A WORD IN EDGEWAYS

Sir
My congratulations to SWM after 50 years of splendid service to the amateur and experimenter. I wonder how many more, like myself, started with the interest and still maintain a hobby communications equipment brought back many memories. Now retired, I was a professional designer of wooden chassis in the school workshop! The illustrations of early pages in the March issue brought back many. I remember cutting out the wooden chassis in the school workshop! It's good to see that you appreciated the nostalgic look at SWM. We hope that you will enjoy many more copies of the magazine.

ED

Sir
It is with dismay and sadness that I read of the changes forthcoming in SWM. It was because of the fine technical articles that I had originally entered a subscription. It sounds to me that the intent is to go for quantity of readership rather than quality of content in the publication. In any event I will, for the present, keep my subscription to SWM and give it a chance to prove its place.

JAMES OWENS
BOULDER COLORADO
USA

By now you should have discovered that we think content is important. Hang on in there!

ED

Sir
I have just read Short Wave Magazine. GREAT! I am just a listener not an engineer or whatever and have no interest in building my own set. The new SWM is for me for ever!!

MIKE SHEPHERD
CWMBRAN WALES

Sir
I would like to say how much I have enjoyed the April issue of SWM. Best wishes for the future! I also look forward to the new PW.

C. M. LINDARS RS32010
WALLINGTON SURREY

Sir
Yes, I like the "new" magazine, it has interesting articles, and I certainly hope to construct the Antenna Tuning Unit.

My one complaint — rather faint print on smooth, shiny paper — a job to read in artificial light! Alright for young eyes, perhaps, but when one has almost reached the "three score years and ten" mark, the eyes are not so bright as they once were. Anyway, thank you for a great magazine — keep up the good work. My regular order for it has gone into my newsagents — as well as for PW — that's been in for years.

H. E. CHAMBERLAIN
NEWARK-ON-TRENT
NOTTS

Sir
You have done it. You have bridged the gap, the gap that everyone said could not be bridged. Congratulations. You must be on to a winner and deserve to be. I started reading the new SWM but had to keep putting it down so that I could stretch it out and make it last longer. The way you have set the adverts out every few pages, not all at the beginning and end, is good.

I must tell you about one advertiser, Johnsons Shortwave Radio. I rang them up on Saturday afternoon, was given the most courteous, professional service and we did the deal over the phone. They also found a circuit for a radio that I wanted repairing. They did not keep me hanging around on the phone but told me that they would phone me back — which they did.

Thank you Johnsons and thank you Short Wave Magazine.

REACTION

I would like to thank all of you who have taken the trouble to let me know what you think of the re-vamped Short Wave Magazine. From the letters received and the face-to-face chats at the various rallies at which SW/M and PW have had stands, it would seem that by and large we have started off in the right direction. Your comments and ideas for future articles are always welcome — how else can I be expected to find out exactly what you expect to find in SW/M?

Certainly I am sure that you will find Godfrey Manning's excellent series on Aeronautical Radio, starting in this issue, of great interest. There are a large number of seemingly ordinary people who enjoy spending a pleasant Sunday afternoon on the airport observation platform with the family, watching the aircraft come and go and listening to the radio conversations between aircrews and control tower. Being able to listen-in to instructions from the control tower and reports from the aircrews obviously enhances their enjoyment.

This new series of articles will explain to the layman just what is going on. As the series unfolds you will find out about the equipment and how it works, the language used between ground and aircraft and what sort of information the aircrew need to be able to fly safely around the crowded skies.

Later on we will be looking at the range of receivers and scanners available in the High Street for listening in on the "airbands", as well as trying to unravel the legal implications of the Wireless Telegraphy Act and how it affects the many thousands who listen, quite openly, to this interesting traffic.

Antennas are an area that is always popular with the home constructor and this month we present a loop that is simple and cheap to build and will give good results up to about 4.6MHz giving coverage of the amateur bands at 1.8 and 3.5MHz as well as being capable of getting down into the medium wave broadcast band. I am interested, by the way, in just how far you would like the magazine to get into home construction. What about receivers for instance, and how complex should they be?

DICK GANDERTON

First Word

Short Wave Magazine May 1987
COMMUNICATIONS SATELLITES
by Larry Van Horn
Published by Grove Enterprises Inc., Brasstown, NC 28902.
Available from Interbooks, Lynton, Stanley, Perth, Scotland PH1 4QO.
215 x 280mm, 255 pages. Price £14.80 including UK P&P (paperback)
This book is a must for those who are interested in finding out what can be heard on what satellite. It covers spy and surveillance satellites, US and Russian manned space missions, military tactical and scientific satellites, oceanographic and weather orbiters, deep space probes, navigational and communications satellites, private and broadcast satellites.
This is basically a "dictionary" of space communications and includes chapters on channelisation band plans, transponder identification, international satellites and even a history of earth satellite development.
The bulk of the book is informative text, essential if you want to understand more about what is "flying around up there". The end section (Appendix B) is a frequency cross reference. The systems are listed in ascending frequency order and gives you the country or agency, transmitter location, mode and system frequencies. The list of acknowledgements is quite impressive and shows that the book had a good source of background information and photographs.

SATELLITE TELEVISION A Layman's Guide
by Peter Pearson
Published by Argus Books Ltd., 1 Golden Square, London W1R 3AB.
152 x 233mm, 73 pages. Price £4.95 (paperback)
ISBN 0-85242-906-1
Satellite television is the latest rage, if you're not into it then you're missing out - or are you? This book sets out to explain what is satellite TV and how will it change your life?
The language in the book isn't really very technical, although obviously it requires some sort of technical explanation as to how the system works. There are chapters that cover the transmission of the signals to and from the satellite, the satellites themselves, the terminal you need to receive the signals, cost, who makes the programmes, the type of installation and what you might see. There is also a glossary of technical terms which is useful when wading your way through manufacturers' "bumpf".
The list of acknowledgements is quite impressive and shows that the book had a good source of background information and photographs.

THE RADIO AMATEUR'S MICROWAVE COMMUNICATIONS HANDBOOK
by Dave Ingram K4TWJ
Published by TAB Books Inc. Available from John Wiley & Sons Ltd. Baffins Lane, Chichester, Sussex PO19 1UD. Tel: 0243 784531.
132 x 210mm, 183 pages. Price £11.45 (paperback)
ISBN 0-8306-0584-0
The first thing to remember is that this book is written by an American for a mainly American market. Involvement with amateur microwaves need not be highly technical or overly expensive - at least that's what this book says.
It covers topics like the amateurs' microwave spectrum, the electronic techniques needed for microwaves, klystron operation, 23cm DX, a quick and easy 10GHz set-up, power supplies for microwave systems, fast scan TV at 2.3GHz and linking home computers via microwaves to mention but a few.
Operational concepts of all different types of microwave setups are outlined in this book, which is really meant to encourage experimenters to "have a go". As the author says in the book, "the Golden Age of Radio is very much alive and well. It lives in the highly specialised areas of modern communications technology".

RADIO BEACON HANDBOOK
by Dr Jürgen Trochimczyk
Published by Wilhelm Herbst Verlag. Available from Interbooks, Lynton, Stanley, Perth, Scotland PH1 4QO.
142 x 207mm, 251 pages (paperback).
ISBN 3-923 925-00-X
This book is a list of just about all known long and medium wave beacons of the world. It is divided into ten sections (Europe, USSR, Africa, Near & Middle East, Asia, Pacific, Antarctica, North America, Central America & Caribbean, South America) with seven columns in each section. The stations are listed alphabetically by their call and the other columns are frequency in kHz, country, name/airport/lighthouse, co-ordinates, range/power and field. The book deals with all kinds of radio beacon, directional and non-directional, which operate in the lower frequency range (150-1900kHz) as well as navigation aids for air and sea traffic. As all the details about each station are included on one line of text, abbreviations must be used. These are listed in the front of the book and a copy of the list is useful when using the book during S.W.L.

The Preface and Abbreviations list has been written in seven different languages, so most people should find one they understand.
**WHAT'S NEW**

**Space Symposium**
AMSAT-UK/UrS are holding their space symposium between July 17 and 19 at the University of Surrey, the programme has been arranged (provisionally) and includes social evenings, lectures on all aspects of satellite operation, tours of the UrSAT Mission Control Centre, AMSAT-UK meetings, AMRAC meetings as well as lectures on packet radio.

There will be available two large areas for trade and information stands and displays. Many well-known names should be there, Dr M Sweeting, Jeff Ward and members of the UrSAT Team, Dr L Labutin UA3CR, Dr AC Gee QZUK, as well as representatives of AMSAT-UK, AMSAT-NA, Aust, NZ, Sweden, Belgium, Norway, DL, ESA and IARU. Other groups such as AMRAC, RIG and BARTG will also be there. If you wish to attend, or require more details then you should write to AMSAT-UK HQ, don't forget to enclose an s.a.e.

London E12 9EQ

**Media Network**

This is a weekly survey of communication developments compiled with the assistance of 130 monitors spread across the globe.

April 30: "Who's Listening Anyway?" the programme looks at the subject of audience research, and how major international broadcasters are measuring their listeners. Even figures of 120 million listeners worldwide quoted by some broadcasters isn’t too much when compared with the world population. How do you find out what the scattered but loyal shortwave audience wants?

May 7: "Secret Celebration". Media Network becomes six years old as from this programme. They hope to dream up an off-beat way to celebrate it. They are looking forward to receiving telegrams of congratulations from heads of state around the world, but since that is unlikely, they’ll be looking at new publications instead.

May 14: "QRZ, QSL, QRT?" The public image of the amateur radio operator sometimes leaves a lot to be desired. The "hams" sometimes have a reputation for putting up large antennas, causing TV interference, and talking in strange codes. The VERON, the Dutch National Amateur Radio Society, has succeeded in breaking down these cliches. The VERN, the Dutch National Television Service carries a regular column about amateur radio. Media Network visit the headquarters in Arnhem, and look at how one million QSL cards are processed each year. We also look at the role of the club station W2 and all bands fitted

May 21: "News Update". A current affairs orientated edition, with Andy Sennitt looking at the news received by the WRTH editorial office, now in Amsterdam.

May 28: "Back to the Future". They look at developments towards satellite radio. What ever happened to France’s DBS plans?

**Stolen**
The Hastings Electronics and Radio Club had their club room broken into early on March 16. The following items were stolen.

1. Icom IC-251E. Serial No. 03528 with MuTek front-end board fitted
2. Icom desk mic IC SM2. Serial No. 20501
3. FT-101ZD. Serial No. 101121. TX RX. Serial No. 1011121. TX RX.
5. Large brass Morse key on mahogany base, with brass plate engraved "In memory of John Taplin"
6. M600 Altai headphones. Any information then either contact GAFET QTHR or Hastings CID.

**For Trio Read Kenwood**

One of the most intriguing pieces of news to come our way for some time is the announcement that the radio gear sold in the UK under the Trio label will, in future, be known as Kenwood. This brings the UK into line with the rest of the world concerning the use of the Kenwood trademark of the Trio-Kenwood Corporation.

This change has been made possible following agreement between the Trio-Kenwood Corporation and Trans-EMI who market a range of domestic equipment under the Kenwood banner.

Of course, the radio equipment sold in the UK will continue to be the special versions needed to cope with differences in the requirements of the UK market, such as different bands, band limits or repeater shifts.

We have talked to Lowe Electronics at Marlborough who are the official distributors in the UK for Kenwood equipment. They emphasised us that it is now more important than ever to purchase your Kenwood gear from an authorised dealer to ensure that you get the necessary technical and after-sales service, as in the past, as well as ensuring that you get the correct model for the UK market.

**Cirkit Help Line**

Many people in our communities who would like the benefit of the use of an economical kit or project find themselves at a disadvantage when it comes to construction.

The elderly may have failing eyesight, a handicapped person, restricted or no limb movement.

To help these people overcome this problem, Cirkit is using the IBM System 36 computer to operate a "constructor" database from clubs or individuals who are competent builders and testers in their own right.

This listing will be issued free of charge to anyone who requests it. They would hope to see the list by geographical location so that the list is as local as possible to the user of this service.

If you can help please give details of your address, name and telephone number and the area of expertise, i.e. computer, r.f. general.

DXCC Countries Guide

Geoff Watts, well known as the editor of The DX News-sheet from 1962 to 82, has just sent in details of his latest publication, the DXNS DXCC Countries Guide.

The booklet lists DXCC countries alphabetically, with present and past prefixes back as far as 1945, plus a reference list of previous names of countries to help you keep up with those frustrating country name changes that seem to take place so regularly. It also contains other useful notes and a list of deleted countries with full information.

Geoff reckons that it will be most useful to DXers who have retired and are again taking up radio as a hobby after a long period of inactivity and are possibly thinking of applying for the DXCC Award.

Those on the Honour Roll may wish to begin working islands instead of countries. The list gives the IOTA reference number of all those islands on the DXCC list, well over the one hundred necessary to claim the basic IOTA CC 100 Award and get onto the IOTA Honour Roll.

Also included is a comprehensive Oblast listing for those interested in obtaining the USSR R-100 Oblast Award.

The 11 page booklet costs £1.00 in the UK or $2.00 overseas airmail.

Cancelled

The Milton Keynes Amateur Radio Exhibition on May 30/31 has been cancelled. Due to the vagaries and anomalies concerning the Sunday Trading Act and the legality of Sunday trading at exhibitions, the club have sought legal advice, the outcome of which was that if they proceed and hold the exhibition on a Sunday, the club, the exhibition hall management and the exhibitors can be liable to prosecution by the county and/or the local council.

The club has reluctantly accepted this advice and have decided not to hold this year’s exhibition on a Sunday and cancelled the event.

However, all is not lost, they plan to hold next year’s exhibition on a Friday/Saturday during late May or early June, details of which will be released later.

AMRAC

AMRAC, the Amateur Radio and Computer Club have just revised their membership subscriptions. From May 1 the subscriptions will be: UK - £5, Europe - £10 and the rest of the world - £12.

AMRAC produce a bi-monthly 40-page newsletter AMRAC User, which covers all the latest news, ideas and technical items on Packet radio, as well as AMTOR and RTTY. In addition to the newsletter the club also produce a “hot news sheet” in the alternate months to ensure members are kept right up-to-date.

AMRAC is keen to encourage the formation of local AMRAC groups which hold regular meetings and promote digital communications at a “grassroots” level. Such groups have already been formed in Hampshire, Thames Valley and Essex. It is hoped that many more will be formed around the country.

For more details send an s.a.e. to the secretary.

DIY Morse

In the latest issue of Morsum Magnificat there is a lovely article with instructions on how to make your own Morse key, not the old nail file type either – a proper straight brass key. That is just one of a number of interesting articles ranging from the historical type to the informative.

Morsum Magnificat is published quarterly to provide international in-depth coverage of all aspects of Morse telegraphy, from its earliest concept to the present time. It is for all Morse enthusiasts, amateur or professional, active or retired. It brings together material, which would otherwise be lost to posterity, providing an invaluable source of interest, reference and record, relating to the traditions and practice of Morse.

The UK subscription is £6 per annum. If you are interested, cheques should be made payable to Morsum Magnificat.

ASTRID’s Alive

Some 18 months ago a new satellite earth station was launched onto the market, ASTRID, an acronym for Automatic Satellite Telemetry Receiver and Information Decoder, was originally designed to let BBC-B and Spectrum 48K home computer owners access the educational scientific satellites UoSAT 1 and UoSAT 2. This enabled them to display the masses of scientific news and data from these interesting satellites.

ASTRID’s designer, Steve Webb has now set up his own company, SRW Communications Ltd., to manufacture and market the unit.

The price is still £129.57 plus VAT and it now works with all the Spectrum range (48K up), all the BBC range and also the Amstrad range. For the Amstrad computers you do need the correct Amstrad serial port and some extra software.

Extra software is now available for the BBC and Spectrum computers and graphs can be produced from the “whole orbit data”, the telemetry can be fully decoded without using “look-up” tables and satellite orbits can be predicted and displayed over maps. On Spectrums even the UoSAT 1 pictures can be displayed.

ASTRID is a complete, ready to operate system which includes everything to set up your own satellite earth station. However, alternative antennas to the standard dipole are available including a special circularly polarised 2-element antenna priced at £35 plus VAT.

Short Wave Magazine May 1987
When club officials send in info on their club, the thing most newsletters and letters forget to say is when and where the club meets and who do you contact. It takes ages to look up the details so please, please send full details and make my life easier.

I have been told that the Taunton & District ARC are now fully operational at the County Hall Emergency planning HQ, The Crescent Taunton. They meet on the first and third Fridays at 7.30pm. For more details you should contact Peter GOEYR on 0622 75973 or Geoff on 0823 51526.

May 14 heralds a quiz night for the members of Northampton Radio Club, with the 21st as a walking v.h.f. d.f. evening. The club meets at Kingsthorne Community Centre, Kingsthorne, Northampton at 2000 each Thursday. If members or visitors want more details then Peter Saul G8EUX on 0327 51716 is the contact.

Maths with Maurice is the unusual sounding lecture scheduled for May 12 at Bury Radio Society. Their news letter provides a very interesting read, they have technical features, historical features and for sale to mention but a few. The club meets every Tuesday at 8pm in the Club Room, Moasses Youth and Community Centre Bury Street, Bury M 5iven, their hon sec., can be reached on 061-764 5018 for more details.

The Stamford & District RS are celebrating their 30th anniversary this year and they would like to hear from any past members with information about the very early days of the club. Nowadays they meet on the 1st and 3rd Wednesdays at 7.30pm in either the Southgate Public House (Cellar Bar) or the Rugby Club in Stamford. To avoid turning up at the wrong venue, contact David Bradberry G4OZM on 0790 54433 for more details.

The Edgware & District RS have had a committee change according to their Edgware Ham News. The Hon. Sec. is now Ian Cope G4IUZ and he can be contacted on Hatfield 65707. On May 28 they have a constructors’ contest scheduled. Meetings are held on the 2nd & 4th Thursdays, 8pm at the Watling Community Centre, 145 Orange Hill Road, Burnt Oak, Edgware. Another interesting sounding lecture is being held by the Itchen Valley ARC on May 22. It is called “The Hurdles of a London Tourist Board Guide” by Maurice G4IPQ. The club meets at the Scout Hut, Brickfield Lane, Chandlers Ford, Eastleigh, Hants on the second and 4th Fridays. All meetings are at 1930 for 2000. You can obtain more details about the club from Maurice Cheesman G4IPQ on Southampton 736784.

Colin Mills G0AAO is the Secretary for the Pontefract & District ARS and says he’ll be pleased to answer any queries. They meet in the Carleton Community Centre, Carleton Road, Pontefract every Thursday at 7.30pm. On the cards in the near future is club equipment on June 4 and the History of Amateur Radio by Ray Price G3VID on June 11. You can contact Colin on Pontefract 43101.

A talk by a Crime Prevention Officer is scheduled for May 13 at the Trowbridge & District ARC. They meet in the Territorial Army Centre, Bythesea Road, Trowbridge at 8pm alternate Wednesdays. Ian Carter G0GRI can be reached on 0380 66566 for more details.

South Bristol ARC have a busy time between now and their rally on September 6. May 13 is a DX Broadcast TV Evening by Ron G3NJR and May 20 is a Radio Exchange & Multi organised by Dave G4WUB. The club meets every Wednesday at the Whitchurch Folk House, East Dundry Road, Whitchurch – Len Baker G4RZY on Whitchurch 834282 has all the details.

The Stourbridge & District ARS are just building up their 50th year fit starts in Jan 88 and they have recently chosen the committee to get them there. One item that caught my eye in their newsletter was ‘Tomorrow has been cancelled’, a really clever piece. “It was a dreary grey day. As I journeyed to work it was a moment, I rested, I closed my eyes, it was only to do it twice next time, as it had been forced to do last time it rested, it continued on its remorseless journey. Several hours later it quietly dropped back over the edge realising that no one had seen it or even cared if it was there”. How many committee members know the feeling? Anyway the club meets 1st and 3rd Mondays at 8pm in the Robin Woods Centre, School Street, off Enville Street, Stourbridge.

The away leg of the quiz versus the Maidenhead Club is scheduled for the Reading and District ARC on June 4. The club normally meets on Tuesdays at 8pm in the White Horse, Emmer Green, North Reading, contact Steve Coleman G4YFB on Reading 687620 for more details.

Chilton ARC have GSVR scheduled for the June 24 slot in their programme. They meet at the Sir William Ramsay School, Science Block, Rose Avenue, Halemere on the 2nd and 4th Wednesdays at 8pm. Further details from Chris Dunn G4KUI on 04946 3372.

Stan Meadons G1UGA is the Secretary for the Greater Peterborough ARC and says that the club meets every 4th Thursday at 7.30pm. The venue for the club is the Starground Junior School, Peterborough. G1UGA can be contacted on 0733 69322.

Tuesday May 5 is a lecture on The New Transceiver by George Fare G3QOG for members and visitors of the Warrington ARC. They meet Tuesday at 8pm in the Grappenhall Community Centre, Bellhouse Lane, Grappenhall. Paul Forster GOCBN has all the details 0925 814005. Other meetings are a junk sale on May 19 with Ron Strokes G3MAD as the auctioneer and May 25 is an open forum.

The Torbay ARS have a new secretary, he is John Dart and can be contacted on 0833 51995. The AGM is scheduled for April 26, and it is “Working with Animals” by Robert G1VOK booked for May 30. They meet on Friday evenings at 7.30pm at the ECC Social Club, Ringside Road, Highweek, Newton Abbot.

A bit further round the coast is the home of Exmouth ARC. They meet fortnightly at the 6th Exmouth Scout Hut, Marpool Hill, Exmouth, Michael Newport G1GZG at 30 Maristow Avenue, Exmouth, will tell you the next dates. Still in Devon, the
GRASSROOTS

Exmoor Radio Club meet in the Physics II Lab, South Molton School and Community College, South Molton, North Devon. They have meetings most Thursday evenings, but their temporary secretary John Stacey will be able to tell you more on 07955 3332.

Op-amps and active filters by Andrew G8OMH are on the menu on May 13 for those at Stockport RS, as well as an informal natter night on the 20th and pre-NFD planning on the 27th. The club meets on Wednesdays at 8pm in the Blossoms Hotel. Contact Mel 27th.

The Mid-Sussex ARS meet every Thursday at Marie Place, Leylands Road, Burgess Hill at 1945. They have their own fully equipped shack and visitors are welcome. April 30 is an informal evening and May 14 is the club construction contest. Chris G0DMC on 07918 2937 can supply further details for those interested.

Bury St Edmunds ARS have a new meeting place now, it’s the County Upper School, Burren Way, Bury St Edmunds. All new members are welcome at the 3rd Tuesday Meetings at 7.30pm. May 19 heralds the third in the series of Marconi lectures, but Chris G1FUU on 0359 520271 has all the details.

D. H. Wood has been elected as secretary for the Morecambe Bay ARS following their AGM. The club meets every Tuesday evening at the Trimpell Sports & Social Club, Out Moss Lane, Morecambe at 7.30pm. You can contact D. H. Woods on 0524 52042 for the latest news of the club.

Members of the Wakefield and District RS have an interesting little newsletter to read. Their meetings for the next few weeks are, April 28 a talk on Egypt by G4AALU, May 5 a bring a buy sale, May 12 a quiz night and May 19 a film about Sellafield. The Club meets on Tuesday in the Ossett Community Centre, Prospect Road, Ossett with D. J. Bryan on Leeds 820196 able to tell you more.

York ARS have a home-brew night scheduled for May 8. Keith Cass G3WVO at 4 Heworth Village, York has all other details for meetings. The club meets Fridays at 7.30pm in the clubroom United Services Club, 61 Micklegate, York. This year is the club’s 40th anniversary and they will be holding a series of special events stations with anniversary QSL cards, and they would especially like to hear from anyone who has been "mixed-up" with York ARS.

The Coventry ARS have a couple of d.1 evening lined up, the first is on May 1 at it’s a 144MHz d.1 contest, the second is on the 25th when it is the lindoor direction finding game. The club meets on Fridays at 8pm in Baden Powell House, 121 St Nicholas Street, Radford, Coventry. Robin Tew G4UJO has all the latest details on Coventry 73999.

The ever popular junk sale is on the programme for the Midland ARS on May 19, with txhunting tips by GB8TU and GB6DE on June 16. The club meets every week night in Unit 5, Henstead House, Henstead Street, Birmingham. If you want more details then contact Tom Brady G8GAZ on 021-357 1924.

May 12 brings a video called ‘Other Man’s Shack’ for those at the Chester & District RS meeting. Then there is Clandestine Radio by Gordon Adams G3LEO on the 26th. The club meets at the Chester Rugby Union Football Club, Hare Lane, Vicars Cross, Chester at 8pm on Tuesday evenings. If you want more details contact Dave Hicks G5IF on Chester 336639.

The Chelmsford ARS meet on the 1st Tuesday at 7.30pm in the Marconi College, Arbour Lane, Chelmsford. Andrew Mead G4KOE on 0376 83094 can tell you more. Ken Willis G8VR is talking about ‘How to work v.1. DX by Meteor Scatter’ on May 5.

April 29 brings a lecture on Kite Antennas by R Withers G4IBL for members and visitors to the Nene Valley RC. The club meets Wednesdays in the Prince of Wales, Well Street, Finedon. M. P. Byles on 0333-71189 has all the details.

A club construction contest is on the cards for May 11 if you belong to the Surrey Radio Contact Club. This meeting is being held one week earlier than normal due to the Bank Holiday. The club meets on the 1st and 3rd Mondays at 7.45pm in the TS Tuna Nova, Mess Deck, 34 The Walkrons, South Croydon. You should contact John Simkins G8YS on 01-657 0454 if you want to know more.

The talk by Denis Walker G30LM on a Bonsai Aerial Farm must be popular as it is “doing the rounds”. This time it’s on April 28 at the Dorking & District RS. They meet on 2nd and 4th Tuesdays at 8pm, with various meeting places available. Contact J. Greenwell G3AEZ on Newdigate 77326 to sort out such details as venue.

An unpleasant piece of news from the Hastings Electronics & RC, their premises were broken into and a number of pieces of equipment were stolen (What’s New holds more details). Not very nice for the club, they meet 3rd Wednesdays at 7.15pm in the West Hill Community Centre, Crott Road, Hastings. Dave Shirley G4NVO on Hastings 420608 has the latest news.

ICOM introduces the IC-R7000, advanced technology, continuous coverage communications receiver. With 99 programmable memories the IC-R7000 covers aircraft, Marine, FM Broadcast, Amateur Radio, television and weather satellite bands. For simplified operation and quick tuning the IC-R7000 features direct keyboard entry. Precise frequencies can be selected by pushing the digit keys in sequence of the frequency or by turning the main tuning knob. FM wide/FM narrow/AM upper and lower SSB modes with six tuning speeds: 0.1, 1.0, 5, 10, 12.5, 25KHz. The IC-R7000 has 99 memories available to store your favourite frequencies including the operating mode. Memory channels can be called up by pressing the memory switch then rotating the memory channel knob, or by direct keyboard entry. A sophisticated scanning system provides instant access to the most used frequencies. By depressing the Auto M switch, the IC-R7000 automatically memorises frequencies that are in use whilst it is in the scan mode, this allows you to recall frequencies that were in use. The scanning speed is adjustable and the scanning system includes the memory selected frequency ranges or priority channels. All functions including the memory channel readout are clearly shown on a dual-colour fluorescent display. Other features include dial-lock, noise blanker, attenuator, display dimmer and S meter and optional RC-12 infra-red remote controller, voice synthesizer and HP1 headphones.

IC-R71E, General coverage receiver.

The ICOM IC-R71E 100KHz to 30MHz general coverage receiver features keyboard frequency entry and infra-red remote controller (optional) with 32 programmable memory channels, SSB, AM, RTTY, CW and optional FM. Twin VFO's scanning, selectable AGC, noise blanker, pass band tuning and a deep notch filter. With a direct entry keyboard frequencies can be selected by pushing the digit keys in sequence of frequency. The frequency is altered without changing the main tuning control.

Options include FM, voice synthesizer, RC-11 infra-red controller, CK70 DC adaptor for 12 volt operation, mobile mounting bracket, CW filters and a high stability crystal filter.

THE FINEST EVER SCANNER AT AN UNBEATABLE PRICE
25-520, 760-1300 MHz, 300 MEMORIES — ALL FOR £329.95

This wonderful new scanner not only has all the facilities found on ordinary scanners, such as: scan, search, lockout, delay, priority, adjustable speed and direct entry keyboard but it also has these additional features:

Continuous tuning from 25 to 520 MHz and 760 to 1300 MHz. 300 permanent memories in ten banks of 30 plus an additional ten channels used for temporary storage when in search mode. Switchable audio squelch allows you to ignore blank carriers. Three reception modes, AM, FM (Wide), and FM (Narrow). Adjustable step size 5 kHz, 12.5 kHz and 50 kHz. Sensitivity (NFM) 0.5μV for 20dB S/N up to 1100 MHz. Extremely attractive, information packed blue LCD display. Headphone jack socket, tape recorder socket, external speaker socket, attenuator switch, 240 Volt operation and 13.8 VDC with optional mobile power lead.

PRO-2004 in stock now

OUR BEST —
200 CHANNELS WITH DIRECT KEYBOARD ACCESS

(A) Realistic PRO-32. You'll catch all the action with this full-featured, microprocessor-controlled scanner with extended frequency coverage — all in a hand-held size. Scan up to 200 channels in 10 selectable bands or search a selected frequency range for new channels. Scan any of the following bands: VHF-Lo 68-88 MHz, VHF AIR 108-136 MHz, VHF HI 138-174 MHz, UHF Lo 380-470 MHz and UHF HI 470-512 MHz. Two scan and search speeds. Two-second scan delay, selectable for each channel. Keyboard-lock switch prevents accidental changes. Large LCD display shows channels and frequencies being scanned, monitored or programmed, plus status of channels. Priority function monitors your favourite frequency while listening to others. Squelch control, built-in speaker, earphone jack. With flexible antenna and jack for long-range external antenna. 7 1/2 x 2 15/16 x 1 13/16. Requires 6 "AA" batteries or AC or DC adapter. Memory back-up requires 3 silver-oxide batteries.

(B) Realistic PRO-2021. Superior performance from the very latest in solid-state technology. Features direct keyboard entry, search and scan in two speeds, two-second scan delay so you don't miss return calls, priority function will automatically switch to the priority channel when a call is received on it and individual lock-outs for temporarily bypassing channels. Scan up to 200 channels in these bands: VHF-Lo 68-88 MHz, VHF AIR 108-136 MHz, VHF HI 138-174 MHz, UHF Lo 380-470 MHz and UHF HI 470-512 MHz. Easy-to-read LCD channel/frequency display with electroluminescent back lighting, squelch control and built-in speaker, telescoping antenna. Jacks for external speaker, external antenna, tape recorder and DC power supply, 3 1/8 x 1 15/16 x 8. Includes mounting bracket for mobile use and DC power cord. Mains operation (or 13.8 VDC neg. gnd.). Memory back-up requires 9v battery.

ATTENTION
ALL ICOM IC 2, 02 and 04 OWNERS
Now available for the above ICOM hand portable transceivers is the Kimaski Audio Booster (KAB 1). The KAB 1 is designed to increase the audio output from your handheld by a substantial amount. The improved audio level will drive the internal or an external speaker to full volume and it will even help you pull in those stations with low deviation.

The KAB 1 transceivers is the Kimaski Audio Booster (KAB 1). Now available for the above ICOM hand portable

The standby current is typically 4mA and should not take no more than 10 minutes. The KAB 1 is a solid state hybrid amplifier which fits neatly inside the rig, it is fully sealed with only four connections needed to be made. Full details are given for installing the unit and installation should take no more than 10 minutes.

The KAB 1 costs £12.95 incl VAT + £1.25 P&P and is available from SCARAB SYSTEMS, 39 Stafford Street Gillingham, Kent ME7 5EN (Telephone: Medway (0634) 570441)

DEALER ENQUIRIES WELCOME

RTTY TUNING MADE EASY
Now you can easily tune in RTTY signals using the latest kit from Kimaski. This unit will enable you to quickly and easily tune into RTTY transmissions using the 16 LED bargraph.

The TUNICATOR is adjustable so that it can be used to display most common forms of audio type signal and as there is adjustment for the base reference frequency as well as a frequency span control the TUNICATOR can be made to readout narrow (170Hz) as well as wide (850Hz) RTTY shifts all in one go. The TUNICATOR may be used either horizontally or vertically because of its novel display mode.

The TUNICATOR accepts audio signals straight into the convertor PCB and can therefore be used with any existing terminal unit or even with 'no-interface' computer programs.

The TUNICATOR is available in kit form and costs £29.95 + 50p P&P.

Other Kimaski kits include a CW filter which is ideal for use with direct conversion type receivers and a 555 timer tester, ideal for testing all those 555s lying in the junk box, this project also includes a tested 555!

Kimaski Kits are available from...

RX-4
MULTIMODE RECEIVE RTTY / CW / SSTV / AMTOR
This is the ultimate in software for the SWL. Just one program to receive all four modes, switching from one to the other at a single keypress. Extremely user-friendly, RX-4 has the facilities and performance you need to catch all the action on the bands as soon as you hear it.

When you see the features it's easy to see why RX-4 is today's best-selling receive software.

RTTY and AMTOR tuning scale makes tuning-in very quick and easy.

Four RTTY baud rates, any shift, normal or reverse, with selectable unshift-on-space.

CW software filters and controllable autotrack for maximum performance up to 250 wpm! On-screen indicator lets you set the level and tuning with a minimum of fuss.

SSTV has selectable scan rates in both directions and two modes of picture storage for maximum use of memory.

Text and pictures can be stored, recalled to the screen and dumped to a printer as well as being saved to tape or disc.

Please note that the AMTOR section only receives ARQ mode (mode A) but this is the most common mode and covers a lot of commercial TOR stations, also.

Previously, people have paid over £30 for separate RTTY, CW and SSTV programs which do not have the performance, facilities and convenience of RX-4. We are offering this amazing software for the low price of only £25 on tape, £27 on BBC or CBM64 disc.

SPECTRUM needs no hardware. BBC-B, CBM64, VIC20 need our TIFI interface. This has isolation between computer and radio to reduce computer noise and switchable filters, giving much improved copy. Kit £15 (assembled PCB + cables and connectors) or ready-made, boxed with all connections £25.

We also have the TX-3 RTTY / ASCII / CW TRANSCEIVE program for BBC-B and CBM64. This has every possible feature and amazing performance. Uses our TIFI interface (see above) or a terminal unit. Tape £20, disc £22. State rig if ordering ready-made TIFI.

NEW UK/EUROPE and WORLD MAP and LOCATOR. Accepts lat/long, locators, NGR and hundreds of placenames. Displays your QTH and the distant location and the great circle between them on the map and prints full details of distances, beam headings, etc. For BBC-B/ELECTRON only, tape £10, disc £12. Mapless locators available for CBM64, VIC20, SPECTRUM £7 on tape.

Logbook date, band, mode, call and remarks. Callsearch and printout. For BBC-B, CBM64, VIC20, SPECTRUM, ELECTRON. Tape £8.

Also a superb MORSE TUTOR £5 and RAEN MATHS £9 for all the above computers.

All BBC-B and CBM64 programs are available on disc at £2 extra (BBC: state 40/80 track). All VIC20 programs need at least 8K expansion.

Same day dispatch by First Class Post, Airmail Overseas. Prices include p&p and VAT, where applicable.

To all SWLs and VHF DXers,

Remember that whatever VHF band you listen or DX on, the best results can always be obtained using one of our converters. We manufacture converters for the six, four, and two metre amateur bands as well as 70 and 23 centimeters. All of our converters come in a choice of popular IFs.

Perhaps one of our GaAsFet preamplifiers will enhance your results? Microwave Modules also specialise in linear amplifiers as well as Transverters, so if you decide that it is time to 'get your ticket' you may well decide to purchase one of our products to complement your station.

For the enthusiast in amateur TV DXing our company produces the finest 70cm converter commercially available. Priced at £35.65 it will allow the SWL into the exciting new world of ATV transmissions. The converter is simple to use. Just plug into any TV, tune to approximately channel 36, and assuming that you've plugged your seventy centimetre antenna to the converter and supplied it with 12 volts you are ready to receive ATV transmissions.

Are you interested in weather satellite reception? M.M. can offer the best and most competitively priced system on the market. If your club would like a demonstration of METEOSAT and our complete range of products, why not give Mick a ring? You can catch him or the answerphone on 0403 730 767. But hurry, like last year the bookings went very quickly!

Just to round up, if you read on you'll find our current price list. Please remember, when you go to your local emporium ask for one of our products by name. Don't settle for second best and regret it. You will receive a factory warranty with any of our products to give you peace of mind. If your local emporium can't or won't supply you with Microwave Modules, speak directly to the factory, we will be pleased to give all of our customers the service that they rightly deserve.

Short Wave Magazine May 1987 17
BUILD THE DX 160/80 LOOP ANTENNA

Richard Q Marris G2BZQ

Loop antennas are deservedly popular with listeners for several reasons. They are cheap and easy to make and their excellent directional properties give just the sort of results that are needed by effectively nulling out unwanted stations. A previous design by G2BZQ, the DX 80 Loop Antenna, was described in the April 86 issue of SWM and was intended to cover reception on the 3.5 MHz (80m) amateur band. The results obtained were more than acceptable with continuous coverage of frequencies in the range 2.3 to 6 MHz. In this article he describes a development of the original design to cover 1.5 to 4.6 MHz.

The DX80 Loop Antenna used a novel construction giving a neat and tidy, yet simple, design. Covering 2.3 to 6 MHz more than fulfilled the original design criteria. The circuit, if it warrants such a title, is reproduced in Fig. 1 to show its simplicity and the polar diagram of loops of this type is shown in Fig. 3. You are recommended to read the original article if full constructional details and specification interest you.

More sophisticated, complicated and expensive methods of coupling the loop to the receiver had been tried with minimal practical improvements in performance and they were consequently abandoned in favour of the simple arrangement used.

Thoughts of producing a similar loop to cover the amateur Top Band (1.8 MHz) had prevailed for some time with a view to replacing other Top Band loops. During the thinking process some rough and ready experiments with turns of wire around a cardboard box it became obvious that a similar design could be produced to cover both Top Band and the 3.5 MHz band! It was also evident that the construction could be simplified even more than that used in the DX80, the variable capacitor could be replaced by a selectivity/coupling switch and fixed capacitor arrangement to give lower costs, fewer controls and easier assembly. And, if desired a simple M.W. facility could be added.

The result is the DX160/80 covering 1.5 to 4.6 MHz, the circuit of which is shown in Fig. 4a, together with front view in Fig. 4d. It is a "spiral" loop as opposed to the more usual "box" construction, and is only 712 mm high by 610 mm wide.

Description

As can be seen from Fig. 4d the assembly takes the form of a crossboom affair, mounted on a simple base together with a small panel carrying the controls.

The circuit, Fig. 4a, consists of a 6-turn loop winding, L1, tuned in a semi-balanced circuit by C1, a two-gang, 500 pF per section, good quality, air-spaced, receiving type, variable capacitor. The coupling loop consists of 1 turn of wire coupled to the RX by a coaxial feeder cable. The coupling/selectivity is controlled by adding extra capacitors into the circuit using switch S1. These capacitors should be ceramic disc or silvered mica types.

The polar diagram is shown in Fig. 3 and it can be seen that the maximum signal is received off the ends with the minimum, or null, at 90° to this.

Construction

The constructional details of the "X" boom unit are shown in Fig. 4d. A piece of wood 15 x 30 x 712 mm is dovetailed and glued to a second piece 15 x 20 x 610 mm to form the "X". If thought necessary additional strength can be added by drilling and bolting the joint. The wooden assembly, should be finished with a quick-drying spirit-based wood stain.

A 7-way plastics terminal block, cut from 12-way, 5A Tandy 61-7099 terminal strip, is screwed to the end of each arm. Other makes of terminal strip can be used provided they are 18 mm wide. 2.5 mm holes are drilled in each arm as detailed in Fig. 4d exactly 4.8 mm in from the edge of the wood.

The 64 x 127 mm control panel should be made from a non-metallic material such as Paxolin, glass fibre, hardboard or even plywood. Perforated Paxolin board should be avoided as the prototype used this material at first and it broke up after the switch had been operated a few times.

The panel requires two holes to suit the variable capacitor, C1 and switch, S1. The positioning and size of these holes will depend on the components used, of course. Two more holes will have to be drilled in the panel to allow it to be screwed to the boom arm, immediately under, and hard up against, the bottom terminal block.

The base is a simple unit but must, of course, be heavy enough to prevent the loop tipping over. Pieces of 15 x 38 mm wood were used as shown in Fig. 4c and the completed base was stained in the same manner as the boom.

At this stage it is a good idea to have a "dummy run" and screw the base unit to the "X" boom before winding the loop, a job which can only be carried out with the boom separated from the base.

Winding the Loop

The main loop consists of 6 turns of pvc-covered 1/0.8 mm copper wire having an outside diameter of 1.2 mm. Other pvc-covered wire can be used, but could affect the final frequency coverage of the antenna. The winding is started with a tail 150 mm long secured, with screws, in the outer hole of the bottom block. The winding is carried out clockwise for six complete turns finishing at the inner hole of the bottom block with a 150 mm long tail. This means that all seven holes are used in the bottom block but only six in the other three blocks. The fixing screws in the top and bottom blocks are then tightened carefully to clamp the wire leaving it free in the right and left arms.

The coupling loop, L2, is a single turn of the same wire wound through the 2.5 mm holes previously drilled through the four arms. Start at the bottom with a 150 mm...
long tail and thread the wire through the hole in each arm finishing through the extra hole, but in the opposite direction, leaving a 150mm tail again.

Fit the variable capacitor and switch to the panel before screwing the panel to the vertical boom arm. Trim the tails of the main loop, L1, to length as required and solder one to each of the fixed plates of C1. The switch, S1, is a small 4-pole, 3-way rotary wavechange switch wired as shown in Fig. 4b to give the total capacitance values shown in the table.

A length of 50ohm coaxial cable about 1200mm long, is secured to the cross-bar of the base unit with cable cleats and the centre core is soldered to the bottom tail of L2, which should be cut back to suit. The other end of L2 is connected to the frame of C1 together with the common ends of C2, 3 and 4. The other ends of these capacitors are soldered to the switch contacts as shown. An optional earthing connection, E, is shown on the circuit diagram and the author uses about 3m to the nearest water pipe. This actually increased the noise level masking any marginal increase in signal strength.

**Testing**

Testing the DX160/80 Loop is simple. After plugging the coaxial line into the RX, switch S1 to WIDE-BAND — all the capacitors in circuit. Testing is best carried out during the evening when there is plenty of on-air activity.

If you are using an amateur bands RX adjust to 1.800MHz, turn C1 for resonance, indicated by an increase in noise level. Readjust the RX tuning slightly until a convenient signal is heard and adjust C1 for maximum signal. Rotate the loop for maximum signal and then turn it through 90° when the signal should be greatly reduced or even eliminated. Repeat this procedure at 2.0, 3.5, 3.8 or 4.0MHz depending on the coverage of the RX.

For those using a general coverage RX it will be found that it is just possible to resonate broadcast stations at the top end of the m.w. band at around 1500kHz. The other extreme of the loop’s frequency range should be around 4.6MHz depending on the exact construction of the loop and the lowest obtainable capacity of C1. The minimum capacitance value of this type of tuning capacitor tends to vary a few picofarads depending on the type and make, so that the highest frequency of the loop can very from unit to unit.

When using the loop in place of the normal RX antenna it will be noticed that there is a considerable reduction in noise level, it is possible to rotate the loop...
BUILD THE DX 160/80 LOOP ANTENNA

slightly to greatly reduce, or even eliminate, QRN in general and noise from domestic electrical wiring and appliances in particular. Keep the loop at least 500mm away from the wall. Walls have a nasty habit of containing hidden electrical wiring!

The QRN from interfering stations can be reduced or eliminated by simple slow rotation of the loop for optimum results. Using S1 it is possible to reduce QRN by narrowing the bandwidth, useful for c.w. Loops will not, of course, eliminate QRN if the offending station is on the same, or reciprocal, bearing as the wanted station.

Using a good RX with adequate r.f. amplification, the results with the DX160/80 Loop are impressive. If an RX with only mediocre r.f. amplification is used then it would be a good idea to place an r.f. pre-amplifier between the loop and the RX input.

Medium Wave Facility

It is possible to add a m.w. facility to the loop to enable the user to listen to some light entertainment or news on a communications RX, although this is unlikely to be of much use for m.w. DX work!

Medium Wave Facility

It is possible to add a m.w. facility to the loop to enable the user to listen to some light entertainment or news on a communications RX, although this is unlikely to be of much use for m.w. DX work!

The I.F. end of the loop actually just “clips” the h.f. end of the m.w. band. This can be extended by winding a few turns of thin pvc-covered wire around a short piece of ferrite rod. A little experimentation will get it right for you. It can be mounted vertically, using Terry-Clips, onto the upright boom just above the bottom terminal block. The extra coil is inserted, electrically, between the top end tail of L1 and C1 using a small switch or shorting lead so that it may be shorted out when using the loop for its intended purposes.

The purpose of the loop was to give a dual-band receiving antenna of compact proportions to sit on the table alongside the receiver. It should also eliminate, or greatly reduce, QRN/QRM and assist in reducing the dreaded noise from electrical wiring and appliances in a block of flats.

100 kHz-950MHz in one box!

**YAESU FRG9600/RWC MK3 HF-UHF SERIES**

After many months of research and development RWC LTD are pleased to announce their latest HF modification for the Yaesu FRG9600 which now includes LF/HF/VHF/UHF coverage from 100kHz to 950MHz and improved 'S' Meter and a typical receiver sensitivity now >2µV pd HF, >1.5µV 60-950MHz all @ 12dB SINAD. (Please contact us for detailed specifications).

We have fitted a High performance HF Front-End made for us by AKD. The new HF section is fitted internally with switching circuits and a small toggle Switch on the rear apron to enable band change whereby the display changes to read actual frequency (100kHz-60MHz). The standard SO239 antenna connector has now been changed for an 'N' connector for coverage from 60-950MHz and an SO239 connector fitted for HF coverage 100kHz-60MHz. (UHF extended coverage is now standard as per our original MK2 modification up to 950MHz).

As an 'N' connector is now fitted to all RWC FRG9600s for VHF-UHF coverage it is possible to use a wide-band discone antenna such as the ICOM AH7000 which is supplied with low-loss coaxial cable and 'N' connectors. A dipole or long-wire antenna can be used for HF coverage with very good results. This facilitates use of two antennas for all bands.

All modifications are Fully Guaranteed for twelve months from date of purchase/modification providing our modifications seals are unbroken. © RWC LTD 1987

* We reserve the right to change specifications due to continuous development and modification of this product.

**ASk For Colour Brochure & Specifications.**
This is an interesting kit which converts a amateur fast scan TV signal in the 430MHz band into a form suitable for demodulation by a conventional broadcast TV receiver.

**Construction**

The kit arrived well packed and complete and all the components were up to Wood & Douglas's usual high standard. The p.c.b. is a double-sided glass fibre board with the top being the ground plane. All holes were of the correct size and spacing which saves the constructor having to open up holes to make components fit. The first job, as always, was to read the instructions supplied and check all the components. The instructions were detailed enough to enable a reasonably experienced constructor to continue without problems. Those less experienced may need to consult someone with more practice as the soldering of double sided boards needs to be carefully done.

The first items to be fitted were the trimmer capacitors which needed the earth legs soldering on both sides of the p.c.b. Useful tip here is to tin the leads just before insertion as this ensures that a good joint can be formed quickly. This avoids excess heat on these sensitive components. The next stage was to fit the resistors, capacitors and p.c.b. pins. To ensure correct placement of these components a set of diagrams is included in the instructions. The inductors, all of which were ready wound and stripped, were fitted next followed by the active devices.

The mixer uses a 3SK88 m.o.s.f.e.t. which should be handled with care as it is static sensitive. A simple way to achieve a reasonable degree of static protection is to use a static discharge lead as illustrated in Fig. 1. This lead is connected between earth and a conductive wrist band i.e. a metal watch strap, and discharges any static build up. One important word of warning when using this lead is that you should ensure that your bench is protected by a sensitive Residual Current Circuit Breaker (r.c.c.b.), they may be expensive but how much is your life worth?

To complete the construction, the kit should be mounted in a well screened enclosure, a die cast box being ideal. The enclosure, a die cast box being ideal. The unit was put through its paces in the Practical Wireless test lab and was found to match the advertised specification in all counts. The photograph in Fig. 2 shows the output spectrum centred on 660MHz with an input frequency of 437MHz ± 2.25MHz. The vertical scale is 10dB per division and the horizontal scale is 1MHz per division. The conversion gain of the kit was a very respectable 30dB.

Test equipment used for these measurements was a Marconi TF2017 signal generator, Marconi TF2370 spectrum analyser and Marconi TK2373 frequency extension kit. The test signal was a 1MHz sinewave at a power level of 30dBm, measured using a 30dB attenuator. The unit was put through its paces in the Practical Wireless test lab and was found to match the advertised specification in all counts. The photograph in Fig. 2 shows the output spectrum centred on 660MHz with an input frequency of 437MHz ± 2.25MHz. The vertical scale is 10dB per division and the horizontal scale is 1MHz per division. The conversion gain of the kit was a very respectable 30dB. Test equipment used for these measurements was a Marconi TF2017 signal generator, Marconi TF2370 spectrum analyser and Marconi TK2373 frequency extension kit. The test signal was a 1MHz sinewave at a power level of 30dBm, measured using a 30dB attenuator. The test equipment used for these measurements was a Marconi TF2017 signal generator, Marconi TF2370 spectrum analyser and Marconi TK2373 frequency extension kit. The test signal was a 1MHz sinewave at a power level of 30dBm, measured using a 30dB attenuator.

As can be seen from the measured performance, the high conversion gain means that even a relatively insensitive television receiver becomes quite usable for amateur television reception. The kit was very well planned and the construction and alignment instructions were suitable for the enthusiast with a few kits under his belt. If after building the kit, you have problems with the alignment it can be returned to Wood & Douglas to be repaired and aligned for which they charge £4.85 plus parts.

S.E.M. UNIT C, UNION MILLS, ISLE OF MAN
Tel: MAROWN (0624) 851277

S.E.M. QRM ELIMINATOR. Do you suffer from local QRM. Motors, power lines, TVs, local station, computer etc.? We can stop it, with this entirely new concept, developed by us. Phase out your local problem. 1.8-30MHz. £85 Ex-stock.

If you don't believe it's true, try one for 10 days, if it doesn't solve your problem we'll refund, less £5.00 to cover costs. We have many delighted owners now, who can't speak too highly of its performance. With comments such as "I can operate for the first time for years" or "you have got a winner".

NEW S.E.M. Dummy load. 100W with dummy load/through switch. So you leave it plugged in line. £22.00 Ex-stock.

NEW S.E.M. TRANZMATCH Mk III. Now has a switch to select DIRECT to aerial, BALANCED or UNBALANCED or DUMMY LOAD. The matching unit retains its tremendous versatility. Capable of matching virtually any aerial to 50 ohms, at up to 1kW balanced or unbalanced. The link coupled output isolates the aerial from the rig, which can cure TVI both ways, and their robust construction is proved by ones in daily use for 15 years. 1.8-30 MHz £110.00, EZITUNE built-in £39.50 (see below), Dummy load built-in £8.90. Ex-stock.

S.E.M. 2 METRE TRANSMATCH, match your V.H.F. aerial, 1kW max. £32.00 Ex-stock.

S.E.M. EZITUNE. Do you use an antenna matcher? You need our EZITUNE to tune it to your frequency without transmitting. Listen to the S9+ noise on your receiver and adjust your aerial tuner for a dip in the noise and you are matched up to 50ohms (1:1 SWR). Protect your radio and save tuning QRM £45.00 boxed, or p.c.b. + fixing bits and instructions to fit in any A.T.U. £39.50 Ex-stock.

VERY WIDE BAND PRE-AMPLIFIER. They cover from 3-500MHz with a noise figure of 1.5dB and an unprecedented + 30dB 3rd order IP at the input. This means that they are quite exceptional in handling very strong signals, very important on wideband pre-amps. Gain is 9dB.

We make three types. Straight pre-amp, this has a signal loss if you switch it off, £32.00. One which switches to "straight through" when switched OFF, can be used for transmitting through (100W) if supplied with 12V on receive and 0 on TX, costs £37.00. An R.F. switched unit is £45.00. All Ex-stock.

We are continuing to make our highly acclaimed dedicated 2 Metre preamps with adjustable 0-20dB gain and 1dB N.F. Receiver only £21.90. R.F. switched £34.50 and with 240V P.S.U. £39.50. Ex-stock.

CONVERTERS for LF, MF, HF, VHF, UHF. Our new H.F. CONVERTER opens new horizons for receivers, use with the new all mode V.H.F., U.H.F. receivers FRG9600 and ICR7000, extends their coverage down to 10kHz, giving you LF, MF, HF, VHF and UHF. You tune your RX from 100MHz up, e.g. 103.500 is 3.5MHz. It has two aerial sockets, one for H.F. into the converter and one for V/UHF switches straight through into your RX when you switch the converter OFF, i.e. No plugs to change. All this for £45.00. Ex-stock.

R.F. NOISE BRIDGE. If you are experimenting with aerials you need one of these units. Tells you the resonant frequency and impedance of your aerials and also invaluable for measuring ¼, ½, etc., wavelength of feeders, etc. £45.00. Ex-stock.

WAVEMETER. A pretty little absorption wavemeter, to satisfy the licence conditions. 1.5-30MHz with a meter indication. £39.50. Ex-stock.

IAMBIC KEYER. We use the world famous CURTIS chip which eliminates the little idiosyncracies common in other keyers. Opto-isolators from the chip ensure that R.F. can't get in, a common problem with multi-chip keyers. Compatible with any Tx. £45.00. An excellent twin paddle key often mistaken for ones costing several times more at £19.50. Ex-stock.

2 METRE LINEAR POWER AMP/PRE-AMP. People are constantly telling us that comparing different makes our Pre-amp is best. (See Pre-amps for spec.) Three models, Sentinel 40 14x power gain e.g. 3W IN - 40W OUT. Ideal for FT290 £85.00, Sentinel 60, 10W IN-60W OUT £95.00. Sentinel 100, 10W IN-100W OUT £135.00. All Ex-stock.

AUDIO MULTIFILTER. Has fully adjustable BAND PASS, HIGH PASS, LOW PASS and 2 NOTCH filters. From 2.5kHz to 20kHz. Making the most versatile filter available. £75.00. Ex-stock.

T.V.I. Our Braid Breaker/High Pass Filter cures T.V.I. by plugging into the TV aerial socket. £7.50. Ex-stock.

S.E.M. SWITCH. 3 way ant. switch + 4th position to earth. 1kW. SO239S D.C.-150MHz. £23.00. Ex-stock.

12 MONTHS COMPLETE GUARANTEE INCLUDING ALL TRANSISTORS.

Prices include VAT and delivery. C.W.D. or phone your CREDITCARD No. Ring or write for further data. Orders or information requests can be put on our Ansaphone at cheap rate times.
**WARC — Well Advanced Radio Chaos!**

May 17 is World Telecommunication Day, as proclaimed by the United Nations specialised agency, the International Telecommunication Union. It is marked annually to commemorate the founding of the Union in May 1965 with 20 States. The ITU now has 162 member states, Antigua and Barbuda joining on February 4. Clearly, the larger the Union has grown, the more difficult it has become to co-ordinate world telecommunications. At a recent conference, where a decision taken in Europe will affect communications as far as the Pacific, things appear to have been deadlocked.

Between Monday February 2 and Sunday March 8 just over 700 people gathered in Geneva Switzerland for Part II of the World Administrative Radio Conference on High Frequency Broadcasting. Approximately 140 countries actually use short wave, but at the start of the conference only about 90 turned up. The participation improved as the conference proceeded.

The frequency that an international broadcaster currently picks to beam to a particular part of the world is decided by tradition and a bit of diplomacy. A station chooses a channel, sends a note about it to the ITU in Geneva, and they in turn publish the White Book. This comes out a few months before the season it represents, attempting to show the state of the short wave broadcast bands. If two or more stations decide to use the same channel, and that happens a lot at the moment, it is up to those affected to sort out a solution amongst themselves.

Currently there are a lot of frequencies where no solution is found, and that spot becomes a "Tower of Babel". The situation is complicated by the fact that many countries, such as USSR, register more frequencies than they actually use.

**Computer Planning**

In 1984, the first part of the WARC conference laid down some ideal specifications, such as the current selectivity and sensitivity of the average receiver. It also decided to look at another way of planning how the short wave broadcast spectrum is divided up. A team of six renowned experts devised a computer planning method. Although we’re oversimplifying, it basically asks each country to send in a list of broadcasts it would like to make. A computer in Geneva would then sort out how many frequencies the station would get at the time requested, and exactly what those frequencies should be.

Trial runs of the computer method have now been made, and the results demonstrated at WARC 87. The software programmers had worked hard. Yet the computer plan showed that it was impossible to fit everyone’s requirements into the space allocated. Either overall reception quality would have to be reduced drastically (nothing better than S10-3331), or countries would have to agree to switch some of their facilities off. Stations with 40 or more transmitters were being told by the computer plan that as many as half of their transmissions would have to be scrapped if the new system were adopted. Smaller short wave users, on the other hand, were told that they would have to hop to new frequencies every 30 minutes, often in the middle of a broadcast. Bearing in mind that many transmitters (especially in Latin America) are crystal controlled, this news wasn’t greeted warmly by developing countries.

**Working Groups in Square Brackets**

The conference was divided into several committees. Most of the attention concentrated in Committee 4 looking at...
technical standards, and Committee 5 examining the computer planning of the bands. Initial discussion took place in working groups who sent their reports to the committee, and the committee in turn reported to the open session. It was much easier to change a proposal in a working group than in front of the plenary session with 800 people around you. If agreement could not be reached in a working group, then the text of the disputed area was put into square brackets, and then passed on to the committee level to be resolved there.

By the end of February, nearly all of the text from the four working groups in Committee 5 was written between square brackets! The conference was at the point of failing. At the last moment the chairman of the committee came up with a Global Compromise. It involved developing further both the computer planning method and the current procedure (the so-called Article 17). By 1992, both systems should be running alongside each other. Then a new conference can decide how much, if any, of the short wave broadcast spectrum should be sorted out by computer, and how much by an improved version of what we are doing now. This decision would take effect in 1994 at the earliest.

Failure

The word failure wasn’t used officially to describe the conference. But privately many delegates expressed reservations about the chances of reaching an ideal agreement five years from now. There has been a marked lack of trust between North and South during WARC HF 87, and that threatens to spill over into other conferences too. The Geneva disarmament talks being held at the time of WARC softened the relationship between two large users of the spectrum — the USA and USSR. Jamming was not discussed at the conference at all, it was regarded by most delegates as a political, not a technical, problem. But the conference was not all bad news.

The idea of gradually switching over to single-sideband (s.s.b.) is now accepted. Broadcasts using s.s.b. take up half the space that standard a.m. transmitters occupy on the radio dial. But the switch to this more efficient method of mass communication is a long term process.

Listeners have to buy new radios with synchronous detectors, broadcasters have to buy new transmitters or modify existing facilities. WARC agreed that stations can switch over to s.s.b. as from have to buy new transmitters or modify should be capable of broadcasting in either a.m. or s.s.b. By the year 2015, all short wave stations should be transmitting in single-sideband. Until then, stations will probably opt for a reduced carrier a.m. This can be received on standard receivers currently in use, without too much added distortion. So no mad rush on new receivers as yet, though a new challenge is now created for receiver manufacturers to take up.

Broadcasters point to the fact that only 10 per cent of the spectrum is allocated to their needs. They hope that the bands will be further expanded, pointing to the fact that other users of the s.w. spectrum are switching to satellite. But it remains to be seen if military and point-to-point stations are willing to give up the chance for back-up services on short wave should the satellite fail. With all of short wave’s imperfections, a lot of people still care about it.

Save Your BRT Stickers

The Flemish speaking Belgium Radio and TV Service will shortly change its logo to the VRT — Vlaamse Radio and TV. A few years ago, the French speaking counterpart Radio Television Belge spent several million francs adding the letter “F” to its logo to become RTBF — Radio-Television Belge de la Communaute Francaise. With the cultural differences between the French and Flemish communities apparently widening, Flemish politicians in Belgium feel the need for a VRT. Currently the BRT external service is the only way non-French and Flemish speakers can get daily news from the country. A small dedicated team in the Belgium capital put together an excellent half-hour programme called Brussels Calling. One of the producers, Frans Vossen, also puts together a DX programme called Radio World. RTBF on the other hand is content with relaying French programmes to Africa.

Marshall Music

The Marshall Islands are on short wave! The bad news is that the station WSZO is not going to “boom in like a local”, at least here in Britain. A 10 kilowatt unit started broadcasting at the beginning of March on 4940kHz. It was immediately heard in the rest of the Pacific around sign-off at 1100UTC. The short wave transmitter is needed to improve reception in the outer islands, but the general manager was surprised to get reports from Melbourne, Australia within days of going on the air.

Amateurs Join the Professionals

The Westlink Amateur Radio group in California USA are currently preparing a non-profit video production about amateur radio. The idea is that the finished product can be offered as documentary to TV stations. This is being organised by former NBC award winning TV broadcaster Roy Neal. They’ve now launched an appeal to radio societies around the world for any video material that features amateur radio in action in their country. Whether it’s PAL, SEECAM or NTSC colour format doesn’t matter. Even if you don’t have the material yourself, the organisers would be interested to learn of the title of any presentation you may have seen at a club or on television so they can contact the producers. Westlink hope that this initiative will help to reverse a downward trend in the interest of amateur radio in North America. By making it themselves, Westlink can concentrate on promoting the positive sides of amateur radio, rather than the “QRM, QSL, QRT” impression that some people have. Suggestions and comments please to: Westlink Video Project, 28197 Robin Avenue, Saugus California 91350 USA.
BBC Radio 648

As from the middle of May, the BBC is planning to improve the continuity of its medium wave service to Europe. Currently the frequency of 648kHz jumps abruptly between the English "World Service", and the French and German services. This is especially annoying during peak listening periods. By creating BBC Radio 648, they hope to iron out the language changes giving a more uniform connected sound. Maybe something can also be done about the rather abrupt change-over between Radio 4 on 200kHz and BBC World Service which occurs when the former signs off.

VOA Expanding/contraction

The Voice of America recently concluded a new agreement with the Greek government to continue using its facilities in Kavala and Rhodes. The ten 250 kilowatt transmitters in Kavala are particularly important to VOA's Russian service. Meanwhile, VOA's recently confirmed director Richard Carlson is constantly having to defend the US$1.3 billion modernisation programme. This ambitious project will considerably improve VOA's audibility in important target-areas -- especially Latin America. Yet budgets are reviewed on an annual basis. Cutbacks have already been made to English programmes from VOA. The 0700-0800UTC release to Europe has been scrapped for instance, and programmes in Slovene, Hausa, and Swahili have also been hit. VOA-Europe, the satellite radio service started in October 1985, has been saved from being scrapped altogether. But the budget is now US$1.2 million instead of 3.1 million.

Sweet Dreams

The latest White Book from the ITU in Geneva contains some more registrations from Burkina Faso, formerly Upper Volta. For the last couple of years this country has registered channels but has never actually been heard on them. No-one is sure if they ever will. One of the latest is 6045kHz between 0800 and 0000UTC. The power is listed at 50kW. That would make for a nice catch in Europe.

Radio Nederland Wereldomroep

Royal Opening

As part of the 40th anniversary celebrations, Prins Claus of The Netherlands is expected to officially open the new Radio Netherlands Flevo transmitter site at 1130UTC on May 19. Special QSL cards have been promised by the station for reception reports on programmes put out that day. The Flevo transmitter site has been in a testing phase for the last two years, but now it seems it is time for a royal seal of approval.

Link-ups Increase

The upward trend for special link-ups seems to continue. One of the best so far this year was a live programme between NHK Radio Japan, and Radio Australia in Melbourne. Listeners who reported on the programme have recently received an attractive commemoration card. Radio Beijing and BBC Radio Manchester also did a swap to celebrate the Chinese New Year at the end of January. This was the first time that an English exchange had taken place between the English section of Radio Beijing and another station.
Alignment

The (hopefully) final task was to check the r.f. alignment and adjust as necessary. For this job I used the Marconi TF867, which needs, as they say, no introduction from me but which deserves my praise as being not only accurate, but so darned convenient in the way its frequency ranges are arranged.

I found that in the Escorial the large ceramic formers beneath the chassis were for the three higher ranges, with the other four having smaller formers mounted in the above-chassis box. With almost any receiver it is soon possible to establish a sequence for the various trimmers, padders, etc., and the Escorial proved to be no exception. All but one of the flat, rotary trimming capacitors consented to being adjusted, and I tolerated a small discrepancy on the 545kHz - 1500kHz range rather than risk a breakage. All the other bands could be brought to very acceptable standards of alignment, which brought much relief as well as pleasant surprise, since I had feared that more iron-dust cores might have to be repaired.

I have now assembled the Escorial into its cabinet and have it on a bench near to hand whilst I am working so I may operate it frequently and with great facility. Curiously enough, one of the first radio programmes I received at length was a Dutch station - much the kind of thing that the set may be expected to have reproduced in its war-time days.

Superior

As was mentioned before, s.s.b. may be resolved satisfactorily, and the short wave performance in general is excellent. The superb tuning mechanism in conjunction with the large dial and comparatively narrow coverage of each band endow an almost band-spread effect. Accurate tuning is aided by the meter above the dial, which needed no more than the freeing-off of its needle to be put into working order. The sound quality is extremely good, as might be expected from a push-pull stage rated (according to valve-data books) at around 8W. In short, the Escorial is as good for general listening as it is for long-distance work. Tuning drift appears to be negligible and the logging scale makes it possible to re-tune to s.w. stations with no difficulty.

Post Script

Was the malevolent shade of Adolf Hitler peering over my shoulder when I iterated Winston Churchill's remarks regarding him and his regime? At any rate, only an hour or so after the article was completed the Escorial went up in a cloud of smoke! I had left it running in anticipation of the arrival of an interested friend, and although it had previously been run for hours at a time, in the short time that I was absent from the workshop the mains-transformer went into the self-destruct mode. We actually smelled the smoke, but did not connect it at once with evil fumes. There was nothing to be done but to stand the set outside and hope that the wind would eventually disperse the stink of burned insulation.

In the meantime I tried to locate a transformer that would act as a replacement. The main problem was that the old 4V valves are notoriously heavy on heater current, a typical triode consuming around 0.65A and an output pentode perhaps as much as 2A. I had, therefore, to assume that the Escorial would require some 10A total, especially when the dial lamps were taken into account. A transformer capable of delivering this current is hard to find nowadays, since 4V valves have not been used in this country for some 35 years, and even then they were in a minority compared to 6.3V and series-run types. I have a number of transformers offering 4V, but only for rectifier heater purposes at about 2A maximum, and everyone else I contacted seemed to be in the same boat. The chances of having the original transformer re-wound appeared sufficiently remote to make me consider an emergency alternative.

Transformer

In my searching I turned up a transformer that had come from a local jumble sale, rated at 12V 50VA on its secondary. Since three times 4 is 12 the prospect of a series/parallel heater arrangement appeared. To set up a system of this kind one has to know the heater current of each valve with some accuracy, so I set about measuring the values with the aid of the 4V transformer winding mentioned above. I found that the two output valves drew 1.5A each, and that all the other valves close to 0.65A (some a little under, some a little above, but near enough for the figure to be accepted as nominal). This suggested that the r.f. and i.f. sub-chassis, with their three valves each, could be wired for series operation without too much trouble, leaving the remainder of the valves to make up a third chain. The configuration that came to mind was to have the two AL4s in series to take 8V at 1.5A, followed by the a.f. and b.f.o. valves connected in parallel to draw as close to 1.5A as possible at 4V. This would necessitate discarding my EF9 b.f.o. valve and its replacement by a 4V type. In the absence of anything else suitable, I opted for a Mazda VP41 (0.65A) re-based to fit the original valve-holder on the Escorial. This was done by removing the base from the defunct P-base valve and fitting on to extended base leads on the VP41. Possibly someone very brave might have gone as far as actually to remove the VP41 base altogether and to use the wires coming from the glass bulb, but I was not inclined to tempt fate in this manner! In the event the results are not too bad as regards appearance, whilst the VP41 works extremely well in this rather unusual role. But I anticipate. The AC2 and the VP41 draw a total of 1.3A, leaving only another 200mA to be dissipated by a shunt resistor of 20 ohms.

POWER SPLITTERS

Specification:
- CONNECTORS: N' Type Socket
- IMPEDANCE: Greater than 25 dBd Across the Band
- SWR: Less than 1.1 to 1 Across the Band
- INSERTION LOSS: Less than 0.2 dBd
- FREQUENCY: 144-2 Way 136-155 MHz
- TYPICAL BANDWIDTH: 144-4 Way 138-154 MHz
- 432-2 Way 400-500 MHz
- 432.4 Way 410.490 MHz

Power Handling: Better than 2kW in a system with a VSWR of less than 2.0 to 1

NON-METALLIC MAST

A non-metallic mast is essential for best results where vertically mounted antennas and crossed Yagis are required. MET have released a Reinforced Polyester Pultrusion onto the market with comparable weight per metre as the same diameter aluminium tube. It is available in 1.5m and 3m lengths in both 1½" and 2" diameter.

NON-METALLIC MAST

R.P.M. 1.5M (1½") dia. With Fixing Clamp: £15.75 B
R.P.M. 3M (1½") dia. With Fixing Clamp: £39.50 B
R.P.M. 1.5M (2") dia. With Joinder and Resin: £22.25 B
R.P.M. 3M (2") dia. With Joinder and Resin: £44.50 B

Post and Package Codes: A = £5.00; B = £1.95; C = £6.50.

Restoring a Communications Receiver from Nazi Germany

Heaters

It proved possible to modify the heater wiring in such a manner as to make restoration to original fairly simple should a genuine transformer become available. Once the job had been accomplished I tried a trial run with heater supplies only, to check their voltages under working conditions. Fortunately all were within the close tolerances demanded by valves not really intended for series operation. The other transformer mentioned was then wired in to provide the AZ1 with heater and anode voltages. It was then possible to check the performance of the set and to much relief it was found to be back to what it had been before the burn-up. I naturally endeavoured to find out what had triggered the failure, but could determine nothing specific. An h.t. short is the most common cause of transformer breakdown, but none was evident, and I was forced to the view that the primary may have broken-down to earth. Shorting of the l.t. windings is a less likely event.

Dial Lamps

Turning my attention to the dial lamps, to my surprise I found them to be two long "festoon" types, rated at 15V at 0.2A each. Presumably there must have been a special l.t. winding on the original mains transformer to supply them. One was a little blackened, the other pristine, which is laudable since they are patently original. They give ample light when connected across the 12V supply. The lamp illuminating the tuning meter was changed from a 4V type to an 8V at 0.45A type, of which I happen to have a plentiful supply. This operates happily on the 6.3V winding on the h.t. transformer. It proved to be quite impossible to make out any voltage rating on the miniature festoon lamps fitted to the band-indicator light, but they too seemed to accept 6.3V without protest. However, in the interests of making them last as long as possible (where should I obtain spares?) it was decided to fit a series resistor to drop the supply to around 4V.

Inter alia, I discovered that the output transformer has been replaced at some time, and as a matter of course I tested the wiring to see if it had been carried out properly. I found that the anodes of the two output valves had different, incorrect loads. In putting this to rights, with the aid of a reputable transformer, a very useful increase in a.f. gain and sound quality was obtained.

The only remaining work to be done to realise the Escoria's full potential was the re-tuning of the b.f.o. to compensate for the different internal capacities of the VP41 as compared with the EF9.

I am prepared to accept that purists may carp at this method of restoring the set to use, and can make only this defence: As a pioneer motorist said of his gear-box, "ces't brutal, mais ca marche!"
AERONAUTICAL RADIO

Godfrey Manning BSc MB BS G4GLM

Aeronautical radio falls into two categories: communication ("com") and navigation ("nav"). The latter can either rely on ground aids or else be self-contained within the aircraft. The table in Fig. 1.1 summarises the radio facilities that will be dealt with in this series.

Communications

Here we will deal with the first group, communications. Military users can be found in the ultra high frequency (u.h.f.) band (225-400MHz) and will not be further considered here.

Civil flying over the United Kingdom (UK), Europe and most populated land masses uses the very high frequency (v.h.f.) band for communications. Only when overflying remote areas, such as the North Atlantic, is high frequency (h.f.) required. The v.h.f. com band occupies 118–135.975MHz giving 720 channels with 25kHz spacing, using conventional amplitude modulations (a.m.) with both bands sidebands. VHF signals are most commonly propagated along a line of sight, the limiting factor for terrestrial transmissions being the curvature of the earth: the radio waves can't "see" beyond a theoretical horizon. Aircraft have the advantage of altitude when in flight, and much longer straight-line air/ground paths are possible than ground-to-ground routes.

Most airliners carry at least two, and sometimes three, v.h.f. transceivers or "boxes". In light aircraft each set might be built as a single unit, but airliners more commonly banish their transceivers to a radio rack that is either behind the flight deck or under the floor in an electronics bay. All that is left on the flight deck is a remote controller (one per transceiver), a station box (one per crew member) and a headset socket (one per crew member). Most airlines provide for a supernumerary crew member for training and other purposes and in this case an extra station box and headset is needed. There will also be a flight deck loudspeaker and handheld microphone to enable the uncomfortable headsets to be removed during cruise (above 10000 feet, when the crew member's hands are free). Lastly, allowance must be made for loss of cabin pressure in which case the crew switch rapidly to breathing from oxygen masks (Fig. 1.2) if the aircraft is above 10000 feet. The oxygen masks must also contain a microphone which switches into circuit automatically (in place of the usual headset) when the mask is donned. If oxygen goggles are provided, then again an internal microphone is needed as these too cover the crew's mouths to provide oxygen. The standard NATO type headset socket has 4-poles. The push-to-transmit (p.t.t.) switch is typically a flat paddle attached to the control column such that it lies easily under the pilot's thumb whilst the controls are being held. Often this is pushed one way for transmit, and in the opposite direction for talking to the other crew members by intercom.

The Antenna

The last item of equipment is a fin-type antenna for each transceiver. The antenna is fitted to the outside of the aircraft, and you can look at this when you next board a flight (Fig. 1.3). Sometimes antenna are "suppressed" into a less conspicuous shape, this suppression describes the mechanical configuration (i.e., the equipment does not protrude much from the line of the fuselage skin) and has nothing to do with electrical interference! The aim is to reduce drag by streamlining. Antennas are normally seen sticking out of the midline top or bottom of the fuselage, but are sometimes found atop the tail fin (e.g., on the BAC One-Eleven). The aluminium alloy fuselage makes a good ground-plane. Connection is by coaxial cable which mates with a socket that protrudes into the fuselage from the antenna itself.

Fig. 1.1

Fig. 1.2
Remote Controller

Looking more closely at the remote controller (Fig. 1.4) it is seen that the channel selection is made via two knobs (concentric, in the example shown). The larger knob in our case changes the frequency by 1MHz increments and the smaller one by 25kHz steps. The selected frequency is shown in a window above the knobs, but with the third decimal place omitted. This particular example also includes the navigation receiver controller (to the right of the com section) and one difference here is that the channel spacing is 50kHz. In the example shown, the com set is on the Heathrow tower frequency of 118.7MHz which is appropriate for the final stages of an approach. The nav set, by the way, shows 109.5MHz which is the instrument landing (i.l.s.) frequency for Heathrow runway 28 left. One further feature that may be operated from the controller is a squelch which mutes the receiver’s background hiss in the absence of a signal. This is less tiring to listen to over long periods of time. Constant hiss can eventually cause “ringing in the ears” (tinnitus) which might possibly become a permanent affliction.

The function of the station box (Fig. 1.5) is to enable the crew to switch their headsets (and the cockpit loudspeaker) between the various radios. The captain might remain listening on Heathrow Tower (using v.h.f. com set No. 1) whilst the first officer briefly switches to a navigation aid to check that it is correctly tuned in (perhaps the runway 28L i.l.s. using nav set No. 1). When the first officer is satisfied, he will also switch back to the tower frequency (leaving the nav set connected to the instruments but without listening to it himself). During a typical landing, the first officer might converse with the tower controller; the captain (who is handling the aircraft) listens in too.

The headsets also enable intercom discussions between crew members, again controlled by the station box. Finally, the crew members have their own individual volume controls for each listening channel on their station boxes.

Having a combination of two transceivers and rapid switching between them enables easier liaison with air traffic control (a.t.c.). Modern aircraft are becoming simpler to fly, thanks to more automated systems; the third crew member (flight engineering officer) who was previously needed on larger aircraft types is now increasingly redundant. The pilot’s greatest problems at present are in the environment outside the aircraft; other traffic and rapidly repeated changes of a.t.c. instructions, including frequency selection, are amongst these. If on a complex and busy approach, say, the likely frequency settings are known in advance then one pilot can fly the aircraft whilst the other sets up the transceivers and talks to a.t.c. on one of them. It is routine to set up the next anticipated frequency in advance on the other box; a quick flick of the switch enables frequency changing (when instructed by a.t.c.) without loss of time. As a safety feature, the previous frequency is still selected on the first box at this moment and so if a wrong frequency change is made, contact is not completely lost. Further safety accrues from the redundancy of two complete transceivers, antennas, etc., i.e. complete replication: not just switching between two v.h.f. sets on one set.

Two Services

There are two types of service for aeronautic communications. Pre- recorded messages are broadcast continuously on certain frequencies. A complication is that some are also obtained whilst listening to a tuned-in navigation beacon. In general, reports of current/recent weather are broadcast and the VOLMET (“volume meteorological reports”) are an example of this. London VOLMET South transmits continuous reports in a cycle on 128.6MHz for Heathrow, Gatwick, Luton, Bournemouth, Stansted, East Midlands, Brussels, Cardiff and Jersey with an identification message at the start of each cycle. The message was previously recorded on a continuous tape loop but is now computer-digitised speech. Another continuous transmission is the automatic terminal information service (a.t.i.s.) for either arrival or departure. These give weather, which runway is in use, and other information about arrival or departure operations such as any beacons that are off the air. Heathrow arrival information, for example, is on 133.075MHz.

Most communication is two-way air/ground. Not all a.t.c. services have a controlling role, in fact some are information only. Control implies that the ground station has authority to tell the aircraft what to do; there will be good reason for this, such as the controller having the entire traffic pattern in view on a radar screen. Some services are just advisory, such as in the flight information regions. Here, pilots are told about other aircraft what to do; there will be good reason for this, such as the controller having the entire traffic pattern in view on a radar screen. Some services are just advisory, such as in the flight information regions. Here, pilots are told about other traffic in the area and are expected to work out avoiding action for themselves. In the wide-open spaces this works satisfactorily; as there is no obligation to speak to the ground station, it is also not possible.

AERONAUTICAL RADIO

for control instructions to be issued since the "controller" doesn't necessarily know the position of all aircraft in his areas. This is clearly not suitable for congested areas such as defined airways and the airspace surrounding terminal and larger airfields so here contact with the controller, who does give pilots instructions, is mandatory.

Special Interest

Two frequencies are of special interest. The first is 121.5MHz, which is the international distress frequency. At the London a.t.c. centre (based at West Drayton, near Heathrow) the distress and diversion (D&D) cell monitors this frequency. If no major emergency is in progress, pilots in mild distress can use this (e.g. to ask for directions if lost). Pilots and the D&D cell both appreciate the chance to practice, so "Practice Pan" calls are often heard for direction-finding purposes. "Mayday" signifies real immediate danger to life but "Pan" is a less urgent degree of distress. If a Mayday call is made on any frequency, all other traffic must cease to use that frequency until the emergency is over. Using the v.h.f. communication frequencies for direction finding (as in a practice or real Pan call) is where com and nav overlap and is described in more detail later. The other noteworthy frequency, the easily-remembered 123.45MHz, is often used unofficially by pilots to informally pass useful information between themselves (especially on the longer-haul routes).

Technique

The technique used for aeronautical radiotelephony is closely defined. In the UK, for example, numbers are stated digit by digit (e.g. "10" is pronounced "ten") and in a rather exaggerated way (e.g. 9 is pronounced "nin-er!"). The decimal point is stated as "decimal" so the London VOLMET frequency is "Wun Too At Decimal Six". Letters of the alphabet are given using the same standard phonetics as are already familiar to radio amateurs and s.w.l.s (e.g. "C" is read as "Charlie" and "O" as "Quebec" etc.). Sometimes this is taken to absurd lengths; visual meteorological conditions (v.m.c.) implies visibility adequate for not having to rely on instrument navigation, but pilots insist on describing this as flying in "Victor Mike Charlie". The phonetics (Fig. 1.6) are standardised worldwide by the International Civil Aircraft Organisation (ICAO), so when spelling something (in any country) there is a maximum of only 26 sounds to differentiate. For this reason, radio amateurs would also be advised to stick to the standard phonetics and stop inventing their own as the fancy takes them! Also, these phonetics are claimed to be easily distinguishable even when spoken by a variety of foreign accents.

Another internationally-agreed convention is the use of Q-codes. Radio amateurs are familiar with many of these (e.g. QSY which is code for changing frequency) although a special subset tends to be required for aeronautical purposes. Two codes commonly heard relate to altimeter setting but it is not within the scope of this article to describe non-radio instruments so only a brief description is given here. The pressure altimeter is really a barometer that measures the pressure of air outside the aircraft; as this pressure decreases with height above sea level, altitude can be computed. Unfortunately this means that before taking a reading from a pressure altimeter the instrument must be corrected for the current day's atmospheric pressure (in millibars or, when in the United States, inches of mercury). The altimeter has an adjustment knob and a pressure subscale that indicates the setting as selected by this knob. If the aircraft is on the runway and the QFE pressure (as given to the pilot by the controller) is set on the subscale, the altimeter will always read zero and after take-off height relative to the aerodrome is indicated. Setting the QNH will instead cause the altimeter to indicate height above sea level, be it whilst on the ground or in flight.

What does one hear whilst sitting with the pilot on the flight-deck? Most information exchanged with the controller seems to be numerical. The aircraft has an identifying call sign, e.g. "Speedbird 123" will be British Airways flight 123 or, in the case of a private service the aircraft's registration will be used - such as Golf Bravo Golf Lima Mike for G-BGLM (all British aircraft registrations begin "G"). Other parameters are aircraft speed in knots (nautical miles per hour), heading in degrees, (always given as three digits such as zero nine zero for due east) and altitude. Altitude is normally given in feet, but higher-flying aircraft refer to flight levels (f.l.). which are just the altitude divided by 100 (e.g. 10000 feet = FL100). Other numerical information concerns estimated time of arrival at a given navigational point, often given as just minutes after the current hour, but distances are rarely needed except distance to touchdown which is sometimes given to the pilot on approach. Weather information obviously includes OPE/QNH but also wind as direction and speed in knots; temperature and dew-point; runway visible range in metres and cloud given as oktas (eighths) cover at each height.

A typical call might be: "London, Speedbird 123 passing three thousand five for 1014, estimating Brookman's Park at one five. This aircraft is climbing through 3000 feet on its way 10 000 feet (from which point further clearance will be needed from the controller before climb can be resumed) and as a safeguard, the current QNH setting in use is stated by the pilot. The time of arrival at the next radio beacon (Brookman's Park) is given as 15 minutes past the hour". Fig. 1.7

DF station B

Position of aircraft with cockpit hat

DF station A

DF station C

Short Wave Magazine May 1987
Direction Finding

Direction finding (d.f.) is really a navigational facility that uses the communication frequencies. The relative bearing of the aircraft from the d.f. station is measured whilst listening to the aircraft's com transmission. The v.h.f. d.f. (v.d.f.) or homer station might be called by the aircraft in order to find out the QDM: "What magnetic heading must I steer in order to reach you, if there is no wind?" The pilot must transmit his callsign, or count, for several seconds in order for the bearing to be taken. If several receiving stations are linked together, such as by the D&D cell, then an actual position can be found. Two receivers can each work out a bearing, with the aircraft being at the point where the lines cross. But there is bound to be a slight error; if three bearings are taken, it is most unlikely that they will cross and the resulting enclosed triangle is called a "cocked hat". The smaller the triangle, the closer the agreement between the bearings and so the more accurate the position report (Fig. 1.7). Some aircraft also carry a homer receiver.

The signal from two antennas is compared to produce a deflection on a meter needle that indicates that the ground station is either to the left, to the right, or ahead of the aircraft.

Use of the h.f. band is only necessary for long-range flights and many short-haul airliners do not carry an h.f. set. The h.f. antenna is sometimes a long wire stretched from the top leading edge of the tail fin down to a short pylon mounted on the front roof of the fuselage. An alternative is a long boom, resembling a jousting lance, protruding horizontally for perhaps from the top of the tail fin (e.g. Boeing 707) or from one wing-tip (e.g. Boeing 747 "Jumbo"). Because of the vagaries of propagation, the aircraft will always be given two alternative frequencies on which to attempt contact. Even then contact may well be indistinct so here more than ever strict procedure must be adhered to, e.g. "Shanwick, Speedbird 123 on 8879, position". The aircraft is making a call on 8879kHz. After establishing contact, current position is given along with an estimate of time to the next reporting point; other information might include temperature and wind as measured by the aircraft at that position.

Selcal

A useful addition to an aircraft's communications equipment, especially for long flights is selective calling (selcal). Each aircraft is allocated a four-letter code, e.g. AM-DH, to which its selcal receiver is pre-set to respond. To call the aircraft, the ground station transmits the necessary code to activate the receiver, on the flight deck, a chime sounds and a light flashes to alert the crew members by making them listen to all other aircraft's transmissions on a long flight, whilst trying not to miss a call meant for themselves.

In this first part I have given an insight into the use of radio for communications by aircraft. Subsequent parts will describe the multiplicity of airborne navigational equipment. Visitors to my small collection of such items are welcome by prior arrangement. Also, donations of unwanted, old or broken aircraft equipment, instruments and manuals are always appreciated, no matter how small and insignificant they may appear.
The RF-B60 covers v.h.f. f.m. from 87.5 to 108MHz, long wave 156-519kHz, m.w. 522 - 1611kHz and short wave continuously from 1615kHz to 29.999MHz (except for models sold in West Germany which range only to 26.100MHz).

The set has a most sophisticated tuning system which allows one of three possible methods to be employed. A large rotary tuning knob with two faces, one on the front and another on the right hand side of the set, allows for conventional tuning, whilst a calculator type keypad enables frequencies to be input directly. There are 12 keys on the pad, marked from 1 to 9 together with 0, a decimal point and a final key marked M for memory. To input a frequency, it is necessary to depress the small key marked FREQ alongside the main key board, followed by the frequency in either kHz or MHz and then the ENTER key: if the combination is correct, the receiver tunes in the selected channel in less than a second. The digital display shows the numbers as they are keyed in, and displays the final tuned frequency.

Alternatively, individual broadcast metre bands may be selected, using the same keypad — the number 1 key doubles as 120m, through to 13m on the M key. Once again the sequence is the same -press the METER key, followed by the numeric key and then ENTER. The set is then tuned to a frequency towards the lower end of the metre band.

The RF-B60 may also be tuned using two arrow keys adjacent to the keypad. These will tune the receiver in 5kHz steps on shortwave, 9kHz (or 10 for North America) steps on medium wave and long wave, and 100kHz steps on v.h.f. f.m.

These two keys double as controls for scanning. If either arrow key is held down for more than around one second, the receiver will tune automatically along the band, stopping on the first strong signal. Once the upper or lower limit of a broadcast band is reached, the set will start to scan from the other end of the band again. If the scanning mode is used when the set is outside a broadcast band, it will scan until the next broadcast band is found, and then run within that band.

Other features include a dual-time clock, enabling local time and perhaps GMT to be stored; an alarm facility to switch the receiver on at a pre-programmed time and a sleep facility.

A total of thirty-six memory channels are provided, nine on each of medium wave, long wave, f.m. and short wave. Storage of frequencies is straightforward — depress the M key, followed by the numeric key to which one wishes to assign the frequency. To recall a frequency, it is simply necessary to select the appropriate waveband followed by the numeric key. A handy flip-up lid on the top edge of the set conceals a compartment with a station reminder sheet enabling the stored frequencies to be recorded for easy reference.

The clock is displayed when the set is switched on, or may be shown during operation by depressing the appropriate key. Dual time is recalled by the operation of a further button.

### Using the Set

Operation of the Panasonic RF-B60, is, as has been suggested previously, very straightforward, and the designers are to be congratulated for using such intelligent software for the digital tuning and memory features. Audio quality is excellent and is far better than that of the Sony ICF7800D, the Panasonic’s closest competitor. A two position tone control — high and low — will alter tonal quality to some extent, by attenuating the higher audio frequencies. I found some of the minor controls a little fiddly in operation, and could prove to be problematic for those with arthritic fingers. Similarly, the absence of a raised “bip” from the 5 key on the key pad makes operation in the dark less easy, and will therefore hinder operation by a visually handicapped listener. There is also no back light for the digital display.

The scan facility is useful, in particular in its ability to operate outside the specified broadcast bands.

The large digital display is easy to read and contains a good deal of operating information, including the currently selected band, and the frequency in MHz on v.h.f. f.m. and short wave and in kHz on long wave and medium wave. The display also shows whether the alarm or sleep functions are selected, whilst a colourful lower segment contains a signal-strength meter with a turquoise background and an orange coloured box detailing which number memory, if any, is selected.

The built-in whip antenna seems to be adequate for day-to-day listening, although there is provision for the connection of a short external antenna. Headphones may be connected to the set, and a 6V d.c. adaptor [optional] may be used instead of the four AA size batteries. Two more AA cells provide memory and clock backup.

A HOLD switch is a useful feature enabling a frequency to be locked, to prevent accidental detuning, and also acts as a main power switch preventing the set from becoming accidentally switched on in luggage when travelling resulting in a set of flat batteries on arrival at your destination!
**PANASONIC RF-B60 RECEIVER**

**Performance**
We carried out tests on the RF-B60 by injecting a test signal through the external antenna socket, and measuring the a.f. output through the headphone socket.

**Sensitivity**
Fair for a set of this type on shortwave, but poor on long wave and medium wave. The r.f. signal required to produce a S + N/N ratio of 15dB at output. Carrier modulated with 1kHz tone to depth of 30 per cent:

- SW + 32dB/V at 1.6MHz
- + 21dB/V at 3MHz
- + 21±14dB/V above 3MHz

**Selectivity**
The selectivity was very good on short wave for a set of this type.

- 6dB points at ± 3.1MHz
- 60dB points at ± 6.35MHz
- Attenuation at ± 5kHz = 29dB
- Attenuation at ± 10kHz = 71dB

The DX/LOCAL switch attenuates signal at 26dB which is useful for night-time listening on 49 metres in Europe.

The signal strength meter cannot be used for serious measuring for whilst covering a total range of 40dB or so, most of this is taken up by the 30dB interval between readings of 4 and 5!

Image rejection and i.f. rejection are both good for a single conversion receiver with an I.F. of 45kHz.

Battery consumption is fairly heavy and using conventional batteries, the life is around 2-3 hours, whilst alkaline batteries appear to last for more than 12 to 15 hours. If battery voltage falls below a certain level, the set will not operate.

**Conclusions**
The Panasonic RF-B60 is an extremely well built set, with tidy electronics inside. It is well equipped and logically thought out and proves a pleasure to use. It is aimed at the travel market, or at the broadcast listener who wishes to listen to conventional broadcasting on the short wave bands, or it may suit the ardent listener who wishes to supplement his current receivers. It is a direct competitor for the Sony ICF-7600D 12002 (in North America) which is comparably priced and has s.s.b. but has only 10 memory channels and has been on the market since late 1983. Lack of s.s.b. could be a drawback for the enthusiastic listener, but is insignificant to count against the set at this time.

With attractive styling and good build quality, and excellent shortwave performance, the Panasonic RF-B60 represents good value for money.

— Callers by appointment only —
I suppose that I first became interested in radio whilst at school. Physics has always been my best subject, and out of amusement I had made one or two crude pieces of apparatus such as shocking coils and a crystal set from odds and ends, and what I could afford from my limited pocket money. I also had a compelling desire to go to sea.

agony wait of three weeks followed, till one morning the postman delivered a registered package containing my brand new First Class ticket together with an Official Secrets Act form to sign and return forthwith.

Now that I had my ticket I could not wait, and immediately set about seeking employment. A few weeks later I was called to London for interview and medical examination by the Marconi Company, who at that time supplied most of the shipping companies with radio personnel.

That evening I returned home with my head in the clouds. I had a job, and in my pocket was a list of the items of uniform and kit that I would require.

My First Job

My first ship was the Corfu. A twin-funnelled, twin-screw, turbine steamer of 14,000 tons belonging to the P & O Company. At that time she was almost new and was engaged in the Company's China and Japan mail service. I joined her in the Royal Albert Dock in London as 3rd RO. Guided by a helpful Goanese steward I made my way along alleyways and stairways redolent with the smell of polish and that indefinable aroma of spices so peculiar to ships in the Far Eastern trades. On entering the wireless room I met the two men who were to be my mentors for the next few months.

The 1st RO, MacNab, was a Scotsman and the 2nd, an Ulsterman named Boyle. Both of them were much older than me. Although I was unaware of it at the time, fortune had smiled on me in the choice of my seniors. During the coming months these two men were to transform me from a gallow greenhorn into something approaching an operator.

Looking round I saw the Corfu was well equipped with radio gear. She had one and a half kilowatt transmitters for m.f. and h.f. and long wave (144kHz), an all-wave receiver with crystal emergency. All ships were fitted with the ultimate stand by, the crystal. She had a quarter kW quenched gap spark set, and direction finding equipment, as well as an extensive public address system. These transmitters were a far cry from the sophisticated equipment of today. They were what might be termed "power oscillators". They had three valves. Two MR4 type diode rectifier valves, each about the size and shape of a large melon, and an MT6 oscillator valve of similar shape but somewhat larger. All the filaments lit up brightly when in use.

Early next morning we left the dock and slipped down river to Tilbury to embark passengers. As the junior I had been allocated the afternoon watch (noon to 4pm) and the middle (midnight to 4am)
You twice already”. In the wild discord and rasps of 500kHz I could not make out the cacophony of bleeps, whines, grunts call on the air. GNF GNF GNF de GRNW happened - at least so it seemed to me. In GRNW GRNW TR fingers on the key and and made my first check that the antenna switches were in the right position. Tentatively I tuned the transmitter, and remembered somehow to send on the air. The nearest coast station with panic. Never before had I asked me, “Well what about it?” I must have looked puzzled. He went on, “Did they never teach you anything in that school? What about a TR to the nearest coast station?” Immediately I was seized with panic. Never before had I felt such fear. The nearest coast station was North Forelands/GNF, and obviously MacNab believed in chucking his juniors in at the deep end straight away.

With sweating palms I put my fingers on the key and and made my first call on the air. GNF GNF GNF de GRNW GRNW TR + K. Nothing happened - at least so it seemed to me. In the cacophony of bleeps, whines, grunts rasp and rasps of 500kHz I could not make out any answer MacNab said nothing. I tried again. Again the same result. I looked at MacNab who said, “Well? He’s answered you twice already”. In the wild discord I had been aware of a loud “whanging” signal making a short transmission at tremendous speed. That must have been GNF answering me. Cautiously I tried again this time concentrating like mad. Somehow I managed to read GRNW de GNF K K K. Slowly I sent GNF de GRNW TR CORFU NW QTO LONDON BND GIBRALTAR ORU ORU? AR. I received a terse acknowledgement. I sat back in the chair sweating. MacNab with a faint grin on his face remarked, “Not to worry lad, they can always tell first timers and try to take the mickey a bit. You’ll soon get used to it”. He stayed with me for the rest of the watch, and before I went off I had actually worked Portishead/GKU on long wave, and another P&O ship on 27m.

That night I kept the middle watch unaided, and managed to copy the Rugby press on 15kHz quite well. I had to copy the press longhand, and I realised I would have to learn to receive direct on to a typewriter as my colleagues did. I became aware for the first time how many variants there were on the Morse code. It took me some little time to work out that ERERTS was in fact FFB Boulogne Radio amongst others.

The ship called at Gib, Marseille, Malta and Port Said, and by the time we were going south through the Canal and working the Suez Canal coast station at Ismailia SUQ I was feeling a little more confident. Being a passenger ship we handled a fair amount of private traffic, most of it in the form of SLTs (ship letter telegram). This was a cheap rate message (obtainable in Japan) whose seams were not really stitched, but held together with soluble glue. This glue would dissolve after a few minutes immersion in water. The staff in the shop, shrewd judges of human nature, had sold one of these suits to the prettiest passenger, and the one most likely to take the whole thing in good part. Unfortunately when the great revelation took place later that afternoon I was on watch, and so I missed the lady’s pink embarrassment, and her threats to shoot everyone in the shop.

One afternoon I picked up a message from a Greek ship about 310km away requesting medical assistance. Being a passenger ship and having a doctor on board I told him to go ahead. The lengthy message in quaint English contained a list of the gruesome symptoms of a certain anti-social disease. It specified a course of treatment which seemed to be even more horrendous than the symptoms.

Tooth-ache

Soon after leaving Aden I developed a rather severe tooth-ache. On arrival in Bombay I was sent ashore for dental treatment by boat, the ship having to lie at anchor meanwhile waiting for a berth. The launch landed me at “Gateway Steps”. It was nice to think back that I entered India for the first time at the famous “Gateway of India”. Sadly the lower walls of this white marble monument were badly defaced with the crimson splatters of betel juice.

As the voyage progressed via Colombo, the exotic island of Penang, Singapore and on to Hong Kong, I thought back to the geography lessons at school, and the reference made to the parts of the map coloured red. Unfashionable though the idea of the Empire may be today, it left a lasting impression on a youth seeing the world for the first time. Since leaving the UK every place at which we had called with the exception of Marseille had been either a British possession or under British influence.

It was at this time that I first heard Japanese Morse. I was listening to a
couple of ships obviously chatting. I could not make anything of the exchanges which seemed to consist of a jumble of accented letters run together. Later I told Boyle what I had heard, remarking that I "couldn't read a thing". His reply, "Neither can anyone else except another Japanese" set my mind at rest. The Japanese use this code between themselves to suit their form of picture writing.

Approaching Shanghai activity on 500kHz was intense. Hundreds of ships plying these waters, most of them British owned. Shanghai Radio XSG seemed to be going non-stop, always with a beautifully handled bug key. I found out later that many of the ships that I could hear working were not at sea at all, but miles inland on passage up and down the Yangtsé. Ashore in Shanghai I paid my first visit to "Jack's Palace", reckoned to have the longest bar in the world. At that time Shanghai was probably one of the most cosmopolitan cities in the world. It was said that all the box office girls in the Grand Cinema in Nanking Road were either Princesses or Baronesses, just a few of the many White Russians who had made their homes in the city after the revolution.

After leaving Shanghai and making our way through the straits of Tsushima, scene of Russia's humiliation at the hands of the Japanese in 1904, we entered the beautiful Inland Sea of Japan making for Kobe and Yokohama.

Time Ashore

The turn-round in Yokohama took ten days. During this time I was able to see something of the place, and on a couple of occasions made the hair raising taxi trip to Tokyo. At night it was a sea of flashing neon signs, bars and cabarets abounded, each with its complement of tiny fluttering kimono clad hostesses. The stores were crammed with all manner of goods, most at ridiculously low prices, and even then the number of radio shops seemed to be legion.

The homeward trip was largely a repetition of the outward voyage. By this time my typing had improved, and I was taking the press much more easily. Even the subscription press with its mass of cypher covering the stock exchange reports and the sports results was much easier to get down on a typewriter. Being homeward bound the radio traffic increased. Most of the passengers were Colonial civil servants and "box wallahs" returning to the UK on leave, and who wished to inform friends and relatives in the UK of their arrival and plans.

On arrival in London I went home for a few days with orders to join another P&O ship Ranpura as 3rd RO at the end of the week. She was an older ship than Cortu and slightly larger at 16500 tons. She was bound for the Far East, but this time I had been told that it might be necessary for me to transfer to another ship abroad, most likely in Singapore or Hong Kong. Ranpura's main m.f. transmitter was a 2kW rotary spark set along with valve transmitters for h.f. and l.f. The wireless room was at the after end of the officer's accommodation, and on joining I was soon informed just how unpopular an operator could become by using the spark set unnecessarily at night, or during the sacred afternoon siesta period. For the uninstructed I should explain that on pressing the key, a spark set emitted a loud crashing noise from the disc discharge, not unlike the noise made by a circular saw cutting through a tough piece of timber. Under tropical conditions with all doors and port-holes open, this din was not looked upon favourably by those bent on a "gentle folding of the arms".

LISTEN OUT FOR

GB8SHF. The Houghton-le-Spring Amateur Radio club are holding a special event station to celebrate Houghton Feast. It marks the dedication of the Church to St. Michael. It dates from very early days. Present day events include: a carnival, fairground, cycle racing, roasting of an ox, special church services and the special event station.

Operation will be on 3.5 and 144MHz from October 2 to 11. RAYNET will also be covering the charity cycle race as part of the week long event.

GB8SEM. On May 9/10 the Southern electricity Museum will be the venue for a special event station. In previous years the collection has been known as the Wedgewood Collection with a call sign to match. The museum and station will be open from 10am to 5pm on both days and talk-in will be available for visitors.

Southern Electricity Museum
Old Power Station
Bargates
Christchurch

GB8SMC. Between August 8 and 23, it is planned to operate a special event station in connection with the celebrations for the 850th Anniversary of the founding of St Magnus Cathedral in Kirkwall in 1137.

The primary mode will be s.s.b. on the h.f. bands 3.5 to 28MHz. There might be v.h.f. activity on 144MHz.

Bill GM3IBU
QTHR

GB8WWW. This station is being run by the Vale of Evesham RAC to draw attention to the work of the Worcestershire Nature Conservation Trust during Worcestershire Wildlife Week. There will be operation on h.f. and v.h.f. from Woodnorton, near Evesham. A QSL card will be issued for all contacts.

Have you Got a
Special Event Station
we should know about?
If so, write and tell us

T05JUN. To commemorate the landing of the US Allied troops in Normandy in June 1944, the amateurs from a radio club in La Manche will be operating a radio station on Utah Beach where the landing took place.

The station will work from May 28 to June 9 using c.w. and s.s.b. on the h.f. bands 3.5 to 28MHz.

They hope that an English special event station will be operating on v.h.f. during June 6-8.

A QSL card will be sent for any QSO, via the bureau or direct in exchange for an IRC.

A. Morio F5AM
QSL Manager
631 Rue de Carentan
F-50000 Saint Lo France

GB4SVC. On May 16, the Spen Valley ARS will be running this station from North Yorkshire, on the summit of Pen-y-Ghent. This is in IO64 and WAB SDB7NY. Pen-y-Ghent is one of the three peaks and is 883m a.s.l.

On May 16, operation will be on 144 and 430MHz multimode and 28MHz f.m. They will also be active on the evenings of the 15th and 16th when h.f. will also be used from the "base camp" at Little Stainforth. Talk-in for any visitors will be on 523. Skeds can be arranged by contacting G4SVG.

CONTRACTORS TO THE M.O.D
**JIL SX-400**
THE PROFESSIONAL SCANNER
- Basic coverage 20-520MHz
- AM, NFM & WFM
- Expandable from 100kHz to 1400 MHz with SSB and CW
- Computer control options
- IF output terminals
- Specifications set by professionals

**AOR 2002**
THE WIDER RANGE SCANNER
- The receiver with the most Megahertz for your money
- Covers 20-550MHz, 300kHz-1.3GHz
- AM & NFM & WFM on all bands
- Computer interface socket
- 20 memories
- Compact size
- 12 V dc operation
- Updown step control knob

**REVCO RS-2000E**
THE VERSATILE SCANNER
- Covers: 60-180MHz, 380-520MHz
- AM & NFM on all bands
- Search & store of active channels
- Channel activity counter
- 70 memories
- 12 V dc & 240 V ac

**REGENCY HX-850E**
THE SMALLER HANDY-SCANNER
- Covers: 75-106MHz or 60-960MHz plus
  118-175MHz, 406-496MHz
- AM & NFM on all bands
- Full scan & search functions
- 20 memories
- ONLY 2.5" x 5.5" x 2"
- Nicads, charger & BNC whip antenna included

**GAREX ELECTRONICS**
MAIN DISTRIBUTOR OF REVCO PRODUCTS. PRICES INCLUDE UK P&P and 15% VAT. Ask for details of our interest free credit.

**IC-R71E HF Receiver**
- £825.00
- 100kHz-30MHz
- CW/SSB/AM/RTTY/FM
- Continuous coverage receiver. 25MHz-2000MHz
- FM/AM/SSB modes. Direct frequency entry
- 98 memories. Scanning, remote control options

**LOWE HF-125**
- £375.00
- Coverage is continuous from 30 kHz to 30 MHz and operating modes are AM, USB and CW with an optional FM and synchronous AM board.

**ALL MODES**
A comprehensive range of bandwidth filters are included.

**IC-R700 VHF/UHF**
- £957.00
- Continuous coverage receiver. 25MHz-2000MHz
- FM/AM/SSB modes. Direct frequency entry
- 98 memories. Scanning, remote control options

**JIL SX-200N**
THE SUPERIOR SCANNER
- The choice of the professionals
- Proven reliability
- Covers: 25-550MHz, 108-150MHz, 380-514MHz
- AM & NFM on all bands
- Control - fast/slow tune dial lock - computer control
- V DC operation (optional)
- Clock and timer on/off
- Memories with back up. 100, 120, 220, 240 V, plus 12
- 150kHz-29.939MHz. AM/FM/LSB/USB/CW 12
- or V.F.O. frequency selection. Full general coverage

**ICOM R5000**
- £895.00
- The frequency range is continuous from 150 kHz to
  30 MHz and its modes of operation are USB, LSB, CW,
  AM, FM and SSB. An optional VHF converter (VIC-3)
  extends the frequency range to include
  108 to 174 MHz
- £637.26
- Continuous coverage receiver. 25MHz-2000MHz
- FM/AM/SSB modes. Direct frequency entry
- 98 memories. Scanning, remote control options

**FRG 8600**
- £525.00
- This is an innovative all-mode SSB, CW, AM, FM receiver that covers 150kHz-300MHz. With an optional VC-10 VHF converter unit, coverage of the 118-1174MHz frequency range is possible. New microprocessor controlled operating features and an "UP" conversion PLL circuit
- £487.30
- Compact size
- 12 V dc & 240 V ac
- Positive action keyboard
- AM & NFM on all bands
- 12V dc & 240V ac
- 16 memories
- 70 memories
- £325.00
- £279
- £649
- £487

**JIL SX-400**
THE PROFESSIONAL SCANNER
- Basic coverage 20-520MHz
- AM, NFM & WFM
- Expandable from 100kHz to 1400 MHz with SSB and CW
- Computer control options
- IF output terminals
- Specifications set by professionals

**AR2002**
- £487.30
- Coverage is continuous from 25 kHz to 50 MHz and its modes of operation are AM, USB and CW with an optional FM and synchronous AM board.

**LOWE HF-125**
- £375.00
- Coverage is continuous from 30 kHz to 30 MHz and operating modes are AM, USB and CW with an optional FM and synchronous AM board.

**REGENCY HX-850E**
THE SMALLER HANDY-SCANNER
- Covers: 75-106MHz or 60-960MHz plus
  118-175MHz, 406-496MHz
- AM & NFM on all bands
- Full scan & search functions
- 20 memories
- ONLY 2.5" x 5.5" x 2"
- Nicads, charger & BNC whip antenna included

**FRG 8600**
- £525.00
- All-mode tuning receiver
- Proving features never offered before, covering
  25 through 905 MHz
- £49.00 (w/o band FM unit)

**GAREX ELECTRONICS**
MAIN DISTRIBUTOR OF REVCO PRODUCTS. PRICES INCLUDE UK P&P and 15% VAT. Ask for details of our interest free credit.

**IC-R700 VHF/UHF**
- £957.00
- Continuous coverage receiver. 25MHz-2000MHz
- FM/AM/SSB modes. Direct frequency entry
- 98 memories. Scanning, remote control options

**ICOM R5000**
- £895.00
- The frequency range is continuous from 150 kHz to
  30 MHz and its modes of operation are USB, LSB,
  CW, AM, FM and SSB. An optional VHF converter
  (VIC-3) extends the frequency range to include
  108 to 174 MHz
- £637.26
- Continuous coverage receiver. 25MHz-2000MHz
- FM/AM/SSB modes. Direct frequency entry
- 98 memories. Scanning, remote control options

**FRG 8600**
- £525.00
- All-mode tuning receiver
- Proving features never offered before, covering
  25 through 905 MHz
- £49.00 (w/o band FM unit)

**IC-R71E HF Receiver**
- £825.00
- 100kHz-30MHz
- CW/SSB/AM/RTTY/FM
- Continuous coverage receiver. 25MHz-2000MHz
- FM/AM/SSB modes. Direct frequency entry
- 98 memories. Scanning, remote control options

**LOWE HF-125**
- £375.00
- Coverage is continuous from 30 kHz to 30 MHz and operating modes are AM, USB and CW with an optional FM and synchronous AM board.

**IC-R700 VHF/UHF**
- £957.00
- Continuous coverage receiver. 25MHz-2000MHz
- FM/AM/SSB modes. Direct frequency entry
- 98 memories. Scanning, remote control options
As promised, we start with a reference to the HPX Ladder. The Rules are printed this time, and we think that they have endured the test of time pretty well, with the small corrections made when people have misunderstood various bits. Nonetheless, we have taken this opportunity to recheck and amend them slightly. The exercise, then, is to hear prefixes as defined in the Rules, and to log them. When you have collected 200, you can then list them up and send them in as an entry. As you hear more of them, you can send in further lists each month as updates. We don’t call for QSL cards, but we do call for entrants to take a careful look at their collections and to “flag up” any they see as being in any way odd or unusual. Usually, such a call is mentioned by several people, and between us we can usually sort out the facts. Sometimes they are pirates, sometimes odd prefixes for some special event or other, sometimes the result of a reorganising of a country’s licensing arrangements, sometimes just plain mis-hearing—bear in mind that “fractured English” under a pile of other stations is not as easy to understand as Oxford English in a quiet room, before you laugh.

The main section of the Ladder is all mod telephone; that is what it says. Most of the signals on the h.f. bands are s.s.b., but at v.h.f., f.m. is used to some extent, and you might trip over the odd a.m. signal: all is acceptable in this situation. The CW and RTTY sections are self-explanatory.

The Letters
First, thanks to those correspondents who have continued to support, and to a welcome to new readers and correspondents.

Various readers have noted, or implied, that conditions have been pretty fair: about all we can say is that two major authorities have now gone on record that they think the old cycle finally concluded last autumn, albeit it is now gone on record that they think that old list, he has an addition and a subtraction to do—it’s nice to know, we were beginning to lose faith in Market Drayton arithmetic!

**HPX RULES**

1. The object is to hear and log as many prefixes as possible: a prefix can only count once for any list. however band it is heard on.
2. Only calls issued for amateur radio operations may be included. Undercover and pirate call signs will not be credited, nor any MARS stations be claimed.
3. The object is to hear prefixes not countries, thus there is no discrimination between say MP4B and MP4K which count as one prefix.
4. The JP, /M and /JM suffixes create a new series; thus G3SWM, G3SWM/P, G3SWM/M and G3SWM/MM all count as prefixes, and where it is known to be legal;
5. When the prefix is changed, both the old and the new may be counted; thus VU4 and S24 both count.
6. G2, G3, G4, etc., all count separately, as do GW2, GW3, etc. and in the same way K2, W2, WA2 all count separately even though they may be in the same place.
7. Send your HPX list, in alphabetical and numerical order showing the total claimed score. With subsequent lists, it is sufficient to quote the last claimed score, the new list of prefixes, and the new total. Give your name and address on each sheet, and send to: LADDERs, Short Wave Magazine, Enefo House, The Quay, Poole, Dorset BH1 1PP. If possible to arrive before the deadline for that particular month.
8. Failure to report for two consecutive listings, i.e. four months, will result in deletion from the Table, although there is no objection to a “nil” report to hold your place.
9. 200 prefixes must be heard to gain entry onto the yearly table, and at 500 prefixes entry to the “all-time” table is automatic. There is a c.w. only table, a “phone only” table and an AMTOR/RTTY table.

10. The prefix list is based on those shown in current Radio Amateur Prefix—Country—Zone List published by Geoff Watts, 62 Belmore Road, Norwich NR7 0PU. listing. Philip intends that this listing will eventually be reduced down to a collection of obsolete prefixes of the period, and so as he hears anything that appeared in that old list, he has an addition and a subtraction to do—it’s nice to know, we were beginning to lose faith in Market Drayton arithmetic!

**HPX Ladder**

Starting scores, 500 for Phone, 200 for c.w. or RTTY. Entries in accordance with HPX Rules.

### Annual HPX Ladder

**Starting Date:** 1 January 1987

Page 45
Thoughts

The most important part of any amateur radio or s.w.l. station is in fact the technical wonders of the latest rigs will not alter that situation in the foreseeable future. For example, a good c.w. operator will be able to hear Morse that is demonstrably below the noise level of the receiver. At a S/N ratio of 1:1, one can look at the noise from the audio output on an oscilloscope and can guess that you can see a difference when the audio signal is present or absent even though you cannot identify the different letters. Hint! It's how to hear the audio is clear enough. Reduce the input signal further still until it is only just copyable, and the oscilloscope now shows no difference usually when the signal is on or off. If the letter being sent is repeated many times in succession, machines can “get it out” by signal-reinforcement techniques; but this is probably the best, in its error-correction mode. No system using the spoken word can even attempt the feat. The joke of it is that the machine-compatible systems, such as RTTY, throw away their man-compatibility while achieving a poorer result, although it is admitted that there are the odd operators who can recognise odd letters sent by RTTY. Why is there this prejudice against Morse? Basically, Morse has been used in a ritual manner in order to achieve the best reaction correctly. However, that time, one has become obsessed by the need for 100 percent perfect copy, and has totally forgotten that when operating on phone the odd word lost in QRM is hardly noticed, let alone worried about. Thus the operator has become scared of using Morse, by his fear of losing the odd letter. On the other hand, the chap who uses Morse every day on the air soon learns that he doesn’t care about the odd letter missed, and that he doesn’t need to write it all down. By now, complete words are being heard and copied as such, rather than as collections of letters. On the sending side, he will have realised very early on that the better the Morse, the easier the copy, and will have taken steps to be sure his station radiates the best possible Morse, so will modern houses, wired to current which guarantees correct spacing of dot, dash and space. While a hand key can send every gradation of Morse, from perfect through to “left foot” stuff, the electronic keyer will send either perfect symbols, or utter gibberish — nothing between, and even the worst transmitter consists of perfect dots and dashes and spaces! And, of course, we should remember that the “digital” modes that everyone reckons to be so “modern” are only one variation. Hint! It’s a carrier on and off, and what is Morse key does.

Safety

Members of RSGB will have seen a recent note on earthing, and in particular as it applies to RTTY. If they are aware of IEE regulations. In essence these houses have their earth line coupled back through the electricity board system neutral lead to earth at the power station; and in addition, all metalwork in the building is also coupled to this. Nominally, there is a perfect balance to the neutral, and it is to a large degree true in practice. However, if the neutral line is broken for some reason, it is theoretically possible for the voltage to rise from zero to 240V; but of course, since everything metallic is bonded together, the occupant of the house is at no risk. Obviously, to rupture the neutral line while leaving the other phases would be some trick for Murphy to achieve — but it could possibly happen. What, therefore, does it mean in terms of an s.w.l. or transponder station? Either you will be using the “mains earth” as the station earth, or you will have an outside earth, to a spike, or metal water-pipe or whatever. (Note at this point, that the reason for changing to the current method was the increasing numbers of plastic water pipes!) What we must do is: first we must make our station earth as good as possibly can; that means that connecting the live side of the mains to the station r.f. earth MUST result in blowing of a 13A fuse. Secondly, we must look at the mains leads of our station and ensure the earth wires are DISCONNECTED. Thirdly, we must look at and bind in r.f. (residual current circuit breaker) and install it. There are types that will plug into the mains socket, and into which one puts the mains plug rather along the style of a two-way adaptor. Fourthly, we must achieve the impossible by a spacing of two metres from any metalwork which is already earthed, to the mains earth. If this has already described. If you can’t meet that requirement, you must now bond the mains earth and the r.f. earth together with a fat lead (at least 2mm square); or make all the run of the r.f. earth as fat as possible — and don’t forget that the radials of a vertical antenna come into this category. Particularly if they are driven from the roof, r.f. isolation should be achieved by fitting a ferrite ring to the lead joining the two earths (this is unnecessary for RTTY; RSGB probably up to four turns might be got on to the ferrite ring, but we have to admit to a mere of worry about what that would do about the sharp leading edges of the fault condition, and its effect on the receiver. Its object of course, is to choke off any noise on the mains earth from the r.f. earth.

And, of course, check that your r.f. earth system is OK at regular intervals.

As to what the risk is if you don’t act as we have described? It is probably unlikely until such times as a fault occurs in the electricity board distribution system. If a fault of the nature described occurs, all the equipment in the station would be at risk, due to the possibility of a high fault current trying to find its way back home by way of the station r.f. earth. That could turn out very expensive, and in addition could result in a secondary fire problem. Electricity is vital to our hobby, but it should be treated with care. Enough said!

Antennas

One frequently reads, in the letters that s.w.l. So-and-So has been playing with antennas. This is a very interesting topic to both the listener and the transmitting amateur. However, even if the author has the technical equipment to establish with certainty that his design is correctly matching in “like the book says” there is often clear evidence to indicate that the evaluation process has been that as a “loading factor” in his design. It is to be sure, say, that an indoor dipole on 14MHz is in fact resonant at 14.175MHz exactly, and that the feeder is operating with a known domestic crisis at J.C. — I’ll deal with that another to establish that this latest creation is better than its predecessor. If you receive one of the DX sheets, most of which give predictions, or you can receive the local RSGB News you can establish at least an opinion as to conditions (Below Normal, Low Normal, High Normal, Above Normal) and apply that as a “loading factor” in comparative tests. You must take into account the state of the sunspot cycle; obviously an accurate comparison of two domestic antennas for which data is obtained for one at minimum, and the other at solar maximum would be hideously difficult. Ideally then, your antenna should be up for at least a year if it is to have a good evaluation. At the very least, there must be a couple of months, with consistent daily activity. Perhaps the best method is to do what G6XN sees as the best method, and that is to confine yourself to the early morning long path to Australia. The columnar method follows, G6XN but adds monitoring, simultaneously on a separate receiver using its built-in whip antenna. This enables us to assess the “conditions” factor a little more carefully, or one thing to be sure.

That’s it for now; deadlines for your letters for the next few months are in the box, apologies to those not mentioned this month — domestic crisis at J.C. — I’ll deal with those next month.

DECODE

Mike Richards G4WNC
200 Christchurch Road, Ringwood, Hants BH24 3AS

14.103MHz and 14.107MHz. The band occupancy is quite high with the following selection of stations demonstrating that packet is truly international: 9K2DZ (Kuwait), SK2GJ (Sweden), 9H1J1 (Malta), AA4V (USA), VE1AJM (Canada), LS1BA (Canada), IK0DVR (Italy). Packet on v.h.f., particularly the repeaters on 145.150MHz, is still very good with many amateurs taking advantage of the on-air mailboxes. I think that the whole packet scene needs some urgent regulatory clarification to enable some of the exciting spaces this mode to be realised i.e. international gateways, etc.

RTTY and AMTOR

Activity has been fairly uneventful over the past month on the amateur scene. As with packet, the 14MHz band has the most activity although 3.5MHz is
quite busy with UK and European traffic. The frequencies to monitor are 14,070MHz to 14,090MHz and 3,580MHz to 3,600MHz. As a general rule amateur RTTY and AMTOR will be found just above the c.w. segment of most bands. On the commercial RTTY front there is a large amount of information transmitted in the form of coded weather data. This data is normally sent as 5 digit groups of numbers at 50 baud with a frequency shift of 425Hz. A typical transmission is one of the Bracknell signals on 4.489MHz. The information is rather tedious to decode unless one has a computer program to help. I am aware of one program for the BBC micro which produces charts from this data but would be interested to hear from other readers who successfully decode this data.

FAX

As mentioned in last month’s column the majority of FAX stations are broadcasting weather charts of various types. For those of you with receiving equipment, one of the most common problems is difficulty obtaining clear pictures. It seems as though you can’t win as weak signals suffer from noise and QRM while the strong signals often smear or ghost. The smearing and ghosting appear to be mainly due to multipath propagation which is almost impossible to overcome. The only solution is to find another signal which is free from multipath. To that end experience has shown that signals from the Russian meteorological station on 6.88MHz usually produce a clean picture during the early evening. If you have any favourite signals that produce clean pictures please write and let me know.

A note for all RIG (Remote Imaging Group) members don’t forget the AGM at the VHF Convention at Sandown Park on April 26.

Book of the Month

This month’s book is Guide to Fasimile Stations distributed by Interbooks. This 128 page publication is from the same stable as the impressive Guide to Utility Stations reviewed last month. The publication is in its 8th edition and has been completely revised using monitoring data collected during 1985 and 1986 making this probably the most up-to-date FAX listing on the market. The book starts by giving information about professional FAX receiving equipment which is very impressive but very expensive, still its nice to know how the other half live! The next two sections deal with the techniques of FAX transmission and the regulations covering the various transmission modes. This is followed by a very comprehensive chapter detailing all the current weather satellites. Individual stations details are contained in three chapters one in frequency order the other in call sign order and the third is the “Radio Times” of FAX and contains lists of the charts to be sent and the times of transmission of all the main stations. The book is rounded off with a chapter showing typical FAX charts and compares the results from different receiving systems. This publication has proved to be a money saver in the shack as one can see at a glance what information is scheduled to be sent and tune into the most desirable.

The book is available from Interbooks price £9.95 + 65p post and packing (UK Only). Thanks are due to Interbooks for the review sample.

Packet & The Amstrad

Packet appears to be a great deal of interest in using this third is the “Radio Times” of FAX and contains lists of the charts to be sent and the times of transmission of all the main stations. The book is rounded off with a chapter showing typical FAX charts and compares the results from different receiving systems. This publication has proved to be a money saver in the shack as one can see at a glance what information is scheduled to be sent and tune into the most desirable.

Packet appears to be a great deal of interest in using the Amstrad PCW8256 and 8512 for packet radio. The simplest way to achieve this is to use a commercial TNC (terminal node controller), serial or parallel. The smearing and ghosting appear to be mainly due to multipath propagation which is almost impossible to overcome. The only solution is to find another signal which is free from multipath. To that end experience has shown that signals from the Russian meteorological station on 6.88MHz usually produce a clean picture during the early evening. If you have any favourite signals that produce clean pictures please write and let me know.

Packet appears to be a great deal of interest in using the Amstrad PCW8256 and 8512 for packet radio. If you have any favourite signals that produce clean pictures please write and let me know.

A note for all RIG (Remote Imaging Group) members don’t forget the AGM at the VHF Convention at Sandown Park on April 26.

Radio Programmes

You may think I am trying to take over the m.w. DX column but you would be wrong. Radio Sweden International has a lot to offer the computer enthusiast. The station is an independent division of the Swedish National Radio Company and is financed directly by the Swedish Government. They produce a regular programme called Sweden Calling DXers on Tuesdays and the English version is broadcast to Europe on 1.179MHz at 1600, 2100 and 2300UTC (GMT). If you are outside Europe I would suggest you contact Radio Sweden for a full schedule. As well as radio programmes they publish a very useful A5 booklet entitled The DXers Guide to Computing. This 34 page booklet is packed with lots of useful contact points and suppliers of computer related information. The booklet is also backed up by regular updates which contain all manner of interesting information including computer programs. To obtain your copy of the guide send an international money order for £2.00 to Radio Sweden International.

Another station providing support is Radio Netherlands International. They produce a weekly programme called Media Network which is transmitted every Thursday. The programme covers radio communication in general with an increasing slant towards the use of computers. For English speaking European listeners the schedule is:

UTC (GMT) Frequency
1130-1225 1430-1525 1830-1925 5.9595MHz
1340-1430 5.966MHz
16020MHz

Radio Netherlands also publishes a wealth of information which is available free of charge. The main publication for the computer enthusiast is INFO DUTCH which is an acronym of INFOrMation Of Direct Use To Computer Hobbyists. This 22 page booklet lists sources of software and includes bulletin boards. There are many other publications available including receiver reviews and a very comprehensive booklist. All the above are available on request from Radio Netherlands International. If you have access to Prestel, messages for Radio Netherlands can be left on their mailbox No 019996700.

Well that’s about it for this month but don’t forget to send me your reports or comments as all are welcome.

Addresses

(4) Radio Netherlands International, P.O. Box 222, 1200 JG Hilversum, The Netherlands.
Getting started on satellites, and weather satellites in particular, is not really the easiest of tasks. On normal modes of radio communication, one only needs to tune around on a normal radio receiver, and keep attentive to all that one hears to keep up to date with what is happening over a wide area. Satellites are a little more specific, as they maintain a strict schedule of format, pass times, and to defined frequencies (as pointed out last month). The very terminology used in satellite work can be very complex for the starter, so a guide for the beginner from a more experienced tracker is invaluable.

One such enthusiast is John G3VJ, of Uttoxeter in Staffordshire, who, despite only starting on satellites four months ago, is now fully captivated and getting good results. John’s interest was first stimulated by reading the excellent series of four articles by Terry Weatherley G3WDI, entitled “Weather Satellites – What’s up There?”, that ran from September to December 1986 inclusive in Practical Wireless. As the method outlined involved the purchase of a BBC computer, a little beyond the reach of the G6SVJ pocket, the project was temporarily shelved.

The second article that John read was written by Adrian G6OJ, in Oscar News No. 54, and this provoked action by writing to the author, who kindly provided a wealth of information, including a recommendation to join the Remote Imaging Group, better known as the RIG (see footnote).

To get started on weather sat, only four pieces of equipment are needed:

1: An f.m. receiver capable of covering from 137.0MHz to 138.0MHz, with a bandwidth of 50kHz.
2: An antenna, ideally a cross polarised Yagi with azimuth and elevation capability, although a simple crossed dipole with a pre-amplifier is adequate for good pictures.
3: A frame store which basically decodes the signals received and produces a video output.
4: A means to view the results, e.g. a video monitor.

The type used with surveillance cameras will do adequately, as the output is composite video, or, alternatively, a black and white TV receiver run from a black and white modulator, such as the one rescued from an old 2X81 computer that John used.

The three p.c.b.s needed can be supplied by the Remote Imaging Group, and consist of:
- Board 001 – the electronic module.
- Board 002 – the memory module. (The pair are available together for just £15.00.)
- The “LOK” board – this gives visible or infra-red selection of NOAA images, the 2400Hz tone needed for the Soviet Meteor satellites, the picture shift when in the zoom mode, and the north-south switch, which allows the picture to be viewed correctly way up, i.e. as on a Mercator’s Projection map.

John built his system from these, which meant a lot of very fine soldering with extreme caution to ensure that no bridged connections resulted, as there were over 50 i.c. sockets plus resistors, capacitors, etc. On board 002, the memory module, some of the i.c. sockets needed to be soldered to the top of the board, and “turned pin” sockets were recommended. (A source of these at only 6p for a 16-pin socket is Linway Electronics, Telephone 01-573 3677.) All of the components are available from the major stockists, and complete kits of components for all three boards are held by Martelec Ltd., of Farnborough, Telephone 0252 515666. (As many improving modifications may be made to the frame store it is recommended that back copies of the RIG newsletters be sought, as it is at the building stage that these changes are best applied.)

The setting up of the boards merely necessitates the use of a i.c. voltmeter, an a.f. counter, and whilst an a.f. generator and an oscilloscope are useful for setting up the LOK board, they are not vital.

John first tested his system by playing in a tape made of a NOAA-9 pass into his completed frame store, and was delighted to see pictures as it passed over Turkey, the Black Sea, and on up over Roumania, Hungary, Czechoslovakia, Poland, the GDR, Bulyrussia, Denmark, Sweden, and Norway. The next step was to organise a suitable receiving.

A number of receivers are on the market, with kits by Cirkit, Martelec and Timestep. Ready built and aligned boards are available from Maplin and the RIG also do their own receiver.

John decided on the Martelec kit, which he found easy to build, with a further advantage that they will perform the alignment service for those who do not possess the necessary equipment. He added a scan facility, and fitted crystals for 137.3, 137.4, 137.5, 137.62 and 137.850MHz, as the 137.5 and 137.62MHz are for NOAA-10 and 9 respectively, whilst the other frequencies cover the Russian Meteosat range.

Some receivers have a facility allowing the remote switching of a tape recorder, which enables images to be taken and erased when one is out or asleep at the early hours. In any one 24 hours some nine passes ranging from 3 minutes to 14 minutes duration for NOAA-10 alone, this giving some 94 minutes of running time for the tape recorder. This is just for one satellite. If we add NOAA-9 and the Meteor series, then to have a little time to switch to the receiver to the tape recorder for required passes is an essential, otherwise we end up with a long tape which is soon filled with small sections of short duration passes.

For an antenna, a right-hand circularly polarised crossed dipole with reflectors was employed, made from a design by G1NSV. (Commercially built antennas for satellites are available from Maplin, Halbar and Jaybeam amongst others.) A 137MHz pre-amplifier available from the RIG was added to give sufficient gain, but a standard 144MHz pre-amplifier will serve well if gently re-peaked to the lower frequency satellite board.

John is now involved in a further step in the world of weather satellite reception by tackling the geosynchronous Meteosat, which works out a little more demanding in equipment and antennas than does the 137MHz system for NOAA. The antenna consists of a 1.4 metre dish including a 1700MHz pre-amplifier, which then feeds a 1700 to 137.5MHz down converter into the receiver.

Whilst the cost comes to some £200, John felt that the superb quality of the 24 hours per day picture availability justifies the outlay. His system came from LMW Electronics of Leicester, Telephone 0533 363664. The frame store controls provides:

- A North-South switch to enable correct picture orientation regardless of the satellite pass direction.
- A Synchronisation switch that is set to an internal 2400Hz tone when receiving Meteor signals (as the Russian satellites do not have their own sync tone) or set to external when Meteor signals are being fed in via a stereo tape recorder. (When recording Meteor a stereo tape deck is necessary, the signal being fed to one channel, and the 2400Hz tone from the output socket on the rear of the frame store to the other channel.)
- A third position is provided for NOAA signals, the internal tone preventing the picture slipping should the signal be lost due to sudden interference, etc.
- Infra-red or visible light pictures at the push of a switch, as NOAA gives both these types of pictures.
- A clock switch, which starts...
Multi-Mode Audio Filters

FL2 or FL3 improve even the best of communication receivers by allowing optimum removal of noise from the signal you want to copy, whether SSB, CW, or RTTY. Extremely versatile yet easy to use and install.

Price: FL2 £89.70 FL3 £129.37 inc. VAT (as FL2 plus auto notch).

WEATHER SATELLITE STATION FOR THE BBC MICROCOMPUTER

Model B B+ Master 128 (Not Compact)

All you need for a high specification weather satellite receiving station based on the BBC microcomputer to receive, decode, display, print and save signals from the North American NOAA series of satellites as well as the Soviet METEROS and COSMOS series. The system is upgradeable to receive geostationary satellites in the METEROSAT, GOES and GMS series with the addition of a downconverter and suitable antenna. The complete package comprises:

- Software on Disc and ROM
- Test tape of satellite signals
- Receiver Hardware Kit
- PCB and parts kit for interface
- MSR20 Mk VHF satellite receiver kit
- MSA20 Antenna kit
- MSS20 WXSAT COMPUTER INTERFACE AND SOFTWARE:
  - Software on Disc and ROM
  - Test tape of satellite signals
  - Receiver Hardware Kit
- MSR20 RECEIVER
  - PCB and parts kit for interface
  - MSR20 Mk VHF satellite receiver kit
  - MSA20 Antenna kit

WXSAT produces superb results. DO NOT TAKE OUR WORD FOR IT. SEND FOR THE DEMONSTRATION DISC... only £3.00 (fully refundable).

Short Wave Magazine May 1987
TUNE INTO MORE STATIONS!

SEE WHAT YOU CAN HEAR ... WITH RADIO DATABASE INTERNATIONAL

**New 1987 Edition Now In Stock**

Turn on your radio, open your RADIO DATABASE INTERNATIONAL and you're set to conquer the world of shortwave listening.

This new, expanded 1987 Edition of RADIO DATABASE INTERNATIONAL features the world's most up-to-date Worldscan schedules presented in clear, easy-to-read graphics and handy frequency order. It's all world tune and it's all there at a glance without page-turning or thumbing through text. In convenient frequency order from 2 to 26 MHz RADIO DATABASE INTERNATIONAL displays station names, locations, frequency, operating times, languages, length, intended reception areas and transmitter powers. It's all in one place, all at a glance. What were formerly separate international and Tropical Editions are now combined into one great book.

And there's more. RADIO DATABASE INTERNATIONAL has added a number of new features and articles designed to help you more the most of your listening moments. Additionally — by popular request — major stations have been listed alphabetically, by country, with quick-access schedules.

The 1987 RADIO DATABASE INTERNATIONAL also features a hard-hitting Buyer's Guide with ratings of dozens of models sold throughout the world. The RADIO DATABASE INTERNATIONAL's veteran team of award-winning reviewers provides you with the world's most trusted advice on radios from portables to high-performance receivers.

With your radio and your RADIO DATABASE INTERNATIONAL, you'll be ready to enjoy the wide world of shortwave listening as you never have before.

Price £12.50 plus £1 postage and packing in UK and Eire. Overseas £8 smallirmall or £2 sea mail worldwide.

**GUIDE TO UTILITY STATIONS 1987**
- Lists 16,717 Frequencies
- Lists 4,593 RTTY Stations
- 1,759 New Frequencies
- 2,931 Callsigns

Tune into the world's Utility Stations, such as airlines, commercial, shopping, military. Mix with the just published 1987 Edition of Guide to Utility Stations. A massive 16,717 frequencies from 0.3 MHz including RTTY, CW, SSB AMTOR, FAX, SSTV, VHF, etc., giving full details of each station.

Price £19.95 plus £1.25 postage and packing in UK and Eire. Overseas £2.45 by sea or £7.25 airmail worldwide.

**WORLD RADIO TV HANDBOOK 1987**
- 1987 Edition Now In Stock
- Recognized as one of the most comprehensive, up-to-date publications on the world's long, medium and shortwave radio and TV stations, the 1987 Edition of WRTV is comprehensively revised for easier and quicker access. In minutes you can identify transmitting stations in each country, including frequencies, power, callsigns, and locations. Whether you want to stay current with political events in Africa, cultural happenings in Europe, or music anywhere on earth, WRTV saves you hours of searching and gives you more time to listening. And to improve the quality of listening there is a careful survey of leading brand receivers.

Price £17.95 postage and packing FREE.

multi-element Yagi, may well be
the DXers dream, useful results
and good entertainment can be
achieved with a modest portable,
especially when used at a good
location or away from home on
high ground.

Like many other enthusiasts, I
often carry a Plustron TVRSD (Fig.
1) in my car and, with its own tele-
scopiacantenna, I can check the
prevailing conditions in Band II as
well as on the TV bands. I have
known a slight increase in activity
between 88 and 104MHz to
herald an extensive tropospheric
opening which, within a few
hours, reached high into the
television bands.

On February 22, while on the
"Black Nixen", near his QTH in
New Radnor, Simon Hamner tried
his Sharp car radio with a rotatable
antenna and logged BBC Radios
Bristol, Derry, Essex, Gwent, Kent,
Lancashire, Leeds, Lincoln-
shire, London, Manchester,
Merseyside, Norfolk, Northamp-
tonshire, Oxford, Shropshire,
Solent, Stoke-on-Trent, Sheffield,
Sussex and WM.

Simon found that conditions
were really good and he soon
identified signals from Belgium
(BRT 1 and 2), France (TDF
Frequence Nord and Culture),
Holland (NOS-1) and Ireland,
Radio Televisie Eireann (RTF FM1
and 2). He also added IRLs Beacon
Radio, Broadland, BRMB, Capital
Radio, Chiltern Radio, City, GWR,
LBC, Ocean Sound, Marcher
Sound, Merica Sound, Mercury,
Piccadilly Radio, Reading, Red
Dragon Radio, Red Rose Radio,
Southern Sound, Trent, Wyvern
and 210 from Hannington for the
Andover and Basingstoke areas.

Addresses

Membership of the Remote
Imaging Group is only £4.00 per
annum (though an addition as a
donation is more than welcome)
and provides an information
packed magazine, with lots of
advice, hints and tips for
weather fans. Send to Mr. Des
Watson, Norton, Gote Lane,

COMPUTERS AND RADIO
Improve computer decoding of RTTY, CW and SSTV signals

The use of suitable audio filters and/or constant level amplifiers is guaranteed to improve the ability of your computer to decode audio signals. The following range is suitable for use with all such audio programmes:

- RTTY only (unboxed but fully built and tested) £8.00
- CW only (unboxed but fully built and tested) £7.00
- RTTY/CW (boxed, fitted with jack sockets) £11.50
- RTTY/CW (ditto and with tuning LED) £13.50
- RTTY super. This unit has an adjustable constant level output. No need for constant adjustment of volume control £19.50
- SSTV (supplied boxed, with jack socket connections and constant level output) £15.00
- CONSTANT LEVEL AMPLIFIER £8.00

When ordering above units, please state software supplier. This will enable us to supply correct filter!

TERMINAL UNITS

- RECEIVE ONLY (RTTY/CW) £45.00
- TRANSCIEVE (RTTY/CW) £75.00

The above units provide Audio, TTL and OCL outputs on Rx. The output level is constant, and full output is achieved with inputs between 10mV and 5V of audio. The transceive version is TTL driven and the output level is adjustable.

SPECTRUM 128 + 2

CASSETTE PORT ADD ON. This unit enables owners of the Spectrum 128 + 2 to run existing decoding programmes which require the audio signal being fed into the cassette port. The guarantee is not affected, as there is no need to open the computer, simply connect to the expansion port £19.50

SOFTWARE FOR THE SWL

MORSE READER PROGRAMME FOR:
- DRAGON VIC 20 CBM 64
- BBC B SPECTRUM ZX 81
- AMSTRAD 460-800XL MSX(1) AMSTRAD 464

The Programmes are self setting 8300 WPM. Decode and display on your screen the text being sent. Off Air — Onto Screen £6.00

- Interface to suit (not needed by Spectrum or by ZX81) £2.50

RTTY DECODER

- SPECTRUM ZX81 CBM 64 VIC20 MSX(1)

Use your computer with your receiver to decode the RTTY signals. Four Baud rates, 45.4, 50, 75 and 110, except ZX81 which has only 50 Baud. Spectrum, MSX and CBM64 have QSO store £6.00

- Spectrum and ZX81 use our RTTY filters only TONE DEMODULATOR to suit the rest £19.50

SSTV

- SPECTRUM only

See your Spectrum, 48K/128K, to discover the fascinating world of Slow Scan T.V. Runs without interface £7.00

For further details of these and our other products, send a SAE.

The majority of v.h.f. tuner dials fitted to combined v.h.f./u.h.f. receivers are enscribed with the European countries/senders; E2 to E4 for Band I and E5 to E12 for Band III. So, with this in mind, I produced the table in Fig. 1 to show new DXers where to find a particular country in Band I.

Computer buffs may like to know that I used an Electronic Studio Light Pen, in conjunction with my Amstrad PCW8512, to prepare both the chart and text used in Fig. 1. Every event contains something of interest so don't be deterred by the date, as a 4.5in clock face and possibly the second sign of increasing activity at the lower end of Band I. During both periods they received signals from Austria - ORF-FS1; Czechoslovakia - RS-KH; Italy - RAI-1; Norway - Kongsberg and Poland - TVP. Further minor Sporadic -E events produced signals from Sweden - TV1 Sverige on March 7; Germany ARD/BR1 test card with Kreuzberg captions on the 8th; Finland - YLE TV1 and programmes from the USSR with Cyrillic captions on the 9th as well as Czechoslovakia, Denmark - DR and Italy on the 11th.

Despite the time taken to build a new shack and install the gear, Edwina and Tony Mancini (Belper) remained active from February 18 to 28 and from March 9 to 11. During both periods they received pictures from Austria, Czechoslovakia, Denmark, E. and W. Germany, Holland, Norway, Poland, Sweden, Switzerland and the USSR and among the German and Norwegian regions, identified by their test cards, were Grunten and SWF/BADN and Brennanger, Gamlem and Melhus, respectively.

Tropospheric
During the lift on February 22, Simon Hamer logged test cards and/or programmes from stations in Belgium - BRT-1 and RTBF-1 and France - TDF Canal Plus in Band III. The high barometer reading on the 28th prompted George Garden (Edinburgh) to take his JVC receiver and amplified loop antenna to his regular DX hunting high spot, Cairn O’ Mount, to check the u.h.f. band. “This was the first time that I received strong sound and a good, but flaky colour picture, from Border TV at Selkirk,” said George. He later tuned to Ch. 41 and, with his antenna vertical, toggled the Tay Bridge satellite transmitter at Dundee. “On placing the antenna in the horizontal plane, co-channel interference was seen and by carefully adjusting its direction and holding it above the car roof, I received a b/w picture of the CH4 programme, Brookside Omnibus. On checking the station and programme schedules, I found that this fitted nicely with the Emily Moor transmitter in Yorkshire, which I have not received up there before,” wrote George.

Noel Smythe received Belgium’s RTBF-1 test card on Ch. E8 at 1425 on February 18 and again at 1945 on March 8. He also logged Canal Plus from France, on Ch. 5, almost daily from February 18 to 28 and daily from March 6 to 12. “RTF Dublin came up on Ch. 41 for a couple of seconds and knocked out HTV picture at 1730 on March 6,” reports Noel.

Slow Scan Television
Readers familiar with the h.f. amateur bands, may already know that the twitting tones, which they frequently hear, around 3.74, 7.04 and 14.234MHz are slow scan television pulses. When
decoded by a dedicated convertor or microcomputer connected to a receiver, a sequence of pictures are seen being pieced together. Long distance SSTV signals are usually copied around 21.33 and 28.6MHz when these bands are open.

Peter Lincoln has received pictures, in this mode, from many countries including Iceland (Fig. 10) and Paraguay (Fig. 11). Signals from England and Norway (Figs. 12 and 13) feature among those copied by Allan Sancto DD5FM/G6BWH, at his QTH in W. Germany.

"The Sunday morning activity on 3.730 or 3.735MHz, depending on the QRM, continues, mostly with colour SSTV," wrote Richard Thurlow G3WW (March). He told me that G3A1 has added a Robot 1200C and 800C keyboard to his system and that GM3SBC is using this mode again. "The Fenland SSTV Net has expanded its colour content, G6SX uses a Volker Wraske SC-1 (24 and 48 seconds) and G0BD has ROBOT 450C and 800C equipment," explained Richard. He continued, "Lately we were joined by G1LXI (Hitchin), G4BEL (Haddenham) and G8MIW. The Finland Net operates on Mondays between 2000 and 2300 and Richard often gets enquiries, over the air, about SSTV from interested amateurs and computer users and says that more enthusiasts seem to be building the G3WCY SSTV convertor and G4ENA transmitting sections. "Local builders are having very good results," said Richard. He reports that BATC's new publication, The Slow Scan Companion, is good.

TV-DXing BOOKS
£5.95
£6.25

YOKO VHF-UHF TV
£89.95

Featured above are THE two guides to TV-DXing, together with our highly popular YOKO model F1 monochrome 5" screen multiband VHF/UHF TV. The books are an essential tool for all TV-DXers, being a practical guide for the beginner, also a source of reference for the established enthusiast. The Yoko TV is a sensitive receiver ideal for long distance television reception (TV-DXing), Continental travelling and domestic use within all of the UK and most of Europe, a fully descriptive leaflet is available on request (SAE please).

AERIAL TECHNIQUES are the acknowledged experts in the DXing field (TV Et FM), we provide an exclusive service for the DXer, we also advise on ALL reception queries and problems. WOULD YOU LIKE TO RECEIVE AN EXTRA ITV CHANNEL AT LITTLE EXTRA COST? IF SO, DROP US A LINE. A wide and varied selection of Aerials, Amplifiers, Fitters, Rotators, hardware and associated accessories are all shown in our comprehensive illustrated CATALOGUE at 65p, why not send for your copy today! 'A TV-DXers Handbook' completely new and updated addition by Roger Bunney, a must for ALL DX enthusiasts (£5.95) 'TV-BILDKATALOG' unique 11 4 page guide to television test cards you can receive with our equipment (£6.25) YOKO model F1 VHF/UHF Multiband 5" screen television, System B/G/I operation (5.6-6 MHz sound) for UK and Continental use, ideal for TV-DXing, covers Bands 1,3 and UHF; battery and mains operated (£89.95)

ALSO AVAILABLE A WIDE RANGE OF MULTI-STANDARD COLOUR TELEVISIONS (PAL/SECAM) FOR USE IN UK, EUROPE AND FRANCE (Large SAE + 24p stamps for details).

All prices inclusive of VAT and Carriage. Delivery normally 7-10 days.

ACCESS and VISA Mail and Telephone orders welcome.

C.M.HOWES COMMUNICATIONS

We are pleased to announce two new dual bandwidth filters to enable you to enhance your receiver. The ASL5 simply plugs into the speaker or headphone socket of your radio, while the CSL4 fits within the set, lie DcRx). Both feature a 300-1kHz bandwidth and fast roll-off for sharp selectivity on speech modes. These filters give improvements with every radio IFM, SSB and CW we have tested to date. So you can have some fun with a constructional project, and upgrade your station too,

ASL5 External Filter kit: £14.90
CSL4 Internal Filter kit: £9.90

DOA Direct Conversion Receiver for CW and SSB reception, versions available for 160, 80, 40 or 30/20 Metres.
TRF3 Shortwave broadcast receiver using TRF principle.
CTX40 and CTX40DPR CW Transmitters for ICM and 4CM bands.
MTX20 20M CW Transmitter, adjustable power up to 10W RF.
CVF VFOs for above TXs (one version per band).
HC220 and HC280 2M to 20M or ICM transverters, 10W RF.
APU Automatic Speech Processor with VOGAD level control.
CMQ Quality microphone kit with electric mic and VOGAD.
CTU30 Antenna Tuner, with balun, all HF bands up to 30W.
SX3 Crystal Calibrator, 80/p markers, usable LF to UHF.

Tuning capacitors for the DcRx receiver (except 160M version) are £1.50 each you need two per receiver. One of the same devices can also be used for the CVF.

All the above kits are built PCB modules. They include a circuit board, full instructions and all board mounted components. For more information on the above, or the rest of our range, simply drop us a line enclosing an SAE. We will send you a copy of our catalogue, and an information sheet on any kit you are particularly interested in.

P&P is 90p per order. Export prices are as above, but add £2.00 per kit for airmail delivery outside Europe. UK delivery is normally within 7 days.

73 from Dave G4KQH, Technical Manager.
It is good news indeed that so many listeners have written in support of the new Short Wave Magazine which is now dedicated to the listener. Many interesting reports for this section of "Seen & Heard" have been received, especially during the month, may I take this opportunity of thanking everyone concerned. I do hope that other readers will send along a report of their reception. This series is not run as a DX race but as a guide to reception conditions, what you can expect to hear and what to do when you are not. Reports are in fact of interest and will help to make this the best ever magazine for the listener.

Long Wave DX
(Note: I.w. m.w., frequencies in kHz, s.w. in MHz: Time UTC)

Writing from Wallsend, David Edwardson says that he has been interested in the I.w. band for some time but has always been disappointed at the performance of his Trio R600 receiver below 500kHz. Recently he decided to build the PW "Taw" v.l.f/l.f. converter and has been amazed at the improvement when using it ahead of the Trio — some 20dB increase in signal strength. Some idea of his reception during darkness can be ascertained from the Sio ratings noted in brackets — DLF Donebach, W. Germany 153 (4541); Allouis, France 162 (4441); Motala, Sweden 189 (3343); BBC Drintwich 200 (5551); Roumoules, Monaco 218 (4441); Oslo, Norway 218 (4541); Kalundborg, Denmark 245 (4541); Tripaza, Algeria 254 (3333) and Topolna, Czechoslovakia 272 (4341).

The news that there is to be a new long wave station located in County Meath, S. Ireland has certainly come as a surprise to many people. It seems that RTE and Radio Luxembourg have joined forces and intend to put the station on the air by the middle of next year. Broadcasting popular music, it will operate on 254kHz and is expected to cover the whole of S. Ireland and most of the UK — as most DXers will appreciate, it will no doubt reach many other places too. A 1500kW transmitter in Tripaza, Algeria also operates on that frequency and since their signals are often good in the UK there may well be some interference problems.

Using a car radio connected to a 4m wire antenna, Paul O'Connor in Cardiff, has been finding suitable m.w. antenna for other DXers too.

MW Transatlantic DX

The conditions at night for the reception of transatlantic signals on the m.w. band have been exceptionally good and dedicated DXers have logged many new stations in the UK. The signals from some areas have still been audible around 0700! Some of the signals arriving here before midnight from eastern USA and Canada have been so good that it has been possible to receive them on a simple transistor portable receiver with built-in ferrite rod antenna.

Using a Grundig Transonette 60A portable with just the internal ferrite rod antenna, Clive Mayhew picked up three stations from NF around 0100 in Stoke-on-Trent — CJYQ in St. John's 930 (SIO 233); CKYQ in Grand Bank 610 (SIO 333) and VOCM in St. John's 590 (SIO 323). At 0145 he received NYs WINS 1010 at SIO 333 — also logged by Paul O'Connor while checking the band with his car radio plus 4m wire antenna.

Using a car radio connected to a 4m wire antenna, Paul O'Connor in Cardiff, has been finding suitable m.w. antenna for other DXers too.

Living in a high rise block of flats can present problems for most DXers. However, Martin Scholes has just discovered that by connecting his Sony ICF-2001 receiver to the communal TV antenna system at his flats in Telford it is possible to hear the Caribbean Beacon, Anguilla on 1610 at 0130! He can also faintly hear CJYQ on 930. This news will encourage other listeners without "proper" antennas to have a go at transatlantic DXing — he has another tip too, if your receiver has a tone control then make more use of it to enchance the broadcasters voice.

The Caribbean Beacon 1610 has also been logged for the first time by Roy Spencer who uses a loop antenna with his realistic DX-400 receiver at his first floor flat in Nuneaton. A simple loop antenna is probably the ideal answer for flat dwellers and could well solve the problem of a suitable m.w. antenna for other DXers too.

Writing from Findochty, Alastair Ross says: "I have been finding m.w. conditions extremely good and just wish I had a good antenna to take full advantage of them." He tried using a TV antenna with his Yeasu FRG-7 receiver and managed to receive weak signals from the Caribbean Beacon on 1610 at 0300. He then changed the antenna to a 10m vertical and reception so much improved that he was able to hear CJYQ 930 and WINS 1010 at good strength too — so remember Alastair's tip and try changing your antenna if you cannot hear the DX.

In an interesting report from Cardiff, Alan Jarvis says: "Although I stayed up only until 0115 I have never before heard US stations coming in so well. In many cases local and European stations only a few kHz away were completely blotted out!" His list includes Canadian CBNA in St Anthony NF, 600; CHYQ in Musgravetown NF, 670; CJYQ 930; CFBR in St John NB, 930; CFRB 1010 & CHUM 1050 in Toronto. From the USA were WINS 1010 & WHN 1050 in NY; WBAL in Baltimore, 1090; WWVE in Cleveland 1100, OH; WCAU in Philadelphia 1210 and WMRE in Boston 1510.

"I'm keeping my tip of using an 'exalted carrier' reception with an s.s.b. receiver last month has enabled Mark Hillier to log his first transatlantic station in Didcot just before midnight — WINS. Writing from Bristol, Len Eastman says he has also been using exalted carrier reception with his FRG-7000 receiver plus 'Sooper Loop' antenna (PW July '86) and has been hearing WINS and CFRB on 1010 every night for two weeks — he has also been hearing WINS in the morning until 0755! Phil Townsend says he has been listening out for WINS in London before 2230 but strong interference from Hilversum 1 on 1008 has so far made things
impossible despite trying four receivers. Although a good loop antenna can be used to "null out" unwanted signals the use of an s.s.b. receiver would also help in such situations — by selecting u.s.b. most of the interference would be rejected.

Up in Glasgow, Alexander Little has been using his new Sony 7600D receiver to listen to some of the interesting broadcasts from stations in Canada and the USA — SINPO ratings in brackets. They included pop music from CQJY 930 at 2230 (3333); the news via W1010 at 2230 (33332); a weather report from CHER in Sydney, NS 950 at 2310 (33333); sports news via WMRZ 1510 at 2317 (33333); pop music from CUCH in Halifax, NS 920 at 0015 (43333); a talk broadcast by WCAU by WRCG at 0026 (23322); pop music and competitions from VOM 590 at 0035 (33333); country & western music via WGN 1050 at 2250 (23322).

While tuning around the band at 0030 in Redhill, George Morley heard 17 stations between 0006 and 0545 — he used a Yaesu 1160 Tijuana, Mexico. A QSL has been received by Derek Taylor of Preston for his reception of KING FRT-7700 a.t.u. with a "Sooper Loop" antenna to log VOIC 890; CKYQ 610; CHQV 670; CKYQ Grand Falls, NF 680; WAXY NB 770; CQJY 930; CBM Montreal 940; WINS 1010; CFBR 1010; WBZ Boston, MA 1030; WKN 1050; WWWE 1100; WCAU 1210; CKCW Moncton NB 1220; Radio Globo in Rio, Brazil 1220; WTOP 1500; CKLM Montreal 1570 and the Caribbean Beacon 1610.

In New Radnor, Simon Hamer added 5 new stations to his growing list of DX — CBT 540; WBOC 680; KQO 720; WGAF 1200 and KGA Spokane, WA 1510. Among the many other stations logged by Simon were CFCB Corner Brook, NF 570; CKBW Bridgewater, NS 1000; CHTN Charlottetown, PEI 1190; CICG Pot Hawkesbury, NS 1410; WERE

Cleveland, OH 1300 and XEBC 1470 Tijuana, Mexico. A QSL has been received by Derek Taylor of Preston for his reception of KING
**REVCONE**

A discone is a broadband antenna that is ideal for use with a scanner as it will usually give good reception from 50 to 500 MHz. Scanner users throughout the world use discones and one of the best is the Revcone. It has 16 elements, which screw into the head assembly, and is British made to the highest standards. The SQ239 for the downlead is protected from the weather because it is inside the support tube and the entire unit is extremely robust.

**NEW MONOLITHIC PRE-AMPLIFIER**

As broadband antennas usually do not have any gain, it is often desirable to use a pre-amplifier to boost weak signals. The REVCOE PA3 is a three-element masthead pre-amp plug straight into the SQ239 socket on the base of the Revcone and because it is fitted at the antenna end of the feeder cable, it compensates for the losses that can occur in long cable runs. The PA3 has been designed in co-axial fashion to connect directly to the Revcone and similar discone type antennas with an SQ239 connector and an N-type option is available for improved UHF performance.

**REVCO**

The 11-5000 covers 1CCkHz to 30MHz in 30 bands. An advanced scanner user, this antenna offers a more consistent performance and is designed to receive all models ISSG, CW, AM, FM, 15kHz from 100MHz to 30MHz. With the optional VC-20V "VHF Converter Unit" coverage of the 108-74MHz frequency range is provided. Advanced microprocessor technology controls various features, including digital VFOs, 100 memory channels, memory scroll, memory and programmable band scan, superb interference reduction and other features for ease of operation to enhance the excitement of listening to stations around the world.

**R-5000 COMMUNICATIONS RECEIVER**

The R-5000 is a competition class communication receiver with its own built-in co-axial band pass filter, narrow band FM, narrow band AM and AM. The receiver has 20 memories, memory scan and a search mode which checks frequencies between user designated limits. The receiver has a push button keypad for easy frequency entry and selection. A front panel knob allows the listener to quickly step up or down in steps of 12.5 or 25 kHz steps from the frequency initially chosen. The R-5000 has a front panel LED bar "S" meter. A socket for the optional RS 232 interface (RC PACK) is provided on the rear panel. The RC PACK consists of an 8 bit CPU with its own ROM and RAM and with your own computer acting as a dumb terminal many facilities become available. Of course, if you want to write your own programs using the RC PACK as an interface then "the sky's the limit".

**RADAC**

The Radac is a breakthrough in wideband antenna technology. Designed for the connoisseur and advanced scanner user, this antenna offers a more consistent performance over a much wider bandwidth. Because the Radac is a masthead antenna, its genuine performance is guaranteed from 28 to 500 MHz. As Roger Bunney said when he reviewed this antenna in the October issue of Television Magazine "On test I found that the performance was excellent, it was the best achieved with any general purpose monitoring aerial so far tried!"

Price inclusive of postage £69.95

Other MW DX

Two stations in the Canary Islands were mentioned by DXers this time – RNE1 in Tenerife on 621, logged by Nigel Final in London at 2245 and Radio Las Palmas on 1008, logged by Ian Smith at 0101. Between 2045 & 2134 Ian logged Ouagadougou, Burkina Faso 747; Qurayyat, Saudi Arabia 900; QBS Qatar 954; IFRD Libya 1125; JLB Libya 1125. An Amstrad 6011 portable receiver was used by Jim Willett from 2359 to log Sidi Bennour, Morocco 540; Qurayyat, Saudi Arabia 585; Pico do Arierio, Madeira 603; Sebaa-Aioun, Morocco 612; Tunis-Djejdaia, Tunisia 702; BC Zakaki, Cyprus 725; Ajun, Jordan 801; BBC Zyi, Cyprus 1323 and Vatican, Rome 1611. Using a Vega 206 portable in Goffsop, Geoff Blake picked up Antalya, Turkey 891 at 2321 and some of them are noted in the extensive log from Ian Smith at 0101. Between 0020 & 0030 more 567 was received

Using an RCA AR77 receiver in Grimsby, Jim Willett was one of several listeners who were lucky enough to log a few new stations along with those more frequently reported – WRQD and Cypress Gardens, FL 540; CFNB Fredericton, NB 550; CHCM Marystown, NF 560; VOCM 590; CHYQ 670; CKAC Montreal, 730; WJR Detroit, MI 760; W2AM Norfolk, VA 1110; CHI Fredericton, NB 1260; AND CHAM 1280 Hamilton, ON – all were noted between 0020 & 0215 and some of them are subject to confirmation by OSL.

Several new stations were also noted in the extensive log from Ian Smith of Pasley. Between 0030 & 0230 he logged CBT Grand Falls, NS 540; CJFX Antigonish, NS 580; VOCCM 590; CBNA 600; CHNC New Carlisle, PQ 610; CKYQ 610; CFCL Timmins, ON 620; CBN St. Johns, NF 640; Greendale Radio, Godhayn, Greenland 650; WBRC NY 660; CHYQ 670; CIYQ 680; CBF Montreal PO 690; WABC 770; CJVA Carquet, NB 810; WHAS Louisville, KY 840; WHDH Boston, MA 850; WWL New Orleans, LA 870; CFBC 930; CJYQ 930; CBQ 940; CBZ Fredericton, NB 970; WYNZ Portland, ME 970; CRFR 1010; WINS 1010; WBZ 1030; WHN 1050; CJCR Quebec 1060; WBAL 1060; KMOX St. Louis, MO 1120; WNEW NY 1130; WHAM Rochester, NY 1180; CFGO Ottawa, ON 1200; WCAU 1210; CKCQ 1220; CFDA Victoriaville, PQ 1380; WTOP 1500; WMRE 1510; WQXR 1560 New York.

Some new stations were logged between 0730 & 0815 too – WSM Nashville, TN 560; WLW Cincinnati, OH 700; WJR 760; WBBM Chicago, IL 780; and WLAM Winston, ME 1470.

Writing from Sheffield, John Donkersley says that he finds reception is much improved when the sensitivity switch of his Sony ICF 7500D receiver is set to "low" while using it with an indoor 10m wire antenna. During the period 1000-1200 he logged six stations in W. Germany

Frankfurt 584; Bremen 936; AFN Stuttgart 1143; VOA Munich 1197; Mainfingen 1539 and Langenburg 1593 and four in France - Rennes 711; Paris 864; Lille 1071 and Nice 1557. Two Scandinavian broadcasters were received by Phil Townsend during daylight - Radio Sweden via Solvesborg 1179 and Radio Norway via Kristo 1314.

Stewart Russell of Forfar and Wyn Mainwaring of Cowes IOW have been monitoring BRT Brussels on 1512 at 1830. Wyn heard their DXers programme state that they do not increase their transmitter power at sunset due to cost, so the increase in signal strength noted by John Greenwood in Evesham is still unexplained. John has now built automatic recording equipment and is running it for 40 days from 1830-1900 - I hope to publish his results soon.

MW Local Radio DX

This aspect of our hobby is very popular - see chart! if you hear any stations don't forget to write and tell me.

Short Wave DX

Although occasional openings to distant places may occur on the 25MHz (11m) band, due to the present minimum period of the 11-year solar sunspot cycle it is unused by broadcasters. It is unlikely that they will include 11m in their operational schedules until a worthwhile service can be established.

The conditions on the 21MHz (13m) band are generally unreliable although there have been a number of days when reception has been better in recent months. Some of the broadcasters on the 21MHz DX window during the day are directed to areas other than Europe but can often be received here. Several broadcasts to Asia were logged by Rab Freeman in Abbeville, IN between 2045 and 2145 with the Holy Koran in Arabic at 0810; RBJ Berlin 21.540 with programmes in English and German at 0845; Radio Cairo, Egypt 21.465 broadcasting in Arabic at 1419; Radio DW Cologne via their Cyclops, Malta relay on 21.650 broadcasting in 1417.

Rab also noted four stations beaming to Africa – RDP Portugal 21.700 in Portuguese at 0124; BBC Bashump, UK 21.650 with programmes in Hausa at 1405; RFI via Allouis, France 21.620 in French at 1421; WYFR via Okeechobee, Florida USA on 21.525 at 1605. The broadcasts intended for the Middle East included the BBC World Service on 21.710 from Daventry, UK at 1208 and REE via Nobijes, Spain 21.575 in the middle.

David Edwardson has also been listening to some of the broadcasts to other areas – Radio Nederlands Madagaskar relay beaming to Asia on 21.485 at 0816; the BBC Misarah Island relay 21.470 with the World Service for Africa at 0900; Radio Pakistan, Islamabad 21.475 with programmes in Pashto at 0900 and DW Radio Cologne beaming to Australia via their Kigali, Rwanda relay 21.560 at 0900. The Radio Nederlands Madagaskar relay in a number of days from 21.480 at 1130 and beams to the Middle East – Ian Baxter noted their signal as SINPO 23333 in Blackburn.

Listening in Macclesfield, Philip Rambaut has been hearing the broadcast in Spanish to S. America from Vatican Radio in Rome on 21.725 at 1300. Philip has also been hearing the broadcasts to S. America from VOA via Greenville, USA with programmes in Spanish on 21.580 & 21.610 from 1100 until 1400. VOA beam to Africa via Radio Monrovia in Liberia on 21.485 from 1630 until 2300 and Philip logged them at 1710.

The broadcasts from Radio RSA in Johannesburg have been the usually well received on 21.590 from 1000 and were mentioned in many of the logs. Gerry Lovell has been hearing them at 1115 in
### DXers

### DXing DXers

- A: Colin Diffell, Corsham.
- B: John Sheridan, Mapperley.
- C: Bill Kelly, Belfast.
- D: Genny Lovell, Weston-Super-Mare.
Western-Super-Mare at SINPO 45444 without extending the whip. Antenna manager is Sir John 2001! Leslie Lyon also uses a small portable receiver with whip antenna to listen to their programmes in Scarborough which mentioned that their 1.3m transmission now ends at 1500 and listeners are then asked to re-tune to 15.156. Nigel final has been listening to Radio Dubai 21.605 from 1000 - their programmes in Arabic and English are also well received during week days in the UK. Alexander Little logged their Carnarvon relay in Spain on 21.530 at 1437 - they beam programmes in Czech to Europe from 0830 until 1600.

Using a Grundig Satellit 600 receiver plus Dreslser 30 antenna in Winchburgh, Davy Hossack has been hearing the RSI 100kW s.s.b. transmitter at Burton, Srinagar on 21.555 at 1300 with SIO 232. Their transmission is beamed towards Africa from 1200 and Simon Illingworth commented that their signal is good in Johannesburg. Simon reports improved reception as they enter their autumn period - the BBC Miar island World Service relay was heard on 21.500 and Radio Norway on 21.700 at 1200 are now both good signals.

The reception conditions on the 17MHz (16m) band have also been improving and some of the rather better periods have enabled DXers to hear some interesting stations from several continents during daylight hours. Some of the broadcast programmes on the 17MHz band are listed below.

**Alan Curry** has been listening to one of the broadcasters who beam their programmes towards Europe in the morning, namely Radio Prague, Czechoslovakia. Alan reported their 17.660 signal as SINPO 54433 in Stockton-on-Tees on 0925 - if you are a cricket fan, then try listening to their commentary on the Ashes Test match in progress! UAE Radio Dubai beam their broadcast to Europe on 17.775 from 1000 until 1500. Robert Taylor enjoyed the DX programme at 1345 and noted SIO 444 in his log.

Using a Uniden CR 2021 receiver in Norton, Edward Broad- smith has been listening to All India Radio on 17.885 at 1000 - they beam to Australia at that time, but can often be heard well in the UK too. Later, Edward has been listening to the broadcasts in English from Radio Sunam via an RNB transmitter in Japan on 17.755 - they are beamed towards Europe five days a week from 1700 until 1745. Writing from Hitchin, Mike Kitchener says has been checking the signals has improved from Radio RSA in Johannesburg on the 13 16-18m bands and finds reception very good on 17.780 between 1430 and 1530 - much better in fact than the transmission which they recommend on 5.185.

Four directional indoor antennas are used in conjunction with a Realistic DX400 receiver by Roy Spencer when DXing. He has been listening to Hello Tokyo via their radio broadcast from Radio Japan on 15.375 at 0300 and Radio Korea on 15.270 at 0600. John Parry mentioned their DX Party Line programme which is very popular with DXers around the world. Tim Shirley has been doing some late night DXing and logged Radio Fern in Munich, Philipsen on 15.455 at 2300.

Radio Moscow continues to dominate the 13MHz (21m) band - John Parry logged their transmission to N. America on 13.790 at 0815 and also noted them on 13.765 at 1200. Philip Rambaut picked up their transmission in Chinese to Asia on 13.628 at 0100. Philip also logged the Voice of Israel, Jerusalem on 13.750 at 1346. Radio Korea, Seoul, S. Korea was logged by Roy Spencer on 13.670 at 0810 and Neil Dove logged Radio Nepal in Kathmandu, Nepal on 13.615 at 1405.

Listening in Brightly, John Nash heard Radio Baghdad on 13.650 broadcasting in Arabic with a station ident at 1429 and also noted the notes that they have been beamed to Asia by Radio Neder lands on 13.770 at 1430.

These bands are full of signals from all continents. Two of the interesting signals heard on the 11MHz (25m) band by Sheila Hughes were TWR on Guam 17.175 at 0830 and RNB Brasilia, Brazil 17.145 at 0215 (during the afternoon Radio Portugal were beaming programmes to Europe on 17.450 between 0900 and 1100). Bill Reese logged their programmes to Asia between 0900 and 1100 - Bill also listened to the Voice of Egypt on 1633, Accra, Ghana.

**SEEN & HEARD**

Your deadlines for the next three issues are May 21, June 20 and July 23.
GUIDE TO FACSIMILE STATIONS
7th edition — May 1987
252 pages. ISBN 3-924509-67-0
£13.00 or DM 35.00

Reliable and easy-to-use FAX equipment is now available for less than £300. It prints weather charts, press photos, satellite pictures, etc., with excellent resolution via a standard Epson-compatible dot matrix printer on ordinary paper. The interest of mariners, yachtsmen, pilots, radio amateurs, monitors and meteorologists around the world in the reception of FAX transmissions has subsequently exploded during the past few months. Apart from the hardware mentioned, the potential user needs detailed and actual schedules of those FAX stations. That vital information is published since the early seventies in our international reference books like the FAX Guide.

The numerical frequency list covers 374 frequencies — from VLF to UHF — of FAX stations which have been monitored in 1986 and 1987. Frequency, call sign, name of the station, ITU country/geographical symbol, technical parameters of the emission, and details, are listed. All frequencies have been measured exact to the nearest 100 Hz. The alphabetical call sign list covers 239 call signs, with name of the station, ITU country/geographical symbol, and corresponding frequency (ies).

Schedules of 101 FAX stations on 358 frequencies are listed alphabetically, including the latest schedules of Bracknell Meteo and Royal Navy London. With reference to the 5th edition of our Guide to Utility Stations, schedules of the following stations have been added or considerably modified: Beijing, Canberra, Darwin, Delhi, GOES-Central/East/West satellites, Grengel, Kiel, Kuybishev, London, Madrid, Offenbach, Tokyo and Wellington.

Additional chapters cover:
- Comprehensive list of equipment on the market for both FAX and meteorological satellite reception, with photos and manufacturers’ addresses.
- Detailed explanation of the technique used for the transmission of FAX pictures.
- Regulations on technical characteristics of FAX equipment, including all CCITT and WMO standard test charts.
- Comprehensive list of both geostationary and polar-orbiting meteorological satellites, with full technical data. Detailed explanation of APT PREDICT and FANAS polar-orbiting satellite position data codes.
- Radio amateur FAX activities.
- 223 abbreviations.
- 60 station addresses in 37 countries.
- 167 sample charts and their interpretation.

References:
Dr. Ing. Gian Claudio Renzo Gallesi I2JJA, FAA Commercial Pilot 2260108, Italy — 20 November 1986.
"As a commercial pilot I have appreciated a lot your publications AIR AND METEO CODE MANUAL and GUIDE TO FACSIMILE STATIONS to receive meteo information really vital to us."

Graeme Ireland, Australia — 19 November 1986.
"The Melbourne Weather Bureau showed me your latest publication of weather fax transmissions throughout the world. It is my intention to leave Australia early in the new year and travel around the world in my yacht. Certainly your publication would be most useful."

Derek A. Bemister G30BX, United Kingdom — 6 November 1986.
"I have had several of your publications during the past few years . . . . They are the best publications on the market. Thanks for your skilled work put into them."

Further publications available are Guide to Utility Stations, Air and Meteo Code Manual, Radioteletype Code Manual, etc. Write for detailed catalogue of publications on commercial telecommunication or shortwave. All manuals are in the handy 17 x 24 cm format, and of course written in English.

Prices include airmail to anywhere in the world. Payment can be by cheque, cash, or International Money Order. Postal Giro Account: Stuttgart 2093 75-709. Dealer inquiries welcome — discount rates and pro forma invoices on request. Please order from:

New HF FAX Receiver price breakthrough!
UK designed and produced, you can now obtain weather maps, press photographs and satellite cloud cover detail on any Epson FX-80 compatible computer printer with amazing clarity. Do not confuse with other products offering only a low resolution screen display. They do not even come close to the FAX-1 in image clarity. Built-in tuning indicator. All standard R.P.M. and I.O.C. rates. Fully automatic operation including START; RPM, IOC selection). 1:1 picture aspect ratio. 12V D.C. power requirement. Built-in tuning indicator. Built-in clock and timer. Battery powered compatible printer available for Marine, mobile applications. Needs only audio from an HF receiver and a suitable printer to operate. PRINT QUALITY COMPARABLE TO PROFESSIONAL UNITS AT ONE FIFTH THE PRICE!

Send for details and print sample.
FAX-1 ONLY £279.95 inc VAT (£3.50 p&p)
FAX-1A (portable printer) £480.85 inc VAT (£4.50 p&p)

Manufacturers and U.K. Main Importers for
A.E.A. and ALINCO.

G2VF Inventor and proprietor of Patent for VARIABLE HIGH FREQUENCY FRAME ANTENNA offers circuit and full assembly details for the modest sum of £5. A Do-it-Yourself project. Components required to be found in most Ham sheds. Most expensive components, two variable tuning capacitors. Antenna twenty-one inches square, mounts on top of control box, fully installable from operating position, tunable all the way from 80 to 10 metres there being only one inductance. SWR One to One 40, 15 and 10 and One Point Five to One BO and 20. S9 on CW from JA, W areas O to 9. VE 1 to friend all Europe. Ninety awards obtained with frame. Maximum power 100 watts. NEW EFFICIENT L.W. AND M.WAVE FRAME ANTENNA. 21 inches square. 0.1.Y. project. Circuit, parts list. assembly data E3. Ideal Caravan and flat dwellers. DIY LOOP ANTENNA FOR BC and SWL's Tuning range 1500 to 10 Meters Parts List/Assembly data E8 SAE for details.

Please mention "SHORT WAVE MAGAZINE" when replying to advertisements
An HF band preselector and antenna tuning unit combined, designed expressly with the S.W.L. in mind, covering 1.7 to 34MHz completely in 6 bands. The ATU is a P1 tank section and will match co-ax fed antennas or any length of end fed antenna. Making the most of your antenna and allowing endless experiments, a P1 tank will literally ‘load up the garden fence’. The pre-amplifier section will give an average gain of +20dBs whilst the RF gain control will attenuate to -15 dBs.

THE HAMGEAR PMX PRESELECTOR

- High Q Coils — airspaced on higher bands
- Input fully protected against overload
- All metal casework
- Engraved front panel in brushed aluminium

The PMX is available in two versions; an unpowered one requiring 12 volts at 40 mA or a mains powered version. The mains version also has facilities for powering other small transistor projects, whilst with the mains disconnected it can be powered from an external 12 volt source, making it an extremely versatile unit.

The unpowered unit is priced at £69.00 whilst the mains powered one is £78.00, both post paid in the U.K.

Why not send for our three-page information?
The nature of radio waves, the fundamental terms of wavelength and frequency and the electro-magnetic spectrum as a whole were discussed last month. By International agreement, small parts or bands of the overall radio frequency spectrum are allocated to broadcasting, however these do not include the v.l.f. region or frequencies above the u.h.f. region.

The Long Wave Band

The lowest frequencies used for broadcasting form part of the l.f. region and the segment involved is usually referred to as the long wave (l.w.) band, which extends from a nominal 2000 to 1053m or 150 to 285kHz.

The broadcasters using this band try to ensure that most of the radiated energy from their transmitting antenna travels along the earth's surface via direct or ground wave paths to reach their listeners. As the signals follow the contours of the ground they lose energy or become attenuated due to the resistivity of the surface. The nature of the land affects the resistivity. Flat pastoral country or marshy and loamy areas have a much lower resistivity than those containing rocks. Hills and mountains tend to absorb energy and sea paths introduce much lower losses than those over land. As the frequency of transmission is raised the losses in the earth's surface increase, causing the ground wave range of a transmitter to become less and less - see Fig. 1.

Because the ground wave signals from a l.w. station can travel considerable distances, a single high power l.w. transmitting installation may well cover the whole of the country concerned. An example is BBC Droitwich on 200kHz. In order to ensure that maximum ground wave coverage is obtained, antenna characteristics dictate that a vertical antenna be employed at the transmitting station - in view of the wavelength a very high antenna is required.

The Medium Wave Band

The segment of the m.f. region which is allocated to broadcasters throughout the world is usually referred to as the medium wave (m.w.) band, which extends from a nominal 571 to 187m or 525 to 1605kHz.

Due to the considerably increased attenuation of ground wave signals at m.f., several suitably placed m.w. transmitters would be needed to achieve the coverage obtained by a single l.w. transmitter. In practice the transmitters used vary from high power installations which are designed to cover as much territory as possible, to very low power ones, which cover a small area close to the transmitter location. As in the case of l.w. installations, a vertical antenna (often a mast radiator) is used to provide an adequate signal-to-noise ratio (40dB) in a given service area. The noise may be from both man-made and natural electrical sources and is present everywhere - more so in cities and towns than in rural areas.

The Ionosphere

The Ionosphere is also changing by day, night and position of the sun are constantly changing. An example of this is the presence of several ionised layers at different heights above the earth and to distinguish them they are termed the D, E, F1 and F2 layers - see Fig. 2.

During the hours of daylight the D layer absorbs most of the waves reaching it, so ground wave signals predominate. At sunset the ionisation of the layers starts to decrease and the D layer quickly disappears to expose the E layer. For some time after sunset the ionised E layer acts like a giant mirror in the sky and reflects the waves which reach it back towards earth. Such reception at night is said to be via the sky wave path and it is via this mode that reception of m.w. signals from countries which cannot be heard during the daylight hours becomes possible. After sunset the E layer gradually de-ionises to reach a steady night-time lower level of ionisation and the m.w. signals can then pass through it to reach the F2 layer. The F2 layer then reflects the signals back to earth, but since the signals have passed twice through the lower layers they are, to some extent, attenuated.

Brian Oddy G3FEX

On this side of the Atlantic the stations are spaced apart at 9kHz intervals between 531 and 1602kHz, but in Canada, N. and S. America and some other areas they are spaced at 10kHz intervals starting at 530kHz.

Fig. 1

The broadcasters using the l.w. band are located in Europe, N. Africa and the Soviet Union and they operate in accordance with a band plan. I discussed the band plan in Long, Medium and Short last month.

Fig. 2

The broadcasters using this band try to ensure that most of the radiated energy from their transmitting antenna travels along the earth's surface via direct or ground wave paths to reach their listeners. As the signals follow the contours of the ground they lose energy or become attenuated due to the resistivity of the surface. The nature of the land affects the resistivity. Flat pastoral country or marshy and loamy areas have a much lower resistivity than those containing rocks. Hills and mountains tend to absorb energy and sea paths introduce much lower losses than those over land. As the frequency of transmission is raised the losses in the earth's surface increase, causing the ground wave range of a station to become less and less - see Fig. 1.

Because the ground wave signals from a l.w. station can travel considerable distances, a single high power l.w. transmitting installation may well cover the whole of the country concerned. An example is BBC Droitwich on 200kHz. In order to ensure that maximum ground wave coverage is obtained, antenna characteristics dictate that a vertical antenna be employed at the transmitting station - in view of the wavelength a very high antenna is required.

The Medium Wave Band

The segment of the m.f. region which is allocated to broadcasters throughout the world is usually referred to as the medium wave (m.w.) band, which extends from a nominal 571 to 187m or 525 to 1605kHz.

Due to the considerably increased attenuation of ground wave signals at m.f., several suitably placed m.w. transmitters would be needed to achieve the coverage obtained by a single l.w. transmitter. In practice the transmitters used vary from high power installations which are designed to cover as much territory as possible, to very low power ones, which cover a small area close to the transmitter location. As in the case of l.w. installations, a vertical antenna (often a mast radiator) is used to provide an adequate signal-to-noise ratio (40dB) in a given service area. The noise may be from both man-made and natural electrical sources and is present everywhere - more so in cities and towns than in rural areas.

The Ionosphere

The Ionosphere is also changing by day, night and position of the sun are constantly changing. An example of this is the presence of several ionised layers at different heights above the earth and to distinguish them they are termed the D, E, F1 and F2 layers - see Fig. 2.

During the hours of daylight the D layer absorbs most of the waves reaching it, so ground wave signals predominate. At sunset the ionisation of the layers starts to decrease and the D layer quickly disappears to expose the E layer. For some time after sunset the ionised E layer acts like a giant mirror in the sky and reflects the waves which reach it back towards earth. Such reception at night is said to be via the sky wave path and it is via this mode that reception of m.w. signals from countries which cannot be heard during the daylight hours becomes possible. After sunset the E layer gradually de-ionises to reach a steady night-time lower level of ionisation and the m.w. signals can then pass through it to reach the F2 layer. The F2 layer then reflects the signals back to earth, but since the signals have passed twice through the lower layers they are, to some extent, attenuated.
DATA & REFERENCE

DIGITAL IC EQUIVALENCES AND PIN CONNECTIONS (BP140)
A. Michaels
Equivalent and pin connections of a popular selection of European, American and Japanese digital I.C.s. 352 pages £6.95

LINEAR IC EQUIVALENCES AND PIN CONNECTIONS (BP141)
A. Michaels
Equivalents and pin connections of a popular selection of European, American and Japanese linear I.C.s. 322 pages £6.95

INTERNATIONAL TRANSISTOR EQUIVALENCES GUIDE (BP95)
A. Michaels
Possible substitutes for a popular selection of European, American and Japanese transistors. 320 pages £2.95

INTERNATIONAL DIODE EQUIVALENCES GUIDE (BP108)
A. Michaels
Possible substitutes for a large selection of many different types of semiconductor diodes. 144 pages £2.25

RSGB RADIO DATA REFERENCE BOOK
G. R. Jessop G3JJP
The 5th Edition of an essential book for the radio amateur's or experimenter's workshop. 244 pages Hardback £8.56

SEMICONDUCTOR DATA BOOK
A. M. Ball
Characteristics of about 10,000 transistors, f.e.s., diodes, rectifiers, triacs and s.e.c.s. 175 pages £7.90

NEWER RADIO AND ELECTRONICS ENGINEER'S POCKET BOOK (10th Edn)
Keith Brindley
Useful data covering maths, abbreviations, codes, symbols, frequency bands/allocations, UK broadcasting stations, semiconductors, components, etc. 170 pages Hardback £5.50

PROJECT CONSTRUCTION

HOW TO DESIGN AND MAKE YOUR OWN P.C.B.'S (BP121)
R. A. Penfold
Designing or copying printed circuit board designs from manufacturers, including photographing methods. 80 pages £1.95

WEEKEND PROJECTS FOR THE RADIO AMATEUR (ARRL)
Practical information on setting up your amateur radio station, dealing with interference problems, etc. 132 pages £4.84

HINTS AND KINKS FOR THE RADIO AMATEUR (ARRL)
How to find a particular station, country or type of broadcast and to receive it as clearly as possible. 112 pages £1.95

INTERNATIONAL RADIO STATIONS GUIDE (BP155)
Revised and updated in 1985, this book shows the site, country, frequency/wavelength and power of stations in Europe, the Far East, North and Latin America, and the Caribbean, plus short-wave stations worldwide. 128 pages £2.95

BETTER SHORTWAVE RECEPTION (USA)
W. S. Orr WESSAI and S. D. Cowan W2LX
Receivers, antennas, propagation, DX listening techniques for the short-wave waves and v.h.f. 150 pages £7.32

BEGINNER'S GUIDE TO RADIO (3rd Edition)
Gordon J. King
New edition of this non-technical guide for the newcomer to radio. 266 pages £4.95

WORLD RADIO TV HANDBOOK 1987
Country-by-country listings of long, medium and short wave broadcasters and TV stations. Receiver test reports. English-language broadcasts. The s.w.l.'s 'bible' 576 pages £17.95

A TV-DXERS HANDBOOK (BP176)
R. Bunney
Information on transmission standards, propagation, receivers including multi-standard, colour, satellites, antennas, photograpy, station identification, interference, etc Revised and updated 1986. 87 pages £6.95

QUESTIONS & ANSWERS AMATEUR RADIO
F. C. Judd 502X
What is amateur radio? The Radio Amateurs' Exam and licence. The technology, equipment, antennas, operating procedure and codes used by amateurs. 122 pages £2.95

QUESTIONS & ANSWERS RADIO
Eugene Trudelle
Basics of electrical theory, radio and semiconductors, receivers, transmitter and CB radio, and test equipment. 110 pages £2.95

AMATEUR RADIO OPERATING MANUAL (RSGB)
A mile of mike! A guide to operating on just about every aspect of amateur operating. Including international call-sign series holders, prefix lists, DXCC counties lists, etc. 304 pages £6.16

THE MORSE CODE FOR RADIO AMATEURS (RSGB)
Margaret M. Lewis
A guide to learning to send and receive Morse code signals up to the 12 w.p.m. required for the RAE. 192 pages £2.08

VHF/UHF MANUAL (RSGB)
G. R. Jackson
Theory and practice of amateur radio reception and transmission between 300MHz and 24GHz. 520 pages £11.95

FOUNDATIONS OF WIRELESS AND ELECTRONICS (10th Edition)
M. G. Sorrell and S. W. Amos
Coverage of d.c. and a.c. circuits, L.C., tuned circuits and selectivity, valves, semiconductors, transmission lines, antennas, radiation, oscillation, modulation, detection, amplification, superhet receivers, c.e.s., waveform generators and sections, computers and power supplies. 551 pages £8.69

THE COMPLETE DX'ER (USA)
Bob Locher W9KNI
Equipment and operating techniques for the DX chaser, from beginner to advanced. 187 pages £8.21

UNDERSTANDING AMATEUR RADIO (ARRL)
Understanding and building transmitters, receivers, antennas, power supplies and accessories. 222 pages £4.20

AMATEUR RADIO LOGBOOK (RSGB)
Standard logbook for the transmitting amateur in hori-zontal A4 format. 25 lines per page. 96 pages £2.32

PASSPORT TO AMATEUR RADIO
Reprinted from PW 1978-1985
The famous series by G3JJP, USA, used by thousands of successful RAE candidates as an aid to their studies. Plus other useful articles for students of amateur radio. 96 pages £1.50

INTRODUCING MORSE
Collected Articles from PW 1982-1985
Reprinted from PW 1982-85, examining the Morse code alphabet, the Electronic Bug with a 528-bit memory. 48 pages £1.25

INTRODUCING RTTY
Collected Articles from PW 1980-1983
Basic of RTTY, ways of generating and decoding it. A simple and inexpensive way of trying out RTTY using a Sinclair 16K ZX81. 33 pages £1.00

SWM GREAT CIRCLE MAP
G. A. Penfold
Showing Great Circle bearings and distances, callsigns, time zones and DX Zones. 1018 x 634mm £4.00

AMATEUR RADIO HANDBOOK (USA)
W. L. Orr WESSAI and S. D. Cowan W2LX
Effective antennas for Top Band to 2m. Including "invisible" antennas for difficult station locations. 197 pages £12.00

A GUIDE TO AMATEUR RADIO (RSGB)
Amateur Radio—the hobby, the equipment, workshop practice, the licence, the RAE (including sample question papers). 154 pages £3.62

AMATEUR EXAMINATION MANUAL (RSGB)
G. L. Benbow GB3H
A standard aid to studying for the Amateur Radio Examination, covering the whole of the 1986-88 syllabus. 155 pages £3.62

HOW TO PASS THE RADIO AMATEURS' EXAMINATION (RSGB)
G. L. Benbow GB3H
The background to multiple choice exams and how to study for them with nine sample RAE papers for practice, plus maths revision. 91 pages £3.15

ANTENNAS (AERIALS)

AERIAL PROJECTS (BP105)
R. A. Penfold
Practical designs including active, loop and ferrite aerials plus accessoyry units. 96 pages £1.95

SIMPLE AMATEUR BAND AERIALS (BP125)
E. M. Noll
How to build 25 simple and inexpensive aerials, from a simple dipole through beam and triangle designs to a multi-band antenna. 324 pages £8.47

ALL ABOUT CUBICAL QUAD
W. I. Orr W6SAI & S. D. Cowan W2LX
Equipment and operating techniques for the DX chaser, from beginner to advanced. 187 pages £8.21

INDEFINITE CUBIAL QUAD ANTENNAS (BP76)
W. I. Orr W6SAI and S. D. Cowan W2LX
Design, construction, adjustment and operation of quad antennas. 91 pages £8.47

ALL ABOUT CUBIAL QUAD ANTENNAS (BP138)
W. I. Orr W6SAI and S. D. Cowan W2LX
Design, construction, adjustment and operation of quad antennas. 91 pages £8.47

THE RADIO AMATEUR ANTEHENA HANDBOOK (USA)
W. L. Orr WESSAI and S. D. Cowan W2LX
Theory, design, construction, adjustment and operation of antennas. 91 pages £8.47

THE ORGANISATION OF A DAB BROADCASTER (BP119)

W. I. Orr W6SAI and S. D. Cowan W2LX
Theory, design, construction, adjustment and operation of quad antennas. 91 pages £8.47

THE ORGANISATION OF A DAB BROADCASTER (BP119)
W. I. Orr W6SAI and S. D. Cowan W2LX
Theory, design, construction, adjustment and operation of quad antennas. 91 pages £8.47
BEGINNER'S GUIDE TO ELECTRONICS
Owen Bahler
For youngists thinking of a career in electronics, theory and applications in computers, radio, TV, recording, medical and industrial electronics. 240 pages £4.95

COMPUTING

MICROPROCESSING SYSTEMS AND CIRCUITS (BP77)
(Elements of Electronics — Book 4)
F. A. Wilson
A comprehensive guide to the elements of microprocessing systems, which are becoming ever more involved in radio systems and equipment. 256 pages £2.95

AN INTRODUCTION TO COMPUTER PERIPHERALS (BP170)
J. W. Penfold
Covers monitors, printers, disk drives, cassette recorders, modems, etc., explaining what they are, how to use them and the various types of standards. 80 pages £2.50

AN INTRODUCTION TO COMPUTER COMMUNICATIONS (BP177)
R. A. Penfold
Details of various types of modem and their applications, plus how to interconnect computers, modems, and the telephone system. Also networking systems and RTTY. 96 pages £2.95

AUDIO FREQUENCIES

AUDIO (BP111)
(Elements of Electronics — Book 6)
F. A. Wilson
This book studies sound and hearing, and the operation of microphones, loudspeakers, amplifiers, oscillators, and both d.c. and magnetic recording. 320 pages £3.50

THEORY & CALCULATIONS

PRACTICAL ELECTRONICS CALCULATIONS
F. A. Wilson
A book for the workbench, with a strong practical bias, covering units and constants, d.c. and a.c. theory, passive components, networks, theorems and measurements. Higher mathematics have been avoided where possible. 256 pages £2.95

THE SIMPLE ELECTRONIC CIRCUIT AND COMPONENTS (BP53)
(Elements of Electronics — Book 1)
F. A. Wilson
The fundamental theory necessary for a full understanding of the simple electronic circuit and its main components, with the minimum of mathematics. 224 pages O/P

FAULT-FINDING

TRANSISTOR RADIO
FAULT-FINDING CHART (BP70)
C. E. Miller
Selecting the appropriate fault description at the head of the chart, the reader is led through a sequence of suggested checks until the fault is cleared. 635 x 455mm approx. £0.95

COMPUTER PERIPHERALS (BP170)
R. A. Penfold
Covers monitors, printers, disk drives, cassette recorders, modems, etc., explaining what they are, how to use them and the various types of standards. 80 pages £2.50

AMATEUR RADIO SOFTWARE (RSGB)
John Morris GM4ANB
Using a computer for c.w., RTTY, data, plus calculations for antennas, distance, bearing, locators, satellites, sun, moon and circuit design. 325 pages Hardback £7.29

HOW TO ORDER

O/P = Out of print
O/S = Out of Stock

Add 75p per order postage (overseas readers add £1.50 for surface mail postage) and send a postal order, cheque or international money order with your order (quoting book titles and quantities) to Short Wave Magazine, Enefco House, The Quay, Poole, Dorset BH15 1PP. Payment by Access, Mastercard, Eurocard or Visa also accepted on telephone orders to Poole (0202) 678558. Books normally despatched by return of post but please allow 28 days for delivery.

Whether you want a subscription to Short Wave Magazine or a joint subscription to PW and Short Wave Magazine, you should contact:

Short Wave Magazine
Subscription Department
Enefco House
The Quay
Poole
Dorset BH15 1PP
Tel: 678558
Take advantage of our special offer and save 10% on a joint subscription to both titles.

TELEVISION INTERFERENCE MANUAL (RSGB)
B. Priestley
TV channels and systems, spurious-radiation TVI, strong-signal TVI, audio breakthrough, transmitter design. 78 pages £2.02

TEST EQUIPMENT FOR THE RADIO AMATEUR (RSGB)
H. L. Gibson G2BUP
Techniques and equipment for tests and measurements on devices, systems and antennas. 142 pages Hardback £5.76

RADIO FREQUENCY INTERFERENCE (ARRL)
Identifying and dealing with interference between radio transmitters, electrical devices, power lines, and cable systems. 65 pages £4.36

John Morris GM4ANB
How to fault-find and repair valved and transistorised receivers, car radios and hi-fi equipment. Suggested lists of tools and spare parts. 106 pages £2.95

QUESTIONS & ANSWERS RADIO REPAIR
Ian Hickman
This book describes oscilloscopes ranging from basic to advanced models and their accessories. How oscilloscopes work, and how to use them. 124 pages £6.50

OSCILLOSCOPES HOW TO USE THEM, HOW THEY WORK
Les Lawry-Johns
How to fault-find and repair valved and transistorised receivers, car radios and hi-fi equipment. Suggested lists of tools and spare parts. 106 pages £2.95

SERVICING RADIO, hi-fi AND TV EQUIPMENT
Gordon J. Kong
A very practical book looking at semiconductor characteristics, d.c. and signal tests, fault-finding techniques for audio, video, r.f. and oscillator stages and their application to transistor radios and hi-fi. 205 pages £7.95

PRACTICAL HANDBOOK OF VALVE RADIO REPAIR
Chas E. Miller
The definitive work on repairing and restoring valved broadcast receivers dating from the 1930s to the 60s. Appendices giving intermediate frequencies, valve characteristic data and base connections. 230 pages Hardback £15.95

NOW AVAILABLE see Book Service above
After Dark

During darkness the sky wave signals can arrive in many distant areas and some broadcasters take advantage of this fact to provide a service beyond their normal ground wave range. For example there is Radio Luxembourg on 1440kHz. However the sky wave signal from a particular ground wave range can arrive in many distant areas and some broadcasters take advantage of this fact to provide a service beyond their normal service area.

The fading is caused by the combination of the ground and sky wave signals and is due to the fact that the strength and phase of the sky wave signal is not constant but continually varying — it may add to or subtract from the ground wave signal at any given instant and so produce fluctuations or fading. Provided all parts (carrier and sidebands) of the sky wave signal are present when the signal fades. However, if all parts of the sky wave signal are not reflected equally then severe distortion of the resultant signal will exist during fades — this is called selective fading and is very objectionable! The overall effect of the combination of ground and sky wave signals is to reduce the normal service area.

The maximum practical distance that can be covered by a single reflection via the E layer at night is about 2000km. However if darkness is present throughout a very long path and reflection is via the F2 layer, considerable distances can be covered — m.w. transatlantic reception becomes possible. At sunrise the sky wave signals rapidly fade out as the D layer reforms and once again the ground wave signals predominate. Many listeners enjoy tuning across these bands at night for new stations and in view of the large number present a receiver with a built-in directional antenna can help in separating the stations. A guide book detailing the frequencies used by broadcasters can help in identification — see Appendix. Next month some of the segments of the radio spectrum (or bands) allocated to broadcasters in the h.f. region will be examined.

Appendix

International Radio Stations Guide. £2.95.

World Radio & TV Handbook. 1987. £17.95. All these three books are available from PW Publishing Ltd, Enefco House, Poole, Dorset BH15 1PP. Don’t forget to add 75p P&P per order regardless of how many books.

RALLIES

June 7: The Spalding & District Amateur Radio Society are holding their rally at Springfields Gardens, Spalding. Gates open at 10am.

Dennis G400
0775 86382

July 12: The Worcester and District ARC are holding their Droitwich Rally at the High School, Droitwich. Entry to the rally is free, as is the parking. All the usual trade stands will be there, as well as entertainment for the rest of the family. They have even laid on free transport to the local strawberry fields.

Steve Colledge G0AOOC
6 Tweed Close
Worcester WR5 1SH

August 2: The Rolls Royce Amateur Radio Club are holding their rally at the Rolls Royce Sports and Social Club, Barnoldswick.

August 15: The Wight Wireless Rally will be held at the Wireless Museum, Arreton Manor near Newport. The rally opens at 11am and closes at 5pm, with talk-in on S22 and G989W. All the usual trade stands will be there and they hope to run some demonstrations on the day too.

Douglas Byrne G3KPO
Tel: 0983 67665

September 6: The South Bristol ARC are holding their rally at Hareclive Youth and Hareclive Community Centres, Hareclive Road, Hareclive, Bristol. Dorsets are open between 10am and 5pm. There will be the usual bring and buy general traders in the Community Centre and radio dealers in the Youth Centre. Admission is £1.50.

Len Baker G4RZY
Tel: 0272 834282

September 6: The West Kent Amateur Radio Rally is being held in the Angel Centre, Tonbridge, Kent. Doors open between 10.30 and 4pm. There will be talk-in on S22, S24 and 29.5MHz f.m. using the callsign G90WKS. The rally has free parking, a bring and buy, club stands, many trade stands and a stamp fair.

Nigel Peacock G4KIU
Tel: 0892 515678

November 15: The Bridgend and District ARC are holding their rally at the Bridgend Recreation Centre, Angle Street, Bridgend. Doors open at 11am (10.30am for the disabled). There will be free parking, a bring and buy, Morse tests (pre-booked with RSGB), bar facilities and talk-in on S22.

Dave George GW1OUP
Tel: 0656 723508

June 7: The Southend and District Radio Society are holding their rally at the Rocheway Centre, Rochford, Essex. Doors open at 10.30am and there will be talk-in on S22.

Ron G6S0H
QTHR

June 14: The Royal Naval Amateur Radio Society are holding their famous rally at HMS Mercury, East Meon, Petersfield, Hants. Gates open from 10am to 5pm. There will be the usual bring and buy, club stands, many trade stands and a stamp fair.

Cliff Harper G4UIJR
Tel: 0703 557469

June 21: The Denby Dale Radio Rally starts at 11am at Shelley High School, which is on the B6115 near Skelmanthorpe. Talk-in will be on S22, S242 as well as 28MHz f.m.

Gerald Edinburgh
Tel: Huddersfield 602905

May 24: The Plymouth ARC are holding their mobile rally at Plymouth School, Plymouth. Doors open at 10am. The usual trade stands and bring and buy will be there, and there will be refreshments and ample free parking. Talk-in on S22.

YOUR ONE STOP LISTENER SERVICE!
HUGE STOCKS — BEST PRICES — GREAT BACKUP — FREE SECURICOR

SONY ICF7600D PORTABLE COMMUNICATIONS!
All way, can be a fantastic communications receiver between 15kHz-30MHz AM/SSB plus FM 75-108MHz Digital readout memories, clock and a host of other features. Listen to the DX at work! Multi or battery. £169 FREE SECURICOR

SONY ICF2000D RECEIVER SUPER PORTABLE + BASE HF & AIR BAND COVERAGE
Described as "the best portable on the market" by a reviewer, it covers 150kHz-30MHz plus AM on band Memories scanning etc. A bargain price. Exemplary aerial socket and a host of other features. 230V AC or battery. £329 FREE SECURICOR

SONY AIR-7 HAND-HOLD AM/FM 108-176MHz + LWM/WFM UNBEATABLE VALUE
The best VHF monitor there is. That's a fact! 108-176MHz plus LW/MW/FM broadcast Covers aural, marine, PFR etc. LCD display, memories, scanning, clock, phone, etc. Supplies are short but we are the UK's largest stockist. Check with us! £247 FREE SECURICOR

TRIO R5000 JUST ARRIVED! TOP SPECIFICATION RECEIVER
The newest and best receiver so far from Trio. A high performance receiver. 100kHz-30MHz AM/SSB/CW. A non-complex receiver with features that many regard as the best available at the price. Covers 118kHz-300MHz and has a host of features. Send for specification sheet. £895 FREE SECURICOR

TRIO R2000 HF RECEIVER POPULAR BASE MONITOR
Well respected, it covers 150kHz-30MHz AM/SSB/CW plus memories and scanning, etc. You're today for full specification. Ft welcome! £637 FREE SECURICOR

YAESU FRG8900 HF RECEIVER IDEAL BASE STATION
The highly regarded Fr from Yaeusu. 150kHz-30MHz AM/SWB/CW plus vhf / uhf and has a host of features. Has a resolution LCD display plus memories and scanning. Very popular and superb performance. £619 FREE SECURICOR

GLOBAL AT1000 AERIAL TUNER
If you want the best out of your receiver, you should have an aerial tuner. This one is the best. 500kHz-30MHz handles all kinds of aerials including wires and coax fed systems. A small price for a perfect match! £21 POST FREE

BOOKS SPECIALLY FOR YOU!

COMPLETE VHF/UHF FREQUENCY GUIDE 26-2250MHz £4.95 + 80p p&p
This guide has sold over 4,000 copies since its publication using August 1987 and is still selling well. More than a guide, it is compiled as being of tremendous value and unique in radio literature. If you are one of the many who are curious to know who transmits where, in the wide VHF/UHF spectrum, you will find this a most valuable and useful book. £4.95 + 80p p&p

UK LISTENERS CONFIDENTIAL FREQUENCY LIST 1.6-30MHz £5.95 + 80p p&p
NEW FOURTH EDITION
1978 EDITION This famous listing is now in its fourth edition. Completely updated for 1987 and a lot thicker. Yet the price is the same as the 1986 edition! Many additional frequencies have been added and of course some have been deleted where they are no longer used. In this guide, and that it shall not be lent, resold, hired out or otherwise disposed of in a mutilated condition or in any unauthorised cover by way of Trade, or affixed to or as part of any publication or advertising, literary or pictorial matter whatsoever.

SCANNING RECEIVERS

ZETAGI 1150 RF DUMMY LOAD AND POWER METER

A very accurate unit for the service man or discerning enthusiast. FREQ: 0.5-500MHz

POWER: 150 Watt max in 3 ranges 0.1, 0.15, 0.50W

ZETAGI 500 SWR AND POWER METER

For the enthusiast who wants the very best: A nine meter unit with built in tuning controls for either 75, 600 or 50 ohm cable FREQ: 3-2000MHz POWER: Up to 2W

FD 1350 13GHZ FREQUENCY COUNTER

FREQ: 100-1500MHz SENSITIVITY: 420W or 2100

SUPPLY: 9-12 Volt DC

£139.95

NEVADA AMATEUR PRODUCTS

HIGH POWER "ROLLER COASTER" VARIABLE INDUCTORS

BASE SCANNING RX BEARCAT 175XL

For the enthusiast a sensitive base receiver which covers:

66-85MHz, 119-174MHz, 405-512MHz

Includes Public Service, Aircraft, Marine etc.

16 channel memory scan
Priority keyboard lock
Lighted display

BASE SCANNING RX BEARCAT 100XL

A super sensitive low cost handheld which covers:

66-85MHz, 119-174MHz, 405-512MHz

Includes Public Service, Aircraft, Marine etc.

16 Channels memory scan
Priority keyboard lock
Lighted display

HANDHELD SCANNING RX BEARCAT 100XL

For the enthusiast a sensitive base receiver which covers:

66-85MHz, 119-174MHz, 405-512MHz

Includes Public Service, Aircraft, Marine etc.

16 Channels memory scan
Priority keyboard lock
