TRIO
5 Band SSB/CW Transceiver TS520
The transceiver with everything
The TS520 System
TRIO have now completed the first stage of the total system concept for amateur radio equipment. With the TS520 and its associated accessories, the amateur radio operator can assemble a station to suit any or all requirements for his hobby enjoyment. All modes and all bands, fixed and mobile/portable are provided by the TS520 system.

SSB/CW Transceiver TS-520
A real "compact", powerful, rugged and reliable. It has everything which otherwise is available only as an accessory at extra cost; built-in power supply for fixed-station use, transistorized DC/AC power converter for mobile operation, loudspeaker, fixed-channel provisions, VOX control, etc. And these are the TS-520's special features in short format:

Versatile Transmit- and Receive Operations—USB, LSB and CW on all radio amateur bands from 80m. to 10m., and—with the aid of the 2m.-Transverter TV-502—also on the VHF-band from 144 to 145.7 MHz, as well as fixed frequency operation on four channels. The TS-520 also allows reception of WWV stations on 10 MHz for dial calibration. By adding the External VFO-520 (optional) the TS-520 demonstrates utmost versatility: independent RX- and TX operation with different frequencies, transceive operation with slightly variable RX frequency by means of the built-in RIT circuit (Receiver Incremental Tuning) plus fixed channel operation totalling nine different combinations.

Advanced Circuitry—With the exception of the transmitter driver and final stage which are equipped with blower-cooled vacuum valves of type 12BY7A and 2 x S2001 the TS-520 is fully transistorized. The semiconductor complement consists of 44 transistors, 18 FETs, 1 IC and 84 diodes. The reliability and stability of this circuit has been substantiated by numerous contests and during rugged mobile operation.

Outstanding Receive and Transmit Performance—The transmitter section of the TS-520 features separate driver, plate and final tuning, a 2-stage ALC circuit for local and DX operation, thus assuring undistorted clearly legible TX signals even after hours of continuous operation. Provisions for linear amplifiers, such as ALC input, antenna relay switching output, etc., are available and ready for use. Dual-gate MOSFETs are employed in all critical receiver circuits to improve the input sensitivity, cross-modulation response and spurious rejection. An 8-pole SSB crystal filter in the IF amplifier provides exceptional selectivity and stability. An optional 500Hz CW filter is available as an accessory and can be installed at any time. The switch-selectable time constant of the AGC assures perfect reception of SSB and CW signals.

Precision-type VFO—a feature of all TRIO receivers, transmitters and receivers also contributes to the supreme performance of the TS-520. The VFO is fully encapsulated and is controlled by a meshedgear dial drive (reduction ratio 4 : 1). Dial accuracy is better than ±1 kHz, frequency drift will not exceed ±100Hz per hour. Dial calibration is accomplished by means of a built-in 25 kHz crystal marker oscillator.

Built-in Power Supplies—for fixed station use with 120/240 VAC 50-60Hz line voltage or for mobile operation with 12-13.8 VDC by means of the built-in DC/AC converter.

Loaded with Extra Features: threshold-type RF gain control; semi-break-in circuit with sidetone; VOX/PTT/MOX-control; RIT; TUNE switch; LED function indicators for RIT, VFO and FIX channel operation; WWV receive pushbutton; 4-position fixed channel selector switch; built-in 25 kHz crystal marker oscillator; two-stage AGC; multi-function meter; terminals for optional accessories such as: 2m.-Transverter TV-502, External VFO-520, External Speaker SP-520, linear amplifier, headphone, microphone and key.

OPTIONAL ACCESSORIES
EXTERNAL VFO-520
Developed exclusively for the TS-520, this external VFO fulfils the same functions as a separate transmitter and due to its numerous cross-fitting and split frequency features. Design and specs. of the VFO-520 are identical to those of the TS-520's built-in VFO. It operates on oscillator frequencies between 4-9 and 5.5 MHz. Remote control and power supply are furnished by the TS-520 by means of a special interconnecting cable. In conjunction with the transceiver the VFO-520 provides a total of nine different operating modes, including RX or TX operation with continuously tunable frequencies and fixed-channel operation.

2m. TRANSVERTER TV-502
This new addition to the TS-520 accessory line extends the transceiver's scope of application to include the 2m.-VHF range which is becoming more popular every day. The TV-502 converts the 10m.-band to 144-145.7 MHz for SSB and CW operation. By installing an optional 39 MHz crystal, the TV-502 will also cover the range between 145-0 and 146-0 MHz, thus making the entire 2m. band available for the shortwave radio amateur. The unit features preselector tuning on the antenna side and IF tuning by means of a multi-gang capacitor, utilizing the TS-520's ALC meter for tuning control. The TV-502's transmitter is controlled by the ALC voltage supplied by the transceiver and provides 10 watts RF output power. The highly sensitive receiver section responds to input signals of less than 0.5µV. Like the TS-520, this transverter can also be used for fixed or mobile stations, operating either from 120/240 VAC, 50-60Hz line voltage, or 12-13.8 VDC supplied by a car battery.

EXTERNAL SPEAKER SP-520
Styled to match the TS-520 accessory line, this 5in-speaker will greatly improve the readability of RX signals, especially in DX operation. Voice coil impedance is 8 ohms, frequency response from 100 to 5,000Hz.

LOWE ELECTRONICS

TR2200G
The most popular 2 metre handy transceiver in the world. 12 Channels 144-146 MHz. 1W Tx. O/P. Tuning fork 1750 Hz access tone. Complete with carrying case, microphone, battery charger and fitted 520, 522, R7 crystals.

£80 VAT EXC.

TR7200G
The finest mobile FM transceiver at any price. 22 Channels 144-146 MHz. 10W/1W O/P. Tuning fork 1750 Hz access tone. VFO available. Complete with mounting bracket, microphone, power leads and fitted 520, 521, 522, R6 and R7.

£130 VAT EXC.

TR3200
The newest FM handy transceiver. 12 Channels 430-434 MHz. 2W/400mW Tx. O/P. Tuning fork 1750 Hz access tone. Complete with all accessories as TR2200 and fitted 3 channels.

£130 VAT EXC.

How does the average chap know how to choose the dealer from whom to buy his equipment? Let me quote below the opening page of our catalogue for 1966 which was written by Bill when he laid down the basic rules by which we still run the business. The ensuing blah is designed specifically to get between you and your wallet—which, let's face it, is the object of advertising. Just how successfully I will be rather depends on whether you believe the aforesaid blah or not. After all, why on earth should you buy from me—my prices are in general about the same as anyone else's (although some things are cheaper), I don't allow any discounts nor do I cut prices, nor give fabulous allowances on trade-ins. On the face of it, I'm a dead loss and you'd be much better with "Honest Sam" who gives a good discount. However, I differ from "Honest Sam" in one or two small points. Firstly, I never, under any circumstances, ever sell anything I am not convinced in good value for money. Many's the time I've been asked for equipment which I know to be inferior and had to turn good money away because I refuse to sell it. Many's the time a chap has wanted to trade inferior equipment for new, recommended stuff. I've lost the sale because I refuse to accept inferior stuff in the trade. Even though I know I could easily sell it to some poor mug. This means that you can come to me confident that you'll not get "sold a pup." Secondly, everything I sell has an unconditional money back guarantee—if you don't think it is good value for money, you get your money back without question! Thirdly, everything I sell carries a guarantee and I have the service facilities to back it up. If you're buying fairly complex gear, by all means buy it from Honest Sam and get a quid or two off for cash, but what happens when it goes on the blink? I'd like to bet Honest Sam just doesn't want to know. I am the actual importer of virtually everything I sell and I carry spares and what I haven't got I can soon get through our Agent in Japan. (Oh yes, we actually have an Agent on the spot.) In the few years I have been in business I have built up a reputation for only supplying excellent, fully tested, trouble-free gear at a reasonable price and it is a reputation I'm not anxious to lose because it's my bread and butter. The defence rests. Whether or not you believe me is up to you, but you can perhaps check by talking to someone who has bought something from me (there are one or two kicking about!). Finally, do beware of "fabulous bargains"—I've yet to see one!

UNIDEN
MODEL 2020
SSB/CW/AM
TRANSCEIVER

We are proud to introduce the very newest in all band, all mode transceivers—the UNIDEN Model 2020. This is an all new rig with a refreshing new approach to amateur radio operating. Fully self-contained for operation on Ac mains or 12v. DC mobile the 2020 uses the very latest design techniques to give superlative performance. Plug-in modules for reliability, optimum circuit isolation and easy servicing.

★ FULLY SELF CONTAINED The 2020 has built-in AC/DC power supplies, CW filter, noise blanker, marker oscillator and PA blower.

★ NEW DIAL READOUT An original combination of digital and analogue displays giving direct readout without counter noise problems.

★ RUGGED PA Uses a pair of 6146B tubes with stabilised screen supply and amplified ALC system.

★ SUPERB CROSS MODULATION AND IMAGE REJECTION Receiver is pre-mixed single conversion using a phase locked loop oscillator circuit. It has excellent signal handling characteristics and uses three filters for USB, LSB and CW.

★ INDEPENDENT RF CIRCUITS Transmitter and receiver RF circuits are electrically separate providing no-compromise performance.

★ DUAL RIT CONTROL Giving two tuning rates for quick scanning or very precise fine tuning—a UNIDEN exclusive feature.

See the UNIDEN 2020 at your local amateur radio stockists. You will have to admire the thought that went into its design.

Price £380 (VAT excluded). External VFO £82 (VAT excluded)

OTHER PRODUCTS As well as the exciting new UNIDEN range of equipment we offer the complete NIHON DENGYO line of SSB and FM, amateur and marine transceivers and receivers; HALLICRAFTERS products; TONO linears; valves; crystals, filters; station accessories; HY-GAIN antennas; RAK antennas; plugs, sockets and cable; in fact everything that a radio amateur may require.

February, 1976
During the last twelve months the popularity of the range of equipment by S.T.E. has been growing. The ARAC 102 receiver has been a "Best Seller" (have you seen any second-hand?). Later in the year the Atal Transmitter came into stock and all reports have been good. Now we are offering the complete range of modules for the D.I.Y. enthusiasts. Transmitters, receivers, etc. The construction of these modules are first class—the P.C.B’s are the finest we have ever seen.

Price List (includes postage)
ARAC 102 Receiver ... £108.00
Atal 228 Transmitter ... £147.00
AR10 Receiver Module ... £37.50
AA1 Audio Amplifier ... £4.40
AD4 FM Discriminator ... £4.86
AL8 Linear Amplifier ... £29.00
AT22 Transmitter ... £55.50
AR20 C.C. Receiver ... £57.50
AT23 C.C. Transmitter ... £39.00
AS 15 Stabilised psu D.C. ... £10.00
AG 10 Tone Generator ... £4.75
AC2A Convertor 28-30 MHz £23.00

AR10 Mosfet receiver. 28-30 MHz Double conversion superhet. RF and amplifiers stages are gate protected mosfets for good sensitivity and low intermodulation. Noise limiter and squelch circuit. AM, SSB and CW reception. 12v. DC.

AT 222. A complete transmitter exciter unit for 144-146 MHz on AM or FM, VFO controlled or fixed channel operation. Complete with microphone pre-amp, speech processor including active audio filter, 1 watt output. FM -25 watt AM. Output impedance 50-75 ohm adjustable. Frequency deviation 3-10 kHz adjustable.

AR20. 12 channel FM receiver 144-146 MHz. Input impedance 50-75 ohm. AM-FM modes. Sensitivity 0.2uV AF output 3 watts. 12v. DC operation.

AT23. 12 Channel FM Transmitter. 3 watts. 144-146 MHz. Frequency deviation 3-10 kHz adjustable. 12v. DC operated AF input sensitivity 2mV adjustable to 50 mV.

WESTERN FOR TEST EQUIPMENT

VALVE VOMETER, TE-45

*With new 6" full-view meter
*Compare it to any peak-to-peak V.T.V.M., made by any other manufacturer at any price.

Specification: DC V: 0-1-5-15-50-150-500-1000V. (using HV Probe, up to 3kV.). AC V: 0-1-5-15-50-150-500-1500V. RMS. 5M-14-40-400-400-4000P. Resistance: Rx 10-100-1K-10K-100K-1000M(ohm). Decibel: -60db to +65db. Power source: 105-125, 220-240v, AC, 50/60 Hz. 1w watts. employs a 1Xtal socket and can be used as below: (a) self-calibration, (b) Marker generator.

RF SIGNAL GENERATOR, TE-20D

*Factory calibrated and tested
*Dual output RF terminals
*Separate Variable Audio Output

Specification: Freq. range: 120 kHz-50 MHz (7 bands). Freq. accuracy: ±2%. Audio output: to B volt. Internal modulation: 400kHz approx. Tubес: 12BN7A, 6AR5. Power source: 105-125, 220-240v, AC, 50/60 Hz. 1w watts. employs a 1Xtal socket and can be used as below: (a) self-calibration, (b) Marker generator.

Compare your ANTENNA ROTOR with the new EMOTO ROTOR.
The CQ-110 (300W PEP) and the CQ-301 (3kW PEP) represent highest communication standards for radio amateurs today. The CQ-110 using the 7360 beam deflection tube as mixer guarantees highest cross-modulation for your QSO.

With CQ-301 in combination, you have the most outstanding signal of any place in the world. Only a big company like NEC with their 85 years' experience in communications can give such features.

Credit where credit is due!

When prices are rising fast it makes sense to consider credit as a hedge against inflation. Purchase by Barclaycard or Access and your rig will be delivered within 24 hours of your phone call. What's more, you will normally not have to pay for your purchase for at least a month. Alternatively you can take advantage of our extended credit plans which require only 20% deposit and up to 30 months to pay. If you hold a UK call-sign then we can arrange credit immediately. Our showroom at Hockley is open from Monday to Saturday (ex Wednesday afternoon) and parking is free in the large car park at the rear of our premises.

UK IMPORTERS OF

ICOM

Who knows what 1976 will bring? Will the pound continue to fall deeper and deeper into the abyss with the consequent increase in the cost of imported goods or will the impossible happen and VAT go back to 8%? Whatever happens there is no doubt that the name ICOM will be increasingly associated with UHF and VHF amateur equipment for its sheer reliability and quality, and THANET will be the name associated with ICOM as the company who have done most to introduce ICOM and who can offer the follow-up service which is so important when you are spending so much money on a black box. Look again at the range:

IC-22A The channel mobile rig with the 10 most useful UK channels already fitted. All the UK repeater channels are there plus five useful simplex channels. The automatic tone burst, devised by THANET, which only works on repeater channels, is fitted and this is now CRYSTAL CONTROLLED to ensure that it is at least as stable, if not more so, than the repeater it's trying to access.

IC-201 £397.50 (with VAT)

IC-3PA The companion power supply for ICOM mobiles. Features electronic overload protection, excellent regulation plus an extra forward facing speaker. Supplied with a quick-release mounting bracket which holds all current ICOM mobiles. £46.87 including VAT.

IC-20A The up-to-date state of the art transceiver for 70 cm. mobile or base station use. The same size and appearance as the IC-22A with the exception of the depth front to back which is 93/4in. because of the generous heat-sink. It has a very sensitive receiver (0.5 uV for 20 dB quieting) and a full 10 watts of well tailored FM. Supplied fitted with 433-200 and crystals for UK simplex and repeater channels when these have been finally decided upon by the RSGB VHF committee. £259.00 including VAT.

CRYSTALS for ICOM equipment. £5.63 per pair, £3.12 singles.

NEW ITEMS FROM THANET

CTB-I A crystal controlled automatic tone burst with facility for automatic triggering from selected channel positions. Designed by us for ICOM equipment but usable with many other makes. Size 70 x 20 x 18 mm. high. £8.00.

REVCO mobile antennas. An excellent range of 3/4 antennas with a stainless steel whip and neat loading coil. The magnetic base is a beauty. All aerials are of the hinged mount type:

**YAESU with 2 Year Guarantee Only from SMC**

With confidence born of long experience in Yaesu quality, S.M.C.'s guarantee (from the 1st February until further notice) is extended to 2 years covering both labour and free components (excluding valves and semi-conductors).

**Free Delivery within 24 Hours**

For Yaesu items over £55 by Securicor (B service). Over £5 post free.

**The Largest Range Ex-Stock in the UK from SMC**

**Send for Free 18 Page Yaesu Catalogue and 22 Page Stock Price List**

---

**FT250 New Two Metre Transverter**

Styled to match the '101' range (114" x 82" x 6"), solid state throughout. Sensitive receiver converter with good image rejection and front panel controlled R.F., gain, 10W P.I.P. (A3 and A1), 4W (A3 and F3) with metered power output and drive level (typ. 3V, RMS at 29 MHz).

---

**Two Metre FT21**

The FT21 is the multimode USB LSB, AM, FM, CW (with semi break-in and side tone), 2m. transverter offering the choice of: phase locked VFO or 44 crystal channels, simplex or repeater (600 kHz up and down shifts), with unique "double push" auto tone burst, mains or 12v. (1A) operation, excellent selectivity 556 ± 2 kHz (15:1 S.F.), or FM (12 kHz). Front panel adjustable VOX and mic gain, a calibrator (1 MHz±10), 1 kHz readout and linearity, sensitive squelch, battery charger, and battery charger (140 mAh) battery, switchable "B" and centre zero tuning meter, noise blanker, serviceable plug-in boards all contained in 11" (14") x 5" x 11", 22 lbs. rigid package.

---

**Digital Frequency Meter**

The YC355 counts from 5 MHz to 35 MHz. The D model's prescaler extends this range to 200 MHz. The ingenious design offers: a dual range system (prescaling eight digit readout but using four cold cathode tubes) and operation from mains, or 12v. DC at the flick of a switch. The accuracy offered is ±0.5% (1 MHz when using 20 MHz, 0.1% on 100 MHz). Input impedance is switchable 1 Mohm or 50 ohm (BNC socket), construction is on a double sided epoxy board. Size 8" x 3" x 11" (12"), weight 7 lbs.

E. & O. E. VAT Reg. No. 239 4864 25
Complete the coupon and we'll send you our complete, new catalogue.

The new Heathkit catalogue is now out. Full as ever with exciting, new models. To make building a Heathkit even more interesting and satisfying.

And, naturally, being Heathkit, every kit is absolutely complete. Right down to the last nut and bolt. So you won't find yourself embarrassingly short of a vital component on a Saturday evening—when the shops are shut.

You'll also get a very easy to understand instruction manual that takes you step by step through the assembly.

Clip the coupon now (enclosing a 10p stamp for postage) and we'll send you your copy to browse through.

With the world's largest range of electronic kits to choose from, there really is something for everyone.

SSB Transceiver  CW Transceiver  Synthesised 2 metre FM Transceiver

Including our full range of test equipment, amateur radio gear, hi-fi equipment and many general interest kits.

So, when you receive your catalogue you should have hours of pleasant reading.

And, if you happen to be in London or Gloucester, call in and see us. The London Heathkit Centre is at 233 Tottenham Court Road. The Gloucester showroom is next to our factory in Bristol Road.

At either one you'll be able to see for yourself the one thing the catalogue can't show you.

Namely, how well a completed Heathkit performs.

Heath (Gloucester) Limited, Dept. SW-26, Bristol Road, Gloucester, GL2 6EE. Tel: Gloucester (0452) 29451.

The new Heathkit catalogue. Out now. FREE.

To: Heath (Gloucester) Limited, Dept. SW-26, Gloucester, GL2 6EE.
Please send me my Heathkit catalogue. I enclose a 10p stamp for postage.

Pollution

The current national and international concern with the problems of pollution covers a wide field—there is even talk of a condition described as people-pollution, and we all know what that implies.

Nevertheless, not yet touched upon are the phenomena which are of considerable importance to all interested in radio communication—and those are the many ways in which the ether has been polluted, and is becoming steadily more so.

All over the country, there are overhead power systems, working at voltages from 6 kV to 400 kV, spewing out sharp and causing severe interference over wide frequency areas, from LF to VHF. Much of this trouble is due to faulty jointing or ineffective insulation, the medium-voltage lines apparently causing most of the trouble, because of having been built with insulators not suitable for all conditions of weather.

But there are plenty of other sources of ether-pollution—from the main-line electric trains with their shoe-collectors, or pantographs fizzing and spluttering against the 25 kV overhead conductors, to next-door's latest electric drill-set (complete with accessories) used with great enthusiasm on Sunday mornings. Between these two extremes are innumerable rotary machines of every sort, size and description, many with dirty commutators of faulty slip-rings; a vast display of flashing electric signs; and many millions of cunning thermo or relay-controlled devices—all totally unsuppressed.

The end-product of all this activity is that the country as a whole is subjected to a general level of electrical noise which tends to rise and fall as the weather changes, affecting telecommunication circuits of all sorts—including, of course, the amateur bands.

This situation tends to get worse and a great deal needs to be done to improve the present state of affairs even marginally. It is evident that pollution of the ether needs to be looked at just as closely and treated quite as seriously as any other sort of pollution of our environment.

Most of this has been said before—but it needs to be said again and again, and repeated with emphasis. While obviously we can never hope for a totally noise-free ether, all authorities should have measures in hand to alleviate those conditions for which they can be held responsible. The Post Office Interference Branch already do a wonderful job in this context, involving much painstaking investigation of individual cases—but the point is that the situation should never have been allowed to arise in the first place.

Austin Forsyth, G6TO
No doubt for many of us this month, the preoccupation is with the repair of aerials after the gale of January 2, the evening after which produced some amusement hearing someone enquiring “Who’s the only station in the county with his aerial farm intact?”—if that was the picture inland one shudders to think of the coastal areas’ aerial problems in such winds even without the heavy tides and flooding.

However, chez ‘KFE, the aerial arrangements all withstood the test (though one was a bit surprised at the 28g. Top-Band half-wave surviving—luckily the gale was from the South-West which favoured its chances); the 14 AVQ which has been up six years wavered about like corn in a breeze but nothing more, and the others are all indoors. And the gale with the accompanying rain did one useful service in revealing at last to human gaze a hole in the roof which had for long eluded this one’s bleary old eye; this gave us reason to latch on to the son-in-law and send him aloft for repairs, and to advise him that all the 14AVQ radials could be renewed while he was about it.

The Bands

Still the sad slide to the bottom of the sunspot cycle goes on; when W4UMF says “High Normal” things are tolerable, but when he says “Low Normal” (which seems to be most of the time!) the only applicable word, at HF anyway, is “Ugh!” But still things go on, in a quiet sort of way, and people with initiative “do things” to their aerial systems so one hopes we’re being radiating a constant signal whenever signs of life are apparent in the favoured bands. And of course, down on Top Band and Eighty the evenings are not devoid of activity for those who are paid-up members of the Order of Boiled Owls, that being what they look like next morning!

Eighty

The CW end, when the writer inspected it occasionally, seemed to be largely its own inscrutable self; as for the Phone section, G3KFE just didn’t have the nerve to look at it! In terms of QSOs, however, it was largely a question of noting that DX was about, but working Europeans only, the long-wave being such that its major lobes on Eighty all seem to be in the wrong directions, and the DX so weak as to be almost uncopiable.

GW4BNLE (Newport, Gwent) makes a welcome return to the scene, he having moved QTH with the resulting QRT for all but a year while things were sorted out, at least as far as our bands of interest were concerned. The planning permission came through in a couple of months with no fuss whatever (a bit different to the ado over this at the old place!) and now there is a TH3 Mk III atop a Versatower at 70 feet, which can be cranked down to 28 feet when necessary, and also dipoles strung up inverted-Vee fashion with the apex at about 60 feet. The 80m. one has not been all that good so far, it seeming to prefer U.K. and Europe instead of the low-angle radiation for DX. Nonetheless, SSB raised A4XX, OX300, VE1A1H, VP1BJ, VP9G, VP98X/MM (off CN8), YV5ANS and ZL2BT, with JA’s heard, long-path, around 0820z but not actually raised.

GW1LU (Reading) just yet another to return to the fold; for him Eighty has been mainly CW although, as he says, he is using SSB for about 20% of his contacts but as yet doesn’t quite ready to apply it to the DX chase after so many years of CW. Thus, most activity was working the regular U.K. crowd, albeit not so many QRP types as usual. DX was also looked for, and QSOs made with U4WWS, VP2MKl, XN1KE and EASE1 for a new country on the band. Harold collected his second DXCC during 1975 (his first one was as ZD4AM), and now has started all over again to go after the new CW-only DXCC, which is a bit sad when one reflects that G2HLL’s previous efforts were both in fact CW-only! On a different tack again, the Trio T5-520 has so pleased him that in 1975 G2HLL made more QSO’s than in any previous year; and to go with the rig, there is now an e-bug—the e-bug has now house-trained G2HLL in using it competently, and it is proving to be a pleasure to drive.

Eighty for G2NJ is mainly the QRP scene these days, as it is indeed for so many of us; an interesting one—and a bit of a rarity at that was a CW QSO with DL6FU/M who was in Hamburg, time midnight. Another one was G3GET in Sittingbourne, who, it appears, has a garden 30 feet square and a mast nineteen feet high; within this unpromising constraint, G3GET has 70 feet of wire bent to a triangle shape with which he gets out well in accordance with his call; it appears that just about anywhere within a radius of 200 miles is workable with one watt from an ECO-PA arrangement; although G3GET is both modest and truthful when he remarks that a lot seems to depend on the chap at the other end of the QSO.

Nice to hear again from GM1FR (Balitound, Shetland) who has been launching out and now has five watts to offer the aerial on all bands, both CW and SSB, which was used on Eighty to get down into mainland GM; Sam is very much of the opinion that we ought to run a table based on countries worked with QRP as an incentive to do more activity, he himself having so far worked thirty countries, mainly on 14 and 21 MHz. There is also a QSO rig in the shack, by the way of a Swan 350, with which other DX is chased.

G3CED (Broadstairs) has a note about the old adage “It’s an ill wind...” referring to the Big Blow. It seems that the mast at the G3VFA station whipped rather a lot and as a result removed the feeder from the Joystick up top and created the necessity for dropping the mast completely. As a result the attempt was made to use the Joystick horizontal on top of something-or-other in the shack, with which George frankly expected nothing but fruitless calling, considering his three hundred milliwatts. Instead he was surprised to receive reports of 599 from UK2WAF and 559 from DK7BI on Twenty although, as he says, Eighty and Forty may be a different tale—but at least his should give some heart to the council tenants and others in all-aerials-banned situations. Prior to the gale, George had sent in quite a long log, but this time we noticed he had more or less deserted Eighty in favour of the HF bands, save for the semi-local ragchew type of QSO.

The note about G5DX/P last time prompted G5DX himself—or, rather G5DX (Hollywood) to drop a line and let us know what it was all about. Seems he and his XYL were summoned for “domestic duties” when the third grandchild was due to make an appearance; having arrived, he was dismissed to play with his radio while the distaff side got on with the more important business—said important business duly arrived and already has QSO lung-power (though maybe not quite T9x7). Anyhow, the gear was the 62 Set in a Maxi, either to an inverted-Vee or a very low end-fed 66-foot, from a site at the side of the road about 7 kilometres NNE of Ponteland, Northumberland. Three photographs were enclosed—sadly not contrasty enough to reproduce—showing the gear as it was set up on a previous (similar) occasion; interesting enough, the station then
The well-equipped station of Archie MacConnachie, GM4ECI, 24 Meteor Row, Leuchars, Fife, who was licensed in May 1975 and has gear for all bands—and a Morse key as well as a microphone! To check it all out, and himself, he spent the whole Christmas holiday on the air, working 43 countries.

was at the site of a Roman signal station at Vindolanda on Hadrians Wall, where a call was received from G3TWG.

**Forty**

Things still seem to be happening on this band, though few people write about their goings-on. It is very noticeable at G3KFE that when the Top Band end-fed half-wave is energised on Forty, it yields far less in the way of DX CW signals than the 14AVQ even when the latter has only one radial operational for Forty; indeed, the L/W could be said to be utterly useless on this band for other than European QSO's, and even then not at good strengths; the feed point of the 14AVQ is at the same height within a couple of inches as the span of the end-fed, which latter runs East-West as near as makes no odds.

G2HKU (Sheppey) is still building gear—however, Ted did find some little time on the air, and on Forty there was a CW contact with YV1AVO.

G4WBLE hasn't worked anything on Forty for the very simple reason that he hasn't operated the band! The problem here is with the inverted-Vee, of which the balun is playing up and producing a 2.5:1 VSWR—naughty! However, a listen round on a couple of mornings just before Christmas showed JA's with fair signal strength at about 0745, long-path.

For G2HLU the only activity mentioned on the band was during the Spanish contest, during which the EA's were notable for their massive absence. However some EA8's were hooked, plus EA9EU for a new one on both Eighty and Forty.

G2BY found that, by and large, conditions have fallen off rather badly on 7 MHz, although early morning activity raised JA, W6, W7, VK and ZL, even though their signal strengths were down.

**Sixty**

One minor snag about the Trio rig at G3KFE is the lack of Top Band, although there is a QRP job on the operating table and an Eddystone 888 to receive the signals with. An interesting sidelight on that old black-box is that at the local club, for December, the writer and G8AZM did a demonstration of receiver alignment using scope, marker generator, counter, and laboratory signal generator. We were able to show the response curve and the sensitivity of the 888. The IF's had been "tweaked up" for maximum selectivity by ear at some time in it's life (nothing of any consequence has been done to it for ten years since it has been at G3KFE) and we opened it out to within a cycle or so of the curve shown in the data-sheet for the receiver, and then checked the sensitivity—and found it better than the claimed spec. for the receiver when new. That is not bad for a receiver which is probably about twenty years old and equally probably had no fundamental rearrangement since new, but which has had as hard a thrashing as any receiver can be expected to get in the shack of an active amateur, throughout those twenty years. Anyhow, that is the rig at KFE, along with the end-fed half-wave, although thoughts are going towards VFO control for the little rig, and a direct-conversion receiver to run off the same set of dry batteries—a sort of "separates" version of the HW-7, in fact.

G2HKU reports CW contacts with DJ3YD, DL7QIA, DL8AX, E19BG, GM4DGT, GW5TW, HB9AOD and OK11J, while SSB yielded the usual QSO's with PA6UP.

On now to G3OKP (Maidstone) who stuck fairly solidly to 160m, and made some comments on the "DX Window" as seen from the U.K. end. As Peter says, our transmitting area of 1800-1806 kHz is getting a little bit fraught; there is an AO signal on 1801-17 kHz, and S9 plus RTTY on 1804 kHz, leaving 1802-1803 as the clear frequencies with, occasionally, 1801 and 1805-1806 as possibles. It does seem as if these W's with clean signals, stable, good fist and the ability to measure their frequencies accurately, also have the happy knack of sending just at the right moment on a clear channel, which is fine; but many of the newcomers on the U.S. side—and there are a lot of First-Timere this year—are getting on with homebrew transmitters or transverters, which are either pulling badly or chirpy—0.047 uF capacitors on HF and heater lines would be a help here, as the usual 1000 pF is not enough for Top Band; and for the transverter wallahs, enough selectivity at the injection frequency to ensure one radiates all the RF on one frequency is a help! By way of actual QSO's Peter worked W1, W2, W3, W4, W5, W8, W9, and W0, VE1, XJ1ASI, XJ1MX, and around 0620 on December 31 heard PY1RO, HK0BKX, HP2, YN1, and about a dozen others but couldn't raise a peep out of 'em.

A last report for some time comes in from G4CBQ (Derby), this being due to the return to Southampton and matters academic (which means getting prepared for those darned exams.). The 50-foot mast stayed up through the gales, and a new rig in the top section even though previous guy arrangements had seen a kink develop in the Big Stick from lesser winds. Down below there is a home-brew CW/SSB transceiver but now, alas, no second receiver for split-frequency working, the HA-350 having been sold. In addition there has been a holiday job involving working nights and so the operating sessions have been either 0530-0730, or midnight to 0200z. Prior to the second receiver departing, the former times found XNIKE, XJ1ASI, W8LRL, W8IJI, WB2URU, K8CCV and K1PBW, while the small-hours sessions managed K1PBW, DL2AA/W1, W1HG and W1BB, all these being on CW, while a lone SSB contact was with K1PBW who was a solid 59 while G4CBQ was struggling to get his "gen" over. Since the receiver went, such goodies as YN1 have been heard but not, of course, worked, using the transceiver receive section.

A new correspondent to the Top Band scene is GW3WMY (Cyncoed), who offers a nice first entry to the Counties Ladder; Steve is on with a K.W. Vanguard, ten watts of AM or CW, into 160 feet of wire, end-fed, averaging about fifteen feet high—it begins to look as though the 1976 running is going to be made, as it was last time, by some one who would appear to be under quite a handicap—and that should surely encourage the majority to "have a go."

Since his picture appeared, GM3YOR (Kirkcaldy) has had to take a deal of good-natured ribbing about it. As a matter of fact, what was shown was not just the mobile set-up but was the actual operating position used by Drew and G3OLK in the Western Isles last summer. Top Band saw contacts with EA8CR on both CW and SSB, while the
key managed DJ6Q/CT3, W8LRL, W1HTG, K1PBW, W1BB, W2DEO, XN1KE, XJ1ASJ, W48JJ, VE1AAX and W6YJB/VE1

Ten Metres
Sliding now from the lowest frequency to the highest, 28 MHz has, naturally enough, been a little “flat” as a DX allocation. G2BY didn’t strike lucky at all—although he checked the band on occasion, he didn’t hear anything beyond the receiver hash, which one has to admit is not DX!

GW4BLE was amite luckier as his looks managed to coincide with busy short-skip. W8DMY and W8BNW were both a true meter S6 on the direct path during the ARRL 10m contest, and W2, W3 and W4 were heard weakly, calling ZS stations.

We hear that OZSKF checked Ten during the Aurora event on January 10; Ten was wide-open from 2200 through till 0100z, during which time 42 QSOs were made, 35 with U.S.A. only W6 or W7. This is a very interesting item, indicating that when the VHF boys have their alerts, some of the HF gang should also be brought into the system, to check whether the ten-metre band also displays any form of anomalous propagation like this.

Odds & Bobs
GM3YOR mentions that he may do another trip to the Highlands and Islands later on in 1976, and he would therefore like to hear from anyone who has made arrangements to visit any particular area—drop Drew a line direct, QTHR.

We mustn’t forget to mention the CQ WW WPX Contest over the 48 hours of March 27-28. If you enter as a single-operator you can only be on for 30 hours, the remaining 18 hours being taken in up to five periods, clearly marked as such in the log. All bands, top to Ten, SSB only allowed, and the contest exchange is to be RS plus serial number starting from 001, going on to a four-digit serial number when you pass the first 1000 contacts. Now points: Between stations in different continents, three points on 14/21/28 MHz, and six points on the low bands; between stations in the same continent but a different country one point on 14/21/28 MHz, and two on the low bands unless you are in North American continent in which case you count them as respectively two and four points. Stations in the same continent are permissible for multiplier but not for QSO points. The multiplier is the total number of different prefixes worked, saving that for this year only the American Bicentennial prefixes (AA1, AB2, and so on) will each count for two multiplier points. Final score, QSO points times multiplier. Apart from the usual, very fine, trophies for the various continental and World winners, there is thought that this year, if enough Club entries are received, there may well be a special trophy for a Club Award. Use the CQ Magazine official log sheets if you can get them in time, or alternatively make up your own at a 40 QSOs per page. Contest log forms, and entries, the latter postmarked May 10 latest, go to CQ WW WPX SSB Contest, 14 Vandeveren Avenue, Port Washington, NY 11050, U.S.A.

Incidentally, these 1976 U.S. prefixes are being used as a base for an Award by CQ in connection with the WPX game. Work 200 stations using the special Bicentennial prefixes, among which there are at least 35 different ones. All the gen from the WPX Award Manager, Bernie Welch, W8IMA, 7735 Reed Bank Lane, Dayton, Ohio, 45424, U.S.A.

G2HKU notes that this year for some reason there has been a drastic change in the morning ZL skeds; every morning this winter, N. Island has been better than S. Island. For example, ZL1VN comes through at 0800, but nothing is heard of the South Island ZL’s on the sked till 0820 or later, and even then the signal is weak by comparison. An odd effect, indeed.

G3IAD’s station appeared last time, and Neville now is pleased to be able to report that he has received the first European WAS on Slow-Scan TV, duly endorsed as such; and as if the WAS is not enough to be going on with, the SS/TV Countries score is up to 98, so, who knows, within a short time G3IAD may well be the first SS/TV DXCC in Europe.

Addicts of The Box may have looked in on “Nation-Wide” on January 5, and seen G3SCW featured, at his home which once was Tavistock North Station—he was station-master when it was operational—and showing his radio station. Ron Hooper, G3SCW is quite an active type not just on the air but in other Amateur Radio activities.

G3YRR (Grimsby) has been silent for quite a while now thanks to the QRM from the Salt-Mines, but he did sneak up to the shack and have a dust-down of the Swan 500, and made the shack more habitable by throwing out lots of old components, old 78 recordings and an old TV, plus much paper music; Twenty was found to be dead (not really surprising at 2030) but Charles was foxed by a weird noise occurring at regular intervals up the band; from the details he gives it sounds rather as though someone has bought a colour TV locally which has a strong line-timebase output! Hard luck indeed to be landed with one of these; perhaps the proper answer would be for each and every licensed amateur and SWL in the country to write to his M.P. calling for stricter standards to be enforced on TV set-makers—our own standards are absurdly compared with other countries.

Anybody know anything about Rockall, asks WA4WME/DA1VH, who rather fancies the idea of mounting a DX-pedition there, particularly if it can be shown to be eligible as a new country for DXCC purposes, there being a whisper going round that the “governing authority” may have changed sufficiently to make this a possibility. If you have any knowledge which could help to add to the store, or any relevant aspect of Rockall, please contact Hugh G. Vandegrift, via Aircraft Division, Hq’s. USAMME, APO New York 09052, U.S.A. If there is sufficient interest and the criteria can be met, Rockall
may yet be activated. (One slight nag might be that the only way to land on Rockall is helicopter! Edit.)

Among all the references to QRP activity in this piece, we don't seem to have found space recently to mention that the QRP chaps have got together into the G-QRP Club, with G3RJV as the “sparkplug” - at the last count 176 members were on the books, which is quite something. If you are interested in QRP, or even just home-brewing gear, this is the Club for you, so get in touch with G3RJV at 8 Redgates Court, Main Street, Calverton, Notts., (not the 1976 Call-Book QTH)

Meetings at the Torbay Mobile Rally were (left) G3NOF and G4CXM, both well-known to CDXN readers as keen exponents of the DX art.

Twenty was poorer than Fifteen in the view of G2HFLU; Harold at least found the odd European and South American on 21 MHz but 14 MHz was distinctly uninteresting.

It was pretty poor, too, for your old scribe, as far as Twenty went, so much of the time was spent with the TS-520 just listening at the CW end, the while contriving a rather complex set-up of switchery to enable all bands to be covered at the flip of a switch, and so arranging things that the same switchery permits the 888 to be automatically available for split-frequency operation on the HF bands, or with the Top Band QRP, without any changing over of plugs and sockets at the operating position. The next step is to consolidate the same position as far as the HF aerials are concerned so as to be able to use beam, or vertical, or long wire without fuss, there being at the moment two ATU’s to cover this requirement so that one has to recall which of the “matched” aerials one is on, as well as to remember to detune or ground the unused ones.

G2BY found the early mornings pretty punk, but late afternoon was much more like it, with W6, W7, JA and ZS; although the W7’s were around 8 MHz both ways, generally the noise level on the band was very high.

GM4DZX (Glasgow) drops a line with some QSL addresses of stuff heard and worked on Twenty; he has an FT-DX500 to a ground-plane with which he rang the bell with VQ9, CT2, T,U2, 9K2 and EL8. Of the QSL addresses more anon.

It was rather a coincidence that G2DRT (High Wycombe) should read our note about VP2EEA last time; he went straight out into the shack and worked VP2EEG.

VP2EEG, along with 9H1R, fell to the GM3YOR sideband, while CW managed to cope with PY1HQP; Drew now has a total of 65 countries up in 1975 which is fair going considering his late start at HF activities.

Twenty for GM3YOR is a matter of either a long-wire or the rhombic, and with this as the “exhailer” powered by five watts or less, CW managed YU, DL, G, HA, UB, W, ON, SP, UR and UA, while SSB accounted for I, LX, F, DL, HA, HB, UB, UC, OK, and LZ. This brings up an interesting question - could a G contact from Balthassar in truth be called short-skip? A look at the map and some rough work with a ruler suggests the distance from this QTH to Balthassar is 750-plus miles which would be normal first hop for any mildly high-angle radiation - this U.K. is bigger than one thinks at first.

Twenty was where GW4BLE spent most of his operating time, particularly over the holiday break. The operating pattern was to have a session around 0830-1000, an hour or so at noon, and then have a dabble in the evenings up to about 2000, by which time the band was generally dead. Most of the stuff worked was in the Central and South American areas, plus W, VE, and the morning ZL/ JA’s. QSO’s were obtained with GX7BV, FG7TD, FG7XE, FR7BE, FM7AQ, HK4DEG, long path JA’s, PY’s, P21AR, TI2CAP, VP1BJ,
Then there is G3CED and his flea-power; George rang up dozens of QSOs on Twenty, both before and after the Big Bloom which knocked his mast out of action. To this writer the amazing part of the G3CED loggings (he sends Xerox copies of the pages in each month) is that with such a set-up as his, he is able on occasion to call ICQ and get people to come back, rather than calling other QSO-ers himself; and also the fact that the log timings show long ragchews of up to an hour on CW—one would have thought the tiny signal would have drowned under QRM from one of the Clots who abound on the band long before one could complete a long natter.

G3YRR does not record a QSO on Twenty, but he does mention a certain Grimsby cabbie who stops him every so often and says, "Did you know the VK's and ZL's were good this morning" to which the reply would probably be at least pale pink!

**QSL Addresses**

G2DRT offers VP2EEG, via W3HNN, while GM4DZX mentions A2CBW, to DK3KD; CT2BB, to W1EP; CT4AT, to WIYRC; EL8O to OES6WG; EPZFR to W3YMB; FCZCH to DK4EB; HP1GC to W6GXX; HZ1AB to DJ9ED; FZ8DR to P.O. Box 396, Paramaribo; TU2FI to P.O. Box 1745, Abidjan, Ivory Coast Republic; VP25I to K3GYD; VP2LBR to K2IGW; VP9QZ to WA6HNO; 6Y5GB to VE3GMT; 9K2DR to P.O. Box 2, Kuwait; and 9Y4OK, K. Barkley, P.O. Box 714, Port-of-Spain, Trinidad.

**A Look at the Future**

From 2100z on February 1 to 2359z February 8 PY7PO and PY7BXC will, all being well, knocking off the contacts on all bands from Fernando da Noronha—all CW, 25 kHz from the lower band-edge saving on Ten where they will be around 28100, listening 5 kHz up the band. There is the possibility of some 160-metre operation if the old Viking can be carried within the weight restrictions.

Papua/New Guinea will be represented on all bands over the February 13/14 period, signing P29PNG on CW and SSB, for some sort of special-event activity.

The Tavul operation by Lloyd and Iris Colvin will almost certainly have been secured by now, so if you haven't worked them you will have to look out for VR8A on Eighty. The earlier VR1Z for the same area, activated by the Colvins during December, made some 4000 QSO's. Cards for the VR1Z and VR88 operations go to Yasme, Box 2025, Castro Valley, California 94546, U.S.A.

Some there be who have indicated Bouvet activity, by way of "Y71DX" and "Y91BL" signals—the indications are that both are true-blue (stinkers). Likewise Phoney Phred seems to have been signing "W6UD/1Y1".

Look out for some action from South Georgia late in February; VP8MS and VP8OT should arrive around that time. All through the month you can keep an ear lifted and flapping for any signals from Niue, although it may have happened before this reaches you. St. Brandon looks possible for March or April, the spark-plug on this one being 3B8DA; indications are that it will be a 14-day affair. Baja Nuevo may also appear during the Spring.

Further ahead—a year ahead, in fact—is the likelihood of a DX-pedition to South Sandwich, for which the support of the Argentine Navy would be necessary. This plot looks quite healthy at the time of writing. Meantime, you may have heard LU2XR on Thule, the operator being LU5ADU/MM of the ice-breaker San Martin. VQ9HCS is for the time being, at least, more or less history; a hurricane practically removed Astore Island, levelled the VQ9HCS home and set fire to it and sent Harry back to Mahé in consequence. A sad business indeed.

If you should happen across a VU7, remember the prefix covers Andaman, Nicobar and the Laccadives; VU2ANI is now on as VUTANI and we also have noted VUTGV, both operating sideband on Twenty.

Finally, we hear that the Venezuelan Club have raised a protest formally with ARRL regarding the station signing YV8AL/YV0 from Aves. Basically, their contention is that the YV8AL call expired back in 1960, and no authorisation from their Ministry of Telecommunications has been given either to reactivate it, or for any operation from Aves Is. since the YVOAA event back in January 1973. We have no news of any reaction from ARRL or anywhere else at the time of writing.

**Conclusion**

That's it for this month again; deadline for February will be February 10 latest arrival, addressed as ever to: "CDXN," SHORT WAVE MAGAZINE, BUCKINGHAM, MK18 1RQ. Adios, amigos!
What else? Preparation, of course. Adequate revision. Enter the examination room fully equipped with gear that can last the course—the guy who's pen dries up half-way and hasn't brought some more ink deserves to fail.

Try and relax, and to be fresh and alert when you arrive—early, of course. Fill in the front of the answer book, and when the battle starts spend a few moments sorting out the easiest question regardless of where it lies in the paper—you can answer the questions in any order. Tackling the easy one first gives you time to gain confidence and get your second wind after that initial (everyone gets it) reaction of "Blimey, there's only one question I have a clue about!"—which is just panic. Answering that first question gives time for panic to subside naturally; once you are "stuck in" you forget your fears in concentrated effort.

Answer the exact number of questions you are required to, in each part; and if you make crossing-out anywhere do so with a single line so the crossing-out can still be read, lest there be a clue for the examiner and a mark picked up underneath the crossing-out!

Finally, ten minutes to dot the i's and cross the t's. Then hand your effort in, and pray!

RADIO AMATEUR'S EXAMINATION, MAY 1975

This examination is divided into two parts: failure in either part will carry with it failure in the examination as a whole.

Each question in Part I carries 15 marks; each question in Part II carries 10 marks.

Answer eight of the following ten questions as follows: Both questions in Part I and Six questions in Part II.

Part I—Answer Both questions in this part. Each question in this part carries 15 marks.

Q.1. (a) State the three purposes for which an amateur sending and receiving station may be used,
(b) State four types of emission or message which may not be sent by or from an amateur station.

Answer 1
(a) (1) Reception of standard-frequency service transmissions.
(2) Reception or transmission of third-party messages at the request of and for the St. John Ambulance Brigade, the Red Cross or the Police, in connection with disaster-relief operations or exercises in this context.
(3) Communication with other amateur stations.
(b) (1) Spark transmissions.
(2) Messages of a grossly offensive, obscene or indecent nature.
(3) Broadcasts to amateur stations in general.
(4) Signals not having a satisfactory method of frequency stabilisation.

Q.2. (a) What are harmonics of a radio frequency emission?
(b) Why is it important that they be sup-
pressed as far as possible?

(c) Describe carefully, with the air of diagrams, four measures which can be taken in the construction and installation of an amateur sound transmitter to reduce harmonic radiation to a minimum.

**Answer 2**

(a) Harmonics of a transmission frequency are multiples thereof, i.e., the second harmonic of a 7 MHz signal is at 14 MHz, the third harmonic at 21 MHz and so on.

(b) Harmonics of an RF signal can and do cause interference with reception by other services or receivers; the situation is complicated by the fact that some harmonics of an amateur transmission may lie outside the amateur bands, and into some other service band, e.g. the second harmonic of a 21 MHz signal is at 42 MHz, in the passband of a Channel I TV transmission.

(c) (1) Careful screening of the transmitter, and in particular the PA stage into its own compartment, with RF only allowed to escape through the (usually coaxial) aerial socket. See Fig. 1A.

(2) Operation of the transmitter into a properly matched transmission line, to enable.

(3) Installation of a low-pass filter (which works best in a matched transmission line) in the output of the transmitter. See Fig. 1B.

(4) Provision of anti-parasitic stoppers in all stages of the transmitter needing them, and certainly in the PA. See Fig. 1C.

**Note to Candidates:** Two more measures which could have been mentioned are (a) Neutralisation of the PA, and (b) the provision of RF key-click filtering and over-modulation indication. See Fig. 1 D, E, F.

**Part II—Answer any Six questions in this part. Each question in this part carries 10 marks.**

Q.3. (a) Describe a variable capacitor suitable for use as the tuning capacitor in an HF tuned circuit.

(b) What are the differences between a tuning capacitor for a variable frequency oscillator and that for the tank circuit of a power amplifier stage.

**Answer 3**

(a) See Fig. 2. In a metal frame are fitted the stator plates, suitably joined together but all insulated from the frame. The rotor plates are fitted to a shaft rotating in a bearing in the frame at each end; one end of the shaft protrudes from the frame to enable it to be coupled to

---

**Fig. 1**

(a) PA Stage Screening

(b) Installation of Low-pass filter

(c) Anti-parasitic stoppers

(d) Neutralising a pi-network PA

(e) RF key-click filter

(f) Over-modulation indicator using oscilloscope
a knob or shaft coupler, and the shaft is solidly grounded to the frame of the capacitor by some spring mechanism. The frame itself is normally grounded to the equipment chassis by its mechanical fixings; the stator plates have a solder tag provided, so fitted as to obtain the connection without earthing the stator plates. The size and shape of rotor and stator plates and their number is determined by the maximum capacitance and the "law" desired, consistent with a spacing between plates suitable for the voltages involved.

(b) For a VFO capacitor, one would look for a design having brass rather than aluminium plates, of robust design such that neither stator nor, particularly, rotor plates can vibrate unnecessarily; other things being equal, a design where the end plates of the frame are ceramic would be preferred, and having been conveniently placed to enable good solid connections to be made both to the stator and the rotor without placing reliance on chassis-fixings. On the other hand, the prime consideration in the transmitter PA tank would be that the capacitor should have adequate plate spacing for the full voltage impressed across it, AC peak-to-peak plus DC; and that for a multi-band arrangement, the maximum and minimum capacitances are suitable. A further consideration is that the capacitor will have very heavy circulating currents, and hence should be of materials which can cope with this.

Q.4 (a) In describing an alternating current circuit what is meant by (i) frequency, (ii) cycle, (iii) Root Mean Square (RMS) Voltage?

(b) Describe how an e.m.f. is induced in a loop of wire rotated at a constant speed in a uniform magnetic field.

Answer 4

(a) (i) The rate at which an alternating current repeats itself, usually measured in hertz, where the hertz equals one cycle per second.

(ii) A cycle of an alternating (repetitive) waveform is one complete waveform; for example, for a sinewave, from 0 to 360 degrees. See Fig. 3A.

(iii) The RMS value of an alternating voltage is the equivalent DC voltage. For example, household mains of 240 volts (the power company quote the RMS value) applied to an electric fire, will give the same amount of heat as 240 volts DC. Root Mean Square is the method of obtaining this equivalent mathematically for a sine-wave form; RMS volts are 0.707 of the peak voltage, and thus the peak-to-peak voltage is 2.828 times the RMS voltage.

(b) See Fig. 3B. Induction of an e.m.f. into a length of wire is achieved by causing the wire to thread through a magnetic field by its movement, or alternatively to cause the magnetic field to move relative to the wire. The effect is found to be proportional to the strength of the magnetic field and the rate of movement of the wire relative to the field.

Turning now to the end view shown in Fig. 3B, we may notice that the rate of movement relative to the uniform magnetic field is greatest when it is at that instant when the wire is at right angles to the magnetic lines of force, and zero when, ninety degrees of rotation later, the turn is in effect momentarily sliding along a line of force. A little consideration will show that the rate of cutting lines of force will, in the specified example, follow a sine law over each 360 degrees of rotation. In practice the output would deviate from uniformity largely by the degree to which the magnetic field deviated from uniformity; and it is explicit in the above argument that the peak amplitude would depend on the speed of rotation of the wire loop.

Fig. 3, to go with Q.4. (A) Showing definition of one cycle. (B) Shows one-turn loop of wire rotating in a magnetic field.
Q.5. (a) Why is it necessary to use different frequencies at different times of the day if twenty-four hour contact between the same two stations is to be maintained, on high frequencies over long distances?
(b) How is the choice of such frequencies affected by
(i) The season of the year,
(ii) The sunspot cycle?

Answer 5
(a) In order to meet the requirement, communication at HF must be via ionospheric propagation. The reflecting layer is the F (or, if it is present, the F2) layer of the ionosphere, and there will be some Maximum Usable Frequency (MUF) for a path above which signals will not be refracted from the ionosphere but instead will pass through it and escape into outer space. Below the F-layer lie the D and E layers, which are largely absorbers of HF energy; they will cause there to be a Lowest Usable High Frequency (LUHF) for a path which is also dependent on transmitter power, aerial gain, and local noise level. All the layers, D, E and F, are generated by the action of the Sun, weakening or disappearing at nights; the absorption effect of the lower layers varies inversely with frequency. Thus, when the path is in daylight, a higher frequency will be used to avoid absorption in the D and E layers, and a lower frequency when the path is in darkness, when first the MUF falls and secondly the D and E layers largely disappear. An Optimum Working Frequency is normally chosen, preferably about 15% below the MUF, allowing for perturbations in MUF; in amateur practice one would choose the band nearest the OWF.
(b) (i) In general, it can be shown that daytime MUF’s show a peak in February and November, this peak being more noticeable at sunspot maxima.
(ii) The level of the MUF is directly related to the amount of sunspot activity, being highest at maxima and lowest at minima of the nominally 11-year sunspot cycle. Typically, at maxima, noon MUF’s for a path may rise as high as 50 MHz, while noon MUF’s for the same path at sunspot minima may drop below 14 MHz.

Q.6. Answer either (a) or (b).
(a) With the aid of a circuit diagram describe how the following may be measured in the case of a triode valve:
(i) Mutual conductance
(ii) Amplification factor
(iii) AC resistance or impedance.
(b) With the aid of a circuit diagram describe how the collector current (Ic)/collector to emitter voltage (Ve) curves can be plotted for a transistor in the common-emitter configuration.

Answer 6
(a) See Fig. 4A. It will be noted that the circuit enables any one of the three variables, namely grid voltage, anode voltage and anode current, to be held constant, while varying a second and noting the reaction of the third. Mutual conductance is defined as the change of anode current for change of grid volts; similarly, the amplification factor μ and the AC resistance, where in each case the remaining variable of the three, Va, Vg and Ia is held at some constant value. A graph can be drawn from the results, and where necessary a family of curves taken, where each curve in the family is drawn for a specified value of the non-varied parameter. An example of this is the drawing of a family of Ve/Ia curves for values of Vg varying from zero to cut-off voltage in one-volt steps, on to which a “load line” can be superimposed to indicate the dynamic operation of the valve.
(b) See Fig. 4B. In the given circuit, adjustment of the base bias by R1 will produce some desired base current Ib. Adjustment of Ve to a specified value is by resistor R2 in series with the collector; these being set up Ib is measured. Note that the value of Ic is adjusted to be the same at each step. The results when plotted constitute the curve required.

Q.7. (a) Draw the circuit diagram of a frequency changer stage of a superheterodyne receiver and describe its action.
(b) Explain briefly how the frequency difference between the signal frequency and the
local oscillator frequency is kept constant across the tuning range of the input signal circuit.

**Answer 7**

(a) See Fig. 5A for a typical circuit; it should be noted that any non-linear element supplied with signal frequency and local-oscillator signals will act as a mixer. Output of the mixer will be, not only the input signals and their harmonics, but additionally their sums and differences, e.g. $F_s + F_{10}, F_s - F_{10}, 2F_{10} + F_s, 2F_{10} - F_s$, and many others. One of these, usually $F_{10} - F_s$, is arranged always to have a constant frequency no matter what the position of the tuning gang, and this is known as the Intermediate Frequency; this is selected by a tuned circuit (the IF transformer) and the other, unwanted outputs decoupled way to ground.

In our circuit, a triode-hexode is used; consider first the triode section, which is a simple tickler oscillator, with feedback from L6 to L5. The hexode is the mixer proper with signal on $g_1$ and local oscillator on $g_3$, while the second and fourth grids are at DC HT potential and RF earth. Thus, both the first and third grids can modulate the electron stream, while the other two grids provide isolation. Cathode bias is provided, plus, in the case of the oscillator, that due to $C_g$ and $R_g$. The two capacitors marked $C_d$ will be seen to be decoupling the HT lines.

(b) If, as is normal good practice, the oscillator is higher in frequency than the signal, the oscillator frequency swing will be less than the signal frequency swing; for example, with an IF of 500 kHz, and signal swing of 500 kHz to 1.5 MHz, the oscillator will need to swing between 1 MHz and 2 MHz—signal frequency range 3:1 and oscillator range 2:1. Therefore, in order to gang-tune, we must either (1) Make the oscillator section of the gang capacitor of a different capacitance to the signal section, or (2) Use a standard two-gang capacitor and artificially modify its capacitance range. (2) is usually chosen, and the method is shown at Fig. 5B which extracts the relevant parts of Fig. 5A. $C_p$ is adjusted to give correct tracking at the low frequency end of the band, and $C_t$ at the high-frequency end; if all is correct there will be a third tracking point at the middle of the band, and over the whole range the tracking will be “near enough” when the bandwidth of the signal frequency tuned circuits is taken into account. It should be noted that in modern practice, $C_p$ is usually fixed at a calculated value and the inductance tuned by a suitable slug.

**Q.8.** In amplitude modulation, what is meant by

(a) depth of modulation.
(b) modulation envelope,
(c) sidebands?

**Answer 8**

See Fig. 6A, B and C. At Fig. 6A is shown a pure CW carrier, at B the same carrier partially (less than 100%) modulated, and at C the same carrier modulated to 100%. Depth of modulation is expressed as a percentage, where depth of modulation (%) = \[ \frac{R - S}{R} \times 100 \]

R being the height of the peak of modulation, and S the height of an unmodulated (CW) moment of the transmission.

(b) Modulation envelope is the area bounded by a line joining all the positive peaks of RF, and a line joining all the negative peaks of RF. Each line should reproduce faithfully the shape of the modulating waveform. The envelopes are shown in Fig. 6A, B and C.

(c) The diagram of Fig. 6C shows the display on an oscilloscope of a 100% modulated carrier with sine-wave modulation. The same signal waveform, applied to a spectrum analyser would give the display shown in Fig. 6D. The centre, tallest line, is the carrier, the smaller...
check the depth of modulation of an amplitude-modulated wave.

Answer 9
(a) There are various ways of using the 'scope in this application. Given that the Y-amplifier bandwidth is equal to or greater than the RF carrier frequency to be looked at, and a timebase is available, a suitable scheme is shown at Fig. 7.

The oscilloscope should be set to give an RF envelope pattern to fill nicely the screen by adjustment of the input attenuator (Y-Amp gain) and timebase frequency; some adjustment to the relative values of R1 and R2 may be required to achieve this, and if a 10:1 probe is available this should be used to avoid stray RF pick-up between these resistors and the 'scope lead being applied as shown. The display will be the envelope pattern already shown at Figs. 6A-C, and if sine wave modulation is used, percentage modulation can be calculated from the formula already quoted. Deriving R and S from this.

If now a CW carrier is put up, and two lines to show the envelope on the 'scope face are drawn with china-graph pencil, two more lines can be drawn which will indicate the peak levels at 100% modulation. Now modulate the carrier with speech, and positive modulation in excess of 100% will show by the peaks being beyond the outer lines; overmodulation in the opposite direction will show up as bright spots at the central (zero-signal) line and are the result of the momentary loss of RF output. These can be drawn out to the lines usually produced by expansion of the trace in the X-direction.

Q.10 (a) What is meant by
(i) A half-wave dipole aerial
(ii) A full-wave dipole aerial?
(b) With the aid of diagrams describe suitable coupling circuits and feeder arrangements for each type of aerial.

Answer 10
(a) (i) A half-wave dipole aerial is half-wave length
long at the frequency in question, less a small factor for "end effects." Thus, current maximum and voltage minimum will occur at the centre: the aerial may be excited at the centre or the end, usually.

(ii) A full-wave dipole aerial is one full wavelength long at the required frequency, less the small factor for end-effect, and again may be end or centre fed. At the centre of the full wave dipole, voltage is at a maximum and current at a minimum.

(b) See Fig. 8A. This shows how a half-wave dipole may be fed at the centre; the feed impedance in free space will be about 73 ohms resistive, and it is usual to feed it with 75-ohm coaxial cable, preferably through a 1 : 1 balun which is however usually in practice omitted, as shown. (The balun if used would be inserted at X.) This arrangement could be coupled directly to the output of a transmitter which is capable of feeding a 75-ohm coaxial line.

Now see Fig. 8B. The full-wave dipole fed at the centre will have a very high impedance and so there will be high standing waves with any kind of feeder system. This dictates the use of, preferably, an open-wire balanced transmission line of 600-800 ohms characteristic impedance, and length suitable to couple the aerial tuner or coupler to the aerial feed point. The impedance "seen" at the coupler will depend on the electrical length of the line at the frequency in question and may be high or low resistive, plus positive or negative reactance. Fig. 8C shows a wide-range coupler circuit for such a feedline, with coax feed from the coupler to the transmitter. Most impedances can be matched by adjustment of tapping points X-X, symmetrically about the centre of the line—always as near the outer ends as possible—to obtain maximum transfer of power, shown by maximum and equal currents in each feeder for given RF PA input and 1 : 1 VSWR on the coaxial feeder to the transmitter. The method is to load the transmitter for the desired PA input into a dummy load. Transfer from dummy load to aerial coupler, set taps to some arbitrary setting, and attempt to obtain 1 : 1 VSWR on the coaxial line by adjustment of C₁ and C₂. Note RF current in each feeder. (Do not make any alteration to the transmitter PA tuning and loading during the exercise, once set on the dummy load.) Move taps and repeat, until maximum RF current occurs in the feeder at 1 : 1 VSWR, and transmitter PA input tuning should not have moved. Should the feeder be a quarter-wave long at the operating frequency, then the series arrangement with no feeder tapping also shown on the diagram may be resorted to. Occasionally, a line length on a given frequency may be such that neither of these expedients serves, in which case the feeder length may be adjusted to give a more amenable impedance at the coupler end—this last will not alter the VSWR, which is determined entirely by the aerial/feeder impedance relationship.

SIMPLE FILTER FOR SEVENTYCEMS

CONSTRUCTIONAL DETAILS AND APPLICATION

A. H. DORMER, C.Eng., M.I.E.R.E. (G3DAH)

THE output of a 70 cm. transverter will contain, as well as the desired frequency, elements of the injection frequency and various spurious products. With a correct level of 28 MHz input and linear post-mixer stages, the most significant unwanted output will be at the injection frequency of 404 MHz, harmonics of both this and the signal frequency being so remote from the signal frequency as to be adequately reduced by the transverter tuned circuits.

It is highly desirable, therefore, to install a filter or Hi-Q break at the transverter output to reduce this and any other by-products of the mixing process. Such a device, if multi-section, can be large, mechanically difficult to construct and, without suitable filter response curve display apparatus, not easy to align correctly.

It was decided to see what a simple resonant filter would do and the design which follows shows an insertion loss of a mere 1 dB for a bandwidth of ±6 MHz with a response at 404 MHz 15 dB down or, if the particular application permits, a higher insertion loss, a bandwidth of 2 MHz and a response at 404 MHz better than 40 dB down—all as measured on a Polyskop.

Construction

See Fig. 1

The 9in. long, ½in. o.d. copper tube is soldered to both ends of a 9 x 2 x 2in. tin-plate box which has a tight fitting lid, soldered into place after the final adjustments have been made. The input and output coupling loops are of 12g. silvered copper wire 1½in. long, also soldered to the box ends and the BNC connectors. The 1½in. diameter tuning discs are turned up from ½in. brass sheet, the fixed plate being bolted and soldered to the centre of the line and the moving plate soldered to a length of 2BA studding which passes through a tapped bush in the side of the box and locked in position after final adjustment by a 2BA nut. There would be a slight advantage if the loops were positioned on opposite sides of the line to reduce mutual coupling but the particular layout with which the prototype is associated made this impracticable.

For a 2.5 dB insertion loss and a 2 MHz bandwidth the loops are spaced ½in. from the line and at ¼in. for a ±6 MHz bandwidth and an insertion loss of 1 dB.

The dimensions given are correct for an input and output impedance of ground 75 ohms. If other impedances are required dimensions may be calculated from the formula

\[ Z_0 = 138 \log \frac{D_1}{D_2} \]

where D1 is the length of the short side of the box, and D2 is the o.d. of the resonant line.

Tuning

The filter should be connected in as shown in Fig. 2. It should be tuned for minimum reflected power indication and thereafter the transverter plate and output coupling circuits and amplifier input circuit for maximum power transfer. Do not retune the filter once minimum SWR has been established. It may be noted that, although this filter introduces a loss, it can give improved matching between transverter output and amplifier input which should more than compensate for this.
KW-77 MONITOR MUTING
RECEIVER MODIFICATION

MOST CW and SSB operators like to be able to monitor their transmitted signals without having to fiddle with receiver controls after each change-over operation. In most instances this is easily effected by having a pre-set resistor somewhere in the receiver RF/IF gain circuit, to reduce greatly receiver sensitivity during transmission.

Owners of the KW-77 receiver will have discovered that such a check on transmission can be made only on 80m, and that on all the other bands the muting is such that the receiver is completely dead. Muting in the KW-77 is achieved by switching out the screen-grid HT feed to the RF stage, first mixer and IF amplifier. The HT to the anode of the crystal controlled first oscillator is also switched off. This oscillator is not used when the receiver tunes 80m, so the muting does not completely “kill” the receiver on this band. On all the other bands the crystal oscillator is essential to the operation of the receiver and it must be working if a listen-through facility is desired.

Modification

When a KW-77 was acquired the first thing was to explore the possibility of modifying the muting system without making involved changes in wiring, which might reduce the re-sale value of the receiver. Examination of the circuit diagram and the underside of the receiver showed that the job could be done in less than five minutes, and that the original circuit could be put back in about the same length of time.

Fig. 1 shows the original muting circuit with the wiring identified and circuit references as in the KW-77 manual. Fig. 2 explains the modified version. The crystal oscillator HT supply is no longer switched but comes directly from the 150-volt stabilised line; and an external relay which closes when receiving is energised by the station push-to-talk or change-over switch. It was found that the sensitivity of the receiver during transmission was inadequate, so a 270K 2-watt resistor was wired across the relay contacts to provide a little HT for the screen grids.

The actual modification involves the unsoldering of the two white plastic covered wires from the lower of the three feed-through insulators located on the central screen beneath the chassis adjacent to V2 (first mixer/oscillator). The two white wires are soldered together and the joint is protected by a strip of insulating tape. The feed-through they came from connects to the anode of the crystal oscillator via R18, and a new lead is soldered to it and taken to the 150-volt stabilised line; a convenient point is the lug of C90a (a metal cased electrolytic capacitor) carrying three pink wires. No other internal changes are necessary if an external relay is used for muting. Should the front panel muting switch be needed to function as a control, the 270K resistor can be wired across the mute socket at the back of the receiver.

Many amateurs hesitate to make any modifications to commercial equipment—but the changes outlined here will be in no way detrimental to the operation or the value of the receiver, and will prove to be the answer for CW, and SSB, operators who normally wear phones and like to know how they sound and that they are dead on frequency.
LEARNING MORSE

GUIDANCE FOR SELF-TEACHING

WHETHER we like it or not, a pre-requisite for obtaining a U.K. amateur transmitting licence is the ability to "send and receive plain-language text at a speed of not less than 12 words per minute." Thus, one of the first problems facing most beginners is "How can I learn Morse, quickly and easily?"

First of all, there are the excellent courses designed for learning at home and enabling a high standard of proficiency to be reached. There is also the possibility of local tuition, either at a radio club or by some kind friend who is already a competent operator. If no Club exists locally and no personal contact can be made with a qualified operator, a beginner still without his helping hand can—strange as it may seem—learn Morse perfectly well all by himself! The first thing to do is to memorise the Code, in terms of dots and dashes buzzed vocally, simply remembering that the length of a dash, dah, is equal in time value to three dots dit-dit-dit.

This should be practised until any letter of the alphabet can be buzzed instantly, on sight, without having to sort it out in terms of dots and dahs. For example, the letter "Q" should sound like dah-dah-dit-dah, in the same way as it looks like "Q," as printed here, without having consciously to analyse its shape.

Having got thus far, and the alphabet memorised with confidence tune round on the short wave bands—in the BC and amateur frequency areas—till you hear some powerful station sending repetition signals in Morse. There are many of them, fast and slow and between the sending of actual traffic, they hold the channel open by idling on the callsigns. These are the repetition signals, and what is being sent may be something like "VVS de WSC," or "ABC de OHX." (On Top Band DHJ is a prime example). For some little time, you may not be able to make much of this, especially if the repetition suddenly breaks into high-speed sending; then, you leave him, and tune on to some other station transmitting repetition signals. At first, when listening to these signals, all you will grasp is that it is repetition, because your ear will pick up the rhythm. After carefully listening, you will start getting a letter here and there, finally you have the whole sequence complete "VVS de WSC."

This will be your first big thrill—you have picked up something in Morse, entirely by your own efforts!

Now the factor of rhythm will assume its true importance. For if you have been lucky enough to pick out a steady, well-keyed repetition signal you will automatically begin to get your time values right. Your "VVS de WSC" begins to sort itself out neatly, because there is a definite timing between the letters of each group and between the groups themselves.

Practice

Having learnt the Code by its sound values and appreciated the importance of rhythm which really means spacing, exactly as print is spaced in this sentence you are reading—the next thing is practice, and yet more practice.

Apart from the help your receiver will afford you in finding stations to which to listen, you can also practice continuously, almost anywhere and any time, without even a receiver! How is this possible? It is by buzzing over to yourself in Morse such phrases as newspaper headings, advertisement posters, car numbers—in fact, any piece of print that happens to catch your eye. By this process you get the sound value of each letter and figure impressed on your brain. Remember, it is by sound that you read Morse, not by analysing each group of dots and dashes into their letter-meanings. The importance of this cannot be overstressed, for if you can acquire it, you cut out the one mental process which is every beginner's difficulty in acquiring speed and accurate reading, or "copying" as it is called by CW operators. "Q" must mean (buzz it) dah-dah-dit-dah to you, and nothing else. The aim must be to get the sound of each character impressed on your brain, so that you read by ear in the same way as your eye reads print, without having to analyse the shape of each letter, or even the letters of a word.

General Guidance

There are no snags whatever in this process—except perhaps that your family and friends may begin to look at you a bit oddly when they hear the buzzing noises!

Do not be discouraged by what may seem slow progress—in the preliminary stage. Some people can learn the Code, letter by letter, very quickly. Others take much longer, especially if, as they should, the Code is learnt not in alphabetical order (which involves another mental process) but by putting letters and numbers down at random. Avoid anything in the nature of "memory aids"—that "A" is opposite to "N," or that "U" is "D" the other way round, or that "6" has one more dot than "B." These are not aids at all; they slow you up by giving your brain something else to remember and work out!

The time factor in learning is only important insofar as you should not overdo it and tire your brain; one hour's practice a day is usually quite enough, unless you feel you really want to give more. A good check on your own progress by this standard is that you may find yourself able to read callsigns and previously-unheard repetition signals in about three weeks. The rest comes with continued practice, and you will probably be reading pretty confidently on the amateur bands in about two months. If you can do better than this, you are doing well. Remember, you are learning for the fun of it, so don't wear yourself out, or allow yourself to be influenced or discouraged by those who tell you either that it took them three weeks, or three years, or that they never could get on with it at all.

All sorts of nonsense is talked about learning Morse, and the fact is that each case is individual.

No Key or Buzzer!

Having decided to learn on your own by the method described here—which is, of course, only recommended where there is no expert tuition available—the one thing to avoid is practice with a friend who is at the same stage as you are! The worst and most difficult way in which to learn Morse is to sit down, with buzzer and key, with
somebody who also has no idea, and then proceed to make unintelligible noises at one another. Unless one partner is an operator with a good knowledge of how properly-sent Morse should sound, the whole business will take very much longer and will almost certainly mean that much will have to be unlearnt.

In the early stages, the CW station that you find on your receiver, sending repetition signals, is your partner sending to you all the time perfect Morse over which you can spend as long as you like.

What is suggested here is a self-help approach to the problem of learning to read Morse. It is a method which assumes no outside aids (beyond a receiver) and if practised as explained above, will enable almost anyone to master the Code—we have to say “almost” because apparently there are some people who find it impossible to learn Morse, however they may be taught. On the other hand, those who may be doubtful about their own ability can be assured that over the years a great many amateurs have taught themselves Morse by the method advocated in this article.

Indeed by now there should be some readers, at least, who can read well enough to be thinking about learning to send. But here again it must be emphasised: Until you can read with some confidence and fluency, you should not even think about sending! This is a subject for later discussion.

**BASIC AUTO KEY**

**GIVING ELECTRONIC DOTS WITH MECHANICAL DASHES**

THOUGH expert manipulators can do very well on a pump-handle key—still the recognised instrument commercially—there are easier ways of sending Morse. These vary from the elegant, automatic electronic keyer, complete with variable speed control and panel meter, down to the humble side-swiper, made from Meccano strip and old razor blades. Described here is a key which lies somewhere between these two extremes—it works sideways, for thumb-and-forefinger action, and the dots come automatically.

This article is to enable those operators who are interested in CW, and who still do not possess a bug key, to construct one at low cost and with the minimum of mechanical skill. The current list price of the latest commercial mechanical bug keys is not inconsiderable. The simple key described here will be found to compare very favourably with the commercial mechanical bug.

Severe band interference (and TVI) can be caused by electronic keys. The instrument to be described is completely free of this trouble. Fig. 1 shows the basic circuit. However, if the key were actually to be used in this form serious interference would be caused and, further, the key clicks and thumps will be heavy. It seems that few amateurs realise the importance of correct key-click filtering. With this key, a suitable click filter and supply leads filtering should be used, as shown in Fig. 2.

If monitoring is required (a “must” in the case of bug keys), then this filter is the minimum that should be fitted, to all keys—straight or bug—where cathode or plate keying is employed.

**Construction**

The instrument is built on a small chassis, and all parts except the paddle and LFC are mounted below chassis, with the paddle and audio choke on top. A small tin, suitably camouflaged, is cut down to cover and screen completely the paddle mechanism.

The lid of the tin is secured to the chassis top and the
box is slotted over the top of the paddle, for easy access and adjustment and a hole is cut in the end of the box to allow the paddle handle to protrude.

A simple paddle can be easily constructed, as shown in Fig. 3. It will be found that this paddle, for all its simplicity, is quite efficient and capable of sending good Morse. However, those who require a really first-class paddle should use adjustable-compression springs, but this does call for some mechanical ingenuity.

The construction of the paddle shown here could be best explained as follows: If one end of four inches of hacksaw blade is secured firmly in a vice and a paxolin handle fitted to the other end—with two contacts—the paddle is complete: the shaft provides its own spring. This is the principle of its operation; the vice is, of course, replaced by two holding angles, as shown in Fig. 3.

It will be noted that with this type of key, as compared with the mechanical bug, paddle construction is very simple, because no “ditherer” is necessary. The dots are produced electronically by the circuit shown in Fig. 2. Dashes are made manually, as with a Vibrexplotype key.

Adjustment

A 30-Henry choke is used in the main keying lead (see Fig. 2), and this will be found ample to cover a wide range of key stages, from PA to buffer amplifiers. LFC will be large, possibly the full 30 Henry, in the case of a stage taking small current. However, the inductance can be reduced by shortening the choke with a 10K-20K resistor if a larger current is to be keyed.

The value of Cx likewise will depend on the current keyed, and will be between 0.1 and 2 µF. The network C4, R2, C5, Cx and LFC will affect the quality of the note, and it is possible to make the note sound “hard,”

“soft” or chirpy.

The key has been used for years with entirely satisfactory results, and there is no possibility of returning to the old pump-handle. Power supply requirements are very small and depend upon the relay used.

THE TUNNEL DIODE

THEORY AND APPLICATION

BRIEFLY the Tunnel Diode is a two-terminal (diode) oscillator in the transistor category—but it is unaffected by transit-time as we know it in valves and transistors—the Barkhausen effect. The tunnel diode will function at frequencies up to tens of GHz. It is unaffected by temperature over a very wide range, and is virtually indestructible. And, of particular significance, the tunnel diode is easier and cheaper to produce than the transistor. All this added together means that tunnel diodes have become of immediate and fundamental importance in the world of radions and computer.

The tunnel diode is especially useful in very high frequency work where compactness, reliability, simplicity and low power consumption are important.

The name “tunnel diode” is derived from the way in which the electrons tunnel their path through an energy barrier which exists between p and n types of semiconductors. Various semi conductors such as germanium, silicon and indium antimonide have been used, but gallium arsenide appears to be the best material which has yet been investigated for tunnel diode manufacture.

The voltage-current curve of the tunnel diode (Fig. 1) enables its basic performance to be understood. The most important region is that between A and B in Fig. 1, in which an increase of applied voltage produces a decrease in the value of the current flowing through the device. The incremental resistance is therefore negative in this region; this enables the tunnel diode to amplify, oscillate, act as a frequency converter, and function in other RF applications.

Although signals take an appreciable (but very short) time to travel through a valve or transistor, there are, for all practical purposes, no such transit-time effects in the tunnel diode. The signal passes through it at about the speed of light and consequently the maximum operating frequency of the tunnel diode is very high—certainly above 10 GHz—and is probably limited only by the capacitance of the p-n junction of the diode and by the inductance of the diode leads. The passage of a current through a tunnel diode is a majority carrier effect; conduction through transistors depends on minority carriers (holes or electrons) with consequent frequency and other limitations.

Tunnel diodes are essentially low-power, low-voltage, very high frequency devices.
Modern Quantum Mechanics approaches the problem in a rather different manner, however. In 1928, Quantum Mechanical calculations were undertaken on the probability of the ejection of an \( \alpha \) particle from an atom during radioactive decomposition. It was shown that there is a certain probability that an \( \alpha \) particle which does not possess enough energy to leave an atomic nucleus (owing to the energy barrier over which it would have to climb) can leave the nucleus by a process, which, in ordinary non-quantum mechanical language, can be called “tunnelling underneath the energy barrier.” It has been shown that the same kind of process can operate under certain conditions at the barrier between the \( p \) and \( n \) junctions of a semi-conductor device—hence the name “tunnel diode.”

An electron, according to Quantum Mechanical ideas, consists of a kind of probability wave—a mathematical idea which merely conveys information about the probability of finding an electron at various places. This probability becomes extremely slight at places which are even a small distance away from the electron, but there is always a certain finite probability of finding any particular electron at any stated place in the universe—however small that probability may be. Therefore,

Basic Theory

The tunnel diode consists of a semi-conductor \( p-n \) junction, but the semi-conductor materials contain about a million times as many impurity atoms as those which are contained in the same volume of the ordinary \( p \) and \( n \) types of semi-conductors employed in the manufacture of transistors and the normal type of semi-conductor diodes. The junction between \( p \) and \( n \) types must be very abrupt. Under such conditions, electrons in the conduction energy band of the \( n \) type material come opposite, i.e. have the same energy as, certain empty energy levels in the \( p \) type material.

From a consideration of the Laws of Physics, it would be expected that no movement of electrons or holes between the \( p \) and \( n \) types of semi-conductor materials would be possible owing to the very large electrostatic energy barrier across the junction. The electrostatic field strength in a typical tunnel diode across the very narrow junction region is of the order of one million volts per centimetre. According to the Laws of Classical Physics, an electron striking such a barrier will always be reflected, as it will not have enough energy to pass over the barrier.
for an electron approaching a p-n junction, there is a certain probability that it will be found on the other side of the barrier, although it does not have enough energy to pass over the barrier. The more abrupt the barrier, the greater is the probability that the electron will be able to tunnel through it.

If it is assumed that tunnelling can take place, it is not difficult to explain the shape of the current-voltage curve shown in Fig. 1 by means of electron energy level diagrams.

Fig. 2 shows an energy level diagram for the electrons in an unbiased tunnel diode. The dotted lines in the p and n materials are the Fermi levels—a sort of reference level of electron energies; there are as many vacant states below the Fermi level as there are states which are filled with electrons above it. At zero bias the Fermi levels in the p and n types of semi-conductor materials line up as shown in Fig. 2. Electron tunnelling currents occur to the same extent in each direction and therefore no net current passes at zero bias.

A small forward bias (p type positive) will cause a current to flow in the forward direction as shown in Fig. 3. Fermi levels are no longer at the same height in the two materials and the bias helps the forward current to flow.

A further increase of bias leads to the energy states shown in Fig. 4. Here the AC resistance of the device is negative, and this region is the most important one, in which the operating point of the tunnel diode can be situated. It can be seen from Fig. 4 that the number of electrons in the n type material which are opposite to vacant energy states in the p type material will become less as the bias increases further. The tunnelling current therefore becomes smaller with increasing forward bias when the diode is biased in this region; this causes the negative resistance effect.

A larger forward bias causes the current to move into the valley region of Fig. 1 where it is a minimum. This can be explained by the electron energy level diagram shown in Fig. 5. No electrons in the n type material are opposite vacant states in the p type material, and therefore no tunnelling current can flow. The valley current is not quite zero, however.

Yet a further increase of the forward bias leads to the energy level diagram of Fig. 6. The electrons in the n type material are then raised far enough for them to spill over the barrier into the p type semi-conductor. A large current can therefore flow without any tunnelling taking place.

If the junction is given a backward bias (p type negative), the diagram of the electron energy levels is as shown in Fig. 7. A large tunnelling current flows in the reverse direction.

The various parts of the current-voltage curve shown in Fig. 1 can thus be explained by the electron energy level diagrams for the semi-conductor junction. The whole of the forward region shown occurs at a bias of less than 1 volt.

In actual practice the picture as described is complicated by the existence of very high frequency ultrasonic vibrations of the crystal ("phonons") which can assist the tunnelling process.

Special Features
The tunnel diode is much smaller than the transistor and is, in fact, the smallest known device which is capable of oscillating or giving amplification. Tunnel diodes are extremely reliable, and some silicon types can operate at any temperature, from a few degrees above absolute zero to over 400°C. Transistors are much more sensitive to changes of temperature.

The only amplifiers which generate less noise than the tunnel diode are the complicated maser and parametric types. The valve and the transistor generate much more noise than the tunnel diode. Tunnel diodes can operate on a power input of about a microwatt and therefore produce little heat. As they are much less sensitive to nuclear radiation than are transistors, they may find a useful application in atomic physics research.

The part of the voltage-current curve on which the tunnel diode operates is determined by the bias voltages and the circuit impedances. As an amplifier or oscillator, the DC working point must be on the negative resistance
part of the curve. In addition, the total AC resistance (including the negative resistance of the tunnel diode) must be negative for oscillator operation and positive for working as an amplifier.

If the DC circuit resistance is greater than the negative resistance of the tunnel diode, the circuit will function as a switch. Switching times of less than a thousand millionth of a second are possible—which is nearly a hundred times faster than the best transistors yet made. This fast switching capability is leading to the use of tunnel diodes in many new computer designs.

**Practical Uses**

Using a tunnel diode, an FM transmitter about an inch square has a range of nearly a mile. (Fig. 8). The resistance of the tuned circuit is cancelled by the negative resistance of the tunnel diode. The audio frequency voltage from the microphone affects the frequency of oscillation by altering the working point of the diode on its characteristic curve. Such circuits are extremely useful in short-range “walkie-talkie” equipment. No doubt they also find their way into the miniature radio transmitters which espionage agents place in the clothing of unsuspecting diplomats or under the blotting pad in their embassies!

The wide frequency response of most tunnel diode circuits allows one diode to perform several functions at once. For example, a single tunnel diode has been used simultaneously as an RF amplifier, mixer and oscillator—all for a very minute power consumption.

One of the main disadvantages of the tunnel diode is the difficulty of devising circuits which will enable them to be used in several successive stages operating at the same frequency, e.g., a high gain IF amplifier. This difficulty derives from the fact that the device has only two terminals, whereas most other amplifiers such as the transistor have a separate control electrode.

Tunnel diode characteristics are usually expressed in terms of peak current and of peak-to-valley current ratio, as the voltages at which the peak and valley currents occur are virtually constant for all diodes made from the same semi-conductor material. The negative resistance can be decreased by increasing the area of the junction; this will also increase the peak and valley currents whilst leaving the peak-to-valley current ratio unchanged. A value of the maximum permissible current is usually quoted for each type of tunnel diode.

Tunnel diodes are simple devices and will probably become quite cheap, as it is expected that they will eventually be much easier to manufacture than the transistor!

It has been reported that ZL1AAX has a microwatt tunnel diode transmitter radiating on the 80-metre band, powered by solar (photo-electric) cells. On this, he has succeeded in working ZL1AOF over a distance of about 160 miles. In this sort of context, it is worth recalling that the first solar-powered milliwatt transistor transmitter results (over distances up to 30 miles or so) were obtained by G3HMO:G6FO in 1954, as reported in the October-November-December issues of SHORT WAVE MAGAZINE of that year. The ZL results, of course, represent a greater distance covered with even lower power, and using a newer “semi-conductor device”.

---

The latest Redifon HF Portable/Mobile station Type TM400 is all solid-state and runs up to 400 watts, channel switched in 100-cycle steps from 1.5 to 30 MHz. All modes CW/DSB/MCW/SSB can be worked and if required the whole rig can be remote-controlled by cable. It is shown here mounted in a Land Rover. The whole set-up is air-transportable. Output control is by either p-t-t, Morse key or Vox. The Rx has full front end protection and the rig will load into any aerial.
VHFCC Awards

Two of the VHF Century Club Awards, gained this month are for 70 cm. work Certificate No. 20 goes to G8BKRR, John Woodham from Westbury-on-Trym, Avon. The present 70 cm. station comprises a TS-700 into a Microwave Modules varactor tripler, whilst a BF180 preamplifier into a G8ABP converter feeding a Hammarlund HQ170a, tuning 28-30 MHz takes care of the receive side. The aerial is a 46-ele. Multibeam at 46ft. The QTH being 190ft. a.s.l.

G8BED, Dave Richardson from Southall in Greater London, receives certificate No. 21. He first got on 70 cm. about 18 months ago with two watts of AM to a dipole. Shortly afterwards the power was increased to 10 watts of FM and a Multibeam installed. Present activity is the building of an SSB rig for 2m. for subsequent use on 70 cm. and 23 cm. At G8BED we heard the fruits of G8BED's labours when we copied his 20 mW of 2m. SSB recently. Dave mentions those few amateurs who never QSL, even when sent a prepaaid, prepared card. Anyone's ears burning?

G8IMF is the recipient of 2m. certificate No. 249. Malcolm Connah operates from Highworth, Wiltshire, and subbed in for February, 1974 with 10 watts of FM using a Telford TC7/TC9 combination and crossed dipole aerial. The present equipment comprises the popular TS-700 into an 8-ele. Yagi. In only three months of operation from his new QTH, G8IMF has worked 66 counties and 16 countries with just 10 watts of SSB.

During 1975, 21 VHFCC's were awarded to readers, 18 for 2m., two for 70 cm. and only one for 4m. The rules are very simple. Just send a list of QSL cards you hold from 100 stations worked on the band for which you are claiming, showing callings, dates and locations to "VHF Bands" SHORT WAVE MAGAZINE, BUCKINGHAM, MK18 1RQ. Please include some station details with a potted history of your Amateur Radio career. We will then ask you to send six cards picked at random from your list for verification. If all is in order, you will get your VHFCC award.

Contests

Last month we could only mention briefly the 144 MHz Fixed Station contest which took place on the weekend when the January column was started. We understand that G4BPO, the station of the Marlborough Radio Society in Suffolk, achieved some 280 QSO's and that G8BTV, the Pye Telecommunications Group in Nottingham, managed about 260 contacts. G4BVG (Peckham) opted for FM only, actually phase-modulation, which can be received perfectly on SSB receivers. Steve's best DX was G4CZP plus a couple of GC's, and a CQ call in his 21G1's.

From his first floor flat in London's Barbican, G8ITS made 40 QSO's including one F using his 8-ele. Yagi on the balcony, aimed South. Other reports over the air on conditions during the contest confirm our initial assessment last month. The next main event is the 432 MHz Open Contest from 1000-1500 GMT on February 8, followed by the 2m. Open and Listeners' event on March 6/7.

Pictures have been received in Edinburgh and Glasgow. G3MBQA, G3MPOU and G8BDX are active on the band and G3BJW is having infinite patience rewarded by regular contacts with G3MBQA in North Berwick. G3DIJ is building an SSB rig for 23 cm. and hopes others will follow suit. On 2m. there is a steady increase in FM activity and, on the whole, operating discipline seems good. SSB activity is also on the increase, recent QSO's including G3MPC and G3KIE (Invergowrie), G3MAF and G3NIV (Kirkealdy) and G3NIO in Edinburgh. G3MIX has installed a ground plane for 2m. which has greatly improved his coverage to mobiles. Scots amateurs are very pleased that microwave activity was recognized by his being awarded the Courteney Prize Trophy. Now, with the cooperation of G3MGE, he is working on the problem of improved frequency stability at 10 GHz.

Satellite News

Having recently acquired the necessary crystals to provide complete coverage of the 2m. and 10m. bands by the Hallcrafters Txs/Rxs at G3FPPK, the first imaging from the double star and coping with the SSB stations in the Oscar world were taken on December 20. The 2m. aerial is the main, 10-ele. long Yagi, fixed horizontally, consequently, whilst both satellites can be accessed at extreme range, an indoor, 3-ele. Yagi mounted in a vice placed on a table in the shack and rotated in and out of view, was the successful on overhead passes. First priority must be to improve the 10m. receiving system for the

Starting Date January 1, 1975
crude, crossed wire dipoles in the loft are not very good and a 40673-type preamplifier would doubtless prove most beneficial.

First reactions are that it is nice to be able to have DX QSO's on 2m. "by proxy" when the band is flat, tropospherically speaking. The signals from Oscar VI are much stronger than those from Oscar VIII on the 10m. downlink. Occasional decoding of the telemetry from downlink. Occasional decoding of the signals from Oscar VI. Readers wishing to get orbit predictions may like to note that on Sunday evenings at 1930, AMSAT U.K. has a net on 2m. SSB on 144-28 MHz. G8CSI in New Malden being M.C. G3COJ, G3FPK and others are regular participants.

Rick Zwikko, K1HTV, AMSAT Vice-President Operations, has sent a letter to all Area Coordinators concerning the overloading of Oscar VII by 70 cm. operators who are running far too much power. Only 100 watts e.r.p. is necessary, e.g., a 10 watt Tx with a 10 meter gain aerial is sufficient. It seems that some of the E-M-E lads have been using their kilowatt and huge aerials. Naughty! If this practice continues, irreversible damage will be done to the space-craft's batteries resulting in Oscar VII becoming prematurely a useless, silent chunk of space debris.

Meteor Scatter

G3POI (Downe, Kent) reports continued successes on MS in his skeds with O3UP and SM3BIU. Other QSO's recently concluded are EA4AO (Y441g), OH2AXH (MU65h), OH5NW (NU13c) and UT5DL (Ll22f). Clive has some real DX skeds in the pipeline. G4MCX has confessed that the MS bug has bitten and Derrick has already worked 144ET (FE600) on December 13 at 13.5 pm. He was determined to have a go in the Quadrants. His SSF skeds with 14WP and SM0FES came to nought, though. Another reader who is interested in this mode is GR8XV (Haverfordwest, Dyfed). Tim will be QRV on 28th when he has built a 4CX250B linear and should be a popular fellow from square XL. He also reports that GW3XQ (Dyfed) is active on MS and had successful CW QSO's with SK6AB (FR30c) and SMMT (GQ56b) during the Gentilics, but failed to make it to SSB with DC7IT. G4DGU (Oxon.) was active for the Quadrants but only concluded one QSO, with SM5LE in JT square. Best gotway was UC2AA (NN08j) but neither Chris nor G3SEK, had any luck with LZ1CD in MC64D.

Auroral Opening

A telephone call from G8IGY on January 10 alerted G3FPK to the fact that an aurora was in full swing on 2m. The first QSO was with GM3BQA (YQ77j) at 1718. G3RXY (W161f) was at 1728 with QRM so the number of GM's in the new regions were worked. Best DX in the first phase was SM4ATA (HT51c), whilst the last station worked was LA3DUU (FT114) at 0006. The phenomenon ceased at just before 0200 having lasted about four hours. G3POI made "A" second contact for a while around 2200, when another three GM's were worked. Your scribe was in on the third phase from midnight and was glad to hook SM5BZQ (JT41h) for another new QTH square, plus SM0ERK (IT50f) and LA2PT (FT51h) to finish off this heap. G4MCX working UR32D (LS53e) so we look forward to receiving your reports for the next issue. As we compile this offering, a solar storm warning has been notified so there may be another aurora in the offing.

Four Metres

G4CVI (Fecham, Surrey), in a recent QSO, asked why no 4m. new last month? Easy. Nobody sent in any reports! Richard advises Sunday morning skeds on 70-32 MHz SSB with G4MCX and would welcome skeds with any Northern stations—QTH. Weekends preferred. Other Northerners reported active are G3JYP and G3VIT in Cumbria, whilst G4AIE (Macclesfield) puts Cheshire on the map. Please send us your reports on the CW contest.

Two Metres

As expected, the "ZB2DC" worked by G4DGU mentioned last month, has proved to be a phoney. G8EWW, the owner of the call, was in Gibraltar at the time of Chris' QSO, but confirms it was not he who was worked.

After the several aurorae in November, it seemed that December would be a dull month. However, the band went out in fine style with a good extended tropo opening on the 27th and 28th. G3COJ (Bucks.) found two new EA's on CW. EA2LA in Bilbao runs 7 watts to a vertical 3-ele. Yagi and was up to 58 at times, but with a chirpy note. EA2LW was also worked on CW at first, then on SSB. He is situated at the TV station at Solluce, 40 km. North of Bilbao and uses 5 watts to a 9-ele. beam. Brian worked these two between 0300 and 0100 on the 28th. G4CMV (Leeds) had to battle through the QRM from the South yet managed to hear most of the French QTH squares, working CG, DF and DH. Three HB9's were worked in DG, DH and EH, plus a lot of portables in Southern Germany. A gotway was G8MCALP.

G8RBR (Bristol) only found out about the good conditions at 1515 on the 27th. John's best DX was F1BUT (AD63g) and F1DGD (ZD45J). HB9MKW/M in DH60 was a very good signal using 10 watts. G8GSM (Benfleet, Essex) worked 1I3EBP (DF15g) and 1I3FGF/P (DF65e) at lunch time on the 27th and heard 1APY/P in FE64a.

Keith reports—G4DL/M's best DX from Benfleet was IQRRP/P in FD56G at 0610 on the 28th, whilst F9NL put the news that OZ to EA6 on CW had been achieved. Other
countries worked by G8FUF included DM, HB9, OE and OZ. G8KXX (Northants) found the lift to funnel into Southern Germany, France and Switzerland at different times, although covering most of the U.K. Roy did not hear any ON, OZ, PA or Western European stations.

G62HDZ was one of those who worked OE2CAL/P2, thus bringing the final 2m. countries total to a respectable 17. A new one for the Three-Band Annual for G8HXY (Down) was GC2FZC Guernsey, during the lift on the 27th, whilst E19Q in Waterford was contacted on the 5th. The H'BP (Dyfed) mentions December 22 when ON6AT/A (BK18F) and F6CCEC/P (BF21J) were bagged, the F6 being 99 all day. On the 26th, Tim worked many F's from the Northern coast down to the Paris region, whilst the 27th brought much DX during which the linear blew up (Murphy at it again?). Eventually it was repaired and DC6MY (F134A) was raised at 1710 km. During the opening 22 European QTH squares were worked with 14 DL, 22 F, three HB9 and two ON's in the log. At G1FPK, December produced 12 new QTH squares. During the period 27/28, the band was wide open to central and Southern France so it was decided to try and fill in the QTH map of France, with considerable success, eventually. Some 13 new Departments were logged. On CW, F9NL (AD71b) in 66 was worked, whilst SSB brought F1CAE (CE06g) in 26, F1DPQ/P (DF11J) in 74 and F2KE (BE33H) in 12 for the best of the bunch.

Two metres was well open to the South on January 7 and many CW users accounted for EA1AB (YD41b), another new square for G3FJK, as was F8RZ in ZF50h, Dept 16. The same evening brought the first SSB QSO with Spain, thanks to EA1CV in Gijon. Antonio now has a FT-221 and doubts will be in great demand. The one watt, 9-ele. CW station, EA1KE (XD32d) also in Gijon, was on during the 7th. G3CHN (Devon) had a CW contact with EA1AB during which Javier advised that he detects on CW on 144-04 MHz to 1700, "... all days of the year." From his excellent vantage point on Trelawney Down, G3CHN proposes to plug away on a fairly regular basis down the West coast of France towards EA and CT to ascertain how reliable propagation is over this sea path.

Seventy Centimetres

Following the Repeater Meeting in October at Brunel University, the Home Office was contacted concerning the restrictions on the use of the 70-342 MHz section of the 70 cm band. Regrettably, we hear that these restrictions are to remain in force in their present form.

The excellent conditions over the period December 27/28 on 2m. also extended to 70 cm., with warnings flashed and UHF TV screens blackening out. G63HJ (London) was very pleased to work OE2CAL/P2 and G62HDZ for new countries for G3FJK. For G32MD, Murphy's Law was dumber, for once, since the day after John came up on SSB for the first time, there was the opening. The TS-510 and Mod-2 Electronics 9 watts transmitter netted F1BUT (AD63g), F2TU (DI55a), F9NL (AD71b) and OE2CAL/P2 (GH16c). A 4CX250B linear amplifier is planned for 1976. G8KFR heard F2TU but was unable to make a QSO due to a fault on the aerial relay. G8FDK (Launceston), who has given so many 2m. operators their first Cornish contact, advises that he has a 2C39A, high level mixer built and plans to use his FT-101 as a prime mover to get going on the band, with an 8-0 over-8 aerial. Alan certainly won't be a poor customer! G8FUF was another who heard the portable but with only 10 watts, due to TV, Keith did not make a QSO. However, he did manage FL and HB9. The station consists of a TS-510 exciter, transistor transmitter with 2N5915, 10 watts output. A linear with a pair of 4CX250B and 4CX511A is available and the aerial is a 27-ele. stack. G8GMZ (Cambridge) came on the band for the first time in mid-December with 12 watts of FM. G32HDZ has worked GD at last, thanks to GD3YEO, for a new 1975 country. In the past, Arthur has relied on visiting DX-Peditionsaries to work his own country. He reports no Continentals being heard in the big lift. G8HXY does not mention the lift, but did add GM and three counties to his score in the month. GW8HVP appears to be getting ready for 70 cm. operation and has a receiver working into the IF strip of the Liner-2. Tim writes that GW83XHQ has 9 watts of SSB from Pembroke Dock and did well in the lift.

Twenty-Thre

We have no reports of 23 cm. activity this month. Pressure on space precludes the inclusion of the All-Time Table but please send in your up-to-date claims for next time, adding the number of QTH squares worked, as well, all time.

The Danish Scene

A welcome letter from Julian Macasse, OZ1YI from Farum in OP12c, informs us that, "Conditions on VHFR over here are terrible. Activity on SSB is almost nonexistent, which means that if there is any DX around I am often the only one to bag it." OZ1YI puts the blame for this fairly and squarely on repeaters. In Copenhagen alone there are three, plus six more, including those in Sweden, within a 50 km. radius. He says that most "amateurs" have a VHF rig with a ground-plug under the roof and use the repeaters even if they are only working the fellow in the next street. Julian sums it up thus, "Great for taxi drivers, but no good for Amateur Radio." We could not agree more, OM. However, the picture does not seem to be quite so black since, in the G3FJK log, there are 20 different OZ's in all districts, except 7, on SSB. As compensation, OZ1YI has notchéd up 52 QTH squares since 1-1-75 with, "... a Liner-2, 10-ele. Yagi and lotsa patience!"
Repeaters on Seventy cemis

The Repeater Working Group, formed at the Brunel University meeting last October, has proposed a compromise plan for U.K. 70 cm. repeaters, now that we know that the restrictions on the use of the 430-432 MHz section will not be lifted in the foreseeable future. In essence, it is an inverted Warsaw system in that the output frequencies would be: 433-05, 433-10, 433-15, 433-25 and 433-35 MHz, the inputs being 1-6 MHz higher. It is realized that this could cause interference to A/TV so the RWG has suggested that the repeaters could be switched off a couple of evenings each week from 7 p.m. to midnight. The Home Office has rejected the 2m. GB3RF proposal for a Burley repeater due to its being much less than 100 miles from Barnsley, Pennines notwithstanding.

Final Miscellaneous

Several 2m. CW and MS operators have been complaining about phone stations operating in the CW band. One reader is particularly critical of a weekly net of old timers on AM around 144-12 MHz which has ruined his MS skeds on Tuesday evenings. Others are none too happy about a net on 144-14 MHz used as a talk-back frequency for 70 cm. A/TV. Two very useful beacons, DLOPR and ZB2VHF, are clobbered by these stations. Surely the 2m. band is wide enough for these folk to QSY to a more appropriate part of the band?

G8FUF states that in France, there is a "Licence Commercial" whereby French amateur stations can run as much power as they like by quoting any special reason. This explains why one or two F's have been stating powers of one kilowatt output.

G3JEJ agrees there is a difference between the German and British authorities concerning the use of -M and -P. His reciprocal DL licence says he must sign -M when using the car's power supply, even if a fixed aerial is used. The "A" suffix is used only from your own, second QTH, without any oblique stroke, whilst anyone operating from an alternative QTH must use his own call -P.

Deadline

February 7 for your claims and comments for the March column, please, to "VHF Bands", SHORT WAVE MAGAZINE, BUCKINGHAM, MK18 1RQ. 73 de G3FPP.

THE MONTH WITH THE CLUBS

By "Club Secretary"

(Deadline for March issue: February 6)

YES—we know we said "no Clubs in February," but the Editor made a New Year resolution not to give old scribe any spare time to pollute the ether; and you chaps sent in lots of reports (or missed last month's deadline), Out came the whips and scorpions and—Presto! Seriously, because of the MCC Report, we have only a small amount of space, and so for this month only, everyone will get their mention in the form of a place in the Table herewith. Thus, for more details on any group, all you have to do is to ring or call on the appropriate hon. secretary at the address in the Secretaries' Panel.

Normal "Clubs" service will be resumed in the next issue, for which the deadline is February 6, addressed "Club Secretary," SHORT WAVE MAGAZINE, BUCKINGHAM, MK18 1RQ.

N.B.—In each case, the Secretary's name and address appears in the panel below.

Names and addresses of Club Secretaries reporting in this issue:

**ACTON, BRETNTFORD & CHISWICK:** W. G. Dyce, G3GHE.
188 Gunnersbury Avenue, Acton, London, W3 5LB.

**B.A.R.T.G.:** J. P. Jones, GW3JGG, Heywood, 40 Lower Quay Road, Hook, Haverfordwest, Dyfed, SA62 4LR.

**BURY:** J. Clifford, G4BVE. 10 Arley Avenue, Bury, Lancs. (061-766 2466.)

**CHELTENHAM (RSG):** G. D. Lively, G3KII, 26 Priories Road, Cheltenham, Glos.

**CHILTERN:** Secretary's OTH wanted.

**CORNISH:** H. Webster, G3XIT, Crandale, Gillyfields, Redruth (6033), Cornwall.

**CRAY VALLEY:** M. Tripp, G3YWO, 57 Cathcart Drive, Orpington (68199), Kent.

**CRYSTAL PALACE:** G. M. C. Stone, G3FZL, 1 Lippock Crescent, London, SE23 3BN. (01-699 6940.)

**DERBY (Nunfield House):** J. Cake, G4CZT, 25 Petersham Drive, Alvaston, Derby, DE2 0JU.

**EAST LANCs.:** N. Jenkin, G4GCT, 125 Lambeth Street, Blackburn (670761), Lancs.

**ECHELLED:** J. H. Ellis, G2FNV, 15 Georgian Close, Leacroft, Slains (54628), Middlesex TW18 4NR

**HARRIGATE & KNARESBOROUGH:** D. Boniface, G81BB, Heleinfeld Road, Ripon, Yorks.

**HEREFORD:** S. Jesson, G4CNY, 181 Kings Acre Road, Hereford (3237).

**MAIDSTONE YMCA:** G. H. Taylor, G4BNI, 26 Valley Drive, Loose, Maidstone (47576), Kent.

**MIDLAND:** A. L. Walton, G3ZKQ, 243 Barnes Hill, Birmingham, B29 3UJ. (021-427 3083.)

**MID-WARWICKSHIRE:** A. C. Outhwaite, G8GDY, 7 St. Anna Close, Leamington Spa, Warwickshire.

**NORFOLK:** M. J. Coan, 20 Hobart Square, Norwich.

**NORTH KENT:** R. Wells, G4ARQ, 12 Bulbank Road, Belvedere, Kent.

**QRP CLUB:** Rev. G. C. Dogg, G3RIV, 8 Redgates Court, Main Street, Calvert, Notts.

**R.A.I.B.C.:** Mrs. K. Shepherd, G3NGB, 59 Pantain Road, Loughborough, LE11 3LZ, Leics.

**REIGATE:** R. Wells, G3RIN, 5 Cronks Hill Road, Redhill, Surrey. (Rejoin 47639.)

**SCARBOROUGH:** C. H. Whitaker, 1 Ryefield Close, Eastfield, Scarborough, Yorks. YO11 3DN.

**SOUTH BIRMINGHAM:** N. Gutteridge, G80HE, 68 Max Road, Quinton, Birmingham, B32 1LB. (021-422 9787.)

**SOUTHDOWN:** B. Chuter, G8CVV, 15 Coopers Hill, Willingdon, Eastbourne, East Sussex, BN20 9JG.

**SOUTHGATE:** B. Oughton, G4AEZ, 48 Morley Hill, Enfield, Midx. (01-356 7766.)

**SPALDING:** R. Harrison, G3VPR, 38 Park Avenue, Spalding, Lincs., PE11 1QX.

**SURREY:** S. A. Morley, G3FWR, 22 Old Farleigh Road, Selston, South Croydon, CR2 8PB, Surrey. (01-657 3258.)

**SUTTON & CHEAM:** A. Keech, G4BOZ, 26 St. Albans Road, Cheam, Sutton, Surrey.

**TORBAY:** M. Yates, G3UQ, Top Flat, 23 Waverley Road, Newton Abbot (3025), Devon.

**W.A.M.R.A.C.:** L. Colley, G3AX, 13 Ferry Road, Wavne, Nr. Hull, Yorks., HU7 5UO.

**WHITE ROSE:** K. R. Robson, G8JFY, Flat 7, 34 Saint James Drive, Horsforth, Leeds.

**WOLVERHAMPTON:** D. T. Pugh, G8BRR, Brigands, 38 Applebrook, Shifnal, Salop.

**WORTING:** S. G. Williams, G3LQI, 58 Grinstead Lane, Lancing (4017), Sussex.
NEW QTH’s

This space is for the publication of the addresses of holders of new call signs, or changes of address, in EI, G, GC, GD, GI, GM and GW of stations not already listed. All addresses published here will appear in the U.K. section of the American “CALL BOOK” in preparation. Please write clearly and address on a separate slip to QTH Section. Be sure to give correct County designation and postcode. In the case of direct subscribers needing Change of Address, please state for card index adjustment. Address items for this space to: “New QTH Page,” SHORT WAVE MAGAZINE, BUCKINGHAM, MK18 1RO.

Get the Optimum from your Rig

- STOP MISTREATING IT!

Match your antenna system to the PA stage with a KW 107
- observe your TX 'Waveform' with a KW 108

KW 107 ANTENNA TUNING SYSTEM
The KW range of aerial matching units will ensure optimum power transfer from the PA stage to the antenna system.
- Longer life for your PA tubes.
- KW 107, suitable for most transceivers and transmitters (250 watt rating).
- KW 108 is for use with linear amplifiers.
- Antenna selection.
- SWR, power and SWR measurement.
- Dummy load incorporated.
- Observation of SWR with and without antenna tuner.
- Matching automatic "G" line case.

The antenna tuner in the above unit can be purchased separately if you already have the KW 101/103, dummy load and antenna switch. This unit is known as the KW E-Z match.

KW 109 ANTENNA TUNING SYSTEM
- Offers same facilities as KW 107 but with higher Power rating for most linear amplifiers.

Other KW
Favourites:
KW 2000E Transceiver 10-160;
KW 204 Transmitter;
KW 103 SWR/RF Power meter;
KW Dummy Load;
KW Traps (the original and best);
KW Trap Dipoles;
KW Low Pass Filter;
KW Balun;
KW Antenna Switch.

Stockists for Hy-Gain beams and verticals,
CRD rotators,
Shure microphones,
etc.

Easy terms on Equipment available over 12, 18 or 24 months.

NEW! FREQUENCY-AGILE AUDIO FILTER - MODEL FL1

FIRST-EVER FULLY AUTOMATIC NOTCH FILTER PLUS FULLY VARIABLE BAND-PASS FILTER WITH A.F.C.

Automatic Notch Mode
It sounds fantastic but it's true, with Model FL1 in circuit you can simply forget about heterodyne interference (audio whistles). In its automatic notch mode the filter will automatically locate and remove an interfering whistle in your receiver's audio output, usually in less than one second. No more fiddling with manual notch filters, the advanced Datong circuitry does it faster and better and automatically!

So far as we know this is the first-ever device with this capability. It has to be heard to be believed.

Variable Band-pass Mode
Nearly as spectacular and just as revolutionary, Model FL1 in its band-pass mode for the first time puts you in complete control of your receiver pass-band for CW and SSB. Compare these features with any other audio filter:
- Flat-topped response for ease of tuning of CW, and for effective SSB filtering.
- Continuously variable bandwidth (20Hz to 1000Hz) for perfect matching of selectivity to prevailing conditions or CW sending speed.
- Continuously variable centre frequency (250 to 3000Hz) so you can put the pass-band precisely where you want it.
- Switchable a.f.c. makes the 20Hz bandwidth as easy to use as if it were 100Hz.

Our UNIVERSAL R.F. CLIPPER and R.F.
CLIPPER MODULE are available from stock as usual. Please see previous ads. for details. Data available on request.

Model FL1 looks just as good inside as it does outside. All components, including controls, connectors, and eight i.c.s. plus six transistors, are directly mounted on two large glass-epoxy P.C.B.s. Power comes from either an internal PP9 battery (not supplied) or an external supply between 6-5 and 16 volts DC. Price in the U.K.: only £4/50 plus 25% VAT (p.p. included). Full details on request.

50MHz DIGITAL FREQUENCY METER MMD050

Now that we are established in our new factory we hope to expand our range of products for the amateur radio market. The latest design is a result of several months' work and incorporates M.O.S. L.S.I. devices of a very advanced technology. By virtue of this technology we have been able to manufacture a 50 MHz frequency counter in the same small die-cast box as used for our popular range of converters. This counter has a six digit display using 0.27” red L.E.D.’s and thus gives read out to 100 Hz. There is provision for adjusting the internal oscillator and, in practice, the overall accuracy of measurement is of the order of 200 Hz at 50 MHz. The unit is designed to operate from a nominal 12 volt DC supply with a current drain of 250 mA. The power is fed through a 5 pin locking DIN connector and provision is made for programming the position of the decimal point either by internal strapping in the plug or by external switching. This facility is required so that correct positioning of the decimal point is achieved when the counter is used with our 500 MHz prescaler, type MMD500P. The unit also has reverse polarity protection.

500 MHz DIVIDE BY TEN PRESCALER MMD500P

This prescaler uses the very latest design of E.C.L. integrated circuit and has output buffering to provide a 5 volt logic output swing. Input protection circuitry is incorporated. The unit is thus suitable for use with most types of counter in addition to our MMD050. The prescaler is designed to work with input frequencies in the range 50-500 MHz and has an input sensitivity of typically 100 μW.

NEAREST STATION: LEYTONSTONE (Central Line)

MARKER GENERATOR

Two versions available as follows:

Model IIIA outputs at 1 MHz, 500, 50, 10 kHz Hz above plus 25 kHz output. Technical specifications:

- 5 or 6 volt supply
- 30mA consumption
- Harmonics extend to over 600 kHz
- Built-in signal identification
- All outputs being modulated at approx. 5 MHz, minimising risk of alignment to birdies, etc. An optional switch removes the bleep to aid zero-tuning to Standard Frequency Transmissions.
- High quality FME socket
- High reliability—1 year guarantee.

COMPLETE MODULES BUILT AND TESTED

Model IIIA £19-95 inc. VAT & P & P.

- All units are tested in an industrial fridge and oven to ensure complete satisfaction and reliability.

DESPITE 25% VAT AND THE GENERAL DEPRESSION—1975 HAS BEEN OUR BEST YEAR YET AND 1976 LOOKS LIKE BEING EVEN BETTER

SENTINEL 2 METRE CONVERTER KIT, 28-30 MHz IF ONLY
A well proven kit supplied with printed circuit board drilled and with all coils mounted to make assembly easy. Price: £12-74, ex-stock and IF it doesn’t work send it back with £2-30 and we will fix it. YOU CAN’T GO WRONG!

SENTINEL X 2 METRE CONVERTER
A de luxe version of the Sentinel. Performance spec. is the same but it contains an external mains power supply and a front panel RF gain control.
* Size: 5” x 12” front panel, 4” deep.
* Stock 2 metre IFs: 28-30 MHz, 2-4 MHz, 4-6 MHz.
Price: £24-37—ex-stock.

SENTINEL MF. Another Dual Gate MOSFET 2 metre converter which converts to medium wave in 2 switched bands. Price: £20-00 ex-stock.

2 METRE OR 4 METRE PRE-AMPLIFIERS. These can be supplied for Satellite and Marine Band from stock. Other frequencies to order.
Two models to choose from:
Sentinal low noise FET pre-amplifier.
* This pre-amplifier uses a selected low noise FET to provide the ultimate in sensitivity and selectivity.
* Isolated supply lines, compatible with any equipment.
* Low noise figure—1 dB. High gain—30 dB.
* Size: 1½” x 2½” x 3”. Price: £9-68—ex-stock.
PA3 dual gate MOSFET pre-amp.
* Small about 1 cubic inch, printed circuit pre-amp.
* Now incorporated in thousands of transceivers.

70 cm. U.H.F. CONVERTERS AND PRE-AMPS
SM 70 70 cm to 2 metre FET converter. This is a very high performance 70 cm converter at a very attractive price. Size: 1½” x 2½” x 3”. N.F. 3-5 dB. Gain 30 dB. Price: £18-75—es-stock.

SM71 70 cm. (432 MHz) PRE-AMPLIFIER
Selected FETs give a noise figure cf—3-5 dB and a gain of 18dB. Size: 2½” x 1½” x 4”. This unit is also available on other frequencies, e.g. 400 MHz region for satellite or radio astronomy use, for which it was originally developed. Price: £11-25—es-stock.

NEW! SSM Z MATCH 80-10 METRES
This unit has been produced to satisfy the constant demand for a compact matching unit to meet the critical load requirement of the modern P.A. Receivers are also becoming more sensitive to aerial matching and although our Z match can of course be used to match the aerial to your receiver. The units have been tested at 2KW CW output power into a Bird Terminate Wattmeter/Dummy load. The aerial connections can be used with balanced or unbalanced feeders and the connectors are screw terminals for wire aerials AND SO239s for co-ax fed aerials. Price is only £29-50.

VHF TRANSVERTER ★ EUROPA B 2 METRE
or 4 METRE or 6 METRE
In production now for over three years and in use all over the world and ideal for normal tropo or OSCAR work. The Europa B plugs into Yaesu/Sommerkamp equipment and you are on VHF. All other HF equipment can be used with our Europa power supply the CPS 10.
The Europa B gives you:
* The confidence of our most efficient back up service in the 12 month warranty period and stock.
* Highest transmit power available 200W. Highest receive sensitivity available—2 dB N.F.
* Compact, attractive appearance will complement your station. Size: 9” x 4½”, front panel 4½” deep.
* Cleanest output spectrum available. All spurious outputs—80dB.
* Price: £109-37 complete to plug in and from stock.

EUROPA COMPLETE POWER SUPPLY TYPE CPS 10
Supplies all voltages to Europa and contains a dummy load attenuator to make the Europa compatible with any HF equipment. Price: £50-00—Ex stock.

VHF CONVERTERS—2 METRES, 4 METRES, 70 cms., SATELLITE BAND AND MARINE BAND FROM STOCK—OTHER FREQUENCIES TO ORDER.

SENTINEL DUAL GATE MOSFET CONVERTERS
* N.F. —2 dB. Gain —30 dB.
* No oscillator frequency multiplication to reduce spurious signals.
* Very high tolerance crystals, 5 p.p.m. for calibration accuracy.
* Strong signal and overvoltage and reverse polarity protection built in.
* Standard I.F.s are: 2 metres: 28-30 MHz, 2-4 MHz, 4-6 MHz. 4 metres: 28-28 MHz.
* Size only: 2½” x 1½” x 3” long except 2-4 MHz and 4-6 MHz which are double conversion and 4” long.
Price only £18-75 and ex-stock.

All prices include 25% VAT and delivery. 12 months guarantee on all units. We offer same day COD (£50 limit)

You can call in anytime to inspect or collect equipment. Paul, G3MXG.
ABOVE ALL
IT'S THE ANTENNA THAT MATTERS
TRANSMITTING AND RECEIVING!

MINIMUM RF LOSS and VERY LOW ANGLE FIRE ensures FURTHER MINIMUM SIGNAL LOSS from ionosphere and Earth Bounce, making DX—COMMONPLACE—with only MILLIWATTS of RF power, in spite of the present Sunspot minima. Send stamp for PROOF!

YOU just CANNOT AFFORD R.F. LOSSES and S.W.L.’s, remember, the SAME antenna* is used for RECEIVING the DX—YOU SURE CAN’T WORK ‘EM—IF YOU CAN’T HEAR ‘EM!!! — the "JOYSTICK V.F.A." — the 'QRP ANTENNA' (230cm—7” 6”) that handles ALL your R.F. — "FLEA POWER" or KILOWATT — EFFICIENTLY!!!

NEW SAMSON ETM-3C C-MOS KEYER

1 μA battery drain—Why switch off?
- Self-completing dots/dashes/spaces.
- Can be used either as normal electronic keyer or as an iambic mode keyer.
- 8-50 wpm.
- Constant 3:1 dash-dot ratio.
- 6 C-MOS ICs and 4 transistors.
- Plug-in PCB. Long battery life—typically 1 μA drain when idle—built-in battery holder for 4 x 1.5-v. batteries (but will work over 30v. range).
- PCB has both a reed relay (250v., 0.5 amp., 25w. max.) and a switching transistor (300v., 30 mA max.)—either keying method can be used.
- Has the well-known fully-adjustable Samson precision twin keying lever assembly. Operate/Tune button. Side tone oscillator.
- Grey case 4" x 2" x 6". £49.95.

BUILT FOR DEPENDABLE MARINE AND COMMERCIAL SERVICE

JUNKER PRECISION HAND KEY

A superbly engineered standard key used for many years by professionals aboard and ashore. With this key you can't help but send good Morse. Free-standing—no screwing down. Front and back contacts—fully-adjustable gaps/tension. Key-tick filter. Hinged grey cover £21.95.

BAUER KEYING PADDLE

Single-paddle unit on 1/4" x 1/2" base for home-built El-bugs. Adjustable gaps/tensions £6.97.

88 mH TOROIDS

For CW, RTTY, SSTV and other filters, 70p each.

All prices post paid UK and include 25% VAT. Please send stamp with enquiries.

RTTY FREQUENCY SHIFT CONVERTER CV-89A/URA—8A. This must be the first quantity release of this most sought after RTTY Converter. Brief description uses 15 BG9 and BG7 valves. With a 2" C.R. Tuning Tube. Houses in grey alloy case, size 17" x 5" x 15" deep. Input supply fully filtered for interference. Requires 105-125 volts A.C. A two position selectivity or filter switch that enables to set up for any narrow shift from 10-200 cycles, or any wide shift from 200 to 1000 cycles. The Mean or Centre frequency for the narrow shift is 1000 cycles, for the wide shift is 2500 cycles. Normal Audio input from receiver 600 ohms. The Converter will operate with an input of 60 Microwatts or 60 Milliwatts or about —14 to +18 DBM. Has Internal Tone OSC Freq. 595-1785 CPS. Mark space switch normal or reverse. Supplied in good used condition, checked complete, but not tested electronically £22-50, carriage £2-50 onwards.

We also have a few COMPARATORS CM-22A/URA—8A same colour and size, using 13 BG7 and BG9 valves, made for use with above for dual diversity reception. 105-125 V. A.C. Supply, fully filtered for interference. Used, good condition, checked complete but not tested electronically £10-00, carriage as above. We have in stock a clip-on Fan Blower Cooler complete with filter and heat switch that only switches on when units get too hot a pre-selected heat, normally if units are used up to 24 hours a day. Housed in alloy case £2-50. Post or carriage 50p.

TELEPRINTER CREED 7B. New or rebuilt as new by Govt. In original Govt. transit case. Power 100-250V. DC. Few only at £22-50 each. Carriage £3-50 or at cost.

JOHNS RADIO

424 BRADFORD ROAD, BATLEY, YORKS.
P.M. ELECTRONIC SERVICES

We at P.M. hold one of the largest stocks of Crystals for the Amateur, with a by return of post service (see below). Our range of 2 Metre Crystals now covers TX Crystals in 4, 6, 8, 12, 18, 36, 48 and 72 MHz and RX in 10, 11, 14, 44 and 52 MHz for use in most of the popular Japanese Equipment and many of the Ex-Commercial Equipment, e.g. Pye, Storno, etc.

For 70 cms. we carry S88 (433-2) and RB14 (G3B3Y) and will bring RB10 into stock as soon as it is approved by the H.O. These are stocked for Pye Pocketstone PFI, UHF Cambridge U10B, UHF Westminster W15U, UHF Base Stn U450 and Storno CQL/CQM 662.

On the 4 metre band we stock the popular channel of 70-26 MHz.

We also have the largest range of converter crystals available to the amateur. These include 38-666, 42, 58, 70, 71, 95, 96, 101, 105-666 and 116 MHz.

Our range of Test Equipment/Marker Crystals includes 100 kHz, 1 MHz, 5 kHz, 10 MHz, and 11 MHz.

We can also supply from stock 10-245 MHz alternative 2nd IF Crystals, Crystals Sockets and The ANZAC MID108 Double Balanced Mixer, etc., etc.

BURNS ELECTRONICS and MODULAR COMMUNICATIONS SYSTEMS. We are main agents for these companies and can supply the full range of their kits/modules, etc.

For those whose Crystal requirements do not fall into any of the above categories we supply Crystals specifically manufactured to your exact requirements, including to full commercial spec., in the range 1-5 to 105 MHz.

For full details please see last months Radio Communications/Short Wave Magazine or send us a large SAE and we will send our latest lists.

P.S.—We have just heard that the Post Office intend to go "even slower" with their second class mail. Our prices include P. & P. (U.K. & Eire) by this rate; should you urgently require your crystals please include a 2p stamp with your order and we will send it 1st class.

SHORT WAVE MAGAZINE
29 High Street, Welwyn, Herts., AL6 9EE
Tel.: Welwyn (043871) 5206/7
Audios compressor — Suitable for SSB/AM/FSK — pure compression, no clipping! £14 transistors £2 to 20dBs of compression, with less than 1% distortion — fast attack time in the order of 200 microseconds — variable decay time, on front panel £6.00. Variable noise gain on front panel prevents ambient noise level tripping the compressor. All functions routed to output in "off" position and goes between mic, and tx no mods involved! Standard jack socket input runs from internal PP9 battery. 3 J/sf. These compressors have been tested alongside commercial RF and AF clippers, the only difference at the receiving end was far superior audio quality on the Technical Associates compressor. Why pay more? £25.00 VAT.

R.X. audio filter — 9 integrated circuits covers ssb and cw in one unit built in loudspeaker amplifier — headphone socket — B positions of filter high pass 2.5 kHz-200 kHz - B high pass 100 kHz-100 Hz audio filters. No mods to equipment, goes between rx and loudspeaker. Bypass switch allows unit to be left in circuit. Makes the super rx better and the poorest rx superb! Runs from internal PP9 battery. No ringing when in circuit! Your rx volume control controls the audio output of the filter. £26.00 + VAT.

R.X. peak and notch filter. This unit clears that annoying Q.R.M. — simple to use — goes between r.x. and loudspeaker. Built in loudspeaker amp — headphone socket — Bypass switch! Can be tuned from front panel either H.F. or L.F. to clear the Q.R.M. Can be used in series with our famous bandpass filter — a real aid to today's crowded band. All integrated circuits — runs from internal PP9 battery. Don't put up with Q.R.M. Notch it out! £26.00 + VAT.

TECHNICAL ASSOCIATES
83 SCOTLAND WAY, HORSFORTH, LEEDS, YORKSHIRE
Tel.: HORSFORTH 586735

Opportunity to Acquire a really high-power linear RF Amplifier, one of the few "Anglian 2500" made. Coverage 10-80m. with integral 3000w. PSU, new PL-172 valve, and spare. Today's cost of PL-172's is about £80 each. This amplifier has adequate quiet cooling, loads into any conventional aerial and is easily driven by any 100w. Exciter; well-metered and ready to go, price £210, carriage paid by Securicor. Also offering a Johnson Kilowatt Matchbox, with directional coupler and instructions, as new, at £160. carriage paid. And a Heathkit Monitor Scope, Type HO-10, with handbook, working and in good condition, only £20. Also an Astatic D104 crystal microphone, on stand, with press-talk. £9. — Robinson, G6RJ, QTHR, or ring 0473 78748, evenings.

Selling: Heathkit HW-7 QRP CW Transceiver, £35. — Wild, G3GYU, QTHR, or ring Ramsbottom (Lanes.) 3191.

For sale: FT-2FB two-metre transceiver. 13 months old, xtals for channels 145-00 MHz, S22, R6, with all accessories. manual and in mint condition, price £80 includes delivery by Securicor. — Ring Backham, G8KOC, Kings Lynn 673014.

Selling: National NCX-3 Transceiver with matching PSU/Speaker, £125. Also a 40ft. lattice tower on hinged base, at £50. — Sharratt, G3XXF, QTHR, or ring Eaton Bray (Beds.) 220297.

Sale: "Microwave Modules" 432 MHZ Varactor Tripler. ICOM IC-210 two-metre transceiver. ATAC-102 two-metre receiver, fitted with additional 70 cm. "Microwave Modules" converter. All perfect and little used, at half new prices. — Ring Tomkins, 021-357 3488, evenings.

For sale: New and unused parts for "G3ZVC" Tx/Rx, comprising Minikit (1) less filter, Minikit (3), also extras as listed in catalogue, £10. — Box No. 5475, Short Wave Magazine, Ltd., 29 High Street, Welwyn, Herts., AL6 9EE.

Selling: Late model FT-101 Mk.1. fitted with new "G3LLL" RF clipper, fan and SP-101. Price £250. — Steward, GM4DHJ, 8 Somerled Avenue, Paisley, Scotland.

For sale: RTTY Creed 656 auto-transmitter, £9. Type 85R printing reperforator, £10 — as new. PSU's Type 26B and 43A, £4. Also many others, 7B, 7BRP, etc. Silence covers for all machines, tension gauges, stroboscopes, etc. Send s.a.e. for list. Call by prior arrangement. — Bonner, 6 Broadway Road, Bishopston, Bristol, BS7 8ES, or ring Bristol 46365 after 5.30 p.m.

Large and heavy valved Vibratal built. Also similar ideal Offering: distortion measuring constant -voltage AN/USM-24C), Wanted: Partridge lightweight (outdoor) transceiver, Michaelson, Copnor, Sell: HW-202 Box £1.00, Steeple Aston (Oxon.) 40509 85 MHz, matching mains £125. 6BW6 (Herefordshire). or -2 near to 730/4 Herts., AL6 (20315), MHz, frequency meter, coverage -volt mint offer, Valve needs separate PSU, at £120.

Offering: Ferrite Rings, o.d. 1-in., i.d. 1-in., H 1-in., ideal for anti-TV1 choke in TV lead or baluns, four for £1.00, post/packaging 25p. Transistor 2N3632, rated 13.5w. at 175 MHz, £1.00, post/packaging 10p. —Smith, 98A West Green Road, London, N15 5NS. Tel: 01-800 3026.

Wanted: In Merseyside area, TA-33JR/TA-32JR. or similar three-band Yagi antenna; also TR-44 rotator. — Box No. 5476, Short Wave Magazine, Ltd., 29 High Street, Welwyn, Herts., AL5 7EE.

Wanted: Eddystone 730/4 receiver. unmodified, in good condition and working order. — Ring Doidge, Munderfield 608 (Herefordshire).

Selling: Liner-2 fitted internal preamp, £120. Vibratal 100w. p.e.p. 12-volt solid-state linear amplifier (cost £108. Nov.), bargain at £50. Hamgears valved preselector/amplifier, £5. Codar ditto, ditto, both mains operated. Microwave Modules converter for 28-144 MHz, as new, £10. Triple T-valve stereo amplifier, £125 output, £10. Eagle FM mono tuner, £7. Parabeam, 14-element, for two metres, £10. Two-metre transmitter, AM/FM, 6WAT-PA, screen-grid modulated, internal mains PSU, £45. Large and heavy 100w. modular, ex-RAF, needs separate PSU, at £7 to be collected. — Rabjohn, G3YBG, Quarries Bungalow, Exeter (74607), Devon.
ADVANCED
COMMUNICATION SYSTEMS

Edited by B. J. Halliwell

The world-wide telecommunication network as we know it today is one of the most complex man-made systems in existence. The primary objective is to facilitate communication between any two points on earth, wherever they may be. This is achieved by a hierarchy of national, international and intercontinental transmission, switching and signalling systems.

The six chapters are each written by an expert in his own field, and cover history and growth of the network as a whole, F.D.M, systems, P.C.M. and digital networks, microwave radio systems, communication satellite systems, and optical (laser) communication.

Definitely not a book for the beginner, but essential reading for those, amateur or professional, who wish to extend considerably an already sound technical knowledge of the subject of radio communications.

Wanted: By private collector, old telegraph, technical, scientific navigational and optical equipment, such as Morse keys, telephone sets, sextants, compasses, telescopes and similar items. Anything over 40 years old considered, good prices paid, will collect. Please write with details.

For sale: B4 receiver, M11, as new, £10. Buyer to collect. - Adkins, G3SEV, 40A Denning Road, London, NW3.

Wanted: By newly-licensed pauper, transmitter working on HF bands, anything considered up to £25 limit. - Forsey, 36 Sibland Road, Thornbury (416988), Bristol.

Sale: Drake R-4B receiver, with matching speaker, ten extra crystals and spare set of new valves, in immaculate condition, £250. - Cameron, Coome Cottage, Wigtown, Stroud (3081), Glos, GL6 6LL.

Selling: Hallicrafters FP3/300 Mk.II "Safari" transmitter. Coverage 10-80m, with built-in PSU (mains and 12V.), fan, mobile mounting kit, DC lead and manual, six months old, at £325 (save over £100 on list price). - Berry, G3PL1, QTHR, or ring 0274 (Bradford) 29692, day, or 09766 (Bingley) 5218, evenings.

Manuals: For CV.89A, 390A, R.408, £5. RA-17, £6. Mercury Tx, 770R receiver, £2. - Brooks, 5 Farrant House, Winstanley Road, London SW11 2EJ.

Wanted: AR-8516L receiver, in excellent condition, details and price, please. For sale: HRO coil packs, 50 kHz to 30 MHz; also IF transformers, etc.: send s.a.e. for list. - Box No. 5477, Short Wave Magazine Ltd., 29 High Street, Welwyn, Herts., AL6 9EE.

Selling: Loran Antenna Coupler, £3.75. Aerial Kits, consisting of 10-ft. whip, coupler, earth spike, 25-ft. length 50-ohm coax, with plated MIL-type coax plug and line socket, 4-ft. length 50-ohm coax with coax plug, cores carrying case, full kit, £3.30.

"Command" Rx, medium-wave coverage, rough but working, £4.25. VHF tetrode, QY3-65, 200 MHz, £1.75. OPI/1 4 cm. diameter Mullard oscilloscope tube, boxed, £3.50. 5B/255M tetrode valves, boxed, 85p. Ex-computer equipment transformers, 12v/24v., approx. 4A output, £1.95. Various relays, PO-3000 type, 45p., thermal relays, B7G base, 60p.; MIL-type single-hole mounting key switches, various, as new, 55p. Various lengths 7/22 Aerial Wire, with link insulators or wooden spool, all at £2.00. Generator, 24/30v. 50 amp., running, £25. All items except generator include postage. Send s.a.e. for further details. - Stevenson, GMBKCU, 2 Fife Crescent, Bothwell, Glasgow, G71 8DG. (Tel: 0698 852349).

For sale: Stolle Rotator 2010, little used, with about 16 metres of cable, £35. - Sanderson, G3UQZ, QTHR, or phone 021-373 8806 (Birmingham).

Selling: Ex-Royal Navy type B.41, in almost as-new condition, will haggle around £75 cash. Buyer to collect. - Hammond, Reeves, Great Stepping, Spilsby, Lincs., PE23 5PJ, or ring Little Stepping 650.
For sale: Braun T.1000 receiver, covers LW/MW, eight short-wave bands and VHF, works anywhere, in excellent condition, £90. — Bugden, 29 Newbridge Way, Truro, Cornwall. (Callers after 6 p.m.)

Wanted: Dead or alive, an HMV dog! Also very old Voigt horn speaker, receivers, transmitters, valves, early copies radio books and magazines. Collection arranged. — Byrne, G3KPO, Alstoneford Manor Hotel, Shanklin (098-386 2586), Isle of Wight.

Wanted: Cheapest oscilloscope in working order, Electronic-Tec. or similar, £10 offered, carriage extra. (South Wales). — Box No. 5478, Short Wave Magazine, Ltd., 29 High Street, Welwyn, Herts., AL6 9EE.

Wanted: Trio 9R-59DS/DE receiver, in good condition, details and price, please.—Winn, Penny, Mount Ambrose, Redruth, Cornwall.

Selling: Hallicrafters receiver, coverage 500 kHz to 30 MHz, £25. R.115 receiver, £12.50. T.1154 transmitter, £8.50. BC221 frequency meter, £12.50. Avo Model £25. Send s.a.e. for details. (Lancs.) — Box No. 5479, Short Wave Magazine, Ltd., 29 High Street, Welwyn, Herts., AL6 9EE.

Wanted: All types of Morse key, semi-automatic or bug (but not automatic), will pay cash. — Berge, ON4QX, Everdijstreet 33, Antwerp 2000, Belgium.

Selling: TCS-12 TX, with valves, manual and much modification gen., new PSU and not tested, £8. Wilcos-Gay master oscillator (VFO) with manual, £6. Crystal test set Type 193A, ex-W.D., working, no manual, £10. LF Adaptor No. 1, ex-W.D., frequency range 50 to 600 kHz, output to Rx 700 kHz, with instruction card but no PSU, working, £4. All items “or near offer” and carriage extra. (Devon). — Box No. 5480, Short Wave Magazine, Ltd., 29 High Street, Welwyn, Herts., AL6 9EE.

For sale: Yaesu FR-50B receiver, complete with crystal calibrator, in mint condition, £65. Also K.W. Viceroy Mk.III CW/SSB TX, with built-in PSU, coverage 10 to 80 metres, 180 watts p.e.p., in good condition, £65. — Wyse, G31WE, QTHR or ring Warrington (Lancs.) 64178.

Selling: Lafayette HA-230, coverage 550 kHz to 30 MHz, bandspread on amateur bands, complete with spare valves, speaker and manual, excellent condition, £30. R.107T in good working order, complete with headset, £10. — Ring Allinson, Aspatria 20243, Cumbria.

**APPLICATIONS MANUAL No. 1**

Theory and applications of resonant circuits in oscillators, amplifiers, filters, detectors, mixers, multipliers covering 85 kHz-205 MHz together with circuits and results. Block diagrams show combinations of circuits for receivers, low power exciters, etc.

Available now—Price £60 post free and zero rated VAT.

**STANDARD RESONATORS**

Range of 12 miniature tuned circuits covering 85 kHz-205 MHz with appropriate tuning capacitor. Low impedance secondary winding/ tapped, adjustable ferrite core, common base connections and screened assembly. Price £54p-£62p + 25% VAT each depending on type. Mixed quantity discounts on 10+ quantities. Data sheets on request.

**WIRE ANTENNAS**

by William I. Orr, W6SAI

This excellent and thoroughly recommended handbook, is the publication on the practical approach to building aerials. After starting with aerial fundamentals there are discussions and descriptions of ground-plane, end-fed, DX dipole, vertical and wire beam antennas, plus coverage on a universal HF antenna system and working DX with an “invisible aerial”; the SWR meter and coaxial cable also have chapters to themselves.

The whole book is presented in an authoritative, immensely clear, readable and enjoyable manner with the emphasis on the practical throughout—to the extent that even the chap who can hardly strip a piece of co-ax need not feel at all left out!

**The ideal combination for a good FM station**

**THE EMUPRESSOR**

This old favourite will give your audio a lift at low cost. No clipping, so minimum distortion, practically the same output whether you speak into Mic. or talk away. No knobs to adjust fit and forget. A sample tested gave a dB change of output of 0 dB change of input. Fitted with coax type sockets for in and output. Needs 12v. DC at 35mA supply. Size is only 4 x 2 x 1 1/2" so you should be able to find room for it somewh<ref>here.</ref>

Price £1.80

**THE EMU VFO**

This unit is proving to be a big success so it is now available for 6, 8, 9 or 10MHz to give others a chance to take advantage of this small VFO. There is a sine wave output of not less than 2V. p-p into low impedance via co-ax socket. 1MHz is tuned by a potentiometer (supplied) and the VFO is housed in a die-cast box 1 1/4 x 4 7/8 x 3 5/8" and a polyethylene box for optional thermal insulation. A separate diode to give you quality FM or SSTV is employed. A supply of 12V, DC, Neg. earth is required to power the unit. Stability is adequate for most Amateur applications.

Price £6.50

**THE EMU FM UNIT**

This will look after the RX side of the FM station. A compact add on unit measuring 6 x 2 1/4 x 1" containing limiters, squelch, audio and output stages giving approx. watt for a low power amp. There is also an output from this stage circuit that can also be used for AFS etc. There is only one connection to the main Rx, a small capacitor to the last IF stage and fitted via co-ax to the Unit. A negative earth 12V DC supply is required to power it. For those wishing to include inside the Rx there is a PC board. 450kHz to 1.5MHz. Price £13.50. PC version £11.50

**THE EMUMARKER**

The well-known crystal calibrator still available in a 4 x 2 x 1 1/4" box. There are 3 co-ax sockets on top, one for each of the outputs which are: 1MHz, 100kHz and 10kHz or in the Emumarker 25 the last output is 25kHz instead. Most useful for finding spot frequencies. This needs a supply of 12v DC at 100mA. Price £1.80

**EMU CALL**

This will send your own call sign at intervals in Morse from a small speaker or from a jack socket in to the mediator if preferred. It is a solid state with TRL 74 series and will give your station a distinctive sound.

Price £2.80

Post and packing all units to UK 15p

Money-back guarantee if not satisfied. Please write for any further details required to:

15 KNIGHT AVENUE, CANTERBURY CT2 8PZ, KENT

---

**March Issue:** To appear Friday, February 27, single copies at 45p post free will be despatched first-class mail on receipt from printers. Orders by Wednesday, February 25, with remittance to: Circulation Dept., Short Wave Magazine, Ltd., 29 High Street, Welwyn, Herts., AL6 9EE.

**For sale:** Trio 9R-59DS with speaker and stabiliser, good condition, £50. **Wanted:** FT-200 or KW-2000 series. or FR-50B, FL-50B, FV-50B. Details and price, please. — Ring Knock. Ledbury 2736.

**Sale:** Yaesu 101B, 6 months old and in excellent order, accept £310 (over £100 below today's price). Also Rex digital transceiver, new (same as N.E.C.), £400. — Ring Goodbody, 01-592 7800.

**Sale:** Heath HP-13 mobile PSU, £25. — Ring McCudden, GM4DLU, Alexander 56118 (evenings).

**Selling:** The following all brand new: J-Beam Type 2/8 4/4-4 2m. aerial, £5.50. Edystone 898 dial, £8.50. Halson aerial with 80/160m. coils, £7. Jackson SL-15 FM dial assembly, £2.25. Lab-Gear CM-6002WB aerial amplifier, £5; ditto E-5031 high-pass filter, £1.50. Waters U.S.A. co-ax switches Type 341, 1P2W, £5; ditto Type 335, 1P6W, £6. Valves: 4X250B, £10; QQV06-40A, £8.50; QQV07-40, 825B, £14.44, £7.50 each; 825B, £14.44; 325B-1; National 200, NCF-5, NCE-5; Eddystonia 960, at £1 each. — Hope, GMT3MG17, 17 Longhill Gardens, Dalgety Bay, Dunfermline, Fife. (Tel: 0383-822932).

**Wanted:** JR-310 fitted with Top Band and xtal calibrator. Perfect condition, please. — Thorne, G3ART, QTHR. (Tel: Maryport 3030).
Wanted: K.W. Atlanta Tx/Rx, must be in first-class condition and complete with manual etc. Will collect 60 miles from Liverpool or Manchester, otherwise will pay carriage charges. K.W. 50-ohm dummy load also required. All letters answered. — Box No. 5481, Short Wave Magazine, Ltd., 29 High Street, Welwyn, Herts., AL6 9EE.

Wanted: K.W. E-Zee Match, all offers acknowledged. — Moore, 63 Leopold Avenue, Birmingham 20.

Selling: Liner-2 fitted PA linear, mint, £135. K.W.-201, 11 ranges 10-160m, spare valves, immaculate, £95 or near offer. PR-40 FET preselector, £10. HF trap vertical, £15. — Ring G8KXV, Hemel Hempstead (0442) 50351.

Wanted: Marine receiver, LF to 4 MHz, with D/F facilities (e.g. Pye ‘Hamble’, or similar). Also good AR88 or SP-600. — Cain, G3DVF, 18 Oaky Balks, Alnwick (2487), Northumberland.

For sale: Pair of walkie-talkie transceivers, as new, one watt output, three-channel (one fitted, 29.86 MHz), squelch, tone-call, battery meters and earpiece, ideal for 10 metres (cost £90), will sell for £60 or near offer. — Dodd, G8JBW, QTHR.

Wanted: Heathkit GR-78 receiver, coverage 200 kHz to 30 MHz; built and aligned for “Practical Wireless” review July 1975. Kit costs £12.50, so offers please. — Ring Dowdeswell, G4AR, Ashstead (Surrey) 72515 evenings, or 01-634 4294 office hours.

Shack leftovers: Complete items and components, IC’s etc., s.a.e. for latest list. — Jarvis, GM8APX, Dall, Rannoch Station, Perthshire.

For sale: Pye Cambridge U-10B radiotelephone, suitable for conversion to 70cm, good condition, £40 or near offer. Also Pye U-450E Rx and Tx units. — Beard, 9 Millfield, Folkestone, Kent.

MORSE MADE EASY BY THE RHYTHM METHOD!

FACT NOT FICTION. If you start RIGHT you will be reading amateur and commercial Morse within a month. (Normal progress to be expected.)

Using scientifically prepared 3-speed records you automatically learn to recognize the code RHYTHM without translating. You can’t help it. It’s as easy as learning a tune. 10xP, P.M. in 4 weeks guaranteed. For Complete Course 3 Records & Books send £4-95 including P&P, etc. (List A extra).

For further details of course ring 01-660 2896 or send 7p stamp for explanatory booklet to — S. BENNETT, QHSC

HAMGEAR PRESELECTORS

We have a range of preselectors covering the HF bands, some
battery, some mains and some with built-in calibrators. We can
offer you a single band device covering 14, 21 or 28 MHz, or a
general coverage one from 1.5 to 34 MHz, this one having a Pl
tank ATU included, so you get your antenna peaked up as well.
Prices are from £8-50.
All have a low noise VHF FET front end and two bipolars, all have
a 25dB plus gain. These units are a definite aid to reception
and customer reports tend to confirm this. Six large pages of informa-
tion is available, including details of three small space antennas
using our units; please send four 6p stamps towards cost and
postage.

Welwyn (043871) 5206/7

(COAS a/c No. 547 6151)
ALL BELOW — ADD 8% VAT

High Band Transmitter section (suitable for 2M operation) 10W out. Complete with valves, 50p. for 50W Model (as removed from Pye Cambridge), Complete with VQVO3/50A, with circuits, 65-00.

0000, for 150-006 Xtal (suitable for above) £1-75.

ALL BELOW — ADD 8% VAT

WE BASES MULTITURN LEAD from Xtal (not needed, ideal for sockets for AM 10.7k for operation) £3-00.

ALL BELOW — ADD 8% VAT

PLUGS & SOCKETS
BNC SOCKETS (single-hole mounting (ex-socket)) £0-50.
BNC PLUGS (ex-equipment) 5 for £1-00.
BNC "TYPI" SOCKETS, 50p. each.
PL299 PLUGS (PITF). Brand new, Packed with red seals, 65p each or 2 for £1-25.
SO29 Sockets (PITF). Brand new, 4 hole fixing type, 50p each or 5 for £2-25.
N-TYPE PLUGS, 50p. each, 60p. each.
S-TYPE Sockets, (4 hole chassis mounting, 50 ohms, small coax lead type), 60p. each.
GREENPAN (GE001S). Chassis Lead Termination. These are the units which bolt on to the chassis, the lead is secured by screw cap, and the hole of the chassis passes through the chassis), 40p each, 4 for £1-00.
BULGIN FLAT 2-pin FLEX CONNECTORS, Non reversible, Mains Lead and Socket as used on Continental Test Equipment. New, 50p.
25-WAY ISEF PLUGS and SOCKETS, 40p. set (1 plus 1 skt). Plugs and sockets sold separately at 25p each.

ALL BELOW — ADD 25% VAT

HIGH QUALITY SPEAKERS: 8" x 8" eliptical, 2" deep, 4 ohm, inverse magnet currents, 20 for £1-45 each, or 2 for £2-75. (Discount applies.)

ELECTROLYTICS
ELECTROLYTICS, 50p., 450v., 2 for 50p.
ELECTROLYTICS, 100p., 275v., 2 for 50p.
ELECTROLYTICS, 4700p., 63v., 3 for 50p.
ELECTROLYTICS, 1000p., 30v., 3 for 50p.
ELECTROLYTICS, 1000p., 275v., 3 for £1-75.
ELECTROLYTICS, 5000p. md at 35v., 50p. each.
ELECTROLYTICS, 5000p. md at 75v., 65p. each.
ITL ELECTROLYTICS, 6000p. md at 25v., high grade, screw terminals, with mounting clip, 50p. each.
ELECTROLYTICS, 10000p. at £5, 75p. each.
PRESLEY "CATHODRAY" CAPACITORS. 0.01µF at 125v. DC, screw terminals, 65-00 each.

A large range of capacitors available at bargain prices, S.A.E. for list.

ALL BELOW — ADD 8% VAT

TYPE 10/2 3-0-10V at 2A, £1-50.
TYPE 125BS approx. 125v., 125mA, 65p.
TYPE 28/4, 28v. at 4V, 125mA, 500p.
TYPE T7207, 400v. at 10mA, 200v. at 5mA, 65-00, 40v. at 300Hz, 65-00.
TYPE 14/4 at 4V, £2-50.

BEST FOR TRANSFORMERS
ALL 240v. input, voltages quoted approx. RMS (Please quote Type Only when required).
TYPE 10/2 3-0-10V at 2A, £1-50.
TYPE 125BS approx. 125v., 125mA, 65p.
TYPE 28/4, 28v. at 4V, 125mA, 500p.
TYPE T7207, 400V. at 10mA, 200V. at 5mA, 65-00, 40v. at 300Hz, 65-00.
TYPE 14/4 at 4V, £2-50.

IDEAL TRANSFORMER FOR YOUR LINEAR Mains. Mains Input, 115-00/118v., at 360A output, supplied with matching choke 18H at 360mA, oil filled fettled, high quality type, Transformer and choke, £1-50.
