Sony SW1S Receiver Reviewed

For The Radio Listener
ICOM introduces the IC-R7000, advanced technology, continuous coverage communications receiver. With 99 programmable memories the IC-R7000 covers aircraft, Marine, FM Broadcast, Amateur Radio, television and weather satellite bands. For simplified operation and quick tuning the IC-R7000 features direct keyboard entry. Precise frequencies can be selected by pushing the digit keys in sequence of the frequency or by turning the main tuning knob. FM wide/FM narrow/AM upper and lower SSB modes with six tuning speeds: 0.1, 1.0, 5, 10, 12.5, 25KHz.

The IC-R7000 has 99 memories available to store your favourite frequencies including the operating mode. Memory channels can be called up by pressing the memory switch then rotating the memory channel knob, or by direct keyboard entry. A sophisticated scanning system provides instant access to the most used frequencies. By depressing the Auto-M switch, the IC-R7000 automatically memorises frequencies that are in use whilst it is in the scan mode, this allows you to recall frequencies that were in use. The scanning speed is adjustable and the scanning system includes the memory selected frequency ranges or priority channels. All functions including the memory channel readout are clearly shown on a dual-colour fluorescent display. Other features include dial-lock, noise blanker, attenuator, display dimmer and S-meter and optional RC-12 infra-red remote controller, voice synthesizer and HP 1 headphones.

IC-R71E, General coverage receiver.

The ICOM IC-R71E 100KHz to 30MHz general coverage receiver features keyboard frequency entry and infra-red remote controller (optional) with 32 programmable memory channels, SSB, AM, RTTY, CW and optional VFO's scanning, selectable AGC, noise blanker, pass band tuning and a deep notch filter. With a direct entry keyboard frequencies can be selected by pushing the digit keys in sequence of frequency. The frequency is altered without changing the main tuning control. Options include FM, voice synthesizer, RC-11 infra-red controller, CK70 DC adaptor for 12 volt operation, mobile mounting bracket, CW filters and a high stability crystal filter.

Helpline: Telephone us free-of-charge on 0800 521145. Mon-Fri 09.00-13.00 and 14.00-17.30. This service is strictly for obtaining information about or ordering Icom equipment. We regret this cannot be used by dealers or for repair enquiries and parts orders, thank you.

Datapost: Despatch on same day whenever possible.

Access & Barclaycard: Telephone orders taken by our mail order dept, instant credit & interest-free H.P.

ICOM (UK) Ltd.
Dept SW, Sea Street, Herne Bay, Kent CT6 8LD. Tel: 0227 363859. 24 Hour.
If you are going abroad for your summer holidays then you should be thinking of taking a small, portable short wave radio to enable you to keep in touch with what is going on at home. If it also receives v.h.f. f.m. as well as long and medium wave broadcasts so much the better. John Waite looks at Sony's latest offering which ties in well with our free, pull-out feature on holiday listening, 'Waves Away'.
May I thank all those readers who took the time to fill in and return the questionnaire from the April issue. These are now being prepared for processing and analysis, which will take quite a while — so good was the response.

I had a quick look at the forms as they came in and some of the comments and answers confirmed my own thoughts and ideas based on the normal feedback from you through letters and chats at rallies. In this issue you will find one or two changes based on your replies.

The most obvious one is the introduction of "Readers Adverts". The rules governing these will be quite strict to rule out the pseudo-dealer and the advertising of illegal equipment. You should use the form printed on page 52 but if you do not wish to cut your copy of the magazine you may use a photocopy or plain paper. However, in this case you must send in the Corner Flash from page 52 or quote your Subscriber Number to prove that you have bought a copy of SWM. No Corner Flash or Subscriber Number — no advert! The charge has been fixed at £2.30 inc. VAT for up to 50 words plus £0.50 inc. VAT for each additional word and payment must accompany your copy. The first adverts should appear in the June 88 issue.

The special "gate-fold" cover was very well received and I have had requests for extra copies of the covers. We have had a small quantity of each side printed and these will be available from our stands at rallies price 50p per side. Unfortunately they will not be available by post — this size makes it too difficult and expensive to package them.

If you are holidaying abroad this summer then the pull-out section in the centre of this issue will interest you. It will prove to be a handy guide to help you find the English language broadcasts in your holiday area and give you the times and frequencies of the BBC World Service broadcasts to keep you in touch with home.

DICK GANDERTON

A WORD IN EDGECAYWS

Sir

As one who has been dabbling in radio for many years I have seen plenty of changes.

For instance, all station wavelengths used to be in metres and the frequency given in kilocycles. Nearly all of the old radios were calibrated in metres, and later in kilocycles, which made the calibration far easier, giving the exact frequency of the station.

Then some bright spark decided that it should be called kilohertz?

I am all for change if it helps progress, but I see no reason for change when it is not. I refer here to the changes of frequencies on the long wave band.

Ever since the BBC started broadcasting on the long wave band, around sixty years ago from the old DXK transmitter at Daventry, the station has been on 1500 metres, 200Kc/s (sorry kHz). The result of moving it to 198Khz has been to put it 2kHz nearer to Motala on 189KHz and it is still 9kHz from DLF Munich on 207kHz.

So why has it been changed?

It has not altered the fact that some thirty stations use frequencies from 153 to 281KHz — a mere 128kHz, and all are receivable in the UK. There are three on 153, two on 171, four from 177 to 183, three on 198, two on 207, two on 216, two on 236, two on 245, two on 254 and two on 263KHz. Of the six stations in the USSR five share the same frequency with another station outside Russia. No Russian station shares the same frequency with another Russian station as far as I know. There are five I.W. stations pumping out 2000Kw.

How long will it be before someone realises that the reliable coverage area of a I.W. transmitter is far greater than the m.w. counterpart, and that some could be used for propaganda purposes, perhaps with a power in excess of 2000Kw. The result — chaos, the same as the medium wave band where far too many stations are trying to make themselves heard above the rest of the noise that is going on.

It is high time that some sort of world-wide organisation was set up to sort out this mess and to ensure that all transmitters are restricted to a power whereby they do not overlap another station on the same frequency.

GEORGE MILLMORE

WOOTTON ISLE OF WIGHT

I will use George's letter as a peg to hang some comments about abbreviations and units on. I too was brought up on Kc/s and can well remember the change to hertz and all the comment and trauma that went with it. We all thought that it would never catch on!

What is more to the point, however, is the laxity in writing abbreviations, units and their multipliers. This is particularly true of the multipliers for "kilo" and "mega". The correct way of writing kilohertz is kHz, not KHz, KHZ or KH. K is reserved for degrees Kelvin (absolute temperature) or 1024 bits of computer memory. The other common error is to write mhz instead of MHz. So what, you say, everyone knows what is really meant. Do they? How do you know if one million cycles occur every second or one cycle takes nearly 17 seconds to complete?

ED.

Sir

I read with interest David Gommo's letter in "A Word in Edgeways" April 88 SWM and agreed with most points. He suggests that c.w. swamps everything else. If you cannot beat them, why not listen to them? I have been a s.w.l. for some 70 or so years and some time ago I did just that. It is quite easy to learn and modern aids are helpful.

It is said that c.w. (Morse) is dying — this may be true — but there is plenty of life around at the moment. A tiny squeak on 28.262 AX2RSY Australian Centenary, a ship entering the Black Sea asking for a pilot, a trip around the beacons using the excellent Beacon Chart given away with the March 88 issue of your sister magazine, Practical Wireless — or perhaps an Ice Report from the Arctic. Excellent books are available from various sources such as Interbooks or the Short Wave Magazine Book Service.

I am not competent to comment on the quality of amateur operating standards or indeed would I wish to, they form a very small percentage of my listening. OK — 73 — 888BCNU, etc. is of no particular interest to me. I would, however, be very interested to read any comments from any listener who shares my corner of the Hobby.

A passing thought — with the mass arrival of scanners (v.h.f., u.h.f. and up) would it be convenient to abbreviate "r.f." taken from the SWM slogan "For the Radio Listener", be more appropriate than s.w.l.? E. SWAN

EASTBOURNE

SUSSEX

This letter touches a sore point with me — Morse (c.w.) is better at sending me to sleep than counting sheep! The mere sound of Morse entering my ears seems to completely turn my brain off, so if anyone has any ideas on how to stay alert while receiving Morse I would appreciate hearing them.

The final paragraph is also interesting. I have received several letters from readers, some quite abrupt, on the subject of the title of the magazine and the description "For the Radio Listener". The first grouse is that it is not Short Wave Magazine it should not cover anything outside the short wave bands. This is, in my opinion a nonsense — short wave listener (s.w.l.) has become a term for anyone who "listens" to any form of radio signal no matter what the frequency, mode or subject matter. This brings me to the other major complaint — that as a magazine for "listeners" it should not be covering anything that is not output through a loudspeaker or headphones! Television and any form of data transmission is not considered to be "listening". Again this is nonsense. The term "listener" is used to describe anyone who receives radio transmissions no matter how they have to be presented to be understood.

ED.
Peaks & Plains Award
This award is sponsored by Gradus Ltd., in conjunction with the Cheshire Peaks and Plains Tourist Board.

The award is available to all licensed radio amateurs and s.w.i.s. on a worked/heard basis. You need to work/hear 10 Cheshire stations PLUS either of the MDRS club stations or GB2W30 OR any one of the special event stations organised by MDRS active throughout 1988.

All contacts must be made after 1 January 1988. The award costs £1.50 (4 IRCs for non-G callsigns) with a log extract showing stations worked/heard, date, etc. countersigned by one other licensed amateur to:
R. Thornley G1NUS
270 Hurdsfield Road
Macclesfield
Cheshire SK10 2PN

Media Network
This programme, broadcast by Radio Netherlands, is a weekly survey of communication developments compiled with the assistance of over 170 monitors spread across the globe.

April 28: Digging in the Archives. This edition of Media Network will explore some of the huge radio archives which are gradually being sorted by the Dutch Broadcast Museum in Hilversum. They'll also be including news from the WRTH editorial office in Amsterdam.

May 5: Dayton Developments. If host Jonathan Marks makes it back to Holland in time, you'll have a report on the Daytom Convention in Ohio USA. Over 30000 amateur radio operators are expected to attend and this year will see special sessions for s.w. broadcast listeners. Also included will be Arthur Cusson's Pacific News.

May 12: Media News Roundup. This edition will include news from the African continent from Richard Ginney.

May 19: Media News Roundup. This edition includes Timedestine radio news from John Campbell.

May 26: Antwerp Antics. This programme will include a report on the 1988 EDX conference which takes place May 20-23 in Antwerp, Belgium. Media News from Victor Goonetilleke is also scheduled.

Radio Sweden SSBB
Radio Sweden transmit broadcasts from their short wave s.s.b. relay of Swedish home service programmes. These will continue only until July 1 when the transmitter will be closed down. The times of transmission are (for the moment): 0200-0230UTC on 17.840MHz (a) 0230-0300UTC on 17.840MHz (b) 0500-0700UTC on 17.770MHz 0700-0900UTC on 17.770MHz (c) 0900-1100UTC on 21.555MHz 1100-1600UTC on 21.555MHz 1600-1800UTC on 15.435MHz 1800-2030UTC on 15.420MHz 2330-2400UTC on 17.840MHz (a) (a) Radio Sverige, the Swedish service of Radio Sweden. 2330-2400UTC (b) English service. 0200-0230UTC (c) Saturdays and Sundays only.

934MHz CB
The Parliamentary Under Secretary of State for Trade & Industry made the following statement about the future of 934MHz CB.

"The Government in common with other administrations in Europe is to consider the introduction of a Short Range Radio (SSR) system in this band 933-935MHz. One of the existing users of this band is the 934MHz CB allocation. Approximately 3000 users have these sets out of a total of over 115 000 CB licences.

Once SSR becomes widely used, it is inevitable that the CB service will suffer an increasing level of interference and it is important that potential users of the band are aware of this, and that the many potential users of any new SSR service are adequately protected.

I have decided therefore that the Performance Specification MPT1321 to which 934MHz CB transceivers are manufacturer certified should be withdrawn from 30 December 1988. This will provide warning to traders and potential users alike that new sets should be made or imported from this date.

It is of course only fair that existing users of the CB band get a good life from their sets. I can assure users that their existing equipment will continue to be used for its foreseeable useful life.

When further details are available about what will happen to the users on the band, etc., we will let you know.

BRARS Special Award
British Rail in conjunction with the British Rail Amateur Radio Society have organised a special award to celebrate 21 years of Inter City.

The award will run from the start of the new timetable, May 16, and finish on commencement of the winter timetable in October. It is open to both overseas and British radio amateurs.

The certificate can be gained by a licensed amateur or short wave listener producing a signed log sheet confirming contact with, or in the case of short wave listeners, having heard both stations in contact with 21 different amateur stations whose postal address includes any of the towns listed in the index to the pocket sized InterCity Guide to Services.

Ham Aid Mondial
A group of Wiltshire Radio Amateurs are setting up Ham Aid Mondial during the Bank Holiday weekend May 28/29. This is to raise money for the Disasters Emergency Committee and to funds to purchase a cardiac resuscitation unit (LIFEPAK 5) for Marlborough Ambulances.

Alderney is Active
On May 22, the Guernsey Amateur Radio Society will be active on 1.8 and 3.5MHz around the normal WAB s.s.b. frequencies from the Island of Alderney. They will be using the callsign GU4NYT/P.

It is hoped that the transmitting station will operate on all amateur bands below 430MHz. They intend to operate on all permitted modes in these bands. They have three special event calls for the event, GB95HAM, GB1CHAM and GB1HJK. The station will be located between Marlborough and Pewsey near Martinsell Hill.

The following conditions must be adhered to: At least one of the contacts must be with a member of British Rail Amateur Radio Society, or the club station LMR. No cross band calls contacts allowed. Contacts by repeater or satellite not allowed. Overseas short wave listeners need only hear the G contact. The log sheet must be set out - date - time - station worked/heard, and signed by the operator.

QSL confirmation is not required. The closing date for receipt of log sheets is postmarked no later than 10.12.88.

Logs to be forwarded to:
Award Manager BRARS

Glossop
Derbys SK13 9AJ

Short Wave Magazine May 1988
RAFARS Golden Jubilee
The Royal Air Force Amateur Radio Society was 50 years old on 1 April 1988. They were about on the air with GB50RAF, which will be used now for all kinds of events until 31 March 1989. They have created a Golden Jubilee Award too. It is open to all s.w.l.s and amateurs for contacts made between, or reports confirmed between, members of the RAFARS (14.88-31.3.89). The basic award will be issued for the first 50 points scored and endorsements will be available if 100, 150, 200 or 250 points are scored. Points can be scored for completed contacts (or confirmed listener reports) as follows:

- 2 points for each contact on s.s.b. with a RAFARS member in the same country as that of the claimant.
- 3 points for each contact using a mode other than s.s.b. (e.g. a.m., c.w., f.m., RTTY, SSTV, etc.) with a RAFARS member in a different country from that of the claimant.
- 4 points for each contact using a mode other than s.s.b. (e.g. a.m., c.w., f.m., RTTY, SSTV, etc.) with a RAFARS member in a different country from that of the claimant.

Claims are submitted in chronological order showing the following information (Special logsheets are available from the contest manager):

- Date, Start and finish times of the contact (UTC).
- Call sign of station worked, Frequency band used, Mode used, Signal reports sent and received, RAFARS number of station worked, Points claimed for the contact.

All claims must be in by 31 July 1989. No QSL cards are required but logs must be signed by a licensed amateur stating they have checked the entry.

The cost of the basic award including P&P is £1 for UK addresses or £1.50 for airmail postage. For claims and full details of the award, contact:

Sqn Ldr A. J. Gilchrist RAF GB8BVJ

The World of Amateur Radio Exhibition
The World of Amateur Radio exhibition will take place in the URC Church Hall, Rock Street, Thonbury on May 21 from 10am to 4pm.

The purpose of the exhibition is to present to the general public the fascinating world of amateur radio. Aspects of radio to be seen at the exhibition will include:

- Short wave listening.
- A complete working s.w.l. station, equipped with both high performance and economy communications receivers.

AMSAT Colloquium
The AMSAT Colloquium will again be held at the Lecture Complex of the University of Surrey, Guildford from July 29 to 31. The University is about 48km from the centre of London, situated in very pleasant surroundings, near to shops, BR station and adjacent to Guildford Cathedral. Whereby Royal Horticultural Gardens are also very near.

The Colloquium will be officially opened on Saturday morning (July 30) at 1000 and will run until midnight on that day, recommencing at 0930 on Sunday 31st until 1700.

A full programme of lectures, demonstrations, workshops, exhibitions by the trade and amateur radio groups in the Concourse area, large fun junk sale after the Colloquium Dinner on Saturday evening and visits to the UoSAT Command Stations with the Stations Controllers to answer questions. The AMSAT UK callsign and amateur station GB2SAT and GB75SAT will be available to any licensed amateur to use. Accommodation, meals and drinks have been booked at the University at prices very much lower than costs at local hotels and will be VAT free if booked in advance.

Members and friends who may wish to attend, are daily as well as full weekend options, should apply for a booking form to:

The Hon Secretary AMSAT UK
94 Herongate Road
Wanstead Park
London E12 5EQ

75 Years of Radio
Seventy-five years of radio is the theme behind a special day celebrating the 75th anniversary of the RSGB. The event will take place at the FE Centre, Tower Hill, Haverfordwest, Pembs on May 21. Dooms will be open to the public from 10 am.

On the day the Pembrokeshire Radio Society will be operating under the special callsign GB75PRS. In common with most special event stations, members of the general public may send messages of greetings to different countries, under supervision.

The station hopes to have three transceivers in operation, h.f. phone, h.f. Morse and a v.h.f. station. The society will be taking a point of putting the callsign on c.w. as well as s.s.b. Morse operators may like to listen between 3.515 and 3.540MHz.

There will also be a fascinating display of vintage radio equipment on show. Many of the items in the static display will be on loan from local radio historian Eric Down GW0DDK.

**Short Wave Magazine May 1986**
Wirral & District ARC meet alternate Wednesdays, 8pm in the Ibby Cricket Club Room, Ibby, Birkenhead. May 4 is a Treasure Hunt, the 11th a Quiz Night and a talk by Mr X on the 25th. Aan Griffiths G1XYP on Morton 7517.

Cheshire ARC meet Fridays, 8pm in Sale Moor Community Centre, Norris Road, Sale. A spring d.f. Contest starts at 20.15 on April 29 and May 13 is Conversion on the BB Set by G4JLG and Co., the AGM is on the 20th. More from David Holland on Sale 1837.

On May 13, York ARC have a Hunt at Priory Barn, Dr-global Farm, Barmston, 10am, 450 acres, and a meeting at Latch Camp, 2pm, 160 acres.

On May 9, Altrincham Stone have Rig Testing by the DTI Radio Service Investigation and the 23rd is d.f. Hunt. They meet 2nd & 4th Mondays, 7.30pm in the Crystal Palace Community Centre, Old School, Long Street. More from John Arrowsmith G4IWA on Atherstone 713670.

Farnborough & District RS meet 2nd Wednesdays, 7.30pm in the Railway Enthusiasts Club, Hawley Lane, May 11 is an Open Evening and the 25th a h.f. Field Day Review by G0CCI. Details from John Ferry G4UE on Camberley 29231.

Crystal Palace & District RC meet 3rd Saturdays, 8pm in the All Saints Parish Rooms, Broughill Hill. May 21 is an Evening on the Air. Further info from Geoff Stone G3FL on Forest Hill 6940.

Meetings for the Paddington Co-operative ARC are 1st Wednesdays at 7pm in Paddington College, Paddington Green, London W2. Contact Don Pye G1UCT on Paddington 3847 (after 7pm).

G4IUZ runs a Symposium for The East Kent RS, the 18th is an Operating Evening at Bishopstone. Meetings are 1st & 3rd Thursdays, 7.30pm in Parkside Lodge, Kings Road, Herne Bay or at the Radio Shack, Bishopstone. Brian Didmon on G4RJS on Whitstable 262042.

On May 9, Exeter ARC have a talk on the Radio Station of Models. Meetings are 2nd Mondays, 7.30pm in the Community Centre, St Davids Hill. More from Ray Dono G3YBK on Exeter 7871.

On April 30, the Cornish RAC have the Trevithick Day Exhibition Station, Trelawrence Street, Camborne (GB2R7T). Meeting’s are 2nd Mondays, 7.30pm to 9pm, more from N. Pascoe G4USB on Redruth 213234.

Chalmsford ARC have a Visit to Chelmsford Police HQ on May 3. They meet 1st Tuesdays, 7.30pm in the Marconi College, Harlow Lane. Roy Marley G3PMX on Chelmsford 353221, Ext. 3815.

On May 12, the Colchester RA’s have a Construction Evening & Regional Liaison Officer – Ted Whitworth, the 26th is a Bognor Aerials by G4TYG. Meetings are in the Boardroom, 1st Floor, “B” Block, Colchester Institute, Sheepen Road, 7.30pm. More from Mike Greggs G4YJN on Colchester 348189.

The May 10 meeting of the Mid-Warwickshire ARC will be a d.f. Foxhunt and Barbecue. They meet 2nd Saturdays, 8pm in the St John Ambulance HQ, 61 Emscote Road, Warwick. Details from Peter Brown G0HII on Marton 632370.

Dunstable Downs RC meet in Room 3 of Chews House, High Street South on Fridays, 8pm. Sunday May 8 is a d.f. Hunt, the 13th a Junk Sale and provisionally a Visit to Fire Station, the 20th. More from Tony GOCQ on Luton 502589.

South Bristol ARC meet Wednesdays in the Whitchicot Folk House, East Dundry Road. A Demonstration of DX Contacts on TV by Ron Gardner is on May 4, the Club Project – Construction Evening G3KED on the 11th, a 144 MHz Operating Evening on the 18th and a Microwave Activity Evening on the 25th. Further info from Len Baker G4RZY on Whit- chicot 834282.

Wimbledon & District ARC meet 2nd Saturdays, 7.30pm in St Andrews Church Hall, Herbst Road, Wimbledon. April 29 is a General Activity Evening and May 13 is Allard Motor Cars by David Kinella. Contact David Love G4RRQ on Burgh Heath 51558.

The North Wakefield RC have a talk on The Police by PC Workman on May 5, On the Air on the 12th and a talk to Jonvik Vicar by coach total cost (£5) on the 19th. They meet Thursdays, 8pm in The White Horse Public House, Fall Lane, East Ardsley. More from Steve Thompson G4RCH on Leeds 536635.

On May 11, Fareham & District ARC have the Mystery of Micro- waves by G8BOI and a Talk and Slide Presentation by G6NZ on the 25th. They meet Wednesdays, 7.30pm, with Morse Classes from 6.30, in Room 12, Porchester Community Centre, Westerleigh. Details from Bob Reeves G8BOI on Portsmouth 568889.

Horsham ARC have Independent Television by G3GOF on May 5. They meet 1st Thursdays in the Guide Hall, Denne Road. More from Presh Godbolt G4UDU on Steyning 814516.

Binsted ARC meets Mondays, 7.30pm in Bricklewicks, Newnham Road, Binsted, Isle of Wight. Their May lecture is on Vintage Aircraft by G4HVR. Portable offers also on the 25th. More from Peter Davies G1KQA on Lea Valley 764930.

Halifax & District ARC meet 1st & 3rd Thursdays, 7.30pm in the Running Man Public House, Pender Lane. May 17 is Birkenhead Centenary Night, David Moss G0DLM on Halifax 202306.

Felixstowe & District ARC have their annual Holiday Social in the Grosvenor Hotel, Felixstowe on May 2 and ESWR Planning on the 16th. They meet alternate Mondays, 8pm in the Scout Hut, Bath Road. Paul Whiting G4YQC on Ipswich 642595.

The Mansfield ARC have their AGC on May 6. Meetings are in the Victoria Social Club, 1st Fridays & 3rd Tuesdays, 7.30pm. More from Keith Lawson G4AAH on Mansfield 642719.

On May 10, Keighley ARC have an Informal Evening and the Annual Field Event follows on the 27/28/29th. They meet in the Club Room at the rear of the Victoria Hotel, Keighley (near the Leisure Centre), 8pm. Kathy G1IGH on Bradford 46822.

Rhiw & District ARC meet 1st & 3rd Mondays, 7.30pm In The 2nd Rhiw Scout Hut, (behind the little theatre), Vale Road. Designing and Building by GW3UTG is on May 9 and Microwaves by GWBGAC on the 23rd. More details from Mike GW0WHK on Llandegla 621.

Wakefield & District RS have a Junk Sale on May 17. They meet alternate Tuesdays, 7.45pm in the Community Centre, Prospect Road, Ossett. John Bryan G4VRY on Leeds 820198.

Conventry ARC meet in the Baden Powell House, 121 St Nicholas Street, Redditch, Fridays, 8pm. April 29 is The (Indoor) Direction Finding Contest (Cup Qualifier). May 6 and 20 are Nights on the Air & Morse Tuition. More from Jonathan Ward G4AHFT on Coventry 610408.

Radio Society of Harrow meet Fridays, 8pm in the Roxeth Room, Harrow ARC Centre, High Road, Harrow. A Lecture by the Chairman on Impedance Matching is on April 29, an Activity Night on May 6 and Access Control using f.t. Transponders by Howard Berry on May 21, more from Peter G8GIO at 65 High Road, Uxbridge 730158.

South Powsy ARC have Practical Satellite TV Pt 2 on May 3. Meetings on the 1st Floor, RAFA Club, The Street, Brecon. More from B. Carter G8BAAG on Bwlch 730158.

Homdean & District ARC meet 1st Thursdays, 7.30pm in Merchiston Hall. They have the DTI on May 5. Dan Bernard G4RLE on Portsmouth 755274.

Midland ARC have Drayton Manor Rally on May 8 and a Junk & Sale Night on the 17th. Meetings are in Unit 16, 60 Regent Road, 11.30am, 7.30pm with classes from 7pm. More info from Tom Brady GBGZ on 357 1924.

On April 28, Edgware & District ARC have a Demonstration by G4GY/GX4RD. May 12 is Antenna Surgery – How to Cut your Wire Antennas, the 20th is Straight Key Night, the 27th is a From Pots to Mic’s, NFD/Constructors Contest is on the 26th. More from Ian Cope G4UIZ on Hatfield 65707.

Todmorden & District ARC meet
**LISTEN OUT FOR**

**GRASSROOTS**

1st & 3rd Mondays, 8pm in the Queen Hotel, Todmorden. A Natter Night is on May 2 and talk by a Crime Prevention Officer on the 16th. Details from G1GBZ on Todmorden 7572.

Southgate ARC meet 2nd & 4th Thursdays, 8pm in Holy Trinity Church Hall (Upper), Green Lanes, Winchmore Hill. On May 12, Stan Woods gives the third of his annual lectures on the History of Valves and the 26th is an Informal Meeting. Details from Brian Shelton on Winchmore Hill 2435.

Reading & District ARC meet alternate Tuesdays, 8pm in the White Horse Pub, Emmer Green. May 10 is Satellite Reception by Dave Bryant and the 24th is 23cm TV Repeater GB3HV by G4CRJ. More from Mike Anthony G4THN on Reading 774042.

May 11 is a Social/Morse Class for the Wyre ARC. The 18th is a Barbecue and the 25th is NFD Planning/Morse Class. They meet in the Breck Sports and Social Club, 2nd & 4th Wednesdays, 8pm. More from Dave Westby G4UH on Lancashire 854745.

Newport ARC have a Grand Surplus Equipment/Junk Sale on Sunday May 15 at Brynglas House. Opening times 11am-4pm (10.30 for disabled), items accepted from 10am. Talk in by GW1NRS on S22. Bob Keyes GW4IED on Newport 280968.

Wirral ARC have Original Predictions for Satellites by G3VOT on May 4 and a Portable Activity Meeting on the 18th. Natter Nights are Tuesday. Details from R. E. Bridson G3VEB on Wallasey 1346.

Verulam ARC have an Activity Meeting on May 10 and the 24th is Packet Radio Networking in the UK by G3KXV. Meetings are 2nd & 4th Tuesdays, 7.30pm in the RAF Association HQ, New Kent Road, off Marlborough Road, St Albans. More from Hilary G4JKS on St Albans 59318.

Stourbridge & District ARC meet 1st & 3rd Mondays in the King Edward VI School. May 9 is an Informal Evening and the 16th is Formal Evening with Talk and Slides on Early Amateur Radio by G3CAQ. More information from Derek Pearson G3ZOM on Kingswinford 288900.

Rugby ATS meet Tuesdays, 7.30pm in the Cricket Pavilion, outside Rugby Radio Station. May 3 is a Natter Night and the 10th a talk by Mr Ian Hopwood GOEDT RSGB. Preparation for special event at the Rugby Hobbies Festival on the 17th, Hobbies Festival De-brief on the 24th. More from Kevin Marriott GBTWH on Rugby 77986.

Stevenage & District ARC meet 1st & 3rd Tuesdays, 8pm in SITEC Ltd, Ridgemonde Park, Telford Avenue. May 1 is RSGB Convention at Sandown Park, the 3rd a Construction Evening and a Committee Meeting on the 24th. More from Peter GOGTE on Stevenage 724991.

**GB20WR:** The Mid Lanark ARS Motherwell are starting the 1988 series of special event stations with the Distillers plc on the Malt Whisky Run. The purpose is to activate the Whisky Route by radio.

The Whisky Route is located in the Highlands of Scotland where most of the whisky Distillers are located.

The stations will be located at four different distilleries over a period of eight days, with a day and a half at each location. All operating will commence at 1000 local time and finish at each location at 1500 local time the following day. A special QSL card and a certificate will be available.

The venues and dates are:

May 16: Cardu Distillery
May 17: Cardu Distillery
May 19: Royal Lochanag Distillery
May 21: Blair Athol Distillery

**GB4PCP**:

Coleshill (Llanelli) ARS will be operating from Pembrey Country Park from July 16 to 23 between 0800 and 2200 +.

This will be the first outside activity for their disabled members, who will include four “white-stick” operators.

All contacts will receive the special QSL card and some specially are looking forward to cards from s.w.i.s.

**GB6BH**:

This station will be active from Barbour Hall, Barbour, near Chesterfield, IO98TH. They will be on air most weekdays and every weekend during the month of May. They will be using the following bands and modes: all h.f. bands including 50 70MHz, 144 and 430MHz, phone, ATV, AMTOR, packet and RTTY.

Peter McCarty GODAG QTHR

**GB8GS**:

This station is being operated for the annual Humberside Scouts camping weekend at Primrose Woods camping site (near Scunthorpe). They will be using 3.5-14MHz between May 27 and 30.

John Pullen G4TGE QTHR

**RALLIES**

**★ May 1:** The RSGB VHF Convention will be held at Sandown Park Exhibition Centre, Esher, Surrey. All the usual attractions will be there. For more details, contact: Les Hawkyard G5HD

The Eryr

Newtown St Petrock

Torringdon

North Devon EX38 8LU

May 1: The Kelso ARS assisted by the Borders ARS will be hosting the 5th Anglo-Scottish Rally in the Tait Hall, Kelso. Doors open from 11am to 5pm. There will be the usual trade stands and talk-in on S22. Entrance will be £1, juniors ops, YLs and XYLs very welcome and admitted free.

Mr R. Cavers GM4UJB Tel: 0573 24654

**May 2:** The 1988 Doncaster Rally will take place at Bricotes Leisure Centre (near Bawtry). Talk-in will be on S22 using G4YRD. Audrey Wilson Tel: 0302 721259

**May 2:** The Dartmoor Radio Club’s annual mobile rally will be held at the Princetown Town Hall. Doors open from 10.30am to 5pm. All the usual traders will be there. Refreshments are available and there is ample parking. A small entrance fee will be charged.

May 15: The Granbryn Rally will be held this year in the Silverwood Hotel, Lurgan, Co. Armagh. Doors open at 12 noon and the entrance fee is £1. There will be the usual trade stands, QSL bureau, etc. Talk-in will be on S22. The proceeds of the rally will be given to The Stanley Ekins Memorial Fund.

Sam White G11BIW Tel: 07622 22855

**★ May 15:** The Otley ARS are holding the 31st Northern Mobile Rally at the Yorkshire Agricultural Showground, Harrogate, in the Flower Show Hall. The rally starts at 10.45am, but the showground is open to visitors from 10am. Morse tests are not available. More details from:

G3QQ Tel: 0943 602118

**May 22:** The Swindon & District ARC are organising a Radio, Electronics & Hobbies Fair at the Science Museum, Wroughton. It is planned to have models of model boat, aircraft, steam engines, etc. There might even be helicopter rides over Swindon. There is ample free car parking on site and the venue is well sign-posted. Gates open at 10am.

**May 29:** The East Suffolk Wireless Revival will take place at the Civil Service Sportground, The Hollies, Straight Road, Ipswich. Doors open at 10am and there is plenty for all the family to do.

Colin Ranson Tel: Ipswich 688204

**★ SWM in attendance**

May 2: The Dartmoor Radio Club’s annual mobile rally will be held at the Princetown Town Hall. Doors open from 10.30am to 5pm. All the usual traders will be there. Refreshments are available and there is ample parking. A small entrance fee will be charged.

May 15: The Parkanuar Rally will be held this year in the Silverwood Hotel, Lurgan, Co. Armagh. Doors open at 12 noon and the entrance fee is £1. There will be the usual trade stands, QSL bureau, etc. Talk-in will be on S22. The proceeds of the rally will go to The Stanley Ekins Memorial Fund.

Short Wave Magazine May 1988
The NRD-525 from JRC

Those of you who read about the NRD-525 last month will recall that I gave some background information about the JRC company. What I was trying to get across was the fact that a company with such a long history in the communications business can endow its products with a host of subtle details based on actual operating experience, JRC are in many ways similar to the Marconi Company (as it was), in that they can meet every possible need of their professional customers. Any owner of an NRD-525 will rejoice that a company such as JRC decided to bring their quality to the non-professional user.

But what of the NRD-525 itself? What will it do for you as a dedicated listener? In such a limited space as I can possibly carry all its outstanding features so I will draw some extracts from the Rainer Lichte review which I mentioned last month. Here’s what he says about:-

Accuracy and stability.

"The tuning accuracy and the matching display are impressive indeed. Still the more impressive is this receiver’s frequency stability. Drift is virtually non-existent, it was measured at less than 5Hz/hour."

And about dynamic range:-

"ICP 3rd order (3rd order intercept point) was measured at +17dBm at 7MHz and +14dBm at 25MHz. These are excellent values, and they are not the result of decreased sensitivity. The NRD-525 is amongst the most sensitive receivers I’ve measured so far. Dynamic range was computed to 102dB, an equally outstanding value."

All very well you may say, but what does this technical jargon mean in real life? Let me quote Rainer Lichte again:-

"The signal quality under adverse conditions is remarkable, e.g. the 40 metre band here in Europe is fairly cluttered with high-power stations and most receivers just quit when you try to extract some intelligence from a weak radio amateur signal. The NRD-525 is unimpressed and functions in a truly professional manner."

In other words, there is virtually nothing you cannot resolve. If it cannot be received by the NRD-525, it cannot be received by anything. As a final quote from the review, let me give some conclusions:-

"This receiver is a joy to operate and a joy to listen to."

"The new NRD-525 very impressively manifests itself as the No. 1 receiver outside the commercial/military bracket."

"Performance-wise, the NRD-525 is way ahead of the competition because this receiver delivers outstanding results in all modes of operation."

What you will find about the NRD-525 is that with all its undoubted performance, it is so easy to use and never thrusts itself at you like a knob bedecked military receiver. If you want to use it as a high quality broadcast receiver, then that is what it will be. As you discover more and more about the art of listening you find that the NRD-525 contains every operating feature and convenience that you might need, and there is almost nothing you cannot hear with it even when listening conditions are really difficult.

If you want to extend the use of the receiver, you will find a range of optional accessories to broaden the horizons, including a VHF/UHF converter which extends the already impressive 90kHz-34MHz range to include 34-60MHz, 114-174MHz, and 423-456MHz, (and the converter fits inside the receiver). When you get deeper into the art, you may decide that specialised listening requires specialised receiver bandwidths, and a range of high performance filters is available for your choice.

One final comment from Rainer Lichte with which I totally agree is his remark that the internal speaker in the NRD-525 is really only suitable as a monitor, and does not do justice to the high quality available from the receiver. This being so, if voice communications are your forte I recommend the matching JRC loudspeaker the NVA-88. If however you really want to enjoy the audio from broadcast stations, we carried out a long series of tests and decided that the Wharfedale Diamond III loudspeaker produces the most excellent sound from this and many other receivers. Normally of course these loudspeakers are sold as pairs, for stereo listening, but we split the pairs and can sell you a single Diamond III to enhance your listening pleasure.

Truly happy listening.

John Wilson

NRD-525 £1195 inc VAT

STOP PRESS. JST-135 matching transceiver to NRD-525 available soon.

FREE

Send 80p to cover the postage and we will send you, by return of post, your FREE copy of "THE LISTENER'S GUIDE", a commonsense look at radio listening on the HF, MF and VHF bands. Its unique style will, I am sure, result in a "good read" but underneath the humour lies a wealth of experience and expertise. You will also receive detailed leaflets on our range of receivers and a copy of our current price list.

Short Wave Magazine May 1988
OF SCANNING DISCS AND STEAM

Joan Ham

Chalk Pits Museum gets more than its fair share of interesting visitors. Here’s the intriguing story of Thomas W. Fishlock.

The disc had to run at precisely the right speed of 720 r.p.m., governed by a superimposed impulse on the transmitted signal. At the receiving end were two electro-magnetic coils which pulled 30 pole pieces into position and whether this all worked or not depended on signal strength. During the half-hour transmission period, the eager experimenters were thrilled if they got a full picture for 5 seconds at least twice! The picture fidelity was so bad, that on one occasion, having got their picture completely synced, they couldn’t decide what it was. The opinion was that it must be a row of dining-room chairs, until someone deciphered an H and an N. As transmissions went off soon after, they realised that it was "THE END".

Prototype

This prototype set was kept until the c.r.t. came in. Five years before this breakthrough, Thomas Fishlock attended a lecture at the Royal Institute, where this wonderful thing called the cathode ray tube was demonstrated. In front of the electron gun was a piece of aluminium shaped like a Maltese cross and the image of that was thrown on the end of the tube, which was a fluorescent screen. Little did they realise the import of that experiment.

Home-Made TVs

In common with many other enthusiasts, Mr Fishlock made his first TV set after the war with an ex-government radar tube, the VCR97 and a lot of BF50 valves, eventually graduating to a 9in Bush. Living in the eastern counties, the signal from London was dicey and in the winter they used to sit around a blazing open fire. Because the length of feeder was critical, the set had to stand on the sideboard, which meant that Mrs Fishlock could see it, but her husband couldn’t, so they installed a mirror for him and she read him any text that appeared (backwards to him!)

BBC Anniversary

The BBC decided to celebrate the 50th anniversary of the end of the Baird contract with a special programme and contacted the RGB for anyone who had actually used the scanning disc system. About 25 attended the Pebble Mill studios to be winched and dined by the directors of the BBC, whose archives included a scanning disc. The programme went out on Pebble Mill At One.

Veteran Viewers

Talk amongst the veteran viewers turned naturally to the problems of those early days. Mr Fishlock told of his motor-cycle power boosting but was capped by another man, who claimed to have driven his TV with a steam engine!

Embryo TV

What was this embryo TV like? What kind of reception did they have? Each hole of the receiving disc had to match the transmitting hole, otherwise they would have two halves of a picture of 1/3 + 2/3.

The picture was taken from Television the first fifty years published by the National Museum of Photography, Film and Television. It is one of a series of pre-war posters "Television is here; you can’t shut your eyes to it".
Utility News

The Ontario DX Association has published a new loose-leaf guide for aeronautical enthusiasts. Written by veteran DXer Bob Evans this is a useful reference source for the utility monitor. This book explains how you can follow conversations between aircraft en route and the various control centres around the world. Check your national legislation as utility monitoring is forbidden in some countries, in others the passing on of information gained to third parties is considered an offence. The guide is to be updated quarterly. Further details from Ontario DX Association, P. O. Box 161, Station A, Willowdale Ontario Canada M2N 5S8. Enclose return postage in the form of 2 International Reply Coupons.

Behind the Headlines

If the Home Secretary Douglas Hurd gets his way, radio in Britain will see some significant changes during the 1990s. Headlines to this effect appeared in the middle of January but many reports were confused, so let's take a close look. For a start, BBC's Radio One pop music channel will get a national chain of v.h.f. f.m. transmitters to augment the single sender that's currently on the air in the London area. Mr Hurd has announced that the two medium wave frequencies 1063 & 1089 for the Radio One pop service, and the classical music network Radio 3 on 1215kHz will be handed over to independent radio operators. The highest bidders will get themselves a national channel. It won't be run by the existing body that currently governs British commercial local radio, namely the Independent Broadcasting Authority.

In 1986 only just under half of the existing independent local commercial stations in Britain made a profit. Although figures for '87 look better, the umbrella organisation for local radio operators says it will be curious to see whether the government plans are feasible in gaining the required advertising revenue. Legal commercial radio came much later than commercial television to Britain, and as a result, the levels of creative advertising on radio are much lower in Britain compared to North America. It accounts for just 2 per cent of the total amount of money spent by industry on advertising!

In addition to the new commercial networks though, smaller town size stations on v.h.f. f.m. will be authorised. The Home Office press release quoted the Shetland Islands Broadcasting Company out on the somewhat isolated Shetland Islands as an example of commercial community radio. In fact its company secretary Ian Anderson has gone further than other community groups that have been waiting for a license. For the last two months Shetland Islands Broadcasting Company has been making daily experimental broadcasts on f.m. with 250 watts of power. There are long-term plans for a separate medium wave service on 556kHz.

Back to the mainland, and in three major population centres, BBC local radio stations have just been given a three year reprieve. BBC Radio London along with BBC WM in Birmingham and BBC Manchester have been told to look at their output to reach more of the community than at present.

Radio 4 on 198kHz

British subjects based at the European Parliament in Strasbourg raised a media question in a debate recently. Currently the long wave signal from the BBC Radio 4 network is widely heard in North-West Europe. Euro-MPs say they are concerned about plans to create a new BBC long wave service in the course of the next decade and have produced a protest petition with more than 1000 signatures. 196kHz would continue to carry material from the existing Radio 4 programming, but occasionally switch to live reports from parliament as well as English output from the BBC's External services. Euro-MP for York, Edward McMillan-Scott, says that Britains staying outside the UK want to hear an unabulated version of what's being heard within the country. The recently launched medium wave BBC Radio 648 is described as a "quirky attempt" and cannot meet their needs.

Captive Audience

Another group of listeners this time inside Britain are rather concerned at the news that some programmes will be dropped from medium wave. In some prisons in the UK, possession of v.h.f. f.m. radios are forbidden. Tune above 98MHz and you'll find out why, the police forces are still using parts of the v.h.f. broadcast band for point-to-point communication, though under an international agreement they will have to move out to other channels above 108MHz within the next couple of years.

Satellite News Desk

A growing number of stations and cable systems across Europe seem to be re-broadcasting the English and European language programmes of the BBC Externals Services. Two channels of audio from Bush House have been integrated into the subcarrier on the Superchannel Television transponder on the Eutelsat communications satellite. Those equipped with the necessary satellite dish and decoder can access the radio programmes in studio quality. The Finnish government gave official approval to a Helsinki station to relay programmes from the BBC Finnish service, Europe's largest cable system in Amsterdam recently added 24 hours of English via satellite last week, and a local station in Salonika Greece is relaying some BBC programmes in Greek. On Monday January 11 came quite a major development, at 2300UTC daily the Catholic "Radio Renascensia" network takes a satellite feed of BBC's Portuguese service and puts it out nationally on medium wave and f.m. Incidentally Renascensia's 100kW short wave transmitter is off the air at that time, so don't go looking for a new BBC relay station.

From midsummer this year the topical tapestries of external services will resume live broadcasting in English to the Caribbean. The plan calls for local relays by existing stations in the area. Finally, in the next few weeks movement is expected in the BBC's World Television Service.

Teltekt

The Dutch Teltekt's that's carried as an integral part of the two national TV channels in The Netherlands has started broadcasting two pages of news in English, page 133 now contains selected items of news taken off the air from Radio Netherlands' newscasts. Meanwhile the Dutch Minister of Culture Mr Eico Brinkman, has given the go-ahead to a new regional radio station in the province of Flevoland. A foundation has been formed by the provisional council to run the new station which hopes to commence broadcasting in the latter part of this year. The province is made up of reclaimed land pumped dry from the former Zuyderzee, now called the IJsselmeer. Because it mainly consists of
MATSUI WORLD BAND RECEIVER WITH QUARTZ ALARM CLOCK TIMER

Sensitive enough to pull in broadcasts and transmissions from every corner of the world, this feature-packed receiver offers unbeatable value to radio enthusiasts. It’s manufactured to the very highest specification, and comes complete with full user instructions.

Exclusive to Currys.

Currys are credit brokers.
large farms, the population in the province is rather low. Residents of the Flevopolder will have to pay an extra 6 US dollars on their radio-TV license fee giving the station some 1.8 million dollars a year to run the studio's f.m. transmitter. Any deficit on the initial starting costs will be met by the Minister of Culture. There has been considerable public opposition to proposals for a regional radio station in the province of North Holland though. As this province includes the city of Hilversum where the national and international Dutch networks originate, there appears to be a general feeling that this part of Holland already has enough electronic media coverage.

ANARC Board Moves

The computer bulletin board for the Association of North American Radio Clubs has moved, the new number is: 010, then 1 for North America, area code 503, followed by 534 6866. In fact ANARC has had its share of re-organisation in the last 12 months. The ANARC Newsletter was suspended in the course of last year, but now under the guidance of the Bob Horvitz, the monthly journal of radio developments has resurfaced in a much improved form. The Newsletter costs 7 dollars 50 in North America, 10 US dollars elsewhere from this new address. ANARC Publications, P.O. Box 462, Northfield Minnesota 55057 USA.

Other North American SWL Bulletin Boards

In April 1986, Larry DiGiogia, s ysop of the "Neverboard" in Pittsburgh, organised a small group of BBS's running Fido software into a network to exchange short wave-related messages and files automatically every night. This arrangement not only increased the information available on each BBS, making them more interesting for callers, but callers were able to save on their phone bills by accessing the pool of messages through the node nearest to them. From this small seed grew the FidoNet's SWL EchoConference. The basic idea remains the same, and the Neverboard is still the unofficial "hub," but so many BBS's are involved now, and the number of files and messages transferred nightly is so large, that not all participating boards store the same information. Most of the messages seem to be discussions of equipment, reports of recent DX "catches," and questions asked and answered. While there's a definite similarity to the mix of information-sharing and camaraderie one finds in radio clubs, the EchoConference has an advantage to club newsletters' consolidated lists of loggings, so useful as tuning guides, and Fido's software limits the length — thus the detail — of message texts. Here's a list of bulletin boards in the SWL EchoConference, based on information provided by Kurt Barmhart, Dennis Diaz, Larry DiGiogia and David Snyder. They do their best to keep track of who's in the net, although as proud-papa Larry points out, "Now there are simply too many boards to keep an accurate list":

In Europe dial the international access code for your country (in the UK that's 010) then 1 for North America, followed by the number listed below.

Is anyone running a short wave listener related computer bulletin board in the UK? What about our readers in Australia? There are successful boards running in Ireland and The Netherlands. Input to this column would be welcome.

SW Reception Report Record

A listener to the Voice of America in Korea should apply to the Guinness Book of Records. He wrote them a detailed reception report on their December broadcasts, rolled it up, and posted it When it got to Washington at the start of February the staff there uncurled it to find that it was beautifully written on a continuous roll of paper 20 metres long!
WHY PAY £1195 FOR A NEW NRD-525 . . .

. . . WHEN YOU ONLY NEED TO SPEND £995.00?

We cannot think of a GENUINE reason either. No boring waffle, just “realistic” prices.

The JRC NRD-525. Brand new, with 1 Year parts & labour warranty. £995.00 including delivery. Available NOW.
INTRODUCTION TO DX-TV

Part 9
Keith Hamer and Garry Smith

Predictable Behaviour

In the UK, a minimum of four television channels are available to the viewing public. The choice of channels is predictable, namely BBC1, BBC2, ITV and Channel 4 and so are the programmes, to some extent; the viewer knows what to expect on the screen. During periods of enhanced tropospheric propagation, neighbouring ITV regions may be available on normally blank channels. Under these conditions, the DX-TV enthusiast will be meticulously tuning through the channels with the antennas beaming to the Continent in search of foreign material. During a typical period of enhanced reception the Continental transmitters closest to the UK will tend to become available first. During periods of exceptional tropospheric enhancement, stations further afield will begin to appear, often co-channelling with closer transmissions. Towards the end of the opening, which may last many days, signals become much weaker, indicating that the end of the opening is approaching.

This sequence of events will become familiar and fairly routine after a while and the experienced enthusiast may be able to predict the likelihood of reception from certain stations or countries with a fair degree of certainty. Although tropospheric reception creates great excitement, it can be reasonably predictable in behaviour. Two major periods of tropospheric enhancement occurred towards the end of 1987. If this was your first successful attempt at DX reception and you were impressed, you have a treat in store this summer as soon as the Sporadic-E season gets underway.

Sporadic Behaviour

Some forms of propagation tend to be totally unpredictable and consequently produce lots of surprises. In this respect, Sporadic-E propagation perhaps rates as the most curious and unpredictable of the lot. Imagine switching on the television set not knowing whether anything will be present on the screen, let alone what the programme might consist of, or even its origin. If a signal is present, how long will the reception last and will something else take its place? From which direction will other broadcasts appear? These are just a few of the long list of uncertainties posed by Sporadic-E propagation. No wonder it generates so much interest and excitement. It also fuels a competitive spirit among many enthusiasts and it can so easily become an addiction. Many DXers agree that there is a special magic appeal with Sporadic-E reception — a quality other forms of propagation fail to provide. Every DXer has his own anecdote to tell about how, regrettably, he missed an elusive signal during a Sporadic-E opening, or how a mysterious-looking test card emerged from a snowy screen at five o’clock in the morning. Sporadic-E propagation can provide endless fun and although the season may at first seem long enough, lasting as it does between May and September, time quickly passes. It can be a thoroughly rewarding, though hectic, time. Even when the screen has been blank for hours, there is always the possibility of something unusual emerging; often it does.

Ionisation

As many readers will know, short wave radio communication is possible due to reflections within the various layers of the earth’s atmosphere, including the “E” layer. This particular region is situated at approximately 80km above the surface of the earth. Although it is capable of reflecting short wave signals, it is normally transparent to television transmissions, these subsequently being lost forever in space. However, during the summer months, ionised gas layers form within the E-layer and if the electron density is sufficiently high, TV and f.m. radio signals within Bands I and II (approximately 40-100MHz) will be reflected, or more accurately, refracted back to earth. This is basically Sporadic-E propagation, usually abbreviated to Sp-E or Es. In the USA, this form of propagation is known as E-skip.

Without realising, many members of the viewing public have experienced the effects, or rather disruptions, caused by Sporadic-E activity. The dreaded “Continental Intercurrence”, which blasted Wimbledon tennis from our screens during the sixties, was caused by foreign TV transmissions mingling with our own. The technical differences between our 405-line system and the ones in use on the Continent (discussed in detail in Part 2) meant that only a mass of sloping white lines, rather than a picture, would be apparent. In areas of the UK where Channel 2 was in use, the BBC1 sound channel would very often be drowned by a severe buzz which was caused by the vision carrier of a Continental Channel E2 transmitter on the same frequency. This is the reason why areas served by the Holme Moss transmitter in the north of England were eventually allocated BBC1 outlets operating on Channels 12 and 13 in Band III.

Reception Distances

When signals are refracted back to earth from ionised clouds formed within the E-layer, a hop or skip distance is involved. This will vary depending upon the angle of refraction, but it is typically 120km.

Fig. 1: The Swedish test card as received on Channel E2 during Sporadic-E opening on 31 July 1970. The equipment used by one of the authors comprised a modified 7pin Bush TV/66 receiver (originally 405 lines only) and a home-made dipole antenna balanced precariously above the banister rail at the top of the stairs.

Fig. 2: An example of Sporadic-E reception showing the disruption caused by several signals competing on the same channel. Although the type of test card is easy to recognise, its centre identification is impossible to read.

Fig. 3: The Swiss test card as received by a colleague from the Uetliberg transmitter on Channel E3 at 1730UTC on 19 August 1970. A chimney-mounted vertical dipole, originally used for the local BBC-1 Sutton Coldfield transmissions, captured during a heavy thunderstorm.
INTRODUCTION TO DX-TV

Generally, the shallower the angle, the greater the skip distance. Newcomers to the hobby are often amazed to learn that distant countries such as Yugoslavia, Spain, Italy and Russia are regularly received in the British Isles whereas transmissions from relatively closer countries can be extremely elusive. Consequently, Dutch or Belgian transmissions can be extremely difficult to capture via Sporadic-E propagation, unless the DXer happens to live in the extreme parts of the British Isles. However, during the 1967 Sporadic-E season, on July 10 to be precise, short-range Sporadic-E reception did take place and was witnessed by several DXers located in the Midlands. The sequence of events was as follows:

Sporadic-E reception from Central Europe had built up since early morning but shortly after 1100UTC many West German Band 1 transmitters began to show. Although this in itself is not uncommon, the more experienced enthusiasts recognised the trend for a shortening in the skip distance. Therefore, it came as no surprise when signals began to arrive from the Belgian Liege outlet on Channel E3, followed shortly by signals from the Dutch transmitter at Lopik.

The maximum distance attainable via Sporadic-E propagation is considered to be in the region of 5000km; this happens when double-hop conditions occur. It is thought that more than two hops are not possible, although Brazilian reception occurred in the Netherlands a few years ago, at a distance considerably in excess of that figure.

CAUSES

There is still plenty of research being carried out into the true cause, or causes, of Sporadic-E propagation and its behaviour. Many theories have been put forward over the years as to why intense ionisation takes place within the E-layer, resulting in the formation of Sporadic-E clouds.

One theory suggests that meteorites entering the earth’s atmosphere could be responsible. A few years ago, exploratory rockets directed through the Sp-E clouds discovered that the region consisted chiefly of ionised metal atoms. The types of metal found strongly suggested that meteorites were the most likely cause. Upon entry, the meteorites evaporate and the resulting gases become highly ionised. This phenomenon occurs between altitudes of approximately 150km to 90km depending on the velocity and the mass of the meteorite. At such altitudes, strong winds exist which create an accumulation of the ionised particles resulting in the formation of Sporadic-E clouds. By coincidence, the altitudes at which Sporadic-E clouds form corresponds with the position of the E-layer.

The formation of clouds begins at an altitude of around 150km but because there is comparatively less material from meteorites at that height, the ionisation is relatively low. However, ionisation is sometimes strong enough to reflect Band I TV signals from transmitters located at over 200km away, although it must be stressed that such reception is usually very weak. This has been observed in the past when signals have arrived from Canada, Jordan and the Canary Islands. The signals tend to resemble those usually associated with weak tropospheric propagation with a characteristic very slow fading and with usually very little ghosting present on the picture.

MOVEMENT

A downward shift of the Sporadic-E clouds is thought to result in a greater accumulation, and therefore a higher concentration, of ionised particles. This produces very strong signals from stations located within a range of 900-2000km from the receiving site (see Fig. 1), especially when the accumulation takes place at the lower altitude within the E-layer. Normally no further downward movement or increase in ionisation occurs, but on rare occasions when it does, it can result in short-range reception from transmitters sometimes located as close to the receiving site as 450km.

Sometimes the ionised clouds within the E-layer may be virtually stationary permitting sustained reception from one particular transmitter, area or direction. At other times, horizontal cloud movement takes place, frequently attaining a speed of 400km/h. (250m.p.h.). Under such conditions, a multitude of transmissions from a range of different outlets can appear within a very short space of time. Reception may commence in one particular area, southern Italy for instance, and as the opening progresses, Central European and the USSR will be received, finally culminating in Swedish and Norwegian broadcasts. Very often Icelandic reception is preceded by an opening to Scandinavia. Although low-pressure systems and thunder weather appear to play a part in promoting Sporadic-E activity, there is no definite scientific evidence to support this. From observations by TV DXers, a reduction or absence of activity is frequently experienced when extensive anticyclonic weather conditions cause periods of intense tropospheric reception. Conversely, several enthusiasts have commented that extreme fringe reception of the Dutch Lopik E5 outlet deteriorates rapidly during the onset of a Sporadic-E opening.

RANDOM ACTIVITY

Sporadic-E activity predominates during the summer months. In the Northern hemisphere, the main activity occurs between early May and mid-September. In the southern hemisphere it lasts between November and March. This

Fig. 4: Map showing the area from which Sporadic-E DX reception is most likely to occur. Most openings consist of signals from transmitters located within the boundary lines A and B. This represents a distance from the centre of the UK of approximately 900 to 2000km.
period of main activity is usually called a "season" by DX enthusiasts and the actual duration of a particular period of reception is known as an "opening", whether it be a matter of minutes or several hours. Although Sporadic-E reception peaks during the summer months, it can occur without warning at any other time of the year. Out-of-season openings are relatively few and far between compared with the summer ones and much patience and enthusiasm is required to take advantage of these. A mid-winter peak in activity is usually experienced towards the end of December, although over the past few years it has failed to materialise with any significance. However, within recent years, an upsurge in activity during October and November has produced prolonged openings as good as those experienced during the summer months.

Because of its random nature, Sporadic-E openings can occur virtually daily throughout the summer. Sometimes openings are classed as minor and insignificant with hardly any time available to identify the origin of transmission. At other times, an opening may be sustained lasting from sunrise until well after midnight. Sporadic-E reception can occur at any time of day or night, but bear in mind that very few European stations broadcast after 2300UTC. Within recent years, there has been a growing tendency for Eastern European countries to extend their programming hours until well after 2400UTC. With the introduction of early morning broadcasts in Russia (and taking the time difference of two hours into account), it is possible to log Russian signals as early as 0300-0400UTC, especially on test transmissions. A large number of private Italian TV stations broadcast identification captions throughout the night, with the sole intention of preventing other companies from stealing their channel! The Icelandic TV service radiates the colour test pattern throughout the night too, and its reception can indicate the possibility of an opening from across the Atlantic. Sometimes it pays to look for transmissions of Arabic origin shortly after sunrise. The time difference (2-3 hours) and the absence of most European transmissions before switch-on may allow a glimpse of a test card during their early morning test transmissions. There is a lot of truth in the proverb, "the early bird catches the worm".

**Trends**

Over the years experienced TV DXers tend to anticipate a particular reception trend, although this can suddenly change, of course. During some Sporadic-E seasons, openings may favour a particular area or country. In 1987, for instance, sustained openings to the south-east were very much in evidence with comparatively fewer signals from Scandinavia. In general, the reception of countries such as Russia, Italy and Spain can be considered to be common throughout any Sporadic-E season. Data collected by the authors and TV DXer Chris Howles, over specific periods (see Figs. 2 and 3), clearly shows this. The graph in Fig. 3 also shows the marked variation in the total number of readily identified countries observed on a day-to-day basis during June 1985.

The first three months of the years are traditionally dead months where Sporadic-E reception is concerned. Often the Sporadic-E season is preceded by a series of small but interestingly April openings and in the past unexpected reception from African countries has been recorded during the month of May with many inactive days present.

Certain dates and months are regarded as special by some DXers. Many ensure they are available and watch intently during those periods. June is a rewarding month and perhaps one of the best, when many long-haul signals may be logged. June 18-24 is often considered to be the period for "exotics" or unusual stations, while signals from across the Atlantic seem to favour July or early August. Generally the season begins to wind down after the middle of August with fewer openings. The decline becomes more noticeable during early September when the DXer realises, much to his horror, that the season is swiftly drawing to a close.

**Variable Results**

The behaviour of the ionisation within the E-layer is unstable making reception strength and quality continuously variable. This is a characteristic of Sporadic-E propagation. It is not

---

LANCASHIRE & THE NORTH WEST'S
uncommon to discover a solitary programme occupying a channel and remaining steady for lengthy periods. On the other hand, several stations may be competing on the same channel over a period of a few minutes. During some of the more intense openings the situation has to be seen to be believed! Many of the channels can become completely jammed solid with transmissions from almost every direction. It goes without saying that under these chaotic circumstances there is little chance of identifying anything, unless a recognisable test pattern is spotted lurking beneath the deluge of broadcasts. Signals may be reflected by more than one ionised cloud or within the cloud layer itself, creating a multi-path phenomenon with constantly changing phase distortion effects associated with typical Sporadic-E reception. These distortion effects usually cause rapid and dramatic changes in signal strength combined with severe ghosting, the degree of which varies constantly. These effects are more pronounced on the lower TV channels in Band I and often the chroma and sound channels disappear, sometimes through phase cancellation, even though the overall signal seems strong. There may also be a frequency selective element connected with Sporadic-E propagation; occasionally radio stations within the Eastern European f.m. band (63-72MHz) are noted but TV channels on lower frequencies from the same countries are not.

Polarisation changes are frequently noticed, especially on the short to medium range signals. This means that a horizontally polarised transmission can arrive as a vertical one at the receiving site.

Reception on the higher Band I channels exhibits a far superior degree of stability and in many cases it resembles tropospheric propagation with its slower fading and the relative ease at which it will support chroma and sound information. The lower Band I channels of E2 and R1 tend to become more readily active and it is a good idea to concentrate on these for initial signs of DX reception. Not all channels will necessarily become active during an opening. This may give the impression that the opening is selective in frequency. It may be, but not all TV services make use of every Band I channel available.

Antennas for Sporadic-E Reception

Although we intend to cover this subject in greater detail in a forthcoming article, it is important for the newcomer to realise that the strength of signals propagated by Sporadic-E ionisation often attain extremely high levels. As a consequence simple antennas can be pressed into service, especially for initial experimentation. The use of an indoor dipole antenna is not unheard of. A dipole cut to approximately 1.3m per element is quite sufficient to begin with. As with satellite reception, height is not of great importance with Sporadic-E propagation because signals arrive at an angle. However, enthusiasts should aim for a minimum antenna height of around 5m in order to avoid problems with local obstructions. It is advisable to mount the antenna horizontally since most European stations favour this form of polarisation. Some means of rotating the antenna is recommended to enable optimum signal pick-up from different directions.

Sporadic-E Shopping List

The following will be necessary in order to sample the joys of Sporadic-E propagation:
(1) A television set capable of receiving v.h.f. TV channels on 625 lines. Alternatively, a special purpose-built TV DX converter such as the D-100 can be used. This plugs into the antenna socket of a standard u.h.f. television receiver.
(2) Some form of Band I antenna - a simple home-made dipole with both elements cut to 1.3m can be used for initial experimentation.
(3) Patience and a sense of adventure!

The D-100 DXT Converter System, antenna hardware and various publications covering the hobby may be obtained from: HS Publications, 7 Epping Close, Derby DE3 5HR. An 18p stamp for 1 IRC for overseas readers should accompany all enquiries.
SHORT WAVE WEATHER

Dave Miers

Anybody who has spent time idly flicking round the dial will have come across various meteorological transmissions. To the initiated these are just strings of meaningless figures, but are in fact the General Aviation Visual Flight Forecast Service (GAVFFS), also known as VOLMET — provided by the National Air Traffic Service.

The official “phonetic” numbers are used — “foxtrot” for five, “zulu” for four and “ninhydrin” for nine. Having listened through several complete broadcasts, it should be possible to sort it all out.

The first item is the name of the place and the time of the forecast — usually in Zulu (Greenwich Mean) Time. Most forecasts are updated every two hours, so listening to two successive reports can give an idea of which way the weather is moving, and how fast.

Next comes the wind direction and speed in degrees and knots. “Tree six zero degrees, lower side knots” (written as 360/45) would thus be a northerly, gale force wind. Following on is the visibility at ground level (in kilometres), which can usually be ignored.

Cloud

Of most interest to the listener is the cloud, which comes next. This is often abbreviated to “CAVOK”, pronounced kav-oh-kay, which means that there is too little cloud to worry about. Otherwise the readings are given in octas and feet, usually at two or three levels. Thus “six oktas, one hundred feet, eight okta lower thousand feet” would be an unusually thick, low cloud cover.

After the air temperature and dew point (temperature at which fog will form — given in celsius) comes the final piece of useful information: the QNH or barometric pressure. This is usually given in millibars, but in the USA it is given in inches of mercury. A usual reading will be between 990 (low) and 1100 (high). By joining together points of equal pressure on a map, it is possible to examine the resulting isobars and get an idea of where the cold and warm fronts are.

Having taken all this down, you should have an accurate weather report looking something like this:

<table>
<thead>
<tr>
<th>Place/time</th>
<th>Wind</th>
<th>Visibility</th>
<th>Cloud</th>
<th>Temp</th>
<th>QNH</th>
</tr>
</thead>
<tbody>
<tr>
<td>BELFAST 0900Z</td>
<td>220/15</td>
<td>10&gt;</td>
<td>CAVOK</td>
<td>11/9</td>
<td>1002</td>
</tr>
<tr>
<td>BENSON 0900Z</td>
<td>225/16</td>
<td></td>
<td></td>
<td>10/9</td>
<td>1012</td>
</tr>
</tbody>
</table>

There are four other terms that may be encountered:

- TEMPO Temporarily
- GRADU Gradually
- INTER Intermittently
- RAPID Rapidly

Thus, the forecast for the cloudbase may be “eight okta, five thousand feet, GRADU tree thousand feet...”, showing that the cloud is expected to descend slowly before the next update.

The RAF strike command has added some Weather State Colour Codes, in order to abbreviate the information:

<table>
<thead>
<tr>
<th>Colour</th>
<th>Cloud Base</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blue</td>
<td>2500 feet</td>
</tr>
<tr>
<td>White</td>
<td>1500 feet</td>
</tr>
<tr>
<td>Green</td>
<td>700 feet</td>
</tr>
<tr>
<td>Yellow</td>
<td>300 feet</td>
</tr>
<tr>
<td>Amber</td>
<td>200 feet</td>
</tr>
<tr>
<td>Red</td>
<td>Below 200 feet</td>
</tr>
<tr>
<td>Black</td>
<td>No Report</td>
</tr>
</tbody>
</table>

Weather forecasting is always a tricky business, but given up-to-date information it is nearly always possible to forecast 24 hours in advance, even knowing little more than “the weather comes from the West”. A little experience can produce longer range forecasts, especially if worldwide information is used. Whatever the case, those “meaningless” numbers are there to be used.

They are of course meant for pilots, but anybody can use them to prepare their own weather maps, which can be in very useful for checking radio reception conditions.

In the UK, there are three main services — all on h.f./s.s.b. Which to choose depends on the areas covered. The Royal Air Force Transmissions covers the main military bases in Britain and West Germany. These are:

<table>
<thead>
<tr>
<th>Place</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Belfast</td>
<td>Leuchars</td>
</tr>
<tr>
<td>Birtmood</td>
<td>Lossiemouth</td>
</tr>
<tr>
<td>Brize Norton</td>
<td>Lyneham</td>
</tr>
<tr>
<td>Coningsby</td>
<td>Manston</td>
</tr>
<tr>
<td>Finningly</td>
<td>Marham</td>
</tr>
<tr>
<td>Honington</td>
<td>Northolt</td>
</tr>
<tr>
<td>Kinloss</td>
<td>Odiham</td>
</tr>
<tr>
<td>Leeing</td>
<td>Prestwick</td>
</tr>
</tbody>
</table>

Transmissions are continuous on 4.722 and 11.200 MHz, and are usually easiest to pick up. A more widespread service, covering most of Europe is available as follows:

- Daytime: 13.264 MHz
- Nighttime: 3.413 MHz

This is known as Shannon Volmet, and is only available for five minutes on the hour and half hour. Reports are received from the following places:

- Amsterdam: Goteburg Delo
- Athens: Hamburg Paris
- Barcelona: Helsinki Prestwick
- Brussels: London Rome
- Copenhagen: Lyon Shannon
- Cologne: Madrid Santa Maria
- Dublin: Manchester Stockholm
- Dusseldorf: Milan Turin
- Frankfurt: Munich Zurch
- Geneva

This can be very useful for obtaining a general picture of the weather, but is only updated every three hours. Of the other services, the best is probably the RAF Strike Command. This covers about half the locations of the normal RAF service, but is available on more frequencies. These are:

- Continuous: 4.742, 5.729, 6.736, 9.032, 11.204, 11.244, 18.018 and 23.200 MHz
- Daytime only: 13.257 and 15.031 MHz

In addition to these there are three v.h.f. frequencies, but of course reception is very localised. Thus London VOLMET can be heard on 126.6, 126.8 and 135.375 MHz. Further afield, it is possible to pick up forecasts from worldwide. For example, the New York VOLMET can be heard on 3.485, 6.604 and 13.270 MHz.

Whichever service is chosen, the format of the information is very much the same. It is a good idea to make up a form with the place names, to be filled in as the information is read out. The intonation can take a little getting used to, especially as

Short Wave Magazine May 1988
THE HAMGEAR PMX PRESELECTOR

The PMX is an antenna tuning unit combined with an RF amplifier, covering from 1.7 to 34 MHz. The ATU section will match into your receiver all those odd lengths of wire whether indoors or out, making the most effective use of the antenna. The amplifier section takes the ATU signal and boosts it to the amount necessary to give you a better readable signal. Some receivers, normally used with no ATU and the odd wire ant, are literally transformed by the PMX; with others the improvement is more subtle but still quite definite. All in all the net result is better copy of the DX.

The PMX is an investment in better reception; you may eventually change your receiver, but you will always keep your PMX.

Some outstanding results have been reported by customers and some of our early units are still in use after 24 years.

There are four pages of free information available on the PMX, one devoted to 8 unusual antenna experiments using the PMX, non-technical and well illustrated. The PMX can be supplied unpowered (you provide 12v DC) or mains powered.

Unpowered PMX

Mains powered PMX

Mains powered PMX with calibrator

All prices include postage and packing. Despatch normally same day first class.

SONY ICF-SW1 RECEIVER

John Waite

Introduction
The ICF-SW15 system represents a new direction for portable short wave listening, featuring not only a very capable receiver but a set of matching accessories to allow operation in a variety of situations.
The first problem encountered after opening the black plastics carrying case is finding the receiver! It is just one of five items neatly stored in the very sturdy case, the active antenna supplied is larger than the receiver. There is even a separate soft carrying case to protect the receiver. The other accessories are an active antenna, an antenna controller, an attenuator, a pair of minute stereo ear phones and a 3V mains power pack. The compact mains power unit takes any mains voltage from 100 to 240V, 50 or 60Hz without any need for adjustment. The receiver and all its accessories are the same colour making the entire outfit very visually appealing.

Stored in a specially designed pocket in the lid of the case is the operating manual and a booklet called Wave Handbook. The operating manual is written in four different languages, English, French and Spanish at the front and Arabic (I think) written from the back.

The quality of this operating manual is up to Sony's usual high standard with very clear diagrams illustrating most of the operations. There is also a particularly good "trouble-shooting" guide to help out if the receiver is not behaving as you would expect. This can be useful for saving an embarrassing trip back to the dealer when things don't quite work out. To augment the basic operating instructions there are hints and tips about the various facets of operating at the bottom of each page.

The Wave Handbook is helpful guide giving the transmission times, frequencies and target areas of many major broadcasting stations. It is laid out as easy-to-read bar charts and provides a very quick reference source.

A few points I have not mentioned yet is that the ICF-SW15 will receive f.m. stereo broadcasts, it has a clock, an alarm, a sleep timer and a timer to switch on when your favourite programme is on as well. Not bad for something that will fit inside a large matchbox! Oh yes, it also has ten memories and scans!

Accessories
Let's talk about the front end first, i.e. the various antenna options available. When using the receiver on its own the 520mm telescopic antenna will rotate and swivel in just about any direction for best results.
The telescopic antenna is only used when receiving on the short wave bands or v.h.f. f.m. The long and medium wave bands are received using a built-in ferrite rod antenna.
The active antenna system comprises two parts, the antenna controller and the antenna module. The controller plugs into the tape socket on the left hand side of the radio and engages with the retracted telescopic antenna via a recessed pin. You don't lose the tape facility as it is extended and appears on the edge of the antenna controller itself.

Incidentally, the tape socket provides a means of recording interesting stations but only in mono. The output, 0.775mV, should be adequate to feed the DIN input of a standard tape recorder.

The active antenna has a 1.17m telescopic whip, again that will swivel and rotate, and a 3.65m connecting cable. With this length of cable you should be able to place the antenna at a window, using the cord and suction cup supplied, to provide best results. The antenna module has been very well thought out in that the cable is stored on an internal drum allowing rapid deployment and storage. In addition to storing the cable, the antenna module houses four AA size cells which power the active antenna system.

Operation of the active antenna system is achieved using three slider switches on the antenna controller. The three switches are: power on/off, band switching and an 20dB attenuator. This attenuator was particularly useful for reducing distortion caused by very strong signals. This all sounds very complicated, but it is far more difficult to describe than operate!

If you have never seen Sony's "Twin Turbo Ear Phones" then you are in for a surprise - they defy description. The are supplied in an "almost round" 70mm diameter case some 15mm deep. They all use the principle of storing the cable on a drum. The whole set looks more like a ladies compact than a stereo headphone case! Each ear phone (marked L and R) is 18mm in diameter and has a removable foam cover - presumably so you don't get cold ears! Surprisingly the sound from these phones is very good, they are also very comfortable and you hear very little of the noise going on around you when wearing them. The people sat around you can't hear what you are listening to either.

Frequency Selection
For something so small, the ICF-SW15 was extremely easy to operate - without having to study the manual in detail first. I was able to immediately select frequencies and tune around with very little experimentation, which is great credit to the ergonomic design of the set.

There are two basic methods of frequency selection, direct entry by inputting the frequency of the station using the keypad and manual tuning using the + and - buttons. The only drawback with this radio that I found was there is no means of fine tuning. The tuning steps are defined according to the band in use, e.g. 5kHz on s.w. and 9 or 10kHz (switchable) on m.w., etc. Quite where they would have fitted fine tuning I'm not sure, but it only proved a problem for me where the stations refuse to stick to the recognised frequency spacing.

The other two methods of specialised frequency selection are the 10 memories and the scan function. The memories are very easy to program and recall is by just pressing the required memory number. If, when you are listening around the bands, you find a frequency you want to put in the memory you press the required memory number whilst holding down the ENTER key.

Short Wave Magazine May 1998 21
Scanning is equally as easy, you choose a start frequency and press the SCAN button and away the receiver goes. It pauses briefly (1.5s) when it finds a signal, just about long enough for you to decide whether you want to stop or not. To stop the scan you depress the SCAN button a second time.

Direct entry of frequencies is not immediately obvious, but it didn't take many seconds to find out what you do. You select the mode (a.m. or f.m.) then enter the frequency of your choosing, then press the MODE button a second time. If you try and enter a frequency that doesn't align with the channel spacing on that band, then the ICF-SW1S automatically jumps to the nearest correct frequency. If you try and enter a frequency outside the range of the ICF-SW1S then a little message appears flashing on the display: "TRY AGAIN?". Very user friendly. Once you have chosen your station, you can move up and down the band using the + and - buttons if you wish.

There is a KEY PROTECT button too, so very useful if you have clumsy hands with such a small receiver. There is nothing more irritating than to be enjoying a broadcast and find that by moving your hand you have shot off up the band.

**In Use**

The ICF-SW1S was great fun to use over the three weeks or so I had it for review. One of the biggest surprises was how well it worked, the audio quality was remarkable for something of that size.

I spent quite a few evenings using the ICF-SW1S whilst sat downstairs in the house with the active antenna propped up on the sofa. Here are a few examples of the stations heard:

- RC 1 in Sackville Canada
- BBC on Ascension Island
- Africa No. 1 in the Gabon
- WYFR in the USA
- HCJB in Ecuador
- WCSSN in the USA
- Radio Budapest in Hungary

All these stations were in the region of 15 and 22MHz. There is a very useful switch on the ICF-SW1S which helps with the clarity of the signals when DX listening. This is the NEWS/MUSIC switch, it is in effect a simple treble cut tone interference, mainly the dreadful hiss and squelches from adjacent stations, on the wanted signal.

I also listened to the various local radio stations, both ILR and BBC, all in good quality stereo. Obviously to get the stereo reception it was necessary to use the twin ear pieces. The stereo headphone socket is a standard 3.5mm stereo jack which can drive 18Ω headphones.

I think that the ICF-SW1S would be quite useful for the traveller or holiday maker with its sturdy plastics carrying case. It should certainly stand up to the rigors of travel well. Unfortunately I couldn't organise a trip anywhere exciting in the three weeks the Sony was here!

If you like dropping off to sleep whilst listening to DX stations around the world then it's quite easy to do with the ICF-SW1S. The SLEEP button provides 65 minutes of use (non-adjustable) before the set closes down. There is even a little stand attached to the carrying strap so you can see the display easily. If you are in the habit of DXing in the dark then the light on the radio will be useful. It was one of the best back-lit displays I have seen for a long while, not just a tiny bulb at one end, you could read the whole display easily.

The ICF-SW1S will wake you up the next morning too if you want, the radio can be turned on automatically at any time you pre-select.

All in all I found the ICF-SW1S an enjoyable set to use and was sorry to see it WINGS its way back to Sony. The set costs around £250 from any Sony outlet. Many thanks to them for the loan of such an extraordinary radio.

**AUDI FILTERS**

**MODELS FL2, FL3, FL2/A**

Model FL2 incorporates the latest in audio filters for SSB and CW. Construction is very simple with the switchable gates available at a selection better than a whole bank of expensive crystal filters. In addition, it contains an automatic filter which can remove a “funny” filter signal if the loop can still be filtered at the receiving end. A selected filter is available in either a stand-alone audio filter unit. Decaying filters frequently allow continuous copy when otherwise SSB would have to be abandoned.

---

**ACTIVE RECEIVING ANTENNAS**

Decaying filters are ideal for modern broadcast communications receivers – especially where spot a high sensitivity (comparable to full-size displays).

- Broadband coverage of 500 kHz to 20 kHz

- Needs no tuning, matching or other adjustments

- Two versions: FL2/70 for inner mounting or FL2/70/20/40/370

- Very compact, only 5 mm over all

- No expensive transformers

- Both include mains power leads

---

**MORSE TUTOR**

The unique training methods of improved and maintaining Morse Code proficiency. Effective, proven by consistent record of users working at their own convenience.

- Practice anywhere, anytime

- Can be used with any Morse code

- Includes practice characters

- Features: long-life battery operation, compact size, built-in loudspeaker plus personal service

NEW! 2M and 6M CONVERTER KITS

If you have a receiver that covers the 20M amateur band, you can use it to monitor the 2 and 6 Meter bands by adding the new HOWES CV220 and CV620 frequency converter kits to your station. Suitable for use with our popular DCRx200 receiver, these new converters can also be used with any general coverage communications receiver (no modifications to the receiver are involved, they simply connect externally to the antenna socket).

An excellent constructional project could combine these two new kits, together with one of our DCRx200 SSB/CW receiver kits. This will give a great little monitor receiver covering three of the DX chasers most favoured bands. A really cost effective way of enjoying the “weak signal mode” DX on 2 and 6 meters, together with the most popular HF DX band.

CV220 or CV620 kit: £17.50 Assembled PCB module: £23.90

HOWES FINISHED EQUIPMENT RANGE

HC266 2M to 6M transverter. 10W RF output with ALC, VSWR protection and very low harmonics. Case specially manufactured to high standards by computer controlled machine tools. 1 to 5W drive level standard, 5 to 10W drive available as a no cost option. Operators handbook includes block and schematic diagrams. HC246 4M output version may be available by the time you read this. Price including post and VAT: £179.90, normally available off the shelf from us, and from selected retailers.

Howes Kit Range includes: KIT Assembled PCB
DCRx200, DCRx40, DCRx80, DCRx160 SSB/CW Receivers
£15.30 £20.90

CMX40, CMX80 GRP CW Transmitters for 40 and 80M
£13.40 £19.40

CVF20, CVF40, CVF80 VFOs for above transmitters
£9.90 £15.90

HC225, HC270 2M to HF transverters, 10W output
£52.50 £63.50

CE4A Dual bandpass SSB/CW filter for DCRx
£9.90 £15.90

ASL5 Dual bandpass filter for “black boxes”
£14.90 £22.50

TRF3 Shortwave Broadcast receiver
£14.50 £19.90

CT500 HF bands ATU for receiving or 30W TX
£24.90 £29.90

SWS30 SFR/Relative power indicator, 150 to 2M
£11.90 £16.50

CM2 Quality microphone with VOGAD
£12.20 £15.20

AP3 Automatic Speech Processor
£15.90 £22.80

EST3 Sine-wave side-tone practice oscillator
£8.50 £12.90

XM1 Crystal Calibrator with 8 marker intervals
£16.80 £21.90

All HOWES kits include a high quality glass-fibre PCB with screen printed parts locations, full instructions and all board mounted components. Tuning capacitors to suit our receivers and VFOs (except 160M) are available at £1.50 extra (DCRx needs two, TRF3 and CVF need one).

A copy of our free catalogue and information sheets on any products you are interested in available for an SAE.

Please add 90p P&P for kit orders.

UK delivery is normally within 7 days.

HELPING TO BUILD YOUR STATION

Photo Audiosc. Ltd.

58 High Street, Newport Pagnell, Bucks. MK16 8AQ.

Royal Blue

Photo Audiosc has pleasure in presenting the ROYAL BLUE — a Small Walser Folded dipole antenna that covers 2-30MHz. Its neat and compact design (just 6' tall) makes it ideal for unobtrusive outdoor or indoor use. It will work quite happily on your roof or roof top in the corner of your shack. It is a truly versatile antenna that will pull in the DX and which works exceptionally well with modern receivers such as the Yaesu FR8800/5000. Icon R71, TR2000 and so on.

To buy this superb new antenna, just send us £25, plus £3 for postage and packing and we will rush one to you.

NOW IN STOCK!

NEW KENWOOD R2-1 wideband AM/FM receiver 500kHz-950MHz. Ultra compact size, size of a car radio! FM stereo broadcast and multichannel TV sound. Price: £455.00.

Send a stamped addressed envelope for details.

SCANNING

Alan Gardener

This month's column has a distinctly Scottish flavour, with several letters from north of the Border. A variety of modifications to popular scanners are described and some of the mysteries of outside broadcast radio microphones are unveiled.

![Additional diodes](image)

Fig. 1

memories to each existing bank. If you want to increase the scanning speed add a diode in the space next to D515. Reassemble the unit and switch on. You should now have a super-tuned PRO2004. So you can start breathing again.

You may well ask what do the other missing diodes do? Well D513 inhibits the 855-870MHz range for the American market, D512 inhibits the default 30kHz channel spacing found on this range, D514 in conjunction with D514 sets the scanning/search speeds, and finally D511 — well the use of this one is not clear but it may well be to permit some form of factory testing on the unit, perhaps someone out there knows?

Fig. 2

Bill has also produced some artwork which can be used to relabel the front panel of the receiver, Fig. 2. His suggested method is to take the drawing along to a friendly High Street photocopy shop and to get it produced the same size on coloured paper. Cover the copy with self-adhesive, matt film, cut to size and finally place over the existing part of the front panel by spraying the back of the copy with an adhesive such as 3M “Spraymount”. This permits removal at any time without damage to the original panel. Jim has been kind enough to produce a few examples in various colours, so if any of you would like one, just send an s.a.e. to me. Please state the colour you would like, and providing there are still some left I will try and oblige. My thanks to Bill for all his effort.

Icom R-7000

As we seem to be on the subject of memories and modifications how about another 100 memories for the Icom R-7000? This one is just as cheap as the last but it does require the skill of a brain surgeon! Scalpels ready — away we go. Disconnect the power and remove the top and bottom covers of the receiver. A piece of Oleng Film over the point of your screwdriver will help prevent marking the matt black screws.

Turn the receiver upside down and remove the large metal plate covering the main microprocessor control board. Locate IC8, and partially remove the board in order to gain access to the underside of the i.c. Rest the board on some bunched up cloth to give support and prevent the memory back up capacitor from shorting to earth. Locate the p.c.b. track connecting pins 19 and 20 (Fig. 3).

Using your scalpel cut away part of the track so that pin 19 is left isolated — you will have to reconnect part of the existing

![Fig. 3](image)
track with an insulated wire link in order to be able to achieve this. Now connect a miniature 47kΩ resistor between pin 19 and pin 24 to act as a “pull-up” resistor. Run an insulated wire link from pin 19 to a convenient miniature switch and connect the other end to the earth rail or chassis of the receiver. I used the front panel noise blanker switch by disconnecting the lead which normally feeds it, and reconnecting it to the chassis. This leaves the noise blanker permanently on, but I have never found this to be a disadvantage. I suspect that the manufacturers only include this facility so that you can check if the noise blanker actually works! The pin on the switch that is now left free is connected to IC8 pin 19.

Reassemble the receiver in reverse order, power up and check to see if the modification works. After you operate the switch you will have to use a function which accesses one of the memories in order to “read” the new information. This gives you a second bank of 99 memories, a new priority memory and a new set of upper and lower search limits.

The modification originated, I believe, from IC20, UK, so if you bought your R7000 from them and would like to know a few more modifications, why not ask for a copy of their Modification Sheets. Whilst you are talking to them about how about buying a copy of the R-7000 Service Manual? At around £10 it will prove invaluable, if like me you enjoy experimenting with the receiver.

**UHF Aircraft Band Converters**

You may remember that in the March issue I asked for information regarding the availability of the Samatron U-Verter on behalf of reader A. Sheldon. I have received several interesting letters on the subject, and I will be passing these on as requested. Anne Reed of Cheltenham comments on the converter from a user’s point of view. She felt that the need to use a conversion chart in order to work out the received frequency was too complicated for general listening, and that the sensitivity was not as good as could be expected from a dedicated receiver. Anne is something of an airband fanatic and says that the new Signal RS05 is “The Best”. Being a dedicated airband receiver, it’s much faster at scanning than her other favourite, the AR2002. M. Hames of Walsall has supplied me with the new name and address of Aero Hobby Supplies, who were the original distributors of the converter. They are now The Aviation Hobby Centre, 1st Floor, Terminal Building, Birmingham International Airport, Birmingham B26 3JQ. Tel: 021-742 0424. I hope that helps those of you who were trying to track them down. Mr Hames and another reader Leslie Milton of Nottingham have both offered second-hand converters for sale so it looks as if the story has a happy ending.

**Radio Microphones**

Nigel Compton of Wantage asks about frequencies used for outside broadcasts. He asks this question after tuning across what sounded like a very high-level, business discussion just outside the 50MHz amateur band UK allocation, at around 54MHz. After a short time he realised that he was in fact listening to a radio microphone being used in the production of a television programme, and he wondered if this was a general allocation. Well Nigel, the recent removal of TV Bands I and III has left many TV companies with a problem as many of them, particularly the BBC, have used spare channels in these bands in the past for services connected with programme production. As the use of these bands gradually changes away from broadcasting to other services the TV companies are having to find new allocations, particularly as many of the pirate radio stations are now using what were old TV allocations for studio to transmitter links. One method is to use the improved technology found in modern radio microphones and to put them on spare channels in the u.h.f. TV Bands IV and V. The main problem with all radio microphones is the poor range obtainable, due to constraints in both the size and life of batteries. Most output powers are in the region of only a few milliwatts. In order to overcome this problem many companies use the technique of a “repeater” back-pack, and this is what I suspect Nigel heard.

The actual radio microphone was more than likely operating around 175MHz and this would be received a few yards away by an engineer carrying a set of equipment mounted on a haversack type frame. This would then be re-transmitted at a higher power level, say about five watts at around 50MHz, back to the outside broadcast vehicle. The received signal would be transmitted on yet another frequency, say around 70MHz back to the engineer acting as the “repeater” in order for him to be able to check the quality of the signal received back at the outside broadcast vehicle. The director may also feed instructions to the engineer over this link or he may use yet another channel at say around 140MHz, so he can give instructions to all the other staff who may be at remote points. Other links are employed in the p.m.r. bands, and sometimes, when required, in the v.h.f. marine and aircraft bands.

If you are interested in reading more about the use of radio communications in programme making then try and get hold of a copy of the Department of Trade and Industry publication Study of the requirements for a radio frequency plan for radio services ancillary to the making of programmes, films, presentations, advertisements and other entertainment and sporting purposes, available free from the Radio Communications Division Library, Waterloo Bridge House, Waterloo Road, London SE1 8UA. Tel: 01-215 2352. With a title like that it might be a good idea to telephone during the Cheap Rate period! The publication gives examples of many different types of outside broadcasts and the bands of frequencies involved. For example during the 1984 Round Britain Powerboat Race more than 44 different communication channels were in use, and a detailed chart of communications paths is provided. An interesting section on the requirements of radio microphones is also included. I would be glad to hear of any other publications dealing with subjects such as this, so if you know of any drop me a line to the usual address PO Box 1000, Eastleigh, Hants S05 5HB.

Until next month — good listening.

---

**Rebro RS3000**

Garex Electronics have just sent me information on the latest addition to their range of scanning receivers, which unfortunately arrived just a little too late to be included in last month’s column. The RS3000 covers the bands 26-32MHz, 60-90MHz, 118-180MHz and 380-512MHz. It has 50 memories which are accessible in blocks of 10 and which can hold the type of modulation, a.m. or n.b.f.m. as well as the frequency. Priority and lockout functions are provided, with selectable search step sizes of 5, 12.5 and 25kHz. Sensitivity is good at around 0.5μV on v.h.f. and 0.8μV on u.h.f. for 12dB SINAD. The unit is ideal for mobile use requiring 12V d.c. at around 0.6A, and being small at around 150mm wide, 50mm high and 200mm deep. The price — good at around £199. Contact Garex Electronics, 7 Norvic Road, Marsworth, Tring, Herts HP23 4LS. Tel: (0296) 666684 for further details.

Holidays are generally a time to escape from the rat race, and the realities and pressures of every day life, a time to relax and forget about the cares of the world. No telephones ringing, no fuel bills coming through the letter box, no newspapers to bring gloom and dispensancy into your life.

But travelling abroad can mean that you become rather cut-off from life at home: it's all very well searching for a copy of the previous day's "Express" or "Telegraph", and paying a suitably inflated price for the privilege of reading old news, but how can you find out about what's really happening in the world. After all, it might be important to have the latest news — is there an air traffic controller's strike at home, or somewhere "en route"? Are the cross-channel ferries running? Is sterling plunging against major currencies, threatening to leave you short of holiday spending power? Perhaps you would like to know the football results, to see if you have won on the Pools? Or what is at Number One in the hit parade?

Information is becoming considerably more important to an increasing number of people, and whether one is travelling near or far, is it really possible to know what is happening both back at home, and around the world, without the need to read or understand Spanish, or Greek, or Portuguese, or Arabic, or Italian, or any one of the dozens of other languages spoken in holiday destinations around the world.

In touch with home

To keep up-to-date with news from home, and abreast of events in the rest of the world, listen to programmes from BBC World Service, on the air around the clock on short wave, and in some parts of the world, on medium wave as well.

Programmes come from the central London studios in Bush House, and include international and British news, analysis, music — from the classics through to the Top Twenty, drama and more. On Saturday afternoons, Paddy Feeny's "Sportsworld" provides comprehensive coverage of major UK sporting events, with full classified results together with commentaries and analysis of results from Britain and worldwide. Daily "Sports Roundup" offers all the news from Britain and around the world. Pop music fans are kept up-to-date with the latest charts in "Multitrack", and classical music lovers are not neglected with the weekly programme "Classical Record Review".

Some regular programmes from the BBC World Service are shown on page Four.

World Service Frequencies

Broadcasts from Bush House are carried on numerous short wave frequencies, beam'd to different parts of the world, and on medium wave and f.m. to certain areas, so whether you are travelling in Europe, Asia or the Caribbean, it is easy to stay in touch with home.

Our frequency chart gives details of which frequency is used at which time to which area.

BBC World Service has to cope with broadcasting to all of the world's time zones, and therefore inevitably programmes are repeated for the benefit of listeners around the world. This means that if you tune in at breakfast-time, and then listen later in the day, you may well hear a feature repeated. This is the time, perhaps, to look elsewhere for English language programmes!

English in Europe

For a continent where several tens of languages are spoken, it is perhaps not too well known that, if you know where to look on a radio dial, it is possible to hear English language programmes, some of them from unusual sources. Of course, BBC programmes are readily available, but there are many other radio stations which carry some English news and information, including programmes designed especially for tourist. Details of the main English language services are shown in the table at the bottom of page Four.

Times of all the programmes listed are given in GMT/UTC for mainland Europe, add two hours for local time until the end of September.

In the popular holiday areas of the Spanish coastal resorts, and the French Riviera, you will find several local f.m. radio stations which carry programmes in English for tourists and expatriates. These stations are liable to change frequencies without notice, so we have not included comprehensive information in this table.

What Radio do I Need?

It is no good lugging a full-blown communications receiver on holiday with you — apart from the weight, size and power problems, imagine the trouble which could be encountered at customs! For travelling, a small, compact receiver is really all that you will need, and if you do not already have such a set, perhaps now is a good time to consider investing in one. There is a great deal of choice in the market place at present, with receivers ranging from around £40 through to almost £200 for more sophisticated models. Most low-priced sets will be quite good enough for holiday listening, but the

This map shows the daytime coverage of BBC648. It also indicates some of the stations with English language programming.
### Current Affairs
- **World News**: Bulletins on the hour.
- **News about Britain Newswatch**: Half-an-hour of world news & despatches from UK & overseas correspondents. Analysis of the day's main news stories. Correspondents report from all over the world.
- **Twenty-four Hours**: People, events & opinions, plus the latest UK news, sport and weather.
- **Radio Newsfeed**: People, events & opinions, plus the latest UK news, sport and weather.

### Points to Look for
- When travelling, small is generally beautiful! Some of the radios which might be suitable include:
  - Panasonic RF-810 or RF-20
  - Realistic DX-360
  - Panasonic RF-840 or RF-860
  - Sony ICF-4900
  - Sony ICF-7600DA
  - Sony ICF-SW1

- **Radio News**
  - Reporting on new receivers, equipment & developments in international radio.
  - 0000, 0200-0800, 1100, 1300, 1600, 1700 (not Sat), 1800, 2000, 2200, 2300, 0900, 0309, 1109, 0400, 0600 and 1800
  - 0509, 0709, 1309, 2009, 0015, 1200, 1500 & 0215 South Asia
  - 2230 Mon-Fri
  - Repeated 0450 Tue-Sat
  - 0930 Mon-Sat
  - 1939 Mon-Fri
  - 1400 & 1900 Mon-Fri
  - 0100 Tue-Sat

- **Radio News**
  - Reporting on new receivers, equipment & developments in international radio.
  - 1830 & 2330 Mon, Wed & Fri 1215 Tue, Thurs & Sat
  - 0330 Tue, 0830 Thu, 1330 Fri
  - 1015 & 1901 Sun, 0815 Wed, 0430 Sun, 0630 & 1715 Sun, 1030 Fri
  - 1130 Tue & Thurs repeated 1715 Tue & Thurs, 0230 Wed & Fri

</table>
I can give no answer to that question, except perhaps to say that if you want to get something out of a pastime, even life itself, one must be prepared to put something into it!

One thing is certain: we do not do it for the money which some of us may be rewarded with, barely covering our expenses of postage and stationery.

An s.w.l. from the mid-20s, I found it difficult to settle down to the hobby after the Second World War ended, having served in the army for nearly six years. Single side-band operation had come in, my old short wave receivers had been battery operated and I had lost the patience to rebuild them.

**Back to SWLing**

I renewed my acquaintance with the short waves about 25 years ago, but found the hobby lacked any real purpose.

So I decided to study reception by concentrating on certain areas of the continents or regions: North America, South Africa, and so on.

I had, of course, heard Radio Australia during the morning transmissions, and coming across the Waitzing Matilda tune one afternoon — until then I had forgotten that in the 1930s WK2ME could be heard on 31 metres. I decided to learn more about reception from Australia, eventually becoming an official monitor to its technical branch.

**The UK Summer**

During the UK summer months I switch on the receiver — an old Eddystone 940, often referred to as the “old faithful” — at 0400UTC for my first check of the day; 11.910MHz which opens at that time. Three other transmissions are also checked at that time: 17.715, 17.750, and 15.240MHz.

Each of these transmissions is checked every quarter of an hour, give or take a couple of minutes. At 0700UTC 9.656kHz opens up with a transmission which comes to the UK across two oceans, the Pacific and the Atlantic.

For UK s.w.l.s Radio Australia has one major advantage over the rest (most of anyway) of the world; its transmissions can be heard mainly over two routes; the short route (across Southern Asia to Europe) and the long passage (across the Pacific and Atlantic Oceans).

As one transmission goes off the air so another may well open up, including one or two off-beam receptions which are also checked, like the others, on a daily basis every quarter of an hour.

My morning listening session ends around 1030UTC, having covered up to ten transmissions. In the afternoon I switch-on again at 1530UTC during the summer (as early as 1230UTC in our winter-time) in order to check confining any reports to transmissions directed to each other's area.

**The Other Hand**

On the other hand, the specialist amateur monitor can, as I do, devote himself (or herself) to a wider range of transmissions, becoming experts in doing so on the area of their choice.

Although the average listener’s report may be of great interest to the station staffs who are responsible for programming and choosing target areas, at the same time such reports may be of little or no use to the station’s technical department.

Most of the major broadcast stations have computers and, with them, memory banks for the storage of reception data and other information. Invariably the monitor’s report will therefore have to be compatible with the computer’s memory banks.

**The SIO Code**

I use the SIO code with a maximum of 4, the lowest 2, and a zero for when there is no reception. Interference is usually recorded by using various letters (such as J for jamming), and my report has to be kept strictly to this coding. I can, if necessary, add any remarks relating to the transmission and its reception such as the name of any station causing side band or co-channel interference. Otherwise there can be no deviation from the pre-arranged coding if it is to be of any use.

---

**Communication decoders**

**AFR-1000 Automatic CW-RTTY Decoder**

The microprocessor-controlled POCOM AFR-1000 CW-RTTY Decoder automatically processes radio teletype signals in accordance with Baudot No. 1 and No. 2, ASCII, ARQ/FEC (SITOR/SECTOR/AMTOR) and CW (Morse telegraphy) standards and corresponds to the latest state of the art. The AFR-1000 Automatic Decoder is remarkable for its value for money. Its moderate price makes it particularly suitable for the cost-conscious RTTY beginner. Unlike the other models in the AFR series, however, it cannot be upgraded for special codes.

**FEATURES**
- Fully automatic recognition of CW, ARQ/FEC and Baudot No. 1 and No. 2 teletype signals with automatic decoding, independently of the shift position.
- Baud rate analysis in the range from approx. 30 to 250 bauds.
- Extremely fast phasing of ARQ-FEC signals (Typical: 1-5 seconds).
- Special narrow-band quadrature discriminator for all usual LF shifts of 50-1000 Hz and CW Morse telegraphy.
- Swiss technology and quality — 1-year guarantee.

The POCON AFR-1000 is extremely easy to use and very simple to operate. The AFR-1000 is simply connected to the loudspeaker outlet on the shortwave receiver. Operation is confined merely to choosing the mode required. No tiresome testing of the baud rate and shift position. Two LED's indicate the active operation states in each case.

The baud modulation rate measurement facility is a complete new innovation in a unit in this price range. Knowledge of the baud rate permits reference to special codes, specific radio services, etc., and makes it possible to shed light upon a radio teletype signal. The display is provided on the screen or printer linked to it to 1/1000 baud (e.g., 96.245 bauds) with quartz accuracy and within a measuring range of approx. 30 to 250 bauds.

**AFR-2000 All Mode RTTY Decoder**

The technology of models AFR-2000 and AFR-2010 meets the highest demands. Their exceptional value for money will not be so easy to obtain in the near future. By choosing one of these units, you will be deciding in favour of the latest receiver on the market — enabling you to receive more and do less setting! Teletype reception has never been so easy!

**DEWSBURY ELECTRONICS, 176 LOWER HIGH STREET Stourbridge, West Midlands, DY8 1TB**

**AIRBAND LISTENERS!**

Our UHF frequency list, apart from being continuously updated now has a new layout, still with the same information on Airfield / ATCC / Range / Ops & Air Refuelling frequencies etc. It is available for £5.00 inc. postage. Our FIRST VHF listing should be available now and will (we think!) live up to our UHF's reputation as the BEST available. Both will be sold individually or as a volume.

We keep in stock a wide range of VHF/UHF "airband" receivers from the leading manufacturers, along with accessories including VHF/UHF base antennas.

If you are "looking" at a SONY AR-7 or 2001D try giving us a call for our prices. For further information please send SAE or telephone for details.

**JAVIATION**

Carton Works, Carton Street, BRADFORD, West Yorkshire, BD7 1DA

**S.E.M.**

**UNIT C, UNION MILLS, ISLE OF MAN**

Tel. Manroon (0824) 851277

S.E.M. VHF CONVERTER
Plugs into any HF receiver aerial socket to give you coverage from 118 to 146MHz. Tune your receiver from 2 to 30 MHz £48.95. Ex-Stock.

S.E.M. H.F. CONVERTER
Plugs into your VHF scanner aerial socket and converts its range to cover 10kHz to 25MHz. Gives you full HF, MF, HF, VHF coverage. £68.95 from stock.

**VERY WIDE BAND PRE-AMPS.**

30kHz to 500MHz, 9dB gain, 1.5 s N.F., and unprecedented performance. Basic Pre Amp £32.00. Switched through when OFF £37.95 from stock.

**QRM ELIMINATOR**

A unique design, which has revolutionised interference supression. Connects in your aerial lead and phases out interference before it gets to your receiver. Any sort of QRM, it can be next to your rx (your computer?) or several miles away, 1.5-30MHz, £68.95. Ex-Stock.

If you require more information on our products, ring or write. Prices include VAT and delivery. C.W.O. or CREDIT CARD by phone.
No prizes for the unintentional guessing game in the March issue. Did you recognise the airfield in Chris Mlynek's photo as being Wellesbourne Mountford, near Stratford-upon-Avon, Warwickshire? Yes, that really is me looking across the field with binoculars! Active runways are 05/23 and 18/36 and the air ground frequency is 130.45MHz. Once a wartime airfield, it is now used by flying clubs, although a Vulcan is also kept here! Visitors will welcome the light refreshment facilities and informal atmosphere. If you are thinking of visiting/flying to some light airfields Pooley's Flight Guide will tell you about them and is available from the Airfour Flight Shop at Elstree Aerodrome, Hertfordshire. Tel: 01-953 4870.

**Frequency and Airspace Changes**

A couple of navigational beacon changes have cropped up since last time source: Civil Aviation Authority (CAA) General Aviation Safety Information Leaflet 2/88. The Detting v.o.r.f.d.m.e in Kent is back on the air (DET: dah-di-dit, dit, dah, 117.30MHz, the d.m.e. being on Channel 120). In Cumbria, the Dean Cross v.o.r. (DCS: dah-di-dit, dah-di-dah-dit, dah-di-dit, 115.20MHz) is still withdrawn and if heard on test must be ignored. Any navigational aid that puts out an unexpected Morse identity TST (dah, di-di-dit, dah) indicates a facilities under test. The Dean Cross d.m.e. is still available (Channel 99) and there is a temporary n.d.b. Pilots should not rely on this unofficial column to help with their flight planning, however, please consult up-to-date NOTAMs!

Further north still, major changes will occur to the Scottish flight information region (announced in the CAA Aeronautical Information Circular 32/1988). Part of the changes involve moving the Glasgow v.o.r. (GOW: dah-dah-dit dah-dah dah, 113.40MHz with d.m.e. on Channel 81) onto the airport itself. Also the Prestwick v.o.r./f.d.m.e/f.d.b. will be renamed Turnberry (TRN: dah, di-di-dit, dah-di-dit, 117.50MHz v.o.r. channel 122 d.m.e.; 355kHz n.d.b.) The airspace changes will happen in time to appear on the next issue of the half-million topographical ICAO Aeronautical Chart sheet 2171AB. This will be issue 11 and should be available a couple of weeks after this "Airband" is published.

**You Write**

Richard Buckby G3VGW (Castle Donnington, Derby) lives so close to East Midlands Airport that he has to be interested in aircraft! Some time ago he was based near the Daventry beacon which was then a n.d.b. around 670kHz with a T-shaped antenna. Having deduced this much about it, Richard then noticed the concentration of aircraft overhead and went on from this early beginning to discover much more about aeronautical radio.

One problem that exists with cheaper modern receivers is image reception. An f.m. broadcast receiver might pick up aircraft communications that are twice the i.f. higher than the frequency selected on the dial. For example, tuning around 100MHz with a set that uses a 10.7MHz i.f. could result in an image being received at 100 + (2 x 10.7) = 121.4MHz.

One of my relatives complains of this whenever the weather is wet and windy: Heathrow go onto Runway 23 during strong southwesterlies, and this brings the final approach path close to my house. Since the aircraft are thus nearer and lower than usual their signal strength is greater and more likely to be received as an image. This not only says little for the r.f. stage selectivity of the receiver — it also indicates that the limiter/discriminator or other f.m. detector is too susceptible to amplitude modulation!

By the same token, aircraft receivers could be susceptible to image reception in the 144MHz amateur band. For example, going 2 x 10.7 down from 144.4 gives 123MHz, again in the aircraft communications band. Remember that the image frequency depends on whether the local oscillator is higher or lower in frequency than the signal that it is intended to receive.

Richard remembers Ascension Island in the pre-Falkland War days when aircraft visitors were rare. Airports in general have ground maintenance vehicles which might include bird scarers (known at Heathrow as "Seagulls"), leader cars to guide aircraft during taxi, checkers to inspect the runway for foreign objects and debris (f.o.d. in RAF jargon) and repair teams for lighting and telecommunications. These might not only have their own radio channel (often u.h.f.) but also tend to talk to the ground movement controller or tower controller when it is necessary for them to venture out on to the active runways and other areas where collisions with aircraft might arise.

Richard understands that the airband will be extended up to 141.5kHz which will bother professional outside broadcasters who already use part of this allocation. It will also worry airlines and any other owners of existing equipment that can't manage this extra coverage!

The integration of civil and military traffic has set Colin Berry (Crawley, West Sussex) thinking. The military use u.h.f. frequencies extensively and have their own national air-traffic controllers in suites directly adjacent to the civil sectors at the London Air Traffic Control Centre (LATCC), West Drayton, near Heathrow and at ScATCC, the Scottish equivalent at Prestwick, Ayrshire. The civil controllers also tend to have a military liaison controller attached to their teams at LATCC. In principle, a v.h.f.-equipped military flight will be able to use the same control facilities that are available to its civil counterpart. The problem comes when the aircraft is fitted with u.h.f. only in which case all communication must be with the military controllers.

At LATCC the civil controllers work in reasonable lighting conditions but the military ones use smaller fluoride displays...
that require dim room lighting although under these conditions an extra degree of
definition is possible. A special case is the
Distress and Division Cell which answers
emergency calls by all aircraft on 121.5kHz
but is staffed by military controllers.
The CAA produces three documents on

Publications List at the same time?
One-time 19-set operator Peter
(Eastbourne, East Sussex) is interested in
"armchair flying" (aren't we all?) and has
suitably equipped himself with a multitude
of books and magazine subscriptions.
Peter has the right idea: it's off to
Heathrow and Gatwick, not to mention
the RAF Museum at Hendon, armed with
camera and binoculars. My own little
collection is not too far from Hendon and
a visit can be arranged by 'phoning me on
01-956 5113 (weekday evenings). Peter's
own radio exploits involve 594MHz; next
time you write, I'd be interested as to how
your designation "HLO4" is derived —
even columnists need to learn something
new every day!

Catalogue
Regular advertiser Fairbotham & Co
(Stockport, Cheshire) have sent their
latest catalogue. They also refer to
themselves as "Flight Deck — The
Airband Shop" and this tells you all about
their wares! One product to which they
draw my attention is a dedicated 10mm-
thick logbook for the enthusiast which
consists of A5 pages ruled with a headed
grid for observations. If you'd like a sample
page from this please send a 13p-stamped
reply envelope (or 1 international reply
coupon) to me via the editorial address
offered while stocks last.

Glossary of En-Route
Navigational Aids
It's a year since my "Aeronautical Radio"
series appeared and it is obviously
necessary to keep referring to some of the
radio facilities that were covered in those
earlier articles. Here then is a brief
summary of the most frequently-used en-
route navigational beacons.
Very high frequency omni-directional
radio range (v.o.r.) is the main directional
facility in current use. These are on 50kHz
channels from 108-117.95MHz i.e. v.h.f.
navigation ("nav") band. When tuned on
the nav receiver the beacon will be heard
to emit its identity at short intervals as
three Morse code letters. On first tuning
any beacon, the identity must be
confirmed: the facility might be off the air,
faulty, wrongly tuned or too distant to be
in range. Frequent confirmation of the
ident signal should be made while using
the beacon. The v.o.r. is considered to be
at the centre of 360 radial spokes and the
cockpit indication shows the position
on which these radials the aircraft is
situated. This enables a track to be steered
directly towards the v.o.r. for example.
Distance measuring equipment
(d.m.e.) is a transponder system where
the ground station is interrogated by the
airborne equipment and the delay in
receiving the reply is used to calculate
distance. Frequencies are in the GHz
region but this does not concern the pilot.
Most d.m.e.s. are co-located with a v.o.r.
and are also frequency-paired. When the
airborne equipment is tuned to the v.o.r.
the d.m.e. will be automatically activated
too.

Non-directional beacons (n.d.b.s)
are the older type of directional facility. The
airborne equipment uses standard
direction-finding techniques to work out
the bearing of the beacon from the aircraft.
Frequencies are between the long and
medium wave broadcast bands and in
case overlap the medium waves. Again
there is a v.m.i.d. and this is especially
critical since without a positive
identification it is impossible to know
whether the cockpit indicator is
responding to the beacon or is instead just
moving around randomly due to the effects
of noise. Several crashes have been due
to this error on the part of the pilot. Don't
just tune and identify an n.d.b. but keep
checking its signal at regular intervals. Our
seamen colleagues can also use these
beacons with hand-held direction finders.
TACAN (TACTical NAVigation)
resembles a combined v.o.r. and d.m.e.
system and is still in use by the military.
As the weather improves (won't it)? I'm
sure that, like me, you'll focus your
attention more and more on the sky and its
airborne contents. Don't forget to write
with your experiences!

12

Palestinian Clandestine

A medium wave clandestine voice that
first starting broadcasting mainly
Lebanese popular music back on
September 24 has now changed its tune.
In fact when the megawatt transmitter
signs on in the morning and afternoon
they begin by playing a simple synthesiser
version of Turkey in the Straw. The station
identification for Radio Al-Quds is clearly
said as the Palestinian people in Israel. It
thought to be coming from Syria. So far
the two v.h.f. frequencies mentioned in
transmissions haven't been heard but the
coverage of the medium wave signal on
702kHz is excellent in the area. Though
the bulk of the programming is in Arabic,
English has also been heard. The
identification reads "Al Quds, the
Palestinian Broadcasting Station for the
Liberation of Land and Man. Good Day

Chinese Exit 7MHz
Shozo Hara JA1AN, president of the
Japanese Amateur Radio League, says
that all Chinese broadcasts within the
7MHz amateur band has ceased. This
objective was the result of a 17-year
campaign by JA2RL and the Ministry of
Posts and Telecommunications of Japan.

Skytext Pages
The Dutch language teletext service of the
Sky Channel TV Network has started a
dedicated service to hi-fi and short wave. In
February page 341 was opened up to
hobbyists and although primarily aimed at
the entertainment channel's Dutch
speaking audience in Holland and
Belgium, it can be seen right across
Europe by those with a connection to the
service. Now why doesn't CEEFAX do the
same thing?
RX-4 MULTIMODE RECEIVE RTTY / CW / SSTV / AMTOR

This is the ultimate in software for the SWL. Just one program to receive all four modes, switching from one to the other at a single keystroke. Extremely user-friendly, RX-4 has the facilities and performance you need to catch all the action on the bands as soon as you hear it.

When you see the features it’s easy to see why RX-4 is today’s best-selling receive software.

RTTY and AMTOR tuning scale makes tuning-in very quick and easy.

Four RTTY baud rates, any shift, normal or reverse, with selectable unshift-on-space.

CW software filters and controllable autotrack for maximum performance up to 250 wpm! On-screen indicator lets you see the level and tuning with a minimum of fuss.

SSTV has selectable scan rates in both directions and two modes of picture storage for maximum use of memory.

Text and pictures can be stored, recalled to the screen and dumped to a printer as well as being saved to tape or disc.

Please note that the AMTOR section only receives ARG mode (mode A) but this is the most common mode and covers a lot of commercial TO

Previously, people have paid over £30 for separate RTTY, CW and SSTV programs which do not have the performance, facilities and convenience of RX-4. We are offering this amazing software for the low price of only £25 on tape, £27 on BBC or CBM64 disc.

BBC-S, CBM64 and VIC20 need our TIF1 interface. This has isolation between console and radio to reduce computer noise and switchable filters, giving much improved copy. Kit £20 (assembled PCB + cables and connectors) or ready-made, boxed with all connections £40, both for receive only with no transmitters. For SPECTRUM we have two versions. One needs no hardware at all, the other uses the TIF1 via an interface adapter board SIA-1 for improved performance. Tape + SIA-1 £40.

Both versions are available on - 3 disc at £2 extra.

Same day dispatch by First Class Post, Airmail Overseas. Prices include p&p and VAT, where applicable.

GAREX ELECTRONICS

WEATHER SATELLITE SYSTEM

This is the genuine MICROWAVE METEORSAT system, 24 hour geostationary (prediction charts not required).

Not to be confused with cheaper, computer add-on devices that normally utilise the VHF Satellites which are only usable for a few minutes at a time.

Our complete plug in and go package requires no computer, no software, and can be up and running, including dish alignment within 10 minutes.

Nothing more to buy: Dish, Microwave Receiver, Frame Store, 12" BW Monitor AND ALL PLUGS & CABLES £995.95

Expandable to include VHF Satellites and colour. Designed by Timestep Electronics, now supplied by Garex.

VHF SYSTEMS

VHF Active Antenna + 35m cable £74.75

VHF 10 Channel Receiver £115.25

Colour Frame Store (suits VHF & Microwave) £454.25

SAE for full details and prices of other ‘separates’

GAREX VHF RECEIVERS

The celebrated Timothy Edwards designs now owned & manufactured by GAREX.

A simple but versatile design capable of covering spot frequencies in the range 25-2000MHz.

* Excellent sensitivity (typically better than 0.4µV for 12dB SINAD).

* Double superhet (10.7MHz and 455kHz IFs).

* Goes of IF bandwidths from weather satellite to ‘12.6kHz’ PMR standards.

* The basic receiver is single channel crystal controlled.

* Multichannel options.

* 2 watt audio output stage having a low quiescent current.

* Size: 153 x 33mm Requires 10-14V DC supply.

PRICES:

Stock Versions: (fully assembled, aligned & tested boards)

6m, 4m, 2m & Weather Sat. £49.95

Complete boxed versions & special options: details & prices on request. Crystals can be supplied if required: most popular 2 metre frequencies and the currently active Weather satellites are readily available. Crystal prices on request.

Mains power supply module £15.50

THE GAREX VHF PREAMPLIFIER

* Compact size: 34 x 9 x 15mm

* Up to 26dB gain

* Can be made for any frequency in the range 40-2000MHz

* 3dB bandwidth ±3MHz (at 145MHz)

* Uses BF981 (0.75dB NF at 200MHz)

* Input & output impedance 50 ohms

* 1dB compression: +10dBm

* Saturated output: +15dBm

* Supply voltage 8-17V DC at 5-10mA

Stock Versions: (fully assembled, aligned & tested boards) 6m, 4m, 2m & Weather Sat. £11.46

Other versions: prices & details on request.

* NEW! HIGH PERFORMANCE 2 metre PRE-AMPLIFIER

* Band-pass stages for improved selectivity

* 16dB gain with 1dB NF

* RF switched (fail-safe action): gas-filled relays

Assembled, tested (box version on request) £42.50

Main Distributors for REVCO ELECTRONICS LTD.

Ask for details of the latest REVC "Whippet" and "Kwid" antennas and solderless co-axial adaptors (see PW June 87).

Prices include UK P&P and 15% VAT

Reference Oscillator

The heart of a frequency synthesiser is a quartz crystal controlled master reference oscillator, and ideally its frequency of operation should be unaffected by vibration, changes in temperature and power supply variations. Rigid mechanical construction, good screening, high quality components and a voltage regulated power supply are essential to achieve the necessary stability. Some designs take things a stage further and mount the quartz crystal in a temperature controlled oven so that changes in ambient room temperature do not affect the stability of the oscillator; however, for the oven to be effective it is necessary for power to be applied to it at all times, so this feature is unsuitable for portable equipment. The Wadley Loop was described last month. In another type of synthesiser the injection frequencies are generated by a separate oscillator which is “locked” to the master reference oscillator so as to achieve equal stability. Note that in this design there are no mixer stages involved in the generation of the final frequency, consequently the output signal may be relatively pure.

The separate oscillator is known as a voltage controlled oscillator (VCO) which is similar to a VFO except that the mechanical tuning capacitor has been replaced by a varactor diode. The internal capacitance of a varactor diode may be varied by changing the d.c. potential applied across it, so this property is used to enable the oscillator to be tuned to any desired frequency.

Phase Locked Loop

In order to lock the VCO to the reference oscillator three additional items are required, namely a variable divider, the division ratio of which may be controlled by external switches; a phase comparator which produces a d.c. output error voltage proportional to the phase difference between two signals present at its inputs; and a loop filter — see later. These three components, together with a VCO and reference oscillator, form the basic building blocks of a phase locked loop (PLL), synthesiser, see Fig. 1.

If the output from the reference oscillator (f1) is connected to one of the comparator inputs and the output from the VCO (f2) is coupled to the other comparator input via the divider which is pre-set to a division ratio (N) the comparator will produce a d.c. error voltage (Ve) proportional to the phase difference between f1 and f2. If Ve is then applied to the Varactor diode in the VCO it will cause f2 to change until the phase and frequency of f2/N is the same as f1; the system then locks up and the stability of the VCO is directly governed by the stability of the reference oscillator input, f1. If there is any phase noise present in the output from the comparator it will impair the overall stability of the system, so a low-pass loop filter is usually inserted in the d.c. path between the comparator and the VCO.

In a practical design the amplitude of Ve from the comparator may be insufficient to control the VCO, so a d.c. amplifier may be required to boost the error voltage. When the system has locked up, the output frequency of the VCO (f2) will be N x f1. By varying the division ratio (N) of the divider, f2 can be changed in discrete steps equal to f1.

As recently mentioned in this series many of the more expensive modern portable receivers, and most of the complex communications receiver designs, employ some form of frequency synthesis to provide the highly stable local oscillator injection frequencies required for the mixer stages.

If all this seems a little complex consider a few numerical examples.

**Question 1:** If the reference oscillator output (f1) is 100kHz and the tuning range of the VCO lies between 1MHz and 10MHz, what division ratio (N) is required if the desired output frequency (f2) is exactly 2MHz?

**Answer:** It has already been explained that the system will only lock up when f2 = f1/N,

so N = 200 000 / 4 000 = 50.

**Question 2:** If the division ratio (N) is set to 20, what will be the output frequency?

**Answer:** It has been shown that f2 = N x f1,

so f2 = 40 x 100 000 kHz = 4 MHz.

**Question 3:** If the division ratio is changed to 40, what will be the output frequency?

**Answer:** f2 = f1/N,

Therefore f2 = 49 x 100 kHz = 4.9 MHz.

From these examples it can be seen that the output frequency can only be changed in steps of 100kHz and to make smaller steps it will be necessary to decrease f1.

In a practical design a frequency of 10MHz is often chosen for the quartz master reference oscillator, since it may be easily compared with one of the World Standard Time/Frequency signals broadcast by, for example, MSF or WWV. A fixed divider chain using integrated circuits may then be employed to produce, say, a 1kHz signal which is used in the synthesiser as the reference so that the output frequency of the VCO (f2) may be changed in steps of 1kHz.

Only the very basic principles of PLL synthesisers have been mentioned here, and many interesting and complex designs have evolved during the last decade. In many of the more advanced designs the switches used to vary the division ratio of the divider are replaced by a digital “up-down counter” which is driven by an encoder operated by a tuning knob. A digital memory bank is often used to store numerous division ratios so that they may be instantly recalled when certain channels or frequencies are required. The digital information stored in memories can also be scanned and used to control the divider in the synthesiser so that any number of desired channels may be sequentially monitored.

When rotary switches are used to control the division ratio of the divider they may be easily marked to indicate the output frequency of the VCO (f2) in steps of 1MHz, 10kHz and 1kHz, however if they are replaced by a digital controller there may well be a lack of indication of the operating frequency unless a digital frequency display is also incorporated in the design.

Frequency Counter

The building blocks of a simple type of
digital frequency counter and display are shown in Fig. 2. An output from the synthesizer v.c.o. is coupled via a buffer amplifier into a limiter so as to change its sinusoidal waveform into a square wave. It then enters the counter via a gate which is only open for a highly accurate predetermined period. A highly stable quartz reference oscillator, usually called the clock, is used with a divider chain to produce a suitable pulse which will open and close the gate.

When the square waves from the v.c.o. output are allowed to pass through the gate they are counted and the information obtained is then stored so that it may be displayed continuously during the next counting period—thereby ensuring the display does not blink. At the end of each counting period the stored information is updated.

Each of the numerals depicted in the display is made up from combinations of segments within a seven-segment display; these may be produced by filament wires in a special vacuum tube, light emitting diodes or liquid crystal technology. The segments used when "6" is displayed are shown in Fig. 3.

![Fig. 3.](image)

Of course, in most receiver designs the display indicates the incoming signal frequency rather than simply the v.c.o. output frequency. The difference between them will amount to the i.f. used in the receiver and due allowance has to be made for this within the counter—perhaps by using an additional mixer stage.

The majority of the components and circuits used in p.i.i. synthesizers and frequency counters are now available as integrated circuits, thus permitting very compact designs to be evolved. If the output from the quartz master reference oscillator used in the synthesizer can also be used as the clock for the counter, a very compact layout can be achieved!

---

**SERVICES**

**Subscriptions**

Subscriptions are available at £17 per annum to UK addresses and £19.00 overseas by Accelerated Surface Post outside Europe. For further details see the announcement on page 15 of this issue. Airmail rates for overseas subscriptions can be quoted on request. Joint subscriptions to both *Short Wave Magazine* and *Practical Wireless* are available at £27.00 (UK) and £30.00 (overseas).

**Queries**

We will always try to help readers having difficulties with a *Short Wave Magazine* project, but please observe the following simple rules:

1. We cannot give advice on commercial radio, TV or electronic equipment, nor on modifications to our designs.
2. We cannot deal with technical queries over the telephone.

**3. All letters asking for advice must be accompanied by a stamped, self-addressed envelope (or envelope plus international Reply Coupons for overseas readers).**

**4. Write to the Editor, "*Short Wave Magazine*", Enefco House, The Quay, Poole, Dorset BH15 1PP, giving a clear description of your problem.**

**5. Only one query per letter, please.**

**Back Numbers and Binders**

Limited stocks of most issues of *SWM* for the past 10 years are available at £1.45 each, including postal and packing to addresses at home and overseas (by surface mail).

Binders, each taking one volume of the new style *SWM*, are available price £3.95 to UK addresses, or overseas, including post and packing. Please state the year and volume number for which the binder is required. Prices include VAT where appropriate.

Please note that Volume 45 finished with the December 1987 issue, making nine issues in the volume. In future each volume will run from January to December.

**Ordering**

Orders for p.c.b.s., back numbers and binders, *PW* computer program cassettes and items from our Book Service, should be sent to PW Publishing Ltd., FREE-POST, Post Sales Department, Enefco House, The Quay, Poole, Dorset BH15 1PP, with details of your credit card or a cheque or postal order payable to PW Publishing Ltd. Cheques with overseas orders must be drawn on a London Clearing Bank and in sterling.

Credit card orders (Access, Mastercard, Eurocard or Visa) are also welcome by telephone to Poole (0202) 678556. An answering machine will accept your order out of office hours.

. . . AT YOUR NEWSAGENT
Where can the reader get information on what contests, DXpeditions or events are on the horizon? Well, there are a few choices, the most obvious being columns like this one! Other options are things like the W1WY Contest Calendar in Q Magazine, or the weekly DX News Sheet, DX Reporter. After all, both of these excellent works suffer from the fickleness of organisations. Some forget to send out press releases until two days before the event, some don't bother others changing the date of a contest that has been held for donkey's years at the same time.

For the s.w.i. these are still the best thing other than a crystal ball. The DXNS is now run by Brendan G4DYO under the aegis of the RSGB. Subscription details can be obtained through them. To give you an idea of what's in the DXNS it includes a tabulation of what's going on, contest news mentions the current activities in this year, DX Calendar looks forward, R. H. now picks up the odds-and-ends, IOTA covers the Islands on the Air Award, there is a section on Propagation Prediction and the historical solar figures and on the back pages is a listing of Band Reports with precise frequencies and day of the week, QSL Round-up and a few snippets of other information.

B. Patchett (Sheffield) notes how the Russians are so much better on the QSLing business. This is, I understand, because before a Russian can have his own call, he must have at least three years of contact with so many other amateurs from the club station. I believe the Russian s.w.i.'s have a similar routine too. R. R. Webb (Ashford) is noting the Europeans that so many s.w.i.'s disregard to increase his HPX total.

A couple of queries come from W. J. Prior (Lochcarron) on RTTY, G865C and VX1AJJ. The former was obviously a special event station and VX1AJJ was a Canadian, I wonder if there is any connection with the Winter Olympics.

D. B. Glover (Newton-le-Wilows) has a number of queries over HPX. In accordance with the topical rules, the presence of a suffix (for example, VE2PAB/P/4U) would mean that, quite arbitrarily, he is counted as a 4U2. Alternatively, you could just claim him as VE2 but, on the other, not both. With VE2's plentiful, and 4U2 non-existent, in the quoted case the choice is pretty obvious. With something like K2MFP/P/VP2M, when such prefixes are heard fairly regularly, the choice is less easy.

However, in modern times there has been a tendency for the suffix to become a prefix such as 4U/VE2PAB/P and this seems likely to become the normal routine. I think to put the bit that tells you where the station actually is at the front seems an eminently sensible thing, I hope it catches on.

R. D. Degg (Stoke-on-Trent) uses a Realistic DX300, fed by way of an a.u.c. from a long wire. He queries the hearing of TU2EW on 3.639MHz. Nothing wrong with TU2 as such, but I have to admit that it seems an odd sort of frequency to find such DX on. I can't imagine an easy way in which the reception could have been from another band, unless the chap were using a multiband antenna and had a rig such which put out a fat spurious signal on the wrong band.

On a different tack, Roy offers VX3FHL, VX8CHN and VX6VEY as all being from Australia. Well, until someone proves it wrong, I am going to stick with VX = Canada, for the simple reason that this is what my information says.

M. Ribton (Gillingham) has built himself a loop antenna. At the moment, it peaks up on 3.5, 7 and 14 MHz. The next move is to remote control the tuning capacitor and then to mount it on a rotator.

Turning to the letter from Neil Malville (London N18), he admits to being very much a c.w. addict. He hardly ever listens to phone these days. Neil has a couple of the VX prefixes, with VX3AT and VX6KV in the list but has a query in the form of VBAT heard at 1100Z on January 19 on 14MHz. V8 suggests Bruneil, but usually as V85; that being said does anyone else have information to add?

R. G. Williams (Borehamwood) is now concentrating all his efforts on the Table, using his Joystick, a.t.u. and FRG-7 receiver. Thus 34 new ones go on including such as 6Y2SRP, 86HV and OA166.

P. Townsend (London E17) is now "in the picture" as far as Top Band goes. I mentioned how G38DQ set about creating an earth system, which he thought was wrong. He used a galvanised iron stake for an earth and I don't think that stands much chance. He could try driving it rather deeper and constructing a chemical earth. A chemical earth means keeping the area around the spike damp and adding chemical compounds to improve the earth conductivity. I really feel that an artificial earth made of a quarter wave radical hidden under the carpet of the shack for each band would work.

P. Davison (Market Harborough) has heard FJ5BL (St. Barthelemy) and SORASD. The latter, incidentally has been accepted as a new DXCC country, making the current "possible" 319. However, this has been done by reactivating the old country Rio de Oro and retitting it Western Sahara, which creates the odd puzzle for those who have both. US and Canadian celebratory prefixes abound; W200AW, W200VYN, VX1CYL, VX1AT, CJ1QU, not to forget the Italian IY4FGM Marconi club station. The Russian Oblasts continue to attract and of course 2LOACF was Amti 4XETX following his swing around the DX spots.

Now we turn to E. W. Robinson (Felixstowe). He heard CIBHO give his QTH as Resolute Bay, Canadian North West Territory, at the time he was working KL7XD, Fairbanks, Alaska. This complete QSO was on 14MHz at 1918Z on February 27. Others included G2GIS, one of the RSGB 75th anniversary Commemoration stations and AK200Y came from VK.

Among the up and coming prefixes are EI1000 part of the EI/Dublin celebration of 1000 years of the city, SX1RAAG covering the 30th anniversary of the Greek RAAG; and of course the QSOs to SG55G. The 75th anniversary celebrations in July will have GV calls, of the form GV/AB1CD.

Taking a breather from the ARRL Contest, N. K. Y. (Bengoe), says he has been tinkering with his antenna; it has been extended by another 10 metres or so and a pair of head-phones have been acquired and found to make a lot of difference to reception. An interesting one was the recent Abu Al-Iff effort he found they were working split-frequency because of the pile-up, but once he had the hang of it he got the complete QSO with W8AH. The 500th prefix was T77C on 3.5MHz, the band where he found 8R1PN too. The 21MHz band yielded HH2SD, G3UBJ/MM, A22BB and SORASD.

This is the last showing of the 1987 Annual Table, to December 31, 1987. The first listings for 1988 will appear in the next issue of this piece. 200 Prefixes in peak have been allowed for an entry to be made in accordance with HPX Rules. At score 500, transfer to the All-Time List is automatic. Note, the Annual Table is a Phone only listing.

Rules as for the Annual Listing. An entry for this listing must be in addition to any claim for the All Time Post War listing.
I'll start this month with a new subject, aircraft flight plans and SELCALs. No, this is not a take over of the Airband column but some interesting information can be received using RTTY on the H.F. bands. According to a letter I received from John Davies there is an assortment of stations out there sending aircraft flight plans and other details. The stations involved are often listed as airports i.e. Cairo Air.

For listing these stations are usually left either sending continuous RYS or a constant carrier. The biggest problem with the stations is finding the schedule and therefore working out the transmission times.

As to the transmission mode, this is normally 50 baud with either 170Hz or 425Hz shift, so that should present no particular problem. Two stations which are thought to be active with this information are: Santa Maria Air (CSY) on 14.488MHz and Cairo Air (SUC) on 10.635MHz.

If any of you have received schedules for H.F. air stations then I would be very pleased to hear from you.

**ASCII**

Colyn Brooke from Cape Town has sent me an interesting letter describing his station and interests. Colyn, a UK ex-patriot, is a licensed amateur with a particular interest in listening to RTTY where a HAL ST-6000 terminal unit and a HAL DS-3000 KSR teletype are employed. In addition to this he has a Commodore C-64C computer, but apparently the software is very expensive in South Africa. All this is fed from a NRD 515 receiver. Colyn also employs an old “Teletype 33” which runs 110 baud ASCII only!

This brings me nicely on to yet another request. After asking for information on regular ASCII transmissions last year I received details of several amateur transmissions, but sadly no commercials. Does anyone have details of any commercial ASCII transmissions? If so please drop me a line and I will publish them.

To continue with Colyn’s story, he is also President/Treasurer of the 34 DX Club which derives its name from the fact that they are all situated on the 34 degree parallel. Although the club is still very small they publish their own News Letter with details of all forms of short wave listening including RTTY.

**BARTG Spring h.f. Contest**

Did any of you enter this contest on March 19/20 as short wave listeners? I was intending to enter but had already been contacted by my local radio club to help them out with an Open Day designed to encourage new blood into the hobby. All was not lost as I took along most of my station for demonstration purposes.

The band conditions for the contest seemed to be quite good, though it is always difficult to be sure when using an unfamiliar antenna system. The antenna system in this case comprising a half size G5RV using a co-axial feeder which had been hurriedly assembled and was only really effective on 14MHz and above. My monitoring showed a very high level of activity on 14MHz, though it was difficult to find any DX amongst all the high powered European signals. The most interesting band was 28MHz which was wide open in the afternoon. I worked A22BW (United Arab Emirates) and heard 3C1MB (Equatorial Guinea) and PP (Brazil) amongst others so there should be some high scores about. If you had any interesting experiences or would perhaps like to know more about contests then please let me know.

**Amstrad PCW**

Although I have mentioned this computer several times I think it would be useful to clarify the situation with regard to radio software. First RTTY/ASCII, the only dedicated software that I am aware of is that sold by BARTG which enables the PCW to send and receive both RTTY and ASCII providing an Amstrad compatible serial interface and a suitable terminal unit is used. The alternative is to use an intelligent terminal unit such as the AEA PK-323 or Kantronics KAM. When using an intelligent terminal unit the MAIL 232 communications package supplied with the computer can be used as a driver. If you require some more sophisticated software then I suggest you contact the Public Domain Software Library who can supply a communications package specially adapted for the Amstrad. This package, particularly MEX, provides a very comprehensive communications system when used with an intelligent terminal unit.

With regard to packet radio operation this is only possible by using a serial interface and a dedicated TNC (Terminal Node Controller) or again the intelligent terminal unit. If you know different then please let me know.

**Report Formats**

Glynne John Hather has written asking what format he should use when compiling reports for inclusion in the column. Well, generally the more information you can give the better but here are the important points: frequency, mode, speed, shift, callsign and time. If there is anything particularly interesting about the transmission then a short note is always appreciated.

Glynne continues his letter with a brief description of his RTTY station which comprises a Sony ICF-7600D feeding a Microwave Modules RTTY to TV converter.

**RTTY Mailboxes**

Another question asked by Glynne John Hather was what are RTTY mailboxes and how are they used? These mailboxes are run by amateurs and normally comprise a computer system with disk storage and suitable software which is coupled to a standard RTTY station. Both the computer and radio station are usually left running 24 hours a day. The main use of the system is to enable amateurs to leave messages for other amateurs.

The mailbox is accessed by typing the mailbox callsign followed by your own callsign. Once the mailbox has received your call it searches its memory to see if there are any messages waiting for you. If it finds a message, it will tell you and give you the option of reading or storing the message. Once you have dealt with the outstanding messages you can then enter your own messages. Although this may sound complicated, mailboxes are actually very easy to use as you just follow the instructions and prompts given to you by the

Rome Meteo satellite picture.
mailbox. Some mailboxes will allow you to look through an assortment of files which are often filled with allsorts of useful information, e.g. modifications to rigs.

**RTTY Frequency Lists**

Jan Nieuwenhuis (The Netherlands) has discovered the English schedule of the Kyodo News Service from Japan.

**Time (UTC) Callign Freq Zone (kHz)**

- 0030-0100 JAE 58 8175 Asia
- 0240-0340 JAE 58 8175 Asia

- 1200-1250 JAE 58 8175 Asia

Some other stations that have been logged recently by various readers may be useful to others. They are:

- 2.474MHz RTTY 75/425 PBC32 Holland.
- 4.002MHz RTTY 50/425 YVR2 Bucharest Metroe.
- 5.199MHz RTTY 50/425 YV 53 ADN Berlin News.
- 10.214MHz RTTY 50 EPD Tehran Air.

**FAX**

Does anyone know a source of 8½in wide high-quality roll paper with perforations? Ivar Cooper needs it for his Info Tech FAX decoder. Apparently Info Tech recommend a polished pure white paper, but not Teletype roll paper and he hasn’t a clue where to start looking, any suggestions?

**INFO IN ORBIT**

**Pat Gowen G3/IR**

17 Heath Crescent, Hellesdon, Norwich, Norfolk NR6 6XD

The joint Canadian-Russian North Pole non amateur radio trip should be nearing the Pole by the time this column is in print. The base camp Canadian Resolute North West Territory and the USSR Cape Artichevsky Severnaya Zemlya stations have been active both on h.f. and the satellites, with 280, 28/28, EXODR, EXOCR and VO1SA/UIAO all putting in good signals. Additional polar stations active in the expedition are 4KOC on North Pole 28, an ice island, and EXODR on Dixon Island. Look on 14.182 and 14.125MHz for h.f. activity and around 29.420-29.430MHz for signals via RS-11.

As planned, the COSPAS/SARSAT navigational satellite doppler tracked position from the parties emergency location transmitter is passed on 14.182MHz to G3/IR from EXODR daily, from where it is passed to GO/PA3BHF and G3YJO at the University of Surrey. They then place it onto the packet radio bulletin boards and the 14.825MHz UoSAT – OSCAR-11 'Digitalker'. As the satellite performs the polar pass, the information "spoken" by the satellite is taken for the expedition by member Laurie Dexter VE6LD, on his Icom IC-H3 hand-held. Then he knows the moving group position, so do the many enthusiasts now following the expedition all over the world.

Table 1 gives a few suggested times when readers in the UK might like to listen to OSCAR-11. It will be close to overhead and easily read on a modest antenna. It is recommended that listening should commence up to ten minutes before the times given, as dramatic increases in solar flux are likely. This could expand the earth’s atmosphere sufficiently to cause an increase in drag, bringing the satellite to a lower, shorter period orbit, and arriving earlier than the predictions.

Some hundreds of schools and individual enthusiasts are involved in tracking the expedition. Several reports have come in from frustrated would-be-listeners who are having the satellite transmissions wiped out by inconsiderate amateur stations using the space band for local contacts, contrary to IARU agreements. If any reader should experience this outrageous behaviour, please report the callsign, date and time heard to the RSGB and/or G3AAJ of AMSAT-UK.

**Help Line**

Shawn Smith writes to ask if any weather satellite fans can help him locating any computer programs for the Commodore-64 that will enable him to decode and weather satellite information. He has been disappointed to find that, despite all attempts, he has only so far been able to track programs for the BBC and Amstrad computers. "This seems very surprising, in view of the excellent graphics capabilities of the C-64," says Shawn. If any reader can help him, who has performed or knows of any "translations" of alternative computer programs for his computer, please write to him at 12 Westerparade, Warminster, Wiltshire BA12 8LY.

Leslie Sargent uses a Yaesu FRG-7700 communications receiver with a FRG-VHF converter, allowing him to explore from 118 to 150.63MHz. He has been hearing satellites on the following frequencies...

Shawn Smith writes to ask if any weather satellite fans can help him locating any computer programs for the Commodore-64 that will enable him to decode and weather satellite information. He has been disappointed to find that, despite all attempts, he has only so far been able to track programs for the BBC and Amstrad computers. "This seems very surprising, in view of the excellent graphics capabilities of the C-64," says Shawn. If any reader can help him, who has performed or knows of any "translations" of alternative computer programs for his computer, please write to him at 12 Westerparade, Warminster, Wiltshire BA12 8LY.

Leslie Sargent uses a Yaesu FRG-7700 communications receiver with a FRG-VHF converter, allowing him to explore from 118 to 150.63MHz. He has been hearing satellites on the following frequencies...

149.994 149.975 149.979 149.984 149.989 150.021 150.023 150.024 150.026 150.029 150.035 150.037 150.039 150.039 150.042 (all frequencies in MHz)

Leslie wonders if any readers are able to indentify these satellites, their identification, mode, etc. Leslie lives at 2 Bartlegate Close, Brookvale, Phase 2, Runcorn, Cheshire WA7 6BX.

Many readers have written in complaining of a new source of

1940. Many thanks to Jan Nieuwenhuis for most of this information.
interference blocking their ability to receive weather satellites. Investigation has shown that the vast majority of these problems emanate from British Telecom and Mercury telephone paging systems that use frequencies only just above 138MHz. These signals are very strong, often well above 100dB over the satellite signals only 250kHz lower, as they run high power from elevated antennas, intended to give adequate and maximum coverage to mobile telephone systems.

Such signals in close proximity can totally block satellite reception by overdrive and block the operation of the first r.f. stage. These signals also overcome the selectivity of the intermediate frequency stages, particularly when these are wide band, e.g. up to 60kHz wide for the NOAA satellites. Although the bandwidth of the Soviet Meteor satellites is less, they are in fact much closer to 138MHz, so all weather picture sources can be critically affected. A number of remedies may be sought, one or all of which should be effective. First, a Faraday screen mesh reflector could be placed on that side of the effected antenna, i.e. in line with the paging signal, to reduce the capture lobes from the low angle interfering source. This would permit the receiving antenna lobes to “see” the satellite at high elevation angles, but substantially reduce the blocking signal.

Any vertical satellite receiving antenna, or one with any major vertical component will be effected far more than a horizontally polarised system, such as a “tunstistle” (crossed dipoles) as the problem signals are strongly vertically polarised. Circularly polarised crossed dipoles that nevertheless exhibit pure horizontal polarisation off the sides at low angles should be employed, preferably with a reflector below to minimise the low angle lobes that would otherwise capture the undesired signal. (Such an antenna was described in this column in the June 1987 issue). Great care should be taken to ensure minimum s.w.r. so that the coaxial down line does not act as part of the antenna system.

A cavity low-pass filter as depicted in some v.h.f./u.h.f. handbooks could be tried in the antenna line. With critical adjustment should reduce the source of the problem by at least 40dB without sufferance of the bandwidth needed for the satellite signal resolution.

A further method is to re-design the i.f. filter of the satellite receiver, using a well tuned crystal filter with sharp sides, as used for s.s.b. transceivers. Of course, it needs to be substantially wider than the 2.7kHz in the conventional circuit. Circuits for these will be found in most technical handbooks dealing with amateur radio receiver techniques and only require a recalculating of the crystal frequency spacing to give the bandwidth needed, with a sharp fall off at the i.f. equivalent of the local oscillator frequency less 138MHz.

Ground Stations

Howard Barnes of Wivenhoe, near Colchester has sent in some photographs of his satellite station. The first, Fig. 1, shows the sum total of his prediction apparatus, consisting of two AMSAT-UK derived “Oscarlators”, a table of predictions from the Remote Imaging Group newsletter, a pad of graph paper and a pencil. Howard points out that only a few days observation of any particular satellite enables one to enter times on a daily calendar in such a way that a grid of times will accurately predict the future passes for several weeks ahead. “I hit on this idea after remembering seeing a page of Kepler’s note books,” says Howard. “A recent Oscar News describes the same method, in an article by Geoff Perry”. (This involves plotting the time heard vertically on graph paper against the day date on the horizontal axis, when a dropping sloping line will appear on joining the marks vertically, an extension of which will give future appearances).

You can try his method by using Fig. 1 for OSCAR-11 to give future predictions. The sloping chart lines from April 30 to May 4 will result, and on May 5 and 6 a new pass comes into our window from the “right”, the older having slipped below our horizon. Note that the passes come some 22 minutes earlier on alternate days and that after 5 days the passes almost repeat, coming just some 6 minutes earlier. Most certainly, one does NOT need a computer to predict satellite appearances!

Howard’s current set-up is shown in Fig. 2. The monitor is a new Philips 32In, made for desktop publishing with a white screen giving a high resolution image with a good scale of grays. The rest of the system comes from Maplin. The receiver is a fully tuneable, (by Varicap diode, tuned by a slow motion dial and potentiometer) single conversion superhet with no phase lock loop. It is found to be far less susceptible to interference than the original dual conversion with p.p.l. and permits tuning over the whole band.

Howard uses a microprocessor controlled 64-pin diode video i.c. made by Yamaha for a video store which, whilst rather expensive, takes the uncertainty out of construction. The display consists of 212 50x50 pictures, of which the picture is re-written from the bottom. He has no north-south reversal switch, but does not find this to be disadvantageous. He finds NOAA pictures to be very good, but prefers the USSR Meteor satellites as they are less demanding in all respects. They have only 30kHz bandwidth (compared with 50kHz for NOAA), have less modulation to cope with and permit recording on a simple cassette recorder. This is not the case with NOAA, as the wider bandwidth requires a “Hi-Fi” approach!

The characteristic distortion from the raw unprocessed radiometer image is evident, appearing, as Howard says, “as though there were two observers on the satellite back to back, each looking at opposite horizons . . .” The explanation and reasons for this will appear in our next column, as although the space for satellites may seem limitless, it is not so in the context of our column length!

The last dates for mail to arrive is: May 17, June 21 and July 19

BAND II DX

Ron Ham
Faraday, Greyfriars, Storrington, West Sussex RH20 4 HE

Early Warning

During the summer months it is worth dedicating a button on a scanning receiver to the R1 vision frequency (49.75MHz). When television synchronising pulses appear on this channel, you will know that Sporadic-E is present. Take note of the signal strength and when these pulses becomes very strong it is time to carefully tune through Band II looking for programmes from Italy, Spain and the USSR. If possible, try and get some identities which can be passed on, through this column, to fellow enthusiasts.

Meteor Scatter

I also suggest that readers with scanning receivers should tune one of their pre-sets to 70.31MHz and patiently listen for tiny “pings” of speech or music being
transmitted by the Polish broadcast station at Gdansk. These "pings" will suddenly burst above the receiver's background noise. Random "pings" are frequently heard and these numbers are expected to show a marked increase in May especially around the 5th and 13th when the earth, on its orbit around the sun, encounters the Aquarius and Saturn shower clouds. Incidentally, signals from Gdansk sound like a low-pitched "bubble" when reflected from an auroral event. They usually have exceptional deep and sharp fading, throughout the life-time of a Sporadic-E disturbance.

Reports
In Bristol, Tim Shirley listened to BBC Radio Manchester from 0700 to 0730 on February 25 and BBC Radio London during the mid-afternoon of the 27th. He also heard signals from Belgium at 1800 on the 26th and Germany (Saarländischer Rundfunk) on 88MHz at 0100 on the 28th. "My best catch was RTBF on 102.7MHz," said Tim. His report to the German station, SRI, was acknowledged with their QSL card.

John Raleigh (Bedford) saw a "quick flash" of picture from the USSR at 1400 on March 7. "I just recognised the announcer, this station normally has the logo '1 NPORPAMMA'," said John. He also logged pictures from Belgium (RTBF) on Ch. E3 and Holland (PTT-NEO 11) on E4 at midday on about 12 of the days between February 15 and March 14. "That Russian station is just a short glimpse of things to come," he remarked. Let's hope so John, or these pages will be empty.

Tropospheric
"G8PP alerted me to a good lift on 144MHz which had been going since early morning on February 14," said Ian Galpin. He checked Band III on Ch. E2, logged French TV on Channels 5 and 18 and identified some as coming from the Dieppe area. He received weak pictures from France again at 1514 on the 22nd.

While in Laurencekirk on the 20th, George Garden noted that his barometer was really high (30.5in) and reacted by taking his JVC 610GB receiver to his favourite local high spot, Cairn O' Mounth. At 1700, with a vertical rod antenna, he saw Border News in good colour from Border TV on Ch.23. After a series of checks and getting poor results with a horizontal antenna, he realised that this signal was coming from the vertically polarised 2kW transmitter at Eyemouth on the coast near Berwick. The signal from George also found a bit of u.h.f. DX during the afternoon of March 5 and as it was snowing he stayed indoors and logged a few black and white pics at his station, Fig. 11, in an upstairs room.

The Mancinis received pictures in Band III from Belgium (BRIT TV-1 and RTBF-1) on February 22, sometimes spasmatic pictures from France (Canal +) on the 10th, 11th, 16th and 22nd and test-cards from Ireland (RITE 1) on the 11th, 16th and 19th. They also watched the Winter Olympics and ice hockey from RITE-2 on the 19th and football from RITE-1 on the 20th.

Simon Hamer logged test cards from Belgium in Band III as well as France (TDF) and Holland (PTT-NEO 1 and 2) in the u.h.f. band on February 21. He gave a similar report, plus the reception of Luxembourg (RTL Plus) on Ch. E7 and the French A2, TF1 and FR3 networks, from Dunkirk on March 9. To add to the fun DXing he watched the programmes Planet Earth and Junkyard News on RITE 1 and 2 respectively.

John Raleigh checks Band III between 1300 and 1400 on most days and received signals from France (Canal +1, Chs. L5 and 9, on February 15, 15, 22, 23, 24, 26, 27, 29, March 1, 2, 6, 8, 9, 10, 11 and 12. He also saw Belgium (RTBF 1), Ch. E8, on most of those days after the 20th, but (BRIT), Ch. E10, only appeared on February 21, 22, 25, 26 and 27.

I noticed various types of simple rain-gauges costing less than £5. The one I selected, Fig. 2, is supplied with mounting bracket which I fitted to a 2m length of antenna boom. This now protrudes from our lawn in a position that is clear of unwanted water sources such as trees or roof spans. This type of rain-gauge is ready calibrated and easy to use so it is just a matter of logging the reading, at a fixed time each day and not forgetting to empty it.

I am always pleased to hear from readers with details about their weather stations and observations.

Fig. 1: Realistic, Trio and Vega receivers and for Band II he uses a 7-element rotatable beam. I know that many of you are interested in keeping weather records especially as this subject is so closely allied to the propagation of signals in Band II. On a recent visit to a local garden centre, Fig. 1, Tim has

Fig. 2: The author's recently purchased rain gauge.

"To date this year we have had just 4 tropo-openings," wrote Lt. Col. Rana Roy (Meerut) on February 13. Rana received excellent pictures, in colour from Pakistan in Band III on Chs. 5 and 10, Figs. 9 and 10, throughout the morning of January 1 and early on the 31st. He watched a "keep fit" programme, followed by the news in English from Jalandhur TV on Ch. 9. On February 9, he saw prayers on the Lahore station, Ch. 5, of Pakistan TV and before this event faded, at 1030. He had

"News From India"

logged programmes for schools on Chs. 9 and 12 from the low power transmitters at Agra and Bathinda. "Doordarshan is planning to set up 45 u.h.f. transmitters which are being manufactured by Bharat Electronics Ltd in Hyderabad, who also provided six colour TV o.b. vans which were used during the World Cup Cricket," said Rana. He added, "Arunachal Pradesh will have 16 very low powered TV relay centres functional by March 1989." Rana told me that six are already established at Along, Bomdila, Namsi, Tawang and Ziro and by now they should be operational.

"SSTV"

During the month prior to March 3, Les Hobson GOGUI (Rotherham) exchanged 8 seconds slow scan pictures with stations in Austria, Brazil, Italy, Spain and South Africa on 14MHz. On the 6th he worked 5 stations in England, 2 in Wales and 1 in Scotland on 3.5MHz. Les, whose first time SSTV QSOs now number 251, tells me that GOAZX is organising a net for 1600 on Sundays and would welcome a call on this band with 8 seconds b/w pictures, from
anyone wishing to take part.

At his QTH in Rhayader, Bert Mills GW3LUP produced a picture of Simon Hamer, with our sister magazine Practical Wireless; Fig. 12, while showing him a new development of his home-brew SSTV gear.

Further to the television pictures, Figs. 2 and 3 published in the March issue, John Coulter (Winchester) suggests that the former is of Scandinavian origin and the latter is Greek. He says that "Halvem" (half past four) seen at the bottom left of Fig. 2 is the same in all three Scandinavian languages.

From Denmark, Erik Koie says that Fig. 2 is from Sweden 1, nowadays called KANAL 1 and that Fig. 3 is most likely to have come from Greece.

"Fig. 2 is a Swedish TV clock caption," said Ian Galpin G1SM from Poole.

"Fig. 2 is Sweden," say Edwina and Tony Mancini from Belper.

Not much doubt about that now and my thanks to all for the gen because such information is always valuable to the DXer, especially when only a glimpse of a caption or logo is seen.

Before I start filling these pages with reports about the 1988 Sporadic-E season, let’s use my picture space this month to give new readers a chance to see some of the television signals received, in Band III, during some of the 1987 tropospheric disturbances. Early in the year, I logged test cards from Belgium (Fig. 1) and Denmark (Fig. 2). Garry Smith (Derby), received test patterns from East Germany (Fig. 3) and in November, a rare one, Czechoslovakia (Fig. 4) on Ch. R10. Signals from West Germany are often received in many parts of the UK when the troposphere is open as Peter Lincoln (Aldershot) and Noel Smythe (Caerphilly) found when Figs. 5 and 6 and 7 and 8, respectively, appeared on their screens. Peter referred to “the amazing strength” of the pictures he logged and Noel said that SWF BADN (Fig. 7) was being "knocked" by a signal from Switzerland and that Hessischer

The last dates for mail to arrive is:
May 17, June 21 and July 19
The fifth and latest edition of this very popular publication has just been published. Essential reading for anybody who listens or operates on the short-wave band. Packed with the latest information on frequencies and services. A mine of information that will tell you much about the fascinating part of the radio spectrum between 2 and 30MHz.

**INCLUDES:**
- Marine
- Aviation
- Weather
- Embassy
- RTTY
- Fax
- Military
- Broadcast
- Press
- Duplex splits
- Navigation

£6.95 plus £1 post

This frequency manual is now available at most good amateur radio dealers in this magazine and many specialist book shops. In case of difficulty it can be ordered direct from the publishers as below:

SPA PUBLISHING LTD
18-20, Main Road, Hockley, Essex.
VISA & ACCESS Tel 0702 206835

**NEW FROM YOKO**

**MODEL F6/I**

**VHF/UHF SYSTEM B/G/I/L Operation**

Yes, the ubiquitous Yoko 5" black & white TV for reliable VHF, UHF TV/VIDXing is back - but in an improved version! Model F6 incorporates not only SYSTEM I 10MHz sound for UK/Eire/South African but SYSTEM B/G/I/L sound for Europe, Middle East, Australia and parts of ALL SYSTEMS L FRENCH standard. 5.5MHz sound switching is automatic within the receiver, the 5.5MHz and positive/negative video switch is situated at the rear of the television.

It's restyled too, featuring a sleek black monitor look and with rotary drum continuous band tuning. A telescopic antenna is situated at the rear, together with a 75ohm coaxial input socket.

Vailable 3-way powering for AC mains, internal batteries or an external 12v DC source (not supplied). Ideal for the home, mobile, camping/sharing or that DX-peditioner to the local mountain (and we'll supply the aerial if needed) Completely compatible for use in the UK and throughout the Continent (including FRANCE)! It's just the answer for a compact 3.0MHz x 5.5MHz x 8.8cm x 12cm - big gain and comprehensive TV/VIDX installation and at a reasonable price.

Stocks of this new receiver have just arrived from the Far East, so don't delay, order today and maximise your bidding.

YOKO model F6 multiband VHF/UHF 5" screen TV (SYSTEM B/G/I/L) £90.00. Carry Bag £4.95 elsewhere POA.

Aerial Techniques, the company that knows the TV/VIDXing hobby carry a comprehensive range of aerial equipment for every type of installation — and with a huge range of filters, amplifiers, cables, rotators, masts and supporting hardware. Send for our illustrated catalogue at 75p, if it doesn't list what you want, then we can obtain it quickly.

All prices exclusive of VAT

Delivery normally 7-10 days.

ACCESS & VISA Mail and Telephone orders welcome.

11, KENT ROAD, PARKSTONE, POOLE, DORSET BH12 2EH
Tel: 0202 736232
Runfunk (Nr 1) (Fig. 8) was "coming in all day" on August 31. Edwina and Tony Mancini reconnected their Grundig 265RC video recorder to their station to match their Grundig multi-system receiver. This enables them, at the touch of a button, to record any system that comes up. Sounds good to me and it should add a great deal more to your enjoyment of TVDXing during the forthcoming Sporadic-E season.

Band I
Ian Galpin, using a JVC 3040 multiband receiver and dipole antenna for Band I, logged a burst of picture via meteor scatter from Poland on Ch. R1 at 2043 on February 4. He also heard synchronising pulses for several minutes on Chs. E2 and R1 at 1926 on the 6th, many good bursts of m.s. pictures on these channels between 1300 and 1600 on the 17th and on his FT-680R and dipole, heard a very strong TV carrier on 53.75MHz, via aurora, during the early evening on the 22nd.

In New Rudmor, Simon Hamer received mainly test cards from Sweden (SVT Kanal 1 Sverige) on March 1 and 9, Iceland (RUV Island) and the USSR on the 3rd, Czechoslovakia (RS-KH), Norway (Norge) on the 4th, Denmark (IDR Denmark) on the 5th and Czechoslovakia and Poland on the 7th.

If you intend to take a holiday abroad, taking a portable with you will be very rewarding since a whole new range of broadcasts will be at your finger tips. No doubt you will soon discover just how well the BBC World Service and other broadcasts reach that distant location. Be sure to compile a simple log and send it along to me so that other DXers may have some idea of the type of reception to expect when they go on holiday.

Long Wave DX
(Note: I.w. and m.w. frequencies in kHz, s.w. in MHz: Time UTC.)
When the second stage of the new I.w. band plan was implemented last February, all but one of the broadcasters affected moved to their new operating frequencies so as to continue the 5kHz spacing introduced below 200kHz in the first part of the plan in February '86. At the time of going to press Radio Monte-Carlo, Monaco have still not complied with the plan and their broadcasts via Roumoules (1404kHz) continue on 218. It is not clear why, by this situation exists but, by continuing to operate 2kHz off the frequency of 216 nominated in the new plan, two undesirable effects have arisen. These are a potential 2kHz heterodyne whistle that arises when their signal beats with the broadcasts from Norway via Oslo (200kHz) now on 218 and their upper sideband now interferes with the lower sideband of the broadcasts from Warsaw, Poland via Konstantinow (2000kHz) now on 225.

The broadcasts from Radio Monte Carlo are audible for much of the day in the UK and the 2kHz heterodyne whistle is evident between 1700 and 1900. The bands from the broadcasts from Norway cross our shores. Writing from Newcastle, Glen Davison says he could hear the heterodyne with his receiver tuned anywhere between 214.5 and 222kHz, but the intensity of it varied with time of day.

Although Glen rated the signal from Oslo as 33352 during a check at 1850, he says that in general their transmission does not reach him at all well during the day. In contrast the signal from Kalundborg, Denmark on 245 (300kHz) is a comfortable 44454 during the day, similarly those from Montala, Sweden on 189 (300kHz) rate as 43454. The poorer "C" rating is due to adjacent channel interference from Saarlos, W. Germany at 183, but it is not bad.

The report from David Edwardson in Walsend also mentioned the 216/218kHz situation. He found that he could hear either Oslo or Roumoules provided he used the "narrow" (2.7kHz) f.i. filter position on his Tri R600. However, the narrow bandwidth severely restricts the audio response of the demodulated signals.

Because the sensitivity of the Trio R600 receiver is rather poor on the i.w. band, David employs a PW "Taw" f.i. converter ahead of his receiver to improve the performance. He compiled his log for the period by using this combination with a home-built I.w. loop measuring 0.25m by 0.25m and consisting of 55 turns of 22swg. wire - see Fig. 1.

When tuning around the i.w. band one Saturday evening at 2120 David noticed that many of the stations were broadcasting the same type of programme. Allouis 162, Saarlos 174, Roumoules 218 and Junglinster 234 were all carrying reports on the various football matches played in the French leagues. A commentary of Olympic ice hockey could be heard via Konstantinow 225, Lahati 254 and Topolina 272. In contrast Kaliningrad 171, Moscow 263 and Minsk 281 were broadcasting a rerun of the JSSR.

A Vega Selena B210 portable enabled George Millmore to compile an interesting log for the chart in Wootton, Isle of Wight during daylight. He found the internal ferrite rod antenna useful for separating Lahti, Finland and Tipiza, Algeria on 254. In Coventry, Alan Taylor compiled his list for the chart between 1600 and 1700 while using a "Super Loop" with a "Car Radio Signal Booster" (PW, March '87) ahead of his Realistic DX302 portable.

Writing from Great Missenden, Howard Newell has been writing to several of the French speaking I.w. broadcasters and requesting their QSL. So far he has received a letter from France-inter confirming reception of their broadcasts via Allouis on 162. He now awaits verification from Europe No 1 (183); RT Luxembourg (234); Radio Monte-Carlo (218) and RT Algerienne (254). Howard uses a Matsui MR-4099 portable with just the built-in antenna when checking the I.W. band.

A QSL card from Europe No. 1 has been received by Colin Godwin in Malvern to confirm his reception of their broadcasts via Allouis on 162. Howard used a Grundig Satellit 650 receiver he tried m.w. transatlantic DXing and was delighted to log twelve stations. The strongest signal stemmed from WSH in Boston, MA on 1510, which rated as SIO 322 at 0039.

The Caribbean Beacon, Anguilla 1610 was logged before midnight by several DXers including Christopher Dane. He rated their signal in Middlesbrough as SIO 233 at 2248.

Christopher has strung a random wire antenna around the loft space with an a.t.u. Having hooked up his Walthamworth Satellite 650 receiver he tried m.w. transatlantic DXing and was delighted to log twelve stations. The strongest signal stemmed from WSH in Boston, MA on 1510, which rated as SIO 322 at 0039.

The Caribbean Beacon, Anguilla 1610 was also heard by Howard Newell at 0035. Howard uses a
The broadcasts from Torshavn on the remote Faroe Islands 531 (5kW) are seldom mentioned by DXers, although they may be audible in the UK at times. They will be interesting to know if other DXers have observed this effect.

Other MW DX

The broadcasts of the Italian Radio 2 programme via the 540kW transmitter in Rome, Italy on 846 were heard in S. Africa by Dick Moon at night, although no other European signals were heard. Their signals have also been reaching the UK well during the early evening. Phil Townsend has noted them as SIO 333 in London at dusk and by 1950 they peaked to 444.

However at 2005 a rapid wakening effect was observed by the rating fell to SIO 422. It would be interesting to know if other DXers have observed this effect.

Newfound, Martin Andrews listens to some of the broadcasts at night from Europe and N. Africa. The programmes from Algiers, Algeria 981, John Evans often rated the signal from RNE-1 via Madrid on 585 as SINPO 4444 at 1959 and via La Coruna on 639 as 5344 at 2000. La Coruna 639, also heard Newell at 2220, who also heard RNE-1 via Barcelona on 738 at 2130.

Using a Matsu MR-4099 portable with just the built-in antenna in Newhaven, Martin Andrews listens to some of the broadcasts at night from Europe and N. Africa. The programmes from Algiers, Algeria 981, John Evans often rated 1900 and 2000 usually rate as SINPO 4444. He tunes into the daily broadcasts from Radio Mediterraneo via Cyclops, Malta on 1160 at 2220. On Sunday morning he listens to Radio World by BRT via Wolvertem, Belgium on 1512. He says, this “programme is full of information for the DXer.”

The broadcasts from Algeria 981 were also mentioned in the report from John Evans, but he can receive them during daylight as his location in Shawforth is some 365m a.s.l. on top of the Pennines! Using a Vega 206 portable he rated their signal as SIO 333 at 1245. The broadcasts from Mann, Italy are often rated the band at night and logged. AFN Frankfurt, W. Germany 873 as SIO 444 at 2147; Milan, Italy 900 as 432 at 2156; Monte-Carlo, Monaco 1467 as 424 at 2245 and Langenberg, W. Germany 1593 as 444 at 2227.

Using a Sony IC-7600D portable with the internal antenna in London, Andy Macdonald often listens to Programme 2, broadcast via Katowice, Poland (1500kW) on 1080. He rated their signal as 2333 at 2011. Other broadcasts noted during the evening stemmed from Zagreb, Yugoslavia 1134; Prague, Czechoslovakia 1233; Valencia, Spain 1260; Rome, Italy 1332; Vienna-Buchberg, Austria 1476 and Sarnen, Switzerland 1566.

Scandinavian broadcasts reach Edinburgh well after dark, Robert Taylor also heard the signals from Vigo, Norway 630; Pori, Finland 963; Kalundborg, Denmark 1062; Solvesborg, Sweden 1179 and Kvisby, Norway 1314 as SIO 444.

Three broadcasters who employ 1000kW transmitters were mentioned by Ken Whayman of Marthwaite. He rated the signal from Radio Tirana via Lushnje, Albania 1395 as 43444 at 2250; TWR Monte-Carlo, Monaco 1467 as 54444 at 2315 and Radio Malaysia via Kalinigrad, USSR 1386 as 54555 at 2258.

Listening in Eyemouth at 0030, David Middlemess received Radio Moscow via Kalinigrad, USSR (150kW) on 1147 at 0100. This was probably his best DX for the month, although he did hear BBC Essex via their 0.1kW transmitter on 1530 in Southend-on-Sea! BBC Radio Studio X was also logged in Eyemouth by David Middlemess, he heard their signal via Reigate on 1368 (0.5kW) underneatd Mannox Radio, IOW.

Howard Newell uses a loop antenna with his Matsu MR-4099 portable for local radio DXing. Martin Andrews has been putting his Mat12 MR-4099 portable to good use too. He’s received QSLs from ILR DevonAir Radio 954 and BBC Radio Jersey 1026, but he still awaits confirmation fromo another burner.

Stewart Russell wrote to BBC Radio Cumbria saying he was receiving their programme in Forfar and got a mention on one of their Sunday request shows! He says, “They found it quite surprising I was picking them up. I also told them I was receiving Radio Norfolk and the DJ couldn’t believe it!”

Radio Norfolk was also mentioned in the report from Sheila Hughes in Morden. She now has a m.w. loop too. Sheila says, “When I heard the idnet and frequency of BBC Radio Mersey side this evening I could hardly believe it! But sure enough it was right, as I listened for half an hour and heard the stations names and a station itself again.”

Darran Taplin uses a 25m random wire antenna with his recently purchased Eddystone 160RX receiver, he is considering trying a “Scooper Loop” instead. Using a Vega 206 portable with just the built-in ferrite rod antenna, John Evans found his first venture into local radio DXing very worthwhile.

Short Wave DX

Although Radio Norway International are making good use of the 25MHz (11m) band to reach their listeners in S. Africa, at the time of this writing no press or other broadcasters have been tempted to use the band.

The daily transmissions from Radio Norway International, Oslo have been reaching customers across Norway via Fredrikstad, SE Norway on 25.730 between 1200 and 1345. They are being well received there, often SINPO 55555. The skip distance is too long for reception in the UK, although part of their signal does reach us back scatter. Frequent variations in the strength of the signal, and the band here is generally poor, Robert Taylor mentioned SIO 222.

There has been a marked improvement in the conditions prevailing on 1044KHz band and many of the transmissions have been reaching their target areas at considerable strength! The daily broadcasts to Europe from Radio RSA Johannes- burg, S Africa on 21.590 have been reaching the UK well. Using a Panasonic DR-22 receiver with a home-made loop antenna in Nettingdround, Christopher Pritchett rated their signal as 44444 at 1300.

Programmes in English and Japanese are broadcast to Europe by Radio Japan in Tokyo via Moyabi, Gabon on 21.700 from 1500 until 1700. Christian rated their signal as SINPO 44334 at 1500 and 44445 at 1530 as SIO 55555. The pass between Europe via Gabon on 21.695 from 0700 until 0830 is monitored daily by John Berridge in Cardiff. He finds that fading and phase distortion often makes reception poor at 0700. UAE Radio Dubai beam their programmes in Arabic and English to Europe on 21.605 from 0615 until 1400. Their signal was rated as SIO 444 at 1336 by Paul Hawkward in Newcastle-upon-Tyne.

During the day other broadcasts were logged, Radio Nederlandse, via Talata Velon, Madagascar 21.480 (English to SE Asia 1130-1225) rated as SINPO 24422 by David Edward- son; RBI via Nauen, GDR 21.540 (Hindi to India) and 1145-1445; Radio DW via Julich, W. Germany 21.600 (Hausa, French to C. Africa 1130-1350) both logged by Darran Taplin; RBI via Issoudun, France 21.620 (French, English to the Middle East 1000-1500); Radio Moscow, USSR 21.635.
SEEN & HEARD

Short Wave Magazine May 1998

Note: Entries marked * were logged during darkness. All other entries were logged during daylight.

Edwardson, he noted 23432 in his log at 0820.

Some broadcasts were logged by Kenneth Reece between 0555 and 0700, Radio Kuwait 17.895 (Arabic to Se Asia) rated as SINOPO 21544; FEB Radio, Seychelles 17.855 (English to Middle East) at 35444; Radio Moscow, USSR 17.665 (English to Europe) at 2332; UAE Radio Dubai 17.644 (Arabic to Middle East at 45544; Voice of Israel, Jerusalem 17.655 (Hebrew to Europe 0615-1490) at 45545; Radio Beijing, China 17.700 (Chinese) at 34434; Radio Bucharest, Romania 17.790 (English to Australia) at 55444; UAE Radio Dubai 17.865 (Arabic, English to Europe 0615-1645) at 54444; RSA English to Europe 0615-1490) at 45544.

Later, Radio Moscow, USSR 17.775 (English to Europe) was logged by John Nash in Brighton on 00333 at 1000. Radio DW Cologne via Kigali, Rwanda 17.800 (English, Hausa, French to W Africa) was received at 1130 by Leslie Hollis in Grahamton at 45533. At noon, John Nash picked up AWR via Gabon 17.890 (English to W Africa), noting their signal as 32122. Glen Davison heard Radio Bucharest, Romania 17.795 (English to W Africa), logged at 1400 by Edward Broadsmith in Worcester.

Later, Radio Moscow, USSR 17.775 (English to Europe) was logged by John Nash in Brighton on 00333 at 1000. Radio DW Cologne via Kigali, Rwanda 17.800 (English, Hausa, French to W Africa) was received at 1130 by Leslie Hollis in Grahamton at 45533. At noon, John Nash picked up AWR via Gabon 17.890 (English to W Africa), noting their signal as 32122. Glen Davison heard Radio Bucharest, Romania 17.795 (English to W Africa), logged at 1400 by Edward Broadsmith in Worcester.
Later, a number of broadcasts from Canada, North, Central and South America were noted in the reports. A home-built 'straight' receiver employing two 1T4 valves enabled Ron Pearce in Burlington, Ontario to hear the African Service of RCI Montreal, Canada 17.820 and rated their signal as 333 at 1808. WYFR via Okeechobee, Florida was logged by John Thompson in Rainham at 2050. The DX programmes beamed to Europe by Radio HCB Quito, Ecuador 17.790 at 2130 were monitored by Martin Andrews. John Perry picked up their broadcast in Spanish to South America at 17.890 and rated their signal as 5640.

The reception conditions on the 15MHz (19m) band have been good. The broadcasts from Radio New Zealand 15.150 to the pacific are now being reaching the UK around 1830, but their signals suffer from a rapid form of fading. The SINPO 25432 noted by Ron Proudfoot at 1830s is a typical example of their signal under favourable conditions. Kenneth Reece logged their transmission several times during the month, he says, ‘This station is weak but it can be heard around noon with a band around noon with a

Although not intended for the UK, the broadcasts from Radio Australia have also been audible here. George Hewlett monitored their transmission to the Pacific via Shepparton on 15.240 from 0400, noting their signal as SIO 4352 at 0420 and 0630. Tim Shirley logged their broadcast to S Asia via Carnarvon on 15.415 at 0930. Using a rod antenna on the balcony of his flat in Brussels with an antenex, a Cedar PR30 pre-selector and a CR70A receiver, Al Gray picked up their broadcast to the Pacific area via Shepparton on 15.160 at 2130. At 2300 Tim Shirley heard their transmission to N America via Shepparton on 15.395.

Some other broadcasts noted during the day include the Voice of Nigeria, Lagos 15.120 (English, Arabic to N. Africa 0700-1030) logged by Martin Andrews at 0830; Radio Bangladesh, Dhaka 12.500 (English to Europe 1230-1300) rated as 44434 by Christian Pritchard; Radio RSA Johannesburg, S Africa 15.125 (French, English to A. Africa) the signal received by Peter Vlietink in London; UAE Radio Dubai 15.320 (Arabic, English to Europe 1500-1915) rated as SIO 212 at 1600 by Julian Wood in Little, Later; Ron Proudfoot at 1600 logging RNR Brasilia, 15.265 (English, German to Europe 1900-1950) during the evening signal being very strong.

Listening in Newcastle-upon-Tyne at 1900, Ron Proudfoot heard WOGO, Boston, MA 17.500 (English, German to Europe 1600-1745); also by Kenneth Buck on 17.612 at 1725 (English to N America 1900-2345) and on 17.875 at 1915 (Spanish, Arabic, Italian, English to Europe 1600-1945).

Ron Pearce at 1930 received their broadcast in Spanish to South America on 17.890 and rated their signal as 5640.

The SINPO 25432 noted by Ron Proudfoot at 1830s is a typical example of their signal under favourable conditions. Kenneth Reece logged their transmission several times during the month, he says, ‘This station is weak but it can be heard around noon with a band around noon with a

Although not intended for the UK, the broadcasts from Radio Australia have also been audible here. George Hewlett monitored their transmission to the Pacific via Shepparton on 15.240 from 0400, noting their signal as SIO 4352 at 0420 and 0630. Tim Shirley logged their broadcast to S Asia via Carnarvon on 15.415 at 0930. Using a rod antenna on the balcony of his flat in Brussels with an antenex, a Cedar PR30 pre-selector and a CR70A receiver, Al Gray picked up their broadcast to the Pacific area via Shepparton on 15.160 at 2130. At 2300 Tim Shirley heard their transmission to N America via Shepparton on 15.395.

### Johannesbuerg 9.665 - all rated 55555. Using a Sony ICF-2001 portable while in Cairo, Egypt Bill Griffith logged several stations during the evening, REE via Noblejoe, Spain 8.675 at 20:30; Radio Nederlands via Field Holland 9.895 at 2100; also Radio Budapest, Hungary 9.585 at 2130 - all rated 55555.

Many broadcasts were noted on the [41m band including WHRI South Bend, Indiana 7.355 at 0855 (Ian Curry); Radio Australia 7.205 (logged by Graham Johnson at 2004 using a Panasonic 8843 portable in portable in auro); AIR New Delhi, India 7.410 at 2110 (Neil Dave); Radio Polonia, Poland 7.270 at 2205 (Alex Mackow); Voice of Israel, Jerusalem 7.460 at 2255 Colin Godwin); Radio Vilnius, USSR 7.400 at 2300 (Cyriel Kellam). While monitoring the 6MHz (49m) band during the evening, Bill Griffith logged Radio Beijing, China on 6.933 at 1755; Edward Broadsmith listened to Radio Pakistan, Islamabad 6.210 at 1718; Alf Gray picked up Radio Sophie, Bulgaria 6.070 at 2130; Paul Hawkyard heard Vatican Radio, Rome 6.190 at 2150 and Julien Wood heard the BBC World Service via Limmasol, Cyprus 6.180 at 2150.

**WHAT SCANNER**

**Regency MX 7000** Monitor Scanner
- **COVERAGE**: 25 to 550MHz continuous, 800MHz to 1.3GHz
- **MODES**: a.m., n.b.f.m., w.b.f.m.
- **SENSITIVITY**: n.b.f.m. = 0.4μV at 12dB S/N; w.b.f.m. = 1.0μV at 12dB S/N; a.m. = 0.8μV at 10dB/s
- **SELECTIVITY**: n.b.f.m. = 25kHz at 6dB; w.b.f.m. = 25kHz at 6dB; a.m. = 25kHz at 6dB
- **RESOLUTION**: 5, 12.5, and 25kHz
- **IMAGE REJECTION**: -50dB
- **IF STAGE**: 550kHz, 45.0kHz, 5.5kHz, 455kHz
- **AUDIO OUTPUT**: 1W at 10% distortion
- **SCAN RATE**: 9.0Hz
- **SEARCH RATE**: 15 channels per second
- **MEMORIES**: 20
- **FEATURES**: Tuning dial as well as keypad, priority channel, mains adapter and mounting bracket available as extras
- **REVIEWS**: Available second-hand
- **PRICE**: £399

**Bearcat 100FB** Handheld Scanner
- **COVERAGE**: 136 to 174MHz, 406 to 512MHz
- **MODES**: a.m., n.b.f.m., w.b.f.m.
- **SENSITIVITY**: 0.05μV at 12dB S/N; 0.1μV at 12dB S/N; 0.1μV at 10dB/s
- **SELECTIVITY**: 50kHz @ 25kHz
- **RESOLUTION**: 5kHz
- **IMAGE REJECTION**: -50dB
- **IF STAGE**: 5kHz
- **AUDIO OUTPUT**: 300mW
- **SCAN RATE**: 16 channels per second
- **SEARCH RATE**: 15 channels per second
- **MEMORIES**: 16
- **FEATURES**: Available second-hand
- **PRICE**: £286.95

**Yaesu FRG 9600** VHF UHF Scanner
- **COVERAGE**: 60-905MHz up to 460MHz for s.s.b.
- **MODES**: a.m., n.b.f.m., w.b.f.m., w.b.f.m., s.s.b.
- **SENSITIVITY**: At 435MHz 12dB S/N n.b.f.m. 0.3μV; At 435MHz 10dB S/N n.b.f.m. 0.5μV
- **SELECTIVITY**: 10kHz, 5, 15, 2.5, 10, 100kHz
- **IMAGE REJECTION**: At 145MHz - 398Hz
- **IF STAGE**: 5GHz
- **AUDIO OUTPUT**: 1W into 8Ω
- **SCAN RATE**: 15 channels per second
- **SEARCH RATE**: 15 channels per second
- **MEMORIES**: 1,000
- **FEATURES**: 0.6m whip antenna, mobile mounting bracket, wire stand, 1.8m d.c. power cord
- **REVIEWS**: Available second-hand
- **PRICE**: £525

**Realistic PRO 32** Programmable Handheld Scanner
- **COVERAGE**: 68 to 88MHz, 106 to 138MHz (a.m.), 138 to 174MHz, 380 to 512MHz
- **MODES**: a.m., n.b.f.m., w.b.f.m., w.b.f.m., s.s.b.
- **SENSITIVITY**: 0.02μV at 12dB S/N; 0.05μV at 12dB S/N; 0.05μV at 10dB/s
- **SELECTIVITY**: 50kHz @ 25kHz
- **RESOLUTION**: 5kHz
- **IMAGE REJECTION**: -50dB
- **IF STAGE**: 5kHz
- **AUDIO OUTPUT**: 300mW
- **SCAN RATE**: 20 channels per second
- **SEARCH RATE**: 12 channels per second
- **MEMORIES**: 10
- **FEATURES**: 3000s of programmable memories
- **REVIEWS**: Available second-hand
- **PRICE**: £129.95

**Regency HX 850E** Handheld Scanner
- **COVERAGE**: 75—105MHz or 60—90MHz, 118—135MHz, 136—174MHz, 380—490MHz
- **MODES**: a.m., n.b.f.m., w.b.f.m., w.b.f.m., s.s.b.
- **SENSITIVITY**: v.h.f., f.m. = 0.3μV at 12dB S/N; u.h.f. f.m. = 1.0μV at 12dB S/N; v.h.f. a.m. = 1.0μV at 10dB/s
- **SELECTIVITY**: 1m (a.m.) ±7.5kHz at 6dB
- **RESOLUTION**: 5, 10, 50 kHz
- **IMAGE REJECTION**: -60dB
- **IF STAGE**: 21.4MHz, 656kHz
- **AUDIO OUTPUT**: 10mW, 10% or less t.h.d.
- **SCAN RATE**: 20 channels per second
- **SEARCH RATE**: 7 channels per second
- **MEMORIES**: 10
- **FEATURES**: Key lock switch, LCD channel readout, jack for earphone, belt clip and flexible antenna supplied
- **REVIEWS**: Available second-hand
- **PRICE**: £280

**Unden Bearcat 70XL** Handheld Scanner
- **COVERAGE**: 29—54, 136—174, 406—512MHz
- **MODES**: a.m., n.b.f.m., w.b.f.m., w.b.f.m., s.s.b.
- **SENSITIVITY**: 0.05μV at 12dB S/N; 0.1μV at 12dB S/N; 0.1μV at 10dB/s
- **SELECTIVITY**: 50kHz @ 25kHz
- **RESOLUTION**: 5kHz
- **IMAGE REJECTION**: -50dB
- **IF STAGE**: 10kHz
- **AUDIO OUTPUT**: 140mW at 10% t.h.d. into 8Ω
- **SCAN RATE**: 15 channels per second
- **SEARCH RATE**: 15 channels per second
- **MEMORIES**: 10
- **FEATURES**: Available second-hand
- **PRICE**: £199.95

**Unden Bearcat 50XL** Handheld Scanner
- **COVERAGE**: 29—54, 136—174, 406—512MHz
- **MODES**: a.m., n.b.f.m., w.b.f.m., w.b.f.m., s.s.b.

**HOW TO ORDER**

Add 75p per order postage (overseas readers add £1.50 for surface mail postage) and send a postal order, cheque or international money order with your order (quoting book titles and quantities) to PW Publishing Limited, FREEPOST, Enfeco House, The Quay, Poole, Dorset BH15 1PP. Payment by Access, Mastercard, Eurocard or Visa also accepted on telephone orders to Poole (0202) 678558. Books normally despatched by return of post but please allow 28 days for delivery.

**A recent addition to our Book Service.**

O/P = Out of print, O/S = Out of stock.

---

**RADIO**

Air & Meteo Code Manual
Joerg Klingensius

A detailed description of the World Meteorological Organisation Global Telecommunication System operating procedure of aircraft and radio meteorologists, CB and amateur formats with decoding examples. Also contains detailed description of the International Fixed Telecommunication Network amongst others, 280 pages. £14.00

**BETTER RADIO/TV RECEPTION**

A. B. Clark

An Australian publication giving guidance and advice both to listeners seeking reliable reception of some distant stations, and to DX listening hobbyists. 124 pages £9.95

**SHORTWAVE RADIO RECEPTION (USA)**

W. S. Orr W8SAI & S. D. Cowan W2LX

A guide for users of scanning receivers, covering hardware techniques for the short waves and v.h.f./u.h.f. communications band and gives constructional instructions for accessory components to improve the performance of scanning equipment. 216 pages £9.95

**SHORT WAVE RADIO LISTENERS HANDBOOK**

Peter Rouse GUDKO

A guide to understanding and using amateur radio, weather and TV broadcast services. 207 pages. £9.25

**BEGINNERS**

An introduction to Radio DXing (BP81)
R. A. Penfold

How to find a particular station, country or type of broadcast and to receive it as clearly as possible. 112 pages.

**BEGINNER'S GUIDE TO RADIO (9th Edition)**

Gordon & Kim Rees

Radio signals, transmitters, receivers, antennas, components, covers the amateur radio and covers all with detailed explanations. 266 pages £6.95

**BEGINNER'S GUIDE TO ELECTRONICS**

Peter Rouse GUDKO

A comprehensive guide to understanding and using radio amateur, weather and TV broadcast services. 207 pages. £9.25

**ALL SYSTEMS, ALL ALPHA**

This book provides detailed descriptions of the characteristics of telegraph transmission on short waves, with all commercial modulation types including voice frequency telegraphy. It provides comprehensive information on all radio modulation formats, call letters and alphabets. 207 pages £8.00

**THE SATELLITE EXPERIMENTER'S HANDBOOK (USA)**

Peter Rouse GUDKO

A guide to understanding and using amateur radio, weather and TV broadcast services. 207 pages. £9.25

---

**TELEVISION**

An introduction to Satellite Television
F. A. Wilson

Answers all kinds of questions about satellite television. For the beginner and the one looking at hiring or purchasing a satellite TV system there are details to help you along. For the engineer there are the technical details including calculations, formulae and tables. Plenty of advice for the d.i.y. enthusiast. 104 pages £9.95

A TV-DXERS HANDBOOK (BP176)

R. Bunney

Information on transmission standards, propagation, DXers including multi-standard, colour, satellites, antennas, television identification, interference, etc. Revised and updated 1986. 87 pages £6.95

**THE SATELLITE TV AMATEUR**

Peter S. Pearson

How satellite TV works, setting up your own TVRO terminal, the costs, the programmes available. 72 pages £4.95

**GUIDE TO WORLD-WIDE TELEVISION TEST CARDS**

Edition 2

Keith Hamer and Garry Smith

This manual is to assist long distance television enthusiasts (TV DXers) around the world with signal identification. There are 240 test cards, identification slides and clock captions pictured. It is in "sem-alphabetical" order, that is the stations are in alphabetical order in their geographical sections. 52 pages £3.95

**THEORY**

Amateur Radio & Electronics Study Guide

3rd Edition

Ian Ridpath ZL1BCG

This book aims to fill the gap between high level amateur radio handbooks and the oft-simplified amateurs manuals. It is written in a "students own notes" format that hopes to put the reader as easy as then formally written test books do, 216 pages £7.00

**COMMUNICATIONS (BP89)**

Elemscan - Book 8

F. A. Wilson

Fundamentals of line, microwave, submarine, satellite, digital multiples, radio and telegraphy systems are covered, with less complicated theory or mathematics. 256 pages £2.95

**FOUNDATION OF WIRELESS AND ELECTRONICS**

Elemscan - Book 10

M. G. Sorensen

Covers d.c. and a.c. circuits, L.C. tuned circuits and selectivity, valves, semiconductors, transmission lines, antennas, radiation, oscillation, modulation, detection, amplification, superhet receivers, c.r.i.s., waveform generators and switches, computers and power supplies. 551 pages £6.95

**LEVEL II RADIO & ELECTRONICS THEORY**

Ian Ridpath ZL1BCG

A sequel to Amateur Radio & Electronics Study Course, this book covers advanced theory up to a level needed on most technical courses. The "handwritten" format is designed to make the student feel as though the pages are his own notes. 169 pages £6.70

**PRACTICAL ELECTRONICS CALCULATIONS AND FORMULAE (BP63)**

F. A. Wilson

This has been written as a workshop manual for the electronics enthusiast where there is a strong practical bias and higher mathematics have been avoided where possible. 249 pages £3.95

---

**LISTENING GUIDES**

Air Band Radio Handbook
David J. Smith

With air band radio you can savour the conversations between aircraft and those on the ground who control them. An air band Air band operator explains more about this listening hobby. 174 pages £5.95

**DIAL SEARCH (5th Edition 1988/89)**

George Wilcox

The listener's check list and guide to European broadcast. Covers medium wave, long wave, v.h.f. and short wave, including two special maps, making the most of your portable and many more. 46 pages £3.25

---

**GUIDE TO BROADCASTING STATIONS**

Phillip Darrington

Frequency and station data, receiver, antennas, Latin American DIXing reporting, computers in radio, etc. 240 pages £9.95

**GUIDE TO FACSIMILE STATIONS**

7th Edition

Joeorg Klingensius

This manual is the basic reference book for everyone interested in FAX. For the beginner, FAX, facsimile is the name of the station, ITU country/geographical symbol, technical parameters of the emission are all listed. All frequencies have been measured to the nearest 100Hz, 252 pages £12.00

**GUIDE TO FURTHER UTILITY TRANSMISSIONS**

3rd Edition

Joeorg Klingensius

This manual is built on continuous monitoring of the radio spectrum from the sixties until the present. It is a useful summary of activities of utility stations and provides information to the active radio monitor in the classification and identification of radio signals. 126 pages £8.00

**GUIDE TO UTILITY STATIONS**

6th Edition

Joeorg Klingensius

This book covers the complete short wave range from 3 to 30MHz plus the adjacent frequency bands from 0 to 150kHz and from 1.6 to 3MHz. It includes details on all types of utility stations including FAX and RTTY. There are 15802 entries in the frequency list and 3132 in the alphabetical call sign list plus press services and meteorological stations. 494 pages £19.00

**HF OCEANIC AIRBAND CODIFICATION (2nd Edn.)**

Bill Laver

Airband channels by frequency and band, main ground radio stations, European R/T networks, North Atlantic control frequencies, 240 pages £3.50

**INTERNATIONAL RADIO STATIONS GUIDE (BP155)**

Revised and updated in 1985. This book shows the site, country, frequency/wavelength and power of stations in Europe, the Near East and Australia, North and Latin America, Africa, plus short-wave stations worldwide. 128 pages O/P

**THE COMPLETE VHF/UHF FREQUENCY GUIDE Updated 1988**

This book gives details of frequencies from 26-2250MHz with no gaps, from the sixties. Recently updated, there are chapters on equipment requirements as well as antennas, etc. 85 pages £8.95

**THE INTERNATIONAL VHF FM GUIDE**

7th Edition

Julian Baldwin G3UHK & Kris Partridge GBAUQ

The latest edition of the useful book gives concise details of repeaters and beacons worldwide plus coverage maps and further information on UK repeaters. 70 pages £2.85

**UK LISTENERS CONFIDENTIAL FREQUENCY LIST UPDATED 1988**

Covering the services and transmission modes that can be heard on the bands between 1.635 and 2.97MHz. £6.95

**VHF/UHF AIRBAND FREQUENCY GUIDE**

A complete guide to the airband frequencies including how to receive the signals, the frequencies and services, VHF/ UHF airband frequencies and the interesting subject of airband radio. 74 pages £6.95

**WORLD RADIO TV HANDBOOK 1988**

Country-by-country listings of long, medium and short wave broadcasters and TV stations. Receiver test reports, English language broadcast. The s.w.t. is "bible": 576 pages £17.95
INTERFERENCE HANDBOOK (USA)
William R. Nelson WA8FOQ
How to locate and cure f.r.f. for radio amateurs, CBers and TV owners. 253 pages £6.75

RF INTERFERENCE (USA)
What causes f.r.f. And what f.r.f. problems difficult, expecially if you are trying to cure them? These questions and many more are answered in this book. 84 pages £4.30

TELEVISION INTERFERENCE MANUAL (RSGB)
B. E. Bryant
TV channels and systems, spurious radiation TV, strong TV, TV or FM transmitter. 48 pages £2.94

AMATEUR RADIO CALL BOOK (RSGB)
Winter $7.88 Edition
This manual now incorporates a 48-page reference section of useful information for amateurs. 56 pages £2.30

AMATEUR RADIO OPERATING MANUAL (RSGB)
A universal manual covering everything about every aspect of amateur operating, including international call sign and prefix lists, DXCC counties list, etc. 204 pages £6.16

CARE AND FEEDING OF POWER GRID TUBES (USA)
The manual analyses the operation of EMAC power grid valces and provides design and application information to assist the user of these valves. 156 pages £6.75

HOW TO PASS THE RADIO AMATEUR LICENSE EXAM (RSGB)
G. L. Benbow G3HBW
The manual includes multiple choice exams and how to study for them with nine sample RAPE papers for practice, plus maths revision. 31 pages £3.15

PASSPORT TO AMATEUR RADIO
Reprinted from PW 1981-1982
The famous series of GW3JGA, used by thousands of successful RAPE candidates as an aid to their studies. Plus other useful articles for students of amateur radio. 96 pages £1.50

QUESTIONS & ANSWERS AMATEUR RADIO
P.W.
What is amateur radio? The Radio Amateurs’ Exam and answers. The meaning of the prefixes, antennas, operating procedure and codes used by amateurs. 122 pages £2.95

AMATEUR RADIO’S GUIDE TO RADIO WAVE PROPAGATION
C. P. Judd G2BXC
and why of the mechanism and variations of propagation for each band. 144 pages £8.95

— AMATEUR RADIO’S MAP OF NORTH AMERICA (USA)
Shows radio amateur prefix boundaries, continental boundaries and zone boundaries. 780 x 63mm £2.26

— THE AMATEUR RADIO’S QUESTIONS & ANSWER MANUAL
Revised and Updated Edition R.E.G. Perri GBCJC
This book has been compiled especially for students of the City and Guilds of London Institute RAE. It is supplemented with carefully selected multiple choice questions, to progress with any recognised course of instruction. Though it is not intended as a test book. 258 pages £8.95

THE 1988 ARRL HANDBOOK FOR THE RADIO AMATEUR
This new edition of the ARRL Handbook is available only in hardback, the first time the ARRL has done this. New construction projects are the theme of this edition, there is a detailed memory keyer, receiver projects, a linear QSK converter, a power supply balancing Transmatch and a c.t.r.m. decoder. Updated every year, this provides useful reference material for the radio amateur. It also includes 18 pages of p.c.b. track patterns for you to build your own bug kit. 534 pages £19.25 (hardback)

VHF HANDBOOK
FOR RADIO AMATEURS (USA)
H. S. Briner W8EGQ & W. L. Duv W8SI
VHF intra-protocol, including moonbounce and satelites, equipment and antennas. 325 pages £7.95

VHF/UHF MANUAL (RSGB)
G. R. Jessop G3JP
Theory and practice of amateur radio reception and transmission, between 30MHz and 24GHz. 520 pages £12.92

DATA & REFERENCE
DIGITAL IC EQUIVALENTS AND PIN CONNECTIONS (BP140)
A. Michaels
Equivalents and pin connections of a popular selection of European, American and Japanese digital i.c.s. 256 pages £15.95

INTERNATIONAL DIODE EQUIVALENTS GUIDE (BP108)
A. Michaels
Possible substitutes for a large selection of many different types of semiconductor diodes. 144 pages £2.25

INTERNATIONAL TRANSISTOR EQUIVALENTS GUIDE (BP065)
A. Michaels
Possible substitutes for a popular selection of European, American and Japanese linear i.c.s. 320 pages £5.95

— NEWNES AUDIO & HI-FI ENGINEER’S POCKET BOOK
Vivian Capel
This is a concise collection of practical and relevant data for anyone working on sound systems. The topics covered include microphones, gramophones, CD’s to name a few. 150 pages Hardback £9.95

NEWNES COMPUTER ENGINEER’S POCKET BOOK
A. Michaels
This is a valuable compendium of facts, figures, circuits and data and is indispensable to the designer, service engineer and all those interested in computer and microprocessor systems. 203 pages Hardback £8.95

NEWNES ELECTRONICS POCKET BOOK 5th Edition
Presenting a vast collection of electronics in a readable and largely non-mathematical form for both the enthusiast and the professional engineer. 315 pages Hardback £15.95

NEWNES RADIO AND ELECTRONICS ENGINEER’S POCKET BOOK (17th Edition)
Keith Brindley
Useful data ranging from maths, abbreviations, codes, symbols, frequency bands/allocations, UK broadcasting stations, semiconductors, components, etc. 201 pages Hardback £6.95

NEWNES TELEVISION AND VIDEO ENGINEER’S POCKET BOOK
Eugene Trottule
This is a valuable reference source for practitioners in “entertainment” electronic equipment. It covers TV reception from v.h.f. to s.h.f., display tubes, colour cameras technology and video disc equipment, video signal and hi-fi sound. 323 pages Hardback £9.95

POWER SELECTION GUIDE (BP235)
J. C. J. Van de Ven
This guide has all the information on all kinds of power devices in useful categories (other than the usual alpha numeric sort) as it gives good book proper and making of replacements easier. 150 pages £4.95

RGB RADIO DATA REFERENCE BOOK
G. R. Jessop G3JP
The 8th Edition of an essential book for the radio amateur’s workbench. 244 pages Hardback £8.95

SEMICONDUCTOR DATA BOOK
A. M. Ball
Characteristics of about 10,000 transistors, f.e.s.t. u.v.g.s., diodes, rectifiers, trans. and s.c.r.s. 175 pages £7.50

TRANSITOR SELECTOR GUIDE (BP234)
J. C. J. Van de Ven
This guide has all the information on all kinds of transistors in useful categories (other than the usual alpha numeric sort) such as voltage and power properties making of replacements easier. 192 pages £4.95

OSCELLOSCOPES, HOW TO USE THEM, HOW THEY WORK (Rev'd Edition)
Ian Hickman
This book describes oscilloscopes ranging from basic to advanced models and the accessories to go with them. 133 pages £5.95

PRACTICAL HANDBOOK OF VHF & UHF RECEIVER DESIGN
Chez E Miller
This practical work on repairing and restoring valued broadcast receivers dating from the 1930s to the 60s. Amateurs give over 200 intermediate to advanced receiver circuits, descriptive data and base connections, 230 pages Hardback £15.95

QUESTIONS & ANSWERS RADIO REPAIR
Les Lawrey-Johnson
How to fault-find and repair valve and transistorised receivers, car radios and unit audio equipment. 80 pages £2.95

SERVICING RADIO, HI-FI AND TV EQUIPMENT
Gordon J King
A very practical book looking at semiconductor characteristics and c.d. and signal tests, fault-finding techniques for audio, video, r.f. and oscillator stages and their application to transistor radios and hi-fi. 205 pages £8.95

TRANSISTOR RADIO FAULT FINDING CHART (BP121)
C. E. Miller
Used properly, should enable most common faults to be traced reasonably quickly. Selecting the appropriate fault description at the head of the chart, the reader is led through a sequence of suggested checks until the fault is cleared. 635 x 455mm approx. £0.95

PROJECT CONSTRUCTION
HOW TO BUILD ADVANCED SHORT WAVE RECEIVERS (BP226)
R. Penfold
Greater satisfaction can be gained from the hobby of shortwave listening when you build and own your own home constructed equipment. This book gives full practical constructional details of a number of receivers as well as some odd circuits like S-meter and noise limiters. 118 pages £6.95

HOW TO DESIGN AND MAKE YOUR OWN P.C.B.s (BP121)
R. Penfold
Designing or copying printed circuit board designs from manufacturers, including photographic methods. 80 pages £9.95

INTRODUCING GRP
Collected Articles from PW 1983-1985
An introduction to low-power transmission, including constructional details of designs by Rev. George Dobbs G3RLW for transmitters and transceivers from 10 Bands to 14kHz, and test equipment by Tony Smith G4AFI. 64 pages £3.90

* MORE ADVANCED POWER SUPPLY PROJECTS (BP192)
R. Penfold
The practical and theoretical aspects of the circuits are covered in some detail. Topics include switched mode power supplies, precision regulators, dual tracking regulators and computer controlled power supplies, etc. 92 pages £2.95

POWER SUPPLY PROJECTS BP76
R. A. Penfold
This book gives a number of power supply designs including simple unswitched types, fixed voltage regulated types and variable voltage stabilised designs. 91 pages £2.50

PRACTICAL POWER SUPPLIES
Collected Articles from PW 1978-1985
Characteristics of transformers, transformers, rectifiers, filters and heat sinks, plus designs for a variety of mains driven power supplies, including the PW. “Marchwood”, giving d.c. stabilised and protected 12V 30A c.d. or 48 V 10A d.c., 48 pages £1.25

PROJECTS IN AMATEUR RADIO AND SHORT WAVE LISTENING
F. Hayver G3OGR
Full constructional details are given for all projects, including housing the equipment in a suitable case. All the projects are either on p.c.b. or matrix board. 90 pages £4.95

SOLID STATE SHORT WAVE RECEIVERS FOR BEGINNERS (BP222)
R. Penfold
There is a strange fascination in listening to a broadcast which has been transmitted over many thousands of kilometres. This is even more the case when the receiver yourself. This book contains designs that will give a fairly high level of performance. 53 pages £2.95

AUDIO FREQUENCIES
AUDIO (BP111)
(Elements of Electronics — Book 6)
F. A. Wilcox
This book studies sound and hearing, and the operation of microphones, loudspeakers, amplifiers, oscillators, and both disc and magnetic recording. 320 pages £3.95
The past year we have been persistently asked to re-introduce some form of “Readers’ Adverts”. Starting with the June 88 issue you will be able to advertise your Sales and Wants in Short Wave Magazine. There will, however, be a set of strictly enforced rules which are aimed at excluding trade adverts and the advertising of illegal equipment.

The cost of each advert, which can be up to thirty words long plus your address, has been set at £2.30 inclusive of VAT. Advertisements from traders, apparent traders or for equipment which is illegal to possess, use or which cannot be licensed in the UK will not be accepted. Advertisements will be published in the earliest available issue and SWM reserves the right to exclude any advertisement not complying with the rules.

You should copy your advert onto the special form below, one word in each box, using block capitals. Do not forget your name, address and Postcode. Send the completed form, together with your cheque for £2.30, to Trading Post, Short Wave Magazine, Eneco House, The Quay, Poole, Dorset, BH15 1PP.

If you do not wish to mutilate your copy of SWM you may use plain paper or a photocopy but in this case you must send the Corner Flash from the bottom of this page, or your subscription number if you have a subscription, as proof of purchase of the magazine.

Huge stocks — best prices — good backup — free Securicor
You name it — we've got it!

SONY AIR-7 HAND-HELD
AM/FM 108-176MHz +
LW/MW/FM
UNBEATABLE VALUE
The best VHF monitor there is, this 10W 108-176MHz plus LW/MW/FM broadcast covers all major bands. LCD display, memories, scanning, lockout, priority and squelch. It is designed to give you the best DX performance. £247 FREE SEURICOR

SONY ICF7600DS
PORTABLE COMMUNICATIONS!
Not a toy, this is a serious communications receiver. Frequency range 150kHz-30MHz AM/SSB plus 5W FM/900kHz digital. Full memories, clock and provision for external antenna. Listen to the DX at work! Making up a serious team in your area could cost you £169 FREE SEURICOR

New SW-1 in stock £249

NEW SONY PRO-80
RECEIVER
AM/FM/SSB
1150-2230MHz
A major innovation in monitor receivers. Just think, a complete short-wave and VHF monitoring system in your pocket! Memories, scanning, etc. Only today £329.00 FREE SEURICOR

SONY ICF-2010D RECEIVER
SUPER PORTABLE AM/SSB/CW
+ AIR Band COVERAGE
Latest SONY model. This is superb and can match many base band memories scanning etc. £320 FREE SEURICOR

RS37S AIR
BAND MONITOR
118-136MHz
This well known receiver is ideal for the serious air band enthusiast. Superb sensitivity and selectivity, this pocket size monitor is invaluable in value for money. 2 fixed channels are possible and the squelch control ensures silent background. Complete with battery and whip. £59.50 CARR. FREE

From AOR the latest VHF/IFSM monitor that covers 26-1300MHz. AM/FM highly compact, 230V or 12V DC with LCD memories and scanning. Ideal for the serious wide range of better. £475 FREE SEURICOR

Described as "the best portable on the market" by a recent reviewer, it covers 100kHz-30MHz AM/SSB/CW plus AM VHF air band and FM broadcast. Memories, scanning, etc. And all included! This performance is superb and can match many base band receivers. 230/110V AC power supplied.

Special Offer on above!
Complete ICF 2010D system comprising receiver, AN 1 active aerial and SW-1 coax. Broadcast station guide, UK Confidential Frequency List of shortwave stations, and VHF/IFSM Airband guide all sharply backed at a price that is unmissable!

£376.00 inc. delt.

An I 1 Active aerial separately £99 + £2 car!

GLOBAL AT1000 AERIAL TUNER
The AT100 is a receiver aerial tuner designed to give you maximum performance from your receiver. Covering the frequency range 150kHz to 30MHz it matches all the modern receivers produced in recent years. Ideal for matching long wire, dipole or balanced feeders.

£69.00 POST FREE

HF OCEANIC AIRBAND COMMUNICATIONS
Published December 1997
This exciting world of long distance airband communications. Hear aircraft navigating the world's oceans, air and sea rescue in action, flight crews talking back to base, instant weather broadcasts from all corners of the world. It's exciting, and this book will tell you exactly where and when it all happens. A unique publication!

£33.00 plus post 80p.

NEW 1988 EDITION
THE COMPLETE VHFM/FM FREQUENCY GUIDE
This complete revised and updated book can be on every enthusiastic's bookshelf. The previous edition sold 6000 copies in 18 months. The revised 1988 edition is 25% larger and has been completely re-written with a new easy-to-read layout. No other book ever written on so much information for such a low cost. It provides complete details on all the services in the UK that make up the VHFM/FM spectrum, 25MHz-275MHz, with organised sections, and additional listings to 360MHz. Each section begins with full details of services that are used in each segment of the spectrum. Followed by details of individual services in frequency order. Users covered include the emergency services, marine, aeronautical, land mobile, etc. Many of these services use duplex frequencies and full details of the services are included for land and mobile. Although many of the frequencies listed cannot be monitored without a licence, all listeners should find this book a mine of information. Tremendous value.

£6.95 + £1.00 p&p
FIFTH EDITION
This complete listing is now in its fifth edition. Completely updated for 1988 and a lot thicker. Many additional frequencies have been added and of course some have been deleted when the service is known to no longer exist. Packed full of information on all that happens between 1.6 and 30MHz, you will find this fascinating reading. Covering all aspects of the shortwave service, here is just a selection of the listings included: AVIATION, ICBM, MULTIPATH, MILITARY, RITTY, FAX, PRESS, etc. and much more. Not only frequencies and stations, but in many cases times of transmission are given. As well as an American Import, it is a UK manual specifically for UK listeners. If you are one of the few people that have not purchased one of these yet, then you really don't know what you have been missing. At the other hand, you have our previous editions, we know that you will want to get the latest edition. Available end of stock. Order your copy today.

THE SECRET OF LEARNING MORS CODE £4.95 post 90p
Here's a book that takes the problem of learning Morse code by the scruff of the neck and explodes the myths and mysteries that surround this most valuable ability. The author, Mark Francis, takes you simply but thoroughly through the whole learning process and shows that with his method you will quickly be able to read Morse and enjoy your new found skill. Long overdue, the book is written in non-technical language which looks a bit heavy but makes it easy to read. It shows you how to start on the right way and improve your scores. It also covers all aspects of the subject and provides some very useful hints and tips. All you have to do is look at the last word in each section and you'll see why it's called the sample tests at the back of the book. There is even a chapter that tells you exactly what you should expect when you take your seat in the examination room for your RAE Morse test. As one reviewer said "it's the most comprehensive one available on the subject today.

Yaesu has serious listeners for the serious listener.

Yaesu’s serious about giving you better ways to tune in the world around you.

And whether it’s for local action or worldwide DX, you’ll find our VHF/UHF receivers are the superior match for all your listening needs.

The FRG-9600. A premium VHF/UHF scanning communications receiver. The 9600 is no typical scanner. And it’s easy to see why.

You won’t miss any local action with continuous coverage from 60 to 905MHz.

You have more operating modes to listen in on: upper or lower sideband, CW, AM wide or narrow, and FM wide or narrow.

You can even watch television programmes by plugging in a video monitor into the optional video output. (NTSC System).

Scan in steps of 5, 10, 12½, 25 and 100kHz. Store any frequency and related operating mode into any of the 99 memories. Scan the memories. Or in between them. Or simply “dial up” any frequency with the frequency entry pad.

Plus there’s more, including a 24-hour clock, multiplexed output, fluorescent readout, signal strength graph, and an optional PA4C, AC power adaptor.

Extend the coverage further with the optional FC965DX 0.15-30MHz and FC1300 800-1300MHz external converters.

The FRG-8800 HF communications receiver. A better way to listen to the world. If you want a complete communications package, the FRG-8800 is just right for you.

You get continuous worldwide coverage from 150kHz to 30MHz. And local coverage from 118 to 174MHz with an optional VHF converter.

Listen in on any mode: upper and lower sideband, CW, AM wide or narrow, and FM.

Store frequencies and operating modes into any of the twelve channels for instant recall.

Scan the airwaves with a number of programmable scanning functions.

Listen in. When you want more from your VHF/UHF or HF receivers, just look to Yaesu. We take your listening seriously.

Yaesu South Midlands Communications Ltd
