NEW FROM NETRONICS
AUTO-PATCH HARD DISK
With plug-in multi-user ports
Automatically Installs Itself Into
Your Present CPIM® 2.2 Operating
system & Floppy Disk Hardware.
It's Exclusive!

6 megabytes... $2995.00
12 megabytes... $3495.00

What's the big concern of $100 owners when they consider adding Hard Disks? They worry that it will be difficult to install, that it won't be compatible with their present software and hardware, and that it may cause down-time on their $100 system.

Worry no more — Netronics new AUTOPATCH Hard Disk Systems are here. AUTOPATCH installs in just one-two-three: (1) plug in the hard disk S100 card. (2) run three short programs supplied on disk. (3) disable the boot on your floppy controller and enable the boot on your hard disk controller (this step not required if you wish to continue to boot to your floppy drives).

And that's it: The AUTOPATCH feature automatically finds the end of your existing BIOS and then self retocates and patches itself into the existing BIOS. A very complete copy of CCP and BIOS is loaded into memory, a customized SBOOT is added to the front of CCP and the whole memory image is written to the reserved tracks on your hard disk. You can add up to 4 hard disks to the controller supplied. The new BIOS will automatically rename any old devices as B: and C: and define the hard disk as drive A:. All with the bit of one finger! If your BIOS is large you may have to re-sysgen your system down or 2 k. If this is necessary the AUTOPATCH program will prompt you to do so.

AUTOPATCH Hard Disk Systems are available in 6 and 12 megabyte models, included in the system 6 or 12 megabyte Hard Disk Drive... Controller for up to 4 Hard Disk drives... S100 Hard Disk card with provisions for adding 8 additional I/O ports to be used when adding a multi-user operating system... Power Supply... Deluxe Steel Cabinet... All necessary cables... AUTOPATCH Program supplied on either 8" or 5 1/4" IBM formatted single density diskette (specify type required)... Complete installation instructions... Fully wired and tested... ready to go.

SPECIFICATIONS
Unformatted Recording Capacity: 6.4 or 11.6 M Bytes... No. of tracks: 612 or 1380... Data Transfer Rate: 3 ms... Bytes/sector format: 512... Communication Port: D0 (other ports available on special order)... Programs supplied on 5 1/4" or 8" single density IBM formatted diskettes (North Star CPIM® version available on special order)

(a) 8-bit registers
- 8080/8085
  - A: AL
  - B: CH
  - C: CL
  - D: DH
  - E: DL
  - H: BH
  - L: BL

- 8086/8088
  - A: AL
  - B: CH
  - C: CL
  - D: DH
  - E: DL
  - H: BH
  - L: BL

16-bit register pairs
- 8080/8085
  - PSW: AX(1)
  - BC: CX
  - DE: DX
  - HL: BX

- 8086/8088
  - PSW: AX
  - BC: CX(2)
  - DE: DX(2)
  - HL: BX

16-bit register pairs
- 8080/8085
  - SP: SP
  - PC: IP

- 8086/8088
  - SP: SP
  - PC: IP

(1) TRANS86 does not preserve 8080 byte order on the stack.
(2) The Seattle translator uses SI on loads from memory and DI for stores to memory. TRANS86 and XLT86 do a register exchange between BX and the appropriate register to allow indirect addressing through BX, then a register exchange to fix up BX and the appropriate register.

(b) 8-bit registers
- 8068/8088
  - Z80
  - TRANS86
  - Seattle
  - XLT86

16-bit alternate registers
- 8068/8088
  - Z80
  - TRANS86
  - Seattle
  - XLT86

(3) Since the 8086 does not have equivalent registers, none of the translators support these registers. However, they can be mapped to a memory location by the programmer.
(4) Seattle's TRANS86 handles these registers by generating memory references to storage locations defined by the programmer.
(5) Although these registers are not mapped by the translators, the programmer can define storage locations and deal with them through macro definitions.

Figure 6: 8080/8085/Z80-to-8086/8088 register mapping. Figure 6a shows 8080/8085-to-8086 register mapping by the three translator programs. Figure 6b shows Z80-to-8086 register mapping by the three translator programs.

- In general, when the 8080 does 16-bit arithmetic, only the carry bit is affected; this is definitely not so in the 8086.
- The Z80 and 8086 do string and block operations differently; the 8080 has no primitive block operations at all.
- As noted earlier, the segment registers in the 8086 allow addressing of up to 1 megabyte; no corresponding registers exist in either the 8080 or Z80.
- Registers used for indirect memory references in the 8080/Z80 are different from the corresponding mapped registers in the 8086.
- Conditional jumps in the 8080/Z80 can reach anywhere in its address space; conditional jumps in the 8086 can reach only 128 bytes on either side relative to the IP register.
- No conditional calls in the 8086 correspond to the conditional calls of the 8080/Z80.

Listing 1 makes it apparent that the three translators treat most instructions the same way, allowing for the differences in the target instruction set. The following comments highlight the differences found.

The only incorrect translation is TRANS86's rendering of the SPHIL instruction. The transfer is in the wrong direction. The comment field of the instruction was wrong in the
