term benefits of training, and encourage youngsters to take advantage of it and not be dissuaded by those with negative attitudes.

The financial rewards are not what they should be in our branch of electronics. We all know the basic reason for this – low retail prices. But personally, having done the job since leaving school at fifteen, I have been more than happy. My belief is that the basic requirements are an ability to see opportunities and patience in developing them. There is always something new that will require technical know-how for its successful implementation.

While remaining a practicing engineer, I have recently joined the staff of Exeter College. I will shortly be mailing engineers and dealers in this region, canvassing interest in all CGLI 2240 courses starting in September 1996. This will enable us to decide which options to run, for example short, specific courses on such subjects as Nicam, camcorders etc. If anyone would like to receive details, I can be contacted at Exeter College, Room G1, School of Engineering. Hele Road. Exeter, Devon EX4 4JS. Nick Beer,

Bideford, Devon.

#### Thank You

I would like to thank all those *Television* readers who took the trouble to write to me following my plea in the February issue.

I am overwhelmed by the response and the offers of help. It's going to take me some time to get everything in order, so if I have missed anyone it's not because I'm ignorant – what a magazine!

Once again I thank everyone for their interest and *Television* for publishing my letter. *Ms C. Raynor*, *Cheshire*.

# Amstrad SRD510 Channel Change Mod

The popular Amstrad SRD510 satellite TV receiver has one drawback – lack of a frontpanel channel-change facility. Peter Haylor, G6DRN, describes a modification that enables the standby buttons to be used instead

The design of the Amstrad SRD510 has a curious feature: there are two standby buttons on the front panel but no channel up and down buttons! The modification described here enables the standby buttons to be used for changing channels up and down, with standby controlled by the remote control unit – as with most receivers.

Pins 11, 12 and 13 of PL1 are used for channel changing – see Fig. 1. The modification procedure is as follows. Disconnect the unit from the mains supply.

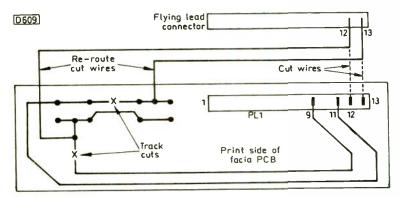

Fig. 1: Modifications to the facia PCB in the Amstrad SRD510 satellite receiver to provide front-panel channel up/down selection.

Remove all connections to the receiver, then the top cover, the card reader PCB and the front panel complete with the small PCB. Remove the small PCB and lay it out so that the multipin connector (PL1) is at the top right when viewed from the print side.

There are two types of PCB. One uses a ribbon cable while the other has separate cables – they are both wired in the same way. Cut the wires to pins 12 and 13 as close to the connector as possible.

Cut the print as shown. Solder the wire that went to pin 12 to the bottom left-hand button connection, just above the print cut, and the wire that went to pin 13 to the right-hand button top connection, to the right of the cut.

If the front PCB is the type that uses ribbon cable, cut leads 12 and 13 with care then split them with a sharp knife.

#### Test

This completes the modification. Reconnect the PCB to the front panel and reassemble the receiver. When the mains supply is connected the standby light should be on. Press either the left or the right side of the standby button: the red LED should change to green and the receiver should come on. Pressing the receiver's left-hand button should provide channel up selection and the right-hand button channel down. Standby is now available only via the remote control unit.

# TELETOPICS

## Digital TV - terrestrial, satellite and cable

A forecast by market research organisation Vision Group suggests that terrestrial digital TV, which is expected to start in the UK late next year, could bring us 13-25 new channels. The area to the south of Teeside, covering about 65 per cent of the UK, would be able to receive all the new channels. The area stretching from Northern England to Southern Scotland would be able to receive 7-15 of the new channels, with a further reduction of services farther north.

The five DBS channels assigned to British Satellite Broadcasting by the ITC could be re-advertised. They have remained unused since BSB merged with Sky Television in November 1990. With the advent of digital technology the spectrum space could be used for up to fifty channels.

## **Trade Scene**

Sales figures for the last quarter of 1995, released by GfK Marketing Services, reveal widely varying fortunes in the UK consumer electronics market. Satellite receivers did best, with a year-onyear increase of 27.2 per cent to 248,000. Games consoles fared worst, with a decline of 28.4 per cent to 328,400. Total TV sales were around 1,050,000, with an increase of 9 per cent in large-screen receiver sales and a fall of 7.5 per cent in small-screen receiver sales. VCR sales rose 7.3 per cent to 817,000 while camcorder sales fell 7.4 per cent to 101,000.

## **Cable TV**

The latest broadband cable TV subscriber figures released by the ITC reveal a threefold increase over the last three years to a total of 1,326,842. During the course of 1995 there was a 45 per cent increase in the number of subscribers – over 400,000. Installed telephone lines have almost doubled over the last two years, the total at January 1st 1996 being 1,417,819 – a slightly greater total than that for TV subscribers. The first European satellite digital TV service has been started in Italy by DStv-Atena Servizi. Atena plans to run eight TV channels and ten audio channels, providing a subscription service. One of the main attractions will be up to 19 Serie A and B football games broadcast live each week. Pace is supplying MPEG-2 standard set-top boxes for reception of the service.

BT feels that its VOD experiment, with signals delivered via standard copper telephone lines to 5,000 homes in the Ipswich and Colchester areas, has been a success. Average paid use of the service has been five hours a week, with twenty per cent of homes making use of it for over ten hours a week. BT is considering a substantial investment in developing the service. The BBC has transmitted and received digital TV signals that conform to the DVB (Digital Video Broadcasting) specification for terrestrial TV (DVB-T). It is understood to have been the first end-to-end broadcast using this specification, which was finalised in February. Transmission was from Crystal Palace, with reception at Kingswood Warren and the TV Centre in West London. The BBC intends to follow up with tests of electronic programme guides and other digital services.

Hitachi is to start producing DVB decoders at Hirwaun early next year. The initial production rate is expected to be 25,000 a month. Firms that have announced DVB chips include Mitsubishi, IBM, SGS-Thomson, Toshiba and Hyundai.

#### **Technical Information**

Edition 27 of Mauritron's technical books catalogue is now available from Mauritron Technical Services, 8 Cherry Tree Road, Chinnor, Oxfordshire OX9 4QY (phone 01844 351 694, fax 01844 352 554). An interesting addition is the CD-ROM that contains the power supply circuits used in hundreds of VCRs, enabling them to be displayed on a PC.

## **Product News**

Toshiba has released its first widescreen TV set, Model 32W6DB, at a suggested retail price of £2,000. The specification includes Dolby Pro-Logic Surround Sound, picture size options and a 512-page teletext memory. Pro-Logic sound is also a feature with two rear-projection sets, the 48in. Model 48PJ6DB at £3,000 and a 55in. version at £3,500. Toshiba's latest VCR, Model V856B at £500, incorporates the company's digital noise reduction system and colour-signal enhancement circuitry in a single chip.

Thomson brand products have been launched in the UK. The company has also introduced its Technozen technology. This is designed to improve TV picture quality: features include 100Hz scanning, dynamic focusing and a digital mastering system to remove picture smear and improve the definition and colour stability. Features of Samsung's new range of widescreen TV sets include a dynamic multiple focus system. A low-noise amplifier system for use in poor-reception areas boosts the signal by 8dB.

A new TV range that incorporates features called IQ Concept has been introduced by Sony. There are three elements. First IQ Picture. This uses digital technology and a phototransistor for automatic brightness, contrast, colour and sharpness adjustment. At low light levels the saturation and sharpness are increased while the contrast and brightness are reduced. In addition to reducing eye strain, Sony claim that this can reduce power consumption by up to twenty per cent. Secondly IQ Operation uses an on-screen menu and remote control joystick to operate various features. Finally IQ Sound uses a new digital processor chip to give improved sound quality.

One of the new range of prepacked aerials and accessories introduced by Micromark, Devonshire House, 550 White Hart Lane, London N17 ZRQ. Telephone 0181 880 2001. This 10element array is intended for use in strong signal areas. SURVEILLANCE TELESCOPE Superb Russian zoom telescope adjustable from 15x to 60xt complete with metal tripod (imposible to use without this on the higher settings) 66mm lense, leather carrying case £ 149 ref BAR69

RADIATION DETECTOR SYSTEM Designed to be wall mounted and connected into a PC, ideal for remote monitoring, whole building coverage etc. Complete with detector, cable and software. £19.95 ref BAR75.

WIRELESS VIDEO BUG KIT Transmits video and audio signals from a minature CCTV camera (included) to any standard teevision! All the components including a PP3 battery will fit into a cigarette packet with the lens requiring a hole about 3mm diameter. Supplied with telescopic aerial but a piece of wire about 4<sup>-1</sup> long will still give a range of up to 100 metres. A single PP3 will probably give less than 1 hours use. £99 REF EP79. (probably not licensable!)

CCTV CAMERA MODULES 46X70X29mm, 30 grams, 12v 100mA, auto electronic shutter, 36mm F2 lens, CCIR, 512x492 pixels, video outputis 1v p-p (75 ohm). Works directly into a scart or video input on a tv or video. IR sensitive, £79.95 ref EF137.

IR LAMP KIT Suitable for the above cameral enables the camera to be used in total darkness! £5.99 ref EF138.

REMOTE CONTROLTANDATA TD1400 MODEM/ VIEWDATA Complete system compnising 1200/75 modem, auto dialler, infra red remote keyboard. (could be adapted for PC use?) psu, UHF and RGB output, phone lead, RS232 output, composite output, Absolute bargain for parts aloneII/E9 95 ref BAR33.

#### **9 WATT CHIEFTAN TANK LASERS**

Double beam units designed to fit in the gun barrel of a tank, each unit has two semi conductor lasers and motor drive units for alignement. 7 mile range, full circuit diagrams, new price £50,000? us? £349. Each unit has two gallium Arsenide injection lasers, 1 x 9 watt, 1 x 3 watt, 900nm wavelength, 28vdc, 600hz pulse frequency. The units also contain an electronic receiver to detect reflected signals from targets, five or more units £299 ea. £349 for one. Ref LOT4.

TWO WAY MIRROR KIT Includes special adhesivefilm to make two way mirror(s) up to 60°x20°. (glass not included) includes full instructions. £12 ref TW1.

NEW HIGH POWER RF TRANSMITTERS

AMPLIFIERS Assembled PCB transmitters, 4 types available, 12.6vdc 90 watt 1.5-30mbz 75 ohm in/out FWAM £75 ref RF1 12.6vdc 40 watt 50-200mbz 50 ohm in/out FWAM £65 ref RF2 28vdc 125 watt 1.5-30mbz 75 ohm in/out FWAM £75 ref RF3 28vdc 100 watt 50-200mbz 50 ohm in/out FWAM £75 ref RF4 A heat sink will be required, ring for price and availability. If you intend using these as audio transmitters you will need a also

need a preamp. Complex module available at £40 ref RF5. COMPUTER/WORKSHOP/HFFI RCB UNITS Complete

protection from faulty equipment for everybody! Inline unit fits in standard IEC lead (extends it by 750mm), fitted in less than 10 seconds, resettest button, 10A rating, £9 each Ref MM5

RADIO CONTROLLED CARS FROM £6 EACH!!!! All returns from famous manufacturer,

3 types available, single channel (left,right,forwards,backwards)£6 refLOT1. Two channel with more features £12 refLOT2. Two channel proportional (plug in crystals etc) £35 ref LOT3.

THOUSANDS AVAILABLE RING/FAX FOR DETAILS! MAGNETIC CARD READERS (Swipes) £9.95 Cased with flyleads, designed to read standard credit cards! they have 3 wires coming out of the head so they may write as well? complete with control eletonics PCB. Just £9.95 ref BAR31 WANT TO MAKE SOME MONEY? STUCK FOR AN

WANT TO MAKE SOME MONEY? STUCK FOR AN IDEA? We have collated 140 business manuals that give you information on setting up different businesses, you peruse these at your leisure using the text editor on your PC. Also included is the certificate enabling you to reproduce (and sell) the manuals as much as you like! £14 ref EP74

PANORAMIC CAMERA OFFER Takes double width photographs using standard 35mm film. Use in horizontal or vertical mode. Complete with strap £7.99 ref BAR1

COIN OPERATED TIMER KIT Complete with coinslot mechanism, adjustable time delay, relay output, put a coinsid on anything you likel TVs, videos, findges, dinnis cupboards, HIFL takes 50p's and £1 coins. DC operated, price just£7.99 ref BAR27. ZENITH 900 X MAGNIFICATION MICROSCOPE zoom, metal construction, builtin light, shrimp farm, group viewing screen, lots of accessiones. £29 ref ANAYLT.

AA NICAD PACK Pack of 4 tagged AA nicads £2.99 ref BAR34 PLASMA SCREENS 222x310mm, no data hence £4.99 ref BAR67

NIGHTSIGHTS Model TZS4 with Infra red illuminator, views up to 75 metres in full darkness in infrared mode, 150m range, 45mm lens, 13 deg angle of view, focussing range 1.5m to infinity. 2 AA batteries required. 950g weight. £199 ref BAR61.1 years warranty

ServiceBase Lite

#### 3 Simple Steps to ServiceBase Lite ....

Step 1: Complete a data entry screen to record the customer & unit details then press a single key to produce a receipt.

Step 2: Enter the engineers screen to create and display the billing information. Write a description of the work carried out and append any spare parts used.

Step 3: A simple print routine will bring all the required information together to produce a professional looking invoice.

#### If it's software only then ServiceBase Lite is the answer

but if you are looking for a complete solution contact the ServiceBase... \_ONE STOP SHOP

When you are ready to computerise your business speak to PC Control Systems. We will help you choose a computer system and if necessary a finance plan that best suits your requirements.

Our One Stop Team will deliver a pre-configured computer directly to your premises and spend a full day teaching your staff how to maximise its potential.

- Mail Merge Facility

ServiceBase will finally allow you to computerise In confidence...

This new series will describe the electronics in Pace MSS1000 series receivers. In this opening instalment J. LeJeune provides an overall view of the receiver and covers the power supply, the tuning arrangements and video processing

# **MSS1000 Satellite Receiver**

he Pace MSS1000 satellite receiver has been on sale for almost two years. It fills a niche in the market, for those who want Dolby Pro-Logic Surround Sound without having to replace a reasonably new TV set. A review of the receiver appeared in the August 1994 issue of Television. It described the basic features thoroughly. Briefly, the main ones are: Dolby Pro-Logic Surround Sound; twin LNB inputs; an ultra wideband tuner (750-2,100MHz); line-level audio sockets to feed a larger audio amplifier; twin card reader slots; and a comprehensive menu system to control the receiver. The basic UK version of the receiver is Model MSS1001-I.

More recently Pace has added the long-promised dishpositioner module, which will be described in a separate article. At present this is factory fitted, but a dealer retrofit kit is to be introduced. Another version of the receiver caters for D2MAC transmissions - we'll deal with only the PAL/VideoCrypt 1 version here, as this is the one generally found in the UK and Ireland.

#### **Block Diagram**

There are several microcontroller chips in the MSS1000. In addition to the main Z8 micro, another one controls the fluorescent display and processes the remote-control commands, there's one in the VideoCrypt decoder and, if a dish-positioner is fitted, this also has one. Fig. 1, a simplified block diagram, shows the bus lines for the clock, data and enable

signals that interconnect the microcontroller chips and the circuits under their control.

A point to note is that the chip-enable lines are of the pulsed type, toggling the chips so that they receive or send data. In the Dolby Surround area however the chips are enabled by turning on the normally-absent clock signal - a cunning way of saving precious IC pins.

Much of the MSS1000 will be familiar to those acquainted with previous Pace models. The video processor chip is a Nicky III while the modulator, microprocessor subassembly and on-screen display generator are all old friends.

There's a new switch-mode power supply which uses a field-effect chopper transistor controlled by an MC3842 chip. This is also used in the MSS1000's non-Surround Sound stable mate, the MSS500. Feedback from the secondary side of the circuit to the primary side is via an optocoupler. A variable-voltage zener diode on the secondary side of the circuit provides the feedback signal.

#### Power Supply Operation

Because the power supply departs from previous practice in some respects we'll look at it in a little more detail. Fig. 2 shows the primary side of the circuit.

The mains input is fed via the surge limiter resistor R1 to filter C1,T1 which is included primarily to prevent mush from the power supply reaching the mains in any great quantity. Four 1N4007 diodes (D1-4) in a bridge

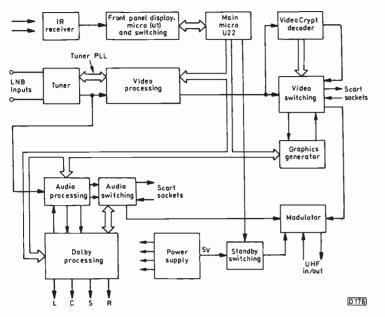

Fig. 1: General block diagram of the Pace MSS1000 receiver. arrangement rectify the mains input, charging the reservoir capacitor C2 to provide a roughly-smoothed DC supply for the chopper circuit. R5 and R367 provide start-up action, charging C6 via R804. The combination of 94k $\Omega$  (2 x 47k $\Omega$ ) and 100µF provides a slowly-rising input at pin 7 of the MC3842 control chip U1. Once the voltage here reaches 16V the power supply starts up. D8 then takes over the supply to U1, rectifying the pulses at pin 13 of the transformer. When the receiver is working normally the voltage at pin 7 of U1 is approximately 12V. D5 and D55 are included to protect U1 against surges. The squarewave output generated at pin 6 of U1 drives the gate of the 2SK1643 MOSFET chopper chip Q1.

The 5V supply on the secondary side of the circuit (see Fig. 3) is sampled to provide regulation feedback. R13 and R12 form a potential divider which provides a nominal 2.4V at the control electrode of the TL431 variable-voltage zener diode D9. This voltage varies with any 5V supply changes. It alters the diode's zener voltage and thus the current flowing through the IR diode in the PC111LY optocoupler U2. The varying illumination produced by this diode alters the conduction of the phototransistor on the output side of U2.

The phototransistor is connected as an emitterfollower. It receives a stable supply at its collector from U1 and develops its output voltage across R4. This output is fed to pin 2 of U1 via R3. A comparator circuit within U1 sets the on/off time of Q1 in accordance with any variation in the 5V supply across C11. Thus the regulation loop is completed. R2 and C270 set the gain of the comparator stage. The circuit's basic frequency of oscillation is set by R369 and C4 at somewhere between 25-30kHz.

R7, C7 and D6 form the usual snubber network, while D72, R110 and C295 provide peak-voltage limiting. The parallel-connected  $0.75\Omega$  resistors R9, R710, R711 and R594 monitor the current that flows through Q1. The voltage developed across them is fed via R10 to pin 3 of U1, the current-limiting input.

#### **Secondary Side Supplies**

A wide selection of voltages is provided by the secondary windings on the chopper transformer T3. D13 rectifies the voltage at pin 8, producing 30V across C13 for tuning purposes. The voltage is stabilised by the 27V zener diode D18.

D54 produces 34V across C216 for the Surround Sound power amplifiers. This supply is also used for the motor drive circuit when the dish positioner is installed.

D12 produces an 'unregulated 12V' (about 14V) supply across C12. This is passed to the 12V regulator REG1 (LM7812). There is also a feed via D22 to the LNB supply.

This supply is obtained from two sources, depending on the polarisation selected. For horizontal polarisation,

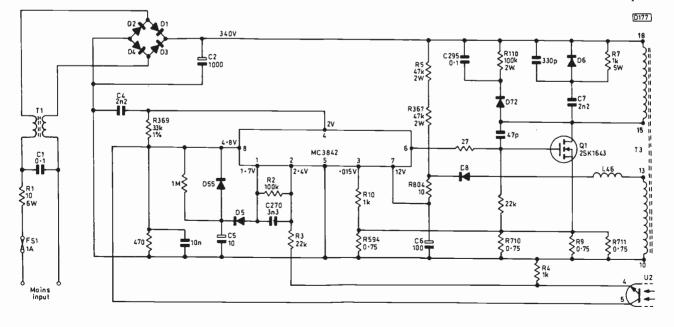

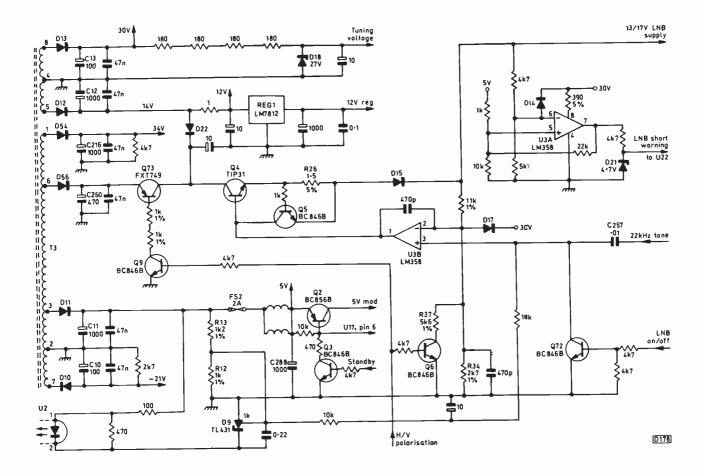

Fig. 2: The primary side of the chopper power supply circuit. Voltages measured in the standby mode using a 10M $\Omega$ /V DMM.

D56 produces 20V across C260. Q9 is switched on, and in turn Q73 switches on. Thus the 20V is presented to the collector of the TIP31 series regulator transistor Q4 and D22 is reverse biased to prevent the 20V being passed into the unregulated 12V supply. Q6 is also switched on, placing R37 in parallel with R34. This adjusts the voltage at pin 2 of U3B, which drives Q4. Q4 now produces a regulated 18V output which is fed to the LNB via D15.

When vertical polarisation is selected, Q6, Q9 and Q73 are switched off, the collector of Q4 being fed via D22. R37 is open-circuit and the regulator supplies 13V to the LNB.

Q5 is a simple current limiter that samples the voltage developed across R26. If there is a short-circuit in the LNB or the coaxial downlead, the voltage across R26 will increase and Q5 will switch on, placing a shortcircuit across the emitter and base of Q4 which switches off to protect the power supply.

U3A senses the LNB supply voltage, sending a warning to the main microcontroller U22 which produces an on-screen message. Failure of the regulator circuit or D15, giving a low or absent LNB supply, will also result in the LNB SHORT warning display. If you get this message for more than a few seconds, check whether the fault is external or internal by removing the input F connector. When the fault condition is present, U22 will keep switching the LNB supply on and off at a frequency of 2Hz.

The LNB can also be turned off via the software in U22. The drive for this comes from pin 4 of U25 (a shift register/store chip) to the base of Q72. Under these conditions the software cancells the LNB SHORT warning. A high from U25 switches Q72 on, earthing pin 3 of U3B to switch off the LNB power.

The LNB power status is also set by the programming

of the LNB power menu, which gives a choice of LNB l or LNB2. The switches that direct the power to the selected LNB are Q44 for LNB1 and Q43 for LNB2. They are driven by Q45-48. This part of the circuitry is not illustrated here.

Tone switching for a universal LNB is produced by the 22kHz multivibrator Q12/13 shown in Fig. 4. The switching signal is superimposed on the LNB supply, being fed via buffer transistor Q11 and C257 (Fig. 3) to pin 3 of U3B. Q7 switches the tone on or off by controlling the base of Q11.

The other important function of the 22kHz oscillator is to provide a drive for the fluorescent display device's filament – this drive is taken from the collector of Q12, being buffered at the front panel PCB.

The main 5V supply for the receiver is produced by D11, which rectifies the waveform at pin 3 of T3. Its reservoir capacitor is C11.

D10 produces a -21V supply across C10. This is part of the filament supply system for the display device.

#### **Standby Switching**

Standby switching is controlled by Q3 and Q2. A low from U25 indicates standby, switching off Q3. The high at Q3's collector inhibits the switches in the 4053 chip U17, blanking all video. It also switches off Q2, removing the 5V supply to the modulator. The UHF loop-through, the LNB supply, the tuner supply and the VideoCrypt decoder are all kept alive.

#### The Tuning System

The tuning system is shown in block diagram form in Fig. 5. The tuner itself is a Pace design, with a local oscillator that runs at 479.5MHz above the incoming IF. Tuning is under the control of the main microcontroller chip U22. It talks to the Nicky chip

Fig. 3: Circuitry on the secondary side of the power supply.

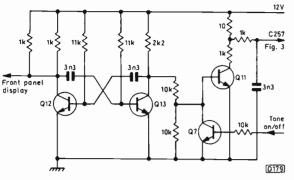

Fig. 4: The 22kHz tone oscillator circuit. U26, which contains the phase-locked tuning loop. The local oscillator frequency is divided by 128 within the tuner and is then fed, as the PLL sample, to pin 18 of U26. This input has a range of 9.5-19.5MHz. The tuning voltage output from pin 16 of U26 is fed to Q52, which is a MOSFET device, then to the tuner's local oscillator. The bandwidth of the second IF can be switched between 15 and 27MHz.

The tuner constantly monitors the position of the signal within the selected passband, making any adjustment required to the local oscillator frequency to maintain the IF signal's central position – the action is the equivalent of applying AFC. More on this later.

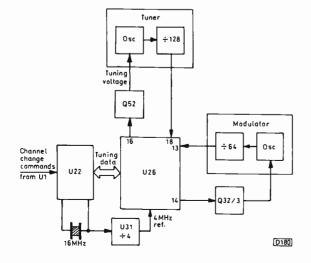

As with all modern satellite TV tuners, another phaselocked loop system within the body of the tuner demodulates the signal.

#### **Video Processing**

Fig. 6 shows in block diagram form the video paths within the MSS1000 receiver. Demodulated video from pin 13 of the tuner is fed to pin 3 of the Nicky video processor chip U26 via a C-band switch circuit whose purpose is to invert the signal polarity for C-band operation. It uses four transistors, Q49, Q50, Q51 and Q77.

The video input at pin 3 of U26 is amplified and then passed via pin 2 to the *RC* de-emphasis circuits. There are two of these. One is a dual PAL/D2MAC arrangement. The output from this returns to U26 at pin 1 where it goes to a baseband amplifier whose output appears at pin 22. This signal is further amplified by Q54/5/6 to a level of approximately 1.5V peak-to-peak and is then sent to pin 19 of scart sockets AV1 and AV2. The second de-emphasis circuit is for PAL only. The

Fig. 5: Block diagram of the tuning system.

signal from this one returns to U26 at pin 4, where it's fed via an amplifier to the video source selector switch. This selects either internal PAL video or video from pin 20 of AV1 or AV2.

This switching arrangement provides for two external decoders, either PAL or D2MAC, or different descrambling systems. The baseband video output at AV1 is not suitable for recording, only for feeding another decoder or descrambling system of a different standard. The return video signals from the AV1 and AV2 sockets return to U26 at pins 9 and 8 respectively.

The video source selected by the switch in U26 is passed via the contrast control amplifier to pin 20. Expect about 1.5V peak-to-peak unclamped video at this point with a PAL transmission. The purpose of the contrast control amplifier is to enable the user to adjust the video level should descrambling drop-out be experienced. A normal contrast setting is level 5: below 4 will probably result in unreliable descrambling.

Before we leave U26, note that it contains two phaselocked loop systems for frequency-synthesis tuning, one for the tuner and the other for the modulator (see Fig. 5). Pin 12 receives a 4MHz reference clock signal from U31, which divides by four the 16MHz master clock signal used by U22. Pin 16 delivers a pulse-width modulated waveform to tune the satellite TV channels. This output is not present all the time: it appears in bursts when tuning correction is required and when another channel is selected. A similar arrangement is used for the modulator. The prescaled input from the modulator is at pin 13, the modulator tuning output appearing at pin 14.

The bus connections to U26 are at pins 11 (enable), 15 (data) and 19 (clock).

The selected video at pin 20 of U26 is fed via filtering and phase-compensation networks to the sound trap. Once the audio subcarriers have been removed the video can be clamped, on a line-by-line basis, to remove the energy dispersal signal. The reference level for clamping is set by circuitry within the VideoCrypt decoder. Clamping, to achieve a constant black level, is essential for the correct operation of the decoder.

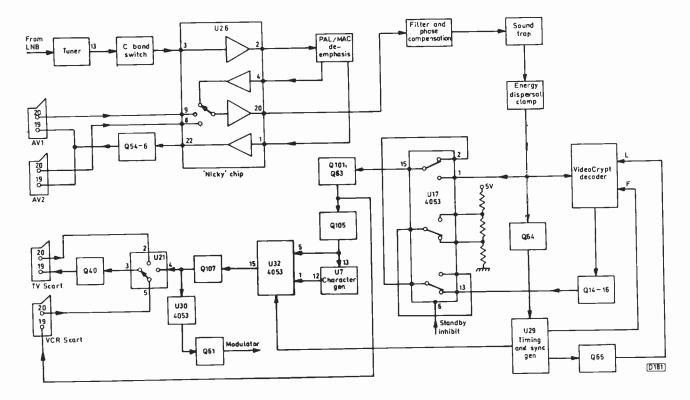

The clamped signal from Q62 is fed to pin 1 of the 4053 switching chip U17 and to the VideoCrypt decoder. We have to draw a veil over what goes on here, since the circuitry is subject to a confidentiality agreement. The clamped video also passes via Q64 to pin 19 of the timing and sync generator chip U29.

U17 contains three independent two-way switches. These are used to select clear or descrambled video and to assist with the insertion of on-screen messages relating to the descrambling operations. Clear video enters U17 at pin 1 and leaves at pin 15. Video that comes via the VideoCrypt decoder enters at pin 13. If selected it emerges at pin 14 and returns at pin 2, again leaving at pin 15. Switching is controlled by the VideoCrypt decoder.

After buffering (Q101) and clamping (Q63), the video signal is passed to pin 19 of the VCR scart socket. This arrangement allows graphics-free video recordings to be made.

#### Graphics

The video signal from Q63 is fed via a further buffer, Q105, to pin 13 of the U50555 on-screen display graphics generator chip U7 – on its way, eventually, to

#### Fig. 6: Block diagram of the video circuitry.

the TV scart socket or the modulator. It leaves U7 at pin 12. Line and field sync pulses are fed in at pins 30 and 31 respectively of this chip. The internal graphics colour generator is clocked at 17.734MHz, four times the colour subcarrier frequency. Character readout is clocked by an *LC* oscillator (pins 4 and 5) at about 7MHz.

U32 is included basically to cater for 'out of hours' operation. Fig. 7 shows the arrangement. In normal operation the video signal enters at pin 1 then emerges at pin 15, where it goes to another buffer transistor Q107. Switching between the inputs at pins 1 and 2 of U32 is controlled by the Station ID line, which is connected to pin 10. This input comes from pin 7 of the timing and sync generator chip U29.

The Station ID line is also connected to pin 33 of the main microcontroller chip U22. When it goes low, U22 generally tells U7 to send U32 a plain coloured screen with the words NO SIGNAL on it. This can be cancelled by pressing F then STORE on the remote control unit. You will then see a screen with noise. When the Station ID line goes high, U22 may instruct U7 to superimpose menu graphics (for tuning etc.) on the picture. By pressing the TV/SAT button, the menu is displayed on a plain coloured background instead of the picture.

When there is no valid video signal the Station ID line goes low. Transistor Q78 then switches off, enabling the composite sync signal from pin 27 of U7 to reach pin 11 of U32. Under these conditions the noise signal from Q105, arriving at pin 5 of U32, is switched through to the output (pin 15) via pins 4, 13, 14 and 2. The sync signal is inserted into the noise,

0 • 22 16 \$R \$442 U32 4053 Video output to Q107 nput from U7 pin 12 video from Q105 Composite sync from U7, 10 6.7,8 Chor pin 27 control from U7. pin 23 D6 R44 078 4k7 470 ٠n 5k6 Station ID from U29, pin 7 D182

which is an essential condition for adding on-screen graphics. Character insertion is controlled by the CHAR input at pin 9. This comes from pin 23 of U7. When it goes high, the peak white input at pin 3 is selected to create the character. The values of R442 and R443 set the white level.

In our description of the complex video path in the MSS1000 satellite receiver we have reached buffer transistor Q107, which leads to the AV and other source switching. This is a convenient point at which to break off. We will take up the video arrangements following Q107 next month.

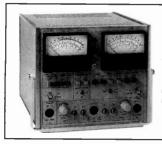

#### Fig. 7: Switching chip U32, which is used to provide 'out of hours' graphics insertion.

#### **ELECTRONIC TEST EQUIPMENT**

Audio - Video - Television - Satellite TV - Telecommunications

The manufacturer who cares about quality & features rather than being lowest in price !

#### Audio Analyser Model AA-930

Multi-function meter. Measures distortion wow & flutter, stereo power, signal levels in & out; generates audio test signals. Features include large clearly marked analogue meters. Performs the work of many individual instruments. £ 498

#### **Television Pattern** Generator

Model GV-698/11

Optional on screen logotype. (Other pattern generators available from £ 210). £ 1428

#### **Television Pattern Generator** Model GV-298

Compact high performance generator, RF and video outputs. Frequency range same as GV-698/11, 37 to 865 MHz. Circle pattern included. £ 433

#### TV & Satellite Level Meter Model MC-360

Ideal instrument for the professional installer of FM/TV aerials and satellite TV dishes. Covers 48 to 856 MHz and 950 to 2050 MHz Lightweight, compact and rechargeable battery operated, £ 599

#### Frequency counters

Models FD-250 & FD-252 FD-250 covers 20 Hz to 160 MHz and FD-252 covers same plus, 100 MHz to 2.4 GHz. Large L.E.D. display. Wide performance at low cost. £ 153 & £ 206

#### TV & Satellite Level Meter Model MC-944 This meter has everything for the top flight installer of aerials, dishes, CCTV, MATV, SMATV and other systems. Features include TV monitor, spectrum analyser, sync pulse,

teletext, printer output, 99 memories, tune

The company has been producing test equipment in Spain for over thirty years, earning a strong reputation for excellent engineering, quality performance at budget prices. The equipment is supported by Alban Electronics from their St Albans facility. These products are suitable for only professional and educational applications.

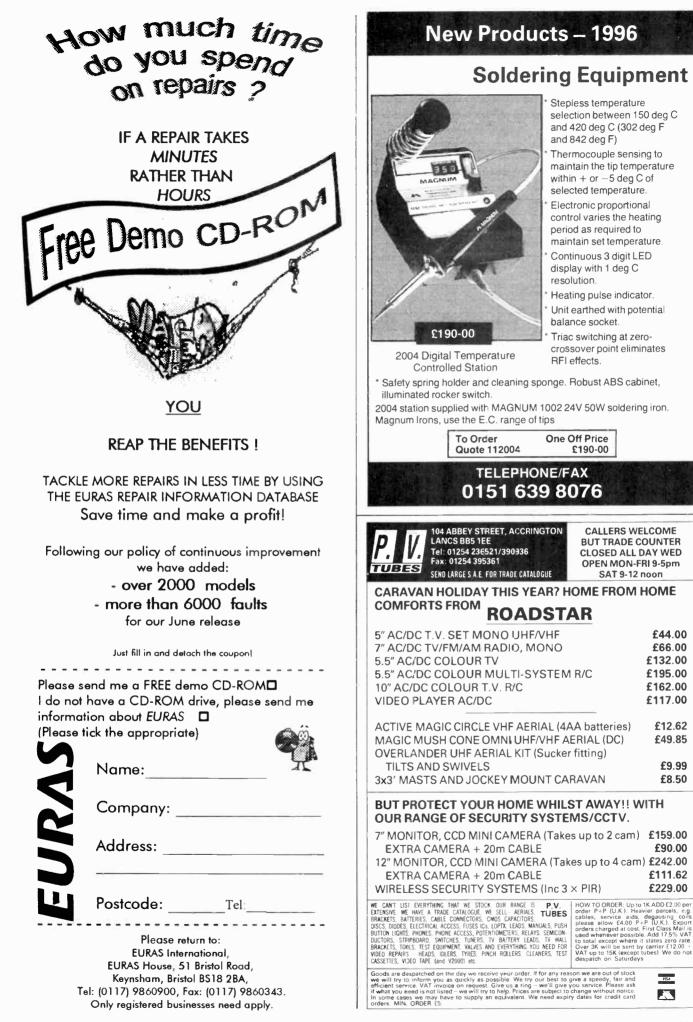

Most items available for immediate despatch.

# Help Wanted

The Help Wanted column is intended to assist readers who require a part, circuit etc. that's not generally available. Requests are published at the discretion of the editor. Send them to the editorial department – do not write to or phone the advertisement department about this feature.

Wanted: Circuit diagram and any setting up information (photocopy OK) for the Chuntex CTX multisync monitor Model CPS1760DF. Dan Shaw, 4 Brentcot Close, Ealing, London W13 8EH. 0181 998 5138. Wanted: October, November and December 1991 issues of *Television*. John Banner, Lydes Road, Malvern, Worcs WR14 2BY. 01684 569 285. Wanted: Loan or hire of operator's instruction manual for the Sharp VC651HM VCR. R.B. Hall, 14 Wakeman Road, Rippon, N. Yorkshire HG4 1SE.

Wanted: Front panel with good pushbuttons for the JVC HR7300EK VCR. Also instruction book and circuit diagram (photocopy OK). A. Ashurst, 62 Westfield Road, Harpenden, Herts AL5 4JU. 01582 767 990.

Wanted: Base and Mumetal screen for tube type VCR97/VCR517 to help with replica TV project. Peter Tomlinson, 34 Strathmore Road, Bristol BS7 9QJ. 0117 951 4755 (home), 0117 924 9231 (office). Wanted: Mains transformer for the Telequipment D54 scope. Have for disposal Granada/Labgear colour-bar generator, Leader LCT910A CRT tester/rejuvenator and BK Precision 467 CRT tester/analyser. Ross Electrics, 1 Church Street, Ainsworth, Bolton BL2 5RA. 01204 524 736 or 01204 521 408.

Wanted: Mains lead to fit Panasonic and Toshiba mains/battery portable sets. One end fitted with six-pin socket. Leon Electronics, 11 Woodend Close, Three Bridges, Crawley, West Sussex. 01293 520 536.

Wanted: Circuit diagram and source of spares for the Pioneer SV2801. S. Akers, 8 Farm Road, Lakeside, Redditch, Worcs B98 8LB. 01527 501 598.

Wanted: STR451 voltage regulator for the Matsui Model 1430. Need not be new. Remote control unit for the Amstrad VCR4500. Michael Payne, 294 Whiteleas Way, South Shields, Tyne and Wear NE34 8HW. 01915 192 848.

Wanted: For repairs to pensioners'

sets. (1) Main PCB for the Panasonic Model TC2175 (Z1 chassis). (2) Main PCB for the Spectrum 128-2 computer (cassette-loading version). (3) Screen for an Advent (Barco) 750E projection TV (used in club). (4) *Radio and TV Servicing* books 1975-76, 1979-80, 1981-82. (5) CRT tester/rejuvenator, any type. Malcolm Lambert, 1 Dundale Farm Cottages, Dundle Lane, Bells Yew Green, Tunbridge Wells, Kent TN3 9AQ. 01892 824 657.

Wanted: Source of spares for the Thorn TV Model CT202T etc. sold by Rumbelows. They don't seem to be available from the usual sources. Have for disposal a new Philips SBC522 colour-bar generator. M.D. Stevenson, 124 Green Lane, Eastwood, Essex SS9 5QJ. 01702 522 929.

Wanted: Lower drum for the Panasonic Model NVG10B. R.J. Evans, JE Electronics, 27 High Street, Lossiemouth, Moray IV31 6AA. 01343 813 913.

Wanted: Circuit diagram (photocopy OK) for the B&O TV type 3119. Also remote control unit or where one can be obtained. M.A. Doody, 5 Mounts Close, Hillslane, Madeley, Telford, Shropshire TF7 4BU. Wanted: Bullet-type BSB LNB as used with BSB compact dish. C. Mitchell, 12 Canberra Road, Bexleyheath, Kent DA7 5SG. 0813 106 227.

Wanted: A76JTS90X08 tube for the Grundig Model M82575. Pat Reveillino, 24 Broom Avenue, Broom, Rotherham, South Yorkshire S60 3NQ. 01709 378 693. Wanted ECC85, ECH81 and ECL86 valves and 7V, 0·3A dial bulbs for the Arkansas stereo radiogram type 807405, made in Germany. V. Alexis, 12 Pearcroft Road, Leytonstone London E11 4DR. For disposal: Several Philips VR2020 VCRs, some working, all

free. Also quantity of service manuals, mainly Nat. Panasonic. Sony and Philips audio all dating from the mid Eighties. Again free. R. Lucas, Heather View, Dorking Road, Tadworth, Surrey KT20 5SA. 01737 812 703.

Wanted: Mains transformer for the VideoCrypt SVA1 decoder. Also most copies of Television for 1984-1991 inclusive and the January 1992 issue. T. Milverton, 121 Borrowdale Road, Northfield, Birmingham B31 50L. 01214 772 044 (evenings). Wanted: Circuit diagrams (photocopy OK) for the Rediffusion RSR50 satellite receiver and RDC50 driver control. H. Douglas, Craigandonna, 1 William Street, Gourdon by Montrose, Scotland DD10 0PS. 01561 361 529. Wanted: Complete working or nonworking Panasonic NV780EM VCR for spares. W. Parris, 6 Knappers Way, Brandon, Suffolk IP27 0DA. 01842 811 793. Wanted: On/off switch for the Ferguson 38030 mono portable (1590 chassis). D.J. Maule, 58 Greenhill Way, Shirley, Solihull, W. Midlands B90 3PX. 01217 338 629. Wanted: Any information (circuit diagrams etc.) for ICL OPD units. John Savery, Unit 6, Kellys Farm, Birdham, Chichester, W. Sussex. 01243 514 188. Wanted: Remote control handsets for the Dual Model TV5504 CTV and the Sony Model SLV415 VCR. R. Askew, 17 Coltishall Avenue, Bramley, Rotherham, S. Yorks S66 OSR. 01709 546 396. Wanted: VHF/UHF versions of the tuner/IF panel (06) and presetter panel (07) used in some JVC/Ferguson HR7200/3V29 VCRs and clones (e.g. the Telefunken VR520). Ex-equipment will do. Brian Renforth, 174 Helmsley Road, Sandyford, Newcastle-Upon-Tyne NE2 1RD. Wanted: Scan coils for the Amstrad TVR3. Any reasonable amount considered for just the coils or the coils plus an old tube. The tube fitted is an Amstrad 510UFB22-TC and the coils bear the label YS-60250K. D.R. Bracknell, 9 Tweed Close, Farnborough, Hants GU14 9NF. 01252 513 062.

#### Answer to Test Case 402

#### - see page 549 -

Compared with the other sections of a VCR, the signal-processing and record amplifier circuits give very little trouble. As a result they are perhaps less well understood. It's also a fact that the manufacturing precision now achieved with mechanical and electrical components can sometimes lead technicians to neglect the few set-up adjustments provided in a modern machine – in the VCRs of a decade or more ago, a great deal of adjustment and setting up was required after component replacement or a repair.

The colour-under signal uses the luminance FM carrier as a bias signal for recording on the tape. Thus the luminance carrier drive level is as important for correct chrominance signal recording as the record bias level is in linear audio recording and playback systems. The cause of the patterning with the Panasonic NVSD40 was excessive 'bias': the luminance record current level had not been checked and was too great. With the luminance carrier set to the correct level of 130mV peak-to-peak, colour recording and playback were interference free. The technician had come so close to getting it right when he'd checked the chroma record current level!

Why was the patterning stronger during the first ten seconds of each recording? Because the luminance record current is automatically boosted during this time to minimise the visibility of colour patterning caused by any previous, overwritten recording.

## NEXT MONTH

#### **SERVICING THE MITSUBISHI EURO 6 CHASSIS**

John Coombes provides servicing guidance on these sets, which include Models CT2145BM and CT2146TX.

#### **ZENER DIODE TESTER**

Zener diodes are a common cause of faults, but can't be checked with a multimeter. They may test OK in the forward direction but stabilise at the wrong voltage or not at all. Michael Dranfield's tester applies a current-limited high voltage, displaying the actual breakdown voltage – to an accuracy of 0.1V – on a liquid-crystal display. A very helpful addition to the workshop facilities.

#### **TOSHIBA SERVICE BRIEFS**

Latest TV and video know-how from Toshiba Technical.

#### **AERIAL RIGGING**

Maybe you would like to add this to your TV/video business? In a follow up, John Pitt-Francis describes what you will need.

#### TELEVISION INDEX/DIRECTORY AND FAULTS DISCS PLUS REPRINTS SERVICE

#### INDEX DISC

Version 4 of the computerised index to TELEVISION magazine covers Volumes 38 to 45 (1988 – 1995). It has thousands of references to TV/VCR fault reports and articles, with synopses. A TV/VCR spares guide, an advertisers list and a directory of trade and professional organisations are included. The software is easy to use and very quick. It runs on any IBM or compatible PC with 512K RAM and a hard disc.

## Price £30 (3.5"HD, alternatively 3.5DD" or 5.25" if required)

Those with previous versions can obtain an upgraded version for £15. Please quote the serial number of the original disc.

#### FAULT REPORT DISCS

Each disc contains the full text for TV, VCR, camcorder, satellite TV and CD fault reports published in individual volumes of TELEVISION, giving you easy access to this vital information. Note that the discs cannot be used on their own, only in conjunction with the Index disc: you load the contents of the Fault Report disc on to your computer's hard disc then access it via the Index disc. Fault Report discs are now available for:

Volume 41 (November 1990 – October 1991) Volume 42 (November 1991 – October 1992) Volume 43 (November 1992 – October 1993) Volume 44 (November 1993 – October 1994) Volume 45 (November 1994 – October 1995)

Price £15 each (3.5"HD, alternatively 3.5"DD or 5.25" if required)

#### REPRINTS

Reprints of articles from TELEVISION back to 1986 are also available: ordering information is provided with the index, or can be obtained from the address below.

Hard copy indexes of TELEVISION are available for Volumes 38 to 45 at £3.50 each.

All the above prices include UK postage and VAT where applicable. Add an extra £1 postage for overseas EC orders, or £5 for non-EC overseas orders. Cheques should be made payable to SoftCopy Ltd.

Allow 28 days for delivery (UK).

#### SoftCopy Limited, 1 Vineries Close, Cheltenham GL53 0NU, UK.

## RECRUITMENT

## Kidderminster, Bridgwater, Bedford, Macclesfield, Burnley, Leeds, Kendal, Poole. AUDIO/VISUAL BENCH ENGINEERS

We're looking for people who really stand out!

NORWEB is one of the leading electrical retailers in the country with a large chain of high street shops and out-of-town stores.

We have vacancies for Bench Engineers based at the above stores and a variety of field positions based throughout the country.

You will use your technical skills to ensure that all customer and stock repairs are carried out quickly, accurately and with the minimum of fuss. However this is only part of the story: a lot of your time will be spent with customers, talking over any A/V problems they may be experiencing and offering advice and reassurance in a friendly and sympathetic manner. Therefore your role is crucial to maintaining our current high standards of customer service.

To fill this role to its full potential demands a special blend of experience and skills You will need to be a fully qualified engineer with well developed communication skills and the motivation and enthusiasm to deliver your best at all times.

You will work a 39 hour, five day week spread over six days, which includes every Saturday and two late evenings. Because we value highly the skills and commitment you will bring to the role, we offer a competitive salary, excellent holiday allowance and generous staff discount. You would expect nothing less from NORWEB Retail, one of the country's leading electrical retailers.

If you are interested in these positions, please send a full CV outlining your experience and current salary and stating preference for Bench or Field, to: NORWEB Retail Personnel, PO Box 148, Manchester Road, Bolton BL3 2SW no later than Friday 31st May 1996.

Applications will only be acknowledged on receipt of an S.A.E. If you have not heard from us within three weeks of the closing date, please assume that you have been unsuccessful.

Equal consideration will be given to all applications, irrespective

of sex, race, creed or disability. To support a healthy working environment NORWEB operates a No Smoking policy.

T15063
